COROT, kō-ro, Jean-Baptiste-Camille, French landscape painter; b. Paris, 28 July 1796: d. there, 22 Feb. 1875. Against the wishes of his family he studied art, first under Michallon, next under Victor Bertin, and then passed a year or two in Italy. In 1827 he first exhibited in the Salon, but it was not till nearly 20 years afterward that his genius in landscape painting was generally recognized. The last 25 years of his life were spent in affluent circumstances (his professional income being immense, and his father's death having brought him a large fortune) and in the happiness engendered by success. In 1867 he was made an officer of the Legion of Honor. Skillful as a figure-painter, it was in landscape that Corot excelled. He was a diligent student of nature, whose aspect he idealized on canvas with no profusion of color, but in sober tints of brown, pale-green and silver-grays. He was pre-eminently successful in painting scenes in the faint lights of dawn and twilight, behind a transparent veil of mist, the early rays glinting through dense foliage, mirrored in sparkling water. There is a sameness in Corot's work which forbids him the very highest rank, but within his own province he was inimitable. Among his works may be mentioned 'Danse des nymphes' (1851); 'Martyrdom of Saint Sebastian' (1849); 'Morning' (1855); 'Evening' (1855); 'Sunset' (1857); 'Orpheus' (1861); 'Rest' (1861); 'Soleil' (1866); 'Landcape with Figures' (1870); 'Pleasures of Evening' (1875); and 'Danse des amours.' The Boston Art Museum contains his 'Dante and Virgil'; the Metropolitan Museum in New York his 'Ville d'Avray,' and there are various other works by him in public and private American galleries. Consult Blanc, 'Les artistes de mon temps' (1879); Bigot, Ch., 'Peintres français contemporains: Corot' (Paris 1888); Clarie: Jules, 'Peintres et sculpteurs contemporains: Corot' (ib. 1884); Moore, Geo., 'Ingres and Corot in Modern Painting' (London 1893); Geoffroy, A., 'Corot and Millet' (New York 1903); Gansel, 'Corot and Troyon' (Bielefeld 1906); Meynell, 'Corot and his Friends' (New York 1910); Rousseau, 'Camille Corot' (ib. 1884); Robaut, Alfred, 'L'oeuvre de Corot, catalogue raisonné et illustré précédé de l'histoire de Corot et de ses œuvres' (Paris 1905); Roger-Miles, 'Les artistes célèbres' (ib. 1891); Thomson, D. C., 'Life of Corot' (London 1892); Strahan, 'History of French Painting' (1889); Muthers, 'History of Modern Painting' (London 1907); Van Dyke, 'Modern French Masters' (New York 1886).

COROZAL, Porto Rico, a municipal district of the department of Bayamon about 16 miles (direct) southwest of San Juan. It was much damaged by a hurricane in 1899. Pop. 11,508.

COROZO-NUT. See Vegetable Ivory.

CORPORAL, in the army, a non-commissioned officer with rank under that of a sergeant. He has charge of small bodies of men, places and relieves sentinels, etc. In the British army there are also soldiers distinguished by the designation of lance-corporal, who are privates acting as corporals but receiving only privates' pay. In the British household cavalry the sergeants are called corporals of horse and the sergeants-major, corporals major. This is a survival of the organization of the 16th and 17th century cavalry. In the United States army a corporal is the lowest non-commissioned officer. His especial duty is to place and relieve sentinels. The corporal wears two chevrons on his sleeve as a mark of his rank, the lance-corporal one only. A ship's corporal is an officer who has the charge of setting and relieving the watches and sentries and in general assists the master of arms.

CORPORAL, the linen cloth laid on the altar, on which the sacred vessels are set during the consecration of the elements of bread and wine in the Mass or Holy Communion. It is to be distinguished from the veil, which is used to cover the chalice and paten, and the pall or pall (q.v.). Both corporal and pall must be blessed and when not in use are carried in the burse, a square pocket of cardboard covered with silk; none except those in holy orders being allowed to touch them when they are in use.

CORPORAL, The Little. A term of affection applied to Napoleon Bonaparte by the soldiers of his Grande Armée, who always remembered that he began his career as a sous-lieutenant in Corsica.

CORPORAL PUNISHMENT, punishment applied to the body of the offender. In its connection with civil government it technically includes flogging, imprisonment and the death penalty, but in common parlance its meaning is more restricted and refers only to flogging or whipping of the body. Various extreme and cruel methods of punishment once in vogue have been discontinued in Christian nations, but
CORPORAL TRIM—CORPORATIONS, HISTORY OF

are still practised in Oriental countries and among uncivilized races. The practice is supported by the argument which produces stinging but transient pain, without mangle the body and without such public disgrace as to destroy the sense of shame, is an efficient corrective for those cruel or brutal or intractable offenders, such as wife- and child-beaters and white slavers, who are insensible to the punishment of confinement or other ordinary penalties. Corporal punishment at the hands of public officials as a punishment for crime is usually inflicted by flogging in prison or at the public whipping post. It still survives in England and in many other States as a means of discipline of convicts confined in prisons. Corporal punishment was once considered indispensable in school discipline and was very severe in form in the schools of Europe before the advent of the Innovators (q.v.). Since that period its moral and even its immediate practical benefits have been increasingly questioned, and its practice has gradually lessened. American schools have gone farther in this respect than those of Europe. This form of punishment is still included by the law of New Jersey, and to a greater or less degree is restricted in many municipalities of the other States. See BASTINADO; CANG; FLOGGING; TORTURE.

CORPORAL TRIM, a servant of Uncle Toby in Sterne's 'Tristram Shandy.' He is an old soldier and performs his duties in strictest military fashion.

CORPORATIONS, History of. The origin of corporations is lost in antiquity. The word "corporation" comes from Latin corpora, from a Sanskrit root signifying "to form into a body." This masterpiece of juristic ingenuity is usually attributed to the Romans. Yet they are said to have existed in Greece (594 B.C.) in Phcenicia (900 B.C.) and possibly in Babylonia (2200 B.C.).

A recent definition is: A corporation is "an association of persons to whom the sovereignty is by the act of law transferred to an artificial juridical person with a name of its own under which they can act and contract, sue and be sued, and who have accepted the offer and effected an organization in substantial conformity with its terms." The prominent ideas are: 'the organization of the franchise, the association so related that the association is converted by the franchise into a new person, characterized by unity and continuity. *Groups* of persons or things are as old as human history. Wolf-pack, deer-herd, bee-swarm, must have been among the earliest such combinations of like experiences. Hunting-pack, totem-group, family-group, war-host were the earliest and most important of human experiences. *Man did not make society. Society made man.* The primitive fundamental personal conception is "ours" or "we," in which "my" and "I" are included but not distinguished. The "group" is the "entity," which includes the individual, as a part of "it." The family was a permanent body, with perpetual succession, including both the living and the dead. The individuality, distinct from its members. Radin says this is the datum to begin with, and its corporate character was "much more clearly apprehended than the conception of detached individuals." Primitive society was organized along three lines: (1) Social, tribal, clan, family; (2) Totemistic, artificial, as phratry, age-grade, etc.; (3) Ceremonial, quasi-voluntary, conventional, as secret societies, etc. All these were continuous units with distinctive names, usually with religious significance. In Solon's time, (594 B.C.) there were "deae," "ephraties," "orgeones," "gens," and "clans." So, too, as early as the 8th century B.C., there were many "clans" people, who were organized for Dionysos worship, on the model of the existing corporate bodies, such as clan, phratry, etc. The Greek terms were "thiasos," a band of initiated religious followers; "orgeones," a fraternity of worshippers and celebrants; "eranos," a festal band of "collecta; "koion," things that had common; and "synods," a meeting together. The first three were used disjunctively and last two collectively, but interchangeably. In Latin, collegia, a group of colleagues, is the oldest term; corpus, a whole composed of parts, is next in frequency of use, and interchangeable with collegium. Sodales, a group of companions, was used for official brotherhoods. Universitas, a later term, signifies "turned into one, all together, collectively." In all these words there is the idea of a unity in the possession of something, as, e.g., a religious rite or a slave. In the earliest history the "outward sign of all corporate organization was community of rites," carrying with it the idea of continuity and permanency of association. Societas, on the other hand, was used for a temporary association. This idea of permanence persists throughout corporate history. With Ulpian (220 A.D.), whether the individuals all remain, or are all changed, the corporation remains, or Bracton (1260 A.D.), a corporation is as a flock of sheep, always the same flock, though the sheep successively depart; or Blackstone (1765), all the individual members that have existed, or that shall ever exist, are but one person in the law, a person that never dies, as the river Thames is the same river though the parts are changing every instant. A corporation consists in name and frame and essence of a corporation consist in the franchises which constitute this body politic. Comyns (c. 1740) says "A corporation is
CORPORATIONS, HISTORY OF

franchise created by the King. A franchise, by Blackstone (1765) and Finch (1613) is a grant of the King by the hands of the subject. Our Supreme Court (1887) says, "A franchise is a right, privilege or power of public concern, which is not to be exercised by private individuals...but should be vested in public control." Corporate capacity is a franchise. The Continental doctrine is the same. No corporation can be created without authority from the sovereign or state. This probably comes from the Roman law. Greek and Roman corporations originally were mere voluntary associations. They early became centres of political conspiracy and required regulation. Solon (c. 600 B.C.) and the XII Tables (450 B.C.) permitted agreements not contrary to law. The Bacchanalian sacra were forbidden to be secretly celebrated by more than two men and three women, together, by a Senatus Consultum (186 B.C.). In 64 B.C. boisterous game celebrating colleges were dissolved. The Cidonian law (58 B.C.) permitted them but the Licinian law (55 B.C.) again forbade them. Julianus and Valentinian and Augustus (7 A.D.) required all in Italy affecting the public to be sanctioned by emperor or Senate; Trajan extended this to the provinces (98-117 A.D.), and by the time of Gaius (c. 150 A.D.) and Marcus (c. 215 A.D.), unless a collegium is specifically authorized it is illicit, and its assemblies seditious.

The Carolingians prohibited guilds, unless authorized, on the Continent, while the Canonists, especially Innocent IV (1243-54 A.D.), evolved the doctrine that the corporate law was the creature of the state. As Maitland says: "Into its nostrils the state must breathe the breath of fictitious life, for otherwise it would be no animated body, but individualistic dust." These views found their way into English law by 1376, when "None but the King can make a corporation," which is still the rule. Although this "right to be a corporation" in recent times is now extended to all who comply with a few general provisions, and not by special grant to only a few persons, this was not changed the legal nature of the grant. The effect of such a grant is to convert the group of persons to whom the grant is made into "a legal or juristic person," for the purposes specified, and give the group a capacity in law which they otherwise would have. "Persona" signified the mask an actor wore to indicate his part in a play, and in law a "person" is a subject of legal rights and obligations, and could be applied to either human beings or things. Amos says this idea had been applied to corporations long before Justinian (527-65 A.D.), but Pollock and Maitland say it is not so plainly written in the Roman law books that the Glossators (1100-1250) or Bracton's master, Azo (c. 1230), grasped it. This corporate personality is often said to be invisible, incorporeal, intangible, immortal, existing only in contemplation of law, a mystical body not found in the world of sense, an impenetrable and intangible creation of human thought, a figure of speech, an abstraction, a fiction.

On the other hand it is said it "is no fiction, no symbol, no piece of State's machinery, no collective name for individuals, but a living organism, with body and members, and a will of its own, as visible as an army, and as real as any aggregate of men, a corpus, a body made up of several bodies." These are different sides of the same coin. If a natural person is a natural organism, a physical body and a legal conception. A corporation is a conventional organism, a physical body and a legal conception. From the earliest times Greek and Roman corporations are found in possession of property, stated to be that of the corpus, and not of the members jointly. When they died no action de commune dividendo arose. In Rome what the corporation owed the members did not owe, nor the reverse; the agent or slave of the corporation was not that of the members; its property was liable for its debts, but not for theirs, nor theirs for its; a member could be its debtor or creditor. What the greater part did was done by all; it took three persons to make a corporation but if reduced to one person, the corporation continued (stet nomen universitas); it was doubtful if a municipal body could be guilty of deceit (municeps dolo facere non possit); a slave of the corporation could be required to testify against the corporation through the members for he is丁in the Roman and Augustus (7 A.D.) required all in Italy affecting the public to be sanctioned by emperor or Senate; Trajan extended this to the provinces (98-117 A.D.), and by the time of Gaius (c. 150 A.D.) and Marcus (c. 215 A.D.), unless a collegium is specifically authorized it is illicit, and its assemblies seditious.

The Carolingians prohibited guilds, unless authorized, on the Continent, while the Canonists, especially Innocent IV (1243-54 A.D.), evolved the doctrine that the corporate law was the creature of the state. As Maitland says: "Into its nostrils the state must breathe the breath of fictitious life, for otherwise it would be no animated body, but individualistic dust." These views found their way into English law by 1376, when "None but the King can make a corporation," which is still the rule. Although this "right to be a corporation" in recent times is now extended to all who comply with a few general provisions, and not by special grant to only a few persons, this was not changed the legal nature of the grant. The effect of such a grant is to convert the group of persons to whom the grant is made into "a legal or juristic person," for the purposes specified, and give the group a capacity in law which they otherwise would have. "Persona" signified the mask an actor wore to indicate his part in a play, and in law a "person" is a subject of legal rights and obligations, and could be applied to either human beings or things. Amos says this idea had been applied to corporations long before Justinian (527-65 A.D.), but Pollock and Maitland say it is not so plainly written in the Roman law books that the Glossators (1100-1250) or Bracton's master, Azo (c. 1230), grasped it. This corporate personality is often said to be invisible, incorporeal, intangible, immortal, existing only in contemplation of law, a mystical body not found in the world of sense, an impenetrable and intangible creation of human thought, a figure of speech, an abstraction, a fiction.

On the other hand it is said it "is no fiction, no symbol, no piece of State's machinery, no collective name for individuals, but a living organism, with body and members, and a will of its own, as visible as an army, and as real
CORPORATIONS, HISTORY OF

magistrates, senate, assembly and *citizens,* and were centres of local self-government. The Saxon invaders frequently used them for camps, but there seems to be no continuity of organization. The *burh*—the fort on the hill, surrounded by ditches, rents, fines,—was the land community on its way to the corporate existence. As early as the 10th century it had pleas of life, liberty and land, and numerous local customs, and there was such a place in nearly every shire in Domesday survey, upon which a separate or special return was made. From Norman times, the *farm* of the borough had been rendered by the sheriff of the county. But the king was willing to accept a composition, and the burgesses, wishing to have the amount fixed, raised money to buy a charter granting their customs. In 1130 Lincoln did this, and perhaps this had been done much earlier. In 1161–89 Henry II delivered my borough of Cambridge to my burgesses of Cambridge, to render same farm as before. John, in 1201, did the same to them all. In 1282 a gild of German traders obtained an exclusive right to trade in London. In 1391 Richard II granted to the *communities* of English merchants trading in Prussia the right to meet, elect a governor to rule over the traders, do justice and settle disputes between them. Henry IV, during the next 20 years, gave similar privileges to many other companies, and in 1490 Henry VII made the English merchants at Pisa a corporation. While it was not till about 1600 that English companies were incorporated in England, they had long before had substantially the powers of such under their gild organization. The members, instead of trading with a joint stock, traded separately on their own individual capital, subject to the regulations of the gild or corporation; hence the name regulated company. The great trading and colonizing corporations of the 16th and 17th centuries were of this kind.

The *fondus* was the result of a combination between this regulated company and the continual idea of a joint stock. There were stringent laws against usury. Perhaps to evade these, the device of *commendia,* similar to that of the Babylonian law, was resorted to all over Europe in the Middle Ages. Two parties, one with money and one without, together undertook to engage in trade and share profits; the one with money stayed at home but let his partner have the money to trade on abroad, the latter to have one-fourth of the profits after the expenses were paid. Later both would contribute the funds and one do the trading, and still later several might contribute the money, and the others do the trading; this differed from the *societas,* in which each was surely bound to the whole. In the *commendia,* only the active parties were liable. As early as 1346, various parties loaned money to Genoa, for conquest purposes, and she gave the shareholders an interest in the conquered lands. In 1407 the bank of Genoa took over the state loans, and issued a con-

supervising the trade, conditions, processes, prices, material, tools, labor, hours, wages, apprentices, workmanship, weights and measures, in the trading towns. There were religious, merchant and craft,—the members being bound together by a cross roads or river ford, where defense was needed, a natural place for trade, an asylum for the tribe and administrative centre for a district,—with all sorts of persons and all kinds of tenure, with a reeve to collect dues, rents, fines,—was the land community on its way to the corporate existence. As early as the 10th century it had pleas of life, liberty and land, and numerous local customs, and there was such a place in nearly every shire in Domesday survey, upon which a separate or special return was made. From Norman times, the *farm* of the borough had been rendered by the sheriff of the county. But the king was willing to accept a composition, and the burgesses, wishing to have the amount fixed, raised money to buy a charter granting their customs. In 1130 Lincoln did this, and perhaps this had been done much earlier. In 1161–89 Henry II delivered my borough of Cambridge to my burgesses of Cambridge, to render same farm as before. John, in 1201, did the same to them all. In 1282 a gild of German traders obtained an exclusive right to trade in London. In 1391 Richard II granted to the *communidades* of English merchants trading in Prussia the right to meet, elect a governor to rule over the traders, do justice and settle disputes between them. Henry IV, during the next 20 years, gave similar privileges to many other companies, and in 1490 Henry VII made the English merchants at Pisa a corporation. While it was not till about 1600 that English companies were incorporated in England, they had long before had substantially the powers of such under their gild organization. The members, instead of trading with a joint stock, traded separately on their own individual capital, subject to the regulations of the gild or corporation; hence the name regulated company. The great trading and colonizing corporations of the 16th and 17th centuries were of this kind.

The *fondus* was the result of a combination between this regulated company and the continual idea of a joint stock. There were stringent laws against usury. Perhaps to evade these, the device of *commendia,* similar to that of the Babylonian law, was resorted to all over Europe in the Middle Ages. Two parties, one with money and one without, together undertook to engage in trade and share profits; the one with money stayed at home but let his partner have the money to trade on abroad, the latter to have one-fourth of the profits after the expenses were paid. Later both would contribute the funds and one do the trading, and still later several might contribute the money, and the others do the trading; this differed from the *societas,* in which each was surely bound to the whole. In the *commendia,* only the active parties were liable. As early as 1346, various parties loaned money to Genoa, for conquest purposes, and she gave the shareholders an interest in the conquered lands. In 1407 the bank of Genoa took over the state loans, and issued a con-
solidated stock divided into shares, to those who had put up the money, and these were given the right to do a banking business (1408), and later (1455) to administer the colonies. In the 15th and 16th centuries, the idea began to be utilized in England for foreign trade. The Genoese Cabots probably were instrumental in introducing them. The Russian Company was incorporated with a joint stock, and shares, in 1553, as were many others soon afterwards, including the East India (1580), Hudson's Bay (1670), Royal Africa (1672). At first joint stocks were only for particular transactions, and it was not till 1657 that the East India Company had a permanent joint stock. In 1694, the group of persons who loaned money to the government was incorporated as the Bank of England, with a joint stock, based upon the credit fund of the state, upon which it was to pay interest, and which the bank could use as a basis of credit for doing an ordinary banking business. It seemed possible to extend this idea to trading purposes, so the South Sea Company was incorporated in 1711 to take over the floating debt of the state (49,000,000), on which 6 per cent interest was paid, issue shares therefor, and lend the Bank of England money to borrow money for trading with Peru. The English debt had increased to £31,000,000 by 1720. The Bank of England and the South Sea Company bid against one another for the privilege of acquiring this as a credit fund for enlarging their business,—the latter by a bid of £5,000,000 bonus, and accepting 5 per cent interest, and bribes, secured the privilege. The shares immediately rose enormously in value, and wild speculation began. In 1692, stock quotations began to be published; stock exchanges developed; stock jobbing began; all sorts of schemes,—for perpetual motion, to import jackasses from Spain,—an undertaking to be revealed,—were promoted; unincorporated stock companies, as well as incorporated ones with ill-defined purposes, soon began to be issued, and in another hand,—a water company went to dealing in forfeited lands,—a banking partnership bought a charter of 1691 to make hollow sword blades. All this speculation led to the panic of 1720, Pennsylvania, 23; Of war was passed, forbidding the creation of joint stock companies, or transferable shares, unless they were incorporated, but making no adequate provision for the regulation of those incorporated. This was repealed in 1825, and the Crown was authorized to incorporate companies, making the members individually liable for the corporate debts. In 1834 such joint stock companies were to sue and be sued in the name of an officer. In 1844, a general act was passed for 258 companies to be formed by a Certificate of Incorporation, and charter from king or Parliament, but with individual membership liable to creditors if the corporation's property was insufficient to meet its obligations. In 1855, 1856, laws enabled the formation of companies under Act of 1844, with limited liability, of members, and in 1862 these acts were superseded by the Companies Act, which with the amendments made since is the basis of existing English Corporation Law. The colony of New Jersey, 10, 12; Carolina, 1609—17, and Massachusetts Bay (1628), the seat of the latter being transferred to America. The grants to colonial proprietors, 1621 (New Scotland), 1629 (Carolina), 1632 (Maryland), 1634 (New Albion), 1681 (Pennsylvania), contained provisions broad enough for the proprietors to create corporations, and in 1682, Penn incorporated the Free Society of Traders. Similar powers were conferred upon the royal governors, but when Governor Seymour incorporated Annapolis (1708), the legislature protested. Other governors disclaimed such power. The concessions to the proprietors in Carolina and New Jersey (1665) authorized the legislatures to create municipal corporations. There was much doubt about the power of the legislatures in other colonies to do so. Harvard College was authorized by an Act of 1642, but without an incorporating clause, which was not inserted till 1650, and then not published with the other laws. In 1652 a water company with quasi-corporate powers was authorized by the Massachusetts legislature. In 1649 the English Parliament incorporated the President and Society for the Propagation of the Gospel in New England; in 1701 the Society for the Propagation of the Gospel in Foreign Parts, and in 1709 the credit fund for the Christian Knowledge. In 1693 William and Mary College in Virginia was chartered by the English sovereigns. The Bubble Act of 1720 was extended to the colonies in 1741, but without apparent effect. The constitutions of Pennsylvania (1776) and Vermont (1786, 1793), conferred power to create corporations on the legislatures, and when Governor Livingston of New Jersey undertook to incorporate a Baptist church in 1778, the legislature objected and he acquiesced. In 1781 the Congress of the Confederation incorporated the United States Bank, although the Articles of Confederation were silent as to such power. So it became the rule that the power to create corporations was vested in the legislature, and not in the executive side of our governments. See on each hand,—a water company went to dealing in forfeited lands,—a banking partnership bought a charter of 1691 to make hollow sword blades. All this speculation led to the panic of 1720, Pennsylvania, 23; Of war was passed, forbidding the creation of joint stock companies, or transferable shares, unless they were incorporated, but making no adequate provision for the regulation of those incorporated. This was repealed in 1825, and the Crown was authorized to incorporate companies, making the members individually liable for the corporate debts. In 1834 such joint stock companies were to sue and be sued in the name of an officer. In 1844, a general act was passed for 258 companies to be formed by a Certificate of Incorporation, and charter from king or Parliament, but with individual membership liable to creditors if the corporation's property was insufficient to meet its obligations. In 1855, 1856, laws enabled the formation of companies under Act of 1844, with limited liability, of members, and in 1862 these acts were superseded by the Companies Act, which with the amendments made since is the basis of existing English Corporation Law. The colony of New Jersey, 10, 12; Carolina, 1609—17, and Massachusetts Bay (1628), the seat of the latter being transferred to America. The grants to colonial proprietors, 1621 (New Scotland), 1629 (Carolina), 1632 (Maryland), 1634 (New Albion), 1681 (Pennsylvania), contained provisions broad enough for the proprietors to create corporations, and in 1682, Penn incorporated the Free Society of Traders. Similar powers were conferred upon the royal governors, but when Governor Seymour incorporated Annapolis (1708), the legislature protested. Other governors disclaimed such power. The concessions to the proprietors in Carolina and New Jersey (1665) authorized the legislatures to create municipal corporations. There was much doubt about the power of the legislatures in other colonies to do so. Harvard College was authorized by an Act of 1642, but without an incorporating clause, which was not inserted till 1650, and then not published with the other laws. In 1652 a water company with quasi-corporate powers was authorized by the Massachusetts legislature. In 1649 the English Parliament incorporated the President and Society for the Propagation of the Gospel in New England; in 1701 the Society for the Propagation of the Gospel in Foreign Parts, and in 1709 the credit fund for the Christian Knowledge. In 1693 William and Mary College in Virginia was chartered by the English sovereigns. The Bubble Act of 1720 was extended to the colonies in 1741, but without apparent effect. The constitutions of Pennsylvania (1776) and Vermont (1786, 1793), conferred power to create corporations on the legislatures, and when Governor Livingston of New Jersey undertook to incorporate a Baptist church in 1778, the legislature objected and he acquiesced. In 1781 the Congress of the Confederation incorporated the United States Bank, although the Articles of Confederation were silent as to such power. So it became the rule that the power to create corporations was vested in the legislature, and not in the executive side of our governments. See on each hand,—a water company went to dealing in forfeited lands,—a banking partnership bought a charter of 1691 to make hollow sword blades. All this speculation led to the panic of 1720, Pennsylvania, 23; Of war was passed, forbidding the creation of joint stock companies, or transferable shares, unless they were incorporated, but making no adequate provision for the regulation of those incorporated. This was repealed in 1825, and the Crown was authorized to incorporate companies, making the members individually liable for the corporate debts. In 1834 such joint stock companies were to sue and be sued in the name of an officer. In 1855, 1856, laws enabled the formation of companies under Act of 1844, with limited liability, of members, and in 1862 these acts were superseded by the Companies Act, which with the amendments made since is the basis of existing English Corporation Law.
COURT MATTERS

needy and to enrich and ennoble humanity which is not to a great extent done through the instrumentality of corporations.

In recent years there has been not only wonderful growth in the number and size of separate corporations, but also an extraordinary tendency to combine, into authorized consolidations, or authorized trusts. About 1900, it was estimated that the capital of great corporations formed in one or other of these ways was in the great industrial enterprises as follows: Railway consolidations, $9,000,000,000; industrial (manufacturing), $7,000,000,000; street railroads, $1,800,000,000; municipal service, $2700,000,000; telegraph and telephone, $280,000,000; or a total of nearly $21,000,000,000, or about one-fifth of the total wealth of the United States. Very recently, too, there has been a great increase in corporation formation; corporations (having over $1,000,000 capital stock) were formed in the United States, with nearly $895,000,000 capital stock in 1914; with $426,000,000 in 1915; and $2,708,000,000 in 1916; and those (30,000 in number) with over $100,000 in 1917, had $329,000,000 capital stock. All this change is not so great, increase in corporate activity has characterized other great commercial countries.

Horace L. Wilgus,
Professor of Law, University of Michigan.

CORPORATIONS, Legal. Characteristics.
In general the legal status of a cor-

poration is that of a person, with a name in which to do business, own or convey property, sue and be sued. It is normally managed by a board of trustees or directors, and officers, such as president, secretary, treasurer, etc. Its powers are those given at its creation. Its powers and obligations are its own, and not those of its members. Its creditors must look to it and to its property alone for payment, and not to its members, unless they have not paid for shares, or have wrongfully appropriated its property.

Classes.—Corporations are: Aggregate, created with a capacity to have more than one member at a time; or Sole, with capacity to have only one member at a time. Reduction to one member does not make an aggregate a sole corporation. Either may be: Ecclesiastical composed of ecclesiastical persons, for ecclesiastical purposes, and subject to ecclesiastical jurisdiction; or Lay, for temporal purposes, as "major or corporate" persons or "beneficiaries," and other purposes, -social and literary purposes.

In the United States, where there is no established church, church organizations, when incorporated, are Religious Corporations, and really lay corporations to manage the church business, without, and subject to no, ecclesiastical jurisdiction, except under the agreement of membership. Lay corporations are Eleemosynary (or charitable) for the distribution of the alms of the donor or founder, as in the case of hospitals, colleges, etc.; and Civic, for other purposes.

Civil corporations are: Public, for governmental purposes, as the State, municipal corporations, etc.; Quasi-public (more properly, Public Service corporations), for private gain but also to perform some public function as railroad, telegraph, etc., companies; and Private, for advancing the interests of individuals in their private capacities. They are "not-for-profit," i.e., for the benefit of other than the members, as colleges, etc.; and for "profit," either pecuniary or otherwise, i.e., for the benefit of the members, if not stock. —i.e., without capital stock and for some benefit other than pecuniary, as a literary society, or college fraternity; and stock (or moneyed), for pecuniary profit by way of dividends on a capital stock. These classes are not mutually exclusive,—some corporations are within two or more of them.

In England, lay corporations are: Trading and Non-trading. They may be "chartered," by the king; or "Statutory," formed under acts of Parliament. These are usually called companies. The Non-trading are Municipal, for local government, or Eleemosynary, for charitable and benevolent purposes. Companies under the Companies Acts may be limited by shares, limited by guarantee and unlimited, according to the liability of the shareholders, and by limited liability companies, resembling corporations, but without full corporate powers, or a "personal status," separate from the members exist both in England and the United States. They are: public, as counties, townships, parishes, etc.; territorial units for governmental purposes, or institutions, such as asylums, penitentiaries, State universities, etc., controlled by boards, with quasi-corporate powers; or private, such
as miners' federations, labor unions, etc., stock exchanges, boards of trade, partnerships, syndicates, cost-book mining companies, joint-stock companies, trusts and partnership associations limited.

Joint stock companies are similar to corporations, but unless excluded by contract or statute, there is an unlimited individual liability of the members for the acts of the managers. The capital stock is usually divided into transferable shares, represented by certificates, and an owner is not an agent of the company unless he is so appointed. Recently "Trusts" have been organized for business purposes, with the legal title and power of managing the property vested in trustees, subject to the trust deed, the beneficial interest being represented by transferable trust certificates. In the absence of notice and agreement to the contrary the trustee is liable to third parties as an owner, and to the beneficiary for breach of trust. Partnership Associations, Limited, are created under statutes of Pennsylvania, Ohio, Michigan, etc., with powers very like corporations, with a capital stock, transferable shares and limited liability of members; the property is held and conveyed, and suits, by or against, are in the association name; they are sued by corporations and within the Federal courts, as a citizen of the creating State, without alleging and proving that no member is a citizen of the other party. The New York joint stock companies and some of the English insurance companies are similar.

Continental Systems.—Corporations are "Juristic Persons" in the Continental law, following the Roman. However, associations similar to those noted above exist. They are provided for in the Civil and Commercial codes. The general term is "Associations" (Societas, Genossenschaft), which includes both. Juristic persons are Public, as the state itself (Ficus); Charitable (Stiftung or Foundation), the property, rather than its owners or managers, being personified. There are Trading or Mercantile (provided for in the Commercial codes), joint ventures, for profit, and associations for a common enterprise not for profit. The members are co-owners, but not partners. The Trading or Mercantile (provided for in the Commercial codes) is equivalent to our general partnership, but considered a juristic person in the Italian and Japanese law, so that death or withdrawal of a member does not dissolve, as it does in English, French or German law. Société en Commandite (Kommanditgesellschaft), with members with limited, and others, usually the managers, with unlimited, liability, corresponding to the English and American special or limited partnerships. Société Anonyme (Aktiengesellschaft), or joint stock corporation, with transferable shares, limited liability of members, and managed by directors elected by shareholders. Société commanditée par actions (Kommanditgesellschaft auf Aktien), a combination partnership and stock corporation, with unlimited liability, and managing partners with limited liability.

Tests of Corporate Existence.—The line of demarcation between an incorporated and an unincorporated body is not sharply defined. There is no universally accepted mark of a "juristic person," which excludes associations not such. The American courts have suggested these tests in the creating State: (1) There can be no valid corporation without legislative authority; (2) when the legislative intent is clear, that will control in the absence of a statute; (3) when this is not clear, resort must be had to powers conferred, and which, in order to make a corporation, must merge and vest the rights and liabilities of the individuals into one distinct, artificial existence. The courts of other States, however, will come to their own conclusions, from the powers conferred, and will not be bound by the legislative or judicial declarations of the creating State.

Creation of Corporations.—Coke said the essentials are: Lawful authority; persons to be incorporated; name; place; apt words. Lawful authority may be either by common law; act of Parliament; king's charter; prescription; to which may be added, implication and consolidation. By the common law, kings, bishops, parsons, vicars, deans, governors and officers generally are held to be corporations sole, "by the universal assent of the people from remote ages," and from necessity in order that they may carry out their official functions. For the same reason, the English "Parliament," the "United States," and the separate States, are held to be corporations aggregate, but the "British Empire," the "United Kingdom" and the "Church of England," are not. The king is the state. Australia, however, is considered a corporation sole. By legislative act—in 1783 Parliament incorporated the "College of Physicatians," and the king "in Parliament" has always claimed the power to erect corporations, as well as "without" Parliament. Like power inheres in the United States Congress, and in the State legislature, without express constitutional provision, and may be exercised by special or general act, if constitutions do not forbid. The colonial and State legislatures, in our early history, acted by special acts only. The Roman legislature acted either way. In 1597 a general law was passed allowing companies, joint adventures, for profit, and associations for a common enterprise not for profit. The members are co-owners, but not partners. The Trading or Mercantile (provided for in the Commercial codes) is equivalent to our general partnership, but considered a juristic person in the Italian and Japanese law, so that death or withdrawal of a member does not dissolve, as it does in English, French or German law. Société en Commandite (Kommanditgesellschaft), with members with limited, and others, usually the managers, with unlimited, liability, corresponding to the English and American special or limited partnerships. Société Anonyme (Aktiengesellschaft), or joint stock corporation, with transferable shares, limited liability of members, and managed by directors elected by shareholders. Société commanditée par actions (Kommanditgesellschaft auf Aktien), a combination partnership and stock corporation, with unlimited liability, and managing partners with limited liability.
CORPORATIONS, LEGAL

Ohio (1831) said "The general assembly shall pass no special act conferring corporate powers. Corporations may be formed under general laws; but all such laws may from time to time be altered or repealed." One or the other of these provisions now exists in nearly all the State constitutions, put there to secure equality of price, of rate, uniformity of powers and to prevent fraud, corruption and loss of time, incident to special legislation. There is no such limitation in the Federal Constitution, so Congress may act either by special or general act. In the manufacturing act of 1808, Massachusetts reserved the right to amend or repeal it. After the decision of the Dartmouth College Case in 1819, holding that an accepted corporate charter constituted a contract, the obligation of which could not be impaired by subsequent State legislation, State constitutions and incorporation laws usually provide that corporation charters shall be subject to repeal or amendment. The inhibition in the United States Constitution, against impairing the obligation of contracts, is on the States only. The United States government does not exercise the power of expelling corporate charters nor is it necessarily implied therefrom, and so Congress (except in the Territories and District of Columbia, where it has a general legislative power), can create corporations only to carry out some State or express implied powers.

King's charter—"Anciently, a gild, either religious or secular could not be legally set up without the King's license, and in 1179 many adulterine gilds were amerced by Henry II.

Dracton (c. 1250) said it was the exclusive prerogative of the King to confer charters, but from late as 1523, the Pope incorporated religious bodies in England. The bishops of Durham (a county Palatine) claiming iura regalia from the Conquest, incorporated the "Barkers" and "Tanners" at Gateshead, and granted charters to the city in 1565, 1602 and 1780. In 1376 it was held that only by the king could new corporations be created, though he could license another, as the chancellor of Oxford University, to create corporations to advantage of the University. The King incorporated many rotten boroughs, for political reasons.

Henry VII granted charters to John and Sebastian Cabot in 1496, 1498 and from then to Victoria many great trading and colonizing companies have been incorporated by the English sovereigns.

In the United States, in colonial times, the king chartered corporations, e.g. William and Mary College (1693), Governor Andros of New York (1675, fisheries), William Penn (1682, trading), and Lord Baltimore, exercised such authority, but since the American Revolution the power is vested exclusively in the legislature, and not in the chief executive.

Prescription—A body which has claimed and exercised unquestioned, corporate powers so long as to raise a presumption that the corporation never existed, but lost by the lapse of time, is said to exist by prescription, which is sufficient until the contrary is proved. Implication—Coke says "of ancient times the inhabitants or burgesses of a ville or burg were incorporated when the King granted to them to have a merchant gild." The king's charter to the "men of Dale and their successors," or an act of Parliament granting an estate in fee to the "Conservators of the river Tone, and their successors" made them a corporation. Consolidation—this is now only by express legislative authority whereby two or more corporations unite to form a third, although in 1377 it was said one corporation could be so united to another as to succeed to its rights.

Persons to be incorporated. Coke says these may be either natural or artificial, but where the statute says "Three or more persons may incorporate," natural persons only are meant; however, in most of the States statutes authorize the consolidation, merger or amalgamation of two or more corporations into another, or the holding of shares in another. Sometimes incorporators are required to be citizens or inhabitants of the State, but not usually. A person incapable of contracting probably cannot be an incorporator, but incompetent persons may succeed to the ownership of shares. In the Roman and Continental law, a "bundle of property," —a "foundation," or an "inheritance" might be incorporated, but in the English and American law it seems persons only can be incorporated, although possibly an "image of an Indian God" may be, under the English law, incorporated. Under the English law, a corporation may be incorporated by the charter and by-laws, in non-stock corporations; but by the ownership of shares in stock corporations, either by original subscription, purchase from a corporation or by a merger; (6) underwriting; (7) application and notice. (1) and (2) are statutory and effective at once by force of the statute if it is followed. In (3) the corporation is not yet in existence, and if the paper reads: "We the undersigned hereby subscribe the shares set opposite our names," there are four theories in the American courts: (a) A mere offer to the future corporation, revocable by withdrawal, death or insolvency, any time before the corporation is formed; (b) A binding contract as soon as all the stock agreed upon is subscribed, the mutual subscriptions being considerations for one another, and since the group of subscribers is the same after, as before, incorporation, they then can enforce it in the corporation name. This accords with the intention and purpose of the parties. Only a few courts so hold however, the majority following rule (a); (c) Only an offer to the future corporation, but a contract among the subscribers, as soon as the subscription is complete. This recognizes the right of revocation as to the corporation, but not as to the subscribers. The result is not clear; (d) A binding agreement if, before incorporation, the subscribers have relied on the subscriptions to pay for property that a corporation cannot be placed in statu quo. (4) Subscriptions to promoters, before incorporation, are generally held to be enforceable by the corporation, when it comes into existence against the subscribers. If the incorporation, or (5) there is no difficulty about parties or consideration, and the subscription may be either oral or in writing; (6) An underwriter agrees to take the stock not subscribed by the public, for a commission, or at a discount from the price.
to the public. The purpose is to guarantee the taking of the stock within a specified time; (7) Application, allotment and notice is the English method, where application is made to the proper officer. Compliance with all the requirements for all the shares applied for, the contract being completed when the notice of allotment is dispatched. The effect of a completed subscription contract is to make the subscriber a member, whether or not he has paid, received a certificate or been regularly, as of right. He essentially agrees to pay, upon call, the amount stated.

**Name.**—The early authorities said a name is of the very essence of the corporate institution, the knot of their combination without which corporate acts could not be performed. It is usually given by charter, but may be acquired by user. General laws require the name to be stated in the incorporation paper, and it must not be the same as another in the same jurisdiction. It may be protected as a trade mark, as its unfair use in an incorporation. A change of name does not change the identity of the corporation.

**Place.**—An old authority says: "There must be a place certain where to fix and bottom the corporation; incorporation can be made." General laws require the location of the principal office, or place of business to be stated in the incorporation paper. Places within and without the incorporating state may be designated.

**Proper words.**—"But not restrained to any certain and legal and prescript form of words." Any, indicating an intention to incorporate, as incorporate, found, erect, create, form, or others, will do.

**Charter.**—The document containing all (not part of) the terms offered by the lawful authority by the persons to whom made is essential. Promoters usually have the papers prepared, and secure the acceptance of the persons to be incorporated; they stand in a fiduciary relation both to such persons, and the corporation if formed, and are liable for unfair dealing, to both. In a special act, or a charter from the king, the terms, conditions and forms of organization are set forth, and may be accepted formally by acting under them. A contract then results between the corporation and the state, constitutionally exempt from subsequent amendment or repeal, unless such right is reserved.

**Incorporation.**—Acceptance of all by the persons to whom made is essential. A corporation may be incorporated in an Incorporation Paper (usually prepared by the promoters), often called Certificate of Incorporation, Articles of Association, Memorandum of Association, etc. The general law usually requires the purposes, name, place, capital stock, amount subscribed, number of shares to be issued, names of incorporators or subscribers, to be stated in this incorporation paper, which must be signed and acknowledged in a specified way by a certain number of incorporators, and then filed, recorded or registered in designated public offices. Other provisions as to organization, powers, voting, meetings, transfers of shares, reports, amendments, dissolution and winding up are usually found in the general laws. These and the incorporation paper, executed as required, become the charter, and have the effect both of a law and a contract, as under a special act. Corporation shall be in accordance with the conditions precedent of the general law makes a de jure corporation, i.e., one invulnerable against the direct attack by the State. What are conditions precedent and what conditions subsequent are difficult to determine. Are the things to be done by incorporators, or by the corporation? If the former, they are conditions precedent; if the latter, subsequent. In most States, a certain number of incorporators, written articles stating everything specified, executed in the precise way indicated, and filed as directed, are conditions precedent to de jure corporate existence.

**De Facto Corporations.**—In the United States, failure in some of these particulars does not make the effort abortive entirely. A good faith effort to organize under a valid law, colorable compliance therewith and corporate user,—although some condition has not been complied with,—results in a corporation de facto, valid as to all the world except the state which maynull it in a direct attack. Incorporation is a condition. In a majority of the States it acquires a corporate status, and the members escape individual liability, as a de jure corporation. Some deny this, in eminent domain proceedings by it, or to it for subscriptions, or in suits against the members by persons not stopped by dealing with it as a corporation. De facto existence is not recognized in England or on the Continent.

Some courts go further and say that whenever a group of persons hold themselves out as a corporation, and thereby induce others to deal with them as such, it and they are stopped to deny the corporate existence, if it would be inequitable to do so. Some say estoppel arises only on matter of fact and not of law; others that there is estoppel only when there is de facto existence; and others deny the doctrine entirely.

**Commencement of Corporate Existence.**—Some statutes read "upon filing the incorporation paper" by acting under them. A corporation must be in existence, before stock is subscribed or organization effected. They require the incorporators after filing the incorporation paper to take subscriptions, and when the requisite amount is subscribed to call a meeting of the subscribers to organize. Only an inchoate existence seems possible until there are stockholders and organization. The weight of authority so holds, but there is authority to the contrary.

**Where to Incorporate.**—Arizona, Delaware, District of Columbia, Maine, New Jersey (formerly), Porto Rico, South Dakota and West Virginia have more liberal incorporation laws, and lower fees, than many other States. Business men dislike divulging business secrets, making reports and being hampered in their operations, and so prefer incorporating in the liberal States. To answer "where," various matters are to be considered, requiring careful attention and comparison by a competent attorney.

**In Corporate Rights.**—In corporate rights it acquires jus persona, and is capable of all civil rights of having and doing. So run the old authorities, and so was the Roman law. *No
freeman ought to be diseseised," "No person shall be deprived of life, liberty or property, and No State shall deny to any person the equal protection of the law," all include corporations; and generally the word person in statutes includes corporations, if the subject matter permits.

Of course a corporation has no body to be assaulted, beaten, imprisoned, hung or electrocuted, although old cases discussed the situation when it lost its head by the death or imprisonment of the dean of a chapter. It cannot "eat, drink or be merry," marry, have children, heirs, brothers or sisters, although "to-morrow it may die." It has no sex, race or color, but whether it is it or they has been discussed. It may have a good will, good or bad reputation and be slandered, libeled or maliciously prosecuted. It may be "respectable and responsible person," but not a "colored person," or a "rogue or vagabond." In England and Germany it may be an alien enemy if incorporated, domiciled or controlled by agents, in the hostile state. The inferior courts of the United States have held otherwise if only incorporated in the hostile state.

In the United States a corporation is a citizen of the incorporating State, regardless of the citizenship, domicile or residence of its members, for suits in the Federal courts, and an inhabitant of the district in which it has its principal place of business. It can do business and have agents in other States, and sue and be sued there.

On the other hand, it is not a citizen of the incorporating State, within the meaning of the clause "the citizens of each State shall be entitled to all the privileges and immunities of citizens in the several States." Nor can it, nor its officers for it, refuse to produce its books and papers in evidence, because they would incriminate it. It has, however, whatever other rights are given it by its charter. And in general, a corporation has the same rights to sue either at law or in equity to protect or vindicate its rights as a natural person has.

Corporations. Liability — Corporations, like individuals, are subject to the general duties and obligations imposed upon other persons by the law, and are liable for breaches thereof. In the Roman law, Ulpian (ad dictum, 198-217 a.d.) said: "just as the praetors allowed an action on behalf of a municipality, he thought the edict should allow actions against one.

Torts. — Corporations are now held liable for torts both in England and America. Such liability was of slow growth due to the "artificial personality" theory, current in the Middle Ages. In 1234 Gregory IX authorized the excommunication of ecclesiastical corporations, but in 1245 Innocent IV forbade such as "the innocent may . . . be caught by a sentence of this kind." In 1268, in England, "The corporation not provable. Trespass does not lie against it, for captas nor esquity, nor against a commonality," and in 1356 "Nor can they commit treason, or be outlawed or excommunicated, for they have no souls." The actions of trespass and nuisance were current in 16th Century and corporations were thought not to be liable for torts or crimes of misfeasance. However, they were held in England for forcible diseseizin (1357), and trespass (1371, 1430, 1454); negligence (Massachusetts 1810); conversion (England 1812); nuisance (Pennsylvania 1818); assault and battery (Florida 1842); deceit (Ohio 1846); false imprisonment (England 1851); malicious prosecution (Connecticut 1853); but denied in England until 1890 or 1904; libel (England and U.S. 1794); but only since 1880 for slander; exemplary damages (Illinois 1858); and tort in an ultra vires transaction (United States 1858).

Crimes. — Corporations were punished very early for delinquencies. The liberties of London were seized in 1245, for a false judgment by its magistrates, in 1264, for joining the barons against the king, in 1284, because the mayor, being bribed, connived at the bakers making their penny loaves six ounces too light, and many others, to the quo warranto in 1683, for extortion in tolls and the publication of a seditious libel. In 1811 a corporation was indicted for not repairing a bridge in England, and in 1812 in Massachusetts; in 1846, in England for disobeying a court's order, and obstructing a highway, followed in 1852; in 1876 for criminal libel in Missouri; in 1879 for Sabbath-breaking in West Virginia; in 1892 for keeping a disorderly house in New Jersey; in 1900 for criminal negligence, in not maintaining a bridge, causing death and equivalent to manslaughter in Canada, Supreme Court. The United States courts refuse to go so far. Corporations, however, are generally held criminally liable for violations of pure food, anti-rebate, anti-trust and revenue laws, as well as for public nuisances. They are not yet held liable for higher felonies,—the requisite criminal intent supposed to be impossible and the punishments provided inapplicable.

Powers. — In England corporations chartered by the king have a general capacity to do anything not forbidden, while one created by an act of Parliament has only a special capacity to do what is expressed,—"only that and nothing more." Yet both have the incidental power of succession, to contract, grant, sue in its name, resume property, have a seat in Parliament and make by-laws. The doctrine of special capacities has obtained in the United States from the beginning, and for all corporations. This has led to the doctrine of ultra vires, beginning in 1804 with the United States, and in 1826 in England, based on four principles: (1) a corporation has no powers except those granted by its charter; (2) whoever deals with it must know these; (3) stockholders should not be subjected to risks not contemplated; and (4) the state is interested that the powers shall not be exceeded. An entirely executed contract will not be disturbed at the suit of either party; so, too, a wholly executory contract will not be enforced, or damages allowed for its breach by either party. In England, in many States, and by the Federal courts, an act of a corporation void, because of incapacity of the corporation; in many other States, void because illegal as against public policy; but in New York and others valid and enforceable whenever it would be illegal if done by an individual. If the contract is executed by one party but not by the other, the decisions divide: those holding it void will allow no suit on the contract, but permit recovery in quasi contract or tort for benefits conferred if unjust to refuse; while
the New York courts would then permit recovery on the contract. If the public is injuriously affected by the *ultra vires* act, the State may dissolve the corporation in *quod warranto* proceedings. In the United States a business corporation may borrow money and give a note, secured by mortgage upon its property. In England the power is not so broad. There is no implied power to form a partnership, or become a guarantor or surety, for the accommodation of another. It may acquire its own share to secure payment for its obligations; or, if otherwise collectible, but not for speculative purposes, to discriminate among its own shareholders, or defraud creditors. A corporation may acquire the shares of other corporations, but not for the purpose of controlling them. Investment, insurance and charitable corporations in some cases are held to have an implied power to invest in the shares of other companies. Many States by statute permit one corporation to hold stock in another. A corporation is said in *ultra vires* acts in its name. It is said that the court has no conscience to be coerced by the chancellor. Statutes now generally allow the incorporation of trust companies with power to act as guardians, executors or administrators. But if the law of any State is a corporation could acquire land as an individual, but this deprived the feudal overlord of his feudal relief, wardship and marriage fees, for corporations did not die, or have children. So in 1217, a gift to a religious house "is to be utterly void and that land is to accrue to the lord of that fee," if he enters within a year, or the next higher lord within six months thereafter, and so on to the king. When the Franciscan friars came to England under a vow of absolute poverty, *dominum was sinful*. Their need of food and shelter was supplied by a benefactor conveying his property to another for their use (*ad opus*), as Richard le Molines did at Oxford in 1225. The clerks caught the idea, and *uses*, enforced by the chancellor, enabled the corporations practically to evade the mortmain acts of 1217 and 1279. Uses were devisable but legal estates were not. So in 1391, another mortmain act, extending to lay corporations as well as ecclesiastical, and including *uses* passed. In that year, the mortmain act of 1541 the first statute of wills enabled a man to devise land to any one. This seemed to repeal the mortmain statutes, if the land was devised to a corporation, so in 1543 the wills act was amended allowing devises to any one, except *corporations*. Thereafter the mortmain laws which still exist, in England prevent a corporation from taking or holding land either by deed or will, unless expressly authorized by its charter. Mortmain statutes do not exist in the United States, and statutes of wills do not generally forbid devises to corporations. However, under the doctrine of special capacity, a corporation has power to appropriate to its use such land as is reasonably necessary for its purposes. More is held *ultra vires*. What is the effect? Under the mortmain policy the overlord could escheat it to himself, but neither the grantor, his heirs, nor the grantee corporation could repudiate the executed grant. But there is no overlord here,—but the State may bring *quod warranto* proceedings against the offending corporation for its *ultra vires* act,—yet the title remains in the corporation and the land continues assets of the dissolved corporation by the weight of authority. Some cases hold otherwise. A limitation in a statute of wills against devises has a different effect from a limitation in the corporate charter to take and hold land. A devise contrary to the statute is void, passes no title, the heirs inherit, and the corporation gets nothing. If there is no limit on the power to devise, but only an in the corporation's devise to take or hold, a devise to it will be good,—but the State may dissolve the corporation for taking or holding. Such is the weight of authority, but there are several decisions to the contrary. A corporation may take an estate in fee, for life, for years, or at will, in common, remainder or reversion, but not dower, curtesy or joint tenancy.

**Corporate Funds.**—All the title, legal and equitable, belongs to the corporation, and not to the members. The stock, or, in common, and this is true if the membership is reduced to one person. He does not own and cannot replevin the property. A conveyance by persons of their own property to the corporation for all of its stock may be taxed to a stamp tax (if there is one), and afterward the property can be taxed to the corporation and the shares to their owners. A member has an equitable right to have the funds applied only to the corporate purposes. In business corporations, the funds are represented by a capital stock, divided into shares; the authority for this, or to increase or decrease the same, must come from the State. The amount is stated in the incorporation paper; it is raised by subscription, to be paid as called for; it is the basis of corporation credit. If the net property of the corporation exceeds this capital stock, there is a surplus; if less, a deficit. The market value of all the shares may be more or less than either the property or capital stock. Shares are generally required to have a par value. Shares may be created with a preference as to dividends at incorporation, but afterward the statute or statutory authority. In the absence of statutory prohibition, shares may be issued at a discount, valid between the corporation and the subscriber, but not as against the creditor who has relied upon the par value of the outstanding stock; if he cannot get paid otherwise he may compel the balance of the par value to be paid. New York holds otherwise. Even if the statute says "all fictitious issue of stock is void," the subscription at a discount is not void, the subscriber becomes a shareholder,—but he can be compelled to pay the "discount" for the protection of innocent creditors. Stock may be issued for such property as the corporation needs at a fair valuation, determined by the directors, and if in good faith and with reasonable judgment that such an overvaluation is evidence of fraud, unless satisfactorily explained; a court of equity may require, for the protection of creditors, the difference between the reasonable value and that at which it was taken to be made good. Stock may be issued for patents, trademarks, copyrights, formulas, good will and services, if
reasonably valued, in most States, but not in all. New York allows the payment for construction work at the actual value of stock without reference to par value, and generally when a corporation is in failing circumstances, to a good faith effort to resuscitate it, shares may be issued as a bonus to "sweeten bonds" without liability to subsequent creditors.

In 26 States there are "blue sky laws" (q.v.), forbidding corporations or dealers to offer corporate bonds or stock or bonds— for sale as a continuous transaction, without first reporting to and securing a license from the State securities commission. In many States similar provisions exist as to public service corporations, which are required to get authority from public service commissions.

Corporate Action.—Since a corporation is one person made up of other persons, an organization of some kind is necessary in order that they may manage it, for it can act only through agents or organs provided in its constitution. These are duly assembled meetings of the members, or directors, officers, agents, servants,—the last two not being parts of the organization. To be valid, a meeting must be held by proper notice and required, and attended by a quorum. These usually are regulated by by-laws. If not, notice must be personal,—and all notified. At common law, a quorum of members,—being a fluctuating body,—consists of those who come, though only one or two; but of directors,—being a fixed body,—a majority is required. These should be fixed by by-laws.

Voting may be by show of hands, polling, viva voce or ballot, and, at common law, was by persons and not by shares, although now, in stockholders' meeting usually by shares; in directors' meeting not. A majority vote of the quorum controls. Voting by proxy is now usual among shareholders, but should be authorized by statute, charter or by-law provision. Directors cannot, unless expressly authorized, vote by proxy. Some States have authorized shareholders to cumulate their votes for directors.

Seal.—The old authorities said a corporation acts and speaks only by its common seal. This was the "visible sign of the invisible body," but it also was and is known, and the only authentic evidence of it. Exceptions allowed were in trivial matters, as driving out trespassing cattle; doing what the corporation was appointed to do; buying and using goods. A seal according to Coke is "an impression on wax," and this "magic of the wafer" yet exists in England, except as to corporations under Companies Act (1908), which may contract in writing, by parole and without a seal wherever an individual may do so. Such has been the general rule in the United States since 1813 and 1827.

Members.—Their rights are Collective — (1) to elect directors, and sometimes officers; (2) amend the charter; (3) control the issue, increase and decrease of stock; (4) make and amend a corporation in failing circumstances, in a good faith effort to resuscitate it, shares may be issued as a bonus to "sweeten bonds" without liability to subsequent creditors.

generally necessary to confer complete rights of membership.

**Dividends**—are properly declared and paid only after the directors, have, by or for a surplus, list this may be from earnings or increase in value of property. Current obligations, interest and taxes should be paid first; sinking fund to meet outstanding funded securities when due, and, depreciation, should be provided for, but are not legally required. When proper conditions exist, whether a dividend shall be declared and paid rests in the sound discretion of directors, and may be either cash or stock; if cash the money is paid out to shareholders; if stock the money is kept by the corporation, but the stock to an equal amount is issued to the shareholders, in which case there must be authority to increase the stock. A dividend is declared by resolution of directors, and when notified to shareholders, becomes irrevocable, and makes the shareholder a creditor of the corporation, for his part of the dividend, whether then due or not, and when the dividend fund is actually or constructively set aside, the shareholders then become not only creditors but the equitable owners of the stock at the time it is declared the owner of the dividend, without reference to when the profits were earned, or time of payment, or name on the register, although the corporation will be protected if it pays the registered owner, without notice of the real owner. Of course the parties may stipulate as to who shall be entitled to the dividend, and when sold on the stock exchange its rules apply. Shares may have a preference in dividends if originally created as preferred and common. Seven per cent. preferred entitled the holder to receive 7 per cent before the common receives anything, but only out of profits; also, cumulative, i.e., to receive when profits are sufficient, what was unpaid up to 7 per cent for back years, although some courts hold this is not so unless expressly stated to be cumulative. By weight of authority, preferred shares are not entitled to participate in profits beyond their preference, but Pennsylvania holds that preference stock participates equally with the common. The corporation has this same as we preferred share. Even if the preference is guaranteed, it is entitled, not to interest, but to dividends out of profits only. Efforts to make preferred shareholders creditors, on equality with other creditors, in reference to the capital have failed, and their stock is postponed to creditors' claims.

**Participation**—proportionally, in issue of new stock, at its par value, whatever may be the market value, is a right incident to existing stock; otherwise, the shareholder cannot be deprived without his consent. Participation in assets is considered below.

**Directors**—Though elected by shareholders, or members, directors receive their authority from the State, and their judgment is not subject to control of members. They are clothed with the business powers only, advisability of corporate action, selection of inferior officers and agents, application of funds, declaration and payment of dividends. These duties are fiduciary toward the corporation and shareholders and directors must act with reasonable skill and negligence,—that of any ordinarily prudent man in his own affairs according to some authorities—but since they get no pay, ac-

According to other authorities, only the ordinary care of a gratuitous bailee is required. To some extent they are general agents, mandatories and trustees, but this may be from earnings or increase in value of property. Whereby, any or a portion, of the property, they may deal with the corporation itself, though some authorities hold the corporations may object, if it acts promptly. Dealings between corporations having the same directors, or a majority of the same, are subject to similar rules. Slight evidence of unfairness or overreaching will enable the corporation to impeach the transaction.

**Officers**—President, secretary, treasurer, with the power incident to such officers in deliberative assemblies generally, and no others, without others are conferred expressly, or impliedly by "holding out," are customary. The secretary is usually made custodian of the corporate seal, and the president, general manager. For performing the official functions incident to their offices they are not entitled to pay, but other service they are. There is no right of removal during term of office, by shareholders, unless statute, charter or by-law so provides. For gross misconduct, or fraud, a court of equity on proper application and showing may remove.

**Creditors**—The corporation and its property only are liable to creditors; the members are not, unless they have not paid for their stock, or wrongfully received the corporate property, or by statute. The corporation has the same power, within its charter, to manage and control its property, without interference by creditors as would an individual, and as he may, so may the corporation, prefer creditors, by the weight of authority. Some States hold otherwise, and the present United States bankruptcy law now forbids preference made within four months of bankruptcy. Some permit the corporation to prefer its own officers as creditors, if there is no actual fraud. Perhaps the weight of authority is the other way however. Creditors of course may complain of the disposition of the corporate property for the purpose of defrauding them, and have all the ordinary rights at law and in equity, against the corporation, and its property, they would have against an individual, but in the public service corporation its property cannot be taken on execution so as to prevent the performance of the public duties. Resort must then be had to the sequestration of earnings by receiversonship or otherwise.

It is often said that the corporate assets are a trust fund for the protection of creditors. Assets here include the corporate property, what is owing to it by others whether by members for unpaid stock or issued for over-valued property, or otherwise, or by others including claims for wrongs done to the corporation by the wrongful disposition or negligent dissipation of its funds. A receiver, in a court of equity, or a creditor by a creditor's bill, after an unsatisfied judgment against the corporation, can reach all the foregoing, so far as necessary to pay the creditors. This, however, is not a trust fund in the sense that the corporation has the legal, and the creditors have the equitable, title, before the court has taken possession of the property on behalf of creditors. Only such creditors as have relied upon the outstanding stock or property can complain. Creditors who become such before the unpaid stock was issued
or after its property had been wrongfully dissipated cannot complain if they had or ought to have, knowledge of it. One dealing with a corporation has a right to assume all its stock will be paid in if necessary, that the officers will not negligently or wilfully dissipate the funds, and the shareholders will not divide it, without providing for creditors, and a creditor is not obliged to prove intentional fraud, in complaining of them. Several States impose a statutory liability on the members,—equal to the stock in proportion to debts, or for labor debts, for the benefit of creditors. It is, in general, secondary, enforceable only after corporate property is exhausted. Debts here usually means contract debts and not damages for torts. Several States also make officers liable for debts, if they fail to make certain reports at certain times.

**State and Corporation.**—The grant of a franchise, whether by special or general law, when accepted, makes a contract within "No State shall pass any law impairing the obligations of contracts," and the States neither amend nor repeal it without consent of grantees, or unless there is a reservation of power to do so. The Federal Congress is not expressly so limited, but it and the States shall not pass a law impairing the obligation of person (which includes corporations) of life, liberty or property without due process of law." The English Parliament and Continental legislatures are not so limited. Before a material amendment can become a part of a charter, it must be accepted, even if the power to amend is reserved, because persons against their will cannot be forced to exercise corporate functions they do not want, but if the power to amend is reserved they may be required to accept, or be dissolved. Material amendments require unanimous assent of the stockholders, unless there are express provisions to the contrary in the original agreement; immaterial may be accepted by a majority. Directors have no authority to accept. The courts are not in harmony as to what is, and what is not, material; adding persons to an insurance company would be material, but adding accident insurance to life insurance would not be so, by some authorities. If the power to repeal has been reserved in unqualified terms, it may be exercised at any time, and for any or no reason.

The State has the ordinary legislative powers—eminent domain, police and taxing—over corporations, that it has over individuals. Any corporate property, rights, privileges or franchises may be taken for public use upon making compensation. When the public safety, health or morals require, the State may impose burdens and the cost of complying upon a corporation without making compensation; it may also regulate rates for public service, if rates imposed allow a reasonable compensation for the services rendered. Taxes can be imposed as upon individuals, but not so as to deprive the corporation of the equal protection of the laws. Corporations, however, have a primary franchise,—the right to use the highways, streets, and railroads. Any have secondary franchises,—as to operate a street railway in city streets,—which may be taxed. Methods of valuation are difficult, arbitrary and more or less unjust, when the "good-will" of partnerships and individuals is not taxes; for the value of the corporate franchises is usually fixed at the difference between the market value of the shares, and the assessed value of the other property. This would seem to include primary and secondary franchises, and goodwill. Such methods of valuation have been generally sustained, though the good-will of partnerships and individuals is not taxed at all. In addition to this, and on top of it, the State may, and often does, tax the shares to their owners at their market value. This is legal, though unfair. The Federal government may tax corporations as it may individuals, but the States may not, without express permission, tax Federal corporations.

Corporations are subject to the ordinary jurisdiction of the courts, and in addition to an extraordinary jurisdiction under the prerogative writs of quo warranto, to dissolve a pretended corporation, or a valid one for misbehavior; seire facias to dissolve an existing corporation for violation of its charter,—judgment in both the foregoing is or may be ouster; mandamus, to compel the performance of a definite duty legislative or otherwise is inadequate; and injunction in equity, to prevent public injury where quo warranto is not adequate, but not for merely ultra vires acts in a suit by the State. A member, however, may enjoin such acts includes corporations.

**National Government and Corporations.**—The Federal government has no express, but an implied, power to create corporations wherever necessary or desirable to carry out any of its express powers, as banks under currency law, power to operate under interstate commerce, power, manufacturing company to supply army or navy (armor plate, etc.). While the Federal Congress might make the exercise of such power exclusive in it, until it has done so, the States have and exercise a concurrent power to create corporations for carrying on any of these purposes. Except in the Territories and in the District of Columbia, Congress probably cannot create corporations for other purposes than those stated or implied in its express powers, to operate in the States, against their consent, although because the National banks and the Pacific railways incorporated by Congress do a local business, it has been argued that Congress can give such capacity, if not the legal right, to do such business. While the power to operate "commerce power," Congress has not only incorporated railroad companies to build and operate interstate railroads, but also a canal corporation with authority to construct a canal in a foreign country. Congress has provided for regulation of corporations, whether created by it or by the States, so far as they engage in interstate and foreign commerce by the Interstate Commerce Commission, the Federal Trade Commission, the Federal Anti-trust Act, Employer’s Liability, Child Labor Laws, etc., and the banks by the National Bank and the Federal Reserve Banks, acts.

**Foreign Corporations.**—A corporation exists and must dwell only in the state of its creation, and cannot migrate to another state, according to the judgment of the Court of the United States. Yet it may through its agents do business in another State, have a domicile, hold meetings, be taxed, sue and be sued and served with process there, so as to justify a personal judgment there, with the same effect as against a natural person actually there. Yet the cor-
poration is considered as being a citizen of the State creating it, even though it has been required to file its incorporation papers in the other States in which it has business. So too, if corporations of two or more States are authorized and do consolidate into one, with one membership, stock, officers, powers and place of business, there are as many different corporations as there are States, each tracing its life to the legislation of the State originally creating it, and subject there to its laws. The States of the Union are foreign to one another, and the corporation of one State, although it has corporate capacity, has no legal right to do business in any other State without its consent. It is not a citizen under the "privileges and immunities" clause of the Constitution. It may be excluded or discriminated against, when it seeks entry into another State, although after it is within the jurisdiction of the State, it enjoys equal protection of the laws; this, however, gives no right to enter, or stay after entry, if the license is revoked. The States, however, cannot so exclude corporations of other States engaged in interstate or foreign commerce, from carrying on such or unreasonably hamper them therein. Notwithstanding these undoubted powers of the States, there exists a "comity" between the States, whereby, in the absence of express provision or a public policy to the contrary, the corporations of any State or foreign country are permitted to exercise their corporate powers in another, and its courts are open for the protection and vindication of their rights therein. Many of the States require the corporation to file its articles of incorporation and appoint a resident agent upon whom service of summons may be made in the State where it seeks to do business. Sometimes penalties are provided. The courts are in hopeless conflict as to the effect of non-compliance with such laws, and the laws are declared void, and can be enforced by neither party; others that it is enforceable by either — only the State can enforce the penalty if there is one; still others that the corporation cannot enforce any contract until compliance.

Contingent theories vary; one is that the corporation can have a personal status only in the creating state, not elsewhere; another is that personal status of an individual is always a matter of law, and there is no more difficulty in recognizing the personal status of a corporation than of an individual, and since the status of the latter is recognized as of right, the former ought to be also; another says that corporations have both civil and functional capacities; so far as the civil status of an individual is recognized in a foreign state, likewise that of a corporation should also be, but its functional capacity should be recognized only by express permission.

Dissolution and Winding up.—Corporations may be dissolved: (1) by lapse of charter period; (2) repeal of charter; (3) by judgment of ouster in quo warranto or scire facias; (4) surrender accepted by the state; (5) death of all the members in a non-stock corporation. Insolvency or reduction to one member does not itself work a dissolution with us, as it did not at Rome. In England under Companies Acts, if membership is reduced below two (private companies), or seven in other companies, it is a cause for winding up. Similar provisions exist in some of the Continental codes.

The common law had no adequate method of winding up the affairs of a dissolved corporation, and looked upon the situation as that of a dead man without administrator or heirs; personal property went to the king as bona vacantia; real property reverted to the grantor or his heirs; all claims in favor of or against the corporation were ended. In the absence of provisions to the contrary, such seems yet to be the English law, and formerly was in the United States, although here it was often said to have grown up in reference to the English ecclesiastical corporations, it was unnecessary to our conditions. In 1855 the United States Supreme Court so vigorously assailed this view, that since then, even in the absence of statute, courts of equity have at suit of creditors or shareholders entertained suits to wind up the affairs of a dissolved corporation, usually by appointing a receiver, to collect all the claims owed to the corporation, convert all its property, both real and personal, into money, pay the corporate debts and distribute the balance to the shareholders. The courts, however, are not yet in accord as to what shall be done with the unexecuted contracts of the corporation; some say no damage can be had for their breach by dissolution; others that there can be, if the dissolution was voluntary on the part of the corporation.

Until recently, in the United States, the common law rules have been applied to the dissolution of non-stock and charitable corporations. Recent cases have taken a different view, but the United States Supreme Court applied the common law doctrine to the dissolution of the Mormon Church in 1890. In many States the matter is fully covered by statute, and under the English Companies Acts, there are elaborate provisions for the appointment of an official known as a liquidator, with so made the dissolution of the corporation. Still, a receiver under the equitable procedure in this country. On the Continent, the directors are usually made liquidators under the Commercial codes, with similar powers. See Charter; Dartmouth College Case; Contract; Franchise.

CORPORATIONS — CORPUS CHRISTI

Abridgments, Digests and Encyclopedias: English — Fisher (1870); Mews (1897 to the present); 'Encyclopedia of the Laws of England' (1897); Harboury, 'The Laws of England' (1910). American—American Digest (Century ed., Vol. XII; Decennial ed., Vol. V.; 2d Decennial and annuals to date); 'Cyclopedia of Law' (1904); 'Corpus Juris' (14 vols. issued 1918; others in preparation, New York).

FISHAC L. WILGUS, 
Professor of Law, University of Michigan.

CORPORATIONS, Political Contributions by. See CORRUPT PRACTICES ACT.

CORPS, kör (Fr. 'body'), a word often used in military and political language. The term is applied to various kinds of divisions of troops; the corps d'armée is a military unit consisting in from two to four divisions (the German Heeresabteilung; our field army. See ARMY ORGANIZATION); corps de garde; a guardhouse; also the body which occupies it.

In political use, corps législatif was used from 1857 to 1870 of the lower house of the French legislature; its members were elected for six years. Corps diplomatique refers to a nation's ambassadors, ministers and other diplomatic officers.

CORPSE (Lat. corpus, 'body,' through Fr. corps), a dead body, usually animal, and in most common usage applied only to the human body. To the human corpse there can be no property rights, save in the rare case of disposition by regular will of one's body. Questions as to disposition of a corpse must be heard by an ecclesiastical court in England, by the usual civil courts in the United States and elsewhere if Church and state be independent. Prior right to a dead body naturally goes to the nearest of kin; marriage ties ranking above those of blood. Burial expenses come under the general head of property rights in that they take precedence over any claims against deceased or his estate. Privileges of the corpse extend still further; pagan superstition, which identified to a certain degree body and soul and long established Christian belief in the resurrection of the body, combine with the law's view, to make mutilation of the buried body, or body-snatching, (as digging up the anatomical or other purposes is called), detested and criminal. Both practices are still widely exercised and public opinion seems less severe than formerly. See BURIAL; CREMATION; MAUSOLEUM; MUMMY.

CORPULANCE. See OBESITY.

CORPUS CHRISTI, Tex., city and county-seat of Nueces County; on Corpus Christi Bay, at the mouth of the Nueces River, and on the Mexican National and the San Antonio and Aransas Pass and the Saint Louis, Brownsville and Mexico railroads, 140 miles south of San Antonio. Corpus Christi has regular steamboat connections with New Orleans. It is the stock-raising and farming centre of the county and has an extensive packing business, several daily and weekly newspapers, a Catholic convent, several churches, a national bank and an assessed property valuation of $2,000,000. It is a popular health resort and is adapted the commission form of government. The city owns its waterworks. Gen. Zachary Taylor encamped
here during the Mexican War, and his entrenchments are still preserved. Pop. 8,222.

CORPUS CHRISTI, Festival of, a holiday instituted by the Roman Catholic Church in honor of the mystery of the Eucharist, observed on the first Thursday after Trinity Sunday. Its observance began in the diocese of Liège while the archdeacon of that diocese was James Pantaleon, who afterward became Pope Urban IV. In 1264 Urban composed a bull ordering throughout the Church the celebration of the festival on the Thursday following the first Sunday after Pentecost: the bull seems not to have been promulgated save, perhaps, in the city of Rome, for though the festival was duly observed by the Pope and his court, no proof exists of its celebration on that year or after for a long time in other parts. The proximate occasion of Urban's act was the reported occurrence of a miracle at Bolsena in the Papal dominion, when a priest in saying the mass accidentally spilled out of the chalice some drops of the sacramental species of wine, and tried to cover it in with a linen cloth: forthwith the cloth was covered with red spots in the form of the sacred host. The bull of Urban was revived at the Council of Vienne, 1311, by Clement V. The procession of the Host in connection with the festival is revived by Pope John XXII and succeeding pontiffs down to the Council of Trent were zealous for the observance of the holiday. The Council of Trent declared the institution to be a triumph over heresy regarding the doctrine of the Eucharist. At the Reformation it was one of the first holidays abolished by Luther. The procession is eliminated even by Catholic communities in places where there is strong division of religious sentiment.

CORPUS CHRISTI COLLEGE, Cambridge, England, sometimes called Benet College, was founded in 1352 by the united guilds of Corpus Christi and the Blessed Virgin, two fraternities which used to meet for prayers at Saint Benedict Church and Saint Mary's respectively. The endowments of the college were considerably increased by Archbishop Parker, who also bequeathed to it his valuable collection of manuscripts. It consists (1914-15) of a master and 14 fellows, besides 19 scholars. The college has the patronage of 16 livings. The college has a wonderful collection of plate and the Lewis collection of printed books. Christopher Marlowe and John Fletcher were members of Corpus Christi.

CORPUS CHRISTI COLLEGE, Oxford, England, a comparatively small college founded in 1516 by Richard Fox, bishop of Winchester and lord privy seal, under a license from Henry VIII. It consists (1915-16) of a president, 14 fellows, 32 scholars, 4 exhibitioners, 2 chaplains and 82 undergraduates. Three of the fellowships are annexed to two professorships, the professors occupying the position of honorary fellows, being elected by boards appointed by university statute. The college has the patronage of 16 livings. It counts some famous men among its members, notably Udall, author of 'Ralph Royster Doyster'; Richard Hooker; Keats, the painter; Thomas Arnold, master of Rugby, and Chief Justice Coleridge.

CORPUS DELICTI (literally "the body of the crime or offense"), in Scottish law, those external marks, facts or circumstances which accompany a crime, and without the proof of which the crime is not supposed to be established. Thus the corpus delicti of homicide is establishing the fact that the intentional use of violence, not merely that he has died. According to German law no crime can be established unless the corpus delicti is clearly present, and self-accusation or confession without this does not empower a court to convict. Consult authorities cited under Criminal Law.

CORPUS DOCTRINE (Lat. "body of doctrine"), in German ecclesiastical history, the name given to each of several collections of theological writings promulgated by various German Protestant churches during the 16th century. Among the most important of these collections were the 'Corpus Manicium' or 'Philippicum' (1559), enforced by the elector of Saxony, containing the Apostles', Nicene and Athanasian creeds, the Augsburg Confession and Melanchthon's 'Locii Communes'; the Pomeranian of 1561; that of Nuremberg of 1573; and the Hambach (1563), Pomeranian (1564), Prussian (1567), Brunswick-Wolfenbüttel (1569), Saxon (1570, called Corpus Thuringicum); and others of a Lutheran character. These were all superseded in 1580 by the 'Formula Concordiae.'

CORPUS JURIS CANONICI, the body of laws for government of the Church enacted by popes, councils and synods or drawn from the writings of the fathers, and the whole approved and promulgated by the holy see. There were numerous collections of canons made and published both in the East and the West prior to the time of Gratian, the Camaldolese monk, professor of theology in the University of Bologna, who in 1139 compiled the Decretum, called also Decretum Gratiani, which constitutes the first part of the body of the canon law. It is the first methodized general collection of Church laws from the time of Constantine to the year of its publication, and is in three books, treating, the first, of ecclesiastical persons and offices; the second, of cases arising under the several canons, decrees and other authoritative rules; and the third, of the sacraments and rites of the Church. The second part of the Corpus Juris Canonici is the Decretals of Gregory IX, promulgated in 1234. This book contains all decretal epistles of popes from 1139 to the date of its publication. It is followed by the Liber Sextus, 1298, promulgated by Boniface VIII; by the Clementine or constitutions of Clement V, 1317; finally the Extravagantes, revised in 1563, contain all decreals, promulgated to that date. With the Extravagantes ends the systematic compilation of matter of canon law. In the reign of Henry VIII the English Parliament ordered a revision of the Corpus Juris Canonici to make it conform to the new order of things brought about by the law of the king's supremacy in matters of religion: meanwhile the new code hold so far as might consist with the new order. But no revision has been made, and hence, with, a few reserves, the Corpus Juris Canonici is law for the Church of England. For the Corpus Juris Civilis see Civil Law; see also Canon Law.

CORPUSCLE, in anatomy, a small, usually microscopic, body regarded by itself and defined

**Vol. 8**
CORREGGIO, kör-rē′jō, Italian painter, frequently called Antonio Allegri, from the place of his birth: b. Correggio 1494; d. there, 5 March 1534. He was intended for a learned profession, but nature had designed him for an artist. It has not been ascertained how much he was indebted to his first instructor, who was probably his uncle, Lorenzo Allegri. Three qualities will always be admired in him—grace, harmony and a skilful management of the pencil. There is a peculiar grace in the movements of his figures and a loveliness in their expression which takes possession of the soul. These attitudes and movements could not be executed by any artist without his masterly skill in foreshortening, which not only gives greater variety to a piece, but is also favorable to gracefulness. Avoiding all roughness and hardness, Correggio delights by mild and almost effeminate beauties. He strove to obtain this object also by harmony of coloring, of which he may be called the creator. He is unrivaled in the chiaroscuro; in the grace and rounding of his figures and in the faculty of giving them the appearance of advancing and retiring, which is the distinguishing excellence of the Lombard school, of which he may be considered the head. In his drapery, he calculated with extreme accuracy all the effects of the chiaroscuro. He possessed the power of passing, by the most gentle transitions, from the bright colors to the half tints. It was his object to make the principal figure prominent, that the eye, after gazing till it was satisfied on the bright colors, might repose with pleasure on the softer masses. He made a skilful use of this art in his ‘Night’ (La Noche) which is to be seen in the gallery in Dresden, where there are seven pictures in which his progress in the art may be recognized. Among his best pictures, besides the ‘Night,’ are the ‘St. Jerome,’

CORREGGIO, kör-rē′jō, DE SERRA, José Francisco, Portuguese scholar: b. Serpa, Alem-tejo, 6 June 1742; d. Lisbon, 12 Dec. 1823. He was educated in Rome and Naples, was admitted to holy orders and soon after his return to Portugal in 1777 was made perpetual secretary of the academy recently instituted at Lisbon. He collected cabinets of natural history, especially of botany, established a laboratory for scientific research, and prepared for the press numerous unpublished documents relating to the history of Portugal. Accused before the Inquisition, he escaped to Paris in 1786, but was permitted to return to Portugal after the death of Pedro III, where he took up residence with Láfões. At Paris he had been intimately associated with the naturalist Broussonet, and became the host of the latter when he fled in disguise from the reign of terror to Lisbon. Endangered by the detection of Broussonet, he took refuge first in Gibraltar and then in London. He lived in Paris in learned society and pursuits from the Peace of Amiens till 1813, when he came to the United States, where he continued his scientific studies, and in 1816 became Minister plenipotentiary of Portugal. He was recalled to Lisbon before the promulgation of the Constitution of 1820, and made Minister of Finance. His most important writings are treatises on the physiology of plants and a collection of unedited memorials of Portuguese history (in 4 vols., 1790–1816).

CORRAL, kör-rā′l, Ramon, Mexican statesman: b. Alamos, in the state of Sonora, 10 Jan. 1854. When 21 years of age he had established and successfully conducted two newspapers, El Fantasma and La Voz de Alamos, but in 1875 abandoned the newspaper field, later writing a history of the state of Sonora. He was subsequently elected to the Sonora legislature, and later secretary of the state, in the latter capacity rendering invaluable service in the preparation of various important laws. Later he had much to do with the revision of the penal code of the federal district. He represented the state of Sonora in the federal Congress for a considerable period; in 1897 was elected lieutenant-governor of Sonora, exercising practically all the powers of the governor, by designation of that official; from 1891–95 was secretary of the same state; and later was unanimously elected governor. On 15 Sept. 1900 Mr. Corral became governor of the federal district; became secretary of government 16 Jan. 1903; and in 1904 was elected to the vice-presidency of the republic.

CORRASION, mechanical wear by wind, running water or moving ice, producing actual abrasion of a rock mass, as contrasted with corrosion, a chemical process of weathering.
which has kindled the admiration of several distinguished painters to such a degree as to render them unjust toward Raphael; the ‘Penitent Magdalen’; the altar-pieces of Saint Francis, Saint George and Saint Sebastian; Christ in the Garden of Olives; ‘Cupid’; the frescoes of those and, above all, the paintings on the ceiling of the cathedral for the same city. In 1520 he was married to Girolama Merlina, who appears to have inspired several of his most charming Madonnas. Of his four children, a son and daughter survived; the former, Pompeo, was a painter, but vastly inferior to his father. The story of his extreme poverty, and of his death in consequence of it, has been long since disapproved, yet Oehlen- schläger has made it the subject of one of his best tragedies in German and Danish. Consult Meyer, ‘Correggio,’ Heath’s translation (London 1876); London, ‘Vie et œuvres de Correggio’ (Paris 1803–20); Morelli, ‘Critical Studies of Italian Painters’ (Vol. II, 1893); Ricci, ‘Antonio Allegri da Correggio’ (London 1884); Rieth, ‘Künstler- Monographien’ (Bielefeld 1898). Consult also the monographs by Sturge Moore (London 1896) and Gronau (Stuttgart and Leipzig 1907); and Berenson, ‘Studies in Italian Art’ (London 1900).

CORREGGIO, Italy, city in the province of Reggio nell’Emilia, about 25 miles northwest of Modena. In the Piazza is a statue of the painter Antonio Allegri, known as Correggio, who was born here in 1494. The modern town has none of the importance of the mediæval city, which was the principal city of northern Italy, belonging to the duchy of Modena, and the princely castle still remains. Its importance in history is due to its having been the birthplace of the painter Correggio. Pop. 16,996.

CORREGIDOR, kör-ré’dór, Philippines, an island, lying in the entrance to Manila Bay and forming a part of the inner line of defense of the city of Manila; length, east and west, four miles; average width, one mile; area, two square miles. It rises on the west coast to a height of 649 feet above the sea; on the land side of Manila Bay. It is the easternmost station of the port of Manila, from which the approach of vessels is signaled. There are also four lighthouses on the island. The island is exposed to ocean storms, and this makes the cultivation of the soil unprofitable; a few crops are raised in the sheltered localities. The chief industries are trade and fishing. San José is the only town. Its fixed population is about 500. The island was strongly fortified by the Spaniards in the 18th century, but the defenses were not well kept up. When Admiral Dewey entered Manila Bay 1 May 1898 he steamed past this island, which was supposed to be very strongly fortified and to be the base of operations for the mines and torpedoes in the bay. The forts have been strengthened by the United States government, which established a military station here in 1900.

CORREGIDOR, kör-rá-hé’dór, in Spain, the principal magistrate of a town, appointed by the king. In Portugal the corregidor has administrative but not governing powers.

CORRESPONDENCE SCHOOLS, educational institutions that supply, in place of classroom work, such instruction by mail as may prove a most valuable substitute to those unable to attend the regular colleges or schools; and the statement has been made that the establishment of the correspondence system in the mining districts of Pennsylvania, many thousands of the men have secured through such an education in the theory involved in their trades as to fit them for much higher positions than they could ever have attained without such education. The University Extension movement in England (1868) undoubtedly called attention to the latent possibilities in the plan and method developed in the United States about 15 years later, when the Correspondence University was founded at Ithaca, N. Y. Important service is ascribed to the correspondence method in connection with the Chautauqua “universal education” idea. Its most concrete manifestation, however, is to be sought in the achievements of the International Correspondence Schools at Scranton, Pa. Organized in 1891, these schools extended their usefulness and increased the enrolment very rapidly, until the latter embraced students in nearly every part of the world; the professions or branches through architecture to advertising, from chemistry to window-trimming. Each school is in charge of a principal, who has under him assistant principals and a large force of examiners. See EDUCATION SUPPLEMENTAL.

CORRESPONDENCE TEACHING. See HOME EDUCATION; UNIVERSITY EXTENSION; CORRESPONDENCE SCHOOLS; EDUCATION SUPPLEMENTAL.

CORRÉZE, kôr-réz’, an inland department of south-central France. It is named from the river Corrèze. Area, 2,273 square miles; capital, Tulle. The surface is mountainous, especially to the north and east. The soil is far from fertile, except in a few of the valleys. Heaths occupy a great extent of surface and agriculture is in a very backward state. Hay is abundant and large crops of beet-root are grown, besides maize, barley, hemp, flax, etc., in moderate quantities. Minerals are plentiful, but little worked. The only manufactury of note is that of firearms at Tulle, employing about 1,000 hands. The trade is principally in horses, cattle, wood, nut-oil, bees-wax, lumber, iron, etc. The department is divided into 3 arrondissements, 29 cantons and 287 communes. It forms the diocese of Tulle. Pop. 309,646.

CORRIB, Lough, ló’b kör’rib, a large lake, the second in size in Ireland, between Galway and Mayo, about 23 miles in length and varying from 2 to 6 miles in breadth, and composed of two expansions, united by a narrow channel, about half a mile wide at its narrowest part, across which is a ferry. It is about three miles distant from the sea at Galway, where it is only 14 feet above sea-level. It is separated from Lough Mask by a narrow isthmus, through which there is a subterranean channel. Corrib contains many islands and near it are prehistoric stone-circles. To the west are mountains, 3,000 feet high. On its sides are metamorphic rock, carboniferous limestone and marble.

CORRIDOR (Italian and Spanish, "that which runs"), in architecture, a gallery or long aisle leading to several chambers at a distance from each other, sometimes wholly enclosed, sometimes open on one side. In fortification, corridor signifies the same as covert-way.
CORRIENTES—CORRODI

CORRIENTES, kór-ré-én'tés, Argentina, a province bounded by Paraguay on the north, by the territory of Misiones on the northeast and the republic of Uruguay on the southeast, by Entre Rios on the south and the province of Santa Fé and the territory of Chaco on the west. Area, 48,357 square miles. The Paraná River forms its boundary on the west and north; the Uruguay River on the east; and there are other streams and lakes. Thus the soil is abundantly watered and well adapted to agriculture. Sugarcane, tobacco, cotton, wheat and maize are grown extensively; the value of the cattle and horses, however, is much greater than that of the crops, the proportion being about six to one. Its chief industries are shipbuilding, meat-curing and foundries. A railway runs diagonally through the province from the capital, Corrientes, in the northwest, to the southeastern towns on the frontier of Uruguay. The city was founded in 1588, and occupied a place of considerable prominence in the revolutionary movements during the latter part of the 19th century. Pop. about 127,000.

CORRIENTES, Argentina, the capital city of the province of the same name. It is situated on the left bank of the Paraná River, and for many years has been an active port for both steamers and sailing vessels. It has several plazas, hospitals for men and women, a national college, a normal school, a theatre and a library. The natural-history museum was at one time managed by the naturalist Bonpland. The city is the centre of a fertile district and has considerable trade in lumber and oranges. At several private shipyards near the city vessels are built of the wood brought from El Chaco, which is remarkably durable. There are also meat-curing establishments and a foundry. The city, founded in 1588, occupied a place of considerable prominence in the revolutionary movements during the latter half of the 19th century. Pop. 23,904.

CORRIEVERECKIN, kór-rí-vrěk'ín, a noted strait and whirlpool on the west coast of Scotland, between the islands of Jura and Scarba. The breadth of the strait is about one mile, and because of the noise of the water rushing through it during storms this passage is terrifying, though not very dangerous.

CORNIGAN, Michael Augustine, American Catholic prelate; b. Newark, N. J., 13 Aug. 1839; d. New York, 5 May 1902. He made his elementary studies in a private school in Newark and at the age of 14 was sent to Saint Mary's College, Vincennes, Ind. In the spring of 1859 he was graduated from Mount Saint Mary's Emmitsburg, and in the fall of the same year entered the American College in Rome. He was the first student from the United States who asked for admission to this now famous college. At Rome in 1863 he was ordained a priest for the diocese of Newark, United States, but remained in Rome another year for further study. He began his duties in the Newark diocese (1864) and was soon appointed by his bishop as professor of dogmatic theology and sacred scripture at Seton Hall Seminary, South Orange, N. J. As vacancies occurred in the seminary he was until 1888 he was made president of the institution. In 1873 he was elevated to the office of bishop of Newark, remaining at the head of this diocese for seven years. In his management his executive ability proved to be equal to his charity. He introduced religious communities, founded charitable institutions and greatly stimulated the religious life of his diocese. The number of organized parishes increased, and in 1880 he was called to the position of coadjutor of Cardinal McCloskey, archbishop of New York. In October 1880 he received the papal bulls appointing him archbishop of Petra and coadjutor to the archbishop of New York, with the right of succession. Upon the death of Cardinal McCloskey, bishop Corrigan became archbishop of New York, and the pallium was conferred upon him 4 March 1881. This charge he retained until his death. During the years he was at the head of the diocese he became one of the largest and most effective in the world. He became known through his many activities as one of the most prominent Roman Catholics in the United States. He was untiring and unobtrusive; a scholar of high attainments and spiritual power. Consult Coen, Michael Augustine Corrigan; A Memorial (New York 1902).

CORROBOREE, kór-ób-ré' or kór-óhb-ré', the Australian name for a gathering of natives, either for religious or festive purposes. The characteristic feature of these assemblages is a peculiar dance to which the name corroboree is applied. The gatherings are held on moonlight nights and generally last the whole night through. The men dance while the music is supplied by the women. The words accompanying the songs are made to suit the occasion. This ceremonial is the only great national institution in the primitive life of these people. Consult Roth, Ethnological Studies among the Northwest-Central Queensland Aborigines (1897).

CORRODENTIA, a group of primitive insects allied to the orthoptera, discovered by Burmeister. The corrodentia, as recognized by Brauer, comprise the families Termitidae, Psocidae and the group Malphaga, or biting lice. It is not, however, a very natural assemblage of families and by Packard the corrodentia form a sub-order of his order Platyptera, including passage-flies (Pseudocera, Empida, and Termitidae, or white ants (q.v.). Kellogg includes the Psocidae and Atropidae, or book lice, and considers the family to be closely related to the Malphaga in that both possess a peculiar hard plate in the pharynx in all except the Psocidae the body is flattened and the head extended horizontally. The prothorax is large, broad and more or less square, while the chest-pieces (sterna) are large and broad, and there are 8 to 11 segments in the abdomen.

CORRODI, kór-ró'dé, August, Swiss poet; b. Zürich, 27 Feb. 1826; d. there, 16 Aug. 1885. He studied theology but became a painter and from 1862—81 taught drawing in Winterthur. His first volume of 'Songs' (1853) exhibited graceful versification and deep sympathy with nature, while his songs and dramatic compositions in local dialects, 'Der Schnee und Leben' (1855), 'Waldeben' (1857), 'Der Herr Professor' (1858), 'Der Herr Vikari' (1860, dramatized by the author in 1872), had extraordinary success. Most of his works are distinguished by a fine, droll sense of humor. He illustrated...
several of his own books. He translated several of Burns' songs into the Swiss-German dialect and published 'Shakespeare: Life Wisdom from His Works.' His works are numerous and possess much merit.

CORROSION. See CORROSION.

CORROSIVE SUBLIMATE, also called mercuric chloride, HgCl₂, bichloride of mercury, perchloride of mercury; prepared by heating mercuric sulphate with dry sodium chloride; the mercuric chloride sublimes as a white transparent crystalline mass, having a specific gravity of about 5.43. It is soluble in about 20 parts of cold water and very soluble in alcohol and ether. It precipitates albumen, hence white of egg is an antidote. It is very poisonous, and is used to preserve both animal and vegetable substances. It is used in pharmacy as Liquor hydrargyri perchloridi, and as Latia hydrargyri flavum when mixed with lime. Corrosive sublimate is a powerful irritant and is used externally in skin diseases. It is administered internally in syphilis, usually in conjunction with iodide of potassium. It is also much used in surgery as an antiseptic spray and as a cleansing agent for sterilizing their operating instruments. When used as an antiseptic wash for wounds or sores one part of the salt is usually dissolved in from 2,000 to 5,000 parts of water.

CORROSIVES (Lat. corrodere, "to eat away"), in surgery, medicines which corrode whatever part of the body they are applied to; such as spirit of acetic acid, burned alum, white precipitate of mercury, red whiting, red precipitate of mercury, butter of antimony, etc.

CORRUGATED IRON, sheet iron formed with parallel ridges and furrows, so that the cross-section is a continuous waved line. Flat sheet metal tends to buckle and get out of shape with every change in temperature. The corrugations, made in one direction, give it greater increased stiffness and adapt it to numerous purposes for which it would otherwise be less suitable. The sheet metal is corrugated by passing between ridged rollers, whose ridges are opposed like the teeth of gear-wheels. It comes out in the commercial form, and is frequently subjected to a process of heating with zinc, to protect it from oxidation, and is then known as galvanized corrugated iron.

An important use of corrugated iron is for the liners of steam boilers. For this purpose mechanism has been devised for forming the metal into annular corrugated flue pipes which present greatly increased resistance to collapse over the plain form. The heating surface is materially increased by the corrugated area. Later, a flute was manufactured with spiral corrugations, giving increased strength. This material has also found an extensive use in the construction of cheap partitions, walls and roofs of temporary structures, and for buildings where utility is more valued than ornament.

CORRUPT PRACTICES ACTS. The effort to eliminate dishonesty in political and criminal methods of influencing public elections has resulted in the enactment of various laws to supplement the common law against bribery and corruption (see Bribe). Such acts enfranchise and define the corrupt or illegal practices and fix penalties for the same; they usually include bribery in any form, treating, undue influence, intimidation, personation of voters or aiding and abetting in the same, the making of false election returns, the solicitation of candidates for campaign contributions — save by political committees — the contributing of campaign funds to other than authorized agents, the making or receiving of campaign contributions under an assumed name, the rendering of a false declaration of election expenses, etc. Many laws forbid the acceptance of campaign contributions from certain sources, especially from corporations and from assessments levied on officeholders in the civil service.

British Acts.—Statutes to prevent bribery and corruption have been passed in 1729, 1809, 1827, 1842, 1854, 1868 and 1883. The most important of these are the Corrupt Practices Prevention Act of 1854 (which repealed all previous legislation and dealt especially with the practice of electoral bribery), the Parliamentary Elections Act of 1868 and the Corrupt and Illegal Practices Prevention Act of 1883, which incorporated the act of 1854. The act of 1883 defines and fixes the penalties for the criminal offenses classed as corrupt practices, which consist of bribery of seven different varieties, treating, undue influence and personation, all of which are punishable by fine or imprisonment and by loss of political rights for seven years. If a candidate for a seat in Parliament is found guilty by a trial court of committing or consenting to corrupt practices, his election is void and he is forever debarred from representing the district in Parliament; but when only his agent be proved guilty of corrupt practices, the candidate, though personally innocent, may not be elected for the same constituency for a period of seven years. The sections of the act relating to illegal practices as distinguished from "corrupt" practices are intended to limit election expenses. For boroughs of 2,000 voters the maximum expenditure is fixed at £350 while £650 is allowed for counties with the same number of voters with an extra allowance for each additional thousand in the district.

The legal expenditures are enumerated, such as printing and meeting halls, etc., and the number of paid agents is limited. Within 35 days after the election the candidate's agent must file a statement of expenses, certified by the candidate. The corrupt practices law applies equally to parliamentary, municipal, county and parish council elections, and the punishments provided for minor officials correspond with those imposed on parliamentary candidates; a municipal candidate personally guilty (of corrupt practice) is forever incapable of holding office, but if guilty merely through acts of his agents he is incapacitated only for three years.

United States Acts.—The Federal government has legislated less regarding corrupt practices than the States, since the latter control most of the election machinery. In 1907 Congress passed an act forbidding corporations to contribute to campaign funds in Federal elections; on 25 June 1910 an act was approved requiring for publicity of political party contributions, requiring each political committee to file a financial statement within 30 days after a national election, and on 19 Aug. 1911 an act amending this act was approved extending its provisions to individual candidates as well as to committees. Candidates for the House of Representa-
CORRUPT PRACTICES ACTS

tives are allowed to expend a maximum of $5,000 and for the Senate of $10,000. The candidates for the offices of the clerk not less than 10 nor more than 15 days prior to the election (whether it be a primary election, a nominating convention or a general election) a preliminary itemized statement of receipts and their sources and of expenditures and their objects, including the statement to be filed within 30 days after the election. The act provided that senatorial candidates must file with the secretary of the Senate (not less than five nor more than 10 days prior to the day on which the State legislature first balloted for such candidate) a similar itemized statement of receipts and expenditures, but since 1913, when the Seventeenth Amendment to the Constitution, providing for direct election of Senators, was declared in force, senatorial candidates follow the practice of the Representatives.

All the States and Territories have enacted corrupt practices acts of some sort. The earlier laws related chiefly to bribery, betting on elections, and similar laws to the latter laws to regulate expenditures by party candidates and committees and define legal and illegal practices with such particularity that few loopholes exist for "honest graft," the most tempting opportunity for evading the law being furnished by the allowances for "necessary personal expenses" (comprising expenditures for traveling, stationery, postage, express, telephone and telegraph services, etc.), which need not be included in the financial statement. Hence only slight limits are placed on the candidates.

New York was the first State to legislate against corrupt practices at elections, passing an act in 1890 requiring candidates to file itemized statements of expenditures on pain of imprisonment and loss of office. As the operations of political committees were not restrained by this law, the defect was remedied by a supplementary law providing that within 20 days after the election the treasurer of such committee shall file an itemized statement giving amounts of contributions with names of donors and details of all expenditures over $5 with the objects and names of persons to whom payment was made. Bribery, personation, illegal registration, the use of false naturalization papers and the aiding of another to do so are punishable by imprisonment not exceeding five years, while giving a bribe also disqualifies for holding office and receiving a bribe disqualifies for holding office for five years. Illegal primary voting is a misdemeanor as is making a false declaration of party affiliation. The amounts that candidates for various offices may spend are carefully listed, graded and defined, as are also the legitimate expenses that may be incurred by all others connected with the elections. In 1909 New York also prohibited all corporations, save political associations, to make campaign contributions or to expend money for any political purpose whatsoever, and an officer, stockholder or agent of any corporation guilty of such practice may be imprisoned for one year and fined a sum not exceeding $1,000. Candidates may not be solicited for contributions nor are Judicial candidates allowed to donate. The influencing of voters by promising employment or office was first prohibited by Massachusetts, which State also forbids the publication of unsigned political advertisements, the subsidizing of newspapers to favor a particular candidate, the contributing of funds by indefatigable parties to certain corporations and the payment of naturalization fees by political committees.

Several States prohibit electioneering on election day and the giving away of liquor within a certain distance of the polling places, and a few States have a part of the election expenses. Oregon limits the amount to be expended on an election and pays part of the expenses of informing voters about candidates and parties. In 1909 Colorado provided that only the State and the candidates should pay the expenses of electing State, district and county officers at general elections. Each political party receives from the State 25 cents for every vote cast for governor by that party in the preceding election, the money being paid to the State chairman who is bonded to guarantee the legitimate use of such funds and also to vouch that one-half of the sum received by him is distributed among the county chairmen. Candidates may personally contribute a sum regulated so carefully as to prevent prospecting salary or fees. Other persons or corporations contributing to any party candidate or committee or receiving such contributions are guilty of felony. In 1915 Nevada limited the expenditures of any party to $15,000 during one campaign. In the same year Kansas prohibited a candidate from spending more than 10 per cent of the office salary for the first year, his expenses not including travel. This State also forbids any candidate or organization to "lure" voters to the polls. California penalizes frauds in connection with initiative, referendum and recall petitions, making such practice a felony punishable by imprisonment from one to 15 years. Most of the States require the publication of financial statements at specified intervals before election day and complete sworn statements within a certain time after election, various penalties being imposed for failure to comply. Nebraska requires not only the itemized statement to be issued 15 days before election but also daily reports thereafter until election of all contributions over $25. In 1911 Indiana provided that candidates must conduct their financial operations through "political agents" to prevent the irresponsible distribution of political funds. South Dakota requires a secretary for each political committee who must receive all contributions, transfer them to the treasurer and approve all vouchers before the latter officer may expend the funds. Most States require that these statements be open to public inspection. See BALLOT; BRIBE; ELECTIONS; LOBBY; UNITED STATES—THE NEW DEMOCRACY AND THE SPOILS SYSTEM.

CORRUPTION OF BLOOD—CORSICA

CORRUPTION OF BLOOD, in law, the incapacity to inherit, or pass an inheritance, in consequence of an attainer to which the person was adjudged in the United States it was abolished by the Federal Constitution. See ATTAINER; FORFEITURE.

CORRY, Pa., city in Erie County, about 26 miles southeast of Erie, on the Erie, the Philadelphia and Erie and the Western New York and Pennsylvania railroads. It was settled in 1809, and developed rapidly because of the petroleum deposits which underlie the city and vicinity. It has varied manufactures of iron wares, flour and feed mills, brick works and manufactures of tram locomotives, stationary, gas and steam engines, leather goods, corsets, furniture, radiators, shovels, wrenches, brushes, toys, etc. It has also extensive dairying interests. It has several mineral springs, and is the location of the State fish hatchery. The city adopted the commission form of government in December 1913. Pop. 5,991.

CORSAC, kōrs'ak, AVIVÉ (Vulpes corsac), a species of fox or dog found in Central Asia, Siberia and Mongolia, sometimes called the steppe-fox. Its color varies from reddish-yellow in summer to a whitish tinge in winter. The Kirghiz hunt the corsac for its soft, thick pelt. About 50,000 skins come to market annually. It is gregarious, prowls by day, burrows and lives on birds and eggs. The corsac stands captivity well and is often seen in zoological gardens. It is much like the American kit-fox (q.v.) in its habits.

CORSAIR, kōrs'ər (Fr.; in origin identical with 'croiser' or 'cruiser'), a term employed to denote pirates or their vessels. By the princes of the coast of Barbary the corsairs of their states were commissioned to attack the merchant ships of foreign nations, and they became the scourge of the Mediterranean. See BARBARY POWERS.

CORSAIR, THE, a poem by Lord Byron, published in 1814. The romantic adventures of the hero are continued in 'Lara.'

CORSE, kōrs, John Murray, American military officer: b. Pittsburgh, Pa., 25 April 1835; d. Winchester, Mass., 27 April 1893. He was a cadet at West Point for two years, and in 1860 became a lieutenant, but enlisted in the regular army at the outbreak of the Civil War. He was a brigadier-general in 1864; commanded a division in Georgia, and upon the advance of the Confederates against Allatoona, Sherman histrigraphed him, 'Hold the fort for I am coming,' which inspired Ira D. Sankey to compose the famous hymn beginning with these words. General Corse repulsed the enemy and accompanied Sherman on the march to the sea. After the war he was successively collector of internal revenue in Chicago and postmaster of Boston.

CORSET, an article of dress worn generally by women for the purpose of keeping the form erect and trim. It is usually made of two thicknesses of white jean, stiffened by whalebone or steel, closed in the front by heavier steels and laced at the back. It was in use in Germany in the Middle Ages, and was introduced into France about the time of the Revolution. At an early age it was in use in Great Britain and Ireland, at least in the 18th century, and was worn by little girls as a support for the body. The styles of corsets have changed with the styles of dress, the modern tendency being to emphasize the natural figure. Corset manufacture in the United States has increased rapidly since 1899.

CORSICA (Fr. Corse), an island in the Mediterranean belonging to France. It is separated from the island of Sardinia, on the south, by the Strait of Bonifacio, about 10 miles wide, and its shortest distance from the mainland is 50 miles. It is distant from France about 100 miles. It is somewhat irregular in shape, but tolerably compact, except toward the north, where it terminates in a long and narrow tongue of land about 22 miles long by about six miles broad. Greatest length, north to south, 110 miles; greatest breadth, near its centre, 53 miles; area, 3,337 square miles. The east coast is remarkable for its uniformity, presenting a line which is broken in only one or two places by comparatively small indentations. To this the west coast presents a striking contrast, a number of deep bays following each other in rapid and almost uninterrupted succession. Of these the most important, proceeding north to south, are the gulfs of Saint Florento, Calvi, Porto, Liscia, Ajaccio and Valinco. The interior is traversed by a mountain chain, which has its principal direction north to south, but breaks out several lateral branches, particularly to the northwest. The highest summits are near the centre of the island, including Monte Cinto, 8,881 feet, and Monte Rotondo, 8,612, while others exceed considerably 7,000 feet and the greater part of the year are covered with snow. The mountain masses are chiefly composed of granite and porphyry, and appear to be generally overlaid by extensive beds of limestone. From the east and west sides of the chain numerous streams descend to the opposite sides of the coast. They are more torrential on the east, and altogether unfit for navigation. The largest are the Golo and Tavignano. Along the river mouths large quantities of débris and alluvium have accumulated which, preventing the egress of the waters, have gradually formed on the east coast a series of lagoons and morasses and made that part of the island very unhealthy; but with this exception the climate is one of the finest in Europe. The heat is sometimes excessive, but the sky is generally clear and the air bracing. The surname army of the mountains are covered with pines, evergreen oaks, cork-trees, beeches and chestnuts. In other
parts the hill sides are overgrown with dense thickets of cistus, myrtles, arbutus and other shrubs. Numerous valleys lie between the lofty ridges, and sometimes plains of considerable extent occur, the soil of which is generally fertile and well adapted for the growth of all the ordinary cereals. Agriculture implements in use are of the crudest form. The slopes are covered with vineyards, and the olive trees appear to be indigenous. The mulberry, orange and citron succeed well, particularly in the lower valleys near the coast. One of the most valuable productions of the more elevated districts is the chestnut, on which, at least during the winter months, the poorer inhabitants principally subsist. Among domestic animals, the first place for usefulness and numbers is due to mules and goats. The principal wild animals are the boar and the fox. Deer are numerous and all the smaller game and wild fowl are common; eagles, vultures and numerous other birds of prey frequent the mountains, and foxes abound. The principal source of mineral revenue is derived from quarries of fine granite, porphyry and marble. Neither manufactures nor trade have made much progress. The chief exports are wine, brandy, olive-oil, chestnuts, fruit and fish. The inhabitants have the reputation of being haughty in temper, passionate and revengeful. Corsica is one of the countries in which the vendetta obtains, the taking of private vengeance for the blood of a relative of which a striking picture is to be found in Merimee's 'Colomba.'

From the Phenicians, its first colonists, the island took the name of Cyrnos; and from the Romans that of Corsica. On the decline of the Roman empire it was seized by the Goths and passed from them to the Saracens. In 1481 it fell under the dominion of the Genoese, who retained it, with some interruption, till 1755, when a great part of it was wrested from them and made independent by the celebrated General Paoli. France, claiming it on a pretended cessation of war, the Genoese, obtained forcible possession of it in 1768, after the inhabitants had distinguished themselves by a long and valiant resistance. At the time of the French revolution, Paoli, who had taken refuge in England, returned to his native land, and unfurling the banner of the death's head (the old Corsican arms), he summoned his countrymen to strike for their independence. With the assistance of the British, who landed 18 Feb. 1794, he reduced Bastia in May and Calvi in August. Corsica was constituted a kingdom under the government of the Council of Censors (General Elliot); the constitution and laws of Great Britain were adopted, and a parliament such as Ireland had been established. But a large part of the people were averse to the British, whom they regarded as heretics, and the French party again appeared on the island in October 1796, under General Moreau. Sickness had reduced considerably the effective force of the British, and their position was rendered still more critical by the French occupation of the neighboring city of Leghorn, and in consequence they evacuated Corsica in May 1797, ending their occupation. Since 1815 the island has formed a French department. For administrative purposes the department is divided into five arrondissements—Ajaccio (the capital), Bastia, Calvi, Corte and Sartene, subdivided into 62 cantons and 364 communes. The most distinguished individuals to whom Corsica has given birth are Paoli and Napoleon. Pop. 228,320. Consult Caird, 'The History of Corsica' (1899).

CORSICANA, kör-si-käˈna, Tex., city, county-seat of Navarro County; on the Houston and Texas and the Saint Louis Southwestern railroads, 180 miles northeast of Austin. The city is the seat of the State Orphans' Home and the Odd Fellows' Widows' and Orphans' Home, a Carnegie library, sanitarium, a fine courthouse, Federal and high school buildings, a natacorium and an Elks' home. Corsicana is a progressive manufacturing centre, having among its industries large cotton mills, gin and compresses, sheet-metal works, broom, harness, candy, overall and soda water factories, cottonseed-oil mills, brickyards, flour mills, a grain elevator, foundry and machine shops, planing mills, etc. It is also the seat of an extensive oil industry, being in its vicinity a number of wells, oil machinery factories and two large refineries. The sewage system is owned by the city. It also has street railways, waterworks, daily and weekly newspapers and three national banks. Pop. 10,000.

CORSINI, kör-zéˈnē, FAMILY, a famous Florentine family, known since the 11th century. (1) ANTONIO, Saint: b. Florence, 30 Nov. 1336; d. Fiesole, 6 Jan. 1373. He early entered a monastery in Florence, where he remained for 40 years; he was then made bishop of Fiesole and sent as a papal legate to Bologna, where he was successful in making peace between factions and putting an end to civil war. (2) LORENZO became Pope as Clement XII (q.v.). He restored the Corsini Palace in Rome now containing the interesting Corsene Gallery. (3) TOMMASO, Italian politician: b. Rome, 5 Nov. 1677; d. there 1856. He was a supporter of Pope Pius IX and was made senator (chief magistrate) of Rome; when the Pope fled from Rome, Corsini went to Florence for a time, but later returned to Rome. (4) His brother NERI: b. 1771; d. 1845, was a member of the council in Tuscany under grand dukes Ferdinand III and Leopold II. (5) NERI, Italian politician: b. Florence, 13 Aug. 1805; d. 1 Dec. 1859. He was the younger son of Thomas Corsini and became one of the leaders of the Liberal party in Tuscany. In 1848 he was Minister of War and Foreign Affairs under the grand duke Leopold II Offered him the first place in the ministry and he immediately proposed to establish the constitution. The duke, however, would not consent to this and went into exile. The provisional government then organized sent Corsini to London to represent Tuscany there.

CORSNED, körsˈned, or MORSEL OF EXECCUTION, a form of trial or purgation formerly made use of in England. See ORDEAL.

CORSO, an Italian term first applied to races of riderless horses, then to the long lines of gaily decorated carriages driven through the principal streets of the cities, and afterward to the most noted in British literature. The Corso at Rome, stretching from the Piazza del Popolo to the Capitol, and dividing the city
into two equal parts, as nearly 3,500 paces in length, and is enclosed by high and mostly splendid edifices; but its breadth is not proportionate; so that in most parts not above three carriages can go abreast. The higher class of citizens take the air in carriages, which form a very long row. The greater part, however, in all large Italian cities is splendid, and is imitated in very small towns (although it may have only a few coaches), attracts great numbers of spectators on foot. The carnival is the gayest of the festivals, and at this time the Corso appears in its greatest splendor. Goethe has written a description of the Roman carnival and the Corso. See CARNIVAL.

CORSSEN, körs'n, Wilhelm Paul, German philologist: b. Bremen, 20 Jan. 1820; d. Berlin, 18 June 1875. After studies in philology at Berlin, and two years spent in teaching at Stuttgart, he was called in 1846 to lecture at Schulpforta, where he remained till 1866, when ill health compelled him to retire. His earliest important work is his treatise, "Über Aus- sprache Vokalismus und Betonung der lateinischen Sprache" (1858), for which he received the prize offered by the Royal Prussian Academy of Sciences for the best work on that subject. It was followed by "Kritische Beiträge zur lateinische Formenlehre" (1863); "Kritische Nachträge" (1866); "Über die Sprache der Etrusker" (2 vols., Leipzig 1874-75), in which he labors with great ingenuity and vast learning to prove against the world that the Etruscan language was cognate with that of the Romans. His arguments were violently contested by the classical scholars everywhere, especially by Wilhelm Deecke, 'Corsen und die Sprache der Etrusker, eine Kritik' (Stuttgart 1875).

CORT, kört, Cornelius, Dutch engraver: b. Hoorn 1536; d. Rome 1578. In his youth he worked for a printer at Antwerp. He then went to Venice, where he was warmly welcomed by Titian, some of whose pictures he was employed to engrave. Cort finally settled at Rome and established a school of engraving there, and it is said had Agostino Carracci for a pupil. He made the first engraving of the 'Transfiguration' by Raphael, and about 150 prints from the other Italian and Flemish masters, including the two Zucchari, Mizrano, the miniature painter Clovio and Michelangelo. His work was not superseded until the advent of Goltzius. This number, considering the shortness of the engraver's life, and the size and fine style of the plates, betokens a considerable amount of industry; but although he had a complete mastery of the graver, he is reproached with deficiency in discriminating delicate shades and relative distances, or the nice varieties of expression. Consult Longhi, 'Caligrafia' (Milan 1830), and Bartsch, 'Anleitung zur Kupferstichpunde' (Vienna 1821).

CORT, Frans de, Flemish poet: b. Antwerp, 3 Feb. 1503; d. Brussels, 18 Jan. 1578. As singer of the quiet joys of home life and conjugal happiness he has few peers in any literature. He was at first associated with the publication 'Grondweet,' and was later appointed editor of the 'Schelde' (1538). He was secretary to the general auditor of state at Brussels from 1561 until his death. His original homely lyrics appeared in 'Liederen' (1587-59); 'Zing-Zang' (1866) and a second volume of 'Liederen' (1868). He also translated into Flemish verse 'The Finest Songs of Robert Burns' (1862); as well as those of Jasmin and German verse. After 1861 he conducted the periodical 'De Toekomst.' In 1869 he edited the posthumous poems of Dautzenberg, his father-in-law.

CORT, Henry, English inventor: b. Lancaster 1740; d. 1800. Having at an early age conceived the idea of making England independent of foreign countries for the supply of iron, he established himself as an iron merchant at Gosport, Hampshire, and afterward erected iron works at Pontley, near that town, where he expended large sums in perfecting his processes for puddling and rolling iron. His experiments were successful, in spite of the most disheartening opposition of the most powerful iron masters of England. He took into partnership Adam Jellicoe, cabin clerk in the office of the paymaster of the navy, but after his partner's death the navy board seized his iron works for claims against Jellicoe, involving Cort in law suits, and eventually in total ruin. After his death, the members of his family, receiving insignificant pensions from the government, to him England owes its success in the manufacture of pig-iron. In 1740 the production amounted to 48,000 tons, while in 1913 it had increased to 15,997,326 tons. He is now commonly styled "the father of the iron trade," though Dud Dudley, whose 'Metallum Martis' was printed in 1665, has a much better claim to the title.

COTRE, Corsica, the capital of an arrondissement, at the confluence of the Tavignano and Restonica, 52 miles northeast of Ajaccio by rail, picturesquely situated among the mountains and protected by a commanding citadel which has sustained many notable sieges. Cort was the seat of Paoli's reform government. A university founded by that patriot bears his name; a communal college, an ancient palace, from which Paoli ruled, and a church, and a monastery which served as the parliament house in 1765, and the house in which Paoli lived also remain. There are monuments to Paoli, General Gaffori and General Casanova, Duke of Padua. Marble is quarried extensively in the neighborhood; lumber, wine, oil and cheese are the staple products. Pop. 5,211.

COTRELLEOU, George Bruce, American cabinet officer: b. New York, 26 July 1862. He was graduated from the Hampstead, Long Island, Institute, 1879, and the State Normal School, Westfield, Mass., 1882. Between 1883 and 1885 he was a general law and惟报imreporter in New York; and a teacher 1885 to 1889, when he entered the public service. He was private secretary to various Federal officials in New York 1889-95; was appointed stenographer to the President November 1895; executive clerk February 1896; assistant secretary 1898 and became secretary to President McKinley 1 May 1900. President Roosevelt continued him in this office until 1903 when he became Secretary of Commerce and Labor. On 6 March 1905 he became Postmaster General and on 4 March 1907 Secretary of the Treasury. In 1909 he became president of the Consolidated Gas Company.
Cortereal, kōrstē-rā-āl, Gaspar, Portuguese navigator: b. about 1450; d. about 1502. In 1500 he was appointed by the king of Portugal to command an expedition to explore the northern coasts of North America. He sailed from the Tagus in 1500 with two ships, ranged the shores of the country afterward called Canada and freighted his ships with 57 Indians, whom on his return he sold as slaves; and the name Labrador (laborer), afterward transferred to a more northern region, is a memorial of his visit. Soon after he set sail from Lisbon on a second voyage to the same regions, but never returned. His brother Miguel, who sailed in search of him in 1502, was never afterward heard from. King Manuel sent an expedition to learn their fate but in vain. Consult Harrisse, 'Les Cortereal et leurs voyages au nouveau monde' (Paris 1833).

Cortés, kōr-tēs, Hernando, or Hernando, Spanish conqueror of Mexico: b. Medellín, Estremadura, 1485; d. Castilejo de la Castra, near Seville, 2 Dec. 1547. He entered the University of Salamanca, but his penchant for the fair sex soon led to his expulsion and the same cause led to his return. He went to leave Spain and try his fortune in the New World. He went to the West Indies in 1504, where Velasquez, governor of Cuba, gave him the command of a fleet, which was sent on a voyage of discovery. Cortés landed Santiago de Cuba 18 Nov. 1518, with 11 vessels, about 700 Spaniards, 18 horses and 10 small field-pieces, and landed on the Mexican coast. The sight of the horses on which the Spaniards were mounted; the movable fortresses in which they had crossed the ocean; the iron which covered them; the noise of the cannon;—all these objects alarmed the natives; and the adventurer by his address gained over the Totonacs and Tlaxcalans, who were his faithful allies to the last. To keep in check another tribe he built a fort and a few houses, which formed the nucleus of the city of Vera Cruz, and in order to prevent the desertion of his soldiers, and to give them the courage of despair, he caused his little fleet to be destroyed. Cortés entered the city of Mexico 8 Nov. 1519. Montezuma, the sovereign of the country, received him as his master; and the inhabitants, it is said, thought him a god and a child of the sun. He destroyed the idols in the temples, to whom human sacrifices were offered, and placed in their room images of the Virgin and of the saints. In the meantime he made continual progress toward getting possession of the country, forming alliances with several caciques, enemies to Montezuma, and assuring himself of the others by force of stratagem. On a general of Montezuma attacking the Spaniards, in obedience to a secret order, Cortés repaired to the Imperial palace, had the commander and his officers burned alive, and forced the emperor, while in chains, to acknowledge publicly the sovereignty of Cortes. One unhappy monarch added to this homage a present of a large quantity of pure gold, and a number of precious stones. But the jealousy of Velasquez was so much excited by the deeds of his representative, that he sent an army numbering about 1,400 against him, a force not more than 200 strong, advanced to meet it, gained over the soldiers who bore arms against him, and with their assistance again made war with the Mexicans, who had also revolted against their own emperor, Montezuma, whom they accused of treachery. After Montezuma, who had hoped to restore tranquillity by showing himself to the multitude, had failed to extinguish their rage, Guatimozin, his nephew and son-in-law, was acknowledged as emperor by the Mexicans, and gained some advantage over the Spaniards. He defended his capital during three months, but could not withstand the Spanish artillery. Cortés again took possession of Mexico, and in 1521 the emperor, the empress, the ministers and the whole court were in his power. The unhappy Guatimozin was subjected to tortures to make him disclose the place where his treasures were concealed, and was afterward executed with a great number of his nobles. The court of Madrid now became jealous of the power of Cortés, who had been some time before appointed captain-general and governor of Mexico. Commissioners were sent to inspect and control his measures; his property was seized; his dependents were imprisoned and he repaired to Spain. He was received with much distinction, and returned to Mexico with an increase of titles, but a diminution of power. A vicerey had charge of the civil administration, and Cortés was entrusted only with the military command and the privilege of prosecuting his discoveries. The division of powers proved a constant source of dissension; and though he discovered the peninsula of California in 1533, most of his enterprises were frustrated, his life embittered and he returned again to Spain, where he was coldly received and neglected. He followed Charles V in his unfortunate expedition against Algiers in 1541 and gave signal proofs of his valor, yet the monarch continued to refuse him admission to the court. It is said that one day, having forced his way through a crowd round the carriage of his king, and put his foot on the step to obtain an audience Charles coldly inquired who he was.

"I am a man," replied Cortés, "who has gained you more provinces than you fathers, towns." He passed the remainder of his days in solitude, leaving a character eminent for bravery and ability, but infamous for perfidy and cruelty. Consult Antonio de Solís, 'Historia de la conquista de Méjico' (Madrid 1694); and a popular edition in 5 volumes, Paris 1822; MacNutt, F. A., 'Fernando Cortés and the Conquest of Mexico 1485-1547' (New York 1909); id., 'Letters of Cortés to Charles V, Translated and Edited, with Biographical Introduction and Notes' (2 vols., New York 1908); Ober, 'Hernando Cortés' (New York 1905); Prescott, 'Conquest of Mexico'; Helps, A., 'Life of Cortez' (London 1871).

Cortés, José Domingo, Chilean journalist and historical writer: b. about 1830; d. 1882. After some years spent in journalism he was for a time an attaché at the Legation, and subsequently a government director of libraries in Bolivia. He was a prolific author and among his works are 'Diccionario biográfico americano'; 'Poesías americanas'; 'Historia de Bolivia'; 'Estadística bibliográfica de Bolivia,' and 'República de Méjico' (1872).

Cortés, kōr-tēs, the old assembly of the estates in Spain and Portugal, the representa-
tives chosen by the "estates" to assist in the making and administering of the laws of Spain and Portugal. In Spain the cortes of Castile, which was composed of the higher nobility, the superior ecclesiastics, the knights of the orders of Saint James, Calatrava and Alcántara and the representatives of certain cities held the first rank during the time of the united Spanish monarchy. In early times the king was very dependent upon the cortes; indeed, they were invested with the power of making war and frequently exercised it in opposition to the throne. In the constitution of Aragon the form of government was very remarkable, a supreme judge, called the justicia, selected from persons of the second class, presided over the administration of the government. He decided all questions and disputes between the king and his subjects, and confined the royal power within the constitutional limits. King Ferdinand of Aragon and Isabella of Castile succeeded in rendering themselves independent of the "estates" (las cortes); and afterward, when the Castilian nobility refused to resist an unconstitutional tax at a meeting convened at Toledo by Charles in 1538 the king abolished this assembly of the estates. After this neither the clergy nor nobility were assembled. Deputies from 18 cities were sometimes, however, convened, but this only in case subsidies were to be granted. Philip II restrained the liberties of the Aragonese in 1591. After the Spanish war of succession Philip V deprived those provinces which had adhered to the Austrian party of the privileges that still remained to them. From that time the cortes were convened only to pay hommage to the king or the Prince of Asturias, or when a question respecting the succession to the throne was to be determined. But when Napoleon attempted to extend his influence over Spain he convoked (15 June 1808) a junta of the cortes at Bayonne. In their last session, 7 June 1812, a new constitution was adopted by them. The ninth article regulated the powers and duties of the cortes, and provided that they should consist of 25 archbishops, 25 nobles and 122 representatives of the people. Napoleon afterward attempted, by offering to restore the cortes to their ancient importance, to gain over the Spanish nobility, and through them the people, but failed. The constitution of 1826 was suppressed, but it was restored by Dom Miguel in 1842. The constitution of the Republic (21 Aug. 1911) provides for a cortes consisting of two bodies, an upper and a lower house. The former is chosen by the municipalities and the latter by the people; and the two jointly elect the president for a term of four years. The Portuguese cortes is coeval with the monarchy. In 1143 the assembly at Lamego was asked to confirm the elevation of Alphonso I to the throne, and replied: "We resolve that he shall be king during his life, and his children after him." The general prosperity of the country made the people less interested in the cortes, their representatives; and the kings, elated with success, paid attention to them only when in need of money. Dom Pedro formulated a new constitution in 1826, called the cortes together and abdicated in favor of his daughter, Maria da Gloria. In 1828 Dom Miguel assembled the cortes, in order to be acknowledged by them, and to give his usurpation an appearance of legitimacy. Consult Colmeiro, 'Cortes de los antiguos reinos de León y de Castilla' (Madrid 1883-84); Desdevises du Desert, 'L'Espagne de l'ancien régime' (Paris 1897-99); Muro y Martínez, 'Constituciones de España' (Madrid 1881); Prescott, 'Ferdinand and Isabella'; Stephens, 'Portugal' (in the 'Stories of the Nations Series'). See PORTUGAL; SPAIN.

CORTES, that portion of an organ usually situated on the outside. Thus the cortex of the brain is the external gray portion in which most of the nerve cells are located.

CORTHELL, Elmer Lawrence, American engineer; b. South Abington (now Whitman), Mass., 30 Sept. 1840; d. Albany, N. Y., 16 May 1916. He was educated at Phillips Exeter Academy and at Brown University. In his second year at Brown University the Rebellion broke out and he enlisted in the First Regiment, Rhode Island Light Artillery, rising from private to captain during the war. Then he re-entered Brown, obtaining successfully the degrees of B.A., M.A., and in 1846 Sc.D. He took up engineering work, mainly in the Mississippi Valley. After engaging in railroad and bridge construction requiring great skill, he was associated in 1875 with James B. Eads in building the jetties at the mouth of the Mississippi River. Among the many engineering projects in which he participated were the planning with Captain Eads of the ship railway across the Isthmus of Tehuantepec; the building of several large bridges over the Missouri, Ohio and other rivers; the opening of the Amazon River and the designing of the harbor works at Tampa, which raised that port to the first rank in Mexico and which he considered his greatest feat. He was consulting engineer of the Department of Public Works in the Argentine government from 1900 to 1902, represented that country and the United States in various engineering and navigation congresses of an international character, and was a member of the advisory board of consulting engineers for the New York barge canal. Besides being president of the American Institute of Civil Engineers and of the Society of Civil Engineers he belonged to almost every engineering society of importance in the world and to various patriotic organizations. Consult 'History of the Mississippi Jetties' (1880); 'Report on Boulevard Bridge and Navigation Congress' (1898); 'Maritime Commerce of the World' (1898); 'Some Ports of the World' (1901); 'Argentine, Past, Present and Future' (1903); 'Allowable Pressure on Deep Foundations' (1907); 'Engineering and Commercial Conditions and Problems in Latin America' (1911).

CORTINA, Juan Nepomucena, ná-pó-moo-ch'ná kör-té'ná, Mexican adventurer; b. 1830. He took an active part in the Mexican war, organizing a band of independent guerrillas, which later became a part of the national army, and with their commandery made the people less interested in the cortes, their representatives; and the kings, elated with success, paid attention to them only when in need of money. Dom Pedro formulated a new constitution in 1826, called the cortes together and abdicated in favor of his daughter, Maria da Gloria. In 1828 Dom Miguel assembled the cortes, in order to be acknowledged by them, and to give his usurpation an appearance of legitimacy. Consult Colmeiro, 'Cortes de los
ordered his execution, but he was shut up in a military prison instead. No record of his death appears.

CORTISSOZ, Ellen Mackay Hutchinson, American journalist and author: b. New York. She is on the literary staff of the New York Tribune, with which her husband, Royal Cottissoz, is also connected as a literary and art editor. She is the author of 'Songs and Lyrics' (1881), and with E. C. Stedman edited the 'Library of American Literature' (11 vols., 1888-94).

CORTLAND, N. Y., city, county-seat of Cortland County; situated on the Tioughnioga River and the Lackawanna, the Lehigh Valley and the Erie railroads, about 38 miles northwest of Binghamton. It is a farming and manufacturing trade centre, and has several wireworks, foundries, machine shops and manufactories of carriages, stoves, harness, furniture, cash registers, corundum wheels, motor trucks, piano cases, wall paper and steel ware. The United States census of manufactures for 1914 recorded for the city 59 industrial establishments, employing 2,752 persons; of which number 2,459 were wage earners, receiving annually $1,474,000 in wages. The capital invested aggregated $5,577,000, and the year's output was valued at $6,438,000; of this, $279,000 was the value added by manufacture.

The city has electric lights and railways, several churches, a State Normal school, daily and weekly newspapers and three national banks. The government, under a charter of 1900, is vested in a mayor, a municipal council and administrative boards and officials appointed by the executive, the appointments, except the board of education, being subject to the consent of the council. First settled in 1792, Cortland was included in the township of Homer until set off as Cortlandville in 1829. The waterworks are owned by the city. Pop. 13,000.

CORTONA, kör-to-nä, Pietro di, properly PIETRO BERETTINI, Italian painter and architect: b. Cortona, 1 Nov. 1596; d. Rome, 16 May 1669. Pope Urban VIII employed him to decorate a chapel in the church of San Tibia and also to execute the frescoes of the great hall of the Barberini Palace. Many churches of Rome were decorated by him; and at Florence he adorned the Pitti Palace for the Grand Duke Ferdinand II. His easel pictures, although of less value are in great estimation. As an architect he did some important work in church restoration.

CORTONA, Italy, city, in the province of Arezzo, northwest of Lake Trasimenos, about 70 miles southeast of Florence. It is one of the oldest cities in Italy, and has, in a good state of preservation, a number of the old Roman buildings. It has well-preserved cyclopean walls, built more than 3,000 years ago, 8,500 feet in circumference, the ruins of the old Roman baths, a museum of Etruscan antiquities, including a remarkable candelabrum with 16 lights, assembled by the Etruscan Academy, founded in 1726; the cathedral of Santa Maria containing paintings by Luca Signorelli, who was born here in 1441, as was Pietro Berrettini in 1596. The ancient Cortona, called *Kyrtonia* by Polybius, was the strongest of the 12 cities of the Etruscan League. As a Roman colony it lost its importance, but in the 11th century again prospered. It sided mostly with the Gibellines, came into the possession of the Casale family in the 14th century, in 1409 was given by the last of the house to Ladislao of Naples, and by him in 1412 to Florence. Consul Della Cella, 'Cortona Antica' (Cortona 1900). Pop. 29,659.

CORMUBA, kör-room'ba, Brazil, town of the state of Matto Grosso. It is situated on the Paraguay River, near the Bolivian border, and has the largest trade of any place in the state. The receipts at its custom-house average annually $282,210. The principal products of Matto Grosso, maté, cattle, bees, hides, skins, rubber, etc., are shipped from this point. Here also is located the important arsenal of Ladario. Pop. 10,000.

CORAÑA, kör-ro'na, La, Spain, seaport in the province of the same name in Galicia, on the northwest coast, on a peninsula at the entrance of the Bay of Coruña. It consists of an upper and a lower town, the former built on the eastern side of a small peninsula, and the latter on the isthmus connecting the peninsula with the mainland. The harbor, which is well protected, is deep, spacious, and safe, and many improvements have lately been made. Coruña is the centre of an extensive commerce, the exports comprising live stock, fruits, vegetables, wine, hams, sardines, leather, peat, etc., while the principal imports are sugar, hides, coal, oil and manufactured articles. There is also an important coastwise trade. The city has a large variety of manufactures, including cigars, linen goods, canvas, cordage, lumber, barrels, paper, etc. There is a large government tobacco factory. There is a lighthouse 92 feet high, called the Tower of Hercules, and supposed to be of Carthaginian construction and to have been remodeled in Trajan's time. Pop. 45,650. The chronicled history of Coruña dates from the Roman occupation. In the Middle Ages it was called Caronum. It was part of the emirate of Córdoba for some time, and suffered severely in the reconquest. The Portuguese captured the town in 1370. Here in 1386 John of Gaunt landed to urge the claims of his wife, Doña Constanza, to the Castilian throne, and in 1554 Philip II sailed from the port to marry Queen Mary of England. Coruña was the point of departure of the "Invincible Armada" in 1588, and in the following year it was taken by Drake and Norris and nearly destroyed. The harbor was the scene of English naval victories over the French in 1747 and 1805. Coruña is famous for the repulse, on 16 Jan. 1809, of the French under Marshal Soult, by Sir John Moore, who succeeded in withstanding the French attempt to stop the English embarkation, but lost his life in the battle. The engagement took place on the heights of Elviña. In 1823 the city fell into the hands of the French. In 1836 it was captured by the Carlists. The result of the Spanish-American War in 1898 was disastrous to Coruña's trade with Cuba and Porto Rico. The province of La Coruña has an excellent harbor especially adapted for a naval station, namely Ferrol. It has many mineral springs which have been little exploited. The sea-fisheries are the prime industry. Pop. 631,000.

CORUNDUM, or ADAMANTINE SPAR, a native oxide of aluminum, Al₂O₃, crystallizing
CORVALLIS—CORWIN

in the rhombohedral system, and also occurring massive. Its hardness is nine, and its specific gravity about four. It is adamantine or vitreous in lustre, and very variable in color. Three varieties are commonly recognized. Of these the first is known as sapphire, and includes those specimens that are colored as gems (q.v.). The second kind, being known as "oriental ruby," the yellow as "oriental topaz," the green as "oriental emerald," and the purple or violet as "oriental amethyst." The colors of these gems are due to the presence of traces of certain metallic oxides. The second principal variety of the mineral is that which is known in the arts simply as "corundum," and is used as an abrasive (q.v.). It includes the less transparent varieties of blue, brown, black, gray or white colors. It is either crystallized or granular, or in masses showing distinct parting. The third variety, "emery," is not pure, but is an intimate mixture of corundum with magnetite or hematite. It has long been one of the most important abrasives (q.v.), but it is now being superseded by the greatly superior emery produced artificially. This mineral usually occurs in crystalline rocks such as granite, gneiss, nepheline-syenite, granular limestone, also chlorite and mica-slate. Sapphire and ruby (q.v.) are usually in alluvial deposits and in the beds of rivers. The Canadian corundum deposits, discovered a few years ago, are the largest and most important known. Corundum is also found in many other localities, notably in North Carolina, Georgia, Montana and India. The commercially valuable deposits in the United States occur as aggregates in ultrabasic igneous rock (dunite) in North Carolina, and Georgia, while the Canadian deposits occur as pegmatite dikes (q.v.).

CORVALLIS, Ore., town and county-seat of Benton County, situated in the western part of the Willamette River and on the Southern Pacific and the Oregon Central and Eastern railroads. It also has steamboat service for two-thirds of the year, and as the centre of an agricultural district has considerable export trade, particularly in wheat. It has sawmills, grain mills, a carriage factory, flour mills, woolen mills, brick and tile factories, and other manufacturing industries. Dairying, stock raising and the raising of fruit and berries are important occupations. It is the seat of the State Agricultural College. Pop. 5,000.

CORVEE, kör-ve (Fr., from Lat. cura

CORVÉE, kör-va (Fr., from Lat. cura

Wittekind, the historiographer of the convent, Brino, known afterward as Pope Gregory IV, and many other learned men were educated here. To its library belonged the only manuscripts of the first six books of the 'Annals of Tacitus' discovered here in 1514. In 1793 it was made a bishopric by Pius VI. Its territory then embraced about 700 square miles, with 10,000 inhabitants. In the first quarter of the 19th century Corvey passed in quick succession into the possession of the House of Orange, of Westphalia, of Prussia, and of the Duke of Ratibor, to whom it has remained. The church of the abbey or castle of Corvey is built in the Gothic style, magnificently adorned in the interior and contains a number of monuments of successive dynasties and has a rich and extensive library; but the ancient collection of the Benedictines is no longer in existence. Certain brief 'Annales Corbeienses' from 648 to 1148 are printed in the 'Monumenta Germaniae Historica.' Consult Vigand, 'Geschichte der Abtei Corvey' (Höxter 1819).

CORVIDÆ, kör-vi-de, a family of passerine birds containing the true owls and closely related to the blackbirds (Icteridae), starlings (Sturnidae), birds of paradise (Paradisaeidae) and larks (Alaudidae). The bill is generally strong, more or less compressed; the upper mandible to a certain extent curved, the tip notched; the nostrils are covered with stiff bristle-like feathers pointing forward; there are 12 retrices in the tail and 10 primary wing feathers. Most ornithologists now recognize three sub-family divisions, the Fringillina or thrushes, the Carolina, or jays and magpies, and the Corvine, or crows, of which the last two are represented in North America by numerous species. About 150 species, distributed in upward of 35 genera, are found in all parts of the world except a few islands of the south Pacific region. Colenso and its allies of the New Zealand islands are sometimes included as a fourth sub-family.

CORVinus, kör-vín-nus, Matthia. See MATTHIAS I. CORVINUS.

CORVO, the westernmost island of the Açores (q.v.) or Western Islands and the nearest European point to America. First mentioned in 'The Book of the Spanish Indies,' written about 1350, of which a translation by Sir Clement Markham was issued by the Hakluyt Society in 1912. It appears on Atlantic Mercator map attributed to 1551. The name signifies Sea Crow. The island is an extinct volcanic crater uplifted about 300 feet above the sea. It is about six miles long and three miles wide with population of about 950. Consult Babcock, W. H., 'Geographical Review' (Vol. V, pp. 62-72, 18 Jan. 1918).

CORVUS, Marcus Valerius, Roman gener: (a) about 371 B.C. ; (b) about 270 B.C. He was twice a dictator, six times a consul and occupied the curule chair 21 times. He distinguished himself in the first Samnite war, and, according to the legends, was assisted in killing a gigantic Gaul in single combat by a raven, which picked out the eyes of his antagonist.

CORWIN, Edward Tanjore, American clergyman: (a) New York, 12 July 1834; (b) North Branch, N. J., 22 June 1914. He was graduated at the College of the City of New York (1853), and at the New Brunswick, N. J., Theological
Seminary of the Reformed Dutch Church. He held New Jersey pastorates at Parsamus 1857-63, and Millstone 1863-88, when he became rector of Hertzog Hall, New Brunswick. In 1897-98 he was in Holland as special agent of the Synod of the Reformed Church collecting from the Archives of the Classis of Amsterdam and elsewhere the so-called "Amsterdam Correspondence" of the Colonial American Dutch churches with the Classis of Amsterdam. From 1859 to 1907 he lived in New Brunswick, N. J., and at North Brother, N. J., until his death. He has published 'Manual and Record of the Church of Parsamus' (1858); 'Manual of the Reformed Protestant Dutch Church in North America' (1859); 'The Millstone Centennial' (1866); 'The Corwin Genealogy in the United States' (1872); 'Ecclesiastical Records of New York State' (1905) and many articles and addresses published in papers, pamphlets and magazines on historical and biblical subjects.

CORWIN, Thomas, American statesman and orator: b. Bourbon County, Ky., 29 July 1794; d. Con. D., 18 Dec. 1885. He was admitted to the bar at Lebanon, Ohio, in 1817, and elected to the Ohio legislature in 1821. He became a member of Congress in 1831; was governor of Ohio 1840-42; United States senator 1845-50; Secretary of the Treasury 1850-53; member of Congress 1859-61, and United States Minister to Mexico 1861-64. He was an eloquent orator and one of his most famous speeches was delivered in the Senate 11 Feb. 1847, in opposition to the Mexican War. Consult: Russel, Thomas; Corwin (Cincinnati 1882); and Morrow, L., "Life and Speeches of Thomas Corwin" (Cincinnati 1896).

CORY, Charles Barney, American naturalist: b. Boston, Mass., 31 Jan. 1857. He is a director in many important corporations, but best and most widely known as an expert vertebrate zoologist. He is an honorary curator of the Field Columbian Museum, Chicago, and a fellow of the Linnæan and Zoological societies of London, England. His published works include 'A Naturalist in the Magdalen Islands' (1878); 'Birds of the Bahama Islands' (1880); 'The Bird Ramblers: Florida' (1881); 'The Beautiful and Curious Birds of the World' (1883); 'Birds of Haiti and San Domingo' (1884-86); 'Birds of Eastern North America'; 'How to Know the Ducks, Geese, and Swans of North America'; 'How to Know the Shore Birds of North America'; 'The Birds of the West Indies'; 'Key to the Water Birds of Florida'; 'Key to the Birds of Eastern North America'; 'Hunting and Fishing in Florida'; 'Montezuma's Castle, and other weird Tales' (1899); 'Dr. Wandermann'; 'The Birds of Illinois and Wisconsin' (1901); 'Mammals of Illinois and Wisconsin' (1912); 'Description of Twenty-eight New Species and Subspecies of Neotropical Birds' (1913).

CORYAT, Thomas, English traveler: b. Odcombe, Somerset, 1577; d. Surat, India, December 1617. He published in 1611 some of his travels' experiences, 'Crudities, etc.', a curious book, to which various verses in various ancient and modern languages, written by Ben Jonson, Donne and other authors, are appended. The latter were afterward published separately under the title of 'Odcombian Banquet,' with an advertisement reflecting satirically upon Coryat, who was a butt of the wits with whom he associated in London. In a second volume, however, entitled 'Cramb, or Colwort Twice Sodden,' published the same year, he protested that the verses were appended to theformer without his consent. In his first European journey, which occupied five months in 1608, he traveled nearly 2,000 miles in Europe, about one-half of which distance he walked. He departed on his second journey in 1612, explored the Levant, resided for a time at Constantinople, examined the ruins of the ancient Thebes, traced the history of the sites of the seven churches of Asia Minor as he could discover, and reached India with the intention of proceeding thence through China, the plains of Tatar and Ethiopia, and of casting his eyes upon many other places.

CORYBANTES, beings mentioned in Greek mythology which were said to have sprung from Corybas, son of Cybele and Iasion, who appointed them to perform religious service for his mother, the goddess Cybele, in Crete and Phrygia. They engaged in wild religious dances to the accompaniment of the music of flutes, cymbals, etc. There were also Corybantes who were regarded as a class of deities resembling the Cabeiri, and of whom little is known. According to ancient traditions, they were descendants of Hephaestus (Vulcan). The name is sometimes given to the priests of Cybele, as it was said they imitated the dance of the Corybantes. Consult Frazer, 'Adonis, Attis, Osiris' (London 1907), in part IV of 'The Golden Bough'.

CORYDALIS, or ALDER-FLY, one of our largest insects, whose net-veined wings expand nearly six inches. It is a member of the neuropterous family Sialidae, and is named Corydalis cornuta in allusion to the enormously long horn-like mandibles of the male, used as claspers in the act of pairing, those of the female being large, but short, broad and toothed. The larva is called in the northern States dobson or hellgrammite, and among the Mississippi fishermen it is known as crawler; it is much esteemed as bait. The female lays for nearly three years under stones in brooks; is nearly three inches long, with six legs and big jaws, and along each side of the hind-body is a series of long filamentary appendages, at the base of which are short bushy or spongy gills. It breathes by the spiracle during its latter larval life, when it lives out of the water. It transforms into a chrysalis in the earth on the banks of brooks. The female lays from 2,000 to 3,000 eggs in a mass. Though very ferocious in appearance, the insect, which sometimes alights on one's dress, is entirely harmless. Consult Davis, 'Aquatic Insects in New York State' (Albany 1903); Howard, 'The Insect Book' (New York 1901); Kellogg, 'American Insects' (New York 1908); Miall, 'The Natural History of Aquatic Insects' (London 1895).

CORYDON, Ind., town and county-seat of Harrison County, 25 miles southwest of Louisville, on the Louisville, New Albany and Corydon Railroad, and on Indian Creek. It contains a sulphur spring which attracts a great number of vacationists and valetudinarians. From 1813 to 1816 Corydon was the capital of the Territory, and of the State from 1816 to 1825. The old capitol building still stands. Morgan's
raiders attacked a small Federal force here in 1863. Pop. 1,669.

CORYDON, Iowa, town and county-seat of Wayne County, situated in the southern part of the State, 81 miles south of Des Moines, on the Keokuk and Western and the Chicago, Rock Island and Pacific railroads. Corydon is essentially an agricultural town and exports a large amount of timothy seed. The electric-light plant and sewer waterworks are under municipal ownership and control. Pop. 1,703.

CORYMB, in botany, a form of indefinite inflorescence, in which the flower-stalks, though springing from different parts of the main axis, have their lengths such that their tops form a flat or nearly flat surface. Examples are meadow-sweet, hawthorn, candytuft, etc.

CORYMBUS, in ancient sculpture, the wreath of ivy-leaves, berries or garlands with which vases were encircled. The term is also applied to that style of dressing the hair among the Grecian women, in which it was tied in a knot on the top of the head. The Venus de' Medici represents the simplest form of this head dress.

CORYPHENA, kōr-i-fē’nā, a genus of fishes of the family Coryphaenidae, related to the mackerels. The body is elongated, compressed and covered with small scales, and the dorsal fin extends the whole length of the back, or nearly so. The dolphin of the ancients is the C. hippurus. All the species, natives of the seas of warm climates, are very rapid in their motions, and very voracious. They are of brilliant colors and are objects of admiration to every voyager.

CORYPHÆUS, kōr-i-fē’s, the leader of the chorus in the ancient dramas. His functions, however, were often as wide as those of our stage-manager, conductor and ballet-master. The name is now applied to the leaders of the different parts in operatic ensembles, or the principal dancers in the corps de ballet. By extension it is also applied to those eminent in the arts or sciences.

CORYPHODON, kō-rif’ō-dō’n, a fossil ungulate of the extinct order Amblypoda (q.v.), found in the Lower Eocene sediments of Europe and America. The bone is short and post-like, somewhat like that of elephants, while the head resembled rather that of a hippopotamus with large flaring front teeth covered by a broad bony muzzle, and the skeleton had many archaic and peculiar characters. The coryphodon was the largest land animal of its time, intermediate in size between the tapir and rhinoceros. A mounted skeleton has been erected in the American Museum of Natural History, New York.

CORYZA (Gr. κορυζα, "catarrh"), a cold in the head. See Catarrh.

COS, or KOS, island belonging to Turkey; situated off the southwest coast of Asia Minor, in the Ægean Sea; length about 25 miles; area about 110 square miles. It is noted as the birthplace of Hippocrates and Pliocmy II, sur- named Philadelphia, and it claims the honor of being the birthplace of the Greek Muses. The surface rises partly into rugged hills, but a considerable portion is fertile and well cultivated, yielding grapes, oranges, olives, pomegranates, etc. The modern town of Cos is well built, and contains a large quadrangular fortress erected by the Knights of Rhodes in the 14th century. The harbor is now so filled up that only small vessels can enter. In the lliad we find mention of this island as one of the allies of the Greeks. Later it was annexed to the Dorian Hexapolis. It changed hands many times until its capture by the Turks in 1523. In 1912 it was captured by the Italians but restored in the same year to the Turks with the other Ægean Islands. During the Balkan War, a movement was pushed for the union of Cos with the Greek kingdom. By the Treaty of London 30 May 1913, the Ægean Islands was left to the Powers; the Italian occupation of Cos continuing for the time being. In Cos was manufactured a fine, semi-transparent kind of silk, much valued by the ancients. Pop. about 10,000.

COSALITE, an important bismuth ore containing 42 per cent of that metal with formula PbBiS. Occurs in Colorado, Utah and Washington.

COSCINOMANCY, or COSKINOMANCY, a kind of divination effected by means of a sieve, which was either suspended or fixed on the point of a pair of shears. The diviner then uttered a certain formula, and repeated the names of any persons suspected of a crime. If the sieve moved at the mention of any name, that person was considered guilty.

COSEQUINA, kō-sē-gwē’nā, a volcano in the western part of Nicaragua on a peninsula south of the Gulf of Fonseca. The mountain is cone-shaped and 4,000 feet high. It is remarkable on account of the eruption of 1835, beginning 20 January and lasting three days. The country within 100 miles was darkened by the cloud of ashes, and ashes were carried as far as Jamaica and Mexico. The volcano is now quiescent.

COSSEL, or KOSSEL, Germany, capital of a district of Silesia, Prussia, on the Oder, at the confluence of the Kladnitz, 25 miles southeast of Oppeln. It is a garrison town, has a castle, and was formerly surrounded by walls, the site of which has been converted into boulevards. A fine monument commemorates the funeral siege by the Swedes in 1807. The town manufactures celluloid, lumber, flour, malt, beer, bricks and refined petroleum. It was the capital of a former duchy in the 14th century. Pop. 7,832.

COSELEY, kōz’lē, England, town in Staffordshire, within the parliamentary boundaries of the borough of Wolverhampton, eight miles northwest of Birmingham. There are iron foundries, nail, hook, chain and screw works, stove-grate manufactories, cement works, malting establishments and brick-fields. There are extensive iron and coal mines in the district. Pop. 22,834.

COSENZA, kō-sēn’sā (anciently, Cosen- tia), Italy, city of the southern part, capital of the province of Cosenza (Calabria Citeriore), situated on seven small hills, at the foot of the Apennines, where the Busento joins the Crati, 150 miles southeast of Naples. The metropolitan is the only church within the walls; but there are three parish churches in the suburbs. The cathedral, of the 13th century which has been restored, contains the tombs of Louis III
of Anjou and Isabella, consort of Philip III of France. In the public gardens are a figure of Liberty by Giuseppe Pacchioni, erected to those who took part in the Calabrian rebellion of 1844, and busts of Garibaldi, Cavour and Mazzini. It contains one technical school, two academies of science and fine arts and one college. The environs are beautiful, populous and well cultivated, producing abundance of corn, fruit, oil, wine and silk. It manufactures faience, iron and steel ware. This town was anciently the capital of the Bruttii, and a place of consequence in the Second Punic War. It is supposedly the burial place of Alaric, king of the Visigoths. Cosenza has frequently suffered from earthquakes, particularly in the years 1638, 1783, 1854 and 1870. Pop. about 20,000.

COSHOCTON, kō-shōkˈtən, Ohio, city and county-seat of Coshocton County, situated on the Muskingum River, on the Ohio Canal and on the New York, Ohio and Pennsylvania Railroad, 69 miles northeast of Columbus. The city has four large advertising and sign manufactories employing about 1,000 hands, machine-shops, pipe works, automobile, furniture and glass factories, potteries, flour-mills, iron and steel works and a paper-mill. There is an abundant supply of gas, iron and coal nearby. There are three banks, with a combined capital of $225,000. There are four public schools, and an excellent public library, and 10 church edifices. Settled in 1811, Coshocton became a borough in 1848, and a city in 1902. Municipal affairs are administered by a mayor and council of seven members, elected biennially. The city owns and operates its waterworks. Here after a long struggle, Colonel Boquet concluded a treaty with the Delaware Indians in 1765. Pop. 10,000.

COSMATI FAMILY, a family of architects and sculptors who flourished in Rome from the last half of the 12th century to the beginning of the 14th, who are known principally through their inscriptions. The more popular members of the family were: Nicola (12th century), Giovanni (12th century), Leonardo (12th century), Simone (12th century), Agostino (12th century), Andrea (12th century), Guglielmo (12th century), and many others. The Cosmati were noted for their skill in mosaic work, and many of their works can be found in Rome, particularly in the Lateran Palace and the Vatican. Their works were often commissioned by the wealthy nobility and the papal court, and their style was characterized by intricate geometric patterns and a love for detail.

COSMIC DUST. See DUST.

COSMICAL GEOLOGY, or COSMOGONY, that branch of geology that treats of the origin of the earth and its relations to the rest of the solar system and to the universe in general. See COSMOGONY, and the section on Cosmogony in the article on Geology.

COSMOGONY. From the Greek κοσμογονία, meaning creation of the world. It is authenticated by Philolaus and Plutarch that Pythagoras himself used the word κοσμογονία, to denote the order of the world's constitution, and that it is derived from κόσμος, world, and γονία, origin; the word κοσμογονία, being first used as the title of a work by Parmenides (born 544 B.C.), who was the revered teacher of Plato. The term is now used to designate theories in regard to the origin and development of the solar and stellar systems, and the universe in general.

From the earliest ages the subject of cosmogony has been considered so important for human thought that, by way of poetry and allegory, it usually enters into the religious teachings of the Greeks, Egyptians, Persians and Hindus, in fact, it is almost as prevalent among primitive races as mythology and folklore, with which, in early literature, it is usually connected. The cosmogony of the Book of Genesis may be considered the most advanced development of Hebrew thought, as modified by the learning of the Chaldeans and Egyptians.

From the earliest ages the subject of cosmogony has been considered so important for human thought that, by way of poetry and allegory, it usually enters into the religious teachings of the Greeks, Egyptians, Persians and Hindus, in fact, it is almost as prevalent among primitive races as mythology and folklore, with which, in early literature, it is usually connected. The cosmogony of the Book of Genesis may be considered the most advanced development of Hebrew thought, as modified by the learning of the Chaldeans and Egyptians. Among the Greeks cosmogony was first treated by the poets in a very primitive manner, and as the extension of a science by the natural philosophers,—such as Thales, Anaximenes, Anaximander, Xenophanes, Parmenides, Empedocles, Anaxagoras, Plato and Aristotle. The highly artistic doc-
trine set forth in Plato’s *Timaeus* probably represents the highest development of Greek thought on this subject, though from a modern point of view the theories of the school of Atomists, founded by Leucippus and Democritus, are the most interesting because they predicted the development of vortices such as we find among the spiral or whirlpool nebulae, disclosed by modern astronomical observations. Thus the Greeks were the first to attempt to explain the origin and motions of the heavenly bodies, and how these motions originated; and we shall therefore pass over the other early writings and notice only the cosmogony of the Greek Atomists, since this alone approaches the requirements of modern astronomy.

In his *Outlines of the History of Greek Philosophy*, the late Prof. Edouard Zeller, of the University of Berlin, summarizes the views of the Atomistic School thus: "On account of their weight, all the atoms from eternity move downward in infinite space; but according to the Atomists, the larger and therefore heavier atoms fall more quickly than the smaller and lighter ones. Lighter than the heavier atoms, they are impelled upwards, and from the collision of these two motions, from the concussion and rebound of the atoms, a whirling movement is produced. In consequence of this, on the one hand the homogenous atoms are brought together; on the other, through the entanglement of variously shaped atoms, complexes of atoms, or worlds, segregated and eternally sundered, are formed. As motion has no beginning, and the mass of atoms and of empty space has no limits, there must always have been innumerable multitudes of such worlds existing under the most various conditions, and having the most various forms. Of these innumerable worlds our world is one."

(Cf. Zeller’s *Outlines*, p. 79.)

The theory of the Atomists here set forth is erroneous in ascribing the collisions to the more rapid fall of the heavier atoms; yet this accorded with the teachings of physics coming down from the time of Aristotle. This fallacious doctrine was retained by Ptolemy and other mathematicians, but must chiefly be ascribed to the discovery of the true law of accelerative force, under which heavy and light bodies fall with the same velocity. Leaving out of account this defect in physical theory, the Greek explanation of the system of the world is an excellent attempt of scientific character at explaining the motions of rotation and revolution noticed among the heavenly bodies.

DEVELOPMENT OF THE SOLAR SYSTEM.

**Laplace’s Nebular Hypothesis.**—Not long after Galileo’s invention of the telescope in 1610, and its application to the heavens by his immediate successors, it was found that the Sun and Mars were rotating on their axes, that Jupiter had equatorial belts and a system of four satellites whirling about that great planet, and that the planet Saturn was surrounded by the system of rings. The rotation of the earth on its axis had been taught by Aristarchus of Samos (who flourished about 270 B.C.), and was fully expounded by Copernicus, published in 1543. Similar rotatory motion of the other planets was now proved by the telescopic discoveries of Galileo. So many motions of rotation and of revolution naturally increased the complexity of the system of the world; and when philosophers began to cast about for the cause of these things, Kepler suspected that the rotation of the sun had some influence on the orbital motions of the planets. In fact, he thought that subtle spirits emanating from the surface of the sun had impressed themselves on the motions of the planets, so that they were carried around tangentially in the same direction. This is the earliest hint of the theory afterward developed by Kant and Laplace under the name of the "nebular hypothesis." The term nebule designates patches of luminous matter occurring in the sky and differing from the stars in that they present large surfaces of varying brilliancy instead of small definite points of light.

We shall not go into the details of the early history of the nebular hypothesis, beyond remarking that in various forms it was imperfectly outlined by Emanuel Swedenborg (1688-1772); more satisfactorily treated by Thomas Wright (1711-86), of Durham, England; Immanuel Kant (1724-1804), of Königsberg, Prussia; and finally put on a much sounder basis by the telescopic observations of Sir William Herschel (1738-1822), and the mathematical genius and dynamical judgment of the great French astronomer Laplace (1749-1827). Swedenborg’s Cosmogony was the earliest, 1734. Wright’s work dates from 1750; Kant’s from 1755, and he acknowledges his indebtedness to Wright; Herschel’s from 1791, after years of mature observations on nebulae; while Laplace’s theory of 1796 was the outcome of a quarter of a century of profound study of the mechanics of the solar system.

On account of the great mathematical prestige of the illustrious author of the *Mécanique Céleste*, it was natural that Laplace’s theory should be the one most generally accepted by men of science. According to this view the matter now constituting the sun and planets was originally diffused into an oblate planetary nebula. Sir William Herschel had recently observed and catalogued great numbers of planetary nebulae throughout the sidereal universe. To Galilei’s discovery of the law of accelerative force, under which heavy and light bodies fall with the same velocity, leaving out of account this defect in physical theory, the Greek explanation of the system of the world is an excellent attempt of scientific character at explaining the motions of rotation and revolution noticed among the heavenly bodies.

The satellites were explained in the same way, by the condensation of rings of vapor imagined to have been thrown off from the several planets, as they cooled and contracted and accelerated correspondingly their velocity of axial rotation.

In very brief outline this is the celebrated nebular hypothesis of Laplace, which has exerted so great an influence on philosophic thought for more than a hundred years, and in some form or other it enters into all the books on astronomy, as giving the best available explanation of the origin of the solar system; and it will be shown below that the "hypothesis of detachment" postulated by Laplace is entirely er-
COSMOGONY

Raneous, and will have to be supplanted by a very different theory.

Before considering certain grave errors in the theory of Laplace, it may be remarked that Sir Isaac Newton had given much thought to the motions of the planets and satellites, especially remarking on the beautiful, orderly and symmetrical arrangement of the solar system; but he was unable to explain the orderly movements of these bodies, except by supposing that they had been set revolving in their orbits by the immediate hand of the Deity. Laplace's theory had the great advantage, from a scientific point of view, that for a theological it substituted a mechanical explanation of the motions of the planets, in harmony with Herschel's observations of the nebula. Notwithstanding the fundamental error involved in the theory of detachment, the nebular hypothesis as a whole has guided our thought pretty much up to the present time. Yet the difficulties encountered by the theory of Laplace have steadily increased, and of late years became so overwhelming that the old conceptions of rings detached by rotation have had to be entirely abandoned.

As the solar system was held to have resulted from the condensation of a globular or planetary nebula, the subject of the nebular hypothesis is closely connected historically with the gravitational theory of the sun's heat. For a long time it was assumed by investigators that the sun was originally expanded into a nebula filling the planetary orbits, and rotating in equilibrium under the hydrostatic pressure and attraction of its parts. In order to keep this figure of equilibrium the temperature would have had to be enormous, and such a temperature really could not be maintained, owing to the extreme tenuity of the hypothetical nebula. For when the nebula extended to Neptune's orbit the average density would be 260,000,000 times less than that of atmospheric air at sea-level; and such a tenuous medium could exert no hydrostatic pressure from the centre outwards, for detaching the planets by inertial centrifugal forces under acceleration of rotation, as imagined by Laplace. This criticism against Laplace's theory was urged by Kirkwood and Peirce over 40 years ago, and such an objection is valid and convincing; but as there was no other suggested way in which the planetary bodies could be started revolving in their nearly circular orbits, it was not doubted that such detachment had occurred.

In 1861 the French physicist, Babinet, pointed out a fatal weakness of Laplace's theory which is now usually known as Babinet's criterion. It is based on the mechanical principle of the conservation of areas, so much applied by Laplace and other investigators since Newton's proof of the constancy of the areas described by any system of particles contracting and accelerating its rotation under central forces. It readily follows from this principle that whatever changes may take place in the system, its whole quantity of rotation must remain constant; by this is meant that if the mass of each particle of the system is multiplied by the square of its distance from the central axis of rotation, and also by its angular velocity, and if all the products thus obtained for the particles are added together, the sum will remain forever constant. Now it is possible to obtain a quite approximate value for this sum derived from the actual system as we see it today, for the masses of its various parts, their distances from the central axis, and their observed angular velocities of motion are all known. Having found this quantity, we may proceed to test the Laplacian hypothesis in a great variety of ways, many of which lead to necessary assumptions which are not only quite incredible, but in some cases impossible.

For example, we may readily determine the period of rotation of the solar nebula when it extended outward to each of the planets successively; by so doing we obtain the results given in the following table:

<table>
<thead>
<tr>
<th>Planet</th>
<th>Observed period of planet</th>

It will at once be noticed how greatly the numbers of the third column exceed those of the second. Should we suppose that Neptune, for example, could have been formed in this way it would be necessary to assume that the period of its ring was diminished from nearly 3,000,000 to but 165 years, notwithstanding that we can recognize no imaginable cause which could produce this diminution.

Babinet's criterion furnishes us with several other tests of some of the greatest magnitude more conclusive than this, of the impossibility of the material from which the planets are formed having been abandoned by the original nebula in the form of rings. If, overlooking these, we admit that a ring were abandoned, it can be shown that so far from the material of the ring ultimately being gathered into a single mass, the tidal action of the central portion of the cloud would separate and scatter it, so that a ring would not even start to gather into a planet. But further than this, it can be shown that even if the greater part of the ring could be gathered into a single planet, it would be quite impossible for this mass to gather to itself the remaining parts of the ring.

We have thus considered the Laplacian hypothesis somewhat fully because of its historical importance and because for so long a time it was regarded as furnishing a very probable outline of the successive steps by which our solar system developed from the original nebula into its present form. It should not be overlooked, however, that the much less importance ascribed to this theory by its originator than by his followers, who, attracted by its completeness and seeming simplicity, raised it almost to the position of a proved and fundamental doctrine.
Laplace himself, a master of rigorous mathematical deduction, could not have been deceived as to the weakness of its foundation. Indeed, he himself, at the outset, would (in his own words) was advanced "with that distrust which everything ought to inspire that is not a result of observation or of calculation."

**Modern Hypotheses.**—In all modern hypotheses as to the development of the solar system it is recognized at the outset that the original nebula must have been of a very heterogeneous structure. Its material in the beginning may have been arranged in a more or less spiral form, the curved branches extending outward from a common centre, and thus resembling the thousands of spiral nebulae seen in the sky, but whether this be so or not, it is assumed that there existed here and there throughout the cloud many smaller clouds, or knots, of the nebulous material, denser than the nebula immediately surrounding them. The original nebula is supposed to have been a great cloud, composed of meteorites or meteoric particles, cosmic dust, gases, and probably some matter in a radiant condition; in short, to have had the composition and structure possessed by the same class of nebulae which we see in the sky. The whole meteoric cloud thus constitutes a Resisting Medium, through which its separate particles and the denser clouds within it must necessarily move. The question concerning what such a heterogeneous cloud will develop into as it shrinks together under its own gravitation has recently received a great deal of attention from certain astronomers. The result of a most thorough mathematical analysis is to indicate that the outcome must be a solar system more or less closely resembling our own. The analysis has been applied, not only to a broad outline of the development of the system as a whole, but also to the separate planet-satellite systems, the rings of Saturn, the retrograde or apparently too rapid motions of certain satellites, and even to the reason for the present situations and rotations of the planets, for all of which it seems to account in a satisfactory manner. The principal contributions to this line of research are to be found by the reader as follows: Thomas C. Chamberlain and F. R. Moulton, 'Year-book No. 3' of the Carnegie Institution of Washington; *The Astrophysical Journal* (Vol. XXII, 1905); See, T. J., 'Evolution of the Stellar System' (Vol. II, Lynn, Mass.), and numerous papers in the *Astronomische Nachrichten* and the *Journal of the American Philosophical Society*. By the former authors, the new theory is called the Planetary System; the separate particles of the original nebula being called Planetesimals; by the latter it is named the Capture Theory, attention being thus drawn to the fact that the lesser bodies of the completed system, instead of having originally formed a part of the central body and having afterward separated from it, were actually drawn nearer to this body from without, and so in a sense *captured.*

In the present article we can only indicate in brief an outline the successive steps of the development which the original nebula underwent.

In the first place, any separate particle or any cloud of particles in the original nebula will (unless there is no motion at all) find itself moving, not in empty space, but in a resisting medium. It can readily be shown by mathematics that the certain effect of this resistance will be to cause the particle to fall continually nearer the centre, where it gathers up and adds to itself much of the material through which it moves, until finally, if the resisting medium extends quite to the centre, the particle or cloud will fall onto the central mass and become a part of it. Thus the central mass will continually grow by the absorption of a great part of the cloud around it, nor will this action cease until the resisting material has been quite completely swept away.

There will thus come a time when the nebula has been replaced by a dense, central, nebulous mass, around which a greater or less number of smaller clouds or swarms are revolving in a region which still contains a considerable amount of resisting material. And these smaller clouds will all move around the central cloud in the same direction, which will be that of the general rotation of the original nebula as a whole, for it can be shown that such bodies as began to move in a contrary direction, when the resistance was high, must have been speedily blown away from the central mass. Investigation shows that a second effect of a resisting medium must be to diminish the eccentricity (or increase the roundness), of the paths in which the bodies are moving. Thus the lesser clouds must steadily drop nearer the centre, their orbits at the same time becoming continually rounder, until they attain a region which has been swept clear, or nearly so, of resisting material. The contraction of each smaller cloud into a planet with a possible system of satellites is explained by an exactly similar course of reasoning.

It is thus from the lesser clouds, or portions of greater condensation in the original nebula, that the planets have originated, and each has acquired a greater or less size according as its cloud in passing through the resisting medium has gathered up and added to itself a greater or less amount of this material. It can be shown that in whatever manner a small cloud may have been originally rotating, the effect of its collisions with the scanty solid matter with which it moves will be to give it a forward rotation; that is, one in the same direction as its own motion around the central mass. And the more collisions it has sustained, and hence the larger it has grown, the more rapid should we expect its rotation to become. This is in accordance with what is observed in the solar system, where Jupiter and Saturn rotate in less than half the time of the small planets. A similar investigation shows that all satellites formed near the smaller clouds, while the system was still young, should have small and rounded orbits, and their motion should be direct, but that there may also be more distant satellites moving in a retrograde direction in orbits which are highly eccentric.

**The Origin of Spiral Nebulas.**—A theory has been advanced, and quite fully developed from a mathematical standpoint, to account for the existence of spiral nebule in general, and in particular for that of the original solar nebula, which is thus supposed to have had a spiral form. It is supposed that these nebulae are caused by the close approach, or even by the actual collision, of two suns, for it can be shown that if such a close approach occurs the
enormous gravitational attraction may tear one or both of these bodies apart into a roughly two-branched cloud, whose arms under the pull of the passing body may be drawn into curves strikingly similar to the outlines of certain of the well-known spiral nebula. But there are grave and apparently insuperable objections to this hypothesis. In the first place, where the stars are most thickly gathered together (that is, in the direction of the Milky Way), almost none of these nebulae are found. It is here that the so-called New Stars predominate, but spiral nebula are almost wholly confined to outside regions where the stars are few and the probability of a collision, or even of a near approach, of two suns is almost infinitely small. Moreover it is certain that the spiral nebula seen in the sky are of enormous size. Though the spectroscope shows that they are moving through space with speeds which range from 200 to 700 miles a second, they are so distant that even these great nations have not displaced them appreciably on the sky (except perhaps, on one instance), when measured which are separated by many years are compared. In many cases they must have thousands of times the extent of our solar system. Indeed, some astronomers believe that these nebulae, so far from being true nebulae, are, in reality, clusters of the most distant stars.

It is not indeed unlikely that any rotating nebula would as it contracted assume a more or less spiral form, and this may with some probability be assumed to have been the form of the prototype of the solar system. But the assumption of this, or of any other definite form, for the original nebula in no way affects the modern theory of the development of the solar system which has just been discussed.

The Earth-Moon System.—In the general process of evolution above described there are several local and minor modifications which must be made the subject of special inquiry. The system of our earth and moon, for example, is wholly unlike that of any of the other planet-satellite systems, for while in these the moon is in all respects similar to the planet, our own moon is comparable in size with the earth and is indeed so large that it is perhaps better to regard these bodies as forming a sort of double-earth system than a planet attended by a satellite. It is uncertain whether the earth and moon originally formed a single body which afterward separated into two, or whether they separately condensed from neighboring clouds of the original nebula, the moon later being drawn nearer to the earth and its orbit rounded by the action of the resisting medium. The former theory has been very fully investigated both by Poincaré and Darwin, and though the methods of attack in the two cases were wholly different, the results are in remarkable agreement. By the former astronomer the development of a rotating, tenuous mass, or cloud, was examined: it was shown mathematically that if the velocity of rotation exceeded a certain limit, two separate centres of condensation would appear within the rotating mass. As these separated the mass would take a pear-shaped form: the constriction around the neck of the pear increasing, there would finally result two bodies almost in contact revolving about their common centre of gravity. At this time the length of the month must have been equal to the time of rotation of the earth; it has since been greatly lengthened by the enormous bodily tides which the two closely adjacent, plastic masses must have raised in each other, for it can be demonstrated that the effect of these tides is to rapidly push the two bodies apart and also to reduce the speed of rotation of each of them. The original energy of rotation of the moon being much less than that of the earth, its relative rotation was thus completely destroyed, so that now it turns almost the same face toward us. In the same manner the relative rotation of Mercury with reference to the sun has been destroyed by the bodily tides produced on the planet while it was still in a nebulous or plastic condition.

Double-star Systems.—Whether the earth and moon originally formed one body which afterward separated into two through excess of rotation, followed by the action of bodily tides, is subject to grave doubt, but there is but little doubt that the evolution of double-star systems has taken place in substantial accordance with this theory. For here are abundant examples of two suns of approximately equal mass revolving about one another with their surfaces almost in contact, and it is most significant that in every such known case the spectrum of the system is that of the distant stars.

The densities of these pairs are also very low, and on the whole it cannot be doubted that they represent a very early stage of the system's development. When we pass to a consideration of the wider (visual), double-star systems it is found that the circularity of the orbits has disappeared and that the stars have aged to later spectral types. It can be shown mathematically that the continued effect of tidal action is not only to push the bodies farther apart but also to increase the eccentricities (that is, to diminish the roundness) of the orbits.

We have thus apparently found a true and satisfactory account of the genesis and development of many of the double-star systems. But it should be added that there are many examples of unconnected stars which move through space together, and which therefore belong to one system, but which are separated by distances so vast that it is quite inconceivable that any form of tidal action could have been effective in pushing them apart from a single body. The periods of such pairs are double stars to be reckoned in tens, or even in hundreds, of thousands of years. It is reasonable to suppose that the common motion observed in these cases is merely the original motion of the nebula from which they, and perhaps other stars of the same stream, were a part. But when this explanation is to be replaced by that one which, as we have seen, accounts so fully for the development of closer pairs, we are not able to say.

Development of the Stars.—It is universally believed by astronomers that the stars have developed from nebula, but the exact mode of this development, and especially a knowledge of precisely what is taking place in certain phases of the nebula, is very uncertain. Roughly speaking, the known nebula can be divided into four great classes: (1) The vastly extended, faintly shining, very irregular, nebulous clouds, of which the nebula in Orion is a well-known example; (2) the small, round,
planetary nebulae, which frequently have a condensed nucleus in the centre; (3) the hazy, nebulose stars; and (4) the great host of Spiral nebulae, which far exceed in number all others combined. It is a remarkable fact, thus far quite unexplained, that while the first three classes are most numerous in the neighborhood of the Milky Way, the spiral nebulae are almost wholly wanting in this region but are found by tens of thousands in the most vacant areas of the sky.

It is probable that the first class of nebulae represent the simplest form of inorganic substance known to us. Whether these inconceivably extended and tenuous clouds can under their own gravity become denser clouds, from which ultimately even stars may develop, we do not know. It is believed by some astronomers that certain of them, as, for example, the faint nebulosity in the Pleiades and the nebulose streams, are made up of inconceivably small particles, or ions, which have been repelled from hot stars, and thus are in a sense a diminution or reversion to the course of the general stellar evolution. The spiral nebulae are of such great size that it is doubtful whether the smallest of them visible to us could develop into a solar system more or less closely resembling our own. It seems more probable that from these a star stream, or even a star cluster, containing multitudes of stars, will eventually be produced.

All observation leads us to the conclusion that the majority of the nebulae are of a heterogeneous structure; that is, they are very far from being of a uniform density throughout their extent. It is not unreasonable to suppose that much of their material may condense into solid bodies, or meteoric particles, before the general development has proceeded far toward a condensation into many separate star centres. But this possibility has no important bearing upon the general history of the system's development. And whether the nebula is of so great extent that it develops into a multitude of suns or whether it is so very small that there results but one, the fact that the growth of each sun takes place in a resisting medium leads us to the conclusion that some of the nebulous matter will escape being drawn into the centre but will be left revolving around the central sun. Accordingly, it appears to us very probable that a vast number of the stars have worlds revolving around them and that our solar system is not unique in this respect.

T. J. J. See.

Revised by ERIC DOOLITTLE, Professor of Astronomy and Director of the Flower Astro-nomical Observatory.

COSMORAMA, a species of picturesque exhibition, consisting of 8 or 10 colored drawings, executed in body colors, laid horizontally around a semi-circular table, and reflected in mirrors placed diagonally opposite to them. The spectator looks at them through convex lenses placed immediately in front of each mirror. The exhibition takes place by lamplight only, and the lamps are so placed as not to be reflected in the fields of the mirror. The views exhibited are generally copies made from engraved views, such as those of Piranesi, De Nou, Le Bruyer and other artists. The pictures are thus seen not only enlarged but in perspective.

COSMOS, about 20 species of annual and perennial herbs of the natural order Compositae. They are natives mostly of Mexico, whence several have been introduced into gardens for their bright flower-heads, which appear in late summer and during the autumn. They are rather tall plants with opposite pinnate, entire, or lobed leaves, and typically, red or purple flowers (yellow in one species), but in horticultural varieties white and other colors. Their long flower-stems make the plants useful for bouquets. Cosmos is especially popular in the United States because it is easily grown from seeds started in hotbeds, and because it thrives upon almost any garden soil and with the most ordinary care. The cultivated forms are derived mostly from C. sulphureus and C. bipinnatus, the former of which often exceeds eight feet in height, the latter rarely more than four feet. The flowers are often more than two and a half inches in diameter. C. diversifolius, sometimes called black cosmos, is widely known as a Doldka, or a Bidens, and seems to belong on the border line between these genera. Probably no plant introduced into ornamental cultivation during the closing years of the 19th century offers such possibilities of improvement as cosmos. Since 1885, when there were few distinct varieties, so much improvement has been wrought that plant breeders are very hopeful. Comparing the typical species of chrysanthemum with its improved varieties will give an idea of what may possibly be accomplished with cosmos.

COSMOS. In the four volumes of Cosmose, Alexander von Humboldt laid the foundations of modern physical geography and meteorology in their larger aspects. Begun in 1843, when the author was already 74, the work represented the slowly matured results of explorations made between 1799 and 1804 on the Atlantic, in Tenerife, South America, Mexico and the United States, supplemented by extensive though rapid journeys in Russia and Siberia in 1829. It happily united the philosophic, though often vague generalizing of the 18th century, with the 19th's demand for precision in detail and showed the author supreme as day as co-ordinator of the great facts of plastic geography, climatology, terrestrial magnetism, the distribution of volcanoes, plants, animals and races, and a genial investigator into social and linguistic origins. The purpose of the book was, Humboldt said, "to comprehend the phenomena of physical objects in their general connection and to represent nature as one great whole moved and animated by internal forces." Volume I (1845) gives, after a nobly conceived introduction of the study, a general review of natural phenomena in general and hints to incidents to the study of nature and a history of the physical sciences; Vol. III (1850, III and IV of the English translation) the results of observations of cosmic phenomena; Vol. IV (1858, Vol. V of the English translation) those of telluric phenomena. Parts of an unfinished fifth volume appeared in 1862. The style of 'Cosmos' is at times labored. One feels that Humboldt is not quite expressing his own conception of the dignity of his theme; but his descriptions of South American scenes
are often powerful and his imaginative generalizations illuminating. The successive volumes of 'Cosmos' were translated on their appearance into most European languages. A German edition commemorating the Humboldt centenary was issued in Philadelphia in 1869. The influence of 'Cosmos' not alone on scientific thought but on the popular attitude toward science has been very great. Consult Stoddard, R. H., 'Life Travels and Books of Alexander von Humboldt' (1860).

Benjamin W. Wells.

Cosoryx, a genus of antelope-deer (see Ruminants; Fossils) allied to Mercuras (q.v.), but with antlers of two equal sizes. It is found fossil in the Miocene bad lands of the western United States, and is thought to be ancestral to the modern pronghorn antelope.

Cosquin, kô-skôn. Emmanuel, a French folklorist: b. at Vitry-le-François in 1841. His 'Contes Populaires de Lorraine' (1886) is his most important contribution to letters on account of its bearing on folklore. He has contributed many articles to Le français Catholic and conservative journal; and has translated into French the works of Joseph Fessler: 'La Vraie et la Fausse Infallibilité des Papes' (1873), and 'Le Concile du Vatican' (1877).

Cossa, kô-sâ. Francesco, Italian painter: fl. 1470. He lived first in Ferrara, and is considered one of the founders of the Ferrarese School of Painting; after 1470 he lived in Bologna, where he and his contemporary, Ercole Roberti, are said to have been the founders of the Bolognese School. His works include 'Madonna with Saint' (at Bologna), and frescoes in the Schifanoia Palace at Ferrara, which are remarkable alike for their fidelity to nature and their splendid studies of costume. The Berlin Museum and the Johnston collection, Philadelphia, have representative pictures by him. Consult Berenson, 'North Italian Painters of the Renaissance' (New York 1907).

Cossa, Luigi, an Italian writer on political economy: b. at Milan in 1831; d. 1896. He was graduated from the University of Pavia in 1853, was for a time a doctor of law, and continued his studies in economics at Vienna and Leipzig, and, in 1858, became professor of political economy at his Alma Mater, and later at Milan. He is the author of 'Guida allo studio del' economia politica' (3d Ital. ed., 1896; Eng. trans. 1893), 'Primi rimenti di economia politica' (10th ed., 1895, 3 vols., of which the third volume, 'Taxation,' was translated into English in 1888).

Cossa, Pietro, an Italian dramatic poet: b. at Rome in 1834; d. at Leghorn 1881. He went to South America following the political events of 1840: but, returning to Rome, he taught Italian literature at one of the technical schools. A series of dramas having for their themes the stories of ancient and modern Rome comprises his main success in literature. These are 'Nerone' (1871); 'Plauto il suo Scontro' (1875); 'Macrina' (1876); 'Chopatra' (1879); 'Borgia' (1878); 'Cecilia' (Giorgione's mistress), (1878). His best play is the 'Nerone,' an English version of which by F. E. Trollope, appeared at Rome in 1881. His 'Teatro Poetico,' in seven volumes, was published at Turin (1877-85), and a volume of lyrics in 1876. Consult Trevisani, 'P. Cossa' (1885), and Arcari, 'I P. Cossa e del dramma in Italia' (1899); Mazzoni, 'L'Ottocento' (Milan); Fromental, 'P. Cossa in Antologia' (1881); 'Works' (Turin 1887).

Cossacks, tribes who inhabit the southern and eastern part of Russia, paying no taxes, but performing instead the duty of soldiers. Nearly all of them belong to the Greco-Roman Church, to which they are strongly attached, and to the observances of which they are particularly attentive. They must be divided into two principal classes, both on account of their descent and their present condition -- the Cossacks of Little Russia and those of the Don. Both classes, and especially those of the Don, have collateral branches, distributed as Cossacks of the Azov, of the Danube, of the Black Sea, of the Caucasus, of the Ural, of Orenburg, of Siberia, of the Chinese frontiers and of Astrakhan. Writers are not agreed as to the origin of this people and of their languages, which are believed to be of mixed Caucasian and Tartar race. In personal appearance the Cossacks bear a close resemblance to the Russians, but are of a more slender make, and have features which are decidedly more handsome and expressive. Generally speaking, they are better educated than their Russian fellow subjects.

Originally their government formed a kind of democracy, at the head of which was a chief or hetman of their own choice; while under him was a long series of officers, with jurisdictions of greater or less extent, partly civil and partly military, all so arranged as to be able on any emergency to furnish the largest military array on the shortest notice. The democratic part of the constitution has gradually disappeared under Russian domination. The title of chief hetman is now vested in the heir-apparent to the throne, and all the subordinate hetaems and other officers are appointed by the Crown. Care, however, has been taken not to interfere with any arrangements which preserve the military spirit of the Cossacks. Each Cossack is liable to military service from the age of 18 to 50 and is obliged to furnish his own horse. They furnish the empire with one of the most valuable elements in its national army, forming a first-class irregular cavalry, renowned for excellent service as scouts and skirmishers. In 1570 they built their principal 'stanița' and rendezvous, called Tcherkask, on the Don, not far above its mouth. As it was rendered unhealthy by the overflowing of the island on which it stood, New Tcherkask was founded in 1895 some miles from the old city to which nearly all the inhabitants removed. This forms the capital of the country of the Don Cossacks, which constitutes a government of Russia, and has an area of 63,532 square miles and a population estimated in 1912 at 3,591,000, 98 per cent of whom are Cossacks. It has a military organization of its own.

Service begins at the age of 18 and lasts 17 years. All Cossacks able to serve belong, without age limit, to the "National Defense." Their war strength is said to be about 5,000 officers and 175,000 men, with more than 170,000 horses, and a reserve force of over 300,000 officers and men in case of emergency. About 88 per cent are Christians out of the whole population living on land.
assigned to the Cossacks. The non-Christian element is principally composed of Mohammedans; the Kazakh lands cover an area of about 229,000 square miles. Their principal industry is agriculture and the breeding of horses and cattle. They are also greatly interested in the fisheries of the Don, Ural and Caspian, the vine-culture of the Caucasians and the beekeeping of various districts.

The Don Cossacks have a regular history from 1554. In 1792 the Cossacks of the Cuban or Black Sea (Chernomorski) were formed; and other Cossack lines were subsequently established on the lower Volga, on the Terke, on the Ural River, in western Siberia, in the Transvaal territory, in the government of Irkutsk, on the Amur, etc. The present military organization dates from Peter the Great; and their adoption of a thoroughly settled life, with its modern characteristics, is largely due to the government of that monarch and of Catherine II assisted by the ordinances of Nicholas I in 1835, of Alexander II in 1875 and of Alexander III.

The name Cossacks (Kazakhu) is a name signifying the original character of these people, who were "treebooters" according to the Turkish idea. The name Kazak was given by the Byzantine Emperor Constantine VII, Porphyrogenitus, to the Circassians and is still in use (for the same people) among the Georgians. Consult Khoroschin and Von Stein's "Die Russischen Kosakenheere" (in Petermann's "Mitteilungen"); Gogol's "Taras Bulba"; and Byron's "Mazeppa" (1820).

Cossacks, kôs-saks, The, a story by Tolstoi, published 1852. Volpi, is a series of picturesque studies on the life of the Cossacks of the Terek, rather than a romance. The story is particularly interesting as showing the first germs of the altruistic philosophy which Count Tolstoi has developed into a vigorous system of self-renunciation.

Cosse, kôs-so, Charles de, Comte de Bassac, French marshal: b. Anjou about 1505; d. Paris, 31 Dec. 1563. He served with success in the Neapolitan and Piedmontese wars and distinguished himself as colonel in the battle of Perpignan in 1541. He rose to the rank of grand master of artillery of France and subsequently obtained the office of governor of Piedmont, and the baton of marshal of France in 1550. He afterward returned to France as governor of Picardy, and rendered that province important services.

Cosso, kôs-so, Aluigi, Italian clergyman and educator, b. Cividale del Friuli 1874. He was educated at the Seminary of Udine and at the universities of Padua and Freiburg. He also studied at Tübingen, Stuttgart and Fribourg, Switzerland. He was ordained to the priesthood in 1807; served at various times as missionary to his countrymen in different parts of Europe, librarian of Saint Bede's College, Manchester, England, and Dante Society lecturer at Victoria University, Manchester. He was also successively professor of Christian archaeology and the history of art at Upholland College, before the Dante societies of Dublin, Liverpool, Manchester and Queen's College, London, and official of the Sacred Congregation of the Consistory, Rome. He later was appointed auditor of the Apostolic

Delegation to the United States at Washington.

Cost accounting. See Accounting.

Costa, Alfonso Augusto, Portuguese statesman: b. Ceia, Guarda, 1871. He studied at Coimbra, receiving his doctor's degree in 1899, and in the following year became professor of law. Known as an eloquent speaker, he affiliated himself with the Republican party and was elected by a great majority deputy to the Cortes, in spite of the machinations of government agents, 26 Nov. 1899. The ministry annulled his election on a futile pretext, but in the new elections, 18 Feb. 1900, he was again triumphantly elected. In the Cortes, received as a recognized enemy of the monarchical régime, and he soon gave more than ample proof of his enmity by introducing, amid great protest, a resolution in the Cortes in which he proposed the abolition of the monarchy. After the fall of the ministry he failed to be re-elected, but threw himself enthusiastically into the preparations for the revolution which established the Republic in 1910. Under the new régime he became Minister of Justice, and in January 1913, Minister of Finance and Premier. The exiled Royalists in July 1913 made an attempt on his life, but he escaped with slight injuries; another plot to kill him in September 1913 was also frustrated. In March 1916 he became Minister of Finance in the Almeida Cabinet. Dr. Costa, more than any other one man, typifies the spirit of the new Republic of Portugal. He has written "Direito civil" (1896); "Economia politica" (1896-98); "Organização judiciaria" (1897-1901).

Costa, kôstâ, Isaac da, Dutch poet and theologian: b. Amsterdam, 14 Jan. 1796; d. 26 April 1860. He studied at Leyden, received the degree of Ph.D. in 1821. By parentage he was a Portuguese Jew, but he embraced Christianity in 1822 and became a professor and director of the Free Scotch Church Seminary. He was called to the Institute of Amsterdam in 1840, and soon acquired a high reputation both for his poetic and theological works. Poetry he continued to write up till 1857, when his last poem, the "Battle of Nieuwpoort," was published. Among his theological works are a "Refutation of Strauss"; "Life of Jesus." a "History of the Destinies of the People of Israel" (translated into English and German); "Considerations on the Spirit of the Age." The more noteworthy of his volumes of verse are "Prometheus" (1820); "Leaves" (1819); "Festive Songs" (1828); "Hagar" (1840). His poems were collected and published by Hasebrook (1861-62).

Costa, Lorenzo, Italian painter: b. Ferrara about 1460; d. Mantua, 5 March 1535. He studied with Cosimo Tura at his birthplace and was influenced at first by Ercole Roberti
and Francesco Cossa. He was employed to decorate the choir of the church of San Domenico in Ferrara, and was invited to the ducal court, where he painted a number of portraits of princes and nobles. Shortly afterward we find him at Ravenna, at Bologna, under the patronage of the Bentivoglio family, and there began his connection with Francis, with whom he worked as copainter. Here he executed a 'St. Sebastian Pierced by Arrows,' a 'Virgin,' and 'Saint James,' in 1502. At Mantua, the city to which he returned, whether he was invited by Francesco Gonzaga, he painted the greater number of the pictures in the palace, then being restored by that prince. He left behind him a reputation for keenness of observation, correctness in design and great simplicity and grandeur in form, together with harmonious grouping. Other works include 'Isabella d'Este Crowned by the Muse' (Louvre) and 'The Dead Christ' (Berlin Museum). The young Correggio, who accompanied him to Mantua, was his principal pupil. Consult Morelli, 'Italian Painters: Critical Studies of their Works' (translated by Constance Jocelyn Froukes, London 1892-93); Berenson, 'North Italian Painters of the Renaissance' (New York 1907); Gardner, 'The Painters of Ferrara' (London 1911).

COSTA-CABRAL, Antonio Bernardo da, Count of Tomar, Portuguese statesman; b. Figueira d'Alcântara, province of Beira, 9 March 1803; d. San Juan de Flor, 1 Sept. 1889. He received his education at the University of Coimbra. He became judge of the Supreme Court in Oporto and in Lisbon, and in 1835 was elected to the Chamber of Deputies, where he was at first one of the leaders of the Radicals and then of the Conservative party. He was chosen Prime Minister 7 March 1838, but relinquished this position two months afterward. In 1841, however, he was reinstated. His oppression and misgovernment resulted in his being driven from power 17 May 1846. In 1849, however, he was reappointed Prime Minister, but only to inaugurate a still more stringent dictatorship. Empowering the people by his unscrupulous system of expenditure, contracting new loans and imposing new taxes, the new régime became so irremediable that his own brother Sylva, a member of his cabinet as Minister of Justice, would not any longer serve under him, and became leader of the opposition in the Cortes, which body was now determined on his overthrow. In the meantime, however, Saldanha set on foot a revolution at Cintra, which spread rapidly over the whole kingdom, and put an end to Costa-Cabral's administration 26 Feb. 1851. Saldanha became Prime Minister of Portugal and Costa-Cabral fled to England. He was Ambassador to Brazil 1859-61. In 1862 he became a member of the Council of State and president of the Superior Administrative Court.

COSTA RICA. Physical Geography, Political Divisions and Population.—Costa Rica, a republic of Central America, is bounded by Nicaragua, the Caribbean Sea, Panama and the Pacific Ocean; area about 22,000 square miles. The republic is divided into seven provinces and these are subdivided into cantones, and the cantones into districts. Each canton has a municipal organization elected by the people; but the political chiefs of the cantons and the governors of the provinces are appointed by the president of the republic. The provinces are San José, Alajuela, Cartago, Heredia, Guanacaste, Puntarenas and Limón. The mountains do not form a continuous chain, but are divided into two main groups, that of the northwest and that of the southeast, the former including the volcanoes Izalco (11,200 feet), Turrialba (11,000 feet), Barba (9,335 feet) and Poas (8,606 feet). A Mauna Loa occurred in 1723, 1726, 1821, 1847, 1864 and 1869. The southeastern or Talmanca group, in which there are no signs of recent volcanic activity, includes the Buena Vista (10,800 feet), Chirripo Grande (11,850 feet) and Pico Blanco (9,650 feet). A transverse system, the Cordillera de Dota, below Cartago, renders communication between the northern and southern sections of the country exceedingly difficult. More than one half of the area of Costa Rica lies between 2,900 and 6,825 feet above the sea and is covered with virgin forests; the vegetation being so dense that it is almost impossible to penetrate the interior of these regions save by way of the rivers. From the coast to a height of 2,900 feet are tropical forests and savannas; above 6,800 or 6,900 feet, approximately, are the regions of oaks and chaparales, extending up to 9,800 feet; and subalpine or subandine flora characterize the regions between 9,800 feet and the tops of the highest mountains. The climate in general is healthful; fevers occurring only in regions of less than 150 feet elevation; but it varies greatly according to altitude. The coast lands and regions below 3,000 feet have a high temperature, ranging from 70° to 80° F. In consequence a torrid climate. The temperate zone lies between 3,000 and 7,500 feet and is very healthful with a mean temperature of about 62° F. Winds blow continually and are a great cause of discomfort in the dry season, December to May. The annual rainfall averages about 100 inches. The tapir, deer, puma, jaguar, armadillo, iguana and many varieties of monkeys are found in the forests, a few species peculiar to Costa Rica, while the rest belong as well to South or North America or both. Of avifauna there are 725 known species; of reptilia and batrachia over 130 species; and the species of fish are especially varied owing to the circumstance that those of the Pacific are almost wholly different from those of Caribbean waters. The flora is essentially tropical. There are mahogany, cedar, brazilwood, fistic oak and ebony in the forests. Coffee, bananas, maize and sugarcane are commonly cultivated. Rubber also is found.

On 31 Dec. 1915 the official estimated population was given as follows:

COSTA RICA

the date just mentioned, it had grown by 1915 to 430,701. In marked contrast with the other Central American states, Costa Rica's population, in the larger towns of the uplands, is almost entirely white. Only 3,500 Indians remained in 1916. The negroes (some 25,000 British West Indians) live near the coasts.

The obligation and "traditional" policy of Costa Rica is to solve its own problems and to avoid complications with other countries. The frontiers of modern Costa Rica (Panama) were to a certain extent determined by the award of the President of the French Republic as arbitrator, 11 Sept. 1900. President Loubet's decision extended the Colombian frontier to Punta Carreta on the Caribbean coast, thus depriving Costa Rica of extensive territory to which she laid claim. But there is still contention between the interested countries in regard to the interpretation of the terms of the award; and it is with this qualification that the estimate and the paragraph is offered. Previous estimates have varied between 23,000 and 34,000 square miles. On 20 Jan. 1902, a "Convention of Peace and Obligatory Arbitration" was signed at the Port of Corinto, Nicaragua, between the legations of Costa Rica, Nicaragua, Honduras and Salvador.

History.—An account of the Spanish settlements at the beginning of the 16th century is given in the article CENTRAL AMERICA. The Spanish Crown in 1540 established the province of Costa Rica; in 1569 and 1573 defined its frontiers; in 1562 appointed Juan Vasquez de Coronado military governor of Costa Rica and Veragua. The city of Cartago, until 1823 the capital, was founded by Coronado, but it was a city only in name. During the first century of the existence of the province no headway was made. The Indian tribes were the most intractable of their kind; white settlers were few. A brief period of comparative prosperity began when Captain-General Sandoval, in 1635-39, made a new port at Matina and opened a road from it to the capital. The value of cacao plantations near the road increased, and the eastern coast, as well as the Gulf of Nicoya, was visited by trading ships. But the buccaneers found upon the coast as soon as there was anything of value to be seized, and Indians completed the work of destruction. This wretched state of things continued throughout the 18th century. One hundred years ago Costa Rica was described as the most desolate, woful province in the whole Spanish empire. Its colonists, ignorant and indigent, "clothed with the bark of trees," had been reduced to this condition of misery through being cut off from communication with the outside world, and generation after generation and by century-long ravages of pirates from Europe and marauding bands of Indians from the Mosquito coast. But to-day the republic holds a leading position among Latin-American nations in regard to public instruction, and (except for the fortunately untarnished finances of the public finances) it can no longer be called a very poor country. Every Costa Rican who cares to do so can own valuable property of some sort, and the foreign commerce of the country is far from being contemptible. The change may be described in a few words.

Less than four months after proclaiming that Spanish control was at an end (15 Sept. 1821), Costa Rica with the other weak Central American states was drawn into a union with the Yturbe empire of Mexico. This dependence lasted until 1824, and then followed the experimental union of the Central American countries. But genuine independence began after 1830. Even in that time of extreme poverty the state acknowledged and declared that it could not postpone and would not shirk its duty to provide for the education of the people. During the first half of the 19th century commerce received a new impulse through the discovery of gold in the mountains near the Gulf of Nicoya, and the extension of coffee culture. Several of the Presidents holding office since 1824 have been eminently patriotic and far-seeing men, under whose guidance the graduates of Costa Rican schools have begun to appropriate some of the natural resources of the land, with little aid from immigration, though not without the aid of foreign capital. Immigration up to the present time has been small.

In 1907 Costa Rica and all the other Central American states sent delegates to a conference in session at Washington, D. C., from 14 November to 20 December. This conference decided, among other things (see CENTRAL AMERICA), to establish a Central American Court of Justice and a Central American "pedagogical institute," both to be located in Costa Rica. The delegates expressed the opinion that each republic should have the right to maintain, at the proposed normal college, not more than 200 students of both sexes and they agreed to send not less than 20 students of each sex. On 20 March 1910 Costa Rica and Panama signed a protocol setting forth the basis of fact for the arbitration of their boundary dispute by Chief Justice Fuller. In May, Ricardo Jiménez was inaugurated as President of the republic. An earthquake wrecked a large part of the city of Cartago, including the new Palace of Peace. The estimated loss of life was 1,800. In 1913 the President in his message stated that the government was particularly solicitous for the advancement of education. Although one-eighth of the total revenue of the state had been expended for schools and colleges in the preceding year, Congress was asked to increase the inheritance tax for the benefit of the School of Arts and Crafts and the hospital fund. Among the measures passed by the Congress was a law limiting the armed force of the President (the regular army) to 1,000 men in time of peace and 5,000 in time of public danger from insurrection, etc. President Alfredo González Flores, chosen for the term 1914 to 1918, was known to be the moving force responsible for legislation in favor of agriculturists and in defense of the rights and privileges of workingmen which engaged the attention of the Congress in 1915 and 1916. Costa Rica brought action in March 1916 against the violation of her rights under the canal treaty with the United States, and the Central American Court of Justice, on 5 May, gave decision in her favor. General Federico Tinoco, after a bloodless revolution in January 1917, overthrew the González government and proclaimed himself provisional President of Nicaragua. By instructions from Washington, the American minister to Costa Rica issued the
COSTA RICA

following statement to the people of Costa Rica 2 Feb. 1917:

"The government of the United States has viewed the recent was the established government of Costa Rica with the greatest concern, and considers that illegal acts of this character tend to disturb the peace of Central America and to undermine the unity of the American continent. In view of this policy in regard to the assumption of power through illegal methods, clear action was initiated by it on several occasions during the past four years, the government of the United States desires to set forth, in emphatic and distinct manner, the positions it has arrived at with respect to the actual situation in Costa Rica, which is that it will not give recognition or support to any government which may be established, unless it is thoroughly proven that it is elected by legal and constitutional means."

Government.—The legislative branch of the government consists of a single house, called the Constitutional Congress; its 43 deputies, who are chosen, one for every 15,000 inhabitants, for a term of four years, assemble each year for a 60 days' session which may be extended for 30 days. One-half of the deputies retire every two years. The term of the President, in whom is vested the chief executive power, is four years. Congress annually appoints three presidential substitutes called deputy secretaries of state and five other departments in charge of secretaries or ministers appointed by the President are six in number. An assistant secretary (subsecretary) assigned to an important bureau (for example, public instruction) reports directly to the Constitutional Congress. Judges also hold office for terms of four years. The main tribunals are the Supreme Court of Justice (11 justices) and two Appellate Courts (three magistrates each). Subordinate courts are established in the provinces. In the chief towns of each canton the alcaldes are judges of petty offenses, act as committing magistrates and have jurisdiction in the less important civil cases.

Education and Religion.—Elementary instruction of both sexes is by constitutional mandate compulsory and at the government's expense. The most recent statistics available (1915) show that about 35,000 children were enrolled as pupils in 419 elementary schools, controlled by local educational junta for whose support the government had paid a budget loan and imposed certain taxes. In these schools there were 1,489 teachers. Higher education is provided at several provincial institutes, and at the Liceo and Colegio Superior de Señoritas—both of the latter in the capital. There are schools of law and medicine, a national museum, a national library, the University of Santo Tomas and the Physico-Geographical and Meteorological Institution. The government has made a practice of defraying the expenses of a number of young men who are sent as students to European universities. Dr. Claxton, Commissioner of Education, Department of Interior, government of the United States, writes: "In Costa Rica, which has made greater advance in respect to primary education than any of the Central American states, a very important movement in rural education has been started by the establishment of schools which are furnished with gardens, orchards, and fields, and which provide for rural industries carried on under a special program of instruction." Report for year ended 30 June 1915). By executive decree of 14 Jan. 1915 rules for the newly-established Normal School at Heredia were promulgated.

The Roman Catholic is the religion of the state, but there is entire religious liberty under the constitution. The bishop of Heredia is a suffragan of the archbishop of Guatemala. Spanish is spoken everywhere throughout the country, even in the Indian districts.

Industry, Agriculture and Commerce.—Coffee raising was for a long time regarded as the most profitable form of industry in Costa Rica, and the decline in the price of coffee brought on the financial crisis soon after the beginning of the present century. Coffee in voiced at the American consular agency at Puntarenas for the United States during 1914 amounted to 7,718,057 pounds, valued at $39,543.

The systematic cultivation of bananas has increased during recent years to such a degree that it has become Costa Rica's leading industry. Indian corn, rice and cocoa grow readily. The live stock consisted of 33,000 cattle, 52,000 horses, 63,000 pigs, besides 10,000 goats. Because of the great number of peasant proprietors agriculture is advancing and both the economic situation and political stability of the country are on a sound basis. The year 1915 cattle were never in Costa Rica, but were extensively imported from Nicaragua at the rate of from 20,000 to 30,000 head annually. During the year 1915, however, 3,151 head of cattle, valued at over $100,000, were exported to the Canal Zone, Panama, for the United States military forces stationed there. Owing to the scarcity of cattle in this district it is not likely that they will continue to be exported to any extent. Prices of milk, butter, cheese and beef are much higher in Costa Rica than in the United States, and large quantities are imported annually. The cultivation of cacao is increasing in Costa Rica. In 1915 1,272,905 pounds, valued at $174,809, were exported. The Congress of Costa Rica, in 1917, provided for the payment of bounties to the growers of hemp, sisal and similar plants. This bounty, according to the Revista Economica, is to be in the form of 6 per cent treasury bonds, at the rate of 30 colon (colon = 46.5 cents) for each hectare (2.47 acres) of land planted in a fibre crop. The total imputed a hectare of 500,000 colones, and 100,000 colones more is appropriated for machinery. The bounty will be divided into three parts, the first to be delivered when the fibre is planted, the second part two years later and the third when the plants are ready to be cut. When the planter has cultivated his fibre crops for 10 years after receiving the first bounty, and has marketed his crops during this time, the mortgage which he has given on his property for the proper use of the bounty money, will be paid off by the government. When owners of plantations representing 800 hectares of land or more wish to establish a common fibre factory the government will grant them a loan in treasury bonds for two-thirds of the cost of the installation, taking a mortgage for the amount of the loan payable in 10 years at 8 per cent with amortization of 10 per cent. In 1914 the imports were valued at $7,551,679, while the exports surpassed this figure by $3,310,069. In 1915 the imports were valued at $4,479,782 and the exports at $9,971,582. Exports in the last normal year before the European War, 1913, showed the following distribution: To the United States, $5,297,146; to Great Britain, $4,364,436; to Ger-
many, $509,894; to France, $96,665. In the
same year Costa Rica imported from the United
States goods valued at $4,515,871; from Ger-
many, $1,355,417; from Great Britain, $1,303,187;
from France, $391,681. The following table
shows the value of the leading exports for the
last two years and the principal countries of
destination, according to the customs statistics:

Banking and Finances.— The gold standard
was adopted in 1896; in 1900 gold certificates
were redeemed and gold put into circulation.
The unit is the colon. The gold coins are
2, 5, 10 and 20 colones; the silver coins 5, 10,
25 and 50 centimos. The principal banks are
the Banco Anglo-Costarricense, established 1863;
the Banco de Costa Rica, established 1877, and
the Banco Commercial (1908). In addition to
these three banks the government has estab-
lished, as a temporary measure to cover the
deficit of revenues and assist their merchants
and farmers over the crisis of the European
War intensified, the Banco Internacional,
with a restricted issue of bank notes to the
extent of 4,000,000 colones (or colones), secured
by a new issue of 2,000,000 colones, 6 per cent
interior bonds, in conjunction with 2,000,000
colones, exterior refunding bonds, which in
1915 were in escrow in a New York bank.

The unit of the monetary system, the colon,
is divided into 100 centimos and is used only in
Costa Rica. Its weight is 0.7780 grammes of
900-fine gold, or, say, 0.7002 German grams
of gold, which it gives a par value of $0.46536,
currency of the United States. The par value
of $1.00, currency of the United States, is
1.24887 Costa Rican colones. Under normal
conditions, the commercial rate of exchange for
Costa Rica for sight draft on New York fluctuates
between 2.13 and 2.18 colones per $1.00 currency of the United States. The circulation
consists of banknotes, backed by gold and
other assets of the issuing banks. Foreign
gold coins are legal tender in Costa Rica at the
following rates: American dollar = 2.15 colones; French franc = 0.4125 colones; German mark
= 0.51 colones; English sovereign = 10.45
colones. The situation in Costa Rica has been
complicated by the failure, in February 1914,
of the Banco Comercial de Costa Rica (of
Limón, not the Banco Comercial de San José).
In order to facilitate the circulation of the
notes issued by the new bank mentioned above,
the government has decreed that all obligations
which are to be liquidated in colones, or other agreed-upon moneys, shall enjoy the
privilege of a moratorium until one year after
the signing of European peace, unless the creditors are willing to accept payment in bills of
the Banco Internacional ("Latin American Monetary Systems"). One of the results of the Pan-American Financial Conference held at Washington in 1915 was
noted, as follows: Costa Rica arranged with
New York bankers for a credit of $500,000,
making New York exchange available in transac-
tions between the two countries.

National Debt.—The total debt in 1915
was $19,000,000, of which about $8,000,000 was
English credit, $7,000,000 was French credit
and $4,000,000 scattered. The economic
problems of the government were set forth in
the inaugural message of President Esquivel,
2 May 1902, to be grave and complicated. The
total foreign debt in 1901 was $2,080,000; it was
contracted in England in 1871 and 1872. In
March 1901 Costa Rica bonds to the amount of
642,300 colones were incinerated, having been
issued in 1897 and 1899, and subsequently re-
deemed. The revenue of the government is
derived from custom-house duties, the liquor
monopoly, tobacco, stamped paper, post-office,
etc., the export duty on coffee having been abol-
ished 1 Sept. 1901. The government revenue in 1915 was $2,945,517 and the expenditures for the same year amounted to $4,257,511. In 1917 the estimated income was $3,937,700 and the expenditure $4,407,200.

Weights and Measures.—The libra = 1.043 pounds; manzana = 1¾ acres; centaro = 4,2581 galleles; fanega = 11 bushels. The metric system was established by law, 10 July 1884, but has not entirely displaced old weights and measures.

Transportation and Communication.—The Costa Rica Railway runs from Limón to the cities of the central uplands, and has several branch lines; the Pacific Railway connects San José with a good harbor on the western coast. In all, there were, in 1916 in Costa Rica, 683 kilometers (433 miles) of railways, of which 136 kilometers (84 miles) were owned by the government. The lines are the Northern Railway Company, 225 kilometers (140 miles), and the Costa Rica Railway, 334 kilometers (208 miles). As the latter is leased to the Northern, they together form a system of 348 miles under one management. The rapid growth of the banana trade has called into being railway lines in the coast regions. The Northern Railway has an extension down the coast southward from Bananito River, near Port Limón, with short branches running into the fruit districts. A line was also being extended northward in 1917. Between Limón and New Orleans and Mobile there is direct communication by steamship lines each week between Limón and New York steamers run weekly. There is a regular service between ports of the Central American coast, from Colón to Belize. Sailings to Jamaica, Cuba and England are fortnightly. French and Italian steamers call at Limón once a month. On the Pacific Coast there are three regular lines touching at Puntarenas; the Pacific Mail and the Chilean and British lines. There are (1915) 147 telephone offices and 1,600 miles of wire and 640 miles of telephone lines. Wireless telegraphy with 300 miles radius is in operation in Limón, and there is a small station at Colorado, at the mouth of the San Juan River.

Army.—All male citizens between the ages of 18 and 50 may be called upon to do military service; the standing army, however, and the militia together numbered 36,946 and consisted of 3 brigades, 1 battalion, 3 companies and 135 unclassified soldiers (1917). Supplementing land forces are two government-owned motor launettes used principally for revenue purposes.

John Hubert Connyn, Editorial Staff of The American.
were used in ale and various aromatic drinks; and also as a salad. In America the plant grows wild from Nova Scotia to Ohio, having escaped from European gardens. The common name is alecote or alcoate. The name is popularly supposed to mean the fragrant plant of the Virgin Mary, but recent authorities incline to derive it from the Latin mare, the sea.

**Costume** ("custom"); and especially usage, habit or appearance in dress, etc., a term now restricted to external dress, and its modes. The history of costume is an exceedingly difficult one to trace in any accurate detail, owing to the difficulty of interpreting the vague and scanty notices on the subject which we can collect from the earlier writers. The most interesting and profitable thing will be to attempt to work out certain general lines of development, leaving minute questions to antiquarians who have made a special study of the subject, as far as anything can be accurately known about it. It must be observed that our earliest indications on the subject come from warm or semi-tropical countries; thus eliminating as far as possible the factor in the development of clothes which originates in the nature of the climate. In such countries, the women, who are the first in the line of fashion, are the most active. Considerations of modesty, which may be regarded as the outgrowth either of specifically Christian or of other highly civilized conditions, according to the point of view, appear only in a rudimentary form. The development in early times is regulated largely by the desire to make the dress tell something of the position or rank of the wearer. Thus the earliest distinction as to the amount of clothing prescribed by custom seems to have been that the wearing of many clothes was a mark of rank, while the lower classes were content with a very scanty covering. This would follow since the nobles had in those days very slight need for active exertion; while practical considerations would dictate the minimizing of the garments which might hamper those whose occupations required free movement of the limbs.

The early Egyptians seem to have worn little besides an apron or loin-cloth; under the later dynasty it was extended into a long skirt, which was sometimes worn to form a complete garment. The women wore the *calasiris*, a shirt with short sleeves or none at all. Light and frequently transparent materials seem to have been most commonly used. For a headdress, both sexes wore what is known as the spicilyx-cap. Here, as elsewhere, however, ordinarily people paid very little attention to dress; kings, priests and other officials were distinguished by elaborate vestures. Under the Ptolemies Greek costume was generally introduced. The Assyrians covered more of the body than the Egyptians and used heavier stuffs—cotton, linen, wool and possibly silk, introduced from China. They wore a long shirt with short sleeves, and confined at the waist. For the upper classes this was bright-colored and ornamented with heavy fringes. Sandals were worn. The king was distinguished by a purple mantle and a white cylindrical cap. The Persian costume was generally tight-fitting, consisting mainly of a short coat (which may have originated very early in Central Asia), often made of leather. When they conquered the Medes, they adopted very generally the dress of the latter, which was loose and usually woolen. The leather breeches remained in use among the lower classes.

The Greek costume was characterized by great simplicity and fell into graceful folds. The principal parts of it were an undergarment called the *chiton* and a sort of cloak known as *himation*, which, when folded over the shoulders, ultimately originated a separate garment, the *dalmatic*. Men wore the *chlamys*, a short cloak for the more active occupations to which the *peplos* of the women partly corresponded. White was the usual (though not, as formerly believed, the exclusive) color of Greek garments; the material was wool among the Dorians and linen with the Ionians. Silk was introduced rather late from Asia and employed to make the semi-transparent robes for which the island of Cos was famous. Oriental luxury increased as time went on, until in the Byzantine period, while clothes retained much the same shape, costly material and rich ornamentation distinguished them.

The Romans also commonly wore but two garments, and the hardy, vigorous life of their early days tended to keep these simple. They wore a woolen tunic called the *toga*, a large, loose, white cloak adopted by all citizens for outdoor wear, and a somewhat similar garment called *pallia* for women. While, however, men had a uniform manner of wearing the *toga*, women draped their robes in many graceful shapes at will. Shirts, more practical over-garments, such as the *lacerna* and the *tagum* or soldier's cloak, were worn by those engaged in more active occupations. The *torque*, or cord of gold fastened around the neck, was a fashion introduced from Gaul after the conquest.

The history of fashion in the Christian era may be divided into four periods:

**First Period.**—In the first, down to 486, the Gallic, Roman and Byzantine elements were combining to form a new costume. In the second, 486 to 1300, had been introduced. The nobles vied with each other in introducing new fashions, though the middle class were far slower in adopting innovations, and the peasantry kept the traditional form almost unaltered down to the time of the Crusades. The third is the Renaissance period of transition, leading down to the fourth or modern era.

With the Roman conquest of Gaul came the introduction among the conquerors of the *bracca, e breeches of the Gauls, first adopted for campaign wear by the Roman soldiers. As the empire went toward its end, extravagance in dress was unbounded among the wealthier classes. The women wore a sleeveless outside tunic confined at the waist by beautiful bands and on the shoulders by jeweled clasps. They delighted in wearing tunicum, held in such a way that at least some portion of each tunic was revealed and brought into contrast with the others. A bright transparent veil sparkling with green and silver spangles fell from the head and a short mantle hung from the shoulders. A sort of cord or string fastened the veil to the head, and jeweled garters bound at the knee drawers of fine linen.
Sumptuary laws were passed relating to the style of shoe to be worn by each class; but similar laws relating to the variety of jewels had little effect, since the general love for ornamental was too strong to be regulated.

**Second Period.**—During the Merovingian era (480-751) in Fr. owe important modification of the general scheme of clothing came in. The ruder element introduced by the rough Franks gradually softened beneath the enervating, refining influence of Roman fashions. The Frankish women who had been content with their more costly costume, and the mantle and a cap were transformed to Merovingian ladies delighting in gay, trailing tunics of delicate tissues exquisitely embroidered. Their arms were still bare according to the ancient Teutonic fashion. Their hair fell in long braids and was ornamented with fillets and flowing veils. As France acquired unity, the influence of both Roman and barbaric invasion visibly faded away. From the ancient shapeless tunic developed the gown, fitting close to the body. The dress was a full and flowing. This was the general principle of form from the accession of the Capet dynasty (987) down to the Renaissance.

Men's dress underwent little change down to the 13th century. The costume of the Frankish men of Charlemagne's time may be described as the approximate model. It consisted of two tunics, the outer one of wool or silk varying in length from the hips to the knees, according to the prevailing style. These were covered by a blue mantle fastened on the right side with a clasp, and often highly ornamented and trimmed with beautiful furs and gold fringes. Head coverings of diverse and increasingly extravagant styles were among the first distinctive modifications; and these were sometimes combined (as also in the development of the academic costume) with a hood or cape falling over the shoulders.

Each century saw its own modification of these general types. It was a growing fashion in the 15th century for women's outer robes to stop at the knee and show the full and flowing tunic beneath. In the 10th and 11th centuries the robe was belted by a rich girdle both above and below the waist. In the 11th century, too, the long train, in vain anathematized by the Church, became extremely popular. Sleeves reached the limit of absurdity in the dress of both sexes. At various periods the leg-of-mutton sleeve was worn, and in the beginning of the 15th century the outer sleeve widened at the wrist until it swept the ground. Commercial relations with the East were improved through the Crusades, and new varieties of costly fabrics were introduced. The splendor displayed in armor and military appointments affected the customs of the women. Ladies of noble birth emblazoned their full-fitting gowns and surcoats. Even the dress of the middle classes, many of whom were dependents of the nobles and wore livery colors and armorial badges, acquired a heraldic character. The helmets, decked with scarfs and mantlings, suggested many grotesque varieties of feminine headgear, both in the 14th and 15th centuries. As the mantles of the knights but partly concealed their armor, so a surcoat worn by ladies only half concealed the beautiful decorated gown beneath. This surcoat was a jacket of varying shape; at one period it was only a coat without sleeves or sides; later a loose, flowing skirt was added to it, which in the 16th century stopped at the knee. The hip-girdle, of exquisite workmanship, which showed through the openings of the surcoat, was a counterpart of the military belt worn by the knight. These were often two or three times the length of the foot. The odd parti-colored gowns of the women blazed with heraldic impalements and quarterings. During the 13th, 14th and 15th centuries there was great confusion about those garments which we know as stockings and trousers. One garment sometimes reaches the waist, even covering the feet. At others there were two articles, the nether stocks (Fr. bas de chausses) came to the thigh or knee and were continued by the trews and hanging by the skirt full and flowing. About 1600 the word breeches came into use to indicate the trunk-hose, and the term hose was confined to stockings.

**Third Period.**—This epoch was the transition from the medieval to the modern style of dress. Speaking generally, up to the 14th century, long dress prevailed, loose and flowing, and offering a welcome contrast to the tight-fitting armor of the knight. About 1350 the costume of the men began to change, with the introduction of the doublet, a short jacket padded at the shoulders, plaited a few inches below the waist and fastened with a belt. The nether stocks, now entirely exposed to view, were attached to the trunk-hose. Long, loose robes with immense drooping sleeves were indeed worn throughout the 15th century, but only by professional men or nobles on occasions of state. In women's dress the tendency appeared to cut the figure into sections instead of keeping to the girded gown. A bodice reached to the hips. The dress was somewhat shortened, and a step was taken toward the short humped petticoat. During the Renaissance Period full forms became more and more popular, and petticoats and gowns spread into the form of a bell, which year by year increased in circumference.

**Fourth Period.**—A more distinct transition between ancient and modern dress took place in the 16th century. Men wore for show a short cloak which hung from the shoulders. The doublet was made with rather tightly fitting sleeves; beneath it was a sleeveless jerkin fitting the body and, like the modern waistcoat, so cut as to allow the beautifully embroidered shirt to be seen. The short skirt of the doublet was gored to fit the bulging trunk-hose padded with hair, while the lower hose were plain and tight, so that the figure looked broad and full above and narrow below. In this century began the wearing of the top of the nether garments loose, or slashed, with pieces of different colors set in. The arms and shoulders of the doublet or jacket were similarly trimmed. Boots were worn looser, and the upper part falling down. Ruffs, or ruffled collars, and velvet bonnets with feathers came into use.

In England the Tudor Period was characterized by great extravagance. The chronicler Hall describes several of Henry VIII's superb
dresses, among them a "frocke" or coat of velvet embroidered all over with gold, the sleeves and breast cut and lined with cloth of gold, and tied together with great buttons of diamonds, rubies and Orient pearls. The cloaks and mantles were of corresponding magnificence. The shirts were pinched or plaited and embroidered with gold, silver or silk. The shoes and buskins were of the German fashion, very broad and tied together with velvets and samplers and puffed. A plain russet coat and a loose kind of kersey breeches, with stockings of the same piece, constituted the ordinary dress of middle-class men. The London apprentices wore blue cloaks in summer and gowns of the same color in winter, as badges of servitude; for this was a period of domestic distinctions, relics of feudalism. The women wore long woolen gowns, worsted kirtles (hereafter called petticoats) and white caps and aprons. About this time white underlinen came into general wear.

In Elizabeth's time the men's huge trunk-hose, "stuffed with hair like woolsacks," were made of silk, velvet, satin or damask. The doublets were very costly, and stuffed, with the addition of some kirtles of lattice and lace. The cloaks were of Spanish, French or Dutch cuts; of cloth, silk, velvet or taffeta; of all colors; trimmed with gold, silver, silk-lace and glass bugles; equally superb inside and out. Hats now began to supersede the bonnets of the former year. They were for the most part made of felted wool, dyed. Those of beaver were exceedingly expensive.

The most conspicuous features of women's dress in the reign of Elizabeth were the farthingale and the ruff. The former consisted of an extravagance of the lower garments by means of cane or whalebone. It was the predecessor of the hoop, which in its turn was succeeded by the crinoline. The widely extended ruff of fine linen, like a huge frill, is familiar from the pictures of Elizabeth and Mary of Scotland. The extravagance of the ruff reached such a point that it was anathematized from the pulpit, together with the extremely low cutting of the bodice; and the fancies of women's costume were denounced in a sermon preached before James I, at Whitehall, as "her French, her Spanish, and her foolish fashions."

England was slower than France, but ahead of Spain, in abandoning the farthingale and the ruff. In the beginning of the reign of Charles I dress was little changed; the ruff, of thinner make, stood farther away from the throat and looked like a framework of gauze, but the skirts were not so wide. In the middle of the 17th century there came a revolution against the entire system of padding, whalebone, starch and wire, and for about 50 years the upper classes followed the canons of beauty and grace. Instead of the ruff, the Van Dyck collar, made of rich point-lace, was worn hanging down on the shoulder and held by a cord and tassel at the neck. Long breeches, fringed and pointed, met the ruffled tops of the boots; an embroidered sword-belt, worn over the right shoulder, held a Spanish rapier. In the flapping beaver hat hung a plume of feathers fastened by a jewel. Ladies' dresses were still made with skirt and bodice, the bodice defining but not cramping the figure, and the skirt hanging full and gracefully.

During the latter half of the 17th century, France, more than ever, gave the law to Europe in dress, and the typical style became known as that of Louis XIV—although, for accuracy, a distinction must be made between the gay and brilliant and the sombre parts of his reign, in the latter of which a tendency toward sober plainness not unlike that of the English Puritans was felt. The result of long struggles with inconveniences of dress was a nearer approach to the modern masculine dress of three pieces, coat, waistcoat and trousers. The richly laced and embroidered doublet was long and loose, and had large puffed-out sleeves reaching a little below the elbow. The rest of the arm was covered by the full sleeves of the shirt. The long, loose, sleeveless waistcoat showed beneath the doublet, and the wide, ruffled breeches were fastened at the knees with bunches of ribbon. The doublet had buttons and buttonholes for its entire length, thus becoming a coat. Instead of the lace collar the long, square-ended cravat was worn. In the early part of the 18th century this dress became more exact in shape and cut. The doublet, now a coat, fitted the body. The absurd wide "petticoat breeches" were exchanged for close-fitting garments tied below the knee. The broad-brimmed hats were turned up on two sides, later on three, and edged with feathers or ribbons. Wigs, which had been some time in use, were worn still longer than before, hanging down in front or flowing upon the shoulder. The coats of the 18th century were of velvet, silk, satin or broadcloth and of fanciful colors. Hogarth's favorite color was sky-blue. Reynolds' deep crimson, and Goldsmith rejoiced in plum-color. Meanwhile women's dress had also become more stiff and formal. Long bodices were tightly laced over very stiff corsets; overdresses were bunched up in the neck and on the hips; and the hoop-skirt, as outrageous as the farthingale of the 16th century, was generally worn. About the middle of the century the sacque came into style—a loose gown, resembling the mantle of antiquity, which was looped over the hoop-skirt and turbaned or left trailing behind. Heavy towering headdresses replaced the simple ringlets of the previous century. Small muffins, flowing veils and fans were important accessories. Muffs were carried for a time by men.

The formalities of the 18th century received a severe blow from the general tendency of the French Revolution toward simplicity. In the 10 years from 1790 to 1800 a more complete change was effected in dress by the spontaneous action of the people than had taken place in any previous period in the century. The change began in France, partly to mark contempt for old court usages, and partly in imitation of certain classes in England, whose costume the French mistook for that of the nation generally. It consisted of a round hat, a short coat, a light waistcoat and pantaloons reaching to the ankles and fastened by buttons. A handkerchief was tied loosely around the neck, with the ends long and hanging down, and showing the shirt collar above. The short hair à la Titus was unpowdered, and the shoes were tied with string in place of the buckles which had before been universal. This comparatively simple form of dress found many admirers in England and soon
became common among the young men. The abandonment of hair-powder followed the imposition of a tax on its use, and with the giving up of wigs and powder came the fall of the cocked hat. Pantaloons which fitted closely to the legs remained in general use until about 1614, when the wearing of looser trousers, already introduced into the army, became fashionable, though many elderly persons still held to knee-breeches against all innovations. The general simplifying of dress subsequent to 1815 was not allowed to pass without a last effort to retain the elaborate fashion of the previous period. The neoclassicism of the 18th century was now succeeded by the *dandy*, who prided himself on his starched collars, his trouser-straps, and the flashy bunch of seals which dangled from his watch-chain. The period covered by the Regency in England was indeed the heyday of this kind of dandymanship; but even later it characterized not a few leading public personages.

The end of the 18th century witnessed a signal change in the style of women's dress. The gown no longer consisted of two dresses, an outer and an inner one. The formal style, which had prevailed throughout the century and brought into use stiff materials such as solid damasks, velvets, satins and silks, were replaced by the fashion of the short-waisted clinging gown made of muslin and soft silk. This "Empire" mode characterized the dress of the first quarter of the 19th century. Large, loose, warm coats and cloaks were used for outdoor wear. Elaborate hats, turbans and caps were worn on all occasions. In the twenties there was a new fashion. Skirts were shortened and trimmed with flowers, puffs and ruchings; sleeves became fuller, and the waist came nearer its natural position. Then the sleeves began to widen and stiffen, and the hats grew larger and more cumbersome. From these wide skirts the crinoline was evolved in 1854. In the seventies the skirt became narrower again, worn with a polonaise of a different color. Meanwhile the size and shape of the sleeve was not constant for more than a year.

But it would be both impossible and profitless to follow the minute varieties of changing fashion. To return to general principles, it is safe to say that neutrality is becoming more and more the basis of costume, at least for men. Extravagance in dress, especially among the Anglo-Saxon nations, has become a note of bad taste; and man's dress, which was formerly characterized by gorgeous display, is little more than a uniform which, with certain variations prescribed by etiquette, adapts itself to different functions and amusements. As a result of the general modern abandonment of formality, and the opening of new employments for women, together with their invasion of the realm of athletic sports, the simplicity which characterizes the masculine dress has come to exist more and more also in the feminine. Fashion is forced nowadays to accommodate itself, to some extent at least, to health and convenience; and only the artist and the antiquarian will be found to regret that the picturesque costumes of bygone days are to be seen only among the peasantry of distant and isolated lands.

**Bibliography.**—Racinet, *Le costume historique* (1885) is the best general work.

Master of Arts.—Black gown of stuff or silk, falling below knee, with long sleeve with semi-circular cut at the bottom (similar in size to that of the Cambridge M.A.), hood, black stuff, lined with pale blue silk.

Master of Science.—The same gown as Masters of Arts; hood, black stuff, lined with yellow silk.

Doctor of Medicine.—The same gown as Masters of Arts; hood, scarlet cloth, lined with purple silk.

Doctor in Dental Science.—The same gown as Masters of Arts; hood, scarlet cloth, lined with yellow silk.

Doctor of Laws.—The same gown as Masters of Arts; hood, scarlet cloth, lined with white silk.

Doctor of Literature.—The same gown as Masters of Arts; hood, scarlet cloth, lined with blue silk.

Doctor of Science.—The same gown as Masters of Arts; hood, scarlet cloth, lined with white silk.

The idea of a well-defined system for the American colleges and universities arose about 1893 after there had become evident a decided movement toward the use of academic costume by senior classes, trustees and faculties outside of the institutions named in the opening paragraph of this article. The College of Bryn Mawr opened with caps, gowns and hoods for faculty and students in 1885, the faculty of Harvard had equipped for her 250th anniversary in 1888, the trustees of Yale about the same time, the seniors of Williams in 1890, the seniors of Wellesley for Tree Day in 1884, the Yale, Union and Amherst seniors in 1891, seniors of Harvard, Dartmouth, University of Syracuse and several others in 1892, the faculties of Brown and The University of Chicago, seniors of the University of Vermont, Dickinson, Wesleyan, Tufts, Hampden-Sidney, Wells, Lafayette, Mount Holyoke, Elmira, Colby and many others in 1893. The movement was essentially a student movement to provide a senior badge and to improve the commencement week exercises, take the place of the archaic "dress suit" or "swallow-tail" and revive the traditions of a continuing and related university life. It was approved particularly by the
students on account of its being uniform which overcome all differences of dress and made for democracy. It was seen that the gowns aided grace and overcame awkwardness in speaking and that the general effect was to make university functions more characteristic, interesting and impressive to all beholders. It was discovered that on account of the improved appearance of all wearing academic costume, and the increased interest aroused by the dignity of the ceremonies that there was better attendance on the part of trustees, faculties, alumni, students and friends of the colleges and universities.

Realizing that there must be an intelligible system adaptable to all institutions if the many

American colleges were ever to enjoy the full advantages of academic costume, an intercollegiate commission was formed in 1893 and there was prepared a tentative draft of a uniform code for caps, gowns and hoods for the various degrees, designed so as to show in the hoods also the sources of the degrees by use of the college colors. Col. John J. McCook of the Princeton trustees, President Seth Low and Bishop Potter of the Columbia trustees, Rev. Charles Ray Palmer of the Yale trustees and Chancellor MacCracken of New York University were the most active members of this commission, and the writer of this article was called in as a technical adviser. He prepared colored sketches; made up experimental hoods and gowns; and solved the problem of satisfactorily combining two colors in a hood lining by the adaptation of the heraldic chevron of the second color on the field of the first color. A few zones are set on fields of other colors.

The Intercollegiate system makes the following distinctions in the gowns, hoods and caps.

**Gowns.**

*Undergraduate.* — Of black stuff, open or closed in front, round or pointed sleeve.

*Bachelors.* — Of black stuff, open or closed in front, long pointed sleeve.

*Masters.* — Of silk preferably, open front, long closed sleeve with slit in upper part for arm.

*Doctors.* — Of silk preferably, open front, round bell sleeve; faced down the fronts and barred on the sleeves with black velvet or velvet wholly or in part of the color designated for the trimming of the hood for the doctorate held.

Presidents, Chancellors and Deans may wear the gowns trimmed with gold braid and may wear other marks of office not inconsistent with the Code.

Members of the Governing Body (Trustees, etc.) may wear the doctor's gown during tenure of office.
BRITISH USUAGE IN ACADEMIC COSTUME.

(Convocation Robe)  (Full Dress)  Trinity College, Cambridge  Vice-Chancellor, Cambridge

D.D., Edinburgh  (Full Dress)  D.C.L., Oxford     (Full Dress)
COSTUME, ACADEMIC

HOODS.

Hoods should be of material similar to the gowns, are of distinctive shapes or lengths for Bachelor, Master or Doctor; are lined with silk showing the official colors of the institution that conferred the degree or with which the wearer is connected and are trimmed in proper widths with velvet distinctive of the degree as follows:

Arts and Letters, White
Theology and Divinity, Scarlet
Law, Purple
Pharmacy, Olive
Science, Gold yellow
Fine Arts, Brown
Medicine, Green
Music, Pink
Pharmacology, Lilac
Dentistry, Lilac
Forestry, Russet
Engineering, Light blue
Veterinary science, Gray
Library science, Lemon
Pedagogy, Light blue
Commerce and Accountancy, Drab
Physical Education, Sage green
Humanics, Crimson
Oratory, Silver gray
Public health, Salmon pink
Agriculture, Mauve
Economics, Copper

CAPS.

The Oxford cap, of stuff or broadcloth, is worn for all degrees, but the doctorate is entitled to a tassel of gold or part gold and the doctor’s cap may be of velvet.

Official Colors.—The official colors for the hood linings of some of the leading institutions of the United States are as follows:

Allegeny, Navy blue, old gold chevron
Amherst, Purple, white chevron
Boston, Scarlet, white chevron
Bowdoin, White
Brown, Brown
Bryn Mawr, Mauve, white chevron
Carnegie Institute of Technology, Carnegie Tartan
Columbia University, Papal yellow, white scarlet
Colgate, White
College of the City of New York, Maroon
Colorado College, Black, old gold chevron
Columbia, Light blue, white chevron
Cornell, Cornellian, two white chevrons
Dartmouth, Green
DePauw, White, old gold
Drew, White
Fordham, Maroon
Georgetown, Gray, blue chevron
George Washington, Dark blue, buff chevron
Georgia School of Technology, Old gold, white chevron
Georgia Institute of Technology, Dark blue, gold yellow chevron
Hamilton, Blue, buff chevron
Harvard, Crimson
Holy Cross, Purple
Hunter, Lavender, white chevron
Indiana, White, red chevron
James Madison, Presbyterian blue, white chevron
Johns Hopkins, Black, gold chevron
Lehigh, Maroon
Leland Stanford Jr., Cardinal
Louisiana State University, Purple above old gold, parti-chevron
Miami University, Bright red, silver-gray chevron
Mount Holyoke, Bright red, white chevron
New York, Light blue
Northeastern, Violet
Oberlin, Red, gold yellow chevron
Ohio State, Scarlet, silver gray chevron
Pennsylvania State College, Navy blue, white chevron
Princeton, Orange, black chevron
Purdue, Black, two old gold chevrons
Radcliffe, Crimson, white chevron
Rensselaer Polytechnic Institute, White, bright red chevron
Rutgers, White, Scarlet
Simmons, Dark blue, gold chevron
Smith, White, gold chevron
State College for Teachers (Albany, N. Y.), Purple, wide yellow chevron
St. Lawrence, Bright red, dark brown chevron

Stevens Institute of Technology, Gray, scarlet chevron
Syracuse, White, orange
Temple, Red, gold chevron
Tufts, Brown, light blue chevron
UCLA, Olive green, light blue chevron
Union, Garnet
University of Alabama, Oxford crimson, white chevron
University of California, Gold, blue chevron
University of Chicago, Maroon
University of Cincinnati, Bright red, two black chevrons
University of Illinois, Navy blue, two orange chevrons
University of Kansas, Dark blue, red chevron
University of Kentucky, White, black chevron
University of Maine, Light blue
University of Michigan, Mauve, azure blue chevron
University of Minnesota, Old gold, maroon chevron
University of Missouri, Old gold, two black chevrons
University of Nebraska, Scarlet above cream-white, parti-per-chestron
University of North Carolina, Light blue, two white chevrons
University of Oklahoma, Cream, crimson chevron
University of Oregon, Lemon yellow, dark green chevron
University of Pennsylvania, Red, blue chevron
University of Pittsburgh, Mustard, gold-yellow chevron
University of Rochester, Dandelion-yellow
University of Southern California, Gold yellow
University of Tennessee, White, orange chevron
University of Texas, White above orange, parti-per-chestron
University of Virginia, Marine, orange scarlet
University of Washington, Purple above gold, parti-per-chestron
University of Wisconsin, Cardinal
Vassar, Rose, gray chevron
Washington (St. Louis, Mo.), Maroon, white scarlet
Wellesley, Dark blue
West Point, Cardinal, wide black chevron
Western Reserve, White, scarlet, blue, gold
West Virginia, Old gold above dark blue, parti-per-chestron
Wheeling (Mass.), White above blue, parti-per-chestron, reversed
Whitman, Blue, mauve chevron
Williams, Olive, gold
Wayne State University, Royal purple
Winthrop, Garnet, gold chevron
Woofer (College of), Old gold, black chevron

The commission offered its code to all higher institutions of learning and it was soon officially adopted by the leading universities and colleges and generally understood to be in effect throughout the country. The Intercollegiate Bureau of Academic Costume was established at Albany, N. Y., and did the work of registering the official colors in their official arrangements as the various institutions adopted them. It has required much labor to keep distinct the hood linings of more than 700 institutions that use the intercollegiate System in the United States, Philippines, Chinese and Canada. Degrees from French, German and Swiss universities held by residents of America are also shown by characteristic linings duly registered after suitable official action. Correct and differing shades of the same colors have to be registered and gown makers are confronted with the problem of keeping the colors the same through the passing years which can only be done by having considerable quantities woven to order of each color, as recorded by the Intercollegiate Bureau at Albany, N. Y.

This bureau is working under a charter granted in 1902 by the Regents of the University of the State of New York and has for its object “to establish and maintain a library relating to the universities, professional, technical and advanced schools and colleges of the world, particularly as to their membership and the memorial and other public appearances, including their gowns, hoods, caps, robes, badges, banners, arms and other regalia used on such occasions; to maintain a register of statutes, codes and usages, designs and descriptions of the articles of academic costume and regalia, to collect and record colors, materials, qualities, sizes, proportions and the arrangement thereof; to promote
social intercourse among members of universities and colleges and to disseminate information on the subjects above mentioned. The Bible alludes to 50 cloaks or confusion the distinctive details of symbolic academic costume and to aid without charge all institutions with any information in its possession. It invites correspondent.

The use of hoods by graduating classes has been increasing in recent years and candidates who are known as eligible, often don the hoods for the baccalaureate sermon or at a special ceremony at the beginning of commencement week known as "Hi Juvenes" when the names of those who have passed the final examinations are read off. The hoods, with their aesthetic stiffening of the otherwise rather somber costumes and their appeal to college spirit by the display of the college colors, thus yield their significance during the full period of commencement time.

GARDNER COTRELL LEONARD, Director of Intercollegiate Bureau of Academic Costume.

COSTUME, Ecclesiastical. Hebrew.

The vestments of the Levitical priesthood briefly enumerated were as follows: (1) Drawers or 4breeches 5of linen. (2) Tunic of linen concerning which Josephus informs us that it reached to the feet, fitted close to the body and was furnished with tight sleeves. It was girded to the breast, a little above the level of the elbow. (3) Girdle. A strip of linen four fingers broad, Josephus says, but, according to Maimonides, three fingers broad by 32 cubits in length. This was wound several times round the body, the ends tied over the breast, leaving the extremities hanging down to the feet; in officiating over a sacrifice or other ceremony the priest threw it over his shoulder to afford more freedom of action. Elaborate embroidered decoration was done in scarlet, purple and blue threads in the form of flower motifs. (4) Priest's Cap. This was of turban form which Josephus describes as "a cap, not brought to a conic form nor encircling the whole head but still covering more than half of it, and is termed 6menaphthe" These are all of the sacerdotal vestments, according to Mosaic law, of the Jewish priest. The high-priest's vestments now follow: (5) The 7robe of the ephod consisting of a blue tunic that reached to the feet, according to some authorities, but only to the knees, according to others. These are all woven in a single piece having an aperture for inserting the head. Golden bells and pomegranate motifs were suspended from the hem alternately. (6) The Ephod. This was the most important part of the high-priest's equipment. The Book of Exodus tells the distinctive details of symbolic academic costume and to aid without charge all institutions with any information in its possession. It invites correspondent. The Book of Exodus tells the distinctive details of symbolic academic costume and to aid without charge all institutions with any information in its possession. It invites correspondent.

It appears probable that this vestment was composed of two pieces, a front and back, arranged together with two onyx stones, one on each shoulder, set in bezels or "ouches 9and engraved with the names of the 12 tribes, six on one and six on the other. Round the waist was passed a girdle which was made of materials similar to the ephod and embroidered elaborately with colored threads. (7) The Breast Plate. This was a rectangular piece of cloth the same as the ephod and folded to make a perfect square of about nine inches on each side. Twelve stones were fixed in this in gold settings, arranged in four rows of three each. Each had the name of one of the tribes engraved on it. The stones are said to have been carnelian, peridot, emerald, ruby, lapis-lazuli, onyx, sapphire, banded agate, amethyst, topaz, beryl and jasper. Josephus says the ephod by two plaited or twisted gold chains or rods which fastened to the bezels on the shoulders of the ephod and whose other ends were attached to gold rings on the upper corners of the breast-plate and below by two cords or ribbons passing from two rings in the lower corners to the sides of the ephod above the embroidered girdle. (8) The Mitre. The high-priest's mitre appears to have differed from the headdress of the priest only in having a gold plate set in blue lace and in having the inscription "Holy to Jehovah." Vestments of the Roman Church.—The vestments worn by the priests of the Western Church at the Eucharistic ceremony (sometimes termed "sacred vestments") during the papacy of Innocent III (about 1200) were the alb, amice, stole, maniple, dalmatic, chasuble, sandals, pall, stockings, subcingulum, mitre, gloves, ring, staff, tunicule, orale. The 1210 was in use in the 12th century. In ecclesiology the term "vestments" has passed into the church furniture in old inventories of the Church. (1) Alb. A long gown usually of linen but frequently of silk, or cloth of gold is mentioned sometimes, or even velvet. As its name implies, it was originally white but is little used, blue or black. Early in the 11th century the alb had a round gold plate just above the lower hem on either side as an ornament; sometimes in the same period we find rows of small gold plates ranged round the lower edge; these are, respectively, the alba sigillate and alba biretta. Ordinarily, especially in later years, the ornamentation is embroidery in small patches, termed appendices, sewn on various parts of the vestment. Such were located as follows: Two rectangular ones just above the hem on the front, one behind; another on the back and one on the breast; a small patch was on each cuff and a narrow strip bordering the orifice for the head. Early examples show two narrow strips running down the front and the back. Early cut-apparel edges. The artist was worn plain at
times (on Good Friday, for instance). The alb used to be made so long as to need drawing in and hanging over the girdle. (2) Girdle. The security; called also tadus and ano didium. This was a creation of the Middle Ages and intended at first to act as hood; it is still so worn in some places in France from All Saints Day till Easter. It is the first vestment to be put on. The amice was rectangular (36 inches by 25) and has strings at each end long enough to go round the body and cross over the breast. Embroidery (orphrey) ran along one of the long sides. In its position around the neck it is worn like a collar above the other vestments, but leaving the amice uncovered. In the middle of the upper edge is a small cross. The amice was made of linen. (4) The Stole. Spelled also stola. This is a narrow strip, 9 or 10 inches long, of embroidered work two or three inches wide. It was worn between the neck and chasuble, crossing over the breast and secured there by the alb girdle, but at present only during mass officiation. Deacons wear the stole over the left shoulder and under the right arm; bishops wear it between the alb and chasuble. In ancient times the stole was made so long as to reach almost to the feet, thus showing both ends below the chasuble of the priest or the still lower dalmatic of the bishop. It was of intensely rich decoration, sometimes made of gold thread with very little silk. In Anglo-Saxon days little silver bells, apparently, were attached to the extremities of the stole. (5) The Maniple. This vestment is of similar form to the stole and was worn, at first over the forehead, but later it was suspended from the left wrist, in which latter case it is often buttoned or sewn on to avoid its slipping off. Its length varies from three feet to three feet three inches and its width is about three inches. (6) The Dalmatic. This appears to have originated about the 9th century. It is split open a short distance on both sides and the slits decorated with fringe (the deacon's dalmatic is fringed only on the left side). Perpendicular bands or horizontal orphrey ornament the dalmatic, which was white up to the 12th century, then the entire vestment became elaborately embroidered. (7) The Chasuble. The last vestment to be put on before celebrating mass. It was made from different materials, velvet, silk or cloth of gold, most frequently the alb and a color or cross and period a hood was sewn to the ordinary chasuble when used in processions, but it soon was displaced by the cope. The early chasuble was constructed of a semi-circular piece of cloth with a neck for the neck slit in the centre. The two straight edges were then sewn together producing a vestment of truncated cone form. This form created an impediment to upward movement of the arms of an officiating priest, so it was made of an oval piece and an open space cut in the centre for the head, this left the length of the row bands (called also cinigulum), usually of cotton with a tassel at each end. Some bore colored embroidery. The girdle is about four yards long. As the alb is drawn in and over the girdle the latter is not seen in mediaeval monuments. (3) The Stockings. Called often buskins. These were, apparently, at first a papal vestment solely, as the bishops wore sandals. The early ones included, however, the calque by the time of Ivo of Chartres. From a condition of simplicity they took on enrichments in the Middle Ages.
(11) The Subringulum. This vestment has become almost obsolete. It is a purtenance of the Pope exclusively and is formed like a girdle, passes round the alb and having on the left side a maniple-like appendage. This would appear to have been the 14th century form. (12) The Rationel. This has also become almost obsolete by bishops and abbots of some monasteries by special privilege, also by the canons of certain churches. A characteristic of the mitre is its upper section dividing itself into two peaks; but illustrations of the 13th century would lead us to suppose that the bishop's headdress was closed. The mitre was probably a simple one, the biretta. In the 14th century it grew more pointed and enriched, then attaining its greatest perfection of form and decoration. The ornamentation grew to be most costly and elegant, the edges assumed crockets, the apex ended in a jewelled cross. From the end of the 15th century to the middle of the 18th century mitres kept growing higher and wider. There are three kinds or qualities of mitres, viz.: (1) The Simplex; (2) the Aurifragata; (3) the Pretiosa. The Simplex is made of plain white linen, or white silk damask, with red fillets (infuse). The orphreyed mitre, mitra aurifragata, is composed of silk damask, or cloth of silver or gold, but without plates of metal or any jewels except seed pearls. The pretiosa mitre, mitra pretiosa, is adorned with jewels (properly uncut) and the precious metals. Dr. Rock says of the mitre: "Except when made from hard gold beaten into thin plates, or of cloth of gold, its cost was usually high, and all the old mitres known still in existence have a white ground." Early Irish painters depicted mitres in colors, chiefly red and crimson. Lee says "the plain mitre (or Simplex) is used for proces- sions." He states that the Church used the pretiosa mitre over a century after the Reforma- tion; it was so in the American Church, at all events, for Bishop Seabury's mitre is still (1877) preserved in the library of Trinity College, New York. Two pendants, termed insulae, hang down from the back of the mitre, terminating usually in a gold fringe. (14) The Episcopal Gloves; called also chirotheca and manice. These do not get special mention till the time of Honorius of Autun. They were jeweled and richly embroidered, sometimes studded with pearls, in the Middle Ages, and fronton was set in the back. Cahier says: "It was customary that the gloves destined for ecclesiastical ceremonies had to be made without seams (sewing) which necessi- tated knitting. Some authorities say they were made of silk cloth. This is the "Ring. This is but one of a number of rings worn formerly by bishops; it was worn on the third finger of the right hand above the second joint and was usually held in that position by a plain guard ring. The ring consists of a circle and precious stone set en cabochon (carbuncle), never cut; and the circle was large enough to pass over the gloved finger. A sapphire was considered most appropriate but the emerald or the ruby figured often in episco- pal rings. (16) The Pastoral Staff. Terraced to the middle ages, depictions of the staff in the form of a crosier. The pastoral staff was often used in its potereca to this day. Since the volute end appeared it has assumed many forms and its decoration has changed with the periods and styles. A favored form in early days was the serpent staff, the termination of the volute taking the shape of a serpent's head; frequently also dragon forms appear; the loop often encloses the Lamb. Immediately beneath the crook is a protruding member often of knob form—it is frequently called a knop—evidently intended to afford a better grasp on the staff. The double-pointed mitre was often take on beautiful architectural forms (abernacles) of intricate carved work in lantern shape. While the Greek staff is short and only reaches to the hand (as symbolic of support), the Roman staff ranges from five to seven feet long. A cloth or scarf is attached to the shaft of the staff, apparently for the purpose of keeping the hand's moisture from tarnishing it. It is variously termed ovarium, sudarium, infusa, etc. (17) The Tunicle. A small and lines them: "The Tunicle is made of white linen, and white silk damask, with red fillets (infuse). The orphreyed mitre, mitra aurifragata, is composed of silk damask, or cloth of silver or gold, but without plates of metal or any jewels except seed pearls. The pretiosa mitre, mitra pretiosa, is adorned with jewels (properly uncut) and the precious metals. Dr. Rock says of the mitre: "Except when made from hard gold beaten into thin plates, or of cloth of gold, its cost was usually high, and all the old mitres known still in existence have a white ground." These do not get special mention till the time of Honorius of Autun. They were jeweled and richly embroidered, sometimes studded with pearls, in the Middle Ages, and fronton was set in the back. Cahier says: "It was customary that the gloves destined for ecclesiastical ceremonies had to be made without seams (sewing) which necessi- tated knitting. Some authorities say they were made of silk cloth. This is the "Ring. This is but one of a number of rings worn formerly by bishops; it was worn on the third finger of the right hand above the second joint and was usually held in that position by
of a tippet or hood, the upper part being thrown back from the head and allowed to hang down. In England, before the Reformation the almoce was worn by parish priests (parsons) as well as by canons. *Biretta*. Spelled also beretta. A square cap having three or four projecting corners rising from the crown. A tassel or tuff appears in the centre where these corners come together. The priest wears it on approaching the altar to say mass, those officiating in the choir and others. The biretta of a cardinal is red; that of bishops is often purple; other clerics wear a blue one. Doctors of Divinity have the privilege of being allowed to wear a biretta, and in France, Germany and Spain it is worn generally by the clergy. *Ca-lotte*; the clerical skull cap. *Camauro*. This is the cap belonging to the Pope and worn on extra-liturgical occasions. It is made up of red velvet and white fur. *Cassock*. Frequently called after the French term, *soutane*. It is the outer garment of every order of clergy and consists of a long coat reaching to the feet; the clerical *frock*. It is confined at the waist by a broad sash called the *ceinture* and has an ushaped front body. The priests wear a black cassock; bishops, purple; cardinals, scarlet; popes, white. In the English Church black is usual with all the clergy, but bishops sometimes wear violet. Cassocks are worn in the choirs as well as surplices. *Chimere*. The upper robe of a bishop. It is purple for Roman prelates, black for English clergy. The latter have added long sleeves. *Cope*. Called often by the Latin name, *capea*. While the pallium and puviale are termed cope by some writers, others say this is a choral, not Eucharistic, vestment. It is a large semi-circular cloak of silk or other material, stiff with gold and embroidered enrichment. In front it is held together by a morse or clasp, and is worn by the priest above the alb or surplice. The decoration (*orphrey*) consists of two broad bands from neck to bottom of the garment; a hood is behind, *originally designed to be drawn over the head in wet weather, . . . hence the term *pluviale*, *Mantelletta*. A sleeveless vestment, not worn or thrust on the body, but fastened, and reaching to near the knees. It has openings for the arms, and a wide collar round the neck. Cardinals, bishops, abbots wear it. It covers the *rochet*, so that bishops do not wear it except outside their dioceses; the rochet uncovered being a sign of jurisdiction. Cardinals' mantellettes are in three colors (red, violet and rose), that of the bishop of one color. *Mozetta*. This is a papal garment but worn, with the Pope's privilege, by cardinals, bishops, abbots, etc.; it is worn by English cardinals. It is a short vestment open in front (but may be buttoned over the breast) and covers the shoulders; it has a small hood behind. Painters generally depict bishops wearing the mozetta as it is part of their state costume when not officiating in sacred ceremonies. As the mozetta or rochet, cardinals, bishops and other dignitaries do not wear it outside their jurisdiction unless it is over the mantelletta. The Pope has no less than five different mozettas. Of red satin during the holy season, except on vigils, ember days, masses of the dead and other penitential ceremonies, then it is of red serge or camlet. The rest of the year he wears a red velvet mozetta, except on penitential or sorrowful occasions, as Advent, Septuagesima, Lent, Vigils, etc., when his mozetta is of red woolen cloth. His mozetta on weekdays from Monday to Sunday in Low Week is of white damask. Four mozettas belong to the cardinals; red or purple silk, violet silk, rose-colored silk, violet serge. *Rochet*. A linen or lawn vestment, similar to the surplice but sleeveless or of less ample sleeves, worn by bishops, abbots and at times by canons. It reaches only to the knees. The uncovered rochet is sign of jurisdiction. *Scapular*. The hood and cloak of the monastic orders. This term is also used by the Catholic Church to designate two small pieces of cloth worn over the shoulders under the ordinary garb, connected by cords and reaching almost to the feet. The scapular of the Holy Trinity is of linen with a red and blue cross; the scapular of the Servites is of black woolen material; that of the Immaculate Conception of light blue cloth; that of the Passion in red. *Surplice*. A long, loose vestment worn over the cassock in choir and in the administration of the Sacrament. It is one of the most modern of ecclesiical garments. It is composed of white linen with wide sleeves. Pugin calls it an enlarged alb. The surplice is sometimes termed *cotta*, but others term the sleeveless or short-sleeved short surplice a *cotta*. The Greek Church has a vestment termed *phorion* which consists of a long woolen band enriched with embroidered crosses.

**Papal Vestments.** In the ceremonies of the Pope's investiture he wears the *tiara* or triple-crowned head-piece. Up to the time of Boniface VIII (end of 13th century) the Pope was decorated with a single crown; he added a second crown. Benedict XII (about 1334) added the third crown. The three crowns have been claimed to refer to the Trinity, also to his power over Heaven, earth and purgatory; others affirm they denote temporal power over the Roman states, spiritual power over the souls of men, and ruler over the kings and potentates of Christendom. It has been termed *regum, paplis mitra, physgium*, etc. The cap is of thin metal or cloth of gold, but fastened, and opened. It is of foliated gold adorned with pearls, and sometimes set with jewels. It is only worn on the most solemn ceremonies. Above an alb of fine linen, of which the lower border is decorated with narrow lace, the Pope wears a stole embroidered with gold. An ample mantle covers the pontiff's body; it is termed a *pluviale*, fastened in front by a magnificent clasp (*agrafe*) enriched with pearls. The pearls are arranged in a triangle, while in the *formale* (mentioned above) of the cardinals they are in a perpendicular line. It is a souvenir of the *rational* (breastplate) of the Jewish high priest. In celebrating mass the Pope never wears the tiara but a mitre, the same as that of a bishop. But what is termed the *mitra prehosa* differs from that of a bishop, the mitre is gold set with precious stones and a cross in front with a plate of gold, reminder of the mitre of the high priest of Mosaic law. Besides a white *soutane* (cassock) and *rochet* (see above) the Pope is clothed with an *amice* and an alb drawn in at the loins. The cardinal-deacon now hands him the stola enriched with sapphires, and the fanon, which later covers the shoulders and part of the breast. The stole, of which the two ends hang down,
is then covered over by the sub-diagonal tunic. The pontiff is lastly dressed in a chasuble on which the face, short sleeves, also on this last is placed a pall. In reception, in his apartment, when not giving audience, the Pope is clothed in a white cassock (this white cassock has been worn by the popes since early centuries). The shoulders are covered with a soprano or kind of cloth the face, short sleeves, also on this last is placed a pall. In the vigil of Quasimodo the head of the Pope is covered with a white calotte (skull cap). His foot covering of cloth has on its upper part a cross embroidered in gold. The Pope’s ring is conferred in conclave and is adorned with a representation of Saint Peter fishing and the pontiff’s sign manual. On the death of the Pope, the ring is broken; his successor always receives a new ring.

Costume of the Monastic Orders. — The characteristics of the outer robes of the different orders of monks are as follows: Brevillaries, all black. Branches of same: Camaldolites, black; Carthusians, white habit, saffroned feet; but wore long black cloak and hood out of boundaries; Vallombrosans, pale ash color or light gray habit; Cistercians and Trappists, white habit and cowl; Olivetans, white habit; Oratorians, black habit; Basilians, black habit. Branches of the Augustinians: Premonstratensians, habit brown or black, white cloak; Servites, habit black, leather girdle, and cape; Trinitarians, brown habit with blue or red ermine. On the breast: Braggines, black habit; Order of Mercy, white habit. Mendicant Orders: Franciscans are generally bare-footed or saffroned, their habit, originally gray, changed (after two centuries) to dark brown with knotted cord around the neck. Members of Franciscans: Capuchins, dark brown habit with long pointed hood, termed capuche; Poor Clares (nuns), gray or brown habit and cord, black veil; Observants, gray habit and cord; Cordeliers, brown habit and cord; Minimes, brown habit, short scapulary with rounded ends and cord of Saint Francis. Dominican Order, white habit under long black cloak with hood. Carmelites, dark brown habit, long scapulary, white mantle — the Scalzi branch is barefooted. Jesuits, black habit, straight black cassock, square black cap (biretta). Paulists, black cassock and biretta.

Clement W. Courme.

COSTUS, or COSTUS ARABICUS, an aromatic much esteemed by the ancients, is the dried root of Aplolita auriculata, a composite plant, and is not derived from the plant Costus arabisus, as is often supposed. It is native to the moist open slopes surrounding the valley of Cashmere. The roots are that are burnt for incense. They have a strong, aromatic, pungent odor, and are employed in protecting bales of shawls from moths. It is also used in India as a hair wash, as a stimulant in cholera and as a stimulating ointment.

COTABATO, köt-tä-ba-tö, Philippines, a province in the southern part of the island of Mindanao: area, including dependent islands, 5,344 square miles. The chief river is the Grande River of Mindanao. The Pulangui, the largest river of the Philippines. The province is the most fertile in the island, and rice, sugarcane, cotton, coffee, tobacco, corn and vegetables are raised for home consumption. The guma-pacha trade is quite large and is controlled by Chinese. The first United States military station was established in 1899, and in 1903 the province was placed under civil government. Pop. 4,150.

COTÉ, kö-tä, Aureole Suzor, Canadian artist: b. Athabaska, Quebec province, 1870. He was educated at the Commercial Academy, Athabaska, and as a youth was employed in Montreal in the decoration of the walls of churches and public buildings. He went to Paris in 1891, where he studied under Bonnat and Lefebvre, and won the grand prize for the competitive picture. ‘The Death of Archimedes’ in 1898. He began exhibiting in the Salon in 1894. In 1907 he returned to Canada, and was commissioned by the Dominion government to execute panel decorations and illustrations for the Parliament buildings at Ottawa. ‘The Landing of Jacques Cartier in 1534’ and ‘The Landing of Champlain at Quebec’ are two of the best known of his historical pieces; his portrait of Sir Wilfrid Laurier in the Parliament
buildings is a good example of his skill in portraiture; and in sculpture, his 'Habitant Drawing Wood.'

CÔTE D'OR, kot-dōr, France, a department formed of part of the old province of Burgundy; area, 3,392 square miles. The surface is in general rather elevated and is traversed by a chain of hills forming the connecting link between the Cevennes and the Vosges. A great part of the department is covered with forests. The valleys and plains are fertile and there is good pasture land; but vine culture is by far the most important branch of industry. The wines of the department are celebrated. Côte d'Or is watered by the Seine, which rises in the northwest, and by several of its branches; by the Saone and by Arroux, a tributary of the Loire. The climate is temperate; iron, coal, marble, gypsum and lithographic stones are found, the first in large quantities. Côte d'Or is divided into four arrondissements, 36 cantons and 717 communes. Capital, Dijon. Pop. 350,044.

CÔTE-D'OR (hill, or hillside of gold), a chain of mountains in France which separates the basin of the Saone from the basins of the Seine and Loire, and connects the Cevennes with the Vosges. The name has special reference to a small chain in Burgundy, so called from the abundance of excellent wine which they yield. Their height varies from 1,400 to 1,800 feet. The chain runs from north-northeast to south-southwest and is about 150 miles long, beginning at the plateau of Langres and extending to the sources of the Bourbince and the Dheune.

COTES, köts, Roger, English mathematician: b. Burbage, Leicestershire, 10 July 1682; d. Cambridge, England, 5 June 1716. He was educated at Trinity College, Cambridge, and in 1706 became first Plumian professor of astronomy and natural philosophy in his university. In 1713 there appeared a new edition of Newton's 'Principia,' thoroughly revised by the author with the assistance of Cotes, and containing, besides, many corrections from the pen of the latter. Cotes published only one independent work, an essay entitled 'Logometria' (1713); but after his death there appeared a volume entitled 'Harmonia Mensurum' (1722). His name is still given to a theorem discovered by him relative to the circle. The correspondence of Newton and Cotes was published in 1850. Newton is reported to have said: 'Had Cotes lived we might have known something.'

COTES, Sara Jeannette Duncan, Canadian author: b. Brantford, Ontario, Canada, 1862. She attended journalism as a correspondent for several Canadian and American newspapers at the Cotton Centennial in New Orleans in 1884-85; served on the staff of the Washington Post, Toronto Globe and Montreal Star; married 1896 to C. Cotes, Simla, whom she accompanied to India. Her books include 'A Social Departure' (1890); 'An American Girl in London'; 'A Daughter of To-day'; 'Vernon's Aunt, an Oriental Story'; 'The Simple Adventure of a Mem Sahib'; 'His Honor and other small fruits.' The Simla Mission (1898); 'The Path of a Star' (1899); 'On the Other Side of the Latch' (1901); 'Those Delightful Americans' (1902); 'Cinderella of Canada' (1908); 'The Consort' (1912); 'Her Royal Happiness' (1915).

COTES-DU-NORD, kot dü-nōr, France, a maritime department in the north, forming part of ancient Brittany; capital, Saint Brieuc; area, 2,786 square miles. The coast extends about 150 miles; the herring, pilchar and mackerel fishing is actively pursued. One of the main branches of industry is the rearing of cattle and horses; in manufacturing, the spinning of flax and hemp and the weaving of linen and sail-cloth. Among the minerals are iron, lead and granite. Pop. 605,523.

COTGRAVE, Randle, English lexicographer: b. Cheshire; d. probably 1634. He was secretary to William Cecil Lord Burghley, to whom he dedicated the French-English dictionary by which alone he is remembered. This work appeared in 1611, and is important not only as being the first of its kind, but as a valuable source of material for the elucidation of the philology of the English and French languages. It was remarkably accurate and reliable for its time, and has been several times reissued. Of Cotgrave's life very little is known.

COTHURNUSS, kö-th Chernus. See BUSKIN.

COTIDAL, kö-ti'dal, having the tides at the same moment of time. Cotidal lines are imaginary lines marked on the surface of the globe, indicating where the tides are in the same state at the same time.

COTILLON, kö-ti'lon, a lively dance of French origin performed by eight persons together, resembling the quadrille which superseded it. The name is now given to a dance which often winds up a ball, and which is danced with any number of dancers and with a great variety of figures, the pairs of dancers following in this the leading pair, and partners being successively changed. Consult Grove, 'Dancing' (in the 'Badminton Library,' London and Boston 1895).

COTIN, kö-tin, Charles, French author: b. Paris 1604; d. Dieppe, 31 January 1682. He is indebted for his notoriety, in a great measure, to the satires of Boileau. Among his poems are some which rise above mediocrity. It has often been supposed that Boileau introduced the name of Cotin into his satires because it furnished a convenient rhyme, and Moore refers to this in his 'Life of Byron.' Unluckily his follies drew upon him a new enemy in Mollière, who, in his 'Femmes Savantes,' introduced him on the stage and exposed him to ridicule under the name Trissotin, which Mollière at first wrote 'Tricotine.' His knowledge of Oriental and classic languages was extensive and he was a member of the literary circle of the Hôtel Rambouillet. He was an abbé and a successful preacher. His 'Œuvres Mêlées' appeared in 1659 and his 'Œuvres Galantes' in 1653.

COTINGIDÈE, an extensive family of passerine birds, the cotings allied to flycatchers, and inhabiting the forests of tropical America. They are of moderate or small size; frequent tall trees in most cases; and feed on insects, snails, etc., and also largely on berries and fruits. The plumage is generally plain, rufous, green or gray, the females being nearly always dull, although many of the males are very brilliant, and some species are extraor-
dinary among forest-birds in being pure white. The cotongas include some celebrated South American species, as the bill-bird, umbrella-bird and cock-of-the-rock.

**COTNER UNIVERSITY.** located at Bethany, Neb., was founded in 1889 under the auspices of the Disciples of Christ. It was named in honor of one of its most liberal patrons. The first building was erected on a prairie farm about five miles from Lincoln (q.v.), and the college was called Cotner. By the sale of lots a fund was obtained for the school, and the village of Bethany, which has grown up around the university, has a population of about 1,200. In 1915-16 there were connected with the school 27 professors and instructors, and, in the college department, 250 students. The library contained about 5,000 volumes; the grounds and buildings were valued at $134,000. The school has the following departments: College of Liberal Arts, embracing all branches of a university course, leading to A.B. and A.M. degrees; Normal College, for training teachers, leading to first grade and life professional certificates; Biblical College, for training teachers and missionaries; Academ-emy, corresponding to the regular four years' high school course; School of Art, School of Music, School of Expression, Commercial School and School of Home Economics.

**COTO,** the reddish-brown, aromatic and slightly bitter bark from various South American sources, one of which seems to be *Pithe- comia*

**COTONEASTER,** kô-tô-nè-ăs'ter, a genus of plants of the natural family *Rosaceae.* They are closely related to Crataegus, but the fruit consists of bony carpels, each containing two similar ovules. There are some 20 species, mostly natives of Europe and western Asia. The plant is a shrub or small tree, some of the species being evergreen. It has been introduced and cultivated in the United States and England as an ornamental shrub, having bright red flowers in the fall. The evergreen or fire-thorn (*C. pyracantha*) is a species which has escaped from cultivation and is found wild among the thickets about Philadelphia and Washington. Several species, among which are *C. microphylla* and *C. rotundifolia,* come from India, and are especially used for covering walls and rock-work. The seeds of these are said to contain prussic acid. Cotoneasters thrive in any good, well-drained garden soil not too shaly situated.

**COTOPAXI,** kô-tô-päh'hé or kô-tô-pak'si, the most remarkable volcanic mountain of the Andes, in Ecuador, about 60 miles northeast of Chimborazo; lat. 0° 43' S., long. 78° 40' W. Its upper portion, a perfect cone 4,400 feet in height and perpetually snow-covered save near the crater, shows conspicuously. This covering of snow conceals from the eye of the observer the many cones of the ground. No point or mass of rock penetrates the coating of snow and ice, or breaks the exact regularity of the conical figure. The crater is surrounded by a small circular wall, which, when viewed through a telescope, appears like a parapet. Its height above the sea is 19,550 feet. The valley at its foot, however, is itself 9,000 feet above the sea. Remarkable eruptions, spreading destruction over the surrounding plains, took place in 1698, 1738, 1742, 1744, 1766, 1803 and 1877. In 1698 the eruption destroyed the city of Tacunga, with three-fourths of its inhabitants, and other settlements. In 1744 its roarings were heard as far as Honda, on the Magdalena, 600 miles distant. With respect to the explosion of 1803, Humboldt observes: "At the port of Guayaquil, 52 leagues distant in a straight line from the crater, we heard the continuous noise of this volcano, like continued discharges of a battery; and we distinguished these tremendous sounds even on the Pacific Ocean." A similar eruption took place in 1885. Part of a neighboring village was overwhelmed; and at Guayaquil a sound was heard like the incessant discharges of heavy artillery, shaking the earth and causing doors and windows to rattle. Humboldt found it difficult to ascend the mountain as far as the limit of perpetual snow, and he pronounced it impossible to reach the summit. It has been ascended, however, at least twice, on the latter occasion by Mr. Whymper in 1880, who remained 24 hours on the top. He reports that more or less smoke and steam are always issuing from the crater. The most recent violent eruption occurred in 1903.

**COTSWOLD.** See SHEEP, DOMESTIC.

**COTTA,** kô'tă, Johann Friedrich, Baron COTTENDORF, German publisher: b. Stuttgart, 27 April 1764; d. there, 29 Dec. 1832. He began business at Tübingen, but in 1811 removed to Stuttgart. He was the publisher for many great writers in Germany, including Goethe, Schiller, Wieland, Richter, Uhland, Fichte, Hegel, the Humboldts and others. He published Schiller's 'Horen' (1795) and the *Allgemeine Zeitung* at Augsburg (1798). In politics he bent his efforts toward social reform, especially toward the improvement of his estates and the abolition of serfdom.

**COTTAGE,** originally a small house with no land attached to it. Such ejections were discouraged by old English law. No one was allowed to erect a cottage unless four acres of freehold land in the village were added to it, or more than one family was to inhabit it. It had usually no second story, and was built of brick or stone, very rarely of wood. Recently the term has been extended to mean country houses of moderate extent, and especially summer residences of well-to-do families.

**COTTER,** Joseph B., American Roman Catholic prelate: b. Liverpool, England, 1844; d. Winona, Minn., 1909. He came to the United States in 1850, studied theology at Saint John's University, Collegeville, Minn., was ordained priest 1871, and was pastor of Saint Thomas' Church, Winona, Minn., 1871-89, when he was consecrated first bishop of the Roman Catholic see of Winona. He was a pronounced advocate of total abstinence, and was three times president of the Catholic Total Abstinence Union of America.

**COTTER'S SATURDAY NIGHT.** The. This poem, written while Burns was farming and composing poetry at Mossgiel, in 1785, depicts "the lowly train" of life that the poet best knew. Although in origin and form the poem is a hybrid — the plan and title suggested
by Ferguson's 'Farmer's Ingle'; the scene and sentiment reminiscent of Gray and Goldsmith; the form a medley of English and Scottish idiom in Spenserian stanza—the inspiration and spirit are native. The poet's brother tells us that "the Cotter is an exact copy of my father in his manners, his family devotions, and exhortations." It is with genuine affection that Burns has pictured the home-coming of "the toil-worn Cotter" and his bairns, the welcome to the "feeboor-lad," "the cheerful supper," the family worship around the ingle. This homely realism, this sincerity of feeling, have given to the poem not only its instant popularity, but its enduring place in English literature. Modern readers may find both forced sentimentality and artificial poetry in those stanzas in which Burns wholly abandons his native idiom, and with it his poetic instinct, for stilted eulogy of simple love and piety, and rhetorical scorns of betraying villainy and religion's pomp. But no one can fail to feel, in the scene itself and in the final stanzas, that true love of country that is love of man. It is this humanity that has made Burns not only "the patriot-bard," but the poet of democracy, and 'The Cotter's Saturday Night' not only a Scottish, but an idol of the English. Consult 'The Cambridge Hist. of English Literature' (Vol. XI, Chap. 10) and 'Dictionary of National Biography.'

FRANCES W. CUTLER.

COTTET, kɔtˈtɛt/, Charles, French landscape and genre painter: b. Puy, Haute-Loire, 1883. He studied under Maillart at the Académie Julian and under Roll. He at first joined the Impressionists and later helped to found the Société Nationale des Beaux-Arts. He is known chiefly as a painter of Breton subjects. A cycle of 10 landscapes, entitled 'The Country of the Port' (1938), are now in the Luxembourg, attracted wide attention. He also painted many Venetian, Egyptian, Algerian and Spanish subjects. There are also a few Icelandic landscapes by him. His paintings include 'The Port of Camaret,' and others in the Luxembourg Museum; 'Go to Church in Brittany' (Vienna); 'A Moonlight Night' (Philadelphia); 'Breton Women in Mourning' (Cincinnati). He is represented also in Buffalo and Providence, and is an officer of the Legion of Honor.

COTTER, TENURE, a system of tenure according to which laborers rent small portions of land directly from the owner, or from a farmer, often giving personal service as part of the rent, and holding by annual tenancy. Later the "cotters" was used to denote peasant farmers whose rent was determined by competition. Ireland was the chief representative of this system. The same class was called "crofter" in the west of Scotland. The enactments of land laws by Parliament has changed the situation and alleviated the resulting evil conditions to some degree. See IRISH LAND LAWS.

COTTIN, kɔtˈtɛn/, Marie (called also Sophie) Risteanu, better known as Madame Cottin, French novelist: b. Paris, 22 March 1770; d. 25 Aug. 1807. In 1797 she married M. Cottin, a Moveau Fellow of the Académie Française; and thenceforth she followed literature. Her best-known work is 'Elizabeh, ou les exilés de Sibérie' which was imitated by Xavier de Maistre in 'La Jeune Sibérienne.' It was translated into English by G. R. Lockwood (New York 1869); other novels are 'Claire d'Albe'; 'Malvina'; 'Amélie'; and 'Mathilde.' Consult Saint-Beuve, 'Causeries du Lundi' (Vol. XII) and Kavanagh, John, 'French Women of Letters' (Leipzig 1862).

COTTLE, Joseph, English bookseller and author: b. 1770; d. Bristol, 7 June 1853. The earliest poems of Southey and Coleridge were published by him, and these two poets in later life expressed their appreciation of his assistance and kindness to them. He also published Coleridge's periodical, The Watchman, and the 'Lyrical Ballads of Coleridge and Wordsworth' (1798). He then retired from business. His own works include 'Malvern Hills'; 'John the Baptist'; 'Alfred, an Epic'; 'The Messiah.' Cottle's poems, and those by his brother, Amos, are satirized in Byron's 'English Bards and Scotch Reviewers.' A prose work, 'Early Recollections,' chiefly relating to Samuel Taylor Coleridge (1837), is marked by glaring bad taste, though it has some value as containing many details of the early life of the poet. A second edition appeared (1847), entitled 'Reminiscences of Coleridge and Southey.'

COTTON, Charles, English poet and translator: b. Beresford Hall, Staffordshire, 28 April 1630; d. Westminster, February 1667. In 1668 he inherited his father's estates, near the river Dove, on the banks of which he built a fishing house, in which he entertained for years his friend Izaak Walton. His works are numerous and nearly all in verse, including 'Scarcornicles' or Virgil Travestie' (1664–70), being the first and fourth books of Virgil's 'Aeneid,' in rather indelicate burlesque; and a translation of Montaigne's 'Essays' (1685), his best work. After the death of Cotton's first volume was published, entitled 'Poems on Several Occasions.' He also translated 'Horace,' a tragedy of Corneille (1671); but the work by which he will be best remembered is the part which he added to the fifth edition of Walton's Complete Angler—"Instructions How to Catch a Trout and Grayling in a Clear Stream."

COTTON, Charles Stanhope, American naval officer: b. Milwaukee, Wis., 15 Feb. 1843; d. Nice, 19 Feb. 1909. He entered the Naval Academy 1858, served on the frigate Saint Lawrence, which captured the Confederate privateer Petrel, in July 1861; on the flagship Minnesota 1861–63; took part in the battle between the Monitor and Merrimac 8–9 March 1862; and served during the battle of Mobile Bay and subsequent operations to the surrender of Fort Morgan. He was promoted commander, 25 April 1877, and was on the Asiatic station 1880–83; captain 28 May 1892, and commanded the flagship Philadelphia on the Pacific station 1894–97. During the war with Spain he commanded the auxiliary cruiser Hesperus. In 1900 he became rear-admiral and from 1903 commanded the European squadron.

COTTON, John, American Puritan clergyman: b. Derby, England, 4 Dec. 1585; d. Boston, Mass., 23 Dec. 1652. He was educated at Trinity College, Cambridge, and was afterward Fellow of Emmanuel College, Cambridge, where he became a lecturer and tutor. About 1612 he became vicar of Saint Botolph's Church in Boston, Lincolnshire, where he remained 20 years, noted as a
COTTON

preacher and controversialist, and inclining in his doctrine and practices toward the Puritan worship. He was at length informed against for not kneeling at the sacrament and cited to appear before Archbishop Laud in the high commission court. Upon this he sought safety in flight, arriving in Boston 4 Sept. 1633. In October he remained on a day of fasting, by imposition of hands by the minister and two elders, teacher of the church in Boston and colleague with Mr. Wilson the pastor. In this connection he remained over 19 years, with such influence and standing that he has been called the patriarch of New England. His reputation for learning was very high, and, as was frequent among the ministers of that time, was sustained by the accumulation of obscure and professional knowledge. He was a critic in Greek, wrote Latin with elegance, and could discourse in Hebrew, and spent 12 hours a day in reading, his favorite author being Calvin. His pulpit eloquence was famous for its simplicity and plainness, and his discourses were exceedingly effectual in exciting attention to religious subjects. The public lectures were numerous, consisting of sermons and controversial works upon most of the subjects discussed in his time. The most important are those published in the course of his controversy with Roger Williams. 'The Bloody Tenent Washed and Made White in the Blood of the Lamb' (1647), 'A Treatise Concerning Predestination,' and 'The Keys to the Kingdom of Heaven and the Power Thereof,' on the nature of church government. He maintained the church is constituted of elders and brethren; that the elders are entrusted with the government to the extent of administering communications, yet that there is so much liberty left among the brethren that nothing of common concern can be imposed upon them without their consent. Against Williams he defended the interference of the civil power in religious matters for the support of the truth, maintaining the duty, for the good of the church and of the people, of putting away those who, after repeated admonitions, persist in rejecting fundamental points of doctrine or worship. A tablet, with a Latin inscription by Edward Wadsworth, was erected in Saint Botolph's Church in 1857, in honor of Cotton, chiefly by contributions from his descendants in Boston, Mass. He published 50 volumes, among the most important of which are 'A Brief Exposition upon Eclesiastes'; 'A Brief Exposition upon Canticles'; 'A Treatise Concerning Predestination,' and the famous catechism entitled 'Spiritual Milk for Babes,' etc. A part of his controversy with Roger Williams may be found in the 'Publications of the Narragansett Club' (Vols. I and II, Providence 1866-67). Consult Cotton, Mather, 'Magna2' (1702); McClure, 'Life of John Cotton' (1846); Tyler, 'History of American Literature' (1878); Norton, 'Abel Being Dead, Yet Speaketh;' or the Life and Death of that Deservedly Famous Man, John Cotton' (London 1658; Boston 1834).

COTTON, Sir Robert Bruce, English antiquarian: b. Denton, Huntingdonshire, 22 Jan., 1571; d. London, May 1631. He was educated at Westminster School under the famous Camden; and later at Cambridge. He settled in London, devoting his time to antiquarian pursuits, and employing himself especially in collecting ancient deeds, charters, letters and other manuscripts of various kinds, illustrative of the history of England. He was one of the first members of the Antiquarian Society; and not only promoted the general objects of that learned association, but also assisted, with his literary treasures as well as with his purse, Camden and other writers on British archaeology. He sat in Parliament under James I and in the first Parliament of Charles II's reign, his sympathy being against the growing power of the king. In 1629 he was falsely accused of having written an obnoxious political tract, and was thrown into the Tower; yet although he succeeded in establishing his innocence, his library was sequestrated, and his death seems to have been partly due to his being deprived of the company of his books. Among his works may be mentioned, 'Power of the Peers and Comons of Parliament in Point of Judicature' (1640); 'Cottoni Postuma—Choice Pieces of that Renowned Antiquary' (1672); 'Divers Short Pieces Exposed to Publick Light by J. Howell' (1679); 'Speech before the Privy Council Touching the Alteration of Coynt' (published in Shaw, 'Select Tracts and Pamphlets' (1892). Consult Kiffis, 'Robert Bruce Cotton' (in 'Biographia Britannica,' London 1797); D'Ewes, 'Autobiography' (2 vols., ib., 1845); Nichols, 'Progresses of James I' (4 vols., ib., 1828); Gardner, 'History of England' (ib. 1883-84). See COTTONIAN LIBRARY.

COTTON. This important vegetable fibre is readily distinguished from all other commercial fibres by its spiral twist, a character that renders it especially valuable for spinning. The wide-spread distribution of the plant, its adaptability to a great variety of soils and climates, and its comparative cheapness, all tend to make it one of the great staples of agricultural production, and it is probably used by more people and for a wider range of purposes than any other fibre. The country in which cotton was first used has not been definitely determined. It had long been known in India before the conquest of that country by Alexander. The writings of Herodotus and Pliny tell us that the excellence of its fibre was known to the Greeks and Romans. Columbus found it in use by the natives of the New World and in the conquests of Mexico and Peru cotton cloth was found to be in use. Ancient Peruvian tombs have yielded mummy clothes of cotton but those obtained from Egyptian tombs appear to be linen, although it is probable that cotton was known in that country from quite early times. While the principal commercial value attaches to the beautiful fibre that surrounds the seeds, the seeds themselves have important uses aside from that of producing a new crop. The stems and roots are also of value and the so-called by-products now utilized add fully 20 per cent to the value of the commercial cotton crop.

Botany, Commercial Classification, etc.— The cotton of commerce is a product of plants of the genus Gossypium, a member of the Malvaceae or Mallow family of plants. There have been many opinions as to the number of species of Gossypium, but no two authorities agree. In a recent widely known catalogue of plants, about 50 species are recognized, and probably four or five times as many names combined or rejected. While this list of names
is quite large there are only five or six species whose product enters into commerce and the bulk of the production is the product of two species of plants: the Indian upland cotton, G. hirsutum, the source of the Sea Island cotton. All the species are of tropical origin. They are small trees, shrubs or herbaceous plants, enduring for one, two or more years, dependent upon the species. There has been much discussion regarding the origin of the many varieties of cotton grown in this country, but by almost common consent they are all attributed to the two species mentioned above or to some of their numerous hybrids. The Sea Island cotton is undoubtedly indigenous to America and was the type observed by Columbus, but the evidence for the American origin of the species to which the Upland cottons are referred is less conclusive. These two classes of cotton differ materially in their seed characteristics. The Sea Island has a small black seed from which the lint separates readily, while the Upland cottons have large seeds which are greenish in color and surrounded by a short dense fuzz beneath the lint. Both of the species are perennial in climates without frost, but in cultivation they are treated as annuals. The plants are shrubby, 3 to 10 feet high, more or less branched and bear large, alternate 3- to 5-lobed leaves which when held to the light show numerous pellucid dots. The flowers, which resemble to a degree those of the hollyhock, mallow and hibiscus, are white when newly open in the varieties of Upland cotton, turning red with age, and a creamy yellow in the Sea Island, with a purplish spot at the base of the petals. The flowers are usually single in the axils of the leaves except in those varieties designated "cluster types" in which a number are produced together. Surrounding this conspicuous flower are three or more heart-shaped, fringed or deeply cut bracts which constitute the so-called "squares." The indenterations of the squares are deeper and more numerous in the Sea Island varieties than in the Upland forms. The capsules within the squares are the "bolls." The cotton boll contains the seed covered with the white or slightly tawny lint. The bolls of Sea Island cottons are uniformly smaller and more sharply pointed, contain fewer and smaller seeds and longer lint than the Upland bolls. The lint of the Sea Island cotton is from one and one-half to two and a half inches in length, while the Upland cotton of the G. herbaceum type seldom exceeds one and a half inches in length and much of it is shorter. There are numerous hybrids between these two types as is shown by the character of the seed and lint. The Sea Island cotton flourishes along the coast region of South Carolina, Georgia and Florida, and also in Egypt, the famous Egyptian cotton being a development from American Sea Island seed sent to Egypt a number of years ago. The varieties of Sea Island cotton furnish the finest and most valuable fibre, but their production is restricted by the soil and climatic requirements of the plants. The Upland varieties, while not furnishing so high a quality of fibre, are grown over a much wider territory and the total production far exceeds that of the Sea Island. In India there is a perennial species to which the name G. arboreum is given. It is a small tree and grows about the temples, but is not cultivated to any considerable extent. It produces a fine leaf staple, but its former place of culture is believed to have been overrated. This cotton usually called Nurma, from its growing about temples, is also known as Deo cotton. From South America are received a number of varieties of cotton that have usually been attributed to G. peruvianum. They have a short, strong, curly fibre somewhat resembling wool and their smooth black seeds adhere in an oval mass, on which account they are called kidney cottons. The plant which produces this cotton is a small short-lived tree and like the Nurma cotton of India will not mature in the United States.

When considered commercially the fibre produced by the seed is the most valuable product of the cotton plant. Viewed under a good microscope it appears to be an irregular, flattened, twisted tube, the edges of which are somewhat thickened and corrugated. This twist distinguishes cotton from all other fibres and it is to this character that its superior value for spinning is due. The fibre of some of the wild species of cotton is short and such as do not are of little value. If not thoroughly matured the fibre is more flattened, less twisted and thinner walled. Such fibres, if abundant in a sample, depreciate its value as they curl up, do not spin well nor dye evenly. Among the leading commercial types of cotton the fibre varies from one-half inch to two inches or more in length and is exceedingly fine, the extreme diameter measurements being 0.0084 to 0.0064 inch, the longest and finest fibre being of the Sea Island types. The commercial grading of cotton is as follows: Samples, the average fibre of which is under 0.98 inch (25 millimeters) in length are called "short staple;" those between 0.98 and 1.17 inches (25 to 30 millimeters) are called "medium" and from 1.18 to 1.57 inches (30 to 40 millimeters) are called "long staple." Those exceeding 1.58 (40 millimeters) are called "extra long." The "long" and "extra long" fibre produced in the United States are all from Sea Island varieties and their hybrids. Those under 1.58 are being called Upland cottons of the G. herbaceum type. Other classifications adopted by the New York Cotton Exchange are: What are known as "full grades" are designated by the words "fair," "middling fair," "good middling," "middling," "low middling," "good ordinary," and "ordinary." To designate qualities of staple a half grade above the grades mentioned, the prefix "strictly" is used. Quarter grades between the half grade and the next higher full grade are referred to as "barley" prefixed to the full grade term and the quarter grade below the half grade is designated by the prefix "fully" to the full grade below. As examples a staple graded as "barley middling" is a quarter grade below middling, "strict low middling" is a half grade between middling and low middling and "fully low middling" is the quarter grade between the last and low middling, a full grade. This classification is generally adopted in this country, while for Europe that of Liverpool is followed. This differs from that of the New York Cotton Exchange in being somewhat higher in the low grades and lower in the high grades. These classifications are based not only upon the length of staple, but its fineness, color, freedom
COTTON CULTIVATION IN THE UNITED STATES

from dirt, etc., and are more or less subject to differences in judgment, although little variation will be noted in the timeliness in determining the quality of a sample when presented for sale.

Like every crop of wide cultivation many varieties of cotton have been produced and named. Some of these achieved a wide reputation for some superior quality, flourished for a time and then disappeared from seedsmen's lists. While particular varieties may cease of cultivation in a short time, the general type remains and types of cotton can now be readily recognized that have been in cultivation for more than half a century. The well-known tendency of the plant to vary is responsible for the production of so many varieties. There is perhaps no cultivated plant that responds so quickly to changed conditions of soil, climate and cultivation as the cotton plant, and for this reason the improvement and deterioration of many varieties. The most successful planters keep up the quality of their crop by continued selection of seed and for a crop that depends so much on the quality of the staple this is one of the most important considerations. The practice of planting seed purchased from gins and mills does more to depreciate the quality of the lint than any other factor.

COTTON CULTIVATION IN THE UNITED STATES. From the time its seeds are planted until it reaches the consumer in its variously manufactured forms cotton employs more human beings than any other product or industry. This is not surprising when we consider that 2,500,000 farmers and laborers produce the crops of the United States, about 1,500,000 the crops of other countries, and that about 1,750,000 wage earners throughout the world are employed in its manufacture, to say nothing of the many thousands who manipulate the cotton lint and its branches from the producer until it reaches the mill and the consumer.

Cotton Area.—The cotton producing region of the United States embraces nearly all of the territory lying south of the 37th degree of latitude, and covers 25 degrees of longitude and 10 degrees of latitude. A line drawn from Norfolk County, Va., to Presidio County, Tex.—more than 1,300 miles—would indicate the eastern and western limits of the cotton area, and a line from Osage County, Okla., to the mouth of the Rio Grande in Texas—about 500 miles—the northern and southern limits. Cotton is cultivated in only eight counties in the extreme southeastern corner of Virginia, while in North Carolina its cultivation extends from the coast to the mountain ranges of the western part of the State. In South Carolina it is cultivated in every county, as the same may be said of Alabama, and of Georgia—except as to four mountain counties on the northern border. In all Mississippi only two counties on the Gulf Coast may be excluded. The section of Florida extends from its western boundary almost to the Atlantic Ocean, and as far south as Sumter County, and in Tennessee it embraces all of the territory lying west of the Tennessee River, and includes a half-dozen counties in the southern central section and three counties in the extreme southeast corner of the State. In Missouri 8 or 10 counties in the extreme southeast and lying along the Arkansas State line cultivate cotton to a limited extent, and all of the counties in Arkansas except the four mountain counties in the extreme northwest. All of the Louisiana parishes grow cotton except one in the southwest, and eight in the southeast section bordering the Gulf and lying adjacent to the mouth of the Mississippi. Of the 250 counties in Texas all cultivate cotton except 38 located in the Pan Handle and the extreme west, and in Oklahoma all except nine lying along the Kansas border. Outside of what is known as the great cotton belt cotton is cultivated to a limited extent in Fulto County, Ky.; Eddy County, N. Mex.; Yuma, and Manicopa counties, Ariz.; Imperial, and Riverside counties, Cal.

Geographical Divisions.—Geographically the cotton States may be divided as follows: Atlantic States—consisting of Virginia, North Carolina, South Carolina, Georgia and Florida; Middle Gulf States—Alabama, Mississippi, Louisiana, Arkansas, Tennessee and Missouri; Southwestern States—Texas and Oklahoma. Of the total area devoted to cotton the Atlantic States cultivate about 27 per cent, the Middle Gulf States about 33 per cent and the Southwestern States 40 per cent. The largest area ever devoted to cotton was 37,400,000 acres planted in 1914.

Limits of Area.—But this by no means represents the limit of the tillable area that might be put in cotton. Of the total cultivated area in the 10 principal cotton States only an average of 44.5 per cent is planted in cotton, about 41 per cent in corn, about 12.5 per cent in wheat, oats and hay, and the remainder in miscellaneous crops. Texas could double its present cotton area without encroaching upon other crops, and likewise Oklahoma could
greatly increase its cotton area. Besides there are large areas in southern California, Arizona, Nevada, New Mexico, Utah, Kansas and Ken-

tucky suitable for cotton culture. In addition to this there are in nine of the principal cotton States (not including Florida and Tennessee) nearly 31,000,000 acres in swamp and overflow lands, about 17,000,000 acres of which, if reclaimed, would be suitable for cotton growing.

**Temperature.** — The average maximum and minimum temperatures for the northern, middle and southern sections are as follows:

**Rainfall.** — The rainfall varies from month to month and from season to season, the average precipitation in some of the States even differing considerably. Texas, for instance, makes its crops with an average rainfall during the season of less than three inches, while the crops of Louisiana are made with an average of about five inches. The following is the average rainfall for 10 years (1904–13) in the 10 principal States, from April to November, inclusive (inches): North Carolina, 4.27; South Carolina, 4.15; Georgia, 3.94; Alabama, 4.10; Mississippi, 3.95; Missouri, 3.32; Black Arkansas, 4.23; Tennessee, 3.89; Texas, 2.88; Oklahoma, 3.29. The following is the 10-year average monthly rainfall during the growing and maturing season in each of the geographical divisions:

The average for the entire season in the Atlantic States is 4.08 inches, in the Middle Gulf States 4.31 inches, in the Southwestern States 3.08 inches and for all States 3.97 inches.

**Soil.** — Within the limits of the cotton belt, wherever climatic conditions are favorable, cotton may be produced on almost any character of soil. It is grown on light sandy soils, on loams, on heavy clay and bottom lands, the yield varying with the different types. On light sandy soils, unless well fertilized the yield is small; on clay and bottom lands the yield is good, unless the rainfall happens to be excessive, when the plants develop too much stalk and limb at the expense of fruit. The fine prairie lands of Texas are high in yield, but are often subject to prolonged droughts, while the Delta lands of the Mississippi, the most fertile in the South, are liable to overflow. Perhaps the safest soils for the cotton plant are the medium grades of loam. Without considering their chemical composition, the soils of the cotton belt may be classified as follows: pine lands and pine hills, metamorphic or Piedmont region, alluvial lands, oak and high loam region, black prairie lands, bluff and brown loam table lands, red loam lands, valley lands and sand hills. The pine lands and pine hills, which produce about 18½ per cent of the cotton crop, extend all along the Atlantic and Gulf coasts from Virginia to the Trinity River in Texas, the width of which varies from 50 to more than 150 miles. The metamorphic or Piedmont region, producing about 17 per cent of the crop, lies along the border of the pine hills region and extends
through North and South Carolina, Georgia and well into Alabama. The prairie lands, which generally produce the largest proportion of the crop, or nearly 21 per cent, including the black prairies of Alabama, Mississippi and Tennessee. This is followed by Texas, the gray silt prairies of Arkansas and the red loam prairies of western Texas. The oak and hickory lands upon which about 14½ per cent of the crop is made extends over eastern Texas and northwestern Louisiana and southern Arkansas. Four counties in western Alabama and three in northeastern Mississippi are included in this region. The alluvial lands, yielding nearly 15 per cent of the crop, cover extensive areas in all of the Southern States and in almost every region in each State. The bluff and brown loam table lands lying east of the Mississippi Delta extend all the way from the mouth of the Ohio River to Baton Rouge, La. These lands produce about 7 per cent of the crop. The valley of the Mississippi River in Alabama and Tennessee, and the valleys of the Coosa River and its tributaries in Alabama and Georgia, make about 3 per cent of the crop, while the red loam lands in the southern half of Arkansas and in southeastern Oklahoma make about 2½ per cent.

Land Tenure.—According to the United States census of 1910, there were 1,714,149 farms that cultivated 32,043,838 acres in cotton and which produced 10,649,268 bales (501.7 lbs. to the bale), each farm averaging 18.7 acres and producing 6.2 bales to the farm. In the 10 principal cotton growing States there were 2,196,708 farmers, 1,421,991 whites and 774,777 negroes, or 65 per cent whites and 35 per cent negroes. This would indicate that about 65 per cent of the cotton crop is produced by white labor. This proportion however has increased since 1910, due to the cultivation of new lands in Texas and Oklahoma, so that the proportion of the crop now made by white labor is approximately 70 per cent. Farm tenure is divided into three general classes, viz.: Owners and managers for owners, cash-tenants and share-tenants. Owners and managers constitute about 44 per cent, share-tenants about 38½ per cent, and hired cash-tenants about 17½ per cent. As between land owners and managers, and tenants, land tenure is apportioned between the two races about as follows: white owners and managers 36.2 per cent, white tenants 28.5 per cent, negro owners and managers 7.2 per cent and negro tenants 28.1 per cent. Landowners and managers operate upon practically a cash basis—so far as labor is concerned—while cash tenants pay a money rent and supply themselves.

Share System.—The share system is based upon the practice of the landowner taking for rent a share of the crop, the share depending upon whether the land is cultivated mostly in corn or cotton, and to what extent the owner supplies the tenant with the necessities for making the crop. Some share-tenants furnish themselves with everything and pay one-fourth of the crop for the use of the land. Others look to the landowner to furnish the fertilizers, pay blacksmith accounts, keep of stock, etc., in which case they give the landowner his one-half share of the crop. Another class of share tenants are those who furnish nothing but their labor, the landowner taking two-thirds of the crop to cover land rent and expenses.

Cultivation.—The methods of cultivating cotton differ somewhat in the different sections according to the character of the soil. A diversity of methods is used, and improvements may be observed even in the same locality and when the same kind of soil is cultivated. The farmers in the pine hills practice shallow culture, while those of the prairie lands believe in deep culture; in the case of one the single-horse plows are used, in the other heavy double-horse plows. In some sections most of the cultivation is done with hand hoes, and in others with two-horse cultivators. On alluvial soils when the crop is laid by the land is generally left almost level, on most other soils in ridges or beds. In the southern part of Texas preparation for the crop begins 1 December, in many other regions plowing begins as near the time for planting as possible. In the eastern section commercial fertilizers are in general use, in the western section manures are used. On many farms crop rotation is followed, but the great bulk of the cotton crop is grown on the cotton lands of the previous year. After the final picking and before plowing for the new crop begins the old stubbs are dug up and turned under. Some farmers attach a drag chain to the mule and plow so arranged that the stalks may be drawn under the plow, broken up and turned under. The more progressive farmers use a stalk cutter usually attached to a cultivator. It is generally conceded that in preparing for a cotton crop the lands should be broken up as early as possible after the crop has been gathered, the earlier the better, so that all vegetation may be turned under while green and sappy, and so that the soil may be disintegrated and the insect killed by the winter freezes.

The plowing may be done in the fall or during the winter, or sometimes it cannot be done until spring. It all depends upon whether the old crop is early or late, whether the yield is light or heavy, cut 17½ per cent of the crop in December happens during February, or even in March, that picking the last of the old crop and plowing for the new one are going on at the same time in the same field. However, if possible, the land should be thoroughly broken up with a two-horse team, using a plow that will turn the soil 8 to 12 inches deep, the depth being governed by the character of the soil.

Bedding Up.—After breaking up the land the next thing to be done is to bed it up. For this purpose a one-horse turning plow should be used, the bed being formed by turning a furrow along one side of the field and another on the opposite side, running parallel to it and so close that the two furrows may lap. This may be repeated to build up the beds to the proper height. The beds are spaced at varying distances, on thin lands 2½ feet apart, on rich alluvial lands as in Mississippi Delta where the plants grow 9 to 10 feet high, at 6 feet. The average distance is about 4 feet. It is not an uncommon practice in cotton, not to break up the land at all, but to form the beds upon the alley left between the beds

of the previous crop. Sometimes fertilizers are dropped into the alley before the bedding begins. After bedding up is completed the next step is "bursting out the middles," or plowing out the alley with a "middle burster." This plow is applied to the alley and plows out the soil upon either side of the bed, making it more compact and leaving a good drainage trench.

**Fertilizing.** Many varieties of fertilizers are used in cultivating cotton. Barn-yard manure, cottonseed, manure and acid phosphate, and cotton seed meal mixed with acids are used to a limited extent, but the commercial fertilizers that contain available phosphoric acid, nitrogen or potash are in general use. Some of the cheap fertilizers contain only a small per cent of plant food, while the higher grades of "complete fertilizers" contain a very large per cent. Fertilizers should be carefully selected and determined by analysis, for what may benefit one variety of cotton may be harmful to another.

In the northern section of the cotton belt where the season is shortest a fertilizer should be selected that will force maturity, and such fertilizers should also be used in the hilly, well-drained sections of the field. The quantity to be applied to the acre is a matter of judgment, depending upon the quality of the fertilizer and the character of the soil. Some lands may require a half ton to produce the best results, others much less. The average quantity applied to the acre in all the cotton States is about 400 pounds.

Some farmers still adhere to the old method of applying the fertilizer, using a tin tube 5 or 6 feet long with a funnel at the upper end. The funnel is fed by hand from a bag filled with the fertilizer and suspended from the shoulder, the end of the tube being inserted in the soil where the fertilizer is to be dropped. Home-made fertilizers are generally broadcasted and harrowed in before the land is bedded up. The up-to-date farmer puts it in a fertilizer machine, consisting of a hopper mounted on a frame something like that of a wheelbarrow. The fertilizer is evenly distributed from the movable bottom of the hopper which alternately opens and closes by the revolutions of the wheel. Two shoes attached to the frame cover the seed and fertilizer.

**Seed Selection.** The seed to be planted should be carefully selected and reserved from the first pickings of the bottom or middle fruit of the plant, never from the last picking, or top crop. It would be far better if the seed could be taken from selected plants or rows of plants of prolific yield. Unfortunately too little attention is paid to seed selection, the common practice being to take the required number of bushels of seed promiscuously just as they come from the gin, or to buy them from a neighboring oil mill. There are any number of varieties of seed. Among the favorite early varieties are Cherry Cluster, Dickson, Drake Cluster, King and Welborn Pet; of the medium (date) varieties, Rainy, Alamo, Pima, Beulah, Elong, Peterkin and Petite Gulf; and of the late varieties Allen, Cook, Mammoth Prolific, Peeler and Texas Storm Proof. The seed are now planted almost entirely with machines, except where the stands are irregular and broken, which is usually done by hand and with the use of the hoe. A few farmers still adhere to the old method of opening the top of the bed with a light bull tongue plow, dropping in the seed by hand and covering them with a block or board drawn over the bed. The machine planter now used is so arranged as to open the furrow, drop the seed, and cover them. In this way, the seed is distributed more uniformly, but ensures a better stand while facilitating cultivation. Some of these machines also distribute fertilizers along with the seed, but this is not considered the most advisable method of fertilizing.

**Date of Planting.** The date of planting varies according to latitude and local conditions. There are a group of some thirty-five counties in south Texas bordering the Gulf, between the eastern and western limits of the State, and a few other counties in the extreme southern section of the Gulf States, that begin planting as early as 1 March, and continue until the middle of the month. The tier of counties lying just above these, averaging about five miles from south to north, and extending from the Atlantic Ocean to the Rio Grande River, begin planting about 15 March and continue until 1 April. In the next tier of counties, covering the middle section and extending from the Atlantic to the Pan Handle of Texas, cotton planting commences on the 15th of April. In the most northern tier of counties, extending from the Atlantic to the Pan Handle in Texas, planting begins about 15 April, and sometimes continues until the middle of May.

**Chopping Out.** With favorable weather the seed ought to germinate within a week. As soon as the plants have formed three or four leaves and have attained a few inches in height, they should be thinned or chopped out to a stand. This is done with the hoe, the distance left between the plants depending upon the character of the soil and the usual size of the plants when full grown. On the fertile lands of Mississippi, Louisiana and Texas, where the plants grow 6 or 8 feet high, as much as 2 and sometimes 3 feet are left between the plants. On the poorest lands the distance is usually 8 to 12 inches, and on good soils 12 to 15 inches. Chopping to a stand is usually done in May, unless the season is late. If the season is favorable and the seed have come up so irregularly as to necessitate replanting, chopping out to a stand may go on until the middle of June and even later. After the thinning out process a turning or shovel plow is used to harrow the soil from each side of the bed and kill the young grass. A sweep is then run through the alley or trench between the beds, throwing the soil back upon the bed and close up to the plants. Following this at different intervals the crop should have at least three hoeings and three to four plowings. The soil must be continually and industriously disturbed, not only to keep down grass and weeds, but to conserve moisture. This cultivation should be kept up until the crop is finally "paid by," which is usually, by the middle of July if the season is favorable. The different stages of cultivation may be summarized as follows: Breaking up and plowing in January, February and March; planting the seed in April; chopping out in May; cultivating with hoe and plow in June; harvesting the crop in July and August; picking in September, Oe-
COTTON CULTIVATION IN THE UNITED STATES

tober, November and December. During the process of cultivation the plant has developed stalk and limb, squares have appeared, developed into blossoms and the young fruit or bolls have formed.

Blossoms and Bolls.—The first blooms appear about 15 May in southwest Texas, 20 May in central Texas, Louisiana and southwest Georgia; 1 June in the Mississippi bottoms, south Arkansas and middle Georgia; 10 June, in the pine hills of South Carolina, middle Alabama and central Georgia; 20 June, in northwest Louisiana, middle Arkansas, northwest Georgia and southern North Carolina; 4 July, in north Arkansas and north Texas; 10 July in northeast North Carolina; 25 July in western Tennessee and Oklahoma. The first bolls open about 15 May in south Texas; 25 June in middle Texas; 1 July in south Louisiana; 10-15 July in central Louisiana, south Georgia, the pine hills of South Carolina; 1 August northwest Louisiana, south Arkansas, coastal Texas and the southernmost counties of the Flintmont region, North Carolina, Texas prairies; 15 September, north Arkansas and Oklahoma.

Picking.—The ingenuity of man has not yet overcome the difficulties of picking cotton by machinery. In the last few years a number of machines for this purpose have been invented and tested, but so far none has proved successful. If the plants were of more uniform height, and if the fruit ripened all at once, success might be attained. But the plant varies in height from 1.75 or 3 feet to 8 or 10 feet, and the fruit ripens continuously from August to mid-winter. Even when the fields are ready for the first picking the plants are filled with young tender bolls of all stages of growth that are likely to be irreparably damaged by a machine. So that hand picking goes on as in centuries past, and there is not yet in sight the promise of relief from the most tedious and expensive process connected with cotton culture. Picking, unless the crop is unusually late, begins in south Texas and the southernmost counties of Georgia and the Gulf States in July and August, and at later dates in the three other divisions corresponding in variation to the dates of planting assigned to each, as given on the page before. The bolls are picked over three or four times, and even oftener. However, they should be kept clean of open cotton to avoid injury by unfavorable weather and loss by wind storms blowing the cotton to the ground. The hands, men and women and children—and often every available one in the community—go into the field as soon as the dew is off of the plant, each taking a row of cotton and picking the lint from the bolls until the sack is full. The cotton is emptied into large baskets and the bolls when filled are weighed and each hand credited with the day's picking. The cotton is then hauled in wagons to the bins or to the plantation gin-house. Many small farmers and tenants never send the picked cotton to the gins where it is weighed and sold to the ginner, the price paid being about one-third of that paid for the lint after it is ginned. The price paid for picking is by the 100 pounds, and varies from time to time and in different sections being governed by the supply of labor and the market price of cotton. In Georgia 60 to 60 cents may be the ruling price while in Texas during the same season it may be $1 or more. Expert hands pick from 250 to 300 pounds a day, but the average for the whole country will hardly exceed 125 pounds per hand. There is a record of a one girl picking 603 pounds in one day, and of two Oklahoma boys averaging 1,100 pounds a day. The records of the United States Department of Agriculture, in an investigation of the comparative efficiency of white and negro labor in Georgia in 1907, note that of 525 counties, with a negro population amounting to 75 per cent of the whole, the average picking per day was 111 pounds, whereas in 192 counties with a white population constituting 75 per cent of the whole, the average was 145 pounds. Higher prices are paid in Texas and Oklahoma for picking than elsewhere, due to the greater scarcity of labor. In recent years the ruling price for the whole cotton belt has been from 60 to 70 cents per hundred, but in 1917 the average was $1 per hundred, due to the increased cost of labor. As indicating the vast sum expended for this item it cost the farmers of the South approximately $162,100,000 to pick the record crop of 1914.

Bolls.—After the fields have been cleaned of all cotton that can be picked by hand, there is always found on the plants a number of partially opened bolls the maturity of which has been prevented by frost. Until recently all such cotton was considered worthless. But the high price paid for the staple since 1905 has led to the invention of machinery for utilizing the unopened bolls. These machines thresh out the seed cotton from the bolls, after the latter have been well dried, and the seed cotton is then passed to the gin and treated as the hand-picked cotton. The lint thus obtained is classed as "bolly cotton," and being of an inferior grade and staple sells for much less than hand-picked cotton. Its production is on the increase, but as yet is confined to Texas and Oklahoma, where the winter rainfall is much less than in the other States, and the high winds assist in drying out the frost-bitten bolls.

Yield.—The yield of a field of cotton depends upon a number of contingencies, among which may be mentioned the amount of the seed, the care taken in the selection of seed, the proper use of fertilizers where the soil needs fertilization, the kind of cultivation the crop receives, the absence or presence of plant diseases and of insects, the character of the soil, and above all the weather. A good yield, or such as the land is capable of producing, may not be expected with slip-shod preparation and cultivation, nor with insufficient nor misapplied fertilizers. Diseases of the plant, such as root rot, anthracnose, blight and shedding of the fruit sometimes greatly reduce the yield. Some insects, such as cut worms, caterpillars, boll worms, are at times very destructive, while the boll weevil, ever present when the fields are planted, is often the most unfavorable conditions for its propagation destroyed as much as one-half the crop. Another pest, said to be just as destructive as the boll weevil, is the pink boll worm which has just made its appearance in the extreme southeast of Texas. It is supposed to have been introduced from Mexico,
COTTON CULTIVATION IN THE UNITED STATES

into which country it was introduced in 1911 from Egypt, which is said to be its original habitat. Adverse weather, such as to give the crop a late start, or droughts in August, or early October frosts may materially affect the yield. The average yield per acre for 10 years (1906 to 1915, inclusive) in each State, beginning with Virginia and going westward, is as follows (in pounds): Virginia 228.4, North Carolina 243.5, South Carolina 224.1, Georgia 194.2, Florida 123.1, Alabama 173.6, Mississippi 192, Louisiana 174.3, Texas 170, Arkansas 190.9, Tennessee 197, Missouri 286.6, Oklahoma 174.4, California 482, and for all States 186.3 pounds. The higher yield in the Atlantic States is due to a more liberal use of fertilizers and to a more general practice of intensive culture. There are records of occasional extraordinary yields in some sections, for instance, 15,100 pounds of seed cotton on five acres of well-fertilized pine-wood land in Wayne County, N. C.; 10 bales on four acres in Marion County, S. C.; 12 bales on four acres in Pamlico County, N. C.; and five bales weighing 500 pounds each, on one acre of highly fertilized sandy soil in Washington County, N. C.

Ginning.—Cotton ginning in recent years has become a distinct business. The ginneries are divided into three general classes, namely, those conducted exclusively for the public, those conducted exclusively for the plantation and those conducted for both the public and the plantation. The plantation ginneries constitute about 17 per cent of the whole. The modern up-to-date automatic ginery practically does away with labor, and yields from 5 to 10 times as much lint cotton per day as was possible by the old method. A four-gin establishment of 40 saws each when in constant operation will turn out 40 to 60 bales of cotton per day. Of the 24,418 active ginneries in 1914, 21,045 used steam power, 1,069 water power, 1,922 gasoline power, 342 electric power and 40 animal power. During this year cotton was ginned in 897 counties. The competition of the ginneries is so sharp that charges for ginning have been considerably reduced. It used to be $1 per hundred or $5 a bale. Now it is about $2 a bale where the ginner furnishes the bagging and ties, or $1 a bale where the farmer furnishes both, the farmer taking all the lint and seed. Formerly the farmer furnished the bagging and ties and the ginner got all of the seed for ginning, now the two portions of the seed are separated. The part that is taken also furnishes bagging and ties. It has become a very general practice, and this obtains particularly among small farmers and tenants, to sell the whole crop (in the seed) to the ginneries, the ginner paying one-third the market value of cotton. Before running it through the gin the seed cotton should be thoroughly aired and dried, then stored so that the lint may absorb some of the oil in the seed, though this practice is not generally resorted to. It should then be passed through the "whipper" to beat out the dust, sand and other trash, and thence to the gin which separates the lint from the seed. In ordinary seasons the lint cotton as it comes from the gin ought to weigh about 33 3/4 per cent of the weight of the seed cotton. In other words, 33 3/4 pounds of seed cotton contain 1,500 pounds of lint and two-thirds seed, or 1,500 pounds of seed cotton should turn out a 500-pound bale of lint. But this depends upon whether the crop is early or late, whether the rainfall has been deficient or excessive, and also upon the fertility of the soil. Sometimes the proportion falls below and sometimes exceeds 33 3/4 pounds. Better seed selection, and improved methods of ginning, have now increased this proportion to about 35 per cent. After being ginned the lint cotton is passed into the press and packed in bales averaging 500 pounds gross weight, that is, including the bagging and ties, each bale being covered with six yards of bagging weighing 2 1/2 pounds to the yard, and bound with six iron or steel ties weighing about seven pounds. The average or standard size bale is 24x24x45 inches. Though 500 pounds is the accepted average weight of a bale, the weight differs in nearly all of the States. In the Carolinas the average gross weight (i.e., including bagging and ties) is about 478 pounds, in Georgia 491, in Alabama, Mississippi and Louisiana 506, in Arkansas, Tennessee and Oklahoma 510, while in Texas it is about 520 pounds, the bales averaging heavier going from East to West. The average gross weight for all States is about 505 pounds.

Since the advent of the boll weevil cotton is not only planted earlier, but earlier maturing varieties are used. This has almost doubled the amount of cotton ginned in July and August, as compared with former years, and has led to fixing upon 1 August as the beginning of the commercial crop year instead of 1 September as heretofore. The average proportion of the crops of the past four years picked and ginned in July and August is 4.8 per cent; to 25 September, 22.6 per cent; to 1 November, 63.7 per cent; to 1 December, 84.8 per cent; to 1 January, 93.5 per cent; the remaining 6.5 per cent being ginned within the next two or three months.

Cost of Production.—It is impossible to ascertain with any degree of accuracy the cost of production. So much depends upon the quality of the soil, the climate, the efficiency of labor, the character of the season, the freedom of the crop from plant diseases...
and insect deprivations, the price realized for the crop, that the cost will vary from year to year, and vary even in the same year. The returns of the first investigations made in 1896 show that the average total cost of cultivation per acre was $15.42, and the average total return $19.03, leaving a net profit of $3.61 per acre. The average yield per acre was 255.6 pounds of lint, and the average price 67.6 cents per pound. The average cost of production in all States was 5.27 cents per pound. To produce a bale of 500 pounds the cost was $30.15. The results of the investigation in 1910 indicated that the average total cost per acre was approximately $20.35, and the yield of lint per acre 247 pounds, making the average cost of production in all States 8.30 cents per pound. The cost in 1910 was 32 per cent greater than that of 1896. In comparing the various items of cost this is readily accounted for. For instance, the cost of plowing increased from $4.12 to $6.36, picking from $3.37 to $4.67, and rent of land from $2.88 to $3.56 per acre. The average cost in all States of the chief items in 1910 were: rent $3.56, preparation of the land $2.17, fertilizers $2.96, seed 51 cents, planting 30 cents, cultivation $4.19, picking $4.67, ginning $1.61, miscellaneous 68 cents; total per acre $20.35. The estimated cost per pound in the different States was: North Carolina 8.22 cents, South Carolina 8.07 cents, Georgia 8.48 cents, Alabama 7.64 cents, Louisiana 8.09 cents, Texas 8.59 cents, Arkansas 8.20 cents, Tennessee 8.19 cents, Oklahoma 8.44 cents and all States 8.30 cents. The Watkins Statistical Bureau of New York City in January 1918 concluded an exhaustive investigation of the cost of cotton production in 1917. In their introductory remarks they say: *that the cost of producing a pound of cotton varies from year to year. Not only so, but it varies in each State, in each county, and indeed the cultivated fields on the same plantation may produce varied results.* As evidence of the very wide variation at different periods, the cost as assayed by the United States Department of Agriculture in 1896 and in 1910 are cited, the first being 5.27 a pound in the former and 8.30 cents in the latter season, as compared with 11.28 cents in 1917, as estimated by the Watkins Bureau. The average cost of production and the net profit per acre as estimated by this authority are as follows: Virginia, cost $5.00, profit $3.97; North Carolina, cost $4.61, profit $3.61; South Carolina, cost $4.94, profit $4.80; Georgia, cost $3.15, profit $3.31; Florida, cost $2.61, profit $2.87; Alabama, cost $2.87, profit $2.22; Mississippi, cost $3.10, profit $3.01; Louisiana, cost $3.42, profit $4.63; Texas, cost $2.81, profit $2.85; Arkansas, cost $3.59, profit $3.51; Tennessee, cost $3.74, profit $2.73; Missouri, cost $3.90, profit $4.29; Oklahoma, cost $2.89, profit $2.68; California, cost $3.27, profit $0.70; Arizona, cost $9.44, profit $6.20; New Mexico, cost $1, profit $0.25; average cost for all States, $3.47, and average net profit per acre $3.15.

The net cost of producing a pound of cotton in each State is estimated as follows: Virginia, 13.10 cents; North Carolina, 13.08 cents; South Carolina, 9.85 cents; Georgia, 11.33 cents; Florida (partly long staple Sea Island), 17.74 cents; Alabama, 12.90 cents; Mississippi, 11.42 cents; Louisiana, 9.94 cents; Texas, 11.07 cents; Arkansas, 11.42 cents; Tennessee, 12.14 cents; Missouri, 12.35 cents; Oklahoma, 10.21 cents; California, 9.70 cents; Arizona, 4.74 cents (high cost due to high cost of irrigation); New Mexico, 7.11 cents; net cost per pound for all States, 11.28 cents. The extraordinary profits per acre are due to the very high prices obtained by the farmer for his lint cotton, and its by-product the seed, the former averaging 27½ cents a pound, and the latter 51 per bushel —prices the like of which have not been realized since 1870.

**Marketing.**—Cotton is the most marketable of all farm products. Non-perishable, and put up in conveniently handled bales, always in

*Net receipts only. Gross receipts at New York 1915-16, 1,630,000, 1914-15, 1,728,000 bales.

N. B.—The apparent discrepancy between receipts, exports and stocks at some of the ports is accounted for by the fact that they not only reship cotton to interior points, but coastwise to other United States ports.
1 Vertical cross section of elevator, feeding, plain gin flue and platform

demand, it finds a ready sale anywhere and at any time. But the old time method of consigning the crop to a commission merchant to be sold on the market is no longer followed except by a few large planters. Railroads traverse so much of the cotton territory that markets are convenient, and buyers are always on hand to pay cash for every bale offered for sale, thereby saving the farmer the cost of freight, cartage, storage, insurance and commissions for selling. If the cotton is carried to market and the price is not satisfactory it may be stored in a warehouse, weighed, marked for identification and a receipt issued for it that may be negotiated at any local bank at a reasonable rate of interest. In marketing his crop the farmer has the advantage of selling it according to the grades established by the government. Heretofore, the grading was done by the buyer and the farmer knew little or nothing of the grades or their values. The cotton mills of the South are now consuming about 23 per cent of the total production, a considerable proportion of which is bought by the mills from farmers in the locality where it is produced. The remainder of the crop is nearly all marketed at interior points and thence, after being compressed into smaller bales, is shipped either to Northern mills, or to the seaboard and through inland ports to various foreign destinations. In the general distribution of the crop about 23 per cent is taken by Southern mills, 20.5 per cent by Northern mills, and 56.5 per cent is exported. The largest amount of cotton exported in any year was in 1911-12, when 11,070,000 bales were taken by foreign countries. Of this Great Britain took 39 per cent, Germany 28.5 per cent, France 11 per cent, Italy 6 per cent, Japan 4 per cent, Spain 3 per cent and various other countries the remaining 8.5 per cent.

Grades.—The cotton grown in this country may be divided into three kinds: long staple sea island, long staple upland, and short staple upland. The long staple sea island of South Carolina ranges from 1¾ to 2¾ inches in length, is silky, fine, strong and clean and is used in making doubled or ply yarns from 150s to 400s; the Florida and Georgia sea island ranges from 1¾ to 1¾ inches, is silky and clean, and is spun into lower grade sea island yarns from 150s to 200s. The grades of sea island at present are fine, medium fine, good medium, medium, medium common and ordinary. The long staple upland, such as the Allen, Peeler, benders or the bottom land cottons of Mississippi and its tributaries, as well as those classified as Gulf or New Orleans, is from 1 to 1½ inches in length, and is used in making yarns from 50s to 70s; the shorter staple upland ranges from ¾ to 1 inch, is easily manipulated and is suitable for weft or filling yarns from 30s to 40s. To classify cotton with the view to determine its market and spinable value requires long practice and skilful use of hand and eye. The points to be determined are the grade, the staple, the color, the amount of sand and trash, the amount of dampness and whether or not the cotton is clean running. When these are determined from samples drawn from each bale, the cotton is classified under one or the other of the nine standard grades established by the government. These grades consist of middling as the basis, and above this the order named, strict middling, good middling, strict good middling and middling fair; below middling in the order named, strict low middling, low middling, strict good ordinary and good ordinary. These grades have been universally adopted in this country and now form the basis of all sales of cotton.

Cotton Exchanges.—The marketing and financing of the enormous crops of recent years have been greatly facilitated by the cotton exchanges. These exchanges bring together cotton dealers from all parts of the world, affording the foreign spinner and merchant the opportunity of buying cotton on short notice for future delivery. They give the domestic spinner and merchant, and the planter as well, the opportunity to purchase a contract or hedge as an insurance against market fluctuations that otherwise might result in loss. The manufacturer who has an order for the future delivery of goods may buy on the Exchange at a definite time and price a contract for the amount of cotton required to fill that order; the Southern merchant who has on hand a certain amount of cotton for which there is no immediate demand may sell on the Exchange a contract for a like amount, and hold his cotton until there is a demand for it; the planter whose cotton is not yet ready for delivery, seeing the market continually advancing, may sell on the Exchange a contract for a portion or all of his crop. In each case the transaction is an insurance against loss. Thus the Exchanges dispense with the old and costly custom of consigning and selling the crop through
commission houses, and through its agency a very large proportion of the crop is sold at home and abroad at a minimum of expense to the producer.

Cotton Futures Act.—The Act of Congress, known as the Cotton Futures Act, became a law 18 Aug. 1914, and went into effect six months later, 18 Feb. 1915. The object of the Act is to regulate trading on the cotton exchanges in cotton for future delivery, by levying a prohibitive tax on such trading except where certain specified conditions are complied with. These conditions were determined with the view to correcting existing abuses, and are imposed upon parties to future contracts in order to equalize their privileges, and also to protect the rights of cotton owners, inasmuch as futures contracts made on the exchanges control to a considerable extent the price of spot cotton in the Southern markets.

The first administrative duty imposed by the Act was the establishment of new official standards for cotton throughout the United States. On 15 Dec. 1914 the Secretary of Agriculture, therefore, established and promulgated new standards for nine grades of cotton—middling fair, strict good middling, good middling, strict middling, middling, strict low middling, low middling, strict good ordinary and good ordinary. Under the Cotton Futures Act the official cotton standards for the different grades are practically compulsory upon the exchanges in the United States, and they were compelled to adopt them in order to avoid excessive taxation, therefore the New York and New Orleans exchanges adopted the official standards for all transactions subsequent to 18 Feb. 1915. The use of the standards for other exchanges in the United States is optional; but 21 of such exchanges or similar organizations have adopted the standards and are making their quotations in conformity therewith.

Another duty imposed by this Act is the investigation and designation of bona-fide spot markets within the meaning of the Act. Thirteen cities have been named as such thus far, and ten of these are being used in establishing commercial differences for the settlement of future contracts, as required by the Act. By carefully prepared rules governing the making of price quotations, by frequent visits to the spot exchanges, and by telegraphic and mail reports from each exchange, it is undertaken to have the differences of the 10 designated markets accurately represent the true commercial values of the various grades, the average of which may be taken as a satisfactory basis for the settlement of future contracts.

Another important administrative duty under the Act is the settlement of disputes when they arise, as to the length of staple, grade or quality of any cotton tendered in settlement of a future contract, the Act requiring that future trading shall be on the basis of the official cotton standards. For the settlement of these disputes 12 expert cotton classifiers or "examiners" have been designated to act in these disputes, and their conclusions as to the grade, length of staple or quality are the basis of the formal findings of the Secretary of Agriculture, which are prima facie evidence in the United States courts as to the true grade, length of staple or quality, and tenderability of any cotton covered thereby.

Sea-Island Cotton.—Unless we except the small production of the West Indies, the cotton grown on the Sea Islands of South Carolina is the finest and most valuable in the world. The plant is larger and of a more vigorous growth than the upland plant, is less subject to disease and shedding of forms and bolls, and withstands adverse weather much better. There are over 5,000 farms on these islands, cultivated mostly by negro labor, many of which are owned by negroes. The farms are small, and the cultivation of the cotton so expensive that few farmers plant more than 100 acres. In preparing the land for cultivation the old stalks and weeds are knocked down and burned. The land is rarely plowed or broadcast, but early in February two furrows are run with a single-horse turning plow in the old alleys, making a trench seven or eight inches deep. The trench is fertilized with about 20 cart loads of marsh mud and 1,000 to 1,400 pounds of cotton seed to the acre; or stable manure with composts of marsh mud and rushes are applied. Recently commercial fertilizers have come in general use, especially among the negro farmers who do not like the care and labor of making composts. One of the best fertilizers used consists of 250 pounds of acid phosphate, 200 pounds of kainit and 200 pounds of calcined marl per acre. After applying the manure the land is lists by using a hoe and pulling the soil on to the manure from the sides and tops of the old beds, or by covering the manured trenches with two furrows of a turning plow. A heavy roller is then run over the ground and the beds are afterward built up by lapping in two more furrows on a side with either a single or double-horse turning plow. The land is now ready for planting which is usually done by hand. The seed are planted by three hands; the first one using a hoe opens holes 12 to 18 inches apart in the top of the bed, and the second hand
COTTON CULTIVATION IN THE UNITED STATES

follows dropping 8 or 10 seed in each hole, the third hole following and covering the seed with a hoe. About a bushel of seed to the acre is used. The seed come up in 8 to 12 days, and from the second week in April to the first week in May the plants are thinned out to a stand. The crop receives two hoeings in May, the plows then break out the middles between the beds, and they are followed by hoe hands who draw up the loose soil around the young plants. Cultivation with the hoe goes on continually until the last of July, by which time with one plowing in July and one in August to keep down the grass between the rows, the crop is laid by. The first blooms appear about the middle of June, and the bolls begin opening the latter part of August when the plants are four or five feet high. Picking begins from the last week in August to the second week in September, and is completed by the middle of December. When the cotton has been picked it is sun-dried and run through a "whipper" machine to knock out the dust and sand. A roller gin is always used in ginning in addition to the above; the cotton is washed as it passes through the gin and it tears the fibre. The average yield per acre is about 125 pounds. The cost of production is just about twice that of upland cotton, all the items of expense, except rent, being much higher. The crop is not only more expensively fertilized, but it is much more difficult to pick owing to the smallness of the bolls and the tenacity with which the cotton adheres to the pods. In 1914 sea-island cotton was cultivated in two counties in South Carolina, 15 in Florida and 22 in Georgia. Atlantis, the climate, discourages its cultivation very far from the coast, as the fibre looses its lustre, strength and length, and to retain these characteristics the inland planters find it necessary to obtain fresh seed from the sea islands every two or three years. The largest crop ever produced was in 1905, when South Carolina made 13,714 bales, Florida 33,635 and Georgia 76,440; total 123,789. The average weight of bales is about 355 pounds in South Carolina, 375 in Florida and 400 in Georgia.

Long Staple Upland.—The long staple upland cotton such as Allen, Peeler and benders, until recent years was produced almost exclusively in the Mississippi Delta. The acreage has been reduced greatly and north of the Delta the crop is not only more expensively fertilized, but it is much more difficult to pick owing to the smallness of the bolls and the tenacity with which the cotton adheres to the pods. In 1914 sea-island cotton was cultivated in two counties in South Carolina, 15 in Florida and 22 in Georgia. Atlantis, the climate, discourages its cultivation very far from the coast, as the fibre looses its lustre, strength and length, and to retain these characteristics the inland planters find it necessary to obtain fresh seed from the sea islands every two or three years. The largest crop ever produced was in 1905, when South Carolina made 13,714 bales, Florida 33,635 and Georgia 76,440; total 123,789. The average weight of bales is about 355 pounds in South Carolina, 375 in Florida and 400 in Georgia.

The total quantity of bleached cotton fibre consumed in the United States during the calendar year 1915 in the manufacture of explosives was 121,311,385 pounds, equivalent to 244,003 bales of 500 pounds each net weight. During the three months ending 31 March 1916 there were consumed in this industry 144,988 bales and during the three months ending 30 June 1916 142,725 bales. The increase of cotton fibre in this industry is striking, the quantity consumed during the first half of 1916 being considerably in excess of the total for 1915. The quantity of prepared cotton held on 30 June 1916 by the manufacturers of explosives was 11,347,422 pounds, equivalent to 22,895 bales of 500 pounds each. This quantity compares with 22,933 bales of 500 pounds on 31 Dec. 1915. The loss in bleaching cotton for nitrating purposes varies considerably, depending on the condition of the raw fibre, some stock being quite clean and some very trashy. From the information at hand it would appear that the loss in preparing linters from the wrapped and iron bound bales to the purified fibre as used in nitration is from 30 to 40 per cent. Based on an average loss of 35 per cent the gross weight of cotton fibres used in the manufacture of explosives was 375,000 equivalent 500 pound bales in 1915, 223,000 bales for the first and 220,000 for the second quarter of 1916.

Sea-island cotton, of which 91,844 running bales were ginned in 1915, represented in that year less than 1 per cent of the total cotton produced. All this cotton was grown in Georgia, Florida and South Carolina, the first-named State producing 57,572 bales, or more than three-fifths of the total.

Although cotton is grown in 18 States, the combined product of four — Texas, Georgia, South Carolina and Alabama — represented nearly two-thirds of the total crop of 1915. Texas alone produced 3,227,480 bales, or more than one-fourth of the total crop of 1915.

on the western coast to the farthest confines of Assam and Burmah where they unite with China and Siam in the East. The sections of India where the bulk of the crop is raised embrace the principal cotton regions: the valley of the Ganges, the Deccan, western India and southern India.

Although the area devoted to cotton in recent years is immense—25,000,000 acres in 1914, or more than two-thirds of the American area—one-third of the average yield in the Southern States, that of India being 80–85 pounds compared with 185–190 pounds in this country. There are plenty of good cotton lands throughout the empire, but their fertility is exhausted from many centuries of cultivation. Fertilisers are never used and cotton is cultivated pretty much as it was a thousand years ago in the most primitive manner. Both the soil and climatic conditions in the several cotton-growing provinces vary more than in any other cotton country of importance. In some sections the rainfall is abundant, while in others it is so light as to necessitate irrigation. Nor are the seasons uniform, but vary considerably in the different sections; for instance, it is long in the northern provinces, in the extreme south the seed are being planted, and such is the variance of the seasons that cotton picking is going on somewhere in almost every month of the year. Thus, in the Bengalis and Sind the usual date of planting is from the middle to the end of June; picking begins in September and October and ends in December and January. In the Coompta and Dharwar districts planting time is from the middle to the end of August, while picking begins in February and March and ends in May and June. In the extreme South—the Madras presidency—planting begins in October and November which picking begins in April and usually ends during the month of June.

The native cottons of India have a very short, coarse fibre, from one-half to three-quarters of an inch staple, and are used in the manufacture of very low counts of yarn. There are, however, some varieties such as Hinghunghat from the Central provinces, Oomars from the north-western provinces, Dharwar cotton from the Bombay presidency and Tinnevellys from the Madras presidency, the staples of which run from three-quarters to one and one-eighth inches and are used in turning out counts or numbers of yarn 24s and below, usually for wooll or filling.

Although India has for centuries produced large quantities of cotton, from which the most beautiful and delicate fabrics were woven and sent to all parts of the world, it was not until the cotton famine brought about by the Civil War, 1861–65, that its raw product began to assume commercial importance. Prior to this period the average annual exports of raw cotton amounted to about 600,000 bales of 500 pounds; since then the exports have gradually increased until now fully 2,000,000 bales (of 500 pounds each) are exported from Bombay and other ports to foreign countries. In the distribution of the crop Great Britain takes about 2½ per cent, Japan and China 24 per cent, the continent of Europe 31 per cent, domestic manufacturing establishments 35 per cent and domestic hand machines 7½ per cent.

The following table will give an idea of the progress made in the cotton industry in British India 1870–1907. (The largely reduced acreage in 1915 was the result of the European War):

Note.—The Indian government's figures (converted into 500 lb. bales) have been used in the above table. It is a recognized fact, however, that the government's crop estimates are usually much smaller than the combined exports and domestic consumption. The latter amounts to about 400 pounds, but for comparative purposes they have been converted into bales of 500 pounds.

Egypt—As is true of East India and other Eastern countries, cotton was grown in Egypt at a time antedating all historical records. It is now cultivated all along the Nile, from the Soudan to the Delta of this wonderful stream, but the rainfall is so light that no crops can be grown without irrigation, and the Nile is the only source of water supply. Irrigation works known as the "Barrage" of a few miles north of Cairo were completed in 1863. In 1898 the government began the construction of two great dams across the Nile, one near Assuan and the other at Assiout. They were completed by 1906 and as a result the cotton acreage has increased by about 22 per cent. The area in the Delta country, however, has about reached its limit, and any increase hereafter must be looked for in the Soudan and the Upper Nile country. For hundreds of years a low grade cotton had been produced from the native plant and used in domestic manufactures, but a great impetus was given to the industry in 1821, when a new variety of seed was introduced from Abyssinia, and, although cotton was more greatly stimulated by the cotton famine caused by the Egyptian Civil War.

Egyptian cotton has a long, strong, silky staple from one and one-eighth to one and five-eighths inches in length, and in quality and value ranks next to our better grades of Sea Island which range from one and one-half to two and one-half inches in length. The best known varieties of Egyptian cotton are classified as Mitaffi, Abassi, Joannovich, Ashmouni, Nubari, Sakel-laridis and Aff Assil. About 18 per cent of the cotton area is devoted to the Mitaffi variety, 19½ per cent to Ashmouni, which is grown in Upper Egypt, 9 per cent to Nubari, about 46 per cent to Sakellaridis, and 7½ per cent to other varieties. The Sakellaridis, grown in Lower Egypt, is of recent origin and is considered almost as valuable as the Mitaffi. It is described as very clean and white, very lustrous, free from neps, the staple being fully one and five-eighths inches in length. Egyptian cotton is especially adapted for making sewing thread, fine underwear and hose, and for mercerising and other processes that give a
COTTON CULTIVATION IN OTHER COUNTRIES

high silky finish to cloths. Its capacity for taking dyes makes it valuable for mixing with silk and for filling satins, India linens and similar highly finished goods. The brown color of the Mitafiq adapts it for use without dyeing in making balbriggan undervests and lace curtains in which the ecru shade is desired.

Preparations for planting the crop begin in February and March, and planting is carried on during March and April. Picking begins in September and is usually completed during the early part of December. To prevent the hibernation of boll-worms the law requires all cotton plants to be removed from the land before 1 January. Ginning is usually done at ginning establishments at interior towns, most of which are owned by cotton merchants and large exporting houses. The bales are packed by hydraulic pressure and average about 750 pounds each, but before being exported are rebaled and steam compressed at Alexandria.

As there are no cotton manufacturing establishments in Egypt practically the whole of the crop is exported. In the distribution of the crop for consumption in normal times Great Britain takes about 38.5 per cent, the United States 22 per cent, Germany 11 per cent, France 8.5 per cent, Russia 7.5 per cent, Austria 3.5 per cent, Switzerland 7.5 per cent, and various other countries the remaining 6.5 per cent.

In the decade 1870-80 the crop averaged about 430,000 bales (500 lbs.) annually, in the decade 1880-90 the average increased to about 560,000. Since the latter period the crops have increased as more lands were brought under cultivation. By a government decree the cotton area in 1915 was considerably reduced on account of the European War. The following table will show the progress of the industry since the completion of the irrigation works.

**Russia.—** Cotton production in the Trans-Caspia and the Trans-Caucasia has attained great importance since the occupation of that territory by Russia, so that now instead of depending upon the United States for its supply of cotton to make underwear and linen, Russia is able to supply itself with fully 60 per cent of the needed raw material. The great bulk of the crop is grown in Turkestan.

Cotton is grown in most of the river valleys, but its cultivation is limited to localities adapted to irrigation, as the climate is dry, very hot, with mild winters, and scarcely any rainfall during the crop-growing season. Some of the irrigation works were built centuries ago, but the Russian government has offered such encouragement to cotton culture that over 2,000,000 acres have been brought under irrigation, with the probability of this being considerably increased. Experiments have been made with a number of imported seeds, but the Upland American have given the best results and a large proportion of the present growth is either of American varieties or varieties developed from this seed. The staple is about an inch in length, of a smooth good color and clean. The indigenous varieties are about an inch staple, of good color, but rough. In 1890 the cotton crop was 25,000 bales, of which it is known had never exceeded 150,000 bales (of 500 lbs.), but in 25 years, owing to the building of irrigation works and the extraordinary duty imposed upon foreign cotton (amounting to $2.00 per 30 lbs.), the production increased to 1,372,000 bales, or 625 per cent. Russian cotton manufacturers are said to believe that it is possible to meet the full requirements of the Russian industry with cotton of domestic production, and that produced by countries under Russia's economic influence. Recent surveys have shown that enormous areas of land well suited for cotton could be irrigated in the lower basin of the Amu-Daria River.

The average weight of bales of cotton in central Asia is about 300 pounds, and in the Caucasus 350 pounds. The ginning and baling is performed practically in the same manner as in America. The bales are covered with heavy jute wrapper, held in place by four wires, thus guaranteeing the proper protection of the bales.

The following table shows the area planted in cotton and the production (reduced to bales of 500 lbs.) for four seasons in each of the provinces of central Asia and Trans-Caucasia:
COTTON CULTIVATION IN OTHER COUNTRIES

China.—There are no records showing how largely cotton has been cultivated in China, but it is known that about 1800 it became native, and began to be extensively used. Since that period its growth and manufacture have reached immense proportions. The Chinese keep no statistics whatever, and it was not until very recently that any information could be obtained as to the amount of cotton grown. About 1895 the crop of China (including its dependency, Korea) was estimated at 1,600,000 bales of 400 pounds each. Recently, the Ministry of Agriculture of the Republic has estimated the annual production for the years 1909, 1910, and 1911 at 1,418,333 bales of 500 pounds each. The suppression of the opium trade, the rapid development of the cotton mill industry and high prices for the raw material have undoubtedly stimulated production in recent years.

The Chinese method of cultivation is very primitive. After the ground is plowed in March the seed are sown broadcast, and in consequence the plants grow up thickly and are so poorly developed that the bolls are small and the crop is destroyed by weeds. Some plants are raised in banks or ridges, but this is carried on only to a limited extent. The staple of the Chinese cotton is short, averaging from one-half to three-fourths of an inch, is rough, but very clean. There are no extensive farms, most of the cotton being grown on patches and small tracts of one or two acres. The old Hindu churches are generally used for separating the seed from the lint, and the spindle and hand loom for domestic manufactures, though modern cotton factories are now coming into more than 10,000 bales.

In 1906 the exports of cotton from China amounted to 205,000 bales (of 500 lbs.), in 1910 to 333,000 bales, and in 1915 to 142,000 bales. The great bulk of the exports are shipped to Japan. An estimate from a reliable source places the amount of Chinese cotton from the crop of 1914 which entered into commercial channels at 1,750,000 bales of 500 pounds each.

Brazil.—Cotton is indigenous to the country, but its cultivation received comparatively little attention until the shortage caused by the American Civil War greatly increased the demand for all kinds of cotton. Fields of cotton, such as are to be seen in the United States and other countries, are unknown in Brazil. In the preparation of the soil all the planter has to do is to clean the land and plant the seed at the proper season. There is no breaking up the land, no preparation of the soil, no laying out of furrows and no cultivation except occasional chopping out of weeds with the hoe. As a rule cotton is grown by the small farmer, who has little or no capital, in the most primitive and haphazard manner in connection with other crops. Several varieties are cultivated, the native tree cotton, which grows 7 to 10 feet high and bears well for two or three years, also several kinds of shrub cotton bearing one or more bolls, the cvm, a form of cotton from American seed. The lint is separated from the seed with the common hand roller gin, though the saw gin is used in some sections. A rude hand screw is used for packing the cotton in bales averaging about 280 pounds each. The staple of Brazilian cotton is from 1 to 1 1/4 inches, is harsh, wiry, clean, creamy colored, and is good for making warp yarns for sizing. The principal states in which cotton is grown are Pernambuco, Ceara, Paraiba, Alagoas and Maranhao. The states of largest production are Pernambuco and Paraiba. In 1859-60 the cotton crop of Brazil amounted to about 70,000 bales, and in 1895-96 to 300,000. The crop of 1910-11 was 230,000 bales, of 500 pounds each, of that 1912-13, 315,000, and of 1914-15, the largest crop on record, 440,000. The largest amount of cotton exported in any one year was 346,000 bales in 1872. In recent years the exports have greatly decreased, owing to the increased consumption by domestic mills, which now consume about 80 per cent of the crop. The possibilities of cotton production are said to be very great—in fact, that there is a sufficient amount of available land to produce 40,000,000 bales, allowing a yield of only 100 pounds to the acre.

Mexico.—Cotton is indigenous to this country, and though it was of the first importance before the Spanish conquest, there is now less cotton produced than under the Aztec monarchy, notwithstanding the fact that modern spinning mills have been built for the native product, but draw upon the United States for additional supplies. Cotton is grown in all the states along the two oceans and in the interior states of Chihuahua, Coahuila, Durango and Nuevo Leon. The famous Laguna district in Coahuila, with its rich alluvial deposits from the Nazas River from which the lands are irrigated, produces the largest crop. In this district it is the custom to replant every seventh year, though some planters gather cotton from plants 10 to 20 years old. The staple of Mexican cotton is about one inch in length and of superior quality, particularly that of Vera Cruz, but the finest cotton, one and one-half inch staple, is grown at Acapulco in the state of Guerrero. The normal crop of Mexico is about 200,000 bales of 500 pounds each, but owing to the revolutionary uprisings in recent years the production has been gradually decreasing. The crop of 1913-14 is estimated at 150,000 bales, that of 1914-15 at 125,000, and that of 1915-16 at only 100,000. It has been officially stated that Mexico contains at least 8,000,000 acres that are particularly adapted to cotton culture.

Peru.—In Peru, as to nearly all Central and South American countries, the cotton plant is indigenous. The principal producing districts are located near the coast, and are irrigated by canals connected with the waters of the Andes. The soil is very fertile and yields from 325 to 500 pounds of clean cotton to the acre. The plant is perennial, growing from 10 to 15 feet high, and under favorable conditions will bear two crops for a number of years. Plants have been known to yield for 30 years, though the average fruit-bearing period is seven or eight years. The fibre is long, from 1/4 to 1 1/2 inches, strong, rough, spiral shaped and admirably suited for mixing with wool to give the lustre and finish to goods in which it is used, and is especially adapted for underwear and hose. While the production of cotton is comparatively small, it has increased rapidly in recent years. In 1902 the crop amounted to only 56,500 bales of 500 pounds each, and in 1890 to 107,316 bales. The production in 1913-14 was
COTTON EXCHANGES—COTTON INSECTS

176,000 bales, in 1914–15 152,000, and in 1915–16 160,000. The domestic mills consume about 12,000 bales annually in the manufacture of a coarse grade of cloth.

Turkey.—The principal cotton-growing regions of Turkey are on the Cilician Plains in Adana, the Aidin district in Smyrna and other districts in Armenia, Palestine and Mesopotamia. During the cotton famine period, 1860–65, high prices stimulated production and as much as 240,000 bales (weight of bales unknown) were exported in 1865. Following the decline in prices the crops produced from 1870 to 1875 were of little commercial importance. A new impetus was given to cotton culture after 1895 and by 1912 the production reached 200,000 bales. The crop of 1914–15 was 195,000 bales, and that of 1915–16, 155,000. The largest crop, about 100,000 bales, is produced in Adana. The weight of the bales differs so much in the various districts that no uniform weight can be given. The above figures are therefore in running bales.

Persia.—The cotton plant is said to be indigenous to this country, and thrives in almost any soil when water is furnished, and the absence of a sufficient water can be procured for irrigation. The method of cultivation is of the simplest, and has continued almost unchanged from early times. Planting begins early in April and continues during the month. Harvesting begins the latter part of September and is finished by November. The lint is separated from the seed with the ancient hand-roller machine, while the bales are pressed by the feet and hands into packages varying from 100 to 220 pounds. The staple is a bright creamy color, strong and from 1/2 to 1 1/4 inches in length. The product of the central, southern and southeastern provinces is exported mostly to India, and that of the north, northwest and northeast to Russia. The latest available statistics place the Persian crop at 140,000 bales.

JAMES L. WATKINS,
Cotton Statistician, New York City.

COTTON EXCHANGES. See COTTON GROWING IN THE UNITED STATES.

COTTON FAMINE, the destitution caused by the outbreak of the American Civil War (1861–65) in the English cotton manufacturing districts, especially in Lancashire. The cotton supply failed on account of the blockade of the Southern ports of the United States, and in consequence the mill-owners finally closed their mills entirely, nearly 2,000,000 of people being reduced to great distress. A Cotton District Relief Fund was started, and a Relief Act passed by Parliament, by which loans were granted to the guardians of the poor for the purpose of instituting relief works. In 1863, in the midst of the war, three shiploads of provisions and supplies were sent to England from New York. Gradually the difficulties were overcome, and by June 1865 the distress was at an end, greatly increased supplies of cotton having been received from Brazil, Egypt, India and elsewhere.

COTTON GINNING. See COTTON GROWING IN THE UNITED STATES.

COTTON-GRASS, a genus (Eriophorum) of the sedge family (Cyperaceae). About 10 species are distributed in bogs and moist places throughout the northern hemisphere. The fruit of the cotton-grass is clothed at the base with a silky or cotton-like substance, which has been employed in making paper and candle-wicking, also used for stuffing pillows. The plant was formerly used for medicinal purposes.

COTTON-GUM (Nyssa aquatica) belongs to the natural order Cornaceae. Besides this species there are three others, natives of eastern North America. It is a large tree, which sometimes reaches the height of 100 feet, with a circumference of four feet, abounding in deep swamps and ponds from Florida to southern Virginia and westward to Texas, Missouri and Illinois. The wood of N. aquatica is soft, though hard, and the sapwood is reddish brown, nearly white color. It is also called tupelo-gum.

COTTON INSECTS. The cotton worm and boll-worm are the chief enemies of the cotton plant in the United States; in other countries different insects prey upon it. Various caterpillars and other insects attack this plant wherever it is grown. In Egypt a noctuid larva, in Greece various kinds of cut-worms, in India a small tined boll-worm (Depressaria), while in Australia a red-bug, allied to the cotton-stainer (Dysdercus stricticeps) affects it. This insect, by sucking the buds, causes the bolls to burst or become diminutive, and also stains the cotton fibre by its excrement.

The cotton worm is by far the most serious pest. It is the larva of a noctuid buff moth (Aelia xylina), which often feeds in vast numbers on the leaves of the cotton-plant. Alabama argillacea is a semi-looper caterpillar, has a loping gait; is slightly hairy, green, dotted with black along a subdorsal yellowish line, with black dots beneath. The insect, as shown by Riley, "never hibernates; either of the first three states of egg, larva, or chrysalis, and it survives the winter in the moth or imago state.
COTTON MACHINERY

only in the southern portion of the cotton belt.\* The moth,\* he adds, hibernates principally under the shelter of rank wire-grass in the more heavily timbered portions of the South, and begins laying its eggs (400 to 500 in number) on the ratoon cotton when this is only an inch or two high. The localities where it hibernates, and where, consequently, the earliest worms appear, seem to be more common in the western part of the cotton belt (Texas) than in the Atlantic cotton States. It is inferred that from this region the moths either die out or go north, laying their eggs later than the original Texan brood, as in Alabama and Georgia. The recently hatched worms of different sizes were found late in March on ratoon cotton in southern Georgia and Florida, and in late seasons from the middle of April to the middle of May, though they do not attract the attention of planters until the middle or last of June. In midsummer the period from hatching to the time when the moth lays her eggs is less than the third generation of or broods of caterpillars in a season, while in Texas there are at least seven annual generations. The first generation is only local, but in Texas, says Riley, "the third generation of worms may become, under favorable conditions, not only widespread, but disastrous, and the moths produced from them so numerous that they acquire the migrating habit. This generation appears in southern Texas during the latter part of June, and in southern Alabama and Georgia somewhat later, and this is the first brood which attracts general attention. When the worms are very abundant and the cotton well "ragged," the moths, driven by need of food and with favoring winds, migrate to distant points, and thus spread late in summer, having been seen as far north as Massachusetts and the Great Lakes.

Another insect, destroying great numbers of cotton bolls, is the brown worm, the caterpillar of another noctuid moth (Heliothis armigera), well known for its injuries to tomato and tobacco plants and to corn in the ear. The adult is a tawny, yellowish moth, about an inch across, the quarters across the wings, which may be seen in any cotton field, in summer and autumn, hovering over the cotton blooms, and depositing a single egg in each flower; the egg is hatched in three or four days, and the worm eats its way into the centre of the boll, causing its premature fall; the insect instinctively leaves the boll when it is about to fall and enters another, and finally attacks the nearly matured bolls, rendering the cotton rotten and useless. The caterpillars have 16 feet, and creep with a gradual motion, unlike the true cotton worm; they vary much in color, some being green, others brown, but all more or less spotted with black, and having a few short hairs. A single moth will lay 500 eggs, and as three broods are produced in a year, a whole field will be very soon infested with the worms.

These are the greatest enemies on the cotton plantations, and the same remedies are effectual in both. The natural enemies of the cotton worms are numerous and abound in proportion as the worms are abundant. Certain kinds of ants are most effective in reducing their numbers, as well as ground beetles, bugs and ichneumon flies (q.v.). The general and most practical remedies against this troublesome pest are the insecticides, especially Paris green and kerosene emulsions. The dry preparation is one pound of the green to 20 to 35 pounds of cheap flour, or, instead of flour, land plaster (gypsum or cotton-seed meal. The best preparation of Paris green consists of one pound to 40 gallons of water. London purple may be applied dry, using two pounds to 18 of flour, etc.; or wet, one-half a pound to 50 or 55 gallons of water.

A fine spray of kerosene oil applied to the leaves will kill all the worms in a remarkably short time, but as petroleum in any form injures the plant, the oil must be so diluted as to injure only the worm and not the plant. The use of milk as a diluent has been suggested.

In recent years the pink cotton boll-worm, long a pest in Egypt, has invaded the United States via Mexico, where it got a footing in 1911. In the latter country it is destroying from 30 to 75 percent of the crop that may be required. There are thus in the northern Cotton States at least three crops of cotton boll-worm, the cotton boll-worm being the second brood of the 1911 pest, the late brood of 1911, and the early brood of 1912. The first brood which attacks the young cotton plants, the late brood which attacks the young cotton plants, and the early brood of 1912, the late brood of 1911, and the early brood of 1912, the latter brood being the most destructive. The cotton boll-worm is present in about 3,000 acres of cotton land in Galveston and Harris counties, Tex., where the State and Federal governments are now engaged in its extermination. The Congress appropriated $500,000 for the work. The method of extermination is radical. First the cotton stalks in the entire field are cut by a machine which covers about 22 acres per day. Then a rake goes over the field and places the stalks in rough piles. Next come handworkers who gather each little boll and piece of cotton and all other vegetation and put it on the pile. The whole is then burned, leaving a field cleared utterly of all vegetable and animal life. The moth which is the parent of the pink boll-worm is fragile and can fly no great distance. It is chiefly in the seed that it is transported, and the eggs can exist there for months. The boll worm damages the crop in many ways. In the field bolls fall to the ground and 50 per cent of the crop may be lost in this way. The grade of cotton is also damaged and the insect stains what cotton is produced. In addition the production is lessened and the cotton seed is rendered unfit for planting and germinates poorly. Consult Journal of Agricultural Research for 4 June 1917, issued by the United States government; also Riley, Report IV of the United States Entomological Commission (1885); and Bulletin 18 of the Entomological Division of the United States Department of Agriculture (1898). For cotton-boll weevil, see WEEVL.

COTTON MACHINERY. Ginning machinery is always located at or near a railway station in a cotton-growing territory. The earliest cotton gin probably dates back to the days when the market price of animal skins became so great that man had to look around for a cheaper substitute for clothes. A primitive machine called the charkha is still in use to-day by the Hindus and Chinese. It consists of two plain rollers mounted on a frame and revolved in contact. Between these rollers the cotton is drawn and torn from the seeds.

In most parts of the cotton belt of the
United States the saw-gin which Eli Whitney invented in 1794 is still the machine used to gin cotton. The purpose of the machine is to separate the seeds from the fibers of the cotton. Evolution has done comparatively little to change its three essential elements, the saws, ribs and brush. These have been retained in nearly all modifications intended to meet modern ideas, methods, means and material of construction, although a number of changes in the quality and quantity of the staple of the cotton, but thus far no machine has been invented which can excel the saw-gin in capacity. The cotton gin consists principally of a hopper in which the raw cotton is thrown. A blower-case and a rotary brush serve to guide the cotton against a cylinder which has needle-like teeth, or, in later construction, saw-teeth. These teeth catch the cotton fibre and withdraw it through openings too narrow for the seeds to follow. A seed-box and screen remove the seeds, the dust is blown out and the separated or ginned cotton is ready to be baled. As the fibres of the cotton were found to be injured by the action of the saws, the McCarthy roller gin was introduced. It consists of a series of rollers on which a knife is tightly held tangentially and a moving blade that moves up and down in a plane just behind and parallel to the fixed knife. As the cotton is drawn between the rollers and the knife the seeds are forced loose by the moving blade. It works well, but its limited capacity has prevented its general introduction.

Until about 1875 the average ginning plant consisted of one gin standing having a gang of 60, 70 or 80 saws, capable of turning out from 8 to 10 500-pound bales of cotton in a day. The isolated cotton plantations did not require a greater capacity than this size of plant, and each planter did his own ginning. But after the development of the Southwest with its large areas capable of raising cotton and the large number of small farms located close together, system gins were erected at railroad stations capable of ginning for the entire neighborhood. The competition of the gins with each other required a perfection of machinery never attained. The cotton gin has not lost its importance in the world of cotton-harvesting. As the development of the Southwest increased its competition with the Southeast, this latter section adopted the methods which had grown up in the former. Small plantation gins were not rebuilt as they wore out or burned, but larger gins owned by a company of planters or merchants were built at the railway stations. Thus the entire cotton-handling business underwent a revolution, until, for economy, speed and efficiency, it ranks with the latest machinery for harvesting grain crops.

The constant danger of fire which hangs over all cotton gins has caused the separation of the different buildings which go to make a complete establishment. The gin building proper is only large enough for the machinery which does the ginning; no cotton is in the building except that which is undergoing the process of ginning. The seed house in which the seed is stored is usually located on a near-by spur of the railway. Further to avoid the risk of fire and to ensure better running of the machinery, the gins are located on a low platform three feet high. The floor of the building is brick or cement and the building is made of brick, stone or sheet iron.

The line shaft is carried directly under the gins where all of its journals are in sight; it can be easily oiled and hot-boxes instantly detected. At the end of the row of gins the higher platform is built to surround the press. Bales are taken out on this platform and can be thrown into the wagon thence without further expenditure of labor. After the mechanical processes of carrying by the exhaust fan and dropping the cotton into each gin, blowing it from the gins to the presses and its packing there by a steam trumper, the operation of putting on the bagging and tying the hoops is the first manual labor necessary after the feeding from the wagon into the telescope.

The principal machines used in a modern ginning establishment, in the order in which they are used, are the telescope, the elevator, the exhaust fan, the feeder, the gin, the seed conveyer, the flue, the condenser and the press.

The telescope is an extensible tube which hangs from the inlet cotton pipe; it is counter-balanced and so arranged that its tube can be pulled down and kept close to the pipe of cotton unless as it is desired rolled to where a knife is tightly held tangentially and a moving blade that moves up and down in a plane just behind and parallel to the fixed knife. As the cotton is drawn between the rollers and the knife the seeds are forced loose by the moving blade. It works well, but its limited capacity has prevented its general introduction.

Until about 1875 the average ginning plant consisted of one gin standing having a gang of 60, 70 or 80 saws, capable of turning out from 8 to 10 500-pound bales of cotton in a day. The isolated cotton plantations did not require a greater capacity than this size of plant, and each planter did his own ginning. But after the development of the Southwest with its large areas capable of raising cotton and the large number of small farms located close together, system gins were erected at railroad stations capable of ginning for the entire neighborhood. The competition of the gins with each other required a perfection of machinery never attained. The cotton gin has not lost its importance in the world of cotton-harvesting. As the development of the Southwest increased its competition with the Southeast, this latter section adopted the methods which had grown up in the former. Small plantation gins were not rebuilt as they wore out or burned, but larger gins owned by a company of planters or merchants were built at the railway stations. Thus the entire cotton-handling business underwent a revolution, until, for economy, speed and efficiency, it ranks with the latest machinery for harvesting grain crops.

hydraulic ram, or a screw which is raised and lowered by a revolving nut. The bales turned out by this square press usually weigh 500 pounds gross, and average 28 x 56 x 42 inches in size and thus have a density per cubic foot of about 14 pounds. They are usually shipped from one to some concentrating point where they are assorted and compressed, and their size is reduced to 28 x 56 x 18 inches, giving them a density of 30 or more pounds per cubic foot. They are then ready to be shipped to the cotton mills.

The large compressors which do this pressing are enormous machines weighing in some cases as much as 200,000 pounds, and are operated either by direct-acting steam cylinders coupled to the jaws of the press by multiplying levers, or the jaws of the press are brought together by a large link moved by hydraulic rams sitting directly over the press. The capacity of this press ranges from 800 to 1,200 bales in 10 hours. The bales while in the press are recovered and their bands are shortened to suit the reduced bale size.

Early in the present century the American Cotton Company developed a cylindrical bale, which permitted the cotton to be compressed more tightly and therefore to occupy less space in a freight car. A bat or layer of cotton is formed, rolled down very hard and wound up on itself, or rolled together under pressure and tension so that it forms a cylinder and tends to hold itself together. The square bale when compressed to more than 60 pounds to the foot required heavier bands or else bandage, and there is a risk of burst; but the cylindrical bale makes use of the cotton itself to hold it in place. It is simply wound up very tightly and tied, taking very readily a pressure of 35 to 40 pounds to the cubic foot. This bale is made in a bat-forming and condensing machine, and is usually made smaller and hence considerably lighter than the so-called square bale. This cylindrical bale has the advantage that it arrives at the cotton mill more conveniently protected by bagging having neither haws nor loops, and there is less tear and waste; it is also cheaper to manufacture.

Carding and Combing Machinery.—The first machine to which the cotton goes in a factory is the bale-breaker, on which the cotton is opened and beaten. In modern practice there is less beating of cotton and more dependence on air suction to remove the dirt. Automatic feeders are now used with breakers. The breaker-lapper, after cleaning the cotton stock, converts it into a lap or roll, after which it may go to a finishing lapper. The carding machine was invented by Lewis Paul and improved by Arkwright. Modern machines are usually of the revolving flat card type. The main cylinder of about 50 inches diameter bears card-clothings or a surface of points resembling a very fine wire brush. This clothing may have from 40,000 to 90,000 points per square foot. Above and opposed to this cylinder is an endless apron called a top flat, which also bears card-coating. The cylinder and flats moving oppositely strike out or strip, and render parallel, the fibres of cotton that come into the machine in the form of a lap, and the top flat removes all knots and slivers. This lap is taken up by the picker-in, a toothed cylinder that feeds or supplies the carding machine. After passing the cards the cotton is received by the doffer or doffing cylinder.

A recent French invention is the Roth aspirator, which is applied to combers as a substitute for the doffer or doffing combs. It is a perforated tube with a suction draft and does the work without any harsh handling of the cotton fibres. The Whitfield and high-speed comber has 8 heads, takes laps 12 inches wide and has devices for reducing vibration. It runs normally at 135 nips per minute.

The cotton comes from the doffer as a fleecy strand termed a sliver. It is deposited in cans and may go to a sliver-lap machine and be formed into a lap about 15 inches in diameter and 10 or 12 inches wide. This lap may go to the ribbon lap machine, which doubles four laps into one, the object being to obtain greater evenness from the repeated doublings and drawings out, and paralleling of the fibres. The laps from the ribbon lap machine are placed on the comber, which doubles eight to one. A combed sliver yarn gets 640 extra doublings and is smoother and more lustre and resilient.

Drawing, Roving and Twisting.—The drawing frame receives the sliver, and by passing it between series of rolls at increasing speeds draws it out finer. These machines have been highly developed and are truly automatic. When the drawn slivers are slightly twisted they are termed roves or rovings. Roving machinery includes slubbers, intermediates, fine roving frames and jack-frames. The product of the roving machine is usually delivered on bobbins and may then be termed yarn.

The Spinning Frame.—This is the machine that made Richard Arkwright famous, it being a development of the spinning Jenny invented by James Hargreaves. Many other machines in the cotton industry are based on the same operating principles as the modern spinning frame. It draws out the fibres and twists the cotton yarn hard and firm and winds it on bobbins. The modern frame first passes the roving through a series of rolls that permit a variation in twist. When drawn to the required roving density and twist the yarn passes to the bobbins, mounted on rows of spindles that stand upright and rotate on either side of the frame. Frames run from about 112 to 352 spindles each, the 240-spindle frame being now popular. After being spun, the yarn is doubled and twisted to form thread. It may be twisted wet or dry; in wet twisting the yarn is drawn from a creel through a trough of water. In modern twist frames a wide range of twist combinations is possible for making all kinds of thread. With a builder-motion the bobbins may be wound straight, taper-top or for warp or filling. While in the yarn it is often desirable to bleach, dye or mercerize the cotton.

The mule-spinner or spinning-mule, invented by Samuel Crompton, is in use less than formerly. It is a combination of the drawing-rollers and jenny used in the early history of modern machine weaving. It has a carriage that travels away from the drawing rollers as the threads are twisted and comes back to wind on the yarn on the bobbins. While the mule draws, stretches and twists at one operation, it is not as satisfactory as the later and more highly developed frames. The ring-spinner or ringframe is a spinning machine in which a metal loop revolves around each spindle to carry the
thread. Spoolers and quillers are machines for winding the yarn on either spools or quills—the modern quill being simply a paper tube. See Spinning.

Weaving Looms.—These are made in almost infinite variety for various purposes. The heavy-pattern loom, the wide loom and the endcam loom are perhaps the most common. For fancy weaving the dobby loom is generally employed. There are also special gingham looms and looms for light and heavy duck weaving, and two-, four-, and six-box fancy looms. See Textiles; Weaving.

Testing Machinery.—A typical form of yarn-examining machine consists of a light hand-reel, in which a black card may be fitted to carry the wound yarn or thread. A moving guide spaces the yarn so that every strand is well separated. When wound the card of yarn may be placed under a microscope, or in the reflectoscope, which is a small box with a dark background, a mirror and an easily positionable lamp. The yarn for dampening the conditioning oven is employed. A sample of yarn is hung on the scale of the oven and heated. As the moisture is dried out the reduced weight is registered on the scale. For strength-testing, an upright frame is provided, with grips in which a number of less of thread or yarn may be broken at one operation. If four leas are strained by the reel at one time, and the dial shows they break at 88 pounds, it follows that their average strength is 22 pounds. A single-thread recording tester is also manufactured. The operator can run through a sample, breaking it a dozen times, and follow this with other samples, and withdraw a card on which are recorded the breaking strains of each break of each sample. The average strength as well as the greatest weakness of a lot of thread is thus readily obtained. There are several forms of twist-testing machines and some record the contraction resulting from the twisting.

CHARLES H. COCHRANE, Author of ‘Modern Industrial Progress.’

COTTON MANUFACTURES IN THE UNITED STATES.

Although cotton manufacturing is one of the oldest of the factory industries in the United States it had made but little progress until the embargo was laid upon foreign commerce during Jefferson's and Madison's administrations. It resulted in a remarkable development of the industry. Like all other industries it has had its periods of depression, but since that time there has not been a single decade—not excepting the Civil War period—when cotton manufacturing has not shown a substantial growth.

No statistics of the industry were collected until the taking of the Federal census in 1839. That census showed 1,240 establishments at work, giving employment to 72,119 persons and turning out products valued at $6,350,000. The next year there were 1,169 establishments employing 92,280 persons with manufactured products valued at $61,869,000, while to the census following, 1859, there were returned 1,091 establishments giving employment to 122,028 persons and making wares valued at $115,682,000. Similar statistics collected decennially by the census (also for 1914), and including the capital employed, are as follows:

<table>
<thead>
<tr>
<th>Year</th>

<td>$971,923</td>
</tr>
</tbody>
</table>

In addition to the value of the products in 1914, cotton goods to the value of $6,538,000 were produced by establishments engaged primarily in other lines of industry.

As measured by the amount of capital employed, and as indicating the progress made, the percentage increase in each decennial period is as follows: 1869-79, 48 per cent; 1879-89, 70 per cent; 1889-99, 32 per cent; 1899-1909, 76 per cent, and for six-year period 1909-14 9½ per cent.

The number of spindles engaged in the production of yarn is another and more accurate method of measuring the growth of the cotton industry. Thus, taking the same decennial periods as above, and the seven-year period 1909-15, the following figures indicate the progress made in the United States, as well as in the cotton-growing States, New England and all other States.

<table>
<thead>
<tr>
<th>Year</th>
<th>Number of spindles</th>
</tr>
</thead>
<tbody>
<tr>
<td>1869-70</td>

<td>38,018,000</td>
</tr>
<tr>
<td>1919-1929</td>
<td>62,906,000</td>
</tr>
</tbody>
</table>

Beginning with 1869 the increase in the number of spindles the first decade, 1869-79, was 3,521,000 or 49½ per cent; the second, 1879-89, 3,731,000 or 35 per cent; the third, 1889-99, 5,088,000 or 34½ per cent; the fourth, 1899-1909, 8,546,000 or 44 per cent, and for the period 1909-15, 4,788,000 or 17 per cent. In addition to the above number of spindles, there were approximately 500,000 that used raw cotton mixed with other fibres in the manufacture of woolen goods, hosiery and knit goods.

The above figures show that within the past 16 years, or since 1899, the number of spindles in the United States has increased 14,417,000 or 77½ per cent. But the most striking feature in
COTTON MACHINERY

1 Gin

2 Press

3 A Ginnery
the progress of this industry is the remarkable increase in the number of spindles in the cotton-growing States. In 1900 these States operated only 4,358,000 spindles, as compared with 13,171,000 in the New England States and 1,933,000 in all other States. By 1910 they had added 9,788,000 spindles, an increase of 224 per cent, compared with 4,500,000 for New England, an increase of about 34.8 per cent, while in all other States there was an increase of only 17,000 spindles or less than 1 per cent.

The following table gives the number of mills, the number of spindles operated, and the quantity of domestic and foreign cotton consumed in each State, and the United States, during the season 1915-16.

**Mills, Spindles and Consumption of Domestic and Foreign Cotton, 1915-16.**

All of the New England States—except Vermont—the two Carolinas, Georgia and Alabama operated more than 1,000,000 spindles, Massachusetts being in the lead, followed in the order named by South Carolina, North Carolina, Rhode Island, Georgia, New Hampshire, Connecticut, Maine and Alabama. Massachusetts is also the largest consumer of raw cotton, North Carolina coming next, followed by South Carolina, Georgia and Alabama. As indicated by the increase in spindles, the largest increase in the annual consumption of cotton is in the cotton-growing States, the increase since 1910 amounting to 1,338,000 bales, or about 60 per cent, while the increase in New England since 1910 is 483,000 bales or about 24 per cent.

All of the cotton consumed in the United States is of domestic growth—except from 250,000 to 300,000 bales imported from other countries. Nearly 84 per cent of the foreign cotton is Egyptian, the remainder coming from China, Peru, East India and Mexico. The Egyptian cotton is used mainly for mercerizing and making highly finished cloths, balbriggan underwear, and lace curtains, sewing threads, and similar goods requiring a long fibre and unprecedented consumption of "linters" in 1915-16, amounting to 880,916 bales, or an increase of nearly 114 per cent over the previous year, is explained through the great quantity of explosives manufactured for the Allies engaged in the European War.

The cotton manufacturing establishments in the United States turn out a great variety of products. Indeed, American ingenuity is constantly finding new uses for cotton, the most wonderful of all fibres. A classification of the cotton mill products for 1915 shows that of the 2,098 establishments in the United States, 1,069 of them manufactured almost every known variety of yarns from the coarsest to the finest, many of these also manufacturing cotton goods. The number of establishments making the different kinds of wares may be classified as follows: 296 manufacturing sheeting, shirting and drills, 107 colored cotton goods, 97 print cloths, 89 fancy white goods, 86 duck, 86 cotton twine, 81 fine white goods, 81 cotton cordage, 76 cotton webbing, 73 cotton braid, 65 cotton towels, 59 converters' goods, 57 cotton batting, 57 cotton tape, 54 ticking, 52 satins, 43 cotton upholstery goods, 42 gingham's, 39 cotton felt, 36 cotton lace, 33 cotton flannel, 31 shoe laces, 31
COTTON MANUFACTURES IN THE UNITED STATES

denims, 30 cotton damask, 30 cotton bagging, 29 cotton plush, 23 cotton hammocks, 22 bed spreads, 19 cotton hair clothes, 17 cotton wicks, 16 cotton comforts, 16 absorbent cotton, 13 mosquito netting, 12 shade cloths, 11 cottonades, 11 tire fabrics, 10 book cloths, 8 crinoline, 6 cotton blankets. Besides these 1,553 establishments were engaged in the manufacture of hosiery and various kinds of knit goods.

According to the latest census statistics (1914) the total capital employed in cotton manufactures amounted to $899,765,000, of which $358,556,000 was invested in the cotton States, and $540,908,000 in all other States. The total value of all goods manufactured was $701,301,000 the products of the Southern mills representing $283,189,000 in value, and those of all other States $418,112,000.

The value of the cotton goods of domestic manufacture exported during the fiscal year 1914 amounted to $51,467,000, which was an increase of $27,067,000, or nearly 121 per cent since 1900. More than one-half of the value of the exports in 1914 is accounted for by the exports of bleached, unbleached and colored cloths amounting to 4,148,860,000 square yards and valued at $28,845,000. Of the 119,887,000 square yards of unbleached cloths exported more than two-thirds went to China, the other countries in the order of the amount taken being Aden, India, Chile, Cuba, Philippine Islands, San Salvador, British East Africa, Turkey, Canada, Bolivia and Columbia. Of the colored cloths exported the largest quantity went to the Philippine Islands, and large quantities also to the West Indies, Central and South America and Canada. Of the other cotton goods exported Canada was the largest customer, taking very large proportions of the clothing and other wearing apparel, and various other manufactured goods.

In this connection it is worthy of notice that the value of imported cotton goods in 1914 amounted to $694,411,000, or $17,944,000 more than the value of the cotton goods exported. The largest contributor to this trade was Great Britain, its imports being valued at $23,853,000, those of Germany at $17,618,000, France at $14,836,000, Switzerland at $10,335,000, Japan at $1,007,000, and all other countries at $1,759,000.

The value of cotton manufactures exported from the United States in the three years of war (1914-17) is one-half as much as in the 20 years before the war. A recent compilation shows that the value of cotton cloths alone exported in the fiscal year ended 30 June 1917 is nearly three times as much, knit goods seven times as much, and cotton yam eight times as much as in the fiscal year 1914. The quantity of cotton cloths exported in the fiscal year 1917 exceeds that of any earlier year except the fiscal year 1906, when the demand of China at the close of the Russo-Japanese War was exceptionally heavy. Even in cotton laces of which the export value has been extremely small, the total for 1917 exceeds $1,000,000

*Pounds † Including Panama. ‡ Including Bermuda. § Including Hong Kong. † Not separately given.

against less than one-quarter of a million in 1914. Cotton wearing apparel, which prior to the war was about $10,000,000 per annum, was in the fiscal year 1917 over $30,000,000. This increase in value of cotton goods exported is not merely due to higher prices. Of cotton cloths alone, for example, the exports for the fiscal year ended 30 June 1917 are about 700,000 yards against 397,000,000 in 1915, and in the other classes of cotton manufactures there has been a gain in quantity as well as in value. In May 1917, the latest month for which details are available, the quantity of cotton cloths exported is 63,000,000 yards, against 44,000,000 in 1915. Cotton yarn also shows a large increase in exportation since the beginning of the war, having amounted in 1917 to over $3,000,000 against $716,000 in 1914. This increase has been chiefly to our neighbors to the north and south. To Canada the exports of cotton cloths alone in the fiscal year 1917 is over 75,000,000 yards against 20,000,000 in the year before the war; to Central America, 63,000,000 yards against 37,000,000 in 1914, and to South America 170,000,000 yards against 42,000,000 in 1914. To the Orient, which formerly was our best market for cotton cloths, there is a distinct fall off, due to the fact that Japan is now manufacturing cotton goods largely for her Oriental neighbors. The quantity of cotton cloths exported from the United States to Asia in 1914 (the year before the War) was 125,000,000 yards and in 1917 but 38,000,000 yards. Even in the Philippines, which have been our largest customer in recent years for cotton goods, the total for the fiscal year 1917 is but 83,000,000 yards against 106,000,000 yards in the fiscal year 1915. The Philippines still take more cotton cloths from the United States than does any other country, though the values are less than those of Canada, which took in the fiscal year 1917 cottons of a higher price than those of many other countries, presumably utilizing them for war purposes. This is also true of the limited quantity of American cotton cloths taken by Great Britain. The marked fall off in the value of our exports of cotton goods to the Orient is illustrated by a comparison of figures of recent years with those at intervals since 1900. In the fiscal year 1916 the exports of cotton goods of all kinds to Asia were but $3,911,000 against $9,016,000 in 1914, $7,501,000 in 1910 and $31,352,000 in 1908. On the other hand the exports to Oceania show a large gain since 1900, having been in 1916 $9,455,000, in 1914 $8,730,000, in 1910 $4,187,000, and in 1900 $1,296,000. To South America the increase since the War is very large, the total for 1916 of cotton goods of all kinds being $15,336,000 against $3,785,000 in 1914, $3,347,000 in 1910 and $2,069,000 in 1900.
To North America the total for 1916 is $39,970,000 against $20,459,000 in 1914, $12,485,000 in 1910 and $7,001,000 in 1900. The increase to Europe in 1916 and 1917 is very large, but occurs chiefly in knit goods and in a less degree in cotton cloths. The total of all cotton manufactures to Europe in 1916 was $35,536,000 against $3,614,000 in 1914, $1,996,000 in 1910 and $1,507,000 in 1900. Of this large total of $35,536,000 to Europe in 1916, $12,936,000 was knit goods, $7,287,000 cotton cloths and $7,086,000 other cotton clothing. Details of distribution by grand divisions in 1917 are not yet available.

JAMES L. WATKINS,
Cotton Statistician, New York City.

COTTON PRODUCTION OF THE WORLD. The ever increasing demand for cotton is not due exactly to the fact that it supplies the world with the cheapest possible clothing, nor yet to the fact that 250,000,000 of the earth's inhabitants need cheap clothing to hide their nakedness, but largely to the additional fact that there are innumerable other uses to which cotton is adapted and for which there is no substitute. As might be expected, this continually increasing demand has stimulated its production throughout the world, until now it is cultivated on a larger scale than ever before. The following table, compiled from the most trustworthy authorities, gives the production in each country from 1910 to 1915, inclusive. The figures for the first 10 countries represent bales of 500 pounds each, those for all other countries running bales, the weights varying in each. The reduced crop of 1915 is partly due to the European War, as in East India and Egypt, where by government decree the acreage in 1915 was considerably reduced.

COTTON STATE, a nickname for Alabama.

COTTON WHIGS, or CONSCIENCE WHIGS. See Whigs.

COTTON-WORM. See Cotton Insects.

COTTONIAN LIBRARY, a valuable collection of ancient manuscripts, books and coins, begun by Sir R. Cotton (q.v.), and much augmented by his son and grandson. His grandson, Sir John, wishing to make the library

* Includes the crop of Venezuela.
a public one, an act of Parliament was passed in 1700 for this purpose; in 1707 another act authorized the purchase of Cotton House and library on behalf of the queen and her successors; and in 1730 it was deposited in a house in Westminster. The next year a fire broke out there, whereby 114 volumes of manuscripts were burned, lost or entirely defaced, and 98 rendered imperfect. A great number of the injured volumes were effectively restored, so that the library consists of nearly 300 volumes. Nearby 200 are a matter of greater value covering the diplomatic relations of Europe from the reign of Edward III to James I. It was then removed to a new building in Westminster, and in 1757 finally removed to the British Museum. In addition to manuscripts, it contains many valuable coins and antiquities.

**COTTONMOUSE** (Peromyscus spinosus), a native to the southern portions of the United States, and destructive to cotton plants. It is dark brown in color, with grey ears. Its habits are like those of the white-footed deer-mouse (q.v.), common in the North.

**COTTONMOUTH,** a common name in the southern States for the moccasin (Ankistrodon piscivorus), so called because of the whitish streak along the lips. The name is also sometimes applied to the cupped-head snake (q.v.).

**COTTONSEED OIL INDUSTRY.** More than 2,000 years ago the Hindus mastered the uses of the cotton fibre, demonstrating its remarkable adaptability for spinning into fabrics to cover the nakedness of the savage and adorn the dress of the nobleman. But it remained for the practical genius of America to discover many other wonderful properties of the cotton plant; that its seed furnished an invaluable food for man and beast, and, when combined with other chemical ingredients, a most excellent fertilizer; that its stalks may be ground into pulp for making the finest kind of writing paper; that the ashes from the hulls of the seed yield a good grade of potash, and that even the root itself may be utilized for dye-stuffs.

**History of Cotton Oil.—** To Dr. Otto, a Moravian, of Bethlehem, Pa., belongs the honor of making the first cotton oil ever produced in the United States. He began experimenting in oil from cotton seed and other vegetable seed about the year 1768. Samples of the oils obtained were sent to his friend Dr. Bond, of Philadelphia, and on 20 Sept. 1768 they were presented to the American Philosophical Society with the statement from Dr. Otto that one bushel and a half of cotton seed would yield nine pints of oil. Some years later, 1783, it is said that the London Society for the Encouragement of Arts, Manufactures and Commerce called attention to the possible value of this oil.

It is of record in the United States Patent Office that on 2 March 1799, one C. Whiting obtained a patent for a “process for extracting oil from cotton seed.” All of the records relating to this patent are supposed to have been destroyed by fire. Sir William Dunbar, the earliest cotton planter of Natchez, Miss., when the Mississippi territory was under British dominion, had some knowledge of cotton oil, for in ordering a cotton screw press from Philadelphia in 1801, he wrote his correspondent: “I shall endeavor to indemnify myself for the cost by making cotton-seed oil. It will probably be of a grade between drying and fat oils, resembling that made from linseed in color and tenacity, but less drying. Where, he asked, can a market be found for such an oil? Whatever knowledge Sir William may have had of cotton oil he made no practical use of it, but it is an interesting coincidence that 32 years later Natchez was one of the first places to attempt the manufacture of cotton oil.

The very first machine for hulling cotton seed was invented by J. Lineback, of Salem, N. C., and patented 31 March 1814. The records relating to this patent were also destroyed by fire, the only reference to it being contained in the index volumes, where it is referred to as “a cotton hulling machine.”

Meanwhile, it appears that Egyptian cotton seed was introduced into England and France for manufacture and refining of cotton oil was begun and carried on to some extent in England and France.

So far as the United States is concerned, the first step in a practical direction to manufacture of cotton oil was made by Francis Collins of Petersburg, Va., to whom belongs the distinction of having constructed the first cotton oil mill in this country. On 21 Jan. 1829, he obtained a patent for a “machine for hulling and husking cotton seeds and separating the hulls from the kernels,” and the same year constructed and put into operation a mill that was pronounced by competent judges from different parts of the Union as “second in importance, to the South, to the cotton gin only.” In December 1829 Mr. Follett obtained a patent for improvements in his machine, meanwhile having formed a partnership with Mr. Smith, also of Petersburg. In an advertisement (1829) Messrs. Follett and Smith claimed that one of their two- or three-horse-power machines would hull and clean at one and the same operation from 20 to 25 bushels of seed per hour, which would yield one-third its measure, or 55 per cent of its weight in kernel from seed of fairly good quality; that one bushel of kernel would yield two gallons of oil, and perhaps one or two quarts more, equal to flaxseed oil if well expressed, and leaving 35 pounds of oil cake. It was claimed that because of its cheapness and aptitude for almost every purpose the oil would supersede all others in use, while the oil cake was a highly nutritious food for cattle, and these products would become important articles of export.

**Commercial Extension.—** As rude and imperfect as was the beginning as the manufacture of cotton oil, Follett and Smith succeeded in demonstrating that oil for commercial purposes could be extracted from the cotton seed, so long neglected and considered more or less of a nuisance. They sold their patent rights for most of the Southern States to A. Plummer & Co., which resulted in the construction, about the year 1833, of several more mills, viz., one near Raleigh, N. C.; one at Natchez, Miss.; one at Florence, Ga., and another at Mobile, Ala. The most pretentious and extensive of these mills was the one at Natchez, capable of turning out 1,000 to 2,000 gallons of oil per day. A New Orleans trade journal in 1836 noted the
arrival in that city by the steamer Lamplighter from Arkansas, of 20 barrels of cotton-seed oil and 20 tons of cotton-oil cake, no doubt the most prominent of the party were Dr. Edward J. Coxe and William Wilber of New Orleans. Dr. Coxe undertook to demonstrate that the planters were throwing away the seed of three-million-bale cake, that might be made to yield them millions of dollars annually; that 100 pounds of seed would produce two gallons of oil, 48 pounds of oil cake and 63 1/2 pounds of soap stock, and that if only one-half the seed was used the value of seed products would amount to $36,820,000. He also showed that, regarded as a medicinal oil or medicinal purposes, few could detect the least difference between it and the famed olive oil of Italy, and eaten with salad or rice it had the same flavor and taste of the best produce of that country.

The oils experimented with at this time were chiefly made by Mr. Wilber of New Orleans. He exhibited a specimen of his oil at the annual exhibition of the American Institute, held at New York in October 1853, for which he was awarded a silver medal. In 1854 Messrs. Wilber & Co. constructed a mill in New Orleans and began making oil with a huller patented by Mr. Wilber the year following. From time to time Mr. Wilber improved upon his original machine and in a few years so perfected it that the seed were pressed into oil without any handling except for the shape of cakes. This machine was so constructed that the seed was taken from the bin, introduced into the crushing apparatus, and thence the crushed material passed through the pressing machines to take off what was called "cold pressed oil"; thence the partially formed cake passed into the heating and reducing apparatus, where it was prepared for a subsequent pressing for the machine with the remaining oil in the crushed material producing "hot pressed" oil. From the last pressing the machine the oil cake passed under a knife and was cut into shapes convenient for handling. And so by this new process, it may be said, that the rough seed was introduced at one end of the machinery and came out of the other in the shape of oil and cake.

In 1855, through the enterprise of Messrs. Kendall and Klapp, the Union Oil Company was organized and a large mill was built at Providence, R. I. The same year Messrs. Martin and Aldige put up a mill at New Orleans, and a few months following another was built in the same city by A. A. Maginnis. About the same time two mills were erected at Memphis, one at Saint Louis, and a little later another at Brooklyn, N. Y. The seed for the New Orleans, Memphis and Saint Louis mills was obtained by water transportation from the plantations along the banks of the Mississippi, the steamboat lines carrying the seed at very low rates on return trips when other freight was scarce; the Providence and Brooklyn mills obtained their seed from New Orleans and other Southern ports through sailing vessels. The seed was purchased at ton rates, the price varying from $8 to $10, and was delivered in sacks furnished by the mills and containing from 80 to 100 pounds.

When cotton oil mills were first built in the South the planters, who had previously allowed their seed to rot about the gin houses, were suddenly seized with the idea that their seed was a very valuable article of trade, and that the demand would far exceed the supply. Many, therefore, began to house and take care of the seed, and as plentiful as was the supply, the mills were obliged to pay $10 a ton for all they consumed. By and by, when the planters had figured out the quantity of oil to be pressed in each bale, and the magnitude of the cotton crop, they put down the price, and in 1860 more seed was offered at $5 a ton than the mills could possibly consume during the year.

New Machinery.—From 1855 to 1890 a dozen patents were issued for hulling machines, four for processes for extracting oil from the seed, five for cleansing the seed and two for delinting the fibre. Of these only four proved to be useful inventions, namely: the huller patented by William R. Stockdale, of bridgeport, Conn., August 1857; another by F. A. Wells of Memphis, Tenn., October 1869; and two delinting gins, one by W. F. Pratt, of Bridgewater, Mass., June 1869, and the other by G. W. Grader, of Memphis, August 1869.

The hulling machine invented by William R. Fee attracted considerable attention, as it introduced the new principle of cutting the hulls in two instead of crushing them. All the machinery hitherto employed in decorticating the seed subjected them to a grinding action, which so packed the hulls, fibres and kernel together that it was impossible to separate them in the process of screening without waste. When grooved cylinders were used, the grooves sometimes became so choked up as to necessitate separating the parts for cleaning, and it was found impossible to hull seed that were the least damp. This defective mode of hulling rendered the subsequent screening imperfect and occasioned a ruinous loss of oil, much of which was extracted by the remaining fibres of cotton. There was also an additional waste in the fragments of kernel screened out with the hulls. The Fee huller corrected all these faults. A single huller was capable of hulling three tons of seed per hour, which was claimed to be 24 times the capacity of any other huller. It was also claimed that by cutting instead of crushing, or grinding the seed, 30 per cent more oil was made from a given quantity of seed, and that it would also hull seed comprised was turner water. This huller, and also an hydraulic press, also invented by Mr. Fee, were in use at the mills in New Orleans, Memphis, Saint Louis, and at one or two places in Texas, and at Dayton and Cincinnati, Ohio, in 1860. Several of them had been tested and satisfactorily used as early as 1856. No little credit is due to Paul Adige of New Orleans, who about this period visited the important oil mills in Europe, including those at Marseilles, France, where he obtained much valuable and practical knowledge of extracting and refining cotton oil.

Market.—The best quality of crude oil found a market among oil refiners, who by a very simple process removed all mechanical
imperfections, and destroyed the coloring matter so as to produce an oil of a rich olive color, sweet and agreeable to the taste. It was found to be an admirable substitute for olive oil, and when flavored by an addition of oil could not be distinguished from the genuine article. This gradually found its way to the table of private families and first-class hotels. The chief consumers, however, of the oil made from 1855 to 1870 were the soap manufacturers. From the crude oil they produced almost every grade of soap, from the cheapest family to the purest white case. The finest and most highly perfumed toilet soaps. The surreptitious use and mixture of the cotton oil with other oils brought it into disreput and only small quantities under its true name found a ready market, except to the soap manufacturers.

Growth of the Industry.—The census returns of 1860 show seven mills in operation, three in Louisiana and one in each of the States of Missouri, New York, Rhode Island and Tennessee. They employed 183 persons who worked 47,900 hours on $73,000 worth of capital, and turned out 44,600 bushels of oil. In 1869, only three mills survived the Civil War, the one at New Orleans, the one at Saint Louis and the other at Providence, R. I. But no sooner was the war ended and the cotton planters began producing sufficient seed than the attention of the capitalists was turned to cotton oil making as a profitable investment, and the industry again revived. So far as the mechanical process was concerned, about the only difficulty encountered at this time was the lint, or short fibres adhering to the seed as it came from the ginn house. This trouble was soon obviated by the delining machines invented by Wm. F. Pratt, of Bridgewater, Mass, and Geo. W. Grader, of Memphis, already referred to. These machines were entirely distinct from the old delin gin, taking the seed after the ginning was done and stripping them of the short downy fibre, and thus preparing them for a more perfect separation of the hulls from the kernel. The delining gin was constructed on the principle of the common saw ginn and consisted of a series of circular saws and a fluted roll, the roll serving as it revolved to turn the seed over and over, thus causing all parts of them to be acted upon by very fine teeth saws.

In the meantime various improvements were made in the detail workings of the machinery used for making cotton oil, which resulted in greatly increasing its capacity and cheapening the cost of making the oil. The capacity of the first fuller in use was about one-third of a ton per hour; that of the hullers of the 1855-60 period about three tons per hour, and of the Improved hullers of 1870-94 a still greater capacity. The presses used in 1855-60 had a capacity of about three tons per 24 hours, and modern press 15 tons or more in the same time.

It having been clearly demonstrated that there was a demand for cotton seed products, and that the industry was a profitable one, mills began to increase. So that from three mills in 1855 with an invested capital of $225,000, the number in 1870, just five years after the Civil War, increased to 26 with a capital of $1,225,350; the number of hands employed was 664 and the wages paid was $292,032; the value of raw material $1,333,631 and the value of products $2,205,610. The quantity of oil produced was 2,490,853 gallons, valued at $1,547,218.

But as important as had been the improvements made in the cotton oil machinery at this time, of still greater importance were the discoveries of the value of the oil as a food product in various forms. In the beginning, or about the time the Polet and Smith mill was built in Petersburg, Va. (1829), it was first used, in an experimental way, as a paint oil, as an illuminant and lubricant, and then as food for stock. But now it was to find its way into the markets as a food product of great value.

The first use made of cotton oil as a food product was about the year 1855, when it was mixed with lard to temper it for consumption in cold climates. But this was done surreptitiously, just as afterward was done when it was used for mixing with olive oil for the same purpose. At the same time it was tested as a salad oil and was found to equal in purity the best olive oil. These experiments and tests were so satisfactory that the demand for it to mix with lard and olive oil steadily increased.

Sometime between 1865 and 1870 a Frenchman, Héprovile Mige, at the request of the French government, one authority says of Napoleon III himself, was induced to make the experiments that led to the discovery of a substitute for butter that was cheap enough to reach the poorer classes, and would also keep better than butter, and thus be adapted for the use of the navy. In 1873 he took out the first patent in the United States for artificial butter, and this was followed by nearly 50 other patents relating to the manufacture of oleomargarine, or some similar product of artificial butter. One of these patents was a combination of "swine fat, cotton seed oil, slippery elm bark and beef stearin," and this led to a large consumption of cotton oil for making artificial butter. The surreptitious mixture of the oil with lard and its use in the manufacture of artificial butter brought down upon the industry the combined opposition of the lard manufacturers and dairymen of the whole country, who were, by legislation to tax out of existence. One result of the attempt to bring cotton oil into popular disrepute, and destroy its commercial value, was to subject it to careful and most searching analyses by the most eminent chemists in the world. Their verdict was uniformly in favor of the oil; not only that it was not harmful, but on the contrary a food product of the greatest value, being pure, nutritious and healthful. Its intrinsic merits became so well established that at one of the meetings of the Baltimore Grocers' Exchange (1887) the Committee on Cotton Seed Oil reported its superiority in every respect to hog's lard for cooking purposes — it was cleaner, did not become rancid in any season, was healthful and nutritious, and entirely free from any odor or unpleasant taste, besides going one-half further in cooking and costing less in the proportion of 7 to 12.

About the year 1871 the American oil began to find its way into the Mediterranean ports for
COTTONSEED OIL INDUSTRY

mixture with olive oil. Soon afterward the French and other European countries began using it for packing sardines, and it came into use for the same purpose on the coast of Maine.

A story is told of a Marseilles oil merchant who ordered a shipment of cotton oil from a New Orleans mill to mix with olive oil, the olive crop being short that season. He mixed the two oils in proportions of about one-half each, labeled it "pure olive oil," and exported it to South America where he had a good trade. The adulteration was not detected, so the next season he ordered a much larger consignment of cotton oil from New Orleans, and this time mixed the oils in proportions of about three-fourths cotton and one-fourth olive, again exporting it to his South American customers as "pure olive." No complaint being made, another order for a larger consignment followed. This time only a very small quantity of olive was mixed with the cotton oil, and as before was labeled "pure olive" and exported. Still no complaint was heard; on the contrary, his South American trade grew so rapidly, and he prospered so, that he actually proposed a copartnership with the New Orleans mill, he to furnish the "pure olive" labels and packages from Marseilles, and the New Orleans mill to do the exporting.

No wonder, with the varied uses now found for cotton oil, the growing demand for it at home and abroad, the well-known fact that the mills were making handsome profits, that the industry should have grown so rapidly since 1870. In 1880 the number of mills had increased to 45; and the capital invested to more than three times what it was in 1870. The following table from the census of 1880 will show what proportions the industry had grown to that date:

At the fifth annual convention of the Cotton Seed Crushers' Association, held in Chicago in June 1883, it was stated that there were 101 cotton oil mills in the United States, 85 of which were then in active operation throughout the year. In 1884 this number increased to 130, and 10 years later there were just twice this number, distributed among the States as follows: Alabama 20, Arkansas 8, Georgia 37, Louisiana 19, Mississippi 24, North Carolina 17, South Carolina 28, Tennessee 18 and Texas 89.

Between 1890 and 1914 the number of mills increased from 357 to 872, or 144.3 per cent, and the quantity of seed crushed from 2,479,386 tons to 4,847,628 tons, or 95.5 per cent. The number of active mills has increased since 1909 in all of the States except Louisiana and Mississippi, where the industry has been greatly affected on account of the destruction of the cotton crops by boll weevils. There has also been a slight decrease in the number of mills operated in Arkansas and South Carolina. Texas shows an increase of 37 mills as compared with 1909; Oklahoma 21; Alabama 15; Georgia 10. All of the States, with the exception of Mississippi, show an increase in the quantity of seed crushed.

Value of Product.—The total value of crude cotton seed products manufactured in 1915 amounted to $180,260,000, compared with $107,528,000 in 1909, $99,311,000 in 1904 and $42,412,000 in 1899. Compared with 1909, all the States show an increase excepting Louisiana. The average value of products per ton of seed crushed was $17.11 in 1899, $20.72 in 1904, $28.10 in 1909 and $42.89 in 1915. The average value of oil produced in 1914 was 41.9 cents per gallon; of cake and meal $25.30 per ton; of hulls $7.99 per ton; and of linters 27.3 cents per pound. Since the outbreak of the European War the price of linters has increased threefold due to its importance in the manufacture of gun cotton and other high explosives. The extraordinary demand for this short-fibre cotton has resulted in a readjustment of the delinter gins so that almost every particle of fibre is stripped from the seed, many mills even running the seed through the delinter gins a second time. In 1915 the average production of linters per ton of seed was slightly more than 100 pounds, in 1914 74 pounds, 67 pounds in 1913 and 1912, and 57 pounds in 1911. Not many years ago 30 pounds to the ton of seed was considered a good average. In 1914 oil represented 51.9 per cent of the value of crude products; meal and cake, 36 per cent; hulls, 7.2 per cent; linters, 4.9 per cent. The estimated quantity of seed produced from the crop of 1915 was 4,992,000 tons, of which the mills took 4,202,000 tons, or 84 per cent, leaving 790,000 tons, or 16 per cent, for planting, export, feeding and other purposes. This is by far the greatest percentage of seed ever taken from any crop, the average in recent years being about 75 per cent.

Present Process.—The present process of extracting the oil from the cotton seed is a rather complicated one in its preparatory stages, but is simplified to the last degree by the employment of machinery at each and every step. The seed, on reaching the mill, is first conditioned to remove sand, dirt, bolls and foreign substances, and finally a draft of air is used to complete the cleaning process. The seed is now ready for the linters, which machines are an...
elaboration of the ordinary cotton-gin; and whatever staple remains upon the seed is stripped off in passing through them. From the linters the seed passes to the huller, a high-speed cutting-machine, which cuts it up most thoroughly. The hulls, by screens and beaters, are now separated from the meats, which latter are, by screw-conveyers, conducted to bins contiguous to roller-crushers, and as fast as required are passed through the crushers, where the mass is reduced to a uniform consistency, and is known to millmen as "uncooked meal." The first step is cooking this meal, which is done in steam-jacketed kettles. When heated to a proper degree the meal is drawn from the kettles, formed into cakes, enveloped in camel's-hair cloth and placed in boxes of an hydraulic press, when by the application of proper pressure the crude oil is speedily extracted. The solid residue remaining in the press-box is the decorticated cottonseed oil cake of commerce.

In the practical methods by which these mills are supplied and operated all the improvements of modern industrial enterprise have been laid under tribute. In the distribution of the oil product, tank-cars on the railroads and tank-steamers on the high seas are used for transportation in bulk. The diversity of the industry requires factories other than the crude-oil mills, as refineries, lard and cottoleone plants, soap factories, cotton-gineries, cotton compressors and fertilizer-mixing establishments. The supply for all these is derived directly from the crude-oil mills, which in their turn are operated immediately from the raw material, in providing which there has grown up a most important branch of the agricultural system of the South.

New Uses.—One of the chief factors in the remarkable growth of the cotton oil industry has been the continuous discovery of new uses for its crude products, oil, cake and meal, linters and hulls. The uses found for each and products manufactured from each may be classified as follows:

LINTERS.
Batting, wadding, absorbent cotton, mixing with shoddy, mixing with wool in hat making, mixing with lamb's wool for fleece-lined underwear, felt.

Stuffing material for—Pads, cushions, comforts, horse collars, mattresses, upholstery.

Low-grade yarns—Lamp and candle wicks, twine, rope, carpets.
Cellulose—Writing paper, guncotton, nitrocellulose, or pyrocellulose, smokeless powder.
Pyroxlamine—Varnishes—Coating for metals, artificial leather, waterproofing.
Plastics—Celluloid, collodion, varnishes, artificial silk, photographic films.

HULLS.

Feed, fertilizer, fuel, packing, household utensils, bran-cattle feed.
Fibre—Stuffing for horse collars, basis for explosives, paper stock, pressed paper products.

MEATS.

Cake and meal—Fertilizer, dyestuffs. Feed for cattle, poultry, horses and mules, swine, sheep.
Flour—Bread, cake, cracker.
Crude oil—Refined oil—Prime summer yellow oil—cosmetics, animal compound lard, cooking oil, salad oil.
Hydrogenated oil—Lard substitutes, synthetic stearin, vegetable compound lard.
Cold pressed oil—Winter oil—Salad oil, setting olives, packing sardines, winter white oil.
Stearin—oleomargarine. Emulsion for medical purposes, substitute for sweet oil, deodorized oil.

Off-grade summer yellow oil—Soap, miners' oil, hydrogenated oil.

Foots—Acidulated foots or black grease, washing powder, soap.
Glycerin—Nitroglycerin.

Fat acids—Candle pitch—Stearin acid—Candles, washing powder, soap. Distilled fat acids—Stearin pitch or cotton oil pitch.

Oleic acid—Soap, washing powder, fulling ware.

Present Statistics.—The last census report (1914) shows that there were 882 establishments engaged in the manufacture of cottonseed products; that they employed 27,047 persons, who received in salaries and wages $14,409,000; that the capital invested was $118,073,000; that the cost of materials was $180,976,000 and the total value of products $212,127,000; and that the value added by manu-

facture (or the value of products less the cost of materials) was $31,151,000.

JAMES L. WATKINS,
Cotton Statistician, New York City.

COTTONTAIL. See Rabbit.

COTTONWOOD, species of Populus trees belonging to the willow family (Salicaceae). There are two very common species in North America, P. deltoides and P. cannabina. Besides these there are some 15 others, which occur under the names of poplar and aspen. The cottonwoods are large trees found along the banks of rivers nearly throughout North America. The wood is soft and weak, of a dark brown color and weighs about 24 pounds to the cubic foot. It is also known by the names of Carolina poplar and necklace poplar.

COTTONY CUSHION SCALE. See Scale Insects.

COTTRELL, Frederick Gardner, American chemist: b. Oakland, Cal., 10 Jan. 1877. He was educated at the universities of California, Berlin and Leipzig, from 1897 to 1900 taught chemistry at the Oakland High School, and between 1902 and 1911 was instructor and assistant professor in the department of physical chemistry at the University of California. In 1911 he became chief physical chemist of the United States Bureau of Mines, and chief chemist in 1914. He has written 'Der Restrom bei galvanischer Polarisation betrachtet als Diffusionsproblem' (1903).

COTYLEDONS, köt-lë'döns, the seed-leaves of the embryo plant, which serve it as organs of nutrition until the young vegetable is established in the soil and develops its true leaves. In flowering plants there are two kinds of embryos—one in which there is only a single cotyledon, and the other in which there are two cotyledons. This difference, being associated with several others of an important character, serves as the basis for the primary division of phanerogamic, or, more accurately, of angiospermous plants into monocotyledons and dicotyledons. The lower class of plants producing spores or cellular embryos having no cotyledons are called acotyledonous. Of the generation the cotyledons either serve as foliage-leaves or remain underground as fleshy lobes.

COTYLOSORIA, köt-lö-sö̆-ri'-ə, the most ancient of reptiles, from which, as is claimed by the American naturalist, E. D. Cope (q.v.), and his adherents, sprang the saurian and snake-like species of later ages. Their remains are among the characteristic fossils of the Carboniferous and Permian Ages. They are characterized by Williston as primitive reptiles with notochordal vertebrae; imperfect temporal region; persistent intercentra; two coracoids; plate-like pelvis; with all or most of the amphibian skull-elements; short legs and short neck; phalangeal formula primarily 2, 3, 4, 5, 3(4).

COUCAL, koo'kal, or LARK-HEELED CUCKOO (Centropus), a genus of common bush-birds in Africa, India and through the Malayan Archipelago to Australia. The hind toe is prolonged into a very long spur. The 35 known species constitute the sub-family Cen-
tropicaina of the cuckoo family (Casuiaidea). One species is held in religious veneration in Madagascar.

COUCH. See Quiller-Couch, Arthur Thomas.

COUCH, Darius Nash, American soldier: b. South East, Putnam County, N. Y., 23 July 1822; d. Norwalk, Conn., 12 Feb. 1897. He was graduated at West Point 1846, served in the Mexican and Seminole wars, and resigned from the army in 1855 to engage in business. During the Civil War he was commissioned brigadier-general 1861; commanded a division in the battles of Williamsburg, Fair Oaks and Malvern Hill; promoted major-general June 1862, and took part in Pope’s retreat and the battle of Antietam. At Fredericksburg and Chancellorsville he commanded the Second Army Corps; organized the Pennsylvania militia to resist Lee’s invasion 1863, and took part in the battle of Nashville and the North Carolina operations 1864-65. In 1865 he was unsuccessful as the Democratic candidate for governor of Massachusetts; and was collector of the port of Boston 1866-67. He removed to Concord, Mass., and was adjutant-general of that State 1883-84.

COUGH-GRASS (a corruption of quick-grass and quick-grass), a perennial grass (Agropyron repens) and one of the most common and troublesome weeds of agriculture. When it first appears above ground its blade is readily eaten by sheep. In arable land, under any tolerable management, the seeds are never allowed to ripen, and the propagation is effected by the numerous joints of the long trailing rootstock, each joint sending forth a shoot which becomes a new plant. The proper time for extirpating it is in summer, when the land is undergoing a pure fallow, or, where fallow is not used, when the land is being prepared for a root-crop. The most effectual means are a deep ploughing, 50 in. deep, and roots of the plant, a diligent use of the roller, grubber and ordinary harrows, and careful hand-picking. The rootstock may be used as food for various domestic animals, or, when prepared, as a medicine. The root is pulled up by the Germans and cut into small fragments and dried large enough to venders of patent medicines. It has a large amount of gum which renders it somewhat demulcent, but its medical properties are nil, although enormous quantities of it are used in the United States by manufacturers of quack medicines.

COUCY, koo'zi, Raoul, rä-ool, or Renaud, ré-nô, Châtélain de, French chevalier; hero of a tragic story often celebrated in ancient ballads and songs, sometimes in connection with other names than his. He became Châtélain de la Tour in 1180, took part in the Third Crusade (1189-91) and was killed by the Saracens about 1203. His work consists of about 16 songs, in the troubadour style. They were published by Path as 'Die Lieder des Castellain von Coucy' (Heidelberg 1883). He was in love with Gabrielle de Verzy, lady of Fayel, and dying in the Holy Land, he directed his faithful spouse to enclose his heart in a casket and carry it to the Lady of Fayel. He was surprised by the lord of the castle, who found out where the casket had come. Burning with rage, and determined on revenge he ordered the heart to be served at table. The unhappy woman, having eaten, was told the nature of this horrible meal, whereupon she refused all sustenance, and died of voluntary starvation. Uhland has made this story the subject of a fine ballad. The story has been verse by Jakob Sedlacek (at the end of the 13th century). There is a modern version by Crapelet (Paris 1829) and an English romance on the same subject in Ritson’s, 'English Metrical Romances' (Vol. III, 1885).

COUDES, koo'd, Louis Charles Auguste, French painter: b. Paris, 1 April 1773; d. there, 23 June 1873. He studied in Paris under David, and later in Munich. Among his works are ‘Cesar on the Ides of March’; ‘The Battle of Lawfield’; ‘The Opening of the States-General, 1789’; and ‘The Siege of Yorktown’; the last three are at Versailles. In 1820, he decorated the Rotunda of the Louvre with frescoes which were unsuccessful. His decorations of several Parisian churches and his later pictures are decided improvements. As a member of the council superintending the arts and Beaux-Arts he wrote some critical works on art. Consult Breton, Jules, ‘Nos peintres du siècle.’

COUDES, Pa., town and county-seat of Porter County in the northern part of the State, 110 miles southeast of Erie, on the Allegheny River and on the Coudersport and Pennsylvania Railroad. It contains a public library and a hospital. It has a foundry, a tannery, a flour mill and manufactures of furniture, rubber goods, mangle rollers, condensed milk, barrel headings, etc. Pop. 2,100.

COUDET, koo'd, Frederic René, American lawyer: b. New York, 1832; d. Washington, D. C., 20 Dec. 1903. He was graduated at Columbia College in 1850, and admitted to the New York bar in 1853. In 1877 he was a delegate of the New York Chamber of Commerce to the Antwerp Congress, which was held for the purpose of establishing a universal system of general average. In 1892 he was appointed one of the counsel on the part of the United States before the Bering Sea Tribunal of Arbitration in Paris, and was specially complimented by Baron de Courcey, president of the tribunal, for his argument on the necessity of putting a stop to pelagic sealing. On 1 Jan. 1896, President Cleveland appointed him a member of the Venezuela Boundary Commission. He had a world-wide reputation as an advocate and authority on international law, and several times declined appointment to the bench of the United States Supreme Court. He was the legal representative of the French government in the United States for many years. He received the cross of the Legion of Honor and also decorations from Italy and Venezuela. His publications include ‘International Law, the Rights of Ships’ (1895) and ‘Addresses, Historical-Political-Sociological’ (1905).

COUES, kow'z, Elliott, American naturalist: b. Portsmouth, N. H., 9 Sept. 1842; d. Baltimore, 26 Dec. 1899. He entered the Harvard Medical School in 1862 and from Columbia University, Washington, D. C., and the year following entered the United States army as a medical cadet. His thorough work as assistant surgeon in the army, 1863-81, attracted attention, and for that and other services he was brevetted captain. For some years
he continued to practice surgery or teach its science; but he also continued to pursue the study of zoology, begun while in the university. In 1853 he was appointed surgeon and naturalist for the United States Commission to examine American birds in the northern boundary. For three years he remained connected with this commission, and in addition gave some assistance to the Smithsonian Institution. In 1877 he was called by the Columbia University to take charge of a department of comparative anatomy, biology and zoology. He was one of the founders of the American Ornithologists' Union, and an active member of many scientific societies in Europe and America. He was president of the board of control of the American Museum of Natural History. His last years were given chiefly to the Smithsonian Institution. He has left a large number of valuable works on mammalogy and ornithology, some of which are *Key to North American Birds* (1872); *Field Ornithology* (1874); *New Key to North American Birds*; *Birds of the Northwest* (1874); *Fur Bearing Animals* (1877); *Birds of the Colorado Valley* (1878); *New England Bird Life* (1881); *Check List of North American Birds* (1884); *Biology* (1884); *The Daemon of Darwin* (1886); *Quotative Birds*. He edited the *Journals* of Lewis and Clark in connection with his investigations regarding the early exploration of the trans-Mississippi region.

**COUGAR**, koo-går', the great American cat (*Felis concolor*), which ranges from Hudson Bay to Cape Horn, a remarkable distance for any wild animal. It was formerly called panther by the settlers of the Eastern States; but in the West it is usually *mountain-lion* or *puma,* the latter name said to be of Peruvian origin. *Cougars* comes from a native Brazilian name. The cougar is from six to eight feet long from the tip of the nose to the tip of the tail. There are several varieties, but they cannot be marked; but this wears off with the advent of maturity; and, after the first year, the animal is a uniform reddish, tawny color, deepening in tone toward the spine, paler around the eyes, and whitish on the throat, legs and under portion. The color is so much like the hide of the Virginia deer that at a distance hunters have been known to mistake a cougar for a deer. This is one of the creature's greatest advantages as a beast of prey. He may be mistaken by his intended victim for an animal of another kind, and thus is enabled to get into their midst before his identity is disclosed. In South America he is sometimes called, on this account, *false deer.* The head of the cougar is rounded, and the face is extremely intelligent, beautiful features, which can be drawn into as ferocious an expression as that of any of the great jungle felines of the Old World. It is said to be more cowardly and less dangerous than the other large carnivores; and it is asserted by authorities that it generally flees from man except in defense of the young, when the female becomes desperately brave. The puma will prowl about lone camps and logging-huts from curiosity or hunger, but rarely ventures on offensive warfare with humanity. This imputation of cowardice is denied by certain American people, notably Portland. Porter, and Foss says *there is no need to argue the question whether or not pumas will kill men; that has been affirmatively settled by facts;* and Theodore Roosevelt says, in his *Hunting Trips of a Ranchman:* *When hungry, a cougar will attack anything it considers fleshy, and later was appointed by the Virginia Agricultural and Mechanical College as professor of biology. He was associate editor of *The American Naturalist* and other periodicals; and edited, for the Century Dictionary, the departments of comparative anatomy, biology and zoology. He was one of the founders of the American Ornithologists' Union, and an active member of many scientific societies in Europe and America. He was president of the board of control of the American Museum of Natural History. His last years were given chiefly to the Smithsonian Institution. He has left a large number of valuable works on mammalogy and ornithology, some of which are *Key to North American Birds* (1872); *Field Ornithology* (1874); *New Key to North American Birds*; *Birds of the Northwest* (1874); *Fur Bearing Animals* (1877); *Birds of the Colorado Valley* (1878); *New England Bird Life* (1881); *Check List of North American Birds* (1884); *Biology* (1884); *The Daemon of Darwin* (1886); *Quotative Birds*. He edited the *Journals* of Lewis and Clark in connection with his investigations regarding the early exploration of the trans-Mississippi region.

**COUGAR**, koo-går', the great American cat (*Felis concolor*), which ranges from Hudson Bay to Cape Horn, a remarkable distance for any wild animal. It was formerly called panther by the settlers of the Eastern States; but in the West it is usually *mountain-lion* or *puma,* the latter name said to be of Peruvian origin. *Cougars* comes from a native Brazilian name. The cougar is from six to eight feet long from the tip of the nose to the tip of the tail. There are several varieties, but they cannot be marked; but this wears off with the advent of maturity; and, after the first year, the animal is a uniform reddish, tawny color, deepening in tone toward the spine, paler around the eyes, and whitish on the throat, legs and under portion. The color is so much like the hide of the Virginia deer that at a distance hunters have been known to mistake a cougar for a deer. This is one of the creature's greatest advantages as a beast of prey. He may be mistaken by his intended victim for an animal of another kind, and thus is enabled to get into their midst before his identity is disclosed. In South America he is sometimes called, on this account, *false deer.* The head of the cougar is rounded, and the face is extremely intelligent, beautiful features, which can be drawn into as ferocious an expression as that of any of the great jungle felines of the Old World. It is said to be more cowardly and less dangerous than the other large carnivores; and it is asserted by authorities that it generally flees from man except in defense of the young, when the female becomes desperately brave. The
ica they are frequently caught with lassoes by the mounted cattle-herders.

The cougar was the religious veneration by the Indians of California, as was the tiger by certain sects in India; hence the red men did not dare to kill the beast, and it multiplied accordingly. Among the Zuñis it is regarded as the chief "prey-god."

COUGH, in physiology, a deep inspiration of air, followed by a sudden, violent and sonorous expiration, is in great measure involuntary, and excited by irritation of the air-passages, due to the presence of some foreign material or irritation of the nerves distributed to the respiratory organs. The organs of respiration are so constructed that every foreign substance, except atmospheric air, stimulates them. The smallest drop of water entering the windpipe is sufficient to produce a violent coughing, by which the organs labor to expel the irritating substance. A similar effect is produced by inhaling smoke, dust, etc. The sudden expulsion of air from the lungs is produced by the violent contraction of the diaphragm and the muscles of the breast and ribs. The contraction of the muscles is due to impressions reaching them by their ramifications, such impressions coming from the nerve-centre in the medulla, thrown into activity by stimuli received from the irritated sensory nerves of the air-passages. The sensation of obstruction or irritation, which gives rise to cough, though sometimes perceived in the chest, especially near the pit of the stomach, is very often confined to the trachea, or windpipe, and especially to its aperture in the throat, termed the glottis. Of the various irritations which give rise to cough, some occur within the cavity of the chest; others are external to that cavity; some exist even in the viscera of the pelvis. Of those causes of which take place within the chest, the disorders of the lungs themselves are the most common, especially the inflammation of the mucous membranes. Here the cough may be a dry one, that is, without expectoration, and this occurs in the early stage of the affection, or a loose cough attended by expectoration, as in the later stage. In the former case it is due to the dry inflamed membranes being sensitive, in the latter case, so that the cough is excited even by the coldness of the inspired air. In the latter case the presence of the defluxion causes the cough and thus excites its expulsion.

Fleitritis, or inflammation of the serous membrane which covers the lung and lines the interior of the chest, also gives rise to cough, this disease being almost invariably accompanied by inflammation of the outer layer of the tissue of the lung. It may be simple, but is very frequently associated with tuberculosi. Another common cause of cough which has its seat in the chest is inflammation of the lungs. In this disease there is inflammation of the tissue of the lungs, with exudation of fibrin, which solidifies the lungs and shuts up the air-cells. Much functional disturbance accompanies it. In the progress of the disease the exuded material softens, and, being swept up the air-tubes, irritates the passages and brings on the cough by which it is expelled. In such a case the cough is desirable rather than the reverse, since it is nature's method of sweeping out the foreign substance from the air-cells and tubes. Another frequent origin of cough is the rupture of some of the blood vessels of the lungs, and the consequent effusion of blood into the cells, which is expelled by the cough that its irritation excites, constituting what is technically termed hemoptysis, or spitting of blood. Cough is also excited by the existence of tubercles in the lungs, one of the most frequent causes of consumption; and by cancer and growths in the lungs.

Then the irritation may arise at the back part of the throat, no disorder being present in the windpipe, bronchial tubes or lungs. Thus a long uvula, by tickling the back of the throat, may be the cause of a most persistent dry cough, coming on specially when the person lies down. Enlarged tonsils, a chronically thick condition of the mucous membrane of the back of the throat, small growths or polypi in this neighborhood or in the box of the windpipe, may maintain a most troublesome cough. Direct irritation of the nerves connected with respiration, as by the pressure of a tumor, the pressure, for example, of an aneurism in the chest on one of the nerves of the larynx, may excite spasmodic cough of a suffocative kind. Again, cough is very often excited by reflex irritation, the seat of the irritation being a large nerve, such as the vagus, or some of the air-passages. Where a cough is excited by disorders of parts external to the cavity of the chest, it is generally dry, as the irritating cause is external, and not any obstructing matter in the lungs themselves. Disorders of the abdomen, especially those which lie in contact with the diaphragm (the muscular curtain separating the cavities of the belly and chest), frequently induce a cough. A short, dry cough invariably attends inflammation of the liver, whether acute or chronic, and accompanies the various tubercular and other obstructions in that organ. Hence inflammation of the liver is not infrequently mistaken for inflammation of the lungs; and in some of the chronic diseases of the liver, the cough is occasionally complained of as the most urgent symptom. The presence of pain in the right side, shooting up to the top of the shoulder, the dryness of the cough, and pain, enlargement, hardness or uneasiness on pressure below the ribs of that side, will afford the best means of distinguishing whether a disease of the liver is the origin of the cough. Disorders of the stomach are also often accompanied with a cough of the same dry and roaring nature. A short cough is, therefore, a frequent symptom of indigestion. In short, there is scarcely any one of the viscera in the cavity of the abdomen the irritation of which, in a state of disease, has not excited cough. Disorders of the spleen, pancreas, and even the kidneys, have all given rise to this symptom; and external tumors attached to them have had the same effect. Any distension of the abdomen, which, by its pressure upward, impedes the descent of the diaphragm, and consequently the expansion of the lungs, occasions cough. The variety of causes from which coughs may arise must convince every reader of the absurdity of attempting to cure all kinds of cough by the same remedy. The treatment can be satisfactorily indicated only when the real cause is ascertained. When a long uvula is the cause a small piece may be snipped off; when it is a relaxed condition of throat, or a similar state of the box of the windpipe, local applications, paints directly applied by a brush, or inhalations, are the suitable remedies. One of
the commonest coughs attends slight swelling and irritability about the larynx. To relieve this warm poultices should be applied to the front of the neck; a piece of flannel sprinkled with turpentine should be placed over the larynx on the neck. In bronchitis and inflammation of the lungs the treatment of the cough resolves itself into the treatment of the special disease, and so with the cough due to diseases of distant organs. Often soothing remedies must be given to allay the excitability of the irritated nerves. Certain coughs are purely psychogenic in origin and are to be grouped with the psychoneuroses.

COUIY. See TREE-POURCUPINE.

COULANGES, ko-o-lahnzh', Numa Denis Fustel de, French historical writer: b. Paris, 18 March 1830; d. Passy, near Paris, 12 Sept. 1889. After filling professors' chairs successively at Amiens, Paris and Strassburg, he was transferred in April to the École Normale at Paris, and became a member of the Institute in the same year. In 1880 he became director of the École Normale. His earlier writings, 'Mémoire sur l'île de Chio' (1857); 'Polybe, ou la Grèce conquise par les Romains' (1858) had the reading public for the altogether exceptional importance of his brilliant book, 'La cité antique' (1864; 17th ed., 1885), which threw a flood of fresh light on the social and religious institutions of antiquity. The work was owned by the French Academy, and was also his profoundly luminous 'Histoire des institutions politiques de l'ancienne France' (1874-92); while 'La Gaule romaine' (1888-91) and 'La monarchie franque' (1888-91), received the Reymaud prize. For biography consult Guiraud (Paris 1896).

COULOMB, ko-o-lenh', Charles Augustin de, French scientist and inventor: b. Angouleme, France, 14 June 1736; d. Paris, 23 Aug. 1806. He is famous for his experiments on friction, and the invention of the torsion balance for measuring the force of magnetic and electrical attraction. In early life he entered the engineers' corps and served some time at Martinique. In 1777 he gained an Academy prize by a work on magnetic needles, and again two years later by his 'Theory of Simple Machines.' Coulomb was a member of the French Academy, and in 1784 was made intendant-general of the waters and fountains of France. During the Revolution he took part in the investigations attending the introduction of a metric system of weights and measures by the new government, being a member of the commission of 12 appointed under the provision of the law of 7 April 1795. His name has been given to the unit of electrical quantity.

COULOMB, the unit of quantity in measuring electric currents. It is the quantity produced by a current of one ampere in one second. It takes its name from its discoverer, Charles Coulomb (q.v.).

COULOMETER, in electricity, an instrument for determining the quantity of electric current which is passing through an electric circuit. In other words it is a measure of current density. Several forms of coulometer have been proposed and many tests made with them. Three distinct principles have been employed; the iodine and the iron coulometers depend upon the chemical changes taking place as the result of the current; the copper and the silver coulometers depend upon the weight of a metallic deposit made by the current; the oxy-hydrogen gas coulometer depends upon the dissociation of water by the current. The last named was the earliest and is the simplest to operate. The figure shows this gas coulometer to the left connected with a battery which is being tested. A circular vessel has two wires let through its bottom, which bear inside two electrodes of platinum foil as shown; water slightly acidulated with sulphuric acid is poured into the vessel, and two tubes which have been filled with water are placed over each electrode. On the poles of the battery being connected with the exterior ends of the wires by means of binding-screws, water will be decomposed and hydrogen will appear in one tube and oxygen in the other. It will be found, as represented in the figure, that more than twice the quantity of water is displaced in the hydrogen tube than in the oxygen tube. Two volumes exactly of hydrogen and one volume of oxygen are the proper proportions to form water; but some of the liberal oxygen in the form of ozone is dissolved by the water. One of the drawbacks of this type of instrument is that it requires a certain minimum strength of current before it begins to operate.

An improved form of the oxy-hydrogen coulometer is the Walter-Neuman single-tube instrument. Instead of separating the two gases, it allows both to flow into the one tube, which is placed upright and graduated. The upper part, which is quite long, is about five-eighths of an inch in diameter and has a stop-cock valve at the top. This is used when the gases are taken to an eudiometer for more accurate measurement. The lower end of the tube is expanded into an oblong bulb of considerable content as compared with the smaller tube. The electrodes have each an area of one square inch and are set in the bottom of the bulb. A leveling tube is attached to ensure accurate reading. The advantages claimed for the gas coulometer are that it may be read instantly at the close of the test and that it has a smaller margin of error in that the amount of gas by which the measurements are made is so much larger proportionally than the metallic deposits or volumetric changes which must be relied on in the other instruments.

The so-called 'silver coulometer,' however, has the largest acceptance among scientific men, although the records show an almost endless
series of disagreements as to extreme accuracy in the results obtained by its use by different operators. It was formally adopted by the International Electrical Congress, held in Chicago in 1893, as the most dependable of all the coulometers, and that congress fixed upon the deposition of silver as the official measure of the efficiency of an electric current, making the international ampere *that unvarying volume of current which, when passed through a standard aqueous solution of silver nitrate, shall deposit metallic silver at the rate of 0.001118 of a gramme per second.*

In the approved form of the silver coulometer the cathode is a small platinum bowl, and the anode is a circular silver plate. The latter is smaller in diameter than the bowl, and is riveted to a silver rod by which it is raised out of the bowl or lowered into it. The platinum bowl is set upon a clean copper plate which is connected with the appropriate pole of the battery to be tested. The other pole is electrically connected with the silver rod. Before beginning the test the bowl is washed scrupulously clean with nitric acid, rinsed then with water and with absolute alcohol. It is then dried at a temperature of 320° F. and accurately weighed. The bowl is then nearly filled with a neutral solution of nitrate of silver in distilled water — 15 parts nitrate to 85 parts water. The silver plate is wrapped with a piece of filter paper in such a way that no sediment falling into it during the operation can fall into the bowl. The current is then turned on and the exact time noted. It is allowed to run for less than half an hour. When it is turned off the time is again noted. The silver plate is raised out of the liquid and the latter poured out. The deposit in the bowl is then washed with distilled water and left to soak in it for six hours at least. It is then rinsed with distilled water, and then with absolute alcohol and dried at 320° after which it is allowed to cool in the drier, and then again weighed. The difference between the two weights will show the amount of silver deposited. This weight, in general divided by the number of seconds during which the operation is continued, and then by the constant 0.001118, gives the number of coulombs of current in the circuit tested. A modification of this apparatus makes use of a platinum wire within the platinum bowl and containing a bed of granulated metallic silver upon which the silver plate is set down firmly. The porous cup effectively prevents the passing of any of the "slime" which accumulates among the grains of oxides, and when, being metallic silver, would tend to vitiate the test. Consult United States Bureau of Standards, "Bulletin 3" (Washington 1905), and "Bulletin 8" (1911).

COULTER, kōlt̄er, John Lee, American statistician; b. Mallory, Minn., 16 April 1881. He was educated at the universities of North Dakota, Wisconsin and Minnesota and at Iowa State College. Between 1907 and 1909 he was an instructor at Iowa State College, the University of Wisconsin and the University of Minnesota, where he also served for two years as assistant professor of rural economics. From 1910 to 1912 he was expert special agent of the United States Census Bureau, and, during the same period he also lectured at the West Virginia State College of Agriculture and director of the Experiment Station. He has written "Economic History of the Red River Valley of the North" (1910); "Co-operation among Farmers" (1911); "The Problem of Rural Credit" (1913), and many articles to current periodicals on economic and agricultural subjects.

COULTER, John Merle, American botanist; b. Ningpo, China, 20 Nov. 1851. He was graduated at Hanover College, Ind., 1870, and was appointed botanist of the United States Geological Survey in the Rocky Mountains 1872-73; professor of the natural sciences, Hanover College, 1874-79, and professor of biology in Washburn College 1879-91. He was president of the University of Indiana 1891-93; president of Lake Forest University 1893, when he was elected professor and head of the department of botany in the University of Chicago. Among his many publications are "Manual of Rocky Mountain Botany" (1885); "Botany of Western Texas"; "Manual of the Phanerogamia and Pteridophytes" (1891-94); "Preliminary Revision of the North American Species of Cactus, etc." (1894); "Morphology of Spermatophytes" (with Chamberlain, 1901); "Plant Relations" (1899); "Plant Structures" (1899); "Plant Studies" (1902), the last three being excellent introductory manuals for use in schools; "Elementary Studies in Botany" (1913); "Fundamentals of Plant Breeding" (1914); "The Evolution of Sex in Plants" (1914). He is editor of the "Botanical Gazette."

COULTER, Stanley, American biologist; b. Ningpo, China, 2 June 1853. He was educated at Hanover College. In 1887 he was appointed professor of biology and director of the biological laboratory at Purdue University and in 1907 dean of the School of Science. In 1902 he became a member of the State Board of Forestry. He wrote "Forest Trees of Indiana" (1892); "Flora of Indiana" (1899); also 11 pamphlets upon nature study, 45 pamphlets of scientific studies and reports and 70 other titles, and "A Key to the Genera of the Native Forest Trees and Shrubs of Indiana" (1907).

COUMARIN, or CUMARIN, a compound of the aromatic series, having the formula CH₂O₃ or CH₃ and occurring in nature in the Tonka bean (the fruit of Coumarana odorata, or Dipteryx odorata), in small white crystals, between the seed-coating and the kernel; also in woodruff (Asperula odorata), in the leaves and flowers of sweet-scented vernal grass (Antithusanthum odoratum), and in other plants. It is obtained from the Tonka bean by extraction with strong alcohol, and may also be prepared synthetically by heating sodium-salicylaa hydrd with acetic anhydrid, or by heating phenol with maleic and sulphuric acids. It crystallizes in colorless triclinic plates, which melt at 159°. Coumarin is scarcely soluble in cold water, but dissolves somewhat in hot water, and freely in alcohol. It has an agreeable, aromatic odor and a burning taste. Melted with solid caustic potash, it yields acetate and salicylate of potassium. The peculiar odor of Swiss tobacco comes partly or in greater extent to the coumarin existing in the melilot that is
COUMOUNDOROS—COUNCIL

used in its manufacture. The "Maiwein" (or May-wine) of the Germans is prepared by steeping woodruff in white wine, and owes its pleasant aroma to the coumarin that that herb contains. Indeed, the woodruff is often dispensed with, and the Maiwein prepared by the direct addition of an alcoholic solution of pure coumarin.

COUMOUNDOROS, koo-moon-duh'rohs. See KUMUNDOROS, ALEXANDER.

COUNCIL (Lat. concilium), an assembly met for deliberation, or to give advice. The term as used in an ecclesiastical sense specially applies to certain assemblies of the Roman Catholic Church. These may be classed as ecumenical, provincial or patriarchal councils and synods; but the last is not usually included among councils. An ecumenical or general council is one in which the bishops and others entitled to vote are convoked from the whole world to deliberate on the state of the Church or to meet an emergency, as the rise of a new heresy. The decrees of such a council, having received papal confirmation, are binding. A council might be ecumenical in its convocation, yet if its decrees did not receive the papal confirmation they would not be binding, and the council would not be considered of ecumenical authority. Or a council might not be ecumenical in its convocation, but its decrees being accepted and receiving the papal confirmation, it is then classed as ecumenical. The First Council of Constantinople was originally a council of the East, but ultimately its decrees on faith were accepted in the West and received the Pope's approval. Papal councils represent a whole patriarchate; national councils, a nation; and primatial councils, provinces subject to a primate. (See Patriarchs). Provincial councils are of a province and are known usually by the name of the metropolitan see. (See Metropolitan). Diocesan councils, usually termed synods, are composed of the clergy of the diocese and are presided over by the bishop or vicar-general or a representative of the bishop.

Ecumenical councils are convoked by the Pope, and are under his presidency or that of his legate. In the early ages of Christianity councils were sometimes convoked by emperors, but only by permission or by request of the Pope. The dangers and difficulties of traveling in those times made it necessary to have the protection of the civil powers, and hence the real part which the emperor took in convoking the council was to promise it immunity from those who might wish to influence or retard its deliberations. The patriarch, metropolitan or bishop convokes the council within his jurisdiction. The membership of councils not ecumenical consists of the local clergy, as in a diocese, or the suffragan bishops of a province or patriarchate. Certain rules regulating representation are observed. In the early ages (as late as 598), laymen were sometimes invited to attend. They were permitted to present complaints and give advice, but it is very doubtful if they ever took any part in the voting. In two instances at least women attended. (See HILDA, SAINT). Ecumenical councils are composed of patriarchs, archbishops and bishops and such other ecclesiastics as may be invited for specified reasons, as theologians, one at least for each archbishop or bishop. (The Council of Trent gave procurators—priests and deacons—of absent bishops a right to vote. The Vatican council did not even admit to the council hall such procurators). In matters of faith the Holy Scriptures and the traditions of the Church are the guide, while in lighter matters human reason and expediency are consulted. In the former, ecumenical councils are held to be infallible, but in other matters of discipline, etc., the last council decided by the bishops and cardinals, even if not bishops or abbots, generals of regular orders, mitred abbots of whole orders, may be members with right to vote. The rule has always prevailed that no royal representative may be present at any council except a general one in which "faith, reformation and peace" are in question.

The presidency of a council does not confer an ex officio right to vote or to take part in the deliberations, such right depending upon the hierarchical rank of the one presiding.

Usually bishops take their places according to the rank of their sees. At the Vatican council they were arranged according to their hierarchical rank, first the Pope, then the cardinals, patriarchs, primates, and archbishops. Cardinals, even if not bishops or abbots, generals of regular orders, mitred abbots of whole orders, may be members with right to vote. The voting is generally by single vote, but at Constance the vote was by nations. At Basel the members were divided into four deputations which met separately. Decrees passed by three deputations were accepted by all. At Trent much of the matter to be debated was first considered by commissions. (See Counter-Reformation).

The proceedings of the Vatican council, not yet finished, were conducted in a somewhat similar manner.

Church historians usually regard the assembly of the apostles in Jerusalem described in the Acts of the Apostles as the first example of a general council of the Church; yet that assembly is not entered in the list of the 21 general councils. From the times immediately subsequent to the epoch of the apostles, the fathers always on occasion of controversy over questions of faith or of discipline appeal to the tradition of the apostolic doctrine and government as preserved in the churches and by the several apostles or authentically derived thence, to the churches scattered over the world. Not till peace was assured to the Christian body by Constantine was it deemed prudent to hold a general assembly of the Church's pastors, the bishops; though in various provinces of the empire—in Gaul and Spain, in Mesopotamia, in Africa, synods or councils were held even in the times of persecution. But in the year 325 there assembled at Nicaea in Bithynia, at the call of the emperor, the first or Nicene council. As this council and many which followed were in their membership predominantly Eastern, so in later councils Western bishops predominated; and for some time the decrees of these predominantly Eastern, or predominantly Western, provincial councils were observed by both sections; but in time many of them received a tacit acceptance as expressing the teaching of the whole Church Catholic; while the decrees of other Eastern and other Western churches are ignored on one side or the other.

The general or ecumenical councils of the
COUNCIL OF BLOOD—COUNCIL OF THE INDIES

Church, as reckoned by Roman Catholic historians, are as follows:

Council of Basel continued in Council of Ferrara-Constantinople

Council of Florence | 1438-1443 |

Council of Pisa | 1439-1443 |

Council of Ferrara-Constantinople | 1439-1443 |

Council of Florence | 1439-1443 |

Council of Trent | 1545-1563 |

Council of the Vatican | 1809 |

Of these councils the Greek Church acknowledges the first seven. See separate accounts of the different eccumenical councils.

Among religious bodies of the Protestant faith the council is applied to term councils in relation to gatherings called on matters of local or restricted interest or in connection with ordinances or other church functions. A national council in these denominations is advisory in its nature. The Presbyterian Alliance is in the nature of a council of churches following the Presbyterian form of organization and holding the Reformed faith. The Evangelical Alliance (q.v.) is broad and inclusive in its constituent elements and in the themes considered. In the systematic nature of their organizations and the authoritative character of their decisions the councils of the Roman Catholic Church are more nearly related to the permanent governing bodies of evangelical sects charged with the regulation of faith, order and discipline—such as the general and diocesan conventions of the Protestant Episcopal Church, the general assemblies and synods of the Presbyterian Church, the general conferences of the Methodist Church, etc.

In its use as a term relating to civil government, the word council signifies a body of men selected to advise a sovereign or other ruler. The body exercising such functions in Great Britain is known as the privy council (q.v.). In colonial times there existed in America councils modeled on the English privy council and originally intended as the executive bodies of the various colonies, in conferences with the respective governors. Such a body was called the executive council or legislative council, or simply the council, and besides its executive functions bore much the same relation to the legislature as the chief justice does to the house in the States. As the legislatures developed into the form in which we now know them, the upper house kept the name council till long after the Revolution; in South Carolina till 1790; in Delaware till 1792; in Georgia till 1797; and in Vermont till 1836. The Territories have retained the name, and it is used in some States for a body like that in the old provinces, the executive council of the governor.

The great history of the councils from the Apostolic Age to the Council of Trent is by C. J. Hefele, assisted in the latter part by A. Knöfler and Cardinal Hergenröther (9 vols., Freiberg 1855-90). Consult also Mansi's collection of canons and other documents of councils (31 vols., Florence and Venice 1759-98); Perceval, 'Canons and Dogmatic Decrees' (New York 1900).

COUNCIL OF BLOOD, The, a court created in the Netherlands by the Duke of Alva, its object being to put down all agitation caused by the religious and political tyranny of Philip II. Its first session was held 20 Sept. 1567, and in less than three months it had put to death 1,800 persons, among them the counts of Egmont and of Hoorn. See ALVA.

COUNCIL BLUFFS, Iowa, city and county-seat of Pottawattamie County, situated on the left bank of the Missouri, opposite Omaha, Neb., at the junction of several railroads, chief of which are the Union Pacific; Chicago and Northwestern; Chicago, Milwaukee and Saint Paul; Chicago, Burlington and Quincy; Chicago, Rock Island and Pacific and the Illinois Central. The name is said to have been derived from a council held here in 1804 between the Indians and the explorers Lewis and Clark. In April 1847 the Mormons, who had been violently expelled from this place, became the pioneers of the new Mormon settlement of Utah. The city is well laid out, with brick-paved streets, and lies to a great extent on a plain underlying high bluffs. Electric lines connect it with Lake Manawa, a beautiful summer resort three miles south of the city, and with Fairmount and other parks. Council Bluffs is the seat of the Iowa School for the Deaf, and has a fine public library building. Railroad and wagon bridges over the Missouri and electric lines connect it with Omaha, with which city there is extensive traffic. Council Bluffs is one of the great agricultural-implement trade centers of the world and also has a large trade in fruit and produce. There are eight large grain elevators. The city government is vested in a mayor, elected for two years, and a city council. Pop. 30,000.

COUNCIL GROVE, Kan., city and county-seat of Morris County, situated on the Neosho River, and on the Missouri, Kansas and Texas and the Missouri Pacific railroads, about 50 miles from Topeka. It is the center of rich grazing country, and its principal business is connected with stock raising. The city is situated on the old Santa Fe trail, and contains a public library. It was settled in 1847 and is one of the oldest towns in the State. It adopted the commission form of government in 1911. Pop. 3,000.

COUNCIL OF THE INDIES, The, a tribunal to which, in conjunction with the Casa de Contratación, or India House, at Seville, the administration of the Spanish colonies was assigned by King Philip II. It was evolved from the two councils. It was established to further the progress of discovery, watch over the infant settlements and adjust the disputes which grew up in them. Eventually the India House was sub-
COUNCIL OF TEN — COUNSELLOR AT LAW

ordained to the council, the powers of the latter having been greatly extended in the reign of Charles V.

COUNCIL OF TEN, a secret tribunal in the old republic of Venice, instituted in 1310, after the conspiracy of Cappello. It was first composed of 10 members who wore black costumes; later six more, who wore red, were added. This council was founded to protect the interests of the state, and it had power to punish offenders. All its process were secret, and through its means one of the most wicked and bloodiest crimes were committed. At first established temporarily, it was prolonged from year to year until 1335 it was declared perpetual. It went down with the republic in 1797. The archives of the council extending from 1315 to the end of the republic throw great light on the history, political, ecclesiastical, and economic, from that period to the end of the republic. Consult Brown, 'Studies in Venetian History' (2 vols., London 190).

COUNCIL OF TRENT. See Counter-Reformation.

COUNCIL OF WAR, an assembly of officers of high rank called to consult with the commander-in-chief of an army or admiral of a fleet on matters of supreme importance. The commandant of a garrison will accept or generally solicit the advice of such a council before surrendering to an enemy.

COUNCILLORS, City. See City Councillors, American.

COUNCILMAN, William Thomas, American physician: b. Pikesville, Md., 2 Jan. 1854. He was educated at the University of Maryland, and at Vienna and Leipzig, was for some time associate professor of pathology in Johns Hopkins University and has been Shattuck professor of pathological anatomy at Harvard University since 1892. He has given much attention to the study of smallpox and has recently announced his important discovery of the probable etiology of smallpox. He has published 'A Contribution to the Study of Inflammation' (1879); 'On the Etiology of Malaria' (1884); 'Syphilis of the Lungs' (1890); 'Pathology' (1902); 'Pathology: A Manual for Teachers and Students' (1912); 'Disease and its Causes' (1913); besides monographs on dysentery, cerebrospinal meningitis, diphtheria, smallpox, and other papers.

COUNSEL, in the United States a term applied indiscriminately to all members of the legal profession retained in a cause; as, the counsel for the defendant. In the United Kingdom the word has a limited and specific use, as lawyers, as the term is understood in America, being classified as advocates, attorneys, barristers, counsellors, proctors, serjeants, solicitors (qq.v.). The function of the counsel, or more usually barrister, is the pleading of cases in court from the data furnished to him by the attorney or solicitor in the form termed a brief (q.v.). King's counsel (abbreviated K.C.) are barristers appointed counsel to the Crown by the lord chancellor. They have the privilege of wearing silk gowns instead of the stuff gowns worn by ordinary barristers, of whom the king's counsel takes precedence, pleading cases from within the bar, while the utter or outer barristers plead beyond the bar.

COUNSELLOR AT LAW. In the United States a counsel at law is a lawyer authorized to follow his profession and practice in the superior courts of record. The special function of a counsellor at law is to give advice as to the legal aspect of judicial proceedings, to try causes, argue motions or appeals, or conduct any other legal business that takes him into the presence of the courts. A distinction is made between counsellor at law; this, however, was never strictly observed in this country, and now the two designations are used interchangeably, or in combination, in all the States but one — the title of a practising lawyer in this country being ordinarily, 'Attorney and Counsellor at Law.' In England, not only has the distinction in titles been preserved, but a variety of designations has been applied to members of the legal profession, according to the courts in which they practised and of which they were officers, or according to special functions. Practitioners in the common law courts at Westminster, and also country lawyers enrolled in the Courts Leet and other inferior tribunals in the shires and boroughs, were called attorneys; practitioners in the Court of Chancery were known, while those practising in the Admiralty and Ecclesiastical Courts and other tribunals where the civil and canon law was administered were called proctors. The titles solicitor and proctor are sometimes used by lawyers in the United States when they appear in equity suits or proceedings in the Admiralty and Probate Courts, but this is a matter of fancy and has no specific legal or customary sanction. These distinctive appellatives have been obliterated to some extent in England. According to the Judicature Act of 1873, whereby the King's Bench, Common Pleas, Exchequer, Chancery, Admiralty and Probate and Divorce Courts were consolidated, practitioners theretofore designated solicitors in chancery or proctors were to be called solicitors of the Supreme Court. Only a barrister, however, may practise as counsel in the trial and advocacy of causes in the superior courts. The initiation of law suits, the drawing of ordinary pleadings, the preparation of evidence and briefs, and attendance to all preliminaries up to the actual trial or argument in open court, are functions of attorneys or solicitors. A person qualified to become a barrister may waive a call to the bar and be licensed to practise, "under the bar," as a conveyancer or special pleader. The simplification of pleadings by the modern practice acts has effected a decline in the demand for specialists, however, and this work now generally falls to junior barristers. The highest rank among barristers is that of king's (or queen's) counsel. When engaged with other barristers in a case these counsel lead the trial, and they give opinions on questions of law submitted to them; in which respect their office is somewhat like that of the jurists of Rome and of counsel in the Roman Republic at-law rank after king's or queen's counsel and, while the order of sergeants still exists, no new appointments are being made, so that this title will, and is probably intended to, become extinct. In the Admiralty and Ecclesiastical-
tional Courts among "the civilians and canonists," as Blackstone rather contemptuously calls them— the title corresponding to that of barristers at-law is advocate. Counsellors, barristers, advocates, attorneys, solicitors and proctors, all alike, are officers of the courts in which they are enrolled and subject to the discipline of these tribunals. While they are not officers administering justice, but rather officers exercising a privilege or franchise, they are, nevertheless, regarded as officers of the state with obligations to the public no less significant than their obligations to their clients.

Education for the bar has been regarded in all times and under all juridical systems as a severely practical matter. Cicero's definition of a jurisconsult—as a person skilled in the laws and in the usages current among private citizens, and in giving opinions, bringing actions and taking security—still holds good. Nor is the manner in which such skill was acquired in ancient Rome without its modern parallel. Every jurisconsult had in his train a number of pupils, who followed their master to and fro without clients or delivering opinions, and obtained their knowledge of legal procedure by practice, and of the usages current among merchants and other private citizens by actual contact with men and affairs. We may be sure a great deal of "sea law" was picked up by the budding jurisconsults of Rome from the Rhodian and other mariners who beached their ships on the strand at Ostia. In later days, when Ulpian and the other learned jurists, whom the Emperor Justinian commissioned to codify the ius civilis, had evolved a science of jurisprudence, they compiled the 'Institutes' as a compendium especially designed for the instruction of students in the principles of law. With the revival of learning after the Dark Ages, the Roman, or civil law became one of the subjects of study at the universities. The University of Bologna, in particular, where Imerius in the second half of the 11th century introduced, and lectured on, the 'Corpus Juris Civilis,' became famous as a seat of the higher education in juristic lore. This interest, it is argued, spread all over Europe. The emancipation of the human mind and, also, the development of the modern state were due in no small measure to this influence. One effect, however, was the arrest of the development of the body of customary Teutonic law into an independent system. In Germany the jus civilis became supreme and the doctors and practitioners of law there knew little but what they had learned from the Pandects. In England the propagation of the Roman law, civil and canonical, was strenuously resisted and successfully combated by the judges and practitioners in the king's courts. The Inns of Court, not the universities, became the schools for the education of lawyers in the common law, as they still are. These inns—they are really colleges—maintained by the four ancient law societies, are known as the Inner and Middle Temple, Lincoln's Inn and Gray's Inn. To each of these there are attached one or more Chancery Inns, which have the characteristic of representing the various visiting societies. As an barrister one must be a member of one of the law societies, and have followed a prescribed course of study at one of the Inns of Court. The method of instruction was by moots or disputations, and lectures or readings by barristers. The English courts do not proceed not from the courts but the superior order of benchers, who are the custodians of the property of the societies and directors of their affairs, and who control the discipline of the profession. The Inns, however, are subject to the visitor, speaking for the benchers of the superior courts. At the present time the chancery inns are used merely as chambers by barristers, to which the latter, unless they be king's or queen's counsel, are expected to admit pupils. A university training in the liberal arts or sciences is not a prerequisite to entrance as a pupil into a barrister's chambers or as a student to the Inns of Court. Until its dispersal in 1858 the College of Advocates in Doctors' Commons stood in somewhat similar relation to advocates in the admiralty and ecclesiastical courts of England that the Inns of Courts did to barristers. Advocates, however, were graduates of the universities, where they were instructed in civil and canon law.

The qualification and admission to practice of attorneys and counsellors at law in the United States, are under the direction of the courts. Usually students of law in England who do not aspire to become barristers begin by entering as articled clerks in the service of attorneys or solicitors, and a legal education there as here is obtained mainly by practical experience. In Canada the regulation of admissions to the bar rests with the Law Society of the Dominion. No person has the privilege of practising law who has not been duly admitted to the bar, and all proceedings or judgments obtained in an action brought by one unauthorized to represent litigants as an attorney or counsellor at law are ipso-facto invalidated. In courts not of record a license to practise is not necessary, though there are some exceptions to this rule. Any person, however, may appear in his own behalf in any court. In this country admission to the bar is regarded a judicial act and the right to admit, generally speaking, is vested in the courts exclusively. The crime of the police power of the States, however, legislatures have assumed the making of regulations, which are held binding on the courts. This has been denied in several weighty opinions, however, wherein such legislative intervention is held to conflict with the constitutional powers of the judiciary. Applicants for admission to practise in the Federal courts are required to show that they are attorneys or counsellors at law duly authorized to practise in the Supreme Court of the State where they were domiciled at the time of their admission. Good character and fair professional standing, of course, are essentials. An applicant for admission to practise in the State courts must possess the requisite ability and legal training, to test which he must submit to examination by the court itself, or by examiners appointed for that purpose. Courses of study, periods of preparation and other conditions are prescribed by rules made, usually by the Supreme Court of the State. If the unit of judicial organization is the county, as is the case in Pro by admismission to the court of original jurisdiction is the Common Pleas Court in each county, the rules of admismission are established by this tribunal. But
even in Pennsylvania the Supreme Court grants admissions to practise at its own bar, and this privilege carries with it the right to practise at the bar of any other State. The rules governing admissions usually require that the applicant have studied law at a recognized law school, or in the office of a practising attorney, for a minimum term of two years. Where the period of study is spent in a lawyer's office the term is in many instances extended to four years, and the student is required to file a certificate of entry when his service in his mentor's law office begins. In some States students must pass a regents' examination in the liberal arts and obtain a file a regents' certificate of proficiency before they take their examination for admission to the bar. In New York the regents' examination must be taken within three months after the beginning of the student's term of service in a law office. In some jurisdictions proof that the applicant has pursued classical studies to some extent, shortens the ordinarily required period of service in a law office. During his law clerkship the applicant must have been actually engaged in assisting in business that he serves, under the control and personal direction of his preceptor. Every important university in the United States now has a law department and in many States the graduates of recognized law schools, who have received the degree of Bachelor of Laws, are admitted to practise at the bar without examination. This courtesy is frequently extended also to attorneys or counsellors admitted to practise in the superior courts of other States; but this rule of comity, once universal, is meeting with growing disfavor. No State takes its position among the States of distinguishing between attorneys and counsellors. Only counsellors have the privilege of practising in the Supreme and Chancery courts, and no one can become a counsellor until he has been admitted and has practised as attorney for three years.

The suspension or disbarment of counsellors or attorneys-at-law, like their admission, is in the control of the courts and under their regulation. Suspension or disbarment, being judicial, must be accorded the same procedure. There must be a sufficient cause for action and the preferment of charges and a hearing are indispensable. The conviction of an attorney or counsellor of a crime involving moral turpitude is, of course, a ground for disbarment, but suspension or disbarment may follow misconduct which is merely unprofessional and does not constitute an indictable offense. The legal profession itself assumes disciplinary powers over its members and almost every county bar association maintains a complaint committee, to which charges made against members of the local bar are referred for investigation and eventual prosecution. A long step forward was taken in professional self-discipline when the Alabama State Bar Association in 1898 adopted a 'Code of Legal Ethics.' This was reprinted with obvious approval in 118 Georgia Reports. On 27 Aug. 1908, finally, the American Bar Association at its annual meeting approved and adopted a 'Canon of Ethics' in 31 articles, of which the following is an epitome: (1) It is the duty of counsel to maintain toward the court a respectful attitude; (2) Members of the bar should prevent political considerations from outweighing fitness in the selection of judges; (3) Counsel should not exert influence on the court by manner or speech; (4) The rules of evidence, etc., toward judges, which are uncalled for by the personal relations of the parties; (4) A lawyer assigned as counsel to an indigent prisoner should not ask to be excused for trivial reasons, but protect the interests thus committed to him to the best of his ability; (5) It is a right of a lawyer to undertake the defense of a person accused of crime, regardless of his private opinions as to the guilt of the party; the primary duty of a public prosecutor is not to convict but to do that justice which is done; (6) A lawyer must disclose at the time of his retention all circumstances of his private relations to the parties, and any interest or connection he has with the controversy, such as might influence a client in the selection of counsel. To represent opposing interests, except by the express consent of all parties, is unprofessional; (7) Lawyers jointly prosecuting or defending a cause and failing to agree must state their differences to their clients and leave the law studied under the control and personal direction of their preceptor; (8) Suggestion of a client to call in other counsel is no ground for offense; (8) Lawyers should endeavor to obtain full knowledge of the facts of a case before advising thereon and are bound to give candid opinions of the merits and of the probable results of contemplated litigation; (9) A lawyer should not communicate on a subject of controversy with an opposing party who is represented by counsel, nor should he in any manner mislead a party not so represented; (10) A lawyer must not acquire any pecuniary or other beneficial interest in the subject matter of a litigation in which he is taking part; (11) When money or trust property comes into the hands of an attorney the fact should be promptly reported to his client; the same must not be commingled with the attorney's private property or used by him; (12) Lawyers should avoid making charges for services which overestimate their value, as well as such as underestimate the same; a client's ability to pay does not justify excessive charges, though a client's inability to pay may justify a reduction of the fee to be demanded; (13) Contingent fees, when sanctioned by law, should be under supervision of the court; (14) Controversies with clients concerning compensation should be avoided and suits to recover the same resorted to only to prevent injustice, imposition and fraud; (15) It is not the duty of a lawyer to do unscrupulously whatever may enable him to win a client's case: it is improper for a lawyer toassert in argument his personal belief in the innocence of a client or the justice of his cause. No fear of judicial disfavor or public unpopularity should deter a lawyer from the full discharge of his duty, but the great trust of a lawyer is to be performed within, not without, the bounds of the law. No violation of law, no fraud or chicanery, is demanded of him for any client, however powerful or influential. The lawyer must obey the dictates of his own conscience; (16) A lawyer must restrain and prevent his client from doing things which he himself ought not to do; (17) The relations between litigants should not influence counsel in the conduct of a case. All personalities between counsel should be scrupulously avoided;
COUNT—COUNT OF MONTE CRISTO

(18) Adverse witnesses and suitors should be treated with fairness and consideration; a lawyer must never minister to the malevolence of a client; (19) When a lawyer is a witness, except with good cause, he should have the trial to other counsel; (20) Newspaper discussion by lawyers of pending litigation is condemned; (21) Punctuality is a prime duty of a lawyer; (22) Conduct before a court must be characterized by candor and fairness. To knowingly withhold documents or the oral testimony of witnesses, or the language or argument of opposing counsel, is unprofessional and dishonorable. So also is the getting before a jury, in the form of argument, testimony that would be excluded as objectionable; (23) Fawning or flattery of a jury, or pretended solicitude for their personal comfort, is unprofessional. So also is conversation with jurors privately about a case either before, during or after the trial; (24, 25, 26) Condemn refusal to extend professional courtesies to opposing counsel when no harm can be done thereby to a client's interest; condemn the taking of technical advantage of the trustfulness of opposing counsel, the repudiation of unwritten agreements with regard to the services rendered in proceeding and other sharp practices; (27) The publication of ordinary business cards is not improper, but solicitation of business by circular or advertising, or through touts, or by inspiring newspaper comment, which magnifies the importance of the services of the advertiser or of the cases in which he is engaged, are denounced as unprofessional; (28) Stirring up litigation directly or through agents is not only unprofessional but indictable at common law; (29) Lawyers should expose corrupt or dishonorable conduct in the profession and accept employment unhesitatingly against an attorney who has wronged his client; (30) A lawyer must decline to conduct a cause or make a defense the purpose whereof is merely to harass the opposing party or work oppression; (31) No lawyer is obligated to act either as adviser or advocate for every person who may wish to become his client. P., Jr., 'Cases and Other Authorities on Legal Ethics' (Saint Paul 1917); Loftie, W. J., 'Inns of Court and Chancery' (London 1895); Home, G., and Headlam, C., 'The Inns of Court' (London 1909).

STEPHEN PFEIL

COUNT (Lat. comites) appears to have been first used, as a title of dignity, under the reign of Constantine. During the existence of the republic the inferior officers as tribuni, prefecti, scribi, mediici, horsepises, accensi praecores, who accompanied the proconsules and proprators into their provincial governments, were known as the comites or robors of their provincial. On the establishment of the imperial government the name was applied to the court and household of the prince; and Dio (53) mentions a council of senators selected by Augustus into the composition of his dominions, and the foundation of the new capital by Constantine, 10 out of 35 provincial generals received the title of comites.

After the fall of the Roman power the title was retained by the conquerors; and under Charlemagne it denoted equally a military or civil employment. About the end of the 15th century, in Germany, and in the north of the Moravian race in France, the title appears to have become hereditary in families. The institutions of the ancient German tribes may have contributed much to the establishment of this class of nobles. In early times, before the existence of the Latin comites, the Germans had officers chosen, at least in some tribes, by the people. These were a kind of inferior judges. After the Franks became the ruling nation they made a change in their character. The king now appointed them, and they exercised jurisdiction over certain districts in the king's name, with the title of grafen. These ancient officers are perhaps as fairly entitled as the comites to be considered the root of the subsequent counts. The German title grafen corresponds to the title "count" in other countries of Europe. These grafen superintended the administration of justice, the police and the taxes. After the time of the Carolingian dynasty different classes of counts were formed; thus pfalzgrafen, or comites Palatii, the judges of the court who decided whether a case should be brought before the king; markgrafen, counts of the frontiers; holzgrafen, counts of the forest, that is, inspectors, etc. These royal officers soon usurped power which did not belong to them, and treated the people so badly that the emperors and kings were obliged to go themselves into the provinces and hold courts, or to send particular officers for this purpose, called sendgrafen. The sheriffs in England were originally the deputies of the English counts or earls, who correspond to the German grafen. The wife of an earl has been called "countess" from very early times. Their Latin title is still "comites." Their English title, derived from "shire" and "gerefa," has the same origin with the German graf. (See SHERIFF.)

In the 12th century the division of counties on the continent of Europe was abolished, and thus the counts lost their jurisdiction, except on their own possessions. In the British and English earls are considered as corresponding to the continental counts. In Italy a large number of landed counts were created, but they are no longer recognized by the government. In Spain the title is still of value owing to the existence of primogeniture. In the Russian monarchy the title of graf bore little social prestige. In present times, the Japanese use the word to translate a similar rank in their country. (See COUNTY; EARL; TITLES OF HONOR.) Consult Sed- den, 'Tales of Honor' (1672); Luchaire, 'Essai sur l'origine de la noblesse en France au moyen âge' (Paris 1902); Brunner, 'Deutsche Rechtsgeschichte' (Vol. II, Leipzig 1892).

COUNT OF MONTE CRISTO. The. A typical novel of the romantic period in France was "The Count of Monte Cristo," by Alexandre Dumas, written from 1841 to 1845 with the assistance of two minor collaborators, Auguste Maquet and P. A. Fiorentino. It was begun before and completed after the equally famous "Three Musketeers," from which it differs in being more melodramatic and intense, less natural and humorous. The protagonist, Edmond Dantès, bears the earmarks of the roman-
tic hero of the Byronic poems, although he is not so sentimental, being endowed with an active passion that sets him wrestling with superhuman difficulties instead of brooding over the ruin in sick despair. Dantès is the victim of unscrupulous enemies, a gloomy giant outraged by society. Unjustly confined within the dungeons of the Château d'If, he learns from a fellow prisoner the arts and sciences, and the secret of a buried treasure. When his companions, Dantès, assuming the role of the corpse, is flung into the sea and swims to freedom. He recovers the lost treasure, and, as the possessor of immense wealth, proceeds to work out his elaborate schemes for mysteriously rewarding those who have been his benefactors, and wreaking vengeance upon those who are responsible for his misfortunes. He is ruthless in his pursuit of these enemies, insinuating himself unsuspected into their good graces, and leading them to divergent paths to destruction. Fernand, who had married Dantès' sweetheart, is brought to suicide; Danglars, who had permitted the father of Dantès to die of starvation, is forced into bankruptcy and social disgrace; and de Villefort, who had treacherously secured the imprisonment of Dantès, is publicly humiliated, and when his criminal wife slays herself and her son, he goes raving mad. With his thirst for revenge thus slaked, Dantès turns for solace to the fair Haydey, daughter of Ali Pacha, ruler of the Greeks.

Duels, poisonings, sleeping potions that induce the semblance of death, documents written with invisible ink, secret passageways, luxuriously furnished grottoes, disguisings, and all the other paraphernalia of hectic romance are musterèd here for duty. Villainy and virtue are extreme: demons and angels rub shoulders. Slaves, bandits, bankers, soldiers, sailors, priests throng the pages, every one of which yields its thrill.

In power of improvisation, Dumas vies with Walter Scott; and in wildness of imagination far surges him. The intricate plot of the novel is woven with consummate skill, and, theatric as are its scenes and personages, they win at least that temporary suspension of disbelief which Coleridge would exact of all romance. Indeed, in many matters of detail, Dumas has taken care to arouse in his reader, not only the pleasure of surprise, but that also of recognition. Thus, in his account of the ingenuity of the Abbé Faria in fashioning various articles for use in the dungeon, he has torn realistic leaves from "Robinson Crusoe." Features of the intrigue he drew from Peuchet's "Police dévoilée" after his publishers had asked an exciting story in the style of Eugène Sue's "Mystères de Paris." The Roman scenes he completed before it occurred to him to develop fully the incidents connected with Marseilles and the Château d'If, now so auspiciously setting the story in motion. The location of the buried treasure and the title he hit upon during a visit, in 1842, to Elba, off the coast of which he noticed the rocky island of Monte Cristo. Translations and dramatizations of the romance have appeared in every modern language.

FRANK W. CHANDLER.

COUNT OF PRESIDENTIAL VOTES.

See ELECTORS, UNITED STATES PRESIDENTIAL.

COUNT ROBERT OF PARIS, a novel by Sir Walter Scott, published in 1831. The scene is laid in Constantinople during the reign of Alexis Comnenus (1080-1188). Many historical facts are altered for artistic effect.

COUNTER-IRRITATION, the production of an artificial inflammation in order to relieve another in some other part of the body. The principal counter-irritants are dealt with in the article on blister (q.v.).

COUNTER REFORMATION, a movement that assumed importance in the Roman Catholic Church in the 16th century, and lasted from 1560 in the pontificate of Pope Pius IV to 1648, the end of the Thirty Years' War. Before the Protestant Reformation the synods and provincial councils of the Church had always considered and acted upon points requiring reform. Luther, as a Catholic priest, emphasized the urgent need for further reforms of abuses which were creeping into the Church. When he seceded and became a Protestant, the reformation movement in the Catholic Church continued, growing in its formidable aspect to a more or less definite and avowed attempt to counteract the Protestant Reformation. It had as an inevitable outcome of the very conditions that produced the great schism. Among those who shared the widespread discontent with existing abuses in the Church and who longed for a return to its apostolic purity and simplicity, there were many who remained loyal to the parent communion and believed in the possibility of an internal reform. There were others whose piety and sincerity of motive were more questionable, but who from wise policy advocated an amendment of the abuses that were prevailing. Perceiving that moral and not physical force was required to keep wavering adherents within the Church's pale and to regain those who had broken away. The Council of Trent was one of the most prominent of the factors in the problem counteracting the spread of the Reformed faith. Conciliatory measures which were originally intended were abandoned after the fifth session and attention was concentrated on the reaffirmation of doctrines questioned by the Protestants and on regulations for the purification of the Church. Although Macaulay's estimate of the Jesuits' share in the Counter-Reformation is exaggerated, the devotion and zeal of Loyola and his followers undoubtedly played a large part in the abatement of ecclesiastical scandals and abuses. The Jesuits perceived that in an age of intellectual ferment and inquiry the Church must control the education of the better classes if she would retain her spiritual influence with them, and in the perfectly organized Society of Jesus they offered an instrument fitted for the task. The representative and punitive features of the Counter-Reformation as illustrated by the work of the Inquisition (especially in Spain and in the Netherlands), and by force of arms, banishment, confiscation and other political penalties, are familiar, being more frequently dwelt upon than the changes taking place within the Church. Consult Pennington, A. R., "History of the Counter-Reformation" (London 1900); Ward, A. "History of the Counter-Reformation" (New York 1889); Wiedemann, "Catholic Reformation and Gegenreformation" (Enns, 5 vols., 1879-96).

COUNTERFEITING, the making of imitations or counterfeits of money, either paper or
COIN.

in an extended sense including some degrees of forgery and other cases of fraudulent imitation, as spurious trade-marks or dies. This is a crime heavily punishable by statute, and the United States has provided for it at considerable length for its suppression. The punishment prescribed for imitating United States paper money is a fine of not over $5,000 and imprisonment at hard labor not exceeding 15 years; for counterfeiting coin, the penalty is a fine not over $5,000 and imprisonment at hard labor not exceeding 10 years; for minor coins of five cents and less, $1,000 fine and five years' imprisonment is the maximum. For having counterfeit money or counterfeit tools in possession, or for counterfeiting post office locks, or for altering or reusing revenue stamps, similar penalties are prescribed by statute. The United States laws on the subject may be found in the Revised Statutes, §§ 5413 et seq.

For the suppression of counterfeiting and enforcement of the laws on the subject, the United States has been divided into 10 secret-service districts, in each of which officials are constantly working to detect passers of counterfeit money and ferret out those who are engaged in its manufacture.

The paper money of the United States has been rendered very difficult of imitation by reason of the high character of the workmanship employed. The paper used includes colored silk threads, and as the manufacture of such paper for other purposes is prohibited, the counterfeiter must either control a paper mill, involving a very heavy investment, or must steal some government paper, or imitate the colored threads with colored lines written or printed. Pen-written lines are the usual form of imitation of these, commercial paper being employed, the government paper that the counterfeiter can buy. The engraving of the plates is of such high quality that there are usually not a dozen men in the country, outside of those engaged on the government notes, who are capable of executing good imitations, and these men are known to the secret-service, which keeps an eye on them and their associates. The printing is done in colored inks in order to prevent reproduction of the plates by photography, which would be comparatively easy if printed in black. These conditions, combined with excellent work by the secret-service, have almost stopped the counterfeiting of United States paper money, and the temptation to counterfeit is still further reduced by the government's policy of changing the designs of the notes frequently and withdrawing the old paper from circulation, rendering it certain that high-class counterfeit would be driven out of circulation in a short time.

The success of counterfeiters is not so much due to the cleverness of their work as it is due to the ignorance and carelessness of the general public. A man who is not familiar with the distinctive ear-marks on the genuine money of the land cannot be expected to detect the counterfeit presentation of them when they face him on spurious money; so that every man ought to make himself familiar with these distinctive ear-marks. Everyone must do this if he would successfully protect himself against the skilful imitations and the cunning devices of the shrewd counterfeiters who infest the land and prey upon this species of popular ignorance.

Steel-engraving is a fine art, about which the general public knows next to nothing; and yet the possibility of detecting paper money unerringly is bound up in the engraved features of its make-up. Of course, it is not contended that everyone must become a master of the engraver's art before he can successfully detect counterfeit money, but it is contended that he must make himself familiar with the distinctive features of the genuine machine-engraving on the national currency that he can distinguish it from spurious and imperfect imitations of it. Nor is it a very difficult task. It can be done by anyone who will take the trouble incident to a proper study of the subject. The work executed by the government, as well as that which is executed by the banknote companies, possesses great beauty in its art and exact perfection in its execution and finish. It is mathematically and geometrically exact in all its parts, while the spurious work of imitating counterfeiters is necessarily imperfect in these respects.

This is due to the fact that the former is done by machinery, while the latter is done by hand; and to the further fact that hand-engraving, even when aided by simple machinery, can never approach the beauty, exactness and general perfection of machine-engraving. And yet although these very designs have bound up in them the chief safeguards which the government has thrown around our national currency to protect it against being successfully counterfeited, not one man in any 10 met upon the streets of our cities, much less among the rustic tillers of the soil, is familiar with either the character or the object of these beautiful designs which are found upon our national currency. This fact is very aptly illustrated by the tests which are applied by different persons to determine whether a suspected note is spurious or genuine: one looks carefully for pen-holes; another scans it for signs of wear, and another scrutinizes the vignettes, while others examine the paper,—not knowing that all of these evidences may be counterfeitcd successfully or imitated so perfectly as to deceive almost anyone; but very few, if any, apply those real tests which involve the only truly and unmistakably distinctive features of genuine notes. Hence, the alarming success of counterfeiters in passing their spurious products is not so much due to the fact that the excellence of their imitations of these distinctive features of genuine notes is prone to deceive the intelligent observer as it is due to the fact that the general public is ignorant concerning the construction, purpose, character and distinctive features of that difference which distinguishes the genuine from the spurious. Everything on the average national currency note, except the fine lines of engraving, may be successfully counterfeited; but these fine lines defy all impostors. All of the circles, ovals, squares and parallels, as well as the geometrical lathe-work upon which the denominations are usually placed, are composed entirely of a perfect network of finely engraved lines which cross each other at such angles and approaches each other in such distances as to produce the desired effect. These finely engraved lines constitute the chief, the distinguishing feature of the government's money-engraving,
COUNTERFEITING

and they cannot be successfully counterfeited.

It will be noticed in all genuine work that these fine lines can be traced by the use of a lens, throughout the figures,—not a line being broken, not a line losing itself in another line and not a line showing any irregularity whatever in its course, in its uniformity of curve and width or in its degree of shading. These lines may be either white upon a background of black, green or red; or they may be black, green or red upon a background of white; but they are always exact, always even and always uniform. They are made by a geometrical lathe which was invented by one Asa Spencer and introduced to the public about 1818.

This lathe is a perfect wonder; it produces patterns of almost every conceivable variety in form and figure; but this same fine quality of the lines clings to them in whatever form they may appear. So that, when it is remembered the uniqueness of execution is impossible in hand-engraving, the spurious note falls all to pieces under this test. The striking difference between the genuine and the spurious is very natural from the simple fact that the one is mathematical and exact, while the other is mechanical and necessarily variable. The lathe does not engrave directly upon the note-plate, while the counterfeit engraver does. The lathe engraves upon a piece of soft steel one-eighth of an inch thick. After this piece of soft steel has been properly engraved by the lathe, the piece of engraved steel is hardened by a peculiar process; then (by means of a powerful machine called a transfer press) a cylinder of soft steel is rolled over the hardened piece of engraved steel in such a manner that the engraving is transferred to the cylinder, which is then hardened; and, from this hardened cylinder the designs are transferred to the note-plate by means of the transfer press. In this way the work is not only exact—mathematically exact and artistically perfect—but it is always uniform; for this cylinder acts as a perpetual model from which any number of plates can be transferred—each being an exact facsimile of all the others taken from that same cylinder. Hence all United States notes of any one series are exactly alike in every respect except the numbers and the signatures. And right there is where the counterfeiter falls down before the practised eye. He must do his engraving directly upon the note-plate—which imposes many impossible difficulties; the lines cannot be made as perfect as they are in the lathe work, and the general effect of the printing is inartistic in comparison with the impressions taken from lathe-made plates. Even to the naked eye these lines are more or less dull and sunken, or scratchy; and the figures are sure to be lighter or darker in spots, as the lines are heavier or lighter in places. The use of the lens in such cases discloses the fact that the lines are often broken, varied or irregular, either in size or course. Besides, it being impossible for any hand-engraver to produce two dies exactly alike, it happens that the spurious dies are not only not exact reproductions of the genuine lathe-made dies, but no two of the spurious dies are exactly comparable, under the lens, between the dies on a suspected note (if it be spurious) and a genuine note brings out this difference so clearly that very little skill is required to detect and read it.

All the government dies used in printing any given series are exactly the same—all being transferred from the same cylinder, and they must therefore be exactly the same in every respect. This impossibility of making two dies separately and independently exactly alike by the hand-engraving process not only prevents the counterfeit dies from being like the genuine, but it also prevents any two counterfeit dies from being exactly alike, since the plates must be separately and independently engraved. But besides this absence of exactness in the reproduction of the dies, there is another notable feature of difference which is conspicuous for its presence in the genuine and for its absence from the spurious note; and that is the beautiful clear-cut, raised impressions produced by the correct and uniform lines of the lathe-work which the counterfeit cannot reproduce to save his life.

This machine work is therefore the safest ear-mark there is for detection purposes; but it must be used intelligently. In examining this work on any suspected note, it is a pretty safe way for the examiner to begin at the centre of the curvilinear figures and then gradually follow the lines around the circles, one within another, carefully searching for any special defects and for the discovery of any irregularity not patent to the naked eye. And he should also make careful and minute comparisons between the general designs on the genuine note and those on the suspected one.

Sometimes the whole face of a note (except the vignettes and dies) are tinted a pale red or some other color; but examination under a lens discloses the fact that this tint is composed of fine crossed or looped lines running clear across the face of the note. This is another species of machine work which is but poorly imitated by the most expert counterfeit engraver who has to depend upon his hands. This work, when genuine, shows the lines to be perfect in execution and in shading, while the spurious note bears evidence of imperfection in both respects.

Parallel lines also afford a check. They are made by a parallel-ruling machine, which is governed by an index to regulate the width of the lines, and they are mathematically exact. They are always uniform, always regular and always exactly parallel—conditions which do not obtain when the counterfeiter undertakes to reproduce them by the process of hand-engraving. These parallel lines are used in shading the letters and figures on the genuine notes into a perfectly even pale gray. They are also used to represent a clear sky or water; but crossed lines are used to represent cloudy or heavy skies. In genuine work these lines can always be counted, while such is not always the case with counterfeit notes, as the lines on them are often broken, blurred and irregular.

Some people rely on the vignettes as reliable ear-marks for detection purposes; but they make a mistake in doing so. The vignettes are the most artistic part of the whole note, and they are mostly hand-engraved, even on the genuine notes; so that they are also exactly reproduced—but that is not often the case. The vignettes on the national currency are made by the very finest artists in the country,
and they are beyond the successful imitator or reproduction of any one but an artist of the first water; and, since the after-piece which such methods call for cannot be too satisfactorily for them to resort to the rather risky business of counterfeiting themselves or lending their talents to others engaged in that hazardous outlawry, these would-be imitations are made by rather inferior artists and are necessarily imperfect in many respects. Real vignettes have this advantage over spurious ones: They are never made but once, and are therefore uniform and always exactly the same. They are transferred to the cylinder, just as the lathe-work is, and then transferred (by use of the transfer press) from the cylinder to the note-plate, thus using one model all the time; but such is not possible with the spurious vignettes. They must be reproduced, and exact reproduction is very difficult, if not impossible. But, it being noticed that counterfeiters get along better in reproducing outdoor scenes than they do in reproducing portraits, the government has very wisely mingled its vignette work — presents and allegorical pictures, portraits and allegorical figures, which it not only becomes difficult for counterfeiters to imitate, but which furnishes a somewhat graduated scale of difficulties for them to surmount.

The engraving test is the best possible earmark in the detection of counterfeit, for two very good and sufficient reasons: In the first place, the above-noted differences will always appear as long as counterfeiters have to rely upon hand-engraving while the government uses machine-engraving; and, in the second place, these counterfeiters will always have to rely upon hand-engraving, because machines for the purpose are too bulky and too expensive for them to handle,—considerations which will always place machine-engraving beyond their reach. If a man has $75,000 to $150,000 capital (the cost of a proper outfit of machinery for this work), he would hardly risk his investment in an illegitimate enterprise which might be swooped down upon at any moment by government officers and utterly destroyed, with the legacy of a long sentence in the penitentiary added. Hence, it may be pretty safely assumed that all the engraving done upon spurious note-plates will always be done by hand, and that this test can always be applied.

Coin is more easily counterfeited. The government mints it by subjecting blanks of metal to heavy pressure between dies. The cheap imitator casts them under slight pressure in a base metal. The maker of a better grade of counterfeit coin cuts out or casts a blank or disc of the required size, and compresses it between dies in an ordinary stamping-press. To make a really good imitation of gold coin requires a very wide knowledge of alloys, possessed by the men, and in particular for this reason counterfeit gold coins are scarce. The imitation of silver is much easier, as there are in the market numerous metals, used in the manufacture of tableware, etc., that closely simulate silver. Their principal basis is lead, and it is by the softness of the mixture and its increased weight that counterfeit silver is most easily detected. It does not require an expert to distinguish the average counterfeit silver coin from the genuine, as a simple balancing on a scale with a good coin shows the difference in weight, a shave with a penknife exhibits the softness of the vessel, and ringing the coin produces a dull sound as compared with the ring of silver.

Counterfeits made in real silver have been circulated since the value of the metal deteriorated, and these, if well made, are very difficult of detection. The best safeguard against them is obtained by watching all purchasers of silver, and following up those who do not seem to have good reason for requiring it. The imitations of five-cent pieces in the real metal are not difficult for a skilled mechanic, and the statement has been widely circulated that they were once actually manufactured by convicts while serving sentence in a prison of one of the larger States, where electro-plating was carried on in the workshop. The more common imitation of the five-cent piece, however, is simple lead, cast in a mold, and, while easy of detection, it secures circulation because the passers handle it without examination. This is the most usual form of counterfeiting cacti, and the hobby of making bad nickels is liable to break out anywhere as the result of some misguided man's efforts. As soon as they attract attention in a locality the secret-service men concentrate their action, and usually find the base of supplies within a few months, unless the counterfeiters take the alarm and fly, destroying their apparatus.

The most elusive counterfeiter the United States secret-service men were ever called on to unearth was a New Jersey mechanic skilled in photography and chemist who used his skill in machine-engraving; and, in the second place, these counterfeiters will always have to rely upon hand-engraving, because machines for the purpose are too bulky and too expensive for them to handle,—considerations which will always place machine-engraving beyond their reach. If a man has $75,000 to $150,000 capital (the cost of a proper outfit of machinery for this work), he would hardly risk his investment in an illegitimate enterprise which might be swooped down upon at any moment by government officers and utterly destroyed, with the legacy of a long sentence in the penitentiary added. Hence, it may be pretty safely assumed that all the engraving done upon spurious note-plates will always be done by hand, and that this test can always be applied.

Coin is more easily counterfeited. The government mints it by subjecting blanks of metal to heavy pressure between dies. The cheap imitator casts them under slight pressure in a base metal. The maker of a better grade of counterfeit coin cuts out or casts a blank or disc of the required size, and compresses it between dies in an ordinary stamping-press. To make a really good imitation of gold coin requires a very wide knowledge of alloys, possessed by the men, and in particular for this reason counterfeit gold coins are scarce. The imitation of silver is much easier, as there are in the market numerous metals, used in the manufacture of tableware, etc., that closely simulate silver. Their principal basis is lead, and it is by the softness of the mixture and its increased weight that counterfeit silver is most easily detected. It does not require an expert to distinguish the average counterfeit silver coin from the genuine, as a simple balancing on
to a given theme the melody added is called its counterpoint. In former times musical sounds were represented by dots or points placed on the lines, and the added part or parts were written by placing the proper points under or against the main line, punctus contra punctum. Some authorities use the word counterpoint simply as an equivalent of harmony, by others it is employed to denote the art of composition generally. It is preferable to apply this term now to that branch of the art which, a musical thought being given, teaches the development of it, according to the laws of the art, by extension or embellishment, by transposition, repetition or imitation throughout the different parts. Contrary motion, augmentation and diminution, the latter two referring to the time-value of the notes, are also other devices of counterpoint. It thus stands related to harmony as literary composition stands to grammar. *Simple counterpoint *is the art of adding a part or parts to a given melody in notes all of equal value, as in plain-song or ecclesiastical style. *Florid counterpoint *is when the notes of the added parts are of less time value (say two crochets or four quavers against a minim) than those in the melody or subject, itself. In *double counterpoint, *the subject may start in the bass and be repeated in the upper part, or vice-versa. It becomes triple or quadruple when two or three parts are added with the harmony inverted. Further, counterpoint is divided into the free and strict styles, the former, which is of the florid order, allowing many licenses as to discords, etc., not permitted in the dignified slow movement of the strict style. The fugue (q.v.) may be classed among the highest developed forms of the art of counterpoint. It has been said that the art was known as far back as the 4th or 5th century; others again ascribe its invention to Guido d’Arezzo in the 11th century, or Adam de la Hale two centuries later. It was not until the 17th or 18th century that the art attained its maturity under the fostering care of Palestrina, J. Sebastian and Emmanuel Bach, Handel, Haydn and Mozart. Beethoven’s avowed aim in his later works to make every part sing, and not to be mere harmonic padding, well illustrates the object of counterpoint, while among the greatest contrapuntalists and innovators of modern times are Wagner and Brahms who by their intensive utilization of overtones practically extended the field of counterpoint and harmony. Numerous treatises on counterpoint exist; among the best modern authorities are Prout, Richter, Riemann and Jadassohn. See Harmony.

**COUNTERSIGN,** in military affairs, a watchword used to prevent unauthorized persons passing a line of sentries, whose orders are to stop anyone carrying it. It is to be given each day by the commanding officer, but may be changed at any moment if necessary, and is communicated only to those entitled to know it. The parole is a similar watchword given only to those entitled to inspect guards and to their commanders. Countersigns are usually names of battles; paroles are names of distinguished military persons. To give a countersign or parole other than that received, or to make a countersign or parole known to one not entitled to receive it, is in time of war punishable by death, or such other punishment as a court-martial may determine, according to the 7th Article of War, United States Army.

**COUNTING-OUT GAMES.** See Games.

**COUNTRY- or CONTRA-DANCE,** a dance in which as many couples can take part as there is space to accommodate them; the gentlemen being ranged at the commencement on one side, and the ladies on the other. The dancers are constantly changing places, leading one another back and forward, up and down, parting and uniting again. Sir Roger de Coverley is the best-known example. The oldest collection of country dances was published in 1651 under the title 'The English Dancing Master.' In the 18th century it was introduced into France, where it was first known as "Anglaise." It was also known as the "Contredanse." Under this name it spread to Germany.

**COUNTY,** in the United States, an administrative subdivision of each State, intermediate between the body as a whole and the town, parish or municipality. In the northern states (except the wild northern parts of Maine and New Hampshire), and the thickly settled States of the central West, it is an aggregation of actual towns, there being no county land which is not a part of some town. In the South and the more sparsely settled Western States, the town is a piece cut from the county, the greater part of which may be entirely unorganized, except as divided by the State into artificial sections for administrative convenience or the saving of future boundary disputes; townships (as also in Aroostook County, Me.), military districts as in Georgia, *wards* as in Louisiana, *beats* as in Mississippi, etc. The relations of the county to the political and social life of the community also vary widely in different sections, owing to historic development. In New England it is of less consequence than anywhere else in the United States: a mere artificial group of towns, which might be regrouped at any time with little disturbance. Here it has three commissioners, who act as its attorneys and representatives, as well as executive officers, appoint the taxes among the towns, care for highways, etc. The old militia regiment, of which the town train-bands were companies, has disappeared; the County Court has been replaced by sessions of the State Superior Court on circuit; there are, as of old, a sheriff, courthouse, and jail, a Probate Court, registry of deeds, etc. The representative system here is not based in the least on the counties, but on the towns in general, singly for the lower house in the State, and grouped into "senatorial districts" for the upper. Hence there is but languid interest in county matters, and no feeling of county unity. But in the Middle and Southern States the county is a much more integral part of daily life; it is the basis of representation, and often the real unit of growth and settlement. In the Middle States the towns were the original centres of settlement, as in New England, but they have not reduced the counties to insignificance. The county-seat is usually the chief centre of business and political interest, and the coveted spot at which to edit a newspaper sure of the largest circulation—in New England the county-seat has no advantages such as to make it a newspaper focus, and frequently is an insignificant

COUNTY ASSESSOR—COUNTY DEMOCRACY

three to seven members, to deal with specified matters of administration in each county, of approximately half of the States in the Union. County Courts or boards of supervisors perform like duties in other States. The duties of county commissioners, generally, are to control public finances, superintend county roads and other public works, and poor relief. Some county commission boards supervise police, township and other county officers and perform a limited ordinance power. In western and southern States they often license peddlers, saloons and other businesses, and establish county precincts and polling places. Experience indicates that more efficient administration is exercised by small boards of county commissioners compared to large boards of supervisors. The combination of taxing and spending facilities, however, always creates criticism, and caused Indiana to establish a county council in 1899 to control the boards of county commissioners. See COUNTY COUNCIL.

COUNTY COUNCIL, a body of officials, comprising a specified number elected from each district and by the county, to control revenue and expenditure. The first county councils in the United States were established in Indiana in 1859, each to consist of seven members, four elected by districts and three at large. They are empowered to borrow money at interest, issue bonds, and make appropriations for county expenses, the boards of county commissioners (q.v.) being the executive authority to carry out orders.

County councils in England and Wales date from 1888 when these territorial divisions were, for various purposes, divided into 63 counties with elective administrative bodies known as county councils. The new administrative counties were given the same boundaries to correspond as closely as possible with the 52 historical shires or counties, but seven of the latter, Sussex, Suffolk, Hampshire, Cambridgeshire, Northamptonshire, Lincolnshire, Yorkshire, were subdivided into two or more administrative counties, and London County was created. The population of the different administrative counties vary from London County with 5,000,000 inhabitants to Rutland with less than 25,000. The same administrative type of organization practically governs each. Since their institution considerable improvement has been effected in local government throughout England and Wales. See GREAT BRITAIN—GOVERNMENT; LONDON.

COUNTY ASSESSOR. New York, founded 1880 and lasting till 1890, represented a "better citizenship" movement started in New York city and county, with the object of reforming Democratic organization and curbing the power of Tammany Hall. In 1884 New York delegates defeated the Tammany representatives at the State convention; in 1884 they elected Mayor Grace; in 1886 Tammany united with County Democracy to defeat Henry George and elect Mr. Hewitt mayor, withdrawing its support when he asserted independence of its control. In 1888 Mr. Hewitt was defeated in the re-election, and in 1890 County Democracy, uniting with other reform associations, ceased as an independent organization. See NEW YORK CITY.

COUNTY ASSESSOR, a public official generally elected by popular vote for terms of two or four years in southern and western States, to value all property liable to taxation. They prepare lists of owners and descriptions with valuations of property, supervising and equalizing such assessments where the original assessment is made by town officers. In Wisconsin and Indiana a county officer is appointed to superintend and instruct the town assessors. In Illinois and Ohio similar duties are performed by one of the other county officers. In Kansas town assessors have been superseded by county assessors who make the original assessment. See TAXATION.

COUNTY BUDGETS. See BUDGETS, AMERICAN; APPROPRIATIONS, AMERICAN SYSTEM OF.

COUNTY COMMISSIONERS, officials appointed on boards, usually consisting of from place where none is published — and the county meetings of the town boards of supervisors determine the important actions of the county population. In the South, generally, the county was originally not only the most important, but almost the one subordinate unit of settlement, owing to the paucity of towns due to the plantation system. The county regiment, instead of being made up of town companies, was divided into district bands for convenience of drill and assemble; the local management was mainly by county instead of town officers; the magistrates were mostly self-perpetuating, in the hands of a few leading families, instead of being elective or even appointive. The very settlements intended for towns often did not grow into such, but spread into disconnected plantations, and became counties; as James City County and Charles City County, Va. In South Carolina there were two systems — the county in the low country, bordering the coast, in the Piedmont region; after the war the district system was extended over the whole State; in 1868 it was abolished and the whole State divided into counties. But these are purely artificial creations, and may be contested with good judgment, they are of immense size, nearly double those in Massachusetts or Connecticut, and treble those in Virginia or Kentucky; Charleston County is larger than Rhode Island. They have no courts, being grouped into judicial circuits. The real subdivision seems likely to take place within them. In Louisiana the corresponding divisions are called parishes instead of counties. The institution was brought from England by the first settlers: the county there was an old tribal settlement, sometimes a whole kingdom as in Kent, the counties or shires being gradually fused into the kingdom. The shires are therefore not divisions made in the kingdom, but small governments whose coalescence made the state. The name "county" was given them after the Norman Conquest, from their likeness to the counts' governments on the continent. At first here the English organization was copied: there were courts called quarter-sessions, justices of the peace with extensive powers, lieutenants or Constables, etc. All had the county in 1634, Maryland in 1638, Massachusetts in 1643. Consult Piske, 'Civil Government in the United States;' (1890); Pollock and Maitland, 'History of English Law' (Boston 1899).
COUNTY GOVERNMENT IN THE UNITED STATES. Local administration in the United States is not regulated by any legislation of the national government, but is determined by each of the 48 States acting independently. Under these conditions there are inevitably countless variations in the organization and powers of the local authorities in the different States; and an account of the system of local administration requires an elaborate study of the constitutions and laws of all the States. At the same time such an examination discloses certain important institutions resembling each other throughout the Union; and other features which are similar in closely related groups of States. These conditions are due to the historical origin of American institutions in those of England, to the constant intercourse between the various States; and to the conscious and unconscious imitation and adaption by each State of the institutions and practices of other States.

Among the districts of local administration in the United States, the county is the commonest. Every State is divided into districts called counties, except in the State of Louisiana, where the corresponding district is known as the parish, and with a great deal of variation in the powers and organization of the county authorities, there are yet important features in common which mark county administration as fundamentally similar throughout the United States.

The American county occupies a distinctly different position in the general plan of public administration from the chief local districts in European countries. The name county indicates its historical connection with the county in England, from which the American county has developed. But in its functions and general importance the American county now differs widely from the English county; while it is even less like the provinces, departments, circles or other local districts in the countries of continental Europe.

Historical.—To understand the development of the county in the United States, it is necessary to note the system of county administration in England in the 17th century, when the English colonies in America were established. At that time the county officials in England were the lord lieutenant, the sheriff, the coroner and justices of the peace. All but the coroner were appointed by the Crown; but after the decline of the active control by the Privy Council, the local administration in practice was highly decentralized. The lord lieutenant was head of the militia system. The sheriff was the chief conservator of the peace and executive agent of the judicial courts. But the local administration was mainly looked after by the justices of the peace, the justices in each county forming collectively a quarterly court of criminal jurisdiction, which also acted as the fiscal and administrative authority for county affairs.

In the American colonies counties were organized with similar officials, appointed by the colonial governors. But during the colonial period, and especially about the end of the 17th century, important changes were made in some of the colonies. In New York and Pennsylvania locally elected county boards were established, which gradually acquired the fiscal and administrative powers of the justices of the peace. In Pennsylvania the sheriffs were made locally elective in 1705. Some new county officers and additional county functions also developed; the county treasurer appearing first in Massachusetts; local prosecuting attorneys in Connecticut; and in most of the colonies county recorders were appointed to keep public records of documents relating to land titles.

At the same time the importance of the county was affected by the development of town government in New England and to some extent in the middle colonies from New York to Pennsylvania. But in the southern colonies the county was the main unit of local administration.

From the establishment of State governments in 1776 until the middle of the 19th century important changes in county administration, as well as in other features of State and local administration, were gradually introduced, both in the seaboard States and in the new States organized in the interior. The main results of the commonwealths and territorially democratic and decentralized system. The electoral franchise was extended to include all male citizens. County officials were made locally elective; and the number of such officials was largely increased. In most of the States an executive county board took over the administrative functions of the justices of the peace, while the sheriffs, prosecuting attorneys, county treasurers, county clerks, county records and the justices of the peace all became elective officials.

Since the Civil War there have been few general and permanent changes in the legal principles of county administration. But with the growth of the United States there have been important developments in the functions of the county and in the methods of administration. The county system has been extended throughout the country; and the increase of population and the general tendency toward the expansion of public activities have added much to the scope of county administration.

General Characteristics.—A county is one of the civil divisions of a State for judicial and political purposes; and at the same time is a district of a quasi-corporate character for purposes of local taxation. As a rule the State legislature has power to establish counties; and in the North Atlantic group of States this power is not limited. But the constitutions of most of the States now impose various restrictions, as to minimum area and population and requiring the consent of the voters. In most of the States the organization of new counties and changes in county boundaries are now seldom made; but in some of the newer States the creation of new counties and readjustment of boundaries are still not infrequent.

There are about 3,000 counties in the United States. Most of the larger States have from 60 to 100 counties each. At one extreme Texas has 245 counties; at the other Rhode Island has five and Delaware three.

In area and population the counties show great differences; but for the most part American counties are much smaller both in area and population than counties in England, departments in France, and provinces in Prussia, Belgium, Italy or Spain. Nearly two-thirds of the counties contain from 300 to 900 square

106
COUNTY GOVERNMENT IN THE UNITED STATES

miles; and the most usual areas are from 400 to 650 square miles. More than half the counties have a population of 10,000 to 30,000; but in the arid states the counties are usually much smaller; many have less than 10,000 population.

Municipalities of the counties are mainly rural in character; but most counties contain urban communities, a considerable number have important cities, and the most important counties are those where the largest cities are located,—as New York city (which includes five counties), Chicago, Philadelphia, Saint Louis, Boston, Baltimore, San Francisco and Denver. In most of these cases the county administration is partly absorbed in that of the city.

The comparatively small area and population of most counties in the United States necessarily makes them less important for some branches of public administration than the counties, departments and provinces in European countries. On the other hand the highly decentralized methods of administration followed in the United States adds greatly to the number of officials locally elected by counties. Not only local county authorities, but even the principal local agents of the central government are elected within each county, and are subject to little or no effective supervision by the central government of the States. The national government has no supervision or control whatever over county or other locally elected officials.

Powers and Functions. There are wide variations between the States in the relative importance of the county as an administrative district; and the powers and public functions of counties and county officials are far from uniform in all the States. But it is possible to note certain common factors and to call attention to some of the most important differences.

Very little in the way of legislative power, even in local matters, has been conferred in counties on the United States. They are considered in judicial decisions as primarily agents and instrumentalities of the State to carry out its governmental functions. The county officials thus act almost entirely under the provisions of statutes passed by the State legislatures, which define their duties and enumerate their powers in minute detail. Important questions are, however, often submitted to a popular referendum of the whole body of electors in the county,—such as the location of the county seat, loans for public buildings or public works, and the prohibition or licensing of places for the sale of intoxicating liquors, under "local option" laws. In 1909 a more general grant of local legislative power was made to the county authorities by the legislature of the State of Michigan. In 1911 California adopted a home rule constitutional amendment authorizing counties to frame and adopt their own charters of local governments.

But if the legislative power of the counties is administrative functions are numerous; and locally elected county officials are entrusted with the execution of the most important State laws.

In all the States the county is primarily a district for the administration of justice. Courts of general criminal and civil jurisdiction are held at intervals in every county. The judges of these courts are usually elected (or in some States appointed) for a term of years, and there is only one judge to each county except in larger counties; but a number of the more populous counties form each a judicial district for such courts; while more frequently county judges with a limited jurisdiction are locally elected. In any case the administrative officers of such courts (clerks, sheriffs and prosecuting attorneys) are, for the most part, elected within each county. In connection with the administration of justice, courthouses and jails are maintained in each county. The county is also to a slight extent a police district, the sheriff acting as conservator of the peace; but no system of organized and disciplined county police has been developed in any of the States. In nearly every State the county is the district for the public record of land documents, and for the probate of wills, the administration of estates and superintendence of orphans.

Except in some of the New England States, counties have to do with the construction and maintenance of the more important roads and bridges, and in the States where public works are not under local control the work has been done by State authority. In nearly every State the county is also a district for the public record of land documents, and for the probate of wills, the administration of estates and supervision of orphans.

In all the States outside of New England (and in New Hampshire) the county is a district for the administration of poor relief. Public almshouses or poorhouses are maintained; and in the more populous counties there are other charitable institutions. But such specialized institutions as hospitals for the insane, and schools for the deaf and dumb, are for the most part maintained directly by the State governments.

Outside of New England the county is a district for school purposes. In the most important group of States, covering the central region from New York and New Jersey west to Kansas and Nebraska, the county schools are supervised by the county school officials appointed for a larger district. In many of the Southern and Western States the county is the main unit for local school administration.

In many States the county is also a district for the administration of health and sanitation laws.

In connection with these functions and also as agents for both State and smaller districts, the county in all but the New England States is a district of considerable importance in finance administration. It levies taxes and expends the proceeds for the different purposes noted above. In most States county officials act also as agents for the collection of State revenues; and frequently also for the collection of revenues of smaller local districts. In the States of the South and the far West, property is assessed for taxation by county officials; and in many other States county officers have some supervision over local assessments.

The numerous list of officials elected in each county makes the county an important election district; and it is also a unit for the canvass of votes for officials elected in larger districts, such as members of Congress and State officers. The position of the county as an election district is
indicated by the importance of the county committee in the political party organizations in many of the States.

The number of functions and by the relative importance of the county in comparison with smaller local districts, the county is of most importance in the Southern States and the Mountain and Pacific Coast States. By these tests the county is relatively of least importance in the New England States, where on one hand the judicial administration is more highly centralized, while on the other the towns are local districts of importance.

But if a quantitative standard of the intensity of county administration is applied, the relative positions are somewhat different. Judged by the per capita rate of expenditure, the county is of much the greatest importance in the States from the Rocky Mountains westward. Second rank is taken by the populous Middle Atlantic and New England States; third by the Central States, where the aggregate county expenditures are the largest. By this standard of per capita expenditure the Southern States fall in the third rank. Of the New England States — in Massachusetts, New Hampshire, and Maine, county finances are of some importance, but in the others they are negligible.

Until recently county finances were comparatively unimportant, but have notably increased since 1890. County taxation hardly doubled in the 30 years from 1870 to 1902, but in the next decade to 1913, had again doubled; and during this period county revenues and expenditures gained at about the same rate as those of the central State governments.

Nearly half of the total county receipts and expenditures are trust and agency funds, mostly taxes collected for the State and for other local authorities. County revenues and expenditures are about the same as those of the State governments; but both State and county finances are on a much smaller scale than those of the National government or cities.

The main source of county revenue is from the general property tax. There are numerous fees, which yield a considerable sum, as do also State taxes, school taxes, and local taxes for roads and loans for roads and public buildings are becoming more important.

Next to general expenses, county payments for schools are the most important, followed up largely in the Southern and far Western States; in other States school expenses are mainly borne by other local districts. Next in importance are expenses for highways and for public charities, — the latter being the largest item in the Middle Atlantic and some of the North Central States. In the New England States, the expenses of judicial administration are relatively of most importance.

County Organization. — No well-defined principle seems to have been followed in the organization of county administration, except that popular election has been extended to all classes of county officials indiscriminately. There is no authority with important powers of local legislation corresponding to the councils general of France, the county councils of England or of the local diets in Prussia. In about two States (Rhode Island and Georgia) there is a county board which usually levies local taxes and has general supervision over the local administration, though by no means an effective control over the elective officials. In two-thirds of the States these county boards are composed of three to five members, usually called commissioners and elected at large. In the others, however, the county boards are larger and include from 15 to 50 members elected by the townships and cities. Such boards of supervisors are found in New York, New Jersey, Michigan, Wisconsin and Illinois; and there are somewhat similar bodies in Louisiana under the title of police juries. In some States there are intermediate types. In a few of the Southern States (Kentucky, Tennessee, Arkansas) the fiscal and administrative business of the county is still performed by the local justices of the peace sitting as a County Court, these justices being now elected in subdivisions of the county. But these larger bodies have, as a rule, but little more legislative power than the small boards of commissioners; and their size makes them really in most cases mere courts of record.

An important exception is found in the recent legislation of Michigan, where the boards of supervisors have been given a broad and general grant of local legislative powers.

In a few States the taxation and appropriations are placed in a body distinct from the county board, as in Indiana, where there has been established (in 1899) in each county a county council of seven members in addition to the board of three county commissioners; while somewhat similar results have been secured in other ways in some of the smaller New England States. In Cook County, Illinois, and some New Jersey counties the president or chairman of the county board has some special powers. In Georgia the ordinary is the chief county officer. But this separation of powers is as yet exceptional.

Besides the county board there are a considerable number of other county officials, most of them chosen by popular election. These elective officers are largely independent within their own sphere; and there is no effective supervision either by the county board or by any one of the officials being clearly recognized as the chief executive officer of the county.

The sheriff is the chief officer of the county; but he has lost much of the power and dignity of the English sheriff. He still retains some relics of former authority as chief conservator of the peace; but for the most part is now a ministerial officer of the judicial courts, to execute their warrants and decrees. The public prosecutor has now become one of the principal county officials in some of the States; and in counties containing large cities, such as New York, Chicago, Philadelphia and Saint Louis, the importance of this office is now fully realized. In several cases it has been a stepping stone to the governorship of a State. The office of county treasurer is usually one of the most lucrative; and is important as the financial agent not only of county funds, but also as the collector of State revenues and sometimes also the revenues of local districts within the county.

Other elective county officials of less importance are the county clerks, court clerks, recorders of deeds, assessors, surveyors, and coroners. The titles of some of these officials vary in the different States. In the New England States there are comparatively few county officers; and in Rhode
Island there are only two—the sheriff and clerk of court—both of whom are chosen by the general assembly. On the other hand, there and some States additional elective officials besides those named above; and in most of the States there are also a number of appointed officials, such as poor commissioners, road superintendents and health officers.

In the United States are usually elected for terms varying from two to six years. In the older States east of the Mississippi River, the terms of different officers often vary and overlap. West of the Mississippi most of the States have a uniform term of two years for county officers, and all terms expire at the same time.

In most counties the subordinate staff is small, and subject to change with the frequent changes of the elective officers. In the more populous counties, the number of deputies, clerks and other employees is larger and of more importance; but in most cases they remain under the patronage and spoils system. The merit system of civil service has been applied to some extent only in a number of the larger New Jersey counties and a few isolated counties in other States.

There is some State administrative supervision over county school officers; and more recently in about half the States over the assessment and collection of State assessed taxes by county officials, and in a number of States over county road officers in the construction of State-aid roads. But there is no effective State control over sheriffs and prosecuting attorneys; and no general system of State supervision.

There can be no doubt that county government in the United States lacks systematic organization, and that there are too many elective offices. The numerous lists of positions and the slight importance of many of them makes impossible any real knowledge or discussion on the part of the voters of the merits and demerits of candidates. Elections, especially in the more populous counties, are usually determined by the success of one party ticket, and the effective choice is thus made in selecting the party candidate who is supposed to strengthen the influence of party machines and bosses; and in many cases county offices have been filled by politicians of the lower types. In rural counties a popular candidate may more often secure his election on personal grounds; and there have been some important cases of successful independent candidates in populous counties. But as a rule, comparatively little public attention is paid to the election of county officials. The short terms promote frequent changes and prevent the establishment of any real system in the offices, many of which are purely administrative and with no political functions. At the same time the duties of the county officials are of no little importance; and as their importance is steadily increasing, there is little serious need for decided changes in the organization of the county administration.

During the last few years there has been increased attention to the county government, especially in States containing large cities; and proposals for important changes in organization have been urged, notably in New York, New Jersey, Illinois and California. In the latter State several counties have adopted home rule charters making important changes. Under the

Los Angeles County charter, the only elective officers are the supervisors, sheriff, district attorney and justices of the peace. Other county officers are appointed by the supervisors and constables are appointed by the sheriff, all from civil service lists.

To Summarize.—The county in the United States has developed from the English county, but the organization of the county administration has been thoroughly decentralized and in fact disorganized by the radical extension of popular elections for all classes of officials. Most of the 3,000 counties are smaller in size and social importance than the principal districts of local administration in European countries; and the field for administrative action is necessarily less important in some respects. But the decentralized system of State administration adds to the number of locally elected and appointed officials in the counties. The administration of justice, roads and bridges and poor relief are the principal branches of county administration; while there is some county supervision of public instruction in most States, and the county is the main local unit for school purposes in some of the Southern and far Western States.

The principal county authority is the locally elected county board, organized in various ways, with administrative and taxing powers, but with little local legislative authority. Among the numerous other elective officials are the sheriff, prosecuting attorney and treasurer; but there is no clearly defined chief executive, and the county administration should be more systematically organized to meet the increasing importance of the functions exercised. There should also be more effective State supervision over the county officials who act primarily as agents for the enforcement of general State laws. Many counties are too small in area; and in the larger States there is need for local districts larger than the county.

Professor of Political Science, University of Illinois.

COUNTY-SEAT, the village, town or city in every county selected as headquarters for the county administration and containing the courthouse, including offices for the prominent officials and the jail. The most prominent building is frequently selected as the county courthouse in scattered farming communities. The legislatures usually select the county-seats and can change them, but west of the Alleghenies, in about half of the States, a public popular vote under constitutional provisions is required for the purpose. As county-seat the location assumes importance, being the principal—although not necessarily the largest—community in the county, concentrating there the white business; and in newly settled regions or territories there is frequently great rivalry to secure this selection, while efforts are sometimes made to have a chosen location changed.
COUNTY TRAINING SCHOOLS. See Teachers, Professional Training of.

COUP, koo (Fr. "a stroke"), a word used in certain phrases which have become almost universally familiar. "Coup de grace" (stroke of state) means an arbitrary encroachment suddenly effected by the governing authorities upon the constitution of a state, altering or setting aside the prerogatives of other parts of the body politic. The term is applied particularly to the procedure whereby Louis Napoleon placed himself as virtual dictator at the head of government in France, 2 Dec. 1851. "Coup de main" (a stroke of the hand) means a sudden and successful attack; "coup d'oeil" (a stroke of the eye), a quick comprehensive view of a complicated matter; "coup de theatre," a trick of the stage, or any striking dramatic effect; and "coup de grace," the merciful blow that puts a victim out of pain; hence a decisive or finishing stroke. In Canada the word is used to designate a war custom of the Plains Indians. The first warrior to touch an enemy or his body was credited with a coup or deed of honor. On the number of coups, the social rank of the individual depended. Consule Grinnell, "The Coup" (in American Anthropologist, 1911).

COUPÉ, koo-pâ, a four-wheeled carriage carrying two persons inside, with a seat for the driver outside. The landau, and all other compartments of a railway carriage in continental Europe.

COUPER, koo-pèr, William, American sculptor: b. Norfolk, Va., 20 Sept. 1853. He studied at the Cooper Institute, New York, and the Royal Academy at Munich. In 1875 he removed to Florence and entered the studio of Thomas Ball. In 1897 he returned to America and established himself in New York. His art is modern Italian in manner, but his beauty and technique are somewhat marred by overelaborate detail and neglect of powerful lines and planes. His management of drapery is especially good. Among his works are "Mother's Love"; "The Falconer"; "Beauty's Wreath for Valor's Brow"; the marble statue of Moses on the Appellate Courthouse, New York; "Te Deum" (a low church) and several unusually sympathetic and exquisitely executed angels for funeral monuments. His portraits include the heroic bronze bust of Prof. Thomas Eggleston, Columbia University, New York, and that of President McKinley. He won the competition for the monument to Colonel Hawkins, at Pittsburgh, Pa. Consult Taft, "History of American Sculpture" (New York 1903).

COUPLAND, William Chatterton, English philosophical writer: b. London, 2 Dec. 1838; d. 7 Jan. 1915. He was educated at Manchester New College and the University of Berlin, and held Unitarian pastorate at Bridge-water 1864-68, and at Kensington 1870-72. He was professor of mental and moral science at Bedford College for Women, London, 1881-86; first secretary of the English Goethe Society 1886-90; and has since lectured on philosophical themes. He has published "Incentives to the Higher Life" (1875); "Lectures on the Arts of Life and the Arts of the Unconscious" (1884); "The Spirit of Goethe's Faust" (1885); "Elements of Moral Science Applied to Teaching" (1889); "Gain of Life and Other Essays" (1890); "Thoughts and Aspirations of the Ages" (edited, 1895).

COUPON, koo-pön (from Fr. couper, to cut), a warrant or certificate for the periodical payment of interest on bonds issued for any term of years. The interest being payable in different cases quarterly, half-yearly or yearly, as many coupons are attached to each bond as represent the total number of such payments as are to be made, with the date of payment printed on each. When a payment of interest becomes due at any particular date the holder of the bond detaches the corresponding coupon and presents it for payment at the specified banking house or office. The term is also applied to one of a series of tickets which bind the issuer to make certain payments, perform some service, or give value for certain amounts at different periods, in consideration of money received. Each interest or dividend coupon constitutes in law a separate claim or demand and may be separately enforced. The advantage of the coupon lies in the fact that corporate coupons are of a negotiable or quasi-negotiable character facilitating their transfer. See Negotiable Instruments.

COUPON BALLOT: See Ballot.

COURBET, koor'ba', French painter: b. Ornans, Franche-Comte, 10 June 1819; d. near Vevvey, 31 March 1877. In 1850 he was sent to study law in Paris, but all the bent of his nature was turned toward art. He studied at the studio of Steuben and Hesse, but he preferred to work independently. He made himself acquainted with the Flemish, Florentine and Venetian schools; but amid all he was careful to preserve — as he phrases it — his "own intelligent and independent individuality." His first works were literary subjects, but he soon became interested in portraying live subjects. At this time he painted "The Man with a Pipe," and his own portrait with a dog. These subjects, treated broadly, were not accepted by the Salon; but were welcomed enthusiastically by the Realists. Courbet became the chief leader of this sect. He despised his critics and went so far as to exhibit independently. In 1841 he took to landscape work, painting in the forests of Fontainebleau. In 1844 he began to exhibit at the Salon; and his works created a great sensation when shown in the Salon of 1850. Among the pictures of this period are "After Dinner at Ornans," "The Stone-Breakers," "Peasants of Flazy." His hunting scenes and animal subjects and marines are especially vigorous and spirited. But he is often coarse and lacks spirituality throughout. After the revolution of 1870 he was appointed director of the fine arts. His radicalism in painting led him to attempt to promote political and social reform, to which end he wrote essays and dissertations. When Napoleon offered him the cross of the Legion of Honor, he openly refused it, and this heightened his popularity among the people. In the following year he joined the Commune, and was responsible for the destruction of the Vendôme Column (16 May). For this act, in the following September, he was sentenced to death on charges of arson. At a fine was imposed for its restoration, his pictures being sold in 1877 toward that purpose. On his release he retired to Vevvey. Several of his pictures are owned in the United States, four of
them being contained in the Boston Art Mu-
seum. The various provincial museums of
France possess many of his paintings, as do
likewise the collections of Frankfort, Cologne,
Vienna, Amsterdam, The Hague, Copenhagen
and Munich. Consult for biography and criti-
cism: Eastgirg (Paris 1874); D’Teville (ib.
1878); Van Dyke, ‘Modern French Master-
ies; Manz, ‘G. Courbet’ (in Gazette des Beaux-
Arts, Paris 1878); Muther, ‘History of Modern
Painting’ (Vol. II, London 1896, 1907); Zola,
‘Mes Haines’ (Paris 1879).

**COURBEVOIE**

koo-rbvoi, France, town in the department of the Seine, on the left
bank of the Seine, in the northwest suburbs of
Paris. In 1883 a bronze group, the ‘Monument
de la défense de Paris,’ by E. Barrias, was
erected here. It contains numerous handsome
villas; extensive barracks built by Louis XV for
the Swiss regiment, and manufactures of white-
lead, carriages, brandy and drugs. Pop. 23,765.

**COURCELLE**

koo-sel, Daniel de Rémy,
rámí, governor of Canada, 1665-72. The Mo-
hawk Indians annoyed the colony by constant
attacks, for which the governor sought to pun-
ish them by lesser executions against their
encampments. In the winter of 1666 he marched
with 300 or 400 men from Quebec to the
Mohawk Valley by way of Lakes Champlain
and George, but gained nothing as the extreme
severity of the season diminished his force.
Next year with a much larger force, and under
more favorable conditions, he had greater suc-
cess and succeeded in destroying several strong-
holds of the Indians. This invasion of English
territory caused much alarm in the New York
colonies, and Nicolls prepared vigorously to
meet it. Consult Parkman, ‘Old Regime in
Canada.’

**COEURS DE BOIS**, koo-er de bwa, or ranges of the woods. During the French
régime, numbers of the adventurous youth of
Canada and soldiers of the regular gar-
risons, subjected to the vexatious restrictions
of a paternal government, took to the woods
and lived the free life of the Indians, trading with
and frequently marrying among them. This
drain on the resources of the colony called for
the severest injunctions from the representa-
tives of Church and State, and amnesties were
offered to couriers de bois to return and engage
in agriculture, but few availed themselves of
these offers. They were, however, always loyal
to the French interest, and their alliances with
the Indians gave them great ascendancy over the
sages and kept them friendly to the
French power.

**COURIER**

koo-riør, a bearer of special
dispatches, whether public or private.
The employment of couriers is of great antiquity.
There was a very complete organization of them
in the ancient empire of Persia. They were also
used by the Greeks and Romans. In the Mid-
dle Ages each sovereign employed a staff of
couriers, while the nobility in France and Eng-
land also engaged professional runners called
étourds. In the 14th century, the Electors of
England. In Germany and Spain toward the
middle of the 15th century the couriers were
given permission to carry unofficial letters.
Couriers who act as guides to and attendants on
travellers are common on the continent of Europe,
and are useful to those having much
baggage or unacquainted with the foreign
languages and moneys. Their special duty is
to make all arrangements for journeys, and to
relieve their employers as far as possible of
anxiety about passports, exchange of money,
hotel negotiations and the like. The ability to
speak several languages is therefore of the
many important qualifications to a good courier.

**COURIER DE MÉRÉ,** koo-rér dé mér, Paul Louis, French Hellenist: b. Paris, 4 Janu-
ary 1772; d. near Veretz, Touraine, 10 April 1825.
He was a pupil in the artillery school at
Châlons and served in the army 1792-1809.
In 1813 he made an elegant translation of ‘Daphnis
and Chloe,’ an ancient romance by Longos,
discovered by him at Florence; he also trans-
lated ‘The Lucid, or the Ass of Lucius of
Phatras,’ published with the Greek text (1818).
His numerous pamphlets, especially his ‘Les
pamphlets des pamphlets’ (1824), are master-
pieces of style, of marvelous conciseness and
noteworthy documents for the history of the
ancient political and ecclesiastical contentions.
He was assassinated shortly after the publica-
tion of this work. His ‘Œuvres complètes’
were published in four volumes in 1825 on
his life by Armand Carrel (Paris 1830;
de Paul-Louis Courier, étude sur sa vie et ses
œuvre de 1772 à 1812.’ The same author has
also published a critique of his style. Consult
also Schwab, ‘Vie politique de P.-L. Courier’
(Mercure de France 1909); Sainte-Beuve,
‘Causeries du Lundi’ (Vol. VI, 1857-72).

**COURLAND,** Duke of. See BIREN,
ERNST JOHN.

**COURLAND,** or KÜRLAND, Russia, a
province on the Baltic, bounded north by Livo-
nia and the Gulf of Riga, west by the Baltic,
south by Kovno and east by Vitebsk; area,
10,535 square miles. In the neighborhood of
Mitau, the capital, the surface is diversified
generally by hills of very moderate height; but elsewhere,
and particularly toward the coast, it is flat and
contains extensive sandy tracts. About one
fifths of the whole province is occupied by
forests; and there are many small lakes. The
principal rivers are the Aa and the Windau;
the latter is connected with the Niemen by a
canal. Agriculture and cattle raising form
the chief occupations of the inhabitants, but many
are engaged in fishing. The industrial establish-
ments include distilleries, breweries and facto-
dories for tobacco, metals, wool and leather.
Letts form the largest constituent element in
the population, there being also Germans, Jews,
Russians and Poles. The climate is moist, and
the winters very cold. The prevailing religion
is Lutheran. Courland was anciently a part
of Livonia, and, like the latter, was conquered in the 13th century by the Teutonic
Order. It was subsequently united with Sem-
gall, and, under the name of the Duchy of
Courland, the two provinces became a fief of
Poland. The duchy, however, was governed by
its hereditary dukes till 1739. The 9th duke,
Frederick William, espoused, in 1741, Anna
Ivanovana, Princess of Russia, who, after his
death, maintained possession of the duchy; but the
government of it was entrusted to Prince
Ferdinand, brother of the deceased duke. On
the death of Ferdinand in 1737 the Estates, in
consequence of the influence of the Empress
of Russia, elected to succeed him her favorite and grand chamberlain, Ernest John Biren, who was exiled to Siberia in 1740. In 1762 the Emperor Alexander offered Russia 10,000 rubles to hire the duchy in his absence, was declared by the Estates the only legitimate duke. In 1769 he transferred the duchy to his son, at whose death the Estates of Courland solicited a union with the Russian Empire. Catharine consented, and by an edict of April 1795, secured to the inhabitants all the privileges which they had enjoyed under their princes and all the rights of their other subjects. In 1818 the Emperor Alexander sanctioned the charter of the nobility of Courland, which declared the peasants free, and regulated their relations to their former lords. Libau is the chief commercial city. During the Great European War, a large part of the province was in German occupation, and was the base of attacks against Riga. Pop. 749,100.

COURNOT, koo-rôô, Antoine Augustin, French economist and mathematician: b. Gray 1801; d. Paris 1877. He was appointed professor at the Faculté de Lyon in 1834; was made director of the national library in 1835, and of that of Dijon in 1834. He did important work in philosophy in relation to the adjustment of rational processes to inanimate nature and the resultant insufficiency of the former as a means for the analysis of vital phenomena. Cournot's fame, however, is founded principally on his mathematical researches relative to the theory of probabilities, which he sought to apply both to natural philosophy and to political economy. He simplified the theory of the supply and demand and discovered the theory of monopoly price now generally held by economists, and elucidated many other economic theories in regard to public finance. His greatest service, perhaps, was his application to the problems of the statistics of the mathematical theory of probabilities. He is the author of 'Traité de l'enchaînement des idées fondamentales dans les sciences et dans l'histoire' (1861); 'Principe de la théorie de la richesse' (1863); 'Des institutions d'instruction publique' (1864); 'Considérations sur la marche des idées et des événements dans les temps modernes' (1872); 'Matérialisme, vitalisme, rationalisme,' etc. (1875); 'Revue sommaire des doctrines économiques' (1877).

COURSER, a bird of the genus Cursorius, belonging to the family Glareolidae of the order Charadriiformes (waders), closely allied to the plovers, characterized by a decurved bill as long as the head, arched mandibles compressed toward the extremities, basol oval nostrils with an oblong lateral opening and long whitish legs with three separated front toes, the middle one longest and armed with a serrated claw. They are found chiefly in Africa and Asia, on arid inland tracts, along which they run with great swiftness. One of the species, called the black-bellied courser (C. temminckii), is eight inches long, and generally of a cream-colored breast and rump; the upper part of the head is white and black on the quills and middle of the body. One of the best-known species is the cream-colored courser, or swift-foot (C. gallicus), found almost exclusively in the East, although it has been seen as an occasional visitor in western Europe.

COURSING, a kind of sport in which hares are hunted by greyhounds, which follow the game by sight instead of by scent. Courising is a very old sport, but in modern times it has been considerably modified in various ways, mainly through the influence of the English coursing clubs, which began to be formed in the latter half of the 18th century. The first coursing club, the Swaffham, being founded in 1776. These clubs in 1858 formed a central body called the National Coursing Club, which now controls the whole sport. In 1882 the 'Greyhound Stud Book,' a genealogical record, was started, and dogs without pedigrees entered in that book, are not now allowed to compete. Meetings are held in various localities, at which dogs are entered for a variety of stakes, as horses are at a race-meeting. The 'blue ribbon' of the coursing year in England is the Waterloo Cup, run in the Altcar meadows, near Liverpool, for which 64 dogs compete.

This pastime has become immensely popular in the western United States, and under the supervision of the National Coursing Board large meets annually take place in the open country of the two Dakotas, Kansas, Nebraska, Iowa and Minnesota, where hares are plentiful. The contests take place in practically the same way as in England and under similar rules. Two dogs, however, are two in each leash, in the care of a 'slipper,' who lets the dogs slip upon orders from the judge, when a hare has been sighted. The judge follows the dogs, and gives 'points' to each according to the cleverness of its individual work. It may so happen that the dog which actually kills the hare may not be adjudged victor, because the other dog may have made the most points during the course. The following is the scale of marks: (1) For speed, according to the dry weight of the hares of good quality; (2) two or three points. (2) For the 'go by' (the starting of a greyhound a clear length behind its opponent, passing him in a straightaway run and obtaining a clear length's lead), two or three points. (3) The 'turn' (a sharp turn of not less than a right angle in the hare's course when pressed by a dog), one point. (4) The 'wrench,' a change of less than a right angle in a hare's course when pressed, half a point. (5) The 'kill,' two points or less. (6) The trip, an unsuccessful effort which throws the hare off its legs; or the getting so close to the hare as to snatch the hare and lose hold, one point, more or less, in the judge's discretion. One course will often traverse three miles before a kill is made. The cavalcade of sightseers is kept in a line behind the coursing hares and hounds by the steward. Consult Macpherson, H. A., 'Coursing the Hare' ('Fur and Feather Series'); Earl of Suffolk, 'The Encyclopedia of Sports and Games' (London 1911).

COURT, koor, Antoine, French Protestant clergyman: b. Villeneuve-de-Berg, Ardèche, France, 17 May 1666; d. Lausanne, Switzerland, 13 June 1760. He was one of the most prominent Protestant leaders of his time and is commonly regarded as the restorer of the Reformed Church in France and the founder of
the "Church of the Desert." At the age of 17 he began to address secret assemblies of persecuted Calvinists. Later, he maintained that the only way to maintain the religion was by organization rather than by the inspiration of zealots, he devoted his life to the building up of regular churches in the various small communities. To this end he summoned a synod of all the preachers in the Cevennes and lower Languedoc at Monoblet. A regular church system and rules were agreed upon. Pierre Cortelye received ordination at Zrich, and by him Court was likewise ordained. Persecutions broke out again in 1724, and Court fled to Lausanne (1730). There he labored incessantly for the founding of a college, of which he was the director and chief pillar for the rest of his life. From this college emanated the pastors of the Reformed Church of France. Court collected documents for a study of Protestantism in France, but his work was not completed and the materials are still preserved at Geneva. His best work is the 'Histoire des troubles des Cevennes ou de la guerre des Camisards' (1751); consult Hugues, 'Antoine Court' (1872); Baird, 'The Huguenots and the Revolution of the Edict of Nantes' (1885); Peyrat, Napoleon, 'Histoire des pasteurs du dsert' (1842, Eng. trans., 1852); Haag, E. and E., 'La France protestante' (Vol. IV, new ed. 1884).

COURT. Although the word *court* is used as descriptive of the household of a reigning monarch and in connection with the official functions of royalty, it is now almost exclusively used in the United States and European countries in connection with judicial tribunals. The objects and powers of these judicial tribunals called courts in English-speaking countries, and probably in all lands where such institutions are free and independent of the executive, are: (1) The preservation of personal liberty, the enforcement of the criminal and penal laws, and the punishment of all infractions thereof, and the conservation of the public peace, order and safety; (2) the preservation of property rights, the adjudication of disputes and controversies between individuals, corporations and states, and the determination of all kinds of legal actions commonly known as suit in law.

The establishment of law courts, the growth and gradual increase of their jurisdiction and power has marked, step by step, the advance of civilization, the increase of personal liberty, the rights of individuals to enjoy and to hold property, and to maintain suits for the preservation and enforcement of their civil liberties and the free and unrestrained enjoyment of their personal and real property. Almost every gain in these directions made by the courts of Great Britain in the increase of their authority and jurisdiction has been attended by individuals of increased liberty and the enjoyment of their property rights, coupled with the curtailing of the prerogatives of the king, springing from the acquisition by the people of some great charter enlarging their liberties.

The English Courts.—In very early days in England and in many of the European countries, all of the power and jurisdiction now held by the law courts was vested in and exercised by the king or the executive ruler, commonly described as the throne. This was also true in the primitive administration of law among the ancients. Such judicial powers were exercised by the executive in early Rome and were delegated to many of the subordinate officers. In the states of Greece the king or chief magistrate was not alone a military leader, but was also the chief judge of peace, as is the case now in Oriental autocracies where the sovereign appoints deputies to act as judges subject to his right of review on appeal. This is the system in vogue at the present time in Persia and Turkey, where the deputies of the shah and the sultan respectively govern the various states and administer the laws. The early English kings held almost absolute judicial power; they were to all intents and purposes courts of law. The sole executive and judicial authority over whatever law there was, free from the will of the king, vested in his person and was exercised by him to such an extent that individual ownership and personal liberties were subordinated to his absolute whim and caprice. As a legal fiction the king was considered, even after 1215, as acting with the consent of the great barons and of the feudal nobility, in the exercise of his judicial powers. The Great Charter was a large measure of independence, the head of the court, and in such sense the king is so treated purely as a matter of fiction at the present time in England, for in that country and throughout Great Britain all writs run in the name of the king. That the administration of justice was one of the prerogatives of the English king in early times is clearly shown by the fact that the king himself sat on circuit even as late as the rule of Edward IV. Regular courts had then been established but authority was still vested in the king to participate personally in the business of the courts. King James I exercised what has been frequently termed the last judicial act of an English monarch when he settled the controversies between the courts of law and the Court of Chancery.

The first step toward the separation of the executive and judicial powers as jointly vested in the king came when King John was compelled to sign the Magna Charta, or Great Charter, in 1215. By the Great Charter the inconvenience caused by the court following the king's person was remedied, as far as private litigation was concerned, by the provision that *communia placita—common pleas—should be held at some fixed place, and it was in this way that the Court of Common Pleas was established in England and that the independence of the courts became a vested right of the people.

John Richard Green, in his 'History of the English People, after commenting on the vagueness of some of the provisions of the Great Charter says: "But all vagueness ceases when the Charter passes on to deal with the rights of Englishmen at large, their right to justice, to security of person and property, and to good government." He also writes: "A memorable article that lies at the base of our whole judicial system ran. 'No Freeman shall be seized, or imprisoned or dispossessed, or outlawed, or in any way brought to ruin; we will not go against any man or send against him, save by legal judgment of his peers, or by the law of the land.'"

Another section of the Great Charter reads as follows: "To no man will we sell or deny, or delay, right or justice."

In summing up the beneficial effects of the
Great Charter, Mr. Green writes: "The great reforms of the past are now formally recognized; judges of assize were to hold their circuits four times in the year, and the king's court was no longer to follow the king on his wanderings over the realm, but to sit in a fixed place.

During the reign of Edward I judicial reforms of great importance were brought about. The King's Court was divided into three distinct tribunals: (1) The Court of Exchequer, which took cognizance of all cases in which the royal revenue was involved, and was, so to speak, the judicial arm of the Exchequer. (2) The Court of Common Pleas, for the trial of suits between private persons. (3) The Court of King's Bench, which had jurisdiction in all matters that affected the sovereign as well as in pleas to the Crown, or criminal cases that were expressly reserved for his decision. Each of these courts was provided with a distinct staff of judges.

Another judicial reform of even greater importance was the establishment, in the reign of Edward I, of the Court of Common Pleas, as a distinct court side by side with that of the common law. By this measure was brought into existence the equity side of the court, and by it the courts were enabled to give more adequate relief in many cases where former courts could not. The King, as above stated, the judicial power vested, delegated his judicial authority to the several courts of law by means of a "writ." No case could be instituted in a court of law except by the purchase of the proper writ. The common-law courts acquired jurisdiction in each particular case by virtue of the writ, which could only be issued in cases already provided for and found in the registry of writs, or by the statute of Westminster II. By a narrow construction of the statute of Westminster II, the writs issued by the clerks failed to give proper redress, and often, because of technicalities, no redress at all. Perhaps it was not always intended that they should give complete remedy because that meant simply a residuum of judicial power remaining with the king, not as yet delegated to any of the courts. Hence, applications for relief were allowed to be made to the king, or what amounted to the same thing, to his chancellor. The litigant would go to the chancellor, tell him that the writ issued by your clerk does not suit my case. Your clerk says he has no other writ to sell me. Writ or no writ, I appeal to you for justice." This was in substance the petition addressed to the chancellor, who, besides being the keeper of the king's seal and his secretary, was also known as the keeper of the king's conscience, and in constant attendance upon his person. Ways and means were devised for granting relief in cases where the common-law writs had failed. In this way grew up a form of relief and a system that has evolved during the centuries into what is now known as the equity jurisprudence. After the establishment of parliamentary government, the courts took their law from the legislative enactments that were then or were to be, and were widened and increased by the many legislative acts that were adopted from time to time.

The judges of all the courts were appointed by the king and could be removed by him at will, until during the reign of William III (1701), it was enacted that the commissions of the judges should be quamdam se bene pesserrint instead of durante bene placito, as formerly, and they could be removed only by an address to both Houses of Parliament. The chancellor, who presided over the equity jurisdiction, became subject to removal by the king at pleasure, his office being by political tenure.

It will accordingly be seen that it was not until the tenure of judicial office was made independent of the king and the separation of the judiciary from the executive was made effective, that the independence and power of the courts of justice were established; and it was not until these reforms were brought about that the courts were organized and firmly established under the system which prevailed for two centuries prior thereto and so continued until modified by the Judicature Act of 1873.

Prior to the Judicature Act of 1873, the superior courts of England consisted of the common-law courts; namely, the Court of King's Bench (called Queen's Bench in the reign of a queen), the Court of Common Pleas, and the Court of Exchequer. These three courts were of about the same importance and rank, although the Court of King's Bench was looked upon as having a pre-eminence, because the chief justice of the court was styled the Lord Chief Justice of England. In addition to these common-law courts, there was, on the equity side, the High Court of Chancery. Other courts were the Admiralty, Probate and Divorce Courts, and the London Court of Bankruptcy. There was also a court known as the Judicial Committee of the Privy Council, and the Court for the Consideration of Crown Cases Reserved. The House of Lords exercised the highest appellate jurisdiction.

By the Judicature Act of 1873, which went into effect in 1875, there was established the Supreme Court of Judicature, consisting of two permanent divisions; one division, under the name of the High Court of Justice, has and exercises original jurisdiction in proceedings formerly brought in the common law, equity, admiralty, probate, divorce and bankruptcy courts. This court also exercises certain appellate jurisdiction from inferior courts. This act, which created a Supreme Court, tells us simply that the administration of law and equity concurrently. Every court has power to grant whatever form of relief the nature of the case may require, whether legal or equitable.

The High Court of Justice is divided into sections named after the old courts; namely, the Court of Chancery, the King's Bench, the Court of Exchequer and the Probate, Divorce and Admiralty Division. The Chancery Division's main work is the equity business, but its powers are not confined to any particular subject matter. The King's Bench Division tries civil cases, with or without a jury, exercises criminal jurisdiction and has appellate jurisdiction from County Courts and magistrates. The Probate, Divorce and Admiralty Division decides as to the validity of wills, handles divorces and manages the admiralty business.

The Chancery Division consists of five justices, with the Lord Chancellor as president; the King's Bench Division consists of 14 justices and the Lord Chief Justice as president; and the Probate, Divorce and Admiralty Di-
vision consists of two judges. The criminal jurisdiction of the court is exercised entirely by the King's Bench Division.

The other division of the Supreme Court of Judicature was established under the name of the Court of Appeal. The Court of Appeal has appellate jurisdiction, with such original jurisdiction as may be deemed necessary to dispose of cases on appeal. It consists of four ex officio judges and five ordinary judges, appointed by letters patent. The Court of Appeal is the superior court of record, and the highest court of appeal except the House of Lords. In hearing ecclesiastical appeals the court is composed of judges and assessors, the latter being archbishops or bishops of the Church of England.

In addition to these high courts of England there are many inferior courts of criminal and civil jurisdiction. The lowest of criminal courts is that of a Justice of the Peace, sitting singly; sometimes the Justices of the Peace, two or more sitting at the same time, constitute a Court of Petty Sessions and may dispose in a summary way of minor offenses. Justices at the Court of Quarter Sessions are commissioned to determine felonies and other offenses, not including treason, murder, forgery and bigamy. These and other more serious offenses are reserved for the superior courts. The Assize Courts, so called, sit in general in each county twice a year. Sometimes several counties are united together for the Assize Court. In London there is a high criminal court known as the Central Criminal Court, and there are many inferior criminal courts known as Police Courts. The Court of King's Bench has general supervision over all criminal jurisdiction and all criminal courts.

There are a number of civil courts of inferior jurisdiction, in which small claims may be litigated. These are the County Courts and the Borough Courts of Record. The County Courts are of ancient origin, but have been reconstituted and changed from time to time. Their practice and jurisdiction is now regulated by the County Courts Act of 1888.

The civil courts at the present time are the County Courts, the Borough Courts of Record, the High Court of Justice, the Court of Appeal, the House of Lords, and the Judicial Committee of the Privy Council.

The Judicial Committee of the Privy Council hears appeals in ecclesiastical matters and also from the colonies.

The House of Lords: Appeal still lies to the House of Lords, to the judicial body known by this name, not to the legislative assembly.

The criminal courts now are the Magistrate Courts, the Borough Courts of Quarter Sessions, the Assizes, the Central Criminal Court, the King's Bench Division of the High Court of Justice and the Court for the Consideration of Crown Cases Reserved.

The Court for the Consideration of Crown Cases Reserved is at present the only criminal court provided by the Federal Constitution and created and deriving their powers from Congress, and of the courts of the several States, created by the States and provided with laws by the legislatures of the several States. All of these courts follow the common law, except where it has been repealed or statutory laws provided in the place of the common law. The judges of the Federal courts, including those of the Supreme Court of the United States, are appointed by the President, with the consent of the Senate. The judges of the Federal courts hold office during good behavior, their appointment being for life. The Supreme Court of the United States, while having original jurisdiction in certain specified cases, is the highest court of appeal. The Federal courts are usually spoken of as the "United States Courts."

Federal Courts.—The Federal courts at present are the District Courts, the Circuit Courts of Appeals, the Court of Claims, the Court of Custom Appeals and the Supreme Court of the United States.

The United States is divided into judicial districts, which districts comprise a State or Territory or a portion of a State, it being necessary to divide the largest States into several districts. By the Judicial Code of 1911, each district is provided with a District Court, for which there is appointed at least one judge, who is called a District Judge and who receives a salary of $6,000 a year. These District Courts exercise equity, common law, criminal, admiralty and bankruptcy jurisdiction. Their jurisdiction covers suits when the matter in controversy exceeds $3,000 and arises under the Constitution or the laws of the United States, or under treaties, or between citizens of different States, or between citizens of a State and foreign states, or citizens of foreign states; all suits brought by the United States; all crimes and offenses under the laws of the United States; admiralty and maritime causes; all prizes brought to the United States; all cases under the internal revenue, custom and tonnage laws, under the postal laws, under patent, copyright and trade-mark laws; all cases under the interstate commerce laws, immigration laws and bankruptcy proceedings, and suits against trusts and monopolies. District Courts existed prior to 1911, but they were of limited jurisdiction. By the Act of 1911, the District of Columbia, which was not constitutionally a State, became the court of original jurisdiction in the respective districts.

The other Federal courts are the Court of Claims, the courts of the District of Columbia, the Territorial Courts and the Court of Custom Appeals. The Supreme Court of the District of Columbia has jurisdiction corresponding to that of the State courts and similar to that of the Federal District Court. It consists of a chief justice and associate justices. The District of Columbia has a Court of Appeals.

The Court of Claims consists of five judges and has authority to hear and determine all claims against the United States, founded upon any law of Congress or regulation of the executive department, or upon any contract, express or implied, entered into with the government. It can also be called upon to determine claims which may be referred to it by Congress, also all set-offs, counterclaims, claims of damage or other demand whatsoever on the part of the government against third persons, or for making claims against the government in that court.

The Court of Custom Appeals consists of
five judges and has jurisdiction on appeal as to the laws and regulations of customs revenues and duties.

Territories of the United States, including Porto Rico and all the Territories acquired by the United States as the result of the Spanish-American War, have been provided with a court, usually called the District Court, with general jurisdiction similar to the State courts. Most of the Territories are also provided with a Supreme Court, which exercises appellate jurisdiction, although, for some of the Territories, provision is made for an appeal to one of the Circuit Courts of Appeals.

In 1910 there was established the Commerce Court to hear appeals in cases affecting the interstate commerce laws. This court was abolished in 1913.

Circuit Courts of Appeals.—The United States is divided into nine judicial circuits. Each circuit comprises several States. In 1891 there was established in each circuit a new court called the Circuit Court of Appeals. These nine new courts were given only appellate jurisdiction. There had existed prior thereto in each circuit a Circuit Court which exercised an extensive original jurisdiction and also an intermediary appellate jurisdiction over the then existing District Courts. The Circuit Courts of Appeals were established for the purpose of relieving the Supreme Court of the United States, in which court there was such an accumulation of appeals that a case could not be heard for years, and for the purpose of expediting the determination of cases, thereby more speedily rendering justice to litigants. These courts have admirably accomplished the double purpose which caused their creation.

All appellate jurisdiction was finally taken from the original Circuit Courts, thereby removing a source of delay in the determination of cases, and in 1911 the Circuit Courts were abolished, and the District Courts, then constituted, were given the original jurisdiction possessed by the Circuit Courts.

A Circuit Court of Appeals consists of three judges, two of whom constitute a quorum. There are appointed by the President circuit judges for each circuit, and each circuit has on its payroll three circuit judges. The term of office is seven years. Most of the circuits have three circuit judges, but provision is made by the statute for district judges also to sit on the bench of the Circuit Court of Appeals; it being expressly provided, however, that no district judge can hear in the Circuit Court of Appeals any case which he decided in the District Court.

The Chief Justice and associate justices of the Supreme Court are each assigned to a circuit and are competent to sit as judges of the Circuit Court of Appeals. This right is rarely, if ever, exercised by the Supreme Court justices.

The Circuit Courts of Appeals exercise appellate jurisdiction from the district and other courts.

The decision of the Circuit Court of Appeals is final in all cases where jurisdiction is dependent upon diversity of citizenship, in patent, copyright, revenue, criminal and admiralty cases. By the making of their decisions final, relief was afforded the Supreme Court in a certain class of cases. In other orders, however, that full and complete justice may be done, whenever special cases arise, requiring further and special consideration, provision was made by Congress for a hearing of any such cases by the Supreme Court; it being provided that the Circuit Court of Appeals may certify any question of law concerning which it desires the instruction of the Supreme Court. The Supreme Court may order any case to be certified to it by the Circuit Court of Appeals for review and determination.

The jurisdiction of the Supreme Court in constitutional cases has not been disturbed. An appeal, therefore, can be taken direct to the Supreme Court from the District Court in any case involving the construction of the Constitution of the United States, in any case in which the constitutionality of any law of the United States, or the validity or construction of any treaty is involved, and in any case in which the constitution or law of a State is claimed to be in contravention of the Constitution of the United States.

As the Federal as well as the State courts are the outgrowth of the English system of judicial tribunals, drawing their precedents from the common law, and being in a measure, so far as practice and precedents are concerned, a continuation of the English colonial courts, prior to the American Revolution, they have an equity and common-law side.

State Courts.—The several States of the Union have a system of courts similar in many respects to the Federal courts and those of England. Each State has a court of last resort, which hears and determines all questions of law and equity on appeal from the trial court. The highest court in most of the States is named the Supreme Court, although in many of the States, like New York, for instance, the court of last resort is the Court of Appeals, the Supreme Courts in the State of New York being trial courts, similar in jurisdiction to the Superior or Circuit Courts in many of the States. The judges of these State courts are elected for a term of years by popular vote, like other officers. The State courts have a separate criminal and civil jurisdiction, and the court of final appeal in each State settles all questions on appeal except where a violation of the Constitution of the United States is set up.

Each separate State has its probate and other minor courts, and disposes of crimes and civil actions committed within the county. The counties and towns in each county have justices of the peace and minor courts of limited jurisdiction, like those in the English system, which dispose of minor offenses and determine civil actions. The justices of the peace are usually committing magistrates, who issue warrants of arrest, hold preliminary hearings and commit offenders to await the action of the grand jury or the disposition of their cases by courts higher in criminal jurisdiction.

In the large cities and towns there are many police magistrates and justices of the peace to perform the same duties. In some towns and cities the magistrates and police justices are elected, and in others they are appointed by the mayor, as is the case in New York. There are also in each city minor courts which hear and determine civil actions.

Where a prisoner is held by a magistrate for trial, and is subsequently indicted, he or she is placed on trial on the indictment found, in a court of record of criminal jurisdiction, and, upon conviction, appeals in capital cases directly
to the court of last resort. The decision of the court of last resort is final unless an infraction of the Constitution of the United States is alleged, and the cause is brought before the Supreme Court of the United States. In case the Supreme Court of the United States finds that a constitutional right has been violated, it orders a new trial of the prisoner. In the event of a decision adverse to the prisoner the sentence imposed by the trial court is carried out.

A similar rule follows in cases of civil suit where the final appeal is taken to the Supreme Court of the United States. Such appeals from the State courts to the Supreme Court of the United States usually go up on a writ of error. There are, however, in many of the State courts intermediary courts of appeal, as, for instance, in the State of New York there is the Appellate Division of the Supreme Court, which disposes of many appeals, and from whose decision there is no absolute right to appeal, except in those cases provided for in the Code of Civil Procedure of the State of New York. For instance, an appeal may be taken as a matter of right to the Court of Appeals where there is directly involved the construction of the constitution of the State of New York or that of the United States, or where one or more of the justices of the Appellate Division dissents from the decision of the court.

New York Courts.—In the State of New York the trial courts for civil actions are the Supreme Courts; the Court of Claims; the County Courts in each county, except New York; the Surrogates' Courts in each county; the City Court of the City of New York and the City Courts of certain other cities; Courts of Justices of the Peace in each town and in certain cities and villages (none in New York city); the Municipal Courts of the City of New York and of several other cities.

The trial courts for criminal matters in the State of New York are the Courts of General Sessions, for capital cases and other felonies and also misdemeanors; the Courts of Special Sessions, for cases of misdemeanors and such cases as are specially directed to be tried in such courts; County Courts, with both criminal and civil jurisdiction; Magistrates' Courts and Courts of Justices of the Peace.

As the city of New York, second to London, is, probably, the home of more courts than any other city in the world, a brief résumé of the courts of the city of New York may not be out of place here. The borough of Manhattan, of the city of New York, contains the largest judicial system of the metropolis; the same system is carried out in the other boroughs of the city, the number of parts in the courts in those boroughs being, however, considerably less in number.

There are 18 Trial Terms and eight Special Terms of the Supreme Court sitting in the borough of Manhattan; all these parts, with the exception of one (Trial Term, Part I, Criminal Term) sit or are housed in the County Courthouse, known also as the Supreme Court House. The two parts of the Surrogate's Court sit in the Hall of Records.

The jurisdiction of the Supreme Court of the State of New York in law and equity includes "all the jurisdiction which was possessed and exercised by the Supreme Court of the Colony of New York, at any time, and by the Court of Chancery in England on the 4th day of July, 1776; with the exceptions, additions and limitations, created and imposed by the Constitution and laws of the State of New York; and the exceptions and limitations, the Supreme Court of the State has all the power and authority of each of these courts, and exercises the same in like manner." Certain courts, known as the Courts of Common Pleas, the Superior Courts and the Court of Oyer and Terminer, the latter a criminal court, were abolished 31 Dec. 1895, and their jurisdiction transferred to the Supreme Court.

Special terms for the hearing of litigated, non-enumerated motions (Special Term, Part I) and for ex parte business (Special Term, Part II) are held in the County Courthouse in the borough of Manhattan every court day in the year.

Special Terms for the hearing of equity cases and enumerated motions are held each month in all or several of the special parts, beginning on the first Monday of each month, except in the months of July, August and September.

Trial Terms, for the trial of jury cases, are held in all or in nearly all of the trial parts at the County Courthouse, each month, beginning on the first Monday of each month, except in the months of July, August and September. Trial Term, Part I, for the trial of criminal cases is held at the Criminal Courts Building.

The Appellate Division of the Supreme Court.—This court holds its sessions in the Appellate Division Courthouse. There is but one term each year; this term usually begins on the first Monday in October and lasts through the month of June, with short recesses. Its jurisdiction is appellate and is final, except in cases duly certified by it to the Court of Appeals.

The Appellate Term of the Supreme Court sits in the County Courthouse. It is presided over by three justices of the Supreme Court who are designated for that purpose by the justices of the Appellate Division sitting in the First Department. This court hears appeals from judgments and orders of the Criminal Court of the City of New York and of the Municipal Court of the City of New York, Borough of Manhattan. An appeal may be taken to the Appellate Division from a decision of the Appellate Term if the justices of the Appellate Term or a justice of the Appellate Division in the same department allows the appeal.

Surrogate's Court.—The Surrogate's Court for the borough of Manhattan, county of New York, has two parts or terms, a Trial Term and a Special Term. All contested probate proceedings must be disposed of at the Trial Term. Motions may be heard at the Special Term. The court has the power to take proof of wills, to admit wills to probate and to revoke probate; to grant and revoke letters testamentary and of administration, to direct and control the conduct and settle the accounts of executors and administrators; to administer justice in all matters relating to the affairs of descendents, according to statutory provisions.

City Court.—The City Court of the City of New York holds its sessions in the brown stone building, known as No. 32 Chambers street, borough of Manhattan, city of New York. The jurisdiction, in general, of this court is
limited to the sum of $2,000. Process of this court must be served within the boundaries of the county, except the Supreme Court, it has a number of Trial and Special Terms. The court was formerly known as the Marine Court and still has jurisdiction in certain specified causes of action known as marine causes (Code, sec. 317).

The Old Municipal Court of the City of New York corresponds to a court of a Justice of the Peace in other sections of the State of New York; it has, however, no criminal jurisdiction. It has jurisdiction, with certain exceptions, of actions where the amount involved in the summons does not exceed $1,000, exclusive of interest and costs; also of summary proceedings authorized by the Code of Civil Procedure to recover the possession of real property situated wholly or partly within the district where the application is made. The city of New York, that is the Greater New York, is divided into 24 districts, in each of which a session of the court is held. Nine of the districts are within the borough of Manhattan, and in this borough the courts sit every court day during 10 months of the year; during the summer months of July and August the court is held only on such days as the justice presiding in each district designates.

The criminal courts in the borough of Manhattan, city of New York, are as follows: Trial Term, Part I, of the Supreme Court; the Court of General Sessions of the Peace; the Court of Special Sessions of the Peace; the Children's Court of the City of New York; and the City Magistrates' Court.

The first named court, namely, Trial Term, Part I, of the Supreme Court, has jurisdiction to try all crimes and misdemeanors triable within the county of New York and to deliver the jail of the county, according to law, of all prisoners therein. The court sits in the Criminal Court Building. It has, apparently, become the custom to send to this court for trial cases which are considered of great importance or which are expected to take a long time for the trial.

The Court of General Sessions sits in the Courthouse; it is divided into six parts; there are seven judges, who sit in rotation and who are called Judges of the Court of General Sessions. The six parts have co-ordinate jurisdiction. Each part may be held each month and continue as long as the public interest may require. This court has power to hear, determine and punish all crimes which are triable in the county of New York, including crimes punishable by death or imprisonment for life. Every person convicted in this court of a capital offense has an absolute right of appeal.

The Court of Special Sessions holds its sessions in the Criminal Court Building. There are six parts and 11 justices. Three justices sit in each part. There are no jury trials in the city of New York. The first part of the Supreme Court, before the committing magistrate, has the right to elect whether he shall be tried in this court or in the Court of General Sessions; if he elects to be tried in this court, his election must be in writing. Part VI of this court is known as the circuit part and sits in whatever county of the Greater New York city the press of business may require. The Court of Special Sessions has in the first instance exclusive jurisdiction of all misdemeanors committed within the county, except the Supreme Court.

The Children's Court of the City of New York.—This court is presided over by five judges, one sitting in each of the five counties or boroughs of the city of New York. In the borough of Manhattan the court is held every day in the week, with the exception of Sundays and legal holidays.

City Magistrates' Courts.—These courts are presided over by 42 magistrates; they are divided into two boards, one for the boroughs of Manhattan and the Bronx, the other for the boroughs of Brooklyn, Queens and Richmond. The magistrates are appointed by the mayor. Twenty-three reside in the boroughs of Manhattan and the Bronx. Twelve parts sit in the borough of Manhattan. These courts have jurisdiction to summarily punish those charged with petty offenses and to commit or hold others to await the action of the grand jury. Parts of this court are known as the Women's Night Court, the Men's Night Court, the Domestic Relations Court, the Traffic Court and the Municipal Term. The trial of the criminal matters are referred to the various parts.

Supreme Court of the United States.—The Supreme Court of the United States, created in 1789 after much discussion and consideration and supreme Court, Supreme Court of the United States, has jurisdiction over all cases affecting ambassadors, other public ministers and consuls, and those actions in which a State is a party. It has appellate jurisdiction, which is final, and from its decisions there is no appeal. It even has the power to declare void acts of Congress, or of the States, which it finds in conflict with the Federal Constitution. This great court has always upheld the national character of the Federal government, and has, while indicating the national policy, carefully guarded the reserved rights of the several States. Its decisions have not been confined to narrow questions of commercial law, but have interpreted the Constitution and established the welfare of the nation. Within the great powers exercised by it, it restricts congressional acts to constitutional limits. Its jurisdiction extends over sovereign States as well as over the humblest of its citizens. It has power to annul the statutes of any State in the Union whenever any such statute violates the Constitution and is in violence to civil right, the contracts, the currency or the internal interests of the people.

Hampton L. Carson, in his 'History of the United States Supreme Court,' says: "The establishment of the Supreme Court of the United States was the crowning marvel of the wonders must be enjoyed by the American people. In truth the creation of the Supreme Court with its appellate powers was the greatest conception of the Constitution. It embodied the loftiest ideas of moral and legal power,
and although its prototype existed in the superior courts of the various States, yet the majestic propriety and which the court became sublime. No product of government, either here, or elsewhere, has ever approached it in grandeur. Within its appropriate sphere it is absolute in authority. From its mandate there is no appeal. Its decree is law, and its decisions, whether right or wrong, carry the moral influence it outranks all other judicial tribunals of the world. No court of either ancient or modern time was ever invested with such high prerogatives.  

The third article of the Federal Constitution provides for the establishment of the Federal courts. It embodies in three sections the system from which has been developed the greatest and wisest judicial system the world has ever known.

Section 1 vests the judicial power of the United States in one Supreme Court, and in such inferior courts as Congress may from time to time ordain and establish, and regulates the tenor of office of all Federal judges, prescribing their good behavior and guaranteeing their compensation during continuation in office.  

Section 2 provides that the judicial power shall extend to all cases in law and equity arising under the Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority, to all cases affecting ambassadors, other public ministers and consuls, to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States, between a State and citizens of another State, between citizens of different States, between citizens of the same State claiming lands under grants of different States, and between a State, or the citizens thereof, and foreign states, citizens or subjects. It also provides that in all cases affecting ambassadors, other public ministers and consuls and those in which a State shall be a party, the Supreme Court shall have original jurisdiction. In all other cases before mentioned the Supreme Court shall have appellate jurisdiction both as to law and fact, with such exceptions and under such regulations as the Congress shall make. Section 2 also provides that the trial of all crimes, except in cases of impeachment, shall be by jury and that such trials shall be held in the State where the said crime shall have been committed; but when not committed within any State, the trial shall be at such place or places as the Congress may, as by law, direct.

Section 3 provides: 1. Treason against the United States shall consist in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act or on confession in open court. 2. The Congress shall have power to declare the punishment of treason, but no attaint of treason shall work corruption of blood or forfeiture, except during the life of the person attainted.

Before the adoption of the Constitution the great importance of such a court as the Supreme Court of the United States was recognized. As early as May 1783, Alexander Hamilton called attention to the grievous defect in the Articles of Confederation in failing to provide a Federal court of last resort, especially for the settle-

ment of matters involving foreign nations. In the Federalist he wrote: "Laws are a dead letter without courts by which they may be enforced and defined in their true meaning and operation. The treaties of the United States, to have any force at all, must be considered as part of the law of the land. Their true import, as far as those who have made, can be understood, is by judicial determination. To produce uniformity in these determinations they ought to be submitted as a last resort to one supreme tribunal, and this tribunal ought to be instituted under the same authorities which form the treaties themselves."  

James Madison and other statesmen of that day held practically the same view. It was from such ideas as these expressed by Mr. Hamilton and concurred in by his contemporaries that the Supreme Court of the United States took its rise, and when the main business of the Constitutional Convention was begun, 28 May 1787, a provision for the creation of a national judiciary was suggested, among a series of 15 resolutions relating to the adoption of the Constitution, commonly known as the Federalist plan. The clause relating to the judiciary provided as follows: "That a national judiciary be established, to consist of one or more supreme tribunals, and of inferior tribunals to be chosen by the national legislature. The judges to hold their office during good behavior, and to receive punctually, at stated times, fixed compensation for their services, in which no increase or diminution shall be made so as to affect persons actually in office at the time of such increase or diminution; that the jurisdiction of the inferior tribunals shall be to hear and determine, in the first instance, and the supreme tribunal in the dernier ressort, all piracies and felonies on the high seas, captures from an enemy, cases in which foreigners or citizens of other States applying to such jurisdiction may be interested, or which respect the collection of the national revenues, the impeachment of any national officers and questions which may involve the national peace or honor."  

A resolution that a national judiciary be established was unanimously passed by the convention, which was made up chiefly of lawyers and four judges. Then followed a vigorous and protracted discussion as to the formation and the method of selecting the various judges. John Rutledge was against establishing any national tribunal except a single supreme one, and he contended that the State tribunals might and ought to be left in all cases to decide in the first instance as to the right of appeal to the supreme national tribunal. He contended that to do otherwise was making an unnecessary encroachment on the jurisdiction of the States. He was supported in these contentions by Roger Sherman. After the various plans and suggestions had been fully discussed, the convention committed to the people of the United States, on 17 Sept. 1787, the Constitution, containing the article (3) relative to the formation of the Federal judiciary.

The first Congress to meet after the ratification of the Constitution, which was summoned to meet in New York as the seat of government, on 4 March 1789, did not convene until the beginning of April, and after the counting of votes it declared Washington President-elect. His inauguration followed on 30 April, but
there was no Federal judge to administer the oath required by the Constitution, and this service was performed by Robert R. Livingston, the first chancellor of the State of New York, under the constitution of that State of 1777. Having had its attention called in this striking manner to the fact that the new Federal government was without a single judge, Congress, the day after its organization, began the preliminary work for the establishment of a judiciary by appointing a committee, of which Oliver Ellsworth, one of the framers of the Constitution, and afterward Chief Justice of the Supreme Court, was chairman. The judicial act which set in operation the Supreme Court of the United States, and the other courts of the United States, was the work of Ellsworth. It was approved by Washington, 24 Sept. 1789.

The first section of this act provides that the Supreme Court of the United States shall consist of a Chief Justice and five associate justices (now increased to eight), any four of whom may constitute a quorum, and shall hold annually, at the seat of government, two sessions, the one commencing the first Monday of February and the other the first Monday of August. The Senate promptly confirmed Washington's appointment of John Jay, of New York, to be the Chief Justice of the Supreme Court. Washington appointed and the Senate confirmed, as associate justices, John Rutledge, of South Carolina; William Cushing, of Massachusetts; Robert H. Harrison, of Maryland; James Wilson, of Pennsylvania, and John Blair, of Virginia. Of these, Jay, Cushing and Harrison had served as chief justices in their own States; Rutledge, Wilson and Blair as members of the convention that framed the Constitution. Harrison declined to serve and his place was afterward filled by the appointment of James Iredell, of North Carolina.

The first Monday of February,—it was the first day of the month—1790, being the day fixed for the opening session of the Supreme Court of the United States, in the city of New York, was the day of the first session of the Federal government. Chief Justice Jay and Justices Cushing and Wilson appeared in the court room, which had been provided at the Exchange, Federal Hall being occupied by Congress. A quorum was not present and the court adjourned to the following day, when, Justice Blair having arrived with Edmund Randolph, the first Attorney-General, the Supreme Court of the United States was open for its first session. Chief Justice Jay wore on that occasion a robe of black silk with salmon-colored facings on the front and sleeves. This robe was, according to family tradition, the academic gown of a Doctor of Laws of the University of Dublin, which had recently conferred this degree upon the new chief justice. The associate justices wore the ordinary black robes which have since been used by all the members of the court. Richard Wенman was appointed "Crier," and made proclamation that the Supreme Court was open. John Tucker, of Massachusetts, was appointed first clerk of the court. After a seal had been adopted, the roll of counsellors was opened. The first name on the roll of counsellors was that of Elias Boudinot, of New Jersey, a Revolutionary patriot, who was conspicuous in the Continental Congress and later in the first Congress of the United States.

After holding a few formal sessions the court adjourned for lack of business, 10 February. In 1791 the Supreme Court was removed to Philadelphia, then the seat of the Federal government, where it continued to sit during the term time for years, the court room being on the second floor of the City Hall, at the corner of Fifth and Chestnut streets. In 1801 the court was removed to Washington, where it has remained ever since. On the day of the first meeting of the Supreme Court of the United States in the city of Washington, 4 Feb. 1801, John Marshall sat as Chief Justice for the first time.

Chief Justices.—Since 1790 the Supreme Court of the United States has had only nine chief justices, namely: John Jay, of New York; John Rutledge, of South Carolina; Oliver Ellsworth, of Connecticut; John Marshall, of Virginia; Roger B. Taney, of Maryland; Salmon P. Chase of Ohio; Morrison R. Waite, of Ohio; Melville W. Fuller, of Illinois, and Edward D. White, of Louisiana, who is the present Chief Justice.

The Supreme Court (q.v.) at present consists of Chief Justice Edward D. White, of Louisiana, and Associate Justices Joseph McKenna, Oliver Wendell Holmes, William R. Day, Van Devanter, Mahlon Pitney, James Clark McReynolds, Louis D. Brandeis and John H. Clarke.

CAMPBELL CARRINGTON.

COURT, Presentation at, a formal presentation to the sovereign of Great Britain of persons whose official, social or intellectual standing entitles them to that honor. It takes place either at Saint James' Palace, at a levee, intended for gentlemen only, or at Buckingham Palace, a drawing-room, where both ladies and gentlemen appear. The days when levees and drawing-rooms are to be held are always announced some time beforehand. It is difficult in the present day to define exactly who may and who must not be included. Members of families of the nobility and landed gentry, diplomats, members of the House of Commons, persons holding high offices under the Crown, judges, magistrates, Church dignitaries, officers in the army and navy, persons who have attained eminence of any kind, foreign ambassadors, members of their staffs and strangers of distinction, and the wives and daughters of the same classes, form the larger number of those presented at levees and drawing-rooms. Person entering on some office or attaining some dignity. Any one who has been once presented is entitled to appear at any future levee or drawing-room without a new presentation. The whole arrangements connected with presentations are under the supervision of the Lord Chamberlain, in whose office in Saint James' Palace information is given to all persons wishing to be presented. The names of ladies and gentlemen desiring presentation, and of the ladies, noblemen and gentlemen who are to present them, have to be submitted to the sovereign for approval and there is a strict exclusion of persons of damaged reputation, whatever their rank. Court dress or official uniform must be worn. A British subject who has been presented at Saint
James' may on any after occasion claim to be presented by the British Minister at any foreign court. For information as to court dress both for ladies and gentlemen, court etiquette, court mourning, etc., consult Armytage, Hon. Mrs. 'Old Court Customs and Modern Court Rule' (London 1883).

COURT OF APPEALS. See COURT; UNITED STATES COURTS.

COURT OF APPEALS IN CASES OF CAPTURE (1780-87), the chief Federal court prior to the establishment of the Supreme Court, which in a sense grew out of it. From the nature of the revolt against Great Britain, the colonies were very loath to erect any new plenary power to decide their mutual disputes, which would also create new disputes between it and themselves. The first clash of jurisdictions came on the question of naval prizes. At least as early as the autumn of 1775 cruisers were capturing British vessels off the Eastern coast, part under commission from Massachusetts, part from the Continental Congress (see CONTINENTAL NAVY); and on the 26th Washington, conducting the siege of Boston, was appealed to for determination of conflicting claims, there being neither provincial nor Federal courts for trial and condemnation of captures. On 11 November he suggested to Congress to establish such a court; on the 29th it recommended to the colonies to erect them, reserving an appeal to itself or such persons as it appointed. The act, however, provided neither court, procedure nor method of enforcement, did not define the scope or limits of its jurisdiction and had the same defects as the entire Confederation proceedings. (See CONFEDERATION, ARTICLES OF.) Washington criticized it on the first ground. Nor would Congress take original jurisdiction, but only appellate. Several appeals were referred to special committees; then, on 30 Jan. 1777, a special committee on revision of prize methods reported in favor of the creation of a standing committee of five to hear all such appeals. This was appointed, and the following March three more were added, but it was too largely reduced to five again, with three as a competent quorum. But Washington's suggestion was evidently the right one, and on 5 Aug. 1777 it was moved to consider the establishment of a permanent court. This was discussed for over two years, and not finally acted on till 15 Jan. 1780. Meantime a case had come up which forced some new method on them. Four Connecticut men in the fall of 1776 had been captured by the British and compelled to help navigate the sloop Active toward New York, then in British hands; they recaptured it from the British crew, and were steering it for a patriot port when a Pennsylvania privateer captured them and claimed the sloop as prize. A Pennsylvania jury gave the Connecticut men one-fourth of the sloop and its cargo sold and the proceeds divided. (It should be said that the State authorities acted to protest the privateers to the Confederate States, and that the men were eventually set free without any attendant action.) The committee thereupon refused to hear any more cases until its jurisdiction was settled. Congress re-solved that such cases could not be left to self-interested State decision, but that it would not prejudice the Union by returning to it the Connecticut men only obtained their rights many years later through the Supreme Court. After futile conferences with State legislative committees, an act was passed establishing a Federal "Court of Appeals in Cases of Capture," to hold sessions first in Philadelphia, then in Pennsylvania, anywhere they pleased between Hartford, Conn., and Williamsburg, Va. But like all other enactments of the time, it was shorn of its needful powers: it could not fine or imprison for disobedience, the State courts were not to execute its decrees and no marshal was appointed. No tenure, either of definite time or good behavior, was assigned to the judges. Three of these were appointed, but one of them died soon after, and the other two performed the duties for two years, when another resigned and two others were chosen. But the cases were gradually decided after the war, and on 23 Dec. 1784 the docket was reported empty. The judges were still retained, but their salaries were abolished, except for a per diem allowance when in actual service. About this time the States began to constitute courts of appeal, to take matters out of the hands of the Federal court. The defeated parties, however, insisted on appeals to the latter, and on 27 June 1786 Congress resolved that these should be heard. The last session of the court was on 16 May 1787 at Philadelphia, while the Constitution was being framed (see CONSTITUTION, FRAMING OF) was framing the Supreme Court. Consult Carson, 'The Supreme Court of the United States: Its History' (1892).

COURT BARON, in England, a court composed of the freeholders of a manor, presided over by the lord of the manor or his steward. Its business was to administer the laws or custom of the manor. A tenant who had acquired copyholds (q.v.) by inheritance or purchase and had to pay a fine to the lord of the manor. The institution still exists for the conducting of this latter business, but is presided over by the steward of the manor; and its proceedings are not recorded. Consult Pollock and Maitland, 'History of English Law' (2d ed., London 1899); Gordon, 'History of Court Baron and Court Leet' (Selden Society 1731).

COURT CEREMONIAL, certain forms of international etiquette or usage, which have arisen in Europe during modern times. No independent state can actually have precedence of another; but as the weaker seek the protection and friendship of the more powerful, there arises a priority of rank. The origin of elaborate formalities is to be traced to the Eastern nations, who for ages have practised various forms expressing reverence for exalted personages. By a gradual establishment of dignities, rank and acts of respect to states, their rulers and representatives, (in contradistinction to the internal etiquette of a state) an international ceremonial has been formed, that has been the source of confusion and war, to its observance is often paid more than to the fulfilment of the most sacred contracts. Louis XIV carried this folly further, perhaps, than any one...
before or after him. To this international ceremonial belong:

1. Titles of rulers. Accident made the imperial and regal titles the highest, and thus conferred advantages apart from the power of the princes. After Charlemagne, the emperors of the Middle Ages, maintaining the highest rank and even asserted the dependence of the kings on themselves. For this reason several kings in the Middle Ages, to demonstrate their independence, likewise gave their crowns the title of "imperial." England, for example, in all its public acts, is still styled the "imperial crown." The kings of France received from the Turks and Africans a title equivalent to emperor of France. In progress of time the kings were less willing to concede to the imperial title, of itself, superiority to the royal.

2. Acknowledgment of the titles and rank of rulers. Formerly the popes and emperors arrogated the right of granting these dignities; but the principle was afterward established that every prince could grant to a ruler the title of pleasure, the recognition of which rests on the pleasure of other powers and on treaties. Some titles were therefore never recognized, or not till after the lapse of considerable time. This was the case with the royal title of Frisia, the imperial title of Russia, the new titles of German princes, etc.

3. Marks of respect conformable to the rank and titles of sovereigns. To the "royal" prerogatives, so called (conceded, however, to various states which were neither kingdoms nor empires, such as Venice, the Netherlands, Switzerland and the electorates), pertained the right of sending ambassadors of the first class, etc. In connection with this there is a much contested point, namely, that of precedence or priority of rank, that is, of the right of assuming the more honorable station on any occasion, either personally, at meetings of the princes themselves, or of their ambassadors, at formal assemblies, etc., or by writing, as in the form and signature of state papers. There is never a want of grounds for supporting a claim to precedence.

As the councils in the Middle Ages afforded the most frequent occasion of such controversies, the popes often intervened. Of the several arrangements of the rank of the European powers which emanated from the popes, the principal is the one promulgated in 1504 by Julius II, through his master of ceremonies, in which the European nations followed in this order: (1) the Emperor of the Romans (Emperor of Germany); (2) the King of Rome; (3) the King of France; (4) the King of Spain; (5) of Aragon; (6) of Portugal; (7) of England; (8) of Sicily; (9) of Scotland; (10) of Hungary; (11) of Navarre; (12) of Cyprus; (13) of Bohemia; (14) of Poland; (15) of Dalmatia; (16) of Hungary; (17) Duke of Bretagne; (18) Duke of Burgundy; (19) Elector of Bavaria; (20) of Saxony; (21) of Brandenburg; (22) Archduke of Austria; (23) Duke of Savoy; (24) Grand-Duke of Tuscany; (25) Duke of Milan; (26) Duke of Bavaria; (27) of Lorraine. This order of rank was not, indeed, universally received, but it contained a fruitful germ of future quarrels; some states, which were benefited by the arrangement, insisting upon its adoption, and others, from opposite reasons, refusing to acknowledge it. To support their claims for precedence the candidates sometimes relied on the length of time which had elapsed since their families became independent, or since the introduction of Christianity into their dominions; sometimes on the power of the government, the number of crowns, the titles, achievements, extent of possessions, etc., pertaining to each. But no definite rules have been established by which states are designated as being the first, second, third, fourth, etc., rank. Rulers of equal dignity, whose crowns are equal to each other the precedence at home; in other cases, where the precedence is not settled, they or their ambassadors take turns till a compromise is effected in some way. In Great Britain and France far less ceremonial is observed, in the official style, than in Germany. Emperors and kings mutually style each other "brother," while they call princes of less degree "cousin." The "we," by which monarchs style themselves, is used either from an assumption of state or from a feeling of superiority, as an expression that "we" would sound despotical, while "we" seems to include the whole administration, etc. The French Revolution destroyed the too elaborate ceremonial of the French court; it was revived to a degree by Napoleon, and still further after the Bourbon Restoration, but disappeared entirely on the establishment of the Third Republic. In England court ceremonial was considerably abridged under Victoria, but was restored under Edward VII and continued by George V.

COURT OF CHANCERY. See Court; English Courts.

COURT OF CLAIMS. See Court; United States Courts.

COURT DE GEBÉLIN, koor de je-bé-lahn, Antoine, French scholar, only son of Antoine Court (q.v.); b. Nîmes, 25 Jan. 1725; d. Paris, 10 May 1784. After receiving a good education he became pastor of the Reformed Church, but his natural tenacity and ambition caused him to abandon the calling for literary pursuits. After his father's death he went to Paris to gather materials for a comprehensive study of the languages and mythologies of the ancient world. This long research finally appeared in nine volumes, still unfinished in 1784. He continued to work for the Protestant cause, publishing in 1760 a work entitled 'Les Touloïsains, ou lettres historiques et apologetiques en faveur de la religion reformée,' and he founded at Paris an agency for stirring up sympathy for the suffering Protestants. He supported the idea of the independence of America and the liberal political opinions of Quesnay. Bad investments of money impoverished his old age. Consult Darder, Charles, 'Court de Gebelin' (Nîmes 1890).

COURT OF HIGH COMMISSION, a court which was established in Queen Elizabeth's reign, and exercised powers like those which during the reign of Henry VIII had been entrusted to Lord Cromwell. The judges had the power of arresting suspected persons, imprisoning, torturing them and causing them to accuse their confederates or their friends. They could impose new articles of faith and impose them on recalcitrant consciences by compulsion.
COURT OF HONOR—CURTIS’ TESTS

of the severest and most odious kind. It was abolished for abuse of power in 1641.

COURT OF HONOR, a court of chivalry, of which the lord high constable was judge, for the purpose of settling such disputes as had commonly been settled by duels. It was a continuation of what in the time of Henry IV. was called curia militaris, a military court. Suggestions have been made from time to time for the establishment of courts of honor, but the law has made provisions for settling larger affairs of offense against honor, such as libel, slander, etc., and the need of special court is not apparent. See DUEL.

COURT OF LIONS. See ALHAMBRA.

COURT OF LOVE (Fr. cour d’amour), in mediæval France and Germany, a tribunal composed of ladies illustrious for their birth and talent, whose jurisdiction, recognized only by courtesy and opinion, extended over all questions of gallantry. Such courts existed from the 12th to the 14th century, while the romantic notions of love which characterized the ages of chivalry were predominant. The decisions were made according to a code of 31 articles, which had been preserved in a manuscript entitled, ‘De Arte Amatoria et Reprobusam Amoris,’ written by André, royal chaplain of France, about 1170. Some of the troubadours were often present to celebrate the proceedings in verse, and the songs of these minstrels were not unfrequently reviewed and judged by the tribunals. Among the ladies who presided were the Countess De Die, called the Sappho of the Middle Ages; Queen Eleanor of Guillaume and her daughter, Marie de Faute, Countess of Champagne, and Laura de Sade, celebrated by Petrarch. There was such a court in Provence in the days of the Troubadors. The following case was submitted to their judgment: A lady listened to one admirer, squeezed the hand of a second and touched with her toe the foot of a third. With which of these three was she in love? King René of Anjou attempted in vain to revive the courts of love, and the last imitation of them was held at Rueil at the instance of Cardinal Richelieu, to judge a question of gallantry between two friends, one of whom had been in the Hôtel de Rambouillet. Consult Mery, ‘La vie au temps des cours d’amour’ (Paris 1876), and Reynouard, ‘Choix de poésies originales des troubadours’ (Vol. II, Ib. 1817).

COURT-MARTIAL. See Law, Military.

COURT-PLASTER, so called because originally applied by ladies of the court as patches on the face; black, flesh-colored or transparent silk varnished over with a solution of isinglass, which is often perfumed with benzoin. It is used for covering slight wounds.

COURT OF PRIVATE LAND CLAIMS. See Courts; United States Courts.

COURT OF SPECIAL SESSIONS. See Court; United States Courts.

COURTENAY, keért’ nā or kērt’ nā, Edward Henry, American mathematician: b. March 7, 1859, in Waverly, Pa.; d. Nov. 12, 1883. He was graduated at West Point in 1821, and was professor of philosophy there 1821–34, and professor of mathematics at the University of Pennsylvania 1834–36. After several years devoted to civil engineering he was professor of mathematics in the University of Virginia 1843–53. He was an engineer in the construction of Fort Independence in Boston harbor 1837–41, and was chief engineer of the dry-dock work in the Brooklyn Navy Yard. He published ‘Treatise on Differential and Integral Calculus’ and ‘Calculus of Variations.’ He translated and edited the ‘Elementary Treatise on Mechanics of Bouchaïrat’ (1833).

COURTESY, or CURTSEY, the estate to which by common law a man is entitled on the death of his wife in the lands or tenements of which she had possession in fee simple or in tail during their coverture, provided they had lawful issue born alive, which might have been capable of inheriting the estate. The origin of this custom and its name is English in England, but the same law existed also in Normandy and still holds in Scotland. In the United States the law differs in various States, but has generally been supplanted by other laws.

COURTESY TITLE, a title assumed by or given to any person by common consent as an act of courtesy or respect, not of absolute right. See Titles of Honor.

CURTHOPE, kör’t hōp, William John, English scholar: b. 17 July 1842. He was educated at Harrow and Oxford, was first civil service commissioner in 1892 and professor of English literature at Oxford 1895–1901. He is author of ‘Ludibria Lunae’ (1869); ‘Paradise of Birds’ (1870); ‘Life of Addison’ (1882); ‘History of English Poetry’ (6 vols., 1895–1909); ‘Life in Poetry.’ ‘Law in Taste’ (1901); ‘The Longest Reign.’ He was appointed C.B. in 1892, and both Durham and Edinburgh conferred honorary degrees on him. In 1906 he became Fellow of the British Academy of Letters and of the Royal Society of Literature in 1907. He was editor of the last five volumes of the standard edition of Pope (10 vols., 1871–89), which was begun with Whitwell as editor.

CURTIS, Stuart Appleton, American educator: b. Wyandotte, Mich., 15 May 1874; educated at Detroit Business University, Massachusetts Institute of Technology, University of Chicago and Columbia University. He was head of the department of mathematics in the Liggett School, Home and Day School, Detroit, from 1898 to 1914, when he became superintendent of educational research in the Detroit public schools. At the same time he held the position of director of the department of measurements for the University of Oklahoma from 1913. He is the originator of Curtis’ standard tests, a system for the measurement of the efficiency of school work. He was a member of the Hamus Committee on School Inquiry held in New York in 1911. He is well known as a lecturer and contributor to magazines.

CURTIS’ TESTS. For several years Stuart Appleton Curtis (q.v.), in the discharge of his duties as head of the department of science and mathematics in the Detroit Home and Day School, made use of comparison tests for purposes of va. division. During this time a gradual evolution of these tests took place; and they finally assumed the shape of an attempt to apply scientific methods to the teaching of the fundamentals in reading, writing, arithmetic and English subjects so as to make possible rapid and reliable measurements of the effects of
teaching through testing work practicable under classroom conditions. After considerable comparative investigation along experimental lines, "Series A," the first of the Courts' Tests, was published in 1880. Copies were sold at cost or given away as a preliminary to a comparative investigation to determine standard scores. Failure after failure met these attempts to control individual variation; but a test of 5,000 children in Detroit and 33,000 in New York schools for the Hanus Committee on School Inquiry provided the necessary scope and opportunity for the standardization of the tests in 1911. The result of these tests shows that the supreme factor in education is the variation of the natural abilities of children. Courts came to the conclusion, therefore, that new educational methods that would give each child a chance to develop in his own way and along his own lines would have to be invented. He experimented along the same lines in the Boston schools in 1912. In October and again in March 20,000 children were tested and several experimental methods of giving assistance to individuals were put into practice in the schools tested. These original tests were applied principally to the teaching of arithmetic; but as it was found that this was not a broad enough basis on which to work, other tests were applied to the teaching of reading and writing.

The Courts' Tests are divided as follows: (1) Diagnostic. To make evident the actual conditions existing in schools, classes, and individuals that the weaker points may be noted, cause determined and remedies devised. (2) Scientific. To discover the natural laws of mental developments operative in school work. (3) Experimental. To make possible control experiments that will settle all questions of educational procedure upon a fact basis, through scientific determination of the efficiency of different methods. (4) Supervisory. To secure the information needed in setting standards for the guidance of teachers and schools and in determining whether or not standards already set are being attained. The Courts tests have been defined as a correspondence course in educational measurements. By means of printed test book, construction records and graphic sheets superintendents and teachers are enabled to carry on experimental work with a minimum of effort. The tests aim to secure information for the formation of reasonable aims in terms of objective standards; to measure the efficiency of methods designed to produce desired results; to obtain knowledge of the factors and natural laws of teaching and learning; and to enable comparisons of school with school, or teacher with teacher, to be made upon a scientific, impersonal, objective basis. The Courts tests differ from those of Binet (q.v.) in that they are more scientific, more carefully worked out by means of co-operation; and that there is but one set of tests for children of all ages. The giving of exactly the same tests under identical conditions and by the same person is an essential feature of the method and distinguishes it from previous methods. The standardized tests cover arithmetic, writing, dictation, reading, spelling, punctuation, reproduction and the comprehension of all the work done by the pupil. Consult Courts, S. A., 'Manual of Instructions for Giving and Scoring the Courts' Standard Tests' (Detroit 1913); 'Better Teaching in Arithmetic' (Detroit 1913); 'Teachers' Manual' (Yonkers 1914).

COURTANS, koor-män', Joanna Desideria Berchman, Flemish poet and novelist: b. Oudegem, East Flanders, 6 Sept. 1811; d. Maldegem, 6 Sept. 1890. She was married in 1836. Besides dramas and poems, she wrote 22 volumes of stories. She excelled particularly in her descriptions of the life of the common people. The most notable of her tales are 'Het geschenk van den jager,' which won the Flemish literature prize in 1864; 'De zwarte Hoeye' (2d ed., 1866); 'De Koewacht' (1873); 'De Hoogmoedige' (1882).

COURTNEY, Leonard Henry, 1st BARON COURTNEY of Penwith, English writer and politician: b. Penzance, Cornwall, 6 July 1832; d. London, 11 May 1918. The son of a banker, he was educated at Cambridge University and became a barrister in 1858. He engaged in literary and journalistic work, dealing mainly with economic, historical and statistical topics. Elected to Parliament as a Liberal in 1877, Courtney successively held the under-secretaryships of the Home Department and Colonial Office, and in 1882 was made Financial Secretary of the Treasury. His political career was characterized by a peculiar opposition to nearly all popular causes. He opposed the first annexation of the Transvaal and Redistribution. In 1886 he went over to the Unionist side and became deputy-speaker in the Commons. He broke out into opposition again by advocating the evacuation of Egypt, and later denounced the South African War, which lost him his seat in the 1900 election. He received his peerage from the Liberal government in 1906. On the European War question he advocated peace by negotiation. He left no heir to the title.

COURTNEY, William Leonard, English author: b. Poona, India, 5 Jan. 1850. He was educated at Oxford, became editor of the Fortnightly Review in 1894 and has served on the editorial staff of the Daily Telegraph. He has published 'The Metaphysics of John Stuart Mill' (1879); 'Studies on Psychology, records and graphic sheets' (1882); 'Constructive Ethics' (1886); 'Studies New and Old' (1888); 'Life of John Stuart Mill' (1889); 'Studies at Leisure' (1892); 'Kit Marlows' play' (1893); 'The Idea of Tragedy'; 'Undine' (1902); 'The Feminine Note in Fiction' (1904); 'The Literary Man's Bible' (1907); 'The Literary Man's New Testament' (1915), etc.

COURTOIS, koor-twé', Bernard, French chemist: b. Dijon 1777; d. Paris, 27 Sept. 1838. He was trained in pharmacy and entered Fourrey's laboratory in the Ecole polytechnique. He had to join the army in 1799, but after his discharge resumed his chemical work with Thénard and Séguin. In conjunction with the latter he discovered morphee in opium, but nothing was published on the subject till Séguin's paper long after, and Courtois' share has consequently been overlooked. In 1804 he began work on nitrates of sodium, the process consisting in decomposing nitrate of calcium by the carbonate of sodium obtained from kelp. In the course of his operations he observed that the iron vessels were corroded if the liquors from which the sodium salts had been crystallized were kept in them for a time. In-
CURTOIS—COUSINS

vestigating the cause of this, he found that on
distilling the liquors with sulphuric acid a body
with a splendid purple vapor was liberated. He
examined it and ascertained some of its prop-
erties; for instance, its formation of a detonat-
ing compound with ammonia, and then gave a
specimen of it to Clement, who read a paper on
it, and ultimately resigned the investigation to
Gay Lusac. This was the first discovery of
iodine. In 1815 his nitre manufacture was
ruined, and thereafter he had a precarious
livelihood by making various chemical products.

CURTOIS, Gustave Claude Édouard, French painter: b. Pusey, 18 March 1852. He
studied at Paris as a pupil of Grérome; first
exhibited in the Salon in 1876; won the first-
class medal at the Paris Exposition of 1889.
His works include 'The Death of Archimedes';
'Narcisse' (in the Luxembourg); 'Dante and
Virgil in Hell'; 'Bayaderes'; 'The Burial of
Atala'; and a number of portraits. At the
Saint Louis Exposition in 1904 he exhibited
'Adam and Eve in Eden'; 'Cupid Feasting'
and a portrait of Mme. G. From 1880-90 he
was the most fashionable portrait painter in
Paris.

CURTOIS, Jacques (lt. Jacopo Cortese),
surnamed Le Bourgignon (lt. Il Borgonone),
French painter: b. Saint Hippolyte, Doubs,
1621; d. Rome, 14 Nov. 1676. He was a pupil
of his father, Jean Curtois, but went to Italy
in 1636 and served three years with the Spanish
army in Lombardy. He then studied at Bo-
logna, Florence, Siena and Rome, where he
came under the influence of Guido Reni and
Francesco Albani in Bologna, and Pieter de Laar in Rome. He was especially eminent in
battle-pieces. His wife dying of poison, which
he was suspected of having administered, he
took the habit of a lay brother of the Jesuits,
with whom, though he still practised his art, he
remained till his death. His brother William
(d. 1679) was also an eminent painter who
excelled in historical pieces, and assisted Jacques
in some of his works. His pictures are to be
found in nearly all of the galleries of Europe.

COURTRAI, koor-trâ, Belgium, a fortified
town in the province of West Flanders, on the
Lys River, 26 miles south of Ghent. It is well
built, having handsome and spacious streets and
a fine church with a narrow square tower. Its
manufactures are table linens, lace—which
is celebrated for its beauty of design and ex-
quisite workmanship—cambrics, cotton goods,
etc., and it has extensive bleaching and dyeing
works. Here, in 1302, took place the 'Battle of
spurs' between the French and Flemings. It
was in German occupation during the Great
European War. Pop. 35,872.

COURTSHIP OF MILES STANDISH,
The, the title of a poem by Longfellow. It is
written in hexameter measure and was first
published in 1838.

COUSIN, koo-zan, Jean, The Elder,
French artist: b. Soucy, near Sens, France,
1501; d. Sens about 1590. He is generally re-
garded as the earliest French historical painter.
He chiefly painted on glass, but his 'Last Judg-
ment' painted on canvas for the convent of the
Minims at Sens, is esteemed an excel-
لent work. In 1540 he designed the festi-

delections for the entry of Emperor Charles V

at Paris. Noteworthy among his sculptured
works are the tomb of Admiral Chabot
(Louvre) and the sculptures formerly in the
chapel of Pagny (Burgundy). A large number
of wood cuts have also been credited to him.
He was the author of 'Livre de perspective'
(1560) and 'Livre de sculpture' (1571). His
son, Jean the Younger, also an artist: b. Sens
about 1522; d. 1594. He designed the glass
windows and possibly the sculptures of the
castle of Fleury-les-Sens. The glasses in the
church of Saint-Gervais, Paris, are also attrib-
uted to him. He painted five portraits of the
Bouyer family. He wrote a book on the
'True Science of Portraiture' and a 'Book of
Fortune' containing 200 drawings. Consult
Furmin-Didot, 'Etude sur Jean Cousin' (1872);
Roy, 'Les deux Jehan Cousin' (in Mem. de
la Société Archéol. de Sens, Vol. XXIV,
1909); Dimier, 'French Painting in the Six-
teenth Century' (1904); id., 'Bulletin de l'art
ancien et moderne' (1899).

COUSIN, Victor, French philosopher: b.
1867. He founded a school of eclectic philosophy,
combining the doctrines of the Scotch school
of Reid and Stewart, based on sensation, with
those of Schelling and Hegel, which rest on the
opposite principle of idealism or intuition. He
was not an original thinker but possessed in a
high degree the faculty of clear exposition, and
for that reason his lectures and his writings
enjoyed a great popularity. He rendered a
memorable service both to philosophy and lit-

erature by his translation of Plato (1840).
Besides his ' Fragments philosophiques' (1826)
and other works on that theme, he is the author
of a few biographical sketches, mostly of char-
acters related to the spiritual and intellectual
movements of the 17th century as 'Jacqueline
Pascal'; 'Mme. de Longueville'; 'Mme. de
Hautefort'; 'French Society in the 17th Ce-
tury.' As a lecturer and philosophical writer
Cousin was distinguished by a rare combina-
tion of eloquence, enthusiasm and, as already stated,
clearness of exposition. He possessed a beauty
of style such as no modern or ancient philoso-
pher excepting Plato has equaled. He rendered
a very valuable service to his native land in the
part he took in the organization of primary
instruction. In 1831, under a commission from
the French government, he visited Germany to
study educational methods there, and the 'Rap-
port sur l'Etat de l'Instruction Publique' pub-
lished on his return had powerful influence
on subsequent legislation. Consult Janet, 'Vic-
tor Cousin et son Œuvre' (1885); Simon, Jules,
'Victor Cousin' (1887); Taïne, 'Les Philoso-
phes Classiques du XIXe Siècle' (1888); Saint-
Hilaire, B, 'Victor Cousin, sa vie, sa Cor-
respondence' (1895).

COUSIN MICHIEL, më'etl, a nickname
sometimes applied to a German, as John Bull is
to an Englishman, or Brother Jonathan to an
American.

COUSINS, Samuel, English engraver: b.
Exeter, 9 May 1801; d. 7 May 1887. He was
early apprenticed to the mezzotint engraver,
S. W. Reynolds. He first brought himself into
notice by his engraving of Lawrence's 'Lady
Acland and her Child'. In 1844 he was
elected A.R.A., and in 1855 became the first
Royal Academician engraver. These were
followed by many portraits and pictures after Reynolds, Lawrence, Gainsborough, J. E. Millass, Wilkie, Landseer and others. Of his numerous works the following may be mentioned: Pope Pius VII (1827), after Lawrence; Bolter Abbey in the Olden Time (1837), after Landseer; Queen Victoria (1838), after Chalon; The Maid and the Magpie (1862), after Landseer; Yes or No (1873), after Millais; Simplicity (1874), after Reynolds; and Pomona (1882), after Millais. Consult his biography by A. Whitman (London 1904).

COUSTOU, koo'sto'o, Guillaume, The Elder, French sculptor: b. Lyons, 25 April 1678; d. Paris, 20 Feb. 1746. He studied under his father and spent several years in Rome, where he assisted Pierre Legros. Besides work done in collaboration with his brother, he modeled the kneeling statue of Louis XIII in Notre Dame, 'Ocean and Mediterranean' and the vigorous and spirited marble groups of 'Horses of Marly' at the entrance to the Champs Elysées. He was a brother of Nicolas Coustou (q.v.) whom he succeeded as director of the Academy of Fine Arts. The monument of the Cardinal Dubois, in the church of Saint Roch, is much esteemed.

COUSTOU, Guillaume, The Younger, French sculptor: b. Paris 1716; d. there 1777. He was eldest son of the preceding, and on his death Joseph II, during his stay in Paris, conferred with his own hands the order of Saint Michael. The statues of Venus and Mars, larger than life, which he made in 1769 for the king of Prussia, gained universal admiration. His monument of the Dauphin and Dauphiness, parents of Louis XVI, in the cathedral of Sens, bears the character of majestic simplicity. Consult Lady Dilk, 'French Architects and Sculptors of the 18th Century' (1900); and 'Les Coustou' (in Gazette des Beaux-Arts, Vol. I, 1901).

COUSTOU, Nicolas, French sculptor: b. Lyons, 9 Jan. 1658; d. Paris, 1 May 1733. He studied with his father, François, a wood carver, and later at Paris. He then spent three years in Rome, and then returned to Paris, where he was appointed rector of the Academy in 1720 and chancellor in 1733. He is admired for his ability in grouping and delicacy of design, although a tendency to an affected refinement, then becoming common, is observable in his works. His works include decorations for the palaces of Versailles, Trianon and Marly, in which he was assisted by his brother, Guillaume; Union of the Seine and the Marne; Daphnis Pursued by Apollo, in the Garden of the Tuileries; statues of Julius Cesar and of Louis XIV in the Louvre, and the Descent from the Cross, in the Notre Dame in Paris, which is particularly valued. The younger brother was a worthy disciple of the elder.

COUTHON, koo-tou'n, Georges, French revolutionist: b. Orcet 1756; d. Paris, 28 July 1794. Immediately previous to the Revolution he had made himself conspicuous as a Liberal in the provincial assembly at Avon, and had gained considerable popularity by the gratuitous assistance he offered the people. It was after the Revolution he was chosen a member of the National Assembly, where he soon forfeited his character for mildness and amiability, and allying himself with Robespierre, aided and abetted the latter in all his atrocities. He was appointed on the Committee of Public Safety and sent against the insurgent city of Lyons. The lives of his family were spared, although property was destroyed. On his return to Paris he established with Robespierre and Saint Just a supreme tribunal. On the downfall of Robespierre's party Couthon shared, along with him and Saint Just, the decree of arrest pronounced by the Convention on 9th Thermidor. The same day he and his companions were seized in the Hôtel de Ville, where, in the scuffle that ensued, Couthon was nearly trampled to death, but survived sufficiently to be guillotined next day. Consult Mege, 'Correspondence de Couthon' (Paris 1872); Aulard, 'Les orateurs de la législative et de la convention' (Paris 1885-86); Morse, Stephens, 'The French Revolution' (New York 1891).

COUTURE, koo-tour, Thomas, French historical and genre painter: b. Senlis, 21 Dec. 1815; d. Villers-le-Bel, near Paris, 26 March 1879. He studied under Gros and Delaroche; he was a disciple of neither. In 1837 he was awarded the Prix de Rome, and in 1845 his picture 'The Thirst for Gold' (Toulouse Museum, replica in Amsterdam) attracted considerable attention. His best work is 'Les Romains de la Decadence' (1847), now in the Louvre, which obtained a first class medal and created a noteworthy sensation. Among other works are 'Une veeve' ('Le troubèr' (1844); 'Joconde' (1847); and 'The Volunteers of 1793', now in the Boston Museum of Fine Arts. Under Napoleon III he became court painter, but not being gallant never gained much popularity. His pictures were purchased mostly by foreigners, especially Americans. He also painted the frescoes in the chapel of the Virgin, Saint-Eustache, Paris, and, during this last period, many portraits of which there are frequent examples in the museums of southern France. His art is rich in color and clear in line. Among his pupils were Fuerbach, Victor Müller, Puvis de Chavannes, Manet and many lesser artists of countries other than France. His book, 'Conversations on Art Methods,' was translated by Stewart and published in New York in 1879. Consult Healey, 'Couture' in Van Dyck's 'Modern French Masters' (New York 1896); Clarete, 'Peintres et sculpteurs contemporains' (Paris 1873); Fial, 'Un peintre assimilateur' (in Revue Polite et Littrare, Paris 1913).

COUVADE, koo-vad', a curious custom prevalent in ancient as well as modern times among primitive races in all parts of the world. After the birth of a child the father takes to bed, and receives all the delicate food and careful nursing which, among civilized peoples, is given to the mother. This custom was observed, according to Diodorus, among the Corsicans; and Strabo states that it existed among the Iberians. Many travelers from Marco Polo downward have met with similar custom among the Chinese, the Dyaks of Borno, the negroes and especially among the aboriginal tribes of North and South America. The Indians explain it by saying that descendance is dependent on the father, while anthropologists suggest that it is a ceremony by which the father proclaims his
COVARIANT — COVENANTERS

relation to the new-born child. Tylor at first explained the usage as a symbol of a direct physical bond between the male parent and the child. Thus the father refrained from eating flesh of certain animals for a period before the birth of the child, in the belief that food directly influenced character. The theory which seems most plausible is that the covaut was simply an evidence of the belief in sympathetic magic. Consult Ripley, 'The Races of Europe' (1899); McGee, 'The Seri Indians' (17th Report American Bureau of Ethnology); Tylor, 'Researches into the Early History of Mankind' (pp. 20ff); id., 'On a Method of Investigating the Development of Institutions' (in Journal of the Anthropological Institute, Vol. XVIII, pp. 254ff, 1889); Floss, 'Das Web' (1897).

COVARIANT. See INVARIANTS.

COVELLITE, a copper ore consisting of the indigo-blue sulphate of that metal, containing 66.4 per cent of copper. It is one of the rich ores in the Anaconda mines, near Butte, Montana, also at Ely, Nevada.

COVENANT, in law, an agreement between two or more persons, entered into by deed, whereby one of the parties promises the performance or non-performance of certain acts, or that a given state of things does or shall, or does not or shall not, exist. It differs from an express assumppt in that it must be by deed. Affirmative covenants are those in which the covenantor declares that something has already been done, or shall be done in the future. Such covenants do not operate to deprive covenantees of rights enjoyed independently of the covenants. Auxiliary covenants are those which do not relate directly to the principal matter of contract between the parties, but to something connected with it. Collateral covenants are those which are entered into in connection with the grant of something, but which do not relate immediately to the thing granted. Concurrent covenants are those which are to be performed simultaneously. Declaratory covenants are those which are limited in use. Dependent covenants are those in which the obligation to perform by one is made to depend upon the performance by the other. Covenants for title are those covenants in a deed conveying land, where the purpose of securing to the grantee and covenantor the benefit of the title which the grantor and covenantor profess to convey. A real covenant is one which at early common law bound the covenantor's heirs to the extent to which they inherited real estate. They are now of slight importance, and the term is now used in contradistinction to personal covenants which do not run with the land. An inherent covenant is another name for real. When a covenant relates to an act already done, it is called executory; when the performance is not yet due, it is called executory. An action of covenant might be instituted for breaking covenant. The doctrine of *warrandice* in Scottish law fills the place of covenant to some extent. Those in common use are five in number in Scotland and are set out in a series of articles, for quiet enjoyment, against encumbrances and for further assurance, and are held to run with the land. There is besides in the United States, where most of the classes of covenants are enforced, a covenant of warranty which is more commonly used than any of the others. The covenants of seisin, against encumbrances, and right to convey, are generally held to be in presenti and not assignable. Consult Sims, 'Treatise on Covenants' (Chicago 1901); Goodacre, 'Law of Real Property' (5th ed., London 1906); Hamilton, 'Law of Covenant' (London).

COVENANT, a term in theology derived from the Hebrew *beth* bond, *better*, probably introduced into Canaan during the Babylonian occupation; in Greek, the corresponding word is *diatheke*, diathékē, meaning will, testament. Not all of the old meanings are included in the English word *covenant*, which applies to a contract between two parties acting freely, while both the Hebrew and the Greek words may be used of anything binding upon the two parties to any transaction, whether the terms are accepted voluntarily or imposed by one of the parties or by another.* In Old Testament history, a covenant was usually an agreement between clans or tribes for the securing of peace and safety: as defining the relation of sizerain to his subjects, the bond between God and his people. Ceremonies such as animal sacrifices attended the making of a covenant. Religion was a covenant with Yahweh, to which the latter was also bound to be faithful. The provisions and sanctions of the covenant are summarized in the laws of Israel. In the course of prophetic history, the covenant became the means of union of Yahweh and his people — the promise of the restoration of the kingdom founded by David is such a covenant. In the New Testament the word is translated by the English words *testament* and *covenant*. In the federal theology of Johannes Cocceius, this conception of covenant assumed primary importance. In Scottish history the covenant is the articles of faith of the dissenters. See COVENANTERS.

COVENANT OR LIBERTY OF WORSHIP, the first Covenant subscribed to in Scotland (3 Dec. 1557) in which the signers petitioned the government for liberty of worship. Two years later a second covenant was signed (31 May) for the *mutual assurance of all the subscribers thereto in defense of their religious rights.* Finally civil war broke out. French troops were invited to Scotland by the Papal party; and the *congregation* called in the aid of Elizabeth of England. The French troops were withdrawn from Scotland in 1560, and the Scottish Parliament, being left at liberty and free from pressure on the part of the royal family and favored nobles, decreed that the Presbyterian should be the Established Church of Scotland. In 1688, all the preceding covenants were summed up in the National Covenant, which was subscribed to all of Scotland. See LORDS OF THE CONGREGATION and also CONGREGATION.

COVENANTERS, in Scottish history, the name given to the party which struggled for religious liberty from 1637 on to the Revolution. They were so called because they bound themselves in a series of oaths, for quiet enjoyment, against encumbrances and for further assurance, and are held to run with the land. There is besides in the United States, where most of the classes of covenants are enforced, a covenant of warranty which is more commonly used than any of the others. The covenanters, of seisin, against encumbrances, and right to convey, are generally held to be in presenti and not assignable. Consult Sims, 'Treatise on Covenants' (Chicago 1901); Goodacre, 'Law of Real Property' (5th ed., London 1906); Hamilton, 'Law of Covenant' (London).

Catholicism, which it denounced. It was again subscribed to in 1590 and 1596.

After the union of the crowns of Scotland and England (1603), as the Stuarts favored the Episcopal churches, whose hierarchical form seemed fitted to promote their despotic views, the dangers which threatened Presbyterianism brought its followers in Scotland to a closer union; and when, in 1637, the new liturgy, modeled after the English, was ordered to be introduced into their churches, disturbances among the members of the ASSOCIATION of a new Covenant the following year. This was called the National Covenant. The subscription of it began in the Grayfriars' Church, Edinburgh, 28 Feb. 1638. Copies were circulated throughout the country for general signature, many of which are still extant. The Covenant, with the confession of faith which it embodied, was ratified by the General Assembly at Glasgow, 21 Nov. 1638, and by the Scottish Parliament in 1640. In 1642 the English Parliament applied to the Scottish Assembly for aid in the Civil War in the reign of Charles I., and a more earnest subscription of the Covenant was pressed more earnestly in the following year. The Covenanters, who were then masters of Scotland, demanded that the English Parliament should take the Covenant, and assimilate the doctrine and worship of the churches of the two nations. In consequence of this stipulation, 25 Sept. 1643, both Houses of Parliament met at Saint Margaret's Church, Westminster, along with the Assembly of Divines and the Scottish commissioners, to take the Covenant, which had been modified by the Assembly. After prayers and sermons, all present held up their hands in testimony of assent to it; and afterward, in their several Houses, subscribed it on a Parliament roll. The House of Commons ordered it to be taken by all persons in their respective parishes next Lord's Day.

Both covenants were signed by Charles II on his landing in Scotland in 1650, and again at his coronation at Scone, 1 Jan. 1651. The covenanters were now the supreme power in Scotland, but their supremacy was undermined by the victory at Dunbar in 1650, and vanished when Charles was restored in 1660.

In 1661 the Covenant was burned by the hangman, and in 1662 abjured by act of Parliament, in both England and Scotland. Oppressive measures were inaugurated against the Covenanters who, outraged, finally in 1665 took up arms in defense of the Presbyterian form of church government. The Presbyterian ministers who refused to acknowledge the bishops were ejected from their parishes and drew around them crowds of their people on the hillsides, or any lonely spot, to attend their ministrations. These meetings, called "convenicles," were denounced as seditious, and to frequent them, or to hold communication with those frequenting them, was forbidden under pain of death. The unwarrantable severity with which the recusants were treated provoked them to take up arms in defense of their opinions. The first outbreaks took place in the Hebrides of Ayr and Lanark shires. Here at Drumclog, a farm near Loudon Hill, a conventicle was attacked by a body of dragoons under Graham of Claverhouse, but were successful in defeating their assailants (1679). The murder of Archbishop Sharp on Magus Moor, and this defeat, alarmed the government, who sent a large body of troops to put down the insurgents, who had increased in number rapidly. The two armies met at Bothwell Bridge, where the Covenanters were totally defeated (22 June 1679). In consequence of the rebellious protests called the "Sangmar Declaration," put forth in 1680 by Cameron, Cargill, and others, as representing the more irreconcilable of the Covenanters (known as Camerons), and a subsequent proclamation in 1684, the government proceeded to more severe measures against the Covenanters; and the dragoons who were sent out to hunt down the rebels were empowered to kill anyone who refused to take the oath. During this "killing-time," as it was called, the sufferings of the Covenanters were extreme; but, notwithstanding the great numbers who were put to death, their fanatic spirit seemed only to grow stronger. Even after the accession of William III., some of the extreme Covenanters refused to acknowledge the Act of Toleration, and the Assembly of Divines, which had been held at Edinburgh in 1681, was thenceforth an assembly of those who were determined to maintain the Presbyterian form of church government in Scotland. The latest covenant was that drawn up in 1712 by the Scottish Presbyterians of Ulster who were opposed to the Irish Home Rule Bill of Mr. A. K. Guthrie, on the ground that it might endanger Protestantism. Consult Gardiner, S. B., 'Constitutional Documents of the Puritan Revolution' (London 1897); id., 'History of England' (1688–84); Grub, G., 'Ecclesiastical History of Scotland' (Edinburgh 1861); Macpherson, 'History of the Church of Scotland' (Paisley 1901).

COVENT GARDEN (corrupted from Convent Garden, originally the garden of the Abbot of Westminster), is a spacious square in London, celebrated for a great market of fruit, vegetables and flowers. The square was formed about 1631 from the designs of Inigo Jones, and has the arcade or piazza on the north and north-east side, Tavistock Row on the south, and the church of Saint Paul's on the west. In the 17th century Covent Garden was a very fashionable quarter of the town. The last scene in Dryden's plays is laid here, and frequent allusions are made to the place in plays of Charles II's time. The market, now so famous, appears to have originated about 1656 in a few wooden sheds and stalls. The first theatre erected here was built in 1733. It was burned in 1808, rebuilt from a design by Smirke, burned in 1856, and since wholly rebuilt. Covent Garden market is for a stranger one of the sights of London, and is seen to greatest advantage about 6 o'clock on a summer morning.

COVENTRY, England, city in the county of Warwick, 85 miles northwest of London, on the Sherbourne. It is one of the oldest cities in England, formerly a walled town. A Benedictine monastery was founded here in 1044 by Earl Leofric and Lady Godiva (q.v.), his wife. Many of the buildings, the cathedral among them, were razed of Ayr and Lanark shires. Here at Drumclog, a farm near Loudon Hill, a conventicle was attacked by a body of dragoons under Graham of Claverhouse, but were successful in defeating their assailants (1679). The murder of Archbishop Sharp on Magus Moor, and this defeat, alarmed the government, who sent a large body of troops to put down the insurgents, who had increased in number rapidly. The two armies met at Bothwell Bridge, where the Covenanters were totally defeated (22 June 1679). In consequence of the rebellious protests called the "Sangmar Declaration," put forth in 1680 by Cameron, Cargill, and others, as representing the more irreconcilable of the Covenanters (known as Camerons), and a subsequent proclamation in 1684, the government proceeded to more severe measures against the Covenanters; and the dragoons who were sent out to hunt down the rebels were empowered to kill anyone who refused to take the oath. During this "killing-time," as it was called, the sufferings of the Covenanters were extreme; but, notwithstanding the great numbers who were put to death, their fanatic spirit seemed only to grow stronger. Even after the accession of William III., some of the extreme Covenanters refused to acknowledge the Act of Toleration, and the Assembly of Divines, which had been held at Edinburgh in 1681, was thenceforth an assembly of those who were determined to maintain the Presbyterian form of church government in Scotland. The latest covenant was that drawn up in 1712 by the Scottish Presbyterians of Ulster who were opposed to the Irish Home Rule Bill of Mr. A. K. Guthrie, on the ground that it might endanger Protestantism. Consult Gardiner, S. B., 'Constitutional Documents of the Puritan Revolution' (London 1897); id., 'History of England' (1688–84); Grub, G., 'Ecclesiastical History of Scotland' (Edinburgh 1861); Macpherson, 'History of the Church of Scotland' (Paisley 1901).
of the 15th and 16th centuries are in existence. Coventry has now several fine churches. Its boundaries have been extended because of the expansion of its industries. Its chief manufactures are bicycles, tricycles, ribbons, artificial silk, watches, sewing machines, naval ordnance, motors and fringes. The city owns its own gas, electrical and water plants; it has public baths, an excellent system of sewerage, libraries, a technical school and other public institutions. The city sends one member to Parliament. Pop. 106,777. Consult Dormer, 'History of Coventry' (New York, 1888); and Fretton, 'Antiquarian Losses in Coventry' (in Archæological Journal, Vol. XXXVI, London 1880).

COVENTRY, R. I., town in Kent County, situated on the Pawtucket River, 13 miles southwest of Providence, and on the New York, New Haven and Hartford Railroad. The chief industries are the manufacture of cotton and wool and dyeing, bleaching and mercerizing. There is also some agricultural interest. Coventry was taken from Warwick and incorporated in 1671. The town is noted as the home of Gen. Nathanael Greene (q.v.) Pop. 5,948.

COVENTRY PLAYS. These, a series of 42 old plays exhibiting the characteristics of both the old English Morality and Mystery plays. Three complete sets of such dramas have descended to modern times: the 'Chester,' the 'Towneley' and the 'Coventry' mysteries; and from these we derive nearly all our knowledge of the early English drama. Coventry was formerly famous for the performance of its Corpus Christi plays by the Gray Friars. These plays contained the story of the New Testament, composed in Old English rhythm. One manuscript is preserved in the British Museum in the Cotton Library. The earliest record of their performance is in 1392, the latest in 1589. The Coventry plays were published in a volume by the Shakespeare Society in 1841, under the title "The Book of Miracle Plays." 'Noah's Flood,' 'The Birth of Christ,' 'Adoration of the Magi,' 'Last Supper,' 'The Pilgrim of Emmaus,' 'The Resurrection,' 'The Ascension,' 'Doomsday.' Consult Morley, 'English Writers' (Vol. IV, London 1887 et seq.).

COVERDALE, Miles, English bishop and reformer: b. probably at Coverdale, Yorkshire, 1488; d. 19 Feb. 1559. He was educated at Cambridge, entered the convent of the Augustine friars, was ordained a priest at Norwich in 1514, and entered the convent of Austin friars at Cambridge where he fell under the influence of Robert Barnes who became prior about 1523. He also became a friend to Cromwell at this period. He was led some years afterward to embrace and preach the reformed doctrines, and, having gone abroad, is said to have assisted Tyndale in translating the Pentateuch. In 1535 his own translation of the Scriptures appeared, with a dedication to Henry VII, being the first printed English version of the entire Bible. No name of publisher or place of publication appear on the imperfect copies which now exist. It was probably printed by Nicolson in folio and quartto in 1537, and by Froshoner at Zürich in 1539. It appears possible that Jacob van Meteren was his promoter who engaged Coverdale to do the translation for him. Many of the copies have the preface "out of Douche and Latyn." Coverdale's work occupied a long period of time. In the dedication to Edward VI he says "I was boldened in God 10 years ago to labour faithfully in the same." The basis of the translation of Coverdale has been the Vulgate, the Latin of Pagninus, Luther, the Zürich or German-Swiss and Tyndale's Pentateuch and New Testament. The New Testament is based chiefly on Tyndale and is much better than the old. In 1538 he was engaged in superintending at Paris the printing of a revised English version, the greater part of the impression of which was seized and destroyed by the ecclesiastical authorities. The printing presses and types, however, escaped the inquisitors, and being brought over to England, enabled Cranmer's, or the Great Bible, to be printed by Grafton and Whitchurch. The Prayer-book version of the Psalms is from the Great Bible. After the execution of his patron Cromwell (1540), Coverdale went abroad. Having returned in 1548 he was made chaplain to Queen Catharine Parr. In 1549 he assisted Whitchurch in the second volume of the 'Paraphrase of Erasmus.' In 1551, during the reign of Edward VI, he was appointed bishop of Exeter, but was ejected on the accession of Mary, and thrown into prison. After two years' confinement he was liberated, and proceeded first to Denmark, and subsequently to Geneva, where he assisted in preparing the Geneva Bible (1560), the favorite Bible of the Puritans. On the Reformation he returned to England, but his recently acquired views on ecclesiastical ceremonies prevented him being restored to his see of Exeter. He was, however, made rector of Saint Magnus, London Bridge. In 1553 he obtained the degree of D.D. from the University of Cambridge. The third centenary of the publication of his Bible was celebrated by the clergy throughout the churches of England 4 Oct. 1835. His writings are numerous. Consult 'Memorials of Miles Coverdale' (1839), which contains a bibliographical biography; Fry, 'The Bible by Coverdale' (London 1867); Hoare, 'The Evolution of the English Bible' (2d ed., 1902); Pollard, 'Records of the English Bible' (Oxford 1911). Biographies are in the Parker Society Series. Coverdale's pieces, an index to which may be found in Gough's 'General Index to the Parker Society.' Consult also 'Dictionary of National Biography' (Vol. XII).

COVERED WAY, in fortification, a space of ground 30 feet broad, on the outer edge of the ditch, above the counterscarp and next the glacis, ranging round the works of a fortification. It affords a safe communication round all the works, facilitates sallies and retreats and the reception of reinforcements, and its parapet protects the fortifications in its rear.

COVERLEY, Sir Roger, b. (1) The name given by Addison to a fictitious character whose adventures were related in the 'Spectator'; (2) a Scotch air and dance, known to the Americans as 'The Virginia Reel.'

COVERTURE, kuv-er'tür, a legal term applied to the position of a woman during marriage because she is under the cover or protection of her husband. See LAW OF HUSBAND AND WIFE.
COVILHÃO, kó-vél-youh, Portugal, town in the modern district of Castello Branco, and formerly in the province of Beira, on the southeast slope of the Serra da Estrela, some 25 miles southwest of Guarda. In the neighborhood there are noted sulphurous baths. The town contains dye works and important cloth factories. Pop. about 16,000.

COVILLE, Frederick Vernon, American botanist: b. Preston, N. Y., 23 March 1867. He was educated at Cornell University and was instructor in botany there 1887-88, and assistant botanist in the United States Department of Agriculture 1888-93. Since the last named year he has been chief botanist of that department, as well as curator of the United States National Herbarium. He has published "Botany of the Death Valley Expedition"; "Our Public Grazing Lands"; "Experiments in Blueberry Culture"; "The Formation of Leaf Mold" and many other papers relating to systematic, geographic and economic botany.

COVINGTON, Ga., city and county-seat of Newton County, 40 miles east of Atlanta, on the Georgia and the Central of Georgia railroad. It is the seat of Emory College (Methodist) and has a public library, courthouse, etc. Its cotton interests are extensive and it has also cotton and oil mills, ice plant, fertilizer works and marble yards. The city owns the electric plant and the waterworks. Pop. 2,697.

COVINGTON, Ind., the county-seat of Fountain County, situated in the northwestern part of the State, on the Wabash River, the Wabash and Erie Canal, and the Cleveland, Cincinnati, Chicago and Saint Louis and the Wabash railroads, 72 miles northwest of Indianapolis. It exports live stock and agricultural produce, and has several iron foundries. There is a canning factory, and the city has a Carnegie library and municipal waterworks and electric-light plant. Pop. 2,069.

COVINGTON, Ky., city and county-seat of Kenton County, on the Ohio River opposite Cincinnati, with which it is connected by a handsome suspension bridge, 2,250 feet long, and costing $1,060,000. It is the northern terminus of the Kentucky Central Railroad and is also on the Louisville, Cincinnati and Lexington Railroad. It is a residence town for Cincinnati business men and is the see of a Roman Catholic bishop. Covington occupies an area of about 5½ square miles on a beautiful plain partly surrounded by hills and resembles Cincinnati in its general arrangement. The city has many fine residences, a public library, city hall, race track, and a Federal building noteworthy as a specimen of modern Gothic; and among charitable institutions, a hospital for contagious diseases, Catholic and Protestant orphan asylums and a home for aged women. Covington is an important centre of Roman Catholic influence, the cathedral, a type of flamboyant Gothic, being one of the finest ecclesiastical structures in the State. Connected with this denomination there are also a Bene-diction priory, a convent, a hospital, foundling asylum, Notre Dame Academy and La Salette Academy. The facilities for transportation, both by water, in Covington, and for communication with a wide territory possessing valuable natural advantages, have contributed to the city's commercial importance. Its industrial interests are also important and include extensive pork-packing establishments, distilleries, breweries, cotton factories, iron works and manufactures of vinegar, furniture, stoves, tinware, bricks, tile, pottery, rope, contractors' machinery, metal signs, automobile trucks, X-ray machines, circus tents, pianos, cordage, etc. The United States census of manufactures for 1914 reported in the city 161 industrial establishments of factory grade, employing 3,736 persons, of whom 3,199 were wage earners, receiving annually a total of $1,815,000 in wages. The capital invested aggregated $7,778,000, and the year's output was valued at $8,205,000: of this, $5,475,000 was the value added by manufacture. Covington has adopted the commission form of government. There are municipal waterworks, built in 1887, furnishing an abundant supply of water drawn from the Ohio River at a distance of about 13 miles above the city. Its annual budget approximates $600,000, the main items of expense being $108,000 for the police, $81,000 for interest on debt, $47,000 for police department, $35,000 for fire department, $35,000 for street expenditures and $15,000 for public library fund. Settled in 1812 and laid out three years later, Covington was charted as a city in 1834. Pop. 9,600.

COVINGTON, Tenn., county-seat of Tipton County, 37 miles northeast of Memphis, on the Illinois Central Railroad. It has an export trade in the agricultural products of the surrounding region, and has cotton-mills, a cotton compress and saw-mills. It is a shipping point for cotton and oil. The waterworks and electric-light plant are owned by the city. Pop. 2,990.

COVODE, John, American congressman: b. Westmoreland County, Pa., 17 March 1808; d. 11 Jan. 1871. He was a farmer's lad of Dutch blood, and became a coal dealer, a woolen manufacturer and a railroad owner. He entered public life as a Whig, served two terms in the legislature, was sent to Congress in 1854 by the Anti-Masons (see Anti-MASONRY), and re-elected 1856 as a Republican, serving by regular re-elections till 1863. In 1859 he was appointed chairman of the special committee to investigate President Buchanan's conduct in enforcing through the Lecompton Bill (see title below, and LECOMPTON CONSTITUTION), and his report was valuable ammunition for the Republican party. He was a member of the committee on the conduct of the war. After Johnson's accession he was sent South to aid in that President's reconstruction policy, but was recalled for lack of sympathy with it. In 1868 he was again elected to Congress, and was a strong opponent of Johnson. In 1869 he was chairman of the Republican State Committee of Pennsylvania. He was an eager, impulsive man, with the friendships and the enmities natural to such a temperament, but respected for his entire honesty. See COVODE INVESTIGATION.

COVODE INVESTIGATION, 1860. President Buchanan, in the struggle to have Congress validate the Lecompton Constitution (q.v.), was urged by the party organs to save the unity of the Democratic party, which was menaced with irremediable division, by using
the patronage at his disposal to bring the hesitating members into the ranks. In the debates at the meeting of the 30th Congress 1859-60, two anti-Lecompton Democrats alleged that he had attempted to use corrupt influence with them. On 5 March 1860 John Covode (q.v.) moved the appointment of a committee to inquire whether the President or any other official had attempted, by money, patronage or other improper means, to influence legislation or the execution of the laws, etc. In spite of Democratic objection that only insinuations and no specific charges were made, the rules were suspended by 117 to 45, and the resolution adopted; an investigating committee of five was appointed, with Covode at the head. Buchanan sent in a message of protest 28 March, objecting on the ground that the President could only be indicted by impeachment, and that this was an indictment; and that such a method was inconsistent with the dignity of the office. The protest was declared unfounded by 88 to 40. On 16 June the committee reported, the Republican members declaring that the mass of evidence collected was proof of corrupt use of patronage, and Covode later alleged that they found a receptacle, a bankbook. The Democratic members declared the allegations unsupported. No action was recommended to the House by the majority report, and none was taken. On 22 June Buchanan sent a second message protesting against the rejection of his first, and saying that on such views no man of honor and principle could accept the presidency. The House appointed another committee to report on this at the next session. Consult 'Report of the Committee' (Washington 1860); Buchanan's 'Autobiography,' with his defense; Curtis, 'Life of Buchanan' (1883), for another defense.

COW, the female of bovine animals, of which the male is called an ox (q.v.) or a bull. By a familiar process of extension the term has been applied to various other large herbivorous animals, such as the elephant, and even to female seals and whales.

COWBANE. See COWITCH.

COWBANE, or WATER-HELMLOCK (Cicuta maculata), a perennial, umbelliferous, aquatic plant, producing an erect, hollow, much-branched, striated stem three or four feet high, furnished with dissected leaves. It is highly poisonous, containing cicutine, an alkaloid resembling conia (q.v.). C. maculata is the spotted cowbane of the United States.

COWBERRY, a name sometimes used for the starchy roots of C. palustris of the genus Comarum, of the rose family (Rosaceae). It is known also as marsh cinquefoil and purple marshlocks. It is a stout green herb with large and showy purple flowers. It grows in swamps and peat-bogs from Labrador to New Jersey, Alaska and California. It is also indigenous in Europe and Asia. It received the name of cowberry because it was thought, when rubbed on the milk-pan, to thicken the milk. The name is also applied to the cranberry (q.v.).

COWBIRD, a bird (Molothrus ater) of the family Icteridae (q.v.), abundant throughout North America except in the far north, and notorious because of its habit of escaping the drudgery of domestic cares after the fashion of the European cuckoo. Closely related to the bobolink or reed-bird, the male has acute tail feathers and rich spring plumage of that species, while its general build, and particularly its stout beak, are even more finch-like. The male is from seven and a half to eight inches long and iridescent black with a brown head and the female slightly smaller and nearly uniform dull brown. The common name from the habit of associating in flocks with cattle in the fields, apparently for the purpose of securing the flies which frequent the cattle or the other insects which are disturbed by their movements. They are migratory and gregarious, never separating in pairs, but apparently quite promiscuous in their sexual relations. Nests are never built, but, like the European cuckoo, the eggs are stealthily introduced into the nests of other birds, preferably those of smaller size, such as warblers, finches and vireos, of which a great many species are vitiated. Apparently the cowbird expects little choice, but drops its eggs into any suitable nest that happens to be convenient; and, owing to its abundance, an astonishingly large number of nests are thus invaded. Some of the smaller warblers, notably the yellow warbler (Dendroica aestiva) and the redstart (Setophaga ruticilla), endeavor to circumvent the intruder by building a second story to the nest, enclosing between the two floors the egg of the cowbird and even sacrificing one or more of their own. Nests with three cowbird's eggs thus enclosed in as many compartments have been found. Although but a single egg is deposited at a time, as many as three or four will sometimes be found in a single nest, in which cases they have probably been dropped by different females. The alien eggs, which are white or grayish and speckled with brown, and are about 84 by 65 of an inch, hatch before those rightfully belonging to the nest, and, once the young cowbird has hatched, its demands for food so claim the attention of its foster-parents that the latter's own eggs or young are neglected and usually perish. Although chiefly insectivorous birds, their seeds are sometimes eaten by the cowbird.

In the warm parts of America a number of related species occur, which, having similar habits, are also known as cowbirds. A most remarkable relation exists between two South American species.

Molothrus badius, one of those in question, has the unusual habit of seizing and utilizing for the purpose of incubating its own eggs the nests of weaker birds, whose eggs are destroyed. The second species (M. rufoaxillaris) is regularly and perhaps exclusively parasitic on the former. Consult Bendire, 'The Cowbirds,' (in Report of the National Museum, for 1893, Washington 1895).

COWBOYS, in the American Revolution, a band of American Tories who infested the neutral ground of Weston County, N. Y., robbed the Whigs and Loyalists and made a specialty of stealing cattle. A similar band of marauders on the British side received the name of 'Skinners.' The word cowboys is now used to designate the men who have charge of the cattle on the vast ranges in the west and south-
west of the United States. They are well
mounted and usually wear a fanciful costume.
They are bold and adventurous and necessarily
have to encounter many dangers. A number of
them were enlisted in two regiments of cavalry
for the war with Spain, and, under the popular
name of "Rough Riders," greatly distinguished
themselves in the early part of the campaign
against Santiago, in Cuba.

COW-PARSNIP, or GIANT PARSLEY,
popular names for several species of the genus
Heracleum of the family Apiaceae. They are
core perennial herbs three to six feet tall,
with large attractive leaves, for which the plants
are valued in ornamental gardening, especially
close to water and in wet soil. They should not
be allowed to produce seed, because they are
likely to become troublesome as weeds. Several
of the species, of which there are about 60
widely distributed in temperate climates, are
used as stock-feed, particularly in Europe, and
have been as desirable to plant for this purpose,
because they produce an abun-
dance of leaves very early in the spring. H.
panaceus is usually so recommended. It often
attains heights exceeding eight feet and bears
numerous leaves two or more feet long. One
species, H. lanatum, is widely distributed in
North America and furnishes edible stems
which in Alaska are called wild celery.

COW-PILOT, (pomacentrus saxatilis),
a small fish, so called in Bermuda because it
is believed always to accompany the cowfish
(ostracion). It is one of the demoiselles and is
also called "mojarras.

COW-PLANT, a perennial plant of the
family Asclepiadaceae, milkweed family, which
has acquired a celebrity from the repeated state-
ment that its juice is used as milk and that its
leaves are boiled to supply the want of cream.
This arises from the appearance of the juice,
which is white and viscid and contains the poi-
nion of the plant. The leaves of the milkweed
family. In parts of the United States cow-plant
is a common name for Rhododendron maxi-
mum.

COW-TREE, a name given to a number of
trees of different families, the milky juice of
which is used as a substitute for milk. A large
tree (Brosimum galeodendron) belonging to the
family Moraceae, emits, when pierced, a
highly nutritious milky juice with an agreeable
creamy odor and taste recalling that of cow's
milk, but which is slightly viscid and soon be-
comes yellow, gradually thickening into a some-
what cheesy consistency. It grows on the Cor-
dilleras of the coast of Venezuela, where it is
called palo de vaca, or árbol de leche.

COW-WHEAT, the common name for the
hemiparasitic serpentineous genus Melamp-
pyrum, of which there are several species.

COWELL, Edward Byles, English Sans-
krit scholar: b. Ipswich, Suffolk, 23 Jan. 1826;
d. Cambridge, 9 Feb. 1903. He was educated at
Oxford and was for some years principal of
the Sanskrit College, Calcutta. Since 1867 he
was professor of Sanskrit in Cambridge Uni-
versity and was ranked as the foremost Eng-
lish Orientalist of his day. His association with
Edward Fitz Gerald of Omar Khayyam fame
makes him an important figure in English liter-
ary history. He published "The Prákrta Gram-
mar of Vararuci in Sanskrit and English" (1854);
"The Black Yajur Veda" (Books 1-2
with Roer, 1856-64); "The Kaushitaki
Upanishad, in Sanskrit and English" (1861);
"The Maitri Upanisad, in Sanskrit and English" (1863);
"The Kusumāṇḍali, or Hindu Proof of the
Existence of a Supreme Being, in Sanskrit and
English" (1864); "The Aphorisms of Sán-
dilya" (translated from the Sanskrit, 1878);
"The Sarva-Dārsana-Samgraha, an Annotated
Translation from the Sanskrit (with Gough, 1882);
"The Divyāvandana" (with Neil, 1886);
"The Buddha-carita," by Asvaghosa in Sanskrit and
English, 1892-94). He left unfinished the
translations of "The Jātaka of Buddha's Former Births" (7 Vols., 1895-1913), of
which the sixth volume was published in 1907,
translated by him in conjunction with Rouse.
His "Life and Letters" were edited by George
Cowell, his kinsman (Oxford 1904).

COWEN, Sir Frederic Hymen, English
musical composer and conductor: b. Kingston,
Jamaica, 29 Jan. 1852. He was brought to
England when very young, and studied music
under Sir Julius Benedict and Sir John Goss.
His cantata, "The Rose Maiden," produced
in 1870, was followed in 1876 by another, "The
Corsair," and "Pauline," an opera. His other
works include "Saint Ursula" (1881), a cantata;
"The Sleeping Beauty" (1885), also a cantata;
"Ruth" (1887), an oratorio; "Song of Thank-
giving" (1889); "St. John's Eve" (1889), a
cantata; "Thorgrim" (1891), an opera; "The
Water Lily" (1893), a cantata; "Signa" (1892),
an opera; "Harold" (1895), an opera; "The
Tranfiguration" (1895), a cantata; "The
Dream of Endymion" (1897); "Ode to the
Passions" (1898); "Coronation Ode" (1899);
"John Gilpin," a cantata (1904); "The Veil" (1910).
He has also composed six sym-
phonies, the chief being No. 3 (the Scandi-
navian), No. 4 (the Welsh), and No. 6 (the Idyl-
lic). Overtures, dances, suites, songs and
duets, piano-pieces, etc., make up the rest of
his musical productions. In 1888 he con-
ducted the concerts at the Melbourne Centennial
Exhibition, and from 1888 till 1892 was conduc-
tor of the Philharmonic Society, and was re-
elected in 1900. In 1893 and 1895 he conducted
Charles Hallé as conductor of the Manchester
concerts, Liverpool Philharmonic Society,
Brad- ford Festival Choral Society, etc. He was
knights in 1911, and has published his remi-
niscences, 'My Art and My Friends' (1913).

COWES, kowz, West, England, seaport in
Hampshire, on the north coast of the island of
Wight, at the mouth of the river Medina. It is
divided into East and West Cowes, a steam
ferry across the river furnishing connection.
The public buildings include the castle, an old
block fort of the time of Henry VIII., now used
by the Royal Yacht Squadron as their
COWHAGE.—COWPEA

great literary distinction, and published in 1638 a pastoral comedy, entitled 'Love's Riddle,' and another in Latin, called 'Naufragium Joculare,' acted before the university by the members of Trinity College. He was ejected from Cambridge as a Royalist and removed to Saint John's College, Oxford. In 1641 he wrote a satirical poem entitled the 'Puritan and the Papist.' He engaged actively in the royal cause, and when the queen was obliged to quit England Cowley accompanied her. In 1656 he returned to England, where he now published an edition of his poems, containing 'Miscellanies,' 'The Mistress,' 'Findariege Odes,' and the never-finished epic, 'Davideis' (on the history of King David). He again visited France, and resumed his functions of agent in the royal cause on the death of Cromwell. On the Restoration he returned with the other Royalists. By the interest of the Duke of Buckingham and the Earl of Saint Albans he obtained the lease of a farm at Chertsey whether he retired in 1656. He took part in founding the Royal Society; in 1661 he published a 'Proposition for the Advancement of Experimental Philosophy,' and a 'Discourse by Way of Vision Concerning the Government of Oliver Cromwell,' which is pronounced by Bishop Hurd one of the best of the author's prose works. He published two books of a Latin poem on plants in 1662; he afterward added four more books, and the whole, together with other pieces, was published in 1676 under the title of 'Poemata Latina.' A poem on the 'Civil War' appeared in 1679; his 'Select Works,' with preface and notes by Bishop Hurd, were published in 1772-77. Cowley was extremely popular in his day, and his style, both in prose and verse, has been highly commented on by critics; but his poems have failed to maintain their ancient popularity. The wit for which they were once celebrated has become obsolete, and he is now little read; but Charles Lamb speaks highly of him as a poet, and Hazlitt as a prose writer. Good modern editions are 'The Birminghamp' (London 1880-81); 'Poems' (ed. A. R. Waller, Cambridge 1905); 'Essays, Plays, etc.' (Waller, ib. 1906). Consult Johnson, 'Lives of the Poets.'

COWPEA (Vigna sinensis). It belongs to the natural order Leguminosae, family Fabaceae, and is native of southeastern Asia, the Malay Archipelago and central Africa. It is closely related to the asparagus bean and the catjang, the other cultivated species of the genus. It was introduced into the United States in the 18th century, and is most largely grown in the southern States, where it is known as the cowpea or black-eye pea. Its habits of growth vary from a bush type in the northern States to a vine where it has a longer period of growth. Numerous varieties are on the market. Whippoorwill, Black, Clay, and Unknown are favorites. They are often grown on poor soils, but such should be enriched either with barnyard manure or phosphatic fertilizers. The seed is sown broadcast or drilled, at the rate of from one-half to one and a half bushels per acre.

Uses and Feeding Value.—It is grown for food, hay, silage, soiling, grazing and soil renovation, having marked powers of enriching the

club-house and the Royal London Yacht branch club-house. Cowes is now principally known as a yachting port, and is considered the best place for building, fitting out and lays down that class of vessels. Besides the building and repairing of yachts and other vessels, the industries include sail and rope making, etc. Cowes is the customs port for the Isle of Wight. The harbor, though small, is well sheltered and perfectly safe. There is good steamer service to Portsmouth and Southampton. The yachting season commences about the middle of May and extends to the beginning of November. Regattas are held annually. Cowes is much resorted to as a bathing place. Pop. 9,635.

COWHAGE. See Cowitch.

COWITCH, COWAGE, or COWHAGE, a plant (Stizolobium pruriens) belonging to the pea family (Papilionaceae). It is a twining annual with large racemes of dark-colored flowers, which in India appear in the rainy season. The food, shaped like the letter S, is covered with delicate bristle-like spines, which are easily detached and, sticking in the skin, produce an intolerable itching. In India these spines are mixed with syrup and used as a vermicidal, the plant being mechanically. When young the pods are cooked and eaten like string-beans. A plant of the same genus, growing in the West Indies, has the same characteristics. The negroes of the Southern States apply the name cowitch to the poison ivy (Rhus toxicodendron).

COWL (Sax. cuggle; Lat. cuculus). See Costumes, Ecclesiastical.

COWLES, Alfred Abernethy, American manufacturer: b. Torrington, Conn., 28 Sept. 1845; d. 8 Dec. 1916. He was educated at Middletown, Conn., and at Paris, France; became president of the Ansonia Clock Company; the Coronet Phosphate Company; Terraces Estates, Inc.; and vice-president of the American Brass Company. He was also president of the Ansonia Brass and Copper Company; the Ansonia Land and Water Power Company; the Birmingham Elevated Company; the Pebbledale Phosphate Company. He was author of the article "Copper and Brass" in 'One Hundred Years of American Commerce,' edited by C. M. Depew; 'Copper and Brass Industry' in 'The Encyclopedia Americana'; and 'Semitones,' a book of poems (1907).

COWLES, William Lyman, American educator: b. Belchertown, Mass., 1856. He was educated at Amherst College, where he was instructor in Latin, 1880-83. Since 1894 he has been full professor of Latin there. In the study of classical archaeology he has expended extensively throughout the Italian Peninsula. His publications include, besides articles for periodicals, an annotated edition of the 'Adelphi of Terence' (1896); 'Selections from Catullus' (1900); and 'Selections from Pliny, Catullus, Tibullus, Propertius, with Parallel Passages from Horace, Ovid, and Martial' (1909).

COWLEY, Abraham, English poet: b. London 1618; d. Chertsey, Surrey, 28 July 1667. He so early imbibed a taste for poetry that in 1633, while yet at school, he published a collection of verse, entitled 'Poetical Blossoms.' In 1637 he was elected a scholar of Trinity College, Cambridge, where he soon obtained
soil in nitrogen like clover (q.v.). Its average percentage composition is:

Cowpea seeds are eaten by man, either green, shelled and cooked like garden peas or shellbeans, or dried for winter use. They are often fed to stock. Some find difficulty in curing cowpea hay satisfactorily, but this is overcome with experience. The silage is somewhat similar to the green crop in composition. When used for feeding the amount consumed and time of feeding can be regulated, thus avoiding bloating, which is liable to occur when pasturing. Sheep are usually turned on the pasture before the plants are in bloom, cattle about the time the plants come into bloom; while for swine, the peas are allowed to reach full size. An acre will pasture 15 or 20 pigs for several weeks. The manure more than compensates for the vines eaten. Turkeys and chickens eat the ripe peas and do well on them. The plants are sometimes cut down by the cowpea wilt. The September brood of the boll-worm and the weevil (Bruchus xylostinus) also give trouble to the plants. Consult Smith, "Cowpeas." Farmers' Bulletin No. 89; Farmers' Bulletin No. 318; United States Department of Agriculture and Bureau of Plant Industry, Bulletin No. 229.

COWPENS, S. C., post village in Spartanburg County, near the border of North Carolina, with a population of about 1,100. Near here a signal victory was gained by American forces commanded by Gen. Daniel Morgan, over a British division under Colonel Tarleton, 17 Jan. 1781. This engagement is sometimes called the "Bennington of the South," for its decisiveness. See COWPENS, BATTLE OF.

COWPENS, Battle of, in the American Revolution, 17 Jan. 1781. At the end of 1780 Cornwallis held South Carolina with a little over 3,000 men, having lost 1,100 with Ferguson two months before, at Fort Watauga. Waiting for reinforcements, he lay at Winnsborough, north of the centre, within supporting distance of Fort Motte and Orangeburg in the centre, Charleston and Georgetown on the coast, and Augusta and Ninety-Six in the west. In December Greene came down with only 2,000 men, but with a wonderful group of subordinate leaders fit for separate commands. With 1,100 men he occupied Cheraw Hill in the northeast, and kept Cornwallis in alarm for his communications with the coast; 900 under Daniel Morgan, part militia, part regulars, he sent to join hands with the victors of King's Mountain if possible, and alarm Cornwallis for the western posts. Cornwallis moved north into North Carolina to force a like movement on Greene, and sent Tarleton after Morgan. The latter took post in a pasture ground called the Cowpens, near the northern boundary, a few miles southwest of King's Mountain, and just west of Broad River. A long slope led up to a low rise; then came a depression, succeeded 150 yards farther on by another rise; and in rear of this was the river, cutting off retreat. This move of Morgan's was in violation of all military rules, but he was a man of genius and used to militia; he said that he could ask but one thing better, and that was to have them entirely surrounded by the enemy, so they could not run—the river was as regular as a shot to shoot them down. Tarleton came in sight on the morning of 17 Jan. 1781, and Morgan placed his militia 150 yards in front of the first hill, with injunctions to fire at least two volleys at close range before breaking; on the hill, the famous First Maryland regulars, with some fine Virginians; on the second hill, his cavalry under Col. William Washington, a second cousin of George. As the British closed, the militia did not break; they were under Col. Andrew Pickens, and fired many more than the two volleys, with destructive effect. Finally forced back, they retired to the left around the hills to the river bank, in rear of the cavalry, to re-form. The British left stretched around to flank the right of the American regulars, who drew back to face them; the British thought them retreating, and hurried forward in some disorder. Just then Colonel Washington's cavalry charged around the two hills to the left, coming up to the militia's old position and taking the British in rear, with the river on their flank; the militia rushed around the hills to the right, taking them in flank on the left; and the Continental regulars, only 30 yards off, poured in a withering fire and charged bayonet. Hannibal himself led one of the two regiments of a finer piece of tactics, or caught an enemy in a deadlier trap. Most of the British troops threw down their arms; the remnant fled with Tarleton, who barely escaped being cut down by Colonel Washington's sabre. Of the 1,100, 270 were killed and wounded, and 600 taken prisoners, with two field-pieces and 1,000 small arms. The Americans lost 12 killed and 62 wounded. Nearly a third of Cornwallis' army, including all his light troops, were annihilated at a blow.

COWPER, William, English poet: b. Great Berkhamsted, Hertfordshire, 26 Nov. 1731; d. East Dereham, Norfolk, 25 April 1800. The eldest surviving child of the Rev. John Cowper (pronounced Cooper) and Anne Donne (d. 1737), he was born and educated at Oxford. After inheriting weakness of mind and body, and was unfortunate in the influences that surrounded his childhood. At 10 he entered Westminster School. Here he formed friendships with bright youths like the future poet, Robert Lloyd, and showed fondness for athletics and literary
studies; but he also displayed some morbidity, particularly in religious matters. After eight years at Westminster, and a few months at home, he was articled for three years to a London solicitor. Later he described these and the following 12 years as "misspent," meaning that he thought little about the state of his soul and, as the following year, the thirty-seventh of his uncle, Ashley Cowper. In 1752 he took chambers in the Middle Temple. He was called to the bar in 1754, but made few efforts to secure clients, his conduct being partly explained by the fact that in 1753 he was afflicted with a sort of mental dejection that for many months paralyzed his energies. Finally, after he had received consolation from George Herbert's poetry and had had his hard heart softened by prayer, a visit to the seashore completed a temporary cure.

In 1756 his father died; the same year his suit for the hand of his cousin, Theodora Cowper, was rejected by his uncle. She remained true to him, and shortly after her death that year he married her, according to the published (1825). Cowper does not appear to have been inconsolable. There is evidence of a shadowy love affair in 1758, and he had previously been attending the weekly dinners of the "Nonsense Club," with Lord Bute and other old schoolmates, and had done some translating and written a few essays for periodicals. In 1759 he bought a suite of chambers in the Inner Temple and was made a commissioner of bankrupts; but he spent more than his income. In his pecuniary stress he obtained from his cousin, Major Cowper, the gift of the patent office of clerk of the journals of the House of Lords. But his kinsman's right to bestow the post being questioned, it was decided that Cowper's fitness must be tested by an examination. He broke down in his preparation for this, and, as the ordeal drew near, he grew more and more despondent. Finally he made four vain attempts to commit suicide (November 1763). The idea of his securing the office had to be abandoned, and a few weeks later he was placed in the private asylum kept at St. Albans by the poet-physician, Dr. Nathaniel Cotton.

After about five months he began to mend, and arguments with his younger brother, the Rev. John Cowper, tended to dispel the belief that he had committed the unpardonable sin. He continued at the asylum, however, until June 1765, when he removed to Huntingdon, resuming to break away forever from his former life. He became practically a recluse, but he had already acquired a taste for urbanity which was to be so marked a characteristic of his poetry and his correspondence.

In Huntingdon Cowper began his famous friendship with the family of the Rev. Mr. Unwin, particularly with the latter's pious wife (Mrs. Unwin), and his son, later the Rev. William Cawthorne Unwin. They soon took Cowper as a boarder, and at last his religious aspirations were apparently in a fair way of being satisfied. Every day was spent in attending church, reading, and in reading and conversing on evangelical topics. Withal, the friends seem to have been cheerful, not outwardly morbid.

In the summer of 1767 the elder Unwin fell from his horse and died in consequence. Then John Newton (q.v.), curate of Olney, persuaded Mrs. Unwin and Cowper to remove to that town, which has since been associated with the poet's memory. They took a house called "Orchard Side," and Cowper found congenial employment in assisting Newton in his work among the poor and in writing hymns. In 1770, on the death of his brother John, Cowper wrote "Adelphi," an account of that gentleman's man's conversion to evangelical tenets (published 1802). Two years later he and Mrs. Unwin became engaged, but all thoughts of marriage were soon dispelled by Cowper's third derangement, which began in January 1773, and lasted until May 1774. After a terrible dream in February 1773, he seems never to have been able to believe for long that there was any hope of his salvation. Yet, when he had outwardly recovered, he strove manfully not to exert a depressing influence on others, and he took much innocent pleasure in taming hares, keeping a garden, building his summer-house, and describing to correspondents such local events as the Olney fire of 1777. In 1779 Newton published the first part of "The Midnight Ride," including "Oh for a Closer Walk with God" and "God Moves in a Mysterious Way," were by Cowper. Later in the same year Newton accepted a rectory in London. Whether his intense nature had oppressed Cowper's mild genius is a moot point. It is at least certain that the latter's literary career really commenced after his friend Newton left Olney.

Under the encouragement of Mrs. Unwin, Cowper began to write steadily upon a series of didactic, semi-satirical poems— "Progress of Error," "Truth," "Table Talk," and "Expostulation" (December 1780—February 1781). Newton acted as a friendly critic and secured a publisher for the volume, which, with the addition of "Hope," "Charity," "Conversation," and "Retirement," and some shorter pieces, including translations of the Latin poems of Cowper's old schoolmaster at Westminster, Vincent Bourne, finally appeared in February 1782, and was moderately successful. Time has shown, not only that it contained many and passages of observation and reflection, but that it heralded a departure, not too violent, from the overpolished style and somewhat metallic versification of Pope.

Meanwhile, the poet had made the acquaintance of a baronet's widow, Lady Austen, who was visiting near Olney. The intimacy, which Mrs. Unwin shared, became too intense to last more than a couple of years; but, whatever Lady Austen's disappointments, we owe it to two of Cowper's best poems the ballad of "John Gilpin" (November 1782), based on a story she told Cowper to dispel his melancholy, and "The Task," his great discursive poem in blank verse, which, beginning with Lady Austen's theme, the sofa, broadened out into reflections upon life and descriptions of nature unrivaled in their day and in respect to realistic fidelity and homely charm not clearly surpassed since. "The Task" was probably begun in July 1783, and was finally published in June 1785, along with a prose "Lecti on Reading," and in reading and conversing on evangelical topics. Withal, the friends seem to have been cheerful, not outwardly morbid.

In the summer of 1767 the elder Unwin fell from his horse and died in consequence. Then John Newton (q.v.), curate of Olney,
COWPER'S GLANDS—COWPOX

Poplar Field.' All this time, with the exception of three days in May 1785, he believed firmly that God had given him over, and that it was his duty not to pray, since that would imply a questioning of the righteousness of the divine decree.

"The Task," helped by the vogue of "John Gilpin," attained success. Cowper became the chief poet of the day, and secured a popularity which lasted well into the next century. His relations began to pay more attention to him, and in Lady Hesketh, sister of his sweetheart Theodore, and the Rev. John Johnson, of Norfolk, he found supporters during the trying years that were to store for him. His income was increased, and with Lady Hesketh's aid he and Mrs. Unwin removed from Olney to the neighboring Weston in November 1786. Shortly afterward they were shocked by William Unwin's sudden death. Then Cowper suffered his fourth derangement, which lasted from January to the 17th. He was speedily and worked away at Homer, wrote excellent short poems, and resumed his correspondence, but was all the while subject to hallucinations and melancholia. In September 1788 he left from which he the Odyssey, and the complete Homer, including the "Bacchae, Eumolchia," was published by subscription in July 1791, with a success which time has not ratified. Posterity much prefers the pathetic lines "On the Receipt of My Mother's Picture out of Norfolk," written in the spring of 1790. After the Homer Cowper, having been assured by a demented schoolmaster-friend named Teedon that heaven was willing, undertook to edit an elaborate edition of his favorite, Milton. The scheme came to little, but it was the occasion of his forming a warm friendship with his future biographer, William Hayley, to whom he paid a visit in August 1792, accompanied by Mrs. Unwin, who had been partly incapacitated by paralysis. Then Mrs. Unwin's health sank steadily, and Cowper, in a sad state himself, became in his turn the indefatigable nurse. The lines "My Mary" commemorate the melancholy situation. In January 1794, Cowper himself was seized with his old complaint and sank into a groaning illness from which he practically never rallied. He did not appreciate the fact that he had been granted a pension of £300 by the government. Mrs. Unwin also grew worse, and but for the ministrations of Lady Hesketh, Hayley and John Johnson, the last six years of Cowper's life would be a stretch of unrelieved gloom. In July 1795, Johnson removed the two invalids to Norfolk. They settled finally at East Dereham, where on 17 Dec. 1796, Mrs. Unwin died, the event scarcely producing an emotion in the man who loved her. Cowper continued in his state of dejection, though he could still work at the revision of his Homer. His only important original composition during the period was the poignantly pathetic "Castaway," written 20 March 1799. He still persisted in believing that God had forsaken him, and in this dreadful belief he died on 25 April 1800. He was buried in East Dereham Church beside Mrs. Unwin.

Cowper's importance as a precursor of Wordsworth lies in the positive excellence of many of his descriptive and satiric passages and of his humorous and pathetic shorter poems are generally acknowledged. He is a classic, and, if his range of work were sufficiently taken into account—his heroic odes, his familiar verse, his humorous ballads, his poems of domestic affection, his verses on animals (in which he is almost unrivaled), his reflective lyrics, his sonnets and his faithful descriptions of rural life and English nature—he would be ungrudgingly pronounced a great classic. As a correspondent his supremacy is generally allowed.

To his works enumerated above should be added the unpleasant satire "Anti-Thelyphthora" (1781), "Poems from the French of Mme. de la Mothe Guyon, etc." (1801), and "Latin and Italian Poems of Milton" (1808). The first edition of Hayley's biography, with letters, appeared in 1803. In 1835 Rev. T. S. Grimshawe edited the life and letters in eight volumes. Southey's life and edition of the works in 15 volumes (1834–37, 1853–54) is the standard. Of the poems there are numerous editions, among the best being rather the "Poems and Fragments," (4 vols., 1863), "Bennham" ("Globe," 1870), and Milford ("Oxford," 1905); "The Poems of William Cowper" (by J. C. Bailey, 1905). Thomas Wright, author of "The Town of Cowper" (1880), and of the best biography (1892), has edited the fullest collection of the letters (4 vols., 1904). (See John Gilpin; Task, B. E.) For criticism, consult Goldwin Smith's "Cowper" ("English Men of Letters," 1888); Ste. Beuve's "Causeries" (Vol. XI); and Leslie Stephen's "Hours in a Library" (III); Grayce, Caroline, "Cowper and Mary Unwin" (1900) and "A Concordance to the Poetic Works of William Cowper" by John Nove (1887).

William P. Trent,
Professor of English Literature, Columbia University.

COWPER'S GLANDS, two glands discovered by an English anatomist, William Cowper, situated in male mammals behind the anterior portion of the membrane of the urethra. They secrete mucus and are active in the generative function, corresponding to Bartholin's glands in the female.

COWPOX, also known as variola, is an infectious disease of cattle characterized by fever, falling off in the milk yield and the appearance of pustules on the teats and udder. The disease ordinarily runs a harmless course and is quite prevalent, especially in the eastern part of the United States. It is not transmitted except by contact. A similar disease affects horses and sheep. As should be well known, the virus obtained from the pustules of cowpox is used in vaccinating man against smallpox. This virus produces a mild form of the disease, from which man recovers in a few weeks and is then claimed to be immune.

The disease appears in four to seven days after natural infection, or may evince itself in two or three days as the result of artificial inoculation. The attack causes a slight rise in temperature, which is soon followed by the appearance of reddened, inflamed areas, principally upon the teats and udder. These areas expand into nodules containing at first a pale serous fluid and later pus as the disease runs its course. The typical symptoms are present. The total duration of the disease covers about 20 days. The fallen scabs and crusts retain their contagious properties and
tend to spread the disease if fresh cattle are brought in contact with them. In herds that receive careful attention the usual treatment consists of the application of softening and disinfecting agents to such vesicles upon the teats as may have become ruptured by the hands of the milker. Carbolic water or iodine ointment is well suited for this work. In more persistent cases the use of a milking tube is desirable in order to prevent the repeated opening of the pustules during the operation of milking. Washing the cows twice daily with a weak solution of zinc chloride (2½ per cent solution) checks the inflammation and cleanses and heals the parts by its germicidal action. When the udder is hard, swollen and painful, it is well to support it by a bandage and foment frequently with hot water. Milk from affected herds should not be given young children, as in the raw state it exercises a deleterious action on the alimentary canal. (See Smallpox; Vaccination.) Consult 'Abridged Agricultiral Records' (Vol. III, Washington, 1817); and Wilson and Smith, 'Farmer's Cyclopaedia of Live Stock' (New York 1912); 'Farmers Bulletins' (Washington, D. C.).

COWRY, a mollusk of the genus Cypraea, a gastropod, comprising nearly 200 species with beautifully colored shells. The cowries are mostly confined to the tropics, especially of the Old World, none occurring on the coast of South America. They live in reefs and under rocks at low water and feed on various polyps. The money cowry is Cypraea moneta. See Wallich.

COWSLIP, a popular name for several distinct species of plants, both American and European. The English cowslip is Primula officinalis, of the family Primulaceae. It is a stemless perennial herb with a rosette of oval or oblong soft leaves, from among which arise numerous scapes 6 to 10 inches tall and bearing six or eight bright yellow, fragrant flowers in a close umbel which leans to one side. The plant has long been a general favorite in gardens where it usually receives little attention beyond an occasional stirring of the soil to remove weeds and the application of the usual winter mulch of stable manure. Several improved varieties have been produced in divers colors. The plant most widely known in America as cowslip is Caltha palustris, the marsh marigold, a member of the family Ranunculaceae. This is a succulent perennial herb common in wet ground from the Carolinas to the Arctic regions. It has strong fibrous roots, hollow branching stems one to two feet tall, heart-shaped or kidney-shaped leaves and brilliant yellow flowers resembling buttercup, by which name the plant is sometimes called. It is often cultivated for ornament in marshy ground and has developed some improved double-flowered varieties. Its leaves and young stems are often used as a pot-herb in early spring. The American cowslip or shooting-star is Dodecatheon meadia of the family Primulaceae. It is a stemless perennial with fibrous roots, spatulate-oblong leaves in a dense rossette from which the scape rises to a height of 9 to 18 inches or more, bearing at the base of the flower. The foliage resembles that of the cluster resembles the solitary flowers of cyclamen. Other species of the same genus are also known by the name, and like it are planted in hardy flower borders like the English cowslip.

COX, David, English landscape painter: b. Birmingham, 29 April 1783; d. Harbourne, near Birmingham, 7 June 1859. He was for several years engaged as scene-painter for various provincial and London theatres, and during a considerable portion of his early life he had to teach his art for a subsistence. His travels in Wales (1805) furnished him with material for numbers of his paintings. In 1813 he was made a member of the Society of Painters and Water-Colorists and in the following year published a treatise on 'Landscape Painting and Effect in Water Colors.' He removed to Harbourne near Birmingham in 1841. His works are chiefly of English landscape, and in water colors, in which he especially excelled, being ranked by some critics as the first of English water-colorists. At the age of 56 he began the study of oil-painting under Müller and became very skilful in the art. Cox ranks as the greatest of the successors of Gainsborough. His colors are light and fresh, and his treatment of light and shade is most skilful. He excels in small productions. The British Museum and the South Kensington Museum possess some of his water colors and drawings, but the best of his works are in the Birmingham Art Gallery and in private collections. An exhibition of his paintings was held in Manchester 1887. Well-known pictures by him are 'Washing Day' (1843); 'The Vale of Clwyd' (1846); 'Peace and War' (1846); 'The Summit of the Mountain' (1853). His son, David Cox (1809–85), was likewise a water-colorist of some distinction. Consult Hall, 'Biography of David Cox' (London 1881); Solly, 'Memoir of David Cox' (ib. 1875); Baldry, (in Masters of English Landscape Painting,' ed. by Charles Holmes, New York 1903).

COX, Sir George William, English clergyman and historical writer: b. Benares, Hindustan, 10 Jan. 1827; d. Walmer, England, 9 Feb. 1902. He was educated at Rugby and Trinity College, Oxford, and took orders in 1850. From 1850 till 1851 he was curate of St. Mary's, Devon; from 1854 till 1857, of Saint Paul's, Exeter, and in 1881 became vicar of Bekesbourne, Kent. From 1881 till 1897 he was rector of Scrayingham, Yorkshire. He succeeded his uncle in the baronetcy in 1877. In 1891 he was chosen bishop of Natal by the friends of Bishop Colenso (q.v.) but the archbishops and bishops of England refused him consecration. He published 'Poems Legendary and Historical' (with the historian Freeman, 1850); 'Life of Saint Boniface' (1853); 'Ancient Greece from Greek Antiquity' (1861); 'The Tale of the Great Persian War, from Herodotus' (1861); 'Tales of the Gods and Heroes' (1862); 'Tales of Thebes and Argos' (1864); 'A Manual of Mythology' (1867); 'Tales of Ancient Greece' (1868); 'The Mythology of the Aryan Nations' (1870); 'Latin and Teutonic Christendom' (1870); 'History of Greece' (1874); 'The Crusades' (1874); 'The Greeks and Persians' (1876); 'The Athenian Empire' (1876); 'A General History of Greece' (1877); 'The Establishment of British Rule in India' (1881); Introduction to Science of Comparative Mytho-
COX, Isaac Joslin, American educator: b. West Creek, Ocean County, N. J., 19 Nov. 1873. He was educated at Dartmouth College and at the universities of Texas, Chicago, Wisconsin, and Pennsylvania. Between 1896 and 1906 he was instructor and vice-principal at the Ohio State University, where he was afterward assistant professor. In 1911-12 he was Shaw lecturer at Johns Hopkins University. He has published "The Journeys of La Salle and His Companions" (2 vols., 1905); "The Early Explorers" (1906); "The Indian as a Diplomatic Factor in the History of the Old Northwest" (1910). He is actively engaged on a series of frontier studies covering the early relations between Spain and the United States.

COX, Jacob Dolson, American statesman and soldier: b. Montreal, 27 Oct. 1828; d. Magnolia, Mass., 4 Aug. 1900. He was graduated at Oberlin in 1851 and became a lawyer; but upon the outbreak of the Civil War was made brigadier-general of Ohio Volunteers. In 1862 he became major-general of the United States Volunteers, and in 1864 commanded a division at Nashville. At the close of the war he resigned his command and entered the practice of law in Cincinnati. He was elected governor of Ohio in 1865, and in 1869 became Secretary of the Interior in President Grant's Cabinet until 1870 when he resigned. In 1873 he became president of the Walbach Railroad and removed to Toledo to take charge of his new work. He was representative to Congress from October 1877 to March 1879. The University of North Carolina and Davison University, Ohio, conferred on him the degree of LL.D. He has published "Atlanta; The March to the Sea"; "Franklin and Nashville"; "The Battle of Franklin.

COX, James M., American journalist and statesman: b. Jacksonburg, Ohio, 31 March 1870. After a public-school education he was employed in a printer's office, taught a country school, became a newspaper reporter, and was for a time on the editorial staff of the Cincinnati Enquirer. In 1898 he became proprietor of the Dayton Daily News and in 1903 of the Springfield Press-Republic, thus forming the News League of Ohio. From 1909 to 1913 he was a member of the Congress. He was governor of Ohio from 1913 to 1915.

COX, Kenyon, American painter: b. Warren, Ohio, 27 Oct. 1856. He studied in Cincinnati and in Pennsylvania Academy of Design and, from 1877 to 1882, in Paris under Carolus Duran and J. L. Gérôme. In 1883 he settled in New York and painted subjects of many kinds, including portrait, landscape and ideal figure compositions, and also illustrated and wrote on art subjects. Since 1892 Cox has been known principally as a mural-painter, having executed important decorative work in the Library of Congress at Washington, D. C., in the State capitols of Minnesota, Iowa and Wisconsin, in county courthouses at Newark, N. J., and Wilkes-Barre, Pa., in the Public Library at Winona, Minn., and in other public buildings. He modeled a statue of Greek Science for the front of the Brooklyn Institute of Arts and Sciences. He has received various awards and medals, including the Medal of Honor for Mural Painting of the Architectural League in 1910. He is represented by pictures in the National Gallery of Art at Washington, D. C., the Metropolitan Museum, New York, the Cincinnati Museum and other public collections. He received the degree of M.A. from Yale University and of LL.D. from Oberlin. He was a member of the Society of American Artists from 1882, becoming its vice-president at the time of its union with the National Academy of Design in 1906. He is also a member of the American Academy of Arts and Letters, the National Academy of Design, the Architectural League of New York and president of the Mural Painters. He has published six volumes of criticism on art, "Old Masters and New"; "Painters and their Work"; "The Classic Point of View"; "Artist and Public"; "Winslow Homer"; and "Concerning Painting" (1917), besides numerous reviews and magazine articles.

COX, Louise Howland King, American artist: b. San Francisco, Cal., 23 June 1865. She was a pupil of the National Academy of Design and of Kenyon Cox (q.v.), whom she married 30 June 1892. In 1896 she won the third Hallgarten prize of the National Academy of Design, and in 1900 was awarded a bronze medal at the Paris Exposition. She was also awarded a silver medal at the Pan-American Exposition, Buffalo 1901; the Julia A. Shaw Memorial Prize, Society of American Artists, 1903; and a silver medal, Louisiana Purchase Exposition, Saint Louis 1904. She was a member of the Society of American Artists before its union with The National Academy of Design and is an Associate of the Academy. She is represented in the National Gallery of Art (Evans Gift), Washington, D. C.

COX, Palmer, American artist and writer for young people: b. Granby, Quebec, 28 April 1840. Since 1875 his home has been New York. His works are both written and illustrated by himself. He is best known by his "Brownie Books," a very popular series containing humorous pictures and verse for children. Other productions are "Hans Von Petter's Trip to Gotham" (1878); "How Columbus Found America" (1878); "Quercs People" (1888); etc. His "Brownies in Fairyland," a cantata in two acts, and "Palmer Cox's Brownies," a spectacular play in three acts, were produced for several years, on the stage, throughout the United States and Canada.

COX, Samuel Hanson, American Presbyterian clergyman: b. Rahway, N. J., 25 Aug. 1793; d. Bronxville, N. Y., 2 Oct. 1880. He undertook to study for the legal profession, but abandoned it for theology and was ordained to the Presbyterian ministry in 1817. From 1817 to 1821 he held a pastorate at Mendham, N. J., and in the latter year removed to New York, holding two pastorates there until 1834. His prominence as a leader of the anti-slavery movement made him unpopular, and on one occasion his house and church were sacked. He
helped to found the University of the City of New York, now New York University; in 1834-37 served as professor of philosophy in Auburn, and in the latter year became pastor of the First Presbyterian Church of Brooklyn. He also served as professor of church history at the Union Theological Seminary. His voice failed in 1854, and he resigned his pastorate and his chair as professor, but removed to Owego, N. Y. He was a noted orator and is well remembered for a speech at Exeter Hall in 1833, in which he took the British government to task for the continuance of slavery in America. He wrote 'Quakerism not Christianity' (1833) and 'Interviews, Memorable and Useful' (1835).

Cox, Samuel Sullivan, American statesman and author: b. Zanesville, Ohio, 30 Sept. 1824; d. New York, 10 Sept. 1889. He was graduated at Brown University in 1846 and was later admitted to the bar, but forsook the law in 1853 to become editor of The Ohio Statesman at Columbus. For one year he was secretary of legation in Peru. He was a Democratic member of Congress from Ohio 1857-65; and from New York 1869-85, and 1886-89. He was also for a short time Minister to Turkey. He was popularly known as the "letter-carriers' friend" in reference to legislation proposed by him for increase in their salary and the concession to them of a vacation with pay. A statue of him was erected by the letter-carriers in Astor Place, New York. A glowing piece of descriptive writing published in the Statesman during his editorship won him the nickname "Sunset," which clung to him through life. He was a popular lecturer and published 'Eight Years in Congress' (1865); 'Why We Laugh' (1876); 'Diversions of a Diplomat in Turkey' (1887); 'A Buckeye Abroad'; 'Arctic Sunbeams'; 'Orient Sunbeams'; 'Search for Winter Sunbeams'; 'Free Land and Free Trade,' etc.

Coxalgia, or Coxitis, a term formerly applied to a disease of the hip-joint. It is characterized by inflammation, sometimes accompanied by suppuration, which leads to stiffness of the joint and its final destruction by necrosis.

Coccie, kok'ss', or Cockie, Michel, Flemish painter and engraver: b. Mechlin 1499; d. there, 10 March 1582. He was a pupil of Bernard van Orley, and traveled to Rome, where he remained several years, attracted by the works of Raphael, with whom he was probably personally acquainted. Here he executed several paintings in fresco, and many other pieces. He also painted the 'History of Cupid and Psyche,' in the style of Raphael, which was engraved on 32 copper-plates. In the Imperial Gallery at Vienna is a fresco of the Infant Jesus by him. He was the first Fleming to attempt lifesize frescoes in the style of the Roman school. He was appointed court painter by Philip II of Spain and commissioned to copy the altar-piece of the brothers Van Eyck (q.v.) in Ghent. To this day he is regarded as the founder of a defined style. There are some good examples of his painting in the Escorial and in the museums of Brussels, Antwerp, Madrid, Vienna and Prague. His works are rare, even in the Netherlands.

Coxe, Arthur Cleveland, American Protestant Episcopal prelate and author: b. Mendham, N. J., 10 May 1819; d. Clinton Springs, N. Y., 20 July 1896. He was a son of S. H. Coxe (q.v.), but adopted an older spelling of his surname. He took orders in the Episcopal Church in 1841; and after holding rectories at Hartford, Conn., Baltimore, Md., and New York was consecrated bishop of western New York in 1865. In 1872 he visited Haiti to establish churches and ordain clergy. He also founded the Christian Literature Company of whose publications he edited a series of Antinicene fathers. He was a vigorous, powerful prose writer, and his 'Christian Ballads' (1840) was long popular. His other works include 'Athanasiian and Other Poems' (1842); 'Saul, a Mystery, and Other Poems' (1845); 'Thoughts on the Services'; 'Impressions of England' (1865); 'The Criterion' (1866); 'Apollo's, or the Way of God' (1873); 'Institutes of Christian History' (1887); 'The Pascal,' a collection of Eastern poems (1889).

Coxe, Trench, American economist: b. Philadelphia, Pa., 22 May 1755; d. there, 17 July 1824. At first a Royalist he became a Whig, was a member of the Assembly 1780; the Continental Congress 1788; Assistant Secretary of the Treasury 1790; Commissioner of the Revenue 1792-97; and purveyor of public supplies 1803-12. He early devoted much attention to political economy, and his writings and ideas on this subject constitute his chief claim to remembrance. He favored the prohibition of the coating trade to foreign shipping; the importation of foreign goods only in ships of the country producing them; the special encouragement of manufactures; and the exemption of raw materials from tariff duties. He urged the South to take up cotton-raising, is sometimes called the father of the American cotton industry, and is said to have been the first to attempt to bring an Arkwright machine to the United States. His publications are 'Inquiry into the Principles on Which a Commercial System for the United States Should be Founded' (1787); 'Examination of Lord Sheffield's Observations on the Commerce of the American States' (1792); 'Memoir on the Cotton-Slaves of America' (1794); 'Thoughts on Naval Power and the Encouragement of Commerce' (1806); 'Memoir on Cultivation, Trade, and Manufacture of Cotton' (1809); 'Statement of the Arts and Manufactures of the United States for the Year 1810' (1814), the first extended attempt to make an industrial census of the country.

Coxe, William, English historian and traveler: b. London, 7 March 1747; d. Wiltshire, 16 June 1828. He was educated at King's College, Cambridge, and in 1771 took the curacy of Denham, but soon resigned to become the tutor of several young noblemen. With them he spent many years in travel. He published an account of his travels through Switzerland (1779), and through Poland, Russia, Sweden and Denmark (1784-92), which have been translated into almost all the languages of Europe. In 1786 he became a vicar again. He was made prebend of Salisbury in 1791 and archdeacon of Wiltshire in 1804. As historian he brought himself into notice by his 'Memoirs of Sir Robert Walpole' (1798), followed by
those of Horatio, Lord Walpole (1802). He then published his 'History of the House of Austria from 1218 to 1792' (1807); afterward 'Memoirs of the Kings of Spain of the House of Bourbon, from 1700 to 1788' (1813); 'Life of God' (published separately from his Fables, 1807).

COXSWAIN, or COCKSWAIN, a minor officer on board of a ship, who takes charge of a boat and the boats' crew in the absence of superior officers. The term also designates the helmsman of a racing crew.

COYOTE, кóйот or koi’ó-të, prairie wolf (Canis latrans) of the western United States, and before the advent of civilization numerous as far east as the extent of the prairies of the Mississippi Valley, where it was called the red wolf in distinction from the large gray or timber wolf (q.v.). At present it is abundant from the dry plains of Texas, Nebraska and Manitoba, westward to the Pacific coast, south of central British Columbia, and also in Mexico. Throughout this wide range it supports itself easily in spite of civilization, and at night its long-drawn cry, more like a bark than a howl, is heard for long distances; and, owing to its predatory habits, this wailing call inspires terror in its possible victims and rouses the anger of the western ranchman whose flocks and herds are apt to suffer from the inroads of the barking wolf, as the coyote is sometimes called.

Coyotes are smaller than other wolves, being about the size of setter dogs, and, although they often travel in packs, as do other wolves, they are cowardly where man is concerned, and confine their raids to the smaller animals. Their fur is soft, reddish or tawny-gray in color, sometimes slightly tipped with black. The tail is bushy, the ears upright and the slender muzzle very pointed. The coyotes live in hollows among rocks, or in deserted burrows, whence they usually issue at dusk, to hunt. Their food is chiefly gophers, mice, ground-nesting birds, prairie-dogs and other small animals, their depredations on sheep-folds and cattle-ranches being mainly reserved for winter. In former days they were persistent enemies of the prong-horns. They are fleet footed, cunning in avoiding snares and adapt themselves readily to varying conditions,—hence they increase rather than diminish in the more isolated regions where they are found. They were well known to the Western Indians and formed the basis of some breeds of their dogs. Many tales of American Indian folk-lore in these tribes are concerned with them. Consult Elliott, 'Synopsis of Mammals' (1901); Ingersoll, 'Wild Neighbors' (1897).

COYPEL, kvä̃pəl, a celebrated family of French artists (1) Notil.: b. 25 Dec. 1628; d. Paris, 24 Dec. 1707. After he had embellished, by the royal command, the old Louvre with his paintings (from the cartoons of Lébrun), and had in like manner adorned the Tuileries, the Tuileries of the Hotel des Invalides, he was appointed a director of the French Academy in Rome. His four pictures for the Council Hall at Versailles—Solon, Trojan, Severus and Ptolemy Philadelphia—excited the admiration of connoisseurs. His chief works are the ' Martyrs of Saint James' (in the church of Notre Dame), 'Cain Murdering His Brother' (in the Academy), the 'Trinity and the Conception of the Holy Virgin' (in the Hôtel des Invalides). Coyell had a rich imagination, drew correctly, understood expression and was an agreeable colorist. He wrote a 'Dialogue sur le choix des coloris' (published by Camus, 1711).

(2) ANTOINE, his son, b. Paris, 12 April 1661; d. there, 7 Jan. 1722. At the age of 20 he was elected member of the Academy; in 1707 he became professor there and president in 1714. He was made painter to the king in 1716, and painted a great number of portraits. Among his best works are 12 subjects from the 'Aéneid, a portrait of Molière and 'Athalie chassée du Temple.' The designs of the 'Histoire numismatique du règne de Louis XIV' are mostly his. His collected lectures were published under the title 'Discours sur la peinture' (Paris 1721). His pictures are to be found in nearly all of the museums of his provinces.

(3) NOZ.-NICOLAS: b. Paris, 18 Nov. 1690; d. there, 14 Dec. 1734. He excelled in portrait painting. His best-known pictures are 'Triomphe de Galatée' and paintings in the chapel of the Virgin at the church of Saint Saviour. He became a member of the Academy in 1720, professor and court-painter in 1731. (4) CHARLES-ANTOINE, etcher, painter and draughtsman, son of Antoine (q.v.): b. Paris, 11 July 1694; d. there, 14 June 1752. He studied with his father. At court his dramas made him very popular, especially 'Les folies de Cardenio' (1724). His 25 pictures from the history of Don Quixote (at the palace of Compiègne) were very well known. He painted in pastel and also numerous portraits. The principal illustrations of the 'Comédies de Molière' are also the work of this versatile artist. In 1715 he became a member of the Royal Academy; professor in 1720, chief court-painter in 1747 and director of the Academy in the same year; and later chief painter to the Duke of Orleans who became his pupil. Consult Casteu, 'Vie des peintres' (Paris 1910).

COYPU, koi-poö, or NUTRIA, an aquatic rodent (Myopotamus coypu), native to South America. It is known colloquially as the nutria, or otter, in the countries where its pelts furnish the fur commercially misnamed as 'otter.' It is dull brown, has a gray muzzle and red incisors. Its nostrils are so set that it can breathe when all immersed except the tip of its nose. It is somewhat smaller than the beaver, and has a slender, rat-like tail. It is distinctly aquatic, dwelling in ponds, and burrowing into the banks, or building platforms among the reeds on the shore. Owing to the threatened extermination of the coypu local laws have been enacted for its protection as a valuable fur-bearing animal, and it has been saved by these and by a smaller demand for its pelt. Its call is like the moan of a human creature in pain; and when a female and her family of eight or nine take to the water they are very noisy, as well as playful. Consult Hudson, 'The Naturalist on the La Plata' (1892).

COYSEVOX, kwä̃s'voks', Antoine, French sculptor: b. Lyons, 29 Sept. 1640; d. Paris, 10 Oct. 1720. He studied with Lemambert was admitted to the Royal Academy in 1676, was employed by Louis XIV in decorating Versailles and the palace at Marly. His best works are an equestrian statue of Louis XIV;
1-3 Limulus moluccanus, King Crab — upper — lower views are larva
4 Eurypterus Fischeri
5 Pterygotus Anglicus
6-20 Trilobites of various forms
the statue of Cardinal Mazarin; the tomb of Colbert; the group of 'Castor and Pollux'; the 'Sitting Venus'; the 'Nymph of the Shell'; the 'Psyche'; the 'Faun with the Flute'; 'Pegasus and Mercury,' and many portrait busts and statues of the most famous individuals of the day, including Mazarin, Richelieu, Condé, Fénélon, Racine, Charles Le Brun and Maria Theresa of Spain. He carved also a number of memorials.

COYUVOS, kō-yoo'vōz, natives of the Cuyos islands, Philippines (q.v.). They are of Tagbanua stock of the civilized branch known as Silanganen and speak the Tagbanua language. They are Christians. See Tagbanuas.

COZENS, John Robert, English water-color painter; b. 1752; d. 1799. He was instructed by his father, Alexander Cozens, who was one of the two natural sons of Peter the Great by a woman of Deptford. In 1776 he visited Switzerland, with Payne Knight, and in 1783 returned from an extended tour in Italy with William Beckford, who commissioned many of the washed drawings which he then executed. Among his English subjects are some fine studies of trees made in Windsor Forest. The date of his death has been usually stated as 1799, but there is reason to believe that he was alive after 1801. In his treatment of out-of-doors scenery he is a forerunner of the Impressionists. Turner and Constable have learned much from him. (Hannibal Crossing the Alps) was the most famous of his pictures in his day, but it cannot be located.

COZUMEL, kō-soo-māl', an island in the Caribbean Sea, off the coast of Yucatan, in lat. 20° 34' N.; long. 86° 44' W. It is 30 miles long, by about 8 miles broad, and is low and covered with trees. It is fertile and abounds in fruit and cake. Numerous interesting remains of ancient buildings have been discovered on it. When visited in 1518 by Juan de Grijalva it contained a populous nation, and was much respected to as a place of peculiar sanctity by the Indians of the neighboring continent.

CRAB, the name applied to any of the brachyurus or short-tailed decapod crustacea, comprising numerous forms, which, with the exception of a very few fresh-water species, are inhabitants of the ocean. In the crabs the abdomen is folded under the chest (cephalothorax), while the antennae are short and small. The group includes among others the spider-crabs (Hyas, Libinia, etc.), which have a somewhat spherical body with long sprawling legs. The shore-crabs are represented by the species Cancer, which are among the largest of the order. They have a broad shell or carapace, without a prominent beak, or rostrum. There are nine gills on each side. Of the two species on the New England and Canadian coast, C. irroratus is the more common, and often used for food; C. borealis is less abundant. It is an inhabitant of the fossil species (C. pruinosus) has been detected by Packard in a collection from the Miocene Tertiary green-sand beds of Gay Head, Martha's Vineyard. It appears to have been the source from which the two existing species arose by divergent evolution. Allied to Cancer is the mud-crab (Panopecus).

The soft-shelled crab of the markets is Callinectes sapidus; it is so called from being captured soon after molting, when its shell is still soft. The fiddler-crabs (Gelatium), so abundant on our shores, dig holes near high-tide mark, closing the entrance with their larger claw. The oyster-crab is soft-shelled and living within the shell of bivalves. (See Crustacea.) The land-crabs of the tropics live away from the sea, only going to it to lay their eggs in the water during the spawning season. Most crabs are fleet swimmers. They are very active and are remarkable for their gait, running sideways rather than straight ahead. The rear pair of limbs are generally expanded at the extremities into a blade for swimming. Their development is accomplished by metamorphosis through several successive stages or molts. (See Crustacea.) They vary in size from the giant crab of Japan, which is about 18 inches long and 12 inches across the disc, but often has legs over 3 feet in length, to the little pea crabs often found in oysters. The crab forms an article of food for many kinds of fish and is used as human food in various parts of the world. Crabs are generally caught in wicker traps, baited with meat; they are also taken with shallow hopped nets which are baited and hauled rapidly at night. The crabs are kept for market in floating pens, and are shipped alive packed in seaweed. (See also Hermit-crab; Palm or Robber-crab; and the various groups and species above mentioned.) Consult Calman, 'Crustacea' (in Lankester's 'Treatise on Zoology,' London 1909); Calman, 'The Life of Crustacea' (New York 1911). For fossil forms and history consult Ortman, 'Das System der Decapodenkrebsen' (in Zoologische Jahrbiicher, Vol. IX, Jena 1896); Zittel, 'Textbook of Palaeontology' (Vol. I, London and New York 1900).

CRAB-APPLE, a plant of the genus Pyrus belonging to the apple family (Pomaceae). The genus comprises about 15 species, natives of the temperate zone of the northern hemisphere. The term crab-apple is applied rather vaguely to any sour or uncultivated species of the apple family, but strictly it belongs to the varieties of baccata. The species best known in America is P. angustifolia, the narrow-leaved crab-apple, which is a small tree, reaching 30 feet in height, with a diameter of 10 inches. It grows in wild thickets from New Jersey to Texas, Kansas, and south to Florida and Louisiana. The American crab-apple, P. coronaia, grows to the height of 25 feet, and has a diameter of 12 inches. The wood is soft, and of a reddish-brown color. In both trees the wood weighs about 44 pounds to the cubic foot. The American crab-apple grows from Ontario west to Michigan, and as far south as South Carolina. Its fruit is about one and a quarter inches in diameter, greenish-yellow, very fragrant and externally acid. This tree produces the varieties of sweet-scented crab-apple. Other species grow farther south and west; one species, P. loenis, known as the western crab-apple, resembling the American crab-apple, is found from Minnesota eastward through Wisconsin and Illinois, and extends south and west through Kentucky to Louisiana and Indian Territory. The cultivated crab-apple requires about the same treatment as the true apple. See Apple.

CRAB-EATING DOG, a fox-dog (Canis cancricivorus), native to eastern South America from Guiana to northern Argentina, but said
to be quite unknown on the pampas. It is somewhat smaller than the colpeo of the extreme south, and less handsome in color. In this respect it is subject to great variation, ranging from black, with bright red on the legs, to dun-gray with very little black on the back, but the tip of the tail is always black. It is a forest or jungle-dwelling animal, feeding upon rodents and birds and upon crustaceans, whence its English and Latin name. It does much damage to crops in the inhabited districts when hunting in the woods it follows its prey by scent, but in the open it is said to hunt by sight.

CRAB-EATING ICHNEUMON, ik-nü'-món, a mongoose (Herpestes urva or cancriorus), native to southern Asia from the slopes of the Himalayas to southern China and Assam. It is said to be partially aquatic in habits and to live on frogs and especially on crabs, whence its name. It is, however, little known scientifically.

CRAB-EATING RACCOON, a kind of raccoon (q.v.) native to South America (Procyon cancriorus), considerably larger than the northern raccoon and having shorter fur and proportionately much larger teeth. It is found from Panama to Colombia and Guiana. The darker sort, found farther south, has often been considered as a distinct species, and called the black-footed raccoon. In habits, these South American raccoons are much like their northern relatives.

CRAB GRASS, or FINGER GRASS (Syn-therisima sanguinalis), belongs to the family Poaceae, or grass family. It is a very common annual grass found throughout the United States and thriving in warm weather. It has erect or decumbent stems which often grow two or three feet high and bear from 4 to 15 erect or spreading spikes, which carry the flowers and fruit. It is cultivated in the southern States for hay and pasturage. The hay is easily injured if wet while curing. Its value is similar to that of Bermuda grass. It was introduced from Europe, where it is a weed, although it is cultivated on sandy land in Bohemia, the fruit being used for orridge. In the northern parts of the United States, owing to its strong roots it is difficult to eradicate and is regarded as a bad weed.

CRAB ISLAND, West Indies. See Virques.

CRAB-LOUSE (Phthirius inquinis), a wingless insect of the family Pediculidae or sucking lice, which is usually classified under the Hemiptera. It is different in shape from the other lice, having a short and broad crab-like appearance. It is whitish, with the thick legs and claws reddish, and is nearly one-tenth of an inch in length. The crab-sole infects the pubic regions of the human body, sometimes occurring among the hairs of the arm-pits, or even of the eye-brows. The insect attaches its eggs in great numbers to the hairs, or may easily be seen with an ordinary reading-glass; and the young half burrow beneath the skin, clinging tenaciously. The itch or disease called phthiri-asis is due to the attacks of this repulsive pest, when occurring in great numbers. The virulence of the disease in ancient writing was probably exaggerated. Sharp suggests that in the cases of disease attributed to this insect the patient was suffering from some other disease, but being in a neglected and filthy condition was horribly infested with these disgusting creatures. Red precipitate, and any oily or greasy applications, together with frequent use of carbolic acid soap are efficient remedies.

CRAB-SPIDER, a small spider of the family Thomisidae, so-called on account of its laterally bent legs and side-wise progression. The body is much depressed and the legs are ar-ranged in two parallel transverse rows. The Thomisus vulgaris and other species are common in the United States. They spin no webs except for the support of the cocoon, but pursue their prey which, owing to their flat bodies, they are enabled to seek in crevices. The claws or talons of this spider are very large and strong; sometimes they are removed, set in gold, and used as tooth-picks, being supposed to have medicinal properties as prophylactic of tooth-ache. The name is also applied to the bird-catchin spider (q.v.).

CRABB, George, English lawyer and philologer: b. Falgone, England, 8 Dec. 1778; d. Hammersmith, England, 4 Dec. 1854. He studied in Germany, and on his return to England published a series of German textbooks which were long in use. In 1829 he was admitted to the bar. He was the author of 'Old East English Synonyms' (1816; 10th ed. 1849); 'An Historical Dictionary' (1825); 'Mythology of All Nations' (1847); 'A Technical Dictionary of Terms Used in Science and Art'; and 'A Dictionary of General Knowledge.'

CRABBE, George, English poet: b. Alder-burgh, Suffolk, 24 Dec. 1754; d. Trowbridge, Wiltshire, 3 Feb. 1832. He early showed a passion for reading. A week before the time at school he was apprenticed to a village doctor and afterward to a surgeon. He contributed verse to 'Whistle's Magazine' after 1772. He returned to medical studies in London and returned to his native place to practise his profession. He abandoned the profession in 1780 and went to London to pursue literature. In that year he published 'The Candidate,' but its failure disheartened him and he called upon Burke, who took him under his protection and helped to publish 'The Library' (1781). At Burke's direction he entered the Anglican ministry, was chaplain to the Duke of Rutland, held several other church livings, the last of which was Trowbridge, where he remained from 1814 until his death. Among his best-known poems are 'The Village' (1783); 'The Newspaper' (1785); 'The Parish Register' (1807); 'The Borough' (1810); 'Tarquin in Venice' (1812) and 'Tales of the Hall' (1819). Crabbe was popular in his time, being praised by Dr. John-son, Scott, Byron and Wordsworth. His reputation has declined greatly since his day, but he is still important for his realism and tragic portrayal of the lives of the people of old Anglia. (See PARISH REGISTER, T.E.) Consult 'Works,' with memoir by his son (8 vols., London 1835; 1 vol., 1901); Ainger, A., 'Crabbe' (New York 1902); Huchon, R., 'George Crabbe and His Times' (1907); and Courthope's essay in Ward, 'English Poets' (London 1884).
CRABETH, kra'bat, Dirk and Wouter, two famous Dutch glass painters of the 16th cen-
tury, have left in the art of glass painting a
mark that is still characteristic of the
period. Wouter's paintings are found in France and
Italy, but the best work of both brothers is in
the Saint Jansekerk in Gouda, where Dirk
painted a group of bishops. The piece known as
'The Bishops' is one of the finest, and show more
brilliant coloring than those of Wouter. The others are
'The Sacrifice by
Elia Thys' and 'Priests of Baal'; 'Washing the
Disciples feet'; 'Queen of Sheba before
Solomon' and 'The Sacrifice of Heliodorus.'
Wouter died about 1581, 20 years before his
brother. His work was of wider range than
Dirk's, including some portraits and archer
glass in the Museum of Delft and
'the Loan of a Lover' at Petaluma. In 1863 she appeared in
New York in spectacular plays at Niblo's Garden, and first
•
gained a reputation in John Brougham's 'Little
Nell and the Marchioness.' She soon became a
favourite with the American public in pronon-
ced comedy, playing parts especially written
for her. Her chief successes have been as
'Topsy,' 'Sam Willoughby,' 'Fire-fly,' 'Mut-
ette,' 'Zip,' 'Bob,' 'The Little Detective,' and
'Nineteenth.' She retired from the stage in 1891,
having achieved Fortune. Consult Welch,
McKay and Wingate's 'Famous American
Actors of To-Day' (New York 1896); and
Clapp and Edgett's 'Players of the Present' (in
Dunlap Society Publications, lb. 1869).

CRACKER. See BISCUIT.

CRACKER INDUSTRY. The. There is,
perhaps, no branch of American enterprise that
has enjoyed more phenomenal development dur-
ing the past few years than the cracker, or bis-
cuit, industry, for certainly there is no other
single avenue of commercial endeavor that is so
far reaching in its source of supply, or which
brings its perfected product into so many homes.
While we have derived the name 'biscuit,'
from the French, it originally came from the
Latin, having been a word that was used to
signify that the bread eaten by the Roman
soldiers was sent twice to the oven. Thus, its
actual meaning, 'twice baked.' Just how, or
when it first came to be used in France, nobody
can tell, but it reached the United States via
England sometime about the middle of the 19th
century. Prior to that time such a title had never
been applied to the product of our bak-
eries, although in Europe almost every article of
food in the form of a sweet, or flavored cake
had long been known as a biscuit.

It was in the latter part of the 18th century
that some bakers in the United States began
to produce crackers. They were crude arbi-
cles of food, made of plain and unsweetened
dough, always unflavored, but crisp. The re-
ception which this kind of cracker was
so favorable that their use in this country
not only continued to increase but there was
an ever-widening demand from abroad, where
the name 'cracker,' was dropped, all such
products promptly being absorbed into the
generic title, 'biscuit.' The name 'biscuit'
was retained in America, however, until within
the past few years, when the term 'biscuit'
has been adopted in some cases as a more sweeping
classification.

So far as we have any authentic record,
the first cracker bakery in the United States
was that of Theodore Pearson, at Newbury-
port, Mass. Beginning business in 1792, his
specialty was a large cracker which was
known both as 'pilot' and as 'ship' bread. It
was a large, round, clumsy, crisp affair, but fit
met the demands of the merchant marine who
were glad to purchase any article of food that
could be depended upon to keep for a longer
period than ordinary bread.

Pearson's first great business rival was
Joshua Bent, who erected an oven for cracker
baking at Milton, Mass., in 1801. It was a
comparatively small affair, being operated only
three days in each week by Bent himself, as-
isted by other members of his family. During
the other three days the product of the oven was
sold throughout the country from a wagon.
Insignificant as this beginning was it was the
foundation of the manufacture of the celebrated
Bent's water-cracker, another product of the
American baker that has attained an interna-
tional reputation. To-day the cracker is made
as it always has been, of unleavened dough
(flour, water and a little salt). Later ma-
chinery was substituted for the old hand process,
by which the dough was not only mixed and
kneaded by hand, but each cracker was even
rolled out and shaped separately before being
placed, one at a time, on the long-handled sheet-
iron shovel or peel, by which they were trans-
ferred to the floor of the oval-shaped tile oven
which was then in use. So far as the use of raised
or fermented dough in the making of crackers
is concerned, it has been only within the past
half century that its practicability has been
developed to any considerable degree.

It was in 1825 that Artemas Kennedy es-
ablished his bakery at Memotony, now Arling-
ton, Mass. A few years later he moved to
Westford, and, afterward, to Milton. The
elder Kennedy died in 1832, but, in 1834, one
of his sons, Jason Kennedy, inaugurated a
similar enterprise at Charlestown, and, in 1860,
a cousin who had been Jason's foreman, and
who was also named Artemas Kennedy, went
into business for himself at Cambridgeport,
Mass. It was in this manner that the name of
Kennedy became associated with the cracker
industry of America.

The first cracker bakery in Boston was
started by Richard Austin, in Ann street, about
1830. In 1843 he was succeeded by his brother,
Thomas, and the business was continued with-
out interruptions, but under various titles, until
1885, when it again passed into the hands of
the Austins, by being purchased by J. W. Austin,
a descendant of the founder of the house. At
later dates other firms of prominence were estab-
lished throughout New England, among them
CRACKER INDUSTRY

The business of cracker baking in New York was introduced about 1828, when Ephraim Treadwell founded the establishment which is now conducting its operations under the name of Treadwell & Harris. During the next 25 years several other firms entered the same business, but, although some of them were in a position to make a name for themselves, it is yet, so far as its principle was concerned, it was very similar, except in the matter of size and capacity, to the most improved cracker-making machines of the present day.

Great as the demand for this kind of food had become, the year 1849 gave additional stimulus to the trade, for, among all the articles of food that were known at that time, not one was more suited to the purposes of the pioneer and the gold-hunter than the ordinary cracker. If this demand was to be met, therefore, it was necessary that a more rapid process should be devised, so, to cope with this emergency, the manufacturers began to turn the machines, which had formerly been turned by hand, first by horse power, and, finally, by steam power. Already in 1836 the various plants was increased sufficiently to meet all requirements until the War of the Rebellion, in 1861, gave the second great impetus to the industry, for no sooner had war been declared than the demand for crackers, known as "hard bread," began to increase to such an extent that it was absolutely impossible for the manufacturers to keep pace with their orders. Crackers were needed, however, both for the army and for the navy, and it was to meet this imperative demand for food that the mechanical reel oven was invented. This contrivance, which practically revolutionized the cracker trade, consisted of an arrangement of long iron pans, which revolved, one over the other, with an action not dissimilar to that of the Ferris wheel. The pans, which were located in the large oven-chamber, were capable of handling so large a product that the capacity of a single oven was increased from six barrels to 25 or 30 barrels of flour a day, and practically the only change that has been made in this method of baking is in the gradual increase of the size of the pans, some of those that are used at this time having a daily capacity as great as 50, or even more, barrels of flour per oven.

The increase in the variety of goods produced by American bakers did not begin to become apparent until after the introduction of the machine method of baking. Prior to 1840, or even for some years after that date, there were only five kinds of crackers that were known to the general trade, and the few exceptions were products that were of purely local invention and sale. The standard crackers in this period, were the old-fashioned "pilot-bread," the original hard cold-water crackers made by the Dutch, the soft or butter cracker, and the square and round soda biscuit. The last three varieties differed from the older crackers both in the fact that they were products from a fermented dough, and that they were baked a second time. Of these crackers, the most popular varieties for ordinary use were those that had been produced by the process of fermentation, as they were of lighter and softer texture than the old type of hard cracker.

The sweetened, or fancy, cracker more
familiarly known as "biscuit," is an English invention which was placed upon the market sometime later than 1855. Among the English firms that sent their goods to the American market were Mintley & Falcon and Frean & Company, but the products of both houses were sold so widely that they soon found it necessary to establish distributing agencies in every large city of the country. As all these English firms were selling these goods, and as everybody who could afford such luxuries were buying them, it did not take long for the domestic manufacturers to recognize the fact that this was an avenue of trade that must not remain closed to the bakers of this country. Belcher & Larabee of Albany was the first firm to take steps in this matter, but as early as 1865 they sent to England for the cutters and machines necessary to the undertaking, and their attempt to produce these sweetening and fancy biscuits was so successful that other firms soon followed their example, with the result that this branch of the cracker manufacture has gradually extended until it has become one of the greatest sources of profit to the trade. In fact, some of the most important English firms were invaded by the American crackers. The firms of H. J. McCollum of New York, and Denio & Roberts of Boston, then the most prominent makers of bakers' supplies in America, began the manufacture of all necessary appliances for the new industry, so that they were soon able to equip all domestic plants with all machinery needed to enable them to rival the operations of the best bakers of England. As the result, the importation of English goods not only decreased to a marked degree, but, encouraged by their success in this country, several American firms, including Holmes & Coutts, the Wilsons of Philadelphia, and F. A. Kennedy, began to introduce their high-class unsweetened goods to the European market.

In 1890, in accordance with the consolidation idea that was then sweeping the country, the largest plants in the United States were formed into three large companies. The first, the New York Biscuit Company, included nearly all the cracker interests in New York and New Jersey. The second, the English Biscuit Company, New York city being the largest and most complete in this country. The American Biscuit Company represented chiefly the West and South, while the United States Baking Company had large factories in Ohio, Indiana, and Pennsylvania. These three concerns, which then represented an aggregate capital of $25,000,000, and an annual consumption of flour which approximated 1,400,000 barrels, were again absorbed, in 1898, under the one title of the National Biscuit Company. With a capital of $55,000,000, and with bakeries in all the principal American cities, this company has not only revolutionized the methods of cracker-making but has introduced many novel ideas, not only in the form of new varieties of crackers, but also in the matter of high-grade packages and other inventions which have added greatly to the commercial value of this product of our national industry. Consult 'The Cracker-baker, Devoted to the interests of the Cracker and Biscuit trade of the World,' (Vols. I-V, New York 1912-13).

CRACKING PETROLEUM. The process in petroleum distillation known as "cracking" is the subjecting of certain distillation products to a degree of heat so far above their boiling points that they are decomposed into component parts whose boiling points are lower. It is accomplished in an efficient manner by passing the condensing vapors arising from the boiling petroleum upon the cool dome of the still, whence they drop into the superheated oil below, where they are broken up into lighter oils and instantly vaporized, passing on to the condensers. As ordinarily carried on the process aims to increase the yield of illuminating oil (kerosene) by thus cracking the heavier oils which distil over immediately after the kerosene vapors have ceased, that is, above the temperature of 625°F. When this temperature is reached the fire under the still is subdued, and the distillation continued slowly up to 700°F, during which period the heavier oils dripping back are cracked into gasoline and kerosene. The additional amount of kerosene obtained from the oil is from 18 to 28 per cent.

The cracking process has more recently been invoked to secure a larger amount of gasoline from crude oil, and from kerosene, to meet the enormous demand for motor fuel. Several processes were invented in the United States and Europe almost simultaneously. The Burton process in extensive operation in the United States keeps the entire contents of the still and also of the condenser under a pressure of 60 to 75 pounds to the square inch, through the manipulation of a valve, which is opened occasionally to avoid the liquefaction of the gases in the tubes. The syrupy residue of the distillation is distilled at atmospheric pressure, and its distillate returned to the cracking still. Some crude oils by this process are made to yield as much as 60 per cent in crude gasoline distillate. This is immediately available for use in marine motors, but requires deodorizing for use in automobiles.

The Hall process (American), patented in 1913, found a warm reception in England and on the Continent, and many large plants are using it. The raw material in this process is common gas oil, and the gasoline yield reaches 70 per cent of "motor spirit" as it is called, having from 18 to 31 per cent more power than ordinary standard gasoline.

In the Rittman process the petroleum vapor is passed into a tube heated to 850°F., under very heavy pressures, ranging up to 500 pounds to the square inch. This vapor is then condensed under pressure, and the resulting lighter distillate is distilled for gasoline. The yield is from 60 to 70 per cent of the original bulk of the oil, in small quantities.

Other processes first subject the oil to great heat under heavy pressure, and then distil it; or take the vapors of boiling oil through iron tubes containing a red-hot sponge of some metal; or vary the operation either in the heat and pressure in the still, or in a decomposer, or by some other manipulation, the essential features being heat and pressure. All of these processes are successful in some degree in securing an increased yield of the sought-for gasoline. Consult Bacon, R. F., and Hamor, W. A., 'The American Petroleum Industry' (New York 1916).

CRACKLIN', or CRACKLE WARE. See CERAMICS.

CRACOW (Ger. Krakau, Polish Kraków, Lat. Cracovia or Carodunum), a city of Galicia,
Austria, capital of the former Polish republic of Cracow. It stands on the left bank of the Vistula, across which it is connected since 1850 by a suspension bridge. Cracow consists of the inner city, whose ramparts have long been demolished, and seven suburbs—Piasek and Kleparz in the north, Wesoła east, Stradom and Kazimierz south and Wawel and Novi Szwiat in the west. When the old fortifications were the Florian Gate and a tower dating from 1498. According to tradition Cracow was founded A.D. 700 by the Polish duke Krak (Cracus), and built with the spoils taken from the Franks. It was the Polish capital from 1320 to 1609, when Sigismund III moved his court to Warsaw, though Cracow remained the coronation site till 1764. Charles XII captured the city in 1702; it was taken and retaken several times by the Russians and other confederates. Formally a wealthy city (it holds 25 votes in the Hansa League in 1430) Cracow became gradually impoverished until, in 1787, its population had fallen below 10,000. The Russians, who had captured it in 1768, were expelled by Kosciusko in March 1794, but it surrendered to the Prussians three months later and was handed over to Austria in 1795, when Poland was dismembered for the third time. Together with western Galicia it formed part of the duchy of Warsaw 1809 to 1814. The Congress of Vienna made Cracow a republic in June 1815, with independence and neutrality guaranteed by Prussia, Austria, and Russia. The constitution vested the legislative power in a house of representatives and a senate of eight members and a president. In consequence of repeated breaches of the constitution by the nobility, the three guarantory powers sent a commission of inquiry to Cracow in 1829. Part of the population joined the Polish revolution in 1830, which led to a Russian occupation of the republic, which was restored and reorganized in 1833. Renewed disorders brought about military occupation in 1836 and again in 1838 till 1841. Cracow became the headquarters of the insurrection in February 1846 and in a few days was seized by Russian and Austrian troops. On 6 Nov. 1846 the Treaty of Vienna (1815) was abrogated and Cracow was annexed to Austria despite the protest of England and France. In 1849 it was incorporated with the Crown land of Galicia. A great fire on 18 July 1850 laid most of the city in ashes. Violent anti-clerical riots broke out in 1869 owing to the discovery of a nun having been secluded in a convent cell for 21 years.

There are in Cracow 40 churches, numerous chapels, 2 monasteries and cloisters and 7 synagogues. Until 1060 it was the seat of an archbishop; since then of a bishop. The cathedral was erected in 1320–59 and enlarged during the 16th and 17th centuries. It contains the tombs of Polish kings, bishops and national heroes, including Sobieski, Poniatowski and Kosciusko. Some fine marble statues are by Thorwaldsen. Other churches have historical relics and works of art dating back to the 12th century. The Krokevski castle, founded 1265, is used as a barracks and military hospital. The arsenal (1257) is now a museum and art gallery. The new walled town (1881–93) is a magnificent block of buildings and contains treasures of art, literature and scientific research. The old university (1364) was a renowned centre of learning during the Middle Ages and boasted over 8,000 students. It has considerably revived in the last 100 years and is now bilingual in Polish and Latin. There are numerous schools and academies, a high school for women, a conservatoire and a horticultural training college. The population is about 170,000.

During the war the Russians reached as far as the outer line of the defenses of Cracow, which was surrounded by a triple line of fortifications consisting of 30 forts. The Russian advance on Cracow in November 1914 came after the conquest of Galicia in September. An ineffectual battle in December 1914 by the Austrians to check the enemy and close the gate to Silesia. It was in and around Cracow that the great Austro-German concentration took place early in 1915 for the Dunajec-Biala drive of General Mackensen, which culminated in the reconquest of nearly the whole of Galicia. See Poland; War, European—Eastern Front.

CRACOW, University of. See Cracow.

CRADDOCK, Charles Egbert. See Murfree, Mary Noailles.

CRADLE, (1) an infant's bed or cot, usually oscillating on rockers or suspended in such a way as to admit of a swinging motion. (2) In surgery, it is applied to the case in which a broken limb is laid after being set. (3) In engraving, a steel tool shaped like a currycomb, with sharp teeth used in cutting microscopic grounds. (4) As a nautical term, a cradle is the basket run on a line and carrying to land persons from a wrecked vessel; and the frame supporting a ship hauled over a marine railway. (5) The frameworks sustaining the guns in transportation are also called cradles. (6) In agricultural use the cradle consists of a sort of broad scythe for cutting grain. It is furnished with a set of long parallel fingers for catching the grain and laying it in swaths. (7) The cradle or rocker employed in a deterministic consists of a box agitated by hand and used for washing out gold-bearing earth.

CRADLE OF LIBERTY, a name by which Faneuil Hall, in Boston, is known. During the Revolution it was the favorite meeting-place of the American patriots. The name is also sometimes applied to the city of Boston.

CRADDOCK, Sir Christopher, British rear-admiral; b. 1802; d. 1 Nov. 1914. He served in the Sudan in 1881 and in China 1900. During the South African war he acted as transport service officer. Early in August 1914, after the outbreak of the war, Craddock was sent with a small squadron to protect the southern trade routes. He began by sweeping the North Atlantic, sailed through the West Indies to the coasts of Venezuela and Brazil, touched at the Falkland Islands, and toward the end of October he was cruising up the Chilean coast in the Pacific. The object of Craddock's mission was to seek the German Pacific squadron of Admiral von Spee, which had sailed from Kiau-Chau early in August. It was known to the British Admiralty that Craddock's squadron of slow and old vessels was no match for the German squadron of the new swift vessels of superior gun range. Reinforcements were daily expected from Britain or the Mediterranean, but for some unknown reasons these were not forthcoming.
CRAFTS — CRAIG

coming. The surgeon of Craddock's flagship, the Good Hope, wrote on 25 Oct. 1914: "We think the Admiralty have forgotten their trade-route squadron 10,000 miles from London town. Five German cruisers against us. What's the bet on the field? Pray to your Pentases we may never see them."

In the battle that ensued the Good Hope and the Monmouth were sunk, and Craddock went down with his ship. On 8 Dec. Von Spee's squadron was destroyed off the Falkland Islands by a British squadron under Admiral Sturdee. In June 1916 Mr. Winston Churchill, then First Lord of the Admiralty, stated that "the ships which composed Admiral Craddock's command bore no relation to Admiral von Spee's squadron on the other side of the world, and were never intended to be matched against it." See War, European — Naval Operations.

CRAFTS, James Mason, American chemist; b. Boston, 8 March 1839. He was educated at the Lawrence Scientific School, Harvard. In 1859 he went to Germany and studied at the Academy of Mines of Freiburg and at the University of Heidelberg. At the latter institution he acted for some time as private assistant to Bunsen. In 1861 he went to Paris, and there met Charles Friedel, with whom he later carried out some of his most brilliant researches. In 1865 he returned to the United States, and, after devoting some time to mining, became professor of chemistry and dean of the faculty at Cornell University, where he remained until 1870. During the following four years he was professor of chemistry at the Massachusetts Institute of Technology. In 1874 he joined Friedel in Paris, and devoted himself exclusively to scientific research. His investigations were chiefly in the field of organic chemistry. He invented a new hydrogen thermometer; measured the densities of iodine at very high temperatures. His most important achievement was the discovery, with Friedel, of one of the most fruitful synthetic methods in organic chemistry. Hundreds of new carbon compounds have been brought into existence by this method. In recognition of his services to science, the French government made him a chevalier of the Legion of Honor (1885), and the British Association for the Advancement of Science made him one of its corresponding members. In 1891 he again returned to this country, and from 1892 to 1897 was professor of organic chemistry at the Massachusetts Institute of Technology. In 1898 he became president of the institute, and in the same year Harvard conferred upon him the honorary degree of doctor of laws. In 1900 he resigned the presidency of the institute, and again turned to research work in organic and physical chemistry. His recent work concerns questions of thermometry and catalysis in concentrated solutions. The numerous results of his work were published in various scientific periodicals. He has published 'Qualitative Analysis' (1869, and several later editions).

CRAFTS, Wilbur Fisk, clergyman and author; b. Fryeburg, Me., 12 Jan. 1850. He was graduated at Wesleyan University in 1869, and Boston University School of Theology in 1872; preached as a Methodist minister from 1867 to 1879, a Congregational minister from 1880 to 1888, and has been a Presbyterian clergyman. Later he engaged in literary work. He is secretary of the American Sabbath Union, and prominent in reform work; since 1895 he has been superintendent of a bureau of lectures, literature and law, The International Reform Bureau, which he founded in that year. Its headquarters are in Washington where it undertakes agitation in favor of Congressional legislation against various forms of vice. He is author of 'The Sabbath for Man'; 'Successful Men of To-day'; 'That Boy and Girl of Yours'; 'Internationalism'; 'Prohibitor and Hand Books' (1911), etc.

CRAG MARTH, or ROCK SWALLOW. A swallow closely allied to the bank swallow, which is found from Portugal eastward to China in the breeding season, migrating to the tropics for the winter. It frequents and rocky river banks among hills, but does not ascend to Alpine regions. It builds in niches of the rocks a large open-toped nest of mud, occasionally placing this on the timbers of buildings or among ruins, and lays profusely speckled eggs. The general color of the adult bird is a light ash grey brown, the lower parts being creamy buff, and the tail feathers are dark brown, the central and other pairs being conspicuously spotted with white. Consult Sharpe and Wyatt, 'Monograph of the Hirundinidae' (London 1885-94).

CRAIG, Charles Franklin, American army officer and bacteriologist; b. Danbury, Conn., 4 July 1872. He was graduated from the Yale Medical School in 1894, was appointed acting assistant surgeon in the United States army in 1898, and in 1908 became captain and assistant surgeon. Thereafter as biologist and bacteriologist he served in army hospitals at Chickamauga Park, Ga., Fortress Monroe, Havana, the Presidio, Cal., and Manila. In 1896-97 he was a member of the Army Board for the Study of Tropical Diseases; after 1909 he was assistant curator of the Army Medical Museum in Washington, at the same time acting as an instructor in clinical microscopy and bacteriology at the Army Medical School in Washington; and in 1910-11 he was also assistant professor of bacteriology in the medical department of George Washington University. He has published 'The Astivo-Autumnal Malarial Fever' (1901); 'The Malarial Fevers and the Blood of Protozoa of Man' (1909); 'The Parasitic Amebae of Man' (1911); also 'Malarial Fevers' (in Osler's 'Modern Medicine,' 1907); 'Parasitic Disease' (in Hare's 'Modern Treatment,' 1911).

CRAIG, Edward Gordon, English actor and author; b. near London, 16 Jan. 1872. He is the son of Ellen Terry. He played his first part in a London theatre when only six years old, and appeared again in Chicago when he was 13; but his regular début was made in 1889 under Sir Henry Irving, his mother appearing in the same performance. He continued with Irving till 1897, when he left the stage and devoted himself to the study of drawing and wood engraving. In 1900 he began a series of operatic and theatrical productions in which he put in practice some novel ideas in regard to scenery and the mechanical details of stage management. His success with these innovations led him to devote his time wholly to the art of production, and in 1913 he founded a school in Florence,
ITALY, for the dissemination of his theories of theatrical art. He published, besides numerous magazine articles, 'The Art of the Theatre' (1865); 'On the Art of the Theatre' (1911); 'Towards a New Theatre' (1913).

CRAIG, Frank, English artist: b. Abbey Wood, Kent, 27 Feb. 1874. He was educated at Merchant Taylor's School, studied art at Cook's life class, the Lambeth School of Art and the Royal Academy Schools. He began as a painter of humorous life and contemporary history, such as the Boer War, and as an illustrator for Kipling's poems and for the London Graphic. He has illustrated also for Scribner's Magazine, Harper's, the Cosmopolitan and Hearth's Magazine. In 1905 he joined the new Pre-Raphaelite movement, and thereafter painted historical pictures full of expressive figures and quaint costumes, in their general color scheme often resembling Gobelin tapestries. Good examples are 'The Heretic' (1906, National Gallery, London); 'The Maid' (1907, Luxembourg); and 'The Meetinghouse of Nonconformists' (1906); 'Goblin Market' (New Zealand Academy). Among his more recent works are the curiously characteristic portraits of Sir John Jardine and Mr. Pierson (1910). The general style of his early life is 'The Communion on the Velt' (1900, Durban Museum, South Africa). He was awarded a medal at the Barcelona Exhibition of 1911 and also at the Carnegie Institute, Pittsburgh, in the same year.

CRAIG, James Alexander, American Semitic scholar: b. Fitzroy Harbour, Ontario, 5 May 1853. He was graduated at McGill University, Montreal, 1880, and took his Ph.D. degree at Leipzig 1886. He was instructor and professor of Biblical languages in Lane Theological Seminary, 1886-90; professor of Old Testament literature and exegesis, Oberlin Theological Seminary, 1891; and, from 1893 to 1912 was professor of Semitic languages and Hellenistic Greek in the University of Michigan. He has published 'Inscriptions of Salamanassar, King of Assyria, 859-820 B.C.' (1887); 'Hebrew Words in the Assyr. and Babylonian Religious Texts' (1895-97); 'Astronomical-Astrological Texts of the Babylonians' (1899). He edited the Semitic Series of Handbooks and translated and edited Winckler's 'Geschichte der Babylonier.' He has also contributed articles to many philological journals.

CRAIG, Sir James Henry, English soldier and administrator: b. Gibraltar 1748; d. London, 12 Jan. 1812. He entered the army in 1763, became captain of the 47th Foot in 1771, came to America in 1774, was wounded at Bunker Hill, was transferred with the 47th to Canada, and distinguished himself in the early part of Burgoyne's advance upon Saratoga. Made major of the 82d, he sailed for Nova Scotia; in 1781 fought in North Carolina; and was promoted successively lieutenant-colonel of the 82d and colonel of the 16th. In 1794 he became adjutant general to the army in the Netherlands and was promoted major-general. On the conclusion of the war in the Netherlands, he was appointed to command a force to co-operate with the army in 1st instance of the Dutch colonists at the Cape of Good Hope. The colony surrendered to him 14 Sept. 1795. He was governor at the Cape in 1795-97, and from 1797 to 1802 was in India. Having been promoted lieutenant-general in 1801, he commanded the troops in Italy and Sicily in 1805-06, operating in conjunction with the Russians against the French. In 1807 he was made lord lieutenant and captain-general and governor-general of Canada. The French were not well disposed toward the British government, and there were perpetual contentions in the assembly. Craig dismissed two assemblies and he suspended the first of the 'Canadien' newspaper. He resigned the government in October 1811, and in 1812 was promoted general.

CRAIG, John, Scottish preacher of the Reformation: b. Aberdeenshire 1512; d. Edinburgh, 12 Dec. 1560. He was educated at Saint Andrews, entered the Dominican Order, but soon fell under the suspicion of heresy and was cast into prison. On his release (1536) he traveled on the Continent, and after sometime was, through Cardinal Pole's influence, made novice master in the Dominican convent at Bologna and later was prior. While here Calvin's 'Institutes' fell in his way and converted him to Protestant doctrines. He was brought before the Inquisition and sentenced to be burned—a fate from which he was saved by the match breaking open the prisons of Rome. Craig escaped to Vienna and obtained favor at the court of Maximilian II, but the Pope demanded his surrender as one condemned for heresy. The emperor, however, instead of complying with the request, gave Craig a safe-conduct out of Germany. He now returned to Scotland (1560) and was appointed the colleague of John Knox in the parish church of Edinburgh. Thinking the marriage of Queen Mary and Bothwell contrary to the word of God, he boldly refused to proclaim the banns, but afterward yielded under protest. In 1572 Craig was sent to Forfarshire until 1579, when he was appointed chaplain to King James VI. He now took a leading part in the affairs of the Church, was the compiler of part of the 'Second Book of Discipline,' and the writer of the national covenant signed in 1580 by the king and his household. He was a man of great conscientiousness and was not slow to oppose the proceedings of the court, whether contrary to Scripture and to speak wholesome but unpleasant truths to majesty itself. Consult the black-letter facsimile reprint of Craig's 'Catechisms' (Edinburgh 1885), with introduction by T. Graves Law.

CRAIG, Katherine L., American educator: she was educated in the Colorado public schools and at Missouri Valley College. She was elected superintendent of public instruction of Colorado in 1904, re-elected 1906, and became field secretary of the Colorado Women's College in 1909. She codified and annotated the school laws of Colorado; compiled 'Color. School Law and Rules;' 'Washington and Lincoln Day and Flag Day books for use in the public schools and takes an active part in all movements for the political and educational progress of Colorado. She also published 'Primary Geography and its Relation to Judge Greyburn and Kathrine Lee.' She was a contributor to 'Teachers and Pupils' Cyclopaedia'; 'New Students' Reference Work' and the Woman's Athenaeum.

CRAIGHILL, kräg'il, William Price, American military engineer: b. Charlestown, Va., 1
July 1833; d. 18 Jan. 1909. He was graduated at West Point 1853; superintended the building of Fort Sumter 1854-55; built the defenses of Pittsburgh 1863; and on 13 March 1865 was brevetted lieutenant-colonel for faithful and meritorious services. Later he was employed on the defenses of New York and Baltimore, and in the improvement of navigation of southern rivers. He became brigadier-general and chief of engineers; 10 May 1865; and was retired 1887. His publications include an Army Officer's Pocket Companion (1862); and a translation of Dufour's 'Cours de tactique' (1863).

CRAIGIE, Pearl Mary Teresa Richards ("John Oliver Hobbes"), English novelist and dramatist: b. Boston, Mass., 3 Nov. 1867; d. London, England, 13 Aug. 1906. She was educated in Paris and London, married R. W. Craigie in England in 1887 and was divorced from him in 1895. Her vivid and picturesque style, acuteness of observation and caustic humor as well as her extraordinary precision, have charmed readers. Her writings include 'Some Emotions and a Moral' (1891); 'The Sinner's Comedy' (1892); 'A Study in Temptations' (1893); 'A Bundle of Life' (1894); 'Journeys Eastward' (1895); 'The Gods, Some Mortals and Lord Wickenden' (1895); 'The Herb Moon' (1896); 'School for Saints' (1897); 'Osbern and Ursyne,' a blank verse tragedy (1899); 'The Ambassador,' a play (1890); 'The Serious Wooster' (1901); 'Love and the Soul's drummer' (1902); 'The Orange' (1902); 'The Flute of Pan,' a drama (1905); 'The Dream and the Business' (1906).

CRAIK, cräk, Dinah Maria, best known as "Miss Mulock," English novelist: b. Stoke- upon-Trent, 20 April 1826; d. Shortlands, Kent, 12 Oct. 1887. At her 23rd year she published her first novel, 'The Ogilvies.' This was followed by 'Olive' (1850); and 'Agatha's Husband' (1853); but it was with the story of 'John Halifax, Gentleman' (1857) that she gained and retained her reputation as a novelist. This work has had extraordinary popularity, having been translated into French, German, Italian, Greek and Russian. She published in all about 20 stories, among which were 'A Life for a Life' (1859); 'Mistress and Maid' (1863); 'A Noble Life' (1866); 'Hamish' (1871); 'The Little Lame Prince' (1874), etc. Besides these she was the author of a great number of essays on various subjects, such as 'Sermons Out of Church' (1875); 'Plain Speaking' (1882). She published a volume of poems in 1839, reissued with additions in 'Poems of Thirty Years' (1881). Among these 'Douglas, Tender and True' and 'Philip My King' have been widely popular. In 1864 she was married to George Lillie Craik, a nephew of the professor of the same name. The chief characteristic of her literary work was its refined optimism, and its success with the public was largely due to simplicity of diction.

CRAIK, George Lillie, Scottish miscellaneous writer: b. Fifeshire 1798; d. Belfast, Ireland, 25 June 1866. He removed to London in 1832, and for many years was a contributor to Penny Cyclopaedia in the departments of history and biography, but his first independent work of any importance was his 'Pursuit of Knowledge under Difficulties.' This was succeeded by his 'Romance of the Peerage'; 'Spenser and his Poetry'; 'History of Literature and Learning in England'; 'History of British Commerce'; 'English of Shakespeare'; 'Bacon, His Writings and Philosophy,' etc. In 1849 he was appointed professor of English literature in Queen's College, Belfast, an appointment which he held till his death.

CRAIK, Georgiana Marian. See May, Georgiana Marian.

CRAIK, Sir Henry, Scottish educator: b. Glasgow, 18 Oct. 1846. He was educated at Glasgow University and Balliol College, Oxford, and was secretary of the Scotch Education Department 1885-1904. He was created K.C.B. in 1897 and has represented Glasgow and Aberdeen Universities in the House of Commons since 1896. He is the author of 'Life of Jonathan Swift' (1882); 'The State and Education' (1883); 'A Century of Scottish History' (1901); 'Impression of India' (1908).

CRAIK, James, American physician: b. Scotland 1731; d. Fairfax County, Va., 6 Feb. 1814. He came to Virginia early in life, and on 7 March 1754 was commissioned a surgeon. In 1755 he was a surgeon in Braddock's army and took part in the memorable action on the Monongahela. After serving through the French war in the Virginia regiment he settled as a physician near Mount Vernon, and finally at Alexandria. During the Revolution he was in the medical department. He took a prominent part in the disclosure of the plot to remove Washington from command during the winter at Valley Forge and was present at the surrender of Lord Cornwallis at Yorktown. He was Washington's family physician, and ever associated with him on terms of the closest friendship, attending him in his last illness, and being affectionately mentioned in Washington's will as "my compatriot in arms and old and intimate friend to whom he bequeathed his tambour secretary and the circular chair, an appendage of my study.

CRAILSHEIM, or KRAILSHEIM, krl's-him, Germany, town of Württemberg, on the Jagst, 47 miles northeast of Stuttgart. It contains three handsome churches, large public buildings, tanneries, factories, tanneries, machine shops, lumber yards, etc. It has also a large trade in cattle and farm products. It was incorporated in 1338, was ceded to Prussia in 1791, to Bavaria in 1806 and to Württemburg four years later. Pop. 6,100.

CRAIOVA, or KRAJOVA, krl-ya'vâ, Rumania, capital of the province of Doljul, on the river Jiu, 112 miles west of Bucharest. It is the chief commercial centre west of Bucharest and has a very extensive trade in the live stock and agricultural produce of the surrounding fertile district. It has rope and carriage factories, tanneries, military and commercial academies and several churches. It is the headquarters of the First Army Corps. In Roman days it was known as Costra Nova and in the Middle Ages was the capital of Lower Wallachia. Pop. 45,700.

CRAKE, or CORK CRAKE, English name for the sandrill ('Crex Crex'), formerly in imitation of its cry "crake, crake," which is heard everywhere in valleys and low grounds in Great Britain and Ireland in early summer. It is reddish-brown in color, with streaks of a
darker brown along the middle of its feathers. The under parts of its body are of a light brown.

**CRALLÉ, Richard K.** American author: b. South Carolina; d. Virginia, 10 June 1864. He was a relative of John C. Calhoun (q.v.), who employed him as his confidential clerk and amanuensis when he was Secretary of State. He had previously been an editor and Swedeborgian preacher in Washington. He published "Journals of John C. Calhoun, with a Memoir" (6 vols, New York 1853-56) and several polemical works on New-church doctrines.

**CRAM, Ralph Adams,** American architect and author: b. Hampton Falls, N. H., 16 Dec. 1863. He was educated at Exeter, N. H., and Westford, Mass. He has practiced as an architect since 1889. As senior member of the firm of Cram & Ferguson he helped to plan some of the most notable academic and ecclesiastical buildings in the United States. Among these are the New College and Cleveland Tower, Princeton University; Rice Institute, Houston, Tex.; Saint Alban's Cathedral, Toronto, Canada; Saint Thomas's Church, New York; Calvary Church, Pittsburgh; Euclid Avenue Presbyterian Church, Cleveland, Ohio. He became consulting architect for the cathedral of Saint John the Divine, New York, and, in 1914, professor in Massachusetts Institute of Technology. His writings include "Church Building" (1901); "The Ruined Abbeys of Great Britain" (1905); " Impressions of Japanese Architecture and the Allied Arts" (1906); "The Gothic Quest" (1907).

**CRAM, William Everett,** American author: b. Hampton Falls, N. H., 22 June 1871. He is a brother of Ralph Adams Cram (q.v.). He has written "Little Beasts of Field and Wood" (1899); "More Little Beasts" (1901); and, in collaboration with Witmer Stone, "American Animals; Guide to the Mammals of North America North of Mexico" (1902); "More Little Beasts of Field and Wood" (1912).

**CRA BE.** See **SEA-KALE.**

**CRAMP, Charles Henry,** American shipbuilder: b. Philadelphia, Pa., 9 May 1828; d. the same date 1913. He went to the Central High School of his native city, and entered the shipyards of his father, William Cramp. He soon established the prestige of the firm of William Cramp & Sons, which he incorporated and of which he became president. Their shipyards in Philadelphia are the most extensive in the United States, executing contracts for the governments of the United States, Russia, Japan, Argentina, Chile, etc., and exercising a great influence upon modern naval development. He built ironclads and monitors for the United States government in the Civil War and assisted in the reconstruction of the United States navy and the re-establishment of the United States merchant marine. The destroyed battleship "Maine" was built at the Cramp yards, in whose 31 acres of ground nearly 6,000 workmen are employed. Consult Buell, "Memoirs of C. H. Cramp" (New York 1906).

**CRAMP, iteau, painful sensations usually located in a voluntary muscle. It is a form of local cramp in the muscle and may be due to one of several causes, the most im-

**CRAMPTON, Charles Albert,** American chemist: b. Davenport, Iowa, 18 Feb. 1858; d. Washington, D. C., 26 July 1915. He was graduated at the University of Michigan in 1882; was assistant chemist in the United States Department of Agriculture for 10 years; and was chief of the Internal Revenue Bureau from 1910. He became chief of the division of food and drug products. He carried out a number of investigations in agricultural chemistry and published memoirs and reports on special topics of the chemistry of food and agricultural products, including the composition of plant tissues, the composition of butter and other fats, etc. His writings include "Record of Experiments at Des Ligne Experiments Station, Baldwin, L. A." and "Sudden Cutting of the muscle on vigorous stretch oftentimes will relieve cramp. Cramps attacking swimmers are particularly difficult to handle, but if the presence of mind of the swimmer is not lost, turning on the back and floating may prevent drowning.

**CRAMPTON, Henry Edward,** American zoologist: b. New York, 5 Jan. 1875. He was educated at the College of the City of New York and at Columbia College, where he was an assistant in biology in 1893-95, and to which, after one year as instructor in the Massachusetts Institute of Technology, he returned to be fellow, lecturer and instructor in zoology; adjunct professor in 1901-04, and thereafter professor. He was a graduate of the expeditions to the islands of the South Pacific Ocean in 1906, 1907, 1908, 1909, and to British Guiana and the interior of Brazil in 1911, and to the Bahamas and Porto Rico 1912-13. In 1909 he was made curator of invertebrate zoology at the American Museum of Natural History, New York. He has published "The Doctrine of Evolution" (1911); also various monographs on evolution, embryology, experimental zoology and travel.

**CRAMPTON, Thomas Russell,** English engineer: b. Broadstairs, Kent, 6 Aug. 1816; d. London, 19 March 1888. His engineering training was received under such men as the elder Brunel, Sir Daniel Gooch and John and George Rennie. Between 1842 and 1848 he made many improvements in locomotive machinery. In 1843 he designed and patented the engine which bears his name. *The characteristic features of the Crampton engine are a long boiler, outside cylinders set in the middle of the engine's length, and large driving wheels placed quite in the rear of the driving box.* In 1851 he laid the
first practical submarine cable between Dover and Calais, his best piece of professional work. Among other works carried out either wholly or in part by him were the Berlin waterworks; the Smyrna railway; and the Varna railway. He also invented a rotary dust-fuel furnace, and an automatic hydraulic tunnel-boring machine. The outside fire-box shells on many modern engines are still known as Crampton's.

**Crampton's Gap**, Battle of. See South Mountain, Battles of.

**Cranach**, krā'nākh, **Kranach**, or **Kronach**, Lucas, the Elder, German painter and engraver, founder of the Saxony school. Kronach, Ger., 1472; d. Weimar, 16 Oct. 1553. His family name is said to have been Müller, and the name by which he afterward called himself is said to have been taken from his birthplace. In 1508 he became court painter to Friedrich the Wise, Elector of Saxony, and at 1508 he was ennobled. In 1509 he traveled through the Netherlands and at Malines painted the portrait of the future Emperor Charles V, then a child of nine years. In 1519 he was elected to the town council; he became burgomaster in 1537 and again in 1540. He was the intimate friend of Luther, of whom he painted various portraits, several of them still extant. After the death of the Elector Frederick he still remained attached to the Saxon court, for he received as much favor from Frederick's successors—John the Constant and John Frederick the Magnanimous. Cranach's portrait of the latter is contained in the New York Metropolitan Museum. After the battle of Mühlberg, in 1547, in which John Frederick was taken prisoner by the troops of Charles V, Cranach showed his attachment for his master by following him from prison to prison until in 1552 he was set at liberty, when he returned with Cranach at his side to Weimar. He engraved both on copper and wood, and also illuminated manuscripts, and was remarkable for his rapidity of execution. His smaller cuts are by far superior in drawing and detail. He devoted many of his engravings to subjects of value to the Reformation. His work was original and real, and rich in merit. He painted a large number of Madonnas, perhaps the most celebrated of which are to be seen in the cathedral of Glogau and the Pinakothek of Munich. Another favorite subject with him was Christ blessing the little children, a good specimen of which is in the Barings collection in London. Perhaps the most beautiful of his paintings on this subject is contained in the city church of Naumburg. Of his larger religious paintings, good examples are the 'Marriage of Saint Catharine' at Dresden, and the 'Crucifixion', depicting the object of the Reformation, and introducing the figures of Luther and Cranach himself. He excels in portrait painting, but although these show much in detail, they lack the great strength and spirit of the German masters. They have a dry uniformity, a false idea of elegance, which, added to his desire to amuse, heighten the comic effect. Among the best are 'Cardinal Albrecht of Mainz as Saint Jerome' in the Berlin Museum; 'Count Frederick of Saxony,' and an 'Unknown Female' in the National Gallery, London. He painted many miniatures, as in the album of the University of Wittenberg, now at Halle, and especially in John Frederick's 'Book of Toursneys' now at Coburg, a work of 144 pictures. He wrote 'Leben und die Werke Lucas Cranach's' (2d ed., 1844); Schuchardt, 'Lucas Cranach des älteren Leben und Werke' (1851-61); Dodgson in 'Bibliothèque des bibliothègraphes critiques,' (Paris); Fieschig, 'Tafelbilder Lucas Cranaches die Älteren; Cranach Studien,' (Leipzig 1862) and the monographs by Warnecke ('Görlitz 1879'); Lindau (Leipzig 1883); and Michaelson (ib. 1902).

**Cranach**, Lucas, the Younger, German painter: b. 4 Oct. 1515; d. 25 Jan. 1586; second son and a pupil of Lucas Cranach, whose manner he copied so faithfully that many of his father's works are assigned to the son. Moreover, each used a similar mark, a crowned serpent with wings. According to Schuchardt, the son varied his mark by showing the wings of the serpent folded instead of erect, as in the pictures signed by the father. His 'Crucifixion' and 'The Lord's Vineyard,' symbolic of the progress of the Reformation, are in the Staatliche Kirche at Wittenberg. Other pictures of his may be found in Dresden, Berlin and Munich.

**Cranberry**, several trailing species of the family Vacciniacae genus *Oxyccocus*. One of these species, *O. macrocarpus*, is extensively cultivated in the United States for its acid fruit which ripens in the autumn and may be kept until spring, and which finds an important culinary use in the making of sauce, pies, etc., but is never eaten as a dessert fruit. The crop of 1909 was reported to be 967,500 bushels, produced mainly in Massachusetts, New Jersey and Wisconsin, the balance being made up from smaller areas in the northern States. Though one of the species (*O. oxyccocus*) is a native of Europe as well as America, it has not developed European horticultural varieties. Indeed, in Europe the cranberry is cultivated to a much smaller extent than in America.

The two species from which the cultivated varieties have been derived are *O. oxyccocus*, the smaller cranberry, and *O. macrocarpus*, the larger cranberry. Both are natives of northern swamps and marshes, especially in Europe. He painted a large number of Madonnas, perhaps the most celebrated of which are to be seen in the cathedral of Glogau and the Pinakothek of Munich. Another favorite subject with him was Christ blessing the little children, a good specimen of which is in the Barings collection in London. Perhaps the most beautiful of his paintings on this subject is contained in the city church of Naumburg. sible. Late spring frosts injure the blossoms; early autumn ones, the fruit. Further, there must be sufficient water to quickly flood the field. Birds in which sphagnum moss grows upon a peat or muck soil are preferred and are considered specially promising if plants related to the cranberry grow naturally upon the land. Draining the bog and clearing it of trees, brush, roots, moss, etc., is followed by the digging of permanent open ditches two to four feet deep. These spread the water and remove it in times of flooding, etc. After the land is prepared it is usually covered with a few inches of sand to keep down weeds and thus reduce the cost of maintenance. In this sand cuttings six or eight inches long are set at intervals of from 12 to 15 inches apart each way. Beyond the removal of weeds no cultivation is generally given. The third or fourth year a full crop may be expected; 50 barrels being a good yield, though four times that amount has been obtained.

When the beds become too full of vines they are mown or burned over to start a fresh growth and every fourth or fifth year a fresh covering of an inch or so of sand is given. Sanding is not practised in some localities. The cost of preparing and planting a bed as above indicated varies from $300 to $500 an acre. Harvesting is done by hand when highest grades are picked; by raking and combing for the less choice.

Several diseases and insects attack the cranberry. Of the former the most serious is probably the scald, which appears most frequently in hot muggy seasons as a soft reddish-brown spot on the fruit, which quickly swells and gets hard, but later shrivels and either drops off or remains attached to the vine. The leaves are also more or less affected. Spraying with bordeaux mixture is found to be the most satisfactory method of treatment. It is usually most easily done while the bed is flooded. Red galls are often troublesome upon the leaves. This is controlled by burning the beds over in the autumn to kill the spores of the fungus. A large and conspicuous distortion and reddening of the green parts may sometimes prove destructive. The leading insect enemies are two caterpillars which attack the foliage, the other the fruit. The former, known as the black-headed fireworm, may be controlled by the application of kerosene or Paris green. The latter, a kind of span-worm, may be destroyed by spraying with an arsenite when the leaves are falling and the fruit is setting. Generally, perhaps, the beds are flooded to destroy these and other insect pests.

Several other plants bear the name cranberry. Among the best known are Vaccinium vitis-idea, known as low bush cranberry, wolf-berry, mountain cranberry and cranberry. It is a native of Europe and America and is often found in the markets, but is not cultivated. Its fruits reach American markets not only from the northern United States and eastern Canada, but to some extent from Germany and Denmark. The high-bush, high cranberry or cranberry-bush is a shrub, a species of Viburnum, which attains a height of 12 feet and bears scarlet berries which persist during winter. The fruit is scarcely edible. This plant is the one on which the cultivation of the snowberry has been developed. In both forms it is a very attractive and popular ornamental shrub.

CRANBROOK, Gathorne Gathorne-Hardy, 1st Earl, English statesman: b. Bradford, 1 Oct. 1814; d. 30 Oct. 1906. In 1865 he defeated Mr. Gladstone in the celebrated Oxford University election; in 1878 he was raised to the peerage as Viscount Cranbrook. He was Under-Secretary of State for the Home Department (1858–59), president of the Poor-law Board (1866–67), Home Secretary (1867–68), War Secretary (1874–78), Secretary of State for India (1879–80) and Lord President of the Council (1885, 1886–92).

CRANBROOK, Canada, town of British Columbia, in the Kootenay Valley between the Selkirk and Rocky mountains on the Canadian Pacific Railroad, 35 miles west of Fernie. It contains the provincial buildings, a high school, manual training school, several primary schools and churches. It has extensive agricultural and mining interests and is an important trade centre. Its manufactures include lumber, mineral water works, iron foundries, planing mills and saw and door factories. Pop. 3,090.

CRANCH, Christopher Pearse, American artist and poet: b. Alexandria, Va., 8 March 1813; d. Cambridge, Mass., 20 Jan. 1892. He was a son of William Cranch (q.v.). He studied at Columbia University, Washington, D. C.; was graduated at the Harvard Divinity School 1835; preached in Unitarian pulpits for a few years, and then gave himself up entirely to painting and poetry. He studied in Italy 1846–48, 1853–63, when he returned to America and was elected a member of the National Academy, but exhibited nothing after 1871. He was an intimate friend of Lowell and Longfellow; a man of versatile if not commanding talent; and one whose friendship was highly cherished by the few favored with it. Some of his best-known of his paintings are 'Val de Moline, Amalfi, Italy' (1869); 'Venice' (1870); and 'Venetian Fishing Boats' (1871). His well-known poem 'Thought' appeared in The Dial (1840). His published works include 'Poems' (1844); 'The Last of the Huggermuggers' (1856); 'Kobolzelo' (1857); a blank verse translation of the 'Æneid' (1872); 'Satan: a Libretto' (1874); 'The Bird and the Bell, and Other Poems' (1875; 2d ed., 1890); 'Ariel and Caliban' (1897).

CRANCH, William, American jurist: b. Weymouth, Mass., 17 July 1769; d. Washington, D. C., 1 Sept. 1855. He was graduated at Harvard in 1787; admitted to the bar in 1790; appointed an associate judge of the United States Circuit Court for the District of Columbia in 1801; and chief justice of that court in 1805. He held this office till his death, and during a period of over half a century had only two decisions overruled by the Supreme Court. His reports of cases decided in the Circuit Court (1801–41) were published in six volumes; and those of the United States Supreme Court (1801–15) in nine volumes, with supplementary issues in 1835.
CRANDALL, Charles Henry, American writer: b. Greenwich, N. Y., 19 June 1858. He was for five years on the staff of the New York Tribune, and in book form has published: 'The Story of a Social History of New York' (1883); 'Representative Sonnets,' (edited, 1891); 'Wayside Music' (1893); 'The Chords of Life' (1898); 'Songs from Sky Meadows' (1909), the last three being volumes of poems. Mr. Crandall was selected to read the poem at the dedication of the Battle Monument at Saratoga (where Burgoyne surrendered). He contributes essays on social subjects and country life, poems, etc., to leading periodicals.

CRANDALL, Charles Lee, American civil engineer: b. Bridgewater, N. Y., 20 July 1850. He was graduated from Cornell University in 1872 and has been connected with that institution as instructor and professor of engineering from 1874. He has published 'Tables for Computation of Railway and Other Earthwork' (1886); 'Notes on Descriptive Geometry' (1888); 'Notes on Shades, Shadows and Perspectives' (1890); 'Textbook on Geodesy and Least Squares' (1907); 'Field Book for Railroad Surveying' (1909); and is joint author of 'Railroad Construction' (1913).

CRANDALL, Prudence. See PHILLO, PRUDENCE CRANDALL.

CRANE, Bruce, American landscape artist: b. New York, 17 Oct. 1857. He studied art in New York city and in France, and made his first exhibition of pictures at the National Academy of Design in 1879. He gained the Webb and the Sultus prizes; was awarded the bronze medal of the Paris Exposition in 1900; the silver medal of the Pan-American Exposition in 1901; the silver medal of the Carolina Exposition, the gold medal of the National Academy and the gold medal of the Louisiana Exposition in 1904; and the silver medal of the Pan-American Exposition in 1915. He was elected a member of the National Academy of Design in 1901. Among his notable pictures are 'The Hills' in the National Academy; 'March' in the Brooklyn Museum; 'Autumn Uplands' in the Metropolitan Museum; and 'Springtime' in the Peabody Institute, Baltimore.

CRANE, Frank, journalist and author: b. Urbana, Ill., 12 May 1861. He studied at the Illinois Wesleyan University and was ordained to the Methodist Episcopal ministry in 1882. He received from his alma mater the honorary degree of Ph.B. in 1892 and D.D. from Nebraska Wesleyan University in 1894. He held the pastorate of two Chicago Methodist Episcopal churches 1896-1903; and of the Union Congregational Church, Worcester, Mass., from 1904 until 1909 when he resigned to devote himself to journalism. As editorial writer for The Associated Newspapers, the syndicate of 40 newspapers which form the press of France, and as a contributor to leading magazines, his essays treating with the daily problems of life are written in a popular vein and are marked by versatility, shrewd and kindly philosophy. One of the ablest of these essays is widely read throughout America and the English-speaking world under the following titles: 'The Religion of To-Morrow' (1899); 'Vision' (1907); 'The Song of the Infinite' (1909); 'Human Confessions' (1911); 'God and Democracy' (1911); 'Lame and Lovely' (1912); 'Footnotes to Life' (1913); 'War and the World Government' (1915); 'Dust' (1917); 'Adventures in Common Sense' (1916); 'The Looking Glass' (1917); 'Christmas and the Year Round' (1917); 'Lighted Windows' (1918).

CRANE, Frank, American illustrator and cartoonist: b. Rahway, N. J., 1856; d. New Rochelle, N. Y., 26 Oct. 1919. He was a descendant of Sir Peter Crane, and his ancestors founded the town of Crane's Ford, now Cranford, N. J. Crane was graduated from the New York Academy of Design, and became successively cartoonist and art editor of the New York World, and later art editor of the Philadelphi Press. He was subsequently connected with the New York papers, the Times, Herald and Tribune, and the Boston Herald. He was a cousin of Mr. Stephen Crane, the author. Among his humorous creations are 'Uncle Dick's Contractions,' 'Muggsy' and 'Willie Westinghouse Smith.' He also wrote several boys' stories.

CRANE, Ichabod, the country schoolmaster in Irving's 'Legend of Sleepy Hollow,' in the 'Sketch Book' who was frightened away from the Hollow by his adventure with the Galloping Hessian.

CRANE, Stephen, American novelist and poet: b. Newark, N. J., 1 Nov. 1873; d. Badenweiler, Germany, 5 June 1900. After receiving his education at Lafayette College and at Syracuse University, he began as a reporter and newspaper writer; was correspondent for the New York Journal in the Greco-Turkish War 1897 and in Cuba for the Spanish-American War. 'The Black Riders and Other Lines' (1895), a collection of verse, was his earliest volume, followed by his 'Red Badge of Courage' (1896), which excited a widespread interest in his author and adduced a reputation of more than ordinary brilliancy. His later works are 'Maggie: a Girl of the Streets' (1896); 'George's Mother' (1896); 'The Little Regiment' (1897); 'The Third Violet' (1897); 'The Open Boat' (1898); 'The Eternal Patience' (1898); 'While up at Stories' (1898); 'Shadow in the Rain' (1900); 'Great Battles of the World' (1901). In 1903 appeared 'O'Ruddy' written in collaboration with Robert Barr.

CRANE, Thomas Frederick, American scholar: b. New York, 12 July 1844. Graduated A.B. at Princeton College in 1864 and became a professor of the Romance languages at Cornell University on its opening in 1868. For 13 years, 1896 to 1909, he was dean of the College of Arts and Sciences and of the university faculty, and in 1899 and 1912 was acting president. He retired under the provision of the Carnegie Foundation in 1919. He has contributed to periodicals articles on Folk Lore and Medieval Latin Fiction, and has written the following works: 'Tableaux de la Révolution Française' (1884); 'Le Romanisme Français' (1886); 'La Société Française au dix-septième siècle' (1889); 'Boileau les Héros de Roman' (1902); 'Rotrou's Saint Genest and Vancelas' (1907); 'Chansons populaires de la France' (1891); 'Italian Popular Tales' (1885); 'The
CRANE

Exempla or Illustrative Stories from the Sermons of Jacques de Vitry' (1890).

CRANE, Walter, English artist and writer: b. Liverpool, 15 Aug. 1845; d. 14 March 1919. He became apprentice to W. J. Linton, the well-known wood engraver, in 1859, and soon began to illustrate books. In 1888 he became first president of the Arts and Crafts Society. In the following year he became associate of the Royal Hibernian Academy and of the Royal Water Colors Society. From 1893 till 1890 was director of design in the Manchester Municipal School of Art. His principal publications were 'Picture Books' (1865-76); 'Baby's Opera' (1877); 'Grimm's Household Stories' (1882); 'The First of May' (1883); 'The Sirens Three: a Poem' (1885); 'Flora's Feast' (1889); 'Queen Summer' (1891); 'Renascence' (1891); 'Claims of Decorative Art' (1892); 'Decorative Illustrations of Books' (1896); 'Spenser's Faerie Queene' (1895-97); 'Shepherd's Calendar' (1897); 'The Bases of Design' (1898); 'Line and Form' (1900); 'Don Quixote' (1900); 'A Masque of Days' (1901); 'An Artist's Reminiscences' (1907); 'India Impressions' (1907), etc. Among his pictures are 'Renascence of Venice', 'The Curfew', 'They Say But a Shepherd', 'Europe' (1881); 'The Bridge of Life' (1884); 'Freedom' (1885); 'La Belle Dame Sans Merci', 'England's Emblem' (1895); 'The Rainbow and the Wave' (1896); 'Britannia's Vision' (1897); the 'World's Conquerors' (1898); 'Mask of the Four Seasons' (1905) and 'Prometheus Unbound.' Mr. Crane belonged essentially to the imaginative and poetic school so prominent among recent artists. He was identified with the Socialist movement as lecturer, writer and artist.

CRANE, William Henry, American actor: b. Leicester, Mass., 30 April 1845. He was educated in the Boston schools. In 1863, after some amateur experience, he made his début at Utica, N.Y., with the Holman Opera Company, taking the part of the notary in Donizetti's 'Daughter of the Regiment.' In 1870 he became a member of the Alice Oates Company, with which he remained for four years. In 1874 he played at Hooley's Theatre in Chicago, filling the leading comedy roles, and later he acted in San Francisco. Returning East, he made his first marked success with Stuart Robson (1877), at the Park Theatre, New York, in Grover's farcical play, 'Our Boarding House.' Among their other successes were those in the 'Comedy of Errors' and the 'Henrietta' (1899), after which he separated from Mr. Robson. His subsequent plays include 'The Senator,' 'The American Minister,' 'On Probability,' 'A Fool of Fortune,' 'A Virginia Courtship,' 'David Harum' (1900); 'Business is Business' (1905); 'She Stoops to Conquer' (1906-07); 'Father and the Boys' (1907); 'The Senator Keeps House' (1911); and a revival of Bronson Howard's 'Henrietta,' rewritten and produced as 'The New Henrietta' (1914).

CRANE, Winthrop Murray, American paper manufacturer: b. Dalton, Mass., 27 April 1853. He was lieutenant-governor of Massachusetts 1897-99, and made two trips abroad 1900-02. In 1901 he was offered, but declined, the position of Secretary of the Treasury. In 1904, upon the death of Senator Hoar, he was appointed to the Senate, in 1905 elected to fill his unexpired term, and in 1907 for the full term ending in 1913, when he retired from public life.

CRANE, a large wading-bird of the extensive and cosmopolitan family Gruidae. Cranes are often confused with herons, but really are related to the rails. The typical and most widely known species is probably the common crane (Grus communis) of Europe and northern Asia, which has long figured in literature and legendary history. Cranes are large birds, the biggest, as for example our whooping crane, holding its head, when erect, nearly as high as that of a man; but this height is mainly owing to the long neck which eminently fit them for living in marshes and situations subject to inundations, where they usually seek their food. This is principally of vegetable matter, consisting of the seeds of various plants or grains plundered from the grounds recently covered or sown. They kill devour insects, worms, frogs, lizards, reptiles, small fish and the spawn of various aquatic animals. They build their nests among bushes or on tussocks in the marshes, constructing them of rushes, reeds, etc., surmounted by some soft material. They lay but one egg; usually buff, gray or greenish in ground-color and variously marked with darker spots. These birds are said to mate for life.

The cranes annually migrate and perform journeys astonishing for their great length and hazardous character, transporting themselves from the tropical heat of southern India and central Africa to the icy waters of Lapland and Siberia and from Arctic America to the tropics. They are remarkable for making numerous circles and evolutions in the air when setting out on their journeys, and generally form two lines meeting in an angle forward, led by one of the strongest of their number, whose trumpet-like voice is heard as if directing their advance, when the flock is far above the clouds and entirely out of sight. To this call-note of the leader the flock frequently respond by a united clangor, which, at such a distance, does not produce an unpleasant effect. From the fugacity with which these birds disappear, according to the states of the atmosphere, they have, from the earliest ages, been popularly regarded as indicators of events; and their manoeuvres were attentively watched and interpreted by the augurs and auguries among the Romans—a circumstance which, together with their general harmlessness and apparent gravity of demeanour, led to their being held in a sort of veneration, even by some civilized nations. When obliged to take wing from the ground, cranes rise with considerable facility and speed, quickly with their wings and trailing their feet along and near the ground until they have gained a sufficient elevation to commence wheeling in circles, which grow wider and wider until they have soared to the highest regions of the air. When their flight is high and silent, it is regarded as an indication of continued fine weather; they fly low and are noisy in cloudy, wet or stormy weather. Against approaching storms the cranes, like various other birds of low flight, drop to the level of the clouds and the atmospheric currents which bear them.

The North American cranes are three, the whooping or great white crane (Grus Ameri-
CRANE—CRANE-FLY

Crane, pure white, with wing quills black and the top of the head dull red; the little brown crane (G. Condenisis), comparatively small and dull gray in plumage; and the sandhill crane (G. Mexicana). The first of these is almost extinct, even in the far northwest; and the second is growing rare in its subarctic summer home; but the larger, grayish sandhill crane is still fairly common in the Mississippi Valley and Gulf States. The genus contains many foreign species, as the splendidly colored, as the graceful "demoiselle" of southern Europe and eastward; the crowned crane of northeast Africa, whose head bears a spreading tuft of feathers and bristles larger than the head itself; the two-wattled cranes of South Africa; the "native" companions of Australia, and the national crane of Japan, called there "tan-cho," whose gray, black and white plumage and stately attitudes are familiar to us in the paintings and decorative designs of Japanese artists. Many of them are of large size and handsome plumage, although none wear bright colors. It is an ancient family, represented in fossils from the Miocene period onward. Consult Tegetmeier, 'Natural History of the Cranes' (London 1861); Evans, 'Birds' (New York 1900).

Crane, a hoisting and transporting machine, consisting essentially of a central post on which is mounted rigidly a crosswise arm or jib; together with a winding apparatus and a device for rotating the entire structure upon a pivot or on a circular track. The jib is commonly supported at or near its outer end by a strut footed against the lower part of the post or by a tie to the top of the post. The jib is usually so arranged as to carry a traveler, by which the load may be transported toward or away from the post as the case may be. The crane differs from the derrick in that the latter has a boom hinged to the post instead of a jib rigidly attached. In the derrick-crane the jib and the post form one continuous structure, either curved or canted, and this is hinged to the revolving base.

Crane is of very many types, and the largest ones are quite individual in character and construction, as they are erected for particular use. They may, however, be grouped into three general classes: Fixed cranes, portable cranes, and traveler cranes. Each of these classes is susceptible of subdivisions, depending upon their peculiarities of structure and the power used to operate them.

Fixed cranes, as their name implies, are built to operate in the place where erected, within a fixed radius. This class includes the common foundry or quarry crane, suitable for lifting and moving loads up to 10 or 15 tons, and often operated by hand; the whip cranes used in warehouses and commercial establishments, lifting up to five tons and operated by hand or electricity; the wall crane, built like a bracket pivoted against the face of a wall; and wharf cranes, erected substantially at the waterside and often far inland for loading and unloading the cargoes of vessels and of railroad trains. Some of these are of great power, lifting up to 100 tons. They are operated variously by steam or electricity or pneumatically with water or oil.

Portable cranes are also known as balance cranes because of the heavy weights which are placed on the tail of the smaller sizes to counterbalance the load. They are mounted on a truck with wheels to run on a track. This type is in common use by railroads for removing wreckage, and in bridge building and similar work. Instead of the counterbalancing weights, it is usual to mount the hoisting engine and machinery on the tail of the crane. For railroad work, the post and jib are commonly in one piece, and demountable for convenience in transportation. The operating power is steam or electricity. Frequently the machinery is so arranged as to make the crane self-propelling, and it is then called a locomotive crane.

Traveling cranes are of two general types: the overhead gauzy crane and the gauzy crane which runs on the ground. In the former a bridge-like structure runs on elevated tracks placed lengthwise of a yard or building, and on this bridge a traveler runs transversely, thus covering the entire space within the tracks. In small installations the motive power is often a chain worked by hand, but these cranes have been greatly elaborated, and electricity is generally used, though there are instances of the employment of compressed air and also pneumatic installations. In very large plants the traveler frequently carries a cargo in which the operator sits, controlling every motion from a switchboard. Some of these cranes employed in shipbuilding yards and locomotive works are of great power, handling a load of 100 tons with ease and speed. The gauzy cranes, which run on tracks laid on the ground, partake of the type seen in the portable crane in some cases, mounted on an elevated gauzy, the base of which is fitted with trucks to run on the tracks. Another type resembles the overhead traveler crane. Combination structures are numerous and various, including the cantilever crane, in which the jib is extended on both sides of the post into a long trussed arm of the cantilever type; the bridge crane, in which one end of the long jib is supported on a track running on an elevated rail, with a traveler running on this bridge arm; the Titan crane, often built upon a float for harbor use, with its long arm supported by several guys from the top of the tail mast; and the coal and ore hoist, which is used for emptying whole cars, operated generally by hydraulic power. For the multitude of specific details of construction and operation of these indispensable machines, consult Boettcher, A., 'Cranes' (Tolhausen's translation and additions, London 1908); Hill, C. W., 'Electric Crane Construction' (London 1911); Marks, E. C. R., 'The Construction of Cranes and Other Lifting Machinery' (Manchester 1904); Wilda, H., 'Cranes and Hoists: Their Construction and Calculation' (Salter's translation, London 1913).

Crane-fly, or Daddy-long-legs, of Tipula, etc., of the dipterous family Tipulidae. These flies are very common and known by their large size and long sprawling legs. They can usually be distinguished from midges and mosquitoes by their six pairs of legs, each by a V-shaped mark on the back of the thorax. The antennae are rather long and slender, and the hind-body long, slender and cylindrical. They possess a distinct ovipositor, with two pairs of long, horny, pointed valves. The larva is a footless grub, like a maggot, which lives under stones in brooks or in damp soil; its head
CRANE'S BILL—CRANIAL NERVES

is distinct, and in this respect the larva is more primitive and generalized than are those of most flies. It is housed by a mud sprig situated at the extremity of the body. There are many species of crane-flies in the United States.

CRANE'S-BILL, the common name of Geranium, the typical genus of the geranium family, Geraniaceae, so named because of the long slender peak of the fruit of the plant. There are about 175 species, which are widely distributed throughout the temperate regions of the world, of which 16 are found in North America. The plants are mostly useless weeds, although some of them have very showy flowers. Other common names of American species are alum-root, herb robert, red robin, etc. See GERANIUM.

CRAKEY ISLAND, an island in Norfolk County, Va., near the mouth of the James River. Here is situated a lighthouse 50 feet in height, standing on an iron pier, lat. 36° 53' 28", long. 76° 21'. There are government powder magazines on the island.

CRAKEY ISLAND, Battle of, 22 June 1813, in the War of 1812, a British fiasco. The island is at the mouth of Elizabeth River, Virginia, where it opens into Hampton Roads and lies close to the shore at the west, separated by a shallow strait and opposite a tidal creek. To guard the entrance to Norfolk, Portsmouth and the navy yard, a battery of seven guns had been placed on the island, with about 700 men, and 15 or 20 gunboats were anchored across the river channel. Admiral Warren ordered Sir Sydney Beckwith with 800 men to land on the mainland and take the island in rear, while Captain Pechell with 700 in barges landed on the island from the northwest, out of range of the gunboats. Beckwith came to the rear of the island, found the creek and strait too deep to risk fording— or according to Warren's report, the island was too strongly fortified to attack — and re-embarked without an effort, 40 men deserting. Pechell's boats grounded in shallow water some hundreds of feet from the island; the seamen sounded and found deep mud below; three of the barges were sunk by the American guns, and the American troops waded out to musket-range and fired at the men in the boat, killing three and wounding 16, while 20 deserted to the Americans. The remaining boats took in their comrades and retired. There were no American losses.

CRANFORD. Not exactly a novel, Mrs. Elizabeth Gaskell's 'Cranford' was first published as a series of 'sketches from life' in Household Words, a periodical which Dickens was editing. When the series came to an end in 1853 the sketches were collected and issued as a book. Mrs. Gaskell wrote with her memory upon Knutsford (renamed Cranford), a little country town in Cheshire, England, where she passed her childhood, where she later visited, and where she was married. And yet, though she drew freely from her recollections, her art required that she make many alterations in incident and character. Her Cranford is a town given over mostly to spinsters, who somehow manage to spin out a pleasant life on small incomes inherited from a father or a mother dead long ago. A widow may be received into the society, but it is with some suspicion; and a retired army officer is welcome, provided he brings no wife. Rarely are there any marriages except among servants and shop-keepers. Mr. Hoggins, the doctor, manages to take Lady Glenmire, a newwoman, but their conduct is frowned upon by the chaste ladies, one of whom, on retiring, always rolls a ball under her bed as a sure and easy means of detecting whether by chance a man lies concealed there to frighten her with a great fierce face. The most exciting amusements are visits to the shops, little select parties at tea or cards, and an occasional exhibition of a travelling juggler in the assembly rooms. A cow falls into a lime-pit and loses all her air, and her feminine owner dresses her in a flannel waistcoat and flannel drawers to keep away the winter's cold. The literary lady cultivates her mind with the works of Dr. Johnson, and contends that 'Rasselas' far surpasses in humor anything in Mr. Dickens's 'Pickwick,' but just appearing in monthly numbers. There are, of course, no children, but the younger members of the best society find something to do in chasing sunbeams from a new carpet in order that it may not fade. If Cranford's central figure, it is Miss Matty Jenkyns, who should have married in youth Thomas Holbrook, Esq., and been made happy long ago. Both live into old age and die unmarried. It is a romance of subdued but rare pathos.

Mrs. Gaskell wrote novels of wider sweep than 'Cranford.' Her 'Mary Barton,' for example, dealing with the conflict between labor and capital, between the manufacturer and the operatives in his mill, made a profound impression upon the Europe of her day. But this and other novels, like 'North and South,' have lost the greater part of their interest because they are intimately bound up with social conditions which no longer exist and which the world is anxious to forget. 'Cranford' likewise depicts a state of society which has very few resemblances to anything that may be seen at present; but it is a society upon which intrude none of man's darker passions — no greed or avarice or distrust or treachery. Over a woman's world as it once was, with its small duties, anxieties, fears, moderate pleasures, and respectable poverty, Mrs. Gaskell throws the glamour of her own delightful personality. Hers was a delicate humor, a true but not insistent pathos and a charming style.

Willa L. Cross, Professor of English, Yale University.

CRANGANORE, krān-gā-nōr' (Coranganur), India, a town in Hindustan, in the presidency of Madras, on the Malabar coast, lying north of a small bay, 16 miles north of Cochin. It has much historic interest, especially as one of the earliest seats of Christianity in India. The Syriac Christians are said to have been settled here since 345. It was formerly possessed by the Portuguese and later by the Dutch. Pop. 10,000.

CRANIAL NERVES, 12 important pairs of nerve branches which have their origin close to the brain stem and are connected with some of the most important functions of the body. The first or olfactory, the second or optic, the fifth or trigeminal, and the eighth or auditory, are largely sensory in their function, whereas the third or oculomotor, fourth or trochlear, sixth or abducens, seventh or facial, the ninth or
glosso-pharyngeal, tenth or vagus, eleventh or spinal accessory and twelfth or hypoglossal are largely motor in their function, whereas the accessory nerves originate in ganglia situated outside of the nervous axis, whereas the origin of the motor nerves is found in the medulla.

The first or olfactory nerve originates in the mucous membrane of the nose and sends its fibers backward into the brain, where perceptions of smell are located. The second or optic nerve originates in the ganglion cells of the retina and then passes by an extremely complicated series of tracks to the occipital area of the brain. Here sight memories are stored and destruction of a portion of the brain results in forms of sensory aphasia or of various types of partial blindness. The fifth nerve is a mixed nerve, containing both sensory and motor fibers. The sensory fibers originate largely from the Gasserian ganglion and the fibers are distributed over the surface of the face, neck and head, conveying sensory impressions of touch. Branches also go to the teeth and tongueache is usually an affection of these branches of the fifth nerve. The motor portion of the nerve originates at the base of the brain, travels upward in the temporal lobe, where sense impressions of hearing are stored. The sixth, or abducens nerve, is a motor nerve that innervates the muscles of the eye, and is responsible for lateral movement of the eyes. The seventh nerve is of particular interest in that it is the twelfth nerve of the heart and lungs, being the chief inhibitory or regulatory nerve of the heart. Of the purely motor nerves the third or oculomotor is distributed to a number of muscles of the eye, and the fourth innervates the muscles of the face, as well as the sixth. The seventh innervates the muscles of the face, and in facial palsy this nerve is affected. The twelfth nerve is exclusively motor, originates in the medulla and is distributed to the muscles of the pharynx, and in the larynx, the motor fibers being distributed to the various muscles of the tongue, pharynx, larynx, and the heart and lungs. The tenth nerve is of particular interest in that it is the great nerve of the heart and lungs, being the chief inhibitory or regulatory nerve of the heart. Of the purely motor nerves the third or oculomotor is distributed to a number of muscles of the eye, and the fourth innervates the muscles of the eye, as well as the sixth. The seventh innervates the muscles of the face, and in facial palsy this nerve is affected. The twelfth nerve is exclusively motor, originates in the medulla and is distributed to the muscles of the pharynx, and in the larynx, the motor fibers being distributed to the various muscles of the tongue, pharynx, larynx, and the heart and lungs.

The CRANK, in mechanics, is a fundamental form of the lever. The word means primarily a bend, the simple form of crank being a bend of an axle for turning it. On a windlass the crank is the cross-piece that joins the axle with the handle. In a steam-engine the crank may take the form shown in the diagram at 1, in which the broad end of the crank is keyed fast to a rotating shaft and the smaller end is loosely bolted to a connecting rod, for producing reciprocating motion. Sometimes the crank takes the form of a wheel, when it is termed a wheel-clip, tenth or 2. Here, the broad end of the connecting rod shows connection with a piston. The double crank shown as 3 is employed where the crank interrupts the axle lengthwise. B and B are the cranks and A the connecting rod. A three-throw crank is constituted by three of these double cranks on one axle. When there are two or more cranks on one axle they are placed oppositely so as to balance. The one theoretical difficulty with a single crank is that it has two dead centers in every revolution, the dead center being a point at which if stopped the two parts are so disposed that neither a push nor a pull on the connecting rod will start rotation. With a three-throw crank the dead centers are so timed that one crank is always in working position. The crank is the simplest device known for altering reciprocating (or back and forth) motion to rotating motion, or vice-versa, as it has few parts and nothing to get out of order, while the reciprocating part slows up and starts again with the most desirable speed ratio, obviating all shocks in the machine. A crank-pin is the pin or bolt that joins the crank to the connecting rod. A bell-crank is a bent lever somewhat resembling an engine crank, for changing the direction of motion of a wire that pulls a mechanically operated bell.

CRANMER, Thomas, English prelate and reformer: b. Aslacton, Nottinghamshire, 2 July 1489; d. Oxford, 21 March 1556. He was educated at Cambridge and in 1528 was chosen reader of theological lectures in his college and examiner of candidates for degrees in divinity. In the course of conversation on the meditated divorce of Henry VIII from Catharine of Aragon Cranmer remarked that the question of its propriety might be better decided by consulting learned divines and members of the universities than by an appeal to the Pope. The opinion thus delivered gained the favor of the king and Cranmer was sent for, made a king's chaplain and commanded to write a treatise on the subject of the divorce. In 1530 he was sent abroad with others to collect the opinions of the divines and canonists of France, Italy and Germany on the validity of the king's marriage. At Rome he presented his treatise to the Pope and afterward proceeded to Germany, where he obtained for his opinions the sanction of a great number of German divines and civilians, and formed intimate connections with the rising party of the Protestants which probably influenced his future conduct greatly. In January 1533 he was announced as the new archbishop of Canterbury, and on 30 March he was consecrated at Westminster. Soon after, he set the papal authority at defiance by declaring invalid the marriage between Henry and Catharine and confirming the king's marriage with Anne Boleyn. Next year an act of Parliament was passed for abolishing the pope, declaring the king chief head of the Church of England. The new or revised English translation of the Bible, now appointed to be placed in
churches, received the name of 'Cramner's Bible.'

On the death of Henry, in 1547, the archbishop was left one of the executors of his will, and member of the regency appointed to govern the kingdom during the minority of Edward VI. He proceeded to model the Church of England according to the notions of Zwinglius, rather than those of Luther. By his instrumentality the liturgy was drawn up and established by act of Parliament, and articles of religion were compiled, the validity of which was enforced by royal authority and for which infallibility was claimed. The exclusion of the Princess Mary from the crown, by the will of her brother, was a measure in which Cranmer joined the partizans of Lady Jane Grey, apparently in opposition to his own judgment. With others who had been most active in her elevation, he was sent to the Tower on the accession of Mary. He was tried for treason, and being condemned was sentenced to death, but was spared by the queen, though he lost his position as archbishop of Canterbury. In March 1554 he was sent to Oxford with Ridley and Latimer and after being kept in prison nearly a year and a half they were formally tried. Cranmer's trial took place before a papal commissioner, on the charges of blasphemy, perjury, incontinence and heresy, and he was sentenced to be degraded and deprived of office. After this, promises were made, which induced him to sign a recantation of his alleged errors. He was placed on a scaffold in Saint Mary's Church, the day he was to suffer, there to listen to a declaration of his faults and heresies. Instead of confessing the justness of the charges and submitting to it in silence, or imploring mercy, he calmly acknowledged that the fear of death had made him believe his conscience; and declared that nothing could afford him consolation but the prospect of extenuating his guilt by encountering, as a Protestant penitent, with firmness and resignation, the fiery torments which awaited him. He was immediately hurried to the stage, where he kept his right hand, with which he had signed his recantation, extended in the flames, that it might henceforward be the rest of his body, exclaming from time to time, 'That unworthy hand.' His principal writings were edited by Jenkyns, 'Remains of Archbishop Cranmer' (Oxford 1833); and by Cox, for the Parker Society, under the title, 'Writings and Disputations Relative to the Lord's Supper' (Cambridge 1844) and 'Miscellaneous Writings and Letters' (ib. 1846). Consult Strype, 'Memoirs of Thomas Cranmer' (Oxford 1848-54); and his 'Ecclesiastical Memorials' (ib. 1853); Nichols, 'Narrative of the Reformation,' Camden Society, from the papers of John Foxe; and Brewer and Gairdner, 'Calendars of Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII' (ib. 1862-80); Todd, 'Life' (1861); Hook, 'Thomas Cranmer' (in 'Early Churchmen,' 2nd series, 1868); Legard, 'History of England' (Vol. V); Froude, 'History of England' (Vols. I-VI); Green, 'History of the English People' (Vol. II, 1879); Mason, 'Thomas Cranmer' (1889); Pollard, 'Cranmer and the English Reformation, 1489-1856' (London 1904); Foxe, 'Acts and Monuments' (ib. 1877); Burnet, 'History of the Reformation' (New York 1842).

CRANNOG — CRAPE

CRANNOG, a fortified lake dwelling. See Lake Dwellings.

CRANSTON, Earl, American Methodist bishop; b. Athens, Ohio, 27 June 1840. He was graduated at Ohio University in 1861; served in the cavalry during the Civil War, rising to the rank of captain, 1862-64. He entered the Methodist Episcopal ministry, 1867; was publishing agent of the Church 1894-96, when he was elected a bishop. During 1898-1900 he visited China, Japan and Korea in discharge of his episcopal duties. He was commissioner from his Church for unifying all Methodist missions in Japan into one Japanese Methodist Church in 1907; president at the Methodist Episcopal Conferences in Germany, Sweden, Denmark, Norway, Finland and Italy in 1909; chairman of Commission on Finance and Commission on Federation of Methodist Churches for his denomination; became senior bishop of the Church in 1912.

CRANSTON, R. I., town in Providence County, on the New York, New Haven and Hartford Railroad. Cranston was originally a part of Providence, but was incorporated as a separate township in 1754. The villages that were included in the town were consolidated under a city charter in 1911. Important industries are market gardening, brewing, dairying and the manufacture of cotton and print goods, tubing and wire. The government is administered by a mayor and city council. It receives its water supply from Providence. The town is the site of the State prison and of reform schools for boys and girls. Pop. 21,107.

CRANTARA, krán-tä-ra (Gael. crann, a beam + tair, reproach, disgrace), a fiery cross which formed the rallying symbol in the Highlands of Scotland on any sudden emergency, so called because the neglect of the symbol implied infamy. The Highlanders appear to have borrowed it from the ancient Scandinavians, of whose use of it Olaus Magnus gives a particular account. As late as the insurrection in 1745 the crantara was circulated in Scotland, and on one occasion it passed through the district of Breadalbane, a tract of 32 miles, in three hours. After Charles Edward had marched into England, two of the king's frigates threatened the coast with a descent. The crantara was sent through the district of Appin by Alexander Stuart of Invernahyle (who related the circumstance to Sir Walter Scott), and in a few hours a sufficient force was collected to render the attempt of the English hopeless.

CRAPAUD, krä-pød', Jean, or Johnny, a nickname applied to Frenchmen, as that of John Bull is similarly applied to Englishmen. It has its origin from the popular belief that all Frenchmen were frog eaters, 'craupad' meaning a "frog or toad."

CRAPE, a light, transparent stuff, like gauze, made of raw silk, gummed and twisted on the mill, woven without crossing and much used in mourning. Crapes are either creped (that is, crisped) or smooth. The silk destined for the first is more twisted than that for the second, it being the greater or less degree of twisting, especially of the warp, which produces the crisping given it when it is taken out of the frame, steeped in cold water and rubbed with a piece of wax for the purpose. Crapes are all dyed raw. This stuff came origi-
nally from Bologna, where tradition says it was made in the 16th century; but till of late years Lyons has had the chief manufacture of it. It is now manufactured in various parts of Great Britain. The grape brought from China is of a more substantial fabric. A woolen imitation is cradled by machine rollers.

CRAPPLE, kräp’l, a widely distributed American sunfish (Lomoxys annularis) with a confusing number of local names, such as “bachelors,” “Campbellites,” “new-light,” “tin-mouth,” or “papier-mouth,” etc., in the central Mississippi Valley, and “sac-a-lait” and “chin-qua-pin” in the Gulf States, where it is especially numerous. It is silvery olive in color, mottled with dark green on the upper part of the body, with vertical bars on the high fins. It may readily be distinguished from its congener, the calico bass, by the fact that its dorsal fin has not more than six spines. It will take a minnow with the avidity of a black bass, but will not make so keen a fight. Its range has lately been very widely extended by the efforts of the United States Fish Commission. Consult Jordan and Evermann, “Food and Game Fishes of America” (1902). See Sunfish.

CRASHAW, Richard, English poet: b. London, Aug. 1, 1613; d. Aug. 25, 1649. He was educated at the Charterhouse and at Cambridge. In 1637 he became a Fellow of Peterhouse, and having been admitted to orders, was noted as an eloquent and powerful preacher. In 1634 a volume of Latin poems, under the title of “Epigrammatum Sacra,” had been published anonymously by him at Cambridge. In 1644 he was ejected from his fellowship by the Parliamentarians for refusing to take the Covenant, and proceeded to Paris, where he became a convert to the Roman Catholic faith. Through the influence of Cowley, he was introduced to Queen Henrietta Maria, who recommended him to Cardinal Pasquillo at Rome. The cardinal afterward made him a canon in the church of Loreto. In 1634 he published a volume of Latin poems. A collection of his entitled “Steps to the Temple, Sacred Poems, with other Delights of the Muse” was published in 1646; and a posthumous volume 1652, “Carmen Deo Nostro.” Gilfillan published some of Crashaw’s poems in his edition of “British Poets,” and an edition by Grosart was published in 1872 (with supplement in 1888); and Waller, A. R., “Poems” (in the “Cambridge English Classics,” 1908). Consult Coleridge, “Literary Recollections” (1836); Gosse, “Seventeenth-Century Studies.”

CRASSULACEAE, kräs-ū-läs’sē-ē, a family of plants and upward of 500 species, widely distributed throughout the world. The petals are persistent, the calyx is free and the fruit consists of distinct carpels. The Crassulaceae are herbs or shrubs, mostly fleshy or succulent. The best-known species of the family are the upright or live-forever (Sedum telephium) and various succulents. The family is particularly rich in tropical species, which are known for the beauty of their flowers, and are cultivated in hot-houses and used for bedding out in warm, dry locations.

CRASSUS, Lucius Licinius, Roman orator: b. 140 B.C.; d. 91 B.C. He is introduced by Cicero, in his treatise “De Oratore,” as the representative of that writer’s own opinions on the subject of oratory. In 95 B.C. he was elected consul, with Quintus Mucius Scævola (who had been his colleague in all his previous offices). He was unfortunate as a legislator, inasmuch as the law proposed by him, to compel all who were not citizens to depart from Rome, was a main cause of the Social War. He became censor in 92 B.C., when he closed all the schools of the rhetors, on the ground that their influence on the minds of the young was bad. He was distinguished for his love of the arts; and his mansion upon the Palatium is cited, both for its architecture and for the statuary and paintings with which it was adorned, as having been one of the most noteworthy buildings in ancient Rome. Consult the Introduction to Wilkin’s edition of Cicero’s “De Oratore” (2d ed., Oxford 1888).

CRASSUS, Marcus Licinius, Roman triumvir, surnamed Divus: b. about 115 B.C.; d. 53 B.C. When Sulla landed in Italy, 83 B.C., Crassus joined him and rendered him important services, for which he was rewarded with donations of confiscated property. He was allowed to purchase confiscated estates at an almost nominal value. He was exceedingly fond of wealth, and also skilful and by no means scrupulous in the ways and means of accumulating it. In 71 B.C. he was created prætor, and took the command against Spartacus and the revolted slaves. Spartacus was defeated and slain, along with a great number of his followers, and 6,000 captured slaves were crucified along the road between Rome and Capua. In 70 B.C. Crassus was elected praetor at Rome, and Pompey as his colleague; was censor in 65 and with Caesar and Pompey made up the first triumvirate in 55. In this year he obtained the province of Syria, and professed to make preparations of war against the Parthians, which he used as a ruse to gain more money. In 54 B.C. he undertook a campaign, after which he returned to Syria. In the following year he set out again and was defeated at the river Bilechas by the Parthians. Retreating to the town of Carrhae, he was slain at a conference with the Parthian general.

CRATÆGUS, genus of plants placed by American botanists in the apple family (Pomaceae). The genus includes about 50 species, natives of the north temperate zone, Mexico and the Andes of parts of Central America. The name is from the Greek, meaning “strong,” and the plants are so called from the toughness of their wood. Twenty or more of the genus are found in North America. They are all large shrubs or small trees, more or less thorny; hence the name thorn, which is generally applied to them. The best-known American species is C. crus-galli or cockspur thorn, a shrub or small tree with a maximum height of 30 feet, the thorns numerous and slender, which blossoms in May and June in thickets from western Quebec westward to Manitoba and southward to Florida and Texas, and heavy, weighing about 45 pounds to the cubic foot. The hawthorn, hedge-thorn, May-bush or quickset is C. oxyacantha. The scarlet thorn, haw or red haw is C. coccinea. It is a small tree, reaching 30 feet high, growing in the same region as C. crus-galli. The wood is hard, of
a reddish brown color and weighs about 53 pounds per cubic foot. The azaroles (C. azaroles), natives of the Levant, are occasionally cultivated for their fruit, which is about the size of the Siberian crab, and is used either for dessert or for pies. C. orientalis (or odoratisima) and C. tancatefolia have also fruit of considerable size. The latter is much aper in Armenia. C. mexicana has a large fruit, like a small apple, but not eatable. It is, however, very ornamental. The wood of most of the species much resembles that of the hawthorn. It is common to graft the rarer species on the hawthorn.

CRATER (Gr. καταρρ, bowl), the opening on the tops or sides of volcanic mountains, through which the lava and ashes are ejected. The crater of Ætna, like many of the most ancient volcanoes, does not retain the bowl-like shape to which the name owes its origin; that of Vesuvius, however, preserves the typical form. Variations in the form of the crater are due to varying violence of the eruption. The more powerful eruptions tear off the mountain top to produce the hollowed cup. The craters of the Hawaiian volcanoes are usually large, that of Kilauea being about 2½ miles in diameter and filled with a lake of molten rock. Such large craters are known as calderas.

CRATER, one of Ptolemy's constellations, near the autumnal equinox. It is sometimes considered a part of the constellation Hydra, and contains 35 stars visible to the naked eye, the two largest being of the fourth magnitude.

CRATER LAKE, in general, a term applied to any lake occupying the crater of an extinct or dormant volcano. In the United States the name is given to a small lake in the Cascade Mountains, in Oregon, remarkable for its wall of nearly perpendicular rock, from 1,000 to 2,000 feet high. The lake is about six miles in diameter and the water is nearly 2,000 feet in depth. A small cone within the main crater forms Wizard Island. The region about Crater Lake has been set aside as a national park.

CRATER LAKE NATIONAL PARK, a government reservation created by act of Congress approved 22 May 1902. It is situated in southwest Oregon, about 60 miles from the California boundary, on the crest of the Cascade Mountains. Measuring approximately 18 miles north and south by 13½ miles east and west, it has an area of 159,360 acres and includes the wreck of Mount Mazama, whose sides now form the bowl containing the lake that gives the park its name. The accepted explanation of such geological and topographical conditions as are observed at present is that plutonic forces destroyed the mountain's crest, leaving a vast crater which gradually filled with clear spring water to its present depth of 2,001 feet, on all sides of which the walls of the crater still rise to heights ranging from 500 to nearly 2,000 feet. The surface of the lake, 6,177 feet above sea-level, has an area of 254 square miles. A movement was started by W. G. Steel 16 Aug. 1885 for the creation of a national park at this point. Until then the lake was but little known, even among the residents of southern Oregon, although its discovery occurred 12 June 1853; and Mr. Steel's plan "was successful," he writes, "only after 17 years of strenuous labor." The lake was first stocked with fish (rainbow trout) in 1888. A survey for a road entirely around the lake and close to the rim wherever possible was made under the direction of the Secretary of War, and a report submitted to Congress estimated the total cost at approximately $700,000. Of that amount the appropriation was made of $125,000 for use during the season of 1913, $85,000 for 1914 and $50,000 for 1915. Under these appropriations grading proceeded steadily; besides a portion of the rim road, roads from the Klamaht, Medford and Pinnacles entrances were constructed; and the official report for 1915 contained the statement that a line of automobile stages, maintained by the Crater Lake Company from Medford, on the main line of the Southern Pacific Railway, and from Chiloquin, on the northerly extension of the Southern Pacific from Klamath Falls, or the Crater Lake cut-off, was rendering satisfactory service in transportation of visitors (11,371 at the close of September 1915, as against 7,096 at the same time in 1914). During the year 1915 Crater Lake Lodge, located on the rim of the lake, nearly 1,000 feet above the water, was opened to the public; and to this building additions were made in 1916. By that time the lake had become abundantly supplied with large rainbow trout, the largest taken weighing six or seven pounds. The park, according to the superintendent's enumeration, abounds in black and brown bear, black-tailed deer, cougar, lynx, timber-wolves, coyotes, pine marten, squirrels of several varieties, ringtail grousé, the common pheasant, Clark crow, etc. During 1915 private telephone lines were purchased and lines required for the improvement of that service were constructed; progress was also made in connection with the proposed tourist village. It is evident that Klamath and Modoc Indians, who fancied that the lake held the throne of the god Llao, were not insensible to the mystery and wonder of the scene, which received its most striking characterizations—as "The Sea of Silence" and "A sea of sapphire so around by a compact circle of the great grizzly rock of Yosemite"—at the hands of Joaquín Miller. The government's purpose in the creation of such parks is stated in the article NATIONAL PARKS AND MONUMENTS.

CRATER MOUNTAIN, Arizona. This feature in the plains 25 miles due west of Winslow, Ariz., formerly known as Coon Butte, is one of the most remarkable natural wonders in existence. It consists of a crater 600 feet deep and 400 feet in diameter surrounded by a rim 100 to 150 feet high. This rim consists of loose fragments of rock and sand from the hole. The walls of the hole are limestone (Kaibab) and sandstone (Coconino), more or less upbent and shattered. The relations are shown in the figure. The cause of this extraordinary hole is one of the perplexing questions to which geologists and scientists speculate. It has been suggested that
the crater was caused by impact of a large meteor, a view sustained by the occurrence of many small masses of meteoric iron in the vicinity, but a mining company organized to find and work the large mass of iron presumably buried in the hole obtained no evidence of its existence. A detailed survey with magnetic needle hung to swing vertically also failed to indicate the presence of a body of metallic iron. A plausible suggestion is that the hole was caused by explosion of carbonic steam accumulating in the porous sandstone under the dense limestone and finally reaching the limit of tension. Many conspicuous volcanic features occur in the general neighborhood but not in the immediate vicinity of the hole. Closely similar craters due to explosion are known in the Southwest, in Mexico and other parts of the world.

N. H. DARTON,
United States Geological Survey.

CRATERUS, Macedonian general: d. 321 B.C. After the death of Alexander the Great he received, together with Antipater, the government of Macedonia and Greece. He assisted Antipater in the Lamian War, and also against the Ætolians and Perdiccas, and fell in a battle against Eumenes, his rival.

CRATES, kرادت̓ς, OF ATHENS, Greek comic poet: flourished about 450 B.C., and contemporary with Cratinus. Eminent as an actor, he often performed the principal parts in the plays of Cratinus. As a comic poet he was the first Athenian who ventured to follow the example of Epicharmus so far as to bring drunken characters on the stage. Aristophanes in his 'Poetics' bears testimony to the excellence of his works. Little, however, is really known of him. Meineke, who has made a careful analysis of the statements of ancient writers on the subject, gives the titles of 14 ascribed to him. Fragments of eight of these are still extant. Consult Kock, 'Comiconum Atticorum Fragmenta' (Leipzig 1880).

CRATES OF MALLOS, Greek grammarian: flourished about 150 B.C. He founded the celebrated Pergamene school of grammar and became the great rival of Aristarchus, of the Alexandrian school. From his work on Homer he is said to have been called Ὅμηρος. He wrote commentaries on Hesiod, Euripides and Aristophanes. Only a few fragments of his works are preserved. Under him the catalogue of the Pergamene Library was enlarged and catalogued. Later grammarians based their works on his study of the Attic dialect. About 167 B.C. he was sent as an ambassador to Rome, where he introduced the study of formal grammar. Consult Suéttonius, 'De Grammaticis' (Vol. 2); Wachsmuth, 'De Cratete Mallota' (Leipzig 1880); Susemihl, 'Geschichte der griechischen Literatur in der Alexandrinerzeit' (1881, 1892); Sandys, 'A History of Classical Scholarship' (Vol. I, 2d ed., Cambridge 1906).

CRATES OF THEBES, Greek cynic philosopher: flourished about 320 B.C. He was born at Thebes and inherited a large property. This he renounced early and removed to Athens. He is remembered as Diogenes and afterward one of the most eminent in that school of philosophers. According to Diogenes Laertius, he lived a cynic of the strictest sort. He was the teacher of Zeno, the founder of stoicism, and thus formed the connecting link between cynicism and stoicism.

CRATINUS, κρατίνος, Greek comic poet: b. about 520 B.C.; d. 422 B.C. The Archilochi, supposed to have been his earliest production, was not exhibited till he was upward of 70 years of age; but he lived to achieve much for his profession, and at the advanced age of 97 died at the height of his fame, having just triumphed over Aristophanes. He found the Greek comedy a mere plaything, employed to excite merriment and laughter, and at once converted it into a terrible weapon for the chastisement of public and private vice. Horace particularly commends the public spirit and the impartial justice with which he exercised his censorship over the morals of his age. The uniform testimony of ancient writers places Cratinus in the first rank as a comic poet. His great rival, Aristophanes, was fully aware of his power. In the 'Knights' he compares him to a torrent carrying everything before it. According to the best authorities he wrote but 21 dramas, 9 of which were successful in the Dionysiac contest. Not a single one of his dramas is now extant; only a few fragments remain to attest the excellence of his admired productions. The 400 fragments of his works that now known were collected by Kock, 'Comiconum Atticorum Fragmenta' (Vol. I, Leipzig 1880). In the 'Axyrynychus Papyri' (Vol. IV, 1904) appeared the newly found argument of a play 'Dionysalexander,' of which nine fragments had been known, though they did not reveal the plot. Consult Körte, 'Hermes' (1904); and Morgan, 'Addresses and Essays' (25-33, New York 1910).

CRATIPPUS, κρατιππός, Greek historian, contemporary with Thucydides. He continued the work of the great historian, and brought it down, according to Plutarch, to the time of Conon. The well-known words of Dionysius: 'He wrote what Thucydides left unwritten,' evidently show that Cratippus not only continued the history of Thucydides, but also supplied whatever omissions he thought he found in it. He has gained in importance in recent times because of an historical fragment discovered by Grenfell and Hunt and published by them in 'Oxyrhynchus Papyri' (V, 1907-08). The fragment has come to be known as the Hellenica Oxyrhynchia. Consult Hunt, in 'The Year's Work in Classical Studies' (London 1908). The present tendency is to ascribe the work rather to some one other than Cratippus. Consult also Walker, 'The Hellenica Oxyrhynchia: Its Authorship and Authority' (Oxford 1913).

CRATIPPUS, Greek peripatetic philosopher: b. Mitylene about 75 B.C. He appears to have been held in the highest estimation by the great men of his age. Cicero calls him the prince of all the philosophers whom he had known. Pompey visited him after his defeat
at Pharsalia, and received at his hands the consolations of philosophy; and Brutus went to Athens, to which city Cratinus had lately betaken himself, to listen to his prelections, even while making preparations to meet Octavius and Antony. Nothing that he wrote has survived.

CRAVEN, Alfred Wingate, American civil engineer: b. Washington, D. C., 20 Oct. 1810; d. Chiswick, England, 15 March 1879. He was educated in New York, in connection with its seaward improvement of Fourth avenue. From the organization of the Croton water board, in 1849, till 1868 he was its engineer, and planned and supervised the construction of the great works of that period. Among these were the Central Park Reservoir completed in 1867, the reservoir at Boyd’s Corners and the survey of the Croton Valley. The establishment of the sewerage system of New York is largely due to his endeavors. He was a founder, director and president of the American Society of Civil Engineers.

CRAVEN, Elijah Richardson, American Presbyterian clergyman: b. Washington, D. C., 28 March 1824; d. 1908. He was educated at Princeton 1842, and from its Theological Seminary 1848. Ordained in the Presbyterian ministry 1850, he held pastorates at Somerset and Newark, N. J., 1850-57, when he became secretary of the Presbyterian Board of Publication and Sabbath-school Work, remaining in this relation till 1904. He was the American editor of E. Lange’s “Commentary on the Book of Revelation.”

CRAVEN, Pauline de la Ferronays (Madame Augustus), French religious novelist: b. Paris 1820; d. there, 1 April 1891. Her father was at one time French Ambassador to Berlin. In 1834 she married an Englishman named Craven, a descendant of the Margravine of Anspach. She traveled extensively and lived much in England. Her principal literary works include articles on English politics and biographical sketches of Sister Nathalie Narishkin and Lady Georgiana Fullerton, and reminiscences of England and Italy. She is best known for her ‘Family Memoirs’ and ‘The Story of a Sister,’ a picture of a noble Roman Catholic family and the slow passing away of a simple-minded and deeply religious woman; and other fictions are as well known in English translation as in their original French.

The best of her novels are ‘Anne Severin,’ ‘The Enigma’s Answer’ and ‘Fleurange,’ in all of which she is an ardent advocate of Roman Catholicism. Consult Bishop, Mary, ‘Memoir of Mrs. Craven’ (London 1894); Smith, J. F. A., ‘The Life of Mrs. Augustus Craven’ (Nürnberg 1910).

CRAVEN, Thomas Tingey, American naval officer: b. Washington, D. C., 30 Dec. 1808; d. Boston, Mass., 23 Aug. 1887. He joined the navy in 1822; was promoted captain in June, 1842; and the following year was given command of the Brooklyn, with which vessel he took part in the capture of New Orleans and the later actions on the Mississippi. In 1862 he was placed in command of the Niagara, and during the remainder of the war he served along the coasts of England and France. He was promoted rear-admiral in October 1866; retired in December 1869.

CRAVEN, Tunis Augustus Macdonough, American naval officer: b. Portsmouth, N. H., 11 Jan. 1813; d. 5 Aug. 1864. He entered the navy in 1829; in 1857 surveyed the Isthmus of Darten; coasted about Cuba to intercept slave ships, and in 1862, in preventing the capture of the fort on Key West. Given the rank of commander, he joined Farragut’s fleet off Mobile, commanding the monitor Tecumseh. In the battle of Mobile Bay the Tecumseh was sunk by running upon a torpedo, and Craven and almost all his crew lost their lives.

CRAWFISH. See Crawfish.

CRAWFORD, Coe Isaac, American statesman: b. Volney, Iowa, 14 Jan. 1858. He was graduated in 1882 from the law department of the University of Iowa, practised law for one year in that State and for 15 years in Pierre, S. D.; was a member of the Dakota territorial legislature in 1889, and upon the admission of South Dakota into the Union in that year became a member of the first State senate. He was attorney-general in 1891 and 1892, and upon removal to Huron, S. D., in 1897, was attorney for the Chicago and Northwestern Railway Company until 1903. In 1907 he was elected governor of South Dakota on the Republican ticket and in the following year United States Senator for the term expiring 3 March 1915.

CRAWFORD, Francis Marion, American novelist: b. Bagni di Lucca, Italy, 2 Aug. 1854; d. Sorrento, Italy, 8 April 1909. He was educated at Trinity College, Cambridge, and afterward studied Sanskrit and other subjects on the European continent. In 1879-80 he was editor of the Allahabad Indian Herald and for nearly 20 years subsequently resided mainly in Italy. His novels and other writings include ‘Mr. Isaacs’ (1882); ‘Doctor Claudius’ (1883); ‘A Roman Singer’ (1884); ‘An American Politician’ (1884); ‘Zoroaster’ (1885); ‘A Tale of a Lonely Parish’ (1886); ‘Marzio’s Crucifix’ (1887); ‘Saracinesca’ (1887); ‘Paul Patoff’ (1887); ‘With the Immortals’ (1888); ‘Greifenstein’ (1889); ‘San Martino’ (1889); ‘A Cigarette-maker’s Romance’ (1890); ‘The Witch of Prag’ (1891); ‘Khaled’ (1891); ‘The Three Fates’ (1892); ‘The Children of the King’ (1892); ‘Don Orsino’ (1892); ‘Marion Darce’ (1893); ‘Pietro Ghisleri’ (1893); ‘The Novel: What Is It?’ (1893); ‘Katharine Lauderdale’ (1894); ‘Love in Idleness’ (1894); ‘The Ralston’ (1895); ‘Constantinople’ (1895); ‘Casa Bracio’ (1895); ‘Taquisara’ (1896); ‘A Rose of Yesterday’ (1897); ‘Corleone’ (1897); ‘Ave, Roma Immortals’ (1898); ‘In the Palace of the King’ (1898); ‘Via Crucis’ (1899); ‘The Rules of the South’ (1900); ‘Marietta’ (1900); ‘Cecilia’ (1902); ‘Man Overboard’ (1903); ‘Gleanings from Venetian History’ (1905); ‘Widower Shall ’Off!’ (1904); ‘Fair Marjorie’ (1905); ‘Prince Darnley’ (1906); ’A Portrait of the White Sister’ (1909). As a novelist Crawford is characterized by excellence in the depicting of character and general carelessness in the handling and collection of his materials. The Saracinesca series, stories of modern Rome, is
generally regarded as his most important performance. He had the beguiling gift of the born story-teller who has also become an accomplished master in the art of fiction. Ingenious plots, a varied company of interesting dramatis personae faithfully studied and freshly polished forth from their different behinds, and the attractive personality of an intelligent and cultivated man of the world—these characteristics explain and justify the delight with which an immense audience, American and European, welcomed the annual appearance of one of the long series of his novels. In his historical works he betrays a gift of conjuring up the life of the Italian past in a manner that makes the spirit and the facts of history as entertaining as a romance. Several of his novels have been translated into German, and he himself produced French versions of 'Zoroaster' and 'Marzio's Crucifix.' In recognition of his merits as a writer the French Academy bestowed on him the Monbrun prize and a gold medal.

CRAWFORD, George Washington, American lawyer: b. Columbia County, Ga., 22 Dec. 1798; d. 22 July 1872. He was graduated at Princeton 1820; was attorney-general of Georgia 1827–31; a member of the State legislature 1837–42, and Whig representative in Congress 1844. He was elected governor of Georgia 1843, and re-elected 1845. He was Secretary of War in President Taylor's Cabinet 1849–50, resigning upon the death of the President.

CRAWFORD, John Martin, American physician and surgeon: b. Herrick, Pa., 18 Oct. 1845. He was graduated from Lafayette College 1871; from Pulte Medical College, Cincinnati, 1878; from Miami Medical College 1881; he was professor of physiology, microscopy and of physical diagnosis in the Pulte Medical College 1881–89. He was consul-general of the United States to Russia 1889–95; commissioner of the World's Fair 1892–93. He made the first complete English translation of 'The Kalevala,' the national epic of Finland (1888). He also edited and translated from manuscript a five-volume edition of 'The Industries of Russia.' He was on the staff of the Russia the American system of governmental crop reports. He is president of the Ohio chapter of Phi Beta Kappa; president of the American National Bank, Cincinnati; president of the Cincinnati Discount Company, and director in several industrial and manufacturing corporations; lecturer on the Flms and their ancient literature, and on Russia and on Russian folk-lore. He received the unusual honor of election to honorary membership in the Finnish Literary Society at Helsingfors, Finland. He is an active member of the Literary Society of Cincinnati, established in 1848. In 1899 he received the degree of L.L.D. from Ohio University.

CRAWFORD, John Wallace ('CAPTAIN JACK'), American author: b. County Donegal, Ireland, 1814; d. Woodhaven, N. Y., 28 Feb. 1917. He served in the 48th Pennsylvania Volunteers in the Civil War, and while lying wounded in a hospital at West Philadelphia was taught to read and write by a Sister of Charity. As a scout he served under Generals Sherman and Sigel in 1862 and later against the Apaches in New Mexico. In 1886 he retired from the army, was a miner and ranchman in New Mexico for many years, went to the Klondike in 1898, remaining there two winters, and finally became a public lecturer. Besides many poems, several songs and more than 100 short stories, 'Captain Jack' is author of 'The Poet Scout—A Book of Song and Story' (1885); 'Chimney Corners' (1888); 'Tat,' a drama (1900); 'Colonel Bob,' a drama, with Marie Madison (1909); 'Whar the Hand o' God is Seen and Other Poems' (1911).

CRAWFORD, Mary Caroline, American author: b. Boston, Mass., 5 May 1874. She was educated at Radcliffe College, and besides contributing editorially and otherwise to various New York and Boston journals, was literary editor of the Boston 'Budget' 1896–1902. In 1907–08 she was secretary of the Women's Trade Union League; she then became secretary of the Ford Hall meetings. She has published 'The Romance of Old New England Roof Trees' (1902); 'The Romance of Old New England Churches' (1903); 'The College Girl of the Rockies' (1904); 'Among Old New England Inns' (1907); 'St. Botolph's Town' (1908); 'Old Boston Days and Ways' (1909); 'Romantic Days in Old Boston' (1910); 'Goethe and his Women Friends' (1911; 2d ed., 1913); 'Romantic Days in the Early Republic' (1910); 'The Romance of the American Theatre' (1913); 'Social Life in Old New England' (1914).

CRAWFORD, Samuel Wylie, Federal general: b. Franklin County, Pa., 8 Nov. 1829; d. Philadelphia, Pa., 3 Nov. 1892. He graduated at the University of Pennsylvania in 1846; was licensed to practice medicine in 1850; served as assistant surgeon in the United States army in Texas, New Mexico and Kansas, 1851–60; commanded a battery at the bombardment of Fort Sumter in April 1861; became major of the 13th Infantry in August 1861, and on 25 April 1862 was appointed brigadier-general of volunteers, commanding a brigade in the army of the Potomac. He served throughout the Shenandoah Valley campaign (q.v.), distinguished himself at Winchester, Cedar Mountain, South Mountain and Antietam; and, as chief of General Mansfield, was placed in charge of a division. He commanded the Pennsylvania reserves at Gettysburg, being brevetted colonel for gallant conduct; was engaged in all the battles of the army of the Potomac and was present at Lee's surrender. He was brevetted major-general of volunteers 1 Aug. 1864 for conspicuous gallantry in various battles; was brevetted brigadier-general of the regular army for conduct at Five Forks, and major-general for meritorious services throughout the war; and on 15 June 1866 was mustered out of the volunteer service. He became colonel of the 16th Infantry, 22 Feb. 1869, but in March was transferred to the 2d Infantry, of which he remained in command until 19 Feb. 1873, when he retired because of disability resulting from old wounds.

CRAWFORD — CRAWSHAW

'Mercury and Psyche'; and 'Dancing Jenny.' His statue of the 'Genius of America' is placed on the dome of the capitol at Washington, and for the State of Virginia he made the equestrian statue of Washington, at Richmond. Other public buildings of Braddock's work are: The Metropolitan Museum of Art, New York; Symphony Hall, Boston; 'The Indian' (New York Historical Society); 'Flora' (Metropolitan Museum, New York). Crawford executed many bas-reliefs, and 87 of his plaster casts were presented by his wife to the commissioners of Central Park, who arranged them in a building for public exhibition. They have since been destroyed by fire. Consult Taft, Lorado, 'History of American Sculpture' (New York 1903), and Tuckerman, 'Book of the Artist' (ib. 1897).

CRAWFORD, William, American soldier: b. Berkeley County, Va., 1732; d. Wyandot County, Ohio, 11 June 1782. He was a surveyor by profession, and an associate of Washington, who trusted him greatly. He served with the Virginia riflemen under Braddock's command and was promoted captain on Washington's recommendation in 1761, and served through the Pontiac War 1763-64. When the Revolution broke out he joined Washington with a company of Virginians; was at the battles of Trenton and Princeton; on frontier duty 1778, and was colonel when he resigned in 1781. In May 1782, at Washington's request, he commanded an expedition against the Wyandot and Delaware Indians on the Sandusky River. They met the Indians 4 June, and in the engagement which followed Crawford was captured and subsequently tortured by his captors before being burned at the stake. Consult Roosevelt, 'Winning of the West' (Vol. II, 1889); Butterfield, 'Expedition Against Sandusky' (1871); Hill, N. N., 'Crawford's Campaign' (in Magazine of Western History, Chicago 1885.)

CRAWFORD, William Harris, American statesman: b. Amherst County, Va., 24 Feb. 1772; d. Albert County, Ga., 15 Sept. 1834. In 1788 he settled in Georgia, was admitted to the bar in 1792, and served on practice in Lexington. He was elected to the State senate in 1802 and to the United States Senate to fill a vacancy in 1807 (fighting two duels during the canvass); was re-elected for a full term in 1811; was chosen president of the Senate pro tem, in 1812. Refusing the Secretarieship of War, he was appointed minister to France in 1813. Two years later he became Secretary of War, and the next year Secretary of the Treasury and held the latter office till March 1825. He was urged as a candidate for the Presidency several times, received the nomination in 1824, and in the election had 41 electoral votes. No choice for President having been reached, the election was decided in the House of Representatives, but meanwhile Crawford had been stricken with paralysis, which precluded his effective candidacy. He never recovered wholly, although he still remained active politically, serving as judge of the northern circuit of Georgia from 1827 until his death.

CRAWFORD, William Henry, American educator: b. Wilton Centre, Ill., 6 Oct. 1855. He was graduated at Northwestern University 1884, and from Garrett Biblical Institute. After five years' pastoral work in the Methodist ministry he became professor of the history of theology in Gammon Theological Seminary 1889-93. In 1893 he was elected president of Allegheny College, Meadville, Pa. He was one of the judges to select the names for the Hall of Fame in New York. His publications include 'Life of Savonarola' (1906); 'The Church and the Slums' (1908); and 'Thoburn and India' (1909).

CRAWFORD NOTCH, the picturesque pass in the White Mountains, New Hampshire, between Mounts Webster and Wiley, at an elevation of about 2,000 feet above the Saco River, which flows through the notch.

CRAWFORDSVILLE, Ind., city and county-seat of Montgomery County, on Sugar Creek and the Chicago, Cleveland, Cincinnati and Saint Louis and the Vandalia and Monon Route railroads, 44 miles west of Indianapolis. It is the trade centre of an extensive agricultural region, with annual dealings of $3,500,000. It is the seat of Wabash College and contains a fine courthouse, a community house for women, a country club and a Carnegie library. The city is the home of five insurance companies, has manufactures of matches, paving bricks, burial furnishings, flour, foundry products, lumber, metal polish, barbed wire, etc. Settled in 1822, Crawfordsville was incorporated in 1865 and is governed under a charter of that date, which provides for a mayor, elected every four years, and a city council. The electric-light plant is owned by the city. Crawfordsville was the home of Gen. Lew Wallace, author of 'Ben Hur,' to whom a monument has been erected. Pop. 10,000.

CRAWFURD, Oswald John Frederick, English author: b. London, 18 March 1834; d. Montreux, 31 Jan. 1909. He was educated at Eton and Oxford and after serving as a clerk in the Foreign Office was English consul at Oporto, Portugal, 1867-91. Poet, novelist, essayist and anthologist, among his most notable works are: 'Travels in Portugal, by John Latouche'; 'Round the Calendar in Portugal'; 'Portugal: Old and New'; 'British Comic Dramatists'; 'Lyrical Verse from Elizabeth to Victoria'; 'Four Poets' (1899); 'Two Masques,' a book of verse, and the novels, 'The World Wakes,' 'Beyond the Seas,' 'Sylvia Arden,' 'The New Order.'

CRAWLEY, Edmund Albern, Baptist educationist: b. 1799; d. 1880. He was graduated at King's College, Windsor, Nova Scotia, and was called to the bar. Later he entered the Baptist ministry; in 1837 was a candidate for a chair in Dalhousie College, Halifax, but his claims were rejected by the dominant Presbyterian element on the board of that institution; and thereafter he became one of the founders and first principal of Queen's (afterward Acadia) College, Wolfville, established by the Baptist community of Nova Scotia.

CRAWSHAW, krā'shā, William Henry, American educator: b. Newburg, N. Y., 6 Nov. 1861. He was graduated at Colgate University, Hamilton, N. Y., 1887, and was elected professor of English literature to the chair vacated by Professor Sill. Since 1897 he has also been dean of the college faculty. He received the degree of A.M. from Colgate University, 1889; Litt.D., University of Rochester, 1909; and that of LL.D. from Syra-
Crazer—Crayon 167
cuse University, 1910; studied at Oxford Un-
iversity, England, 1900-01; traveled in Eng-
land, Scotland, Holland, Belgium, France, Ger-
many, Switzerland, Italy, Spain, North Africa;
member National Institute of Social Science;
acting president of Colgate University, 1897-
99, 1907; 1908; president pro tempore, 1908.
(For his biography, 'The Interpretation of Life' (1896); 'The Literary Interpre-
tation of Life' (1900); and an edition of Dry-
den's 'Palamon and Arcite' (1898); 'The Mak-
ing of English Literature' (1907).

Crazer, Kriyer, Gaspar, Flemish painter.
B. Antwerp 1582; d. 1669. He was a pupil of
Raphael Cocxie, and became, by the study of
nature, one of the greatest historical and por-
trait painters. At the Spanish court in Brussels
he painted the portrait of the Cardinal Ferdi-
nand, brother of the king, and received a pen-
sion. He established himself in Ghent, where
he constantly executed works for the court, labor-
ing with industry and perseverance till his 86th
year. The city of Ghent alone had 21 altar-
pieces by him. In Flanders and Brabant are
many of his works and some of his pictures
are in the public collections at Parma and
Munich. His paintings are praised for fidelity
to nature, excellent drawings and a coloring
approaching the manner of Vandyke. He
maintained a certain excellence in composition and
execution, in spite of his great productivity.
He was strongly influenced by his friend Ru-
bens. Among the best known are 'The Four
Crowned Martyrs' (Lille Museum); six pic-
tures representing the entrance of the Cardinal
infant (Ghent); 'Alexander and Diogenes'
(Metropolitan Museum, New York); 'The
Miraculous Draught of Fishes,' 'Adoration of
the Shepherds' (Brussels Museum); 'Decapi-
tation of St. John the Baptist' (Ghent Cathed-
ral); 'Martyrdom of St. Blasius' (1668, Ghent
Museum). His most important pupil
was Jan van Cleve. Consult Maeterlinck,
'Bulletin de la Societe d'Histoire et d'Arché-
ologie de Gand' (Ghent 1900).

Crayfish, or Crawfish (Fr. écrevisse, so not connected with "fish"), a fresh-
water crustacean of the family Astacidae, order Decapoda. They are
known by their large size, lobster-like shape, the abdomen being as long
as the cephalothorax, and ending in a broad tail-fins. The first pair of legs
end in large claws (chele), not so large in proportion as
those of the lobster, and those of each leg are
nearly equal in size. Crayfish attain a length
of three to six inches and live in streams or
ditches, sometimes abounding in great numbers.
They dig holes in the banks, from a few inches
to a yard in depth, probably, like the lobster,
using their big claws for this purpose. They
lie at the mouth of their burrow with their
clawed extended ready to seize any passing ins-
sects, snails, tadpoles or frogs, and sometimes
larger animals, and, like the lobster, they will
suck up and occasionally feed on
eculent roots. The European crayfish spawns
in the early spring, the eggs hatching in May and
June. As in all fresh-water crustacea
the young are hatched in the form of the parent,
there being no metamorphosis,—in other words,
development direct. As in the lobster, if an
antenna or leg is lost it is gradually renewed,
growing at every molt. For some time after
they are hatched the young adhere by the
hooked end of their claws to the swimmerets
of the mother, and are carried about under
cover of her abdomen. During this period
the young crayfish are very sluggish, and take
no food, being nourished by the food-yolk still
persisting in the front part of the body. The
European crayfish molts eight times in the
course of the first year and five times during
its second year; in the third year only twice,
that is, in July and September. At a greater
age than this the females moult only once and
the males twice a year.

The crayfish of the Old World belong to the
genus Anticus, while those of North America
east of the Sierra Nevada belong to the genus
Cambarus, the latter differing by the absence
of gills on the fifth or last pair of legs. An
interesting feature in geographical distribution is
the occurrence of half a dozen species of the
European genus Anticus in the streams draining
the Pacific Coast from British Columbia to
California. East of the Rocky Mountains, from
the Great Lakes to Guatemala, there occur be-
tween 30 and 40 species of Cambarus. These
extend to eastern New York west of the Hud-
son River, and a single species (C. bartoni)
occurs under stones in certain lakes of northern
Maine as also in Lake Champlain and the Great
Lakes, extending southward to Kentucky and
the District of Columbia.

The presence of the Eurasian Anticus on the
Pacific Coast indicates their gradual migration
from eastern Asia, at a time when Bering Strait
was dry land. In certain characters the Amur-
land and Japanese Anticus differ from the Ponto-
caspian and the west American Anticus and
approach the Cambari of eastern North Amer-
ica. This is also paralleled in the distribution
of many plants and insects.

The family to which the crayfish belongs
dates as far back as the Jurassic Period, and in
Europe Anticus first appear in the Upper Creta-
cean. In North America fossil Anticus (Cama-
barus primaxevus) occur in the Lower Tertiary
beds of the western border of Wyoming. The
discovered fossil Anticus in the late Pliocene
beds of Idaho. Anticus probably originated in
western America, since it is found fossil
throughout the Tertiary.

Crayfishes are of no little economic importance
from the fact that in the course of their
extensive fossorial operations they undermine
dams, and it is supposed that the inundations of
the Mississippi River and the breaks in the
levees may be due largely to the mining habits
of these animals. For the blind crayfish see
Cave-Dwelling Animals. Consult Fisher,

the United States' (1884); Sterle, 'The Crayfish
of Missouri' (Cincinnati 1902).

Crayon, Geooffrey, a pseudonym
of Washington Irving (q.v.).
CRAYON, a colored pencil consisting of a cylinder of fine pipe-clay colored with a pigment. Black crayons are colored with plum-bago or made of Italian black chalk. A white crayon is a cylinder of chalk, common in Europe and America. Red chalk is found in France. It is made from ochre clay, i.e., ochery clay, containing much iron oxide. The holder is a porte-crayon. Crayons are said to have been made in France in 1422. It is hard to say how long ago charcoal, chalk and ochrous earths were used. Colored crayons are used for pastel-drawing and are quicker and softer in effect than oils or water colors. Their disadvantage lies in their delicacy; they smudge so easily that it is practically impossible to use them for sketching, and they must be kept under glass. In lithography, a crayon is a composition formed as a pencil and used for drawing upon lithographic stones. It is of a soapy nature, consisting of soap, wax, resins and lampblack, melted, and sometimes burned, together. Pastel is made by mixing chalk and color materials with gum water in order to form a paste. The vegetable colors used are tumeric, litmus, saffron and sap green, but should in every case be free from acid, as the latter reacts on the chalk. Vienna white, purified chalk, is also used by artists. Briancian chalk and French chalk are popular names for soapstone, which is very different from chalk in its composition, being a silicate of magnesia.

CRAZY HORSE, a leader of the Southern Siouxs, who refused to the reservations and who made war against the Crows, the Mandan and the whites. He and Sitting Bull were the two foremost leaders of the Sioux War which broke out in 1875. This Indian outbreak was due to several causes, chief of which was the occupancy of the Black Hills by the whites. General Reynolds that same winter surprised the camp of Crazy Horse, but the band succeeded in retreating with comparatively small loss, in a storm. A little later Crazy Horse with a strong band of Sioux and Cheyenne compelled the forces of General Crook to retreat. He then strengthened his band and withdrew from the different reservations, which were filled with a seething unrest by his agents. Others from the reservations joined Sitting Bull in Dakota. The forces of the two leaders joined, and under the leadership of Sitting Bull they annihilated the forces of General Custer at the battle of the Little Bighorn River in Montana (25 June 1876). For over a year the united bands held the country in terror. The following winter Gen. Nelson A. Miles marched against them, whereupon the two Indian bands separated. General Mackenzie followed Crazy Horse and defeated his band on the Tongue River, and Miles followed the retreating Indians to the Bighorn Mountains, where he can scarcely be said to have won any victory over them, thanks to the skilful maneuvers of Crazy Horse, even though he used artillery against them effectively. However, the pressure on the Indians from all sides became so great that Crazy Horse with 2,000 warriors surrendered the following spring. Suspected of attempting to get up more trouble he was arrested (7 May 1877). He tried to escape he was shot by the guard. Consult Hodge, Handbook of American Indians (Washington 1910); Miles, Personal Recollections (1896).

CRAZY-WEED, a common name in the prairie States for species of vetch (Astragalus) of the pea family. They are herbs with purple or yellowish purple flowers, growing on the prairies from Nebraska and Colorado southward to Texas and New Mexico. They receive the name of crazy-weed from the effect they have upon cattle when eaten by them. Another common name is loco-weed, from which arises a local term for an insanely acting person, who is said to be locoed. The same common names are applied to Oxytropis lamertii, which grows northward from Minnesota to British Columbia and south to Texas and New Mexico.

CREAM NUT. See Brazil Nut.

CREAM OF TARTAR, a white, crystaline compound of tartaric acid (q.v.) and potassium. Tartaric acid is dihydric, its molecule containing two atoms of hydrogen that are replaceable by metals. Cream of tartar is the substance that is formed when only one of these typical hydrogen atoms is replaced by potassium; and it is therefore known to chemists as hydrogen potassium tartarate. The potassium tartrate, to distinguish it from the normal potassium tartrate, in which both of the typical hydrogen atoms of the acid are replaced by potassium. Cream of tartar is obtained from argol (q.v.), which forms about vats or casks in which wine is undergoing fermentation. The argol is dissolved in hot water and the solution decolorized by albumin or animal charcoal, the cream of tartar being then extracted by evaporation and crystallization, and purified by recrystallization. Cream of tartar is soluble in water, but it does not dissolve as freely as the other familiar compounds of potassium. It constitutes the chief commercial source of tartaric acid and its compounds, and is used in medicine to some extent. The best baking powders consist of cream of tartar mixed with sodium bicarbonate in the proportion of the relative molecular weights of the two substances. These salts do not act upon each other when dry, but when they are moistened they combine to produce carbon dioxide and water, with the formation of water and the liberation of carbon dioxide gas. The formula of cream of tartar is KH₂C₂O₄, and that of sodium bicarbonate is HNaC₂O₃. The reaction that occurs is represented by the equation

\[ \text{HNaC}_2\text{O}_3 + \text{KH}_2\text{C}_2\text{O}_4 \rightarrow \text{H}_2\text{O} + \text{CO}_2 + \text{KNaH}_2\text{C}_2\text{O}_4 \]

The last formula on the right being that of the normal tartrate of sodium and potassium. The carbon dioxide gas that is liberated in the reaction is retained by the dough or batter with which the baking powder is mixed and serves to make it porous, or light.

CREAMERIES, Co-operative. See Dairy Industry.

CREAMERY. See Dairy Industry.

CREASOTE, a variant spelling of creosote (q.v.).

CREASY, Sir Edward Shepherd, English historian; b. Bexley, Kent, 12 Sept. 1812; d. London, 27 Jan. 1878. He was educated at Eton and Cambridge. He became Fellow of King's College, Cambridge, in 1834; was called to the bar at Lincoln's Inn in 1837. He was for about 20 years a member of the home circuit.
In 1840 he was appointed professor of history at the London University, and in 1860 was knighted. His principal works are 'The Rise and Progress of the British Constitution' (1834); 'The Fifteen Decisive Battles of the World' (1851), a book famous in both England and America. Less known, though still of considerable merit, are his 'Imperial and Colonial Conclusions of the Britanniace Empire'; 'The History of the Ottoman Turks' (1854–56); 'A Historical and Critical Account of the Several Invasions of England'; 'The Old Love and the New,' a novel; and 'A History of England' (1869–70).

**CREATINE**

**krē′ā-tin, or KREATINE**, a crystalline, nitrogenous substance having the formula C\(_4\)H\(_7\)N\(_2\)O\(_3\), and known to chemists as 'methyl guanido acetic acid.' It exists in the muscular flesh of mammals, birds, reptiles and fishes, and also, in smaller quantities, in brain-tissue and in urine. It may be extracted by chopping up lean muscular flesh (freed from fat), rubbing it with water at about 140° F. and removing the water by pressure. The liquid so obtained is heated on a water bath to coagulate the albumin and then a state of lead is added to the filtrate so long as it gives a precipitate, excess of lead is removed by sulphured hydrogen and the filtrate is concentrated on a water bath. Crystals of creatine then separate out, the yield being larger if two or three volumes of alcohol are added. The crystals are redissolved, decolorized by filtration through animal charcoal and purified by recrystallization. Creatine crystallizes in monoclinic prisms containing one molecule of water. Its aqueous solution has a bitter taste and is strongly alkaline to litmus. With silver nitrate it gives a white precipitate, which is soluble in caustic potash. If a small quantity of silver nitrate is added to a saturated solution of creatine, together with just sufficient caustic potash to dissolve the precipitate formed, the solution presently solidifies to a transparent gelatinous mass, which, when heated, deposits metallic silver. Creatine is dissolved by strong acids, losing one molecule of water and becoming converted into creatinine. It is also decomposed by boiling with baryta water, yielding sarcosine (C\(_2\)H\(_4\)N\(_2\)O\(_2\)) and urea (C\(_2\)H\(_4\)N\(_2\)). Creatine may be prepared synthetically by allowing an alcoholic or aqueous solution of sarcosine and cyanamide, C\(_3\)H\(_7\)N\(_2\), to evaporate spontaneously, crystals of creatine separating out as the evaporation proceeds. See also CREATININE.

**CREATININE, or KREATININE**, a crystalline substance having the chemical formula C\(_4\)H\(_7\)N\(_2\)O\(_3\), and closely allied to creatine (q.v.), from which substance it may be obtained by the removal of one molecule of water by the action of mineral acids or dehydrating agents. It may also be prepared directly from human urine, though, according to Johnson, slight differences exist between the substances obtained from creatine and from urine; for example, both reduce Fehling's solution, but the creatinine prepared directly from urine has a much 20 per cent greater solubility than that prepared from creatine. Differences in solubility are also said to exist. Creatinine crystallizes in prisms, which may be anhydrous or may contain two molecules of water. It is very soluble in hot water, its solution being neutral to litmus according to some authorities, but alkaline according to others. It is a well-crystallized salts with acids, and in alkaline solution it slowly takes up water and becomes transformed into creatine. Physiologically, creatinine is to be regarded as a derivative from creatine; for, according to Carpenter, "the latter predominated in the juice of flesh, almost to the exclusion of the former, while the former predominates in the urine, almost to the exclusion of the latter."

**CREATION** (Lat. *creatio*, from *creare*, to create). The Creation is the act of creating or bringing into existence, also something created or caused to exist; specifically, the act of bringing into existence the universe, likewise the universe itself. The Old Testament account of the creation contained in Genesis i–ii, 4 (first clause), is received by those who accept the literal authority of the Bible. The second (second clause), contains, according to many of the later biblical critics, another and quite distinct narrative of the creation. According to the first and generally accepted account, God created the heaven and the earth in the space of six— or, including the rest-day, seven—successive days. On the first day he created light, and called the light day and the darkness night; on the second day he made the firmament and divided the waters; on the third day appeared the dry land, while the waters were gathered together in seas, and plants began to grow upon the earth; on the fourth day the lights were set in the firmament; on the fifth day God created aquatic and bird life; on the sixth day he made land animals and created man. On the seventh day God rested from his work, and from this part of the account came the institution of the Sabbath, as having been hallowed for man by the example and decree of God himself. Various attempts have been made to bring this narrative into harmony with the discoveries and speculations of modern scientific and philosophical thought; but at the present time there appears to be a feeling, as well among scholars as among people at large, that such endeavors can only be unprofitable; while of primitive theorizing upon the origin of the world may well be left to tell its own story, however variously interpreted, to the modern mind.

Other ancient cosmogonies have long engaged the attention of students, and in the different early accounts of creation brought to light from the literary and monumental remains of antiquity much valuable material has been found for the study of comparative records bearing upon history and religion. Among the old cosmogonies, that contained in the Babylonian and Assyrian legend of creation is especially interesting, from the points of resemblance between itself and the account above given from the book of Genesis. The two are variously regarded by specialists, some treating them as independent variants of one original tradition or myth, while others hold that the narrative of Genesis is a borrowing from the Babylonian legend.

It is now more than 30 years since the learned world was startled by the announcement that Assyriologists had discovered a remarkable version of the history of the creation, which closely resembled the main narra-
tive of Genesis, and appeared to be based upon the archetype from which one of the earliest editors or writers of the Hexateuch drew many of his statements. The credit of the discovery of the cuneiform creation records in the British Museum belongs, undoubtedly, to Sir Henry Rawlinson, for the British Museum, has continued and completed, as far as is possible, up to the present time, the work begun by Rawlinson. As the result of his labors we are able to form a connected idea of the whole of the Babylonian story of the creation. Formerly only 21 tablets and fragments inscribed with portions of the legend were known, but now no less than 49 separate tablets and fragments have been identified as containing portions of the cuneiform texts of the creation series, and the details of the story can now be followed consecutively.

The great Babylonian poem of creation was divided into seven sections, or tablets, and the whole work was known by the title "Enuma Elish," which also forms the opening words of it contained 594 lines. Each of the seven sections contained, on an average, 140 lines, and each section was intended to describe the events of one "day" of creation. It is difficult not to think that such artificial divisions of the legend indicate that we are dealing with a comparatively late recension of it, and this may well be the case when we remember that the oldest copies of it which we possess date from the reign of Assurbanipal (668-626 B.C.); no one takes the trouble to read the seven tablets and who is familiar with ancient cosmogonies and theogonies will have the slightest doubt that the original form of the Babylonian and Assyrian history of creation is many thousands of years old. It is very probable that the Semitic Babylonians were only the borrowers and not the inventors of this remarkable work.

At the beginning of all things, according to the legend, Apsu and Tiamat were water deities and typified chaos; to these were born Lahmu and Lahamu, and later appeared Anshar and Kishar, and still later Anu and other gods came into being. One of the fragments of the first tablet mentions the birth of Nudimmud (Ea), and shows that Marduk, who is made to take the leading part in the later tablets of creation, was supposed to be in existence, like Mimmu and Giga. In the earlier episodes of the creation story, it is Ea and not Marduk who is the hero, and it was Apsu, a god of chaos, who rebelled against the gods. Apsu disliked the new order of things and the creation of the universe for the simple reason that the beings who formed members of the new world disturbed his peace and rest; as soon as he had made up his mind as to what was likely to happen, he called Mimmu, his minister, and with him went to Tiamat and took counsel with her, and completed her after every day by day nor by night. The putting of the house of the world into order by the gods destroyed his peace of mind. Of the conflict which took place between Ea and Apsu and his ally Mimmu we know very little, but that the great god did not succeed in his attack on Apsu and his allies is clear from the fact that, later, Anshar found it necessary to exhort Marduk to do battle with Tiamat. Marduk slew her and split her body into halves. The actual account of the creation of the world by Marduk begins toward the end of the fourth tablet, where it is said that one-half of the body of Tiamat formed a covering for heaven, and that Marduk, having formed E-shara, made the great trinity of Anu, Bel and Ea to dwell therein.

In the fifth tablet we hear of the fixing of the constellations of the zodiac, the founding of the year, etc., and it seems as if this section contained an account of the creation of vegetation. The sixth tablet told the story of the creation of man, and it seems as if Marduk made man with the view both of punishing the gods and of providing a creature who should at all times worship him. Marduk, or Bel, instructed Ea to cut off his (Marduk's) head, and the man was formed out of the blood which flowed from the god's body. Marduk is made to tell Ea that he intends to create man from his own blood and from the "bone" which he will create. The Assyrian word for "bone" is teimmu, which is the exact equivalent of the Hebrew esem,""bone,"" which occurs in Genesis ii, 23, in connection with the account of the creation of woman.

The creation of man was the final act of creation, and when this was accomplished, the gods assembled in their council chamber in Upshukkinaku, with Marduk at their head, and they sung to him a hymn of praise, the text of which forms the seventh section of the creation story and contains 50 addresses to the god. How Marduk managed to survive his decapitation is not told us, and we can only surmise that he met the gods in their council chamber in some sort of spiritual body. The parallels which may be drawn between parts of this legend and the book of Genesis are taken by many scholars to prove that the Jews borrowed large portions of their religious literature from their kinsmen, the Babylonians, and that the seven days of creation were imagined long before the days of Abraham. Consult Johns, C. H. W., 'A short bibliography of works on the Babylonian stories of creation and the flood' (Manchester, England, 1913); Ball, Sir R. S., 'The Earth's Beginning' (New York 1902); Bergson, H., 'Creative Evolution' (New York 1911); Hastings, H. L., 'Was Moses Mistaken? or Creation and Evolution' (Boston 1895); Muss-Arnolt, W., 'The cuneiform account of the Creation and the Deluge' (Chicago 1894); Gridley, A. L., 'The first chapter of Genesis as the rock foundation for science and religion' (Boston 1913).

CREATIONISM. See MAN, CHRISTIAN ANTHROPOLOGY.

CREATIONISM. (1) In theology, the doctrine that a soul is specially created for each human fetus as soon as it is formed in the womb; opposed to Traducianism, which teaches that the souls of children as well as their bodies are begotten by reproduction from the substance of the parents; and to Infusionism, which holds that souls are pre-existent, and that a soul is divinely infused into each human fetus as soon as it is formed by generation. Many theologians regard the mode of the soul's coming into being as a part of the mystery which envelops the whole subject of the existence and transmission of life. (2) A term for that theory of the origin of man which is opposed to evolutionism (see EVOLUTION); the doctrine of the creation of all
things by the Creator's fiat, and not through evolutionary processes.

CRÉBILLON, krá-bé-yón. Claude Prosper Joyot de. French novelist: b. Paris, 14 Feb. 1707; d. there, 12 April 1777. He was the younger son of Prosper Joyot de Crébillon (q.v.), and succeeded as an author in an age of licentiousness. For his theological allusions in his dramatist, b. Dijon, France, 13 Feb. 1674; d. Paris, 17 June 1762. His first piece, 'La Mort des Enfants de Brute,' was rejected by the players. His 'Idoménée' was brought upon the stage in 1705. The faults of the play were overlooked in consideration of the youth of the author and the promising talent which it displayed, and his talents after the appearance of his 'Atrée,' in 1707, were loudly applauded. A taste for unnatural declamation had been excised by Corneille's tragedy, 'Rodogune,' and the play was further by Crébillon in the 'Atrée.' In 1709 appeared his 'Electre,' which is as declamatory and as intricate as his earlier plays; yet it suited the taste of the age. His chef-d'œuvre, at least according to La Harpe, was 'Semiramis' (1711). In eight decades the 'Rhadamiste' passed through five editions, and Paris and Versailles vied with each other in admiring it. Crébillon had been told that his talent lay in the terrible, and thought, therefore, that he could not exert himself too much in scenes of horror. 'Xerxes' (1714) exceeded in this respect all that he had before written, but soon disappeared from the stage. 'Semiramis' (1717) was severely censured, but 'Pyrrhus' appeared in 1726 and met with a good reception, contrary to the expectations of the author, who, in this work, had abstained from the frightful and the shocking. When Madame de Pompadour wished to humble Voltaire, Crébillon was thought of as a fit instrument for her purpose. The king gave him the office of censor of the police, a yearly pension of 1,000 francs, and an appointment in the library. Thus freed from pecuniary anxiety, he finished his 'Catiline,' which was represented in 1749 with all the pomp that the court there could display. To make some atonement to the character of Cicero, thought to have been wronged in his 'Catiline,' he wrote at 76 the 'Triumvirate, or the Death of Cicero,' which was brought upon the stage in his 81st year. The defects of this piece were overlooked, from respect to the age of the author. In general Crébillon shows none of the true elevation of the tragic art, but only an imitation, sometimes a happy one, of the manner struck out by Corneille. He was a man of a proud and independent character, disinclined to flatter the great, and passed much of his life in a condition bordering on poverty. In 1731 he became a member of the Academy. His works were edited best by Didot (1812). There is a Life by the Abbé de la Porte, and a fine essay by Brunetiére in 'Époques de théâtre français.' Consult Duthoit, 'Étude sur Crébillon' (1895); Amaton, C. H., 'Particularités sur les deux Crébillon' (1835).

CRÉCHE, krásh (Fr. cribe, manger), a sort of public nursery where, for a small payment or, as in America, usually for nothing, the children of women who have to go out to work are fed, nursed and taken care of during the work hours of the day.

CRÉCY-EN-PONTThIEU, krá-sé ôn pon-tyey, or CRESSY, a village in the French department of Somme, on the Mayo, 12 miles north of Abbeville. Crécy has a 15th century church and is celebrated on account of the brilliant victory obtained here, 26 Aug. 1346, by Edward III, with 40,000 English soldiers, over a French army amounting, according to Froissart, to 100,000 men under the command of the Count of Alençon. In this great battle perished the flower of the French chivalry, as well as the blind king of Bohemia, who was fighting on the side of France. The Black Prince distinguished himself greatly, bore the brunt of the fight, and gained his spurs. After this battle, tradition says, the Black Prince assumed the crest of the slain king of Bohemia, which consisted of three ostrich feathers with the motto Ich dien, "I serve," but this is more than doubtful. The battle of Crécy was one of the first in which cannon were used by English troops. Pop. about 1,400. Consult: George, 'Battles of English History' (New York 1899); and Oman, 'History of the Art of War' (London 1898).

CREDENCE, a small table placed near the altar or communion table, at its south side, on which the bread and wine intended for consecration are placed in readiness. In this connection it is used especially in the Roman Catholic and Episcopal churches. In the Greek Church this is called the trapeza prothesos, or simply prothesis, but is always placed north of the altar, usually in a structural side-chapel. It was sometimes used in the English Church. The word is generally used to denote a small side table or buffet, on which dishes were placed or kept before meals.

CREDI, krá'dé, Lorenzo, Italian artist: b. Florence 1459; d. there, 12 Jan. 1537. He was a fellow pupil of Leonardo da Vinci in the school of Verrocchio, and so closely followed his style that some of his copies of Leonardo's works are scarcely to be distinguished from the originals. His 'Holy Families,' of which he painted a great number for private collections, are gracefully designed and highly finished. His most esteemed work is the 'Madonna of the Child with Saints Julian and Nicholas,' now in the Louvre, and the 'Nativity' at Florence. Two very fine works are the 'Annunciation' and
the 'Venus' in the Uffizi. The Metropolitan Museum has a 'Madonna Adoring the Christ Child'; and the Boston Art Museum a beautiful boy's head. He did some sculpture also, being designated by Verocchio to complete his statue of Colossi.

CREDIT, Economic and Public. In political economy the term credit is used to signify (1) the ability of a person to secure a sum of money or its equivalent on a promise to pay the same sum or its equivalent at some future date; (2) claims for future payment of money or its equivalent. It implies confidence of the creditor in the debtor; and the credit system implies general confidence in people's ability to meet their obligations. Credit may also rest upon the fact that a person possesses readily salable commodities, and the extent of credit may depend in large degree on the volume of such merchandise, though at times personal characteristics greatly influence the line of credit extended or allowed. In a mercantile community credit is used more extensively than in an agricultural community since mercantile capital can be converted into cash more readily than agricultural.

The chief function of credit is the transferring of capital from those who own it to persons who presumably expect to make a profit that exceeds the interest on the loan or in the case of goods sold on time (a disguised loan transaction) an excess of price usually exacted in credit sales. Thus while itself not a productive agent, credit increases the productive power of capital. The modern credit system does not rest on good faith alone but its development through efficient credit institutions and its extensive use in commercial transactions are made possible by means of bonds, drafts, checks, promissory notes, etc., which have been standardized through the intermediation of a credit institution such as a bank. Thus the secondary function of credit is to permit the exchange of commodities without the intervention of coin money. By means of a credit system a comparatively small stock of money can be made to do duty for carrying on a number of different transactions, but it is indispensable for every good system of credit that money be instantly available when required. When credit media of exchange are used, business may be violently disturbed by any doubt cast upon the general solvency of business men, whereupon occurs a sudden contraction of the medium of exchange, with the resultant inability of producers to sell their commodities and a depression in prices. See Crises, Economic.

Public credit is the confidence which men entertain in the ability and disposition of a nation to fulfil its engagements with its creditors, or, in other words, the ability of public bodies to buy supplies or to contract to buy them. As more generally used the term means the borrowing capacity and rate at which money can be secured for the public service. The term is also applied to the general credit of the individuals in a nation. The credit of the government does not always flourish or decline at the same time as private credit, yet there is some correspondence between the two, as general individual confidence can rarely if ever persist in the midst of distrust of the government, and a firm confidence in the government tends to promote a corresponding confidence among citizens. A government is usually supposed not to possess complete public confidence if its securities sell at less than par. In time of emergency the strongest government might be compelled to accept unfavorable terms for a loan, either by paying exorbitant interest or accepting less than the face value of the obligation in payment. See Debts, Public; DEBT AND CREDIT, LAWS OF.

CREDIT, Instruments of. See Banks and Banking—Commercial Paper.

CREDIT, Letter of, an order given by bankers or others at one place to enable a person to receive money from their agent or agents at another place; when it is an order on more than one person or firm it is known as a circular letter of credit.

CREDIT FONCIER, krâ'dê' fôⁿ'syâ'; in France and other continental countries, a mode of raising money on land, the peculiarity of which is that the advance must not exceed one-half of the value of the property pledged or hypothecated, and that the repayment of the loan is by an annuity, which includes the interest and part of the principal, terminable at a certain date. Several companies have been established by the government with the privilege of making loans. The movement was initiated by L. Wolowski and was accepted by government decree in 1852. Its name became the Banque Foncière de Paris. Similar institutions at Nevers and Marseilles were amalgamated into one under the title of 'Crédit Foncier de France.' A Consulat Général, the Consulat Général de la Mobilisation du Crédit foncier (in Revue Wolowski, Vol. X, p. 241, 1839), Josse, Chonsky and Delanoy, Des Institutions de crédit foncier et agricole dans les principaux États de l'Europe (1851); Girault, A., 'Le Crédit foncier et ses privilèges' (Paris 1889, in Bulletin de la Société de législation comparée, 1891, pp. 232-237).

CREDIT INSURANCE. See Insurance, Credit.
CRÉDIT MOBILIER, krá-dé mô-bé-lyý (Fr. krá-dé mô-bé-leê), a large company, incorporated under the name of Société générale du Crédit Mobilier, in France in 1852, and sanctioned by law in 1854. Its objects were (1) To take in hand and originate trading enterprises of all kinds, on the principle of limited liability, (2) To supersede or buy up trading companies; and to substitute scrip and shares of its own for the shares and bonds of other companies. In 1855 the net result of the formation a capital of 60,000,000 francs, and did a very extensive business. In 1855 the directors proposed to issue bonds to the amount of 240,000,000 francs, but financiers feared so large an amount of paper currency, and the issue was forbidden by the government. The prosperity of the company declined after this, and the management changed in 1871.

CRÉDIT MOBILIER OF AMERICA, the source of the most tremendous legislative scandal in American history. The national government, only a few years before, had chartered a "Union Pacific Railroad," with $100,000,000 capital, to complete a transcontinental line west from the Missouri River; and offered to assist it by a loan of $16,000 to $48,000 a mile according to location, over $20,000,000 in aid of the land grant of 20,000,000 acres, worth $20,000,000 to $100,000,000. Even this offer attracted no subscribers; it meant building 1,750 miles of road through desert and mountain, at enormous cost of freighting for supplies, with frequent bloody encounters with Indians, and no probability of business to pay dividends. Then a House committee, of which Oakes Ames (q.v.) was a member and probably advised the plan, added an authorization to the railroad to issue its own bonds for dollar with the government's, the former to be first mortgage and the latter second; the bonds might be issued 100 miles in advance of construction. In other words, the government assumed all the risk. Still the stock had no marketable value on its own basis as an investment, but only through the government's offer in excess of probable cost, which made it worth while for capitalists to take up the stock and earn these offers. Mr. Ames, chief of the enterprise, and a few associates, knew that this cost would not be much more than half the government's loan and the latter second; the bonds might be issued 100 miles in advance of construction. Thus the Union Pacific was stripped of everything but its roadbed and equipment, while its double would pay business rates and pocket the remainder. Besides Mr. Ames, the chief managers were Thomas C. Durant, vice-president of the Union Pacific (John A. Dix being president), Cornelius S. Bushnell and John B. Alley. They and their associates bought up a moribund Philadelphia concern called the "Pennsylvania Fiscal Agency," chartered in 1859 and organized as a loan company in 1863, and reorganized it the "Crédit Mobilier of America," oddly, as its French prototype was bankrupt and not in good savor. The Union Pacific stockholders took the same amount of stock in it as in the road. The history of the details by which it accomplished the objects of its being cannot be given here. In 1866 the government extended its offer to such mileage as the Central Pacific should build east from its California lines, and the two companies began a race to secure the benefits. Probably the Central Pacific paid as much profit as the Crédit Mobilier, but that was legitimately earned for its stockholders; and even the Crédit Mobilier's action would have been less obnoxious but for the collusion of government directors and public representatives. The net result of the passage of the Union Pacific bill was $94,650,287.28, and the Crédit Mobilier $50,720,958.94, leaving a profit of $43,929,328.34, counting at par the stock and bonds with which the Crédit Mobilier paid itself; on the statement of the trustees, they realized only $25,365,319.81 in cash. But this was certainly much underestimated; and even so, it was all gained in two years, to December 1868. But the rise of Crédit Mobilier stock in a few months from five cents on the dollar to three or four hundred thousand and then out of the market, the payment of over 500 per cent a year dividends, the knowledge that there was only one place they could come from, and the inference that the government trustees must be incompetent or worse, aroused suspicious excitement. Then the promoters began to quarrel bitterly over the division of spoils, and to sue each other, and one of them came within an ace of exposing the whole, and outsiders demanded a share as the price of silence or assistance. The Crédit Mobilier needed additional legislation, and procured it by "special legal expenses"; and in the latter part of 1867 the suit of an outsider, H. S. McComb, to obtain stock to which he alleged a claim, laid the mine for the final explosion. Representative Elihu B. Washburne of Illinois had moved an investigation and the fixing of transportation rates, and in alarm Mr. Ames (also a representative) came to Washington with 343 shares of stock, then commanding 100 per cent premium, but which he sold to congressmen and leading government officials. In a petition to him that became classic, he afterward said that he had put the stock "where it would do the most good." McComb asserted his right to 375 shares, and to quiet him Mr. Ames, in February, 1868, told him the names of the public men to whom he had "sold" his stock, and bid him his time, and in the presidential campaign of 1872 published those names, or what he alleged to be those; but he added others, or was misinformed, as some of the accused had perfectly clean hands. The list was shocked by the Vice-President of the United States (Colfax), the Vice-President-elect (Wilson), the speaker of the House (Blaine), and many other eminent names. When the third session of the 42d Congress opened in December 1872, the speaker descended to the floor and demanded a committee of investigation containing a majority of his political opponents; which was appointed, with Luke P. Poland of Vermont as chairman. It made a report 18 Feb. 1873, which proved that the speaker had been offered the stock but had refused to touch it, as had Mr. McComb, Boutwell and others. Some had taken it but returned it when lawsuits were threatened, without retaining the dividends; some kept it and justified it openly as a business investment; some kept it and the dividends till investigation was imminent and possibly kept the dividends altogether, a few kept both and attempted to
deny or explain away the ownership. The report recommended the expulsion of Oakes Ames for using the stock to influence the votes of members of Congress; that of James Brooks, a general director of the Union Pacific, for using his position to obtain stock for himself or his family. The vote on the report was deferred for a week, and the House merely censured both, who by a strange coincidence died shortly after, only a week apart. In the Senate, an investigating committee recommended the expulsion of Senator Pomeroy of Kansas, but no action was taken on it. Consult Crawford, 'The Crédit Mobilier of America' (1880); Hazard, same title (1881), paper before the Rhode Island Historical Society; Scribner's Magazine, 'The Crédit Mobilier' (March 1874).

CREDITS. See Banks and Banking—The Functions of Banks: World's Systems and International Banking.

CREE (křē) INDIANS, a tribe of North American Indians of Algonquin stock, living on several reservations in Manitoba and Assiniboia, near Lake Winnipeg and the Saskatchewan River. The tribe numbers about 10,000. They are on friendly terms with the Assiniboins, but until brought under governmental control were constantly at war with the Sioux and Blackfeet. Their bands are commonly grouped in two main divisions: Plain and Wood Cree. After obtaining firearms, they began to harass weaker Athabascan tribes, as far as the Great Slave Lake and the Rocky Mountains, but retired to their present position. (See Algonquian.) Consult Skinner, 'Notes on the Eastern Cree and Northern Saulteaux' (American Museum of Natural History, 1911).

CREECH, Thomas, English classical scholar: b. Blandford, Dorsetshire, 1659; d. Oxford, June 1700. He was educated at Wadham College, Oxford, elected Fellow of All Saints College in 1683, and was head master of Sherborne School from 1694-96. He returned to Oxford, and in a fit of melancholy committed suicide. He owes his fame almost exclusively to his translation of Lucretius, the poetical merit of which is not very great, although, in the versification of the argumentative and mechanical parts, considerable skill is exhibited. As an editor of Lucretius, he is chiefly valuable for his explanation of the Epicurean philosophy, for which, however, he was largely indebted to Gassendi. He translated also the elegies of Ovid, two eclogues of Virgil, some of Plutarch's Lives, Theocritus, thirteenth satire of Juvenal, etc.

CREED. See CREEDS AND CONFESSIONS.

CREED, Colo., town and county-seat of Mineral County, on the Denver and Rio Grande Railroad; 35 miles northwest of Del Norte, and 165 miles southwest of Denver. It is in a narrow gulch on Willow Creek, high up among the mountains, and is engaged exclusively in mining, having been formerly noted for its highly productive silver mines. Since 1903, however, the mining of lead and zinc has been more profitable. Wagon Wheel Gap, Hot Springs and Antelope Springs are of scenic interest and make the region attractive for students. It is named after N. C. Creede, who staked the first claims here in 1889. Nearly destroyed by fire in 1892, it was rebuilt and has public schools, weekly newspapers and a national bank. Pop. 741.

CREEDMOOR, a rifle range belonging to the State of New York, located near Queen's station on the Long Island Railroad, just within the boundaries of Greater New York. Each regiment of the 1st and 2nd battalions of the National Guard is required to practise at Creedmoor at stated times. The range extends over 85 acres, has 30 targets and can be used at any distance from 50 to 1,200 yards. The range was founded as a private enterprise by the National Rifle Association and was later acquired by the State. Creedmoor village is the seat of a State insane asylum. Pop. 600.

CREEDS AND CONFESSIONS (Lat. credo, 'I believe'; confessio 'I confess'), formularies of religious doctrine, rules, symbols or testimonies of faith for public use, setting forth with authority articles of belief which are regarded by the different Christian sects as necessary for salvation.

Of these formularies, the earliest is the Apostles' Creed which developed from the confession of Peter, Matthew xvi, 16, and from the baptismal invocation which determined the form of liturgical order and arrangement of controversies which arose over differences of opinion on doctrinal points came the creeds of ecumenical councils of bishops; the Nicene Creed, A.D. 325; and the Creed of Chalcedon, A.D. 451. Between these two, and about 1517, appeared the Athanasian Creed, attributed to Athanasius, bishop of Alexandria (d. 372). The early existence of the Apostles' Creed is inferred from a passage in the work 'Against Heresies,' written by Saint Irenaeus, who died about 202, being then 60 or perhaps 80 years old. The order in which the topics of the Apostles' Creed occur in the passage gives force to the conjecture based on its phraseology. Irenaeus says of the Christians of his day: All teach one and the same God the Father, and believe the same confession of the Son of God, and know the same gift of the Spirit, and meditate on the same precepts, and maintain the same form of constitution with respect to the Church, and look for the same coming of the Lord, and wait for the same judgment as of the whole man—that is, of the soul and body. Rufinus, who lived in the latter half of the 4th century, gives us the "symbol" of the apostles as it was received by the Roman Church of his time; it is shorter than the form that is now current, but it contains nearly all the articles of the now existing creed and in the same words and the same order. In 870 the Eastern or Greek Church under Photius, archbishop of Constantinople, separated from the Western or Mother Church of Rome, over the insertion of filioque—and the Son—in the Creed, two years before at the Council of Toledo, Spain, held in 589. The doctrinal system of the Greek Church underwent no further change, but the Reformation called forth a number of confessions or doctrinal manifestations against Protestantism and some against the Church of Rome; namely, the Confessions of Gennadius,
CREEKS (named for the same reason as or in translation from their Algonquin name, Muskoki, "creeks," from their many-rivered land), a once powerful confederacy of Gulf Indians, the strongest of the five native races of New York, except the Cherokees. They occupied a large part of Georgia and Alabama, and formed the largest section of the Muskogean stock. The Muskogi were the dominant tribe, and their language the *lingua franca* of the confederacy; others at the outer border were the Coosa, Kahta, Kawiata (Coweta), etc.; later came in the Abilhamu, Hitchiti, Kosati, Yamas (Yemasssee), Uchi or Uchee, Natchez and others, and a band of Shawanoes had been incorporealized by desire or force. The Seminoles ("wanderers") of Florida had broken away from them. They numbered probably 30,000 at their highest. Lying between the English spheres in Georgia, the Spanish in Florida, and the French at Mobile, and in Louisiana, each power bid for their allegiance, the latter from side to side; but the destruction of the French power and the cession of Florida 1763-83, left the English supreme. In 1763 they had 5,860 warriors and 50 towns; the latter of log houses plastered outside, and the former of adobe; all the Southern tribes, built in an oblong with a space in the centre for public ceremonials, like the classic forum or agora. Their head chief was called mico, besides whom they had a war chief; no chief seems ever to have been deposed, but new ones added, and at last they became so burdensome that their number was limited to 500. In the Revolution the Creeks took the English side, and after it many Southern Tories took refuge among them and kept them stirred up to hostility: Congress had determined on war, but in 1790 the chiefs were induced to visit New York, and made peace for both Upper and Lower Creeks and Seminoles. This did not prevent attempted raids on Nashville and Knoxville 1792-93. A number of treaties were made with them involving cessions of land in the years after 1786; and from 1800 on, a number of them settled in Louisiana, and later in Texas, where they remained on a reservation till reunited with the others in 1872. In the War of 1812 the Episcopal Church of England's faith were, when first promulgated (1552), 42 in number, but later that number was reduced to 39. In 1646 was published the Westminster Confession of Faith by the Presbyterian divines of England, Scotland and New England, which in the year 1803 underwent amendment by vote of the Presbyterian churches of the United States. (See Canon Law; Christian Doctrine, Development of; Christology; Reformation; Grotius, Reformed; and separated articles on different creeds and confessions). For further creeds of modern evangelical denominations consult Schaff, P., "Creeds of Christendom," (3 vols., New York 1877); also Curtis, W. A., 'A history of creeds and confessions of faith in Christendom and beyond, with historical tables' (Edinburgh 1911); Briggs, C. A., 'The fundamental Christian faith; the origin, history and interpretation of the Apostles' and Nicene creeds' (New York 1913); Dix, M., 'The Creed: A historical study of the Christian Faith' (New York 1903); Strine, J. H., 'Creed and the Creeds, their function in the church' (London 1911).
the Seminoles, but others began raiding Georgia and Alabama villages. Scott reduced them, and the government at once began deporting them to the Arkansas; 24,594 were removed, and 744 left behind. The government tried to Christianize and civilize them, but they fiercely refused either missionaries or schools; especially Christianity, which to them was a badge of their negro slaves. In 1857 they numbered 14,888. In the Civil War they divided, and after three battles the Confederate section drove the other into Kansas, where many perished, and about 6000 perished on the march and died of disease. After the war they were forced to cede 3,000,000 acres of land, for $975,000. Their government is the same as that of the Cherokee. The number in 1915 was 6,873 of Indian blood. The entire "nation," white, negro and Indian, numbered in 1915, 18,776. At that date the total area of the Creek Nation was 3,079,095 acres, of which 16,016 acres were reserved for town sites, railroad rights of way and other purposes; 2,997,114 acres were allotted to 18,172 citizens and 6,393 were given to Indians in fee; and 470 acres were sold. The tribal affairs of the Creek Nation, with the exception of the completion of equalization payments had been disposed of, and the former nation was incorporated in the United States.

CREELMAN, George Christie, Canadian educator: b. Collingwood, Ontario, 9 May 1869. He was educated at the Collegiate Institute, Collingwood, the universities of Toronto, Cornell and Wisconsin, and Michigan Agricultural College. He was assistant professor of biology at Mississippi Agricultural College 1889-92, and held the professorship from 1892-97. He was superintendent of the Farmers' Institutes of Ontario from 1897-1904, and since the latter year has been president of the Ontario Agricultural College, Guelph.

CREELMAN, James, American war correspondent and journalist: b. Montreal, Canada, 12 Nov. 1859; d. 12 Feb. 1915. He entered the service of the New York Herald in 1877, was an editorial writer and correspondent 1877-79; editor of the London edition 1890, and of the Paris edition 1891-92, when he became editor of the New York Evenin Telegram. He represented the New York World in the China Japanese War of 1894; the New York Journal in the Greco-Turkish War 1897, the Spanish-American War 1898, where his gallant conduct met with wide and well-deserved recognition, and the Philippine insurrection 1899. He was a volunteer aide on General Lawton's staff in the Philippines. From 1900 to 1906 he was a special and editorial writer on the New York World, and from 1906 to 1910 was associate editor of Pearson's Magazine. He was a member of the New York Board of Education (1911-12), and president of the Municipal Civil Service Commission (1911-13); and during the following years covered important political assignments for the Evening Mail and the New York American. He has published: On the Great Fortieth Parallel (1901), an account of his travels and correspondent; 'Eagle Blood' (1902), a novel.

CREEPER, a local name of a variety of small birds. The term is usually distinguished by prefix, but most frequently used for the tree-creeper (Certhia). With the one exception all of the 12 or 14 species and 5 genera are confined to the Old World, those of Africa and Australia being less typical than the north temperate (Certhia). The common or brown creeper (Certhia familiaris) has a slender curved bill, strong feet with short tarsi, 12 stiff, acuminate tail feathers, and brown plumage streaked with white. In a number of varieties it occurs in temperate North America and Europe breeding mostly to the north. It is a common little bird in open woodlands. Encircling trees spirally from the base upward, it clings to the bark in the manner of woodpeckers by means of the feet, aided by the stiff tail feathers, and picks insects and their eggs from the crevices with its sharp bill and slender exsertile tongue.

CREFIELD. See KREFIELD.

CREIGHTON, kran'ton, James Edwin, Canadian-American philosopher, teacher and writer: b. Pictou, N. S., 8 April 1861, graduated from Dalhousie College 1877, and studied philosophy at Cornell University and at the universities of Leipzig and Berlin; Ph.D. Cornell University 1892, LL.D. Queens University 1903; Sage professor of logic and metaphysics in Cornell University since 1895; editor The Philosophical Review and American editor of Kant-Studien. He was the first president of the American Philosophical Society, which was organized in 1902. He has published 'An Introductory Logic' (1898), been a frequent contributor to philosophical journals, and made important translations from the German.

CREIGHTON, Mandell, English Anglican prelate and historian: b. Carlisle, 5 July 1843; d. Fulham, London, 14 Jan. 1901. He was educated at Merton College, Oxford (1861), and was lecturer in oriental theology and deacon in 1870, and priest in 1873. He was vicar of Emlorton, Northumberland, 1874-84, and in the latter year was elected to the Dixie professorship of ecclesiastical history at Cambridge, being the first occupant of the chair. In 1883 he became canon residuary of Worcester Cathedral, but in 1891, on his appointment as bishop of Peterborough vacated both that post and his professorship. He also became Privy Councillor. In 1897, he was appointed bishop of London. The most important of his numerous historical works is his 'History of the Papacy During the Reformation' (1882-94). Other publications of his include 'Primer of Roman History' (1875); 'Life of Simon de Montfort' (1876); 'The Age of Elizabeth' (1876); 'The Tudors and the Stuarts' (1876); 'Cardinal Wolsey' (1884); 'Carlisle' (1889); 'The Early Renaissance in England' (1895); 'The English National Character' (1896); 'Story of Some English Shires' (1897); 'Persecution and Tolerance'; 'Councils for Church People'; 'Historical Essays and

CREIZENACH, kriz-nách, Theodor Adolf, German poet and literary historian: b. Mainz, 16 April 1818; d. 5 Dec. 1877. He was educated at Giessen, Göttingen and Heidelberg, and was prominent among the Jews in Frankfort until his conversion to Christianity in 1854. After that time he taught in the public schools in Frankfort, becoming professor of history and literature at the gymnasium in 1863. He wrote poems published in two volumes (1838 and 1846) and edited the letters of Goethe and Marianne von Willemer.

CREMA, kré-má, Italy, episcopal city in Lombardy, province Cremona, in a beautiful plain on the left bank of the Serio, 25 miles east of Milan. It was founded about 570 by the Lombards, and was destroyed in 1159 by Frederick Barbarossa, for taking part with the Guelfs. It was rebuilt in 1185. It is now a well-preserved city, Packeted in a brick wall and a deep ditch, and containing an old castle, a cathedral dating from the middle of the 14th century, a picture gallery and several educational institutions. Chief products of the district are wine, fruit, flax, hemp, rice and cheese; lace, silk and linen goods are manufactured here, which are famous throughout Europe. Pop. 11,411.

CREMATION OF THE DEAD, the practice of disposing of the bodies of the dead by reducing them to ashes, instead of by burial. The custom is of ancient origin, and has been revived in modern times. In Greece burial was practised through the 5th century a.c., but with the spread of belief in a future life and the need of purification by fire, cremation became common. It was the Roman custom also, and only with Christianity did earth-burial become general. European civilization within the last few decades the conviction has spread that a more rapid and sanitary method of disposal must be substituted for burial, especially in the great centres of population. To find a safe and convenient means of disposal is becoming a more and more difficult matter. If 4,000 corpses are crowded into an acre, and a mortality rate of 15 per 1,000 be assumed, then nearly four acres per 1,000,000 population are required annually to bury the dead. A computation of population, death rate and space required for burial will show that unless the custom is changed, much of the available space in the vicinity of all large cities will eventually be required for burial purposes. The sanitary objections to burial are of still greater importance than the economic difficulties. Eminent scientists advocate that while cremation remain optional for ordinary cases, it should be made obligatory when death is due to such transmissible diseases as smallpox, diphtheria, scarlet fever, typhus fever, influenza and cholera, of epidemics and after battles, when large numbers of bodies are to be disposed of at once, cremation is deemed especially advisable. It is also pointed out by the advocates of cremation that where burial is resorted to, even though the cemetery be located at a distance from dwellings, there must be contamination of the water and the air, because they are the only means of carrying off the products of dissolution. In these days of reaching out for streams to supply reservoirs for cities and towns, it becomes a difficult problem to ensure protection of the water supply from burial in the same watershed.

An objection to cremation, in the minds of some, is that trace of the dead is obliterated from the sight of the living. Aside from this sentimental objection, the chief argument against cremation is the modern belief that with the burning of the body possible traces of crime are obliterated. Frederick L. Hoffman, in a paper on 'Cremation as a Life Insurance Problem' (Sanitarian for January 1901), calls attention to this phase of the subject and points out that 64 of the 528 persons cremated at Saint Louis, Mo., in 1895-99 died from accidents, violence or suicide. In view of the number of murders, by poison or otherwise, that are committed to obtain insurance money, it is recommended that very special precautions be taken to ascertain the exact cause of death before issuing a permit for cremation. In 1873 there was a strong agitation in New York, more or less echoed in other parts of the United States, in favor of cremation, and the newspapers published numerous opinions of eminent physicians and others to the effect that burial grounds were an injury to the health of the living, especially in populous sections. There was a similar movement in the leading cities of Europe about the same time. In 1776 Dr. E. Julius LeMoyné established the first crematory in the United States, at Washington, Pa., the first incineration being that of the body of Baron de Palm, in December of that year. This was a semi-private institution, the first thrown open to the general public in this country being the Fresh Pond crematory, operated by the United States Cremation Company of New York. Others were built in leading cities, there being a total of 24 at the close of the year 1900.

The total number of cremations, distributed among these 45 crematories, had risen to 80,006 at the end of 1913 case last year for which statistics are available. The total for the year 1913 alone reached 10,183.

In the earlier furnaces body and coffin were burned separately, but in the latest furnaces the remains are incinerated in the casket, without handling, as received. A chapel is connected
with the crematorium, where services may be held if desired. The casket is then lowered into the incinerating room, and, after metal handles and name plate are removed, introduced into the retort. The heat is so intense that after a few hours only the ashes of the bones remain, all else, including the structure of the casket, having disappeared in light ash or gaseous products. Screws and nails are removed by a magnet, and about four pounds of pure ash remain. This is placed in a metallic receptacle, labeled and sealed.

Cremation. — A chapter on cremation, treating the subject from the sanitary and economic standpoint, is contained in Baker, 'Municipal Engineering and Sanitation' (New York 1901); Cobb, 'Quarter Century of Cremation in North America' (Boston 1901), includes a complete history and statistics of the movement in the United States, with brief supplementary matter and tables for Europe. The book also contains a full bibliography of the subject. Freeman, 'Crematoria in Great Britain and Abroad' (London 1905), contains descriptions, diagrams, and illustrations of some of the principal crematoria of the world. An introductory chapter contains an historical sketch. The Sunny Side, an undertakers' trade publication, contains a department devoted to cremation news and propaganda.

CREMAZIE, krá'ma-zé. Octave, French-Canadian poet-bookseller: b. Quebec, 16 April 1827; d. Havre 1879. He was educated at the Seminary of Quebec and became associated with his brothers in a book-selling business, which, however, was unsuccessful, and in 1852 financial reverses forced him to seek refuge in France, and he lived there under an assumed name. His poems, which are inspired by an intense religious and patriotic sentiment, began to be published in 1854. His complete works were published in Montreal in 1882. He has been called the father of French-Canadian poetry.

CREMER, krá'mér, Jacobus Jan, Dutch novelist: b. Arnhem, 1 Sept. 1827; d. The Hague, 5 June 1880. He was a painter, but forsook the pencil for the pen. His series of Stories of Betuwe (a rural district) are specimens of idiomatic expression, faithful portraiture and exquisite humor. The same traits distinguish all his works, 'Daniel Sils' (1856); 'Anna Rooze' (1867); 'Doctor Helmond and His Wife' (1869), etc.; but he is at his best amid rural scenes. He published a volume of Poems (1873). For biography consult Brink, J., Geschiedenis der Noord-Nederlandse Letteren (1887–90).

CREMER, William Randal, English advocate of international peace: b. Fareham 1838; d. 1908. He was prominent in English trade unions in 1860–70. In 1885, as a Liberal, he entered the House of Commons, to which he was re-elected in 1886, 1892, 1900 and 1906. To further the cause of universal peace he founded in 1887 the Inter-Parliamentary Conferences which have met since 1888 at frequent intervals. He visited the United States repeatedly in the interest of an international treaty of arbitration and in support of the International Arbitration League, of which he was secretary for 37 years, he journeyed through all Europe. He also edited the Arbitrator, a monthly devoted to the cause of peace. The Nobel peace prize, which was awarded to him in 1903, he gave as an endowment to the International Arbitration League.

CRÉMIEUX, krá-mé-ô. Isaac Moses, French jurist and politician: b. Nimes, 30 April 1796; d. Passy, 10 Feb. 1880. He became an advocate in Paris in 1830; in 1842 entered the Chamber, and in 1848 was a member of the provisional government. Imprisoned at the coup d'état, he subsequently confined himself to professional work till 1870. He was a member of the government of national defense. He was made a senator in 1876, and was the founder of the Alliance Israélite Universelle.

CREMNITZ. See Kremsnitz.

CREMONA, krá-mo'na, Italy, city and capital of province of same name, on a plain on the left bank of the Po, 47 miles south of Milan. It is surrounded by walls and wet ditches, and defended by a citadel. It has broad but irregular streets and attractive public squares, and a bridge 3,100 feet long over the Po. The most remarkable edifice is the cathedral, begun in 1107 and completed about 1491. It exhibits little harmony of parts, but has a venerable and imposing appearance. The exterior decorations are of the most costly description. Others of its 44 (formerly 87) churches are the richly decorated 16th century San Pietro al Po; San Agostino e Giacomo in Braida, with paintings by Perugino; Sant'Ago; Santa Margherita. Among the civic buildings are the city hall, and the 13th century Palazzo de' Gonfalonieri, and the Palazzo Reale, with natural history and other collections. Close by, and connected with the cathedral, is the Torrazzo, a Gothic clock tower, 397 feet high, built of brick and having 400 steps to the bell-storey. Cremona has a seminary, a lyceum, a gymnasium, a school of industrial art, a school for voice culture, a technical school, two theatres, a library of 100,000 volumes and a chamber of commerce. The town markets grain, flax, cheese, etc., and manufactures machinery, silk, earthenware, colors and mustard, the latter of which is much esteemed in Italy. It was at one time celebrated for its violins. Their manufacture was almost wholly confined, for nearly 100 years, to a family of the name of Amati. Antonius Stradivarius and Joseph Guarnerius were also celebrated violin-makers of Cremona. A memorial tablet marks the house where Stradivarius made his violins. Cremona was also famous for its painters, Boccaccio, the founder of the Cremona School, Melone, Bembo, the three Campi and Sofonisba d'Anguissola, whose five sisters also practised the art.

Cremona was colonized by the Romans 219 B.C. and again 190 B.C., and became a populous and flourishing town. In the time of Vitellius and Vespasian it was plundered and burned by the troops of the latter, but was subsequently rebuilt by Vespasian. After the fall of the empire it eventually fell under the dominion of the Venetians of Milan. In 1796 it was taken possession of by the French, and was included in the Cis-Alpine Republic, and afterward, from 1800 to 1814, in the kingdom of Italy under Napoleon. Consult Rubakoth, 'Cremona e sua provincia' (Milan 1859);
CRENELLE—CREOLIN

CRENELLE, an opening in an embattled parapet; a loop-hole or embrasure through which to shoot. It is sometimes used to designate a battalion.

CRENIC ACID, a vegetable acid having the formula C₃H₆O₅, said to exist in vegetable mold, and in marshes, peat bogs and the deposits through which run by terrigenous waters. It is pale yellow in color, and uncrystallizable.

CREODONTA, krē-ō-dŏnt'á, an extinct suborder of the carnivora (q.v.), distinguished by many primitive characters, and especially by the fact that the scapohoid and lunar bones of the wrist are separate instead of united into a single bone as in modern carnivora. In all modern land carnivores the last premolar tooth in the upper jaw and first true molar in the lower jaw are enlarged and peculiarly adapted to cutting flesh (hence called carnassials), working against each other like a pair of shears. This is also the case with one group of the Creodontia, from which the modern carnivora are descended. But in most creodonts there is no specialized carnassial, or it is developed from other teeth; these groups evolved on lines similar to the true carnivora, but have left no descendants. One group, the arctocyonids, resembled the bears, with omnivorous teeth, plantigrade feet, and large compressed claws. Another group (Meponyx, Paechyatra, etc.) resembled rather the hyenas, with large canines, teeth fitted for bone-crushing and digitigrade feet. Others had the teeth more especially adapted to cutting flesh, the first upper and second lower molar being developed into carnassials in Oxyaena and Patriofelis, the second upper and third lower molar in Hyymena. Besides these larger forms from the size of a polar-bear to that of a prairie wolf, there was a great variety of smaller creodonts, some more or less transitional to the primates, others to the insectivores. The early creodonts appeared most nearly the central stock from which most, if not all, of the modern mammals are descended (see CONDYLAHRHA). Creodonts were the dominant carnivora of the Eocene epoch, and a few survived into the Oligocene, when their place was taken by the true carnivora of more modern type. The evolution in the creodonts and true carnivores of carnassials of remarkably similar form, out of different pairs of teeth originally much less alike, is an excellent instance of "convergence" in evolution.

CREOLE, a person born in America or the West India Islands, of pure European blood: as a Spanish creole. The term is sometimes applied, but wrongly, to any person born within tropical latitudes, of whatsoever color. In South and Central America the creoles enjoy high social privileges, and a creole nobility long exists in Brazil, sallow, fine-haired and dark-eyed. Creole dialects are an interesting example of broken-down grammar. By English writers it has sometimes been used to mean a mestizo or mulatto; but it cannot properly be applied to any person of mixed race, non-Latin stock or non-European birth. Consult Thomas, 'Theory and Practice of Creole Grammar' (1869).

CREOLE CASE, 1841-42, one of the landmarks of the anti-slavery struggle. On 27 Oct. 1841 the brig Creole sailed from Hampton Roads to New Orleans with 130 slaves; on 17 November 17 of them rose and overpowered the crew, killed one of the owners, and ran the boat into the English port of Nassau. The authorities, as wont, imprisoned those directly charged with mutiny and murder, and let the rest go. Webster, then Secretary of State, demanded from England the surrender of the whole, as being legal property of a State under the Constitution, engaged on a legal voyage (Coastwise Slave-trade Act of 2 March 1807), and covered by the United States flag on the high seas. This was Calhoun's exact theory. The English government refused, but a new extradition treaty was agreed on (9 Aug. 1842). In the House, 21 March 1842, Joshua R. Giddings (q.v.) presented a set of resolutions which formulated the position of the political anti-slavery party to the end. They were, that the States have exclusive jurisdiction over slavery in their territory; that the Federal government has exclusive jurisdiction over the high seas; that slavery, as an abridgment of the natural rights of man, can exist only by edict of a municipality and within its power of enforcement; and that Judge Curtis's argument in the Dred Scott case; that a vessel on the high seas has passed from municipal to national jurisdiction, so that Virginia law ceased to apply to the Creole when it left Virginia territory; that the negroes in resuming their natural rights violated no Federal law, and ex hypothesi no State law; that the attempts to re-enslave them were violations of the Constitution and laws, the rights of the free States and national honor. The resolutions roused a storm. John Minor Botts (q.v.) of Virginia moved a counter resolution that no good citizen, and especially no national representative, should provoke contention over a question on which diplomatic negotiations were pending, and which might plunge the whole civilized world into war; and that Giddings' resolutions justified mutiny and murder. He asked a suspension of the rules to give it precedence of Giddings'. Giddings' colleague adopted it and moved the previous question; and after a two days' wrangle the order of the resolution was passed without debate, 125 to 69. Giddings at once resigned; his constituency immediately re-elected him by an overwhelming majority, and instructed him to push his resolutions to a vote. This would 'put the Democratic party in a hole,' —the first two clauses being their pet tenets, and the others only obvious inferences from them —they evaded it by abolishing "resolution day" for the rest of the session, devoting the day to other business when it came around. His resolutions expressed the basis of one phase of the constitutional anti-slavery agitation. Consult Giddings, 'History of the Rebellion' (New York 1864). The statute of 1807 regulating the coastwise slave trade is in 2 U.S. Statutes at Large, 426.

CREOLE STATE, Louisiana, where the direct descendants of the original French and Spanish colonists form an important element in the social fabric.

CREOLIN, a mixture of cresols and creosols and other allied substances derived from
the destructive distillation of wood, once used very widely in watery emulsion as antiseptics.

CREON, krē'on, in Greek legend, the son of Menæcész and brother of Jocasta. After the death of her husband, Laius, Creon seized the crown of Thebes and offered Jocasta and the kingdom to anyone who should free the city from the Sphinx. This Creon succeeded in doing, unconsciously becoming the husband of his own mother. In the legend of the war against Thebes, Creon, the king, is said to have forbidden any one to bury the bodies of Eteocles and Polynices the sons and successors of Odipus, and their sister, Antigone, was condemned to death for disobeying this order. Creon’s son, Hamon, the betrothed of Antigone, killed himself on her body. The story is told in the plays of Sophocles (q.v.), ‘Edipus Rex’; ‘Edipus at Colonus’ and ‘Antigone.’

CREOSOTE (Greek 'meat-preserver'), a product of the destructive distillation of wood or coal especially the former. Wood-tar creosote, when freshly prepared, is an oily, transparent liquid, colorless, and of indefinite composition, containing many different chemical substances, chiefly belonging to the aromatic series. It was discovered by Reichenbach in 1832, and for a considerable time was confused with carbolic acid. It has a strong, smoky smell, burns with a sooty flame and refracts light powerfully. It has been greatly used as an antiseptic, both in dentistry and general surgery, and also for the preservation of meat, from which circumstance it derives its name. Its preservative action is so marked that meat will not decay after it has been treated superficially with a 1 per cent solution. Coal-tar creosote (technically known as 'creosote oil') is used for the preservation of timber. For this purpose the timber to be treated is placed in an air-tight cylindrical iron tank, from which the air is exhausted by means of an air-pump. The creosote is then introduced at a temperature slightly higher than 212° F., and fixed by evaporation and vacuum are both maintained until the moisture of the wood has been entirely vaporized, and the wood itself impregnated with the oil.

Creosote is also used for fuel, for softening pitch and as an antiseptic application for the treatment of certain diseases of cattle and sheep. It is but slightly soluble in water, though it mixes readily with alcohol, ether and many other organic fluids.

For medical purposes creosote is a mixture of phenols, chiefly guaiacol and cresol, obtained during the distillation of wood tar, preferably of that from the beech. Its physiological action, being a mixture of phenols, it naturally resembles carbolic acid very closely. It is now widely used as a stimulant to digestion and as a tonic in tuberculosis and other wasting diseases. The vapor is of service when inhaled, in diminishing the mixed infections that occur in many cases of tuberculosis. Creosote is not specific for this disease. It is very widely employed in the treatment of nausea and as an intestinal antiseptic. Poisoning by creosote resembles that of carbolic acid (q.v.).

CRERAR, John, American philanthropist: b. New York 1827; d. Chicago, 19 Oct. 1889. He entered mercantile life and accumulated a fortune, removing to Chicago in 1862, and adding to his wealth by railway financing. He readily bestowed large sums upon charitable undertakings, and in his will left $2,500,000 to found the John Crerar Public Library, from which sensational novels and skeptical works should be excluded; $100,000 for a statue of Abraham Lincoln; and $1,000,000 to charitable and religious organizations.

CRERAR, Thomas Alexander, Canadian statesman: b. Molesworth, Ontario, 17 Oct. 1876. While a boy his parents settled at Russell, Manitoba, as homesteaders. He was educated at Portage la Prairie, helped on his father’s farm till he was 19, then taught school for five years; later attended Manitoba College; and farmed for several years. He entered public life as a member of the Russell council. He is not a politician; but he showed remarkable business ability in organizing the Grain Growers’ Grain Company (now the United Grain Growers, Ltd.), formed to secure better selling facilities on the Winnipeg exchange, and of which he is chairman. In October 1917 he joined, as one of the Western Liberal representatives, the Union ministry of Sir Robert Borden, and was given the portfolio of agriculture.

CRESP, Michael, American trader and Indian fighter: b. Allegheany County, Md., 29 June 1742; d. New York, N. Y., 18 Oct. 1775. His father, Thomas, emigrated from Yorkshire, England, settled in western Maryland, and was a member of the Ohio company in 1752. His son married a Miss Whitehead, of Philadelphia, while yet a minor, became a merchant, removed to the Ohio in the spring of 1774, and established a settlement below Wheeling. He took command of the pioneers, who prepared for an Indian war, and, after Dr. Connolly had warned him of a general Indian war, made a declaration of hostilities on 26 April and defeated a party of Indians in a skirmish on the river. Another party of whites treacherously massacred the family of the chief Logan on Yellow Creek. Logan, who had been represented as a generous and guiltless accused Cresap, as the leader of the white men in that region of committing the crime, and through a pathetic speech, attributed to Logan and preserved in Jefferson’s ‘Notes,’ the deed attached to his memory, until his son-in-law, J. J. Jacob, and later Brantz Mayer, proved that he was in Maryland at the time of the occurrence. Governor Dunmore gave him the commission of captain of the Hampshire County militia in Virginia. After the conclusion of the Dunmore expedition he returned to Maryland, but again went to Ohio the following spring, and penetrated almost to the Kentucky wilderness. On his return he learned that he had been commissioned by the Continental Congress as captain of the Kentuckye Militia. He went with his company to Boston and joined the army of Washington, but, having been afflicted with his final illness before he took the command, and finding himself growing worse, he left for home, and died on the way, in New York, where he was buried with military honors in Trinity churchyard. Consult Jacob, J. J., ‘Biographical Sketch of Captain
M. Cresap' (1826; new ed., with notes, by Brantz Mayer, Cincinnati 1866), and Mayer, Brantz, 'Tagah-jute, or Logan the Indian and Captain Cresap' (New York 1867).

CRESCENDO, or CRES (Italian), a musical term signifying that the notes of the passage over which it is placed are to be performed with constantly increasing volume of tone. The ancient Romans, as we learn from a passage in Cicero, were aware of its beauty, and practised it continually. Crescendo passages are frequently marked \( < \) signifying piano to forte and fortissimo; the corresponding mark \( > \) diminuendo, marking the transition from forte to piano.

CRESCE (Lat. *crescere*, growing), an emblem representing the moon in its state of increase. The Egyptians and the Greeks decorated their moon-goddesses, Isis and Selene, with the crescent, which announced the returning light of the moon. Athenian citizens of illustrious birth wore crescents of ivory and silver upon their buskins; and the same mark of distinction was granted to the patricians and senators of Rome. It was used by the Romans as an emblem of the eternity of empire. Hence, it was found on medals of many cities, particularly of Byzantium, as capital of the Eastern Empire, whence it is supposed to have been borrowed by the Ottomans. Since their establishment in Europe it has been the universal emblem of their empire. It is frequently seen on churches in Russia, generally surmounted by the cross, indicating the Byzantine origin of the Russian Church. During the Crusades, particularly, the crescent was the distinguishing symbol of the Mussulmans, as the cross was representative of the Christians. The word is also applied to a Turkish musical instrument introduced into the German military bands at the time of the Turkish wars and now in general use in military bands. It consists of a staff surmounted by a cap and supporting several crescent-shaped brass plates on each of which little bells are hung. The instrument is played by being jingled in time to the music. In heraldry, the crescent is used both as a bearing or charge and as a difference or mark of cadency. In the latter cases, it designates the second son and those that descend from him.

CRESCENT CITY, a name by which New Orleans is widely known because the older portion is built around a semi-circular bend of the Mississippi. Now the city has spread around another bend farther up stream, and is nearly S-shaped.

CRESCENTIA. See Calabash-Tree.

CRESCENTINI, krēsh-ĕn-tēnĕ, Girolamo, Italian singer; b. Urbino, 2 Feb. 1766; d. Naples, 24 April 1846. He was styled the Italian Orpheus, because of his exquisite mezzo-soprano. After studying with Gibelli at Bologna, he made his debut at Rome in 1783, and then toured through the principal cities of France, England and Italy. Napoleon awarded him the Iron Crown in 1805, and was his patron (1806-12). Leaving Paris in 1816, he became a professor of voice culture at Naples. His treatise on vocalization was published in both French and Italian.

CRESCENTIUS, krē-shĕn-shĕ-ĭs, John, Roman patriot; d. 998 A.D. He was a leader of the party in Rome opposed to the rule of the emperor in the 10th century. From 985 to 996 his rule in Rome was practically undisputed, and he was recognized as Patriarch by the Byzantine empress. In 996 Otto III came to Rome, and he overthrew the rule of Crescentius temporarily, but the latter resumed his position when the emperor left the city, drove the Pope, Gregory V, from Rome, and supported the anti-Pope, John XVI. Otto, however, finally defeated Crescentius in 998 and had him murdered. Consult: Gregorovius, 'Rome in the Middle Ages' (Vol. III, London 1893).

CRESCENNZI, krē-shĕn-zĕ, Pietro, or PETRUS DE CRESENTIIIS, Italian writer on agriculture; b. Bologna 1230; d. 1307. At the age of 70 he was made senator, and he now carried into execution his principles of agriculture on an estate near Bologna, in the cultivation of which he passed the remainder of his life. He has left a work on agriculture entitled 'Opus Ruralium Commodorum,' a remarkable monument of his time of which it is far in advance. This work was written originally in Latin. There exists an Italian translation (1478), esteemed very highly on account of the purity of the language, which has given rise to the opinion that Crescennz wrote in his native tongue. His principles are simple, founded upon experience and free from many prejudices which continued to prevail in Europe for centuries after. His work was translated into several European languages, particularly for Charles V of France, in a splendid manuscript (1571); still extant; and no sooner was the art of printing invented than copies of this work were greatly multiplied. The oldest known edition, now very rare, appeared at Augsburg in 1471. The genus Crescenzia was named by Linnaeus in honor of the famous author, who was probably the first since the days of the Romans to point out the high value of agricultural science.

CRESCHIBENI, krē-shĕm-bĕnĕ, Giovanni Maria, Italian scholar and poet; b. Macerata, 9 Oct. 1663; d. 8 March 1728. In the Jesuits' college at Macerata he wrote 'Daris.' He was one of the 14 poets associated with Christine of Sweden in founding the Academy of Arcadia, of which he was the first president (1690). In 1698 appeared his 'Istoria della volgar Poesia,' a work of vast industry, but destitute of method and critic. He next published his 'Trattato della Bellezza della volgar Poesia' (1700), which passed in a short time through three editions, and like the earlier work was first made capable of being understood and enjoyed by the 'Commentario intorno alla Storia della volgar Poesia' (1702).

CRESCO, Iowa, the county-seat of Howard County, situated in the northeastern part of the State, about 150 miles northeast of Des Moines, on the Chicago, Milwaukee and Saint Paul Railroad. It maintains a hospital, has extensive dairying and live stock manufactures, machinery, cupolas, telephone condensers, electrical supplies, steel corn crib, lightning rods, furniture, stamp pullers, tow, flour, brick and tile. A Farmers' Alliance store is successfully operated here. The town is governed by a mayor and council and owns its water works. Pop. 2,658.

CRESOLE, krē-sōl, an aromatic compound having the formula C\(_6\)H\(_3\)(CH\(_3\))OH, which may
be regarded as derived from phenol by the substitution of methyl (CH₃) for one of the hydro-
gen atoms in the benzene nucleus. Like all di-
substitution benzene compounds, cresol exists in
tree isomeric modifications, known respectively as ortho-, meta- and para-
cresol. (See ARSINE.) All three occur in
coal-tar, though the ortho- and para-
compounds are present in much larger quantity than the metas-compounds. The ortho- and meta-
compounds readily yield nitroso-derivatives, and are used in the manufacture of coal-tar colors.
Orthocresol melts at 90°, and boils at 370°; 
paracresol is liquid at ordinary temperatures
and boils at 394°; and meta-cresol melts at 99° 
and boils at 392°; all these temperatures being
on the Fahrenheit scale.

CRESPI, Giuseppe Maria, Italian painter, 
surnamed Lo Spagnuolo: b. Bologna 1655; d. 
there, 16 July 1747. His first work was the 
' Combat of Hercules with Antaeus.' From 
this time he had continual employment. He painted 
for Cardinal Ottoboni the ' Seven Sacraments,' 
now in the Munich gallery; besides several pieces 
for Prince Eugene of Savoy, for the Elector of 
the Palatinate, for the Grand Duke of Tuscany, 
and for Cardinal Lambertini, his patron, who 
afterward, when Pope Benedict XIV, conferred 
on him the honor of knighthood.

CRESS, various plants of the family Brassi-
caeae. The cultivated ones are all used as 
osalads, for which their pungent foliage especially
recommends them. The common or garden 
cress or peppergrass (Lepidium sativum) is 
generally found in gardens as a spring annual.
The seeds may be sown as soon as the soil can 
be worked and the fresh herbage cut for use in
about three weeks. Successive sowings should 
be made every three or four days. The plant 
resembles watercress in flavor, and makes an 
excellent garnish. Virginia cress (L. virginii-
cum) is a similar species and has been grown 
and used like the preceding. Winter or upland 
cress (Barbarea barbara) is an annual, com-
mon in fields in Europe and America and some-
times cultivated for winter use, as is also its 
close relative (B. verna) which is called early
winter cress. Watercress (Radicula 
asturtium-aquaticum) is a perennial aqua-
tic herb common in cool brooks and yielding 
an important winter salad where the streams do 
not freeze. Though it does best in gravelly bot-
tomed shallow streams, it may be cultivated in 
any moist ground, or under greenhouse benches 
if well supplied with water. Indian cress, which 
is a species of Tropaeolum, is commonly known 
as nasturtium, a popular garden flower whose 
foliage, flower buds and blossoms are used as 
osalads, and its immature fruits as a substitute 
for capers. Several other species of Brassicaceae 
are called cress in various parts of the world.

CRESSET, (1) a bowl-shaped article made of 
imincustible material, used to contain a 
light, and hung from above or suspended on a 
pole or placed as beacon on a watch tower or 
on a triplicate place. The cresset-light was 
formerly the flame from a coil of pitched rope,
and in more modern times oil and wick were 
used. The large lanthorn of ancient days when 
suspended from the end of a long pole and 
carried on a man's shoulder was called a cresset. 
A small, containing bowl-shaped hollows which 
are sometimes used as cresses is called a cress-
set-stone. (2) An iron frame used by cooper's 
who make barrels by hand.

CRESSEY, George Creswell, American 
clergyman: b. Buxton, Me., 1 April 1856. He 
was graduated at Bowdoin College in 1875 and 
received the degree of M.A. from this institu-
tion in 1878. He studied for a time at Leipzig, 
receiving there the degree of Ph.D. in 1880. He 
was graduated at Andover Theological Semi-
inary in 1884 and entered the Unitarian minis-
try; held pastorates at Bangor, Me., Salem, 
In 1907 he was called to the pastorale of the 
Effra Reformed Church, London, England, in 
which relation he remained until 1913, when he 
returned to America and became minister of 
the Church of the Redeemer, New Brighton, 
N. Y. He is a author of 'The Essential Man' 
(1885); 'Mental Evolution' (1894); 'Philoso-
phy of Religion' (1892); 'The Doctrine of 
Immortality in Liberal Thought' (1897); 'Soul-
Power' (1899); 'Outline of Unitarian Belief' 
(1905); 'A Talk with Young People on Liberal 
Religious Thought' (1912).

CRESSIDA, in Greek legend a daughter of 
Calchas, the Trojan priest. She is also known 
as Briséis, and her fame rests upon the legend 
of her amour with Troilus. The original story 
of Troilus and Cressida was ascribed to Loli-
us, a historiographer of Urbino. It was 
written in Latin and translated by Chaucer. Cres-
sida was faithless to Troilus and became mist-
ress to Diomed.

CRESSOL. See CRESOL.

CRESSON, Elliott, American philanthrop-
ist: b. 2 March 1796; d. 20 Feb. 1854. He was 
a successful merchant in Philadelphia, where 
he resided all his life, and a member of the 
Society of Friends. He engaged in establishing 
the first African colony of liberated slaves in 
the territory of Bassa Cove, and was agent of 
the National Colonization Society. He every-
where recommended his measures with the 
eloquence of sincere conviction, and met with 
much favor and success. He died in Philadelphia 
in 1840, where he spent some years in advocating 
the project of colonization. His time and 
labor were contributed without pay, and by his 
will he distributed his estate to a great 
variety of charities, mostly to institutions already 
established, but a bequest of a landed estate, of 
$30,000 was to establish a home for aged, in-
firm or invalid merchants or gentlemen, unable 
to procure the comforts appropriate to their 
condition in life.

CRESSON, Pa., village in Cambria County, 
situated among the Allegheny Mountains at an 
elevation of 3,000 feet and 75 miles east of 
Pittsburgh, on the Pennsylvania Railroad. Its 
fine scenery and the magnesia springs in the 
vicinity make it a popular summer resort. It 
has an academy and hotel, lumber, coal and 
coke yards, and a brewery. Pop. of township 
1,470.

CREST (Lat. crista, tuft or comb), the 
raising on the defensive armor of the head, also 
the ornament frequently affixed to the helmet, 
such as a plume or tuft of feathers, a bunch of 
horse-hair, etc. Warriors have always been in 
the habit of adorning their persons; and the 
helmet, from its protection, is very natu-
really chosen as the place of one of the principal
CRESTING—CRETE

ornaments. The crests of the earlier Greeks were of horse-hair; afterward plumes, especially red ones, were adopted. In the Middle Ages, when rank and honors became hereditary, and particular heraldic devices were appropriated to particular families, the crest became a distinguishing hereditary mark of honor. It denotes in heraldry a figure placed upon a wreath, coronet or cap of maintenance, above both helmet and shield; as for instance, the crest of a bishop is the mitre. The crest is considered a greater criterion of nobility than the armor generally. It is commonly a piece of the arms, rests on a wreath of the principal metal and color of the coat of arms, color and metal alternating, or on a cap of maintenance. Consult Fairbairn, 'Book of Crests of the Families of Great Britain and Ireland' (Edinburgh 1892).

CRESTING, in architecture, is an ornamental finishing in stone, tiles or metal in the wall or ridge of a building, such as the cresting at Exeter Cathedral, where the ridge is ornamented with a small range of leaden fleurs-de-lis.

CRESTON, Iowa, city and county-seat of Union County, about 200 miles west of Burlington on the Chicago, Burlington and Quincy Railroad. It was first settled in 1859; became a borough in 1871, and a city in 1881. The present form of government is by State enactment under a charter of 1870, revised in 1890, which provides for a mayor, chosen biennially, and a council of aldermen. Five aldermen are elected each spring. The city has three banks, with a combined capital of $250,000; 15 churches, public and parish schools, a government building, costing $100,000, and a railroad depot, costing $75,000. It is a trade centre for the surrounding country and has machine shops, brickyards, broom and cigar factories, wagon works, planing mills and a cold storage plant. Pop. 6,924.

CRESWICK, Thomas, English landscape painter; b. Sheffield, 5 Feb. 1811; d. Baywater, 28 Dec. 1869. He studied drawing at Birmingham under John Vincent Barber and early showed artistic talent. His first pictures were admitted into the Academy exhibition when he was only in his 17th year, and his success was afterward rapid. He was elected an associate of the Royal Academy in 1842 and R.A. in 1851. Among his works are 'England'; 'London Road a Hundred Years Ago'; 'The Weald of Kent'; 'A Roughish Road'; 'On the Clyde'; 'Sunshine and Showers.' Cresswick's landscapes are pleasing and attractive, and display much delicate and finished detail. He was also known as an etcher. His works were collected for the London International Exhibition of 1873, and a catalogue compiled by R.C. Baxendale. Consult Ruskin, 'Modern Painters'; Hammerton, 'Etching and Etchers.'

CRETAIGE, a name applied by geologists to the latest period of the Mesozoic Era, and to the system of rocks then formed. It follows the Jurassic and precedes the Tertiary. The name is etymologically derived from the Greek word for earth, and in the type localities the formation is usually characterized by white, soft chalk, but sometimes, more especially in Italy and the south of France, this chalk is replaced by compact, solid limestones. In England and France the Cretaigous rocks consist chiefly of carbonate of lime, but usually abound with fossils, in the shape of nodules, plates and veins, and with iron pyrites in nodules and radiated cylinders. The organic remains in the chalk are, with few exceptions, eminently marine, and from the fine texture of the substance in which they have been embedded are usually well preserved. They embrace seaweeds, sponges, corals, echinoderms, mollusks, crustacea, fishes and reptiles. Deep-sea dredgings in the Atlantic have revealed the fact that a fine, white, organic ooze resembling the chalk, is still in process of formation in the oceanic abysses at the present day. In America, the system is divided into Lower or Comanchean, and Upper or Cretaceous. Some writers give Comanchean the rank of a period, making it co-ordinate with Jurassic, and restrict the term Cretaceous to the Upper Cretaceous as above defined. During the Lower Cretaceous the continent of North America was not very different in outline from now, except that the Gulf of Mexico was expanded, and that the Pacific still covered the site of much of the present oceanic regions. During Upper Cretaceous time, a great arm of the sea encroached on the land, finally extending from the Gulf of Mexico to the Arctic. In this a great thickness of marine sediments was laid down. At the same time much of the Atlantic and Gulf Coastal Plain was under water. Toward the close of the period (Laramie Epoch) the interior sea again retreated leaving a large area of low swamp, in which much coal was formed. The period, and the Mesozoic Era as well, were brought to an close by folding which produced the Rocky Mountains. The Andes were probably folded at the same time.

Life of the Cretaceous.—The great groups of reptiles which developed during Triassic and Jurassic (q.v.) reached their climax in Cretaceous, and Dinosaurs, Pterodactyla, Ichthyosaurs and Plesiosaurs all became extinct at the close. The Ammonite Cephalopods also died out completely. The most notable addition was the development of the modern types of flowering plants which became dominant before the close of the period.

CRETE, or CANDIA (called in the most ancient times IDEA, from Mount Idas, afterward Creta, whence the Turkish name KIRDI), one of the most important islands of the kingdom of Greece; situated in the Mediterranean, 81 miles from the southern extremity of the Morea, and 230 from the African coast; is 160 miles long, 7 to 35 broad, and contains 3,326 square miles. A high chain of mountains covered with forests runs through the whole length of the island, in two ranges. On the northern side it declines moderately to a fertile coast, provided with good harbors; on the south side, steeply to a rocky shore, with few roads, and reaches its greatest height in the lofty Psiloriti (the ancient Ida), 8,060 feet high, and always covered with snow. Numerous springs give fertility to most of the valleys, in which, and on the declivities of the mountains, is seen a luxurious vegetation. The air is mild; the summer is cooled by the north winds; the winter is distinguished only by showers of rain. Earthquakes, however, are not infrequent. Agriculture is at a very low stage, and education
and the amenities of civilized life are almost entirely absent. The principal products of the island are olive oil, wheat, oranges, lemons, silk, grapes, wine, valonia, carobs and honey. The Venetians (estimated at 1,200,000 in ancient times, or 900,000 in the time of the Venetians) are now 344,000, of whom about a third are Mohammedans. Soap is extensively manufactured, and the exports comprise olive oil, soap, wool, carnations, acorns, etc. Most of the harbors are silted up. The capital is Candia or Megalokastron; Candia is the most important place of trade.

Greek mythology made Crete the scene of many of the adventures of the gods and heroes. Here Saturn is said to have reigned and afterward Minos.

Archæological exploration and excavation in modern times have revealed that a Neolithic period of evolution from about 10,000 to 3315 B.C. was followed by the Minoan or Egyptian period of civilization, which existed contemporaneously with the first dynasty of Egypt, from 3315 to 1450 B.C., and reached its culminating point in Crete. Minoan towns and palaces have been uncovered in different parts of the island, which till the skill attributed to Daedalus (q.v.). They exhibit architecture and engineering of a high order, unsurpassed for domestic conveniences in modern times. At Cnosus in the ruined palace of Minos (q.v., where Minoan), the thalassocratic king of the eastern Mediterranean in the Hagia Triada and its shrine near Phaestus, in the palace at Phaestus, in the recovered ruined towns at Palaikastro, Gourni and Zakro, in the shrine and Dictæan cavern, the legendary birthplace of the Cretan Zeus, near Psychro, and in the ruins on the neighboring islets of Pseira and Mochlos, the finds include archives of clay tablets in great quantities inscribed with the early forms of Minoan pictographic and linear script, polychrome decorated pottery, lifelike ivories, metal work, and all the customs of the period, enormous decorated storehouse jars, stone and bronze votive figures and objects of cult, sarcophagi, etc. While at Cnosus, also, have been unearthed the foundations of what is believed to be the traditional labyrinthine prison of the Minotaur (q.v.) or bull of Minos, the incestuous monster for whose gratification Athens was compelled to send an annual tribute of seven noble maidens and seven boys until Theseus (q.v.) killed the beast, probably during an invasion of the island which consummated the catastrophe that overwhelmed this early Cretan culture.

The island figures little in Greek history, and took no part in the wars with the Persians. It possessed a number of independent towns often at war with each other, ready to combine against a stranger. Crete was conquered by the Romans 67 B.C. In the year 823 it passed from the Roman emperors of the East to the Saracen, who built the capital, Candia, on the ruins of Heraclea, but were expelled again in 961 by the Greeks. The Byzantine sovereign sold the island to the Venetians in 1204, who fortified most of the cities, won the good will of their new subjects by a mild government, and retained all the assaults of the Genoese and Turks till the middle of the 17th century. About this time the attacks of the Turks became more determined. They landed a large force in 1645, which soon took Cana and Retimo, and besieged the capital with vigor. The siege, the longest in modern history, lasted over 20 years. To assist the Venetians and 110,000 Turks were killed or wounded during the siege. Having obtained possession of the capital, the Turks now endeavored to expel the Venetians from the strongholds which remained to the Venetians, and before the expiration of the 17th century they had been successful in their efforts.

Three pashas, at Candia, Cana and Retimo, now governed the island. On account of the feuds of these pashas the inhabitants of the western mountains succeeded in forming a government of their own, under Turkish protection. As the components made with them by the Turks were not always observed, they were wont in such cases to take up arms, and though they were often defeated they were never entirely subdued. All the pashas having been taken and hostages of them in 1821, they joined the Greek insurgents.

Haid the mountaineers been armed when the Turks made their first descent on the island, it would probably have been impossible for the invaders to have maintained themselves in Candia, but as it was the island remained under Turkish rule. In 1868 a formidable insurrection, fomented by Greece, was with difficulty suppressed by the Turks, after a tedious contest. In consequence of this revolt the Turks granted to the Cretans a certain degree of autonomy, but Turkish bad faith produced another revolt nine years later. At that time a new constitution of a parliamentary character was introduced, but many of its provisions were annulled and in 1899. In 1896 there was again a rising against the Turks, in which, as before, the Greeks took part, one result being the outbreak of war between Greece and Turkey. The Greek troops landed on the island were withdrawn at the desire of the inhabitants, who undertook to secure an autonomous government under Turkish suzerainty and to cause the Turkish troops to be withdrawn. On 6 Sept. 1898 the Mohammedans of Candia rose against the Christians, and the fighting resulted in the death of many of the latter, including some British sailors. The leading powers at once demanded the complete withdrawal of the Turkish troops who had abetted the rebels, and ultimately, on 11 October, the Sultan complied with their demand, the troops being soon after withdrawn. Shortly afterward Prince George of Greece was appointed high commissioner or governor of the island. A national assembly met and formed a constitution providing for the creation of a legislature and guaranteeing freedom of religion to all inhabitants. Although order was restored, popular sentiment continued to be increasingly in favor of annexation to Greece, and in 1904 the High Commissioner attempted to gain the consent of the Powers to such a step but without success. There were revolts against the High Commissioner's arbitrary policy in 1904 and 1905; in the latter year a revolutionary assembly proclaimed the union
of the island with Greece, and this was followed by a similar proclamation on the part of the regular Chamber. The Powers intervened, and after some litigation the insurgents laid down their arms in November 1905. In 1906 Prince George resigned the high commissionership of Crete and returned to Athens, but the designation of his successor was accorded by the protecting powers to King George of Greece as a satisfaction to Greek national sentiment. This arrangement lasted six years, but by no means satisfied any of the parties directly interested. The overwhelming majority of Greeks in the Cretan Assembly persisted in treating their island as an integral part of the Greek kingdom, while the government at Athens, out of deference to the four protecting Powers, was obliged to respect Crete as a shadowy vassal of Turkey. The six years were marked by almost constant political unrest on the island. A renewed proclamation of union with Greece in 1905, the exclusion of Mohammedan deputies who refused to take an oath of allegiance to King George in 1910 and the election of delegates to represent Crete in the National Assembly, which revised the constitution of the Greek kingdom in 1912 provoked in each case repeated intervention of the Powers. It was a Cretan leader, Eleutherios Venizelos, who in 1910 became Premier of Greece and organized the Balkan League that prepared to wage war against Turkey. A popular uprising in March 1912 put an end to the government that had been forced upon the island by the protecting Powers, and erected in its stead a provisional government. The reception of whose delegates at Athens in October 1912 was one of the excuses for the outbreak of the Balkan War. In that war the Cretans fought shoulder to shoulder with their fellow Greeks of the Cretan kingdom, and by the Treaty of London (31 May 1913) Turkey renounced all sovereignty over the island. The union of Crete with Greece was formally recognized by the other Balkan states by the Treaty of Bucharest (10 Aug. 1913). Consult Höck, 'Creta' (1823-1857); Frazer, 'T. J. in Creta' (Cambridge 1887); Spratt, 'Travels and Researches in Crete' (London 1865); Stillman, 'The Cretan Insurrection of 1866-68' (New York 1874); Mitchell, 'The Greek, the Cretan, and the Turk' (London 1897); Freee, 'Short Popular History of Creta' (ib. 1897); Howes, 'Cretie the Forerunner of Greece' (ib. 1907); Nevor-Batteje, 'Camping in Creta' (ib. 1914).

CRETE, Neb., city in Saline County in the southeastern part of the State, 20 miles southwest of Lincoln, on the Chicago, Burlington and Quincy and the Missouri Pacific railroads, and on the Platte River. It is the seat of Doane College (Congregational), established in 1872, which has a well-equipped observatory. It has a public library and several industries, including flour mills, a creamery and a voting-booth factory. Crested Butte was incorporated as a village in 1871 and is at present governed under a revised charter of 1886. The council consists of the mayor and representatives from the city wards. The city owns and operates its waterworks and electric-light plant. Pop. 2,604.

He was ordained a priest in 1838 and was assigned a charge in his own diocese. His great desire was to work in the foreign missions, and when the opportunity to go to America presented itself he at once accepted. He was somewhat disappointed when he found himself among civilized people in Iowa instead of among Indians. He was made vicar-general of Dubuque, a position which he held until 1851, when he was appointed bishop of the new diocese of Saint Paul. He found only nine priests in his diocese, but new parishes were soon opened, schools established, the orphans and the sick received attention and provisions were made for the Indian tribes, the Ojibways, the Winnebagos. In three years he increased the number of churches from 1 to 29, and to these added 35 stations. Consult Clark, 'Lives of Deceased Bishops of the United States.'

CRETINISM. This is a broad general term applied to a combination of physical and mental changes which, in the young, result from loss or diminution of the thyroid function. Such a loss may occur sporadically ('Sporadic cretinism') from causes to be enumerated, where the picture is analogous to that seen in the adult from removal of the thyroid, cachexia thyreopitca adipitum, or in many occur as a localized or endemic degeneration affecting the thyroid glands of a large number of individuals, causing a hypothyreosis which may show a number of tendencies. The chief of these are goitre, goutous heart and endemic cretinism.

These four fairly well-defined conditions may be discussed to advantage under the head of cretinism. The historical chapters on cretinism are full of interest. The disorders were known in early days. Pliny has left indubitable evidence of their presence in early Roman times. Vogt in his admirable monograph in the Lewandowsky, 'Handbuch der Neurologe' tells of Marco Polo's descriptions of certain types he had seen in his Asiatic travels. During the past two centuries the disorders here included under the term have been observed throughout the world. In certain lands, in certain mountainous districts of Switzerland, northern Italy, etc., the disease is very widely distributed — endemic cretinism — while in other regions it occurs rarely — sporadic cases. In the United States it is not frequent. It has been observed in California, in Vermont, and the writer has seen such patients in New York State (Adirondacks). In certain regions it has been a veritable plague. Thus in Switzerland, between the years 1875-84, 7 per cent of the recruits in the army showed some form of cretinoid degeneration. In 10 years 2,500 men were lost to the Swiss army from this cause alone. Certain valleys, especially those of Berne and Wallis, are thickly populated with individuals showing cretinoid degeneration. In the years 1899-1904, of 336,000 children fit for school 15,000 had one or another type of cretinism. Similar conditions existed in Styria, in Austria, and in certain Italian provinces.

So far as the etiology is concerned, it seems certain that the conditions are due to a defect of the thyroid substance — diminution or loss of the thyroid hormones. There are certain limitations which must be discussed in their respective paragraphs.

Sporadic Cretinism.—Infantile Myxedema. The clinical picture in an extreme case — i.e.,
fully developed, in contrast to the many irregular or incomplete forms— is that of a normally born child who, about the end of the first or the beginning of the second year, begins to show the characteristic changes in development. The little patients fall behind in their normal bony development. This may be due to a defect in the development of the long bones. The epiphyses fall to lay down bone even after 20 to 35 years and in 20-year-old cretins the anterior fontanelle may still remain open. There is a proportionate loss in bone substance throughout; thus a characteristic dwarfism results. But perhaps in the development of the skull which becomes larger in proportion to the rest of the body. The sphenoid, however, fails to develop and therefore gives the peculiar characteristic nose to the cretin. Dental deficiencies go hand in hand with the bony defect. In severe athyroid cretins the teeth do not develop for a number of years, and the first or milk teeth may persist far beyond the normal period. The bony defects show in a high palate arch, with large adenoids and tonsils, and chronic rhinitis causes the child to snore and snuffle, often with copious excretions from the nose.

A fairly constant finding is that of umbilical hernia. The abdomen is usually puffy, the navel sunken. The skin is myxedematous in the young, but becomes atrophic in later years. An hypoplastic in the supraclavicular and facial swelling remaining for many years.

The facial habitus is characteristic. The hair line begins low, the nose is sunken, the zygomatic arches prominent, the eyelids swollen, the face puffy, the tongue enlarged and often protruding between the swollen lips, in the mild cases giving one the impression of a child whose whole countenance is puffed up with crying.

There is usually an enlargement of the liver. Respiration is unusually slow in the severe athyroides. The genital organs show marked changes. The labia are small, the external not covering the internal ones. The uterus and ovaries are usually small, and the mammary glands are atrophic or hypoplastic. The penis is apt to be small, the testicles undescended, and small. Genital hair and that in the arm pits is absent or scanty. In boys the puberal changes in the voice are lacking.

Nervous system defects are present with the others and apparently conditioned by the endocrine gland insufficiencies. These show at vital levels in the deficiencies of the sensory and motor nerves, and at psychical levels in various grades of stupidity, mental weakness (moron), imbecility, or even idiocy—these words being used according to the arbitrary scaling of the Binet-Simon tests.

Thus smell is at times defective. The eye sight is poor, hearing is frequently disturbed and with it speech, so that many patients are deaf and dumb. The vestibular function is frequently involved, so that these patients balance badly, often showing unsteady gait, wobbling of the head and nystagmus. Some sporadic cretins may show little disease of the nervous system.

Cretinoid Degeneration.—Mention has been made of the widespread character of this type of degeneration related to defective or absent thyroid secretions. The statistical study of the conditions, particularly in Switzerland, in France and in Italy (Bircher), has shown that goitre, goitrous heart, endemic cretinism, endemic deaf and dumbness and endemic feeblemindedness are closely allied. The cretins are almost all goitrous, or nearly always have goitrous parents. Exophthalmic goitre (hyperfunction) is rare with goitre, but very frequent with goitrous heart. The causes of the hypothyroidism are not definitely settled, but there seems to be a constant relation between it and certain factors in certain waters, so that goitrous springs are known. Just what the noxious element may be is still conjectural, but it apparently is related to mineral constituents found in certain geological formations, notably in the Trias and Tertiary. The disease is absent in regions fed from waters of crystalline formation. Through Birch's suggestion of supplying a goitrous region in Rupperswill from Jura water supplies, in an adjacent valley, the disease disappeared. Similar results followed in the town of Asp. Animals may be made goitrous from drinking water from certain springs. They also develop goitrous hearts and are delayed in the growth, and the hypothyroidism shows degenerative changes. The agent passes through a Berkefeld filter, but is modified and made non-active by being heated to 70° C. It does not dialyze and is not thought to be an organized plant or animal substance, but is of a colloid nature. An hypothesis which had the authority of Birch behind it was that the disease was of an infectious nature.

Endemic Cretinism.—Here there is a richer and much more variable picture than obtains for sporadic cretinism. Whereas a typical habitus is described, there are many gradations and variations. The head is usually broad (but may be small and flat, instead of large and broad), at times very large. The nose is usually wide spreading and flat, the eyes wide apart. The neck is short and thick, the features swollen, the facial expression, especially of the prognathism, is one of moroseness or stolidity. The bones are shortened, various anomalies as scoliosis, ankyloses, etc., being present. Great variation in dwarfism is observed. Certain cretins are under three feet six inches in height and cretins have been observed of seven feet in height. As a rule they die young, but Kocher reports cretins 70 and even 100 years of age.

The general co-ordination of these patients is poor. They are usually short, clumsy, unelastic with badly developed masculinity. The skin is loose, lax, anemic, marked with folds and wrinkles, giving a peculiar appearance of old age. The lips are swollen, the tongue is enlarged and not infrequently protruding. The breasts are flat or badly developed, the abdomen flat or pendulous. Short stumpy fingers and toes give an ugly appearance to the extremities and contribute to clumsiness. The entire activity is apt to be heavy and awkward, although a few athletes and acrobats may be found among cretins.

The changes in the bones have been mentioned in the paragraphs on sporadic cretinism. The skin has a peculiar cachexia. It is swollen and flabby, whitish or yellowish, folded and soggy. The general appearance of old age is striking. The hair and nails are badly developped, both breaking easily. Thick, underlying fatty masses are unevenly distributed, usually in the neck, back, upper chest regions, occasionally over the hands. Variable states of tension occur
in these fatty masses; at times they are hard, again like empty sacks. The mucous membranes are pale and dry, but are, often folded but look different from a typical anemia.

The sexual organ changes have been touched upon in the description of sporadic cretinism. They are characteristically infantile. Menstruation is scanty, wanting or done very late. Fecundation does take place, but the results are either miscarriages, dead children, various monsters, etc. The secondary sexual characters are all delayed in their development.

The majority (63 per cent, Ewald) of cretins show a swollen thyroid, but it is not an over-functioning one, nor do they all show athyrosis or hypothyrosis.

Most of the internal organs show reduction in activity. Digestion is usually slow, constipation is marked. The metabolism is modified as already indicated. The urinary secretions are apt to be diminished and of high specific gravity.

Mentally cretins show marked variability. A few are practically normal, but most show a condition that is between normal and feeble-minded, in contrast with many other mental defective states. The feeble-mindedness is accompanied by great slowness of all reactions, marked retardation of motion, apathy and indolence. This indolence is a marked feature. Many cretins will lie in the sun all day long, and in the hospital or other institutions will lie around and do nothing for weeks or months. In the milder grades there is often great shyness which makes them unapproachable and serves to make them appear more feeble-minded than they really are. It is with the greatest difficulty that they can be trained to the simplest of performances. With many, in spite of the marked general stolidity of their average mood, they may show great excitement and emotional outbursts.

They are very negligent, love to sit still, but many show much variability in this respect. As noted the great majority suffer from impairment of the chief sensory tracts. Hearing seems to suffer most. The defect in hearing is associated with speech defects. Taste and smell are also involved. They take little interest in their food or drink and therefore show little interest in hunger, which is marked. The sense of sight is frequently diminished. It is highly probable that the receptors and conduction paths are less involved than the reception areas in this diminution in sensory intake. The hearing seems to be affected primarily as to its receptor and conduction paths. Pain, touch and thermal sensibilities are all dulled. Motility is extremely retarded. The reflexes are active (50 per cent).

The field of vision is reduced in many, although the *fundus* is usually normal (Hitzchmann).

Aberrant and abortive types are to be expected. In the former one may find patients with striking development of one or more features, in the latter a very great shading off to almost normal states, i.e., endemic goitre with mild mental signs.

**Endemic Deafmutism.—** This combination is very frequent, where endemic cretinism is present (29 per cent, Scholz). It may constitute one of the aberrant types just mentioned with striking development of single features, or it may be associated with all the grades of a complete cretin picture. According to the studies of Kocher, the loss of hearing is due to a bony defect which has destroyed the possibility of normal cochlear development. Bad hearing is reported at 32 per cent among cretins in Scholz's investigations.

Thechanges found in the brain which may account for the feeble-mindedness have been variable. Meningeal inflammation and mild grades of hydrocephalus have been found by Scholz and Zingerle. The brain is often symmetrical, small or single lobes are diminished in size. Often the brain's development is arrested at an infantile stage, the pallium or the ganglia being involved alone or together. The cerebellum is often imperfectly developed, which fact stands in correlation with the marked inco-ordination and possibly in relation with defective labyrinthine development.

The ear difficulties have been protean. Peripheral, conducting and central mechanisms have been found at fault; at all events they all seem secondary to the developmental anomalies induced by the action of the poisonous substance on the thyroid. The speech defects usually go hand in hand with those of hearing, but this is not universal. The cortical developmental defect is sufficiently explanatory for most of the cases.

**Therapy.—** Many contradictions may be found in the literature concerning the use of thyroid substance in cretinoid degeneration. Among the best reported results are those of V. Wagner who obtained a diminution in the myxedematous swelling of the skin, rapid development of the genitals, diminution in size of the tongue, disappearance of the umbilical hernia, development of new hair, hardening of the skin, closure of the fontanelles, increase in bony development. The psyche was less hopefully modified, but there was a diminution in the apathy and slight increase in intellectual capacity.

Early therapy is naturally the main feature. According to V. Wagner, small doses of iodine in addition seemed to stimulate the thyroid activities still further. Magnus Levy, V. Eysselt and others also report excellent results, complete cure resulting in some patients still in their teens.

A widespread state experiment carried out by V. Kutscher in Styria treated 1,011 cretins. A large number were neglected by the parents, i.e., treatment was not kept up. In 24 per cent of these the thyroid tablets could not be well borne. All idiots and severe grades of deafness and dumbness were left alone. Of 440 of the cases 10.2 per cent showed slight increase in bony development, 5.7 per cent showed definite change, 85 per cent showed an increase well above the average. The increase in bony growth was marked with the younger individuals, but also persisted into the third decade.

A careful revision of 677 cases showed 42.8 per cent marked improvement, 48 per cent some definite improvement, 8.6 per cent no improvement.

Iodothyne has also been utilized. One gram contains three milligrams of active substance representing the iodine content of one gram of fresh sheep's thyroid. It will be seen that the iodine content is not the only factor in the activity of the thyroid substance and it is not as yet definitely demonstrated what the combination is that is effective. The result of the use of implanting of glandular substance would be
the ideal therapy and experiments directed to this end have been attempted since 1899 when Birchler was one of the first to attempt it. The gland has been implanted in different portions of the body—the neck, under the breast, in the spleen, even in the body substance. As a rule, however, the implantation has not been as successful as was hoped, the gland itself undergoing retrogressive changes. Furthermore, there have been attacks from the studies of Enderle and Borst that thyroids from other animals possibly are not the best things to use as the biochemical composition of the human and animal varieties are so widely as to render degeneration of the implanted gland likely. Implantation of human glands has not been successfully brought about as yet, but with the newer work on organic transplantation as inaugurated through the researches of Carrel it would seem that this technical difficulty might be overcome in the very near future.

One is compelled, therefore, to resort in most cases to the dried or liquid preparations of the thyroid itself or to such biochemical products as laboratory research has provided through the utilization of the glandular substance itself or through the use of which its principal hormone activity.

The general results of thyroid medication in typical cases is fairly constant. Especially is it of value in the aberrant and minor forms of the disease of which one of the most chronic of symptoms is the persistent anemia. This may be in part overcome by the simultaneous use of small doses of arsenic, which have been recommended by a number of experimenters. Alcohol and morphine work disadvantageously and are therefore avoided. The use of small doses of sodium bicarbonate and bismuth work advantageously in diarrheal states.

Thyroid medication for the sporadic cases varies somewhat from its use in the endemic cases. In the sporadic cases of the light or mild type the action is quite similar to that seen in the endemic ones, but as a rule, sporadic cases by reason of their longer involvement and the less rapid development of the symptoms, the more hidden or obscure nature of the same, with their great mixture of syndromes, make such cases less responsive to the therapy. Nevertheless, many of them respond very kindly to it, the same dosage being utilized. Consult Bircher, F., 'Pathogenese der kretinischen Degeneration' (Berlin 1908); Haugardy and Längstein, 'Jahrbuch für Kinderheilkunde' (1908, 61); Falta, 'Erkrankungen der Blutdrüse' (1913); Jelliffe and White, 'Diseases of the Nervous System' (1917).

SMITH ELY JELLIFFE.

CRETONNE, kré-tônn', a thick, firm cotton cloth with various textures of surface, printed on one side or on both with pictorial and other patterns, and used for curtains and for upholstery. Unlike chintz, it is hardly ever glazed. It takes its name from its manufacturer.

CREUSA, kré-ú'sa, the name of several celebrated women of Greek antiquity. (1) Daughter of Erechtheus, who, before she was married to Someus, the symbol of an amour with Apollo. To her second husband she bore Achaesus. (2) The wife of Jason and the daughter of King Creon (q.v.) of Corinth. She was burned to death with her father by the magical poisoned diadem and robe given her as bridal gifts by Medea. Consult the 'Medea' of Euripides. (3) The daughter of Pheres and Heraclides. (4) The mother of Ascanius. In the tumult of the conflagration of Troy, Æneas fled with the images of his gods, with his father and son, he lost her, and after he had sought her for a long time in vain her spirit appeared to him, saying that the mother of the gods had taken her to herself because she was not willing that she should leave Phrygia. Consult Virgil, 'Éneid' (II, 730-794).

CREUSE, kré, a department of central France; capital, Guéret; area, 2,164 square miles. It is named from the river Creuse, which rises in it and traverses it diagonally in a northwest direction. The surface is generally rugged and the soil is thin, rocky and by no means fertile. Coal is the only mineral worked. Many cattle, and notably fine cavalry horses, come from Creuse. The chief manufacturers are carpets and tapestry. Thousands of the inhabitants migrate to other parts of France in March each year in search of work and return about Christmas. The department is divided into four arrondissements. Pop. 268,438.

CREUSOT, kré-zô', Le, town in east-central France, in the department of Saône-et-Loire, 236 miles south of Paris. Situated in the midst of a district rich in coal and iron, it owes its importance to the establishment here in 1837 of the great iron works of Schneider & Company, which rank among the largest in the world. Steel rails, armor plate and ordnance, engineering material of all descriptions and electrical machinery are all produced by this firm, which in normal times employs 15,000 men.

CREUTZ, krois, Gustaf Philipp, Graf von, Swedish poet and statesman; b. Finland 1731; d. 30 Oct. 1785. He was a member of the learned and elegant circle which surrounded the queen of Sweden, Louisa Ulrica, sister of Frederick the Great. His 'Atis og Camilla,' an erotic poem in five cantos, was 'Letter to Daphne' are considered as masterpieces in Swedish poetry. He was appointed Minister to Madrid, and at a later period to Paris, where he remained 20 years and became particularly acquainted with Marmondet and Grétry. On 3 April 1783 he signed with Dr. Franklin a treaty of amity between the United States and Sweden. His works and those of his friend Gyllenberg are published together under the title 'Vitterhets Arbeten of Creutz og Gyllenboe' (1796).

CREUZER, krois'ér, Georg Friedrich, German philologist and archaeologist; b. Marburg, 10 March 1771; d. Heidelberg, 16 Feb. 1858. He studied at Marburg and Jena, and in 1802 became professor of philology at Heidelberg. In 1807 the professorship of ancient history was also conferred on him, and he held both chairs till his resignation in 1845. His works treat of mythological subjects and classical history, the most important of them being 'Die historische Kunst der Griechen' (1803); 'Dionysos Urant' (1808), the symbol of an alten Völker, besonders der Griechen' (1810-12); and an edition of Plotinus (1835). His Symbolical theory of mythology gave rise to considerable controversy with Hermann,
CREVAUX, krá-vo, Jules Nicolas, French explorer: b. Lorquin, Lorraine, 1 April 1847; d. Paris, 25 March 1896. He took part in the French-Prussian War, and was later made a surgeon in the navy. In 1876 he turned his attention to the exploration of South America; he first crossed the Tumacumac Mountains; then explored the valley of the Oyapok and its tributaries and several tributaries of the Amazon. In 1880 he crossed the cordilleras of the Andes and reached the Orinoco by the Guaviare River, a tributary never before explored. He returned to France for a short time, but in 1882 started on another expedition, intending to explore the upper part of Paraguay and some of the southern tributaries of the Amazon; when he arrived at Buenos Aires he became interested in a plan for the exploration of the Gran Chaco and the Pilcomayo River, and joined an expedition for that purpose. He and his companions were murdered by the Tobas Indians on the banks of the Pilcomayo. An account of his explorations was published under the title 'Voyages dans l'Amérique du Sud' (1883). A work published in the Royal Society of Paris and entitled 'Flèves de l'Amérique du Sud' (1883) is based on his researches.

CREVECOEUR, krá-v'ker, Jean Hector Saint Jean de, French agriculturist: b. Caen, France, 1731; d. Sarcelles, near Paris, 1813. He emigrated to America in 1754 and for some years lived on a farm near New York. In 1768 he was arrested by the English as a suspected spy and was confined for several months. He then went to Europe but returned in 1783 and was for a long period French consul at New York, where he enjoyed the friendship of Washington and Franklin. At London he published in English 'Letters from an American Farmer' (1782), which he translated into French under the title 'Lettres d'un cultivateur Américain' (1784). He wrote also 'Voyage dans la haute Pennsylvanie et dans l'état de New York' (1801). His works were translated into English and Dutch and have been greatly admired for the beauty of their style. Consult Tyler, 'Literary History of the American Revolution' (1897).

CREVILLENTE, krá-vél-yán'tä, Spain; city in the province of Alicante, about 20 miles southwest of the city of Alicante. It is picturesquely situated at the foot of the hills, some 10 miles from the boundary of Murcia, and has an imposing town hall and a castle, besides the possession of the Count of Altamira. Weaving and agriculture are the principal industries. Crevillente is supposed to have been founded by the Romans. Pop. 10,452.

CREW, Henry, American physicist: b. Richmond, Ohio, 4 June 1859. He was graduated at Princeton in 1882; after five years as instructor in physics at Haverford College, Pa., and astronomer in the Lick Observatory, was elected Fayerweather professor of physics in Northwestern University 1892; past president of the American Physical Society; member of the National Academy of Sciences; joint translator, with de Salvo, of Galileo's 'Two New Sciences' (1914). He has written 'Elements of Physics' (1899); 'Principles of Mechanics' (1908); 'General Physics' (1908, 1911); is assistant editor of the Astrophysical Journal, and has contributed important papers to the American Journal of Science and Philosophical Magazine.

CREW, of a ship: collective name for all the persons employed therein, but usually limited to designate petty officers and seamen only. In men-of-war, the entire crew are divided into five groups: (1) Commissioned and warrant officers; (2) chief petty officers; (3) first-class working petty officers; (4) second-class working petty officers; (5) able seamen, ordinary seamen, landsmen and boys. In the very largest war-steamers now afloat, there are upward of 152 different ranks, grades or offices among the crew, excluding officers and mariners. In sea-going passenger and freight steamers, the number of hands is relatively greater than in sailing vessels, owing to the various duties relating to the machinery; there is a steamer of 1,000 tons still have as many as 60 or 70 hands, if bound for a long voyage.

CREWE, Robert Ofley Ashburton Crewe-Milnes, Marquis of, English statesman: b. London, 12 Jan. 1858. Ph.D. Trinity College, Cambridge, was assistant private secretary to the Secretary for Foreign
Affairs in 1833-84, lord in waiting to the queen in 1836 and lord lieutenant of Ireland in 1852-95. In 1905-08 he was lord president of the council. In 1898 and 1910-15 lord privy seal, and Secretary of State for the Colonies 1908-10. In 1910-15 he was Secretary of State for India. In the latter year he again became president of the council. Besides several articles on Ireland, he is the author of a volume of 'Stray Verses' (1899-90; 2d ed., 1913).

CREWE, England, a town in Cheshire, 21 miles southeast from Chester, an important station on the London and Northwestern Railway, 158 miles northwest of London. It is quite a new town, having been as recently as 1842 an obscure village with about 200 inhabitants. The first portion of it was built by the railway company for the accommodation of its workmen. The railway works comprise forges, rolling-mills, locomotive and carriage works, rail works, Bessemer steel works, etc., and give employment to about 7,000 persons. It is one of the most important railway centres in the world, at which from 9,000 to 10,000 workmen are employed. The town gives its name to one of the parliamentary divisions of Cheshire. Pop. 44,960.

CREWEWORK, work executed with the needle, and consisting of designs sewed in colored silk or woolen threads on a basis of unbleached cotton or linen, toweling or the like. It is a kind of Embroidery. See EMBROIDERY.

CREYTON, kra'ton, Paul, a pseudonym sometimes used by John Townsend Trowbridge in the earlier portion of his literary career.

CRIBBAGE, a card game of an essentially skilful nature, played mostly by two persons, though three or four can be arranged for; with an ordinary pack of cards. Court cards and tens rank equal, all others according to their "pips," ace counting one. The game is to win 61 points. The scores are kept on a tally, each side of which is perforated with six groups of 10 holes each. Each player scores the points he makes by inserting a peg into the hole his count entitles him to, on the board. The cards broken out, shuffled and cut, the dealer, from the utmost half of the cards, deals five to each player, beginning with his adversary. The remaining cards are placed face down on the cards already on the table. Both players then inspect the face values of their five cards and select two each to be thrown out. In this selection each is guided by the remaining cards he holds, and by the fact that whether or no, in the subsequent stage of the game (hereafter explained) he or his adversary will have the benefit of counting to his score the "thrown-out" cards. The non-dealer then cuts the cards left on the table again, and the top card is turned face upward. From that moment, for that hand, this "turned-up" card forms, with the four cards "thrown out," what is known as the "crib," which the dealer in each game, after counting the points made off the cards in his hand, is entitled to add to his game. This turn-up card also is counted in the play of both players with the cards in their hand. In the ordinary play the dealer deals, lays his turn-up card, and the non-dealer also lays a card down, face upward, on the table, of which he calls out the value. The opposing player has at once to determine how he can best utilize the card so played. There are several objects to be attained. You can so play as to ensure scoring yourself, or to prevent your opponents playing a next card, which will make all the 15 lord privy seal, and Secretary of State for the Colonies 1908-10. In 1905-08 he was lord president of the council. Besides several articles on Ireland, he is the author of a volume of 'Stray Verses' (1899-90; 2d ed., 1913).

CREWE—CRICKET

Crichton, kra'ton, James, surnamed The Admiraile, Scottish nobleman: b. Perthshire, Scotland, 19 Aug. 1500; d. Mantua, Italy, 3 July 1583. His father was a lord of session and through his mother he was of royal descent. He was one of the young men selected to be fellow-students of the young king, James VI, at Saint Andrew's University. He then went to France, where he continued his studies, and also, as he adhered to the Roman Catholic Church, took part in the war carried on by Henry III against the Huguenots. The beauty of his person, the strength and agility he displayed, joined to his multifarious accomplishments and surprising capacity for eloquent talk, made him the admiration of all. About 1580 he went to Italy, visiting Venice, where he was introduced to the Doge and Senate, created astonishment at Venice and Padua by his brilliant off-hand discourses on philosophy, theology and other high themes and his challenge to disputation in any of several languages and on either side of the controversy. He next went to Mantua and was appointed tutor to the son of a duke. Attacked in the streets one night by a party of men armed and masked, he overcame them by his superior skill, took the pupil, to whom he at once loyalty presented his sword. The young prince immediately ran him through with it. The authority for this account is the Venetian publisher Aldus Manutius, with whom Crichton had associated. W. H. Ainsworth wrote a romance founded on the story of Crichton in 1837. Consult Tytler, P. F., The Life of James Crichton (London 1819; 2d ed., 1823); Crichton Douglas, The Admiraile Crichton; the Real Character (ib. 1809); Whibley, 'Essays in Biography' (ib. 1913).

CRICKET, the name applied to orthopterous insects of the family Gryllidae, allied to the grasshoppers. Their heads are somewhat flattened, though in some forms more or less cylindrical, while the abdomen ends in a pair of long, slender styles. The tarsi have three segments, the ocelli may or may not be present, and the hind legs are fringed, the foreleg having a needle with a slightly expanded tip. They are active leapers, the hind femora or thighs being enlarged. The males produce a shrilling sound made by raising the upper or fore wings and
rubbing them on the hind wings. The noise is due to the clear drumhead-like area in the middle of the fore wings forming a resonant surface; on the hind wings is a raised toothed ridge which rubs on the drumhead above it. The females are silent. They are dull blackish brown. The European house-cricket (Grillus domesticus), and related species, are found all over the United States and in Canada. It prefers the warmth of the hearth, while our native species live in the open air, the males beginning to sing at the opening of the summer season, which in southern New England is about the 10th of June. See Mantis-cricket; Tree-cricket.

CRICKET, a well-known game, commonly called the national game of England, played in the United States, Great Britain, Australia and India, the players being arranged in two contesting sides of 11 each. Strutt, one of the best English authorities on ancient sport, adduces some evidence to show that "club-ball" players in the 14th century, may have been the parent of cricket, but both "cat-and-dog" (mention of which occurs in the 16th century) and "stool-ball" (frequently referred to in the 17th century) have a closer affinity. It is stated in Russell's "History of Guildford" that cricket was played in that town in the middle of the 16th century, but for 50 years subsequently no trace has been found.

Cricket stands pre-eminent in England among the many outdoor pastimes pursued during the summer months. Cricket is not solely an affair of skill; chance is also a factor to a very large extent. Conditions of ground and weather exert such a remarkable influence on the game that in many cases a side which apparently possessed little hope of success has come out as the match victorious. Also a mistake in the field, or an act of carelessness on the part of a batsman, may change the character of the whole game. To excel at cricket it is necessary that the study of the game should begin early; and at nearly all schools a cricket "coach" or tutor is engaged.

Cricket may be played either single-wicket or double-wicket, but it is now so rarely played in the former manner that we can safely confine our attention to the latter. For a double-wicket match game, 11 players on each side are necessary, and after the captains have tossed to settle who shall go to the bat first, the loser places his field and the winner sends in two of his surest, safest batsmen to defend the wickets and to make runs. The disposition of the field depends upon the style of bowling, whether it be fast, medium pace or slow and the following diagram will give a pretty clear idea of how the fielders are placed and what dangers the batsman has to guard against. A distance of 22 yards separates the wickets, and by this scale the relative position of the players may easily be estimated. The field being having been duly placed, the batsmen having taken their stand, the empire calls "play," and the bowler sends down his first ball. After five balls have been delivered from one wicket the umpire calls "over," and the whole field changes about till the position of the men bears the same relation to the other wicket that it did to the one first bowled against. These "overs" continue to be bowled from alternate ends by different bowlers until the whole 11 players have tried their hand at the bat and been disposed of. Runs are made by the batsman driving the ball far enough away to give him time to change places with the other batsmen before the ball returns; each change constitutes a run. Six is the largest number of runs that can be made from a single hit, that being what is allowed when the ball is driven clear out of the grounds. The business of the bowler is to try in every possible way to knock down the wickets in front of which the batsmen stands, or else to tempt him into hitting the ball up into the air so that it may be caught on the fly by one of the fielders. Besides being bowled or caught out, a batsman may be "run out," that is, have his wickets knocked down by the ball while he is busy making a run, or he may be "stumped out," which is to have the same thing happen when he incautiously steps out of his ground to hit at a ball. The ball comes to the batsman on the first bounce and the bowler's skill is shown in varying the pitch, speed and direction of the ball so that the batter may become bewildered and fail to defend his wickets. The best kind of bowling is what is known as "bowling with a break," the peculiarity of which consists in that the ball after striking the ground does not continue straight on, but swerves sharply to the right or left like a "cut" tennis ball.

The great point in batting is to play with a straight bat, that is, as far as possible to swing the bat at right angles to the ground, the advantage thereby gained being that the wickets are more completely covered and there is less liability of giving a catch. Next in importance is to play forward, that is, to meet the ball as far forward as safety allows and not wait for it to come upon one. Thirdly, it should be the batter's aim to play low; in other words, to hit as many "grounders," or "daisy-cutters," as possible, for they are harder to field and give no chance for a catch. Two whole days at least are required for a first-class two-innings match. In Canada there are clubs in almost every city, town and village. In the United States the two chief homes of cricket are in Philadelphia and Boston, although there are good clubs in New York, Detroit and elsewhere and also at some of the larger colleges. Consult Grace, 'Cricket' (1891); Daft, 'Kings of Cricket' (1893); Ranjitsinhji, 'Jubilee Book of Cricket' (1897); and Read, 'Annals of Cricket' (1897); Knight, 'The Complete Cricketer' (1906).

CRICKET FROG, a small frog (Acris gryllus; northern species are variety crepitans),
abundant throughout the warmer parts of the United States, east of the plains, and noted for its striking color changes; for it is about an inch long, brownish, with a blackish triangular patch between the eyes, the borders of which are light-colored, continued as a dorsal band to the rear end of the body; throat in spring yellow and legs barred; but all these color changes with surroundings, as the species possesses the power of metachrosis in a high degree. "The note of this species," says Cope, "may be exactly imitated by striking two marbles together, first slowly, then faster and faster, for a succession of about 20 or 30 beats. The noise cannot be heard at a very great distance, it keeps on the high grass in and around marshy places, seldom if ever ascending trees or bushes. When pursued it leaps with prodigious agility and hides under water." Their eggs are deposited in April, in little masses attached to the blades of coarse grass. A short time afterward all the great numbers which make the marshes so noisy in April and May die off, so that until the eggs hatch and the young formers develop late in August, the species is practically extinct. Consult Abbott, 'Notes on the Habits of the Savanna Cricket Frog,' in American Naturalist (Philadelphia 1882) and Dickerson, 'The Frog Book' (New York 1906).

CRICKET ON THE HEARTH, a simple story by Charles Dickens, published 1845. It has been adapted for the stage and used by Joseph Jefferson.

CRIDGE, Edward, Canadian bishop: b. England 1817; d. 6 May 1913. He was graduated at Cambridge University; was appointed chaplain to the Hudson's Bay Company at Victoria, B. C., in 1855; and was first inspector of schools for Vancouver Island. His trial and condemnation for ecclesiastical offenses, before a court presided over by his bishop, Bishop Hills, had as its sequel his secession from the Anglican Church and appointment as first bishop of the Reformed Episcopal Church in British Columbia. In his last years he was afflicted with blindness.

CRILE, George W., American surgeon: b. Chile, Ohio, 11 Nov. 1864. He was graduated at Ohio Northern University in 1884 and received the degree of M.D. at Wooster in 1887, studied also in Vienna, London and Paris. He was lecturer on the principles and practice of surgery at Wooster University from 1889-1900, when he became professor of clinical surgery at Western Reserve University. In 1913 he was granted an honorary fellowship in the Royal College of Surgeons. His work, 'On the Blood Pressure in Surgery' (1903), is especially important. He published also 'Surgical Shock' (1897); 'Surgery of the Respiratory System' (1900); 'Certain Problems Relating to Surgical Operations' (1901); 'Hemorrhage and Transfusion' (1909); 'Surgical Anemia and Resuscitation' (1914).

CRILLON, krè-yôn, Louis des Balbes de Berton de, French soldier: b. Murs, Provence, 1541; d. Avignon, 2 Dec. 1615. In his first campaign in the war of the League (1557-58), he contributed much to the conquest of Calais. He subsequently distinguished himself in the battles of Dreux (1562), Jarnac and Moncontour (both in 1569), against the Huguenots. In the famous naval battle of Lepanto fought in 1571 Crillon displayed prodigies of valor and skill. He even saved the Prince of Parma with his horse. It is said that he carried the tidings of the great victory to the Pope and the king of France. The massacre of Saint Bartholomew (1572), the preparations for which had been carefully concealed from Crillon, was loudly reproved by him. He fought heroically for Henri IV against the League and distinguished himself at the battle of Ivry (1590), and at the sieges of Paris and Laon. After the peace with Savoy, Crillon retired to Avignon. Consult Montrond, Histoire du brave Crillon (Lille, 5th ed., 1874).

CRILLY, Daniel, Irish journalist: b. 14 Dec. 1857. He edited the United Irishman, Liverpool 1876, and joined the staff of the Nation, Dublin 1880. He represented North Mayo in Parliament 1885-1900 and has published 'In the Byways with Young Ireland' (1888); 'The Felon' Literature of Ireland (1889); 'The Celt at Westminster' (1892); 'Pencillings on Parnassus' (1889); 'In the Footsteps of John Mitchel' (1900-01).

CRIME, a word signifying in its legal acceptance any act to which the law attaches a penalty or punishment, without any reference to its moral turpitude. The common-law division of crimes was into treason (q. v.), felony (q. v.) and misdemeanor (q. v.). A present treason is usually classed as a felony and the distinction between felonies and misdemeanors hinges upon the degree of punishment prescribed for the crime, a felony being punishable by loss of life or by incarceration in a State prison for at least a year and by the deprivation of civil rights, and a misdemeanor being punishable by a fine or by imprisonment in a workhouse or by both. To constitute a crime, there must first be an act, since a mere opinion or intention, however wrong from a moral or religious point of view, if not carried into an act, cannot be treated as a crime, although the criminality of the act when done, may be partially or entirely dependent upon the intention of the actor. The true and only reason for making any given act a crime is the public injury caused by it and from its frequent perpetration. Each individual instance constituting an individual injury, frequent repetition would make it a social injury. Society accordingly takes the most efficient measures for its prevention, by appealing to the fears of mankind. The crime is first accurately defined and the requisite punishment attached to it and then government itself becomes a party to the prosecution of the offender, in order to ensure the carrying into effect of the penalty; for the certainty of punishment is even more effectual in preventing crimes than any degree of severity with a probability of escape. But while the only legitimate object of punishment is to protect society against a repetition of crimes, humanity dreads that the reformation of the offender should also, if possible, be effected. But as government has no concern with men, except as members of society, it is obvious that their moral improvement can never be made the primary object of punishment. Self-preservation is at once the foundation and the end of the power exercised by society in punishing its members. In preventing the repetition of crimes, punishment is designed to operate both upon the individual offender and
upon the community at large. Upon the offender itself it operates by physically disabling him from repeating the offense, or by dissuading him from it through the recollection of past suffering, or by both of these means together. Upon the community at large, it operates to add to public terror of example. Consequently it follows that the mode and measurement of punishment are to be determined, not so much by the abstract nature of the offense as by its liability to frequent repetition, and also that the severity of the reparation or atonement of which does not injuriously affect the temporal welfare of society. Insanity, infancy, coercion or duress may excuse an act otherwise criminal in the degree that they destroy the voluntary nature of the act, which is therefore performed by the agent without specific criminal intent. See CRIMINOLOGY; FINGER PRINTS.

CRIME AND PUNISHMENT (Préstupleniye i Nakazaniye). Dostóyevsky's greatest masterpiece in fiction, 'Crime and Punishment,' is the psychological study of a murderer. A law student at the University of Petersbourgh, he has written for a periodical an article on crime. This has turned his attention to the subject, and as he has not been informed that the article was accepted, and as the small pittance that his mother and sister have been in the habit of sending him has inexplicably ceased coming, he is reduced to such straits that he has been obliged to pawn some of his possessions and is deeply in debt. The notion enters his head of murdering Alena Ivánovna, a disreputable old woman who lends money on pledges and is reputed to be as rich as a Jew. He dwells on the plan until it obsesses him. He argues that if great conquerors, like Napoleon and Alexander the Great, who had succeeded in winning fame and glory by their colossal deeds, were justified by their success, it would not be wrong for him to rid the world of a hard and evil usurer, and then, by taking the thousands of rubles which he should find in her possession, to pursue his career without the sorrow that is always left behind when a man loses his life without any purpose. He takes a hatchet, which he fastens by a loop to the inside of his cloak, and wrapping up a chip and a piece of iron as a pretended pledge, he goes to her apartment. Everything favors the accusation of murder, for there is no suspicious old woman alone, and while she is cutting the knot around the package, he strikes her on the head and kills her. He hastily ransacks the inner room; he fails to find the great sums of money which are hidden about, but picks up a few pieces of jewelry and a pocket-book stuffed with bank-notes. While he is at work, the old woman's half-sister enters the outer room. He strikes her down also, and then, having steps, he for the first time thinks to bolt the door. Persons try to enter. They ring and knock, and suspecting something is wrong, go to find the janitor. Raskólnikov manages to escape. In order not to meet the two visitors coming back with the janitor, he steps into a room just vacated by two patients there accidentally dropping one of the jewel-cases. Undetected he leaves the house. Reaching his room he regards his boots, insignificant as it is, with a sort of horror. He goes to a deserted house and buries it all under a large stone. Returning to his room he discovers blood on his boots and on his clothing. He tries to get rid of all such incriminating evidence. He cannot, however, eliminate his conscience. His crime haunts him night and day. He becomes ill, and his friends cannot understand his actions, which are those of a crazy man. He is taken to the police-station and to revisit the scene of his crime. He is as yet safe from suspicion, since one of the two painters, who had left the apartment-house just about the time of the murder, has confessed to being the perpetrator. The examining-magistrate, who had read Ruskôlnikof's article, now published, and has a high idea of the young man's abilities, has gathered from his wild talk that he is the criminal: he advises him to confess and bear his punishment like a man; he intimates that his sentence will be mitigated by such action. In the meantime Ruskôlnikof has confessed his crime to Sónya, a girl of the town, the victim of cruel circumstances. He had met her through chance acquaintance with her father, an official degraded by drink, and had become greatly interested in her. Ruskôlnikof, finally, yields to Sónya's earnest entreaties, goes to the police station and is sentenced to eight years of hard labor in Siberia. The young girl accompanies him, and by her utter devotion brings him back to sanity and to complete repentance.

There are subordinate threads of plot, involving Ruskôlnikof's mother and sister and a wealthy roué, named Svidrigailof, who in spite of his rascallies has the saving grace of a generous spirit; he is a character worthy of Dickens. The episode of his suicide is depicted with startling power. So is the tragic end of Sónya's father. The scene of his funeral reaches the highest degree of pathos, mingled with a touch of sardonic humor. One of the most famous episodes in the story shows Sónya reading the New Testament to her unhappy friend: the prostitute and the murderer make a picture which haunts the memory by its realism and its dramatic poetry.

The power of the novel consists of the exhaustive analysis of the motives and reactions of a man who is on the verge of insanity and yet who is shown to be responsible for his deeds. Dostóyevsky had in his own life made a first-hand acquaintance with the lives of the poorest and most wretched of the exiles in Siberia, and his descriptions of the murder, of the meeting of Ruskôlnikof and Marmeládof at the lower tractie, where the drunkard tells his life-story, of the funeral-dinner given by Marmeládof's widow and the dramatic appearance of Sónya among the queer persons present, who draw back from her as from the plague, and of the life of the exiles in Siberia, which Dostóyevsky knew at first-hand—all these and many more are portrayed with a masterly pen. The beautiful and touching epilogue where Ruskôlnikof comes to himself lifts the tragedy to its joyful conclusion. The serene light of optimism: it fully repays for the long pages of hypochondriacal psychological analysis, which however microscopic and scientific are yet morbid and unwholesome.

'Crime and Punishment' was regarded as...
the greatest literary event of the year 1866. It made a vast impression. It is said that it was immediately followed by a murder committed by a student at Moscow in almost precisely the same way as that described by Dostoievsky. He himself remarked, "to be like a criminal who had committed some terrible deed that weighed on his conscience." It was anonymously translated into English from the French version and published in London in 1865, and in New York the following year. It forms the third volume of the complete works of Feodor Dostoievsky from the Russian by Constance Garnett. It has been carefully analyzed by the Vicomte de Vogué in his 'Russian Novelists' (Boston 1897) and by William Lyon Phelps in his Essays on Russian Literature (New York 1916).

NATHAN HASKELL DOLE.

CRIMEA, kri-mē'ə or kri-mēs'-ə, The (Fr. Crimée; German, Krim; ancient Chersonesus Taurica), a peninsula forming the southern part of the Russian government of Taurida on the north side of the Black Sea, separated from the mainland on the north by the Isthmus of Perekop, over three miles across, the Kerch Strait on the east separating the Black Sea from the Sea of Azov. It has a maximum length, east to west, of 200 miles, and a breadth of 130 miles from north to south, and is estimated to have an area of 9,700 square miles. It is washed on three sides by the Black Sea. The northern part of the peninsula is a continuation of the Russian steppes, with saline stretches, cold in winter and hot and dry in summer, with a disagreeable prevalence of dust storms. The southern littoral, sheltered by the Yaila-dagh or Alpine Meadow Mountains, is known as the Russian Riviera, has a climate Mediterranean in character, in which peaches, pomegranates, almonds and apricots grow to perfection. Here are the palatial residences of the Russian nobility, and Livadia, one of the tsar's palaces. The forests are of limited extent and seldom contain magnificent trees.

Among domestic animals the first place is due to the sheep, of which there are large numbers of fine-wooled breeds; horned cattle, horses and camels are also reared in large numbers. Of mining products, coal is the most important, which is obtained from lakes in the saline tracts already referred to, in large quantities, and furnishes the material of an active trade, chiefly with the interior, by land transport. Other minerals are porphyry, ironstone and limestone. Fishing, shipbuilding, flour-milling, tanneries and soap manufacture are the principal industries. The Crimea is now included in the Russian government of Taurida. The chief towns are Simferopol (pop. 81,859) and Sebastopol (pop. 61,849) and the population is estimated at 855,000, the majority Turkish-speaking Tatars.

The history of the Crimea extends over 24 centuries, commencing with the earliest annals of Greece. It figures in Greek fable as Cimmeria. Greeks meant that the south shores of the Crimea in early times; cities were built, one of them Theodosia, which still retains its name. The Bosporus finally became a dependency of Rome, and after the fall of the empire the settlements in the Crimea appear to have had a very precarious existence; at one time placing themselves under the protection of the Byzantine emperors, at another becoming the tributaries of some marauding adventurer and at another claiming to be their own masters. The time when some offshoot of the Turks first arrived in the Crimea is not accurately defined, but in the 7th century the greater part of it was in the hands of a Turkish tribe called Khazars, and had, in consequence, changed its name to that of Khazaria. In like manner its southern coast, where the Goths had established themselves, was called Gothia. But in the latter sense, it was only a minute portion of the territories of which the Khazars had made themselves masters. Their capital was seated near the mouths of the Volga, probably not far from the present Astrakhan, and their sovereigns, called khazars or khans, lived in a state of splendor which the monarchs of western Europe have seldom equalled. In the 10th century the Russians and Pechenges come upon the scene, and before the end of it the power of the khans is almost broken. The Russian, in the north of the Crimea having been included in his conquests, passed on his death, to his grandson, Batu-Khan, and in 1240 was incorporated in the empire of the Golden Horde. Batu-Khan was the founder of Baktchi Serai, which continued long to be its capital. Mengli Timur, the second in succession from Batu-Khan, having granted the Crimea to a nephew, to be held as a dependency of the grand khanate, it took the name of Crim, or Little Tartary, from which with which it now bears is evidently derived. Previous to the year 1290 the Genoese lived on the Crimea as traders, but they now applied to the under-khan for permission to form a permanent settlement. This was granted, and in consequence in 1280 they founded Kaffa, which is still known as the Kaffa, which is still known as the Genoese, is the chief town of the Crimea. The great object of the Genoese in making this settlement was to exercise a control over the extensive and lucrative trade which was then carried on with the East, by way of the Caspian Sea and the Volga, and thence, after a short land carriage, down the Tana or Don into the Sea of Azov. This trade and a large business in slaves so increased the importance of this settlement that the Genoese, who had come as simple traders, began to aspire to be masters. The jealousy of their great rivals, the Venetians, was excited, and open hostilities were carried on, each party contending for an exclusive monopoly of the whole trade of the Black Sea. In this contest the Genoese gained the advantage, and they continued to follow it up by forming round the shores of the Crimea strong fortifications. In this way they obtained possession of Soldaia, now Soudak, in 1365, and about the same time made themselves masters of Cembalo, which afterward exchanged its name for that of Balaklava. The old castles at both these places are Genoese. While Genoa
was thus a rising power, the khans were rapidly declining. To complete their downfall, the terrible Timur appeared, and early in the 15th century the Golden Horde was broken up into fragments. Early in the 15th century the Crimea thus became an independent khanate, and continued so to exist under the line of Gheral, descended from Genghis-Khan, for a succession of reigns. The Genoese in the meantime gained power, and succeeded, by interfering in a disputed succession, in gaining complete ascendency over the khanate. The Tartars invited the interference of Turkey, and 1475 an Osman fleet appeared in the Bay of Kaffa. The Genoese offered an ineffectual resistance; and Kaffa, along with all their other settlements, was soon in the possession of the invaders and the Crimea became a province of the Ottoman Empire. The Turks, not satisfied with the Crimea, extended their power even farther into the territory of the Russians; and, soon Russia turned to the Crimea as a possible and valuable maritime province. In 1736 a Russian army of 30,000 men crossed the isthmus of Perekop and marched down to Sebastopol, but the tempestuous climate forced the speedy return of less than half of the army, all that was left. The contest for the Crimea, thus begun, was steadily persisted in; and the conquest was virtually completed by the troops of Prince Dolgorouki in 1771. In 1783 the Crimea was united to the Russian Empire.

The Crimean War.—The progress of Russia in this direction naturally held out to her more tempting objects of ambition and it was generally believed by the western powers of Europe, who were jealous of the growth of her gigantic power and particularly by England, of whose policy, in consequence of her possessions in the East, the preservation of the Turkish Empire had become a primary object, that she aimed at the dismemberment of that empire and the conquest of Constantinople itself. Among other indications of aggressive tendencies, the great naval arsenal of Sebastopol, occupying the most commanding position in the Bay of Sebastopol, on the west coast of the Crimea, about 30 miles north of Sebastopol. The disembarkation having been completed on the 16th, the army began to move southward on the 19th and early on the 20th approached the banks of the Alma. Here the Russian army was found occupying a position which Prince Menschikoff, its commander, believed to be unassailable. After a sharp struggle the Russians were forced to give way at every point, leaving the allies in possession of a victory which is destined to hold an honorable place in military annals. Two days after the allied army continued its march for Sebastopol, the real object of attack; but for strategical reasons, instead of proceeding directly to the north side of the fortress, made a circuit which brought it considerably to the south, in the vicinity of Balaklava. This small harbor, near which the British were stationed, furnished them with facilities for landing the munitions of war, while the same object was gained, perhaps more advantageously, by the French, on the peninsula, begun by Catherine II in 1789, was completed on a scale of which the world has not seen a parallel and provided to an unlimited extent with all the means both of offensive and of defensive warfare. One main object of this arsenal undoubtedly was to hold out a standing menace against Turkey and make her destruction certain whenever an opportune period for striking the final blow should have arrived. The Emperor Nicholas I, one of the ablest as well as the most successful of the tsars who have ever swayed the Russian sceptre, had satisfied himself that this period was actually at hand. In February 1852 the Porte had given a decision on a dispute between the Latin and Greek churches, the former protected by France, the latter by Russia, to the latter; and the Holy places in Palestine, which was deemed favorable to Russia. A new demand, however, was made by this power, which in November claimed, in virtue of the Treaty of Kainardji, a protectorate over the Greek Church throughout the Turkish Empire. After complicated negotiations, the Porte, under pressure from France, vacillated toward the side of the Latins, and on 22 December delivered the key of the church of Bethlehem to the Latin patriarch. The diplomacy of England, France, Russia, Austria, Prussia and Turkey exhausted itself in negotiations over this point, which was finally settled in May 1853, Prince Menschikoff delivered an ultimatum to the Porte, which being rejected, the Russian troops, which had been advanced to the Pruth at the close of the previous year, crossed it and occupied the Danubian principalities. The Porte declared war on 23 Oct. 1853; France on the 27th and England 28 March 1854. On 26 Jan. 1855 the allies were joined by Sardinia. Happily the common danger had dissipated all the misunderstandings which had arisen between Great Britain and France. Nicholas had selected the Danubian principalities as the scene of warfare and here the allied army was first conveyed; but after remaining inactive for some time at Varna and suffering great losses through cholera, it was determined that the Crimea should be made the battleground. Accordingly, in the beginning of September 1854, the combined fleets of Great Britain and France, forming up till then, if efficiency as well as vastness are considered, the mightiest armament ever conveyed, under the terrible climate forced the speedy return of less than half of the army, all that was left. The contest for the Crimea, thus begun, was steadily persisted in; and the conquest was virtually completed by the troops of Prince Dolgorouki in 1771. In 1783 the Crimea was united to the Russian Empire.
ing to take it. The consequence was that not only were defensive works constructed rapidly while the siege made comparatively little progress; but the besieged, who had also the assistance of an army without the walls, were able to maintain an aggressive. On 25 October took place the famous battle of Balaklava, distinguished by the heroic charge of the Light Brigade, when, in consequence of the misinterpretation of an order, 600 cavalry rode headlong against the Russian army. On 5 November followed the battle of Inkermann, in which the overwhelming force of Russians was gallantly repulsed. Both Great Britain and France now became more alive to the magnitude of the struggle in which they were engaged. While the siege continued, other important positions in the Crimea were occupied and the possession of Eupatoria on the west, and of Kerch on the east, both seriously threatened the communications of the Russians and furnished the means of destroying a large portion of their supplies. The Crimea, thus virtually conquered and a successful issue of the siege began to be confidently anticipated. At an early period the Russians, by sinking a number of large ships across the mouth of the harbor, had rid themselves of the attack by sea. The remaining part of the fleet within the harbor was still available for defense and from its powers of locomotion enabling it to change its position so as to meet emergencies, was able greatly to retard the besiegers. Decided progress, however, continued to be made. On 7 June 1855 the Mamelon, a commanding height, was taken; and on 8 September the flag of the allies waved on the tower of the Malakoff. The Russians on the night of the above day, aware that further defense was impossible, withdrew to the northern side of the harbor, after sinking their ships and blowing up the defenses of the town, which was now taken possession of by the allies. There is no reason to doubt that in another campaign the Russians might have been driven entirely out of the Crimea; but the victories were made and they gladly availed themselves of them. A treaty of peace was concluded at Paris on 30 March 1856 by which the independence of the Ottoman Empire was guaranteed and her admiralty society (concert of European powers declared by the other contracting parties, namely, Great Britain, Austria, France, Prussia, Russia and Sardinia; the Christians in Turkey to remain under the protection of the Sultan, who, by a firman, allowed them religious liberty; Russia renounced her protectorate over the Danubian principalities; the Black Sea was neutralized; the navigation of the Danube was to be free to all nations. The total casualties in the Crimean War have been estimated at half a million; the costs — Great Britain, £59,000,000; France, £93,000,000; Russia, £142,000,000. Taking advantage of the Franco-German War, Russia, on 31 Oct. 1870, denounced the Treaty of Paris so far as it related to the neutralization of the Black Sea, and in a conference held in London in January 1871 this part of the treaty was given up, while the remainder of the treaty was confirmed. CRIMEAN WAR. See CRIMEA, THE.

CRIMINAL CONVERSATION, the technical term for adultery with another man's wife. It is no defense to an action by the husband, in such a case, that he presented to the defendant's solicitation, for the husband does not sue for a wrong done to her, but to himself. The gist of the action is the shame which has been inflicted upon him and the hazard to which he is subject of maintaining spurious issue. It is therefore quite distinct from the wrong of enticing the wife away from her husband, although, like seduction, it is looked upon as a personal injury to the husband. He may condone the wife's offense, and thus lose his right to secure a divorce, without affecting his right to damages against the paramour. It has been judicially declared that the law will not hold a party remedyless for an injury of this kind because, through the exercise of Christian virtue, the influence of his family interest, or for any other reason, he forgives an erring wife and trusts in her reformation and promise of future good conduct. He may forgive the wife without forgiving the author of the wrong done him. See ADULTERY.

CRIMINAL LAW. A definition of criminal law as that part of the law which relates to crimes and their punishment requires an expository definition of the term "crime." A definition of a crime as an act or omission for which legal punishment may be inflicted upon the person in default would be too broad for practical purposes; for law in its very nature is coercive and all coercion at some stage involves the possibility of punishment. Calling crimes "wrongs" does not help matters. There are many acts and omissions which would not be accounted criminal, though they are considered wrongs, which result in injury to persons or property and are done in negligence and even with malice. The criminal law, therefore, in one of its most important aspects, is the law which defines crimes. Secondly, the function of the criminal law is to provide for the punishment of crimes. Thirdly, the criminal law prescribes the procedure whereby responsibility for crime is legally determined and the penalty admeasured and inflicted. Crimes may be either attacks on public order, abuses or obstructions of public authority, or acts injurious to the public good; or they may be attacks on the persons or property of individuals, or rights annexed to persons or property. In primitive communities, the law did not greatly concern itself with the redress of wrongs. It was left to the injured individuals and their kinsmen to wreak vengeance on the offender and get what satisfaction they could through retaliation. The fear of private vengeance, indeed, was the only really efficient check upon crimes of violence. The modern method of criminal procedure, if it can be called so, was merely regulative of the right of summary execution accorded to one who catches a wrongdoer on his premises flagrante delicto; a thief might reclaim his life by paying over, and, if he had obtained sanctuary in a church or in a demesne of the king, or of a bishop or
a lord, and should be killed there during the prescribed days of grace, the slayer was obliged to pay a fine to the protector whose sanctuary had been violated. The privilege given to compose a feud by the payment of *wer-gild* to the avengers of a wrong was, in effect, a recognition of the right to redress by acts of violence a wrong done by the violent act of another. The idea that wrongdoing might injure not merely the individual directly affected but also the state was not grasped until much later times. During the first four centuries of English history crimes continued to be regarded as acts of war, and blood feuds and private warfare characterized a normal condition of society. The object of the law-maker was to reconcile antagonists upon established terms of peace rather than to put down violence by orderly legal process. The conception of the *King's Peace* as a state opposed to the state of private war began to gain currency, however, in the time of Alfred, although the laws of the new courts corresponded with the local man could fight with or for his lord, for instance, and a lord could defend his vassal by force of arms without being answerable for a breach of the peace. But offenses against community and commonwealth, menace to the general welfare, were still treated as merely private injuries to be compensated by damages. The foundation for a more enlightened system was being laid, nevertheless, and even while these barbarous institutions persisted, by laws ordering the local organization of the country by shires or counties, hundreds and parishes, for the purpose of police and the administration of justice. All men were bound to combine themselves in associations of 10, each of whom was a surety for the good behavior of the rest; and were likewise bound to produce any of their number charged with any offense or, failing in this, to make good any mischief they had done. This was the institution of *frankpledge*. The Hundred Courts and County Courts were local courts, and police organization, but in criminal matters the sheriff's *tourn* was simply the County Court held for a particular hundred. The court consisted of the parish priest, the reeve and four men, and the towns of large cities and public officers of the vicinage.—for the County Court was the *Folkmoot* or general assembly of the people. But a representative body of 12 appears to have been constituted as a judicial committee of the court. Accusations might be made by this committee, the prototype of the grand jury, or by members of the Folkmoot, or by private accusers. The guilt or innocence was decided by compurgation, or by ordeal if the accused was not *oathworthy*. Whether the compurgators examined witnesses before they "dared" is uncertain, but it is inconceivable that an inquiry into the facts should not have preceded the verdict. By the time of the Norman Conquest the killings and burnsings in private wars and blood between private war under regulations. By William and his immediate successors the super-

visor" of the King's Court were greatly increased and its concurrent jurisdiction was exercised more stringently and frequently until, ultimately, the King's Assizes practically displaced the County Court in the exercise of the more important part of their jurisdiction. Criminal actions up to the time of Edward I (reigned 1272-1307) were instituted by *appeals* to the County Courts and proceeded from private initiative, not from the Crown; this was so even in regard to such serious offenses as homicide, arson and perjury. In fact the final appeal was a wager of combat, the appellant offering to "prove by his body" the justice of his cause and the appellee likewise undertaking to "by his body" to defend himself against the accusation. If the appellee succeeded in defending himself until the stars came out he was acquitted; if defeated, he was hanged. But it was left to the viscount and coroners to determine whether the appellee "ought to have the country," meaning, probably, an inquisition by the judicial committees of the state. It was in the peace of the (grand jury?) and a determination of the facts on the testimony of witnesses by petit jurors or compurgators.

Neither the ancient laws, decreed on the sole authority of the kings, nor the earlier acts of Parliament yield much to those who go to them in search of definitions of crimes. Their administrative and regulative provisions assume a knowledge on the part of the law officers of what characterizes a criminal offense and distinguishes it from a trespass. The forms of procedure devised by the courts, however, are more helpful to a historical study of the development of the criminal law. From a number of forms of appeals given by Bracton in his *Leges Anglie,* it appears that in his day the idea of a crime being an injury to public order as well as an invasion of private rights had been definitely accepted. The appellee was required to allege that at the time of the injury suffered, whether abed at home or traveling on the king's highway, he was "in the peace of the lord king," that the defendant "came with his force against the peace," in felony and in "premeditated assault." Violence, feloniousness, malice and premeditation have in all times been considered necessary constituents of any serious criminal act. Returning to the law, we find that, if the injury inflicted was a wound, the appellee must describe it with exactitude and state upon what part of his body it was received, also the kind of weapon with which it was inflicted. It seems that only with weapons that cut and pierced could an assault be made that would be accounted felonious. If one were injured from a blow with a bludgeon or the bare fist, such as would ordinarily cause merely a bruise or a welt, unless bones were broken, it was regarded a "misdemeanor and lighter" offense, answerable in a civil action though even such lesser wrongs would "appertain to the crown, for sometimes they are against the peace." An appeal for mayhem would lie only for injuries that would disable the victim. The introduction of trial by battle in the reign of William the Conqueror, therefore, was an apparent reversal. Indeed, the language of the royal *carta* by which this was instituted shows that it was so intended, and that trial by battle was merely private war under regulations. By William and his immediate successors the super-
lies. Thus early (Bracton's book was written about 1258) did the law clearly recognize the distinction between "felonies" and "misdemeanors," which has subsisted to this day. Thus early was "intent" estimated at its true value as an element of criminality. Not for the first time in English history, however, was such recognition then accorded to these principles. The Saxon laws directed a less compensation to be made for accidentally causing a death than where the killing was an act of villition; and in the laws of the Norman, Henry I, son of the Conqueror, there is a general provision that "one who does amiss unknowingly is free of guilt." The common-law crimes against private proprietary rights were those involving destruction of property, as arson, and those depriving the owner of its possession, as theft. The former was a capital crime and the latter, the perpetrator being of the age of puberty, and the property taken being above a few shillings in value, was also punishable with death. Thus burning of a domicile, strictly speaking, is an injury to the person of the owner, being regarded as an attack on his life. The commission of larceny in the night (burglary), or with accompanying violence to the person of the victim (robbery) were aggravated forms of the offense, justifying the summary killing of the offender. Land, under the feudal system, being held in tenure of the king or lord, and not owned, was not susceptible to theft; anyhow, a thief could not conveniently carry away an earl's lord or even a farm. Yet this insusceptibility of real estate to appropriation by larcenous taking was extended to the appurtenances thereof. So, while it would be a larceny to steal a sheep from the fold or an apple from the tree, these things being chattels, one might carry away any part of a house, or even jack up and remove the entire structure, without committing a theft at common law. The principal crimes against the government mentioned in the early laws were: plotting against the king's life or the harboring of exiles whom the king might suspect as a lord, fighting in the king's house or breaking the king's peace in tumult and riot; also contempt and disobedience of lawful authority, especially by public officers, possibly the basis of the law of impeachment for maladministration of the oath of fealty to the sovereign and making head against him with force of arms was treason and rebellion, severely punished when unsuccessful. Of crimes against public justice, perjury is several times mentioned, and of offenses against the police power "conning" is attended to at a very early date. Usury originally was an offense under the canon law of which the ecclesiastical courts took cognizance exclusively, until a compromise was made between the king and the bishops and embodied in act of Parliament (15 Edward III, Chap. 5), the usurers dead belonging to the king and alive to the bishops. Usury was finally declared a thing unlawful (by 37 Henry VIII, Chap. 9), repealed in the time of Edward VI, being rendered in 1765 (11 Geo. III, Chap. 8). The law of 25 Edward III, St. 9, Chap. 1, is still the standard act on which law of treason is based. In fact, by the end of the reign of this monarch (1377), we find the criminal law of England practically complete, in outline, with respect to its substantive provisions as well as with respect to the organization of the courts and their procedure. The King's Bench had obtained a much more than supervisory jurisdiction over the County Court and when the king's judges came into a shire their jurisdiction in criminal cases was practically exclusive. The County Courts, no longer the Folemoot, and the Quarter Sessions twentysix magistrates. Twenty-three of these were tried to form a grand inquest, or jury, of which 12 would constitute a quorum, while the whole body, the custodian of the rolls—custos rotulorum. Shakespeare shows the wisdom of the law when he permits Robert Shallow, Esq., in the county of Gloucester to call himself "justice of peace and coram, aye, and cust-alorum," titles which the popular wit of a later age has further travestied and transmuted into "high cockalorum." Criminal prosecutions by private appeal continued in vogue, however, long after the institution of grand juries and pleas of the crown. In 1482 the judges of all the benches unanimously directed that one indicted for murder shall not be prosecuted at the King's suit for a year and a day; every indictment was to be stayed until the suitor had his opportunity to prosecute his appeal to trial by battle. This remarkable piece of judicial legislation was repealed by statute (3 Henry VII, Chap. 1) which provided that because "the party is innocent" at the beginning of the year and at the end of the year all is forgotten, indictments for murder shall be tried at once, but acquittal was no bar to a private suitor's appeal. This form of action, however, fell out of use, though an appeal for murder was instituted as late as 1818. Notice of a appellant declining to fight, and in the following year (59 George III, Chap. 46) private prosecutions of criminal offenses were definitively abolished. When an accusation presented by the officers of the crown has been endorsed by the grand jury a "true bill" it becomes a writ. A majority of not less than 12 jurors is necessary to a finding, hence the practice of drawing 25 men to the grand jury, so that 12 may be the smallest possible majority. The indictment derived its preciseness of form from the appeal, on which it is modelled. As a variance between the statement made by the appellee to the coroner and that made to the judges was fatal. The same strictness of rule applies to the indictment. The requisites of an indictment at common law were: the "writ," which was important as showing whether an action was brought in the proper jurisdiction; the "statement," which sets out all the ingredients of the offense charged; the "conclusion" which was merely a form, of no importance whatsoever, and is now generally omitted. In other respects a modern indictment does not differ greatly from one of the earliest times. A history of the criminal law in England leads through a maze of refinements in special pleading and of capricious and casual legislation. The many definitions of crimes, made at various times (within the last 150 years), past, naturally were not always consistent, while the subtleties and technicalities of the special pleading were often ridiculous. Many of the rules of pleading were, in effect, legislative acts as Chief Justice Coke's specification of the three degrees of intentional crimes in various forms, as of absolute certainty,
reasonable assurance, and betwixt and between. Practically the same in effect as an act of Parliament, also, was Sir Matthew Hale's doctrine that with respect to theft, one who carries stolen property from place to place goes on stealing it in each place he takes it to, so that he may be indicted in every county to which he conveys it. The ancient theory of trial by the vicinage was carried so far that, if a man received a fatal wound in one county and died in another, the slayer was indictable in both. This was regulated by the statute of 2 & 3 Edward VI (Chap. 24, 1548); but many other and quite as serious abuses were permitted to continue. There was no limitation of time in which a criminal action could be instituted. Eugene Aram was convicted and executed 20 years after the murder of Clarke and Sir James Fitzjames Stephen, when a young barrister, held a brief as prosecutor where the offense charged was the abstraction of leaves from a parish register 60 years previously. An early instance of the appeal to the sycophant, as thus defined by Hale in his "Pleas of the Crown," of a man indicted for a murder in 1672. The person killed was caught in the act of adultery with the slayer's wife, and it was resolved by the world that the husband had "benefit of clergy" and, though he was branded in the hand, the court directed the executioner to "burn him gently, because there could be no greater provocation than his." Beginning with the 19th century in England and even earlier in America, the rigor of the substantive law relating to crimes and penalties and the intricacies of criminal procedure became the subjects of ameliorative action and simplifying regulation, by legislative enactment and, in less degree, by judicial rulings. But until quite recently the unwritten law covered: principles relating to extenuation and justification of criminal acts; the definition of murder, manslaughter, assault, theft, including larceny by trustees and bailees, and by fraud; forgery; perjury and libel; and the whole law of procedure. With some extent, this unwritten law has been reduced to statutory form, particularly since the middle of the last century, but systematic codification has been carried out in only a few places and hesitatingly. The 'Penal Code' and 'Code of Criminal Procedure,' prepared by David Dudley Field and others under commission from the New York legislature, lay neglected for a generation before they were adopted. These have since found acceptance in other States; and in still other States and also in the Federal Congress, more or less systematic revisions of the statutes relating to crimes and procedure have taken place. The 'Draft Criminal Code' prepared by Sir James Fitzjames Stephen in 1876 and introduced in the British Parliament the following year, after rejected by Sir Robert Peel, Blackburn, Justice Barry, Lord Justice Lush and the author, has been gathering dust in committee ever since. In his draft the substantive law and procedure are treated as an inseparable unit, because of the inter-relation of the two parts. The division of the whole body of criminal law into substantive and remedial law or procedure is natural, however, and in accordance with the plan followed by all modern codifiers and analytical writers from Beccarria and Bentham to the end of the alphabet. Thomas Erskine Holland would divide the substantive criminal law itself into two parts. The first and more general part should deal with (1) the nature of criminal acts; (2) responsibility of the wrong-doer on the ground of intention or negligence; (3) facts negating responsibility, as non-age, compulsion, idiocy, lunacy or drunkenness; (4) facts in justification of acts otherwise criminal, as consent of the injured party, self-defense, provocation, the authority of a public officer; (5) a list of punishments, hard labor, whipping, loss of civic rights, liability to police supervision or pecuniary fine; (6) the period of time which would bar prosecution; (7) aiding and abetting crime; (8) criminal attempts; cumulative punishments. The distinction between felonies and misdemeanors, now become meaningless, might be superseded by a distinction between indictable offenses and others. In the second and more special part should be contained a classification of criminal acts and the penalties provided for, each act being divided into offenses committed directly against the state or the community in general, and offenses the mischief of which is fixed primarily against particular individuals. The state or community interests are served by (1) acts tending to interrupt its friendly relations with other powers, under which head would be included our Federal laws against " filibustering" and the like; (2) acts tending to subvert the government, as treason and rebellion; (3) acts tending to the subversion of the liberties of the citizens; (4) riots and other offenses against public order; (5) abuses of official position; (6) resistance or disobedience to lawful authority; (7) obstruction to the course of justice by perjury or the falsification of documents, or by the rescue or harboring of defenders; (8) offenses relating to the coinage or to weights and measures; (9) acts injurious to public morality, as bigamy or adultery; (10) acts injurious to the public health, such as non-compliance with ordinances to prevent the spread of epidemics or the maintenance of nuisances. The wrongful acts primarily affecting individuals may be classified as follows: Violence to the person in various degrees of homicide, or by wounding, rape, assault or imprisonment; (2) defamation of character, libel, etc.; (3) offenses against family rights, such as the abduction of children; (4) offenses against possession and ownership, such as theft or embezzlement or the willful destruction of property, as by arson; (5) forgery and breaches of contract of a kind likely to cause social inconvenience; (6) fraudulent misrepresentation and swindling. The rules whereby the machinery of courts is set in motion for the punishment of offenders, and classified under the head of criminal procedure, usually are of two kinds: (1) Legal proceedings for the trial of serious crimes have been described in the historic part of this article. A simpler form of proceeding is by summary process before a minor magistrate or even an administrative or police official. This method is applicable only to trilling transgressions, unless the accused should consent to this manner of disposal in a matter of greater consequence. Many of the offenses over which minor magistrates exercise summary jurisdic-
tion consist in the breach of statutory regulations to prevent petty nuisances, or of ordinances passed by municipalities or other public bodies, under legislative authority, or to enforce the execution of administrative measures of public importance. Among the latter are provisions, subjecting parents to fines for not sending their children to school, numerous punitive ordinances for violations of regulations of boards of health, of traffic rules made by the police, building regulations, etc. These make an increasingly important part of our legal system and are too characteristic of modern tendencies to be passed over even in a necessarily brief survey of the penal law. They defy classification and a bare allusion to them, in order to round out this article, must suffice. See CRIMINOLOGY; BURGLARY; BIGAMY; JURISDICTION; HOMICIDE; COUNTERFEITING; PERJURY; LIBEL; RAPE; MALICIOUS MISCHIEF; TREASON; PENLOGY.

STEPHEN PFEIL.

CRIMINAL SOCIETIES. See SOCIETIES, CRIMINAL.

CRIMINOLOGY is the scientific study of crime and the criminal. It is not one of the fundamental sciences, but is a hybrid product of several sciences. Zoology, anthropology, history and sociology furnish the facts for a description of the nature, origin and evolution of crime. Meteorology, demography and the special social sciences, such as economics, politics, etc., contribute to the analysis of the environmental causes of crime. Anatomy, physiology, psychology and psychiatry furnish the facts and methods for the study of the traits and types of criminals. Comparative jurisprudence and law contribute to the study of the penal treatment of the crime and the criminal.

The subject matter of criminological science may be grouped into the following principal branches:

The study of criminology has great sociological significance and practical value. It furnishes one of the most striking illustrations of the relation between the individual and society and of the conflict between individuals and social interests. Punishment is, in the most drastic form of social repression, and criminology is essentially a study of social control. Consequently, criminology and ethics are closely related, and the study of crime and the criminal involves the discussion of numerous ethical problems of great social importance and scientific interest.

Equivalents of crime are to be found among animals. The mammals and birds share many of the instincts and feelings possessed by man. In each of these animal species, species-specific customs arise which in the long run aid the survival of the species. Acts which are contrary to these habits and customs will usually be injurious to the species, and therefore are rejected by members of the species. The study of the primitive peoples has shown that violations of customs constituted some if not all of the primitive crimes. In most cases the laws of the higher stages of social evolution have developed out of the customs of the community, and even down to the present day changes in the laws are determined mainly by changes in the customs. Other forces which have influenced greatly the evolution of crime have been magical practices, religious beliefs, public opinion and moral ideas. Some of the primitive crimes were treason, witchcraft, sacrilege, incest, poisoning, breaches of the hunting rules, etc. These offenses were punished sometimes through private vengeance, in other cases by means of penalties inflicted by the primitive community, such as death, banishment, etc. As civilization developed, government as an organized mechanism of social control came into being. The written law now specifies the acts which are to be stigmatized and punished as criminal, and thus gives formal expression to the customs and beliefs of the civilized community. Private vengeance has been gradually eliminated, and the government now exercises its police powers by imposing the penalties prescribed by the law through an elaborate system of courts, prisons, etc. Thus a crime in a civilized community may be defined as an act which is forbidden and punished by law, which is almost always immoral according to the prevailing ethical standard, which is usually harmful to society, which it is ordinarily feasible to repress by penal measures, and whose repression is necessary or is supposed to be necessary to the preservation of the existing social order.

Cosmic and Social Factors in Crime.—The forces in the environment which give rise to criminal conduct are many. Climate, season and the weather have a good deal of influence upon crime. Many statistics have accumulated which indicate several definite correlations between these telluric conditions and the extent and character of crime. As a
general thing, crimes against the person increase with a rise in temperature. Crimes against property, on the contrary, usually decrease with a warmer temperature and increase as the temperature falls. Atmospheric pressure, winds, humidity and other meteorological factors also have a discernible effect upon criminal conduct. But all of these factors have incidental influence, an influence in greater indirect influence, namely, through their influence upon industrial and social conditions. Economic activities are determined to a large extent by climatic and seasonal factors, and these activities determine the incidence, the extent, of crime. Crime has increased more rapidly than any other occupational conditions. The struggle for existence for mankind has assumed, to a large extent, an economic form. It has become a struggle to obtain the commodities needed and desired within the system of production based upon the division of labor and exchange. Most of the criminal activity, therefore, arises out of the economic struggle, while all of it is conditioned by the economic environment. The influence of economic factors in the determination of crime may be studied in at least four ways. In the first place, fluctuations in the extent of crime may be correlated with economic changes. In the second place, the economic crimes, namely, the crimes in which economic motives are predominant, may be studied. In the third place, the economic status of criminals, namely, their position with respect to the distribution of wealth and occupations, may be studied. In the fourth place, professional criminality may be studied.

The results from such studies are varied and complicated and sometimes rather conflicting. A few of the outstanding facts, however, may be summarized. As a general rule, crimes against property increase with a rise in prices or with a fall in wages. Changes in prices and wages affect materially the economic welfare of the vast majority of the population. So that there is, apparently a causal relation between economic welfare and crimes against property. The analysis of statistics of crimes shows that the so-called economic crimes, the crimes which economic factors predominate, constitute from two to three-fifths of the total number of crimes. Furthermore, economic factors play a part in the causation of many of the other crimes. Economic motives are predominant in many of the personal crimes. A disproportionate number of criminals come from the poorer classes and from the occupations of the poorer classes. The study of the careers of professional criminals reveals the fact that it is economic pressure early in life in the form of a struggle for subsistence or for a higher standard of living, and resulting usually in inadequate intellectual and moral training and association with bad companions, which leads many of these professional criminals into their first crimes.

But the economic forces are not the only factors of the social environment which influence criminality. Political conditions have much influence upon crime. Inefficient and corrupt government encourages greatly the incidence of crime. But efficient government discourages crime, especially if it adopts and carries out successfully far-reaching measures which remove some of the economic and other causes of crime. In fact, according to those who take the socialistic point of view, the extent of crime depends very largely upon the nature of the political organization of society.

Religion, science, art, the press, education and many other factors of our modern civilization have their influence either for or against crime as the case may be. A rapid increase of population tends to increase criminality by accentuating the economic pressures. In fact, some criminologists have believed that the advance of civilization in general has increased crime. Comparative statistics of crime have furnished some evidence that this is true. If so, it is probably due rather to the fact that life has become much more complex and that ethical standards have risen, thus resulting in stigmatizing many more acts as criminal. But this apparent increase is probably due in part to the fact that the law is being enforced much more rigorously now than it was in the past. The modern forces of criminality are to be witnessed in an accentuated form in the cities. Criminal statistics reveal a great preponderance of crime in the cities as compared with the rural communities in the country. The increase of population has created new conditions in which more regulations are necessary to harmonize the conduct of individuals with each other. Much of urban criminality is due to violations of ordinances. The streets, roads, sidewalks, factories, sanitation, etc., which are unnecessary in rural communities. The complexity of the urban environment makes it difficult for social groups to function normally. Persons weak in mind or character find it particularly difficult to adjust themselves in the city. Furthermore, many kinds of crime can be committed only or best in cities, such as pickpocketing, some kinds of burglary, blackmail, embezzlement, forgery, fraud of various kinds, etc. It is also more feasible for the criminal to live and hide himself in the city than in the country. Most of these forces which accentuate urban criminality also increase urban vice.

Individual Factors in Crime.—Many of the causes of criminality are to be found within the criminals themselves. Lombroso gave excessive weight to these traits. As a result of his anatomical and physiological studies, he formulated his theory of the "born criminal." He found certain malformations of the skeleton and other abnormalities in the physiological processes unusually prevalent among the criminals he examined, and arrived at the conclusion that they constituted the traits of a distinct biological and anthropological type which is prone to become criminal. He also concluded as a result of a study of the equivalents of crime among animals and among primitive men and of the traits and conduct of children, that this congenital criminal type is to a large extent an atavistic type. Lombroso seems to have been rather ignorant of the modern science of biology, and especially of the theory of heredity. Biologists recognize that atavism, or reversion, takes place when there reappears in an individual a trait of an earlier type, provided that the earlier type of trait is due to hereditary forces. That is to say, if primitive, traits which have long remained dormant reassert themselves in the germ plasm at the time of conception, there is a true case of reversion. But a perusal of Lombroso's writings shows that many of the
criminal traits which he calls atavistic are not hereditary in their origin, but are cases of arrested development either before or after birth. In other cases he characterizes as atavistic. So they have been transmitted by social agencies. In fact, Lombruso's exposition of his theory of the born criminal indicates that he probably believed in the hereditary transmission of acquired traits, though he nowhere explicitly states his opinion on this point. But he again and again speaks as if habits, or the effects of habits, are transmitted by hereditary means. The consensus of opinion among biologists to-day is that no acquired traits can be transmitted by hereditary means. It is obvious that there can be no "born" criminal in the literal sense of that term. No person is a criminal in the strict legal sense until he has committed a criminal act, and no one could commit such an act until several years after birth. Furthermore, no person is predestined from birth to become a criminal on account of his congenital traits, because criminality depends in part upon environment and social status.

So that the theory of the born criminal must be extended to the limits of social life, and it is futile to attempt to identify a criminal type solely by means of anatomical and physiological traits. The study of these external, physical traits is of significance only when correlated with the internal traits, namely, the mental traits.

The physical basis of mind is neural. All of the mental phenomena, namely, the instinctive, the affective and the intellectual phenomena, take place through the agency of the nervous system. The instincts function, in the first place, because stimuli from sense organs pass over nerve fibres to the central nervous cells which constitute the centres for the instincts in the central nervous system. These centres are probably located mainly in the spinal cord, the medulla and the cerebellum. The instinct function in the second place, because impulses are sent out from these centres and travel over nerve fibres to the muscles which perform the instinctive acts. Feelings are possible only when nerve fibres are excited, and they arise mainly as a result of stimulation of the sympathetic nervous system. The intelligence is localized in the association areas of the cortex of the brain. Consequently, inherited variations in the nervous system may give rise to exceptional strength or exceptional weakness of some of the instincts and feelings. In similar fashion, use or disuse may lead to acquired variations which may in turn result in the accentuation or inhibition of instincts and feelings. It is doubtless true that some persons are born with traits which make them prone to commit crimes if their environment is conducive to criminal conduct, and a portion of the criminal class is recruited from this group. Thus abnormal variations may take place in sensory, motor, and central nervous organs which make certain instincts stronger or weaker. Or variations may take place in the cortex of the brain which weaken the intelligence. Some of these variations are hereditary. But many of the anatomical and physiological traits which are abnormal from the time of birth are more likely to be due to irregularities in the development previous to birth, such as are due to pressure on the brain, ill-nutrition, etc., which have been transmitted by social agencies. The consensus of opinion among biologists to-day is that no acquired traits can be transmitted by hereditary means.

The excessive strength or weakness of some of the instincts furnishes a powerful impulse toward crime, or removes a powerful restraint which acts upon most persons. In similar fashion, the excessive strength or weakness of some of the feelings furnishes a powerful impulse toward some kinds of criminal conduct, such as crimes of passion, or removes the restraint from certain other kinds of criminal conduct. The weakness of the intelligence makes it difficult or impossible for the amenable or feeble-minded person to understand the nature of or the justification for the regulations and restrictions imposed upon him by society. Owing to these abnormalities, the individual does not succeed in adjusting or adapting himself to social life. Some kind of rent in the fabric of the society to which he belongs. Recent investigations indicate that in all probability a minimum of 5 per cent of criminals are aments, and that there are probably at least 10 times as many aments proportionately among the criminals as there are in the population at large. It is even more difficult to estimate the number of psychopathic criminals. Among these are the demented, the insane and the neurotic criminals. Dementia precox characterizes some of the younger criminals, Manic-depressive insanity and paranoia are more or less prevalent among the insane criminals. Epilepsy characterizes some criminals. Hysteria, neurasthenia and psychasthenia are other nervous which are found among criminals probably much less frequently than epilepsy. Bad habits, such as alcoholism and drug habits, excessive suggestibility, mental conflicts and depressions, etc., are other abnormal traits which give rise to criminality or at least aggravate it.

There is, therefore, a clear and fast line between the different criminal groups. On the contrary, there is an almost infinite degree of gradation between the different types. This extensive gradation is due, on the one hand, to the large amount of variation in the traits of individual criminals, and, on the other hand, to the great variety of circumstances under which crimes are committed. However, the following is an accurate and useful classification of the principal types of criminals: (1) The criminal ament or feeble-minded criminal; (2) The psychopathic disjoint; (3) The psychopathic criminal; (4) The occasional criminal, (a) The accidental criminal, (b) The criminal by passion: (5) The evolutive criminal; (6) The political criminal. The distinctions of age and of sex are of importance in the study of the criminal. The criminal traits of the young are of significance not only for their own sake, but also because of the light their study throws upon the corresponding traits of adults. Many criminal careers begin in childhood or early youth. And even with a criminal career begins after maturity has been attained, the experiences and influences of early youth frequently aid
in explaining the later criminality. Criminal statistics indicate that criminals are astonishingly precocious. The criminality seems to be higher relatively at about the time maturity is reached than at any other age period. Furthermore, there is some reason to believe that juvenile crime has been increasing rapidly in civilized countries during the last few decades. Consequently, it is important to study poverty, parentage and home life, education, recreation, immigration, etc., in relation to juvenile criminality. Criminal statistics indicate a great preponderance of male over female criminality. In fact, in some civilized countries there is from four to six times as much male criminality as there is female criminality. But this difference is in part misleading. In the first place, woman is favored in the repression and treatment of crime, thus lowering somewhat the statistics of her criminality. In the second place, there are many more extra-judicial female crimes than there are extra-judicial male crimes, because manslaughter, etc., is more complicated and which are more difficult to detect than overt crimes. In the third place, prostitution serves in a measure as a female equivalent of crime. In so far as female criminality is actually less than male criminality, there is a considerable moral difference between the sexes. It is due in part to the physical disabilities of woman which restrain her from committing certain kinds of crime. But it is due mainly to the fact that woman is very largely shielded from criminality by her secluded life in the home. Consequently, it is to be expected that as woman's position becomes more like that of man human criminality will increase, and the available statistics seem to indicate that her criminality is increasing as she is attaining a greater degree of economic independence. Criminal law and procedure, the fundamental objects of punishment, penal responsibility, the principle of the individualization of punishment, the indeterminate sentence, suspension of sentence, probation, etc., are described under the title, C R I M I N A L L A W.

Modern Treatment of the Criminal.—The statistical method is very useful in criminological research and is ancillary to all of the other methods. It is of great utility in the study and analysis of the causes and conditions of crime and has great value for measuring the effects of the different kinds of penal treatment. Unfortunately governments have not usually collected as many or as reliable criminal statistics as would be desirable. Especially true is this in the United States. In some of the States scarcely any of these statistics are gathered, while there is no adequate system of collecting and publishing statistics of crime as a national problem. So far as we can judge from the statistics available in the leading civilized nations there has been an increase of crime during the past few decades. It is, therefore, concluded by some persons that civilization has had a harmful effect. However, it has been possible in the past few decades. Further, more, owing to the increase in the complexity of human life due to the progress of civilization, the category of criminal acts has been greatly extended so that it is possible to commit a much greater variety of crimes now than has been possible in the past. Furthermore, owing to the increase in the efficiency of government, many of the old criminal laws are enforced now much more rigidly than in the past. The apparent increase of crime in modern times in civilized countries is doubtless due in part to these two factors, and may be entirely due to them. The most drastic form of penal treatment is death. Capital punishment is much used in the past. It is little used to-day in civilized countries. Owing to the modern humanitarian movement, which has enhanced greatly the value of human life in the popular estimation, there is much effort to reduce capital penalty, and it will probably disappear entirely in course of time. Imprisonment is the characteristic modern penalty. It very largely superseded transportation during the 18th century. At first, prison life was usually congregate and no work was provided. The physical conditions were very unsanitary and the moral atmosphere very corrupting. During the 19th century the physical conditions were much improved. Cellular confinement was introduced and in many prisons was made compulsory, which was usually imposed. But even after these changes were effected, prison life was far from beneficial for the inmates on account of its rigid and artificial character. During the latter half of the 19th century the idea of making reform came prevalent in prison reform and resulted in the construction of reformatory and reform schools for the younger criminals in which these criminals could be educated and trained as well as punished. This idea is being extended more and more to other classes of criminals and is pervading the management of prisons in general. The ideal of penal treatment now is to develop a system of penal institutions in which a suitable place will be provided for each type of criminal. Such a system will include reception and observation prisons, reformatory institutions, and farm colonies, asylums and penitentiaries for incorrigibles. In this system the principle of the individualization of punishment would be applied, and the data and scientific principles of criminology would be fully utilized. Crime can never be entirely abolished, but it can be prevented to a certain extent. The program for the prevention of crime is included very largely in the program for the prevention of poverty and evil. It is more difficult to rise to crime. Criminology can aid greatly in the prevention of crime by revealing how these social evils give rise to crime.

nalpsychologie und Strafrechtliche Psychopathologie auf naturwissenschaftlicher Grundlage; Tarde, ‘Penal Philosophie’; Wulffen, ‘Psychologie des Verbrechers.’

Author of ‘The Science of Human Behavior’; ‘Criminology’, etc.

CRIMP, an agent who for a commission supplies ships with seamen, the term being applied especially to low characters who decoy sailors by treating them, advancing money to them on giving them goods on credit, till they have them in their power, frequently getting them shipped off in a drunken state after all their money is spent. They also keep an outlook for emigrants, and take them to low lodging-houses, in which they themselves are interested. There are laws protecting seamen from the extortion of crimps and their dealings with masters of vessels, but these are unable to reach a very large proportion of cases.

CRINOID, krī'nev, or SEA-LILY, a stalked echinoderm usually fixed to the sea-bottom by a jointed stem so as to present a flower-like form. The body is more or less cup-shaped, with 5 to 40 jointed flexible arms subdivided into branches, and bearing pinnules, all made up of minute bony plates, which in some of the larger fossil species numbered over 150,000. The arms may be absent in the blastoids (Pentremites) and certain cystoideans, but the pinnules remain. There are not now many existing species, the greater number (nearly 1,000) having become extinct. A typical crinoid is Pentacrinus, which lives attached to rocks in the West Indies at all depths from 20 to 3,000 fathoms; it is about a foot high, the arms much subdivided, the joints of the stem five-sided. In one fossil species the stalk was more than 50 feet long. In geologic times crinoids often grew in dense flower-like masses. A curious little living crinoid is a slender simple form about two inches high, which lives at the depth of from 100 to 1,000 fathoms on the coast of Norway and in the Straits of Florida in the cold water under the tepid Gulf Stream. It is a survivor of a genus of the Cretaceous Period. A north Atlantic shoal-water form is the Antedon (Comatula), which in its early youth is fixed to the bottom by a stalk, but which becomes free when mature; it also inhabits the Mediterranean Sea. The existing crinoids, more than 200 species, are merely the remnants from a much larger assemblage of fossil forms, which begin to appear in the rocks of the Cambrian, culminate in the early Paleozoic and decline toward the end of that period. At first small and delicate, they became larger and coarser in the later rocks. They flourished in greatest numbers about paleozoic coral reefs in shallower water than at present. The most famous American fossil crinoid beds are those of the Subcarboniferous limestones of Burlington, Iowa and Crawfordsville, Ind. Thick beds of crinoid facies are known in various parts of the world at various periods and under favorable conditions from the Ordovician to the Jurassic Period, those of the Carboniferous and of the upper Muschelkalk, the lower beds forming the so-called Trochitenkalk, being especially characteristic almost of all the basins of the world. The stems of Eucrinus bifurcatus, the ‘stone lily’, Crinoids are divided into three classes. The oldest, most generalized and primitive appears to be the class Cystoidea. These were more or less spherical in form, either with imperfectly developed arms, or without, and stalked or not. About 250 species date from the Cambrian Period, culminated in the Ordovician and Silurian Periods, then suddenly diminished in numbers, finally disappearing before the close of the Permian. The second class is the Blastoida, or bud-shaped crinoids, represented by Pareolithia, which were short-stemmed or entirely stemless. The arms are short, recumbent and appear as if soldered to the calyx or body. These have not yet been detected in strata lower than the Silurian and the type became most numerous in the Subcarboniferous limestones of the United States. Upward of 120 species have been recognized. The third class is Crinacea proper. The three classes are arranged under the sub-branch, Feimatozoa. New species are constantly being found, notably in the waters off Africa and the Hawaiian Islands, and a few along the Atlantic Coast of the United States. Consult Clark, A. H., ‘A Monograph of Existing Crinoids’ (United States National Museum Bulletin 82, Washington 1915); Proceedings of the United States National Museum, Vols. 34 onward; Zittel, K. A. von (Eastman’s trans.), ‘Text-book of Palaeontology’ (London 1900–02).

CRINOLINE (Fr., from Lat. crinis, hair), properly a kind of fabric made chiefly of horsehair, but generally applied to a kind of petticoat supported by steel hoops, and intended to sustain or give a certain set to the skirt of a lady’s dress. Hooped skirts are by no means a new invention of fashion, a somewhat similar monstrosity, supported by whalebone, being worn in the time of Queen Elizabeth and James I, and the fashion being again introduced in the time of George II. The earlier hooped petticoats were called fardingales or farthingales. The crinoline proper came in about 1856, and was worn by women of all ranks, and sometimes reached portentious dimensions, so that they could not cross the street without assistance from other persons carrying a pole to support the weight and all coming in contact with her, but also the cause of accidents from fire, etc. The immense bell-shaped crinolines fell into disuse about 1866. Crinoline wire was for years a leading branch in the steel trade. A horse-hair and cotton fabric used as a material for making ladies’ bonnets is also called crinoline.

CRINUM, krī'num, a genus of bulbous-rooted herbs of the family Amaryllidaceae. The numerous and widely distributed species are characterized by rather broad, usually persistent leaves, and umbels of few to many funnel-shaped flowers, often deliciously fragrant. The flowers are usually pure white, with bands of purple or red, or tinted throughout with one of these colors. Several species are widely popular as greenhouse specimens and in the warm South and California as outdoor subjects on lawns. C. americanum, the Florida swamp lily, is common in wet ground in the Gulf States. C. longifolium and C. moorei are somewhat hardy, the former as far north as Washington, the latter not quite so far. Both these species bloom continuously throughout the summer; the others generally have a short season of bloom. More than 20 species with many horticultural
CRINOIDS

1. *Metacrinus angulatus*
2. *Pentacrinus Maclearanus*
3. *Pentacrinus Wyville-Thompsonii*

varieties are cultivated in American gardens and greenhouses. They differ widely in their demands as to cultivation, for an account of which, and also for a description of the popular species, consult Bailey, 'Cyclopedia of American Horticulture' (1914).

CRIPPLE CREEK. Colo., city and county-seat of Teller County, on the Florence and Cripple Creek and the Midland Terminal railroads, Supplies west of Colorado Springs. It is the trade centre for the Cripple Creek mining district, in which the output of gold from 1890 to 1916 was $301,000,000. The town has several cyanide mills, smelters and other mining industries, a national bank and daily and weekly newspapers. It was founded in 1890, and was nearly destroyed by fire in 1896. Several great labor strikes have taken place here. The Roosevelt Drainage tunnel opened in 1910 has greatly increased mine values by unwatering the field which covers an area of nearly six miles, one-tenth of which alone has been developed. Pop. 6,206.

CRIPPLED CHILDREN. See CHILDREN, DEFECTIVE.

CRISSES. Economic. Crises are periods of financial or commercial and industrial depression or disturbance, distinguished by sudden and general efforts to liquidate, by scaling down of prices, by restriction of credit and by widespread failures, insolvencies and bankruptcies. The words crisis and panic are used interchangeably, though the former is the more nearly correct term denoting the period during which industry changes from a state of prosperity to one of depression. The word panic more fittingly describes a briefer period, or an acute phase not always appearing in crises, during which the morale and judgment of the business community are seriously upset by fear of impending trouble. Lord Overstone has described the sequence of phenomena known as a "business cycle" as follows: "State of quiescence, improvement, growing confidence, prosperity, excitement, overtrading, convulsions, prostration, stagnation, distress, ending again in quiescence." The period of expansion of business, accompanied by increased activity in production and commerce, known as "good times," is followed by a period during which, owing to rapidly advancing prices of materials and labor, some enterprises find their profits considerably reduced. Accordingly they contract their operations, dispense with a portion of their workmen, restrict their purchases of raw materials and thus affect adversely the industries supplying the materials and encourage upon the ability of the workmen to continue their former scale of living. There is a consequent decline in the demand for general commodities and the curtailment extends in ever-widening circles until the whole business system is affected. One of two crises may be anticipated; a suspension and general disaster follows, panic rules and total collapse seems imminent. The recovery is slow, a period of stagnation or depression follows, during which business is at its lowest ebb, prices are stagnant, distress, ending again in quiescence, restored, considerable time has elapsed. Business then begins to improve and expand, prices begin to soar, activity increases, and another period of prosperity is at hand, good times prevailing until again checked by a new crisis. A depression of business need not constitute a crisis but may be only a period during which business and commercial activities are below the normal standards; a depression may exist independently, but usually follows a crisis.

Many reasons have been advanced for crises but the actuating causes are never twice alike, one crisis being caused by the failure of some great firm or firms, another by war, another by monetary legislation, another by stock market speculation, another by bad harvests, another by over-expansion of world commerce, another by a change of a nation's political policies, which may cause investors to become timid and reluctant to loan their capital to enterprises that may not receive the protection through national economic policies considered necessary and adequate to their stability and success. A century or two ago local distress might have been caused by crop failures or some other calamities, and panic might have been induced by such wild-cat adventures as the South Sea and the Mississippi Bubbles (qq.v. See also LAW, JOHN), but these events had not the far-reaching effects characterizing modern industrial disturbances and, therefore, are not worthy of notice, as they are practically 19th century phenomena. Some assert that capital forms more rapidly than fields wherein to invest it safely and profitably and as profits decrease capitalists are liable to make investments of an unusual or hazardous nature, resulting in the total loss or destruction of capital and the consequent general alarm and crisis. A theory advanced by Ricardo and elaborated by Rodbertus is the "iron law of wages," under which the laborer does not receive all he produces either in the commodity produced, in a commodity of corresponding value which he may need, or in an equivalent wage, but receives a sum so small as to place him under the necessity of continuing his work of reproduction in order that he may not starve, thereby maintaining the supply of labor. The capitalist takes the difference between the laborer's wages and the selling price of the commodity and, being unable to spend the total amount and anxious to increase his power or the earning capacity of his surplus wealth, converts it into capital through investment. Thus capital increases more rapidly than the laborer's ability to purchase, resulting in a so-called over-production, though the Socialists insist that this actually is an under-consumption. Ultimately this results in an industrial disaster.

Much space is devoted by economists to the subject of credit and its abuses as a cause of crises. The extensive obligations contracted during normal times to conduct business enterprises are based largely on physical assets and partly on the faith of the lender in the ability, character and integrity of the borrower. Such obligations are usually of indefinite maturity, though the loans are mostly for a short time only, and the borrower may be called upon to liquidate his indebtedness quickly. Good times may mean easy money and the unwary capitalist may loan his money to inexperienced, incapable, oversanguine, or speculative companies. One of the results of easy money is the tendency of those in charge of business enterprises, on obtaining a loan, to divert the funds to other than immediate actual requirements. During periods of depression production is curtailed
and often discontinued entirely, wherefore stocks of goods become depleted. On the return of confidence and the renewal of activity, through the resumption of buying by the public, the manufacturing plants experience difficulty in filling orders and their owners or managers therefore borrow money or put down their working capital to remodel and extend their plants or to purchase extra equipment or for some other form of fixed asset. Often large sums are invested merely in anticipation of future increase in demand and production, mills and railroads being excellent examples of such preparations for future prosperity. Usually this work is carried too far; the means of production outstrip the demand for goods; the ratio between current assets and liabilities is reduced; and such enterprises, with impaired working capital, are liable to insolvency when trade depression sets in. In order to prevent the disruption of industry through the over-extension of credit there must be some means to safeguard the granting of short time or indefinite credits and to check speculation that will allow a large portion of these loans to be liquidated safely within the brief period of a panic. The usual safeguards are the credit reports of the mercantile associations, the registry of commercial paper and the demand for audits by certified public accountants. The facilities for quick liquidation have been extended by the Federal Reserve system of banks. See CREDIT; CURRENCY; BANKS AND BANKING—FEDERAL RESERVE SYSTEM.

Cries have been confined practically to western Europe and to the more advanced American countries. In the United States the most notable crises have been those of 1819, 1837, 1854, 1857, 1873, 1884, 1893 and 1907. These were nearly coincident with crises occurring in England, and the crises of 1836–39, 1857 and 1873 may be called international in extent. Prior to and during the War of 1812 there had been much wild-cat banking and the country was launched on a paper money era, the banks being unable to secure specie sufficient to redeem even a small portion of their paper. In 1814 Congress refused a charter to a proposed national bank and people began to lose faith in banks and to withdraw their money. Banks in the South ceased to redeem their notes and on 28 Aug. 1814 the Philadelphia banks suspended specie payments, followed by others in the North and in Ohio, until every bank in the seaboard States had taken similar action. But by threats and legislation the State and Federal government compelled these banks to resume specie payments which the majority had done by the latter part of 1817. Meanwhile in 1816 Congress had established a bank of the United States to regulate the currency. On the conclusion of the war foreign trade began to revive and vast sums of money; in 1814, while the blockade was in force, the imports were valued at $12,965,000 and exports at $6,927,441, but in 1815 these figures had risen to $113,041,274 and $52,557,753 respectively and in 1816 to $147,101,679 and $81,929,452. Furthermore, during the blockade, when commerce was practically at a standstill, the merchants transferred their capital to manufacturing establishments and when the lifting of the blockade resulted in a vast influx of foreign made goods, protection was demanded for the industries, resulting in the enactment of a protective tariff in 1816 (amended in 1818). Meanwhile in 1815 a commercial convention had been concluded with Great Britain, under the terms of which each country was to regulate, as it saw fit, its trade with British North American and Western Indian possessions. In retaliation for a supposed discrimination against them in American regulations, the merchants of Nova Scotia and New Brunswick secured the passage of the "Plaster of Paris" Act which prevented the transportation of this article in American vessels. In the same year Great Britain then excluded American ships from the West Indies and as these acts rendered idle 100,000 tons of American shipping, the shipping interests were prostrate, all allied trades languished, and thousands of mechanics were thrown out of work. In 1811 steamboats had been introduced on Western waters and capital and enterprise turned to the task of opening the West. Owing to the ease with which people could secure paper money from the new banks which had begun to operate and speculation in lands, the record of public land sales being 270,000 acres in 1813, 1,120,000 in 1815, 2,160,000 in 1817, 5,470,000 in 1819 and 820,000 in 1820. Everyone hastened to plunge into debt, expecting to become rich thereby, and when the banks began to reduce their specie accounts and currency began to be reduced, the debtors were unable to meet their obligations and general bankruptcy followed with its attendant hardships in all circles. There was a general depression in business. Many blamed the tariff but the greatest outcry was against the banks, both State and National, and accordingly there was a wave of anti-banking excitement throughout the country. But this soon subsided, the States enacted stay laws, prohibited imprisonment for debts less than certain amounts, passed acts against usury, and conditions became about normal in 1821.

In 1832 President Jackson became convinced that the Bank of the United States was using its funds insidiously and ordered the government funds deposited therein to be withdrawn. Since $9,891,767 in public money was on deposit, the bank was compelled to curtail its loans and could not use any of the public deposits for the benefit of the commercial community. As a result money became scarce, discounts rose rapidly and in 1833 many business houses failed. Jackson's quibble with the bank resulted, in 1834, in its failure to secure a renewal of its charter, and its career as a national institution was practically ended. Almost simultaneously the national debt was paid off and the treasury began to have a surplus, wherefore a bill was passed in 1836 providing that all but $5,000,000 of the money in the treasury on 1 Jan. 1837 should be deposited with the several States in proportion to their representation in Congress, and in order to safeguard the deposits the Secretary of the Treasury was to select the State banks for depositories. The effect of this distribution of surplus revenue among the States, with its share of both nominal capital and the floating of the country with paper money. In 1837 there were more than 600 such banks with an aggregate capital of $291,000,000, of which $149,000,000 was in circulating notes and $127,000,000 in deposits, while their total loans and discounts amounted to
$325,000,000. Wild speculation occurred, especially in land, millions of acres being bought and held for a rise. Prior to 1836 sales of land never exceeded $4,000,000 but in 1834 the receipts were $4,887,000, in 1835, $14,-757,000 and in 1836, $24,800,000. But this consisted not of specie but only of credit on the books of the banks that held government deposits. Far worse than the bank failures were the demands on their loans, to curtail their accommodations and to increase rates of interest. Owing to the crisis in England specie ceased to be imported, whereupon the price of wheat and flour rose rapidly, until early in 1837 wheat brought $2.25 per bushel and flour $12.50 per barrel, which caused several flour riots. Furthermore an abnormally large cotton crop the previous year was accompanied by a proportionate slump in prices and a consequent depreciation in the credit of those connected with the cotton industry. Soon three great cotton firms offered to buy cotton in all bales, increased importations of $2,500,000, to be followed immediately by three New York firms with liabilities of $9,000,000. By the first week in April failures in New York numbered 96 with liabilities of over $50,000,000 and two weeks later they numbered 168. Real estate, and railroad, canal and other stocks depreciated in value and thousands of workmen were deprived of employment. Prior to this time President Jackson had caused to be issued the "Specie Circular" to be issued, requiring all public land agents to accept nothing but specie in payment. This compelled the banks to redeem in specie practically their entire circulation, and as the contingency caught them unprepared, on 5 May 1837 they suspended specie payments and not until two years had passed did the last of the banks resume. Before that, however, Congress had enacted a bankruptcy law and the States had passed statutes of limitations and similar measures, so that some order began to appear out of the chaos. The most important result of the suspension was the establishment of the independent treasury system in 1840. Moreover, from 1837 to 1842 the number of banks of the country was reduced by nearly 100, circulation and deposits were cut in two, and the banks in general exercised more caution.

In 1854 came a stringency in the money market and hard times began to press upon the country. Trade was more sluggish than at any time since 1837. Money was hard to obtain and the very best paper sold at 10 and 12 per cent, some going as high as 15 per cent per month. The export of specie from the country was large. These conditions brought on a panic in Wall street in September 1854 which was followed in November by financial disasters in the West and South and the suspension of many banks and bankers. This panic and the subsequent depression were only a precursor of the panic of 1857. After a few minor failures the Ohio Life Insurance and Trust Company of Cincinnati failed on 24 Aug. 1857 with liabilities estimated at $8,000,000. This led to what was called a panic in Wall street and many brokers and bankers were unable to meet their obligations. On 25 September the Bank of Pennsylvania at Philadelphia suspended payments, to be followed soon by banks in almost every section of the country. Early in October the Illinois Central Railroad made an assignment, the New York and Erie Railroad suspended payments on its notes and the Michigan Central suspended payment on its floating debt. The prices of commodities rapidly declined, factories and workshops suspended and thousand lacked employment. Armies of workmen, desperate in their fear of starvation and poverty, paraded the streets of cities, rioting occurred in many places, and the militia was called upon to restore order. In 1857 there were in the United States and British provinces 6,022 failures, with liabilities of $282,335,000, and during the first three months of 1858 there were 1,540 failures, with liabilities of $31,733,000. The causes of the panic have been attributed to various circumstances, such as the reduction of the tariff, the speculation engendered by the influx of gold from California (which caused the belief to prevail that no undertaking was too stupendous for the fortunate nation to undertake), the enormous extension of railway lines, the expansion of bank loans and circulation, the export of specie, the importation of crops, the increase in the volume of foreign trade, the due extension of credit. During 1858 the depression continued unabated but at the opening of 1859 good times seemed to have returned. The South was prosperous, general crops were bounteous and prices were high, but in June 1859 a killing frost laid low the crops of wheat, grain, potatoes, vegetables and fruit in New York, Pennsylvania, Ohio, Indiana and Illinois. Nevertheless by 1860 another season of prosperity seemed at hand, only to be stifled by the Civil War.

In the spring of 1873 occurred a sharp reversal of previously prosperous business conditions. In anticipation of profits, a speculative spirit had been aroused which produced an overproduction in every branch of industry, a general glut of the market and a ruinous decline in prices. Money gradually became tight, discount rates advanced rapidly, and by September little money could be borrowed at any price. After the downfall of a few smaller concerns, the panic broke forth on 18 September when Jay Cooke & Co., of Philadelphia, suspended, as a result of which stocks slumped on the exchanges and a score of brokerage houses, banks and banking firms were forced to the wall. Sudden suspension of payments occurred first at New York but extended to all the larger cities and continued until 1 November. The panic in the "Street" was of short duration but its effects were apparent in commercial and industrial circles for months, thousands of establishments being handicapped or completely prostrated by the lack of available funds to conduct their business. Between 1873 and 1876 the mercantile failures were $775,000,000 and the defaults by railroads up to 1 Jan. 1879 amounted to nearly $800,000,000. The number of bankruptcies up to 1878 was 10,478, while the depression following the panic was even more fatal to productive industries. Between 1873 and 1879 these failures numbered 47,000 and the money lost was $1,200,000,000. It is estimated that 3,000,000 men were thrown out of work. The depression extended to many parts of the world. In 1883-84 another period of panic and depression began. The gigantic speculation in railroads reached its zenith about 1880 and a retrograde movement set in. President A. T.
Hadley in his (Railroad Transportation,) says that of the 29,000 miles of road constructed in 1880-82 only a third was justified by existing business, another third might be profitable some time in the future, and of the remainder some were built to put money into the hands of the builders as distinct from the owners, some were built to increase the power of existing systems, where they were not needed, and some were built to sell as a blackmailing scheme against other roads. During 1883 there were a few small commercial failures and on 1 Jan. 1884 the special situation of the Idaho Central and the Erie and Lehigh Valley Railroad Yards at Buffalo. In November 1892 Cleveland was elected President on a platform calling for a parity between gold and silver coins, and creditors feared that the government either could not or would not redeem its legal tender notes in gold coin, there being only $100,982,410 in the gold reserve when Cleveland assumed office, and barely $25,000,000 in other forms of money. Hence, according to Lauck, the widespread Railroad went as to the parity of the gold standard of payments, together with general industrial unrest, caused the panic of 1893. On 20 Feb. 1893, before Cleveland assumed office, the Philadelphia and Reading Railway, with $40,000,000 capital and $125,000,000 debt, went into bankruptcy; on 5 May came the failure of the National Cordage Company with $20,000,000 capital and $10,000,000 liabilities, these failures causing a heavy slump in the stock market. On 26 June the government of Britain instructed its bankers to accept silver and the price of silver dropped in three days from 82 to 67 cents per ounce. In July the Erie Railroad failed and the Milwaukee Bank suspended, causing runs on banks, particularly in New York. In August the House of Representatives voted to repeal the Sherman Silver Purchase Law, but though this helped to restore confidence, the Senate failed to act until 30 October (Cleveland signing the bill 1 November), when it was too late to stem the tide of disaster. In December 1893 the Comptroller of the Currency announced the failure during the year of 158 national banks, 172 State banks, 177 private banks, 47 savings banks, 13 loan and trust companies and 6 mortgage companies, though a few of these after- ward resumed business. In 1894 156 railway companies, operating nearly 39,000 miles of track, were in the hands of receivers, the total capitalization of these companies being about $2,500,000,000, or one-fourth the railway capitalization of the country. Commercial failures increased from 10,344 in 1892, with liabilities of $114,000,000, to 15,242 in 1893, with liabilities of $346,000,000. The problem of the unemployed became acute and relief committees were organized in many cities; numerous demonstrations by the unemployed occurred, most spectacular being the march to Washington in April 1894 of the "industrial army" under J. S. Coxey to demand help from the government. In the same month 150,000 miners stopped work, followed later by 25,000 more; in one week occurred the Pullman boycott in Chicago; other strikes took place at New Bedford, Fall River and New York; and in January 1895 the employees of the Brooklyn Electric Railway system went on strike. Agricultural disaster also overtook the country in 1894, a drought ruining the corn crops of Iowa, Kansas and Nebraska, reducing the yield to one-fourth that of 1893. The wheat crops were larger, but so were European wheat crops, and as there was no market either abroad or at home the price of wheat declined to its lowest mark, 49 cents per bushel, and similar declines were experienced in the prices of corn, oats, rye and barley. In August 1894 the Gorman-Wilson Tariff Bill became law, the treasury reserve was kept intact during the next two years by
the sale of gold bonds, and the public began to regain its confidence in the government and the security market. This confidence was further enhanced by the election of McKinley in 1896 on a protective platform and by the enactment of the Dingley tariff in 1897.

The crisis of 1907 has been called a "rich man's panic" and the "panic of undigested securities." Under the fostering protection of the high tariffs came the organization of numerous consolidated corporations known as trusts, of which, according to one authority, 225 sprang into existence during 1899 to 1903. An era of speculation was set in but in 1906 the life insurance scandals and the subsequent investigations and legislation tended to throw discredit on some of the business methods in vogue. In spite of these revelations, the year 1906 was the most prosperous the country had known, crops being abundant, wages high, iron and steel production numerous, freight business beyond capacity, dividends earned on non-paying stocks and money plentiful for promoting any kind of speculative enterprise. By the end of the year, however, there was a downward turn, due in part to the Lawson articles, in part to prosecution of corporate interests by the Federal government under Roosevelt, in part to instability of the banking and currency system, in part to over speculation and over expansion of business enterprises and various other causes, resulting in March 1907 in a general unloading of speculative securities. Values continued to decline, producing a temporary stringency in August 1907, which was followed by the financial crisis of October, involving several of the strongest banking institutions of New York and Brooklyn suspended, to be followed by others in various sections of the country. In spite of the inability of business men to obtain adequate financial accommodations, the number of failures was surprisingly small. The government aided the banks by depositing money, the clearing houses issued certificates, the importations of gold increased and confidence slowly returned, the normal level being reached again late in 1908, though the event was not repeated for a much longer time, even as late as 1912-13.

Irving E. Rines.

CRISFIELD, Md., city in Somerset County, 100 miles southeast of Baltimore, on the New York, Philadelphia and Norristown Railroad on Chesapeake Bay. It was incorporated in 1910. It has a marine hospital. Oyster and crab-fishing are chief industries. There is steamship communication with Baltimore. Pop. 3,468.

Crisis, in medicine the turning-point in a disease at which a decided change for the better or the worse takes place. In regular fevers the crisis takes place in certain days, which are called critical days (the 7th, 14th and 21st); sometimes, however, a little sooner or later, according to the climate and the constitution of the patient. The word crisis is also figuratively used for a decisive point in any important affair or business, for instance, in politics and commerce. See Crises, Economic.

Crisis, the, the general name given to a series of political articles by Thomas Paine. These are 13 in number, exclusive of a Crisis Extraordinary and a Supernumerary Crisis. The first and most famous was the first 'Pennsylvania Journal,' 19 Dec. 1776, began with the famous sentence, 'These are the times that try men's souls.' It was written during the retreat of Washington across the Delaware, and by order of the commander-in-chief was read to
groups of his dispirited and suffering soldiers. Its opening sentence was adopted as the watchword of the movement on Trenton, a few days after its publication, and is believed to have inspired much of the courage which won that victory. The 13th, published 19 April 1783, bears the title, "Thoughts on the Peace, and the Probable Advantages thereof." It opens with the words, "The times that tried men's souls are over." The pamphlets throughout exhibit political acumen and the common-sense for which one was noted. As historical evidence of the underlying forces in a unique struggle, and as a monument to patriotism, they possess great and lasting value.

CRISP, Charles Frederick, American jurist: b. Sheffield, England, 24 Jan. 1845; d. Atlanta, Ga., 23 Oct. 1896. He came to the United States when a child; served in the Confederate army 1861–64; was admitted to the bar in 1866; was solicitor-general of Georgia from 1872 to 1877; and judge of the Supreme Court 1877–82. He resigned the last office to accept a nomination for Congress, of which body he was a member until his death. From 1891 until 1895 he was speaker of the House.

CRISPI, Francesco, Italian statesman: b. Ribera, Sicily, 4 Oct. 1819; d. 11 Aug. 1901. He studied law at the University of Palermo, taking the degree of doctor of laws at the age of 18 and settled at Naples in 1846. He took part in the Sicilian revolution at Palermo (1848), but when the Bourbon government was reinstated he fled to Piedmont, where he engaged in journalism for various radical papers and in private studies. He must have been in bad financial straits, for he actually descended to apply for the wretched position of communal secretary to Verolengo, a small village of Piedmont, which he was denied. He was offered a position in journalistic work on a journal supported by Cavour, but his adverse principles made him refuse the post. In 1853 he became implicated in Mazzini's attempt to raise an insurrection in Lombardy and was consequently exiled. He thereupon went to Malta and thence to France and London, where he made the personal acquaintance of Mazzini, to whom he became devoted. Both conspired for the freedom of Sicily. After the war of 1859 Crispi returned to Italy, set moving his plans for insurrection and in 1860 assisted Garibaldi in the expedition of the Thousand for the deliverance of the two Sicilies. Palermo fell, and Crispi was at once made Minister of Interior and Finance in the provisional government. Italy's immediate annexation of the Sicilies caused Crispi to resign. He was sent to the Italian Parliament as first representative from Palermo, where he immediately made himself the leader of the radical Left and then as an exponent of monarchical constitutionalism. It was at this time that he wrote to Mazzini his article of faith: "The monarchy unites us; the republic divides us." In 1866 he made himself the leader of the Interior. In the following year he visited the European countries and came to know their leading representatives. In December 1877 he became Minister of the Interior in the Depretis Cabinet, and during this time assisted in securing the establishment of a union of monarchy under Humbert I of Italy. He was, however, denounced and removed from office on a charge of bigamy. His acquittal did not win public opinion to his favor, and it was not until 1887 that he resumed his office. In July 1887 he became Premier and head of Foreign Affairs, on the death of Depretis. As an earnest supporter of the Triple Alliance, he came to be a friend of Bismarck. The pending FrancoItalian commercial treaty was broken off. His vigorous policy reformed the courts and secured the adoption of commercial and sanitary laws. But he was ostracized in February 1890, and the succeeding cabinet found him an effective opponent in the Chamber of Deputies. In 1893 he was recalled to office and immediately entered upon a resolute suppression of disorders, and reorganization of public financial administration. When the elections were held in 1891 for the representatives of the radical leader, Cavallotti, became his bitter opponent, resorting to all sorts of underhand methods of ruining the reputation of Crispi. Several attempts were made on his life; but popular favor retained him in office, until, on the defeat of the Italian expedition to Rethimnon, he resigned, to be succeeded by the Rudini Cabinet, which was in sympathy with Cavallotti. Charges were brought against him for swindling public money, but the Chamber refused to prosecute on discovery that the ground for the accusation was the irregular handling of a sum for the use of secret service. Crispi's resignation from Parliament was soon annulled by his overwhelming re-election in 1898. His failing eyesight caused him to withdraw from politics temporarily, but with a successful operation, he again wrote articles in behalf of the Triple Alliance and remained an important public figure to the last. Crispi's greatness is no longer disputed. His splendid, vigorous persistence brought Italy to the point of taking its place among the Powers of Europe, and gained for that country a trust and confidence which it had never before enjoyed. Consult Stillman, W. J., 'Francesco Crispi' (London 1899); a translation of his memoirs by Agnetti (London 1912); Crispi, T. P., 'Francesco Crispi' (Milan 1913).

CRISTOBAL, city of the Canal Zone, comprises that part of the city of Colon, Panama, lying within the boundaries of the Canal Zone and upon lands purchased in other transactions by the United States. Its government is entirely separate from that of Colon. The docks of the Panama Railroad line of steamers are located here, and here also are the offices of the resident engineer of the Atlantic Division of the canal and the headquarters of the Canal Commissary Department. The city is the site also of the great cold-storage plant of the Canal Commission and the shops of the Panama Railroad. The establishment of Cristobal in 1915 of a branch of the Commercial National Bank of Washington, D. C., marked an important advance in the commercial possibilities of both cities. The old De Lesseps mansions here became Minister of Finance, stands the statue of Columbus and the Indian Maiden, presented by the Empress Eugenie to the city at the time of the French occupancy. The new terminal docks of the canal, affording docking facilities for 20,100-ton vessels at once, are on the site of former shipping trade
of the old city of Colon has gone over to Cristobal.

CRITIAS, kri'ti-as, Greek orator: d. 404 B.C. He was a pupil both of Socrates and of Gorgias of Leontini. He was one of the 30 tyrants set over Athens by the Spartans. He applied himself with great success to the culture of eloquence, and Cicero cites him among the public speakers of that day. Banished from Athens for some cause that is not known, he retired to Thessaly, where he incurred an insurrection among the Phenician or seris. Subsequently to this he visited Sparta and wrote a treatise on the laws and institutions of that republic. Returning to Athens with Lysander, 404 B.C., he was appointed one of the famous 30, his pride of birth and hatred of demagogues having pointed out to him a fit person for that office. After a cruel and oppressive use of the power thus conferred upon him, he fell in battle against Thrasybulus and his followers. Plato, who was a relation of his, has made him one of the interlocutors in his Phaedrus and Critias. He wrote tragic and elegiac poetry, fragments of which are restored in Bergk, *Poete lyrici Graeci* (Vol. II, Leipzig 1900); and fragments of his historical work are preserved in Müller, *Fragmenta Histori corum Graecorum* (Vol. II, Paris 1863-83).

CRITICAL ANGLE. See Light.

CRITICAL POINT (of CRITICAL STATE). In physics a state or condition at which the physical properties of a given substance undergo some important and more or less hidden modification. The term is seldom applied to a state or condition at which an easily visible change (such as freezing) takes place, but is usually reserved, by common usage (though not of necessity nor by any formal agreement), for limiting conditions of a less obvious nature. For example, the temperature (ranging, for different samples of the metal, from 600° C. to 800° C.) at which iron ceases to be susceptible of magnetization, is called the "critical temperature" of iron with respect to magnetism. At or near this same temperature the iron also undergoes important changes in its thermal and electrical properties.

The critical point is most familiarly applied to the state that a gas is in when any further rise in temperature would preclude the possibility of liquefying it by pressure alone. It was long known that reduction of temperature facilitates the liquefaction of a gas, but it was nevertheless believed that a sufficient pressure would effect the liquefaction at any temperature whatever. Dr. Thomas Andrews, in the Bakerian Lecture for 1869, entitled "On the Continuity of the Gaseous and Liquid States of Matter," (see "Philosophical Transactions" for 1869, Pt. II, p. 575), showed that this view is erroneous, and that there exists for every gas a definite temperature above which it is impossible to liquefy the gas by the application of pressure. The temperature so defined is called the "critical temperature"; and the vapor tension that a liquefied gas exerts at its critical temperature is called the "critical pressure" of the gas. Similarly, the volume occupied by a unit mass of a gas that is at its critical temperature and pressure is called the "critical volume" of the gas. The critical constants of the various gases and liquids have not yet been determined with as much precision as could be desired, though good values have been obtained in a number of cases. Generally speaking, the critical temperatures are best determined. The critical pressures come next in order of accuracy, but as the experimental determination of the critical volume of a gas is exceedingly difficult, few of the critical volumes are known with any approach to precision. The accompanying table gives some of the values of the critical constants of gases. The critical temperatures are given on the Centigrade scale, and the critical pressures in atmospheres.

One important and curious fact that follows from the existence of a critical point is that the gaseous and liquid states of a given substance may be regarded as continuous with each other, inasmuch as it is possible to cause a substance to pass from one of these states to the other by a continuous process, and without any abrupt change of condition such as is apparent when ordinary condensation takes place. For example, if we heat a cubic foot of carbon dioxide gas up to 50° C., we can then compress it, at a temperature that we please without producing the least sign of liquefaction; because the critical temperature of this gas is 31° C., and hence liquefaction cannot be induced at any temperature higher than 31° C. Let us now compress it at this temperature until its pressure is (say) 150 atmospheres. It is still a gas, for the reason just given. Finally we cool the gas, still constantly maintaining its pressure at 150 atmospheres, until its temperature becomes 15° C. There can be no doubt that it has now become liquid, and in fact actual experiment proves this to be the case. If the temperature had been maintained at 15° C. throughout it would not have been possible to compress the gas into the liquid condition without a visible, discontinuous passage from the one state to the other; but by the principle thus described above it is possible to convert the substance from the gaseous state into the liquid state in such a manner that the transition is imperceptible to the senses, and is not accompanied by any sudden change of density. (For further discussion of the theoretical principles involved in the consideration of the critical state, see Molecular Theory; Thermody-
CRITICISM—CRITIQUE OF PURE REASON

CRITICISM, the expression of a judgment concerning any subject; specifically the formulating of opinions based upon certain principles, in matters of art, literature, philosophy, etc. Certain canons apply in a general way to all criticism, but each branch has its own particular marks and standards. In its narrow sense, the art of criticism is confined to the study of the beauties or defects of some particular work; in its broadest aspect it includes the establishment as well as the application of principles, for the determination of which it must be largely indebted to philosophy. Aristotle was the first writer to develop a philosophy of criticism, applying it to the study of rhetoric and poetry. In connection with the truth that poetry deals more with "universals" and history with "particulars," he assigns a higher rank to the former and brings out a fundamental distinction pointing to the crucial test for any high performance in art or literature. A work cannot permanently contribute inspiration and enjoyment, without possessing those elements which arise from the essentially and universally human, as contrasted with individual or temporary, characteristics. The Augustan Age produced one critic that the world of letters could ill spare. To Horace the art of criticism owes much of permanent value and perennial charm. In the 3d century appeared Longinus, whose refreshing enthusiasm for the beauty of letters places him above the mechanical student of forms and rules. Cicero and Quintilian have recorded observations on style that have been of permanent service. The traditions of culture, forgotten or dormant during the Middle Ages, and revived by the leaders of the Italian renaissance and the humanists, for a long time produced little that was broad, fundamental or independent in criticism. In France, Boileau, Voltaire, Cornelle, Diderot and others led the way. French writers, Taine, Sainte-Beuve and more recently Brunetiére; in England—Pope, Sidney, Dryden, Coleridge, Hazlitt, Macaulay, Ruskin, Carlyle, Pater, Matthew Arnold and Saintsbury; and in America—Emerson, Ripley, Child, Ticknor, Longfellow, Lowell, Curtis and Stedman. Modern conditions have opened wider paths for criticism. The Greek and Roman critics had only their own work to study. To-day we have the dramas, the epics, the novels of many nations and ages. The study of comparative literature, now possible, opens up opportunities for tracing those influences which affected the literatures of all Europe, and affords the student the chance of building up from varying yet interrelated sources a standard of criticism. The differences due to national character and individual genius will teach him the limitations of hard and fast formal rules, while his faith in the fundamental canons of great art can only be made firmer by such comparison and analysis.

Criticism will be found of use as a method of judgment for the reader, rather than an inspiring guide to the past. It is thus a rational study of fitting construction and adequate expression. As the art of judgment concerning the fairest flowering of the liberal arts, criticism has one of the highest judicial functions; as the art of interpretation, admitting individual intuition and inspiring teaching, it has a creative function of wide and lofty worth.

CRITIQUE OF PURE REASON, The. Kant's 'Critique of Pure Reason' (Kritik der reinen Vernunft) has commanded the attention of professional philosophers to an extent attained by no other modern work. Though a clumsy, unintelligible and technical writer, Kant long stood at the centre of academical philosophy—a position which he still enjoys in Germany—and this Critique is the portal to his system. In the background are certain moral and religious problems of God, Freedom and Immortality to which the 'Critique' is a destructive metaphysical preludement. He is here examining into the possibilities of metaphysical knowledge by a criticism of the nature of knowledge in general and would show through this criticism that the idea of a self-contained and ordered universe and God can have no metaphysical foundation and are not subject to either metaphysical proof or refutation. Their place as objects of belief and their development as moral postulates were accordingly made secure. The objects of these ideas of soul, cosmos and God are not given us in experience; and the proof of their existence, if it is to be found, must be by way of some knowledge transcending experience; so his quest is to find how knowledge a priori is possible.

Kant introduced what he called the Copernican revolution in philosophy. Philosophy had conceived the mind as that which is impressed with the form of objects and the order of nature. Kant reversed the point of view, making the mind put forth its conceptions and structure to its universe. His peculiar contribution to epistemology lies in this recognition of the mind as active in experience. All knowledge begins with experience, but the mind only knows what it can produce ac-
to its own ideas; so that, although the object is the occasion for the experience, the mind must reproduce this in knowledge and supply the form which it here takes. Experience, put into certain and of the object, is a chaos of particulars. In so far as it has unity this must be supplied by the mind. As a compound, experience can never give universality and necessity. If we find universality and necessity in knowledge, it must come a priori.

There are three stages in knowledge: perception, judgment and reason. We get experience through sense perception; we think these various perceptions under conceptions, that is, make judgments about them, and finally we tie all our experience together under the "ideas" of a simple soul, an ordered and absolute universe and a first cause.

The mind perceives the manifold of sense under the forms of time and space. These are known through a priori intuitions. For of them we may have universal and necessary propositions, such as those of geometry, which could not be arrived at through a summation of particulars. They supply unity to the internal and external world. Critical Philosophy has accordingly transcendental ideality, that is, considered as to their origin in the act of knowing, they are ideal, being supplied by the mind.

The matter of perception is the sensation without form. The object, as perceived, is a phenomenon, but behind the phenomenon is something unconditioned from the point of view. Although this thing in itself, or noumenon, must remain unknown to us, for our minds cannot reproduce it except according to their own conditions, it is not to be looked on as a mere dialectical by-product, for Kant showed the conception of noumenon in his moral philosophy.

The second part of the 'Critique' takes up the question of the synthesis of the understanding. The act of judgment, A is B, is a synthesis. B may be thought of as a part of, a category of, the unity of A, etc. These various relations in which experience is thought, such as whole and part, cause and effect, substance and attribute, are the categories or forms of synthesis of the understanding. Kant deduced them from the classification of propositions given in formal logic. Their significance lies in the conception which they give of knowledge as a structure, constituted by the mind, and not an accumulation, as, for example, the general conception of universal causal relation among phenomena, is a result of the mind imposing its own law of unity on the manifold, and thus constituting an organized world. The application of these laws of the understanding, however, is only to the world of phenomena beyond which their reign does not extend.

Reason cannot remain satisfied with the manifold given by the understanding in thought and must think this under absolute and unconditioned forms which it supplies in the "ideas": the unity of the thinking subject; the absolute unity of the series of the conditions of phenomena; the absolute unity of the conditions in general; in other words, the simple soul, the cosmos and God. The objects of these ideas of pure reason cannot be presented in possible experience and we can only possess a problematical conception of them. We are led to these ideas by a "necessary procedure of reason," but the attempts of the orthodox metaphysics to establish their objective reality are shown to be illogical and contradictory, thought here running out into certain antinomies. The paradoxes express the utmost possibility of synthesis, the vanishing points in the perspective of human experience. As such they are of use in experience, but not for gaining knowledge of the nature of reality through reason pure and simple.

The influence of the 'Critique' in the history of philosophy has been multiform and is to-day a factor to be reckoned with. The limitation of our knowledge to phenomena comes down in the French positivists and Herbert Spencer; for German idealism the laws of understanding become the most important features in the structure of reality; and further consequences by way of Kantian ethics are, perhaps, even more far-reaching.

There are two English translations of the 'Critique of Pure Reason': one by Max Müller (2d ed., London 1896), and the other by J. M. D. Meiklejohn (London 1854 and reprints). The former is much the better. The great commentary in English is E. Caird's "Critical Philosophy," 3 vols. (London 1889). Four representative German interpretations are those of Kuno Fischer, H. H. Vaihinger, Erich Adickes and Cohen.

WALTER B. VEAZIE,
Department of Philosophy, Columbia University.

CRITO, kri'tō, Greek philosopher. He was a friend and disciple of Socrates, whom he is said to have supported with his fortune. He made every arrangement for the escape of his master from prison and used every argument which ingenuity or affection could suggest to induce him to save his life by fleeing from his persecutors. His eloquence was, however, in vain and Socrates drank the fatal cup. Crito is a prominent interlocutor in one of Plato's dialogues, which is named after him. He was himself a voluminous writer on philosophical subjects, but all his writings have perished.

CRITOLAUS. (1) A celebrated Achæan demagogue, who incited his countrymen to insurrection against the Romans. He commanded the Achæan army at the battle of Scarpheus, 146 B.C., and when overthrown by Metellus, either committed suicide or perished in the marshes of the coast. He was the immediate cause of the war which terminated in the destruction of Corinth and put an end to the political existence of Greece. (2) A peripatetic philosopher, a native of Phaselis, a Greek colony in Lycia who studied philosophy at Athens under Aristo of Ceos, whom he succeeded as head of the Peripatetic School. In 155 B.C. he was sent with Carneades on a political mission to Rome. His philosophy attracted great attention at Rome. He was a noted rhetorician and orator. A Critolaus is mentioned by Plutarch, as the author of a work on Epierus; and Gelius also speaks of an historical writer of this name.

CRITTENDEN, George Bibb, American military officer: b. Russellville, Ky., 20 March 1812; d. Dansville, Ky., 27 Nov. 1880. He was graduated at the United States Military Academy in 1832 and served as an officer in the Mexican War, rising to the rank of lieutenant-colonel. He joined the Confederacy at the
CRITTENDEN — CROATAN

break of the Civil War, became a major-general and suffered defeat at Mill Spring, Ky., in 1862. He was kept under arrest in consequence and resigned his commission the following year. He served as a volunteer later and from 1867-71 was State librarian of Kentucky.

CRITTENDEN, John Jordan, American legislator: b. Woodford County, Ky., 10 Sept. 1787; d. near Frankfort, Ky., 26 July 1863. He was graduated at William and Mary College in 1807; in 1816 became a member of the State legislature; in 1817 was elected to the United States Senate; United States district attorney from 1827-29. He was subsequently re-elected twice to the United States Senate. In 1848 he became governor of Kentucky. He was again Attorney-General under President Fillmore and in 1855 was sent a fourth time to the Senate. In the Senate he urged unsuccessfully his famous compromise. After 1861 he served for one year in the House, and in that body also strove for the supremacy of the Constitution. Thus the State of Kentucky and the remainder of the Union in the Civil War. (See CRITTENDEN COMPROMISE). Consult the biography by his daughter, Mrs. Chapman Coleman (2 vols., Philadelphia 1871).

CRITTENDEN, Thomas Leonidas, American military officer: b. Russellville, Ky., 15 May 1819; d. Annandale, N. Y., 23 Oct. 1893. He was a son of J. J. Crittenden (q.v.) and was educated for the law. In 1842 he became State attorney for Kentucky; served as an officer in the Mexican War and in 1849 was appointed consul at Liverpool. On the outbreak of the Civil War he became brigadier-general of volunteers and in 1862 was promoted to major-general. He distinguished himself at Shiloh, Stone River and Chickamauga. He was placed on the retired list in 1881.

CRITTENDEN COMPROMISE, 1860-61: the last desperate effort of the Southern Union party to avert secession and war, by permanently crystallizing the free and slave communities as they stood; dividing the boundaries on the line of the Missouri Compromise and engaging the Federal power to uphold slavery to the full, where it existed. In the session of Congress after Lincoln's election, the Constitutional Union party (q.v.) having broken down, John J. Crittenden of Kentucky, a leading Unionist senator, introduced a proposition for a constitutional amendment, in substance as follows: (1) Slavery to be abolished in all national territory north of 36° 30' and recognized and protected south of it, the people to decide the status on its becoming a State; (2) not to be abolished in forts or other Federal territory in slave States; (3) nor in the District of Columbia while it existed in Maryland and Virginia, nor at all without consent of the inhabitants and compensation, nor slaveholders forbidden to bring their slaves thither; (4) the interstate slave-trade never to be prohibited; (5) the United States to pay for all fugitive slaves rescued by violence and sue the county of rescue, which could sue the individuals; (6) no future amendment ever to affect these provisions, nor Art. I, § 2, § 3, nor Art. IV, § 2, § 3 of the Constitution; nor to give Congress power to abolish slavery in a slave State. Four resolutions were appended, declaring the Fugitive Slave Act constitutional, urging the repeal of the State personal-liberty laws, promising the modification of two specially obnoxious features of the Fugitive Slave Law and the rigorous suppression of the outside slave-trade. The legislatures of Virginia, Kentucky, Tennessee and New Jersey instructed their delegates to the Peace Conference of 1861 to support it. In Congress, Crittenden continued to press it during the session. It was lost in the House 14 Jan. 1861, 113 to 80; in the Senate 2 March, 20 to 19.

CRITTENTON, Charles Nelson, American philanthropist: b. Adams, Jefferson County, N. Y., 1833; d. San Francisco, Cal., 16 Nov. 1909. He engaged in the drug business in New York in 1861, but after 1862, when his five-year-old daughter Florence died, he devoted his time and wealth to the establishment of Florence Crittenton Homes for homeless and unfortunate girls and their infant children. In 1895 the National Florence Crittenton Mission was incorporated to carry on this work. Of these mission homes 75 were organized in Mr. Crittenton's lifetime in all parts of the United States and in Marseilles, Tokio, Shanghai, Mexico City, etc. The drug-manufacturing company which bore his name was one of the first profit-sharing concerns in the United States. He was an active member of the Prohibition party.

CROATAN, or CROATOAN, *The Lost Colony,* (For Raleigh's attempt to colonize Roanoke Island, see ROANOKE COLONY). In 1587 he abandoned the effort and incorporated a company to settle on Chesapeake Bay, entitled *The Governor and Assistants of the City of Raleigh in Virginia.* A colony of about 140 persons was left there. Raleigh's attempts to rescue them were unsuccessful and the fate of the colonists was unknown till Indians told the settlers at Jamestown. They had accepted the friendly invitation of the Croatian Indians to live among them and remained there probably till not long before the Jamestown settlement in 1607, doubtless intermarrying considerably, then the priests or medicine-men had urged *Powhatan* to kill them—probably from jealousy of the influence their superior intelligence gave them—and all had been murdered except four men and two boys saved by one of the chiefs to work his copper-mines, and a "young maid" saved probably for a wife, who may have been Virginia Dare. The latter escaped up the Chowan and her ultimate fate is unknown: the boys seem to have died or been killed; but the men were taken westward with the small tribe to somewhere around the Neuse or the Cape Fear River in North Carolina. They or their predecessors taught the natives to build two-story stone houses, make roads, use improved agricultural methods, etc. The Huguenots found these Indians there in 1709 and noted their farms and roads and their gray eyes, different from those of any other Indians; and the protest of a chief of some mixed-blood Indians from Robeson County, N. C., over a murder in 1864, led to an investigation which in 1890 was instilled, but in 1897 was declared by the Indians of the Croatan tribe and the colonists. The State has officially recognized them as *Croatan Indians,* and their language is said to contain many English words. However this may be, the actual fate of the "lost colony*
rests on evidence it is absurd to discredit and on which in fact we base unquestioned conclusions as to all other early Virginian history. Conseus in 'The Croats and Jews' of southwestern Virginia' (Hakluyt Soc., Vol. VI); Hamilton McMillan, 'Raleigh's Lost Colony' (1888); chart printed in Brown's 'Genevis of the United States,' where on the Neuse (apparently) is marked a place at which remained 'four men cloistered' from Roanoke.'

**CROATIA-SLAVONIA**, kró-a'shle-a (in Serbo-Croatian, Hrvatska-Slavonija), a Hungarian crownland bounded north by Hungary and Hungary, from which it is separated by the rivers Drave and the Danube; in the south it is divided from Serbia and Bosnia by the Una and the Save, southwest by Dalmatia, Istria and the Adriatic and northwest by Kraina and Styria. *Total area 16,421 square miles. Pop. (census of 1910), 2,621,954. The country is agricultural, 82 per cent of the population being engaged in agricultural pursuits. It is most picturesque (especially Zagorje), in the Karst district, fir, beech and oak forests cover the land, as also rich pastures and good vineyards. The lowlands of Slavonia, Syrmia (Srem) and especially Fruska Gora are arable and most fertile. The croplands include all kinds of cereals, potatoes, hay, grapes of good quality, apples, prunes, nuts and, near the coast, figs, oranges and other tropical and semi-tropical fruits. The mountains form a continuation of the Julian Alps and are very rich in coal, manganese and iron wells containing sulphur, copper and iron; in the north a small branch of the Carnic Alps forms the watershed between the principal rivers, the Save and the Drave.

**Climate.**—Considering the situation of Croatia-Slonia the climate is rather moderate and the country could be divided into three parts: (1) The narrow strip of land above the sea with mild winters, warm summers and dry summers; (2) the level land Slavonia with very hot summers and severe winters and (3) the Zagorje (western Croatia) with prolonged and severe winters and short summers which are often tempered by the northeastern wind called Bora.

**Industries.**—The manufacture of wine constitutes one of the chief industries of the country and the peasantry use wine freely as their principal beverage. Vineyards are most numerous in Syrmia, but they are frequent also in the coastland. In the western part, however, they have been devastated by phylloxera. Oak and beech forests are abundant, especially in Slavonia where there are even virgin forests, and form the principal wealth of the country. The timber is of excellent quality and is used in various industries, even in shipbuilding. The surplus of the production is exported mostly to France. Great quantities of acorns furnish good food to numerous herds of pigs which are exported. Horses of two races, the Hungarian in the plains and the Bosnians in the mountains, oxen, pigs and sheep are the principal food animals. They have been cultivated to an appreciable degree only since the reign of Maria Theresa, but the silk industry is still in its infancy. The same could be said of the industries of glass, paper, chemicals and tobacco. Hemp, flax and tobacco are cultivated by the peasants, of which they manufacture their own clothes with much originality in design and shape. Owing to the lack of native capital the commerce is in a deplorable state. It is practically controlled by Germans, Magyars, Russians and Jews. The principal port are: Timbers, wine, cereals, plums, plumbrandy, horned animals, wax, honey, etc. The principal ways of communication are the Drave, the Save and partly the Danube, but there are also railways (about 1,000 miles in all) connecting the country with the Adriatic and Bosnia.

**Education.**—Education is compulsory for all children between the ages of 11 and 12. There are elementary schools in great numbers all over the country; 21 high schools and secondary schools with an aggregate staff of 320 professors and about 6,500 students. At Zagreb there are, besides the university, schools of arts and crafts, commercial academies, academy of forestry and normal school of rural economy, music schools, high schools for girls, the Normal Teachers' Institute and the Nautical School.

**Language and Literature.**—The language and literature of the Croats and Slovians is in Serbian (see SERBIA) in its quintessence. However, there are some dialects peculiar to Croatia-Slavia. The literature of the Croats and the Slovians is consequently only a branch of the Serbian and it is hard to establish the borders in that field. The Croats and the Slovians use in their written language the Latin alphabet, modified somewhat by means of certain diacritics, while the Serbs, like the Russians, remained faithful to their Cyrillic alphabet, derived from the Greek characters, by the so-called Slav apostles, saints Cyril and Methodius, and modified by Vuk Stefanovich Karadzic.

**History.**—The Croats are virtually the trans-Danubian Serbs, having the same ethnographic characteristics and speaking absolutely the same language as the Serbs in Shumadia, Montenegro, Bosnia-Herzegovina, etc., with the exception of some slight dialectic differences, due chiefly to foreign influences. The inhabitants are chiefly Serbo-Croats and Slovians ("Sloveni") with some admixtures of other races (Magyars, Germans, Gypsies, Jews, etc.), and they belong to the same Church, represented by the archbishop of Zagreb (Agram), and the Orthodox Church, represented by the patriarch of Karlovci. It is not certain when and from where the Croats came to inhabit the Adriatic littoral, nor is it possible to establish the exact frontiers of their original state. Their primitive abode must have been on the slopes of the Carpathians and the provinces to which they immigrated were situated around the cities of Clissa, Trannona and Suebica; they were divided into 11 counties, ruled by counts, and one principality consisting of three counties, ruled by a ban (or prince). The Croats, like their brothers, the Serbs, were pagan and the cultured Catholic priests, who were then numerous in Dalmatia, energetically spread Christianity among them; but it was only in the 9th century that, with the aid of the Byzantine Emperor Heraclius, they were baptized in any considerable numbers. Their first metropolitan had his palace in Spalato. But when the ever-growing star of the Sarracens spread its authority over the Croatian lands and Louis, the ban of the Croats of Save,
endeavored to resist their dominion with his army, Borna, the ban of the Dalmatian Cro-
ati, aided the Frankls and frustrated the pa-
triots plans of his northern brother. Ban
Louis's successors (Ratimir, Mutimir and Brals-
sav, 872-882) fought bitter battles against the
Moravians, while the Dalmatian Croatiens were
engaged in a secular struggle against the Yen-
netian Republic. Borna's successors extended
their territory in Istria, the Veltev Mountains
and in Gorica and (in 910) Ban Tomislav as-
sumed the title of king. But it was only under
King Zvonimir that Croatia grew to any con-
siderable size, for he took possession of Naret-
nna and part of Bosnia. No sooner had the Cro-
atiens succeeded in forming a powerful state
than their leaders, torn by their vices and in-
ordinate desire for power, started a state of
anarchy which was followed by numerous civil
wars. The Hungarians took advantage of the
disaster and their King Koloman found the
country an easy prey and had himself crowned
king of Croatia and Dalmatia. He granted to
the Croatiens a sort of conscription which still
more humiliated them, and made them unac-
tive dynasties, their bans, almost slavish vassals
of the Hungarian Crown. When the Turks
conquered Bulgaria, Serbia and Bosnia, the
principal objective of their expansion was the
level of Hungary, but they found bitter
resistance in Croatia under the celebrated Nik-
ola Zrinski, who perished in the siege of Sijet.
The Austrian court utilized the opportunity to
subjugate Croatia with the result that a fierce
insurrection of the peasants broke out during
the reign of Hungary, but they found bitter
resistance in Austria under the celebrated
Ilija Turcanu, who, for the purpose of making the Croatiens
better fitted for resistance to the Turks, the Aus-
crian government nominated a king of Croatia,
Dalmatia and Slavonia. A wholesale Germanization
of the Croatiens and the Slovenes was prac-
tised for over three centuries, but the
national spirit was kept alive, as in Serbia,
by means of the cherished traditions and
especially by the exaltation and enla-
ging name of poetry, above Royal Prince Marko,
the Battle of Kosovo, etc., which rapidly
spread from Serbia and Montenegro through-
out the Serbo-Croatian-speaking lands of the Haps-
burg Crown. It was only in the beginning
of the last century, when Napoleon, by virtue
of the treaties of Pressburg (1805) and Schön-
brunn (1809) won the united Dalmatia, a large
part of Croatia, Istria, Gorica, Gradiska, Ca-
rinthia and Carniola, giving them the collective
name of "Illyrian Provinces" and organizing them under a single administration, that the
Serbo-Croatian people inhabiting those lands
realized that their language, traditions and as-
pirations were absolutely identical and that they
formed one and the same nation. Unfortu-
nately, when the provinces were taken from France at the Congress of Vienna (1815) and
restored to the Hapsburgs, the national spirit
and language were once more condemned and
prosecuted. The Serbo-Croatians resented
sharply the ever-growing Germanization and
Magyarization and, when the Magyars passed
certain laws in their Parliament in 1849, where-
by the autonomy of Croatia was virtually an-
nulled, and when the whole of Hungary re-
volted against the court of Vienna, ban of Cro-

tia, Jelachich, upon advice from Austria, im-
mediately declared war on the Hungarian Rev-
onatory Cabinet and, with his army of 40,000
men, largely contributed in suppressing that
insurrection. The Serbians in Hungary, who also
rose against their Magyar oppressors, now de-
manded their long-promised autonomy, which
they finally obtained in the Treaty of Zren-
dina® dukedom, comprising Syrmia (Srem),
Bachka and the Banat, only to be shortly after-
ward suppressed by the Austrian government.
The Croatiens were treated in like manner, for
they were abandoned entirely to the mercy of the
revengeful Magyars and a reactionary poli-
cy of the blackest type was started. When,
however, the Austrian government collapsed
(in 1859) and the necessity of Serbo-Croatian
help was again keenly felt, several Serbo-Cro-
atian deputations were kindly received in Vienna
and the just demands of the people were grant-
ed. The Serbo-Croatian language was rein-
troucted in the national schools and the local
administration and, in 1868, a treaty between
the Serbo-Croatians and the Hungarians was
concluded whereby they gained complete
independence in their national aspirations.
But the notorious Ban Khnen Hedewary (1883-
1903) eluded most of the treaty stipulations and
executions of most notable Croatians in Agram
(1907) and Vienna (1909) accelerated the for-
mation of the Serbo-Croatian coalition which
complicated more than any other event the dif-
ficult South Slavonic problem in Austria-Hun-
gary. The struggle of the Slovenes (or Slo-
venians) against their German oppressors re-
resulted first in the literary emancipation of
115 in the course of the 16th and 17th centuries the Croati-
ian lands were called *religie que relieriurum* and,
for the purpose of making the Croatiens
better fitted for resistance to the Turks, the Aus-
crian government nominated a king of Croatia,
Dalmatia and Slavonia. A wholesale Germanization
of the Croatiens and the Slovenes was prac-
tised for over three centuries, but the
national spirit was kept alive, as in Serbia,
by means of the cherished traditions and
especially by the exaltation and enla-
ging name of poetry, above Royal Prince Marko,

W. M. Petrovitch,
Chief Slavonic Division, New York Public Library.

CROCKET, kró-shé, a species of knitting performed with a small hook of ivory, steel or wood, the material used being woolen, cotton or silk thread.

CROCODILIDE, kró-sid-ó-lit (Gr. threadstone) a mineral of the amphibole group composed of long, delicate fibres and also occurring massive and earthy, and then called abriachinite. It has the formula NaFe3(PO4)3·(OH)2·SiO2, one of the components of the iron being frequently replaced by magnesium and calcium and part of the sodium by hydrogen. The mineral has a hardness of 4 and a specific gravity of about 3.25. The fibrous varieties have a silky lustre and vary from bluish green. Crocidolite occurs in Griqualand West, Africa, in the Voges Mountains of France and Germany, in Greenland, in Ontario and in Rhode Island. The South African varieties are often altered by oxidation of the iron and by infiltration of silica, until they are of a brown or yellow color and exhibit a chatoyant lustre. Specimens of this kind are known as "tiger-eye," and, when polished, are used in the manufacture of umbrella handles and other ornamental articles.

CROCIN, C9H16O5, a coloring matter obtained from the fruit of Gardenia grandiflora, Chinese yellow pods, huang-chi, which is largely used in China for dyeing silk, wool and other fabrics yellow. The color is extracted from the pods by a complex process and forms a yellowish substance which is soluble in water and in spirit. By dilute acids it is decomposed into crocetin, which dyes a fine yellow. Crocin has been identified with a body obtained from saffron.

CROCKER Charles. American capitalist: b. Troy, N. Y., 16 Sept. 1822; d. Monterey, Calif., 14 Aug. 1888. He received a common school education and went to California in 1849, where he opened a store. In 1850 he went to Washington and served in the State legislature. With Leland Stanford, Mark Hopkins and Collis P. Huntington, he projected and completed the Union Pacific Railroad system.

CROCKER, Francis Bacon, American electrician: b. New York, 4 July 1856. He graduated at Columbia University in 1882; was employed as electrical engineer in 1882-89; became vice-president of the Crocker-Wheeler Electric Company in 1888 and professor of electrical engineering in Columbia University in 1889. He has taken a prominent part in the national and international standardization of electrical apparatus. He was president of the American Institute of Electrical Engineers in 1897-98, of the New York Electrical Society in 1892-95; and is author of 'Practical Management of Dynamoe and Motors' (1892); 'Electric Lighting' (2 vols., 1896-1901; 8th ed., 1908); 'Electric Motors' (1910), etc. The honorary degree of master of science was conferred upon him by Columbia University in 1914.

CROCKET, a Gothic architectural ornament projecting boldly, usually in imitation of curved and bent foliage, but sometimes of animals, placed on the angles or the sides of the pinnacles, canopied, gables, etc. The name is also given to one of the teeth of a stag's horn. This ornament is probably derived originally from the corner volutes of the Corinthian type of capital with the acanthus leaves curled up under them.

CROCKETT, David, an American pioneer: b. Limestone, Greene County, Tenn., 17 Aug. 1786; d. Alamo, Tex., 6 March 1836. He spent a number of years in hunting and pioneer work in western Tennessee, and finally settled in Franklin County in 1811. He served in the Creek War under Jackson; and in 1821 and 1823 was elected to the Tennessee legislature. In 1826 and 1828 he was elected to Congress; was defeated for re-election in 1830 because of his outspoken opposition to Jackson's Indian bill; but was again a successful candidate in 1832. In Washington, although his eccentricities of dress and manner excited comment, he was always popular on account of his shrewd common sense and homely wit; although generally favoring Jackson's policy, he was entirely independent and refused to vote for any party leader. At the end of his congressional term, he joined the Texans in their war against Mexico, and in 1836 was one of the force of 140 which defended Alamo, and, as one of the six survivors who surrendered, was shot by order of Santa Anna. He was unlettered and probably dictated the following work, of which he is the acknowledged author: 'A Narrative of the Life of David Crockett' (1834); 'A Tour to the North and Down East'; 'Exploits and Adventures in Texas'; 'Sketches and Eccentricities' (1847). The best popular biography is by E. S. Ellis (Philadelphia 1884).

CROCKETT, Samuel Rutherford, Scottish novelist; b. Little Duachies, Galloway, 24 Sept. 1860; d. Avignon, France, 18 April 1914. He was educated at Edinburgh and Oxford, and entering the ministry of the Free Church of Scotland in 1886 was for several years pastor
CROCODILE—CROCODILES

at Penuilk. A volume of verse, 'Dulce Cor,' and 'The Stickit Minister,' his first novel (1893), showed literature to be his vocation. He made a name in rapid succession in a series of novels, about 50 in all, making his native Galloway country on the Scottish border his special field. He was one of the leaders of the "Kailyard School," with Ian Maclaren and James M. Barrie, who included 'The Raider' (1894); 'The Lilac Sunbeams' (1894); 'Mad Sir Uchtred' (1894); 'Bog Myrtle and Peat' (1895); 'The Men of the Moss Hags' (1895); 'Sweetheart Travelers' (1896); 'Cleg Kelly' (1896); 'Lad's Love' (1897); 'Lochinvar' (1897); 'The Standard Bearer' (1898); 'The Black Douglas' (1899); 'Kit Kennedy' (1899); 'Joan of the Sword Hand' (1900); 'The Stickit Minister's Wooling' (1900); 'Love Idylls' (1901); 'The Dark o' the Moon' (1902); 'Raiderland' (1904); 'Maid Margaret' (1905); 'Sir Toady Cruceol' (1905); 'The Cherry Ribbon' (1906); 'White Plumes of Navarre' (1906); 'Little Esson' (1907); 'Deep Moat Grange' (1908); 'Men of the Mountain' (1909); 'Dew of their Youth' (1910); 'Love in Peril' (1910); 'Sandy's Love Affair' (1913).

CROCODILE, a huge reptile of the genus Crocodilus and order Crocodilia, distinguished from the other genera of the family by having the enlarged fourth lower tooth fitted into an emargination, and not a pit, in the upper jaw, the dorsal head and trunk plates not united and the posteri or teeth not entering the nasal canal as a septum. The bones of the head have a peculiar corrod ed and pitted appearance, the skin is marked into transverse rows of hard quadr ate areas and in addition protected dorsally by large keeled bony scutes, and the tail is provided with a partly double crest. Although fitted for terrest rial locomotion, the feet are as well adapted for aquatic life by being Webb ed. More remarkable adaptations for life beneath the waters are valves on the snout for closing the nostrils and external ear openings, and especially the arrangement by which the glottis fits into the internal nares, enabling the crocodile to breathe while the mouth is open and to hold a struggling animal beneath the surface until it drowns. A crocodile's stomach is constructed much like a bird's gizzard and is a receptacle for stones and other hard substances by which the food is ground. About 10 living species are known, all of which are strictly aquatic animals; three are American, an equal number African and the remainder distributed through the Indo-Malayan and North Australian regions.

The only species which enters the United States is C. americanus, which is of rare occurrence in southern Florida, where it has been known to exist since 1875, but more common in the West Indies, Central and South America. Little is known of the habits of this species and it may be readily distinguished from the very much more abundant alligator by the longer, more slender snout with a median ridge, besides the generic characters mentioned above. The extreme length appears to be about 14 feet. Unlike the alligator it enters brackish and salt water, and may be found in the swamps throughout the continent and swarms in the waters of Madagascar and of the upper Nile, but has been exterminated in lower Egypt. Like the alligator, the crocodile is essentially a scavenger, but attacks, drowns and devours various animals which enter the water in which it lives, not excluding full grown cattle, or even man, especially after nightfall. It is said that, like the tiger, the crocodile acquires a taste for and prefers human flesh. The Mugger, or crocodile of the Ganges, crochets in C. palustris, is an object of religious worship by the natives. Crocodiles are numerous dens in the river banks above the water level, which they enter by means of long burrows opening beneath the water; they are used as retreats in case of danger, and in which to devour their prey. Numerous eggs are deposited in a hole or nest in dry earth, the mother remaining near to guard them, a point in which as, indeed, in most of its habits the crocodile resembles our well-known alligator (q.v.). In one of its associates, however, it is unique. A species of leech (Limnatis nilotica) infests the great saurian's mouth, which is said to be habitually entered by a plow-like bird for the purpose of feeding upon the parasites. It is not clear to what species of bird this habit is due and it is attributed to the M use of crocodiles, as it may as easily be considered to be Pluvianus aegyptius. The Egyptian crocodile was anciently the object of elaborate worship, possibly, as was suggested by Eusebius, because it appeared in greatest numbers at the time of the flooding of the Nile; hence it was connected with the fertility of the soil, was cared for by the priests, and in many cases embalmed after death.

CROCODILE-BIRD, an African pla ver, credited since the days of Herodotus with entering the open mouths of basking crocodiles to feed on the bits of food clinging to the reptiles' teeth, or possibly to pick out parasites. Two noisy plows common along African river-banks, and both called "zie-zac" from their cries, are said to indulge in this dangerous performance, but the name crocodile-bird belongs more properly to only one of them—the crested, spurt-winged plow (Hoplotypus spinosus) of the Nile Valley. There is good evidence that this bird does actually enter the mouth of crocodiles, which welcome the bird's attentions. Consult Lydekker, 'Royal Natural History' (Vol. IV).

CROCODILES, Fossil. Crocodiles are a very ancient group of reptiles and were much more abundant and widespread in former geological periods, when the climate was more tropical than it is to-day. They have changed comparatively little in external appearance from the beginning of the Age of Reptiles until now, and the bony plates over the head and back were from the first characteristic of them. The most ancient crocodilian animals were the Belodontia (see Belodon) of the Triassic Period, partly intermediate between crocodiles and dinosaurs and with many archaic characters. In the succeeding Jurassic Period flourished primitive marine and fresh-water crocodiles (Telesaurus, Bemissartia, Goniopholis), in which the vertebrae were bi-concave instead of convexo-concave, as in true crocodiles. In the later Cretaceous and Tertiary times the crocodiles were abundant, their range extending much farther north than it does now. They are found in the New Jersey green sands, in the Bad Lands of western United States and Canada,
and in various parts of northern and central Europe, and their distribution was probably world-wide and not restricted, as now, to tropical or sub-tropical regions.

CROCODILIA, a sub-class of reptiles characterized by the possession of four well-developed, approximately equal legs, long tails, fixed quadrate bones, teeth firmly implanted in alveole and restricted to the jaws, solid vertebræ, cervical and thoracic ribs with distinct tubercular end capitula, complete and abdominal ribs, simple pubic bones and the separateness of the two pubic bones and ischia. There is a strong quadratojugal arch in the skull. The cloaca is longitudinal and the copulatory organ of the male is single and anterior. The heart is a single ventricle and the aorta is divided at the heart into three equal branches; the limbs, head and body-walls receive arterial blood, while that which goes into the viscera is mostly venous. The existing Crocodilia are divided into gavials (Gav.), with long and slender snout and a large number of approximately equal teeth, and crocodiles and alligators (All.), with a relatively blunt snout and unequal teeth. For the differences between alligators and crocodiles, see the articles on these animals.

CROCOITE, native chromate of lead, PbCrO₄. Crocoite crystallizes in prismatoid forms belonging to the monoclinic system, and also occurs in granular and columnar forms. It is scarlet red in color and translucent, with a adamantine lustre. It has a hardness of 2.5 to 3 and a specific gravity of about 6. It was in this mineral that Vauquelin discovered the element chromium in 1797. Crocoite occurs in the Ural Mountains, also in Brazil, and in small quantities in Hungary, the island of Luzon and in Mariposa County, Ariz. Tasmania is by far the most important locality, having produced many specimens which rank among the finest mineral specimens known.

CROCUS, in mythology, a youth who was enamored of the nymph Smilax and changed into the flower which was named after him. According to another tradition he was metamorphosed by his friend Hermes, who had kept the game of discus. Consult Ovid, Metam. IV, 283.

CROCUS, a genus of perennial herbs of the family Iridaceae. It includes about 70 species characterized by corms, showy, long, funnel-shaped, erect, sometimes fragrant flowers of six nearly equal segments, three stamens and a three-celled ovary containing numerous nearly globular seeds. They blossom in autumn or early spring, the spring species being most widely known, and valued for their diversely colored flowers, the ease with which they are cultivated, and the cheapness of the corms, commonly called bulbs. The corms are planted about three inches deep in any good garden soil in autumn, and allowed to remain for several years, when, owing to the formation of the new corms above the old ones, the plants are in danger of becoming uncovered. The little corms which have been developed by the old ones are separated, stored in a dry place until autumn and replanted. They are often planted in lawns, but must there be frequently removed, because the grass chokes them. C. sativus yields the formerly well-known dye, saffron, which was prepared from the dried stamens. This coloring-matter has been largely replaced by aniline dyes. About 30 species are cultivated in American gardens and greenhouses. Consult Bailey, 'Cyclopedia of American Horticulture.' (New York 1914).

CROCUS, or Colchothur, a polishing powder composed of oxide of iron and prepared by calcining ferrous sulphate. Crocus is purplish in color and differs from rouge chiefly in its comparative coarseness. (Formerly called "crocus of Mars" or "crocus Martis astringens").

CROES, John James Robertson, American civil engineer: b. Richmond, Va., 5 Nov. 1834; d. 1906. He was graduated at the College of Saint James, Maryland, in 1854; and was engaged as civil engineer, principally in hydraulic and sanitary work, after 1856. He was engaged in the waterwork construction in New York, Brooklyn and Washington; became an expert on the problem of water-supply, sewerage, waterworks and water power valuation, irrigation and rapid transit in cities; and wrote numerous articles on engineering subjects. He was treasurer in 1877-87 and president in 1901 of the American Society of Civil Engineers. He was editorial writer for the Sanitary Engineer 1880-90.

CRESUS, krè'sus, king of Lydia of the Mermnad line. He succeeded his father, Alyattes, 560 B.C. The territory governed by him included nearly all of Asia Minor, which he had conquered. His riches, obtained chiefly from mines and the gold dust of the river Pactolus, were greater than those of any king before him, so that his wealth became proverbial. Proud of his treasures, he carried his love of splendor to extravagance and thought himself the happiest of men. His capital, Sardis, became the brilliant centre of arts and letters. The legend says that, when of his wealth, he asked the philosopher Solon what he thought of his good fortune. *I pronounce no man fortunate until his death,* was the sage's reply. Subsequently Cressus was made prisoner by Cyrus, king of Persia. When seated on the funeral pyre and about to be burned to death, he recalled the words of Solon, and thrice repeated his name. Cyrus demanded an explanation. Cresous gave it, and Cyrus not only spared his life but also took him into his favor and protection. At the death of Cyrus he recommended Cresous to the favor of Cambyses. Consult Herodotus 1 (Vol. I, pp. 99-100, Oxford 1912); Jebb, 'Bacchylides' (London 1905).
CROFTERS—CROLL

bits' (1886); 'The Prophecy and Other Poems' (1893); 'The Folks Next Door' (1893); 'Five Years in Camp and Field' (1909) and many pamphlets.

CROFTERS, a term applied in Scotland to a species of small farmers, the occupiers of small pieces of land, from which they derive their livelihood, or great part of it, by cultivation or rearing and grazing cattle. Their conditions were such as to make inevitable the fact that the chiefs of the clans came to be regarded as proprietors of the land. The followers of the chieftains settled on the land, paying rent in lieu of personal services. Crofters are numerous in the Highlands and Western Islands of Scotland, and they live for the most part in townships, each with his own piece of arable land, but with a joint tenancy in mountain pasture. From some districts, in recent times, they have been summarily removed to make room for sheep farms and deer forests, so that they are now chiefly congregated on the seashore, where they are able to maintain themselves in part by fishing, and generally eke out a precarious existence. They have often complained of many grievances, such as high rents, want of compensation, disentitlemen to ousting, high local rates and want of harbors and railways. In the early 19th century measures for relief were undertaken. A parliamentary commission was appointed in 1833 to investigate their conditions. Under the Crofters Act (1886) some of these hardships have been removed and great reductions of rent granted. This act is applicable only to the counties of Argyle, Sutherland, Inverness, Caithness, Ross, and Cromarty, and Orkney and Shetland, where there are estimated to be 40,000 families of the crofter class. There are crofters to some extent also in other counties, but generally these seem to be in more favorable circumstances. (See SCOTLAND.) Consult Dalriad, 'The Crofter in History' (Edinburgh 1888); Guernier, 'Les crofters écossais' (Paris 1889).

CROFTS, Ernest, English painter: b. Yorkshire, 15 Sept. 1847; d. 19 March 1911. He studied art at London and Düsseldorf, and first exhibited at the Royal Academy in 1874. He became a Royal Academician in 1896. He attained celebrity as a painter of historic battle scenes. His works include 'Napoleon at Ligny' (1875); 'The Morning of Waterloo' (1876); 'Cromwell at Marston Moor' (1877); 'Wellington's March from Quatre Bras' (1878); 'The Evening of Waterloo' (1879); 'Napoleon Leaving Moscow' (1887); 'The Execution of Charles I' (1890); 'The Conspirators' Last Stand at Holbeach House' (1896).

CROGHAN, krō'gən, George, American military officer: b. near Louisville, Ky., 15 Nov. 1791; d. New Orleans, 8 Jan. 1849. He was graduated at William and Mary College in 1810, and greatly distinguished himself at the defense of Fort Meigs and Fort Stephenson in 1813, receiving a gold medal from Congress. In 1814 he became lieutenant-colonel but resigned in 1817 and was appointed postmaster at New Orleans in 1819. He became inspector-general of the army in 1825, joined General Taylor's forces in Mexico in 1846 and took part in the battle of Monterey.

CROKER, B. M. (Sheppard), English novelist. She was married to Lieut.-Col. John Croker of the Royal Munster Fusiliers, and spent 14 years in India and Burma. Her writings include 'Pretty Miss Deville' (1883); 'Some One Else' (1884); 'A Bird of Passage' (1886); 'Diana Barrington' (1888); 'Two Masters' (1890); 'A Family Likeness' (1892); 'Village Tales and Jungle Tragedies' (1894); 'Married or Single' (1895); 'The Real Lady Hilda' (1895); 'In the Kingdom of Kerry' (1896); 'Beyond the Pale' (1897); 'Miss Baldwin's Past' (1898); 'Terence' (1899); 'A State Secret' (1901); 'Angel' (1901); 'The Spanish Necklace' (1907); 'Katherine the Arrogant' (1910); 'In Old Madras' (1913); 'Lismore' (1914).

CROKER, John Wilson, Irish miscellaneous writer: b. Galway, 20 Dec. 1780; d. Hampton, 10 Aug. 1857. He was educated at Trinity College, Dublin, and entered Lincoln's Inn as a student in 1850, being admitted to the Irish bar two years later. His capacity for satire revealed itself in 'Familiar Epistles,' a clever satire on the Irish stage, and 'An Intercepted Letter from Canton.' His 'Songs of Trafalgar' spread his fame as a poet. In 1808 he issued 'State of Ireland, Past and Present,' a pamphlet denouncing the Catholic exclusions, and brought him before the notice of the politicians; and in the same year he was elected member of Parliament for Downpatrick. In 1809 he became Secretary to the Admiralty, a post which he held for more than 20 years. He was one of the founders of the Quarterly Review, and contributed many violent political articles, as well as many personal and abusive criticisms, notably of Keats' 'Endymion.' He was caricatured by Disraeli in 'Coningsby.' Macaulay's review of Croker's edition of Boswell's 'Life of Johnson' and the latter's counterblast on Macaulay's 'History of England' are among the celebrities of literary duels. He was a Tory politician of intense fervor, permanently resigning his seat in Parliament because of the passage of the Reform Bill of 1832. He published also 'Stories from the History of England for Children' (1817) and a poem, 'The Battle of Talavera' (1809), which received much praise. Consult Jennings, 'Diaries and Correspondence of Croker' (London 1884).

CROKER, Richard, American politician: b. Black Rock, Ireland, 24 Nov. 1843. When two years of age he came to America with his parents and received his early education in the public schools of New York city. Associating himself with Tammany Hall, he became prominent in politics during the scandal of the Tweed ring, whose schemes he vigorously opposed. In 1868-70 he was alderman; 1873-76, coroner; 1883-87, city fire commissioner; 1889-90, city chamberlain; also being the recognized leader of Tammany Hall 1884-1903. In the latter year he retired to a country life in England and Ireland, as a recreation interesting himself in horseracing. In 1907 he won both the English and the Irish 'Derby' with his racehorse Orby. In 1908 he was made a freeman of the city of Dublin. Consult Lewis, 'Richard Croker' (New York 1917).

CROLL, krōl, James, Scottish geologist: b. Little Whitefield, Perthshire, 1821; d. Perth, 15 Dec. 1890. He received the ordinary education of a peasant's son and then studied philosophical and physical science and published a treatise
on 'Physical Cause of the Change of Climate During the Glacial Period' (1864). In 1859 he was appointed keeper of the museum in the institution known as Anderson’s University, Glasgow, a position which he held until his appointment to a minor post in the Geological Survey of Scotland in 1867. His writings include 'The Philosophy of Theism' (1857); 'Climate and Time in their Geological Relations' (1873), perhaps his ablest work; 'Drumlanrig's Cremation' and 'Geology' (1886); 'Stellar Evolution' (1889); 'The Philosophical Basis of Evolution' (1890). Consult Irons, T. C., 'Autobiographical Sketch of James Croll, with Memoir of His Life and Work' (London 1896).

CROLLIUS, Oswald, German chemist: b. Wetter, Oberhessen, about 1580; d. 1609. He is remembered as author of a Latin work entitled 'Basilica Chymica,' which appeared at Frankfort in 1609 and went through 16 editions, was translated into French, into German and by Richard Russell into English under the title of 'Royal and Practical Chymistry' (London 1670). This is a remarkable mixture of speculative ideas about the action of chemical substances in different diseases and practical skill in their preparation of substances they were familiar with. Crollius was obviously quite familiar with the details of the processes he described, although they sometimes would, sometimes would not, yield the bodies he intended, and although he was of course ignorant of the true composition of many of his occupant's skill he discovered new preparations, which he introduced into medicine, and which still remain, and this practical ability seems to have given weight to his therapeutic theories.

CROLY, krölī, Jane Cunningham ("Jennie June"), American author and journalist: b. Market Harbor, England, 19 Dec. 1831; d. New York, 23 Dec. 1901. She removed to New York in 1841, and in 1856 married D. G. Croly. She was editor of Demorest's Magazine 1860-67, and of The Cycle and The Harpers' Weekly. She was one of the founders of "Sorosis" and its president for 14 years; founded the New York Women's Press Club in 1889 and in 1892 became professor of journalism and literature in the Rutgers's Women's College; and was one of the most active promoters of the Federation of Women's Clubs. She published 'Talks on Women's Topics' (1863); 'For Better or Worse' (1875); 'Three Manuals for Work' (1885-89); 'History of the Women's Club Movement in America' (1900), etc. Consult "Memories of Jane Cunningham Croly, "Jennie June"" (New York 1904).

CROMARTY, krō'mär-tē, Scotland, a former county in the north, consisting of 14 detached portions scattered over the county of Ross and Cromarty, now united to it. The total area was about 220,800 acres. This singularly awkward county was formed at the request of an earl of Cromarty, who desired that one county might contain all his lands wherever situated.

CROMARTY FIRTH, a long, narrow inlet of the sea, unifying into one the counties of Ross and Cromarty in a southwesterly direction, and having a length of about 18 miles and an average breadth of two to five miles, and from 5 to 40 fathoms deep. Its entrance from the Moray Firth, between two bluff-wooded headlands called the Sutors of Cromarty, is about a mile wide, with 30 to 40 fathoms of water. It is relatively shallow, and it affords excellent shelter for shipping and is often crowded in stormy weather. At its upper end it receives the river Conan, and this portion of the firth is shallow, several square miles of mud-flats being laid bare at low water. On its shores are the towns of Cromarty, Invergordon and Dingwall.

CROME, John, English landscape painter: b. Norwich, 22 Dec. 1768; d. there, 22 April 1821. His school education was very scanty, but after some struggle and a long apprenticeship to a sign painter he succeeded in getting established as a drawing-master. He studied the Dutch masters, his favorite being Hobbema, but his distinguishing characteristic is his genuine English realism. He paid great attention to detail, and though this is sometimes exaggerated in his work, the idea of feeling for light and out-of-doors which give great force and individuality. In 1805 he founded the Norwich Society of Artists, of which he became president as well as chief contributor to its annual exhibitions. Some of his pictures are "Household Heath," "View of Chapel Fields, Norwich," "Carrow Abbey," and "Clump of Trees," the "Oak at Poringland" (in the National Gallery); the "Willow"; "Hautbois Common" (in the Metropolitan Museum); and "The Old Bishop's House," also in New York. His visit to Paris enabled him to catch the livelier note in his "Fishmarket at Boulogne" and "Boulevard des Italiens, Paris" (Keswick Hall, near Norwich). He excelled in depicting the scenery of his native county, and especially in his native handling of trees; and his high place among British landscape painters is now universally acknowledged. He also practised etching with great success. His etchings were published posthumously under the title of "Norfolk Picturesque Scenery" (1834, 1838, 1850). Consult his biography by Turner (Norwich 1838); Wedderspoon (ib. 1858); Hardie, in the "Connoisseur" (London 1904); VanDyck, "Old English Masters" (New York 1902); Dickes, "The Norwich School" (London 1905). Binyon, "J. Crome and J. S. Cotman" (ib. 1906); Theobald, "John Crome's Etchings" (ib. 1906). He is sometimes called "Old Crome," to distinguish him from his son, J. Berney Crome, also an artist (q.v.).

CROME, John Berney, English landscape painter: b. Norwich 1794; d. 1842. He was the son and pupil of John Crome (q.v.), and is called "Young Crome," to distinguish him from his father. In 1819 he became president of the Norwich Society of Artists. His pictures are mostly river and coast scenes of England, France, Holland and Italy. His father's style so closely that much confusion of authorship has resulted, especially in "Yarmouth Water Frolic," which was for a long time considered the masterpiece of the elder Crome. Toward the end of his life he painted inferior subjects. Consult Dickes, "The Norwich School of Painting" (London 1905).

1917. He was educated at the Ordnance School, Carshalton, and at the Royal Military Academy of Woolwich. He joined the Royal Artillery in 1858, became aide-de-camp to Sir Henry Storks, high commissioner of the Ionian Islands, in 1878, and was also called to the bar. He was made a C.B. in 1875 and was appointed commissioner for the inquiry into the Jamaica outbreak in 1863. He came to New York in 1864 to study the Civil War, went to the front with the Federal troops and succeeded in reaching the Union lines before Petersburg. He was gazetted captain in 1870, and in 1872 became private secretary to his cousin, Lord Northbrook, viceroj of India, where he remained until 1876, when he was gazetted major and was appointed British commissioner of the Egyptian public debt office. He was mainly responsible for the report of the commission of inquiry of 1878, into the financial methods of the Khedive Isma'il, and on the latter's enforced abdication in 1879, Major Baring became British controller-general of Egyptian finances and practical director of the dual control. He was transferred to India in 1880, where he became financial member of the council of the governor-general of India. He remained there till 1883, leaving an unimpeachable mark on the financial system of India, and in the same year became British agent in consul-general of Egypt and a minister plenipotentiary in the diplomatic service. He was created first Baron Cromer in 1892, viscount in 1898 and earl in 1901. His record was made in Egypt, where he found the country bankrupt and the people ground down by heavy taxation. He bolstered up the country's credit, reduced taxation to a minimum, removed dishonest officials by the thousand, abolished forced labor, built schools and hospitals and introduced modern sanitation methods. His biggest single work was to build the country's irrigation system, considered for years the model of the world. This greatly increased the country's prosperity, by securing the natives three crops a year. He saw to it that the peasants and small farmers received proportionately the same benefit as the owners of huge estates. He also reformed the army, increased trade and greatly extended railway, postal and telegraph facilities. His efficient administration won for him the title of "Maker of Modern Egypt." He resigned in 1907 because of ill health and received a grant of £250,000 from Parliament in recognition of his services in Egypt. In 1908 he published, in two volumes, "Modern Egypt," in which he gave an impartial account of events in Egypt and the Sudan since 1876, and dealt with the results to Egypt of the British occupation of the country. In 1911 he was active in securing Unionist support for the Parliament Bill, so as to prevent the creation of new peers. He wrote several articles on the European War, and in July 1916 was appointed chairman of a commission to investigate all Dardanelles campaign. His publications, besides those already noted, include "Staff College Essays"; "Paraphrases and Translations from the Greek"; "The War Game"; "Ancient and Modern Imperialism" (1910); "Political and Literary Essays" (1908-13); "Abbas II" (1915). See EGYPT.

CROMLECH. króm'lék, the name given to a kind of ancient sepulchral monument, numbers of which have been found in all parts of the British Islands, as well as on the continent of Europe, in Asia and in America. A cromlech consists of three or more columns of unhewn stone supporting a large tabular block so as to form with it a rectangular chamber, beneath which the floor of which is generally found a sepulchral chamber or cist enclosing a skeleton with arms, stone implements and other ancient relics. Sometimes the cromlech was encircled by a ring of standing stones, as is seen in the case of the Standing-stones of Stennis, in Orkney, and some it was itself buried beneath a large mound of earth. Among the most remarkable cromlechs in England are those known as Kit's Coty House, near Aylesford, in Kent, consisting of three upright stones with a very large flat one above them; the cromlech of Chun Quoit, in Cornwall; the capstone of which is calculated to weigh 20 tons; and two cromlechs standing beside each other at Plas Newydd in Anglesey. Among cromlechs in Scotland we may mention one near Crugmaddie House, Stirlingshire, called the Hay; and one remarkable for being a complete cromlech consisting of three stones only; and a partially ruined one at Bonnington Mains, near Edinburgh, called the Witch's Stone, the capstone of which measures 11½ feet long and 10½ feet in greatest breadth. The term cromlech is supposed by Prof. Daniel Wilson to be derived from cromad (Gaelic) or cremen (Welsh), signifying a roof or vault, and clach or lech, a stone, and would therefore mean the suspended or vaulted stone. See Dolmen.

CROMMBLAIN, krám-mé-lán', May de la Cherois, sá'rá, Irish novelist: b. in Ireland, the descendant of a Huguenot founder of the Ulster linen trade. She has traveled extensively and is the author of "Queenie"; "My Love, She's but a Lassie"; "A Jewel of a Girl"; "Miss Daisy Dimity"; "Orange Lily"; "In the West Country"; "Brown Eyes"; "Goblin Gold"; "Violet Vivian, M. F. H."; "For the Sake of the Family"; "Love Knots"; "Bay Ronald"; "Dust Before the Wind"; "Over the Andes"; "Half Round the World for a Husband"; "Divil-May-Care"; "Carolina"; "The Luck of a Lowland Laddie"; "A Woman Derelict"; "Crimson Lilies"; "Partners Three"; "The White Lady"; "Lovers on the Green"; "Pink Lotus." Her novels have circulated extensively in the United States.

CROMPTON, Samuel, English inventor: b. Firwood, near Bolton, 3 Dec. 1753; d. Bolton, 26 June 1827. He early displayed a turn for mechanics, and when only 21 years of age invented the machine for spinning cotton which is now constantly associated with his name, and was called a mule, from its combining the principles of Hargrave's spinning jenny and A. Wright's roller-frame, both of which had been invented a few years previously. The mule shared in the odium excited among the Lancashire hand weavers against these machines, and for a time Crompton is said to have taken his invention to pieces and conceal it from view. He afterward refitted it and brought it again into work, but was unfortunately unable to secure a patent for it. Various improvements were introduced from time to time on the mule, but the original principle, as in the case of Crompton, remained the same. In 1812 the sum of £5,000 was voted to him by Parliament. This
was almost all the remuneration which he ever received for an invention which contributed so essentially to the development of the greatness of Great Britain as a manufacturing nation. Charles Freeth, 'Life and Times of Crompion' (London 1860).

CROMWELL, Bartlett Jefferson, American naval officer: b. Georgia, 9 Feb. 1840. He was at the Naval Academy 1857-61, and was the first midshipman appointed from Nebraska. He served on the Quaker City, and Conemaugh with the fleet in blockade during 1861-63; and with the east Gulf squadron 1863-65. He was commissioned commander 24 Oct. 1874; was inspector of ordnance 1878; on duty at Portsmouth navy yard 1882-85; League Island navy yard 1886-89; and promoted captain in March 1889. At the conclusion of the Spanish-American War he was ordered to Havana to receive the surrender of the naval station there. He became a rear-admiral 3 March 1899. In 1901 he was appointed to the command of the United States fleet in South American waters and later in the same year to the command of the European station. He retired 9 Feb. 1902, having reached the age limit of 62 years.

CROMWELL, Henry, English soldier: b. Huntington, England, 20 Jan. 1628; d. Soham, Cambridgeshire, 23 March 1674. He was the fourth son of Oliver Cromwell, under whom he served as colonel in Ireland in 1649. He sat in Parliament in 1653, and was lord-deputy of Ireland 1655-57 and lord-lieutenant 1657-59, his rule being conservative and popular. His toleration of the Royalists was rewarded by the approval of Charles II and the confirmation of his Irish estates under the Act of Settlement. After 1659 he lived in retirement as a farmer on his estate at Spwney Abbey in Cambridge.

CROMWELL, Oliver, lord-protector of England: b. Huntingdon, 25 April 1599; d. London, 3 Sept. 1658. He was the second son of Robert Cromwell and Elizabeth Steward. His father was a younger son of Sir Henry Cromwell, knighted by Queen Elizabeth; and Sir Henry again was a son of Sir Richard Wroth, lord Cromwell, Earl of Essex, whose name he took. He entered Sidney Sussex College, Cambridge, 23 April 1616, but left on the death of his father in 1617. In 1620, at the age of 21, he married Elizabeth, daughter of Sir John Bourchier, and settled on his estate at Huntingdon. In 1628 he was a member of Parliament for Huntingdon and distinguished himself by his zeal against popery. On the dissolution, in 1629, he returned to Huntingdon; in 1631 he went with his family to a grazing-farm he had taken at Saint Ives; and in 1636 to Ely, where he had inherited a property.

The storm was already at hand which was to shake England to its foundations. The arbitrary measures of Charles I were so stoutly resisted that he endeavored to summon Parliament; but at length the king was compelled, by the state of affairs in Scotland, to summon a Parliament (1640). Cromwell, now a member for Cambridge, and others were so loud in the complaints of abuses in Church and state that Charles prorogued the Parliament, but six months after was obliged to reassemble it. In this Parliament, called the Long Parliament (from November 1640 to April 1653), Cromwell first attracted notice chiefly by his rustic and slovenly dress and by the vehemence of his oratory.

On the breaking out of the great Civil War in 1642, being appointed captain, he raised a troop of horse (the 'Ironides') composed of zealous Puritans. He was present at Edgehill (23 Oct. 1642); his first military exploit was to capture the magazine of Cambridge along with the university plate. He then united the Royalists and made himself master of their supplies. He laid the foundation of his military fame by the relief of Gainsborough (28 July 1643), and in October 1643 he was assailed by a greatly superior Royalist force at Wincely, but defeated it. In this action he had a horse killed under him, and was himself struck down while in the act of rising. On 2 July 1644 the battle of Marston Moor was gained by the parliamentary army—a result mainly brought about by Cromwell and his magnificent discipline of his regiment of Ironides was designed to fit men of religion to oppose men of honour. Cromwell also bore a distinguished part in the second battle of Newbury (27 Oct. 1644) under the Earl of Manchester.

The Independent party, led by Cromwell and his friends, were for pursuing the war with the utmost vigor, and in order that they might have their way determined to get the entire control of the army. In order to accomplish this, they procured the passing of the Self-denying Ordinance, prohibiting members of either house of Parliament from holding any military command on the ground that vices and corruptions had crept into the army, that it required to be reformed and a stricter discipline maintained. Fairfax was made lord-general in place of Essex, while Cromwell was placed under him, with the rank of lieutenant-general. Cromwell now introduced into the whole army the excellent discipline which he had already trained a part of it, and gained the decisive battle of Naseby (14 June 1645), in which the king was routed with great loss. The spirit in the army, which the officers, and especially Cromwell, had created by the songs and prayers, had now risen to fanaticism; though at the same time good order and morality were so well maintained that profanity, drunkenness, robbery, and the like offenses, hardly ever occurred. After Naseby no time was lost by the parliamentary leaders in following up their success. Leicester was retaken, Taunton relieved, Bridgewater stormed, Bristol, held by Prince Rupert, was besieged and surrendered, Devizes was stormed, Winchester surrendered, Dartmouth was stormed, and finally Sir Jacob Astley was defeated at Stow-on-the-Wold, 21 March 1646.

The Royalists were completely crushed. Charles took refuge with the Scottish army (5 May 1646), but was soon given up by them to the Parliament, on which occasion Cromwell was one of the commissioners. When Parliament, in which the Presbyterian element predominated, wished to disband the army, the soldiers, headed by the Independents, appointed a council of officers, consisting of officers and privates called Adjudicators (misspelt agitators), who declared to the Parliament that they would not lay down their arms till the freedom
of the nation was established. Some of the soldiers conducted themselves so boldly that Parliament ordered their arrest; on which occasion, the execution of Artaxerxes, and the traitor the House of Austria. By the support of Fairfax and others, even entered into a treaty with him; but he soon discovered that Charles was not to be trusted and that the king's success would be his destruction. Fighting now took place with the Royalist party in Wales, but Cromwell soon finished the struggle in this quarter; after which he proceeded against the Scots, who had raised a strong army "to deliver the king from sectaries." As Fairfax, from Presbyterian scruples, declined the command of the expedition against Scotland, Cromwell undertook it. With a much inferior force he defeated the Scots in a three days' action at Preston (17–19 Aug. 1648) and marched on to Edinburgh.

Now followed the tragedy of the king's execution, 29 Jan. 1649. Cromwell's name stood third in the death warrant; though he may have been impelled to the step by force of circumstances and by his knowledge of the king's faithlessness, there is no reason to suppose that he regretted the share he took in the death of the king, or thought that he was unjustly punished. Affairs in Ireland now demanded his presence, and having been appointed lord-lieutenant and commander-in-chief, he joined the troops there in August 1649. He took Drogheda by storm (September 1649), where he gave orders that nothing should be spared. Most of the cities opened their gates without resistance, and within six months the Royalist party in Ireland was wholly crushed.

Resigning the command to Ireton, he now undertook, at the request of the Parliament, a similar expedition against Scotland, where Prince Charles, afterward Charles II, had been proclaimed king. The victory at Dunbar, 3 Sept. 1650, rid Cromwell of the menace in that direction; meanwhile, however, Prince Charles had elected new Lords, but Cromwell, by skilful marches near Stirling, cut him off from his points of support, when, contrary to his expectation, the prince entered England and threatened the metropolis itself. Cromwell hastened from the Scottish troops into England. Charles was totally defeated at Worcester, 3 Sept. 1651, and this victory, which Cromwell called the crowning mercy of God, gave the commonwealth party full power over the three nations.

Cromwell already exerted a weighty influence on the supreme direction of public affairs. He succeeded in restoring the continental relations of England, which had been almost entirely dissolved, and regulated them so as to promote the interests of commerce. The Navigation Act, from which may be dated the rise of the naval power of England, was framed upon his suggestion and passed in 1651. Meanwhile the Long Parliament, aiming to establish its own power, was growing more and more unmanageable. To prevent its disguising tyranny, the war which it had provoked with the Dutch and its treatment of the prisoners taken at Worcester, some of whom were put to death in prison and others sold for slaves in the colonies. Cromwell now spoke openly to his friends of the ambition, the godlessness and state, and equipped the House of Commons. Encouraged by their support, he, with five or six files of soldiers, dispersed that body 20 April 1653. He then summoned a council of state consisting mainly of his principal officers, which finally chose a Parliament of persons selected from the three kingdoms, which, from Praise-God Barebone or Barebone, one of the principal characters in it, by trade a leather seller, was nicknamed Praise-God Barebone's Parliament, another name being the Little Parliament. Cromwell opened the session with a speech, in which he said that the day was come on which the saints were to commence their reign upon earth. Fifteen months after, a new annual Parliament was chosen; but after five months Cromwell prevailed on this body to place the charge of the commonwealth in his hands. The chief power now devolving again upon the council of officers (12 Dec. 1653), they declared Oliver Cromwell sole governor of the commonwealth, under the title of lord-protector.

The need of an assembly for the regulation of the new order, and the necessity of the monarchy and firmness. With the aid of General Lambert he formed a constitution called the Instrument of Government, by which the Protector with his council was invested with the power of peace and war, and was to summon a Parliament once every three years; the supreme legislative authority was declared to be and to reside in the lord-protector and Parliament; all commissions, patents, writs, processes, etc., were to run in the name of the lord-protector; all the forces of the kingdom were to be under the protector and Parliament during the sitting of the latter, but in the intervals of Parliament, under him and his council alone. In case of his death the council were immediately to choose a new protector; but no protector after him was to command the army. Cromwell treated Ireland with great severity. Apart from that, his political administration was masterly and adapted to the circumstances of his situation. He established large magazines of provisions; the Muster Day of the soldiers was fixed for them a month in advance; yet the public revenues were strictly and economically managed, without any additional imposts. He appointed for judges the most upright and distinguished men. He never interfered with the proceedings of the courts of justice. Every man had liberty of conscience—a principle for which the protector was a lifelong supporter. In other things, too, Cromwell, as his own correct judgment prompted, would have governed with mildness and justice, and promoted the arts and sciences, but was orld to maintain his power, as he had acquired it, by a severity often amounting to tyranny. He cultivated the friendliest relations with the Protestant powers, Holland, Sweden and Denmark, and concluded an advantageous commercial treaty with Portugal. The skilful and fortunate conduct of the war with Spain, from 1655 to 1658, in which Jamaica and Dunkirk were taken, made the new Parliament, from which Cromwell had carefully excluded all Republicans, so obdurate, that they at last conferred upon him the title of king. Some individuals opposed the measure so resolutely that Cromwell, fearing the fate of Caesar, declined the title. Parliament gave
him the title of "Highness," and the right of appointing his successor; and he was a second time solemnly invested by the Speaker with the ensigns of his office (26 June 1802). He died at Hampton Court on 13 Aug. 1628, and was buried in the Church of St. James's, prisoner, and was buried in King Henry VII's Chapel, in Westminster Abbey. Most of the European courts went into mourning for him, even that of Versailles. After the Restoration his body was taken up and hanged at Tyburn, the head being fixed on a pole at Westminster Abbey, and the rest of the remains buried under the gallows.

Cromwell was great as a soldier—one of the greatest leaders of cavalry in history; his "crowning mercy" at Worcester has been regarded as the prototype of Sedan; but he was greater as a statesman and civil administrator. His task after his elevation to the protectorate was one of unexampled difficulty. It was on the one hand by royalist plots and on the other by republican revolutionaries, he who had humbled and stamped out one tyranny was, by the ironical pressure of events, impelled to set up a more complete absolutism in its place. His death had, it is true, redounded to the glory of England. "His greatness at home," said Clarendon, "was a mere shadow of his greatness abroad." Even in the England drunk with the excesses of the Restoration this side of his rule was remembered. It is strange records Pepys in his diary, eight years after Cromwell's death, "how everyone do nowadays reflect upon Oliver and commend him, what brave things he did, and made all the neighbour princes fear him."

In his personal habits, Cromwell was austere, temperate, indefatigably industrious and exact in his official duties. His exterior inspired neither love nor confidence; his figure had neither dignity nor grace; his voice was harsh; in his public speeches he expressed himself with force and fire, but without method or taste. On the other hand, he possessed extraordinary penetration and knowledge of human nature; no one knew so well as he the art of winning men and using them to his purposes. He devised the idea of the Protectorate, and effectually carried it out, not only by the decision and intrepidity with which he executed them. No obstacle deterred him; and he was never at a loss for expedients. Cool and reserved, but full of great projects, he patiently waited for the favorable moment, and failed not to make use of it. In his religious views he was an upright and tolerant Calvinist. In his family life he was irreproachable.

GEORGE EDWIN RINES.

CROMWELL, Oliver, English biographer: b. 1742; d. Cheshunt, Hertfordshire, 31 May 1821. He was the great-grandson of Henry Cromwell, son of the protector, and the last of his known descendants to be born in the estate of "Theobalds," which descended to him through the children of Richard Cromwell, eldest son of the protector. He wrote the Memoirs of the Protector, Oliver Cromwell, and his Sons, Richard and Henry, illustrated by Original Letters and other Family Papers (1820).

CROMWELL, Richard, lord-protector of England: b. Huntingdon, 4 Oct. 1626; d. Cheshunt, Hertfordshire, 12 July 1712. He was the third son of Oliver Cromwell, and by the deaths of his two other brothers, Robert and Oliver, became his father's heir. He was amiable and popular but weak, devoted to field sports and fond of pleasure. He lived for some time in comparative privacy, and was called to succeed his father in the protectorate in September 1658. Scarcely had he entered on his office, when the forces of anarchy, both parliamentary and military, broke loose, and he found himself utterly unable to restrain them. It was probably with little reluctance that he quitted Whitehall in April 1659, and returned to a private life. After the Restoration he lived for a time abroad under the name of Clark, but he returned to England about 1680, passed the remainder of his life at Cheshunt, and was buried in the church at Hursley, Hampshire.

CROMWELL, Thomas, Earl of Sussex, English statesman: b. Putney, Surrey, about 1485; d. 28 July 1540. In his youth he went to the Continent, and was successively common soldier, clerk and trader. In 1514 Wolsey made him collector of the revenues of his see of York, and nine years later he entered Parliament, where his ability soon attracted attention. In 1524 he became a member of Grey's Inn, and Wolsey now employed him in the work of suppressing the smaller monasteries. On his master's disgrace in 1529 Cromwell defended him with great spirit in the House of Commons, and effectually secured the bill of attainder and treason brought against Wolsey. After the cardinal's death Cromwell was taken into the king's service. He was the ready instrument in compassing the royal purposes, by the establishment of the royal supremacy in spiritual things, humbling the power of the nobles, and thus malding the king an absolute monarch. Honors rained upon him. He was knighted and made a privy councillor; in 1533 he was appointed Chancellor of the Exchequer, and in 1534 king's secretary and Master of the Rolls. On the abolition of the Pope's supremacy in 1534 he was created king's vicar-general, and used all his influence to promote the reformation. In 1535 he was commissioned to hold a general visitation of all the monasteries in England, in order to suppress them. In the office he acted with great severity and injustice. He became lord-keeper of the privy seal and was elevated to the House of Lords with the title of Baron Cromwell of Oakeham. In 1539 he became lord High chamberlain, and the following year Earl of Essex. He was elevated to the House of Lords with the title of Baron Cromwell of Oakeham. In 1539 he became lord High chamberlain, and the following year Earl of Essex. He was elevated to the House of Lords with the title of Baron Cromwell of Oakeham. In 1539 he became lord High chamberlain, and the following year Earl of Essex.
CRONIE—CROOKES

Henry, who fell in love with Catherine Howard, and partly in consequence Cromwell was arrested at the council table on a charge of treason committed to the Tower, and a bill of attainder—his own favorite engine of tyranny—was passed against him. After piteous appeals for mercy, which were disregarded by the king, Cromwell was beheaded on Tower Hill, declaring that he died in the faith of the Catholic Church.

Owing to the rigorous suppression of the monasteries, Cromwell has been called "Malleus monachorum," the hammer of the monks. The Protestant reformation in England was greatly advanced by him; the Church of England as a state-controlled institution has continued to exist much as he left it. He ordered that a copy of the Bible should be placed in every church, and an edition of the Bible is named after him. One of his enactments, for which posterity owes him gratitude, was that parish registers of marriages, births and deaths should be regularly kept. Cromwell is not without his apologists—the chief of whom is Prudden; his persecutions, which involved men like Sir Robert More and Bishop Fisher, were undertaken from no religious motive, but like all his measures, from a desire to retain the king's favor as a means to his own aggrandizement. Consult Drayton, 'Historie of the Life and Death of Lord Cromwell' (1609); Gairdner, J., 'The English Church in the 16th Century' (London 1902); Merriman, 'Life and Letters of Thomas Cromwell' (1902).

CRONJE, krön'yé, Pieterus Arnoldus, Boer military commander: b. near Pretoria 1835; d. 4 Feb. 1911. He was prominent in all the history of the South African republic. Bred to farm life, he entered politics, refused office after the British annexation in 1877, commanded at the siege of Potchefstroom, became a member of the Transvaal executive government, and forced the surrender of Sir John Willoughby's forces after the Jameson raid in 1896. During the great war with England Cromwell was appointed to the command in the western theatre of war, and laid siege to Kimberley. He opposed the British column under Lord Methuen, on whom he inflicted a severe defeat at Magersfontein. After the relief of Kimberley he was surrounded at Paardeberg in the Orange Free State, and after a stubborn resistance with an inferior force surrendered to Lord Roberts, 27 Feb. 1900. He was sent as a prisoner of war to Saint Helena, returning to the Transvaal on the conclusion of peace. He visited the United States in 1905.

CRONSTADT. See KRONSTADT.

CRONUS, krön'nus, in ancient Greek mythology, a son of Uranus and Ge ('Heaven and Earth') and the youngest of the Titans. He received the government of the world after Uranus was deprived of it, and was in turn deposed by Zeus. Cronus was considered by the Romans as identical with their Saturnus. See SATURN.

CROOK, George, American military officer: b. Dayton, Ohio; 8 Sept. 1828; d. Chicago, Ill., 1 March 1890. He was graduated at West Point in 1852, and rose to the rank of major-general. In the Civil War he greatly distinguished himself at South Mountain, Antietam, Chickamauga and Appomattox, and after the war achieved celebrity in campaigns against the Indians as commander of the districts of Idaho and Arizona. From 1888 until his death he commanded the military division of the Missouri.

CROOK, Isaac, American clergyman and educator: b. Crossenville, Ohio, 10 Dec. 1833. In 1859 he was graduated from Ohio Wesleyan University, and, having been ordained in 1864 to the Methodist Episcopal Church, he served pastorates in Ohio, Illinois, Michigan, Minnesota and Kentucky. He was president of the University of the Pacific in 1891-92 and of Ohio University in 1896-98, and chancellor of Wesleyan University in 1892-96. After serving four years as pastor at Ironton, Ohio, he was presiding elder of the Chillicothe district from 1902 to 1908. He has published 'Character Sketch of Hon. C. C. White, of Grete, Nebraska' (1896); 'Life of Jonathan Edwards' (1903); 'John Knox and the Scotch-Irish' (1905); 'Earnest Expectation' (1905); 'The Great Five' (1907); and numerous other contributions to newspapers and magazines.

CROOKED ISLAND, one of the Bahamas, in lat. 22° 15' N., long. 74° W. Area about 176 square miles. The chief product is salt. Pop. 1,541.

CROOKED LAKE. See KEUKA LAKE.

CROOKER, Joseph Henry, American Unitarian clergyman: b. Foxcroft, Me., 8 Dec. 1859. He was graduated at Ypsilanti (Mich.) Union Seminary in 1870, and was a Baptist pastor for five years, when he entered the Unitarian ministry. He has received the following honorary degrees: S.T.D. Saint Lawrence University, 1900; D.D. University of Nashville, 1901. He was very successful as a pastor at Madison, Wis., 1881-91; Helena, Mont., 1891-97; and Ann Arbor, Mich., 1897; Roslindale Unitarian Church, Boston, Mass., 1905-12; Redlands, Cal., 1912-13. Called to London in 1913 Crooker was appointed the anniversary sermon before the British and Foreign Unitarian Association he gave an address that year at Amsterdam, Holland, before the International Liberal Congress. In 1914 he was called abroad to preach and lecture in London, Cambridge, Oxford and Liverpool. Among his publications are 'Jesus Brought Back' (1889); 'Different New Testament Views of Jesus' (1890); 'The New Bible and Its New Uses' (1893); Growth of Christianity' (1897); 'Plea for Sincerity' (1898); 'Problems in American Society' (1899); 'The Supremacy of Kindness' (1899); 'The Menace to America' (1900); 'Religious Freedom in American Education' (1903); 'The Supremacy of Jesus' (1904); 'The Church of To-day' (1908) issued simultaneously by three denominations; 'The Church of To-morrow' (1911); 'Shall I Drink?' (1914). 'The Unitarian Church' (1902), has had a circulation of over 100,000 copies; it was reprinted in Great Britain, and translated into Hungarian, Finnish and Japanese.

CROOKES, Sir William, English electrician and chemist: b. London 1832. In 1854 he became superintendent of the meteorological section of the Radcliffe Observatory, Oxford, and in the following year was chosen professor of chemistry at the Chester Training College.
In 1859 he founded the Chemical News. In 1863 the Royal Society elected him a Fellow, and since then many scientific bodies have conferred distinctions on him. He was knighted in 1877, and presided over the 1886 meeting of the British Association at Bristol. Professor Crookes has made his name famous by his important researches and inventions in connection with molecular physics, radiant matter and high vacuum. One of the earliest works was 'Select Methods of Chemical Analysis' (1871). He has since published works on such widely separated subjects as sanitation, spiritualism, beet-root-sugar manufacture, dyeing and calico printing, besides translations on chemistry.

In 1897 he was awarded the Nobel prize in chemistry jointly with Edouard Buchner of Germany; and in 1910 the Order of Merit was conferred on him.

**CROOKES TUBE**, a tube containing a gas at very low pressure, such as was used by Sir William Crookes (q.v.; then not yet knighted) in his researches on electrical discharges in high vacua about 1875, and such as is nowadays employed in the production of X-rays. In its present form it consists of a glass bulb with a tube for exhausting it, sealed when the vacuum has attained the desired point, one or more concave cathodes, a target of platinum set obliquely at the focus of the cathode or cathodes, a ring-shaped anode between each cathode and its target. See ELECTRON; ELECTRODE; MOLECULAR THERMY; RADIATION; X-RAYS.

**CROOKSTON**, Minn., city and county seat of Polk County, on Red Lake River, and on the Great Northern and Northern Pacific railroads, 300 miles northwest of Saint Paul. Crookston was first settled in 1877 by Colonel Crooks, became a borough in 1880 and a city in 1882. It is a commercial centre of a fertile agricultural region and carries on a large business in lumber, wheat and live stock. It manufactures lumber, farm machinery, gas engines, castings, sashes and doors, leather goods, furniture, wagons, biscuits, etc. It has four banks, with a combined capital and surplus of $1,000,000. The city has a fine courthouse and municipal buildings, two Roman Catholic and 12 Protestant churches, a fine high school, two large business colleges, a gymnasium and a public library. The city government is administered under a charter which provides for a mayor and a council of 11 members, elected annually. Pop. 7,559.

**CROP**, a term coming to be widely used, particularly in the oil fields of Oklahoma, as the equivalent of the term outcrop.

**CROPS.** See Agricultural Chemistry; Farm Crops; Irrigation.

**CROPS**. Jasper Francis, American artist: b. Rossville, N. Y., 18 Feb. 1823; d. Hastings, N. Y., 22 June 1900. At first he devoted himself to landscape painting, but he abandoned this in order to study painting, and in 1847 visited Italy. He finally devoted himself to landscape painting, and his third picture, a view of Greenwood Lake in New Jersey, procured his election as an associate of the National Academy of Design, of which he became a full member. He belonged to the so-called "Hudson River School" and painted mostly views of local scenery and English views of similar type. In 1847 ill health compelled him to visit Europe, where he spent three years in close study of his art. Among his most successful compositions after his return to America were the "Sibyl's Temple"; "American Harvesting"; "Peace"; "War"; and "Niagara Falls" (Brooklyn Museum). Consult Isham, "History of American Painting" (New York, 1905).

**CROQUET**, krö-k'ë, to the most scientific form of which the name Roque is given in America, an open-air game played with balls, mallets and arches, either upon a closely mowed lawn or a specially prepared court. The game is substantially a revival of the old game of pall mall, which gave its name to the well-known London street. France introduced this game into Ireland and thence into England early in the 17th century, and during the 18th century it was largely neglected, but came again into favor about 1850 and was later superseded in popularity by tennis. When first introduced into the United States croquet was a simple game destitute of all ornamental features, and it has so developed that it is now considered by experts to be as scientific as billiards. The court upon which the most improved form of this game is now played has a hard rolled and brightly sanded surface composed of either loam or clay, the nature of the material being determined by the character of the native soil upon which the ground is built. The regulation size for the court is 36 feet by 72 feet, the angles of the rectangular being cut off by eight-foot corner pieces. This space is enclosed by heavy timbers 4 x 6 inches, which are securely spiked together. Cars are used in making carom shots and on a billiard table. A player frequently finds his ball in such a position upon commencing his turn of play that he has not a straight shot for either ball or his arch, and at such times a carom shot is resorted to in order to capture one of the wired balls and thus attain an annual business of $10,000,000. The city has a fine courthouse and municipal buildings, two Roman Catholic and 12 Protestant churches, a fine high school, two large business colleges, a gymnasium and a public library. The city government is administered under a charter which provides for a mayor and a council of 11 members, elected annually. Pop. 7,559.

**CROP**, a term coming to be widely used, particularly in the oil fields of Oklahoma, as the equivalent of the term outcrop.

The court upon which the most improved form of this game is now played has a hard rolled and brightly sanded surface composed of either loam or clay, the nature of the material being determined by the character of the native soil upon which the ground is built. The regulation size for the court is 36 feet by 72 feet, the angles of the rectangular being cut off by eight-foot corner pieces. This space is enclosed by heavy timbers 4 x 6 inches, which are securely spiked together. Cars are used in making carom shots and on a billiard table. A player frequently finds his ball in such a position upon commencing his turn of play that he has not a straight shot for either ball or his arch, and at such times a carom shot is resorted to in order to capture one of the wired balls and thus attain an annual business of $10,000,000. The city has a fine courthouse and municipal buildings, two Roman Catholic and 12 Protestant churches, a fine high school, two large business colleges, a gymnasium and a public library. The city government is administered under a charter which provides for a mayor and a council of 11 members, elected annually. Pop. 7,559.

**CROP**, a term coming to be widely used, particularly in the oil fields of Oklahoma, as the equivalent of the term outcrop.

**CROPS.** See Agricultural Chemistry; Farm Crops; Irrigation.
been bolted. The blocks are then buried under the ground, so that the arch stands between eight and nine inches above the surface. The stakes, which are located at the starting and turning points in the game, are one and one-half inches high and one inch in diameter. The mallets, which range in price from $5 to $20, are very carefully made, usually to order. Their dimensions and weight vary according to individual taste, but the average sizes are: length of handle, 10 inches; length of head, 7½ inches; diameter of head, 2 or 2½ inches. The average weight is about two pounds. The ends or tips of the mallet heads are protected by heavy steel or brass ferrules, and the faces themselves are made of either ivory or vulcanized rubber, in the one end, and soft rubber in the other, the latter being used for making certain shots which are impossible with the horn end.

While the old game croquet was, and, in fact, is still played by any number of persons up to eight, roque as played to-day contemplates the participation of but two players in a game, each of whom uses two balls, playing them as partners and opposing two of the adversary. The object of the game is to play by stroke of the mallet all through the arches, with both balls in order, by any number of turns or plays, and finally putting both partner balls out by making them strike successively the home stake. The player who succeeds in doing this first is the winner. While advancement of one's own balls is of course of primary importance, hardly less important is the ability to retard the progress of one's opponent. This is often done by moving the two balls playing ball into or behind an arch, so that upon the opponent beginning his turn, little chance for him to advance presents itself.

Croquet tournaments are held at stated intervals at Wimbledon, England, and attract considerable attention in that country, but although challenges have been sent to the United States by some of the representative players of England, international matches have never been arranged, owing largely to the difficulty of unifying certain differences in play. The greatest of these is that the Englishmen play upon grass, while in the United States all championships are contested upon dirt or clay courts.

The principal clubs of the United States are federated into the National Roque Association of America, which was organized in New York in 1882, under the name of the National American Croquet Association, which name was subsequently changed to the present one. The headquarters of the association are at Norwich, Conn., where there are first-class courts and a spacious and attractive club-house, in which on the Tuesday following the third Monday in August the association holds its annual meetings. During the remainder of the week the annual championship contests are held to determine the champion for the next year. There are more than two dozen clubs comprising the National Association. The rules for the game will be found in the 'Official Roque Guide,' Group xi, No. 271, of Spalding's Athletic Library (New York, annually), and in which a plan of the court is reproduced. See also Lillie, 'Croquet Up-to-Date' (New York 1900).
the spring and summer of 1861 he served in Chesapeake Bay. The next year he commanded the gunboat Pinola and joining Farragut's Gulf squadron, co-operated with the Itasca in breaking through the chain barrier across the Mississippi at Forts Jackson and Saint Philip; participated in the capture of New Orleans, and in the bombardment and capture of Vicksburg batteries; commanded the Meteor (1864–65), blockading Galveston, Tex., and participated in the attack on Mobile. After the war he was commandant at various navy yards and became commodore in 1874, and rear-admiral in 1882. He commanded the south Atlantic station in 1882 and Asiatic station 1883, and was retired at his own request in October 1883.

CROSBY, William Otis, American geologist: b. Decatur, Washington County, Ohio, 14 Jan. 1850. He was graduated at the Massachusetts Institute of Technology 1870, became an instructor in its physical department, from 1876 Thayer professor of physics, and from 1877 director of the Rogers laboratory. In 1882, at his instance, the institute established the first course leading to a degree in electrical engineering in this country and one of the first in the world, of which he was in charge for 20 years. Most of his scientific papers have been published in the Proceedings of the American Academy of Arts and Sciences. He is the author of the textbooks 'Course in Elementary Physics' (1873); and 'Lecture Notes on Mechanics and Optics' (1884); 'Notes on Mechanics' (1911).

CROSS, Charles Robert, American physician: b. Troy, N. Y., 29 March 1848. He was graduated at the Massachusetts Institute of Technology 1870, became an instructor in its physical department, from 1876 Thayer professor of physics, and from 1877 director of the Rogers laboratory. In 1882, at his instance, the institute established the first course leading to a degree in electrical engineering in this country and one of the first in the world, of which he was in charge for 20 years. Most of his scientific papers have been published in the Proceedings of the American Academy of Arts and Sciences. He is the author of the textbooks 'Course in Elementary Physics' (1873); and 'Lecture Notes on Mechanics and Optics' (1884); 'Notes on Mechanics' (1911).

CROSS, Charles Whitman, American geologist: b. Amherst, Mass., 1 Sept. 1854. He was educated at Amherst College and at the University of Leipzig. In the United States Geological Survey he was assistant geologist in 1880–88, geologist after 1888, and chief of the section on petrology in 1903–06. In 1911 he became treasurer of the National Academy of Sciences. He is author, with three others, of the important 'Quantitative Classification of Igneous Rocks' (1903), a new system with new nomenclature. He also prepared a number of geological survey bulletins and in 1902 published 'The Development of Systematic Petrography in the Nineteenth Century.' He is a member of the Geological Society of America.

CROSS, Mrs. George Frederick, Australian novelist. See Cambridge, Ada.

CROSS, Wilbur Lucius, American educator: b. Mansfield, Conn., 10 April 1862. He was graduated at Yale 1885; was instructor in English in the Sheffield Scientific School 1894–97; and has been professor there from 1897. He has published 'The Development of the English Novel' (1899), and Life and Times of Laurence Sterne (1909), besides an edition of Sterne's works (1904), and editions of 'Macbeth' (1900), 'Silas Marner' (1903), Stevenson's 'Travels with a Donkey' (1909), and 'Robinson Crusoe' (1876). Since 1911 he has been editor of The Yale Review, which under his editorship at once took a high place among contemporary periodicals. He is also a contributor of literary criticisms to various magazines.

CROSS, a common instrument of capital punishment among the ancients; esteemed so

Augustin Daly's company in 1890, and in 1892–94 was Charles Frohman's leading woman. Her career as a star began under the management of her husband, Maurice Campbell, in Bronson Howard's 'One of Our Girls'; and on 9 Oct. 1900 she produced Hazelton's 'Mistress Nell' at the New York Bijou, where it ran for over 100 performances. She appeared as Rosalind in 'As You Like It' in 1902, which ran for eight weeks at the Republic Theatre, New York. After this she appeared in many popular successes, including 'The Sword of the King' (1902); 'Swan Song' (New York, 1903); 'All-of-a-Sudden Peggy' (1906–07); 'Sham' (1909); 'Anti-Matrimony' (1910); 'The Real Thing' (1912).

dishonorable that only slaves and malefactors of the lowest class were subjected to it by the Romans. It was customary to proclaim the name and offense of the person crucified, or to affix a tablet (album) to the cross on which they were inscribed. Malefactors were sometimes fastened on a simple upright stake, and so left to die, or they were impaled upon it, but very generally a cross-piece was added to the stake, to which the arms of the criminal were tied, or to which his hands were nailed. The cross was erected outside the gates of towns, but in places of frequent resort. The person crucified often lived for days upon the cross. The death of Christ by crucifixion led Christians to regard the cross with peculiar feelings of reverence. From the early days of the Church it was a usual emblem of Christian faith and hope, and the first Christians were wont to show great respect to its representations, with Saint Paul glorifying in the cross of our Lord Jesus Christ. The gestural sign of the cross was in general use among them, so that in the 22d chapter of Luke the Apostles and the people were moved to move and movement, when we go in or out, when we dress or put on our shoes, at the bath, at the table, when the lights are brought, when we go to bed, when we sit down, whatever it is that occupies us, we mark the forehead with the sign of the cross. He tells us that the Christians were reproached with worshipping the cross. In the Catholic Church blessings and benedictions are always accompanied with the sign of the cross. The Church has an annual festival commemorative of the finding by Saint Helena, mother of Constantine, of the cross upon which Christ died. Another festival is that of the Exaltation of the Cross, to commemorate a miraculous appearance of a cross in the heavens in 317 at the moment when Constantine was ordering his army for an attack on that of his rival, the Emperor Maxentius. On Good Friday is practised the usage of the "Adoration of the Cross," when the faithful humble and reverently by kissing the crucifix express their devotion and gratitude to the author of their redemption. In church processions the cross or the crucifix is always borne in the forefront, its bearer, the crucifier, having on his right and left an acolyte bearing a lighted torch or candles. See CROSSES AND CRUCIFIXES and consult the authorities there referred to.

CROSS-EXAMINATION, the questioning of a witness by the party or the counsel of the party against whom he has been called to testify. The object is to test the correctness of the testimony given. For this reason, the inquiry is likely to be more or less drawn out on the direct examination of witnesses. Leading questions are permitted in cross, but not in direct, examination. The questions asked in cross-examination must be confined to material and relevant matters, but the determination of guilt from the witness's veracity. The right of this form of examination should be exercised immediately after the principal examination, but in some cases it is allowed later. (See EVIDENCE; DUE PROCESS OF LAW). Consult Wellman, Art of Cross-Examination (New York 1904).
resulting in loss of vigor in the progeny. The transfer of pollen in cross-fertilized plants is generally accomplished through the agency of the wind, water, insects or birds, and the various devices that have been adopted by the plant to secure crossing form an interesting and inexhaustible field for study and observation.

Wind-fertilized or anemophilous, flowers are those so modified as to depend upon the wind to secure cross-fertilization by carrying the pollen of one plant to the stigmas of another. Anemophilous plants are characterized by having dry and powdery pollen, which is very abundant and light and easily carried by the wind. In most cases also the pistils are large and feathery, with large, sticky stigmas, presenting an abundant surface to catch the pollen floating in the air. In wind-fertilized plants there is a great opportunity for loss of pollen and it thus becomes necessary that an abundant supply should be formed. The various pine-trees, of which there are large forests in some parts of America, are wind-fertilized and form enormous masses of pollen. In this case, the pollen grains are provided with two lateral wing-like extensions which are supposed to be of service in making the pollen lighter and easier to blow about. Several instances are recorded where the decks of vessels at sea have been covered by a rain of pollen which, in some cases, must have been carried a distance of some 400 miles. Corn, or maize, forms a familiar example of a wind-fertilized plant. The pollen is produced in great abundance in the stamens of the tassel, which forms the upper part of the stalk. When the pollen is mature the stamens protrude from the flower and the slightest jar of the plant by the wind causes the pollen to fall in a cloud, and as the plants are grown near together, some grains are almost certain to lodge on the pistils, or silks, of the ear of another plant. The silks are long and are covered with numerous villi. The flowering plant is said to have the opportunity for plants to catch floating pollen and be cross-fertilized, in an ordinary field where numerous plants are grown, is very great. Experiments prove that cross-pollination is not necessary for the flowers of many plants to produce varieties of corn pure. If different varieties are grown near each other cross-fertilization is certain to occur and impure seed results. Vilmorin found by careful experiments that plants of different varieties have to be separated by at least 1,000 feet to prevent cross-fertilization, and this distance is by no means sufficient if strong winds blow over one field of corn in such a direction as to carry the pollen from it toward another field of corn. Nevertheless it is well known that a number of plants must be planted near together to ensure thorough pollination. Plants standing alone at a distance from other corn plants seldom produce well-filled ears. The flowers of wind-fertilized plants are usually green, or greenish, inconspicuous, and have no odor to attract insects or birds, and the regular in form and they frequently appear before the leaves, though this is by no means universal.

Water-fertilized, or hydrophilous, plants, are those in which the pollen is transferred through the agency of water, and the subject is by no means common. Following Delphino, they may be divided into two types: the first type includes Zostera, Posi-

donia, etc., and the Floridae, where the pollen is of the same specific gravity as water, and is carried here and there by water currents; the second type includes such plants as Hygrostachys and Valmissera, in which the pollen is lighter than water, or is borne on a floating raft formed by the loosened flower. The peduncles of the female flowers elongate and bring them to the surface of the water where their position allows the stigma to be pollinated by the floating pollen. By far the greatest number of plants that require cross-fertilization depend upon insects as pollen carriers, and these plants have been termed entomophilous. Such plants are characterized by the large size, showy colors and markings of their flowers and their odor, which serves to advertise the nectar and nourishing pollen that the flower contains and thus attract insects to the flower. The insects in passing from flower to flower in search of nectar and pollen become useful to the plant by incidentally transferring pollen from one flower to the stigma of other flowers, thus causing cross-fertilization. Flowers have in many cases become adapted to certain insects and have stamens and pistils developed in the position best suited to ensure pollination when these insects visit the flowers for nectar or pollen. Many insects depend wholly, or in large part, on the nectar and pollen of flowers as food, and such insects usually visit only one kind of flower during the day and therefore carry but one kind of pollen. They work systematically, passing from one flower to another, and clearly do an enormous amount of crossing and wasting pollen than the wind or water. Some insects, like certain beetles, have smooth bodies and carry but little pollen, but many beetles, and all bees, moths, butterflies, etc., have their bodies, wings and limbs roughened with hairs and scales, and these collect and retain a large quantity of pollen ready to be left on the sticky stigmatic surface of the pistil of the flower when the insect rubs against it. The nectar glands of the flower are usually located in such a position that the insect in getting to them to suck the nectar must enter the flower in the best way to ensure cross-polllination. Insects are greatly attracted by odors, and the flowers of many plants are scented which serves to make them more attractive. The evening primrose (Emonitha), which opens early in the evening and is fertilized by night-flying moths, has a very strong odor, and the same is true of many night-fertilized flowers, such as the honey-suckle (Lonicera caprifoliun), night-blooming Cereus, etc. Night-blooming flowers which are fertilized by insects are usually white and generally more sweet-scented than day-blooming flowers. Some flowers, such as the Stapelia, are purplish or brownish, resemble decayed flesh in appearance and are carrion-scented to attract carrion flies. Certain insects are attracted by certain colors more than others. The favorite color of the honey-bee, for instance, is said to be deep bluish-violet, while the more blue and violet are less sought, but is not avoided, while red is disliked and shunned. Kerners states that in the Vienna Botanical Gardens the honey-bees in great numbers visit the bluish-violet flowers of Monarda fistulosa, and the blue hyssop (Hyssopus officinalis), but avoid the scarlet flowers of the Monarda didyma. Experiments, however, tend to show that color
CROSS-FERTILIZATION

does not necessarily attract insects; flowers rich in nectar are the most attractive. In some plants the involucre is highly colored and takes the place of the colored parts of the flower. Such is the case in some Euphorbias such as snow-on-the-mountain, which is nearly white, and the poinsettia (E. pulcherrima), in which the involucre is red. In a large number of cases the petals of large flowered species spread over the main part of the flower of different color from the main ground color of the petals. These are usually known as nectar guides and are believed to be of service in aiding insects to find the nectar.

One of the most interesting and instructive modifications to secure cross-fertilization is the formation on different plants of flowers with different lengths of stamens and styles. Sprengel noted that some plants in Hottentia bear only flowers whose anthers are included in the tube, but whose style is exerted; while other plants bear only flowers having short styles and long stamens, longer than the flowing tube. He was, however, unable to suggest any reason for such variations. Some plants, such as Lythrum, regularly show these different lengths of stamens and style. Darwin subjected the peculiar sexual relations of these plants which he called dimorphic and trimorphic, to most careful and extensive research, crossing the different forms back and forth in various ways. The results of these experiments are summarized below.

In dimorphic plants, such as Primula and Linum, two forms exist in about equal number and usually growing together. In one form the plants have flowers with a long style extending considerably beyond the short stamens, while in the other form, the position is reversed, the style being short and the stamens long. In the long-styled form the stigma is rough and furnished with long papillae, and the pollen grains are small, while in the short-styled form the papillae of the stigma are short and the pollen grains are larger (Fig. 3). In the trimorphic heterostyled plants of Lythrum salicaria three lengths of styles are formed, long-styled, mid-styled and short-styled (Fig. 1). In each form the stamens exist in groups of two lengths corresponding to the two other lengths in which styles occur in other plants. The longest stamens produce the largest pollen grains, the shortest stamens produce the smallest grains. When insects visit the dimorphic and trimorphic flowers, the organs become dusted with the pollen at certain heights. When they later visit other plants with other lengths of styles, this pollen will be at the exact position and height to best cause cross-fertilization. In such crossing a pistil always receives pollen from stamens of corresponding heights and the size of the pollen grain is thus proportional to the length of the style which its tube must traverse. Such crossing Darwin called legitimate. When a pistil of a dimorphic or trimorphic flower is crossed with pollen from stamens of different heights he termed it illegitimate fertilization.

By very careful experiments Darwin found that only seeds produced as a result of legitimate crossing give completely normal and fertile plants. Illegitimate crossing leads to the production of progeny with all degrees of diminished sterility or even complete barrenness and give offspring which have all the characters of hybrids produced by the union of different species, Aside from the classes above mentioned a few plants are specially adapted to cross-fertilization by small birds and snails, but such plants are few in number and their modifications are similar to those adopted by plants which are fertilized by insects.

Prepotent Pollen.—The great majority of plants that have devices to secure cross-pollination also have some modification that ensures self-fertilization. This in a way would seem to have been developed as a safeguard to ensure seed development should cross-pollination fail to take place. In most cases the self-pollination takes place before or about the same time as the cross-pollination, and it would seem that in such cases where the plants are not self-sterile that a large majority of self-sterilized seeds would be formed. However, it has been found in many cases that the pollen of a different plant of the same race or species or in some cases of a different race will be prepotent over the plant's own pollen. In one instance, Darwin selected two flowers which had only recently opened on a plant of a variety of cabbage known as "Ragged Jack," and abundantly pollinated them with pollen from the same plant. After an interval of two or three hours pollen of a different variety, known as "Early Barnes," was dusted on the stigmas of the same flowers. Under these circumstances it is seen that little effect could be expected from the pollen of the Barnes cabbage, yet three out of the 15 plants raised from the seed formed by the above two flowers showed plainly that they were hybrids.

A similar experiment was carried out by the writer with cotton. A bud of Sea-Island cotton (Gossypium barbadense) was covered with a manila paper bag before it had opened. Early in the morning, when the flowers of cotton normally open and are pollinated, the bag was removed and the stigma abundantly dusted with pollen from the same flower, after which the bag was replaced. Cotton is abundantly self-fertilized, about 5 to 15 per cent of the flowers being normally cross-fertilized under the most favorable circumstances, so that this capsule should have set the normal number of seeds without further pollination. After four hours the bag was removed and the same stigma dusted with pollen of upland cotton (G. hirsutum), which belongs to a different but nearly related species. The seed of this Sea-Island capsule gave five plants, of which three were clearly hybrids.
The prepotency of pollen can be easily observed where different races or varieties are concerned, but in cases where the pollen of a different plant of the same race or species is prepotent over the plant's own pollen, as is not infrequently the case, the fact is not so easy to prove. Darwin demonstrated prepotency in a number of cases of this kind, using as his guide the superiority of seedlings raised from cross-fertilized seed to those resulting from self-fertilization, which after a few experiments can be used as a fairly safe index.

![Diagram showing the mean heights of cross- and self-fertilized plants in ten generations.](image)

**Fig. 2.**—Diagram showing the mean heights of cross- and self-fertilized plants in ten generations. The mean height of the crossbred plants being taken as 100; on the right hand are shown the mean heights of the cross- and self-fertilized plants of the ten generations taken together. (After Darwin.)

**Benefits of Cross-fertilization.**—The benefit derived from cross-fertilization in the case of plants was first clearly brought forward through the classical treatise of Charles Darwin on "The Effects of Cross- and Self-fertilization in the Vegetable Kingdom." Sprengel at times apparently foresaw this law, but he seems never to have grasped its full significance. In one place he states that nature has not willed that one flower should be fertilized by its own pollen, yet he failed to realize that this carrying of pollen from one flower to another was of any service to the plants themselves. Knight, Koelreuter and Herbert plainly had the main features of this law in mind, but did not recognize it as of sufficient importance to give it special attention. Darwin carried on extensive experiments to demonstrate the effect of cross- and self-fertilization in various plants and his conclusions are generally accepted to-day. His general plan of experimenting was to grow cross- and self-fertilized seed of the same plant in the same pot on opposite sides, with a partition between them. They were carefully watched and as often as one on each side germinated at the same time they were transplanted to another pot and again placed on opposite sides of a superficial partition.

The increased vigor and productiveness due to cross-fertilization may be illustrated by Darwin's experiments with morning-glory (*Ipomoea purpurea*). The experiments were carried to the tenth generation and in each generation the height of the cross-fertilized plants greatly exceeded that of the self-fertilized plants (Fig. 2). The ratios between the average heights of cross- and self-fertilized plants in the different generations were as follows:

1st generation, as 100 to 76.
2nd generation, as 100 to 79.
3rd generation, as 100 to 68.
4th generation, as 100 to 85.
5th generation, as 100 to 75.
6th generation, as 100 to 72.
7th generation, as 100 to 81.
8th generation, as 100 to 85.
9th generation, as 100 to 79.
10th generation, as 100 to 54.

The average ratio of height during the 10 generations was 100 to 77. The same vigor and superiority of the cross-fertilized plants was also shown in all other features, such as the number of capsules and seed, constitutional vigor, etc., in fully as marked a proportion as was shown in increased height. Similar superiority of cross-fertilized over self-fertilized plants has been demonstrated to occur in *Medicago, Digitalis, Verbascum, Papaver,* and many other plants, and the rule may be considered a fairly general one. However, the evidence available at present does not tell nearly so much in favor of the advantages of cross-fertilization as did that of Darwin's time.

Darwin's experiment with the common garden pea, however, form an exception of some interest. Here the average height of the cross-fertilized plants was 34.62 inches and that of the self-fertilized plants 39.68 inches, or in the proportion of 100 to 115. The pea, however, is a plant that is normally self-fertilized, crossing rarely occurring. The plant has therefore become adapted to self-fertilization, and does not lose vigor as a result. The lack of vigor shown by the cross-fertilized progeny would indicate that such plants which are normally self-fertilized may have assumed this habit through some benefit derived from the self-fertilization and would thus be injured as a result of crossing. Wheat, barley and oats, among the cereals, are almost wholly self-fertilized, crossing very seldom occurring. As a result of experiments conducted by Professor Hays, of the Minnesota Agricultural Experiment Station, it has been shown that the artificial crossing in wheat of individuals of the same race, or of different races, almost invariably results in decreased fertility as a whole, although as a result of crossing distinct races, certain individuals with increased fertility can be selected.

It has been said by Nageli that "the consequences of fertilization reach their optimum when a certain mean difference in the origin of the sexual cells is attained"; and by Fritz Müller, that "every plant requires, for the production of the strongest possible and most prolific progeny, a certain amount of difference between the male and female elements which unite. Fertility is diminished as well when this degree is too low (in relatives too closely related) as when it is too high (in those too little related)." Darwin says: "The offspring from the union of distinct individuals, especially if
their progenitors have been subjected to very different conditions, have an immense advantage in height, weight, constitutional vigor, and fertility over the self-fertilized offspring from one of the same parents.

Attention has been called by Willis to three factors in the gain resulting from cross-fertilization, namely, a, fertility of mother plant; b, vigor of offspring; and c, fertility of offspring. The relative value of these factors varies with different plants. In the carnation, for instance, factor a of cross-fertilized plants was 9 per cent greater than in self-fertilized plants, b was 16 per cent greater, and c was 54 per cent greater; in tobacco, factor a was 33 per cent less than in self-fertilized plants, but factor b was 28 per cent greater, and factor c 3 per cent greater. Even when the fertility of the mother plant is greatly reduced by hybridizing with a distinct species and the hybrids themselves are sterile or very unfertile they nevertheless often show extraordinary vigor, that is, with corn and practically the same results obtained. McCluer states that: "The corn grown from the crossed seed was in nearly all cases clearly increased in size as a result of crossing, and that 'nearly all the corn grown a second year from the crosses is smaller than that grown the first year, though most of it is yet larger than the average size of the parent varieties.'

In maize, the loss of vigor caused by close inbreeding was found in experiments conducted by the writer, in conjunction with Mr. C. P. Hartley, to be very marked. Seeds of Hickory King, a race grown commonly in the Eastern States, produced by inbreeding with pollen of the same stalk, yielded the next year at the rate per 100 stalks of 46 ears, weighing 9/5 pounds. Seeds of the same race, in every way comparable, but produced by crossing different seedlings, yielded under the same conditions at the rate per 100 stalks of 82 ears, weighing 7/5 pounds. In attempting to fix hybrids of Hickory King crossed with Cuzco or Peruvian corn, some ears were inbred with pollen from the stalks bearing them, while others were pollinated from other hybrid seedlings of the same parentage. The hybrids of the second generation, where the seed was inbred with pollen from the same stalk, showed great loss of vigor, being small in stature and almost totally sterile; while those produced from seed which was inbred with pollen from a different seedling were much more vigorous and productive, seeming to have lost but little by this process of inbreeding. In the majority of cases crossing distinct sorts improves the vigor and results in greatly increased yield. By selecting varieties which have increased yields uniformly when crossed and crossing these for seed corn, it seems certain that the average yield can be greatly increased. Securing seed corn from a cross of any two races desired is not a difficult or expensive process, being easily accomplished by planting the two desired sorts in alternate rows and removing the tassels, as soon as they ap-

![Image](image-url)
PEAR, from the one to be used as the female parent. The ears that form on the rows from which the tassels have been removed will have been crossed with pollen from the variety from which the tassels have not been removed. The seeds cured therefore be selected from the ears produced on the detasseled rows. The field planted to the two varieties, as above described, to secure crossed seed should be somewhat isolated from other cornfields, and should be of sufficient area to furnish a small quantity of seed. The only extra expense incurred in producing seed corn in this way is the cost of de-tasseling the alternate rows, as ears will form on both as usual. 

SHULL, East, Emerson and others have more recently demonstrated this same principle and the effect produced in crossing diverse types has been related to the fact that the crosses possess a larger number of favorable growth factors.

The increased vigor and fruitfulness which almost invariably result from crossing closely related diverse types of varieties is a principle of the utmost importance in our common agricultural practices, for there is a great need for more vigorous forage plants, timber and shade trees, vegetables, etc., and more prolific grains and fruits.

SELF-Sterile Plants.—Some plants have become so completely modified for cross-fertilization that they are sterile to their own pollen and will not set seed unless cross-fertilized. Of our wild plants this has been found to be the case in a number of instances. Koelreuter and Gärtner long ago found that some plants, namely, Verbascum thapsiicum, V. nigrum and Lobelia fulgens, under certain conditions were sterile to their own pollen, but would set seed abundantly when crossed with pollen of other species. Fritz Müller proved by careful-experiment that Eschscholtzia californica, Abutilon Darwinii and a species of begonia were sterile to their own pollen, whether fertilized with pollen from the same flower or from different flowers on the same plant, but were perfectly fertile when pollinated with pollen from other plants. Darwin found that these plants in England were also largely self-sterile, but that under certain conditions the degree of fertility with their own pollen could be greatly increased. The same phenomenon of self-sterility and necessity for cross-pollination is shown by some of our important cultivated plants. Mr. M. B. Waite has demonstrated that many of the varieties of pears, such as Bartlett, Anjou, etc., are largely self-sterile, producing few or no fruits when pollinated only with pollen of the same variety. In the case of varieties of pears and fruits of this kind that are propagated altogether by budding, as is well known, all of the various trees of the variety that exist are simply parts of the same individual pollinating flowers on one tree. Bartlett pear-tree with pollen from another Bartlett pear-tree is in effect the same as pollinating one flower on a plant with pollen from a different flower on the same plant and is what we recognize as self-fertilization. Mr. Waite and others have shown that when such sterile varieties are pollinated from a different horticultural variety, which in reality is simply a different individual of the same species, they are rendered perfectly fertile. This discovery has proved of great practical value, as many pear orchards were planted with trees of a single variety like the Bartlett and were found for some unknown cause to be very unfruitful. Waite's discovery showed the true cause of this lack of fruitfulness and at the same time pointed out the natural and simple remedy of cross-fertilization. All that remained to be done in such barren orchards was to bud some of the trees over with a susceptible variety and by experiment been found to produce a good percentage of fertility in crossing on the variety concerned. Since Waite's discovery of the reason for the barrenness of certain varieties of pears many experiments have been conducted by different investigators. It is now known as a result of experiments by Waite, Waugh, Beach and others that many varieties of plum and apple are largely sterile and require cross-pollination for complete fruitfulness.

The pineapple, also, as is known, is the writer's studies is an interesting example of a self-sterile plant. Ordinarily the pineapple is wholly seedless, yet the flowers are so arranged that they are abundantly fertilized with their own pollen. The self-sterility is so perfect that even under these circumstances seeds set so rarely that few growers and consumers have ever seen seeds. In experiments in crossing various varieties it was found that when certain varieties were crossed seeds were formed in abundance, showing that cross-fertilization is necessary to ensure the development of perfect seeds. The explanation for the setting of such few seeds in cultivation normally is probably to be found in the fact that the proper insect pollinators are not present, and the flowers are therefore not cross-fertilized. See FERTILIZATION IN PLANTS; FERTILIZATION IN FLOWERS.

Dean of the Graduate School of Tropical Agriculture, and Director of the Citrus Experiment Station, University of California.

CROSS-FERTILIZATION IN ANIMALS AND IN MAN. In animals and man, cross-fertilization means the crossing of individuals of different races or breeds in con-
tradi distinction to in-and-inbreeding which is generally regarded as leading to evil results. Inbreeding, interbreeding or close breeding, which means the breeding together of closely related individuals, generation after generation, without intermission, that is believed by some to result in delicacy of constitution, predisposition to disease, lack of fecundity, etc. It must be admitted that breeders who have used in-and-inbreeding the most have done so as a means to an end, and not because they believe primarily in any beneficial result of in-and-inbreeding in itself. This is the surest and best way to render a character prepotent — i.e., to isolate pure Mendelian characteristics. (See Heredity.) It is used, therefore, as a means of strengthening the transmitting power or prepotency of a character, which otherwise in most instances would be lost. Miles states that *From a careful examination of the pedigrees ... that may be found in the herd-books and breeding-registers, representing the practice of breeders of acknowledged reputation, it will be found that in-and-inbreeding has only been reported to in the case of some favorite animal or animals that were superior in certain respects to the average members of the herd or family which they represent, and the object has evidently been to secure in the offspring a predomina nce of their most highly valued characteristics. In most instances the older original character is more strongly hereditary, and it is only by in-and-inbreeding that a new character can be rendered stable and prepotent and prevented from being swamped and lost. In regard to the belief that in-and-inbreeding leads to sterility and predisposition to disease, a careful consideration of the evidence at command leaves the student in doubt as to the conclusion to be drawn. The facts seem to indicate that close breeding or in-and-inbreeding may be very detrimental in some cases, as it tends to perpetuation of constitutional defects that may have been produced by other agencies; therefore the best animals, free from constitutional weakness or disease should be selected as mates. When used judiciously, in-and-inbreeding forms an important means of securing improvements and is the only known means of fixing and rendering slight variations hereditary.

The majority of our various breeds of cattle have been brought up and improved as a result of very close inbreeding. As an illustration, the famous Shorthorn bull, Favorite, was bred to his daughter, grand-daughter and great-grand-daughter, and the product of the last union was matched with the bull Wellington, having 62.5 per cent of the blood of Favorite. Clarissa, the offspring of the last union, was bred with the bull Lancaster, having 68.75 per cent of the blood of Favorite and gave very valuable offspring. The majority of our best breeds of animals have been very closely in-and-inbred without noticeable deterioration in any direction except possibly in fecundity. Darwin says that *Although by careful selection of the best individuals or inter-breeding may be carried on with cattle, yet the good effects of a cross between almost any two breeds is at once shown by the larger size and vigor of the offspring; and authorities agree that crossing distinct breeds certainly improves cattle for the butcher.*

In the case of man, where families have interbred very closely, as has sometimes occurred, there is said to be a great gain in vigor as a result of intermarriage with a distinctly different family, a fact long recognized and acted upon in the seeking of American heiresses in marriage by scions of ancient European families of distinction. The hardihood and general vigor of the Americans as a nation is commonly attributed to the great intermixture of peoples of many different nationalities; and the whole human race, apparently from the beginning has acted on this principle by the almost universal practice of exogamy. This is the rule, held all but sacred among savages everywhere, that a man or woman must not marry one of his or her own group (clan, gens or phratry) but must intermarry with an individual of some other of the minor divisions of the tribe. The theory is that all members of each such minor division are children of the same (ancestral) mother. The world-wide prohibition of, and repulsion against, marriage within certain 'degrees of consanguinity, minister to the same end. Interracial marriage, or miscegenation, the marriage of individuals of distinct races, as a whole results very disastrously both as to physical and mental characteristics. The result of such a union is a hybrid, frequently sterile, mainly intermediate in characters between the two races, and usually in large measure a social outcast. Such half-breeds or hybrids are in general inferior to the pure parental races, particularly in physical vigor, though mentally they may be equal or possibly superior. In crosses, for instance, of the negro and white races, the offspring commonly show a tendency toward sterility and are in general weak in constitution.

In conclusion it may be stated that injury results on the one hand from too close inbreeding and on the other hand from crossing races too distinct; but that the crossing of slightly distinct strains, and of individuals reared under different conditions, is beneficial. See Breeding; Exogamy; Heredity; Mendel's Law, and consult bibliographies under these articles.

Ernest Ingersoll.

CROSS-EXAMINATION. The examination of a witness, called by the party against whom he has testified. The purpose is generally to test the character of the witness and the truthfulness of his statement, the sources of his information, etc. Leading questions are permitted on the cross-examination, although the counsel must confine his interrogations to relevant matter. The relevancy of the matter is determined by the court. Generally, a cross-examination takes place directly after the chief examination; but if the court permits, it may, on the presentation of valid reasons for delay, be held later. Consult Vol. I, Art of Cross-Examination (New York 1910).

CROSS-FOX, a peculiarly marked northern variety of the American red fox. It has a dark line along the back, and crossing this a stripe on the withers. This gives its name. Its rarity and beauty make its skin more valuable than is the pelt of the ordinary fox.
CROSS KEYS, Va., post village in Rockingham County, 20 miles northeast of Staunton, where a battle took place 8 June 1862, between the Union and Confederate forces. The engagement was a strategic success for the Confederates, in that it checked the pursuit by Frémont and prevented his joining with General Shields for a combined attack.

CROSS KEYS, Battle of. On the morning of 8 June 1862 General Frémont, with 10,500 men and 44 guns marched from Harrisonburg, Va., following Gen. "Stonewall" Jackson, who had been pursued up the Shenandoah Valley, and who had now fallen back in the direction of Port Republic. Frémont's cavalry drove in Jackson's, and when eight miles beyond Harrisonburg Cluseret's brigade, in advance, came upon General Ewell's division of about 5,000 men and 16 guns, at Cross Keys, and Frémont formed for attack. Cluseret's brigade, with artillery, was on and near the road; Stabel's and Bohlen's were sent on the left, and Schenck's on the right. Eight batteries were put on the line and opened a spirited fire. Stabel was now ordered to attack Ewell's right and, going forward, met with some success, but when his two left regiments were ascending a gentle slope and had approached within a few feet of its summit, Ewell's men opened un an unexpected and severe fire, and the regiments were repulsed with great loss. Part of Ewell's line pursued, but was checked and driven back by Stabel's right regiment, which was concealed in the woods. Bohlen's brigade was now ordered forward, but under conflicting orders it was misdirected, and for the most part remained as support to the batteries. Re-enforcing his own right, Ewell advanced beyond Frémont's left, got an enfilading fire on his batteries, which, not properly supported, were withdrawn, the infantry following a full mile. Meanwhile on the right Milroy and Schenck had made some progress, and were preparing to make a determined attack on Ewell's left, when Frémont ordered them to fall back and re-enforce his left, but by this time his left had been forced back, and the entire line fell back at 6 p.m. to organize for a renewal of the battle in the morning. During the night and early in the morning Ewell withdrew, under Jackson's order, to join in an attack on General Shields, who was nearing Port Republic by way of Luray Valley. Frémont followed Ewell to the south fork of the Shenandoah, to find that he had burned the bridge behind him and joined Jackson. He was an idle spectator of the battle of Port Republic, 9 June, in which his comrades were defeated, and the day following he returned to Harrisonburg. The Union loss at Cross Keys was 558 killed and wounded and 127 missing. The Confederate loss was 273 killed and wounded and 15 missing. Consult "Official Record" (Vol. XII).

CROSS IN MYTHOLOGY. See Nature Worship; Mexican Mythology; Swastika.

CROSS VINE. See Bignonia.

CROSSBILL, a bird of the genus Loxia belonging to the finch family (Fringillidae) and unique from the character of the bill the two mandibles of which are twisted away so that they cross. This peculiarity has given rise to a well-known and pretty legend to the effect that the crossed beaks is a mark of the bird's pity in having attempted to draw the nails which held Jesus' hands and feet to the cross, and that the red plumage of some species is the dye of his blood. This singular structure, having the appearance of a deformity, is in reality a wonderfully efficient mechanism for tearing asunder and extracting the seeds of pine cones on which these birds largely feed. Two species belong to the North American fauna, the red crossbill (L. curvirostra) and the white-winged crossbill (L. leucoptera). Both are birds of the northern pine and spruce forests, breeding within the United States, which they do in the very early spring, and only in the extreme northern States and the higher mountains. They are better known as irregular winter wanderers, which appear in flocks usually containing both species, remain in a neighborhood until they have devoured all of the seeds of conifers which are to be found, and then leave. Closely related species are found in Europe and Asia.

CROSSBOWS. Called also arbalettes. The main elements that compose the crossbow are the arbrier or stock and the short, powerful bow mounted on the stock at right angles. At
up to the shoulder as with the modern gun. The bow, in its early stages, when drawn by hand, was built up of a number of layers of whalebone, usually. To bend the bow the stirrup end was placed on the ground and, to hold the weapon firm, one foot was placed in it thus releasing the hands to pull the bowstring (made of sinew) back to a notch in the stock. For firing, the butt end was held up to the shoulder as with our modern guns. When, later, the more powerful bow of steel was used, the necessity for a mechanical power arose and the pied de biche (hind’s foot) or “goat’s foot,” with its double lever purchase was used. Still further fortifying the bow brought forth the detachable “wheel and ratchet” (cric) or “winder,” in which a cogwheel, turned by a handcrank, acted on a movable ratchet which engaged the bowstring. Another device was the detachable roller-purchase (à tour), in which a drum turned by a crank (moulinet) wound a long cord working on a system of fixed and free pulleys to draw up the bowstring. The crossbow à jailet or à prodd had the bow bent by a lever fixed to the stock. It was used in the 16th century, for discharging stones, lead bullets, etc., for birdshooting (fowling). A “barrelled” crossbow (set by hand) had a half tube superimposing a groove in the stock for the passage of the projectile (bolts), and the bowstring found free passage between the half barrel and the groove below it. It was much used in the 17th century. The projectile used for the crossbow was termed a bolt or quarrel and usually had a pyramidal head (termed pile), the feathering was done with wood—sometimes inserted diagonally to cause rotating in its passage.

Crossbows date back to the 4th century and manuscripts of the 10th century mention this arm; but, apparently, it was then used for sport only. Richard I of England and Philip Augustus of France (12th century) armed some of their crusaders with crossbows. This arm became obsolete (giving place to the longbow) in England in the 13th century, but was continued in use on the Continent. In the 14th century the French had 6,000 Genoese arbalestiers (crossbow men) at the battle of Crecy. We read of the use of the crossbow as late as 1572.

CROSSES AND CRUCIFIXES. The cross as a symbol dates back to an unknown antiquity. It was recognized in all countries throughout the world at all times. Before the present era the Buddhists, Brahmins and Druids utilized the device. Seymour tells us: “The Druids considered that the long arm of the cross symbolized the way of life, the short arms the three conditions of the spirit world, equivalent to heaven, purgatory and hell.”

With the ancient Egyptians the cross was a reverence symbol. Their ankh (crux ansata or handled cross) represented life, and a perpendicular shaft with several arms at right angles (Nile cross) appears to have had some reference to fertility or crops. Five of their planet symbols (see illustration) were represented by a cross attached to a circle or part of a circle. Prescott says that when the first Europeans arrived in Mexico, to their surprise, they found “the cross, the sacred emblem of their own faith, raised as an object of worship in the temples of Anahuac.” To the Christian the cross and the crucifix represent the Savior, also his Faith, and the Church. Crosses, according to their utilization, may be classified as: Ecclesiastical, heraldic and architectural.

In Ireland great monoliths beautifully carved into elaborate crosses are found. They date from the early Celtic Christian period and they are freely inscribed with Runic inscriptions—hence these crosses are vulgarly termed “Runic crosses. A beautiful specimen of these monuments is in the Metropolitan Museum of Art, New York city. In some of the religious orders, the official insignia consist of a cross; also with many orders of chivalry, with the military, as well as with some civil orders. Constantine the Great adopted as his standard (labarum) the two first letters in the Greek word, Christ. This combination in many varied forms is known as the “Sacred Monogram” or “labarum of Constantine.”

In architecture the cross is a very favorite form for finials. It is found in stone, wood and
CROSSES AND CRUCIFIXES

iron, on gables, steeples, etc. Many very beautiful forms are to be seen on the older churches.

Ecclesiastical Crosses.—The principal forms of crosses used in the Catholic Church are:
Crux immissa or capitata (1), or Latin cross.

1. Processional cross. 2. Rood cross. 3. Cross of the order St. James of France.

The Greek (+) cross. Crux decussata (X), (so termed because it was the figure for the Latin decus, 10) or Saint Andrew’s cross. Crux commissa (T) or tau cross (its form is that of the Greek T, tau), dedicated to Saint Anthony. The earliest location of the Christian cross was crowning the ciborum (altar baldachin), where it is still in some Romanesque basilicas. At times it hung from the top of the ciborum; but with the omission, later, of the altar baldachin, the cross was placed in the centre of the altar (see altar), or was displayed on the rear wall. In the Constantinople Council (680) the bleeding Lamb, heretofore figuring on the symbolic crucifix, was forbidden, and the dying Savior’s image on the cross was ordered to take its place, thus originating the present form of crucifix to be displayed to the public.

Reliquary Crosses.—In the very early days of the Church, already, relics of the saints were being enshrined. The different churches emulated one another in obtaining relics of greater distinction than others, and in enshrining them in reliquaries each more elaborate and rich in gems and workmanship than the others. Nothing was more natural than that the altar cross should itself become a container of holy relics.

Rood Crosses.—Between the nave and the choir of large churches, or between the nave and chancel of small churches, were lofts or beams since very early days. Codin (15th century), in his history of Constantinople, tells of a cross of gold which stood over the jubé of Saint Sophia’s; it was enriched with precious stones and was provided with sconces for lights. Every jubé or rood loft became embellished with its rich rood cross. Anastasius mentions (6th century) such a cross in the middle of the church of Saint Peter the Apostle, at Rome, made of pure silver weighing 72 pounds. Both the Greek and Latin churches all had such roods until quite recent times. In Flanders were many up to the period of the present war, notably one at Louvain. They were usually constructed of wood (carved oak, mostly). Facing the nave, the four ends of the crucifix contained emblems of the four Evangelists, enclosed in quarterfoils; toward the choir faced the four “doctors” Saints Jerome, Ambrose, Augustine and Gregory. At the foot of the cross are found the Blessed Lady and Saint John on pedestals. The entire structure was gilded and painted.

Processional or Station Crosses.—In the Middle Ages, on certain religious processions, the altar cross was carried in advance of the clergy and, at some fixed places called stations, the procession stopped. The cross was then lowered to receive the devout kisses of the populace. From this act arose the special processional cross (crux stationalis) which was mounted on the end of a staff and carried aloft. These crosses often were furnished with two lighted torches for night processions. On the arms were, frequently, the Greek letters Alpha and Omega (first and last letters of the alphabet), one on each arm, to signify “the Beginning and the End.” Lastly, these crosses received the image of the crucified Savior, also medalion decoration with bas-relief representations of scenes taken from the Old and New Testaments, often chased or painted. The medallions of these elaborate, often richly bejewelled, processional crosses, were termed manuexa.

Pectoral Crosses.—A ritualistic cross worn by bishops suspended round the neck by a chain hangs, as the name implies, on the breast. This
pectoral cross acted as insignia of authority over a diocese, hence "when any bishop enters the diocese of another he wears the cross concealed." (Pugin).

Reliquary crosses of small size were made for use by the general public as amulets, and were extremely popular in the Middle Ages. They were termed encolpia. Cardinals and archbishops, for hierarchical distinction, are empowered to use a Latin cross furnished with two arms (patibula) or traverses. A special, distinctive three-barred cross is dedicated, solely, for the use of the Pope. These two styles of cross are known respectively as patriarchal and papal crosses.

Heraldic Crosses.—It is said that the knight Crusaders, in their armor and with their faces hidden by helmets, would have been recognizable by their followers had they not adopted different kinds of crosses to attach to their persons. This condition is generally referred to as the origin of the numerous kinds of crosses used in heraldry. There are no less than 300 different devices and forms known among the crosses of heraldry, and each has its own blazon or titular description. When a cross in heraldry is mentioned without any further blazon, it implies the Greek cross. See HERALDRY.

Market crosses are crosses which were erected in the markets or trading places to remind people so to deal with their customers as to be Christ-like. Most market-towns in England and Scotland formerly had their crosses, and are still in existence. Some of the chief are those of Bristol, Chichester, Cheddar, Edinburgh, Malmesbury and Winchester.

Crucifix, a cross bearing the figure of Christ. It cannot be said at what time this emblem of the Christian faith began to be used, either by the Christian Church or by individual Christians. A general feeling of repugnance toward the instrument of punishment which, among the Romans, was reserved only for the most infamous class of criminals, would for a long time prevent the early Christians from representing Christ upon the cross, and this feeling would have to be conquered before the crucifix could come into use in public worship. There are certain remains which would seem to show that crucifixes existed in the beginning of the 3d century; but it is probable that all these were merely tokens of individual piety. It is certain that the most ancient crucifixes known to exist belong to this class. Such, for example, is that painted in the Syriac evangelistary of the year 582, contained in the Laurentian Library at Florence; and such also is the pectoral cross of the superiors of Monza, which is said to have been a gift of Pope Gregory the Great to Theodolinda, who founded the cathedral. Crucifixes appear to have been first used in public worship toward the end of the 6th century. The most ancient example known of a crucifix used for this purpose is one which, on the testimony of Saint Gregory of Tours, was painted in a church at Narbonne. For more than 100 years after this period they were still rare, and it was not till after the Trullan Council, held at Constantinople in 692, which ordained that historic painting should be preferred to emblems or symbolic figures, that the images of Christ crucified began to multiply.

As to the manner of representing Christ on the cross it appears to be unquestionable that, as a rule, the figures on the most ancient crucifixes were engraved on gold, silver or iron crosses. On the pectoral cross of Monza, however, the figures are enamelled on a gold cross. At a later period they were painted on wood, and it is only in the 9th century, in the ponti...
HERALDIC CROSSES

(See description on preceding page)
ficat of Leo III, that the figure of Christ appears carved upon the cross in bas-relief. Although there can be no doubt that Christ, in accordance with the Roman custom of representation, was crucified naked, all the most ancient crucifixes, almost without exception, represent him as clothed, with a tunic reaching down to the feet. This practice lasted down to the 8th century, when it began to be modified, the body of Christ being no longer covered above the loins; and at length it became the custom to represent Christ, as in the crucifixes of the present day, entirely naked with the exception of a cloth about the loins. Another point in which the ancient crucifixes differ from modern ones is as to whether Christ is represented dead or alive. Until the 11th century he is represented alive; since that period he has been represented as dead. The first example of Christ being represented as dead is furnished

tached to the crucifix in several countries because of its primitive employment having been to save the metal of the crucifix from the perspiration of the hands of its carrier. (Cahier). Many crucifixes bear also the inscription put upon the cross by the order of Pilate, but this is always found in later, edictic inscriptions, both in ancient and modern times. In the Latin Church it is frequently omitted, but the Greek Church has adhered more strictly to this practice. Various accessories are also sometimes found in crucifixes, such as figures of the sun and moon, the lamb, of the Virgin Mary and Saint John, of the two soldiers—one presenting the vinegar for Christ to drink, the other with the lance with which he pierced the side of Christ; emblematic figures representing the four evangelists; angels in a posture of adoration and certain saints.

CLEMENT W. GOMME.

CROSSWELL, Edwin, American journalist: b. Catskill, N. Y., 29 May 1797; d. Princeton, N. J., 13 June 1871. His able management of his father's paper, the Catskill Recorder, led Martin Van Buren and other prominent Democrats to invite him to help in the Albany Argus, and also State printer 1824. During his 30 years' control he made it one of the most influential Democratic papers in America, and as a member of the political group known as the 'Albany Regency,' he preserved order in.

the party ranks through the columns of his paper. He was a great antagonist of Thurlow Weed. His articles were regarded as authoritative and were widely copied. Subsequently he found himself opposed to Van Buren and other early friends, and leaving journalism (1854) went into business in New York.

CROSWELL, Harry, American writer and clergyman: b. West Hartford, Conn., 16 June 1778; d. New Haven, Conn., 13 March 1858. He first came into notice as a Federalist editor of The Balance newspaper published in Hudson, N. Y. (1802), his bitter and sarcastic editorials involving him in numerous libel suits. Alexander Hamilton's last, and one of his finest, forensic efforts, was made in defense of Crosswell in a suit caused by an article on Jefferson. He entered the Episcopal ministry in 1814, became rector of Trinity Church, New Haven, Conn., 1815, and remained there until his death. He published Young Churchman's Guide (1838); Family Prayer (1843); Morning and Evening Crosswords (1853); Guide to the Holy Sacrament (1857).

CROTALARIA, krṓ-talär-ía, or RATTLE-BOX, a genus of annual and perennial herbs and some shrubby plants of the natural order Leguminosae. The numerous species are widely distributed in the tropical and temperate zones, the greater number of which grow in long-stemmed species yield a textile fibre. The most important of these species are C. juncea, which yields the Sunn hemp of India, and C. tenuifolia, by some botanists considered a variety of the preceding species, which yields Jubbupore hemp. These plants are grown thickly in order to produce attenuated stems with long strands of fibre. If sown thinly they branch freely. Several American species are reputed to cause trouble (crotalism) to horses which eat them too freely. A few species are cultivated for ornament both out of doors and in greenhouses. The most popular outdoor species is probably C. retusa, a hardy annual herb about one and a half feet tall and bearing racemes of yellow and purple rather fragrant flowers during summer.

CROTALIDÆ, krṓ-tálid-ē, a family of poisonous snakes, the rattlesnakes or pit-vipers. It is now reduced in classification to the rank of a sub-family (Crotalinae) of the viper family (Viperidae), differing from typical vipers by the presence of a deep pit, of unknown function, between the eye and the nose, and by the possession by most species of tail-rattle. The group is exclusively American, and includes the rattlesnakes, copperheads and moccasins (qq.v.).

CROTHERS, Samuel McChord, American clergyman and essayist: b. Oswego, Ill., 7 June 1857. He was graduated at Princeton in 1874 and from the Union Theological Seminary. After holding several charges in the West, he entered the Unitarian ministry and removed to Brattleboro, Vt., in 1882. In 1894 he was called to the First Parish of Cambridge, Mass., where he became also one of the preachers to Harvard University. His essays are humorous and shrewd, and he is happiest when dealing with the intellectual weakness and frailties of the time. His works include: The Gentle Reader (1903); 'The War' (1905); 'The Endless Life' (1905); 'By the Christmas Fire' (1908); 'Among Friends' (1910); 'Humanly Speaking' (1912); 'Three Lords of Destiny' (1913); 'Meditations on Votes for Women' (1914).

CROTON, a genus of plants of the family Euphorbiaceae, consisting of about 600 species in the warmer parts of the world, chiefly in America. Several are natives of the United States. C. tiglium, an Asiatic species, is the croton-oil plant or physic nut, which yields the powerful purgative croton oil. C. eleuteria, cascarilla or sweetwood, found in the Bahamas, and C. cascarilla, yield cascarilla bark. The plants commonly cultivated in hothouses under the name Croton belong to the related genus Codiaeum.

CROTON AQUEDUCT and CROTON DAM, an aqueduct and dam for many years the only means of water supply for the city of New York. The waters of Croton Lake, an artificial body of water formed by damming the Croton River, were first conveyed to the city in 1842, by what is known as the old aqueduct, and a new aqueduct was opened in 1890. The old aqueduct was of masonry lined with brick, and had a cross-section area of 53.34 square feet, and a nominal capacity of 72,000,000 gallons per day. On occasions it has actually delivered 95,000,000 gallons in 24 hours. (See AQUEDUCTS.) The new aqueduct has a cross-section area of 155.57 square feet, and a flow capacity of 300,000,000 gallons per day. It passes in its lower course under the northern part of Manhattan Island, rising at 135th street, where a gatehouse is constructed from which the water is distributed through 12 lines of 48-inch iron pipe, four of which enter the reservoir in Central Park. Throughout its entire length this great tunnel was blasted out of solid rock, with the exception of one or four spots where 4 Blow-offs were constructed with the object of rapidly emptying the aqueduct — which here meets the surface — for the purpose of examination, repair or cleansing. The tunnel is lined throughout with brick, and in one or two places where the rock has been found imperfect and a leakage is possible an iron lining has been added.

As early as 1881 the question arose of providing a large water-supply for the future needs of the city, and a new dam across the Croton River was ultimately decided on, the contract for the structure being awarded 26 Aug. 1892, the work to be completed 1 July 1899. It was not finished, however, until 1906. In 1901 the dam was about half completed and a modification of the design at that time involved doing away with the proposed earthen section of the dam and building the whole of masonry, except a low embankment at the south end. The dam crosses the valley about three and a fourth miles above the mouth of the Croton. The first step in its construction was the cutting through solid rock of a canal 1,100 feet long and 125 feet wide to turn aside the river. The foundation pit for the dam was finished in September 1897. The excavation reached about 75 feet below the country level at the center of the bedrock, and involved the removal of 1,821,400 cubic yards of earth and 400,250 cubic yards of rock. The dam is 1,168 feet long and 394 feet high, from its foundation, and 210 feet above the former level of foundation. The dam and base being 206 feet, from which the structure tapers to 22 feet at the top. At the north end
of the dam is a spillway or overflow, 1,000 feet long, built in continuity with the dam and nearly at right angles to it, reaching up the valley. The waste from this spillway is discharged into a channel 50 feet wide at its upper end and 125 feet at the lower end, cut into the solid rock. At the southern end the masonry of the old aqueduct runs through the dam. This great mass of masonry forms the largest and most expensive dam ever constructed on this continent and its height is second only to that of the reflection dam (324 feet), which, however, contains less than half the mass of the Croton dam. The steam and machinery equipment equalled that of an ordinary railroad, for besides the many hoists and derricks, there were several miles of tracks and 11 locomotives of the dinky type and 282 cars in hauling earth and stone, besides 39 steam boilers and 51 hoisting engines. The new dam increased the storage capacity of the city water supply by 30,000,000,000 gallons. The old Croton dam impounded 2,000,000,000 gallons in a lake 545 miles long and covering 500 acres. This old dam now lies 30 feet below the level of the new lake. The new dam forms a lake 1935 miles long covering 3,425 acres. The watershed of the Croton valley has an area of about 12 square miles. In this area there are a dozen or more reserve dams auxiliary to the Croton dam, and these impound a total of 67,952,000,000 gallons, making the capacity of the Croton system close to 100,000,000,000 gallons. The intake from the large new reservoir is from the upper gatehouse where there are 22 gates each supplied with charcoal-filters through which the water must pass before it is turned into the aqueducts. These intakes have a capacity of 400,000,000 gallons a day.

**CROTON BUG.** See COCKROACH.

**CROTON OIL,** a fixed oil expressed from the seed of *Crotolum Tiglium.* (See Croton.) The seeds have been used in medicine for a great many years. The oil is a thick, viscous, pale yellowish or brownish-yellow liquid, having a slightly fatty odor and an acrid burning taste. Its solubility is like that of similar fixed oils. Its composition is extremely complex, but the active principle is chiefly a glyceride of crotonoleic acid; this makes it an extremely powerful irritant, and administered to the skin it causes vesication and pustulation. Given internally it is a very active, drastic purgative and is used practically only in obstinate cases of constipation and for the insane, who refuse to take internal medication. It should be administered very sparingly, as five drops have been known to cause severe poisoning.

**CROTON RIVER,** river in New York which rises in Dutchess County, runs south through Putnam County and southwest through Westchester County, emptying into the Hudson at Croton Point, 32 miles north of New York. Its length is nearly 60 miles. It supplies the city with water through the Croton aqueduct and the river is of the type which have water supply reservoirs about 362 square miles above the new Croton dam. Within this area are about 30 lakes and ponds, many of which are utilized as natural storage basins. Along the course of the river the following reservoirs are situated: the Boyd's Corners, the Middle Branch, the East Branch, the Titicus, the Carmel and the new Croton.

For many years New York (i.e., the present Borough of Manhattan) was dependent chiefly upon this source for its water supply. For an account of the city's enlarged water-supply system see CROTON AQUIDUCT.

**CROTONE, Italy,** a Greek republic in Magna Graecia or South Italy, founded about 700 b.c. Livy gives the circumference of the city of Crotone at 12 miles. This city was famous for producing the strongest athletes, among them the celebrated Milo. It is still more celebrated as the home where Pyrrhus settled between 540 and 530 b.c. and where he taught. Milo was one of his disciples. After the destruction of Sybaris (510 b.c.) the Pythagoreans were expelled. The city was captured by Dionysius the Elder of Syracuse and later by Agathocles and in the war between Pyrrhus and the Romans was plundered and nearly destroyed. It suffered severely in the Second Punic War, and was for three years the winter quarters of Hannibal. Under the Romans Crotone was a province for its naval and dissoluteness. Crotone is the modern Cotrone, and the ruins of the ancient town are still to be seen above Capo della Colonna. Pop. (commune) about 9,000.

**CROTOPHAGA,** krō-tō-fa-ga, a genus of birds, the typical one of the sub-family *Crotophaginae.* The bill is greatly compressed, and the ridge of the upper mandible is strongly developed. The species are found in South America. *C. ani* is the ani or anno so called by the Latin races of South America, the razor-billed blackbird of Jamaica, called also the savannah bird and the great blackbird. It feeds on small lizards and insects and seeds. It lives in flocks, and when one individual is slain the rest gather again almost at the same spot. Several females are said to use the same nest.

**CROUCH, Frederick Nicholls,** English musician: b. London, 31 July 1808; d. Baltimore, Md., 10 Aug 1896. He played the violoncello in Queen Adelaide's private band and later was principal violinist at Drury Lane Theatre. In partnership with others he established a large rolling mill for the manufacture of zinc, and patented the engraving known as microphotography. He composed 100 songs, including the famous 'Kathleen Mavourneen.' In 1849 Crouch visited New York and played in the orchestra at Astor Place Opera House; taught music in Portland, Me., 1850-56. He fought on the Confederate side in the Civil War. He also composed two operas, 'Sir Roger de Coverley' and 'The Fifth of November 1670.'

**CROUP,** a term popularly used for a number of conditions which have been more specifically defined. It is in reality a symptom present in a large number of diseases or disorders of the larynx, which are spasmodic or inflammat- ory. Croup occurs mostly in children and is characterized by the peculiar strident sound, sometimes a distinct cough, which accompanies inspiration or expiration due to interference with the vibrations of the vocal cords because of spasm, inflammation or growth upon the cords and adjacent tissues. The term has been popularly used to denote a diphtheritic laryngitis (acute membranous laryngitis), which, however, belongs distinctly to a different class (See DIPHTHERIA). It is also used generally for acute catarhal...
spasm of the larynx (catarrhal cough, false
croup, spasmodic cough, laryngitis stridulosa).
This is common to childhood and may follow a
slight coryza, dietetic disturbances or sometimes
comes on without any apparent premonitory
symptoms. The attack comes on suddenly and
usually at night. The respiration is obstructed
and consequently labored with a peculiar strid-
ulent inspiration on expiration.
There is a loud metallic cough. The
pulse is small and rapid and there is usually a
marked rise in temperature. The attack lasts
several hours when the child gradually becomes
easier and falls asleep. The attack may be re-
peated several successive nights after which a
slight catarrh remains for a week or two and
then disappears. The most effective means of
treatment is by the use of steam inhalations
with warmth and rest in bed. Occasionally in
more severe cases other means of treatment
may also be used. Although the attacks are fre-
quently very alarming fatality is extremely rare.
Attention should be given to certain prophyl-
actic measures in the child disposed to this
form of attack. Exposure should be avoided
before the child should not be taken from
the atmosphere or one deprived of some amount
of moisture. The condition of the tonsils and
adenoids should be ascertained as these will
often be found enlarged. There is also an acute
simple laryngitis which is more serious but less
frequent than laryngitis stridulosa. It is often
associated with infectious diseases of childhood
or with coryza or inflammation of some adjacent
portion of the respiratory tract. Recovery is
usual in a few days or two weeks. Sometimes
the inflammatory process extends to the bron-
chial tubes or even develops into bronchopneu-
monia. A laryngospasm, known as laryngis-
mus stridulus (cerebral cough), occurs chiefly
in infants under 18 months of age who are
rachitic or have a tendency to convulsions. It
manifests itself in a sudden attack of apnea
followed by a protracted coughing inspiration
and ending in crying and fretfulness with per-
haps a general convolution.
This form especially marks the psychogenic
origin of cough, which is not absent likewise
from the adult, although not so readily de-
scribed. They call attention to the presence of
a neurotic diathesis which determines such a
mode of response by which the infant seeks to
express the lack of conformity between its
individual power seeking and the demands of
environment. Diphtheric laryngitis represents
such a reaction upon the level of physicochemi-
cal activity and has therefore found its place
among the distinctly infectious conditions.
Laryngitis stridulatus also manifests disturbance
of the vegetative nervous functions. In all of
these forms the psychogenic factor finds its
separate mode of control. This is further em-
phasized by the fact that as the tendency toward
these forms of reaction diminish, thumb-suck-
ing, enuresis or other psychoneurotic mani-
festations become substituted for these more acute
symptoms.

SMITH ELY JELLIFFE

CROW. The crow family (Corvidae), order
Passeres, comprises birds that have a strong
bill, compressed toward the points, and covered
at the base with stiff, bristly feathers, which
advance so far as to conceal the nostrils. The
plumage is dense, soft and lustrous, generally
dark, but sometimes of gay colors. They are
very omnivorous, and remarkable for their in-
telligence. The family, widely diffused over
the world, includes the common crow, type of the
Corvus; and the raven, the fish crow, the
rook, the jay and the magpie. The common
crow of North America, Corvus americanus
(Audubon), is about 20 inches long. Its
wings about 12 inches. It is remarkable for its
gregarious and predatory habits. The bill is
straight, convex and compressed. The nostrils
are placed at the base of the bill, and are panta-
lous; the tongue short, and bifid at the tip; the
Toes are separated almost to the base, and the
middle one is the longest; the wings sub-elon-
gated and acute, and the tail composed of 12
feathers. They pair in March; the old repair
their nests, the young frame new ones; but they
are such thieves that while the one is fetching
materials the other must keep watch to prevent
the rising fabric from being plundered by their
neighbors. As soon as the nest is finished and
the eggs produced (five, bluish green, with
dark blotches), the male takes upon himself the
care of providing for them, and continues during the
whole period of incubation. They frequent the same rookeries for years, but
allow no intruders into their community. They
are omnivorous and feed largely upon insects
and small animals of all kinds, as well as on
grain and seeds, whence they have sometimes
been supposed injurious to the farmer; but they
amply repay him for what they take by destroy-
ing the vermin in his fields. The fish crow
(Corvus ossifragus) is a closely similar but
somewhat smaller species, chiefly maritime in the
eastern United States, but found for a con-
siderable distance along river valleys. Less
social than the common crow, it often associates
with that bird, so that it is very commonly over-
looked. In India there is a hooded crow, also
of the genus Corvus.

CROW-BLACKBIRD, the name of cer-
tain American birds of the genus Quiscalus,
family Icteridae or hang-nests. The great crow-
bird, or grackle, Q. major, found in the
Southern States, Mexico and the West Indies,
16 inches long; and of glossy black plumage.
The female is of a light brown above and whitish beneath. The purple grackle, lesser or
common crow-blackbird, Q. quiscula, is similar in color to the preceding, but smaller. They
reach the Middle States of the United States
from the South in flocks in the latter part of
March, and build in April in swamp-bushes and
trees. In their first arrival they feed upon in-
sects, but afterward commit great ravages upon
the young corn. In November they fly south
again.

CROW INDIANS or CROWS, or AB-
SORUQUE or ASAROKA, a tribe of the
Sioux division of the North American Indians.
They are named after a species of hawk, not
after the bird commonly called the crow. They
belong to the linguistic stock included under the
name Siouan Indians and are of the same family,
as the Dakotas. After 1790 they remained at
peace with both their neighbors and the whites,
frequently furnishing troops against hostile
tribes. In language and customs they resemble
the Hidasta. Their society is founded on a
clan system with maternal descent, combined
CROWBERRY—CROWLAND

with social usages dependent on the father's clan. They had a series of ungraded military societies, and a strange ceremony of planting their tobacco. It was common for them to be engaged at war with other tribes of the same family. When the explorers Lewis and Clark visited the Crow, they found the tribe divided into four groups or "bands."

Brown located them on the Yellowstone River in 1817, and in 1842 they were reported by the government agents as inhabiting the land around the head waters of the Yellowstone. They were then 4,000 in number. Later they were moved to a reservation in Montana. Pop. 2,827.

CROWBERRY (Empetrum), a genus of low-growing evergreen shrubs of the family Empetraceae. The few species are characterized by small, crowded, evergreen leaves, inconspicuous blossoms, and globular, usually black, edible berries, with 6 to 10 bony seeds in a slightly acid, very juicy pulp. They are natives of cold, northern climates (one in South America), and are sometimes used for making a fermented beverage. As dessert fruit they have little value, but they are eaten in northern Europe, where they are regarded as a scorbatic and diuretic. Crows are especially fond of them, hence the name. The plants are often used for ornament in rockeries where the soil is moist and peaty or sandy.

CROKE, Eyre, English historical and genre painter: b. London, 3 Oct. 1824; d. there, 12 Dec. 1910. He studied painting in the atelier of Paul Delaroche in Paris, and went with that artist to Rome in 1844. Acting as amanuensis to William M. Thackeray, he visited the United States in 1852-53. He was elected an associate of the Royal Academy in 1876, and an academician in 1888. Among his paintings are "Goldsmith's Mourners" (1863); "Blue Coat Subject" (1862); "French Savants in Egypt" (1875); "The Rehearsal" (1876); "Sanctuary"; "Prayer"; and "Bridal Procession at St. Macou, Rouen" (1877); "School Treas" (1878); "Blue Coat Boys Returning from Their Holiday"; "Marat: 13 July" (1873); "The Queen of the May" (1891); "Queen Eleanor's Tomb" and "Fortéits" in 1880; "Sandwiches" and "Sir Roger de Coverley and the Spectator at Westminster Abbey" (1881); "How Happy Could I Be with Either?" and "The Defense of London in 1643," exhibited in 1882; "Old Porch, Evesham" (1884). He published "With Thackeray in America" (1893); and "Haunts and Homes of Thackeray" (1897).

CROCE, Sir Joseph Archer, English historian of art and miscellaneous writer: b. London, 20 Oct. 1825; d. Baden, 6 Sept. 1896. He was long eminent as a journalist, and for a time secretary to the British diplomatic service. His celebrity rests mainly on the histories of painting in Italy (1864-71), the most important work on this subject, written in collaboration with G. B. Cavalcaselle (q.v.). He also published other volumes on art subjects.

CROCE, William, English clergyman and poet: b. Midgham, Berkshire, 1745; d. Bath, Somerset, 9 Feb. 1829. He was the author of "Lewesdon Hill," a descriptive poem, praised by Wordsworth; if planting, "Treatise on English Versification" (1827), etc.

CROWELL, Edward Payson, American educator: b. Essex, Mass., 1830; d. Amberst, Mass., 1911. He was graduated at Amherst College 1853; was tutor there 1855-56; professor of German 1858-64; and of the Latin language and literature 1858 till his death. He edited a number of Latin classics, such as "De Senectute" and "De Amicitia" of Cicero (1871), the "De Officiis" of Cicero (1873), and his "De Oratore" (1879); "Selections from the Latin Poets, Catullus, Tibullus, Propertius, etc." (1882), and with Richardson, translated Herman Bender's "Brief History of Roman Literature" (1880); and wrote "A Clue to the Prose Writings of the Silver Age" (1897).

CROWELL, John Franklin, American economist: b. York, Pa., 1 Nov. 1857. He was graduated at Yale in 1883, and studied also at Columbia and at the University of Berlin. He was principal of the University School, Freericksburg, Pa., for several years; president of Trinity College, N. C. (1887-94); head of the department of economics and sociology at Smith College (1895-97); and in 1900-04 an expert for the United States Industrial Commission, writing one of the 19 volumes issued. He was also expert on internal commerce for the Bureau of Statistics in the Treasury Department. In 1906 he became editor of the Wall Street Journal, New York, and in 1910-11 was president of the American Civic Alliance. He is now an executive officer of the New York Chamber of Commerce. He has published "Taxation in the American Colonies"; "The Logical Process of Social Development"; "Trusts and Competition" (1913), "The Distribution of Farm Produce in the United States"; "Report to the War Department on Deepening the Mississippi River" (1903); and many contributions to the Monthly Summary of Commerce and Finance of the United States.

CROWFIELD, Christopher, a pseudonym sometimes used by Harriet Beecher Stowe.

CROWFOOT, or BUTTERCUP, common names of the genus Ranunculus, the type genus of the natural order Ranunculaceae or crowfoot family. The genus has over 200 species, widely distributed in the temperate regions of the world, and on the mountain-tops of the tropics. The plants of the genus are both aquatic and terrestrial, and are generally classed as useless weeds. The name buttercup is popularly applied in the United States to those species with large flowers and divided leaves. The buttercup is called "crazy" by the rustics of central England, who believe that its smell will cause madness.

CROWLAND, or CROYLAND, England, town in the county of Lincoln, eight miles northeast of Peterborough; pop. about 2,800. It is in the Fen country, and consists of four principal streets, at the intersection of which is a very curious ancient triangular bridge. On one of the wings of this is a disused pavilion, attributed to the 9th century, and supposed to be that of Alfred or Ethelbald, king of Mercia. The only other remarkable edifice is the ruined abbey of Crowland founded in 714.
and rebuilt about 1112, the north aisle of which forms the parish church. Ingulphus, to whom a history of the abbey of Crowland, first published at London in 1596, afterward at Oxford in 1684, has erroneously been attributed, was abbot of Crowland from 1075 till 1109. Pop. 2,655.

CROWLEY, La., town and county-seat of Acadia Parish, on the Southern Pacific and Louisiana Western railroads, about 135 miles northwest of New Orleans, and 45 miles from the Gulf. It is the centre of a rice district, and nearby are oil fields. Rice-milling is the principal industry. A rice-growing experiment station was established here under State and Federal control. Settled about 1887, Crowley was incorporated two years later and grew rapidly. The government is administered by a mayor, elected biennially, and a council. The town contains an Odd Fellows' Home and the electric plant, sewerage system and waterworks. Pop. 5,099.

CROWN, an official or symbolical ornament worn on the head, now the symbol of royalty. At first it had no regal significance and was nothing more than a garland of leaves or flowers thrown over the head or it was made of gold and was bestowed on citizens deserving well of their country. In the Middle Ages crowns became exclusively appropriated to the royal and imperial dignity; the coronets of nobles were only borne in their coats of arms. It is, however, with the eastern diadem rather than with the classic corona that the crown as a symbol of royalty is connected; indeed, it was only introduced as such a symbol by Alexander the Great, who followed the Persian usage. The English crown has been gradually built up from the plain circlet with points. This form was elaborated and jeweled, and finally arched in with jeweled bands (diadems) surmounted by the cross and mound. As at present existing the crown of England is a gold circle, adorned with pearls and precious stones, and bearing alternately four crosses, pattées and four fleurs-de-lis. From the top of the crosses rise imperial arches, closing under a mound and cross. The whole covers a crimson velvet cap with an embroidery. The Scottish crown consists of a jeweled and enamelled circle of gold, supporting 10 fleurs-de-lis and 10 crosses fleury in alternation. Each of the crosses is adorned with a diamond and pearls, and from them rise four gold arches, closing under a mound, which bears a pearl-bedecked cross pattée. The royal crown of France is a circle ornamented with eight fleurs-de-lis, from which rise as many quarter-circles closing under a double fleur-de-lis. The Austrian crown is a sort of cleft tiara.

1. The term crown is used figuratively for the royal power, in contradistinction either to the person of the monarch or to the body of the nation, with its representatives, interests, etc. Thus, in modern times, the word crown is used to express the rights and prerogatives of the monarch, which includes all powers—the legislative, judicial, etc. Thus the Crown domains are distinguished from the state or national domains.

3. In architecture, crown denotes the uppermost member of a cornice; the corona; also a sort of ornamental structure surmounting a tower and formed by flying buttresses meeting together at top.

4. In English money, the crown is a coin, worth five shillings, or $1.22.

See CROWNS AND CORONETS; CORONA; WREATH.

CROWN COLONIES. British colonies are officially divided into three classes; those coming under this head are colonies which were ceded or conquered, and where the Crown, i.e., the home government, has the entire control of legislation and of the officials, such as Gibraltar. A special department of the Colonial office in London deals with the administrative and political work of the Crown colonies and protectorates.

CROWN-GALL, a disease of many fruit and forest trees usually caused by Bacterium tumefaciens, which obtains entrance usually at the juncture of the roots and the trunk (the crown), but sometimes appears on the roots. In young trees the galls are often half an inch in diameter, colored like the roots or darker, soft and composed of apparently unorganized tissue, but in old trees they frequently show concentric rings and may become several inches in diameter. In Europe, America and New Zealand, where this disease is known, considerable damage has been reported, even whole orchards being destroyed by the fungus. The only remedy thought to be of service is the annual removal of the galls and the covering of the wounds with thickened Bordeaux mixture.

CROWN GLASS, very hard and clear, made almost entirely of sand and alkali and a little lime, without lead or any metallic oxide except a very small quantity of manganese, and sometimes of cobalt. The original balloon is flattened, crown-shaped. A steel rod tipped with molten glass is now attached opposite to the blowpipe which latter is then removed. By rapidly revolving the rod on a horizontal axis opposite the large opening of the glass furnace, the mass of glass softens and spreads out into a disc, thick at the centre and thinning toward the edges. The limit of the diameter of these discs is about four feet. Crown glass is used in connection with Flint-glass, in order to destroy the disagreeable effect of the aberration of colors. This important discovery by Dollond, who turned it to admirable account in the achromatic telescope, was carried to the highest perfection by Reichenbach. This glass is much used for windows, especially for art work, where its peculiarly brilliant surface makes it most acceptable. See GLASS, VARIETIES OF.

CROWN LANDS, English, territories in the British Isles formerly the private property of the sovereign. Since George III., however, every British monarch has on accession surrendered the Crown lands to be disposed of by Parliament. The income from them, like the other revenues of the state, are now devoted to the public service. The administration thereof is in the state, of which the proceeds of woods, forests and land revenues. The produce for 1915-16 amounted to $3,912,720, of which sum $2,750,000 was paid into the Exchequer. Before the Norman conquest (1066) all the so-called folk-land gradually became terra regis or king's land. The confiscations of Wil-
CROWN POINT—CROWNS AND CORONETS

liam the Conqueror greatly increased these tractions, but their redistribution among the king's followers so reduced them again that an Act of Resumption was passed under Henry III, and during the reign of Edward II an act was in force prohibiting the alienation of Crown lands. The Wars of the Roses and the confiscations of Henry VIII enlarged the possessions by forfeiture and seizure, but the necessities of James I and Charles I compelled the disposal of the whole estates. These were partially recovered at the Restoration by the sales being declared void. An important constitutional effect was produced by the wholesale granting away of the Crown lands; being thus deprived of a private income, the monarch had perforce to apply to Parliament and the nation for his income, which was not infrequently granted only on condition of good government. The extravagance of William III led to an act being passed in the reign of Queen Anne (1702-14) by which further alienation was greatly checked, but in 1800 the act was declared not to apply to the private property of the sovereign acquired by purchase or inheritance from any person other than a sovereign of England. In 1910 the Civil List of the king was fixed (after the usual surrender of hereditary revenues, i.e., the Crown lands) at $2,350,000.

CROWN POINT, a town in Essex County, N. Y., on the west shore of Lake Champlain, on the Barge Canal and on the Delaware and Hudson Railroad, 110 miles northeast of Albany. It has a large park, a library and chapel and a memorial lighthouse erected to Samuel de Champlain. The town manufactures building materials, sashes and doors and has spar mills, grain elevators and a creamery. Crown Point was first visited by Champlain, who fought and defeated the Iroquois there. In 1714 it became an important English trading station. This place, because of its location near a narrowing of the lake, was called Pointe à la Chevelure (Sculp Point) by the French, Crown Point by the English. In 1726 the French established a post opposite, on the east side of the lake; they withdrew in fear of Massachusetts. In 1631, the governor of Canada built a fort there, which they called Fort Frédéric. In 1756 it was the opening of the final contest, an expedition against Fort Frédéric was planned by Governor Shirley of Massachusetts, and led forward by Sir William Johnson; but it got no farther than Fort Edward, and ended in the bloody drawn battle of Lake George (q.v.). In 1756 the French built Ticonderoga farther down, on the isthmus between Lake Champlain and Lake George; this left Crown Point a second instead of first line of defense, but the two were the chief French frontier posts through the war. In 1756 an expedition from Albany was undertaken, but came to nothing; in 1757 Maj. Robert Rogers' rangers attacked them, in numerous raiding parties. In 1759 they were captured by Amherst, Crown Point being abandoned as soon as Ticonderoga was taken. Both posts were kept up by the British and at the outbreak of the Revolutionary War were the first thought of the colonists, to open the route to Canada and seize the stores they contained. On 10 May, while Arnold and Ethan Allen took Ticonderoga, Seth Warner captured Crown Point, with over 200 cannon and a quantity of ammunition. The present village of Crown Point is several miles below the point and the old fort. The grounds containing the ruins of Fort Frédéric and Crown Point were presented to New York State for a public park in 1910.

CROWN POINT, Ind., the county-seat of Lake County, in the northwestern corner of the State, on the Erie and the Pittsburgh, Cincinnati, Chicago and Saint Louis railroads, about 40 miles southeast from Chicago and 15 miles south of Lake Michigan. Among the noteworthy features are the county jail and almshouse, the juvenile home for delinquents and the Carnegie library. The town has grain elevators, wagon works, iron-works and a shirt factory. Pop. 2,526.

CROWNINSHEILD, Arent Schuyler, American naval officer: b. Seneca Falls, N. Y., 14 March 1843; d. 27 May 1908. He was graduated at the United States Naval Academy in 1863, and participated in both attacks on Fort Fisher in the Civil War. Later he rose to the rank of captain. During the war with Spain he was a member of the Board of Strategy. In 1900 he was chief of the Bureau of Navigation, with the rank of rear-admiral; commander European squadron 1902-03; a member of the Board of Naval Strategy, and retired 20 March 1903.

CROWNINSHEILD, Frederic, American artist: b. Boston, Mass., 27 Nov. 1843. He was graduated at Harvard 1866; spent 11 years in Europe studying art under Couture and Cabanel, his first exhibited work appearing in the Paris Salon of 1878. He was instructor in the Boston Museum of Fine Arts 1879-85, after which he removed to New York, where he was president of the Fine Arts Federation from 1900 to 1909. In 1911 he was appointed director of the American Academy in Rome. He is a member of the National Society of Mural Painters. He devotes himself largely to mural painting and stained glass work. His water colors are greatly sought by collectors. He has published 'Mural Painting' (1887); 'Pictorial Carmina, a Painter's Songs' (illustrated by himself, 1900); 'A Painter's Moods' (1903); 'Taales in Metre' (1903); 'Under the Laurel' (1907); 'Villa Mirafiore' (1912).

CROWNS AND CORONETS. Crowns may be divided into three classes; they may be either emblems of royalty, insignia of office or authority, or decorations of honor. The insignia of royalty adorning the heads of the ancient Eastern kings (Assyrian, Babylonian, etc.), which in English works usually are termed crowns, were ribbons or bands of linen or silk (sometimes of thin gold) worn round the head and passing over the temples. These were the diadema. The ciborium of the ancient Persian monarchs was in the form of the Phrygian cap (our cap of Liberty) later copied for the crowns of the old Doges of Venice. The ancient Greeks' crowns of honor were wreaths made from vegetable growths entwined. The Roman Caesars changed the wreaths as insignia into a circlet or ring of metal. Perhaps the earliest of actual crowns, according to present definition of the term, were those of the Nile kings. The ̓eskritn̓ combination of Upper and Lower Nile kingdoms was a true crown as dif-
CROWNS AND CORONETS

11th century. The Bohemian crown (*Crown of Wenceslaus*) is of the 14th century. The crown of Lombardy or *Iron Crown* dates from the 8th century; it was lost to Austria in 1866, when it was returned to Italy. Most noted of all is the crown of the Holy Roman Empire of Germany.

Descriptions.—The crown of the Holy Roman Empire is of fine gold. It is in the Hofburg in Vienna, and was used by Pope Leo III in crowning Charlemagne at Saint Peter’s, Rome, in 800 A.D. This crown consists of eight flat plates rounded at the top and riveted to an inner frame of two iron octagonal rings. Four plates are studded with pearls and polished, but uncut, precious stones (most are pierced, showing they originate from a pre-Christian necklace probably). The other four plates show gorgeous enamel pictures depicting symbolic and allegoric subjects. The arch (*diadem*) was added by Conrad III in 1147. It weighs seven pounds. The Saint Stephen’s crown, known also as the Corona Sancta or Holy Crown of Hungary (recently used at the coronation of Charles I), was sent (1022) by Michael Ducas, emperor of the Eastern Empire, to Geisa, the 1st Duke of Hungary. Its Byzantine style shows its origin. King Stephen (canonized as saint on account of Pope Sylvester II giving him the title of "Apostolic King") was crowned with this *Holy Crown*. It is preserved in the castle at Buda-Pesth and consists of a crown of gold surrounded by a circlet of six plaques hinged together. The edge of these plaques is surmounted by five arched and four triangular plates of gold open-work, decorated with inscription (scale) pattern, the openings in the metal being filled in with a green enamel (*plique à jour*). In the centre, above a plaque, is an arched-shaped plate depicting, in enamel, an artistic *Christ enthroned*. The plaques forming the circlet show large polished precious stones set in enamel surroundings and, alternately, the Archangels Michael and Gabriel, Saints Come, Damian, Demetrius and George, two Greek princes and a king. Two diadems (arches), supporting a plain cross botton in the apex, are decorated with enamel medallion figures of Saints John, Bartholomew, Thomas, James, Peter and Philip, Paul and Andrew. The cross leans to one side, whether by accident or with occult intent is unknown. Three *kataselis* (pendant chains) of flat rubies are suspended from the lower edge of the circlet, two at the sides and one behind after Eastern ancient style. This crown has been used in the coronation of over 50 Hungarian kings. The Bohemian crown, or crown of Wenceslaus, consists of four plates in fleur-de-lis form fastened together by hinges and studded with uncut precious stones. Two arches support a cross and a cap of crimson velvet lines the inside. It is of Byzantine workmanship. The *Iron Crown*, or Lombardy, preserved in the cathedral at Monza, is of uncertain origin. The ancient monarchs of Lombardy were crowned with this *Corona Ferrrea*, and Napoleon I, with his own hands, crowned himself with this crown. Charlemagne, as king of the Lombards, was inducted with this circlet. Its name is derived from the fact that it contains, in its make-up, a narrow wrought iron band, which tradition says was forged from one of the nails taken from the cross on which our Saviour was crucified. The golden circlet to which the iron band acts as inner frame is composed of six plaques about two and one-half inches wide and hinged together. Each plaque has as decoration a setting of jewels surrounded by floral blooms and foliage of chased and enamel work. The diameter of the jewel is but six inches.

English Crowns.—Early Anglo-Saxon crowns consisted of a circlet of gold with up-right spikes or points bearing a ball or "pearl" above. The English kings since Charles II have two royal crowns. One is known as the official Saint Edward’s crown and the other is the one used at the coronation ceremony and known as the State or Imperial crown. Saint Edward’s crown has two arches (*diadems*), a circlet with four crosses-pâtée, four fleur-de-lis alternating. It is composed of gold, emeralds, and several few jewels. The present coronation crown of England is of silver or platinum frame closely encrusted with precious stones, some with historic records, taken from former state crowns. The crown of the present king (George VI) differs from that of his father (Edward VII) only in having one of the great Cullinan diamonds (*"Star of Africa"") in the circlet. The "State Crown of India," made for the coronation of George V, at Delhi, contains over
6,170 diamonds as well as other precious stones. The bandeau or circlet supports eight arches rising from four fleur-de-lis and four crosses-patté alternating. The arches support a mound with cross-patté. The upper and lower borders of the circlet consist of diamonds; between these are 16 large clusters, four of emeralds and diamonds alternating with four of sapphires and diamonds, while between each are eight large brilliant clusters, the whole of these being divided by trefoils. The centrepiece contains a 34-carat Indian diamond of great beauty. The eight arches are formed of 48 large brilliants separated by diamond foliation and enclosed with outer bands of diamonds; their fleur-de-lis and cross-patté bases are of diamonds surrounding magnificent Indian rubies.

**English Coronets.**—Modern English coronets formerly enclosed a velvet cap with a tassel above of bullion; but these caps are now often omitted in practice. Lodge describes the coronet forms thus: The Prince of Wales' coronet has "cap of velvet, turned up with ermine and having a tassel of gold." (This authority's illustrations do not follow his rules strictly, as our illustrations show. Fig. 3). "Over it is worn a circlet of gold enriched with jewels; above its upper rim rise four fleur-de-lis and four crosses-patté alternately; from them an arched diadem of gold crosses the head and is finished at top with a ball surmounted by a cross-patté. . . . It is, in fact, the same as the imperial crown, with the difference of having but one diadem." **Ducal coronet.** The duke's cap is of crimson velvet, lined with ermine, having a gold tassel on the top. His coronet, worn over the cap, is a circlet of gold enriched with jewels, and set around with eight golden strawberry leaves rising from its upper rim. **Marquis' coronet.** His cap and coronet resemble the duke's, differentiated only by four of the strawberry leaves on the rim being exchanged for as many golden balls. **Earl's coronet.** His cap is the same as the duke's. His coronet is a circlet of gold enriched with jewels, from which rise eight points surmounted by as many balls of gold, and between them eight small strawberry leaves close to the upper rim of the circlet. **Viscount's coronet.** His cap is the same as a duke's. His coronet is a circlet of gold enriched with jewels the upper rim of which is surmounted by 16 balls set close together. **Baron's coronet.** His coronet is differentiated from that of a viscount by having only six balls upon its rim.

**French Crowns and Coronets.**—King. A circlet surmounted by eight fleur-de-lis from which arise four arches (diadems) that support a double fleur-de-lis. (Fig. 4). Duke. A circlet surmounted by eight leaves (fleurons). Marquis. A circlet bearing four leaves (fleurons), a point between each surmounted by a triple pearl cluster. Count. A circlet bearing 16 pearls. Baron. A plain circlet having a cord of pearls wound around it diagonally (torse) and displaying three windings. Vidame. A circlet surmounted by four crosses patté. Viscount. A circlet surmounted by four large pearls. (Fig. 5).
1 The Crown of St. Stephen Used at the Recent Coronation of King Charles of Hungary
2 The Famous Iron Crown of Lombardy
3 The Crown of Mercedes of Spain
German Crowns and Coronets.—King. The new German king’s crown bears close similarity to the crowns of the crown prince and the archduke. But the crown prince of the Empire and of Prussia has a crown similar to the imperial crown (four arches surmounting a mound), the circlet of eight plates alternating four eagles and four crosses as decoration. (Fig. 6). The German king’s (modern) crown has no lining (Futter), whereas the crown prince’s and archduke’s has. Electors without sovereign rights bear a coronet with ermine circlet and but one arch (diadem). The ducal coronet has a circlet of ermine and is lined to the top of the arches.

The coronet of the prince (Fürst) not of royal blood shows two crossed arches on a circlet of ermine; often, however, a crown or gold circlet with leaves (like the noble coronet) took the place of the ermine, surmounted with an ermine tail. Count. The last-mentioned coronet, but without the ermine tail, was attribute of a count. The modern count’s coronet displays nine pearls. The baron’s coronet displays seven and that of the untitled noble, five. (Fig. 7).

The Crown in Heraldry.—Unless otherwise stated, the crown in heraldic blazon refers always to a ducal coronet (see Fig. 3). Animals, chiefly as supporters, often carry a coronet on their necks. In such cases they are blazoned as gorged, as a hind gorged and chained.

Votive Crowns.—Early Christian kings frequently dedicated their crowns to the Church. From this arose the cult of devotion imitating crowns to churches to be suspended by chains attached to their upper rim. Such gifts to the Church were known as donaria and the crowns are known as votive crowns. Later, these crowns were often used for illuminating purposes by suspending other chains from the lower rim to support a lamp. Many of these votive crowns of ancient date exist, but the most noted are the eight massive Gothic gold crowns discovered (1888) buried at Guararaz (Spain). They are beautiful products of the art of the Visigoths and were consecrated in some church in the second half of the 7th century, as an inscription on one of them proves. The largest of these crowns displays an inscription that it was the gift of the Gothic king Reccesvinthus, whose reign commenced in 649 and who died 672. (Fig. 8). The four-inch-wide gold circlet is set with 30 Oriental sapphires of great beauty, separated by 30 large pearls. Suspended from the lower band by 24

![Fig. 7 — German Crowns and Coronets.](image)

Corona Lucis.—It was the cult of early Christian monarchs dedicating crowns to the Church and, later, the utilizing of these circlets as a point of suspension for lamps, that led to the coronal or corona lucis — the crown-light.
During the Middle Ages these crown-lights were suspended from the church roof or vault to hold tapers. Some of these were most elaborate and of great dimensions. Several are still extant. (See CHANDELIERS.) Our illustration (Fig. 9), taken from an old manuscript, displays two votive crowns in a church. a corona luces between them. See also CORONA.

CROZER THEOLOGICAL SEMINARY.
Upland, Pa. (post office, Chester, Pa.). Founded in 1877 by the heirs of John P. Crozer. The school is on a large campus and endowed with buildings and invested funds to the amount of a million dollars. It has a faculty of 12 professors and instructors and a library of about 30,000 volumes. It is under Baptist auspices.

CROZET ISLANDS, a group of four, in the southern portion of the Indian Ocean, be-
between Kerguelen and Prince Edward islands. They are all of volcanic origin and the most easterly of them, called East Island, has precipitous cliffs on the coast and in the interior lofty peaks, exceeding 4,000 feet. The largest, called Possession Island, visited by the Challenger expedition in 1873-74, is believed to be about 20 miles long by 10 broad. The total area is about 200 square miles. They have no permanent population, but are visited by seal-hunters and war vessels. They were recently visited on a recent cruise of the Rotorua." (London 1891).

CROZIER, krōz'ər, John Beattie, English philosopher: b. Galt, Ontario, 23 April 1849. He was educated at Toronto University, and in 1872 began the practice of medicine in London. He has written "Religion of the Future" (1880); "Civilization and Progress" (1885); "Lord Randolph Churchill, a Study in English Democracy" (1887); "History of Intellectual Development" (1889-1901); "My Inland Life" (1898); "The Wheel of Wealth" (1906); "Sociology Applied to Practical Politics" (1911).

CROZIER, William, American military officer: b. Carrollton, Ohio, 19 Feb. 1855. He was graduated at the United States Military Academy in 1876; served for three years in the West, taking part in the campaigns against the Sioux and Pawnee Indians; was instructor of mathematics at the Military Academy in 1879-84, when he entered the ordnance department; and was commissioned captain in 1890. He invented a wire-wrapped rifle, and with General Buffington, a disappearing gun carriage. He took part in the Spanish-American War; and was appointed chief of ordnance with the rank of brigadier-general in November 1901; and re-appointed in 1905, 1909 and 1913, the detail lasting for four years. In 1912-13 he was detailed as president of the Army War College. He is the author of several of the series of "Notes on the Construction of Ordnance," which are the textbooks of the Department for the instruction and guidance of its officers. He is of international repute in all matters connected with his department of military science.

CRUCIBLE, a vessel used in chemistry and the arts for containing substances that are to be subjected to high temperatures. A good crucible should be capable of withstanding great and sudden changes of temperature without fracture or disintegration; it should not be attacked by the substance it is to contain; and it should be infusible at the temperatures to which it is exposed. Numerous materials are used in the manufacture of crucibles, each having its own peculiar advantages and disadvantages. Platinum is an ideal material for many purposes, but it is exceedingly expensive and it cannot be used for the fusion of metals. Nickel is sometimes used instead on account of its cheapness. Clay, or a mixture of clay with sand, graphite, or old broken crucibles, is a favorite material, and Hessian crucibles, composed of equal parts of clay and sand, are very general use. Hessian crucibles are commonly triangular in shape and coarse in texture. They are porous and liable to rapid and sudden changes in temperature, and they will not withstand the action of litharge; but they are cheap, and will not fuse at any temperature that is attained in ordinary operations. The clay that is used in the manufacture of crucibles should be "weathered" for some months, by exposure to air in a moist condition, in order to effect the decomposition or elimination of certain impurities, such as pyrites, that would be prejudicial to the finished vessel. Graphite is used to a considerable extent in the manufacture of crucibles, especially for those that are to be used for melting metals. Lime crucibles, cut from blocks of well-burnt lime, are practically infusible, but they will not stand exposure to air for any length of time, since they absorb moisture, becoming converted into calcium hydrate, and then disintegrate. Magnesia crucibles are also practically infusible, and are not affected by exposure to the air. A mixture of equal parts of magnesia and bauxite (q.v.) makes excellent crucibles. Alumina (oxide of aluminum) is also highly recommended as a material for crucibles, as it will withstand sudden changes of temperature quite well, is practically infusible for all ordinary purposes, and is attacked even by melted sodium. Carborundum is also used.

CRUCIFERIA, kroo-sifer'ē-ə. See BRASSICACEAE.

CRUCIFIX. See CROSSES AND CRUCIFIXES.

CRUCIFIXION. The history of crucifixion as a mode of punishment for crime must be studied as part of the Roman system of jurisprudence rather than of any Eastern system, Asiatic or Grecian. Greece and Asia had indeed from very early times occasionally resorted to it; but the practice did not become universal. The Hebrews, for example, adopted or accepted it only under Roman compulsion: under their own system, before Palestine became Roman territory, they inflicted the death penalty by stoning. At Rome, however, from the period of the Republic until the 4th century (when Constantine, in memory of the Passion of Jesus Christ, abolished this form of punishment) it was customarily inflicted upon slaves found guilty of denouncing their masters. Provincial brigands might also be crucified, but the crucifixion of a Roman citizen was never permitted by law.

In art, the cross upon which Christ was nailed has been usually represented as one formed with the vertical staff or post extending noticeably above the horizontal beam; and this harmonizes not only with the description in Matt. xxviii. 37—that they set up over His head His accusation written—but also with the traditions transmitted to posterity by the earliest Christian Fathers. It seems to us that the choice of the T form by certain modern painters lacks justification. Certainly the oldest known works of Christian artists indicate the general acceptance of the so-called immisa or Latin form of that symbol which, from the time of the sacrificial death onward, the faithful regarded as an emblem of divine approval of Christian virtues in general, and as a symbol for supposing that the continuance of interest in the symbol of the Passion was ever wholly broken. Artistic representation and reproduction of the sacred theme, however, appear to have been frowned upon until, in the 6th century, the carving of crucifixes began, and, in the 8th, the crucifix was represented in mosaic. The latter was made for the oratory.
that Pope John VII built in the Vatican (A.D. 705), and it exemplifies the artistic treatment of its theme—especially by clothing the figure of Christ—noted throughout the first period, which extended from the 6th century to the 12th or 13th. It has been well said that in this early period "The Crucified is shown adrift to be carried forward and from it: He is alive and shows no signs of physical suffering; He is clad in a long, flowing, sleeveless tunic which reaches the knees. The head is erect, and surrounded by a nimbus, and bears a royal crown." We see Christ not suffering but triumphant on the cross. "Moreover Christian art for a long time objected to stripping Christ of His garments, and the traditional tunic remained till the 9th century or even later." But presently realism begins to transform Christian art; the tunic becomes a shorter garment, reaching from waist to knees; the head droops and is crowned with thorns; the arms are bent back; the body is contorted; the face is wrung with agony; blood flows from the wounds. Usually, but with occasional exceptions, realism prevailed during the second period (12th or 13th century onward), and often the living and triumphant Christ gives place to a Christ dead, in all the humiliation of His Passion. The older interpretation, with derivatives in the second period, may be exemplified as follows: Wholly serene, unmoved, superior to suffering are the 8th century representation in ivory in the Museum of Cividale and the fresco, also of the 8th century, in the church of Santa Maria Antiqua in Rome. Giorgione ("Christ with the Cross") and Rubens ("The Crucifixion") seem to glory in and upon His beauty—the former upon the beauty of the face; the latter of the naked body. Tintoretto ("The Crucifixion," church of San Cassiano, Venice) represents the Saviour as a robust man who evidently is able to endure anything unflinchingly, almost defiantly, thanks to physical courage.

CRUDEN, kroö'den, Alexander, Scottish biblical scholar: b. Aberdeen, 31 May 1700; d. Islington, 1 Nov. 1770. He was educated at Aberdeen at Marischal College, with a view to the Church, but decided symptoms of insanity, he was placed in confinement. On his release in 1722 he went to London, where he was employed as tutor in several families. Previous to 1732 he opened a bookseller's shop under the Royal Exchange, and in 1735 was appointed bookseller to Queen Caroline. His great work appeared in 1737, under the title of "A Complete Concordance of the Holy Scriptures of the Old and New Testament." In a peccary point of view it was not at first successful, and the embarrassment to which it reduced the author caused a return of a mental malady, which occasioned his being sent by his friends to a lunatic asylum. After his release he instituted an action of damages against those who had confined him, and published an account of his confinement under a whimsical title. He then acted as corrector for the press, and began to believe that he was divinely commissioned to correct the manners of the world. He styled himself "Alexander the Corrector," and went about exhorting the public to keep the Sabbath. He also petitioned the king for the honor of knighthood and Parrliament to constitute him by act "the Corrector of the People." In 1753 he was again placed in confinement, and again, on being libelled, published an account of his case. Of Cruden's great work, the Concordance, three editions appeared during his life. The pains which he took with it were prodigious, constructing it anew to the four corners of the earth without availing himself of the labors of his predecessors and verifying personally the accuracy of each quotation and reference. The best edition is by Alexander Chalmers (London 1812; 10th ed., 1824, with a memoir). He was also the author of "A Scripture History from the Foundation of the Holy Scriptures"; and "The History and Excellency of the Scriptures."

CRUELTY, in law, any wilful and malicious conduct which may be dangerous to the health or life of another; a malicious act causing great pain. Within the past 100 years many statutes have been-passed, both in Great Britain and the United States, to protect the helpless, particularly lunatics, children and domestic animals. The term is important in law also in connection with divorce. Parents who are guilty of cruelty to children may be punished by law for their children taken away from them and put in the care of others. While cruelty to domestic animals, except when it amounts to a nuisance, is not a criminal offense at common law, many statutes provide for the protection of persons guilty of this crime. The earlier laws on the subject were enacted more for the protection of the animals as chattels than for humane principles, but through the influence of philanthropic societies this was remedied not only in the United States but also in Great Britain and other parts of Europe as well. The punishment in the United States is usually by fine or imprisonment. By a statute passed in England in 1900, the same protection is given to wild animals in captivity as to domestic animals. See Divorce.

CRUICKSHANK, krık'shänk, Ernest Alexander, Canadian historical and military writer: b. Welland County, Ontario, 1854. He was educated at Upper Canada College, early acquiring an extensive acquaintance with several modern languages. But largely engaged in newspaper work in the United States, but he returned to Fort Erie, Ontario, became warden of Welland County in 1889, police magistrate at Niagara Falls, Ontario, 1893, and was in 1908 military archivist at Ottawa. In 1899–1904 he was lieutenant-colonel commanding the 44th regiment of militia, and afterward was appointed a district commanding officer. In 1907 he was elected a Fellow of the Royal Society of Canada. His principal publications are "The Battle of Lundy's Lane" (1899; 3d ed., 1894); "Battle of Queenston Heights" (1891); "Battlesfields of the Niagara Peninsula" (1891); "A Century of Municipal History" (1892-93); "Battle of Fort George" (1890); "Documentary History of the Campaigns on the Niagara Frontier in 1812-14" (9 vols., 1896-1910).

CRUICKSHANK, George, English illustrator and caricaturist: b. London, 27 Sept. 1792; d. there, 1 Feb. 1878. Family necessities compelled him when still a child to produce what he could to keep the family. He also petitioned the king for the honor of knighthood and Par-
productions through a great part of his career. Hence his defects were chiefly those of taste and these have operated to his being popularly ranked among second-rate artists, yet the merits he deserves. For his drawing was always faithful, precise and felicitous, his facility amazing and his invention inexhaustible. The catalogue of his productions prepared by the keepers of the library of the Massachusetts Institute of Technology comprises 5,500 articles, many of them recalling Rembrandt's work by their richness in light and shade. The earliest of his drawings known is dated 1799, when he was only seven years of age, and when 15 he was comparatively distinguished. His first occupation was designing illustrations for children's books and popular songs. He contributed also to The St. George and The Meteor and at about the same time sketches referring to the trial of Queen Caroline. In 1837 Cruikshank commenced in 'Bentley's Miscellany' his famous series of etchings on steel illustrated of Dickens' 'Oliver Twist,' full of pathos, humor and tragic power; the illustrations for the 'Waverly Novels,' and 15 plates for 'Don Quixote.' Having connected himself with the publishers of these works, he was induced to produce 'The Bottle,' a powerful series of designs, characterized, from its subject and the artist's object, by inevitable vulgarity, but pregnant with genius and high moral teaching. In 1830 he tried to paint and while he could not handle his tools well, he nevertheless displayed here as elsewhere his keen sense of caricature. Of these efforts the best are two: 'Cinderella' in the South Kensington Museum and 'The Worship of Bacchus' (National Gallery). In spite of his genius, industry and homely mode of life he never succeeded in acquiring a competency and was compelled in extreme old age to depend on the aid of his admirers. His true life-work consisted in illustrating the costume, manners and vices of the people for a period of considerable more than a century. Consuly Stephens, 'A Memoir of Cruikshank' (London 1891); Bates, 'George Cruikshank' (1878); Jerrold, 'Life of George Cruikshank' (1897); 'Cruikshank's Water Colors' (1903); Cohn, 'Bibliographical Catalogue of the Printed Works Illustrated by George Cruikshank' (New York 1914) and a biography by W. H. Chessou (1912).

CRUISER, an armed vessel the prime function of which is to gather information and to prevent the enemy from doing likewise, though it may incidentally protect the commerce of its own country or inflict damage on that of another. These vessels are generally built for fast sailing and are well manned. The cruiser rates technically just below the battleship and above the destroyer and gunboat. The battle cruiser carries guns of the largest size, but fewer of them and less armor than the battleship. The weight thus dispensed with enables it to be faster than the battleship. It can thus both gain information of the enemy before the battle and take part in the battle. The armored and protected cruisers, though still useful, are obsolescent that stands in the development of the battle cruiser. An armored cruiser has side or vertical armor and horizontal or deck armor. A protected cruiser has horizontal or deck armor only. A scout cruiser is of moderate size, with almost no armor, lightly armed, but of tremendous speed. They are used for reconnaissance. Sometimes in war, merchant steamships of great speed are armed and a navy and such vessels are then called auxiliary cruisers. In the Spanish American War cruisers of this class performed services of great importance to the United States Navy. Similar boats, known as commerce-destroyers, have been used by the Germans in the European War. See United States Navy, The; Warship.

CRUMMELL, Alexander, American colored Episcopal clergyman: b. New York, 3 March 1819; d. Point Pleasant, N. J., 9 Sept. 1898. His father was a native African and his mother a free woman. He received his education at the Oneida Institute and in 1839 applied for admission to the General Theological Seminary. His request was refused owing to the intense prejudice against the higher education of the negroes. He accordingly went to England in 1849 and graduated at Cambridge University in 1853. He engaged in missionary work in Liberia 1853-73, when he went to Washington, D. C., and founded Saint Luke's Church, of which he was the first rector. In 1867 he organized the American Negro Academy in New York. He published 'The English Language in Liberia' (1861); 'The Future of Africa' (2d ed., 1862); 'The Negro Race Not Under a Curse' (1863); 'The Greatness of Christ, and Other Sermons' (1882); 'Africa and America' (1891).

CRUSADE, Children's. See Crusades.

CRUSADES (Portug. cruzado, 'marked with the cross*), the military expeditions which were sent out by the Christian peoples of the West from the end of the 11th till the latter half of the 13th century for the conquest of Palestine. From the earliest times pilgrims had gone to what, because of Christ's life therein, was called the Holy Land. In 637 Palestine fell into the hands of the Mohammedans, but, though several churches were turned into mosques, Christians were allowed full liberty to come and go to the holy places in Jerusalem for nearly four centuries. In 969 the Fatimite dynasty extended its rule over Egypt and Palestine and with this change of rulers there came an end of the cordial relations. The insults, and even injuries, that Christian pilgrims suffered aroused bitter feeling in the West. Finally Pope Silvester II (999-1003), one of the best known of the medieval popes and famous for his very practical character, issued a call for volunteers for the purpose of freeing the Holy Land. His summons met with no success. In 1073 Palestine came under the control of the Seljukian Turks and the conditions there became even worse than before for the Christians. Pope Gregory VII (Hildebrand), in 1074, asked the Western nations for help for their suffering brethren in the East and even suggested to the German emperor, Henry IV, that it would be easy to raise an army of 50,000 for the rescue of the Holy Land from the hands of unbelievers. The idea of the crusades that had it of being religious moved the Western minds for nearly a century did not come to fruition until 1095, when the awful state of affairs that Christian pilgrims had to encounter in the Holy Land became unbearable. Peter of Amiens, surnamed the Hermit, saw the terrible
situation while on a pilgrimage to the Holy Sepulchre and succeeded in arousing the interest of Pope Urban II and obtained permission to preach a crusade.

The first great cause of the crusades, then, was the earnest desire to free the Holy Land. It seemed to the medieval Christians to be a question of the maintenance of their religious honor that the infidel should not be allowed to occupy the holy places. Other causes conspired for their occurrence just at this period. It was felt by Western rulers, and especially by the pope, that the year before the East might be the time to invade it. Western rulers, especially those dependent on the land and its products suffered severely from famine. These material difficulties predisposed the people to risk all in the hope of betterment. There was little chance to rise in the West and the vague opportunity with of distant war seemed to promise much. Besides, the spirit of chivalry had come in and many of the nobles devoted themselves to the cause with the idea that they would thus win favor of the heavenly queen, the mother of the Lord, whose life had been lived in Palestine and whom they had chosen for their patroness. Devotion to the Blessed Virgin also caused women to urge their husbands, brothers and other male relatives to join in the holy war for the Christian possession of her home. It needed only the intimidation of authority to precipitate an Eastern expedition and that came very naturally from the popes as the acknowledged spiritual heads of Christendom. Pope Urban II, having heard Peter of Amiens' story of Christian suffering in the Holy Land, summoned a council to meet at Piacenza and gave Peter the opportunity to address the multitude, which assembled in such numbers that he had to talk in the open air. In the following November 1095, ambassadors of all the nations were present at a council at Clermont, where Peter's words had so much power that with one voice the multitude called out "God wishes it," and this became the slogan of the crusade.

First Crusade. In 1096, a number of armed bodies set out in different divisions. Many of these hosts were unmanageable to military discipline, and, being unprovisioned with even the necessaries for such an expedition, were practically completely destroyed in the different countries through which they had to pass before reaching Constantinople, which had been chosen for their place of meeting. Only a few stragglers found their way home again or succeeded in maintaining themselves for a time until the arrival of the more regularly organized bodies of crusaders. Only a few of this body were most of the distinguished men whose names are associated with this first great chivalric effort to redeem the Holy Land from the infidel. At the head of nearly 100,000 men were Godfrey of Bouillon, duke of Lower Lorraine; Hugh of Vermandois, brother of Philip, king of France; Baldwin, brother of Godfrey; Robert II of Flanders; Robert II of Normandy, brother of William II, king of England; Raymond of Toulouse; Bohemond of Tarentum, son of Robert Guiscard; Tancred of Apulia, cousin of Bohemond; and other heroes. Tancred is the hero of whom many poets have written, and what Chaucer called "the type of the very gentle perfect knight." It is this first crusade that has formed the subject of Tasso's 'Jerusalem Delivered,' and the poem owed not little of its interest to the fact that it was written while the victors were expressed in the mind of the poet and still well remembered by his readers, for, while the crusades are considered to end with the last quarter of the 13th century, the gathering of the naval force that overcame the Turks under Don John of Austria was really the result of the crusading spirit.

The various armies of the First Crusade gathered at Constantinople about Christmas 1096. Here they were delayed for some time by the diplomacy of the Greek emperor, who wished to be assured that many of the crusaders and those dependent on the land and its products suffered severely from famine. These material difficulties predisposed the people to risk all in the hope of betterment. There was little chance to rise in the West and the vague opportunity with of distant war seemed to promise much. Besides, the spirit of chivalry had come in and many of the nobles devoted themselves to the cause with the idea that they would thus win favor of the heavenly queen, the mother of the Lord, whose life had been lived in Palestine and whom they had chosen for their patroness. Devotion to the Blessed Virgin also caused women to urge their husbands, brothers and other male relatives to join in the holy war for the Christian possession of her home. It needed only the intimidation of authority to precipitate an Eastern expedition and that came very naturally from the popes as the acknowledged spiritual heads of Christendom. Pope Urban II, having heard Peter of Amiens' story of Christian suffering in the Holy Land, summoned a council to meet at Piacenza and gave Peter the opportunity to address the multitude, which assembled in such numbers that he had to talk in the open air. In the following November 1095, ambassadors of all the nations were present at a council at Clermont, where Peter's words had so much power that with one voice the multitude called out "God wishes it," and this became the slogan of the crusade.
made himself ruler of an extensive territory stretching even beyond the Armenian Mountains and the plain of Mesopotamia. He was acknowledged as his brother's natural successor as the ruler in Palestine.

Second Crusade.—In 1144 the Saracens recaptured Edessa. This produced great consternation throughout Europe, because it was feared that the other acquisitions made by the Christians during the First Crusade would also fall once more into the hands of the infidels. As a result, Pope Eugenius III called upon Saint Bernard of Clairvaux to preach the Second Crusade. The two leaders of the expedition were the German emperor, Conrad III, and the king of France, Louis VII. They collected about 140,000 men and in 1147 led them to the East. Notwithstanding the enthusiasm with which this crusade had been entered upon, for it is recorded that after Bernard's sermon, it happened more than once, that enough crosses not having been provided for all those who wished to assume the cross, that is, to promise to go on the crusade, Bernard had to cut up his garments in order to supply them, the army failed of its purpose. King Louis VII was also served by his presence still further to weaken the already almost tottering kingdom of Jerusalem. The crusading armies returned to Europe in 1149 and it was nearly 50 years before any other attempt was made to diminish the domination of the Saracens.

Third Crusade.—In 1187, Saladin took Jerusalem from the Christians and the zeal of the West blazed out once more. The three principal monarchs of Europe, Frederick Barbarossa, emperor of Germany, Philip Augustus, king of France, and Richard Cœur de Lion, of England, offered to lead their armies in person against the Saracens. Frederick's army succeeded in reaching the Holy Land only after having overcome an immense Turkish army at Philemonium, 7 May 1190. Not long after his victory Barbarossa was drowned in the river Kalykadnos and this took all the spirit out of his troops. His son Frederick led the army to the siege of Acre, but after his death, in January 1191, the German army dispersed by a violent storm and his wife and mother were detained as prisoners on the island of Cyprus, to which their vessel had been driven, by Isaac Comnenus, the heartless, despotic ruler of the island. On Richard's arrival from Rhodes, where his vessel had been compelled to put in, he succeeded in taking Isaac and his daughter prisoners and had himself proclaimed king of Cyprus. 'Twas not until the beginning of June that he joined the French at Acre. Owing to jealousies between the two monarchs, the French king abandoned the expedition shortly after the fall of Acre. Richard succeeded in many wonderful exploits against the Saracens, but was not able to accomplish much in regaining territory. He did not succeed in recapturing Jerusalem, and, though he defeated Saladin at Azoz and captured Jaffa, he at last despaired of the capture of Jerusalem and made a truce with Saladin by which the sea-coast from Tyre to Jaffa remained in the possession of the Crusaders, and Christians were allowed full liberty to visit the Holy Sepulchre.

The Fourth Crusade was due to the zeal of Pope Innocent III. Its chief promoters were Godfrey of Champagne, Baldwin, Count of Flanders, and Dandolo, the old Doge of Venice. The Marquis of Monteferrat was chosen leader of the expedition. The Crusaders assembled at Venice and were invited by Francis I, king of France, and the Venetians. Francis I was the warlike Dandolo's friend, and the Doge, in return for the loan of the Venetian fleet for the crusade, was allowed to enter into Syria. Francis had then to be satisfied with the title of protector. The Venetians also asked for a share in the rich land and the city of Zara in Dalmatia, a town which had formerly belonged to the Venetians but which had renounced its allegiance. This was contrary to the wish of the Pope, who communicated the Crusaders for their failure to fulfil their vow of proceeding to the Holy Land. News now came to the Crusaders that there was a revolution in Constantinople and their aid was asked for one of the claimants to the throne. Dandolo seems to have been mainly responsible for encouraging the Crusaders to accept the invitation to proceed to Constantinople, and as a result the crusade was entirely diverted from its original purpose. In 1203, Constantinople was taken by the Crusaders, who established therein a Latin empire.

Children's Crusade.—The failure of so many expeditions to the Holy Land proved very discouraging and people began to wonder if there was not some cardinal fault in the make-up of the parties that went on the Crusade. It began to be said that the Holy Land would never be captured, except by those who were innocent. Accordingly, when Stephen, a French peasant boy, in June 1212, began to preach a children's crusade, he made many converts to his opinion that possibly children might accomplish what adults had failed in. Some 30,000 French children are said to have taken part in the expedition. A like movement began in Germany and soon proved to have almost as great a following. Over 20,000 German chil-

These expeditions represent a phase of that tendency to psychic contagion that sometimes comes over even intelligent people in an inexplicable way, and it is from this standpoint that they have been very much discussed in recent years. The Children's Crusade corresponds to the witch baying of more modern times, or to some of the many spiritual manifestations of older periods. Some doubts have been thrown on phases of the history of the Children's Crusade, as for instance the fate of the French children, but there seems good reason to believe the account given here to be correct. Consult Winkelmann's Geschichte Kaiser Frederichs II. Röhricht's article in Sybel's Histor. Zeitschrift, in E. B. Gray, 'The Children's Crusade' (New York 1871), and in French, 'Des Essards La croisade des enfants' (Paris 1875).

Fifth Crusade.—After an interlude of five years, after the Children's Crusade, a Hungarian expedition went to Egypt and captured Dami-
etra. There was so much disaffection among the Crusaders themselves, however, that the expedition had to be delayed. This is sometimes spoken of as the Fifth Crusade. What is more usually called the Fifth Crusade was led by Frederick II of Germany and owed its inception to Pope Honorius II and to Pope Gregory IX. A pestilence broke out in the army just as it was ready to sail and this delayed the expedition. Frederick seems to have lost heart after this and retired to Pozzuoli, near Naples, thus incurring the displeasure of Pope Gregory IX, who put him under a ban of excommunication. The next year, nevertheless, Frederick went to the Holy Land and without giving battle succeeded by negotiation with the Sultan in securing for himself the kingdom of Judea, only on condition, however, of tolerating in this kingdom the Mohammedan religion. He was crowned king and concluded a truce with the Sultan for 10 years; but this was soon broken.

The Sixth and Seventh crusades were led by Saint Louis IX of France. He considered the defence of the Holy Land of prime importance. He took Egypt and he resolved to strike his blow there. He laid siege to Damietta and captured the city in June 1249. In his march up the Nile, however, his army became involved in the mazes of the delta and the streams of the river and was defeated. Forced to retreat, it was overtaken by the army of the Sultan, where resistance was hopeless, and the king and his whole army had to surrender. Louis's ransom was the city of Damietta. After waiting for a time for reinforcements, he returned to France; the king of France died before Tunis. Peace was concluded and the French Crusaders returned home. About the same time an English army under Prince Edward, afterward Edward I, proceeded to Syria. Finding that little could be accomplished, they concluded a truce for 10 years and returned to England. For about 20 years after this, the remnants of the Latin kingdom in Palestine succeeded in maintaining themselves independent. Acre was captured by the Sultan of Egypt in 1291, just 100 years after it had been originally taken by Richard Coeur de Lion, and this obliterated the last remnant of the kingdom that had been founded by the Crusaders.

The results and significance of the crusades were considerable. For western Europe, and, indeed, for the civilized world of all after times, are out of all proportion to the little that was accomplished in Palestine. The result of the intercommunication of nations caused by a series of joint enterprises could scarcely fail to bring with it good results. The view of the intellectual and commercial frictions of mankind will not be the same in future as it has been the object of the Crusades to extend good results, and so different. In merely material progress, the most noteworthy effect was upon commerce. The use of many Eastern luxuries was introduced into Europe, and a result of the cities of Italy especially acquired commercial importance. The commercial spirit thus aroused and the impetus of the later crusades gave rise to the Hanseatic League, which marks the first great step in modern commercial progress. In every branch of art and knowledge the effect of the crusades soon became evident. There has been in recent times a renewed interest in the 13th century. There are some who do not hesitate to say that the 13th is one of the greatest centuries because of what it represents of accomplishment in the arts and of development of the human mind as well as the rise of human society. This is a time of great achievements that led to such accomplishment can be traced to the crusades. In the East, the Europeans had come in contact with Arabian philosophy and Arabian mathematics, and the consequence was an interest in these subjects that spread very widely and that eventually gave rise to the university and even to the development of such advanced physical science as was taught by Albertus Magnus and Roger Bacon.

The interest of the Crusaders in Byzantine architecture and arts led to the development of a taste that soon created a demand which must be satisfied. Gothic architecture has been traced to Eastern influences. The other great arts of the 13th century, statuary, stained glass working, book illumination, metal working in its various forms, were of Eastern inspiration to Western sources. That they were developed quite beyond the models that had been sent by Europeans is due to the fact that the generations following the crusades had traditions of accomplishment that led them to raise their genius to the highest possible point of accomplishment. Great political benefits in the crusades must not be overlooked. Many of the nobility lost their lives and many more lost their fortunes and their power, and as a consequence government became more centralized and national. This was especially true in France, and as a consequence peace was easier to maintain. The honors conferred on many of the Crusaders gave them opportunities to rise such as they would not otherwise have had. The distribution of wealth brought about by the heavy expenses that were incurred gave opportunities for many of the poorer classes to enter into industrial and commercial occupations. The very independence of mind that had been acquired by the distant expeditions created a spirit of enterprise and made ready to try far-off adventures and even commercial speculations, than was the case before. Undoubtedly to the Crusaders is owed more of what is distinctive in modern Europe than to any other connected series of human events.

Bibliography.—The literature of the crusades is vast and only a few of the principal titles can be given. The most important collection of sources is the Recueil des historiens des croisades, of which 15 volumes have been published (Paris 1841 et seq.). Consult also Bonnars, Gesta Dei per Francos (Hanover 1611); Villehardouin and De Joinville, Chronicles of the Crusades (1908); Brebicier, L'Eglise et l'Orient au Moyen Age (Paris 1907).

JAMES J. WALSH,
Author of 'The Thirteenth, the Greatest of Centuries,' etc.

CRUSHING AND GRINDING MACHINERY. This article describes the class of crushers and grinders used to break up and reduce rock, stone, ore, pigments, etc., to fragments or to powder.

Crushing machines are used for purposes of
Coarse reduction. They consist of various forms of "stamps" or stamp-mills, crushing rolls, gyratory crushers, etc., and are employed to reduce metal ores for subsequent treatment by the processes of amalgamation and concentration; for stone-breaking for road-metal, and for crushing coal and coke.

For preliminary crushing, that is, for preparing material for finer crushing by various forms of stamps, rolls and rotary mills such as those described in detail under the title MINING AND MILLING MACHINERY, the types of machines usually employed are the jaw crushers and the gyratory crushers. Of the former, the "Blake," the "Dodge," and the "Buchanan" crushers are among the most familiar and extensively used types.

![Diagram](image)

Fig. 1 illustrates a vertical section and a top view of a "Buchanan" stone crusher. It consists of a cast steel frame carrying two steel jaws, one fixed and one movable, which are arranged to form a V-shaped opening. The movable or swing jaw is hinged at the top and is connected with suitable mechanism by which it is alternately pushed forward and backward, to and from the fixed jaw, thus alternately reducing and enlarging the V-shaped opening. The material to be crushed is introduced at the top of the opening, and is reduced by the reciprocating motion of the swing jaw to a size fine enough to allow it to pass through the smaller outlet at the bottom of the opening. The adjustment to crush fine or coarse is made by means of removable steel liners placed between the planeed surfaces of the frame and the main toggle block. The stroke is adjusted by means of jaw liners of steel placed between the top of the main toggle bearing and the bottom of the steel lugs cast on the frame so that the angle of the toggle can be increased for lengthening the stroke, or it may be flattened to diminish the same. For increasing the stroke one or more liners are added, and by this means a variation of about 50 per cent is obtained in the throw of the jaw. The receiving openings of these crushers range in size from 1½ x 3 inches to 24 x 30 inches; their weight ranges from 160 to 60,000 pounds; they require from 4 to 65 horse power to operate them at 250 revolutions per minute, and are capable of reducing the rock supplied to them into fragments ranging from 1 to 3 inches in size at a rate ranging from 4 to 35 tons per hour, according to the size of the machines. The capacity of a rock breaker depends on the distance between the jaws, and the number of revolutions of the power wheel. The amount of product is also affected by the kind of rock, the hard, brittle variety will go through faster than the sand-

</table>

The accompanying table of "Relative Hardness of Elements and Ores" will serve to give a general idea of the relative powers required to crush them. It is important to note, however, that the power required will depend very much on the relative proportions of the mineral to the gangue matter; for example, galena may occur in a quartz gangue, and if the ore is very large, the hardness of the ore will be near the scale for galena as shown in the table; but, if the proportion is very small, the hardness of the ore will be near the scale for quartz.

Compounds of the heavy metals, such as gold, silver, copper, lead, etc., are soft, their hardness rarely exceeding 2.5 to 3; while that
of the compounds of the arsenides and oxides of iron, nickel and cobalt are relatively hard, ranging from 6 to 6.5. Most of the sulphides, carbonates, sulphates and phosphates are soft. The conspicuously hard minerals are found chiefly among the oxides and silicates. The weights of the various ores differ within very wide limits. A spongy dry quartz containing very little metallic sulphur is naturally much lighter than a wet dense quartz heavily charged with galena. Broken quartz sent to the mill generally ranges from 15 to 22 cubic feet per ton, and a convenient size of truck for handling the same is one having a capacity of about half a ton.

Gyratory Crushers.—In these machines, the crushing elements consist of an inverted hollow frustum of a cone within which an upright frustum of a solid cone is given a gyratory motion by a vertical shaft connected with a counter shaft operated by a suitable propelling mechanism. The vertical shaft is hinged at the top, and the material dumped into the hopper is crushed in the annular space between the walls of the two cones until it is fine enough to pass down and out of the openings at the bottom. The McCully and the Austin gyratory crushers are among the best representatives of this class of machines. Fig. 2 illustrates a vertical cross section of the Austin crusher. These machines are adapted to produce a much finer grade of crushed material than those of the jaw crusher type.

Crushing rolls are made in a great variety of forms, and are used for the production of a much finer grade of crushed material than that obtained by the use of the machines already described. In some of them the rolls are equipped with removable steel teeth. Such machines are used by the smelters for the coarse crushing of slag shells from slag cars and pots. Other forms have corrugated rolls, while the coal crushers and the coke crushers and sizers have rolls equipped with teeth of special design adapted for the crushing and sizing of the product according to the sizes demanded by the industrial and commercial trades. Coal crushers are described in detail under the title Coal Mining Machinery, while Fig. 3 illustrates a "Jeffrey" coke crusher and sizer. It is equipped with a feed hopper the form of which may be arranged to suit any required condition, and the rolls are made in segments with removable teeth, as shown by Fig. 4, or of interchangeable tooth rings, as shown in Fig. 5.

An external view of a set of plain crushing rolls is given in the article under the title Mining and Milling Machinery, together with a general description of the same, but Fig. 6,
showing a sectional view of a "Humphreys" crushing rolls, is introduced here to convey a more detailed idea of the internal arrangement of the principal parts of these machines. Various forms of roll crushers are also used for crushing sugar-cane and other fibrous materials.

Other forms of crushers in common use are the "coffee mills," which, while resembling the gyratory crushers, yet differ from them in that the vertical shaft has only a simple rotary motion without gyration; the "edge runner" crushers consisting of a vertical axle which carries a number of radial arms with heavy metal wheels attached to their outer ends. The rotation of the vertical axle causes these wheels to travel in a circular track on the bottom of a metal trough containing the material to be crushed; and sausage mills consisting of a longitudinal shaft carrying radial teeth which intermesh with similar teeth projecting from the inside of the cylindrical containing shell.

Grinding and pulverizing machines are used in many processes to reduce the products of the crushers. They are commonly known as mills, and are necessarily of a different character and of lighter construction than the crushing machines.

In the simple mill-stone mill, two stones set vertically one above the other, one fixed and the other rotated by a vertical shaft, are placed face to face. Usually the upper stone is the movable one, and has a central hole into which the material to be ground is fed. As this stone is revolved, the material is ground between the stones and passes out through grooves in their faces to the edge, where it is caught by a suitable receiver.

The best representatives of the ore-grinding machines are the "Huntington" and the "Chilian" mills. Fig. 7 shows a partly sectional detailed view of a Huntington mill. The ore and water fed into the mill at the hopper is thrown against the ring-die by the rotating rollers and scrapers, where it is crushed by the centrifugal force of the rollers to any desired degree of fineness, and then discharged through the screens in the form of a fine pulp suitable for concentration.

Fig. 8 illustrates a "Davis" Chilian mill. It consists of a heavy cast iron pan with an annular die. The periphery of the pan is provided with screens. A vertical driving shaft is jour-}

naled in the centre of the pan and is driven from below by bevel gears on a countershaft connected with the driving pulley. Three crushing rolls are driven from the vertical shaft by axle bearings so designed as to allow the rollers to swing in a vertical plane. The material to be crushed is delivered into a central hopper carried on the driving shaft, and is distributed by suitable spouts in front of each roll. Scrapers are provided to prevent packing, and ensure proper circulation for the screens.

Other forms of machines used for fine grinding are the "pebble mills," "tube mills," and "ball mills." Of these, there are two principal types — those in which metallic balls of hardened steel, comparatively large in size, travel around a fixed track, and those in which the balls revolve loosely in a rotating drum. In the former the material is ground between the rotating balls and the path on which they travel, and in the latter, by the constant movement and fall of the balls which are fed into the mill
with the material. In many forms of these machines pebbles of flint are substituted for the balls of hardened steel.

Fig. 9 illustrates the general form of a pebble mill. The principal dimensions are as follows: The size of the cylinders range from 30 x 19 inches to 6 x 8 feet; the charge, taking sand as the unit of measure, ranges from 120 to 4,000 pounds; and the size of pulleys range from 24 x 4 inches to 30 x 12 inches in diameter. These machines require 1 to 18 horse-power to drive them in dry-grinding, and from one-half to nine horse-power, in wet-grinding at cylinder speeds ranging from 44 to 13 revolutions per minute.

Fig. 10 illustrates a tube mill of the ordinary type. The general principle of grinding employed is similar to that of the pebble mills, but with the difference that the material to be ground in the tube mill is fed at one end, and delivered as a finished product at the other end, its fineness being regulated simply by the speed at which the material is fed into the machine. As every particle of the material must pass under the grinding action of the entire charge of pebbles, a thorough and uniform grinding is the result, and the use of sieves is unnecessary.

Fig. 11 shows a vertical cross-section of an "Abbe" ball mill.

Jar-mills, consisting of porcelain jars in which pebbles are rotated together with the material to be ground, are extensively used for the grinding of paints, ink and other chemical compounds. They are composed of one or more grinding jars. Fig. 12 shows a machine of the single jar type. Its outside dimensions are about 12 x 13 inches; it uses a charge of porcelain balls weighing about 22 pounds; and is capable of grinding up to 15 pounds at a charge, when running at 50 revolutions per minute.

Impact pulverizing machines are represented by the "Max" mills and various forms of "Raymond" pulverizers. The principle employed is that of percussion, the working device consisting of a vertical shaft attached to a carrier provided with hardened steel beaters. As the material is fed into the mill it is thrown by centrifugal force against a hard iron plate, the particles at the same time being thrown into violent contact with each other. Equipped with vacuum air separators they are extensively and economically used for the reduction of all kinds of dry colors and chemicals, and for the threshing, cleaning and separating of tobacco stems.

The mechanical apparatus required to effectively apply this system of air separation should be capable of satisfying the following conditions: (1) To expand and rarify the air so that the coarser particles will fall out of the current and allow it to deliver the impalpable powder at the discharge spout. (2) When a large output of the finely ground material is required per hour, the apparatus should be capable of using an amount of air sufficient to lift the total weight of the charge of raw material. (3) When using a large volume of air, sufficient room should be provided for its expansion and rarefaction so as to obtain a current light enough to carry away the impalpable powder only. (4) The apparatus should be so constructed that the coarse particles will fall out of the light air current gravity into the contracted portion of the separator where the blast is stronger, and thus pass out through the tailing spout or into the pulverizer to be reground, without being accompanied by any of the fine powder. (5) The air space within the apparatus should approach as near as possible to a perfect vacuum.

As the fineness of the product depends upon the size of the separator, almost any limit of grinding is readily obtained by making the apparatus of sufficient size to produce the proper relative expansion and rarefaction of the air. When it is desired that the finished product should be an extremely fine powder, the use of the large-sized separators will give the best results; but for products of medium degrees of fineness, and large output, the smaller machines with fan and dust collector attachments are the most effective.

Fig. 13 illustrates a Raymond impact pulverizer and vacuum separating plant as erected for the cleaning and separating of tobacco stems. The material is fed to the machine by the operator in a manner similar to the feeding
of a threshing machine. The perforations of the screen surrounding the pulverizing cylinder vary in size in proportion to the fineness desired. As the stems come in contact with the rapidly revolving beaters, the particles of the leaf are liberated therefrom, and passing through the screens with the stems are caught by the air current and drawn up into the separator, which expands the air, so that all the light pieces of stems drop back and are discharged through the opening at the bottom into the drag elevator. The particles of leaf drop into the centre cone of the separator and discharge from the spout, while the dust is carried through the fan into the dust collector and discharged therefrom.

Stones are made of the best granite, and range in weight from 11,000 to 25,000 pounds. The ore is first prepared by being passed through the jaw-crushers of a primary crushing plant. From these machines it passes through a set of crushing rolls and is dropped automatically into revolving screens which separate the fine pulp from the coarser grindings. The last-named material is sent back and passed again through the crushing rolls until all of the pulp is fine enough to be finally treated in the arrastra.

Each arrastra requires about six horse-power for its operation, and ranges in crushing capacity from 6 to 10 tons each, per 24 hours, according to the character of the ore.

For other forms of crushing and grinding machinery, and their special application, see articles UNDER THE TITLES BRICK MAKING MACHINERY, COAL MINING MACHINERY, AND MINING AND MILLING MACHINERY.

Crusius, kroo-zhoo-us, Otto, German philologist: b. Hanover, 20 Dec. 1857. He has been a professor in the University of Heidelberg and at München (1903). He has written among other works 'Musikertheorie und Musikgeschichte,' 'Zur griechischen Religionsgeschichte' (1886); 'Untersuchungen zu den Mimetam des Herondas' (1892); and has also edited 'Philologia; Herondas' (1901); 'Fabeln des Fabrius' (1897); 'Griechische Lyrik' (1897).

Crust of the Earth, a term formerly in much use to indicate the solid shell of the earth that covered the supposed molten interior. More recently it has come to be believed that the earth is probably solid throughout, and the term crust has lost its original significance, and is not much used by scientists, though it is still widely retained popularly for what is more properly called the lithosphere. For the conditions that obtain in the lithosphere see Rock Flowage; Rock Cleavage; Faults; Joints; Mountains; also Geology, Geognosy.

Crustacea, krus-ta-shé-a, a primary group (phylum) of animals represented by the barnacle, lobster, crayfish, shrimp and crab. Crustacea differ from other arthropod animals. The body consists of about 20 segments which in the more specialized forms are grouped into two regions, the head-thorax (cephalothorax) and hind-body or abdomen. The appendages of the cephalothorax are fused together so that the limits between the segments are lost, and the whole mass is protected by the shield or carapace. The skin is thin and rendered solid by the deposition of lime (carbonate and phosphate), so that the integument forms a dense crust, hence the name Crustacea. They differ from trilobites and king crabs in having two pairs of antennae, while they breathe by means of gills attached to the legs. Like the other marine arthropods named, they have legs which are divided into two divisions, an outer (exopodite) and an inner (endopodite). Crustacea differ also from the Palcopora (trilobites, merostomes and arachnids) in the high degree of specialization of their appendages, there being three to six kinds, with various folding functions, while in the trilobites, so far as we know, the single pair of antennae are succeeded by numerous (over 20) pairs of legs, all of the same shape and functions. In the head-thorax, besides the antennae, there is on each side of the mouth a pair of mandibles,
each with a palpus, two pairs of maxillae or accessory jaws, which are flat, divided into lobes, and of unequal size; three pairs of foot-jaws. The latter differ from the maxillae in having gills like those on the five following pairs of legs. There are thus 13 pairs of cephalothoracic appendages, indicating that there are 13 corresponding segments; these, with the seven abdominal segments, indicate that these 20 segments are in a variety crustacean. There are six pairs of swimming legs (swimmerets), the last very broad in the lobster and shrimp, with the telson forming the "tail-fin." The Crustacea as a rule respire by gills. These, as in the lobster and crab, are composed of a series of little filaments into which the blood flows to be aerated. The filaments branch out from a common stalk which grows out of the basal joint of the five pairs of legs and the three pairs of foot-jaws. These gills are folded upward toward the back, and are contained in a sort of chamber made in part by the carapace. In shrimps, lobsters and crabs the sea-water passing into the cavity between the body and the free edge of the carapace is afterward scooped out through an opening or passage on each side of the head called the movements of membranous flaps called "gill-bailers." The digestive organs are well developed, especially the fore stomach, in the hinder part of which are several very large calcareous teeth for crushing the food, serving, when closed together, as a strainer through which the partly digested food presses into the long slender straight intestine, which ends in the telson. The liver is very large, as in all marine arthropods, or in such terrestrial types as the scorpions and spiders, which are derived from the king crabs. The brain of the higher Crustacea is very complex, corresponding with the complicated reflex movements of an animal composed of so many segments, and bearing such a complicated series of appendages devoted to so great a variety of functions. The eyes are usually compound or many-faceted, and are mounted on freely movable stalks. The ear is a sac in the basal joint of the smaller or second pair of antennae. The organs of smell are usually well developed, as Crustacea badly depend on this sense in finding their food. These consist of minute delicate sensory rods on the smaller antennae. The hairs of the mouth-parts and legs are often delicate tactile organs. The green glands in the head function as kidneys, and open out at the base of the larger antenna.

With only a single known exception (Squilla), Crustacea carry their eggs about attached to the swimming or other legs. The eggs of some crabs (Neptunis) are minute and excessively numerous, their number amounting to millions, while the lobster may produce from 20,000 to 80,000 eggs. Crustacea pass through a well-marked metamorphosis, nearly all (except the amphipods and isopods) hatching from the egg as a larva called "nauplius," which swims on a very non-segmented body, with three pairs of appendages, by which it swims about at the surface of the sea. After a series of molts, at each of which new segments with their appendages arise, it finally reaches maturity. The shrimps and crabs hatch in a more advanced larval stage called "zoa," the nauplius stage being partly suppressed and thrust back into the embryonic period. The zoa has a head and abdomen, but no thorax: this, however, is developed later, and after a series of molts the parent form is attained.

The prothorax is a precarious one, not infrequently resulting in death. The crust being too solid to admit of a continuous growth, and increase in size being rapid, frequent sheddings of the skin are necessary. In the lobster, the old skin being detached from the under cellular layer by the secretion of the new cuticle beneath, ruptures between the thorax and abdomen, and the lobster draws itself out of the rent, shedding not only the entire skin and every hair, but also the lining of the mouth, throat and fore stomach, and likewise the outlet of the intestine. In about three weeks after the casting of the shell the new one becomes solid and hard. In the crayfish the old skin is loosened and pushed away from the cellular layer beneath by the growth of temporary, short stiff hairs, which disappear after the skin is shed.

The Crustacea are a very ancient type. The earliest remains are found in the Cambrian rocks, but are very scanty compared with the trilobites. They comprise two principal groups: the Branchiopoda, Ostracoda or small shelled forms, Phyllocarida, and an obscure form supposed to be allied to the modern freshwater Apus. In the Devonian Period shelled phyllopods (Estheria) appeared, and in the Carboniferous arose an order (Sycocardia), represented by an ancient form (Amphipides) still living in a lake in Tasmania. From this group the existing Schizopoda or opossum shrimps (Mysis), the Squilla, and the ordinary shrimps and crabs, are supposed to have descended. Isopoda also appeared as early as the Devonian. A shrimp-like Crustacean occurs in the Devonian, and true crabs date from the Jurassic.

The Crustacea are divided into 11 orders, the Branchiopoda, Phyllopoda, Ostracoda, Copepoda, Cirripedia or barnacles, Arthrostraca, Cumacea, Phyllocarida, Syncarida, Schizopoda, Stomatopoda and Decapoda. More than 5,000 species are known. See Barnacle; Crab; Fish; Lace; Hermit Crab; Shrimp.

ERNST INGERSOLL.

CRUTCHED FRIARS. See Orders, Regious.

CRUVELHIER, kru'vəl'yar, Jean, French anatomist: b. Limoges, 9 Feb. 1791; d. Jussac, 6 March 1874. He obtained in 1824 the chair of pathological anatomy in Montpellier and in 1826 in Paris. He published an important work 'Essai sur l'anatomie pathologique en general' (1816); and an expansion of this in five volumes. His other works include 'Anatomie Descriptive' (in 3 vols., 1833-38); 'Anatomie du systeme nerveux de l'homme' (1845).

CRUZ, kroos, Cano y Olmedilla, Ramon Francisco, b. Madrid 1731; d. 1799. He rescued the native Spanish drama from an inundation of French influence. A marvelously prolific writer, he
produced some 500 pieces in all departments of dramatic composition. Classical drama, comedy, farce, zarzuela and a mixture of classical drama, more especially of the French school; and he translated and adapted playlets from Italian and French. But he gradually learned to trust himself. So prolific was he, so devotedly did he work and so endlessly was his literary and dramatic resources that he has been called the Lope de Vega of the 18th century. He wrote for all the theatres of Madrid and often a week or less was for him sufficient time in which to write a play or zarzuela. This work he kept up constantly for 30 years. The years following his death it was the custom to belittle his work; but the criticisms of to-day are finding, in his dramas, the mirror held up to the Spanish life of the 18th century, and they are beginning to understand what De la Cruz meant when he said of himself: 'Truth dictates and I write'; for his works are a vast and rich treasury of information relating to the life and customs of the age in which he lived and which he knew thoroughly. In rescuing Spanish drama from foreign influence and in developing the zarzuela, or musical comedy, and in other departments and especially in his Spanish plays, he led the way for the modern renaissance of the Spanish drama. Consult Cotarelo y Mori, 'Ramón de la Cruz y sus obras' (Madrid 1899).

Cruz, Juan de la (Saint John of the Cross), Spanish mystic and poet: b. Fontiveros, Old Castile, 1542; d. Ubeda, 14 Dec. 1591. He was a Carmelite friar. His real name was Juan de Yepes y Alvarez. He became an ardent supporter of Santa Teresa who was attempting to reform the order of Carmel. In this work he found himself constantly in trouble and finally he died in exile. His prose writings on the inner life won for him the title 'The Estatic Doctor'; famous among them is 'The Soul's Darksome Night.' In form and spirit his poetry is noble, deep and inspired by profound feeling; but he is often so mystical that it is difficult to understand. The beauty and harmony of his prose won for him many admirers; and the strong religious fervor of his works, probably more than anything else, led to canonization in 1726. His 'Obras espirituales' stand in the fore-rank of the Spanish mystics. Probably no other Spanish mystical writings have such sustained lofty expression. This and various of his other works have been translated into French and have been printed and reprinted in many forms. Among his other notable works are 'Noche oscura del alma' and 'Subida del Monte Carmela.' Consult Dominguez Berrute, M., 'Elimitismo de San Juan de la Cruz en sus poesías' (Madrid 1894). His complete 'Spiritual Works' were first published in 1619, and in a 12th edition in 1703.

Cruz y Guoyeneche, kroos-ay-o-yen-ché, Luis de la, Chilean military officer: b. Concepcion, 25 Aug. 1766; d. near Valparaiso, 14 Oct. 1828. He explored the Andes in 1806, discovering several important mountain passes, which are described in a report published in the Angel's collection at Buenos Aires in 1835. He bore a leading part in the revolution against Spain, and at last had to beg in the hands of the enemy, but was liberated in 1817. He next became a political leader of the young republic, serving for a time as acting President of Chile. He was invested by Peru with the dignity of grand marshal. Shortly before his death he was appointed Minister of Marine.

Cryolite, kri-öl'ít (Gr.  "
allusion to its translucent whiteness), a native fluoride of aluminum and sodium, having the formula 3NaF·AlF₃. It crystallizes in the monoclinic system, and also occurs massive. It is transparent and translucent, and the purer varieties are colorless or white. In lustre it is vitreous, and it has a hardness of 2.5 and a specific gravity of about 3. The best-known deposit of cryolite is in West Greenland, whence large quantities of it have been taken for use in the preparation of metallic aluminum. Less important deposits are also known in the Urals, and in El Paso County, Colo. Cryolite is also used in the manufacture of alum, soda and certain kinds of glass, notably the so-called "milk-glass," or hot-cast porcelain, which is composed of cryolite, silica and oxide of zinc. The only commercial supply of cryolite is the great mine at Iqvitug, where two grades are produced, known to the trade as "white cryolite" and "black cryolite." The discoloration of the latter is due to its large admixture of fluorite. The mine years only the black cryolite has been imported into the United States. The imports for 1916 amounted to 3,857 tons, valued at $42.84 per ton, as compared with 3,949 tons valued at $21 per ton for 1915. The latter price is about the average for the last 10 years, the increased price for 1916 being due to the greatly advanced rates for ocean tonnage caused by the war. An excellent description of the cryolite mine at Iqvitug may be found in The Mining Magazine (London) for April 1916. Consult also United States Geological Survey, 'Mineral Resources of the United States, 1916' (Part II).

Cryophorus, kri-fó'-rús (Gr. "ice-bearing"), a simple instrument devised by Wolaston for illustrating the freezing of water by rapid evaporation. The instrument consists of a bent tube of glass 8 cm. long, with a stopper at each end. A small quantity of water is placed in it, and boiled until the air is entirely expelled and replaced by steam. The tube is then hermetically sealed. In using the instrument, the water is brought into one of the bulbs, and the other, containing only water-vapor, is placed in a freezing mixture. The vapor condenses rapidly in the chilled bulb, and a correspondingly rapid evaporation is induced in the other one. The formation of vapor, however, is attended by the absorption of large quantities of heat; and the water in the free end of the apparatus, being the chief source from which this heat is obtained, presently becomes chilled to such a degree that it freezes.

Cryopon, in architecture, a cell or vault constructed underground. The galleries of the catacombs and the catacombs themselves were known by this name in the early Christian era. The underground tombs of the Christian martyrs were so called where the early Christians met to perform their devotions, for fear of persecution. Hence crypt came to signify a church underground, or the lower story of a church, which may be set apart for monumental purposes, or used as a chapel. It came to occupy the entire space under the choir; and often
the part of the church above it was elevated and approached by flights of stairs, in order to give height to the crypt. The crypt is not common in churches built after the Norman period and when found in those of the Gothic period is usually much older than the structure above them. The position of a crypt is generally beneath the choir, but occasionally, as at Glasgow Cathedral, beneath the transept also. The largest crypt in England is that at Canterbury Cathedral. Crypts rarely occur as a feature of a parish church. The larger crypt at Glasgow Cathedral is entirely above ground and at one time was used by itself as a church. In Germany, these underground chapels are numerous — the ones at Göttingen, Strassburg and Naumberg are fine examples of architecture. The most remarkable crypt in Italy is that of Saint Mark’s, Venice, which is in the shape of a Greek cross. Short columns support low arches on which the floor above rests. Other Italian crypts are at Brescia, Fiesole, Modena, Milan, Pavia, Verona, Florence; and a particularly fine one at Assisi. A good example of Norman crypt is to be seen in the church of the Holy Trinity at Caen, France. In this country there are notable crypts at Saint-Chapelle, Paris, and at Saint Gervase, Rouen. Later churches abolished the necessity for this form of chapel.

CRYPTIDINE, krip-ti-din (C₉H₈N), a base homologous with quinoline, obtained in the preparation of that body, and also found in the less volatile parts of coal-tar. Its boiling-point is about 525° F., but it has not yet been prepared perfectly free from its lower homologues. It forms a double salt with platinum.

CRYPTO-CALVINISTS, name given to Melanchthon and those who agreed with him in wishing to unite the Lutherans and Calvinists, and especially in his supposed leaning toward the Calvinistic view of the Lord’s Supper as shown in the difference between the original and the altered Augsburg Confession (q.v.). The former said "The body and blood of Christ are truly present in the Lord’s Supper in the form of bread and wine and are there distributed and received by the communicant; therefore the opposite doctrine is rejected." In the latter the last clause is omitted. Luther did not approve the alteration, but tolerated Melanchthon’s change of doctrine. Many, however, called him a Crypto-Calvinist. The truth seems to have been that he did not consider that either opinion was a sufficient bar to communion with Christ and therefore thought that both of them ought to be allowed. The controversy was becoming violent before his death, but afterward it broke out with great virulence, and continued with alternate success for 50 years, during which time frequent attempts were made to suppress the Calvinistic opinions by imprisoning their leading advocates and at last, in 1611, by the execution of Chancellor Nicolas Crell. The term has also been applied to the Missouri Lutherans because of their acceptance of the doctrine of unconditional election. Consult Richard, ‘Philip Melanchthon’ (New York 1886).

CRYPTOBRANCHIDÆ, krîp-to-brânk’kî-dë (Gr. "with hidden gills"), a family of urodele Amphibia (q.v.) most nearly related, according to Cope, to the Amblystomidae. There are no gills in the adult, but a single pore-like branchial fissure may persist on each side. Respiration is pulmonary, but the inspirations occur only at intervals of several minutes. The vertebrae are biconcave but, like the remainder of the skeleton except the cartilaginous carpi and tarsi, are well ossified. There is no ethmoid bone, and the internal ear is separated from the brain by membrane only. A maxillary bone is developed, and teeth are borne on the margins of both jaws, still fixed to the vomer but not on the parasphenoid. The eyes are very small and devoid of lids; two pairs of limbs with four and five digits respectively are always present, and the tail is permanently provided with a fin.

Two genera are known: Magalobatrachus, which has no branchial carinae except those on the vomer, and only the giant salamander of eastern Asia, and Cryptobranchus, which contains the American hellbenders (q.v.).

CRYPTOGAMOUS PLANTS or CRYPTOGAMS (from Gr. kryptos, hidden + gamaio, marriage), all plants below the Phanerogams or flowering plants. The names were first used by Linnaeus, who may thus have indicated his conviction that all plants possess sexuality, as most of them do. For a long time the vegetable kingdom was divided into two groups, as follows: (1) Phanerogamia, with seeds and embryos. (2) Cryptogamia, without stamens, ovules, seeds and embryos, and with spores. These distinctions, although long since acknowledged to be unscientific, are still maintained, especially in popular usage. The Cryptogams, instead of being a single group co-ordinate with the Phanerogams, include several such groups, namely, Algae and Fungi (Thallophytes); Mossworts (Bryophytes); Ferns (Pteridophytes). The Bryophytes and Pteridophytes are more closely related to one another and to the Phanerogams than to the very heterogeneous assemblage of the Thallophytes, the green members of which are known as algae, while those without chlorophyll are mostly called fungi. For more detailed accounts of the cryptogams, see the articles on the special groups just mentioned.

CRYPTOGRAMS. See Cipher Writing.

CRYPTOMERIA, krîp-tô-mê’r-ə (Gr. "with hidden parts," its seeds being concealed in bracts), a beautiful tall-growing conifer, known also as the Japanese Cedar. The tree grows in the most northern parts of China and Japan, and many varieties are cultivated. It was introduced into Europe in 1844, and is now widely cultivated. It is closely allied to the Sequoia (q.v.).

CRYPTURI, krîp-tûr-ə (Gr. "hidden tail" because of the rudimentary tail), an order of birds, sometimes called the Timani or Tinami-formes, from their native name timanou, generally regarded as Ratite (q.v.) but placed among the Cynurae (q.v.) by those who regard the presence of a keeled sternum as of greater classificatory value than the deagamous palate. Besides the characters just mentioned, which are combined in no other known birds, other remarkable osteological features are the complete union of the vomer and palatine bones, the single articular head of the quadrangular rudimentary tail skeleton (pygostyle), the ostrich-like pelvis and legs (but not feet), and the well-developed clavicles, all but the last being ratite characters. The quill feathers of the tail are 10 or 12 in number and completely
CRYSTAL

hidden beneath the coverts; the wings, which are very short and concave, have 10 primary and from 15 to 16 secondary quills; contour feathers are of the same strictely anhedral type. About 9 or 10 genera and 70 species are known, all but six of which are South American, occurring especially in Argentina and Brazil. See Tinamous.

CRYSTAL. The term crystal, derived from a Greek word signifying a hard crust, or more specifically ice, was applied by the Greeks at least 400 B.C. to a material which they supposed to be a hard, durable form of frozen water. This substance is the colorless, transparent variety of quartz still called rock crystal and this belief as to its nature lasted into the 16th century. The angular forms and the smooth, even surfaces of this substance were observed by the ancients, but were regarded either as accidents or as shapes “pleasing to the gods.” The polyhedral solids obtained by the evaporation of solutions were also thought to be ice and therefore called crystal, although the error was earlier realized, for not only was crystalization recommended by Geber in the 8th century as a means of purification but the shapes of the crystals were to some extent recognized as characterizing the salt.

The secondary meaning of polyhedral form, solids bounded by plane faces, was therefore associated with the original meaning of frozen water and clear ice-like appearance and by a natural association of ideas other minerals, such as beryl, diamond, garnet and pyrite, which were observed to occur frequently in angular forms, were spoken of as crystal-like, or crystalline, and when, toward the close of the 18th century, the study of the shapes was first systematically undertaken, Romé de l’Isle called the new science crystallography (q.v.). That is, the word crystal no longer meant the transparent, anhedral substance, rock crystal, but an individual solid of any substance, whether transparent or opaque, provided this solid was bounded by plane faces at definite angles, and was formed as a result of the solidification of the substance.

This definition however is not fundamental and does not touch the essential nature of a crystal and while still held to by some authorities it can only be consistently maintained by the creation of some new term to include all individuals possessing that character which distinguishes crystals from all other bodies, namely, homogeneity of internal structure. The limitation to plane faced solids was due to the fact that external form was long the only character studied and even this character is a direct consequence of a regular internal structure, and although it is a striking proof of this, it is often dependent upon comparatively minor conditions at the time of solidification.

All individual solids formed at the solidification of a substance, whether they are completely bounded by planes or partially bounded by planes or lack such boundaries and are of a shape determined by the space in which they formed exhibit equally well phenomena which prove the regular internal structure. For instance, characters such as transmission of light, the conductivity of heat, the cohesion, the elasticity or the rate of solubility are always alike in parallel directions, and, generally speaking, unlike in directions which are not parallel. Or if alike in more than one direction these directions will (whatever the boundary of the individual) bear the same relation.

The general use includes all the faceless and partially faced individuals, either with or without a modifying term, under the term crystal, one suggestion being to distinguish them as anhedral or faceless crystals, and the following definition of Rock expresses this tendency: A crystal is a homogeneous solid body of definite chemical composition, whose physical properties are the same in parallel directions, but are generally different in directions not parallel. The outward sign is the form, but its destruction does not rob the fragments of their perfect internal structure, whereas the most perfect model is not a crystal, because it lacks the internal physical characteristics.

A further modification of the definition will be needed if the doubly refracting liquids described by Lehnemann are admitted among the blages of liquid crystals. There is no definite limit between solid and liquid. In some of the softer solids a layer may be made to glide over another by pressure as in calcite and ice, other solid crystals are pliable, iodide of silver at 145° C. will flow like a thick liquid yet retain many crystal properties and certain organic substances which possess the mobility of oil or water and yet show double refraction dichroism, interference figures and even polyhedral form are difficult to exclude. The definitions thus far limit crystals to solids; whether this limit will be sufficiently removed to include the so-called liquid crystals is still in doubt.

The External Form of Crystals.—Although some differences between the shapes of crystals of different substances had been noticed and these differences utilized in descriptions of minerals and salts, the general belief, as late as the 16th century, was that the shapes in which any one substance occurred were neither constant nor related to each other.

In 1669 Nicolas Steno, a Danish anatomist, announced that the angles between corresponding faces of different quartz crystals were constant no matter how much the crystals varied in shape. This constancy of angles was stated by Guglielmini in 1704 to be general, in that every salt had its peculiar crystals, the angles of which were constant even when the crystals were imperfect and broken.

That in addition to the constancy of angles between corresponding faces there was an intimate relation between the very different shapes often assumed by crystals of the same substance was first shown clearly by Romé de l’Isle, who, continuing the method of Linnaeus, measured and made wooden models of different crystals and in 1783 described over 400 regular forms. As a result of his comparisons de l’Isle found that differently shaped crystals of any one substance always formed a series and that all the members of such a series were united by “modifying” one so-called “primitive form,” the shape and angles of which varied with the substance, by particular methods, such as replacing each edge by one plane or by two planes,
or each solid angle by one, three, four or six planes.

Hauy, just as either of the result of an independent discovery or in view of the fact that Torbern Bergman in 1773 had shown that calcite could be cleaved or broken into little six-faced fragments with constant angles and that these rhombohedral fragments could be built together again into the different observed shapes of calcite, assumed this property of cleavage to be general and instead of the arbitrarily chosen primitive form of de l’Isle he chose for each substance a primitive form the faces of which were parallel to directions of cleavage, or if no cleavage was found or cleavage only in one direction, he assumed a shape determined by striations or other markings or by analogy between the shapes of the crystals of other substances which did show cleavage.

More important than this however he laid the foundation for the great law of "simple mathematical ratio" by showing that the angles made by the secondary planes were not arbitrary, but always fulfilled certain conditions, and were designated by the heights of a prism in the same way as the corresponding edge or angle but were at exactly those angles which would result if upon the primitive form little "integrant molecules" of shapes determined by cleavage were built up in successive layers, each successive layer regularly diminishing from the subtraction of one or more rows, always some simple rational number, never to his knowledge exceeding four.

Professor Weiss of Berlin in 1809 discarded Hauy’s hypothesis of delected rows and substituted the conception of imaginary axes "around which the crystal is uniformly disposed." He divided all crystals into groups dependent upon the relative inclinations of the axes. The primitive forms of Hauy he constructed by planes intersecting all the axes or parallel to one or to two of them. If a primitive form cut three axes at distances a, b and c from the centre, then all secondary forms could be constructed by taking points along each of the axes at twice, three times and four times, etc., the lengths a, b and c, and constructing planes in the same way as before. That is, the intercepts of any secondary face in terms of a, b and c were rational, such as 2a : b : 3c or a : 3b : 2c.

Symmetry, or the repetition of equal angles or similarly grouped faces, was made a crystal character by de l’Isle in his statement, "Every face has an opposite parallel face." In any de l’Isle or Hauy series each form was derived by equivalent changes of each similar edge or angle of the primitive form, therefore without change of symmetry, that is "All crystals of any one substance are of the same grade of symmetry." Hess in 1830, Gadow in 1864, and von Lang in 1867 considered the possible varieties of symmetry of polyhedrons when limited by the law of rational parameters. Each obtained 32 types or classes.

It may be said then briefly that, with respect to external form, the crystals of any one substance will have the same symmetry, which will be one of the 32 types, that the angles between corresponding faces will be constant, and that the possible sets of planes in series in which the positions of the faces are not arbitrary, but fulfill certain conditions (the law of rational parameters).

The methods by which angles are measured and symmetry symbols and constants determined are described in brief in the article on Crystallography.

The Dependence of Physical Behavior upon Direction in Crystals as Evidence of Regular Internal Structure.—The physical behavior of a crystal varies in the direction in which the test is applied. Like effects are obtained in directions which are parallel in the crystal and, generally, unlike effects are produced in directions not parallel, and like effects are obtained in directions symmetrically related in the crystal form. All this may be interpreted as similar molecular arrangement in directions giving like effects and differing arrangement in directions giving unlike effect.

These facts were suggested toward the close of the 17th century by the results of the studies of calcite made by Bartholin and Huyghens, which may be summed briefly as follows: A ray of light transmitted through calcite in any direction, except one, is split into two rays usually following different paths so that an object viewed through calcite appears double.

The divergence of these paths (roughly shown by the distance apart the rays varies with the direction. In one direction, which is also the direction of the principal axis of geometric symmetry, there is single refraction only, and in all directions equally inclined to this direction of single refraction, double refraction (shown by the distance apart of the images) is the same.

If polarized light, in which the vibration direction is known, is transmitted through crystals, many proofs of the dependence of the effects upon the direction and upon symmetry can be obtained, the regularly varying indices of refraction, the vibration directions of the transmitted light, the differences in absorption and color—in fact, by these effects the symmetry can be accurately judged.

Even with very primitive apparatus Brewster and others obtained before 1820 the so-called interference figures, color rings of various shapes crossed by-dark bands, and Brewster was able to classify nearly all those substances to which Hauy had assigned names in order to correct several errors in classification made by the latter. Furthermore, these results were obtained in particular crystallographic directions and the distribution of color and shape of the figures were symmetrical to the planes and axes of geometrical symmetry of the crystal.

A striking proof of the dependence of optical behavior upon direction and of a relation between this and crystal line form is shown when polarized light is transmitted through quartz crystals in the direction of the prism axis. In this direction and in this direction only in all such crystals the emerging ray is polarized in a different plane from the entering ray, or, as it is usually stated, quartz crystals rotate the plane of polarization a definite number of degrees, dependent upon the thickness. But when crystals of quartz which show the less common faces are examined it is seen by the arrangement of these faces that there are two sorts of crystals, the faces of which are relatively like the right and left hand, and Hauy and Brewster in 1821 showed that the plane of polarization was turned to the right by the one sort of quartz crystal and to the left by the other.

direction in crystals is not limited to optical phenomena, for instance, spheres of quartz when uniformly heated expand with regularly varying inequality into ellipsoids of rotation, the direction of the principal symmetry axis of the crystal being the axis of rotation. A sphere of glass or opal would have expanded as a sphere.

A very remarkable instance of dependence upon direction and its connection with external form is shown by crystals in which there are different planes of cleavage about the opposite ends of certain axes. These axes are not only *polar* in the sense mentioned, but when the crystal is heated, one end of the axis becomes negatively electrified and the other end positively. This fact was observed in tourmaline crystals as early as 1762 by Epinus and the same property is shown by calamine, boracite, quartz and other minerals and always with respect to an axis which shows different grouping of planes at the two ends.

That the cohesion of crystals varies with the direction and is equally strong parallel to all geometrically equivalent directions is indicated by several characters. For instance, the directions of least cohesion are frequently shown by already mentioned under Haüy's discoveries and described in a separate article.

The inequality of the cohesion, except in parallel and similar directions, may also be shown by the variations in hardness and by the cracks developed by punching or pressing with a conical point, and it is especially shown in the "unbuilding" of the crystal, which takes place under the action of a solvent. Solution proceeds with different velocities in different directions in the crystal and if stopped at an early stage the crystal faces are found to be pitted by little angular cavities, the faces of which belong to forms in the same series as the crystal, and not only that but the shapes vary on different faces of the crystal and conform in this and in their shape to the symmetry of the class to which the crystal belongs.

Other characters could be instanced, elasticity, heat conductivity, electrical and magnetic characters and so on, but these are discussed more fully in the articles on Crystallography. All observations lead to the same conclusions, that most of the physical characters are dependent upon direction and intimately connected with the external form, or a more exact statement is that the physical characters and the external form are both results of the same cause, a *regular internal structure,* which in turn is dependent upon the chemical composition as described in the article on Chemical Crystallography.

**THE HOMOGENEOUS INTERNAL STRUCTURE OF CRYSTALS.**

That there exist in crystals some homogeneous internal structure has been sufficiently illustrated. The further consideration subdivides into (a) the kinds of homogeneous crystal structure possible, (b) the nature of the structural unit.

**The Possible Varieties of Homogeneous Crystal Structure.**—The discussion is simplified by the method of Seeber (1824) who substituted for the molecules their centres of gravity. It is then only necessary to consider from a geometric standpoint those types of homogeneous repetition of points in space which conform to the law of rational parameters, and their agreement with the 32 varieties of crystal symmetry already theorized from a consideration of external forms of the crystal being the axis of rotation. Such an arrangement of points is called a space lattice in which each point is in a similar position with respect to those surrounding it.

Frankenhheim in 1842 and Bravais more exactly in 1848 showed that there were 14 different types of space lattice, in each of which the units were parallel and similarly orientated. Each conforms to the symmetry of one of the 32 classes and in each plane through any three points conform to the law of rational parameters.

The broader principle of homogeneity of Wiener (1869), that regular arrangement of atoms consists in every atom having the remaining atoms arranged about it in the same manner, and the methods of movements used by Jordan in discussing the possible types of regular repetition in space were applied by Schöncke to the consideration of crystal structure.

Sixty-five regular point systems were obtained, each consisting of two or more identical Bravais space lattices the one thrust within the other, not coincident with it, but either moved parallel to some axis or rotated 180 degrees, 120 degrees, 90 degrees or 60 degrees around this axis, or with both motions.

Finally, von Federow, Schönflies and Barlow (1890-94) showed that other arrangements of points not identical but similar could be added which "faced the opposite way," that is, were like the mirror repetitions of the preceding groupings. In this way 165 types were added, making in all some 230 *space groups* or types of homogeneous crystal structure each with the symmetry of some one of the 32 crystal classes and for the first time representing all these crystal classes.

**The Nature of the Structural Units.**—Haüy in 1784 advanced the theory that crystals were built up of little parallelepipeda constant in shape in any one substance but differing in different substances and closely fitted together without interstices.

From that date until comparatively recently, the view has been widely held that the structural unit of the space lattice was an aggregation of chemical molecules called the physical molecule, and that for instance polymorphic substances were due to differences in number of chemical molecules constituting the physical molecule.

This view is definitely abandoned as a result of the increasing knowledge as to the close relations which exist (see Chemical Crystallography) between the crystal structure and the composition. Whether the unit is the chemical molecule in which the position of the atoms is definitely fixed or whether the chemical molecule is not present in the crystalized compound and the unit is merely a group of atoms in equilibrium is not yet quite agreed upon, but later researches indicate that each atom constitutes a point in a space lattice, fixed under one set of conditions and of definite volume but susceptible of change under changed conditions giving different structures and therewith new physical characters. For instance, Bragg's researches indicate that for halite, NaCl, the
structure is composed of two intersecting face-centred cubic spaced lattices, the sodium atoms on one, the chlorine atoms on the other, while for the anions, the atomium atoms are all ranged on a face-centred cubic lattice and the fluorine atoms are at the centres of the small cubes.

Various theories as to the shapes and relative volumes of the different atoms exist, some of which assume closed from the existence of interstices, some base the volume on the atomic weight, others on the valence, and each succeeds in explaining many peculiarities of structure.

Experimental Proof of the Existence of a Regular Internal Structure.—Light rays are diffracted by ruled "gratings" when the intervals between the parallel rulings are of the order of the wave length of light used. Thus sodium light with wave length of 0.000589 millimeters is diffracted by a ruling of 700 lines per millimeters, that is, with intervals of .00143 millimeters.

Dr. Laue of Zurich conceived the idea of using a crystal as a diffraction grating for X-rays of wave lengths of which is very much shorter than those of light and in 1912 by passing a pencil of X-rays through a crystal plate obtained upon a photographic plate not only a strong spot due to the original pencil but a series of other isolated spots which were always arranged in conformity with the symmetry of the crystal and evidently due to reflection from different sets of net planes.

W. L. Bragg showed that for any set of parallel net planes the reflections were obtained only for particular angles of incidence which corresponded to particular intervals between successive planes such that the crests of the reflected waves from each plane agreed, that is, to intervals of 1, 2, 3, etc., wave lengths, where as for other intervals the different reflected waves tended to neutralize each other. Hence it followed that from the angles and the wave lengths the intervals could be calculated.

The device for measuring these intervals is called an X-ray spectrometer. A fine pencil of X-rays of definite wave lengths is reflected in an ionization chamber and its presence being made known by the connected electroscope, the angles are recorded.

Variations in intensity indicate furthermore variation in spacing between similar net planes or lack of similarity between net planes uniformly spaced.

Crystal Growth.—Many strange views have been held as to the causes of crystallization, such as "intense cold," "divine fire," "the influence of the stars from which the six-rayed snow crystals come," "the influence of a particular salt," and the "motions of organic molecules, especially those derived from the remains of animals and plants." Later theories involved the idea of an embryonic period during which the forming crystal lacked characteristic shape. This was based on the study of the crystallization of sulphur from solution in carbon disulphide during which there were observed tiny globules called "globulites," which according to Vogelsang's theory are liquid spheroids or ellipsoids with a definite internal molecular movement, which renders them capable of mutual attraction. These group themselves in definite forms, sometimes in rows, like strings of beads, "marguerites," and others in the form of "longitudines." From these develop "crystalloids" of characteristic shape, often doubly refracting, and so on to the complete crystal.

It was found, however, that the globules were carbon disulphide supersaturated with sulphur and that on cooling the viscous Canada balsam and moreover that from pure solutions the minutest crystals are the same shapes as the larger ones, as, for instance, when very minute, perfectly formed crystals are obtained by suddenly diminishing the solubility by the addition of another liquid.

It appears from the researches of Miers that there are two distinct varieties of crystallization possible in any cooling fused mass or any evaporating solution, "labile" or spontaneous crystallization and "congelent" or induced crystallization requiring the presence of "germs," that is, minute crystals of the substance or a related substance. In studying the phenomena he made use of the fact that the refractive indices of the substance and its varied "germ" as the saturation and were highest just preceding spontaneous crystallization.

Labile crystallization occurs only with supersaturation or undercooling but in the interval between this and normal saturation or the melting temperature crystals will form by inoculation of the mass with crystal "germs." This has been experimentally proven both by inducing crystallization by stirring in an open vessel and by failure to induce crystallization either if the substance was new and its germs were not in the room or if the air was excluded as in a sealed tube. In all instances, however, "labile" crystallization occurred.

The germ presumably is an assemblage of parallel molecules, therefore possesses a larger attractive force than the surrounding particles, and if this force exceeds the internal friction will draw to itself and orientate other particles.

Frequently the growth, as observed on a plate of glass on the microscope stage, is relatively slow upon the crystal and the latter is revolved, at certain angles a pencil of rays is reflected into an ionization chamber and its presence being made known by the connected electroscope, the angle is recorded.

Variations in intensity indicate furthermore variation in spacing between similar net planes or lack of similarity between net planes uniformly spaced.

It is sometimes claimed, as showing an analogy between crystal growth and the growth of an organism, that every species of crystal has a definite limit of growth, and that when this is passed new crystal individuals are formed and the old individual grows no further. Exact measurements show that the large crystals do continue to grow, although with the larger surface the growth is less evident. Moreover, if the cooling or evaporation is made sufficiently slow no new crystals are formed, but all the material deposits on the already formed crystals.

Why a substance should vary in the occurring faces of its crystals is not understood. Rapid formation often results in simple forms
and slow formation in complex forms. Foreign material in small amounts, if it crystallize with the substance, may cause the development of unusual faces and the simple presence of large amounts of foreign material may have a similar effect.

In conclusion, it may be said the study of crystals is no longer a simple study of external form, but involves questions of the highest interest to the physicist, chemist and geologist. The purely geometric portion, both as relating to varieties of regular structure and to the laws governing the association of faces in the external form, is well advanced, possibly nearly completed. But much, facts remain to be explained as to origin, growth, habit, nature of molecules and molecular forces and the relations between chemical constitution and structure. See CRYSTALLINE; CRYSTALLOGRAPHY; CHEMICAL CRYSTALLOGRAPHY; GEOMETRICAL CRYSTALLOGRAPHY; PHYSICAL CRYSTALLOGRAPHY; MINERALOGY.

ALFRED J. MOSES,
Professor of Mineralogy, Columbia University.

CRYSTAL FALLS, Mich., city and county-seat of Iron County, 205 miles north of Milwaukee, on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads. It contains a high school and courthouse. Lumbering and iron mining are the chief industries. It received its city charter in 1859 under which the government is vested in a mayor and council. The electric plant and water-works are municipally owned. Pop. 3,775.

CRYSTAL PALACE, a building at Sydenham, England, about seven miles from London. The material in this building was at one time used in the Crystal Palace erected for the World's Fair in Philadelphia and was formally opened by Queen Victoria, 25 Feb. 1851. The original building was designed by Sir Joseph Paxton; the materials composing it were glass, iron and wood. It cost £1,450,000; and every department of art and science was represented. Its area was nearly 21 acres. In 1854, when the building was about to be demolished, a company formed to purchase it tore down the original and removed the material to Sydenham in Kent, about eight miles from London. The new edifice was opened after the World's Fair building. The grounds around the present Crystal Palace are in area about 200 acres, and are beautifully laid out. This palace was opened by Queen Victoria, 10 June 1854. The name of Crystal Palace was also given to a large building erected in 1858 in New York. The site was on Sixth avenue, between 40th and 42d streets. It was a favorite place for large exhibitions, but in 1858 it was destroyed by fire. The locality is now Bryant Park.

CRYSTALLINE. The term crystalline, like the term crystal, because of the fact that the external form of crystals was long regarded as the most essential characteristic and is still used with different meanings. Any product of solidification in which there is a regular orderly arrangement of the molecules is said to possess a crystalline structure whether the individuals of this product are bounded by planes at characteristic angles or not, and such a substance is said to be crystalline as opposed to amorphous. "Granite mountains are mountains of crystals, each particle being crystalline in nature and structure." But some authorities use the term to imply an imperfect grade of crystallization especially applicable to aggregations in which the individuals while possessing perfectly the regular internal structure show no regular external form. While this is of some convenience in descriptions of such material as marble, no sharp distinction is drawn.

CRYSTALLO-CHEMICAL ANALYSIS. Professor von Fedorow published in the Zeitschrift f. Kristallographie (38, 321-490; 50, 513-575) a method by which it is claimed if a few measurable crystals of any one of the over 10,000 recorded substances be subjected to a short, goniometrical measurement on the two-circle goniometer, occupying at most two or three hours and possibly only a few minutes, a reference to the tables will identify the substance of which the crystal is composed. To test this out samples were sent of many well-crystallized substances, some of which had only been investigated previously by one authority and in every one of these cases the substance, often an organic compound of considerable complexity, was identified.

While the fact that each chemical compound, unless isometric, possesses its own characteristic series of angles is well established, the orientation or setting up of the crystals has hitherto been to a great extent arbitrary; for instance, in an orthorhombic crystal any one of three sets could be chosen and in the monoclinic and triclinic any number are possible. To understand von Fedorow's method requires a study of his theory of "parallelohedral" structure. The work involves the determining of a "correct setting" based upon the crystal structure, as determined chiefly by graphic methods, on the assumption that the most densely packed planes of the space lattice correspond to the best developed crystal faces.

Thereafter the task is to measure five or fewer characteristic angles and compare these with von Fedorow's tabulation for over 10,000 substances, the angles for a triclinic crystal being, for instance, 1, between two prism faces; 2 and 3, between basal pinacoid and prism faces; 4, between basal pinacoid and pyramid; 5, between pyramid face and one of prism faces. The entire tables are unpublished as yet.

CRYSTALLOGRAPHY. Crystallography is broadly divided into "geometrical or morphological crystallography," "physical crystallography."
raphy* and "chemical crystallography." In a narrower sense and as a natural result of the fact that the geometrical relations were first studied the term crystallography is restricted to a study of the relations between the bounding faces of crystals and in that sense it is used here, separate articles being devoted to the other divisions.

The tasks in consideration of crystal form in elementary work are determinations of a crystal, recognition of type symbols, approximate angle measurements and interpretation of crystal descriptions, and in more advanced work are exact measurements of angles, projection and delineation, determination of indices and elements and calculation of theoretical angles from elements and indices.

As developed in the article on CRYSTALS (q.v.) the individual solids which result from the solidification of a chemical element or compound possess a regular internal structure but may be completely bounded by plane surfaces or partially bounded by plane surfaces or lack all plane boundaries.

These planes are not at haphazard positions with respect to each other, but at positions dependent upon the regular internal structure and are found to obey certain laws.

**Law of Constancy of Interfacial Angles.** —In all crystals of the same substance the angles between corresponding faces are constant.

A corollary to this law is that aside from the crystals of the isometric system the crystals of each chemical substance have a separate and definite set of angles.

The **Law of Symmetry.**—Different crystals of the same substance often show unequal numbers of faces, different angles and notably different shapes, but there is in practically every crystal some repetition or recurrence of equal angles or similarly grouped faces, although such faces often are unequally distant from the centre, unequal in size and different in shape, and are comparatively rarely equal. Crystals may be regarded as possessing grades of symmetry in the sense of symmetry of direction with repetition of equal angles and crystals obey the law that all crystals of any one substance are of the same grade of symmetry.

**The Law of Simple Mathematical Ratio.**—If the bounding planes or faces of crystals are defined in position by referring them to coordinate axes after the manner of analytical geometry, the axes being chosen by rules later stated, a simple and very important relation is found to exist between all true crystal faces of crystals of any one substance which may be expressed as follows:

If the relative intercepts of all the faces are reduced so that the same term in each is unity then in all crystals of the same chemical substance, if the intercepts of any face are divided, term by term, by the corresponding intercepts of any other face, the quotients will be simple numbers or simple fractions or infinity.

**Elementary Determination of System, Type Symbols and Approximate Angles.**

**Finding the System of a Crystal.**—The following rules quickly determine the "system" of a crystal, whether the need of a complete determination of symmetry or any consideration of "crystal" axes.

**Approximate measurements are usually needed.**

**Essential Conditions**

**An axis of symmetry in a crystal is a direction rather than a line through specific points.**

If the entire crystal is revolved (or assumed to revolve) about this direction there must be one or more repetitions, that is, positions at which all the faces are parallel to the previous positions of other faces.

According to the number of repetitions during a complete revolution the axis is known as two-fold, three-fold, four-fold or six-fold. No other varieties exist.

In Fig. 1 there is an axis of three-fold geometric symmetry perpendicular to the plane of the page and through the centre of the drawing, and in Fig. 2 a similarly placed four-fold axis.

**A plane of symmetry** holds a definite angular relation to a crystal rather than a fixed position in the crystal, and with respect to it the crystal faces are in pairs, the angle between each pair being bisected by the plane of symmetry. Thus, in the crystals shown in Figs. 1 and 2 there are planes of symmetry parallel to each of the dot and dash lines and each perpendicular to the plane of the paper.

The system may be also determined from the relations between coordinate axes chosen in the following order:

First, axes of symmetry.

Second, lines perpendicular to planes of symmetry.

Third, lines in a plane of symmetry parallel to edges or faces.

Fourth, lines parallel or equally inclined to several faces of the crystal.

The six systems may then be defined in terms of axes, each including all crystals which are, by the given rules, referred to a particular set of axes:
THE TRICLINIC SYSTEM.—Three non-interchangeable axes at oblique angles to each other.

THE MONOCLINIC SYSTEM.—Three non-interchangeable axes, two of which are oblique to each other; the third is at right angles to the other two.

THE ORTHORHOMBIC SYSTEM.—Three axes at right angles but not interchangeable.

THE TETRAGONAL SYSTEM.—Three axes at right angles, of which two are interchangeable.

THE HEXAGONAL SYSTEM.—Four axes, three of which lie in one plane at 60 degrees to each other and are interchangeable, the fourth is at right angles to the other three.

THE ISOMORPHIC SYSTEM.—Three interchangeable axes at right angles to each other.

Crystal Faces and Their Symbols.—The position in space of any crystal face, CDE, Fig. 3) is absolutely determined if the numerical values of its intercepts, OA, OB, and OC, on the chosen axes are known, and if these are stated as relative distances, for instance:

\[ OA:OB:OC = 0.7:1:1.46. \]

These intercepts are independent of the absolute position of the face and represent any face parallel to it, that is, any face in the same angular position.

The relative intercepts for any face are simple numbers only in the case of isometric crystals, but, as stated previously, there is a simple relation between the intercepts of different faces. The symbols which are used are therefore not the relative intercepts themselves but simpler expressions from which these intercepts may be derived, and a crystal description states usually the relative intercepts of some chosen face, hereafter spoken of as parameters, and expresses the other faces by simpler symbols.

The Miller indices of any face are those numbers which divided term by term into the parameters give as quotients the intercepts of the face, and the Weiss coefficients of any face are those numbers which multiplied term by term into the parameters give as products the intercepts of the face. The common bounding faces almost without exception have very simple indices or coefficients, usually 0, 1, 2, 3 or 4. Somewhat larger numbers result for the smaller and less common faces.

The Seven Type Faces and Type Symbols in any Symmetry Class. In each symmetry class there are seven typically different positions in which a crystal face may occur with respect to the chosen crystallographic axes; these positions may be expressed in the Miller indices and the Weiss coefficients by letters, usually \( h, k, l, m, n, \) and \( f \) in the Miller and \( m, n, \) and \( \) in the Weiss.

Since the numerical values are not needed in the determination, this is merely by parallelism or non-parallelism, equality or inequality. These type symbols may be determined as follows in models and large crystals: Place a straight edge or pencil in contact with a face and, keeping it in contact, turn the straight edge until its relation to each axis has been noted in the same way the corresponding Miller index is 0 and the corresponding Weiss coefficient is \( \infty \).

If two intercepts of a face are equal, the corresponding indices (or coefficients) are expressed by the same letter.

If all intercepts are unlike all three letters are used, the order depending upon the convention used in the symmetry class.

Experience proves that well-developed faces upon crystals of the same substance occur at particular angles dependent upon the structure and that these angles yield intercepts conforming to the law of simple mathematical ratios, the ratio of having been noted for crystals of the same angles with the crystallographic axes. Their symbols are therefore variants of one symbol. They are sometimes closely alike in size and shape, and usually they have similar markings and lustre. The assemblage of these faces, that is, the form, must satisfy the symmetry of the crystal.

Form symbols are not mathematical expressions for the form but for some one face of the form. In the Miller indices, for instance, \( (112) \) signifies a form to which this face, (112), belongs, \( (121) \) conventionally being reserved for forms, ( ) for faces.

A crystal may be bounded entirely by faces of one form. More frequently the bounding faces belong to two, or more, different forms.

The Classes of Symmetry and the Crystal Systems.—As discussed in the article on Crystals, solids bounded by planes so arranged as to conform to the law of simple mathematical ratio are limited to 32 forms. This number of forms is the maximum possible for crystals of any one substance. An examination of these forms reveals the fact that the 32 forms are conveniently grouped into the older divisions called systems, each of which consists of the crystals of these classes which can be referred to a similar arrangement of co-ordinate axes.

Thirty-one of the classes have known examples. In one class in the hexagonal system no example has yet been found. Nearly all the important minerals crystallize in 10 or 11 of the 32 classes.

The determination of symmetry elements by geometric relations alone is not conclusive. The symmetry is really that of the internal structure and hence manifests itself also in the physical characters, often thereby proving a lower grade of symmetry than evidenced by shape alone.

Triclinic System (Two Classes).—Referred to three axes oblique to each other and not interchangeable.

1. Unsymmetrical Class.—Each forming a single face. Example: Calcium thiosulphate, \( \text{CaS}_2\text{O}_6\text{H}_2\text{O} \).

2. Pinacoidal Class.—Symmetrical into the
Monoclinic System (Three Classes).—
Referred to three non-interchangeable axes, two oblique (at angle $\beta$) to each other, the third at right angles to the other two.

3. Sphenoidal class.—With one axis of two-fold symmetry. Example: Tartaric acid, $\text{H}_2\text{C}_4\text{O}_4$.

4. Dorsal Class.—With one plane of symmetry. Example: Clinohedrite, $\text{H}_4\text{ZnCaSiO}_4$.

5. Prismatic Class.—With one plane and one two-fold axis at right angles to the plane. Example: Pyroxene, $\text{RSiO}_3$.

The crystallographic description of a monoclinic crystal would include the parameters, the angle between the oblique axes and the symbols, for instance, the pyroxene crystal, Fig. 5.

Orthorhombic System. (Three Classes).—
Referred to three non-interchangeable axes at right angles to each other.

6. Class of the Rhombic Bipyramid.—With three axes of two-fold symmetry at 90 degrees to each other. Example: Epsomite, $\text{MgSO}_4\cdot 7\text{H}_2\text{O}$.

7. Hemimorphic Class.—With two planes of symmetry at 90 degrees to each other, intersecting in an axis of two-fold symmetry. Example: Calamine, $\text{Zn(OH)}_2\cdot \text{SiO}_2$.

8. Bipyramidal Class.—Three planes at right angles to each other, their intersections being axes of two-fold symmetry. Example: Chrysoberyl, $\text{BeAl}_2\text{O}_4$.

The description of an orthorhombic crystal would include parameters, and indices of occurring forms. For instance, the crystal of chrysoberyl, Fig. 6.

Parameters $a : b : c = 0.470 : 1 : 0.580$. Forms: unit pyramid $p$ \{111\}, unit prism $m$ \{110\}, prism $n$ \{120\}, pyramid $r$ \{121\}, brachydome $d$ \{011\}.

Tetragonal System (Seven Classes).—
Referred to three axes at right angles, two of which are interchangeable with each other. The intercepts of a face upon the interchangeable axes are always simple or infinite multiples of each other.

9. Bipyramidal Class.—One two-fold axis. Example: $\text{Ca}_2\text{Al}_2\text{Si}_2\text{O}_8$.

10. Pyramidal Class.—One four-fold axis. Example: Wulfenite, $\text{Pb}_2\text{Mo}_3\text{O}_{8}$.

11. Sphenoedral Class.—Three two-fold axes at right angles. Two planes through one axis and midway between the others. Example: Chalcopyrite, $\text{CuFeS}_2$.

12. Trapezohedral Class.—One four-fold axis at 90 degrees to four two-fold axes. Example: $\text{NiSO}_4\cdot 6\text{H}_2\text{O}$.

13. Class of Tetragonal Bipyramid.—One four-fold axis and one plane perpendicular to it. Example: Scheelite, $\text{CaWO}_4$.

14. Class of the Ditetragonal Pyramid.—Four planes intersecting in a four-fold axis. Example: Iodosuccinimid, $\text{C}_8\text{H}_8\text{O}_3\text{N}$.

15. Class of the Ditetragonal Bipyramid.—
One four-fold axis, four planes intersecting in it, and one plane and four axes perpendicular to it. Example: Rutile, $\text{TiO}_2$, Fig. 7, shows a rutile crystal, $\delta = 0.644$, with unit first and second order pyramids $p$ \{111\} and $d$ \{110\}, with first and second order prisms $m$ \{110\} and $a$ \{100\}.

The Hexagonal System. Rhombohedral Division (Seven Classes).—Referred to four axes, one a three-fold symmetry axis, the others interchangeable at right angles thereto and at 60 degrees to each other.

16. Class of Trigonal Pyramid.—With the three-fold axis. Example: Sodium periodate, $\text{NaIO}_3\cdot 3\text{H}_2\text{O}$.

18. Class of Trigonal Trapezohedron.—With three-fold axis and three two-fold axes of symmetry at 90 degrees thereto. Example: Quartz.

19. Class of Trigonal Bipyramid.—With three-fold axis and one plane of symmetry at 90 degrees thereto. No example known.

20. Class of the Ditrigonal Pyramid.—With three-fold axis and three planes through this at 60 degrees to each other. Example: Tourmaline, $\text{KAl}_2\text{(SiO}_3\text{)}$.

21. Sphenoedral Class.—With three-fold axis and three planes intersecting at 60 degrees to each other, and three two-fold axes diagonal to the planes. Example: Calcite, $\text{CaCO}_3$.

The most important class in the hexagonal system.

Fig 8 is a crystal of calcite, $\epsilon = 0.854$ showing the rhombohedron $e$ \{101\}, and the first order prism \{101\}.

22. Class of Ditrigonal Pyramid. The three-fold axis, three planes at 60 degrees and one at 90 degrees to the three. Example: Benitoite, $\text{BaTi}_2\text{Si}_3\text{O}_9$.

Hexagonal System. Hexagonal Division (Five Classes).—Referred to four axes, one a six-fold symmetry axis, the other three interchangeable, at right angles thereto and at 60 degrees to each other and interchangeable.

23. Class of Hexagonal Pyramid.—With the
CRYSTALLOGRAPHY

six-fold axis only. Example: Nephelite, NaAlSiO₄ (nearly).

24. Class of Hexagonal Trapezoedron.—With six-fold axis and two six-fold axes of symmetry at 90 degrees thereto. Example: Ba(SbO₄)(C₂H₂O₄)₂.KNO₃.

25. Class of Hexagonal Bipyramid.—With six-fold axis and a plane of symmetry at 90 degrees thereto. Example: Apatite, CaCl₂F (PO₄).

26. Class of Dihexagonal pyramid.—With six-fold axis and six planes of symmetry at 90 degrees to each other intersecting therein. Example: Greenockite, CdS.

27. Class of Dihexagonal Bipyramid.—With six-fold axis, six planes of symmetry at 90 degrees to each other intersecting therein, and one plane and six axes perpendicular thereto. Example: Beryl, BeAl₂(SiO₃)₂. Fig. 9 shows a beryl crystal with c = 0.009 and the forms prism of first order m₁₁₀₁₀, basal pinacoid 211, pyramid of first order p₁₁₀₁₁₁ and pyramid of second order p₁₁₀₁₁₁.

Isometric System. (Five Classes).—Reflected to three interchangeable axes at right angles to each other. The symmetry axes are either three cubic at right angles to cube faces, four octahedral, through opposite corners of a cube, or six dodecahedral, through centres of opposite edges of a cube.

28. Class of Tetartoid.—With the three cubic and four octahedral axes. Example: Barium nitrate, Ba(NO₃)₂.

29. Class of Gyroid.—With the three cubic, four octahedral, and six dodecahedral axes. Example: Sylvite, KCl.

30. Class of Diploid.—With the three cubic and four octahedral axes and three (cubic) planes. Example: Pyrite, FeS₂.

31. Hexitetrahedral Class.—With the three cubic and four octahedral axes and six planes (dodecahedral). Example: Tetrahedrite, Cu₃Sb₃S₆.

32. Hexoctahedral Class.—With all the axes and planes of the preceding, that is, three cubic, four octahedral and six dodecahedral axes and with three cubic and six dodecahedral planes. Example: Garnet, R₃ºR₆º (SiO₃).

Typical crystals of pyrite tetrahedrite and garnet are shown in Figs. 10, 11, 12, in which the forms are the cube ε₁₁₀₁₁₁, octahedron p₁₁₁₁₁₁₁, dodecahedron d₁₁₁₁₁₁₁, trapezoedron m₁₁₁₁₁₁₁, pyritohedron e₁₁₁₁₁₁₁, deltahedron r₁₁₁₁₁₁₁, and tristetrahedron o₁₁₁₁₁₁₁.

The Grouping of Crystals.—Crystals are frequently grouped, sometimes in parallel position, when many little crystals may unite to one large crystal, sometimes in twin positions as if one individual had been revolved 180 degrees with respect to the other about some "twin" axis, or as if two individuals had developed symmetrically with reference to a so-called twin plane. The twin-plane is always a possible crystal face, usually with simple indices, and the twin-axis is a crystal edge or is normal to a possible crystal face. The twinning law is defined by the twin-plane or twin-axis.

Frequently there is a repetition of the twinning, a third individual occurring reversed upon the second, a fourth upon the third, and this may result in many thin lamellae, "polysynthetic" twinning, or in circular forms which often suggest a higher symmetry. Twins may usually be recognized by the presence of re-entrant angles or by striations as in the plagioclases.

Even when not grouped in parallel or symmetrical positions, there may be some degree of regularity as parallel or radiating and whether showing plane faces or not the individuals may be distinguished as to their shape by such terms as: columnar, banded, fibrous, foliated, lamellar and granular.

Crystal Habit.—The prevailing shape or "habit" of the crystals of a substance is fairly constant, under one set of conditions, but with different conditions at formation the "habit" usually is different. The reasons are not understood. Terms used to express habit are prismatic, or tabular, conveying a general idea of the shape or more specifically cubic, octahedral, pyramidal, implying that the usually dominant form is the cube, octahedron or pyramid respectively.

Imperfections of Crystals.—The perfect crystal completely bounded by smooth plane faces is difficult to find. Unless formed while in a non-binding medium they will not be completely bounded and the faces are often marked by parallel "grooves" called "striations" or less frequently by etched figures and secondary...
growth, or they may be replaced wholly or in part by so-called vicinal planes which are faces of flattened pyramids nearly coincident with the true face. Occasionally the faces are curved from strain or partial resolution or the union of many smaller crystals and lack of homogeneity may be indicated by various phenomena, such as opalescence, zonal structure, phantoms, variation in color or visible solid liquid or gaseous inclusions.

The Measurement of Crystal Angles.—In the simpler tasks of determining symmetry, system and type symbols, approximate measurements within one or two degrees with a contact goniometer often suffice. This instrument in its better forms consists of a brass protractor with detachable arms which can be slid upon a pivot until of the most convenient length for the particular crystal. In measuring the arms are detached, set at an angle a little less than the angle to be measured, clamped loosely and one of the arms placed in perfect contact with one crystal face. The other arm then nearly touches the second face and, while holding between the eye and the light is brought into perfect parallelism with the second face by a gentle pressure with the forefinger. The arms are then replaced on the arc and the angle is read.

For the more exact work of determining parameters and angles and the numerical values of indices some form of reflection goniometer is almost universally used by which the angles between smooth bright faces are measured to minutes or closer. The goniometers may be one-, two- or three-circle and may vary considerably in details of construction. In the one-circle goniometer the crystal is attached by wax to a carrier and adjusted so that the edge between the two faces coincides with the axis about which the crystal is free to turn. Light is directed through a so-called collimator fixed in position at right angles to the axis of rotation and falling upon any face parallel to this axis it is reflected in the same plane and for some position of rotation is reflected to the reading telescope. By further rotation the second face to the position of reflection and the difference between the two readings is the supplement of the angle between the two faces. In the two-circle goniometer there are the same crystal carrier, collimator and reading telescope but the circle which bears the crystal carrier in turn revolves about an axis perpendicualr to its own. The crystal is mounted with some chosen face parallel to the circle which bears the carrier and this face for all positions of this circle and one position of the other circle sends a reflection to the reading telescope. By rotation of the two circles reflections are obtained for each face and from the readings co-ordinate angles are obtained corresponding to the longitude and colatitude of a place.

The principal advantage of the two-circle goniometer is that only one adjustment of the crystal is necessary, while with the one-circle goniometer there must be a separate adjustment of the crystal for each zone.

The three-circle goniometer combines the advantages of the one-circle and the two-circle in that the zones are obtained by two of the circles and measured on the third without further adjustments.

The Projection of Crystals.—The faces and zones of a crystal are most conveniently studied in some form of projection in which each face is represented by a point (or line) in a position determined by the measured angles. Such projections may be regarded as maps made to scale, from which both graphically and by calculation all the relations of symmetry, indices, constants and angles may be determined, the methods being at once simple and accurate.

The most used projections are the stereographic and the gnomonic, both of which assume that the crystal is surrounded by a sphere, the centres of the sphere and the crystal coinciding, and that radii are drawn from the centre perpendicularly to each face of the crystal, piercing the surface of the sphere in definite points or poles. The projections of the imaginary sphere and its face poles upon planes, the stereographic being a projection upon the equator by lines drawn from each face pole to the south pole, while the gnomonic is a projection upon a plane tangent at the north pole by prolonged radii. Naturally the construction proceeds at once from the measured angles to the projection by simple and accurate methods which have been developed.

After the projection has been made, the zones obtained and the elemental faces assumed, the method of procedure varies. A simple order would be:

1. Determining graphically and by zonal relations the indices of all faces.
2. Calculation of the axial elements from the relations between the measured angles.
3. Calculation of the theoretical angles corresponding to the determined indices and elements.

These can only be glanced at.

Zonal and Graphical Determination of Indices.—All edges between faces of a zone are parallel and there must be some radius in the surrounding sphere parallel to them. There must also be three indices corresponding to the point at which these are a called zone indices and may be derived from the indices of any two faces of the zone by cross multiplication. For instance, if a zone contains the two faces (133) and (311), the values of the zone indices [uvw] are obtained as follows:

\[
\begin{align*}
1 & 3 & 3 & 1 & 3 & u & w = 3-3 = 0 \\
3 & 1 & 3 & 1 & 3 & v & w = 3-1 = 8 & \text{ or } [uvw] = [083] = [011] \\
1 & 1 & 3 & 1 & 1 & w & v = 1-1 = 0 & \\
\end{align*}
\]

The indices of a face in two zones result from a similar cross multiplication of the two sets of zone indices, and very rapid calculations can be made, more especially if one of the known faces in each zone is either (011), (010) or (100), for then the ratio of the two indices, which are zero for this face, is constant for all the other faces of the zone.

For instance (Fig. 13) an unknown face lies in a zone with (010) and (305) and also in a zone with (100) and (110).

To substitute in \( hkl \) we have therefore

From first zone, 3, 3, 5.

From second zone, 3, 3, 5.

Remembering these are ratios and combining by
inspection the indices of the face \( h \) must be \((355)\). Similarly the indices of the face \( b \) must be \((335)\) and of \( k \) must be \((011)\) and \( e \) \((131)\).

It will usually happen that only the indices of a few faces can be obtained directly by zonal equations, certain factors being lacking, but many graphical devices exist by which a fresh start can be made and zonal solutions again obtained.

Calculations of Axial Elements and Theoretical Angles.—The formulæ of spherical trigonometry and special formulæ in terms of the determined indices and measured interfacial angles are most used. For instance, in the Orthorhombic system for the ratio \( a : b : c \), if \( b \) is taken as unity the simplest formulæ are:

\[
\frac{a}{b} = \tan \left( \frac{100}{h} \right) \wedge (hk0) ; \quad c = \frac{b}{k} \tan \left( \frac{001}{h} \right) \wedge (okb).
\]

Similar but somewhat more complex formulæ exist for the \((hkl)\) angles.

Similarly in the monoclinic system for the values of \( \beta \) and of \( a : b : c \), \( b \) being taken as unity

\[
\beta = \left( \frac{100}{h} \right) \wedge (001) , \quad \cos \beta = \cos \left( \frac{001}{h} \right) (hk0) , \quad \cos \left( \frac{001}{h} \right) (k00).
\]

Simple formulæ for \( a \) and \( c \) are

\[
a = \frac{h}{k} \cot \left( \frac{010}{h} \right) \wedge (hk0) , \quad c = \frac{1}{k} \tan \left( \frac{001}{h} \right) \wedge (okl).
\]

Crystal Drawing.—The usual crystal drawing is a "cylindrographic" projection, such as Figs. 4 to 12, in which the crystal is projected upon a vertical plane by parallel rays oblique to the plane of projection. The eye is assumed at an infinite distance a little to the right and above the centre of the crystal.

The figures obtained in this way have an appearance of solidity, all parallel edges are parallel and all points in a given line remain the proper proportionate distances apart.

The work consists chiefly of two stages, first finding the projection of the crystal axes cut off at the parameter lengths; second, finding the direction of the projection of any edges from the indices of the intersecting planes.

The dominant forms are drawn and then the minor modifying planes, either in ideal symmetry or so as to indicate the relative development of faces and forms. The details cannot be given here. See Chemical Crystallography; Crystal; Crystallo-Chemical Analysis; Geometrical Crystallography; Physical Crystallography; Mineralogy.

ALFRED J. MOSES,
Professor of Mineralogy, Columbia University.

CSABA, chôb'o, or BÈKÈS-CSABA (ba'kash), Hungary, a market town near White Körös, with which it is connected by canal, in the county of Békés, about 105 miles southeast of Budapest. The trade is chiefly in grain, wine, hemp, flour and cattle. The Lutheran religion predominates. Pop. 42,599.

CSOMA DE KOROS, chôʼmõ de ke'riš, Alexander (Hungarian Sandom), Transylvanian traveler and philologist: b. Körös, 4 April 1784; d. Darjeeling, India, 11 April 1842. He was educated first at the college of Nagy-Enyed and subsequently at Götingen, where he specialized in Oriental languages. He was in early life seized with the desire to investigate the origin of the Magyar race. He went, in 1820, to the East for that purpose. He visited Egypt and Persia and spent several years in a Buddhist monastery in Tibet, diligently studying the Tibetan language and literature, imagining he recognized resemblances between the Tibetan and Magyar. He next lived some years in Calcutta, studying Sanskrit, and compiled his 'Dictionary of Tibetan and English,' and a Grammar of Tibetan. He catalogued the Tibetan books and wrote a number of articles in the Asiatic Researches. Once more he set out on his old-time search to find the home of the early Magyars and bent his way toward the western confines of China, but died on the way. Consult Duica, Th., 'Life and works of A. C. de Körös' (London 1885).

CSONGRAD, chôn'grad, Hungary, a market town, capital of a county of the same name, at the junction of the Körös with the Theiss, 72 miles southeast of Budapest. The surrounding country is very flat and has excellent pastures. The chief occupations are cattle-raising, agriculture, wine-making and fishing. Pop. 28,310, mostly Magyars.

CTENOID, tên'oid (Gr. "comb-like"), applied to the scales of fishes when jagged or pectinated on the edge like the teeth of a comb, as in the perch, flounder and tench. Standard uniform.

CTENOPHORA, tên'o-fô-ř, a phylum of animals, sometimes grouped under the Ctenentata (q.v.) but distinguished from them by the absence of stinging cells and the presence of a third germinal layer. They also possess comb-like bands of cilia which serve them for
CTESIAS, tē-shī-as, Greek historian and physician: fl. about 400 B.C. In 415 he was captured by the Persians and lived for 17 years at the court of Persia, where he wrote his 'History of Persia' with the view of correcting the errors prevalent among his countrymen about that country. According to Diodorus his work is derived from the official history of the Persians, written according to the law of the country. His work was written in the Ionic dialect and consisted of 20 books. Of this work all that remains is an abridgment in Phothis and the fragments contained in Diodorus and other historians. His writings are particularly valuable for the light they throw on the history of eastern nations. An edition of Ctesias, with an introductory essay on his life and writings, was published by Bähr (1824), and by C. Müller in an appendix to Dindorf, 'Herodotus' (Paris 1844). Consult Gilmore's edition of the fragments of the 'Persika,' with notes and introduction (1855); Blum, 'Herodotus and Ctesias' (Heidelberg 1836), and Wachsmuth, 'Einleitung in das Studium der alten Geschichte' (Leipzig 1895).

CTESIBIUS, tē-sib'ī-ús, Greek mechanician. He flourished under Ptolemy Philadephus and Euergetes, at Alexandria, about 250 B.C., and was famous for his inventions in mechanics. We owe to him and his pupils, Hero Alexanderinus, the pump, the bent siphon and also the discovery of the elastic force of air and its application as a motive power. His work on hydraulics is lost.

CTESIPHON, tē-tĭf'n, or TAK-KE-SRA, Asia, a city of Babylonia, on the east bank of the Tigris and opposite Seleucia, the common winter residence of the Parthian kings, and finally the capital of the Parthian kingdom. It was conquered by the Romans in 115 A.D. and destroyed by the Arabs under Omar in 637. Its ruins still attest its former magnificence. The two places Ctesiphon and Seleucia are known as the Arab town, El-Medain.

CUAJINIGUAPA, kwä-ńē-nē-kê t'ē-pā, Guatemala, the chief town of the eastern department of Santa Rosa, 35 miles southeast of the city of Guatemala. Its altitude above the level of the sea is 3,254 feet. Pop. 3,062.

CUAUTLA MORELOS, kwä-oöl'la, dā mó-rā-lōs, Mexico, the chief town of the district of Morelos, in the state of Morelos. It is about 26 miles from Cuernavaca, the capital of the state and 85½ miles from the City of Mexico, was founded by the Aztecs and is the most fertile district. Cautla is historically interesting because it occupies the site of an old Indian town; and, furthermore, in the war of independence the famous patriot leader José María Morelos y Pavón was besieged here. It is well known as a health resort on account of its hot sulphur springs. Pop. 7,000.

CUBA. An island in the West Indies, isolated from the United States by the Strait of Florida, and from Mexico by the Yucatan Channel, and commands the entrances of the Gulf of Mexico. Extending east and west from the 24th to the 85th meridian, it constitutes the most important part of the northern barrier of the Caribbean Sea, and guards the Windward Passage, the natural route for commerce between the Atlantic Ocean and the 'American Mediterranean,' which is equivalent to saying that it guards the route of commerce between the Atlantic and Pacific oceans, via the Isthmus of Panama. Its eastern point, Cape Maisi, lies directly south of New York city; its western point, Cape San Antonio, near Cincinnati. But the length of the island, 730 miles, is somewhat greater than that statement would indicate, for Cuba curves 'like a bird's tongue' as the Spaniards used to say, from lat. 19° 40' N. in the province of Oriente up to lat. 23° 13' N., the most northerly provinces being those of Matanzas and Havana. In its upward curve the coast-line attains a point that is only 96½ miles distant from Key West; whence it curves away again, 670 miles, and a point miles separate it from the mainland of Mexico. Its width decreases gradually from 100 miles in the east to less than 25 near the line between the two western provinces, Pinar del Rio and Havana. Its total area, including the Isle of Pines and the Cayos or keys (more than 1,000 islets that form an irregular border along the northern and southern coasts) is estimated at 44,164 square miles. Thus it is larger than Virginia; smaller than Pennsylvania.

Physical Features.—Nature has provided unusual facilities for making the most of Cuba's favorable situation upon a great and permanent marine highway. The coast-line is 2,000 miles long, or much more than that if we take into account all its indentations. Capacious harbors, quite evenly distributed along this coast, are Baracoa, Nipe, Gibara, Nuevitas, Sagua la Grande, Matanzas, Havana, Cabanas and Bahia Honda; and, on the south coast, Cienfuegos, Trinidad, Manzanillo, Santiago de Cuba and Guantanamo. Besides these there are scores of fairly safe roadsteads and harbors of moderate size. Therefore no plantation on the narrow island can be very far away from some port at which supplies may be received and from which produce may be shipped. The mountains of Cuba occur in three distinctly separate parts of the westernmost province, Pinar del Rio, the Guaniguanico Range (Sierra de los Organos; greatest altitude, 2,592 feet), extends from Cape San Antonio to the boundary-line of Havana province, and hence continued in lower disconnected hills which give a bold outline to the northern coast of the four central provinces, it becomes the chief feature of the impressive landscapes around Sagua de Tanamo and Baracoa, far away in the east. The Guamahaya group of islands is limited above by the southern part of Santa Clara province, between the cities of Cienfuegos and Trinidad. Its highest summit, El Poterillo, is 2,900 feet. While the foregoing are of no great height, but owe their
Cuba's agricultural wealth is due to the fertility and depth of the soil that covers the pre-Tertiary sedimentary rocks forming the base of the island's structure. Above the diorites, basalts and serpentines, the granitoid rocks, the primary and secondary sandstones, limestones and conglomerates, is a great sheet of late Tertiary limestone. This white sheet or crust, of remarkable thickness, was formed as a deposit of organically derived oceanic material, says Dr. Robert T. Hill; and he adds: "The island was reclaimed from the sea by a great mountain-making movement in late Tertiary time, succeeding the deposition of these limestones. In later epochs, Pliocene and Pleistocene, the island underwent a series of epeirogenic subsidences and elevations which affected the coastal borders, producing the wave-cut cliffs and a margin of elevated reef rock which borders the coast in many places. About two-thirds of the eastern coast of Cuba is covered with soils derived from this organic limestone—soils whose colors, red and black, are not at all suggestive of their origin. In quality, in depth and in the proportion they sustain to less productive districts of the island, these calcareous soils are probably unrivaled. It is quite certain that they have no rival in any land whose situation is equally favorable for easy and cheap transportation of produce to foreign markets. A different type of soil, also valuable in agriculture, is the clay and gravel resulting from the decomposition of Tertiary igneous rocks. This occurs in parts of the provinces of Oriente, Santa Clara and Matanzas. Approximately one-half of the island has been cleared, but between 13,000,000 and 15,000,000 acres are still covered with forest. Cuba also furnishes a great variety of vegetable production, for the air is moist and injurious extremes of temperature are unknown. At Havana the thermometer averages 77°F. for the year, or 82°F. in the months of July and August, and 72°F. in December and January. At Santiago the average temperature for a year is somewhat higher—about 80°F.; on the other hand, towns located in the interior at an elevation of 200 or 300 feet above sea-level have an agreeable climate, the temperature averaging not more than 74°F. Rain falls most abundantly between the end of April and the beginning of November. The largest river is the Cauto, with its flow westward through Oriente province and empties into the Gulf of Guacanayabo. Many smaller streams make their way from the mountains to both the southern and northern coasts; not a few have cut out subterranean passages through the white limestones at the base, and long past, caverns of remarkable beauty have been formed. Even to-day in the western provinces, a number of streams disappear from view in some underground channels long before the sea is reached.

Population and Political Divisions.—The number of inhabitants, according to the census taken in 1907, was 2,048,980. In 1913 it was given as 2,382,900; in 1916 as 2,627,536. The area and population of the six provinces of Cuba are (1916) as follows:

Natural Resources.—In the mountainous eastern province deposits of copper, iron, manganese, mercury, zinc, silver, antimony, lead, etc. exist, and some of the mines have been worked on an extensive scale. The copper mines at Cobre, near the city of Santiago, were opened in 1524, and ranked as the greatest copper mines in the world until the deposits of this metal in the United States were developed. Iron ore of excellent quality outcrops on the slopes of the Sierra Maestra Range. Especially worthy of mention, in the province of Oriente, are the hematite and magnetite mines at Daiquiri and other points farther toward the east and north. Large deposits of silver have been found in the provinces of Camagüey, Oriente and Santa Clara, and every province contains mines of asphaltum. Cedar, mahogany, pine, lignum-vitae, ebony, rosewood, logwood, and other dyewoods, are valuable products of the forests for export. For the use of the Cubans themselves the royal palm stands unrivaled. There are many less familiar trees, not only the characteristic flora of the other West Indian islands of Central America and Florida, but plant-forms that have developed quite distinctive characteristics in the depths of these forests whose borders have only been touched by the inexpert native lumberman. More than 3,350 native plants were catalogued before an exhaustive study of the subject could be undertaken. These include various medicinal plants and local fruits grow luxuriantly, many of them without cultivation. In point of value the banana heads the list. Cocoanuts, oranges, lemons, limes and pineapples are grown for shipment in larger or smaller quantities to correspond with the demand in foreign markets, the supply being practically unlimited. The anom, mango,
rose-apple, pomegranate, sapote, tamarind, fig, citron, guava, aguacate (alligator pear), mammy and guanábana are abundant. The cultivation of grapes was forbidden by the Spaniards in the interest of the wine merchants of the Peninsula. Coffee culture was at one time a flourishing industry; and since the comparatively small amount still grown in the eastern end of the island is of excellent quality, coffee may prove one of the minor sources of Cuban wealth in future. Cotton grows freely in Cuba. Its cultivation on a commercial scale, abandoned after the liberation of the slaves, was resumed experimentally in the province of Oriente in 1902-03. In all parts of the island grasses grow rankly, and forage is abundant throughout the year. Other conditions favorable to cattle-raising are the mildness of the winters, the streams of fresh water, and the ready access to important markets on the Atlantic coast. Before the insurrection there were two and one-half millions of cattle in Cuba, a census not more than 75,000. The promotion of this industry was encouraged by the Palma administration in 1902-03, and undertaken largely by American capitalists.

History.—A score of years after the discovery of America, a town of Baracoa was founded by Spaniards under the leadership of Velasquez. Next, in rapid succession, came Trinidad, Sancti Spiritus, Puerto Príncipe and Santiago, dating from 1514 to 1515. In the year last mentioned Velasquez founded the original town of Havana (San Cristóbal de la Habana) on the south coast; but in 1519—the present site on the north coast was chosen, and to it the settlers of the older town were transferred. So important did this new Havana appear to be that the first governor of Cuba called it “The Key of the New World.” Burnt by the buccaneers in 1528, it was rebuilt and surrounded with fortifications by De Soto. Again captured and sacked by pirates in 1556, it was again fortified, more strongly, by direction of the Spanish Crown. Morro Castle was the key before 1600. During the 16th century the value of Cuba in Spanish eyes was precisely what the words “Key of the New World” expressed. At its ports expeditions were fitted out for conquest and the mainland; but there was no thought of obtaining revenues from the island itself except by the discovery of the precious metals, the futile search for which was never quite abandoned. When the first plants of sugarcane were imported from the Canary Islands to start an industry more remunerative than mining, it became necessary to import slave-labor from Africa. The Indians had been nearly exterminated—not entirely so, as is commonly asserted, for the aboriginal strain can still be detected in the physiognomy of some Cubans. English, French and Dutch pirates continued to ravage the coasts during the next century. Cuban cities of that time, with their old-fashioned defensive works, were like the walled towns of medieval Europe. The cost of maintaining them upon the capital was repulsed in 1628; in 1762, however, a force of English and American colonial troops, under Lord Albermarle, took Havana, which they held until, by the terms of the Treaty of Paris of 1763, Spain regained possession. A period of moderate prosperity and exceptionally good government followed. Las Casas, who came out as captain-general in 1790, worked earnestly and wisely to promote Cuba’s interests; the Cubans, for their part, evined their appreciation of such considerate treatment by a chivalrous display in Spain’s time of need. Havana learned, in 1808, that the Spanish dynasty had been overthrown by Napoleon; thereupon her citizens declared war against Napoleon. And when Spain was losing one after another of her American colonies, Cuba remained loyal. But prosperity brought long years of suffering to the swampy island, and the mother country as well. The result was inevitable. When the long-sought treasures of Cuba were at last brought forth, not from the gold mines but from fertile soil, Spain sought to make the treasure all her own, as she had monopolized the precious metals three centuries before. With a few exceptions, the high Spanish officials sent to Cuba were simply related conquistadores, lacking the personal valor, but possessing the avaricious character of the military rulers who first exploited Mexico and Peru. The decree of 1825 placed the hives and forges of all Cubans at the disposal of the captains-general. Conspiracies, insurrections, filibustering expeditions from the United States, called the Cabildo, were flouted by the government, and a return furnishing a poor justification of repressive measures, are the main incidents of the story of the following 70 years marked by the conspiracy of 1829, the rising of the blacks in 1844, the Lopez expeditions in 1845, 1850, 1855 and 1851, the revolts in 1855, the Ten Years’ War (1868-78) and the revolution of 1895. About 200 Americans took part in the ill-starred expedition of 1851, and of those who surrendered after Lopez’s defeat many were shot. Captain-General Tacó (1836) set native Cubans against resident Spaniards by impolitic discrimination, intensifying that antagonism between the two elements of the white population which to-day makes political controversies rancorous. The cause of the revolutionary movements between 1849 and 1855 was the virtual commission in 1848, more than 3,000 persons being tortured, imprisoned, banished or executed at that time for real or supposed complicity in a plot. The cry of outraged patriotism, that the maní and the maníeya, or Indian and the Moor, were a burden, was one of the causes of the revolt of 1868. During a part at least of the Ten Years’ War, the aim of the Spaniards was, as Captain-General Valmaseda wrote, to convert the island into a desert. Spain sent 257,000 men against the insurgents and lost 208,000 of them, according to official reports. The cost of the war, excluding the value of property destroyed, was $300,000,000. Midway in this struggle the Virginius, a vessel whose American register had been fraudulently obtained, was captured by the Spanish warship, taken into the harbor of Santiago and about 100 of its officers and men were shot without civil trial. The Treaty of Zanjón (1878) restored the old oppressive conditions; moreover the cost of the war had made a new burden for the island to bear, with the Dutch fleet. But the government tightened its commercial relations with other countries. *Underground Cuba gathered force for a final effort. In February 1895 the flame of insurrection was kindled and, in the course of three years, the whole island was again laid waste. Throughout the last century the government of the United States manifested an interest in

Cuba's fate. In 1823, Monroe being President, a dispatch was sent by the Secretary of State to the American Minister at Madrid, in which the Secretary (Mr. Adams) called particular attention to the commanding position which Cuba occupies with reference to the Gulf of Mexico and the Caribbean Sea, and expressed the opinion that there was no other foreign territory which could compare with it in the sum of the national interests of the United States. In 1825 and 1826 Colombia, being then at war with Spain and designing to invade Cuba and Porto Rico, refrained from this projected attack on the strength of a protest from the United States—a protest in the interests of the slave-power. The new Spanish-American states always marched under the standard of universal emancipation. Martin Van Buren said in 1829: "It is the interest of the southern section of the Union that no attempt should be made in Cuba to throw off the yoke of Spanish dependence." Webster, in 1848, declared that Cuban emancipation would destroy the existence of slavery in the United States. Thus for 20 years the Southern slave-owners insisted that the status of Cuba and Porto Rico should not be changed. The annexation idea came to the front in 1848. A proposition for the purchase of the island was made by President Polk, through his Secretary of State, Mr. Buchanan, who wrote to the American Minister authorizing the latter to offer $100,000,000 to Spain as compensation for the surrender of a colony which was, as we have seen, a particularly troublesome possession just then. The strategic value of Cuba was dwelt upon in this correspondence, and the fear was expressed that the island might fall into Great Britain's hands, in which event that nation would exercise supreme control over the Gulf of Mexico. The offer was declined by Spain. Both England and France were warned in 1852 that the United States would not admit the claim of any other power to intervene in a dispute of which Cuba was the subject. In February 1854 the cargo of an American steamer, the Black Warrior, was seized unjustifiably in Havana. It seemed for a time that war, and the acquisition of Cuba by force might ensue; but reparation was offered by Spain, and was accepted. Thereafter, that "mediation and intervention" might become necessary to put an end to the long struggle then in progress.

The revolution of 1895 falls naturally into three periods: first, that of Capt. Gen. Martinez Campos, whose fair fighting utterly failed to prevent the spread of the revolutionary movement from the eastern to the western provinces; second, that of Captain-General Weyler, who inaugurated the policy of reconcentration; third, that of Captain-General Blanco—including the events from Weyler's recall to the destruction of the Maine. Fighting fairly and like a gentleman, Campos was fairly beaten by men who developed positive genius in the art of exterminating the population. Maceo, who knew how to win by skilful evasion, by opportune attack, and, above all, by making an ally of every peasant and living on the country. Maceo crossed both trochas and reached Pinar del Rio province, thus carrying revolt from one end of the island to the other. Among the hills of the Sierras de los Oros, he maintained his band of followers and defied all efforts to dislodge him up to the close of the year 1896. Then he risked his life once too often and was killed. Campos failing to check the insurrection, Weyler was sent to crush it. The reasoning of the latter was strictly logical. He learned that Cuban peasants supplied the rebels with food, with information in regard to the movements of Spanish columns and with ammunition, bought, stolen or brought to the coast by filibusters. He did not shrink, then, from the extreme cruelty involved in the removal of the country folk from their homes to garrisoned cities, where, as "reconcentrados," they should become quite harmless. On 21 Oct. 1896, his proclamation was issued. Thousands of Cuban families were sent in towns or zones under surveillance of a Spanish garrison; and as time went on they died of starvation and fever.

United States and Cuba.—When Spain's Prime Minister, Canovas del Castillo, was assassinated, 8 Aug. 1897, it was reported that American policy was withdrawn. His successor, General Blanco, took to Cuba a policy of compromise. Autonomy was offered; and, for the rescue of the reconcentrados, the suggestion was made that charitable people in the United States might forward supplies to be distributed by the American consuls in Cuba. The proposal of autonomy was rejected with emphasis. General Blanco's emissary who brought the message was shot by an insurgent commander. And when it became known that an appeal for contributions to feed starving Cuba had been made in the United States, formidable riots in Havana expressed resentment of the proffered relief, which was regarded as the entering wedge of the dreaded intervention. For the protection of American interests the Atlantic squadron was ordered to make its headquarters at the Dry Tortugas, within six hours' sail from the Cuban capital; and on 25 January the battleship Maine was sent to Havana harbor. The Spanish government sent the cruiser Virey to New York harbor soon afterward. On 9 Feb. 1898, a letter addressed to Señor Canalejas by Señor Dupuy de Lome, Spanish Minister to the United States, was published in the newspapers of the latter country. Its cynical tone and insulting character in later days led McKinley were reelected, and Señor de Lome resigned his office. One week later the Maine was destroyed "by the explosion of a submarine mine," —to quote from the report of the court of inquiry—which caused the partial explosion of two or more of her forward magazines. The court was unable to obtain evidence fixing the responsibility upon any person or persons; before the official investigation was made, however, public opinion in the United States had rightly or wrongly assigned the responsibility to Spain and war with Spain seemed inevitable. On 8 March, the House of Representatives passed a bill appropriating $50,000,000 for national defense. Senator Redfield Proctor's statement of his personal observations in Cuba, read to the Senate 17 March, did not heartened. It confirmed previous reports which had excited pity and indignation. Diplomatic representatives of the six great European powers called at the White House on 7 April to present a joint note, a "pressing appeal" for the "preservation of peace." President McKinley's reply was con-
ciliatory, but the resolve he had formed was expressed in his message of 11 April: "In the name of humanity, in the name of civilization, in behalf of enthralled American interests, which give us the right and the duty to speak and act, the war in Cuba must stop." The war in Cuba had, indeed, stopped or halted. The queen regent of Spain had directed General Blanco to proclaim a suspension of hostilities, in order to prepare and facilitate the restoration of peace; and the President's message concluded with the statement that he had received official information of this circumstance. The text of General Blanco's proclamation had been published, and the orders of General Weyler revoked. It was asserted that the reconcentrados were to be permitted to return to their homes; that the sum of $600,000 had been voted for their relief; and that public works had been undertaken for the purpose of giving employment to the poor. Spain had offered to submit to arbitration the disputes which might arise in the matter of the Maine. President McKinley called attention to all these things, and said that they would be given full weight in the deliberations of Congress. But the "full weight" of such programs had been ascertained. The reports of American consul in Cuba accompanying the message denounced measures which precluded reform without forcible intervention. The famous joint resolutions of 19 April recognizing "the independence of the people of Cuba, demanding that the government of Spain relinquish its authority and government in the island of Cuba, and withdraw its land and naval forces from Cuba and Cuban waters, and directing the President of the United States to use the land and naval forces of the United States to carry these resolutions into effect, concluded with the words: "The United States hereby disclaims any disposition or intention to exercise sovereignty, jurisdiction, or control over said island, except for the pacification thereof, and asserts its determination when that is accomplished to leave the government and control of said island to its people." The Spanish-American War began on 21 April 1898; Admiral Cervera's fleet was destroyed off Santiago 3 July; the formal surrender of Santiago took place on 17 July. In the protocol suspending hostilities which was signed on 12 Aug. 1898, it was provided that Spain should relinquish all claim of sovereignty over and title to Cuba, and that Cuba should be immediately evacuated. The evacuation proceeded gradually; the last of the Spanish troops leaving 1 Jan. 1899. The participation of the revolutionary army in these events has two noteworthy features: A force of about 3,000 Cubans, led by Gen. Calixto Garcia, joined the American troops as Aserradores and served through the Santiago campaign, forming a part of the army. Later, the returning Spanish army was closely followed, outside of the chief cities, by the Cuban army, which took charge of the towns and country, maintaining order and performing police duty; and, when further dispersed, was dispersing peacefully among the people. The treaty of Paris, signed 10 Dec. 1898, provided for the temporary occupation of the island by the United States. By an order dated at Headquarters of the Army, Washington, 13 Dec. 1898, a division known as the Di-

vision of Cuba was created, under command of Maj.-Gen. John R. Brooke. The author of military governor of the island was exercised by General Brooke from 28 Dec. 1898, until 20 Dec. 1899, when he was succeeded by Maj.-Gen. Leonard Wood, who continued in office until 20 May 1902. During the entire period of American occupation (1898-1902), the total revenues were $57,197,140.80; amount in hands of the treasurer at the close of business, 19 May 1902, $635,170.29. The latter sum was paid to the republic of Cuba; the former was expended for maintenance of government ($2,780,761.16), justice and public instruction ($11,108,187.46), sanitation ($9,706,258.20), public buildings, works, ports and harbors ($5,533,607.90), charities and hospitals ($4,124,986.60), barracks and quarters ($2,525,483.78), etc. A comparatively small amount was used for the pay of the army; very large sums devoted to works of public utility, in the interests of the Cuban people. Cuban imports during this period amounted to $625,437,135, the largest items being foodstuffs, animals and animal products, cotton, silk, and tobacco; and metals and metal manufactures. From the United States came 43 per cent of imports, while the rest of the world supplied 57 per cent. Cuban exports amounted to $180,609,067; the United States taking 75 per cent. The articles exported to the United States were tobacco and its manufactures, $45,400,678; sugar and molasses, $77,648,819; wood, unmannered, $1,751,451; iron and manganese ore, $2,587,715; fruits and nuts, $2,547,392; all other articles, $3,470,072. The trade of Cuba was adopted; the death-rate of the island was lowered; the causes of yellow fever were discovered, and that disease nearly exterminated. Especially successful were the efforts to beautify Havana and improve its sanitary condition. That city became one of the most attractive in Latin America. The reforms extended to the prisons, hospitals and asylums. A general system of free schools was established throughout the island, and, in many practical ways, Cuba was prepared for self-government. A constitutional convention, the members of which were elected 15 Sept. 1900, met in the city of Havana the following November. The constitution of Cuba was adopted 21 Feb. 1901, and an appendix thereto (the Platt Amendment*) 12 June 1901. A form of government was thus provided which, in its main features, resembled that of the United States. The appendix, however, curtails Cuban independence. Its eight articles follow:

1. The government of Cuba shall never enter into any treaty or other compact with any foreign power or powers which will impair or tend to impair the independence of Cuba, nor in any way authorize or permit any foreign power or powers to obtain by colonization or for naval or military purposes, or otherwise, lodgment or control over any portion of said island. 2. That said government shall not assume or contract any public debt to pay the interest upon which, and to make reasonable sinking-fund provision for the ultimate discharge of which the ordinary revenues of the Island of Cuba, after defraying the current expenditure, shall be inadequate. 3. That the government of Cuba agrees that the United States may exercise the right to intervene for the preservation of Cuban independence, the maintenance of a government adequate for the protection of life, property, and individual rights of the inhabitants, and the suppression of any insurrection, should the obligations with respect to Cuba imposed by the Treaty of Paris on the United States, now to be assumed and understanding by the government of Cuba as a basis of the United States in Cuba during the military occupation of said island shall be satisfied and be carried out, and all debts and claims lawfully acquired by virtue of said acts shall be fully assumed and protected. 5. That the government of Cuba will ex-

* Platt Amendment
CUBA

... and, as far as 'necessary,' extend the plans already devised, or other plans to be mutually agreed upon, for the sanitation of the cities of the island, to the end that a reduction of epidemic and infectious diseases may be prevented, thereby assuring protection to the people and commerce of Cuba and the commerce of the southern ports of the United States and the people residing therein. 6. The island of Pines shall be omitted from the boundaries of Cuba specified in the constitution, the bill of exchange thereon being left to future adjustment by treaty. 7. To enable the United States to maintain the independence of Cuba and to protect the people thereof, as well as for its own defense, the Cuban government will sell or lease to the United States lands necessary for coaling or naval stations, at certain specified points, to be agreed upon with the President of the United States. 8. The government of Cuba will embody the foregoing provisions in a permanent treaty with the United States.

The convention adopted the foregoing articles reluctantly, after considerable delay, and relying upon representations made to certain delegates by President McKinley, Senator Platt and other officials at Washington, that the tariff on Cuban products sent to the United States would be reduced, as a proper concession in view of the surrender by Cuba of such valuable privileges. The Congress of Cuba (elected 31 Dec. 1901 and 24 Feb. 1902) was convened in Havana 5 May 1902, to examine into the credentials of its own members and to count and ratify the electoral vote. At 12 o'clock noon, 20 May 1902, the Republic of Cuba was established; Tomas Estrada Palma being President and Luis Estevez Romero Vice-President. The transfer was made in the reception hall of the palace of the military governor. A salute of 45 guns was fired while the document of transfer and President Palma's reply were being read; the troops of the 7th United States Cavalry, formed in the plaza before the palace, presented arms; the band played the American national air, and the American flag was lowered. Next the Cuban flag was hoisted and greeted with the national salute of 21 guns by the U. S. S. Brooklyn; the Cuban national air was played; the American troops saluted the Cuban flag and then immediately embarked.

Independent.—There remained on the island, at Santiago, Cienfuegos and Havana, small forces of artillery, for the preservation and care of the coast defenses and to avoid leaving the island entirely defenseless against external attack, pending such arrangements for the conclusion of a peace treaty.

The failure to secure tariff concessions from the United States as promptly as was expected increased the difficulty of their financial problems, the people of Cuba have a fair record for the first year of their independence. An intelligent effort was made to keep the most important industries moving along in the usual way and to preserve order throughout the island, the single conspicuous exception being the strike of Havana workers; in Havana (November 1902). From the first the balance in the treasury showed a tendency to increase. The completion of the central railroad, connecting Santa Clara with Santiago, and the western with the eastern provinces for the first time by a continuous line of railway transportation, gave a new impetus to industrial development in 1903. The treaty of reciprocity between the United States and Cuba, having been approved by the Senate of the United States, 17 March 1903, and by the Cuban Senate, 28 March 1903, was submitted to the House of Representatives at Washington, convened in extraordinary session 9 Nov. 1903. Violent disputes between the Cuban Liberals and Moderates, culminating in the insurrection of 1906 which the Palma government was unable to suppress, led to the second American intervention. A census of the island was taken and fresh elections were held in 1907; and in January 1909 the American troops were again withdrawn. On 16 March 1912 the hull of the battleship Maine, having been raised by American engineers, was towed three miles outside of Havana harbor and sunk. On 20 May 1913 Gen. Maria Garcia Menocal (Conservative) was inaugurated as President and Dr. Enrique Jose Varona as Vice-President. In 1915 the Cuban delegation to the Pan-American Financial Conference reported most favorably in respect to the important and very close commercial and financial relations between the United States and Cuba, so essential to the latter's well-being and political stability. This favorable condition obviously is due in great measure to the benefits of the reciprocal trade created between the two countries in the year 1903, as may be seen by the statistics showing the increase in the reciprocal trade relations since the treaty was put into effect. (Memorandum submitted by the Cuban delegation, page 384). Again, in the group conference report, page 379: "So clearly has it been recognized that these special relations (which were established by the reciprocity treaty) existed between Cuba and the United States that many measures are already in force for promoting intimate commercial and financial relations which in the case of other countries are only in the preliminary stage. From the beginning the national loans of Cuba were taken by American bankers and are still held largely in the United States. The means of transportation and other public utilities have also been, to a large extent, established and are now operated by American capital. (For the expansion of Cuba's trade with the United States, and a summary dated 1 May 1916 of the island's whole foreign trade, see under Commerce). On 11 Feb. 1917 two companies of soldiers encamped just outside Havana mutinied, and on 12 February, three days before the date set for the new presidential election, nearly the entire force of government troops in Ciego de Avila and other towns in the eastern part of the island revolted and took possession forcibly of those districts. The Cuban government met the crisis with energy and had the moral support of the government of the United States; accordingly the revolt was suppressed in less than two months (before the middle of April 1917).

Government.—Executive powers are conferred upon the President, who is assisted by a cabinet of nine officers, the Secretaries of State, of Justice, of Government, of the Treasury, of Public Works, of Agriculture, Commerce and Labor, of Public Instruction and the Fine Arts, and of Health and Charities and of the Executive Department. The Cuban Assembly, on 11 July 1917, approved a new Constitution. The Senate creating the Cabinet office of War and Marine. Both President and Vice-President are elected indirectly, by an electoral college, for the term of four years; and they cannot serve more than two consecutive terms. The legislature or National Congress consists of the Senate (24 members) and the House of...
Representatives (83 members). Senators are elected indirectly for eight-year terms, four senators for each province, and the Senate is renewed by halves every four years. Representatives are elected by the vote of the people and senators by the vote of representatives at the rate of one representative for every 25,000 inhabitants. Every male citizen 21 years of age or over has the right of suffrage. The House is renewed by halves every two years. Congress meets twice each year, on the first Monday of April and November, and its regular sessions last 40 days or more. The judiciary consists of a National Supreme Court, six superior courts, courts of first instance and minor courts. Justices of the Supreme Court are appointed by the President with advice and consent of the Senate.

Education.—The census returns of 1907 show that there were then in Cuba 31 percent of illiterates. This good showing was the result of the establishment of the present elements, by which each municipality was required to have a school board and every town to have schools, at which the attendance of all pupils within school age should be obligatory. On 30 June 1907, there were 23,946 schools, 2,490 teachers and 289,679 pupils in Cuba with an average attendance of 183,947. There are six secondary schools or "institutes" maintained by the government, one in each province. Annexed to each of these is, with the one exception of the province of Havana, a special school of land surveying. Attached to the Institute of Havana are schools of commerce, navigation, stenography and typewriting and other special branches of learning. In these various institutes there were over 2,000 students in the fiscal year 1915-16. The University of Havana has three faculties: liberal arts and sciences, medicine and pharmacy and law. In the fiscal year 1915-16 there were in attendance at the University 1,432 students. Very liberal provisions have been made by the government for the maintenance of the elementary and secondary schools of the nation. The Department of Public Instruction and Fine Arts is divided into two sections, one having charge of the elementary schools and the other directing the normal and high schools, the National University, the School of Arts and Crafts, the School of Painting and Sculpture, the National Conservatory of Music and Declamation, the National Astronomical Observatory and the national and other public libraries. The establishment of normal schools in the provinces was authorized by law in 1915.

Army and Navy.—The regular army and rural guard together have 444 officers and 11,000 men. The navy, according to the Official Bulletin of the Treasury Department (Havana, January 1916) has 18 vessels—the Cuba (2,055 tons), Patria (1,200), Hatuey (538), Baire (500), Fara (339), 10 de Octubre (208), 24 de Febrero (208), 20 de Mayo (141), Enriqueta Villegas (132) and nine other boats of less than 100 tons.

Agriculture.—The staple products of Cuba include tobacco, sugar, coffee, cocoa, potatoes, tropical fruits and cereals. As early as the 16th century the sugar industry was established under the special protection of Spanish sovereigns, but at the beginning of the 20th century, after more than 300 years had passed, only about 7 percent of the area of the island was devoted to the sugar crop. In other words, about 2,000,000 acres out of the total 28,000,000 acres. During the 17th and 18th centuries the annual output was about 40,000,000 lbs. of raw sugar, 90,000 tons in the first quarter of the 19th century, to 200,000 tons in 1840, and to nearly 300,000 tons in 1850. The increase is significant, for it was directly occasioned by the withdrawal of an annual allowance of $1,000,000 that Spain made to the Cuban admiralty in return for naval vessels from Mexico. The loss of Mexico to the Spanish Crown closing that source of income, Cuba was thrown upon her own resources, with the result that she turned her attention more earnestly to the development of this profitable form of agriculture. The period 1853-68, in which the amounts produced increased from 322,000 to 749,000,000, was in a restricted sense Cuba's Golden Age. Not until 1891 was a greater amount obtained. The million mark was passed in 1894-1895.

The insurrection beginning in 1895 reduced the crop of the following year to 225,221 tons, and the continuance of hostilities in 1897 and 1898 forced the output of those years down to 212,051 and 222,648. However, with the restoration of peace in 1898, a new era of development began; and though four years passed before the injuries to mills and fields could be fully repaired, the conditions at the beginning of 1903 justified the hope that the prosperity of the best years before 1898 would be regained. In the year 1894 the output of beet-sugar for the world was but 50,000 tons, principally grown in France. From that date the production of this competing industry increased so rapidly that in 1894 it was 3,841,000 tons, and naturally this enormous addition to the world's supply caused a reduction in the price of cane-sugar which seemed ruinous, and indeed proved to be ruinous to the planters of many sugar-growing countries. But in Cuba the problem of producing sugar at a profit, despite the constant tendency toward lower prices, has always been met. It was solved in the great crisis of 1884, and in more recent years whenever presented. In 1902-03 improvements in mills and the methods of management effected a reduction in the cost of the standard grade on some of the larger estates to much less than two cents a pound. Such results could not have been achieved unless the soil and climate were in the highest degree favorable to the growth of sugar cane. Yet large districts in which the soil is equally good had never been touched by the plow. In the fiscal year 1912-13 the sugar crop of Cuba was 2,443,986 tons. This had been increased in 1915-16 to 3,007,913 tons. The value of sugar products exported from Cuba to the United States in 1915 was $193,476,972; and in 1916, $266,743,554, exclusive of molasses and confectionery. In 1917, they were valued at $4,338,429. In this latter year the total Cuban sugar crop was valued at over $360,000,000. Cuba produced 696,067 gallons of rum in 1915 and 420,517 in the following year. An additional cane product was alcohol, of which the output was 649,722 gallons in 1914, and 2,021,116 gallons in 1915.

Soil and climate are also favorable to the production of valuable tobacco. The area in which the characteristic Cuban leaf can be
grown is, however, much more restricted. The systematic cultivation of tobacco was not begun in Cuba until 1580, though the indigenous plant had been grown by the natives before the first voyage of Columbus in 1492. Early in the last century the leaf grown in the Vueltas Abajo district (an area of about 90 miles in length by 10 in width, situated in the province of Pinar del Rio) won recognition the world over on account of its excellence; and as the profits of this industry, wherever it could be carried on by any means, far exceeded those of sugar-making, no effort was spared to extend the area of production into other parts of the island. At least 10,000 tobacco plantations were in operation before the year 1890, but all experiments demonstrated the inferiority of the soil for this use outside of the Vueltas Abajo. Before the revolution of 1895, the production of leaf-tobacco in the island was about 560,000 bales (averaging 50 kilos each) in a year. Of this amount about 260,000 bales were cultivated within the province, about 70,000 bales in the province of Havana, 130,000 bales in the province of Santa Clara and 100,000 bales in the province of Santiago (Oriente). Only the 260,000 bales from the latter province were of quality of the other components of the annual crop being known as the Partido leaf, the Remedios leaf and the Gibara or Mayari—in the main coarser and cheaper grades. The amount of soil available for the production of first-class tobacco being thus limited, the conditions under which it had to be grown were also not at all favorable to either great or cheap production before the year 1903. First-class tobacco lands of the Vueltas Abajo were held at an exceedingly high price, and large rentals were demanded. Irrigation and constant care in most sections were absolutely necessary; efficient labor was scarce, and untrained laborers were not employed lest their blundering should ruin the product of the best fields. The average cost of production per case, 33.17 pesos, after a painstaking investigation showed to be in that part of the island between $8,000 and $9,000; and the conclusion is that the production of tobacco in Cuba before 1903 was much more expensive than in any other part of the world, and in view of the failure to secure good results outside of a few small districts, it appeared that the tobacco industry was destined, as compared with the cultivation of sugar, to play a secondary role, though still an important one, in the commercial development of Cuba. During seasons of moderate prosperity it furnished employment for about 80,000 persons. The value of its product exported to the United States annually, before the insurrectionists laid waste the Vueltas Abajo and Partido districts, was between $9,000,000 and $13,000,000. The transfer in 1902-03 of large interests to American capitalists led to the introduction of modern labor-saving devices and economical methods. Formerly growers made the mistake of following as closely as possible regaining the lost land, lost much of their fine quality. This was done even after it became a matter of common knowledge that the crops could be improved by scientific selection of seeds. For work in the fields, antiquated wooden plows were still used in 1902; and the tobacco land was cultivated in small farms, an arrangement that seemed necessary to those who employed only the primitive methods of destroying insects and ignored the spraying machine. So long as the old methods prevailed, a native family could not take care of more than a small field; moreover, the labor of the entire family was required, for work went on day and night. Every leaf had to be examined frequently and kept free from tobacco caterpillars. The wife and children aided the adult male laborer, taking turns throughout the 24 hours. In such details as these, improvements were made by the new management, not without opposition. The early attempts to introduce reforms in the established methods of handling the leaf in the manufactories was one cause of the strike of operatives and the riots in Havana (November 1902). Leaf tobacco valued at $2,231 was exported from Cuba in the fiscal year 1914-15; and to the value of $16,156,004 during the following year. Of this latter $12,536,808 worth went to the United States, which, in 1915, took 63.26 per cent of total value of Cuban tobacco exported. Leaf tobacco valued at $15,661,332 and cigars and cigarettes at $3,618,868 went from Cuba to the United States in 1916. Of this the greater part was shipped from Havana, which exported leaf tobacco to the United States valued at $15,627,894, and cigars and cigarettes at the total output of $3,618,868.

Commerce.—The value of Cuban foreign commerce in 1914 was $296,555,000, and in 1915 $409,739,996; one explanation of these large figures being that the area of the land devoted to sugar crops was so increased that the crop grown in 1914 and available for exportation amounted to 2,500,000 tons. The chief products exported by Cuba are sugar and its products (73.4 per cent of total in 1916), leaf and manufactures (15.3 per cent of total); fruits, coffee, cocoa, etc. (2 per cent); minerals (1.9 per cent); other articles (7.4 per cent). The principal articles imported by Cuba are foodstuff (39.3 per cent of the total in 1914); textiles, etc. (13.5 per cent of total); instruments, machinery, etc. (9.9 per cent); drugs, chemicals, perfumes, etc. (6.6 per cent); other articles (30.7 per cent). The island exports practically all it produces and imports nearly everything it consumes. Conditions are not favorable to manufacturing, and excepting cigars, but little is done. There is one small sugar refinery, the product of which is sold in the home market, but the rest of the product is exported raw. Cuba's imports from the United States in 1915 were valued at $104,723,108; from the other American countries, $892,586; from Germany, $799,903; from Spain, $10,807,435; from France, $5,197,110; from Great Britain, $15,287,998; from other European countries, $6,203,081; from all other countries, $4,397,012. In the same year Cuba exported to the United States goods valued at $206,164,414; to the other American countries, $3,356,875; Spain, $5,021,230; France, $1,135,404; Great Britain, $3,083,046; other European countries, $1,864,679; to all other countries $77,042, the value of Cuba's imports was $155,448,233, and
of her exports, $254,291,763, making the total for foreign commerce, as above stated, $409,739,956. Cuba's trade with the United States alone had expanded from $66,000,000 in the closing year of the last century to $108,857,526 in 1915, under exceptional conditions, created by the European War, which also affect banking relations.

Cuba's total foreign trade for the period of June 1, 1915, to July 1, 1916, amounted to $371,721,332. Of this, $225,000,000 was consigned to Cuban ports aggregated $336,801,000, and imports $301,024,000, the balance of trade in Cuba's favor being $135,777,000. In 1916 Cuba imported gold, silver and platinum to the value of $13,030,635; chemical products, $8,248,171; textiles, $26,612,074 (cotton and cotton goods, $2,242,562); paper and paper goods, $3,870,470; wood and wood products, $6,431,060; animals and animal products, $10,150,580; machinery and instruments, $37,574,493; foodstuffs, $64,540,500; metals of all kinds, $14,244,395; stone, earth and ceramics, $7,902,711; miscellaneous, $10,815,286. Goods to the value of $10,815,286 were admitted free of duty. Cuban currency imports were $14,553,631 in 1915, and in the following year $32,316,394. In 1916 the value of the imports of the United States was $185,337,194 out of a total of $224,278,279; and of exports $250,090,418 out of a total of $356,571,350. In the same year the principal exports were valued as follows: Animals and animal products, $3,364,738; sugar and sugar products, $271,081,963; fruits, grains and vegetables, $3,164,828; mineral products, $11,396,797; tobacco products, $25,887,513; miscellaneous products, $4,631,447; currency, $34,781,640. Total commerce, $605,066,234.

Banking and Finance.—Some of the principal banks of Havana are Banco de Cuba, Banco Nacional de Cuba, Bank of Nova Scotia, Fidelity and Deposit Company of Maryland, La Nacional, The Royal Bank of Canada, The Trust Company of Cuba, and the Banco de la Habana with whose The Hawaiian CB Bank of New York had made certain arrangements. Cuba has adopted a system of coinage founded on a parity with the American gold dollar, and the new monetary law declares money of the United States to be legal tender in Cuba. As a matter of fact, currency of the United States has long been employed in commerce as a supplement to the gold money of Spain and France. The new unit created in 1915 is the gold peso, worth exactly one dollar (gold of the United States), and the law provides for pieces of $20, $10, $5, $4, $2 and $1, together with silver pieces of one peso, two-fifths, one-fifth and tenths (10 centavos), and also subsidiary coins down to one centavo or one cent. Cuba has no paper money. The law establishing the new currency provides that only coins of the Republic of Cuba and the national currency of the United States shall be legal tender in future; but this, of course, does not affect the validity of outstanding contracts. As intimated above, the American-Cuban trade, which had increased somewhat less than threefold (or to $182,000,000) before the European War, made its further advance in 1915 under exceptional conditions. These are explained as follows: In the past a large part of the island's banking business was carried on through Cuban banks with London, Paris and Hamburg, from which blank credits were obtained and used in Cuba for the movement of crops and advances made to planters. But the European War changed this state of affairs, and Cuba applied to American banks for the credit that Europe could no longer grant. The banks of the United States facilitated the granting of those credits to Cuba by means of loans secured by warehouse deposits of sugar, the price of which had advanced in the previous years, or by shipments of that product to the United States. The budget of 1914-15 was, by executive decree, continued in force for 1915-16 and for 1916-17. It showed estimated receipts $41,820,580 and expenses $40,202,905. The principal items of this estimated income were customs revenue, $29,100,000; consular fees, $670,000, distributed as follows for expenditure: Home Affairs, $11,044,249; Finance, $2,861,019; Instruction, $5,190,429; Public Works, $4,680,665. The exterior debt at the commencement of 1915 was $15,875,000; as $57,420,000, the interior debt being $10,408,000.

Transportation and Communication.—The aggregate extent of the Cuban railways was 2,359 miles in 1916. The four systems in Cuba are the Eastern Line, from the Gulf of Mexico to Havana; the Cuba Railroad, 589 miles; the Cuban Central Railway, 349 miles; and the Western Railway of Habana, 147 miles. Railways connect the principal towns and seaports of the island; and the principal sugar properties have their own private railways connecting with the main lines. Others were under construction in 1917. Among the more important steamship lines entering Cuban harbors in 1917 were the New York and Cuba Mail S. S. Co. (American) with bi-weekly service between Havana and New York, bi-monthly passenger service to Guantanamo and Santiago, weekly freight service to the same ports, and weekly service to Mexico; the United Fruit Co. (American), with weekly passenger and freight vessels between Havana and New York, New Orleans and Boston; the P. and O Line (American) with daily, except Sunday, passenger and freight connections with Key West; the Munson Line (American), with weekly freight service to Mobile; and a line of vessels running between important ports of the United States and Cuba; the United S. S. Co. (American), with bi-weekly freight service from Galveston to Havana; the American and Cuban S. S. Line, with fortnightly freight service between New York and Cuba; the Herrera Line (Cuban), with fortnightly service, Santiago to Porto Rico; the Royal Mail Steam Packet Co. (English); the General Transatlantic Line (French), with monthly passenger and freight service, France to Havana; and the Transatlantic Company of Spain, with monthly service to Spanish north coast ports via New York, and a monthly service to the south of Spain and Mediterranean ports. There were, in 1915, 658 post and 226 telegraph offices; and telephone service was supplied to 321 cities and towns. A commission to report upon a plan for the nationalization of the railway lines was nominated by presidential decree on 16 Feb. 1916.

MERRILL WILCOX.

CUBA—AMERICAN DIPLOMATIC RELATIONS WITH. Cuba, lying as it did in the Gulf between the arms of Florida and Yucatan, has had an important relation to the United States. Its return to Spain in 1863, one year after its capture by an Anglo-American expedition against Havana, was opposed by the English colonies, and the Revolution it was a strategic point for Spanish fleets which regained the Floridas, and later it was the centre of Spanish rule and the Floridas. In 1803 the debate on Louisiana in the American Congress, its strategic position in controlling the commerce of the Mississippi was considered. In 1807, after Napoleon jumped the Pyrenees and claimed the right to rule Spanish America, the possible destiny of the island attracted the attention of Jefferson, who, while he contemplated the possibility of future annexation, declined an offer of annexation. Both Madison and Monroe, following the policy of Jefferson, declared that the United States would not wish to see the island fall into the hands of any European nation which might use it as a fulcrum against American commerce. Its destiny was a subject of consideration in connection with the events which gave rise to the Monroe Doctrine, and in connection with the later rivalry and jealousy between England and the United States in their relations toward the Caribbean. In 1819 to 1826 the American government was apprehensive of British plans to occupy Cuba, first (1819) to counteract the American annexation of Florida, and later (1825 and 1826) to prevent French occupation. In 1819 to 1822 Mr. C. F. B. Devay, American Minister at Madrid, suggested to Spain that by recognition of Mexico and Colombia and a liberal system of commerce she might be able to obtain a guarantee of Cuba by the United States. Mexico and Colombia, the plan of association was considered in 1823 both in Washington and at London. In 1822, when Cuban representatives visited Washington to request annexation in case of a strike for independence, the American government, by advice of Secretary Adams, acted upon a policy of strict moral duty to Spain. In 1823 the American government took steps to prevent a proposed Colombian-Mexican expedition to set Cuba free, and at the same time was apprehensive of the purpose of a French fleet in Cuban waters. Secretary Clay declared that the United States could not consent to the occupation of the island by any European power except Spain. Consideration of its destinies was a great object of the Panama mission. American policy for two decades after 1825 practically guaranteed to Spain the possession of Cuba on condition that she would not cede it to France or England. From 1836 to 1840 the American government feared that Spain in order to replenish her depleted treasury would sell the island to England or France. Even until 1840 there were fears that England, through her influence in Cuba, and by her treaties to suppress the slave trade, or on account of British debts due to British citizens, would obtain a hold on the island which would ripen into possession. After 1840 American influence increased by the Union of England in Cuba because of the similar interest of Southern and Cuban slave holders. In 1840 and in 1843 the American government officially assured Spain that, in case of any attempt to wrest the territory from her she would rely on the military and naval forces of the United States to aid in preserving or in recovering it.

American extension to California, resulting in plans and in negotiations for isthmian transit routes across Tehuan-tepec and Central America attracted American attention to Cuba as a controlling position for the protection of these routes and as a station for steamer lines connecting therewith. From 1848 to the opening of the Civil War, Cuba was continually a subject of international dispute or negotiation. The American government, under Southern and commercial influence, persisted in unsuccessful diplomatic efforts to acquire the island, and, although not responsible for the filibustering expeditions of 1849-51, was almost drawn into a policy of forcible annexation by the event resulting from the seizure of the American vessel, Black Warrior, by the Havana officials for violation of port regulations, and by the famous Ostend Manifesto of 1854, issued as a recommendation by a conference of the American Ministers to Spain, France and England to consider the conditions of Cuba. In 1852 it declined to enter into a joint, tripartite, self-denying agreement, proposed by England and France on suggestion of Spain, against any attempt at exclusive control of the island by either of the contracting parties. Although Marcy repudiated the Ostend Manifesto, the question of annexation by purchase was a prominent administration object until it was lost by Southern secession.

At the beginning of the American Civil War the government at Washington warned Spain that Cuba must not be made a base for enterprises endangering the American Union. During the war, although it felt the need of harbors in the West Indies, it assured Spain that under new conditions the plan of annexation was considered in 1823 both in Washington and at London. In 1822, when Cuban representatives visited Washington to request annexation in case of a strike for independence, the abolition of slavery termi-
nated Southern agitation for the acquisition of the island.

Later, inconvenienced by the Cuban revolt of 1868-78, which expected to obtain American aid through the Cuban Junta in New York and sought recognition at Washington, the Grant administration unsuccessfully offered mediation on a basis of independence, later contemplated a policy of recognition of the insurgents which Secretary Fish prevented and finally (in 1875) took steps toward intervention by inviting the views of various European powers. In 1873, the Spanish-American War, a culmination of a series of irritating affairs, almost precipitated war. After the pacification of Cuba in 1878, the American government urged Spain to establish a more liberal government by independence or autonomy, to adopt a more liberal commercial policy and to secure better protection of American property and persons in Cuba. In 1884 and 1886 it obtained agreements to end discrimination and retaliatory duties, but officials in Cuba found excuses to violate them.

In 1891, negotiated with Spain a reciprocity schedule for Cuba, which considerably increased American commerce, although the execution of the agreement was obstructed by the Spanish authorities in Cuba. In the Cuban insurrection of 1895-98 the American government, embarrassed both by Cuban activities in the United States and the Spanish treatment of American citizens in Cuba, gave warning that American forbearance had limits, later offered mediation, and finally (after the destruction of the Maine in Havana harbor) actively intervened (1898) to terminate Spanish rule with its intolerable conditions in Cuba. After the withdrawal of Spanish forces and officials from Cuba the American government assumed control through a military governor, who inaugurated a series of useful improvements and aided in the establishment (1902) of a new independent Cuban government under a constitution defining future political relations with the United States, on the basis of the Platt Amendment, which provided for American intervention for certain control of financial obligations and foreign relations and for the preservation of Cuban independence and order. The Washington government also negotiated a reciprocity commercial treaty which was ratified in 1903. Later, during a post-election insurrection of 1906, it intervened, assumed control, established a provisional government for the restoration of order, and (in 1909) inaugurated the new independent Cuban government. During the insurrection of 1912, it sent a fleet to Key West to be ready for emergencies, but found that the Cuban government was able to control the situation.

James M. Callahan, Professor of History and Political Science, West Virginia University.

CUBA, N. Y., town in Allegany County, on the Erie and Pennsylvania railroads (Rochester branch). The principal industries are the manufacture of cheese, butcher knives, stable equipments, flour and pulleys. Borden's condensing plant is also located here. There are two banks, whose combined resources amount to $1,600,000; a modern high school, and six rural schools. Cuba Lake, about two miles north at an elevation of nearly 2,000 feet, attracts many excellent sport fishermen.

CUBE, in geometry, a solid contained by six equal square sides. The content of a cube is found by multiplying the superficial area of one of the sides by the height; or, in other words, by multiplying the number that expresses the length of one of the edges by itself, and the product thus found by that number again, and this is called the cube of the number. A cube is generated by the motion of a square plane along a line equal to one of its sides, and at right angles to it; whence it follows that the planes of all sections parallel to the base are squares equal to the base, and consequently to one another.

CUBES, or CUBIC NUMBER, in arithmetic, the result of taking any number thrice as a factor; thus 64 is a cube number, and arises by multiplying 4 by 4 and the result again by 4.

CUBEB, the unripe fruit of Piper cubeba, a climbing perennial with smooth, grey-green leaves, and lance-shaped, bright green, shining leaves. It is a native of the West Indies, being extensively cultivated in Java and Sumatra. It was introduced into medicine by the Hindus and Moslems, who employed it widely as a condiment also. Cubebes contain about 14 per cent of volatile oil, a small amount of an indifferent substance termed cubebin, and cubebic acid. It also contains a small amount of resin. A mixture of oils, resins and acids comprises the oleoresin of cubebes that is used in medicine. It is an active spice somewhat related to pepper, its botanical ally, but the taste is more pleasant and less pungent. It is used as a local stimulant in indigestion and as a flavoring vehicle in mixtures and gargles. It is valuable, particularly in diseases of the mucous membrane, especially of the bronchi, of the bladder and of the urethra. Cubebes are very frequently smoked in cigarettes, in which form they have a pleasant stimulating effect on the mucous membrane of the bronchi and bladder.

CUBIC EQUATIONS, equations in which the highest exponent of a given quantity in any term is 3. Every such equation of one unknown quantity can be reduced to the form \( x^3 + px + q = 0 \), where \( x \) is the variable and \( p \) and \( q \) are constants. Every equation of this form has three roots, all of which may be real or one or two may be real and two imaginary. The solution of cubic equations was accomplished first by Tartaglia and Cardan. An equation containing any number of variables in which the greatest sum of the exponents of the variables in each term is 3 is called a cubic equation. Thus \( x^3 + 5y^2 + 6z = 0 \) and \( xyz + x^2 = 0 \) are cubic equations in \( x, y, z \), and \( x, y, z \), respectively.

CUBISM, the name given to a movement in painting founded by the Spanish post-impressionist Pablo Picasso (b. Malaga 1881). It has been said that cubists see and depict natural objects as if composed of innumerable cubes. They have often done so, it is true, but that is far from being an essential in practice. The defensible position held by the more thoughtful
members of this group is that their movement tends toward the integral, the deep, the complete realization of painting; and the cube of course, by virtue of its third dimension, symbolizes such depth or entirety as distinguished from flat surfaces with their two dimensions. Reasoning cubists say that the beauty of a work resides essentially in the work itself, not in that which is only the pretext for the work. Naturally ardent advocates of this revolutionary movement have occasionally become over-energetic—whence they declare that *sans le present, le cubisme est la pierette meme... (cubism is at present painting itself), and that they see in it the only conception at present possible of the pictorial art. But this movement, like others, undergoes transformation, the still newer forms—futurism (q.v.), etc., claiming supremacy in the interpretation of *young* painting and *young* sculpture. See also FRANCE—FRENCH ART.

CUBITT, Sir William, English civil engineer: b. Dilham, Norfolk, 1785; d. 13 Oct. 1861. He was manufacturer, cabinet-maker, and millwright until 1812, when he became chief engineer to Messrs. Ransome's works at Ipswich. In 1823 he joined the Institution of Civil Engineers, and, removing to London, was afterward engaged in most of the public undertakings of his day. The immense works of the Sewer and Burghport, the Bute docks at Cardiff and the water-works for Berlin are among his works. He also invented the treadmill, and constructed the Southeastern Railway; and for his services in connection with the erection of the Great Exhibition buildings he was knighted 1851. From 1850-51 he was president of the Institution of Civil Engineers.

CUCHIA, a teleost fish of the rivers and estuaries of India and Burma, growing to two feet in length. It is the sole representative of the family Cuculidae, and is remarkable for having on each side of the neck a respiratory air-sac, connected with organs resembling the lungs of serpents. When in the water this amphibious fish constantly rises to the surface to breathe air, and is frequently found lying in the water bank as for enjoyment. It is one snake-headed, or walking-fish tribe (Ophiicephalida).

CUCHULLIN. See TAIN BO CUAILGREN.

CUCKOO, formerly spelled cuckow, the English name of a common bird, so called from the note of the male, and now generally applied to all related birds of the family Cuculidae. The cuckoo of Europe, the Cuculus canorus of ornithologists, perhaps occupies more space in general literature than any other bird, on account of the interest which attaches to its remarkable habit of nest parasitism, and the equally remarkable but unfounded superstitions which have collected about what is to many persons its mysterious life. It is a common summer bird throughout Europe, retiring in winter to equatorial Africa, its southward migration beginning immediately after the close of the breeding season. During April, May and June the loud "cuck-oo" of the males is one of the most familiar of country sounds; but it wanes with the breeding season. The eggs are invariably laid in the nests of other birds, the hedge sparrow, the jay (Garrulus) and other similar small species being the victims. The female cuckoo is said to deposit her egg on the ground, from which it is then conveyed in the beak to the nest selected, the rightful contents of which are often cast out. A curious circumstance, the reason for which is not fully understood, is that the cuckoo egg is often of the same color as the eggs of its hosts with which it is in closest contact. The young cuckoo secures the exclusive attention of its foster parents by working itself beneath any eggs or other young birds in the nest, raising them on its back, and tumbling them over the edge of the nest.

The true cuckoos are represented in North America by three or four species of the genus Coccyx, of which two, the yellow-billed cuckoo (C. americana) and the black-billed cuckoo (C. erythroptilum) are the best known and most widely distributed, the former ranging with its Western variety, throughout the United States, the West Indies, and much of the British provinces, the latter being chiefly Eastern and migrating in winter far into South America. Both species have the bill strongly curved, stout and somewhat flat-topped at the base, the feet large, the tarsus and metatarsi, the wings long and the tail long and wedge-shaped. Both are of a plain, uniform, bronzy olive-gray above and white, or nearly so, below. They are readily discriminated by the entirely blue-black bill and the absence of brownings on the tail feathers of one species, and the partly yellow bill and broad white margins of the tail of the other. In habits the two species differ but little, and except in the manner of deposition of their eggs, not much from the European cuckoo. Both in build and nests, which are mere loose platforms of twigs placed in thickets and trees, and lay a considerable but variable number of pale green eggs at long and irregular intervals, with the result that the same nest frequently contains freshly deposited eggs along with young birds. Besides the faint tint, which the manner of nesting and oviposition suggest, both species occasionally appear to fall into the parasitic habit and place an egg in another bird's nest; it seems that not infrequently the yellow-billed species, which is the chief offender, selects her black-billed relative as the recipient of these parental courtesies. In the Northern States the cuckoos are late arrivals from the South, not appearing until the fully leaved trees and bushes afford them the concealment which their retiring tastes demand. Their presence is soon known by the oft-repeated loud cow-cow-cow, etc., the frequent utterance of which, upon the approach of storms, has gained for them the name of rain-crow. As destroyers of hairy caterpillars, which most birds pass untouched, the cuckoos deserve the esteem of horticulturists. Though subsisting largely on caterpillars they also eat other insects and occasionally fruits. The ground cuckoo or chapparral cock and the ani or Savannah blackbird are also American. The number of exotic species of cuckoo is very great, and many of them are interesting and handsome birds which are frequently exhibited in zoological gardens. See CUCULIDE.
wasps. The females do not sting severely. Although their eggs are laid in the cells of their hosts, and the larvae feed upon the pollen stored for the young of their hosts, they are quite different in shape, the head being smaller, and the body being tuberculate or cylindrical. The young as well as the adults of both host and commensal may live together harmoniously, the adults of both kinds reaching maturity at the same time.

CUCKOO FLIES, a species of the hymenopterous family Chrysidae, which, cuckoo-like, live at the expense of various solitary bees and wasps, but, unlike the usual custom of the cuckoo bees (q.v.), actually devour the young of their hosts. They may be seen in hot days briskly flying about and alighting on posts and trees, darting their ovipositor into holes in search of the cells or nests of other Hymenoptera, in which to lay their eggs. They feed on the pollen stored up by the host when hatching as maggots. More often they are known to fasten on the back of the larva of their host, suck its blood and thus destroy it; they also appear to destroy the eggs of their host. Although the chrysalis larvae from 4 to 10 eggs, all but one shrivel up. Chapman has noticed the young larva seize with its mouth-parts a fold of the skin of the helpless larva of the wasp (Odynurus) and suck it, without inflicting any visible wound. It spins its cocoon inside that of its host, remaining there until the following spring. Cleptes is supposed to prey on sawflies, probably laying its eggs in the cocoons of the latter.

CUCKOO FLOWER, or LADY'S SMOCK (Cardamine pratensis), a common and pretty meadow-plant, order Cruciferae, with pale lilac or white flowers. C. pratensis is found in swamps and wet meadows from Labrador to northern New Jersey, in Minnesota and west to the Pacific coast of British America. It is common in England, and throughout northern Europe and Asia. It blossoms in April or May, presenting a very pleasing appearance. It possesses antiscorbutic properties. The name is also given to the ragged-robin (Lychinis flos-cuculi) of the pink family.

CUCKOO SPIT, a froth found on plants. It is a secretion of the larvae of small homopterous insects, of the family Cercopidae. It serves the purpose of concealing the larva from its enemies.

CUCUJO, coo-cooh'he, or CUCUYO, a luminous beetle of the click-beetle family Elateridae, which, in the West Indies, Mexico and northern South America, is often used as an ornament in the hair or upon the dress of women. The Indians capture them by waving about in the air a stick to which they have attached a rag, to the light of which the beetles are attracted, when they may be caught in nets. The Indians keep them in cages of wire-netting, feed them each evening upon pieces of crushed sugarcane, and bathe them twice daily in tepid water. Inches long, are offered for sale in large numbers in the shops and street-markets of Vera Cruz and other tropical cities. The principal species (Pyrophorus noctilucus) is from one and three-quarters to two inches in length, and has no beauty by daylight, being rusty brown or blackish; but when belted and attached to a pin in the hair by a delicate chain

it glows at night like an immense gem. See Fireflies.

CUCULIDAE, kū-kū'lē-dē, the cuckoo family, the typical one of the order Cucygodomorpha. The toes are paired, the first and fourth being directed backward, and the second and third forward; the metatarsi are scuteillate and the palate is desmognathous; the wings are variable in size and have 10 primary quill feathers; the tail is usually long and wedge-shaped, with 10, or rarely 8, quill feathers. The family is a large one and comprises upward of 40 genera and nearly 200 species, which are especially numerous in Africa and India. Much uncertainty prevails among ornithologists in regard to the number and arrangement of the subfamilies. Shelly, in the British Museum Catalogue, recognizes six: Cuculinae, containing the typical tree cuckoos; Centropodinae, semi-terrestrial birds of Africa, India, etc., commonly known as coucals; Phanocryptinae, also mostly of semi-terrestrial habits and including the curious genus Cucala, peculiar to Madagascar, some similar genera of the Indian and Indo-Malayan regions, and the so-called rain birds (q.v.) of the West Indies; Neomorphinae or Saurotherinae, the true ground cuckoos, comprising the American chapparral cocks, and related East Indian forms; Diplopterae, comprising a few little-known birds of South America, and finally the Crotophaginae, a small group of remarkable typical American cuckoos, represented by the Savannah blackbird. Sometimes the American tree cuckoos are separated as a distinct sub-family, the Coccypinae. See CUCKOO; COCCYDOMORPHA.

CUCULIFORMES, an order of birds, characterized especially by zygodactylous feet. They comprise two suborders: (1) Cuculi, the cuckoos and plaintain eaters (Musophagidae); and (2) Friti, the parrots, macaws, lories, etc. See Ornithology.

CUCUMBER (Cucumis sativus and its congers), an annual trailing or climbing vine of the natural order Cucurbitaceae, cultivated for its unripe fruits which are used as a salad and for making pickles. The plant is a native of southern Asia where it has been cultivated since the earliest history of man. The vine is more or less prickly, bears three-lobed or angled leaves which closely resemble those of the muskmelon, and generally spiny fruits which may become smooth as they mature. The fruits are solid and contain numerous boat-shaped flattened seeds embedded in a somewhat watery pulp, which in the immature fruits is the part esteemed. Small-fruited varieties and little fruits of large varieties are popularly known as gherkins and are generally preferred for pickles. They are covered with strong brine until needed for use, when, after soaking in pure water to remove the salt, they are put in vinegar, which they soon absorb. There is a great range in size of fruits in the various varieties, some being only about two inches long, and others more than 12 inches by 3 in diameter. Perhaps the most popular group of varieties is the white spine.

Cucumbers thrive best in warm soils well exposed to the sun. They do not produce well upon heavy clays or very light sands. The land must be well-drained and fairly rich. For earliest crop the seeds are
often sown in hoed beds on inverted sods, and the plants set in the field as soon as danger of frost has passed, a sowing of seed being made about a fortnight before the last expected killing frosts. Usually only two or three plants are allowed to remain in the hills which are made about four by six feet apart. Since the cucumber-beetle is very actively destructive while the plants are small, six or eight plants should be allowed to remain in the hills until the vines are able to resist attack. Cultivation should be very thorough until the plants begin to run, when it should be confined to the space not occupied by vines. Often, in making the hills, a forkful of well-rotten manure is mixed with the soil to give the plants a little start.

Of the numerous diseases that attack the plants the one usually seen earliest in the season is damping-off (\textit{Pythium debaryanum}), which appears while the seedlings are small. Infested plants quickly become yellow, and wilt and die. It may be prevented by early spraying with a standard fungicide (q.v.) which should be applied to the whole hill and to the under sides of the leaves. Wilt disease caused by \textit{Bacillus tracheiphilus} is an internal trouble that cannot be combated. The bacteria are spread by insects which inoculate healthy vines by biting or puncturing them. The bacteria multiply in the water-vessels of the vines and impede or stop the flow of water; the leaves wilt and finally shrivel, and the plant dies. It is believed that the prevention of the attacks of insects by covering the plants with wire netting until they begin to run will postpone the time of the attack of the bacillus, so that a partial crop may be obtained. Usually the vines die just before the crop is ready to gather, the whole field being attacked. In greenhouses the most common disease is powdery mildew (\textit{Erysiphe cichoracearum}). It appears as white patches on the leaves which become yellow, brown, then die. Often the whole plant is involved. Evaporated (not burned) sulphur and spraying as above will control this pest.

The most important insect enemies of the cucumber are the cucumber-beetles (\textit{Diabrotica}) and the codling moth (\textit{Anarsa trifida}). The beetles are striped or spotted yellow and black, or green and black, and are about a third of an inch long, very active in taking flight, and feed mostly upon the under sides of the leaves and the soft stems of seedlings. The larve burrow in the roots, and if numerous, they often kill the plants. During the heat of the day the adults generally hide below the surface of the hill. A liberal use of tobacco-dust upon the hills as soon as the plants peep through the soil is the popular remedy. But this is not entirely satisfactory, the plants are frequently covered with netting until they are about to begin running.

The squash-bug is a dull-gray insect about three-quarters of an inch long. It sucks the juices of the leaves. There is no known satisfactory remedy for it, but the destruction of the vines as soon as they have fruit or blooming them under is helpful toward its extermination. Hand-picking is sometimes resorted to, as is also the destruction of the eggs, which are conspicuously laid on the under sides of the leaves. The cucumber is frequently grown in greenhouses, especially in spring after the main winter crops are out. The plants are started in pots, transplanted to the benches when well established, trained on trellises close to the roof, kept at a rather high temperature, and allowed to suffer no crop. This class is most popular for this purpose in America, but the long English forcing varieties are by many considered superior in quality.

\textbf{CUCUMBER BEETLE. See MELONS.}

\textbf{CUCUMBER-TREE}, a popular name for two trees which bear cucumber-like fruits. One of these is \textit{Annona glabra}, known also as blumbling and blomberg, which belongs to the family \textit{Osinaeaceae}. It attains a height of 8 to 15 feet, has pinnate leaves, red flowers in long racemes, and green fruits with acid pulp. It is a native of India and China, is sometimes grown under glass for ornament, and is widely cultivated for food in the warm parts of South America. The other tree is \textit{Magnolia acuminata} of the family \textit{Magnoliaceae}. It is found from New York to Illinois and southward to Arkansas and the Gulf States. It often attains a height of 90 feet, bears oval or oblong leaves, greenish-yellow flowers two or three inches long in late spring, and cylindrical pink, bitter fruits three or four inches long. The timber is useful for boat-building. \textit{M. macrophylla} is often called large-leaved cucumber-tree. It is smaller than the preceding, more spreading, has fragrant flowers and broader and pinker fruits.

\textbf{CUCURCITACEAE}, the gourd or melon family of plants. They are large herbaceous plants, annual or perennial, with alternate leaves usually palmately veined and scabrous and unisexual flowers. The corolla of the flowers is regular and with five lobes, often plaited longitudinally; and the petals, usually either yellow, white or green, are deeply veined. The fruit is fleshy and more or less succulent. The general habit is climbing or trailing, by means of tendrils. The family contains 90 genera and some 600 species, and abounds in useful or remarkable plants, including the melon, cucumber, colocynth, etc. They are natives of both hemispheres, chiefly within the tropics. The annuals, however, are mostly cultivated to the summer flowers, and hence are common in northern gardens. Eight genera, comprising about 65 species, are found in America. The principal American genera are \textit{Cucurbita}, \textit{Micromelpa}, \textit{Cylanthura} and \textit{Sicyos}.

\textbf{CÚCUTA}, \textit{koo'koó-tá}, or \textbf{SAN JOSÉ DE CÚCUTA}, Colombia, a city of the department of Santander, near the Venezuelan frontier. It is a place of recent origin which had begun to grow very rapidly when it was destroyed by an earthquake 18 May 1875. Rebuilt soon afterward, it is to-day the handsomest, and commercially the most active, town in the department. It is an important coffee centre. A railway connects it with the Zulia River, which is navigable by small steamers. Pop. about 20,000.

\textbf{CUDAHY}, kud'a-hí, Wis., city in Milwaukee County, five miles south of Milwaukee, on the Chicago and Northwestern Railroad and on Lake Michigan. The manufactures of the city include rubber goods, machinery, vinegar and gloves, and there are foundries and a meat-packing establishment. Pop. 3,691.

\textbf{CUDDEAR}. See ARCHIL.

\textbf{CUDDAPAH}, kúd'da-pá, India, a district and town in the presidency of Madras. The
district has an area of 8,722 square miles, and is transversed north to south by the Eastern Ghauts, and watered by the Penner and its affluents. The heat is intense in April and May. Soda is found in the hills to the southwest, and is used by the natives in place of soap. Salt and salt peter are likewise abundant, and are easily procurable. On the plain round Cuddapah hematite and fusiform iron ores are found. On the banks of the Pennar, about seven miles northeast of the town of Cuddapah, are diamond mines, which have been worked for several hundred years, and in which gems of considerable value have been found. The mines have not recently proved profitable. Nearly a fifth of the district is under grain cultivation. Cotton is likewise grown. The town lies on a small river of same name, an affluent of the Pennar, 140 miles northwest of Madras. It exports indigo and cotton, and manufactures a kind of coarse cloth. Cuddapah was formerly the capital of an independent state. Pop. 17,807. Pop. of the district 1,554,291.

CUDWEE, one of the popular names of many weeds of the genera Gnaphalium and Anaphalis, of the Composite. The leaves and stems are covered with a white cottony down, and the flowers are composed of dry scales, and may be kept for a long time. They are also known as everlasting flowers. The genus *Gnaphalium* has about 120 widely distributed species, and the cudweeds belong properly to this genus alone. *G. polycephalum*, common in old fields and open woods, blossoming in October and November, has some repute in household medicine.

CUDWORTH, Ralph, English clergyman and philosopher; b. Aller, Somerset, 1617; d. Cambridge, 26 June 1688. He was educated at Emmanuel College, Cambridge, and became an eminent tutor. He was subsequently appointed rector of North Cadbury, Somerset, and in 1642 published a "Discourse Concerning the True Nature of God's Sovereignty," and "The Union of Christ and the Church Shadowed, or in a Shadow." The first of these productions, which maintained that the Lord's Supper is a feast upon a sacrifice, produced considerable controversy in the author's death. In 1644 he was chosen master of Clare Hall, and in the following year was made regius professor of Hebrew. In 1654 he was chosen master of Christ's College, Cambridge, where he spent the remainder of his days. In 1678 he published his grand work, entitled "The True Intellectual System of the Universe, the First Part, Wherein All the Reason and Philosophy of Atheism is Confuted, and Its Impossibility Demonstrated." It is a work of great power and production, although the attachment of the author to the Platonism of the Alexandrian school has led him to advance some opinions which border on incomprehensibility and mysticism. It champions the innate character of moral ideas which are held to cognize the objects of morality with the same accuracy which characterizes our geometrical knowledge. Selections appear in Selby-Bigge's "British Moralists" (1897). Consult Martineau, "Types of Ethical Theory" (Vol. II, Oxford 1898); Lowrey, "The Philosophy of Ralph Cudworth" (New York 1895); Birch, "Life," in the edition of Cudworth's works (1743; reprinted 1820), and the preface to Mosheim's Latin translation of Cudworth's works (1733); Seth, "English Philosophers and Schools of Philosophy" (1912).

CUENCA, koo-en'ka, Ecuador, capital of the province of Azuay, and in size third city of the republic. Quite being first and Guayaquil second. It is situated in the canton of Cuenca, 8,640 feet above the level of the sea; the mean annual temperature is one degree higher than that of the national capital, though it lies 189 miles farther toward the south. As a centre of literary and artistic life, and the birthplace of celebrated authors, it is called "the Athens of Ecuador." Civil, military and ecclesiastical authorities are the governor, town council, bishop, commanding-general of the district, superior court of justice, judge of commerce and chief of police. Principal institutions are the town hall, cathedral, seven churches, and several convents, orphan asylum, hospital, prison, library, parks, the university (with faculties of law, medicine, philosophy and science), lycéeum for younger students, gymnasium, and a school of fine arts, giving instruction in drawing, painting, architecture, music and the history of the arts. It is the centre of a fertile grain, cotton, sugar and cochineal producing region, and rich metal deposits are worked in the neighborhood. The most important manufactures are pottery, hats and woolens, and a considerable trade in preserved fruits, cheese and grain is carried on. Cuenca was founded in 1557, on the site of the old native village Tumibamba, and in 1760 was created an episcopal see. There are numerous interesting Aztec remains in the vicinity. The mountain of Tarqui on the south was chosen in 1742 for determining the meridian line of La Condamine, Bouguer and Godin. At the base of the mountain occurred the battle of Tarqui in 1828 between the Colombian and Peruvian forces. Peruvian bark is an important product. Pop. 30,000.

CUENCA (anciently CONCA), Spain, (1) city in New Castile, capital of a province of same name, 125 miles by rail east by south of Madrid; pop. 1,721. It is a port and contains a fine Gothic cathedral. It was built by the Moors and stands on a high and craggy hill, about 3,400 feet above sea-level, between the rivers Jucar and Huescar, which makes it naturally strong. Here the painter, Salmeron, and the famous esuit, Molina, were born. (2) The north and east part of the province is mountainous, and fit only for sheep pasture; the other parts are fertile, producing corn, hemp, fruit, etc. Area, 6,636 square miles. Pop. over 260,000.

CUERNANAVACA, kwärn-ä-vä'kä, Mexico, the capital city of the state of Morelos and the chief town of the district of Cuernavaca. It is situated on the river Tepeyotl, about 46 miles south of the City of Mexico. The Palace of Cortés, where the state legislature meets, is one of its noteworthy buildings; also the meteorological observatory and the public library. It contains a church built by Cortés, an agricultural academy, a theatre with a capacity for 2,000 spectators, a hospital and a literary institute. The city is the centre of a fertile district and has extensive irrigated land. Near by are the ruins of an Aztec temple, 400
CUFFEE, Paul, American negro sailor and philanthropist: b. Westport, Mass., 1759; d. Sept. 1818. His father was an African-born Massachusetts slave, who purchased his freedom, bought a farm of 100 acres, and brought up in respectability a family of 10 children; his mother, a Nantucket Indian. At 16 he was a sailor on a whaling vessel, and in 1806 an experienced navigator, owning considerable landed property, houses, stores, a ship and several smaller craft. He built a schoolhouse, hired a teacher and opened at his own expense the only public school in the neighborhood of his native town. In 1811 he sailed for Sierra Leone in his ship, the Traveller, with a colored crew, won favor there with both whites and blacks, and instituted the Friendly Society of Sierra Leone. In London he was warmly received by Wilberforce and Clarkson, and commissioned by the African Institution to carry goods to Sierra Leone. He died while carrying out his plans for colonizing that country.

CUPIC WRITING, the written characters of which the Arabsians now make use, and which we meet in printed works, namely, the Neski characters are an invention of the 4th century of the Hegira. Before this time the Cufic characters, so called from the town of Cufa, or Kufa, where they are said to have been invented, were in use. These old characters have so much resemblance to the ancient Syriac writing, the Estrangol, that it hardly admits of a doubt that the Arabians borrowed them from the inhabitants of Syria. Historical traditions confirm this supposition. The Cufic characters, and perhaps others at an earlier date which essentially resembled them, were probably first introduced among the Arabians a short time before Mohammed. Although we are at present ignorant of the characters which were previously in use among them, and although the imperfect accounts of the Mussulman writers throw very little light upon the subject, yet it is scarcely credible that the Arabians remained destitute of a written character until the 6th century of the Christian era. We find the transition of the Cufic to the Neski on the ruins of Chilmarn. The influence which the school of Cufa exerted on Islamism caused the use of the character which proceeded from it; and when the others had fallen into oblivion, Cufic writing was the name commonly applied to all kinds of Arabic writing previous to the change made by Ebh Mokla. A knowledge of it is important on account of the many monuments in which it is preserved; especially the coins inscribed with Cufic characters and made in the first centuries of the Hegira.

In connection with these coins are to be considered the small pieces of glass which were introduced, particularly in Sicily, under the dominion of the Moors, and which were made of money, or perhaps under the sanction of public authority became used as standards of the weight of coins.

CUIRASS, kwé-ras'. Defensive armor protecting the body from neck to hips. The word undoubtedly is derived from the French word cuir (leather), probably from the fact that, up to the time of its coining, the piece of armor was made of cuir bouilli (leather hardened by boiling or steeping in oil); a method practised in several periods. The cuirass is made
up of two parts (front and rear) the fore part is known as the breastplate, plastron, pectoral, or (rarely) mammelons; the rear portion a termed dossière. Perhaps the earliest body armor was the jaeseron, a jacket of linen, or other strong material, to which were attached scales of bronze or leather. They appear to have originated among the Eastern nations. In the Herodoteus of Greece, the cuirass was made of bronze and was worn over a linen tunic. It, apparently, consisted of a breastplate with arm and neck protection composed of lames (strips). From ancient descriptions it was often highly ornamented with repoussé (embossing by hammer) work and sometimes inlaid with gold. About 400 B.C. the Greeks adopted a lighter tunic defense (used by the Egyptians and Asiatics) made of layers or folds of linen glued together. The early cuirasses were modeled to the figure and had strips of leather (lambrequins) hanging from the lower edge to afford protection to the lower part of the body. These strips were often studded with metal plaques. Etruscan cuirasses were (like the Grecian) made up of a breastplate (plastron) and back piece (dossière) but the overlapping shoulder-guards, as Etruscan pottery discloses, tend to meet in front, thus differing from the Greek method. They also appear to have worn cuirasses made up of metal discs or plates (scales) or strips sewn on to a padded ground.

The heavily armed troops of the Romans wore a laminated cuirass made up of about seven steel lames encircling the trunk. Each lame was in two parts joined in the centre of the front and back with clasps and hinges, respectively. Four or more curved lames passed over the shoulders, being joined to the corselet at its upper lame front and rear, and moving freely on their pivots at each end. Fixed to the lower edge of the bottom body lame but one, in front, hung three or four lames vertically to protect the middle of the lower part of the body. The body lames were attached to a tightly fitting leather jacket or waistcoat. This armored garment opened in front. Two layers of leather with notches in the edges attached to the lowest lame and the lambrequins hung below. In the Republican period the Roman cuirass or lorica (termed also thorax) followed the Greek style with a plastron and dossière held together by straps at the sides and having broad straps crossing over the shoulders. These latter fastened to a ring on the breastplate, with permanent attachment to the dossière below the shoulder-blades. The lorica was, usually, of bronze and modeled to the configuration of the body's surface. Straps passed over the shoulders above, while below were two bands of leather, the nether one longer and extending below the upper. And the lambrequins hanged over these, often studded with metal plates, and with a plaited or curled edging. A style worn under the lorica. The officer of the Imperial period wore the same style of lorica modeled to the figure but it was shorter, few reaching below the waist. The scaled cuirass (squamata) was a favorite among the leaders, as was also the laminated cuirass. The medieval period styles and forms of the cuirass will be found under Plate Armor.

In the *half armor* time (early 17th century), when firearms made armor ineffective, only the cavalry retained the cuirass, wearing it over a buff coat. By the reign of Charles I of England these armored cuirasses were called cuirassiers. Lancers wore a breastplate, close helmets, gorget, pauldrons (shoulder protection), etc. Arquebusiers wore a back and breastplate as did also the pikemen and musketeers.

In modern times, despite the weight, cuirasses were carried in the German army in 1888, but for parade and show. In France the cuirassiers have existed to this day. And the royal bodyguard ("Horse Guards") of England still wears a bright, plain steel cuirass and helmet on parade.

**Clement W. Combe.**

**Cuirassier,** kwē-rāsˈsēr, a cavalryman wearing the cuirass and helmet. The cuirassier represents the horse soldiers of the 16th and 17th centuries, who wore similar armor. The French and German armies had regiments of cuirassiers, and the Russian army four. Napoleon III's bodyguard, called Les Cent-Gardes, wore cuirasses of aluminum, as do the British Life Guards and Royal Horse Guards on parade. See Cavalry.

**Cuitlahuatzin,** kwēˈtla-hwaˈtζin. Aztec ruler: b. 1470; d. October 1520. He was the younger brother of Montezuma, and after the latter's death succeeded to the throne, but lived only a few weeks. He was a prisoner in the hands of the Spaniards with his brother, but succeeded in escaping or was released. He organized an active resistance to the invaders and in one of the attacks upon them Montezuma was killed. The warfare he instituted resulted in the defeat of the Spaniards for the time being, and their retreat to the coast. He was succeeded by his cousin Guatemotzin, the last of the Aztec (q.v.) rulers.

**Culberson, Charles A.,** United States senator for Texas: b. Dadeville, Tallapoosa County, Ala. 10 June 1855. In 1856 his parents removed to Texas. Charles A. Culberson was graduated at the Virginia Military Institute, Lexington, in 1874. He prepared for a legal career under his father's tuition, completed his law studies in 1876–77 at the University of Virginia. In 1890, and again in 1892, he was elected attorney-general of Texas, and in 1894 and in 1896, governor of the State. He was chosen United States senator in 1899, and again in 1905, and for 1911–17.

**Culdees,** koolˈdēz, members of an order of monks or an imitation of such an order, in the British Isles and particularly in Gaelic Scotland, of which mention begins to occur in medieval annals and other writings in the 11th century. The name Culdee, in the Scottish Gael, Cuideteach, believed to be equivalent to gille-Dé in that dialect and to ceiltie-Dé in the Gaelic of Ireland, is by some philologists derived from the Latin Cultor Dei, all three words, Scottish, Irish, meaning a servant, a worshipper, of God. The Culdees seem to have been immediate successors or continuators of the communities of monks established among
the Picts and Scots of North Britain and the Western Isles by Irish missionaries in the 6th century. They were attached to cathedral or collegiate churches, living in monastic fashion, but without monastic rule. They gradually disappeared. Some like Dunkel and Abernethy were superseded by regular canons; Brechin and Dunblane were extinguished at the introduction of cathedral chapters, while Mounifieth passed into the hands of laymen. Before the Reformation, Saint Andrew too disappeared. At York was their only English establishment. In Ireland, their seats were at Clones, Devenish and Scattery Islands. Consult Reeves, 'The Celts' in Transactions of the Royal Irish Academy, Dublin 1864; Lanigan, 'Ecclesiastical History of Ireland' (Dublin 1825) and in Scotland in the Middle Ages (Edinburgh 1860); Skene, W. W., 'Celtic Scotland' (3 vols., Edinburgh 1876-80); Beveridge, W., 'Makers of the Scottish Church' (New York 1908).

CULEBRA, koo'-le-brə, ISLAND. See Virginia Islands.

CULEX, a short pastoral poem of 414 hexameter lines in Latin, dealing with a goatherd who is awed by the sight of a gnat, which he kills only to find that the gnat had saved his life by awakening him in time to flee from a snake. At night the shade of the gnat approaches the goatherd for his base ingratitude and the latter in atomic hurl erects a tomb and performs the customary funeral rites for the gnat. Modern scholars disagree with the ancients who ascribe such a poem to Virgil. Consult Jackson, 'The Authorship of the Culex' in (the Classical Quarterly, Vol. V. 1911).

CULIACÁN ROSALES, koo'-lee-kan' rō-sā'las, Mexico, capital of the state of Sinaloa, and of the district of Cúllan. It is situated about 887 miles from the city of Mexico, and is an important commercial centre, with fine public buildings, including a cathedral, government palace, and mint. It is an episcopal see. 177 miles long connects it with the seaport town of Altata. It has cotton-mills and other industrial establishments. It was founded in 1599 with the name San Miguel. Pop. 13,527.

CULICIDÆ, kū-lis'-id, the mosquitoes (q.v.), a family of nematocerous diptera.

CULILAWAN, koo'-le-lō'-wán, BARK, the aromatic pungent bark of the Cinnamomum culilawan, a tree of the Musaceas; useful in indigestion, diarrhoea, etc. Called also clove-bark.

CULIN, Stewart, American anthropologist: b. Philadelphia, Pa., 13 July 1858. He was educated at a Friends' School and afterward at Nazareth Hall. Leaving this school at the age of 18 in business, but was soon persuaded to take up anthropological research. In 1883 he became secretary of the Numismatic and Antiquarian Society of Philadelphia and began a study of the Chinese in America, and wrote a report on their language. He was numerous expeditions to Korea, Japan, China and India and among American Indian tribes. He became curator of the Museum of Science and Art of the University of Pennsylvania in 1889, and one of the foremost anthropologists of America. In 1892 he was appointed director of the Museum. In this capacity he represented Pennsylvania University at the Colombian Historical Exposition in Madrid, where he was at the same time secretary of the United States Commission. In 1886 he organized the Oriental Club in Philadelphia; in 1887 he became president of the American Folk-Lore Society; and vice-president of the anthropology section of the American Association in 1901. He has been elected honorary member of the Swedish Spanish, Italian and Mexican Anthropological Societies. He has written: 'Korean Games' (1896); 'Mancala, the National Game of Africa' (1894); 'American Indian Games' (1905).

CULINARY. See Cookery.

CULLEN, Paul, Cardinal, Irish Roman Catholic prelate: b. near Ballymore, County Kildare, 27 April 1803; d. Dublin, 1 October 1868. He was ordained priest in 1829, and filled the offices of vice-rector and rector of the Irish College in Rome, and rector of the Propaganda College. During the period of Mazzini's power in Rome in 1848, Cullen saved the property of his college by placing it under American protection. At the close of 1849 he unexpectedly found himself nominated to the archbishopric of Armagh and primacy of Ireland. His vigorous denunciations of Feminism made him many enemies. He also forbade the clergy to take an active part in politics, and advocated papal infallibility. At the Synod of Thurles in 1851, principally by Cullen's persuasion, the establishment of a Roman Catholic university in Ireland was recommended, but his quarrel with Dr. Newman, its head, wrecked the scheme. Translated to Dublin in 1852, he was created a cardinal priest in 1856, the first Irishman who had reached that rank. One of the majority at the Vatican council, he long enjoyed the familiar friendship of Pope Pius IX.

CULLERA, koo'-lō'-rə, Spain, a fortified town in the province of Valencia, on the Mediterranean. Its natural position makes it a place of military importance, and though its fortifications have been repeatedly dismantled, they are now in an efficient state. Its streets follow the contour, and among the noteworthy features are a ruined castle and the chapel of the Virgen de Cullera. Fishing, agriculture and stock raising are the principal industries. The city is the centre of a considerable trade in grain, rice, oranges, wine, etc. Cullera was of great military importance under the Moors, by whom it was strongly fortified, and successfully withstood attacks of the Christian armies in 1234 and 1235, though later it was taken by James I. of Aragon. Pop. 13,500.

CULLODEN, or DRUMMOSSIE MOOR, a heath in Scotland, four miles east of Inverness. It is celebrated for a victory obtained 27 April 1746, by the Duke of Cumberland over Prince Charles Edward Stuart (the Pretender) and his adherents. The battle of Culloden was the last battle fought on British soil, and the termination of the attempts of the Stuart family
to recover the throne of England. A monumental cairn and green mounds have been raised where the fiercest of the fight raged, and where many of the slain are buried. The Cul-looden Papers were discovered at Cullooden House, the family seat of Duncan Forbes a mile to the north with the stories 1625-1748, and were published in London in 1815. Consult William Augustus, Duke of Cumberland, 'Authentic Account of the Battle of Cullooden' (London 1746).

CULLOM, Shelby Moore, American senator: b. Wayne County, Ky., 22 Nov. 1829; d. 28 Jan. 1914. In 1853 he went to Springfield, III., to study law, was admitted to the bar and settled in practice there. He was in the Illinois House of Representatives 1856, 1860, 1872, 1874, and its speaker in 1861 and 1873. He was elected to Congress 1865-71. At the Republican national convention, 1872, he nominated Gen. U. S. Grant. He was governor of Illinois 1877-83, when he was elected to the United States Senate, and re-elected 1888, 1894, 1900 and 1907. He was chairman of the Senate committee which reported the Interstate Commerce Bill, and he was the chairman of the committee which prepared a system of laws for the Hawaiian Islands. His report on the regulation of rail-road corporations by national legislation, presented to the Senate, 18 Jan. 1886, has taken its place as a permanent contribution to economic literature. He wrote 'Fifty Years of Public Service' (Chicago 1911).

CULLUM, George Washington, American military officer: b. New York, 25 Feb. 1809; d. there, 26 Feb. 1892. He was graduated from West Point in 1833; and was engaged for the next 28 years in engineering labor and instructing at West Point in practical military engineering. During the Civil War he was chief of staff to the general-in-chief 1861-64, and superintendent of the Military Academy 1864-66. He was chief engineer of the Department of the Missouri in 1861, superintendent of engineering work on the Western rivers and chief engineer at the siege of Corinth. From that time he was a member of the board of engineers for fortifications, until he was placed on the retired list in 1874. At the time of his retirement he was colonel and brevet major-general in the regular army. Besides numerous military memoirs and reports, he published 'Military Bridges with India-rubber Pontoon' (1849); 'Register of Officers of the U. S. Military Academy from 1802 to 1850' (1850); a translation of Dupaix's 'Elements of Military Art and History,' with notes, etc., (1863); a 'Biographical Register of the Officers and Graduates of the U. S. Military Academy' (1874); 'Campaigns of the War of 1812 Criticised' (1880). He bequeathed $250,000 for the erection of a memorial hall on the grounds of the Military Academy, and $40,000 for furnishing it with military busts, paintings and other appropriate objects and for the continuance of his 'Biographical Register.'

CULM, a term used in the United States to designate waste anthracite coal, but in some parts of England for anthracite in general. At one time disposal of the culm heaps surrounding the shafts of the mines in Pennsylvania became a serious problem, until its use as fuel was made possible, either by burning it in special grates, or by pressing it into briquettes (q.v.). In England the culm is sometimes made up into balls, with one-third of its bulk of wet clay. This mixture burns without flame, and gives a steady heat suitable for cooking. In botany culm is the straw or hollow stem of the grasses.

CULMINATION, an astronomical term, signifying the passage of a star across the meridian. The star is then at the highest point (culmen) of its course; hence the name. The sun culminates at mid-day, or 12 o'clock, apparent solar time—which seldom agrees exactly with mean time, as shown by a watch or clock. The full moon culminates at midnight. The term is interchangeable with transit.

CULPEPER, John, English colonial leader in the provinces of North and South Carolina. He was a refugee from the southern or Clarendon colony, and in 1678 was the head of an insurrection in the northern or Albemarle colony in favor of popular liberty. The insurgents later sent Culpepper to England to negotiate a compromise. He was indicted for high treason, but through the influence of Shaftesbury was acquitted on the ground that no regular government had existed in Albemarle. He returned to Carolina, and in 1680 laid out the city of Charleston, reducing the plan to squares and squares to comparative regularity, and enclosing the town site with a line of fortifications.

CULPEPPER, or COLEPEPPER, Thomas, American royal governor: b. England; d. there 1719. He was one of King Charles II's favorites, who received from that monarch a grant of the entire territory of Virginia for a period of 31 years from 1673, a grant so astounding in character that, in the opinion of at least one historian, nothing but the very deed itself, still extant, could be accepted as evidence of the fact. He was governor of Virginia 1682-83, and two years later relinquished most of his Virginia grant, retaining only a portion called Northern Neck, and securing, instead of the remainder, an annual pension of £400 for 20 years. His whole career was marked by the meanness of rapacity, an example of which may be seen in his trying to swindle the colonists by paying the public wages in light coin, on which he had himself put an arbitrary value. In 1683 he returned to England, was tried and convicted
of corruption and deprived of his commission. His daughter Catherine married Baron Fairfax to whom the great estate descended. Con- sued by Doyle, "English Colonies in America" (Vol. II. 1882).

CULVER, local name in Africa for a fish resembling a perch, but of uncertain classification, which inhabits the Zambezi Valley. It burrows in the mud and thus survives droughts, and is exhumed both by animals and the native negroes for food, but is not thought palatable by the white colonists.

CULPRIT FAY, The, a poem by Joseph Rodman Drake (q.v.). It relates the love of a fairy for a mortal, and the punishment of the offense.

CULVERIN, in early times, any small gun, the name being derived from the serpent-shaped handles cast on the piece. In the 16th century and later the name is also given to the heavier cannon, like the 18-pounder. Variations of the name were whole culver or culver, referring to the heavier guns, demi-culverin to the smaller.

CULVERT, an artificial channel for carrying a small stream underneath a canal or the embankment of an railway or railways. For very small streams vitrified clay pipe or cast-iron pipe is used for culverts. For streams of larger size stone box culverts are employed, consisting of two parallel masonry walls covered over with stone flagging and having a paved bottom. Where stone is scarce from the source of the heavier cannon, like the 18-pounder. Variations of the name were whole culver or culver, referring to the heavier guns, demi-culverin to the smaller.

CUMANA, a small city in Venezuela, capital of the new state of Sucre, which formerly constituted a section of the state of Bermúdez. It was founded by Gonzales Ocampo in 1520, under the name of Nueva Toledo, and near Nueva Cordoba, founded in 1523 by Jacome Castellon. It is situated on the banks of the Manzanares River, one mile from the southern coast of the Gulf of Cariaco. The city is celebrated as being the first permanent settlement of Europeans on that coast. Being situated on ground of volcanic formation, the city is subject to frequent earthquakes. The surrounding country is fertile, producing especially fine grapes, pine-apples and other fruits, and such tropical plants as coffee and cacao. A railroad connects the city with the gulfs. It has a college and is the seat of a United States consular agent. It is an important commercial centre, its trade being promoted by an excellent roadstead and harbor, which are dominated by the fort of San Antonio on a hill overlooking the town. The exports are cacao, sugar, coconuts, taro, pearls and hides. The suburbs of San Francisco, Guay- quirias and Serritos have an aggregate population equal to that of Cumana, which has 12,225 inhabitants.

CUMARIN. See CUMARIN.

CUMBERLAND, Richard, English dramatist and essayist: b. Cambridge, 19 Feb. 1732; d. Tunbridge Wells, 7 May 1811. He was graduated at Trinity College, Cambridge, in 1750, and two years afterward was elected Fellow. He was appointed private secretary to the Earl of Halifax, became Ulster secretary during Halif- fax's term as lord lieutenant of Ireland. In 1775 he obtained a post in the Board of Trade and retired to Tunbridge Wells, where he devoted himself to literature. His comedies, "The West Indian," "The Wheel of Fortune," "The Jew," and "The fashionable Lover," are an epitome of the culture of the time, as are his essays, collected under the title of "The Observer." He wrote novels, tracts, religious and didactic poems, not now important; "Anec- dotes of Eminent Painters in Spain." His plays, though popular in their day, have not survived. His "Memoirs" are considered untrustworthy. Consult Paston, George, "Little Memoirs of the Eighteenth Century" (London 1901).
CUMBERLAND, England, the extreme northwest county. It has 75 miles of coast and an area of 1,520 square miles. A little more than half the county is cultivated, the rest is covered by mountain and lake. The highest peaks of the Cumbrian Mountains are in the lake region, whence valleys radiate in all directions, gradually ending in a flat coastal belt. The chief rivers are the Eden and Derwent. Mineral wealth abounds, chiefly coal, iron and lead. Dairy farming and domestic manufactures are carried on. The chief towns are Carlisle, the capital, Whitehaven, Brampton, Workington, Maryport and Millom. Consult Ferguson, ‘History of Cumberland’ (London 1890) and Wilson (editor), ‘The Victoria History of Cumberland’ (Westminster 1901). Pop. 265,780.

CUMBERLAND, Md., city and the county-seat of Allegany County, 150 miles southeast of Pittsburgh; 178 miles northwest of Baltimore; 152 miles northwest of Washington, D. C., is picturesquely situated on the Potomac River, 632 feet above tide water. It is also on the main line of the Baltimore and Ohio Railroad, the Western Maryland Railroad, the Pennsylvania Railroad and other interurban railways and is at the head of the waters of the Chesapeake and Ohio Canal, which extends thence to Georgetown, D. C. Cumberland is situated 11 miles from the noted Cumberland and George’s Creek bituminous coal regions and is the shipping point for large quantities of this coal, considered the finest in the world for steaming purposes. Its manufactures are also considerable; they include large glass works, brick works, cement works, steel works, iron foundries, dye works, tanneries and numerous other enterprises. Here are located large rolling mills for the rolling of steel rails and other materials of railway supplies, as well as large railway car and repair shops, and large capital is invested in mercantile interests. Fort Cumberland was built in the winter of the years 1754-55 at the beginning of the French and Indian War; on the site of the fort, Cumberland was laid out in 1785. It was incorporated in 1815 and became a city in 1850. The government of Cumberland is now by commission, composed of a mayor and four councilmen. This was the first city in Maryland to adopt this form. The proximity of Cumberland to Pittsburgh, Baltimore and Washington led to much speculation as to the influence which this radical step would have on the government of those cities. Yet after six years’ experience in which many important undertakings were carried to a successful conclusion, such as a new gravity water supply, costing $750,000 which furnishes abundance of the purest drinking water in the world to its entire population. A new sewerage and conduit system involving over 40 miles of street, without any appreciable raise in tax rate has proven this form a success in this instance. Pop. 29,000.

CUMBERLAND, R. I., town in Providence County, six miles north of the city of Providence, on the New York, New Haven and Hartford Railroad and on the Blackstone River. It has extensive manufactures of cotton goods, silk, clothes, horse shoes and iron ware, and in the vicinity are valuable granite quarries, and the “mineral pocket of New England,” containing deposits of coal, iron, copper and gold. Among its buildings and historic points of interest are the Elder Ballou Meeting House, built about 1740; the Catholic (monastery) Association Institute; the Cistercian Trappist monastery; the grave of William Blackstone, the first white settler in Rhode Island, who built “Study Hall” as a residence about 1635; and the Nine Men’s Misery Mountains, a cluster of nine victims of early Indian wars. Named after William Augustus, Duke of Cumberland, the town was incorporated in 1747. Pop. 10,107.

CUMBERLAND, Army of the, in the American Civil War, a name applied to one of the principal Federal armies, which prior to 30 Oct. 1862, had been known as the Army of the Ohio. On this date Gen. W. S. Rosecrans assumed command and a new army of the Ohio was formed. The Army of the Cumberland continued under the command of General Rosecrans until October 1863, when Gen. George H. Thomas became commander. At the beginning of 1864 the 11th and 12th corps, which had been added in 1863, were consolidated into the 20th corps.

CUMBERLAND GAP, on the dividing line of Virginia and Kentucky on the north, and Tennessee on the south, is the main gateway of the Cumberland Mountains, between eastern Kentucky and East Tennessee. Early in the Civil War it was occupied by the Confederates and remained in their possession until 18 June 1862, when, in view of a concentration of the Confederates at Chattanooga, which was threatened by the advance of Gen. O. M. Mitchell from Huntsville and Bridgeport, Ala., it was evacuated, and was occupied by Gen. Geo. W. Morgan, who, with a division of 8,000 men, had been operating against it for nearly two months. Morgan fortifed it, established magazines and an arsenal, from which thousands of arms, with ammunition, were distributed to the Union men of East Tennessee, and remained in possession until 17 Sept. 1862. Then Gen. E. Kirby Smith, having crossed the mountains south and defeated General Nelson at Richmond, Ky. (29 and 30 August), thus cutting off communication from the north, while Gen. C. L. Stevenson with a division of 9,000 men was pressing him in front, Morgan, short of provisions and forage and not prepared for a siege, blew up his arsenal and magazines, set fire to his storehouses, and at night, 17 September, started on a march of 200 miles through an almost unbroken wilderness to Greenup, on the Ohio River. He reached there 3 October without the loss of a gun or a wagon, and with the loss of only 80 men, although pursued some distance by Stevenson, and harassed much of the way by Morgan’s cavalry. Bragg retreated through the Gap, after the failure of his Kentucky campaign, and it remained in Confederate possession a year. General Burnside entered Knoxville, 3 Sept. 1863, and finding the Gap occupied by Gen. W. Carter with a brigade of 2,300 men, ordered General Shackleford with a cavalry brigade to approach it from the south and co-operate with Colonel DeCourcy, who, with a division of new troops, had been ordered to march from it from the north. Shackleford reached the south end of the Gap on the 7th and communicated with DeCourcy, who had arrived on the north side, and both summoned Frazer to surrender, who
refused. Burnside led an infantry brigade from Knoxville, joined Shackleford on the morning of the 9th and at his demand Frazer surrendered his force of over 2,000 men, with 12 guns and a large supply of ammunition. The Gap remained in Union possession to the close of the war. "Conduct of the Rebel General" (Vol. XXX); "The Century Company's Battles and Leaders of the Civil War" (Vol. III).

E. A. CARMAN.

CUMBERLAND MOUNTAINS, or CUMBERLAND PLATEAU, that portion of the Appalachian group which ranges along the southwest border of Virginia and the southeast of Kentucky, and passes across the State of Tennessee into the northeastern part of Alabama. The region is bounded on the east by a bold escarpment overlying the Great, or Appalachian Valley. On the east, next to the escarpment, the rocks are somewhat folded, but farther west the sediments are practically flat, and the area is more truly a deeply dissected plateau than a definite range of mountains. The region is also bordered on the west by a less marked escarpment. The ridges are rocky and little cultivated, but the valleys are fertile. These mountains lie west of the range of the granite and metamorphic rocks, which compose the mountains on the western borders of North Carolina and the northern part of Georgia. They are upon the range of the great coal formation of the Middle States, and essentially composed of the same groups of stratified rocks as those of the Alleghany Mountains, Chestnut Ridge, and Laurel Hill in Pennsylvania. The Tennessee River and its branches drain a portion of the eastern slope.

CUMBERLAND PRESBYTERIANS. See PRESBYTERIANISM.

CUMBERLAND RIVER, river of Kentucky and Tennessee, rising in the Cumberland plateau, in eastern Kentucky, near the Virginia line. It flows at first generally northwest and then southwest through southern Kentucky and enters Tennessee in long. 85° 30' west. It then flows, in a very tortuous course, southwest, west and then generally northwest, through northern Tennessee, re-entering Kentucky near 88° West. From this point it approximately parallels the Tennessee River, to its confluence with the Ohio River at Smithland, about 12 miles east of Paducah, Ky. Its total length is 688 miles, and its basin area is about 18,000 square miles. It is navigable for steamboats to Nashville, 193 miles, and for vessels of three-feet draught 325 miles farther, to Burnside, Ky., which is commonly considered the head of navigation.

CUMBERLAND ROAD, THE, OR GREAT NATIONAL PIKE, originally a road planned from the Maryland frontier at Cumberland, Md., to connect with the State roads and run to Saint Louis (then just fallen into United States hands by the Louisiana Purchase); to open up the West to immigrants, and provide for military and postal transportation. It was to be built by the States of Pennsylvania, Maryland, and Virginia out of public lands, as a fair counterpoise to the seaboard States' ability to pay their expenses by levying customs duties; and pushed forward by sections as settlement advanced. Henry Clay was its most conspicuous projector and advocate, and a monument to commemorate his services to it has been erected on its course near Wheeling, W. Va. The bill for the first section passed Congress, 29 March 1806; it authorized the President (Jefferson) to appoint three commissioners to lay out the road from Cumberland to the Ohio River (Wheeling), and appropriated $30,000 for expenses. At the same time another was passed to lay out one through Georgia, on the New Orleans route; and others followed in swift succession for two decades. This policy of roads, soon supplemented by canals, became the great battle-ground for the strict-construction party, who sought the whole policy of internal improvements as unconstititutional; and the Cumberland Road with its constant call for improvements and repairs aroused ever fresh resistance. Finally in 1822, Monroe, although he had signed the annual bills of the kind, vetoed a third; and for the time the improvements and new roads came to a standstill. With John Quincy Adams, who was in thorough sympathy with Clay's policy, as with every other to increase the national wealth and power, the system was less marked escarpment. The ridges are rocky and little cultivated, but the valleys are fertile. These mountains lie west of the range of the granite and metamorphic rocks, which compose the mountains on the western borders of North Carolina and the northern part of Georgia. They are upon the range of the great coal formation of the Middle States, and essentially composed of the same groups of stratified rocks as those of the Alleghany Mountains, Chestnut Ridge, and Laurel Hill in Pennsylvania. The Tennessee River and its branches drain a portion of the eastern slope.

CUMBERLAND MOUNTAINS—CUMMINS

University was reopened without buildings, endowment or apparatus. Since that time it has had a steady growth; its buildings are large and commodious; its libraries, general and depart- mental, number 21,000 volumes. Since 1877 it has been a coeducational institution. The total enrolment in 1915 was 416 students, and there were 28 instructors. The buildings and land of the university together with furnishings and equipment are valued at $247,000, and the productive endowment is $90,000. The institution is under the auspices of the Presbyterian Church.

CUMBERLAND MOUNTAINS, a range of mountains, England, occupying part of the counties of Cumberland, Westmoreland and North Lancashire, about 37 miles long and 35 miles broad. The mountains rise with steep activities, enclosing in some parts narrow but well-cultivated valleys, with numerous picturesques lakes, this being the English "Lake Country", frequented by tourists. There are 25 mountain tops upward of 1,500 feet high, the highest being Scafell Pike, which measures 3,210 feet and is the loftiest peak in England. The deep valleys between the mountains contain 14 lakes, 1 to 10 miles long. The largest is Windermere. Many eminent persons have lived in this district, among them Wordsworth, Southey, Coleridge, De Quincey, Arnold and Harriet Martineau. The heavy rainfall of the region is utilized by the conversion of one of the lakes Thirlmere, into a reservoir for the water supply of Manchester.

CUMMIN, küm’n, Oil of, the expressed product of a long-known umbelliferous plant, grown in Egypt and Ethiopia, and largely cultivated in Sicily and Malta, whence it is brought to this country. Cumin seeds, when distilled with water, yield a pale-yellow liquid of disagreeable odor and harsh taste, consisting of an oil called cuminol, hydride of cumyl, or cuminic aldehyde (CaH4O), and cymene or cymol (CaH4). Cymene is methyl-isopropyl benzol. Cuminol and cymol can only be partially separated by distillation, cymol being the more volatile, but cuminol is better removed by causing it to combine with hydropotassic sulphate. When pure, cuminol is a colorless liquid, lighter than water, boiling about 446° F. The other constituent, cymol (CaH4), is a colorless, strongly refracting, lemon-smelling fluid, which has a specific gravity of 0.85, and boils at 347° F. It is insoluble in water, but dissolves in alcohol, ether and oils.

CUMINUM, cu’mi-nüm, the fruit of Cuminum cuminum, an umbelliferous plant closely related to caraway, with which it is allied in properties and uses. See Cumin, Oil or. See CUMMING, Oiu or.

CUMMING, Alfred, American territorial governor: b. Augusta, Ga., 1802; d. 1873. When the Mormons under Brigham Young disputed the authority of the Federal government, President Buchanan, in 1857, sent Cumming to Utah as governor with a force of 2,500 men. He at once declared the territory to be in a state of revolt, to which Young replied by a proclamation forbidding the army to enter the territory. It was not until 1858 that Cumming regularly assumed office, in which he was supported by the troops for nearly two years. Cumming held the position until 1861. See Utah, History.

CUMMINGS, Amos Jay, American journalist: b. Conings, N. Y., 15 May 1841; d. Baltimore, Md., 2 May 1902. At the age of 12 he entered a printing office as an apprentice, and was accused of stealing. Since 1861 he had set type in nearly every State in the Union. He was with Walker in the last invasion of Nicaragua; was a sergeant-major in the 26th New Jersey Infantry during the Civil War; and received the congressional medal of honor for gallantry on the battlefield. In 1863 he entered the service of the New York Tribune under Greeley, and later was on the staff of the New York Express and the Sun successively. From 1887 until his death he was a Democratic representative in Congress from New York city districts. He was the author of a series of letters, which attracted much attention, written from Florida and California to the Sun, over the signature "Ziska."

CUMMINGS, Charles Amos, American architect: b. Boston, 26 June 1833; d. 1905. He was educated in the Boston schools and at the Rensselaer Polytechnic Institute, Troy, N. Y., and till his retirement practised his profession in his native city. He published a valuable 'History of Architecture in Italy from the Time of Constantine to the Dawn of the Renaissance' (1901), and collaborated with W. P. P. Longfellow (q.v.) in 'A Cyclopedia of Works of Architecture in Greece, Italy and the Levant' (1897).

CUMMINGS, Thomas Seir, American miniature painter: b. Bath, England, 1804; d. Hackensack, N. J., 1894. He came to New York early in life and studied there with Henry Inman. He painted miniatures in water color, and many of his sitters were well-known contemporaries of the artist. In 1826 he helped to found the National Academy of Design, was its treasurer for many years and one of its early vice-presidents. He also wrote an account of its history, entitled 'Historic Annals of the National Academy from its Foundation to 1865' (Philadelphia 1865). His later life was spent in Connecticut and Hackensack, N. J.

CUMMINS, Albert Baird, American lawyer and statesman: b. Carmichaels, Pa., 15 Feb. 1850. He received an academic education at Waynesburg, Pa., was admitted to bar and settled in practice at Des Moines, Iowa. The honorary degree of L.L.D. was conferred on him by Waynesburg College in 1906 and by Cornell College, Iowa, in 1904. From 1896 to 1900 he was a member of the Republican National Committee, in 1901 was elected governor of Iowa, in 1903 was re-elected and, again for his third term in 1906. In 1908 he was elected to the United States Senate to fill the vacancy caused by the death of Senator William Boyd Allison, and was re-elected for the terms 1909-15 and 1915-21. While governor of Iowa he made a thorough study of matters relating to the regulation of railroad and other corporations, and to him was largely due the passage by the Senate of various important measures relating to trusts and railroads.

CUMMINGS, George David, American clergyman: b. Kent County, Del., 11 Dec. 1822; d. Lutherville, Md., 26 June 1876. He was graduated at Drexel College in 1850, and was ordained to the Episcopal ministry, 6 July 1847, and was successively rector at Norfolk, Va., Richmond,
CUMMINS—CUNEIFORM WRITING

Va., Washington, D. C., Baltimore, Md., and Chicago, Ill., until consecrated assistant bishop of Kentucky, 15 Nov. 1866. In November 1873 he resigned his office and went to the Episcopal Church, preliminary to taking steps to form a new sect, "The Reformed Episcopal Church," of which he was made the presiding bishop December 1873. He was formally deposed from the Protestant Episcopal ministry, 24 June 1876. See REFORMED EPISCOPAL CHURCH. Consult the 'Memoir' by his wife (New York 1878).

CUMMINS, Maria Susanna, American novelist: b. Salem, Mass., 9 April 1827; d. Dorchester, Mass., 1 Oct. 1866. Her novel, ('The Lamplighter' (1853) had enormous success and was translated into foreign languages; it is still remembered for the idyllic charm and tenderness of its first few chapters, but the rest is commonplace. Her other books are 'Mabel Vaughn' (1857); 'El Fureidis' (1860); 'Haunted Hearts' (1863).

CUMNOR HALL, a ruined manor house near Oxford, England, the "Cumnor Place" of Scott's 'Kenilworth.' Meikle's musical ballad of 'Cumnor Hall,' a lament for Amy Robsart, furnished Scott, as is supposed, with the motive of 'Kenilworth.'

CUMONT, kūmōn', Franz Valery Marie, Belgian Orientalist: b. Alost, East Flanders, 3 Jan. 1868. He studied at the universities of Ghent, Bonn, Berlin, Vienna and Paris; from 1892 to 1910 he was professor in the University of Ghent, and from 1899 to 1912 curator of the Royal Museum at Brussels. In 1913 he was made an associate of the French Academy of Inscriptions. He was Hibbert lecturer at Oxford in 1901 and 1900. His principal works are on the Eastern cults that took root in Rome about the beginning of the Christian era: they include 'Textes et monuments relatifs aux mystères de Mithra' (1894-1901), translated as 'The Mysteries of Mithras' by McCormack (Chicago and London 1903); 'Catalogues Codicologum Astrologorum Graecorum' (1898 et seq.); 'Studia Pontica' (1901-11, with Anderson); 'Là. See Recherches sur le Manichéisme' (1908-12); 'Astrology and Religion in Antiquity' (1912).

CUMULATIVE VOTING, the system by which every voter is entitled to as many votes as there are persons to be elected, and may give them all to one candidate, or may distribute them among the candidates, as he thinks fit. The practice was first introduced into Great Britain in 1870, and used in the election of school boards, and later in parliamentary elections. Although the general adoption of the system has been urged as a desirable reform it has not had much success. The States of Illinois and Michigan have used the method in some elections, and its legality was questioned. The Supreme Court of the latter State declared it constitutional. See MINORITY AND PROPORTIONAL REPRESENTATION.

CUNARD, Sir Samuel, English shipowner: b. Halifax, Nova Scotia, 21 Nov. 1787; d. London, 28 April 1865. Becoming early a successful merchant and shipowner, he went to England in 1838, and joined with George Burns and David M'iver in founding (1839) the British and North American Royal Mail Steam Packet Company. The first passage was that of the Britannia in 1840. This small venture developed into the present great commercial enterprise known as the Cunard line of ocean steamers plying between England and America. He was knighted in 1859.

CUNAXA, kū-nāks'a, Mesopotamia, east of the Euphrates, about 60 miles north of the site of the ancient city of Babylon. Famous in history for the defeat of the younger Cyrus, 401 B.C. See Xenophon.

CUNDINAMARCA, koon-de-nā-mär'kā, Colombia, a department once of extensive area, but now reduced with ill-defined boundaries to about 8,046 square miles. It consists of an elevated plateau transversed by the eastern Cordillera of the Andes, and cut by many rivers. Its capital is Bogotá, also the capital of the republic. Its soil is fertile and tobacco is extensively cultivated. It is also rich in minerals and good grazing country. Pop. 713,968.

CUNURANGO, kūn-dū-ran'gō, the bark and wood of a vine growing in Ecuador, South America, supposed at one time to be a specific for cancer.

CUNEIFORM WRITING is so called because its characters consist of strokes of the shape of a wedge (Latin, cuneus); and for a like reason it is also known as arrow-headed but less widely; it is a mode of writing used in early times, and till the downfall of the Babylonian and Assyrian empires, in the region of the Euphrates and Tigris and in contiguous countries northward and eastward of those empires, as Armenia, Persia, Media, Susiana. It was an outgrowth of a primitive hieroglyph most probably originating among the peoples of that part of western Asia and not derived from Egypt. For an account of the archaeological researches in Babylonia and Assyria see the article BABYLONIA, where the invention of cuneiform writing is credited to the Agade period, the population of Chaldea, from whom it passed to a Semitic people, their conquerors, later known as Babylonians and Assyrians. Before the conquest the cuneiform writing of the Accadians had been adapted by them not only to ideographic representation—representation of objects or notions, as the sign $ denotes dollar or as in astronomy the trident $ stands for the planet Neptune—but also to representation of sounds. This was a step in the direction of alphabetic writing, but the cuneiform system never reached that development, and its highest achievement was the production of a syllabary—i.e., a catalogue of the syllables of the language. The transition from the ideographic to the alphabetic use was a long step toward perfection as it immensely simplified the problem of writing by reducing to a comparatively small number of different characters the infinity of emblems required for ideographic representation. It was as though a sign, as $, originally, let us suppose, the ideograph for tree, were made to stand for the syllable ta, to, etc.: in that case all words beginning with the syllable ta or to would be represented by a form of expression
having that sign for its first element, and not by an independent arbitrary form.

The cuneiform writings found among the ruins of the Assyrian, Babylonian and other ancient cities of western Asia were either impressed with a stylus on tablets of moist clay then kiln-baked or were incised with a chisel on monuments of stone. The wedge either stands upright or rests on an inclined angle, or lies horizontal, or two wedges form an angle coming together at their points, or at their bases. A few examples will give an idea of the manner of combining them for the expression of ideas:

In its stage of highest development the cuneiform writing was exceedingly complex and clumsy, and was in such a state that it was made to serve some purpose on the needs of the Babylonians and Assyrians as a means of literary expression, as the vehicle of laws and as a means of historical record, gives striking demonstration of man’s invincible effort to develop his intellectual and moral powers. It was a very simple thing to make the ideograph speak to the ear as well as to the eye — to represent, for example, the sun (utu) by an ideograph and then to make that symbol stand for the syllable ut in all situations; but it was a beginning, and out of it was constructed as efficient a mechanism as was allowed by the refractoriness of the material of construction. But the cuneiform writing never gave any indications of a tendency toward an alphabetic system.

The results of archaeological exploration in those countries of western Asia are justly regarded as among the most valuable of modern historical research. They put us in possession of much of the literature and early history of peoples whose record seemed already lost past recovery back as the time of Herodotus (5th century B.C.) or at least of Berosus (3d century B.C.) of whose writings only some fragments have come down to us: our knowledge of the history of those great empires, beginning with the Semitic peoples in the Bible, was drawn mainly or wholly from those two historians; but now, thanks to the researches of our contemporaries, we have with regard to many points of Assyrian and Babylonian history fuller and more authentic information than we possess regarding the history of ancient Greece and Rome.

No one document of the thousands that have been unearthed in the course of those explorations surpasses or even equals in interest the code of King Khammurabi (the Amraphel of Genesis xiv. 9, “King of Shinar” or Elam, called also in the Scripture Shushan, and by the Greeks and Latins Susiana, from the name of the capital city Susa). This code, discovered at the site of ancient Susa in 1901, afterward translated by the Dominican friar Schiel, who was the Assyriologist of Monsieur de Morgan’s exploring expedition, and published in 1903 by order of the French Minister of Public Instruction, is inscribed on a great monolith of granite; it dates from 2200 B.C. It consists originally of about 3,000 lines of writing in 49 columns, five of which are effaced; but the rest of the inscription of a very beautiful type is still plainly legible. The code contains a law relating to witchcraft or sorcery, and touches all grades of social and domestic life, even determining the wages of workmen and laborers from the lowest to the highest. Very curious is the law regarding enchantments or sorcery. The person in whom the spell of enchantment has been laid must plunge into the Euphrates: if he sinks and drowns, his house goes to the sorcerer; but if he floats the sorcerer forfeits his life and his house. Proof of the general use of writing in Khammurabi’s dominions is seen in the requirement of written testimony in lawsuits and in business transactions. The code commands that land be kept in cultivation; uncultivated and unimproved land is taxed at the same rate as neighboring cultivated land. The farmer whose crop is seriously damaged by storm is excused from paying interest on money loaned him. He through whose neglect the irrigation canals and ditches cause damages must make good the loss. The wagon keeper — usually, it would appear, a woman — is required to “seize and drive to the palace” riotous persons who resort to her place: failing to do this she incurs the penalty of death. The defamer of an honest woman, be she wife or “votary,” is to be branded on the forehead. A man was permitted to divorce his childless wife. If a man divorces his wife without cause he must allow her alimony and custody of her children, also a share in his estate equal to a son’s portion. Here are some points at which Khammurabi’s code touches matters which were afterward made the subject of Hebrew legislation. Says the Elamite king: “If a man strike another in a quarrel and cause him a wound and he shall swear ‘I did not strike him knowingly’ he shall answer for the doctor.” The Hebrew law (Deut. xxxi, 19) prescribes as penalty for one who smites another with stone or fist so that the injured man keepeth his bed, that the smiter shall “pay for the loss of his time and shall cause him to be thoroughly healed.” The Hebrew law punished with death “him that smiteth his father or his mother”; the punishment decreed by Khammurabi for the same offense was loss of the hands.

The word “cuneiform” is traced first to Thomas Hyde in 1700, professor of Hebrew at Oxford, and has passed into most modern languages. It is called Keilschrift or wedge-script, by the Germans, and Mismari or nail-writing by the Arabs.

CUNENE, koo-nä’né, a river of South Africa, rising in about lat. 13° S. and entering the Atlantic in lat. 17° 20’ S. It flows at first in a southerly direction and afterward in a westerly direction. In its lower course it forms the boundary between the Portuguese and German territories in that region. At the mouth are sandbanks, and there begins with a law governing commerce.

CUNLIFFE, John William, American educator: b. Bolton, Lancashire, England, 20 Jan. 1865. He was educated at the University of London and at Owens College, Manchester. He taught English literature at McGill University, Montreal, from 1899 to 1906, at Columbia University, New York, from 1906 to 1912, and at Wisconsin from 1912 until his death in 1914. He then became pro-
CUNLIFFE-OWEN — CUORE

fessor of English and associate director of the school of journalism, Columbia University. He wrote 'The Influence of Seneca on Elizabethan Drama' (1907), edited Gascoigne's Supposers (1903), and wrote a complete edition of Gascoigne (1907–10); in 'Cambridge English Classics', and 'Eastward Hoe' in volume II of Gayley's 'Representative English Comedies' (1913); and contributed to volumes III and V of the 'Cambridge History of English Literature' on "A Mirror for Magistrates," Gascoigne, and early tragedy. Other works are 'Writing of Today' (1915) and 'Poems of the Great War' (1917). He is joint editor of a revised edition of the Warner Library (1917–18), contributes to philosophical journals.

CUNLIFFE-OWEN, (Philip) Frederick, American editor, son of the late Sir Philip Cunliffe-Owen, K.C.B.: b. London, England, 30 Jan. 1855. Since 1889 he has been one of the editors of the New York Tribune; is vice-president of the Pilgrims' Society of America, and director of Saint George's Society, New York. He is grand officer of the Order of Charles III of Spain; Osmanlieh, Turkey; and commander of the Order of the Crown of Italy; commander of the Legion of Honor of France, and of Orange-Nassau, Kingdom of the Netherlands. He is a contributor to the North American Review, and is author of a series of letters, signed Ex-Attacché, Fontenoy, Veteran Diplomat.

CUNNER, or CHOJSET (Tantogalobus adpersus), one of the commonest of shore fishes on rocky ledges along the New England coast, and found from Virginia to Newfoundland. It rarely attains a length of one foot, and is of a brownish-blue color with yellowish reflections; the teeth are strong and sharp. Although an excellent panfish and a favorite with the boy angler, its great numbers and its boldness render it a great pest to the professional fisherman, whose bait it continually strips from the hooks.

CUNNINGHAM, Allan, Scottish poet and miscellaneous writer: b. Keir, Dumfriesshire, 7 Dec. 1784; d. London, 30 Oct. 1842. When a youth he served as an apprentice to a stonemason. His spare time was given to song and the collection of traditions. In 1810 he contributed to R. H. Cromie's 'Remains of Nithsdale and Galloway Song.' The ballads in these collections, though purporting to be ancient popular songs, were Cunningham's own compositions. Later he became a reporter in London, and wrote 'Sir Marmaduke Maxwell,' a dramatic poem, and 'Lord Roldan' and 'Paul Jones,' interesting but rather theatrical romances. He became one of the best-known writers for the London Magazine. He subsequently obtained a situation in Chantrey's studio as foreman, or confidential manager, and this office he held till the sculptor's death. Other works are 'Traditional Tales of the Peasantry' (1822); 'The Songs of Scotland, Ancient and Modern' (1825); 'Lives of the Most Eminent Painters, Sculptors and Architects' (1859–33). Horace Walpole has longest remembered for this story, 'A Wet Sheet and a Flowing Sea.' Consult Hogg, 'Life' with selections from works (London 1875).

CUNNINGHAM, John Francis, Roman Catholic bishop: b. Irremore, County Kerry, Ireland, July 1842. He was graduated at St. Benedict's College, Atchison, Kan., 1860; studied theology in Milwaukee, Wis., and was ordained priest at Leavenworth, Kan., 1865. He was pastor at Fort Scott, Kan., 1865–68; Lawrence 1868–76; Topeka 1876–82; rector of Leavenworth Cathedral 1882–98, and consecrated bishop of Concordia, Kan., 21 Sept. 1898.

CUNNINGHAME-GRAHAM, Robert Bontine, Scottish writer: b. 1852. He was educated at Harrow and sat in the House of Commons for North Lanarkshire as a Socialist, 1888–92. He has published 'Father Archangel of Scotland and other Essays' (1896); 'Journey in Morocco' (1898); 'Thirteen Stories' (1900); 'A Vanished Arcadia' (1901); 'Hernando de Soto' (1903); 'His People' (1906); 'A Hatchment' (1913); 'Life of Bomal Diaz del Castillo' (1913); 'Brought Forward' (1917).

CUNNINGHAMIA, a genus of the Comiferous so named in honor of the botanists and travelers I. and G. C. Cunningham. C. sinensis is a tall and handsome tree, native of China and Cochin-China, with leathery leaves somewhat resembling those of the Arawanga (q.v.). It is too tender for the ordinary temperate climate, but is used in favorable localities as an ornamental tree. It attains a full beauty except in its native country, as the transplanted specimens must be small enough to be protected from the slightest frost. It is therefore known generally as a house-plant.

CUORE, kü-ō're, a 'book for boys,' by Edmondo de Amicis, which, as he says in the brief preface to the story, is dedicated to the boys between 9 and 13 years of age in the elementary schools, and might well be entitled: "Story of a school year written by a third grade pupil in an Italian elementary school," meaning that the child noted the incidents and his father wrote the book, conforming, however, both in matter and manner, to the spirit of his little boy's version. The story which first appeared in 1886 had an extraordinary success, 285 editions (of a thousand each) having appeared up to 1917, a literary work which has been paralleled in Italy. Moreover, outside of Italy the success of the book was likewise very notable, no less than 22 translations of it appearing in the various world languages. As the name Cuore (Heart) indicates, the main spring of what is told in the daily events of school life or in the stories supplementing them has its origin in the noblest and finest of sentiments that spring spontaneously from the heart, revealing that personality toward which sympathy is immediately attracted and which throughout life possesses a charm second to no other. The difference between Mantegazza's book for boys, 'Testa' (Head) and 'Cuore' of de Amicis, both of which aim to edify, is that in the former, which reminds the English reader of the "Kolla" books, the reader is conscious of the author's object, while in the latter he is not. Therein lies much of its success. In 'Cuore' the author extols love for one another, fraternity, equality and solidarity, all sterling democratic virtues, yet that in itself and the purpose of the book, as A. Maurizio and Italian Socialists of his class attempt unsuccessfully to prove, implying that 'Cuore' is a work defend—
ing the privileges of the humble bourgeois class.

‘Cupra’ is the work of a sincere patriot upholding
the traditional humanitarian virtues.

JAMES GEDDES, JR.

CUP, Divination by, a mode of foretelling
events, in use among the ancient Egyptians, and
still surviving in some of the rural districts of
England and Scotland. In the East, one method
was to put small pieces of gold, silver and
precious stones engraved with mystic characters
into a cup of water, then to invoke the infernal
powers, who replied by some signs in the cup.
By the modern method, a person’s fortune is
foretold by the disposition of the sediment in
his teacup after pouring out the last of the
liquid.

CUP-AND-SAUCER LIMPET, shells of
the gasteropod genera Calyptraea and Crucibul-
num, so called from having in the middle of
the inside of the shell a cup-like process, the shell
proper constituting the *saucer.* Hippolytus
is an another form. Crucibulum striatum occurs off
shore on our coast.

CUP-SPOONGE. The cup-sponge of Tur-
key (*Spongia adriatica,* also called the Levant
toilet-sponge, is one of the finest sponges
brought from the Mediterranean Sea. It is of
the branch Desmospongia. See Sponges.

CUPID, in Roman mythology, the god of
love, similar to the Greek Eros, the son of
Mercury and Venus. He is usually represented
as a winged infant, naked, armed with a bow,
and a quiver full of arrows. Sometimes he was
represented with a helmet, a spear and a buck-
ner, intimating that even Mars himself owns the
supremacy of love. His power was generally
shown by his riding on the back of a lion, or
on a dolphin, or breaking to pieces the thunder-
bolts of Jupiter. He was supposedly capable of
all sorts of mischief and is so represented in
modern works of art. The ‘Cupid Frescoes’
at Pompeii are among the best examples of this

CUPOLA, in architecture, a hemispherical
semi-elliptical roof, built of stone, timber, metal
or glass. The ancient cupolas were hemispheri-
cal and were used with great effect by the
Romans. The greater part of modern cupolas are
semi-elliptical, cut through their shortest
diameter. Of ancient cupolas, the finest is that
of the Rotunda or Pantheon at Rome, erected
under Augustus, and still perfect; of modern
construction, some of the handsomest are those
of Saint Peter’s at Rome, of Saint Paul’s, Lon-
don, the Hotel des Invalides, Paris, Santa Maria
da Fiore at Florence, Saint Sophia at Constan-
tinople and the national capitol at Washington.
D.C. The term is also applied to any small
structure rising above the roof, not necessarily
spherical, but of any shape. It is distinguished
from "dome" in that it may be used either of
the interior or exterior structure, generally the
former. When the outer roof differs in shape
from the inner roof it is proper to call the latter
a cupola.

CUPPLES, Samuel, American manufactur-
er: b. Harrisburg, Pa., 13 Sept. 1831. At
the age of 12 he was employed in a grocery
store in Pittsburgh, but removed to Cincinnati
in 1840, where he entered a woodeware es-
tablishment. In 1851 he was sent to Saint Louis
to establish a branch house there, which as the
house of Samuel Cupples & Company became
widely known. In 1883 this was reorganized as
the Samuel Cupples Woodware Company, of
which its original founder is still president. It
is the largest business of its kind in the world,
its trade equaling in amount that of all other
woodenware houses in the United States. He
has taken a warm interest in education and has
done very much to sustain the school system
of Missouri. He was the original promoter of the
Saint Louis Manual Training School, and the
gifts to educational institutions have amounted
to several millions. Cupples Station (q.v.) is
one of his most beneficent enterprises for the
good of Saint Louis.

CUPPLES STATION, a railway junction
in Saint Louis established by Samuel Cupples
(q.v.) and others. An extensive system of rail-
road warehouses has the basements traversed by
railroad tracks. Merchants are thus enabled
to receive and reship goods with the expense of
handling them reduced to a minimum, the ex-
 pense and delay of cartage being eliminated
from the problem. This was presented by Samuel Cupples and his partner,
R. S. Brookings, to Washington University, this
institution collecting all rentals therefrom.

CUPRITE, kū’prīt, native cuprous oxide,
Cu₂O. It is the richest of the copper ores and
occurs earthy, massive and granular, and also
in beautiful isometric crystals which in the
variety chalcocite are elongated into capil-
ary crystals. Usually it is translucent, of ada-
mantine lustre and very dark cochineal-red
color. Its hardness is 3.5 to 4 and specific
gravity about 6. Among its many important
localities are Chessy in France, Cornwall in
England, South Australia and Chile and in the
United States at Bisbee and Morenci in Arizona.

CUR, a dog of any kind not highly valued,
and in this way often particularly appropriated
to dogs of mongrel breed. Naturalists use the
term cur as the common designation of many
races, of which the terrier may be considered as
the type.

CURA¿A, koo’rā, also CIUDAD DE CURA,
Venezuela, city situated 56 miles west of Caracas
and a short distance from Lake Valencia, in the
old state of Miranda (now separated into the
states of Rivas, Guárico and Miranda). It was
founded in 1730 by Juan Bolivar y Villegas.
The site of Cura is 1,600 feet above sea level at
the foot of a steep hill; an extensive valley,
watered by two streams, outspreads before it.
A record of its temperature shows as the maxi-
mum 87° F.; minimum 72°; mean annual 79°
F. Owing to its proximity to the llanos of the
Guárico and the surrounding agricultural and
grazing districts, with their plantations of
sugarcane, coffee, cacao, cotton, indigo, etc., as
well as herds of cattle, Cura is a thriving little
place. It suffered considerably in the War of
Independence. In 1900 it was visited by a
destructive earthquake. Pop. about 12,000.

CURAÇAO, koo’rá-sā’ô or kū’rá-sō, Dutch
West Indies, an island in the Caribbean Sea,
46 miles north of the coast of Venezuela, be-
tween lat. 12° 3’ and 12° 24’ N., and long. 68°
47’ and 60° 16’ W., stretching northwest to
southeast, 36 miles long and 8 miles broad;
CURAÇAO—CURCUMA

capital Willemstad. Its surface is generally flat, except for the hills in the southwest, whose highest point is 1,200 feet. Streams are few and the rainfall light. The chief minerals are iron and copper (but the mines are not developed), and salt. The cocoa-palm, banana and three varieties of the orange—from one of which varieties the far-famed Curacao liquor is made—are grown abundantly. Sugar, tobacco and corn are raised. Curacao was settled by the Spaniards early in the 16th century; it was taken in 1632 by the Dutch; and was captured by the British in 1798, but restored at the Peace of Amiens. It was taken again by the British in 1802, and finally ceded to Holland at the general peace in 1814. The island of Curacao, together with the adjacent Dutch islands of Bonaire, Aruba, a part of Saint Martin, Saint Eustatius and Saba form a separate colony (area, 436 square miles) officially called Curacao, administered by a governor assisted by a council of four members and a colonial council of eight members. The members are nominated by the sovereign. Pop. colony, 54,469; of the island of Curacao 32,585.

CURAÇAO, or CURAÇA. The genuine Dutch liquor is not so much esteemed for its taste and aroma, as is prepared from a peculiar kind of bitter oranges growing in Curacao, which fall from the tree before they are ripe, and which have an extremely persistent aromatic odor and taste. The skin of the orange is macerated, the white pulp matter scraped off, and the yellow part, along with yellow fresh oranges, steeped in strong alcohol for 24 hours. The liquor is distilled and rectified, about half being collected, and this is mixed with a gradually made of white sugar. To this is added a certain quantity of curacao infusion, which is a stronger alcoholic extract of the peel containing sugar, and then a certain proportion of water. The fluid is clarified and allowed to settle. The finest quality has a deep yellow color, which is sometimes improved by a few drops of tartaric acid.

CURARI, koo-râ’î, CURARE, OURARI, etc., an arrow poison widely used by the natives of South America. Its exact composition is unknown, but it is certain that the juice of some species of Strychnos is always present. No species of Strychnos that is now known, however, has the same physiological action that curari has. Its method of preparation is kept secret and it is probably true that each tribe has its own method of preparing the poison. The physiological action of curari is unique. It is a type of pure motor paralytic, affecting the motor end organs in voluntary muscles. In death by poisoning from curari, the muscles of respiration becoming paralyzed, asphyxia results. Therapeutically, curari is of secondary service. Its varying composition and uncertain strength make it dangerous, and theoretically it would be indicated only in motor disorders of the voluntary muscles such as convulsive tics, torticollis, hydrophobia, etc. In the treatment of poisoning, artificial respiration is the best procedure.

CURASSOW, kú-râ’sú, a bird of the subfamily Cracina and family Cracidae of the Galliformes, related to the guan (q.v.) and mound-bird (q.v.). The name is derived from the supposed origin of those first known to Europeans from the island of Curacao. The curassows are exclusively birds of tropical America and are especially abundant in the forests east of the Andes. They are large, sometimes equaling the turkey in size, with handsome plumage and in some varieties a crested head. Usually the trachea of the males forms a loop within the sternum, as in certain cranes, and this renders possible the clear ringing voices of these birds. They are essentially arboreal, but also scratch on the ground for their food, which consists largely of nuts, berries and tender leaves. Most species also nest in trees and, as the young are precocious, a curious sight is presented by their scrambling among the branches while still in the down. Being highly prized for food, some of the species have been domesticated. The genus Crax has a soft cere and crested head; there are about 10 species in Central and South America. The Notocrax has no cere, and the lore or spaces between the eyes and beak, are naked. Mitra is similar, but the lores are feathered. M. miti is a beautiful blue-black species of Brazil and adjoining countries to the north. Powri contains the well-known game of zoological gardens, in which the frontal region of the head bears a large, deep blue knob. It is a native of the extreme northern parts of South America. Interesting accounts of these birds will be found in Bates, 'Naturalist on the River Amazon' (1863).

CURB, a disease in horses consisting of strain of the straight ligament which runs down the back of the hock. It is most common in animals with straight small hocks and sickle hams. Like other strains it occurs from sudden and violent exertion, often proceeding in the lighter breeds from leaping or galloping in heavy ground, and in the heavier, from the effort of keeping back a load while going down a steep incline. Swelling appears on the outer and back part of the joint, about five or six inches below the point of the hock, generally causing lameness, most apparent in trotting, and, in slight cases, usually decreases after the animal has been out for 10 minutes. Fomentations must first be used to allay the irritation and inflammation, and a high-heeled shoe put in. When heat and tenderness disappear, cold applications will be advisable; after which, the enlargement still continuing, a blister may be necessary. From the first all work must be forbidden.

CUBINA. See DRUMFISH.

CURCULIO, kér-kû’ô, an insect-enemy of the plum. See paragraph Insects, under Plum.

CURCULIONIDÆ, kér-kû-Iôn’id-dé, the snout-beetles, or weevils (Insect.). One of the most extensive families of coleopterous insects. They belong to the section Phyochophora and all the species have a curious snout-like head.

CURCUMA, kér-kû’ô-ma, a genus of the Marantaceæ, the gingerwort and cardamom order. The corm is about as thick as the thumb, and is divided into several parts. The leaves which are about a foot long and lanceolate in form and sheathing. Curcuma longa is a turmeric plant, the tuberous rhizomes of which furnish the substance called turmeric (q.v.). This plant is extensively cultivated in
southern Asia. *C. amada*, a native of Bengal, is the mango-ginger, which has qualities resembling ginger. From the colorless rhizomes of *C. leucorhiza* is prepared a kind of arrowroot. *C. sedoaria* yields a tonic medicine, and is also used as a food.

**CURD.** See Cheese.

**CURUES, kā-rḕz̩,** an ancient town of the Sabines, 25 miles northeast of Rome, near the Tiber, the birthplace of Titus Tatius and of Numa, whence the Romans, after the people of Cures united with them, came to be called Quirites. The Lombards destroyed the town toward the close of the 6th century. It stood not far from the modern Corneto.

**CURFEW, kərˈfəʊ,** also CURFEU, from the French *couvrir,* to cover, and *feu,* fire. The ringing of a bell at nightfall, originally designed as a signal to the inhabitants to cover their fires, extinguish lights and retire to rest. The practice is said to have been instituted by William the Conqueror, in all probability as a safeguard against fire, but the English in early days regarded the curfew as a badge of servitude. Originally the hour set for the ringing of the curfew bell was 8 o'clock, but it was also rung at 9 o'clock. The bell in each village or community which tolled the curfew became known as the curfew-bell. In certain parts of rural England the custom is still kept of ringing a bell at 9 o'clock.

The curfew bell was introduced into the United States early in the century, but without regularity of practice. About 1850 Col. Alexander Hogeland, who has been called "the father of the curfew-law," introduced an ordinance in Omaha, Neb., compelling youths to absent themselves from steamboat landings, railroad stations and low variety shows. The curfew ordinance, somewhat changed and modified, was adopted in 1894 at Lincoln, Neb. The term curfew-law has since been given to all laws intended to keep young people off the streets at certain hours and to enforce obedience by 9 o'clock at night. In 1894 at the National Convention of the Boys' and Girls' Home Employment Association in Indianapolis, the adoption of curfew ordinances was urged in view of the great increase in crimes among children. Since that time the law has been generally enforced in over 3,000 cities and towns in this country. The officials of many of these towns report a decrease of 80 per cent in the arrest of boys and young men, under the provisions of the law, and former objections to the curfew have ceased. In 1898, a consensus of opinion was taken in 300 towns where the curfew law was in operation and all reports showed that there was a decided improvement in the youth morally and socially.

The curfew law, in general use, provides that all children under 15 years of age shall not be on the streets at night after 9 P.M. in summer and 8 P.M. in winter, without the written consent of their parents or guardians. The law applies to boys and girls, to commercial associations, school boards and boards of trade in various sections of the country. The enforcement of the law has largely reduced the number of commitments to reform schools as is illustrated at the State Reform School at Bonnville, Mo. During two years prior to the adoption of the curfew ordinance at Kansas City, Mo., 47 boys were sent to the reform school while for two years after the adoption of the law only 17 boys were committed from Kansas City. The ordinance has been recognized as a crime-reducer, child protector and home builder. Benjamin Harrison called it the "curfew-law, the most important municipal regulation for the protection of the children of American homes, from the vices of the street, of the present century."

**CURI-CANCHA, koo-ro-kănˈcha,** the splendid Temple of the Sun, built by the Incas in Cuzco (q.v.), Peru, on the site now occupied by the church of San Domingo.

**CURIA,** a certain political division of the Roman people, said to have been established by Romulus; also the place of assembly for each of these divisions. According to Livy, Romulus divided Rome into 30 curiae, and assigned to each a separate place of meeting. In early times only the members of the curia were in possession of the full citizenship of Rome. The curiae were probably territorial divisions, including groups of related families. They had political functions and religious functions of various sorts. Consult *Graecia Antiqua,* *The Roman Assemblies?* (New York 1909).

**CURIA REGIS** (Lat. "King's Court"), in English history, the name applied at different times to three distinct judicial bodies: (1) the feudal assembly of the tenants-in-chief; (2) the Privy Council, organized under Henry I; (3) the Court of King's Bench, founded in 1178. The first of these bodies constituted the Magnum Concilium or "Great Council of the Realm," and combined the characters of the Saxon witan and the Norman feudal court. Its consent was necessary for the imposition of extraordinary taxes and the enactment of new laws; also, the king was supposed to consult its advice on general questions of state policy. In those days no distinction was recognized between the various functions of government—legislative, executive, judicial, financial, ecclesiastic or military; hence all royal measures of national importance were undertaken in the presence and with the consent of the Council. In course of time an inner council arose, the nucleus of which was the great household, and gradually took shape under Henry I as the *Curia Regis proper.* This was the beginning of the House of Lords, and was practically a committee of the parent body, which had grown too unwieldy. While legislative powers remained with the council, the committee supervised legislation generally, and was composed of high court officials appointed by the Crown. It comprised what may be regarded as the Privy Council, a bureau of administration, and a high court of justice, and in the course of centuries grew birth to all the administrative institutions of the United Kingdom as each was severed from the parent body and became an independent unit. In the reign of Henry I the Curia, presided over by the Great Justiciar, was preoccupied mainly to judicial work, and its members were called justices, who sat in the Court of Exchequer. Every baron (lord) of this court was also a justice of the Curia, and from this connection arose the system of judicial circuits. Judicial administration was suspended and developed by the Curia until it became part of the
regular judicial machinery under Henry II. Up to that time the Curia moved with the king from place to place and held its sittings wherever the royal court happened to be located. In 1178, however, a separate committee of five judges was created to be fixed in one spot and deal with criminal cases, and its day-to-day business was the Court of King's Bench. The separation of the Court of Common Pleas from the Curia was effected by Magna Charta (1215). The three bodies were completely separated with a distinction in their jurisdiction under Henry III. Another offshoot from the Curia Regia is the Court of Equity; while the Court of Exchequer, formerly the financial committee of the Curia under the Chancellor, is now part of the Supreme Court of Judicature. On the accession of the Tudors the Privy Council of the Curia was organized into the Star Chamber (1486), a distinctly illegal court in which the king's ministers sat as judges and conducted trials without juries, inflicting torture, mutilation, imprisonment, and fines contrary to law. This unsavory institution, which was abolished in 1641, was the direct ancestor, strange to say, of the modern "Cabinet."

**CURIA ROMANA**, strictly, the authorities which administer the Papal Primacy, the ensemble of departments which assist the Sovereign Pontiff in the government of the Roman Catholic Church. It includes the tribunals, the offices of Curia and the Roman congregations. (See CONGREGATIONS, ROMAN). The tribunals of the Curia are three in number: the Sacred Penitentiary, the Rota and the Apostolic Segnatura. The Segnatura consists of the cardinal chief penitentiary, a regent, a theologian, datary, canonist, corrector, sealer, copyist, secretary, surrogate and archivist. It is formed of the cardinal penitentiary, the theologian, the corrector, the sealer, the canonist, the secretary also taking part in it, but without a vote. The other members are only consulted, the decision being left to the cardinal penitentiary. The constitution "Sapienti consilio" of Pius X confined the competency of the superior, subject to internal jurisdiction, of being granted powers to grant graces of all kinds in all internal matters — absolvements, dispensations, commutations, ratifications in matter of impediments, condonations and matters of conscience submitted to the judgment of the Holy See.

The Rota has competence in all contentious cases that must come before the Holy See and require a judicial investigation with proof, except the so-called major cases. It therefore tries in the first instance the cases, including criminal cases, which the Pope, either motu proprio or at the request of the contesting parties, calls up for his own judgment and commits to the Rota. It decides these cases even in the second or third instance. It is also the court of appeal for cases already tried judicially in episcopal tribunals of first instance. It also decides in the last instance cases tried by any inferior tribunal of second or further instance. The Rota is composed of the auditors, ranking in order appointed by the Pope; they must hold a doctorate in theology or canon law and are automatically retired on attaining the age of 70. They form a college of which the oldest is dean. Each auditor chooses an assistant. Other officers are a promoter of justice, defender of the bond in matrimonial cases, and in cases relating to religious ordination, three notaries, selected by the college of auditors. The auditors decide by a majority vote and the sentence not only gives the conclusion arrived at but the reasons therefor.

The Apostolic Segnatura consists of six cardinals, appointed by the Pope, one of whom is its prefect. It has a secretary, a notary, consultants and a few minor officials. Under the new constitution promulgated by Pius X the Segnatura is a genuine tribunal, with jurisdiction in four kinds of cases, namely: accusations of suspicious against an auditor of the Rota; accusations of a violation of secrecy by an auditor of the Rota; appeals against a sentence of the Rota; and petitions for the nullification of a decision of the Rota that has already become res judicata. Special commissions are also given this tribunal from time to time by the Holy Father.

The officers of Curia are five in number: The Secretariat of State; the Apostolic Chancery; the Apostolic Dataria; the Apostolic Camera and the Secretariat of Briefs.

**The Cardinal Secretary of State** is the exclusive channel through which must pass all communications carried on between the Holy See and foreign powers. He is the Pope's prime minister — not of course in the sense which the word bears in countries where the Minister is more powerful than the sovereign, so that the former's "advice" overrides the latter's initiative — but in the proper sense of the term a faithful agent executing the will of his master, whom he serves to the best of his ability. He carries on the negotiations, in which the Pontiff is perpetually engaged, which have for their object to secure the liberties, extend the limits and promote the welfare of the Church. Under him are placed the nuncios and other diplomatic agents of the Holy See, and to him they make their reports. The officials under him consist of several Minutanti, writers in cipher, an archivist, subarchivist, etc. Being in close and permanent relations with the Pope he represents the principle of the Pontifical Government; his influence is consequently felt in all ways in acts emanating directly from the Pope; he directs all important political measures, puts in force the decisions relative to the other organic institutions of the Church, and transmits the instructions by which the functionaries of the Curia are guided.

The Apostolic Chancery takes its name from civil law and from the imperial chanceries, and in its essence is of very ancient origin. Since the Constitution of Pius X it has been reduced to a forwarding office (Ufficio di Spedizioni) with a small personnel. It comprises the cardinal who presides, the regent, the college of apostolic prothonotaries, a notary, secretary and archivist, a protocolist and four amanuenses. At present the Chancery is charged only with the expedition of bulls for consistorial benefices, the establishment of new dioceses and new chapters and other important affairs of the Church.

The Dataria consists of a cardinal and datary, sub-datatype, cashier, reviser, and writer of bulls, and minor officials. Formerly the Dataria was commissioned to grant many papal indulgences and graces, but since 1908 has only to investigate the fitness of candidates for cons
sistorial benefits, which are reserved to the Holy See, to write and to dispatch the Apostolic letters for the collusion of those benefits, to dispense from the conditions required in regard to them and to provide for the pensions or for the execution of the charges imposed by the Pope when conferring those benefits.

The Apostolic Camera administers the property of the Holy See during a vacancy of the latter. The cardinal-camerlengo presides over the Camera and is governed by the rules of the Constitution ‘Vacante sede apostolica’ of 25 Dec. 1905.

The Secretariate of Briefs consists of the secretary and two office assistants. The secretary is a prelate whose duty it is to write the Pontifical briefs addressed to emperors, kings, civil princes or other exalted personages. He also prepares the allocutions which the Pope pronounces, as, for instance, the Pontifical Letters or apostolic letters addressed to the bishops and to the faithful.

In addition to the above the Curia comprises certain commissions of cardinals, such as the commission for biblical studies, for historical studies, for the codification of the canon law, etc.; also the Pontifical Family. (See Congregations, Roman; Papacy; Rota Romana). Consult Haskins, ‘The Sources of the History of the Papal Penitentiary’ (in American Journal of Theology, LIX, 1905); Chonet, ‘La sacreé pénitencier Apostolique’ (Lyons 1904); Chiari, ‘Memoria giuridico-storica sulla Dataria Cancellaria’ (Rome 1900); Trombetta, ‘De juribus et priviligioni del Lauratorum Romanae Curiae’ (Sorrento 1906). A good popular account is that by Benedetto Ojetti in ‘The Catholic Encyclopedia’ (Vol. XIII, New York 1912).

JOHN B. MCDONNELL,
Editorial Staff of The Americana.

CURIATII.—CUREW

CURIATII. See Horatii.

CURIÓ, koo-re-koe, Chile, a province lying between Colchagua and Talca. Area 2,919 square miles. It is divided into the departments of Curicó and Vichuquén. Its capital city, also called Curicó, has two commercial banks, several tanneries and other industrial establishments. It is 114 miles south of Santiago, with which it is connected by railroad. It has considerable trade with Argentina through the Planchòn Pass. It was settled in 1743, though not on its present site. The port of Llico is on the Lake of Vichuquén. Numerous irrigating canals are derived from the Teno and Lontué, which unite the Mataquito River. Cereals, vegetables, wine, cattle, timber and fruits are among the products; there are also a few copper, silver and gold mines in the Cordillera and the coast range of hills, and the annual output of salt from the estuaries of the lakes of Vichuquén, Boyeruca and Bucalemù exceeds 25,000 tons. The State Central Railroad crosses the province. Pop. (province) 108,120; (city) 18,313.

CURIE, koo-re, Pierre and Marie, distinguished physicists, the former French and the latter Polish, of whom more is written in the Scientific America. Pierre has said that ‘they afford an example of a most interesting collaboration, since it concerns a husband and wife, both of high scientific attainments, who aided one another with their efforts and knowledge in the arduous path that finally led to the production of pure radium.’ Pierre Curie was born in 1859 at Paris, 19 April 1906, and at the age of 20 years began to make independent scientific researches. In 1895 he received his appointment as professor of physics and chemistry, having discharged the duties of chef de travail up to that time; and the future Nobel laureate and his wife entered a laboratory of the Industrial Museum, in 1896, they went to Paris and obtained a licentiate’s degree in the mathematical sciences (1893), taking a degree in physical and chemical sciences two years later. Before M. Pierre Curie married her she had become instructor in physics at the high school of Sèvres. She entered the path marked out by her husband, and together they continued their experiments in the laboratory of the school of physics and chemistry. Toward the end of 1898 Professor and Mme. Curie positively confirmed what they had previously announced with respect to the distribution of radioactivity derived from pitchblende. In the first place they found an element to which they gave the name polonium; then their collaboration was rewarded by the discovery of radium (q.v.). In 1903 they were awarded the Nobel prize in physics jointly with A. H. Becquerel (q.v.). In 1904 M. Curie was made professor of physics at the Sorbonne and in 1905 a member of the Institute of France. His memoirs were published mostly in the ‘Comptes rendus’ of the French Academy. In 1905 Mme. Curie was appointed chief professor of physics in the University of Paris. In 1910 she was awarded the Albert medal of the Royal Society of Arts (England), and in 1911 she received the Nobel prize for chemistry. She wrote ‘Recherches sur les propriétés magnétiques des aciers trempés’ and ‘Recherches sur les substances radioactives’ (Eng. trans., 2d ed., New York 1904).

CURIO (clipped from curiositas), term still popularly used, though somewhat obsolete, to describe any kind of object of curiosity, especially such as would belong to cabinet collections, on account of antiquity, rarity or intrinsic interest, in such domains as pottery, porcelain, enamels, metal work, ivories, wood carving, arms, clocks, fans, watches, snuff-boxes, musical instruments and the like.

CURITIBÁ, koo-re-tib-ah, Brazil, the capital of the state of Paraná, situated on a plateau 3,000 feet above sea-level. It is about 80 miles west of the port of Paranaguá. A railroad built in 1885 connects the city with the ocean. A line of steamships running directly between Paranaguá and Hamburg, Germany, is subsidized by the state. It manufactures coarse woollens and has considerable trade in maté and exports corn beef and tobacco. Pop. about 10,000.

CURLEW, kair-l, shore birds of the genus Numenius, belonging to the snipe family (Charadriidæ). In this genus the body is long, slender and accurate, and the toes are rather short, thick and margined. Most of the species are of large size for the family and about 15 are found throughout the world.
The long-billed curlew (\textit{Numenius longirostris}) is the largest species, its total length sometimes exceeding two feet. It is found throughout temperate North America, but is rare in the New England States. In the interior it is common throughout the Mississippi Valley, as well as in the south Atlantic States, it breeds, laying three or four eggs on the ground in meadows or prairies. Like other species its principal food consists of worms, crustaceans and insects, but vegetable matter is also eaten.

The Hudsonian curlew (\textit{Numenius hudsonicus}) is smaller, with the bill scarcely more than one-half as long and the color of a less rufous tone than the last. It is more a bird of the North, breeding in the Arctic regions and migrating through the United States. The common curlew, Eskimo curlew, or dough-bird of gunners (\textit{Numenius borealis}), is still smaller, having a total length of 12 to 15 inches and a bill of only 2 or 3 inches. This bird is remarkable for its extensive migratory movements in the spring and fall, which the players do not trust, but breed in high northern latitudes, but winters still farther south in tropical America. During the migrations it abounds along the eastern seaboard of the United States. Consult Elliot, 'North American Shore Birds' (1895).

\textbf{CURLLEWS, Mrs. H. R. (ERHEL TURNER), Anglo-Australian novelist: b. Doncaster, England, 24 Jan. 1872. She was brought to Australia when nine years of age, was educated and began to write in 1890. She was married in 1896 to H. R. Curlew, a lawyer, and she and her husband live in Sydney. Ethel Turner, as she is known to the public, has a gift of telling stories for children and her works are very popular. But she does other work almost equally well. She is one of the most promising of the younger writers of the Australian school. Among her already numerous published works are 'Seven Little Australians'; 'The Family at Mistle'; 'The Story of a Baby'; 'The Little Duchess'; 'The Little Larrakin'; 'Miss Bobbie' (1897); 'The Camp at Wangaratta' (1900); 'The Three Little Maids' (1900); 'The Wonder Child' (1901); 'Betty and Company' (1902); 'Little Mother Mag' (1904); 'White Root Tree' (1905); 'In the Midst of the Mountain' (1906); 'The Stolen Village' (1907); 'That Girl' (1908); 'Fugitives from Fortune' (1909); 'Fair Ines' (1910); 'The Apple of Happiness' (1911); 'Pools and Happy Havens' (1912); 'The Secret of the Sea' (1913); 'The Flower o' the Pine' (1914); 'The Club' (1915).

\textbf{CURLING, a Scottish game played on the ice, with large smooth stones of a hemispherical form, with an iron or wooden handle at the top. The players slide from one mark to another. The space within which the stones move is called the 'rink.' (32-42 yards long and 10 yards wide), and the hole or mark at each end is the 'tee.' The number of players upon a rink is 8 or 16—8 when the players upon 2 sides each have a stone weighing more than 44 pounds nor less than 32 pounds without out handles, and not of greater circumference than 36 inches, nor of greater or less height than one-eighth of the longest diameter of each. The object of the player is to lay his stone as near to the mark as possible, to guard that of his partner which has been well laid before, or to strike off that of his antagonist. When the stones on both sides have been all played, the stone nearest the tee counts one, and if the second, third, fourth belong to the same side, each counts one more. No stone is counted unless it reaches the mark called 'hog score'; and if it passes out of the rink it is discounted also. One player on each side, called the 'skip,' takes charge of the sweeping of the ice. The game is also played for individual points, no drawers or sides being taken. The stones are usually polished to facilitate their speed. A set of matches is called 'bonspiel.' The game is a very old one of Scottish origin and very popular in northern countries. International and interstate matches are played and trophies are awarded. There are various clubs devoted to the sport, the oldest being in Scotland. England, Ireland, Newfoundland, Russia, New Zealand, Switzerland and the United States have associate clubs. In 1867 the Grand National Curling Club was organized. Consult Ramsay, 'An Account of the Game of Curling' (Edinburgh 1811); and Spalding's Annual Athletic Manual.

\textbf{CURLY-GRASS, a common name for a fern (Schizaea pusilla), the typical genus of the climbing fern family. The plant is rare, being occasionally found in wet soil in the pine barrens of New Jersey and in Nova Scotia. The climbing fern family has 16 genera, of wide geographical distribution, the two American genera being Schizaea, as above, and Lygodium, represented by the Hartford fern.

\textbf{CURRAN, Charles Courtney, American artist: b. Hartford, KY, 13 Feb. 1861. He studied art in Cincinnati, the New York Art Students' League and the AcademieJulien in Paris, France, receiving an honorable mention in the Salon of 1890. He has been awarded several of the prizes of the National Academy of Design and received medals at the World's Columbian Exposition and the Cotton States International Exposition. He was in the Expositions of Paris (1900), Buffalo (1901) and Saint Louis (1904). He was elected to the National Academy of Design in 1904. There are pictures by him at Vassar College, in the National Gallery, Washington, D.C. and the Pennsylvania Academy and the museums of Columbus, Richmond, Ind., Toledo and Buffalo. He has a wide range of subjects, but prefers to paint beautiful female nudes in idyllic surroundings. His color is delicate, his draftsmanship sure and minute. Among his noteworthy paintings are 'Perfume of the Roses'; 'The Breezy Day'; 'Wild Asters on the Mountain Side'; 'Victoria'; 'June'; 'In the Garden'; 'The Lanterns.'

\textbf{CURRAN, John Philpot, Irish orator: b. Newmarket, near Cork, 24 July 1750; d. London, 14 Oct. 1817. He was designed for the Church and educated at Trinity College, Dublin, after which he went to is counted under trial at one of the inns of court. His youth was rollicking and dissipated. He was called to the Irish bar in 1775, and in 1783 was chosen a member of the Irish House of Commons. Slow in gaining a practice, partly because of the known hostility of some of the judges to the young barrister, he attained lasting celebrity by
his skilful conduct as defending counsel in a great series of state trials in the last decade of the 18th century, associated with political troubles. For this work he was singularly well adapted, his knowledge of the Irish peasantry lending a peculiar relish to his cross-examinations. His wit and virulence made him enemies if they gained him friends, and as a consequence he was a party to no fewer than five duels, none of them with serious results. A Protestant himself, he fought strenuously for the removal of Catholic disabilities. The usual distances for planting are four by six feet, upon land well prepared by plowing and harrowing. The bushes are cultivated until mid-summer, when a cover crop is sown to be plowed under the following spring. Annually, two or three new stems should be allowed to grow, preferably from below ground, at the centre of the bush, and when this wood has borne fruit twice (that is, when three years old) should be cut out, since younger wood is more productive and less likely to get disease. On this account, training to the tree form is not recommended. A plantation should continue to be commercially profitable for 6 or 10 years after coming into bearing and should yield 100 bushels an acre if properly cared for. Yields of 250 bushels have been reported. Individual plants in gardens should produce from two to four pounds.

Of the many insects that attack the plant, the currant sawfly or currant worm (Neatoma rubella) is the best known. It is a European four-winged fly somewhat larger than a housefly, which lays its eggs upon the midribs of the under sides of the leaves, particularly those near the ground, in early spring. The green, black-dotted worms frequently caused considerable damage before their presence is suspected. Spraying with arsenites or hellebole as soon as the leaves appear and at intervals of about a week is a positive remedy. As a result of neglect, however, the bushes are frequently defoliated. A long-horned beetle (Eunotus supernotatus) lays its eggs upon the shoots and branches into which the larva burrow and emerge as adults during late spring of the following year. When troublesome the bushes should be pruned away in the winter, and the pruning burned. This treatment will also destroy other species of borer, the adult of which is a moth (Sesia tipuliformis). No practical remedy has been discovered for the currant fly (Eochora canadensis) which sometimes is seriously troublesome, since its attacks the fruit, which ripens prematurely from the presence of larva beneath the skin.

All leaf diseases of the currant, the best known of which are anthracnose (Glaoeosporium riesta) and leaf spot (Septoria rista), may be controlled by thorough spraying with a standard fungicide (q.v.). The former of these diseases is characterized by small black spots on the upper surfaces of the leaves and white ones beneath; the latter has black-centred white spots. The leaves ripen prematurely. The currant tubercle, a disease which attacks the whole plant, has become locally destructive in some of the Eastern States. The leaves wilt, the fruit colors prematurely, the clusters become small and few, and both foliage and fruit shrivel and fall. The plant soon dies. No remedy is known except prompt digging and

CURRENCY. See CURR.

CURRENCY, a popular term sometimes used as synonymous with the phrase medium of exchange but more commonly confined to the paper elements of the medium. If used in the broader sense, two kinds should be distinguished, metallic and paper.

Metallic Currency may be classified on the basis of its form as bullion and coin. Bullion is a name applied to uncurrenct coins and to gold and silver bars or ingots. The metal in these may be pure, that is, without alloy, or standard, that is, alloyed with other metals prescribed by law for coins. For example, a law approved 18 Jan. 1837 prescribed that the standard for both gold and silver coins of the United States shall hereafter be such that of 1,000 parts of which 500 shall be gold, 250 silver, and 250 alloy; and the alloy of the silver coins shall be of copper; and the alloy of the gold coins shall be of copper and silver, provided that the silver does not exceed one-half of the whole alloy. These gold and silver bars are chiefly used as material for the manufacture of coins or in the payment of balances between banks, especially those located in different countries. The latter is their chief use as currency. They may, however, and doubtless sometimes are, used in payments between individuals and between individuals and banks.

Coins are stamped pieces of metal in form, size, weight and design of the stamp, calculated to fit them for use as hand-to-hand money. The form found to be most serviceable is that of a flat, circular disc with a milled edge. The circular form and the milled edge make clipping difficult and loss of weight from wear and tear easily observable. The flat sides present a surface well adapted to receive a stamp. In other words, to weigh and count the coins may be convenient, gold, silver, nickel or some kind of an amalgam and copper are used in their manufacture in all countries in which commerce is well developed, gold for those of highest denominations, silver for those denominations next lowest, nickel or amalgam for those next and copper for those of the lowest denominations.

The denominations found most convenient are those based upon the so-called decimal system. In this denomination is usually one-one-hundredth part of the unit coin and the other subdivisions are one-twentieth, one-tenth, one-fourth or one-fifth and one-half of the unit. The other denominations are the unit and multiples of 5, 10 and 20 times the unit. For example, in the United States the unit coin is the dollar and the subdivisions are 1, 5, 10, 25 and 50 cent pieces, and the multiples are 5, 10 and 20 dollar pieces. The 1 cent piece is made of copper, the 5 cent piece of nickel, the 10, 25 and 50 cent pieces and the dollar of silver, and the 5, 10 and 20 dollar pieces of gold.

The only noteworthy exception to the decimal system among the nations of the present day is England. She has preserved the original system which was in operation in European countries before the decimal system was adopted. The old system was denominated by the system of weight at the time in use. As it is preserved in England the unit called the pound sterling is subdivided into 20 parts called shillings and these again into 12 parts called pence, and these again into four parts called farthings. The denominations of the coins are the following: half-penny, penny, sixpence, florin or two-shilling piece, half-crown or two and one-half shilling piece, the crown, half sovereign, sovereign, two and five-sovereign pieces. The farthing, half-penny and penny are made of copper, the sixpence, florin, half crown and crown of silver, and the half sovereign, sovereign, two and five-sovereign pieces of gold.

The stamps put upon coins are designed to indicate their denominations, to make counterfeiting difficult, and to use the metal for commemoratve purposes. The names given to them frequently have historical as well as practical significance. From the point of view of their relation to each other, coins may be classified as standard or subsidiary. Standard coins are those made of the standard metal used in most countries at the present time is gold, and which are coined for individuals who bring to the mint the metal of the proper standard. A small charge called seniorage may be made or the entire expense of the coinage may be borne by the government. Subsidiary coins are those which are made redeemable on demand in standard coins. They are usually also made legal tender only for relatively small payments; coined on government account and in limited quantities, and the amount of the standard metal for which they are redeemable exceeds in market value that of the amount of the metal of which they are made.

It is only by thus making some coins subsidiary to others which are standard that a currency consisting of coins made of different metals can be maintained. Otherwise, since the relative values of the different metals are constantly changing it will always be found profitable to melt down one kind of metal into another, as bullion or to ship them abroad, where they always pass at their bullion value. For example, suppose at the time a coinage system is established 300 grains of silver is exactly equivalent in value on the bullion market to 20 grains of gold, and that accordingly coins containing each 20 grains of gold and legal tender for one dollar, and others each containing 150 grains of silver and legal tender for half a dollar are freely coined at the mints for individuals bringing in the proper weight of the precious metal. The relative value of gold and silver on the bullion market changes so that 20 grains of gold are equivalent in value to 400 grains of silver. Then it will be profitable to melt down the gold coins for sale as bullion or to use them in foreign payments at their bullion value and at home to use two silver half dollars in making a dollar payment instead of a gold dollar. This condition is prevented by making the silver coins subsidiary. They can then only be obtained by purchase from the government at the rate of two silver half dollars for a gold dollar. Since the government at any time will give back a gold dollar for two silver half dollars, there will be no reason for anyone's refusing
to take two silver half dollars for a dollar's worth of goods. The government protects itself from the danger and expense of an excessive volume of redemptions of silver coins by itself monopolizing their manufacture and by limiting the amount strictly to the need for them as a circulating medium.

Certain coins, notably the silver dollar of the United States and the five-franc piece of the states of the Latin Monetary Union, occupy a somewhat anomalous position, being neither subsidiary in the strict sense of that term nor standard but midway between the two.

Paper Currency is distinguished by the element of credit which is its dominant characteristic. It may be defined as a record of an obligation to pay made in a form suitable for monetary purposes. It may be the obligation of a government, of a bank or of some other kind of a private corporation or even of a private person. The obligation is always expressed in terms of the standard value of the nation in which it is issued. The form may be that of a promise to pay or that of an order to pay. If the former, the notes recording the promise are usually issued in denominations such as bills of hand-to-hand money and are made payable to bearer on demand.

Paper currency will circulate wherever the credit of the party which issues it is known or believed to be good, provided its form is suitable for commercial purposes, and it may circulate at a discount even when the credit of the issuing party is not of the best. Within the territory in which it circulates the extent of its use, which is now greater than that of any other form of currency, is due to its superior convenience and safety and to the economy of its use. For large payments it is more convenient and economical than coin and for payments between people located in different places and for the use of travelers and for nearly all payments by mail or express it is safer as well as more convenient and economical. The most widely used kinds of paper money are circulated through the agency of governments and banks.

Government Currency, as the former kind may be called, consists of notes issued by governments in denominations suitable for monetary purposes, payable to bearer on demand and usually, though not always, non-interest-bearing. They may be convertible or inconvertible, that is, redeemable in coin on demand or not so redeemable. In the latter case the obligation of the government to redeem them is unquestioned, since it is usually expressly stated in the form of a promise, but the time of redemption is left for future determination. The form of the two kinds of notes may be identical, in which case the only difference between them is that in the one case the government actually redeems its promise to pay on demand and in the other it does not.

In order to aid in the circulation of inconvertible government notes they are usually made legal tender—that is, their tender in the payment of debts is declared by law to constitute a legal fulfillment of the obligation; and they are made receivable for taxes and most, if not all, other public dues. The fact of their inconvertibility, however, renders the inferior to the metallic elements of the currency, all of which are freely interchangeable, and the standard coins of which have a market value as bullion, identical or identical less a small seniorage charge, with their value as coin. They, therefore, depreciate, that is, they are exchangeable on the money market for something less than the amount of coin which is indicated in the promise to pay which they record. The amount of depreciation depends upon subjective influences. It is a fairly accurate expression of the combined judgment of the people regarding the credit of the government and the time at which it is likely to redeem the promises it has expressed on the notes. It is, therefore, subject to wide, sudden and frequent fluctuations. On account of their depreciation inconvertible government notes take the place of coin in the circulating medium since the latter can more profitably be sold as bullion or exchanged for notes on the money market at their discounted value, and the former being legal tender may be used in all payments. Since everyone must receive and pay in it is always expressed in terms of, and consequently all prices rise to the extent of the depreciation of the notes and thereafter fluctuate in accordance with the amount of their depreciation. On account of the national and consequent erratic character of these fluctuations all business becomes highly speculative, calculations based on a study of cost, demand and supply and the other factors upon which sound business depends become untrustworthy and everybody is forced to gamble in order to live. The circulation of such notes, therefore, constitutes a national calamity.

Convertible Government Notes may be merely representatives of coin, as is the case of the silver and gold certificates of the United States, in which corresponding amounts of coin are kept in the vaults of the Treasury, or they may be only partially covered by coin, as in the case of the greenbacks of the United States, in which a reserve of from $100,000,000 to $150,000,000 of gold coin is kept for the redemption of $346,000,000 and some thousands of dollars of notes.

Bank Currency may be in the form of notes or of what is called deposit currency. Bank notes are promises of banks on demand issued in denominations suitable for use as hand-to-hand money. They are usually convertible but sometimes inconvertible, in which case in essentials they resemble inconvertible government notes. Since the circulation of bank notes is obligatory upon an act of the bank which issues them, many devices have been employed to secure their safety. Among these the most noteworthy are the assets, special security and safety fund devices. According to the last of these, the holders are given a first lien upon all the assets of the bank and the quantity issued is usually limited to a percentage of the assets. According to the special security system the bank of issue is required to purchase certain specified securities, such as government bonds, real estate mortgages or commercial paper, and to mortgage them to the noteholders as security. According to the safety fund system a special fund of cash or securities or both, contributed pro rata by all the issuing banks in the system, is set aside, usually under government control and supervision, out of which the notes of any failed bank may be paid. Two or more of these systems may be combined.
Deposit Currency is operated in the following manner: The customers of a bank trade cash, checks and drafts on other banks and interest-bearing promissory notes or bills of exchange due in the future for credit balances on a so-called checking account. By the use of orders upon the bank called checks they may have their credits transferred to the credit of other customers of the bank or to that of customers of another bank, or they may acquire so-called drafts on banks in other places which enable them to transfer their credit balances to those places for similar use. By similar arrangements between banks this machinery operates in such a way that exchanges between people in the same town, in different towns and even in different countries are affected by the process of debiting and crediting these checking accounts. The greatest part of the exchanges of the commercial world are now-a-days effected in this way. Deposit currency and bank notes based on general assets or on commercial paper possess the especial merit that they can fluctuate in value in accordance with the needs of commerce. This is due to the fact that they are created by the sale of notes or bills of exchange representing needs for currency and disappear by return to the banks of issue when said notes or bills of exchange mature. Consult Dodd, 'History of Money in the British Empire and in the United States' (London 1911); 'Reform of the Currency' (pub. by the Academy of Political Science, New York 1911); Hepburn, A. B., 'History of Coinage and Currency States' (1903); Sumner, 'A History of American Currency' (ib. 1878).

William A. Scott,
Director of School of Commerce, University of Wisconsin.

CURRENCY BILL of 1901 (15 February), the culmination of the many years' struggle between United States parties over the standard of value; ending in the complete victory of the gold party, 46 to 29 in the Senate on the adoption of the bill. The provisions are: The unit of value to be the gold dollar of 25.8 grains, or $1.00 United States money to be maintained at a parity with it and all government paper-money to be redeemable in gold. A redemption fund of $150,000,000 to be set apart not to fall below $100,000,000, and if necessary replenished by sale of bonds at not over 3 per cent. As fast as silver dollars are coined, an equal amount of treasury notes to be replaced by silver certificates; gold certificates on certain conditions to be issued against the gold in the treasury. No United States or treasury notes to be of less than $10, nor silver certificates of more than $10. The bonded debt may be refunded in 30-year 2 per cent gold bonds, at not less than par. Any national bank may issue circulating notes up to its paid-up capital by depositing an equal amount of national bonds.

CURRENT, a flow or stream of a body of water, more or less rapid, by which vessels are conveyed, or which imparts velocity, or both, according to the set or drift of the current. Rivers have currents varying in strength, chiefly according to the inclination of the bed down which they flow.

The technical language in which the flow of water and its channels are known and described is as follows: The bed is the water-course, having a bottom and two sides or shores. When the latter are described as right- or left-hand, going down stream is assumed. The transverse section is a vertical plane at right angles to the course of the current. The perimeter is the length of this section in the bed. The longitudinal section or profile is a curve whose abscissa is proportional to the distance up or downstream from a given point and whose ordinate is proportional to the depth. The slope or declivity is the mean angle of inclination of the surface of the water to the horizon. The fall is the difference in the height at any two points of determinate distance apart, as, for instance, eight inches to the mile. The line of current is the direction of maximum velocity. The mid-channel is the deepest part of the bed. The velocity is greater at the surface than at the bed. The surface is higher in the current than at the shore when the river is rising, lower than at shore when the river is falling. The direction is the set of the current; the rate is the drift of the current. For an electric current, see ELECTRICITY. See also OCEAN CURRENTS.

CURRENT EFFICIENCY. See FARADAY'S LAWS.

CURRENT METER, an instrument for measuring the velocity of the flow in rivers and streams. The current meter used by the United States Geological Survey consists of two essential parts: (1) a wheel which is so arranged that the flowing water shall turn it steadily, and (2) a device for recording the number of wheel revolutions. The earlier forms of meters were mounted on floats and measured only the surface velocity. This was soon proved inadequate, and was improved so that measurement at any depth may be made. The current meters in present use are of two distinct types, direct-action meters and differential-action meters, the classification depending on whether in revolving the wheel the water does or does not exert a force which tends to retard the wheel's motion. In the direct-action type the wheel carries vanes (either flat or warped) set on a horizontal axis and revolving by the direct pressure of the moving water against the vanes. In this form of meter the friction increases as the velocity decreases. In the differential, the wheel is made up of a series of cups at the extremities of short spokes. This wheel revolves on a vertical axis. The pressure of the current of water on the concave side of the cup is greater than on the convex side in the proportion of 100 to 38. The wheel revolves slower than the direct-action wheel and the friction increases with the velocity, but is overcome by the increased motive power developed by the velocity. The current meter is usually equipped with a tail which holds it steady in the current. It may be attached rigidly to rods from an overhead bridge or hung by a cable. In the latter case weights are attached below to hold it in position. In high velocities or deep streams guy wires are attached. The recording mechanism is either on the shore, connection being made by an electric cable, and the record is made by electricity supplied by a battery. The true relation between the revolutions of the meter wheel and any velocity of a stream must be established individually for each meter before it is used.
This testing is called rating. A current meter is rated by drawing it through still water at a uniform speed and noting the number of revolutions as to time and distance, from which the number of revolutions per second is computed. Many such experimental runs are made with each meter at different speeds and the results are so recorded as to be quickly available in computing current velocities from any record that individual meter may make.

**CURRENT RIVER**, a river of Missouri, rising among the Ozark Mountains in the southern central part of the State, flowing southeast and south into the Black River in Arkansas; length about 250 miles.

**CURRENTS, Ocean.** See Ocean Currents.

**CURRICULUM**, the term applied to a course of study, or collectively to that of any type of educational institutions, as the college curriculum, the high-school curriculum, the common-school curriculum, etc. The historical basis of the modern educational curriculum is found in the Seven Liberal Arts of the Middle Ages, which developed from Greek philosophical speculation and educational practices. As long as the idea of the symbolical perfection of this organization of studies and of human knowledge prevailed there was no modification of the form of the curriculum, though the content of these terms was modified from time to time. All lower education was included in the subject of the *liberum*, i.e., grammar, rhetoric and dialectic, which was presented to so many approaches to the Latin language. This was based on the work of the *singing school,* which furnished to the child the school arts (reading and writing), with a modicum of arithmetic. The curriculum of higher education included the subject of the *quadrivium,* i.e., arithmetic, geometry (mathematics and geography), astronomy (natural sciences) and music (esthetic, etc.). The elaboration of the curriculum under the influences of the early universities and of the Renaissance consisted chiefly in the addition of the subjects of law, both common and civil, and in the change in the content of the subject of the quadrivium. These changes can be followed in the successive papal rules and university regulations which prescribed the books that should be read in the several subjects. From the time of the Renaissance to the close of the 18th century there was no modification in the organization of the educational curriculum and little in the content. From that time, however, the changes have been numerous and radical, and the old idea of the historical and logical perfection of the traditional curriculum has largely disappeared. In the United States, where conditions permitted these changes with less opposition than in the more conservative societies, very extensive changes have occurred, and an almost chaotic condition has ensued. These changes have consisted primarily in the addition of new subjects to each of the stages of the curriculum, due to the great development of knowledge, especially scientific, during the 19th century and the curriculum of the elementary school has expanded in content from the three fundamental school arts until it now embraces from 12 to 15 subjects in half that many spheres of intellectual interests, and in time, from three or four years to eight and nine; the secondary curriculum has undergone no expansion in time, perhaps a diminution, owing to the encroachment of both business and the higher curricula, but has added so great a number of subjects that it deals in a preliminary way with almost all those included within the curriculum of college and university. The problem of curriculum is twofold—that of content and that of organization. This twofold problem is now and long has been the chief topic of educational discussion in the United States. The matter has received extended study by American educators and has formed the subject of two important reports by committees appointed by the National Education Association. Consult ‘Reports of the National Education Association’ (Washington 1865 et seq.); ‘Proceedings of the National Education Association’; Payne, ‘Public Elementary School Curriculum’ (Boston 1905); Henderson, ‘Textbook in the Principles of Education’ (New York 1910); Ruediger, ‘Principles of Education’ (Boston 1910); Cubberley, ‘Changing Conceptions of Education’ (Boston 1909).

**CURRIE, Sir Arthur William**, Canadian soldier: b. Napperton, Middlesex County, Ontario, 5 Dec. 1875. He was educated at Strathroy Collegiate Institute, and migrated to British Columbia in 1893, where for a time he taught school at Sydney and afterward engaged in real estate business in Victoria. Always keenly interested in military affairs, he served for 14 years with the 5th regiment of Canadian Garrison Artillery, and afterward became lieutenant-colonel of a Highland regiment, the 50th, of Victoria. He was elected president of the Rifle Club of British Columbia in the outbreak of the Great War in August 1914 he immediately volunteered for active service, and went overseas as a brigadier. He has taken a distinguished part in many of the stiffest battles of the war—the second battle of Ypres, Saint Julien, Courcellette, Thiepval and Vimy Ridge. In September 1915 he was appointed to the command of the 2d Canadian Division; and it was said of his division that it never lost a trench. He has been repeatedly mentioned in dispatches; was created C.B. in the Legion of Honor and the Croix de Commandeur in 1915. On 3 June 1917 he was created K.C.M.G. He was appointed to succeed Sir Julian Byng in command of all the Canadian forces at the front, and was shortly thereafter raised to the rank of lieutenant-general.

**CURRIE, Lady Mary Montgomerie Lamb Singleton (“Violet Fans”),** English poet and miscellaneous writer: b. Littlehampton, Sussex, 24 Feb. 1843; d. Harrogate, 13 Oct. 1905. She was married in 1864 to Henry Sydenham Singleton, who died in 1893, and in 1894 to the 1st Baron Currie. Her books, published under her pseudonym, are ‘From Dawn to Noon’ (1872); ‘Denzil Place’ (1875); ‘The Queen of the Fairies’ (1876); ‘Edwin and Angelina Papers’ (1878); ‘Collected Verses’ (1880); ‘Sophy, or the Adventure of a Sargo’ (1881); ‘The Love of the War’ (1886); ‘Autumn Songs’ (1889); ‘Helen Davenant’ (1889); ‘Under Cross and Crescent’ (1896); ‘Betwixt the Seas’ (1900); ‘Two Moods of a Man’ (1901); ‘Collected Essays’ (1902).

**CURRIER, Charles Warren**, American Catholic prelate: b. Saint Thomas, Danish West
Indies (now Virgin Islands, U. S. A.), 22 March 1857. He was educated at Roermont and Wittertem, Holland; was ordained to the priesthood in 1880; and served successively as missionary in South America and in the United States. He was also lecturer, pastor, professor of Latin, assistant, etc., at the Bureau of Catholic Indian Missions, Washington, D. C., 1905 to 1913. In 1913 he was consecrated bishop of Matanzas, Cuba, resigned in 1915 and was made titular bishop of Hetalonia. He represented the United States in the First and several international congresses of Americanists. He is a member of the American Oriental Society and the Spanish American Athenæum. He has published 'Carmel in America' (1890); 'History of Religious Orders' (1894); 'Dimitrios and Irene' (1893); 'The Rose of Alabama' (1893); 'Cuba, What Shall We Do with It?' (1898); 'Lands of the Southern Cross' (1911). He is a contributor to the 'Catholic Encyclopedia,' the American Ecclesiastical Review, etc.

CURRY, Jabez Lamar Monroe, American educator and diplomat: b. Lincoln County, Ga., 5 April, 1819; d. near Athens, Ga., 18 May, 1886. He was graduated at the University of Georgia in 1843 and at Harvard Law School in 1845. He served in the Alabama legislature from 1847 to 1855 and in Congress from 1857 to 1861, and then became a member of the Confederate Congress. He became a diplomatist and minister; served in the Confederate army; was president of Howard College 1866-68; and in 1881 was appointed general agent of the Peabody Educational Fund and later also of the Slater Educational Fund. He was Minister to Spain 1885-89, and special ambassador from the United States at the coronation of King Alfonso XII of Spain, 17 May, 1902. He published 'Constitutional Government in Spain' (1889); 'William Ewart Gladstone: a Study' (1891); 'The Southern States of the American Union' (1894); 'Difficulties, Complications, and Limitations Connected with the Education of the Negro' (1895); 'Civil History of the Government of the Confederate States, and Some Personal Reminiscences.'

CURRY, Samuel Silas, American educator: b. Augusta, Ga., 19 June, 1847. He was graduated at Grant University 1872. He received the degrees of A.M. and Ph.D. at Boston University. He has gained wide reputation as a teacher of speaking and of the voice. He has been connected as a teacher with Boston University, Harvard University, Newton Theological Institution and Yale Divinity School, and has lectured and given short courses in many other universities. He is the founder and head of the School of Expression, Boston, Mass. His publications are 'Minimized Voice,' 'Foundations of Expression' (1908); 'Province of Expression' (1891); 'Classics for Vocal Expression'; 'Vocal and Literary Interpretation of the Bible' (1903); 'Lessons in Vocal Expression' (1893); 'Imagination and Dramatic Instinct' (1896); 'The Art of the English Language' (1897); 'Little Classics for Oral English' (1912); 'Spoken English' (1913); 'The Smile' (1915); 'How to Add Ten Years to Your Life' (1915); 'Bell.'

CURRY NORMAL AND INDUSTRIAL INSTITUTE, institution for the training of colored youths, founded in 1889 at Urbana, Ohio, by E. W. B. Curry. The institute includes a Bible school and normal, literary, commercial, music and industrial departments. The exten-

CURRY POWDER and CURRY PASTE, compound condiment added to cooked dishes of meat and rice to render them piquant and appetizing. So generally is curry powder employed in East Indian cookery that it has been called the 'salt of the Orient.' The substances that commonly form the bases of these powders are turmeric, fenugreek and sago. To these ginger, black and Cayenne pepper, coriander, caraway and many other spices are added in varying quantities, or omitted, according to the locality. Such curry powders as contain the pulverized leaves of Murraya koenigii are used not only as aromatic stomachic stimulants, but as remedies for dyspepsia, diarrhoea and even dysentery. The basis of many curry pastes is tamarind.

CURSE OF SCOTLAND, the, in cards, a term applied to the nine of diamonds. Its origin is unknown. Among the many explanations offered are the following: (1) The nine of diamonds is the 'pope' in the game of Pope Joan, and hence the symbol of Antichrist to the Reformers. (2) It is the chief card in comette, which game ruined many families in Scotland. (3) It goes back to the nine lozenges on the Dairyrmum arms, the Earl of Stair having been responsible for the massacre of Glencoe. (4) Tradition says that the Duke of Cumberland, while drunk and gambling on the night before the battle of Culloden, wrote across the face of this card the order that no quarter was to be given on the morrow.

CURSORES, kêr-sô'rèz, or RUNNERS, the, kali (q.v.).

CURTESY, in law, the life interest which the surviving husband has in the inheritable estate of the wife. Originally courtesy attached, as dower still does in most of the United States, to all estates of inheritance of which the wife was seized at any time during the marriage. But it is now generally, though not invariably, limited to such lands as she is seized of at her death; and she may therefore, in most States, by alienating the land during her lifetime or by last will and testament, defeat her husband's claims as tenant by the curtesy. See Blackstone, 'Commentaries on the Laws of England'; Pollock and Maitland, 'History of English Law' (Boston 1889); Tiffany, 'Law of Real Property.'

CURTIALGE, the enclosed space of ground and buildings immediately surrounding or lying near a dwelling and used for its convenient occupation. The term is of feudal origin and originally meant a castle and outbuildings enclosed in a stone wall for defense. There is no exact limit to the area which may be in-
CURTIN. Andrew Gregg. American politician: b. Bellefonte, Pa., 22 April 1815; d. there, 7 Oct. 1894. He studied law at Dickinson College, and was admitted to the bar in 1839. Entering politics, he became secretary of the Commonwealth of Pennsylvania in 1854, governor in 1859 and again in 1863, being one of the most noted "war governors" of the Civil War period. In 1869 he was appointed Minister to Russia. In 1873 he left the Republican party, and from 1881 to 1887 sat in Congress as a Democrat. Consult Egle, W. H., "Life and Times of Andrew Gregg Curtin" (Philadelphia 1896).

CURTIN, Jeremiah, American linguist and antiquarian: b. Milwaukee, Wis., 1838; d. Burlington, Vt., 14 Dec. 1906. He prepared for Harvard and was graduated there in 1863. At the encouragement of the late E. V. Huntington, he became an excellent linguist. In 1864 he entered the diplomatic service, becoming secretary of legation for the United States at Saint Petersburg, where he remained until 1870. During his stay in Russia he made a study of Slavonic and allied languages. This knowledge turned the curtailt greater protection of Tolstoy, Zagoskin and Sienkiewicz, being the first to introduce the latter to the English-speaking world. From 1883 to 1891 he was connected with the Bureau of Ethnology of the Smithsonian Institution. Afterward he made independent researches concerning the North American Indians. He was reputed to have known 70 languages, 12 more than the redoubtable Cardinal Mezzofanti. By his translations from the Russian, Polish, Czech and other languages he added enormously to our knowledge of foreign literature. Besides his translations he wrote "Myths and Folklore of Ireland" (1906); "Tales of the Fairies and the Ghost World"; "Myths and Folk-Tales of the Russians," "Western Slavs, and Magyars" (1894); "Hero Tales of Ireland" (1894); "Chrestus, Myths of Primitive America" (1898); "The Mongols" (1907); "The Mongols in Russia" (1908); "A Journey in Southern Russia" (1909); "Myths of the Medes" (1912).

CURTIS, Alfred A., American Catholic prelate: b. Somerset County, Md., 4 July 1831; d. 11 July 1908. When only 21 years old he was ordained in the Episcopal ministry and for several years labored in Baltimore and western Maryland, finally returning to Baltimore. Later he resigned his ministerial duties, entered the Catholic Church, took a theological course, was ordained priest by Archbishop Bayley, 17 Dec. 1874, and stationed at Baltimore Cathedral till 14 Nov. 1886, when he was consecrated bishop of Wilmington, Del. He resided in 1896 and in 1898 became vicar-general of Baltimore.

CURTIS, Benjamin Robbins, American jurist: b. Providence, R. I., 4 Nov. 1809; d. Newport, R. I., 15 Sept. 1874. He was graduated at Harvard 1829; was admitted to the bar 1832, and rose rapidly to the height of his profession in Boston, Mass. He was appointed to the United States Supreme Court 1851, and in the famous Dred Scott case made a powerful and greater protest than outside property, and this idea prevails to-day, as in most jurisdictions breaking and entering curtilage is burglary, and setting fire to any building in it constitutes arson. See AMOS; BURRIS; R. A. Reports of Cases in the Circuit Courts of the United States' (1854): 'Decisions of the Supreme Court of the United States, with notes and a digest'; 'Jurisdiction, Practice, and Peculiar Jurisdiction of the Courts of the United States' (1880). Consult 'Memoir and Writings of Benjamin R. Curtis' (Boston 1880), the first volume of which, containing the memoir, is written by his brother, G. T. Curtis.

CURTIS, Carlton Clarence, American botanist: b. Syracuse, N. Y., 26 Aug. 1864. He was educated at Syracuse and Columbia universities and also studied at the universities of Cambridge and Leipzig. In 1892-94 he was principal of the Fayette Union School, New York, in 1894-96 instructor in natural science at the Brooklyn Polytechnic Institute, from 1896 to 1908 tutor in botany and afterwards associate professor. Besides contributions on professional topics to botanical journals, he is author of 'Text-Book of General Botany' (1897); and 'Nature and Development of Plants' (1907; 3d ed., 1915).

CURTIS, Charles, American statesman: b. North Topsham, Vt., 25 Jan. 1803. His mother was a full-blooded member of the Kau tribe of Indians. He was educated in the common schools, and after studying law was admitted to the bar in 1831. In 1834 and again in 1836 he was county attorney of Shawnee County. From 1835 to 1837 he served in Congress from the Fourth Kansas District and from 1897 to 1907 represented the First District of the State. He resigned from the House in 1907 upon his election to the United States Senate to fill the unexpired term of J. R. Burton, resigned, and was the first Indian to hold such office. He was a candidate for re-election in 1912, but was defeated. He was elected, however, for the term 1915-21.

CURTIS, Cyrus Hermann Kotschmar, American publisher: b. Portland, Me., 18 June 1850. He was educated in the public schools and in 1876 removed to Philadelphia, where he became publisher of the Tribune and Farmer. He later established the Ladies' Home Journal and made it one of the most successful periodicals in the United States. The Curtis Publishing Company, of which he became head, published, in addition to the Ladies' Home Journal, the Country Gentleman and the Saturday Evening Post, the latter established by Benjamin Franklin in 1728. Under Mr. Curtis's management the Saturday Evening Post attained a larger circulation than had hitherto been reached by any American periodical. In 1913 he took over the interest of A. S. Ochs in the Philadelphia Public Ledger.

CURTIS, Edward, American medical scientist: b. Providence, R. I., 1 June 1836. He is a brother of G. W. Curtis, q. v. He graduated at Harvard in 1859, and took his medical degree at the University of Pennsylvania in 1864. He was an army surgeon during
the Civil War and from 1866 was a member of the faculty of the College of Physicians and Surgeons in New York. He made a specialty of microscopic study and the camera in connection with diagnosis, and later became assistant field geologist of the United States Geological Survey. He was the first to apply aerial perspective to topographical models; this he did in models of Boston and vicinity, and of the city of Washington as it existed and as it would appear if a proposed development were carried out. A member of the expedition to the West Indian eruptions, he was the first to visit the crater of La Soufrière and discovered the new summit of Mount Pelée. He also spent a year among the coral islands of the south Pacific and made a special study of the Atlantic coast from Maine to Newfoundland, and in 1913 made a tour of the world studying volcanoes. Besides his special geological and topographical articles, he is author and illustrator of "A Description of the Topographical Model of Metropolitan Boston" (1900).

CURTIS, George William, American essayist and journalist: b. Providence, R. I., 24 Feb. 1824; d. New Brighton, Staten Island, N. Y., 31 Aug. 1892. At 18 he spent some months at Brook Farm (q.v.) and a few years later visited the Old World, the results of his travels appearing in "Nile Notes of a Howadji" (1851); and "The Howadji in Syria" (1852). He was an early sympathizer with the abolition movement and as the editor of Harper's Weekly for nearly a generation exercised a measurable influence over the more thoughtful of his countrymen. At an earlier period he was editor of Putnam's Magazine, which did not prove a financial success, and for many years thereafter he devoted the proceeds of his lecture tours to paying off the obligations incurred in relation to that enterprise. From 1854 till not long before his death he edited the "Easy Chair" department of Harper's Magazine, and it is by his "Easy Chair" essays that he is likely to be longest remembered. In these are displayed a gentle persuasiveness of argument and a fund of humor which made them very attractive reading, while the style was at all times polished and graceful. In them he touched upon varied topics of the day, the lighter as well as the more serious, and since his death several small volumes of selections from them have been published. He was one of the leaders of the Republican party at its outset and in his later life was conspicuous as an advocate of civil service reform and of independent action in politics. He declined offers of diplomatic service abroad. A short time before his death he was made chancellor of the University of New York. As a lecturer and orator he was very popular, and several of his political speeches and orations upon special occasions take high rank among specimens of American oratory. Besides the volumes already named he published "Lotus Eating" (1852); "The Potiphar Papers" (1853); "Prue and I" (1855); "Trumps" (1862). These are more or less ephemeral in their nature, "Prue and I" being the only work among them which interests the present generation. "Maple and Moods: A Fifteen-Year Calendar" (1903); "Nature and Health" (1906).

CURTIS, John Ticknor, American lawyer, author and publisher: b. Watertown, Mass., 26 Nov. 1812; d. New York, 25 March 1894. He was graduated from Harvard in 1832, admitted to the bar (Boston, Mass.) in 1836 and practised in Worcester, Mass., and Boston. From 1840 he sat three years in the lower house of the Massachusetts legislature, after which he devoted himself entirely to law and literature. One of his earliest literary productions was a pamphlet advocating State compensation for the destruction by a mob of the Ursuline Convent in Charlestown, Mass. His ability as a patent lawyer gained him the patronage of many distinguished inventors. In 1852 he visited England, where he met the prominent men of the time. On his return he strongly supported the compromise measures of 1850, and in 1857 participated in the famous Dred Scott case in the Supreme Court of the United States, claiming the power of Congress to prohibit slavery. He migrated to New York in 1862, and was engaged in active practice up to his 80th year. He never held any official position beyond his legislative experience of three years in Massachusetts, though he was more than once offered the nomination to a seat on the bench in New York city, and by Daniel Webster the post of Minister to England. Besides many contributions to the press he published a number of authoritative works on law and constitutional history, the more celebrated ones being a Digest of Admiralty Decisions in England and America; a "Treatise on the Rights and Duties of Merchant Steamers"; "Origin, Foundation and Adoption of the Constitution" (1854-58); "Commentaries on the Jurisdiction, Practice and Precedent Jurisprudence of the Courts of the United States" (1854); "The Nature of the American Union, as the principal controversy involved in the late Civil War" (1875); "Life of Daniel Webster" (1869); "Life of James Buchanan" (1883); "Treatise on the Law of Patents" (1849); "Treatise on the Law of Copyright" (1847); "John Chambers: a Tale of the Civil War in America"; "John Charaxes"; "Creation or Evolution".

CURTIS, Mattoon Monroe, American educator: b. Rome, N. Y., 19 Oct. 1858. He was graduated at Hamilton College, New York, 1880, and from the Union Theological Seminary in 1883. He was pastor of a Presbyterian church at Cleveland, Ohio, 1885-88, and in 1891 was elected Handy professor of philosophy in the Western Reserve University. He has published "Locke's Ethics" (1890); "Philosophy and Physical Science" (1892) and "The Mind in America" (1896); "Kant and Edwards" (1895), etc.

CURTIS, Olin Alfred, American theologian: b. Frankfort, Me., 10 Dec. 1850. He was educated at Lawrence College and Boston University, and at the universities of Leipzig,
Erlangen, Marburg and Edinburgh. He served as pastor of Methodist Episcopal churches in Janesville, Wis., 1883-88, Milwaukee 1883-86, and Chicago 1888-89; from 1889 to 1895 he was professor of systematic theology at Boston University, and in 1896 accepted the corresponding chair at All Souls. Professor Curtis came to be recognized as perhaps the most distinguished Methodist theologian of his generation. Besides many theological papers, his publications include 'Elective Course of Literature of Christian Systematic Theology' (1901), and 'The Christian Faith Personally Given in the System of Doctrine' (1905), a work of great importance.

CURTIS, Samuel Ryan, American soldier: b. near Champlain, N. Y., 3 Feb. 1807; d. Council Bluffs, Iowa, 26 Dec. 1866. He was graduated at West Point in 1831, but resigned to become a civil engineer. He studied law, was admitted to the bar and practised from 1843-45. He served as colonel in the Mexican War, and was a Republican congressman from his State 1857-61. He was commissioned a brigadier-general 1 May 1861: defeated Generals Price and McCulloch in a decisive engagement at Pea Ridge, Ark., and was promoted major-general 21 March 1862. He subsequently commanded the departments of Missouri (1862-63), of Kansas (1863-65), and of the Northwest (1865); and becoming United States commissioner in 1865, negotiated treaties with several Indian tribes.

CURTIS, William Eleroy, American journalist: b. Akron, Ohio, 5 Nov. 1850; d. 1911. He was graduated at Western Reserve University in 1871. From 1873 to 1878 he was on the staff of the Chicago Inter-Ocean, and later in securing interviews with the James brothers, during their contest with Pinkerton's detectives, and in investigating the Ku-Klux-Klan of the South gained a national reputation. He was for a time Washington correspondent of the Chicago Record in 1887-1901, when he became associated with the Chicago Record-Herald. He was a commissioner of the United States to the Central and South American republics in 1885 and subsequently with the United States Department of State, attended the International American Conference of 1889-90. He has written 'Children of the Sun' (1882); 'Capitals of Spanish America' (1888); 'The Land of the Nihilist' (1888); 'Japan Sketches' (1891); 'Venezuela' (1891); 'Life of Zachariah Chandler'; 'The Yankees of the East' (1896); 'To-day in France and Germany' (1897); 'Between the Andes and the Ocean' (1900); 'The True Thomas Jefferson' (1901); 'Denmark, Sweden, and Norway' (1902); 'The Turk and His Lost Provinces' (1902); 'The True Abraham Lincoln' (1903); 'To-day in Syria and Paleistine' (1904); 'Modern India' (1905); 'Egypt, Burma, and British Malayias' (1905), etc. He was director of the Bureau of American Republics 1890-93, and chief of the Latin-American department of historical section of the World's Columbian Exposition 1891-93.

CURTISS, Glenn Hammond, American aviator: b. Hammondson, N. Y., 21 May 1878. He began life as a newshoys, but was early interested in mechanics. In 1906 at Ormond Beach, Fla., he established the world's record for the farthest flight ever traveled on a motor cycle, making a mile in 26 2/5 seconds. From 1907 to 1909 he was the director of the Aerial Exper-
dorl, 12 Aug. 1885, he was a brother of Ernst Curtius (q.v.), and in 1849 went to Prague as professor of classical philology, removing five years later to the corresponding chair at Kiel. In 1861 he became professor in Leipzig University and held this post till his death. He was the teacher of many of the foremost philologists of the day. His earliest work was 'De Nominiun Graecorum Formatae' (1842); and among many important later ones are the 'Indogermandische Grammatik' (1853), his 'Chef d'oeuvre' translated into English by Wilkins and England; 'Zur Chronologie der indogermanischen Sprachfor- schung' (1867); 'Das Verbum der griechischen Sprache' (1873 and 1876); and 'Griechische Schulgrammatik' (1852), the last two having been translated for English students; 'Sprachvergleichung, Beiträge zur griechischen und lateinischen Grammatik' (1846); and in his 'Studien zur griechischen und lateinischen Grammatik' (1868-70) he published not only his own studies, but a number of his pupils and others. Consult Sandys, 'A History of Classical Scholar- ship' (Vol. III, Cambridge 1908); and Platten, 'The Topography and Monuments of Ancient Rome' (2nd ed., Boston 1911).

Curtius, ker'shul-tus, Mettus, Roman legendary hero, who, according to tradition, sacrificed himself for the good of his country. In 362 B.C. it is said a chasm opened in the Roman forum, from which issued pestilential vapors. The oracle declared that the chasm would close whenever that which constituted the glory of Rome should be thrown into it. Curtius asked if anything in Rome were more precious than arms and valor; and being answered in the negative, arrayed himself in armor, mounted a horse splendidly equipped, solemnly devoted himself to death in presence of the Roman people and sprang into the abyss, which instantly closed over him. The laus Curtius, which marked the spot, has been discovered by the modern archaeologist. An altar was erected on the spot and a regular sacrifice offered there.

Curtius, Rufus Quintus, Roman historian. He wrote the history of Alexander the Great in 10 books, the first two of which are lost. The exact period in which he flourished is not known; for though his style would indicate that he lived in one of the best periods of the Latin language, no writer of any earlier date than the 12th century has made any mention of the Curtius. His information is insecure and the book is, on the whole, unreliable. The style is generally polished and elegant. Modern editions are by Vogel (Leipzig 1884); Dosson (Paris 1887); and Hetdick (1908). An English translation by Crosby was published in New York and London (1858). Consult Dosson, S., 'Etude sur Quinte Curce, sa vie et ses œuvres' (1887); Steele, in Proceedings of the American Philological Association (Vols. XLIII, LI-LIV, 1912); and the English edition by Laven (Cambridge 1889).

Curtius, koor'te-oos, Theodor, German chemist: b. Duisburg, 27 May 1857. He studied at Leipzig, Heidelberg and Munich; in 1886 was lecturer at the University of Erlangen; in 1889 became professor of chemistry at Kiel; in 1897 he went to Bonn, but on the death of Victor Meyer, in the same year, accepted the professorship of chemistry at the University of Heidelberg. He investigated the diazo-compounds of the fats and discovered hydrazine and hydrazoic acid, both compounds of nitrogen.

Curule Magistrates were the highest dignitaries of the Roman state and distinguished from all others by enjoying the privilege of sitting on ivory chairs (sella curules) when engaged in their public functions. The curule magistrates were the consuls, praetors, censors and chief aediles, who, to distinguish them from the plebeian aediles, were called curule.

Curves, Higher Plane. A curve can be looked upon in many ways: geometrically as the intersection of two surfaces, as the locus of a moving point, or envelope of a moving line; analytically as a representation of an equation in point- or line-co-ordinates, and therefore as yielding a singly infinite system of points or lines. But if this view be adopted, the "curve" must not necessarily be regarded as identical with the system of points; for most curves (not all) have tangents, hence a curve yields also a system of lines, of equal importance with the system of points; a definition that lays stress on one system to the exclusion of the other is incomplete. This was recognized by Plucker ('Theorie der algebraischen Curven', 1839, p. 200), in his statement of the dual generation of a curve: "If a point continually moves along a straight line, while the line continually rotates about the point, one and the same curve is enveloped by the line and described by the point." Clifford ('Math. Papers,' pp. 40-42) treats the true curve as an undefined entity, of which the assemblages of points and lines are two distinct manifestations. The present tendency is toward this view, at least as regards an algebraic curve—a curve whose equation, whether in point- or line-co-ordinates, is algebraic. A curve whose Cartesian equation cannot be reduced to an algebraic form is called a transcendental curve. It is non-algebraic or transcendent. It is convenient to treat first of algebraic curves.

If \( f(x, y) = 0 \) it can be shown that \( \frac{dy}{dx} \) has a definite value \( \left( -\frac{\frac{df}{dx}}{\frac{df}{dy}} \right) \) unless both \( \frac{df}{dx} \) and \( \frac{df}{dy} \) vanish. There is therefore a tangent, \( \frac{df}{dx} + \frac{dy}{dx} \left( \frac{df}{dy} + \frac{dy}{dx} \right) = 0 \). In homogeneous co-ordinates \( \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} + \frac{\partial f}{\partial z} = 0 \). The co-ordinates of the tangent are:

\[ \xi : \eta : \zeta = \frac{\partial f}{\partial x} : \frac{\partial f}{\partial y} : \frac{\partial f}{\partial z} \]
number of tangents that pass through an arbitrary point they belong respectively to the point system and the line system, not to the curve itself. A number that is more intimately associated with the curve is the genus, \( p \), to be defined later.

An algebraic curve cannot break off; the tangent cannot suffer a sudden change in direction; no finite part of the curve can coincide with a straight line. Thus the normal character of an arc of an algebraic curve expresses gradual and continuous change of position (motion of point), gradual and continuous change of direction (motion of tangent), as stated by Plücker.

The number of terms in the equation \( f(x, y, z) = 0 \) is \( \frac{1}{2}(m + 1)(m + 2); \) the number of disposable constants is therefore \( \frac{1}{2}(m + 1)(m + 2) - 1 \), i.e., \( \frac{1}{2}m(m + 3) \). Hence passage through \( \frac{1}{2}m(m + 3) \) arbitrary points determines the curve; while if the curve passes through \( \frac{1}{2}m(m + 3) - q \) arbitrary points, the coefficients can be expressed linearly in terms of \( q \) parameters, and the curve has \( \frac{1}{2}m(m + 3) - q \) degrees of freedom. If the points are not arbitrary, the curve may have mobility greater than \( q \), or it may break up into curves of lower order. The theory is really that of the intersections of curves. Two curves of orders \( m, m' \) intersect in \( mm' \) points, for the elimination of \( z \) from the equations produces an equation of degree \( mm' \) for \( x, y \). The \( m' \) intersections of two \( m \)-ics, \( u, v \), do not determine an \( m \)-ic (although \( m \geq m' \)), \( \frac{1}{2}m(m + 3) \), for all curves \( u + kv = 0 \) pass through the points; the \( m' \) points are precisely \( \frac{1}{2}m(m + 3) - 1 \) conditions. Similarly, the \( mm' \) intersections of \( C_m \) and \( C_{m'} \) do not impose independent conditions on all curves; e.g., the 20 intersections of a quartic and a cubic impose 14 conditions on a quartic, 17 on a quintic, 19 on a sextic, but 20 on all higher curves. The most convenient statement is: the quartic excess is 6, the quintic excess is 3, the sextic excess is 1 (Macaulay). The first notice of theorems of this character is due to Maclaurin (1720); the first explanation was given by Euler and Graeffe (1748-50). From this has arisen the whole modern theory of groups of points on a curve (geometry on a curve).

The fundamental theorem is the Cayley-Bacharach theorem (1843, 1886): a \( C_m \), through all except \( \frac{1}{2}(m + m - n - 1)(l + m - n - 2) \) of the intersections of \( Cl \) and \( C_m \) will pass through the remainder unless these lie on a curve of order \( l + m - n - 3 \). In particular if \( l = n \), precisely \( \frac{1}{2}(m - 1)(m - 2) \) of the intersections of a fixed \( C_m \) by a variable \( C_m \) is a consequence of the rest if \( n > m - 3 \); but if \( n \leq m - 3 \), fewer than \( \frac{1}{2}(m - 1) \) \( (m - 2) \) is a consequence. Thus no matter what the order of the cutting curve, the number of the induced intersections can never exceed \( \frac{1}{2}(m - 1) \) \( (m - 2) \). This number, which limits the interconnection of points on the curve of order \( m \), is called the genus of the curve, and is usually denoted by \( p \). The genus of a quartic, e.g., is 3; 3 points on a quartic follow from 5 intersections with a conic, or from 9, 13, 17 intersections with a cubic, quartic, or quintic, and so on.

If a curve has multiple points, corresponding theorems hold and preserve their significance, provided the cutting curve is an adjoint curve, that is, a curve with a multiple point of order \( k - 1 \) where the fixed curve has a multiple point of order \( k \). The genus, the number \( p \) which limits the interconnection, is in this case \( \frac{1}{2}(m - 1)(m - 2) - \frac{1}{2}k(k - 1) \). (Macaulay, 'Proc. Lond. Math. Soc.,' 1875, pp. 495-544; 1876; Hardcastle, 'Report on Point Groups,' in progress in Proc. of the Brit. Assoc., Brill-Neuhofer Bericht, 'Die Entwicklung der Theorie der algebraischen Functionen in älterer und neuerer Zeit' (1894).

Multiple points arise when two or more points of the system occupy the same position in the plane; according to the number of points that coincide, the point is double, triple, etc. Double points (dps) are nodes or cusps, a node is the coincidence of two non-consecutive points, a cusp is the coincidence of two consecutive points; similarly double tangents are either bitangents or inflexional tangents. The cusp and inflexional tangent are also called stationary point and line, on account of the effect of the singularity on the tangent point and line by which the curve is described.

The coincidence of two points at \( P \) causes an arbitrary line through \( P \) to meet the curve in two points there; hence if \( P \) be taken as origin, the terms of the first degree in the equation will vanish. The conditions for a double point at \( x, y, z \) are therefore the vanishing of \( f, \frac{df}{dx}, \frac{df}{dy}, \frac{df}{dz} \) (in homogeneous co-ordinates, \( \frac{df}{dx}, \frac{df}{dy}, \frac{df}{dz} \)). Two lines can be found to meet the curve in more than two points at \( P \); these are the tangents; they are given by the terms of degree 2 equated to zero. Similarly the conditions for a \( k \)-point are the vanishing of \( \frac{1}{k}k(k + 1) \) derivates: \( (a + \beta + \gamma + \ldots + k - 1) \), and there are \( k \) tangents, lines which meet the curve in more than \( k \) points.

If the tangents at a dp are distinct, the point is a node, formed by the crossing of two simple branches, real or imaginary according as the tangents are real or imaginary. In this last case, the point is detached from the main body of the curve, and is called an isolated point, or acnode, the visible crossing being called a node, or crenule. If the tangents are coincident, and meet the curve in precisely three points, the point is a cusp; if the coincident tangents meet the curve in more than three points, the singularity is complex.

Elimination of \( x, y, z \), from \( \frac{df}{dx} = 0, \frac{df}{dy} = 0, \frac{df}{dz} = 0 \) gives a condition, \( D = 0 \), to be satisfied by the equation of any curve that has a dp. Hence a general locus of order \( m \) has no point singularities, and a general envelope of class \( n \) has no line singularities. But a general envelope has point-singularities and a general locus has line-singularities; for the direction of a tangent, given by the value of \( \frac{dy}{dx} \) is unchanged if \( \frac{dy}{dx} = 0 \), i.e., if

\[
\frac{df}{dx} \frac{dy}{dx} + \frac{df}{dy} \frac{dx}{dy} + \frac{df}{dz} \frac{dz}{dx} = 0.
\]
CURVES

This condition, and \( f' = 0 \), are only two equations, and consequently no condition is imposed on the locus by the existence of line-singularities.

If a curve of order \( m \), class \( n \), has \( v \) nodes, \( \xi \) cusps, \( \tau \) bitangents, \( t \) inflexional tangents, these numbers are connected by Plücker's equations. The tangent at \( x, y, z \) is

\[
X \frac{\partial f}{\partial x} + Y \frac{\partial f}{\partial y} + Z \frac{\partial f}{\partial z} = 0;
\]

this passes through \( x', y', z' \) if \( x, y, z \) lie on the curve \( x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} + z \frac{\partial f}{\partial z} = 0 \), the polar of \( x', y', z' \) with respect to \( f \). Since this curve, \( df = 0 \), is of order \( m - 1 \), it meets \( f \) in \( m(m - 1) \) points; two of these lie at every node, three at every cusp; hence the number of tangents from 

\[
X = mn(m - 1) - 2v - 3s.
\]

Similarly from the line-equation,

\[
m = n(n - 1) - 2r - 3s.
\]

The condition that the tangent at \( x, y, z \) be stationary becomes in homogeneous co-ordinates

\[
\begin{vmatrix}
\frac{\partial f}{\partial x} & \frac{\partial f}{\partial y} & \frac{\partial f}{\partial z} \\
\frac{\partial^2 f}{\partial x^2} & \frac{\partial^2 f}{\partial y^2} & \frac{\partial^2 f}{\partial z^2} \\
\frac{\partial^2 f}{\partial x \partial y} & \frac{\partial^2 f}{\partial x \partial z} & \frac{\partial^2 f}{\partial y \partial z}
\end{vmatrix} = 0;
\]

the point of contact must lie on this curve, \( H(f) = 0 \), the Hessian of \( f \), of order \( 3(m - 2) \). At a node on \( f \), \( H \) has a node with the same tangents; at a cusp, \( H \) has a triple point, composed of two branches touching the cuspidal tangent with one branch cutting it; the numbers of intersections are \( 6 \) and \( 8 \). Hence

\[
\tau = 3m(m - 2) = 6v - 8x,
\]

and reciprocally

\[
k = 3n(n - 2) - 6s - 8t.
\]

Any one of these four equations can be obtained algebraically from the others. From these we can find also \( (3 \text{ and } 3') \) expressions for \( \tau \) in terms of \( m, v, s \), and for \( \tau \) in terms of \( n, t \).

These six are Plücker's equations; three only are independent. It must not however be supposed that we can choose any three of the numbers arbitrarily. There is a limit to the number of dps that a proper curve can have; \( \sqrt{3} \) on this one, \( \sqrt{3} \) on the other. For if the curve had one more, a curve of order \( m - 2 \) could be passed through the dps and \( m - 3 \) other points on the curve; but this would have with \( f \) intersections in number \( 2(1 + (m - 1)(m - 2) + \cdots + (m - 3)) \), i.e., \( m(m - 1) + 1 \), which is impossible. A curve can actually have this number of dps; it is then called rational (or unicursal), because the co-ordinates of any point can be expressed rationally in terms of a parameter, as follows: The dps and \( m - 3 \) other points on \( f \) determine \( (m - 2) \)-ics with one degree of freedom, a system of the \( m(m - 2) \) intersections of one of these with \( f \), all except one are at the fixed points; the co-ordinates of the one remaining variable intersection are therefore given rationally in terms of the parameter \( k \) by \( f = 0, u + kv = 0 \).

If the curve has not this number of dps, let it have \( \delta (\gamma + s) \); the number \( 4(m - 1)(m - 2) \) has already been given as the genus, was originally called the deficiency of the curve (Cayley).\footnote{During the last 30 years the whole theory of plane algebraic curves has been modified in important respects, especially the influence of the theory of functions; in particular, this has shown the significance of the genus.} From Plücker's equations we find

\[
\frac{1}{(m - 1)(m - 2)} - \frac{1}{v - 1} = \frac{1}{(n - 1)(n - 2)} - \frac{1}{1},
\]

i.e., the point deficiency and the line deficiency are equal; the deficiency (or genus) does not belong specially to the point system or the line system. In particular, if the curve is rational qua locus, it is rational qua envelope. If we introduce \( \eta \) for the genus, the equations assume a convenient form.

\[
\frac{1}{m(m - 3)} - \frac{2}{v - 1} = \frac{1}{n(n - 3)} - \frac{2}{(r + 1)},
\]

There are other limitations on these numbers, but the theorem is not complete. Clebsch proved (Crell's, v. 64, p. 51; 1864) that the number of cusps on a rational curve cannot exceed \( \frac{1}{2} (m - 2) \); the more general question as to the maximum number of cusps for a curve of assigned order awaits solution.

So far the singularities have been supposed to be simple. A multiple point of order higher than the second is, in a certain sense, equivalent to a number of simple singularities. If the tangents at a \( k \)-point are distinct, the point arises from the crossing of \( k \) branches; these cause \( \frac{1}{2} k(k - 1) \) intersections, nodes by the geometrical definition. It can be shown that such a point reduces the class of the curve, the number of inflexions, and the genus by \( 2k \) each. The point cannot be replaced by these nodes for all purposes, e.g., as regards the number of conditions; the \( k \)-point imposes \( \frac{1}{2} k(k + 1) \) conditions, whereas the nodes would impose \( k(k + 1) \), i.e., \( \frac{1}{2} k(k + 1) + k(k - 1) \). It is an important fact that this equivalence holds only as regards the conditions imposed on adjoint curves; the presence of the \( (k - 1) \)-point on the adjoint imposes \( \frac{1}{2} k(k + 1) \) conditions, equal to the number that would be imposed on the adjoint by \( \frac{1}{2} k(k - 1) \) separate nodes.

If the tangents are not distinct, the matter may become very complicated. The multiple point immediately revealed by the equation may be but one of a series of multiple points indefinitely close together, and the singularity then involves also multiple tangents. The determination of the point- and line-components, the "analysis of higher singularities," has received much attention. If the singularities are regarded as singularities of the equation, the question is properly considered from the algebraic standpoint. At an ordinary point of the curve, some can be expanded in an ascending series of positive integral powers of \( x \), provided \( x = 0 \) is not the tangent; at a \( k \)-point the process is not directly applicable, it requires some modifications, and then leads to \( k \) expansions, with exponents either integral or fractional. An expansion with fractional exponents, whose L.C.D. is \( g \), is accompanied by the \( g - 1 \) conjugate
expansions, thus forming a cycle of order \( q \) (Puiseux). The integral expansion is a cycle, \( q = 1 \), and the \( k \)-point is represented by a number of cycles of orders \( q_k, q_k, q_k, \ldots \) where \( 2q = k \). The number of cusps in a cycle is \( q - 1 \); this agrees with the known facts about the simple curve (y = \( a_0 x^4 \)), and is a generalization of the algebraic definition of cusps. The algebraic definition of a node is indeterminate; it yields always a positive integral value for \( v \). (Chrystal, 'Algebra,' v. 2, 1889, pp. 359–371; Harlends and Morley, 'Treatise on the Theory of Functions,' 1893, pp. 127–151; Brill-Noether Bericht, pp. 367–402 for full references.) Die Entwicklung der Theorie der algebraischen Funktionen in älterer und neuerer Zeit (1894).

The process as outlined above, dealing with the expansions as a whole, simply enumerates the components, algebraically defined, of a singularity; it affords no clue to the structure. The expression for the algebraic description of the singularity (Smith, H. J. S., 'Proc. Lond. Math. Soc.,' v. 6, pp. 153–182; 1876; Halphen, 'Mém. prés. à l'Ac. des Sc. de Paris,' v. 26, 1877; Zeuthen, 'Math. Ann.,' v. 10, pp. 210–220; 1876). A different treatment of the expansions, due to Noether, gives a clearer idea of the structure.

By a geometrical process, depending on the simplest Cremona transformation (see below), it is possible not only to enumerate the multiple points and lines contained in any singularity, but also to construct a penultimate form to indicate the arrangement of these components. (Scott, 'Am. J. Math.,' v. 14, pp. 301–325; v. 15, pp. 221–243; 189–93).

The various processes lead to the following conclusions as to the content of a complex singularity. The points of any cycle of order \( q \) with terms gives the order, \( k \), of the singularity; the line-equation gives the class, \( l \). If \( k = 1 \), the singularity is an isolated point, and the tangent at the point, and thus the class is known without reference to the line-equation. Coincident tangents may lead to other multiple points, or to chains of multiple points, contained in the singularity; if the total number of \( k \)-points in these is \( k' \), the singularity has \( k' \) independent double points. It has also independent double lines, \( k' \) in number, and it has proved that \( k' = k \). The singularity of order \( k \), class \( l \), greater \( h \) (supposed irreducible), involves \( k(k - 1) + h \) lines, of which \( h - 1 \) is a cusp, and \( h(l - 1) + k \) lines, of which \( l - 1 \) are inflexional tangents. The singularity is equivalent to those components as regards Plücker's equations and as regards the genus; but not in the number of conditions imposed on the curve. The number of the multiple points of a curve cannot always be chosen arbitrarily. A sextic, e.g., can have 10 dps; but these, chosen arbitrarily, would impose 30 conditions, whereas 27 conditions cannot be imposed by 9 dps arbitrarily chosen, for these would determine only the reducible sextic \( v = 0 \), where \( v \) is the cubic through the 9. If the 9 admit of a proper sextic, \( u = 0 \), they allow one degree of freedom, for all curves \( u + kv = 0 \) satisfy the conditions. Hence the 9 are not arbitrary. The theorems of geometry on a curve, and in general results of this character, but there are evidently many special theorems as to the position of singularities to be formulated for curves of specified order or class.

By means of a birational transformation, either of the whole curve or of the one curve, it is possible to change any curve into one, in general of different order, with point-singularities except simple nodes. Let \( P, (x, y, z) \) become \( P', (x', y', z') \) (represented on a second plane for distinctness), where \( x', y', z' \) are given by

\[ x' = y' = z' = \phi(x, y, z); x = \psi(x, y, z); \phi(x, y, z); \]

then corresponding to any point \( P \) of the first plane \( II \) there is one point \( P' \) of the second plane \( II' \); but the converse does not hold. The straight lines of \( II' \) are axis of \( II' \) correspond to the \( \alpha \) transformation-curves in \( II, \alpha \) in \( \alpha \), and \( \alpha \) in \( \alpha \), of order \( \alpha \); to a single point \( P' \) of \( II' \), given as the intersection of two lines, there correspond in \( II \) all the \( \alpha \) variable inter sections of two \( \alpha \) lines, \( P_1, P_2, \ldots, P \); the correspondence of the two \( \alpha \) lines is said to be \( \alpha \)-to-one, \( \alpha \) (\( \alpha, 1 \)). Since the \( \alpha \)'s may have fixed points, simple or multiple, \( A_1, A_2, \ldots \) of orders \( \beta, \beta, \ldots \), \( \beta \) may be less than \( \alpha \).

If \( \alpha > 1 \), i.e. if one point of \( II \) corresponds to one point of \( II' \), the equations of transformation are reversible; not only is \( II' \) expressed rationally in terms of \( II \) by these equations, but also \( II \) is expressed rationally in terms of \( II' \) by \( x'y'z' = \psi(x, y, z); \phi(x, y, z); \psi(x, y, z); \). The reversed equations, which are of the same order \( \alpha \). The transformation is a birational transformation of the plane, usually called a Cremona transformation. In the simplest Cremona transformation the \( \alpha \)'s are conics through three fixed points; the equations of transformation are therefore of the second degree; this is a theorem of the most important theorems that every Cremona transformation can be accomplished by a succession of these reversible quadratic transformations. If \( \alpha > 1 \), the equations cannot be reverted; the transformation is therefore not birational for the whole plane. But if \( P_1, P_2, \ldots, P \) trace some curve, \( F' \) trace the corresponding curve \( F' \); the points \( P_1, P_2, \ldots, P \) trace some curve, \( F \) (different from \( F' \), the companion curve of \( F \)). If we ignore all of \( II \) except \( F \), that is, if we confine ourselves to the two curves \( F, F' \), the correspondence becomes one-to-one; with the help of the equation \( F = 0 \) the equations of transformation can be reverted, and the transformation becomes birational. Such a birational transformation of a curve is called a Riemann transformation. Thus a Riemann transformation is birational for the whole one curve only, while a Cremona transformation is birational for the whole plane, and therefore for every curve in the plane.

The importance of transformation is due to its effect on singularities. The fixed points \( A_1, A_2, A_3, \ldots \) in \( II \) have no corresponding points in \( II' \), but a point close to \( A_1 \) in a determinate direction has a determinate correspondent, and if a point describes a small circuit about \( A_1 \), the corresponding point in \( II' \) describes a curve \( \alpha \),
rational and of order \( n \); this is a fundamental curve of the second plane. If \( F \) passes \( k \) times through \( A_1', F' \) cuts \( a_1' \) \( k \) at points; if the \( k \) directions through \( A_1' \) are distinct these points are \( k \) distinct \( a_1' \). If \( F \) is dissipated. If any of the \( k \) tangents at \( A_1' \) coincide, \( F' \) has contact with \( a_1' \); or it may have a multiple point on \( a_1' \) but of a less complex character than the original at \( A_1' \); and by retractions of the process the singularity is made to disappear.

But new singularities may arise, due to fundamental curves in the first plane. Such fundamental curves might be defined by means of the reverted equations of transformation; but as it is not usually convenient actually to form these (at least in the case of a Riemann transformation), it is simpler to adopt an independent definition. An irreducible curve \( b' \) that meets the transformation curves \( \phi \) only at their fixed points, is a part of the system; all points on such a curve, \( b' \), correspond to a single point \( B' \) of \( I' \); or, more precisely, to points close to \( B' \) in different directions. If then \( F' \) meets \( b' \) in \( k \) points, \( F' \) has at \( B' \) a multiple point of order \( k \).

Finally, new multiple points, in general only simple nodes, arise on \( F' \) owing to the passage of \( F \) through associated points of the first plane (intersections of two \( \phi' \)’s). Such passages are indicated by intersections of \( F \) with its companion curve \( f' \); hence they are in general inevitable.

By either transformation, Cremona or Riemann, the multiple points on the given curve can be dissipated, whether the tangents are distinct or coincident. A Cremona transformation-system, however, always has fundamental curves, whose number is equal to that of the fundamental points (Bertini, Palermo Rendiconti, v. 3, pp. 5-21, 1899); hence when \( F \) is transformed, new multiple points, possibly of high order, will arise unless the Cremona system is specially chosen. A Riemann transformation-system, on the contrary, need not have any fundamental curves, hence in general the new multiple points that arise will be simple nodes. A transformation, however, requires the elimination of \( x \): \( y \): \( z \) from the equations of transformation, of degree \( \sigma \), together with \( F = 0 \), of degree \( m \); whereas a Cremona transformation is accomplished by the direct substitution of \( \psi(x, y, z) \), \( \psi(x', y', z') \), \( \psi(x', y', z') \) for \( x, y, z \) (Hilbert, Einführung in die Curve, chap. 8) in the German translation by Fiedler; also references at end; Scott, Quart. Jour., v. 29, pp. 329-381, 1898; v. 32, pp. 203-239, 1900).

When a curve is subjected to a birational transformation of the first kind, Cremona or Riemann, the induced points of a group of intersections transform into the induced points of the transformed group; this affords one proof (Bertini) of the important theorem that two curves which are birationally connected are of the same genus. The converse is not true; curves of the same genus cannot necessarily be birationally transformed into one another. A curve of genus \( p \) depends in general on 3(p - 1) characteristic constants, the so-called moduli, if these are equal for two curves, then the two curves are birationally equivalent. (Clebsch-Lindemann, Vorlesungen über Geometrie, 1876, pp. 709-720).

Closely connected with this is the transformation of a curve into itself. This however is more conveniently considered as an independent theory, that of correspondence of points on a curve. (Cayley, Proc. Lond. Math. Soc., 1866-66; no. 385; multiple points on \( F \) is dissipated. If any of the \( k \) tangents at \( A_1' \) coincide, \( F' \) has contact with \( a_1' \); or it may have a multiple point on \( a_1' \) but of a less complex character than the original at \( A_1' \); and by retractions of the process the singularity is made to disappear.

An entirely distinct class of investigations deals with the form of curves (topology, analysis situs). The method employed by Riemann to vary the variation of the coefficients, by which the curve is derived from a known reducible curve of the same order. In this manner Klein proved (Math. Ann., 10, pp. 199-209, 1876) that the numbers of the real singularities are connected by the relation

\[ m + I + 2T' = n + K + 2A' \]

where \( I, K, T', A' \) are the numbers of real inflexions and cusps, isolated tangents and isolated points, on a curve of order \( m, \) class \( n. \) Hence if the curve has no point-singularities, \( m + 2T' = m + 2A' \) (from which it follows, since \( I = 3m - 4 \) (no singularities)), that no third of the inflexions of a non-singular locus can be real. Klein’s relation has been proved algebraically by Brill (Math. Ann., 16, pp. 348-408, 1880), and extended to complex singularities. There is no corresponding restriction on the bitangents; all may be real.

Topological theorems relate in general to the nature, number and arrangement of the distinct parts (circuits) of a curve. The first division of circuits, due to von Staudt, is into odd and even, for the number of real intersections with an arbitrary line is always odd or always even. An odd circuit necessarily extends through infinity. Simple examples are the oval and the infinite branch of a bipartite cubic \( y^2 = (x - a)(x - b)(x - c) \); but circuits may be much more complex. Let the minimum number of real intersections with a straight line be called the index of the circuit. Zeuthen showed (Math. Ann., 7, p. 426, 1874) that a quartic may have a circuit of index 2, with two nodes; Cayley showed (Phil. Mag., 29, 1865; no. 361, v. 5, Coll. Papers) that a sextic may have a circuit of index 2, without multiple points. It has been proved (Scott, Trans. Am. Math. Soc., 3, pp. 388-392, 1902) that for every order \( m \) there exists a curve \( (p = 0 \text{ or } 1) \), composed of a simple and of two nodes; \( m = 4, m = 6, \) down to 0 or 1, according as \( m \) is even or odd; any such circuit of index \( k \) can be produced by a simple process of linking from \( k \) odd circuits. The Zeuthen quartic circuit finds its place in this category; it is due to the linking of two odd circuits; but the non-singular sextic circuit is entirely different in character, and a general theory of such circuits is still to be suggested. 8

The possible number of circuits is \( p + 1 \). (Harnack, Math. Ann., 9, pp. 189-198, 1876) for every order \( m \) there exist curves with this maximum number of circuits, and with every smaller number.

The question of arrangement has been con-

---

Curves considered only with reference to circuits that can be projected into the finite circuits, the so-called ovals. Hilbert ("Math. Ann.," v. 38, pp. 115–138, 1891) discussed curves with "nestled ovals," whose simplest type is the annular quartic, composed of one oval inside another; the number of nested branches cannot exceed $\frac{1}{m}m(m - 2)$ or $\frac{1}{m}(m - 3)$, according as $m$ is even or odd; moreover, non-singular curves with the maximum number of circuits and the maximum number of nested ovals do exist.

Hilbert draws attention to the arrangement of the 11 ovals of a non-singular sextic ($p = 10$); he states that one of these must lie inside another (p. 118). It appears highly probable (V. Ragsdale, "Bull. Am. Math. Soc.," v. 11, p. 464, 1905) that this unproved theorem of Hilbert's is the simplest case of a general law in accordance with which at least $\frac{1}{m}(q - 1)(q - 2)$ of the circuits of a non-singular curve of order $2q$ must lie inside some of the remaining $q' = q(q - 1)(q - 2)$.

Thus as regards circuits the only question completely solved is that of the possible number; their nature: their arrangement as regards one another, or as regards the straight lines of the plane (on which depends the answer to the inquiry whether all the even circuits can be projected simultaneously into the finite), have been hardly touched upon, though there must be many interesting results awaiting discovery.

Although the general theory of polars belongs properly to the theory of algebraic forms, it supplies convenient expression for some geometrical facts. The first polar of $x'$, $y'$, $z'$ is the curve of order $m = 1$, $df = 0$, where $d$ denotes the operator $\frac{\partial}{\partial x} + y \frac{\partial}{\partial y} + z \frac{\partial}{\partial z}$. A second order with $A$ produces the second polar, $df = 0$, of order $m = 2$, and so on; thus any point has $m - 1$ polars, of which the last two are the polar conic and polar line. The polar conic of a dp is simply the pair of tangents; the polar conic of an inflexion consists of the inflexional tangent together with another line which does not pass through the inflexion; thus in both cases the polar conic has a dp. It is easily proved that if the polar conic of $A$ has $m$ $A$, the first polar of $A$ has a dp $B$. This suggests three derived curves: the locus of points $A$, the Steinerian, of order $3(m-2)^2$; the locus of points $B$, the Hessian, of order $3(m-2)$; the envelope of the line $AB$, the Cayleyan. Thus, e.g., the curve by which the points of inflexion are determined, the Hessian, is geometrically defined; every point is in a known geometrical relation to $f$. On the other hand, though it is known that a curve of order $(m-2)(m-9)$ can be passed through the points of contact of the bitangents, no geometrical definition of any such curve has yet been formulated. The curve is of course not unique; what is needed is a geometrical definition of some one curve that shall meet $f$ only at these points of contact, and at the multiple points, in such a way as to account for the whole number of intersections. (Cayley, "Coll. Papers," v. 11, pp. 471, 473).

The metric properties of a curve are important in particular questions, though not in the general theory. The curve has $m$ points at each of these, there is a tangent, which is an asymptote unless it lies entirely at infinity. Consequently for every non-repeated direction to infinity there is an asymptote; for a repeated direction there may or may not be asymptotes. A twofold direction, e.g., may be accounted for either by contact with the straight line at infinity, with no asymptote, or by a dp at infinity, with an asymptote, a tangent, or coincident point. A branch that has a real asymptote is called hyperbolic; a branch that has contact with the straight line at infinity, whether at a single point or at a multiple point, is called parabolic.

The curve has $n$ imaginary tangents from each of the circular points; these by their intersections determine the $n$* foci, of which $n$ are real (Pliicker's definition, 1833); but the number of foci is diminished if the curve passes through the circular points or touches the straight line at infinity.

There is a theory of diameters; these are the polars of points at infinity. The polar line of a point at infinity is the locus of the mean centre of the $m$ intersections of the curve with chords through the point (proved by Newton for cubics); this is analogous to the bisector property of a diameter of a conic. The other polar (curvilinear diameters) also can be explained in terms of the segments of the chords. (Salmon, H. P. C., chap. 4).

The first enumeration of varieties of a curve of any order beyond the second is Newton's "Enumeratio linearum tertii ordinis" (1706). He proves that all the 72 varieties (it should be 78) can be obtained by projection from the five types of cubic with an inflexional tangent at infinity (divergent parabolas), bipartite, unipartite, crunodal, acnodal and cuspidal. Similarly when once the distinct types of a curve of any order have been enumerated, the varieties can be obtained at once. There are 144 types of quartic (R. Gentry, "On the forms of plane quartic curves," 1896); the number for higher curves, even for quintics, must be very great. It does not appear that any special purpose would be served directly by the enumeration of these, though there are matters of interest in which this might throw light. For example, the theory of the inflexional tangents of a cubic has been thoroughly worked out; suitably taken in threes they determine three inflexions on a straight line; the three tangents and this line form a framework for the curve. As regards quartics, a closely corresponding theory is that of the bitangents; suitably taken in fours, these determine sets of eight points on the quartic, each set lying on a conic; the curve is conveniently referred to the four bitangents and the conic. What is the generalization of this? Even for the quintic, this is as yet unknown.

A more profitable classification of curves is according to their genus, and the values of the $(p-1)$ characteristic constants, or moduli. Rational $(p=0)$, elliptic $(p=1)$, and general elliptic curves (which include among others all curves with $p=2$) have been extensively treated. (Clebsch-Lindemann, pp. 883-903, 903-915, 915-923; also 711-712, 717-720; Loria, "Il passato ed il presente delle principali teorie geometriche," 2d edition, 1896, pp. 76-79 for references).

Investigations on special classes of algebraic
The curves are too numerous to mention; in particular, bicircular quartics and cartesians (with nodes, or cusps, at the circular points) have a literature to themselves. The Steiner curve, or deltoid (hypocycloid with three cusps), is perhaps the most interesting individual among algebraic curves, on account of its geometrical properties. (Loria, "I passato," etc., pp. 61-70.)

If a curve has an equation that cannot be expressed in finite algebraic form it is said to be transcendental. Algebraic and transcendental curves, however, are by no means as widely separated as this would suggest; e.g., the equation \( r = a \sin b \theta \) represents curves which are algebraic when \( b \) is rational, transcendental for all other values of \( b \). Thus the algebraic curves of the series bear to the whole series the relation that is borne by rational numbers to all numbers; they are isolated members, whose number is insignificant. The same is probably true of all algebraic curves; they are isolated members of transcendental families. It is not surprising, therefore, that there is as yet no general theory of transcendental curves. Results proved algebraically \(^1\) for the entire algebraic equation (e.g., Plucker's equations) are not applicable to transcendental curves, which from one point of view are of infinite order; while results that depend only on a small arc are in one case applicable. Such knowledge as we have of transcendental curves is obtained from metric investigations of special curves.

Among these special curves, one of the most important divisions is that of roulettes. A roulette is traced by a point attached to a curve, which itself rolls without slipping. The point of contact of the rolling curve with the fixed curve. A point on the circumference of a circle which rolls on a straight line traces a cycloid; if the circle rolls in or on a circle the roulette is an epicycloid or hypocycloid. If the point is not on the circumference of the rolling circle, the curve is an epitrochoid, epicycloid, or hypocycloid. The epicycloid or hypocycloid is algebraic if the radii of the two circles are commensurable. An important theorem, due to Descartes, is that the normal to a roulette at any point passes through the corresponding point of contact of the rolling curve with the fixed curve.

Some of the best known of the transcendental curves are the spiral of Archimedes, \( r = a \theta \); the hyperbolic spiral, \( r^\theta = a \); the logarithmic spiral, \( r^\theta = a \theta \); which cuts all its radii vectors at a constant angle; the logarithmic curve, \( y = e^\alpha x \), or \( s = m \log y \), which is noteworthy on account of the curious discontinuity of the negative branch (Salomon, H. P. C., chap. 7); the catenary, \( y = c \left( e^x / e^{-x} \right) \) the form assumed by a chain hanging from two points of support; the tractrix, \( x = c \log \left[ e^x + e^{-x} \right] / y \), which cuts all the tangents to the catenary orthogonally; this curve is of special interest on account of the use made of it by Beltrami ("Saggio d'interpretazione della geometria non-euclidea," 1868). (For detailed references consult Loria, "Spezielle algebraische und transcendente Kurven," etc., trans. by Schütte, 1902.)

All the curves hitherto mentioned have tangents, which vary continuously from point to point; but there are curves, graphical representations of certain functions, which differ in this respect. A curve may have a tangent at every point, which yet may not vary continuously; e.g., "polygonal lines," \( y = \int f(x) dx \), where \( f(x) \) is a certain arithmetic function; such a curve is composed of a number of segments of straight lines. (Gravé, "Comptes-rendus," v. 127, pp. 1005-1007, 1898.)

There are curves which are continuous, and yet have no definite tangents; the classic example, due to Weierstrass, is \( y = \Sigma^\infty_0 \sin \pi^n x^n \). (Wiener, "Crelle," v. 90, pp. 221-252, 1881.)

The explanation of the impossibility of assigning the tangent at any point of such an interval the curve makes an infinity of oscillations.

Another possible deviation from the natural idea of a curve was discovered by Peano ("Math. Ann.," v. 36, pp. 157-160, 1890). He shows that it is possible to construct functions \( \Psi(t) \) of a single variable such that the points \( x = \Psi(t), y = \Psi(t) \) occupy all positions inside a given square; thus a curve can cover a plane area. (For detailed discussion of such curves, consult E. H. Moore, "On Certain Crenelated Curves," trans., Am. Math. Soc., v. 1, pp. 72-90, 1900.)

These examples show clearly that the most general idea of a curve is far removed from the comparatively simple idea first presented in analytical geometry. The definition at present accepted of a plane curve without multiple points, due to Jordan and Hurwitz, has been thus expressed in English (by Osgood): "A set of points which can be referred in a one-to-one manner and continuously to the points of a segment of a right line, inclusive of the extremities of the segment, if the curve is not closed, and to the points of the circumference of a circle if the curve is closed." (Hurwitz, "Verhandlungen des ersten internationalen Mathematiker-Kongresses in Zürich," 1897, pp. 102, 103.)

Charlotte Angas Scott,
Professor of Mathematics, Bryn Mawr College.

CURVES OF DOUBLE CURVATURE

(For French, courbes gauches; in German, Curven doppelter Krummung.) A curve whose points do not all lie in a plane is variously called space curve, twisted curve, tortuous curve, or curve of double curvature. The significance of the last-named designation becomes apparent in the description of the elements which enter the theory of the curve. There are two ways of regarding the curve: first, as given immediately and in all its extent by the intersection of two surfaces—a purely geometric conception; second, as arising kinematically through the continuous movement of a point. The first conception leads to the analytical formulation of a curve as the locus of points whose Cartesian co-ordinates satisfy two equations, the equations of the intersecting surfaces:

(1) \( f_1(x, y, z) = 0 \), \( f_2(x, y, z) = 0 \).

The second conception leads to the expression of the Cartesian co-ordinates \( x, y, z \) as func-
tions of a variable magnitude \( w \) called the parameter:

\[
(2) \quad x = q(w), \quad y = \chi(w), \quad z = \psi(w),
\]

a form of representation called the parametric representation of the curve. To the continuous succession of values of \( w \) corresponds the continuous succession of points of the curve.

It is known that if not every curve in space is the complete intersection of two surfaces, and therefore (1) and (2) are not always equivalent forms. In fact, when the three equations (2), defining a curve, are transformed to the two equations (1), the latter often furnishes fewer branches in addition to the original curve. The parametric representation is, in many important respects, preferable to the first form, and such equations and formulas as are hereafter used will have reference to this form.

The subject matter may be conveniently divided into four parts: first, the determining elements of an infinitely small portion of the curve in the neighborhood of any point \( P \) of the curve; second, the character of the curve as associated with the associated curves and surfaces; third, special curves and their derivation from given properties; fourth, classification, miscellaneous matters and the literature of the subject.

1. The Elements of the Curve at a Point.

The consideration of two points, of three points and of four points of the curve conducts immediately to fundamental elements.

The tangent at \( P \) is the limiting position assumed by the right line through \( P \) and a neighboring point \( P_i \) of the curve as \( P_i \) moves along the curve toward coincidence with \( P \). It is convenient to say that the tangent at \( P \) is the right line through \( P \) and \( P_i \), \( P_i \) being infinitely near or coincident with \( P \), but it must be remembered that this and similar expressions which will be used further on are only abbreviations and figures of speech.

The single infinity of lines through \( P \) perpendicular to the tangent are normals to the curve and define the normal plane of the curve at \( P \). Every plane through the tangent is a plane at \( P \). A plane passing through \( P \) and two neighboring points of the curve assumes in general a limiting position at \( P \) as the two neighboring points move along the curve toward coincidence with \( P \). This is the plane of osculation at \( P \) and may be described as the plane determined by three consecutive points \( P, P_i, P_i \). It is the tangent plane at \( P \) which has the closest contact with the curve.

The plane through the tangent perpendicular to the plane of osculation is called the plane of rectification. The normal plane, the plane of osculation and the plane of rectification are mutually at right angles and constitute the principal planes of the curve at \( P \). Their intersecions are three lines through \( P \): the tangent, which is the intersection of the plane of osculation and the plane of rectification; the principal normal, which is the intersection of the normal plane and the plane of osculation; the binormal, the intersection of the normal plane and the plane of rectification. The three lines form a configuration called the principal triedral at \( P \).

Of importance in the theory is the circle of curvature, namely, the limit circle defined by the fixed point \( P \) and two variable points \( P_i, P_i \), as the variable points move along the curve toward coincidence with \( P \). It is referred to as the circle through three consecutive points \( P, P_i, P_i \) and obviously lies in the plane of osculation at \( P \). Its centre, radius and the reciprocal of the radius are called respectively the centre of curvature, the radius of curvature and the curvature of the curve at \( P \). Relative to the same, curve of double curvature, the curvature here described is properly first curvature, but it is customary to use the word "first". The second curvature, to be noted shortly, is usually referred to as torsion.

Four points not in a plane determine one sphere. Through \( P \) and three variable points of the curve a sphere may be passed, which, when the variable points come into coincidence with \( P \), becomes the sphere of osculation at \( P \). It will be subsequently seen that its centre and the centre of first curvature are on a line parallel to the binormal at \( P \).

The further development of the theory will employ the methods of the differential geometry in preference to limit processes. The elements already defined, when taken in pairs, give rise to new elements. The normal planes at the consecutive points \( P_i \) intersect in a line passing through the centre of curvature of \( P \) and parallel to the binormal at \( P \). It is called the axis of curvature of the curve at \( P \). The planes of rectification at \( P \) intersect in the line of rectification at \( P \). This line passes through \( P \), makes an angle with the binormal of \( P \) and is perpendicular to the principal normals of \( P \) and \( P_i \). The planes of osculation at \( P \) and \( P_i \) intersect in the tangent of the curve. The principal normals at \( P \) and \( P_i \) do not intersect, nor do the binormals of \( P \) and \( P_i \). The consecutive tangents do intersect in a point of the curve.

The Two Curvatures, or Curvature and Torsion.—As a point moves on the curve, the tangent continually changes its direction, as does also the plane of osculation: the first marks the tendency of the curve to depart from a right line, and the second the tendency to depart from a plane. Measures of these tendencies at a point \( P \) are defined as follows: If \( PP_i \) be an infinitesimally small arc of length \( ds \), and \( d \) the infinitesimally small angle between the tangents at \( P \) and \( P_i \) and \( d_s \) the infinitesimally small angle between the planes of osculation at \( P \) and \( P_i \), or, what is the same thing, the angle between the binormals of \( P \) and \( P_i \); then the ratio \( \frac{ds}{ds} \) is called the curvature of the curve at \( P \), and the ratio \( \frac{ds}{ds} \) is called the torsion of the curve at \( P \). The angles \( ds \) and \( d \) are called respectively angle of coningence, and angle of torsion at \( P \). This point of view of curvature leads at once to the circle of curvature previously described. The ratio \( \frac{ds}{ds} \) has the same value for the curve and}

\[
\frac{1}{R} = \frac{ds}{ds}
\]

the circle at \( P \), and if \( R \) designates the radius of the circle, there results curvature at a point

\[
1 = \frac{1}{R} = \frac{ds}{ds}
\]

On the other hand, there is no circle of torsion connected with the curve, and it is only by analogy that the term radius of
CURVES OF DOUBLE CURVATURE

Expression of the torsion, \( T \), is defined to be the reciprocal of the torsion. Expressed in equational form, torsion

\[ T = \frac{1}{ds} \frac{dr}{ds} \]

A third curve is sometimes regarded, but merely as a convenience. It is the limiting ratio of the infinitely small angle \( d \alpha \) between the principal normals at \( P \) and \( P_1 \) to the arc \( ds \). It is in a sense the resultant of the other two curvatures, and has received the name of entire curvature. The angle \( d \alpha \) is called the angle of entire curvature. Entire curvature is not an independent curvature, for, as will shortly be seen, its angle \( d \alpha \) is a function of the other two through the equation \( ds = dx + dy + dz \).

Before clothing the foregoing definitions in analytical garb, it is necessary to adopt conventions as to the signs of directions and to complete the notation. Of the two directions on a curve, that is taken as positive which corresponds to increasing values of \( u \). The positive direction of the tangent is taken to coincide with the positive direction of the curve, and the direction cosines of the angles the positive tangent makes with the positive directions of the coordinate axes \( x, y, z \) are designated by \( a_1, \beta_1, \gamma_1 \) respectively. The positive direction of the principal normal is the direction from \( P \) toward the centre of curvature, and its direction cosines are designated by \( a_2, \beta_2, \gamma_2 \). The positive direction of the binormal is so taken that it is directed with respect to the positive tangent and positive principal normal as the positive \( x \) axis is directed to the positive \( x \) axis and positive \( y \) axis.

Its direction cosines are represented by \( a_3, \beta_3, \gamma_3 \).

A table conveniently exhibits these relations:

<table>
<thead>
<tr>
<th>Tangent</th>
<th>a₁, β₁, γ₁</th>
</tr>
</thead>
<tbody>
<tr>
<td>Principal normal</td>
<td>a₂, β₂, γ₂</td>
</tr>
<tr>
<td>Binormal</td>
<td>a₃, β₃, γ₃</td>
</tr>
</tbody>
</table>

In the elements of solid analytic geometry, it is shown that the determinant of the nine direction cosines equals 1, i.e.,

\[ a_1 \beta_2 \gamma_3 - a_2 \beta_3 \gamma_1 - a_3 \beta_1 \gamma_2 = 1, \]

and that each constituent is equal to its cofactor. For example, \( a_1 = \gamma_2 \beta_3 - \gamma_3 \beta_2 \). It is also a theorem of the elements of analytic geometry that if a straight line varies its direction infinitely little, say by an angle \( dw \), and if \( l, m, n \) are the direction cosines of the first position, and \( l + dl, m + dm, n + dn \) are the direction cosines of the second position, that \( dw = dl^2 + dm^2 + dn^2 \). It has immediate application in the two curvatures.

Taking over from the calculus the value of \( ds^2 \) and differentiating,

\[ ds^2 = dx^2 + dy^2 + dz^2, \]

it becomes

\[ ds^2 = dx^2 + dy^2 + dz^2, \]

The analytical side of the foregoing development is now easily formulated. All equations which follow and which contain the variables \( x, y, z \) and their differentials \( dx, dy, dz \) may be expressed in terms of the parameter \( u \) and its differential \( du \) by means of equations (2), the equations resulting from their differentiation, and equations (3).

One has immediately from the definitions of the elements at the point \( P(x, y, z; u) \)

\[ a_1 = \frac{dx}{ds}, \quad \beta_1 = \frac{dy}{ds}, \quad \gamma_1 = \frac{dz}{ds}, \]

hence, for the equations of the tangent,

\[ \frac{dx}{ds} = \xi, \quad \frac{dy}{ds} = \eta, \quad \frac{dz}{ds} = \zeta, \]

and for the normal plane,

\[ (\xi - x)dx + (\eta - y)dy + (\zeta - z)dz = 0. \]

The symbols \( \xi, \eta, \zeta \) represent here and subsequently the current co ordinates of the points of line, plane, etc.

In determining the constants \( L, M, N, Q \) so that the plane \( Lx + My + Nz + Q = 0 \) passes through the point \( x, y, z \), and the infinitely near points \( x + dx, y + dy, z + dz \), and \( x + 2dx + dx, y + 2dy + dy, z + 2dz + dz \), one obtains

\[ (\xi - x)(dy dz - dx dy) + (\eta - y)(dz dx - dy dz) + (\zeta - z)(dx dy - dz dx) = 0, \]

or, in putting for convenience

\[ \xi = dy dz - dx dy, \quad \eta = dz dx - dy dz, \quad \zeta = dx dy - dz dx, \]

the equation of the plane of osculation in the form

\[ A(\xi - x) + B(\eta - y) + C(\zeta - z) = 0. \]

This at once gives

\[ \xi = \frac{A}{B} \eta = \frac{C}{A} \xi, \]

and for the equations of the binormal

\[ \frac{\xi - x}{A} = \frac{\eta - y}{B} = \frac{\zeta - z}{C}. \]

From the determinant of the direction cosines one has

\[ a_1 = \gamma_2 \beta_3 - \gamma_3 \beta_2, \quad a_2 = \gamma_1 \beta_3 - \gamma_3 \beta_1, \quad a_3 = \gamma_1 \beta_2 - \gamma_2 \beta_1, \]

and hence, by virtue of (4) and (9),

\[ a_1 = \frac{Bds - Cdy}{ds \sqrt{A^2 + B^2 + C^2}}, \quad a_2 = \frac{Cdx - Ady}{ds \sqrt{A^2 + B^2 + C^2}}, \quad a_3 = \frac{Adx - Bdy}{ds \sqrt{A^2 + B^2 + C^2}}. \]

The equation of the plane of rectification is

\[ (\xi - x) + (\eta - y) + (\zeta - z) = 0, \]

and the equations of the principal normal are

\[ \frac{\xi - x}{a_1} = \frac{\eta - y}{a_2} = \frac{\zeta - z}{a_3}. \]

Applying to curvature the theorem relative to the infinitely small change in direction of a right line, one has \( ds^2 = ds^2 + 2dy^2 + dz^2 \), whence, in differentiating (4) and employing (3) in the reduction,

\[ (\text{curvature})^2 = \frac{1}{R^2} = \left( \frac{ds}{ds} \right)^2 = \frac{A^2 + B^2 + C^2}{ds^2}, \]

and also

\[ a_1 = \frac{Bds - Cdy}{ds^2}, \quad a_2 = \frac{Cdx - Ady}{ds^2}, \quad a_3 = \frac{Adx - Bdy}{ds^2}. \]
A comparison of (11), (14) and (15) gives

\[ a_0 = R \frac{d\alpha}{ds}, \quad \beta = R \frac{\gamma}{ds}, \quad \gamma = R \frac{d\beta}{ds}. \]

When the arc \( s \) is the independent variable, that is, when \( u = s \), equations (14) and (16) take simple forms,

\[ \frac{1}{R} = \frac{dx}{ds} + \frac{dy}{ds} + \frac{dz}{ds}; \quad a_0 = R \frac{d\alpha}{ds}, \quad \beta = R \frac{\gamma}{ds}, \quad \gamma = R \frac{d\beta}{ds}. \]

Applying the same process to torsion

\[ ds^2 = \alpha^2 + \beta^2 + \gamma^2, \]

a differentiation of (9) gives

\[ da = \frac{Bdx + Cdy}{\sqrt{A^2 + B^2 + C^2}} \frac{A dx + B dy + Cdz}{A^2 + B^2 + C^2}, \]

\[ \begin{align*}
  d\beta &= -\frac{Aby}{\sqrt{A^2 + B^2 + C^2}} \frac{A dx + B dy + Cdz}{A^2 + B^2 + C^2}, \\
  d\gamma &= -\frac{Axz}{\sqrt{A^2 + B^2 + C^2}} \frac{A dx + B dy + Cdz}{A^2 + B^2 + C^2},
\end{align*} \]

whence

\[ \text{torsion} = \frac{1}{T} \frac{ds}{ds} = -\frac{A dx + B dy + Cdz}{A^2 + B^2 + C^2}. \]

The radical \( \sqrt{A^2 + B^2 + C^2} \) is to be taken throughout with positive sign. The numerator in the value of torsion, written in the form

\[ ds dy dx, \]

of a determinant, is \( dx dy dz, \) and its evanishment for all values of \( u \) is the necessary and sufficient condition that the space curve is in reality a plane curve. If it vanishes only for isolated values of \( u \), the planes of osculation at the corresponding points are stationary, that is, the plane of osculation does not tend to change in passing to the consecutive point. Curvature and therefore \( K \) are always taken positive. This, however, is not the case with torsion; its sign may be positive or negative and is determined without ambiguity in the foregoing equation. A space curve is said to have a right (left) twist at \( P \) if it appears to an observer, standing at \( P \) on the plane of osculation (either side) and looking in the direction of the centre of curvature, to rise from left (right) to right (left) through \( P \). The above formula, with this definition of twist, associates right twist with positive torsion and left twist with negative torsion.

The Frenet Equations. These are nine very important equations in which the quotients of the differentials of the direction cosines of the lines of the principal triad divided by \( ds \), are expressed in terms of the direction cosines and \( K \) and \( T \). Six of these equations are already at hand: from (16)

\[ \begin{align*}
  \frac{da}{ds} &= \frac{a_0}{R} \frac{dx}{ds} + \frac{\beta}{R} \frac{dy}{ds} + \frac{\gamma}{R} \frac{dz}{ds}, \\
  \frac{d\beta}{ds} &= \frac{a_0}{R} \frac{dx}{ds} + \frac{\beta}{R} \frac{dy}{ds} + \frac{\gamma}{R} \frac{dz}{ds}, \\
  \frac{d\gamma}{ds} &= \frac{a_0}{R} \frac{dx}{ds} + \frac{\beta}{R} \frac{dy}{ds} + \frac{\gamma}{R} \frac{dz}{ds}.
\end{align*} \]

from (11), (17) and (18)

\[ \begin{align*}
  \frac{ds}{dt} &= \frac{a_0}{R} \frac{dx}{ds} + \frac{\beta}{R} \frac{dy}{ds} + \frac{\gamma}{R} \frac{dz}{ds},
\end{align*} \]

from (11) by differentiation, with substitutions from (19) and (20).

\[ \begin{align*}
  \frac{ds}{dt} &= -\frac{a_0}{R} \frac{dx}{ds} - \frac{\beta}{R} \frac{dy}{ds} - \frac{\gamma}{R} \frac{dz}{ds}.
\end{align*} \]

The equations were also given later by Serret and are sometimes called by his name. They are particularly useful in the differentiation of equations, and are of importance in questions relating to the determination of curves with assigned properties.

2. The Curve and Its Associated Curves and Surfaces. There are four ruled surfaces on which the space curve lies and a fifth ruled surface on which it does not lie, to all of which surfaces it sustains special relations. The tangents at all the points of the curve constitute the tangential surface of the curve. This surface consists of two sheets with the space curve as a sharp edge. A normal plane at \( P \) intersects the two sheets of the surface in a curve which has \( P \) as a cusp point. The space curve is the locus of intersections of consecutive tangents and is called the edge of regression of the tangential surface. The surface is a developable surface, namely, one which could be supposed laid down in a plane without stretching. To the space curve there is an infinity of involutes all lying in the tangential surface. One may imagine a string stretched on the curve and so unwound that the part continually being freed from the curve remains tangent to the curve. Each point of the string will describe an involute on the tangential surface to which the space curve is an evolute.

The locus of the binormals of the curve is called the surface of the binormals. It is a developable or skew surface. The infinitely small arc element is perpendicular to the bi-

normals at its extremities, whence it follows that the space curve is the line of striction of its binormal surface.

The locus of the principal normals is a skew surface and is called the surface of the principal normals. The space curve is an orthogonal trajectory of the right lines of the surface and is also an asymptotic line of the surface. This latter property follows from the fact that the planes of osculation of the curve are tangent planes to the surface at the points of the curve.

The locus of the lines of rectification is a developable surface and is called the surface of rectification of the curve. It owes its name to the circumstance that if the line of rectification of a plane, the space curve is transformed into a straight line. From this it follows that a space curve is a geodesic on its surface of rectification. That the space curve passes into a straight line when the surface of rectification is developed in a plane is readily established from the Frenet equations (21). The angle between two consecutive planes of rectification, \( ds \), vanishes in the development of the surface, or

\[ de^2 = \frac{ds^2}{R^2} = dy^2 + dz^2 = 0. \]

Writing (21) in the form

\[ \frac{ds}{dx} = \frac{a_0}{R} \frac{dx}{ds} + \frac{\beta}{R} \frac{dy}{ds} + \frac{\gamma}{R} \frac{dz}{ds}, \]

squaring and adding, there results

\[ dx^2 + dy^2 + dz^2 = 0. \]

As the angle of contiguity is zero, the consecutive tangents of the developed curve coincide, and the curve is a straight line.

The fifth ruled surface is the locus of the axes of curvature. It is a developable surface, not containing the curve, but containing the curve of centres of curvature, and also the curve of centres of the osculating spheres. The surface bears the name of polar surface, or evolute surface. The axis of curvature is sometimes called polar axis and hence the name polar surface. To the space curve as an involute there
is an infinity of evolute curves all lying on the polar surface, and hence the name evolute surface. If one imagined a string stretched freely on the polar surface with one extremity at $P$ of the space curve, the string on the surface would lie in one of the evolutes of the space curve. Further, if two strings were supposed joined at $P$, each lying on an evolute, and the two strings then unwound from the polar surface, the point $P$ would describe the space curve, and the angle between the strings at $P$ would remain constant in the motion. The polar surface is the common surface of rectification of all the evolutes, and these curves are, accordingly, geodesics of the surface.

The curve of centres of curvature is the intersection of the polar surface and the principal normal surface. Its equations are

\[ \xi = x + R_a, \eta = y + R_b, \zeta = z + R_c. \]

Those of the axis of curvature are

\[ \xi = x + R_\alpha + m\alpha, \eta = y + R_\beta + n\beta, \]

\[ \zeta = z + R_\gamma + \gamma, \]

for $\mu$ constant and $\nu$ variable. If $\mu$ is regarded as variable as well as $\nu$, the equations define the polar surface. Two consecutive axes of curvature, as the axes of $P$ and $P_\alpha$, intersect in a point of the edge of regression of the surface, but the point as a point on the first axis is equidistant from $P$, $P_\alpha$, and as lying on the second axis is equidistant from $P_\alpha$, $P_\beta$, and $P_\gamma$, therefore equidistant from $P_\alpha$, $P_\beta$, $P_\gamma$, or is the centre of the osculating sphere at $P$. The edge of regression of the polar surface is the locus of the centres of the osculating spheres of the space curve. Analytically treated the problem gives for the equations of the locus of centres of the osculating spheres:

\[ \xi = x + R_\alpha - \frac{dR}{d\alpha} \alpha, \eta = y + R_\beta - \frac{dR}{d\beta} \beta, \]

\[ \zeta = z + \frac{dR}{d\gamma} \gamma, \]

and for the radius, $r$, of the sphere

\[ r^2 = R^2 + \left(\frac{dR}{d\theta}\right)^2. \]

There is a complete reciprocity between a space curve and the edge of regression of its polar surface when, and only when, the space curve is a curve of constant curvature, i.e., $R = \text{constant}$. Equations (23) reduce to (22), showing that the curve on the polar surface becomes the locus of the centres of curvature of the space curve. Some of the relations between the two curves when $R = \text{constant}$ are here stated: Each is the locus of the centres of curvature of the other with the same constant curvature; the tangent of one is the axis of curvature of the other; the corresponding plane of osculation of the one is the normal plane of the other; corresponding planes of rectification are parallel; angle of contiguity of the one equals angle of torsion of the other. The last two properties hold also when $R$ is not constant.

If a space curve is spherical, its polar surface will be a cone with vertex at the centre of the sphere, and the polar edge of regression reduces to a point, the centre of the sphere $\xi, \eta, \zeta$ are, accordingly, constants for all values of $\mu$, and their differentials are zero. The differentiation furnishes $dR = d\left(\frac{dR}{d\theta}\right) = 0$ as the necessary and sufficient condition for a spherical curve.

**Spherical Depiction.**—Each point of the space curve is co-ordinated with a point on the surface of a unit sphere in some definite manner. Assume a sphere of radius one with centre at the origin of axes, and draw a radius to a point $p$ of the surface parallel to the positive direction of the tangent at the point $P$ of the curve. The point $p$ is the spherical image or picture of $P$ with respect to the tangent, and the picture of all the points of the space curve is a curve called the **spherical indicatrix of the space curve with respect to the tangent**. Similarly, there are spherical images with respect to the principal normal, binormal, etc. Such depictions lead to problems concerning the determination of curves with given spherical images.

**Intrinsic Equations.**—A space curve is completely determined as to its form, though not as to its position in space, when curvature and torsion are given in terms of the arc $s$ of the curve. Two equations of this character are called the intrinsic equations of the curve. To pass from the intrinsic equations $R = f(s)$, $\theta = g(s)$ to the parameter representation requires the integration of a differential equation of the Riccati form. A discussion of the problem is given in Darboux, Vol. I, and in Scheffer, Vol. I (see paragraph on literature of subject). Curvature and torsion do not change in value when the curve is moved about in space, nor do the successive derivatives of curvature and torsion with respect to $s$ change in value. These quantities and all functions of them are called differential invariants with respect to all movements of the curve in space.

3. **Special Curves.**—The curve of constant curvature, $\frac{1}{R} = \text{constant}$, has already been spoken of. It is obvious that in the development of the tangential surface in a plane, the curve transforms into a circle. Any curve of this class of radius of curvature $R$ is given by the equations

\[ x = R \int \lambda d\theta, \quad y = R \int \mu d\theta, \quad z = R \int \nu d\theta, \]

in which $\lambda$, $\mu$, $\nu$ are any three functions of $\theta$ that satisfy the two equations,

\[ \lambda \theta + \mu \mu + \nu \nu = 1, \frac{d\lambda}{d\theta} + \frac{d\mu}{d\theta} + \frac{d\nu}{d\theta} = 1. \]

Direct differentiation of the equations of the curve will show that $\lambda = \alpha, \mu = \beta, \nu = \gamma$, and $d\theta = ds$.

The curve of constant torsion $\frac{1}{T} = \text{constant}$ is defined by the equations

\[ x = T \int \left(\mu d\theta - \nu d\theta\right) d\theta, \quad y = T \int \left(\nu d\theta - \mu d\theta\right) d\theta, \quad z = T \int \left(\mu d\theta - \lambda d\theta\right) d\theta, \]

where $\lambda$, $\mu$, $\nu$ are functions of $\theta$ satisfying the conditions (25). Again, direct differentiation of the equations shows $\lambda = \alpha, \mu = \beta, \nu = \gamma$, and $d\theta = ds$. Examples of curves of constant torsion are furnished by the asymptotic curves of surfaces of constant negative (Gauss) curvature.\(^1\) This theorem was established by Enneper, *Göttinger Nachrichten*, 1870.
The curves in which the ratio of curvature and torsion is constant, $\frac{T}{R}$=constant, are helices, namely, curves on cylindrical surfaces that intersect all the right-line generators of the surface under a constant angle. Such a curve is a general helix. When, however, both curvature and torsion are constant, the curve becomes the ordinary helix, i.e., the helix on a right circular cylinder. A helix passes into a straight line when the cylindrical surface is developed in a plane. The cylindrical surface is its surface of rectification, and the right-line generators are the lines of rectification. The helix is, accordingly, a geodesic of the cylindrical surface, and this property itself could be taken as the definition of a helix. The principal normals are all parallel to a plane perpendicular to the generators of the cylindrical surface. The original sources on the subject of the helix are Puiseux, Journ. de Math. (Vol. VII, 1842); Bertrand, Journ. de Math. (Vol. XIII, 1848).

Bertrand found that if a curve is of such a character that there exists between its curvature and torsion a linear relation with constant coefficients, $a \frac{d^2s}{du^2} + b \frac{ds}{du} = 1$, there is one, and only one, other curve which has the same principal normals as the first. The length on a principal normal between corresponding points of the curves is constant. The associated curves are called Bertrand curves. The theorem suffices exception when the curvature and torsion are both constant, namely, in the case of the ordinary helix. Here there is an infinity of Bertrand curves, all helices on the common principal normal surface. Bertrand, Journ. de Math. (Vol. XV, 1850); J. A. Serret, Journ. de Math. (Vol. XVI, 1851).

The ordinary helix holds, relative to space curves, a position somewhat similar to that held by a circle relative to plane curves. The circle is the curve of constant curvature (torision=0), and the ordinary helix is the curve of constant curvature and constant torsion. At a point of a plane curve, one circle may be passed having contact of the second order with the curve, or, as one may say, the circle and curve have three consecutive points in common, and, in general, no more than three points. It is the circle of osculation of the curve. Through three consecutive points, $P, P, P$, of a space curve a single infinity of ordinary helices may be passed, but in general they will not have more than the three points in common with the curve. All elements that depend on three consecutive points are common elements of the curves, viz., tangent, plane of osculation, principal normal, circle of curvature, at $P$.

Among the helices is one whose principal normal at $P$, coincides with the principal normal of the space curve at the same point. This helix has the same torsion and curvature as the space curve at $P$, and it is called the osculating helix of the space curve at the point $P$

The length of a finite portion of a curve defined by equations (2) rests upon the evaluation of the integral. If on the arc lying between $M$ and $P$ points are marked in succession proceeding from $M$ toward $P$, viz., $M, Q_1, Q_2, \ldots, Q_n, P$, and the chords $MQ_1, QQ_2, \ldots, QQ_n, P$ are drawn, there will be formed an inscribed polygon, the length of which will vary with the number of inscribed points and their position. But if the number of sides of the polygon be indefinitely increased, and each side be indefinitely diminished, the length of the polygon will approach a definite limiting value. This definite limiting value is defined to be the arc length from $M$ to $P$. If $M$ corresponds to the parameter value $u=u_0$, and $P$ to the general value $u$, the arc length $s$ is the definite integral

$$s = \int_{u_0}^{u} \sqrt{\left(\frac{dx}{du}\right)^2 + \left(\frac{dy}{du}\right)^2 + \left(\frac{dz}{du}\right)^2} \, du.$$

Whence by differentiating the linear element of arc is

$$ds^2 = \left[\left(\frac{dx}{du}\right)^2 + \left(\frac{dy}{du}\right)^2 + \left(\frac{dz}{du}\right)^2\right] \, du^2 - dx^2 + dy^2 + dz^2.$$

The foregoing theory of the space curve contains implicitly the assumption that the arc element $ds$ is not zero; an assumption which holds for all real curves. In dropping the condition that $ds$ may not be zero, one is led to certain imaginary curves defined by the differential equation

$$\left(\frac{dx}{du}\right)^2 + \left(\frac{dy}{du}\right)^2 + \left(\frac{dz}{du}\right)^2 = 0.$$

These curves are called minimal curves and are either minimal right lines or minimal twisted curves with tangents that are minimal right lines. The right lines

$$x = a + bu, \quad y = a + cu, \quad z = a + du$$

satisfy the above differential equation when $b^2 + c^2 + d^2 = 1$.

The values of the constants $b, c, d$, taken subject to this condition, furnish a single infinity of minimal right lines lying on an imaginary cone with vertices at the points $(a, a, a)$. The intersection of the cone by the plane of infinity is the imaginary circle at infinity. The minimal lines through any point of space are the lines joining the point to the points of the imaginary circle at infinity. The twisted minimal curves are all represented by the equations

$$z = \frac{1}{2} (1 - u^2) f''(u) + u f'(u) - f(u),$$
$$y = \frac{1}{2} (1 + u^2) f''(u) - i u f'(u) + i f(u),$$
$$z = u f''(u) - f'(u).$$

The accents indicate differentiation with respect to $u$; $i = \sqrt{-1}$; and $f(u)$ is a function of the complex imaginary variable $u$. $f(u)$ is restricted only in that its third derivative must not be zero. Elements of the curve which do not essentially rest on $ds$ can be obtained in the usual way, viz., tangent, plane of osculation, etc. As the plane of osculation contains two consecutive tangents, it touches the imaginary circle at infinity. The tangential surface of the minimal curve accordingly circumscribes the circle at infinity. Inversely, a minimal curve can be defined as the edge of regression of a developable surface circumscribing the imaginary circle at infinity. The introduction of the minimal right lines and the imaginary circle at infinity enables one to express certain metric relations in projective form. The minimal curves find very elegant application in the theory of minimal surfaces (real). See Surfaces, Theory of.
The point \( P \), to which all the developments have been attached, is supposed to be an ordinary point of the curve. A point is ordinary when this point and points on the curve in its immediate vicinity of osculation by the same three equations of form (2), each point corresponding to a single value of \( w \). The three functions \( \Phi(w) \), \( \chi(w) \), \( \psi(w) \) must be developable in power series at the point, and the three first derivatives must not be simultaneously zero. A consequence of this is that in ordinary it is evident that these conditions are not satisfied by a point at which the curve intersects itself. The singularities of a twisted curve are discussed in Cayley, 'Collected Works,' Vol. I, 8; Fine, 'Amer. Journ. of Math.,' 8; Staudte, 'Amer. Journ. Math.,' 17.

4. Classification and Literature.—Curves are divided into algebraic and transcendental curves, according as their equations are or are not algebraic. The order of a space curve is the number of points of intersection (real or imaginary) of the space curve by an arbitrary plane. The rank of the curve is the number of tangents intersected by an arbitrary straight line, i.e., it is the order of the tangential surface of the curve. The class of the curve is the number of osculating planes of revolution that pass through an arbitrary point of space. At present there is no known system of elements which suffice to characterize the general space curve. There is no proper curve of the second order; there is one family of curves of the third order; there are two families of curves of the fourth order, a fact which puts in evidence that the order of a curve does not in itself suffice to characterize space curves. When to order is added the number of apparent double points, viz., the number of chords which can be drawn through an arbitrary point of space, a differentiation is effected, but this again fails in the case of curves of the ninth order. Cayley established formulas for the space curve corresponding to the Plücker formulas for plane curves. Consult Cayley, 'Collected Mathematical Papers,' Vol. I, p. 207.

The first systematic treatment of space curves was given by Clairault in 1751, 'Traité de courbes à double courbure.' Among the old authors are Lagrange, 'Mémoires présentés ... à l'Académie des sciences' (1806); de Saint-Venant, 'Journal de l'École Polytechnique.' The more important treatises and texts that give more or less complete representations of the theory are Bianchi, 'Lezioni di geom. diff.' (Pisa, 1855-86); translated into German by Lukat, Leipzig (1889); Darboux, 'Leçons sur la théorie générale des surfaces' (Paris 1887-96); Hoppe, 'Lehrbuch d. anal. Geom.' (Leipzig 1889); Joachimsthal, 'Anwendung der Differential- und Integralrechnung auf die allgemeine Theorie der Flächen und der Linien doppelter Krümmung' (Leipzig 1890); Laurent, 'Traité d'analyse,' 2, 7 (Paris); Salmon, 'Geometry of Three Dimensions,' 2, 7 (Paris); Salmon, 'Fleissiger' (Leipzig 1902); Scheller, 'Anwendung der Differential- und Integralrechnung auf die Kugel' (Leipzig 1890); Schell, 'Allgemeine Theorie der Curven doppelter Krümmung in rein geometrischer Darstellung' (Leipzig 1898).

James Maclay, Professor of Mathematics, Columbia University.

CURWEN, kér'wén, John, English musical educator; b. Heckmondwike, Yorkshire, 14 Nov. 1816; d. Heaton Mersey, Lancashire, 26 May 1880. He became a minister of the Independent body, being in 1844 by the same three equations of form (2), each point corresponding to a single value of \( w \). The three functions \( \Phi(w) \), \( \chi(w) \), \( \psi(w) \) must be developable in power series at the point, and the three first derivatives must not be simultaneously zero. A consequence of this is that in ordinary it is evident that these conditions are not satisfied by a point at which the curve intersects itself. The singularities of a twisted curve are discussed in Cayley, 'Collected Works,' Vol. I, 8; Fine, 'Amer. Journ. of Math.,' 8; Staudte, 'Amer. Journ. Math.,' 17.

4. Classification and Literature.—Curves are divided into algebraic and transcendental curves, according as their equations are or are not algebraic. The order of a space curve is the number of points of intersection (real or imaginary) of the space curve by an arbitrary plane.
