PARTIAL LIST OF CONTRIBUTORS TO VOLUME IX

ALEXIS, JOSEPEH, A.M.
Assistant Professor of Germanic Languages and Literatures, University of Nebraska
EDITOR, THE

AUTENRIETH, GEORGE C.
Professor of Mechanical Drawing, College of the City of New York
DRAWING, MECHANICAL

AYRES, SAMUEL GARDNER, B.D.
Garrett Biblical Institute
DISCIPLINE, ECCLESIASTICAL
DISPUTATIONS, HISTORIC

BABCOCK, KENDRIC CHARLES, Litt.B., Ph.D.
Dean of the College of Liberal Arts and Sciences, University of Illinois
EDUCATION, INDIAN
EDUCATION, PROFESSIONAL
EDUCATION, TECHNICAL

BAKER, IRA O., B.S., C.E.
Professor of Civil Engineering, University of Illinois
EDUCATION, ENGINEERING

BALDWIN, CHARLES SEARS, Ph.D.
Professor of Rhetoric and English Composition, Columbia University
DREAM OF GERONTIUS, THE

BEIK, ARTHUR K., Ph.D.
Instructor in Education, State College for Teachers, Albany, N. Y.
EDUCATION, NATIONAL SYSTEMS OF

BEVAN, WILSON LLOYD, Ph.D.
New York City
DIES IRÆ

BOGART, ERNEST L., Ph.D.
Professor of Economics, University of Illinois
ECONOMIC HISTORY
ECONOMICS

BREWSTER, WILLIAM T., A.M.
Professor of English, Columbia University
DICKENS, CHARLES

BROWN, ELMER ELSWORTH, Ph.D., LL.D.
Chancellor of New York University
EDUCATION, SECONDARY IN AMERICA

CALLAHAN, JAMES H., Ph.D.
Professor of History and Political Science, University of West Virginia
DOMINICAN REPUBLIC, DIPLOMATIC RELATIONS WITH

CARVER, THOMAS NIXON, Ph.D., LL.D.
Professor of Political Economy, Harvard University
DISTRIBUTION

CHANDLER, FRANK W., Ph.D.
Professor of English, University of Cincinnati
DIANA
DON QUIXOTE

COUME, CLEMENT W.
Technical Art Expert, New York
DEVIL IN ART AND SYMBOLISM
DOG IN ART AND SYMBOLISM
DRAGON IN ART AND SYMBOLISM
DRESDEN PORCELAIN
DUTCH AND FLEMISH FURNITURE
EAGLE IN ART AND SYMBOLISM

CUTLER, FRANCES W., M.A.
Instructor in English, Vassar College
EARTHLY PARADISE

CREIGHTON, JAMES E., Ph.D., LL.D.
Professor of Logic and Metaphysics, Cornell University
DETERMINISM
DIALECTIC
ECLECTICISM

DAKE, CHARLES LAURENCE, A.M.
DEVONIAN
ECONOMIC GEOLOGY

DEIMEL, RICHARD F., B.S., M.A.
Assistant Professor of Mechanics, Stevens Institute of Technology
DYNAMICS OF MACHINERY

DICKINSON, THOMAS H., Ph.B., Ph.D.
Associate Professor of English, University of Wisconsin
DUCHESS OF MALFI, THE

DOLE, NATHAN HASKELL, A.B.
Editor of "Masterpieces of Famous Literature"
DIVINE COMEDY, THE

DUGGAN, STEPHEN PIERCE, Ph.D.
Professor of Education at the College of the City of New York
EDUCATION IN THE UNITED STATES

DUTTON, GEORGE B.
Department of English, Williams College, Williamstown
DIANA OF THE CROSSWAYS

EMERSON, HARRINGTON, C.E.
Efficiency Engineer, New York
EFFICIENCY ENGINEERING

ERSKINE, JOHN, A.M.
Professor of English, Columbia University
DONNE, JOHN

FERRIS, RICHARD, C.E., Sc.D.
Editorial Staff of The Americanist
DISINFECTANTS
DISTILLATION
DISTILLED LIQUORS
Contributors to Volume IX—Continued

FINEGAN, THOMAS E., M.A., LL.D.
Deputy Commissioner of Education and Assistant Commissioner in charge of Elementary Education, State of New York

EDUCATION, STATE OF NEW YORK
EDUCATION, COMPULSORY
EDUCATION, RURAL
EDUCATION OF FEEBLE-MINDED OR MENTAL DEFECTIVES
EDUCATION OF IMMIGRANTS
EDUCATION OF THE PHYSICALLY HANDICAPPED

FLATHER, JOHN JOSEPH, Ph.B., M.M.E.
Professor of Mechanical Engineering, University of Minnesota

DYNAMOMETERS AND THE MEASUREMENT OF POWER

FOWLER, HENRY THATCHER, Ph.D.
Professor of Biblical Literature and History, Brown University

DEUTERONOMY

FREEMAN, FRANK N., Ph.D.
Professor of Educational Psychology, University of Chicago

EDUCATION, PSYCHOLOGY OF

GARRISON, J. H., A.M., LL.D.
Editor of "The Christian-Evangelist"

DISCIPLES OF CHRIST

GRAVES, CHARLES, REV.
Hartford, Conn.

EDUCATION, THEOLOGICAL

GRIFFIS, WILLIAM ELLIOT, D.D., L.H.D.
Author of "Brave Little Holland and What She Taught Us," "The American in Holland," "The Story of New Netherland"

DUTCH IN AMERICA, THE

HAILMANN, WILLIAM NICHOLAS, A.M.
Professor of The History and Principles of Education, Broadman School, Pasadena, Cal.

EDUCATION, ELEMENTARY

HANUS, PAUL HENRY, LL.D.
Professor of Education, Harvard University

EDUCATION, STUDY OF

HARRIS, H. F., M.D.
Georgia State Board of Health

DISEASE, GERM THEORY OF

HEMMETER, JOHN COHN, M.D., Ph.D., LL.D.
Professor in Medical Department of the University of Maryland

DIGESTION

HEUER, COLONEL WILLIAM HENRY
Consulting Engineer, Corps of Engineering, United States Army

DREDGING

HOWARD, WILLIAM G., A.M.
Professor of German, Harvard University

EGMONT

ISAACS, EDITH J. R.
Critic and Essayist

DBS MEERES UND DER LIEBEN WELLEN

ISAACS, LEWIS M., Ph.B., LL.B.
Musical Critic and Composer

DON GIOVANNI
DON PASQUALE

JERNEGAN, MARCUS W., Ph.D.
Associate Professor of History, University of Chicago

EDUCATION AND NATIONAL DEVELOPMENT
EDUCATION AND THE WAR

KELLOGG, VERNON LYMAN, M.S.
Professor of Entomology, Leland Stanford Jr. University

DISUSE

KUNZ, GEORGE F., Ph.D., Sc.D.
Author of "Gems and Precious Stones of North America," etc.

DIAMOND

LAWRENCE, WILLIAM WITHERLE, Ph.D., Litt.D.
Professor of English, Columbia University

EDDAS, THE

LE GALLIENNE, RICHARD
Author, Critic and Reviewer

EGOIST, THE

LEE, GUY CARLETON, Ph.D., LL.D.
Managing Director, National Society for Broader Education, New York

EDUCATION, ADULT

LEONARD-STUART, CHARLES, B.A.
Editorial Staff of The Americana

EASTER

LIVINGSTON, ARTHUR
Professor of Romance Languages, Western University, London, Ont.

DIALOGUES OF LEOPARDI, THE

ULL, RICHARD SWANN, M.Sc., Ph.D.
Professor of Vertebrate Paleontology, Yale University

DINOSAURIA

MORE, PAUL ELMER, LL.D., Litt.D.
Author of "Platonism," "The Judgment of Socrates," etc.

DIALOGUES OF PLATO, JOWETT'S TRANSLATION OF DISCOURSES AND HANDBOOK OF EPICETUS

MOSES, ALFRED JOSEPH, E.M., Ph.D.
Professor of Mineralogy, Columbia University

DETERMINATIVE MINERALOGY

MOSES, MONTROSE JONAS, B.S.
Dramatic Critic

DOLL'S HOUSE, THE
Contributors to Volume IX—Concluded

MUNROE, CHARLES EDWARD, S.B., Ph.D.
The Columbian University, Washington, D. C.

DYNAMITE

NELSON, EDWARD WILLIAM
Chief, Bureau of Biological Survey, Washington, D. C.

DISTRIBUTION OF LIVING MAMMALS

NOYES, GEORGE RAPPALL, Ph.D.
Associate Professor of Slavic Languages, University of California

DRYDEN, JOHN

PILLSBURY, WALTER BOWERS, Ph.D.
Professor of Psychology, University of Michigan

DETERMINING TENDENCY

RANDALL, B. ALEX, M.D.

EAR, THE

ROBINSON, MAURICE HENRY, Ph.D.
Professor of Economics, University of Illinois

ECONOMICS AND THE WORLD WAR

SCHAFFER, NATHAN C., Ph.D., D.D., LL.D.
Superintendent, Department of Public Instruction, State of Pennsylvania

EDUCATION, THE DEVELOPMENT OF THE OFFICE OF SCHOOL SUPERINTENDENT

SCHMIDT, NATHANIEL, A.M.
Professor of Semitic Languages and Literature, Cornell University

ECCLESIASTES

ECCLESIASTICUS

SMITH, CHARLES FORSTER, Ph.D., LL.D.
Professor of Greek and Classical Philology, University of Wisconsin

DIALOGUES OF THE DEAD

STANOJEVICH, MILIVOY S., M.A., M.I.
University of California

EASTERN QUESTION, THE

SULLIVAN, JAMES, Ph.D.
State Historian, The State Educational Department, Albany, N. Y.

EDUCATION, HISTORY OF EDUCATION, MORAL

THORNDIKE, ASHLEY HORACE, L.H.D., Ph.D.
Professor of English, Columbia University

Drama

'(prime),' (secondary) accents, to indicate syllabic stress.
DESGERT, a term designating in its broadest application any uninhabited region. In its more ordinary use the word means a portion of the earth's surface that on account of its barrenness cannot support inhabitants. Four classes of desert may be distinguished: (1) Ice-wastes occupy the central plateau of Greenland, the islands of the Arctic Sea, and probably the entire Antarctic continent. (2) Tundras (q.v.) are flat plains, little elevated above sea-level, forming the Arctic shores of the northern continents and especially characteristic of Siberia. (3) Temporary deserts, or steppe-lands, border the Asiatic deserts to the north and west. The saline steppes of the Caspian are true arid wastes; but the typical steppes in South Russia are luxuriantly clothed with verdure and flowers in spring. In the dry season they form a dusty plain of withered herbage. The llanos (q.v.) of the Orinoco have similar characteristics, but the pampas of South America include portions perennially green and suitable for agriculture. (4) Arid wastes, or deserts in the popular sense of the word, occur mainly in two zones encircling the world, and are known with desert pavements and sesquioxide pavements etched away by natural sand blast erosion. Desert vegetation is extremely scanty, consisting mainly of hard prickly plants of the cactus, euphorbia and spinose kinds, whose surface crumbles off and exposes little moisture. Animal life is correspondingly restricted both in variety and number of individuals. The camel is par excellence the beast of burden for conducting traffic across arid wastes. When an overflowing river, such as the Nile, traverses a desert, the land becomes richly fertile in its immediate neighborhood, and wherever springs bubble up through the sand there are oases, bearing palm trees and grass. Artificial irrigation, especially the sinking of artesian wells, has done much to reclaim tracts of desert for agriculture in the Sahara and to a lesser extent in Australia, while the area of arid land in the western part of the United States, once considered ir reclaimable, is being rendered by irrigation increasingly productive. Geological considerations show that arid deserts are not permanent features of the earth's surface. The most level expanses are believed by many to have once formed part of the ocean bed, or at least great inland seas. The orographical changes which cut off these seas and created inland drainage areas probably at the same time modified the rainfall of the locality.
Excessive evaporation dried up the great lakes, leaving at present a series of diminishing salt lakes without outlet, receiving rivers which dwindle down by evaporation as they flow. The only commercial commodities yielded by deserts are the salts (common salt, borax, sodium carbonate and sometimes sodium nitrate) left in the dried-up lake beds. These salt lakes are subject to alternate long periods of desiccation and flooding; during the former the area of the desert extends, during the latter it contracts. These periods have been traced out in the case of the Great American Basin by a series of most interesting researches on the part of the United States Geological Survey. See Gobi; Sahara.

DESSERT, The Great American. The North American deserts possess all the physiographic, geologic and climatic elements which distinguish the African desert of Sahara. The chief difference between the two regions is the relatively larger area of the Sahara, the arrangement of the topographic units and the occurrence in the Great American Desert of a wealth of mineral resources which the Sahara does not possess. Through the application of modern mechanical agencies by American energies and brain, its wastes have become inhabited by an intelligent and progressive people, and its arid hills and plains made to yield a wealth twice as much per capita as that of any other portion of the United States.

The vast stretches lying between the Sierra Nevada and California and the eastern Cordilleran ranges (Rocky Mountains) in the United States, and between the Pacific Ocean and the eastern Sierra Madre of Mexico, constitutes the Great American Desert.

Of the total area of the Cordilleran province, three-eighths are forested mountains, one-eighth plateau and one-half waterless, treeless, turfless mountain and valley desert. The deserts occur in Nevada, Utah, eastern and southern Arizona, New Mexico and all of Texas west of the Pecos, 550,000 square miles. The American Desert is international, however, for in addition to the above area within the United States, it continues southward into Mexico where it includes most of the states of Sonora Chihuahua, Coahuila, San Luis Potosi and Sinaloa — another 500,000 square miles — making a total of 1,050,000 square miles, which although one-third the area is as truly a desert in every natural sense as is the Sahara, which embraces an area of 3,500,000 square miles, and has a population of 2,500,000 people.

In its entirety (with a few exceptional forested summits) this desert province is one of barren, stony mountain ranges, separated by equally barren stretches of desert plain, an aggregation of elongated arid plains and lower mountain ranges, which mostly follow the avial line of the Cordilleras. The individual deserts have many names, and each differs from the other in some minor aspects.

From a technical point of view an arid desert in its ultimate analysis is a region in which the rainfall is insufficient to produce run-off. The light rainfall, striking the heated rock surfaces and sandy soils, is soon evaporated or drunk in; even the large bodies of water which may start down the mountain sides as roaring torrents usually die out at the margins of the plains. These waters are highly charged with mineral salts derived from the heated rock surfaces, and these salts are readily redeposited upon the surface or in the interstices of the permeable sands. The torrents locally transport the rock debris — boulders, pebbles and powder—from one locality to another, but only for short distances; and hence the desert plains are usually composed of the debris of the adjacent mountains, which in more humid regions of ample run-off would have been carried to the sea. The expansion and contraction from the daily temperature causes the desert rocks to fracture in situ into the desert waste. This is distributed by wind and torrent, and hence the features of the desert are largely air-made as well as water-wrought.

The scarcity of moisture results in the absence of vegetation of the root-twinning, soil-gathering and soil-making type that distinguishes the humid region. Every plant and species attests the aridity of the country. Exactly as in the Sahara, these plains are thorny, coriaceous bushes and shrubs of the cactus, aloes and acacia families, adapted to withstand their drouthy environment and to defend themselves from attack by man or beast. Physiographically the features of the Great American Desert, lying to the east and to the west of the western Sierra Madre and Colorado Plateau, respectively. The westernmost of these may be termed the Nevadan and the eastern the Chihuahuan. The western, or Nevadan, Desert occupies much of the area of Utah, Nevada, Arizona, southern and eastern California in the United States, and the states of Sonora and Sinaloa in Mexico. The Chihuahuan Desert occupies the vast area of country lying between the eastern and western Sierra Madre of Mexico and their northern continuation into southern New Mexico and Texas west of the Pecos, and is the so-called Mexican Plateau.

The Great Basin Desert is marked by wide flatness and is largely a region of ancient lake beds. Its surfaces are in many instances what the geologists term constructional, built up largely of great alluvial fans or piedmont alluvial plains, constituting the so-called filled valleys of the inter-montane basins, mostly sage brush and grease wood; its agricultural products are cereals and tubers, and minerals gold, silver and copper. The Sonoran Desert is of a more complicated geological type, and instead of being land-locked is bordered on one side by the Pacific Ocean. Some of its surfaces are also the result of what geologists call destructive processes. Its floral types are the saguara, the palo verde and the cats-claw. Its sparse agricultural products are fruit and wheat, its mineral resources gold and copper.

The Chihuahuan Desert, marked by parallel plains and ranges, is a relatively higher region; its features are a combination of destructive and constructional processes. Its floral types are the maguey cactus and yucca; its chief agricultural product maize (corn), and its principal mineral product silver.

While the desert plains may be extensive, they also have many phases of variation. There are the alkali plains, while crystal patches of saline efflorescence which vegetation abhors, and vast plains of *doby* (adobe) — brownish choc-
DESSERT

olate clay soils through which here and there are cut the deep channels of streams, streams, or even of oases. The headlike bunches of a woody grass, abhorred by animals and useless to man, through which one may travel for days. The great white gypsum desert of the Tularosa Valley—New Mexico is one of the most wondrous of all the desert plains. To the eye it is a veritable sea of purest granular snow, marked with wind waves and ripples like the Tropic Ocean, with billows and troughs. In some places there are extensive lakes of crystalline salt which the desert inhabitant uses for herd- and flock. Sometimes there are stretches of dreary brown sand hills, great billows gathered around the protecting roots of the thorny mesquite, the particles blowing with each breath of wind.

The half cannot be told of the many other aberrant features of the Great American Desert, like Death Valley; the great medanos or white sand dunes just south of El Paso, each as high as the national capitol, which creep from the place to place under the desert sun; the vast plains of malpais in New Mexico with their burning, cutting, black, waterless surfaces of lava; the flour dust deserts of Jimenez and Arizona and Sonora, where the traveler is choked with clouds of chalk-white powder; the Crow Flat with its glare that blinds; the Jornada del Muerto, with its hundred whirlwinds; the saguara desert of Sonora, where for hundreds of miles grows no blade of grass.

The clouds are the most wonderful manifestations of the desert heavens. The forms of vaporous atmosphere are numerous. In the morning they fill the valleys with snow white vapor, which at midday rises and gathers into solitary fluffs sailing majestically along. Sometimes showers freshen the desert. These are occasionally of sufficient volume to dampen the earth and vegetation, and an awakening of life ensues which is most remarkable. Vegetation seems to awaken instantaneously, plants which before were dry and dust-covered unfold into broad areas of vivid green. Carioaceous ferns, ordinarily lying like dead leaves among the stones, unroll and wave their fronds in the freshened air. From the inconspicuous flowers of the many thorny shrubs of the acacia and yucca tribe the air is laden with perfume. It would seem paradoxical to speak of the desert in bloom, but the human senses of sight and smell can be regaled by no more pleasant experience than the delicate odors and sweeps of color that sometimes follow an unusual rainfall.

Like a dainty pencil line drawn across the sheet of desert, the trails may be seen for miles and miles. These, originally made by the wild Comanche and Apache, lead in long tangents from water-hole to water-hole, cutting paths of deep-worn ruts. Were it not for these trails connecting the various water places the desert probably would be impassable, for the priceless water is usually concealed in spots where least suspected. These water-holes were discovered by the Apache when the settler came or the army wagons and cavalry troops deepened the impress of the trails. What stories of death and pain, thirst and starvation could be told by these old trails! We know that as early as 1528 many of them existed, for in that year Cabeza de Vaca and his three shipwrecked survivors of the Narvaez expedition followed these paths from water-hole to water-hole across this southern border, and that modern commerce and migration still use these, the oldest and most stable monuments of the desert.

In the desert water is king. Without it priceless ore is but as dross, and fertile soils are worthless. Upon the desert plains many men and cattle have died for the want of a drink of water.

Like the Sahara, the Great American Desert is superficially waterless. Its plains are usually barren of surface water save as for an exceptional saline lagoon. A few brooks, streams or rivers arise within its larger mountain ranges, but no water ever runs off its surface to the sea. Even the great floods of water which sometimes burst from an erratic cloud with devastating effect are rapidly swallowed up by the sands or evaporated by sun and wind. It is true that there are two long rivers comparable to the Nile of the Sahara—the Colorado and the Rio Grande. The higher forested mountainous border lands and flow into and across the deserts like great canals, without gathering contributory drainage from them, losing volume in fact from absorption and evaporation in the desert portions of their courses. These are rivers born of the mountains, however, and not of the deserts.

Upon the area of the Great American Desert the maximum rainfall is less than 15 inches per annum and does not average more than 10 inches. In places such as Death Valley and the Yuma Desert it is less than 5 inches. Deducting from this maximum of 15 inches 60 per cent of its effectiveness, due to loss through evaporation, the actual rain value is only 6 inches per annum, less than the amount falling in the two crop-growing months of May and June in the Eastern States, and less than one-half the quantity that fell in September 1901 in a single 24 hours at Galveston, Tex. To this great natural fact the desert is resigned, that within its area the land with a few exceptions, not amounting to 3 per cent, is permanently and hopelessly dry, and even the most sanguine cannot refute this fact.

Before the railways came, the Great American Desert was a most primitive region. It was inhabited by a population about as dense as that of the Sahara now, but practically in the same state of culture; and the mission bells rang over the same civilization that existed in 1528. The inhabitants practised irrigation, agriculture and architecture very much like that of the Egyptians of to-day, and constructed dwellings of unburnt brick and stone. The aborigine found sustenance on the desert, but of a kind upon which the white man could not well exist. maize was his staple of diet. This with the tunas (fruit of the prickly pear) and the roots of various yuccaceous plants, supplemented by a few wild animals, provided an aboriginal diet pure and simple.

It was no great feat for the Spaniard who already possessed an Old-World knowledge of desert craft to amalgamate with the aborigines. He gave to them a few domestic animals (the goat and the burro, which can live where other animals starve). He also gave to them the Catholic religion and the Spanish language. For nearly 400 years the desert population made
no progress in industrial civilization beyond adopting the wooden plow and the cumbersome wheeled cart known as the carreta.

The old desert and country estates were practically in the same status of civilization that existed in the 1st century after discovery. The cities had no commerce except by caravan; the estates were great feudal districts with their fortified haciendas, to which all the surrounding people were attached as fiefs. For 200 miles along either side of the international border in Mexico and our own desert country the conquered Apache spread devastation from the Pecos to the Colorado; and the only white men there were the soldiers at scattered and lonely outposts, or bad men endeavoring to hide from civilization, and hardly better than the Apaches in instincts or action. Here and there in the United States at the widely dispersed water-holes were a few nomadic ranchmen who owned cattle of primitive breed for which there were no purchasers, except the army and beef contractors. Some mines there were also, but these were merely those with easily reducible ores and limited in depth by a remote distance; which from which burdens could be carried on the human back. In Utah alone had the white man attained a foothold.

With the advent of the railroads the modern conquest of the desert began. It was first awakened from its centuries of lethargy by the whistle of the locomotive in the eighties. In the Great American Desert in the United States and Mexico there are now more than 9,000 miles of railway. But for the railroad the Great American Desert would to-day be as unproductive as the Sahara, and still populated, like the Sahara, by people who exist without division of labor, the use of mechanical appliances or extra-territorial commerce. The first railways to be constructed were designed merely as highways between the Atlantic and Pacific seaboard. No thought of revenue from a desert itself was anticipated. Next came a great longitudinal line along the ancient trails of the Aztec from Mexico to San Antonio. The Cimarron soon followed these trunk lines, which are now extending out even into the utmost recesses of the desert. From the Pecos in Texas to California, a distance of 1,500 miles, the route of the Southern Pacific followed a belt of country devoid of water except occasionally in the Rio Grande. Not a herd of cattle, a modern house, a farm or a mine existed along this desert stretch. Nor would they exist to-day had it not been for the construction of this railway. Now its course is marked by many prosperous embryo cities and villages.

Notwithstanding the apparent scarcity of water, one of the most remarkable features of the American Desert is that water has been secured, often in apparently impossible places, and in quantities which have made possible the existence of cities and industries. Like the deserts of the Sahara and Asia, those of America have a supply of underground water; there is hard and desert, upon which has been tried where waters have not been found within 2,000 feet of the surface. Though not often sufficient for agriculture, enough has usually been found to afford a supply for cattle, railroads and mines.

Underground water has usually first been found by the railway companies. When the track was first pushed across the desert, water was brought from the river but when the track was completed water was bored for in the desert itself. The engineers have had at command a mechanical appliance second only in importance to the locomotive, and one which in the desert usually goes to side by side with it. This is the mechanical drill. At great expense they bored in many places. The existence of underground water beneath any particular area having once been demonstrated by the railroad company, individuals, of course, usually repeated the experiment. Three notable triumphs of the mechanical drill over nature are the flowing wells of the Salton Desert, the flowing well at Benson and a supply of 700,000 gallons a day from the deep wells on the Mesa at El Paso. Each of these supplies of water was obtained from the localities which superficially were hopelessly dry.

Several of the largest mines in the desert depend almost entirely upon the water transported on cars. The Copper Queen runs its vast smelter and mine dug in a solid rock without machines or powder, and from which burdens could be carried on the human back. In Utah alone had the white man attained a foothold.

But the sterile and hopeless-looking soil of the desert, when artificially watered, is apparently more fertile than where rainfall is abundant. There is no nobler spectacle than a dreary waste converted into an emerald oasis by water artificially applied, and in the desert may be seen some of the most profitable and skilful agriculture in the world. The wheat fields of Utah and Sonora, the great cotton farms of Coahuila, the alfalfa valleys of the Rio Grande and the orchards of California are all inspiring examples. The transformation made in the desert where irrigation has been possible is marvelous, and in one instance — in southern California — has resulted in the development of communities of great wealth and culture, where the ideals of the American for existence are as nearly attained as possible.

A word of caution must be written, however, against an overestimate of the agricultural capacities of the desert. It is necessary artificially to collect the precipitation over large areas, and to concentrate it upon smaller areas by impounds and canals. In this manner at least 25 acres must be set aside as unproductive catchment areas for every one that may be cultivated. All rain water that falls upon the desert or upon its neighboring mountain, if it could be protected and carefully preserved, would not irrigate 5 per cent of the great desert area. The efficiency of the rain of the Great Desert region for agricultural purposes is still further diminished owing to the season in which it falls — June to October — too late for the growing crops, the planting and growing months of spring and early summer being dry. From a practical standpoint it is doubtful if even 1 per cent of the vast area can be productively tilled by irrigation. The underground water supply, too, is entirely insufficient for extensive agricultural uses, even when it is free from injurious salts; and the desert people, after every possible experiment, have long since ceased to
anticipate any material supply for irrigation from that source.

From whatever point of view the problem is approached, the sober conclusions cannot be avoided that the desert as an agricultural country has its limitations. The only apparent way in which the area of irrigable lands can be seriously increased is by the construction of reservoirs to save the run-off of the forested mountains, especially that portion of the desert adjacent to the Californian, Utah and Mexican sierras. Even when this is accomplished there will still be left a vast area of desert. Hence the agricultural produce of the desert will never be large, and this product, with the exception of the fruits of southern California will contribute but little for export, and will never be sufficient to supply the needs of its own population. The Great Desert is and will continue to be a profitable market for the consumption of the fresh and preserved food products and forage of the ocean seabords and Middle West.

Notwithstanding the scarcity of water and forage the pastoral interests of the desert are considerable. Upon the stony foothills and in the mountain calions the scant herbage and green vegetation furnish nutritious foods for many animals, and there are numerous cattle ranches, especially in the Chihuahua province, which are profitable and thriving. Statistics are wanting and hence exact figures cannot be given, but the livestock values of the desert amount to several million dollars, exceeding the agricultural products many fold.

So far as even the present agriculture in the desert is concerned, it would not exist were it not that its products were consumed at good profit by the people engaged in mining and transportation. One good mining camp, a few acres in extent—and there are many of these—gives employment and remuneration to more people than whole countries of arid farming lands. Previous to the introduction of the railway, mining in the desert was limited to simple processes and products. Without mechanical drills and hoists only moderate depths could be reached, and limited quantities of ore taken out and treated. Consequently the deeper, larger and richer ore bodies remained untouched. Silver and gold were alone considered, and the mines which now yield over $50,000,000 annually of copper could not be touched.

On the California trail near Pearce, Ariz., for 40 years the overland pioneers built their camp-fires against a ledge of quartz. Since the railway came these rocks are being crushed for the gold they contain at one of the most complete and profitable mills in America. The huge stamps and other machines were brought from New York, Pittsburgh, Chicago and Denver; the oil for fuel to run them, from California; the food for the village of over a thousand people living in homes built of Texas lumber is all brought in from the great canning, packing and fruit-growing sections of the country.

A dozen other places in the desert, each with its modern hoists, smelters, converters and electric furnaces are producing millions of mineral wealth per annum. Not one of these new mines has been opened and equipped, but many of the historic old mines of Mexico, abandoned because the limit of hand mining had been reached, have been reopened with the aid of the steam-hoist and air-drill, and to-day are more productive than ever.

The Great American Desert yields annually over $100,000,000 worth of metals—chiefly silver, copper and gold. This represents at 10 per cent a productive capital of $1,000,000,000. In addition to the paying mines, as large an investment is now being made in mine development and preparation for the coming of lines of railway which are everywhere reaching out to new mining fields. There is every possible reason to expect that the mineral output of the desert will be quadrupled the next decade. Mexico's production of gold and silver has increased steadily despite the political turmoil and anarchy of recent years. It produced in 1912 gold to the value of $24,343,482, and silver valued at $44,632,332; Arizona and New Mexico produced a mineral output in 1914 valued at $78,463,191. Silver, instead of being a dead metal, is being mined with renewed activity and improved appliances. The American Great Desert yields about $8,000,000 from the United States.

The smelting interests are not the least important adjuncts of the mining business and each smelter gives employment to many workingmen. The American Smelting and Refining Company, with its capital of $80,000,000, has great central plants in the desert at El Paso, Agua Calientes and Monteray. Many of the mines like Bolo, the Copper Queen, the United Verde Verde and Greene Consolidated have their own smelting works.

Many mineral districts of the desert still lie unproductive for want of transportation. This is especially true of the great copper, gold and coal fields of the Pacific States of Mexico, while the rugged western Sierra Madre contains veins of ore awaiting transportation facilities which will furnish many new and important mines.

The total population of the Great American Desert in 1910 was about 2,750,000 people. Of this total population in the United States, 500,000 are in southern California, leaving about one person to every two square miles in the remainder of the territory. Of the remaining people in the American portion of the desert, at least four-fifths are in cities, towns and mining camps. These people in their own picturesque language are by profession "prospectors," "punchers," "nesters," "miners," "jumpers," "Mexicans" and "promoters." In plainer English, mineral seekers, cattle men, irrigator-farmers, miners, health-seeking consumptives, laboring Indians who have abandoned the "blanket" caste, and men who serve as intermediaries between the latent wealth of the desert and the ready cash of the East. As a whole they are an energetic lot. In the United States they consist chiefly of two classes, the Caucasian, whose ingenious brain conceives and develops industries, and the Mexican (Indian) peasant, who does most of the manual labor. Across the line in Mexico the same conditions exist, except that the American finds a ready co-operator and companion in the higher caste of Mexican citizens. If any of our readers should still retain in his mind as a type of the desert citizen the bad man with the slouched hat, flowing mustaches and quick-acting revolver, he is at least ten years behind the times.

The aboriginal population of the Great American Desert was and is of quite a different type from that of the nomadic savage who lived
DESERT ANIMALS—DESERT LAND LAW

by the chase, in the forested mountains and upon the Great Plains. They were largely village dwellers, home builders and agriculturists who by the arts of pottery and weaving had raised themselves above the grade of barbarism as distinguished from savagery. It was their social arts and habits of industry which produced the highest aboriginal type in the ancient Aztec, and it is their blood (not the Spanish) which to-day constitutes the ruling spirit of Mexico. Upon the invasion of the Spaniards and later by the Anglo-American civilization, they assumed at least a portion of these and to-day they are the people who constitute almost the sole laboring classes of the desert, being called Mexicans in the United States and peons or peasants in Mexico.

It is the intensity rather than the density of the desert population that appeals to the observer; whatever is done is done better than elsewhere. This is a necessity of the desert condition; it will not pay in that region to trifle with inferior methods or products. In mining the best man and the best machine must be had; in farming with expensive water it is a waste to plant poor seed; if cattle are placed on the range they must be good cattle, and so on throughout the entire gamut of industry. The desert cities, if not as densely populous as those of some regions, are unique in their thrift and prosperity. They are all picturesque communities, presenting an interesting mixture of architectural, social, and business conditions, busy with commerce and buoyant with hopes and prospects. Each desert city is thoroughly alive to municipal improvement and development. Electric lights and street cars, waterworks, schools, churches and public libraries abound, while many of the American towns have copied from their Mexican neighbors the picturesque plazas or ornate public parks within the central portions of the busy cities. In many of the Mexican desert cities may be seen the union of all the best of modern industrial improvement with the picturesque Spanish architectural features for which these places are noted. Steam and electricity have asserted their mastery, but have concealed their cold mechanism behind the prettily stuccoed and flower-lined entwined walls of the artistic Mexican type.

DESERT ANIMALS. Men are apt to think of the vast tracts of absolutely treeless arid sand as uninhabited, because they are void of the creatures known to the regions where humanity dwells. Yet these tracts are often teeming with life. On the shadowless expanse, which affords no lurking-place, animals, adapting themselves to the exigencies of their life, often assume the pale tints of the sands whereon, by lying motionless, they may be overlooked. They are not only able to develop a protective coloring, but acquire certain other capabilities. They learn, for instance, to subsist on a minimum of water, or to store it within their bodies, some, indeed, developing an ability to live altogether without direct water-supply. Many desert animals are said to exist throughout the summer, as animals of cold climate hibernate by lying dormant through the winter season. The desert snail, in order to protect itself from desiccation in the daytime, retreats at night times with two or three layers, across the opening of its shell to prevent evaporation of its moisture during the extremest heats. Small desert animals, like plain-dwellers, are burrowers, not only because they can thus escape the fierce rays of the sun, but also because they are so protected against their enemies. Even some serpents burrow, and these are more virulently poisonous than corresponding species of a different habit. All the desert creatures, from the snakes and lizards to the camels, are provided muscursively with the ability to shut out from their nostrils and eyes the sand that is blown by the powerful winds; and most of the insects (except the locusts) are practically wingless, so that these strong desert currents do not carry them away.

The large desert animals are swift, and their feet are adapted for the hot rocks and sand by being cushioned beneath with callous skin. The swiftness of these animals is indispensable to their preservation; for they must generally escape their pursuers by flight, since their habitat affords no hiding-places; moreover, they have to travel long distances for both food and water. Examples of this may be found in the camel and ostrich (qq.v.).

The desert is undoubtedly the refuge of certain animals which have been driven by competition from the more desirable habitations, and which, having located in arid land, have adapted themselves to their unfavorable environment. That they are the unsuccessful and outcast representatives of species living under better conditions is substantiated by the fact that they are always closely related to the forms in the fauna of the green, fertile lands beyond the desert; the differences usually being only the changes necessitated by difference of habitat.

DESERT IGUANA, or keeled lizard (Dipsaurus dorsalis), a stout-bodied iguana lizard of the deserts of the Mexican border of the United States, distinguished by a single row of keeled scales along the spine. It is terrestrial, lives in burrows, runs swiftly and is largely herbivorous. See IGUANA.

DESERT LAND LAW. Under the group of acts known as the Desert Land Law, any citizen of the United States 21 years of age or more or any person of such age who has declared his intention of becoming a citizen who is a bona-fide resident of the State or Territory in which the land to be entered is located, and who has not previously exercised the right of making desert land entry, may take not to exceed 320 acres of arid land which he proposes to reclaim by conducting water thereon within four years from the date of his application. He must acquire a clear right to the use of sufficient water to irrigate and reclaim the whole of the land entered or as much of it as is susceptible of irrigation. At the time of filing his application he must pay the sum of 25 cents per acre. Each year after entry for three years he must file proof of having expended not less than $1 per acre or a total of $3 for the necessary irrigation, reclamation and cultivation improvements thereon and in the purchase of water rights. Thereafter upon proving compliance with the law as to reclamation of one-eighth of the irrigable area and the payment of $1 per acre for 320 acres of unirrigated lands. Title may be acquired in less time if the showing required by the law is made.
DESSERT PLANTS — DESERTED VILLAGE

The Desert Land Law is the result of conditions found as the settlement of the public lands pushed westward beyond the hundredth meridian. It soon became evident that a large part of the public domain was semi-arid and that new agricultural conditions must be met by legislation.

The first attempt was by means of special legislation passed 3 March 1875 for the sale of desert lands in Lane County, Oregon, attracting not more than 640 acres at a price of $1.25 per acre. The land was to be reclaimed by conducting water thereon within two years. This act was a departure in two particulars from the policy of the Homestead Act enacted 13 years before and being then the principal mode of disposing of public lands, first in not requiring residence on the land, and second in allowing an individual to take four times the limit of area fixed in the homestead law.

The general Desert Land Act was adopted 3 March 1877, and applied to practically all the States and Territories in which desert land is found. The principal difference from the former act was in allowing three years for reclamation instead of two.

The Act of 30 Aug. 1890 limited the amount of land which anyone could acquire under any or all the public land laws to 320 acres. The Act of 3 March 1891 provided more in detail as to the requirements of reclamation and demanded for three years the annual proof of an expenditure of $1 per acre in the reclamation of the land and in permanent improvements thereon. The entryman is also required to cultivate one-eighth of the land.

The lack of residence requirement and the ease with which the proof of expenditure could be made opened the way for much fraud under this act and the amount of land permanently improved under it is disappointingly small.

The opportunities for irrigating lands on a scale which could be handled by a small number of comparatively few and experience showed that irrigation companies which did not also own or control the land to be irrigated were seldom financially successful. Congress has not been willing to give individuals or corporations control of large areas such as was necessary for the success of the more extensive and costly irrigation enterprises. The limit of individual development was therefore soon reached and some new plan became necessary.

To meet this situation Congress provided a method of encouraging reclamation by the States under the Act of 18 Aug. 1894 known as the Carey Act, and later Congress provided for the reclamation of the arid lands by funds from the public treasury under the Act of 17 June 1902 known as the Reclamation Act. See RECLAMATION LAWS. For the soldiers' and sailors' relief acts of 1917-18, see HOMESTEAD LAWS.

MORRIS BIEN,
United States Reclamation Service.

DESSERT PLANTS, such plants as are characteristic of arid regions in general marked by structures adapted to check transpiration of water, such as reduced leaf-surface, absence of leaves, thickened epidermis, hairy or waxy coverings, stomata (“breathing apparatus”) in sunken pits, the entrances to which may or may not be protected by hairs, perennial underground parts such as bulbs, tubers, rhizomes; and annual plants which flourish during the wet season, where such occurs, and, like the tops of many of the perennial herbaceous species, die during the dry season. On the other hand water-absorbing organs are often highly developed; the root-systems are not only large but the root-hairs are exceedingly numerous. Storage organs other than underground parts are common, as in many plants with fleshy leaves and in the thick stems of cacti. In regions of less and less rainfall the vegetation becomes more and more monotonous and restricted where such occurs.

In addition to intense heat and light, drying winds and small rainfall, the plants have often to adapt themselves to withstand salts which are brought to the surface in solution and left as the water evaporates.

Structural differences and similarities may be observed in the plants characteristic of Alpine and Arctic conditions. Another striking character of desert plants is their restriction to a limited area by isolation and by enforced adaptability to peculiar conditions. With such respects desert and Alpine plants are similar, but in which each differ from Arctic plants that have a wide range. See ALPINE PLANTS; ARCTIC REGION; BEACH PLANTS; HALOPHYES; PLANT GEOGRAPHY; XEROHYTES.

DESSERT VARNISH, a hard dark brown coating that occurs on the surface of most rocks in desert regions. As waters circulate through the rock they gather a certain amount of mineral matter in solution. In humid regions this mineral matter is carried out in springs and removed by river washing. But in deserts all this water evaporates as soon as it gets to the surface of the rock, and the mineral matter is left behind to form the desert varnish.

DESERTAS, dâ’sêr-tâs, a group of four small rocky islands in the Atlantic Ocean, 30 miles southeast of Madeira, visited at certain seasons of the year by fishermen and herdmen. They are named Sâl Rock, the northernmost and smallest, Deserta Grande, Chao and Bugio, the southernmost.

DEsertED Village, The. 'The Deserted Village,' the best known of Oliver Goldsmith's poems, appeared in May 1770, and reached a 5th edition by August of that year. There has never been any marked diminution of the favor in which it is held by lovers of poetry, though pentameter couplets and didacticism were even in 1770 not the newest poetic fashion and were soon dispossessed. Goldsmith's couplets, less epigrammatic than Pope's and less austere than Dr. Johnson's, are easier and more natural than those of either of his masters, not because Goldsmith paid less attention to his workmanship but because he gave his measure, by means of unusual variety of pauses and a singularly limpid diction, a flowing rhythm that matches the deeper rhythm of his genuine emotion. The didactic element grew out of his wish to exhibit the harm done to those rich men when they sold their private grounds, buy up neighboring farms or villages and drive the inhabitants out. Doubtless he was somewhat melodramatic in his plea, but the evil did exist, as it does still, and he merely used a poet's weapons against selfish
and inhumane luxury. Argument, however, is not the essential merit of the poem. Grief at finding his native village deserted and in ruins brings back to the poet, who is partly Goldsmith himself and partly a mere poetic generalization, the memory of its prosperous days. The images which rise within him—the earnings sports on the green, the parsonage, the schoolhouse, the inn—are described with an exquisite fidelity, a kindly humor, a tender sympathy and an unexcelled felicity of language which then there had never been such an abuse as Goldsmith wrote against, would have made his poem unforgettable and universal.

Carl Van Doren.

DESERTER, in military affairs, a soldier or sailor who absents himself without leave with the intention not to return. An officer who absents himself without intent to return upon tendering his resignation, before that resignation has been accepted, or a soldier who enlists in the army, navy or marine corps of the United States or in a foreign army, before receiving his discharge, is considered ipso facto to be a deserter. In the United States desertion from the army or navy in time of war is subject to a court-martial which may inflict a sentence of death. Desertion under ordinary conditions is punishable by dishonorable discharge and two and one-half years hard labor, but if done during an insurrection or similar disturbance, by five years' hard labor. The United States government offers a monetary reward for the arrest and delivery of a deserter, the sum usually ranging from $20 to $30. In every civilized country the laws against desertion are similar to those of our own land—always severe upon the man who abandons his duty, punishing him with harshest discipline, and, sometimes, death.

DESECT, in legal terminology a word applied almost exclusively to violations of the obligation of husband and wife to live together in the state of matrimony. Desertion may be defined as the wilful termination of the marriage relation by one of the parties without lawful or reasonable cause; or the voluntary refusal to renew a suspended cohabitation, without justification either in the consent or wrongdoing of the other. Where the party absenting himself or herself from marital community with the other has a reasonable cause for so doing the severance of relations is not a desertion. It has been held that only such misconduct as would constitute a ground for divorce will excuse either a wife or a husband who separates, and lives apart, from the other; but the justification of the act would probably be a matter to be determined on the merits of each case. The refusal of matrimonial intercourse, the parties continuing to live in the same house, would not of itself constitute desertion; this would be a breach of a single conjugal obligation only. Desertion imports a complete cessation of relations, and the absconding of the duty of cohabitation and all other obligations of marriage by refusal to live together. Where the separation is by mutual consent, and the husband makes adequate provision for the support and maintenance of the wife, desertion cannot be imputed, of course. Where husband and wife are living separate without reasonable cause, and without mutual consent, and an offer of reconciliation and the renewal of marital relations is made by one party and refused by the other, the party refusing becomes a deserter. The refusal to return must be voluntary, however. If the refusal is given under restraint or duress from a third party, the remedy is against the restrainer, either by writ of habeas corpus or by a suit for alienation. Probably only the husband could sue out the writ. At common law the remedy for desertion is a suit for the restitution of conjugal rights which has never been such an abuse as Goldsmith wrote against, would have made his poem unforgettable and universal.
DESFONTAINES — DESIGN

but, armed with a requisition of extradition issued by their governor, the police officers of any State can now take a fugitive wife deserter from any other State to which he has fled or may flee. A propertyless husband in prison, of course, cannot comply with the order to pay maintenance. In some States, therefore, the law permits the delinquent to be committed into the custody of a probation officer, who is charged with the duty to see that the order to support the wife is complied with, and the stipend is regularly paid. An alternative method to insure payment is to require the institution wherein the delinquent is imprisoned to pay a stated sum per diem to a person designated by the court as the proper recipient. The per diem is written off as part of the running expense of the penal institution and is charged to the county. In the last analysis, however, it comes out of the labor of the prisoner breaking stones, digging ditches or building roads. The deserter is thus made to earn bread for his abandoned dependents by the sweat of his brow. The legislation on this subject, the more drastic parts of which have given the worker during the past five or six years, provides the means whereby women in the humbler walks of life can obtain expeditiously and inexpensively the equivalent of a judicial separation with alimony.

STEPHEN PFEIL

DESFONTAINES, də-fɒn-/tɑ̃/, Pierre François Guyot, Abbé, French writer: b. Rouen 1685; d. Paris 1745. He was one of those known to us more for their controversies with Voltaire, and his biting attacks, than from their own productions. Voltaire, by the superiority of his wit, succeeded in gaining many to his opinion; but impartial judges have long agreed that he was not altogether correct, and that the criticisms of the Abbé Desfontaines, though severe, are by no means unjust. One of the works of the abbé, which had the misfortune to excite the particular displeasure of the poet, was the well-known 'Dictionnaire néologique,' of which the sixth edition appeared in 1750 and which was intended to guard the purity of the French language, as the great writers of the 17th century had formed it; and in this respect it has certainly proved of much service.

DESFUL, də-fʊl, or DIZFUL, də-zʊl, Persia, city in the province of Khuzistan, its chief commercial centre, 30 miles northwest of Shuster. It is on the Diz or Coprates River here crossed by a stone bridge of 20 arches. Pop. 30,000.

DESGOFFE, də-gɒf/, Blaise Alexandre, French painter: b. Paris, 17 Jan. 1830; d. 1901. He is famous for having imitated jewels and trinkets with pastes, and transparent coats of color. Among his works are 'Oriental Agate Cup of the 16th Century,' after the original in the collection of jewels in the Louvre; 'Oriental Vase on Enamed Pedestal of the 16th Century'; 'Amethyst Vase of 16th Century' (Luxembourg); 'Onyx Jug'; 'Money Bag of Henri II, Enamels of Jean Limosinus' (Luxembourg); and many flower pieces. In the Corcoran Gallery, Washington, are his 'Souvenirs of the 16th and 17th Centuries.' He is also represented in the Metropolitan Museum, New York; the Walters Gallery, Balti-

more; the Brooklyn Museum and many private collections in America.

DESHOULIÈRES, dâ-zɔ̃-lɛ-är', Madame Antoinette de Ligier de la Garde, French poet: b. Paris, 1 Jan. 1638; d. there, 17 Feb. 1691. During the war of the Fronde she lowered her husband into exile at Brussels, and he rescued her after she had been for eight months imprisoned at Vilvoorden as a suspicious personage. She was called the 10th Muse and the French Calliope on account of her idyls 'Les moutons' and 'Les fleurs.' Her frequent failure in writing tragedy caused this advice to be given her: "Retournes à vos moutons." Voltaire was of opinion that of all the French poets of her sex she had the greatest merit. Several learned societies elected her a member, and her agreeable manner, her animation and wit, which sometimes, but rarely, gave way to a gentle melancholy, made her the centre of attraction in the best societies at that period. A good edition of her works appeared in 1749.

DESCICATION, the evaporation or drying off of the aqueous portion of bodies. It is practised with fruit, meat, milk, vegetable extracts and many other matters. It is usually done by a current of heated dry air, and as such may be considered as distinguished from evaporators, so called, to which furnace heat or steam heat is applied. See Food Preservation.

DESIDERIO DA SETTIGNANO, dâ-sê-de-rî-ô dâ set-tîn-yà'nô, Di Bartolommeo Di Francesco, Florentine sculptor: b. 1425; d. 1476. He was a pupil of Donatello. His chief works are the tomb of Carlo Marsuppini, chancellor of the Florentine republic, in the church of Santa Croce; and the great marble tabernacle of the Annunciation in San Lorenzo. Another church in Florence possesses a statuesque of the Infant Jesus by this sculptor, of which there is a replica in the Louvre. The genuineness of many busts attributed to him has of late been disputed. The Paris and Vienna museums possess some fine examples of these.

DESIDERIUS, Lombard King. See DIMER.

DESIGN, in painting, the first plan of a large work, drawn roughly, and on a small scale, with the intention of being executed and finished in large. See DRAWING.

In music, design means the invention and execution of the subject in all its parts, agreeably to the general order of the whole, especially in the composition of works of classical formula as required by a sonata or symphony. In manufactures, design expresses the figures with which the workman enriches his stuff or silk, and which he copies after his own drawing, or the sketches of some artist.

In architecture, a plan of an edifice as specified by the ground-plans, elevations, sections and any other outlines necessary to guide its construction.

DESIGN, Schools of, schools in which is taught with an industrial application in view rather than a purely aesthetic end. Theoretically such schools may be considered as intermediate between schools of technology, in which (with the exception of the architectural courses) de-
DESIRADE—DES KNABEN WUNDERHORN

signing is of a purely mechanical nature and application, and schools for the training of artists; yet in actual practice this distinction is not always followed. The best results in applied art are produced by foundation work similar to that essential in preparation for a distinctive course. These courses in some schools vary in detail but generally include most of the following branches: free-hand drawing; the theoretical principles of decoration, and the history of art — especially in its decorative aspects; copying and variation of designs; original designing for textile fabrics, wallpaper, stained-glass, pottery, leather-work, book-covers, etc.; and the study of the best examples of designing— for which accessible museum collections are essential. To this is added instruction in technical manipulations.

The definite endeavor to promote art education with the purpose of developing and improving the art industries of the nation, had its rise in England as a result of the first international exhibition, that of 1851, at Hyde Park, London. In the United States a similar movement originated in Boston in 1870, and was an outcome of the former. The related branches of industrial art drawing and manual training owed much to the impetus given by the Centennial Exhibition of 1876. The new spirit was felt by artists and writers and wrought marked changes in them during the next quarter of a century, and museums of art were created and developed. Among the institutions offering courses in applied art in the United States, may be mentioned the schools of Cooper Union, the Lehigh and Lafayette, the School of Industrial Design (1872), affiliated with the Massachusetts Institute of Technology; the School of Design for Women in Philadelphia; the School of Design of the University of Cincinnati; and the University of Minnesota, which has a four years' course in drawing and industrial art. The large cities of Europe were provided with faculties for teaching industrial art long before such a necessity was apparent in Great Britain and the United States. In Paris the Ecole Nationale et Speciale des Arts Decoratifs, in Berlin the Bau Akademie and in Vienna the Imperial Art Institute, may be especially noted. The great schools devoted to the training of artists created the atmosphere and impulse without which the more practical schools would be impossible, but they hardly come within the scope of this review. Among the results produced in Great Britain by the recognition in 1851, of the superiority of France in the arts of applied design, was the creation of the South Kensington schools and Museum of Art, which have been powerful factors in effecting the great change in that nation. Consult Munsterberg, 'The Principles of Art Education' (New York 1904); and Adams, 'Theory and Practice in Designing' (New York 1911).

DESIRADE, dà-zé-rád', an island of the West Indies, dependency of Guadeloupe, from which it lies about nine miles to the east. Since 1814 it has been a French possession. It has an area of 10 square miles, and a population of about 1,500, composed mainly of emancipated slaves. It is known as the island which Columbus first discovered on his second voyage in 1494. The name gave the Spanish name Deseda, 'desired.'

DESJARDINS, dâ-zhár-dẫ', Alphonse, Canadian journalist and politician; b. Terrebonne, Quebec, 6 May 1841. He was educated at Masson and Nicolet colleges, and was admitted to the bar in 1862. In 1868 he turned his attention to journalism, was on the staff of L'Ordre, and later became editor-in-chief of Le Nouveau Monde. He assisted in organizing the Papal Zouaves sent to the aid of the Pope in 1868, and is a member of the Order of Pius IX. He was a member of the lower house of the Canadian Parliament (1876-92) and was then called to the senate. In 1893 he was mayor of Montreal and in 1896 for a short time minister of militia and then minister of public works.

DESJARDINS, Martin, gallicized name of Martin Vanden Bogera, French sculptor; b. Breda 1640; d. Paris, 2 May 1694. He became a member of the Academy in 1671, professor (1681); rector (1685) and court sculptor to Louis XIV. He was a gifted sculptor, decorator and woodcarver, executing many works for the churches of Paris, the College of the Four Nations, palace of Versailles, etc. His chief work was a monogram for Louis XIV (1666), removed in 1792 and destroyed save a few parts now in the Louvre and the Invalides. Another Louis XIV, an equestrian statue, remains at Lyons, with several portraits in busts and bas-reliefs at the Louvre and at Versailles.

DES KNABEN WUNDERHORN, 'The Boy's Marvelous Horn' (Vol. I, 1805, II-III, 1808), the most famous collection of German folksongs, was the work of Clemens Brentano (q.v.) and Achim von Arnim (q.v.), both members of the Heidelberg Romantic group. The title was furnished by the title of the introductory poem, the theme of which suggests in symbol the content of the whole collection. Romantic medievalism began to bear fruit in a profound and varied study of the national past, conspicuously in collections of older tales and poems and in scholarly editions of older masterpieces. German interest in folk-poetry, which was awakened soon after the middle of the 18th century largely through the stimulus of 'Percy's Reliques,' centred mainly in Herder and his followers. Herder's great collection of folk-poetry (1778-79) is in accordance with his conception of the term, was cosmopolitan in scope. 'Des Knaben Wunderhorn,' on the contrary, was distinctly national, in part conceived as a witness to national treasures at a time when the political fortunes of Germany were at a low ebb. The transcription of the texts of the songs, whether from older printed sources or derived from oral tradition, is sometimes careless and linguistically inaccurate; the collectors even made deliberate alterations. Later collections have been more extensive and more scientific, but the importance of 'Des Knaben Wunderhorn' remains: it is a treasure-house of popular song and ballad, of infinite variety and beauty, an index of a people's soul. The influence of this work on the art of songwriting and on art music in the early 19th century can hardly be overestimated, notably on Uhland, Eichendorff, Wilhelm Müller and Heine. The collectors dedicated the first volume to Goethe, who reviewed it favorably and significantly. The Jahrbuch der Allgemeine Litteratur-Zeitung (21 and 22 June 1805). Among several editions with notes and
critical material, those of Boxburger, and of Birlinger and Crecelius may be mentioned. Consult also, Rieser, 'Des Knaben Wunderhorn und seine Quellen' (Dortmund 1908).

HARVEY W. THAYER.

DE SMEDT, Charles, Belgian ecclesiastic; b. Ghent, 6 April 1833; d. Brussels, 4 March 1911. He received his education at the College of Saint Barbara, Ghent, the College of Our Lady of Peace, Namur, the Jesuit scholasticates of Namur, Tronchienne and Louvain. In 1851 he entered the Society of Jesus, taught several years at Tronchienne, was ordained in 1862 and from 1864 to 1870 was professor of church history and of dogmatic theology at the scholasticate of his order in Louvain. In 1871-76 he was a member of the staff of the 'Acta Sanctorum' and from 1876 to 1911 was a member of the Bollandists at Brussels, serving also (1899-1902) as acting rector of Saint Michael’s College. He made an address on 'Des devoirs des ecclésiastiques dans les controverses contemporaines' at the Second Congress of the Catholics of Normandy at Rouen in 1885. Many other important addresses were made by him, notably that on ‘Les origines du culte de la Vierge’ at the Catholic Scientific Congress at Brussels in 1894. He was a member of a very many learned societies, Belgian and foreign. His works include ‘Dissertations selecte in primam etatem historique eclesiasticae’ (1876); ‘Principes de la critique historique’ (1880); ‘Notre vie suraturelle’ (2 vols., 1911); he collaborated also in ‘Acta Sanctorum Hiberniae’ (1887); ‘Catalogus codicum hagiographicorum, latiorum antiquiorum sec. X VI’ (3 vols., 1889-93); ‘Bibliotheca hagiographica latina antiena et medievaetae’ (2 vols., 1901); also contributions to ‘The Catholic Encyclopedia’ (1910) and to various scientific and historical reviews.

DE SMET, Peter John, American Jesuit missionary to the Indians: b. Dendermonde (now Termonde), Belgium, 31 Dec. 1801; d. De Smet, Iowa, 25 May 1873. In 1832, being yet only a scholastic in the order, he was sent by his superiors to join the Jesuit mission in the United States and at the suggestion of the government became an instructor in the Indian school at Florrisant, Mo.; later (1828) he became instructor in the university newly founded at Saint Louis. After this, having been ordained priest, in 1838 he entered on his destined field of labor as missionary to the aborigines, traversing on foot or in canoes or with whatever means of conveyance was possible, the regions inhabited by the Pottawatomies, Sioux, Blackfeet, Flatheads, Pend’Oreilles and other tribes in the valleys of the Missouri, Yellowstone, Platte and Columbia and on both sides of the Rocky Mountains. On many occasions he was a commissioner on behalf of the United States government in pacifying the redmen when, provoked to fury by the wrongs done them, they went on the war path, United States officials reporting that Father De Smet was one of the entire white race could penetrate to these cruel savages and return safe and sound. In his journeys he wandered over 180,000 miles in those wildernesses in the course of his labors of 40 years. But in the meantime he made visits to Europe repeatedly, to collect funds for support of the missions and to enlist young men for labor in the same field. His collections in Europe amounted to 1,000,000 francs.

He wrote several narratives of his experience in the western wilds, among them: 'Letters and Sketches of a Residence in the Rocky Mountains' (1843); 'Oregon Missions and Travels over the Rocky Mountains' (1847); 'Western Missions' (1852); 'New Indian Sketches' (1868).

DESMERES UND DER LIEBE WELLEN (Waves of the Sea and of Love). Among the poetic dramas of the world so many have been marred either by inadequate verse or undramatic material that 'Des Meeres und der Liebe Wellen' (1831), by Franz Grillparzer, stands out by virtue of the harmony of its material and treatment. It is, as the Germans say, "aus einem Guße," all of the same mold—verse, story, handling, setting—all beautiful, majestic, tender, compelling. For his theme, Grillparzer goes back, as he did in 'Sappho' and 'Das goldene Flüiss' to the Greek world, taking the ageless story of Hero and Leander to illustrate the tragedy of love when it comes to those who are dedicated to truth. What makes Grillparzer's method has not the augst simpicity or economy of the Greeks in their handling of tragedy, it has a classic strength that is rare in romantic literature. His verse, moreover, and his characterization, have a warmth and a tenderness that is partly traceable to his appreciation of the great Spanish dramatists. Nowhere in his work does his special gift show to greater advantage than in the radiant love-poetry of 'Des Meeres und der Liebe Wellen,' which fact makes it the more strange and pathetic that a public which gave his earliest and far less favored works a welcome, turned its back on this splendid achievement and on those that followed it. It was not until after Grillparzer's death that 'Des Meeres und der Liebe Wellen' was properly estimated; but to-day it is quite generally conceded to be one of the finest verse-dramas in the German language.

EDITH J. R. ISAACS.

DESMOINES, de-moin, Iowa, city, capital of the State, and county-seat of Polk County; near the Des Moines River, the largest stream in the State, long. 16° 43' 32" W.; lat. 41° 35' 45" N. It is situated at the junction of the Des Moines and Raccoon rivers, and is entered by 19 lines of steam railroads and 4 lines of interurban electric roads, operating 203 miles of track. The city is built on a plateau 849 feet above the sea-level, is intersected by both rivers, which are spanned by eight bridges, and is 54 square miles in area. The business portion lies near the rivers and the residences are on the higher grounds beyond.

Industries.—The city is located in the heart of a rich coal mining district, the mines in the vicinity employing over 3,500 persons, and having an annual output of 3,500,000 tons. The principal industries, besides coal mining, include pork packing; brick and tile, foundry and machine shop products, brass goods, clay products, carriages and wagons, furniture, cotton and woolen goods, cement, wall paper and proprietary medicine, shoes, caskets, art glass, aluminum ware, gloves and caps, work garments, suspenders. It is also noted
for its immense insurance interests, there being in the city 45 insurance companies. The insurance pay-roll approximates $200,000 per month. Des Moines has the greatest fire journal centre in the world. The products of Des Moines' 412 factories, employing more than 5,000 operatives, amount to more than $30,000,000. The city has a growing jobbing trade, in the $100,000,000 a year—an increase of 100 per cent in six years.

Banks and Publications.—There are 21 banks and trust companies in the city, with a combined capital of $3,200,000 and annual deposits of over $40,000,000. There are published in the city four daily newspapers, four weekly newspapers, and 47 other periodicals.

Public Buildings, Churches, Educational Institutions, etc.—Among the most imposing structures in the city are the State capitol, erected at a cost of $3,000,000; the Soldiers' Monument, costing $150,000; the remains on the site of the old State house; capitol extension park, $2,000,000; the State Historical building, for the collection and preservation of historical records, specimens of art, science and taxidermy, fronting 200 feet, and 2,000 feet in depth, costing $500,000; the county courthouse; the United States government building, containing the post-office and Federal courts; the State arsenal; the library, containing over 50,000 volumes; two large hospitals and the city hall. There are several small libraries, five large opera houses and 32 hotels. The education of the young is provided for by 50 public schools and several high schools, the pupils being furnished with free textbooks. For higher and technical education there are Drake University (Christian), founded in 1881; Des Moines College (Baptist) (q.v.), founded in 1885; Danish Lutheran College; Highland Park Normal College (Presbyterian); Iowa College of Medicine and Surgery; one college of osteopathy and seven technical schools. The college population of the city is 6,500. A military post for cavalry was established there by Congress, the land and buildings costing $1,200,000.

Public Works.—The city has 19 public parks covering in all 970 acres of land, and the Iowa State Fair Grounds, 600 acres in extent, are also permanently located there. The streets are well laid out and paved, there being 150 miles of brick and asphalt pavement; the city is lighted by gas and electric light; the gas distributed by 100 miles of mains, and the electric current carried over 110 miles of wire; the sewage and water systems are excellent, the waste being carried off by 93 miles of brick and pipe sewers, and the water conveyed to all parts of the city through 110 miles of mains by the Holly system for general use and fire protection.

History, Government and Population.—Fort Des Moines was built in 1843 to protect the rights of the Sac and Foxes, and around it a settlement was made in 1846 by emigrants from Ohio, Indiana, Kentucky and Missouri. In 1851 it was incorporated as the town of Fort Des Moines and in 1857 received its charter as the city of Des Moines. In 1856 it became the capital of the State by act of the legislature. The form of government before 1907 was under the general incorporation laws of the State and council of nine members elected annually and representing the seven wards into which the city is divided. In 1907 the Des Moines plan of commission government was adopted. Five commissioners elected at large direct the affairs of the city. The annual income of Des Moines is about $1,100,000, and the budget of expenditures amounts to $1,000,000, the principal items being $965,763.84 for schools, $155,876 for the fire department, $90,580.09 for street lighting, and $99,968.61 for the police department. The city has an exclusive of school debt, amounts to $2,057,028.41; property valuation $127,164,442, and tax rate 33.5 mills. Among American cities Des Moines ranks 35th in population and 17th in postage receipt students.

DESMOND COLLEGE, a coeducational institution at Des Moines, Iowa, was organized in 1865 under the name University of Des Moines. This name was afterward changed to Des Moines College in order to conform more nearly to the aim of its supporters, the Baptists of Iowa. Like most schools of the kind, it has passed through severe financial struggles and reverses. It has an invested endowment of about $100,000 and pledges sufficient to increase this sum to $200,000. It also has a beautiful campus consisting of two hundred acres upon which are three substantial brick buildings and a good gymnasium. An additional block adjoining is set apart as an athletic field, the whole comprising about nine acres and valued, with the buildings, at $150,000. The school has four departments: college, academy, music and art. The college has steadily maintained as its aim a high class of work, and has taken rank with the best of Iowa colleges. It has 22 instructors and an average annual enrollment of 670 students.

DES MOINES PLAN OF CITY GOVERNMENT. See Commission Form of Government.

DES MOINES RIVER, the largest river in Iowa; formed by the east and west forks in southwest Minnesota; flows south-southeast to the capital city; then south-southwest, four miles below Keokuk, where it empties into the Mississippi River; estimated length, 500 miles. It drains 10,000 square miles in Iowa; flows through a region rich in agricultural and grazing grounds, bituminous coal and timber; receives the water of Raccoon, North, Middle, South and Boone rivers. In its lower course it falls rapidly and affords abundant water power for manufacturing.

DESMOND, Humphrey J., American editor: b. Oazaukee County, Wis., 14 Sept. 1838. He was educated at Milwaukee University and entered on the practice of law in 1851. In 1891-92 he was a member of the Wisconsin legislature, and subsequently became proprietor of the Northwestern Chronicle, Saint Paul, and the Memphis Journal, of Memphis, Tenn. In 1891 he drew up the compulsory education law and later the freedom of worship law, both of which were enacted. He was one of the founders of the Western Catholic Summer School and is a member of the American Historical Association. He has published 'Mooted Questions of History' (1895); 'From Rome to Europe' (1897); 'The Church and the Law' (1898); 'Ways of Well Doing' (1902); 'History of the Know-nothing Party' (1904); 'Larger Values' (1913). He was a collaborator
of 'The World's Best Literature' and has contributed articles to the American Catholic Quarterly Review, the Century, the Forum, North American Review and 'The Catholic Encyclopedia.'

DESMOULINS, Lucie Simplice Camille Benoist, French revolutionary: b. Guise, Picardy, 2 March 1760; d. Paris, 5 April 1794. He studied at the Lycée Louis-le-Grand and later took up law. In 1785 he appeared before the Parliament of Paris as an advocate, but a defect of speech made him unsuccessful in this capacity. Before the general republican movement came to a head, he published in 1788 a pamphlet called 'La philosophie au peuple français,' but on the removal of Necker, Desmoulins suddenly found himself one of the prime instigators of the revolutionary movement. Carried along by the enthusiasm of the first few weeks, he published a political pamphlet called 'La France libre,' which scored an instant and prodigious success. It was followed shortly afterward by 'Discours de la Laroisière aux Parisiens,' which gained him the nickname of "Procureur général de la Lanterne." In November 1789, there appeared his famous journal La Revolutions de France et de Brabant. It inflamed the hatred of the royalists and the loyalty of the republicans, and established beyond question the position of Desmoulins as one of the foremost of republican journalists. He became a strong adherent of Robespierre, with whom he had studied at college, and of Danton, the leader of the Cordeliers. In April 1792 he founded with Fréron the journal La Tribune des patriotes, which expired after the fourth number had been issued. He abandoned journalism for the platform for a while, but he was less influential as an orator than as a pamphleteer. He was, moreover, not an original thinker nor consistent in his political adherence. The brilliance of his philippics was always the ornament of his devotion to one or another of the great leaders of the various democratic parties, rather than the lustre of his own deeply-rooted policies. His attack on the Girondists, which he wrote at the suggestion of Robespierre, was so effective in undermining that party that he earnestly regretted having written it. He even thought that the total expulsion of the Bourbons was far too extreme a measure. He was finally alienated from the Jacobins by his opposition in Le Vieux Cordelier, the Dantonist paper, to the tyrannical character of the Committee of Public Safety. He advocated just trials, less drastic punishments and more liberal policies. This led to his arrest by the committee, along with Danton and others of the party; and after a semblance of a trial and a half-hearted defense by Robespierre, Desmoulins was condemned and executed. His wife met the same fate eight days later. Consult 'Oeuvres de Camille Desmoulins, avec une notice biographique,' ed. by Matton (Paris 1838); Claretie, 'Camille Desmoulins, Lucile Desmoulins et Claude sur les Dantonistes' (Paris 1875); and Aulard, 'Les lettres et de la Législative et de la Convention' (Paris 1885-86).

DE SOLA, Abraham, Canadian rabbi: b. London, England, 18 Sept. 1825; d. New York, 5 June 1882. Under the careful supervision of his father he received a thorough Hebrew education, and having perfected himself in his general studies, he was called in 1847 to Montreal, Canada, by its Portuguese-Hebrew congregation. His scholarship and energy soon brought him to the front, and in 1848 he was appointed professor of Hebrew and Semitic literature in McGill College, Montreal. Among his more important works may be mentioned: 'The Sanitary Institutions of the Hebrews'; 'Lectures on the Mosaic Cosmogony'; and 'Scripture Zoology.' He was for many years president of the Natural History Society of Montreal.

DE SOTO, Hernando, Spanish nobleman, conqueror and explorer: b. Villanueva de la Serena (Badajoz) about 1496; d. 1542 or 1543. As a captain in 1523-24 he shared the adventures of Córdoba's fleet on the Nicaraguan coasts, but was overcome by the Guatemalan Indians at Dávila through treachery. Joining Francisco Pizarro in Panama with two ships, 60 men and 10 horses, to take part in the conquest of Peru, he was appointed second in command. In 1532 he was the first Spaniard who spoke with Atahualpa; going to visit the unfortunate Inca in the character of an ambassador, he continued to be well disposed toward him during his captivity. He returned to Spain in 1536, where he married in Madrid, the following year, Inés de Bobadilla, daughter of Pedrarías Davila (q.v.). Wholly misled by the first reports of the wealth of Florida, De Soto resolved to undertake the conquest of that country, which was represented to be as rich as Peru. He sold his property and devoted the proceeds to the equipment of his ships and the outfit of his men. Charles I bestowed upon him readily enough the title of governor of Florida and Cuba. At Sanlúcar he collected 950 fighting men, besides sailors. Seven large ships and three small formed the fleet, his wife and family accompanying him in the San Cristóbal. De Soto sailed from Sanlúcar 6 April 1538, reached Santiago de Cuba safely, and there entered upon his duties as governor of the island, but transferred his authority at that point to his wife before proceeding to Havana (August 1538). By his orders Havana harbor was fortified (see CUBA). During the stay in Cuba his command was strengthened; 1,000 well-armed men were finally got ready, and this was probably the best force which up to that time had undertaken the conquest of any part of America. The fleet sailed from Havana 12 May 1539. In Florida the Spaniards were moderately successful until they reached the province of Tascalusa, where a great host of natives attacked them. It was said that in nine hours' fight 11,000 Indians fell, while on the Spanish side 70 were killed and nearly all (including De Soto himself) were wounded. Worn out by the long marches, which did not lead to the discovery of treasure, the soldiers plotted to abandon the enterprise. On learning of this, De Soto marched his men toward the interior, hoping to reach New Spain (Mexico).
by land, and knowing that, at any rate, his
followers would not care to desert him when
the ships had been left far behind. In a noctur-
mal battle (December 1540) the Spaniards
were again severely handled. Four months
later they came upon a fort surrounded with a
stockade, in storming which many were killed
and nearly all wounded. De Soto then led them
forward, through the present Gulf States and
probably as far north as Kentucky, until he
contracted a fever and died—according to
Garcilaso, in 1542, though Herrera says 1543.
The Spanish soldiers, who had thought to leave
their commander in the lurch, were in this man-
ner finally separated from him. At first they
buried him in a trench the natives had opened
near a village on the bank of a great river he
had discovered; but several days afterward—
either fearing the hosts would dishonor the
body or suddenly realizing how they them-
selves might best honor it—they hollowed out
the trunk of an evergreen oak, weighted the
rude coffin with armor, placed the disinterred
body within it and sank it by night in the
deepest part of the lake, on which a tiny lake was
named, called the Grande and we call the Missis-
ippi.

MARRION WILCOX.

DE SOTO, de só-tö, Mo., mining city in
Jefferson county, on the Saint Louis, Iron
Mountain and Southern Railroad, about 40 miles
south by west of Saint Louis, and 15 miles west
of the Mississippi River. In addition to its
mining interests of lead and zinc, it is a large
producer in agricultural and horticultural prod-
ucts, flour, produce and live stock, its industries
include a flouring-mill, shoe factory and the
repair shops of the railroad. The waterworks
are owned by the city. Pop. about 4,900.

DESOXYBENZOIN, phenyl-benzyl-ke-
tone, C₇H₅.CO.C₆H₄.C₂H₅; obtained by the
action of zinc and hydrochloric acid on chloro-
benzil C₆H₅.CO.C₆H₄.C₂H₅, or by heating mono-
brom-stilbene with water. It crystallizes out
of alcohol in large tablets which melt at 60° C.
Desoxy-benzoxy can also be obtained by reduc-
ing benzoin C₇H₅.CO.C₂H₅.OH.C₂H₅.

DESPARD, Edward Marcus, Irish soldier:
1. Queens County 1751; 2. London, 21 March
1803. He served as ensign in 1766 and in
1779 played an important role in the engineer-
ing service of the San Juan expedition. In
1781 he was made commander of the island of
Rattan and from there was transferred to the
position of supervisor, with the rank of cap-
tain, of the English colony in Honduras. In
consequence of complaints made against him he
was recalled in 1790. This made him dissatisfied
and he matured a plan to assassinate the king
on his way to open Parliament. The conspir-
ators were arrested and tried by special com-
mision at Southwark 5 Feb. 1803. There be-
ing no doubt of their guilt, Despard and nine
of his associates suffered death.

DESPENSER, de-spén-ser, Hugh le, Eng-
lish, about 1210; d. Evesham, Aug.
1265. He was justiciary of England in 1261 and
during the war of the barons with Henry III
joined the former. He was killed at the battle of
Evesham.

DESPENSER, Hugh le, The Elder, Earl
of Winchester: b. 1262; d. 27 Oct. 1326. He
was the son of the preceding. He served with
Edmund, Earl of Cornwall, in the Welsh War.
Later he supported the king in Gascony. He
was called to the council at Dunbar; joined the
expedition to Flanders in 1297, and was sent to negotiate a treaty of
peace between Edward, the king of the Romans
and the king of France. In the following
year, he went as a commissioner in France, and served in the various Scotch campaigns.
Though originally of the barons' party he
abandoned it, doubtless for selfish reasons, in
order to support Gaveston, the king's favorite.
He was temporarily dismissed from the coun-
cil but soon returned, and was by the
grateful king for his services with the gift of
the castles of Devizes and Marlborough. He
and his son succeeded Gaveston as the king's
favorites and honors and grants were heaped
on them. This incurred the hatred of the
barons who, in 1321, finally secured their ban-
ishment. At the instigation of the clergy they
were restored and once more joined forces with the king. They assisted at
the trial of the monarch's great enemy, Lancaster, and became very unpopular throughout the
country. Queen Isabella, wife of Edward II,
was driven to drastic action against her weak-
willend spouse and his favorites and finally suc-
cceeded in defeating his troops at Bristol, seiz-
ing the Despensers and having the elder ex-
cuted as a traitor.

DESPENSER, Hugh le, English courtier,
son of the preceding: b. about 1290; d. Novem-
ber 1326. He was made knight on the same
day as the Prince of Wales and established him-
self in power and financial status by marrying
Eleanor of Gloucester. He thereby opposed
against Scotland. He deserted the barony
party for that of Edward II, and became a
royal favorite. He and his father were in-
volved in the misfortunes following the flight
of King Edward from London, and were be-
headed in the same year. His grandson, Henry
of Norwich, was chosen by Urban VI to lead a
crusade against the antipope Clement VII.
Consult Tout, 'Political History of England,
1216-1377' (London 1905).

DESPÉRIERS, dà-pa-ré-à, Bonaventure,
French writer: b. Armay-le-Duc about 1505; d.
1544. In 1535, he published with Dolet, his
'Commentaries on the Latin Language.' He
became secretary to Margaret of Navarre
in 1536. He wrote a series of 90 stories:
'Nouvelles recrétations et joyeux devis' (1558).
In 1537 was published his 'Cymbalum Mundi'
in French, a virulent attack on the Chris-
tian religion, which was burned by the com-
mon hangman, and of which only one copy
is in existence. He ended his life by suicide.
Consult Frank and Chenevière, 'Lexique de la
langue de Bonaventure des Périers' (Paris
1888); Chenevière, 'Bonaventure des Périers'
(ib. 1886); Rüüner, 'Syntaktische Studien zu
Bonaventure des Périers' (Leipzig 1897).

DES PLAINES RIVER (named from a
species of maple called by the French plaine).
A river of Illinois which rises in the eastern part of Wisconsin and flows south and
southwest until it unites with the Kankakee
River at Dresden, Ill., to form the Illinois
River. In length the Des Plaines is about 150
miles. For some distance the river flows al-
most parallel with the shore line of Lake Michi-
For 13 miles the waters of the Des Plaines have been made to contribute to the Chicago Drain.

DESPOLADO, dáz-pó-blá'ðó (desert), a name given in South America to barren tracts in the Andes, which are so high and cold as to be uninhabitable. It is given as a specific name to (1) a treeless, uninhabited plateau, nearly 10,000 feet above the sea, on the Bolivia and Argentine frontier; and (2) a region in Peru between the central and western Cordilleras, ranging from 14,000 to 18,000 feet above the sea-level.

DESPOT (from the Greek despotés), originally a master, a lord; at a later period it became an honorary title which the Greek emperors gave to their sons and sons-in-law when governors of provinces. Alexis III, surnamed Angelus, toward the end of the 12th century, is said to have first introduced this title, and to have made it the first in rank after that of emperor. Thus there was a despot of the Morea, of Servia, etc. At present, despot means an absolute ruler. In a narrower sense, it conveys the idea of tyranny, since in fact the possession of absolute power and the abuse of it are two things bordering very closely on each other.

DESPOTO DAGH, dész-pó-tó-dâb, or RHODOPE MOUNTAINS, a mountain chain of European Turkey, extending 30 miles from the east of the main range of the Balkans to the basin of the Maritza. Its highest summit is Muss-Alla, 9,600 feet. See Rhodope.

DESPRéS, dáz-prâ', Suzanne Isabelle, French actress: b. Mexico 1876. She studied at the Paris conservatory and was awarded first prizes in comedy and tragedy in 1897. She married Aurelien Lugné-Poë, manager of the Théâtre L'Oeuvre. She appeared in 'Remplaçantes' at the Antoine and in 'L'Assommoir' at the Porte Saint-Martin, and in 1902 made her first appearance at the Comédie Française in 'Phédre.' She appeared in 'Elektra' in 1910. Her greatest success has been the portrayal of Ibsen rôles. She has appeared in London and made a tour of Germany in 1906. Consult Nouvelle Revue (May 1902).

DESSAX, dáz-sâ', Joseph Marie, French general: b. Thonon, Savoy, 24 Sept. 1704; d. 26 Oct. 1834. He served at the siege of Toulon, and in Italy under Bonaparte; was elected in 1796 to the council of 500, where he opposed the coup d'état of the 18th Brumaire. He was made a brigadier-general by Bonaparte in 1803, and, in the campaign of 1809 against Austria, a general of division, receiving from the emperor the surname of L'intrepid, and the title of count of the empire. He was also made governor of Amsterdam; served in the Russian campaign of 1812 when he was wounded at Borodino; in 1814 fought against the Allies in Savoy; and became the National Guards at Lyons after 1830. Consult Dessai and Folliet, Etude historique sur la révolution et l'Empire en Savoie; Le général Dessai — sa vie politique et militaire (Paris 1879).

DESSALINES, dáz-sá-lâ'n, Jean Jacques, emperor of Haiti: b. 1760; d. 14 Oct. 1806. He was a slave, and during the last 10 years of his life he was chief of the person in whose service he remained until 1799: after that time he fought under Biasson, and still later, joined Toussaint L'Ouverture. In his struggle against General Rigaud he signified himself as much by his career as Napoleon. In 1802 he surrendered to General Leclerc. But when an epidemic of yellow fever fell upon the French army and almost annihilated it, he attacked Rochambeau with an army of 30,000 blacks, thus obliging the French commander to surrender to the English, and to leave the island (1803). In 1804, when governor-general of Haiti, he issued an order for the general slaughter of the white inhabitants. In October of the same year he was proclaimed emperor and made an unsuccessful attempt to take the city of Santo Domingo in March 1805. Incurring the enmity of his own followers, he was killed in an ambush near Port au Prince. Consult Dubroca, 'Vie de J. J. Dessalines' (Paris 1804).

DESSAU, dész-sow, Germany, capital of the duchy of Anhalt, in a valley of the Mulde, on the railroad between Berlin, Köthlen, and Leipzig, 65 miles southwest of Berlin. Situated in a region well-wooded and well-cultivated it has wide tree-shaded streets, a 16th century palace, containing fine collections of Dutch, Flemish and Italian masters, relics of Napoleon and Prince Leopold, the modern palaces of the ruling prince and of Princess Louise, the parliament buildings, post office, municipal theatre and the old and new town halls. In the church of Saint Mary, erected in 1512, restored in 1857, is the tomb of Prince Leopold, noteworthy for the six stone figures which guard the sarcophagus. The city has a modern water-supply system and an electric-lighting plant, several schools and gymnasium, three libraries, one of which is the property of the municipality, two museums, with priceless art collections, and monuments to Moses Mendelsohn, the philosopher, and Wilhelm Müller, the poet, both of whom were born here, as also the composer Friedrich Schneider. In the Thirty Years' War, on 25 April 1626, Wallenstein won a great victory over Count Mansfeld on the Elbe bridge at Dessau. Modern commercialism has taken possession of the city during the last decades. It now has thriving industries, such as sugar refining, carpet-making, cloth weaving, machinery manufactures, railroad car works, carriage works and distilleries. Being the centre of an intensively cultivated region it has a large trade in agricultural produce, especially grain. Albert the Bear founded Dessau in the 12th century and it became a city in 1213. In 1603 it was made the capital of the Anhalt-Dessau division of the duchy. It suffered much during the campaigns of the Thirty Years' War, but recovered within the century following. Consult Würdig, 'Chronik der Stadt Dessau' (Dessau 1876). Pop. 56,600.

DESEWFFY, COUNT Aurel, Hungarian statesman: b. Nagy-Mihaly, county Zemblen, Hungary, 1808; d. 9 Feb. 1842. He was famous for his erudition, his knowledge of European literature and the political movements of Europe. Early acquainted with the proceedings of the diet of which he kept a journal, after minor state appointments he achieved fame as a member when he eloquently opposed Kossuth's demand for liberty in the sessions of 1832-36. In 1840 he was a member of the committee for the reform of the criminal law.
DESSICANTS, in medicine, substances that check secretions from mucous membranes or cause cicatrization. See ASTRINGENTS.

DESTERRO, dà-stor', Floriopolis. See Brazil.

DESTINN, Emmy, Bohemian operatic soprano; b. Prague, Bohemia, 1878. She studied under Marie Loewe-Destinn and adopted stage name Emmy Destinn in place of her real name Kittl. She secured an engagement at the Berlin Royal Opera, where her début in 1897 was so successful that she obtained a permanent engagement. She appeared as Senta, in 'Der Fliegende Holländer,' upon the invitation of Cosima Wagner at Bayreuth in 1901. She created the rôle of Salome, in Strauss' opera, at Berlin and was selected to sing the part in Paris. She had a notable success in London in 'Madame Butterfly,' and as Donna Anna and Aida 1905. She first appeared in New York in 1908, and has since been prominently identified with the Metropolitan Opera Company of that city. She is a great favorite, not only because of her splendid singing but also because of her qualities as a superb actress. Her repertoire includes over 80 operas.

DESTOUCHES, dà-toosh', Philippe Néri-cault, French dramatist: b. Tours, France, 26 Aug. 1660; d. near Melun, France, 4 July 1754. His comedy, 'Le géant (the giant)' (1732), is a masterpiece in matter, in elaboration and in character delineation. Lessing classes that work, with its companion piece, 'Le dissipateur' (1736), as 'models of the finer high comedy.' Hardy inferior to these is 'Le philosophic marié' (1727), largely based on the author's own life. Consult Bürner, A., 'Destouches et ses comédies' (Albe-Royal 1906).

DESTROYERS. See Anti-TORPEDO Boats.

DESTROYING ANGELS. See DANITES.

DESTUYT DE TRACY, dà-stú't dé trá'sé, Antoine Louis Claude, Count, French philosopher and metaphysical writer: b. Paris 20 July 1754; d. there, 10 March 1836. During the French Revolution he held several important posts and was in repeated peril. He represented the nobility of Bourbonnais at the States General. In 1792 he went into exile with Lafayette. On his return to France he was sentenced to imprisonment, where he remained until the downfall of Robespierre. He served as senator under Napoleon and was raised to the peerage under Louis XVIII. He wrote 'Éléments d'idéologie' (1817), a development of Condillac's philosophy and in part an exposition of what then passed for economics. His 'Déclarations of the Politics of the World's Nations' (1820), and prior works, received considerable notice in the United States through Jefferson, who translated the 'Commentaire sur l'esprit des lois de Montesquieu' (1806) into English and had it published in Philadelphia (1811).

DESULTORES (from desilio, 'I vaul'), the Latin name for vauliers or leapers, who jump horse to another. The Scythian, Indian and Numidian cavalry were very expert desultores and each man brought at least two horses to the field. When one was weary he jumped with great agility upon another, which he led by his hand. The Greeks and Romans introduced the same practice in their games, races and funeral solemnities, but never, as far as we know, in war. Homer describes a vaulter of this sort, who performed his feats on four horses at once (IIiad, xv, 679); and Livy (xxiii, 29) describes a kind of Numidian cavalry in Hasdrubal's army in Spain, in which the soldiers had two horses each, and in the heat of an engagement frequently leaped, fully armed, from one to another. Zellin gives a similar account of a tribe dwelling not far from the Danube, who, on this account, were called Amphiphi. Modern representatives of the desultores are the Russian Cossacks whose equestrian feats surpass those of the ancients.

DETACHMENT, a body of troops or part of a fleet selected from the main body for some special service.

DETAILLE, dé-tâl', Jean Baptiste Edouard, French painter; b. Paris, 5 Oct. 1848; d. 1912. He is distinguished for his treatment of battles and military subjects. He was a pupil of Meissonier. His first picture was 'Repose during Drill in Camp Saint-Maur' (1869) which was awarded a medal. He served in the War of 1870 and his studies of army life were afterward used in his paintings with great effectiveness. Among his pictures are 'Salute to the Wounded' (1877); 'Movement of Troops,' 'The Dream' (at the Luxembourg Museum); 'Defense of Champigny' (at the Metropolitan Museum); decorative paintings at the Hôtel de Ville, Paris, and 'The Panthéon'; 'General Lassalle at Wagram' (1912). He was a member of the Legion of Honor. One of his best pictures, 'The Passing Regiment,' is in the Corcoran Art Gallery in Washington, D. C. Consult Valmy, Baysse, 'Peintres d'aujourd'hui' (Paris 1910).

DETAILER, (1) the unlawful detention of a person against his will or the wrongful detention of the property of another. The term is applied to the unlawful detention of both personal and real property. The property may have been acquired either legally or illegally, but it must be wrongfully held either as against the owner or one entitled to immediate possession. If the person wrongfully detains the property after demand made by the owner or one entitled to immediate possession, he is deemed to have converted it, and he may be sued in trover for damages. The usual remedy for the detention of personal property is replevin, but in some jurisdictions detainer.

Where land is the subject of the controversy, the usual action is ejectment. If the original entry was legal, no action in trespass can be brought. If a tenant at will detains the property with force after the will has determined, he is deemed guilty of forcible detainer. A detainer of land is held to be forcible where the entry was unlawful and with force and retained by force illegally, or even where the entry was peaceful and lawful if the detainer was by force and against legal right.

(2) A writ instructing a judge to continue to keep in custody a person detained there. It was superseded by 1 & 2 Vict. c. 110, §§ 1, 2.

DETECTIVE, one who searches for criminals or ferrets out crime. The work of the de-
DETENTION HOMES — DETERMINANTS

tective is allied to that of the police, and whenever a police force exists there is some detective work to be done, though only in connection with a large police force are men regularly assigned to detective work. The police force of New York includes a body of men known as detective sergeants, who have charge of the work of looking for criminals or investigating such crimes as seem to call for their services. The United States government maintains a force, known as Secret Service men, whose principal duty is in unearthing counterfeiters, and those who rob the mails or infringe the revenue laws. The British government has established in London a force of detectives known as Scotland Yard men. There are private detective establishments in all large cities, the best-known of these being the Pinkerton bureau, which has offices in several cities of the United States under the style of the Pinkerton National Detective Agency. This agency and similar bureaus make a business of supplying detectives, usually to get evidence in civil or criminal suits.

The private detective has fallen into some disrepute in the United States, owing to employment on divorce cases or other matters where there is an inclination to make use of evidence instead of finding it. Some judges have refused to credit the testimony of such detectives unless corroborated. In many cities private detectives are obliged to take out a license before they are allowed to follow the calling. See POLICE; Secret Service.

DETENTION HOMES. State establishments provided by the juvenile court laws of the United States for the temporary care of children awaiting court decisions. They are usually located in rented private houses, sometimes exclusively for delinquent children, but most, both for dependents and delinquents, the sexes separated, generally under the care of a husband and wife, or a matron assisted by male officers. In Syracuse, Columbus and Buffalo, rented private houses contain both detention home and juvenile court. In Philadelphia, Milwaukee and Chicago special buildings accommodate under one roof waiting rooms, detention home and court rooms. See CHILDREN'S COURTS; JUVENILE OFFENDERS.

DETERMINANTS, an important class of algebraic functions which owe their origin to the attempt to formulate the solutions of general systems of simultaneous linear equations. Such a system of the second order is

\[ \alpha x + \beta y = \gamma, \quad \alpha y + \beta x = \delta; \]

from which

\[ x = \frac{\beta \gamma - \delta \alpha}{\alpha \beta - \beta \alpha}, \quad y = \frac{\gamma \alpha - \alpha \delta}{\alpha \beta - \beta \alpha}; \]

The solution of the system of the third order, \( a_{11}x + b_{12}y + c_{13}z = a_{13}, \quad a_{21}x + b_{22}y + c_{23}z = a_{23}, \quad a_{31}x + b_{32}y + c_{33}z = a_{33}; \) in like manner gives

\[ x = \frac{b_{12}c_{23} - b_{22}c_{13} + b_{23}c_{12} - b_{13}c_{22} - b_{12}c_{23} + b_{13}c_{22}}{a_{11}b_{22}c_{33} + a_{11}b_{23}c_{13} + a_{11}b_{13}c_{22} - a_{12}b_{23}c_{13} - a_{12}b_{13}c_{22} - a_{13}b_{23}c_{12}}, \]

with expressions of similar form for \( y \) and \( z \).

The functions appearing in the numerators and denominators of the expressions for the unknowns in the above, and in similar systems of equations, are determinants. They are formed in accordance with a general principle, the first precise statement of which was based upon the recognition of the two classes of permutations, as will presently be explained.

2. It is shown in algebra (q.v.) that the number of permutations of \( n \) elements arranged in a series is \( n(n - 1) \ldots 2 \cdot 1 \equiv n! \). Any two elements, whether adjacent or not, standing in their natural order in a permutation constitute a permutation; standing in an order the reverse of the natural, an inversion. Thus, in the permutation \( a_1 a_2 \ldots a_n \) the permutations are \( a_n a_{n-1} \), \( a_n a_{n-2} \), \( \ldots \), \( a_2 a_1 \); the inversions, \( da, dc, db, ea, ec, eb, eb \).

The permutations of any set of elements are divided into two classes, viz.: the positive, in which the number of inversions is even, and the negative, in which the number is odd. When the elements are arranged in the natural order the number of inversions is zero, which is even.

3. Interchanging two adjacent elements, \( a \) and \( a' \), of a permutation changes its class. For, if \( a \) is a permutation, \( a' \) is an inversion and vice versa; and the interchange either introduces or destroys an inversion. When the two elements interchanged are nonadjacent let the number of elements between them be \( q \) and represent these, in the aggregate, by \( Q \). As in the preceding case the interchange has no effect upon the relation of \( a \) and \( a \) to the elements preceding or following \( aQa \). The arrangement \( Qa' \) may now be obtained by interchanging \( a \) with each of the \( q \) elements of \( Q \) in turn, after which \( a \) may be moved to the first place by successive interchanges with the \( q+1 \) elements of \( Qa \).

Hence, the total number of interchanges of adjacent elements involved in the transition from the order \( aQa \) to the order \( aQa \) is \( 2q + 1 \), an odd number; from which follows the important theorem: The interchange of any two elements of a permutation changes its class.

Of any complete set of permutations one-half are positive and one-half negative.

4. Assume \( n \) elements arranged in a square array thus:

\[ \begin{array}{c}
\alpha_{11} a_{11}^{\alpha} \ldots a_{1n}^{\alpha} \\
\alpha_{21} a_{21}^{\alpha} \ldots a_{2n}^{\alpha} \\
\vdots \\
\alpha_{n1} a_{n1}^{\alpha} \ldots a_{nn}^{\alpha} \\
\end{array} \]

In this array the position of any element is shown by its indices. For examples, \( a_{11} \) is in the third column and the fifth row. The diagonal through \( a_{11} \), \( a_{22} \), \( \ldots \), \( a_{nn} \) is called the principal diagonal; that through \( a_{1n} \), \( a_{n1} \), \( \ldots \), \( a_{nn} \) the secondary diagonal; the position occupied by \( a_{11} \) the leading position.

The above array, enclosed by vertical bars as shown, is used to represent the determinant of its \( n^2 \) elements. This function may now be defined.

Write down the product of the \( n \) elements on the principal diagonal, arranging them in the natural order; thus:

\[ a_{11} a_{22} \ldots a_{nn} \]

This is the principal term of the determinant. Now permute the subscripts of the principal term in every possible way, leaving the superscripts undisturbed. To such of the \( n! \) resulting terms as involve the positive permutations of the subscripts give the plus sign; to those involving the negative permutations, the minus sign. The algebraic sum of all the terms thus obtained is the determinant represented by the given array.
Applying the process to the determinant array of the second order, there results
\[
\begin{vmatrix} a''_{11} & a''_{12} \\ a''_{21} & a''_{22} \end{vmatrix} = a''_{11}a''_{22} - a''_{12}a''_{21},
\]
while that of the third order gives
\[
\begin{vmatrix} a''_{11}a''_{22}a''_{33} & a''_{12}a''_{23}a''_{31} & a''_{13}a''_{21}a''_{32} \\ a''_{21}a''_{32}a''_{13} & a''_{22}a''_{33}a''_{11} & a''_{23}a''_{31}a''_{12} \\ a''_{31}a''_{12}a''_{23} & a''_{32}a''_{13}a''_{21} & a''_{33}a''_{11}a''_{22} \end{vmatrix} = a''_{11}a''_{22}a''_{33} + a''_{12}a''_{23}a''_{31} + a''_{13}a''_{21}a''_{32} - a''_{11}a''_{23}a''_{32} - a''_{12}a''_{21}a''_{33} - a''_{13}a''_{22}a''_{31}.
\]

Each term of a determinant thus contains a single element from each column and each row of its array and is, therefore, a homogeneous function of its elements.

5. The expansion of the array of the second order may be written out at a glance. The process is less obvious, but still simple, for the array of the third order. It is as follows: Beneath the square array write the first and second rows as shown in the figure. Then form the six products, each of three elements, traversed by one of the six oblique lines, applying the signs as indicated. The aggregate of terms thus obtained is the required expansion, as may readily be verified.

6. We may do well to note how the values of the systems of unknowns \(x, y, z\), and \(x, y, \varepsilon\) obtained at the outset, may be written in the notation of determinants.

No such direct methods as the above are available for the expansion of determinant arrays of higher orders, but these will be considered further on. See 13.

7. In writing determinants it is often convenient to use a double-subscript notation, the first subscript designating the row and the second column to which the element belongs. Thus the element \(a_{mn}\) stands in the third row and the fifth column. When the elements are merely symbolic it is customary to write only the principal terms between the vertical bars. In this, which is called the umbral notation, the determinant of the \(n\)th order is
\[
\begin{vmatrix} a_{11} & \ldots & a_{1n} \\ \vdots & \ddots & \vdots \\ a_{m1} & \ldots & a_{mn} \end{vmatrix}
\]
which are often further abridged to \(|a_i^{(n)}|\) and \(|a_{n,1}|\) respectively.

Thus far the economy of the notation of determinants is scarcely apparent. Specific forms of higher order have, however, been purposely avoided. It is only necessary to write out the expansion of an array of the fourth order, which includes 4! = 24 terms each of the fourth degree, to understand the necessity of a general theory of such forms. Determinants of even the fifth and sixth orders would be, if written out in full, quite beyond manipulation; while the complete expansion of
\[
\begin{vmatrix} a_{11} & a_{12} & a_{13} & a_{14} & a_{15} & a_{16} & a_{17} & a_{18} \\ a_{21} & a_{22} & a_{23} & a_{24} & a_{25} & a_{26} & a_{27} & a_{28} \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ a_{71} & a_{72} & a_{73} & a_{74} & a_{75} & a_{76} & a_{77} & a_{78} \\ a_{81} & a_{82} & a_{83} & a_{84} & a_{85} & a_{86} & a_{87} & a_{88} \end{vmatrix}
\]
and such functions are not at all uncommon, would fill over a thousand closely printed volumes like the present! Yet, by means of the theory of determinants, such expressions are not only intelligible but manageable. The general properties of determinants will now be considered.

8. Any term of the development of \(|a_i^{(n)}|\) may be written
\[
\pm a_{ij}a_{kl}\ldots a_{st}^{(n)}.
\]
Designate by \(u\) the number of inversions in the permutation \(ij\ldots l\) and by \(v\) the number of interchanges of two elements necessary to bring the given term into the form
\[
\pm a_{i\sigma(1)}a_{j\sigma(2)}\ldots a_{l\sigma(n)}.
\]
Obviously \(u\) and \(v\) are either both even or both odd; but the permutation \(pqrsth\) is positive or negative, according as \(v\) is even or odd, and the term will, therefore, have the same sign whether it is determined by the permutation of the subscripts of \((a)\) or by that of the superscripts of \((b)\). It follows that the development of a determinant may be obtained by permuting the superscripts and writing the signs of the terms in accordance with these permutations, instead of using the subscripts as already explained. Passing from one of these methods of development to the other is equivalent to changing each column of the array into a row of the same rank and vice versa. Hence, a determinant is not altered by changing the rows into corresponding columns and the columns into corresponding rows. Any statement made with the rows of every determinant must, therefore, be equally true with respect to the columns. Rows and columns are alike called lines.

9. If any two parallel lines of a determinant be interchanged the determinant will be changed only in sign. For, interchanging two lines is the same as interchanging, in each term of the expansion, the indices corresponding to these lines. This reverses the sign of each term and therefore that of the whole determinant.

The element \(a_{p,q}^{(n)}\) may be transferred to the leading position by interchanging the \(n\)th row with the \((n-1)\) preceding rows and the \(n\)th column with the \((n-1)\) preceding columns. This being done, the resulting determinant must take the sign factor \((-1)^{n+q}\).

A determinant having two parallel lines identical is equal to zero; for the interchange of these identical lines reverses the sign without altering the value of the function.

9. A determinant having a line of elements each the sum of two or more quantities can be expressed as a sum of two or more determinants. Let
\[
\Delta = a_{10}(b_1 + b_2 + \ldots + b_n) + a_{11}(b_1 + b_2 + \ldots + b_n) + a_{1(n-1)}(b_1 + b_2 + \ldots + b_n) + \ldots.
\]
be such a determinant. Then, writing
\[
B_{1k} = b_1 + b_2 + \ldots + b_k,
\]
any term of the development of \(\Delta\) is of the form
\[
\pm a_{p,q}B_{gr} = \pm a_{p,q}(b_1 + b_2 + \ldots + b_r) + \ldots + a_{p,q}(b_1 + b_2 + \ldots + b_q).
\]
The terms \(\Delta\) are obtained by permuting the subscripts \(p, q, r\) of \(a_{p,q}B_{gr}\). Permuting simultaneously the same subscripts in the second member and giving to each term thus obtained its appropriate sign, there results
\[
|a_{p,q}B_{gr}| = |a_{p,q}B_{gr}| = \ldots \quad \text{which proves the theorem.}
\]
10. Multiplying each element of a given line of a determinant by a given factor multiplies the determinant by that factor; for each term of the expansion contains a single element from the given line. The common factor thus appears once and only once in each term of the expansion, and the determinant is, therefore, multiplied by that factor.

In the same way, it may be shown that a determinant having a line of zeros is equal to zero. It also follows that if the elements of any
line have a common ratio to the corresponding elements of any parallel line the determinant vanishes. 

11. If each element of a line of a determinant be multiplied by a given factor and the product added to the corresponding element of any parallel line the value of the determinant will not be changed. This follows directly from 9 to 10. Thus 

\[ a_{11}a_{12} \ldots a_{1n} = a_{11}a_{12} \ldots a_{1n} \]

12. The terms of \( |a_{i}^{(n)}| \) which contain the element \( a_{s}^{(n)} \) are those found in the expansion of \( a_{1i}^{(n)} = \begin{vmatrix} a_{11} & \cdots & a_{1s}^{(n)} & \cdots & a_{1n} \\ a_{11} & \cdots & a_{1s}^{(n)} & \cdots & a_{1n} \\ \vdots & & \ddots & & \vdots \\ a_{11} & \cdots & a_{1s}^{(n)} & \cdots & a_{1n} \\ a_{11} & \cdots & a_{1s}^{(n)} & \cdots & a_{1n} \end{vmatrix} \) 

For if, in forming any term, another element than \( a_{s}^{(n)} \) be taken from the first column an element zero must be taken from the first row, and the term vanishes. It may readily be shown that the determinant (a) is equal to \( a_{s}^{(n)} a_{r}^{(n)} \ldots a_{n}^{(n)} \).

\[ a_{s}^{(n)} a_{r}^{(n)} \ldots a_{n}^{(n)} \]

which is therefore the aggregate of the terms of \( |a_{i}^{(n)}| \), \((n-1)! \) in number, which contain the element \( a_{s}^{(n)} \).

The determinant factor of order \((n-1)\) by which the element \( a_{s}^{(n)} \) is multiplied in (b) is called the cofactor of that element in \( |a_{i}^{(n)}| \). It may be obtained from the given determinant by deleting the first column and the first row.

The cofactor of any element \( a_{s}^{(n)} \) may be found in the same manner after transposing this element to the leading position. But this transposition multiplies the determinant by the sign factor \((-1)^{s+r}\). Hence, to find the cofactor of \( a_{s}^{(n)} \), delete its row and its column and give the resultant determinant the

\[(\text{positive sign when } (s+r) \text{ is even})
\]

\[(\text{negative sign when } (s+r) \text{ is odd})\]

The cofactor thus obtained is represented by \( A_{s}^{(n)} \), the sign factor \((-1)^{s+r}\) being intrinsic. For example, the cofactors of the elements of the second row of \( |a_{i}^{(n)}| \) are

\[ A_{21}^{(n)} = \begin{vmatrix} a_{11} & \cdots & a_{1s}^{(n)} & \cdots & a_{1n} \\ \vdots & & \ddots & & \vdots \\ a_{11} & \cdots & a_{1s}^{(n)} & \cdots & a_{1n} \\ a_{11} & \cdots & a_{1s}^{(n)} & \cdots & a_{1n} \end{vmatrix} \]

13. The aggregates of terms containing the elements \( a_{s}^{(n)}, a_{r}^{(n)}, \ldots a_{n}^{(n)} \) of the determinant \( |a_{i}^{(n)}| \) are, respectively,

\[ a_{s}^{(n)} A_{s}^{(n)} a_{s}^{(n)} A_{s}^{(n)} a_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} a_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} \]

Each of these \( n \) aggregates includes \((n-1)! \) terms of \( |a_{i}^{(n)}| \), no one of which appears in any of the others. In all of them, then, there are \( n(n-1)! \) or \( n! \), different terms of the determinant, which is the whole number.

Hence 

\[ |a_{i}^{(n)}| = a_{s}^{(n)} A_{s}^{(n)} + a_{s}^{(n)} A_{s}^{(n)} + \cdots + a_{s}^{(n)} A_{s}^{(n)} \] (1)

Similarly,

\[ |a_{i}^{(n)}| = a_{s}^{(n)} A_{s}^{(n)} + a_{s}^{(n)} A_{s}^{(n)} + \cdots + a_{s}^{(n)} A_{s}^{(n)} \] (2)

Any determinant may, by means of either (1) or (2), be resolved into determinants of an order one lower and thus, since \( A_{s}^{(n)}, A_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} \) are themselves determinants, it may ultimately be expressed in terms of determinants of the third or second order, which may readily be expanded (see 5).

14. If the \( k \)th and \( s \)th rows of \( |a_{i}^{(n)}| \) are identical the elements \( a_{k}^{(n)}, a_{s}^{(n)}, \ldots a_{n}^{(n)} \) in formula (1) may be replaced by \( a_{k}^{(n)} A_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} \) respectively. But in this case the value of the determinant is zero. Hence, \( h \) and \( k \) being different indices,

\[ a_{k}^{(n)} A_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} + \cdots + a_{n}^{(n)} A_{s}^{(n)} = 0. \] (3)

Likewise \( p \) and \( s \) being different,

\[ a_{p}^{(n)} A_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} + \cdots + a_{n}^{(n)} A_{s}^{(n)} = 0. \] (4)

15. The determinant of order \((n-1)\) obtained by deleting the \( s \)th row and the \( s \)th column of \( \begin{vmatrix} a_{i}^{(n)} \end{vmatrix} \) is called the minor of the determinant with respect to the element \( a_{s}^{(n)} \), and is written \( A_{s}^{(n)} \). Obviously, by what precedes,

\[ A_{s}^{(n)} = \begin{vmatrix} a_{i}^{(n)} \end{vmatrix} \] (5)

If two rows, the \( n \)th and \( s \)th, and two columns, the \( p \)th and \( q \)th, of the \( n \)th and \( s \)th, are deleted the result is written \( A_{s}^{(n)} A_{s}^{(n)} A_{s}^{(n)} \), and is called a minor of the second order. Minors of lower orders may be obtained in a similar manner and expressed by a similar notation.

Any \( m \)th minor of a given determinant and the determinant of the \( m \)th elements at the intersection of the rows and columns deleted in forming it are called, with respect to each other, complementary minors. The determinant may be expressed in terms of products of pairs of complementary minors, a method of expansion due to Laplace. Formule (1) and (2) are special cases of the method. In its general statement is somewhat complicated.

16. The principles thus far developed will now be applied to the solution of systems of simultaneous linear equations; the process which, as stated at the outset, led to the discovery and investigation of determinants. Assume the system of three equations

\[ a_{x} + b_{x} = c_{x}, \]

\[ a_{y} + b_{y} + c_{y}, \]

\[ a_{z} + b_{z} + c_{z}, \]

In the determinant \( |a_{i} b_{i} c_{i}| \) let the elements \( a_{x}, a_{y}, a_{z} \) be replaced by the equal quantities appearing in the first members of the given equations. The two determinants now in hand are equal to each other; thus

\[ |a_{x} a_{y} a_{z}| + |a_{x} a_{y} a_{z}| + |a_{x} a_{y} a_{z}| = |a_{x} a_{y} a_{z}| \]

But the first member of this equation may be separated into the determinants (see 9 and 10)

\[ x |a_{x} b_{x} c_{x}| + y |a_{y} b_{y} c_{y}| + z |a_{z} b_{z} c_{z}|, \]

the second and third of which are, by 8, equal to zero. Hence

\[ x |a_{x} b_{x} c_{x}| + y |a_{y} b_{y} c_{y}| + z |a_{z} b_{z} c_{z}| = 0 \]

or, explicitly (see 1).

\[ x = \frac{|a_{x} b_{x} c_{x}|}{|a_{x} b_{x} c_{x}|}, \]

\[ y = \frac{|a_{y} b_{y} c_{y}|}{|a_{y} b_{y} c_{y}|}, \]

\[ z = \frac{|a_{z} b_{z} c_{z}|}{|a_{z} b_{z} c_{z}|} \]

Similarly, by starting with the determinants \( |a_{i} b_{i} c_{i}| \) and \( |a_{i} b_{i} c_{i}| \), respectively, the values of \( y \) and \( z \) are found to be

\[ y = \frac{|a_{x} b_{x} c_{x}|}{|a_{x} b_{x} c_{x}|}, \]

\[ z = \frac{|a_{z} b_{z} c_{z}|}{|a_{z} b_{z} c_{z}|} \]

It will be noted that the values of the un-
knowns have for a common denominator the determinant of the coefficients of the given equation; while the numerator is, in each case, obtained from the denominator by replacing the column of coefficients of the unknown of the question by the column of absolute terms. The method is applicable to linear systems of any order.

17. When the number of given equations is greater than the number of unknowns their consistency obviously depends upon some definite relation among the known elements. Let

\[ a_1 x + b_1 y = c_1 \]

be such a redundant system.

Solving the first two of these equations gives (see 1)

\[
\begin{align*}
\frac{a_1 b_1}{a_1 b_{12}} &= y = \frac{a_1 c_1}{a_1 b_{12}}, \\
\frac{a_{12} b_1}{a_{12} b_{12}} &= x = \frac{a_{12} c_1}{a_{12} b_{12}}.
\end{align*}
\]

If, now, the three equations are consistent, these values must also satisfy

\[ a_1 x + b_1 y = c_1; \]

whence, substituting the above values and clearing of fractions,

\[
\begin{align*}
a_1 a_{12} b_{12} &= a_1 b_1 b_{12}, \\
\end{align*}
\]

or, by 8, and (1)

\[
\begin{align*}
a_1 b_{12} x_1 &= a_{12} b_{12} = 0, \\
\end{align*}
\]

The above process being generalized, it appears that the condition that \( n \) linear equations between \( (n-1) \) unknowns constitute a consistent system is that the determinant of the coefficients and absolute terms be zero.

18. Consider now the homogeneous linear equations

\[ a_1 x + b_1 y + c_1 = 0. \]

Solving these equations as in 16 gives

\[
\begin{align*}
x &= y = z = 0, \\
\end{align*}
\]

unless

\[ a_1 b_{12} c_{12} = 0; \]

in which case each unknown becomes \( 0 \), which may have any value whatever. But the given equations may be written

\[
\begin{align*}
a_1 x + b_1 y + c_1 = 0, \\
\end{align*}
\]

any two of which will determine the ratios \( x : y : z \) and \( x : y : z \). If these three equations form a consistent system in \( x : y : z \) however, the condition expressed by (6) holds good (see 17); that is to say, the given equations consistently determine the ratios \( x : y : z \) only when the determinant of the coefficients vanishes. In this case, as may readily be shown

\[
\begin{align*}
x:y:z &= a_1:b_1:c_1, \\
\end{align*}
\]

When the determinant of the coefficients does not vanish the equations are satisfied only by the values \( x = y = z = 0 \). In general:

The condition that \( n \) homogeneous linear equations between \( n \) unknowns form a consistent system, for other than zero values of the unknown is that the determinant of the coefficients be zero.

The relation expressed by (7) may also be generalized thus: In any determinant which equals zero, the cofactors of the elements of any line are proportional to the cofactors of the corresponding elements of any parallel line.

The determinants (5) and (6) are called resultants or eliminants, each being the result of eliminating the unknowns from the system of equations from which it is derived.

19. Again let there be \( r \) homogeneous linear equations involving \( n \) unknowns, \( r \) being greater than \( n \), thus:

\[ a_1 x'_1 + a_2 x'_2 + \ldots + a_n x'_n = 0. \]

(\( i = 1, 2, \ldots, n, 1, \ldots, r \)).

The consistency of these equations requires that every determinant of the \( n \)th order, formed by selecting \( n \) rows from the array whose elements are the coefficients written in order, shall be zero. If these conditions are fulfilled the fact is expressed by writing

\[
\begin{align*}
a_1 a_{i1} \ldots a_{in} &= \cdots a_{i1} a_{i1} \ldots a_{i1} = 0, \\
\end{align*}
\]

The change of rows into columns being purely arbitrary. The above expression is called a rectangular array or a matrix.

20. Let it be required to eliminate the unknowns from the equations

\[ a_1 x + b_1 y + c_1 = 0, \]

\[ a_2 x + b_2 y + c_2 = 0, \]

\[ a_3 x + b_3 y + c_3 = 0. \]

The eliminant of this system, if consistent, is

\[
\begin{align*}
\begin{vmatrix}
a_1 & b_1 & c_1 \\
a_2 & b_2 & c_2 \\
a_3 & b_3 & c_3 \\
\end{vmatrix} = 0. \\
\end{align*}
\]

If the given equations be inconsistent this determinant does not vanish.

This process, due to Sylvester, may readily be generalized. It is known as the dialytic method of elimination.

21. The product of two determinants may be most readily obtained as an eliminant. To this end let

\[
\begin{align*}
a_1 x_1 + a_2 x_2 &= 0, \\
\end{align*}
\]

be linearly transformed by substituting

\[
\begin{align*}
x_1 &= b_{11} x_1 + b_{12} x_2, \\
\end{align*}
\]

the result being

\[
\begin{align*}
(a_1 x_1 + a_2 x_2 w_1) + (a_1 x_2 + a_2 x_1 w_2) = 0, \\
\end{align*}
\]

Now the condition that equations (c) be consistent is that the determinant

\[
\begin{align*}
\begin{vmatrix}
a_1 x_1 + a_2 x_2 & a_1 x_1 + a_2 x_1 \\
\end{align*}
\]

shall vanish. But they may be consistent
because equations (a) are so, in which case
\[ |a_{1}a_{n}| = 0; \quad (e) \]

or, this condition failing, and (a) thus having no solution other than \( x = 0 = y \), (c) will still be consistent if equations (b) are so; that is, if
\[ |b_{1}b_{n}| = 0. \quad (f) \]

The vanishing of either of the determinants (e) or (f), therefore, causes (d) to vanish; from which it follows that the determinants (e) and (f) are factors of (d). The only other factor is numerical and may readily be shown, by comparing coefficients, to be unity. Hence,
\[ |a_{1}a_{n}| \cdot |b_{1}b_{n}| = |a_{1}b_{1} + a_{2}b_{n} a_{1}b_{n} + a_{1}b_{n}|, \]
\[ |a_{2}a_{n}| \cdot |b_{1}b_{n}| = |a_{1}b_{1} + a_{2}b_{n} a_{2}b_{n} + a_{2}b_{n}|. \]

The same method may be applied to the formation of the product of any two determinants of the same order. The operation may be described as follows:

To form the product \( |p_{mn}| \) of two determinants \( |a_{mn}| \) and \( |b_{mn}| \), first connect by plus signs the elements of the rows of both \( |a_{mn}| \) and \( |b_{mn}| \). Then place the first row of \( |a_{mn}| \) upon each row of \( |b_{mn}| \) in turn and let each two elements as they touch become products. This is the first row of \( |p_{mn}| \). Perform the same operation upon \( |b_{mn}| \) with the second row of \( |a_{mn}| \) to obtain the second row of \( |p_{mn}| \), etc. Any element of this product is
\[ p_{s} = a_{1}b_{1}a_{2}b_{2} \ldots a_{n}b_{m} = \ldots + a_{n}b_{m}. \quad (8) \]

The product may also be formed by columns instead of by rows as above.

The operation just described may be applied to form what is conventionally called the product of two rectangular arrays of the same dimensions. Let these be

\[ |a_{1}a_{n}| \quad \quad |a_{2}a_{n}| \quad \quad |a_{1}a_{n}| \]

\[ |a_{1}a_{n}| \quad \quad |a_{2}a_{n}| \quad \quad |a_{1}a_{n}|. \]

Forming the product by rows gives
\[ |a_{1}b_{1} | + a_{1}b_{n} a_{1}b_{n} + a_{1}b_{n}| \]
\[ |a_{2}b_{1} | + a_{2}b_{n} a_{2}b_{n} + a_{2}b_{n}| \]
\[ |a_{1}b_{1} | + a_{1}b_{n} a_{1}b_{n} + a_{1}b_{n}|. \]

If this product array be interpreted as a determinant it can only be zero; for it is the product of the two determinants formed by writing a column of zeros after one of the given rectangular arrays and a column of elements arbitrarily chosen after the other. An entirely different result would have been obtained had the product been formed by columns instead of by rows.

23. The result of replacing each element of a determinant by its cofactor is called the reciprocal of the determinant. Thus the reciprocal of
\[ \begin{vmatrix} a_{1} & \ldots & a_{n} \\ a_{1} & \ldots & a_{n} \\ \vdots & \ddots & \vdots \\ a_{1} & \ldots & a_{n} \end{vmatrix} = \begin{vmatrix} A_{11} & \ldots & A_{1n} \\ \vdots & \ddots & \vdots \\ A_{n1} & \ldots & A_{nn} \end{vmatrix}. \]

Multiplying and applying the formulae (2) and (4) to the elements of the product, gives
\[ \delta \cdot \delta = \delta, \quad 0 \cdot 0 = 0, \quad \delta \cdot 0 = 0 \]
whence \( \delta \cdot \delta = b_{n} \), or \( \delta = b_{n}^{-1} \).

That is the reciprocal of a determinant of the 4th order is equal to its \((n - 1)\)th power.

Reciprocal determinants are a special case of compound determinants, whose elements are minors variously derived from one or more given arrays.

24. The application of determinants to the study of geometry and pure analysis has led to the recognition and investigation of numerous special forms, some of which will be defined and their most characteristic properties stated without demonstration.

Among the more important are the forms known as symmetrical determinants. In these any two elements symmetrically placed with respect to the principal diagonal, known as conjugate elements, have the same absolute value. If \( a_{x}(t) = a_{y}(t) \) the determinant is described as simply symmetrical. If \( a_{x}(t) = -a_{y}(t) \), a condition which cannot apply to the elements of the principal diagonal, unless these be zero, it is said to be gauche or skew. When the diagonal elements are zeros and \( a_{x}(t) = -a_{y}(t) \) the determinant is skew-symmetric. It is very easy to show that a skew-symmetric determinant of odd order is equal to zero. When of even order, however, it is equal to the square of a certain rational function of its elements known as the Pfaffian. These functions are expressed by triangular arrays; thus
\[ \begin{vmatrix} 0 & a & n & m \\ -a & 0 & b & l \\ -u & -b & 0 & c \\ -m & -l & -o & c \end{vmatrix} \]

The properties of Pfaffians are strikingly analogous to those of determinants.

25. Determinants all of whose elements are zeros except those of the principal diagonal and the adjacent minor diagonals above and below, and in which each element of one of these minor diagonals is \(-1\), are called continuants. They were so named by Muir because of their connection with the theory of continued fractions. If \( q_{n} \) be the number of terms in the expansion of the continuant of order \( t \), it may be shown that \( q_{n} = 2^{n - 1} + (1 + \sqrt{3})^{n - 1} - (1 - \sqrt{3})^{n - 1} \).

26. A determinant in which the elements of the first row are functions of a given variable, the corresponding elements of the second row the same function of another variable, etc., is called an alternant. If the functions used as elements are powers of the variables it is described as a simple alternant. Such a determinant is divisible by the difference product of its variables, the quotient being a symmetrical function of these variables. Thus
\[ \begin{vmatrix} 1 & x & x^{2} \\ 1 & y & y^{2} \\ 1 & z & z^{2} \end{vmatrix} \]

27. When \( y_{1}, y_{2}, \ldots, y_{n} \) are functions, each of \( x_{1}, x_{2}, \ldots, x_{n} \), the determinant
\[ \begin{vmatrix} \frac{\partial y_{1}}{\partial x_{1}} & \frac{\partial y_{1}}{\partial x_{2}} & \cdots & \frac{\partial y_{1}}{\partial x_{n}} \\ \frac{\partial y_{2}}{\partial x_{1}} & \frac{\partial y_{2}}{\partial x_{2}} & \cdots & \frac{\partial y_{2}}{\partial x_{n}} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial y_{n}}{\partial x_{1}} & \frac{\partial y_{n}}{\partial x_{2}} & \cdots & \frac{\partial y_{n}}{\partial x_{n}} \end{vmatrix} \]

is called the Jacobian of the given functions, a name given by Sylvester. There is a complete
analogies between the Jacobian and the ordinary differential coefficient \( \frac{dy}{dx} \) which Bertrand has made the basis of another definition of these functions. Thus, letting

\[
\begin{align*}
&d\xi_1, d\xi_2, \ldots, d\xi_n \ (i = 1, 2, \ldots, n) \\
&d\eta_1, d\eta_2, \ldots, d\eta_n \ (i = 1, 2, \ldots, n)
\end{align*}
\]

be \( n \) distinct sets of increments given to \( x_1, x_2, \ldots, x_n \), and

\[
\begin{align*}
&d\xi_1, d\xi_2, \ldots, d\xi_n \ (i = 1, 2, \ldots, n) \\
&d\eta_1, d\eta_2, \ldots, d\eta_n \ (i = 1, 2, \ldots, n)
\end{align*}
\]

the corresponding increments of \( y_1, y_2, \ldots, y_n \) then is

\[
\frac{d(y_1, y_2, \ldots, y_n)}{d(x_1, x_2, \ldots, x_n)}.
\]

If the functions be subjected to linear transformation the Jacobian is multiplied by a constant factor or modulus, which is the determinant of the coefficients of the transformation. The Jacobian is thus a covariant of the functions from which it is derived. See INVARIANTS AND COVARIANTS.

If the Jacobian vanishes the functions are not independent, and conversely.

The determinant of the partial differential coefficients of a function, taken with respect to its several variables, is called the Hessian of the function. The Hessian is a symmetrical determinant.

Thus, the given function being the ternary quadric,

\[
w = ax^2 + by^2 + cz^2 + 2fyz + 2gza + 2hxy,
\]

\[
H (w) = \begin{vmatrix} a & b & c \\ h & k & g \\ f & e & d \end{vmatrix}
\]

a determinant, which in this instance is also known as the discriminant, for the reason that its vanishing is the condition that \( w \) be resolvable into linear factors.

Like the Jacobian the Hessian is a covariant. Both were originally called functional determinants.

29. The theory of determinants has two notable extensions which will be explained, though little more than the definition of the functions suggested can be undertaken in the present article.

Just as \( n \times n \) elements may be arranged as a square array with two sets of parallel lines, so may \( n \times n \) elements be arranged in the form of a cube so as to lie in three sets of parallel planes. These three sets of planes may be called strata, planes and sections; the last two corresponding respectively to the rows and columns of the square array lying in any given stratum. An element of such an array may be represented by \( a_{nk} \), where \( k \) is the number of its stratum, \( s \) of its plane, and \( x \) of its section. Then \( | a_{nk} | \) represents a function known as a cubic determinant. Its principal term is \( a_{nkk} \) ..., \( a_{nmm} \), and the others are obtained as follows: Permute the third suffixes and in each of the \( n! \) products obtained permute the second suffixes, thus obtaining \( (n!)^3 \) products. Then apply to each product a sign factor which is the product of the sign factor appropriate to the permutation of the third suffixes by that appropriate to the permutation of the second. The aggregate of terms thus obtained is the cubic determinant.

The sign of the cubic-determinant is changed by the interchange of two planes or two sections; but the interchange of two strata has no effect.

There are also determinants whose arrays can be represented only in hyper-space (see HYPERSPACES), but whose elements may be defined by means of multiple suffixes as above. Such determinants are known as hyper-determinants.

30. In the array

\[
\begin{vmatrix}
\alpha_{11} & \ldots & \alpha_{1p} & \ldots & \alpha_{1q} \\
\vdots & \ddots & \ddots & \vdots & \vdots \\
\alpha_{n1} & \ldots & \alpha_{np} & \ldots & \alpha_{nq}
\end{vmatrix}
\]

letting \( \lambda + \mu = n \), \( \rho = \theta \), the given array represents a determinant of order \( (n-1) \). If now \( n \) increase indefinitely, \( \lambda, \mu \) on the one hand and \( \rho, \sigma \) on the other also becoming indefinitely large, while maintaining the above relation to \( n \), the determinant may approach a definite limiting value, and it may become indeterminate, or it may become infinite. Determinants of infinite order, as here defined, present certain analogies to infinite series.

History and Bibliography.—The first definite reference to determinants is to be found in a manuscript of Leibnitz, left unpublished at the time of his death. His later development of the idea is embodied in a communication to De l'Hospital (1693) in which he explains the formation of the eliminant of a system of linear equations identical in form with that discussed in 17. In his notation he used double indices, representing the element \( a_{jk} \) by \( k \) or by \( j \).

If the subject was made quite independently by Cramer (1750), who expounded a rule for writing out the values of the unknowns in a system of linear equations, in which he recognized the two classes of permutations as given in 2. This rule found instant favor and the development of the theory of determinants has since been almost continuous.

The first attempt at a formal exposition of the theory was made by Vandermonde (1771). His treatment of the functions as independent of their connection with the process of elimination and his recognition of several of their more fundamental properties entitles him to be ranked as the real founder of the theory. Almost simultaneously Laplace gave the method, partly anticipated by Vandermonde, of expanding determinants in terms of complementary minors. The functions were called by him "resultants," a term now used in the restricted sense explained in 18.

New applications of the functions were at once found by Lagrange (1773), principally in the domains of geometry and the theory of numbers. Their application was further extended by Gauss (1801), who used the word determinant to designate the discriminant of the ternary quadric (see 28). He also noted the significance of reciprocal determinants (see 23), and was on the verge of discovering the multiplication theorem. This theorem (see 21 and 22) was first given by Binet (1812), but its satisfactory proof is due to Cauchy.

Cauchy was the first to use the word determinant in its present sense. His memoir in the
DETERMINATE PROBLEM — DETERMINATIVE MINERALOGY

Jour. de l’Ecole polytechnique (1812) rounded the general theory of determinants into something like its present form. Jacobi early adopted the new calculus and greatly extended its field of usefulness. In his hands it became, not merely an indispensable system of notation, but a powerful instrument of research as well. His justly famous memoirs in ‘Crelle’s Journal’ (1841) made the subject readily accessible and, since their publication, determinants have been frequent by mathematicians without apology or explanation.

A new impulse was given through the study of linear transformations, in which Cayley and Sylvester led the way. The more recent developments relate mainly to special forms of determinants. Skew determinants and Pfaffians were developed by Cayley, in connection with the orthogonal transformation. He was the first writer to use the vertical bars enclosing the determinant array. Continuants were investigated by Sylvester, who also named and mathematically described the continuant. Alternants, first recognized by Cauchy and studied by Jacobi, have been further discussed by Trudi, Nagelbach, and Garbieri. Important results relating to compound determinants were published by Schweins, published by Tschirnhaus, and Hesse. Bibliography.—Muir’s ‘Theory of Determinants in the Historical Order of its Development’ (London 1890) is the standard work on the history of the subject down to 1841. The same author has also compiled a complete bibliography of determinants down to 1900, (Quar. Jour. of Math.). Spottiswoode (1851) prepared the first regular treatise. Other well-known texts are those of Baltzer (Leipzig 1857); Günther (Erlangen 1875); Dostor (Phil. Mag. 1875); Morrey (Cambridge 1879); (London 1882); Haus (Boston 1886); Weld (New York 1893); Scott and Mathews (Cambridge 1904).

Laenas Gifford Weld,

DETERMINATE PROBLEM, a problem in geometry which admits of a limited number of solutions, an indeterminate problem admitting of an indefinite number of solutions.

DETERMINATIVE MINERALOGY.
That division of the science of mineralogy (q.v.) which treats of the identification of minerals. While the occasional new or undescribed species is necessarily identified by a determination of the percentages of its various ingredients (see CHEMICAL ANALYSIS), the symmetry and geometrical constants of its crystals (see CRYSTALLOGRAPHY), and its optical and other physical properties (see PHYSICAL CRYSTALLOGRAPHY); specimens of previously described species are accurately and rapidly determined by much simpler methods, varying from sight recognition to systematic testing with the aid of tables or “schemes.” Sight recognition is the result of experience in handling and testing and has no fixed order of procedure. Except for this, it is similar to the later mentioned schemes by external signs, inasmuch as it relies chiefly on lustre, color, crystals, cleavage, associates, etc., and supplements these by tests such as the color of the mark (streak) made by it upon unglazed porcelain, or its hardness as tested by a knife point. Testing as a random is nearly worthless and in all cases of doubt it is better to follow the guidance of some systematic scheme in which a few simple physical or chemical tests made in definite order successively place the specimens in smaller and smaller groups until the group is so small that the differences between its members are readily recognized and it becomes possible conclusively to eliminate all but one species. There are many schemes which may be said to be chiefly of three types. (1) Schemes in which the classifying character is so-called “external signs” such as lustre, color, crystalline form and simple physical tests such as hardness, color of powder (streak) or specific gravity. These schemes are invaluable in the classroom, enormous loss being the time spent in looking up characters and they foster acute observation of appearance and require only simple apparatus, such as a pocket lens, streak plate and file or knife. The best known and most followed scheme of this type was prepared in 1866 by Prof. Albin Weibach of Freiberg, and while for the great group of minerals with non-metallic lustre and white or gray streak it is not very conclusive, the minerals of metallic lustre or with colored powders (streaks) are often very rapidly determined. For instance by the Frazer-Brown modification of Weibach’s tables only three species are at once

Submetallic or non-metallic,
Red streak,
Hardness about 4 (that of fluorite).

These are easily distinguished by the shade of red of the streak and by the specific gravity. Zircon, orange red, Cuprite, brownish-red, sp. gr. 6, Hauserite, brownish-red, sp. gr. 4; (2) Schemes in which the “sublimation tests” such as fusibility or qualitative determination of principal constituents, or solubility in acids, are the classifying tests, while the external signs and physical tests are subordinate. These, because they are largely independent of the condition in which the mineral occurs, use only minute amounts of material, and give positive proof of the presence of the component elements, may fairly be said to be of the most general applicability. They require in addition to the simple apparatus used in the previously mentioned schemes, a blowpipe and its accompanying lamp, forceps, wire, reagents, etc. Undoubtedly the most used schemes of this type are translations and modifications of von Kobell’s ‘Tables for Determination of Minerals by Simple Chemical Tests’ first described in 1833 to facilitate determination of minerals so that by simple testing with the blowpipe and in the dry way one is led quickly to a small group which includes the mineral being tested. As with the Weibach schemes, there is first a division by lustre, but thereafter the route followed is different, the next division being by
fusibility and the further subdivisions in some cases being the detection of particular elements as arsenic, sulphur, antimony, iron, etc., and in others some detail of fusion such as "magnetic after heating" or of solubility such as "effervescence." For instance, a specimen of green granular Chrysolite (Mg, Fe),SiO, would be placed by the Brush-Penfield modification of the Von Kobell tables successively in the following divisions and sub-divisions:
1. Non-metallic lustre. One of several hundred.
3. Dissolves in HCl leaving a gelatinous residue on evaporation. Therefore one of 10 species.
4. Gives reaction for Magnesium. Therefore one of 6 species.
5. Contains no water. Therefore one of 2 species.

This confirmed by color, hardness, structure, etc.

(3) Schemes in which characters determined by the polarizing microscope are used as the classifying tests, these including single or double refraction, kind of extinction, birefringence, pleochroism, shape, cleavage, color, etc. Such schemes are extensively used for the determination of the minerals in fine-grained rocks and are coming into more general use for identification not only of those minerals which can be readily made thin enough to transmit light but for the so-called opaque minerals. The testing requires specially prepared sections as thin as paper, or finely crushed powder or, in some cases, polished sections, and the tests usually easily made require for their proper understanding a considerable knowledge of crystal structure and optics. They, however, supplement admirably the blowpipe and physical tests.

Bibliography—Works in English in addition to tables in most textbooks of mineralogy.

Professor of Mineralogy, Columbia University.

DETERMINING TENDENCY. Also called attitude, task (Aufgabe) and is partly synonymous with purpose in its more empirical use. Determining tendency was a term introduced by Ach and taken over into English to designate one of the wider influences which control the course of associations and so of thought and action. One ordinarily thinks of the course of thought as controlled by the closeness of the connection between the elements of which it is made up, and of these connections in turn as due to the number of times which the two experiences have occurred together in the past, the recency of their appearance together, etc. Determining tendency is looked upon as a factor of wider influence, which will make some one or some one class of the possible associates more likely to appear than others which are in themselves equally strong or even stronger. Thus if one is given a series of words and asked to speak the first other word that comes to mind each word may call up a number of associates. 'Water,' e.g., might suggest 'drink,' 'H2O,' etc. However, one has been asked to give the chemical composition of the substances named, 'H2O' alone comes to mind; if the request was to name the use of the objects, drinking or washing or other words of that class alone will appear. The request is the determining tendency.

Determining tendencies are frequently not definite tasks, but are furnished by the knowledge of the circumstances or situation. One tips one's hat to a male friend when he is with a lady, but only speaks when he is alone. One plays one card in a given situation when one suit is trumps; another under the same circumstances when the trump is different. One strikes one note for a given position when the selection is written in one key and another when the key is different. The awareness of the companion, the knowledge of the trump or of the key constitute in each case the determining tendency.

The influence of the wider setting has recently been given wide vogue through the work of the Würzburg school. It was noticed as a factor in the control of perception by Pillsbury in 1897, who spoke of it as 'attitude' or 'setting' by Watt in the control of association in 1904, who called it Aufgabe, was emphasized under the present name by Ach in 1905 as a factor in the control of action and thought, and by Pillsbury again as mood or attitude as one of the conditions of attention in 1906.

The importance of emphasizing the wider controls as opposed to the immediate links which alone were considered by the associationist school is obvious. Were the strength of the mechanical connections alone to be taken into account, we should have no explanation at all of the adaptability and flexibility of thought and conduct. If one were limited to a single response to a given stimulus or to a single thought in succession to any other thought, act and thinking would alike follow unvarying courses. One's existence would be a continuous treadmill. While we still think of all the successions as made possible by earlier associations, selection of the proper one in accordance with the situation or context increases the adequacy of the thought and act.

We must look to the nervous interactions for the real explanation of these influences. The determining tendency acts only as it is accompanied by or induces activities in the neurones. In the nervous system an association has as its analogue a connection between neurone groups induced by simultaneous action at some earlier times. Any neurone group is connected with several other groups in such a way that it may excite any one of them when it is itself excited. The determining tendency decides which of these shall be aroused. When a task is set or a wider context is effective, these preliminary stimuli partially arouse larger or smaller groups of neurones. These larger groups will have elements in common with the groups that will be aroused by the other direct
Determinism is the doctrine that everything that exists, as well as every event that happens, is absolutely fixed and necessary in the sense that this has been made what it is by the action of some ground or cause. From this point of view there is accordingly no element of chance or contingency in the world: nothing which is possibly could have been otherwise. While this doctrine conceives of all of the parts of the world as determined, it derives its main interest and importance from its application to the sphere of mind and the thoughts, feelings, and actions of human beings. At the present day we have become accustomed to the conception of physical nature as a uniform series of events that happen in a fixed and necessary way in accordance with uniform laws. The crucial question is whether the same mode of conception is to be extended to mind and its operations, or whether the view can be justified that mind occupies a unique place in nature and is characterized by real freedom. Most writers on the emotions and on human conduct, Spinoza tells us, seem to be treating rather of matters outside of nature than of phenomena which follow nature’s general laws. They appear to conceive man to be situated in nature as a kingdom within a kingdom, for they believe that he disturbs rather than follows nature’s order, that he has absolute control over his actions and is determined solely by himself. As against such a view, Spinoza maintains the doctrine of determinism: “that nature’s laws and ordinances whereby all things come to pass and are changed from one form to another are everywhere and always the same.” Hence it is impossible that man should not be a part of nature, and subject, like everything else, to nature’s universal laws.

Determinism follows directly when substance and causality are employed as the ultimate principles of explanation. From the point of view of substance, the parts are viewed as determined by the nature of the whole. This whole, whether called God, or “substance,” or “matter,” or “energy,” is conceived as the one ultimate reality, of which particular phenomena are “accidents” or “modifications.” The nature of the part must be determined by the nature of the whole. In the strictest sense, the nature of the parts, as its modes or modifications, are therefore also fixed and determined. More frequently, however, the causal category is employed to support deterministic conclusions, either alone or in conjunction with that of substance. No part of the universe, it is argued, stands by itself: everything gets its constitution and nature through its connection with and dependence on something else. Universal causal relationship, then, implies universal dependence, necessary determination. If the principle of cause and effect is valid throughout the whole field of reality—in the mental realm as well as in the physical—then determinism is the logical and inevitable consequence. The adherents of determinism have nevertheless maintained these principles with varying degrees of strictness so far as their applications to mental life are concerned. Many of those professing determinism have given to the causal principle in its application to mind a meaning which they believe guarantees a rational view of freedom. Some of these positions will be referred to below under the various headings with reference to the reality such principles try to be further discussed. These headings, it will be noticed, indicate different aspects and applications of the problem as already outlined, and not separate or exclusive doctrines.

(a) Metaphysical Determinism arrives at its conclusions from a consideration of the general nature of the world and the universal form in which events happen. The determinism of the will is simply one instance among others of the universal order and uniformity of all events. In strict monistic systems it is difficult to avoid the conclusion that the nature of the one ultimate reality is that which determines everything. This is true, as we have seen, whether that one substance is regarded as God, or as matter or energy. The opponents of determinism accordingly usually fall back upon pluralism, and emphasize the uniqueness and self-centred reality of human personality. But this position is confronted, on the other hand, with the task of accounting for the unity which experience shows actually to exist. How, if there is a plurality of completely independent individuals, is it possible to think of the whole as forming a single world—a universe? It is clear that this world must be something more than a mere collection of human beings least of all are mere points which exclude relation to others. This antinomy is of course just one aspect of the fundamental metaphysical problem of the one and the many, and cannot receive a full discussion here. It is however obvious from what has already been said that a solution can be found only by adopting a metaphysical system that is at the same time both monistic and pluralistic: that holds fast to the unity of things and also maintains the possibility for the possibility of self-determination on the part of finite individuals. Such a result is not possible for materialism, or any mechanical system of metaphysics. If, however, the view can be defended that the universe exists in its ultimate form as life and consciousness, freedom can still be maintained. For life and consciousness are principles of inclusion, not of exclusion, and at the same time they leave within their unity free place and scope for individuality or diversity. From the metaphysical point of view, the solution of the apparent contradiction between freedom and determinism depends, therefore, upon the possibility of finding logical grounds for maintain-
Determination

(continued)

(4) Theological Determinism.—The problem here is in principle identical with that of metaphysics, though stated in different terms and generated by a special interest. The theological doctrine is variously known as predestination, foreordination, election, etc. (qq.v.). The whole course of history, both in its physical and moral aspects, is claimed to take place in accordance with the eternal decrees or purposes of God. The crucial problem is regarding man's ability to secure his own salvation. Theological determinists maintain that God has selected some to everlasting life, and that such election, as an act of free grace, is the necessary condition of salvation. Thus Jonathan Edwards, in summing up his defense of Calvinism against the Arminians, claims: "If we put these things together, it will follow that God's assistance or influence must be determining and decisive, or must be attended with a moral necessity of the event; and so that God gives virtue, holiness, and conversion to sinners, by an influence which determines the effect, much more must the things infallibly follow by a moral necessity, which is what Calvinists mean by efficacious and irresistible grace." ('On the Freedom of the Will,' Ch. XIV).

(5) Psychological Determinism.—Psychology has to describe and explain the conscious processes which constitute mind; and, like all the sciences, is necessarily deterministic in standpoint. From the psychological point of view every mental process without exception finds its explanation in its relation, either to some other mental content, or (as some would maintain) to accompanying neural changes in the body. An uncaused or undetermined mental event, as, e.g., an act of will which is not connected causally with other states of body or mind, is a contradiction from this point of view. Nor is the difficulty to be avoided by supposing that the volition is caused by a free act on the part of the ego, that the self intervenes to produce changes in the natural order of events at this point or that. For if the self is thus distinguished from its states, it is no longer a member of the mental series, and cannot be invoked as a cause of any particular event. To appeal to any such special agent is to abandon the scientific problem, which is to discover the causal relation of the phenomena that constitute the mental life. As Kant in the 'Critique of Pure Reason' clearly shows, there is no possibility of freedom in a phenomena series of mental events; since, as occurrences in time, these are subject without exception to the law of cause and effect. The oft-repeated attempts of defenders of free-will to overthrow determinism while still assuming that the psychological point of view is final are as contradictory and fruitless as the analogous attempts to vindicate teleology in the physical order by supposing that at times the natural order is interrupted by a miracle. If determinism is to be avoided, there must be an advance to a greater bad or evil in life. This was perceived by Kant who, in his doctrine of man as belonging to a noumenal order of reality, passes beyond the psychological and causal point of view to the idea of self-determination in accordance with ends. It is true that Kant did not regard this new category as one that is valid for knowledge, but describes it as a postulate of practical or moral reason. The result of his endeavor, was to establish the fact that while the psychological or phenomenal description of mind must employ everywhere the category of cause and effect, and can therefore only issue in determinism, yet from another point of view it is equally necessary to give rise to the facts of moral experience, to introduce the idea of freedom, or determination in accordance with ends.

(d) Historical Determinism may be a deduction from theological determinism, by simply regarding all the events of history as determined by the will of God, who makes even the "wrath of man to praise him." But what is usually known by this name is the theory according to which historical events are to be explained by referring them to natural powers and circumstances as their causes. The demand that history shall be made a science involves such an explanation of historical events by means of causes, and carries with it the assumption of the determinism. History historically is accordingly regarded by some writers as requiring exhibition of the various causes—geographical location, climatic conditions, racial and economic rivalries, etc.—which are to be taken as determining the course of events in the period with which they are dealing. Since, however, historical events are determined by the volitions of men, the sphere of determinism must be psychological, and the remarks made in the preceding paragraph will also have application here.

(e) Ethical Determinism.—It is because of the supposed ethical implications of Determinism that the doctrine has been most vigorously opposed. If all human actions take place, like natural occurrences, in a strictly determined way, then it seems an immediate corollary that the sense of obligation is unmeaning and the feeling of responsibility an illusion. Consequences of this character, which seem to the opponents of the doctrine to follow from it directly, are taken by them as involving the refutation of the theory of determinism. The advocates of freedom are often content with this practical disproof of the opposing doctrine, admitting that from the theoretical point of view it is unanswerable. Kant, e.g., basing the proof of freedom upon the demands of the moral consciousness. Without the "postulate" of freedom the fact of moral obligation would be illusory; the 'ought' implies and presupposes the "can." On the other hand, the determinists as a rule are not willing to admit that it is necessary to assume freedom in the sense of indeterminism in order to give significance to moral distinctions. In the first place they point out that determinism is by no means identical with fatalism; that the causes of an action are no compelling powers outside the individual, but his own motives and character. Moreover, as H. Sidgwick has remarked: 'The determinist allows that, in a sense, the 'ought' implies and presupposes the "can," morally bound to do what is 'in his power,' and that only acts from which a man 'could have abstained' are proper subjects of punishment or moral condemnation. But he explains 'can' and 'in his power' to imply only the presence
DETONATION. Certain chemical compounds, which, on being exposed to heat or suddenly struck, explode with a loud report, owing to one or more of the constituent parts suddenly assuming the gaseous state. They often have the power of initiating explosions in more stable compounds. A mixture of equal volumes of chlorine and hydrogen exposed to direct sunlight detonates violently, forming hydrochloric acid gas. The chloride and iodide of nitrogen are very powerful detonating substances, but too unstable for practical use. For explosives, powdery mixtures of chlorates with reducing agents such as charcoal have been employed. Fulminate of silver and of mercury detonate by slight friction, by means of heat, electricity, or sulphuric acid. The compound used in the priming of percussion-caps and fuse is the fulminate of mercury or silver \((C\text{–}NO)\), Hg or \((C\text{–}N\text{O})\)–Ag, respectively, collected as a precipitate when the metal, dissolved in nitric acid, is poured in warm alcohol and the precipitate formed is collected, washed and dried. The salts of triazic acid, NaN, are also coming into use for the purpose. See EXPLOSIVES.

DETONATORS are the devices used in firing high explosives by detonation. They consist of small cylindrical copper tubes closed at one end and charged with powder or a mixture of mercurial fulminate and potassium chlorate which is compressed in the bottom of the tubes. Those used for blasting in mines and quarries are also known as blasting caps and exploders. They are rated as single force, double force, triple force and so on, and the charge for the single force cap being about five grains of the detonating substance, and the charges for the higher force increasing about
two grains for each grade. To fire them a piece of Brickford or *running* fuse of the desired length is inserted in the mouth of the detonator or cap and then the copper tube is bent on *crimped* securely about the sides of the fuse. The detonator is inserted in the borehole so as to come in close contact with the first cartridge or *stick* of explosive and the borehole is filled with tamping. When a flame is applied to the end of the fuse that projects from the borehole, the column of powder in the fuse takes fire, the fire travels slowly down to the charge in the detonator, causing the detonation of the dynamite.

For military mines and naval torpedoes and, to a considerable extent, for commercial blasting detonators to be fired by an electric current are employed. These are known as electric detonators. They differ from those previously described only in that the mouth of the copper cap is closed by a plug made of sulphur and ground glass. At the lower end of which two copper wires, known as the *legs* of the detonator, are led. Inside the cap these wires are bridged over by a very fine wire made of an alloy of iridium and platinum. Around the bridge and between it and the cap a layer of composition is placed, a layer of mealed gun-cotton. When it is desired to fire, the legs of the detonator are connected with a dynamo-electric machine and the current generated. As the current passes it heats the bridges to incandescence, which sets fire to the gun-cotton; this causes the fulminate to detonate, and this detonates the charge of dynamite or other high explosives. The detonators used on the Whitehead torpedoes in the United States navy contain 35 grains of mercric fulminate, this large quantity being used to make sure that the detonator will do its share of the work in torpedo attacks on an enemy. See Explosives.

**DE TREVILLE, trà* vil*, Yvonne, American prima donna: b. Galveston, Tex., 25 Aug. 1881. She received her musical education from Madame Marchesi, Paris, being the youngest member of her class. She made her debut in grand opera and created La Bohème in English at the age of 16. Thereafter she sang entirely abroad, appearing in the rôle of Lakmé at Opéra Comique, Paris, and at the Stockholm Royal Opera and Petrograd Symphony Concerts in 1903-04. She sang at the Cairo Khedivial Opera and the Saint Petersburg Imperial Opera 1904-05; in Bucharest, Berlin, Budapest and Nice 1905-06; in Brussels, Vienna, Munich and Treviso Castle, Switzerland 1906-07. In 1910-11 she made a concert and operatic tour of Germany, Austria, Hungary, Poland and Rumania. She sang *Opheilia* in the gala performance of Ambroise Thomas centenary celebrations in France during the summer of 1911; and in the following winter made another operatic tour of Germany, Austria and Russia. Her repertoire covers operas in all the principal languages of Europe.

**DETRITUS**, applied in geology to accumulations formed by the disintegration of rocks, may consist of angular and sub-angular debris, or of more or less water-worn materials, such as gravel, sand or clay, or an admixture of these. Especially applicable to that fragmentary matter which if consolidated into a solid would form what is known as breccia.

**DETROIT** (Fr. D'Étroit, strait), Mich., capital of Wayne County, in the southeast; largest city of the State and of the entire Northwest to the Pacific; situated on the north bank of the Detroit River dividing the United States from Canada, one end fronting west of Lake Saint Clair and the other about 18 miles from Lake Erie. It is 88 miles from Lansing, the State capital; 284 from Chicago; 60 from Toledo, Ohio; 251 from Buffalo and 291 from Mackinaw. Pop. estimated 950,000.

Detroit has the finest harbor on the Lakes; the river, on the city front, is often called the "Dardanelles of America." The broad outlet of Lake Saint Clair, running west and dividing around Belle Isle, narrows to about half a mile and deepens to an average of 32 feet for some miles with a southwest course, before turning directly south, with a current of about two miles an hour. Fed by the Great Lakes, it has always a full stream, neither rising or sinking much, and is little disturbed by storms; and the largest vessels can lie up to the wharves. Here is built Detroit, extending some 11 miles along the river front, lined with wharves, elevators, foundries, factories, warehouses, railroad stations, freight depots, etc. Area, 80.70 square miles, but with well-built suburbs outside not yet incorporated; indeed, from Grosse Pointe at the northeast to Gibraltar at the south where Lake Erie begins, the whole river front for 30 miles is built up with handsome villages and lined with the summer villas of its wealthy business men, all really parts of Detroit. About three miles west of the centre of the city, commanding the channel, is Fort Wayne, an unfinished military post once intended to be the most formidable fortification in the Northwest, and still garrisoned and armed with batteries. Across the river in Canada are Windsor in the centre, the terminal of railroads, through Canada, Walkerville on the northeast. Sandwich on the southwest and just below Sandwich is the site of the proposed city of Ojibway, the Canadian City of the Steel Trust.

The ground of Detroit is a gentle slope for 300 or 400 feet back from the river to 20 or 30 feet high; then sinks slightly, and again rises to about 50 feet, and 661 above the sea. The original plan, on a very small scale, was a series of concentric semi-circles, or rather segments of polygons, with the Grand Circus—a semi-circular park of five and a half acres—as a centre, nearly a mile from the river, toward which they extended. This feature is still preserved; but all the new growth has been laid out in checkerboard system, relieved by a series of noble avenues, 100 to 200 feet wide, radiating from the river. Jefferson avenue extends along it; Woodward avenue runs at right angles to it, dividing the city into halves and the Grand Circus into quadrants; west of Woodward are Michigan and Grand River avenues, at different angles, and east is Gratiot. Between the Grand Circus and the river is the Campus Martius, an open space about 600x200 feet, crossed by Woodward and Michigan avenues, and from which start Monroe avenue and Fort Street, streets radiating from the Grand
Circus and the Campus Martius. Griswold street, with the great banking houses, office buildings, etc., is the Wall street of Detroit; and others spreading from the Campus Martius and Allen Park are among the chief of the show streets is the Grand Boulevard, a macadamized parkway 150 feet wide and 12 miles long, encircling the heart of the city in a vast sweep from Belle Isle bridge at the east to the river at 26th street. The outer portion of all the great avenues mentioned, of Lafayette avenue and of Fort street, are full of fine residences; and a notable residence district clusters around Woodward avenue as it stretches toward Palmer Park.

Public Buildings and Monuments.—The chief of these are on or near the Campus Martius. Within it, facing the City Hall, is the Michigan Soldiers and Sailors' Monument, by Randolph Rogers, of bronze and granite, 55 feet high, and its origin is a colossal base with a daily national and international, a statue of Michigan on the summit; it cost $75,000 and was unveiled in 1871. On the west, facing four streets, is the City Hall, three stories high and mansard, of sandstone in the Italian style; 200x90 feet, 60 feet high to top of cornice, 180 to 200 feet long, and originally, in 1870, cost $600,000, and is one of the finest in the West. Near by are the handsome Wayne County courthouse, the largest public building in the city, the splendid Majestic office building, the Ford building, Penobscot building and new Dime Bank building, 22 stories high. On the north of the Campus is the Detroit opera house. The United States government building, accommodating the post-office, customs and internal revenue office and United States courts, occupies a whole block bounded by Fort and Lafayette, Shelby and Wayne streets. Within the past three years the blocks fronting the West Grand Circle have been built up with lofty office and hotel structures, and near the East Grand Circle are the Y. M. C. A. and Athletic Club buildings. Monuments to Stevens T. Mason, first governor of the State, Generals Alexander Macomb, who commanded at the battle of Plattsburg in 1814, and Mayors Phoenix and Maybury adorn another block.

Parks, Service and Improvements.—The city has 836 miles of streets, of which 593 are paved, mostly with brick, asphalt or creosote block. It has 236 miles of public sewers and 600 miles of laterals, and is inaugurating extensive additions to its sewer systems to accommodate future growth. The water supply is taken from a crib at the head of the American channel of Detroit River, 1,500 feet from the shore and at a depth of 46 feet. The pumping stations have a daily capacity of 250,000,000 gallons. The average daily consumption for the last reported year was 142,578,231 gallons, or 173 gallons per capita per day. The maximum for any single day's pumping was 194,000,000 gallons. There are in the system 1,076 miles of pipe and 6,350 public hydrants. The works are owned by the city and are supported by rates. The value of the waterworks buildings and pumping plants is about $5,000,000. The city is lighted by electricity furnished by a plant municipally owned. There are 9,920 lights furnished for street lighting and the public buildings and school buildings are lighted by this plant. Private lighting and power is furnished by the Edison Company. Value of public lighting plant in 1917, $1,300,000.

The police department has a force of 1,600 men and the fire department one of 900 men, with 42 engine companies, 13 teams, and 754 hydrants and 517 reservoirs.

The electric railway system is owned and operated by a single company, the Detroit United Railway. It consists of 298 miles within the city limits and nearly 600 miles of interurban lines radiating in all directions. In 1917 there were 484,727,818 passengers carried. The fare on about one-third of the city lines is eight tickets for a quarter during the day and six for a quarter at night, with transfers to other portions of the same lines. On the rest of the city system the fare is five cents with universal transfers. There are three railway passenger stations in the city, the Grand Trunk, foot of Brush street; the Union Depot, corner of Third and turk; the Michigan Central, Michigan avenue and 15th street, accommodating that road and the Lake Shore.

Parks, Pleasure Resorts, Public Amusements, Etc.—Detroit has 31 public parks besides a number of small triangular squares caused by the intersection of the radiating avenues with the streets, often with fountains. The largest, and the principal public resort, is Belle Isle in the river, whose entire 705 acres have been parked with great beauty. It is reached by ferries and by a temporary wooden bridge. The island has cost the city for purchase and improvements $2,021,689. The annual cost for maintenance is about $150,000. The next largest is Palmer Park, of 141 acres, on Woodward avenue, about 6½ miles from the river, sedulously made a colonial museum; it has a colonial log house; and a most interesting collection of colonial and other historical relics, besides a colonial casino. The park was a gift to the city by the late Thomas W. Palmer. Clark Park in the west has 32 acres; in part a gift from J. P. Clark. Voigt Park, 8½ acres, and the Grand Circus, in each of whose quadrants made by 100 squares, a fountain, 5½ acres. Besides these, there are opportunities for delightful summer trips on the river and lakes; and the river is dotted with charming places where excursion steamers run, from Grosse Pointe, on Lake Saint Clair, famed for its cherry orchards, to Grosse Isle, where Lake Erie opens. There are 20 theatres and opera houses in the city, the largest of which are the Detroit, Garrick and Washington theatres and the Lyceum. There are also 148 moving picture theatres.

Cemeteries are Elmwood (Protestant) and Mount Elliott (Catholic), side by side on the northeast, about two miles from the centre; beautiful in keeping and monuments; Woodmere, four miles to the southwest of the centre of the city and within the city limits; Weldon, a beautiful cemetery, situated seven miles on Woodward avenue, and Mount Olivet, another large (Catholic) cemetery about seven miles out at the northeast, Grand Lawn, the largest and newest, is nine miles from town on Grand River avenue. There are a number of Lutheran and Jewish cemeteries, making 23 in all.

Schools, Libraries, Newspapers, Etc.—In
1917 there were 135 public schools, of which nine were high schools. For the school year 1917-18 there were about 95,000 pupils enrolled with 2,400 teachers. Aside from the ordinary school curriculum there are classes for the blind, for special and prevocational studies, open-air schools and summer schools. Especial attention is given to night schools for teaching foreign-born residents the English language, the rights and duties of citizenship and the elementary principles of our government. One of the high schools is a fully-equipped technical industrial training school. The school appropriations for 1917-18 aggregated $5,556,278. There are also about 80 private and parochial schools, with an enrolment of 32,000. The number of children of school age, i.e. 5 to 20 years, in 1917 was 164,532. For professional or higher education there is Detroit University (Jesuit); a normal training school for teachers which is a part of the public school system; the Detroit College of Medicine, which has recently been taken over by the city, the Detroit College of Law. One of the State Normal schools is at Ypsilanti, 28 miles distant, and Michigan University is at Ann Arbor, 38 miles distant.

The city owns a central public library, with 14 branches, 27 school and factory stations and 455,000 volumes. The appropriation for 1917-18 was $307,000 for maintenance and $1,250,000 for a new main library building. The Bar Association has an excellent law library. The city also owns an art museum with a fine collection of paintings, statuary and oriental curios and a good art library. During the last year 177,535 visitors passed through its turnstile.

There are in the city, including trade and advertising sheets, 124 regular publications. Of these six are English dailies, two Polish and one German.

Religion and Charities.—The church and religious assemblies and missions number 316. Of these 53 are Roman Catholic churches, 43 Lutheran, 35 Methodist, 30 Baptist, 25 Protestant Episcopal, 21 Presbyterian and 16 Jewish. Among the non-sectarian churches are St. Hedwig's and Saint Albertus, all Roman Catholic; the First and Fort Street Presbyterian; the Central Methodist; Trinity, Saint John's, Saint Paul's Cathedral (Episcopal); Woodward Avenue Baptist; the First Church of Christ, Scientist; Church of Our Father (Universalist); First Unitarian, Woodward Avenue Congregational, First Congregational, First Baptist Church and the Temple Beth El.

The charities include a city poor fund, managed by a commission; the State Associated Charities and a large number of denominational and special charities. There are several large general hospitals, of which the most are noted are Grace and Harper, with training schools for nurses; Saint Mary's (Catholic) the Ford General Hospital; Kiefer Hospital for Contagious Diseases; the City Receiving Hospital; House of Providence (Catholic) and the United States Marine Hospital. Manufactures, Commerce and Transportation—Detroit has a large manufacturing centre and its most rapid growth in this respect has come within the last few years. In the calendar year 1909, according to the United States census reports, its 2,036 manufacturing establishments employed 81,011 wage earners and had a production valued at $252,939,000. It was then 13th in rank among industrial centres of the country. In 1916, according to the report of the State Bureau of Labor, there were 251,000 industrial employees in Detroit and its adjoining manufacturing suburbs. The value of the product was about $900,000,000 and the city stood fourth in this respect, being surpassed only by New York, Chicago and Philadelphia. A large part of this gain was due to the phenomenal growth of the automobile business. In 1909 there were 68 establishments in the city which either assembled automobiles or devoted their whole business to the making of auto parts and accessories. They employed 15,675 wage earners and their product was valued at $59,536,000. In 1916 there were 31 companies that assembled automobiles and 120 others whose sole business was the making of auto parts and accessories. They had 130,000 employees and put out 959,000 cars, valued at about $600,000,000. One of the companies, the Ford, had 42,000 men on its pay-roll and the Cadillac, Dodge Brothers, Packard and Studebaker had over 10,000 each. In 1917 and the first part of 1918 the production of cars was less rapid, as the large companies diverted part of their activities to the production of aeroplane parts, shipbuilding parts, the metal parts of munitions and other government war work. In addition to its primacy in the automobile industry, Detroit is either first or conspicuously near the front in the making of adding machines, aluminum castings, brass and bronze products, malleable iron, corsets, overalls, soda ash and furnaces. The city is also a large producer of furniture, foundry and machine shop products, tobacco and cigars.

The interests of Detroit in connection with the lake marine are great. It is first or second every year among the lake cities in shipyard production. It has the largest fleet of passenger steamers of any port in the country except New York. They number 31, with tonnage of 38,000 and licensed passenger capacity of 60,000. Several of the steamers are licensed to carry Army and Navy passengers each. Their routes include nearby ports on the adjacent rivers and lakes, and also longer trips as far as Buffalo in the East and Mackinac to the north. Detroit is also a port of call for all steamers going from Buffalo to the Upper Lakes. The tonnage passing through Detroit River is more than twice that passing through the Suez Canal, and much larger than the tonnage arriving and leaving at New York or any other seabornd port in the world. The vessel associated with the greatest tonnage in 1915 numbered 37,852, with net registered tonnage of 76,672,264 and actual freight tonnage of 100,907,279.

Not only are the transportation facilities by water unsurpassed but the city is the centre of far-reaching railroads. They include the Michigan Central, five divisions; Pere Marquette, three divisions; Wasahoe, two divisions; Lake Shore; Detroit, Toledo and Ironton; Detroit and Toledo Shore Line; Grand Trunk, four divisions; and the Canadian Pacific. The Pennsylvania Railroad, internationals and expects to bring in trains over its own tracks before the close of 1918.

The foreign trade of the district of Michigan, of which Detroit is the port of entry,
goes to a very considerable extent over the two Canadian trunk lines mentioned, reaching tide-water at Montreal. The exports for 1917 totaled $276,190,292. The largest items were foodstuffs as for the valued cattle raised in the city. Other very large items were automobiles, iron and steel manufactures, live animals, chiefly horses and mules for war service, cotton, copper, lead and zinc. The imports for the district in 1917 aggregated in value $54,569,014.

During the French and Indian War, on 29 Nov. 1760, Maj. Robert Rogers took the place from the French garrison under Capt. Belitre, by order from the Marquis of Vaudreuil; the garrison were sent off as prisoners, but the Canadian inhabitants were allowed to retain their farms upon swearing allegiance to the British Crown. The first act of Pontiac's conspiracy in 1763 was the attack upon Detroit; Pontiac was foiled, and after a desperate siege from 9 May to 12 October, heroically sustained by Major Gladwin, the post was relieved. In 1778 there were about 300 inhabitants, living mostly in log cabins, in a palisaded village. There was a Roman Catholic church in the enclosure, but no public buildings; in that year the British built Fort Lernoult, renamed Fort Shelby by the Americans, but it was not until 1796 that the place was occupied by the Americans. As a war of the Northwest Territory it came under the Ordinance of 1787, and in 1802 was incorporated as a town, but in 1805 was obliterated by a fire which destroyed every building in the village except one. The town was replanted and had broad streets. It became the capital on the organization of Michigan Territory in 1805. In the War of 1812, William Hull surrendered it to the British under Isaac Brock on threat of a general massacre of the inhabitants by Brock's Indians. Hull was court-martialed for this act. The British evacuated it in 1813, and the Americans reoccupied it 29 September. It was incorporated as a village in 1819 and again in 1815 and as a city in 1834. It remained the capital of the Territory until 1837, when Michigan became a State; then of the new State till 1847. Detroit celebrated its centennial 24 July 1901.

Consult Farmer, 'History of Detroit and Michigan' (1889), and 'Detroit and Its History' (1901); Burton, 'Cadillac's Village'; 'Early Detroit'; 'The Building of Detroit' (1896); Parkman, 'Conspiracy of Pontiac' (1867); Ross and Catlin, 'Landmarks of Detroit' (1898).

William Stocking, Statistician, Detroit Board of Commerce.

DETROIT, Minn., county-seat of Becker County, on Detroit Lake, in the Northern Pacific Railroad, about 200 miles northwest of Saint Paul. The town is the trade center of a rich agricultural district and a popular summer resort because of its situation in the beautiful lake region of Minnesota. It owns its electric light and power plant. Pop. 2,807.

DETROIT, Siege and Capture of, in the War of 1812. Before it was officially declared against Great Britain a plan of invading Canada was drawn up. One part of the army under Brig.-Gen. William Hull (q.v.) was to cross from Detroit and sweep eastwardly to meet two other armies along the New York border line. On 25 May 1812 Hull began the march from Dayton with 1,600 troops underCols. Duncan McArthur, Lewis Cass, James Findlay and James Miller (q.v.) and after a long, tedious journey reached Detroit 5 July. On the 12th he crossed the river, occupied Sandwich, a little village on the Canadian side, three miles below Detroit, and there inexplicably remained inactive week after week, thus allow-
ing Brig.-Gen. Sir Isaac Brock (q.v.), the British commander, time to collect a formidable force. The Americans had a few minor successes, like Fort Dearborn, but on 19 and 24 July strong detachments were defeated; on 17 July Michillimackinac was surrendered by Lieut. Porter Hancks to a superior force of British and Indians; and on 8 August, just as preparations were being made to attack Malden, word was received of a defeat at Brownstown. A company of Ohio volunteers under Capt. Henry Brush was hastening with supplies to join Hull, but near Brownstown, at the mouth of the Huron River, 25 miles below Fort Detroit, met a body of Indians under Tecumseh (q.v.). Learning of this, Hull sent a force to rescue Brush, but it was ambushed, many were killed and wounded and the survivors barely escaped to the fort. Hull’s dispatches were captured and sent to Brock and, therefore, knowing that the latter was aware of his desperate condition and learning that a large force of British and Indians was approaching, Hull on 8 August ingloriously returned to Detroit. On his arrival there Hull sent 600 men under Miller to rescue Brush, but simultaneously Col. Henry Proctor set out with a body of British troops to press the advantage gained by Tecumseh. On 9 August the two forces met at Maignaga, near Brownstown and 14 miles from Detroit, and the British were routed, retiring to Malden, while Miller, having lost about 75 men, was recalled to Detroit. On the 9th Hull ordered the evacuation of Fort Dearborn at Chicago (q.v.), but on the way the troops were attacked and massacred by Indians under Blackbird.

On 13 August the British began to place batteries on the Canadian side of the river to bombard Detroit; on the 15th Hull was summoned to surrender under threat of a massacre by the Indians; and on Hull’s refusal the bombardment was begun. On the 16th the British crossed the river intending to assault the fort, but found the Americans drawn up in battle array outside the ramparts, with artillery well placed. Nevertheless the British took position without opposition and were preparing to assault when Hull, apparently desperate at the thought of a massacre, withdrew his troops from all exterior positions and decided to surrender. Thus within an hour the British found themselves in possession of the fort; not a blow was struck, not a gun was fired, not a word of consultation was had with the officers and not a single stipulation was made for the honor of the troops; but everything was unconditionally surrendered to the enemy. The loss is variously stated. Hull estimated his effective forces below 800; Cass stated the loss at 1,600; while Brock reported the number captured at 2,500. The city remained in possession of the British until 1813, despite attempts to recapture it. See FRENCHTOWN.

Hull was charged with cowardice, inefficiency, neglect of duty and treason, was subsequently tried by a court-martial, which concluded its labors in March 1814, was acquitted of all but insubordination of the other charges and sentenced to be shot. On the court’s recommendation of mercy, President Madison remitted the death sentence but ordered Hull’s name to be stricken from the roll of the army.

DETROIT MUSEUM OF ART, the principal art museum of Detroit, Mich., and one of the largest of the Middle West, founded in 1885. It contains a library and has valuable collections on American art, archaeology, science and on local and national history. It contains the famous Stearns collection of Oriental curios, the Scripps collections of old masters and a fine collection of Pewabic pottery. Contemporary American painters and sculptors are well represented, including Borglum, Manuph, Hawthorne, Saint-Gaudens, Dewing and Chase. The museum receives an annual subsidy from the city, which in 1916 amounted to $40,000, payable in monthly installments. Courses of lectures are given and sketch classes maintained, also a school of design for the teaching of art and design and the promotion of art studies generally.

DETROIT RIVER, a river or strait which connects Lake Saint Clair and Lake Erie and forms part of the boundary between the United States and Canada. Detroit is the French word for strait; and the name was given by the French, the first white men who settled here. Its course is nearly south, with slow current and sufficient depth of water for the navigation of large vessels. It is 25 miles long and from one-half to three miles wide. Opposite the city of Detroit it forms an excellent harbor. The tomage passing through this river exceeds in volume that passing through any other river in the world.
DETOYAT, Pierre Léonce, French naval officer and journalist; b. Bayonne, Basses-Pyrénées, 1829; d. 1898. He was educated at the École Navale, was in active service during the Crimean War and subsequently accompanied an expedition to China. He came to Mexico with the Archduke Maximilian and was made Under-Secretary of State for Naval Affairs in the latter's short-lived empire. In 1865-71 he was in command of the coa at La Rochelle. In 1874 he was a staff of La Liberté in 1865-69 and was its editor in 1869-76. He founded two journals, Le Bon Sens and L'Éstafette, and in 1885-86 was editor of the Constitutionnel. He published La cour de Rome et l'empereur Maximilien (1857); L'Intervention française au Mexique (1868); Du recrutement, de l'organisation et de l'instruction de l'armée française (1871); Le sénat et le scrutin de liste (1881); Nos possessions françaises en Indo-Chine (1887); Les chemins de fer de l'Amérique (1886).

DEUCHER, doik'er, Adolf, Swiss statesman; b. Stockhorn, Thurgau, 1831; d. 1912. He studied medicine at Heidelberg, Zürich, Prague and Vienna. He was a member of the Thurgau canton council in 1855 and in 1868 helped to frame the new democratic constitution for Thurgau. He was a member of the Swiss National Council 1869-73 and became its president in 1882. He became a member of the Federal Council in 1883 and its vice-president in 1885. He was chosen President of the Swiss Confederacy and served until 1897. He was re-elected in 1897 and 1903.

DEUS EX MACHINA, məkən-'a (Lat. "a god out of the machine"), a Latin phrase translated from the Greek, where it was used principally in connection with the theatre. When the tragic situation of a play became so involved that the solution of the difficulty lay beyond the situation itself, a god was brought on the stage by some sort of stage machinery, and the dénouement followed quickly. The term has come to connote any extraordinary, unlooked-for agency introduced to solve a difficulty or to designate some unknown supernatural cause introduced to explain phenomena that one is not able to account for by natural means. Consult Haigh, 'The Attic Theatre' (3d ed., Oxford 1907).

DEUTERONOMY, "Second" or "Repeated Law," the title, applied in Greek, Latin and modern versions of the Old Testament to the fifth book of the Pentateuch (q.v.). The name arose from a mistranslation of the phrase "copy of law" (Deut. xvii, 18; also Josh. viii, 32), yet it has had in the past a certain descriptive force in contrasting this code of law as promulgated at the end of the wilderness sojourn with the codes of Exodus and Leviticus as given at Sinai. In Hebrew editions of the text the title is "These Words," taken from the opening words (Deut. xxxii, 32). The central portion of Deuteronomy consists of an hortatory address (v-xi) and a code of laws (xii-xxvi). Introductory matter is prefixed to this, chiefly an historical review (i-iii), and an exhortation (iv, 1-40). The closing chapter (xxvi, 1-42) deals with miscellaneous matter concerning obedience to the law and the last days of Moses. Deuteronomy has been one of the pivotal points in the discussions of the past century as to the true order of growth of the Old Testament literature and religion. It is now generally recognized among those who have been working out the principled method of historical investigation to the Biblical writings that, in the development of Hebrew law, Deuteronomy stands between the briefer and simpler codes of Exodus xxxiv and xxxv and the elaborately detailed law of Leviticus. With some slight modifications, almost the entire contents of the "Book of the Covenant" (Ex. xx, 20-xxiii, 33) is taken up into this new "Covenant" code, which may itself be counted Mosaic in the sense that all the written law of Israel is an organic growth springing in the first instance from the creative work of that great leader. A comparison of the thought and style of Deuteronomy with the historical and prophetic writings similarly suggests its composition between the historical documents of the 9th and 8th centuries and the 8th century prophets (Amos, Hosea, Isaiah, Micah) on the one hand and, on the other, the historical writings and the prophets (Jeremiah, Ezekiel) of the end of the 7th and beginning of the 6th centuries. A further comparison of the contents of Deuteronomy with the account of the finding of the book of the law and the reforms based upon it in the 18th year of Josiah's reign (2 Kings xxii-xxiii) makes it clear that the law promulgated in 621 B.C. was that of Deuteronomy and no other. The composition of the main body of the book may thus be assigned to the period between 700 and 621 B.C. The introductory and concluding chapters seem to have been added not long after 621. The great prophets of the 8th century had called upon the people to reform their entire civic, economic, and religious life in conformity with the newly apprehended requirements of a sole Deity, who demanded justice and mercy rather than religious ceremonies. The prophets had applied these demands to dishonest business dealings, bribery, oppressive monopoly and to established religious customs in a way that united religious conservative and selfish exploiter against the much needed reforms. In the reign of Manasseh beginning in the 7th century there was a great reaction against the reforms undertaken; now anyone who dared to teach publicly the doctrines of the recent prophets met speedy death. It was probably at this time that followers of the prophets secretly compiled the central law code of Deuteronomy and composed the wonderful hortatory address of chapters v-xi, which bases its appeal to obey the law upon the most generous motives of gratitude to God and sympathy for man. The book was probably laid away in one of the Temple chambers until a favorable time for its public reading should be found. Its authors may already have been dead when it came to light in the repairing of the Temple instituted by Manasseh's grandson, Josiah.

The prophets of the previous century had made an antithesis between spiritual religion and worship. Deuteronomy undertook a great synthesis of the two, seeking to purify worship from pagan license and to use it as an expression of love to God and kindness to man; it intended to purify, Deuteronomy changed the old law that permitted altars in various places (Ex. xx, 24) and centralized the cultus at Jerusalem.
The ground of Sabbath observance was made rest for the servants as well as the master. In the joyous harvest feasts the servants, landless Levites, foreign servants, fatherless, and widows were to be given opportunity to share, and the tithes of the produce were to go for the nourishment of these classes. Emphasizing justice, mercy, and knowledge of God as the supreme things, Deuteronomy sought to formulate laws which should give effect to these principles in worship, business, family life, and the entire conduct of the nation. The perpetuity of the nation was indeed declared dependent upon faithfulness to the covenant of Sinai, which required loyalty to Jesus' expressed in a purified worship and a righteous, benevolent social order.

Upon the tragic death of Josiah and the establishment of Egyptian suzerainty the nation reacted sharply against the exacting demands of Deuteronomy. The Kings followed speedily and burned the warnings of Deuteronomy into the hearts of some thoughtful Jews. Out of these conditions there sprang a school of historians who composed such works as Judges and Kings with the primary purpose of enforcing the great lessons of Deuteronomy.

In literary form this book marks a transition in the growth of the Old Testament scarcely less obvious than that in thought. Its rounded periods and solemn, sonorous tone are in marked contrast to the simple, picturesque style of the earlier prose of Israel; here again its influence is plainly seen in the writings that follow the time of its publication.

HENRY THATCHER FOWLER, Professor of Biblical Literature and History, Brown University.

DEUTOPHASM.—See EMBRYOLOGY.

DEUTSCH, doi'tsh, Gotthard, American Hebrew scholar: b. Kanitz, Austria, 31 Jan. 1859. He was graduated at the University of Vienna in 1881 and came to the United States in 1891. He was a member of the editorial board of the 'Jewish Encyclopedia' and is a member of the Cincinnati Board of Education. He is professor of Hebrew at Union College, Cincinnati. He has written 'Symbolik in Cultus' (1886); 'Theory of Oral Tradition' (1895); 'Philosophy of Jewish History' (1897); 'Andere Zeiten,' a novel (1897); 'Unlosbare Fesseln,' a novel (1902); 'Memorable Dates of Jewish History' (1904); 'Israel Bruna, a tragedy (1908); 'History of the Jews' (1910); 'Der Glaube an die Erlösung,' a survey of modern Judaism (1915); and numerous articles in encyclopedias and periodicals.

DEUTSCH, Leo Grigorevitch, Russian revolutionist: b. Kiev 1855. He was educated in his native place, joined the Russian revolutionary movement in 1874 and in 1876 was arrested, ostensibly as a deserter from the army, but in reality because of his revolutionary tendencies; fatherless, elderly, and widows were to be given opportunity to share, and the tithes of the produce were to go for the nourishment of these classes. Emphasizing justice, mercy, and knowledge of God as the supreme things, Deuteronomy sought to formulate laws which should give effect to these principles in worship, business, family life, and the entire conduct of the nation. The perpetuity of the nation was indeed declared dependent upon faithfulness to the covenant of Sinai, which required loyalty to Jesus' expressed in a purified worship and a righteous, benevolent social order.

Upon the tragic death of Josiah and the establishment of Egyptian suzerainty the nation reacted sharply against the exacting demands of Deuteronomy. The Kings followed speedily and burned the warnings of Deuteronomy into the hearts of some thoughtful Jews. Out of these conditions there sprang a school of historians who composed such works as Judges and Kings with the primary purpose of enforcing the great lessons of Deuteronomy.

Spain, Italy, East Africa, Central America and Mexico; the whole representing a large capitalization. In addition, communities of interest have been established with 13 important banks throughout Germany, these last having 94 branches. Through its ramifications there is hardly a financial center, and community in the German Empire in which the Deutsche Bank has not some proprietary connection; and no commercial country in which it has not an active or silent financial connection. In addition to its purely banking functions, it has representatives on the boards of German and foreign manufacturing and trading organizations, many of which are pre-eminent internationally in their respective lines. This representation in 1910 concerned 116 such institutions.

The capital of the Deutsche Bank (1915) was 250,000,000 marks; surplus, 180,000,000 marks; and dividend 12½ per cent. The capital power of the Deutsche Bank group (1908) was 788,858,695 marks, of which 585,900,500 marks constituted capital, 112,357,259 marks surplus. Consult J. J. Die deutschen Grossbanken und ihre Konzentration (1909); 'Germany's Economic Forces' (1913); 'Report on Cooperation in American Export Trade' (Washington 1915).

DEUTSCHLAND, The, a German submarine merchant vessel, the first of its class to cross the Atlantic Ocean. Commanded by Capt. Paul Koenig, and a crew of 28 men, the boat sailed from Bremen 14 June, 1916, stopped at Helgoland for nine days and then set out for Baltimore, Md., arriving July 10, 1916. The whole distance of about 3,600 miles, with the exception of about 90 miles when it was necessary to submerge, was traversed above water. The speed of the vessel was about 14 knots an hour. While the vessel could submerge to a depth of 300 feet, it did not go deeper than 150 feet. With a total gross tonnage of 711 tons, net 447 tons, and scuff iron for ballast, The Deutschland brought 3,042 cases of scarce and valuable dyestuffs of 157 tons gross, 125 tons net. The daring voyage attracted great admiration and praise. While both British and German submarines on warlike errands had sailed as far, The Deutschland was the first to arrange for the necessary victory of a peaceful utilitarian commercial character during her hazardous voyage through enemy waters, without armed escort, eluding pursuers and accomplishing her mission safely. The vessel left Baltimore at 8:30 P.M. 2 August on her return journey, carrying a cargo of rubber, crude nickel and a consignment of gold, and arrived at Bremen 23 August. A sister ship, The Bremen, left port shortly after and never arrived at its destination. The Deutschland accomplished a second voyage across the Atlantic in 17 days and arrived in New London, Conn., 1 Nov. 1916, bringing a cargo of chemicals, gins and securities valued at $10,000,000. She departed 17 November, but within an hour was compelled to return to port for repairs, having rammed and sunk an escort tug, drowning five of the crew.

DEUTZIA, doi'st'-a, or doitsu'-a (so named in honor of the Dutch botanist Deutz), a genus of plants of the family Hydrangeaceae, containing 50 species, all of which are interesting for the beauty of their flowers. Some of the species are cultivated in America as hothouse flowers or ornamental shrubs. The nearest relatives growing wild in the United States are the syringas (Philadephus). The dezutias are small shrubs indigenous to Asia, one species occurring in Mexico. They are covered with stiff stellar hairs, on which account one species (D. scabra) is used by druses of Japan to polish wood. The flowers are arranged in thyrsi like the lilac.

DEUX-PONTS, dé-pônts', the French name for the German town of Zweibrücken, in Latin Bipontium, all which names signify two bridges. There was formerly a county of this name, which took its name from this town, which is now in the Bavarian Palatinate. It was afterward erected into a duchy. By the Peace of Lunéville (1801) the duchy was ceded, with all the left bank of the Rhine, to France, and afterward composed a part of the department of the Donnersberg. It contains 70,000 inhabitants, on 760 square miles. By the peace of 30 May 1814 it was restored to Germany. See ZWEIBRÜCKEN.

DEUX-ÊVRES. See SÈVRES.

DEV, dāv (Persian, demon), identical with daeva of the Avesta and the Sanskrit deva. According to Zoroaster these beings were created by Ahram and are frequently represented as a source of guile, cunning and evil. Consult Geiger and Kuhn, 'Grundriss der iranischen Philologie' (Vol. II, Strassburg 1896-1904).

DEVA, da'vā (Lat. deus, divus), among the Aryans in general, an epithet of divine persons and things; hence often opposed to the dev of the Parsees. It is commonly applied to the goddess Durgā, the wife of Siva, of terrific form and irascible temper. Devakāmājā is the mother of Krishna, who is also named Devakī. Devatārā is the holy fig-tree, belonging to Sverga or paradise. Devātā denotes a deity; Devadatta, the younger brother of Buddha, who is called Devadattaarāja (Deodatus senior). Devadeva is a name of Brahma; Devapati is Indra, the god of the sky; Devayajna is the Homa or burnt sacrifice; Devarishi a celestial saint. There are many great classes of choirs of inferior devatās, who are ministers to the higher gods, such as the 12 Aditi, as the source of the sun; the Maruts or winds, the celestial musicians; in short, endless motley hosts with variable attributes.

DEVA-DASI. See BAYADERE.

DEVANAGARI, da'vā-nā'gā-rē, or NA-GARI, the name of the character in which Sanskrit is written, especially in northern and middle India. Devanagari means writing of the divine city, and Nagari ('writing) of the city, urban. The alphabet is written from left to right. It is believed to have reached its present form about 700 A.D. and is traced to the oldest form of Indian alphabet, the Brahmī lipi, or writing of Brahma, which is known from coins, etc., of about 350-400 B.C. This Brahmī is itself supposed to be an adaptation of a form of Semitic writing which reached India about 800 B.C. Kircher's 'China illustrata' (Amsterdam 1667) contains five tables of Devangari letters contributed by Heinrich Roth, a missionary. Consult Bühler, 'Indische Paläographie' (Strassburg 1896), and Taylor, 'The Alphabet' (Vol. II, London 1899).
DEVAPRAYAGA, dā-vā-prā-ya'gā, or DEOAPRAYAG, India, a sacred city of the Hindus, in the district of Garhwal, Northwest Province, on a mountain side, 2,206 feet above the sea, in the fork of the Alakmand and the Bhigarathi, which join to form the Ganges. Devaprayaga possesses a notable temple and is a favorite place of pilgrimage. See DEOAPRAYAG.

DEVAUX, dé-vou', Paul Louis Isidor, Belgian statesman: b. Bruges 1801; d. 1880. He was educated at Liége and early entered the political arena. In 1824, in conjunction with Lebeau and Rogrier, he founded the Journal Politique, and in 1830, with the same associates, established the so-called Doctrinal party. Through the journal Devaux drew together the Catholic and Liberal elements and consolidated the opposition to William I, king of the Netherlands, to the extent of being largely instrumental in bringing about the separation from Holland and the setting up of an independent government. Devaux assisted in framing the constitution and also the Treaty of London. He was made Minister of State in 1831, but soon afterward resigned. He became leader of the Moderate Liberals in the Chamber and for several years edited the party organ, the Revue Nationale, which he founded in 1840. In his last years he was afflicted with blindness. He published 'Mémoires sur les Guerres médiques' (1874), and 'Études politiques sur les premiers Événements de l'Histoire romaine' (1880).

DÉVAY, dá-voi, Mátyáš Biró, Hungarian leader of the Reformers: b. Déva, Transylvania, about 1500; d. 1574. He studied theology at Cracow, was ordained a priest and in 1529 embraced the doctrines of the Reformation. The government sent him to the Holy See, he spent two years with Luther at Wittenberg, and on his return home preached the new faith abroad at the risk of his life until 1534, when he secured the protection of a nobleman. The Turkish invasion of 1541 obliged him to flee to Switzerland, where he sought safety. There he adopted the sacramental doctrines of Zwinglius. For many years previous to his death he labored zealously at Debreczin, Hungary.

DEVELOPING IN PHOTOGRAPHY. See NEGATIVES, DEVELOPMENT OF; PHOTOGRAPHY.

DEVELOPMENT HYPOTHESIS, the doctrine that all nature, inanimate and animate, is the result of a gradual unfolding of inherent qualities and powers, with ever-increasing combinations and complexity, from certain assumed primordial elements, the origin of which is unknown. In biology the term is specifically applied to the alleged derivation of modern differentiated forms (species) of animals and plants from early synthetic types. See ANIMALS, CLASSIFICATION OF; EVOLUTION; DARWINIAN THEORY, etc.

DEVENS, Charles, American jurist and general: b. Charlestown, Mass., 4 April 1820; d. Boston, Mass., 7 Jan. 1891. He was educated at Harvard and member of the State Senate in 1848-49, and was United States marshal for the district of Massachusetts at the time when the case of Thomas Sims, a fugitive slave, attracted widespread attention. Devens delivered Sims to his master in accordance with the law, and afterward tried to purchase his freedom, but did not succeed until after the outbreak of the Civil War. He served in the Union army from 1861 to 1865, returning with the full rank of brigadier-general and the brevet rank of major-general. In 1873 he was made associate justice of the Massachusetts Supreme Court; in 1877 became Attorney-General of the United States, and in 1881 resumed his place on the Supreme bench of his native State. His orations and addresses with a memoir by John C. Ropes were published in Boston 1891.

DEVENTER, dā-vēn-ter, or DEMETER, Holland, ancient town in the province of Overyssel, eight miles north from Zutphen, on the navigable river Ye and 65 miles east of Amsterdam. It has a large town-hall, a courthouse and prison, places of worship for Calvinists, Lutherans, Mennonites, Roman Catholics and Jews. The Groote Kerk has a fine Gothic tower and a crypt dating from the end of the 11th century. The followers of Gerard Groot, or the Brethren of the Life in Common, have their college here. Besides the manufacture of carpets and Royal Smyrna rugs, there are factories for the molding of iron, cigar making, rope and glove making. Cotton products are also manufactured, and a certain honey cake known as 'Deventer Rock.' Considerable trade is carried on in linen, agricultural products and grain. Erasmus spent his boyhood here. Pop. 28,223.

DE VERE, de vér', Sir Aubrey Hunt, Irish poet: b. Curragh Chase, Ireland, 28 Aug. 1758; d. there, 5 July 1840. His works are 'Julian the Apostle: a Dramatic Poem' (1822); 'The Duke of Mercia: an Historical Drama,' the volume containing also 'The Lamentations of Ireland' (1823); 'The Song of Faith, Devout Exercises and Sonnets' (1842), and 'Mary Tudor: an Historical Drama,' published posthumously (1847). His sonnets Wordsworth declared to be 'the most perfect of our age.'

DE VERE, Aubrey Thomas, Irish poet and essayist: b. Curragh Chase, Ireland, 10 Jan. 1814; d. there, 21 Jan. 1902. He was a son of Sir Aubrey De Vere (q.v.) and became a Roman Catholic in 1851. In 1842 his first volume of verse appeared, 'The Waldenses,' and 'The Search after Proserpine' (1843). His subsequent books of verse include 'Poems, Miscellaneous and Sacred' (1853); 'May Carols' (1857); 'The Sisters' (1861); 'The Infant Bride' (1864); 'Irish Odes' (1869); 'The Legends of Saint Patrick' (1872); 'Alexander the Great' (1874); 'Legends of the Saxon Saints' (1879); 'The Foray of Queen Meave and other Legends of Ireland's Heroic Age' (1882); 'Legends of the Records of the Church and the Empire' (1887); and 'Saint Peter's Chains' (1888). Among his prose works are 'English Misrule and Irish Misdeeds' (1848); 'Picturesque Sketches of Greece and Turkey' (1850); 'Ireland's Church Property and the Right To It' (1858); 'The Church Establishment of Ireland' (1867); 'Constitutional and Unconstitutional Political Action' (1882); 'Essays, Chiefly on Poetry' (1887); 'Essays, Chiefly Literary and Ethical' (1889); 'Recollections of Aubrey de Vere' (1897).
5. a. Cranid. 7, 7a. Torpedo embryo and adult. 8, 8a. Embryo and adult Dog Fish.
DEVEREUX, Robert. See Essex, 3d Earl of.

DEVERON, a river of Scotland, in Aberdeenshire and Banffshire, which flows into the sea at Findhorn. It is about 90 miles long. The salmon-fishery is very valuable.

DEVĪ, dā'vē, in Hindu mythology, the goddess, or Mahadevi the great goddess, wife of the god Shiva and daughter of Himavat (that is, the Himalaya Mountains). She is represented as a being of two characters, one gentle, the other warlike, and it is under the latter aspect that she is generally worshipped. In the Mahabharata she appears under many forms, and her individuality is fully developed in the Puranas.

DEVIATION, in the law of marine insurance, an unnecessary departure from the course of the voyage insured. The legitimate reasons for departure from the course are stress of weather, want of repairs, joining convoy, succouring ships in distress, danger from an enemy, mutiny or assault. Even in these cases the quickest courses must be taken. Deviation, from the moment at which it commences, discharges the underwriter from all liability.

DEVIATION OF THE COMPASS, the deviation of a ship’s compass from the true magnetic meridian, caused by the proximity of iron. In wooden ships no magnetic deviation is perceptible so long as the ship is heading north or south. The greatest deviation is seen when the vessel heads east or west. In iron ships the magnetism is fixed by hammering and riveting, and the deviation manifests itself exactly in accordance with the point toward which the hull headed while these processes were going on. Armor-plated ships should be plated with their head in a different direction from that in which they lay when built. The mode now generally employed to correct deviation is by introducing on board ship masses of iron and magnets to exactly neutralize the action of the ship’s magnetism. Compasses are sometimes carried on masts as a means of warning the disturbing influence of the iron of the hull. In this position they serve as standards of comparison for the binocular compass. Wooden ships are also magnetized, so as to affect the compass, though in a far less degree, by the direction in which they lie when building.

DEVIATION OF THE PLUMB LINE. See DEVIATION OF THE PLUMB LINE.

DEVICE, an emblem, with an accompanying motto or legend used to convey a hidden meaning of some particular conceit of the wearer. Such emblems became general in the 14th century, and were borne only by the person who assumed them, and not like the crest, by the family or descendants. Louis XIII of France had a falcon as a device, with the legend Aquila generosior ales (a nobler bird than the eagle), by which he claimed superiority to the emperor. Consult Radotzitz. Die Devisen und Mottos des späten Mittelalters (Stuttgart 1850).

DE VIGNY, de-ve'nē’, Alfred, Comte, French novelist and poet; b. Loches, Indre-et-Loire, 1799; d. 1863. He received his education in Paris and served in the army 12 years. In 1822 appeared his Poèmes and in 1824-26 his Poèmes antiques et modernes. These were among the earliest attempts to deal in epic form with philosophic subjects. Eloa, appeared in 1826 and served for de Martine’s Chute d’un Ange. In 1826 De Vigny published his great historic novel Cinq-Mars, which though a falsification of history attained an immediate and splendid success. It was the forerunner of the historic tales of Hugo and Dumas. In 1829 he translated Shakespeare’s Othello and wrote the comedy Quite pour la Peur. These were followed by Stello; Servitude et Grandeur militaires (1835), military stories and his best work in fiction. His drama Chatterton (1835) is his best despite its pessimistic tone throughout. After his death appeared the Destinées (1864) and Le Journal d’un Poète (1867), remarkable for their lyric strength. De Vigny’s works were edited in 1863-66, in 1868-70 and in 1883-85. Consult the biography by A. France (Paris 1868); also Caro, Poètes et Romanciers (ib. 1888); Fagué, Emile, Dix-neuvième Siècle (ib. 1889); Sainte-Beuve, Les Portraits littéraires, I (ib. 1891); Séché, La Vie littéraire politique et religieuse; La Vie amoureuse d’Alfred de Vigny (ib. 1913).

DEVIL (O. E. defol; O. S. diubal; O. H. g. tiufal; M. G. Teufel; Gothic, diabolus, from Gk diabolos, a slanderer), an evil spirit, Satan, the tempter, slanderer and tormentor of human beings, according to the Scriptures of the Old and New Testaments. Most of the old religions of the East acknowledged a host of demons not good or bad, but merely exercising a salutary or injurious influence. In the latter case they were looked upon as punishing spirits, without inimical or wicked purpose. Siva, the judging and destroying god of the Indian mythology, is a symbol of the great power of nature, which is alternately beneficent and injurious, but in itself neither good nor evil. Zoroaster named this evil principle Ahriman. The Greek mythology did not distinguish with the same precision between the good and bad spirits. Beelzebub, or Beezzebub, appears to have been regarded by the Jews as the prince of devils. According to the Mohammedans, who have derived their account from Jewish traditions, the devil, or, as they sometimes call him, Ebis, was an archangel, whom God employed to destroy the jinn or genii, a race intermediate between man and the angels, who tenanted the earth before the creation of Adam.

The Satan ("adversary") of the New Testament is a rebel against God. Endowed with the intellect and power of angels, he uses them since his fall to entangle men in sin, and obtain power over them.

The doctrine of Scripture on this subject soon became blended with numerous fictions of human imagination, with the various superstitions of different countries and the mythology of the pagans. The gods of the ancients became evil spirits, seeking every opportunity to injure mankind. The excited imaginations of people frequently led them to suppose Satan visibly present; and innumerable stories were told of his appearance, and his attributes distinctly described. The writings of the fathers of the Church also contain several passages re-
DEVI.—DEVI IN ART AND SYMBOLISM.

The appearance of the devil. In many works of art, the appearance of such an extraordinary character, the devil was supposed to be concerned. Thus, many a dam, bridge, etc., has been built in one night with his assistance, and everyone knows that superstitious writers of former days, applying the legends that had become crystallized with them, represented the devil as the worker of magic, to Fust, to whom the invention of printing has frequently been ascribed, taught that he invented the art by the help of the devil. The modern tendency is to regard the personal devil as a part of the mythology of early times when men conceived the world forces as endowed with personal form. This is due to the advance of medical and natural science, better methods of historical criticism and modern philosophy. Consult Carus, 'History of the Devil' (Chicago 1900); Conway, 'Demonology and Devil Lore' (London 1878); Grimm, 'Deutsche Mythologie' (4th ed., Berlin 1878); Horst, 'Dämonologie' (Frankfort 1818); Lecanu, 'Histoire de Satan, sa chute, son exil et sa répétition de ses œuvres' (Paris 1861); Mayer, 'Historia Diaboli' (Tübingen 1780). See DEMONOLOGY.

DEVI, Tasmanian, or DEVIL-DEVIL.

See DASYURE.

DEVI, The, a tavern which once stood near Temple Bar, in Fleet street, London, where the Apollo Club met. Its site is now occupied by Child's Bank.

DEVI IN ART AND SYMBOLISM.

All representations of the Devil during the first four centuries of our era appear to have been that of a serpent tempting Eve. In a fresco in the cemetery of Sainte-Agnes Satan is figured in the form of a human bust terminating in a serpent's tail. On several early Christian sarcophagi is seen a serpent twined around the trunk of a tree, the head is erect and threatens some doves, whose nest reposes on the tree. M. Le Blant declares that it is an error to consider this, as is frequently done, as a representation of the Devil threatening Innocence; this scene, he says, has nothing of the symbolic, but is an ornamental motif borrowed from antiquity by Christian art. As a rule, in the temptation of Adam and Eve, the serpent, while bodily encircling a tree, is depicted with an apple in his jaws. In the Middle Ages artists frequently placed the head of a young man or women on the serpent form. Again, in the Bibliothèque Nationale, Paris, is an Italian miniature which displays a serpent with two human heads; one looking at Adam, the other at Eve. In a 14th century manuscript ('Speculum humæ salvationis') Didron found the "tree of the Knowledge of Good and Evil" surrounded by two serpents, each offering a fig. one to Adam, the other to Eve. The use of the serpent form to symbolize the Devil is confined to the "temptation" scene, the depiction otherwise being given the conventional demon of grotesque form. Hulme describes an illustration of the Devil in a 14th century missal; he has great tusks protruding from his mouth and curling up nearly to the eyes; his ears are long and pointed. Other heads appear at shoulders and thighs, and from the mouths of these issue the figure's arms and legs; the arms terminate in bear's claws, the legs in eagle's talons. This figure's body is open at the waist, exposing a nest of serpents darting forth; large scales cover the rest of the body. In old works of art we find the Devil given the same form as his imp, half man, half beast, and furnished with a tail and horns. Incidents in the lives of the saints are generally depicted with the devil in such form. Horses' hoofs or a cloven foot are commonly a part of the personality; and the wings of a bat are often added to increase the Satanic hideousness. When picturing the Devil as the devouring monster he generally takes on the form of a dragon. In pictures of Saint Michael in combat with the Devil Satan is depicted in a dragon's form; except rarely, when he is a two-legged creature having a monstrous head with a bird's beak, and is covered with scales. The German Renaissance artists were fond of giving the Devil a crow or raven form. In order to give Satan a special personality the painters of the Middle Ages frequently depicted him as black, but he is found also as red, blue as, green. Besides the above impersonations the evil spirit has been portrayed as a nostrademy, hog, boar and monkey, also basilisk. Another variation used in the Middle Ages was that of a monster with three heads each devouring one of the damned; a statue dating from the 12th century in Venice and d'Étampes has this form. Byzantine artists frequently pictured Satan as "cast out of Heaven" in which case he takes on a personality of black-winged demon. More adapted to modern conceptions are the depictions of the Devil in the form of a young girl or of a young woman. A few pictures by great masters which contain Satan are: One by Niccola of Pisa, in which the Devil has the form of a satyr; Orcagna's 'Hell' in Saint Maria Novelle, Florence, depicts the prince of demons as Pluto; Saint Michael's combat with Satan has been painted by Raphael (in Louvre); by Guido (in the Capucine Church, Rome); by Jacobello del Fiore (in Berlin Museum); by Lucas Giordano (in Belvedere, Vienna). Another favorite subject with artists is the 'Temptation of Christ.'

According to Husenbeth the following saints have been pictured in connection with the Devil: Saint Demetrius (martyr) has been represented with the Devil in prison as a scorpi; Saint Goar (confessor) has been depicted with the Devil on his shoulder; Saint Albert (Carmelite) has been pictured driving away the Devil in the form of a young woman, but with horns and fish's tail; Saint Anthony (abbot) has been portrayed having the Devil at his feet, or with the Devil in the form of a goat; Saint Apollinaris (bishop martyr) has been represented beating the Devil with a club, as also Saint Nicholas of Tolentinum; Saint Hilarion has been depicted mounted on an ass, driving the Devil away with the sign of the cross; Saint Hidulphus has been pictured casting the Devil out of a boy; Saint Zen of Verona has been portrayed casting the Devil out of a demon. Saint Hermes has been represented on horseback casting the Devil out of a woman led by a man with a rope, or with the Devil issuing out of the mouth of a child; Saint Melanius also has been depicted driving out the Devil. Saint Germanius has been pictured casting
out the Devil standing near him; Saint Anthony of Padua has been portrayed vanquishing the Devil; Saint Norbert has been represented with the Devil at his feet; Saint Cyrilicus has been pictured with the Devil or dragon under him, or chained near him; Saint Wulstan has been pictured fixing his pastoral staff in Saint Edward's tomb, the Devil behind him with a hook; Saint Dunstan has been portrayed flying with the Devil by the nose with red hot pincers; Saint Justina has been represented vanquishing the Devil by the cross; Saint Euphrasia (410 not of 1534) has been depicted trampling on the Devil, or the Devil throwing him into a well; Saint Dymphna has been pictured leading the Devil bound; Saint Gertrude of Nivelles has been portrayed with two mice at her feet and the Devil mocking at her side; Saint Juliana has been represented as scourging the Devil held by a rope round his neck, or holding the Devil in chains; Saint Theodora (empress) has been pictured with the Devil taking hold of her hand; Saint Genevieve has been pictured with the Devil on her shoulder blowing out her lighted candle with a bellows.

CLEMENT W. GOMME.

DEVIL IS AN ASS, The. A comedy by Ben Jonson (1616), which sets about proving the thesis laid down in the title.

DEVIL-IN-THE-BUSH. See NIGELLA.

DEVIL OF EDMONTON, The. See MERRY DEVIL OF EDMONTON.

DEVIL-FISH, huge rays of the family *Manta*, which have a lozenge-shaped disc broader than long, with the head free from the pectoral fins and provided with a pair of anterior processes and the tail long and whip-like. The two genera and six or seven species are confined to warm seas. So far as known the young are produced alive after the eggs have hatched within the oviduct. The best-known species is the *Manta birostris*, sometimes called the blanket-fish by tropical American pearl-fishers, from their belief that it attacks and devours men after enveloping them in its great wing-like pectoral fins, which reach a breadth of 20 feet. It is common in tropical American waters and occurs on both the Atlantic and Pacific coasts of the United States. The name also applies to the *Octopus* and allied eight-armed *Cephalopoda*.

DEVIL-WORSHIP, the worship paid to the devil as a malignant deity, or the personified
evil principle in nature, by many of the primitive tribes of Asia, Africa and America, under the assumption that the powers of evil are as mighty as the powers of good and have in consequence to be conciliated. There is a sect called Devil-worshippers, or Yezides, inhabiting Turkish and Russian Armenia and the valley of the Tigris and numbering more than 200,000. They venerate the authority of the Old Testament above that of either the New Testament or the Koran. They practise both infant baptism and circumcision and have a religious ministry of four orders. Their Christian ideas have reached them through Gnosticism. They pay respect to the devil, to Christ and to Allah or the supreme being, and also worship the sun.

DEVILLE. See SAINTE-ClaIRE DEVILLE.

DEVILLE, de,vèl, Jean Achille, French antiquarian: b. Paris 1789; d. 1875. He was made director of the museum of Rouen and wrote several works on local history and archeology, including *l'Histoire du Château-Gaillard* (1829); *Tomeaux de la Cathédrale de Rouen* (1838); *Essai sur l'Exil d'Ovide* (1859); and his monumental *l'Histoire de l'Art de la Verrière dans l'Antiquité* (1874).

DE VILLIERS, dè vîl'ye[z], John Abraham Jacob, Anglo-Dutch geographer: b. London, 23 Sept. 1663. He is the son of a Hollander who settled at Prince Albert, Cape Colony. He was educated at the City of London College. He assisted at the Foreign Office as expert in Dutch in preparing evidence for the boundary arbitration with Venezuela in 1896–99; acted similarly in Dutch and Portuguese in the boundary arbitration with Brazil in 1901–04. He was engaged in researches for the Foreign Office in Lisbon 1901, at Berlin 1902, and at other places. In 1911 he lectured in Dutch throughout Holland. He is superintendent of the map room in the British Museum, is acting commercial attaché at The Hague and honorary secretary of the Hakluyt Society. His publications include *Famous Maps in the British Museum*; *Holland and Some Jews*; *On Some Jewish Interests in the British Museum*; *The Transvaal*; translations of Lepelletier's *Madame Sans-Gêne*; Gautier's *Chemises rouges*; Bourget's *Mensonges*; Biré's *Journal d'un Bourgeois de Paris*; Richard Schomburgk's *Reisen in Britisch Guiana,* and other early works on Guiana. He is also author of various articles in the *Encyclopædia Britannica*.

DEVIL'S ADVOCATE. See ADVOCATE.

DEVIL'S APRON, brown alge, of the order *Laminariales*, usually called kelp. See ALGAE; PHAEOPHYCEAE.

DEVIL'S BIBLE, The, the popular name of a manuscript Bible written on ass-skin. The name arose from a legend that the writing was the work of a man who, by the Devil's help, accomplished it in a few hours in order to save his life, but who in return became the slave of the Evil One. After the Thirty Years' War it was taken to Stockholm.

DEVIL'S-BIT, the common name of a species of scabious (Scabiosa succisa), of the natural order *Dipsacaceae*. It has nearly globose heads of blue flowers, ovate leaves and a fleshy root, which is, as it were, cut or bitten off abruptly. In America devil's-bit is one of the
common names of Lacinaria spicata, which is known as dense button snakeroot, gay feather, broccoli-root, etc. It belongs to the Compositae, and is found in moist soil from Massachusetts to Florida and westward to Wisconsin and Louisiana.

DEVLIN'S BRIDGE, (1) an ancient bridge in Cardiganshire, Wales; it crosses the ravine through which flows the Mynach. (2) A bridge in France, said to be the first crossing the Rhone, on the road over Saint Gothard, from Germany to Italy.

DEVLIN'S CLAW, a stout split hook at the end of a hausher or chain, for manipulating the chain cable in mooring, etc. A firm grip is obtained by slipping one claw on each side of one link, so that the next link is held at right angles to it. A capstan serves to secure the hausher.

DEVLIN'S CLUB, See Aralia.

DEVLIN'S COACH-HORSE (Dreyus oleus), a common British and European beetle belonging to the family Staphylinidae. It has very much reduced wing-covers and like many of its relatives has the habit of curving its body upward, to adjust the wings under their covers.

DEVLIN'S DARNING-NEEDLE, See Dragon-fly.

DEVLIN'S DYKE, (1) an earthwork in Cambridgeshire, England, of prehistoric construction, about 20 feet in height. It is supposed to have been erected as a defense against enemies advancing from the Fen country. It extended from the fens or marshes to the westward hills and thus closed the only way of approach from the interior towns of England, and prevented raids upon whatever band of conquerors held the country near the sea. (2) A natural formation near Brighton, England. The old legend said this was the work of the "good spirits," whose purpose was to prevent the devil's attempt to flood the country because the people had abandoned paganism.

DEVLIN'S-FINGER, a name sometimes applied to the starfish (q.v.).

DEVLIN'S ISLAND (Île du Diable), a small rock formation off the coast of French Guiana, belonging to France. The area is about 14 acres, and the island itself is sandy, dry and torrid. Here Alfred Dreyfus was imprisoned for alleged treason.

DEVLIN'S LAKE, See Minnewaukon.

DEVLIN'S PARLIAMENT, a nickname for an English parliament which met in 1459 at Coventry. The Parliament, under the control of Henry VI, at his instigation unjustifiably proscribed and attainted for treason the Duke of York and his adherents.

DEVLIN'S PUNCH-BOWL, Ireland, a lake near the summit of Mangerton Mountain in the vicinity of the Lakes of Killarney. It is between 2,000 and 3,000 feet above the level of the sea, and is supposed to be the crater of an ancient volcano. It is about half a mile in length and one-third in breadth.

DEVLIN'S RIDING HORSE, See Pirate Bug.

DEVLIN'S SLIDE, Utah, a formation of the Wasatch Mountains, consisting of a natural arrangement of parallel crags resembling an inclined plane. The accidental juxtaposition of two such boulder masses is accounted for by the simultaneous action of a cooling atmosphere on liquefied masses. Nearby is the railway station and village of Devil's Slide. Pop. 200.

DEVLIN'S THOUGHTS, or DEVIL'S WALK, The, a doggerel of 14 stanzas written jointly by Coleridge and Southey in 1799 and republished in the former's "Sibyl Line Leaves" (1817). It may also be found in Southey's poems with additional verses referring to Porson.

DEVLIN'S TOWER, a huge shaft of columnar igneous rock on bank of Belle Fourche River, 23 miles northeast of Moorcroft, Wyo. Visible from Chicago, Burlington and Quincy Railroad. It was made a United States National monument 4 Oct. 1915. Greatly venerated by Sioux Indians as the "Bad god's tower." It is 600 feet high and rises from a platform 600 feet above the river; diameter at top 325 to 375 feet. The columns are an exceptionally fine example of prismatic structure which some igneous rocks assume in cooling, notably Palisades of Hudson and Giants Causeway. Described by John James Audubon and Darton, in reports of United States Geological Survey.

DEVLIN'S WALL, an ancient fortification in the southern part of Germany, about 368 miles long. This wall was originally a Roman ditch, with palisades behind it. It was intended to protect the Roman settlements on the left bank of the Danube, and on the right bank of the Rhine, against the inroads of the Teutonic and other tribes. Remains of it are found at present only from Ahensberg, in Bavaria, to Cologne. As to the time when this rampart was built our information is very scanty. Some parts of the northern Roman fortifications may be as old as the time of Drusus. The Decumatu or Tithe Lands, however; that is, the lands to the east of the Rhine and north of the Danube, which the Roman emperors allowed immigrants to settle on, on condition of paying tithes to the state, do not appear to have had any protecting wall about 14 A.D. The main rampart, stretching southward from the Main to the Danube, was probably completed under Hadrian, and parts of it which had been destroyed seem to have been restored by Probus. All the parts of this great rampart are still far from being thoroughly investigated.

DEVINE, Edward Thomas, American social worker: b. Union, Hardin County, Iowa, 6 May 1867. He was graduated at Cornell College, Iowa, in 1887. He was for seven years a principal of schools in Iowa; in 1891–96 he was staff lecturer on economics for the American Society for the Extension of University Teaching; and was secretary of the Society in 1894–96, when he was appointed general secretary of the Charity Organization Society of New York. He was editor (from 1897 to 1913) of Charities, a paper later published as Charities and the Commons, and after 1909, as the Survey. In 1905 he was called to the chair of social economy in Columbia University. He was director of the New York School of Philanthropy in 1904–07 and again after 1912. He was president of the National Conference of Charities and Corrections in 1906, and as special representative of the American Red Cross had charge of relief at San Francisco after the
fire and earthquake in April 1906. He was in charge of storm and flood relief in Dayton, Ohio, in 1913. He has been connected with various congresses and organizations interested in social betterment. His published works include 'Economics' (1898); 'The Practice of Charity' (1901; new ed., 1904); 'The Principles of Relief' (1904); 'Efficiency and Relief' (1906); 'Misery and Its Causes' (1909); 'Report on the Desirability of Establishing an Employment Bureau in the City of New York' (1909); 'Social Forces' (1902); 'The Spirit of Social Work' (1909); 'The Family and Social Work' (1912); 'The Normal Life' (1915).

DEVINS, John Bancroft, American clergyman and editor: b. Brooklyn, N. Y., 1856; d. 1911. He was graduated from New York University in 1882, and was on the staff of the New York Tribune from 1880 to 1888. In the latter year he was ordained to the Presbyterian ministry and thereafter until 1905 held various pastorate in New York city. From 1880 until 1911 he was managing editor of the New York Observer. He organized the Federation of East Side Workers and the New York Employment Bureau, and was a collaborator in 'Life of Dwight L. Moody' and published 'The Church and the City Problem' (1905); 'An Observer in the Philippines' (1905); 'On the Way to Hai Yuen' (1905); 'The Classic Mediterranean' (1910), and several hymns.

DEVISE, de-viz', a gift of real property by a person's last will and testament. The term devise technically and properly only applies to real estate; the object of the devise must therefore be that kind of property. The word, however, is sometimes improperly applied to a bequest or legacy. In regard to a lapsed devise, where the devisee dies during the life of the testator, although there may be a residuary devisee, the estate will go to the heir. But if the devise be void, as where the devisee is dead at the date of the will, or is made upon a condition precedent, which never happens, the devisees will go to the residuary devisee, if the language is sufficiently comprehensive (4 Kent Com., 541, 542, and cases cited in notes). But some of the cases hold in that case, even, the estate goes to the heir (4 Ire. Eq., N. C., 320; 6 Conn., 292). In England a residuary bequest operates upon all the personal estate which the testator is possessed of at the time of his death, and will include such as would have gone to pay specific legacies which lapse or are void. A general devise of lands will pass a reversion in fee, even though the testator had other lands which will satisfy the words of the devise, and although it be very improbable that he had such reversion in mind. A general devise will pass leases for years, if the devisee have no other real estate upon which the will may operate; but if he have both lands in fee and lands for years, a devise of all his lands and tenements will commonly pass only the lands in fee simple. But if a contrary intention appear from the will, it will prevail. A devise is a positive command as the execution of a power, unless that intention is clear, as where otherwise the will would have nothing on which it could operate. But to have that operation the devise need not necessarily refer to the power in express terms. But where there is an interest on which it can operate, it shall be referred to that, unless some other intention is obvious. The devise of all one's lands will not generally carry the interest of a mortgagee in premises, unless there is some apparent. Devises are contingent or vested after the death of the testator; contingent, when the vesting of any estate in the devisee is made to depend upon some future event, in which case if the event never occur, or until it is certain, it is inapparent. Devises are contingent or vested after the death of the testator; contingent, when the vesting of any estate in the devisee is made to depend upon some future event, in which case if the event never occur, or until it is certain, it is inapparent. Devises are contingent or vested after the death of the testator; contingent, when the vesting of any estate in the devisee is made to depend upon some future event, in which case if the event never occur, or until it is certain, it is inapparent.

DEVIZES, England, a municipal borough in the county of Wilts, 86 miles west of London. It is the seat of a large corn market, and has cheese and bacon factories. The chief manufactures are steam-engines, boilers, gas-engines and beer. Pop. 6,739.

DEVON, a river of Scotland, which has its source at the foot of the Ochil Hills, and flows into the Forth about two miles abovealloa. Its length is 34 miles. Below the Crook of Devon are a series of cascades, the most noted of which are the Calderon Linn and those at the Rumbling Bridge.

DEVONIAN. The name Devonian appeared in geological literature in 1839, when Murchison and Sedgwick applied it to a rock system in Devonshire and Cornwall, England, consisting of conglomerates, shales and fossiliferous limestones lying below the Carboniferous rocks and above the great mass of the grey wacke or transitional series of Wernher, that was already included in the Cambrian or Silurian. Murchison and Sedgwick also included in the Devonian the Old Red Sandstone of Scotland. The Devonian Period is that part of Paleozoic time following Silurian and preceding Carboniferous. At the beginning of the period, the seas were greatly restricted in North America, much as they were in the late Silurian (q.v.). Embayments existed on the present site of the Appalachians, and perhaps somewhat farther west. An arm of the Pacific also covered part of the Great Basin and other smaller embayments probably covered various areas. For the most part, however, the United States was land. By the middle of the period another great interior sea had encroached over a large part of central North America. Europe was also largely submerged in mid-Devonian. In Scotland and Wales were landlocked seas or lakes, and there were others in western Russia. A large part of central South America was covered by water. Fossil evidence indicates that in early Devonian there were land connections between North and South America and between South America and South Africa. Volcanic activity was extensive in western Europe, in New England and probably in California. Some folding took place in northeastern North America, probably near the middle of the period. The rocks of the Devonian System in North America have been variously subdivided. P. C. Cleland (1916) gives the following as the New York type section, beginning with the lowest formations: Holdenberg limestone, Oriskany sandstone, Onondaga limestone, Marcellus shale, Hamilton shale, Tully limestone, Genesee shale, Portage shale and sandstone, Catskill and
The Silurian and Devonian systems should be drawn in North America is still a matter of dispute, but the older formation is now generally assigned to the Silurian and to the Devonian. In eastern United States Devonian rocks on the Appalachian Mountains and plateau. In the central Mississippi Valley Devonian rocks are present, but very thin. In Manitoba and the Northwest Territory, Canada, the Devonian System includes limestones and shales and is of moderate thickness. There is an area of Devonian rocks extending along the Rocky Mountains from Montana across Alberta. In the United States the Devonian rocks of the Rocky Mountains appear in Colorado and Arizona.

In England and on the Continent the Devonian System presents two different classes of rocks: (1) the Old Red Sandstone, occurring in Scotland, in South Wales and across the Welsh border in England, also in the Baltic provinces of Russia and in Spitsbergen; (2) the marine Devonian, occurring in southwest England, in northern and southern France, in Spain and over large areas in Germany and central Russia. The Old Red Sandstone was laid down perhaps in shallow seas either closed or having only slight connection with the open ocean — perhaps in part on land in desert areas. The formation is of interest from its containing remains of Devonian land animals and plants. The rocks are fine-grained conglomerates, sandstones and shales. The marine Devonian of Europe is largely limestone, with some shales and slates.

Devonian rocks in Asia are found over a vast area in Siberia and also occur in China and in Asia Minor. In Africa they are found both in the northern and southern parts of the continent. In South America Devonian rocks form a great system, being found in Brazil, Bolivia and the Falkland Islands.

The vegetable and animal life of Devonian time, so far as can be determined, did not differ greatly from Silurian forms, though it shows a general advance toward more highly developed types. The land vegetation included cryptogams and gymnosperms. Of the cryptogams the tree-ferns and the giant club-mosses (Lepidodendra) must have been conspicuous in the forests, being over 50 feet high. Of the gymnosperms, cycads, now almost extinct, were abundant, and it is possible that conifers of the yew family grew upon the higher ground.

Of animal life the trilobites, so abundant in Cambrian and Silurian time, were less important, but other crustaceans developed greatly, including the eurypterids, related to the horse-shoe crabs. Corals were very abundant in the Devonian oceans. Crinoids, or sea-lilies, and starfish were more abundant than in Silurian time. The brachiopods, or lamp shells, apparently were, as in Silurian, the most abundant elements of marine life. Of mollusks there were bivalves and gastropods; the ammonites among the cephalopods and nautiluses are forms were less abundant than in the Silurian. The characteristic feature of Devonian time, however, was the development of the fishes, the Devonian being known as the "age of fishes." Many of the Devonian forms, however, have long been extinct, while the teleosts, or bony fishes, which include by far the greater part of modern fishes, evidently did not exist at all in Devonian time. Among the old Devonian forms were the ostracodermata, fish-like animals allied to the lampreys, but having the head and sometimes a large part of the body covered with bony plates. Of the true fishes the selachians, or sharks, were represented, as were the dipnoi or lung fishes, now almost extinct. The most highly developed Devonian fishes were the ganoids, now represented by the sturgeon and the gar-pike. (See Catskill Group; Chemung Stage; Corniferous Stage; Hamilton Stage; Mississippi Stage; Portage Stage; Old Red Sandstone; Oriskany Stage). Consult Clarke, "Early Devonian History of New York and Eastern North America," in New York State Museum, Memoir 9 (2 parts, Albany 1908-1909); Chamberlain and Salisbury, "Geology" (Vol. II, New York 1907); Dana, "Manual of Geology" (4th ed., ib. 1896); Geikie, Archibald, "Text-Book of Geology" (London 1903); Lecomte, "Elements of Geology"; Williams, "The Devonian and Carboniferous," in Bulletin of the Geological Survey of Washington (1891); "Devonian," in "Maryland Geological Survey Reports" (3 vols., Baltimore 1913); Zittel, K. A. von, "History of Geology and Palaeontology" (Munich 1899).

C. L. MAKE.

DEVONPORT (before 1824 called Plymouth Dock), England, a parliamentary borough, maritime town and naval arsenal, in the southwest of Devonshire. It forms one of the Three Towns of Plymouth, Stonehouse and Devonport, in the county. Devonport was ceded to the dockyard established here by William III in 1698, which is now one of the chief naval arsenals in Great Britain, largely extended so recently as 1907, and now covering an area of 240 acres. There is an important naval engineering college. Trade centres almost entirely in the dockyard and its subsidiary industries. The borough returns two members to Parliament. Pop. 81,678.

DEVONS, the name given to a breed of cattle which were first bred in Devonshire, England. They are rather wild, tall, and can be used instead of horses for plowing. They are smaller than Shorthorns or Herefords. The bull has a small head, fine muzzle and face, very handsome horns, which should taper upward and rather backward; the eye is large and rather wild, indicating an active disposition; the neck is arched, but the dewlap is not much developed; tail set on rather high; good barrel well up behind the shoulder; not the depth of carcass in the same height as is found in the Shorthorns; skin of a dark-red and rather mottled character, and plenty of long curling hair; the skin is thicker than that of Shorthorns, but not so thick as that of Herefords. They furnish a good deal of inside fat and firm meat, and the cows yield very good milk from which the famed Devonshire clotted cream is made. They are hardy, and able to find food on poor uplands. See CATTLE.

DEVONSHIRE, Spencer Compton Cavendish, 8th Duke of, English statesman: b. 23 July 1833; d. Cannes, France, 24 March 1908. He succeeded to the ducal title in 1891, having
1 A Brachiopod (Athyris concentrica); interior of dorsal valve, showing spiralia
2 An Ammonite (Goniatis cubicus); a lateral view
3 Hulls of fossil Entomostracans (Cyprididae) in a slab of schist
4 Shells of the same (Cypridina serratostriata)
5 An Armored Fish (Pterichthys cornuta)
6 A Trilobite (Phacops latifrons), shown in a and b rolled up
7 A Gasteropod Mollusc (Murchisonia bi-granulosa)
8 A Great Armored Fish (Cephalaspis lyelli); restored
9 The Berry-bone Fish (Coccosteus decipiens); restored
10 A Gasteropod Mollusc (Macrocheilus subcostatus)
previously become well known by his courtesy title of the Marquis of Hartington. First returned to the House of Commons in 1857, he was appointed Under-Secretary for War in 1863, and Secretary of State for War in 1866. In the course of the American Civil War, he visited the United States, and had interviews with both Jefferson Davis and Abraham Lincoln, the latter of whom predicted his rise to eminence. He was General under Gladstone 1868–70, and Chief Secretary for Ireland 1870–74. After Mr. Gladstone’s retirement from the Liberal leadership in 1875, he acted as chief of the opposition, again giving place to his old leader after the Liberal triumph of 1880. He was Secretary for India 1880–82, and became Secretary of State for War 1882–85. After 1886 he was an active and influential leader of the Liberal Unionists, and under a Unionist ministry was Lord President of the Council 1895–1903, retiring when the Tariff Reform issue was raised by Chamberlain, and devoting himself thenceforth to a defense of free trade policy. He was chancellor of Cambridge University, 1892–1908. Devonshire held a unique place in British public life. He was not brilliant or witty; he was perfectly inapparent; his “you-be-damnedness” was proverbial; but his high sense of duty, his pure, practical common sense, and the singular impartiality with which he approached public questions, drew to him that great body of moderate opinion which is so powerful in England. Thrice he refused the premiership; he had no ambitions for himself; and his opposition to both Home Rule and Tariff Reform did much to harden public opinion against these measures.

DEVONSHIRE, the third largest county in England, situated in the southwest. It is famous for its Old Red Sandstone (see Devonian). This county contains the barren tract of Dartmoor and also the valley of the Exe, called “The Garden of Devonshire.” Area, 1,671,364 acres. Three-fourths of the county is arable land or in pasture; the coast is rugged and precipitous; the climate mild and salubrious. It is celebrated for its orchards and dairy farms. The mineral wealth includes lead, copper, iron, coal, tin, granite, and limestone. Lace, coarse woolens and linens are among the manufactures. The fisheries are important and valuable. For parliamentary purposes, the county is divided into eight divisions, each returning one member. The principal towns are Exeter (the capital), Plymouth and Barnstaple. Pop. 699,703.

DEVONSHIRE CLUB, a Liberal club, founded on Saint James’s street, London, in 1875.

DEVONSHIRE HOUSE, the London residence of the dukes of Devonshire, situated in Piccadilly, near Berkeley Square. It contains the Kemble Collection of Plays, including the first editions of Shakespeare, and priceless collections of gems, portraits, etc.

DE VRIENDT, de vrient, Frans (also known as Floris, F.), Flemish painter of the Renaissance: b. Antwerp, about 1517; d. 1570. His father was a stonemason and Frans at first studied sculpture and later painting under Lambert Lombard at Liège. He paid a visit to Rome in order to study the works of Michelangelo and Raphael. In 1540 he returned to Antwerp, opened a school and is reputed to have there instructed 120 pupils. He was successful in obtaining the patronage of William of Orange and others of the nobility. He decorated the houses of many of the first citizens of Antwerp and in 1549 and 1556 had charge of the decorations for the reception of Philip II. The best of his works is “The Falconer,” in the museum of Brunswick. Other pictures characteristic of his mannered style are “The Last Judgment,” in the Brussels Museum; “Lot and his Daughters," in the Dresden Gallery; and “The Fall of the Rebellious Angels,” in the Antwerp Museum.

DEVRIENT, de-vrier-d’t, Gustav Emil, German actor: b. Dresden, 4 Sept. 1803; d. there, 7 Aug. 1872. He was a nephew of Ludwig Devrient (q.v.), and brother of Philipp Eduard Devrient (q.v.). He began his career by engaging in a manufacturing business, but soon followed the family penchant for the theatre, making a successful début as Bischof in Raaff’s “Jungfrau von Orleans” at Brunswick in 1821. In 1825 he married the popular actress, Dorothea Böhler, in Leipzig. He played prominent roles in Magdeburg and Hamburg, and in 1831 established that connection with the Court Theatre of Dresden which lasted for the rest of his life. In his rôle of Hamlet he had no peers, and was considered by his contemporaries as fine an artist as Kean. Posa, Tasso and Uriel Acosta were among the rôles in which he scored the greatest success.

DEVRIENT, Ludwig, German actor, first of the noted actor-family of this name: b. Berlin, 15 Dec. 1784; d. there, 30 Dec. 1832. He engaged in commerce at the advice of his father, but in 1804 joined a traveling dramatic company. His début was made in Schiller’s “Braut von Messina” at Gera. He was engaged at Dessau in 1805 and in 1809 went to Breslau. In 1812, for the first time he appeared in Berlin as Franz Moor in Schiller’s “Räuber.” His best rôles were as Talbot, Schewa, Lorenz Kindlein, Shylock, Lear, Richard III and Mercutio. He was remarkable for his ingenuity in interpreting both humorous and tragic parts with equal skill, having a natural aptitude and definiteness. His fondness for society led to dissipation and a consequent early death. Consult Funck, “Aus dem Leben Zweier Schauspieler, Ifflands und Devrients” (Leipzig 1838).

DEVRIENT, Otto, German actor and dramatist, son of Philipp Eduard Devrient (q.v.): b. Berlin, 3 Oct. 1838; d. 23 June 1894. In 1856 he made his début at Karlsruhe, was subsequently engaged in Stuttgart, Berlin and Leipzig; returned to Karlsruhe in 1863, where he remained for 10 years. In 1873 he became the manager of a theatre in Weimar, and subsequently held similar positions at Mannheim and Frankfort. He removed to Jena in 1879 and there produced his “Luther” in 1883. In 1884 he was made director of the Court Theatre in Oldenburg and in 1889 a similar post in Berlin, from which he retired the following year. He wrote several dramas, including “Zwei Könige” (1867); “Tiberius Graccus” (1871) and “Kaiser Rotbart” (1873). Other works of his are “Zwei Shakespeare-
DE VRIES, Hugo, Dutch botanist: b. Haarlem 1848. He received his education at Leiden, Heidelberg, and Würzburg. In 1871 he began his life-long connection with the University of Amsterdam, first as lecturer and then as professor of botany. His research had bearing on the development of the theory of mutation and the results of his study were the most significant addition to the principle of organic evolution since the enunciation of the theory of natural selection. De Vries has been eminently successful in changing the method of studying evolution from observation to experimental work and, in all probability, herein lies his great contribution to modern science. His publications include 'Intracellulare Pangenesis' (1889); 'Die Mutationstheorie' (1903); 'Plant Breeding' (Chicago 1907).

DE VRIES, Marion, American lawyer: b. near Woodbridge, San Joaquin County, Cal., 15 Aug. 1865. He was graduated from the San Joaquin Valley College in 1886 and from the law school of the University of Michigan in 1888. He practised law at Stockton, Cal., 1889-1900; was assistant district attorney of San Joaquin County in 1893-97, and was admitted to practice before the Supreme Court of the United States in 1897. From 1897-1900 he was a member of the United States House of Representatives. He became a member of the United States Board of General Appraisers, New York, 1900, and presided from College. He resigned then, to accept the appointment of associate judge of the United States Court of Customs Appeals.

DEW, Thomas Roderick, American publicist: b. King and Queen County, Va., 5 Dec. 1822; d. Paris, France, 6 Aug. 1846. He was graduated from the College of William and Mary, in 1837, and in 1827 was elected professor of political economy, history and metaphysics; and in 1836 was made president of that institution. In 1829 he published his 'Lectures on the Restrictive System.' It was brought out at a moment when feeling ran high on the subject of the tariff, between protectionists and free-traders; and though emanating from the closet of a thinker removed from the agitations of political warfare, took a strong hold on the public mind, and the subsequent adoption of the corn law of 1832 may be attributed in part to its silent influence. His 'Essay in Favor of Slavery' did much to decide Virginia's attitude. His most elaborate work was 'A Digest of the Laws, Customs, Manners and Institutions of the Ancient and Modern Nations' (1853).

DEW, a deposition of moisture after sundown upon the surface of the earth. Three concurrent sources of dew are recognized: (1) the condensation of the moisture of the atmosphere; (2) the condensation of watery vapor arising from the earth; and (3) the moisture exhaled by plants. Regarding the first of these sources, it is a well-known fact that warm air has a larger capacity for moisture than cooler air. Given a certain degree of humidity the falling temperature of the air after sundown will so reduce its absorbing capacity for the moisture that some of it will be condensed on objects colder than itself. Secondly, humid vapor rising warm from the warm soil comes in contact with the cooling strata of the atmosphere already depositing moisture and gives up its superabundance. In the third place, the grass, flowers and foliage which, under the action of plant life in sunlight have been evaporating into the atmosphere the water absorbed by the roots to liquefy the sap so that it may be raised to the growing parts of the plant, continue this process until a balance is obtained between the temperatures at the roots and at the tips of the leaves. In some kinds of trees this exhalation of moisture is very large and the dew thus formed may be heard dripping from the trees all night long. Most of the large, sparkling dewdrops seen on herbage in the early morning is this third form of dew. When the temperature of the lower air strata drops to 32° F., the dew is deposited as hoarfrost. When the sky is cloudy the heat abstracted from the earth's surface by radiation is returned by the clouds, which, being good radiators, transmit an equal amount of heat to what they receive; and a balance of temperature between the earth and the surrounding atmosphere, no dew is formed. The deposition of dew is likewise prevented by wind, which carries away the air before the vapor has been condensed. Horizontal surfaces, and those which are ex-
poused to a wide expanse of sky, receive a greater
supply of dew than Sheltered or oblique sur-
faces, where circumstances diminish the amount
of radiation.

An acquaintance with the cause which pro-
duces dew and hoarfrost enables us to under-
stand the rationale of the process resorted to
by gardeners to protect tender plants from cold,
which consists simply in spreading over them
a thin mat or some flimsy substance. To ensure
the full advantage of this kind of protection
from the chill of the air, the coverings should
touch the bodies they are intended to defend.

The heavy dews which form in tropical
regions are in the highest degree beneficial to
vegetation, which, but for this supply of mois-
ture, would, in countries where scarcely any
rain falls for months, be soon scorched and
withered. But after the high temperature of
the day the ground radiates under these clear
skies with great rapidity, the surface is quickly
cooled, and the watery vapor, which, from the
great daily evaporation, exists in large quanti-
ties in the atmosphere, is deposited abundantly.

This deposition is more plentiful also on plants,
from their greater radiating power; while on
hard, bare ground and stones, it is comparatively
trifling. Under cold climates, the clouds, which
are so common in damp and chilly regions, pre-
vent the radiation of heat; the surface is thus
preserved warm, and the deposition of dew is,
in a great measure, prevented. Consult Martin,

DEWALQUE, de-valk', Gilles Joseph
Gustave, Belgian geologist: b. Stavelot 1836;
d. 1905. In 1855 he was made curator of the
mineralogical and geological cabinet at the Uni-
versity of Liége, and became professor there
of mineralogy, geology and paleontology in
1857. In 1870 he became president of the
Belgian Academy. He wrote 'Description du
Lias dans le Luxembourg' (1857); 'Atlas de
Cristallographie' (1860); 'Prodrome d'une
Description géologique de la Belgique' (2nd ed.,
1880); and numerous contributions to scientific
periodicals.

DEWAR, Sir James, British chemist: b.
Kincardine-on-Forth, Scotland, 1842. He was
educated at the University of Edinburgh and became
assistant to Lord Playfair who at that time
was professor of chemistry there. He was
afterward Jacksonian professor of experimen-
tal philosophy at Cambridge and Fullerton
professor of chemistry in the Royal Institution.
He was made president of the Chemical So-
ciety in 1897 and of the British Association in
1902. He was knighted in 1904. He has done
devote research work in regard to the
physiological action of light and the liquefaction
of gases and in the study of low temperatures.
By evaporating liquid hydrogen under reduced
atmospheric pressure he obtained the lowest
temperature yet reached (470° F. of frost). Other
inventions consummated by Dewar are cordite
(with Sir Frederick Abel), a smokeless
powder; tin containers for keeping foods at any
desirable temperature, to which the name thermos bottles has been given.

DEWART, Edward Hartley, Canadian
clergyman and editor: b. County Cavan, Ire-
land, 1828; d. Toronto, Ontario, 1903. His
parents emigrated to Canada in 1834, settling
in Ontario. He received his education at
the Normal School, Toronto, and in 1855 be-
came a Wesleyan Methodist minister. He
afterward held a number of pastorates and be-
came editor of the Christian Guardian, the
principal Methodist publication in Canada, and
held this position until 1894. He was forceful
as an editor, was not narrowly orthodox, al-
though he took some flings at the higher critics.
He was a great factor in bringing together the
various Methodist denominations of Canada
(Wesleyan Methodist, Methodist Episcopal,
New Connexion, Bible Christian and Primitive
Methodist), the first meeting of the delegates
being held in his home. In 1883 the union of
the churches was brought about, but not on the
platform suggested by Dewart. Nevertheless, he
bent his best energies toward making it effective.
He was successful in bringing about the federa-
tion of Victoria University with the provincial
University of Toronto. He was liberal in politics
and by his independent action in these matters
often excited strong opposition from his reli-
grious followers. He was a delegate to the
Ecumenical Methodist conferences of 1881 in
London and of 1891 in Washington. He aided
in editing and compiling a new hymnbook for
the Methodist Church. He was co-editor of
translations from the Canadian Poets (1864); 'Songs
of Life' (1869); 'Jesus the Messiah' (1892);
'Essays for the Times' (1898); 'Outlines of
Christian Doctrine' (1899).

DEWAS, dä-wäs', India, two native states
in the Malwa Political Charge of central India,
founded in the first half of the 18th century
by two brothers, Punwar Mahattas, who came
into Malwa with the peshwa, Baji Rao, in 1728.
Their descendants are known as the senior
and junior branches of the family, and since 1841
each has ruled his own portion as a separate
state, though the lands belonging to each are
so intimately entangled that even in Dewas,
the capital town, the two sides of the main
street are under different administrations and
have different arrangements for water supply
and lighting. The senior branch of the family
has an area of 445 square miles and a population of 52,312,
while the area of the junior branch is 440
square miles, and its population 54,904. Grain,
opium, sugarcane and cotton are the chief pro-
ducts. Dewas, the capital, is the residence of
both chiefs, and near it, on a conical hill, is a
temple. Its population is about 15,100.

DEWBERRY, Rubus villousus, or Rubus
canadensis, a trailing plant of the natural order
Rosacea. Its prickly stems, leaves and fruit
resemble the blackberry. During the last quar-
ter of the 19th century it became popular as a
cultivated fruit, principally through the in-
troduction of its variety, the Lucretia, which is
superior to the wild forms common as weeds
on wornout pastures and poor land. The
plants, which are propagated by means of stem-
tips, do best on a rather lighter soil than the
blackberry, like which, with the exception of
training, it is cultivated and fertilized. They
are usually trained to stakes or trellises and not
given summer pruning, except in the removal
of canes as soon as they are fruited. The
usual distances for planting are three or four
feet by six. The fruits ripen considerably in
advance of the blackberries. See BLACKBERRY;
RASPBERRY; RUBUS.
DEWDNEY, Edgar, Canadian statesman: b. Devonshire, England, 1835. He studied civil engineering, and on removing to Canada was employed to lay out the town of New Westminster. He became a member of the legislature of British Columbia in 1869 and to the Dominion Parliament in 1872. In 1879 he was appointed Indian Commissioner and in 1881 Lieutenant-Governor of the Northwest Territory, holding the two offices until 1888, when he became Minister of the Interior. In 1892-97 he was Lieutenant-Governor of British Columbia.

D’EWES, dūz, Sir Simonds, British chronicler and antiquarian: b. Cuxden, Dorsetshire, 18 Dec. 1602; d. 1650. He was educated by private tutors, early embraced Puritan theology from John Dickinson and in 1618 entered Saint John’s College, Cambridge. In 1620 he was removed by his father to the Inner Temple and was called to the bar in 1623. He abandoned the law in 1626 and was knighted in the same year. Having married a rich heiress he never had leisure to devote himself to antiquarian studies which he pursued zealously even while serving as member for Sudbury in the Long Parliament. He was expelled in 1648. He collected a great number of manuscripts and transcribed documents of, monastic and other records; these transcripts now form part of the Harleian collection in the British Museum. D’Ewe’s greatest work is his ‘Journal of All the Parliaments of Queen Elizabeth’ (1629; edited and published for the first time by W. Paul Bower, London 1862). It was incorporated by Cobbett in his ‘Parliamentary History’. Consult Jessopp in the ‘Dictionary of National Biography’ (Vol. XIV, London 1888) and Halliwell-Phillips’s edition of the ‘Autobiography and Correspondence of Sir Simonds D’Ewes during the Reign of James I and Charles I’ (London 1845).

DE WET, dā-vēt’, Christiaan, Boer general: b. Leeukop, Orange Free State (now Orange Free State Province), 7 Oct. 1854. He was bred a farmer, made a small fortune and became a member of the Volksraad. Though practically without military experience, he served ably in the Boer-British War of 1899-1902, attaining the rank of general and outriveting the pursuit of Kitchener and Roberts in the summer of 1900, and of the former in the early part of 1901. His surprise of the British at Sanna’s Post was highly praised by military experts. With the other Boer generals he visited England after the conclusion of the war. His ‘Three years of War’ was published in 1902. In 1907 he became a member of the first Parliament of the Orange River Colony, and Minister of Agriculture. Taking advantage of the Great European War, he led an insurrection in October 1914, which, however, was promptly的效果 by the December uprising surrended to General Botha, was condemned to six years’ imprisonment and fined £2,000, but clemency was exercised and he was released.

DE WETTE, vērtē, Wilhelm Martin Leberecht, German theologian: b. Ulla, near Weimar, January 1780; d. Basel, Switzerland, 16 June 1849. In 1807 he became the professor of theology at Heidelberg; and in 1810 he was called to be the colleague of Schleiermacher at Berlin. In 1822 he accepted the chair of theology at Basel, where he remained till his death. The influence of De Wette’s views upon the theological tendencies of his time was most important. He was a member of the council of education at the Grand Council of Basel, and in 1849 became its president. He was remarkable for his critical acuteness and for his powers of concise and clear exposition. His works are very numerous. Among them are ‘Beiträge zur Einleitung in das Alte Testament’ (1806-07); ‘Lectures on the Historische-Kritik der Einleitung in die kanonischen Bücher der Alten Testaments’ (1817); ‘Einleitung in das Neue Testament’ (1826); ‘Lectures on the Hebraisch-Jewish Archæology’ (1814); ‘Kurze Gesetzliche exegetische Handbuch der neuen Testament’ (1834-38). These works are all more or less of a critical nature, in the following he developed his own theological views: ‘Lectures on the Christliche Dogmatik’ (1813-16); ‘Christliche Sittenlehre’ (1819); and the didactic novel, ‘Theodore des Zweiflers Weib’ (‘Theodore, or the Consecration of the Skeptic’, 1822). He translated the entire Bible into German in co-operation with J. C. W. Augusti. He edited the correspondence of Luther (Berlin 1823-28). Consult Cheyne, ‘Founders of Old Testament Criticism’ (London 1894).

DEWEY, Charles Melville, American painter: b. Lowville, N. Y., 16 July 1849. From his 12th to his 17th year he suffered from hip disease, an experience which tinged his later paintings with a rare melancholy. He studied in the National Academy of Design, New York, 1874-76, and in Paris under Carolus-Duran, 1876-77. In 1878 he returned to New York. He has specialized in landscapes, both in oil and water color. He is represented in many public and private collections in the United States. Among his works dealing mostly with morning and evening subjects, are ‘Indian Summer’ (1904); ‘A November Evening’ (1904); ‘Morning, Bay of Saint Ives’ (1903); ‘The Edge of the Forest’ (1908); ‘The Harvest Moon’, and ‘The Close of Day’, in the National Gallery, Washington; ‘The Gray Robe of Twilight’, in the Buffalo Gallery; and ‘Old Friends’ in the Pennsylvania Academy, Philadelphia. In 1907 he became a National Academician.

DEWEY, Davis Rich, American political economist and statistician: b. Burlington, Vt., 7 April 1858. He is a brother of John Dewey (q.v.). He was educated at the University of Vermont and at Johns Hopkins University. He is professor of economics and statistics in the Massachusetts Institute of Technology, trustee of Massachusetts Agricultural College and managing editor of the American Economic Review. His works are Syllabus of Political History since 1815; ‘Report of Massachusetts Board to Investigate the Subject of Unemployment’ (1893); ‘Report of Commission to Investigate the Public Charitable and Reformatory Interests and Institutions of the Commonwealth’ (1897); ‘Financial History of the United States’ (1912); ‘Employees and Wages’ (1918); ‘Special Report 12th Census’ (1919); ‘National Problems’ (1917); articles in ‘Cyclopedia of American Government’, edited by McLaughlin and Hart (1914).

DEWEY, George, American naval officer: b. Montpelier, Vt., 26 Dec. 1837; d. Washington,
D. C., 16 Jan. 1917. At 17, after a preparatory course in the Northfield Military School, young Dewey was appointed a cadet at Annapolis, in the class which was graduated in 1858. At the outbreak of the Civil War he was commissioned a lieutenant under Admiral Farragut and assigned to the 1st New England. His first active experience in war was when the West Gulf squadron, early in 1862, forced a passage up the Mississippi River ahead of Farragut. A later enterprise resulted in the great battle of Mobile Bay 16 years before. In writing about the battle Admiral Dewey told how a shot was fired across the bow of one of the German ships to impress Admiral von Dieselich with the fact that the American navy had established a blockade and would continue no undue activity on the part of the Germans.

"A difference of opinion about international laws had been adjusted," Dewey wrote, "without adding to the sum of President McKinley's worries." A sharp attack by Herr Erzberger in the Reichstag followed the publication and Count Reventlow, the German naval writer, published a scathing article in the Tagess Zeitung.

Andrew D. White, who had recently returned from being Ambassador to Germany, speaking of this incident said that von Dieselich conceived it his duty in a vague sort of way to butt in to protect German interests. In 1901 he was president of the Schley court of inquiry, and in the same year became president of the General Board of the Navy, which position he held until his death, and in 1902 was appointed commander-in-chief of the united squadrons and fleets mobilized for extraordinary maneuvers. Consult Clemen's Life of Dewey (1889); 'Autobiography' (1914).

**DEWEY, John**, American philosopher and educator: b. Burlington, Vt., 29 Oct. 1859. He was educated at the University of Vermont and Johns Hopkins University, and has held the chair of philosophy in the universities of Michigan, Chicago and Columbia, having been connected with the last-named institution since 1905. He has been president of the American Psychologic and American Philosophic Associations, and took an active part in the formation of the American Association of University Professors of which he was the first president. Among his chief philosophical writings are Leibnitz's 'New Essays Concerning Human Understanding' (1888); 'The Influence of Darwin on Philosophy' (1910); 'German Philosophy and German Politics' (1915); 'Studies in Logical Theory,' and, in addition to minor works on ethics which are out of print, a widely used textbook in 'Ethics' (1908), written in conjunction with Professor Tufts of the University of Chicago. Since the death of William James, he is regarded as one of the leaders of the pragmatic movement in philosophy. His writings in education include books on 'The Philosophy of Education'; 'How We Think'; 'Schools of To-morrow'; 'Interest and Effort' (1913); 'Moral Principles in Education'; 'Children of School and Society,' the last-named work having been translated into most European languages as well as Japanese.

DEWEY — DE WINTER

He was graduated from Michigan Agricultural College in 1888, and taught botany there 1888–90. He was assistant botanist of the United States Department of Agriculture 1890–1902, and after 1902 botanist in charge of fibre investigation. He has conducted investigations on grasses and troublesome weeds, was United States representative to the International Fibre Congress at Soerabia, Java, in 1911. He is the author of several bulletin of the Department of Agriculture on the production of fibre from flax, hemp, sisal and manila plants, on the classification and origin of the varieties of cotton, etc.

DEWEY, Melvil, American educator and librarian: b. Adams Centre, N. Y., 10 Dec. 1851. He was graduated from Amherst College in 1874; was college librarian during his senior year and for two years after graduation. He then went to Boston where he was active in founding the American Library Association, the Library Bureau, the Metric Bureau for introducing the metric system, and the Spelling Book Association. He was the founder and for five years the editor of the Library Journal and also editor of Library Notes and the Spelling Reform Bulletin. In 1883 he was appointed librarian at Columbia, and in 1887 established the School of Library Economy, of which he was made director. In 1889 he became secretary of the University of the State of New York, and director of the State Library, the library school being at that time transferred to Albany; in 1891 he became director of the home education department, and organized the system of traveling libraries. In 1895 he promoted and organized the Lake Placid Club, a co-operative country residence club with an estate of 6,000 acres, 4 clubhouses, 60 cottages, dairy and poultry farms and forests in Essex County, N. Y., worth over $1,100,000. He is at present devoting his time to general library and allied educational interests, and the business centering round the Lake Placid Club, of which he is president and treasurer. In New York State he has accomplished much in the raising of school standards, and particularly in the improvement and founding of small public libraries. He has also had much influence on library work in the United States; has twice been president of the American Library Association, and its secretary for 15 years; he devised the decimal system for the classification of books which is widely used, and published a set of cataloguing rules, included in his 'Library Catalogue.' He has also published a revision of the laws of New York State in regard to education (1892), and the 'Decimal Classification and Relative Index' (9 editions 1876–1915).

DEWEY, Richard (Smith), American alienist: b. Forestville, N. Y., 6 Dec. 1845. He was graduated from the University of Michigan 1869. During the Franco-Prussian War he was volunteer assistant surgeon at the field hospital at Pont à Mousson, France, and at the Reserve Hospital at Hesse-Cassel, Germany. He studied for a short time under Virchow at Berlin and from 1877 to 1879 was assistant physician at the State Hospital for the Insane at Elgin, Ill. From 1879 to 1893 he was medical superintendent of the State Hospital for the Insane at Kankakee, Ill., and from 1893 to 1909 was professor of mental and nervous diseases at the Chicago Postgraduate Medical School. He is a writer on mental diseases and in 1899 was president of the Chicago Neurological Society.

DEWEYLITE, a hydrated silicate of magnesia, ranging in color through all shades of white, yellow, red and brown. It was named after Chester Dewey, an American naturalist.

DEWI, Saint. See David, Saint.

De WINDT, de wint, Harry, English traveler: b. Paris, France, April 1856. He was educated at Cambridge, and, after serving as aide-de-camp to his brother-in-law, Rajah Brooke at Sarawak, 1876–78, went from Pekin to Paris by land 1887; visited mines and prisons in Siberia 1890–94; explored the Klondike 1897, and went from Paris to New York by land for the London Daily Express 1901–02. He has written 'On the Equator' (1882); 'From Pekin to Calais by Land' (1887); 'A Ride to India' (1890); 'Siberia as It Is' (1892); 'The New Siberia' (1895); 'Through the Gold Fields of Alaska to Bering Strait' (1893); 'True Tales of Travel and Adventure' (1889); 'The World as It Is' (1901); 'From Paris to New York by Land' (1903); 'Through Savage Europe' (1903); 'My Restless Life' (1908).

DEWING, Thomas Wilmer, American figure and portrait painter: b. Boston, 4 May 1851. He was a pupil of Boulanger and LeFèvre and is an academician of the National Academy of Design, and a member of the Society of American Artists. Among his pictures are 'Prelude'; 'The Days,' which took the Clarke prize in 1887, and 'The Garden.' He is represented in the Metropolitan Museum of New York; the Corcoran Gallery, Washington; the National Gallery, Washington; the Saint Louis Art Museum; the Buffalo Academy of Art; the Toledo Museum; and the Rhode Island Gallery of Art, Providence.

DE WINT, Peter, English landscape painter in water-colors: b. Stone, in Staffordshire, 21 Jan. 1784; d. London, 30 June 1849. He studied in the schools of the Royal Academy, where he occasionally exhibited; but pictures were shown in the exhibitions of the Water-color Society. English scenery was his favorite subject. He occasionally painted in oil with marked success. Some of his best pictures are 'A Corn-field'; 'Woody Landscape with Water'; 'Lincoln Cathedral'; and 'Harvest-time.'

DE WINTER, de vin'ter, Jan Willem, Dutch admiral: b. Kampen 1750; d. 1812. He entered the navy at the age of 12 and fought in the French ranks under Dumouriez and Pichegru, reaching the grade of brigadier-general. He returned to Holland in 1795 and was made commander of the 15 ships of the line and 12 frigates. On 11 Oct. 1797 he was attacked by Admiral Duncan's British fleet and defeated at Camperdown, losing his own and seven other ships to the enemy. He was taken to England a prisoner of war, was treated with humanity and on his return to Holland was even commended for his gallantry and skill in the disastrous fight. He was made Minister Plenipotentiary to France in 1798 and in 1802 was again at the head of the Dutch
DE WITT—DEWITT

fleet. He attempted to suppress piracy in the
Mediterranean. He was buried in the Pantheon,
his heart in the Nicholas Church of Kampen.

DE WITT, de vft, Cornelius, Dutch naval
officer: b. Dort 1623; d. 1672. He was edu-
cated at Leyden. In 1652, with de Ruyter, he
sailed in the fleet which Blake defeated off Kentish Knock. He
was with de Ruyter at the burning of British ships
in the Medway in 1667 and took a prom-
inent part in the battle of Solebay (Southwold).
Tichelaar accused him of participation in the
plot to murder the Prince of Orange and he was
tortured and sentenced to banishment. When
he was leaving the prison the burgheis of The
Hague attacked and murdered him and his
brother, Jan De Witt.

DE WITT, Jan, Dutch statesman: b. Dort,
24 Sept. 1625; d. The Hague, 20 Aug. 1672. His
father was Jacob de Witt, a prominent figure
in the stormy dissensions of Holland’s political
life, and an ardent supporter of the Republic
against the hereditary statholders of the
house of Orange. The boy received a thor-
coming education, and as his natural plea-
sity absorbed his father’s political views at
an early age. In 1652, he was sent in the
capacity of deputy to the state of Zeeland,
in order to secure the allegiance of that province,
which seemed to have monarchical leanings.
So convincing were his efforts, that on his re-
turn he was made grand pensionary of Dort
(1653), holding that office by repeated election
until 1672. De Witt soon demonstrated that
the confidence which the Republic had given
him was well placed; but set about ex-
serting his position in the administration of
foreign af-
fairs, and succeeded in establishing amicable
relations with England. In his negotiations
with Cromwell, he took special pains to exclude
the possibility of playing into the hands of the
rival party of the young Prince of Orange.
A secret clause inserted in the treaty rendered the
office of statholder impotent. In his relations
with Sweden and Portugal, De Witt was equally
fortunate. he did not neglect the internal ad-
ministration. He managed his finances on a stable
basis, and developed the East Indian commerce.
But trouble lay ahead. Charles II was restored to the English
throne, and the secret clause inserted in the
by De Witt and Cromwell was wiped
out. Hostilities were resumed on the sea. De
Witt bent all his splendid energies to the task
of defending the honor of his state, and finally,
with the aid of the naval prowess of Admiral
de Ruyter, brought the war to an end with the
Treaty of Breda (1667). He further secured his
position by the brilliant triple alliance of the
Dutch Republic with England and Sweden.
However, this produced only a lull in the
gathering storm. It had been easy enough to sup-
press the adherents of William III during his
minority, but as time elapsed, an increas-
ing number of power. They awaited
an opportunity to restore the statholder,
and the psychological moment finally came.
Louis XIV in 1672 suddenly appeared at the
head of an army to claim the Spanish Nether-
lands in the name of his wife, Maria Theresa.
The Republic turned to William to resist the
invasion; and foreseeing open hostility, De Witt
resigned from the office of grand pensioner in
August. Events followed rapidly. Cornelius,
the brother of De Witt, was arrested on charge
of conspiracy against William and sentenced to
banishment. Jan came to visit him on the day of
his release; and, while returning from the
parishion, both were attacked and killed by the
furious burgheis. When years had mollified
the passions of the moment, Holland saw De
Witt in his true light; and in recognition of
his splendid services and sterling qualities erected
a monument, the work of Jelteema, at The Hague,
June 1918. Among his own writings are his ‘Memo-
irs’ (1709) and his ‘Letters’ (6 vols., 1723–
25), Consult Beck,'History of the Nether-
lands' (New York 1898-1907); Geddes, J.,
'The Administration of John De Witt' (Lon-
don 1879); Knottenbelt, 'Life of Jan De Witt'
(1862); Motley, 'History of the United Neth-
erlands' (4 vols., New York 1860-62); Ponta-
lis, 'Jan de Witt' (Eng. trans., 2 vols., London
1885); Simons, 'Life of Jan De Witt' (1832–36).

DEWITT, Benjamin, American physician
and educator: b. Ulster County, N. Y., 26 Dec.
1775; d. New York, 1823. He was the son of
Charles De Witt, M.D. He was graduated at the
University of Pennsylvania in 1797, practised
and lectured at Albany and New York, occup-
ying the chair of the practice and institutes of
medicinie in Columbia College, and became
vice-president of the College of Physicians and
Surgeons. For the latter he secured from the State
legislature a grant of $30,000. Dr. Thomas W.
Blaichford, as orator at the 54th commencement
of the medical department of Columbia College,
recalled him in these words: He was a true
looking gentleman, of a tall, portly, command-
ing figure, open countenance, affable manners,
pleasing address and delivery, a popular lec-
turer and a great favorite with the students.
His active and useful career was ended most un-
timely by bilious fever. That his memory was
long cherished was shown in 1835, when the
town of De Witt was set off near his estate
and named in his honor.

DEWITT, Moses, American surveyor and
pioneer: b. Ulster County, N. Y., 15 Oct. 1766;
d. Onondaga County, N. Y., 15 Aug. 1794. He
assisted in running the Pennsylvanian boundary
line in laying out the city of New York; was
appointed county judge and surrogate for Herkimer County on its erection
in 1791 and for Onondaga County on its sepa-
rization in 1794. He engaged in the salt indus-
try at Syracuse and with his brothers Eugene
and Jacob Rutzen settled near Jamestown. His
active and useful career was ended most un-
timely by bilious fever. That his memory was
long cherished was shown in 1835, when the
town of De Witt was set off near his estate
and named in his honor.

DEWITT, Richard Varick, American capital-
ist: b. Albany, N. Y., 6 Feb. 1800; d. there,
7 Feb. 1868. Graduating from Union College in
1817, he was admitted to the bar and developed
an artistic and literary taste and a scientific in-
terest that made him a serviceable member of
the Albany Institute during its period of scien-
tific activity and repute. He was active also in
several large business concerns and shared in
the promotion of the Cayuga Lake Steamboat
Company and the Ithaca and Owego Railroad
Company, which later was organized by the
panic of 1837. Served as brigadier-general of the
Albany County militia, 1823-28, and succeeded
his father in the Society of the Cincinnati, of
DE WOLFE—Dexter

which he was vice-president for New York, 1848-68.

DEWITT, SIMEON, American patriot and statesman: b. Wawarsing, Ulster County, N.Y., 26 Dec. 1756; d. Ithaca, N. Y., 3 Dec. 1834. His father was a physician and descendant from a pioneer settler of Esopus, Tjerrick Claessen DeWitt, who probably came from East Friesland. Studied under Domine Dirck Romeyn and was at Queens (now Rutgers) College, New Brunswick, N. J., when Washington retired before Lee at Saratoga in the autumn of 1776. Returning home, he continued the study and practice of the surveyor's art under the experienced direction of his relatives, the Clintons, and early in 1777 enlisted as adjutant in the State militia and was drafted in the campaign against Burgoyne. Early in 1778 became assistant to Col. Robert Erskine, topographical engineer to Washington, and succeeded him in 1780. His duties were to chart the territory covered by his chief's forces and to lay out lines of defense, in which capacities he shared the Yorktown campaign. At the close of the war the topographical materials of his office, 200 manuscripts, were deposited with the New York Historical Society. In May, 1794, DeWitt was called to the Bar to succeed Gen. Philip Schuyler as surveyor-general of the State and, though tendered a similar position in the Federal service by Washington in 1796, he continued in the service of his native State for 50 years, supervising in field and office such major enterprises as the establishment of the State boundary lines, the laying out of the extensive public lands and of the city of New York above the older portion, and the laying out and construction of the Erie, Champlain and smaller canals of the State,—in all of which he was the trusted adviser of both Gov. George Clinton and Gov. DeWitt Clinton. In laying out the State lands DeWitt used with good results the system of square townships based on lines of survey which had come into use scattered instances by the time of the Revolutions and was later applied extensively by the Federal government in the western domain. Credit long enjoyed by DeWitt for the classical townships names of central New York probably belongs to Robert Harper (q.v.). In 1802 he brought out the first State map based on surveys. In 1804-09 he served as one of the commission to build the first capital at Albany. His scientific interest and ability were recognized in 1790 by election to the American Philosophical Society. In 1798 he was made a member of the Board of Regents of the State University and served as vice-chancellor and chancellor. He was active in the organization of several societies for the encouragement of agriculture and the useful arts. These societies were in 1824 merged into the Albany Institute, which for many years had a wide repute for its scientific researches and learned publications. DeWitt acquired a large tract of land at the head of Cayuga Lake and by his liberality fostered a settlement which has grown to the city of Ithaca. Publications: 'The Elements of Perspective'; 'Considerations on the Establishments of Agricultural College' (a remarkable plea to the New York legislature in 1818), and a number of scientific essays.

DE WOLFE, Elsie, American actress: b. New York 1865. She made her debut in Sar-dou's 'Thermidor' in 1890, playing the rôle of Fabienne with Forbes-Robertson. She joined the Empire Stock Company in 1894 under Charles Frohman and later became the star and manager of her own company, giving out 'The Way of the World' in 1901 at the Victoria Theatre. She toured the United States with this play and later appeared in the title rôle of Hubert Davies's 'Cynthia' (1903), as Estelle Kitteridge in 'The Other Girl' (1903) and as Mrs. Lovette in 'A Wife Without a Smile' (1904). She retired from the stage in 1905 and has since engaged in house decorating. She has decorated the Colony Club, New York, the homes of J. Ogden Armour, Chicago and William Cogswell, Burlington, and others. She published 'The House in Good Taste' (1913).

DEWSBURY, England, a municipal and parliamentary borough in the West Riding of Yorkshire, nine miles south of Leeds. Coal is mined, but the trade of the town is chiefly in heavy woolen cloths, including blankets, carpets, flanneles and worsteds. It has manufactories for fancy cloths and shoddy goods and contains iron and boiler, glass and dye works. Pop. of municipal borough 53,351; of parliamentary borough (one member) 76,923.

DE WULF, Maurice Marie Charles Joseph, Belgian educator and philosopher: b. Poperinghe, 6 April 1867. He was educated at Louvain University and after 1893 served as professor, of the history of medieval philosophy there. In 1911 he was one of the honorary presidents of the International Congress of Philosophy. He is a member of the Royal Academy of Belgium and of the administrative council of the Royal Library of Belgium. His numerous publications include 'Histoire de la Philosophie dans les Pays-Bas et al Principauté de Liége' (1895); 'Études historiques sur l’Esthétique de S. Thomas' (1896); 'Histoire de la Philosophie médiévale' (4th ed., 1913; Eng. trans., by Colley, 'History of Medieval Philosophy' (1909); 'Introduction à la philosophie neo-scolastique' (1904; Eng. trans. by Colley, 'Scholasticism Old and New,' 1907) and contributions to periodicals and encyclopedias.

DEWORM, British name for the earthworm (q.v.).

DEXIPPOS, Greek philosopher: flourished in the middle of the 4th century B.C. He was a follower of the Neoplatonist Iamblichus, wrote commentaries on Plato and Aristotle. One of these in defense of the Aristotelian categories appeared in both Greek and Latin texts. The Latin text, with the title 'Questions in Categoriae Libri Tres,' was edited by Félicien (Paris 1549) and the Greek text by Spengel (Munich 1859).

Dexter, Edwin Grant, American educator: b. Calais, Me., 1868. He was graduated at Brown University in 1891, taught there for one year, and in 1892-99 was science master of Colorado Springs High School, director of the Summer School of Science, Colorado Springs, also professor of psychology in the State Normal School at Greeley, Colo. In 1899 he took the degree of D.Ph. at Columbia University and the higher diploma at Teachers College. From 1899 to 1907 he was connected with the University of Illinois successively as professor of pedagogy and psychology, director
of the summer term, director of the School of Education, and dean. In 1907 he became Commissioner of Education in Porto Rico and chancellor of the University of Porto Rico. He served as associate editor of the International Archiv für Schulhygiene and of the Jahresbericht für Körperfunktion. He published 'History of Education in the United States' (1904); 'Weather Influences' (1904) and about 50 articles in educational and scientific journals.

DEXTER, Henry Martyn, American Congregational clergyman: b. Plympton, Mass., 13 Nov., 1847; d. New Bedford, Mass., 13 Nov., 1890. He was graduated at Yale 1840, and at Andover Theological Seminary 1844. He filled a pulpit in Manchester, N. H., 1844-49, and was pastor of Berkeley Street Church, Boston 1849-67. He was one of the editors of the Congregational Quarterly from 1859 to 1865, becoming editor-in-chief of the Congregationalist 1867. He was a staunch defender of the Congregational polity and delighted in controversy. His principal works are 'The Voice of the Bible and the Voice of Reason' (1858); 'Congregationalism: What it Is, Whence it Is, How it Works, Why it is Better than any Other Form of Church Government, and Its Consequent Demands' (1865); 'Roger Williams and His Establishment of the Massachusetts Colony' (1876); 'The Congregationalism of the Last Three Hundred Years' (1881); 'Common Sense as to Woman Suffrage' (1885); 'Early English Exiles in Amsterdam' (1890).

DEXTER, Henry Morton, American clergyman, editor and historian: b. Manchester, N. H., 1847; d. 1910. He was the son of Henry Martyn Dexter (q.v.); was graduated at Yale University in 1867 and at Andover Theological Seminary in 1870. He spent the next three years in travel, was ordained to the Congregational ministry, and in 1873-76 was pastor of the Union Church at Taunton, Mass. From 1878 to 1891 he edited the Congregationalist. He made several visits to England and Holland, and in those countries took occasion to investigate the history of the Pilgrims and early American colonists. He promoted the erection of a memorial tablet to John Robinson at Leyden, Holland, in 1891. He published 'The Story of the Pilgrims' (1899), and 'England and Holland of the Pilgrims' (1905) and numerous magazine articles on historical subjects.

DEXTER, Samuel, American statesman and jurist: b. Boston, 14 May 1761; d. Athens, N. Y., 4 May 1816. He was graduated at Harvard University 1781; was admitted to the bar in 1784. He was repeatedly chosen to the legislature of Massachusetts, and in 1798 was elected senator of the United States. While senator he was appointed Secretary of War in 1800, and in the same year Secretary of the Treasury. He was afterward, at different times, offered foreign missions, but always refused them. In 1802 he withdrew from political life, and resorted to writing. He was an unsuccessful candidate for governor in 1814. He was the first president of the first society formed in Massachusetts for the promotion of temperance. Among his publications are 'Letter on Freemasonry' and 'Speeches and Political Papers.'

DEXTER, Timothy, American merchant: b. Malden, Mass., 22 Jan. 1743; d. Newburyport, 22 Oct. 1806. At an early age he became an apprentice at leather dressing, and progressed so rapidly as to soon own his own establishment. He succeeded in amassing a large fortune for those days. He developed certain eccentricities and his peculiar efforts to attain social prominence gave him great notoriety. For example he assumed the title of 'Lord.' Timothy Dexter, and he constructed odd and bizarre residences in Newburyport, Mass., and Chester, N. H. The grounds of the first house were adorned with 30 or 40 colossal wooden statues of famous men. He included himself in the number adding the inscription, 'the greatest man of the East.' He gathered together an extensive library of books notable chiefly for their rich and expensive bindings, and also made an extraordinary collection of absolutely worthless paintings, in order to prove his knowledge of art, and supported a poet who was supposed to be ready to sing his praises upon occasions. He wrote a book called 'A Pibole for the Knowing Ones' and also a pamphlet with all the punctuation marks printed upon the last page, there being none in the text proper. While an able and shrewd man of business he was extremely dissipated and was regarded as a victim of a deranged mind.

DEXTER, Me., town in Penobscot County, 40 miles west-northwest of Bangor, on the Sebasticook River, and on the Maine Central Railroad. It contains a public library, churches, woolen mills, foundries and machine shops and vegetable canneries. The waterworks are the property of the municipality. Pop. 3,530.

DEXTRIN (C6H4O3), the commercial name for a group of substances obtained from starch, and very similar to it in composition; also called starch gum, British gum, etc. It resembles gum in being soluble in water, but is distinguished from that substance by composition; by being, like starch, converted into oxalic acid by nitric acid, and not into mucic acid; and especially by causing a ray of light to deviate to the right, a property from which it derives its name. The simplest member of the group of dextrins is malto dextrin, and this is the only one which has been obtained in a state approximating purity. For analytical purposes, dextrin is prepared from starch by heating dry starch to a temperature of from 400° to 480° F, in an iron cylinder revolving over a free flame or in an oil bath—usually rape seed oil. When the starch is first moistened with nitric or hydrochloric acid, the product is whiter but less adhesive as it then contains some sugar. After roasting to the right degree, as indicated by an iodine test, it is quickly cooled to check further conversion. The product is an indefinite mixture of several dextrins with unaltered starch. The transformation may be effected also by the action of dilute sulphuric acid at a temperature a little below that of boiling water. The result in this action is a mixture which contains some dextrin but is mostly dextrose (q.v.). By acting upon starch with diastase (q.v.) dextrin is produced. To water at about 70° or 80° F, in a boiler, 8 or 10 parts of dried malt are added, and then 100 parts of starch after the heat is raised to 140° F. The mixture is kept stirred and the temperature maintained somewhat above
this for 20 minutes, and then, when the thick mass has become quite fluid, it is raised to the boiling-point rapidly, cooled, the clear liquor filtered, and evaporated to a syrup. When cold it is an opaque gelatinous mass, which, on drying, becomes hard like gum. It is then crushed, ground and sifted through silk. Dextrose is used in large quantities for thickening calico-printers' colors, as an adhesive for post-office stamps, labels and adhesive papers, as a sizing for textiles and for many other purposes. The corn syrup or glucose of the confectioner and the manufacturer of table syrups dextrin to the amount of 42 per cent. See Gruick.

DEXTROSE, grape-sugar, starch-sugar or dextroglucose, belongs to the class of Monosaccharides, in the section hexoses. Its formula may be expressed either as $\text{C}_6\text{H}_{12}\text{O}_6$ or $\text{C}_6\text{H}_6\text{O}_6^{-}$. Dextrose occurs along with levulose in very many plants, and notably in grapes and apricots. It is also found in many other fruits, and enters into the composition of many animal tissues and particularly in the blood, and also in the urine of diabetic patients. It can be produced by the action of a dilute sulphuric acid on cane-sugar, starch or flaxseed meal. It can also be prepared by boiling for several hours 50 parts of starch with dilute sulphuric acid (100 parts of water to 5 parts of $\text{H}_2\text{SO}_4$). The solution is then neutralized with chalk, filtered, boiled with animal charcoal to remove traces of color, and then evaporated carefully to dryness, forming an amorphous mass which contains about 60 per cent of dextrose, the remainder being chiefly dextrin. This mass is washed with cold, ethyl alcohol of specific gravity 0.830, and the residue dissolved in more alcohol. Upon cooling the pure dextrose crystallizes out. It may also be crystallized from a concentrated aqueous solution at 90° to 95° F., and it then contains one molecule of water of crystallization, and forms microscopic rhombic crystals, which soften at 60°, melt at 86° and lose their water of crystallization at 110°. Heated to 170° it is converted into glucosan or dextrosan ($\text{C}_6\text{H}_6\text{O}_5$), which may again be converted into dextrose by digestion with water or dilute acids. Dextrose tastes much sweeter than ordinary cane-sugar. The action of sodium amalgam dextrose is converted into mannite, $\text{C}_6\text{H}_12\text{O}_6$. A solution of dextrose becomes brown when boiled with caustic alkalis.

Dextrose on oxidation yields in the first instance gluconic acid, $\text{C}_6\text{H}_7\text{O}_7\cdot\text{CO}_2\text{H}$. Further oxidation results in the formation of saccharic acid, $\text{C}_6\text{H}_6\text{O}_6$.

In alkaline solution dextrose reduces completely the oxides of gold, platinum, silver and mercury, the metals being produced. With bismuth, lead, copper, iron, manganese, etc., partial reduction takes place, only the lower oxides being formed. With sodium chloride, iodide and bromide, dextrose forms well-defined crystalline compounds which, however, decompose in solution with the liberation of water.

Nearly all true yeasts and a great many other organisms, and also zymase, ferment dextrose. In the presence of growing bacteria dextrose yields a variety of products, as lactic acid, butyric acid, cellulose, etc., depending on the species of bacteria present.

DEY, dâ (from Turk. day, maternal uncle, a title of dignity), a title formerly given in the 17th century to the Turkish commander of the army in Algiers. The office was attained by seniority. When the French captured Algiers in 1830, the title and office were of course abolished. The European Turk of Tunis has been replaced by that of bey, since the end of the 17th century. There still exists a dey of Tripoli.

DHABB, dâb. See Dâb.

DHAK TREE, dâk, or PALAS, a species ($\text{Butea frondosa}$) of the genus $\text{Butea}$ of the family Leguminosae, native to India. It has trifoliate leaves with a velvety under surface. They yield a resinous exudation. The gum of this species is said to contain about 70 per cent tannin. The bark and roots, being very fibrous, are used for caulkings, rope making, etc., and the flowers yield a beautiful orange dye.

DHAL, dâ. See Pâdon Pêa.

DHALAK, dâ-jâk', or DAHLAK, East Africa, an archipelago of the Red Sea, off the coast of Eritrea, belonging to Italy. It contains nearly 100 rocks and islets, mostly uninhabited, clustering round Dhalak-el-Kebir, the principal island, 23 miles long by 15 miles broad, situated 25 miles east of Addis Ababa. Coral and pearls are the chief products.

DHAMMAR, da-mâr', or DAMAR, Arabia, a town of Yemen, 65 miles south of Sana, on the route to Mecca. It is situated in a thriving agricultural district and carries on a large trade in horses. Pop. about 15,000.

DHAMMAPADA, dhum-mâ-páda, a section of the sacred writings of the Buddhists. It was translated by Max Müller in 'Sacred Books of the East' (Vol. X). The Pali text was published, with a Latin translation by V. Fausböll (Copenhagen 1853). Consult the Pali commentary edited by H. C. Normand (London 1909-12), and for selections consult Anderson, 'Pali Reader' (London 1907).

DHANIS, dâ-nis', François, Baron, Belgian explorer: b. London 1859; d. 1909. He went to Africa and took part in extending Belgian interests there. In 1888 he founded several stations on the Middle Congo. In 1889 he explored the Stanley Falls region to the Kwango. He was attacked by Arab slave raiders and in 1892-93 he carried on hostilities against several fortified towns, finally establishing the supremacy of the Congo Free State. On his return to Belgium he was made a baron and in 1895 returned to the Congo as vice-governor. In 1896-97 while on an expedition to the Nile the black troops mutinied, Dhanis' brother was slain and he himself escaped with difficulty. His later years were spent in retirement in his native country.

DHAR, dâr, India, (1) a small native state in the Malwa agency, in the central part of India, with an area of about 1,740 square miles. The soil is fertile, and yields rice and other cereals. Pop. 169,474. (2) The capital, of the same name, is situated about 180 miles east of Baroda. An extensive trade in grain is carried on. Some striking buildings still standing are relics of its former importance and greater population. These include mosques, temples and tombs. A fort built of red stone stands outside of the town. Pop. about 15,000.

DHARANGAON, dâr-ân-gâ-on, India, city in the Khandesh district, Bombay, having a
trade in cotton and oil-seeds, and manufac-
turing of coarse cloth. Pop. 14,172.

DARSHASTR, d'hār'ma-shār'tra, the metrical law books of Manu, Yajnavalkya and others. The Manu book is translated by Burnell (London 1884), but its date has not been fixed. The Yajnavalkya book dates from the 3d century a.D. For a collection of these texts consult Dharmaśastrasangraha, edited by Pandit Jibananda Vidyasagar (Calcutta 1876). Consult also Jolly, Recht und Sitte, with bibliography (in Bühler, Encyclopaedia of Indo-Aryan Research) (Strassburg 1896).

DARMASTUTRA, d'hār'ma-soo'ttra, a section of the Sutra or liturgical literature of the Vedas. It is devoted to the definition of ethical relationships and on it the Dharma-
śstra (q.v.) or law books are based.

DARWAR, dārwār, India, city, capital of a district of the same name, in the southern Mahatta country, in Bombay presidency. Stross was right in placing it as a railway centre, being the headquarters of the Southern Mahatta Railway and having extensive trade in cotton with the Portuguese city of Marmara-
ga. American cotton is raised successfully and silk and cotton goods are manufactured in the district. Pop. 30,300.

DHAUN, down, Leopold Joseph Maria, Count von, Austrian military commander: b. Vienna, 24 Sept. 1705; d. there, 5 Feb. 1766. He began his military career in his father's regiment; he repeatedly distinguished himself in the Turkish campaigns of 1737-39 and in the War of the Austrian Succession, rose rapidly in rank, being made a field-marshal and privy councillor after the Peace of Aix-la-Chapelle. On the opening of the new military academy at Wiener-Neustadt, Dhaun was appointed its first director. Under his vigorous régime, the Austrian army underwent considerable reorgan-
ization. In 1757, he was placed in chief command of the army, and advanced against Fred-
erick the Great in Bohemia. His first great success was achieved at Kolin (1757), where he, by a decisive victory over the forces of Frederick, Bohemia was freed from the enemy. However, Dhaun suffered defeat at Leuthen in December of the same year; but, rallying his forces, in-
flicted a terrific blow on the enemy in the following year at Hochkirch; and again in 1759, cap-
tured the entire army of General Fink with 11,000 men at Maxen. He was finally defeated and severely wounded at Torgau (1760); and after three years more of tedious fighting, with no signal defeats or victories, ended his military career with the Peace of Hubertusburg (1763). Dhaun combined skill with valor in the execution of his strategic plans, but was outwitted by the more brilliant tactics of the versatile Frederick. He lived in the Grafen Leopold von Dhaun (Frankfort and Leipzig 1759-60). See SEVEN YEARS' WAR.

DHAWALAGIRI, da-hwāl'ā-gē'rē, or DHULAGIRI, once supposed to be the highest peak of the Himalayas, has a height of 26,825 feet above the sea. It is in Nepal, in lat. 27° 39' N. and long. 82° 30' E.

DHOLE, the local Indian name for the wild dog, native to parts of India. It is called *buansu* in the Himalayas. See *Wild Dogs*, under Dogs.

DHOLEPA, dōl'ēpə, India, city in the Ah-
medabad district of Bombay presidency, on a stream entering the Gulf of Cambay, an important cotton mart. Pop. 10,088.

DOLKAI, dōl'kə, India, city in the Ah-
medabad district of Bombay presidency, prob-
ably one of the oldest towns in Gujarat. The weaving of women's robes is the principal in-
dustry of the town. Pop. 16,494.

DHOW, dow, an Arab, sea-going vessel, ranging from 150 to 200 tons burden, with one mast, a yard the length of the vessel, and a large lateen or triangular sail. A pendant and threefold purfle forms the rigging. On the weather rain are fastened the lower block of the tackle and the end of the fall, so that the tackle supports the mast as a backstay. Three shrouds on each side complete the gear. The dhow is used for merchandise and was often employed in carrying slaves from the east coast of Africa to Arabia.

DHULIA, dōo'la, India, the chief town of Khandesh district, Bombay presidency, situated on the south bank of the Panjhra River. There is a new and old town combined. It is a cantonment town. Considerable trade is done in cotton and oil-seeds, and weaving of cotton. A railway connects it with Chalisgaon, on the main line of the Great Indian Peninsula Railway. Pop. 24,726.

DHULIP, dōo'li̇p, or DHULEEP SINGH, Indian maharajah, son of Ranjit Singh, ruler of the Sikhs: b. 1838; d. Paris 1893. While still a minor he succeeded to the throne on the death of his brother, Charak Singh. In his minority, Lall Singh, Maharal, allowed the native army to attack the British in 1845. He waged a prolonged warfare against the British and in 1846, by the Peace of Lahore, was compelled to turn over the administration to them. In 1849 he renounced the throne in consideration of an annuity of $200,000. He received his education in England and became a convert to Christianity. In 1864 he married a German and after her death an English-
woman. In 1886 he abjured Christianity, made an attempt to re-establish the Sikhs, and lost his pension as a result. He spent some time in France and Russia, was at length par-
doned by Queen Victoria, and again received his annuity. His death in Paris was due to a stroke of apoplexy.

DHUNCHEE, dūn'chē (Sesbania aculeata), a plant of the Leguminosae cultivated exten-
sively in India for its fibre. It rises from 6 to 10 feet high, has a sparingly branched stem. It grows rapidly in low, moist soils. The fibre is coarser than hemp, unless cut early. The plant is also grown in China. About 500 pounds of fibre per acre is considered a fair average yield.

DHURRA, door'ra, or DOURAH, Indian millet. See SORGHUM.

DHYAL BIRD, d'āl, or DAYAL, an Eastern bird of the genus *Ceyx*. It is common in Ceylon, India and China, and is a common cage bird in those countries. The fe-
male is of a brownish tinge, while the male is black and white. It nests in tree hollows and at breeding time is exceedingly pugnacious.

DHANI BUDDHA, dh'nē'boodo'ha, one of the five Buddhas, called Sishobha, Vairocana, Ratnasambhava, Amitayu, Amitabha
and Amoghasiddhi, with their female counterparts, the Taras or Sakits. They are produced from meditation alone, are eternal and incorporeal.

DIABASE, a word used by petrographers with varied meanings; but the present usage in this country restricts it to crystalline igneous rocks, of the basalt family, generally occurring as dikes, having as essential constituents plagioclase feldspar, augite and magnetite. Oliver results, or may not be present. Diabases either from the granitoid rocks, to which they have a somewhat similar texture, in that the crystals of basalt are long and narrow, or lath-shaped, and the dark silicates are arranged in the interstices of the feldspar crystals, giving an ophtic texture. Diabases are of common occurrence in the United States. They form dikes and laccoliths at various places along the Atlantic seaboard from Nova Scotia to Georgia. The so-called traps of the Connecticut Valley and the Palisades of the Hudson are familiar examples. In the Lake Superior country diabases are of frequent occurrence; notably in the Marquette Iron Range and on Keweenaw Point; the latter sometimes carry native copper. The conventional field name greenstone is frequently given to old, more or less altered, diabases. By pressure and shearing stresses, and the intrusion of other igneous rocks, diabases change to hornblende and chlorite schists, showing no trace of the original structure. Such rocks are common in the Lake Superior region and elsewhere along the Algokinian and Archaean rocks that characterize the formation of so much of northeastern North America. Diabases are of common occurrence in the Rocky Mountains also, and frequently, over deposits, are found along their contacts with sedimentary rocks, particularly limestones. The typical diabase of the Palisades contains: SiO₂, 53.13; Al₂O₃, 13.74; Fe₂O₃, 1.00; FeO 9.10; CaO 9.47; MgO 8.58; Na₂O 2.30; K₂O 1.03. The specific gravity is 2.96. See BASALT; TRAP.

DIABELLI, dyā-bēl'ë, Antonio, Austrian composer and music publisher; b. Mattsee, near Salzburg, 1781; d. 1858. He studied with Michael Haydn and came to Vienna in 1803, settling there as a teacher of piano. In 1824 he established the publishing house known by his name. This house published most of Schubert's works. Diabelli was very prolific as a composer, making use of all forms. His sonatinas written for educational purposes still hold their place among the best works of instruction for the piano. His other works have long since passed into oblivion.

DIABETES INSIPIDUS, a chronic disorder, characterized by the production of large quantities of colorless urine of low specific gravity and containing no sugar or casts and but little if any albumin. It is not uncommon particularly of young people, and is more frequent in males than in females. In the larger number of patients it seems to be of congenital origin. Its exact nature is unknown, although it seems to be related to some disturbance of the vasomotor mechanism in the kidneys. As a rule it is a disease of slow onset, the early symptoms being an increasing thirst and the passage of large quantities of urine. Occasionally there are pains in the thighs; the appetite is usually good; there is much thirst; the perspiration is small in amount, and the skin is apt to be rough and harsh. Sometimes there is loss of weight and knee jerks. Otherwise the patients suffer but very little. It is a disease that is rarely prejudicial to health, having been known to persist for 50 years. The main discomfort is the want of rest from the polyuria. Occasionally it passes away without treatment. Treatment is as a rule unsatisfactory and there is little benefit from dieting. See DIABETES MELLITUS.

DIABETES MELLITUS, a disorder of nutrition, in which there is deficient oxidation of the sugar in the body, which permits of the storing up of large amounts of sugar in the blood. This is eliminated in part in the urine, and there constitutes one of the most positive findings of the condition. In European countries it is from three to five times as common as here, although statistics seem to show that it is on the increase in the United States. The symptoms vary very widely as the disease is often complicated with other diseases such as albuminuria, tuberculosis and digestive diseases. There is an acute form of the disease which proves rapidly fatal, but in the majority of cases there is a gradual onset, during which increased urination and increased thirst are the initial symptoms. Following this, if the disease progresses, the thirst still increases; there is passing of large quantities of urine containing glucose; very marked increase in the appetite, amounting sometimes almost to voraciousness and gluttony; and an accompanying progressive emaciation or the patient becomes obese. Appetite though usually ravenous may fail. The skin is dry and harsh; temperature is often below normal; the tongue is bright red and glazed; the gums may be swollen; and constipation is the rule though there may be serious diarrhea.

As the disease progresses there are apt to be boils, abscesses, pimples, eczema, intense itching or cellulitis from slight injuries. Perforating ulcer of the foot may occur, and occasionally there is bronzing of the skin. Acute pneumonia is a frequent cause of death. Gangrene of the lung may also arise. In most cases, particularly in the young, there is a form of progressive intoxication which is frequently accompanied by the body's protective agencies. There is gradually progressive anæmia, headache, delirium, great distress and marked hunger for air, which may be accompanied by blueness of the skin or by jaundice. Neuralgic pains are also frequent complications in diabetes. Arterio-sclerosis may be a result. In the young, especially, there is a liability to functional and structural heart diseases.

The cause of diabetes mellitus is a matter of much inquiry, but it would seem that it is a disease of a number of origins. Fundamentally, however, it is due, as implied at the beginning of this article, to some interference with the physiology of sugar-oxidation. This may result from disease of the pancreas, disease of the suprarenal gland, sometimes disease of the central nervous system, and occasionally disorder of the sympathetic system. The pancreas and the suprarenals are considered at the present time as the site of the chief changes leading to the production of this disease. The
outcome is usually dark. In children, as a rule, it progresses rapidly to death. There seems to be an intimate relation between gout and diabetes mellitus, both aggravated by worry, business troubles and mental overwork—hence "Gouty Glyceruria" of the old. Middle-aged people may live for many years, but instances of cure in true diabetes are quite rare. The treatment is largely hygienic, and is extremely complicated. At present time Dr. Allen's so-called " cautiously diabetic diet" and "Hygienic Diet" and "Diabetic hygiene are the most important factors. Each patient having his idiosyncrasies, medical advice on the matter of diet is imperative. The patient, not the disease, needs treatment; hence general rules are more productive of harm than of good.

DIABETIC SUGAR (C₁₅H₁₀O₇), formerly supposed to be a distinct species of sugar, now found to be the same as glucose (q.v.). It is regularly produced by the liver, and is a constant though trifling constituent of healthy urine. In diabetes mellitus it amounts to 8 or 10 per cent. See INSULIN.

DIABLERETS, de-ā-blē-rät, Les (Fr. the "little devils"), a secondary mountain group of the Bernese Alps, Switzerland, between the canton Vaud and canton Valais. The highest peak is 10,620 feet. Two peaks have already fallen, and others threaten to follow. The rocks consist of limestone, resting at a high angle on beds of shale, which becoming disintegrated leaves the limestone without support, and causes treacherous landslips. The most disastrous took place in 1714 and 1749. By the former the surrounding district was shaken as by an earthquake, and many human beings and cattle perished; by the latter the course of the Liserne was arrested, and two small lakes formed.

DIACASTIC (di-a-kās'tik) CURVE, a curve of intense light, formed by the consecutive intersections of rays refracted through a lens.

DIACHYLON, di-ık-lōn, a combination of oxide of lead or litharge, olive oil and water. It is, in fact, lead soap, insoluble in water, and soluble in alcohol, hard and brittle while cold, but soft on heating. It is used in surgery as the basis of adhesive plasters.

DIACRITICAL MARKS. A mark used to indicate a special value for the letter to which it is attached. Such a mark may be a conventionalised letter as the ö in the Swedish å, originally an o, or the é in the German ä, ö, ü, originally an e. Similarly the cedilla (') under a c in French and Portuguese was formerly a z, and the Greek iota subscript was written in the classical period on the line like any other iota. The ~ or tilde over n in some Spanish words and English words derived from the Spanish was once nothing but another n. The accents and long and short signs explain themselves, and are nothing but arbitrary signs. In those Slavic alphabets which are written in Latin characters, and in other languages of eastern Europe, diacritical marks are enormously multiplied. The Semitic alphabets represent the vowels and the modifications of the consonants by diacritical marks. English uses only the hyphen (presumably derived from ~), the diaeresis (~), and the apostrophe ('). The hyphen is not in the strict sense a diacritical mark; it is used to separate the components of certain compound words. The diaeresis is placed over the second of two adjacent vowels which might be mistaken for a diphthong: thus cooperate. The tilde is only found in words from the Spanish, such as carón, and indicates that the n over which it stands is palatalised. The accents are used over an a or e to show it forms a syllable, as peakéd, Bronté. A cedilla indicates that the e over it is pronounced like an s.

Diacritical marks are used according to several distinct systems in the various styles of phonetic spelling for scientific purposes. See PHONETICS.

DIADEM, a band for holding together the adjusted hair of the head, a wreath or chaplet for the head or forehead. In Oriental antiquity it was employed as a badge of royalty or nobility among the Egyptians, Assyrians and Babylonians. It was called nefer among the ancient Jews, and was worn as an ornament by kings and high priests, when it took the form of a golden circlet for the brows. Among the Persians, Armenians and Parthians, the kingly and queenly diadem was a broad band of pale blue. Alexander the Great adopted this regal decoration after contact with the Persians, and his successors followed his example in this fashion. The Greeks early adorned their greater gods with the diadem, notably Zeus, Hera and Aphrodite, and it later became the universal ornament of their women, and their young men, especially the Olympic victors. These diadems were made of such various materials as metal and leather. Among the Romans Anius Martius introduced the diadem from the Etruscans, but it was abolished on the expulsion of the kings. Which of the Caesars revived its use is not known. According to some authorities Aurelian first assumed it. Its use among the non-Roman kings and princes of Europe appears to have been universal. Under Constantine the Great the imperial diadem was studied with gems and took a form which rendered it the prototype of the crowns worn by medieval and modern monarchs. See CROWNS.

DIADESM SPIDER, a common spider (Argiope diadema) so named from its markings, found throughout Europe. See SPIDER.

DIADUMENOS (Greek, binding around), famous statue by Polyclitus, showing an athlete binding a wreath about his head.

DIERSIS, di-ér'sis, in grammar, the resolution or separation into distinct syllables of two vowels whose juxtaposition has either caused them to coalesce or threatened them with coalition. In printing, a mark (""') placed over the second of two adjacent vowels to indicate that they should both be pronounced: as, ætæræ.

DIAEOTROPISM, a form of sensitivity to gravity, in which the bending part grows at right angles to the direction of gravity. See Geotropism.

DIAGNOSIS (Gr. from dia, through, and gnōsis, knowledge), in medicine, the discrimination of diseases. It includes the study of all the vital phenomena of diseases, and also of their appearances after death, in so far as this can aid their discovery during the life of a patient. It is usual to speak of rational or physiological diagnosis, or diagnosis by symptoms, that is, changes chiefly functional,
served by the patient; and of physical diagnosis, or diagnosis by signs, that is, objective phenomena appreciable by the senses of the observer by means of tests of the throat, chest, abdomen, blood, eyes, urine, stool, heart, etc., with various instruments. The latter method of diagnosis has been much enlarged in scope and increased in importance by the modern methods in medicine of auscultation and percussion and also by the advances made in physiological chemistry, and by the use of the microscope. Skill in diagnosis is one of the highest gifts of the physician.

**DIAGONAL, DIAGONAL LINE.** A straight line joining two angles not adjacent, in a rectilinear figure. Every rectilinear figure of more than three sides may be divided by diagonals that do not intersect, into as many triangles as it has sides, minus two. To find the number of possible diagonals, take three from the number of the sides, multiply the remainder by the number of the sides and halve the product.

**DIAGONAL SCALE.** A device for graphically constructing fractional parts of a line, such as hundredths. A square is laid off with sides of unit length. This is then subdivided by equally spaced parallel horizontal lines dividing each side into 10 parts. The top and bottom are also divided into 10 parts, and oblique lines are drawn from the upper left hand corner to the first subdivision of the bottom, from the first subdivision of the top to the second subdivision of the bottom, etc. The length of the nth horizontal line from the left side of the square to the place where it crosses the nth oblique line will then be $\frac{n}{100}$.

The length of the 3rd horizontal line to the place where it crosses the 5th vertical line will be $\frac{3}{5}$. Diagonal scales are used in mechanical drawing and especially in plotting maps. The desired distance is laid off on the scale and transferred to the map with a pair of compasses.

**DIAGORAS, di-äg'-ös'räs' OF MELOS,** Greek philosopher: b. Corinth about 412 B.C. H. of Democritus of Abdera. On account of his ridiculing the popular religion, he was charged with impiety, and received the surname of the Atheist. Fearing for his life, he fled from Athens and went to Pallene and finally to Corinth. He was the author of lyrics and two treatises, one against the gods and the other attacking the sacred mysteries.

**DIAGRAM,** a figure or geometrical delineation applied to the illustration or solution of geometrical problems, or a description or sketch in general. A diagram is characterized by the subordination, conventionalization, or omission, of unessential features, leaving the emphasis to fall on the important points of the object to be represented. Anciently, it signified a musical scale. Among the Gnostics the name diagram was given to a figure formed by the superposition of one triangle on another, and inscribed with some mystical name of the Deity, and worn as an amulet.

**DIAKOVA, dë-ä-kö'và,** Montenegro, town in the extreme southeastern part of the country, 20 miles northwest of Prisrend, on a tributary of the White Drin. For many centuries it was held by the Turks, being one of the most important towns in the Kosovo vilayet. In the Balkan War of 1912-13 it was occupied by Serbia, and, in the subsequent rearrangement of territory and border lines, by Montenegro and Serbia, it was given to the former. The inhabitants, numbering about 15,000, are in great part Mohammedan and Roman Catholic Albanians.

**DIAL.** See Sun-Dial.

**DIALECT,** from the Greek dialectos, Latin dialectus, Ancient French dialecte, a conversation, discourse, manner of speaking, language of a district or country; derived from the Greek verb dialegēthai, to speak through, or across. Hence the term dialect, strictly applied, signifies speech or vehicle of conversation, phaseology, idiom, apart—though not necessarily—from what is written. A dialect that is indigenous or native to a particular place is called a vernacular. A striking example of the latter exists in the so-called Pennsylvania-German dialect, a mixture of Frankish and Alemannic, which in recent years has blossomed into a literature. In relation to modern dialect usually means a variety or form of speech differing from the standard or literary language; a local variation. The French call this patois; their scholars distinguish dialects as variations of a language which is not a common or written language. In its widest sense the name dialect is applied to branch languages springing from a common root, as the Romance tongues, French, Italian, Spanish, Portuguese and Rumanian, originated from a common Latin root. Dialects are not in all cases mutilated or corrupted forms of their standard language, for not only does every great language owe its origin to dialects, but is merely a promoted or elevated dialect itself. The English language arose from the Old Saxon, Old Frankish and Old Frisian dialects, with a large admixture of Latin, Norman-French and the standard or literary French of Paris. But it was not till Chaucer's time, the latter half of the 14th century, that the East Midland dialect of Britain—geographically located between the Northern and Southern dialects—became the English literary language. There were then six great forms of local speech, divided into smaller groups. What decided the superiority—if there was any—of the East Midland dialect, was the threefold recommendation that it was the court language, the language of Wyclif's translation of the Bible, and the language in which Chaucer wrote. Despite his modern detractors, the influence of Chaucer, "the father of English literature," was the predominant factor not in making, but in starting, the English language. Yet no one who knows that language as it is to-day could, without special study, read Chaucer's dialect and understand it. Philologists assure us that even Shakespeare's English, if spoken, would be quite unintelligible to us. Heretofore, languages need centuries to grow; their scientific grammatical framework and vast vocabularies represent the contributions of untold thinkers and writers. Dialects, on the other hand, are not consciously created; their primitive origins are veiled in obscurity or, like the beginnings of human speech, entirely unknown. They grow and develop naturally like trees. But a tongue that is merely spoken or not ex-
tensively written cannot well become fixed: for that a literature is necessary. Chaucer wrote in his own dialect and laid the foundation of a literature; that dialect became the literary language. There were four distinct dialects in ancient Greece—the Ionic, Attic, Doric and Arcolic, each of which possessed a literature; but the greater refinement and the cultivation of the arts and sciences in Athens, where Attic was spoken, finally gave that dialect the superiority; it became the Greek language. Thucydides wrote in that dialect; the standard Greek is the direct form of the second person plural. More than half of the people use voi, and the rest, lei. The accident that Luther spoke the High German dialect and translated the Bible into it made that dialect the standard German and made it the one language, though here again, as in English, enormous changes have taken place through the adoption of foreign words. The Low German or Plattdeutsch (Plattendütsch) bears a strong resemblance to English, while some of the Southern German dialects are almost incomprehensible to the High German. Just as London has its "cockney" dialect, so both Berlin and Vienna have special German dialects, easily recognizable. In the Slavonic family of languages numerous dialects are also encountered. The Great Russian is remarkably free from dialects; Ukrainian or Little Russian may almost be regarded as a distinct language with a literature of its own. But fully 80,000,000 people understand the literary Russian language— the Moscow or imperial Russian languages have so many dialects as the Arabic. Not infrequently one finds several different dialects spoken in the various districts of the same city. The literary Arabic is inviolably fixed by the Koran, but the "spoken" Arabic in the Sudan, while greater dialect groups exist in Syria, Tunis, Algiers and Morocco. Dialects of Turkish (one of the most scientifically constructed languages) are spoken throughout central Asia to China, and also as far as the White Sea. Maltese is a mixed dialect of Italian and Arabic. The Jewish dialects of Europe, though based upon biblical Hebrew and the neo-Hebraic idiom of the Talmud and Mishna, incorporate many French, German, Spanish, Russian or Polish words, according to the country in which they are spoken. The so-called "Yiddish" is largely German, and is understood throughout Russia, Austria-Hungary and the Balkans. Chinese may be divided into two branches—the written language and the spoken language. In the latter, all who can write, but the latter is so violently split up into dialects that sometimes Chinese of different provinces can only verbally communicate with each other through the medium of pidgin English. In the 30 distinct languages, divided into almost innumerable dialects, are spoken both by the Malayan and Negrito tribes. The great languages of India present a bewildering mass of dialects. It is estimated that the Islamic and Indo groups of the Aryan family of languages have some 135 dialects: the Dravidian, about 30; the Tibeto-Burman, 84; the island of Sumatra, 14; Celebes, 5; Madagascar, 9; in Australia, according to one British authority, there are 112 aboriginal languages and dialects. In Africa, Abyssinia possesses two dialects—the Tigre and Amharic, derived from the Ethiopic; the Bantu languages of Equatorial Africa, in Roruba, in fact, every native tongue, is split up into dialects or tribal vernaculars. Not a few, indeed, are unknown to white men.

From the above outlines it may be gathered that dialects are a most important factor in human speech. It is difficult, in fact, to draw a sharp line of demarcation between language and dialect. French, Italian and Spanish were Latin dialects; the Scandinavian languages, as well as Dutch and Flemish, began their careers as Teutonic dialects. The standard Breton and Welsh were cognate dialects which might have become one language if the two nations had not been separated politically. As regards the English literary language, it would be more correct to call that a dialect than a language, for it is constantly changing, both in spelling and pronunciation, whereas the dialects in remote places preserve their forms with but little divergence from those of their Saxon or Celtic ancestors. One who has traveled much in the British Isles or the United States can quickly distinguish a speaker's county or state. It may be said that there are but two distinct English dialects, the modern English and the Scottish; on the other hand, few countries, if any, have more variations from the common literary language than the English-speaking nations. The Scottish dialect exists in its purity only in the earlier poets, historians and other writers. In Britain every county has its peculiarities, which are sometimes striking and difficult to be understood, especially in Lancashire, Yorkshire and Devonshire. The French-Canadian dialect is vivid and picturesque. There are several distinct dialects in the United States, as is shown by the dialect literature of that country. The Valley of the South, and dialect of the slums of New York. Much useful research work has been done by the American Dialect Society. Its valuable publication, Dialect Notes, furnishes interesting information on this subject, and The Ithaca Dialect, in which a local New York State dialect has been investigated by O. F. Emerson, shows that the differentiation of language in distinct sections will some day furnish abundant material for the student of dialect. British scholars have devoted much attention to the subject. Modern provincial English has been carefully studied, its origin traced and locality recorded in the papers of the English Dialect Society (1873-96). In 1898 the first volume of Wright's great Dialect Dictionary appeared (completed 1905). Conner, A., W. E. A., English Dialects in the 18th Century (London 1883); Bonaparte, Prince Louis Lucien, On the Dialect of Eleven Southern and South Western Counties, with a new Classification of the English Dialects (London 1877); also his works on the Basque, French and Italian Dialects; Conway, 'Italic Dialects' (Oxford

W., 'Seven Provincial English Glossaries' (London 1874); and 'Ray's Collection of English Words not generally used,' from the edition of 1691 (London 1874); Skeat and Elwes, 'Specimens of English Dialects' (London 1879); Winkler, J., 'Dialektik' (Berlin 1874).

HENRI F. KLEIN,
Editorial Staff of The American.

DIALECTIC, the art of separating a subject into its parts by discussion. It thus includes both the use of reason and speech, and is of defining an idea or principle, and testing the definition by showing all the consequences, both positive and negative, that it involves.

Aristotle is reported to have said that Zeno the Eleatic was the father of dialectic. The justification of this remark is found in the fact that Zeno defends the position of his school by showing through a process of reasoning the absurd and contradictory results that follow from the conceptions defended by his opponents. With Socrates dialectic is an art of investigating a subject by means of conversation carried on by two or more persons, each of whom contributes something to the result, proposing definitions, or calling attention to certain aspects of the subject, or certain negative cases that had been overlooked. Thus Xenophon ('Memorabilia,' Chap. v.) tells us that Socrates said that dialectic was so called because it is an inquiry pursued by persons who take counsel together, separating the subjects considered according to their kinds. Plato extends the use of the term and makes it the art of working up by a methodological procedure of thought to a knowledge of the highest principles of things. As he says ('Republic,' bk. v.), it is the method by which 'reason avails itself of hypotheses, not as first principles, but as general hypotheses, that is, as stepping-stones and helps whereby it may force its way up to something not hypothetical and arrive at the first principles of all things and seize it in its grasp. For Plato then dialectic is the term used to describe all logical thinking. Aristotle, however, does not use the term to cover his art of logical demonstration from necessary principles, but ascribes to it a lower place, describing it as the method of dealing with what is merely probable, or of arriving at what is most likely to be true in cases when certain demonstration is impossible.

The term dialectic has also frequently been used in ancient and modern times to denote an empty or sophistical art of playing with words or operating with concepts that have no real foundation. A more recent meaning, 'Critique of Pure Reason' employs the word in this sense to denote 'the false pretense of knowledge that is based on illegitimate concepts that have no real basis in experience.' He names the third main division of his work 'Transcendental Dialectic,' and devotes it to a systematic exposure of the emptiness and futility of this form of reasoning. Hegel, on the other hand, uses the term to describe the true method of the development of thought. According to him there is in thought an internal principle of development in virtue of which it moves through three stages—from a thesis or proof, a contradiction, and a negative view that is contradictory of the starting-point, then finally to the synthesis or reconciliation of the two opposing views. Hegel develops this into a universal method of procedure, regarding it as a process that exhibits both the development of the thought and also the nature of reality, and pointing out illustrations of its course in history and in many departments of life and thought.

JAMES E. CREIGHTON,
Professor of Logic and Metaphysics, Cornell University.

DIALLAGE, dǐ al-lāj, a laminated variety of pyroxene of a green or brown color and of pearly lustre. It resembles diopside in composition and is also closely akin to augite. The word is also used to designate bronzeite and enstatite.

DIALOGUE, a conversation or conference between two or more persons. The dialogues of Plato are a sort of philosophical drama. The Socratic dialogue consists of questions and answers, and the person questioned is obliged, by successively assenting to the interrogatories put to him, to come to the conclusions which the questioner wishes to produce. The Socratic method has been adopted in modern times as a means of instruction in certain schools. Lucian claimed to be the inventor of humorous dialogue (see DIALOGUES of the DEAD). Erasmus of Rotterdam, and subsequently, among the Germans, Lessing, Moses Mendelssohn, Enger, Herder, Jacobi, Solger, have written in this form. In comic and satiric dialogue Wieland has imitated Lucian. Among the most distinguished Italian writers of dialogue are Petrarch ('De vera sapientia'), Machiavelli, Gelli, Algarotti and Gozzi; and among the French, Sarsin, Malebranche, Pénfeld, etc. Among the English, Bishop Berkeley and Hurd have imitated Plato and Harris, Cicero. Lord Lyttelton's 'Dialogues of the Dead' (q.v.) and Addison's 'Dialogues on Medals,' are well known, but Landor's 'Imaginary Conversations' is the finest production in English belonging to this class of works. In the drama, the dialogue, in a narrower sense, is opposed to monologue or soliloquy; in the opera, it is that which is spoken, in opposition to that which is sung.

DIALOGUES OF THE DEAD. Lucian is a remarkable figure in the world's literature. A native of Syria and living in the 2d century after our Lord, he wrote the best Greek that had been written in 300 years, and was, indeed, 'the last great master of Attic eloquence and Attic wit.' At the same time he is distinctively modern in flavor, and with his wide knowledge and experience of the world, his vivid observation, fertile imagination, skillful delineation of character, dramatic power, rare wit and gift of satire, would have been as much at home in the 20th century as in the 2d. He bor-
rowed the dialogue from Plato but breathed into its severe and dignified form the mocking spirit of Aristophanes, to whom indeed he is close akin in spirit. The Dialogues of the Dead are probably the best known, though not the best, of his works. The conversations of Odysseus with the various shades in Hades (Homer’s ‘Odyssey’ XI) doubtless suggested the idea, but all else was original with Lucian; so that he may very properly be called the inventor of this style of composition, in which he has few modern imitators, for example, Lord Lyttonel, Fontenelle and Fénelon, in their works of the same title, and Walter Savage Landor in his ‘Imaginary Conversations.’ Consult Rentsch, ‘Das Totengespräch in der Literatur.’ The Dialogues are satires upon human life and society, the vanity of human hopes and pursuits; wealth, power, beauty, strength, the disputations of philosophy furnished the materials, and some philosopher like Diogenes or Menippus is usually the commentator. The short, sharp dialogues may give some idea of their quality (VIII).

C. Why, ‘tis the proverb fulfilled! The fawn hath taken the lion.
D. What’s the matter Cnemon?
C. I have been speculating on the death of Hermolaus, the bank director. He had no children, and my attentions had been well received by him. I thought it would be a good idea to let him know that I had made my will in his favor, on the chance of its exciting his emulation.
D. How was that?
C. I had been speculating on the death of Hermolaus, the bank director. He had no children, and my attentions had been well received by him. I thought it would be a good idea to let him know that I had made my will in his favor, on the chance of its exciting his emulation.

D. Yes; and Hermolaus?
C. What his will was, I don’t know. I died suddenly—the roof came down over my ears; and now Hermolaus is my heir. He is the peak of a peak. He has swallowed hook and bait.
D. And your anglerish into the bargain. The pit that you digged for other...
C. That’s about the truth of the matter, confound it.

CHARLES FORSTER SMITH.

DIALOGUES OF LEOPARDI. The Leopardi’s philosophical paragraphs, known to Italians as the ‘Operette morali’ are mostly in dialogue form; but they are not, as regards substance, to be taken apart from the other prose works composed by him largely in 1824, published first in 1827, and again with slight additions in 1832; nor apart from his ‘Thoughts,’ belonging to his later days in Naples, and his ‘Notebook’ compiled between 1817 and 1832. These works contain the clearest exposition of Leopardi’s peculiar attitude toward life that we possess. In them many of the themes made famous by the poems are restated or anticipated in a different aesthetic compound. Here the sarcasm is merciless, violent and impotent, lashing men and nature in a despair that permits itself no delusions. The style is a certain pedantic classicism not wholly vivified by contact with the living Tuscan speech. Erudite also are the motives from which the humor is made to spring. But the movement is vigorous and the attack relentless. The dialogues are models of concision, representing indeed the results of Leopardi’s meditations on aesthetic theory and his ideas on prose forms, the development of which can be reconstructed from others of his writings.

Too little read by those who know Leopardi only as a poet, the dialogues are, on the other hand, often overestimated and their philosophical value. Leopardi’s pessimism is not a coherent system. His repudiation of justice, virtue, glory, patriotism, even of truth and love, is in reality an affirmation of these same objects as human ideals, though they are regarded by him as unattainable by man. What is considered, and what he states, as his “philosophy” amounts, thus, only to a social satire that easily degenerates under his vehement bias into an unreasoning and not rarely ungracious scold. Leopardi borrows the principal phrases and some of the spirit of French mechanismistic deism of the 18th century. Suppressing the absentee deity of that school—it was in truth a useless encumbrance in social reform—he has left on this hands, a hollow devastation and hence theoretically not even suicide is worth while and which is not resilient enough for a tennis match between Atlas and Hercules. What becomes meanwhile of the humanitarianism, so productive in political and social mortals, or that logically springs from the doctrines of French rationalism? This consequence Leopardi, gritting his teeth, everywhere denies; but denies in words only; for humanitarianism remains the universal trait in his most moderate and just as it is the teaching, if moral there be, of his dialogues. “Live,” says Nature to the Soul, “be great and unhappy.”

Greatness Leopardi defines as “living in accordance with nature,” realizing the sublime excellence of which man discerns the potentiality within him. If the first phrase is a platitude of the French philosophasters, the second concept embraces all the traditional formulae of classic and Christian ethics, abstracting, of course, the mystical virtues of faith. Here the reactionary, aristocratic toryism of Leopardi’s misanthropy, his ridicule of pretended progress, of social reform, of scientific discovery and applied inventiveness. These for him are so many phantoms, so many delusions, with which cowardly, mean-souled mortals conspire to ensole themselves because they are afraid to look at the miserable irredeemable lot of mankind unflinchingly in the face. In this destructive criticism of life Leopardi, it is apparent, holds no view of which the Catholic idealist of his time would not have approved. His pessimism is the point from which Manzoni starts to construct an edifice of Christian hope, and Forlani to seek a reason for existence in aesthetic contemplation and artistic creation. Leopardi, on the contrary, spreads devastation around himself and then rages at its melancholy expanse. With folded arms he views from a superior pinnacle the bootless struggle of humanity for a goal (happiness) beyond its reach; and from his solitude he looks forward to a time when men have become extinct, with insects and beasts inhabiting the earth, the sun itself grown cold and a dim moon performing purposeless revolutions about a planet that is only a sepulchre.

If we put the dialogues in their true social and political tradition, we see that republican and socialistic movements based on French nationalism failed to redeem and integrate
modern Italy. With their humanitarian implications never developed to self-consciousness, it was every appeal, and they had to make to a suffering but aspiring populace. The dialogues of Leopoldi are representative of states of mind that contributed only negatively to the "Resurrection" of Italy. The positive forces are reflected with equal clearness in Manzoni's "Betrothed."

ARTHUR LIVINGSTON.

DIALOGUES OF PLATO, Jowett's Translation of. The worst and the best of Benjamin Jowett's translation of Plato's Dialogues is expressed in two contemporary epigrams. Ingram Bywater, Fellow of Exeter College, Oxford, and Jowett's successor as Regius professor of Greek, used to say, half in jest, "I do not suppose he ever looked at any text of Plato beyond Parker's little Oxford edition"; and it was the opinion of Sir Richard Jebb, of Cambridge, that "Jowett made Plato an English classic." The master of Balliol was, perhaps, most deficient in the so-called science of philology. The first edition of his Plato was replete with manifest errors, and the correctness of the third edition is owing in some measure to his docility in following the strictures of his critics. But even the third (standard) edition is not always a safe guide in details. But Jowett was not writing a crib, nor was his concern much with the niceties of Greek grammar. He was a theologian and a student of statescraft as well as a professor of Greek, and he was interested more in the character and practical career of his pupils than in their scholarship. Plato was to Jowett a depository of the wisdom of the ancient world, which, with the parallel wisdom of Christian theology, formed the basis of sound tradition. In such a spirit, the Dialogues were offered to Englishmen, and it is in large measure owing to this spirit that the translation of the Dialogues has the manner of an English classic. More specifically, Jowett's success is attributable to his sensitiveness to the peculiarities of the Platonic style. The characteristic virtue of this style is its power of conducting a philosophic argument in the natural give-and-take of cultivated gentlemen seeking the truth together, or in the no less natural thrust and-parry of a genuine seeker disputing with sophistical babblers and baiting them with irony and sarcasm. There never has been any other language, not even Greek in the hands of any other writer, so finely adapted as Plato's at its best for just this sort of conversation, shifting as it does with incomparable ease from light to grave and from bantering personalities to the solemn intuitions of eternity. And it is just this note of refined and free-ranging conversation that Jowett, by some gift of sympathy, has caught and transferred to his English. We seem not to be listeners among strange men in a remote age, but among men of modern London or Oxford discussing the ever old and ever new themes of justice and temperance and bravery and wisdom and the way of God's high providence. If Jowett fails anywhere, it is in his rendering of some of the more poetical passages of the original, where for the moment the speaker is rapt out of the ordinary tone of conversation. At times Jowett is too little "literary"; but the fault is on the right side. Readers who have no Greek often ask how much of Plato can be got out of Jowett. They can get much, but not all. The chief obstacle in their way is the correspondence between the Greek ethical terms and their inevitable equivalents in any modern speech. Thus, sôphronuné is commonly rendered by the English "temperance," and, indeed, no nearer equivalent is available. "Temperance" is very far from covering the full sense of the original, which conveys the notion of moderation, but embraces also the wider notion of the mens sana in corpore sano and is deeply colored by the peculiar graces of Hellenic life. There is no possible way to acquire the right feeling for such a word — and a vast amount of Plato's philosophy revolves about just such terms — except by long familiarity with it in its native setting. What can be done to transfer that settler to a new medium, Jowett, perhaps, has done; but he is not Plato, and English is not Greek.

PAUL ELMER MORE.

DIALYSIS, a physical process used principally by chemists for the separation of crystallloid elements contained in a mixture with colloids, the former being bodies which diffuse readily, such as sugar, salt, bichromate of potassium, etc.; the latter bodies which diffuse with difficulty or not at all, bodies resembling glue or gelatin, such as gum, starch, caramel, albumen, and many of the ordinary constituents of food. The dialysis is effected by pouring the mixed solution of crystallloid and colloid on a sheet of parchment or similar animal membrane stretched over a wood or gutta-percha hoop in the fashion of a tambourine. The parchment is allowed to float on a basin of water. In a short time all the crystallloid bodies will have passed through the membranous septum into the pure water, while the colloid matter will remain almost entirely in the dialyzer.

DIAMAGNETISM, the phenomena of repulsion under magnetic conditions, as contradistinguished from the attraction shown in the case of iron, nickel and cobalt in the presence of a magnet etc. The substance of repulsion to the magnetic force are termed diamagnetics. At the head of the list, as showing diamagnetism in the greatest degree, is bismuth. Other diamagnetics, more or less strongly marked, are gold, silver, copper, zinc, lead, antimony, cadmium, mercury, iridium, uranium, tungsten and some others. See MAGNETISM.

DIAMANTE, de'a-mán'tà, Juan Bautista, Spanish dramatist: b. Madrid at what date is unknown; 1626, 1630 and 1640 have been suggested by various chroniclers. The date of his death is also unknown but appears to have been previous to 1684. He was a knight of Saint John, and wrote about 50 plays. His earliest extant work is 'El honrador de su padre,' based on Cornelle's 'Le Cid.' His most popular work was 'La Judía de Toledo,' a work which modern scholars have shown to be only a slight redraft of 'La desgraciada Raquel' of Mira de Mesa. His plays were published in book form (2 vols., Madrid 1670, 1679). The 'Biblioteca de autores españoles' contains four of his plays. Consult Fée, A. L'A., 'Études sur l'ancien théâtre espagnol,' les
DIAMANTINA—DIAMOND

trois Cid' (Paris 1873), and Rennert, H. A., 'Mira de Mescua et La Judia de Toledo' (in Revue Hispanique, Vol. VII, ib. 1900).

DIAMANTINA, Brazil, city lying somewhere in the centre of the state of Minas Geraes, in a region formerly well known on account of its abundant production of diamonds. At the present time the wealth of the state is derived from agricultural and manufacturing industries; nevertheless Diamantina continues to be prospering, being well situated with reference to the Sao Francisco River system, and the routes of travel between Rio de Janeiro and the interior. Its climate is good, owing to its elevation above sea-level (about 4,000 feet). It has an Episcopal seminary and numerous public buildings. It has cotton and leather manufactories, and also diamond-cutting and goldsmiths' establishments. Diamantina was founded in 1730. It formerly was called Tejucu. Pop. about 14,000.

DIAMENIA, genus of venomous snakes of Australia. See SERPENTS.

DIAMETER, a straight line drawn through the centre of a circle, and terminated both ways by the circumference. It thus divides the circle into two equal parts, and is the greatest chord. The radius is half this diameter, and consequently measures the distance between the centre and circumference of a circle. The length of the diameter is to the length of the circumference of the circle as 1 is to 3.14159265... The latter number being an interminable decimal. A diameter of a circle, in general, is the locus of the mid-point of a family of parallel chords, and is always a straight line. The one of the family of parallel chords that is also a diameter is said to be the conjugate diameter of the first one. See QUADRATURE OF THE CIRCLE.

DIAMOND, a natural form of carbon, highly valued as a precious stone when transparent and of the crystalline form. The diamond crystallizes in the cubic or monometric system, its common form being the regular octahedron or a modification of it. The faces are perfectly curved and the general form of the crystal is more or less rounded. The surface of the diamond frequently exhibits strie and triangular impressions, while the interior may contain microscopic cavities and various inclusions, often black carbon. It is the hardest substance known, but is cleavable; specific gravity, 3.52. It is generally colorless, but sometimes tinged with yellow, pink, red, orange, green, blue, brown or black. Blue, red and green are exceedingly rare colors. The finest deep red diamond known is that in the possession of the Russian Crown, purchased in the time of the Emperor Paul of Russia. Light yellow, straw and brown are the most common colors; rich yellow and brown are highly prized. Some bluish-white Brazilian diamonds are phosphorescent in the dark after exposure to the sunlight. The color is attributed to the presence of a possible hydrocarbon, called Tiffanite. This phosphorescence is a property peculiar also to all other gemstones. Except to the eye of a chemist, the diamond is transparent when radiographed, imitation diamonds appearing opaque. The diamond phosphoresces when exposed to roentgen rays, polonium or radium, retaining the light for some time. The brilliance of the gem is caused by the planes reflecting all the light that strikes them at an angle exceeding 24 degrees 13 minutes. The index of refraction is 2.439, being exceeded only by that in chromate of lead and orpiment. The diamond is unaffected by any liquid and infusible at the highest attainable temperature. It gradually burns away at from 760° to 875° C., according to hardness, before the oxy-hydrogen blowpipe, or when heated and plunged into an atmosphere of oxygen, carbonic acid then being produced. Exposed to the intense heat of the voltaic arc, the diamond becomes converted into graphite at 3000° centigrade. Besides its value as a gem it is of great use in the arts and manufactures. Diamond dust is used for polishing other gems, for slicing gems of all kinds, agate, jade and other hard substances. A crystal with natural rounded edges is used by glaziers for cutting glass, for engraving glass, steel and other substances; the cut is generally to a depth of only 1-100 of an inch, but determines the direction in which the glass shall break; a cut of this depth, while scarcely showing, breaks well, whereas a deep scratch does not. Natural fragments or splinters or cleavages, either with the natural edge or sharpened to a point are used for engraving on glass and other hard substances; a splinter is also used as a tool for turning glass lenses in a lathe; and rough diamonds, too imperfect to be used as gems, are mounted as boring tools for perforating the softer rocks. The amorphous black variety, the carbon, carbonado, or bort, is used for boring hard rocks. Rough to the depth of a mile has been bored with this material. It sells for $90 a carat, the value per carat of a fine transparent rough diamond of from one to two carats, as often only 33½ to 40 per cent of the crystal is left in the gem after the operation of cutting.

The finest old East Indian, the Jagersfontein, the Rivers and the blue Wesselton diamonds are all of approximately one grade. The finest Jagers and the finest River diamonds are known as "extra-Jagers" and "extra Rivers" respectively. The Wesselton is the quality superior to a fine "Cape." The Crystals, or fine Capes, as they are called, are of the first quality and always have a fine tint. The Silver Capes have a yellowish tint, while the Bywaters have a decided yellow tint. When the color is pure and rich yellow, it is known as "fancy yellow." Diamonds from the Premier mine occasionally have the faint milkiness or cloudiness of the Brazilian diamonds. Bulfointen diamonds are steel in color and occasionally contain minute black carbon spots. No whiter diamonds were ever found, even in India, than are now found in the Jagersfontein, the Wesselton and Bulfointen mines.

Originally diamonds were preserved in their crystalline forms. But about 1500 A.D. in Europe, and perhaps earlier still in India, the art of polishing and shaping them seems to have been practised, and it was gradually perfected in the course of the ensuing centuries. Such an octahedral diamond set as X-rayed, bearing the hand of Charlemagne at his tomb in Aix-la-Chapelle. The invention of the cutting of regular facets by polishing the diamond on a rotating disk covered with diamond dust has been commonly attributed to Lodowik van Berghen.
of Bruges, in the latter part of the 15th century. These circular discs, about 30 centimetres in diameter, cut of soft sandstone with diamonds, dust and oil, and made to revolve at 3,000 revolutions a minute. This gives the diamonds the artistic smooth surfaces and sharply defined edges. They are secured in a fusible metal dop or holder, held by a metal clamp to the wheel, which is driven by a large water-wheel and requires great skill to produce fine results. Until thirty years ago Amsterdam was the great diamond-cutting centre of the world, but the finest cutting is also done in the United States, and, indeed, great many fine cutters are now brought in from there. As to the cutting process: Diamonds are, first, cleaved; that is, along the line of cleavage of the stone a tiny cut is made by scratching the stone with another diamond at the point where it is desired to cleave it, then a dull knife-edge is placed in the cut, and a sharp blow will separate the stone on a cleavage plane. More recently, they are sawed with thin circular blades of phosphor-bronze charged with diamond dust and oil. Secondly, diamonds are cut by rubbing two diamonds together ("diamond cut diamond," as the old saying says), the stone being cemented with shellac to two pieces of wood or handles which are held in the hands, and rubbed together till they are of the desired form. This also has been superseded partly by an American machine. The diamond-cutting trade is carried on by 8,000 cutters and over 30,000 people are employed in preparing and setting the gems. A rose diamond is one which is quite flat underneath, with its upper part cut into 12 or more little facet triangles, usually triangles, the uppermost of which terminates in a point. A table diamond is one which has a large rectangular face on the top, surrounded by four lesser rectangles. A brilliant diamond is one which is cut in faces both at top and bottom, including the table at the top and the culet at the bottom; there are 32 faces on the top above the girdle, and 24 on the back, 56 in all. Sometimes eight more facets are added making 64 in all. The greatest amount of brilliancy and beauty is developed in the diamond by 56 facets; 98 per cent of all modern diamonds are cut in this form. Very few are at present rose-cut or table-cut, though the rose-cut has been more or less in vogue from the 17th century; the table-cut was favored during the 15th and 16th centuries.

Some of the square or oblong diamonds are brilliant-cut with pointed facets as on the other diamonds; but there is another type of cutting known as the "emerald cut," in which there are generally three rows of gallery—or degree-cutting, as it is termed—above the girdle, and they are degree-cut in the back. The briolette is a stone that is pear-shape, heart-shape, or irregular shape, and is covered entirely with minute facets. The navette, or marquise, are obovate-shaped, brilliant-cut diamonds. The cut is named after its shape.

Diamond cutters vary as to the angle of the dome or the pavilion of the diamond. When measured from the table over the edge to the girdle they vary from 35 degrees to 38 degrees; when measured from the culet over the side to the girdle, from 40 degrees to 45 degrees, although generally 35 degrees for the top and 40 degrees for the back are the accepted measurements. Nearly all diamonds are cut in the brilliant form. This was first used in France in the 17th century, under the influence and possibly at the suggestion of Cardinal Mazarin, who had a wonderful collection of diamonds which he bequeathed to the French Crown in 1661. Two of these Mazarin diamonds sold at the sale of the French Crown jewels in 1887.

The combustibility of diamonds was proved in 1694 by Averani and Targioni with the aid of burning glasses. That diamonds turned to carbonic acid when burned was proved by Lavoisier in 1772. Many cutters are in almost all cases connected with the diamond. It was supposed to show phenomena of sympathy and antipathy. It was fallaciously believed that the diamond, which resisted the two most powerful things in nature, iron and fire, might be dissolved by the blood of a goat; nevertheless, it could not be destroyed by being struck on an anvil, etc. It was believed also to show a curious rivalry with the magnet, to strengthen poisons, and sometimes to drive away madness.

The origin of the term gem to the ancients is problematic; at most, occasional examples may have been brought to the Graeco-Roman world about the beginning of our era. Two diamonds are mentioned by Castellani as being set in the eyes of an antique statue, but even this date for the gem is doubtful. Therefore we may safely say that when the Prophet Jeremiah speaks of diamonds under the name of Shamir as tools for engraving, and when Ezekiel and Zechariah compare the stubbornness of the Israelites to the diamond, they refer to corn suburbum. The same is true in almost all cases when the Greek and Latin writers allude to the adamas or adamant, the "unsubbable" stone. The small, uncut, octahedral diamond crystals set in a very few Roman rings of the 4th century of our era, to be seen in the British Museum, represent all the positive evidence we possess that the diamond was known to the European world in ancient times. Still there is a certain amount of indirect evidence that the diamond-point was used by some of the later Graeco-Roman gem-engravers to a limited extent. The "point of a stone, more precious than gold" of the poet Manilius, who wrote in the 1st century A.D., has also been adduced as confirmatory testimony as to the importation of small Indian diamonds into the Roman world in early imperial times.

Authors and composers of Eastern tales long wrote of diamonds as being found in India only, and chiefly in the mines of Golconda—a misnomer, as Golconda was the market, not the mine; and diamonds from many mines were sold there. But ever since the year 1728 these stones have been found in great abundance in Brazil, no less than 1,146 ounces having been taken from there to Europe in 1730. In 1829 a few diamonds were discovered in the Ural Mountains; and in 1867, in South Africa, John O'Reilly, a trader and hunter, reached the junction of two rivers, and stopped for the night at the house of a farmer named Van Niekerk. Children were playing with some pebbles they had found in the river. Most of these pebbles to Dr. Atherton at Cape Town, who said that it was a diamond of 225
carats. It was sold for $3,000. Nickerk remembered that he had seen an immense stone in the hands of a Kaffir witch-doctor, who used it in his incantations. He found the man gave him 500 sheep, horses and nearly all he possessed for the stone, and sold it the same day to an experienced diamond buyer for $56,000. This was the famous "Star" of South Africa. It weighed 85.77 metric carats in the rough, and was found to be a gem quite the rival of an Indian stone in purity and brilliancy. After it had been cut it was bought by the Earl of Dudley, and is now known as the Dudley diamond. By 1869, parties in ox-wagons had worked their way over the plains to the Vaal River. Soon a tented city of 12,000 or more foreigners grew at Pniel and Klipdrift, on the opposite banks of the stream, where diamonds were found plentifully. Soon hundreds of cradles, like those used by the Australian gold-diggers, were rocking on the edge of the stream, supplied with the precious gravel by a large force of diggers, steevers and carriers.

The Kimberley, or De Beers mines, 600 miles from Cape Town, are immensely valuable, and the great Premier mine in the district of Pretoria, Transvaal, about 300 miles northeast of the Kimberley group, first worked in 1903, has in late years rivaled them in productivity; the New Jagersfontein mine, some 100 miles east of Kimberley, in the Orange Free State, is also a large producer. The total value of the diamonds mined in South Africa in 1913 was $55,000,000, and in the five-year period 1912-16, $60,000,000, in spite of the fact that in 1915, on account of the war, less than $2,000,000 worth of diamonds were extracted. In the year 1913-14, a single group of mines, those of the De Beers Company, comprising the Kimberley, De Beers, Wesselton and Doitoispan mines, furnished diamonds worth $28,000,000. In the 10-year period 1904-13 this company paid dividends amounting to $93,000,000 on its stock, and although the Great War interrupted such payments for a time, they were resumed in 1916 when dividends of $6,000,000 were declared. The records of the other great South African diamond mining company, the Premier, show that for the entire period of its operation from 1903 to 1917, diamonds weighing 19,197,747 carats were recovered, their value being $87,083,224. The stock dividends paid in this time totaled nearly $14,000,000, on a total capitalization of $80,000 ($400,000).

The diamond fields of the Union of South Africa have produced in the half-century (up to 30 June 1917) since diamonds were first found in this region, stones worth the following enormous sums:

<table>

When we add to this the product of the German Southwest African mines, approximately $35,000,000, we have the total for all the African field of about $900,000,000. If we estimate the added value of the cut diamonds made from the rough crystals, and add a reasonable profit for the diamond dealers, there can be little doubt that these African diamonds were eventually sold for as much as $2,000,000,000.

Most of the miners are natives who are kept in compounds for periods of from three to six months; this system has broken up the illicit diamond buyers ("I. D. B."") system, which seriously threatened the successful working of the mines. The chairman of the De Beers syndicate was Cecil John Rhodes, who by his genius and will created the corporation apparently out of chaos, and regulated the value of diamonds for over 12 years, the result being of great benefit to the jewelers of the world.

In 1908 a new diamond field was discovered in German Southwest Africa. Here the stones are found loosely scattered in a sandy overburden, and are believed to have been blown down, or washed down, from a region to the eastward. In 1913, the year before the war, about 1,500,000 carats of diamonds were recovered, and to sustain the price, the annual output was limited to 1,000,000 carats. The crystals are of good quality but almost all of them are very small. In 1914 the Great War put a check upon active operations in this region, although some mining has been done during the British occupation.

The first instance on the American continent of the occurrence of the diamond in the matrix — in its actual rock, peridotite — was described by the present writer as observed by him in Murfreesboro, Pike County, Arkansas, in 1906. More than two thousand diamonds to date have been found, one of over 16 carats, nearly all in the weathered debris of the peridotite rock and several of these in the rock itself. Diamonds have never been found in the original matrix in India or on the North or South American continents before this time.

More than a score of other localities in the United States have furnished in all several hundred diamonds weighing from 1 to 22 carats each, but not one of these was found in the matrix. California, North Carolina and Virginia have supplied a few, and in Ohio, Indiana and Wisconsin occasional finds have been made; the latter diamonds are traced to the glacial debris from Northwestern Canada.

Since 1867 diamonds invoiced at about $700,000,000 have been imported into the United States, and have been marketed as jewelry for as much as $1,500,000,000. There can be little doubt that the total value of the diamonds now owned in the world is approximately $3,000,000,000 and that those in the United States represent nearly $1,500,000,000 or about one-half of the world's diamond holdings.
The yields of the mines in the various diamond-bearing districts are approximately as follows:

- **India** : $50,000,000
- **Brazil** : $150,000,000
- **German South West Africa** : $35,000,000
- **Borneo** : $1,000,000
- **South Africa (Transvaal, Cape Colony, Orange Free State)** : $900,000,000

**Total** : $1,136,000,000

which, after cutting and mounting, payment of duties and placing in the hands of customers, may well have cost $3,000,000,000.

Most of the great diamonds distinguished for beauty and size have very interesting histories. The most noted historic diamond is the **Koh-i-núr** of the English Crown jewels. It has been generally identified with the diamond given to Humayun, son of the Mogul Emperor Babur, shortly after the former's victory at Paniput, 26 April 1526. In his memoirs Baber relates that the diamond formerly belonged to Sultan Ala-ed-din, of the Khiilji dynasty, who reigned over a great part of India from 1288 to 1321. The tradition that he gave it, about 1304, from a rajah of Malwa, in whose family it had been an heirloom for centuries. The legend runs that it was worn nearly 5,000 years ago by the hero Karna, whose deeds are celebrated in the **Mahabharata**. It is believed to have been guarded among the Mogul treasures of Delhi until 1739, when it was carried off as part of his immense plunder by the Persian Nadir Shah. After Nadir's death it was yielded by his weak successor, Shah Rokh, to the Afghan chief Ahmed in 1751. The latter's descendant, Shah Shuja, was forced to give it to Runjit Singh, the Lion of the Punjab, and in 1849 it was surrendered to the East India Company, whose directors presented it to Queen Victoria. The Koh-i-núr was shown to admiring crowds at the London Exhibition of 1851. Its weight in its Indian cutting was 186.16 of the old carats (191.10 metric carats), but after it had been recut in London in 1852 the weight was reduced to 108.57 metric carats.

The largest Indian cut diamond was the Great Mogul, which weighed in the rough 817 metric carats (793.5 old French carats), but was reduced in weight to 287.5 metric carats by the unskilful cutting of a Venetian lapidary. It was purchased in 1790 by the British East India Company from the great French gem-dealer Tavernier at the court of Aurenzeg in Delhi in 1666, and is believed to have later formed part of Nadir Shah's booty. As there is no definite historic notice of it since Tavernier's time, this great diamond must either have been lost or else cut up into two or more smaller ones. Next in size among the Indian diamonds seen by Tavernier was a table-cut stone weighing 242.5/16 carats (249.46 metric carats). All trace of this diamond also seems to have been lost, although it may possibly be hidden away in the very mysterious Persian treasury, to which belong the **Darya-i-núr** (Gem of Light), weighing 191 metric carats, and the **Taj-e-mah** (Crown of the Moon), which weighs 150 metric carats.

The celebrated blue diamond of the French Crown jewels, valued in 1791 at $600,000, was to the Swiss as pledge for the payment of a body of mercenaries. The messenger to whom it was entrusted it was attacked and murdered, but instead of giving up the diamond swallowed it. Sancy had the body opened and found the gem in the faithful man's stomach. This diamond was sold to James I of England in 1664, and was one of the Crown jewels taken to the Continent by Queen Henrietta Maria in 1642 to raise funds for Charles I. It eventually came into the possession of Cardinal Mazarin, who bequeathed it with 17 other fine diamonds to the French Crown in 1661. In 1722 Louis XV wore it at his coronation. It disappeared from France during the Revolution and passed through various hands, being acquired in 1865 by the rich Parsee merchant Sir Jamsetjee Jeejeebhoy. Later the Maharaja of Puttiala owned it. It now belongs to the son of Viscount Astor.

Regarding the early history of the Orlov many strange tales have been related, among others that it had formed one of the eyes of a Hindu idol in a temple on the island of Srinangam. It had been recovered by a French grenadier. It almost certainly belonged to the Persian Nadir Shah, and was probably part of the immense plunder he carried off from Delhi in 1739. After his assassination in 1747 the diamond was sold by one of his Afghan soldiers to an Armenian merchant, who eventually disposed of it in 1775 to Count Orlov for 1,400,000 florins ($560,000) and a patent of nobility. The count gave it to Catharine II of Russia. The **Orlov** weighs 194.56 of the older carats (199.73 metric carats). A much smaller Russian diamond is the **Polar Star**, a brilliant weighing 40 carats (41.08 metric carats). Of precisely the same weight is the diamond called the Pasha of Egypt bought of Ibrahim Pasha for $140,000.

The **Régent** or **Pitt** diamond was the great diamond of the French Crown jewels. It was bought in India by Thomas Pitt, governor of Fort Saint George, Madras, in 1701. Pitt sent the stone to England for cutting, its weight being reduced by this operation from 410 carats (422.10 metric carats) to 136.54 carats (140.64 metric carats). After considerable negotiation Pitt sold his diamond to the Régent Orléans for £135,000 (about $675,000). It was stolen from the Tuileries. It was recovered in the Tuileries. Later on it was pawned in Berlin and then in Amsterdam to raise money for the Republican army. During the Empire it adorned the hilt of Napoleon's sword. The Régent was reserved for the state when the greater part of the French Crown jewels were sold in 1857, and has been placed in the Louvre Museum.

The famous Florentine diamond, now in Vienna, is an Indian-cut stone, acquired in the early part of the 17th century by the Grand Duke of Tuscany. After 1745, when Grand Duke Franz Stephan, husband of Empress Maria Theresa of Austria, was crowned emperor of Germany, this diamond entered the Imperial Austrian Treasury. It weighs 137.27 metric carats (133.4 of the older carats) and is one of a yellowish blue. The history of this stone has been made that it originally belonged to Charles the Bold of Burgundy, but there is no convincing evidence of this.

The celebrated blue diamond of the French Crown jewels, valued in 1791 at $600,000, was
DIAMOND

It weighs 1,680 carats (1,728.72 metric carats). The diamond brilliant known as the "Regent" of Portugal, found in Brazil in 1775, weighs 215 carats (221.25 metric carats). Next in size among Brazilian diamonds is the "Star of the South," found by a negro in the river Bagagem in 1853. In the rough it weighed 261.37 metric carats, and when cut as a brilliant 128.83 metric carats (125½ of the older carats). It was sold to the Gaekwar of Baroda for $450,000.

From 1750 to 1870 the value of a diamond was fixed on a basis of the square of its weight; that is, a 1-carat stone was worth $100, a 10-carat stone was worth —10 x 10 x 100—$10,000. This was due to the fact that large stones were rare. But in the African mines, large stones are found, and the increase in value from one carat up is worth only a fraction more per carat than the carat weight would show. When brilliants are exceedingly small, the value per carat may be double that of stones weighing one-sixteenth to one-fourth each, owing to the difficulty of cutting. The term "first quality" signifies a stone absolutely white and free from all flaws and imperfections. Imperfections, even of the most undesirable colors, greatly lower the value of a diamond. Many are cut so small that they weigh from 200 to 400 to the carat or 30,000 to 60,000 to the ounce.

Since 1910 a radical change has been made in the weighing of diamonds and all precious stones, the standard now being a "metric carat" of 200 milligrams, divided into hundreds in conformity with the decimal system; this change was already suggested by the present writer as far back as 1893. This new carat, which is the one now used in all European and American countries, is equivalent in weight to 3.08647 grains. It was officially adopted in the United States, 1 July 1913.

As the diamond is known to be a crystalline form of common carbon, many attempts have been made to manufacture it by artificial means. No great degree of success has yet rewarded these efforts, although very small diamonds of apparently good quality can be produced. Carbon being practically incombustible, it has not been found feasible to induce crystallization by causing the carbon to solidify from a molten condition. Free carbon is soluble in but few substances, and from such solutions as can be prepared it is deposited mainly in the form of graphite. It dissolves to a considerable extent in melted platinum, but when the metal is allowed to cool and solidify, the carbon is all thrown down as graphite, and no diamonds are obtained. Of the more successful experiments of this sort made at Moissan are best known. Moissan made use of the known fact that carbon will dissolve to some extent in melted iron. Under ordinary conditions the carbon is here also deposited in the graphic form, but Moissan found that when the solution is allowed to cool under an exceedingly great pressure a small portion of it appears in the form of minute crystals that possess all the properties of the true diamond, even exhibiting the peculiar pitting on the surface that are

*At the International Congress of Weights and Measures, Chicago, 1893.

vol. 9 - 5
characteristic of the natural stone. His method consists in saturating the molten iron with carbon and then pouring it into a mold and chilling the casting as quickly as possible by immersing it in water. The interior solidifies under this treatment, while the interior is still quite fluid, and the powerful contraction of the surface gives rise to an enormous internal pressure. As the fluid core solidifies, the greater portion of the graphite that it contains is deposited in particles that are distributed throughout the mass. The casting, when entirely cold, is dissolved in acids, and the residue is treated in various ways to effect the removal of the graphite and amorphous carbon. A small precipitate remains behind, in which tiny crystals of diamond may be distinguished. No stones that are large enough to be of commercial value have yet been prepared, and while the process is of great theoretical interest, it is far too expensive, in comparison with the yield, to be practicable even for the manufacture of diamond powder for polishing and grinding purposes. Moissan's 200 experiments, costing $2,000, yielded one-half carat of diamond powder worth $1.

Many diamonds have occasionally been found in meteorites, as in that from Cañon Diablo, Arizona, at the American Museum of Natural History, New York city. This was one of the earliest instances of diamond identification in a meteorite, the discovery having been made by Dr. G. A. Koning, in 1891. The first find in a meteorite was made in 1888 by the Russian scientists Jerofeev and Lachinov, in the case of one that fell, in 1886, six miles from the village of Novo-Urski, in the government of Perm, Russia. A piece of the meteorite from Cañon Diablo was dissolved with hydrochloric acid, separating the diamond dust, some of which was used under the direction of the present writer to polish several terrestrial diamonds, this being the very first instance of this being done by an expert. The diamond was dissolved by the dust of one dropped from the sky. One of these two stones is to be seen in the collection of the American Museum of Natural History.

These meteorites and diamonds were called to the attention of Dr. Henri Moissan by the present writer, and led to his further experiments and to the discovery of moissanite (named by the present writer) — a silicide of carbon having the hardness 9.5, next to the diamond. See Gems; Precious Stones.

George F. Kunz.

DIAMOND, Cape. See Cape Diamond.

DIAMONDBACK TERRAPIN (Malaclemmys yarrellii). This far-famed turtle belongs to the family Emydidae and may be recognized by the unhinged plastron or lower shell, the concentric grooves and ridges which mark each plate of the upper shell or carapace, the smooth unmotted jaws, smooth skin covering the head, and dark olive or black color. Unlike most terrapins, the diamondback inhabits salt and brackish waters, living in the marshes which fringe our seacoast from Cape Cod to Texas. Formerly very abundant throughout this region, the constant intensive fishing to supply the markets has greatly reduced its numbers, so that the problem of its artificial propagation is now being taken up seriously. The principal fisheries are in Chesapeake Bay and on the coasts of New Jersey and North Carolina. Although a considerable number are dug from the mud while hibernating, a much larger proportion is caught by seineing, etc., during the summer months, and are confined in pens, where they are fed on oysters, fish, and celery to fatten them for the winter market. From the point of view of the epi- zootic, the diamondback is perhaps the most famous and esteemed product of American waters, and during the season of greatest demand commands almost fabulous prices. Those commonly sold have a length of shell of from five to eight inches, and are supposed to be from 6 to 10 years old. The habits differ but little from those of other terrapins. They are omnivorous, lay their eggs in June and July in small nests excavated in some warm sandy bank, and hibernate during the winter after burying themselves a few inches beneath the mud. See Turtles.

DIAMOND-BEETLE, the Entimus imperialis, a splendid coleopterous insect belonging to the family Curculionidae or weevils. The ground color is black, but the insect is covered by a large number of scales which appear brilliantly green by reflecting light very abundant in some parts of South America.

DIAMOND-BIRD, an Australian bird (Pardaloticus affinis), of beautiful plumage, receiving its English name from the peculiar markings of its feathers. Its general color is gray and white, but spotted with red, yellow, orange, and black. It makes its nest in old tree trunks, and sometimes burrows in the ground, or utilizes any chance excavation. It feeds on insects.

DIAMOND GAUGE, a gauge for estimating the size of diamonds. In the staff are set crystals of graduated size, by which jewels are compared. The crystals are from one-quarter to one-sixty-four of a carat.

DIAMOND INDUSTRY, a most important and far-reaching department of national and international commerce, which is spreading and increasing, year by year, especially in the United States. The diamond has been a precious stone procured with difficulty, treasured up with jealous care, and sought after by the rich and magnificent for ages. Diamonds are also indispensable for instruments employed in some of the manufacturing and industrial arts. A consideration of the diamond industry must include an account of the mining, polishing, importation, and sale of this gem. The distribution of diamonds in the geological formations of the world, their mining, etc., has been dwelt upon under the article DIAMOND (q.v.). It remains to point out some recent industrial facts of importance, with regard to the separation of diamonds from the concentrates, which remain when the diamantiferous earth has been washed, after being brought to the surface at Kimberley, that is, in this country, and their artificial manufacture. In mining diamonds, it was necessary until recently to go very carefully over the concentrates to pick out the garnets and many other foreign substances until nothing remained but the rough diamonds. This is a slow and laborious process, but it has been an essential part of the mining industry until it was superseded by...
a discovery made a while ago. The discoverer was Mr. Fred Kersten, one of the employees in the sorting room. His discovery was accidental. A rough diamond was accidentally dropped into a pan, which happened to be lying on a small board on the bench where he was working. He happened to pick up one end of the board when the garnet glided off, but the diamond remained. Kersten found that the grooves in the bottom of the box which had retained the diamond, while the garnet slipped off. He procured a wider board, coated one side of it with grease and dumped a few handfuls of concentrates on it. Then he found that by holding the board in a slightly inclined position and vibrating it, all the concentrates except the diamonds moved to the lower end and fell off while the diamonds remained in place. Then he invented a machine by which his discovery might be utilized. The invention was an entire success. All the garnets and other minerals that are not wanted pass over the surface of the table, while every diamond, large or small, is retained. The entire work is now done by machinery, and both the young and old of the diamond mines are profiting by the new labor-saving device. The United States is a very large purchaser of diamonds. One-third of the entire amount of cut stones is owned in this country. The importations are increasing.

More than $49,529,845 worth of diamonds and precious stones were brought into the United States in 1912-13 according to the statistics of the Department of Commerce and Labor. There is an increase of one million of diamonds and precious stones in a single year; since that date there has been a falling off, due to the war. Prior to 1887 the total had seldom, if ever, reached $10,000,000 per annum; from 1887 to 1893 the total gradually moved upward until it reached $16,000,000; then it rapidly fell to $5,500,000 in 1894, $7,500,000 in 1895, $6,750,000 in 1896, and $2,500,000 in the fiscal year 1897. In 1898 the total increased to nearly $9,000,000, in 1899 to over $14,000,000, in 1900 to over $20,000,000, in 1901 to over $23,000,000, and in 1902 it was about $30,000,000, making the total for the year 1903 not only more than in any preceding year, but 50 per cent in excess of 1901, double the figures in 1899, and more than six times the average for the period.

The rapid growth in the importation of diamonds, while it suggests general prosperity, also seems to indicate the development of a comparatively new industry in the United States—the cutting of diamonds. The total importations of diamonds alone in the 12 months ended with June 1910 amounted to $39,812,214, and of other precious stones $7,987,387. Of the $39,812,214 worth of diamonds imported, $10,232,004 were uncut diamonds; this total of $10,000,000 of uncut diamonds is a large increase compared with the importations of uncut diamonds in preceding years. However, in 1913-14 the importation of diamonds fell to a total of $31,497,897 of which $8,519,688 were uncut. In 1914-15 the importation was still less, due to war conditions.

The diamonds imported are divided by the bureau of statistics into two groups, namely: "Diamonds uncut, including miners', glass cutters' and engravers' work, and "Diamonds cut, but not set." The value of diamonds uncut, including miners', glassellers', etc., imported in 11 months ended with May has grown from $2,500,000 in 1898 to $10,000,000 in 1910, while that of diamonds cut but not set has grown from $4,000,000 in 1898 to $29,500,000 in 1910, these figures being in each case for the period of 11 months. This inference that the cutting of diamonds is becoming an important industry in the United States is strengthened by the fact that the census statistics of "lapidary works" show that the total value of productions of lapidary work in 1905 was over $7,600,000 against less than $500,000 in 1890, and that the value of the materials used in this work in 1905 was over $6,200,000 against less than $250,000 in 1890.

It is indeed worthy of note that although the largest percentage of diamonds is cut outside of the United States, and all of them mined in other countries, the most improved machinery and many of the patented devices for mining and cutting have been the products of American ingenuity. Even Gardner F. Williams is an American born and bred.

Although the annual production of diamonds has increased more than 1,500 per cent in the last 30 years, and though the diamond mines have been developed so as to reach the present time more than 3,000,000 carats annually as against 200,000 before the discovery in South Africa, the changed condition has come about in such a manner that the stone has not been cheapened in value, has been fixed on a more even market basis, and has that much enriched the world.

The cutting branch of the industry has almost doubled in the past eight years, and now keeps employed between 700 and 800 men. Nearly five-sevenths of the diamond cutting of the world is done in Amsterdam and Antwerp, though New York has recently begun to make its influence felt in that direction. There are a number of cutting establishments in New York and Brooklyn, employing from 40 to 80 men each, and although the wages paid to American workmen are much higher than those paid in Europe, the advantage of better machinery in this country averages the cost of cutting. This is especially true in regard to large stones, though not always so with respect to stones running below an eighth of a carat.

Details of the artificial manufacture of diamonds in an electric furnace by Prof. Henri Moissan, at the University of Paris, were published in June 1903. His experiments were begun after his finding of microscopic diamonds in nature, in the "blue earth" from the Cape, in the sands of Brazil, and in several meteorites. His researches showed that if carbon was produced at low temperatures it was always obtained in the amorphous condition and no crystals were found. The details of the manufacture are thus described:

For his experiment, Professor Moissan utilized the pressure which is produced in iron when it passes from the liquid to the solid state. It is known in fact that solid iron is less dense than when in fusion, as is shown by the fact that pieces of ice will float on the melted bath, and it thus resembles water in this respect. He melts the iron in the electric furnace and saturates it with carbon, and to carry this out 200 grammes of Swedish iron and 40 grammes of charcoal were introduced into the furnace. The third and fifth cylinders were placed in a carbon crucible and completely covered with powdered charcoal. The crucible was placed under the arc and heated during three to six minutes with
DIAMOND JOUSTS—DIANA

a current of 350 amperes at 600 volts. The cover of the furnace was removed and the crucible seized with a pair of tongs and plunged quickly into a bath of cold water. The crucible and metal remain red for a few moments, giving off gases which come to the top, then the whole cools off. It was not without apprehension that the experiment was made for the first time, as it was feared that an explosion would be produced when the melted mass at 3,000 degrees came in contact with the cold water. But no bad effect is produced by the meeting of the hot mass and the liquid; and during the first period the mass is cooled rather by a rapid radiation. In order to cool it by conduction, and thus more quickly, it was placed in iron filings. In this way the diamonds which were obtained were of a peculiar nature, and they contained specks of black carbon. The pressure seems to be less, and the transformation of the carbon into the diamond is less complete. The experiment is, however, highly instructive, as it gives a form of speckled diamond which is also found in nature. To obtain a more rapid cooling, a bath of melted lead was found the best; it was kept at about the fusing point, or 617° F. The crucible, heated as before, is quickly plunged into the bath of molten lead, which is about six inches deep. The iron, which is lighter than the melted lead, is detached from the crucible in masses which tend to form spheres and rise more or less rapidly to the top. When the iron is saturated with carbon in the furnace, it becomes so opaque that the crucible can be turned over and it will not run out, but when it cools off the metal soon becomes liquid and gives up graphite.

"The smallest spheres, half an inch in diameter, were solid and sufficiently cool on coming to the top. These spheres gave a good yield of diamonds and the latter were especially clear and brilliant, and the spotted form was absent. Some of the crystalline forms were very sharp. One of the transparent diamonds measured as high as 0.37 millimeter, and had a somewhat triangular form with the angles rounded off. It was perfectly clear. It is curious to note that three months after its formation it split into two pieces; this fact is significant, as some diamonds from the Cape are known to have broken down on account of irregularities of pressure at the time of formation. The samples of diamonds obtained by this method were interesting to examine as to their different form. Most of them were smooth and brilliant, while others had a ground surface. All the specimens had the particular lustre which is characteristic of the native diamond. When a ray of light is sent into the interior they appear to become luminous. Some of the specimens are cubes and octahedra, with rounded angles." See DIAMOND.

DIAMOND JOUSTS, jousts instituted by King Arthur, who (according to the Arthurian legend as set forth by Tennyson) by that name had named them since a diamond was the prize. Before he was king he came by accident to a glen in Lyonesse, where two brothers had met in combat. Each was slain; but one had worn a crown of diamonds which Arthur picked up, and when he became king offered the nine diamonds as the prizes at nine several jousts, “one every year, a joust for one.” Lancelot had won eight and intended to present them all to the queen, “when all were won.” When the knight at last laid them all at her feet, Guinevere, in a jealous rage, flung them out of the palace window into the river.

DIAMOND NECKLACE, a jewel the incidents connected with which have furnished materials for one of the best historical romances of the Dumas. This necklace contained 500 diamonds, was valued at some $40,000, and was made by order of Louis XV for his mistress, Madame Du Barry. The necklace was not finished in the king’s lifetime, and after his death the Du Barry was banished. Between the years 1783 and 1784 the charms of Queen Marie Antoinette had infatuated the Prince-Cardinal Rohan, who was led to believe, by the so-called Countess Jeanne de Lamotte-Valois, an unprincipled adventuress, that the queen reciprocated his feelings. The cardinal was informed that the queen was anxious to purchase the diamond necklace and wished for him to become surety for the price to the makers, MM. Boehmer and Bassauger. The cardinal agreed to become security, the necklace was delivered, but never reached the queen. Jeanne de Lamotte and her husband, meanwhile, had disappeared from Paris, and were selling the diamonds in parcels. The plot was discovered when the jewelers went to court complaining that the necklace had not been paid for. The cardinal and others concerned were thrown into prison. As the trial established rather the folly than guilt of any one excepting the Countess Lamotte, she and her husband were branded on the shoulders as thieves, and sentenced to life imprisonment. The resultant scandal greatly aggravated that popular rage which terminated in the French Revolution.

DIAMOND RATTLESNAKE. See Rattlesnake.

DIAMOND SNAKE, an Australian python regarded by most naturalists as a variety of the carpet-snake (q.v.).

DIAMOND STATE. The popular name of the State of Delaware (q.v.).

DIAMOND WEDDING, the celebration of the 75th anniversary of a wedding, at which presents are normally not given, and which is sometimes celebrated as a wedding, being no identical action being no doubt due to irregularities of pressure at the time of formation. The samples of diamonds obtained by this method were interesting to examine as to their different form. Most of them were smooth and brilliant, while others had a ground surface. All the specimens had the particular lustre which is characteristic of the native diamond. When a ray of light is sent into the interior they appear to become luminous. Some of the specimens are cubes and octahedra, with rounded angles. See DIAMOND.

DIANA, a goddess of Italy whom the Romans subsequently identified with the Greek Artemis (q.v.). Diana was the protectress of slaves, who held a yearly festival in her honor. She was a virgin and no man was permitted to enter her temple. She dwelt in the groves and near wells. Madness and enthusiasm might be aroused in the hearts of men by this goddess. She was also the goddess of the moon, which fact accounts for her identification with the Greek moon-goddess, Artemis. Some sources have been originally the patron deity of the Sabines and Latins. Her temple stood on the Aventine and was built by Servius Tullius for the benefit of the Latin people. It seems probable that the worship of Diana was introduced at Rome by the Sabines and the Latins on the
occasion of the admission of these peoples to the plebscitio.

DIANA. One of the few readable pastoral romances is the Spanish 'Diana' (1558) by the Portuguese Jorge de Montemôr, whose name is usually given in its Spanish form as Montemôr. The pastoral tradition, taking its rise in the 'Idylls' of Theocritus, the 'Eclogues' of Virgil, and the late Greek story of 'Daphnis and Chloe', had been developed by Renaissance Italy in two directions, one dramatic, the other narrative. The best representative of the narrative type had been the 'Arcadia' of Jacopo Sanzzerano (1502) (q.v.). From this work and from Spanish and Portuguese pastorals—especially the 'Menina e Moça' (1554) of Bernadim Ribeiro—Montemôr drew inspiration for a tale in prose and verse that should set forth his personal disappointment in love, thinly disguising folk of a courtly world as moody rustics. His scene was the Arcadia of conventional beauty in a time remote, but the Spain and Portugal of his own day. His prose was allowed larger room than in the narrative of Sannazarro; and it was more caresomely wrought, more pictorial, more vigorous. In spirit, the 'Diana', like its prototype, displayed an urban interest in the life of nature, but the longing for an Age of Gold, so frus- trate and bitter in Sannazarro, was here absent. The drifting plot was better anchored, and the ideal of love was amplified.

Diana is a shepherdess in the fields of Leon admired by Silvano, whom she scorns, and by Sireno (the author), whom she approves. But Silvano, deflected for a year, returns to find her wedded to Delio, a second rival, and to mingle his tears with those of Silvano, whom once he had feared. The woes of unrequited affection are thereafter portrayed, not only in Sireno's case, but in that of Selvaggia and a whole chain of shepherds and shepherdesses loving at cross purposes. Eventually they find sur- cease of woe in drinking a magic potion that induces in their breasts a love requiting and requited, the situation somewhat resembling that in 'A Midsummer Night's Dream.' There are various inserted episodes, the most famous being the story of Felix and Felismena, which suggested to Shakespeare part of the plot for his 'Two Gentlemen of Verona.'

Montemôr's fiction, left unfinished at his death in 1561, was continued three years later by Alonso Pérez and much more agreeably by Gaspar Gil Polo, whose 'Diana Enamorada' ranks little below the original. The Spanish rage for pastoral romances-development of Cervantes and Lope de Vega, and touched the English, who were introduced to the 'Diana' and its sequels in a translation by Bartholomew Young in 1598. Frenchmen felt its influence even more through 'L'Abre' of Honoré d'Urfe, issued in several parts from 1608 to 1624. Three contributions in particular the 'Diana' made to the development of prose fiction: first, it moved later writers to give rein to their feeling for landscape and their sense of nature's sympathy with man; second, it established the analysis of love, a love romantiac and absorbing, but introspective and sentimental rather than impassioned; and, third, it taught a more aristocratic and gallant style than that of the romances of chivalry, offering models of courtly speech. For further information concerning the 'Diana,' the English reader is referred to P. M. War- ren's 'History of the Novel Previous to the Seventeenth Century' (1899), and Frank Hennert's 'Spanish Pastoral Romances' (1892).

Frank W. Chandler, Professor of English, University of Cincinnati.

DIANA, Temple of, a splendid structure and one of the glories of the ancient world, erected at Ephesus in Asia Minor. It was erected at public cost in the year 620 b.c. and became a place of pilgrimage for all Asia Minor and Greece. Its architectural fame was not permanent, for it was burnt for its timber and was very rich in the interior. It was 129 metres long and 66 in width and was supported by 122 columns. At the end was erected the golden statue of Diana Artemis. Chersiphor of Croesus conceived the plan of the temple and supervised its construction and his son, Metagenes, continued the work. Croesus was a liberal contributor to the fund for its construction. In 356 b.c. the temple was burned by Erostratus, who wished to gain immortality through his act. Dinocrates superintended the reconstruction and it was this restored edifice which was one of the seven wonders of the ancient world. It was plundered by the Scy- thians in 263 and was definitely ruined by them. Archaeologists within the past 200 years have discovered traces of earlier temples on this site, notably by J. T. Wood in 1860-75 and by Hogarth in 1904-05. Fragments of the sculpture and some coins and other treasures unearthed by Hogarth now lie in the British Museum.

Consul Ferguson, 'Temple of Diana at Ephesus,' in transactions of the Royal Institute of British Architects (London 1883); J. T. Wood, 'Excavations at Ephesus' (2 vols., ib. 1908); Wood, J. T., 'Discoveries of Ephesus' (ib. 1876).

DIANA OF THE CROSSWAYS. This novel by George Meredith is a penetrating study of feminine character in its marital and social relations. Diana, as Meredith proclaims, is "a positive heroine, with brains and real blood." Her youthful, loveless and unhappy marriage, her reckless plunge into the turmoil of London life, her impulsive and disastrous association with various public men, and her final union, after the death of her first husband, with the unassuming but substantial Redworth, constitute the basis of a brilliant presentation of English society and a delicate and subtle analysis of human nature. The heroine, we are informed in one of Meredith's letters, is modeled after Mrs. Norton, a granddaughter of Sheridan, and many of Diana's experiences resemble those of her prototype. But the central incident of the novel, Diana's sale of a political secret to the editor of a famous newspaper, was found not upon fact, but upon rumor since disproved. In spite of certain flaws and inconsistencies in the delineation of the leading character—her dereliction in the crisis of her career is never quite reconciled with her asserted intellectual discernment—the novel is one of the best balanced of Meredith's contributions to English fiction. It is packed with thought, yet it is entertaining; it is sparkling with wit, yet its brilliance of expression is not so excessive as to be blinding; it is epigrammatic without being cryptic. The inspiring conception of womanhood embodied in the heroine.—strong, independent, courageous, witty, without sacrifice of
DIANA OF FRANCE, Duchess of Montmorency and Angoulême: b. Piedmont 1538; d. 3 Jan. 1619. She was a natural daughter of Henry II, whose name was never legitimized, and married first to a son of the Duke of Parma, next to the eldest son of the Constable de Montmorency. She enjoyed great influence at court under Henry IV, superintended the education of his children, married, in 1580, the Huguenot Henry XIII, and then retired from court.

DIANA OF POITIERS, pwəˈtɛ-ə, Comtesse de Brézé, Duchesse de Valentinio: b. 1549; d. 1566. At the age of 13 she married the Count of Maulevrier, Grand Seneschal of Normandy. She became in 1536 the mistress of King Henry II of France, in whose name she ruled with unlimited power. Till his death in 1559 she exercised such an absolute empire over the king by the charms of her wit and grace that her superstitious contemporaries ascribed her power to magic. Upon his death she retired to her castle Anet, where she established a charitable institution for the support of 12 widows. Medals are still to be seen bearing her image, trampling under foot the god of love, with the inscription, Ominum victorem vici (I have conquered the universal conqueror).

DIANA MONKEY, a monkey (Cercopithecus diana), native to the west coast of Africa. Its name is given because it bears on its forehead a crescent of upright white hairs, suggestive of the new moon, which was the emblem of the Greek goddess Diana. It is black in color, with brown down the back of the head, while the fore parts are pure white, as also is the long beard. It is gentle and easily tamed, but is not strong enough to endure captivity and change of climate. Hence the specimens sent to menageries usually die within a short time.

DIANA'S TREE (Arbor Diana), silver tree, is formed from a solution of silver in nitric acid, precipitated by quicksilver, and crystallized in prismatic needles which are grouped together in the form of a tree. To make this beautiful process visible, let a quantity of pure silver be dissolved in nitric acid; then dilute the saturated solution with 20 to 30 parts of water and put in an amalgam of eight parts mercury and one part silver leaf, upon which after some days crystals are formed. The crystals consist of an amalgam of silver, or rather a definite compound of the silver and mercury. The name is formed from the supposed connection between the moon and the metal silver.

DIANUM, ancient name of Denia, Spain (q.v.).

DIANO MARINA, de-ànə mär-rəˈna, Italy, winter resort in the province of Porto Maurizio, on the Ligurian Sea, 20 miles east of San Remo, and adjoining the Riviera. It suffered greatly from an earthquake in 1887. There is a large trade in olive oil. Pop. 1,929.

DIANORA, a character in the fifth story of the 10th day of the 'Decameron' of Boccaccio. Chaucer's 'Franklynn's Tale' is founded on this story.

DIANTHUS, a genus of the pink family (Caryophyllaceae). The genus has about 200 species, natives of the Old World. The name is said to be from the Greek and to signify 'Jove's flower.' The American species are all naturalized from Europe, and are fugitives from cultivation. The best known are maiden pink (D. deltoides), which in summer is found in the region from eastern Massachusetts to Michigan, and the bunch-pink or sweet-william (D. barbatus), found wild occasionally in the Eastern and Middle States.

DIAPASON, di-ə-ˈpə-zən (meaning complete, all-pervading), a term used in music by which the ancient Greeks designated the octave. The French use the term for tuning fork and as equivalent to pitch. Diapason is also the English name given to the fundamental sonorous, noble-toned stops of the organ.

DIAPDEESIS, di-ə-ˈpə-də-ˈsē-əs, a process in which red and white blood cells pass through the walls of the capillary blood vessels. It is a constant accompaniment of inflammation, and is to be regarded as a protective mechanism on the part of the body, particularly of the white blood cells.

DIAPER, textile fabric used for towels and napkins, and formed either of linen or cotton, or a mixture of the two, upon the surface of which a figured pattern is produced by a particular method of twilling. In the fine arts the term is used for a surface decoration consisting of a repetition of a surface unit or units of design evenly spaced.

DIAPER ORNAMENT, in architecture, an ornamentation of flowers, or variegated figures, applied to a plain surface, either carved or painted. If carved, the flowers are entirely sunk into the work below the general surface. They are usually square, and placed close to each other, and are various in their pattern and design. The name is supposed to be derived from jasper with reference to the decorative effect of veining.

DIAPHANOSCOPE, an apparatus used to exhibit transparent pictures or photographs. It has an adjustable lens so that the picture may be exhibited at the same distance from the eye as the focal lens with which the picture was first taken. Ordinarily a glass positive of the picture is used.

DIAPHORETICS, or SUDORIFICS, agencies that increase the secretion of sweat. The chief diaphoretics are water, heat — in the form of hot packs, warm drinks, etc. — alcohol, ipecac, pilocarpine, opium, sweet spirits of nitre, salicylates, etc. Diaphoretics are employed largely to reduce temperature by use of the perspiration and thus permit of a large amount of surface evaporation. They are also
useful agents often in the treatment of disease of the skin, since they cause an increased amount of blood to flow to the skin and thus improve its nutrition. Sweating is used to eliminate water in dropsy, and to relieve the kidneys from part of their excretory function when they are diseased. Sweating helps to reduce obesity, as the surplus fat is consumed to form water. In the case of chills and colds diaphoretics relieve internal congestion. See PERSPIRATION.

DIAPHRAGM, dīˈà-frām. (1) In anatomy, a dome-shaped muscular partition found in the mammals, separating the abdominal cavity from the pleural cavities containing the lungs. It is attached to the lower end of the sternum, the ninth, tenth, eleventh and twelfth ribs, and the upper three or four lumbar vertebrae. Its general structure is that of a system of muscular fibres radiating from a central tendinous portion. It is pierced by the inferior vena cava, the cœa pha gus, the aorta, the thoracic duct, the greater splanchnic nerve, the azygos and hemiazygous veins and the sympathetic trunks. The diaphragm is lined above by pleura, below by peritoneum, and on its lower surface are supposed to be the stomata by which the lymphatic system opens into the peritoneal cavity, although the existence of these openings is still a matter of dispute. It is innervated by the third, fourth and sometimes the fifth cervical nerves and by the phrenic nerves, which originate from the cervical plexus. It receives blood from the interior phrenic arteries below and behind, the diaphragmatic arteries above and behind, and the superior phrenic, musculo-phrenic, and superior epigastric arteries in front. Its venous circulation is carried on by the inferior phrenic vein. Stomata from the cervical myotomes of the embryo. In the course of development it undergoes the same displacement backwards that characterizes the heart and lungs. This is shown in the adult by the cervical innervation of the diaphragm.

Breathing the diaphragm causes inspiration by contracting, thus decreasing its upward curvature and enlarging the chest cavity. In expiration it is relaxed. It is the principal respiratory muscle. See RESPIRATION.

(2) In optics, an annular disc in a camera or telescope or other optical instrument, to exclude some of the marginal rays of a beam of light. The original form of this beautiful contrivance is the iris of the eye, which shuts out light and regulates the quantity admitted.

DIARBEKIR, dé-ärˈbē-kirˌ, Asiatic Turkey, city, capital of the vilayet of Diarbekir. It stands on a high bank overlooking the Tigris, and is surrounded by a lofty massive wall, built of blocks of black porous stone, the best houses being also of the same material. The principal edifices are the great mosque, a fine structure with a square tower, and originally a Christian church; and the Armenian cathedral and Chaldean church, handsome buildings recently erected. The manufactures, once very extensive but now greatly decayed, consist chiefly of iron and cotton goods; the bazaars are well stocked with goods of every description and a limited trade is carried on with Syria and Aleppo. It is the seat of the patriarch of the Syrian Jacobites. Pop. about 38,000.

DIARRHŒA, a symptom of a disordered condition of the intestines, accompanied by too frequent movements of the bowels, due to their increased peristaltic (or wave-like) motion. Like dyspepsia, it is only a symptom of some pathological condition. Diarrhoea is usually the result of some indiscretion in diet, such as the eating of unripe or overripe fruit, improper or indigestible foodstuffs; or of poorly cooked, decomposed or tainted meats and fish, these inducing a kind of diarrhoea due to toxic substances, and frequently allowed to as pomeai poisoning. While relatively more prevalent in the city than in country districts, and oftener found among the poor than the well-to-do, it cannot be said that diarrhoea is particularly a disease of the city or of the poor, since severe and even fatal attacks of it frequently occur among the rich inhabiting the seaside or mountains.

The conditions that produce diarrhoea are varied and numerous. Exposure and sudden chilling of an overheated body, particularly of the abdomen, are potent causes; and travelers who make frequent changes of climate are very susceptible to it. In these cases personal idiosyncrasy plays an important role. The drinking of impure water and living in poor hygienic surroundings cause diarrhoea. Whether sewer gas or pollution of the atmosphere has direct influence is a disputed point, but it is certain that direct drainage of polluted sewage from districts infected with epidemic diarrhoea into a water supply is a potent cause.

Daily variations of temperature, such as are experienced in the hot season from May to September, are familiar predisposing factors. Environment such as is found in densely populated districts where people live in damp basements, etc., with vitiated atmosphere and want of care, is in the same category of causes.

Diarrhoea is often caused by the irritating action of mineral poisons, such as mercury, arsenic and antimony, by overdoses of croton oil, etc., or by various cathartic nostrums. Worms of various species are likewise causative factors. Of late much attention has been given to these parasitic causes, notably that of protozoon Amoeba coli, so frequently found in the stool of diarrhoeics, principally in tropical cases. Secondary diarrhoea is a phenomenon found during an attack of some antedating disease, as ulcer of the bowel, cancerous growths of the intestines and the inflamed and ulcerative stage of typhoid fever. In diabetes and Bright's disease it is mostly a form of eliminative diarrhoea. In neurotic subjects psychogenic diarrhoeas are frequent and are often very troublesome. Nearly 25 per cent of the chronic diarrhoeas are of psychogenic origin. They represent unconscious wishes. These psychogenic diarrhoeas are characterized by the frequency of partly formed movements although this is not absolute.

The symptoms of diarrhoea naturally vary with the causes, though certain symptoms are common to all forms. One of these is the frequency and character of the stools, which may vary from 5 to 20 or more a day. At first soft, and mixed with particles of undigested food, they gradually grow more liquid until almost watery, and are attended by griping colicky pains about the navel. Flatulence and vomiting are also prominent features, and thirst is
often great, owing to loss of liquids from the body through repeated evacuations. The pulse is usually quickened, though the fever is seldom high, and is of no serious consequence. If the diarrhoea become chronic or long continued, protrusion ensues, though this contingency is infrequent. Diarrhoea, due to chronic congestion or pathological changes in the intestines, is much more intractable.

The treatment of diarrhoea must necessarily vary with the inciting cause, though many cases recover spontaneously or need treatment for only a few days. Absolute rest and low diet are indicated in the toxic forms. If the attack is due to exposure or cold, the application of hot turpentine stupes to the abdomen, with the administration of small and frequent doses of opium and bismuth, may be all that is required; when, however, it is due to offending food in the intestines, or to tominaines, the prompt removal of these elements must be effected. Broken doses (one-tenth grain) of calomel every half hour, or a teaspoonful dose of Epsom salts in Vichy water, until the stools assume a more natural consistence, are effective. By far the most popular is a prepared dose of castor oil containing 10 to 15 drops of laudanum. This should be followed by astringent antiseptics, combined with opium and a digestive; for instance, sulphocarbonate of zinc or soda, opium in either powdered or extract form, with blue-mass. Should the pain be excessive, chlorodyne, or hyoscyamine, or in extreme cases small doses of morphia may be given until the patient is relieved. For the vomiting, small doses of water or plain lime- water will be effective, and the application of the old-time spice-plaster or hot poultice will be found soothing. Some prefer the ice-bag. Should there be any oppression, aromatic spirits of ammonia, or stimulants like brandy or whisky, well diluted, will restore the strength, though this is seldom necessary.

The undue haste to stop diarrhoea suddenly, and the eagerness which patients exhibit to take large doses of paregoric or laudanum, or nostrums called cholera drops or diarrhoea mixture, in all cases are mentioned only to be condemned. A more rational course is to remove the cause, thereby assisting nature to regain her normal tone and reassert her disturbed functions.

In children and infants the same general rules should be followed, with modifications to suit each individual. In place of milk, substitute a milder form of nourishment such as egg, barley or rice water. (See CHOLERA INFANTUM.) Another and more direct form of treatment than giving remedies by the mouth is the use of enemas, or both can be employed in conjunction. High rectal enemas are used of astringent antiseptics held in suspension in thin starch solutions, or with turpentine added.

The constipation which usually occurs after recovery from diarrhoea had much better be disregarded for a day or two, when mild cathartics or laxative remedies can be used. Very effective remedies are glycerine suppositories and enemas of cold water.

DIARY, a daily record of events or observations made by an individual. It contains a narrative, more or less detailed, of matters of personal interest, often including the results of reading or meditation. Yet references to current events of general interest are sometimes introduced. This form of diary is also known as a journal. Books convenient for making such records are issued every year, containing besides the blank pages various reference tables, etc. The "Ephemeris" of the ancients was originally a military record or journal, a day-book or account-book, also a collection of tables showing the position of the heavenly bodies, but passed into literature to mean a collection of records of what has happened on the same day in various years, or a mere general name for any form of periodical books or magazines.

Diaries have often furnished the historian with invaluable material, supplying the absence of public records and furnishing minute and intimate details of manners and of motives that do far more to help us to understand the past than more formal records. Such documents as Robert Baillie's "Journals," the "Diaries" of Pepys and Evelyn, and the "Journals" of Greeneville are among the most valuable sources of real history.

DIAS, d'ês, Antonio Gonçalves, Brazilian poet: b. Capt. de Pernambuco, Recôncavo, 18 Aug. 1823; d. 3 Nov. 1864. He was educated at the University of Coimbra, Portugal, and returning to his native country, entered the practice of law in Maranhão. He published at Rio de Janeiro in 1846 a volume of poems entitled "Primeiros cantos," which was followed by his drama of "Leonor de Mendonça" (1847); "Segundos cantos" (1848); and "Últimos cantos" (1850). In 1848 he was chosen professor of national history in the College of Dom Pedro II; he was subsequently employed in the office of the Minister of Foreign Affairs, and in 1855 was charged with a scientific mission to Europe. His poetry has been exceedingly popular in Brazil. His works also include a report, "Brazil e Oceanía"; and several papers of importance on the migrations of the South American Indian tribes in the collection of the Instituto Geográfico e Histórico of Rio de Janeiro.

DIAS, Henrique, Brazilian general: b. Pernambuco about 1600; d. latter part of the 17th century. He was a freed negro, who by his superior attainments rose to the supreme command of the colored soldiery of the Brazilian army. He took a conspicuous part in the protracted warfare which finally led to the overthrow of Dutch influence. The government failed to reward his services and he died in great poverty and neglect.

DIAS DE NOVAES, Bartholomeu, Portuguese navigator: d. 1500. In 1486 he was commissioned by John II of Portugal to continue the exploration of the African littoral. He advanced along the Atlantic coast of the continent to within two degrees to the south of the Tropic of Capricorn, and 120 leagues further south than any point previously explored. Thereafter he sailed southward on the open sea and doubled without knowing it the meridional point of the continent and reached land about 40 leagues to the east of the entrance of Rio de Infante (Fish River) he turned back, sailing along the coast. It was then he discovered the terminal point of Africa, which he named Cabo Tormentoso, or Cape of Tempêtes. The king later changed the name to Cabo de Bueno Esperanza or Cape of Good Hope. In
December 1487 Dias reached Lisbon and was received with great acclaim. Ten years later, however, he saw Vasco da Gama chosen in his stead to lead the exploring expedition of 1497. He accompanied the latter to India and in 1500 went to Brazil with Pedro Alvarez Cabral, but perished in a storm on his return from this expedition.

**Diaspora.** This was the name given to the Jewish emigrants in the time of the Apostles. The Jews were scattered abroad over the face of the earth. The Roman Empire had in many of its cities these Jewish colonies. In the lands east of the empire they found their way. Some remain discovered a few years ago seem to indicate their presence in far-off China. This widespread movement was due in some quarters to forcible deportation by conquering peoples, as in the Euphrates Valley. Other groups went forth after the failure of the Maccabean patriots to perpetuate their kingdom. Others no doubt left their native land for commercial reasons. Usually they had their own community organization, which sometimes became very powerful, as it did for instance in Alexandria. The organization was commercial as well as religious. The centre of the community was the synagogue. Everywhere Jerusalem was the centre of the national worship. To its priests and temple tithes were paid by devout Jewish worshipers, sending them from all parts of the world.

**Diaospere** (Gr. "scattering"), a native hydrated oxide of aluminum, having the formula Al₂O₃·H₂O, and crystallizing in the orthorhombic system. It is commonly gray, creamy-white or lilac in color, though sometimes various shades of brown and yellow or colorless. It has a hardness of from 6 to 7 and a specific gravity of about 3.4. It is transparent to subtranslucent and exhibits powerful double refracting properties. The best-known localities in which it occurs are Chester, Mass., Newlin, Pa., in the United States and in Europe near Schenmitten, Hungary. Many specimens decrpite strongly when heated before the blowpipe, separating readily into scales that are scattered in all directions; and it is from this peculiarity that the mineral derives its name.

**Diatase, dí-a-stáz, or amylase,** a substance belonging to the group of enzymes and believed to be itself a mixture of several simple enzymes. It is found in barley, oats and other plants and also in animal tissues. When in solution it possesses the property of causing starch to break up at the temperature of 150° F., transforming it first into dextrin and then into maltose. It is obtained by digesting in a mixture of three parts of water and one of alcohol, at a temperature of 113° F., a certain quantity of germinated barley ground and dried in the open air, and then putting the whole under pressure and filtering out the liquid. Such extracts evaporated at a low temperature in a vacuum to a thick syrupy condition are known in commerce as "malt extracts." Diastase is solid, white and soluble in water and diluted alcohol, but insoluble in strong alcohol. If 200 parts of water are mixed with 1,000 parts of water and a portion of diastase be added and the mixture kept at a temperature of about 156° F., the starch is converted gradually into dextrin and then into grape sugar. The action of the diastase is threefold, liquefaction of the starch, hydrolyzing it into dextrin and then hydrolyzing the dextrin into maltose. This triple function is regarded as proving the composite nature of the diastase. The action of diastase is prevented by acids, alkalis and some salts, but not by alcohol or ether. A solution of diastase becomes acid and loses its power on starch. The action of the diastase of germinating barley is important in brewing, distilling and in the baking industry. The composition of diastase has not been exactly determined. It is, however, an albuminoid substance. A body having the power of converting starch into sugar exists in saliva and is known as ptyalin. It is also an albuminoid and is probably analogous to diastase in its composition. Diastase is used in the manufacture of dextrin (qv.). As malt extract it has a limited use in laundries for removing starch from stiffened fabrics before they are laundered.

**Diatostile, dí-ás-tó-lé.** In the description of circulation of the blood it was shown that Harvey first appreciated that the heart muscle is able to contract and dilate of the heart-muscle. The term systole has been applied to this contracted state and the term diastole to the succeeding dilatation.

**Diatrophism, one of the great processes of dynamical geology, including all movements of the earth's crust produced by internal forces.** See section on Diastrophism in the article on Geology. See also Mountains and Continent.

**Diathermancy, a term designating the property that is possessed in various degrees by different substances of transmitting radiant heat.** Bodies that are equally transparent, that is, bodies which have equal power of transmitting rays of light, are very different in their power of transmitting heat rays. Thus a thin plate of glass and a thin plate of rock salt may be nearly equally transparent, but the plate of rock salt has far superior power of transmitting rays of heat. This may be shown very simply. Let a delicate thermometer be placed near a lamp (but not above it); the mercury will rise on account of the heat radiated to it. If a plate of rock-salt be interposed between the lamp and thermometer, the mercury will fall slightly; but if a plate of glass of equal thickness with the plate of rock-salt be interposed, it will be seen that the greater part of the heat is at once cut off from the thermometer. The transparency of bodies to light does not at all necessitate their diathermacy. Thus clear rock-crystal, which is transparent, and smoky rock-crystal, which is opaque, are nearly equally diathermanous; and solution of iodine in bisulphide of carbon, which is perfectly opaque to light, is highly diathermanous. The diathermancy of plates of various thickness has also been determined. The diathermancy decreases very rapidly as the thickness increases. Consult Steward, 'Treatise on Heat'; Deschanel, 'Elementary Treatise on Natural Philosophy'. (See also RADIATION: THERMO-ELECTRICITY). Consult Tyndall, 'Heat as a Mode of Motion' (6th ed., London 1880).

**Diathesis, in medicine, a term applied to the predisposition of the body which renders
it prone to certain diseases. The term is particularly applied to inherited or congenital predispositions which may, however, only become observable at a late period in life. While certain stages of reactions are typical of human bodily processes in general, it must not be overlooked that each individual has peculiarities of composition and structure. Thus, there may be a constitutional lack of resisting power to the entrance of the tubercle bacillus. In the case of the human body, it is known as the doctrine of diathesis. The chief types of diathesis are: bilious, or one in which there is imperfect elimination of bile as a chronic condition; calculous, a constitutional tendency to the formation of calculi or stones; cancerous, the imperfectly understood condition where cancers are liable to form; nervous or psychopathic, an extreme sensibility of the nervous system, generally accompanied by a tendency to derangement; gouty, lithic, rheumatic, or uric-acid diathesis, a constitutional tendency to the accumulation of uric acid and urates in the body fluids and consequent liability to gout, rheumatism, etc. The recognition of a diathesis is often important in connection with the treatment to be adopted for the constitutional state. These diseases may also be defeated by the adoption of a habit of life unfavorable to its development.

DIATOMACEOUS EARTH, and DIATOMACEOUS OOZE. See DIATOMS.

DIATOMS, a sub-order of microscopic plants belonging to the class Algae. A plant of this sub-order consists of a unicellular or a sepiate cell; and its cells are composed of two symmetrical valves, multiplying by spontaneous separation. There are two well-defined sections: (1) Diatomea, including species invested with a silicious epidermal covering occurring both in fresh and salt water, often exhibiting exquisite sculpturnings when seen under the microscope and testing the highest powers of the instrument; (2) Desmidinea, minute freshwater plants of a green color, without a silicious covering. There are more than 400 species of diatoms described for the world. The walls of the cells are rendered hard by silica and they are reproduced by fission, the splitting taking place parallel to the longer axis. When the protoplasm escapes the cell walls retain their shapes and delicate markings. Enormous quantities of them are found as fossils in the beds of the Tertiary formation. Often the protoplasm of two diatoms will escape and unite to form a zygospore, which after a time will divide into two, each forming a new cell larger than before. Some diatoms are free and move rapidly through the water; others secrete a mucilaginous substance whereby they attach themselves to various objects. In some cases the diatoms, after splitting, remain attached to one another; forming bands or ribbons. They are classified, according to the structure of the cell walls, three main families being recognized, according as they have on the principal face of the wall a distinct ridge (Raphidiose), an indistinct ridge (Pseudoraphidiose), or no ridge at all (Cryptoraphidiose).

The diatoms possessing a silicious epidermis have been eagerly studied of late years by microscopical observers, who have greatly increased the number of genera and species. They are universally distributed and their silicious coverings being indestructible, their remains are accumulated and perpetuated in many localities, sometimes forming extensive deposits, as of iron. Richmond, Va., is said to be built upon a stratum of these microscopically minute atoms 18 feet in thickness. Species of Arachnoidiscus and other genera of great beauty are obtained from guano. The berg-mel or mountain-meal of Sweden consists of diatoms. When the water of rivers, the sediment of ponds, ditches and even rain-troughs, contain myriads of the same minute organisms. They were found by the Arctic navigators investing the fields of polar ice, and they have also been detected in the dust evolved from volcanoes.

Their remains are found in rocks of many geologic ages, but are especially abundant in the Miocene beds of California. These organisms are believed to have yielded the organic matter necessary for the formation of the rich petroleum deposits of that state. Diatoms are the source of the diatomaceous earth used in scouring soaps and polishing powders. Diatomaceous oozes are now accumulating on the ocean bottom.

DIATONIC, in modern music the term applied to compositions which follow the tones, intervals, or harmonies of the standard major or minor scales, without chromatic alteration. Originally from the Greek, meaning "through the tones," the diatonic mode of the ancient Greeks — as distinguished from their chromatic and enharmonic mode — formed the foundation of their whole system of music, and was arranged in three tetrachords composed of one semitone and two whole notes.

DIATRIBE, (Gr. diatribe), (a dwelling or lingering upon) originally signified a sustained discourse or disputation, afterward came to be applied to a violent and sweeping criticism, whether written or spoken.

DIAULOS. See OLIMPIC GAMES.

DIAZ, dith, Don Juan Martin, (El Empecinado), Spanish patriot; b. Castroil de Duero, 1755; d. Madrid, 1825. After the death of Napoleon in 1814, the army in 1792 and during the Peninsular War, at the head of 6,000 men, he successfully harried the French. In 1814 he was made colonel in the regular army and was later made field marshal by the king. In 1815 he petitioned Ferdinand VII to reinstitute the Cortes and for this he was thrown into prison and later banished to Valladolid. He joined the Constitutionalists in the insurrection of 1820, and in the short and unequal struggle he showed his former great courage. In 1823 he was captured, and after the restoration of Ferdinand, Diaz was exposed in an iron cage, imprisoned in a loathsome dungeon for two years and then sentenced to death by hanging. He was stabbed to death while he resisted the executioners. The nickname, El Empecinado, "the one covered with pitch," is that given by the peasants to the natives of Castroillo, from the fact that two rivers there form a black mud called pecina.

DIAZ, Miguel, Spanish explorer; b. Aragon second half of the 15th century; d. 1514. He took part in the second voyage of Columbus, and was one of the colonists of the island of Santo Domingo. He quitted the colony in 1495.
in consequence of a duel, and took refuge with a few of his companions in the southern part of the island, where he married a native. Through the advice of his wife he discovered the gold mines in this part of the island, the exact spot he called to his companions to Bartholomé Columbus, whereby he reconciled himself with the colonists, and led the way to the foundation of the town of Nueva Isabella, afterward called Santo Domingo. He was made governor of Porto Rico in 1509, but his fidelity to the family of Columbus repeatedly brought him into trouble.

DIAZ, Porfrio, d'as, Mexican statesman: b. Oaxaca, 15 Sept. 1830; d. 2 July 1915. He received a classical education at the Oaxaca Institute, and had begun studying law when the war with the United States broke out. He served through that struggle in the National Guard, and on the conclusion of peace made a study of military science. On Santa Anna's accession to the dictatorship, he left the army and practised law; but returned and bore a conspicuous part in the revolution of 1854. Subsequently Diaz joined the Liberals under the leadership and control of Benito Juarez, and as a member of this party he won a seat in Congress in 1861. He took the field to oppose the French troops and was taken prisoner, but made his escape; harassed Maximilian's troops till forced to surrender a second time at Oaxaca in 1865; besieged and captured Pueblo in 1867, and immediately marched on Mexico City, which surrendered to him 21 June. On the re-establishment of the republic he was an unsuccessful candidate for president. In 1872 and 1876 he led revolutions against the government and after three severe battles occupied the capital in the latter year. In 1877 he was elected president to fill the unexpired term of the fugitive president, Lerdo. His energetic and businesslike administration at once gained favor with and inspired confidence in foreign investors, and foreign capital soon began to flow into the country which entered upon a new era of development and prosperity. According to the "plan of Tuxtepec," which he had proclaimed, he was ineligible to succeed himself. His secretary, General Gonzales, was elected president and General Diaz was elected minister of the Interior, with the title of "chief-justice of the Supreme Court, and elected governor of Oaxaca. The new administration soon betrayed signs of weakness and it became ever more and more evident that if peace and prosperity were to endure Diaz must be again placed at the head of the government and so in 1884 he was re-elected president; in 1886 his partisans secured the abolition of the law prohibiting a second consecutive presidential term. As each presidential term expired the constitutional provisions for the election of chief magistrate of the nation were gone through, but it was evident to all that partisans of Diaz manipulated the returns. However, no real opponent appeared, at least no strong leader, until 1911, when Francisco Madero opposed what was the dictatorship of Diaz. He was successful and in May 1911, Diaz resigned and departed to Spain. To Diaz Mexico is indebted for her rise, progress and standing as a nation.

DIAZ, Ruy, Spanish soldier: b. Seville, Spain, 1563; d. Peru 1538. He went to Peru in 1532 with the expedition of Diego de Almagro, and took part in the conquest of the province of Cusco; then joined Velazquez in the conquest of the province of Quito. He was sent by Pizarro to explore the valley of the Rimac, and it was in accordance with his report that the site was chosen for the city of Lima (the city), and the city founded. When war broke out between Almagro and Pizarro, Diaz sustained Almagro, was in the battle of Abancay, 1537, and other important engagements; and was captured at the battle of Salinas, 1538, and put to death.

DIAZ DEL CASTILLO, ka-stel-lo, Bernardo (vulgarily Bernal), one of the Spanish conquerors of Mexico, and historian of that conquest: b. Medina del Campo, in Old Castile, about 1498; d. Santiago de los Caballeros, Guatemala, about 1590, leaving numerous descendants. His work, entitled "Historia Verdadera de la Conquista de la Nueva España," of great value and interest. The date of his death is not known. Probably his family belonged to the minor nobility: he says, when speaking of the conquerors, "We were for the most part hidalgos, although from the first we had such clear lineage as others"; but he lacked the influence necessary to secure his appointment as an officer. He speaks of himself as "having been in this country (Central America and Mexico) twice before the coming of Cortés, and the third time with him." On the first occasion he accompanied Pedrarias Davila (q.v.); on the second, he took part in the expeditions to Yucatan and along the coast of Mexico under Córdoba and Ojeda (1517-18). Between 1515 and 1517 he visited Cuba; from Santiago de Cuba, on 18 Nov. 1518, he sailed with the Spanish fleet under Cortés; during the next few years he fought, it is said, in more than 100 of the battles with the Indians preceding or following the capture of the City of Mexico; and in 1523-24 he served under Pedro de Alvarado, conqueror of Guatemala and Salvador. Alvarado established the seat of government in the native (Guatemalan) town of Almolonga, afterward called Santiago de los Caballeros; and Bernal Diaz was made governor of this town, as a reward for his services in the field. He writes naïvely: "I was held in no inconceivable degree of estimation in my day as a soldier; and again, I was twice in the hands of the enemy who were carrying me off to sacrifice, but God gave me strength to escape out of their clutches." In 1550 he was summoned to an important council at Valladolid, "as being the most ancient of the conquerors of New Spain." His history was finished 26 Feb. 1568. Two licenciates who examined the work at that time: 1. That in regard to my style or language it was conformable to that in ordinary use in Old Castile, and that as such it was the more agreeable, not being embarrased with flowering affected phrases. The particular merit of the history is that it gives to each of the events in the history which was his due, instead of ascribing the overthrow of the Aztec empire and the establishment of New Spain solely to the genius of Cortés. "The historians Gomara and Illescas," Diaz writes, "never chose to relate our heroic actions, leaving all our praise and honors in the dark, where they would have remained were it
not for this my true history and assigning such great merit to Cortés. Although they were right to a certain degree (in praising our leaders), yet they should not have forgot us. So desirous is he to make known the exact truth, that at the end of his manuscript he writes, "I beg the printers (señores impresores) for mercy's sake not to omit anything from or add anything to the foregoing." The original manuscript has always been kept in Guatemala, first by the author and his descendants and later by the municipality of the capital. Many editions appeared from 1632 to 1877, the chief being that in 3 volumes at Madrid in 1632, the English version of Maurice Keatinge (1800) and John Ingram Lockhart (1844), the German editions by Ph. J. von Rehfues in 1838 and by Karl Ritter in 1848. Two French versions appeared in 1877, one by D. Jourdanet, the other by José María de Heredia. In 1878 appeared two Hungarian editions, by Károly Brózik, and by Moses Gaal. All these editions and translations failed to do full justice to the original and caused many adverse opinions in regard to the 'Historia Verdadera.' This was remedied, however, in 1904 when the first critical edition of the work was issued in Mexico by Genaro García. Alfred Percival Maudslay published an English translation of this edition, with introduction and notes, under the auspices of the Hakluyt Society (3 vols., London 1908). By means of these publications the work takes its proper place as one of the greatest historical records by an eyewitness of the early conquest and settlement of New Spain.

**DIAZ DE LA PENA, pē-nā, Narcisse Virgin, French painter:** b. Bordeaux, 20 Aug. 1807; d. Mentone, France, 18 Nov. 1876. He was of Spanish parentage, was left an orphan at the age of 10, was educated by a clergyman at Bellevue, where a snake-bit occasioned the amputation of a leg. At the age of 15 he was apprenticed to a porcelain painter, but ambitious of working in oils, about 1813 began to exhibit in the Salon. He in time won fame by his landscapes, which he peopled with nymphs, lovers and satyrs. These figures are badly drawn, but as a colorist Diaz ranks highly among the painters of the romantic school in France, and to color he was content frankly to sacrifice form. He was also an exquisite painter of flower-pieces. He received the cross of the Legion of Honor in 1851. His pictures sold well and he amassed a large fortune, which he expended in great hospitality at his Paris studio. His principal works are 'The Fairy with Pearls'; 'Venus and Adonis'; 'Foolish Girls'; 'Descent of the Gypsies'; 'Sous Bois.' The Metropolitan Museum, New York has several of his pictures. He is also represented in Baltimore and Chicago. Consult Hunter, 'History of Modern Paintings' (London 1907); Hustin, 'Les artistes célèbres'; and Van Dyke, 'Modern French Masters' (New York 1896).

**DIAZ DE PINEDA, pē-nā-'dā, Spanish soldier:** b. Torrelavega about 1500; d. Peru 1545. He went to Peru with Francisco Pizarro in 1531; explored the river Magdalena in 1533 and 1535; became governor of the province of Quito. In 1540 he joined the expedition of Gonzalo Pizarro for the conquest of the Canelos and the exploration of the country east of the Andes. He was sent in search of the party of Orellana, who had gone ahead to seek for supplies. In the course of the search, which was unsuccessful, Diaz explored a large part of the course of the Amazon, but returned to the main expedition, which by his aid succeeded in returning to Peru, though with heavy losses. When Gonzalo Pizarro revolted against the viceroy, Núñez, Diaz at first offered his services to the viceroy, but later joined Pizarro. He was surprised and defeated by Núñez, but escaped capture.

**DIAZ DE SOLIS, Juan. See SOLIS, JUAN DIAZ DE.**

**DIAZEVACTIC TONE,** the name given to the tone interval separating the disjunct and the middle tetrachords in the Dorian scale of ancient Greek music.

**DIAZO-COMPOUNDS** resemble Azo-Compounds (see COAL-TAR COLORS), in containing the group —N=N—, but with the difference that in the former two organic radicals are united to the characteristic group, as R.N=N.R, instead of one as in the latter.

These compounds were discovered in 1858 by Gries, who obtained them by treating aromatic amino-compounds with mineral acids at low temperatures. (See AMINE). Following up his discovery he experimented with them in reaction with many substances, among these the amido-compounds, from which combinations were developed a series of brilliant direct dyes for animal fibres. The present economic value of the diazo-compounds lies in their availability as intermediates in the manufacture of dye-stuffs, and in this function they are not usually separated from the solutions in which they are formed, but are promptly converted into the dyes by a further operation.

When isolated they are colorless crystals, which dissolve readily in water, sparingly in alcohol, and not at all in ether. They are in general unstable, and when dry are explosive. They are prepared by dissolving a molecular part of the chosen amine in water with from two to three parts of hydrochloric acid, and then adding slowly, while stirring a solution of one molecular part of sodium nitrate, keeping the apparatus cold—at 35° to 40° F. When the mixture shows a slight excess of nitrous acid, the diazotisation is complete. This solution is then added to a solution of one molecular part of some amine or phenol, stirring constantly. The dye thus formed in some cases precipitates, in others it has to be separated out by the addition of sodium chloride or hydrochloric acid. The benzenoid and naphthalenoid amines are those most commonly diazotised on a large scale for commercial uses. Diazo-compounds are also produced in a dry state or paste form for the use of dyers in the production of the so-called "ingrain" azo-colors, which are developed directly on the textile fibres. Consult Beacall, T., 'Dye-stuffs and Coal Tar Products' (London 1915); Cain, J. C., 'The Chemistry of the Azo Compounds' (London 1908); Sidgwick, N. V., 'The Organic Chemistry of Nitrogen' (Oxford 1910).

**DIBBS,** the English name of a simple game dating from remote antiquity. It consists in throwing up the joint bones of the legs of sheep and catching them as they descend first
on the palm and next on the back of the hand. The game is common enough throughout Europe and was known in ancient Greece as is proved by figures on Corinthian vases depicting it in the sport. In Scotland small stones are substituted for the bones and the game is popularly known as "chucks" or "chuckle stones."

**DIBDIN, Charles,** English lyric and dramatic poet and actor; b. Southampton, March 1745; d. London, 25 July 1814. He opened a little playhouse in London, the Sans Souci Theatre, and there brought out his own plays, enlivened with his own songs, set to music of his own composition, and with himself as the leading actor. He wrote probably 50 plays and operettas (best remembered among them 'The Quaker,' an operetta), two novels, a 'History of the Stage,' and over a thousand songs. His 'Sea Songs,' such as 'Tom Bowling,' and 'The Flowing Can,' are popular favorites still. He wrote an autobiography 'Professional Life' (1803).

**DIBDIN, John Thomas,** English song writer and dramatist; b. London, 21 March 1771; d. there, 16 Sept. 1841. He was the second son of Dibdin (q.v.) and Dibdin (q.v.) and Dibdin (q.v.), and in 1775, when only in his fourth year, was brought upon the stage as the Cupid of Shakespeare's 'Jubilee,' while Mrs. Siddons personated Venus. After being connected with various theatres, and writing great numbers of songs, he returned to London in 1810 and became a number of dramas with great success for the minor theatres, and obtained an engagement at Covent Garden, with which he continued connected for 14 years. Among his numerous pieces the best known are 'Mother Goose,' by which the theatres are said to have netted a profit of $100,000; the 'High-mettled Racer,' which was almost equally profitable; 'The Cabinet'; 'The Jew and the Doctor'; and 'Past 10 O'clock,' which long held the stage. He wrote a 'Metrical History of England' (1813); and 'Reminiscences' (1827).

**DIBDIN, Thomas Fogral,** English bibliographer, son of the elder brother of Charles Dibdin (q.v.); b. Calcutta 1776; d. Kensington, 18 Nov. 1847. He became a popular preacher in London, and was well known there as a bibliomaniac. He proposed a club to dine together in honor of bibliography, which was established in 1812, under the name of the Roxburghe Club. This club adopted a rule that each member should every year reprint a book for presentation to all the members. Of his numerous writings those connected with bibliography are alone of any value. Among them may be noted 'Bibliomania' (1809); 'Bibliographie Decameron' (1817); 'Typographical Antiquities of Great Britain' (1810-19).

**DIBON,** the name of two cities mentioned in the Bible. 1. A city of Judah, five miles north of Arad, mentioned in Num. xxxiii, 34. At present it is known as Dhaib. 2. A city of Moab, five miles north of Armon, built by the Gadites. It is referred to in Num. xxxii, xxxiii, xxxiv, and xxxi, 30. The modern city is called Dhiban. For its historical connections consult 'Kananäer und Hebräer' (1911); 'Schmidt, Messages of the Poets' (1911) and 'Sons of the Conquest' (in Journal of Biblical Literature, 1914).

**DIBRA,** Serbia, a city near the Albanian frontier, three miles from the confluence of the Black Drin and the Radika. It is an important agricultural centre, and formerly the capital of the Sanjak of Dibra in the Vilayet of Monastir during the Turkish régime. It was taken by the Serbians in the Balkan Wars of 1912-13 and its possession confirmed by the treaty of peace arranged in 1913. The population, mostly Albanians, with colonies of Bulgarians and Serbians, numbers about 16,000.

**DIBUTADES,** di-bu-ta-dez, Greek sculptor or potter of Sicyon; lived about 600 a.c. Although he is the reputed originator of work in relief, the only historical basis for his fame is a Corinthian work, bearing his name, supposed to date from before 600 a.c.

**DICEARCHUS,** Greek philosopher; b. Messina, Sicily. He was a contemporary of Aristotle and lived mostly in Greece and in the Peloponnese. He wrote several works on geography, history, philosophy and politics. Perhaps his greatest work was his 'Life' in three books, an account of the geography of Greece, its political development, its public and private life, manners and popular customs. Only fragments of it have come down to us. Cicero's 'Republic' is supposed to be based on a work of Dicearchus. Many works long attributed to this author are now known to be from other hands, of these the 'Cities of Greece' was the chief. Consult Christ, 'Geschichte der griechischen Litteratur' (Vol. II, 5th ed., Munich 1912), and Pauly-Wissowa 'Real Encyclopädie der klassischen Altertumswissenschaft' (Vol. V., Stuttgart 1905).

**DICEÆUM,** genus of Australasian and Oriental small birds, of the family Dicteidae and akin to the sunbirds. They are brilliantly colored, feed on insects and have melodious voices. They build purse-shaped nests of pliable material suspended from bushes. They are often called flower or honey packers.

**DICAST,** a member of the popular courts of Athens. To Solon is attributed the institution of these courts. From the citizens over 30 years of age about 6,000 were chosen annually by lot and of this number sections of from 20 to 500 members were chosen daily to hear cases. These dicasts listened to the speeches of the litigants and heard the evidence read; then they voted in secret, being sworn to give their decision in accord with the evidence and the laws. The dicasts were sole arbiters alike in points of law and in points of fact. Consult Lipsius, 'Das attische Recht und Rechtsfahrten' (Leipzig 1905- ), and Meier and Schöemann 'Der attische Proces' (Berlin 1887).

**DICE** (plural of Die), small cubes of bone or ivory, on each of the six sides of which a number, ranging from one to six, is marked permanently. The sum of the two numbers on the opposite sides of a die is always seven; thus if six is at the top one is at the bottom, and so on. One, two, three, or five dice are used, according to the game to be played. They are placed in a cylindrical box about four inches high, and from two to two and a half inches in diameter, open at the top. The box is shaken and turned quickly up so that the dice will fall flat on the table. The aggre-
gante amount of the spots uppermost at each throw are summed up and placed to the score of the respective number of sides of each game with which the rules of each game in A. Howard Cady's 'Dice' (1895). There is a long period of history, and no nation, in which some form of dice has not been used. They are depicted on the early Egyptian monuments; those excavated at Thebes can scarcely be distinguished from the dice made to-day, and their use is attested by laws regulating the games played with them in ancient Greece and Rome, as well as in most European countries. The invention of dice is attributed to Palamedes (circa 1244 B.C.). But the use of cubes with numbered sides for gambling purposes is probably much earlier. The Latin word for dice, tesseræ, is derived from the Greek tesseræ, Ionic for tesseræ, four, because it is on every side square. Numerous passages in the ancient writers, and very many representations in marble or bronze, show how frequent dice-playing was among them. Different from the tessera, which were precisely like our dice, were the tali, which means, originally, the eastern bone of an animal—Greek, asparagus. These were almost of a cubic form, and had numbers only on four sides, lengthwise. Three tesserae and four tali were often used together, and the game with dice was properly called alea, though alea afterward came to signify any game at hazard, and aleator a gambler.

DICERATHERIUM, an extinct genus of rhinoceros which inhabited North America during the Oligocene Epoch, distinguished by a pair of horns one above each eye, instead of on the middle line of the head.

DICERY, Albert Venn, English barrister: b. 1835. He was educated at Balliol College, Oxford, was called to the bar in 1863, and from 1865 to 1869 was Vinenian professor of English law at Oxford. In 1890 he was appointed Queen's Counselor. He has published 'The Privy Council' (Arnold prize essay, 1860); 'Treatise on Rules for Selection of Parties' (1870); 'The Law of Domicil' (1879); 'Law of the Constitution' (1885); 'England's Case against Home Rule' (1886); 'Treatise on the Conflict of Laws' (1896); 'Lectures on the Relation between Law and Public Opinion in England during the 19th Century' (1905); 'Introduction to the Study of the Law of the Constitution' (7th ed. 1908).

DICERY, Edward, English journalist and author: b. Leicestershire, England 1832; d. London, 7 July 1910. He was graduated at Trinity College, Cambridge, and was from 1870 to 1889 editor of the 'Observer.' He published 'Rome in 1869' (1861); 'Cavour: a Memoir' (1861); 'Six Months in the Federal States' (1863); 'The Schleswig-Holstein War' (1864); 'The Battlefields of 1866' (1866); 'A Month in Russia During the Marriage of the Czarewic' (1867); 'The Morning Land' (1870); 'Victor Emmanuel and his Family' (1884); 'Bulgaria, the Peasant State' (1895); 'The Story of the Khedivet' (1902); 'The Egypt of the Future' (1907).

DICHEMAGY, the condition arising in flowers whose anthers and stigmas do not mature at the same time. See POLLINATION.

DICHOTOMOUS (Gr. "divided into equal parts"), a term specifically used in botanical description to designate any appearance of branching by forking. Thus the stems of some phanerogams—for example, mistletoe, dounmalm, and many inflorescences—for example, Caryophyllaceae, begonia, appear forked, while an ordinary fern-frond has no such appearance. The progress of morphological research has, however, shown that true dichotomy—for example, complete division of the growing point into two lateral apices, is really as characteristic of development of the fern-frond as of such obviously dichotomous vegetation as that of Selaginella; while conversely the appearance of forking in phanerogams comes about simply by the suppression of the growing point, and the development of two new axes from opposite lateral buds. Outside the cryptogams, (q.v.) indeed, no case of true dichotomy has been described, with the doubtful exception of the roots of cycads (q.v.).

DICHOTOMY in logic, a division or separation of ideas by pairs; the division of a class into two sub-classes opposed to each other by contradiction, binary classification as revived by Ramus against the Aristotelians; the Platonic doctrine that all classification should be by dichotomy. Since Kant this opinion has found scant favor. In botany, a term applied to that kind of branching by a constant forcation or division into two parts, as where the stem of a plant branches into two branches, each of which in its turn divides into others, and so on. Example, the mistletoe. The veins of various ferns thus branch dichotomously. In astronomy, that phase of the moon where its appearance is only half illuminated, as at the quadratures.

DICHEMATISM. The designation of a phenomenon among birds defined by Chapman as "the existence of two phases of color in the same species." Some writers have included under this term, albinism, or lack of pigment; melanism, or excess of dark pigment, producing an extensive or complete blackening of the surface (common in mammals, but rare in birds); and erythrom, or an excessive reddening of the plumage; but it seems best to learn these outside of the present subject, and also the matter of normal differences in color between male and female and adult and young individuals, for dichromatism implies the two phases existing independently of age, sex, or season (Beebe, 'The Bird,' N.Y. 1906). The subject has been most thoroughly considered by Leonard Stejneger, but neither he nor any one else has been able to offer an adequate explanation of the condition.

The best known example is our little screech owl (Stops Asio), known over almost the whole continent. Most of our owls have mottled plumage is decidedly red or deep reddish-brown in general tone; but many specimens are purely gray. The size, special ornaments, voice and habits of both are alike; but all the early American ornithologists considered them as two separate and distinct species; but much older respectively—but some said the red ones were the adults and others the gray. In 1853, however, Dr. J. P. Hou announced that he had
taken both red and gray young from the same nest; and now it is understood that both varieties often occur in the same brood and in any quarter of the country, although on the Pacific coast the gray phase predominates. The same tendency to be of two colors exists in several other owls, as the brown owl of Europe, and the California pigmy owl (Glauisism), as mentioned by Copes. Dick.

Dichromatism is also displayed by many other kinds of birds, notably those of the heron family, and by certain sea-birds. One of the jæger-gulls appears in two different styles, one white on the under side, the other sooty-black all over. The reddish egret (Dichromatus rufescens) of Central America has a white phase long named separately as "Peale's" egret; and "Wurdemann's heron" is now considered merely a color-phase of the great white heron of Florida. The common little blue affords another example.

The only noticeable explanation ever offered for dichromatism is that it may indicate the belonging of a divergent, or "nascent" species, which might subsequently become fixed by birds of the same race. But experiments with the screech-owl have shown that red and gray young will appear "whether both parents are red, or both gray, or one red and the other gray." Barrows states ("Birds of Michigan," Lansing 1912) that it has been shown that in captivity, the gray bird can be converted into a red one by feeding regularly with liver, and by withholding this food afterward the bird has eventually resumed the gray plumage. This would seem to indicate that the color of the plumage may be largely influenced by the character of the food, yet it is difficult to see how this fact can be used to explain the conditions actually found in nature.

**DICHROISM** (Gr. dis, "twice," chroa, "color"), the property which many colored doubly refracting crystals have of exhibiting different colors in different directions. Thus the color of a green tourmaline appears very much darker in the direction of the vertical axis than when the crystal is viewed at right angles to that axis. As in many instances three colors are exhibited, the term "pleochroism" (Greek pleon, "more"; chroa, "color"), being of a more general character, is often used. A crystal of iolite (dichroite) appears blue in the direction of the vertical axis, yellowish-white in the direction of the macro-axis, and bluish-white in the direction of the brachy-axis. Dichroism is detected and measured by the instrument known as the dichroscope. This consists of a rhomb of Iceland spar with wedges of glass cemented at each end of it. These are enclosed in a metal cylinder with a lens at one end and a square opening at the other. If a section of a dichroic crystal is placed in front of the orifice and is viewed through the instrument, two colored squares are seen side by side, one corresponding to the ordinary ray, the other to the extraordinary ray. Dichroism may also be observed by means of the polarizing microscope, by removing one of the nicols and revolving the stage. This furnishes a method of determining in rock sections biotite, tourmaline, epidote and horn-

blende, all of which are dichroic. Thus hornblende is easily distinguished from augite, which is not dichroic. Optically uniaxial crystals, or those belonging to the tetragonal and hexagonal systems, are dichroic; optically biaxial crystals, or those belonging to the orthorhombic, monoclinic and triclinic system, are trichroic. Isotropic bodies, including isometric crystals and also amorphous substances such as soap and glass, transmit the same color in any direction. Dichroism, or the allied term "Dichromatism," has also been applied to those fluids which appear of different colors when viewed by reflected and refracted light; when seen in thick or thin layers, etc. For example, venous blood, or any blood impregnated with carbonic acid, hydrogen or nitrogen, appears, when seen in moderately thin layers, to be of a purple color; while in extremely thin layers it appears green. This property of marked color-variation is due to the difference in the absorption of the light-vibrations in different directions. The property of dichroism is a great aid to the jeweler in distinguishing gems. Diamonds, spinels and garnets show no dichroism; sapphire, ruby, emerald, zircon, beryl, tourmaline, topaz, and almost all other minerals show a characteristic dichroism. Consult Fulton, A. E. H., 'Crystallography' (London 1911).

**DICHROITE.** See IOLITE.

**DICK, Charles,** American legislator: b. Akron, Ohio, 3 Nov. 1858. He was educated in the public schools, was admitted to the bar in 1893, and established his practice in Akron. He was in active service with the Eighth Ohio Volunteers during the Spanish-American War. In 1886-93 he was auditor of Summit County and in 1897-91 was chairman of the Republican county committee and of the Republican State executive committee in 1892-94 and 1899-1907. He was secretary of the Republican National Committee 1897-1900. He was delegate to the Republican National Conventions of 1892 and 1896, and delegate-at-large in 1900 and 1904. He was a member of the 55th to the 58th Congresses (1898-1904) and introduced the militia bill, known by his name, and which passed both houses. On 2 March 1904 he was elected to the United States Senate to succeed the late Marcus Alonzo Hanna. His term expired in 1911.

**DICK, Mr.,** colloquial abbreviation for Richard Daleby, a character in Dickens's 'David Copperfield' (q.v.).

**DICK, Sir Robert Henry,** Scottish soldier: b. about 1785; d. 1846. He was son of a doctor in the service of the East India Company, joined the army in 1800, and as an officer took part in the Peninsular campaign, fighting at Busaco, Fuentes de Onoro and Salamanca. He gained added renown at Quatre Bras and Waterloo. He became major-general in 1837 and from 1841 to 1843 was acting commander at Madras. In the Sikh War of 1846 he was made commander of the third infantry division, and fell in leading a charge at Sobraon.

**DICK, Thomas,** Scotch theologian and educator: b. Dundee, 24 Nov. 1774; d. Broughty Ferry, 29 July 1857. He was educated at the University of Edinburgh for the ministry of the Secession Church. For two years he was pastor at Sterling. The next 20 years he taught school at Methven and Perth, and the last 20
years of his life he devoted to literary work. He wrote several volumes. Among them are ‘The Christian Philosopher’ (1823); ‘The Philosophy of Religion’ (1825); ‘The Philosophy of a Future State’ (1828); ‘Celestial Scenery’ (1838); ‘The Sidereal Heavens’ (1840); ‘The Solar System’ (1840); ‘The Elements of Astronomy’ (1843). His writings were published in an edition of five volumes and later in an edition of two volumes.

DICK BEQUEST, a fund established in 1828 by James Dick of London with the object of encouraging active schoolmasters and to elevate the literary character of both teachers and schools. The fund is for the benefit of the parish schoolmasters of Aberdeen, Banff and Moray, Scotland, and now amounts to about $600,000, yielding about $20,000 annually, which is distributed as an honorarium among the teachers according to their acquirements in English, geography, mathematics, the classics, languages, pedagogics, etc. Consult Kerr, J., ‘Scottish Education, School and University from Early Times to 1903’ (Cambridge 1910).

DICKCISSEL, dik-sis’el, or BLACK-THROATED BUNTING (Spiza americana), a species of finch in which the male is easily distinguished by a conspicuous jet-black throat-patch on a light yellowish background; the upper parts in both sexes are grayish brown variously streaked above with both lighter and darker shades. During the nesting season the black-throated bunting inhabits cultivated fields of wheat in eastern United States, especially southern. It winters in South America. The song is a very simple unmusical ditty, and the nest is built on or very near to the ground.

DICKENS, Charles, English novelist: b. Landport, England, 7 Feb. 1812; d. Gad’s Hill, near London, 9 June 1870. Dickens, who was christened Charles John Huffam Dickens, was the eldest son and the second child among eight of John and Elizabeth Dickens. His father was a navy-clerk in the Portsmouth dockyard at the time of the novelist’s birth; thence he was transferred to London, and, when Charles was five, Thomas Herd, a baker, prepared to read and got some schooling. The most important influence of this early life was his acquaintance with the great novelists of the preceding century, Fielding and Smollett, and also LeSage and Cervantes, all of whom had much effect on his own work. He also read much travel, and had a good deal of pleasure in the ‘Arabian Nights’ and the British essayists.

In 1821, the Dickens family returned to London, in straitened circumstances, and the following year the elder Dickens was confined in the Marshalsea for debt, through hard luck and misfortune rather than, as his biographers are careful to explain, any fault or misdemeanor of his own. The young Charles was put to pasting labels in a blacking warehouse in Blackfriars, much as his hero, David Copperfield, lived in the warehouse in Blackfriars, though he was not ill-used. Beginning with 1824 he got two or three years of schooling of no very profitable sort, and found some employment, first as lawyer’s clerk, and later as newspaper reporter. In order better to perfect his work in this field he learned shorthand and read with some system in the British Museum. For a time, probably, he thought of becoming an actor, whose profession always had great charm for him, but this was definitely abandoned when, in 1831, his toil was rewarded by his being made parliamentary reporter, and later, in 1834, a regular reporter on the Morning Chronicle, an important Whig newspaper. At this period he exerted his greatest energy, but he found time also to begin the writing which led to his great popular fame.

This was a sketch entitled ‘A Dinner at Poplar Walk,’ and it was published early in 1834 in the Monthly Magazine. By the beginning of 1836, enough had been published in that paper and the Evening Chronicle to make a volume, which shortly appeared with the title, ‘Sketches by Boz,’ the nickname of his boyhood, which he used as a pseudonym for many years. The sketches were so successful that Dickens shortly found it profitable to buy back the copyright for 13 times the £150 that he had originally got for it. The same year (1836) he married Catherine Hogarth, eldest daughter of George Hogarth, the conductor of the Evening Chronicle.

The five years following the appearance of the ‘Sketches’ were marked by an enormous amount of production of varied and admirable quality and great popular success. In that year, at the request of Chapman and Hall, he began the ‘Posthumous Papers of the Pickwick Club.’ The original idea was to have a humorous running account of a party of unlucky sportsmen, illustrated with suitable pictures. The idea, after the first few numbers, took a more serious turn in Dickens’s mind, and though the humor to the end remained unaffected, the story grew in depth and intensity and became less caricatures by the time of the close of the publication in 1837. The book was almost instantly popular, it achieved success such as few books have had, and is to-day probably the most familiar of Dickens’s writings.

In February 1837, while ‘Pickwick Papers’ was still in progress, there appeared the first instalment of Dickens’s first regular novel, ‘Oliver Twist.’ Besides being a more coherent story than ‘Pickwick,’ though not, even so, a very closely knit narrative, it was a type common in the author’s later work; it had a purpose. Strong hints of the type are to be found in ‘Pickwick,’ as in the trial of Bardell vs. Pickwick and Mr. Pickwick’s own imprisonment, in which scenes the intention is not wholly comic. In ‘Oliver Twist’ there is a deliberate representation, somewhat along the lines laid down by Fielding and Smollett, of the under side of life, and there is also an attack on the iniquity of the administration of charity schools and the poor law. The most intimate and affecting parts of the story are those dealing with the subterranean life of the young pickpockets and Nancy. Dickens’s feeling for reform is even more poignant in the next novel, ‘Nicholas Nickleby’ (1839–40), where he fell on the school of reform that person of the immortal Squeers and Dotheboys Hall. ‘Critical opinion is in accord with regard to the infinite superiority of the portraits of the Squeers family, the actors, and the rest of those who are more or less taken from the author’s own keen observation of life, to the conventional and unconvincing picture of the
In Mrs. Nickleby, as earlier in Pickwick, and later in Mrs. Gamp, Mr. Micawber, Uriah Heep and many others, Dickens made an interesting addition to the gallery of indigent actors and poor relations established by Chaucer, and added to by Shakespeare, Fielding, Sheridan and others.

After a false start in ‘Master Humphrey’s Clock,’ there emerged ‘Old Curiosity Shop’ (1840), one of the author’s most idyllic and pathetic books, published like all his earlier works, serially. He then essayed a historical novel, and in ‘Barnaby Rudge’ (1841) laid his scene at the time of the Gordon Riots, in the preceding century. It is a novel of pretty elaborate plot and uneven dramatic power and a historical sense. As usual, in Dickens’s work, the best parts deal with genre types and comedy characters rather than with conventional villainy or sentiment. During this period Dickens had not only written several plays, of which two, ‘The Strange Gentleman,’ a farce (1836), and ‘The Village Coquette,’ an operetta (1836), were successful, and had essayed the founding and editing of the weekly magazine in which ‘Old Curiosity Shop’ appeared.

Early in 1842, Dickens and his wife went to America, where he was warmly received and where his popularity was quite as great as in England. The result of the journey is to be found in the ‘American Notes’ published late in 1842, and, to a certain degree,—in those parts that satirize American life,—in the novel, ‘Martin Chuzzlewit,’ of which the first instalment appeared on the first day of 1843. This novel, in which Dickens in many respects, as in the immortal Pickwick and Mrs. Gamp, reached the high-water mark of his comic and satiric power, ran for 20 monthly numbers. It was immediately followed by the first of his ‘Christmas Books,’ which appeared each year from 1843 to 1846 and again in 1848. For about a year, 1844-45, with one return to London, he was with his family in Italy, of which sojourn ‘Pictures from Italy’ contains the record.

A short connection with the newly-founded ‘Daily News,’ early in 1846, was followed by another journey to the Continent. On this trip he began ‘Dombey and Son,’ the first number of which appeared in October 1846. Herein Dickens for the first time on an elaborate scale attempted a statement at a moral and spiritual, rather than a political and philanthropic, problem. In the misfortunes of Mr. Dombey he preached from the text that ‘Pride goeth before destruction.’ It is on the ground of insufficient reality that the major characters of the book have often been criticised, but there is little dissent from the view that the minor characters are done with much of Dickens’s characteristic power, or that the book was one of his great popular successes.

In 1847, Dickens began a series of intellectual diversions in the form of an organized amateur theatrical company, which included many well-known men of letters of the time—R. H. Horne, Mark Lemon, Mrs. Cowden Clarke, and others, who gave successful amateur performances in various places in England. Performances of Jonson’s ‘Every Man in His Humor’ were given in Manchester and Liverpool, in July, with great success, and the following year this play alternated with ‘The Merry Wives of Windsor’ in London and five large towns of the kingdom. Many of the performances were for the benefit of indigent actors and poor relations established by Chaucer, and added to by Shakespeare, Fielding, Sheridan and others.

Meanwhile (May 1849—November 1850), what is commonly regarded as Dickens’s masterpiece of narrative fiction, ‘David Copperfield,’ appeared. Dickens himself thought more highly of the novel than of any of the others, and looked upon it with much affection. The reason for both the popular and the author’s judgment probably lies in the autobiographical character of the book. That is to say, Dickens here speaks more profoundly from his own experience, tells with more closeness and reality the tale of his early days, and introduces a larger number of those inimitable characters, which, however comic and ridiculous, he found on his own observation of actual life. The humorous passages, the idyllic and the pathetic passages are unexcelled by any of his other work. On the other hand, though there are many traces and delineations of the conventional villain type and some soundings of the sentimental motif, these are not so marked as in such earlier novels as, for example, ‘Nicholas Nickleby.’ In short, Dickens, in ‘David Copperfield,’ followed more closely than in any of his preceding novels the groundwork of his own knowledge and experience, at the same time losing nothing of his quality and humor. Criticism and popular verdict alike assign to this novel a very high place in English fiction.

Before the completion of ‘David Copperfield,’ Dickens had started (30 March 1850) a monthly periodical, ‘Household Words.’ The design was to furnish an inexpensive and at the same time cheerful and wholesome periodical for popular consumption. Its idea was to be pleasant and imaginative, at once sensational and literal. To this Dickens himself contributed the novel ‘Hard Times’ (1854), and some of Mrs. Gaskell’s novels also saw the light through its pages. Coming to an end in 1859, it was followed at once by the similar periodical, ‘All the Year Round.’

Three novels which followed are of somewhat different types from ‘David Copperfield’ and by themselves, ‘Bleak House’ (March 1852—September 1853) is more of an attempt at intricate plot construction than had been tried in the earlier novels that depicted the fortunes of a hero, and it attacked vigorously the law’s delays by making the Court of Chancery, as it were, the centre of interest of the story. Interrupting the course of his novels by ‘A Child’s History of England’ (1853), he produced after that ‘Hard Times,’ one of his most didactic works. The moral was a general one; we should cultivate the virtues of charity and kindness for the poor that when they resolve against the evil days wherein hardness of heart will be our bane. More satirical and specific in its application was the attack on the ‘Circumlocution Office’ which forms the burden of
‘Little Dorrit’ (December 1855—June 1857). Its animus was a hatred of war and a wish to satirize the war office because of several breakdowns in the Crimean War, then just ended. Of these novels, ‘Bleak House’ attained an extraordinary amount of popularity, even surpassing ‘David Copperfield’ in that respect.

On 20th April 1858, Dickens began on the large scale, that he carried out into the year of his death, the famous series of readings from his works. As early as 1853 he had given occasional public readings, but, until 1858, never in an extensive and systematic way. At the outset he read with the text before him, but soon memorized the scenes, worked up the "business," and cultivated a dramatic action which so grew in intensity, that toward the close of his life, his reading became almost acting. The success of this almost wholly new departure in the career of an author was startling. His first course consisted of 81 readings in three and a half months, and this was followed by shorter courses. His most successful and arduous courses were a series of 80 readings in America, in 1857—58, which brought him no less than £20,000, and a farewell course of 100 readings in England the following winter, which were worth £8,000, besides expenses and percentages.

The motive that induced Dickens to give these courses was a growing restlessness, the need of activity, and a craving for applause, rather than an pecuniary necessity. As it was, they were a very great tax on his strength and they undoubtedly shortened his life.

In 1859 he gave comparatively few readings, and the following year none. He was then chiefly occupied with the new All the Year Round, in which appeared his second and last historical novel, ‘A Tale of Two Cities’ (April—November 1859). This story of the French Revolution was written with more deliberation, care for construction and succinctness than his previous works, and, in spite of its comparative lack of humor and spontaneity, Dickens thought highly of it, though he went back in his succeeding novels to his more free and easy way.

A series of sketches, ‘The Uncommercial Traveller,’ was begun in 1859, shortly after he had taken up his abode at Gad’s Hill Place in Kent, and this change, with its incident trips to London, furnished him material for his work. The effect of the change also appeared in his next novel, ‘Great Expectations’ (in All the Year Round in 1860), which reverted in many respects to the earlier style of ‘David Copperfield.’

More reading then interrupted the course of his novel writing, and it was not until 1863 that he set to work on his last complete story, ‘Our Mutual Friend’ (May 1864—November 1865). Many of the passages of this novel, have been greatly admired, but opinion is fairly uniform that it, as a whole, lacks the movement and glow of Dickens’ earlier novels and shows signs of the strain under which he was laboring.

A short last course of lectures was delivered between January and March 1870. Then appeared the first installment of ‘The Mystery of Edwin Drood.’ The afternoon of 8 June he finished the sixth number of the story. The next day he was suddenly stricken and died at about six in the evening. He was buried in Westminster Abbey.

With the possible exception of Scott, no English novelist has been, and probably still is, so widely popular as Dickens, both in his own country and the world. Thackeray was not so extensively read in his lifetime, and none of his successors who, like George Eliot, may not unreasonably be regarded as approximating his high place, have been so much beloved. Dickens’ manner of expression has had a wide effect on popular style, and many of his sentiments, as well as a whole galaxy of characters, have become common property. Foreign writers, like Daudet, have to some degree imitated his style. Furthermore, few writers have had so long continued a vogue. Single novels, like ‘Uncle Tom’s Cabin,’ may have surpassed any of Dickens’ works, and several contemporary novels have had marvelous success, but with the exception of Scott, there is in English fiction no instance of such widespread and lasting popularity for so long a succession of novels. Of late years there has been some critical disparagement of Dickens as an artist, but it is doubtful if this has in any way affected his popular vogue or lessened the solid esteem that people feel for him.

The reasons for his great success and the just estimation in which he is held are usually accounted to be the marvelously vital and resourcefulness of his characterizations, the copious and rapid, though lengthy, movement of his narrative, and the unfailing spring of his humor. His power of seeing effects in situations and humors in character and of depicting them with a few salient strokes have probably been the cause of his adding more figures to the common store of characters than any writer since Shakespeare. Most of these figures, it has frequently been observed, are taken from the lower strata of society; with the so-called higher classes he is uniformly less successful, and in some instances wholly unconvincing. His natural habit of mind and his training as a reporter early gave him the faculty of taking in a large number of details at a glance, and his boyhood experience and his active life in London had furnished him with an abundance of material. The subtler effects of more refined or intellectual society were foreign to his early impressions and were beyond the scope of his swift, definite delineation. In this respect he would fall short of Fielding, Scott and Thackeray as an analyst of various humors, but outside of these three writers it is doubtful if any English novelist has so great a range of characterization. Certainly no English novelist has depicted a greater number of characters. His performance remains, in spite of attempts to disparage his genius, one of the most vigorous and lasting in English literature. See DAVID COPPERFIELD; GREAT EXPECTATIONS; OLIVER TWIST; PICKWICK PAPERS; A TALE OF TWO CITIES.

Bibliography.—Standard editions of Dickens are numerous. One of the most recent is Kerton, ‘The Autograph Edition of Complete Works’ (56 vols., New York 1902). The chief life is by his friend John Forster, ‘The Life of Charles Dickens’ (London 1872). Among other books may be mentioned Chesterton, ‘Life of Charles Dickens’ (New York 1906); Fields, ‘Yesterdays with Authors’ (Boston 1872); Fitzgerald, ‘The History of Pickwick’ (London 1891); id., ‘Life of Charles
Dickens as Revealed in his Writings (ib. 1905); Fitzgerald, P. H., 'Memoirs of Charles Dickens' (London and New York 1914); Gissing, 'Charles Dickens: A Critical Study' (New York 1898); Hogarth, 'Dickens and Dickens' (London 1882); Hughes, 'Dickens as an Educator' (New York 1900); Kent, 'Charles Dickens as an Actor' (London 1872); Kitton, 'The Novels of Charles Dickens' (ib. 1897); Lehmann, 'Charles Dickens as an Editor' (New York 1912); Marzials, 'Life of Charles Dickens' (1887); Pemberton, 'Charles Dickens and the Stage' (London 1888); Pugh, 'The Charles Dickens Originals' (ib. 1912); and Thomson, 'Dickens Bibliography' (Warwick 1904). Consult also Cross, W. L., 'The Development of the English Novel' (New York 1899).

WILLIAM T. BREWSTER, Professor of English in Columbia University.

DICKENS, Charles, English editor: b. 1837; d. Kensington, England, 20 July 1896. He was the eldest son of the preceding; was educated at King's College, Eton and at Leipzig; became assistant to his father as editor of All the Year Round and subsequently chief partner in a printing firm. He edited a 'Life of Charles Mathews', 'A Dictionary of London', 'Parish and the Thames', and a complete edition of his father's works.

DICKENS, Mary Angela Evans, English novelist. A granddaughter of Charles Dickens. Her best-known novel is 'A Mere CIPHER' (1893). She has also written 'Cross Currents' (1892), 'Prisoners of Silence' ('The Children of the Age', 1897); 'The Edge of a Precipice' (1899); 'The Wastrel' (1901); 'Unveiled' (1907); and 'The Deborj' (1912).

DICKIE, George William, American engineer: b. Arbroath, Scotland, 17 July 1844. He studied engineering in his father's shipyard, and with the North British Railway Company, and came to the United States in 1869. He was engaged in steamship work on the Pacific Coast, designed machinery for the Comstock mines, became president of the Union Iron Works in 1873, and in 1876 he went to New York. In 1905 he became consulting marine and mechanical engineer of the Panama Canal Company. He was at one time president of the Technical Society of the Pacific Coast. He has written 'Pumping and Hoisting Works' (1876) and numerous papers and articles.

DICKINS, John, American Methodist clergyman: b. London, England, 24 Aug. 1747; d. Philadelphia, Pa., 27 Sept. 1798. He was educated at Eton and emigrated to America prior to the American Revolution. Embracing Methodism in 1774, he entered that ministry, becoming one of the most notable preachers of his day. He was instrumental in founding Cokesbury College, Maryland, and the Methodist Book Concern.

DICKINSON, Anna Elizabeth, American orator, novelist and playwright: b. Philadelphia, 28 Oct. 1842. At the outbreak of the Civil War she became known as a speaker, and under the stimulus of the great events became an orator of great power and persuasiveness, who created by her youth, real pathos and brilliant rhetoric. She was named Mary Vanderbilt and a warning cry was heard. Her prominence was gained mainly by her fiery addresses on total abstinence, abolition, politics and woman suffrage. After a time she devoted her whole attention to lecturing and to the drama. She was called the 'Joan of Arc of the War'. Some of her books are 'What Answer' (1868), a novel; 'A Paying Investment' (1876); 'A Gift for Girls' (1876); 'A Ragged Register of People, Places and Opinions' (1879). She was the author of two plays of excellent dramatic quality, 'Anne Boleyn' and 'Marie Tudor' (1875), in which she played the title roles.

DICKINSON, Charles Monroe, American author and diplomat: b. Lowville, N. Y., 15 Nov. 1842. He attended school at Lowville Academy and Fairfield Seminary, and was admitted to bar 1865; and practised law in Binghamton and New York 1865-78. He was editor and proprietor Binghamton Republic 1878-1911. It was upon his suggestion and initiative in 1892 that the several news organizations in this country were combined into the present Associated Press. He was presidential elector 1896; and in 1897 was appointed by President McKinley United States consul general to Turkey. From 1901-03, he was diplomatic representative to Bulgaria. While serving in this capacity, the American missionary, Ellen M. Stone, was carried off by brigands and, through his efforts and settlement, she was rescued. He was appointed member of the board to draft rules and regulations for the American consular service, 1906; American consul-general-at-large, 1906 to 1 Oct. 1908, when he resigned because of fatal illness in his family. He is a member of the Authors' Club of New York; president of the Barlow Board of Industrial Arts of Binghamton. Author of 'The Children and Other Verses' and 'The Children after Fifty Years' (1915); also part of 'Political History of the State of New York' (1911).

DICKINSON, Daniel Stevens, American lawyer: b. Goshen, Conn., 11 Sept. 1800; d. New York, 12 April 1866. He was admitted to the New York bar, where he soon became prominent; was elected to the State senate in 1830, and became a leader in the Democratic party, which made him lieutenant-governor in 1831 and in 1844 sent him to the United States Senate. There he became known for his pro-slavery and States-rights proclivities, and was made chairman of the Finance Committee. He was brought forward as a candidate for the presidency in 1852, but without success. He spent the later part of his life at Binghamton, N. Y., in the practice of his profession. His 'Life and Works' was published in 1867, two volumes.

DICKINSON, Donald McDonald, American lawyer: b. Port Ontario, N. Y., 17 Jan. 1846; d. Trenton, Mich., 15 Oct. 1917. He graduated at the law department of the University of Michigan in 1867, and began the practice of law in Detroit, where he rapidly rose to a foremost position at the bar; and later practised in Washington, D. C. He was conspicuous in politics as a Democrat; was secretary of the Democratic State central committee, which managed the Greeley campaign in 1872; withdrew from the Democratic party, but was won back by Mr. Tilden; and was chairman of the Democratic National committee in 1876; and again in 1884-85. He was Postmaster-General of the, United States in 1887-89; chairman of the Democratic National campaign committee in
DICKINSON — DICKINSON COLLEGE

1892; and senior counsel for the United States before the Joint High Commission on Bering Sea claims, under the Pur Seal Arbitration in 1896-97. He was a member of the Court of Arbitration to adjust the controversy between the United States and the Republic of Salvador in 1902.

DICKINSON, (Goldsworthy) Lowes, English author, son of the artist, Lowes Dickinson. He was educated at the Charterhouse and at King's College, Cambridge, of which he became Fellow and lecturer. He was also appointed lecturer at the London School of Economics and Political Science. He has been particularly happy in adapting the dialogue as his literary medium. His published works include 'The Greek View of Life' (1890; 3d ed., 1906); 'From King to King: The Tragedy of the Puritan Revolution' (1891; 2d ed., 1907); 'Revolution and Reaction in Modern France' (1892); 'The Development of Parliament during the Nineteenth Century' (1895); 'Letters from a Chinese Official' (1903), which was answered by W. T. Bryan in 'Letters to a Chinese Official' (1906); 'Religion: A Criticism and a Forecast' (1905); 'A Modern Symposium' (1906); and 'Is Immortality Desirable? ' (1909); 'Religion and Immortality' (1911). Consult Chesterton, G. K., 'Heretics' (London 1909); More, 'Shelburne Essays' (Vol. VII, New York 1910).

DICKINSON, Jacob McGavock, American lawyer and public official: b. Columbus, Miss., 30 Jan. 1831. He was graduated at the University of Nashville in 1857, studied law at Columbus College, New York, also at Leipzig and Paris. In 1874 he was admitted to the bar and practised at Nashville from 1874 to 1899, and in Chicago from 1899 to 1909. He served several times by special commission on the supreme bench of Tennessee, was assistant Attorney-General of the United States in 1895-97, Federal solicitor in 1899-1901 and from 1901 to 1909 was general counsel of the Illinois Central Railroad. In 1909-11 he served as Secretary of War in the Cabinet of President Taft. In 1907-08 he was president of the American Bar Association. Since 1915 he has served as receiver of the Rock Island Lines.

DICKINSON, John, American political writer and statesman: b. Talbot County, Md., 13 Nov. 1722; d. Wilmington, Del., 14 Feb. 1808. In 1740 he removed with his father to Delaware. He studied law in Philadelphia in 1750, in 1753 was entered at the Middle Temple, London, and in 1757 began to practise in Philadelphia. He was elected to the Delaware assembly in 1760 and two years later to the Pennsylvania assembly. He served with distinction till 1765 and again in 1770-76. In 1774-76 he was a member of the Continental Congress. He also served in the American army, attaining the rank of brigadier-general in the Delaware militia. In 1781-82 he was governor of Delaware and in 1782-85 was governor of Pennsylvania. He was prominent in the debates of the Constitutional Convention of 1787, but is best known as a writer of State papers and as the author of 'Letters from a Pennsylvania Farmer to the Inhabitants of the Colonies' (1767); 'Essay on Constitutional Power of Great Britain over the American Colonies' (1774). He opposed the Declaration of Independence and refused to sign it. His influence waned after 1776 on this account. His 'Writings,' edited by Paul L. Ford, were published at Philadelphia (1895). Consult Stille, 'Life and Times of John Dickinson' (Philadelphia 1891) and Tyler, 'Literary History of the Revolution' (New York 1897).

DICKINSON, Jonathan, American Presbyterian clergyman: b. Hatfield, Mass., 22 April 1688; d. Elizabethtown, N. J., 17 Oct. 1747. He was graduated at Yale College in 1706 and soon afterward was installed as pastor of the Presbyterian congregation in Elizabethtown, N. J., which relationship continued until his death.

DICKINSON, Martha Gilbert, American poet: b. Amherst, Mass. She is a niece of Emily Dickinson, and was married to Alexander E. Bianchi, 24 July 1903. She has published 'Within the Hedge: The Cathedral and Other Poems' (1901); 'A Modern Prometheus' (1908); 'The Cuckoo's Nest' (1909); 'Russian Lyrics and Cossack Songs' (1910); 'The Sin of Angels' (1912); 'Gabrielle and Other Poems' (1913); 'The Kiss of Apollo' (1915); and also contributions to magazines and literary periodicals.

DICKINSON, Mary Lowe, American educator and author: b. Fitchburg, Mass., 1839; d. New York 8 June 1914. She was married to John B. Dickinson, a New York banker, and after his death taught in schools in Boston, Hartford and New York, being for some time principal of the Van Norman Institute in the last-named city. She edited the Silver Cross magazine for 10 years and was the editor of Lend a Hand. She published volumes of fiction and a collection of poems; also many short stories and much general literary work.

DICKINSON, Peard, English clergyman: b. Topsham, England, 16 Nov. 1758; d. London, 15 May 1802. In 1779 he completed his university course and took his M.A. degree at Saint Edmund's Hall, Oxford. For three years he was curate of the noted rector of Kent, Vincent Perronet. In 1786 he became assistant to Charles Wesley at the New Chapel. He had the complete confidence of John Wesley. Mr. Dickinson was the author of a life of Melancthon. His life was written by Joseph Benson and published in 1803.

DICKINSON COLLEGE, a coeducational institution in Carlisle, Pa., founded in 1783, under the auspices of the Presbyterian Church. The charter is dated Dec. 12, 1783. The college is elected by the general assembly of the State as the result of an appeal by the leading men of the Commonwealth, including Benjamin Rush and John Dickinson. It was named after the latter in
memory of his important services to his country and in commemoration of his donation to the college of 200 acres in York County, 500 acres in Cumberland County, $500 in cash and a number of valuable books. The college began its work in 1784. In 1796 the present site was purchased from the Penns for $150. The first building was destroyed by fire, but another, now known as West College, was erected by popular subscription in 1804. In addition to West College, the other buildings are South College (1835), East College (1836), the Law School (1877), Toma Scientific Building (1884), Gymnasium (1884), Bosler Memorial Library Hall (1885), Denny Memorial Hall (1896). The government of the school was changed somewhat in 1833, and it came under the charge of the Methodist Episcopal Church. The degrees conferred by the college are B.A. and B.S. The annual income amounts to about $50,000. In 1916 the number of students enrolled was 501 and the number of volumes in the library was 34,000.

DICK'S COFFEE HOUSE, a house in London, of which Richard Torner was the first proprietor, about 1690; from him it was called "Richard's" and later received its present name. It is now No. 8 Fleet street, near the Temple.

DICKSON, BARON Oskar von, Swedish merchant: b. Göteborg, of Scottish ancestry, 1823; d. 1897. He was a member of many learned societies and was a liberal contributor to the support of various Arctic expeditions. He was ennobled in 1890 and in 1895 was made baron. Dickson Harbor in the Arctic regions is named from him.

DICKSON, SIR James Robert, Australian statesman: b. Plymouth, England, 1832; d. 1901. He received his education in Glasgow and entered the City of Glasgow Bank. In 1854 he emigrated to Australia, settling at first in Victoria, then in New South Wales and finally, in 1862, in Queensland. He was elected to the Queensland Assembly in 1872 and in 1876 became Minister of Public Works in Melbourne. In 1876-79 he was treasurer of the colony and again in 1883-87. In 1889-92 he lived in Europe; in the latter year he was again elected to the House of Assembly and re-elected in 1893 and 1896. He became Secretary for Railways in the Nelson Cabinet of 1897; became Secretary for Home Affairs in March 1898 and Premier in the month of October following. He favored the establishment of an Australian commonwealth, secured a referendum on the question and obtained a majority in favor of federation. He resigned the premiership in November 1899 and a month later was appointed Chief Secretary in the Robert Philip Cabinet. In 1900 he was Queensland delegate to London to discuss matters in relation to the proposed commonwealth. He became Minister of Defense in the First Federal Cabinet, was knighted but died within a few days after the inauguration of the new federal government.

DICKSON, Leonard Eugene, American mathematician: b. Independence, Iowa, 22 Jan. 1874. He received his education at the universities of Texas in 1893 and later studied at the universities of Chicago, Paris and Leipzig. In 1897-99 he was instructor in mathematics and in 1899 assistant professor of mathematics in the University of California. In 1899-1900 he was associate professor of mathematics in the University of Texas and in 1900-07 was associated professor, and after 1910 professor of mathematics in the University of California. In 1908 he served as research assistant at the Carnegie Institution, Washington, D. C. He is editor of the 'Transactions of the American Mathematical Society,' the 'American Mathematical Monthly.' He is author of 'Lectures on Differential and Exposition of the Galois Field Theory' (1901); 'College Algebra' (1902); 'Introduction to the Theory of Algebraic Equations' (1903); 'Linear Algebra' (1914); 'Theory of Equations' (1914); 'Algebraic Invariants' (1915).

DICKSON, Samuel Henry, American physician: b. Charleston, S. C., 20 Sept. 1798; d. Philadelphia, 31 March 1872. He was graduated at Yale College in 1814 and immediately after commenced the study of medicine in his native city. He was instrumental in the establishment of a medical college in Philadelphia, and on its organization in 1824 he was called to the chair of institutes and practice of medicine. In 1858 he was called to the chair of practice of medicine in the Jefferson Medical College, Philadelphia, which he held till his death. He was author of 'Manual of Pathology and Practice of Medicine'; 'Elements of Medicine' (1835); 'Essays on Pathology and Therapeutics' (1845); 'Essays on Life, Sleep, Pain, etc.' (1852). It is a worthy fact of note that he delivered the first temperance address ever heard south of Mason and Dixon's line.

DICKSON, William Purdye, Scottish theologian: b. Pettinain Manse, Lanarkshire, 22 Oct. 1823; d. 1901. He received his education at the University of Saint Andrews. In 1863 he became professor of divinity in the University of Glasgow and in 1895 was made professor emeritus. He translated Mommsen's 'History of Rome' (4 vols., rev. ed., 1895); 'Roman Provinces' (1887) and Meyer's 'Commentary on the New Testament' (10 vols., 1873-80). He delivered the Baird lectures of 1883, 'St. Paul's Use of the Terms Flesh and Spirit' (1883).

DICKSON CITY, Pa., borough in Lackawanna County, five miles north of Scranton, on the Delaware and Hudson and the New York, Ontario and Western railroads. It is a coal mining centre and contains foundries and machine shops and silk mills. The government is vested in a burgess and a unicameral council. Pop. 11,198.

DICLINOUS, dik'li-nús or dí-kli'nús, a Linnaean term for flowers possessing stamens or pistils only—Monocotyledonous or Polygamozygous.

DICOTYLEDONS, a subdivision of the angiosperms, or plants with encased ovules, which is characterized by the fact that the embryo has at least two (sometimes more) cotyledons or seed leaves, whereas the monocotyledons (q.v.), the other subdivision of the angiosperms, have only one. Besides this almost invariable characteristic, of nearly equal constancy are the structure of the stem, which consists in the mature plant of a wood layer surrounding a pith, and separated from the last layer enclosing it by an adventitious growth, the cambium; the forked, Anastomosing venation of the leaves, with free veinlets ending in the margin, which may be lobed or
toothed; and the prevalently quaternary or quinary symmetry of the flower, as opposed to the usual ternary symmetry of the monocotyle-
dons. There is a very interesting difference between the development of the embryo of the
dicotyledons and that of the monocotyledons.
In both cases, the cell formed by the union of the
two gametes gives rise to a filament of cells placed
to end, the so-called proembryo. In the
dicotyledons, the terminal cell by dividing
generates the entire embryo except the tip of
the hypocotyl, which is formed from a portion
of the next cell. In the monocotyledons, the
terminal cell forms only the cotyledon, while the
whole remainder of the plant is formed from a
part of the next cell. The dicotyledons group
themselves into two great series: the Chori-
petala, with free petals and sepals; and the
Sympetala, with the petals coherent. Those
Choripetala which lack a corolla together with
a few related forms are known as the Monocl-
chlamydeae, as opposed to the Dialypetala. The
orders of Monochlamydeae are the Verticillata,
containing the cassowary trees; the Juglandi-
flora, or walnuts, Querciflorae, or relatives of
the oak, Saliciflorae, or willows and poplars, and
Urticiflorae, containing the elms, mulberries, pe-
rtles, etc., all of these orders being characterized
by the possession of catkins consisting of uni-
sexual, wind-fertilized simple flowers, the
Loranthiflorae, containing the mistletoe; the
Fischeria, or peppers; the Hamamelidinae, or
relatives of the witch-hazel; the Tricoccaceae,
typified by the spurge, and the Centrospermae, such
as the rhubarb, spinach, pink, cactus, etc. The
orders of Dialypetala are the Polycarpaceae,
to which belong the water-lilies, crowsfoots, magn-
olias, etc., usually with free carpels and a
spiral arrangement of some parts of the flower;
the Rheedinae, to which belong the poppies,
mustards, etc., the Cistiflorae, among which are
the violets and the tea plants; the Columni-
ferae, often with a large number of stamens in a
single whorl, containing the mallows, cocoa-
tree, etc.; the Grunales, containing the allies of
the geranium; the Sapindae, among which are
the sumacs, maples and horse-chestnuts; the
Frangulinae, with the grape vine and its allies;
the Rosulinae, with the currants, goosebe-
ries, etc.; the Rosiflorae, containing the rose,
apple, strawberry, plum, etc.; the Leguminosi,
with a pod for a fruit and with flowers usually
bilaterally symmetrical, to which belong such
forms as the bean, pea, clover and lentil; the
Passiflorinae, such as the begonia, papaw and
passion-flower; the Thymelinae; the Myri-
flora, with the myrtle and eucalyptus; and the
Umbelliflorae, or dogwoods, ginsengs, carrots,
parsleys, etc., in most of which the flowers are
borne in simple or compound umbels. The
Sympetala are divided into the Pentactycycica,
with two whorls of stamens, and the Tetracy-
cycica, with one. The Pentactycica consists of
the Eriinae, or heath allies; the Dioicinae,
containing the persimmon, ebony tree, naseberry,
etc.; and the Primulinae, typified by the prim-
rose. The orders of the Tetractycica are the
Contorta, to which belong the olive, lilac, gen-
tian, milkweed, etc.; the Tubiflorae, such as the
morning-glory and mint; the Personatae, among
which are the parsley, with the currants, goose-
berries, plantain, etc.; the Rubinae, containing the coffee
plant, elder and viscaria; the Companulinae, or
bell-flowers, lobelias and gourds; and the vast
assemblage of the Aggregatae, characterized by
the grouping of the flowers in heads with a
common involucre and the reduction of the
calyx of the separate flowers. This last order,
which contains the daisies, sunflowers, asters,
tansies, yarrow, etc., possesses at least
12,500 species. The total number of dicotyledon-
onous species is not less than 103,000 whereas
there are only about 25,000 monocotyledons.

DICROTIC WAVE, a double beating, as
in the human pulse. Each pulse-wave begins
with an ascent corresponding to the systole of
the heart. This ascent usually forms, as regist-
ered by the sphygmograph, an unbroken line
until the apex of the curve is reached and the
descent commences. The descending curve is
marked by several minor waves, one of which
being quite pronounced is known as the dicrotic
wave, and is probably due to a reflection of the
arterial tension on the periphery.

DICTAMNUS. See Dittany.

DICTAPHONE, an adaptation of the pho-
notograph to the needs of business correspond-
ence or other work of a literary character,
taking the place of the stenographer. The
machine carries a waxen cylinder on which it
records the spoken words of the dictator. This
cylinder is afterward placed in a transcribing
machine at the typist's desk, and the typist
writes the letter or other matter direct from
the record. After the letters have been tran-
scribed the cylinder is placed in a shaving
mechanism, the groove is thus removed, and
the cylinder is then ready to record a new
series of dictations. Each cylinder will thus
serve to record from 1,000 to 1,200 average
letters. All the mechanical movement neces-
sary is supplied by electric motors, controlled
by switches. The advantages claimed for the
machine are the saving of the stenographer's
time in toto; the saving of a part of the dic-
tator's time often consumed in waiting upon
the leisure of the stenographer, in halts where
the speed is too great, and in repetitions; and
the opportunity afforded to the typist of check-
ing the work by a complete repetition of the
original dictation exactly as it was given.

DICTATOR, an extraordinary magistrate of
ancient Rome, first appointed 501 B.C. At
first no one was eligible to the office who had
not been previously a consul. The power of
naming a dictator, when an emergency arose
requiring a concentration of the powers of the
state in a single superior officer, was vested by
a resolution of the Senate in one of the consuls.
A plebeian dictator was first appointed 356 B.C.
The dictatorship was limited to six months, and
the person who held it could not go out of Italy
and could not touch the treasury. The dictator
had the power of life and death, and could
abolish without appeal. All the other magis-
trates were under his orders. He had 124
lictors, and, if the Senate so desired, was entitled to a consul.
Such were the dictators appointed to carry on
the government of the state in special emer-
gencies; but dictators were often appointed for
temporary purposes, especially during the ab-
ence of the consuls. The object of the tempo-
rary dictator was to superintend the discharge of some function which could only
be lawfully performed by the first magistrate, as
the holding of the comitia (or meetings) for the
elections. The last dictator entrusted with the government of the state under the republic was appointed 216 a.c., the last temporary dictator 202 a.c. The office was revived by Sulla 82 a.c., and afterward held by Cesar 49 a.c., but in these cases the legal restrictions were not regarded, and the office bore no resemblance but in name to the ancient dictatorship. It was abolished during the consulship of Antonius, 44 a.c. In modern times the term is largely applied to usurpers who have arrogated to themselves extraconstitutional powers. The rulers of Paraguay bore the title of dictator for a number of years, and those of other Spanish-American countries have done so from time to time. Consult Greenidge, 'Roman Public Life' (London 1907); Mommssen, 'Römische Staatsrecht' (3d ed., Leipzig 1887).

DICTIONARY (Low Latin dictionarium, first used in the 14th century; from dicto, post-classical synonym for verbum, word). The various applications of the term, general and special, are so familiar that a detail would be of no service. Of its synonyms, it may be said that the Greek word lexicon is customarily restricted to a dictionary of ancient or Oriental languages, with definitions, etc., in the language of the supposed reader; glossary and vocabulary to dictionaries of the terms used in the special works to which they are attached. A glossary (called by the Germans idiotikon, by the Italians vocabolario) is a defined list of unusual, antique or foreign words; a vocabulary, in classical works sometimes called an index, belongs to a book in or text-book of a foreign language, and renders the foreign words into the reader's language, or the exercises of the latter into the foreign.

The modern use of the term dictionary is not limited to a simple compilation, but has been extended to technical and other subjects, in which alphabetical arrangement of topics is maintained. Thus at present there are biographical, bibliographical, geographical, mathematical, historical, philosophical, medical, musical, rhyming and other dictionaries.

Functions.—The variation of kind with the variation of users and origin, common to all literature, is well exemplified in dictionaries. The original dictionary was a simple definition of words which a cultivated reading class was supposed not to know,—foreign, provincial, technical, obsolete, etc.; the modern dictionary of its own language attempted to exclude nearly all but the accepted vocabulary of current literature,—that is, what people knew already,—or at least what would be needed for such reading; the later ones increasingly include the means of understanding everything ever printed in a language. Two classes only, for obvious reasons, are still excluded, one of which the older ones gave), by reason of the change in audience from men to women and children: gross words, except a few too important philologically to be spared; and argot. The abridged dictionaries for many years, with ludicrous logic, excised the difficult words and retained the familiar ones; the first to exercise common-sense and reverse this plan was Jabez Jenkins in his wonderful vest-pocket lexicon, whose nearly 30,000 words contained almost all the unusual ones and the essentialtranslators' words, the first to exercise common-sense and make a frame in full dictionaries are now recognized as injudicious: that a word or form of a word has gone out of use is the very reason it should be defined or at least cross-referenced. An incomplete record of the language is by so much unseervicable. Part of the exclusions resulted from the growth of the half-educated middle class who looked to it as a standard of taste. The French Academy at first omitted all technical terms, and all words assumed below its standard of elegant usage; but as this made the book half useless, and the problem added to the Academy's ignorance or carelessness instead of its fastidiousness, it could not be maintained. Recent dictionaries attain the same end by marking words as obsolete, little used, provincial, colloquial, slang, vulgar, etc. The attempted arbitrament of pronunciations, though inevitable (being among the chief services for which they are consulted), will always remain a battle-ground embarrassing even to the umpires. Still more important, however, is a dictionary's value for the historical development of a language. No dictionary fulfills its best purpose which does not, as far as possible, trace the varying significations from their sources, with their development by metaphor or technical use; and any arrangement which obscures this is vicious; temporary convenience may be subserved. As the validity of this development depends on citation of passages, these should be full, otherwise we have only the arbitrary assertion of the compilers. Back from even this lie the original etymologies of the words, which are of great value and even more interest; and the best dictionaries give them with their affiliations in other languages. All the irregular grammatical forms, and the particles by which words are inflected,—a sufficient grammatical apparatus for correct usage,—should be given as a matter of course. Syllabifications, divisions, etc., should also be indicated: in a word, the dictionary is a proof-reader's vademecum, and must contain all requisite material for him to use.

Arrangement.—The recognition of usefulness being that the items shall be easily found, no arrangement is tolerable except an alphabetical one, in all languages where the inflections are mainly terminal or after a consonant initial. This arrangement, however, must be used only in a key, making feasible other classifications for the main body; as in Roget's well-known 'Thesaurus' of synonyms, where the grouping is by ideas, in parallel column with the reverse ideas. This would be a very useful addition to the meagre lists of synonyms given in the large dictionaries; but it would need great labor and almost impossible accuracy of cross-referencing, as the group heads must be referred to from each word in its alphabetical place. A very useful variant is in the lists of technical terms of arts and sciences given under each main head in the 'Standard Dictionary.' Rhyming dictionaries are arranged alphabetically under the terminations. In etymological dictionaries, attempts have been made to alphabetize by roots; but as no two scholars ever agree on the roots, the finding is largely guesswork, unless with a full alphabetical key, and scholars condemn the plan. In Semitic languages the arrangement is usually by roots. It was this necessity of arranging Volapük dictionaries, owing to the prevalence of inventing a search in three or four places for one word, which as much as anything else prevented
that "language" gaining favor. The arrangement of Chinese characters is almost incapable of any readily intelligible system, and is not settled by sinologists.

The first dictionaries were used by the Assyrians and Babylonians, to explain not words, but signs. The ancient ideographs, when largely displaced by syllabified or alphabetic signs with phonetic values, rapidly became unintelligible; and syllabaries were therefore compiled; and of late, the former. The old Sumerian language, however, seems not then to have become "dead," being preserved by the colleges of priests for religious use; and foreign languages were learned from foreigners. These were inscribed in vertical columns, on clay tablets; they have been found in the great library of Asurbanipal (Sardanapalus — 668-626 B.C.), at Nineveh, the source of our chief knowledge of Mesopotamian culture. Much the same sort of syllabaries seem to have been used by the Chinese and Japanese.

The ancestry of our own dictionaries, however, is Greek. Here we observe the usual progress from the special to the general. The typical modern dictionary is a complete or representational vocabulary of a language, present and past, with definitions in its own or some foreign tongue; its object being to interpret either the meaning of the foreign tongue or the bygone part of its own, or the usages and history of the latter. But neither of these was thought of by the ancients. The small upper and priestly class settled their own usages of language, there was no half-educated reading populace relying on books for correct form, there was no foreign literature they cared to read, and foreign conversation they learned from conversation. Their first dictionaries were the same as our special vocabularies. The oldest surviving one, by Apollonius of Alexandria in Augustus' time, was a glossary of Homer's words — probably the oldest of all kinds if we had them, Homer being the common textbook of Homer; the dialectal and local or barbarous, foreign or dialectic phrases in the tragic and comic poets — phrases Attic, Lacedemonian, Cretan, Rhodian, Italian, Phrygian, etc.; others of technical terms in cookery, a fashion setting up in the 1890's. And it is thinking of the cries of the animals, of synonyms, etc. Besides glossaries of Homer, there were others of Plato, the Ten Attic Orators, Hippocrates, etc. All of these, so far as preserved — unhappily, very few of them are preserved, and Athenaeus in the 2d century gives the names of 35 lost to us — are of priceless value both for words and antiquities. On a larger scale were the Onomasticon ("word-books") of Julius Pollux, arranged topically in 10 books, which has survived; and a great lexicon, now lost, written by Helladius of Alorwthia about 400 B.C. Of others may be noted an etymological dictionary by Orion of Thebes about 450, the first we have — for Varro's essays in Roman etymology can hardly be called a "dictionary," though he listed 2000 words; and a lexicon by Hesychius of Alexandria, in the 4th century; and one of words similar in sound, but unlike in meaning, by Ammonius of Alexandria. Coming down to the Middle Ages, the most famous is that of Suidas, of unknown date or place, but probably about the 10th century; it is a slowly compilation of words, names and places, but extremely valuable from its matter, not to be had elsewhere. Overleaping some centuries and their works, we come in 1572 to the mightiest of all, the tremendous "Thesaurus Graecae Linguae" of the famous French scholar and printer, Henri Estienne or Stephanus (q.v.), Geneva, 4 vols., folio, a work gigantic not only in size but in scholarship; it was last reprinted by Didot at Paris, 1831-65, ed. Dindorf, 9 vols., folio, 9,902 pages. All the mediaeval and modern lexicons till the 19th century were Greek into Latin; the first Greek-English one was not till 1814, by John Pickering, and that was not finished; the first complete one was by John Jones, 1823, London. For many years the only general one on the market has been the Liddell & Scott, revised by Drisler, in its various editions. This, however, is confined to classic and early-empire forms, to common nouns and to book words; and leaves need for several additional words. Later and mediaeval Greek has been admirably covered by the lexicon of E. A. Sophocles, revised 1887 by J. H. Thayer; and a three-volume lexicon entirely devoted to the vast wealth of forms furnished by the inscriptions in progress. There is one of modern Greek by Contopoulos, Athens 1880; and there are special ones on the Attic, the Byzantine, and of various great authors, English-Greek, Yonge, revised by Drisler, latest edition 1876.

Less needful are details of Latin dictionaries, though they have been very plentiful; in the Middle Ages they were the daily necessity of all cultivated existence. They began much later than Greek — even the etymological treatise of the great M. Terentius Varro, Cicero's contemporary, preserved only in fragments, can hardly be called a dictionary; the first real one is of Vergilius Flaccus under Augustus. One of Gutenberg's volumes was the "Catholic" or "Summa" of Johannes de Janua (Giovanni Balbi), 1460. The monk Calepino published in 1502 at Reggio a Latin-Greek lexicon, which was so famous that for many years all dictionaries were called "carmen" or "corpus," of ambiguous, corrupt or barbarous, foreign or dialectic phrases in the tragic and comic poets — phrases Attic, Lacedemonian, Cretan, Rhodian, Italian, Phrygian, etc.; others of technical terms in cookery, a fashion setting up in the 1890's. And it is thinking of the cries of the animals, of synonyms, etc. Besides glossaries of Homer, there were others of Plato, the Ten Attic Orators, Hippocrates, etc. All of these, so far as preserved — unhappily, very few of them are preserved, and Athenaeus in the 2d century gives the names of 35 lost to us — are of priceless value both for words and antiquities. On a larger scale were the Onomasticon ("word-books") of Julius Pollux, arranged topically in 10 books, which has survived; and a great lexicon, now lost, written by Helladius of Alorwthia about 400 B.C. Of others may be noted an etymological dictionary by Orion of Thebes about 450, the first we have — for Varro's essays in Roman etymology can hardly be called a "dictionary," though he listed 2000 words; and a lexicon by Hesychius of Alexandria, in the 4th century; and one of words similar in sound, but unlike in meaning, by Ammonius of Alexandria. Coming down to the Middle Ages, the most famous is that of Suidas, of unknown date or place, but probably about the 10th century; it is a slowly compilation of words, names and places, but...

For modern European languages into English and vice-versa, the following are standard: French—Smith, Hamilton & Legros, 1891; Spiers & Surenn 1891; Gasc, 1895. German—Thieme-Preussier, 1898; Flügel, 1891; Lucas, 1854–68; Whitney, 1877, valuable for etymology; Adler's, 1875, still unequalled for discrimination of synonyms. Spanish—Velaquez, revised by Gray and Iribar, 1901 (the old Velaquez's Seanco revised with a great new technical vocabulary). Portuguese—Lacerda, 1871; Michaelis, 1894; Valdez, 1879. Italian—Baretti, 1877; Meadows, 1869; James and Grassi, 1894; Millhouse, 1899. Dutch—Callisch, 1890. Danish—Ferrall, Kepp and Rosing, 1873. Swedish—Wenström and Lindgren, 1889; Nilsson, Widmark & Bollin, 1889. Norwegian—Geelmuyden, 1866. Russian—Alexandrov, 1879. Turkish—Redhouse, 1898. Hungarian—Bizony, 1878–86.

Though Oriental and ancient, their close connection with our racial and religious ancestry and current problems make Sanskrit and Hebrew worth noting separately. For the former, the great English works are by Monier-Williams: English-Sanskrit, 1851; Sanskrit-English, 1872. Hebrew, Fürst, 1867.

English lexicography, on its own language begins very humbly, with John Bullokar's 'English Expositor,' 1616. More famous was Henry Cockeram's, 1623, which passed through nine editions up to 1650. Blount (1656), Philips (1658) and Coles (1677) succeeded these; but the great editor was Nathan Bailey's (1721). This gave etymologies, marked accents, and remained the sole possessor of the field till Johnson's appeared in 1755; and was reprinted over a quarter of a century longer from its handy size, the 24th edition dating 1782. Johnson's, however, is the first of any importance from a scholar's point of view. The etymologies are superseded, but he was the first to make a dictionary something like a history of the language, with full (even over-full) illustrative examples, precise definitions, and attention to the form. It has been reprinted as late as 1866, but for popular use is superseded even in England by the best American dictionaries, and for scholars by special works. It did not mark pronunciation except by accents, likely Bailey's. The first to enter on this unending task was Kenrick (1773); then came Perry (Boston 1777); Thomas Sheridan (1780), the elocutionist, father of the great dramatist; Walker (1791), of immense vogue in its time and still cited as an authority, though entirely out of date; Smart (1836), based on Walker; all making their first claim as arbiters of elegant taste. Richardson (1836) was primarily for etymologies. Ogilvie's 'Imperial Dictionary' (1850, new ed. 1883) was the first of the great encyclopedic dictionaries; the 'Century Dictionary' was at first intended only as a slightly revised reprint of Ogilvie, but swelled into the magnificent work so well known. Previously, another English work of the sort had appeared, Hunter's, 1879–88. But the one monumental English dictionary is to be the 'New English Dictionary on Historical Principles,' edited by James A. H. Murray and Henry Bradley, greatly assisted by the late Fitzedward Hall, from matter collected by the Philological Society. It has reached the letter U at this writing, and will take several years to complete; and will form an absolute history of all English words and meanings from 1200 A.D. to date. Noah Webster's first dictionary was in 1806, but the first edition of his epoch-making 'American Dictionary' was in 1828. This has become the 'Webster's International Dictionary' of 1890; always connected with Yale College scholarship, through Webster's son-in-law Chauncey A. Goodrich, and later through Noah Porter. Webster was the founder of American lexicography, and by his enthusiasm and by what he has left a permanent impress on American usages, even where his pet notions have been discarded. His work brought out its chief rival for many years, the 'Worcester's Dictionary' (1800), by a scholar who had assisted him but disliked his innovations, and wished to substitute elegant usage for what he thought Webster's barbarisms. It had great influence for a generation, and has a tenacious tradition yet. The 'Standard Dictionary' (1893–95) is a medium between the impression of Webster and the encyclopedic magnitude of the 'Century.'

Among special dictionaries may be named Jamieson's 'Etymological Dictionary of the Scottish Language,' 4 vols., 1879–82, with a supplement 1887; Wilson's 'English Dictiona- dia,' 1851 and Yule & Burnell's 'Anglo-Indian Words and Phrases,' 1886; Wright's 'English Dialect Dictionary,' about half finished; Bradley's 'Middle English Dictionary,' 1891; Taylor's 'Words and Pronunciation' and 'Revisions, and Blackie's 'Dictionary of Place Names,' with etymologies of names; Bartlett's 'Dictionary of Americanisms' (1877), much too inclusive, and
DIC TOGRAPH — DICYNODON

DIC TOGRAPH, a species of telephone with a sensitive granular carbon transmitter and a large diaphragm which increases the loudness of the sound at the receiving end. This instrument has in recent years figured in many trials. The transmitter is placed inconspicuously behind a picture frame or other object which effectually conceals it, in a room where suspected persons hold conferences. Wires lead to a recording station, where the spoken words are taken down by a stenographer. A variety of the instruments has been installed in the waiting rooms of railroad stations, the announcer speaks into the transmitter and his voice is repeated by several loud-speak- ing receivers located in different parts of the room. See TELEPHONE.

DIC TUM, an expression of opinion by a court on some point not involved in the case under discussion. When the court decision is made some statement which has little to do with the case is often found in the middle of the argument on which it either sheds some light or is allied to it or illustrates the cause in some way. Such expressions are frequently quoted for the judge's opinion on the case and have caused considerable confusion in this way. They are also repeated as binding upon a point which was not involved in the case. When taken by themselves and in their proper relation to the court decision on the real point involved, they are often of great importance and are useful in formulating and grounding other opinions.

DIC TUM OF KENILWORTH, the agreement entered into during the siege of Kenilworth in 1296 by Henry III and the rebellious barons.

DIC TYNIDÆ, a family of spiders which weave irregular webs from two kinds of silk. See SPIDER.

DIC T Y N E M A, genus of fossil graptolites found from the upper Cambrian to the Carboniferous, in the Baltic Provinces, England, Scandinavia, Eastern Canada and New York. The colony, when found pressed out on the surface of a slab, appears as a network of fine filaments radiating from a common base and united at several points by horizontal threads. See GRAPTOPILE.

DIC T Y O T A L E S, a group of marine algae. Their combination of characters is very remarkable, there being present the tetraspores of the red algae, a brown plastid characteristic of the brown algae and sperms proper to themselves. They are generally classed as an offshoot of the red algae.

DIC TYS, dik'tis, OF CRETE, a follower of Idomeneus in the Trojan war, whose name is attached to a professed journal of the leading events of the contest, which he committed to us in Latin prose, under the title 'Ephem- eris Belli Trojaní.' An introduction relates how the narrative, inscribed in Phoenician characters on bark-paper, was found in a coffer of tin in Dictys' tomb, which had been burst open by an earthquake in the reign of Nero, and how the emperor caused it to be translated into Greek; this is accompanied by a letter from one Quintus Septimius, who claims to have prepared the condensed Latin version that follows. Grenfell and Hunt discovered a fragment of the papyrus in 1904-05. It was published in 1907 in the Tebtunis Papyri (Book II). This dates probably from the 4th century A.D., and though of no intrinsic value, was a chief source of the romances of the Middle Ages. The best editions are those of Dederich (Bonn 1832 and 1837) and Meister (Leipzig 1872).

DICY C Y L I C PLANTS. See BIENNIALS.

DIC Y NODON, a genus of fossil reptiles classified with the Anomodonts, or Anomalous-toothed reptiles. Their remains, usually only the skull, occur in a sandstone, supposed to be of Triassic age, in southern Africa and India, and in the Elgin sandstone of Scotland. The bones of the head indicate a distinct type between the lizards and turtles though with some characteristics of the crocodile, but they had two nasal apertures instead of the single one possessed by these other reptiles. The anterior portions of the jaws appear to have been altogether toothless and they form a kind of beak, which was probably sheathed in horn. The lower jaw has no teeth, but each superior maxilla carries an enormous tusk-like canine tooth similar to the tusk of a walrus, growing from a persistent pulp. The eye orbits were
very large and the cranium flat. They were mostly small, the largest skull found being but 20 inches long. The usual size is about six inches long. They were evidently amphibians, and air breathers.

**DIDACHE, did’a-kē.** (Gr. διδασκὴ τῶν δώδεκα ἀποστόλων, the teaching of the twelve apostles), an ancient Christian work, in Greek, of between 120 and 150 A.D. It was found in 1873 by Brynnios, Archbishop of Nicomedia, in the monastery of the Holy Sepulchre. Contemporary with another manuscript was the 11th century. It contains a description of the two ways of life or death, giving rules for Christian conduct. A second part gives directions concerning the observance of the rites of baptism and the Eucharist and their administration, states the duties of apostles, teachers, bishops, etc. The work was held in great esteem in the early church, being quoted as Scripture by some of the Fathers. Most critics are inclined to attribute it to Syria or Egypt and include it among the Apostolic Fathers. The work is of very great value for its information regarding the belief, worship and organization of the primitive Christian church. The text, with critical apparatus, is found in Funk, 'Patres Apostolici' (2d ed., Tubingen 1901). Consult Cruttwell, T. C., 'A Library History of Early Christianity' (2 vols., 1889); Harris, J. R., 'The Teaching of the Apostles' (Baltimore 1887, containing a facsimile of the manuscript); Kemp, Carmen Lake, 'Apostolic Fathers' (in 'Loeb Classical Library,' New York 1912); Krüger, 'History of Early Christian Literature' (ib. 1897); Schaff, Philip, 'History of the Twelve Apostles' (3d ed., ib. 1889).

**DIDACTIC POETRY** (from Gr. διδακτικὸς, pertaining to teaching), has as its object the instruction of the ignorant. In the early ages of Greek literature there was no prose writing. Iasid taught husbandry and theology in verse, Solon harangued in hexameters. Ever since that time verse has had some extent been used as a vehicle of teaching. The early Ionian philosophers, like Xenophanes, expounded their system in poetry, and, in the later days of the Roman republic, Lucretius, in the finest didactic poem that was ever written, unfolded the theories of materialism. Virgil wrote the 'Georgics' to teach the veterans of Augustus the art of agriculture, and Horace in his 'Art of Poetry' embodied for young Roman poets the Greek principles of dramatic writing, while Ovid set forth systematically the 'Art of Love.' Vida, the Italian, Boileau, the Frenchman, Pope, the Englishman, also wrote in verse an 'Art of Poetry.' English poets have been much inclined to didactic poetry. Darwin's 'The Origin of Species' is a treatise on the Linnæan systems of botany. The longer poems of Cowper are moral lectures. Dyer's 'Fleece' is the shepherd's guide, and even the 'Shipwreck of Falconer' may be looked upon as a manual of seamanship.

**DIDELPHIA,** a group of mammals comprising the Marsupials (q.v.), so called in reference to the double condition of the generative organs in the female. See Monodelphian, and see Metatheria.

**DIDEROT, Denis, did’rō.** French man of letters and encyclopedist; b. Langres, 5 Oct. 1713; d. Paris, 31 July 1784. He was educated by the Jesuits but afterward became one of the bitterest enemies of the church. When his education was at an end he became estranged from his family by turning away from respectable callings and engaging in the Bohemian life of a bookseller's hack in Paris. In 1743 he married Anne Toinette Champion, a devout Catholic, but possessed of a narrow and fretful temper; in consequence Diderot's domestic life was unhappy. He sought attachments first with a Madame de Puiseux, who prompted his inconstant nature, 'Les Bijoux indiscrets' (1748), and later with Sophie Voland, to whom he was constant throughout her life. In 1743 he published a translation of Stanyan's 'History of Greece,' and three years later a translation of James' 'A Dictionary of Medicine.' In 1746 he published his first independent work, the 'Pensées philosophiques,' a general statement of the usual rationalistic objections to a supernatural religion. It was followed in 1747 by the 'Promenade du sceptique.' The first work which brought him into general notice was his famous 'Lettre sur les aveugles à l'usage de ceux qui voient' (1749), a study of the philosophy of sensation and its underlying ethical standards and of social condition. It contains strange forecasts of later discoveries and hypotheses, such as the survival by superior adaptation and the suggestion of teaching the blind to read through the sense of touch. The publication of the work caused the imprisonment of Diderot at Vincennes, where he remained three months; then he was released to enter on the gigantic undertaking of his life. Lebreton, the bookseller, had projected a French translation of Chambers' 'Encyclopædia' and approached Diderot in regard to the undertaking. Diderot persuaded the publisher to enter upon a new work which should collect under one roof all the active writers, all the new ideas, all the new knowledge, that were then stirring the cultivated strata of society. The 'Encyclopædia' thus became the organ of intellectual emancipation rather than of any single school of ethics or philosophy. D'Alembert was appointed Diderot's colleague and so remained until 1759. Diderot spent 20 years of unremitting toil on the work, revising, editing, correcting and combating the intrigues of opponents. He wrote all the articles on technology and industries, besides many of those on points of philosophy and even on physics and chemistry. The first volume appeared in 1751 and the last in 1772. The work fell under the ban of the censors in 1759, but owing to the venality and corruption of the authorities the work went on as before, excepting the defences of Turgot and D'Alembert. The work was not primarily revolutionary, but practical. It takes for granted the justice of religious tolerance and speculative freedom. It asserts the democratic doctrine that it is the common people in a nation whose lot ought to be the main concern of the nation's government. The entire work is one unbroken process of exaltation of scientific knowledge on the one hand and pacific industry on the other. Despite this arduous task Diderot gave further facility in the admirable reports on the annual exhibitions of painting, by which he established the first bond between art and literature. He wrote two dramas—'Le fils Naturel' (1757) and 'Le père de famille' (1758), which mark
the beginning of modern domestic drama. His 'Paradoxe sur le comédien' influenced Lessing and the German stage, and Goethe translated an essay of his from the 'Encyclopédie'. His 'Theobald' (1762) is a forerunner of the Aramusic dialogue, 'Le neveu de Rameau,' are wonderfully effective pictures of the corrupt society of the time. His little sketches are pearls of kindly humor and of witty narrative. It is calculated that the average annual salary received by Diderot for his work on the 'Encyclopédie' was but $600 per year. In 1773 he felt obliged to sell his library to provide a dowry for his daughter. It was purchased by Carthorine II of Russia and presented to Diderot whom she constituted her salaried librarian. Diderot went to Russia to thank the empress and spent some months in her society in Petrograd. He returned home in 1774 and passed his remaining years in the acquisition of new knowledge, in epheprophorical compositions and in luminous conversations with his friends, who deemed him unrivaled as a conversationalist. The justice of their opinion is borne out by the fact that his influence on his contemporaries was tremendous. His works were edited by Pratou and Tourneux (20 vols., Paris 1879). His 'Correspondence' with Sophie Voland gives perhaps the best insight into his character.

DIDION, de'dyōn', Isidore, French soldier and author; b. Diedenhofen 1748; d. 1878. He received his education at the Ecole Polytéchnique and the Metz Academy. In 1848 he was appointed head of the percussion-cap manufacture of the French government at Paris and 10 years later was made general of brigade. He was an authority on the science of projectiles; his works on this subject including 'Traité de balistique' (1848; 2d ed., 1860); 'Cours élémentaire de balistique' (1854; 3d ed., 1859); 'Progrès des sciences et de l'industrie' (1875).

DIIDUS SALVIUS JULIANUS, Marcus, Roman emperor; b. about 133 A.D.; d. Rome, 1 June 193 A.D. Having filled the offices ofquestor, aedil, and proconsul, he became commander of a legion in Germany, and subsequently governor of Belgium. Having distinguished himself in Africa and Asia Minor, he returned to Rome, and, on the assassination of Pertinax, made himself emperor by bribing the pretorian guards. He now assumed the name of Marcus Didius Commodus Severus Julianus; but after a short reign of two months was killed in his palace by a common soldier.

DIDO, queen of Carthage. She was the daughter of Agenor (Belus); according to others, of Carchedon of Tyre, from whom Carthage received its name; others call her father Muigo or Muttinus. Her brother was Pygmalion, king of Tyre. Her father married her to her uncle Acrisius, otherwise called Sichaeus or Sicharbas. He was murdered before the altar by her brother, who was instigated by the desire of making himself master of his wealth. She therefore set sail for Africa, with all her wealth and her faithful companions. They landed on the coast of Africa, not far from Lytica, a Tyrian colony. She possessed land as might be covered with the hide of a bull, which she cut into the thinnest possible strips, and surrounded with it a large extent of territory. Here she first built the citadel of Byrsa, and afterward Carthage. Hiabras, a neighboring prince, paid his addresses to her. Unwilling to accept and unable to refuse the proposal, she sacrificed her life on the funeral pile. By an anachronism common with poets, Virgil attributes her death to the faithlessness of Zénea. Dido was worshipped in Carthage as a goddess.

DIDON, dé'dōn, J. Henri, Père, French Dominican preacher and writer; b. Touvet, Isère, 17 March 1840; d. 1900. He entered the Dominican Order in 1858, and attracted much attention for his series of eloquent Lenten sermons. Having come into conflict with his superiors because of his views about devotion, he ceased for a time to preach and resided at Corbara, Corsica. His leisure was spent in preparing a life of Jesus, which should be an antidote to the skeptical 'Vie de Jésus' of Renan. This was published in 1891 under the title
'Jésus Christ,' a book which made a great impression throughout France. He has also written 'Les Allemands' (1884). His last years were spent in the education of youth at the École Albert-le-Grand at Arceuil, near Paris, of which he became director. DIDONCEPHALUS, a monster with a double range of teeth, or a double jaw. DIDOT, dê'dô', Ambroise Firmin, French publisher: b. Paris, 7 Dec. 1790; d. there, 22 Feb. 1866. He was a son of Firmin Didot (q.v.) and with his brother Hyacinthe published such important works as 'L'Univers pittoresque'; 'Nouvelle biographie générale,' etc. He traveled much in the Orient and studied Greek. He began the 'Bibliothèque des auteurs grecs' and also reprinted Du Cange's 'Glossarium mediae et infimae latinitatis.' In 1872 he was elected member of the Academy of Inscriptions and Belles Lettres. DIDOT, Firmin, French publisher, printer and type-founder: b. Paris, 14 April 1764; d. 24 April 1836. He was a brother of Pierre Didot (q.v.). He was inventor of a new sort of script and an improver of stereotype printing. In 1811 he was invited to the Institute and from 1827 till his death represented Nogent-le-Retrom in the Chamber. He translated Tytus and Theocritus and the 'Bucolics' of Virgil. After 1811 he had as partners his sons, Ambroise and Hyacinthe. DIDOT, François, från-swâ, French printer: b. Paris 1689; d. 2 Nov. 1757. He founded the famous firm of Didot in Paris in 1713. His sign read 'À la Bible d'Or.' He it was who published the works of Abbé Prevost. DIDOT, François Ambroise, French printer: b. Paris, 7 Jan. 1730; d. 10 July 1804. He was a son of François Didot (q.v.), and invented many of the machines and instruments now commonly used in the typographic art. From his foundry came the most beautiful types, that, up to that period, had been used in France, and he was the first person in France who printed on vellum paper. He took the greatest care to have his editions correct. By the direction of Louis XVI he printed a collection of the French classics for the use of the Dauphin. The Comte d'Artois employed him to print a similar collection, the 'Collection de divers ouvrages français imprimée par ordre du Comte d'Artois' (64 vols.). DIDOT, Henri, French type-founder: b. 1765; d. 1852. He was a son of P. F. Didot (q.v.), and early distinguished himself as a type-engraver. He then applied himself particularly to improve the method of founding types, in which he succeeded by the invention of a new founding apparatus. He called his process 'fonderie polyamytar.' It is more expeditious than the former mode, and the types are much cheaper. DIDOT, Hyacinthe Firmin, French publisher: b. Paris, 11 March 1794; d. Dandon, France, 7 Aug. 1880. He was a son of Firmin Didot (q.v.), and with his brother, A. F. Didot, conducted the business of the house of Didot from 1827. DIDOT, Pierre, French publisher and printer: b. 25 Jan. 1761; d. 31 Dec. 1853. He was a son of François Ambroise Didot (q.v.), and succeeded his father in the printing business in 1789. In the universal impulse which the arts received from the Revolution he aimed at becoming the Bodoni of France, and conceived the plan of a splendid edition of the classic authors in folio, which should excel, if possible, the best editions extant. He spared no cost to adorn them with all the splendor and elegance of the arts of design, and even sacrificed a part of his property to this favorite object. His 'Virgil' (1798) was worthy of these endeavors, and still more so his 'Europa,' which the French regard as the first typographical production of any age or country. Only 250 copies of these works were struck off. Among the productions of his press, Visconti's 'Iconographie' is particularly distinguished. Didot devoted the efforts of 10 years to the improvement of the types, and caused 18 different sorts, with new proportions, to be cut, with which he printed Boileau and the 'Henriade' in 1819. Didot paid no less attention to correctness and purity of text, and perfect facility of orthography, than to typographical beauty. Consult Piper, Alfred Cecil, 'Some Great Printers and their Work: the Didots' (in Library World, London 1914), and Werdet, E., 'Études biographiques, sur la famille des Didot' (Paris 1884). DIDOT, Pierre-François, French printer: b. Paris, 9 July 1732; d. 7 Dec. 1795. He was a son of François Didot (q.v.), and distinguished himself by his bibliographical knowledge. He also became printer to Louis XVI. He had a great share in the changes made in the character of types, and contributed to the advancement of his art. He published some very fine editions; among them the 'Voyages d'Anacharis.' DIDRON, dê'drô', Adolphe Napoléon, French archaeologist: b. Hautvilliers, Marne, 13 March 1806; d. 13 Nov. 1867. He was advised by Victor Hugo to undertake the study of Christian archaeology. He traveled in Greece, Germany, Italy, England and France, everywhere studying ecclesiastical remains. He began in 1844 to publish 'Annales Archéologiques,' devoted to mediaeval art and antiquities, which he continued to 27 volumes. This work was completed, long after his death, by the 28th volume, which included a general index. It is a valuable storehouse of mediaeval art and archaeology. His chief works are a 'Manual of Christian Iconography,' translated from an ancient manuscript, and 'Christian Iconography' (1843), which forms a history of the representations of the persons of the Trinity in art, their attributes, etc. DIDSURY COLLEGE, a Wesleyan theological institution situated near Manchester, England. It was founded in 1842, from funds collected in 1839 during the commemoration of the centenary of Methodism. It has a high reputation for scholarship, having numbered among its faculty such men as W. B. Pope, the theologian, and Professor Geddes, the great biblical scholar. DIDUNCULUS, a genus of birds allied to the pigeons, and comprising only the one species, D. striirostris of the Navigator Islands. This bird is of special interest as being the nearest living ally of the extinct dodo. It has a length of about 14 inches, with a glossy plumage shining from a velvety black on the back to greenish black on the head, breast and abdomen. The
large beak, which is nearly as long as the head, is greatly arched on the upper half, while the lower is furnished with two or three tooth-like indentations. See Pigeon.

**DIDYNA.** See Branchdier.

**DIDYMÉUS,** did-i-mé’-éz, a surname of Apollo, either because he was the twin-brother of Diana, or from the double light of the sun and moon, which he tends to men. Under this name Apollo had one of the most famous of his temples and an oracle at Didyma among the Milesians. Findar calls Diana Didyma.

**DIDYMIUM** (Gr. “twin”), a supposed metallic element, isolated from the mineral cerite by Mosander in 1842. The symbol D or Di was assigned to it, and its atomic weight was considered to be about 143. The name referred to the close resemblance between the new metal and the element lanthanum, which had been discovered by the same chemist, and in the same mineral, a short time before. Recent researches have shown that didymium is not an elementary body, but that it consists principally of two other elements, which are respectively known as neodymium and praseodymium (q.v.). This discovery renders the name “didymium” singularly appropriate for the new substance.

**DIDYMOCRAPTOUS,** a genus of graptolites, consisting of about 40 species, found abundantly in the graptolite shales of the lower and middle Ordovician in Europe, America and Australia. For structure, forms, etc., see Graptolite.

**DIDYMUS,** Alexandrian grammarian and critic: b. 63 B.C. He was a prolific writer. He belonged to the school of Aristarchus, and was contemporary with Cicero. By Seneca his works were estimated at 4,000; none now extant. Fragments have been published by Schmitt (Leipzig 1854).

**DIDYMUS OF ALEXANDRIA,** ecclesiastical writer: b. 309; d. 394. He became blind when four years old, but nevertheless succeeded in acquiring all the sciences as then known. Athanasius appointed him director of the Theological School of Alexandria. Nearly all his lost works are the result of his labors; for he was one of his pupils, he left a translation of Didymus’ treatise on the Holy Spirit, and there is extant a translation by Epiphanius of his comments on the canonical Epistles. Other extant works, in Greek, are a treatise on the Trinity and one against the Manichaeans. These are contained in Migne ‘Patrologia Graecæ’ (Vol. XXXIX).

**DIDYMUS,** Greek translation of the Hebrew, t‘ón (Aramaic to’ ma’), a twin, of which Διομής, Thomas, is a transliteration. It was the alternative name of one of the three disciples of Jesus (John xi, 16; xx, 24). His first name being Judas, the alternative is given to distinguish him from Judas Iscariot.

**DIE (Dea Vocontiorum),** the capital of an arrondissement in the department of Drôme, southeastern France, is situated on the right bank of the Drôme, at the foot of Mount Glandaz, in a wide and fertile plain. The manufactures are woolen and silk; there is some trade in cattle and timber, and the neighborhood produces excellent fruit, and the white wine called “Clairette de Die.” The town was formerly the seat of a bishop, and previous to the revocation of the Edict of Nantes in 1685, of a Calvinistic university. Among the interesting structures of Die are the old cathedral with granite columns from an ancient temple of Cybele, and the ruins of the 11th century; the episcopal palace, the walls flanked by towers; and the ruins of a castle—all of considerable age; the triumphal arch on the road toward Gap, known as the Porte Saint Marcel, portions of an aqueduct, and other Roman remains. There are several mineral springs in the vicinity. Pop. 4,000.

**DIE ELIXIERE DES TEUFELS.** The Devil’s Elixir (by T. A. Hoffmann, 1816) has held for a century a leading place among the shudder-tales of diabolism. In a cloister is preserved among the relics a bottle once left by the devil in the cell of Saint Anthony. Whoever tastes its contents becomes possessed by Satan. Brother Medardus, to keep his impenitent fame as a preacher, drinks, and gains an intense new life for evil. Haunted by a terrible unknown presence, protected from the confessions of his crimes by his “double,” a crazy Capuchin, who takes the punishments, he runs a wild course of successful criminality as hunter, gambler, and so on, with intervals of self-revealing terrors that border on insanity, and every device of literary fancy to make the naive reader’s blood run cold. At last the ex-monk and libertine returns, after long and gruesome penance, to his cloister and, after a weird phantasmagoria of ghost-walking and witches’ sabbath, attains an edifying death. The book is remarkable, even in comparison with Hoffmann’s other tales of terror, for its exhaustless invention, the realistic illusion of its utter unreality, and its power to grip the imagination, while the author seems to smile with romantic irony at his own power. The fantastic humor of “Devil-Hoffmann” finds more congenial expression in ‘Lebensansichten des Katers Murr’ An English translation of the ‘Elixir’ appeared in 1824, and has been followed by many others.

By BENJAMIN W. WELLES.
French campaign of 1814, which terminated the war, and for this he was decorated with the order of Alexander Nevsky. He took command of the first corps upon Napoleon's return from Elba, but was later appointed adjutant to the emperor, and, having been made chief of staff, accompanied him on his journey through southern Russia, till his death at Taganrog, in 1825. Diebitsch thereupon returned to Saint Petersburg, and by his intrepid conduct during the Revolution of December, won for himself the title of baron, and later Emperor Nicholas created him count. He had the chief command in the Turkish War of 1828–29; stormed Varna; and made the famous passage of the Balkans, compelling the Porte to conclude the peace of Adrianople, for which the surname of Sabalkanski (Trans balkanian), was conferred upon him, and he was raised to the rank of field-marshall. He was appointed commander-in-chief of the army sent to put down the rebellion which had broken out in Warsaw, 29 Nov. 1830, and was also made governor of the provinces adjoining Poland. In this campaign he did not meet with success, suffering defeats at Wisniew and Stoczek, 11 Feb. 1831; at Dobre, on the 18th; and at Wiercioch on the 19th, and in the series of engagements fought near Praga, in March. He was, however, more successful in the bloody battles of Nur, Lornza and Ostrolenka, fought from 15–26 May, but after establishing his camp at Kleczow, was taken sick with choler a, and died shortly afterwards. Consult Belmont, 'Graf Diebitsch' (Dresden 1830); Chesney, 'Russio-Turkish Campaigns of 1828–29' (New York 1856).

DIELENHOVEN, dé-dén-ho'fén. See THIONVILLE.

DIEFENBACH, Lorenz, dé'fén-bakhir, German philologist: b. Osthheim, Hesse, 29 July 1806; d. Frankfort-on-Main, 28 March 1883. He was 12 years pastor and librarian at Solms-Laubach. In 1848 he settled at Frankfort-on-Main, where in 1865 he was appointed second librarian to the city. His literary industry was enormous, embracing Getreue Nachlass, as well as those more ponderous works by which his name will live. His greatest books are 'Celtica' (1839–40); 'Vergleichendes Wörterbuch der Gothischen Sprache' (1846–51); 'Glossenbuch Latino-Germanicum medise et infirmæ æstatis,' a supplement to Ducange's well-known 'Glossary' (1857); 'Origines Europææ'; 'Hoch- und Niederdeutsches Wörterbuch' (with Wücker, 2 vols., 1874–75).

DIEFENBACH, Georg Christian, German poet and theologian: b. Schlitz, Hesse, 1822; d. 1901. He was educated at Giessen and was made chief pastor of his native place in 1871. His poems for children are still very popular in Germany. He also wrote many liturgical, devotional, homiletic and poetic works which attained a great degree of popularity.

DIEFENBACH, Johann Friedrich, German surgeon: b. Königsberg, 1 Feb. 1794; d. Berlin, 11 Nov. 1847. He was educated in theology, but from 1813–15 served as a volunteer in the war against Napoleon. Until he was 35 he was absorbed by himself to the study of medicine, taking his degree at Würzburg in 1822. He soon became widely known as an operator; in 1830 became head surgeon in a Berlin hospital; in 1832 became a professor in the university; and in 1840 director of clinical surgery. He was distinguished as an operator, especially in the art of forming by transplantation new noses and lips. He wrote 'Die Transfusion des Blutes und die Einspritzung der Arzneien in die Adern' (1828); 'Chirurgische Erfahrungen' (4 vols., 1829–35); 'Durchschneidung der Sehnen und Muskeln' (1841); 'Ueber das Schielcn' (1842); 'Operative Chirurgie' (1844–48).

DIEFFENBACHIA, dé-fén-bák't-ya, a genus of Araceae (arum family), of which there are about 15 species, found in the woods of South America and the West Indies. Their leaves have sheathing petioles, and are often variegated. Their form of inflorescence is the spathe-enclosed spadix characteristic of the order, the spathe in Dieffenbachia being green or yellowish. The best-known species is the poisonous dumb cane of the West Indies (D. seguine).

DIEGO GARCIA, dé-agö gär-the'ä, an island of the Indian Ocean, in lat. 7° S., and long. 72° E., extends in an irregular, lopped shape, and is 30 miles long. It belongs to an archipelago known as the Chagos Islands. It contains a spacious bay, and is very convenient for coaling purposes. The group has about 700 inhabitants, and is a dependency of Mauritius.

DIELECTRIC, a name applied by Faraday to any medium through which electrostatic induction can take place. (See INDUCTION, ELECTROSTATIC). Solids, liquids and gases possess this property of transmission, though in differing degrees, and their dielectric value, or specific inductive capacity, is measured by the ratio of the capacity of a condenser in which each may form the insulator, to the capacity of the same condenser with a vacuum as insulator.

DIELMAN, Frederick, American painter: b. Hanover, Germany, 25 Dec. 1847. He removed to the United States in childhood, and was graduated at Calvin College. He was a topographer and draughtsman in the United States Engineer Department 1866–72; studied art under Wilhelm Diez at Munich, and established a studio in New York in 1876. He designed the mosaic panels, 'Law and History' in the Congressional Library at Washington, D. C., and was president of the National Academy of Design from 1899 to 1909. He was most successful as a genre painter. His best pictures are 'The Patrician Lady'; 'My Own Puss'; 'Lunching' and 'The Young Gamblers.' In 1903 Dieflan became professor of drawing at the College of the City of New York and about the same time was made director of the art schools at Cooper Union, New York. He also assisted in promoting the Society of American Artists; was president of the Arts Federation of New York and an important figure in all art education and advancement.

DIELS, dils, Hermann, German educator: b. Biebrich 1848. He was educated at the universities of Bonn and Berlin and in 1886 became professor ordinarius of classical philology at the latter institution. Among his important works is his 'Doxographi Graeci' (1879), in which he first determined the sources of the doctrines of the Greek philosophers as trans-
mitted by post-Aristotelian scholars. He also issued an edition of Simplicius' 'Commentary on the Physics of Aristotle' (1882); and 'Ueber das physiologische Material der Griechen' (1889). 'Die Fragmente der Vorsokratiker, Griechisch und Deutsch' (1903; 2d ed., 1906-10); a treatise on the 'Sibyllinische Blätter' (1890). He was also a member of the editorial staff of the 'Commentaria in Aristotelem Graecae' and of the 'Archiv für Geschichte der Philosophie' (Berlin, 1887).

DIEMER, dyˈmär, Louis, French composer and pianist: b. Paris 1843. He studied at the Conservatoire under A. Thomas, Marmontel, Benoist and other masters, and took first prize for piano playing at the age of 13. In 1868 he was appointed professor of piano at the Conservatory in succession to Marmontel. At the Exposition of 1889 he gave a series of historical piano recitals, the great success of which induced him to devote himself to the older piano music. He is founder of the Société des anciens instruments and has published a fine collection of 'Clavicinistes Français.' His own compositions in the form of chamber music also include several pianoforte selections, concertstücks for violin, piano, and a brilliant pianoforte concerto.

DIEPENBEECK, deˈpɛnˌbɛk, Abraham van, Flemish painter: b. Bois-le-Duc, 9 May 1596; d. Antwerp 1675. He first studied glass painting, and a number of windows in different churches in Antwerp are his work. Later he studied under Rubens. He made a journey to Italy and on his return to Antwerp in 1641 became director of the Academy. Among his paintings are 'St. Norbert,' 'Ecstasy of St. Bonaventura,' 'St. Francis Adoring the Sacramento,' 'Entombment of Christ,' 'Neptune and Amphitrite,' and the 'Flight of Cleopatra.' (There is some difference of opinion as to the authorship of these works, but they are generally ascribed to Diepenbeeck). He was engaged by Charles 1 and by the Duke of Newcastle to execute numerous drawings. He designed various tapestries and illustrations for books, among others 59 plates of a 'Temple of the Muses' (Paris 1655).

DIEPPE, deˈpɛ, France, seaport in the department of Seine-Inferieure, 93 miles north-northwest of Paris. It is situated between two ranges of chalk hills at the mouth of the river Arques. The harbor accommodation is extensive, there being an outer harbor and four inner basins or docks, and a dry dock 341 feet long and 23 feet deep, but Dieppe has been outdistanced as a port by Havre. The manufactures include works in ivory, the most famed in Europe; works in horn and bone, lace-making, sugar-refining and shipbuilding. Fish is the staple trade. Imports include coal, iron, pitch and cement; exports, silk, wines, brandies, fruit and potatoes also manufactures. The church of Saint Jacques is on a pre-Conquest ecclesiastical foundation, built between the 12th and 16th centuries. Among educational institutions are a commercial college and a school of navigation. The suburb of Le Pollet, connected with the town by a drawbridge, is inhabited by sailors and fishermen said to be of Venetian extraction. The castle was erected for defense against the English in 1435, and successfully withstood siege in 1442, but was subsequently captured and destroyed several times. The town suffered severely from the plague in 1668 and 1670, and was reduced to ruins by the English and Dutch in 1694. It was occupied by the Germans during the Franco-Prussian War. Pop. 23,973.

DIES AND DIE MAKING. In the manufacture of machinery by the modern duplicate system, in which every individual part is so nearly alike that it may be replaced for any other broken or worn part, the job of the diesmith has become of great importance. The majority of working parts of machines — practically all but the heavy castings — are now made by machine forging, the rough metal stock being fed into presses, and cut and stamped into desired shapes. See MACHINE FORGING.

In order that the forging machine or press may do its work, it must be provided with dies for shaping the stock that is pressed or squeezed between them. Dies are commonly made in pairs, as shown in Fig. 1, the halves being termed male and female. They have to be formed with great accuracy, and require sharp, strong cutting or forming edges, and must be tempered as hard as is consistent with toughness. They may be designed in many ways. If it is desired to stamp washers out of thin metal, with a central hole of half inch diameter and one and a half inches over all, one pair of dies could be made to punch out the hole, wasting the half-inch center of metal, and another pair of dies to punch out the washer itself, wasting the spaces between the inch and a half circles. Or gang dies could be made, to punch out say 10 holes at a time, while another pair of gang dies at a following operation punched out the 10 washers complete. Or, better still, a progressive gang die could be made that would comprise both rows of half-inch punches and rows of inch and a half punches. This being placed in the press, and a long strip of metal fed in, and advanced at every stroke, so that the row of half-inch holes would be followed on the next stroke with the inch and a half gang, it is apparent that the press would turn out a series of complete washers at every stroke, the most simple die thus enabling the reader to recognize that in die making the designer has to consider how many parts are likely to be made from the dies, and the greater the number the more labor and expense he is justified in putting in or on the pair of dies to secure the largest output from the forging or stamping machine.

The first thing to be considered to determine whether a punch and die should be used to produce work is the number of pieces wanted. If it is staggered, or inhabited by sailors and fishermen said to be of Venetian extraction. The castle was erected for defense against the English in 1435, and successfully withstood siege in 1442, but was subsequently
DIES AND DIE MAKING

pieces are wanted, and a power feed is used, the cost will not exceed two cents per 1,000 blanks.

The power required to blank out a piece of metal depends largely on the shape of the blank and the number of cutting inches in the die, a long blank requiring more power than a round blank of the same area, the shear of the dies being equal. If the work will admit of the face of the punch being slightly rounding, less pressure will be required than with a flat-ended punch.

The making of dies calls for very expert workmanship both in design and execution, and the tempering requires an intimate knowledge of conditions and the consideration of the form and character of the die. A whole series of die-shaping, milling and filing machines have been developed for the special use of the die maker.

Following are the more common types of dies used:

BLANKING DIES.

These are made for cutting out flat blanks from steel, iron, paper, etc. Usually both punch and die are hardened and tempered; sometimes the punch is left soft, and as it gets worn is set out and refitted by being forced or shoved into the die; sometimes it is best to reverse this operation, as in punching paper, playing cards, etc., and harden the punch and leave the die soft.

Shear.—A shear or slightly beveled edge is usually given to the punch or die, determined by the work it has to do; when it is intended to use the blanks, or pieces punched out, the shear should be given to the die, as less distortion is given to the metal by this method, but where the hole is the object sought, as in rivet holes in boiler plates, etc., the shear should be given to the punch.

Die-shoes.—Cutting or blanking dies are usually held in a shoe or die-holder, or if a large die, it is fastened to the bed of the press direct, but as a rule the fewer pieces intervening between the press and the die the better results will be obtained. Very large blanking dies are usually made in one of two ways: either as rings set in a cast-iron holder, or by welding the rings directly on to a wrought-iron holder or die-plate; the latter method is the best in making plain dies, but cannot be used in compound dies. The welding of the steel rings together, and then on to the wrought-iron plate, calls for good work on the part of the smith. In the former method the rings are first welded and then turned, hardened and ground true in the universal grinder, then set in a groove turned in the holder and held there by being bolted from the back of the holder.

Hot Work.—In making dies for hot work (as the blanking out of nuts and other thick work from red-hot metal) a die made of chilled cast-iron with a good clearance will give good results, as the temper is not affected by the heat of the stock punched, the punch being made of steel and fitting the die loosely (in very thick stock a difference of % in more than the diameter of the punch and die is not too much), and if a nice job is wanted, the work can be shaved, or re-punched, as it is called, by forcing it through a second die that is a trifle smaller than the first, leaving a true and smooth surface.

Repunching.—In the repunching of brass and copper, the use of buttermilk as a lubricant gives a better result than any oil or soap water.

BENDING DIES.

Bending dies are used for forming sheet metal or wire into almost any form that may be wanted. The die shown (Fig. 1) is for bending the piece on the right-hand side of the punch. This is blanked out by a previous operation, placed in the die by hand, and is bent as shown by the finished piece on the left-hand side. The two sides of the blank are bent down and the long one on the right is curved around the punch shown and the ring on the end is twisted around to a right angle to the rest of the item.

The Punch.—The punch is made from a single block of steel which is planned up to fit the press, and then machined out as shown in the cut. The twister, which is for turning the ring at right angles to the rest of the arm, is counter-bored and held in place by the quarter-inch pin driven into the side, and which is held up by the spiral spring seen at the upper right-hand corner of the sketch. The die is self-contained and is used in an ordinary single-stroke press, and requires no extra attachments to enable it to do the work. This same principle can be used in many cases, and the bending performed in one operation which would otherwise require two or more strokes of the press.

DRAWING DIES.

Drawing dies are used for shaping or drawing up sheet metal. The use of dies of this class is of comparatively recent origin; it having been first put into practical use by one De Vere of France in the latter part of the 18th century, and in the year 1827 the same process was patented for the drawing up of cartridge shells.

Origin.—In 1850 or 1861, two Frenchmen came to this country, bringing with them drawings of a model of a drawing press. These they had surreptitiously taken from a press upon which they had been employed in France. This press was secreted in a barn near the city of Wilmington, Del, and was finally perfected and put into actual use by Henry Marchand, who formed a company for the manufacture of the
same, known as the Higgins & Marchand Co. The first press was set up in one corner of the shop which was boarded up, and only three men allowed in the room. The first piece drawn up was a washbasin made from a 14" blank, which was probably the first piece of drawn work ever made in America.

Drawing dies may be divided into three kinds: the plain drawing or "push through" dies; solid bottom or "knock-out" where the work is to be knocked back; and combination dies which cut and draw at one stroke of the press. Combination dies are often so arranged as to perform three, four and sometimes more operations on the work at one stroke of the press. Dies of this nature are very expensive, and are only desirable when the work is to be done in large quantities.

Push Through Die.—Fig. 2 shows a plain "push through" drawing punch and die, the blank being punched out to fit the set edge, and then drawn up or rather, it is pushed through the die by the punch, and as the punch rises, the work is stripped from the punch by the "pull off", which is made very sharp for that purpose. A "draw" of about one-quarter to one-half of a degree is given the die, making it that much larger on the upper side or face, and the upper edge is rounded over and left very smooth and as hard as fire and water will make it. "Don’t draw a drawing die." The lower end of the punch is rounded and left in the same shape; often the die will work better if the finish is changed from a circular to a lateral polish. The diameter of the punch is equal to that of the die, minus double the thickness of the stock to be drawn. A die of this kind can only be used on shallow work, or in redrawing or reducing the diameter of the work that has been previously drawn up; if used on deep drawing it will pucker or crimp around the edge. To avoid this there must be a blank holder to hold the stock firmly while it is being drawn.

Single Action.—Fig. 3 shows a single-action cutting and drawing die, better known as a single-action combination die. A combination die is, as the name indicates, a combination of a drawing die and cutting die in one; it punches the blank, and at the same stroke of the press, draws it up into a cup or shell. The die shown is intended to be used in an ordinary single-stroke power press, and will draw up work not over one or two inches deep.

Double Action.—A double-action die is a modification of a single-action die, to be used in a double-stroke press; it can be used on work that is too deep for single-action dies. The one shown in Fig. 4 is known as a "push through" die. It is somewhat like the single-action die, except that the shell is cut by the punch (B) and is carried to the drawing die (D) and the lower surface of the die acting as a blank-holder is held there while the drawing punch (A) forces it through the drawing die, and as the punch withdraws, the shell is removed by the lower edge of the die, which is ground very sharp for that purpose, and is known as the "pull off." The drawing die is held in place by the cutting die being clamped upon it by the ring (G).

This style of die has this advantage; the cutting and drawing dies are independent of each other, and can be changed for a longer or shorter shell, or either die can be repaired or replaced without changing the other.

Triple Action.—Triple-action dies are intended to punch, draw and stamp the work at the same stroke of the press. The construction is the same as the double-action, except that the die block is cut away to allow the stamping die to be set in place, and the shell is carried down to the stamping die and "struck up" between that and the matrix formed on the end of the drawing punch; as the punch rises, the work is stripped from the punch by the "pull off," and is removed from the dies by the use of an inclined press, or by a swinging arm attached to, and operated by the press, that catches the work as it falls from the punch.

This style of die is largely used on blacking-box covers, lard-pail lids, or other work where a stamped or embossed cover is wanted. A die of this class should always be used in an arched press, as the strain of the stamping process is very severe on the "open back" style press, and is apt to crack the body of the press. In making a drawing
die, use a steel that is high in carbon, and if it shrinks a little in hardening so much the better. There is on the market at least one grade of steel which will stand three successive hardenings without cracking or splitting, and so that the die, as it wears out can be "shrunken up" and then ground out to size again.

Various modifications of a drawing die are necessary in order to successfully draw up the different metals. Zinc works better when the soap ends, or whatever lubricant may be employed, is used hot as possible, as that metal works much better at a heat of 125 degrees.

Redrawing.— After a cup, basin, etc., has been drawn, to reduce its diameter still more and make it deeper, redrawing dies are used.

Thick Work.— In drawing very thick work the drawing die can be made bell-mouthed, as the thickness of the metal will reduce the tendency to crimp or pucker. The same method of making the die is followed when it is desired to draw a shell that is very short in proportion to its diameter.

The possibilities of what can be done by this method of forming up sheet metal are almost unlimited; trunks, wheelbarrows, sinks, and the copper boiler for hot-water service are every-day productions at the present time.

Metal.— The great secret of drawing up work is to have good metal, and to properly adjust the blank-holder, so as to hold the metal just hard enough to prevent it from puckering. In drawing up metal it should be borne in mind that it will flow where it can go the easiest.

EMBOSSEING OR COINING DIES.

Embossing or coining dies, for coins or jewelry work, are used for striking up coins, medals, emblems, or other work that has to show the imprint and the figures which are cut in the die. Their manufacture is termed die-sinking. In the case of dies used for coin work, both the upper and lower die are embossed or engraved with the design or letter work that is desired to have stamped on the coin; the blank being fed on to the lower die, which is surrounded by a knurled ring, and as the upper die or punch descends, the metal is confined and kept from spreading by the ring. For coinage are the oldest example of die work that we have any knowledge of as there are in existence a number of coins which were "struck up" over two thousand years ago; showing plainly that the art of die-sinking was known at that period, but the fact that they were left untrimmed or rough, on the edges, indicates that the process of punching by means of a close-fitting punch and die was not known at that time. Dies for coining could have been used in a press of very rude construction, the main requisite being that sufficient power was employed on the upper die or punch, to leave the desired impression upon the coin. This may have been done by the use of an ordinary maul or sledge, the upper die being held by hand. Coining dies are the highest example of the die-sinker's art.

Embossing Dies for Jewelry Work.— In jewelry dies the impression is usually cut or "hubbeted" into the lower die, and the male die or "forge" as it is called, being used to drive the metal into the lines drawn or cut, so as to bring up the desired design. Dies of this class are used to produce almost every known form of jewelry work. The back of a watch or locket, being a familiar example. Spoons, knives and forks, and in fact almost every article of tableware, are formed by the above method.

Hydraulic Dies.— Embossing is often done on very large pieces of work, especially on what is known as hollow-ware, such as ice-pitchers, etc., the blank being placed in the die, which is sectional and then put into the press. The blank is filled with water or sometimes a special composition of wax, which is then subjected to a very heavy pressure, forcing the pitcher or other work into the desired shape, and also into the lines which are sunk or cut in the dies.

FORGING DIES.

The use of dies for machine forging of metal is of recent date, and was first used in gun work, the hammer of a rifle being one of the first parts ever made in that manner. It consists of cutting a facsimile of the forging desired, either in the lower die, or sometimes it is divided equally into the upper and lower die, and then the metal, either in steel or copper, is heated and "drop-forged" into the impression sunk in the dies. See FORGING.

Flash.— The forging operation leaves a fin or "flash" as it is known, caused by the amount of metal being used in excess of what the dies will hold. This is removed as soon as possible, and is termed "flashed" or "flashed out" as soon as removed from the dies, or the work is allowed to cool and then cold-trimmed; the latter work being done in an ordinary power press.

MULTIPLE DIES, ETC.

When a great many small and simple duplicate parts are required to be made, as nuts, hinges, lock-keepers, etc., it pays to make gang or multiple dies, in order that a series may be stamped out at low cost. Assuming that the stock will take on a row six wide, it is common to make a gang die with two rows of six punches, each row spaced far enough apart to admit of a row being punched out between them. In other words it is best for the gang die to punch out every other row at the first operation and then to punch the intervening spaces. If this is not done it is impracticable, as the rows very closely together, consequently this every-other-row arrangement saves stock.

Articles having a great number of holes, as colanders, sieves, strainers, etc., are made with perforating dies, that perforate usually without removing any metal as waste. The dies used to form the curled-over edge of various articles of tin and agate ware are called curling dies. They form a bead, often enclosing a wire to stiffen the edge. To give a handsome appearance to a part which may be conspicuous, burnishing dies are employed, which by applying pressure give an added smoothness and lustre to the piece.

Screw-cutting dies are made in pairs, to fit into a die-stock or screw-cutting machine. They have cutting edges that cut out a spiral of metal, and form the threads of screws, nuts, etc.

J. L. LUCAS,

Author of "Dies and Die Making."

DIES FASTI ET NEFASTI, dē'ār, a Roman division of days, with its rise to indiu business, into working-days and holidays. Dies fastus was a day on which courts could be held
and judgments pronounced; dies nefastus, a day on which courts could not be held nor judgments pronounced.

DIES IRE (Day of Wrath), technically the supreme product of Latin hymn-writing is called a sequence because of its place in liturgical usage. It is first found in Italian missals in connection with the office for the burial of the dead and by action of the Council of Trent it became a formal element in the requiem service of the Roman Catholic Church. Its popularity may be judged by the fact that there are in existence nearly 150 versions of the hymn in English alone; the first one appeared at the close of the 17th century. One of the most popular versions, a condensed one, however, comes from the hand of Walter Scott in 'The Lay of the Last Minstrel.' It is generally recognized that it is a hopeless task to reproduce the simplicity and vigor of the original phrasing or to imitate the harmonies of the Latin diction. Mr. Saintsbury, the well-known expert in prosody, singles out as unique in this respect the line "Thy name be praise" and in his eulogy of the poem as a piece of technique places its author by the side of Dante and Shakespeare. Yet the authorship of these verses is not firmly established. Most authorities are willing to accept the ascription to Thomas of Celano, the companion and biographer of Francis of Assisi. The attribution to Thomas is made in a vague way in a work written in 1385, considerably over 100 years after the period in which Thomas lived. There is nothing in Celano's biography of Francis to suggest the power in word painting displayed in the stanzas of this hymn. One of the first literary allusions to the Dies Irae is of a depreciatory nature; a 16th century writer, Sixtus Senensis, speaks of it as an "inconditus rhythm," an uncouth poem. Assuming that the poem came from one closely associated with Francis of Assisi it would be easy to explain its eschatological austerity from the atmosphere known to have prevailed in Italy during the long struggle between the Papacy and the last Hohenstaufen emperor, Frederick II. Salimbene speaks of the hopelessness of Franciscans presided over by Frederick who in his mind personified all the vices; and Albert de Beham, comparing the emperor to Lucifer, speaks of him as a man who tries to climb up to heaven, raise his throne above the stars and become superior to the vicar of the Most High. The theme of the Dies Irae and the way it is handled do not reflect the naive joyfulness of Francis of Assisi's temperament. Thomas of Celano's biography shows how open he was to the brighter side of the nature of his master. The hymn gives that other aspect of Franciscan teaching which appeared after the death of Francis with strong emphasis on apocalyptic terror due to the impression made by the long career of Frederick, a versatile, constant and therefore dreaded opponent of the mediæval church system. Consult Chevalier, 'Poesie liturgique du moyen âge'; Gebhard, E. 'Italie Mystique'; Julian, S., 'Dictionary of Hymnology'—Julian's Dictionary contains the text and critical remarks thereon. One of the best English versions is that by Dr. Iorns, to be found in the 'Hymnal of the American Episcopal Church'; Kehrlein, J., 'Lateinsche Sequenzen des Mittelalters'; Warren, C. F. S., 'Authorship of the Dies Irae'; Saintsbury, 'History of Literature'; Trench, R., 'Sacred Latin Poets'; Wilson Lloyd Bevan.

DIES NON, more properly Dies non Juridicus, in law, a day on which justice or other business of court or law administration may not be legally undertaken. Under the old common law of England, and also in the United States all Sundays, Christmas Day, All Saints' Day and other holy days, belonged to the category of non-juridical days. In America certain legal holidays (not all) have been added to the list, while the holy days have been reduced to one. Christmas Day, and in some States, Thanksgiving and Independence Day are included. The present tendency is to reduce the number of non-juridical days, and even on such days exceptions are allowed and certain warrants may be issued and executed. These exceptions, in almost all jurisdictions, are now generally stated explicitly in the codes of procedure so that administrators of justice may know exactly when and what may be performed on such days. Consult Southern Law Review, N. S., 697.

DIESEL, de'żel, Rudolf, German inventor: b. Paris 1858; d. 1913. He was educated in England and at the Polytechnic School, Munich. He became manager of a refrigerating plant in Paris, where he remained for some years, returning to Munich in 1895. For many years he conducted experiments in internal-combustion engines and about 1893 news of his discoveries in this field caused considerable comment. After several failures in trying to make direct use of the energy from fuel combustion, in 1897 he brought out the engine since known by his name as the Diesel engine. He subsequently brought it to a high state of perfection. He came to America in 1912 and there delivered a series of lectures and in the year following the British Admiralty summoned him to a consultation. He lost his life by drowning in the Channel while on his way to England. He published 'Theory and Construction of a Rational Heat Motor' (Eng. trans. by Donkin 1894) and 'Die Entstehung des Dieselmotors' (1913).

DIESEL ENGINE. See INTERNAL-COMBUSTION ENGINE.

DIESKAU, de'skow, Ludwig August, Baron, German general in French service: b. 1701; d. Surenne, near Paris, 8 Sept. 1767. He was adjutant of Marshal Saxe, whom he accompanied in the campaigns against the Nether- lands, and became in 1748 brigadier-general of infantry, and commander of Brest. In 1755 he sailed as general to Canada, at the head of French troops, to assist in the campaign against the English. He ascended Lake Champlain with the design of attacking Fort Edward, ambushed a detachment sent for its relief and pursued them to the fort with the hope of entering it with them. He was, however, defeated by Sir William Johnson, was taken prisoner, suffering from four wounds, and remained in captivity until 1763.

DIESTERWEG, de'ster-vag, Friedrich Adolf Wilhelm, German educator: b. Siegen,
DIET.—DIETETICS

Prussia, 1790; d. 1866. In 1808–11 he studied at Herborn and Tübingen. He taught at Mannheim and at Worms for about two years, when he removed to the model school at Frankfort. Later he became rector of the Latin school of Elberfeld, and in 1820 was appointed director of the new Teachers' Seminary at Mors. His years in this position enhanced his reputation as a teacher and writer on education and in 1835 he was made director of the Seminary for City Schools. Teacher and writer were the two sides of his character, and his disagreement with the authorities regarding important phases of higher education he was in constant friction and resigned in 1847. He received a government pension in 1850 and thereafter spread his educational ideas solely through the medium of periodicals. In 1838 he was elected to the Prussian Diet. He was a follower of Pestalozzi and aimed at making every subject a means of education. His greatest services to education were through his work as a trainer of teachers, but he exerted also a wide and far-reaching influence through his writings. In 1851 he founded in Berlin the Pädagogisches Jahrbuch and published Wegweiser zur Bildung für deutsche Lehrer (2 vols., 1834; 6th ed., 1 vol., 1890); Das pädagogische Deutsch (1836); Streitfragen auf dem Gebiete der Pädagogik (1837); Leitfaden für den Unterricht in der Formlehre (1845); Lehrbuch der mathematischen Geographie (1840; 18th ed., as Populäre Himmelskunde, 1891); Unterricht in der Kleinkinder- schule (5th ed., 1852). Consult Rehuhn, Adolf, Briefe Adolf Dieterwegs (Leipzig 1907) and Richter, Karl, Adolf Dieterwegs Ansichten über pädagogische Zeit- und Streitfragen (Leipzig 1913).

DIET, a meeting or assembly of delegates or dignitaries convened and held from day to day for legislative, ecclesiastical, political or administrative purposes; specifically, the legislative assemblies of the German Empire, Austria, Hungary, the old Kingdom of Poland, etc. (in German, Landtage). The Diet of the old German Empire was composed of three colleges: one of electors, one of princes and one of imperial towns, and began with the edict of Charles IV in 1356. Originally a feudal body in which none but tenants in chief could appear, it was not until 1499 that the imperial cities secured the right to appear in all diets beside the higher estates of electors and princes. Each college deliberated by itself, the agreement of all three together with the assent of the emperor being finally necessary for passing judgment. The best-known meetings were those at Nuremberg 1467, Worms 1521 (at which Luther was excommunicated), Spires 1529 and Augsburg 1530. After the treaty of Westphalia in 1648, which closed the Thirty Years' War, its influence rapidly declined, but its meetings continued to be held at Ratisbon, until the dissolution of the Holy Roman Empire in 1806.

DIET. See DIETETICS; NUTRITION OF MAN.

DIETERICI, de’ts-ree’see, Friedrich, German Orientalist: b. Berlin 1821; d. 1903. He received his education at the universities of Halle and Berlin and traveled extensively in the Orient. In 1850 he was appointed professor of Semitic literature in the University of Berlin. His researches in the Arabic language and literature gained him a wide distinction. His numerous works include Alfiyyah Carmen Grammaticum Auctore Ibn Nâlik cum Commentario Ibn Akil (1831); Mutaffifin Carmen cum Commentario Wahibîd (1838); Die Naturanschauung und Naturphilosophie der Araber (1860; 2d ed., 1876); Die Logik und Psychologie der Araber im Zehnten Jahrhundert (1867); Die Lehre von der Weltseele bei den Arabern (1873); Phirenke mit Besonderer Berücksichtigung der Araber im neunten und Zehnten Jahrhundert nach Christus (1876); Die Abhandlungen der Ichwân Es-Safâ in Auswahl (1883–86); Al-sarabis philosophische Abhandlungen (1890); Uber das älteste Bekenntniss der Christenheit (1895); Muhammad ibn Muhammad abu nasr al-Farabi: Die Staatsleitung ... aus dem Nachlaß ... F. Dieterici, edited by Paul Brönnle (1904).

DIETERICI, Karl Friedrich Wilhelm, German economist: b. 1790; d. 1859. In 1813–15 he was an engineer geographer in Blücher's army, was next engaged in the Ministry of Public Instruction, becoming later professor of political science in the University of Berlin. In 1844 he was made chief of the statistical bureau. He wrote very many works, dealing with political economy and statistics, including De Via et Ratione Economianae Politicae (1835); Statistische Übersicht der wichtigsten Gegenstände des Verkehrs und Verbrauchs im preussischen Staat und im deutschen Zollverband (1838); Uber Auswanderungen und Einwanderungen (1847).

DIETETICS, a branch of hygiene, is the science or study and regulation of the diet. Diet is the customary allowance of food and drink taken by any person from day to day—either as a hygienic measure—or as a remedy in cases of disease. The words diet, dietetics and dietary, in their modern significance, appear to have a mixed origin. The dictionaries trace their derivation through the French diète to the Latin diēta and the Greek dieîta, the latter signifying a manner of living. Another meaning, often marked archaic or obsolete by lexicographers, is daily fare, allowance of food, daily pay.

And for his diet, there was a continual diet given him of the king of Babylon, every day a portion until the day of his death, all the days of his life.—Jeremiah iii. 34.

This meaning has an evident connection with the Latin dieîs, day, and is followed in the modern use of the word dietary. As defined by Mrs. Ellen H. Richards, a dietary is "a known amount of food, of known composition, per person, per day." Popularly, dietary appears to be associated with cheap fare, perhaps because first used in connection with the allowance of food for paupers and prisoners. The word also conveys to the average mind the idea of a reduced food supply, probably because the individual choice is restricted.

Under primitive conditions, men satisfied hunger with any edible substances within reach. The progress of civilization, with the increase of material possessions, developed the epicure and gourmand, who magnified the pleasures of the table. The aid of the physician was then required to mitigate woes induced by over-indulgence. In the days of Hippocrates, dietetics
was the province of physicians, who thus aimed to undo the evils caused by wrong living. Later, economists like Count Rumford applied dietary principles to feeding the poor of European cities. Some countries have employed experts to prescribe rations for keeping army and navy in fine physical condition at least expense to the government. The victory in the Franco-Prussian War of 1870 has been ascribed to the food experiments of German chemists. The *weinbrot*, or pea sausage, a food having merit for emergencies, was devised by scientists at that period. Oleomargarine was the result of experiments made for the navy under direction of the French government. The aim of dietitians of the present day includes all that has gone before, the best use of materials at hand, prescription of food for the sick and aid to the well in choosing such foods as shall maintain health, with due regard to pleasing the palate. The 20th century finds prevention wiser than cure, and endeavors by the prescription of food adapted to different ages and conditions of body to develop the sound body and sane mind. At the present time no less emphasis is laid upon diet for diseased conditions of the human body than in the past, but more attention is being largely fat, supplying the heat needed by bodies subjected to severe cold. A mixed diet, both animal and vegetable, has produced the most successful races.

The usual classification of food substances is outlined by the United States Department of Agriculture in the above table.

Sometimes it appears difficult to reconcile practical usage and scientific experiment as to food values, but this is due to an incomplete view of both sides. Many statements about foods are untrue because only one phase is presented. To decide upon the full value of any food we must consider both its physical and chemical composition, its economic value and its physiological effect in the body. The elimination of refuse, and the division and subdivision of particles in the process of manufacture are important factors in the nutritive value and digestibility of foods. Some experiments have shown that a larger percentage of peas and beans was digested when thoroughly cooked and sifted, after removing the hull, than when cooked whole. Such external digestion saves energy in the human organism. Whatever tends to cleanse and purify foods before cooking undoubtedly increases their real nutritive

| Given to building up healthy bodies and then sustaining them by foods chosen with special reference to the work each individual has to do. |

| A practical course in dietetics would cover the source and manufacture of foodstuffs, the processes of cookery and wise combinations of foods, the calculations of dietary for individuals, families and institutions and the adaptation of foods to individual needs according to age, sex, climate and occupation. Students of history and sociology are recognizing the effect of food in forming individual and national characteristics. The French revolution and the destruction caused later by the Communists has been ascribed to the ill-fed condition of the people. |

| Fresh air, pure water and clean food are more essential for nutrition than any special selection of foods. The surroundings and instincts of a people lead them to adapt their diet to the climate. In the tropics fruits and vegetables are the main sources of subsistence, in arctic regions foods are chiefly animal and vegetable. Medical authorities on dietetics have laid much stress upon the choice of foods, but hardly enough upon their preparation. A piece of meat or a nutritious, how so innocent in itself, may be ruined in cooking, while one of doubtful value, by right processes of cookery, may become harmless and even useful. This is equally true from the economic standpoint. Count Rumford found that "the richness or quality of a soup depended more upon the proper choice of ingredients and a proper management of the fire in the combination of these ingredients, than upon the quantity of solid nutritious matter employed; much more upon the art and skill of the cook than upon the sums laid out in the market." The nutritive qualities of many foods are doubtless made more available by a wise use of flavors, which in themselves contain little or no nutrient. Condiments and spices, tea and coffee and the extractives of meats are of special value for the flavor which they impart. The cheap substantial grain foods after all provide the larger part of the food of the human race and are made palatable by changes in flavor. |

| The hours and arrangement for meals have an influence in the assimilation of food. |
Breakfast in America is a more substantial meal than it is in Europe, perhaps from climatic conditions. The midday dinner seems best adapted to children and invalids, the night dinner is a concession to the competition of business. One dietetic authority estimates that more than half of the day’s ration of protein and fat and one-third of the carbohydrate is taken at dinner. The hour spent for a meal at dinner, if it be such as to provide for a period of rest afterward. The savage gorges himself when food is abundant, then sleeps like an animal. The gourmand of classic days took an emetic to relieve his stomach that he might partake of delicacies yet to come. The best thought of the present day tends to shorter menus and simpler compounds, toward “plain living and high thinking.”

Dietetic theories vary from age to age because of imperfect knowledge of bodily processes, or because of changes in the production and preparation of foods. Water, for example, was once excluded mainly from the dietary of patients suffering from fevers, and its use restricted in other cases. Now it is recognized that a lack of water in the diet is a serious error. If it is noted in a certain way are not sufficiently diluted with water. In the past an exaggerated nutritive value was ascribed to beef tea and gelatine, but later investigations show that the one should be classed as a stimulant and the other not so much a real food as a protein sparer. There is yet much discussion as to the relative value of white whole wheat and white flour. The former is probably better for young children, because it supplies bone-making material, but by modern methods of milling most of the nutritive material in the grain is retained in the best grades of white flour. The natural instinct of children for sweets has been repressed, but now sugar is recognized as a valuable food, provided it is taken at proper times. Oysters are less nutritious than is popularly supposed, and as ordinarily cooked are not especially easy of digestion. Combinations of foods often produce different effects from the separate ingredients, and small quantities of certain things may be helpful where larger quantities would produce bad results. A food may be irritable or calcareous in the true sense, and prepared in such a way as to be easily acted upon by the digestive organs and yet fail of perfect assimilation because it does not suit the habit or whim of the eater. In popular estimation a food is digestible when no feeling of discomfort follows after eating it, or when it is easily and quickly digested. The scientist considers a food digestible in proportion as it is completely digested, whether the time be shorter or longer. Persons in health should consume some foods that digest slowly and beware of depending upon pre-digested foods. If allowed to be idle, the stomach, like any other organ, soon finds it difficult to work.

The seven ages of man described by Shakespeare might illustrate the different periods of life: children and invalids, the changing of diet.

The infant thrives and grows on a diet of milk. When the mother cannot supply a sufficient amount, clean milk from a healthy cow, by dilution with water or whey and by modification with milk and cream, may be adapted to the increasing needs of a baby as it develops. Greater cleanliness in collecting and transmitting milk to consumers is a first requisite for the diet of young children. Defective nutrition causes indigestion, rickets, intestinal catarrh and many disorders of childhood.

The schoolboy requires abundant food from which to construct his rapidly growing body and to provide energy for his active exercise. With him quantity is often more important than quality, while his size and consequently his active sports, is over-fastidious. Dainty children and excessively greedy ones both are usually ill fed. Nervous diseases of children, even stammering, will yield to more careful diet. Milk, fruit, cereals, whole wheat bread, eggs and vegetables should form the bulk of the diet of school children. The school luncheon now receives considerable attention from educators.

The lover and the soldier represent the college days and the strenuous life of early manhood. The training-tables for athletes in school and college are an admission of the need of a selected diet for special work. The definition of an army, given by a famous general — an animal that crawls on its stomach — indicates the importance of proper food for the soldier. No less necessary is it to train the pilots and pioneers and explorers of all kinds. Personal idiosyncrasy and differentiation of occupation demand attention to the individual dietary.

The judge is the type of the prosperous man of sedentary habit who is often overfed, and who should begin modifying his diet after passing the half-century mark, but habits are formed and changes must be made gradually. Luigi Cornaro, an Italian who lived in the 15th and 16th centuries, began at 40 to modify his diet and succeeded in passing the century limit. After he had reached 80 years he wrote several treatises describing his manner of living. That his writings are still the basis for much that is written on diet for the later years of life, is a sad commentary on the self-indulgent habits of the human race, which shorten many valuable lives.

I have come to the conclusion that more than half the disease which embitters the middle and latter part of life is due to avoidable errors in diet. The diet must be as much in the form of actual disease, of impaired vigor and of shortened life, averse to civilized man, from erroneous habits of eating habits, the habitual use of alcoholic drink, considerable as I know it to be.

Sir Henry Thompson.

Last of all comes old age, and for this period the food should be similar to that of the young child, and taken often in small quantities. In proportion as activity diminishes, the intake of food should decrease. The sense of taste is dulled and higher seasonings may be desirable. Here if anywhere in a normal diet the stimulus of alcoholic beverages may be allowed.

During the last of the 19th century much data has been collected showing how people actually live, the cost of living and the proportions of protein, fat and carbohydrates. The studies on food and dietaries conducted by the United States Department of Agriculture have furnished much valuable data which is being used as the basis of further work on dietetics by authorities on both sides of the Atlantic. From such studies may be deduced approximate dietaries for different conditions. The ration enabling a man to do good work must necessarily be larger than one calculated merely to sustain life.
DIETRICH

An estimated life ration for one day, measured in grams:

<table>
<thead>
<tr>
<th>Protein</th>
<th>Fat</th>
<th>Carbohydrates</th>
<th>Calories</th>
</tr>
</thead>
<tbody>
<tr>
<td>75</td>
<td>40</td>
<td>325</td>
<td>2,000</td>
</tr>
</tbody>
</table>

When poor families are found living on rations lower than this their diet must be enriched before they can be expected to display much energy. Prisoners often have different rations according to the time of sentence in some reformatories, and a man refusing to work is fed with stimulating food until he desires to expend some of his accumulated energy. A work ration would provide in grams:

<table>
<thead>
<tr>
<th>Protein</th>
<th>Fat</th>
<th>Carbohydrates</th>
<th>Calories</th>
</tr>
</thead>
<tbody>
<tr>
<td>125</td>
<td>125</td>
<td>450</td>
<td>3,500</td>
</tr>
</tbody>
</table>

For severe labor this would be increased. (The calory is approximately the amount of heat which would raise one pound of water 4° F. and is a convenient standard of measure of the fuel value of food. The fuel value of protein is 4 calories per gram, of fat 9 calories per gram, or 4,040 calories per pound; fuel value of fats, 89 calories per gram, or 4,040 calories per pound; fuel value of carbohydrates, 4 calories per gram, or 1,820 calories per pound.)

One of the value of food in construction of new tissues is less simple than its fuel value. It is impossible to measure the amount of good that might be done in schools, hospitals, and public institutions by improving the conditions of diet. Many hospitals now employ trained dietitians to make dietitians and superintend their preparation. The United States Department of Agriculture issues many valuable dietary bulletins.

Diet for the sick may be considered under three general heads: the typical ration for invalids, in fluid form, suitable for the crisis of acute disease; food for the convalescent or for building up a body wasted through lack of nutrition; and last, such diet as may aid in the reduction of an overloaded body but yet sustain the vital forces. For the first few days of an acute illness the human body may sustain itself on the surplus stored in its tissues. An invalid in bed is not using up energy so fast as the man at work, hence the diet should be less rigid. A work ration but a little increased in such directions as may best combat the waste of disease. Liquids are easily taken, quickly absorbed, and as a whole are less irritating than solids to the digestive organs. Concentrated foods are necessary in certain conditions, but these are few. A sick person for the time being is to be fed much like an infant—small quantities of food should be given often, usually warm rather than cold. Pre-digested foods should not be used until the digestive force fails. Where there are wasted tissues to repair—as in convalescence or in diseases like anemia, nervous prostration, or tuberculosis, the diet must be generous—milk and eggs are the main dependence, and the art of cookery has devised many simple ways of serving them. Fat, in easily digested forms—olive oil, bacon, cream and butter—is valuable in such cases, because fat is two and a fourth times as valuable for fuel food as the carbohydrate. From the economical arrangement and service of the food, and the element of surprise are important. The cookery for the sick conforms to the usual formulas, though greater attention must be given to the selection of food and its preparation, and all doubtful articles must be avoided. Starches should be thoroughly cooked, woody fibre reduced by cooking and mashing, or removed by straining. Animal foods should be boiled or stewed at low temperature. High, composite seasonings are not desirable, but a moderate use of simple flavors is admissible. Gout, rheumatism, and obesity may not be due to over-eating in one sense, but indicate an excess of certain substances which are not assimilated nor eliminated, but are stored up in the various tissues, causing discomfort. The many fasts of the early church perhaps were introduced less as a religious duty than as a wise dietetic measure. The "Banting" system for the reduction of fat consists mainly in decreasing the allowance of starch and fat and increasing the protein. Special diets for other diseases should, like medicine, be prescribed by the physician in charge, because of the complications to be considered. Water-cures, milk cures, and grape-cures have been successful in some cases. Increased knowledge of bacteria has explained many heretofore mysterious cases of poisoning, and has changed the point of view regarding the wholesomeness of various food products. Great cleanliness in all preparation of foods would make the use of preservatives practically unnecessary. With our rapid increase in prosperity Americans in future need to guard against over-indulgence of the sense of taste and to control the appetite to accord with the true needs of the body.

Bibliography.—Some of the most useful books on this subject are these: Abel, Mary H., "Practical Sanitary and Economic Cooking"; Atwater, W. O., "Principles of Nutrition and Nutritive Value of Food" (United States Department of Agriculture); Burnett, R. W., "Foods and Dieteries"; Chapin, H. D., "Theory and Practice of Infant Feeding"; Dukes, Clement, "School Diet"; "Food as a Factor in Student Life" (University of Chicago); Pothergill, J. M., "Manual of Dieteries"; Hart, Alice M., "Diet in Sickness and Health"; Holt, L. E., "Care and Feeding of Children"; Hoy, A. H., "Eating and Drinking"; Hutchinson, K., "Food and Diet in Health and Disease: Assuring an Appetite"; "Functions"; Langworthy, C. F., "Diety Study of Groups, etc." (Bulletin United States Department of Agriculture); Miles, E. H., "Muscle, Brain and Diet"; Richards, Ellen H., "Cost of Food"; "Plain Words About Food"; Richards and Williams, "Dietary Computer"; Thompson, Gilman, "Practical Dietetics"; Thompson, Sir Henry, "Food and Feeding"; Yeo, I. B., "Food in Health and Disease."
DIETRICH — DIFFERENCE

106

(1888). He edited "Les poésies de Jacques Richard" (1885).

DIETRICH, Christian Wilhelm Ernst, German painter and etcher: b. Weimar, 30 Oct. 1712; d. Dresden, 24 April 1774. The picture of a July Festival, painted in the Dutch style executed by Dietrich while a boy, is in the Royal Cabinet of Engravings at Dresden. He successfully imitated Raphael and Miers, Correggio and Ostade, but never produced anything of his own. His farming is his historical exchange. His paintings are scattered through almost all Europe, and especially in Germany. In the Dresden gallery, of which he was inspector, there are 53 of them.

DIETRICH VON BERN, a hero of German legend, celebrated for his amazing adventures, and fighting in the 'Nibelungenlied.' He was in actual life Theodoric the Great, founder of the Ostrogoth monarchy; but the two names have resulted in much confusion of legend with fact. He flourished in the 5th and 6th centuries of our era. Bern is German for Verona, the principal residence of Dietrich.

DIETRICHSON, Lorents Henrik Se-gelcke, Norwegian poet and historian of art and literature: b. Bergen, 1 Jan. 1834. While an undergraduate in the University of Christiania, he composed many clever songs which were collected and published in 1859. For a time he served as instructor at Upsala and subsequently for three years was secretary to the Norwegian minister at Rome. On his return he became connected with the administration of the Stockholm National Museum. He was appointed professor in the Academy of Arts, Stockholm, in 1869 and six years later removed to Christiania as professor of the history of art. He published several volumes mostly dealing with Norwegian art in the Middle Ages. He published: 'Olaf Liliomar,' in 1857; and 'Kvileslatten,' in 1859; 'Didactic Poetry in the North' (1860); 'The Art of Wood Sculpture in Norway' (1879).

DIETZ, dets, Feodor, German painter: b. Neumstetten, Baden, 29 May 1813; d. Gray, France, 8 Nov. 1870. He studied in Karlsruhe under Karl and Rudolf Kunz, and while there was greatly influenced by Feodor Ivanovitch. He also studied under Philip Foltz at the Munich Academy, and aided the latter in the decoration of the royal palace. In 1835 he executed his 'Death of Max Piccolomini,' now in the Karlsruhe Gallery, which brought him considerable fame. He spent three years in Paris, coming under the influence of Horace Vernet, and receiving the gold medal in the Salon of 1839. He was appointed court painter at Karlsruhe, but removed to Munich. He took part in the campaign of 1848 in Schleswig-Holstein, and in 1852 was appointed professor of the newly-founded School of Arts at Karlsruhe. He entered the army in 1870 in the Franco-Prussian War, and died in service. He is best remembered as a historical and battle painter. His best works are 'Nocturnal Review' (1853); ' Destruction of Heidelberg by General Melas' (1856), in the Karlsruhe Gallery; 'Flight of an American Family through Susquehanna'; 'Blucher's March to Paris' (1868), in the Berlin National Gallery.

DIEU ET MON DROIT, dy et mohn droit (Fr. signifying "God and my right"), the motto of the arms of England, first assumed by Richard I, who flung this battle-cry at his French adversaries during the engagement at Gisors, 1198, to intimate that he did not hold his empire in vassalage of the crown of France. It was confirmed by Edward III in 1340, when he claimed the crown of France. Except during the reigns of Elizabeth and Anne, who used the motto, 'Semper eadem, and of William III, who used the sat `main tendray as his own motto (D' et non mon droit being retained on the great seal), it has ever since been the royal motto of England.

DIEULAFOY, dy-té-la-fwe, Jeanne Rachel Mayre, French descriptive writer and novelist: b. Toulouse, 29 June 1851. She is the wife of A. M. Dieulafoy (q.v.). Her narrative of travel in 'Persia, Chaldaza and Susa' (1886), and her fiction 'Parysatis' (1890); and 'Rose d'Hatra' (1891), are evidences of her talent. She was made a member of the Legion of Honor. In collaboration with her husband she published 'Le théâtre dans l'intimité: Nais la Sulamite, 'Harce nouvelle du pâté et de la tarte' (2 vols, 1900).

DIEULAFOY, Auguste Marcel, French engineer and archaeologist: b. Toulouse, 3 Aug. 1844. In 1885 he discovered in Persia the remains of the royal residences of Artaxerxes. His discoveries are described in his 'L'Art antique de la Perse' (1884-89). The Lorts contains a special department devoted to specimens of Persian architecture which he also collected and brought to France. Other works by him are 'L'Acropole de Suse d'après les fouilles entreprises en 1884-86' (Paris 1892) and 'Art in Spain and Portugal' (1914).

DIEZ, dets, Friedrich Christian, German philologist: b. Giessen, 15 March 1794; d. Bonn, 29 May 1876. He fought in the War of Liberation, qualified himself as a lecturer at Bonn and was appointed professor of modern languages there in 1830. In addition to various works on the poetry of the troubadours, he published a very valuable 'Grammatik der romanischen Sprachen' (1836-42), which was translated into English, and an 'Etymologisches Wörterbuch der romanischen Sprachen' (1840), also translated into English. Diez laid the foundation of Romance philology, and to him all later investigators are profoundly indebted. His work stands in much the same relation to the Romance dialects as the researches of Grimm occupy with respect to the German dialects. Consult Breymann's 'Life,' published at Munich in 1878, and the centenary estimates by Behrens and Ritter, published respectively at Giessen and Geneva in 1894.

DIFFERENCE, in heraldry, an additional figure or an alteration in a coat-of-arms to distinguish one family from another of the same strain, or particularly to mark the difference between brothers and their descendants during the lifetime of the head of the house. Sometimes this is accomplished by variations of the border, such as having it ingulphed by several marks of heraldic distinction cannot be regulated by cast-iron rule or set law. Each country follows the customs
resulting from its own particular régime, which seem to be the adoption of changes on an escutcheon best suited to individual needs. District is commonly confused with Cadency (q.v.).

DIFFERENCE OF LATITUDE AND LONGITUDE. See LATITUDE AND LONGITUDE.

DIFFERENTIAL CALCULUS. See CALCULUS, INFINITESIMAL.

DIFFERENTIAL EQUATIONS. See EQUATIONS.

DIFFERENTIAL GEAR. A gearing placed between the two inner ends of the divided driving shaft of a four-wheeled motor vehicle to permit the slowing down of the wheel on the inside of the curve when making a turn, although the engine is running at a constant speed. The inner ends of the divided driving axle are each fitted with a beveled gear wheel fixed at right angles to the axle. Between these two gear wheels are placed four bevel pinion wheels, or idlers, on the axle between four points, 90 degrees apart. These pinion wheels turn loosely upon studs projecting inward from a ring-shaped beveled gear wheel which encircles them, and which is driven by a beveled gear pinion at the end of the driving shaft of the engine. The axle gears are driven by the opposite cogs of the pinion wheels, and when the friction of the road upon which a turn is made operates to hold back the driving wheel on the inside of the curve, the loose pinion wheels revolve on their studs, presenting another pair of cogs to transmit the motion of the ring gear wheel, thus adjusting the difference of speed of the driving wheels. Consult Page, V. W., 'The Modern Gasoline Automobile' (New York 1915).

DIFFERENTIAL SENSIBILITY. See DISCRIMINATION, SENSIBLE.

DIFFERENTIAL THERMOMETER, an instrument for determining the difference of temperatures between two points or places. That of Sir John Leslie is one of the best known, and will be found described under THERMOMETER. His invention is now used only as a model. Howard's differential thermometer is the most sensitive of this class of instruments. It consists of a U-shaped tube, the right-hand branch of the U being about twice as long as the other, and each arm terminating in a closed bulb. A scale is attached to the long arm. The liquid used is ether, and the apparatus is so constructed that air is wholly excluded, the gaseous element above the level of the ether being the vapor of ether. Rumford's differential thermometer is a very flat U-tube, with closed bulbs on both of its short arms. The entire tube is filled with air except a very short section of the horizontal part of the U, where there is a "block" of sulphuric acid. The scale is attached to this horizontal part, and differences in temperature between the two bulbs are marked by the travel of the sulphuric acid along the scale. A pair of thermo-electric junctions (see THERMO-ELECTRICITY) is generally preferable to any other kind of differential thermometer. One of the junctions is placed at the point of the "block" and the other junction at the other point and a galvanometer is introduced in the usual way into the circuit, great care being taken to keep all the other junctions of whatever kind that occur in the arrangement strictly at the same temperature. The strength of the current generated, which is measured by means of a galvanometer, is, with the limitation that will be found explained under the article just alluded to, proportional to the difference of temperature between the two thermo-junctions; and with the assistance of a previous experiment at known temperatures on the thermo-junctions employed, the absolute difference of temperature between the two points at which the junctions are placed may be determined with great exactness.

DIFFERENTIAL WEATHERING, the etching out either chemically or mechanically of softer or more soluble rock by wind or water, giving the weathered surface a pitted appearance. It is particularly characteristic of wind work in the desert.

DIFFERENTIALS IN RAILROAD TRAFFIC, a term of variable use in railroad and judicial commission practice, signifying fixed differences, established by agreement, between rates for similar or competing freight. They originated in a desire to equalize conditions, to distribute traffic fairly and to avoid rate wars, the short trunk "standard" lines allowing the longer roundabout lines lower rates on a fixed difference, and also on competing commodities, as dressed meats and live stock, wheat and flour. By decision of an arbitration committee in 1877, Atlantic seaboard differentials, because of stated disadvantages in ocean shipments, gave Philadelphia and Baltimore more lower rates than those ruled for Boston and New York. See INTERSTATE COMMERCE COMMISSION; RAILROADS.

DIFFERENTIATION, in biology, that organic process which occurs when certain parts of a uniform whole become structurally different from the others, or when, in other words, the homogeneous becomes heterogeneous. Inequality in internal and external conditions of life brings about restriction of certain vital processes and the predominance of others, and as this division of function is expressed by structure results. Differentiation is the structural change which is associated with the physiological "division of labor," and the process is essentially the same whether it find expression in cells, tissues, organs or entire organisms. See DIVISION OF LABOR; EVOLUTION; VARIATION, etc.

DIFFRACTION OF LIGHT, the bending of the rays of light, due to interference, as of the slits or ruled lines in a diffraction grating. The study of the diffraction of light has given us the spectrum, and through the spectroscope, the diffraction pattern, and has been the means of identifying the elements of the universe. The word is derived from the Latin "diffracta," a splitting, and is applied to the behavior of light when passing through a small opening, or when passing through a medium whose molecules are in a state of vibration. The light falling on the opposite wall is not a well-defined streak, like the apertures through which it passes, but is divided into a series of upright streaks or bands, showing that the rays of light bend or are diffracted in passing through the slit. Interesting experiments pertain to the effect of passing light through a slit, following the light to pass through a hole or holes of different forms. The phenomena of diffraction were first noted and commented on by
Grimaldi of the Jesuits' College of Bologna in 1665. Sir Isaac Newton investigated the subject and explained it further. About 1819 Fresnel demonstrated that interference was the result of the wave motion of light and that sound waves are traveling. Jean-Jacques-Joseph of Munich made a most exhaustive study of diffraction and classified the lines of the spectrum, which became known as 'Fraunhofer's lines.' He invented the diffraction grating about 1821 for exhibiting the lines and forming the spectrum. This grating as at first made was a glass surface, smoothed as perfectly as possible and covered with a thin film of gold-leaf, lampblack, gelatine or the like. Through this film were scratched or ruled parallel lines, constituting minute apertures for light. In order that these lines might be made very fine, close and accurate, the dividing engine was devised. With this were ruled a great many thousand lines to the inch. These lines must be exactly the same distance apart to be valuable. When the light was allowed to pass through the rulings or slits of this transmission grating to the screen the light on the screen was divided or dispersed, appearing in bands and forming a spectrum. It was found that to obtain a satisfactory spectrum a grating of 15,000 to 20,000 lines to the inch was desirable, and even very much finer rulings have been demanded and manufactured. In order to use gratings ruled on plane surfaces for spectroscopic purposes it is necessary to employ a telescope and collimator. After a time the reflecting grating was invented. In this a surface of spectrum metal was ruled, and this had some advantages over glass. Prof. Henry A. Rowland of Baltimore achieved distinction in the production of improved diffraction gratings, making a reflecting grating with a concave surface that can be used without lenses. The diffraction grating has been much used in studying the solar spectrum. See Light; Spectrum; Spectroscope.

For further information as to diffraction gratings consult 'Gratings in Theory and Practice' (in 'Astronomy and Astro-Physics,' Vol. XII, 1893). For information as to diffraction consult Prestel, 'Theory of Light' (London 1901).

DIFFUSION, in physics, is the gradual and spontaneous molecular intermingling of two gases or two liquids in contact into a homogeneous mixture. It takes place regardless of or in opposition to gravitation and is due to the mutual attraction of molecules. Diffusion is most commonly observed between gases, and the lighter the gas the faster does diffusion take place. It also occurs between viscous substances and, in some cases, between solids. A common experiment, exhibiting the diffusion of gases, is to place mouth to mouth vessels of hydrogen and oxygen. After a time it is found that the contents of both vessels are alike—a uniform mixture of the two gases. If the heavier gas is placed below the lighter the result is the same, demonstrating the fact that gravity does not check the result. If chlorine is one of the gases used, its color will enable the eye to follow the diffusion of a gas. If two vessels contain the same gas, the vessels the rate of diffusion can be measured. This fact is taken advantage of in the construction of the diffusimeter, invented by Thomas Graham. This instrument consists essentially of a tube containing a gas, the lower and open end of the tube being dipped in mercury, while the upper end is closed with a porous plug. The rise of the mercury in the tube serves to measure the diffusion of the gas through the plug. Another method of effecting diffusion is to fill a diffusion tube with—for instance hydrogen—and immerse the lower and open end in water, while the upper end is closed with the porous plug. Diffusion then takes place both ways, into the water and into the air.

Alcohol and water afford one of the readiest means of testing the diffusion of liquids. They will diffuse the same as gases, regardless of gravity. Stirring the two hastens the diffusion, because it brings a larger surface of one liquid against the other. At the same time the action is not a mixing in the ordinary sense, but a mixing of the molecules, forming a liquid that is of like composition throughout when the diffusion is complete. If water in a glass vessel be colored with a few drops of litmus solution and sulphuric acid be introduced through a tube to the bottom of the vessel, care being taken not to disturb the water, the diffusion may be observed visually. The water, which is blued by the litmus, turns from blue to red as the diffusion of the sulphuric acid progresses. The principle of diffusion is used in sugar making for extracting sugar from cane-juice and also from beets. Hot water is applied to the cut cane and sliced beets and diffusion withdraws a large part of the sugar, leaving in place the troublesome colloid matters which are present in the pressed juice of both beets and cane. Surgeons have also utilized diffusion to cause a liquid to pass through a membrane or tissue of the body. It is the principle of diffusion of liquids that enables the druggist to compound the several items of a prescription. The uniform strength of his solutions and extracts is also largely dependent upon diffusion. If it were not for this several fluids in a vessel would tend to arrange themselves in layers according to their gravity, as is the case with water and oil, which do not diffuse. Substances in solution also diffuse, following Fick's law of the diffusion of heat, that the diffusion of substances in solution is comparable to the travel of heat in conductors. As the temperature rises the rate of diffusion increases. Since the rate of diffusion of different solutions and liquids varies, it becomes possible to separate component substances in solution by taking advantage of the difference in rate of diffusion of each component. It has been demonstrated that some solids diffuse, though with extreme slowness. Lead placed upon gold for a period of years will be found to contain gold to a slight distance above the point of contact. When the metals are kept at a temperature of from 300° to 400° F., a recognizable diffusion takes place within 30 or 40 days.

For a fuller understanding of the diffusion of gases, see KINETIC THEORY. Compare also OSMOSIS, which is, practically, diffusion taking place through a membrane.

DIGAMMA, in the Greek language. In addition to the smooth and rough breathings the ancient Greek language possessed a digamma or digammat, which is the most commonly called, from the appearance of the character used to denote it, which resembled our letter F, a digamma, that is, double ν. It
was a true consonant and appears to have had the force of *f* or *v* or our *w*. It was attached to several words which in the more familiar dialect had the smooth or rough breathing. Though the whole doctrine of the digamma is obscure, yet it is found in early Greek words, especially in Homer.

**DIGBY, Sir Everard**, English conspirator; b. 16 May 1578; d. 30 Jan. 1606. He enjoyed some consideration at the court of Elizabeth and James I, by whom he was knighted. Being general of the Protestant forces under the extreme Catholic party, he was induced to give £1,500 toward the expenses for the execution of the gunpowder plot and was entrustted with the preparation of a rising in the Midlands. On the discovery of the conspiracy he was tried and hanged in 1606.

**DIGBY, George**, 2d Earl of Bristol, English legislator; b. Madrid 1612; d. 1677. He was educated at Magdalen College, Oxford. As a member of the Long Parliament he was noted for his opposition to the policy of Straford. We next find him a member of the House of Lords, in which he supported the Roundheads in the Civil War, which followed. He served as lieutenant-general in the Royalist army. He emigrated to France after the rise of Cromwell, entered the French service as lieutenant-general, but was dismissed because he opposed Cardinal Mazarin. On the accession of Charles II he returned to England. His last public act was his lodging a charge of high treason against Lord Clarendon. He wrote 'Elvira; or, The Worst not Always True,' a comedy (1667).

**DIGBY, Sir Kenelm**, English author, diplomatist and naval commander; b. Gothurst, Buckinghamshire, 11 July 1603; d. London, 11 June 1665. His great-grandfather bore arms for Henry VII on Bosworth field; his father, Sir Everard (q.v.), died on the scaffold as one of the leading Catholic gentry implicated in the Gunpowder Plot. 1606. Kenelm was brought up a Roman Catholic. After completing his academic studies at Oxford he went on his travels through France, Spain and Italy; in 1628 equipped at his own cost a squadron against the Algerine pirates and defeated a Venetian force off Scanderoon (11 June). Returning home, he appears for a time to have oscillated between Protestantism and Catholicism; was imprisoned early in 1642 as a Royalist, and released in July 1643, but his property was confiscated and he retired to France; there he was in high favor with the court and with men of learning and philosophers, among them Descartes. At the overthrow of the Royalist cause he returned to England and labored in the Catholic interest, but was banished under pain of death by the Parliament. He then for some time served the French king in various embassies, but under the Protectorate came back to England and was admitted to the intimate friendship of Cromwell. He was one of the founders of the London Royal Society. His works on physical philosophy, on natural science and on metaphysical subjects possess now only the interest of curiosity; among them are a 'Treatise on the Nature of Bodies;' 'Peripatetic Institutions,' 'Treatise on the Soul,' etc. On religious matters he wrote many books, among them 'A Conference About a Choice of Religion,' and 'Letters' on the same subject. His brief critique of Sir Thomas Browne's 'Religio Medici' gives a specimen of his style of argumentation. He was all his life an inquirer into occultism and wrote a book on 'The Wounds by the Power of Sympathy'; he hoped also to discover a means of conserving into old age the extraordinary personal beauty of his wife, and invented cosmetics to that end. Consult Longueville, T., 'Life of Sir Kenelm Digby' (New York 1896).

**DIGBY, Kenelm Henry**, English antiquarian; b. 1800; d. London, 22 March 1880. He was graduated from Trinity College, Cambridge, in 1819, and in 1822 published 'The Broad Stone of Honor,' 'that noble manual for gentlemen,' as Julius Hare called it, 'that volume which, had I a son, I would place in his hands, charging him to love it next to his Bible.' It was much altered in the 1828 and subsequent editions (the latest 1877), its author having meanwhile become a Roman Catholic. Among his other works may be named 'Mores Catholici, or Ages of Faith' (1831-40).

**DIGBY, Nova Scotia**, on Saint Mary's Bay, 150 miles west of Halifax. A United States consular agent is stationed here. The town is noted for its curing of a variety of small herrings or pilchards. Pop. 1,247.

**DIGEST, in England and America, a legal work of reference containing rules, decisions and laws arranged under appropriate headings for facility of reference. Such a work may include also laws or statutes and case law in alphabetical order or may be confined to an index of judicial decisions containing the common law in substance. Of such works there exist a vast number, some of which are encyclopedic in scope and treatment. The best known are: of English law, the Digest of Fisher and Chitty; of American law, Abbott, 'Cyclopedic Digest of American Law,' and 'Corpus Juris,' edited by W. Mack and W. B. Hale. In addition to these general works there are digests of decisions of the Federal courts and digests of the decisions of the State courts for each State. See Civil Law; Code; Consult Wambaugh, 'The Study of Cases' (2d ed., Boston 1894).

**DIGESTER**, a closed boiler in which a temperature above the boiling point can be obtained, the hot water and steam disintegrating or digesting the substance treated. The invention of the digester is credited to Denis Papin, a French scientist. He noted that anything boiled in an open vessel was not subjected to a heat above 212° F., as the water went off into steam at that temperature and was lost. Accordingly he constructed a boiler with a closed top to retain the steam and succeeded in securing a temperature of 400° F., which served to readily digest bones. This digester came into use for the manufacture of soap and Gelatin and for bones that had been previously wasted or thrown to the dogs. Within recent years the digester has found a place in a number of industries. The lard or grease tank of a slaughter-house is a digester. In some American cities digesters have been employed to receive garbage and se-
cure a product of some value from the refuse. Tannin is extracted from nutgalls by a digester, in which the material is saturated with ether.

The digester has found its most extensive use, however, in paper-making. The wood pulp, which is stripped by grinders from the log, is introduced in a form resembling fine sawdust to the digester, and comes out pulped, ready to be rolled into paper. Sulphite digester is the common name for these mechanisms owing to the fact that the bacteria solution employed in the process of digestion. This serves as a solvent, but being acid would attack the iron or steel of which the digester is constructed. To protect the iron shell various linings are employed. The "Non Antem" digester employs a lining made of a continuous sheet of lead placed against the inner sides of the shell, and held in place by two courses of acid-proof brick. The Mitscherlich digester is lined with acid-proof brick laid in Portland cement. The Graham digester is lined with sheetz and the lead lining soldered on before bending. The Partington digester is made spherical, so that the lead lining tends to maintain its place from its form; the lead is also burned to the iron. Pusey & Jones build a digester of welded steel, with double shells and no lining. The Schenck digester is also unlined, being made of deoxidized bronze, and in both of these last named the erosion is claimed to be very slight.

Most sulphite digesters are built in the form of an upright cylinder, with one or more manholes at the top, through which the ground wood is introduced. Steam is admitted by coils and a high temperature maintained for about eight hours. When properly cooked, the liquid is run off and the digested material withdrawn by manholes in the bottom. Digesters are used in the hydrolysis of starch to glucose by means of sulphuric or hydrochloric acid.

**DIGESTION.** The word digestion designates the physical and chemical changes which food substances must undergo before they can be absorbed into the blood and lymph. Only a few food substances can become part of the body without previous change. These are water, certain salts and grape sugar. The most important alimentary principles, namely, protein, carbohydrates and fats, cannot be absorbed in the form in which they are furnished by nature. The digestive process can be considered most conveniently under three headings: Secretion, Absorption and Peristalsis.

**Secretion** refers to the elaboration of complex juices which contain, as a rule, digestive enzymes. One of the secretions, the gastric juice, contains free hydrochloric acid. Others, like the pancreas, the small intestine and the intestinal juices, are alkaline. The processes by which these digestive juices are formed and brought to the surface of the organ in which the digestion takes place are complex and will require special description. When these secretions are on the food substances at the temperature of the body, the food substances are broken down into simpler compounds, the chemical molecule becoming smaller and smaller. Some physiologists claim that the molecule of the food is destroyed and the atoms before it can be taken up by the living cells that line the digestive apparatus. If food substances are forced to enter the animal or-

**ganism without being digested, for example, if egg albumen is injected into the blood circulation, it is again excreted by the kidneys. Egg albumen is a foreign albumen and the object of the elaborate chemical process is to convert it into native albumen which chemically and physiologically corresponds to that which enters the normal or native structure of the body.**

**Under Absorption** are included the processes whereby the dissolved food substances, namely, the soluble end products of the digested carbohydrate and fat digestion are taken up from the mucous membrane of the stomach and intestines and carried directly into the blood, or indirectly by means of the lymphatics. The blood, in turn, carries these end products of digestion to the cells constituting the organs and tissues in the body. The most important seat of absorption is the intestines. To a certain small extent absorption can take place from the mouth and the stomach.

**By Peristalsis we mean the periodic contractions and constrictions which the esophagus, stomach and intestines undergo, and by means of which the contents of the digestive apparatus are moved from the oral end to the rectal end of the digestive tube.** These movements are essential to effect a proper mixing of the food with the secretion, and in the ascending colon there is an actual anti-peristalsis which compels the food that has entered the large intestine through the ileocecal valve, after it has reached as far as the hepatic flexure of the colon, to return to the cecum. This may be repeated many times before the food is allowed to pass into the transverse colon.

To the eye the peristaltic movement consists of a constriction of the walls of the intestine which, beginning at a certain point, passes downward away from the stomach from segment to segment. The advancing area of constriction is preceded by an area of inhibition or relaxation. The peristaltic movement, therefore, consists of two acts — constriction of one small region, preceded by the inhibition of another small region immediately in advance of it. These seem to follow in definite sequence and, when combined in an orderly manner, will facilitate the onward movement of the intestinal contents. Bayliss and Starling were the ones first to describe this twofold character of the movement and they regarded it as a reflex which is controlled within the intestinal wall itself through intrinsic nerve ganglia and their afferent and efferent communications.

There are principally three kinds of peristaltic movements of the digestive tract, one, the regular peristalsis just described and shown to be of a twofold character by Bayliss and Starling; secondly, the rhythmical movement; and third, the anti-peristaltic movement. We will now describe the rhythmical movements. Whilst the food progresses onward during the regular peristaltic movement just described, it seems to remain in the same place during the rhythmical movement but is apparently repeatedly kneaded and what is at one time a string of food of the shape of a sausage,
continuous in one piece six or eight inches long, may be suddenly segmented into five or six small pieces. These may be recombined, only to be separated again. During these rhythmical contractions there is no steady progression of the food, although it is repeatedly subjected to divisions. From time to time, however, the separated pieces are caught by an advancing peristaltic wave of the first kind, moved forward about 6 to 10 inches and then gathered into a new mass which, in turn, undergoes segmentation. F. P. Mall has suggested that these rhythmical contractions may also act as a pumping mechanism upon the venousplexuses in the walls of the intestine and thus aid in driving the blood into the portal system. Similar movements have been described by Hertz in the human being.

Anti-peristalsis occurs under normal conditions nowhere except in the colon, particularly in the ascending colon. Under abnormal conditions, for instance, during complete intestinal obstruction, it may occur anywhere in the bowels.

The time required for the passage of the food from the mouth to the stomach is six seconds, if solid; one to two seconds, if liquid. The passage through the stomach may require from two to four hours, according to the quantity and quality of the food. The passage through the smaller intestine, according to Hertz, is about four hours and a half, though Hemmeter has described in the human being, studied by means of the X-ray, the passage of a meal from the pylorus to the ileo-ecal valve in two hours. The colon has the slowest peristaltic movement. The passage of the food through the colon may require from 10 to 14 hours.

Comparative Physiology of Digestion.

Digestion occurs in unicellular animals, such as the protozoa, in which Hemmeter has described the secretion of an acid into the food vacuole. When food that is stained with acid indicators, for instance, Congo red, is taken into the food vacuole of an ameba, it changes to blue, showing that an acid has acted upon the food.

The next highest class of animals, the Coelenterates, possess a mouth and an alimentary tube which opens into the body cavity. A certain chemical digestion takes place in the tube, and the digested food is absorbed through the cells of the endoderm, the lining membrane of this digestive tube. In the Medusse fine canals radiate from the body cavity into the digestive tube and form part of the so-called gastrovascular system. In the Echinodermata we have a further development, a complete alimentary canal with mouth and anus, and entirely shut off from the body cavity. In many Arthropods it is possible already to distinguish parts corresponding to the stomach and large intestine of higher forms, the digestive glands being represented by organs which in some groups seem to be homologous with the liver, and in others with the salivary glands of the higher vertebrates. A few Mollusces seem in addition to possess a pancreas.

Among Vertebrates, fishes have the simplest and birds and mammals the most complicated alimentary system. The stomach in the lower fishes is only indicated by a slight widening of the anterior part of the digestive tube. There are no salivary glands in water-living Vertebrates. The esophagus is generally dilated to form a crop, in Birds, from which the food passes into a stomach consisting of two parts, one pre-eminentely glandular (proventriculus), the other pre-eminentely muscular (ventriculus). Among Mammals a twofold division of the stomach is distinctly indicated in rodents and cetacea, but this organ reaches its greatest complexity in ruminants, which possess no fewer than four gastric pouches. The differentiation of the intestine into small and large intestines and rectum is more distinct, both anatomically and functionally, in Mammals than in lower forms; but there are marked differences between the various mammalian groups, both in the relative size of the several parts of the digestive tract and the proportion between the total length of the alimentary canal and the length of the body. In general, the canal is longest in herbivora, shorter in carnivora. Thus the ratio between length of body and length of intestine is in the cat 1:4, dog 1:5, man 1:5 or 6, horse 1:12, cow 1:20, sheep 1:24. The digestive capacity of the stomach, small intestine and large intestine is in the dog 6:2:1'5, in the horse 1:35:7, in the cow 7:2:1. The area of the mucous surface of the alimentary canal is very considerable, in the dog more than half that of the skin, the surface of the small intestine being three times that of the stomach and four times that of the large intestine. In the horse the mucous surface has twice the area of the skin.

The gullet or cesophagus is a long tube pass-
ing from the pharynx to the stomach. Its mucous coat is loaded with very large glands which secrete a quantity of very viscid mucus.

The stomach itself is a greatly dilated part of the digestive system. It may be said to consist of two parts, even in the human subject; a more complex arrangement is found in many animals, such as the ruminants. The large dilated portion into which the gullet opens is termed cardiac, and the opening the cardiac or oesophageal opening. The whole is lined with mucous membrane, which, in the empty stomach, is thrown into projecting folds or ruga; but these folds are effaced when the organ is distended with food. In the membrane are innumerable glands which secrete the digestive juices of the stomach. The gastric juice is acid, due to the presence of hydrochloric acid. The ferments called pepsin and rennin, which is necessary for digestion, is secreted by special peptic or enzyme cells of the glands.

The food now called the chyme passes into the small intestine, a tube about 20 feet long. This tube, besides the muscular and mucous coats, possesses an external coat of loose fibrous tissue covered by a single layer of flat cells. This coat is prolonged into and helps to form the mesentery, a membrane connecting various loops of the bowel with each other and also the intestine with the abdominal walls. This membrane is called the peritoneum. The small intestine is somewhat arbitrarily divided into three portions—the upper (duodenum), the middle (jejunum), and the lower (ileum). The mucous coat contains glands very like the pyloric glands of the stomach, called Lieberkühn's follicles. They secrete the intestinal juice. In the duodenum one finds in addition highly branched glands called Brunner's. In both the mucous and sub-mucous coats, and generally involving both layers, are found masses of tissue—lymphoid—similar to that found in a lymphatic gland. Their function is probably connected with the blood and the blood corpuscles. Collections of these solitary glands, forming oblong patches about two inches long, are called Peyer's patches. In addition to the follicles of Lieberkühn and the glands of Brunner, there are the liver and the pancreas, which pour their digestive juices into the small intestine. The bile, which is the secretion of the liver, is formed continuously by that organ, but the amount thus formed is influenced by the kind and quantity of food taken. The bile is to be looked upon not only as a digestive juice, but as a drain or excretion, whereby effete and useless matter is removed from the body. The pancreas is very similar in structure to a salivary gland. It secretes pancreatic juice which pours together with the bile into the digestive system, because the common gall duct and the pancreatic duct have a common orifice in the duodenum. The mucous membrane of the small intestine contains, in addition, little projections called villi. These are important organs of absorption. This property they share with the whole digestive system through any part of which, and especially through the walls of the small intestine, digested matter in solution passes into the numerous blood capillaries which form everywhere a dense network. The villi are peculiar, for each one contains in addition to blood vessels a small lymph vessel or lacteal. Nearly all the fat absorbed by the digestive system is taken up by the lacteals and thence into the subclavian vein. The unabsorbed food, mixed with the various secretions we have mentioned, now passes into the large intestine, where both digestion and absorption go on, though to a less extent. The large intestine is only five feet in length, but its lumen is much greater than that of the small intestine. It commences with ce-

crosses over to the left side (transverse colon) and descends again on the left side (descending colon), and makes a bend (sigmoid flexure), and finally terminates in a somewhat enlarged portion (rectum). The mucous membrane of the large intestine differs from that of the small intestine in containing no villi or Brunner's glands. Lieberkühn's and solitary glands are present, but the aggregation of the latter into Peyer's patches is nowhere to be found.

When food is taken into the mouth it is at once swallowed, unless it is in a solid form. In this case it is chewed into a convenient size for swallowing, for which purpose it is, in addition, mixed with the viscid saliva and juices of the mouth. Many animals can hardly be said to masticate; such are the carnivora (dog, cat, etc.), and they are not provided with grinding teeth. In most animals living on vegetable food large flat grinding molars are found. In these animals, not only is the food finely divided in the mouth but the food, largely consisting of starch, is partially digested by the saliva. During mastication the food would naturally tend to stick between the grinding surfaces of the teeth, and would collect within the mouth and outside the gums. This is prevented by the muscles placed in the substance of the cheeks and lips.

Physiology of Swallowing.—As a result of mastication, the food is gathered in the form of a round moist bolus on the upper surface of the tongue. It is now ready to be swallowed. In the first place, it is pushed backward by the tongue and seized by muscles, many of which are attached to the hyoid bone. According to the most recent investigation, the bolus is propelled with great rapidity through the pharynx and gullet into the stomach. Following the propulsion of the food downward there is a wave of contraction, which, commencing in the pharynx travels comparatively slowly downward through the gullet. It is evident that swallowing is not due to the falling of food down the throat. A horse drinks "up-hill," and the jugglers, or indeed anyone, can drink or swallow with the head vertically downward. When the food has reached the back of the mouth, swallowing occurs irrespectively of the action of the will.

There is a possibility that during swallowing the food may go the wrong way — that is, it may pass into the larynx and windpipe. It is prevented from passing into it by the elevation of the larynx which pushes its aperture against and under the back of the tongue, which at the same time is pushed backward.

The real swallowing mechanism has been studied by Magendie, Kronecker and Melzer and by Cannon. The bolus is moved from the anterior end of the tongue along the hard palate to the anterior pillars of the fauces. By the stimulation of the sensory nerves ending in the mucous membrane at this part, a reflex action is produced which results in a forcible contraction of the mylohyoid and hyoglossal muscles. By this the bolus is pushed backward into the esophagus.

In order that food shall only escape backward, the pharyngeal cavity must be separated from the mouth, nose and larynx. This is accomplished as follows:

The opening into the mouth is closed by the posterior part of the tongue being pressed against the hard palate and against the neighboring anterior pillars of the fauces. The nasal cavity is separated from the pharynx by the elevating of the soft palate (by means of the levator palati m.); by the arching of the posterior walls of the pharynx (by means of the superior constrictors of the pharynx) and by the meeting of the two posterior pillars of the fauces at the median line. The opening into the larynx is closed by the elevation of the larynx by means of the mylohyoid and the geniobrhyoid and the digastric, the tongue being so leved that it can be covered by the roof of the tongue and the epiglottis.

The first act of deglutition here described may occur with so much force that by means of it the food reaches the stomach. According to Kronecker and Melzer this is accomplished by contraction of the mylohyoid muscle alone. This is especially true for liquids and soft foods. Only solid and dry foods remain in the pharynx or upper part of the esophagus till the second step in deglutition carries them downward.

The second part of deglutition consists of a peristaltic movement, that is, a contraction of the esophagus beginning at the top and traveling downward. The pharynx first contracts by means of the constrictors, then the esophagus by means of the constrictor of the circular muscles. Thus the parts of the pharynx and esophagus successively contracted push the bolus toward the stomach.

The propagation of the contraction from one part of the esophagus to another does not take place by direct conduction in the muscles, but is dependent upon the central nervous system. After the esophagus has been cut across, the wave of contraction is set up in the lower part when it has ceased in the upper segment.

The nerve centres which govern the processes of chewing, sucking and swallowing lie in the medulla oblongata.

The walls of the stomach and intestines are, like the gullet, provided with muscular fibre. An external layer passes in the direction of the length of the gut, and within this is a circular layer. These muscles contract slowly on stimulation, and are outside the domain of voluntary action. During the digestion they contract peristaltically, moving the food toward the rectum. The peristaltic wave may begin in any part of the gut and pass slowly downward followed at varying intervals by other waves.
DIGESTION

Vomiting Eructations.—Eructations are frequently caused by anti-peristalsis and by a movement of this kind, food is brought back into the mouth for further chewing in the ruminants (sheep, oxen, etc.). The act of vomiting is a reflex nervous act. It can be excited by stimulating the branches of the vagus nerve, as when indigestible and irritative food is taken, or emetics are administered. But, with a feather, the glossophyragel nerve is stimulated and vomiting may readily be produced. It is of frequent occurrence in irritations of the uterine nerves in pregnancy, of the nerves of the liver biliary apparatus and kidneys during the passage of a hepatic or renal stone, or indeed when irritation of any sensory nerves takes place. Vomiting may be caused by chemic substances acting directly on the vomiting centre in the medulla. Apomorphin acts in this manner. Irritating substances acting on the afferent nerves in the stomach can cause vomiting. Mustard acts in this manner.

In many animals, such as the sheep, ox and camel, the stomach consists of several cavities communicating with one another. In the ox and sheep the cardiac and the pyloric portions are each subdivided into two compartments. The cardiac part consists of a very dilated cavity, the paunch (rumen), into which the food is passed as soon as swallowed. In addition there is a smaller part, the reticulum (honeycomb), so called from the folds of lining mucous membrane which reduplicate, forming a reticulum. The pyloric half is divided into two parts. The psalterium (manyplies), so called from the lamellated appearance of its mucous membrane, communicates with the last division of the stomach (abomasum). Fluid passes either into the first, second, or third part of the stomach, and thence on into the fourth. Solid matter, such as grass, roots, etc., passes either into the paunch or reticulum. This is mixed with the saliva swallowed with it and in addition it is mixed with juices formed by the mucous membrane of these cavities. When the animal has finished feeding, it lies down and rumination commences. Due in part to the contraction of the abdominal muscles and diaphragm, the food is propelled in the form of rounded pellets from the paunch and reticulum up into the mouth. The pellets are there thoroughly masticated, and are returned in a pulpy condition to the stomach. Now the food passes into the psalterium, and into the rennet stomach. Hence the consistency of the food determines into which part of the stomach it passes.

In the bird some interesting modifications in the structure of the alimentary canal are seen. The gullet at about the middle of its course is provided with a pouch or crop. Into this the food passes, and is bathed by a secretion formed by its glands. It is then propelled onward into a dilated cavity, the proventriculus, and is acted on by digestive juices. Thence it passes into the gizzard. This cavity is provided with muscular walls of enormous thickness in the case of flesh-eating birds. It is lined by thick and corneous epithelium, and in its interior are generally found pieces of stone, chalk, etc. The gizzard is a powerful mill, which grinds the food into a soft pulp, upon which digestive juices can readily act. See Buns.

The most essential change which food undergoes in digestion is one of solution. This is effected by the chemic breaking down the large molecule of proteid carbohydrate and fat into smaller molecules. Some physiologic chemists claim that the complex food molecule is broken down to its very elements and completely destroyed. The protein fat and carbohydrate of the food, if they were injected as such into the circulation, would not serve as food, but would be excreted as foreign matter—the proteid and carbohydrate by the kidneys, the fat by the intestines. Albumen, starch, fat, and other foodstuffs are insoluble in the circulating fluids. During digestion these pass either into nearly allied chemical substances which are readily dissolved in water, or in the case of fat partly into a soluble soap and partly in a state of microscopically minute form. It is not sufficient, however, to have a soluble foodstuff in order that it may be absorbed and used by the body. Cane (table) sugar is soluble in water, but it is of no use as cane-sugar to the body. If injected into the blood it is at once excreted by the kidneys. During digestion it is converted into glucose, but in a form which can be used by the economy.

The digestion of food is brought about by the action of the saliva, the gastric, pancreatic, intestinal and other juices. These are mixed with the finely divided food by the movements of the alimentary canal. The digestive juices are in all cases secreted by the microscopic cells which line the various glands opening into the digestive system. All digestive juices exert their efforts on the foodstuffs by means of chemic agents known as enzymes or fermenters. These are not formed as active enzymes, but always as inactive pro enzymes, incapable of showing their specific digestive effect until they are made active by an activator. For instance peptin is not secreted as such, but as pepsinogen. The pepsinogen is activated into peptin by the hydrochloric acid (HCl) of the gastric juice.

When food is passed into the stomach, secretion occurs. In all cases the stomach, pale before, becomes suffused with blood, and the gastric juice is poured out. The flow of the intestinal juice, the pancreatic juice and bile all follow the stimulation of the mucous membrane of the duodenum, and in all cases the blood vessels enlarge so as to give the cells a good supply of blood, though, as we have seen, they themselves actually pass into a condition of activity as a result of the influence of special secreting nerves. Foods belong to four classes:

1. Proteids—albumins, globulins, etc.; for example, the white of egg, the chief constituent of meat, the gluten of bread.
2. Carbohydrates—starches, sugars, gums; for example, potato-starch, cane- or grape-sugar.
3. Fats and oils; for example, suet, marrow, olive oil.
4. Inorganic substances; for example, water, table salt, iron, phosphates.

A few substances are absorbed without being digested at all; for example, water and the salts, though even most of the unsweetened grape sugar undergoes some physical change. Grape-sugar is absorbed and probably proteids too are often absorbed in very small amount. Fat is profoundly modified during digestion. The saliva, of which
about 30 ounces are secreted during the 24 hours, contains a ferment termed ptyalin, which is capable of turning boiled starch into a soluble sugar called grape-sugar, or, according to other observers, into another soluble sugar termed maltose. The ptyalin may be extracted from the saliva or from the salivary glands themselves. It does not appear to be much exhausted during its activity. The saliva is alkaline, and the starchy food is no doubt partly converted into sugar during its sojourn in the mouth by its action. Starch digestion may continue in the stomach for 45 minutes to 1 hour for the hydrochloric acid of the gastric juice does not destroy the ptyalin until the concentration of free HCl has reached 0.2 per cent. Any nondigested starch is subsequently converted into sugar when the food reaches the small intestine by the pancreatic juice.

The Nervous Control of the Gall Bladder and the Relation of the Secretion of Bile to the Peristalsis and Secretion of the Stomach.

As an example of the highly complex neuro-chemical reciprocal relations existing between the digestion in the stomach and digestion in the first part of the intestines below the stomach called the duodenum, we will describe the reciprocal innervation between the gall bladder and the intestine. The orifice of the common gall duct on the papilla of Vater is at the same time the orifice of the pancreatic duct.

The vagus is the constrictor nerve to the sphincter at papilla of Vater and inhibitory to the gall bladder. The splanchnics is the motor or constrictor nerve to the gall bladder and inhibitory to the sphincter at papilla of Vater.

Stimulation of central end of splanchnic causes dilatation by reflex stimulation of vagus (inhibitory).

Stimulation of central end of vagus causes contraction of the bladder and a dilatation of sphincter at papilla of Vater.

Now, when there is no food in the stomach the orifice of papilla of Vater is tightly closed, but as soon as food is taken into the stomach and digested, the solid chyme is spurted out through the pyloric sphincter, by the pyloric reflect (Hirsch—von Mering), into duodenum, and thereby stimulating the afferent fibre of the vagus. This stimulates the splanchnics reflexly, thereby causing inhibition of sphincter at papilla of Vater, and at the same time causing contraction of the gall bladder which shoots out the alkaline bile into the duodenum through the common bile duct. This then mixes with the gastric acid chyme, previously expelled through the pylorus, thereby making it alkaline, and this alkaline mass will cause the sphincter of the papilla of Vater to contract tightly and prevent stimulating effect upon the fibres of the splanchnics. Then follows a reflex stimulation of the vagus which results in a contraction of the sphincter of the papilla of Vater and relaxation of the gall bladder. Or in other words, the alkaline chyme stimulates this sphincter surrounding the orifice of the gall duct and pancreatic duct to contract reflexly, just as HCl, when present on the duodenal side, causes the pyloric sphincter to contract reflexly.

An admirable neurochemical adjustment is such that whilst acid HCl on the duodenal side of the pylorus causes the pyloric sphincter to close, this same acid reaction of duodenal chyme causes the sphincter of the papilla of Vater to relax, that the alkaline bile and pancreatic juice may neutralize this acid, for the enzymes of these juices require an alkaline medium for their best effect. When the duodenal chyme is again neutralized the pyloric sphincter opens, letting through four to ten cubic centimetres acid gastric chyme, but at the same time as long as the duodenal chyme is alkaline the sphincter of the papilla of Vater is closed.

The Chemistry of Digestion. Enzymes and Catalysts. The chemistry of digestion involves a knowledge of the enzymes. The substance upon which the enzymes act is called the substrate; thus the substrate for pepsin is protein and the substrate for the diastatic ferment amylopsin is starch. The ferment attaches itself to the substrate and makes a new compound with it, which is capable of standing a higher temperature than the ferment alone. Proteolytic ferment, like trypsin of the pancreatic juice makes, distribute themselves on several different kinds of protein if such food is present at the same time; but then the protein of the more difficult digestibility acts as an inhibiting substance to the ferment. An example of this is the manner of action of trypsin in a mixture of casein, flour and egg albumen. This inhibitive effect gave rise to the idea of anti-ferments in such solutions. The action of enzymes is very similar to that of the catalysts of inorganic chemistry, but they do not act exactly as the catalyzers do.

According to Ostwald catalyzers simply accelerate a process that is already started and going on. However, it is well known that carbohydrates, proteins and peptones can be kept for years without any change if kept free of bacteria. Hence, ferments cannot be claimed to simply accelerate a process already begun.

The beginning of ferment action is extremely rapid. Sugar can be detected in stomach almost immediately when saliva touches it. There is a glycolytic ferment in muscles which forms CO₂ explosively from glucose, provided pancreatic extract has been added. The rapid beginning is a constant sign if the enzymes are allowed to work under the correct conditions, but in experimental conditions this assumption is hazardous; also, no matter how much glucose is present, the glycolytic action and CO₂ formation ceases in 2-10 hours. This is explained by the following possibilities: (1) Ferments may be used up. (2) They may be destroyed because they are labile. (3) They may be inhibited by products. The characteristic manner of action of enzymes is quick onset and quick cessation. They may act by their presence, they may not be consumed and they do not appear as part of the end products.

For some enzymes it has been demonstrated that their action is reversible—that is, they may take place in opposite directions. One of the first demonstrations of this double effect was made by Kastle and Loewenhart in experimenting with an enzyme of the animal body known as Lipase. A necessary step in the digestion and absorption of fats is their splitting up into fatty acids and glycerine. These two chemists found that when they made use of a simple ester chemically analogous to the fats, namely, butyrate, that it was not only split up by Lipase into ethyl alcohol and butyric acid, but that the
DIGESTION

115
two last-named substances could be resynthesized into ethyl butyric and water. In this case this reversibility can be chemically expressed by the following formula:

\[
\text{C}_4\text{H}_8\text{O}_4\text{H} + \text{H}_2\text{O} \rightarrow \text{C}_4\text{H}_8\text{O}_4\text{H} + \text{C}_2\text{H}_5\text{OH}
\]

Ethyl-Butyrate = Butyric acid-Ethyl-alcohol

The Functions of the Gastric Juice—The Pawlow Experimental Stomach.—By means of a very ingenious surgical operation the Russian physiologist Pawlow prepared a secondary artificial stomach from the walls of the entire organ in the dog. The aim of the operation was to separate the stomach into a smaller and larger stomach in such a manner that the two portions did not communicate, but were separated by a partition made of the mucous membranes of the stomach. The larger portion of the stomach is made to open on the surface of the abdomen by a fistula. It was found by experiment that the juice secreted by the smaller stomach has the same composition as that produced by the large stomach. It had, however, the advantage of being free from admixture with food because no food could get into the lesser or artificial stomach.

The gastric juice thus obtained has a specific gravity of 1.033–1.055. It consists of 99 per cent water and nearly 1 per cent solids. The juice also contains free HCl acid in the proportion of 0.2 per cent. It is this HCl acid that explains the inversion of cane-sugar into equal molecules of glucose and fructose in the stomach, for it has been erroneously thought that the gastric juice contains a ferment to which the name Invertase is given, and to which this action was assigned. Similarly a variety of sugar which occurs in dahila tubers and known as laulin is converted by the HCl acid of the gastric juice into fructose.

Gastric juice has three functions in addition to that already mentioned. It converts proteins into proteoses by virtue of the HCl acid and pepsin it contains; secondly, it coagulates milk, and, thirdly, it acts on neutral fats but only such as are in the form of fine emulsion, such as yolk of eggs and milk.

The stages of peptic digestion of protein may be represented in tabular form thus:

<table>
<thead>
<tr>
<th>Food</th>
<th>Ferments</th>

<td>Acid Metaprotein</td>
<td>Peptone</td>
</tr>
<tr>
<td>Primary Proteoses</td>
<td>Secondary Proteoses</td>
<td>Peptones</td>
</tr>
</tbody>
</table>

Some proteins which occur in food do not undergo these changes. Thus elastin is unaffected by peptic digestion in the time available in the stomach. The collagen of connective tissue is probably converted first into gelatine and then into gelatoses and gelatine peptones. The protein constituent of the conjugated proteins is usually converted into proteose and peptone, the prosthetic group being set free. Thus in the digestion of nucleo-protein by gastric juice an insoluble residue of nuclein is formed; in the digestion of mucin (gluco-protein), glucosamine is found in the products.

The effect of gastric juice upon caseinogen the phospho-protein of milk is peculiar in that there is a conversion of the caseinogen into a comparatively insoluble substance, casein. This action of gastric juice has been for many years ascribed to a separate ferment called rennin but latterly evidence has been brought forward which suggests that the formation of casein from caseinogen is due to pepsin itself. The matter has not been conclusively settled, and it will be convenient to retain the term rennin in the meantime when describing the effect of gastric juice on caseinogen.

Adding rennin to milk and allowing it to stand at a temperature of 37° C. the milk soon becomes clotted, and after a time the clot shrinks, squeezing out a clear fluid, whey, which contains all the constituents of milk except caseinogen and fat.

Three factors are necessary for the formation of the clot, namely, caseinogen, rennin and lime salts. If rennin is added to a solution of caseinogen and the mixture is kept for a short time at a temperature of 37° C. and then heated to kill the enzyme, the addition of calcium chloride will bring about the formation of casein. Obviously the enzyme has produced some change in the caseinogen, and the only factor required to complete the conversion into casein is the addition of lime salts. The process may be represented thus:

Caseinogen + Rennin (or pepsin) + Soluble casein + Calcium salts = Casein.

Gastric juice also acts upon neutral fats, but only on those which are in the form of a fine emulsion, such as yolk of egg and milk. The fats are split into glycerol and a fat-soluble agent of an enzyme, lipase. The fat-splitting function of gastric juice, however, is limited in extent, and is of relatively small importance as compared with that which takes place in the small intestine. Pepsin indirectly assists the digestion of fat by dissolving the cell envelopes of the fats' cells of adipose tissue contained in the food. In this way fat is set free and prepared for the subsequent digestive action of pancreatic juice.

Nervous Control of the Secretion of Gastric Juice.—When a dog that has been provided with a Pawlow accessory stomach sees food or simply smells food gastric juice begins to drop from the cannula in the accessory stomach. Also, if the esophagus of the dog is divided and the two ends sewed to the surface at the lower part of the neck, food may be masticated and swallowed by the animal, but none of it will reach the stomach because it falls out of the end of the cesophageal fistula. In such an animal when food is eaten a secretion of gastric juice from the accessory stomach takes place; as no food has reached the stomach this indicates that the first secretion is due to a nervous reflex. The secretion of gastric juice will not occur if both Vagi nerves are cut. The efferent nerves to gastric secretion are therefore the two Vagi. When juices produce purely nervous influence in the absence of any food reaching the stomach it is called a psychic secretion or appetite juice.

The Chemical Mechanism of Gastric Secretion.—Gastric juice may be secreted even after the two Vagi are divided. This type of gastric juice, therefore, would not be due to influence of nerves. The introduction of meat into the main stomach of a Pawlow dog
is followed in from 20 to 30 minutes by a secretion of gastric juice. The substances which stimulate gastric secretion act directly exciting the cells of the gastric membrane, which, in turn, produce a hormone. The word hormone comes from the word ἥρμος (1 stimulate). There is a hormone formed in the pyloric end of the stomach, according to Edkins. It is called gastric secretin or Gastrin. Hormones are readily diffusible. They are of low molecular weight and each exercises a specific function in stimulating the activity of one particular organ or tissue, and when this function is performed it is rapidly destroyed in the body. It does not act as an antigen, that is does not excite the production of an antibody which would interfere with the performance of its function.

The hormones of the body are not destroyed by boiling like the ferments but are soon oxidized in the body, especially in the presence of alkalis.

The Composition and Functions of Pancreatic Juice.—Pancreatic juice may be obtained from animals by introducing a canula into the pancreatic duct and by an operation providing an external opening for this canula to empty itself into vessels tied underneath the abdomen of the animal. As early as 1867 Rene de Grazi employed a method of obtaining pancreatic juice and published an illustration of a dog with a pancreatic and also a salivary fistula. Consult Ernest H. Starling’s work on ‘Recent Advances in the Physiology of Digestion’ (page 81). Pawlow’s method of making a permanent fistula is to cut out a patch of the duodenal wall with the opening of the pancreatic duct in its centre and stitch up the gap in the duodenum and then suture this patch containing the opening of the duct into the abdominal wall. Pancreatic juice obtained in this way is a clear, limpid fluid with a specific gravity of 1006, strongly alkaline in reaction. The degree of alkalinity is such that equal volumes of gastric juice and pancreatic juice neutralize each other.

Pancreatic juice contains four enzymes, a nucleo-protein, inorganic salts, chief of which is sodium carbonate. The enzymes are a protease called Trypsin, converting proteins into peptones and polypeptides; a diastase called Amylase, which converts starch into maltose but unlike saliva the amylase of pancreatic juice is capable of digesting unboiled starch; thirdly, it contains a lipase called Steapsin, and fourthly contains a milk curdling enzyme.

Pure pancreatic juice obtained directly from the duct without coming in contact with the intestinal membrane possesses no action on proteins. If, however, the juice has flowed over the duodenal membrane it becomes proteolytic. The inactive juice contains not Trypsin in its active state but it contains Trypsinogen, which is a precursor of Trypsin.

Trypsinogen is converted into active Trypsin by an activator or coenzyme which is formed in the mucous membrane of the small intestine and the name Enterokinase has been given to this activator. Trypsinogen may also be converted into Trypsin by calcium salts, but not so rapidly as by Enterokinase. Bayliss and Starling have shown that the secretion of pancreatic juice is due to a hormone which they called Secretin, and which is formed in the mucous membrane of the small intestine. The production of this hormone is brought about by the presence of the acids of the gastric contents when they enter the duodenum.

Pawlow has shown that stimulation of the vagus will start a small flow of the pancreatic juice even when the pylorus of the stomach is ligatured so that the passage of acid substances from the stomach into the duodenum is prevented. It is possible that the first few cc of juice of the pancreas that are secreted may be of nervous origin.

Secretin is not secreted in its complete or active form, but as a precursor state called prosecretin, and the amount of secretin in former as shown by the amount of pancreatic juice that is secreted varies with the nature of the food. The effect of Tryptic digestion may be represented in tabular form in the following manner:

<table>
<thead>
<tr>

</tbody>
</table>

The action of the pancreatic juice on starch is effected by an enzyme called Amylase or Amylase forming maltose from starch, but as the maltose is formed it is hydrolyzed by a ferment called Maltase contained in the pancreatic juice and also in the intestinal juice. Under the influence of maltase each molecule of maltose takes up a molecule of water and is split into two molecules of dextrose. Pancreatic juice differs, however, from the intestinal juice in having no similar action on other disaccharides, such as lactose and cane sugar.

Action of Pancreatic Juice on Fats.—If neutral olive oil be shaken with pancreatic juice and the mixture kept at a temperature of 37° C., the fatty ester will be hydrolyzed, producing fatty acid and glycerine, and the reaction will become acid. The digestion of fats is greatly aided by the presence of bile and also mechanically assisted by the formation of soap. Some of the fatty acid which is set free combines with the alkali of the intestinal contents to form soap. Each fat droplet becomes coated with a fine film of soap, which prevents it from coalescing with adjacent fat droplets and in this way the formation of a still finer emulsion is brought about and the fat made more accessible to the fat-splitting enzyme.

Action of Pancreatic Juice on Milk.—When pancreatic juice is mixed with milk at the body temperature the milk soon clots, but as the clotting stage is very brief, the curd being dissolved by the proteolytic action of the Trypsin, the milk-curdling function has been ascribed by some authorities to the Trypsin and not to a special pancreatic rennin.

The Bile in Its Digestive Function.—Bile is to be looked upon not as a digestive juice in the same sense as saliva, but as an excretion which incidentally assists the digestive action of the pancreatic juice. The reciprocal relations, both chemical and nervous, existing between the secretion of gastric, pancreatic juice and bile have already been described.

As far as digestion is concerned, bile has five important functions. (1) It precipitates the acid-metaprotein and the proteoses resulting...
from gastric digestion of proteins, and the conversion of a fluid or semi-fluid material into this solid condition allows more time for the action of pancreatic juice. (2) Bile salts act as a coenzyme or activator to each of the principal enzymes of the pancreatic juice. The presence of bile salts the power of the pancreatic amylase is doubled, the proteolytic power of Trypsin is doubled and the action of the pancreatic lipase is augmented 20 times. (3) Bile promotes the absorption of the products of digestion. When bile is prevented from entering the intestine at per cent of the fat of a meal passes into the faces undigested, while normally the fat should almost have entirely disappeared from the faces. (4) Bile salts stimulate the peristaltic movements on the intestines. (5) The reabsorbed bile salts stimulate the liver to further secretion.

**Function of the Intestinal Juice.**—Intestinal juice converts Trypsinogen into Trypsin by Enterokinase. It also contains two enzymes which convert the disaccharides, cane-sugar and lactose, into monosaccharides. The enzymes are called invertase and lactase. The terminal stages of hydrolysis of proteins are affected by a ferment called Eepsin. Eepsin acts on proteoses and peptones, splitting them up into amino-acids. The secretion of the preceding as causing the secretion of pancreatic juice is not poured out into the lumen of the intestines but reaches the pancreas by way of the blood channels. It is not a ferment because it is not destroyed by boiling. The normal stimulus and the secretion of intestinal juice is undoubtedly this very secretin and possibly other hormones. It is not satisfactorily demonstrated that the intestinal secretion is influenced by a nervous factor. Hemmert has conceived of the digestive secrections as under control of two chemic factors — (1) stimulators, and (2) arresting factors of secretion. The first are the hormones already described. The second designates as kolliones from "aktive," to check or inhibit. Some of the end products of digestion act as kolliones.

**John C. Hemmert, M.D.**
Professor in Medical Department of the University of Maryland.

**DIGHTON ROCK,** a boulder of "greenstone" (in fact, bluish-grey), in Berkley, Bristol County, Mass., opposite Dighton, the landing-place for it; on the east shore of the Taunton River, about 10 feet from low-water mark, and covered two or three feet deep at each flood tide. It is 11½ feet long and about five feet high, with a flat face toward the river, once covered with inscribed characters varying from scratches to one-third of an inch deep, not chiseled, but "pecked" in. For many years the stream of visitors, unchecked by any authority, so often scrubbed off the tidal deposits of dirt with brooms and water to see the characters more plainly, that most of the latter are effaced and the whole past ineffective study. From old drawings, engravings, and petroglyphs elsewhere, there is no doubt it is Indian; Schoolcraft says, in the symbolic character of the Kekeewin. (Consult Garrick Mal- lory in annual report of the Bureau of Ethnology, 1889, pp. 83-86, 762-764; from Dr. Hoff- man's examination of 1886). Enthusiasts at various times have made wonderful interpreta-

**DIGIT, in arithmetic, usually signifies any one of the 10 numerals, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, though zero was originally not regarded as a digit. The word comes from digitus, a finger, thus indicating the humble means originally employed in computations. In medieval times 10, 20 . . . 90 were called articles, and their combinations with digits were called composites. Digit is also a measure of a finger's breadth equal to three-fourths of an inch. Digit, in astronomy, is the measure by which we estimate the quantity of an eclipse. The diameter of the sun or moon's disc is conceived to be divided into 12 equal parts, called digits; and according to the number of those parts or digits which are obscured, so many digits are said to be eclipsed. When the luminary is wholly covered, the digits eclipsed are precisely 12; and when it is more than covered, as is frequently the case in lunar eclipses, then more than 12 digits are said to be eclipsed.

**DIGITALIN, di-j'it-il'n, the commercial name for a compound substance extracted from the seeds of the common foxglove (Digitalis purpurea), and containing digitoxin and the three glucosides, digitonin, digitalin and digitalin; and probably others. Some of these are deadly poisons, but of great medicinal value, while others are almost inactiv or harmless. The earliest extract was Homolle's "digitaline," prepared from the leaves by the action of alcohol, acetic acid, lead oxide and ether. It is a white, bitter, partially crystalline body without smell, soluble in alcohol, but not in water or ether, and has been used in medicine, under the name of digitalin or digitalis. It contains digitoxin and a glucoside, digitophyllin; the latter being, apparently, identical with the "crystal- line digitalin" of Nativelle. But no digitalin, proper, or digitonin is found in the leaves of the foxglove. Another digitalin was obtained by Walz by treating that of Homolle with ether and water; it is a sort of "camphor," yellow, amorphous, soluble in water, and very powerful in its action, and was received the name "digitalin." Another chemist, Nativelle, obtained from the leaves two crystalline bodies,
known as digitalin and digitin, and an amorphous one called digitalinum. It is to this last-named substance that the powerful physiological action of the drug is to be ascribed. Digitalin, prepared by various processes, and probably not chemically pure, is employed in medicine, being used chiefly in stimulating the action of a weak heart, and effective also in removing drop-sical fluid by its action on the kidneys; but it is apt to derange the stomach and bowels, cause loss of appetite, etc.

**DIGITALIS**, dij-i-tali's, a name given to the leaves of the plant *Digitalis purpurea* (see Foxglove), of the second year’s growth. This is a biennial herb which is largely cultivated for ornament. It is about two to five feet high, with large succulent leaves and tubular urn-shaped purple flowers growing in a raceme. It is a native of southern and central Europe, and is extensively cultivated throughout the world, although the cultivated leaves are not as serviceable as those of the wild plant. The leaves, which lose on drying about 75 per cent in weight, are mostly obtained from the wild plants growing in the mountainous regions when two-thirds of the flowers are expanded. The leaves should not be kept more than one year, as the quality deteriorates very rapidly. The active principles in the digitalis leaves consist of four or five glycosides: digitoxin, digitophyllin, digitalin, digitalein and digitonin. The seeds also contain large amounts of active glycosides. The action of digitalis on the body is complex. It is primarily a local irritant causing secondary paralysis of the sensory nerve-endings. It is bitter to the taste, followed by burning and swelling of the mucous membrane. It is an irritant to the intestines, where it may cause nausea and vomiting. After absorption the chief action of the drug is on the central nervous system, the heart and the blood vessels. The action on the nervous system is of secondary value to the heart action, although there is distinct stimulation throughout. The action of the drug on the heart-muscle is the most important property possessed by digitalis, both pharmacologically and therapeutically. Here by reason of the complicated physiology of the heart action, the different effects of digitalis on this organ are somewhat difficult to comprehend. Digitalis stimulates primarily the muscular fibres of the heart. It stimulates the cardiac nervous ganglia; and it stimulates, and then paralyses, the cardiac inhibitory nerve, the pneumogastric. Thus the normal heart, under the action of small doses of digitalis, is at first made to beat somewhat more strongly and rapidly; but as soon as its action upon the pneumogastric begins to manifest, in larger and increasing doses, the heart action becomes more powertul and is somewhat slowed; and in full medicinal doses, frequently used in medicine when the effects of digitalis are desired, the action of the heart is much stronger and considerably slower. The blood-pressure is high, and the arteries are contracted. If, however, the use of digitalis is pushed beyond this point, its action as a paralyzant of the pneumogastric begins to be evident. By reason of this loss of the inhibitory action of the pneumogastric, the heart action at first is stronger, and the beat becomes more rapid. If still further toxic doses are given, the heart runs away, as it were. It beats very rapidly, irregularly, and with increasingly weakened force, until it finally stops exhausted. Digitalis also increases the secretion of urine; it raises the pressure of the blood vessels, and increases the amount of blood in all the organs of the body, including the heart itself. It is thus one of the great cardiac tonics, when used within physiological limits, and is indicated in most cases of heart disease where there is malnutrition caused by the dilatation of the chamber or a leakage of the valves.

**DIGNE, dé’ny**, France, capital of the department of Basses-Alpes, 60 miles northwest of Marseilles, at the confluence of the Bléone and the Durance. It is encircled by walls, and has narrow, crooked streets. It contains a public library, a modern lyceum and a cathedral. It is an important fruit-growing centre and has a trade in dried fruits, confits, marble, honey, wax, woolens, linen, skins and leather, etc. There are hot saline springs nearby. Dinia was its name in Roman days and it is mentioned by Pliny. In 1629 its population was nearly wiped out by the plague. Consult Guichard, "Souvenirs historiques sur la Ville de Digne et ses Environs" (Digne 1847), P. 731.

**DIJKSTRA, dik’stra, Waling**, Frisian poet: b. Vrouwen Parish, Friesland, 1821. His numerous poetical works contributed greatly to the spread and cultivation of the Frisian language and literature. His best-known works are: 'Doorste mei de noarde' (3d ed., 1875); 'De silveren rinkelbel' (3d ed., 1887); 'In doze fol sinds snipsnaren, in colonization with Van der Meulen (2d ed., 1882); 'Friske winterjouenocht' (5 vols., 1861-76); and 'Uit Frieslands volksleven van vroeg en later' (Leeuwarden, 1892), by many deemed his greatest work.

**DIJON, dé-zho’ (ancient Dibio)**, France, chief town in the department of Côtes d’Or, and formerly capital of the old duchy of Burgundy. It is a well and regularly built town, situated at the confluence of the rivers Ouche and Suzon, 211 miles southeast of Paris by rail. It is encircled by eight forts, those formerly nearest the city having made way for handsome boulevards. The church of Saint Bénigne (who was martyred here in the 2d century) is the most important ecclesiastical monument of the town and is of the 13th and 14th centuries. Down to the Revolution there existed a curious circular church in imitation of that of the Holy Sepulchre, with a spire 300 feet high. The church of Notre Dame is of pure Burgundian Gothic and possesses a clock of date 1382. The church of Saint Jean is a 12th century structure now degraded into a hay-store. The palace of the dukes of Burgundy, begun 1366, now does duty as town-hall, but its front has been entirely modernized. The carvings and frescoes within are exquisite. The museum is specially valuable for its collection of relics and monuments of mediæval times. The theatre has a fine Corinthian portico. The ancient burial place of the dukes of Burgundy, founded in 1383, now serves as a lunatic asylum. Dijon is the seat of a university with three faculties and a valuable library. It is the centre of the wine trade of Burgundy, is famous for its mustard and has manufactures of machinery, automobiles, boots and shoes, flour, beer, biscuits and soap. Dijon was the birthplace of Bossuet. It was in German occupation in 1870. Pop. 76,847.
DIKA, dë'ka, a vegetable fat obtained from the seed of a West African tree, *Irvingia barteri*, of the family *Simaroubaceae*, used in making fine soaps. It resembles cacao-butter and makes very hard soaps. The tree has alternate, entire leaves and drupaceous fruits.

DIKAMALI, dik-a-mäl'i, a resin exuding from Indian trees of the genus *Gardenia*, especially *G. acida* and *G. gummifer*, a solution of which is used to dress wounds and open sores. These trees belong to the family *Rubiacae*.

DIKE. See Dyke.

DIKE, in geology, a term used to describe a mass of igneous rock, filling a fracture in some other rock. It may be vertical, inclined or even horizontal. The filling rock was injected in a fluid condition. Dikes vary from sills in that the latter are intruded along bedding planes parallel to the stratification of sedimentary rocks. A sill may vary from horizontal to vertical, depending on the position of the beds between which it is intruded. A very tall dike, a fraction of an inch thick and a few inches long, projecting from some larger igneous body, is known as an apophysis. Dikes and sills may consist of either basic or acidic rocks, and are usually much greater in two dimensions than in the third, being from a few inches to several feet in thickness, and often hundreds of feet, or even many miles in length and breadth. It is not uncommon for valuable minerals to be associated with dikes.

DIKE, dë'kä, in Grecian mythology, the avenger of wrong and the rewarder of virtue. She is the daughter of Zeus and Themis and is considered one of the Horae.

DIKOÁ, dë-kó'a, Africa, town of the old kingdom of Bornu, in central Africa, included in the former German colony of Kamerun, about 25 miles south of Lake Chad. It is fortified and was at one time the residence of the ruler of the native kingdom. Pop. 15,000 to 25,000.

DILATATION. See Heart-Disease.

DILEMMA (from Gr. δίς, twice, and λέμνα, an assumption), in logic, an argument in which the same conclusion may be drawn from two contrary propositions. A person is said to be in a dilemma, or on "the horns of a dilemma," when each of several courses of action would lead to an unsatisfactory result. We append one of the most famous of the classical dilemmas. A young rhetorician said to an old Sophist: "Instruct me in pleading and I shall pay you when I gain a cause." The master sued for the reward, and the scholar eluded the claim by a dilemma. "If I gain my cause I shall not pay you, because the award of the judge shall be against you. If I lose it I may withhold it, as I shall not have gained a cause." The master replied: "If you gain you must pay me, because you promised to pay me when you gained a cause; if you lose you must pay me, because the judge will award it." When the case came before the judges they were unable to decide it.

DILETTANTE, dill-ët-tan'të, an Italian expression; in its original sense signifying a lover of the arts; and sciences, who devotes his leisure to them as a means of amusement and gratifica-

DILIGENCE, the name originally given in French-speaking countries to a public conveyance of the nature of a stage-coach. The name was also adopted by other countries for their public carriages. The French diligence was a national vehicle going over regular routes periodically. It was a huge, heavy, cumbersome affair, upon four broad wheels which never covered a greater distance than six miles an hour. It had three compartments, designated for the same number of classed passengers. Two officials accompanied the diligence on its trip; a postillon, who managed the horses, and a conducteur, who looked after the passengers and their trunks.

In law, the care and attention which a person is required to show in a given situation in his relations with others. There are three degrees recognized by jurisprudence; ordinary, less than ordinary and more than ordinary. It is a term of frequent occurrence in the law of negligence and bailments.

DILKE, Charles Wentworth, English journalist, antiquary and critic: b. 8 Dec. 1789; d. Hampstead, 10 Aug. 1864. He entered the civil service as a youth, became a clerk in the navy pay office and retired on a pension in 1836. All his leisure meanwhile was devoted to literature, and already in 1814-16 he produced a continuation of Dodgesley's "Old Plays." He was an intimate friend of Keats and knew Shelley, Leigh Hunt and Tom Hood. Keats went to stay for a time with Dilke's father at Chichester in January 1819, carrying a letter of introduction from Mrs. Dilke. Up to 1829 Dilke contributed largely to various reviews and magazines, when he joined the *Athenæum*, of which he became editor in 1830. He reduced its price from a shilling to 4d. (24 cents to 8 cents), enlisted the services of Lamb, Barry Cornwall, Sainte-Beuve and other prominent writers, thereby raising the expenses to the extent that there was no salary for himself — the editor. After 10 years' laborious work the Athenæum was an established success and in 1846 Dilke became business manager of the Daily News, of
which Charles Dickens was the first editor. Lack of unanimity among the proprietors led to Dilké's withdrawal after three years, when he devoted himself entirely to contributing to the *Athenæum*, in the columns of which his best work now began to appear. Among his more important contributions is his series of articles on the mystery of the Junius letters, in which he demolished the claims to their authorship advanced on behalf of Colonel Barré, Boyd, Sackville, Frances and several others. The essays are masterpieces of incisive criticism and quite as interesting as the famous "Letters" themselves. They were collected and published, together with his articles on Pope, Burke, Swift, Wilkes, Grenville, etc., in 1875 under the title of 'Papers of a Critic,' by Dilké's grandson, Sir Charles W. Dilké, in two volumes, prefaced with a memoir of their author. Consult also 'Dictionary of National Biography' (Vol. 15, London 1888).

**DILKE, Sir Charles Wentworth**, 1st baronet, English politician: b. 1819, d. Saint Petersburg, 10 May 1889; son of Charles Wentworth Dilké (q.v.). He was connected with the Royal Horticultural Society and the Royal Society of Arts. He is best known as one of the promoters of the great International Exhibition held in London in 1851, for which purpose the famous Crystal Palace (now at Sydenham, London, S.E.) was originally erected in Hyde Park. He came to New York in 1853 as commissioner to the Industrial Exhibition and went in a similar capacity to the Paris Exhibition of 1855. Dilké was knighted in 1862 and appointed one of the five commissioners for the exhibition of that year. His parliamentary career was unimportant; he represented Wallingford as a Liberal 1864-68. He was in Russia acting as commissioner at an exhibition when he died. He was succeeded in the baronetcy by his son Sir Charles W. Dilké, M.P., the well-known statesman (q.v.).

**DILKE, Sir Charles Wentworth, M.P.**, 2d baronet, English statesman and author: b. London 24 April 1843; d. there, 26 Jan. 1917. Eldest son of the first baronet of that name and grandson of the critic, C. W. Dilké (q.v.). Educated at Trinity Hall, Cambridge, he was graduated with honors and called to the bar in 1866; member Parliament for Chelsea 1868-80; Under-Secretary of State for Foreign Affairs, 1880-82; president of Local Government Board 1882-85; chairman of the Royal Commission for Negotiations with France, 1880-82; chairman of the Royal Commission for Housing of the Working-class, 1884-85; chairman of the Select Committee on Income Tax, 1906. He traveled in Canada and the United States in 1866; thence to Panama, New Zealand, Australia and Tasmania, studying the colonies at first hand, returning home across Ceylon, India and Egypt. On his return he published 'Greater Britain: a Record of Travel in English-speaking Countries during 1866-67' (2 vols., 1868). The work instantly took its place as a classic, passing through numerous editions in Great Britain and America. Inheriting the *Athenæum* from his father and grandfather, he carried on the editorship of *Notes and Queries*, devoting himself to editorial work for a time. His re-election to Parliament was opposed in 1874 on the ground that he openly avowed his preference for a republican form of government, but he retained his seat. In 1875 he made another tour of the world, this time including China and Japan in his itinerary. His strong predilection for France gained him the friendship of many public men in that country.

Though nominally a Liberal in politics, Dilké leaned to the radical section of the party. How he first obtained office is told in Lord Morley's 'Life of Gladstone.' In the first administration of his second administration in 1880 Gladstone had already distributed all the great posts among the "patrician whigs," when he was warned not to overlook the radical leaders. He sent for Dilké, who promptly refused to serve unless either himself or Chamberlain (the late Joseph) were in the Cabinet and that the other would then accept a subordinate post.

In the end Chamberlain was chosen and placed at the Board of Trade, and Dilké became under-secretary to the Board a post not involving a seat in the Cabinet. Between 1880 and 1885 he held the various positions mentioned above. After the collapse of the Gladstone ministry in June 1885, Dilké came out of office—never to return, for in February 1886 fell the tragedy that blasted his political career, the Crawford divorce case. His resignation was inevitable; in his valedictory address to his constituents he said . . . "I can only assure you . . . as I have already often assured you, and with equal solemnity sworn in court, that I am innocent of the charges brought against me. . ." Dilké had been a widower since 1874; in 1885 he married the widow of the Rev. Mark Pattison. She was in India at the time the scandal became public and directly showed her confidence in his innocence by announcing their engagement. In 1892 he returned to public life as Liberal member for the Forest of Dean division of Gloucestershire, which seat he retained till his death. He had spent the intervening years in literary activity, a recluse from society, yet supremely happy in his domestic life and the small circle of friends who remained by his side. His speeches were invariably listened to with respect by both sides of the House; he spoke with authority on numerous questions, colonial and foreign affairs, imperial defense, finance, social and labor problems. A wealthy man, he possessed one of the most interesting private collections in London, including many personal relics of Keats. In addition to the work already mentioned, he wrote 'New America' (1868); 'The Fall of Prince Florestan of Monaco' (1874); 'The Present Position of European Politics' (1887); 'The British Army' (1888); 'Problems of Greater Britain' (1890); 'Imperial Defence'; 'The British Empire' (1896); and a memoir of his wife prefixed to her 'Book of the Spiritual Life.' Consult the 'Life' of S. Gwynn and Miss G. Tucker.

**DILL, Ludwig**, German painter: b. Gernsbach, Baden, 2 Feb. 1848. He studied architecture and engineering, but soon abandoned these and took up painting under Raab, Seitz and Pilch. The latter also had a share of his work showed the influence of the Barbizon school, but afterward was greatly influenced by Baisch. To his early period belong large
marines and fishing scenes painted on the island of Chioggia, of which 'Sirocco,' in the Mannheim Gallery, is a noteworthy example. He paid a visit to Holland and returned to Munich, thereafter spending part of each year at Pavia. He now confined himself to pure landscape. His best works are 'Meadows' (Pennsylvania Gallery); 'Sacred Grove' (Munich); 'A Brook in the Moor' (Dresden); 'A Corner of the Giudecca' (1910); 'A Canal at Asolo' (Mühlhausen); 'November Evening' (1912). In 1897, with Hözel and Langhammer, he formed the so-called 'Dachau Group.' He was one of the judges at the Paris and Chicago expositions and later was appointed professor at the Karlsruhe Academy. Consult Rössler, 'Neu-Dachau' (Bielefeld 1903).

DILL, Sir Samuel, British educator: b. 26 Jan. 1844. He was educated at Queen's College, Belfast, and at Lincoln College, Oxford, and in 1869 became lecturer at the latter. He was Fellow, dean and tutor of Corpus Christi College 1870-77, headmaster of the Manchester Grammar School 1877-88. After 1889 he became commissioner of intermediate education, Ireland, member of the Belfast University Commission and prochancellor of Queen's University. In 1913 he became chairman of the vice-regal committee on education; they include 'Geology of the Lassen Peak District' (1899); 'The Coos Bay Coal Field' (1899); 'Geology and Petrography of Crater Lake National Park, Oregon,' with the cooperation of H. B. Patton (1902).

DILLINGEN, Bavaria, town on the Danube, 25 miles northwestern of Marburg. William of Orange, Liberator of the Netherlands, was born in the castle here in 1533. The site of the castle is occupied by the Wilhelmshof, a tower 130 feet high. Iron mining and leather tanning are the principal industries. A mining school is located here. Pop. 5,571.

DILLENIACEAE, dil-le-nil'-ay-see, a family of plants found chiefly in Australia, Asia and the warm parts of America. Sepals five, persistent, occupied by the cushion, a tower 130 feet high. Iron mining and leather tanning are the principal industries. A mining school is located here. Pop. 5,571.

DILL, (Anethum graveolens), the common mound forming aromatic plant of the carrot family (Umbelliferae). It is a native of Spain, but has been naturalized throughout the civilized world, where the climate is suitable for its growth. It is a particular favorite with the German people, who use it to flavor cucumber pickles, and therefore try to raise it wherever they may be living. In England it is used for the manufacture of gin, and to a small extent in medicine, as a carminative for children. An East Indian species is one of the ingredients in curry powder. It is a hardy biennial plant, growing upright. It has a single slender stem and leaves finely divided or pinnatifid. The flowers, which form an umbel, appear in June or July. The seed is of an oval form, convex on one side, flat on the other, having three strata on the outside, and surrounded with a small membranous border. Its taste is slightly acrid, and its odor stronger but less pleasant than that of fennel, to which it is closely allied. In America, where found out of gardens, it is a fugitive from cultivation and is generally called fennel.

DILLENBROCK, Prussia, capital of the circle of Dil Hesse-Nassau on the Dil, 20 miles southwest of Marburg. William of Orange, Liberator of the Netherlands, was born in the castle here in 1533. The site of the castle is occupied by the Wilhelmshof, a tower 130 feet high. Iron mining and leather tanning are the principal industries. A mining school is located here. Pop. 5,571.

DILLENIUS, DILLEN, Johann Jakob, yoh'-hayn yak'-uhb, German botanist: b. Darmstadt 1687; d. Oxford, England, 2 April 1747. He was distinguished for his investigations into the propagation of plants, particularly cryptogamous plants. In 1727 he went to England, where he became first Sherardian professor of botany at Oxford and published several works, particularly 'Hortus Elthamensis' (1732) in which the drawings prepared by himself are distinguished by the greatest faithfulness. His last work, on the mosses, 'Historia Muscorum' (1741) added much to his reputation and was for long a standard book.

DILLER, Joseph Silas, American geologist: b. Plainfield, Pa., 1850. He was educated at Harvard University and at Heidelberg, Germany. He was geologist to the American association in 1881-83, and in the latter year became a member of the staff of the United States Geological Survey. His writings are very numerous, dealing principally with the Pacific coast region; they include 'Geology of the Lassen Peak District' (1899); 'The Coos Bay Coal Field' (1899); 'Geology and Petrography of Crater Lake National Park, Oregon,' with the cooperation of H. B. Patton (1902).

DILLINGHAM, William Paul, American statesman: b. Waterbury, Vt., 12 Dec. 1843. He studied law, was admitted to practice in 1867, and was state attorney, Washington County, Vt., 1872-76. He was a member of the Vermont legislature 1876 and 1884; State senator 1878 and 1880; commissioner of State taxes 1882-88 and governor of Vermont 1898-90. Since 1890 he has been president of the Waterbury National Bank. He was elected United States senator in October 1900 to fill a vacancy caused by the death of Justin S. Morrill, and was re-elected for the terms 1903-09, 1909-15, 1915-21. In 1907 he was chairman of the United States Immigration Commission.

DILLMANN, Christian Friedrich August, German Orientalist: b. Illingen, Württemberg, 25 April 1823; d. 4 July 1894. He was educated in Tübingen and became lecturer there in 1852. In 1854 he accepted a call to Kiel, where he became professor of Oriental languages in 1860, but was transferred in 1864 to the chair of Old Testament exegesis at Giessen, which in 1869 he resigned to become Hengstenberg's successor at Berlin. In 1877 he became a member of the
DILLON — DIMINUTIVE

Royal Academy of Sciences. Dillon was beyond question the first authority in Europe on the Ethiopic languages. The best books for the student in this department of learning are his "Ethiopian Grammar" (1857, revised by Bishop 1899); "Ethiopian Dictionary" (1865); and his "Ethiopian Selections" (1866). Other works (1879–84) deal with the history of the Ethiopic kingdom of Axum. He also wrote commentaries on Job (1869; 4th ed., 1891); Exodus and Leviticus (2nd ed., 1875; English ed., 1897); Numbers, Deuteronomy and Joshua (1886), and Isaiah (1891). Other works are "Ursprung der alttestamentlichen Religion" (1865); "Die Propheten nach ihrer politischen Wirksamkeit" (1868), and "Vorlesungen über Theologie des Alten Testaments" (1895). Consult brief biography by Baudissin (Leipzig 1895).

DILLON, John, Irish politician, son of John Blake Dillon, who was a prominent member of the Young Ireland party and member of the British Parliament for County Tipperary in 1865–66; b. New York 1851. He early identified himself with the Parnellite movement and in 1880 was elected to Parliament for County Tipperary. In the House of Commons Dillon soon became prominent for the violence of his language, while speeches delivered by him in Ireland led to his imprisonment in 1881, 1882 and 1888. From 1883 to 1885 he was absent from political life on account of ill-health, but in the latter year he reappeared and was elected for East Mayo, which he has since continuously represented. He was one of the most prominent promoters of the "Plan of Campaign." In 1896 he succeeded Justin McCarthy as chairman of the main section of the Nationalist party, continuing until 1898. In 1901 he accepted the leadership of Mr. John Redmond in the reunited Nationalist party and since that date has been one of the most active of his lieutenants.

DILLON, John Forrest, American lawyer: b. Montgomery County, N. Y., 25 Dec. 1831; d. Far Hills, N. J., 5 May 1914. Going to Iowa in early youth he was graduated at the medical department of the Iowa University, but soon gave up medicine for law and was admitted to the bar in 1852. He was State prosecuting attorney 1852–58; judge of the Supreme Court of Iowa 1863–69; and judge of the United States Circuit Court, Eighth Judicial District, 1869–79, when he resigned. From 1879–82 he was professor of real estate and equity jurisprudence in Columbia Law School and became prominently known as a railroad lawyer, being general counsel of the Missouri Pacific Railway Company and the Western Union Telegraph Company, and consulting counsel of the Manhattan Elevated and Pacific railway companies. Among his works are "United States Circuit Court Reports" (1872); "Municipal Corporations" (1872); "Removal of Causes from State to Federal Courts" (1872); "Municipal Bonds" and "Laws and Jurisprudence of England and America" (1894); "John Marshall" (3 vols., 1909); "Commentaries on the Law of Municipal Corporations" (revised and enlarged, 1911).

DILLOO (dye-l’O) Lake, Central Africa, a small body of water discovered by Dr. Livingstone. Its altitude is 5,000 feet above the sea. It is supposed to be connected with both the Zambesi and Kongo rivers, as it lies on the watershed between these two river systems. Its location is in lat. 11° 30' S., long. 22° 30' E. Hippopotami and fish abound in its waters.

DILTHEY, del’ti, Wilhelm, German philosopher; b. Biebrich, 1834; d. 1911. He received his philosophy at Basel and in 1866 became professor of philosophy at Basel, removing to Kiel two years later in a similar capacity, to Breslau in 1871 and to Berlin in 1882. He published "Das Erkenntnis" (1896). He is best known, however, by his attempt to set psychology as the basis for scientific research in history and sociology and ignoring metaphysics. This plan or system is outlined in his "Einleitung in die Geisteswissenschaften" (1883).

DILUENT, remedies that increase the proportion of fluid in the blood. They are employed in fevers to lessen thirst and increase secretion, and are used in certain acrid affections of the stomach and intestinal regions. Water is the only real diluent, although it may be given in various forms—soups, barley-water, toast-water, milk, lemonade, soda water, beer, tea.

DILUVIUM, a term first used by the English geologist Buckland in 1823, and applied by him to the deposits between the Tertiary system and those now in process of formation. He regarded them as the discharge from a universal flood. The diluvium thus includes the boulders, sands and clays which Lyell included under the name Pleistocene and Morlot under the name Quaternary. Though the term diluvium is no longer used, the adjective diluvial is still employed, especially by foreign geologists, to designate accumulations of gravel or angular stones formed during the Pleistocene period. See GLACIAL PERIOD; PLEISTOCENE; QUATERNARY.

DIME (Fr. dime, contraction of dividere), a silver coin of the United States of the value of 10 cents, or one-tenth of a dollar. It was first coined in 1796 in pursuance of the act of 2 April 1792, though pattern pieces were struck in 1792. Its legal standards have been as follows: By act of 2 April 1792 fineness 892.4 thousandths, weight 41.6 grains; by act of 18 Jan. 1837 fineness 900 thousandths, weight 41.4 grains; by act of 21 Feb. 1853 fineness 900 thousandths, weight 38.4 grains.

DIMENSIONS. See UNITS OF MEASUREMENT.

DIMINUTIVE, in grammar (Lat. diminutivum), a word formed by adding a suffix conveying the idea of littleness and other connected ideas, as tenderness, affection, contempt, etc. The opposite of diminutive is augmentative. In Latin, diminutives almost always end in -la, -la, or -lan; as Tulilata, neum cordulim, little Tullia, my dear or little heart.

The Italian is particularly rich in diminutives and augmentatives: ino, etto, ello, convey the idea of smallness, dearness, etc.; one, of largeness; ario, sometimes of smallness, with reproach, but often without it, to signify that the thing is disgusting, displeasing, etc.—for example, casa is a house; casetta, casina, casella, a small house, nice little house; casone, a large house; casaccia, a small, insignificant house; casaccia, is nearly 5,000 feet above the sea. It is supposed to be connected with both the Zambesi and Kongo rivers, as it lies on the watershed between these two river
DIMITY — DINAN

if overflowing with tenderness; for instance, fratellinucciettometto. Adjectives also can receive the diminutive termination; as carino, carinuccio, from caro. In Spanish there are similar diminutives, augmentatives and other affixes. Thus from hombre, a man, are formed the augmentatives hombrecito, hombrerito, hombrerón, hombrecito, and from mujer, a woman, mujeresita, mujerita, mujeronita. Diminutives in ico and ito usually denote endearment or tenderness, as those in illo do sometimes; those in elo always denote contempt. In Portuguese the diminutives and augmentatives correspond to those of the Spanish language. In French there are many diminutives formed from other words; as, tablette, of table, charrette of char; but there is no general affix which can be added to every substantive. The German has the syllables chen (in Low German, ken, with which corresponds the English kin, as in manikin, and some other words),lein and el, for substantivates; ick, etc., for adjectives; ick corresponds to the English ilk or ilk. For instance, rundschreiben, round about; rundschnipsel, round piece; rundstück, round piece, and runddel, from rund, round. The German even adds the diminutive to pronouns, and nouns will sometimes say duchon, from du, thou.

The English language affords examples of diminutives, but has no affix which can be used at pleasure to convey this idea. Those commonly used are ick, kin, el, ling and et, as in bullock, lambkin, kernel, gosling and tablet. Diminutives of proper names are also formed, in colloquial and familiar language, by adding y or ye to the names, as Charley, Johnny, etc.

DIMITY (Gr. δι- double, mitos, thread; literally, made with a double thread), a stout cotton fabric, ornamented in the loom either by raised stripes or fancy figures; stripes are the most common, as the mounting of the loom is much simpler and the texture can be produced at less expense. The figure or stripe is raised on one side and depressed on the other, so that the two faces present reversed patterns. It is rarely dyed, but usually employed white, as for bed and bedroom furniture. There is also a much finer cotton stuff on the market to-day which is manufactured for summer dress material. The fabric was first made in Spain, and as early as 1643 was manufactured in the Massachusetts Bay colony.

DIMMESDALE, dimz'dål, Arthur, the erring clergyman in Nathaniel Hawthorne's tale, 'The Scarlet Letter.' See SCARLET LETTER, THE.

DIMORPHISM (from the Gr. dimorphos, of double form), in crystallography, the crystallization of a body in forms belonging to two different systems, or in incompatible forms of the same system. In biology, the occurrence of individuals of the same species in such a form, that, were not their relation known, they might be considered as separate and distinct in species and even in genera. Thus in sexual dimorphism, the male and female of the same species present distinct characters, the male may be winged, the female wingless. See EVOLUTION; POLLEN.

DIMORPHODON, the oldest known genus of the Ornithoauria, allied to the pterodactyl, and found as a fossil in the Liassic rocks near Lyme Regis, in the south of England. The large head has powerful jaws, with large anterior teeth which are pointed, and small pos-
under Lancaster in 1359, was then captured and later retaken by DuGuesclin. Consult Bazoge, 'Guide du voyageur dans la ville de Dinan et ses environs' (Dinan 1875). Pop. 11,410.

DINANT, dé-nán' or dé-nânt', Belgium, a town in the province of Namur, picturesquely situated on the Meuse, 17 miles south of the city of Namur. Notable buildings are the church of Notre Dame, an ancient and richly decorated structure, and the city hall, once the palace of the princes of Liège. The town contains saw-mills for working the black marble found in the vicinity; paper mills, carpet factories, breweries, tanneries, factories for the production of metal-wear and glassworks. In the Middle Ages, Dinant was famous for its copperware, or dinanderie. The town was fortified as early as the 12th century. In 1466 Philip the Good, Duke of Burgundy, besieged it with 50,000 men; and having taken it by assault, razed it to the ground and threw 800 of its inhabitants, tied in pairs back to back, into the Meuse. In 1554 and again in 1675 it was captured by the French, during the absence of its garrisons and the beauty of its natural surroundings Dinant had long been a popular summer resort. The town suffered severely in the European War. On 15 August 1914 an engagement was fought in the vicinity between French and German troops. More fighting occurred on 22 and 23 August. On the 21st the Germans began setting fire to the houses; batches of inhabitants were driven through the flaming streets at the point of the bayonets, with their hands held above their heads; hussards were shot or bayoneted. According to the Bryce Report (q.v.), unarmed civilians were killed in masses about 90 bodies were seen lying on the top of one another in a grass square opposite the convent. It was also stated that 60 corpses of civilians were recovered from a hole in the brewery yard and that 48 bodies of women and children were found in a garden. The town was systematically set on fire by hand grenades.

The shooting of inhabitants, women and children as well as men, went on after the Germans had passed Dinant on their way into France. The houses and villages were pillaged and property wantonly destroyed. A little tourist steamer on the Meuse was used to collect pianos, pictures, clocks and pieces of furniture from the villages lying on the river banks (Jean Massart, Royal Academy of Belgium).

At Fonds de Léffe, a suburb of Dinant, the population left behind comprised 251 men and boys. They were taken away on 23 Aug. 1914. Of these, eight escaped and only 243 were put to death next day. The population of Dinant before the war was about 8,000. Consult Hachey, 'Histoire de Dinant' (1894-96); Massart, J. 'Belgians under the German Eagle' (London 1916); Pirene, 'Histoire de la conquête de la ville Dinant au moyen âge' (Ghent 1889); Remacle, 'Inventaire des archives de la ville de Dinant' (Dinant 1880-83).

DINAPAC, dé-ná-pák', or GUINAPAC, ROCKS, Philippines, two tower-like rocks, lying east of Camiguin Island, north of Luzon. On 2 Nov. 1899, the United States ship Charleston sank an uncharted coral reef three miles north of Dinapac Rocks and was totally wrecked.

DINAPUR, dé-ní-poor, India, city in the district of Patna, province of Behar and Arissa, British India, on the Ganges, about 12 miles northwest of Patna. It is one of the great stations of the British army. In 1857 it was the scene of the mutiny of three Sepoy regiments. It has cabinet factories, iron foundries and oil presses. Pop. 31,025.

DINAR, dé-nár' or din'ner (Lat. denarius), formerly an Arab gold piece weighing about 65.4 grains troy. Also a Persian money of account worth about 1/125 asmt. It is now the name of the chief Syrian coin, value one franc.

DINARCHUS, Greek orator: b. Corinth, 301 b.c.; d. Athens, 291 b.c. He studied under Theophrastus and was most successful during the reign of Demetrius Phalereus (317-307). After the fall of Demetrius he fled to Chalkis and returned to Athens in 292 b.c. Of his speeches, of which there were probably about 60, only three are preserved; these are entitled 'Against Demosthenes'; 'Against Aristogeiton' and 'Against Philocles.' They were spoken during the absence of Demetrius on a charge of accepting bribes from Harpalus. Consult Blass, 'Attische Beredsamkeit' (Leipzig 1893); and the editions of the speeches by Mätzner, text and commentary (Berlin 1842) and by Thalheim (ib. 1887).

DINARD, dé-nârd, or DINARD-SAINT ENOGAT, France, the capital of a canton, in the department of Ille-et-Vilaine, opposite Saint Malo, on the estuary of the Rance. It is a modern town, picturesquely situated on a rocky promontory and is the most fashionable seaside resort in Brittany. It has beautiful villas and summer cottages and is frequently visited by tourists. Pop. 7,003.

DINCKLAGE-CAMPE, dinklæg-é-kampe', Amalie (Emmy) von, German novelist: b. Campe, Osnabruk, 13 March 1825; d. Berlin, 28 June 1891. Her first novel, 'The Loving Oils Couple,' was published in 1857. Though she traveled extensively and observantly in Europe and America, her themes for stories were nearly all from her own countryside and she is called 'the poetess of the Soll valley.' Among her works are 'The School of the Heart'; 'A Life of Home'; 'Pictures of Emsland'; (posthumously) 'Poems'; 'Young Alaric's Bride' (1890); a story, 'The Woman Nihilist' (1893).

DINDINGS, The, a British possession belonging to the Straits Settlements, consisting of the island of Pangkor and a strip of land on the coast of Perak on the west side of the Malay Peninsula; area about 200 square miles. See STRAITS SETTLEMENTS.

DINDORF, Karl Wilhelm, German classical scholar: b. Leipzig, 2 Jan. 1802; d. there, 1 Aug. 1883. He became in 1828 professor of literary history at Leipzig, but resigned in 1833 in order to devote himself entirely to literary work. He contributed to the edition of Aristophanes by Invernizzi and Beck (1830-34), and between 1835 and 1839 published at Oxford an edition of the same poet. Other editions are: 'Eschylus' (1841-51); Euripides (1834-63); Sophocles (1832-36); and Demosthenes with notes and the Greek scholia (Oxford 1846-51); 'Lexicon Sophocleum' (1871); 'Lexicon Arischyleum' (1866-78); and an edition of Stephens' 'Thesaurus Linguae Graecae' (1831-65). He edited several Greek historians
DINDYMENE — DINICHTHYS

· DINDYMENE. See CYBELE.

DINEIR, dé-ná-ér', or GEYIKLAR, Asia Minor (the ancient CLENEA), a town in the province of Aidin, close to the headwaters of the Meander River. It lies at an altitude of 2,845 feet and commands the road from the Lycus Valley to the interior. Because of this Celenae was at an early period an important centre of commerce and civilization. After long centuries of decline modern railway construction is again operating in its favor. It is now the easternmost terminal of the Aidin Railway from Smyrna and a railway is projected from Adalia north to Dineir. These roads would greatly enhance its commerce, as it is in the heart of a rich agricultural district. It has manufactories of flour. Many of the houses are partly constructed of blocks of marble from the ruins of the ancient town. Pop. 2,000, the majority of which are Turks.

DINGELSTEDT, Franz von, Baron, German poet and dramatist: b. Halsdorf, Upper Hesse, 30 June 1814; d. Vienna, 15 May 1881. His 'Songs of a Cosmopolitan Nightwatchman' (1841) shocked all officialdom, but had a great popular success; and his 'Poems' (1845) showed true poetical feeling and great descriptive power, the latter also visible in his travel sketches and stories; one of the most successful of the latter is 'The Amazon,' a society novel. His tragedy 'The House of the Barneveldts' (1851) was a splendid success. He adapted plays from Molière, Shakespeare and others to the German stage and wrote a volume of 'Studies and Copies After Shakespeare' (1858). He was a successful theatrical director at Munich, Weimar and Vienna; was ennobled in 1867 and made baron in 1876. In 1877 a complete edition of his works was issued in 12 volumes. Consult his autobiography, entitled 'Münchener Bilderbogen' (1879).

DINGLE, Philippines, a city of Panay, in the province of Iloilo, on Jaular River, 18 miles north of the city of Iloilo. It was founded in 1825. There are gold deposits in the vicinity. Pop. 12,129.

DINGLEY, Nelson, American legislator and journalist: b. Durham, Me., 15 Feb. 1832; d. Washington, D. C., 13 Jan. 1899. He was graduated from Dartmouth College in 1855; admitted to the bar in 1856; purchased the Lewiston Journal in 1856; edited a daily edition in 1865 and was its editor and proprietor till his death. He was elected to the State House in 1856. He served in that body till 1855 and in 1868 and 1873, and was speaker of the house in 1864-65. He was elected governor of Maine in 1873 and re-elected in 1874 and was a member of Congress from 1881 till his death. From the beginning of his congressional career he was an advocate of the principle of protection and was author of the Dingley Tariff Bill of 1887. In 1908 he was appointed a member of the Joint High Commission on controversies between Canada and the United States.

DINGO, the Australian wild dog (Canis dingo), the only species of dog known to exist in both the wild and the domesticated states and also the only carnivorous placental mammal in Australia. It is sometimes considered as being of Asiatic origin, the theory being that it was brought to Australia by the first men who came there, and that it has since become wild. The finding of its remains in the Quaternary strata of Australia and in Pleistocene cavern deposits apparently disproves this theory. It is not found in Tasmania or New Zealand, in which the fauna is generally like that of Australia. The dingo has decreased in numbers, retreating before the advance of civilization and suffering from the war made upon it by the settlers, whose flocks it preys upon. The animal is about two and a half feet long and nearly two feet high; has large erect ears and a bushy tail. It is tawny in color; some specimens, however, being pale and others almost black. In the wild state it is especially crafty and courageous and hunts in packs sometimes containing 100 dogs. The native Australians seek the young dingoes and having taken them from the lairs where they are found, bring them up as domestic animals. When well treated they are affectionate and trustworthy and are used to help their masters in hunting the animals on which the natives live—opossums, snakes, lizards, etc. While the domesticated dingo is his friend and companion, the native Australian will hunt the wild dog, kill him and, having roasted him, will eat him with a keen appetite. Consult Lydekker, 'New Natural History' (Vol. I, 1897); Smyth, 'The Aborigines of Victoria' (Melbourne 1878); Wheelwright, 'Bush Wanderings' (London 1865). See Doc.

DINGRAS, dén-grás', Philippines, city in the province of Ilocos Norte, in Luzon, 11 miles southeast of Laoag. It is on the Grande de Laoag River. It is situated in a fertile plain, surrounded by mountains, which is subject to inundations. Dingrás was founded in 1598. Pop. 15,792.

DINGWALL, Scotland, a royal burgh and county town of the united counties of Ross and Cromarty, at the head of the Cromarty Firth, 18 miles northwest of Inverness. A short canal enables vessels of light draught (9 feet) to come up to the town. Nearby are traces of the ancient castle of the earls of Ross. The town lies low, in the midst of a rich, fertile and well-wooded ground. The sulphur springs of Strathpeffer lie five miles to the westward of the town. Pop. 2,639.

DINIAS and DERCYLLIS, characters in an old Greek novel, in 24 books, no longer extant, with the title, 'Incredible Things in Thule.' The author was a Syrian, Dioscorides Antonius, who lived about the 2d century of our era. The work was used as a source by many later writers.

DINICHTHYS, di-níkh'thís, (Gr. δινικ'θυς; terrible; ιερος fish), a genus of enormous fossil fishes found in Carboniferous and Devonian rocks. They are usually designated as Actinopterygii (q.v.) as members of the order Arthrodire. The body is estimated to have been from 15 to 18 feet in length. Its general shape closely follows that of the Coccosteus. The head, often 3 x 4 feet, was composed of heavy plates well joined
together. The eyes were large and the teeth were formidable. There is a hinge joint between the head plates and the body plates. A great number of these fossils have been dug out of the Upper Devonian shale of Ohio. The best-known species are *Dinichthys heresi* and *D. terrelli*. Consult Dean, "Fishes, Living and Fossil" (New York 1895); id., "Contributions to the Anatomy of Dinichthys," in *Anatomy of New York Academy of Sciences* (Vol. XV, 1896; Vol. XII, 1894; and Vol. XVI, 1896); id., "Studies on Fossil Fishes"; id., "Memories" of the American Museum of Natural History Vol. IX, New York 1900; Newberry, "The Paleozoic Fishes of North America," in *Monograph* of the United States Geological Survey (Vol. XVI, Washington 1890).

**Diniz da Cruz e Silva**, dênês dâ kroos ê sêlfâ, Antonio, Portuguese poet: b. Lisbon, 4 July 1731; d. Rio de Janeiro, Brazil, 5 Oct. 1799. A lawyer and official, in 1776 he was made counsel to the Superior Court at Rio de Janeiro. He was one of the founders of the celebrated literary society, the Arcadia Lusitana. His poetry comprises sonnets, eclogues, elegies, songs, epigrams, epistles and several books of Odes and Odes of François Villon. He wrote a lengthy poem, "Brazil's Metamorphoses"; and a heroic comic epic, "Hyssop,"—modeled on Boileau's "Lutrin," but a spirited, original composition, far superior to Boileau's—which was republished several times in France, and translated into French prose. He is referred to as the "Portuguese Findar." His odes are fine and local color pervades all his works. The "Hyssop" pictures faithfully and graphically the vanities and intrigues of the society of a provincial town dominated by two cliques. Boissoneade translated the work into French and it ran through two editions (Paris 1828, 1867). Selections have appeared in English in the *Foreign Quarterly Review* and in the *Manchester Quarterly*. The work was edited by J. R. Coelho (Lisbon 1879), with introductory study of the poet and his works. His collected works, "Poetisas," were issued at Lisbon (1807–17).

**Dinizulu**, last king of Zululand: b. 1869; d. Transvaal, 19 Oct. 1913. He was the son of King Cetewayo (q.v.), after whose death in 1884 he was proclaimed king. The British annexed Zululand in 1887, when the regulations which came into force did not recognize the pre-eminence of Dinizulu, who nevertheless continued to act as king, ordering executions and imposing fines and taxes. Trouble ensued with the British government and the dusky monarch fled, but surrendered 15 Nov. 1888. Brought to trial, he was convicted of high treason and sentenced to 10 years imprisonment 27 April 1889. This was commuted to transportation to Saint Helena in 1890. He was allowed to return to Zululand in 1897, was given a house and a pension of $2,500 per annum. He was convicted of complicity in a rebellion in 1906, was fined $500 and given four years' imprisonment. He was released in 1910 and allowed to reside at a British farm, where he died.

**Dinka**, a powerful tribe of Negritos who live on both sides of the White Nile between lat. 6° and 12° N. in the Egyptian Sudan. Their territory covers about 40,000 square miles. They are intelligent, have some skill in making articles for household use and also follow agriculture. Each village is governed by its own chief. Polygamy is practised. They are brave and of good physique and for these reasons many find their way to the Sudanese army. It is the common practice to extract the lower incisor teeth in both men and women. A good grammar of their language was written by Mitterutzner (Brixen 1866). Consult Gleichen, "The Anglo-Egyptian Sudan" (London 1905); Kaufmann, "Children and Young Folks" (Brixen 1892) and Schweinfurth, "In the Heart of Africa" (Frewer's trans, London 1873).

**Dinkard** (the enactors of religion), an important compilation of information concerning the doctrines, customs and writings of the religion of Zoroaster, compiled shortly after the Mohammedan conquest of Persia. In its present form, much of the work is a descriptive list of the contents of a larger and earlier work. It has been edited, with English and Gujarati translation, by Peshotan Behramji Sanjana (Vols. I–XIII, Bombay 1874–1912).

**Dinohyus**, a genus of gigantic, primitive, swine-like animals, some of which were six feet in height at the shoulders, found fossil in Lower Miocene rock of the western United States.

**Dinornithes**. A group of extinct, flightless, ratite birds of gigantic size, the moas of New Zealand, with small heads, stout legs, the bones without air-passages, wings absent or extremely reduced, furculum absent and after-shafts large. The genera were *Dinornis*, *Pack
gormo*, *Mesopteryx*, *Anomalopteryx* and *Mega
opteryx*. See Moa.

**Dinosauria**. A group of reptilian animals which flourished during the Mesozoic Era, or the Age of Reptiles. They were in many ways the ruling or dominant forms of that time and as such filled the various roles of terrestrial animals as do the warm-blooded mammals of to-day. Dinosaurs were air-breathing animals and, in common with other reptiles, such as the modern crocodiles, to which they were somewhat distantly related, possessed a more or less scaly or armored skin. Usually cold-blooded or poikilotherms, that is, possessing no mechanism for the maintenance of bodily heat, but having an internal temperature which varied with that of the outside air. It is assumed that they were egg-laying, but this can neither be proved nor disproved until either eggs or unborn young are found.

In their anatomy the dinosaurs show certain features which link them with the crocodiles on the one hand and with the birds on the other, and while due in part to community of habits, such as bipedal running on the part of dinosaurs and birds and the consequent modification of the hind limbs, these similarities of structure also imply genetic or blood relationships.

In size the dinosaurs ranged from that of a house cat to a length and bulk exceeded only by the greater of the modern whales—upward of 90 feet long and 40 tons in weight. In habits they were as varied as in size, for some were like of foot and bipedal while others were quadrupeds of unweildy bulk, some armored, others armless, some endowed with horns or with talons and terrible teeth, yet others
From a painting by Charles R. Knight

whose only apparent means of defense lay in their huge size and inaccessible habitat. They were what is now called Novasauria, some of the latter having very defective dentition which made mastication of the food impossible, while others were provided with a dental battery of marvelous detail and perfection.

Their habitat was in all probability the land, at some rate at the beginning of their racial career; indeed, the initial stimulus to their evolution may well have been aridity of climate, which is generally an incentive to the development of traveling powers and hence may have brought about the cursorial adaptation which so distinguishes the earlier forms. Later the dinosaurs, at any rate such as are known to us, were inhabitants of low-land lying along the shores of seas and oceans and some were actually partly, if not wholly, water-living, although none show an extreme of adaptation to aquatic life and none were salt-water inhabitants, the occasional inclusion of their remains in marine strata being the result of accident.

There is reason to believe that the dinosaurs were diphyletic, that is, consisted of two races which we called Theropoda and Saurischia, a parallel evolutionary course, the one group, the carnivores (Theropoda) and their plant-feeding derivatives (Sauropoda) being nearer the crocodiles, and the true herbivores (Preentata) being nearer the birds. It is probable that the Mesozoic era began from the same ancestral stock, but that the divergence began at once, possibly in Permian time.

The duration of dinosaurusian existence was immensely long, for their remains are first found in rocks of Middle Triassic time, but these are already in a state of development that implies a long antecedent evolution. And they continue, despite the extinction of certain lines, until the very close of the Mesozoic, a lapse of time measured by millions of years. Their fossils appear first in Germany, but this does not necessarily imply a Germanic origin; on the contrary, the belief has been expressed that one must go farther west to a continental mass which once linked Europe and North America across what is now the North Atlantic to find their ancestral home. Thence they spread over the world, one of their remains being found in Europe, North and South America, Africa, Madagascar and Australia; but, with the exception of India, they are as yet unknown from the great continent of Asia. Whether this is significant or merely because they have not thus far been discovered is not known.

The classification of the dinosaurs may be given as follows:

**Order Dinosauria.**
- Primitively carnivorous dinosaurs.
- Bipedal carnivorous dinosaurs.
- Quadrupedal amphibious, plant-feeding dinosaurs.
- Predentate or herbivorous dinosaurs.
- Bipedal unarmored dinosaurs.
- Quadrupedal armored dinosaurs.
- Bipedal horned dinosaurs.

The two main phyla or orders of dinosaurs have received the rather curious names of Saurischia (Gr. σαυρος, lizard, and ἰδρος, hip joint) and Ornithischia (Gr. ὄρνις, bird), because of the basic structure of their pelvis, which in the one case resembles that of the crocodile or saurian and in the other that of the bird, and, as has been said, there is evidence that the relationship thus implied is real. In many ways the two groups give evidence of having undergone closely parallel lines of evolutionary progress, especially in their method of locomotion and, consequently, in their motor organs. This is particularly true of the first suborder in each phylum, the Theropoda and Ornithopoda. Out of each of these more conservative stocks arose aberrant lines in which a primitive stock was either on bulk (Sauropoda) or on armor (Stegosaurus) or on weapons (Ceratopsia), with consequent modifications and specializations.

The teeth of the primitive stock. Then, too, there was on the part of the two main orders the diametrically opposed dietary—flesh on the one hand, with its relatively simple dental and digestive mechanism, and vegetal food on the other, with a more highly specialized members which has never been surpassed.

**Saurischia.**
- Theropoda. The earliest known dinosaurs belong to the Saurischia, suborder Theropoda, which consisted, with a few exceptions, until the close of the Mesozoic. They were bipedal, with four-toed, bird-like feet, armed with increasingly powerful claws, and with four-fingered hands provided with grasping talons. The skull was lightly constructed, somewhat bird-like in form, but possessing no beak. On the contrary, their powerful jaws were armed with a single row of teeth, often flattened, curved and dagger-like, with finely serrate margins which must have made them highly efficient for tearing and rending their prey, but not for tearing, smashing, or beak. The head was poised at right angles to the rather short neck and the compact trunk was followed by a long and often very slender tail which served to counterbalance the weight of the body and head when they were borne on the back of the limbs in a semi-erect posture. From an exhaustive study of dinosaurious footprints which exist by the thousands impressed upon the Triassic rocks of the Connecticut Valley, one is justified in assuming that the fore feet were never brought into contact with the ground, although they doubtless were of use in fighting or in grasping the prey. There is as yet no direct evidence of the nature of their skin except on the sole of the foot, but we have no reason to suppose that it was other than reptile-like, clothed in all probability with a flexible scaly covering, but otherwise unarmored.

The Theropoda were highly conservative, increasing in general dimensions and consequent prowess, with the peculiar exception that in the larger forms, the megalosaurus, the hands failed to keep pace with the general increase in stature until in the final forms they were relatively so absurdly small that it is difficult to conjecture their use. But not all Theropoda were of this sort, for another group remained relatively small, agile forms, the majority of their racial career. At least one of these (Struthiomimus) became entirely toothless—a sign of degeneracy, but in this instance coupled with an otherwise efficient body, which makes the interpretation of habits and habitat a matter of great doubt.
Some of the more notable genera were:

*Anchisaurus*, a primitive carnivorous dinosaur, some seven feet in length, from the Upper Triassic, known from several skeletons and numerous footprints from the Connecticut Valley and from New Jersey. See Fig. 1.

*Allosaurus*, a splendid type, with a length of 34 feet, more than half of which was included in the slender tail. This creature is from the Comanchian or Lower Cretaceous of Wyoming and the adjacent West and is represented in the Old World by a near ally, *Megalosaurus*, of wide distribution, both in time and space.

*Tyrannosaurus*, the terminal member of the race, 47 feet long, with the bodily bulk of an elephant, a great four-foot head, armed with teeth three to six inches in length, carried 20 feet in the air, relatively tiny hands, but huge feet which bore powerful claws. This creature, which has been most appropriately named, was the most appalling devourer of flesh which ever stalked abroad, while admirably adapted and equipped to meet and overcome the unwieldy herbivores of its day, would find it difficult to make a living in these days of brainier, more agile mammals. See Fig. 2.

Accompanying their larger, fiercer kin in their evolutionary career were the smaller and more active carnivores, beginning with the slender *Podokesaurus* of the Triassic and with *Compsognathus* of the Jurassic, the smallest known dinosaur, and culminating in the toothless forms which we have mentioned. Their increase in size was gradual, and their slenderness and well developed grasping hands imply, except in the last mentioned, their adaptation to more agile and feebler prey.

*Fig. 2*—*Tyrannosaurus*. 47 feet.

Sauropoda.—Another, relatively short-lived, race were the amphibious dinosaurs or Sauropoda, apparently derived from the theropod group, but departing widely in habitus and consequent habit. What gave them their evolutionary trend we do not know, but their one distinctive character was a vastly increased bulk, which necessitated their forsaking the strictly terrestrial habitat and becoming partly if not wholly water-borne. The weight of the body also rendered bipedality impossible, and if they were ever really capable of walking exclusively on the hind limbs, they soon lost that power except, perhaps, when in the water; indeed, in certain of the later types a large part of the weight was borne on the fore limbs, which, contrary to dinosaurian custom, actually exceeded the hinder members in length and bulk. As a further consequence of their increasing stature and amphibious habitat, the neck grew very long so that the small head might range through a considerable arc, both horizontally and vertically, in its search for food.

The exact nature of this food we do not know, but the spoon- or pencil-shaped teeth, somewhat worn at the end, are in the front of the mouth as with the true carnivores, and could neither have been used for the rending of flesh nor for the mastication of plant food. The inference is that the dietary was vegetal—possibly some floating or readily dislodged aquatic plant which grew in great abundance, and was a water hyacinth of the Nile. This must have been drawn into the stomach in great inert masses, where a powerful muscular device like a gizzard, together with swallowed stones such as have been actually found between the ribs of certain specimens, aided in their digestion.

These creatures waded, as their heavily ballasted limbs impeded propulsion, or swam where depth required it, but show no distinctively natatory adaptation. They were apparently unarmored, and weaponless, unless the terminal 10 feet of the tail, which was sometimes slender like a whip, might be interpreted as a weapon. The earliest forms were moderate in size, some 40 feet perhaps, but the later types were gigantic, the longest authentic measurement being 87 feet, while the living weight exceeded 35 tons. Their bulk, but probably not their length, has been exceeded by the modern whales, but this is because of the slender neck and tail of the dinosaur as compared with the large head borne directly on a neckless trunk and the powerful propelling tail of the cetacean.

Some of the more notable Sauropoda were:

*Brontosaurus*, (Fig. 3) 65 feet long and heavily built, from the Comanchian of Colorado to South Dakota; *Diplodocus*, a contemporaneous 87 feet in length and much slenderer in build, from Wyoming and Colorado; and *Brachiosaurus*, some 80 feet in length, the most ponderous of all, with huge neck and fore limbs, a giraffe-like wader found in rocks of equivalent age in Wyoming and at Tendaguru, East Africa.

Sauropoda were relatively short-lived, existing through part of the Triassic and the entire Jurassic, becoming apparently utterly extinct early in Comanchian time. What caused their extinction we do not know, probably a complex of causes of which the most important may have been a temporary restriction of their habitat. In such relatively huge forms we have come to see evidences of terminal senility, with which, as with old age in general, the hold upon life is precarious and a relatively small cause may have far-reaching and disastrous effects.

*Ornithischia.*—These dinosaurs have been called predentate, from the fact that the front of their mouth bore in the lower jaw a tooth
less bone, the predentary, while except in one known instance the front of the upper jaw, the premaxillary, was toothless as well. But in the rear of both jaws were grinding teeth deeply implanted in open grooves and arising in succession from the depth of the groove outward to replace the teeth consumed by wear. Although in the earlier forms the number of teeth was not great, in the terminal member of one phylum, Trachodon (see Fig. 4), there were so many vertical rows of successional teeth that their total number equaled a half thousand for each half of each jaw, 2,000 more or less all told! The forward part of the mouth varied in form to suit the owner’s habits: in Trachodon it was broadened like the beak of a duck; in others, such as Triceratops, it was more like that of a parrot or turtle; in all cases the bones must have been encased in horn or a leathery skin and served very well for the prehension of the plant food which the highly efficient dental battery reduced to a proper condition for digestion. This dental mechanism and the bird-like type of pelvis, although varying in detail, were the principal structures which these dinosaurs had in common; in other ways they varied enormously.

Ornithopoda.—These, the bird-footed dinosaurs, were the unarmored bipeds which in their evolution paralleled the carnivores most closely. They had a four-toed foot armed with claws which in the larger forms became almost hoof-like. Their hands varied, but were generally four-toed and never possessed grasping claws. The fore limbs were much smaller than the hind, but never so absurdly so as in the later carnivores, and apparently could always be used to support the forward part of the body and for slow locomotion while feeding, although swifter movement was effected by the hind limbs, with the tail for a counterpoise as in the Theropoda.

The earlier types, such as Camptosaurus of the Jurassic and Comanchian, were small to medium in size, ranging from 7 to 17 feet. Iguanodon of Belgium and England was more ponderous, reaching 34 feet in length, and bore on the hand a spike-like thumb, the only weapon thus far recorded in the group. The later Cretaceous types show evidence, in their webbed feet and compressed swimming tail, of having been aquatic in habits. They are, perhaps, more completely known than any other dinosaurs, for not only are the bones and teeth preserved, but mummified carcasses, presenting with wonderful fidelity the skin, some muscles, and other details of structure usually lost in a fossil. The Ornithopoda were conservative except in their head, which, while generally simple, sometimes bore a helmet-like crest of curious form. Of such were Stegosaurus and Corythosaurus from Alberta, Canada. Trachodon, although possessing the most complex dentition, was plain of contour. The last named measured 23 feet in length, and was the terminal member of the race.

Stegosaurus.—These were the armored dinosaurs, whose body was covered with an increasingly heavy cuirass and whose tail in some instances possessed an investiture like a battle mace. The later forms, Ankylosaurus, must have been well-nigh immune to assault, and they mimicked curiously the armored glyptodons — warm-blooded mammals allied to the armadillos of to-day. The glyptodons had to meet the attack of the sabre-tooth tigers, while Ankylosaurus was pitted against the huge Tyrannosaurus, but in each case passive resistance was apparently sufficient.

An earlier type, Jurassic to Comanchian, was Stegosaurus, the form which gives its name to the group. (See Fig. 5.) It represented an aberrant side line which died without further issue at the time of sauropod extinction, and like the latter group showed evidences of racial old age. Stegosaurus was a quadruped, short of fore limb, long of hind, with a highly arched back, powerful tail, and small head containing a deficient dentition and absurdly diminutive brain. But the most striking peculiarity was its armament, which consisted of a double row of armor plates standing on edge, small on the neck, increasingly large until the base of the tail was reached, and then once more diminishing. The end of the tail was armed with two or more
pairs of long spikes which, together with the armor plates, were encased with horn. Stegosaurians are found in Europe and the western United States.

![Stegosaurus](image)

**Fig. 5—Stegosaurus. 21 feet.**

**Ceratopsia.**—These were the horned dinosaurs, so far as our knowledge goes an exclusively American group, and although derived doubtless from the armored forms, from what particular type is unknown. They appear suddenly in the West, in rocks of Upper Cretaceous age, and none are transitional but they show at once all of the distinctive features of the group. Chief among these characteristics is a huge head in contrast to the relatively small skull of other dinosaurs. The head bore upon the face a number of horns, one, two, or three, while the rear of the skull was prolonged backward to form an expanded bony crest which served to protect the neck and also to provide leverage for the otherwise unwieldy head and horns. In the earlier types, such as *Monoclonius*, the crest was incomplete, as it had two large apertures through it, one on either side of the middle line. In the later forms such as *Triceratops* (Fig. 6), the crest was a complete sheet of bone, although in one rare genus, *Torosaurus*, it was still perforate. In the earlier forms, the horn borne on the end of the nose was the larger, those on the forehead not always being in evidence, but in later genera the nasal horn was reduced and the frontal ones were dominant.

The Ceratopsia, like the Stegosauria, were quadrupedal, the weight of armor and armament rendering the ancestral bipedal gait no longer possible, and as certain of the latter resembled the later mammalian glyptodonts, so the former were rhinoceros in general aspect and were doubtless like the rhinoceros in stupid savagery, for broken horns and jaws and punctured crests give abundant evidence of their combativeness.

Among the dinosaurs there seems to have been a constantly maintained balance throughout their evolutionary career, for as the carnivores grew and increased in prowess, the herbivores were forced to meet the menace of their aggression in several ways, either by increased production, or by speed or bulk, or by a partial forsaking of the terrestrial habitat. Or they developed a defensive armor or aggressive weapons, for one and all lacked brains. The price paid to a high premium on brutality, and never perhaps before nor since has the animal world felt to so great an extent the burden of armament.

**Extinction.**—The cause of dinosaurian extinction is by no means clear. One student has argued internecine warfare; another, destructive slaughter of the young, possibly while yet in the egg, by small blood-thirsty mammals; yet another, climatic change, either diminution of heat, for reptiles are very sensitive to temperature changes, or decrease of moisture, with a consequent change in the character of vegetative life. The close of the age of reptiles was marked by great uplifting or diastrophic movements over portions of the earth's surface—the so-called Laramide Revolution. As a consequence the old low-lying dinosaurian habitat was largely restricted, and this, together with other of the necessary chain of sequent events which follow so great a crustal movement, put a period to their existence and cleared the way for the evolution of a potentially higher, though long subject race, the mammals.

**Richard Swann Lull,**
Professor of Vertebrate Paleontology, Yale University.

**DINOTHERIUM** (Gr. διόν, terrible; ἄπιθον, beast), a genus of elephantine mammals occurring as fossils in the Tertiary rocks of Europe and India, characterized by having the lower incisors developed into dome-curving tusks and by having all the molar teeth in use at once. They probably had a proboscis like that of the elephants. See ELEPHANT.

**DINSMORE, Charles Allen,** American clergyman and author: b. New York, 4 Aug. 1860. In 1884 he was graduated at Dartmouth College, having previously, 1881-82, been engaged on the United States survey of the Mississippi River. He made his theological studies at Yale and became a Congregational minister in 1888. Thereafter until 1901 he held pastorates at Whitneyville and Willimantic, Conn., and Boston, Mass., and was pastor of the First Congregational Church of Waterbury in 1905; was lecturer at the Divinity School of Yale in 1904 and at Bowdoin four years later. His published works include 'The Teachings of Dante' (1901; Japanese trans.); 'Aids to the Study of Dante' (1903; Japanese trans.); 'Atonation in Literature and Life' (1906); and 'New Light on Old Truth' (1912).

**DINSMORE, Hugh Anderson,** American lawyer: b. Benton County, Ark., 24 Dec. 1850. He was clerk of the Circuit Court 1873-74 when he was admitted to the bar, and began practice in Fayetteville; was prosecuting attorney of the fourth judicial district of Arkansas in 1878-84; a Democratic presidential elector in 1884; minister-resident and consul-general in the kingdom of Korea in 1887-90; and a member of Congress in 1893-1905.

**DINWIDDIE, Edwin Courtland,** American advocate of Prohibition: b. Springfield, Ohio, 29 Sept. 1857. He received his education at Wittenberg College, Springfield, Ohio, and at Grove City College, Pa. In 1884 he entered the Evangelical Lutheran ministry, was secretary of the permanent committee on temperance of the general synod of the Lutheran Evangelical
DINWIDDIE—DIOCESE

Church in 1899–1903, and chairman since 1903. He was legislative superintendent of the Ohio Anti-Saloon League in 1893–96, and State superintendent of the Pennsylvania Anti-Saloon League in 1897–99. In 1899–1907 he was first national legislative superintendent of the American Anti-Saloon League, and again since 1911. He has been a prominent worker in the International Order of Good Templars. He led the attack which led to the abolishment of the army canteen, and was instrumental in continuing prohibition. He has been a member of the Ohio State Temperance, prohibition forces in the campaign to prohibit shipments of intoxicating liquors in inter-state commerce. He is author of several pamphlets on prohibition and allied topics.

DINWIDDIE, Robert, British colonial official: b. Scotland about 1690; d. Clifton, England, 1 Aug. 1770. He was lieutenant-governor of Virginia 1752–58; and during his official career recommended the annexation of the Ohio valley and the erection of forts to secure the western frontier against the French. He was one of the most earnest supporters of the French and Indian War, which began about 1753 and lasted 10 years.

DINWIDDIE, William, American journalist and author: b. Charlottesville, Va., 23 Aug. 1867. When only 14 years of age, he was assistant electrician of the National Museum at Washington, became inspector of customs at Corpus Christi, Tex., in 1883; was connected with the Bureau of American Ethnology from 1886 to 1895, at which time he went into journalism, serving as correspondent and illustrator for the New York Herald. He became photographer for the Baltimore and Ohio Railroad in 1897. During the campaign in Cuba and Porto Rico he served as war correspondent. During the Boer War he was correspondent in South Africa for Harper's Weekly, and in the Russo-Japanese War he was correspondent for the New York World, Harper's Weekly and Leslie's Weekly. He was associate editor of the New York World 1905–06 and is now a broker. He has published "Puerto Rico and Its Possibilities" (1899); "The War in the Philippines"; "The War in South Africa.

DINWIDDIE COURT-HOUSE and WHITE OAK ROAD, Battle of. General Grant, besieging Petersburg, issued orders 24 March 1865 for a movement on the 29th to destroy the railroads leading into the city from the south to force Lee to come out of his entrenchments and fight on open ground, or so far attenuate his line that a successful assault could be made. The result was the battle of Five Forks (q.v.), the fall of Petersburg and Richmond, the surrender at Appomattox, 9 April and the close of the Civil War. The movement to the left was led by Warren's fifth corps and Sheridan's cavalry, and the first encounter was near the Boydton road, where Warren's leading division (Griffin's) defeated a body of 2,500 Confederates sent out from Lee's right, driving them back to White Oak road. On the 30th the second and fifth corps closed in on the White Oak road on Lee's right, and Wilcox's Confederate division, coming out of the entrenchments at Amelia, drove Warren's advance division now within 500 yards of the road, and, on the 31st, Lee ordered another attack. Hunton's and Wise's brigades attacked in front, and McGavern's and Gracie's on the left flank. Ayres' and Crawford's divisions were driven back in disorder upon Griffin's division, which checked the Confederate advance. General Miles, with two brigades of the second corps, struck Wise's brigade on the left flank, drove it back with severe loss in killed and wounded, and the entire Confederate attacking party retreated, and Warren, resuming the offensive, pushed his advance across the White Oak road. It cost the second and fifth Union corps, on the 31st, 1,111 killed and wounded, and 556 missing.

Meanwhile Sheridan had reached Dinwiddie Court-House, 12 miles southwest of Petersburg, and on the 30th Devin's division and Davies' brigade were pushed 10 miles in advance in the direction of Five Forks, where they encountered the Confederate cavalry under Gen. Fitzhugh Lee. At night Gen. W. H. F. Lee and Rosser joined Fitzhugh Lee and General Pickett, with five brigades of infantry, marched down the White Oak road to Five Forks, and ordered command of all the troops operating against Sheridan. Munford's cavalry division engaged Devin in front, and Pickett moved with infantry and the other two divisions of cavalry to gain Sheridan's left, crossed Chaffin's Creek, struck Davies' brigade in flank and drove it back on Devin, interposed between Devin and Crook, and with the assistance of Munford drove both Davies and Devin northeastward across the country. Fitzhugh Lee moved up and formed his cavalry on Pickett's flanks. In following Devin and Davies, Pickett had exposed the rear of his columns and it was attacked by the brigades of Gibbs and Gregg, which attack forced Pickett to face about. He drove back the two brigades and advanced upon Dinwiddie Court-House. Sheridan had called up Custer with his two brigades, some artillery had come up, and a barricade was thrown up about three-fourths of a mile northwest of the courthouse, behind which Gibbs and Gregg rallied, and Smith's brigade, slowly driven back by the Confederate cavalry, formed on the left. It was now near sunset, and as Pickett advanced, artillery opened upon him, and when within short range the cavalry from behind the barricades poured such a shower of bullets upon him that he was quickly repulsed, and the battle of Dinwiddie Court-House was over. Sheridan says his loss was about 450. The Union forces engaged at Dinwiddie Court-House and White Oak road numbered about 42,000; the Confederates about 20,000. The Union loss, 29–31 March, was 2,198 killed and wounded, and 583 missing. The Confederate loss is unknown. Consult 'Official Records' (Vol. XLVI); Humphreys, 'The Virginia Campaign of 1864–65'; Walker, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; Grant, Personal Memoirs (Vol. 11); Sheridan, 'Personal Memoirs' (Vol. II); 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

DIOCESE, the territory and population over which a bishop exercises jurisdiction. The word diocese was originally a term of civil administration, when about the beginning of the 3d century the Roman Empire was divided into 12 dioceses governed by the emperor's lieutenants, each diocese comprising several of the
divisions called provinces. When the word came into ecclesiastical use it signified rather one of the grand divisions, patriarchates or primatial jurisdictions, instead of the territory presided over by one of the bishops subject to a patriarch or primate or an archbishop. The word began to be used in the meaning it now has in the latter part of the 13th century; but even then it was used in the sense of our present word parish.

DIOCLETIAN, d'i̞-klé'ʃn (Gaius Aurelius Valerius Diocletianus, surnamed Jovius), Roman emperor: b. Dioeclea, Dalmatia, 245 A.D.; d. Salona, Dalmatia, 313. He was of humble origin but attained distinction in the army and held important military commands under the emperors Probus and Aurelian. He accompanied Carus to the Persian War and after the death of Numerianus he was chosen emperor by the army at Chalcedon, 17 Sept., 284, and went forth as the laureate. Aertius Aper, prefect of the praetorians. He thus fulfilled the prediction of a Gallic priestess that he would mount a throne as soon as he had slain a wild boar (aper). He was generally loved for the severity of his disposition. For troubles from within disturbed the Roman Empire and compelled Diocletian to share the burden of government with colleagues. He appointed Maximianus Augustus in 286, who defeated the Bagaudae, insurgent Gauls and the Germans on the Rhine. Meanwhile Diocletian was successful against the Persians in the East and afterward penetrated to the sources of the Danube, in Germany. In view of further disturbances and dangers in the empire, he proclaimed Constantius Chlorus and Galerius Cæsars in 293. Thus the empire was divided into four parts, with each of the four rulers at a separate capital—Nicomedea, Mediolanum (Milan), Augusta Trevirorum (Trier), Sirmium. At the age of 60, exhausted with labor, Diocletian resigned the imperial dignity at Nicomedea, 1 May 305, and retired to Salona, where he found happiness in the cultivation of his garden, and where he died eight years afterward. In the latter part of his reign he was heard to say he detested persecution of Christians, whom he had long protected. In defense of this it may be urged that he hoped to strengthen the empire by a revival of the old religion, and that the church as an independent state over whose inner life at least he possessed no influence, appeared to be a standing menace to the imperial authority. In his reign the senate lost practically all its power, republican institutions vanished and were replaced by an absolute monarchy closely akin to that of his own time. Aetius, royal diadem, assumed the title of lord and introduced a system of etiquette and ceremony, borrowed from the East, in order to surround the monarch and monarchy with a mysterious sanctity. On the other hand he gave great attention to improving the administration of the empire, reformed the coinage, remitted various burdensome taxes, encouraged trade and repressed corruption. He adorned and beautified the city with numerous buildings, notably the baths, portions of which are extant. A famous edict of his and one that has an especial interest in modern days is the De pretiis rei publicae venalium, which, promulgated in 301 A.D., fixed a maximum price for provisions and other articles of commerce, and a maximum rate of wages. The articles mentioned in the edict which, aside from its illustration of Roman legislation, is chiefly interesting as giving their relative values at the time, include cereals, wine, oil, meat, fresh and salt fish, vegetables, honey, fruits, skins, leather, furs, foot-gear, timber, carpets, articles of dress and even pernae mendipraceae (Westphalian hams), and the wages range from that of the ordinary laborer to the fee of the professional advocate. The unit of money was the denarius, not the silver, but a copper coin introduced by Diocletian, and the value of which may be gauged from the fact that in the edict it is set down as the equivalent of one oyster, or approximately two-fifths of a cent of our currency. The edict was a well-intentioned but abortive attempt to meet the distress caused by several bad harvests and commercial speculation. It was mainly in the interests of the soldiery. The punishment for exceeding the fixed prices was death or deportation. The actual effect was disastrous, in that it brought about a disturbance of the food supply in non-productive countries, many of them suffering, and the edict gradually fell into abeyance. Incomplete copies of it have been discovered at various times in various places, the first (in Greek and Latin) in 1709, at Stratonicera in Caria, by W. Sherard, then British consul at Smyrna, containing the preamble and the tables down to number 403. This partial copy was completed by W. Bankers in 1817. It was elaborately edited by Waddington, with new fragments and commentary (1804), and by Mommsen in the third volume of Corpus Inscriptionum Latinarum, where all the fragments are described and their localities indicated. Portions of the Greek copy and the Latin preamble were found in Platea in 1888-89 during the exploration of the American School of Classical Archaeology. In 1890 several hundred lines of the Greek version of the decree were discovered at Megalopolis, including a list of pigments with their prices. For the edict 'De pretiis, etc.,' in addition to those cited above, consult Lepaulle, 'Les edict de Maxi-
mum' (1886) ; 'Papers of the American School of Classical Studies,' Vol. V (1892); and Abbott, 'The Common People of Ancient Rome' (New York 1911). For life and administration of Diocletian, consult: 'Diocletian und seine Zeit' (Leipzig 1869); Mason, 'The Persecution of Diocletian' (1876); Hunzinger, A. W., 'Die Diocletianische Staats-Reform' (1899); Allard, P., 'La persecution de Diocletien' (1890); Bernhardt, T., 'Geschichte Roms von Valerian bis zu Diocletians Tod' (1867).

DIOCIATI, de-ō-dā'ë, Giovanni, Italian Protestant clergyman: b. Lucca about 1576; d. Geneva, 3 Oct. 1649. He was for some time professor, first of Hebrew, then of theology, in Geneva, and he received the title of Greek or Hellenic clergyman at the Synod of Dort, and aided in drawing up the Belgic confession of faith. He was unsuccessful in his attempts to spread the Reformed doctrines in Venice and other Italian cities. He is most celebrated for a translation of the Bible into Italian, which is superior to his translation of it into French, and is still in general use among Italian Protestants. His biography by Eugène de Bude appeared at Geneva in 1869.
DIODON — DIOGENES

DIODON, d'ō-dōn, a genus of teleostean fish, family Gymnodontidae, order Plectognathi, deriving their name from the fact that the ivory-clad terminations of the jaws show no suture, and the fish thus appear to possess but two teeth. The body, as in other members of the family, can be inflated with air till the creature floats on the surface of the water under side uppermost; it is likewise covered with scales that are flattened and clubbed. On the sides, surrounded by a pair of lateral roots and a stiff, movable, erectile spine. The rotundity of these fish when distended has earned for them the name of globe-fish, or prickly globe-fish, in addition to the designations porcupine-fish and sea-hedgehog, suggested by the numerous spines. The four species of Diodon are found in all the seas between the tropics, and range to the Cape of Good Hope. The largest species (D. hystrix) attains the length of two feet six inches. The food of Diodon consists of crustaceans and sea-weeds, for the trituration of which its jaws are admirably adapted. This genus has by some naturalists been made the type of a family Diodontidae.

DIOGEOUS (surnamed SICULUS), Greek historian; Sicyon; fl. second half of 1st century. In order to render his history as complete and exact as possible, he traveled through a great part of Europe and Asia. It is very much to be regretted that the greater part of this history, which the author called the 'Historical Library,' in the composition of which he combined the ornaments of rhetoric with the detail of facts, after the example of Thopompos and Ephorus, and on which he had bestowed the labor of 30 years, has not reached our times. It consisted of 40 books, and comprised the history of almost all nations. It is written in the style of annals and the events are narrated in a confused and discordant manner; it is uncritical; the writer's lack of military training disqualified him from writing authoritatively on the wars; but the work is valuable as containing a great mass of materials collected from a number of writers whose works have perished. Only the books 1 to 5, containing a history of Egypt, and 11 to 20, dealing with the second Persian War and end with the war against Antigonus, and a number of fragments, are now extant.

DIECIOUS, dd-ē'shēs, in botany, a term applied to unisexual plants, such as the willow and the hemp, in which the late staminate and pistillate flowers are on separate individuals. In zoology, a term applied to those animals in which the sexes are distinct; that is, in which the ovum is produced by one individual (female) and the spermatozoid by another (male). It is opposed to monocious.

DIOGENES, dd-ō-jē'nē-s, the most famous of the Cynic Philosophers, born about 404 before C., in Sinope, city of Pontus in Asia; d. Corinth 323 B.C. Having been banished from his native place with his father Icesias, a banker, who had been accused of coining false money, he went to Athens and required Antithenes to admit him among his disciples. That philosopher in vain attempted to repel the importunate supplicant, even by blows, but finally granted his request. Diogenes devoted himself, with the greatest diligence, to the lessons of his master, whose doctrines he extended still further. At the same time he applied, in its fullest extent, his principle of divesting himself of all superfluities. He taught that a wise man, in order to be happy, must not seek to preserve himself independent of fortune, of the judgments of men, and of himself; in order to do this, he must despise riches, power, honor, arts and sciences, and all the enjoyments of life. He endeavored to exhibit, in his own person, a model of Cynic virtue. For this purpose he subjected himself to the severest trials and disregarded all the forms of polite society. He often struggled to overcome his appetite or satisfy it with the coarsest food, practised the most rigid temperance, even at feasts, in the midst of the greatest abundance, and did not even consider it beneath his dignity to ask alms. By day he walked through the streets of Athens barefoot, without any coat, with a long beard, a stick in his hand and a wallet on his shoulders; by night he slept in a tub, though this last has been doubted. He defied the inclemency of the weather and bore the scoffs and insults of the people with the greatest equanimity. Seeing a boy draw water with his hand, he threw away his wooden goblet as an unnecessary utensil. He never spared the follies of men, but openly and loudly inveighed against vice and corruption, attacking them with satire and irony. The people, and even the higher classes, beard him with pleasure, and tried their wit upon him. When he made them feel his superiority, they often had recourse to abuse, by which, however, he was little moved. On a voyage to the island of Agina he fell into the hands of pirates, who sold him as a slave to the Corinthian Xeniaedes in Crete. The latter emancipated him and entrusted him with the education of his children. In summer he lived at Corinth and in winter at Athens. It was at the former place that Alexander found him on the roadside basking in the sun, and astonished at the indifference with which the ragged beggar regarded him, entered into conversation with him, saying, "I am Alexander the Great," to which the philosopher answered, "And I am Diogenes the Cynic." Alexander finally gave him permission to ask for a boon. "I ask nothing," answered the philosopher, "but that thou wouldst get out of my sunshine." Surprised at this proof of content, the king is said to have exclaimed: "Were I not Alexander, I would be Diogenes." At another time he was carrying a lantern through the streets of Athens in the daytime: on being asked what he was looking for, he answered, "I am seeking an honest man." Thinking he had found in the Spartans the greatest capacity for bestowing such men as he wished, he said, "Men I have found nowhere; but children, at least, I have seen at Lacedaemon." We are told that Socrates once remarked to him, "I see your vanity through the holes of your coat," but history will not admit of the truth of this anecdote. No doubt many of the anecdotes told of this singular man are fiction. He died 323 B.C., at a great age, and, according to tradition, on the same day with Alexander, of whom he felt death approaching he seated himself on the road leading to Olympia, where he died with philosophical calmness, in the presence of a great number of people, who were collected around him. Consult Hermann, 'Zur Geschichte und Kritik des Diogenes von Sinope' (Heil-
bronn 1860); Windelband-Bonhöffer, 'Ge-
schichte der antiken Philosophie' (3d ed., Mün-
ich 1912); Zeller, 'Philosophie der Griechen'
(1889).

DIogenes of Apollonia, Greek
philosopher: b. Apollonia, Crete, fl. in the 5th
century B.C. Very little is known of his life.
His philosophical speculations were developed in
his work 'De Con Naturae,' still extant in the 6th
century, but of which we have at present only
fragments, preserved in the works of Aristotle,
Diogenes Laertius and Simplicius. His great
object was to find the first principle of the
world, out of which all things were evolved.
Like his master Anaximenes, he came to the
conclusion that this great first principle was air,
'the origin of all things' which he believed was
dowered with consciousness.

Diogenes Laertius, Greek philoso-
pher: b. Laerte, Cilicia, toward the close of the
2d century A.D. His chief work is 'Lives, Doc-
tors, and Controversies of those who have dis-
tinguished themselves in Philosophy.' The
book is full of absurd and improbable anecdotes,
and characterized by much confusion and care-
less mistakes, yet as containing a mine of infor-
mentation regarding the private life of the
Greeks, and more especially of those who have
left no other record of them, it is of considerable value. It was long
the foundation of most modern histories of philoso-
phy, and has preserved the names and doxaines
of numerous writers, of whom but for little
would have been allowed by Yonge appears in Bohn's Classical Library.

Diogenes of Apollonia, Greek
philosopher: b. Apollonia, Crete, fl. in the 5th
century B.C. Very little is known of his life.
His philosophical speculations were developed in

vigor for any length of time, gradually becoming inert and drying up. Consult Darwin, 'Insectivorous Plants.'

DIONE, in Greek mythology, the mother of Aphrodite (by the Romans identified with Venus).

DIONNE, dë-on', Narcisse Eutrope, French-Canadian librarian: b. Saint Denis, P. Q., 18 May 1848. He was educated at the Grand Seminary and Laval University, Quebec, began the practice of medicine in 1874, but abandoned it in the following year for a literary and journalistic career. From 1880 to 1884 he was editor-in-chief of Le Courrier du Canada and again from 1887 to 1892. He has been secretary of the Associated Press of the Province of Quebec since 1882 and librarian of the legislature of Quebec since 1893. He has written 'Le tombeau de Champlain' (1880); 'États Unis, Manitoba et Nord-Ouest' (1882); 'La Nouvelle France de Cartier à Champlain' (1891); 'Vie de Champlain' (1891); 'Mgr. de Forbin-Janson' (1895); 'John Henry Newman' (1897); 'Sebastian Cabot' (1899); 'L'Abbé Richard, curé de Detroit' (1902); 'The Siege of Quebec and the Battle of the Plains of Abraham' (1903); 'Quebec Under Two Flags,' with A. Doughty (1903); 'Inventaire chronologique des livres, journaux, et revues publiés en langue française dans la Province de Quebec de 1754 a 1905' (1905); 'Le parler populaire des Canadiens-français' (1906).

DIONYSIA, di-o-nish-ta, festivals in honor of Dionysus, or Bacchus, which, originating in Egypt, were introduced into Greece by Melampsus, 1415 B.C. They were four in number, the Rural or lesser Dionysia, which was the most ancient, the Lenaea, the Anthesteria and the Dionysia proper, all of which were celebrated annually, with much extravagant merriment, though they were not disgraced by the excesses of the Roman Bacchanalia.

DIONYSIUS, di-o-nish-t-us, Saint, elected Pope in the year 259. He is supposed to have been a native of Greece, but the exact date of his birth is unknown. He died 26 Dec. 269, having reigned as pontiff 10 years. Prior to his election as Pope he was held in high repute by the theologians of his day, as history states that Dionysius of Alexandria sent him a most important letter on baptism; and later he was the chief theologian in a synod (262) where the principal question had reference to the Trinity. His able commentaries convinced many who had held views different from those taught by the Church. He labored much to reorganize the Church after the severe persecutions which it had undergone. His feast day in the calendar is 26 December.

DIONYSIUS, Saint, "of Alexandria": b. Alexandria in the last years of the 2d century; d. there 265 a.d. His family were noble, wealthy and pagans. Early in his life his philosophical studies turned his attention to Christian writings, and they so influenced his mind, especially the epistles of Saint Paul, that he left the pagan school and became a pupil of Origen. About the year 232 he was ordained a priest, and given charge of the Alexandrian school of theology. In 248 he was consecrated bishop. Shortly after he became bishop of Alexandria the persecution of Decius began, and Dionysius was among the first arrested, and sentenced to be tortured and beheaded. He was rescued by a band of peasants, and for more than 4 years remained concealed in the Libyan Desert. In 257, during the persecution under Valerian, he was again exiled from Alexandria. His day in the calendar is 17 November. The writings of Dionysius were numerous, but many have been destroyed. His works were delivered in controversial oratory, or attacks on the heresies of his day. Consult Butler, 'Lives of Saints'; the English translation, 'Ante-Nicene Fathers'; Förster, 'De Doctrina et Sententis Dionysii Magni' (Berlin 1865); Harnack, 'Geschichte der altchristliche Litteratur' (Vol. I, Leipzig 1893), and the biographies of Dittrich (Freiburg 1867) and Paul Morize (Paris 1881). Consult also 'Letters and Other Remains,' edited by Feltoe (New York 1904).

DIONYSIUS THE AREOPAGITE, converted to Christianity by Saint Paul (Acts xvii, 34), during the apostle's visit to Athens. Dionysius is called the Areopagite because he was a member of the high court of Athens, the Areopagus, which held its sessions on Mars Hill. It was generally believed by the early historians that this Dionysius was ordained a priest, was made bishop of Athens, and strengthened his life by martyrdom. Another tradition had it that he was sent into Gaul by Clement of Rome, and died a martyr on Montmartre. This opinion arose from confusion between Denis the Areopagite and Denis, the patron of France, who founded the church in Paris in the 3d century. The New Testament tells us only that he "did believe" and adhered to Saint Paul. He has been wrongly credited with being the author of certain ancient writings on subjects chiefly mystical which, though attributed to that member of the court of Areopagus who was converted to Christianity by the preaching of the Apostle Paul, Acts xvii, 34, must be referred to some unknown writer of the 4th or the 5th century: hence the author is now usually styled 'Pseudo-Dionysius, or Dionysius the Areopagite. The titles of the works attributed to the Areopagite are 'The Heavenly Hierarchy'; 'The Ecclesiastical Hierarchy'; 'Divine Names'; 'Mystical Divinity.' Ten letters are attributed to him, purporting to be addressed to Saint John the Evangelist, Titus, Polycarp and others, their contemporaries. These writings came first into notice in 533 at Constantinople, when certain Monophysite heretics presented them in confirmation of their doctrines; but, they were repudiated by the orthodox as manifestly spurious. Nevertheless before long they came into high favor both in the East and the West and throughout the Middle Ages were received by the most eminent schoolmen as indispensable monuments of the teaching and belief of the early Church. "There is scarcely a passage in the writings of Pseudo-Dionysius that has not been quoted by Thomas Aquinas." These writings were studied by the Platonists and others and exerted a tremendous influence on the Humanists. Dante and Milton were familiar with them, as were others of lesser note. Erasmus and Valla appear to have been the first to regard them as falsely attributed to this Dionysius and later
DIONYSIUS THE ELDER—DIONYSIUS OF HALICARNASSUS

authorities agree in their opinion that the works were written near the end of the 5th century. Consult article *Dionysius* in Smith and Wace, ‘Dictionary of Christian Biography’ (London 1877–87); Koch, Hugo, *Pseudo-Dionysius Areopagita in seinen Beziehungen zum Neuplatonismus und Mysterienwesen* (Mainz 1900); Parker, J., ‘The Works of Dionysius the Areopagite’ (London 1887); Vaughan, ‘Hours with the Mystics’ (ib. 1860).

DIONYSIUS THE ELDER, Syracusan tyrant: b. 431; d. 367 B.C. He first attracted general notice during the war against Carthage. When Agrigentum fell, he openly accused the generals concerned, brought about their dismissal and had another staff appointed of which he himself was a member. In a short time he removed his associates and took full command himself. He soon supplant his colleagues. He contrived to make himself master of the citadel of Syracuse, together with all the armament and equipment contained in it, and finally to declare himself tyrant, at the age of 25 years. After having finished a short war against the Carthaginians he made preparations for a great war against Carthage. He attacked the Carthaginians at once by land and water, and gained a complete victory, which was soon followed by an advantageous peace. In 368 he commenced a new war against the Carthaginians, intending to drive them entirely out of Sicily. He did not, however, succeed in this attempt, and was obliged to conclude a disadvantageous peace. He holds the unenviable place in ancient history as the representative tyrant. He lived in continual dread of assassination, of which the sword of Damocles has become the symbol. He had the state prison constructed that even the solitary murmurings of its inmates could be heard by him, and it was hence called the Ear of Dionysius. During his régime the prosperity of the city grew apace and it became the first city of the Greeks. Plato, Aristippus and Phaenomenes were among the notable personages who visited his court. In 367 Dionysius won first prize at Athens for the tragedy, *Ransom of Hector*. Consult Freeman, *History of Sicily* (Oxford 1894); Grote, *History of Greece* (London 1853), and Holm, *Geschichte Sicilliens* (Leipzig 1843). See Syrac.; Syracuse.

DIONYSIUS THE YOUNGER, Syracu- san tyrant: b. 395. He succeeded his father, Dionysius the Elder, in 367 B.C. Dion, his kinsman, directed his attention to the doctrines of Plato, representing to him that this great philosopher alone was able to teach him the art of government, and the means of rendering his subjects happy. In consequence of this advice Dionysius invited Plato to his court. The latter succeeded in tempting him into the path of virtue and knowledge, and in giving a new character to his whole court. An opposite fate befell the historian Phanu- tus, awakened the king’s suspicions against Dion, and caused his banishment. Dion subsequently made himself master of Syracuse in 356, to which Dionysius did not return until after the murder of Dion. During his exile he retired to Locri in Italy, the birthplace of his mother, Doris. Here he ruled despotically until 346. The rule of Dionysius now became so oppressive that the Syracusans sought the aid of Corinth to oust him and Timoleon in 343 appeared with a fleet before Syracuse, and expelled the tyrant. Dionysius was carried to Corinth, where he is said to have gained a scanty living by giving lessons in grammar.

DIONYSIUS EXIGUUS, an eminent scholar of the 6th century. He was who introduced the now existing method of calculating the Christian era. He was a monk named, according to his close friend Cassiodorus, was of Scythian origin (*natonis Scytharum*). His surname Exiguus (little) was perhaps self-assumed by him out of humility, for lowly mindedness is one of the virtues enumerated by Cassiodorus in his eulogy of his friend; but the surname may have had reference to his stature. His reputation was high as a theologian and as one intimately conversant with the Scriptures and with the ordinances of the Church. He is author of a collection of a considerable number of both civil and ecclesiastical canons which is still extant, including the first 50 canons of the Apostles; the canons of 10 councils; and 38 decretals of the popes, from 384 to 498. This collection had great authority in the West, and in modified form was finally promulgated by Charlemagne in 802. Many writings of ancient Greek authors have been saved for us in the translations made of them into Latin by Dionysius. Dionysius died before 555. Several of his works are to be found in Migne, *Patrologiae Latinae Centuriarum* (Vol. LXVII). (See CHRONOLOGY; CANON LAW.) Consult Tardif, *Histoire des sources du droit canonique* (Paris 1887).

DIONYSIUS OF HALICARNASSUS, Greek critic, historian and rhetorician: b. about 50 B.C.; d. 7 B.C. He came to Rome about 29 B.C., and lived there on terms of intimacy with many distinguished contemporaries till his death. His most valuable work is his *Archeologia,* written in Greek, a history of Rome down to 264 B.C. Of the original 20 books, we possess only the first nine in a complete form. It is a mine of information on the constitution, history, art, religion and social life of Rome, and is highly regarded by scholars despite the author’s lack of historical discrimination and his inability to distinguish clearly between fable and fact. He was a greater rhetorician and critic than historian, and his extant works on oratory, on the criticism in detail of the great Greek orators, on the characteristics of poets and historians from the time of Homer to Euripides, and upon Thucydides and Dinarchus possess great interest and value. A Latin edition of the *Archeologia* appeared in 1480, but the first edition of the Greek original was that by Stephens (Paris 1546). Fragments of the lost books from a Milan manuscript were published by Angelo Mai (Milan 1816), but are of doubtful authenticity. His complete works on oratory, etc., including *Censura Verbolae; Ars Rhetorica; De Compositione Ver- borum; De Imitatione; On the Style of Demosthenes* and *On the Character of Thucydides,* were edited by Usener and Rade- macher (Leipzig 1899). There is a good edition of the *Archeologia* by Jacoby (Leipzig 1891) and of the *De Compositione Verborum,* by W. Rhys Roberts (Cambridge 1901); the

DIONYSIUS, Ear of. See Ear of Dionysius.

DIONYSUS, di-ô-nis'ús, the original Greek name of the god of wine, the name Bacchus, by which he was also called by both the Greeks and the Romans, being at first a mere epithet or surname. See Bacchus.

DIOPHANTINE ANALYSIS, that branch of algebra which treats of the method of solving certain kinds of indeterminate problems relating principally to square and cube numbers, and rational right-angled triangles. The following are examples: (1) To separate a given square number into two parts, each of which shall be a square number; (2) to find three square numbers which are in arithmetical progression; (3) to find a right-angled triangle whose sides shall be commensurable with each other.

DIOPHANTUS OF ALEXANDRIA, Greek mathematician; the "Father of Algebra." He flourished, according to some authorities, about the middle of the 3d century, according to others about the end of the 6th. He left 13 books of "Arithmetical Questions," of which only six are extant; and a work on "Polygon Numbers." See Diophantine Analysis.

DIOPSIDE, a variety of the mineral pyroxene occurring in monoclinic prisms. It is a silicate of calcium and magnesium, having the formula, CaMg(SiO₃). Iron is occasionally present in considerable amount, replacing the magnesium, and it then graduates toward hedenbergite. It has a hardness of about 6, and a specific gravity of about 3.3. It is usually pale green to nearly colorless and when transparent yields gems of considerable beauty. The finest gems come from Delacab, N. Y., where it occurs in transparent crystals varying from pale green to deep rich green. The Mussa Alp, in the Alta Valley, Piedmont, is another celebrated locality from which it is also called Alalite and Mussalite.

DIOPTASE, a rare, beautiful and highly prized mineral, occurring in prismatic crystals of rich emerald-green color and vitreous lustre. Its inferior hardness, 5, greater specific gravity, about 3.3, the terminal rhombohedrons on its crystals, and its reactions for copper, easily distinguish this so-called "emerald-copper" from the true emerald. It is found sparingly near Clifton and near Riverside in Arizona, also in the French Kongo, Chile and Hungary, but the finest specimens are from the Kirghese Steppes, Asiatic Russia.

DIOPTRICS (from Gr. diá, through, root oph, see), the science which treats of the refraction of the rays of light, when the rays pass through different refracting mediums—for instance, from the air, through the lenses of a telescope. Dioptrics, consequently, is a branch of optics. It demonstrates the different directions in which the rays move, according as they are broken on plane or curved surfaces. The principles deduced from these observations determine the nature of the various lenses, explain the manner in which the light is refracted in the human eye, teach the manner of making telescopes, microscopes, etc. The ancients were not acquainted with this science. Natural science in modern times has been greatly indebted to it. By its aid the human eye has been enabled to reach objects previously unknown. Kepler, Snellius of Leyden, Descartes, Newton, etc., not only extended this science, but founded a great part of their discoveries on it. In modern times, science has been enriched by the invention of the achromatic telescope. See Lens; Optic Light; Refraction; Telescope.

DIORAMA, a method of reproducing landscape scenery, invented or perfected by M. Daguerre, and first exhibited by him in 1823. The particular advantage which this method possesses is that it causes the light to play over the picture with an intensity graduated at will. The illusion is heightened by the cloth transparencies, through which light is poured from behind the picture. The principle of the diorama was successfully applied in producing some of the prettiest scenic effects of the modern stage.

DIORITE, a medium- to coarse-grained dark gray or greenish-colored rock consisting essentially of hornblende, biotite mica, and plagioclase felspar that have a granitoid, or completely crystalline, texture. According to variations in composition, there are augite-diorites which grade into gabbros and quartz-diorites which grade into granites. The hornblende and augite-diorites are dark-colored; the quartz-diorites, light-colored. As augite changes readily to hornblende, many so-called diorites may represent altered diabases and gabbros; by further metamorphism the hornblende changes to chlorite. Diorites under shearing stresses may be changed into hornblende and chlorite schists. Andesites and dacites are rocks of the diorite family, but having a porphyritic texture. As compared with the syenites, diorites contain less potash and soda but more lime and magnesia, hence the principal felspar is soda-felspar, and the lime, magnesia and iron than granite and less silica and potash, these constituting the chief differences. It is often used for building. True diorites are rare in the United States, though quartz-mica diorites and augite-diorites are not uncommon, and granio-diorites—the intermediate stages between diorite and granite—occur in great masses in the Sierra Nevada, in California. True diorites occur in various places abroad. One from Wales contains SiO₂ 61.75; Al₂O₃, 18.88; Fe₂O₃, 0.52; FeO 3.52; CaO 3.54; MgO 1.90; Na₂O 0.67; K₂O 1.24; and has a specific gravity of 2.79.

DIOSCOREACEÆ, a natural order of monocotyledonous plants, with alternate reticulate, veined leaves, tuberous root-stocks and twining stems. The flowers are small and unisexual. There are nine genera, with 200 species, chiefly inhabiting tropical America and South Africa. The typical genus is Dioscorea, which includes the yam of commerce (D. sativa). The best-known species in eastern America is the wild yam (D. cedrorum), which is found in moist thickets from Rhode
Island north, south to Florida and west to Texas. It ascends to 4,000 feet in the Virginia Mountains. The flowers are of a greenish-yellow bloom in June and July, and the fruit, which adheres to the vine until late in the winter, is ripe in September. Tamus (Testudinaria) elephantes, a South African species, sometimes called elephant's foot, and Hottentot's bread, has a large fleshy rhizome, with a rough cracked bark, which is used as food by the Hottentots in times of scarcity.

DIOCIORIDES, Peda'nius, Greek physician: b. Anazarbus (Cesarea Augusta), in Cilicia, in the 1st century A.D. He was a physician in the Roman armies which he accompanied in their various campaigns in several countries, and collected a great store of information on plants in general and on medicinal plants in particular. He was author of a celebrated work on materia medica, in five books. It is particularly valuable in regard to botany, as most of the medicines which the author mentions are taken from the vegetable kingdom. Two other works attributed to him by Photius are by a later Dioscorides of Alexandria—the 'Alexipharmac,' which was united with the 'Materia Medica,' forming the three last books of it, and treating of the poisons in the three kingdoms of nature, and their antidotes; and the 'Euporistia,' which treats of remedies that are easily procured. For 15 centuries his position was pre-eminent in botany and medicine, and he is still highly regarded by the Moors and Turks. The best edition of Dioscorides is that of Spengele (2 vols., Leipzig 1829-30). It contains a Latin translation and a commentary. The work has appeared in most European tongues and also in Arabic.

DIOCIURI, di-ık'raw, the classical name for Castor and Pollux, twin brothers, and tutelary deities of wrestlers, horsemen and navigators. Their transplantation to the sky as one of the 12 constellations of the zodiac (the Twins) is a celebrated allegory of mythology. They are sometimes styled Tyndarids, because Tyndarus was the nominal father of both.

DIOCIUSURS, or DIOCIUSUR, patriarch of Alexandria, immediate successor (444) of Saint Cyril, was a supporter of the heresiarch Eutyches (q.v.). Pope Leo and Flavianus, patriarch of Constantinople, having condemned the teachings of Eutyches, Dioscurus procured from the Emperor Theodosius II the convocation of a council of bishops at Ephesus in 449. To this council Pope Leo sent three legates as his representatives. Dioscurus was present, surrounded by a host of his satellites, and with their aid prevented the legates from presiding in the council and even from reading to the bishops the letters addressed to the assembly by Leo. Flavianus was so roughly handled by the rabble that he died shortly after in consequence of the injuries he received. The council thereupon got the title of Latrocinium (Brigandage) from the Latins, and of Συνελεημονία ληστεία from the Greeks (robbers' synod); but Theodosius upheld its decisions, and Dioscurus procured the appointment of one of his partisans, Anatolius, to succeed Flavianus in the see of Constantinople. After the death of Theodosius another council assembled at Chalcedon in 451, which annulled the decrees of the Latrocinium of Ephesus and decreed the deposition of Eutyches from his offices as presbyter and archimandrite.

DIOSSMA, a genus of plants belonging to the rue family (Rutacea). They are small shrubs with white or red flowers; leaves alternate or opposite, simple. They are remarkable for their overpowering and penetrating odor, arising from the presence of a yellowish volatile oil. They are the buchu plants of the Cape of Good Hope. The plant has been employed in chronic affections of the bladder and urinary organs in general, and has also been administered in cholera.

DIOSSYROS, a genus of plants belonging to the ebony family (Ebenacea). There are about 190 species, most abundant in Asia. They consist of trees and shrubs with white or pale yellow flowers. D. lotus is the Indian date-plum, and is supposed by some to be the lotus of the ancients. The trees of several of the species furnish ebony wood. The fruit of D. kaki, the Japanese persimmon, is a well-known fruit. D. virginiana, the most common American representative of the genus, is the persimmon (q.v.).

DIP, in geology, the maximum angle of inclination of any stratified rock or of a vein or of a fault plane to the horizontal of a given point. In the same way the cleavage planes of any metamorphic rock are said to dip and a thin intrusion of igneous rock, a dike, has a dip. Also the contact plane of an igneous and a sedimentary rock may have a well-defined dip. The direction of the dip is the line of highest inclination and is expressed by compass bearing; thus a bed may dip 63 degrees north, 35 degrees east. The line of intersection of the dipping bed or plane with the horizon is known as the strike, and is at right angles to the direction of dip. The angle of dip is determined by an instrument known as a clinometer (q.v.). Initial dip is the name given to the slight inclination away from the land that sedimentary beds have as a whole when laid down in the sea. Such initial dips are often of importance in determining flexures when the sediments are subsequently subjected to mountain-building pressures. See FAULT; FOLD; GEOLOGY; MOUNTAIN.

DIP CIRCLE, also called INCLINATION COMPASS and INCLINOMETER, an instrument for measuring the angle between the plane of the horizon at any place and the position assumed by a magnetic needle so mounted as to be capable of turning freely in a vertical plane.
When the vertical plane coincides with the magnetic meridian of the place, the resulting angle is called the Dip. An unmagnetized needle if suspended at a point which coincides with its centre of gravity and placed horizontally, will, of course, remain always in a horizontal position; but if the same needle be magnetized uniformly the magnetic north and south direction, but it will also take up an inclined position with reference to the horizon, the north end of the needle pointing downward at places north of the earth's equator and the south end being depressed in southern latitudes. At either of the magnetic poles of the earth the needle will point directly downward, that is the dip will be equal to 90 degrees. On the equator the dip is approximately 0 degrees, while in intermediate latitudes it has values intermediate between these. At Greenwich at the present time the dip is 66 degrees 54 minutes, but at all places the value is subject to somewhat irregular daily, seasonal, and yearly change. Thus at Greenwich the value diminished for a long time at the rate of about two seconds a year, thus changing the dip by a full degree at intervals of about 30 years.

**DIPHTHERIA** (Gr. diptheria, a skin, piece of leather, extended in meaning to comprise membrane), a contagious and (in its severe forms) malignant disease, caused by a specific bacillus, and generally characterized by the fibrinous false membranes in the throat. Although previously observed, it was first clearly described in 1826 by M. Bretonneau of Tours under the name of "diphtherite," as a form of very fatal sore throat occurring chiefly in children. It is now known that most cases of membranous croup are identical with diphtheria. The membranous inflammations of the throat occurring sometimes in scarlet fever and other infectious fevers may or may not be true diphtheria, a bacteriological examination being usually necessary to determine this point.

The period of incubation is usually from two to seven days. The disease begins by malaise, feeling of chilliness, loss of appetite, ache and more or less fever; soon the throat feels hot and painful and the neck is stiff and tender. If seen early, the throat is red and swollen, but a false membrane of yellowish or grayish color quickly appears in spreading patches, usually first on the tonsils, whence it often spreads to the pillars of the fauces, uvula and back of the throat, and may even extend down the esophagus or gullet; extension of the membrane into the nasal cavities is a grave symptom. There is usually enlargement of the glands at the angle of the jaw, and albumen in the urine generally occurs at some stage of the disease. Diphtheritic membrane may be formed on any mucous surface or even on a wound if it extends into the larynx it gives rise to cough and difficulty in breathing. The throat affection is often accompanied by a low and very dangerous form of fever, with quick, feeble pulse and great and rapid loss of the patient's strength, with an inability to take food; in other cases, the disease is fatal by paralysis of the heart or by suffocation, due to invasion of the larynx. Invasion of the larynx may necessitate intubation or tracheotomy. After the acute disease is over, the recovery may be delayed by paralytic symptoms of various kinds; or simply by extreme debility with exhaustion and loss of appetite. In the early stages of convalescence there is danger of sudden heart failure upon exertion.

Diphtheria is communicable. It may occur as a complication of scarlet fever, measles and other communicable diseases. All gradations in the intensity of the disease from the moderate sore throat to septic and gangrenous forms occur. Damp and temperate climates seem to favor its development. Insanitary conditions favor its occurrence, but the disease may appear under the most favorable hygienic surroundings. An important mode of its spread is by school children, either infected in a mild form or coming from households where the disease exists. One attack affords little or no protection against recurrence. In the treatment of the disease the patient should be isolated and all clothing and other articles which have been in contact with the sick, as well as the discharge, should be disinfected. Local applications to the diseased parts and means to maintain the strength of the patient were the most valuable therapeutic measures before the introduction of the antitoxic treatment.

True diphtheria is now known to be caused by a specific bacillus called Bacillus diphtheriae, or the Klebs-Loeffler bacillus. This bacillus was first recognized by Klebs in 1883 by microscopic examination of diphtheritic membranes, but it was first successfully cultivated by Loeffler in 1884. Its causal relation to the disease was not thoroughly established till the investigations of Roux and Versin in 1888, who demonstrated the existence of a peculiar and intensely poisonous substance known as the diphtheria toxin. It is now generally admitted that the Klebs-Loeffler bacillus is the cause of true diphtheria. The diphtheria bacillus is a slender rod, characterized especially by irregularities in shape and staining with aniline dyes. It grows best at about the temperature of the human body, and all growth ceases below 20° C. It can be cultivated artificially on various media, but best on a mixture of blood serum and beef-broth rendered liquid by heating. In a moist condition the bacilli are killed in a few minutes by a temperature of 60° C. They survive for months in a dried condition. Exposure to the direct rays of the sun kills the bacilli, in a short time. Guineas may be inoculated beneath the skin with a small quantity of a pure culture of the virulent diphtheria bacillus, die within two to five days with characteristic changes in the body. Skilled bacteriologists can recognize the presence of diphtheria bacilli in the throat by microscopic examination and the appearances in the cultures within 24 hours or less, but their complete identification may require the inoculation of a guinea-pig. Both in human beings and in animals the bacilli grow only or mainly locally in the false membrane, the severe constitutional symptoms being due to the absorption of a powerful poison secreted by the bacilli.

The ways in which diphtheria bacilli may be conveyed from sick to healthy persons are almost countless. In ordinary breathing the expired breath contains no germs, but in speaking and especially in coughing, a fine spray is emitted which may contain thebacilli and thus convey the disease. All sorts of articles, such as handkerchiefs, toys, dishes, furniture, clothing, bed-linen and the like, may be
DIPHTHONG—DIPLOPECTERUS

come contaminated with the bacilli and be the means of spreading the disease. The specific germs have been found in the hair, on the shoes, and elsewhere on the persons of those brought into frequent and close proximity to the patient. Direct contact with the patient, as in kissing, may communicate the disease. It is especially through direct or mediate contact with infected individuals that the disease is spread. Hence, preventive measures, consisting in isolation of the patient till the bacilli have disappeared from the throat, and in thorough disinfection, are of the first importance in checking the spread of diphtheria. Insanitary conditions, formerly thought to be the direct cause of diphtheria, are now regarded only as accessory causes in affording opportunities for the prolonged survival of the specific germs or in weakening the powers of resistance of the individual.

The discovery of the diphtheria bacillus has led to the introduction of a new and most successful method of treatment of the disease, known as serum-therapy or the antitoxin treatment. The establishment of the principles and the introduction of this treatment are due especially to Behring of Germany and Roux in Paris. The underlying principle of the treatment is based on the fact that, if a susceptible animal is inoculated first with small and then with increasing doses of the toxin produced by the bacillus, the blood of the animal is found to contain a substance called antitoxin, which has the power of neutralizing or rendering harmless the toxin. In order to obtain large quantities of the healing serum a horse is generally selected for the process of immunization. By proper methods very powerful antitoxins can be obtained. The antitoxin is used not only to cure the disease, but also to render persons insusceptible for a time to the disease. This latter procedure of preventive inoculation has been found especially useful in preventing extensive outbreaks in children's hospitals and asylums after the introduction of one or more cases of diphtheria. Dr. William H. Welch, of Johns Hopkins University, in 1895, in an analysis of over 7,000 cases of diphtheria treated by antitoxin found that the fatality was reduced by this treatment by over 50 per cent of the previous death-rates; he concluded that the antitoxin serum is a specific curative agent for diphtheria, surpassing in its efficacy all other known methods of treatment for this disease. Since his report, this conclusion has been confirmed and even more favorable results have been obtained.

The idea of the great benefits which have been derived from the discoveries outlined above may be had by comparing the death rate before and after the serum therapy became the practice. For the five years immediately preceding the discovery and use of antitoxin in the city of Berlin the death rate for diphtheria in every 10,000 inhabitants was 102 per cent, and for the next five years it fell to 3.7 per cent; in Paris, 6.5 per cent before antitoxin, and 1.3 per cent afterward; in New York 14.5 per cent before, and 3.5 per cent afterward. So sure is the use of antitoxin, it is now advised that every child exposed should receive an immunizing dose, as that confers protection.

WILLIAM H. WELCH, M.D.,
Professor of Pathology, Johns Hopkins University.

DIPHTHONG (Gr. having a double sound²), two vowel sounds, following one another so closely as to form but one syllable, as in out, where the sound is really composed of a and u. Many double vowels in English are not real diphthongs, there being only one sound heard, whereas some single vowels have a diphthongal sound. The only real English diph- thongs are i as in high; i as in aye; oi in boil; ow in how; and ew in new.

The spelling of the English language has little or no relation to pronunciation in this matter. In many syllables written with two vowels, only one sound is heard, as in bread. The single vowel letters, again, often have a diphthongal sound; thus the long i, as in high, is really composed of the sound of a, as heard in father, and that of e in me; and tune is pronounced as if written two. Such words as bread, field, which are now monophthongs, are really diphthongs, and are still so pronounced in many parts of England.

DIPLEGIA. See PARALYSIS.
DIPLOBLASTICA. See EMBRYOLOGY.
DIPLOCCOCUS. See BACTERIA.
DIPLODOCUS, di-ploid'o-kus, a saurian-footed, herbivorous dinosaur found in the Jurassic deposits of Colorado. The length of skull of this species was about 21 inches, of brain about 3 inches and of body 50 feet. The cast of a reconstructed specimen in the Carnegie Museum, Pittsburgh, measures 84 feet in length and is 12 feet 9 inches in height. The animal is supposed to have been a bipedal wader, and to have lived on vegetation in the water. It would weigh about 20 tons. It would require about 500 pounds of vegetable food every day.

DIPLOMA (Gr. diplō, "fold" or "double"), originally a document on two tablets of wax (see DIPYCH), or on writing material which was folded. The Roman emperors granted diplomas to couriers, giving them the use of public servants and horses; hence diploma came to signify a writing or document conferring some power, authority, privilege or honor, usually under seal and signed by a duly authorized official. Diplomas are given to graduates of a university on their taking their degrees; to clergymen who are licensed to officiate; to physicians, civil engineers, etc., authorizing them to practise their professions; and are awarded as a certificate of merit at exhibitions. In European countries all diploma-conferring bodies are under state supervision and control, and a movement is on foot to make similar provision in the United States.

DIPLOMACY. See AMERICAN DIPLOMACY; INTERNATIONAL LAW; UNITED STATES — DIPLOMACY OF THE.

DIPLOMATICS, the science of deciphering ancient MSS, inscriptions, etc., now generally known as PALEOGRAPHY (q.v.).

DIPLOPIA, di-ploi'-ə, an affection of the sight in which objects are seen double. It arises from derangement of the visual axis and can be remedied by the wearing of suitable glasses.

DIPLOTERUS, a genus of fossil ganoid fishes, of four species, belonging to the Old Red Sandstone.
DIPLOZOOON, a parasitic trematode worm which infests the gills of the bream, and which appears to be formed of two distinct bodies united in the middle, and not of the form of a Saint Andrew's cross, and only double individuals thus attached are capable of becoming sexually mature. The larva, formerly called Diporpa, swims about in the water for a time, but ultimately settles in the gills of a fish, where it remains during the rest of its existence. The larvae then unite in pairs by the attachment of the ventral sucker of one individual to a knob on the back of another.

DIPNOI, one of the primary subdivisions of fishes, characterized by the presence of membrane or covering bones on the skull, the absence of secondary bony jaws (maxillary, premaxillary and dentary bones), and the direct articulation of the lower jaw with the skull. The Dipnoi were early predominant in geological times, many and varied forms occurring as fossils in the Middle and Upper Paleozoic strata. Some of these, forming the order Arthrodira, are of doubtful relationship, and are classed with the Dipnoi only provisionally. The best-known representatives of this group have the body covered with the bony envelopes or continuous bony plates, with a complex articulation between the head and trunk. In the Devonian of Ohio are found giant forms, like Dimichthys and Macropetalichthys, from 10 to 25 feet long, and with sharp-beaked jaws like a turtle's. Numerous other orders and Dipnoi, more closely resembling the still living ones, have been found as fossils in various parts of the world. At the present time the group is decadent, and but three genera and as many species, each found in a restricted area in widely separated regions of the earth, remain. They are, Protopterus from Africa, Lepidosiren from South America, and Ceratodus from Australia. On account of the lung-like structure of the swim-bladder and its function as an organ of respiration, they are known as lung-fishes. Belonging the earliest vertebrates which are believed to have breathed air, the Dipnoi have an exceptional interest, and many zoologists consider them to have been the original stock from which the Amphibia and all other terrestrial vertebrates arose. See Myxinidae; Fish; Stegoselachia. Consult Cope, 'Origin of the Fittest' (New York 1886); id., 'Batrachia of North America' (Washington 1893); Dean, 'Fishes, Living and Fossil' (New York 1893); Garwood, 'Amphibia' (London 1901); Lydekker, Cunningham, Boulenger and Thomson, 'Reptiles, Amphibia, and fishes' (ib. 1912).

DIPPEL, Johann Konrad, German mystic and alchemist: b. Frankenstein, near Darmstadt, 10 Aug. 1673; d. Berleburg, Prussia, 25 April 1734. He became involved in difficulties possibly due to his tractate, 'On the point and nature of the trident' (1697, 1698) attacking Lutheran theology, which ruined him with all parties, and which provoked replies in the same spirit as that in which the attacks had been made. To avoid persecution he was forced to lead a wandering life. He was imprisoned in a Danish fortress (1719-22) and afterward, through clerical influence, was banished from Sweden. He became a student of alchemical books, and at once threw himself into the search for the philosopher's stone. He is remembered as the refiner of Dippef's Oil (q.v.), from which followed indirectly that of Prussian blue—an accidental discovery, it is true, but one of a class that could hardly have been made but for the constant and multifarious, though not well-directed labors, of such men as Dippel.

DIPPEL'S OIL, the black fetid oil which was formerly produced by the destructive distillation of bones, and was used medicinally. Dippel, in 1711, refined it by washing with lime or potash, and rectifying the oil until it became limpid and aromatic. This refined oil was the oleum animale Dippelii of the older pharmacopoeias, which was prescribed in doses of a few drops as an antispasmodic and diaphoretic; and as a hypnotic.

DIPPER, a name given to the seven stars in the constellation of the Great Bear, from their being arranged in the form of a dipper, or ladle.

DIPPER, a water-ousel. See Ouzel.

DIPPING-NEEDLE, or INCLINATION COMPASS, an instrument for measuring the magnetic dip or inclination; that is, the angle which a magnetized needle, free to move in the plane of the magnetic meridian, and about a horizontal axis, makes with the vertical plane at a place. The dipping-needle is a light magnetized steel bar supported on a horizontal axis which passes, as nearly as possible, through the centre of inertia of the bar. The axis is either a steel knife-edge which rests on agate plates, or a fine wire supported by friction-rollers. A vertical circle surrounds the needle, the axis on which the needle turns being at the centre; the circle is graduated, and the needle moving over the graduations, the inclination to the horizon can be read off by means of it. The vertical circle is mounted on a vertical pillar, which turns round its own axis; and to the pillar there is attached at the foot an arm or pointer, which moves over a horizontal graduated circle. This last is supported on three legs furnished with leveling screws.

To observe with the dipping-needle the vertical circle must be placed in the plane of the magnetic meridian, and then the angle at which the needle is inclined must be read off by means of the graduations on the circle. The plane of the magnetic meridian might be determined by means of a separate instrument, such as the declination compass. But this is not necessary, the vertical pillar and horizontal circle described above furnishing all that is required. A complete observation is made in the following way. The instrument having been properly leveled, the vertical circle is turned round on the pillar till the needle points vertically downward. When this is the case we know that the needle must be moving in the vertical plane at right angles to the plane of the magnetic meridian, because it is only in this plane that there is no horizontal component of force acting on the needle. The vertical circle is now turned round on the pillar through 90 degrees, which is done exactly by means of the horizontal circle at the foot. The needle is thus free to move in the plane of the magnetic meridian, and the inclination is read off.

Corrections for defects in the instrument must be applied in order to make the determination exact. In the first place, in order to correct for any error in centering of the axis
on which the needle turns, readings are taken at both ends of the needle. Next, because the magnetic axis of the needle may not coincide with the axis of the figure, the needle is turned over on its bearings, and fresh readings are taken. Thirdly, the axis on which the needle turns may not pass exactly through the centre of inertia of the needle. If this were the case the needle would not balance about the axis exactly, one or other end of it being the heavier. To do away with error from this source, after one set of readings have been taken, the needle is lifted from its bearings and remagnetized, the end that was formerly north being now made the south end. A complete new set of readings is taken. The mean of all these gives the true inclination. See Declination Needle; Magnetism, Terrestrial.

Diprothodonty. The state of the enlargement in an animal of a pair of cutting teeth, while the neighboring teeth are reduced. This adaptation is frequent and arises independently in many orders of mammals, ancient as well as modern. It is most prominently and fantastically illustrated in the incisors of the rodents, as the rat or the beaver. Sometimes instead of the middle pair, the side pair is so enlarged and it is not always easy to determine their true affinities.

Diprotonodon, di-prō’tō-dōn, a huge extinct marsupial of the Pleistocene Period in Australia. Its nearest living relatives are the wombats and kangaroos, which it somewhat resembled in the character of the head, which was three feet long. The animal was by far the largest of the marsupials, almost equaling a small elephant in size and resembling the elephants in its rather long legs and short post-like feet. The structure of the foot-bones is very remarkable; the great toe is short and stout, the others reduced to small slender rudiments. Its dentition showed molars transversely ridged as in the kangaroo, but without the longitudinal connecting ridge. Its remains have been found in great abundance in certain dried-up salt lakes (Lake Calibona, etc.) of the central and south Australian deserts.

Dipsacus, the typical genus of the Dipsacaceae.

Dipsas, a genus of tropical opisthognphyle serpents, mostly tree-snakes with greatly elongated bodies and protective coloration, which are usually nocturnal, and feed mainly upon lizards and birds and their eggs, though some species pursue mammals and other birds exclusively. Their posterior poison-fangs (see OIsthognphyla) are large, but they differ in venomous ability, which is rarely deadly to a large animal. This and several allied genera form the colubrid sub-family Dipsadinae.

Dipsomania. See Alcoholism.

Diptera, an order of two-winged insects, of which the common housefly and bluebottle are familiar examples, and of which some 40,000 species are known; the number yet to be described will bring the total to 350,000. They are characterized by a body with lightly coriaceous coverings, a trunk open beneath and containing a sucker composed of two, four or six glands lined with elongated scales, two or three antennae almost always composed of three joints, large eyes, an abdomen of four to seven distinct segments, tarsi with five joints and two short clubbed appendages called halteres or balancers, which seem to be the rudiments of the posterior pair in four-winged insects and are kept in continual motion. They all undergo a complete metamorphosis. They are found in the earth, the air and the water in all climates and in all localities. The larger number live exclusively on the sap of flowers. See Flies.

Dipteraceae, or Dipterocarpaceae, an important order of exogenous trees. They are found in India, and especially in the eastern islands of the Indian archipelago. There are about 10 genera and over 100 species known. The trees belonging to this order are handsome and ornamental, and abound in resinous juice. When young, the Dryobalanops camphora yields, on incision, a pale yellow liquid, consisting of resin, and a volatile oil having a camphoraceous odor; when old, it furnishes a kind of crystalline camphor. Other species produce fragrant resins used in temples, also varnishes; while some of the commonest produce plumes used in the making of umbrellas.

Dipterus ("two-winged"). A fossil fish occurring in the Devonian rocks and belonging to the Dipnoi sub-class, family Dipteridae, of which this is the typical genus. Its distinguishing character is the possession of double dorsal and caudal fins. An interesting fact connected with it is that it approaches nearer to the living fishes than do any of the present existing ganoids.

Diptych, dip’tik, a tablet consisting of two leaves, light boards, held together by a hinge. In the time of the Roman empire diptychs were much used in correspondence between friends and were given by magistrates inscribed with names and portraits to friends on the assumption of office. Even when three boards or more were used the name diptych (Sincalos, folded double) was generally retained instead of triptych, tesseraptch, etc. Diptychs figure largely in the history of the Church for several centuries, being tokens of intercommunion between the assemblies of the faithful throughout the world. The use of diptychs in the liturgical service was established in the middle of the 4th century and it must have commenced much earlier. It was continued in the Latin Church to the 12th century and in the Greek Church to the 15th. The Diptychs of the Living had inscribed on them the names of the pope, patriarchs, bishops then living and presiding over the faithful in their respective spheres; also the names of the clergy of the particular churches in which they were kept; names also of benefactors of the churches, of the emperor and the emperor's wife. For these the faithful offered their prayers. The Diptychs of the Dead contained usually the names which had once been written in the Diptychs of the Living. In the diptychs were also inscribed the names of the Virgin Mary, martyrs and other saints. If any name, whether of the living or the dead, was erased from the diptychs it signified that the person was regarded as out of the communion of the Church. The diptychs both of the living and dead were read fro-site-shaped elongated scales, two or three
the Roman Missal, the marks of the diphytches are very evident. At the prayer, "Teigitur," the names of the reigning pope and the bishop of the diocese are mentioned. In other prayers of the Mass the diphytches are followed. Consult Kraus, "Real-Encyclopädie"; Benedict XIV, "De Missa."

DIPUS. See JEROBOAS.

DIQUE, dék, Canal del, Colombia, an artificial arm* of the Magdalena River in the department of Bolivar. It is navigable by steamers, and is a means of communication between Cartagena and the interior of the republic. Its total length is about 746 miles, and in its course it passes through several swamps and receives the waters of various conduits, reaching the coast south of Cartagena.

DIRÆ, di're, or UEMENIDES. See Furies.

DIRCE, dér'ce, in Greek legend, the second wife of Lycurgus, king of Thebes, who from jealousy imprisoned Antiope, whom Lycurgus had divorced in order to marry herself; but Jupiter set Antiope at liberty, when she soon gave birth to two sons, Amphion and Zethus. These latter grew up in ignorance of their parentage. They were commanded by Dirce to bind Antiope to the horns of a wild bull that she might be dragged to death; but having learned the secret of their relation to Antiope, they compelled Dirce to accept the fate she had designed for their mother. The gods, pitying her misfortunes, changed her into a spring, which bears her name and flows near Thebes.

DIRCKS, Henry, English civil engineer: b. Liverpool, 26 Aug. 1800; d. Brighton, 17 Sept. 1873. After 1827 he lectured on chemistry and electricity; later becoming distinguished as a railroad and mining engineer. He also made several inventions, including the mechanical device known as "Pepper's Ghost." He published "Jordan-Type, otherwise called Electrotype" (1852); "History of the Search for Self Motive Power" (1861); "The Ghost as Produced in the Spectre Drama" (1863); "Inventions and Inventors" (1867), etc.

DIRECT AND INDIRECT TAXES, the former are those which in theory the bearer cannot transfer to others, by adding correspondent charges to goods or service; as distinguished from indirect, those on goods for sale, which will be added to their selling price. Direct taxes are laid according to some fixed fact, as of personality, rank, property or earnings, and are consequently assessed according to some list or roll. Indirect taxes are laid according to some changing, temporary, more or less accidental fact, the result of processes and transactions, and are laid and collected according to tariffs. Direct taxes in current understanding include taxes on polls, property, incomes and privileges, such as fees and licenses for doing business, keeping pets, carriages, etc. But the Supreme Court of the United States, in the income-tax cases, decided that only taxes on polls and property are direct; which is law for this country. The theory at best does not quite conform to facts. Taxes on real estate occupied by the owner, for example, are not transferable; but those on property for rent are so much added rent charge, and as indirect as customs duties. The heavy license fees charged by many municipalities for doing certain classes of business are Pro tanto an increase of the business expense, and must be met in the charges if the business is to live; often, indeed, they are used openly as "domestic rates," to give industries of one State an advantage over others — this is especially so with insurance companies. On the other hand, income taxes on salaries cannot in practice be transferred, as an employer's contributions on account of his employees' taxes; while those on mercantile incomes are in the same category as those on licenses, and can to some extent be recouped from customers. All State and municipal revenues in the United States are raised from direct taxes in the broader sense; the constitution prohibits them from laying duties on exports or imports, but not on internal manufactures, which, however, are also left entirely to the general government. In American usage, indirect taxes generally refer to customs and internal revenue duties. On the Continent of Europe they include the octroi and other forms of municipal taxes. Historically, indirect taxes preceded direct taxes, because sovereigns found it necessary to disguise the collection of revenue and secure it by methods more or less concealed. Although this motive no longer exists in its cruder aspects, there is no doubt that it is easier to collect revenue through increased prices of commodities than by direct payments to the treasury. Practically all of the Federal revenue is derived from indirect taxes. The Federal income tax is a notable exception. The cost of collecting indirect taxes is as a rule greater than that of direct taxes. Only six times in its history has the Federal government resorted to direct taxation, in the narrower sense above: in 1798, 1813, 1815 and 1816, on real estate and slaves; in August 1861 a levy of $20,000,000 for war expenses was laid on all house lots with dwellings and improvements. The operation of the act was suspended 1 July 1862, when $15,000,000 had been collected; and the act of 2 March 1891 refunded it to the States; and on 3 Oct. 1913 the Underwood Tariff Act imposed on every citizen of the United States, and every person residing in the United States a personal income tax on his entire net income in excess of $3,000. See BULLOCK, 'Origin and Effect of the Direct-Tax Clause' in Political Science Quarterly, XV (1900); Bastable, 'Public Finance' (2d ed., 1895); SELIGMAN, 'Essays in Taxation' (1897); Plehn, 'Introduction to Public Finance' (1909). See REVENUE TAX; INCOME TAX; IMPOR TAXATION.

DIRECT AND RETROGRADE, terms which, when used in astronomy, have reference to the real or apparent motion of the planets. When the planet moves forward or appears so to move, from west to east, in accordance with the order of signs in the zodiac, the motion is said to be direct. When the motion appears contrary it is said to be retrograde.

DIRECT LEGISLATION. See Reform.

DIRECT PRIMARY. See CONVENTION, POLITICAL; PRIMARY, DIRECT ELECTIONS.

DIRECTORS, the persons authorized to manage and direct the affairs and business of a corporation or company. The directors are
sometimes called managers or trustees in accordance with the purpose and nature for which the corporation or company was formed. At the present time, nearly if not all corporations are formed under general laws and it depends on the law under which the corporation is created as to the number of directors and their qualifications. The general qualification is that all directors must be stockholders in the corporation or, if it has no stock, they must be members of the corporation. The directors are generally elected by the stockholders, and some States have passed laws allowing cumulative voting, by which each stockholder may multiply the number of his shares by the number of directors to be elected, and cast all his votes for one director or distribute them in any manner he desires. It has been held that this kind of a law is unconstitutional, if applied to corporations created before the law was passed; as it impairs the obligation of the contract. It may be valid, if applied only to corporations created after the passage of the act. In some cases directors are appointed. The directors must act by and not as individuals. A majority of the board of directors is necessary to a legal meeting and if that number is present a majority of those present will be sufficient to perform any act. When there is a quorum present, all acts performed are presumed to be done in the regular course of business. The directors for the purpose of the business of the corporation are held to be the corporation itself; and their powers and duties depend on the laws under which the corporation is formed and the charters and by-laws of the corporation. Noted to the board of directors during a meeting of any matter in which they are required to act is notice to the corporation.

The directors are considered as general agents of the corporation, and they are the only ones that can manage the business of the corporation; although the directors are generally elected by the stockholders they are responsible to the corporation and through the corporation to the stockholders. As the directors derive their power from the charter their acts are of no effect if they are outside of the delegated power; and all acts performed by the directors which are outside of their power must be passed upon by the stockholders.

While directors are sometimes called trustees, they are not held to the same strict accountability as an ordinary and regular trustee; although their position is a fiduciary one. At common law directors are under no personal liability for the debts or obligations of the corporation. They are, however, liable to the stockholders in an action of tort for gross negligence or misfeasance in office resulting in loss to them. The directors may deal with the corporation the same as any other individual; but they cannot use their position for any special benefit to themselves. They may even go so far as to buy up the indebtedness of the corporation and at a sale buy in and acquire the absolute title to the corporate property. The directors may delegate their power to an agent, as a private individual may do, and the agent's power is not impliedly revoked by a change of the membership of the board of appointment is not that of the directors individually but of the board. The directors have a discretionary power and when it is honestly exercised there is no one that can make them account for their acts. A frequent illustration of this power is in relation to suit by or against the corporation, as to whether they shall be brought or defended. If a director's individual interests are in conflict with the interests of the corporation the act must be fair and just to the corporation. Modern statutes have increased the liability of directors of corporations to an extent varying considerably in the different States of the Union. A provision sometimes made is one making directors personally liable for the debts of the corporation if they do not file annually with the Secretary of State a report upon the affairs and business of the corporation. Usually the motive of the director in taking the office is the prosperity of the concern as benefiting him in the position of a stockholder. See Corporations.

DIRECTORS OF INCORPORATIONS. See Corporations, Legal.

DIRECTORY, in French history, the executive body established by the constitution of the French republic, 28 Oct. 1799. This body consisted of five members, called directors (directeurs) who were chosen by the Council of Elders from candidates presented by the Council of Five Hundred. Each director was president for three months in rotation, and one was compelled to make room for a new member every year. The unpopularity of the directory's home policy was increased in 1799 by the disastrous results of its war policy, and it was easily overthrown by the coup d'etat of Napoleon and his brother Lucien, 9 Nov. 1799. (See France). Consult Barante, 'Histoire du Directoire' (3 vols., Paris 1855); Granier de Cassagnac, 'Histoire du Directoire' (3 vols., ib. 1863); Guyot, 'Le Directoire et la paix de l'Europe' (ib. 1911); Pierre, 'La terreur sous le Directoire' (ib. 1887); Scion, 'Le Directoire' (4 vols., ib. 1895-97); Sorel, 'L'Europe et la revolution francaise' (8 vols., ib. 1910).

DIRECTRIX (Lat. linea directrix *a directing line*), in mathematics, a line governing the direction of another line. If a point so move that its distance from a given point is to its perpendicular distance from a fixed straight line in a constant ratio, it describes a conic section, of which the fixed straight line is termed the directrix and the fixed point the focus. The constant ratio referred to is termed the eccentricity, and its magnitude determines the nature of the conic. Thus, if in the figure, AB be the directrix and F the focus, if the point P move so that its distance from F is to its distance PM from AB in a constant ratio, then P will trace out a conic section, which will be an ellipse, parabola, or hyperbola, according as the ratio in question is less than, equal to, or greater than unity — that is, FP is less than, equal to, or greater than PM, or FV than VI. A quadric surface has a directrix with analogous relations. The fixed lines on which the heads of the lines whose section is straight or curved, generates a surface, are called directrices or directing lines.
DIRHEM—DIRIGIBLE

DIRHEM, der'm, or DRAMM, a modification of the Greek drachma, the name under which the Romans formed the denomination for a coin containing about 45 grains, and was also used for precious stones and medicine in Arabia, Persia, Egypt, and Turkey. As a coin the value varied, but may be given at 11 cents under the caliphs. In Turkey the name dirhem has been given to the much smaller weight, the French gramme.

DIRIGIBLE. Steerable, driveable; usually applied to lighter than air flying machines which can be propelled and guided.

Form and Size.—If ability to rise in the air depended merely upon a knowledge of the principle that made it possible, dirigible navigation would undoubtedly have been accomplished many centuries ago. Archimedes established the fact that a body upon floating in a fluid displaces an amount of the latter equal in weight to the body itself, and upon this theory was formulated the now well-known law that every body plunged into a fluid is subjected by that fluid to a pressure below the weight of the fluid displaced by the body. Consequently, if the weight of the latter be less than that of the fluid it displaces, the body will float.

Once in the air, a balloon is, to all intents and purposes, a part of the atmosphere. There is scarcely any sensation of movement, either vertically or horizontally. The earth appears to drop away from beneath and to sweep by horizontally, and regardless of how violently the wind may be blowing, the balloon is always in a dead calm because it is really part of the wind itself and is traveling with it at exactly the same speed. If it were not for the loss of lifting power through the expansion and contraction of the gas, making it necessary to permit its escape in order to avoid rising to inconvenient heights on a very warm day, and the sacrifice of ballast to prevent coming to earth at night the ability of a balloon to stay up would be limited only to the endurance of its crew and the quantity it was able to transport. Unless a voyage is to be governed in its direction entirely by the wind, the dirigible must possess a means of moving contrary to the latter. The moment this is attempted resistance is encountered, and it is this resistance of the air that is responsible for the chief difficulties in the design of the dirigible. To drive it against the wind it must have power; to support the weight of the power plant necessary, the size of the gas bag must be increased. It is also necessary to select a form that presents as small a surface as possible to the air as the dirigible advances, while preserving the maximum lifting power. Experience has strikingly demonstrated the analogy between the marine and aerial practice—not only is the shape of the bow of the vessel of great importance but, likewise, the stern. The profile of the latter may permit of an easy reunion of the molecules of air separated by the former, or it may allow them to come together and suddenly clash with one another and producing disturbing eddies just behind the moving body. Marey-Monge laid down the principle that to be successfully propelled through the air, the dirigible must have "the head of a cod and the tail of a mackerel," and nature exemplifies the truth of this in all swiftly moving fishes and birds. The pointed stern prevents the formation of eddies and the cutting of the water which would impose additional thrust on the bow. Zeppelin has disregarded this factor by adhering to the purely cylindrical form with short hemispherical bow and stern, but it is worth note that while other German inventors originally followed this precedent, they have gradually abandoned it, owing to the noticeable retarding effect.

Next in importance to the best form to be given the vessel is the most effective size—something which has a direct bearing upon its lifting power. This depends upon the volume, while the resistance is proportional to the amount of surface presented. Greater lifting power can accordingly be obtained by keeping the diameter down and increasing the length. As the gas is frequently under considerable pressure when the balloon expands under the influence of the sun's heat, a great deal of experiment has been necessary to find the best class of fabric for the envelope. Under the pressure an ordinary fabric would stretch and permit the escape of a large percentage of the gas. It has been found impossible to weave any fabric that will be close enough to hold hydrogen under pressure, so that recourse is had to a combination of cloth and rubber. The cloth is an extremely fine weave of cotton, even closer and lighter than the best of racing yacht duck, and is combined with rubber under high pressures. Three layers of this rubberized fabric are cemented together to form what is known as "balloon cloth," which is about as impenetrable a material as can be made without involving undue weight. The necessity of using rubber in it has introduced a complication, it having been found by experiment that rubber is strongly attacked by the ultra-violet rays of sunlight, which probably accounts for the fact that balloon envelopes are usually found more or less damaged after a high ascension, the influence of these rays being much greater at higher altitudes.

Stability.—Having settled upon the size and shape, there must be an appropriate means of attaching the car to carry the power plant, its accessories and control and the crew. While apparently a simple matter, this involves one of the most important elements of the design of stability. A long envelope of comparatively small diameter being necessary for the reasons given, it is essential that this be maintained with its axis horizontal. In calm air, the balloon, or container, is subjected to the action of two forces. One is its weight, applied to the centre of gravity of the system formed by the balloon, its car and all the supports; the other is the thrust of the air, applied at a point known as the centre of thrust and which will differ with different designs, according as the car is suspended nearer or farther away from the balloon. If the latter contained only the gas to inflate it, with no car or weight to carry, the centre of gravity and the centre of thrust would coincide. If the weight of the envelope were negligible. As this naturally cannot be the case, these forces are not a continuation of each other. But as they must necessarily be equal if the balloon is neither ascending nor descending, it follows that they will cause the balloon to turn until

Vol. 0 19
they are a continuation of each other. As this would be neither convenient nor compatible with rapid propulsion, it must be avoided by distributing the weight along the car in such a manner that when the balloon is horizontal the forces represented by the pressure above and the weight below must be in the same perpendicular. This is necessary to assume a horizontal position while at rest. But the longitudinal stability of the airship as a whole must be preserved. Its axis must be a tangent to the course of the balloon, and it described a helix, curved, or parallel with the direction of the course where the course itself is straight. This is apparently something which should be taken care of by the rudder, any tendency on the part of the airship to diverge from its course being corrected by the pilot. But a boat that needed constant attention to the helm to keep it on its course would be put down as a "cranky" boat, in other words, of faulty design in the hull. A dirigible having the same defect would be difficult to navigate, and even then it would not suffice to correct this tendency in emergencies. Stability of direction is accordingly provided for in the design of the balloon itself, and this is the chief reason for adopting the form of a long, slender, and slender-bodied car. This brings the centre of gravity forward and makes of the long tail an effective lever which overcomes any tendency of the ship to diverge from the course it should follow. However, the weight of the balloon itself would not suffice for this, so just as the stern of the latter "stabilizing surfaces" are placed, consisting of vertical planes fixed to the envelope. These form the keel of the dirigible and are analogous to the keel of the ship. In addition to being able to preserve its static equilibrium and to possess proper longitudinal stability, the successful airship must also maintain its dynamic equilibrium — the equilibrium of the airship in motion. This may be made clear by referring to the well-known expedients adopted to resist the ordinary spherical balloon. To rise, its weight is diminished by gradually pouring sand from the bags which are always called as ballast. To descend, it is necessary to increase the total weight by pouring sand into the car, and the only method of accomplishing this is to permit the escape of some of the gas, the specific lightness of which constitutes the lifting power of the balloon. The balloon, or the container itself, being merely a spherical bag, on the upper hemisphere half of which the net supporting the car presses at all points, the question of deformation is not a serious one. Before it assumed proportions where the bag might be in danger of collapsing, the balloon would have had to come down through lack of lifting power to sustain it longer. Owing to its far greater size, as well as to the form of the surface which it presents to the air pressure, such a crude method is not applicable to the dirigible. Dynamic equilibrium must take into account not only the weight of the balloon upon the pressure of the air, but also the resistance of the air exerted upon its envelope. This resistance depends upon the dimensions and the shape of that envelope, and in calculations the latter is also assumed to be invariable. Assume, for instance, that to descend the pilot of a dirigible allowed some of the hydrogen gas to escape. As the airship came down, it would have to pass through strata of air of constantly increasing pressure as the earth is approached. The reason for this will be apparent as the lower strata bear the weight of the entire atmosphere above them. The contrary will no longer suffice to distend the envelope, the latter losing its shape and becoming flabby. As the original form is no longer retained, the centre of resistance of the air will likewise have changed together with the centre of thrust, and the initial condition of the latter being linear, or parallel with the direction of the course where the course itself is straight. This is apparently something which should be taken care of by the rudder, any tendency on the part of the airship to diverge from its course being corrected by the pilot. But a boat that needed constant attention to the helm to keep it on its course would be put down as a "cranky" boat, in other words, of faulty design in the hull. A dirigible having the same defect would be difficult to navigate, and even then it would not suffice to correct this tendency in emergencies. Stability of direction is accordingly provided for in the design of the balloon itself, and this is the chief reason for adopting the form of a long, slender, and slender-bodied car. This brings the centre of gravity forward and makes of the long tail an effective lever which overcomes any tendency of the ship to diverge from the course it should follow. However, the weight of the balloon itself would not suffice for this, so just as the stern of the latter "stabilizing surfaces" are placed, consisting of vertical planes fixed to the envelope. These form the keel of the dirigible and are analogous to the keel of the ship. In addition to being able to preserve its static equilibrium and to possess proper longitudinal stability, the successful airship must also maintain its dynamic equilibrium — the equilibrium of the airship in motion. This may be made clear by referring to the well-known expedients adopted to resist the ordinary spherical balloon. To rise, its weight is diminished by gradually pouring sand from the bags which are always called as ballast. To descend, it is necessary to increase the total weight by pouring sand into the car, and the only method of accomplishing this is to permit the escape of some of the gas, the specific lightness of which constitutes the lifting power of the balloon. The balloon, or the container itself, being merely a spherical bag, on the upper hemisphere half of which the net supporting the car presses at all points, the question of deformation is not a serious one. Before it assumed proportions where the bag might be in danger of collapsing, the balloon would have had to come down through lack of lifting power to sustain it longer. Owing to its far greater size, as well as to the form of the surface which it presents to the air pressure, such a crude method is not applicable to the dirigible. Dynamic equilibrium must take into account not only the weight of the balloon upon the pressure of the air, but also the resistance of the air exerted upon its envelope. This resistance depends upon the dimensions and the shape of that envelope, and in calculations the latter is also assumed to be invariable. Assume, for instance, that to descend the pilot of a dirigible allowed some of the hydrogen gas to escape.
present is its ability to make long sustained flights, while carrying a comparatively large crew and a great deal of extra weight. As is the case with every part of the design of the dirigible, conflicting conditions must be recognized in order to provide it with a power plant affording sufficient speed with ample radius of action.

Power requirements increase as the cube of the speed, making a tremendous addition necessary to the amount of power to obtain a disproportionately small increase in velocity. In this connection there is a phase of the motor question that has not received the attention it merits up to the present time. The struggle to reduce weight to the attainable minimum has made weight per horse power apparently the paramount consideration—a factor to which other things could be sacrificed. But it is quite as important to make the vessel go as it is to raise it in the air, so that the question of total weight per horse power hour will undoubtedly come in for much more attention in future, particularly since weight per horse power appears to have approached so closely the minimum attainable condition that the question of weight per horse power may have to be considered in relation to the operation and the design of the motor itself. The weight of cooling water, lubricants, accessories, and last, but far from least, that of the fuel must be added. For example, the motor referred to may be assumed to require one pound of fuel and lubricant per horse power to meet it at its normal output. This means that it will consume 100 pounds per hour, or for a run of 10 hours 1,000 pounds, and this weight must be added to that of the motor itself in the computation of the radius of action. This factor depends entirely upon the efficiency of the motor, while its weight per horse power is a question of its construction alone. It requires no abstract calculation to show that it is quite as possible to have the same number of pounds for the weight per horse power if a very light engine that consumes a great deal of fuel is used as it is with a heavy engine that consumes very little. The diminution of the weight per horse-power hour makes possible an increase in the duration of the voyage, which is a very desirable advantage, but as the prime factor is the ability to rise, improvement that involves the addition of weight is closely restricted by the lifting power available, so that radius of action is governed by numerous considerations. Take a dirigible with a capacity of 12,000 cubic feet, equipped with two 60 horse-power motors, giving it a speed of 30 miles per hour. The engines will consume 130 pounds of fuel per hour, and the machine, with six passengers, will have sufficient lifting capacity to carry 1,300 pounds of gasoline. This would mean traveling for 10 hours, or 5 hours in each direction. The radius of action of this dirigible would be 180 miles.

Speed is quite as costly in an airship as it is in an Atlantic liner. To double it the motor power must be multiplied by 8 and the machine must carry 8 times as much fuel. This is a serious factor that has to be taken into consideration. Radius of action as above considered has been based entirely upon traveling in a dead calm. True, where the prevailing wind blew from a certain quarter for a long or short time, favoring influence in going would be neutralized by its resistance in returning, so that the result would be the same, providing the velocity of the wind were not too great to prevent returning at all against it. When the speed of the dirigible is greater than that of the prevailing wind the dirigible may travel in any direction; when it is considerably less it can travel only with the wind; when it is equal to the speed of the latter it may travel at an angle with the wind—in other words, tuck, as a ship does, utilizing the pressure of the contrary wind to force the ship against it. But as the air does not offer the same hold on the hull of the airship as water does on the sea-going ship, the amount of drift in such a maneuver would doubtless be excessive and the forward motion practically nil.

The Zeppelin Type.—Outwardly a Zeppelin may be described as a long cylinder with ogival ends and a V-shaped keel running the length of its bottom. From afar the cylinder and pointed ends appear circular in cross section, but they are 16-sided. About one-third of the distance from either end of the great ship a small boat is suspended from the hull so closely that at those places the keel is omitted to make room. These two boats are rigidly connected with the hull and support it when the vessel rests on or is towed along the water. Within them are the crew and petroleum engines, while above them and outward on each side of the hull and fastened to it by outrigging are two pairs of screw propellers, so placed as to exert their upward thrust along the line of resistance. In some cases the crew can walk through the V-shaped keel from one boat to another, the passageway being illuminated here and there by transparent covering. Again and again land and sea could be seen through the hull and take observations of the sky from above. Telephones, electric bells and speaking tubes serve to transmit intelligence from one part of the vessel to another.

The frame of the hull is formed of 16 or more longitudinal beams or girders of trellised metal work running from prow to stern and riveted at regular intervals to cross bridges of similar trellised metal work, each cross bridge being a 16-sided wheel with trellised rims strengthened by radial rods running inwardly to a central flange of sheet aluminum. Thus the body of the vessel is divided into many compartments, each bounded by two wheels and the surrounding longitudinal beams. Each compartment contains a hydrogen balloon or sac, which fairly fills it and excludes longitudinal beams and against a netting formed of ramie cords stretched from wheel to wheel, diagonally between beams at their inner corners. Similarly the outward corners of the beams are joined by strong diagonal struts for the purpose of rigidity, and the whole external frame is covered with a heavy fabric which forms the outer skin or wall of the hull. Between this skin and the hydrogen bags are air spaces, as
also between bag and bag. Thus the whole vessel is buoyed up by numerous thin hydrogen sacs, protected by the frame and outer skin from the direct sun, from foul weather and from external shocks. The modern Zeppelin is supported by about 18 separate gas bags, each of which contains within itself a small air balloon, in which the air pressure is maintained at a given point by means of an automatic air pump and relief valve. If, therefore, the temperature of the hydrogen in the gas bags becomes high enough to expand the gas, the pressure set up by it on the outside of the balloonet forces the air out of the balloonet through the relief valve, and the correct pressure is in that way adjusted without the loss of hydrogen. The converse happens in case the temperature of the hydrogen falls, and its bulk for that reason becomes less. When it becomes necessary to reduce the buoyancy of the machine hydrogen can be pumped from the gas bags and stored in a compressing cylinder, this hydrogen being available for use later when desired to increase the buoyancy again. By the simultaneous manipulation of horizontal rudders and "trimming" devices and the discharge of ballast a Zeppelin can shoot up to a higher level at the rate of 2,000 feet per minute, the engines in this case assisting the lifting power of the gas.

The size of the Zeppelin has changed constantly since 1912, as shown by the following table:

Other Types.—The Lebaudy airship employed by the French is an example of the semi-rigid type of dirigible. In this design a substantial keel extends to the full length of the vessel; and to this keel is attached the machinery, together with the accommodation arrangement for the crew. The keel is securely fixed to the gas bag above it, to which it gives very considerable support. In the German service the Gross airship is another of this type. The envelope of a non-rigid airship keeps its shape only by the pressure of its gas, the car carrying the machinery etc. The German Parseval, French Clement-Bayard and the Astra Torres are all examples of this type.

The Parseval gas bag is provided with an air-balloonet in its forward end and another aft, the amount of air in each of these balloonets being controlled by a pump in the car. When it is desired to alter the trim of the vessel, air is transferred from the container in the forward end to the other one, with the result that the after end of the ship becomes the heavier. A cord attached to the exterior of the balloonets passes through the hydrogen to a valve in the exterior of the gas bag. If the hydrogen expands to such an extent that the combined capacity of these vessels is insufficiency to relieve the excessive pressure, then the collapse causes a strain on the cord which opens the relief valve in the gas bag and allows some of the hydrogen to escape.

During the first few months of 1916, the British authorities developed a dirigible of considerable importance. Small of structure, its range is naturally limited, but it is capable of great speed which makes it a particularly desirable instrument. A unique feature of this dirigible is its car, which constitutes an ordinary fusilage of a British army aeroplane complete with its engine tractor airscrew or propeller. Even the landing gear wheels are retained. This is particularly practical for small structures where it advantageously does away with the heavy car, which together with the elaborate engine mounting and propeller transmissions greatly reduces the load and also reduces head resistance when the speed of the vessel. During the year 1916 only one dirigible was constructed in the United States—a small vessel of a type of construction which embodied no departure from European practice. See Military Aeronautics.

G. DOUGLAS WARDROP,
Managing Editor, Aerial Age.

DIRK, a kind of dagger formerly carried sheathed between skin and stocking as a weapon by the Highlanders of Scotland. Dirks are worn by midshipmen and cadets of the British navy. See Dagger.

DIRK-HARTOG, děr'här'tōg, ISLAND, an island on the west coast of western Australia, at one of the entrances to Shark Bay, which it partly encloses; area, about 250 square miles. It forms a plateau with good pastures and plenty of water. The pearl oyster and edible oysters are here in great abundance.

DIRSCHAU, děr'shəw, Prussia, city, about 19 miles southeast of Danzig, on the Vistula. The city has railroad and machine shops and large sugar works. Possessed by the Knights of the Teutonic Order in 1360, it became Polish in 1466 and fell into the hands of Prussia at the first partition of Poland in 1772. Pop. 16,894.

DIS (also Orcus and Tartarus), in Roman mythology the name given to Pluto, the Greek god of the lower regions. The word dis is akin to divus, and originally denoted merely godhead.

DISABILITY, in law, when absolute disables the party from holding public office or doing any legal act, and is usually the result of murder, outlawry or any outrage upon person or property. Aliens, infants and aged persons dependent on public charity, are under this ban of incapacity, and in some Catholic countries those individuals who have been excommunicated. There is a disability termed partial that covers infancy, minority, lunacy and drunkenness. Also a term in accident insurance policies which, on account of inability to work or perform natural duties resultant from injuries, provides payment for the afflicted party. See Attainder.

DISASSOCIATION. See Dissociation.

DISASTERS OF THE WORLD. Notable. In man's unceasing war with Nature and gradual harnessing of her forces in the advance of civilization, Nature has shown frequent and often appalling signs of rebellion, exhibiting by a simple letting go of her tremendous forces how artificial and pitifully puny are man's greatest efforts, even yet. In the following classified list of "Great Disasters," one may gather the hopeful fact that in the domain of
"Earthquakes" alone mankind is absolutely helpless; that the dangers from "Conflagrations," "Floods" and "Shipwrecks" may be at least mitigated; and that a final conquest of "Plagues and Pestilences" is now at hand. In the preceding prevalence of "preventable disasters," however, due to man's carelessness, ignorance of natural laws or disregard of human life, there is food for thought and radical remedial action.

**CONFLAGRATIONS.**

1666, Sept. 2-6 — London: 89 churches, many public buildings, and 13,200 houses destroyed; 200,000 persons perished.
1832, Oct. 16 — New Brunswick: Miramichi Forest fires; 160 persons perished.
1833, Dec. 16 — New York: 600 buildings; loss $20,000,000.
1839, Sept. 6 — New York: $10,000,000 worth of property destroyed.
1845, April 10 — Pittsburgh: 1000 buildings; loss $6,000,000.
1850, July 9 — Philadelphia: 350 buildings; 25 persons killed; loss $1,500,000.
1851, May 4 — St. Louis: large part of city burned; loss $15,000,000.
1853, May 3-5 — San Francisco: 2500 buildings destroyed with loss of many lives and property loss of $3,500,000. June 22: second fire occurred with loss of $3,000,000.
1865, April 2-3 — Richmond, Va.: large portion destroyed by Confederates.
1865, July 4 — Portland, Me.: almost complete destruction with loss of 15,000,000.
1871, Oct. 9-9 — Chicago: 31 miles laid waste; 200 persons killed; nearly 100,000 made homeless; 17,450 buildings destroyed. In 1874 another fire in Chicago destroyed property to the value of $4,000,000.
1873, Nov. 9-11 — Boston: 600 buildings; loss of $7,300,000.
1877, June 20 — St. John, N. B.: loss, $12,500,000.
1876, Dec. 5 — Brooklyn theater, 300 lives lost.
1879 — Seattle and Spokane: loss about $10,000,000 each.
1900, April 26 — Hull and Ottawa: loss $10,000,000.
1901, May 3 — Jacksonville, Fl., loss $10,000,000.
1903, Dec. 30 — Chicago: Iroquois theatre, 639 lives lost.
1904, Feb. 7-8 — Baltimore: 75 city blocks destroyed, covering 140 acres; loss $85,000,000.
1904, April 9 — Toronto: business district largely destroyed, loss $1,200,000.
1906, Dec. 18 — San Francisco: four square miles burned out; loss $350,000,000.
1908, Aug. 2 — Kootenay Valley, B. C.: town of Fernie and neighboring places destroyed.
1914, June 25, 26 — Salem, Mass.: 1700 buildings destroyed; loss $3,000,000.
1916, Aug. 6 — New York Harbor: Black Tom Island Explosion and fire; loss $11,000,000.
1917, Dec. 6 — Halifax, N. S.: Explosion of war materials and fire; 1,500 killed, 4,000 seriously injured, 20,000 rendered homeless, property loss $50,000,000.

**GREAT FLOODS AND INUNDATIONS.**

1103 — Flanders: town and harbor of Ostend inundated by the sea and completely submerged.
1421, April 17 — Dort: 72 villages submerged, 100,000 persons drowned.
1530 — Holland: general inundation by failure of dikes; 10,000 persons drowned.
1617 — Catalonia: 50,000 drowned.
1887, May 25 — Johnstown, Pa.: town nearly destroyed and 600 persons drowned.
1896, Japan: 27,000 lives lost, 60,000 homeless.
1900, Dec. 8 — California: tidal waves and more than 6000 lives lost; $30,000,000 worth of property destroyed.
1909-10 — The principal streets of Paris inundated by a flood in the Seine, the water rising 31 feet and 4 inches and causing damages in millions.
1912 — Floods in Mississippi valley made 200,000 homeless and caused the loss of several hundred lives and $45,000,000.
1913, March 31 — April 1: 415 lives lost and damage estimated at $80,000,000; Dayton, Ohio, nearly destroyed.
1913, July 11: Chinese provinces of Kwangtung, Kwantung, and Kiangsi; several thousand lives lost, and $90,000,000 damage.

**GREAT EARTHQUAKES.**

B. C. — Rubes made an island by an earthquake.
345 — Duras in Greece, and twelve cities in Campania buried.

A. D. —
17 — Ephesus overthrown.
79 — Pompeii and Herculanum destroyed accompanying an eruption of Mount Vesuvius.
215 — Auticole destroyed.
157 — Asia and Macedonia: 150 towns destroyed.
557 — Constantinople: thousands perished.
742 — Syria, Palestine and Asia: terrible loss of life.
936 — Constantinople overturned.
1268 — Cilicia: 60,000 perished.
1318 — England: greatest earthquake ever known there.
1456 — Naples: 40,000 perished.
1531 — Lisbon: 30,000 burned.
1626 — Naples: 70,000 perished.
1667 — Shamaz, 80,000 perished.
1693 — Sicily: 35,000 towns destroyed; over 100,000 perished.
1703 — Juddo (now Tokio); 200,000 lives lost.
1731 — China: 100,000 perished.
1745 — Lima and Callao demolished; 18,000 destroyed.
1755 — Lisbon: the great "earthquake," 50,000 persons and most of the city destroyed.
1779 — Cusco and Quiro destroyed; 40,000 buried.
1823 — Alessandria destroyed; over 20,000 perished.
1857 — Many towns in Kingdom of Naples destroyed; 10,000 perished.
1868 — Arequipa, Iquique, Tacna and Chincha and many other towns in Peru and Ecuador razed; 25,000 perished; damage $300,000,000.
1874 — Cities in Guatemala destroyed with great loss of life.
1883 — Java and neighboring islands.
1886 — Constantinople: 41 lives and $5,000,000 worth of property lost.
1887 — Great shocks in southern Europe in the Riviera.
1906, April 18 — San Francisco and neighboring towns; the earthquake followed by fire; 2000 lives lost and $300,000,000 of property destroyed. The business section of San Jose was destroyed at the same time.
1908, Dec. 26 — Southern Italy was visited by a most destructive earthquake — many towns being almost entirely destroyed and 150,000 lives being lost. See EARTHQUAKES.

**PLAGUES AND FESTILENCES.**

B. C. —
767 — A great plague prevalent throughout the world.
354 — Cangue; multitudes affected.
461 — Rome; 100,000 perished.

A. D. —
80 — Rome; 10,000 deaths daily.
167-189 — Roman Empire stricken with sickness throughout.
250-265 — Roman Empire again devastated; many towns depopulated.
430 — Britain; so many died from plague that not enough were left to bury the dead.
746-749 — 200,000 died at Constantinople of a contagious disease.
771 — Chchester, England; 34,000 died in an epidemic.
924 — Scotland; 40,000 perished.
1712 — Ireland; plague so severe it drove back English invaders.
1730 — The "Black Death" spread through all Christendom, causing unprecedented mortality.
1736-79 — Frightful mortality in western Europe.
1833 — The "Fourth Pestilence" in Ireland.
1843 — The "Sweating sickness," makes its appearance and rages at intervals for nearly 100 years, and with dreadful mortality.
1860-64 — 30,000 perished in London.
1861 — 200,000 died at Constantinople.
1865 — London was again visited; 35,000 died.
1862 — 60,000 died in an epidemic at Lyons.
1866 — At Naples 400,000 died in six months.
1866-67 — "The Great Plague" at London; 10,000 died.
1870 — Marseilles lost 60,000 by pestilence.
1741 — Yellow fever makes its appearance in New York.
1760 — Awful plague in Syria.
1783 — France devastated by "putrid fever."
1784 — 20,000 died of the plague in Smyrna.
1791-98 — Yellow fever appeared in various places on the Atlantic coast. New York, Philadelphia and Baltimore suffered especially.
1799 — At Suez the plague destroyed 250,000.
1835 — Yellow fever in New York; great mortality; 37,000 out of 70,000 sick from the city.
1814 — Terrible plague in Asia Minor, Palestine and Greece.
1817 — Asiatic cholera started at Calcutta; great mortality.
1818 — Vast numbers perished of cholera in Bombay, Calcutta, Siam and Macao.
1819-22 — Yellow fever was again prevalent in the United States. The same year Tunis was half depopulated by the plague.
1823 — The cholera extended to the Mediterranean Sea.
1831—2 — Cholera invaded Russia and France. In Paris it was described as 17,000.
1832 — Cholera crossed the Atlantic, and appeared at Quebec, Montreal and New York, and passed thence to other Canadian cities: 2000 died, and in New York 3000.
1849—50 — Another visitation of cholera in England and America.
1865 — Large numbers died at various points in Europe, of cholera.
1878 — Yellow fever devastated many southern towns in the United States.
1884—85 and 1892 — Cholera again raged in various parts of Europe.

OCEAN*DISASTERS.
1778 — Brig Reprisal, founded off Newfoundland; lives lost, 130.
1780 — The Saratoga, sailed and never heard from; 170 lives lost.
1800 — The Pickering, never heard from; 90 lives lost.
1805 — U.S. Frigate Lafayette, sailed from Hampton Roads and foundered in the Bay of Biscay; 200 lost.
1814 — Scoop of War, Wasp, lost; back to the Madeira, foundered after on the Madeira Islands, never heard from; 140 lives lost.
1814 — Scoop of War, Eperon, sunk by collision with a British sloop, which passed on without offering assistance; 128 lives lost.
1837 — British transport Albericia, founded in the Gulf of St. Lawrence; regiment from garrison at Quebec on board; 523 lives lost.
1840 — Steamer Danube, Gulf of St. Lawrence; 292.
1841 — The President, left New York and never heard from; 120.
1854 — The Arctic, sunk by collision near Grand Banks; 325.
1856 — The Collins liner Pacific, sailed from Liverpool and never heard from; 288.
1857 — Steamboat Montreal, lost 515 miles above Quebec; 253.
1858 — Steamer Austria, burned in mid-ocean; 470.
1863 — Steamer Anglo-Saxon lost off Cape Race; 237.
1864 — Steamer Mahone, burned turtle in the Clyde; 124.
1866 — Steamer Evening Star, founded at sea; 250.
1867 — Royal Mail steamer Rhone and Rye; 1000.
1868 — Steamer City of Glasgow, lost on the Grand Banks; 489.
1869 — The Vicksburg, off Cape Race; 65.
1870 — The City of Boston, sailed from New York and was never heard from after; 191.
1871 — The White Star liner Atlantic, lost; 583.
1873 — The Ville du Havre, collision in mid-ocean; 226.
1875 — The Schiller, wrecked in mid-ocean; 312.
1878 — The Pomerania, collision in English Channel; 47.
1881 — The Steamer Cominco, off Cape Good Hope; 49.
1883 — The Cominco, in North Sea; 389.
1883 — Steamer Unico, burned turtle in the Clyde; 124.
1884 — Steamer City of Columbus, ran ashore off Gay Head Light, Mass.; 99.
1884 — The Shipwreck Glim, collision off Pinnister; 150.
1884 — The Bark Pomona, collision mid-ocean; 145.
1885 — The Coquina, collision off coast of Brazil; 300.
1887 — British steamer Wawung, wrecked near Hong Kong; 400.
1889 — U.S. warships Trenton, Vandalia and Mystic, and German ships Adler and Eber, wrecked by hurricane off Sampson; 147.
1890 — Steamer Persia, wrecked on Corsica; 130.
1890 — British steamer Dubreg, wrecked in China Sea; 400.
1890 — British steamer Quineda, founded in Torres Straits; 124.
1890 — Turkish brig Evrakli, founded off coast of Japan; 540.
1890 — British steamer Utopia, collision off Gibraltar; 574.
1892 — Steamer Namskau, wrecked on Chonchi; 414.
1893 — Anchor liner Triandria, wrecked off the coast of Spain; 115.
1893 — H. M. S. Victoria, rammed in Mediterranean; 350.
1894 — Steamer Norse, wrecked on Rockall Reef in the North Atlantic; 600.
1895 — German steamer Bona, sunk by collision in the North Sea; 335.
1898 — U.S. Battleship Maine, blown up in Havana harbor; 260.
1898 — French liner La Bourgogne, collision off Sable Island; 100.
1904 — Excursion boat General Slocum, burned in East River; more than a thousand lives lost.
1905 — Japanese warship Mikasa; 500.
1907 — Steamer City of Berlin, off the coast of Holland; 150.
1908 — Steamer King Kings, founded off Hong Kong; 400.
1908 — The San Pablo, off the Philippine Islands; 100.
1909 — British steamer Warasah, left Port Natal and never heard from; 300.
1911 — From April 1, 1911, to April 1, 1912, there were 66 disasters at sea, with an aggregate money loss of $35,000; 000; 1718 lives lost.

1912, April 15 — The White Star liner Titanic, collision with icebergs off the Grand Banks; 1503.
1914, May 29 — Canadian Pacific liner Empress of Ireland sunk in St. Lawrence River; 1503.
1915, July 24 — Steamboat Eastland capsized at wharf on Chicago River; 852.

DISARBAMENT, the expulsion of an attorney, counselor or advocate from practice at the bar, this act depriving him of the privileges of his profession. A lawyer suffers this penalty if adjudged guilty of any misconduct of grave nature, as gross contempt of court, bribery, etc., or of notoriously evil character. In England this prerogative is reposed in the four Inns of Court, which have the power of admission to the bar, and in Scotland it is in the hands of the Faculty of Advocates, which is possessed of similar powers to those of the Inns of Court; but in the United States the courts alone have power to deal with an offender. Before disbarment the accused is given every opportunity to refute the charge, being allowed to defend himself in open court. A lawyer so dealt with may, at the discretion of the authorities, be restored when sufficient proof is brought to them that there is no likelihood of a future offense.

DISCHARGE. (1) In architecture, the relieving part of a wall or a beam or other piece of timber from the superincumbent weight by means of an arch thrown over it. (2) In hydraulics, the issuing direction of water from a reaction or turbine wheel; as the outward discharge of a turbine or a Bourgouin turbine; the vertical discharge or renaissance from the central discharge, etc. (3) In bankruptcy, a writing or document certifying that a bankrupt has satisfactorily passed the necessary forms and is thereby discharged from all further responsibility for the debts contracted by him prior to his bankruptcy. (4) In the military and naval services, a document given to each soldier or sailor on his dismissal from or quitting the service, in which are detailed all particulars as to his length of service, conduct, reason for discharge, etc. (5) In electricity it signifies the removal of the charge by communication between the positive and negative surfaces or poles, or with the earth. (6) In dyeing, a substance such as chloride of lime or nitric acid, used by calico-printers to remove a color. Suppose a white pattern is to be produced on a uniformly colored ground. The cloth is first dyed and then the pattern is printed with an acid, such as the tartaric, thickened with gum. When passed through a dilute solution of bleaching-powder, the acid decomposes it and the liberated chlorine destroys the color at the parts where the pattern was printed. Sometimes the cloth is prepared at the same time for subsequent pigment printing.

DISCIPLE, literally, one who learns anything from another; and hence the followers of any teacher, philosopher or head of a sect. In this sense the word is sometimes used in Scripture, as when we read of the disciples of Moses, of John, of Christ. Generally, however, it is used with reference to the last of these — the followers of Jesus. Sometimes all who received the doctrines of Christ are called disciples, but in a more limited sense, it is applied to the 70 or 72 persons who were his more immediate personal followers. Some-
times it is used as synonymous with apostle and is thus applied to the inner circle of the Twelve.

DISCIPLES OF CHRIST. The religious movement, whose representatives have come to be known as Disciples of Christ, or Christians, may be said to date its origin from the 'Declaration and Address' issued by Thomas Campbell, September 1809, and endorsed by his son, Alexander Campbell, who later became the leader of the movement. Thomas Campbell migrated to the northern part of Ireland in 1807 to seek a home for himself and his family in the New World. He located near Washington in western Pennsylvania. He was related by blood to the poet Thomas Campbell, and was a man of learning and profound piety. Being a minister in the Seceder's branch of the Presbyterian Church, he entered upon his labors in connection with that denomination immediately upon his arrival in this country. His experience in seeking to assemble the scattered people of different names, and creeds and to instruct them in spiritual things led him to realize more fully the evils of divisions among Christians. In his efforts to promote greater unity and co-operation among the members of these different sects, he found himself in conflict with the ecclesiastical authority under which he was working and was brought to trial before his presbytery, which censured him for his course. Mr. Campbell soon withdrew from the ecclesiastical authority under which he had been preaching but continued his ministry to an increasing number of people in private dwellings and wherever else an audience could be gathered.

In the 'Declaration and Address' referred to it was declared that "the Church of Christ upon earth is essentially, intentionally, and constitutionally one, consisting of all those in every place that profess their faith in Christ and obedience to Him in all things according to the Scriptures, and that manifest the same by their temper and conduct; and of none else, as none else can be truly and properly called Christians." While admitting the necessity of "distinct societies, locally separate one from another," this new declaration of independence declared that "there were not two or three Churches but one, and uncharitable divisions among them. They ought to receive each other as Jesus Christ also received them, to the glory of God, and for this purpose they ought all to walk by the same rule, to mind and speak the same things, and to be perfectly joined together in the same mind and in the same judgment." The address adds that "in order to do this, nothing ought to be incalculated upon Christians as articles of faith, nor required of them as terms of communion, but what is expressly taught and enjoined upon them in the Word of God. Nor ought anything to be admitted as of divine obligation in their church constitution and management but what is expressly enjoined by the authority of our Lord Jesus Christ and his apostles upon the New Testament Church, either in express terms or by an approved precedent."

In a word, the new movement had for its aim no less an object than the unity of Christians as they were one in the apostolic Church. In order to realize this consummation in harmony with the Lord's intercessory prayer they decided to reject all party names for those given in the New Testament, and all human creeds or formulas as authoritative or binding on the human conscience, or as bases of fellowship, and to take the word of God alone as their rule of faith and practice, and especially the New Testament, which was given for the guidance and instruction of Christians in their new life in Christ. Believing it to be necessary to return to the original foundation and practice of the Church in order to realize its unity and its power, they made a fresh study of the New Testament to ascertain (1) what was the essential creed or confession of faith required in the early Church; (2) on what conditions persons were received into its membership; and (3) what was the nature of their organization and government. They reached the conclusion that the confession of faith made by Simon Peter, on which Jesus declared he would build his Church, namely, "Thou art the Christ the Son of the living God" was the creed of Christianity and the essential faith, and that all those who would make this confession from the heart, being penitent of their past sins, were to be admitted by baptism into the membership of the Church; that baptism in the early Church consisted of the burial of a penitent believer in water in the name of the Father, and of the Son, and of the Holy Spirit, and that only such were fit subjects for baptism as that form of Church government was congregational; that each congregation had its deacons and elders or bishops, the former to look after the temporal and the latter the spiritual interests of the Church. The Lord's Supper, it was found, was observed at first daily perhaps, but later weekly, on the first day of the week, in remembrance of Christ's suffering and death. Hence they practise weekly communion.

With this plea for the New Testament basis of fellowship, and a return to the original purity and simplicity of the gospel and church organization, the disciples have made a marvelously rapid increase. The movement at present in the whole world has reached a numerical strength of 1,307,502, having its colleges, its religious journals, and its missionary, educational and benevolent organizations, all of which are doing effective work. The American Christian Missionary Society is the national organization for home missions. The Foreign Christian Missionary Society, as its name indicates, has for its object the evangelization of the world. Besides this the Christian Woman's Board of Missions is an organization of the Christian women, which is doing mission work in both the home and foreign fields.

The Disciples of Christ raised $6,378,493.03 for current expenses in one year, while contributing a grand total of $2,294,522.08 for all religious purposes in that year. They are supporting missions in India, China, Japan, Africa, the Philippines, Cuba, Porto Rico, Mexico, Scandinavia and Turkey. Their aim is to be evangelical without being sectarian; to be liberal without being latitudinarian. They attribute their success to their advocacy of Christian union, the simplicity and directness of their preaching and the freedom which they enjoy, untrammeled by human creeds or by any hierarchical authority.
The following statistics are taken from the 1918 Year Book:

Churches in the world: 9,690
Communicants in the world: 1,307,502
Bible schools (Sunday schools): 9,100
Bible school members: 1,055,719
Ministers (white and colored): 6,200

MISSIONARY

American Christian Missionary Society: $363,669.37
Christian Women's Board of Missions: 178,992.73
Pentecostal Missionary Society: 518,446.34
Church extension: 550,386.85
Christian Church: 146,904.86
Ministerial relief: 61,327.90
National Benedict Association: 225,174.76
Board of education: 238,302.55
Association for Promotion of Church Unity: 54,337.63
Temperance board: 6,962.21

Total for all missions: $2,294,522.08
Money raised for current expenses by the churches (many churches not reporting): 6,378,493.03

Grand total: $8,673,015.11

J. H. GARRISON,
Editor of The Christian-Evangelist.

DISCIPLINA, Arcani. The name given by John Dallenius to the secret discipline of the early Christian Church. The early Church had nothing to conceal. It began after the times of the Apostles, probably in the 2nd century and was finally matured in the 4th century. It is supposed to have ceased about the 7th century, when the catechumenate was discontinued. Neander thinks that it had its source in Alexandria and spread east and west from there. At any rate the theology of Clement and Origen contain it to a considerable extent. The Church seems to have become a secret society. Many things concerning worship, belief and even the sacraments were revealed only to the initiated and were never referred to publicly. Worship was conducted with an air of profound mystery. As Th. Harnack says, "The mystical became mysterious and the liturgical became theoretic." Some Roman Catholic writers have made much of the prevalence of secret worship in the early Church, and have gone so far as to claim that there has been a secret tradition coming from the time of the Apostles and distinct from New Testament teachings.

The first part of the discipline dealt with the enemies of the Christian religion, the doom of hell, and the coming millennium and the end of the world. "The Apostolical Constitutions" refer to certain kinds of secret discipline. The Catechumenat or Novitiates were not allowed to attend common prayers, nor were they allowed to have a sight of the celebration of the Lord's Supper, nor to attend the "feasts of love." Another part of the discipline consisted in the preservation of many maxims and opinions in circulation only among the Christians. The secret discipline included as unmentionable:

1. The manner of administering baptism;
2. The manner of administering unction or confirmation;
3. Ordination;
4. The public prayers of the Church;
5. The manner of celebrating the Lord's Supper;
6. The Creed;
7. The Lord's Prayer;
8. The Creed and the Trinity. There are several conjectures as to its origin. Bingham thinks that it originated because of the plainness and simplicity of the Christian rites and the possibility of their giving offense. Others have thought that these mysteries arose largely through the influence of many pagans who crowded into the Church for political reasons in the reign of Constantine. Many had been devotees of the Eleusinian mysteries, and introduced some of their features into the Church.

Another theory is that it was adopted to withstand the Gnostic encroachments in doctrine and practice.

Still another theory is that it was developed as a means of the aggriagization of the clergy. The rites could be performed only by holy consecrated hands, and common minds were unable to be instructors of the sacred doctrines and ordinances. The rites of the Church had no validity without the bishops.

The chief result of the secret discipline was the corruption of the simplicity and purity of church worship. It is thought by some that the doctrine of the baptismal regeneration from sin, and the doctrine of the actual presence of Christ in the bread and the wine are remains of the secret discipline.

Bibliography—A fairly complete bibliography may be found in Hastings, J. "Encyclopedia of Religion and Ethics." Among the best modern discussions are Hatch, E., "Influences of Greek Ideas and Usages upon the Christian Church" (1880); Coleman, Lyman, "Ancient Christianity Exemplified" (1875); Horn, Edward T., article in "Encyclopedia of Religion and Ethics" (1908).

DISCIPLINE, in military and naval affairs, the general term applied to the prescription and enforcement of statutes, rules of procedure, orders, and regulations governing officers and men in service. Regimental discipline is chiefly maintained by the adjutant. He inspects and tells off all guards, escorts, and parties; keeps the regimental books; receives all garrison orders; superintends the drill and field movements, etc. In matters of discipline the adjutant-general is to the whole army what the adjutant is to a regiment.

DISCIPLINE, Books of, two books connected with the Scottish Church. The First Book of Discipline was drawn up by John Knox and four other ministers, and laid before the General Assembly in 1560. It was also submitted to the privy council; and though not formally ratified by them, it was subscribed by the greater part of the members. A similar document, called the Second Book of Discipline, in the preparation of which Andrew Melville took a prominent part, was sanctioned by the General Assembly of 1578; and from that time it has been recognized as the authorized standard of the Church of Scotland in respect of government and discipline. It lays down principles regarding the relations of church and state; defines the provinces, duties, and relations of church-officers, the mode of their election, etc., and states the operation of the Presbyterian polity in the General Assembly, synods, and presbyteries of the Church of Scotland. See DISCIPLINE, ECCLESIASTICAL.

DISCIPLINE, Ecclesiastical. Church discipline is the authority vested in the hands of the authorities of the Church to preserve the purity and morale of its membership. The Old Testament basis for discipline is almost entirely found in the decalogue and the book of Leviticus. The administration of the law was largely
in the hands of the secular authorities. Sometimes, however, the seer or prophet took into his hands the power to rebuke and punish a king, for legal reasons. Hence ecclesiastical punishments were applied by the priests.

In the New Testament, authority was derived from the decalogue and the ethical teachings of Jesus, especially Matthew xviii, 15-18. At first the Apostles were the administrators, later the deacons were empowered to assist them in minor matters. After the day of Pentecost, Church councils were held which gave added authority to discipline. The administrators of law were the leaders and supervisors of the work of the members or committees appointed by them. Later the bishop was the executor of authority whose power was checked only by the Church council. The punishments consisted almost entirely of exclusion, temporary or permanent, and anathema which was considered the extreme disgrace. Heresy punishment was often resorted to. In Paul's writings various classes of offenders are named. (1 Cor. v, 9-13; 2 Thess. iii, 6).

In the Nicene period to the time of the Emperor Constantine, discipline remained in the hands of the Church and rules were rather rigorously enforced, but there was no precise code governing the whole Church. In this period disciplinary canons were enacted and the system of discipline developed, also the secret discipline or Disciplina Arcani (q.v.) developed.

After the adoption of the Church by the state, many ecclesiastical penalties were enforced by the state. They were of a much wider range than before the change and included confiscation of goods, fines, imprisonment, banishment and even the death penalty. Constantine, as Pontifex Maximus, claimed lordship over the whole Church, with the rights of a universal bishop. Under Constantine less attention was paid to moral conduct than to heresies and offenses against the corporate body of the Church. The death penalty was first imposed at Treves in 385, when Priscillian, a Spanish bishop, and six others, including a woman, were executed. Beginning with Augustine invocation that heresy should be punished by death, and the schoolmen cited Augustine as being in favor of it.

The period of the Crusades witnessed a further development of discipline. The growth of the papal power and authority also tended to change its character.

With the establishment of the Inquisition by Innocent III at the 12th Ecumenical Council, another step was taken when it was not only planned to suppress heresy but to extirpate it. The bull, Unam Sanctam, promulgated by Boniface VIII, 1302, made obedience to the Pope necessary to salvation and declared that both swords were in his hand. The Council of Constance, 1415, reaffirmed the right of the Church to burn heretics, and condemned Huss and John. The Council of Trent did not mention the death penalty, but did place great emphasis on the discipline of penance and the use of inducements.

Luther never made a system of discipline. Zwingle left article of excommunication to the state. John Calvin, however, was intensely interested in the subject, and in the second volume of his 'Institutes' (Book IV) devotes many pages to its discussion. The one great blot on the career of Calvin is his consent to the burning of Michael Servetus. In other matters of discipline the Reformed Churches and the Protestant Church of France followed the teachings of Calvin as set forth in his 'Institutes.'

The Lutheran Church government of Germany in modern days is a mere shadow as it is under absolute domination of the Imperial government. In America there are five general bodies of Lutherans besides several independent synods. No form of Church government is held to be essential and services and organization are carried on under Congregational, Episcopal and Presbyterian forms.

The Church of England in the Thirty-Nine Articles recommended excommunication, but left its execution to civil authorities because the Church was a state institution. The Westminster Confession (XXX) prescribes three forms of punishment—admonition, temporary suspension from participation in the Lord's Supper and expulsion. The Kirk Session, composed of the minister and elders, met once a week and judged and admonished the cases brought before it.

In American colonial times Church discipline was very strict in most of the colonies. It was due to this fact that the Blue Laws were enacted. For a time the Congregational Church was the state Church of some of the New England colonies. With the organization of the United States government and adoption of the Constitution the execution of ecclesiastical discipline was placed entirely in the hands of the churches unless the offense was a criminal act contrary to the civil law. In such a case both civil and ecclesiastical authorities gave judgment.

The Presbyterian Church is governed by the local session with the possibility of an appeal to the presbytery or the synod and a final appeal to the General Assembly (q.v.). Most of the Reformed and other Presbyterian churches have similar church machinery.

The Congregational Church is governed by its local body. Even the ministry is subject to it.

The Methodist Episcopal Church and most of the Methodist bodies have the general conference (q.v.) which is the sole lawmaking body of the Church. The judicial conference is the court of appeals. The annual conference is a local executive body, covering a considerable area. The governing body of the local Church is the quarterly conference. Discipline is twofold: admonition, and trial followed by expulsion if proved guilty. The defendant may appeal to a judicial conference and from that to the general conference which renders judgment through the adoption or rejection of the action of its committee on the judiciary.

There is a general tendency among many of the Protestant Churches to leave the matter of discipline alone and to make it a burden of the conscience as enlightened by the public ministry of the Church. Samuel G. Ayres, Garrett Biblical Institute.

DISCLAIMER, a renunciation, denial or refusal; a disavowal of claims, duties or liabilities. Specifically: (1) In the law of landlord and tenant, the direct repudiation of that relation by some act on the part of the tenant. Such
DISCO—DISCORDANCE

disclaimer may be verbal or written, but a mere verbal or formal recital of the lessor or landlord is not sufficient; it must be made in a proceeding involving the rights of the landlord in the property, thus becoming a matter of record. (2) In the law of trusts, disclaimer is the refusal or renunciation of the office or duties of a trustee. No one is compellable to undertake a trust, and if so appointed has the right to determine whether he will accept or reject such office. The rejection or disclaimer is usually by a deed or other writing, but it may be by conveyance to another accepting trustees, or even orally. (3) In patent law, disclaimer is the renunciation, by amendment of specifications, of all or a portion of an inventor’s claim to protection. (4) In equity, a plea put in on the part of a defendant in which he disclaimed all right or title to the matter in demand by the plaintiff’s bill. It is a formal mode of defense and grants the defendant a hearing to determine whether he has any interest or connection with the matters in controversy, and, if he succeeds in proving that he has not, he is entitled to an order striking out his name as a party defendant.

DISCO, an island on the west coast of Greenland, under the parallel of 70° N. It is mountaneous, reaching a height of 3,000 feet; and contains much excellent coal. Area 3,100 square miles. Godhavn, the seat of the Danish administration of South Greenland, is on the south coast.

DISCOBOLUS, Cuvier’s name for the lump-suckers (Cyclopterus), besides which he placed the Remora (q.v.), now placed in another group. The term is still used for the family to which the lump-sucker (q.v.) belongs.

DISCOMBUSSE. See JELLYFISH.

DISCONTO—GESSELLSCHAFT. The The Disconto-Gesellschaft (Disconto-Gesellschaft in Berlin) was founded in 1851 as a credit partnership, and in 1856 was changed into a limited liability joint-stock company under the name of Direktion der Disconto-Gesellschaft, with a capital of 30,000,000 marks. Its founder was David Hansemann, later Prussian Minister of Finance. Its purpose and earliest activities were in the fostering of current account business and the underwriting of German state and local loans and railway shares. In 1890 a branch was opened in London from which its institution’s activities in overseas matters. In 1901, on the liquidation of the house of M. A. Rothschild & Sons of Frankfort-on-the-Main, a branch was established in that city, connection being made with the Rothschild Syndicate, with which it has since been largely identified. The interests formed with this group made the Disconto-Gesellschaft a prominent factor in the underwriting of many important national and railway loans, notably the state loans of Russia, Rumania, China and Japan. In addition, in connection with other interests, it was instrumental in the founding of the Kaimann Railroad Company and the Great Venezuelan Railroad, both speculative enterprises, and the latter eventually of great financial annoyance. As a national factor, the Disconto-Gesellschaft has lent its greatest support to industry through the promotion and financing of enterprises for the development of Germany’s natural resources: the mining of coal and metals, smelting, iron and steel, potash, shipbuilding, electrical development, railways, fire and life insurance, etc. It assisted in the underwriting of the 10,000,000 thaler (30,000,000 marks) 5 per cent loan for the Krupp Works, in 1874—the first instance in Germany of the issue of fractional form bonds secured by blanket mortgage and providing for common representation of the holders of these bonds. Beginning in 1868 it has established or participated in the establishment of 15 important banking institutions, having 87 branches, scattered throughout Europe, Asia, South Pacific, South America and Africa; and through communities of interest has banking connections in Hamburg, Leipzig, Bremen, Mannheim and Geestumrde, these latter having 51 branches and numerous other agencies throughout the empire. In 1914 it absorbed the A. Schaalhausen’scher Bankverein, this latter still retaining its name and clientele. Close relations have been established with other important financial and industrial institutions, its directorate having (1908) representation on the boards of 92 corporations. The capital for the same year was 170,000,000 marks; surplus, 57,592,611 marks; and annual dividend, 8 per cent. The total capital power of the Disconto-Gesellschaft group amounted to 564,747,329 marks, of which 437,785,200 marks represented capital and 126,981,129 marks given by C. M. Preussische D.R. Dr. J., Die deutsche Grossbanken und ihre Konzentration (1909); Germany’s Economic Forces (1913); Report on Co-operation in American Export Trade (Washington 1916).

DISCOPHORA. See LEECHES.

DISCORD. (Lat. discors, inharmonious), in music, is a combination of sounds producing irregular vibrations and technically called cacophon. It is a direct violation of harmonic laws and frequently spoken of as nothing but downright noise. It is often confused with dissonance (q.v.) which, however disagreeable the effect upon a hearer, obeys certain grammatical rules in the science of music, though never consonant. Celebrated composers have used discords purposely in their composition, requiring macabre character. Berlioz in his Damnation of Faust is a case in point, while Wagner’s scores bristle with cacophonies and dissonances.

DISCORDANCE, a term used in geology in two senses. First, Discordance of Bedding applies to unconformities (q.v.) in which the beds below the unconformable plane have undergone more folding than those above, so that they are not parallel. Second, Discordance of
Junction in rivers applies to hanging valleys. See **Unconformity**.

**DISCOUNT** (O. F. *discontes*, to count off), a deduction made from a quoted price, in consideration of a cash payment. Discount is also the amount deducted from the face value of a bill of exchange or promissory note, as the price for cashing it to the payee so many months or weeks before it is payable by the person who is primarily responsible for its payment. Bank discounts are interest on the face value of a promissory note, and deducted from the face value, instead of being reckoned on the amount advanced. True discount is such an amount deducted, as would be simple interest on the amount advanced, for the time specified in the note. To specially favored customers, or buyers of large quantities, prices or percentages less than those listed may be charged; this is called trade discount. In transportation, discounts or preferential terms given to shippers are called rebates.

**DISCOURSES AND HANDBOOK OF EPICETUS.** When Domitian banished the philosophers from Rome, in 94 A.D., one of the exiles was Epicetus, a former slave from Phrygia, now a professor of the Stoic philosophy. He removed his school to Nicopolis, a town of Epirus, and there, among other pupils, received a certain Greek author named Arrian, who has left memorials of the master's teaching in four books of 'Discourses' and in a summary called the 'Enchiridion,' or 'Handbook.' If these records tell the whole story, Epicetus paid little attention to the encyclopedic training of the sect, but drove straight at its ethical kernel. His lectures were pointed, sometimes extremely personal, alternating with exposition and satire and exhortation. In essence the Stoicism of the 'Discourses' is an outgrowth of the Socratic doctrine. Epicetus was fond of quoting these two dicta, adapted respectively from the 'Crito' and the 'Apology' of Plato: 'But, O Crito, if so it is pleasing to the gods, so let it be'; and, 'Anytus and Meletus are able to kill me, but not to harm me.' These two sentences are given at the end of the 'Handbook,' with two others from the poets, as the *procheira*, or rules of conduct to be kept in hand for all the circumstances of life. The other two may be rendered in prose as follows: 'Lead thou me, O Zeus, and thou, Destiny, whithersoever my place has been set by you; for ungrudgingly I shall follow; and if, being evil, I am unwilling, none the less I shall follow'—and, 'He is the wise man among us and knows the divine, who has yielded nobly to Fate.' There is in these saying a curious medley of fatalism and free-will. Stoicism was deeply influenced by science, and its universe is a mechanical system of causes and effects, God himself being only the finest form of mechanism; substance, intellect, and dominating the whole. In such a world there should seem to be no place for the moralist's distinction between the spirit and the body of man, no place for a free will; there should seem to be no meaning in the words good and evil, if man has no power of self-determination. But this ethical consequence of their physical theory Epicetus and the other orthodox Stoics did not draw. They asserted valiantly and vehemently that one thing was left free to man, his opinions. Cesar, they said, can do what he will with my body, and circumstances may dispose of my life as they will, but neither Caesar nor brute circumstance has any control over my opinions. It ought to follow that he is the free man who holds what general opinion of the world it pleases him to hold; but to this deduction Epicetus would not quite consent. The world is necessarily what it is; nor can we think it—one great homogeneous effect of one cause—and therefore contains no real evil. It follows, then, that he alone is in the way of truth and freedom who resolutely, no matter what befalls him, holds to the opinion that this chain of events in which our life is bound is right and good—as certainly it is inevitable; yet practically no philosophers dwelt more than the Stoics on the inherent worthlessness of life. There is in such a doctrine a deep-lying paradox, an optimism overlaid upon a radical pessimism. Epicetus is at bottom a sad teacher, only less sad than his royal compere, Marcus Aurelius; and this Stoic paradox, with its concealed melancholy, has come down from them, through the English Deists and the French philosophers, to the present day, tincturing the whole of modern life. To the student of the history of philosophy Epicetus is particularly interesting as representing the transition from Pagan Greek thought to Christianity. Though Epicetus, speaking as a physicist, would explain the Deity as fire, or the energy of matter, yet emotionally his attitude toward the first great cause is a fascinating link between the impersonal and philosophical theory of Plato and the religious cults and vehemently personal faith of a Clement of Alexandria or a Saint Augustine. A compeyious way to present this distinction would be to set side by side the prayer of Socrates at the end of the 'Phaedrus,' the prayer of Epicetus in the 10th chapter of the fourth book of the 'Discourses,' and the prayer of the Publican in the 18th chapter of Saint Luke. There are several English translations of the 'Discourses,' and the 'Handbook;' perhaps the best is that by P. E. Matheson (Oxford 1916).

**Author of 'Platonism;' 'The Judgment of Socrates; etc.**

**DISCOVERY,** in law, the act of a litigant who is called on to reveal or make known any matter or document which will aid in enforcing a right or repelling an unjust demand.

**DISCOVERY, The,** the name of several ships famous in the annals of exploration. (1) The vessel built by the East India Company in 1602 to determine the whereabouts of the north-west passage. She was originally commanded by Capt. George Weymouth, who sailed with a consort from Greenland, 2 May 1602. In 1610 Henry Hudson discovered the Hudson Bay in the same vessel, spending the succeeding winter in the ice. In 1611 the crew mutinied and set Hudson and some of his companions adrift, never again to be heard of. Later she was commanded by Sir Thomas Button (q.v.) who discovered Nelson's River and other points. In 1615 and 1616, the Discovery sailed with Baffin (q.v.) and Bylot, making important discoveries and explorations. (2) One of the vessels of Governor Knight's expedition of 1719 to the Arctic Circle in search of precious metals, lost on Marble Island, Chesterfield Inlet, and the
remains of which were discovered in 1767. (3) One of the ships of Capt. Christopher Middleton's expedition of 1742 in search of the northwest passage. (4) One of Captain Cook's vessels in his expedition to discover the northwest passage and in which, in company with the Resolution, Nootka Sound was discovered (29 March 1778). The expedition afterward proceeded to the South Seas, and in February 1779 Captain Cook was murdered at the Sandwich Islands. (5) One of the ships of Vancouver's expedition to the Pacific coast in 1791 when Vancouver Island was first circumnavigated.

DISCOVERY OF AMERICA. See America, Discovery.

DISCRIMINATION, Sensible, or DIFERENTIAL SENSIBILITY. A term employed in experimental psychology to denote our ability to distinguish likeness and difference among sensory impressions. Thus, we are able to say that one tone is the same as another, one light is brighter or duller than another, one scent is stronger or weaker than another, etc. The psychology of sensible discrimination involves two distinct problems. The first is quantitatively comparable sense-differences and determine the stimulus-differences which correspond to sense-differences. The second is qualitative; we may describe the mental processes involved in comparison and discrimination. The former is, historically, the older of the two problems; it is intimately related to the broader question of mental measurement (see INTENSITY OF SENSATION), and to the general correlation between stimulus and sensation differences. See WEBB'S LAW.

The quantitative determination is of two kinds. We may seek, first, to find the just noticeable difference between two impressions. For example, two tones from about the middle of the scale and differing by a single vibration may be readily distinguished as different, but two tones differing by a vibration of one-twentieth of a vibration will be judged as the same. Somewhere between these two extremes of one and one-tenth a difference may be found that is just distinguishable. This difference is known as the just noticeable difference (or j.n.d.). We may seek, secondly, to compare two sense-differences; if, in a series of grays ranging from a light to a dark gray we find one that lies midway between the two extremes, then we, in effect, equate the difference between the light and mid-gray to that between the dark and mid-gray. Again, we may compare a difference just noticeable when two weights are placed on the resting arm with a difference just noticeable when the weights are lifted. The first kind of difference-comparison, that in which we have a distance known as direct comparison; the second in which stimulus-differences are compared is called indirect comparison.

The determination of the just noticeable difference is not as simple, however, as we have made it out to be. The judgment of so small a difference is not easy, and the conditions are so complex as to require a rigorous method if the determination is to be valid. There are, for example, many errors to which the observer is liable; some of these are variable, such as practice, fatigue, habituation and expectation; others are constant and result from the spatial position or temporal order of the stimuli; still others are accidental in consequence of slips of attention, the physical condition of the observer, etc. It was the service of Fechner to work out the principles of method whereby these errors may be either eliminated or taken account of by mathematical treatment of the results. A number of stimuli are chosen, every one of which may be regarded as variable, or one may be constant (standard) and the others variable; these stimuli are arranged in regular order, or at hazard, in series; the order of presentation of every series is predetermined with regard to the variable errors; the temporal order and spatial position of standard and variable are reversed and the series repeated to eliminate the constant errors; the observer is carefully instructed as to what he is to do; and finally, a large number of observations are taken and the ultimate result calculated from the data obtained. The magnitude which represents the just noticeable difference is known as the differential limen, or DL. The differential limen is defined as that difference which is judged less (the form of the judgment depends, of course, upon the nature of the difference) in one-half of a long series of observations, while in the other half the judgment is equal or greater. The magnitude representing the DL may be absolute or relative, i.e., if in the determination of the tonal DL the pitch of the standard is 500 vs., and that of the variable which in 50 per cent of the cases is judged as higher is 500.25 vs., then the absolute DL is 0.25 vs, and the relative DL is \( \frac{0.25}{500} = \frac{1}{2000} \). The differential limen is an ideal value, it represents the most probable value, the mathematical equivalent of the difference which, if all sources of error were eliminated, would in fact be just noticeable. The just noticeable difference thus found has proved to be of signal importance for analytic psychology. The differential limen of the quality, intensity, clearness, duration, extension, direction, (or color) of any of the stimuli or sensations may be obtained and mathematically expressed, it furnishes the basis for the calculation of the number of discriminable qualities in vision and audition, and it is a significant aid in the analysis of both temporal and spatial perceptions.
now this, and now that, form of report. Formerly, it was thought that in the event of successive impressions the judgment was mediated by an image of the first tone. When, however, the comparison is direct, as in the case described, no image or any other process than the bare impression itself is necessary. Indeed, in some cases a long-dead observer will judge by absolute impression, i.e., the report is released upon the appearance of the first tone. Even here, the second tone (which in such a case is the standard of comparison) is not necessarily imaged. Such a discrimination is, of course, far removed from those of everyday life. In the laboratory we reduce the mechanism to its lowest terms; in ordinary discrimination we are not disposed to observe a single attribute, and the discriminative consciousness must, on that account, be much more complex than the artificial conditions of the laboratory have shown it to be.

Harry P. Weld, Assistant Professor of Psychology, Cornell University.

DISCUS, among the Greeks and Romans a quoit of stone or metal, from 10 to 12 inches in diameter, convex on both its sides, sometimes perforated in the middle. The players aimed at no mark, but simply tried to throw the quoit to the greatest possible distance. It was sometimes furnished with a thong of leather to assist in the throwing. The throwing of the discus was a notable feature of the revival of the Olympic games at Athens in 1896. In these games the discus-throwing event was won by Robert Garrett of Princeton University, who far outdistanced the foreign competitors. The world's record in 1909 was 142 feet 10½ inches, held by M. J. Sheridan, of New York. See DISCOLOUS; QUOTS.

DISEASE. Disease is a lack or absence of ease; a condition of uneasiness or of pain. Pathologically, it is a collection of phenomena occurring constantly during life and after death, according to Savile; Huxley defined it as "a perturbation of the normal activities of a living body." Foster conceives of it as "Any departure from, failure in or perversion of normal physiological action in the material constitution or functional integrity of the living organism." It is a condition resulting from disordered physiological action and recognized by change in structure or in altered function. The area of altered anatomical structure, or the tissue changed through, for example, circulatory or eliminative failure, is called a lesion. The term disorder was formerly used to a group of symptoms without a discoverable anatomical lesion; but disorder and disease are now used as synonymous terms. Briefly and conveniently, then, disease is a departure from health, recognized during life through symptoms and physical signs.

Symptoms are subjective manifestations experienced by the patient, as for example, pain or buzzing in the ears. Physical signs are objective manifestations, discoverable by the physician on examination, such as heart murmurs or waves caused by fluid in the abdominal cavity or anomalies of pupils. In the old time before chemistry, biology and bacteriology had been developed, disease was regarded as a dynamic entity, which invaded healthy tissue, causing changes, and with a certain train of symptoms, and was so described, together with its cause and diagnosis, in the old "systematic medicine." The new elaboration of experimental methods, the new school of pathology has been established and normal physiological processes, as well as the processes of the agencies resulting in disease, have become more thoroughly understood and definite causes have been confidently assigned.

Classification of Diseases.—An old classification divided diseases into diasthetic, or those which are dependent upon a constitutional predisposition, or diathesis (q.v.), and enthetic, or those which arise from invading external causes. An example of the few diasthetic diseases is hemophilia (q.v.). This is a constitutional disease generally hereditary and characterized by frequent and prolonged hemorrhages from very slight wounds, or from spontaneous rupture of blood vessels in the mucous or serous membranes. There is a greatly lessened plasticity to the blood and a degeneration of the coats of the blood vessels. Examples of enthetic diseases are plumblism (lead poisoning) and typhoid fever; the former caused by absorbing lead in solution in water through lead pipes or from fresh paint; the latter caused by swallowing in food or water the typhoid bacillus.

Some make two divisions for purposes of classification: germ diseases and non-germ diseases, or infectious and non-infectious diseases. Germ diseases are caused by entrance into and growth within the body of bacteria (q.v.), which are vegetable spores. (See Disease, Germ Theory of). Many harmless bacteria naturally exist in the intestines; but most of the fatal diseases, including pneumonia, typhoid fever, tuberculosis, cholera and bubonic plague, are due to the entrance of the specific bacteria in each case.

Another classification, now little used, divides disease into organic and functional, the former being those in which tissue changes are demonstrated in the vescus or organ affected; while in the latter the organ fails to function properly, although itself exhibiting no lesion. But in functional diseases there are always distal lesions, owing to which, through reflex or directly conducted nerve action, functional disorder occurs.

Diseases are also classified as idiopathic, if arising from causes developed within the body; traumatic, if resulting from wounds or injuries; acute, if of sudden onset and of a brief, definite course; chronic, if pursuing a long course and persistent; contagious, if communicated from person to person; constitutional, if pervading the whole system, as blood-poisoning; local, if limited to a small area, as a boil; congenital, if existing before birth; nervous, if attacking some part of the cerebro-
spinal system or the nerves; **symptomatic**, if due to the action of ferment.

For convenience of study, diseases are grouped according to the systems in which they cause disorder, as diseases of the respiratory system; of the digestive system; of the kidneys or genito-urinary system; of metabolism; of the locomotor system, etc. Very interesting and important is that group of diseases which are incident to **military service** and the group of **occupational** diseases. (See Diseases, Occupational.) The former includes irritable heart, caused by forced marches in heavy marching order in those who are weakened by privation or illness, by dilatation of the heart, or by degenerated heart muscle. Syphilis, alcohol habit or tobacco favors its development.

**Febre exsangue** is also seen in soldiers as a result of excess of acid in the muscles, and is characterized by remittent type of fever, weakness, nervous exhaustion and diarrhea.

**Feigned diseases** are especially trying to the regimental surgeon; for resort is not infrequently made to malingerers in materials handled; duty and to enjoy the indulgence of the hospital. Most frequently feigned are epilepsy, chorea, insanity, coma, blindness, deafness, heart disease and paralysis. The careful study of an experienced physician trained in neurology is often taxed to the utmost to uncover the fraud.

Diseases of occupation, or industrial diseases, include bronchitis, emphysema, pneumoconiosis, tuberculosis, lobar pneumonia, etc., among the respiratory disorders; cerebro-spinal hemorrhage, neuritis, fatigue neuroses, muscular atrophy, toxic paralyses and insanity, among the nerve disorders; eye diseases, from excessive light or heat, or from dust, gases, burns or accidents; skin diseases (dermatoses) such as scalds, burns, eczema among flax-pickers; or the result of lead, arsenic and other poisons; heart and blood vessel disorders from lifting or other excessive strain; disturbances of the digestive tract, as from poisoning with lead, arsenic, mercury, etc.; infectious disorders from pathogenic organisms in materials handled, including anthrax from hides and wool; glanders; anthracylostomiasis (hook worm disease), common among miners, etc.; cœsson disease, common among those who work in compressed air, and due to the sudden transition to the ordinary atmospheric pressure. Besides these, we have glass-blower’s mouth, with swallowing of the parotid gland. Women have increased susceptibility to industrial poisons, such as lead, phosphorus or mercury, similarly as to tobacco. Much depends upon the mental attitude of the worker, his general health and strength, his place of work, its duration and the processes employed. The fatigue neuroses mentioned include writer’s cramp, telegrapher’s cramp, piano-player’s paressis, etc., to all of which alcohol habit, tobacco habit and mental anxiety predispose.

Climate has much to do with the prevalence of certain diseases. For example, cholera and yellow fever are found at sea-level in the tropical regions of the equator, and is widespread; while sunstroke, mountain sickness and frost bite have been erroneously considered as due to climatic conditions. All that one can truthfully say is that climate is predisposing.

We formerly encountered a classification including **house diseases**, founded largely on the false belief that sewer gas caused certain illnesses. These diseases were due to direct contamination, as by insects, or to dust, the conservator of germs.

**Propagation of Disease.**—The propagation of diseases by insects has been receiving increased attention since 1894. Many mysterious, isolated causes of contagious diseases, as well as the progress of many epidemics, have been due to the facility with which certain disorders are transmitted by certain insects. The year 1894 is named, because at that date Manson, of Dublin, appeared as a vigorous supporter of the theory that the mosquito was the cause of malaria. The theory had, indeed, been advanced by Crawford, an American physician, in 1807; again by Mott, of New Orleans, in 1848; and reasserted in 1883 by A. F. A. King, of Washington. Laveran, of Paris, who in 1880 discovered the **plasmodium malariae**, advocated the theory in 1883. Through the studies and researches of the Italians, Biglami, Bastianelli, Grassi and ecali, malaria and yellow fever have been assigned, especially Manson, his pupil Daniels and Surgeon-Major Ross, of the British army, the discovery was completed in 1898, that the **anopheles** mosquito is the carrier of malaria. Reed, Carroll, Agramontie and Lazzeri, appointed in 1900 an American medical commission to investigate yellow fever in Cuba, determined the fact that the **Culex fasciatus** mosquito is the host for yellow fever (q.v.). Another species of the **Culex** is the transmitter of filaria. Elephantiasis has also been transmitted by the mosquito. Still more culpable is the common house fly (q.v.) in the transmission of disease. It conveys to man the infection of bubonic plague, leprosy, anthrax, Asiatic cholera, typhoid fever, smallpox and diarrhoea. The flea that infests the rat is the common carrier to man of the virus of bubonic plague. The itch mite conveys leprosy. The tick propagates Texas fever among sheep. The ant has carried bubonic plague as well as anthrax. The bedbug transmits leprosy, tuberculosis, catarrh and relapsing fever, according to different observers. Roaches and house flies are carriers, not true intermediary hosts, of many disorders.

Obviously, all the propagation of disease by insects can be limited, though not entirely controlled, by proper measures to destroy all vermin and insects and prevent their multiplication as well as their attacks upon human beings. Those living in mosquito-infected districts should be protected by screens, especially at night. The larvae of the mosquito are destroyed by the use of a small amount of crude petroleum, which spreads easily over the entire surface of stagnant water. All pools, marshes and flowed lands should be drained, and the banks of ponds and streams should be altered so as to provide for a constant current of water; and obviate stagnation or occasionally flooded flats or margins. All water butts, eave-troughs and accidental receptacles of rain water should be emptied or treated liberally with chloride of lime. An easterly side of the equator, and Philadelphia, Francisco was terminated by killing the rats in the city.

Not unnaturally certain diseases are grouped together, as they occur largely during the first few years of existence, and during the last years of life, respectively, and are termed **dis-**
DISEASE

cases of childhood and diseases of old age.
The former aggregation includes measles, whooping cough, chickenpox, whooping, pneumonia, scarlet fever, etc.; while the latter embraces arterio-sclerosis, gout, deafness, cataract, etc. See CHILDREN, DISEASES OF; OLD AGE, DISEASES OF.

Diseases caused by perverted activity of the cell tissues are called "autogenous diseases."; but they should no longer be considered in a group by themselves. A familiar example is auto-intoxication (q.v.), better termed intestinal toxæmia, which is due to the retention in the colon and ileum of harmful bacteria, ingested with meat, fish and other albuminous food. Certain amino-acids are generated in the intestine which, being absorbed and carried in the blood stream, cause severe headache as well as much damage to the blood vessels and the brain. As a result, a quantity of animal food, or a meatless diet, causes a change in the intestinal flora which relieves the condition.

Discoveries and Methods of Prevention.—The investigations of recent years have discovered the origin of bubonic plague, as has been said, that scourge which since the Dark Ages has reaped its harvest of millions of human lives; they have revealed also the cause of the fatal sleeping sickness, which is an organism carried by the tsetse fly to its millions of victims in Africa; also the spirochete of syphilis, that dread and deadly disease which invades nearly all organs and tissues in the body. Had Ehrlich achieved nothing else, his life would have been a blessing and his memory immortal because of the invention of Salvarsan (q.v.), which in such a large proportion of cases checks or cures the luetic scourge. Flexner's serum for treatment of cerebro-spinal meningitis; the surely progressing conquest of hookworm disease among countless thousands of "poor whites" and negroes, lazy and shiftless only because of prostrating anaemia caused by the bloodsucking intestinal parasite (Nector Americanus); the discovery of the bacillus of typhus fever by Ploutz, of New York, in 1913, and the signal success of the serum therapy (q.v.) thereupon devised; these stand as the most brilliant achievements of a decade of years.

The forerunner of present day serum therapy was the use of diphtheria antitoxin, a procedure which has reduced the mortality of diphtheria from an average of 42 per cent to an average of 20 per cent, the deaths in some epidemics in cases in which the antitoxin was used falling as low as 12 per cent.

Vaccination against smallpox has been widely practiced as a protection and for terminating epidemics and reducing their incidence to the minimum. See VACCINATION.

The use of derivatives of the "ductless glands," suprarenals, thyroid, thymus, pituitary, corpus luteum and pineal gland, is increasing with the study of hemadenology, especially in treating certain anomalies of preadolescent life. Transitional, compensatory and abortive forms of pituitary disease are now recognized, and the individual suffers, though properly treated, are saved from progressing to acromegaly, gigantism, infantilism, adiposis, sex inversion and eunuchism.

Through the careful study of foods and of metabolism, valuable discoveries have been made. Guelpa, of Paris, devised and suggested the system which, Allen, of Rockefeller Institute, aided by study of Naunyn, has elaborated into a practical dietary which is largely successful in treating diabetes (q.v.), now known to be an expression of diminished functional capacity of the pancreatic islets.

Beriberi (q.v.), a nutritional disease consisting of a multiple neuritis, characterized by a special train of symptoms, is very prevalent among sailors and natives of certain countries whose principal food is rice from which the pericarp has been removed. Restoration of the husk of the grain prevents further extension of the disease, and this, with other dietary expedients, ameliorates rapidly the condition of the sufferers. In the recent uncovering of the cause of beriberi, a train of exploration was begun which ended in 1911 in the discovery, though not the isolation, by Casimir Funk, of the substances he calls "vitamines." They may not be amines, but the name will serve. They are essential to health, resembling in that way the lipoids. Vitamines are found in meats, green vegetables, fruits and the pericarps of grain removed in milling for the sake of the appearance of the product. Pellagra (q.v.), a disease prevalent in the South, especially among negroes, characterized principally by muscular weakness, skin lesion and insanity, is a similar nutritional disease, in the opinion of most students, and is to be relieved by proper diet.

Since a large proportion of disease is avoidable, all reasonable preventive methods should be developed to the utmost. The first measure for a people to adopt for self-protection is a quarantine against the importation of disease by immigration. Records of the incoming vessel's health are examined at the quarantine station before the dock is reached, and inquiry is made concerning all cases of sickness or death on the voyage. Detention for a varying period may be ordered, all immigrants may be subjected to inspection and the boats may be fumigated. At the port of New York, for example, the stream of arriving immigrants is inspected for contagious eye diseases, hernia, and facial dermatoses; mental defects are noted as observed, and these patients are separated for treatment or further individual examination or for return to the country from whence they came. In time of epidemics of cholera and yellow fever, for example, much disease is prevented by strict quarantine regulations. Similar regulations have been enforced against people traveling from one place to another, or from urban to rural districts, as in 1916, during the epidemic of infantile poliomyelitis; and thereby the disease was confined to certain areas, and the number of possible contact cases was limited materially.

Constant preventive measures for the permanent population are taken by municipalities and States through various officials. Tenement-house commissioners enforce ordinances regarding cubic feet of air space, the number of windows proportionate to the size of each room, water supply, plumbing, as well as the amount of ground to be left uncovered by the building erected thereon. Factories and workshops are supervised under mercantile inspection laws in order that air-space, ventila-
tion, water supply, plumbing, sewerage, light and fire protection may all be ample; State meat inspectors examine and approve or destroy carcasses of animals slaughtered for food, tagging accepted portions.

State and local health boards cover a wide field of protection through their activities, with minor exceptions including determination of specific gravity, butter fat, percentage and contamination, as well as control of sanitary features of herding and stabling; licensing and inspection of midwives; suppression of nuisances, including the production of noxious fumes or smoke, as well as maintenance of fly-breeding refuse, contamination of streams, etc.; abolishing of the common drinking cup and the common towel; prohibiting spitting in public places; requiring sanitary conditions in barber shops; more adequate control of tuberculosis; protection of public and private water supplies; control of communicable diseases, and promotion of child hygiene.

Protection from and prevention of disease through control of communicable disorders are secured by thorough notification and very early repression of physicians and other persons, and an immediate study of sources, in order to trace to the origin and eliminate the source in each instance, vaccinating and immunizing thoroughly and repeatedly, and establishing local headquarters where needed, furnishing diagnostic services and also serums and vaccines.

Child hygiene, a measure of prime importance, is promoted by conducting infant welfare campaigns, with traveling exhibits, lectures by members of the department staff, demonstrations and talks by trained nurses, interviews with mothers' clubs and parent-teacher associations, and public meetings. Infant welfare stations are established where mothers are instructed by station nurses and babies receive care. Child welfare exhibits are prepared for county fairs and similar gatherings, at which are distributed pamphlets containing instruction in disease, its cure and its avoidance. "Better baby" contests are inaugurated and motion picture films on child welfare are shown. Older sisters, on whose shoulders fall the care of the babies, are organized into "Little Mother Leagues," with pledge cards and certificates of membership, and information is communicated at these meetings.

In several cities prevention of disease among public school children is aided by daily inspection of all pupils by teachers, who set aside those apparently ill for skilled examination and disposal by the medical school inspectors. All eyes are closely scrutinized; throats are inspected for adenoids and enlarged faudicial tonsils; teeth are surveyed and treated if necessary, and a daily hot meal is served to the under-nourished pupil.

Modern medical discoveries have resulted in reducing the amount of internal medicine used, and in increased attention to diet, exercise, baths, diversion and rest and natural and hygienic modes of life. Preservation of infant life, prevention of health by proper avoidance of morbid agencies and increase of longevity are the aims of medical practice to-day.

ALBERT WARREN FERRIS, M.D.

DISEASE, Germ Theory of. Before beginning a detailed consideration of this subject an attempt should be made to arrive at a clear understanding as to just what is meant by the "germ theory" of disease. A conception disease in either animal or vegetable forms may be the result of the introduction and subsequent growth of minute organisms, all of which are microscopic in size, and which, quickly increasing enormously in number, produce in the bodies of their hosts more or less profound chemical alterations, accompanied by the formation of poisons. In the beginning the true character of these so-called "germs" was in great doubt, but with the progress of knowledge it was discovered that they are for the most part a vegetable nature, though it is unquestionably true that some of the most common of the infectious processes are induced by animal organisms. Such morbid agents, being thrown out in the secretions and excretions of their hosts, may enter into contact with which the diseased bodies are associated, and spreading in this way frequently convey the infectious maladies that they produce to other similar related organisms.

It should be observed that the large number of infectious diseases, the causative agencies of which have so far been discovered, are, as compared with some affections, without exception only mildly contagious, while some are only conveyed by means of inoculation or by intermediate hosts. On the other hand, certain poxes — such as smallpox, measles, chicken-pox, scarlet fever and German measles — are of a highly contagious character, and it is noteworthy that no one has as yet been able to detect the poisons that produce them, and we are still in complete ignorance as to whether they are of an animal or vegetable nature; so apparently minute and imponderable are the causative factors in these maladies that it seems not impossible that they may after all be the result of the growth and development of certain morbid agencies that belong neither to the animal nor vegetable kingdoms, or conceivably of ferments capable of growth and of multiplication.

At this point it may be insisted that much real progress has been made in the study of this most important and interesting subject, and that our knowledge has advanced to the point where we are no longer limited by speculation — it having been proved beyond the possibility of doubt that many diseases are produced by what are called "germs," and that, therefore, it is no longer necessary or strictly accurate to use the word "theory" in this connection — and that we are justified in asserting without qualification that many infectious maladies are the result of the life-activities of certain minute organisms. Notwithstanding that the word "theory" no longer has any proper place in defining or avoiding the conception of disease by minute microscopic forms, the convenience of the term and the difficulty of finding a short and satisfactory substitute therefor has led to its retention, and we therefore find that the expression "germ theory" is still
commonly employed. We should never forget that while the word "germ" is usually thought of as being synonymous with the term bacteria, that, as already mentioned, it should not be regarded as being strictly limited to such low vegetable forms, and that it may be and is qualified to embrace the minute animal organisms, a small number of which have been shown to be the causative factors in the production of disease.

History of the Germ Theory.—A few words as to the evolution of the "germ theory" may not be without interest.

As to just when the idea of the production of disease by minute living forms of life was first conceived, we are in complete ignorance, the origin of the view being lost in the mists of preceding ages, but that it was held to a greater or less extent in the past there can be no doubt. On the other hand there seems to have been little or no attempt to define the nature of these supposititious poisons until the beginning of the 17th century. In the year 1671 the learned Jesuit Athanasius Kircher, in his remarkable book in which he described, with the aid of a very primitive microscope, the discovery of "a countless brood of worms not visible to the naked eye" in a variety of decomposing substances such as milk, vinegar, cheese, etc. He likewise discovered in the blood and in the pus from the buboes of those suffering from the pest many similar organisms, which were regarded by him as the causative factors in this malady. While it was later recognized that these objects were nothing more than cells not dead, and that without interest, this investigator's writings are of great interest as being the first records which we possess of a microscopic study of the body fluids in disease, and at the same time the first attempt to assign to supposed micro-organisms a rôle as the causative factors in a definite affection. The idea having been once clearly formulated it naturally grew, but its further development was slow, as it wholly depended on improvement in technique—particularly on greater perfection in the microscope, for which science is largely indebted to Robert Hooke and Anthony van Leeuwenhoek. Likewise the lethargy of the Middle Ages not yet having been shaken off, further advances were necessarily slow,—this being not a little accentuated by the criticism and stubborn opposition that all great discoveries invariably encounter in the beginning. Indeed, we find that this subject made no great advances for almost a century, the next publication of any importance in this connection having been a book by Plencit in 1762. This very able writer made no discoveries, but deserves great credit for having first clearly pointed out the illogical characteristics of the prevalent notions of the etiology of disease and for having strongly called attention to the fact that the causation of contagious diseases could only be explained upon the supposition that they are the result of a living poison.

With the progress of time considerable advances were made in the study of low vegetable forms, particularly by Müller, Ehrenberg, Du Jardin, Perty, Cohn and Naegeli. In these discoveries, it is of great interest to note that Donné appears to have been the first observer who definitely attributed the causation of an infectious disease to a specific low microscopic form,—he having in 1837 described and figured a vibrio, which he stated he had only found in the secretion from syphilitic lesions, the organism being in form and length much like the spirochete, which only within recent years has been recognized as the causative factor in the production of luet. Curiously, the first organism definitely shown to be the morbid agency in a contagious malady was a low form discovered by Bassi in a silkworm disease known as muscardine.

Following this the pathogenic organisms of a number of different affections were recognized in quick succession, the sarcinae of gangrene having been described by the brothers Goodair in 1842, the organism of the skin disease called favus by Schönlein in 1839, the Tachyphylion tonsurans which causes ringworm of the scalp by Gruby in 1843, the microsporum furfur, which produces Piloryasis versicolor, by Eigstedt in 1846, the supposed germ of thrush by Gruby, Langenbeck and Berg in 1839-41, and the bacillus of anthrax by Poblet in 1880.

Following this there was a considerable period during which no new discoveries in this direction were announced, though in the meantime bacteriology was elevated to the dignity of a science through the epoch-making investigations of Pasteur. This great observer during the same period demonstrated that all fermentations arose from the presence of micro-organisms. He likewise showed that suppuration in wounds is to be looked upon as an analogous process, and that by shielding abrasions and cuts from the effects of contamination by bacteria pus formation could be prevented,—thus laying the groundwork for the subsequent brilliant demonstrations by the great English surgeon Lister of the practical uses to which this knowledge could be put.

Beginning about the year 1880 and for the next decade a large number of diseases were shown to be the result of life activities of certain bacteria, the most important of which was the demonstration by Koch that tuberculosis is produced by a bacillus indebted to Robert Hooke and Anthony van Leeuwenhoek. Likewise the lethargy of the Middle Ages not yet having been shaken off, further advances were necessarily slow,—this being not a little accentuated by the criticism and stubborn opposition that all great discoveries invariably encounter in the beginning. Indeed, we find that this subject made no great advances for almost a century, the next publication of any importance in this connection having been a book by Plencit in 1762. This very able writer made no discoveries, but deserves great credit for having first clearly pointed out the illogical characteristics of the prevalent notions of the etiology of disease and for having strongly called attention to the fact that the causation of contagious diseases could only be explained upon the supposition that they are the result of a living poison.

With the progress of time considerable advances were made in the study of low vegetable forms, particularly by Müller, Ehrenberg, Du Jardin, Perty, Cohn and Naegeli. In these discoveries, it is of great interest to note that Donné appears to have been the first observer who definitely attributed the causation of an infectious disease to a specific low microscopic form,—he having in 1837 described and figured a vibrio, which he stated he had only found in the secretion from syphilitic lesions, the organism being in form and length much like the spirochete, which only within recent years has been recognized as the causative factor in the production of luet. Following this there was a considerable period during which no new discoveries in this direction were announced, though in the meantime bacteriology was elevated to the dignity of a science through the epoch-making investigations of Pasteur. This great observer during the same period demonstrated that all fermentations arose from the presence of micro-organisms. He likewise showed that suppuration in wounds is to be looked upon as an analogous process, and that by shielding abrasions and cuts from the effects of contamination by bacteria pus formation could be prevented,—thus laying the groundwork for the subsequent brilliant demonstrations by the great English surgeon Lister of the practical uses to which this knowledge could be put.

Beginning about the year 1880 and for the next decade a large number of diseases were shown to be the result of life activities of certain bacteria, the most important of which was the demonstration by Koch that tuberculosis is produced by a bacillus indebted to Robert Hooke and Anthony van Leeuwenhoek. Likewise the lethargy of the Middle Ages not yet having been shaken off, further advances were necessarily slow,—this being not a little accentuated by the criticism and stubborn opposition that all great discoveries invariably encounter in the beginning. Indeed, we find that this subject made no great advances for almost a century, the next publication of any importance in this connection having been a book by Plencit in 1762. This very able writer made no discoveries, but deserves great credit for having first clearly pointed out the illogical characteristics of the prevalent notions of the etiology of disease and for having strongly called attention to the fact that the causation of contagious diseases could only be explained upon the supposition that they are the result of a living poison.

With the progress of time considerable advances were made in the study of low vegetable forms, particularly by Müller, Ehrenberg, Du Jardin, Perty, Cohn and Naegeli. In these discoveries, it is of great interest to note that Donné appears to have been the first observer who definitely attributed the causation of an infectious disease to a specific low microscopic form,—he having in 1837 described and figured a vibrio, which he stated he had only found in the secretion from syphilitic lesions, the organism being in form and length much like the spirochete, which only within recent years has been recognized as the causative factor in the production of luet. Curiously, the first organism definitely shown to be the morbid agency in a contagious malady was a low form discovered by Bassi in a silkworm disease known as muscardine.

Following this the pathogenic organisms of a number of different affections were recognized in quick succession, the sarcinae of gangrene having been described by the brothers Goodair in 1842, the organism of the skin disease called favus by Schönlein in 1839, the Tachyphylion tonsurans which causes ringworm of the scalp by Gruby in 1843, the microsporum furfur, which produces Piloryasis versicolor, by Eigstedt in 1846, the supposed germ of thrush by Gruby, Langenbeck and Berg in 1839-41, and the bacillus of anthrax by Poblet in 1880.
DISEASES

organisms is of the first importance, and that it forms the basis of almost the entire science of medicine. Not only by this connection enabled us to formulate rational methods of treatment, but they give us the key to what is even more important—the prevention of disease. So far have we advanced in the latter direction that it is probably no exaggeration to say that we are in a position today to prevent at comparatively small cost three-fourths of all the sickness from which the human being suffers, and that the blind fatalism and stupid ignorance of a great majority of mankind alone prevents its complete extermination so devoutly to be wished—all of which is at bottom due to our study of the relationship of *germs* to disease.

H. F. HARRIS, M.D.
Georgian State Board of Health.

DISEASES: Occupational. The complexities of modern life and modern living have had much to do with the development of a large class of diseases which, because they are associated with, and in many instances clearly derived from, certain trades and occupations, are given the name of occupational diseases and in very recent years have been carefully investigated and classified as such. The work of W. G. Thompson in this field has been extensive and illuminating. While these diseases have been more carefully investigated than they formerly were, many of them are not new to literature and medical science; many others are however the direct consequence of trades and occupations which have been born and developed as the result of and companions of modern discoveries in chemistry, physics, metallurgy, electricity and other sciences. The first publication upon this subject which was given to the world, at any rate to the modern world, was by Ramazzini, a careful Italian observer, who in 1713 published a small book relating to the disastrous effect of their respective occupations upon metal diggers, gilders, chemists and tin workers. We must not forget that in these early days this disastrous effect was due perhaps as much to uncleanliness and to unhygienic conditions and houses as to poisonous and unhealthy conditions in the work itself. This does not signify that such unfavorable conditions have been entirely removed from modern industrial plants; if they had there would not be so many occupational diseases. But the baneful effect of certain occupations has been clearly recognized and sometimes by legal enactment, sometimes by the force of public opinion, the disease-producing conditions have been removed or minimized, compensation for disease or injury sustained while at work guaranteed, and even the hours of work lessened so that exposure and hazard are becoming less and less noteworthy and the responsibility for disease and injury is becoming shifted more and more to the shoulders of the laborer himself. At the rate at which industrial conditions are now improving and the demands which organized labor is insisting upon, the risk which attends many of these occupations is diminishing. It is not unlikely that some of the occupations will have become so unprofitable that they will disappear. For the best interests of society let us hope that employers will become less rapacious and laborers less unreasonable and exacting; that employers will more and more provide their shops and factories with hygienic conditions and safety appliances, so that the laborer will become less careless, less indifferent to safety and health, and more careful to avoid preventable disease and accident.

According to Thompson’s arrangement, occupational diseases may be divided into (1) toxic substances; (2) mechanical irritants; (3) temperature or air pressure; (4) overuse of nerves and muscles; and they may be acute, resulting in sudden death, or chronic continuing through years and serious conditions to a fatal issue. The following classes of disease may be noted: (1) Those which are due to irritant substances, including toxic metals, gases and fluids, irritant dusts, including those which are insoluble and inorganic, those which are soluble and inorganic, and organic dusts and fibres, also those which are due to germs and miscellaneous irritants. (2) Diseases which come from harmful surroundings, including modifications of air, temperature and light, and electric shock. (3) Miscellaneous diseases from occupations involving manual labor, such as mining, dyeing, pottery making, also including diseases of the blood, skin, nerves, eyes, ears, nose, throat, mouth, bones, joints, bladder, etc. The irritant substances which cause the diseases may enter the body in the pure form or as salts of various substances, as dusts, fumes or mixed metal solutions, inhaled in the form of sharp particles in the nose or throat, or less frequently by absorption through the skin. These substances not only cause mechanical irritation but, as in the case of such poisonous metals, as mercury, arsenic, lead, silver, antimony, etc., they have their specific effect upon the nerves, arteries, kidneys, mucous membrane, bones, etc., the effect being sometimes quickly fatal and sometimes fatal through prolonged chronic diseases, especially chronic nephritis, the poisons being chiefly eliminated by the kidneys so far as they are eliminated at all. Some of these substances have a specific action on certain tissues, thus antimony is a specific poison for the nose, pharynx, bronchi, stomach and intestines. Brass dust causes what is known as brass-founders’ fever or ague, though one soon acquires immunity from the effect.

The influence of sand blasting is very injurious to the mucous membrane of the mouth, throat and nose, and upon the bronchi and lungs, unless the face is protected by a suitable mask. Workers in bronze, chrome acid, cobalt, copper, manganese, platinum, silver and zinc may be poisoned by dust or fumes, but those who work in gold, iron, steel, nickel and tin are not injured except by the dust, or by solder which may be used in working them. The effect of toxic gases is local or general, acute or chronic, and they are eliminated by the lungs or kidneys.

The list of poisonous gases which produce disease or death is a long one, among them being bromine, carbon bisulphide, dioxide and monoxide, chlorine, the vapor from essences, extracts and essential oils, ethyl, formaldehyde, gasoline, naphtha, iodine, wood alcohol and turpentine, and the gas from phosphorus and sulphur. The inhalation of ammonia and ammonium chloride produces cough, sneezing, catarh and bronchitis. The clothing of those
who work in amyl alcohol and amalgin may become so saturated that unconsciousness and death may follow prolonged inhalation of the gases as they are volatilized. Benzine vapor is very explosive and may produce an acute or chronic disease.

Workers in dyes, petroleum, alkalis and carabolic, nitric, hydrochloric and sulphuric acids suffer mostly from the direct effect upon the mucous membrane of the respiratory organs. Those who work in nitro-glycerine soon acquire immunity, as it is readily absorbed. The injury from organic dust and fibre which occurs for example, to those who work in grist mills, grain elevators, sugar refineries, etc., consists in mechanical obstruction in the respiratory passages, in the bruising of the mucous membrane, in the inhalation of soluble poisons and germs and in the irritation of the skin, eyes, ears and mouth. Other substances which may cause irritation by being received into the body in the course of one's occupation and which may be mentioned in this relation are all those which are connected with the work of miners, asphalt, cement, emery, glass and stones, metals and earths which are ground or crushed very perfectly. Athletes are very productive of disease through inhalation, including the gathering of ashes and garbage, street cleaning, carpet cleaning, and the mechanical treatments of cotton, felt, feathers, flax, hemp, fur, horn, bone, shell, horsehair, jute, rags, straw, tobacco, wool and rubber. The harmful occupations which are due to bad physical surroundings are those of workers in caissons and tunnels, in which the so-called caisson or compressed air disease is produced, and also conditions in which there is air concussion or air rarefaction. In this category must also be included those occupations in which the conditions of heat, cold, moisture or light are excessive or abnormal.

If we turn our attention to specific trades and occupations we see that farmers, though working in the open air and, under ordinary circumstances, having the best chance for immunity from disease, are nevertheless very often affected. Certain diseases paralyze and suffer from bad teeth owing to the large quantities of indigestible, poorly cooked and imperfectly masticated food which are eaten by so many of them and the failure to give proper attention to their teeth.

Fishermen and sailors are also sufferers from similar diseases and from pneumonia and tuberculosis owing to exposure to bad sanitation at home and on shipboard, bad habits, and too exclusive a diet of fish, salt pork and other cured foods.

Those who contract anemia, tuberculosis and many diseases of the lungs, teeth, mucous membrane and skin in connection with their occupation, owing to bad air or to irritating dust or gas which they inhale, include tanners, blacksmiths, miners, bakers, millers, knife grinders, and many others.

The diseases from working in metals, with serious or fatal poisonous effects and injuries to both soft and hard tissues, affect workers in cement, lead, arsenic, phosphorus, mercury, zinc, tin and brass.

Railroad men, especially those who work on trains, have the usual ailments which come from exposure, such as rheumatism, eye strain and other eye troubles, and kidney disease from excessive shaking, while they are continually in danger from serious accidents.

The workers in tunnels and caissons and in other places where the air pressure may be as great as four or five atmospheres suffer seriously with their blood and nervous system, air being forced into the nervous tissue which is not always dislodged, even by careful decompression, when the victim returns to ordinary atmospheric conditions.

Those who live in a rarefied atmosphere or who ascend, like aviators and mountain climbers, to great altitudes, often suffer from air hunger, from pneumonia and other diseases of the respiratory organs, and from heart troubles. The experience of the great European War shows how that immunity may quickly be gained even for great heights, and ability to work severely and think rapidly and intelligently may be acquired.

Workers in chemicals are particularly sensitive to diseases of the lungs and skin and include bleachers who work in chlorine, sulphur and acids, aniline dye workers, starch makers and workers in ammonia, and many other chemicals. Athletes are very productive of disease through inhalation, including the gathering of ashes and garbage, street cleaning, carpet cleaning, and the mechanical treatments of cotton, felt, feathers, flax, hemp, fur, horn, bone, shell, horsehair, jute, rags, straw, tobacco, wool and rubber. The harmful occupations which are due to bad physical surroundings are those of workers in caissons and tunnels, in which the so-called caisson or compressed air disease is produced, and also conditions in which there is air concussion or air rarefaction. In this category must also be included those occupations in which the conditions of heat, cold, moisture or light are excessive or abnormal.

Rupture and aneurism are not of uncommon occurrence in occupations in which there are great and sudden strains, frequently repeated, porters, blacksmiths, draymen and longshoremen often being victims of these accidents, and they are the more likely when, as is so frequently the case, the tissues are debilitated by syphilis or other venereal disease.

Those who are exposed to loud noises, like boiler-makers and riveters, are sufferers from deafness, and hundreds and thousands of the soldiers in the European War, particularly those who are in the military aviation, are suffering in this way. Those who work under intense light, particularly if it is shifting and uncertain, suffer from eye diseases, especially impairment of vision. The workers under intense electric light in power houses and elsewhere can hardly escape the bad effects of this unusual experience. Brewers and saloon keepers suffer, in great numbers, from the excessive use of alcohol, the lungs, liver and kidneys being the organs most often attacked. Flat feet, varicose veins and constipation are acquired by those who are constantly on their feet, like cooks, waiters, house servants, policemen and salesmen. Glassblowers, potters, and band players on brass instruments often suffer from emphysema of the lungs, a distressing and often serious trouble due to rupture of the lung tissue and escape of air into the chest cavity. Those who work in India rubber and inhale carbon bisulphide and those who inhale benzine and turpentine vapors often suffer from headache, poor sight and hearing and intestinal cramps.

Indigestion is a very common ailment with those whose eating and drinking habits are irregular, notably cabmen, various classes of

DISENTIS, dé·zen·ti·s, Switzerland, a village in the canton Grisons, situated on the Hither Rhine. It is about 31½ miles southwest of Reichenau, and 3,600 feet above sea-level. The Monk Sigisbert, a disciple of Saint Columba, is supposed to have founded a large Benedictine monastery here in 614. Pop. 1,691.

DISESTABLISHMENT, specifically the depriving a church of its rights, position or privileges as an established church; withdrawing a church from its connection with the state. A bill for the disestablishment and disendowment of the Irish Church was introduced into the British House of Commons by Gladstone 1 March 1869. It was passed by Parliament within a few months of its introduction but did not take effect till 1 Jan. 1871. In the session of 1914 an act providing for the disestablishment and disendowment of the Church of England in Wales was passed by Parliament, but owing to the outbreak of the European War its enforcement was postponed until the conclusion of peace.

DISFRANCHISEMENT, the act of depriving a person of any privilege, liberty, franchise or immunity, such as depriving a member of a corporation of his corporate rights. It is distinguished in this case from "sation," which refers to the removal of an officer of the corporation from office without affecting his membership. Another instance is the act of depriving a person of the rights and privileges of citizenship. This term is often applied to the act of depriving a citizen of the right to vote; and in Great Britain to the act which deprives a constituency of the right to return a member to Parliament whether through a redistribution of seats or as a result of bribery and corruption in a constituency, the suspension by the House of Commons on the recommendation of the judges who tried the case of that constituency’s right to return a member. See ALIENS; ELECTORAL QUALIFICATIONS; SUFFRAGE; ELECTIONS; NATURALIZATION, SVIDENS’ VALLIE, VOTING; UNITED STATES—SUFFRAGE IN THE.

DISHONOR, the refusal or omission of the drawee of a bill to accept, or of the acceptor of a bill, or of the maker of a promissory note to liquidate the obligation on its maturity. There are generally three parties in a bill or note transaction, the holder, the drawer and the person by whom the bill or note is payable, whether he be the maker or acceptor of it. In case the bill or note is dishonored the holder must at once notify the endorser and the drawer, if the paper be a draft or bill. Then the drawer, if there be funds of his in the hands of the drawee, will have an opportunity of withdrawing them. If a banker refuses to pay a customer’s check while holding an account of that customer sufficient to meet such check he makes himself liable for damages.

DISINFECTANTS, agents used for destroying or rendering inert the germs of infectious diseases. It has been amply proved that a large number of diseases are of microbic origin, and when these low forms of microorganisms are introduced into the bodies of susceptible individuals they multiply and thereby become capable of producing certain diseases which are called infectious. Any agent capable of destroying these organisms is a disinfectant or germicide, and through disinfection we have a powerful and effective means of controlling these diseases and checking the spread of them.

In order to disinfect thoroughly we must first identify the source of infection. In the eruptive fevers, such as measles, scarlet fever, smallpox, etc., the infectious germ comes directly from the body of the patient suffering with the disease, attaching itself to clothing, bedclothes, etc., and to objects handled by the infected person. The same is true of infectious skin-diseases, such as scarlatina, ringworm, etc. In pneumonia, tuberculosis, diphtheria and whooping-cough the sputum and the breath carry the germ of infection; in cholera the alvine discharges and possibly the vomits; in typhoid fever infection is generally due to the specific germ found in the discharges from the bowels; in malaria, anthrax and elephantiasis the germ is found in the blood and is transferred by biting insects; in hydrophobia it occurs in the saliva, spinal cord and brain; in gonorrhoea in the urethral discharges, etc. Some of the infecting agents do not multiply outside of the body, while others under favorable conditions are highly procreative. While, therefore, the object of disinfection would be accomplished by destroying all infected material, where this is not admissible it is necessary to subject it to a process of disinfection by external to the life of the infecting germ. This must be complete and thorough. The selection of an appropriate disinfectant for each disease is the result of laboratory research. A culture of a germ is made in a medium best adapted to the growth of the germ and by experimenting with various germicides one is found which proves most destructive to the germ in the shortest possible time. The best and cheapest disinfectant is heat, particularly moist heat. There is no infectious germ known that
can survive boiling water continued for a time — longer or shorter, depending on the germ.

In the use of heat various kinds of mechanical apparatus for both dry and moist (superheated steam) heating are used. Boiling infected clothes with or without the addition of a ceramic disinfectant, freezing for 72 hours in water, or spraying with a solution of disinfectant in water. It is possible to use either of these agents, resort is had to fumigation with gaseous vapors of the disinfectant. Cold (freezing) is a natural disinfectant, but fails in the case of typhoid germs, which have been known to survive freezing for 43 days; and the same is true of the tuberculosis germ. Camphor, medicated papers or the burning of incense may clear an odorous atmosphere impregnated with sewer-gas or fumes of decomposing animals or vegetable matter; but these are not true disinfectants.

Of late the utility of steam disinfection has been forcibly demonstrated, and most cities and quarantine stations have established plants for this process. Clothing, bedding, etc., known or believed to be infected, are placed in steam chambers, or cylinders and subjected to superheated steam (220° to 230° F.) for 20 or 30 minutes. This thoroughly disinfects all infected material. Dry heat is not so effective. A practical disinfectant for many domestic purposes, both in the home and in view of the ease and economy of application, is chlorinated lime in the proportion of six ounces to a gallon of water. All typhoid or cholera stools, likewise the sputum of pneumonia or tuberculosis patients, are rendered innocuous by it in less than 30 minutes. If used in the proper quantity with the material to be disinfected. It may also be used as a spray, particularly for cellars, and the dry chlorinated lime is useful in the case of privies and garbage cans. Carboxic acid in a 3-per cent solution — that is, in the proportion of four ounces to a gallon of water — is one of the best. It does not stain or burn and is sufficiently powerful to disinfect floors and workrooms, although for this purpose a 5-per cent solution is generally used. For clothing the 3-per cent bath is used and the immersion should be not less than one hour. The cresols are cheaper and still more effective, a 2-per cent solution being equal to a 5-per cent solution of carboxic acid. Borax is a good disinfectant for open sores, but should be used only under the direction of a physician, as it frequently develops poisonous effects through absorption into the blood. Potassium permanganate is an effective disinfectant for water tanks and pipes. It is non-poisonous, comparatively cheap and possesses the power of destroying the noxious odors of putrescence. It depends for its action upon its generation of nascent oxygen. Another bactericide of great oxidizing power is hydrogen peroxide. Corrosive sublimate in proportion of one part to 1,000 parts water is not only an efficient disinfectant, but a powerful insecticide as well. It can be applied to woodwork, walls, floors, etc., but its corrosive action on metal renders its use limited on sewers, drains and the like. Milk of lime or common whitewash, so highly recommended by the German government during the cholera epidemic of 1892, is a ready and efficient means of disinfection. This may be prepared by sprinkling with water a quarter of a quicklime in a suitable vessel and, when the lime is reduced to a powder, adding three or more quarts of water, allowing the mixture to stand. It may then be applied with a brush to walls, floors, etc. Drains are flushed and all excreta from infected cases treated with equal parts of lime solution.

The use of chlorine and sulphurous gases is objectionable because of their irritating qualities. Sulphur fumes to be effective must be accompanied by moisture. Steam from a boiling kettle will do. A more modern disinfectant is formaldehyde, made by subjecting methyl-alcohol to oxidation and commonly known in commerce as formalin, which is a 40-per cent solution of formaldehyde in water, does not destroy clothing or furniture and is virtually non-poisonous. It is used for disinfecting surgical instruments, for the washing out of sinuses and of indolent and foul ulcers and for the disinfection of dwelling rooms. An approved method of using it for the last-named purpose is to pour 10 ounces of formalin upon 4 ounces of potassium permanganate. This should be done in a sufficiently large vessel to obviate spattering, and the vessel should be set upon a brick or chimney flue or any other heating apparatus. The effective concentration of temperature of the room must not be less than 32° and a humidity of 65 degrees is desirable. This moisture may be provided by boiling a tea-kettle in the room for a time before the gas is liberated, and this will serve also to warm up the room. The proportions given are for a space of 1,000 cubic feet. Larger rooms will require more formalin. Another method which is highly recommended is the following: Make a mixture of three parts of 40-per cent formalin and one part of carboxic acid. Eight ounces of this mixture will be required for each 1,000 cubic feet of space and the room must remain closed for 12 hours. A sufficient number of sheets are saturated with the mixture, each sheet holding about six ounces, and they are hung on lines strung across the room, free of the walls and floor. A so-called "solid" form of formaldehyde has been placed on the market, with a container in which it is burned. If sufficient formaldehyde is used for the size of the room, this device is convenient and effective, as the resulting gas quickly penetrates all cracks and crevices and renders the air clean and pure, besides destroying all infectious germs.

Most of the metallic and acid disinfectants are more or less objectionable on account of their destructive action to the skin and tissues. Osmic acid, brome and iodine are useful in their respective places. The relative disinfectant values of the various germicides in common use, based on the efficiency of carboxic acid on the typhoid germ as 1, is as follows:

In all cases of infectious or contagious diseases disinfection should be complete; articles infected should be burned, boiled or disinfected and not buried or thrown into sewers.
before being treated with a proper disinfecting agent, for infecting germs have been known to lie dormant for years. In disinfecting a room in which infectious disease has been housed a thorough mechanical cleansing should be carried out after a preliminary disinfecting. The walls are carefully brushed with a vacuum cleaner and the floors and woordwork scrubbed with hot water and soap, finishing with a formalin solution to which has been added a little glycerine. A fresh coat of paint or varnish on the woodwork and new wall-paper or calcimine placed on the walls complete the list of essential precautions. The ceiling may be regarded as safe. (See also the article DISINFECTION). Consult Christian, M., 'Disinfection and Disinfectants' (London 1913); Rosenau, M. J., 'Disinfection and Disinfectants' (Philadelphia 1902).

Richard Ferris, Editorial Staff of The Americana.

Disinfection, popularly speaking, the process of destroying the micro-organisms which produce the class of diseases known as infectious or contagious diseases. These diseases are contracted in various ways. Leprosy, anthrax, rabies, the plague and diseases of the genital system are communicated by the direct contact of a healthy body with a diseased body. The dry germs of measles, chick enpox, smallpox, scarlet fever and tuberculosis float freely in the atmosphere and being inhaled may find lodgment. The tiny drops of mucous emitted in coughing, sneezing, talking, laughing and singing may convey the germs of influenza, diphtheria, whooping-cough, phthisis, tuberculosis, spotted fever and glanders. The disease germs of typhoid fever, dysentery and cholera are abundant in the urine and excreta of the patients, and may be spread by spattering when the vessels are cleansed, or they may find their way into wells and reservoirs through the wash of rain. The germs of anthrax, lockjaw and malignant edema settle upon the soil and are likely to make their way thence into open wounds. Malaria, yellow and spotted fevers, the plague, sleeping sickness and some others are transferred from a sick person to a well person by mosquitoes, fleas, gnats or other biting insects. Flies catch the germs on their legs, and when destroyed in their intestines, the germs of many diseases and distribute them everywhere, particularly on human foods which are also fly foods: and most kinds of food are exceptionally good breeding ground in which many disease germs multiply with great rapidity. It is to be remembered also that infection is not likely to cease with the primary contact. A germ originally in the soil may be carried for a long distance in a bit of mud on a shoe and there transferred to a sheep-brush, or to some caressing animal, and soon start on a long journey in which it may menace any person who is in a state of health susceptible to attack by that particular disease. It is to be understood, of course, that the vast majority of persons, although some have been known to be affected by this method of multiplication. This is therefore known as the ancient, but curiously neglected, consists in executing certain complex movements of the dislocated limb which effect the return of the displaced bone to its socket by ingeniously not infected limb attachments and evading the opposition of the muscles, by ingenuity rather than force. It is particularly applicable to the hip, which, as it is commanded by the strongest mass of muscles in the body, always presented the most formidable obstacle to the old method. The first paper on
DISLOCATION—DISPENSATION

this subject which attracted general attention
was by Dr. Reid of Rochester, N. Y. (1851); and in 1869 Professor Bigelow of Boston pub-
lished a careful and exhaustive discussion of inju-
ries to the hip, with such full and clear di-
rections for the manipulation method, as to se-
cure its general adoption in the case of this
dislocation, by surgeons in Great Britain as well as in
America. 

In cases of congenital dislocation of the hip
bone and other congenital misplacements of the
bones, manipulation, intensified into powerful
massage, has been developed practically to a
wonderful extent by numerous surgeons.

DISLOCATION (in geology). See Fault.

DISLY, Duke. See BUGEAU DE LA PICON-
NERIE, Thomas Robert.

DISMAL SWAMP, Great, a tract of
marshy land, beginning a little south of Nor-
folk, Va., and extending into North Carolina;
containing 750 square miles; 30 miles long, from
north to south, and 10 miles broad. This tract
was entirely covered with trees, with almost im-
pervious brushwood between them, but it has
now in part been cleared and drained and is de-
voted to agriculture. In the midst of the swamp
is Dismal Lake, seven miles in length, the
scene of Thomas Moore's 'Lake of the Dismal
Swamp.' The Dismal Swamp was originally
part of the Virginia estate of George Wash-
ington; and it was he who superintended the
digging of the 'Washington ditch,' the first
step in its reclamation. In 1899, the Dismal
Swamp Canal, connecting Chesapeake Bay
with Albemarle Sound, first opened in 1828,
and to the close of the Civil War a famous
historic waterway, was reopened for naviga-
tion. It extends from the village of Deep
Creek, Va., to South Mills, N. C., a distance of
22 miles; and is one of the most important links
in the chain of inland waterways extending
along the coast from New York to Florida. A
marked advantage of the restored canal is that
it eases shipping to avoid the dangers of Cape
Hatteras; and another is that it furnishes the
means of inland and protected navigation for
the smaller vessels of the navy and the revenue
service. Although only 22 miles long it opens
up 2,500 miles of inland navigation. The
improvement of this canal cost the United States
government nearly $1,000,000. Little Dismal
and several smaller swamps are along the coast
of North Carolina; area, about 2,000,000 acres.

DISMAS, Saint, according to ancient
legends based on doubtful authority, the name
of the penitent thief who died on the cross be-
side Jesus Christ; that of the penitent thief
being given as German.

DISPART (Lat. disparsire, to divide
apart), the difference between the semi-diam-
eter of the base ring at the breech of a gun
and that of the ring at the swell of the
muzzle. On account of the dispar the line of
aim makes a small angle with the axis,
so that the elevation of the line of fire above
the horizon is greater than that of the line of fire
in modern guns. The dispar is of no conse-
quence on account of the present placing of the
sights on the mount and not on the gun.

DISPENSARY is literally a place where
medicine or food is weighed out for distribu-
tion; in our own day the term is applied to a
charitable institution where medical and surgi-
cal aid are given without charge to those who
desire or need them. Such dispensaries are
found in most large towns of the United
States and Europe. In the Old World they
originated in the monasteries. The modern
dispensary system in England was inaugurated
in London in 1687. The oldest institution of
that kind in the United States was opened in
New York in 1795.

Figures compiled by the American Hospital
Association show that the number of dispensa-
ries has grown from 200 in 1904 to over 2,300
in the fall of 1916. Of these about 1,000 were
dispensaries for the sick poor, treating general
diseases, while the remaining 1,300 were pub-
lic health dispensaries for the re-

The dispensaries, founded and maintained
for the relief of the sick poor, have been
greatly abused in Europe as well as in the
United States and to a large extent by the propa-
gators of pauperism. In 1897 it was esti-
mated that in Albany 21 per cent, in Brook-
yln 31 per cent and in New York 71 per cent
of the population (inclusive of suburban pa-
tients) applied for free treatment in the disp-
ensaries. In 1899, with the view of putting
matters right, it was enacted in New York State
that dispensaries were only permitted to be operated
under license, and among other reforms, appli-
cants for relief were compelled to sign a decla-
rations of their inability to pay; but it is esti-
mated that, in spite of that and other measures
taken, only 50 per cent of those aided are in
need of what is practically gratuitous medical
relief. In Boston in 1909 it was estimated that
those who attended free dispensaries equalled
over 25 per cent of the entire population of the
city. The weakness of the position is that pub-
lic clinics are attended by fee-paying students
and doctors eager for dispensary experience
and that for their sake patients must be ob-
tained, who, as an equivalent, are expected to
appear before a medical class, submit to public examination and be the text for
a medical or surgical lecture.

Consult Goldwater, 'Dispensary Ideals; a
Plea for Dispensary Reform' (Philadelphia
1909); Report of the Boston Dispensary for
1911, and those of New York State Board of
Charities for 1878, 1897 and 1905; and articles
in the Maryland Medical Journal for March
1907, "Suggestions for Reorganization of Hos-
pital Out-patient Departments"; and Canadian
Journal of Medicine and Surgery for January
1912, "The Out-patient Clinic."

DISPENSATION, in canon law, is the
relaxation of a law in a particular case: it is an
act for which the lawgiver is competent as re-
gards laws enacted by himself as a person and
cessors to whose powers he succeeds. It dif-
fers from absolution, for it not only forgives
the illegal act but validates its results. It is
claimed for the Supreme Pontiff that he can dis-
pense in matters where the jus divinum springs
from a human act, the power as in promissory
oaths (Liguori): in such case casu-
ists hold that the Pope does not do as with
the jus divinum but removes the ground of the
obligation of oath or vow: in the words of Aquinas, "He determines what is pleasing to God." The claim of power in the Pope to do this rests on the power granted to Saint Peter, of binding and loosing, but even those powers, not only from diocesan or provincial statutes, but even from laws imposed by a general council or by the Pope; but since the time of Innocent III (d. 1216) the right has been claimed as a prerogative of the Supreme Pontiff. Bishops by their ordinary power can dispense from the laws and statutes of their own diocese and from the general laws of the Church by virtue of powers delegated by the Pope; as in most vows and in the laws relating to fasts, abstinences, observance of holidays, etc. In 1534 Henry VIII decided that for his realm applications should no longer be made to Rome, and this assumption of ecclesiastical rights he conferred on the archbishop of Canterbury. Dispensations are generally obsolete in the Anglican Church, but bishops have power of issuing special marriage licenses and permitting non-residence and the holding of two benefices.

**DISPERSION**, an optical term applied to the angular separation experienced by the component rays of a pencil of light on emerging from a refracting medium, whose surfaces are not parallel to each other, as in the case of the common prism. The nature of this phenomenon was first clearly expounded by Sir Isaac Newton in 1666 and is accounted for by the different speeds of light of different wave-lengths in the same refracting medium. The refractive index of a transparent medium is different for different kinds of light. Thus, when white light passes through a given prism, the rays of different refrangibility of which it is composed are bent by different amounts from their original common direction. They are said to be dispersed. The dispersion for the given prism depends upon the difference of the refractive indices of the extreme rays of the visible spectrum. It varies with the substance and the angle of the prism. The relative breadth of the two parts of the spectrum varies with the substance of the prism. This constitutes the so-called irrationality of dispersion. In general, rays of short wave-length are more refracted than rays of long wave-length, but in some refracting media this law breaks down in part. This is known as anomalous dispersion. The term false dispersion is applied to the scattering of light by reflection from motes suspended in a transparent medium. See LIGHT.

**DISPLAYED**, a heraldic term used to describe the position of an eagle or other bird with its wings expanded.

**DISPOSE**, in law, to put out of possession, to dislodge and evict; to deprive of actual occupancy, particularly of real property. Dispossess proceedings are begun against a tenant who is then served with a dispossess warrant and forbidden to remain on the premises following. See EJECTMENT AND EVICTION.

**DISPUTATIONS**, Historic. Public debates on religious questions are of very ancient origin according to the tradition in the Midrash which represents Abraham as holding a debate with Nimrod. In 150 B.C. a debate was held in Alexandria before Ptolemy Philomater on the comparative pureness and completeness of the Jewish and Samaritan text of the Old Testament. Later, Jews and Romans debated. In the early Christian Church debates were held with the Jews. Two are of especial prominence: the debate of Athanasius with Zaccarius and the debate of Justin Martyr with Trypho, the Jew. In the 13th century the Jews and Christians of Italy publicly disputed various questions. A great dispute was held at Paris, 25–27 June 1240, in the presence of King Louis IX, and a great number of priests and rabbis. Another famous dispute took place at Barcelona, 20 June 1263, on the question whether the Messiah had appeared or not. It was at the royal palace in the presence of James I of Aragon and his court. Benedict XIV presided over a great debate which was held with great pomp and numbers at Tortosa beginning in February 1413 and ending November 1414. It was probably the longest debate in history, having 69 sessions and many debaters. The councils of the Church have power to issue decrees for the suppression of heresy and the granting of degrees further extended the scope of the public debate. Many of the institutions held a weekly debate where the students were taught to defend a thesis against attack, did more to enable them to grasp a subject than the mute and solitary reviewing and cramming of our modern examinations can possibly do. That method brought into play all the excitement of a contest, the triumph of success, and the disgrace of defeat in order to emphasize the value of what had been learned, together with the importance of an alert wit and constant readiness to use it.
especially noteworthy in the Marprelate and Deistic controversies. A great disputation was held in Geneva in May 1535 in which Viret and Farel took part against Jean Chapsis. Farel and Viret also debated at Lausanne in October 1536, in a public disputation, with the Papal party. In 'The Cyclopedia' edited by Abraham Rees, we find that 'The Port Royalists take occasion to observe that nothing gives so many different lights and openings for discovering the truth as disputation. The movements of the mind employed singly in the examination of any subject, are usually too cool and languid; the mind needs a certain degree of heat to awake its ideas. Now, by the oppositions in dispute we come to find wherein the difficulty lies, and the vigor the mind has acquired enables us to surmount it.' Some debates have occurred in America which attracted wide attention. Alexander Campbell, founder of the Disciples Church, was a great debater. At Cincinnati, Ohio, 13th April 1839, he debated with Rev. Robert O. Lanark, Scotland, on the 'Evidences of Christianity.' Again at Cincinnati, 13th-21 Jan. 1837, he debated on the Roman Catholic religion with Rev. John B. Purcell, bishop of Cincinnati. Mr. Campbell also debated with Rev. Nathan L. Rice, at Lexington, Ky., 15 Nov. to 2 Dec. 1843, on Christian baptism. The report of the debate fills a volume of 912 pages. Cincinnati was the scene for another noteworthy debate, 1st, 2nd, and 3rd Oct. 1845, on the 'Sinfulness of Slavery.' The debaters were both Presbyterian clergymen of Cincinnati, Rev. J. Blanchard and Rev. Nathan L. Rice. A public debate was held at Genoa, N. Y., beginning Dec. 1847 and ending 5 Jan. 1848, between David Holmes, a Methodist, and John M. Austin, a Universalist, on the doctrines of the 'Atonement,' 'Universal Salvation' and 'Endless Punishment.' A debate was held near Cincinnati in 1860 on the 'Coming of the Son of Man,' 'Endless Punishment' and 'Universal Salvation' between Erasmus Manford of Saint Louis, Missouri, and James D. Abu, of the Franklin of Cincinnati, editor of the American Review. A nine days' debate was held at Vienna, Ill., in August 1868, covering 'Baptism,' the 'Work of the Holy Spirit,' the 'Discipline of the Episcopal Church,' and 'Human Creeds.' The debaters were Clark Braden of the Church of Christ and George W. Hughey of the Methodist Episcopal Church. A large volume of nearly 700 pages was probably the only result of the debate. There have been many informal debates between Armenians and Calvinists, Methodists and Baptists, Episcopalians and Dissenters when the discussions were not printed. The American political debates have furnished one of the most brilliant contributions to the forensic history of the United States.

DISRAELI, Benjamin. See Beaconsfield.

DISRAELI, Isaac. English author: b. London, 11 May 1766; d. Buckinghamshire, 19 Jan. 1848. His father, Benjamin D'Israeli, was the descendant of a family of Jews who had settled at Venice in the 15th century to escape the persecutions of the Inquisition. He was educated at Enfield and Amsterdam. In 1791 appeared the first volume of his 'Curiosities of Literature,' the most entertaining of his works and that by which he is best known at the present day. This work, the sixth and concluding volume of which was published in 1834, passed through 12 editions in his lifetime. Its success was such as to determine D'Israeli to pursue the same path through the literary field, the collection of instructive and amusing gossip relative to literary men and their writings. From this period up to 1812 he appears to have been principally engaged in the collection and preparation of literary materials, the results of his labors appearing in the following works, published between that year and 1822: 'Calamities of Authors'; 'Quarrels of Authors, or Memoirs of Literary Controversy'; and 'Inquiry into the Literary and Political Character of James I.' These were afterward published collectively under the title of 'Miscellanies of Literature.' In 1828 appeared the commencement of his 'Life and Reign of Charles I.', a work completed in 1830. In 1841 appeared his 'Amenities of Literature.' He also wrote several romances. D'Israeli was a man of a pensive and solitary turn of mind and his life was quite that of a literary recluse, spending the greater part of his time in his library, and on terms of friendship with Scott, Byron and Bulwer-Lytton. He abandoned Judaism for Christianity in 1817. A memoir of him, prefixed to a new edition of his 'Curiosities of Literature,' was published by his eldest son, Benjamin Disraeli, afterward Earl of Beaconsfield (q.v.).

DISRUPTION, the name commonly applied in Scotland to the act by which, in 1843, about 500 ministers of the Established Church gave up their livings to vindicate principles which they held to be essential to the establishment of the Church and in harmony with its earlier history. A conflict between the civil courts and the Church on the question of lay patronage was its immediate cause. The founders of the Free Church held the liberty of deciding when the turn should come when the Church which they had left had abandoned its attitude and reëndicated its independence of the civil power. See FREE CHURCH; UNITED FREE CHURCH OF SCOTLAND.

DISSECTION, the process of studying the parts or organs of animals or plants by cutting or tearing operations. Practically no complete knowledge of the structure of organized bodies can be obtained in any other way than by complete dissection, and in human anatomy its place in the curriculum is most important. The dissection of human bodies in the study of anatomy has probably taken place as long as we know the history of civilization; although, in certain countries and at certain ages, the practice of human dissection has been forbidden by certain ruling classes,—at one time the Church, another time the state, another time the aristocrat, and another time public opinion. At the present time, however, dissection of the dead body is recognized to be a prime essential to the study of medicine, and throughout all civilized countries it is widely practised.

DISSECTION WOUNDS, wounds made by cutting or tearing operations. Practically no complete knowledge of dissection, which differs from ordinary wounds of accidental origin, largely in their greater liability to become infected by pus-producing
bacteria. The human body after death makes an excellent host for a number of these septic organisms, notably the staphylococci and streptococci. It is by the entrance of these usually present organisms into the wounds that this ready infection takes place. Dissection wounds frequently prove fatal by the extension of the infection, with resulting blood poisoning. Great care should be taken by all students of anatomy as well as by undertakers and their assistants in order to avoid accidents of this kind. See Burn; Poisoning; Pyæmia.

DISSEIZIN, dis-seże-zn, or DISSEISIN (Fr. dessaisir, to seize, deprive of), is the dispossessing one of a freehold estate, or interrupting his seizin. *It is a wrongful putting out of him that is seized of the freehold, not, as in abatement or intrussion, a wrongful entry, double the possession was vacant, but an attack upon him who is in lawful possession, and turning him out. It is an ouster from a freehold in deed as abatement and intrussion are ousters in law." Under the feudal law, when a vassal was admitted to an estate by the ceremony of investiture, he was said to be seized of it. The disseizing of him was the turning him out of his fee. This term is synonymous, in modern law, with "adverse possession." There is also what is called in law disseizin by election, when a property holder chooses to consider himself disseized of certain real estate, in order to avail himself of remedies at law applicable only to a disseizee. Equitable disseizin is where a person is wrongfully deprived of the equitable seizin of land, e.g., of the rents and profits. A title by disseizin is a good title against all but the rightful owner.

DISSEETERS, the common name by which in England all Christian denominations, excepting that of the Established Churches, are usually designated, though in acts of Parliament it generally includes only Protestant dissenters, Roman Catholics being referred to under the more specific name. The name is not applied to those bodies which dissent from the Established Church in Scotland. The term non-conformists is often used as synonymous with dissenters (see NON-CONFORMISTS). Within recent years the term Free Church has been applied with the same significance to dissenting bodies.

DISSEIPMENT, in botany, a division of the ovary; a true dissepiment is formed when the carpels are so united that the edges of each of the contiguous ones by their union form a septum. Each dissepiment is formed by a double wall of two laminae; when the carpels are placed side by side, true dissepiments must be vertical and not horizontal. A spurious or false dissepiment is formed when the divisions are not joined by the union of the edges of contiguous carpels. They are often horizontal, and are then called phragmata. In the Cruciferae they are vertical.

DISSOICATION, in chemistry, is the resolution of a substance into other substances, whose molecules have a simpler constitution; but the word is usually applied only to those reversible resolutions in which the secondary products are capable of recombining to form the primitive substance, when the conditions that led to the dissociation are removed or reversed. Dissociation is therefore to be contrasted with "decomposition," for the latter word is used without any implication as to the subsequent behavior of the products into which the primitive substance is resolved.

Dissociation, in the usual sense of the word, is induced directly by the application of heat, and many cases of it have been exhaustively studied. Calcium carbonate may be taken as an example. When this substance is heated in a closed vessel it parts with a portion of its carbon dioxide and becomes reduced to a mixture of calcium oxide, calcium carbonate, and free carbon dioxide gas. The decomposition proceeds only up to a certain limit, however, and if (as in burning" limestone for the production of quicklime) it is desired to reduce the carbonate of calcium entirely to the form of the oxide, it is necessary to provide for the removal of the carbon dioxide gas. If the operation be carried out in a strong closed vessel which contains nothing but calcium carbonate, calcium oxide and carbon dioxide, the decomposition proceeds only until the liberated carbon dioxide attains a definite pressure called the pressure of dissociation, which is always the same for the same temperature, and bears no relation to the quantity of alkali carbonate that is present, provided some quantity of it (no matter how little) still remains. Sir James Hall showed, many years ago, that when calcium carbonate is confined in this way it may even be fused without undergoing decomposition to any considerable extent.

The explanation of these curious facts is, that the carbon dioxide is continually combining with the calcium oxide in certain parts of the vessel with the production of calcium carbonate, while in other parts of the vessel the calcium carbonate is simultaneously dissociating into free calcium oxide and free carbon dioxide. The recombinations proceeds with a velocity that is proportional to the density of the free gas, while the dissociation proceeds with a velocity which, for the purpose of illustration at all events, may be regarded as constant. It follows that at low densities of the gas the dissociation will proceed faster than the recombinations, the result being that the density of the free gas will increase. But this will lead to recombinations to proceed faster, and finally, when the density of the gas reaches a certain critical value, the recombinations and dissociations will proceed with equal velocity and a state of apparent equilibrium will be attained. No further visible decomposition of the carbonate will take place, unless the equilibrium is disturbed by the removal of some of the carbon dioxide (in which case the dissociation will again proceed until the same critical density of the free gas is restored), or by a further increase of temperature (in which case the dissociation will proceed until the density of the gas attains to a new critical value, higher than the first one, and whose value depends upon nothing but the new temperature to which the system has been raised). Reactions such as the one here described thoroughly refute the old doctrines of chemical affinity, which taught that two substances either will or will not combine under given circumstances, according as the chemical "affinities" of the two substances would be more or less thoroughly "satisfied" in the possible new compound than they are in the separate substances that might combine to pro-

CERTAIN COMPOUNDS (SUCH AS SODIUM CHLORIDE) APPEAR TO BE MORE OR LESS COMPLETELY DISSOCIATED WHEN THEY ARE DISSOLVED IN WATER, BUT THE CONSTITUENTS INTO WHICH THEY ARE RESOLVED POSSESS CERTAIN DISTINCTIVE PROPERTIES THAT ARE NOT MANIFESTED BY THE RESOLVED PARTS OF SUBSTANCES THAT ARE DISSOCIATED BY THE ACTION OF HEAT. FOR THIS REASON IT IS NOW USUAL TO DISTINGUISH THIS PARTICULAR PHENOMENON BY A SPECIAL NAME, AND THE DISSOCIATION THAT OCCURS IN SUCH CASES IS CALLED "IONIZATION." (SEE ELECTROLYSIS; SOLUTIONS.)

THE PHYSIOLOGICAL BASIS AND PSYCHOLOGICAL SIGNIFICANCE OF DISSOCIATION ARE ALIKE MATTERS OF THE GREATEST INTEREST. IT IS NOW INSTEAD ASSUMED BY SIDIS AND OTHER WRITERS THAT THE PHYSIOLOGICAL BASIS OF MULTIPLE PERSONALITY IS A change in the conductivity of the interconnections between the neurons. A theory of this sort, however convenient it may be as a means of summarizing the known phenomena, is worthless for explanatory purposes because of our profound ignorance of the processes of nerve-conduction and because of the practical impossibility of studying the anatomy of the intertwining of the dendrites of different neurons, except as mass-phenomena. The psychological significance of dissociation depends on whether the self as the unity of consciousness is or is not something superadded to the system of experiences it unites. If the self is not something beyond the system it unites, it follows that the result of a dissociation is the formation of two distinct selves, which, as Sidis puts it, share the same body in a manner analogous to the heads of a two-headed monster. On the other hand, if the self is an entity entirely beyond its experiences, it becomes possible and even likely that the duality of a dissociated self is fictitious. See PERSONALITY, DISORDERS OF, AND CONSULT THE BIBLIOGRAPHY THERE.

DISSOLUTION, THE RESOLUTION OF ANY BODY INTO THE SMALLEST PARTS BY CHEMICAL AGENCY. IN ENGLISH POLITICS, THE ACT OF DISSOLVING OR PUTTING AN END TO THE EXISTENCE OF A PARLIAMENT. IT DIFFERS FROM A PRODRAGATION, WHICH IS THE CONTINUANCE OF A PARLIAMENT FROM ONE SESSION TO ANOTHER, AND FROM AN ADJOURNMENT, WHICH IS ITS CONTINUANCE FROM ONE DAY TO ANOTHER. DISSOLUTION IS THE CIVIL DEATH OF A PARLIAMENT AND THIS MAY BE EFFECTED IN THREE WAYS: (1) BY THE PROROGATION OF THE SOVEREIGN ACTING ON THE ADVICE OF HIS MINISTERS—THIS ADVICE MAY BE DUE TO VARIOUS CAUSES, THE MOST IMPORTANT BEING THE LOSS OF SUPPORT OF A MAJORITY OF THE HOUSE OF COMMONS. (2) A PARLIAMENT MAY BE DISSOLVED OR EXPIRE BY LENGTH OF TIME. AS THE CONSTITUTION NOW STANDS THE PARLIAMENT MUST EXPIRE OR DIE A NATURAL DEATH AT THE END OF EVERY SEVENTH YEAR, IF NOT SOONER DISSOLVED BY THE ROYAL PROROGATIVE; BUT THE CUSTOM IS TO DISSOLVE NOT LATER THAN THE SIXTH YEAR OF A PARLIAMENT. A SITUATION WITHOUT PRECEDENT IN MODERN TIMES AROSE AFTER THE OUTBREAK OF THE GREAT WAR IN 1914, WHEN THE LIFE OF THE PARLIAMENT ELECTED IN 1910 AND WHICH IT WAS INTENDED SHOULD EXPIRE ON 30 OCT 1915, WAS EXTENDED FROM TIME TO TIME BY SPECIAL ACTS.

THE DEMISE OF THE CROWN WAS FORMERLY FOLLOWED AUTOMATICALLY BY A DISSOLUTION OF PARLIAMENT, BUT SINCE 1867 THE LIFE OF PARLIAMENT REMAINS UNAFFECTED BY THE DEATH OF THE SOVEREIGN.

DISSOLUTION OF CORPORATIONS. SEE CORPORATIONS, LEGAL.

DISSOLVING VIEWS, PAINTINGS UPON GLASS MAGNIFIED AND DRIED TOWARDS GREAT DISTINCTNESS UPON A SCREEN BY MEANS OF ONE OR TWO
DISONANCE—DISTICH

magic lanterns with strong lenses, and illumi-
nated by the oxyhydrogen light. If one lantern
is used the picture is drawn out of focus gradu-
ally, and a second substituted, which is brought
gradually into focus, thus producing the blure
and brilliancy which have gained this sort of
exhibition its name. If two lanterns are used,
they are placed side by side with their lens
tubes slightly convergent, so that the images
may be superposed on the screen. An opaque
screen, in front of the lanterns, is placed regu-
larly upon a pivot fixed midway between the
lanterns, is placed before the lenses in such a
position that when horizontal, it cuts off one-
half of the pencil of light from each lens.
When this shutter is made to revolve through
a small arc, it shuts off the whole of the pencil
of light from lantern No. 1, allowing that from
No. 2 to pass unhindered. When the shutter is
in this position the image from No. 2 falls on
the screen in full distinctness; but when the
shutter is made to revolve in the opposite di-
rection from No. 1 will be gradually disclosed,
as that of No. 2 becomes concealed.

DISONANCE (Lat. dissonantia—dis-
sonare, to sound harshly). In music, a sound
of two or more tones struck together which
are at variance with the formation of a com-
mon major or minor chord. Thus it is an
interval, one or both of whose members must
move in a certain way to satisfy the ear—
manding resolution into consonance (q.v.). If
the dissonance is minor or major one member
only is compelled to move. If augmented or
diminished both members must move, toward
each other if the interval is diminished, and
contrary if augmented. All augmented and di-
minished intervals, seconds, sevenths and
ninths are dissonances. See ACOUSTICS;
CHORD.

DISTAFF, the earliest instrument of spin-
n ing, a staff, on one end of which the wool or
flax was rolled. The spinner held it under the
left arm, pressed against the body, or fixed in
the waistband of the skirt. The left hand was
busy at the tip of the distaff, feeding and dis-
tributing the fibre as it was drawn off by the
spindle. The spindle, a round stick of wood
about 12 inches long with a whorl of clay, a
stone, or a pole, at the upper end to give it
momentum and steadiness when in rotation, had
a slit or notch to which the yarn was caught
or fixed. A prepared end of yarn was fixed in
the slit and with a deft rolling motion of the
spindle with the right hand against the right
leg, the spinner threw it from her, while with
the left hand, as explained above, the fibre was
fed in an increasing length of yarn and thread,
twisted, drawn and criss-crossed from bottom
to top until the spindle was full. As spinning
was a typically feminine employment, "distaff"
has come to be used figuratively for woman.
The 7th of January is called Saint Distaff's
Day, because it marks the return of the women
to their usual household duties, after the revels
of the Christmas holidays ending with Twelfth
Day.

DISTEMPER, a germ disease of the dog
family commonly considered as a form of
fluenza. It affects not only the domestic dog
but also foxes, wolves, jackals and the hyena.
It generally attacks young dogs—dogs over a
year old rarely take it—and only once during
life. In large cities the disease may break out
at any time; in the small towns and in the
country it is more prevalent in hot weather.
It is contagious in the highest degree, and is
only communicable by infection. In most cases
a running from the nose and eyes is one of the
first and chief symptoms. This defluxion be-
comes after some time mucous and purulent,
loading the eyes and obstructing the nostrils.
And when we of revolving ve-

year old rarely take it—and only once during
life. In large cities the disease may break out
at any time; in the small towns and in the
country it is more prevalent in hot weather.
It is contagious in the highest degree, and is
only communicable by infection. In most cases
a running from the nose and eyes is one of the
first and chief symptoms. This defluxion be-
comes after some time mucous and purulent,
loading the eyes and obstructing the nostrils.
And when we of revolving ve-

consequence. Pneumonia is not an infrequent
supervision of the disorder, and the bowels
are more or less affected by diarrhoea and
dysenteric discharges. In the first stage of
the disease laxatives, emetics, and occasional
bleeding are the principal remedies; diarrhoea
should be checked by astringents, and to re-
duce the violence of the fits warm bathing
and antispasmodics should be resorted to.
Medicine, however, is quite secondary in the
management of distemper: good nursing and
dry comfortable quarters in a warm tempera-
ture are the essentials. The disease generally runs
its course in from two to three weeks.
The death rate from it is much larger in the large
cities than in small towns and rural districts.
The term distemper is sometimes applied
erroneously to influenza in horses, and to epi-
zootic pleuro-pneumonia in cattle.

Consult Hill, I. W., 'Management and Dis-
tases of the Dog' (new ed., London 1881);
Hutryra and Marek 'Pathology and Therapeu-
tics of Dogs' (2nd ed., 1912); Muller and Glass, 'Diseases of the

DISTEMPER (from O. Fr. distemper, Mod. Fr. dîtempe, Ital. tempera)
in painting a preparation of chalk mixed in water contain-
ing a little glue, white of egg or similar binder.
The mixture is tinted by adding dry colors. It is
used now chiefly in scene painting, but was
employed in the higher departments of art, espe-
cially in mural decoration, before the estab-
lishment of oil or varnish painting in the 15th
century. It is distinguished from fresco, in
which the dry colors are mixed with calcined
plaster and water and applied to a fresh damp
surface of plaster with which they become in-
corporated.

DISTICH, dis'tikh, a couplet of verse mak-
ing complete sense; e.g., Pope's couplet:

"Be not the first by whom the new are tried,
Nor yet the last to lay the old aside."

It was much used by Greek and Roman writers
in the crystallization of thought. No form is
more suitable for maxims or aphorisms. It is
also employed in elegiac verse. It was used
largely by Goethe and Schiller. The 'DISTICHA'
of Cato Dionysius (q.v.) is a classical textbook
on the subject.
DISTILLATION is a special application of the process of evaporation which has for its object the separation of the component parts of a complex or compound substance. The vaporization is done generally by heat with, in some cases, the assistance of a vacuum, and the vapors are collected and condensed generally in a liquid form. When the resulting distillate is a solid and the liquid and its condensate involved in the process is called "sublimation."

The apparatus required in a simple distilling plant is: (1) the still or retort in which the vapors are produced; (2) the condenser in which the vapors are liquefied, and (3) the receiver in which the product or distillate is collected.

The process of distillation is applied to both liquid and solid substances. In the latter case it is called dry distillation when the substance distilled does not liquefy in the operation.

The theory of distillation depends on the fact that a simple substance boils or vaporizes at a certain constant temperature—or, in other words, when its vapor pressure exceeds by the smallest fraction the atmospheric pressure upon it. Supposing a complex substance will vaporize each at its individual boiling point. By collecting separately the different vapors which come over from the retort at different temperatures the several components are secured. There are some substances which condense at the normal atmospheric pressure when raised to a temperature high enough to vaporize them. In order to distill such substances it is necessary to reduce the pressure in the retort by producing therein a partial vacuum, which has the effect also of lowering the boiling point. Vaporization of a substance below its boiling point may also be accomplished by passing a current of steam through it.

Another economic use of distillation is the concentration of volatile substances through repeated distillations, as in the case of the rectification of alcohol and the production of glycerine.

Among the articles in common use made by the distillation process are gasoline, kerosene, lubricating oils, paraffin wax, coal-tar color intermediates, aniline oil, alcohol, spirituous liquors, perfumes, essential oils, glycerine, camphor, ether, chloroform, turpentine, sulphuric acid and many others.

When distillation is properly conducted many liquids as for instance, water, can be purified.

Distillation of Water.—Water is never found absolutely pure in nature; it generally contains salts and other mineral substances, organic matter and decomposition products, some volatile and some non-volatile. The water is readily separated from the non-volatile components by distillation. Inasmuch as the volatile constituents are highly evaporative they are received in the very first distillate of the water, so that it is customary to reject this first portion. Experience has taught that pure water is obtained by distilling three-fifths of the entire amount and rejecting the first one-fifth. In some special cases where a water has many volatile impurities which can be detected by its appearance, odor and taste, the distillation might be rendered more difficult as it becomes necessary to add certain chemicals to the water in order to combine with the volatile components and transform them into non-volatile bodies. The purifying of water by means of distillation or, in other words, the preparation of distilled water, is of much practical value. In the laboratory, in the chemical laboratory and in many chemical industries distilled water is an indispensable article. The transformation of the salt water of the ocean into a potable water by means of distillation is also of inestimable value. Pure distilled water, however, has often an empyreumatic odor and a repulsive flat taste. According to the most recent medical investigations pure distilled water when constantly used is, on account of its very purity, deleterious to health. It is claimed that this water possesses high solvent properties and also absterses the mucous membrane of the stomach too much. For this reason the odor of the water is improved by thorough aération or carbonization, and it is made palatable by the addition of pure salt or sugar or any other desired substance. The large ocean steamers have an equipment for producing potable water from sea water. The fundamental elements in this apparatus are a steam generator or evaporator in which the sea water is vaporized by means of superheated steam, the vapor obtained either from a special boiler or directly from the engine boiler, a condenser combined with an aerator and a refrigerator with which in many cases a filter is combined. In recent times many ships supply themselves with an especially good spring water for drinking, while for cooking, washing and boiler feeding they distil the sea water as it is required. For these latter purposes carbonating and aération are of course unnecessary. In most cases the evaporator is connected directly with the ship's engine. The sea water which is to be evaporated is taken from the water cooling the condenser, while the steam is obtained from the steam-jacket or an intermediate compartment of the engine. In this way the cylinder is constantly drained and supplied with fresh steam. One form of still utilizes the escaping gases for heating the water so that the entire apparatus is situated in the chimney. In general the distillation of water is very simple, because it is a liquid which has a constant boiling point, which is heat in the distillation process simply occasions more rapid evaporation. The escaping steam, unless it is heated in a special apparatus as is done in the case of superheated steam, retains the boiling point temperature until it is cooled.

However, it is different with a mixture of various vaporizable liquids each of which has a different boiling point. According to the predominance of one or the other liquid the mixture will have a varying boiling point. When the vapors passing over at different temperatures are separately condensed it is possible to obtain single components from the mixture, provided, of course, that the various components of the mixture differ decidedly in their boiling points. This special method of distillation is called fractional distillation.

The best-known distillation process is the separation of water and alcohol or, in other words, the concentration or rectifying of alcoholic solutions by means of distillation. This is a special branch of modern industry. Distillation of Spirits.—The boiling points of water and alcohol differ considerably. At normal atmospheric pressure water boils at 100° C. (212° F.), while alcohol boils at 78.4° C.
(173.5° F.). Consequently, it is evident that the boiling point of a mixture of water and alcohol will range between 173.5° and 212° F. In proportion to the predominance of alcohol the boiling point will be lower, and as the alcohol vaporizes the boiling point will rise until, finally, pure water is distilled at 212° F. If a dilute mixture of water and alcohol (the mash in the American distillery usually contains 5 to 10 per cent alcohol by volume (10 to 20 proof)) is distilled in a simple distilling apparatus consisting of a pot or still and a worm, dilute alcohol is always obtained, and the smaller the quantity of alcohol contained in the mixture the greater proportionately will be the amount of alcohol contained in the distillate, as is shown in the following table of Groening:

If the distillate obtained from a dilute mixture of water and alcohol is redistilled, a distillate containing more alcohol is obtained. Thus in four distillations from a mash having 10 per cent alcohol by volume (20 proof), a raw spirit 80 per cent alcohol by volume (160 proof) is obtained, in which the first distillate contains 28 per cent alcohol by volume, = 56 proof. Second distillate contains 50 per cent alcohol by volume, = 100 proof. Third distillate contains 70 per cent alcohol by volume, = 140 proof. Fourth distillate contains 80 per cent alcohol by volume, = 160 proof.

Of course, we assume that each time the distillation is carried out completely. Formally, it was necessary to repeat the distillation several times, in order to obtain a highly concentrated alcohol. The first weak distillate with less than 20 per cent alcohol by volume was called louter. It was used for the further concentration of the alcohol. This method of concentrating alcohol was called doubling or rectification, but as this repetition was tedious and consumed much time and fuel, a shortening of the distillation process was eagerly sought for, and with the aid of suitable appliances it has now become possible to accomplish a complex, separatory distillation in one operation.

The following principle is standard for the construction of distillery apparatus. If the concentrated alcoholic vapors developed at the boiling of the alcohol-water mixture are not cooled down to the temperature of condensation, but only a few degrees, then a greater part of the less volatile liquid, that is, water, is condensed than of the more volatile alcohol. Through this partial cooling, the remaining vapor accumulates more alcohol. This process is called dephlegmation and denotes a draining of the alcohol, as the older chemists designated the water as a component of spirit by the word "phlegm." Another device by which the alcoholic vapors are enriched is a small closed retort containing a weak distillate through which the hot vapors are passed. The water vapor is condensed, and the alcohol of the distillate vaporizes from the vapors from the still. Accordingly, the more recent apparatus in larger distilleries, in which highly concentrated alcohols are manufactured, are equipped with a dephlegmation and rectification appliance, in direct connection with the still, so that it has become possible in the column type of still, with continual operation, to produce, from the fermented mash, a high wine free from fuel, containing 90 to 95 per cent alcohol by volume (180-190 proof).

According to the capacity of the plant, and, especially according to the kind of product, different types of apparatus are used in the distillery; but an enumeration here of these would lead too far, while their description properly belongs under special heads. Therefore only the main types of various distillatory apparatus are mentioned here:

1. Simple stills, with worm condenser heated by direct firing.
2. Simple stills, with closed washwarmers, in which the mash is previously heated by the latent heat of vaporization.
3. Double pot-stills, generally consisting of two superimposed stills. While the mash in the lower still is being deprived of its alcohol, the mash in the upper still is enriched with alcohol and heated by the vapors of the lower mash, until the latter after sufficient concentration is heated to the boiling point. From this time on alcoholic vapors develop in the upper pot which are cooled in a dephlegmator and absorb still more alcohol. The concentrated vapors pass over into the condenser, while the condensed liquid flows back into the upper still. Such apparatus is either heated by direct firing below the lower still, or by means of steam, which is introduced into the lower still.
4. Two, three or more chamber charge-stills, with or without charging chamber in one apparatus, in which the single compartments are placed one over the other, and the heat from the lower stills serves to enrich the one above. Steam is used for heating.

All these apparatus, when heated by direct firing, are made either of copper or iron; when heated with steam are made generally of copper, but oftimes of wood, such as heavy
5. Continuous pure still apparatus (on account of their form called column apparatus), which are used mainly in large distilleries, can be regarded as a combination of a large number of small stills, in which the mash, continuously flowing from the upper compartments to the lower, constantly comes in contact with steam flowing in the opposite direction. Through this countercurrent, the rising vapors become more and more condensed, by the dephlegmation and rectification taking place in each of the compartments, while the mash flowing downward is constantly deprived of its alcohol until it flows from the lowest chamber as slope, free from alcohol. The concentrated alcoholic vapors, escaping from the uppermost chamber of the column, are then liquefied in a condenser when alcohols of only moderate strength (125 to 150 proof) are to be produced; but, if very pure highly concentrated alcohols are to be manufactured, a specially constructed rectification column, where they meet with the liquids (lutter or phlegma), returning from the dephlegmator or condenser. The vapors take up alcohol from the liquids and pass from the upper Chamber of the rectifier into the dephlegmator, in which a countercurrent between the condensed liquids constantly takes place.

The advantages of the continual column apparatus in comparison with the simple pot-stills, are, that the mash is more quickly vaporized, that the expense for fuel is diminished and that, as a rule, a more highly concentrated product is obtained. But, on the other hand, they also require more care and attention and skilled operators. Besides, there is a possibility that alcohol might sometimes pass off with the slope. In the simple stills this possibility is considerably reduced, so that it is still advisable for small distilleries to erect good pot-stills, because they manufacture mostly alcoholic liquors with about 50 per cent alcohol by volume (100 proof).

The alcoholic liquid obtained in the distillery with the best modern apparatus contains, besides the highly concentrated alcohol (96 per cent by volume, 192 proof), more or less fusel oil, a mixture of amyl, propyl and isobutyl alcohols. Up to the present time, the following impurities contained in 50 to 95 per cent alcohol have been determined: acetic aldehyde, propionic alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, secondary butyric alcohol, isovaleric alcohol, isobutyric alcohol, fufural and various amines. In the corn and potato spirits amyl alcohol is in predominance, and therefore it is briefly called fusel oil. Technically, fusel oil is not a uniform substance, but the higher boiling part of the impurities accompanying the alcohol distillation.

Very little is known about the origin of these substances. Their presence might be due to secondary fermentations, which are produced by fission fungi, schizomyces, etc., the yeast itself may also have, in a certain influence, as certain yeast species are capable of producing fermentation products of a definite aroma and taste. For example: Saccharomyces ellipsoides produces a peculiar fruit bouquet. It is well known that aging or decaying yeast furnishes a product with more impurities than a sound and vigorous yeast. The material used in the distillery must also be considered. The corn, rye and potato fusel oil differ in composition, so that through experience one is enabled to detect the materials used, by the odor of the raw spirit. The fusel oil of the rye spirit contains besides amyl alcohol, aromatic enanthic ether; the molasses spirit contains the ethers of caproic acid, capric acid, caprilic acid, etc., which are very similar to the so-called oil of wine. Finally, the construction of the distillatory apparatus also influences the composition of the product. High pressure and too long a sojourn of the alcoholic vapors in the rectifier or dephlegmator are also said to be detrimental.

As it is necessary for some industries to use pure alcohol, these impurities are generally removed by either of two processes: (1) Filtration of the raw spirit through charcoal; (2) refining, by fractional distillation, or, in some cases, a combination of both. In the manufacture of brandies, the former method is generally and successfully used, as a trace of impurity gives the brandy its characteristic aroma and taste. Finely powdered charcoal made from soft wood or bark serves as the filtering medium. It is well known that charcoal, by virtue of its absorbing power, acts as a decolorizer and deodorant, but in order to effect thorough absorption, the spirit must be diluted to about 40 per cent by volume (80 proof). In smaller plants the filter consists of a vat packed with charcoal. The larger distilleries and refineries use a battery of iron cylinders packed with granular or powdered charcoal. Steam is conducted into the battery until the charcoal is thoroughly saturated; then the spirits flow in, displacing the steam and filling the pores of the charcoal. The larger part of the impurities is absorbed in the lower cylinder, while the remaining impurities are removed during the passage through the remaining cylinders. If a filter is ineffective, it is cut out, the spirit is drawn off, steam is introduced, which distills the distillate into the condenser. This distillate constitutes the so-called "feints." The feints is a dilute spirit, which is milky in appearance on account of the presence of fusel oil in emulsion. After standing, the fusel separates and can then be utilized, while the alcoholic liquid is worked up anew. The emptied filtering cylinder is repacked with charcoal and used as the last filter. The used charcoal is either ignited in a special furnace, or else purified by means of superheated steam.

Refining of Spirits.—In order to produce an entirely fusel-free and highly concentrated alcohol, which is used for blending wine, cognac, etc., as well for scientific and certain technical purposes, the filtered alcohol must undergo a fractional distillation. It is essential that the alcohol, whether filtered or not, be diluted to about 40 to 50 per cent by volume (80 to 100 proof).

The rectifier for refining in general is the same as the distilling apparatus, but, inasmuch as the operation is not intermittent one, it is an intermittent one. The columns are equipped with caps, bells or sieves.

Through distillation we receive:

1. The first runnings or fore-shot. This is the first distillate which contains those impurities
of the alcohol which vaporize at a temperature below the boiling point of the latter. Among these impurities acetic aldehyde is especially predominant.

2. Rectified fine spirit, which is divided into several distinct products, of which the first still contains some substances vaporizable at a low temperature and the intermediate products are pure alcohol, while the last portion already contains substances which volatilize at temperatures above the boiling point of alcohol. All of these products are separately collected at different intervals and furnish:

(a) Wine spirit, commercially known as Cologne spirit. It contains 96 per cent of alcohol by volume (192 proof).

(b) Prime spirit, which is technically absolutely alcohol. For medicinal purposes it meets the requirements of the alcohol deodorantum of the United States Pharmacopoeia. It contains 94 to 95 per cent alcohol by volume (188 to 190 proof).

(c) Common spirit or high wine, commercially called "rectified spirit." It is used for blending wine and cognac for medicinal and all other purposes when a pure, fusel-free, less concentrated alcohol than the foregoing is necessary. It contains about 90 per cent by volume (180 proof).

(d) Alcohol of about 88 per cent by volume (176 proof), which can be used for blending brandies as well as for preparing dilute alcohol (95 to 100 proof).

(e) Weaker alcohols, which are usually redistilled with the raw spirit.

(f) The so-called last runnings or feints, which usually contain some amyl alcohol, are used in various industries, as for example, in the textile industries, on account of their solvent power over fats and oils; in the manufacture of etheral oil and also in the chemical laboratory.

By means of filtration and fractional distillation, about 85 to 90 per cent of the raw spirit is obtained as rectified spirit, therefore it has been the object of many experiments to improve this yield.

The only successful defuselizing process is that of Traube, by which a sufficiently concentrated potash solution is mixed with the spirit in accordance with its strength and heated to 60° to 70° C. (140° to 158° F.). Two layers are formed, the upper, which is dark-colored and foul-smelling, contains the impurities, and in the lower we find the purified alcohol with the salt solution. After removing the former, the latter is distilled in a rectifier and concentrated; 97 to 98 per cent of the raw spirit is secured by this process.

But after all, filtration through charcoal is the best practical refining process for brandies, while filtration and fractional distillation are best employed for Cologne spirits. In large distilleries the manufacture of Cologne spirit and rectified alcohol directly from the mash is both practically and technically the most advantageous when manufactured in apparatus based on Ilges' system. In ordinary distillations and the degeneration of the material takes place, as the fermentation products of the normal mash are purer than those of the raw spirit. The presence of atmospheric air in the condenser induces the formation of aldehydes and, in the raw spirit, foul-smelling substances. By means of slow vaporization in the rectifier fusel oil is decomposed, while in the new automatic spirit apparatus, it is converted into alcohol. But this apparatus is equipped with very effective dephlegmators and rectifiers, so that it is an easy matter to precipitate the fusel from the alcoholic vapors and to receive only the purest alcohol in the condenser vessel. In order to prevent an accumulation of fusel in the ever-returning phlegma, temperature regulators and fusel separators are attached in the latter, so that the phlegma constantly has a uniform temperature and fusel can never be in excess. The advantages of this process are not only the dispensing with rectification and filtration, but also the production of a pure valuable spirit of about 95 per cent alcohol by volume (190 proof), while the valuable and untaxed fusel is obtained as a by-product. In addition, the yield is greater, as the loss caused by rectification is avoided.

Absolute anhydrous pure alcohol cannot be made in this way, nor can it be prepared by repeated distillation, as alcohol is in itself hygroscopic and tenaciously holds on to the last traces (3 to 4 per cent) of water. Every remnant of water can only be removed by very effective dehydrating agents; for example, freshly burned lime, anhydrous carbonate of potash, anhydrous white copper sulphate, fused calcium chloride and especially metallic sodium. By distillation over any of these substances the water is absorbed and an absolutely anhydrous pure alcohol is produced. This process is, however, only carried out in chemical laboratories and as a precautionary measure this alcohol is stored in small bottles with any of the above substances. This precaution is taken in order to prevent the absorption of moisture by the alcohol.

The distillation of alcohol in the United States in the year ended 30 June 1915 was 81,101,064 gallons, of which 42,742,161 gallons were Cologne spirits and 33,854 gallons "high wines." The distillation of alcohol, as in many other distillatory operations, is merely a mechanical process of purification, as no chemical change takes place, because the distilled have the same chemical composition as the original substance. Distillation is only a mechanical separation of the secondary ingredients from the principal one. Some substances, as for instance, glycerine, when distilled in presence of atmospheric air, will decompose. In such cases the distillation is done in a partial vacuum. By means of an air-pump the pressure of the air is reduced until the boiling point is lowered to that degree at which the distillation can take place without decomposition. It is well known that matter will boil at a lower temperature, when the pressure is decreased; and that decomposition is less liable to occur. Again, other substances cannot be distilled in the presence of much oxygen, so that carbonic acid, hydrogen, or other gases are forced into the still. These gases pass over with the vapors of distillation. This process is called the distillation in an atmosphere of an indifferent gas.

By far the most extensive of the distillation industries is that of petroleum, not to mention the many individual industries distilling petroleum products. The world's annual produc-
tion of crude petroleum is about 20,000,000,000 gallons, and except for a relatively small percentage used direct as fuel, practically the whole output passes twice through the still and condenser before it is fitted for use. In the United States alone nearly 14,000,000,000 gallons is thus twice distilled annually. In Scotland some 70,000,000 gallons of crude oil are obtained annually from the oil shales by dry distillation.

The primary distillation of crude petroleum is commonly called refining. The oil is separated by the first distillation into (1) benzine or naphtha, coming over up to a temperature of 300° F.; (2) kerosene, coming over above 300° and up to 570°; and (3) residuum, which includes lubricating oils, paraffin wax, vaseline, and pitch or asphalt, according to circumstances. These are again separated before marketing. From the naphtha is obtained gasoline, up to 160°; benzine between 160° and 250°; and heavy benzine or "turpentine substitute" between 250° and 300°.

In the kerosene distillation, gas oil is first separated; it is used to enrich coal gas. After the principal part of the kerosene is distilled, the residuum is further treated, when it is divided into distillation oils, but with a higher flash-point. The lubricating oils are obtained by distilling the residuum in a vacuum with superheated steam. There are three degrees of these oils: light, medium and heavy. They are caught in three separate dephlegmating condensing tubes through which the vapors are made to pass, the heaviest oil condensing in the tube nearest the still, and the lightest traveling to the furthest tube before it condenses. Vaseline is obtained by carefully distilling certain kinds of crude petroleum in a vacuum still. Other products obtained from petroleum by distillation are paraffin wax, cere sine or earth wax, and a variety of asphalt, besides pitch and coke.

The distillation of coal-tar is detailed under the title COAL-TAR PRODUCTS.

The distillation process is employed in candle-making for the purification of the fatty acids from which the candles are made. The operating takes place in a large refineries and the fats heated by a direct fire to about 500° F. Melted fats (after saponification) are run into the still as the operation progresses. Steam, superheated to from 500° to 700°, is blown through the liquid mass, and the fats distilled over into copper coils cooled by running water. The palmitic acid comes over first, followed by the stearic and oleic acids as the heat increases. These three fats constitute about 80 to 95 per cent of the whole. The distillate is allowed to cool very slowly for 10 or 12 hours during which time the stearic and palmitic acids crystallize in large crystals, with the oleic acid entangled among them in a liquid form. The "cakes" thus obtained are put cold under hydraulic pressure of 250 atmospheres, and then again in the "hot" press (temperature, 140°) to remove the oleic acid. The candle fats are then ready for molding.

Another important application of the distillation process is in the recovery of glycerol (pure glycerin) from soap and tallow. The glycerin remains in making soaps and candles. The glycerol is obtained in a watery solution after the fatty acids are separated out, and is first concentrated by evaporation to about an 80 per cent solution. This crude glycerol is subjected in a still, in a vacuum of 28 inches, to blowing with dry steam at 300°. The first distillate contains volatile organic acids. These are neutralized with soda, and the product again distilled in vacuum. After concentration and recondensation it is again distilled, and once more concentrated, this time to the standard specific gravity of 1.262. It is then ready for market as "dynamite glycerol," extensively used in making high explosives. For medical and food purposes the glycerol is again distilled and clarified.

The manufacture of natural perfumes and essential oils depends largely upon the distillation process. In preparing perfumes, the flowers are heated with water in stills, and the steam coming over carries the perfume oil with it. In some instances the perfume oil is dissolved out from the flowers by a volatile solvent like alcohol, ether or benzal, and the solvent then distilled off, leaving the heavier perfume oil. With the essential oils, extraction by pressure sometimes precedes the distillation, as with lemon and orange peel, and other citrus oils. The preliminary treatment with solvents is also used in gaining essential oils, as with celery (from the seed), cinnamon (from the bark), and probably others.

The method of extraction by a solvent (bisdil phide of carbon, or petroleum spirit), and subsequent distillation, is finding favor in a much wider field than formerly. It has been found profitable by this process to extract the oils from the oil-cake residue of the cotton-seed and linseed oil presses, and it is used also at first hand in gaining the oils from poppy seed, rape seed, castor oil beans, copra, palm kernels, pumpkin seeds, rape seeds, and the like. It has also been successfully used to extract olive oil from the residuum of the olive oil presses. The solvent is used over and over again in a continuous still which is almost automatic, requiring a minimum of attention, and in the case of the recovery of oil from oil-cake, the oil meal residue is as greedily eaten by cattle as the original oil-cake. This process has made it possible to recover much oil which has heretofore been sacrificed if not altogether wasted.

Another important distillation process is the so-called dry distillation, in which organic substances are decomposed into solid, fluid, and gaseous products by means of high temperatures and with the exclusion of air. As a rule these products, called empyreumatic, are formed simultaneously, but are separately collected and treated. An example of dry distillation, which is also called destructive distillation, as it is accompanied by chemical changes, is the distillation of coal for the manufacture of illuminating gas. Ammonia-water (in the raw condition, tar-water, which contains cyanides and sulphocyanides in connection with ammonia), semi fluid, viscous, oily, and very valuable products, as, for example, tar-oil, which is extensively used in the manufacture of aniline colors, antiseptics, and medicinal preparations, are obtained as by-products, while coke is the residue of the coal distillation.

The distillation of wood is conducted in the case of resinous woods by steam, and with hard woods by dry distillation. The method preferred in the manufacture of turpentine because it avoids drawing the tar from the wood. The retort is filled with pine wood chips, and steam is turned in with a rush, so as to heat the whole as quickly as possible, the pressure
not to exceed ten pounds to the square inch. The contents of the retort are agitated by a mechanical stirrer, and the process continues as long as a paying quantity of oil comes over. With the turpentine is a small proportion of ethers and aldehydes, and some resinous matters. The turpentine is redistilled for the market, leaving a residue, resin oil. The resin (colophony) remaining in the retort is distilled in an iron still by the dry process and yields resin spirit and resin oil, and resin tallow. The resin oils are rectified by the distillation process, followed by a chemical process. In the distillation of hard woods without steam, the products are wood vinegar (pyroligneous liquor) 42 to 45 per cent—equal to acetic acid 7 to 9 per cent; tar 8 to 9 per cent; and charcoal 22 to 26 per cent. Further distillation of these primary products results in the gaining of a great number of substances from the tar, particularly paraffins, phenols and esters such as paracresols, guaiacol (from beechwood tar), krescoil, pyrogallic esters, fatty acids and their esters, light tar oils and heavy tar oils, and pitch. From the pyroligneous liquor is obtained acetic acid, up to 10 per cent; wood alcohol up to two per cent; and small quantities of propionic, butyric, formic and other acids, methyl acetate, allyl alcohol, furfurol, phenols, amines, ketones, etc. The commercial manufacture of wood alcohol, however, is accomplished by treating wood with concentrated sulphuric acid, thus transforming its cellulose to a form of sugar which is then fermented and the mash distilled.

Resins of all sorts are distilled before being of value for varnish making. The process used is generally by superheated steam under pressure.

Ether is obtained by distilling sulphuric acid and alcohol together in a steam-heated lead-lined retort, and passing the vapors through a solution of sodium carbonate, or milk of lime, to remove all traces of acid. A second distillation removes the alcohol, and the ether is rectified in a columnar still.

Besides these above-mentioned industries, many others are also based on the distillatory process.

A special branch of distillation is that in which a solid is vaporized and by condensation directly passes from the gaseous to the original solid usually in a crystalline form. This process is called sublimation, and is mostly used to purify volatile solids, as for example, sal ammoniac (chloride of ammonia), benzoic acid, camphor and indigo. The most interesting fact in sublimation is that the solid does not pass through a liquid state, but at once to the gaseous form. The reverse process also takes place in like manner, namely, the condensation from the gaseous state back directly to the solid condition.

RICHARD FERRIS,
Editorial Staff of The Americas.

DISTILLED LIQUORS, or SPIRITUOUS LIQUORS, the alcoholic beverages obtained by distillation as distinguished from the fermented liquors, wine, beer and cider, etc. The highly concentrated alcoholic liquids used in the interior liquors, medicine, pharmacy, etc, are called alcoholic spirits. In the distilled liquor beverage, alcohol is always the main ingredient and the varying aroma and flavor, due to the origin and the method of production, influence its commercial value. On the other hand, spirits are judged according to their concentration and any secondary ingredients and aromatic substances depreciate their value. Hence in the manufacture of spirits everything that is not alcohol is eliminated.

The distilled liquors best known in the United States are:

- Whisky—made from malt and unmalted cereals.
- Brandy—made from grape wine.
- Gin—made from rye or barley.
- Rum—made from molasses.
- Cordials—compounded from aromatic tinctures and sugar syrups.
- In Germany, korbmarmtein, made from malt and rye or corn, and schnaps, made by diluting rectified alcohol and adding flavors and sugar, are distilled liquors in common use. In Austria slovinik is distilled from the fermented juice of the prune-plum. In the East the liquor arrack is distilled from palm wine, with rice and molasses. In Russia the popular liquor vodka is made from rye.

In the United States the concentration of alcohol in liquors and spirits is determined according to proof-degrees. The regulations of the United States Internal Revenue Office say that "proof spirit shall be held to be that alcoholic liquor which contains one half its volume of alcohol of a specific gravity of 0.7939 at 60° F." Therefore each proof-deg is equivalent to a volume measuring one-half of 1 per cent.

If 100 gallons of liquor contain 48 gallons of absolute alcohol, it is 2 x 2 or 184 proof. The revenue standard is a liquor with 50 volumes per cent (100 proof) of alcohol. "Over" and "under" proof are not officially recognized in the United States, although we find these distinctions given in older books.

The raw materials used in the preparation of alcoholic liquors and spirits are:

1. Alcoholic liquids, as wine and its waste and by-products (wine-yeast, grape-cakes), the waste and by-products of the brewing industry, in which the spirit is obtained solely by distillation. The product of the wine distillation is used almost exclusively for cognac and brandy, which are especially manufactured in California and Ohio.

2. Sugary substances, as the extract of the sugar-beet, sugarcane, mainly molasses and also of sweet fruits (cherries, plums, melons, etc.), the sweet potato, the juice of the sugar palm, the carob bean (Saint John's bread), etc. The sugar must be converted into alcohol by fermentation prior to distillation.
3. Starchy substances, which comprise the various cereals (barley, barley-malt, corn, rye, wheat, oats, rice, buckwheat, etc.), and also potatoes. Corn, barley, barley-malt, rye, oats and wheat are those mostly used in the United States. Before the alcohol can be obtained, the starch must be transformed into fermentable sugar, which in turn is fermented, to produce the alcohol previous to distillation.

4. Fibrous substances, in which the cellulose is converted into fermentable sugar. The further treatment is the same as detailed above (No. 3). Concentrated mineral acids acting under pressure on cellulose, will cause the formation of fermentable sugar, and since such fibrous substances (peat, sawdust, etc.) are inexpensive, many experiments have been made to obtain a practical method for producing alcohol from such materials. Many such methods have been patented. The manufacture of alcohol from fibre stuffs has of late years assumed greater importance and such sugars can now be successfully obtained in large quantities.

5. Mineral spirit is of theoretical interest, although it can be prepared in the chemical laboratory. If ethylene (C₂H₄) is conducted into sulphuric acid, ethyl sulphuric acid (C₂H₄H₂SO₄) is formed, which, if diluted with water, will split up into sulphuric acid and alcohol. Ethylene is a gas and is an ingredient of illuminating gas made from coal. It is also easily produced from acetylene (C₂H₂) by nascent hydrogen, according to the formula

\[ C₂H₄ + H₂ \rightarrow C₂H₆ \]

In accordance with the importance of these various kinds of raw material consumed in the large United States distilleries, we will first of all discuss the manufactures of liquors and spirits from starchy substances.

These raw materials are treated, as in the brewing industry, with malt (mostly barley malt, sometimes also rye and wheat malt) in such a way that the diastase of the malt converts the starch into dextrin and sugar. But a distiller's malt differs in its properties from a brewer's malt. While the latter must impart its aroma and taste to the beer and only exert its diastatic power in a moderate degree, some of the starch remaining unchanged in the liquor, the former must be characterized by a maximum of diastatic power, to convert all the starch into fermentable sugar. Consequently the distiller prefers a malt from a small-kernelled barley, which has been killed at low temperatures. The diastatic power is weakened by high temperatures and hence some distillers, who operate a malting plant in connection with the distillery, use only green malt, or at most air-dried malt. The German distillers universally use green malt. In contradistinction to the brewer, the distiller prefers a malt made from a barley rich in nitrogenous matter, as this latter furnishes material for the formation of diastase and for the nourishment of the yeast.

The malt used by distillers is that known as "long malt" ( malted for 20 days) as distinguished from "short malt" ( malted for 7 days), used by the brewers. In making the long malt the grain is steeped until it has absorbed 40 to 45 per cent of water. It is then spread upon the malting floor for 20 days and kept at a temperature not above 63°. The development of mold or other bacteria is avoided by previously soaking the grain in diluted milk of lime. While the long malting causes a loss of starch, the gain of diastase far overbalances it. In mashing, the largest possible amount of starch must be converted into fermentable sugar (maltose) in order to obtain the highest yield of alcohol in the distillation. Under the most favorable conditions 96 per cent of the starch in the mash material can be converted into maltose (the remaining 4 per cent is changed into dextrin), while in ordinary practice only about 80 to 81 per cent maltose is obtained and the remainder is dextrin. After the maltose is decomposed into carbonic acid and alcohol, the dextrin is gradually converted by the diastase into maltose and then fermented. This can only be accomplished with vigorous yeast and proper treatment in the fermenting rooms. On account of this "after-effect" the diastase must be carefully protected from destruction by avoiding high mashing-off temperatures and the formation of an excess of lactic acid and particularly butyric acid, produced by certain bacteria at a temperature of 104° to 122° F.

The mashing process varies according to the kind of product desired, the capacity of equipment (large, or small, or very small, the latter requiring hand power for mashing in place of machinery), the amount and quality of the raw material and, oftentimes, on the fancy of the customers. Inasmuch as whisky is the main product of United States distilleries, we will discuss its preparation first of all.

The word "whisky" is of Celtic origin, for it apparently is an abbreviation of the word "usquebaugh" or "uisgebeatha," which corresponds to the Latin aqua viva (water of life). According to historical research the word aqua viva is a corruption, because the original wording for distilled spirit was aqua vitae (water from the grape vins). In medieval times the monks changed this earlier form to the one now in general use.

Although the same term is used in America, Ireland and Scotland, the product is different. The Irish and Scotch distilleries use almost exclusively kilned malt (only rarely, other cereals), while the American distilleries have an entirely different equipment and also their own characteristic development.

For the manufacture of whisky, especially corn and rye, sometimes also bran, wheat and kilned malt (6 to 15 per cent) are used. The best-known brands are:

Bourbon whisky, in the manufacture of which corn is the main ingredient, with barley malt, or wheat malt and rye. According to the quality of the Bourbon, the materials vary as follows:

Ordinary Bourbon whisky is made from a mixture of 10 per cent malt; 10 per cent rye; and 80 per cent corn; Medium Bourbon from 12 per cent malt; 18 to 22 per cent rye, and 66 to 70 per cent corn; Good Bourbon from 15 per cent malt; 35 per cent rye; and 50 per cent corn.

Rye whisky when manufactured as a first-class article is made from 10 to 15 per cent kilned barley malt, 70 per cent rye and the remainder rye-malt. Some distilleries replace a part of the rye by oats or barley.

Halfe rye whisky is similarly made as the above, except that for one-half of the rye, corn is substituted.
Malt whisky, in which malt predominates.

Wheat whisky and

Oat whisky are made in the same way as rye and half rye whisky, except that wheat or oats is used in place of rye.

We must remark here, that the above appellation is an exact use only by the distiller, and that in commerce similar names are given to so-called compound whiskies. Under this term are meant those products which are produced from pure whisky, either by dilution with water and rectified spirits, or by a mixture of several kinds, or by still further blending and mixing.

In some cases, other liquors, as for example, cognac, or rum, or even essences, are added to the pure whiskies. This compounding is done in accordance with the requirements of local trade, or the special tastes and desires of the customers. The character of the natural product is dependent upon the materials and the methods of mashing and distilling.

According to the method chosen for mashing we distinguish a "sweet mash" and a "sour mash". The latter is characterized by a delicate, slightly sour taste and a fine ethereal aroma.

Mashing for Whisky.—The material is ground separately, weighed in hoppers, and placed under a revenue-lock. In the smaller distilleries the corn is mixed with 20 to 25 gallons of hot water to the bushel, and kept boiling by means of steam until the starch becomes gelatinous. In larger distilleries the corn is gelatinized in high pressure cookers, under a pressure of 60 to 80 pounds. In either case the cooking is continued until it is cooled down to about 150°F. In the high pressure cookers this reduction in the temperature is accomplished by a vacuum pump. In the smaller plants, malt, rye or other cereals are added to the corn mash cooled to 164°F. The entire mash has a temperature of about 156°F to 160°F. In the larger distilleries the specially prepared rye or malt mash is drawn into the cooker by means of a vacuum pump. Here it is thoroughly mixed so that the final temperature is about 150°F to 155°F. In order to obtain complete saccharification, mashing is done at this temperature for 30 minutes or longer, and then the mash, together with the grain is run into a collecting tub, from which it is pumped through a cooling system into the fermenters. The cooling system usually consists of a worm of a half inch copper pipe, which is encased in an iron water pipe. The mash flows through the copper pipe in one direction, while the current of water flows around the pipe in the opposite direction. It is always desirable to cool the mash to 64°F, but on account of the higher temperature of the cooling water, it is usually possible to cool the mash only to 66°F to 68°F. At any rate its temperature should never be above 70°F. The concentration of the mash varies proportionately with the amount of material, and is usually about 18 to 25 per cent (seldom more).

When the mash is pumped into the fermenters, as much water or slop of the same temperature as the mash is added to the latter until its concentration is about 11 to 13 per cent.

The above-described method is used for sweet mash whisky, while for sour mash, slop is always used for mashing in place of water. The slop has not only acquired a definite lactic acid content through the fermentation process, and certain peculiar and flattering substances from the yeast, but also contains certain conversion products, formed by heating the grains in the distiller. Hence by the use of this slop, the whisky receives certain characteristics which have made it popular. In smaller distilleries, oak vats, so-called bushel tubs, are used, into which boiling slop is poured, and corn in grits-form is dried in under constant agitation with the hand (hence the name, hand-made sour mash). The malt is added at 165°F. In medium-sized plants a large quantity of corn is dried in in a similar manner in special mash tuns, and after the mash becomes somewhat thinner, due to the saccharification, it is pumped into hopper-like copper vessels. After the mashing off, the mash remains in the bushel tubs of the smaller distillery or in the vats of the larger plants for 20 to 24 hours for acidification. After this time, the mash is still of a somewhat solid consistency, so that it is separated in drums by means of a vacuum pump. After cooling to the pitching temperature (64°F to 68°F), the mash is diluted with slop, to about 17 to 19 per cent. In some distilleries the concentration is lower.

The mashing process is different in very large distilleries which have commodious mechanical appliances, and are prepared to mash vast amounts of material. It is customary to bring the corn mashed with water to the boiling point by means of steam, and then to heat the corn to 300°F to 310°F (60 to 80 pounds pressure). The corn is kept at this temperature for 10 minutes in order to gelatinize the starch. The surplus steam is blown off, and the corn mash is cooled to about 164°F. At the same time, malt, rye, oats or barley is mashed in with water in a special mash tank, which is supplied with a simple agitator and a double copper attemperator coil. After both mashes are united, the temperature is about 130°F, which is the temperature at which the largest possible amount of sugar is withdrawn.

This mashing method is used in the large factories both for the manufacture of whisky, high wines and spirits. The various brands of whisky are then made by the use of different materials of varying proportion. In still larger distilleries also use slop in place of water when making a sour mash whisky. In order to obtain a higher degree of acidification, more lactic acid is allowed to form in the malt mash. In comparing the large distilleries with the smaller ones, we find that while the latter can pay more attention to the characteristic properties of the whiskies, especially sour mash and fancy goods, the former does its practical work more technically and also obtains much higher yields. The manufacture of concentrated alcoholic spirits is only profitable when all the modern mechanical appliances are at hand, so that, owing to the constant decrease in the price of alcoholic spirits, the number of smaller plants is becoming less.

Fermentation of the Mash.—The sugary mash is fermented in the fermenters by means of yeast. A very large number of different races of yeasts exist, each of which produces an alcoholic liquor differing in flavor from the others. They fall naturally into two classes: (1) Culture yeasts, and (2) wild yeasts. The former have been cultivated for long periods
of time by the fermentation industries, and have acquired characteristics which render them of great value for the production of alcohol and alcoholic liquors. The yeast used in fermenting whisky mashes belongs to the genus sch. arachymes cerevisiae. The yeast used in fermentation, a certain one cannot be definitely as to which belongs to the genus sch. arachymes ellipsoidus.

The distiller's yeast must be able to flourish vigorously in solutions with a high percentage of acid, and also when the alcohol content of the mash is high. In France and Belgium either top-fermenting or compressed yeast, which is also used by bakers, is generally added. In the scientifically operated German distilleries, the inventions and discoveries of modern times are successfully used, as for instance, a pure yeast culture of a distiller's yeast is made according to Hansen's method, just as a pure beer yeast is cultivated in many United States breweries according to the same method.

In the larger distilleries, yeast obtained by spontaneous fermentation is generally used. Here Delbrueck's teachings in regard to natural pure culture are of importance. Experience teaches that when several yeast species are present, a certain one can be destroyed under certain conditions of nourishment, because a mash of definite concentration and proportion of fermentable to non-fermentable substances, made from definite materials, consequently containing definite percentages of albuminous and mineral substances, will vigorously develop at a definite temperature and acidity only one species of yeast and will suppress the rest. By maintaining the same conditions on a larger scale, that is, by using a greater amount of mash, the yeast thus developed can be further propagated. But in spite of the utmost care, natural pure culture is oftentimes defective, because the standard requirements are not rigorously observed. It may also happen that among the air yeasts which are developed for fermentation, there is no species which will flourish under these requirements. Consequently, it would be advisable to introduce pure cultures, made from one individual cell, according to Hansen's method. Then the distiller would not be bound to change the public yeast developed according to Hansen's method, would have to be cared for according to the principles of natural pure culture, as, otherwise, an infection with undesirable yeasts, mycoderma or fission fungi would gradually destroy the pure yeast.

In the United States distilleries the yeast is developed as follows:

A clear malt mash is made from ground malt and pure water, generally distilled water. The water is boiled with hops, one ounce of hops per gallon of water, cooled to 170° F. and added to the ground malt, whereupon saccharification will take place. As soon as the conversion is completed, a clear mash is drawn either by filtration or extraction, which is then concentrated to 18 to 30 per cent. Balling and cooled to 70° to 72° F. Air is forced into the mash in small copper vessels, so that after 24 to 48 hours the yeasts of the air will cause fermentation. This mash in the copper jugs is the so-called stock yeast and is cultivated as needed. In case the yeast thus obtained is not satisfactory, the process is repeated. Most distillers constantly have a supply of this jug yeast on hand and regenerate it by adding a portion of it to the above described, hopped, clear malt mash. This original yeast is poured into sterilized copper jugs and stored in an ice box or other suitably cool place.

This yeast is propagated for use in this way: The distiller first heats a rye and malt mash very rapidly to 130° F., when the maximum saccharifying action takes place, and keeps it at this temperature a short time. Then the heat is raised quickly to 144° when the maximum liquefaction of starch takes place. Finally the heat is raised to 150° to 154°, which destroys harmful bacteria, but does not injure diastase if plenty of sugar is present in the solution. The temperature most favorable to the action of distiller's yeast is between 75° and 81°. A slightly acid wort favors the development of distiller's yeasts, and keeps the brewery yeasts and bacteria.

Souring is accomplished through a special mash at 148° to 158°, from kilned malt to which is added unmalted wheat, corn or rye. This mash at 122° is inoculated with a pure culture of lactic acid bacteria. When about 1 per cent of lactic acid has been formed, the temperature is raised to 144° when the maximum growth of the bacteria is slowed. The mash is then cooled to 80° and pitched with distillery yeast, and then slowly cooled to 60°. As fermentation proceeds the temperature rises, but it must be kept below 85°. This yeast mash is ripe in 10 to 14 hours after pitching, and is then run into the sweet wort at 68°. The period of greatest fermentation is after 24 hours, and continues 12 to 18 hours—during which the temperature is kept below 85° to prevent loss of alcohol through evaporation. The duration of fermentation is for spirits and sweet-mash whiskies, 72 hours, while for sour mash whisky it requires 76 hours.

Sometimes abnormal conditions arise, among which is the so-called foaming fermentation, that is, an exceptionally stormy fermentation, in which losses of alcohol occur due to the overflowing of the mash over the edge or rim of the fermenter. This is a result of various defects, and is either partly due to the materials, or the yeast, or may be occasioned by irregularities in the operation, or causes other than the above. It would lead too far to enumerate them here, but much has been written on this subject by experts.

The fermented mash, called the sour mash, is now pumped into the distilling apparatus, where it is distilled as is fully described in the article DISTILLATION. It is customary to distil the whiskies to 102-105 proof and spirits to 188-190 proof. In small distilleries an ordinary pot still is used for whiskies and a loquor of about 70 proof is obtained, which is concentrated to 101-102 proof in a doubler. A doubler consists of a copper cylinder having a wide outlet pipe, from which the vapors enter the condenser. In the small distilleries, the heating is accomplished by direct firing, by which a peculiar, characteristic taste, which is appreciated by the consumers, is engendered. Such whisky is called "Fire Copper Bourbon Whisky."

When oats, barley or wheat are used in the manufacture of certain whiskies, they are worked up in the same manner as rye in the above-described mash.

Potatoes are not mashed in the United States,
although they are commonly used in Germany. They contain only 18 to 20 per cent of starch, while the cereals contain 60 and more per cent of starch. Instead of mashing the ground, rapped or chopped potatoes in open mash-tubs, as was formerly done and is even done to-day in small plants, they are now first steamed under a pressure of two to three atmospheres, whereby the starch is put in condition to be easily acted upon by the diastase. After the steaming the potato mass is cooled to 55 to 60° C. (131 to 140° F.), and kept at this temperature for as long as possible, which is best in summer, when potato stems are blooming. Then this mass is mixed with malt, generally green malt, either in the cooker or in the mash-tub, and saccharified. It is customary in Germany to make a thick mash of 22 per cent (Balling), sometimes even of 26 to 28 per cent. The fermentation is accomplished by the addition of a cultivated pure culture yeast. The distilling process is similar to our method. In Germany less brandy but more highly concentrated alcohol for industrial purposes is made.

In all those cases, in which a mealy substance is utilized, the thin slop remains after the distillation, which contains all the ingredients of the corn and yeast mash. Besides the skins and bulks, we find also a considerable amount of lactic acid, acetic acid, glycerine, mineral substances, etc. This wet slop was mainly used as feed for cattle, so that formerly every distiller also had a herd of cattle. It is claimed that an animal's health will suffer if slops are copiously fed, so that on this account, and especially in order to dispense with some of the labor caused by the maintenance of the cattle, the slop was dried. By thorough drying, which can be done immediately after the distillation, spoiling is prevented and a constantly durable and valuable article of commerce, which need never be given away below its full value, is obtained. The drying of slop is accomplished in several operations: (1) Settling of the insoluble substances; (2) Pressing out; (3) Drying in cylindrical driers.

There is also apparatus in which the slop is concentrated by means of steam, pressed and finally dried. The feeding value of wet and dry slop can readily be seen from these analytical data, obtained by the Industrial Chemical Institute of Milwaukee in an analysis of slop in either condition. The mash material was composed of 80 per cent corn, 10 per cent rye, and 10 per cent malt.

Preparation of Alcohol by Fungi.—This process, which is used in Japan in the manufacture of saké, was changed for other cereals by Takamine, a Japanese, and was introduced by him in 1893-94 in the Manhattan distillery in Peoria, Ill. But this process has not been extensively used, so that now it is almost forgotten, although it aroused considerable interest at one time. In this process the spores of a certain fungus, as for instance *Aspergillus oryzae* are exposed in hothouse-like compartments to uniformly moist air of 77° F. on steamed, coarse wheat bran. The spores rapidly develop to an exuberant white mold whose mycelium forms numerous spore-bearing threads which grow into the nutrient medium. A considerable portion of the nutrient medium is consumed and a decided rise in temperature is noticeable. According to the temperature, the formation of mold is finished in about 36 to 48 hours, when it can be mixed with an equal amount of wheat bran and extracted in water, whereby the Koji-extract is obtained. This is added at 140° F. to corn, cooked in the customary manner, whereupon complete conversion is effected as with diastase. The mash thus obtained, which has a concentration of about 15 per cent Balling, is fermented in four days by means of a fungus, called *Takamatsu*, propagating in a similar manner to the Koji fungus. It is claimed that the yield in this process is 11 to 12 per cent higher than by the regular process now in vogue. In some large corn distilleries in Europe the fungus *Amylomyces Rouxii* is used instead of malt to furnish the diastase. A sterilized corn mash is inoculated with the mycelium of the fungus and filtered air is blown through the mash for 20 hours. The fungus spreads with great rapidity, converting the starch into sugar. Yeast is added during the action of the fungus-diastase, and ferments the sugar as it is formed, the two agents acting together. One gram (15 grains) of the fungus culture is sufficient to saccharify 25 tons of corn, saving three tons of malt besides the one ton of starch consumed by the malting. This mash being sterilized is worked in closed vessels so that harmful bacteria do not gain an entrance.

In the Belgian distilleries Effront's system is successfully used to prevent disturbances in the operation of the plant caused by infection. The main principle in this system is that the highly antisepptic hydrofluoric acid or mono- or bi-fluoride of ammonia is added to the mash, taking the place of lactic acid. Hydrofluoric acid, in small proportions, is poisonous to the harmful bacteria, while not affecting distillery yeasts up to 2/10 of one per cent.

The Control of the Distillery.—It is self-evident that the control in the distillery is of prime importance in a rationally operated plant, for which reason also the large distilleries, which have well-equipped laboratories, work ad-

vantagously, while on the other hand, the small distillers constantly suffer losses. The control is properly carried out when regular analyses are made of the raw materials of the supplementary articles, namely the yeast, the mash before and after fermentation, the slop, the water and also the air in the mashing and fermentation cellar. (The Kentucky distillers use a pure, hard water, rich in lime.) It hap-
pens in too many cases that the control is not properly carried out, which is, of course, a loss to the distiller, although at present the small distiller is enabled to have the control carried out by a special laboratory (Industrial Chemical Institute of Milwaukee). When the control is properly exercised, the yield will be increased. In the case of theoretically one pound of starch produces 0.5678 lb. of alcohol, then, according to Hanke, the highest possible yield of a distiller's bushel (which is always figured at 56 lbs. whether the material actually weighs that much or not) would be:

<table>
<thead>
<tr>
<th>Alcohol Content</th>
<th>Yield in Bushel</th>
</tr>
</thead>
<tbody>
<tr>
<td>60 per cent starch</td>
<td>5.76 gal. proof alcohol</td>
</tr>
<tr>
<td>61 per cent starch</td>

</tbody>
</table>

Scotch Whisky is made in a pot-still. Its peculiar smoky flavor is due to the use of a peat fire in kiln-drying the malt. It is made from barley malt and corn, the latter often imported from the United States. But in some cases rye and oats are also used. Irish Whisky is a pot-still liquor made from 30 to 50 per cent of barley malt, with rye, barley, oats, or wheat or a mixture of them. The malt is not peat dried and the liquor has a delicate bouquet and a high alcohol content. Brandy of the finest sort (Cognac) is distilled from clear white grape wine which has been aged for at least a year. It is golden yellow in color and has a content of from 45 to 55 per cent alcohol. Ordinary brandies are distilled from freshly made and fermented grape wines in two distillations. The first yields liquid which is kept pure from cherries. Beside the juice, the extract also contains components of the cherry stones, which are crushed and added to the liquid.

The larger class of various sweet liqueurs, cordials, and ratafias are distillations only of good, fusel-free spirit with an aromatic substance, and the addition of sugar syrup and coloring. The best known are absinthe, anisette, curaçao, benedectine, boonecamp, créme de cacao, crème de menthe, crème de rose, crème de vanilla and crème yvette (violet).

For statistics of production see Distilling Industry.

DISTILLED WATER. See Distillation.

DISTILLING INDUSTRY. There can be no question but that alcohol is one of the most important substances produced by the art of man, for, outside of the extensive consumption of alcoholic liquors as beverages, it is more
extensively applied, and to a greater number of purposes than almost any other manufactured liquid. Notwithstanding, however, there is but one known process by which alcohol can be obtained—the fermentation of sugar or other saccharine matter of plants which contain either free sugar, or starch capable of being converted into sugar. Commercially, when alcohol is made from grain, it is called grain-alcohol; when it is made from reinder and Iceland moss, it is called moss-alcohol; when made from potatoes, or beets, root-alcohol, and, if from grapes, wine-alcohol.

Although the first historic mention of alcoholic liquors dates from the 11th century the art of distillation was known for centuries prior to that time. The Chinese had practised it for hundreds of years before it was introduced into Europe, and tradition attributes its discovery to the Arabian alchemists. This art of distillation consists in the process of converting liquid into vapor in a closed vessel by the application of heat and reconverting it into liquid by conveying the vapor into a cooler vessel; so that spirits are not produced by distillation but by the deglutanization of fermented liquid; the distillation process separates the spirits from the mixture in which they have previously existed. Brandy, one of the first distilled liquors, was originally known as the "water of life," and one of the early alchemists was so enthusiastic over the discovery of this liquid that he declared that "this admirable essence is an emanation from the Divinity; an element newly revealed to man, but hid from antiquity because the human race was then too young to need this beverage, destitute of means to revive the energies of modern decrepitude."

While brandy and several other distilled liquors had previously been made, the first product of the distillery to reach the dignity of a commercial position was called "rectified whiskey." This was a crude high-mash which had been prepared for sale by being passed through a layer of charcoal, a process which was designed to extract the fusel oil. Later, this product was made more salable by the addition of burnt sugar, some flavoring extracts, and a storage in charred barrels, to eradicate some of the rankness and fierceness that distinguished most of such liquors. This method of manufacture was followed until the process of redistilling was invented, when an apparatus was provided by means of which the fusel oil could be more thoroughly extracted from the spirits than had ever before been possible, while, to make the liquor more palatable, a certain proportion of old-fashioned Bourbon from Kentucky, or rye from Maryland, or Pennsylvania, was added to give the bouquet, flavor, and appearance of genuine whiskey. In fact, the sale of the goods known as "redistilled whiskey" became so general that the proportion as compared to the quantity of genuine Kentucky and other whiskies sold was not less than 15 to 1.

With the name "Bourbon whiskey" now has a wide significance, it was originally used to distinguish the particular kind of liquor that was distilled from Indian corn, in Bourbon county, Kentucky. At that time the yield of Bourbon whisky was about in proportion to the amount in body and flavor that it was considered as of great value in the work of compounding, in spite of the fact that it required many years of maturing to neutralize the fusel, and other essential oils which it contained. Popular as this whisky was from the days of its inception, its fame spread so rapidly that it was not long before other distillers, particularly in Kentucky and elsewhere, and as all of these manufacturers produced an imitation of "Bourbon," the best method of defining that liquor-to-day is to say that it is a whisky distilled from corn, after the method which was originated in Bourbon county.

Great as the demand for this whisky was, and despite the fact that the trade was compelled to admit that such goods could not attain to full maturity, the only condition in which they were ready for consumption, within less than the specified three years, the improvements in the process of manufacture were slow. It was at about this time that some important changes were made in the science of mashing, and as these not only increased the yield, but lessened the cost of production, the Bourbon whiskies, which had formerly been used so extensively for compounding purposes, began to attain wider popularity as a beverage. It was also quickly discovered that this increase in yield had not injured the quality of the whisky, but that, on the other hand, such goods were of finer grade, the proportion of fusel oil becoming less though the quantity of whisky increased.

The whisky upon which the reputation of Kentucky so largely depends is that kind of liquor that is known as "straight," for unfortunatly for the commercial integrity of the distillers, it must be admitted that there are comparatively few establishments that are so careful as to the preservation of their reputations that they will distil nothing but genuine sour-mash goods. At the present time the consumption of whiskies of all grades made in Kentucky is estimated as being nearly 14,000,000 gallons per annum, while the principal States in which ordinary spirits are produced are Illinois, Indiana and Ohio.

Owing to the large size, cheapness, and availability and cheapness, grain is the material which is most generally used in the distillation of liquors. Fruits, which are very good for this purpose when they can be obtained, are not only of a perishable nature, but they are not available during the greater portion of the year; thus, while apples, peaches and grapes are used in the manufacture of distilled liquors in California, New York, New Jersey and Ohio, the output is necessarily limited. In the case of fruit brandies, the State of California manufactures more than nine-tenths of the total product of the country.

Rum, which was once one of the popular liquors, is now very little used in this country, being manufactured mainly for export purposes. Made of molasses as the chief material, its distillation is confined almost exclusively to New England, where its production is constantly decreasing, owing partly to the fact that grain-alcohols are cheaper to manufacture, and partly to the steadily increasing popularity of whisky as a beverage. During the past few years several attempts have been made to distil pure spirits there and it was so hesitantly, in body and flavor that it was considered as of
DISTILLING INDUSTRY

difficulty of eliminating the odor which is characteristic of rum. In the making of pure spirits, no aging is required. Such products of the still are ready for manufacturing purposes, or for compounding, the day they are produced, for, no matter how long they are kept, they cannot be improved. It is such a product that is doctored up by the use of coloring and flavoring to the appearance of genuineness in which it is possible to dispose of it as whisky, and some are even made to produce a fairly passable imitation of the real sour-mash liquor.

In reviewing the products of American distilleries it is necessary to give more than passing attention to the use of distilled spirits in the arts, manufactures and medicines of this country. Among these alcohol and cologne spirits are the most important, although such products as high-wines, whisky, brandy, gin and rum, are also used for these purposes. Pure alcohol is a substance that cannot be obtained by the process of distillation alone. The alcohol, or rectified spirits of the pharmacopoeias contain, in the United States, 9 per cent by weight, in Great Britain, 16 per cent; while the proof-spirits, or diluted alcohol, has 54½ per cent by weight of water in the United States, and 51 per cent in Great Britain. In spite of its general undesirability, there can be no doubt but that great quantities of plain alcohol are used as a beverage, and while it is impossible to collect anything like reliable data upon this subject, it has been estimated that no less than 15 barrels of alcohol are thus consumed in New York city alone every day of the year, and that fully one-half of the alcohol which is shipped to the Northwest is used as a beverage by the Poles, Norwegians, Swedes, Hungarians, Finns and Russians, who abound in that part of the country. It is also a well-established fact that the foreigners who are employed in the coal mines of Pennsylvania are great consumers of alcohol.

In the making of pharmaceutical preparations a large proportion of the cost was due here-tofore to the use of distilled spirits in their composition. In some of these denatured alcohol may be used with great saving of the tax formerly paid, but in many cases in which alcohol would be unsuitable, cologne spirits are used, while such liquors as whisky, brandy, rum and gin, furnish the basis upon which many proprietary medicines, tinctures and medicinal wines depend, not only for their preservative qualities, but for their effect upon the human system. In fact, it has been estimated that no less than 45 per cent of all the distilled spirits consumed in the United States, are used in the arts, the manufactures and in the making of medicines.

Production.—The production of distilled spirits in the United States for the fiscal year ended 30 June 1917, was 280,085,464 gallons. Of this total, 57,651,834 gallons were whisky; 13,870,836 gallons, rum; 5,736,627 gallons, gin; 16,180,072 gallons, brandy; 6,870,588 gallons of alcohol; and 65,879,886 gallons neutral or cologne spirits. Fruit brandies amounted to 8,251,097 gallons.

The total consumption for the year was 315,374,502 gallons, of which 41,529,677 gallons were exported; 15,529,578 gallons, gin, brandy and rum, patent, which has been denatured; and 13,119,201 gallons lost by leakage.

During the year quoted there were 625 distilleries registered in the United States, but only 507 of them were operated. Of these, 198 worked on grain; 284 on fruit; and 25 on molasses.

California led all the other States in the production of brandy, her 148 active stills turning out 7,871,759 gallons—95 per cent of the output of the whole country. Ohio stood second, with 160,133 gallons; followed by New Jersey, with 54,494 gallons; New York, with 39,019 gallons; and Kentucky, with 16,106 gallons. In the production of spirits from grain, Illinois was first, with 79,320,206 gallons; followed by Indiana, with 43,332,771 gallons; and Kentucky, with 36,407,615 gallons.

In the matter of materials used, no record of the fruit is available. Of grain, the largest item was corn, 33,973,268 bushels: of other grains the figures were: malt, 4,239,677 bushels; rye, 2,375,439 bushels; wheat, 2,538 bushels; all other grains, 78,902 bushels. Of molasses, the quantity used was 112,497,633 gallons. Of the whole product, 114,596,202 gallons were rectified.

The output of distilled spirits for the fiscal year 1914–15 was the lowest since 1909, as may be seen from the following figures:

<table>

These tabulated figures show the enormous increase in the distilling industry since the great war began. This is due in part to the large use of alcohol in the making of munitions, and the prodigious increase in exports, amounting to 2,500 per cent for 1917 over 1915.

The number of establishments in the United States in 1914 devoted exclusively to the manufacture of distilled liquors, as returned by the Special Census of Manufactures, was 434. They had an aggregate capital of $91,285,028. They employed 6,295 hands, to whom they paid in the year the sum of $3,994,469 in wages. With the internal revenue and other taxes these concerns paid into the United States Treasury $147,251,065. The value of the product manufactured was $206,778,708.

In addition to the above, the production of liquors of which we have record, however, there is no doubt that there are a number of illicit stills throughout the country that are annually producing a considerable amount of distilled spirits that succeed in evading the government's tax, and, consequently, the government's revenue. These illicit distilleries, which owe their exist-
ence to the inherent repugnance of a certain class of grain growers to pay the heavy tax which the government imposes upon the maker of distilled liquors, are common throughout the sparsely settled regions of the country, more especially perhaps, in the Southern States. In such sections these small distillers make and sell their product, irrespective of any claim that the government may have in the matter, and as a large proportion of the liquors that are made and consumed in the neighborhood, it is impossible to obtain any record of them.

Although it is true that the government has succeeded in making the distilling industry one of the most trustworthy sources of national income by the imposition of heavy taxes upon its production, those who are financially interested in the manufacture of liquors are advocating several reforms in legislation, all of which, they believe, will tend to aid the producer in furnishing a wholesome and thoroughly matured beverage at a much lower cost. They hold that the present legislation is unreasonable, and what they claim should be its primary object—the promotion of the public health and welfare—by enforcing a tax that is so high that its collection naturally tends to bring none but inferior grades of alcohol within reach of the masses, for the simple and very natural reason that the manufacturer, in order to meet the demands of so great an impost, will sometimes consent to lower the standard of his goods that he may save in a lower quality the amount which he must pay in meeting the tax. It is held by some that this factor is one of the direct reasons for the production of cheap imitation liquors, which are made out of common spirits to be sold practically the same day they are made, whereas the honest maker of genuine whiskies must hold his goods for several years while they are attaining that maturity that will enable him to place them on the market.

The history of the various combinations in which the American distillers have participated during the past 15 years is too long and too complicated a story to be told in so brief a space. Combinations have been formed and have failed, only to be superseded by others, none of which were without some influence in the progress and development of this great American industry. See BREWING AND MALTING; BREWING INDUSTRY; DISTILLATION.

DISTINGUISHED SERVICE ORDER, an order instituted by Queen Victoria 6 Sept. 1886 for the purpose of rewarding the naval and military officers mentioned in dispatches for their distinguished service. Foreign officers who have been associated with British forces in naval and military operations are eligible as honorary members, and the order ranks next to the order of the Indian Empire. The badge is a gold cross, enamelled white, edged gold, with the Imperial crown on one side and the cipher of the reigning sovereign on the other, each encased in a laurel wreath and worn on the left breast, pendent from a narrow red ribbon edged with blue.

DISTOMA, a trematode or fluke having two suckers, an oral and a ventral, but no other holdfast organs. These forms are the most abundant in the human body and in the domestic animals. Of the 30 or more species recorded from the human host the most important are the blood fluke (Schistosoma hematobium) which is the cause of Egyptian hematuria, the lung fluke (Paragonimus westermani) which causes fluke disease in Japan, Korea and Formosa that simulates pulmonary tuberculosis, and various intestinal flukes that produce grave intestinal disorders. The liver rot of sheep is due to one species (Pascolia hepatica) which is extraordinarily abundant in wet seasons in some parts of Europe, where in 1830 2,000,000 sheep died of this disease and even as late as 1891 a single sheep raiser in England lost over 10,000 sheep. This parasite has been introduced into North America.

Adult distomes occur as parasites in all kinds of vertebrates but are almost wanting among invertebrates. The life history is complicated, involving at least two generations with one or more changes of host. The intermediate stages, real generations in the life history, are found first in mollusks and later in various other hosts. Infection of man takes place through the use of water or uncooked foods which contain encysted larvae of the final generation. No North American fluke attacks man, but one species from the West Indies and several from the Orient are a real menace, with growing intercourse and increased chances of introduction. HENRY B. WARD.

DISTRESS, or DISTRAIN (from the Lat. distingo, to bind fast), is the taking of a personal chattel of a wrongdoer or a tenant, in order to obtain satisfaction for the wrong done, or for rent, taxes or service due, or for such damage as result from the trespasses of cattle. The thing taken is also called a distress. The remedy has been for long unpopular, as giving an undue advantage to the landlord over other creditors. It has been abolished in New York, South Dakota and some other States; in Carolina a landlord cannot distrain except in pursuance of an express agreement. In the New England States the law of attaintder, or mesne process, has been substituted.

DISTRIBUTION. The distribution of wealth or prosperity is to be sharply distinguished from the circulation. The former refers to the physical movement of goods from place to place and from hand to hand. It is a part of the process of exchange. Distribution, however, refers to the relative well-being or prosperity of the various individuals or groups of individuals who perform various parts of the great and complex task of providing for the needs of the community.

The problem of distribution, like that of exchange, grows out of the division of labor. In a primitive, self-sufficing system of economy, where every one produced everything which he consumed, there would, of course, be no exchanging. Neither would there be any problem of distribution, because every one would consume his own products and his prosperity would be an individual and not a social problem. But in an economic system where each worker does that for which he is best fitted, instead of producing everything which he needs, it is of course necessary that goods and services should be exchanged. As the result of this process of specialization of production and interchange, each finds himself, at the end of the process, in possession of a greater or a smaller quantity of
goods. Distribution has to do with this final result, that is, with the quantity of goods which each worker or group of workers gets as a reward for his or their part in the complicated work of production. The reward of the different parts in the work of supplying the needs of the community determines their relative prosperity.

Production and exchange are processes, but distribution is a result. Prosperity is, in a sense, the end and purpose of all production and exchange. Not all peoples alike in any economic system except pure communism. The relative prosperity of different classes, or the differences in prosperity and the causes of those differences are the problems of distribution.

Division of labor is of several kinds, the more important of which are territorial, temporal and occupational. Territorial division of labor, of which international division of labor is one phase, is a system under which considerable regions, such as the cotton belt, the corn belt, the mining regions, etc., specialize in certain kinds of products, shipping their surplus out to other regions, and shipping in the specialized products of those other regions. Temporal division of labor is a system under which the same substance is worked upon at different times by different groups of workers. Wheat, for example, is produced by one industrial group, ground into flour by another and baked into bread by still another. Hides, likewise, are grown by one group, tanned by another and made into shoes by still another. Occupational division of labor is a system under which, in the same industrial group, such as the milling, baking, tanning or shoe-making groups, various kinds of skill have to be combined in order to get the best results.

Each of these kinds of division of labor has its own peculiar problems of distribution. Under the territorial division of labor, one region may prosper and another not. Under the temporal division of labor, one industrial group may get a large and another a small share of the total value of the finished product. In the same industrial group, they who follow one occupation, or supply one of the factors of production, may get a large and others a small share of the value created by the work of the groups. The causes of these inequalities are the problems of distribution, and they are the maps important problems in the whole field of economics.

Inequalities in the territorial distribution of wealth or prosperity are not so very difficult to explain. If cotton, for example, is produced in excessive quantities, it helps the other regions which buy cotton, but it impoverishes the cotton belt which has cotton to sell. Other regions can get plenty of cotton in exchange for small quantities of their own special products, while the cotton belt loses. In other words, they who have cotton to sell can get large quantities of other goods for the proceeds of the sale of small quantities of cotton. The same principle applies to corn, wheat, coal or any other special territorial product.

The inequalities in the distribution of wealth or prosperity among the various industrial groups which work in succession upon the same material is likewise easily explained. The wheat-growing group, for example, gets its reward in the form of the price of wheat. The flour manufacturing group gets its reward in the form of the difference between the price of wheat and that of flour and its by-products; and the baking group gets its reward in the difference between the price of flour and that of bread.

If there should be so many wheat farmers and so few millers as to produce a bad balance, then each individual farmer would cease to be indispensable. He could stop growing wheat, and there would still be as much wheat as the millers could grind. Each mill would, however, become at the same time practically indispensable. If it should close down, it would seriously curtail the supply of flour on the one hand and reduce the market for the farmer's wheat on the other. Under such conditions, the reward of the milling group, that is, the difference between the price of wheat and that of flour and its products would become large. In short, the milling group would be prosperous because a large share of the total price of bread would go to it and a small share to the farming group. Vice-versa if there were so few wheat farmers as to provide an insufficient supply to keep the existing mills busy, the distribution of prosperity would be reversed. Whether it be wheat, hides, iron or any other product which passes from one industrial group to another, the question of the distribution of prosperity among the various groups would be the same.

The great social problems of the present, however, relate to the distribution of wealth or prosperity among the various members or classes in the industrial group. How much of the price of wheat, for example, should go to the landowner as rent, to the farmer as profits, to the capitalist as interest and to the farm laborer as wages? Again, how much of the total reward of the milling group should go to the owner of the site as rent, to the owner of the equipment as interest, to the business head as profits and to the various classes of laborers as wages? This is the problem of occupational distribution. The growth of large industries, with greatly increased numbers of interests to be preserved in each industrial group, has given to this problem its complexity. The vast differences in the prosperity of the different classes who participate in the work of the same industrial group has made this the most acute of all economic problems.

The principles which determine the relative prosperity of different classes within the industrial group are practically the same as those which determine the relative prosperity of territorial and of industrial groups. In the example, two kinds of skill are required in the manufacture of a given product, and one kind of skill is so abundant and the other so scarce as to produce a bad balance, 'no individual possessing the kind of skill which is overstocked can claim to be indispensable. The mill or factory can produce approximately as much without him as with him. Since he can be spared without great loss, he must work, if he works at all, at low wages. Each individual, however, who possesses the kind of skill which is scarce
may be said to be practically indispensable. It will make a considerable difference in the output of the whole establishment whether he works or not. He cannot well be spared and he can therefore dictate good terms for himself. In short he will be well paid.

Unskilled labor is generally oversupplied in proportion to skilled labor, and managerial talent is generally the scarcest form of skill. Thus it happens that no individual unskilled worker is in any sense indispensable. There are so many others available that any one can be easily spared. So long as this condition exists, unskilled laborers will never be able to command a large share of the value produced by the group of which they are a part. For the same reason, so long as the same conditions prevail, the more nearly indispensable the individual becomes, the larger the share of that value he will be able to command.

Various kinds of skill, however, are not the only factors of production. Adequate supplies of capital are equally necessary, and in some cases, suitable land, favorably located, is also indispensable. Whether it be land, capital or skill, the more nearly indispensable the factor is, the more it will command of the total product of the establishment.

This being the case, the obvious cure for the inequalities in the distribution of prosperity is a balancing up of the factors of production, so that no factor and no kind of skill is either oversupplied or undersupplied relatively to all others. With an abundance of available sites, no landowner could command an inordinate rent for his land. With an abundance of capital, no capitalist could command inordinate returns for his capital. With an abundance of managerial skill, no executive or business manager could command an inordinate income either in the form of profits or salary. At the same time, if unskilled labor were scarce and hard to find, so that each one could be considered as practically indispensable, no laborer would be compelled to work for low wages.

In addition to a program for the balancing up of our industrial system, we must, of course, eliminate all injustices, such as monopolies and other methods of creating artificial scarcity. See Economics.

THOMAS N. CANVER,
Professor of Political Economy, Harvard University.

DISTRIBUTION OF ANIMALS. See DISTRIBUTION OF LIVING MAMMALS; ZOOGEOGRAPHY.

DISTRIBUTION OF DISEASES. It is well known that certain diseases without relation to climate are found only within certain well-defined areas; instances are pellagra confined to Lombardy and beriberi to Ceylon and Malabar. Climate, however, is a very important factor and together with the popular habits and customs determines the prevalence or absence of certain diseases in certain parts of the world. The tropics are the recognized home of malarial fevers and cholera, in the spread of which the warm damp soil and rotting vegetation plays a large part. Typhus, typhoid and scarlet fever prevail in the temperate zones, and their spread is due principally to overcrowding or in the densely populated section of these zones. Tuberculosis and other pulmonary diseases are commoner in northern latitudes. Consult Annesley, 'Researches into the Causes of Diseases in India' (London 1855); Manson, 'Tropical Diseases' (14th ed., New York 1907); Miiller, 'Tropical Climate of Tropical Climates on European Constitutions' (London 1877); Clemon, 'Geography of Disease' (Cambridge 1904); Daniels, 'Tropical Medicine and Hygiene' (New York 1913); and Davidson, 'Geographical Pathology' (Edinburgh 1892).

DISTRIBUTION OF LIVING MAMMALS. Mammals live in practically all parts of the earth, both on land and in the sea, excepting the icy deserts of interior Greenland and about the South Pole. The diversity of climate and other physical conditions within this vast area, during both past and present time, has furnished an endlessly varied environment and the characters of the multitude of successively extinct mammals in the fossil beds of the geologic ages show that the group of mammals has always had a most plastic organism.

The mammalian types now inhabiting the earth by their wonderful variety stand testimony to the evidence of this fact. They range from the tiny shrew weighing less than an ounce to the elephant and the whale, weighing tons; from the clumsy mole to the winged bat, excelling the birds in some of its powers of flight; and from the stupid sloth to man. As we see these animals appear to fit so perfectly into their environment that at first glance the various species might be considered to have always existed in their present haunts. The occurrence of closely related living species in widely separated areas and the evidence of the fossil records indicate strongly that the ancestors of much the greater proportion of living mammals probably had their origin far from their present homes. The distribution of existing mammals is merely the latest chapter of a wonderful story going back through the geologic ages and involving almost incredible changes in the earth's surface and the relationships between land and sea. The fossil beds prove that in practically all regions one fauna has succeeded another, often of the most diverse character, in a marvelous procession.

So far as distribution alone is concerned the mammals may be divided roughly into two main categories, each rather definitely limited. First, those which are characterized by having the four limbs more or less completely developed for life on the land. Second, those which have all of their limbs greatly modified, and sometimes with the posterior pair lacking, in order to fit them for life in the sea. Land mammals, living among infinitely diversified conditions, are correspondingly much varied in size, form, color, specialization of organs and habits. Sea mammals, living under far more uniform conditions present much fewer and more uniform types which are included within the three great groups, the whales, the pinnipeds, or seals, and the sirens and their relatives. The seals and larger whales are most characteristic of the colder northern and southern seas, while the smaller whales or dolphins and the manatees are most characteristic of the warmer seas and estuaries or tidal rivers.

The present distribution of land mammals has resulted from the interaction of numerous
causes many of which are little understood or are unknown. Temperature is known to be the most potent single influence. A long continued change of 10⁰ F. in the average summer temperature of any region would have a marked influence on its mammal life; many species would disappear and be replaced by others. We have reason to believe that such changes in temperature have been the primary causes of many of the great changes in mammal life in various parts of the earth which have been revealed by studies of the fossil beds. The distribution of species is strongly affected also by the prevalent degree of atmospheric humidity, as indicated by the contrasting faunas of hot desert areas and of the mighty forests of the humid tropics. Oceans, great rivers, high mountain ranges and elevated tablelands form barriers which also affect the distribution of mammals. The Sahara Desert is believed to have existed since a remote period and for an extensive time against the spread of mammals living adjacent to its borders. In the same way great forested areas in other parts of Africa and elsewhere have their peculiar species and bar the way to species living in adjacent parts of the earth.

The comparative length of time during which certain land areas have been separated is at times indicated in a marked way by the degree of differentiation in the behavior of mammals of the regions. The geologically recent union of northern North America and northern Asia is clearly indicated by the close likeness between the living mammals of the two regions. The convergent mountain ranges, especially those extending in a northerly and southerly course, and high interior tablelands directly influence climate conditions and the animal life on them. For instance the great mountain system of western North America carries southward within the tropics representatives of the characteristic northern mice of the genus *Microtus*. The broad interior tableland of Mexico carries southward from the southwestern border of the United States to the valley of Mexico the pocket mice (*Perognathus*), the kangaroo rats (*Dipodomys*) and others, while along both lowland coasts of that country tropical species of mammals such as peccaries (*Fecari*) and tiger cats (*Felis*) range northward to our border.

The distribution of both the recent and the fossil mammals plainly indicates that numberless species have passed from their original home across land bridges to other continents where they are now isolated by the dis-appearing bridges. In many instances the species has no surviving representative in the region of its origin. For ages Asia appears to have been a vast and fecund nursery for the production of mammal types which passed thence to other parts of the earth. Most of the mammals now inhabiting temperate and Arctic North America were evidently derived from northern Asia by way of a land bridge which united the continents in the region about Bering Strait. No such route came the ancestors of our moose (*Alces*), elk (*Cervus*), caribou (*Rangifer*), mountain sheep (*Ovis*), mountain goat (*Oreamnos*), pronghorned antelope (*Antilocapra*), musk ox (*Ovibos*), wolves (*Canis*), foxes (*Vulpes*), bears (*Ursus*), wolverine (*Gulo*), martens (*Martes*), otter (*Lutra*), Arctic hares (*Lepus*), woodchucks (*Marmota*), field mice (*Microtus*), lemmings (*Lemmus* and *Dicrostonyx*), and others, nearly all of which still have close relatives living in northern Asia and Europe.

Similarly proof of former land connection between now distant areas is afforded by the distribution of other species of living mammals. This is well illustrated by the distribution of the marsupials, an extremely ancient group which, as shown by fossils, was once widely distributed in northern continents. They are represented to-day only by the opossums of South and Middle America and by the kangaroos and numerous other marsupials which in form and habits resemble our mice, moles and carnivores, in Australia and neighboring islands. Equally good indication of former land connections is given by the existence of tapirs in tropical America and in Indonesia; also by the octodont rodents now peculiar to tropical America and Africa as well as by the monkeys of the Old and New Worlds. Land bridges are believed to have once united South America, the Antarctic continent, and Australia on one side, and to have joined Brazil and West Africa on the other.

The comparative length of time during which certain land areas have been separated is at times indicated in a marked way by the degree of differentiation in the behavior of mammals of the regions. monkeys, marmosets, coati-mundis, peccaries, agoutis, prehensile-tailed porcupines, sloths, armadillos and anteaters. Both the scarcity of large mammals in South America and the number of surviving peculiar types evidence the long isolation of that continent from contact with other lands on either side. Certain groups of mammals are typical of cool regions, such as the moose, caribou, musk oxen, marmots and lem-mings of northern parts of the Old and New Worlds. Others like the monkeys are typical of the tropics. Some mammals appear to be indifferent to climate conditions as in the case of the mountain lion (Felis concolor) and its geographic races, which ranges from southern Canada to Patagonia, and appears to be equally at home among the sun-scoured desert ranges of the southwestern United States, the cool slopes of high mountains and the gloomy swaths of the vast tropical forests of Central and South America, amid almost constant rains. A similar hardiness is shown by the tiger of the Old World which has representatives from the hot lowlands of southern India to the valley of the Amur River in eastern Siberia, where winter temperatures prevail in winter. The distribution of certain species serves as unmistakable records of former climatic conditions, as in the case of the field mice (Microtus) which occupy high isolated mountain tops in southern Mexico and Guatemala, separated from their nearest northern relatives by intervening tropical low-lands. It is evident that they spread southward while a suitable cold climate prevailed on the lowlands, and with the change of climate were forced up and stranded on the elevated islands they now occupy. This discontinuous distribution on mountain ranges is as significant as is the existence of closely related types on islands and on distinct continental lands; although they may be separated by a broad and deep expanse of the sea. Isolation on islands, and to a lesser extent on high mountains, where competition from invading species may be mainly or entirely absent tends to preserve the representatives of ancient forms long after they have vanished from other parts of their former range. Both Australia and Madagascar are extreme examples of the effect of isolation in bringing down to recent times representatives of ancient forms which have become elsewhere extinct. The relation of the distribution of living mammals to their near kin of the geologically not distant past is well shown by the discovery on the open plains of North America of fossil remains of several types of antelope now abundant on the plains of Africa. Camels, once occurring from the coast of Florida to the Pacific, now exist in the feral state only in central Asia. They have living relatives, however, in the guanaco and vicunia of South America. Members of the elephant tribe, once common in most parts of the world, exist now only in Africa and southern Asia. Fossil remains abundantly prove that the horse developed on the great plains of North America where it existed in extraordinary variety of size and form. At the hands of the discorid hunters, the large horse had completely vanished from its confines, although representatives still survived in the wilds of Asia and Africa. The fact that the horses brought by the Spaniards to America found the plains of both continents perfectly adapted to their needs, and going wild increased enormously, renders still more inexplicable the cause of the disappearance of the original stock from the Old World. Significantly, one species of extraordinary size existed in various parts of the world which are now represented by smaller species. Among these may be mentioned the giant deer of the Irish peat bogs, the huge extinct marsupials of Australia, the gigantic armadillos of South America and the great wolves and lions of southern California.

The distribution of certain genera is extremely restricted. The genus Romerolagus, an aberrant rabbit having but a single species without near living relatives, is confined to a narrow belt about the bases of the adjacent volcanoes Popocatapetl and Iztaccihuatl on the border of the valley of Mexico, although exactly similar slopes with the same soil and vegetation exist on other mountains distant only a few miles. Another example is the curious rodent genus Aplodontia, confined to damp forests of the northwestern United States and represented by a single species. Such mammals are, no doubt, survivors of groups once having far wider distribution, and in their present restriction in variety of form and extent of range is a forecast of approaching extinction. The llamas and alpacas of South America are similar survivals of once widely spread types. In strong contrast, a highly restricted distribution may be cited other genera which contain many forms, abound in individuals and occupy vast areas of the earth, thus indicating a vitality and attendant fecundity as well as a youthful plasticity of organization able promptly to respond to the requirements of changing conditions. The genus Lepus, which includes the hares, is perhaps the most notable of such groups. It has representatives throughout most of Africa, Europe, Asia and North America, including in its range the northern end of Greenland and the tropical low-lands. The meadow mice of the genus Microtus, numbering many species and untold millions of individuals, occupy most of the low-lands and mountain ranges of Europe, the northern half of Asia and America north of Mexico. The vast range of the hardy puma (Felis concolor) has already been mentioned. The disappearance from the earth of once abundant and widely spread species of mammals when climatic and other conditions remain the same presents an unsolved problem. The mammoth, cave bear, and other large species now extinct, ranged the plains of northern Europe and Asia as late as the time of the Cave Men, while the rodent and other animals contemporaneous with those named and apparently no better fitted for existence still survive. It has been wisely suggested by Lydekker as probable, among the many factors which influence the disappearance of species and even of larger groups of mammals and other forms of animal life, that each species or even much more important groups may, like the individual, have its period of youth, maturity and decay, leading to loss of vitality and final extinction. America the land of the Iceman becomes in the endless succession of life. The reasonableness of the foregoing surmise is shown by the facility with which certain species of birds and mammals have been known to increase and even to become rare within a very recent period. One striking instance within the
DISTRIBUTION OF PLANTS — DISTRICT

last 30 years is the inexplicable disappearance of various species of birds in the Hawaiian Islands with no change in their habitat sufficient to account for it. But the extinction appears to have been due to a lack of enough vitality to withstand the tripling encroachment on the great expanses of their forest homes following the advent of civilized man. The steadily decreasing numbers of the prong-horned antelope on the open plains of the western United States and northern Mexico is no doubt in part due to its small powers of resistance to changes in environment brought by the increased occupation of its territory by man and domestic animals. The lack of ability to resist changes on the part of the prong-horn is strikingly shown by the difficulty experienced in keeping them alive in zoological parks and to maintain small herds of them in fenced government game preserves containing thousands of acres in the midst of their former haunts. In these same parks and preserves, buffalo, elk and deer thrive and increase rapidly.

Man appears to have originated in the Old World and to have become the most widely distributed and numerous of all mammals. He has broken up into a considerable number of specific types which had originally as clearly defined geographic distribution as the lowest of mammals. With the development of civilization man has made land and water into the basis of local distinctions and to obscure the original boundaries of races by migrations at will to all parts of the earth. The weaker species of man disappear before the stronger, as occurs among other forms of animal life.

No treatment of the distribution of recent mammals can well avoid the consideration of the potent influence of man. Although man is the latest type of mammal to appear on the earth he rapidly developed a dominant position and spread to all lands where he has determined the survival or destruction of numerous species, and his influence in this respect is rapidly increasing. From the most primitive times up to the present animal products, including flesh, fat, hides, ivory and other material, have been collected and have formed valued articles of commerce which has led to persistent pursuit and slaughter. In addition man has domesticated the horse, cattle, sheep, goats, pigs, dogs and cats, which he has taken with him to other lands where under his protection they have enormously increased the injury to most native mammals, both great and small, with which they have come in competition. The present situation in the United States is an illustration of this in the death of many millions of domestic animals, and the vast decrease in all the larger game animals, such as bison, elk, deer, antelope and mountain sheep, since the settlement of the country. Not all, by far, of this harmful influence on the native mammal life is confined to the domestic animals, for the improvement of weapons of the chase and of means of transportation coupled with the hunting instinct which persists in man are ever-increasing menaces to the welfare of the game and feral animals which offer any value as game, as bearers of fur or as the producers of commercial products. This danger extends to the species living in the sea as well as to those on land. The increasing occupation and cultivation of the land is another of the factors introduced by man whereby the existence and orderly development of the higher forms of life on the earth is being more and more disturbed and in many instances jeopardized.

E. W. NELSON,
Chief, Bureau of Biological Survey, Washington, D. C.

DISTRIBUTION OF PLANTS. See PLANT GEOGRAPHY.

DISTRICT, a term ordinarily meaning a region, a tract of land, a territory, but in the United States usually employed to designate a political subdivision of a State, county or city fixed for purposes of legislative or congressional representation, either under a law enacted by the legislature or by the adjudication of a court in which this power may be vested. The term has been used historically and currently in several senses. It was applied to organized bodies of territory administered by the Federal government because they were not populous or compact enough for territorial institutions or for other reasons were withdrawn from that system. Examples are the District of Columbia, first district, then territory, then district again; Alaska before its territorial organization; and from 1804-12 that portion of the Louisiana Purchase north of the present boundaries of the State of Louisiana. Until late in their history the counties in South Carolina were called districts.

State Districts.—The term is used also to designate a State or that portion of a State which constitutes the seat of jurisdiction of a United States court, such districts never crossing State lines. See Court.

Congressional Districts are marked off by the State legislature after the apportionment of representation in Congress has been made by that body, which bases its action upon the decennial census. (See APPORTIONMENT; CONGRESS; ELECTIONS.) These districts must consist of contiguous and compact territory and as nearly as possible must contain an equal number of inhabitants. Congress has power to alter or to override entirely the regulations made by State legislatures as to the times, places and manner of holding elections, but this power was not exercised until 1842 when an apportionment act was passed providing that members should be elected by districts instead of by general ticket. Under the Constitution the senator and the representative must be "an inhabitant of that State" in which he is chosen but in some States the two senators have been taken from different sections or districts, while in Maryland for 75 years a statute required that one of the senators be elected from the "eastern shore." Custom or law now requires that members of the House reside in the district from which elected. Since no definite rule governs the manner of redistricting a State after a new apportionment, oftentimes the party in control of the legislature will perform this work in such a way as to secure for itself a number of congressmen larger than warranted under its share of the popular vote. See GERRYMANDER.

State Senatorial Districts follow county lines in most States, especially in New England, where the county itself is usually the basis
for senatorial representation. In the newer States, after each decennial census, the State is redistricted after the election of a fixed number of senators. Minnesota and Illinois are the only States wherein election districts serve for the election of members of both houses of the legislature. In some States unequal senatorial representation occurs, sometimes because a senator is accorded to each political unit (as in Rhode Island, where each town or city is represented by one senator), and sometimes because limitations are imposed with the intent to restrict the influence of any one city (as in New York, where no county may be represented by more than one-third of all the senators).

State Assembly Districts are usually redistricted after each decennial census, the unit of representation being the town in some of the older States, particularly in New England. In Vermont each town may elect only one representative; in Connecticut each town or city may send two but no more and no town which in 1818 elected two representatives has had its representation reduced. As a result, the city of New Haven with 150,000 population has no larger representation in the legislature than the town of Union with only 400 population. For convenience each State assembly district is usually subdivided into election districts or voting precincts, the number depending upon the size or population and the ratio of apportionment decided upon by the board of elections.

City Districts.—For administrative purposes cities are usually divided into districts such as police, fire, school, park, sewer, sanitary, and election districts. Sometimes for taxation purposes, cities are districted, particularly if special assessments are imposed for public improvements, the tax rate varying in the several districts. The charters generally establish these districts outright, confer the power to change their boundaries or delegate authority to establish them. In some cities are territorial subdivisions known as wards, which are established for specific civic purposes, such as units of representation in the city council, and for police, tax, and election districts. They sometimes constitute an important part in the organization of political parties. See Cities, American, Government Of.

Taxing Districts.—Under a decision of the Supreme Court, a taxing district is any section of a State described in a statute or order as to be assessed, without respect to the civil or political divisions which may have been made for election purposes. A remarkable instance was the city of Memphis, Tenn., which, when ruled by plundering politicians, abandoned its city charter and constituted itself the taxing district of Shelby County, to escape suits against the city as a corporation. See also Taxation.

Internal Revenue Districts are established for the collection of internal revenue and come under the supervision of the Treasury Department. The country is divided into 66 districts, each in charge of a collector; as a rule the districts follow the State lines, but the revenues from some States are so large that the States are divided into several districts, as New York into six, Kentucky into five and Illinois into four. See Internal Revenue System.

Customs Districts have been established to administer the tariff laws and to collect the customs duties. (See Duty.) In each of these districts is a port of entry and in several of these ports elections of a fixed number of senators. Minnesota and Illinois are the only States wherein election districts serve for the election of members of both houses of the legislature. In some States unequal senatorial representation occurs, sometimes because a senator is accorded to each political unit (as in Rhode Island, where each town or city is represented by one senator), and sometimes because limitations are imposed with the intent to restrict the influence of any one city (as in New York, where no county may be represented by more than one-third of all the senators).

Rural Districts and Divisions.—The counties of the Southern and Far Western States and the towns and townships of the North Central and North Atlantic States are divided into smaller districts for special local administrative purposes, such as elections, fire, schools, roads, health, water, etc. In the South and Far West, country districts are generally larger than the subdivisions of towns or townships in other States, and to some extent have supplanted the system of township government. The other rural administrative districts, such as county council, town, borough, village, etc., are discussed under their individual headings.

Election Districts sometimes comprise an entire town or township, but the larger towns or townships of the North Atlantic and North Central States result in more than one voting precinct, especially where a town consists of two or more villages. See Elections.

Fire Districts seldom conform to other boundary lines; in villages and smaller cities the fire district comes within the village or city limits. Fire companies are strictly regulated as to their response to alarms in a particular district, but such companies are often called from one village to the aid of nearby towns or villages. Most States have a fire marshal whose principal duty is the prevention of fires. See also Fire Protection; Building Laws.

Health Districts are confined to counties. The health officer and his assistants are usually county boards, having jurisdiction throughout the county, and their chief work is to prevent epidemics and to create satisfactory sanitary conditions. See Sanitary Science and Public Health.

Water Districts generally coincide with the village or city limits and usually come under municipal jurisdiction. In States having large irrigation systems the water district often constitutes an important administrative unit. See also Water Supply; Waterworks.

Poor Districts may coincide with the limits of the county or township, some States having both systems. The county supports an infirm poor and persons unable to enter the infirmary must be aided or supported by the townships. See also Pauperism; Charities, Public.

Road Districts.—Most county roads in the United States have been constructed or repaired by a labor or poll tax under the direction of road supervisors or overseers of road districts into which the counties and townships have been divided. These supervisors may be elected by the road districts or appointed by the township trustees, their duties being to superintend the road work which must be performed by each male citizen between certain fixed ages. Until recently Ohio permitted cities and villages to require two days' labor on the streets. In the Southern and Far Western States these officials are county officials, while in New York a special law was passed giving the districts the power to appoint road supervisors. In other States the road officers are elected by each district in Idaho and Washington. In most of the North Central and North Atlantic States the local road officials are usually town officers, in some States the
road supervisors being appointed by the town; but in many of these States county and State officers now supervise the more important roads. See ROADS, IMPROVEMENT OF.

School Districts are areas set apart as units of organization for the local control and administration of schools within them. In most States these districts are regularly incorporated, with their own power of taxation. The limits of the township school district usually are the same as those of the civil township, but the school affairs are administered by a school board, which may or may not consist of persons chosen by each subdistrict. Independent districts may be formed in townships, which constitute a school district; or, upon vote, all of the township’s subdistricts may be constituted independent school districts. Hence a county might have townships with only subdistricts, or only independent districts, or a combination of both. The independent school districts were first established in Massachusetts in 1789 but were prevalent, however, in Rhode Island, Connecticut, New York, Illinois, Michigan, Kansas and Nebraska, while an entire township or one of its subdivisions may still constitute a school district in Minnesota, Wisconsin, North and South Dakota. In the Southern States bordering on the Atlantic and in Louisiana, where the township has not been fully established, the officers of the district are appointed by the county school officials, who also must establish the school district. The district may coincide with the civil or magisterial district and may elect its own trustees, as does the township in the North. In the other Southern States and some of the Far Western counties are regularly divided into school districts, in which case are distinct distinct municipal corporations. In other Far Western States districts may be designated by county boards or by the county superintendent of schools, but the trustees are selected locally and tax levies for school purpose are assessed by the county and paid into School Supervision; SCHOOLS, COUNTY TRAINING.

Judicial Districts.—For purposes of electing justices of the peace, the counties in many Southern and Far Western States are regularly divided into districts; and some States have districts for the election of county boards. These are called magisterial districts in Virginia, West Virginia and Kentucky; civil districts in Tennessee; and judicial townships in California. In some places, these judicial districts are also used as election precincts.

Other Rural Districts.—Sometimes districts are specially established in certain localities to conduct public works affecting two or more of the regular local districts. Among such special districts are the levee districts along the lower Mississippi, which are excessively variable, both geologically and in water stage; and the levee districts along the Ohio, which are similarly subject to sudden high water. The rainfall averages 50 inches a year. The District originated in the politics of the Confederation time. Until the adoption of the Constitution, the Continental Congress assembled on 10 occasions at eight different places in succession, at Philadelphia, Delaware, Lancaster, Pa., York, Pa., Philadelphia, vol. 9 — 13

IRVING E. RINES,

Author of 'History of the United States.'

DISTRICT OF COLUMBIA, the national capital and its adjoining territory, owned and administered directly by the United States government, to prevent its action being hindered by conflicts with local jurisdictions. It consists of 60 square miles of land and 10 of water on the eastern side of the Potomac, at the head of deep-water navigation; an enclave in Maryland, with three rectangular sides and the fourth following the lines of the river, besides the islands in the tidal river. Near the southern side of the district, forming the eastern and southern boundary of the city of Washington, is the large tidal estuary of Anacostia River or the eastern branch of the Potomac; the northwest boundary is formed by Rock Creek, separating Washington proper from Georgetown. There are several brooks. The district is flat and marshy for some distance back, then rises into gentle hills and swells; there is pleasing scenery all about. The geological formation is Cretaceous, overlaid with drift; in the latter has been found the conglomerate called breccia, from which handsome columns have been carved, used in the capitol. The soil is light, and especially suitable for market gardening, to which with dairying and the pasturage for the cows it is chiefly devoted, outside the built-up sections. The nature of the capital as a "court city" gives flower-gardening a great importance, and over $500,000 worth are sold annually. The farms are very small — about 35 acres for white and 18 for colored occupants. But little over a fifth of the surface is in farms, however; the city and its suburban village, the great National Park, and reserved grounds of various kinds, taking up most of it. The climate is excessively variable, being generally rather cool and warm. The rainfall averages 50 inches a year. The District originated in the politics of the Confederation time. Until the adoption of the Constitution, the Continental Congress assembled on 10 occasions at eight different places in succession, at Philadelphia, Baltimore, Philadelphia, vol. 9 — 13
DISTRICT OF COLUMBIA—DISTURBANCE OF PUBLIC WORSHIP

Princeton, N. J., Annapolis, Md., Trenton, N. J., New York. The first five were during the Revolution. On 21 June 1783, a band of unpaid militia broke up a session in Philadelphia by breaking in the doors, members and pointing muskets at the windows. This emphasized the need of a district guarded by Federal troops, and on 7 October Congress resolved to erect a building near the falls of the Delaware (Trenton). The jealousy of the South, however, demanded one court near the falls of the Potomac, and alternate meetings in the two. Finally a majority abolished the second proposition, and a committee was appointed to lay out a town as first voted. There was no money under the Confederation, however, to build or do anything else, and no action was taken on the committee’s report. It had been voted to meet in New York till the Federal town was ready; but this was disliked from fear of the “money power” corrupting or overbearing Congress. Philadelphia was proposed, but objected to by the Southerners because the Quakers favored abolition. The first Congress under the Constitution revived the government-district plan, but on the banks of the Susquehanna. Finally Jefferson gave a dinner and arranged a “log-rollo” of two anti-Federalists from the Potomac region, who had voted against the assumption of the State debts by the national government, changed their votes on condition of the Federalists voting to fix the new capital on the Potomac, after remaining 10 years at Philadelphia. The act was passed on 28 June 1790, for establishing the seat of government “at some place between the mouths of the Eastern Branch and the Conocoheague.” The first session of Congress was to be held in the new place the first Monday in November 1800. Maryland in 1788 ceded Washington County, and Virginia in 1789 Alexandria County, forming a district 10 miles square; Washington in person laid it out under the act of 30 March 1791 (having previously sold all his lands in the vicinity). The territory selected included the site ofPowhatan’s village, Anacostan or Nacochiant; also the existent village of Georgetown, laid out in 1751 and incorporated in 1789—both on the Maryland side; and on the Virginia side, Alexandria, formerly Belhaven. The site of the new capital itself had been the plantation of one Pope, classically inclined, who by a curious prevision called his hill the Capitol and a brook near by the Tiber. Until 9 September the site was called “The Federal City”; then, by order of three commissioners appointed by President Washington, the district was named “The Territory of Columbia,” and the city “The City of Washington.” For the latter, see that title; also Capitol, where is noted the project, after its burning by the British, of removing the capital north, which was carried by the speaker’s casting vote, but buried in committee. In 1846 no Federal buildings having been erected on the Virginia side, nor likely to be, Alexandria County was retroceded to that State upon the petition of the inhabitants thereof, by a vote of 763 to 222. In 1871 the business men of the District, realising under their political nullity, it was constituted a Territory with a governor and legislature, and delegates in Congress; but was at once seized upon by a ring of speculators who obtained control of its government and plundered it into bankruptcy. In 1874 the territorial government was abolished and direct government by Congress restored through three commissioners appointed by the President and confirmed by the Senate.

The commission of 1874 was a temporary government; in co-operation with Congress and the citizens of the District, it framed as a permanent system the act of June 1878, which the Supreme Court has pronounced “the constitution of the District of Columbia.” Under this act half the expenses of the District, previously laid entirely upon the residents, are paid by the national government, as the owner of more than half the real estate. There is no popular suffrage, the entire executive government in the hands of commissioners appointed by Congress; they recommend legislation and appropriations to the latter, which in turn consults them in the same matters. The government, though not appointed by popular vote, is nevertheless swayed by public opinion; and so excellent that agitations for restoration of suffrage meet no support. The judiciary of the District dates from 1801.

Population—1800: Washington, 8,144; Alexandria, 5,940; 1810: Washington, 15,514; Alexandria, 8,552; 1820: Washington, 23,334; Alexandria, 9,703; 1830: Washington, 30,261; Alexandria, 9,573; 1840: Washington, 33,745; Alexandria, 9,967; 1850: Washington, 51,687; 1860 (same), 75,080; 1870 (same), 131,700; 1880 (District of Columbia), 177,624; 1890 (same), 230,392; 1900 (same), 278,718, of whom 218,196 were in Washington proper and 14,549 in Georgetown. Of these, 20,119 only were foreign born; but 87,186 were colored; (1910), 331,069. In 1913 the population was (police census), 353,297. There was in 1871 a very small foreign-born population, but the negro element was large—98,144.

DISTRICT OF COLUMBIA, Courts of. See Court.

DISTRICT COURTS. See Court.

DISTRICTS, Rural Administrative, the term applied to rural districts other than county, council, town, borough, village and school districts. These minor rural units include election, fire, water, health, road, poor and other districts. In general, they are unsatisfactory, involving crossing and recrossing of district lines and overlapping of authority. The principle of the circumscribed district has been used to restrict college students from voting in college towns. See County; County Government; Municipal Government.

DISTURBANCE, at common law, the offense of violating an incorporeal property right, such as a profit, or arising from the land of another party. Such rights have no possession of right and are not protected by actions of trespass but by appropriate proceedings against a disturbance by the owner of the land. The forms of the offense are numerous, depending upon the nature of the right involved. See EASEMENT; NUISANCE; TRESPASS.

DISTURBANCE OF PUBLIC WORSHIP, a modern offense, defined by statute, which in America has superseded the common law offense of brawling in church. It consists in any wilful interference, by word or deed,
1 Soldiers' Home
2 Falls of the Potomac
with the good order of persons assembled for religious worship. It may be committed by a person within the place of worship or by noisy conduct on the outside. It is a misdemeanor and is punished by fine or imprisonment, or both. See NUISANCE.

DISTYLE, in classic architecture, a composition showing two columns in front.

DISUSE. It is familiar knowledge that continued lack of use of any particular muscles in our body by any one of us tends to make those muscles flabby and weak; in a word, these disused muscles tend to degenerate. This is not only true of muscles but of many other tissues and organs, and is not only true of parts of our body, but of body parts of other animals.

It was largely on the basis of a knowledge of this fact, and of the other related one, that muscles and most other body parts which are much used become larger and better developed, and no longer necessary to us, and which fact that these changes in the structure and functioning of the parts of an individual acquired during the individual's lifetime through use and disuse, are directly inherited by the offspring of the individual, that Lamarck founded his famous theory of evolution. See articles EVOLUTION, HISTORY OF AND EVOLUTION, THEORIES OF.

Many animals that live in dark caves, or at great depths in the sea, or in underground burrows, have rudimentary eyes or no eyes at all, although their nearest relations above ground have well-developed eyes. Species or races of winged animals that have given up, or are giving up, flying, under conditions of domestication, where flying is no longer necessary, as in the case of the barnyard fowl and the moths of the oil-burner, have degenerating wings. In man there is a host of rudimentary, or better, degenerating, organs, such as the vermiform appendix, the skin muscles of the scalp, the wisdom teeth, etc., whose functions are no longer necessary to us, and which are consequently in a state of developing backward toward total disappearance rather than forward toward better condition. Lamarck's explanation of this is that although these organs were useful to our ancestors of far remote date, they are no longer needed because of changing conditions, and hence have, through disuse and the inheritance of the degenerating effects of this disuse, come gradually to be rudimentary in the species. Occasionally an individual is met who can use the skin muscles of scalp or the muscles of his outer ears. He represents an ancestral condition.

Lamarck's explanation is simple: It is plausible. But it lacks an all-important element, and that is the proof of the assumption that characters or changes, acquired by an individual in his lifetime, due to use or disuse, or the influence of the environment, are actually inherited. As a matter of fact, this has not only not been apparent, but it has apparently not occurred. Darwin, who, many years after Lamarck's theory was offered, proposed another explanation to account for rudimentary or degenerating organs, accepted in some measure Lamarck's assumption of the inheritance of acquired characters. But the Neo-Darwinians, coming after Darwin, rejected Lamarck's assumption entirely, maintaining that there was no evidence to support it and much evidence against it. It was August Weismann, an eminent German evolutionist, who took the lead in the attack and final practical overthrow of Lamarck's evolution explanation in general and of his explanation of degenerating organs in particular.

The other principal explanation that has been offered of the presence in animal bodies of rudimentary organs and their increasing degeneration even to actual disappearance is included in Darwin's general explanation of variation, namely his theory of natural selection, based upon a rigorous struggle for existence and survival of the fittest.

If an animal species, or a group of individuals of the species, begins to change its habits of life so as to render less important, or even comparatively useless, certain organs of the body, as by the adoption of a cave life which renders seeing a useless function, there will be no advantage to those individuals born with better eyes and more advantage to those born with poorer ones. Hence there will be selection in the struggle for existence as between these two kinds of individuals, and both kinds can persist and produce young like themselves; or they can mate together and produce young with poorer eyes than the better-eyed parent with no disadvantage to the species or part of the species in the caves. Thus a degeneration of eyes and eyesight may be initiated by this miscellaneous mating or panmixia, and may be continued even to a nearly or quite complete loss of eyes by continued panmixia.

It is even conceivable that in the case of certain organs no longer needed because of a change of habits of the species, the individuals retaining the organ in full size and development might be handicapped in the struggle for existence through the necessity of its being necessary to divert some of their food and air to the nutrition of these useless parts, while others born with the parts smaller or less developed would have a certain useless expenditure of nutrition on the unnecessary parts. These latter individuals might be assumed therefore to have a little advantage in the bitter struggle for existence by being able to use more of their food and oxygen for the other more important parts of the less needed because of changing conditions, and hence have, through disuse and the inheritance of the degenerating effects of this disuse, come gradually to be rudimentary in the species. Occasionally an individual is met who can use the skin muscles of scalp or the muscles of his outer ears. He represents an ancestral condition.

Herbert Spencer tried to reduce this position to an absurdity by taking as an example the tiny rudimentary bones of the whale's limbs. These bones are but a few inches long in a body that may be a hundred feet long, and of correspondingly enormous mass. How much food is saved to the whale, asks Spencer, that finds itself born with leg-bones a few millimeters shorter than those in another whale? Can anyone of sane mind believe that such a life-and-death determining advantage in this minute difference in nutritive necessity?

So the situation to-day as regards a sufficient explanation of the actual evolutionary results of disuse and the actual causes of the degeneration in species of disused parts, resulting in so-called rudimentary or vestigial organs,
is far from satisfactory. We know that disuse of parts by any individual results in degeneration of such parts in the particular individual concerned, but how it can result in an inherited and increasing degeneration or loss of the parts throughout the species is not clear.

Most of the present-day theories offered to explain evolution, the mutations theory, have no more satisfactory explanation of the results of disuse, as these results affect the species, than have those who cling to the older evolution theories. Their theory would simply explain the occasional sudden appearance of an individual, or of several individuals in any species, with any one or several organs in undeveloped or rudimentary condition, and this congenital character could be handed on by inheritance. But original use or disuse would have nothing to do with the sudden appearance of the new condition of the organ, nor would the new condition appear necessarily in an animal or species in which it would be an advantage.

Of all the explanations of the evolutionary results of disuse, the Lamarckian one is the simplest, the most rational and most plausible. But it can have no real standing until it can be proved that acquired characters, or certain categories of them, including the changes produced in the individual by disuse, can be handed down to the next generation by inheritance.

Vernon Kellogg,
Professor of Entomology, Leland Stanford University.

DITCH. (1) A trench or fosse on the outside of a fortification or earthwork, serving as an obstacle to the assailant and furnishing earth (dèblai) for the parapet (remblai). It is from 90 feet to 150 feet broad, in regular fortifications, and 10 to 12 feet deep below the natural level of the ground. The fosse around a Roman encampment was usually nine feet broad and seven feet deep; but if an attack was apprehended it was made 13 feet wide and 12 feet deep. The agger, or parapet, of the encampment was raised from the earth to the fosse, and was crowned with a row of sharp stakes. (2) In agriculture, a trench usually made along the sides of fields, so that all the drains may be led into it, or along the top of a field so as to divert surface water. Sometimes a double ditch is adopted, and a hedge planted between. In arable land, however, since the introduction of pipes, ditches have largely given place to underground drains.

DITCHFIELD, Peter Hampson, English author and clergyman: b. Westhoughton, Lancashire, 20 April 1854. He was educated at Oriel College, Oxford, entered the Anglican priesthood, and has been rector of Barkham, Berkshire, from 1886. He is a prolific writer, especially in the field of ecclesiastical and general antiquities; wrote in 10 volumes 'The National Churches Series' (1891-97); contributed the volumes on Buckinghamshire, Oxford, Kent, London, Lancashire and Cheshire to the 'Memoirs of County History Series,' and acted as general editor.

DITHYRAMBUS, or DITHYRAMB, in Greek literature, a form of lyric or poem sung in honor of the god Dionysus (Bacchus) at his festivals. Since these festivals were celebrated with great extravagance, which would please the god of wine, the dithyrambs employed in his worship naturally breathed the same frenzy. The character of the dithyrambus therefore requires bold images and lofty periods. The more apparent disorder it contains, the more it partakes of the fire of intoxication, the better it sustains the true dithyrambic character. In the wild Phrygian music it was sung to: Arion of Methymne, in the island of Lesbos, was the first to give a regular choral form to it, about 625 B.C. Lasos of Hermione is said to have been the first who introduced dithyrambic contests into the public games. It was out of the mould of dithyrambic songs — later introduced — that ancient Greek tragedy took its rise. The expression dithyrambic poem denotes, also, any lyric poem filled with a wild and impetuous enthusiasm, as is the case with many odes of Pindar. 'Alexander's Feast' by Dryden (1698) is the best example of the dithyramb in English.

DITMERS, Raymond Lee, American naturalist: b. Newark, N. J., 20 June 1876. He was graduated at the Barnard Military Academy in 1891. He spent five years as assistant curator of entomology at the American Museum of Natural History, was correspondant on the New York Times in 1898-99, and entered the New York Zoological Park as curator of reptiles in 1899, and since 1910 has been in charge of the department of mammals. He is a Fellow of the New York Zoological Society and corresponding member of the Zoological Society of London. He is author of 'Snakes Found within Fifty Miles of New York City,' 'The Reptile Book' (1907); 'Reptiles of the World' (1909), two valuable contributions in their fields; also numerous articles on entomology and herpetology.

DITMARSH, or DITMARSHES (Ger. Dithmarschen, *the German marsches*), a district of Holstein in Germany, along the German Ocean, between the mouths of the Elbe and the Eider, so little raised above the sea as to require the protection of strong embankments. Area, 531 square miles. On the south, from 1474-1559 practically an independent state, it became part of Holstein and Denmark, and in 1866 was annexed to Prussia. Pop. 96,373.

DITTANY (Dictamnus), a genus of plants belonging to the rue family (Rutaceae). The members of this genus are beautiful plants, with alternate compound imparipinnate leaves. Their flowers are large and white or purplish in color. They are arranged in racemes, the peduncles and pedicels of which secrete in numerous more or less prominent glands the essential oil which gives these plants their odor. Their roots were formerly used in medicine; their flowers furnish the perfume with a fragrant distilled water. The most common species is Dictamnus albus, the leaves of which greatly resemble those of the ash. It is said that in hot weather the odoriferous particles thrown off from this plant form an inflammable atmosphere around it; and if a lighted candle be brought near the plant, especially in a time of drought, there is a burst of flame around the plant. The dittany of the United States (Gynila mariana) belongs to the mint family (Menthae) and is the only one of the 15 species of the genus native in America. It is an exceedingly aromatic herb,
with purple-pink flowers arranged in loose clusters. It is found from New York to Florida and west to western Georgia and Ohio. The cinnamon of Crete is *Origanum dictamnus*, and the bastard cinnamon is a species of *Murraya* (hoarhound), both labiates.

**DITTE, dē, Alfred, French chemist:** b. Rennes (Isle-et-Vilaine), 20 Oct. 1843; d. 1908. He has made very extensive original investigations in chemistry. He has written extensively in magazines and reviews on a variety of scientific subjects which have received official recognition and commendation from the Institute of which he was elected member in 1897. He is a commander of the Legion of Honor and received numerous other decorations for his research work and discoveries in the physical sciences.

**DITTENBERGER, Wilhelm, German classical scholar:** b. Heidelberg, 1840. He received his education at Jena and Göttingen. In 1874 he became professor of classical philosophy at the University of Halle. He has published "Das Ephesius Atticus" (1863) on the "Inscriptions Atticae, et Romanae" (1878-82), Vol. III of the original edition of "Corpus Inscriptionum Atticorum," published by the Berlin Academy; "Sylloge Inscriptionum Graecarum" (1883), "2d ed., 3 vols., 1898-1901," "Corpus Inscriptionum Graecarum Graeciae Septentrionalis" (1894-97); "Orients Greek Inscriptions Selecta" (2 vols., Leipzig 1903-05). Consult Larderfiz, "Griechische Epigraphik" (Munich 1914).

**DITTERS VON DITTERSDORF, Karl, German musical composer:** b. Vienna, 2 Nov. 1739; d. 31 Oct. 1799. He was a brilliant violinist and accompanied Gluck to Italy in 1761. He is particularly distinguished in comic compositions and perhaps unrivaled in this branch of music among the German composers. Several of his operas were represented with great success in Italy: "Doktor und Apotheker" (1786), which still holds the stage; "Betrug durch Aberglauben"; and "Die Liebe im Irrenhause," were among the most successful of these. He also acquired considerable reputation by his oratorio "Esther," which secured him a place among the Austrian nobility. On his death-bed he dictated his autobiography to his son.

**DITTON, Humphrey, English mathematician:** b. Salisbury, 29 May 1675; d. 15 Oct. 1715. He was for a time a nonconformist clergyman. Through Sir Isaac Newton he received the appointment of mathematical master at Christ's Hospital, which appointment he retained till his death. In 1714, in conjunction with Whiston, he published a new method for finding the longitude at sea, as well as on land. He was the author of several mathematical works, the principal of which are the following: "General Laws of Nature of Motion" (1705); "Institution of Fluxions" (1706); "Treatise of Perspective, Demonstrative and Practical" (1712); "New Law of Fluids" (1714). He also wrote a "Discourse Concerning the Resurrection of Jesus Christ," which was afterward translated into several languages.

**DIU, dé′ōo, an island of India, belonging to the Portuguese since a.d. 1535, off the south extremity of the peninsula of Kathiwar, in the Bombay presidency. Area, 20 square miles. On a point on the east end of the island is the fortified town of Diu, once an opulent city of 50,000 inhabitants, now dwindled to insignificance. Fishing is the chief employment of its inhabitants; it has a small but excellent harbor and a Jesuit's college, erected in 1601, now a cathedral. Pop. 14,614.

**DIURETICS, drugs used to increase the elimination of urine.** Such diuretics may be direct, in that they affect the renal epithelium, or indirect, in that they increase the blood pressure within the kidney and thus increase the urine elimination. This is largely an artificial classification, since it would seem that urine is always a true secretion and not a filtrate, and the renal epithelium must always be involved in the process of manufacture. Still it is a subdivision that has received wide recognition. Diuretics are frequently used in a number of heart, lung, and kidney diseases; because in the normal elimination of urine certain catabolic products are cast off from the body by the urine. If they are retained, however, they give rise to various degrees of intoxication, which may be even fatal. Thus in certain heart diseases, either from insufficient pressure or from accompanying disease of the blood vessels, the elimination of the ordinary amount of urinary solids may be insufficient and result in poisoning. Hence diuretics, by increasing the elimination of urine, increases the output of these poisonous products. In all patients for whom diuretics are useful, certain concomitant drugs are of benefit, those namely that empty the bowels and those that increase the elimination of perspiration. Of the numerous diuretics the saline salts of potassium, sodium, lithium, calcium, magnesium, the heart tonics, such as digitalis, adonis, caffeine, strophantus convallaria, theobromine, are most frequently employed. To this list calomel, copaiba, cubeb, juniper, oil of sandal and other irritating diuretics might be added. Injections of hot water into the rectum cause a pronounced diuresis, and this method is now recognized to be one of the best modes of inducing an increased elimination of urine.

**DIVAN.** (1) With the Turks it was for long the highest council of state; the Turkish ministry. Every pasha has also a divan. (2) In the large mansions of the rich in Turkey a divan signifies a large hall for the reception of visitors, which communicates with a number of ante-chambers surrounding it and which contains sofas placed round the walls, often adorned with costly tapestry and richly embroidered cushions. (3) Divan, with the Arabs, Persians and Turks, is used to denote a complete collection of lyric poems, which they call ghazals and through each of which one single rhyme extends: they never exceed the length of 14 strophes. Such a collection is complete if there are as many divisions as there are letters in the alphabet of the respective languages; and each division contains at least one poem, the rhymes of which terminate with the letter under which the division falls; some letters are excluded, as few or no words end in them. Goethe applied this name to a collection of poems by himself, written in a popular style. (4) The word is also applied to a soft-cushioned seat for the accommodation of several persons.
DIVER, a name properly restricted in ornithology to birds of the family Colymbidae, but applied with little discrimination to various other water-birds of similar habits. The common name is based upon the powerful, posteriorly placed legs with fully webbed feet, the long sinuous neck and stout acute bill admirably adapt them for aquatic life and the pursuit of fish. They are strong flyers, but on the land are awkward and stand nearly upright. The plumage is multicolored, posteriorly. Three species are well known in the United States. The great northern diver or loon, Urinaror (Columbus) imber, is a large bird, sometimes attaining a length of three feet. Above the plumage is a lustrous black with green and purple metallic reflections and marked with numerous white spots and streaks; below, a nearly pure white. The loon is distributed throughout the entire northern hemisphere on both fresh and salt waters, and during the winter is found in all parts of the United States, in the northernmost part of which it breeds, building its nest among the rushes near or in the water, and laying as a rule but two eggs. It winters from the southern limit of its breeding range to the Gulf of Mexico. The loon is best known by the extreme facility with which it dives at the flash of a gun, thus escaping injury while the ball speeds harmlessly overhead, and for its wild resonant cry, about which many traditions and myths have arisen. It can remain several minutes under water and swim 100 yards before rising to the surface for air.

The red-throated diver (U. lumme or C. septentrionalis) is eight or nine inches shorter than the loon, of a rusty black, with profuse small white spots above, white below, with a large distinct chestnut-colored patch on the lower part of the throat. It is distributed like the loon, but is rather more northern, and is found in the United States in the winter only. The black-throated diver (U. arcticus) is intermediate between the other two species, from which it is distinguished by a blue-black neck-patch. It is a high northern species and is restricted within the limits of the United States chiefly by a western variety which occurs abundantly on the Pacific coast in winter. Consult Baird, Brown and Ridgway, 'Water Birds' (1884); Elliot, 'The Wild Fowl of the United States' (1898).

DIVES, dî'vez (Lat. 'rich'), the name popularly adopted from the Vulgate translation for the 'rich man' in the parable of the rich man and Lazarus, Luke xvi.

DIVI-DIVI, dî've-dî've, Libi-dibi, or Libidi, the astringent bean-pods of Cecropia cordiaria, a tree which grows in northern South America, in the Antilles and in Mexico, and a member of the family which yields sapan, Brazil and other red woods. The pods are about one inch broad and three inches long, but are generally bent or curled up and tend to scale off on the outside. They have a pale-brown color with a tinge of yellow; sometimes they are spotted and black and then they are not so good. They are very rich in tannin (especially in the pods), good sample cordage as much as 30 per cent and form one of the best tanning materials. They are largely used in calico-printing for blacks and dark shades.

DIVIDE, The Great, or THE CONTINENTAL DIVIDE, names given to an elevated ridge of land in the United States where occurs the parting of the waters which flow to the Atlantic Ocean and the Pacific Ocean. The name "The Great Divide" is now commonly applied to a broader extent of country than the Continental Divide or watershed proper. It comprises that region in Montana and Wyoming wherein so many of the large rivers of the United States drain their several waters and which assesses within itself nearly all the characteristics of a continent. The arrangement of the elevated land masses in relation to the valleys and plateaus is continental; the temperature and vegetation vary almost from that of the tropics to the frigid zones; its mineral wealth is enormous; and its wild animals and great varieties of fish make it the paradise of the hunter and the angler. Its waters flow to the Gulf, the Atlantic and the Pacific oceans, and streams rise on its eastern borderland whose waters flow to the Arctic Ocean. It is the natural geographical centre of North America. The term 'divide' is used, especially in North America, as synonymous with watershed.

DIVIDEND. (1) In arithmetic, a number to be divided by another; thus, if 20 is to be divided by 4, 20 is the dividend and 4 the divisor. (2) In commerce, the fractional part of the assets of a bankrupt which is paid to the creditor in proportion to the amount of the debt which he has proved against the estate of the debtor. (3) The sum periodically paid as interest on loans, debentures, etc., or distributed as profit on the capital of a railway or other company. The sum to be divided is broken up into as many portions as there are bondholders or shareholders to claim them, and the fractional part falling to each holder bears the same proportion to the whole dividend as the amount of stock or shares he holds bears to the whole capital. Dividends cannot be paid out of the capital of a public company. Preference shares in a company are those entitled to a fixed rate of interest, the interest on which must be paid before the ordinary shareholders can get any return. The declaration of dividends is one of the powers of directors, but must be confirmed by a meeting of shareholders. In England, dividends must be paid in cash; in the United States they not infrequently take the form of stock bonds or scrip. When the profits of a company are so large as to invite hostile comment on the part of that section of the public which it serves, an increase of nominal capital may be deemed politic and carried through by the issue of pro rata stock dividend.

DIVIDENDS. See CORPORATIONS, LEGAL.

DIVIDING ENGINE, a machine for marking fine lines at regular intervals by means of a diamond point or other sharp edge, on the scales of scientific, mathematical or other instruments, and also for dividing a length into aliquot parts as in the making of metre rods. Another use to which they are put is the marking of diffraction gratings, in which a very great number of lines are cut exactly parallel and at very small as much as 450 per cm and form one of the best tanning materials. They were made by Michelson, Rowland and Rutherford.
DIVIDING RANGE—DIVINE COMEDY

The same general principle, however, is found in all. The machine consists of a cylinder with a screw thread and its ends held in yokes, while it carries a large nut, which is held on ways parallel to the screw. When the screw is turned by a crank or otherwise, the nut advances of recedes. The cutting edge is set at a point above the screw so that it makes a line at right angles to the axis of the screw cylinder. The points of the largest and the smallest rul- ings are to be made is attached to the nut. A line is then made by the cutting edge; the cylinder is turned through a certain fraction of a complete revolution, thus carrying the nut and the surface forward a small distance, when a second line is ruled; and so on until the whole surface of the piece is marked. All modern machines are automatic and embody various re- finements of design and construction. See Screw and consult The Collected Papers of Henry A. Rowland (Baltimore 1902), Physical Review (Vol. XXX, No. 4).

DIVIDING RANGE, Great, an Australian chain of mountains, forming the watershed be- tween the rivers flowing into the Pacific and those running westward. It stretches from the north of Queensland to the south of New South Wales and westward through Victoria. The Darling River rises in the range.

DIVINA COMMEDIA, de-vē-nā kōm- mi' dē-ē-sē Dei DANTE; Divine Comedy.

DIVINATION (Lat. divinatio, the art or ac- quit of foretelling future events, or discovering things secret or obscure, by the aid of superior beings, or by other than human means. The deri- vation of the word indicates a belief that omens are sent by divine interposition. Natural divina- tion was anciently thought to come by divine afflatus; artificial divination, by signs, omens, etc. At an early time divination formed a regu- lar science, intimately allied with religion and furnished with rules and regulations. Even though divination did not have its origin in fraud, it became a sort of imposition. Most prohibited divination expressly (Deut. xlviii, 11). Saul expelled “those that had familiar spirits, and the wizards,” from his kingdom; yet he was weak enough to consult the famous witch of Endor shortly before the battle in which he fell. The Egyptians and Greeks had their oracles. With the Romans divination and witchcraft were brought into a kind of system, and constituted part of their religion. (See AUGURIES and AUSPICES.) The ancient Ger- mans had consecrated white horses, from whose snorting and neighing they drew favorable or unfavorable signs. They also followed the guidance of prophets, whom they called Al- runes. Many Christians, from the period of the 3d century, adopted the sortes biblicae or sortes sanctorum—a mode of judging of the future by opening the Scriptures at random, and forming an opinion from the passage on which the eye happened to fall. (See BIBLIOGRAPHY.) In early times Virgil's Aeneid was also used for the same purpose (sortes Virgillae). All the ancient Asiatic tribes had modes of divination; and sorcerers were considered part of the Inquisition of America. Many of the old forms of divination con- tinue to be practised in Christian na- tions at the present day, sometimes from supersti- tion, sometimes for amusement, gypsy for- tune-tellers being often resorted to. There are many names for the different modes of prog- nosticating the future by means of the various appearances which nature and art present, from the revolutions of the stars, the fall of a coffee-cup. The following by no means exhaust the list, as the different modes of divination that have been practised are almost endless: Aëromancy, divination by air; auro- romancy, by flour; arithmancy, by numbers; bibliomancy, by the Bible; capnomancy, by smoke; catopromancy, by mirrors; cheior- mancy, by the palm; cleidomancy, by keys; ciromancy, by wax; geomancy, by the earth; hepatoscopy, by the liver of animals; hydromancy, by water; lamptomancy, by lamps; necromancy, by corpses; nephelo- mancy, by clouds; oneiromancy, by dreams; pyromancy, by fire; rhabdomancy, by rods. The works on this subject are very numerous, including the mystical productions of the East, the Cabala (q.v.); the treatises on astrology, witchcraft, etc., in the Middle Ages, and the studies of more recent writers. See ASTROLOGY; BLACK ART; CUP, DIVINATION BY CLAIRVOYANCE; ORACLE; PALMISTRY; WITCH- CRAFT.

DIVINE COMEDY, The. When Dante was nine years old he for the first time saw Beatrice, the daughter of Messer Folco Porti- nari and Madonna Gilla Caponsacchi. She was his junior by one year; and Boccaccio says that he “received her fair image into his heart with such affection that from that day forth as long as he lived it never left him.” Nine years elapsed before she spoke to him again, although he tried many times to see her. It is believed that she was married, while still a young girl, to Messer Simone de Bardi. She died in June, 1290, in her 23d year, and Dante was inconsolable. In memory of her, that “blessed Beatrice, who lived in heaven with the angels and on earth with his soul,” he wrote, La Vita Nuova (The New Life), which is a mystical account of his passion, interspersed with many sonnets and canzonieri, he having, as he says, discovered “the art of saying words in rime.” The book ends with this sentence: “To me ap- peared a wonderful vision. I saw new things which made me resolve to say no more of this Blessed One until I could more worthily descend upon her. And to attain this, I study to the utmost of my powers, as she truly
knows; so that, if it shall be pleasing to Him through whom all things live, that my life shall be prolonged for some years, I hope to say of her what has never been said of any other woman. The work to which he thus promised to dedicate his life was "La Divina Commedia." He himself called it simply "The Comedy," the epithet "Divina," not having been applied to the poem until 1555, some years after it was written out by Dolce. In the text it is mentioned as "il sacro poema." Dante, in a letter to Can Grande della Scala, says: "The title of the book is, 'Here begins the Comedy of Dante Alighieri, Florentine by birth not by character.' To understand this one must know that "Comedia," derived from comus (village) and oda (song) means about the same as village-song. And Comedy is a sort of poetic narrative, different from any other. As regards its matter, it differs from tragedy, since the latter is at first pleasing and quiet; at the end, soul and horrible . . . Whereas comedy begins with some degree of adversity but ends prosperously. In the same way tragedy and comedy differ in style: the former is lofty and sublime, the latter studied and popular . . . Whence it is evident why this work is called a Comedy: for if one regard the matter thereof it is at first horrible and soul, being in Hell; at the end it is prosperous, delightful and grateful, since it is in Paradise. If one regard the style, it is unstudied and popular, because it is in the vernacular, in which even ordinary women speak to one another. He was indeed, for a time, criticized for not having composed it in Latin, which during the Middle Ages was the polite language.

Like many of the other great works of literature it may be interpreted in two ways: its protagonist may be conceived as either Dante himself, or as the human soul, the type of sinful man. This protagonist struggles first unaided to escape from the dangers of a wild, tangled and frightful forest and to climb the mountain of virtue, or of salvation, which he is prevented from doing by three symbolic wild beasts—a nimble-footed, sly panther, a lion with head held high and ravenously hungry, and a lean, fierce wolf. He retreats into the depths of the forest and there becomes aware of one who by reason of long silence seemed feeble. It is the shade of Virgil come to show him the right way to escape the wild beasts and to attain to the delectable mountain, which is the beginning and the source of all joy. There are several ways of interpreting the symbolism of this introductory canto. The obscure forest in which Dante, "in the midst of the road of this our life" (that is, when he has just reached the age of 35) in May 1365—has wandered in sleep is the world, or sin. The panther is "luxury," "disolute pleasure," "incontinent appetite," or with a political significance, is the city of Florence, which had persecuted the poet, condemning him to death, with confiscation of his property, because as a Ghibelline he favored the Emperor and not the Pope. The lion is "pride" or "bestial violence," or may be regarded as Fortuna, the "ready wolf" taken as subject is "avarice," "greed," "materialism;" taken objectively it may refer to Dante's enemies, the Neri (the Guelfs or Black party); or, taken politically, it may mean Rome. Dante himself gives no clue to this symbolism, but leaves it to the reader to interpret. Virgil typifies Man's Reason, and therefore Dante hails him in a double sense. Here is the poet from whom he has acquired the beautiful style which has brought him fame. Virgil promises to conduct him through the eternal place where he will hear groans of despair, where he will see the spirits in torment. Then they will ascend to the holy place of those that are content to dwell in fire, because they hope, after purification, to attain the joys of the Blessed. Having had experiences of Hell and Purgatory, Dante, still in the flesh, will be admitted to Paradise, there to be guided by a spirit more worthy, since Virgil (or Human Reason) had not been obedient to the laws of that Emperor who reigns over the universe. This more worthy spirit is Beatrice, typifying Man's spiritual Nature, the functions of which are Faith, Hope and Love. Dante, after some demur, is encouraged to follow, and with fear and trembling, begins the descent into the Inferno. Over the gate is the famous inscription which ends with the words, "I leave all hope behind ye who enter here." Hell is the divine, the other worlds, the last, at the centre of the earth, a place where, surrounded by a fourfold ring of ice, Lucifer crushes, in his three mouths Judas, Brutus and Cassius, the three arch-traitors of history. In the circles and their subdivisions, four of the seven cardinal sins still continue, under the inevitable punishments inherent in them. They are inflicted by the symbolical creatures of Greek mythology—Charon, Minos, Cerberus, the Centaurs, the Harpies and by the devils and other beings created by medieval theology, or else they are represented by physical analogies, such as fire, mud, filth, worms, pitch, ice. Dante departed from the conception of Hell as depicted by his great contemporary, Thomas Aquinas, for he gives the sinners that had died in their sins, unrepentant, no room for remorse; lost souls, according to Dante's psychology, will to continue in the horrible state which they had chosen, while still alive, as their earthly environment; they have no wish to escape; and so forever suffer in the whirlwind of passion and lust, the mud and mire of gluttony, the falling flakes of flame and the desert sands of atheism, the cannibalism of treachery, the never-melting ice of the traitor. He lavishes all the scornful symbols of the agony and hopelessness of Hell, and to each place he consigns with sardonic partisanship those that had been his personal or political enemies—popes and poets and teachers: a bitter revenge, unrelenting and horrible. At the vestibule of the Inferno he places LImbo where dwell those that had lived virtuous lives, such as Virgil himself, but without knowledge of Christianity. Here Dante is met by four tall shades: Homer, the sovereign poet; Horace, the satirist; Ovid, who sang of the ancient mythology; and Lucan, the poet of the Pharsalia, forming the School of that Lord of most lofty Song, "who soars above all as an eagle flies." They salute him and with marks of honor accept him as the sixth of their august company. Too many folk with slow, grave eyes, of great authority. Among them he recognizes the heroes and worthies of pre-Christian days, philosophers and historians; they experience in this underworld desire without hope but are not unhappy or subject to other punishment. In the
DIVINE COMEDY 201

Fifth Canto of the Inferno occurs the famous episode of Paolo and Francesca, occupying more than 300 lines——bell without chance repetition by poets and dramatists, in many forms. The lines, "There is no greater woe than in misery remembering the happy time," is an almost literal translation from a Latin apothegm of Boethius. Dante here shows his sympathy with the saints and the damned—— bell without chance for repentance, because their sin grew out of genuine love. He never shows sympathy where a sin was due to meanness or ill-will.

The material removed from the earth to make room for Hell was heaped up to form the Mountain of Purgatory, situated like an island in the ocean which, according to his cosmography, forms the under side of the earth. It is exactly antipodal to Jerusalem. Like the Hell, it consists of nine divisions. The first is the Ante-Purgatory where souls that had repented late were compelled to sojourn 30 times as long as they had been in a state of unrepentance. Here is the Valley of the Princes——rulers that had been negligent of salvation. Then come seven regions of the antipodes where the seven cardinals are purged. At the Fifth Ledge, Statius, the poet of the 'Thebaid,' who happened to have been born and to have died in the first century of the Christian era, meets the two other poets and accompanies them, engaging them in charming conversation. On the top of the mountain is situated the Earthly Paradise. Here Virgil suddenly disappears, declaring that henceforth his pupil's will is free, upright and sane; henceforth he cannot go astray even though he follow his own impulsive guidance. In other words, Human Reason must give place to Divine guidance. There follows a scene of exquisite mystical symbolism. Beatrice appears and Dante confesses his dereliction from the Faith, is made to pass through the River Lethe, and to drink of it, whereby he forgets all his evil past; then he enters the River Eunoë, whereby henceforth he will remember only what is good, and is ready to mount with his new guide into Paradise. In the 'Purgatory,' as in the 'Hell,' Dante departs from the teaching of Thomas Aquinas. Here repentant sinners have no desire to escape from the purging fire; they rather throw themselves upon it, without regret, exult in it, realizing its efficacy in purifying them; they cherish hope and have no fear.

The Paradise is also divided into nine spheres. According to Dante's cosmography the seven great planets revolve around the earth. With Beatrice he ascends in swift flight, first to the Sphere of Fire, pausing for a brief visit on the Moon, which is the abiding-place of those that were, by no fault of theirs, constrained to break their vows; thence to Mercury, to Venus, to the Sun, to Mars, to Jupiter, to Saturn, to the Starry Empyrean, to the Primum Mobile—the Crystalline Heaven, where around a point of dazzling light, symbolizing God, revolves a rainbow ring in turn composed of nine orders: Seraphim, Cherubim, Thrones, Dominions, Virtues, Powers, Principalities, Archangels and Angels. In the seventh and last sphere, the Abode of Beatrice, have been declared by Saint Paul, when he was snatched up into the highest heavens.

Dante and Beatrice are now about 6,000 miles above the earth, according to his calculation, and have one more ascent to make—to the Empyrean, which is pure light. Here Beatrice is taken from him, and in her place appears Saint Bernard, who leads him upward. There he beholds the Celestial Vision: the Holy Virgin amid thousands of jubilant angels with wings outspread, the hierarchy, including Beatrice, who is seated just below the ancient Rachel, who is her counterpart in the Old Testament régime, with the Sacred Rose, the circle divided into two parts, one consisting of the Saints of the ancient dispensation and of course complete, the other, as yet unfilled, the place of those who believed that Christ had already come. Even in these supernal realms Dante does not forget his mundane politics: he finds in the Empyrean a place for Emperor Henry VII, who was to bring about perpetual peace on earth, while he consigns to the third pit or den of the Eighth Circle of Hell the treacherous Pope, Clement V.

Throughout the three canticles are found multitudes of striking episodes, vivid descriptions, now realistic and revolting, now exquisite and beatific, discussions of philosophical, theological and political subjects, history and biography, innumerable similes, often much elaborated; together, a vast array of recondite learning. Much of it is obscure, requiring in order to understand its meaning, an acquaintance with the history of Dante's time, with the mythology of antiquity, with the symbolism of mediæval theology, with the works of the Church Fathers, particularly of Saint Thomas Aquinas, with the details of Dante's own life, his friends and enemies, with the geography of that Italy through which he wandered in exile, going "up and down others' stairs," eating "the bread that savors of salt." Dante takes great pains to keep exact account of the time spent in his Dream—for it is a Dream, as he intimates in the 32d Canto of the 'Paradise.' It begins on the evening before Good Friday, 24-25 March 1300. The First Canticle occupies four nights and three days; the Second the same; Friday and Saturday are devoted to the marvels of the Nine Movable Heavens, and the poem ends on the 10th day.

The 'Comedy,' while having the triple aspect of a political tract, a theological study of the Fate of Man and a personal relationship, is above all a great work of art. It consists of three canticles each of 33 cantos, though the first has one extra as a general introduction, making the full number 100, that being the square of 10, which, according to Dante, is the perfect number. The 'Inferno' has 4,720 lines, the 'Purgatorio' 4,755, the 'Paradiso' 4,758, a total of 14,233. The shortest of the hundred cantos have 115 lines each; the longest has 160. Each canto begins and ends with an alternate couplet; all the rest of the rimes are triple; hence the verse is called terza rima. To the 400 couplets and 4,611 terzine there are allotted 653 different rime-endings: some are used only once, others occur repeatedly, as an do, 39 times; ante, 45 times; ore (amore, love), 37 times; io, 47 times. Yet though there are only between six and seven new ones to a canto, the general effect is rich and musical. The great majority of the rimes are feminine (dissyllabic), but there are 14 instances of masculine rimes in on, or and oth (Sabaoth) or in vowels, e, i, o and u: there are 52 cases of versi sdrucchioli (trisyllabic or dactylic rimes). Each of the three canticles
ends with the word stelle, stars. Dante sometimes invented words, and his skill in managing the difficult metre was extraordinary. At the end of the 28th canto of the 'Paradiso' are eight lines in Provençal. There are a number of complete lines in Latin.

Whether Dante knew Greek is uncertain. He was familiar with Platonism and Neo-Platonism, and with the doctrines of Aristotle, which had come into Italy through the works of Avicenna and Avemroehs. Many others before him had imagined the arcana of the world beyond the grave; from the Bible he knew the story of the 'Witch of Endor,' the visions of Isaiah and Ezekiel, the Revelation of Saint John; and besides the descriptions in the ninth book of the 'Odyssey' and the sixth book of 'The Æneid,' he had as examples which he far excelled, many mediaeval legends: The Vision of Saint Paul, 'The Voyage of Saint Brendan,' 'The Vision of Tantalus,' 'The Purgatory of Saint Patrick,' 'The Vision of Fra Albertico,' 'The Vision of Wettin' and the 'Alberici Visio.'

The immediate plan of the 'Comedy' in early manuscript copies, it is supposed that he wrote seven cantos of the 'Inferno' before he was banished from Florence. Whether he incorporated that portion in his work is not known; but it must have been written. It was probably finished before 1314, for in the 13th canto of the 'Paradiso' Henry VII had not as yet taken his place amid the throng that formed the Sepulchral Rose, and Pope Clement V was still alive.

After Dante's death the 'Comedy' almost immediately became widely known in manuscript copies, but the original has never as yet been found, to settle many disputed readings. Within 50 years, Florence, which had never allowed the poet to return, and 20 years after he was buried at Ravenna, had stigmatized him as a rebel, established a chair for the study of his works, the first incumbent being Boccaccio. Nearly all the other Italian cities did the same. After the invention of printing there were many editions of the 'Comedy.' There are four of the 15th century; those printed by Aldus in 1502 and 1515 are generally taken as the basis of the modern texts. Those of the Giuntina and of the Della Crusca, in the 16th century, are valuable. In the next century only three were issued. In the first 80 years of the 19th century 250 different editions appeared. The whole number is at the present time not far from 400. Many of them have been illustrated, beginning with the Florentine edition of 1481.

Among great artists who engaged in this labours were Botticelli, Michelangelo, Federigo Zuccaro and Giovanni Strada, Bernadino Pocetti, John Flaxman, Peter van Cornelius, Karl Vogel von Vogelstein, Francesco Scaramuzza and Gustave Doré. Doré's coarse and ill-drawn pictures have had a vogue far beyond their merits. Parts of the poem have been set to music, as for instance, the Francesca da Rimini episode by Rossini and also by several other composers; the first lines of the 'Purgatorio' by Robert Schumann, and the 'Inferno' by Girolamo Alessandro Biaggi. A monk, Matteo Ronto, a contemporary of Dante's, translated the whole work, line for line, into Latin hexameters. In the 15th century it was translated into Catalan and Provençal. There are nearly 50 German versions, one of the best is by King Johann of Saxony ('Philalethes,' 1857). It may be read in many other languages and dialects, including Hebrew and Russian. Chaucer was the first to translate parts of the poem into English. Milton versified a few lines. The Rev. Henry Boyd in 1802 published the first complete English version. He was followed by the Rev. Henry Frances Cary, whose blank verse paraphrase is well known. In 1820 Lord Byron translated the Paolo and Francesca episode in terza rima. In 1867 Longfellow brought out his unrimed translation, which seeks variety by the use of the feminine endings at regular intervals. Some of his interpretations of it are incorrect, and he was often misled by fancied resemblances between Italian and English words; but it had great success. Dr. Thomas W. Parsons made the study and translation of the 'Comedy' his life work. He published the 'Inferno' in 1857, other portions at intervals, and the whole was issued after his death in 1893. The latest metrical version, like Cary's in blank verse, is by Professor Courtney Flanagin of Brown University. It runs line for line, facing the latest revised Italian text, and it is provided with a commentary, in which the translator embodies his life-long familiarity with Italian and study of Dante; the 'Inferno' came out in 1918. John Carlyle, brother of Thomas, translated the 'Inferno' in 1855 into English prose; with the continuation by A. J. Butler, also accompanied by the Italian text; this edition is useful. Charles Eliot Norton's careful prose version in three volumes with explanatory notes was brought out in 1893. For a good text edition, with bibliography, consult 'La Divina Commedia,' edited by Charles H. Grandgent (Boston 1909-13). There are hundreds of lexicons, commentaries and other aids to the understanding of Dante, published in all languages, beginning in 1328 with that of Jacopo della Lana. We may mention the latest 'La Divina Commedia di Dante Alighieri, Riveduta nel testo e commentata da Giovanni A. Sciarazzini' (Leipzig 1874-82). Sciarazzini's 'Handbook to Dante' was translated by Thomas Davidson and published with corrective notes and many additions (Boston 1887). Koch's 'Dante Catalogue' (Ithaca 1900) contains a thorough critical bibliography up to bibliographies of this date.

NATHAN HASKELL DOLE

DIVINE OFFICE, the services of the canonical hours. See Office, Divine.

DIVINE, RIGHT, the doctrine that the right of sovereigns to rule is derived immediately from the Deity, whose representatives they are, and that accordingly they are not responsible to their subjects for their method of governing, nor to any other human court of appeal. The English Royalists, among whom were Hobbes, Salmusius and others, maintained that as the immediate representative of the Deity, all power and government were vested in the king, who "could do no wrong." The Parliamentarians contended that the exercise of public power was subject to the people, by what was termed "the social contract." Milton, Algernon Sidney and Harrington were among the chief opponents of divine right. This was the doctrine to which the Stuarts were so much attached and which
was taught almost universally by the clergy of the Church of England and in the universities after the Restoration. Even the tyranny of James II was not enough to induce the English clergy to renounce this favorite doctrine, and after the revolution about 400 of them, including some of the bishops, sacrificed their benefices rather than forsake their principles in this time the theory of divine right and passive obedience was little more heard of in England. In France the doctrine was upheld by many and was revived in the discussions which caused the Revolution. William II of Germany has frequently proclaimed in public addresses his belief that he is ruler of Germany by divine right.

DIVING, plunging into water and remaining submerged for greater or less periods of time, with or without communication with the atmospheric air. Diving without the aid of some artificial means to supply the diver with air under water is now rarely practised (unless for amusement) except in sponge, coral and pearl fishing, and sometimes for recovering treasure from wrecked vessels. The best divers are able to remain about one minute and a third under water, and only in extreme cases do they stay as long as two minutes. Instances are recorded of divers remaining four, five and even six minutes under water, but these are of questionable authenticity.

To enable divers to remain for a considerable time (sometimes five or six hours) under water a diving dress has been used, which is so contrived that the diver is constantly supplied with air from above. It consists of a water-proof dress, to which is attached a neck-piece or breast-plate fitted with a segmental screw bayonet joint to which the head-piece or helmet, the neck of which has a corresponding screw, can be attached or removed by one-eighth of a turn. Air is supplied by means of a flexible tube, which enters the helmet and communicates with an air-pump. To allow of the escape of the used air there is another flexible tube which is led from the back part of the helmet to the surface of the water. There is a signal line attached to the diving dress, by which the diver communicates with another line in his hand to guide him in returning to the rope or ladder by which he descends.

The helmet of the diving dress is usually made of tinned copper. There are several different types with special arrangement of valves for the air supply and exhaust. There are three windows in the head-piece, one-half inch thick glass secured in brass frames, the inlet valve in the helmet is non-return and is very important, as in the event of the air pipe being broken the water closes the valve, and allows the diver time to realize his danger and act for safety. The breastplate and corselet are also carefully designed; they join the helmet to the body dress and preserve the air-tightness of the whole. It is necessary to add weight to the diver by air-pump weights, which, otherwise would cause him to rise to the surface or prevent his descent, due to his displacement. The cuffs at the wrists are made secure by vulcanized rubber rings. The air-connecting pipes from the pumps to the diver are so made and arranged that the least inconvenience due to weight will be experienced by them. The boots are of stout leather with wooden soles and lead over soles. Electric lamps and telephones are provided, so that not only has the diver the best means of seeing around him but can communicate with those above him regarding his operations and be communicated with.

A diving apparatus now in use makes the diver independent of any connection with persons above the water. A strong metallic air reservoir of steel is carried on the diver's back. A respiratory tube issues from the chamber and is terminated by a mouth-piece which is held between his lips and teeth. This tube is furnished with a valve which permits the expulsion of air, but opposes the entrance of water. When the diver wishes to leave the water he inflates his dress with air from his reservoir and immediately rises to the surface. The greatest depth, and the pressure consequent upon it, which has been found safe for a diver of experience and of good physique to descend to, is 35 fathoms, the pressure being about 100 pounds. The pressure on the outside of the diver's dress, the head of which is counterbalanced in the inside by the air pressure delivered by the air pump. Consult Boycott, 'Compressed Air Work and Diving' (London 1909); Dunville-Fife, 'Submarine Engineering of To-day' (London and Philadelphia 1914); British Admiralty 'Report of the Committee on Deep-Water Diving' (London 1907); Siebe, Gorman & Company, 'Diving Apparatus,' with notes and tables for the guidance of those conducting diving operations (London 1916).

DIVING BEETLE, an aquatic beetle of the family Dytiscidae. It is flat, oval, with thread-like antennae, is brown-black in color and sometimes has yellow markings. It is predacious, feeding on other insects, worms and even small fish. These beetles fly at night with great ease. The eggs are laid in water and the larvae are termed water tigers. The larvae are transformed in a cell in the earth. There are about 300 known species and in America the two commonest genera found are Cybister and Dytiscus. Consult Miall, 'Natural History of Aquatic Insects' (London 1903).

DIVING-BELL, a device by which work may be carried on under water with a full supply of atmospheric air. To illustrate the principle of this machine take a glass tumbler, plunge it into water with the mouth perpendicularly downward; it will be found that very little water will rise into the tumbler, but as air is compressible, it could not entirely exclude the water, which by its pressure condensed the air a little. The first diving-bell we read of in Europe was tried at Cadiz by two Greeks in the presence of the Emperor Charles V. The first of any note was made by Dr. Halley. The diving-bell is most commonly made in the form of a truncated cone, the smaller end being closed and the larger one open. It is so suspended that it may sink full of air, with its upper end near the water. As a diving bell of ordinary construction is open to the objection of not being easily moved about, an ingenious kind of diving-bell, called a nautilus, has been invented, which is not open to this objection, but which is entirely at the command of the occupants, who can make it sink or swim and
DIVINING ROD—DIVISION

move it about at pleasure, and can use it at the same time to raise great weights and convey them to any desired spot. (See DIVING; NAUTILUS). For an account of early diving-bells and apparatus consult Gerland and Traumüller, 'Geschichte der physikalischen Experimentier- kunde,' vol. 11, p. 513 (1893).

DIVINING ROD, a forked branch or rod, generally of witch hazel, or some other wood, though sometimes of metal, by means of which the presence of underground water, minerals, treasure, etc., can be detected by certain gifted persons. When carried by these "diviners," the rod is grasped by the two extremities of the fork, and the tip or joint is declared to dip downward, in most cases, though in France it turns upward, when directly over the place of concealment of the substance sought. Although the idea has been held up to ridicule, belief in it persists, and the activities of the divining rod and its bearers have received the attention of eminent scientists. In France an extensive series of tests were made in January and February 1913, with three noted diviners. The results, so far as the time of the meetings permit, show a complete failure to discover underground water. On the other hand at a convention of 345 members of a German society for the study of the divining rod, held in Halle, Germany, in September 1913, the meeting was that the scientific value of the divining rod had been thoroughly established, even to the location of unseen deposits of potash; and a report was issued claiming success in between 70 and 80 per cent of various locations with the rod in German South Africa. The only explanation offered by scientific men is that the phenomena of the divining rod depend on an abnormal psychological condition in the diviner, analogous to clairvoyance.

DIVISCH, dé'vesh, Procopius, physicist: b. Senmburg, Bohemia, 20 March 1688; d. Prenditz, Moravia, 21 Dec. 1765. He studied at the gymnasium at Znaim and at the cloister school of the Premonstratensians at Bruck in Styria. In 1726 he was ordained and changed his name, Wenceslaus, to Procopius. He became professor of philosophy at the school soon after. He devoted his attention mainly to physics. In 1733 he received his doctor's degree in theology at Salzburg. He became parish priest at Prenditz near Znaim in 1736. He devoted himself to hydraulics and electricity, and was called to Vienna to repeat his experiments at court. He applied electricity to medicine, constructed the first lightning rod, meeting much opposition on account of his proposal to render the practice of erecting lightning rods universal, and invented a peculiar musical instrument which he called the "denyder." He published 'Tractatus de Dei unitate sub inscrip. A et Q' (Salzburg 1733); 'Theoretischer Tractat über die längst verlangte Theorie von der meteoro- ldischen Electiricitäts' (Tübingen 1765).

VISIBILITY, the capability of being separated into parts. A metaphysical problem, long discussed by philosophers on abstract principles, is the divisibility of matter. The microscope reveals only to an infinitely small extent the subdivision of substances and tissues, organic and inorganic. Even in the mechanical productions of art distinctness of subdivision is amazing. A slip of ivory, of an inch in length, has frequently a hundred equal parts marked on it, all being distinctly visible. Nobert, a Pomeranian optical instrument maker, is renowned for producing the finest rulings on glass which have hitherto been executed. These test plates, as they are called, contain a number of bands, the coarsest of which in his glass plate contains 11,259 spaces to the inch, and the finest 225,187. Yarn has been spun so fine that one pound of it extended 4,770 miles.

The gold-beaters begin with a ribbon an inch broad and 150 inches long, which has been reduced by passing through rollers, to about the 800th part of an inch in thickness. This ribbon is cut into squares, which are disposed between leaves of vellum, and beaten by a heavy hammer till they acquire a breadth of more than three inches, and are therefore extended 10 times. These are again quartered, and placed between the folds of gold-beaters' skin and stretched out, by the operation of a lighter hammer, to the breadth of five inches. There seems almost no limit to the gold-beater's skill in dividing his tissue of gold into 1,800th part of an inch in thickness, to the extent of 52 square inches, and leaves have been made 367-500 of which would go to the inch. Iron, the least malleable of the above-mentioned metals, has been reduced to wonderful thin sheets. Fine tissue paper is about the 1,200th part of an inch in thickness, but at the exhibition of 1851 Gillott, the steel penmaker, exhibited rolled sheets of iron the 1,800th part of an inch in thickness. Since then a sheet has been produced with an area of 55 inches, weighing but 20 grains and having a thickness of 1-4800th part of an inch.

It has been asserted that wires of pure gold can be drawn of only the 4,000th part of an inch in diameter. But Dr. Wollaston, by an ingenious invention, obtained wires of platinum much finer than this, some of them only the 30,000th part of an inch in diameter. Such excessive fineness is hardly surpassed by the filamentous productions of nature. Human hair varies in thickness from 300,00th to 600th part of an inch. The fibre of the coarsest wool is about the 500th part of an inch in diameter, and that of the finest only the 1,500th part. The silk line, as spun by the worm, is about the 5,000th part of an inch thick; but a spider's line is perhaps six times finer, or only the 30,000th part of an inch in diameter; insomuch that a single pound of this attenuated substance might be sufficient to encompass our globe. A single grain of sulphate of copper will communicate a fine azure tint to five gallons of water. Odours are capable of a much wider diffusion. A single grain of musk has been known to perfume a large room for the space of 20 years. Some germs are almost incomceivably minute. Thus the germ known as micrococci is a minute spherical body sometimes no greater in diameter than the 32,000th of an inch. The minute organisms to which the name of bacteria is specially applied are rod-shaped bodies about 1,000th of an inch in length. Many of the so-called infusorial animals are so exceedingly small that myriads of them may exist in a drop of water.

DIVISION, in mathematics, the dividing of a number so as to discover how many times a lesser number is contained in it; one of the four
fundamental rules of arithmetic. The number to be divided is the dividend, the number which divides is the divisor, and the result of the division is the quotient. Division is the converse of multiplication. See ARITHMETIC.

In military matters the section of an army consisting of two or more brigades, composed of the various arms of the service, and commanded by a general officer. (See ARMY ORGANIZATION.) In the navy, a select number of ships in a fleet or squadron of men-of-war. In deliberative legislation the mode of determining a question at the end of a debate. In the House of Representatives at Washington, a division has no traditional formalities, being determined by the rules of the body itself. In the Senate a division is accomplished by a roll call. In the British House of Commons the speaker puts the question and declares whether in his opinion the "ayes" or the "noes" have it. Should his opinion not be acquiesced in by the minority, the house is cleared and the "ayes" directed to go into the right lobby and the "noes" into the left, where they are counted by the tellers appointed for each party. In the House of Lords the two sides in a division are called "contents" and "not-contents." In logic the act of distributing all the objects included in the denotation of a concept into mutually exclusive classes, each of which is marked off from the others by possessing some distinctive attribute. See LOGIC.

DIVISION OF ACCOUNTS AND DISBURSEMENTS, The. See AGRICULTURE, DEPARTMENT OF.

DIVISION OF LABOR, in economics, a theory based on the principle that industry can be best carried on when each man has a special work to do. Constant practice in doing the same thing leads to a perfection which could not otherwise be attained. The classical illustration of it in the history of political economy is that of pin-making as given by Adam Smith: "One man draws out the wire, another straightens it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head; to make the head requires two or three distinct operations; to put it on is a peculiar business; to fit another; it is even a trade by itself to put them into a paper; and the important business of making a pin is in this manner divided into above 18 distinct operations, which in some manufactories are all performed by distinct hands." In this way 10 men could make about 48,000 pins in a day, whereas, if they worked separately and independently, they certainly could not each of them have made 20, perhaps not one pin in a day. Adam Smith offers the following reasons why the division of labor secures greater efficiency: First, the increase of dexterity in every individual worker; secondly, the saving of the time which is commonly lost in passing from one species of work to another; and lastly, the invention of a great number of machines which facilitate and abridge labor or operations in one employment. The fact that one man is exclusively a bricklayer and another exclusively a carpenter increases their combined production over what it would be were they not each confined to one trade. The great advantage of division of labor lies in the saving of labor and of time. By devoting himself exclusively to one operation a workman acquires a high degree of skill in that operation, makes a better use of material, thus preventing waste, and the continuity at one operation saves the time which would otherwise be spent in passing from one process to another. Another advantage is the stimulus given to invention by the concentration of energies upon distinct and definite processes. Similar advantages result from the differentiation of functions among the people generally, by specialization not only in factories and in trade and commerce, but even in professional and scientific activities. The disadvantages urged against the system are that extreme specialization is harmful to the intelligence, saps the vitality of the operator and produces workmen who through any industrial upheaval, being capable of doing only one thing, would find themselves without a place and a living. While there may be objections to such a presentation, it is an extreme one, and is rebutted by the fact that the mechanical operations of factories are not so widely dissimilar as to preclude a man, displaced from one type from securing suitable employment in another. In addition it may be noted that through the subdivision of labor and the increasing use of machines, there is opportunity for mental development outside of working hours. The disadvantages of specialization and subdivision, so feared by economists and writers of a generation ago, have not proved so serious in their effects on the working classes as they appeared. On the contrary, never in any preceding period of the world's history did the working classes make greater progress, not only in their material welfare, but also in their intellectual development.

In biology, a conception borrowed from economics and introduced into biology by Milne-Edwards to describe the difference of function exhibited by the individual members of an animal colony, or by the different organs, tissues and cells of a single organism. The figure of a hydroid colony, Hydractinia, shows how members, primarily and fundamentally the same in structure, become set apart as reproductive, sensitive and protective. The same division of labor on predominance of special functions in different individuals is beautifully illustrated in the Siphonophora.

DIVISION OF PUBLICATIONS, The. See AGRICULTURE, DEPARTMENT OF.

DIVITIACUS, chief of the Edui, often mentioned in the Commentaries of Caesar. He was a constant adherent of the Romans, and on one occasion made a visit to Rome, where he became the guest of Cicero, who mentions him in his book, 'De Divinatione,' as belonging to the order of the Druids, and professing much knowledge of the mysteries of nature and the art of divination. In 58 B.C. when Caesar refused permission to the Helvetii to migrate from Switzerland and settle in Gaul, he depended on the Edui and Divitianus furnished supplies for his army; but Dumnoniri, the brother of Divitianus, obtained the chief of the Edui in battle and withheld the supplies. When this state of affairs became known to Caesar he suppressed
DIVORCE

Dumnonix and restored Divitiacus to power. Having thus assured the supplies for his army, Caesar campaigned against the Helveti, crushing them near the town of Bibracte.

DIVORCE, the disruption, by the act of law, of the conjugal tie made by a competent court on due cause shown. In the United States, jurisdiction in divorce cases is usually conferred on the law courts by the statutes in the different States. The causes of divorce enumerated in these various statutes are by no means uniform, and are more numerous in many of the western States than in the eastern. In all the States adultery is recognized as just ground for divorce. Conviction of felony is sufficient ground in all the States but Connecticut, Florida, Maine, Maryland, Mississippi, New Jersey, New York, North Carolina, Rhode Island, South Carolina and the District of Columbia. Cruelty is a sufficient ground in all States but Alabama, Arkansas, District of Columbia, Maryland, New York, North Carolina, Tennessee, Vermont, Virginia, Washington and West Virginia. Habitual drunkenness is accepted ground for divorce in all States but Alabama, District of Columbia, Georgia, Maryland, New Jersey, New York, North Carolina, Pennsylvania, South Carolina, Texas, Vermont, Virginia and West Virginia. Desertion for one year is sufficient ground in Arizona, Arkansas, California, Colorado, Florida, Hawaii, Kansas, Kentucky, Minnesota, Missouri, Montana, Nebraska, North Dakota, Oklahoma, Oregon, Porto Rico, South Dakota, Utah, Washington, Wisconsin; desertion for two years in Alabama, Alaska, Delaware, Illinois, Indiana, Michigan, Mississippi, Nebraska, New Jersey, Pennsylvania and Tennessee; desertion for three years in Connecticut, Georgia, Maine, Maryland, Massachusetts, New Hampshire, Ohio, Texas, Vermont, Virginia and West Virginia; desertion for five years in Rhode Island. The drug habit is sufficient cause in Alabama, Colorado, Maine, Massachusetts, Mississippi and Rhode Island. Insanity is sufficient cause in the District of Columbia, Idaho, Iowa, Missouri, North Dakota, Pennsylvania, Utah, Virginia, Washington, West Virginia and Wyoming. Neglect to provide is sufficient cause in California, Delaware, Idaho, Maine, Massachusetts, Michigan, Montana, New Mexico, North Dakota, Ohio, Rhode Island, South Dakota and Tennessee. In New York adultery is the only ground recognized by law for granting an absolute divorce. In South Carolina the courts have no power to grant divorce, strictly speaking, the legislature being the only authority for that purpose. In both of these States, as in others, the courts may declare an alleged marriage invalid on grounds which rendered the parties or either of them incapable of lawfully contracting it, such as idiocy, lunacy, former husband or wife living, etc. Separation from bed and board, commonly called limited divorce, is granted on the ground of cruel and inhuman treatment or incompatibility; and desertion and refusal to support by the husband may be a ground for a decree setting the wife free from the interference and control of her husband, though it may not render the marriage tie.

A person applying for a divorce will not be allowed to obtain judgment should it appear that he or she has also been guilty of the offense complained of, or that there is collusion between the persons concerned in order to procure a divorce. Moreover, the plaintiff is always required to prove the existence of the alleged grounds of divorce by satisfactory evidence, even though no contest is made on the other side. Parties also who have condoned the offense, that is, who, after it has been discovered, have consented again to live with husband and wife, are not allowed to obtain a divorce, but a second act of the same nature revives the right of action on the original offense.

The absence of harmony in the legislation of the different States on this subject has led to very great confusion and conflict in regard to the rights and liabilities growing out of divorce against non-residents of the State where granted, and some uniform system of laws on the subject is greatly needed. As the jurisdiction of Congress over the subjects of divorce and uniformity can apparently be secured only by an amendment to the Constitution of the United States or by the concurrent action of the various State legislatures.

The United States Bureau of the Census published in 1909 a special report upon marriage and divorce, covering the 40-year period, 1867 to 1906. The report shows that the total number of divorces granted in the United States in that period was 1,274,341, of which number 945,625 were granted in the latter 20 years—1887 to 1906. Each 5-year period for the whole 40 years showed a marked increase over the 5 years immediately preceding, averaging about 30 per cent. During these periods the population was increasing only about 10 per cent.

Of the 945,625 divorces granted between 1887 and 1906, the causes for divorce arose after marriage in 922,152 cases. In 415,742 cases the cause was abandonment, or desertion; in 255,135 cases, cruel or inhuman treatment; in 174,558 cases, adultery; in 105,162 cases, neglect of duty, or to make proper provision; in 54,283 cases, habitual drunkenness; in 8,841 cases, conviction of felony; in 1,136 cases, violent temper; 244 cases insanity. Of divorces for causes existing at the time of marriage, there were 3,921. Of this total, bigamy accounted for 1,203; impotency for 1,092; and duress, force or fraud, for 465.

In the same 20-year period there were granted to husbands, 316,149 divorces, and to wives, 629,476. The causes on which the grants were made to husbands were: for desertion, 156,283; for adultery, 90,890; for cruelty, 33,178; for drunkenness, 3,436. The causes on which the grants were made to wives were: for desertion, 211,219; for cruelty, 173,047; for adultery, 62,869; for neglect, 34,664; for drunkenness, 33,080.

The largest proportion were granted the third, fourth or fifth year of marriage, being about 8 per cent of the whole for each of those years. About 5 per cent were granted in the first year, and 7 per cent in each of the second and sixth years. Half of the total number were granted before the close of the ninth year.

Geographically, the larger percentage of divorces granted obtains in the West, being about four times that of the Atlantic seaboard States. The Central section shows a rate about 2½
DIVORCE

207

that of the East. Concretely, the figures show that since 1900 the annual dissolution of marriages in the United States has amounted to four out of each 1,000 marriages then existing. The figures for the States are for 1900 and give the actual number of divorces granted in that year per each 100-
000 married persons in the State, as follows: Washington, 513; Montana, 497; Colorado, 409; Arkansas, 399; Texas, 391; Oregon, 365; Wyoming, 360; Indiana, 342; Idaho, 341; Minnesota, 346; Arizona, 344; Indian Territory, 326; Ne-
vada, 315; California, 297; Kansas, 286; Maine, 282; Missouri, 281; Rhode Island, 261; Utah, 274; New Hampshire, 272; South Dakota, 270; North Dakota, 268; Illinois, 267; Tennessee, 261; Michigan, 257; Iowa, 246; Kentucky, 237; Ohio, 231; Florida, 226; Nebraska, 226; Missis-
sippi, 225; Alabama, 208; New Mexico, 193; West Virginia, 183; Wisconsin, 180; Vermont, 177; District of Columbia, 162; Minnesota, 161; Connecticut, 139; Louisiana, 127; Massachu-
setts, 124; Virginia, 117; Maryland, 114; Penn-
sylvania, 94; Georgia, 78; North Carolina, 75; New Jersey, 60; New York, 60; Delaware, 43; South Carolina, 6.
For the same year for foreign coun-
tries are based on the total population—not upon the married population. For each 100,000 population the number of divorces and separa-
tions were: Japan, 215; United States, 73; Switzerland, 38; Denmark, 29; Roumania, 28; France, 26; Germany, 23; Hungary, 18; Nether-
lands, 16; Belgium, 13; Bulgaria, 11; Austra-
lia, 9; Austria, 8; Norway, 8; Sweden, 8; Fin-
land, 5; Scotland, 4; Italy, 3; Servia, 2; Great Britain and Ireland, 2. There are no statistics for Russia, and no parallel figures for Canada, Mexico, Central America and South America.

The differences in the divorce laws in the States account somewhat for the differences in the number of divorces granted in certain States. In some of the Western States, where high divorce rates prevail, divorces have fre-
quently been obtained by residents of other States before the expiration of time necessary for a residence in a State before proceedings for divorce may be legally begun. There are more divorces in proportion to the population granted in the United States than in Europe. The number of divorce courts in the United States will account in a great measure for this difference; nearly every county court, except in New Mexico, New Jersey and South Caro-
olina, or about 2,921 courts, having the power of granting divorces. There is but one di-
 vorce court in England, 28 in Germany and 79 in France. Canada has few applications for di-
 vorce. In the 21 years ending with 1888, 94 di-
v orces had been granted in Nova Scotia and New Brunswick, together, and 41 in all the rest of the Dominion of Canada.

In England, the divorce court is composed of a judge ordinary, the three chiefs in the courts of common law, and three puisne judges. It is provided that either spouse may obtain a divorce on the ground of adultery, but in case the wife is petitioner the adultery must be accompanied by cruelty or desertion. By another act the power of the law courts is extended in the case of voluntary divorce; the decree nisi was at first reposed in the whole court, is given to the judge ordinary sitting alone; but in this case the decree so pronounced is a decree nisi and cannot become final for at least six months.

After a decree of divorce the offending person is free to marry again, even with the paramour. But it is also enacted that no clergyman shall be compelled to solemnize the marriage of any person who has been divorced. He must, how-
ever, allow another clergyman, if willing to do so, to perform the marriage. The same general rules as to collusion, condonation, the conduct of the parties, etc., which obtain in the United States are law also in England. In order to guard against fraud by parties conspiracy to procure a divorce, power is given to the queen's proctor to interpose, in case he has reasonable grounds to suspect collusion or recrimination, in order to oppose a petition for divorce. By these acts parties are also entitled to obtain a judicial separation on the ground of adultery, cruelty or desertion. Judicial separation is declared to be in place of a separation "a mensa et thoro." A married woman, having obtained decree of judi-
cial separation, is declared to be in all respects as a "femme sole" in regard to any property that she has or may acquire. Even before ob-
taining a separation a woman deserted by her husband may obtain from the court a protec-
tion for any property that she has or may ac-
quire by her own industry.

In France there has been great opposition to any laxity in the divorce laws, but since the year 1884 French law has recognized three grounds of divorce: (1) Adultery; (2) out-
rage, cruelty or grievous injury; (3) convic-
tion of an infamous crime. These causes of action are equally available to husband or wife; but it is provided that the wife shall not marry again till after the expiration of 10 months from the date of the dissolution of the pre-
vious marriage. It is further provided that, in cases where divorce is sought on the ground of outrage, cruelty or grievous injury, immediate divorce shall not be granted, but the parties may be granted separation for a year, with due provision for the wife's support during that time, at the end of which a final divorce may be granted if they have not been reunited in the meantime. Substantially the same rules as to condonation prevail as in the United States. All the proceedings necessary in such cases are carefully provided for by the code civil, as well as the consequences to the parties personal or proprietary.

In Germany, the question of divorce gave rise to a long contest. The General Prussian Code permitted divorce on the ground of mutual consent and deep-seated aversion, but on ac-
count of the newly-awakened religious life in the 19th century there was strong opposition; this under Friedrich Wilhelm IV arose to an overwhelming power. Many attempts were made to establish the laws of divorce on other bases, but on account of the personal antago-
nism of Friedrich Wilhelm IV they remained without result. The demand for the biblical ground of divorce was fulfilled by the state, because the Bible does not offer a precise and comprehensive ground of separation. It was claimed that the Prussian law of divorce was lax and capricious and there was a unanimous demand for a more strenuous law in the inter-
est of morals. This demand found an echo even in circles which were most opposed to ecclesiastical influence in politics. The oppos-
ing elements were reconciled by the personal influence of Friedrich Wilhelm IV; but the
attempts of the legislature to make a new regulation of divorce remained without results. At the present time attempts are being made for bringing about a common divorce law for all of Germany. This proposition holds within the limits of the principle which finds justification in the motives. The Austrian code of common law allows to non-Catholic Christians separation from the bonds of matrimony on account of adultery, malicious desertion, five years continuous separation, account of dangerous diseases and repeated cruelty of treatment and invincible aversion.

Among the Jews: The enactment of the Mosaic law was the following: "When a man hath taken a wife, and it cometh to pass that she find no favor in his eyes because he hath found some uncleanness in her, then let him write her a bill of divorcement, and give it in her hand and send her out of his house" (Deut. xxiv, 1). Here, it will be perceived, impurity is the only assigned cause for such divorce. The woman sent away might marry another man, but if he, too, divorced her, it was not permitted her first husband to take her again. The word "uncleanness" in the passage now quoted is a free translation: the Hebrew words mean literally "the nakedness of a thing." The exact import of this expression was sharply contested in the immediately pre-Christian times, the school of Hillel giving it a general meaning, and holding that a man might divorce his wife for the most trivial cause; while that of Shammai considered that the doubtful phrase signified adultery, for which therefore alone a man could put away his wife.

The Mohammedan law of divorce, founded on some passages in the Koran, allows of a separation by mutual consent, giving the wife the right of retaining her marriage portion, unless she agrees to relinquish a part of it as the price of the separation. The parties are permitted to separate and reunite twice, if they can so agree without any particular conditions; but after the third divorce the husband is not permitted to receive his wife again until she shall have previously married another husband. The act of divorce is a judicial proceeding before the cadi, who does not decree it until three months after the application.

The Hindu and Chinese laws of divorce show little regard for women, and not only the causes recognized in European and American countries, but others, are deemed sufficient for a husband to discard his wife.

The different Grecian states had each their respective laws of divorce. At Sparta they do not seem to have greatly regarded the delicacy of the marriage bed when the interest of the republic was in question; but divorces appear to have been rare, since the ἐφορὶ fined Lyonsander for repudiating his wife. At Athens either the husband or wife might procure a divorce by exhibiting a bill for this purpose to the archon, and obtaining the verdict or consent of a jury to whom the question was referred. But the party applying must, it seems, have made application personally; and Alciabides, according to Plutarch, took advantage of his authority as a husband to prevent his wife from making the application personally; for when she was going from her brother's house, where she had taken refuge, to the archon's, to sue for a divorce, he forcibly seized upon her and confined her to his own house.

The early laws of Rome permitted the husband to divorce his wife for poisoning his children, contracting another marriage, and other causes were afterward added; for the first divorce recorded was for the sterility of the wife. This was by Sp. Carullius Roga, about 230 B.C. Divorces afterward became very frequent and a law was, on this account, made by Augustus, requiring additional ceremonies in a divorce; among other things, the presence of seven witnesses to the act of dissolution of the marriage. By the Theodosian code the husband could divorce the wife for adultery; or if she was a witch or a murderess; had sold a free-born person into slavery; violated a sepulchre; committed sacrilege; been accessory to theft or robbery; was given to feasting with strangers without the knowledge or against the wishes of the husband; lodged abroad without good reason; or frequented theatres and shows, her husband forbidding; or was aiding and abetting in plots against the state; or dealt falsely; or offered blows. The wife had equivalent rights in this respect, for she could procure a divorce on similar grounds against her husband. He could be remarried immediately; she, not within a year.

The facility of divorce continued, without restriction, under the Roman emperors, but as the modern nations of Europe emerged from the ruins of the Roman empire, they adopted the usual interpretation of the doctrine of the New Testament (Matt. xix, 6), "What God hath joined together, let no man put asunder." Divorce under the laws of the Roman Catholic Church is never allowed where the marriage has been duly contracted, ratified and consummated. But a perfectly valid marriage contracted between baptized persons can be annulled by the Pope, before its consummation, never after consummation. It is held by canonsists that a marriage lawfully and validly contracted but not consummated is annulled by either of the parties taking solemn lifetime vows of continence and entering a religious order. If of two unbaptized persons, married, one is converted to the faith and receives baptism, he or she may be released from the marriage bond if either party refuse to live peaceably and without insult to the Christian religion in the marriage state; and then the released party can marry again. Outside of such conditions as have been stated Christians united in marriage cannot in the Roman Catholic Church be freed from the marriage bond, vinculum matrimonii, save by the death of one or other of them. See FAMILY, LAW OF; HUSBAND AND WIFE, LAW OF; MARRIAGE, LAW OF.

DIVORCE, Court of. See COURT.

DIX, Beulah Marie, (Mrs. George H. Flebbe), American novelist and playwright: b.
Kingston, Mass., 25 Dec. 1876. She has published 'Hugh Gwyneth' (1899); 'Soldier Ridge' (1899); 'The Making of Christopher Ferningham' (1901); 'The Beau's Comedy' (with C. A. Harper 1902); 'A Leaf from Blount's Life' (1902); 'Blount of Breckenhour' (1903); 'The Fair Maid of Graystons' (1905); 'Merrylips' (1906); 'Allison's Land' (1910); 'Betty-Brute-at-Home' (1912); 'Mother's Son' (1913); 'The Legend of Chaste' (1914); 'A Tale from the Hunter's Chair' (1914); 'Battle Months of George Daurella'; 'Blithe McBride' (1916); and is author of two plays, 'Across the Border' (1914); 'Moloch' (1915).

DIX, Dorothea Lynde, American philanthropist: b. Hampton, Me., 4 April 1802; d. Trenton, N. J., 17 July 1887. In her youth she supported herself by teaching in Worcester, Mass., but in 1830 fell heir to some property, after which she devoted her life to the relief and betterment of lunatics, paupers and criminals. She visited the prisons, asylums and almshouses of nearly every State in the Union, and by her labors contributed largely to the establishment of lunatic asylums in those States which had none. She also traveled extensively in Europe in the same service, and her efforts materially improved the condition of the insane there likewise. She published several children's books and in 1845 'Prisons and Prison Discipline.' In 1903 a bill was favorably received in Congress appropriating $10,000 for a monument to her at her birthplace. The report of the House committee declares: 'Miss Dix occupies a conspicuous place in history as a philanthropist. Certainly no other woman in modern times has done more to earn the gratitude of the people of this country than this self-sacrificing and devoted woman. Her services during the Civil War as chief of the hospital nurses of the United States and her wonderful success in establishing institutions for the insane—over 30 in number—in the South and West and elsewhere, place her among the noblest examples of humanity in all history.' Consult Tiffany, 'Life of Dorothea Lynde Dix' (Boston 1890).

DIX, John Adams, American statesman and soldier: b. Boscawen, N. H., 24 July 1798; d. New York, 21 April 1879. In 1812 he was appointed a cadet in the United States army and in 1813 ensign. He took part in the operations on the Canadian frontier during the War of 1812, afterward studied law and was admitted to the bar in Washington. In 1826 he was sent as a special messenger to the court of Denmark. He resigned from the army in 1828 and began practising law in Cooperstown, N. Y. Later he was secretary of State and adjutant-general of New York and was prominently associated with the 'Albany Regency,' the controlling power of the Democratic party. In 1841 he was elected to the State assembly and in 1845-49 was a United States senator. In 1861 he was appointed Secretary of the Treasury by President Buchanan. At this time there were two revenue cutters at New Orleans and he ordered them to New York. The captain of one refused to obey his order and Dix telegraphed to put him under arrest. A dispatch from President Buchanan has made him famous, "If any one attempts to haul down the American flag, shoot him on the spot." At the outbreak of the Civil War he was elected president of the Union Defense Committee and organized 17 regiments. He was commissioned a major-general of volunteers and through his active measures saved Maryland to the Union cause. In May 1862 he was sent to Fortress Monroe and after the New York Draft Board was appointed commander of the Department of the East at New York and remained in this relation until July 1865, when he returned to civil life. He was United States Minister to France from 1869-1870. He was elected governor of New York in 1872, but was defeated on a renomination in 1874. His publications include 'Resources of the City of New York' (1827); 'Decisions of the Superintendents of Common Schools of New York, and Laws Relating to Common Schools' (1837); 'A Winter in Madeira and a Summer in Spain and Florence' (1850); 'Speeches and Occasional Addresses' (2 vols., 1864). Consult DIX, Morgan, 'Memoirs of John A. Dix' (New York 1883).

DIX, John Alden, American statesman: b. Glens Falls, N. Y., 25 Dec. 1800. He was graduated at the Glens Falls Academy in 1879 and at Cornell University in 1883. Entering the lumber and paper-making business he became president of the Iroquois Paper Company, treasurer of the American Wood Engraving Company, president of the Blandy Paper Company and of the First National Bank of Albany. He was also manager of the Moose River Lumber Company and director of the Albany Trust Company, the Glens Falls Trust Company and other corporations. He was delegate to the Democratic National Convention at Saint Louis in 1904, received 17 votes for the gubernatorial nomination in 1906 and was Democratic nominee for lieutenant-governor in 1908. He was chairman of the Democratic State Committee in 1910 and was governor of New York for the term 1911-12.

DIX, Morgan, American Episcopalian clergyman: b. New York, 1 Nov. 1827; d. there, 29 April 1908. He was a son of J. A. Dix (q.v.). He was graduated from Columbia College in 1848 and from the General Theological Seminary in 1852. He then took orders in the Episcopal Church and after serving for a few years as assistant in Trinity Church, New York, became in 1852 the rector of Trinity parish. In November 1902 the 40th anniversary of his rectorship was celebrated. Prior to 1901 he was president of the House of Clerical and Lay Deputies in many successive general conventions of the Episcopal Church. He published 'Commentary on the Epistle to the Romans' (1864); 'Exposition of the Epistles to the Galatians and Colossians' (1865); 'Lectures on the Pantheistic Idea of an Immaterial Substance Deity' (1865); 'Lectures on the Two Estates' (1872); 'Memoirs of John A. Dix' (1883); 'History of the Parish of Trinity Church' (4 vols., 1898-1906).

DIXIE, Lady Florence Caroline Douglas, English novelist, poet and essayist: b. London, 24 May 1857; d. 7 Nov. 1905. She was the youngest daughter of the seventh Marquis of Queensberry and was married to Sir Alexander Beaumont Churchill Dixie. She organized the Zululand 1879, was war correspondent for the London Morning Post in the Boer War 1880-81 and was instrumental in securing the liberty of Cetewayo, king of Zululand. In her later years
she became a zealous advocate of sex equality; her last works reveal the extent to which this subject had taken possession of her mind. She published 'The Songs of a Child and Other Poems'; 'A Clairvoyance'; 'In the Land of Misfortune'; 'A Defense of Zululand and Its King'; 'The Child Hunters of Patagonia'; 'The Warrior of the Dying Race'; 'Gloriana'; 'Little Cherie'; 'The Biology of a Mind'; 'Isola'; a drama; 'Two Castaways', etc.

DIXIE, a name associated in negro minstrelsy with the Southern States. It is supposed to be derived from the name of one Dixie, a large-holding and kind-hearted slave owner on Manhattan Island in the latter part of the 18th century. His treatment of his negroes caused them to regard his plantation (or *Dixie's*) as little short of an earthly paradise, and when any of the slaves were taken away from home they always pined for *Dixie's* while singing and talking of its joys. When slavery moved southward in search of a more secure and congenial habitat the same ideal of *Dixie's* was taken along, and the chant which the former slaves of Dixie sang of their old home became so widespread that its origin was lost sight of and it came to be applied to the Southern homes of the negroes.

In fact in the South *Dixie* is held to mean the Southern States, the word being regarded as a derivation and corruption of *Mason and Dixon's line* (q.v.) which originally divided the free and slave States and was supposed by the Southerners to have first come into use when Texas joined the Union and the negroes frequently sang of it as *Dixie*.

Daniel Decatur Emmett (1815–1904) composed a song known by this name as a "walk-around" for Bryant's Minstrels in 1859, and it was first performed at the Mechanics' Hall in New York. It was first used as a song by the Confederates at the inauguration of Jefferson Davis as President at Montgomery (18 Feb. 1861) and was afterward distinctively the Confederate song of the War of Secession. On 30 May of the same year a version of the same song appeared in the *Natchez Courier* from the pen of Gen. Albert Pike and also written in the Confederate interest. A third version, but associated with the cause of the North, was written by T. M. Cooley.

DIXMUD, diks-moo'd-e. (Flemish Diks-milden), a town of Belgium on the Yser Canal, about 15 miles southwest of Ostend and 10 miles from the coast, with a population in 1914 of 4,000. A quaint, old-fashioned place, all bricks and tiles, dotted with cafés and nurseries, Dixmude is the centre of an essentially agricultural district. Surrounded by flat meadows and beetroot fields, intersected by canals and marshes, the district has been reclaimed from the sea by consummate effort. The sea is kept under control by a formidable array of sluices, locks, chambers, water-gates and cranks at Nieuport, eight miles away. In the European War Dixmude witnessed stirring scenes during October 1914. After the fall of Antwerp on the 9th a brigade of French marines, numbering 6,000 and commanded by Rear-Admiral Monarch, was thrown into the town to assist the retreating Belgians in holding the Yser line against the German rush to the sea. Outnumbered by six to one the marines held Dixmude for nearly four weeks, fighting desperately in rags under incessant rain, barring the road to Dunkirk, ensuring the safety of the Belgian army and enabling the French armies to concentrate behind the Yser. All the civil population had left the town. On 25 October the Belgian General Headquarters Staff at the suggestion, it is said, of M. Charles Kegge, *garde moutarde* of the north of Furnes, decided to call the waters to their aid and water-gates at Nieuport were opened, the sea entered and forced back the fresh waters of the canal and its tributaries. By slow degrees the water rose in a few days and converted a zone of about 25 square miles into one vast salt flat-bottomed British monitors, assisted by French and British warships off the coast, fought off the German attempt on Nieuport for 10 days and saved it. The German forces and guns floundered in water and mud, hundreds were drowned and of Amin's struggle for the shortest route to Calais came to an end. The French marines held their position. The loss of Dixmude before 1 November would have been disastrous to the Belgian right. As many as 15 attacks were repelled in one day. In 1914 Dixmude fell after a heavy bombardment. Consult Le Goffic, C., 'Dixmude' (London 1916). See War, European—Invasion of Belgium.

DIXON, Amzi Clarence, American clergyman: b. Shelby, N. C., 6 July 1854. He was graduated at Wake Forest College and took his theological course at the Southern Baptist Theological Seminary. He was ordained to the Baptist ministry in 1876 and subsequently until 1883 held pastorates at Chapel Hill and Asheville, N. C. After 1883 he successively held pastorates in Baltimore 1883–90, Brooklyn 1890–96, Boston 1896–1901, Chicago 1906–11, and since 1911 at the Metropolitan Tabernacle, London. He has published 'Milch and Meat' (1893), new ed. (1913); 'Heaven on Earth' (1896); 'The Lights and Shadows of American Life' (1901); 'The Christian Science Delusion' (1903); 'Present-Day Life and Religion' (1905); 'Evangelism, Old and New' (1905); 'The Young Convert's Problems' (1906); 'The Bright Side of Life and Other Addresses' (1914); 'The Glories of the Cross and Other Addresses' (1914); 'Through Night to Morning' (1913).

DIXON, Archibald, American statesman: b. Caswell County, N. C., 2 April 1802; d. Henderson, Ky., 23 April 1876. In 1805 he removed with his father to Henderson County, Ky., where he received a common-school education, studied law and was admitted to the bar in 1824, and attained high rank as a criminal lawyer. He was a member of the legislature in 1830 and 1841, of the State Senate in 1836 and lieutenant-governor in 1843–47. In 1849, when the proposition for gradual emancipation of the slaves was before the people, he vehemently opposed the scheme, and, being chosen a member of the Constitutional Convention, proposed a resolution which was substantially incorporated in the new constitution, declaring that whereas the right of the citizen to be secure in his person and property lies at the bottom of all governments, and slaves and children hereafter born of slave mothers are property, therefore
DIXON, James Main, American educator: b. Paisley, Scotland, 20 April 1856. He was educated at the University of Saint Andrews, was professor of English in the Imperial College of Engineering, Japan, 1879-86; professor of English in the Imperial University of Japan 1886-92, and professor of English literature in Washington University 1892-1901. In 1903-04 he was president of Columbia College, Milton, Ore. He was professor of English literature at the University of Southern California from 1905 to 1911, when he was transferred to chair of Oriental studies and comparative literature. In 1906 he became literary editor of the West Coast Magazine. He compiled a Dictionary of Idiomatic English Phrases (1891) and wrote Illustrated History of Methodism (1901); Twentieth Century Life of John Wesley (1902); Matthew Arnold in Modern Poets and Christian Teaching (1906); A Survey of Scottish Literature in the Nineteenth Century (1907).

DIXON, Joseph, American inventor: b. 1799; d. 1869. He was at various times shoemaker, printer, wood engraver and establishing crucible works in 1827 at Salem, Mass., became very wealthy. In the course of his experiments he devised important improvements in photography, lithography, lens grinding, smelting, bank-note printing, etc.

DIXON, Joseph Moore, American lawyer and public official: b. Snow Camp, N.C., 31 July 1867. He received his education at Earlham College (Indiana) and at Guilford College (North Carolina). He was admitted to the bar in 1892 and has since practised at Missoula, Mont. He was assistant prosecuting attorney 1893-95, prosecuting attorney 1895-97 of Missoula County and member of the Montana house of representatives in 1900. In 1903-07 he was member of the United States House of Representatives, being elected from Montana at large. He was also delegate-at-large to the Republican National Convention of 1904. In 1907-13 he was United States Senator from Montana. He is publisher of the Daily Missoulian and the Evening Sentinel of Missoula, Mont.

DIXON, Richard Watson, English clergyman and author: b. London 1833; d. 2 Jan. 1900. He was educated at Oxford; was master in the high school at Carlisle in 1863 and canon of Carlisle in 1874. He became vicar of Hayton in 1873 and of Warwicke in 1883. He published Christ's Company and other Poems (1861); Historical Odes and other Poems (1864); Mano, a Poetical History (1883); Odes and Eclogues (1884); Lyric Poems (1885); The Story of Endocia and Her Brothers, a Narrative Poem (1887); Soror and Odes (1896); Essay on the Maintenance of the Church of England (1875); Life of James Dixon (1874); and History of the Church of England from the Abolition of the Roman Jurisdiction (1880-1900). He was a contributor to the London Quarterly Review, with Burne-Jones, Rosetti and Morris in founding the Oxford and Cambridge Magazine, the chief organ of the pre-Raphaelite school.

DIXON, Roland Burgess, American anthropologist: b. Worcester, Mass., 6 Nov. 1875. He was graduated in 1897 from Harvard University and immediately became an assistant in anthropology there, becoming instructor in 1900.
and assistant professor in 1906. He is a Fellow of the American Academy of Arts and Sciences and is author of various papers and monographs, on the Indians of California and the Indians of North America in general, including 'Maidu Myths' (1902); 'The Chimariko Indians and Language' (1910); 'Maidu Texts' (1912).

DIXON, Thomas, American novelist and playwright: b. Shelby, N. C., 11 Jan. 1864. He was graduated at Wake Forest College, N. C., 1883, and Greensboro, N. C., Law School 1885, and admitted to the bar in the last-named year. After serving from 1884-86 as member of the legislature in North Carolina he resigned to enter the Baptist ministry. He was pastor in Raleigh, N. C., 1887; Boston, Mass., 1888-89, and New York 1889-99. Among his works are 'Living Problems in Religion and Social Science' (1891); 'What is Religion?' (1892); 'The Failure of Protestantism' (1896); 'Sermons on Ingersoll' (1894); 'The Leopard's Spots' (1902); 'The One Woman' (1903); 'The Claimant' (1904); 'The Life Worth Living' (1905); 'The Tyrant' (1907); 'Conradians' (1909); 'The Root of Evil' (1911); 'The Sins of the Father' (1912); 'The Southerner' (1913); 'The Victim' (1914); 'The Foolish Virgin' (1915); 'The Fall of a Nation' (1916). He was made director-general of the National Drama Corporation (1915).

DIXON, William Hepworth, English author: b. Manchester, 30 June 1821; d. London, 27 Dec. 1879. In 1849 he published a memoir of Howard, the philanthropist, followed by the 'Life of William Penn' (1851), and by a work on Admiral Blake (1852). In 1853 he became editor of the Athenaeum, a post which he retained till 1869. During this period he published several very popular works, including the 'Personal History of Lord Bacon.' After his retirement from the Athenaeum he wrote some 25 volumes of history, travel and fiction.

DIXON, William Machele, English scholar: b. India 1866. He was educated at Trinity College, Dublin, and has been professor of English literature in the University of Glasgow from 1904. He has published 'English Poetry from Blake to Browning'; 'A Tennisyon Prime' in the Republic of Letters'; 'History of Trinity College, Dublin'; 'English Epic and Heroic Poetry.'

DIXON, Ill., county-seat of Lee County, situated on the Rock River, about 65 miles above its junction with the Mississippi River and on the Illinois Central and the Chicago and North-western railways. The city contains a courthouse, public library, the Rock River Military Institute, the Northern Illinois Normal School and the Rock River Chautauqua. The industrial establishments of the city comprise shoe factories, wagon works, condensed milk factories, farm implement works, furniture and wire cloth works and a Portland cement factory. The city was first settled in 1836; in 1911 the commission plan of government was put in operation. Pop. 8,000.

DIXON ENTRANCE, a strait on the west coast of North America, separating Queen Charlotte Islands and Archipalego, and so dividing British territory from a part of Alaska. It is about 100 miles long from east to west and 70 miles wide.

DIXWELL, John, English recidive: b. 1608; d. 18 March 1689. In 1646 he was elected member for Dover in the House of Commons, was one of the judges who condemned Charles I to death and signed the warrant. After the reaction in England which placed Charles II upon the throne, and caused himself and his associates in the trial to be excepted from the general pardon, he escaped to America, changed his name, taking that of John Davids, and lived undiscovered among the inhabitants of New Haven, where he was married and left children. In 1664 he visited two of his fellow recidives, Whalley and Goffe, who had found a refuge amid the solitudes of Hadley, Mass. His favorite study in exile was Raleigh's 'History of the World,' and he cherished a constant faith that the spirit of liberty in England would produce a new revolution. Consult Stiles, 'History of Three of the Judges of Charles I: Whalley, Goffe and Dixwell' (Hartford 1794).

DIZFUL, dzé-foo', Persia, capital of the province of Arabistan, about 190 miles west of Isphahan, on the river Diz. It has over 35 sacred tombs, and nearly as many mausoleums of schools and baths; but on account of the heat half of the town consists of subterranean excavations in the rock. The river is crossed by a handsome bridge of 22 arches. The chief article of commerce is indigo. Its pens, made of oak, are famous throughout the Orient. Pop. about 25,000.

DJEZZAR, jéz'zár ('butcher'), the name given to Achmed Pasha: b. Bosnia about 1735; d. Acre 1804. He was born in Bosnia of Christian parents, but embraced Mohammedanism. He was famous for his obstinate defense of Acre against Napoleon I. He rose, through murder and treason, from the condition of a slave to be pasha of Acre. In the beginning of 1799 the French entered Syria from Egypt, and advanced from victory to victory till they reached Acre, which was laid siege to on 23 March. By advice of Sir Sittzez Smith, Djezzar was induced to hold out; and such was the savage doggedness of his defense that Bonaparte was obliged to retire on 21 May.

DIMITRIEFF, mit'ryef, Radko, Bulgarian general: b. Grodez, Bulgaria, then a Turkish province. When his country obtained her independence (1878) he was one of the first pupils to pass through the new military academy at Sofia. The Bulgarian army being then entirely under Russian control, he completed his studies in Saint Petersburg (Petrograd), and returned home with the rank of captain on the eve of the Serbo-Bulgarian War of 1885. Immediately promoted to colonel, Dimitrieff commanded a regiment in the Slivnitzza campaign. He became implicated in the conspiracy which led to the abdication of Prince Alexander. Driven out of the country by Stambulov, Dimitrieff served over 10 years in the Russian army, but returned after the accession of Prince—now King—Ferdinand. In 1902 he was made chief of the general staff and placed in command of the military district on the Turkish frontier. In the first Balkan War (q.v.) he commanded one of the forces of the ex-Prince of Bulgaria. He won his first victory of Kirk Kilisseh. He was regarded as a popular hero, but weary of the quarrels among the Balkan Allies, he re-entered the
Russian service as a general. In the European War he was one of the youngest of the great army leaders. When Bulgaria refused to aid Serbia against Austria, Dmitrieff returned all his decorations to King Ferdinand and definitely cast in his lot with the Russians. He performed the perils of fighting in the Galician and Carpathian campaigns. When von Mackensen began his great Galician drive in the spring of 1915, he opened his attack against the Dunajec-Biala line held by Dmitrieff, broke through at Gorlice, and inflicted a severe defeat upon the Russians, which resulted in the reconquest of the whole province for Austria. Dmitrieff was relieved of his command and brought before a military tribunal. As his failure was due to lack of artillery he was honorably acquitted and reinstated. He served with distinction; two years longer and resigned in July 1917. See War, European — Galician and Carpathian Campaigns.

DNIEPER, nép’ér (Russian, Dnjepr; dnieper; ancient Borysthenes), a river of Russia which rises in the government of Smolensk, flows south to Kiev, then southeast to Ekaterniassfla. Here it takes a southerly direction to the Black Sea, and is inhabited by a population estimated at 14,000,000, who cultivate this fertile region famous for its black soil. The fishing industry of the river is also important and lucrative. The annual commerce on the river in normal times is about 40,000,000, and consists chiefly of lumber and grain. The Beresina Canal connects the river with the Baltic, via the Beresina, Dwina, the Pripet and the Dnieper-Bug and Niemen canals. It is close to navigation in its upper course during the winter months, but its lower course is closed only for about two months in midwinter.

DNIESTER, nést’ér (Russian, Dniestra; dnyēstr; the ancient Tyris; later Danastri or Danastus), a large river of Europe, which has its source in a lake in the Carpathian Mountains, in Austrian Galicia. Near Khotin it crosses the Russian frontier and flows in a southeastern direction generally with many windings. It forms the boundaries between Bessarabia and Podolia and Kherson. It flows into the Black Sea between Ovidiopol and Ackerman. Its length is about 850 miles, 360 of which are in Austria. Its basin is about 30,000 square miles in extent. There are rapids at Yampol. The chief affluents of the Dniester are the Sereth and the Stry. Modern improvements have made the river navigable from Khotin to the sea and its annual volume of commerce is very great, consisting for the most part of grain and lumber. It is Ask from commerce, wealth and the catching of which gives a means of livelihood to thousands.

DOAB, do’āb (Sanskrit, “Two Waters”), a name in Hindu applied indiscriminately to any tract of country between two rivers, but especially to the tract between the Ganges and the Jumna in the United Provinces. It is 500 miles long and 55 broad. It is the greatest wheat-producing area in the United Provinces. Its rich alluvial soil is irrigated by three canals. Other similar tracts have their distinctive names, as the Bari Doab, between the Bias and Ghara and the Ravi; the Rechna Doab, between the Ravi and the Chenab; the Jech Doab, between the Jhelum and the Chenah; the Sind Sagar Doab, between the Indus and the Jhelum. The canal parallel to the Jumna from Delhi to Fyzabad is called the Doab Canal.

DOAK, dōk, Samuel, American Presbyterian clergyman: b. Augusta County, Va., 1 Aug. 1749; d. Bethel, N. C., 12 Dec. 1830. He was graduated from Princeton; took a time tutor in Hampton Sidney College; and was licensed to preach in 1777. He first settled at Holston, and later at Salem, Tenn., where he built a small church, formed the Salem congregation, and established a school, the first organized in the Mississippi Valley west of the Alleghanies. It was at this school that the Rev. T. C. Martin Academy, and in 1795 became Washington College; Doak was its president from 1795 to 1818. He then removed to Bethel, where he founded Tusculum Academy. He was known as "the apostle of learning and religion in the West.

DOANE, dōn, George Hobart, American Roman Catholic clergyman: b. Boston, Mass., 5 Sept. 1830; d. Newark, N. J., 20 Jan. 1905. He was graduated at Jefferson Medical College in 1850, became a deacon in the Protestant Episcopal Church, but later entered the Roman Catholic Church and was ordained priest in 1857. In 1873 he was made vicar-general of Newark, N. J., and in 1886 the Pope made him a domestic prelate with the title of monsignor. He wrote: ‘First Principles’; ‘Exclusion of Protestant Worship from Rome,’ etc.

DOANE, George Washington, American Episcopal bishop: b. Trenton, N. J., 27 May 1799; d. Burlington, N. J., 27 April 1859. He was educated at Union College and the General Theological Seminary in New York. He was ordained deacon in 1821 and priest two years later, having become in the meantime an assistant in Trinity Parish, New York. Here he remained until 1824, when he was appointed professor of rhetoric and belles-lettres in Washington (now Trinity) College, Hartford, his position he held for four years, going then to Boston as assistant and afterward rector of Trinity Church. In 1832 he was consecrated bishop of New Jersey, and took up his residence in Burlington, N. J., combining the rectorship of Saint Mary’s Church with the episcopate until his death. Besides a vigorous prosecution of general religious work in his diocese, he devoted himself especially to the promotion of Christian education. In 1837 he founded Saint Mary’s Hall, a boarding and day school for girls, at Burlington, and in 1846 organized Burlington College in the same town. His zeal in this direction, combined with incomplete knowledge of business principles, led to
financial embarrassment and ultimately to presentment for trial before his brother bishops; but though twice brought up, the charge was unanimously dismissed. In many ways Bishop Doane was far in advance of his time, advocating daily services and the free church system when they were practically unknown in America. He left a large number of published sermons, lectures and essays, and was also a poet of no mean ability; his best-known poems being that beginning 'What is That, Mother?' and the well-known hymn 'Softly Now the Light of Day.'

DOANE, William Croswell, American Protestant Episcopal bishop, b. Boston, 2 March 1832; d. Albany, N. Y., 17 May 1913. He was a son of G. W. Doane (q.v.). He was ordained deacon (1853) and priest (1856) in Saint Mary's Church, Burlington, N. J., serving as assistant there until the latter date, when he took charge of Saint Barnabas' Church, Burlington. He succeeded his father in the rectory of Saint Mary's (1859-61), and after building rectories at Hartford, Conn. (1861-67), and Albany (1867-69), became in the year last named the first bishop of Albany, on the division of the large diocese of New York. In this position he acquired a reputation as a wise and statesmanlike administrator, and a diligent promoter of religious education. Saint Agnes' School at Albany was founded by him. He took a prominent part in the second, third and fourth Lambeth Conferences, and in the discussion on the revision of the American prayer-book, to which his liturgical knowledge made valuable contributions. He was a firm believer in the cathedral system, and spent much labor on its organization at Albany, including the erection of a magnificent cathedral. In 1902 he was chosen chancellor of the regents of the University of the State of New York. His most important literary work is his 'Life of Bishop George Washington Doane' (1860). He has published also 'Mosaics, or the Harmony of the Collects, Epistles, and Gospels' (1881); 'A Catechism of the Christian Year'; 'The Manifestations of the Risen Lord'; 'Rhymes from Time to Time' (1901).

DOANE, William Howard, American composer: b. Preston, Conn., 3 Feb. 1831; d. Cincinnati, Ohio, 24 Dec. 1915. He was chief editor of the Baptist 'Hymnal' and composed numerous popular evangelical hymns and songs. He also published more than 20 collections of hymns and several cantatas. He early removed to Cincinnati where he was president and general manager of a firm of manufacturers of wood-working machinery from 1881 till his death.

DOBIN, James Cochrane, American statesman: b. Fayetteville, N. C., 1814; d. there, 4 Aug. 1857. He was graduated at the University of North Carolina in 1832, studied law, was admitted to the bar in 1835 and practised in Fayetteville. He was elected to Congress from North Carolina as a Democrat, and served from 1 Dec. 1845 to 3 March 1847. He was a member of the State legislature in 1848-52 and was chosen speaker in 1850. He was a member of the U.S. Senate from North Carolina in 1852, and appointed Secretary of the Navy by President Pierce, serving from 7 March 1853 to 6 March 1857.

DOBBS FERRY, N. Y., residential village in Westchester County, on the Hudson River, and on the New York Central and Hudson River Railroad, 25 miles north of the city hall, New York. This line was struck, planned and prepared here by Generals Washington and Rochambeau in the Livingston manor house, and in the same place, in 1783, took place the conference between Clinton, Carleton and Washington. The first salute fired by a British war sloop to the American flag was given opposite this place. At present Dobbs Ferry is mainly a fashionable residential suburb of the metropolis. It is pleasantly situated at the widest part of the Hudson River, called the Tappan Zee. It is the seat of the Masters School for Girls, Saint Christopher's Home for Boys and Girls and the New York Juvenile Farm. It has also a hospital, public playground and a public library. The name is derived from a Swede, Jeremias Dobbs, whose family for over a century maintained a ferry here. Pop. 3,455.

DÖBEREINER, dtö-bë-rë-it-ner, Johann Wolfgang, German chemist: b. Hof, Bavaria, 15 Dec. 1780; d. Jena, 24 March 1849. He was professor of pharmacy and chemistry at Jena for 39 years, and discovered the combustibility of platinum, the apparatus for utilizing which is known as Döbereiner's lamp (L.W.). He published 'Zur Pneumatischen Chemie,' and other works. His correspondence with Goethe and Charles Augustus of Weimar appeared in 1856.

DÖBEREINER'S LAMP, a contrivance for producing an instantaneous light, invented by Professor Döbereiner, of Jena, in 1824, and in wide use before the introduction of the sulphur match. The light is produced by throwing a jet of hydrogen gas upon recently prepared spongy platinum, whereupon the metal instantly becomes red hot, and then sets fire to the gas. The action depends upon the readiness with which spongy platinum absorbs gases, more especially oxygen gas. The hydrogen is brought into such close contact with oxygen (derived from the atmosphere) in the pores of the platinum that chemical union, attended with evolution of light, takes place.

DOBROITCH, dob-roich, Bulgaria, town situated 26 miles north of Varna, formerly called Bazarak. It contains a castle and a number of churches. It was twice captured by the Russians, in 1774 and 1810. An important fair is held here annually. Pop. about 15,000.

DOBRIZHOFFER, dob-brit-hôf-er, Martin, a Jesuit missionary to the native tribes of Paraguay and author of a voluminous and celebrated memoir on the Abipones, a Paraguayan tribe: b. Graz, Styria, 7 Sept. 1717; d. Vienna, 17 July 1791. At the age of 19 he entered the Jesuit order and in 1749, having been ordained priest, was assigned to the mission of Paraguay, in which he spent 18 years. On the expulsion of the Jesuits from the Spanish possessions in 1767 he returned to Austria, where he passed the remainder of his life, devoting his leisure to writing his memoir 'Historia de Abiponibus, etc.,' or its English title, 'A history of the Abipones, a cavalier and warlike people of Paraguay, enriched with copious observations on the barbarous natives, rivers, beasts, amphibians, insects, principal serpents, fishes, birds, trees, plants and peculiarities of the said province.'
A translation of the work (somewhat abridged) by Sara, S. T. Coleridge's daughter, was published in three large volumes (1822). DOBROLYUBOV, dô-brô-loyô-boôv, or dô-brô-ô'yu-boff, Nikolai Alexandrovich, Russian critic: b. Nizhni Novgorod, 24 Nov. 1836; d. 1861. At the age of three he knew the names of several fables from Krylov's collections. At school he was considered as an enfant prodige and at home he spent all his time in the library of his father in which were many books on science and art. At the age of 13 he wrote several original poems of considerable merit and translated into Russian verse some of Horace's best poems. Owing partly to the influence of his father (a parish priest) and partly to his own inclination to religion he became greatly devoted to the Christian faith and the Orthodox Church, which love he showed by a rough asceticism. During his studies at the University of Petrograd in 1854 Dobrolyubov lost in a rapid succession his parents and a sister. Poverty and sorrow delayed his literary career until 1855, when he adopted the pen-name, and, aided by Chernyshevsky, wrote for Sovremennik several essays in prose which astonished the critics by their manifestation of deep erudition. His stories 'Donos' ('Report') and 'Dyeltze' ('The Versed') had a great success and improved considerably his financial affairs. Having lost all his dear ones, his heart, refined by suffering, became (1858) an easy prey to the eyes of a beautiful, chaste but extremely carelessly educated girl with whom he lived for some time, but from whom he had to separate on account of her vulgarity. However, he never forgot the good in that woman and under great strain he sent her at regular intervals pecuniary aid until her death. After this he had several other unfortunate love affairs which convinced him that his peace lay only in literature. Indeed, until 1860 he was extremely busy writing criticisms on novels, plays, stories, etc., for the leading periodicals of the capital. All his brilliant criticism carries the seal of the spirit of the sixties in Russian literature. His was a talent in a transient state from Hegel's metaphysics to the realism of the English and French philosophers, from mystical dualism to plain monism and utilitarianism. His critical studies, 'The Dark Cardamom,' 'Spark of Light in the Dark Cardamom,' 'When will the To-Day come,' etc., exhibit a powerful realism and deny the theory of nationalism in literature and contain a deep and universal analysis of the most essential sides of the Russian life.

DOBROUDJA, dô-brô'dja, or DOBRUD-SCHA, Rumania (the ancient Scythia Minor), territory forming the southern division of the kingdom. Its boundaries are the river Danube on the north, Bulgaria on the south, the Black Sea on the east and the Danube on the west. Until the Treaty of 10 Aug. 1913, signed at Bucharest, its area was only 6,000 square miles, but it received an addition of 3,000 square miles. It has a mixed population of Bulgarians, Circassians, Greeks, Roumians, Tartars, Armenians, Jews and Turks, numbering in all about 500,000, of which about 200,000 came with the new territory in 1913. Until 1878 the Dobrudja formed part of Bulgaria. An exceedingly fertile region it has always produced quantities of cereals, beets, grapes, forage crops and tobacco; agriculture being the main industry of the people.

DOBSCHEUTZ, dop'shuts, Ernst von, German Biblical scholar: b. Halle 1870. He was educated at Leipzig, Halle, Berlin and Jena, and in 1899-1904 served as professor extraordinary at the last-named institution. In 1904 he was appointed to a chair at Strassburg, in 1910 at Breslau and in 1913 became professor of New Testament exegesis at Halle. He has published several authoritative works dealing with the history of the apostolic age. These include 'Kerygma Petri' (1893); 'Studien zur Textkritik der Vulgata' (1894); 'Die urchristliche Gemeinde' (1902; Eng. trans., 'Christian Life in the Primitive Church,' 1904, probably his greatest work); 'Probleme des apostolischen Zeitalters' (1904); 'Das apostolische Zeitalter' (1905; in Swedish, English and French translations); 'Thessalonians' in Meyer's 'Kommentar' (7th ed., 1909); 'The Eschatology of the Gospels' (1910); 'Das Deutecum Gelasianum' (1912); 'The Influence of the Bible on Civilization' (1914).

DOBSON, Henry Austin, English poet: b. Plymouth, 18 Jan. 1840. From 1856-1859 he held an official position at the Board of Trade. The earliest verses first appeared in the magazine called 'St. Paul's' and were subsequently published in book form under the title 'Vignettes in Rhyme' (1873). Since then he has published several other volumes of verse, including 'Proverbs in Porcelain' (1877); 'Old World Idylls' (1883); 'At the Sign of the Lyre' (1885); 'Collected Poems' (1897); 'Carmina Votiva' (1901). Among his prose works may be mentioned his Lives of Fielding (1883); Steele (1886); Hogarth (1879); Goldsmith (1889), and Horace Walpole (1890); critical biography of William Hogarth (1891); 'Thomas Bewick and His Pupils' (1884); 'Four Frenchwomen' (1890); three series of 'Eighteenth Century Vignettes' (1892-96); 'A Palinode of Philanthropy' (1899); 'Sidewalk Studies' (1892). Many of his poems are written in various French forms, such as the triolet, rondeau and ballade, and all are marked by gracefulness, ease and meticulous finish. The atmosphere of the 18th century hangs like a garment over his most characteristic work, both in prose and verse.

DOBSON, William, English portrait painter: b. London 1610; d. Oxford, 28 Oct. 1646. Having acquired considerable skill as a painter he came under the notice of Van Dyck, who introduced him to Charles I. On the death of his patron he succeeded him as sergeant-painter to the king. Among his portraits are those of himself and his wife, Sir Charles Cotterell, Sir Thomas Browne's family, the first Duke of Newcastle, the Marquis of Montrose, Fairfax and Old Parr; and in addition there are other pictures by him, the chief being 'The Beheading of St. John.'

DOBSON, the larva of the great neup-terous hellgrammite-fly (Corydalis cornutus), common all over temperate North America. The adult is among the largest of insects, its papery wings spreading more than four inches; and it is dull brown in color. The female has strong biting jaws; and in the male these are extended into long, curved instruments that
look like formidable pincers, but are harmless, for they are used only in holding the female during the mating process. These insects frequent swift-running streams and rarely fly abroad in the daytime. In midsummer the female lays about 3,000 whitish eggs set on end in roundish, flattened masses, glued to leaves overhanging water, or on rocks near its surface. The eggs soon hatch, and the minute larvae drop into the water, descend to the bottom and creep under stones, etc., where they cling to some firm object by claw-like appendages at the hinder end of the body. By preying on everything that can be caught they grow rapidly into powerful, tough-skinned, creeping marauders two inches in length. These are much sought after by anglers for bait, and are known by many names, as dobson, hellgrammite, crawler, water-grampus, hell-devil, alligator, etc. This aquatic life lasts for 2 years and 11 months. The dobson then leaves the water and crawls about on land, searching for a suitable place for pupation; this occurs usually in May, and a month later the fly emerges and spends its few weeks of life in securing and fertilizing a mate, which lays her eggs and then dies. Consult Howard, 'Insect Life' (New York 1901).

DOCE-LA, dô'sâ, a river of Brazil, rising by several streams on the eastern slopes of the Sierra de Mantiqueira in the state of Minas Gerais and flowing to the Atlantic, which it enters about 30 miles northeast of Santa Cruz. It is about 600 miles long and is navigable up to 120 miles from its mouth.

DOCEN, dô'tsen, Bernhard Joseph, German philologist: b. Osnabrück 1782; d. 1828. He studied under Heyne at Göttingen, and also at Jena. In 1804 he began his connection with the State Library at Munich and in 1811 was made its custodian. Docen made a critical examination of the Old and Middle High German manuscripts, which the secularization of the Bavarian cloisters caused to be deposited under his care at Munich. Docen was the first scholar to show the importance of the old glosses in Latin and German and the glosses in Latin works of the period from the 8th to the 12th century as a groundwork for a thorough study of the modern German language. Docen was a member of the editorial staff of the 'Museum für altdutsche Litteratur und Kunst' (2 vols., Berlin 1809-11). His published works include 'Miscellanea zur Geschichte der deutschen Litteratur und Kunst' (2 vols., Munich 1807-09).

DOCENT, dô'tsent, in America, a term indicating a member of the teaching staff of the lowest grade. In the University of Chicago it is the rank next above that of fellow. In some other institutions it indicates the highest formal academic honor, e.g., Clark University. In Germany the docent is a teacher with full official relations and the term is used in a general sense to include professors of all grades.

DOCTELE, dô-se'Tâ, sectaries who held the human nature of Christ to be an illusion, phantasmal and not real. The word is from the Greek verb δοκεω, to appear, to seem. The Docete were adherents of the Gnostic school and believed in an antediluvian dogma that the laws of Oriental sects which preceded and outlived Arianism, both in the East and West. Their denial of the real humanity of Christ was made on the same ground on which Cerinthus (q.v.) denied that the universe is the creation of the principle of all good. That this view prevailed among sects in apostolic times is inferred from a passage in the first epistle of Saint John: "Every spirit which confesseth that Jesus Christ is come in the flesh is of God; and every spirit which confesseth not Jesus is not of God." DOCHMIOSES. See Hookworm Disease.

DOCK, a name applied to a large section of the genus Rumex, belonging to the buckwheat family (Polygonaceae), chiefly those that are not acid. These are large perennial herbaceous plants, with stout roots, alternate, ovate and often entire leaves, and bearing panicles of small greenish and usually perfect flowers in whorls. Their roots have an acrid taste, are astringent and styptic and were used in medicine until stronger remedies took their place. The root of the water-dock (Rumex aquatica) makes a black color in a solution of sulphate of iron. This plant was greatly venerated by the Druids, who attributed to it miraculous qualities. Numerous species of this genus are known, some widely distributed over the northern hemisphere, 22 species being found in eastern and northern America. One variety, introduced by European settlers, was known among the Indians as "the white man's foot.

DOCK WARRANT, a species of warehouse receipt given by a dockowner to the owner of goods specified in dock warrant, and engaging to deliver them to owners or assignees. The Factor's Act in England has placed dock warrants on the same footing as bills of lading, and in many States of the American Union they have been declared negotiable by statute.

DOCKET, or DOCKET, from dock, to cut short, to abridge, in law, a term indifferently used for a summary of a larger writing; a small piece of paper or a formal record of judicial procedure; parchment containing the heads of a writing; an alphabetical list of cases in a court, and the names of the parties who have suits depending in a court.

DOCKS. SEE HARBORS, DOCKS AND BREAKWATERS.

DOCTOR, a term meaning teacher, or instructor, applied by the ancient Romans to those who delivered public lectures upon philosophical subjects. In the Middle Ages, from the 12th century, it came into use as a title of honor borne by men of great learning, as by Thomas Aquinas (Doctor Angelicus), Duns Scotus (Doctor Subtilis), Roger Bacon (Doctor Mirabilis), Bonaventura (Doctor Seraphicus) and other distinguished schoolmen. It was first made an academic title at the University of Bologna, in Italy, which received from the emperor the right of appointing doctores legum (doctor of laws). The University of Paris followed in 1145. Soon after the popes granted the universities the right of appointing doctores canonum et decretalium (teachers of the canon law); and when the study of the civil law came to be combined with that of the canon law, the title was changed to doctor utriusque juris (that is, teacher equal in the art of theology and medicine followed that of law in confessing this title. In the universities of Ger-
many the title of Doctor of Philosophy (Ph.D.) is that which regularly corresponds to M.A. in Great Britain and in America, the philosophical faculty corresponding to the faculty of arts. The degree of Bachelor is subordinate to that of Master and Doctor. The degree of Doctor is either conferred publicly, with certain ceremonies, or by diploma. In many cases it is merely an honorary degree, in other cases it is conferred after examination or when the person receiving it has presented a sufficient thesis on a subject connected with the branch of study to which the degree distinctively belongs. In Great Britain and the United States the degrees of D.D. (Doctor of Divinity), LL.D. (Doctor of Laws) and M.D. (Doctor of Medicine) have long been conferred, the first two being generally honorary. At some of the universities the degrees of D.Lit. (Doctor of Literature) and D.Sc. (Doctor of Science) have been instituted in comparatively recent times, at some also that of D.Phil. (Doctor of Philosophy). The degree of Doctor of Music is conferred at the universities of Oxford, Cambridge, Dublin, London and Edinburgh. The degree may be honorary or conferred after examination. See University; Degree, Academic; and consult the authorities there referred to; consult also Denifle, 'Die Universitaten des Mittelalters bis 1400' (Berlin 1885); Rashdall, 'Universities of Europe in the Middle Ages' (Oxford 1895). Curious accounts of the revelry attending the ceremony of conferring degrees at Oxford will be found in Anthony à Wood's 'History and Antiquities of the University of Oxford' (London 1796).

DOCTOR ANGELICUS, or ANGELIC DOCTOR, a title bestowed by common consent of the scholastic divines, and ratified by the moderns, upon Saint Thomas Aquinas. See Aquinas, Thomas; Doctor of the Church.

DOCTOR JEKKYL AND MR. HYDE, The Strange Case of. Robert Louis Stevenson's powerful allegory of dual personality, 'The Strange Case of Dr. Jekyll and Mr. Hyde,' has created so enduring an impression that 'Jekyll' and 'Hyde' have become proverbial symbols of the good and the evil in human nature. Dr. Jekyll, through the agency of a drug, is enabled to assume at will a dwarfish, repulsive form embodying all the evil in his nature, so that in this shape, under the name of Edward Hyde, he may indulge his baser desires. A renewal of the same potion enables him to assume the tall form of the benevolent physician, dominated by the better side of his personality — until the failure of the supply of the drug leads to the inevitable catastrophe.

The invention of the tale is traceable to Stevenson's recollections of nursery traditions of the notorious Deacon Brodie, who was a respectable artisan by day and a burglar by night, supplemented by later reading of articles on sub-consciousness. But the story actually shaped itself in a terrible dream while the author was suffering from a hectic fever. In three days Stevenson had written a first draft of 30,000 words, only to burn it and to complete the final version in three days more. The story, published in January 1886, had a sale of nearly 40,000 copies in six months in England alone, and was made the subject of sermons and editorials. It was extensively pirated in the United States, where, however, further popularized by three dramatizations, it made the author's reputation. In a letter to Stevenson, John Addington Symonds doubted "whether anyone had the right so to scrutinize the abysmal depths of personality," adding, however, "The art is burning and intense. The Peau de Chagrin disappears, and Poe's work is water. Also one discerns at once that this is an allegory of all two-natured souls who yield consciously to evil. Most of us are on the brink of educating a Mr. Hyde at some epoch of our being." See DOCTOR SYNTAX, The Three Tours of, a series of three books (published 1812, 1820, 1821) by William Combe, written in verse and depicting the adventures of a certain Dr. Syntax, clergyman and teacher, who, on his horse Grizzle, sets out in the first book "in search of the picturesque"; in the second, in search of consolation; and in the third, in search of a wife. The three books were published together in 1826. The work is marked by mild satire, and describes many well-sketched types of character and class.

DOCTOR OF THE CHURCH, a name given to certain eminent churchmen. Benedict XIV gave as the things required to make a man a Doctor of the Church: first, learning so eminent as to fit him to be a doctor in the Church and a doctor of the Church; second, heroic sanctity; third, the title must be conferred by a declaration of the Pope or of a general council. The third has not always been insisted upon. In canon law four Doctors of the Church are named: Jerome, Gregory, Ambrose, Augustine. Others are called doctors without the formal declaration of Pope or council: Chrysostom, Gregory Nazianzen, Anselm, Isidore, Peter Chrysologus, Hilary, Athanasius, and Basil have not the full office proper to doctors. Others who have been added by declaration of popes are Saint Thomas Aquinas, Saint Bonaventura, Saint Leo, Saint Bernard, Saint Alphonsus Liguori and Saint Francis de Sales.

DOCTOR-FISH. See SURGEON-FISH.

DOCTORS' COMMONS, in England, the popular name for the courts and offices formerly occupied by the body incorporated in 1768 under the title of "The College of Doctors of Law exerted in the Ecclesiastical and Admiralty Courts." This body took the place for older institutions of Doctors' Commons, founded in 1568, the buildings of which were destroyed in the Great Fire of 1666 and rebuilt in 1672. The buildings were situated on the east side of Saint Paul's churchyard. The college consisted of a president (the dean of the arches for the time being), and of those doctors of law who, having regularly taken that degree in either of the universities of Oxford or Cambridge, and having been admitted advocates in pursuance of the rescript of the archbishop of Canterbury, had been elected fellows of the college in the manner prescribed by the charter. They formed a distinct legal profession, the advocates holding a position equivalent to attorneys and the proctors to that of solicitors. The term commons refers, as the name implies, to a common dining-room. The Court of Arches (the appellate court of the archiepiscopal province of Canterbury) was the principal ju-
DOCTRINAIRES — DODDER

dicial body meeting here. After the passing of laws in 1857 which made many legal reforms possible the charter of this college of doctors was revoked. The property sold, the corporation dissolved and the courts are merged with others, and are now open to all members of the bar.

DOCTRINAIRES, dôk-trê-närz', a term applied to theorists or theoretical politicians. The name had its origin in France in 1815. After the second Restoration of the Bourbon, a small number of deputies would neither rank themselves among the friends of absolute power nor among the defenders of the Revolution. They supported Decazes while he was minister; and several of them held offices in the ministry, as, for instance, the councillors of state, Camille Jordan and Royer-Collard. Their system embraced a constitutional monarchy on the British model with parliamentary control, allowing the government more power than the ultra-liberals would admit; and, on the other hand, restricting the royal power more and admitting less approach toward the old form of government than the ultra-royalists demanded. They retired with Decazes, became merged in the Orleansists in 1830, and after the Revolution of 1848 ceased to exist as a political force. The first orator among them was Royer-Collard; they drew part of their inspiration from Talleyrand and Montesquieu, and their most distinguished writer out of the Chamber was Guizot. The 'Journal des Débats' was their principal organ. They received the name of doctrinaires because they were looked upon more as theoretical than practical politicians.

DOCTRINE. See Christian Doctrine, Development of.

DÖCZI, dôchté, Ludwig von, Hungarian author: b. Oedenburg 1845. He was educated in Vienna and Budapest, became a journalist and in 1867 entered the office of the Austro-Hungarian Ministry of the Interior. Sometime afterward he became a councillor in the Ministry for Foreign Affairs. He has published 'Utolsó prófétá' (1868) and 'A Csók' (The Kiss 1871), two dramas, also several prose works and poems. He translated the first part of Goethe's 'Faust' (new ed. 1878) into Hungarian and also Schiller's poems (1903-05).

DOD, Daniel, American mechanic: b. Virginia, 28 Sept. 1778; d. New York, 9 May 1823. He was educated at Rutgers College. He devoted himself to the study of steam machinery and the construction of steam-engines; the Savannah (1819), the first steamship to cross the Atlantic, had an engine of his construction. He was killed by the explosion of a boiler on a steamboat, the machinery of which he had altered.

DODD, Frank Howard, American publisher: b. Bloomfield, N. J., 12 April 1844; d. New York, 10 Jan. 1916. He prepared at Bloomfield Academy to enter Yale, but instead went into the New York publishing house of his father, M. W. Dodd. To this business he succeeded in 1870, forming a partnership with Edward S. Mead. Six years later Blecker Van Wagenen joined the firm and the name was changed to Dodd, Mead & Company. Beside publishing books in all departments of literature, the firm, under Mr. F. H. Dodd's supervision, founded the Bookman in 1895 and in 1902 the 'New International Encyclopedia' which succeeded the 'International Cyclopedia of Science.' Dodd was president of the American Publishers' Association for a number of years and has had various civic and philanthropic interests, being largely instrumental, as president of the Fourth Avenue Association, in the business development of that street.

DODD, Walter Fairleigh, American educator: b. Hopkinsville, Ky. 7 April 1880. He was graduated from Florida State College in 1898. In 1905 he took the degree of D.Ph. at the University of Chicago. In 1904-07 he was in charge of the section of foreign law in the Library of Congress. He held a research appointment at Johns Hopkins in 1908-10. In 1910-11 was associate in political science, in 1911-14 assistant professor, and in 1914-15 associate professor of political science in the University of Illinois. Since 1915 he has been associate professor of political science in the University of Chicago. He has published 'Modern Constitutions' (2 vols., 1909); 'Government of the District of Columbia' (1909); 'Revision and Amendment of State Constitutions' (1910); also contributions to legal and other technical journals.

DODDER, a genus of plants, Cuscuta, of the family Cuscutaceae. The characteristics of the group are filiform twining stems, parasitic on other plants, to which they attach themselves by suckers. They have lost all trace of leaves, even the cotyledons of the embryo being no longer distinguishable, while chlorophyll is almost completely absent. In one American species a slight trace of coloring matter has been noticed. The seed germinates very late in spring, and as the seedling rises from the ground a yellow or pink stem soon begins to show the sweeping movements of circumnutation of a climbing plant. If no plant known as the host is in the neighborhood for it to take up its quarters on, it falls to the ground, but retains its vitality for some weeks, by which time a victim may probably have germinated. As soon as it touches a living plant it twines firmly round it, and a series of small wart-like adventitious roots (haustoria) are developed, from the centre of each of which a bundle of succorial cells force their way through the epidermis and cellular envelope into the bast and press against the woody tissue of the host. The portion of the dodder stem below this attachment now dies off and there is then no longer any connection with the ground. The growing point again circumnatures until it finds a new base of attachment upon the same or a different stem of the host, there to repeat the formation of suckers. In this way a tangled skein of threads is formed, over which, late in the season, the yellow or white flowers are dense clusters and the black seeds are shaken out of the capsule by the wind or gathered with the crop. This parasite in very often injurious, fields of flax, clover and lucerne sometimes showing well-marked patches completely colonized by the pest. These have to be mowed down and burned before new seed has set; while pains must be taken to procure seed free from those of the parasite. Preventive measures are, to make careful examination of the
seed (see Seed Testing), rejecting any that contains dodder seed and any produced upon land known to be infested by dodder. When observed growing among a crop, frequent hoeing and burning are often effective. Plants turning with sheep confined to the infested patches is also practised, the animals being kept for several weeks upon the land and given extra food if necessary. The most satisfactory treatment, however, is clean cultivation or the growing of a crop upon which the dodder cannot grow. There are about 100 species of dodder of wide geographic distribution, of which at least 25 are found in the western and southern parts of North America. The temperate species are all annual, but some of the tropical species are perennial. A common American name is tangle-weed. It is a remarkable circumstance that Cassytha, a totally unrelated Oriental genus of Lauraceae, has not only assumed the same general mode of life, and the twining, leafless habit, but germinates and penetrates in a precisely similar way.

DODDRIDGE, Philip, American lawyer and statesman: b. Bedford County, Pa., 1772; d. York, Pa., 19 Nov. 1832. His English ancestors had settled in New Jersey. His father had married in Maryland in 1765 and soon thereafter settled near Middletown, Washington County, which at that time was claimed under the jurisdiction of Virginia. In 1789, young Philip was placed in school at Charlestown (now Wellsburg), W. Va. Soon thereafter he worked his way down the Ohio and the Mississippi as a laborer and supercargo on one of the numerous flatboats. In 1797 he was admitted to the practice of law in Brooke County, and after a trip to Lancaster, Pa., to get married, he made Wellsburg his permanent home. In his practice of law, which extended to all northwestern Virginia, he was greatly aided by the endless litigation resulting from the confused and complicated character of land titles. Always interested in public affairs, he took an active part in politics. He was a member of the old Congress of the Vir- ginia Convention 1815-16 and 1822-23. Against the arbitrary and oligarchical principles of the aristocratic tide-water politicians he began an opposition which he never relaxed. He took a leading part in the remarkable Virginia Constitutional Convention of 1829-30 which was called to amend the State constitution and over which ex-President James Monroe presided. In the numerous debates, he urged a more equitable basis of representation and suffrage, periodical appointment of the governor, selection of county courts independent of the legislature and other reforms. In 1829 he was elected to Congress and continued to serve until his death. He was active in opposing an attempt to annul the control of the Supreme Court of Appeals of Virginia. In 1830 he was equivalent to a motion to dissolve the Union; and he obtained a wide reputation through a speech which he made in favor of parliamentary privileges in the case of the arrest of Sam Houston. He turned his interest into the legal and political department, where he published 20 special reports, including 'A Descriptive Catalogue of Useful Fibre Plants of the World.' Officially connected with 11 international expositions, serving as a member of the jury of awards. He received the cross of the Legion of Honor of France in 1901.

June 1702; d. Lisbon, Portugal, 26 Oct. 1751. He determined to enter the Non-Conformist ministry and was educated at a theological academy at Kibworth, Leicestershire. In 1723 Dod- dridge became pastor of the dissenting congregation at Kibworth. After declining several invitations from congregations whose rigid ideas of orthodoxy he felt would be uncongenial to him, he established a dissenting academy at Market Harborough in 1725, which was a minister in the same year to Northampton. Here he continued to preach and train young students for the ministry till shortly before his death. Doddridge was at once liberal and evangelical, and with all his religious earnestness and enthusiasm had humanity enough for such levities as cards and tobacco. He strove earnestly for unity among the dissenting bodies. His principal work is 'The Rise and Progress of Religion in the Soul' (1745), which has been translated into Dutch, German, Danish, French, and even Syriac and Tami. Besides that may be mentioned 'The Family Expositor' (1739-56); his 'Course of Lectures' delivered to the students under his charge and published (1763); and a great variety of sermons on miscellaneous religious topics. His hymns, by 400 in number, have carried his name over the English-speaking religious world, perhaps the best known being 'Hark, the Glad Sound, the Saviour Comes'; and 'O God of Bethel, by Whose Hand.' His 'Correspondence and Diary' appeared 1829-31. Consult Orton, 'Life of Doddridge' (1866); Stanford, 'Life of Doddridge' (1880).

DODDS, Alexander, American editor: b. Allegheny, Pa., 5 April 1874. He was graduated from Duff's College, Pittsburgh, Pa., in 1890 and has since been engaged as newspaper writer and editor on various journals. In 1894-96 he was associate publisher of The Builder, Pittsburgh, in 1902 was night editor of the Pittsburgh Dispatch, in 1902-04 associate publisher of the Telegraph, Sharon, Pa., and in 1905-06 night editor of the Gazette Times, Pittsburgh. In 1908-14 he was managing editor of the Christian Science Monitor, and since 1914 managing editor of the Los Angeles Herald.

DODCEAHEDRON, dô-dé-kə-á-he'drôn, a regular solid bounded by 12 equal and regular pentagons, or having 12 equal bases. A solid having 12 faces.

DODECATHEON. See Cowslip.

DODGE, Charles Richards, American textile fibre expert: b. Covington County, Miss., 17 July 1847. He was educated at the Sheffield Scientific School of Yale and was assistant entomologist in the United States Department of Agriculture 1867-77, editing Field and Forest 1874-77. From 1890-98 he was in charge of the fibre investigatory department, when he published 20 special reports, including 'A Descriptive Catalogue of Useful Fibre Plants of the World.' Officially connected with 11 international expositions, serving as a member of the jury of awards. He received the cross of the Legion of Honor of France in 1901.

DODGE, Cleveland Hoadley, American merchant: b. New York, 26 Jan. 1860. He is a son of William E. Dodge, was graduated at Princeton University in 1879. He became a director of several banks, insurance companies,
railroads, mining companies, etc., treasurer of the El Paso and Southwestern Railroad and vice-president of Phelps Dodge & Company. He was president of the board of trustees of Robert College, Constantinople, vice-president of the Museum of Natural History, New York, and trustee of the Carnegie Institute, Washington, D. C., and of the New York Public Library.

DODGE, Francis Safford, American soldier; b. Danvers, Mass., 1842; d. 1908. He saw service during the Civil War, after which he entered the regular service as first lieutenant of the Ninth Cavalry. In 1880 he was transferred to the paymaster's department with the rank of major. He was promoted to pay-master-general, with rank of brigadier-general, in 1904. He was retired in 1906. In 1870, with four troops of the Ninth Cavalry, Dodge destroyed a large Indian camp in the Guadalupe Mountains. In 1879, with Troop D of the same regiment, he made a forced march of 100 miles to the relief of Maj. Thomas T. Thornburg, whose force the Indians threatened to annihilate near Mill Creek in western Colorado. Dodge and his troop of colored cavalrymen fought their way through the Indians, joined Thornburg on the march and enabled him to hold the enemy at bay until re-enforcements arrived. For this he was awarded the congressional medal of honor and brevetted major.

DODGE, Grace Hoadley, American educator and social betterer leader: b. New York city, 27 Dec. 1875. She was a sister of Cleveland H. Dodge (q.v.). For over 30 years she was deeply interested in increasing opportunities for self-supporting women. At various times she was a member of the New York School Board, treasurer of Teachers' College and president of the Working Girls' Society. Her greatest work was the unification and assured success of the Young Women's Christian Associations of the United States. She was president of its national board and member of the world board. She gave, about two years before her death, $350,000 for the metropolitan association and national board building of the Y. W. C. A. in New York. She edited 'Thoughts of Busy Girls' (1892) and was author of 'A Bundle of Letters to Busy Girls on Practical Matters' (1897; translated into several European tongues); and joint-author of 'What Women Can Earn' (1899).

DODGE, Grenville Mellen, American soldier and civil engineer: b. Danvers, Mass., 12 April 1831; d. Council Bluffs, Iowa, 3 Jan. 1916. He received his education at the University of Norwich, Vt., and served on the United States survey expedition on the Platte River, perhaps the earliest of its kind undertaken with the object of finding a railroad route to the Pacific Coast. In the Civil War he joined the Union forces as a first lieutenant, and rose to the rank of major of volunteers. He was commander of the 16th Army Corps under Sherman during the Atlanta campaign and later, was placed over the Department of Missouri. He served as chief engineer of the Union Pacific Railroad from 1866 to 1870 and for the next 10 years held a similar post with the Texas and Pacific Railroad. In 1867 he was elected to Congress from Iowa and served two years. He was named chairman of a commission, in 1898, to inquire into complaints charging mismanagement and incompetency in connection with the war against Spain.

DODGE, Jacob Richards, American agricultural statistician: b. New Boston, N. H., 1823; d. 1902. He received an academic and technical education. From 1845 to 1849 he taught in Mississippi, in 1859-54 he edited a paper at Nashua, N. H., and from 1857 to 1863 edited the American Ruralist at Springfield, Ohio. For about a quarter of a century he edited the reports of the Department of Agriculture and wrote pamphlets on rural economics. He had foreign commissions for the department in 1873 and in 1887, and in 1893 became a member of the editorial staff of the Country Gentleman. He wrote 'Red Men of the Ohio Valley' (1860); 'West Virginia: Its Farms and Forests, Mines and Oil Wells' (1865); 'Farm and Factory' (1884).

DODGE, James Mapes, American mechanical engineer: b. Waverly, N. J., 30 June 1852; d. 4 Dec. 1915. He was educated at Cornell University and at Rutgers College. He did much original work in improving conveyors for machinery and allied appliances. He was elected chairman of the Link Belt Company of Philadelphia and late president of the J. M. Dodge Company and the Dodge Cold Storage Company. In 1903 he was president of the American Society of Mechanical Engineers. He published 'The Money Value of Technical Education Training' (1903).

DODGE, Mary Abigail (pseudonym, 'Gail Hamilton'), American author: b. Hamilton, Mass., 1830; d. there, 17 Aug. 1896. For several years she was instructor in the High School at Hartford, Conn. From 1865 to 1867 she was one of the editors of Our Young Folks. Besides numerous contributions to current literature, she wrote 'Gala Days' (1863); 'Woman's Wrongs' (1868); 'The Battle of the Books' (1870); 'Woman's Worth and Worthlessness' (1871); 'The Insuppressible Book' (1885); 'A New Atmosphere' (1884); 'Red-Letter Days' (1884); 'Country Living and Country Thinking'; 'A Washington Bible Class'; 'Twelve Miles from a Lemon'; 'Biography of James G. Blake'; 'Our Common School System'; 'Gail Hamilton's Life in Letters' was issued in 1901, and 'Chips, Fragments and Verses,' edited by H. A. Dodge, in 1902.

DODGE, Mary Elizabeth Mapes, American editor, author and poet: b. New York, 26 Jan. 1831; d. Tannemuske, N. Y., 21 Aug. 1905. Her father was Prof. James J. Mapes, and she became the wife of William Dodge, a well-known lawyer, of New York, but was early widowed. From 1873 until her death she edited, with remarkable ability and success, St. Nicholas Magazine (New York). Her best-known work was 'Hans Brinker, or the Silver Skates' (1865), which went through many editions, was translated into five foreign languages, was crowned by the French Academy and is a recognized classic of juvenile literature. Among her other works are 'Irvington Stories' (1864); 'Theophilius and Others' (1876); 'Donald and Dorothy' (1883); 'Old Wood's Road' (1888); 'Along the Way,' a collection of poems (1879); 'When Life is Young' (1894); 'Poems and Verses' (1904). Consult the memorial article in St. Nicholas Magazine (October 1905).
DODGE.—DODO 231

DODGE, Richard Eliot, American geographer: b. Wenham, Mass., 30 March 1868. He was graduated at Harvard University in 1890, taught geology there 1891-94. In 1895-96 he was instructor in geology and geography, in 1896-97 associate professor of natural science and since 1897 professor of geography at Teachers’ College, Columbia University. He was assistant on the United States Geological Survey in the northeastern and southern Appalachians in the summer of 1885-86. He is the author of "Reader in Physical Geography for Beginners" (1900); "Dodge’s Geographies" (1903); "Dodge’s Geographical Note Books" (1912), and numerous articles on the teaching of geography.

He is co-author, with Kirchway, of "Teaching of Geography in Elementary Schools"; and, with Bowman, of the English edition of Brunhes’ "La Geographie humaine."

DODGE, Walter Phelps, American author and lawyer: b. of American parents in Beirut, Syria, 13 June 1869. He is a nephew of William Walter Phelps (q.v.). He studied in Greece and Germany, later at Yale and Oxford. He was admitted to the London bar in 1896 and to the New York bar in 1909. Among his works are "Three Greek Tales" (1892); "As the Crow Flies" (1893); "A Strong Man Armed" (1896); "The Sea of Love" (1898); "Piers Gaveston" (1899); "The Triple Crown" (1900); "The Real Sir Richard Burton" (1907); "King Charles I, a Study" (1912), and "The Purple Iris" (1915).

DODGE, Kan., town, county-seat of Ford County, on the Arkansas River, the Atchison, Topeka and Santa Fe and the Chicago, Rock Island and Pacific railroads, about 150 miles west of Wichita. When first settled as a Texas cattle-shipping point the place was noted for its lawlessness. It was the centre of important lines of freighting. The business attained its maximum in 1884, when herds aggregating 800,000 cattle in charge of 3,000 men passed through Dodge from Texas on the way north. Much hunting was done in this section, for buffalo and other game were then plentiful. It is the trading centre of an agricultural and stock-raising region. It is the seat of Southwestern College, which is under the Methodist Episcopal Church; a United States land office and weather bureau and a Carnegie library. Dodge has division offices and machine shops of the Santa Fe Railroad. It owns its waterworks and has adopted the commission form of government. It was formerly known as Dodge City and was named for Gen. Henry Dodge, governor of Wisconsin Territory. Consult Wright, R. M., "Dodge City, the Cowboy Capital." Pop. 3,214.

DODGE CITY, Kan. See Dodge, Kan.

DODGEVILLE, Wis., city, county-seat of Iowa County, situated on the Illinois Central and the Chicago and Northwestern railroads, about 11 miles southwest of Madison. The industries of the place are chiefly those of an agricultural region, notably creameries. The lead and zinc mines nearby add to the wealth of the city. The principal industry is the making of butter and cheese. The city is named after the Territorial Governor of that name, who lived here for many years. Pop. 1,791.

DODGSON, dôj’sôn, Charles Lutwidge (Lewis Carroll), English mathematician and author: b. Daresbury, near Warrington, 27 Jan. 1832; d. Guildford, 14 Jan. 1898. He was graduated from Christ College, Oxford, in 1854, took orders in the Anglican Church in 1861 and till 1881 was a mathematical lecturer. His first publication was "A Sylabus of Elementary Algebraical Geometry" (1860); in the following year he issued the "Formule of Plane Trigonometry" and in 1864 appeared his "Guide to the Mathematical Student." He still remained quite unknown to the public at large, but in the next year became famous as the author of "Alice’s Adventures in Wonderland," which, though written for the young, has found not less appreciation among the riper years and has been translated into many languages. Equally delightful is the continuation of Alice’s adventures narrated in "Through the Looking-glass and what Alice Found There" (1871), an exception to the common rule as to the inferiority of conclusions. Both books were admirably illustrated by Tenniel. Dramatized versions by Savile Clark were put at the stage and a novel, "The Hunting of the Snark: An Agony in Eight Fits" (1876), a fantastic narrative in verse, had by no means an equal popularity, however. Among his other works are "Elementary Treatise on Determinants" (1867); "Phantasmatogoria and Other Poems" (1876); "Euclid and His Modern Rivals" (1879); "Rhyme or Reason?" (1883); "A Tangled Tale" (1885); "The Game of Logic" (1887); "Curiosa Mathematica" (1888 and 1893); "Sylvie and Bruno" (1889-93), and "Symbolic Logic" (1896). (See Alice in Wonderland; Through the Looking-glass.) Consult his "Life and Letters," edited by S. D. Collingwood (London 1898), and "Lewis Carroll" by B. Moses (New York 1910).

DODLET, a name sometimes applied to the tooth-billed pigeon (Didunculus strigirostris), of the Samoan Islands.

DODO, dô'dô, or DRONTE (Didus ineptus), the name of a very remarkable extinct bird discovered by the Portuguese about 1507 on the island of Cerne or Mauritius and afterward seen there by the Dutch, both at the end of the 16th and in the 17th century. Between 1610 and 1620 live specimens were brought to Europe for exhibition. The last authentic record shows its survival until 1681. As it was never seen after this it was deemed by some altogether fabulous; but its actual existence was completely established not only by drawings made by artists who accompanied the Dutch voyagers and preserved in Utrecht, Vienna and Berlin, but by fragments of the bird itself—among others, a foot in the British Museum, both a head and a foot in the Ashmolean Museum and a head and foot at Copenhagen. Several other fragments and even entire embalmed birds reached certain of the continental museums, but seem to have been mostly lost or destroyed. In 1865 and again in 1889 large numbers of bones of the dodo were found in a marsh in Mauritius from which an almost complete skeleton has been set up in the British Museum and others distributed to various collections. The dodo had short and ill-shaped legs and feet, scarcely able to support its cumbersome and almost globular body. It weighed about twice as large as that of a turkey; and a monstrous head which, apparently ill-attached to its body, contained an enormous mouth and
terminated in a strong hooked beak. Though covered with thick plumage it was destitute of wings sufficient for flight and had their place supplied by mere stumps or rudimentary appendages, covered with soft, ash-colored feathers in the neck, with yellow at the tail. It was composed of a few small curled feathers of the same description. Naturalists are now agreed that theodo should be put in the order Columbae (q.v.) or pigeons, of which it with one or two similarly extinct birds from neighboring islands, notably the Bourbon or Réunion dodo (Didus solitarius), is the representative of an extremely modified family type (Dididae). The cause of the extinction of the dodo together with several of its associates in the land fauna of Mauritius is said to have been the hogs which, let loose from the ships of the early explorers, multiplied greatly and overran the island. Consult Strickland and Melville, 'The Dodo and its Kindred' (London 1848), and Rothschild's 'Extinct Birds.'

DODONA, dō-dōnā, a celebrated town in Epirus, 11 miles west of the modern town of Janina, on a spur of Mount Tomarus, in the neighborhood of which was one of the most ancient oracles in Greece. This oracle long maintained its celebrity. It belonged to the Pelasgians and other tribes supposed to dwell in the stem of an oak tree. The prophetic priestesses announced the divine communications in different ways. They approached the sacred tree and listened to the rustling of its leaves; or, standing by the fountain at the foot of the tree, observed the murmuring of the water which gushed forth from the earth, and in other ways. The sanctuary at Dodona was destroyed by Dorimachus, the Æolian general, in 219 B.C. For over 1,300 years the site of the shrine was lost to history, but in the 16th century the conjectures of Bishop Worthen in 1832, excavations made by Constantin Carpanos in 1878 revealed the temples of Zeus and Aphrodite, the walls encircling the town and the theatre, etc. 'Excavations in Greece' (London 1893); Gardner, 'New Chapter in Greek History' (ib. 1892); and Wordsworth, C, 'Greece' (ib. 1839). See Zeus.

DODS, Marcus, Scottish theologian: b. Belford, Northumberland, 11 April 1834; d. Edinburgh, 26 April 1909. He was educated in Edinburgh, and in 1858 was licensed as a probationer of the Free Church of Scotland. He was lacking in those pupil gifts which are sometimes considered essential to success in a democratic church, and served a depressing long probationship, preaching as a candidate for 23 vacancies before he was in 1866 ordained to Renfield Free Church, Glasgow, where he remained a power for good, especially among young men (of whom Henry Drummond was one), till appointed in 1889 to the chair of New Testament exegesis in New College, Edinburgh. Among his published works some of the most important are 'Mohammed, Buddha, and Christ' (1877); 'Handbook on Genesis' (1882); 'Parables of Our Lord' (1883 and 1885); 'Footsteps in the Path of Christ'; 'Christ and Man'; (1909). Two volumes of his letters have been published, edited by his son.

DODSLEY, Robert, English dramatist and bookseller: b. near Mansfield, Nottinghamshire, 1703; d. Durham, 23 Sept. 1764. He became a footman, and published by subscription a volume of poems, entitled the 'Muse in Livery,' which attracted public favor, less from its intrinsic merit than from the situation of the author. His next effort was the 'Toyshop,' a dramatic satire. Pope patronized this, and through his influence it was brought upon the stage in 1735. Dodgely was enabled, by his profits as an author, and the financial assistance of Pope, to set up a bookseller's shop in Pall Mall, which ultimately proved very prosperous, and which brought him into close relationship with the literary celebrities of his time. He next wrote the farce of the 'King and the Miller of Mansfield,' founded on an old ballad, which succeeded so well that he produced a sequel to it, called 'Sir John Cockle at Court.' In 1741 he brought out a musical piece, entitled the 'Blind Beggar of Bethnal Green.' He subsequently wrote 'Economy of Human Life,' a well-known collection of moral maxims; 'A Tragedy; Cleone'; and a selection of fables in prose, with an 'Essay on Fables' prefixed. He planned the 'Preceptor'; the 'Annual Register' (commenced in 1758 and still published much on the lines in which he projected it); the 'Collection of Old Plays,' which now chiefly sustains his name as a publisher; and the 'Collection of Poems by Different Hands.' Consult paper by Austin Dobson in 'Eighteenth Century Vignettes,' 2d series, 1894; and the biography by R. Strauss (New York, 1895).

DODSON, John E., American actor: b. England 1857. He studied law, but early in life went on the stage, appearing first in Manchester; he supported Charles Matthews and other star players in England; and in 1889 came to the United States with Mr. and Mrs. Kendall. His first appearance in New York was at the Fifth Avenue Theatre in 'A Scrap of Paper' in 1889, later he joined the Empire Theatre Company as leading comedian. He originated the character of Richelieu in 'Under the Red Robe,' and has been known in 'Richelieu's Stratagem,' in vaudeville and the part of John Weatherby in 'Because She Loved Him So.' Played at Drury Lane Theatre, London, 1902, as Simonides in 'Ben Hur'; appeared as star in 'American Invasion,' New York, October 1902; played Pierre in all-first cast production of 'Two Orphans,' 1904-05; created Stephen Roland in Clyde Fitch's comedy, 'The Truth'; created star role, Sir John Coteswold, in 'The House Next Door' at the Gaiety Theatre, New York, 1909, and played same piece for next two seasons throughout the country.

DOE, John, and RICHARD ROE, two fictitious personages in law who formerly appeared in a common-law suit of ejectment. The former was the plaintiff and the latter the defendant. The defendant's resistance was based was abolished by the Common Law Procedure Act (1852), and now accordingly they do not appear in England. In American usage, attempts have been made to substitute other names, but in proceedings where the identity of the alleged criminal is not known, or is designedly concealed for any reason, John Doe is the favorite term employed.

DOES, doos, Jacob Van Der ('The Elder'), Dutch painter: b. Amsterdam, 4 March

**Standard.**—Head, which should be carried high, long and not too broad; muzzle broad, strong and blunt; eyes small, with sharp expression; neck long and arched, free from dewlap; chest moderately broad; brisket deep; loin slightly arched; shoulders sloping; elbows well under; belly well drawn up; legs straight and muscular; second thighs long and strong; feet large, well arched and close; coat hard and dense; tail strong at root, and ending fine, carried rather low. Colors: brindle, fawn, harlequin, black, white and blue.

**Mastiff.**—In this old breed we have probably the most massive and ferocious looking of dogs.

**Standard.**—Head large and massive; skull flatly rounded; ears small; muzzle square, deep and broad; teeth level; eyes brown or hazel-colored, and wide apart; front legs straight, with great bone; chest deep; loins strong and large as possible; color, brindle or fawn; in both cases muzzle and ears black; size as large as possible, so long as symmetry is retained.

**Newfoundland.**—This noble dog is famed for his remarkable fearlessness of water and the remark with which it will risk his life to save human beings from drowning. The black dog, which is spoken of as the true Newfoundland, is a trifle larger than the Landseer type, which is a black and white dog. Much controversy has taken place as to whence white markings came, some claiming a spaniel cross.

**Standard.**—Head broad and massive with flat skull and somewhat square muzzle; ears small and lying close to the head; coat straight and dense and capable of resisting water; tail carried gaily, but not curled over; color black, black and white or bronze; average weight, 100 pounds for dogs and 85 pounds for bitches.

**Pointer.**—That this breed was descended from the hound was first clearly indicated by Youatt. The disposition to appear to be due to training, and although other dogs have been taught to point, in no case do they assume the same rigid position so notable in the pointer. This breed is marked by a compact and well-knit body, sloping shoulders, muscular limbs and beautiful action. The head is large and flat, with a depression running from the top to occiput, muzzle long and square, with not too much lip. Colors are white with black, liver, and orange markings and solid black and liver.

**Greyhound.**—The English greyhound, which is of great antiquity, has been regarded by some as the ancestral stock of the majority of our domestic dogs, but this is doubtful. It is easily distinguished at a glance from all other dogs by its graceful outline and large size. Greyhounds hunt entirely by sight instead of scent.

**Standard.**—Head long and lean, rather wide between the eyes and flat at the top; jaw powerful, but cleanly cut; teeth level and white; eyes bright; ears small and fine in texture and rose-shaped; neck long and arched and free from throatiness; shoulders oblique and muscular; chest deep and capacious; back broad and square, rather long and slightly arched over loins which should be strong and powerful; forelegs rather long and set under dog, possessing fair amount of bone; hind quarters strong and broad across, stifles well bent, thighs broad and muscular, hocks well let down; feet round, well split up with strong soles; tail long, tapering and nicely carried, coat fine, somewhat course; color, black, red, white, brindle, fawn, blue, blue and the various mixtures of each.

**Whippet.**—This breed is the result of a cross between a greyhound and a terrier, and is bred especially for rabbit coursing and racing. In the latter sport these dogs are without doubt the most speedy animals known, even exceeding the speed of the racehorse for a short distance. In outline they are identically the same as the greyhound.

**Staghound.**—It is a large hound, white in color with black and tan markings; the head somewhat on the pointer type, but the ears more pendulous and set lower. This breed has been used for many years in Europe for stag hunting.

**Deerhound.**—The Scotch deerhound is larger and more massive than the English greyhound, frequently standing 26 to 28 inches at the shoulder, the body being clothed with a rough coat. Its principal use is for deer-stalking in the Highlands.

**Standard.**—Head long and narrow, tapering gradually from the ears; nose black (occasionally blue) and pointed; lips set high, carried in fold, soft and silky and free from long hair; neck long, but strong, with the nape or crest very prominent; shoulders sloping; toes close and arched; chest deep; body long, but well ribbed up; loins arched with great breadth across hips; stifle well rounded; thighs long; tail set on low, curved but not curled; coat rough and harsh on body; mane on neck and slight fringe on inside legs, on thighs and on tail. Colors: All shades from dark blue or black brindle to light gray brindle, yellow, fawn, dun and drab; white markings objectionable, but very often to be found on chest and toes.

**Irish Wolfhound.**—This ancient breed was famous for many years in Ireland for its great power and strength and its prowess against wolves. It has practically the same lines as the deerhound only more massive in skull and body. The colors are the same.

**Borzo or Russian Wolfhound.**—Is of rather larger build than his English cousin, being covered with a wavy silk coat quite different in texture from that of the deerhound; ears small and wolnish; the head is more domed and muzzle of the Roman nose type. It is used in Russia for hunting wolves. Colors are white with drab, fawn or brindle markings.

**Italian Greyhound.**—This breed is kept purely as pets and may be regarded as a miniature greyhound. The eyes are much larger and more prominent than in the large greyhound. There are several colors, among which are a golden fawn and a mouse fawn, the most valuable colors; white markings are undesirable.

**English Foxhound.**—The modern foxhound is somewhat smaller than the staghound and cobbier in body; the head is cleaner with more substance in the muzzle; the ears are rounded and placed much higher on the skull. The American foxhound is much the same type, but somewhat smaller and lighter built, the colors often being black and tan, showing a bloodhound cross.
1 Smooth Fox Terrier
2 Clumber Spaniel
3 Sasset Hound
4 French Bulldog
5 English Bulldog
6 Pomeranian
7 Pug
8 Boston Terrier
Beagle.—This term is generally applied to any hound standing less than 15 inches high, although the true pure beagle is a distinct breed, which may be regarded as a miniature foxhound with the exception of the ears, which are more pendulous; the height varies from 9 to 15 inches. The beagle has a musical note and an acute scent as well as great perseverance in following a trail.

Setters.—The various breeds known as setters are practically large spaniels which acquired this name from being taught to crouch when marking their game.

English Setter.—It is regarded as a result of a cross between the field spaniel and the pointer, and should have a soft coat with a slight wave, but no curl in the hair. There is a great variation in color, which is valued according to the following scale: black and white ticked with large splashes, or the Blue Belton; then orange and white streaked, known as the “Orange Belton;” black and white with tan markings and black and white.

Standard.—Head long and lean, with a flat skull and nostrils not too pendulous; ears of moderate size, fine in texture, set on bone and well bent; neck long, muscular and well set in sloping; deep shoulders; chest narrow, but deep, and ribs well sprung; loins muscular and slightly arched, with powerful hind quarters; front legs perfectly straight and feet small and firm; toes arched and close together.

Irish Setter.—Of a deep-red mahogany color, this dog is rather lighter in build than the English setter, with a narrow and slightly domed head.

The Gordon or black and tan setter is much heavier than either the English or Irish breeds, this heaviness being especially shown in the head, which is broader and deeper. The body should be massive and black with tan markings.

Retriever.—This name applies to a large dog somewhat on the order of the setter, employed for retrieving game. They have more or less Newfoundland blood in them and trace their parents to the water spaniel or setter. The curly-coated retriever, which may be either black or liver color, is the product of a cross between the smaller black Newfoundland and the Irish water spaniel. It is characterized by the short hair of the face and the tail devoid of any fringe, although covered to within a few inches of its extremity with short, crisp curls. The hair on the body is closely and crisply curled, hence the old phrase of the “nigger coated retriever,” a term used in some counties in England. The wavy or flax-coated retriever has the same outline, with the exception of the coat, which is flat and wavy, and is close to the body.

Chesapeake Bay Dog.—As the name signifies, this dog is a native of Chesapeake Bay. It resembles a dull-colored red retriever both in color, shape and size. The coat is extremely dense and absolutely waterproof. For general retrieving work in the water we know of no dog which can equal it. It has been known to work the whole day in the ice and never seems to tire.

Sporting Spaniel.—The Clumber spaniel derives its name from Clumber Park, the estate of the Duke of Newcastle, where this breed has been kept for many generations. The Clumber is distinguished by its silence when hunting and is a large, low, heavy, massive dog, with immense bone.

Standard.—Large, low, heavy and massive throughout, with immense bone; head large, with largely developed forehead; brows heavy and eyes deeply set; muzzle long and very square, with a fair quantity of skin; ears small when compared with the size of the dog, and well shaped, hanging close to the face. Color is white with lemon markings.

Field or Black Spaniel.—It is somewhat on the Clumber style, but has much more activity, a longer muzzle and cleaner head.

Standard.—Head long and lean, with a good length of muzzle, which must not be snipy; a short, coarse or clumsy head is objectionable; eyes dark; ears very low down, narrow where they leave the head, long and lobe-shaped; body large, deep, long and low; tail carried below the level of the back; legs straight, strong, short and very large in bone. Although a long, low dog, he must be active, with plenty of life, and any resemblance in shape, action or movement to the bassethound or dachshund should be discarded.

Cocker Spaniel.—The weight of this variety of spaniel at exhibitions is usually under 25 pounds. The head is long and narrow, but not quite so lean or long as the field spaniel, the muzzle well developed and not snipy; eyes dark, and although not full or prominent, a little larger in comparison with the size of the dog than the eye of the field spaniel; ears long, and small near the head, set low, and lobe-shaped; body large, deep and round throughout, and in length much shorter than in the field spaniel; stern set low; legs powerful and straight and a little longer than the field spaniel; and coat flat and abundant, but not too long, and with plenty of feather. It should be remembered that, although a small spaniel, the cocker is a sportsman’s dog, and any trace in shape, make, expression or action of the toy spaniel should be discarded.

Irish Water Spaniel.—This quaint animal is possibly the most useful all-around worker of the whole group of spaniels. The general appearance is that of a big upstanding shaggy liver-colored dog with a strong head and a distinct top-knot, a well-furnished cobby body and a rat-like tail. These dogs are especially fond of the water and good on all retrieving work.

Dalmatian.—The Dalmatian or coach dog is probably allied to the pointer. It is distinguished by the spots which are black or liver, on a white ground. Its use in England and America is essentially as a car or coach dog, and it devotes itself entirely to the horse, often sleeping in the same stall. In its native country the Dalmatian is used as a pointer and is said to be staunch on game.

Standard.—Head longish, skull flat, moderate amount of stop; muzzle long and powerful; eyes medium size, and dark or light according to markings; neck fairly long and arched, no throatiness; chest very deep, not wide under; feet compact, well padded; tail smooth, slightly curved upward; coat short, hard, dense; ground color pure black or liver color; very decided, not intermixed; ears and tail well spotted; weight 50 pounds. The general appearance is that of a pointer.
Sheep Dog.— The Collie is essentially of Scotch origin. In appearance it is one of the most handsome of the canine race, having a well-knit frame, chest deep, but not wide; fore legs straight, hocks well bent, feet compact and strong. The head should be long, fairly narrow and flat; ears small, set ‘well back on the head and carried semi-erect, but not pricked. Colors are black and tan, black, tan and white, sable, and sable and white.

Smooth Collie.— Is practically on the same lines as the rough collie, with the exception of the coat, which is smooth and lies very close, and the eyes, which in many cases, are china or wall-eyed, that is of whistful color.

Old English (Bobtail) Sheep Dog.— This quaint old breed is quite different in type from the other sheep dog, having a short, wide skull and very massive body, which is covered with a rough, shaggy coat, with an abrupt, or bob tail, hence the name. Is much used in England by the drovers and is locally known as the drover’s dog.

Bearded Collie.— Color, any shade of blue, blue merle or grizzle, with white on face or legs for relief; head big and square; eyes small and dark; in very light-colored dogs wall or marble; square in body and as large as possible, with a broken, harsh, wavy coat; ears small and set on either side of head.

Bearded Collie.— Is practically a repetition of the bob-tail, with the exception of the tail, which is long and carried low, and the body, which is not quite so short or massive.

Bull-Dog.— This breed is, without doubt, the most malignant of the canine race. In appearance it is that of a low cobby dog, with a very large flat skull, showing much wrinkle, short nose or face and a long, wide turned-up under-jaw. In body is low and wide in front, with well-sprung ribs and a short roach or wheel back, and a short, tapering tail, which must not be carried above the level of the back. Since the old-time sport of bull-baiting has been done away with the bull-dog has been bred especially as a pet. They are, in no way, fighters, being, without doubt, the most affectionate of all breeds.

Standard.— Thick-set and compact; very heavy in front, and of comparatively lighter build behind; legs short, muscular and set outside the body, but not exaggerated; shoulders massive, and standing well out; chest wide and deep; skull large; and temples high, with stop well defined; eyes wide apart, and dark in color; underjaw wide, and well turned up; nose large, black and very short; strong loin, well tucked up; tail short and set on low; colors, all shades of brindle, fawn, white and all pied colors.

Terrier.— The bull terrier, as its name implies, is a cross between the bulldog and the white English terrier. The general appearance is that of a symmetrical animal, the embodiment of brute strength and endurance. The ears are cropped, which gives a smart and alert appearance. The popular color is pure white with small black eyes and nose; a cherry or flesh-colored nose is undesirable.

Welsh Terrier.— As the name implies these little dogs come from Wales. They are in general appearance much like the Airedale and of the same color; the head is broader in comparison and eyes set wider apart. The weight should not exceed 20 pounds.

Yorkshire Terrier.— This is a small breed, bred chiefly in the county of Yorkshire, and is easily distinguished by its very long, silky coat, especially on the face, which is parted from the nose down the whole length of the body to the tail. It is exceedingly bright and quite game, but valued chiefly as a pet. The colors are all shades of brindle, fawn, and all pied colors.
dark blue body with tan markings, and black with tan markings. The ears are cropped and carried erect and the weight is between three and eight pounds.

**Manchester Terrier.**—This dog is on the same lines as the Yorkshire but a trifle larger; color pure white, with a black nose and small, deep-set eyes. The coat should be flat and not curly, which, in many cases, shows a toy poodle cross.

**Manchester or Black and Tan Terrier.**—A smooth-coated terrier which has been bred for many years in Manchester, England; derives its name thence. The general appearance is that of a smart dog with a black body and rich tan markings on the legs and feet; the division between the colors should be well defined. The ears are cropped or V-shaped. The weight is from 7 to 20 pounds. The toy black and tan is identically the same breed, but does not exceed seven pounds in weight.

**Pug.**—This quaint and very game breed is essentially of German origin. The general appearance is that of a dwarfy, short-legged, long-bodied but sturdy dog, with strongly developed muscles. The head is long and narrow, the ears lie on the back part of the head and are folded forward, nose set high and broad and nicely rounded, not pointed or folded. The legs should be short and muscular, but not over at the knees; elbows well under and shoulders broad and well placed; loin short, firm and broad, and tail short but carried gaily. Colors are solid red, black and tan and dappled. The coat should be smooth and glossy. The rough-coated variety, which is now becoming popular, is on the same lines exactly.

**Fox Terrier.**—The fox terrier is probably the most popular of all terriers. It is said to have descended from the smooth fox hound and the English terrier. It derives its name from the use of driving foxes from holes or burrows in the ground. The most popular color is a pure white body with black and tan markings on the head with an even blaze up the face. The head should be flat and narrow, with a strong forehead; eyes small, ears likewise small and of V shape, carried forward and close to the head. The body should be short with well-sprung ribs, narrow in the chest, with strong shoulders, perfectly straight front and cat-like feet. The wire-haired dog is identically the same as his smooth brother, with the exception of the coat, which should be rough with a decided harsh texture. Weight, 15 to 21 pounds.

**Irish Terrier.**—As the name implies is of Irish origin and is aptly named the "Dare Devil," being very game. In size it is somewhat larger than the fox terrier and more racy in body and has larger feet. Cropping the ears has now become popular, with the modern ear being the same as the fox terrier.

**Standard.**—Head long, rather narrow, pun-

ishing jaw, eyes small and dark, ears fairly small, not set on too high, legs straight and

strong, feet round and thick with good pads; chest narrow with good depth of brisket, back strong and straight. Color wheaten and red. Expression wicked but intelligent. Coat short and rough and very harsh.

**Boston Terrier.**—This smart little dog is especially of American origin, having been raised in Boston and the nearby towns for the past 40 years. It resembles the bull-dog in head, but is void of wrinkle and must not show the teeth; the body should be built on the terrier type, having a narrow front with strong but not wide shoulders, short back and a short screw or tapering tail. The ears are cropped and carried erect. The three classes by weight are under 15 pounds, under 23 pounds and not exceeding 32 pounds. Colors are brindle with white markings, fawn and white or red and white. They are used entirely as pets.

**Pug.**—This quaint breed is one of the most popular house pets. In appearance they resemble the bull-dog, having a short, square muzzle and heavily wrinkled head. The ears should hang close to the head and be carried forward; the body be short and round, and the tail curled and lie on the back. They are a rich apricot fawn with black shadings and a deep black.

**Toy Spaniel.**—The English toy spaniels are the King Charles, or black and tan, the Blenheim or orange and white, the Prince Charles, and the Red, and are practically all of the same family, distinguished only by the colors. The head should be large and domed, with the ears set very low in the skull; the nose or face, as short as possible and stop well defined; eyes as large as possible and very prominent; body short and well coated and small in size. They are essentially house pets.

**Japanese Spaniel.**—It is black and white, or orange and white. The head is not so large or domed as the English spaniel and the ears are much smaller and carried higher and V-shaped; eyes wide apart and showing a good deal of the white; tail heavily coated and carried over the back. In size it is as small as possible.

DOG IN ART AND SYMBOLISM — DOG-FISH

CHARLES G. HORTON.

DOG IN ART AND SYMBOLISM. Haydn's Dictionary says of the dog, it "was worshipped by the Egyptians and hated by the Hebrews." With the ancient Egyptians Marpi, son of the god Horus, was represented as having the head of a dog. The Oriental symbolism gives the dog a lesson of degradation because these animals are the scavengers living on the filth of the people and in the Eastern cities the garbage and refuse is thrown into the street for the dogs to care for. Being undomesticated, these animals run wild in packs and become often, when starving, rabid and vicious and are permitted existence by Orientals only as serving to cleanse the neighborhood of offal. Hence the mention of the "friend of man" in Holy Writ is rare and, contrary to Occidental symbolism, always made in an evil sense. We find, in ancient Roman dwellings, a chained dog depicted (generally in mosaic) and the words "cave canem" — beware of the dog — on the threshold. Assyrian sculptures are extant representing the greyhound and the mastiff. In European symbolism the dog is an emblem of fidelity and loyalty, and for this reason was placed at the feet of the effigies of married women upon sepulchres. Husenbeth says that in ecclesiastical art the following saint have been pictured accompanied by a dog: Saint Bernard (abbot) has a dog at his feet; Saint Wendelin is pictured keeping sheep, a dog at his feet, or held by a cord; Saint Benignus has a dog by his side; Saint Roch has been portrayed as a pilgrim, a dog near him with a loaf of bread in his month, or a dog licking his feet; Saint Domenic has been represented with a dog firing a globe with a torch; Saint Parthenius has been pictured killing a mad dog by the sign of the cross; Saint Godfrey of Amiens has been represented with a dead dog lying near him; Saint Sira has been pictured with dogs about her. Sirius or Canicula is known as the "dog-star" and figures in the constellation Canis Major ("larger dog"). In the Chinese zodiacal system a dog is the sign of the month of September. In ceramic the amateur collector and the auctioneer use the term "dog of Fo" to designate a fantastic animal figuring in ornament and decorative composition; but it is intended as a lion ("lion of Korea") not a dog and is usually accompanied by a sphere. The Japanese use the device under the term Shishi. It is an almost necessary companion to the statue of Buddha, and in the Chinese mythology is the guardian of temples and domestic thresholds, as an emblem of peace, or tranquillity.

CLEMENT W. COMBE.

DOG-DAYS (Lat. canicula), the name applied by the ancients to a period of about 40 days, the hottest season of the year, at the time of the heliacal rising of Sirius, the dog-star; that is, the time when it rose just before the sun. The heat, which is usually most oppressive at this season, was formerly ascribed to the conjunction of this star with the sun. We still retain the expression dog-days, as applied to the hottest season of the year, but owing to the precession of the equinoxes it is no longer the time of the heliacal rising of the dog-star.

DOG-FENNEL, a plant (Anthemis cotula) belonging to the family Asteraceae. It is found in fields and waste places throughout much of North America, having been naturalized from Europe. It is known as a weed in Asia, Africa and Australia. It derives its name of dog's-fennel from the resemblance of its leaf to fennel, and from its bad smell. It has an acrid taste and emetic properties. It is also called stinking May-weed, the scentless May-weed, or wild camomile. The name dog's-fennel is sometimes applied in America to a species of the genus Eupatorium, hog-weed.

DOG-FISH, the popular name of several species of small shark (q.v.), chiefly belonging to Mustelus and Squalus, two quite unlike genera. The name is derived from their habit of swimming in schools or packs in pursuit of their food. In their general anatomy, they differ but little from the other sharks, so well known for their ferocious habits. These fishes, though among the smallest of the tribe, manifest propensities equally cruel with those which have rendered the white shark and others so justly dreaded. Although seldom or never injurious to man, they commit great ravages in the fisheries, and very often the hooks, of the deep-sea lines, is very considerable and not at all compensated for by the flesh of those which are captured.

The smooth dog-fish or dog-shark (M. canis) is found on both sides of the north Atlantic, and on the American side is particularly abundant south of Cape Cod. It is from two to three feet long. No spines occur in the margins of the dorsal fins, and the smooth pavement-like teeth are especially adapted for crushing crabs, lobsterers and other testaceous invertebrates on which they chiefly feed. The young are hatched from the egg in the oviducts of the female (with which, however, they are not connected by a placenta, as in the related Galeus mustelus of Europe), and are born alive. The eggs are similar to others of the family and covered by a tough membranaceous integument. The skin of these fish is beset with numerous small asperities, which render it, when dried, well adapted for polishing wood and for other mechanical purposes.

The spiny dog-fish (Squalus acanthias) is very abundant on the coasts of New England, and, although similar in size and general aspect, is readily distinguished from the smooth dog-fish by the presence of a strong spine before each of the two dorsal fins. The eggs are deposited before hatching. This species furnishes material for a valuable fishery and fish industry in Maine, where the oil is extracted from the livers, the flesh ground up for fertilizers or poultry food and the skin utilized for preparing metal and wood. The dog-fish-seeds, especially on herring and mackerel, the schools of which it follows in immense numbers. Similar species occur in the Pacific Ocean and other seas.

The flesh of all the species is hard, dry and unpalatable, requiring to be well soaked before
it is eaten. In England the dried flesh goes under the name of Folkestone beef. Poisonous effects are at certain times observed in consequence of eating the livers of dog-fish and some cases are recorded in which the most distressing illness has been occasioned by the practice. The name dog-fish is also applied to several other quite different species, but particularly to the western mud-fish or bow-fin (Amia calva), and to the dog-salmon (Oncorhynchus keta).

**DOG-GRASS.** See COUGH-GRASS.

**DOG PARSLEY,** one of the common names of *Aethusa cynapium,* a poisonous plant of the carrot family, the only species of the genus *Aethusa,* found in America, from Nova Scotia west to Minnesota, and south to New Jersey, having been naturalized from Europe. The fruit bears some resemblance to the fruit of dill and fennel, and is sometimes eaten in mistake for these. The sharp acrid taste marks the difference. Other names are Fool's parsley, fool's cicely and dog-poison.

**DOG ROSE** (*Rosa canina*), a plant of the rose family (*Rosaceae*); known also as the canker rose, wild brier, and referred to by Shakespeare as "canker-blooms." It is a native of Europe and northern Asia. The ripe fruit is sometimes used abroad to make a preserve that is employed in the manufacture of pills. The plant is somewhat naturalized in America, and is not rare in cultivation.

**DOG-SALMON,** a name given on the western Pacific Coast of North America to the *Oncorhynchus,* also known as the chum salmon. The average weight is from 10 to 12 pounds. This is one of the five species of *keta,* the widely-known Pacific salmon (of which the hump-backed salmon is the smallest), which are found on the North American coasts from Alaska to as far south as Oregon or even the Sacramento River.

**DOG-STAR** (*Sirius*), the star that gives their name to the dog-days (q.v.); also applied to Procyon, a double star in Canis Minor. Sirius is the brightest star in the heavens, and once was used as a means of determining the hour of day by its relation to the sun. The star is the nearest in the constellation Canis Major though Seneca and Ptolemy describe it as red.

**DOG-TOOTH SPAR,** a common variety of the mineral calcite (q.v.), so named because of the resemblance of the acute scalene quadrilaterals, of which it is composed, to a dog's tooth.

**DOG-TOOTH VIOLET,** a common but erroneous name for plants of the genus *Erythronium* (q.v.).

**DOGbane,** the common name of the genus *Apocynum,* a group of perennial herbs, possessing a milky acid juice. Numerous species occur in North America, the best known being *A. cannabinum,* Indian hemp (q.v.), and the spreading dogbane or honey-bloom (*A. androsaemifolium*). The plants yield the acrid milky juice so common in members of the family; the root is intensely bitter and nauseous. It is the most powerful part, and is employed by country physicians instead of ipecacuanha.

**DOG-BERRY.** See Dog-wood.

**DOGE,** dōj (Lat.dux, "a leader or duke"). formerly the title of the first magistrates in the Italian republics of Venice and Genoa. The first doge of Venice elected for life was Paolo Anafesto, in 697. The doge was first elected by the people, but afterward by the great council under a complicated and almost incomprehensible scheme of voting which maintained the fiction of popular election. He held his dignity for life. His power was at first almost absolute. He could convocate legislative assemblies, declare war, conclude treaties, take command of the army, appoint military officers and judges, invest bishops and award ecclesiastical penalties. But this absolute authority was by degrees entirely taken from him, and for centuries before the abolition of the dignity he had become merely a gilded figurehead, "the outward and visible symbol of the impersonal oligarchy." The dignity was abolished with the overthrow of the republic in 1797. In rank he was considered only equal to a duke, though the republic of Venice was in dignity equal to a kingdom. In Genoa the office of doge was established in 1339. Here also the doge was at first elected by the people, but the dignity afterward experienced numerous changes both in this and other respects. After the liberation of Genoa from the yoke of France by Andrea Doria the power belonging to this office was more systematically defined. A great and small council were created, and the duration of the doge's term was limited to two years. After the overthrow of Genoa by the French in 1797 the dignity became extinct, although it was revived for a short time between 1802 and 1805. See GENOA; VENICE.

**DOGE'S PALACE,** The (It. *Palazzo Ducale*), the official residence of the former rulers of Venice. It was founded about 1200 but was subsequently destroyed and rebuilt five times. The present edifice was begun in 1350 and completed in 1442. Its noble arcades, variegated walls of marble, and its colonnades make it one of the most beautiful and striking monuments of mediaeval Europe, and adorned internally by the works of Titian, Tintoretto, Veronese and other Venetian masters. The Sala del Maggior Consiglio (Hall of the Greater Council); the Giant's Stairway, which takes its name from colossal statues of various mythical figures by the top; the Scala d'oro (Golden Staircase); the Scala dello Scrutino, or voting hall; and an archaeological museum, are among the rare and surpassing glories of Renaissance art. A narrow passageway leads to the Bridge of Sighs (constructed in 1660). The dungeons which are now shown to visitors were those which formerly were reserved for political offenders, from which access is had to a torture chamber and a place of execution.

**DOGGER** (from Dutch *dogger,* a codfish), a Dutch vessel equipped with two masts and somewhat resembling a ketch. It is principally used for fishing in the North Sea, chiefly on the Doggerbank.

**DOGGERBANK,** an extensive sand-bank of the North Sea, midway between England and Denmark, lying between 54° and 56° N. lat. and 2° and 5° E. long. It is 160 miles long by 70 broad, and has a depth of from 60 feet (English side) to 120 feet. It is celebrated for its cod fishery. An action was fought off the south end in 1781 between the English and Dutch fleets. On the night of 21 Oct. 1904, in a sudden panic which seized the Russian Baltic fleet under Admiral Rozhestvensky, then on
its way to the Far East, the Hull trawling fleet was apparently mistaken for torpedo boats and fire was opened on them, in which a thwart was sunk and two men killed. The incident led to grave risk of war between England and Russia, but matters were smoothed over by means of an international commission established by the payment of compensation to the parties wronged.

**Doggiet's Coat and Badge.** A prize for a rowing-match on the Thames, which takes place every year on 1 August, the course extending from London Bridge to Cadogan Pier, Chelsea. The first prize is an orange-colored waterman's coat and a silver badge representing liberty, and to this have been added other prizes, the first prize being also augmented. The match is open to six young watermen recently out of their apprenticeships. It was instituted by Thomas Doggiet (d. 1721), a native of Dublin, and a popular actor in the early part of the 18th century, who founded the prize in 1716 in commemoration of the accession of George I (1 Aug. 1715) and bequeathed a sum to perpetuate it, the administration of which is now in the hands of the Thames Yacht Club. Dibdin's ballad opera, 'The Waterman,' is based upon this rowing contest.

**Dogma**, in the theological sense of the word, is a tenet of faith given in the word of God whether written or traditional and proposed by the Church to the belief of the faithful. Primarily the term dogma, being derived from the Greek word ἰδίωμα, seems to appear, meant only opinion; but in the ancient schools of philosophy dogmata (plural) were the doctrines of the several heads of such schools. The disciples of Pythagoras accepted on the authority of The Master, as they styled him emphatically, the tenets he proposed, the sufficient ground of the disciples' belief being that ἀλήθεια τῆς Ἰδίωμάτων ἦν. Perhaps the first employment of dogma, dogmata in the now current meaning of the word, is found in a work by Saint Ignatius, called the *Epistle to the Magnesians*, who in an epistle to the Magnesians exhorts them to be established in the dogmata of the Lord and the apostles. The dogmas of the Roman Catholic Church purport to have been taught by the apostles and to have been by them handed down *viva voce* or in writing, to their contemporaries and successors, who in turn did and still do the like; that tradition is the foundation of all the Church's articles of belief. The Church has no power to frame new dogmas and she must to the end of time proclaim the self-same dogmas which at any time in her history were authentically set forth as truths of divine revelation. What the Church may do and has done is to define, as occasion may require, the precise meaning of her teachings, bringing out in definite shape what before was not expressed with all necessary fulness or clearness. An example of this is had in the application of the term transubstantiation to signify what the Catholic Church had at all times believed and taught—that the bread and wine at the sacrament of the Eucharist really and substantially changed into Christ's body and blood. Since the doctrines thus advanced are for belief and not for discussion the dogmatic method may really be considered as the expression of an opinion without advancing therefor any adequate reason or proof and without considering the viewpoint of others or the light in which it appears to them. Consult Arnold, Matthew, 'Literature and Dogma' (1873); Lightfoot, J. B., 'Commentary on the Epistle to the Corinthians,' Schmidt, W., 'Dogmata' (1895); Stange, C., 'Das Dogma und seine Beurteilung in der neueren Dogmengeschichte' (1898); Wetzer and Welte, 'Kirchenlexicon' (2d ed., 1901). See Christian Doctrine, Development of; Theology.

**Dogs, Diseases of.** Chorea usually appears in dogs as an irregular jerking of the muscles of the head or some other part, or even of the entire body. In most cases medicinal treatment does not give great benefit, unless the chorea is the result of other disease. Dogs may be given Fowler's solution of arsenic, beginning with one-drop doses and increased one drop a day until five to ten drops (depending on the size of the dog) are given three times daily. Simple syrup of hypophosphites should be given in teaspoonful doses three times daily with the arsenic. This treatment must be kept up until the dog has gradually improved, then stopped for a like period and then repeated.

**Distemper.** Distemper is a contagious catarrhal fever that is a common and serious disease among dogs. The disease is caused by a germ and animals contract it from coming in contact with or proximity to another animal suffering from the disorder. It is thought that the germs float through the air and are inhaled by the dog. Among the conditions that favor the disease are those that tend to weaken the system. Pure-bred puppies appear to suffer greatly from it. The time that elapses between exposure and the first symptoms is seldom more than three days. When dogs are gathered at shows the disease is likely to occur, owing to exposure to infection and the unusual nervous strain. One attack usually gives immunity to future attacks. The disease is brought on with a chill that may last an hour or more. It is followed by a high fever, the dog's temperature going to 107° F. There is a slight discharge of watery mucus from the nose and eyes that soon becomes profuse and purulent, sticking the lids together. Usually a rash breaks out on the inside of the thighs. In some cases there are nervous symptoms, shown by jerking of the head and twitching of the muscles; or the dog may become delirious. Often there is difficult breathing, with a painful cough or moan. The bowels may be constipated, or there may be a severe diarrhea, with a fetid odor. The dog suffers greatly from pros-tatism and disturbances. The disease runs its course in 10 to 30 days. There is no medicine that will interfere with its course. All the treatment should be directed toward making the animal comfortable and keeping up its strength so that it may resist the disease. Vigorous dogs of good constitution will usually recover; weak, debilitated animals are likely to be overcome by the disease or by various complications. In the early stages, castor oil in doses of half an ounce, the Elixir of Ipecacuanha, or Quebracho tincture added, should be given every six hours until the bowels move thoroughly. This may be followed by two-grain doses of quinine, twice daily. The nose, mouth and eyes are to be well
washed out with warm water three times daily, and the nose and eyes greased with vaseline. The animal is to be fed on raw beef, tea, sweet milk, raw eggs and gruels, and allowed what cold water it wants to drink.

There are many complications that occur with the disease: pneumonia, bronchitis, inflammation of the brain or spinal cord and paralytic, usually of the hind quarters. When the dog rears, covers, abscesses are likely to form in some part of the body. If these occur in the internal organs they are often fatal. Another common sequel is chorera. All infected quarters should be thoroughly disinfected and exposed to the sun and air for several weeks before allowing other susceptible dogs to occupy them.

Ectropium.—This disease is a turning out of the eyelid, usually the lower one, so that it presents a red and irritated appearance. It occurs in horses as well as in dogs but not frequently. It is usually the result of severe inflammation, or an injury. When this condition is permanent, the only treatment is to remove a V-shaped piece from the lower lid, stitching together the parts so as to bring the lid up to its normal condition.

Hydrophobia; Rabies.—Rabies is an infectious disease, originating in dogs, possibly also in wolves, cats and skunks, and by them transmitted to other animals by direct inoculation, usually by biting. Animals suffering from rabies are said to be "mad." Hydrophobia, the common name, means "fear of water," and the inference is that animals suffering from this disease are afraid of water; but this is untrue. "Mad" dogs usually crave water, but the excitement and effort of drinking are likely to cause convulsions, which have been mistaken for fear. Although rabies has been studied extensively, and an attenuated virus for preventing the disease was discovered and introduced by Louis Pasteur, the germ of the disease, if germ it be, has not been isolated. The virus exists in the saliva, as well as in some other parts of the body, and when injected into a wound is likely to cause the disease. There is less danger from being bitten when the teeth of the rabid animal are delayed by biting through cloth or leather. There is a popular idea that rabies is most prevalent during the hot months, but statistics show that a slightly greater number of cases occur during the winter months. In the dog, rabies is in two forms we, the dumb and the furious, the latter being the most frequently observed. The period of incubation,—that is the time that elapses after the animal or person is bitten and the appearance of the first symptoms of the disease,—varies from a few days to many months, the average being from three to six weeks. The first symptom usually seen in dogs is a dull, depressed condition. The dog crawls into obscure places and dislikes to be disturbed. He licks the original wound and the genital organs. The appetite is abnormal, the dog eating grass, stiics, dung, and the like. As the disease progresses, the dog becomes cross, snapping at space or at inanimate objects, at other animals, and at persons. A rabid dog shows a tendency to wander, often going long distances and attacking persons and animals. If confined he will bite sticks or other objects, and sometimes will tear his own flesh. In the later stages of the disease, the dog becomes exhausted, the eyes sunken, and the body emaciated. Associated with this is paralysis, particularly of the hind parts and the lower jaw, the latter condition being accompanied with a discharge of saliva. The bark of a rabid dog is persistent, with a short bark prolonged into a whine. Death occurs from exhaustion soon after paralysis sets in.

Post-mortem examination does not give definite information. There is slight irritation of the stomach and bowels, the stomach often containing sticks and other foreign bodies swallowed by the dog during the progress of the disease. In order to diagnose suspected cases of rabies, inoculations of the cranial cavities of rabbits can be made with some of the spinal marrow from the suspected case. If the rabbit contracts rabies, the diagnosis is, of course, positive. After a dog has contracted the disease it should be put out of its misery, as there is no hope of recovery. The animal should be securely confined, as soon as suspicious symptoms develop, to prevent the possibility of its injuring anyone. A person bitten by a rabid animal should have the Pasteur treatment; the wound should be cauterized with nitrate of silver or other strong caustic, and antiseptics freely used.

Mange.—The term mange as applied to animals is identical with itch in the human race, in both of which parasitic life exists in the skin, and is purely a cutaneous disease. Dogs suffer from two varieties, namely Sarcoptes Canis, sarcoptic mange, and Acarus Follicularum, follicular mange. So-called red mange is not due to a parasite but arises from other causes, viz., too much meat or corn-meal diet, with insufficient exercise, deranged condition of the digestive apparatus, worms, teething, sudden cooling of the body when heated, fevers, etc. The symptoms of sarcoptic mange are: intense itching, small red dots appearing on the skin, which quickly develop into pustules exuding a fluid which forms scabs. When scabs are removed the hair will accompany them, leaving the parts nude. The parasite usually attacks the skin where most exposed, under the shoulders and thighs, about the hock joints, the feet and the eyes. Follicular mange also causes itching, is accompanied by a fetid body smell, the pustules sometimes discharging. It does not yield easily to treatment nor is it as easily transmitted as sarcoptic mange, the parasite being more deeply seated. Treatment of both varieties consists of preparations of mercury, such as corrosive sublimate, red or white precipitate, or ordinary mercurial ointment. Carbolic acid solutions are used. There are several mange remedies on the market into which these are blended.

Dogs suffer also from jaundice, pneumonia, enlarged glands canker of the ear, indigestion, rheumatism, ophthalmia, black tongue, sore feet, and fevers. For these there are the usual remedies for similar diseases in human beings, pills, liniments, fomentations, etc. Consult Barton, F. T., 'Our Dogs and All About Them' (Boston: 1911); Mills, Wesley, 'The Dog in Health and Disease' (New York 1892); Shaw, Vero, 'Encyclopedia of the Kennel' (ib. 1913); Walsh, J. H., 'The Dog in Health and Disease' (London 1859).

DOGS, FOSSIL, several species are known to us in the fossil state remounting to the Eocene period, at which point the forms become so general that it is only with the greatest
difficulty that they are reduced to their proper classification. Thus in tracing back the ancestors of the dog to this period we meet the fore-runners of the same family, the jackal, wolf, fox, etc., and approach closely to the ancestors of the bear. Naturalists are agreed that all these derive a common origin from the carnivores of the Eocene period.

DOGS. Isle of, a peninsula of London extending into the Thames opposite Greenwich in the borough of Poplar. It contains the West India and the Millwall docks, and large ship-building yards. The king's hounds were, it is said, formerly kept here, hence the name.

DOGS, Wild. Zoologically the term "dog" refers to the family Canidae (q.v.), which includes many prehistoric genera, fossil since the Miocene, and modern wolves, dogs, foxes, fennecs, jackals, South American fox-dogs and a few others. All these belong to the typical genus Canis; but the family also contains a series of "dogs" of more dog-like aspect than Canis. They comprise the queer little raccoon-dog of China; the long-bodied, short-legged bush-dog of Guiana; the fennec-like Cape fox of South Africa; the powerful and fierce hunting-dog of central Africa, and a group of species native to eastern Asia. These Asiatic species form the genus Coy, are peculiar in structure, especially as to dentition. One species is Siberian, closely resembles an Eskimo sled-dog, except that its bushy tail does not curl, and with its compact, robust body and short muzzle it has a very dog-like aspect. It lives in forests and hunts in packs. At the other extreme is the wild dog of the Malay Archipelago, which is thinly haired and gaunt. More widely known than either of these, however, is the wild dog of India, called *buansah* in the North and *dhole* in the South. Like the others it is normally rust-red in color, and makes its lair in rocky jungles. It is shy of mankind, and does not often attack cattle, but a pack will make even a tiger or a leopard turn tail.

None of these unwolflike animals called *dogs* belongs in the ancestry of our domestic races as is shown by the teeth. All kinds of our dogs have three molars on a side in each jaw, as in the genus Canis, whereas the dhole and other species of the genus Coy have but two; and it is a rule in morphology that a character once lost may not be regained. Examination of the skull and other parts shows that all our domestic dogs must be derived from members of the genus Canis. Dogs have been found associated with many of all parts of the world except the South Sea Islands, at their first discovery by Europeans, and sometimes in considerable variety. These, in all cases, were local wolves or jackals that had been tamed and more or less domesticated. The sled-dogs of the Eskimos and Siberians were only subjugated wolves; those of our western Indians tamed coyotes; those of South Africa modified jackals; the "pariah" curs of the East came from the small red wolf of southeastern Asia; and so on, until intercommunication of tribes or of civilized with uncivilized races has caused a mixture of dog-races, and examples might be multiplied. In all these there is probably no admixture of fox blood, for the so-called "fox-dogs" of South America, which were captured and domesticated by the Indians there, are wolves, properly speaking.

Foxes do not interbreed with wolves, jackals, or domestic dogs; whereas all these readily interbreed with each other, under captive conditions. Hence there has occurred from the beginning a mingling of various captive stocks, so that the domestic dog as we know him now is a composite that is quite inexplicable. One other element, however, entered into the domestic dog, and that is the probability that the modern dog may carry some inheritance from one or more extinct species to which it may owe its distinctively dogghish aspect (short muzzle, etc.). We know that men of the Stone Age had dogs about their camps, notably among the Neolithic Swiss Lake dwellers. Rüttimeyer, one of the best authorities, considers that their semisossil remains, show such specific distinctions as to indicate derivation from neither wolf nor jackal, but from a distinct canine animal now extinct. This is by no means unlikely. Consult Mivart, "Monograph of the Canidae" (London 1870); Huxley, "Cranial and Dental Characters of the Canidae" (London 1880); Lydekker, "Mostly Mammals" (New York 1903); Ingersoll, "Life of Mammals" (New York 1907); and books on dogs and dog-culture.

DOG'S-TAIL GRASS, *Cynoglossum crassatum*, a perennial grass, 1-2½ feet tall, with a very thin and fine stem and with a spike-like panicle made up of spikelets alternating on two opposite sides of the stem and of two different sorts, sterile and fertile. *Cynoglossum* is an Old World genus, and in England is one of the most important pasturage grasses. In America it is an escape from cultivation and grows in waste places, fields and waysides from Canada to New Jersey. It is much used for the manufacture of leghorn hats on account of its great strength.

DOG'S TONGUE, a biennial plant, *Cynoglossum officinale*, belonging to the Boraginaceae, borage family. It is a native of Europe, but has become naturalized in North America.

DOGTOOTH, in architecture an ornamented molding used in early medieval times in the form of a four-leaved flower, with teeth projecting in the centre; also a steel punch used in working marble.

DOGWATCH, on shipboard, a name given to each of two watches of two hours each instead of four, adopted for the purpose of varying the hours of watches kept by each part of the crew during the 24 hours. The watches are arranged thus: 8 to 12 P.M.; 12 to 4 A.M.; 4 to 8 A.M.; 8 to 12 A.M.; 12 to 4 P.M.; 4 to 6 P.M.; dogwatch; 6 to 8 P.M.; dogwatch; 8 to 12 P.M., and so on.

DOGWOOD, the common name of the genus *Cornus*, a group of plants, either shrubs or trees, with entire leaves, and panicles of showy flowers in cymes, but sometimes solitary. The fruit is a drupe. The genus consists of some 40 species natives of the northern temperate zone, Mexico, and parts of Peru. To this genus belong the American shrubs and trees, known as cornel (q.v.), dogwood, and pincknimmel. The wood of the northwestern species is white and fine-grained, and is used for inlaying, and from the bark a febrifuge is made. Those who "dip" snuff, use the small branches of the tree to make the brush with which the snuff is applied. The common dogwood of Europe (*C.
sanguinea) is a shrub of remarkable beauty in autumn owing to the deep redness of its foliage. The wood makes the very best charcoal for gunpowder. It is very hard, and is made into skewers, cogs for wheels, etc., and in former times it was in request for making arrows. The small bitter fruit yields as much as one third of its weight of an oil resembling that of olive. The wood of *Rhamnus frangula* is also used by gunpowder-makers, and called by them dogwood. Jamaica dogwood (*Icichyomelehis pircipula*) is a leguminous timber-tree; the cortex of the root is powerfully narcotic, used for stupefying fish or deadening the pain of toothache.

DOHERTY, Charles Joseph, Canadian jurist: b. Montreal, 11 May 1855. He was educated at Saint Mary’s College and at McGill University, Montreal, was admitted to the bar in 1877 and was created Queen’s Counsel by the Earl of Derby in 1887. From 1891 to 1906 he was puisne judge of the Superior Court of Quebec and in 1908 was elected to the House of Commons from Saint Anne’s Division, Montreal. In 1911 he was made Canadian Minister of Justice and since 1900 has served also as professor of international and civil law at McGill University. He was one of the lawyers for the Society of Jesus in its libel suit against the Toronto *Mail*, and delivered judgment in the case of the Canada Revue Publishing Company vs. Archbishop Favre of Montreal in 1894.

DOHERTY, Henry Latham, American engineer: b. Columbus, Ohio, 15 May 1870. When 12 years old he entered the employ of the Columbus Gas Company, advanced rapidly and between 1890 and 1905 was engineer or manager of gas or electric companies in about 30 cities. In 1905 he organized the firm of Henry L. Doherty & Co. in New York as bankers and operators of public utility corporations. He patented several pieces of apparatus used in gas manufacture, was awarded the first Beall gold medal in 1898 by the American Gas Light Association.” *Gas for Fuel.* He is a member of the American Academy of Political and Social Science and many other scientific bodies.

DOHM, döm, Ernst, German humorist: b. Breslau, 1819; d. 1883. He studied theology and philosophy at Berlin and Halle and for many years was editor of *Kladderadatsch*, one of the most important humorous publications in Germany. He was ranked very high as a master of keen political satire. He translated Lafontaine’s *Fables* into German, with illustrations by Gustave Doré (1877) and published comedies, farces and poems, the most popular of which was *Das erste Debit* (3rd ed., 1860).

DOHNANYI, döh-hon’yi, Ernst von, Hungarian composer: b. Pressburg 1877. While a pupil at the Royal Conservatory at Budapest 1894–97 he took several prizes for composition. In 1897 he studied with D’Albert to perfect himself in the technique of the piano forte previous to taking the chief cities of Austria, Germany and England. His tours of America in 1900 were successful. His pianoforte concerto in C minor took the Rosendruf prize, Vienna, March 1899. This he played with the Boston Symphony Orchestra. Other works are a concerto in D♭, an overture, a Concert-stick for ‘cello and orchestra, piano pieces, two symphonies and some chamber music and the comic opera ‘Tante Simona,’ produced in Berlin in 1913.

DOHRN, döhrn, Anton, German zoologist: b. Stettin, 29 Dec. 1849; d. 29 Sept. 1909. He studied at Königsberg, Bonn, Jena and Berlin, lectured for a time on zoology at Jena, and in 1870 he founded the great zoological station at Naples. As an embryologist he devoted himself mainly to the development of insects and crustaceans; and besides reports, he published works on the origin of the vertebrates including ‘Der Ursprung der Wirbeltiere’ (1875); ‘Studien zur Urgeschichte des Wirbeltierkörpers’ (1882).

DOIT, a small copper coin anciently current in Scotland, and equal in value to one-eighth of a penny sterling. There was also in Lower Germany a small coin called *duyt*. In the Netherlands the coin is called *duyt*.

DOLABELLA, Publius Cornelius, Roman leader: b. about 70 a.c.; d. 43 B.C. He married Cicero’s daughter Tullia, but treated her so harshly that she was ultimately obliged to leave him. He possessed considerable talents, but owing to his extravagance was compelled in 49 to seek a refuge from his creditors in the camp of Caesar, and was present at the battle of Pharsalus (48). In the following year he obtained the tribuneship, and at once brought in a measure cancelling all debts, which led to an embittered struggle in Rome. He accompanied Caesar to Africa and Spain, but on his leader’s death, he usurped the consular insignia, allied himself with the conspirators, and made a show of republican sentiments. Appointed by Antony to the province of Syria, he murdered the proconsul, C. Trebonius, who had resisted his exactions, and at Laodicea, when about to fall into the hands of his enemies, was slain at his own request by one of his soldiers.

DOLABRA, dō-l’a-bra, the Latin name for a Celf. See Celts.

DOLBEAR, Amos Emerson, American educator and inventor: b. Norwich, Conn., 10 Nov. 1837; d. 23 Feb. 1910. He was graduated at Ohio Wesleyan University in 1866 and was professor of physics and astronomy in Tufts College 1874. He achieved eminence in scientific research, and among his numerous inventions were the writing telegraph (1864), the electric gyroscope (1867), the magnetic telephone (1876), the static telephone (1879), and the air space telegraph cable (1882). Among his discoveries were the convertibility of sound into electricity (1873), wireless telegraphy (1881) and electric photography (1893). He received several medals, including a bronze medal for an acoustic apparatus at the Centennial Exposition, Philadelphia, 1876, a silver medal in Paris 1881, and a gold medal in London 1882. Among his published works are: ‘Chemical Tables;’ ‘The Art of Projecting;’ ‘The Speaking Telephone;’ ‘Matter, Ether and Motion;’ ‘Modes of Motion;’ and ‘Natural Philosophy.’

DOLCE, dōl’tchē, or DOLCEMENTE, in music, an instruction to the performer that the music is to be executed softly and sweetly.

DOLCI, dōlchē, Carlo or Carlinho, Florentine painter: b. Florence, 25 May 1616; d.
there, 17 Jan. 1866. His works, which consist chiefly of madonnas and saints, exhibit the character attributed to him. The faces are full of a pleasing and tender softness, which, however, is often carried so far as to rob them of all character. Dolic's drawing is generally correct, his coloring exquisitely delicate and transparent, and in the nicety and laborious care of his finish he approaches the most characteristic examples of the Dutch school. His works are numerous and scattered over all Europe. Besides his madonnas his most famous works are his 'Saint Cecilia'; 'Christ Blessing the Bread and Wine'; and 'Herodias With the Head of John the Baptist.'

DOLCINITES (from Dolcino, their founder), a Christian sect which arose in Piedmont in 1304. See Apostolic Brethren.

DOLDRUMS, a nautical term for the parts of the ocean near the equator that abound in calms, squalls and light baffling winds; otherwise known as the horse-latitude; also applied to the weather variations characteristic of those regions. See Calms, Region of.

DOLE, Charles Fletcher, American Unitarian clergyman. b. Brewer, Me., 17 May 1845. He is the brother of N. H. Dole (q.v.). He has been pastor of the Unitarian Church, Jamaica Plains, Boston, since 1876. He is the author of 'The Citizen and the Neighbor'; 'Jesus and the Men About Him' (1888); 'A Catechism of Liberal Faith' (1895); 'The American Citizen' (1891); 'The Coming People' (1897); 'Noble Womanhood' (1900); 'The Smoke and the Flame' (1903); 'The Spirit of Democracy' (1906); 'The Hope of Immortality' (1906); 'What We Know About Jesus' (1908); 'The Ethics of Progress' (1909); 'The Coming Religion' (1910); 'The Burden of Poverty' (1912).

DOLE, Nathan Haskell, American writer. b. Chelsea, Mass., 31 Aug. 1852. He was graduated from Harvard 1874, and after teaching at the Deerfield Academy, Deerfield, Mass., and in the Worcester High School and serving as Preceptor of Derby Academy, Hingham, Mass., he was literary, art and musical editor of the Philadelphia Press, also musical editor of the Boston Journal (1880-1897) when he became managing editor of the New York Epoch. That year he took the position of literary adviser to the publishing house of Thomas Y. Crowell & Co. In 1901, he was for a time head of the publicity department of D. Appleton & Co. His principal original works are 'Young Folks' History of Russia' (1881); 'A Score of Famous Composers' (1891); 'Not Angels Quite' (1893); 'On the Point' (1894); 'The Hawthorn Tree' (1895); 'The Mexican Adventure' (1898); and 'Oman: the Tent-Maker' (1898); 'Six Italian Essays' (1907); 'Alaska' (1909); 'The Life of Count Tolstoi' (1911), and 'The Spell of Switzerland' (1913). In 1904 he printed privately a Symphonic Poem in four movements, entitled 'The Blue Garden of the Poema.' He followed this in 1911 with a second 'The Pilgrims,' also privately printed. This symphonic form gives to English poetry a medium only comparable to the Greek as invented by Pindar, since its possibilities are unlimited. In 1896 he furnished 250 poems for the 'Educational Music Readers' and in 1915 was chosen to write many of the songs for the Boston public schools. He was poet to the Ancient and Honorable Artillery Company of Boston on its 256th and again on its 270th anniversary. He also wrote the ode for the 100th anniversary of the founding of the Pennsylvania German colony, and various other poems for public occasions. He translated in the course of 20 years Mascagni's 'Cavalleria Rusticana' and 'L'Amico Fritz' and other operas as well as hundreds of lyrics from Russian, Polish, Bohemian, the Scandinavian, Italian, French, German, Dutch, Italian, Portuguese and various other languages and dialects, mainly for music. In 1899 he edited the complete works of Count Tolstoi, whose novels, 'Anna Karénina,' 'War and Peace,' and many others he had already translated. He has also translated 'Marta y María,' 'Maximina,' and 'La Hermena Sant Sulpice,' from the Spanish of Valdes, as well as various works from the Russian, Italian, French, Swedish and German. In 1896 he edited a multivolume edition of André Thevet's Khayyam, containing versions in English, French, German, Italian, Hungarian and Danish carefully collated. He translated the 'Memoirs' of the Baroness Bertha von Suttner (1910) and her feminist novel 'Der Mensch im Hochgedanken' (1914). He was editor (with others) of 'The International Library of Famous Literature' (1898); 'Masterpieces of Famous Literature' (1899); 'Famous Orations' (1900); 'Library of Oratory' (1902); 'Flowers from Persian Poets' (1901); 'Young Folks Library' (1902); 'Vocations' (1910); also many editions of English, Latin, Greek and American poets. He was president of the Bibliophiles Society (1901-12), for which he edited 'Marat's Letters' and other of its publications; president of the Omar Khayyam Club of America (1901—); also one of the trustees of the Fellows Athenæum of Roxbury, Boston. His wife, Helen Bennett Dole, translated Victor Hugo's 'Ninety-three,' Rudolf Baumbach's 'Schiller's Schriften,' André Thevet's 'L'Abbé Daniel' and 'La Vie Rustique en France,' Paul Marguerite's 'L'Avril,' Johanna Spyri's 'Heidi,' 'Mouni' and 'Rosenresli,' Pierre Loti's 'Pêcheur d'îles' and Klemens Bryant's 'Gockel, Hinke und Gackeleia.'

DOLÉ, Sanford Ballard, Hawaiian statesman. b. Honolulu, Hawaii, 23 April 1844. He studied law in Boston and was admitted to the bar in 1868, returning in the same year to Hawaii. In 1884 he was made a member of the legislature and again in 1886. He had been, in 1887, appointed an associate judge of the Supreme Court, under the monarchy, to which post he resigned in order to accept the leadership of the revolution that overthrew the monarchy in January 1893, and established a provisional government. On 4 July 1894 a republic was formally proclaimed, of which he was elected president. Hawaii was created a territory in June 1900 and he was governor till 1903. In the latter year he was appointed judge of the Federal court for the Territory of Hawaii. This appointment was for six years, and upon its expiration he was reappointed to the same position, retiring to private life in 1915.

DÔLE, dôl, France, town in the department of Jura, 25 miles southeast of Dijon. It is situated on a hill round which the river Doubs
flowery. The church of Nôtre Dame is of the 16th century, and is built in a Flamboyant style. The Hôtel Dieu is a fine Renaissance building. There is an art gallery, a college (once a Jesuit establishment) and a valuable library of 40,000 volumes. The manufactures are Prussian blue, hosiery, ironware, leather, vinegar, surgical instruments, etc. and the city is chiefly in grain, flour, timber, wine, brandy, coal, iron, mill-stones and marble. It possesses many ruins of Roman architecture. From the hills above the town, Mont Blanc, 100 miles, may be seen. Dôle, at one time in the territory of the Abbey of the Holy Ghost, was taken by Louis XI in 1479. It afterward belonged to Spain, but was finally brought under French rule in 1678. Pop. 16,294.

DOLERITE, the name given to a class of rocks, including dolerite proper, and the coarse-grained varieties of basalt, in which the minerals present can be detected by the naked eye. Dolerites of Labrador feldspar and augite, with some titaniferous magnetic iron ore, and other minerals. It has a dark-gray color, crystalline and small-grained, sometimes porphyroidal. Its specific gravity is 3. Its average composition is silica 50, alumina 15, oxides of iron 15, lime 10, magnesia 5, and the rest potash, soda and water. It is very widely distributed. With the introduction of the petrographic microscope and the resultant precision attained in rock investigation, the term is falling into desuetude.

DOLET, dōlēt', Étienne, French scholar and martyr b. Orleans, France, 1509; d. Paris, 3 Aug. 1564. At the age of 12 Dolet went to the University of Paris, where his attention was directed to the study which became the chief interest of his life—the writings of Cicero. During a sojourn in Italy he imbued an enthusiasm for the humanities, with its zeal for the classic writers and indifference to the teaching of the Church. In 1534 he settled at Lyons; in 1542 he obtained a license for 10 years to establish a printing press and published many notable works, but brought himself—not for the first time—under a suspicion of heresy, and in 1544 was found guilty of heresy on a charge mainly based on an alleged mistranslation of Plato, in which he was accused of denying the immortality of the soul. After two years' imprisonment, Dolet was burned in the Place Maubert, Paris, where a statue was erected in his memory in 1889 and round which a demonstration of anticlericals is annually held on the first Sunday of August. The proceedings in his trial were issued by Taillandier in 1836 from the registers of the Parlement of Paris. Consult Études sur le X VIe siècle; Étienne Dolet, The Martyr of the Renaissance (London: 1899); Gallbier, Etienne Dolet (Paris 1907).

DOLGORUKY, dōl-gō-rook’ē, Katharina Michailowna, Princess Yurévskaya (b. 1846), the favorite of the Tsar, Alexander II, who married her in July 1880 after the death of his first wife, Marie. After the tsar’s death she lived abroad and published in Geneva in 1882, under the pseudonym of Victor Lafferté, Alexander II, Unedited Details of His Private Life and His Death.

DOLichocephalic (from Gr. dolicho- long, eopherō a head); longheaded; a term used in ethnology to denote those skulls in which the diameter from side to side is less in proportion to the longitudinal diameter (that is, from front to back) than 8 to 10. This form of skull is seen in an exaggerated form in native Australians and West Africans. The dolichocephalic skull of ordinary type appears among Indo-European races.

DOLICHOPODIDÆ, dol’i-kō-pō’did-ē, a numerous family of the order Diptera, some 1,200 species being known. They are small, metallic blue or green flies with slender legs and active habits. The larvae live in the ground or in decomposing matter. They are not known to be harmful, but the flies are preaceous, and by this habit are beneficial to agriculture, catching, as they do, insects, and even worms, that are injurious to growing crops.

DOLICHOS (Gr. dolichos long, that is, in pods), a genus of tropical herbs and shrubbery plants of the family Fabaceae. The 40 or 50 species, of which a few are cultivated for food, are separated from species of the related genus Phaseolus by technical characters. The best known species are D. lablab, the hyacinth bean, a native of the tropics. It often twines around supports to a height of 20 feet, bears broad, often wrinkled leaves, purple, rather large flowers in erect, axillary racemes and flat, rather smooth pods containing several small, black seeds. It is an annual, frequently planted in sunny situations to form temporary screens and arbor covers. It succeeds well in any good garden soil, but attains the greatest growth and bears the most foliage upon rich soils. It has several horticultural varieties.

DOLL, a favorite plaything of children, found in variety of form and decoration. Most of the dolls found in the stores are made in the village of Sonneberg, in the Thuringian forest, Germany. Here the industry of making children’s toys can be traced back to the 17th century, where the work of making them—as in other centres of the industry on the Continent—is divided among the various members of the household. Other villages in this vicinity and some towns in France and Switzerland also export large quantities of dolls to England and the United States. The importation of dolls into England was at one time almost entirely from the Netherlands, hence they were called “Flanders babies.” There are about 40 doll manufacturers in London who make dolls of a superior kind. In France expensive life-size dolls are manufactured. There are a number of doll factories in the United States, where of late years “doll shows” or bazaars have been very popular. The phonograph doll, invented by Edison, created great interest when it was first introduced. The interruption of trade from Europe through the Great War has given an impetus to their manufacture in the United States: in New York one factory has been established with a productive capacity of 7,000 a day. The doll is the oldest toy known and is found among all nations and tribes, even of the most remote antiquity. Mr. Edward Lovett, of London, England, has made remarkable collections of those toys—one containing 2,000 specimens. The oldest in his collection is
DOLLAR—DÖLLINGER

one 4,000 years old, found in an Egyptian tomb, and another—a little broken image, with no arms or legs—is a relic of the Roman occupation of Britain.

DOLLAR (Low German daler, from thaler, short for Joachimsthaler, coined 1519 from silver mines in Joachimsthal, Bohemia, and standardized 1626; the unit of American currency). During the troubled periods in Europe previous to the 19th century some coins because of their intrinsic value, appearance and other qualities came to have a circulation far beyond the confines of the political state which placed them in circulation. Thus it came about that Prussia, Canada, Mexico and the United States received the name of their monetary unit from a section of the little country of Bohemia. Florence in the Middle Ages issued a coin which came to be known by the city’s name, and the name is perpetuated in Holland, Austria and England. The West India trade before the Revolution had made the Spanish dollar—more convenient than the sovereign—the trade here; and the Coinage Act of 2 April 1792 merely legalized this fact, establishing the dollar as the unit of American currency, making it equivalent to 24.75 grains of fine gold and authorizing the coinage of silver dollars “of the value of a Spanish milled dollar the same as is now current” (see also Cents), and of halves and quarters correspondent. The first actual coinage was in 1794, dollars of 416 gr., 371.25 silver, 892.4 fine. The dollar of account was rated at 4s. 6d. sterling, making the pound equal to $4.44; which, as the sovereign was of pure gold, was too little and should have been $4.565. By act of 28 June 1834, the gold in the dollar was reduced to 23.20 gr., raised 18 Jan. 1837 to 23.22, where it remains, the pound having been unchanged, has since been equal to $4.86½. The last act made the weight of the silver dollar 412.5 gr., but raised it to .900 fine, the amount of silver remaining the same as before, 371.25 gr. On 3 March 1849, a coinage of gold dollars was authorized, weight 25.8 gr., .900 fine, 23.22 gr. pure gold; on 2 Feb. 1853, a $3 gold piece, weight 7.4 gr.; and half and quarter dollars of silver, 192 and 96 gr. respectively, but legal tender only to $5. The act of 1873 discontinued the coinage of the silver dollar of 412.5 gr., but authorized one of 420 gr. (the "trade dollar") for the China and Japan trade. The fall in silver shortly after, however (at this time the silver dollar was worth rather more than the gold), inflated its value and made bullion owners anxious to have their metal coined into these, and on 22 July 1876, their coinage was limited to the actual demand for exports; they not being intended for internal circulation—35,059,360 were issued in all. The coinage was suspended April 1878. The act of 28 Feb. 1878 revived the coinage of the dollar of 412½ gr., and that of 14 July 1890 continued it. It is notable that many times more silver dollars have been coined since 1873 than before; up to 30 June 1872 the total number struck was only 8,045,838, while that of gold dollars was 19,015,642. The act of 14 March 1900 makes the gold dollar the standard of value in the United States. The law, however, did not provide for the issue of coins of this denomination.

DOLLAR BIRD, an Australian roller (Eurostomus australis), prevalingly blue and black in plumage, so called from the large roundish spot of white on its wing, shown in flight.

DOLLAR-FISH, a name used, particularly in Maine, for a small fish of the family Stomatiidae, more widely known as the butter fish or harvest fish (Rhombus plathysma). It is found on the entire extent of the Atlantic coast of the United States and is extremely abundant during the summer on the shores of the New England and Middle States. The dollar-fish is from 8 to 10 inches long, of an oval form, with a blunt snout and small mouth; the color is silvery, bluish above, beautifully iridescent when alive. Great numbers are captured in seines and pound nets and they are highly valued as pan-fish. The young have an interesting habit of swimming, several together, in the company of large jellyfishes, beneath the disks of which they seek shelter and protection. Several allied species occur on both the east and west coasts of the United States.

DOLLARD, Adam, Sieur des Ormeaux: b. 1638; d. 1660. He was an officer of the French garrison at Montreal who, with 16 compatriots and a few friendly Indians, intercepted 900 Iroquois and held them at bay for five days at the long Sault on the Ottawa River above Montreal. He with all his companions perished; but the resistance they had met so disheartened the Iroquois that they abandoned their projected attack on Montreal and the colony of New France.

DOLLART, The, an inlet (nearly land-locked) of the North Sea, at the mouth of the Ems, between the Dutch province of Groningen and the Prussian province of Hanover. It is nearly 13 miles long by seven broad. It was formed by inundations of the sea, which took place in 1277 and subsequently, overwhelming many large villages and hamlets, and destroying thousands of human beings and valuable property. A considerable extent of rich land has been regained by embankment, especially on the Dutch shore. The city of Emden is in the Dollart.

DOLLIER DE CASSON, döl'yer də kás'son, Sulpician: b. near Nantes, 1636; d. Montreal, 1701. He first served as a cavalry officer under Marshal Turenne. In 1657 he entered the Sulpician order, and went to Canada. In conjunction with Father Galinice he made in 1669-70 an important journey of exploration round the Great Lakes, spending the winter on the north shore of Lake Erie. In 1671 he was appointed superior of the Seminary of Montreal; in 1672 he laid out the first streets of that city; and he inaugurated the Lachine Canal undertaking. He wrote a history of Montreal covering the period from 1640-72.

DÖLLINGER, döl'ing-er, Johann Joseph Ignaz von, German Roman Catholic theologian and historian: b. Bamberg, Bavaria, 28 Feb. 1799; d. Munich, 10 Jan. 1890. He received his preliminary education in his native city, and did not enter the University of Munich where his father was professor of anatomy and physiology. In 1817 he began the study of
mental philosophy and philology and in 1818 turned to the study of theology. He paid particular attention to the independent study of ecclesiastical history. He was professor of ecclesiastical history and canon law at the Lyceum of Aschaffenburg. In 1826 he became professor of ecclesiastical history and law in the newly founded University of Munich, where he spent the rest of his life. Here he became famous as a historian, politician, and publicist. He published "Die Lehre von der Eucharistie in den ersten drei Jahrhunderten" in 1826, and in 1828 a history of the Reformation. In 1835 appeared the "Geschichte der christlichen Kirche," and in 1838 "Lehrbuch der Kirchengeschichte." Döllinger contributed frequently to the "Historisch-politische Blätter" and published several pamphlets. His connection with politics began in 1843, when he represented his university in the Bavarian chamber; he lost his seat and professorship in 1847 on the fall of the Abel ministry, and in 1848 he was elected to the Frankfort parliament by a Bavarian constituency. He was here recognized as the leader of the Roman Catholic party. He was recalled to Munich in 1849, and resumed his former place in the Bavarian chamber. In 1857 he visited Rome, and soon afterward it became evident that his views had undergone a change. Previously Döllinger had been an ardent defender of Catholicism and a bitter opponent of Protestantism; from now on he tended more and more to liberalism. Public announcement of this was made in a course of lectures which he delivered at Munich, in which he denied the temporal power of the Pope not an essential part of the Roman Catholic Church, and he expounded his position in "Hippolytus und Kallistus oder die römische Kirche in der ersten Hälfte des dritten Jahrhunderts" (1853); "Heidenthum und Judenthum, Vorhalle zur Geschichte des Christenthums" (1857); "Christentum und Kirche in der Zeit der Gründlegung" (1860), and "Kirche und Kirchen, Papsttum und Kirchenstaat" (1861). This attitude of opposition became more pronounced in 1870, when he declined to accept the doctrine of papal infallibility formulated by the Vatican Council, and assumed the leadership of the Old Catholic party. As a result Döllinger was excommunicated by the Church of Munich in 1871, but still retained the support of the Bavarian government. While the sentence was pending he was chosen rector of the University of Munich, and received numerous honorary degrees and decorations. He continued to lecture on ecclesiastical history and kindred subjects. Numerous works continued to come from his pen including "Sammlung von Urkunden zur Geschichte des Konsils von Trient" (1876); "Akademische Vorträge" (1891) "Beiträge zur Sektengeschichte des Mittelalters" (1890); "Briefe und Erklärungen über die vatikanischen Dekrete" (1890); "Kleinere Schriften" (1890). In collaboration with Rensch he reprinted the autobiography of Bellarmine (1887), and "Geschichte der Moralstreitigkeiten in der römisch-katholischen Kirche seit dem 13. Jahrhundert" (1890); briefs and explanations of the Vatican decrees, foreign and domestic, in English including "Declarations and Letters on the Vatican Decrees;" "First Ages of Christianity;" "Jew and Gentile in the Courts of the Temple of Christ;" "Hippolytus and Callistus." See OLD CATRO-

LICS. Consult the life by Friedrich (Munich 1901); also Kobell, "Ignaz von Döllinger, Einriechungen" (ib. 1891); and Michael, "Ignaz von Döllinger, eine Charakteristik" (Innsbruck 1893).

DOLIVER, Jonathan Prentiss, American lawyer and politician: b. near Kingwood, Preston County, W. Va., 6 Feb. 1858; d. Fort Dodge, Iowa, 15 Oct. 1910. He was graduated at West Virginia University 1875 and admitted to the bar 1878. He practiced law and was a member of Congress from that State from 1889-1900, and was a member of the Senate from 1900 until his death. He offered strenuous opposition to the Payne-Aldrich tariff.

DOLLOND, John, English optician of French descent: b. London, 10 June 1760; d. there, 30 Nov. 1761. He devoted his attention to the improvement of refracting telescopes, and succeeded in constructing object-glasses in which the dispersion of the rays of light was corrected. Subsequent members of his family have distinguished themselves in optics, astronomy, etc.

DOLL'S HOUSE, A. The theme out of which 'A Doll's House' was constructed was not of sudden choice. In his notes for this modern tragedy, Ibsen jotted down, under date of 19 Oct. 1878, the following statement:

"A woman cannot be herself in the society of the present day which is an exclusively masculine society with laws framed by men and with the judicial system that judges feminine conduct from a masculine point of view."

Those who take 'A Doll's House' as indication that Ibsen was a champion of the woman question are wrong in their conclusions; for he was interested much more in the larger spiritual question of the equality of the sexes. If he stressed the feminine in his plays, to the detriment of the masculine, it was simply because he felt that the weaker side of the argument needed the stronger support, in order to reach an equal balance of fairness and justice. 'A Doll's House' was completed while Ibsen was spending the summer of 1879 in Amalfi; and it was almost immediately published. It raised a storm of protest everywhere, and for many years was regarded solely as an attack upon marriage. Ibsen was called every preposterous name imaginable. The only way in which the play was allowed to be given in London was in an adapted form made by Henry Arthur Jones and called 'Breaking a Butterfly': it was produced at the Princess Theatre, 3 March, 1884.

Nora's slamming of the door in her husband's face, as she leaves the house, resounded throughout the world. Debates were held everywhere as to whether Nora was justified in leaving her home, whether it was the true act of a mother and a wife, and whether Nora, in the end, would return to Torvald, her husband.

As an acting drama, 'A Doll's House' has held the stage and has been as much a goal for the young actress as 'Camille.' Apart from its philosophic preachment, it is a portrait of a most interesting woman,—not as subtle a portrait as Hedda Gabler or as Rebecca West in 'Rosmersholm,' but affording, in deep psychology, as well as in such outward scenes as the Christmas Tree, the Tarantella dance, and the denunciation scene, ample opportunity for histrionic ability. Eleanor Duse, Madame Réjane,
DOLOVYARD—DOLOMITIZATION

Agnes Sorma, Mrs. Fiske, Madame Nazimova
and Ethel Barrymore, among the many who
have attempted the rôle. The play was first
seen in America when, during 1883, in Louis-
ville, Ky., Madame Modjeska acted Nora.
It was first played in London, in its regular
form, by Janet Achurch and Charles Carrington,
at the Noveltv Theatre, 7, July 1885.
MONTROSE J. MOSES.

DOLOVARDEN, the soft-hearted, wily
little coquette in Dickens' novel 'Barnaby
Rudge.’ The impression made by the author's
description of her dress of flower-sprinkled
dimity led to the adoption of a style of dress
that is known as the Dolly Varden and was the
vogue from about 1865-70. The name is often
applied to any light dress-goods with bright-
colored flower effects.

DOLOVARDEN TROUT, the common
brook trout ('Salvelinus malma'), a char of the
mountains of western North America, and
northward in the coastal streams to the Aleutian
Islands, so-called because of the beauty of its
markings, which are said to resemble the color-
ations of 'Dolly Varden'. The trout is voracious
and game, often attains a weight of
12 pounds. Its general color is olivaceous,
the sides with round, red or orange spots as
large as the eye. In the region of its native
waters it is known as the bull-trout, red-spotted trout
and salmon trout, was at one time regarded
as identical to the malma of Kamchatka, but
recent investigation has shown them to be dif-
ferent species. It has been used to stock
streams in the northeastern States, Canada,
and Europe.

DOLMAN. (1) A long robe worn by the
Turks as an upper garment. It is open in front,
and has narrow sleeves buttoned at the wrist.
(2) It has given its name to a kind of loose
jacket worn by women as an outer garment.
It has a cape or hanging piece over the arm
instead of a sleeve. (3) The uniform jacket
of a banditti.

DOLMEN, a structure consisting of one or
more large unhewn stones, resting on a number of
unhewn stones, placed erect in the earth.
The name is sometimes used as equivalent to crom-
lech, sometimes in a distinctive sense. Sir John
Lubbock maintains that cromlech should be ap-
plicated to a stone circle, dolmen to a stone cham-
ber, such circle or chamber consisting of huge
stones set up in prehistoric times for religious
or sepulchral purposes or as memorials of some
important event. They are of very wide distribu-
tion; there are over 3,400 in France, mainly
in Brittany, and are to be seen in the British
Isles (especially Ireland). Scandinavia, Hol-
lund, Germany, the Crimea, Persia, Arabia,
Palestine, Madagascar, Australia and Japan are
among the countries in which they have been
discovered. 'Consult Barfage, 'The Dolmens of
Ireland' (London 1897); Keane, 'Etnology'
(Cambridge 1896).

DOLNJA TUZLA, dél'nýě tooz'lä, Bosnia,
Austria-Hungary, town beautifully situated on
the Julla about 20 miles from the Servian fron-
tier. It is celebrated for its salt mines, has a
trade in alkalai and coal, and was the scene of
an Austrian defeat of the Turks in 1690. Pop.
12,000.

DOLOMIEU, dé-lo-mě', Déodat Guy
Silvain Tancrède Gratet de, French geologist
and mineralogist: b. Dolomieu (Isère) 24 June
1750; d. Chateauneuf, France, 26 Nov. 1801. In
youth he became a member of the Knights of
Malta, and having killed a brother knight in a
duel, was condemned to death but pardoned on
account of his youth. He was made cor-
respondent of the Academy of Sciences of Paris,
and from 1777 to 1791 made extensive travels
in the south of Europe, often on foot, with a
hammer in his hand and a bag on his back. In
1796 he was appointed professor or lecturer in
the School of Mines, and on the establishment
of the institute was made a member of that
society. In 1798 he accompanied Napoleon to
Egypt, and on his return was detained at Mes-
sina by the Neapolitan government for having
revealed in 1783 its plans for the conquest of
Malta to the grand master of the knights. He
was imprisoned for 21 months in a noisome
dungeon, clothed in rags, with nothing but straw
for a bed. Deprived of writing materials, he
made a piece of wood into a pen, and with the
smoke of his lamp, for ink, he wrote on the mar-
margins of this 'Voyages aux îles de Lipari' (pub-
lished 1801). In 1801 he received the professorship of mineralogy in the museum
of natural history. The mineral "dolomite" which he was the first to describe, is named in
his honor. Among the works left by him are
'Voyages aux îles de Lipari' (1783); 'Sur le
Tremblement de Terre de la Calabre' (1784).

DOLOMITE, carbonate of calcium and
magnesium ((Ca,Mg)CO₃), containing normally
30.4 parts lime and 21.7 parts magnesia, but
varying in the ratio of the two carbonates. Iron
and manganese carbonates are sometimes pres-
ent as impurities. The crystallization is rhombo-
edral; the hardness 3.5 to 4; specific gravity
2.8. The color is normally white but may be
reddish, grayish, brownish, or even black. In
general the mineral resembles calcite but differs
in not effervescing freely with cold acid, even if
finely powdered. Massive or in thin beds, it is
a form of dolomitic limestone. It is a rock of com-
on occurrence and sometimes forms strata of great
extent and thickness. Such limestones fre-
frequently show all transitions from nearly pure
calcite to true dolomite. Generally, a limestone
containing over 5 per cent of MgO is described as
a magnesian limestone. Under pressure dolomite
limestones and dolomites become crystalline and
are classified as marbles. Many of the great
limestone formations in the United States are
more or less dolomite. See DOLOMITIZATION;
LIMESTONE; ROCKS.

DOLOMITE MOUNTAINS, or DOLO-
mite Alps, a group of mountains, part in
Tyrol and part in Italy. The name comes from
the rock dolomite of which the mountains are
largely composed.

DOLOMITIZATION, the process by
which the calcium in limestones is replaced by
magnesium, forming dolomites. The term is
often indiscriminately applied to all crystals
and dolomites. The exact nature of this process is
still a matter of doubt. Dolomites cannot be
formed directly from the calcareous remains of
animals, since they contain a much larger pro-
portion of magnesia than any animal shells or
tests, and the magnesia therefore was probably
added after the calcareous material had accumu-
luted. In the lagoons of coral reefs, the enclosed body of sea water becomes concentrated by evaporation, and the chloride of magnesium (present in all sea water) by a process of double decomposition forms magnesium carbonate from the calcium carbonate of the coral rocks. It is also possible that fine calcareous mud in suspension in sea water may exchange some of the calcium directly for magnesium. See DOLOMITE.

DOLORES, do-ló-rés, El Grito de, literally, "The cry, or outcry, of Dolores," marking the commencement of the Mexican War for independence. On the night of 16 Sept. 1810, Don Miguel Hidalgo y Costilla, the parish priest of the town of Dolores (q.v.), gathered a number of patriots under his banner to the cry of: "Long live religion! Long live our Most Holy Mother of Guadalupe! Long live America, and death to bad government! All previous attempts (1798-1810) to rebel against the Spanish authorities had been suppressed; but Hidalgo and his followers were victorious in several engagements. Although he and his lieutenants, Allende, Aldama and Jimenez, were captured and put to death in 1811, the movement they began was carried on until the revolutionists triumphed, 27 Sept. 1821, Yturbiade entering the capital on that day. See MEXICO.

DOLORES HIDALGO, e-däl-gó, Mexico, a town in the state of Guanajuato, department of Allende, about 41 miles from the capital of the state, which is also called Guanajuato. Pop. 6,764.

DOLPHIN, Joseph Norton, American statesman: b. Dolphusburg, N. Y., 19 Oct. 1833; d. Portland, Ore., 10 March 1897. He studied law, and began practice at Binghamton, N. Y. In 1862 he settled in Portland, Ore., taking up the practice of law there. In 1864 he was elected city attorney, and was appointed United States district attorney. He was a member of the State senate four consecutive terms, sat in the United States Senate from 1883-95. In his second term he was chairman of the Committee on Coast Defenses, a member of the Committee on Commerce and an active opponent of the free coinage of silver.

DOLPHIN, a group of cetaceans belonging to the family Delphinidae. The common species (Delphinus delphis) is found chiefly in the Mediterranean and North Atlantic Ocean. It is from six to eight feet long; the body tapers toward the crescent-shaped tail, which is about a foot broad. The blow-hole is also crescent-shaped; and the beak is usually about six inches long. The dolphin is blackish on the back, and white below, the sides being gray. The female produces but one at a time, and devotes herself assiduously to rearing for it. There are numerous species of dolphin, each confined, apparently, to a comparatively narrow range. All are voracious, and feed on other fish and crustaceans, and are said to eat even the disabled and feeble of their own kind. They live in herds or "schools," and may be seen by ocean voyagers playing about the vessels. They will leap in graceful curves, into the air, make sudden descents into and through the waves, followed by a track of foam. Then they will reappear, show their slender back-fins, expose their broad tails as they plunge below the water; and almost before one has missed them, they will rise on the other side of the ship. They are a source of pleasure to the ocean traveler; and furnish more substantial gratification to the sailors, who eat their flesh with much relish after their usual rations of salt-pork. The grampus, the porpoise and many of the so-called whales, such as the white-whale, the killer-whale and others, are related genera; as are also the soosoo of the Geramuses, and the species of the Amazons, which inhabit fresh water instead of the ocean. The dolphin gave the name to Dauphiné, one of the provinces of France, from which the "dauphin," the heir-apparent to the French throne, derived his title. Consult Beddard, "A Book of Whales" (1900).

DOLPHIN IN ART. This sea mammal has been adopted by both pagans and Christians as a symbol of the dead. It has been used in Christian art also as emblematic of swiftness, diligence and love. In classic Greek art we find the dolphin figuring on buildings, on pottery, coins and mural paintings. It was used as symbolizing the sea or water, in the same manner as they used a flower to represent land. The dolphin figured as an attribute accompanying nymphs, nereids, tritons, also Arion, Aphrodite, Poseidon, Apollo, Neptune, etc. As a symbol of the sea it naturally appeared in company with an anchor or a trident. A dolphin entwining an anchor was the device or badge of Aludus Manutius (1447-1515), the Venetian printer—also of Venice—of the Adriatic. The dolphin figures in French art for the following historic reason. In 1140, Guigo IV, of Viennois, adopted the title of dauphin and took as his crest a dolphin. Humbert II, a successor, exchanged the dauphinie, in 1349, for a legacy, Charles of Valois receiving the title conditionally that the title "Dauphin" should be attached always to the heir to the throne. In ceramics the dolphin (crowned) figures as the mask of Lille porcelain (18th century). At the present day the dolphin is greatly favored as a decorative device on fountains, etc.

DOMAIN, from the Latin dominium, right of absolute ownership, property, dominion. The territory over which Dominion is exercised; the territory ruled over by a sovereign, or under the government of a commonwealth, as the domains of Greece; the public domain; the public domain is used in Europe, as property belonging directly to and controlled by the state, such as land set apart for state or public uses, roads, canals, parks, etc. In the United States the lands owned by the Federal government or by a State.
DOMANIG — DOMENICHINO

DOMANIG, dö-män'ist, Karl, Austrian numismatist: b. Sterzing, Tyrol, 3 April 1851. He was educated in the high schools of Innsbruck and Strassburg and at the Gregorian University, Rome. In 1880 he was appointed tutor to the children of Duke Philip of Württemberg and until 1891 served in the same capacity to several of the archducal members of the Imperial family of Austria. From 1884 to 1913 he was also engaged successively as assistant custodian, custodian, director and counselor of the Imperial Coin and Medal Collection, Vienna. He traveled extensively for the purpose of artistic research and is honorary member of many Austrian and foreign numismatic societies. In commemoration of his valuable services as its first director the administration of the Vienna Imperial Medal and Coin Collection issued a medal bearing Domanig's head; the town of Sterzing placed a memorial tablet, cut from native marble, on the house of his birth. He has published 'Eine katholische Burschenschaft' (2 ed. 1873); 'Der Tyroler Freiheitskampf' (3d ed. 1909); 'Der Gutsverkauf, a drama' (1890); 'Die deutsche Privatmedaille der älteren Zeit' (1893); 'Porträtmedaillen des Erzhauses Österreich' (1896); 'Die Fremden, a novel' (1898; 3d ed., 1911); 'Die deutsche Malerei und kunstharfist. Historische Studien' (1907); 'Die Entstehung von Wolframs Titulär' (1911); 'König Laurens, drama' (1912). He edited the Tyroler Kalender for three years, and Klassische Andachtsbilder, and contributed to Graf, 'The Catholic Encyclopedia,' and several anthologies.

DOMAT, dö-ma't, Jean, or DAUMAT, a French jurist: b. 1625; d. 1696. He is noted for his 'Lois civiles dans leur Ordre naturel' (3 vols., 1689-94), which Blackstone considered a monumental work. Domat also wrote 'Le Droit public' (1689; 2d ed. 1697) and 'Legum Delectus' (1700). Pascal, with whom he was on terms of very intimate friendship, bequeathed to him his private papers.

DOMBEY AND SON, a novel by Charles Dickens, published in 1848. It represents a man of proud and unbending nature who centres his lonely fortunes in his only son, but whose pride becomes broken and subdued by his child's death, family disgrace and financial ruin. Paul Dombey, Jr., is a puny child whose only companion is his sister, Florence, somewhat his senior. The two children are orphans, their mother having died on giving birth to Paul. The father, Paul Dombey, Sr., neglects the girl, and finally becomes jealous of her influence over her brother. So the boy is sent to school at the age of six with Doctor Blimber, where he sickens and dies under the strain of hard work and grief at separation from his sister. Dombey marries again, and ill-treats and neglects his wife, a proud sensitive woman, who has discovered the good qualities of the little Florence. Finally she is goaded to elope with Dombey's manager Carker. In a passion Dombey strikes his daughter and orders her to follow his wife with whom she has, he asserts, always been in league. Florence leaves home and goes to the house of Solomon Gills, where she meets her lover, Walter Gay, Gills' nephew, who has just returned from a long sea voyage. They are married, and embark on a wedding trip. In the meantime Dombey speculates recklessly and is ruined. Florence goes to him in his trouble and offers him a home, which he accepts. And there he lives his life out devoted to his two little grandchildren.

DOMBOC, döm'bök, or DOOM-BOOK (A. S. *book of dooms or sentences*), the code of laws compiled by King Alfred, who made few if any original laws, but contented himself with restoring, renovating, and adding to the code which he found already in existence. Alfred's religious character is strongly impressed on his code, which begins with extracts from the Bible. Then follow the Ten Commandments, the part of the Mosaic law relating to criminal offenses, and passages from the New Testament, including the Golden Rule. The code was ratified by the Witan, as Alfred expressly informs us. Thorpe gives it in his 'Diplomatarium Anglicanum aevi Saxonic', ('English Diplomata-rium of the Saxon Era') (1863). Consult Pauli, 'Alfred the Great,' from the German (London 1857).

DOMBROWSKI, döm-bróf'skē, Jan Hen-ryk, Polish general: b. Pierszowice near Cra- cow, 29 Aug. 1755; d. Wina-Gora, Prussia, 8 June 1818. After serving under the Elector of Saxony he returned to take part in the Polish campaigns against Russia and Prussia in 1792-94. Next entering the French service, he organized a Polish legion at Milan; and in the campaigns which followed, Dombrowski and his Poles took a distinguished part. After the fall of Napoleon he returned to Poland and was appointed by the Emperor Alexander a general of cavalry and Polish senator.

DOME. See CUPOLA; FOLDS.

DOME OF THE ROCK, a name given to the Mosque of Omar, Jerusalem. It stands on Mount Moriah, on the site once occupied by the Temple of Solomon. Immediately under its dome is an irregular-shaped rock. This rock was the scene of many scriptural events, and has been greatly revered for ages. See JERUSALEM.

DOMENICHINO, dö-mä-ne-kë'nō, or DOMENICO ZAMPIERI, Italian painter: b. Bologna only son, but son of Pietro Domenico, who had died in 1641. He was sent to study first with Calvart, and afterward with the Caracci. From the slowness of his execution he was named, by his fellow-students, the 'ox of painting'; but Anni- bal Caracci predicted that the ox would plough a fruitful field. Having contracted a great friendship for Albano he joined him at Rome, and his former master, Annibal Caracci, jealous of Guido, procured for him the execution of one of the pictures for a church which had been promised to that great painter. It was a cus- tom with Domenichino to assume, for the time, the passion he was depicting; so that, while working by himself, he was often heard to laugh, weep, and talk aloud, in a manner that would have induced a stranger to suppose him lunatic. The consequence, however, was, that few painters have so correctly conveyed representation. His 'Communion of Saint Jerome,' now in the Vatican collection, has been con- sidered, by some connoisseurs, inferior only to the 'Transfiguration' of Raphael; and the frescoes of Cardinal Aldobrandi, is a notable series. His merit excited so much envy that he
DOMESTIC INTERIOR DECORATION — DOMICILE

referred to his native city and employed himself two years on his famous picture of the "Rosary" now in the gallery of Bologna. He was afterward recalled to Rome (1621) by Gregory XV, who created him his first painter and architect of the Vatican. Losing this post after the Pope's death, he accepted an invitation to Naples, to paint the chapel of St. Januarius. But here he encountered a jealousy so rancorous that the Pope, unguarded by it; and so great was his dread of poison, that he prepared all his catables with his own hand. Domenichino, who understood every branch of his art, produced nothing excellent without study and labor; but in consequence of his great premeditation, no painter has given his pieces more of the properties belonging to the subject. At the same time his designs are correct, and he succeeded equally in the grand and the tender. Nearly 50 of his pieces have been engraved. Conrado von Breitenbach (1667); C. Landon (1823); Roncaglì (1842), and Serra (1899).

DOMESTIC INTERIOR DECORATION. See Interior Decoration.

DOMESTIC RELATIONS, in law, the legal relations existing between the members of a family or domestic group. In its widest application the term includes parent and child, husband and wife, guardian and ward, master and servant. Other classifications omit master and servant or restrict the latter term to domestic servants. The law of domestic relations embraces all those rules appertaining to the particular classes of persons above mentioned, and is a term of convenience rather than logical classification. Generally speaking, it may be said to be made up largely of the law of contract, tort and agency. It treats the subjects of marriage and divorce, the rights and liabilities of parents and children, the rights and liabilities of guardians and wards, and various allied topics. In late years much legislation has been passed on this subject in the various States, particularly so in New York, which has codified it in a statute known as the Domestic Relations Law. See Divorce; Family, Law of; Husband and Wife.

DOMESTIC SCIENCE. See Home Economics.

DOMESTICATED ANIMALS. See Animals, Domesticated.

DOMETT, Alfred, English poet: b. Camberwell Grove, Surrey, England, 20 May 1811; d. London, 2 Nov. 1887. He was the original of Browning's 'Waring.' He lived in New Zealand, 1842-71, and became a colonial statesman of eminence. His verse attracted much attention, the best specimens being in the volumes 'Sandheads,' (1872); and 'Potsdam and Jettsam: Rhymes Old and New,' (1877). Consult Gisborne, 'New Zealand Rulers and Statesmen,' (1897).

DOMICILE is the permanent, fixed home of a person, with no present intention of removing therefrom. A person traveling from one city, state or country to another may change his domicile and create a new one at every place he stops, but the place to which he intends to return and reside permanently is his domicile. Generally speaking, a person can have but one domicile at one time; but for different purposes, he may have more than one domicile at one time. Some things for which it is necessary to have a domicile are: administration of a person's estate, jurisdiction in criminal cases, and some cases of steady exemptions. Some countries of Continental Europe ignore domicile altogether, basing their rules of law as to personal status upon nationality alone. In America, the place at which a person exercises his privileges, and which he calls his home, is considered his domicile. The two things necessary to a domicile are an actual residence and a present intention of remaining there.

The place of birth is a person's original domicile, unless his parents were on a journey at the time, in which case their home is the domicile of birth. This domicile may be abandoned for another, of one's own choice. When the domicile of choice is abandoned the domicile of origin revives until a fresh domicile is again selected. After a person has once acquired an actual domicile, he does not lose it by a temporary absence, no matter how long it is continued, if he intends to return; and in cases where a person changes his domicile he does not lose the old place of domicile, until he has actually acquired the new. Intention of the person enters into the question of domicile, it is not a controlling feature; and in a change of domicile the intention must be enforced by some act, such as exercising a political right, engaging in business, paying taxes, and executing a will, according to the laws of the place; all of which are evidence of the intention to create a new domicile. When persons are married, the wife acquires the domicile of her husband; and all children born acquire the domicile of their father at the time of their birth. If a widow with minor children marries, the domicile of the children is not changed until there is an actual removal. Illegitimate and posthumous children acquire the domicile of their mother in most jurisdictions.

A person absent from home on the service of his government, such as an ambassador, consul, soldier or sailor, does not change his domicile; unless, after the service is finished, he continues to reside at that place. A convict or prisoner, a person attending a college or university, does not change his domicile. In case of war it is held that the property of an alien domiciled in a country at war with his own is liable to confiscation as that of an alien enemy. A person may acquire a commercial domicile in a place different from that in which he resides. When a person goes to a foreign country and engages in business there, he is considered a merchant of that country; and it makes no difference what the relations of the government of the countries are with one another.

A man may become a subject of a new country without losing his domicile in the old.

A guardian cannot change his ward's domicile from one country or State to another; and it is doubtful even if he can change the domicile from one county to another. The nature and purpose of the appointment of a guardian may, however, change the general rule. The appointment of a guardian will not prevent the ward from changing his domicile. The question of domicile is important in the case of
DOMINANT — DOMINIC

marriage contracts. Whether or not two persons have the capacity to marry depends on the rules of the law of domicile; but when the marriage has been validly contracted, on the rules of the law of the place where the ceremony was performed; but generally speaking, a marriage validly entered into according to the laws of the place where it is contracted is valid anywhere. Although the domicile of the wife is considered as that of the husband, yet in actions for divorce, a husband, after giving his wife a cause for divorce, cannot acquire another domicile so as to deprive her of that right. In wills, the law of the domicile of the testator governs as to the validity of the execution and the distribution of personal property; but as to real estate, if it is to pass under the will, the testator must execute the will according to the laws of the place where the property is situated. Corporations are considered as domiciled in the country or State from which they have derived their charters. Consult Bentwich, 'Law of Domicile in its Relation to Succession' (London 1911); Dicey, 'Law of Domicile' (ib. 1879); and 'Conflict of Laws' (ib. 1896); James, 'Treatise on the Law of Domicile' (Boston 1912).

DOMINANT, in music, is the fifth note above the tonic or keynote of any scale. It is always major in both major and minor modes, as its harmonies rule or determine the scale. Originally so called because in the ecclesiastical system it was the principal reciting note of the Gregorian chant. It also marks the division of the scale into two co-ordinate parts, as in a fugue when the subject commences with the tonic the answer starts with the dominant, or vice versa. In the sonata form it used to be an almost invariable rule to start the second subject in the dominant key.

The dominant chord is the major triad on the fifth of the major or minor key. Thus of C the triad would be g-b-d. A dominant seventh chord is formed by adding a minor seventh to the triad. Add f to the dominant triad given above and you have the dominant seventh of C.

DOMINE, do'min-e, the title of a minister of the Reformed churches of the Netherlands, South Africa and America, unaltered from the Latin vocative of dominus, master or lord. It is so written in all the old Dutch and American colonial documents, the form of address being often abbreviated to "Dom. auct." (oritate), pastor with authority. As many Dutch teachers went to Scotland and thousands of Scottish students and ministers for study in Holland, the term was taken and became popular in Scotland, but their domicile is spelled as in the character "Dominic Sampson." The title domine is used as a common noun, as well as an affectionate form of address in the Middle States and in the West. There are several American books with titles showing misspelling of this term, but the true orthography should be Domine to be correct.—Murdoch, 'The Dutch Domine of the Catskill,' 'The Domine's Daughter,' and 'The Domine of Haarlem.'

DOMINGO, San. See SAN DOMINGO.

DOMINIC, Saint, founder of the order of Dominicans or Preaching Friars: b. Calaroga, in Old Castile, Spain 1170; d. Bologna, Italy, 6 Aug. 1221. According to the legendary story of his life his future eminence in the church was foreshown to his mother before his birth by an extraordinary apparition of the Virgin. At 17 he entered the University of Palencia (removed later to Salamanca), and devoted himself to the study of philosophy and ancient literature. Here on one occasion he sold his cloak of fasting and took the means of relief for the poor; and he offered himself to be a slave to the Moors in exchange for a widow's only son. He stayed in the university 10 years, and, having been ordained priest, was made a member of the cathedral chapter of Osma, and in that station was the zealous assistant of the bishop in suppressing abuses in the Church. He accompanied this bishop on an embassy to France in 1203, and in passing through Provence was grieved by the extreme laxity of morals in clergy and laity and the alarming progress of the Albigensian heretical sects. Dominic vowed himself to a life of evangelical labor among those sectaries, and resolved to make all possible efforts for the correction of the evils which menaced the existence of the Church in those parts. There were already in the field legal propositions made by the Pope to win the erring back to the fold; but Dominic was scandalized by their worldly pomp, and declared that not in costly attire and with a showy retinue should they approach the misguided Albigensians and the poor men of Lyons but barefoot and without purse or scapular, and the papal envoys, persuaded by the words of the zealous evangelist, aside their state and for a while followed the examples of humility and zeal set by Dominic. But their preaching was not fruitful; they retired from the field and reported to Rome their failure. Nor was Dominic himself rewarded with much success in his 10 years' labors, though the annals of his life tell of great miracles which attended his progress through the country. Then resort was had to force, and a crusade against the Albigensian heretics was proclaimed; which was conducted by Simon de Montfort with extreme severity till, at his death in the siege of Toulouse, resistance on the part of the Albigensians was overcome. No proof exists that Dominic either prompted the crusade or had any part in it; but it is certain that he was a friend of Simon de Montfort and of his family. He quit the country in 1217, one year before the end of the war, and withdrew to Rome, where he spent the remainder of his life in organizing the order of Preaching Friars. He arranged the prayers and meditations of the devotion called the 'Rosary,' much in use by Roman Catholics in all parts of the world. He was canonized in 1234. See DOMINICANS; ROSARY. Consult Drake, 'Life of Saint Dominic.' (3d ed. London 1801); Guiraud, 'Saint Dominic' (Paris 1901); Eng. trans., New York 1901); Herkless, 'Francis and Dominic' (New York 1901); Jordanus de Saxonia (the principal source), 'Opera ad res Ordinis Praedicatorum Spec.' (Fribourg 1891); Labordare, 'La de Saint Dominique' (Eng. trans., London 1883).
DOMINICA, dōm-in-ē'kā, or DOMINIQUE, dōm-ē-nēk', West Indies, an island in the northern half of the Caribbean chain of the Lesser Antilles. (See ANTILLES.) It is the largest of the British Caribbeans, being 29 miles long, 16 miles broad, and having an area of 291 square miles; it has also the highest summit of this volcanic island chain, the Morne Diabolitom (5,314 feet), several thermal springs, and an old crater-lake about 2,800 feet above sea-level which formerly was filled by boiling water from springs bubbling up from the bottom, and every five minutes upheaving in a foaming geyser. The area of this lake was diminished by landslides which occurred in 1880, but it is still of great depth. The rainfall of the island is very abundant. The summer temperature is about 80° F.; that of winter, spring, and autumn about 70° F. An interesting part of the population is a group of Caribs (q.v.), about 400, though these aborigines are now mixed with the blacks. There are about 100 apparently pure Caribs. They inhabit the mountains of the interior, and make their livelihood by weaving a peculiar basket which is universally used in the island for carrying baggage. The blacks refer to parts of the Caribs as negroes, and the Indians, the people live near the coasts. In the luxuriance and beauty of its vegetation, Dominica excels the neighboring islands. Its soil is a rich brown mold, in which all tropical products grow readily. Of its 186,240 acres, two-thirds are crown lands, but the government has utterly failed to promote agriculture, which is now nearly ruined. Exports are cocoa, lime-juice, rum, molasses, coffee, fruit and sugar. The revenues do not equal expenditures, and taxes are increasing. In 1915-16 the revenues amounted to $253,180, and the expenditures to $284,975. Imports in 1915-16 were valued at $956,325 and the exports at $1,092,330. There are 432 miles of telephone line in operation. Dominica is a presidency, belonging to the British West Indies group, which includes also Saint Christopher, Nevis, Antigua, Barbuda, Montserrat, Redonda, and the British Virgin islands, the seat of the Leeward government being at Saint John, Antigua. The local government is conducted by a commissioner, or president, an executive council of seven members, and a legislative council of 12 nominated members. These officers exercise their authority at the small town of Roseau, which is situated on the western side of the island, and has wide and regularly paved, but deserted, streets, a botanical garden, a public library, and French (Catholic) and English churches. The name of the island (from Spanish Domingo, Sunday) is due to the circumstance that Columbus discovered it on the first day of the week, 3 Nov. 1493. The warlike Caribs retained control of it during two centuries, but little by little French settlers gained a foothold, and in the 18th century its possession involved the importance of French prestige in the West Indies, owing to its situation between the important dependencies of that country, Martinique and Guadeloupe. For that very reason the English insisted upon its surrender, in the final balancing of international accounts after the imperial wars, early in the last century. Many laborers have migrated to North and South America in search of employment. Pop. 36,045.

DOMINICAL LETTER (from Lat. Dominicus, Sunday), properly Sunday letter, one of the first seven letters of the week, used in calendars to designate the Sundays throughout the year. The ancient Romans used the first eight letters. A–H, to denote their only period of eight days; the early Christians dropped the eighth and adopted the remaining seven to indicate for all the year; a six-day week. These seven letters are employed to show on what days of the week the days of the month fall throughout the year. One of those seven letters must necessarily stand against Sunday, and is printed as a capital, and called the dominical letter or Sunday letter; and the other six being inserted in different type, to denote the other six days of the week. Now, since a common Julian year contains 365 days, if this number be divided by seven (the number of days in a week), there will remain one day. If there had been no leap year, then one day of the year would constantly begin on the same day of the week; but since one remains, it is plain that the ordinary year must begin and end on the same day of the week; and therefore the next year will begin on the day following. Hence when January begins on Sunday, A is the dominical or Sunday letter for that year; then, because the next year begins on Monday, the Sunday will fall on the seventh day, to which is annexed the seventh letter, G, which therefore will be the dominical letter for all the next year; and as the third year will begin on Tuesday, the Sunday will fall on the sixth day; therefore F will be the Sunday letter for that year. Whence it is evident that the Sunday letters will go annually in retrograde order, thus, G, F, E, D, C, B; A; and in the 18th and 19th years, if there were all common ones, the same days of the week and dominical letters would return to the same days of the months. But because there are 366 days in a leap-year, if the number be divided by seven, there will remain two days over and above the 52 weeks of which the year consists. And therefore, if the leap-year begins on Sunday, it will end on Monday; and as the year will begin on Tuesday, the first Sunday thereof must fall on 6 January, to which is annexed the letter F, and not G, as in common years. By this means, the leap-year returning every fourth year, the order of the dominical letters is interrupted, and the series cannot return to its first state till after four times seven, or 28 years; and then the same days of the month return in order to the same days of the week as before. This method of indicating the days has held its place in Church calendars without variation from the beginning, and rules for finding them are given in breviaries, prayer books, etc.

DOMINICAN REPUBLIC. The Dominican Republic, West Indies, occupies the eastern and central portions of the island of Santo Domingo, or Haiti: bounded on the north by the Atlantic Ocean, on the south by the Caribbean Sea, on the west by the republic of Haiti, and separated by Mona Passage from
DOMINICAN REPUBLIC

Porto Rico on the east. Area about 19,325 square miles.

The mountains — the centre and culmination of the Great Antillean uplift — form several cordilleras or roughly parallel ranges. The highest peak, Mount Tina (10,300 feet), is northwest of Santo Domingo City, and near the centre of the island are numerous peaks from 8,000 to 9,000 feet high. While the enormous mass of these mountains, occupying four-fifths of the island, renders much of the territory nearly inaccessible, between the ranges lie plains, some of which are wonderfully fertile, but others are without value for agriculture. Toward the north and west are the famous, Vega Real and the sterile plain, Despoblado de Santiago; near the south coast the rich valley of Bani, which extends between the Nizao and the Ocoa; and in sequence the valleys of Azua, San Juan, or Antigua Maguana, Santo Tomé, Oncey, Hina, Quava, and others. Toward the east, extending even to Cape Engaño is a region in which the praderias or llanos — valleys, meadows or plains — are most common. The ridge of the Cibao Mountains sinks to a height of only 1,000 feet at its eastern end.

The Ozama and Isabel rivers unite to form the port of Santo Domingo after receiving the waters of many smaller streams, such as the Yavacaco, the Monte Plata and the Savita. The Haina, or Jana, which empties into the sea about 10 miles west of the capital, and the Nigua, whose course is still farther toward the west, enclose a very beautiful plain which was a source of wealth during the Spanish period. The Nizao flows southward between fields of sugar-cane and meadows where herds of cattle graze. At its mouth at La Quillota, Yuna, Naranja, and Magua. The coast-line, about 940 miles in extent, includes the Bay of Samana — a well-sheltered harbor extending westward from the Mona Passage, its average width being 12 or 13 miles and its length more than 120 miles. This bay would accommodate the largest fleets, and defensive works placed at its entrance would make it practically impregnable. Its strategic value is so great that it should be reckoned one of the republic's chief assets. Other ports are: on the north, Puerto Plata and Monte Cristi; on the south, Santo Domingo and Azua.

The geology of the island is similar to that of the eastern ends of Cuba and Jamaica. There are four principal formations: "the older mountain rocks, of Cretaceous and Tertiary Age, made up of igneous rocks and clays, mantled by gravels and crystalline limestone; the white limestones of Tertiary Age; recent alluvial formations; and the coal deposit of elevated reef rock. No recent volcanic rocks are known." The Spaniards obtained large amounts of gold and silver, especially the former, from mines worked during the early years of colonization. Recent reports made by American experts are not especially favorable with regard to these two metals. The fact seems to be that gold exists quite generally, but not in paying quantities. The mining of silver is of real importance. The profits of the old mines were won by the labor of native and African slaves. Copper, iron, manganese, platinum, tin, lignite, salt and petroleum are found; and the analogy of the Oriente mining region in Cuba would suggest that the deposits of the first three metals deserve particular attention.

The diversities of both soil and climate are greater than elsewhere in the Antilles. The Vega Real is fertile and well-watered; the Santiago plain, its western prolongation, is a desert. The soil of the western part of the plain of Suyo is gravelly, while that of the eastern part is composed of loams and clays. The country immediately surrounding Azua and the best sugar estates on the island are only three miles away; and the sugar-lands of no other West Indian island can quite rival in fertility the Dominican Republic's best. The climate of this country is healthful, like that of Porto Rico and other large islands in the West Indies. Trade winds blowing most of the year make the nights cool, and only a short part of the day must be called intensely hot, particularly in low-lying and sheltered regions. The dry season extends from the first part of December to June. During the other months the rainfall is as a rule abundant in the central and northern districts, especially in the northeast, which is probably the most fertile section of the entire country.

Cedar, lignum vitae, mahogany, and other cabinet-woods and timber used in house- and ship-building, are taken from the forests. The most luxuriant growths, however, have no present commercial importance, because adequate means do not exist for bringing them from the interior regions to the coast. As in other parts of the Antilles, the forms of vegetable life are varied and of special interest, while the reverse is true of the fauna.

History.—Columbus on his first voyage to America visited the north coast of the island and left a few of his men. These were killed by the natives; but the colony of Isabel, established on his second voyage, endured until the colonists were transferred to a more healthful locality. The settlement on the south coast began at Santo Domingo. Spanish settlements existed also at Concepción de la Vega, Puerto Plata, Santiago de los Caballeros, and Bonao in the first decade of the 16th century. The cultivation of sugar-cane began in 1506. Three years later Christopher Bar-tholomew Columbus was imprisoned by Bona-di'lla in the citadel of Santo Domingo. The natives were set to work in the mines and fields; and very soon shiploads of Indians were being transported from other islands to replace those who died under the hardships of this forced labor. Subsequently negroes were brought from Africa for the same purpose, a considerable number of black slaves reaching the colony before 1522. There was a short period of prosperity. Before the middle of the century, however, the most enterprising colonists were driven away by the Spanish settlements of Mexico and Peru, and the country began to suffer from the attacks of English and French buccaneers, who established their headquarters on a small island near the northwest corner of Haiti. In the course of a century and a half the population of the Despoblado, now known as the Republic of Haiti, was won for France. The Spanish government at the close of the 18th century abandoned the eastern section as well, the entire island passing first under French control; but soon afterward the
successes of Tousaint L'ouverture and Dessalines united west and east in one country, independent of the European powers and governed by the black revolutionists of Haiti. Between 1809 and 1821 Spain again held the eastern section, and the old name Santo Domingo was revived with that limited application; but in 1821 a treaty was signed by which the Spanish part of the island revolted. The eastern and western sections were united from 1822 to 1843, together forming the Republic of Haiti. The final separation took place in 1844, when the Dominican Republic was established. Spain resumed her bonds towards the west part in 1850. A brief period (1861–65). With that exception, the struggles through which the country has passed since 1844 have been due either to revolutions or to Haitian antipathy. In 1869 a treaty for the annexation of the Dominican Republic to the United States was negotiated during General Grant's presidency, but was defeated in the United States Senate. A revolution which drove President Baez into exile expressed the resentment of the Dominicans when this failure was made known. Comprehensively, good order was maintained for a few years, beginning in 1890, but the most violent methods were again employed by political leaders in 1896–98, and continued in 1902–03. President Jimenez was forced by a revolutionary uprising to resign his office in May 1902. His successor, Vasquez, was driven from power early in May 1903, after severe fighting, attended with heavy losses. Señor Morales became President in 1904. Defaults in the payment of interest to European holders of Dominican bonds brought about a crisis in 1911. President Caceres was assassinated, and an revolution necessitated the resignation of his successor in 1912. Archbishop Nouel served as provisional President for part of a year. The next administration, that of President Bonnet, included such events as the bombardment of Puerto Plata on two occasions by government forces and the agreement (1914) secured by an American mediatory commission for the establishment of a provisional government, with Dr. Ramon Baez as President. Elections were held under the supervision of the United States. Juan Isidro Jimenez was inaugurated as President 5 Dec. 1914. In April 1915, a new revolution broke out on the island and American gunboats were ordered to Santo Domingo City to maintain order. Revolution again became active early in 1916 and the revolutionists gradually extended the sphere of their operations. Jimenez found trouble also in Congress and he was finally impeached by the latter 1 May 1916, and, as a result, he resigned the presidency a week later. In 1915 American marines entered Santo Domingo City to guarantee free elections. The following June Congress appointed Jacinto de Castro President. Marines had also been landed at Puerto Plata owing to the activity of the revolutionists in the neighborhood and in other parts of the island. By an agreement reached with the revolutionists Francisco Henriquez y Carbajal was appointed provisional President (26 July), and at the general elections (15 August) he was elected President for a term of five months. Trouble broke out again and the United States intervened formally in the government of the country in November. The revolutionists were defeated by American forces in November. Representatives of the United States government continued in control of the affairs of the Dominican Republic. A military commission was appointed early in 1917 to study the needs of the diplomatic service and the system of public education, and a new and a better are the functions of Congress and President. Government and Progress.—The constitution vests the executive power in a President chosen by an electoral college for a six-year term. Under the present constitution, which went into effect 1 April 1908, the Congress designates a person to take charge of the executive office, in the event of the death or disability of the President. There is no Vice-President. The cabinet consists of Secretaries of Interior and Police, of Foreign Affairs, of the Treasury and Commerce, of War and Marine, of Justice and Public Instruction, of Agriculture and Immigration, and of Encouragement (Fomento) and Communications. The Congress is composed of Senate (12 members, one from each province) and Chamber of Deputies (24 members, two from each province), both senators and deputies being elected by indirect vote, the former for six and the latter for four years. The judiciary consists of a Supreme Court (eight members, appointed for terms of four years), two courts of appeal, etc. Free primary instruction is offered by the communes, with the aid of the central government; the system including also superior technical and normal schools, and a professional school or university. The State religion is the Roman Catholic, but there is toleration of other religions. The legal currency has been the American dollar since 1900, but before the American intervention the country possessed a very inadequate amount of metallic and paper currency which has since been withdrawn. Certain native banks were invested with the power of issuing notes, but so great was the national distrust that their currency was never accepted. The circulating currency medium of the Republic is Puerto Rico and United States money. The chief banks are the Banco Nacional de Santo Domingo and the Royal Bank of Canada. The International Banking Corporation acquired the established banking business of the Santiago Micheleno in the Dominican Republic, with
head offices at Santo Domingo City and several branches and agencies in other parts of the island. The Michenea Bank was the depository for customs revenues under the arrangement between the governments of Santo Domingo, the United States, and the Inter-American Banking Corporation succeeded to it in that capacity. There are also a few private bankers and merchants engaged in the banking business. The republic has two principal debts, both guaranteed by customhouse duties, one of $20,000,000 at 5 per cent interest and the other of $1,500,000 at 6 per cent interest. An additional debt of $243,000 makes the total indebtedness $21,743,000 in 1916. This debt is being steadily reduced since the United States assumed the management of the financial affairs of the republic. The government's revenue is derived from customs, alcohol and stamp taxes, wharf duties, posts and telegraphs, and civil registration. In the fiscal year 1916-17, total receipts were estimated at $4,468,000 and disbursements $4,446,557.

The principal exports of the Dominican Republic, which are rapidly increasing, are sugar, cacao, tobacco, coffee, hides, wax, honey, bananas, and other tropical fruits, cotton, minerals, cabinet and other woods. The high price of sugar has stimulated the production of sugar cane, the yearly output of which, in normal times, is worth about $5,000,000. The cultivation of cacao and coffee is also on the increase, and more attention is being paid to the raising of cattle. The principal imports of the republic consist of iron, steel, cotton goods, wheat flour, rice, meats and dairy products, oils, raw and manufactured woods. The greater part of the export and import trade is now with the United States.

The railways of the republic have an extent of about 176 miles; private lines on large estates about 225 miles. There are 402 miles of telegraph and 847 of telephone lines. The difficulties of communication between the various districts of the country, primarily due to the cordilleras, are in large part attributable to the lack of good highways, without which peace will never be assured. There is a steamship service between New York and Dominican ports, but the vessels are, as a rule, small and slow. There is also regular steamer service between Santo Domingo, Porto Rico and Cuba. A rural guard (nominally 906 officers and men) supplements a military force numbering about 1,300. The government has six small vessels, four of which are revenue cutters.

The number of inhabitants in 1917 was 724,500, or 57½ per square mile. The Despoblado region — the nearly uninhabited districts of high mountains, inaccessible valleys and virgin tropical forests — comprises, roughly speaking, the central third of the entire area of the island, or one-half of the Dominican Republic. It is bordered east and west by the Haitians and the troops of the Dominican Republic. The people of the latter country, of blended Spanish, Indian and negro blood, with the small proportion of white descendants of the Spanish colonists and foreign merchants, occupy an area that is much more restricted than a glance at the map would suggest.

The Dominican Republic is divided into 12 provinces. Among the principal cities of the country are Santo Domingo (the capital), 26,000; Santiago, 20,000; Puerto Plata, 16,000; San Pedro de Macoris, 15,000; Samana, 6,000; Sánchez, 5,500; La Vega, 5,200; Agua, 5,000; Moca, 4,900; Monte Cristi, 4,500.

MARRION WILCOX.

DOMINICAN REPUBLIC, Diplomatic Relations with. The United States first became interested in Santo Domingo through friendly trade arrangements secured in 1799 from Toussaint (the revolutionist), through Southern fear of the influence of free negroes from that island and in connection with the designs of Napoleon, whose failure there was a prominent cause of the American acquisition of Louisiana. Later, in 1822, the American government was interested in Santo Domingo's declaration of independence from Spain and its union with Haiti, but avoided formal recognition of a government founded on slave insurrection. Again in 1844 it was interested in the formation of the Dominican Republic (under Santana) by separation from Haiti, and the adoption of a constitution modeled on that of the United States, and was also attracted by the international importance which the new republic might have on account of its harbor facilities; but it withheld recognition and continued to refuse recognition until 1865.

From 1844 to 1869 American relations with the Dominican Republic centered around two questions: negotiation for a naval coaling station for American steamers and the danger of foreign intervention. In February 1845, in response to reiterated appeals for the American recognition and protection against Haiti, John Hogan was sent to report on conditions in the island. In 1846, D. D. Porter was sent on a similar mission with instructions to ascertain the value of certain privileges which the Dominicans were willing to accord. Later, in 1849, information was received that the Dominican Republic desired aid from the United States to frustrate European designs.

In 1851, the Dominican government having solicited the mediation of the United States, France and Great Britain to secure peace with Haiti, President Fillmore sent R. M. Walsh as a special agent to co-operate with the representatives of France and Great Britain in a remonstrance with the view of possible joint intervention. The view was much more restricted than a glance at the map would suggest. The Dominican Republic is divided into 12 provinces. Among the principal cities of the

Though the United States government,
under President Fillmore's administration, had the opportunity and power to obtain a foothold in Dominican territory, and was much in need of a naval station in Samana, its rule of policy was to avoid all disturbance of existing political relations in the West Indies, recognizing that any attempt of any great maritime power to get exclusive advantages might result in competition with other powers, which would make the West Indies a theatre of national competition, and which might disturb the peace of the world.

The policy of the American government changed somewhat under President Pierce. Unsuccessful efforts were made to negotiate a general treaty. A treaty of amity, commerce and navigation containing a secret article for the session of Samana Bay was negotiated by October, but it failed to receive the sanction of the Dominican Congress. In April 1861, when it appeared that Spain by co-operation of President Santana had plans for the establishment of a protectorate in Santo Domingo or for annexation to Spain, the American government, through Secretary Seward, and later Mr. Colfax, the Secretary of State, advocated that Spain would oppose such enterprises on the American continent by persistent effective resistance. In 1863, in the struggle under Cabral against Spanish authority in the island, the American government remained neutral, but conditions finally induced Spain to abandon the island in April 1865, and the independence of the newly-established republic was recognized by the American government in September of the following year.

In the period of the American Civil War, in connection with the need of a naval base to meet difficulties in the blockade of Southern ports held by the Confederates, the American government became interested in San Domingo for its excellent harbor. Between 1865 and 1871 the question of the acquisition of a naval base at Samana, or of American annexation of the Dominican Republic, was a prominent one.

In 1869-70 the American government, acting on confidential information and invitation from the Dominican Republic took steps to secure control of at least a part of the republic and, through General Babcock and the American consular agent, negotiated a treaty for the lease of Samana Bay and ultimate annexation, which was defeated in the Senate by a tie vote on 30 June 1870.

In 1871 President Grant, acting under a joint resolution of Congress, passed at his suggestion, appointed a committee of three (A. D. White, B. F. Wade and Samuel G. Howe), which, after investigation, recommended (April 1871) that Grant's policy had a good basis and should be sustained, but largely through the influence of Sumner, the Senate failed to adopt the resolution.

In 1896 Secretary Olney recommended that the missions to Santo Domingo and Hayti should be put on a permanent footing. Late in 1899, after the assassination of Heureaux, who had been dictator for 17 years, the American government recognized the new de facto government. The Dominican government frequently invited the aid of the United States. In 1899 it invited a treaty arrangement for placing the unhappy republic under the protection of the United States, but the American government declined. In 1903 the American government declined a proposal made by a representative of a foreign government for joint fiscal control of Santo Domingo under an American receivership.

Near the close of 1904, certain European powers intimated that they would be compelled to resort to measures to coerce the Dominican government to pay its indebtedness to European creditors, unless the American government would arrange to collect the Dominican customs and guarantee an equitable distribution of the revenue. With credit designations abroad and by treaty on the verge of anarchy, President Morales appealed to the United States to shield his country from foreign interference.

In accord with a protocol concluded by President Roosevelt with Santo Domingo in February 1905, and under a consequent executive-interim modus vivendi, an American receivership was established under the protection of the American navy. The result proved satisfactory in the improvement of conditions. The American Senate, which opposed the territorial-guarantee clause of the treaty (1903) (in 1907) ratified a revised treaty which recognized the importance to the United States of orderly conditions in the island by authorizing the President to appoint a general receiver of the Dominican customs and to furnish any protection necessary.

The American policy — resulting in a practical test of the efficiency of the American government, in preserving order by intelligent direction, and in maintaining the Monroe Doctrine which had recently been restated by American writers — undoubtedly prevented serious difficulties, removed the incentive to revolution, stimulated industry and labor, permitted the President to die a natural death and furnished new evidence in favor of the establishment of a permanent protectorate or right of intervention over the weaker Latin-American states, similar to that guaranteed by the Platt amendment in the American treaty with Cuba.

In outbreaks in 1912 and 1914, American commissioners were sent to restore order in the Dominican Republic.

JAMES M. CALLAHAN.

DOMINICANS, or FRIARS PREACHERS, or PREACHING FRIARS (Fratres Predicantes), the religious order founded by Saint Dominic. While laboring in Provence for the conversion of the Albigenses, Dominic associated to himself 16 disciples eager, like himself, to devote their lives to the work of reclaiming heretics and ministering to the spiritual needs of the poor and ignorant. In 1215 he visited Rome to obtain from the Holy See approval of the institute he proposed to form. Of the 16, 8 were French, 6 Spanish, 1 Portuguese and 1 English. The Pope (Innocent III), in conformity with the decree of the Fourth Lateran Council, then in session, against approval of new religious orders, refused again and again his consent, but at last promised to give his approbation on the condition that the friars should adopt as their own the monastic rule of the Augustinians. The condition having been fulfilled, the order was formally approved in 1216 by Innocent's successor, Honorius III. The order took definite shape in two general chapters at
Bologna in 1220 and 1221. The costume of the friars was to resemble that of the Augustinians, and to consist chiefly of a black cassock and rochet; but a few years afterward this was changed for the white habit and scapulary with outside black mantle, which is still the costume of the Dominicans. Their name Black Friars was given them because of the black mantle worn out of doors. The memory of their great monastery in London is preserved in the name Blackfriars Bridge. Houses of the new order were, in a series of years, founded both in England and Italy; and in 1221 was held the first general chapter of the order at Bologna in which were represented 60 convents of preaching friars. That same year arrived in England the first band of Dominicans, 12 of the brothers in charge of Gilbert de Freney. At this chapter an addition was made to the rule of the order, by which the Dominicans were forbidden to hold any possessions or have any fixed incomes, but to live by the voluntary alms of the people. Thus the friars were mendicant friars like the Franciscans. All the universities were opened to the young scholars of the order, and soon many preaching friars attained the foremost rank as philosophers and divines. Among the more eminent of these was Dr. Thomas Aquinas, often called Thomas of Rome, the greatest of the Dominicans. His avarice made him unpopular in England, and in 1620 he opened negotiations with a view to a return to the ancient faith; and was finally brutally ordered to leave the kingdom. He returned to Paris, and was received by the Council of Trent as the most excellent of the Spanish Ambassador at London, who led him to believe that he would be welcome there and would be raised to the cardinalate. He had published at Brussels a recantation of his subscription to the Anglican articles of religion, but his hopes were disappointed, and in letters to his friends in England he recanted his recantation: but the letters never reached their destination, having been seized by the papal officers. He was thrown into prison by order of Urban VIII and there died 1624. After his death he was adjudged a heretic: his body was disinterred and burned, and the ashes thrown into the Tiber. In 1611 was published his tract, 'De Radiis Visus et Luces in Vitis Perspectivi et Tride' ('Of the Rays of Vision and Light in Perspective Glasses, and the Rainbow'), in which is probably for the first time propounded the true theory of the rainbow.

DOMINION (Lat. dominus, a master) in Roman law, the right by which any one exercised control over property, and by which he was entitled to retain or alienate it at pleasure, as opposed to a mere life interest, or possessory or equitable right. Dominium directum, in feudal law, is the interest or superiority vested in the superior; and dominium utile is the interest in property vested in the vassal, which amounts to the right of merely using it (see SERVITUDES, USUFRUCT) as distinguished from that of his lord's ownership and supremacy.

DOMINO. See MASK.

DOMINO WHIST. See FIVE OR NINE.

DOMINOES, a game played with small flat oblong pieces of ivory, bone or wood, the full number of pieces being 28. They are marked with spots varying in number and shape. Each domino has two sets of spots ranging in number from 0 up to 12, which are distributed in all possible combinations — 0–0, 0–1, 0–2, 0–3, etc., to 0–12; then 1–1, 1–2, 2–2, 3–3, and so on up to 12–12. Those which have the two sets of spots alike — 2–2, 3–3, etc. — are called double tweos, double threes, etc. The game is to appear
remarkably simple, but is played in a variety of ways. The general principle of all the varieties is that when one player leads by laying down a domino, the next must follow by placing alongside of it another which has the same number of spots on one of its sides. Thus if the first player lays down 6-4, the second may reply with 6-7, 4-6, etc. In the former case he must turn in the 4, placing it beside the 4 of the first domino, so that the numbers remaining out will be 6-8; in the latter case he must turn in the 6 to the 6 in like manner, leaving 4-7, to which his opponent must now respond. The player who cannot follow suit loses his turn; and as the object of the game, modified by special conditions in the different varieties, is to get rid of all the dominoes in hand, or to hold fewer spots than your opponent when the game is exhausted by neither being able to play, it is a special point of play to shut out your opponent when it can be done without injury to your own hand. The game, which is probably of Italian origin, was not known in Europe until well on in the 18th century.

DOMINUS, the Latin word which we commonly render by Lord, and which was a title given to the Roman emperor, but which more properly signifies the master of a house and his eldest son, as opposed to slave (servus). The Scottish dominie, in the sense of schoolmaster, is of course taken from it, as is the same term in America, where in some places it is the title of a minister of the Dutch Reformed Church, and in others is applied to Protestant clergymen generally.

DOMITIA, do-mish’t-ä, Roman empress: b. Gaul about 56 a.d.; d. Rome about 100 a.d. She was the daughter of Domitius Corbulus, a general of Nero’s reign. She was married first to Ælius Lamia, but the Emperor Domitian took her for his wife. Finding that her new husband intended to have her executed she caused his assassination in 96 a.d. Her subsequent career is uncertain.

DOMITIAN, Titus Flavius Domitianus Augustus, Roman emperor: b. Rome, 24 Oct. 51 a.d.; d. there, 18 Sept. 96 a.d. He was a son of Vespasian and brother of Titus and made himself odious, even in youth, by his indolence and voluptuousness and his cruel, malignant and suspicious temper. He became emperor 81 a.d. At first, indeed, he deceived the people by acts of kindness, good laws and a show of justice, so that their fears vanished; but he soon returned to his former excesses and cruelty. Agricol’s victories exciting his jealousy, he recalled that general to Rome and kept him in total inactivity. At the same time he spread terror through Rome by the execution of a great number of the first citizens. He gave himself up to every excess and to the meanest avarice. He at last conceived the mad idea of arrogating divine honors to himself, assumed the titles of Lord and God and claimed to be a son of Minor. His principal amusement consisted in the shows of the circus. The misery of the people was, meanwhile, continually increasing; and after the revival of the law against high treason, which enabled almost anyone to be convicted into this crime, no one was secure of his property or his life. A paper fell into the hands of his wife, Domitia, in which she found her own name and those of the two commanders of the Praetorian Guards, with many others, noted down by the emperor as victims. This discovery induced her to conspire against him and he was killed by a freedman named Stephanus.

DOMREMY-LA-PUCELLE, dön-ra-mé-lä-pü-sél (original, Domremy; La Pucelle, that is, The Maid, has been added in honor of Joan of Arc), a small village in the department of the Vosges, in France, not far from Vaucouleurs, on the river Meuse. It is noted for being the birthplace of Joan of Arc (1410). The village contains a bronze statue of the heroine, and another monument to her and the cottage in which she was born still stands. A chapel on a neighboring hill marks the spot where she is said to have learned of her great mission. There is here also a museum. Domremy was exempted from taxation till the Revolution, in honor of its native, and in her honor also an annual pageant is held.

DON (Lat. dominus), a Spanish title of honor, originally given only to the highest nobility, afterward to all the nobles and finally used indiscriminately as a title of courtesy. It corresponds with the Portuguese Dom. During the Spanish occupation it was introduced and became naturalized in some parts of Italy, particularly in Naples.

Don is also a cant term applied in the universities of Oxford and Cambridge to a residential fellow or other college dignitary; and in the colleges of the United States to a professor or instructor.

DON, a river in the county of Aberdeen, Scotland. Its source is several small streams flowing from a bog about 1,900 feet above the sea. It flows east (parallel with the Dee) into the North Sea, a mile northeast of Old Aberdeen. It is about 82 miles in length. Its salmon fisheries are of considerable value.

DON (ancient Tanais), a river of Russia which issues from Lake Ivan-Ozero, in the government of Tula, and flows southeast and southwest about 1,500 miles into the Sea of Azof, near the town of Azov, by two branches of which only one of which is navigable. Its ordinary breadth is from 500 to 1,850 feet, but it has a breadth of 18 miles during the spring floods, although droughts reduce it so much that it is very difficult in summer, even for light draught vessels, to negotiate the sandbanks and shallows. Generally speaking, the right bank is high and the left flat and low. The delta of the Don is an expanse of sandy flats, about 28 by 22 miles at the coast-line. Near its head is the important river-port of Rostov, and Taganrog also shares in the Don traffic. The Don has the most busy trade of all the rivers of South Russia, being navigable for 800 miles. The navigation is generally stopped by ice for about three months of the year; but by means of its lower course, in connection with the Volga, the south provinces of Russia receive much Siberian produce and also manufactured goods from the interior of the empire. It has valuable fisheries. It is connected with the Volga by a canal. Its largest tributary is the Donetz or Little Don.

DON, or DUN, a river of the West Riding of Yorkshire, England, which rises near Cheshire, flows east and southeast and joins
the Ouse after a course of about 55 miles. By artificial cuttings and canals it has been rendered navigable for vessels to Sheffield, a distance of about 40 miles. From Snaith to Goole the channel is artificial and is known as the Dutch River.

**DON CARLOS.** See Carlos.

**DON CÉSAR DE BAZAN,** dön sâ-zâr dè bâ-zâr, the title of a French comedy by Dumas and Demery (1844), founded on a portion of Hugo’s play, ‘Ray Blas.’ Don César is a ruined nobleman who changes his name, and in rags conducts himself with the happy, devil-may-care nonchalance of his better days. It is also the title of a comic opera by Massenet, produced in 1872.

**DON GERARD,** Dutch painter. See Dow, Gerard.

**DON GIOVANNI,** dön jô-vân’nê (Italian form of Don Juan, the name of the hero), the title of an opera by Mozart, considered his masterpiece, produced at Prague 29 Oct. 1787 (q.v.).

**DON GIOVANNI,** opera buffa in two acts by Wolfgang Amadeus Mozart (libretto by Da Ponte), first produced at Prague on 29 Oct. 1787. While a buffa opera according to the terminology of the day, or *dramma giocoso,* as Mozart called it, the buffa elements are transfigured by the power of genius and ‘Don Giovanni’ has been universally accorded recognition as one of the musical masterworks of all time. All of the great composers have paid it homage. Rossini, placing his hands solemnly on an autograph copy of the score, said: ‘He is the greatest, the master of them all; the only composer who had as much science as he had genius, as much genius as he had science’; while Wagner wrote: ‘Is it possible to find anything more perfect than every piece in Don Juan?’ Based on an old subject, that has done service in many literatures, the book of the opera, in spite of certain weaknesses, is an admirable vehicle for musical treatment; but Mozart invested it with a tragic power that carried it to heights undreamt of by the librettist. The overture which at the outset prepares the way with its Mahlerian and grotesque evocations was written in a single day—one of those miracles of musical creation of which Mozart performed so many. The opera is popularly assumed to be merely a string of musical numbers, connected by recitative, instead of a serious dramatic work; and the usual style of performance is largely responsible for this notion. As a matter of fact, Mozart excelled in dramatic characterization, and great as is the sheer musical beauty of the opera, still more wonderful, from the musician’s standpoint, is its subtle reflection of character expression. One has only to recall the trio in the first act when the Commandant is killed, the duet ‘La ci darem,’ the serenade ‘Dalla殊ntri,’ the drinking song ‘Fin ch’han dal vino,’ Zerlina’s ‘Batti, batti,’ to see how wonderfully the music heightens the power of the situations. The ballroom scene is a triumph of contrapuntal skill concealed under a simple exterior. The whole work is filled with touches that reveal the composer’s genius at its best and superlatives fade before it. The orchestra, with the utmost economy of means, is as flexible and responsive an instrument as the great aggregations employed by the most modern composers. An excellent illustration of this is furnished in the accompaniment to Leporello’s ‘Madama’ aria — the catalogue aria, as it is sometimes called. In 1825 Manuel Garcia, a famous singer, and the head of a remarkable family of musicians, brought an Italian opera company to New York. At that time Da Ponte, the librettist, then an old man, was living there — having left Europe to escape importunate creditors. ‘He called on Garcia and on learning his identity, the singer clasped him in his arms and danced around like a child, singing ‘Fin ch’han dal vino.’ The opera was at once included in the repertory and it was produced on 23 May 1826, with Manuel Garcia himself in the title rôle and his daughter, later to become world-renowned as Malibran and two other members of the family also taking part. Its success was immediate and permanent. In spite of the vast strides music has taken in the past hundred years, ‘Don Giovanni’ still remains an ever fresh fount of inspiration.

**LEWIS M. ISAACS.**

**DON JUAN,** dön jû’ân, Sp. dön hw-ân, the hero of a Spanish legend who has also some historical basis in the history of a member of the noble family of Tenorio at Seville. According to the legend Don Juan was a libertine of the most reckless character. An attempt to seduce the daughter of the governor of Seville brought the indignant father and the profligate don into deadly conflict, in which the former was slain. Don Juan afterward, in a spirit of wild mockery, goes to the grave of the murdered man and invites the statue of him erected there to a revel. To the terror of Don Juan the ‘stony guest’ actually appears at the table to bear him away to the infernal world. The tale has furnished the subject for many dramas and operas. The legend first took definite form in Gabriel Téllez’s ‘El Burlador de Sevilla’ or ‘Don Juan de la Encina,’ produced in 1650 versions of this drama appeared in Italy from the hands of Cicognini and Gliberti. In rapid succession appeared Dornold’s ‘Féstín de Pierre’ (1658), De Villiers’ ‘Le festin de Pierre’ (1660), and the Spanish ‘Marina,’ about which the versions by Rosimond and Thomas Corneille, Cokain’s ‘Tragedy of Ovid’ (1669) and Shadwell’s ‘The Libertine’ (1676). It was used repeatedly as a theme for opera in Italy, first by Gluck, and later by Righini, Cimarosa, Albertini, Gazzaniga and others. The greatest of all, however, was Mozart’s ‘Don Giovanni.’ In modern days the legend has been used by Prosper Mérimée in his ‘Les Ames du Purgatoire,’ by Dumas in the drama ‘Don Juan de Marana,’ also by Byron, D’Auverville, Balzac, etc., and by Bernard Shaw in ‘Man and Superman.’ The best and most stirring modern treatment of this legend is that by José Zorrilla, entitled ‘Don Juan Tenorio;’ drama fantastico-religioso. It has become universally popular in Spain, where it is staged annually in practically every playhouse in the country about the festivals of All Saints and All Souls on 1 and 2 November respectively. Consult Engel, ‘Die Don Juan-Sagen’ (Dresden 1887); Farinelli, A., ‘Don Giovanni at His Best’ (Philadelphia 1886); Gendarme de Bévotte, ‘La Légende de Don Juan’ (Paris 1906); ‘Le Festiv
DON JUAN, a drama in prose by Molière, was first acted by his own company at Paris, 15 Feb. to 20 March 1665, with a success rivaled only by that of 'Tartuffe.' It aroused opposition at court hardly less bitter and tenacious, was withdrawn from the stage and first published, altered for the worse by the censorship, in 1682, nine years after Molière's death. Three copies of the unaltered version survive. An edition printed in Amsterdam in 1683 and reproduced in Brussels in 1694 presents the whole drama in form before excisions had been made by Molière, after the first presentation, in hope of placating powerful offended offenders. Don Juan's origin is in an Andalusian legend of uncertain date. Here Juan Tenorio, a degenerate descendant of one of the Twenty-four of Seville, abducts the daughter of Commander d'Ulio, kills him, insults his statue on his tomb, which coming to life sends Juan to subterranean flames. Early in the 17th century this legend was dramatized by Brother Gabriel Tellez of the Order of Mercy, under the name Tirso de Molina, as 'El Burlador de Sevilla y Convidado de Piedra' (The Seville Deceiver and the Stone Guest). This was adapted to Italian taste by Giliberto at Naples in 1652 and by Cicognini at Florence before 1664 with the title 'Il Convito di Pigna.' One of these plays was acted in Italian at Paris in 1657. A French version by Dorimond was acted at Lyons in 1668, another by Villiers soon after at Paris, both with the inept and mistranslated title 'Le Festin de Pierre' (Peter's Feast). The play was a popular success. Molière, unable to produce 'Tartuffe,' urged him to use it and 'Le Festin de Pierre' was the original title of the play now known as 'Don Juan,' written in evident haste, one of the most lowness constructed of his tragedies. Molière, for psychic penetration and strength in presentation of character ranking with 'Tartuffe' and 'Le Misanthrope' as chief among his comedies. The subject was treated dramatically in France during Molière's life also by Gueultte and Rosimond. Thomas Corneille versified and mollified Molière's prose in 1677. This version held the stage till 1841. Since 1847 the original Molière rules unchallenged in France. In episodes masterful but not dramatically linked 'Don Juan' presents an awesome picture of a wicked man of power, fascinating and abusing the despairing love of his wife, horrifying his ignorant and self-seeking but honest-hearted servant Sganarelle, whose part was taken by Molière, deceiving with facile protestations two false or unoccupied suitors. Guided by the most successful beggar to curse and tossing money to him at last with a jeer at 'the love of humanity,' showing physical courage in an encounter with robbers and moral bravado at the moving image of the murdered commander. Feigning hypocrisy as a fashionable vice that he may screen wickedness under the mantle of religion, he continues the same hard, cruel atheist, indifferent to, or taking a fiendish delight in, the suffering he inflicts, till clapping the hand of the statue he finds himself consumed by an invisible fire within. The earth swallows him as flames burst from the cleft in which he sinks. Sganarelle gasps, 'My wages, my wages!' and adds a moral. Thus Molière fixed the type for the Don Juans of Mozart and Mérimee, of Musset and of Byron. The best editions of 'Don Juan,' both with accompanying comment and documents, are by Messrs. Moland in Vol. 6 of their 'Oeuvres de Molière.' Consult also Trollope, H. M., 'Life of Molière' (London 1905, pp. 371-394). There are good translations by H. Van Laun (Edinburgh 1873) and C. H. Page (New York 1908).

BENJAMIN W. WELLS.

DON JUAN, an unfinished poem by Lord Byron, somewhat difficult to classify, since it may be treated as a narrative-satire, a comic epic, a novel in verse, or — the author's amusing description — a versified Aurora Borealis. There is little doubt that it is one of the most original, brilliant and entertaining of modern books, fully entitled as such to the position given it by many readers and critics as the poet's masterpiece. From its first appearance, however, it has been severely censured by the more sedate and conventional portions of the British and American reading publics, both on account of the licentiousness of its scenes and passages and because of Byron's contemptuous and defiant attitude toward many of the beliefs, customs and institutions of sophisticated society. As one might naturally expect, the first objection is supported by the unprofitable use made of the poem by inexperienced readers and by persons of vitiated tastes, while the second objection has steadily lost force in more or less direct proportion with the liberalizing of society. Indeed, it may be held with some justice that the apparently increasing regard for Byron and by this masterpiece of his mature years to seasoned and somewhat disillusioned readers who have reached or passed their prime is largely due to those features of the ebullient performance that originally suggested to conservative minds this second objection.

In length 'Don Juan' stands conspicuous among works in verse since it consists of 16 cantos and a fragment of a 17th, which aggregate nearly 2,000 eight-lined stanzas (octasri) and make, with the included lyrics, one of which is the famous 'Isles of Greece,' a total of a little over 16,000 verses. It was composed, with intermissions due to the remonstrances of the Countess Guiccioli and to the hindering attitude taken by publisher and friends, during a period stretching from the autumn of 1818 to the spring of 1823 — that is, from shortly after the completion of the successful 'Beppo,' which prompted the inception of 'Don Juan,' throughout the unregulated but far from unoccupied Italian just before the writing of 'Mazeppa,' of all the dramas save 'Manfred,' of 'The Vision of Judgment' and of several other important though less memorable poems. Publication was by instalments—Cantos I and II in July 1819; Cantos III—V in August 1821; Cantos VI—VIII, with John Fane
as publisher of the remainder of the work in place of Murray, in July 1823; Cantos IX–XI and XII–XIV in August and December respectively of the same year; and Cantos XV–XVI in March 1824. Thus a few weeks before Byron succumbed to fever at Mesolonghi, the world had before it all of his masterpiece save the scathing dedication to Southeby, which was added in 1833 after prior circulation as a broadside, and the fragment first published in our own generation. Byron had not quickened—Cantos VI–XVI were written between the early summer of 1822 and the early spring of 1823, we should probably not have had the brilliant satire of English life contained in the closing cantos, and we might even not have had the superb siege of Ismail or the picture of Catherine and her court. This would have meant a ‘Don Juan’ consisting only of the Donna Julia, the Haiđee and the Gulbeyaz episodes, with the vivid shipwreck thrown in for good measure—still a great poem doubtless, but one which would have left a more sinister impression of licentious waywardness than the full poem leaves.

The chief literary influences discernible in the work—aside from Byron’s continuous and apt use of details derived from his wide reading and apart from his employment of special sources of information in the shipwreck and siege cantos—are the “Whistlecra† cantos of John Hookham Frere, which had prompted the writing of ‘Beppo’, and the work of the Italian humorous-romantic poets Berni and Pulci. His best editor, Mr. Coleridge, thinks that he knew little of the Spanish “Don Juan,” the legendary titanic embodiment of evil. The name, however, was attractive and suitable to a work that started off as a story of adultery in Spain. Once under way Byron seems to have had no settled plan except to take his hero on a tour—amorous, adventurous, humorous—through a great part or the whole of Europe. Soond, a Greek island, Constantinople and Ismail, Russia and England he lived to compass; one of his letters mentions projected escapades in Italy and Germany; perhaps, if he had lived to write the 100 cantos he jestingly planned, he would have ventured—with his extraordinary versatility and daring—to embark his hero for the America of Washington and Daniel Boone, already praised in the poem; but all that is certain and important in this connection is that Byron made a not inconsiderable beginning of a comic epic, whatever else we may call it, of many characters and scenes which, though frustrated by his death, became his chief and a real contribution to the “criticism of life.” It is not the highest criticism of life that we encounter in ‘Don Juan,’ but it is a criticism that has its value to mature and catholic readers, a criticism presented through poetry that yields to nothing else in modern English literature in romantic passion and sentiment, in spirited action, in idyllic charm, in sham-annihilating satire, in cleverness and daring, and last—but far from least—in sustained energy and sincerity of creation, in unflagging carrying-power. His correspondence shows that he knew better than the naturally timid Murray and some of his other friends what superb poetry he was putting into “Donny Johnny,” as he playfully christened his medley. He knew that it would be “known by and by for what it is intended—a Satire on abuses of the present states of Society, and not an eulogy of vice.” We may dissent when he goes on to say that he cannot help it if it is “now and then voluptuous”; but it is at least time for us to remember that such contemporaries as Goethe, Sir Walter Scott, Shelley and Washington Irving were far-sighted and healthy-minded in praising ‘Don Juan’ highly, and Southeby the reverse in considering it a “foul blot” on English literature and an “act of high treason” to English poetry. Surely the world would be loth to spare such satire as “Oh for a forty-power to chant Thy praise, Hypocrisy” (X, 34), such sentiment as “It’s sweet to hear” (I, 122), such idyllic beauty as is contained in the stanzas beginning “They looked up to the sky” (II, 185), such description as that of Lambro’s home-coming (III, 27) praised by S. T. Coleridge, and of Newstead Abbey (XIII, 55), such effective denunciation of war as in the entire eighth canto—but to attempt to catalogue the great passages of this poem would be absurd. One stanza (XV, 99) “Between two worlds Life hovers like a star” would almost suffice of itself to make ‘Don Juan’ seem quite as much the work of a true poet as every page makes it seem the work of a shrewd man of the world. Probably no other modern long poem is so brilliantly sustained; no other characterized by such infinite and unstaled variety.

DON ORSINO, a novel by Francis Marion Crawford, published in 1892. The author’s purpose is to describe a young man of the transition period in Rome after the unification of Italy. He chooses for his hero Orsino Saracinesca.

DON PASQUALE, pâs-kvâlã, an opera buffa in three acts by Gettano Donizetti (libretto by Salvatore Cammarano) first produced in Paris 4 Jan. 1843. The opera was an instant success, largely ensured by the original remarkable cast—Grisi, Mario, Tamburini and Lablache. The famous serenade, “Com’e gentil,” sung by the tenor Mario to the accompaniment of a tambourine, which was introduced at the last minute, swept the audience off its feet. ‘Don Pasquale’ is one of the best light operas of the period. The scene is laid in Rome and the story, which is typically Italian, is concerned with the love of Ernesto for Norina, the interference of the wealthy Don, who has other matrimonial plans for his nephew, and the intrigue arranged by the mutual friend, Dr. Malatesta, who is so successful that the Don yields and blesses the nuptials of the young couple. The music is brimful of melody and merriment and flows along irrepressibly from first page to last. The solo numbers are primarily prima donna music, filled with the vocal hurdles that are a delight both to the bel canto man successfully negotiate them and to the audience; the ensemble, including an unusually fine finale (second act), are no less noteworthy.

DON QUIXOTE, dön kwiks’ot’; Sp. dön ké-hôt’á. To have written the book which for three centuries has best interpreted Spain to the world is the title not far off the hero’s. Most artists in their view of life are merely personal; Cervantes is national and universal.
In him the genius of his people finds its best expression, yet his masterpiece speaks to all men irrespective of period or place. Books that do this may be counted upon the fingers of two hands, but among them is 'Don Quixote.' When it appeared in 1605, Miguel de Cervantes Saavedra was but two years short of sixty. A native of Alcalá, he had been a soldier in Italy and the Azores, a captive among the Barbary pirates of Algiers, and at home a dabbler in drama and pastoral romance, as well as a collector of taxes and of provisions for the Indies fleet. He had been imprisoned twice because an agent abscended, and once in La Mancha at Argamasilla de Alba, where tradition has it that he began his 'Don Quixote' in confinement. The original of his hero is said to have been Rodrigo Pacheco, whose portrait hangs there in the parish church in witness of his restoration from madness in 1601 by the grace of the Virgin. For 10 years after the publication of the first part of 'Don Quixote,' Cervantes did hack writing for the literate, and play the joker, while vainly seeking court favor. Then, on the appearance of a continuation to his great work by an Aragonese enemy naming himself Avellaneda, Cervantes hurriedly compiled his authentic sequel, which was issued in 1615.

In the next year, after producing a long heroic romance, he died.

That Cervantes was no enemy to the worthy romances of chivalry, this last effort — 'Los Trabajos de Persiles y Sigismunda' — makes clear. Yet it amused him to break a comic lance against the silly books in this kind which had succeeded the 'Amadís de Gaula.' He conceived the notion of showing a meagre, middle-aged gentleman, gone mad from the reading of such fantastic fictions, attempting to enact in the world of actuality the rôle of medieval knight errant. This gentleman, taking the fancy name of Quixote or 'cuish,' sets forth upon his nag, Rozinante, to win glory for his lady, who is only a peasant wench. He makes three journeys. The first and briefest results in his being dubbed knight by a rogue innkeeper. The second, after his mischievous books have been burnt by his friends, a barber and a priest, involves also the misadventures of his squab Sancho Panza, the bumptious anti-hero who was invented as an amusing contrast to the valiant hero. From encounters with windmills and sheep, to the capture of a barber's basin that resembles the helmet of Mambrino; from the release of ungrateful convicts to a penance of love in the mountains, the experiences of the precious pair parody those of the old romances. At length the disguised barber and priest prevail upon the knight to enter a cage wherein he is brought home on a bullock cart, bearing himself under enchantment. His third quest, filling the entire second part of the novel, is longest and most enjoyable. Here Don Quixote is surer than ever of his dignity and of the glory of knighthood; and Sancho is wittier, richer in proverbs and in common sense, loveling, yet playing upon his master. The climax of interest is reached when a duke and duchess entertain the two, fooling Don Quixote to the top of his bent with elaborate pageantry and arranging a mock island for Sancho to grovel on. He successfully provokes the mirth of his master Carrasco, who has already failed in one effort to fetch Don Quixote home, succeeds by overthrowing him in combat disguised as Knight of the White Moon. He is brought to the castle of his cousin Mancha, with his heart broken and his reason only to part with life and the weeping Sancho.

Like other great works, this has been subject to various interpretations. Some have held it to be a satire directed against individuals — Charles V, Philip II, Ignatius Loyola or the Duke of Medina Sidonia. A Spaniard has pronounced it to be a mystic allegory, 'Dulcinea' being an anagram of 'Divina Luce,' or divine light. An Englishman — A. J. Duffield — has written a volume to prove it an attempt to expound the nature of madness. An Englishwoman — Mrs. Oliphant — regards it as Cervantes' confession of his own disillusionment with life. Many have seen here his design to present personified the two elements in human nature, soul and sense, poetry and prose. Thus Coleridge has said to please himself, while vainly seeking court favor. Then, on the appearance of a continuation to his great work by an Aragonese enemy naming himself Avellaneda, Cervantes hurriedly compiled his authentic sequel, which was issued in 1615.

In the next year, after producing a long heroic romance, he died.

That Cervantes was no enemy to the worthy romances of chivalry, this last effort — 'Los Trabajos de Persiles y Sigismunda' — makes clear. Yet it amused him to break a comic lance against the silly books in this kind which had succeeded the 'Amadís de Gaula.' He conceived the notion of showing a meagre, middle-aged gentleman, gone mad from the reading of such fantastic fictions, attempting to enact in the world of actuality the rôle of medieval knight errant. This gentleman, taking the fancy name of Quixote or 'cuish,' sets forth upon his nag, Rozinante, to win glory for his lady, who is only a peasant wench. He makes three journeys. The first and briefest results in his being dubbed knight by a rogue innkeeper. The second, after his mischievous books have been burnt by his friends, a barber and a priest, involves also the misadventures of his squab Sancho Panza, the bumptious anti-hero who was invented as an amusing contrast to the valiant hero. From encounters with windmills and sheep, to the capture of a barber's basin that resembles the helmet of Mambrino; from the release of ungrateful convicts to a penance of love in the mountains, the experiences of the precious pair parody those of the old romances. At length the disguised barber and priest prevail upon the knight to enter a cage wherein he is brought home on a bullock cart, bearing himself under enchantment. His third quest, filling the entire second part of the novel, is longest and most enjoyable. Here Don Quixote is surer than ever of his dignity and of the glory of knighthood; and Sancho is wittier, richer in proverbs and in common sense, loveling, yet playing upon his master. The climax of interest is reached when a duke and duchess entertain the two, fooling Don Quixote to the top of his bent with elaborate pageantry and arranging a mock island for Sancho to grovel on. He successfully provokes the mirth of his master Carrasco, who has already failed in one
remain alive. Their conduct in other situations can be predicated as exactly as that of persons whom we know. Character, indeed, is here more fully revealed than ever before in prose fiction, and the means for its revelation are not description and analysis but speech and action. Power of characterization through dialogue is Cervantes' greatest technical achievement.

As a comic epos, 'Don Quixote' is equally notable. For the comic is here present in all its phases, severely and combined, in unusual degree. 'The comic as burlesque is to be found in the parody of incidents from the romances of chivalry—the knight's watching of his armor, his decotion of a magic balsam, his voyage with Sancho in an enchanted bark, and their aerial flight astride a wooden horse. The comic as farce is to be found in incongruities of situation resulting from rude practical jests and confusions of night by inn. The comic as satire is to be found in assaults upon chivalric and pastoral follies, upon physicians, duenas and governors of Spanish colonies. The comic as wit is to be found in an unflagging play upon words and ideas, as in Sancho's verbal mistakes and his wealth of proverbs. More noteworthy, however, than these four forms of the comic are two others—irony and humor—in which this novel excels. In irony the incongruity of situations is emphasized negatively, as when Don Quixote, watching a puppet show, destroys the Moorish puppets that threaten the Christians, and then asks proudly, 'Who now can doubt the good of knights errant?' In humor the incongruity concerns character, the humorist exhibiting with genial toleration the clash of inharmonious natures, as when Cervantes shows Don Quixote determined, in emulation of love-sick knights, to go mad and dash his head against a rock, whereupon Sancho, unable to understand his master's motives, begs the substitution of cotton, and promises to tell the lady that this substance was rock as hard as any diamond. Humor, indeed, marks the whole relationship of squire and knight, and even their conduct apart, as when the Don rejected the advances of the fair in order to remain true to his Dulcinea, or Sancho, having wisely ruled his island—a mere bend in a river—is fooled by a pretended martial attack upon it, and, relinquishing ambition, returns with relief to humble life. Here one feels a touch of pathos, but if there be any limitation in the humor of this work, it lies in the rarity of such moments wherein English humor abounds.

The influence of 'Don Quixote' has been extraordinary. Although the romance of chivalry was already dying or dead, and Byron was wrong in assuming that Cervantes 'laughed Spain's chivalry away,' this book, translated into all modern languages, has been the subject of countless allusions and hundreds of adaptations in the literature of the world. It has contributed more than any other single work to the development of prose fiction. To trace this influence in detail would require a volume.

Of 'Don Quixote' some 700 editions have appeared at home and abroad. In English the first translation was that of Thomas Shelton (1612). Other versions by Philips, Stevens, Motteux, Jarvis and Kelly were popular in their day but have been superseded by those of H. E. Watts (1888) and John Ormsby (1904). The influence of this novel upon English literature is studied by Gustav Becker in 'Die Aufnahme des Don Quijote in die englische Literatur' (1906). The standard English life of Cervantes is that by James Fitzmaurice-Kelly (1892).

FRANK W. CHANDLER, Professor of English and Comparative Literature, University of Cincinnati.

DONA FRANCISCA, Brazil, a German colony in the state of Santa Catharina, founded in 1851, lying between the Serra do Mar and the Atlantic Ocean, 14 miles inland from the port of São Francisco. Area, 550 square miles; pop. (1903) 21,000. Chief town, Joinville, with 3,000 inhabitants.

DONALDSON, Henry Herbert, American neurologist: b. Yonkers, N. Y., 12 May 1857. He was graduated at Yale in 1879, studied at the Sheffield Scientific School there, and also at the College of Physicians and Surgeons of Columbia University, and at Johns Hopkins. He was instructor in biology at the last-named institution in 1883-84 and associate professor of psychology there in 1887-88. In 1889-92 he was assistant professor of neurology at Clark University. He was professor and head of the department of neurology 1892-1906 and dean of the Osgood School of Science 1892-98 at the University of Chicago. Since 1906 he has been professor of neurology at the Wistar Institute of Anatomy and Biology, Philadelphia. He has written 'The Growth of the Brain' (1895); 'The Physiology of the Central Nervous System' (1896); 'The Rat' (1915), and articles in scientific journals.

DONALDSON, Sir James, Scottish educator: b. Aberdeen 1831; d. 1915. He was educated at Aberdeen University, New College, London, and Berlin University. In 1852 he was appointed tutor in Greek at Edinburgh University. In 1854-56 he was rector of leading high schools and of those of Edinburgh in 1866-81. In 1881 he became professor of humanity at Aberdeen University, was made vice-chancellor and principal of the University of Saint Andrews in 1890 and principal of the United College of Saint Salvator and Saint Leonard. In 1907 he was knighted. His publications include 'A Modern Greek Grammar for the Use of Classical Students' (1853); 'Lyra Graeca' (1854); 'Critical History of Christian Literature and Doctrine from the Death of the Apostles to the Nicene Council' (3 vols., 1864-66); 'The Ante-Nicene Christian Library,' in collaboration with Roberts (24 vols., 1867-72); 'Expiatory and Substitutory Sacrifices of the Greeks' (1875); 'Woman: Her Position and Influence in Ancient Greece and Rome, and Among the Early Christians' (1907); 'Addresses Delivered at Saint Andrews from 1886 to 1910' (1911).

DONALDSON, John William, English classical scholar: b. London 1811; d. 1861. He received his education at University College, London, and at Trinity College, Cambridge. In 1835 he was elected Fellow of the latter college. His earliest work was a revision of Buckham's 'The Theatre of the Greeks.' In 1839 appeared
the 'New Cratylos,' the first attempt on an adequate scale to familiarize the English-speaking world with the principles of comparative philology, the study of which had been so well advanced in Germany by Pott, Grimm and others. In 1841 Donaldson became headmaster of the grammar school at Bury Saint Edmunds. He continued his philological studies and in 1844 issued his 'Varronianus,' which did for Latin what the 'New Cratylos' had done for Greek. He also edited Pindar, Sophocles' 'Antigone,' with metrical translation, and wrote 'Maskil le Sopher,' a treatise on Hebrew grammar, and 'Jashar' (1854), a Latin work by which, by tests, sought to distinguish the remains of early Hebrew songs in the Masoretic text of the Old Testament. In 1855 he returned to Cambridge and here wrote 'Christian Orthodoxy' in answer to the critics of 'Jashar.' He also wrote a 'Greek Grammar' and a 'Latin Grammar' for schools, both of which went through several editions. Donaldson became one of the classical examiners in the University of London in 1856 and two years later his 'History of Ancient Greece' (3 vols., two of which are translations from the German of K. O. Müller). His health failed while working on the compilation of a new 'Greek Lexicon.' Consult Garnett in 'Dictionary of National Biography' (Vol. XV, 1888).

DONALDSONVILLE, La., town, county-seat of Ascension Parish, on the Mississippi River, and the Texas and Pacific Railroad, about 30 miles in an air line south of Baton Rouge. It is the trade centre of a cotton, rice and sugar-growing region, having large interests in these commodities and also in lumber. It is governed by a mayor and commissioners who are elected for a term of four years, subject, however, to recall by the electorate. The waterworks and electric-lighting plant are the property of the town. The town was settled in 1760 and was incorporated 46 years later. In 1863 it was burned by the Federals after a violent bombardment during the battle of Fort Butler. Pop. 4,690.

DONATELLO, or DONATO DI BETTO Bardi, Italian sculptor: b. Florence, between 1382 and 1386, there, 3 Dec. 1466. By his character and genius, by the historic importance and artistic quality of his work, he is one of the most original and grandest figures of the glorious Quattrocento. Since the preponderating rôle of naturalism in freeing modern art has been properly recognized, Donatello has been assigned his real place. In 1886 Florence celebrated, as a national event, the fifth centenary of his birth. At an early period he was greatly influenced by Brunellesco. The great moderns of antiquity also exerted a powerful influence over him. After a stay of two or three years in Rome he returned to Florence, where he began in earnest his career as sculptor. The first work in which Donatello impressed his personality was the marble statue of Saint Michael on the northern façade of Or-San-Michele, together with its accompanying bas-reliefs. Another admirable piece of work are the three figures—Saint John the Baptist, David and Jeremiah on the west façade of the campanile of Santa Maria del Fiore. Among the works belonging to this early Florentine period and in which he holds himself aloof alike from all servile imitation of the ancients and from the violent realism of some of his contemporaries we may note the statue and bust of Saint John in the Martelli palace, 'Christ in the Sepulchre'; 'Madonna and Child'; 'Jesus Christ giving the keys to St. Peter,' all in the Louvre. The charming profile of Saint John in the Uffizi, and 'Head of a Young Girl,' in the Louvre. Donatello was very intimate with his patron and protector, Cosmo de Médici, and it is probably to his influence and to that of Ghiberti that are due certain works, inspired by the ancients. Of these the bronze 'David' is the most noteworthy. The 'St. John' of the Uffizi and the 'Madeleine' of the Florentine baptistery are important as psychological studies rather than as works of art of a purely original type.

Donatello executed four monuments in collaboration with Michelozzo Michelozzi, the tombs of Pope John XXIII, Cardinal Brancacci, and Bartolomeo Aragazzi, also the bas-relief bronze of 'St. John' of the Baptist in the Siena baptistery, all of which were completed between 1420 and 1432. In 1444 Donatello removed to Padua where he was destined to execute some of his most admirable works, among others, the statue of Gattamelata, and the decorations in the basilicas of San Antonio. From 1450 to 1453 Donatello was engaged successively at Ferrara, Venice and Modena, after which he returned to Padua. In 1456 we find him at Ferrara and it was probably in the following year that he returned to Florence. Although now in advanced age and subject to frequent spells of activity and it is without doubt between this date (1457) and his death that he executed many of the works mentioned above, also the bronze 'Saint John' at Siena, and the 'Four Evangelists' for the church of Saint Laurence, where the artist was buried close by his friend and patron, Cosmo de Médici. Donatello was the precursor of Michelangelo. Well versed in the craft of the ancients he preserved, to a degree even greater than Ghiberti, their great canons and simplicity.

Since 1886 the large hall at the Bargello has been exclusively devoted to the display of his works. Consult the biographies by Angelini, Carocci, Melani and Balcarres (London 1903), the best in English; also Vasari, 'Lives of the Painters, etc.' (English trans. New York 1912-16); Bode, 'Denkmäler der Renaissance skulptur Italiens' (Munich 1905), which contains a complete series of reproductions of the sculptor's works; id., 'Florentiner Bildhauer der Renaissance' (English trans., London 1898); Tschudi, 'Donatello e la Critica moderna' (Turin 1887).

DONATI, dò-nà'tè, Giovanni Battista, Italian astronomer: b. Pisa 16 Dec. 1826; d. Florence, 20 Sept. 1873. He was appointed in 1852 assistant at the observatory in Florence, of which he became director in 1864. Here he discovered, in addition to several meteorites and the Halley comet of 1858, which is known as Donati's comet, and proved the gaseous composition of these bodies. He was instrumental in erecting the fine observatory at Arcetri, near Florence, and constructed a spectroscope of 25 prisms.
DONATIO MORTIS CAUSA.—DONCASTER

DONATIO MORTIS CAUSA, in law, a gift of personal property made when the donor believes himself in imminent danger of death and to take effect only if he dies of the illness with which he was affected at the time he made such gift. There must be actual or constructive delivery of the property during the life of the donor to pass legal title. Only personal property is the subject of such a gift. This form of donation is convenient when it is difficult or impossible for the donor to make a will, and it is also claimed that it has been often used to evade the inheritance laws or death duties, as they are known in England and her colonies, now of increasing importance because their justice and expediency are recognized by most economic authorities and because of the probability that they will be adopted generally as they have been in Great Britain, Australia, New Zealand and many European countries. The gift, it will be seen from the foregoing, is conditional, and the recovery of the donor acts as a revocation without other formalities. By the donor law all taxes was an essential. Bills of exchange, notes and checks of third parties, and certificates of stock may be the subject of such a gift.

DONATION OF CONSTANTINE. An ancient document purporting to have been given by Constantine the Great in 324, out of gratitude for his healing from the disease of leprosy. It first appeared between the years 755 and 766. It was translated from the Latin text as follows: “We give as a free gift to our most blessed father, Sylvester the Pope, the city of Rome, and the cities of all Italy as well as the cities of other western countries. To make room for him we abdicate our sovereignty over all these provinces; and we withdraw from Rome, transferring the seat of our empire to Byzantium, since it is not just that a terrestrial emperor should retain any power where God places the head of religion.” The document was exposed as a forgery by Laurentius Valla about the middle of the 15th century.

DONATISTS, a sect in the 3d century, and till the Vandal invasion a formidable opponent of the Roman Church in the Mediterranean provinces of Africa. The sect was not heretical, but was the first to separate from the Church on the ground of discipline. The sect arose out of dissections at Carthage over the question of the readmission to church fellowship of those persons who in Diocletian’s persecution had denied the faith either explicitly or implicitly by giving up to the persecutors the Christian sacred books. On that point they were extreme rigorists, as also in holding that a priest or deacon could not validly administer baptism if he were himself in a state of sin. When Mansurius was consecrated bishop of Carthage the faction headed by one Donatus repudiated him as a traditor — one who had given up the sacred books; and when after his death (265) the pope of Carthage 70 Numidian bishops refused to have communion with him, as one that was consecrated by a traditor. They set up a rival bishop, Majorinus, and the schism grew steadily wider, being specially favored by the schismatics we the concurrent troubles of Melchades, the reigning pope, with three bishops of Gaul, in 313. This judgment was confirmed the next year by the Council of Arles, and in 316 by the Council of Milan, convoked under the protection of the Emperor Constantine. But the Donatists paid no heed and in 330 a council was held by 270 Donatist bishops, who denounced their opponents as heretics. The peace, not only of the Church but of the civil state was seriously compromised by uprisings of the fanatical multitude against the Roman Catholics throughout northern Africa, to repress which the severe laws enacted by the emperors were ineffective. Saint Augustine, bishop of Hippo from 400 to his death in 430, labored zealously to restore peace to the Church. In 411 a conference with 279 of their bishops was held at Carthage at which Saint Augustine took a leading part, judgment being awarded by the imperial representative in favor of the Roman position. The sect early began to split up into independent smaller sects, they were deprived of civil rights in 414 and rigorously persecuted; they are little heard of after the Vandal invasion in 429, disappearing finally two centuries later. All tares was an essential. Consult the works of Saint Augustine; Bright, ‘The Age of the Fathers’ (London 1903); Harnack, ‘Der Ursprung des Donatismus’ (Freiburg 1883); ‘History of Dogma’ (English trans., Boston 1894-1900); Sparrow Simpson, ‘St. Augustine and African Church Divisions’ (New York 1910).

DONATUS, dō-nā’tās, plius, Roman grammarians and commentor who lived in the 4th century. He wrote an elementary work on the Latin language, ‘De Octo Partibus Oratiois,’ which served as a guide to the learning of Latin in the Middle Ages and formed the groundwork of most elementary treatises until recent times. It was one of the books most frequently printed at the commencement of the art, several editions having been issued from blocks even before the invention of types. Copies of these are among the rarest and most valuable of bibliographical treasures. He was also author of a commentary on Terence.

DONAU, dō-nāw. See Danube.

DONAUWORTH, dō-nā-vurt, Germany, walled town of Bavaria at the junction of the Wörnitz and Danube, about 25 miles north by west of Augsburg. It contains saw mills, breweries and machine factories, and carries on a considerable trade in the agricultural products of the region. A great live-stock market, the largest in Bavaria, is held here monthly. The town received municipal rights in the 14th century, becoming a free city. In 1607, after friction between the Protestants and Catholics, it was occupied by the Bavarians who sided with the members of the Old Church. This action was one of the moving causes of the ‘Thirty Years’ War. The Bavarians lost a battle here to the Duke of Marlborough in 1704, and almost a century later, in 1805, it was again the battle-ground of the French and British, the latter being worsted. pop. (1910) 5,500. Consult Steve, ‘Der Ursprung des dreisigjährigen Krieges,’ Vol. I, ‘Der Kampf um Donauwörth’ (Munch 1875).

DONCASTER, England, municipal borough in the West Riding of Yorkshire, on the Don, 32 miles south of York. Herems are still worked the locomotive and carriage works of the Great
Northern Railway. The municipality has been progressive in all forms of collective enterprise, gas, water, electricity, tramways and racecourse being owned by the town. It has long been famous for its annual races, begun in 1703. Nearby are the ruins of Combsborough Castle, the stronghold of Athiseban in Scott's Ivanhoe.

Dondo, dön'dô, West Africa, town in the Portuguese colony of Angola, situated at the head of navigation on the Coanza River and not far from the Loanda Railway. It has a considerable caravan trade and is an import coffee market. It is situated in a very fertile region, but the everchanging climate of this portion of the Coanza district has given Dondo the unenviable name of "the furnace of Angola." Dondo has steamship communication with Loanda. Pop. 3,900.

Don德拉, dön'dra, or Dondera Head, the southern extremity of the island of Ceylon, a steep and rugged promontory, formerly the site of a temple.

Donegal, dön'gâl, Ireland, town at the mouth of the Eske, in the County of Donegal, 12 miles northwest of Ballyshannon. It is surrounded by rolling hills and nearby are the low mountains. Donegal Castle, ancient seat of the O'Donnells of Tirconnell, and the ruins of a Franciscan monastery, founded in 1474 by the first wife of Hugh Roe, are near the town. In this monastery were written the famous "Annales Righachta Erennbran," or as they are better known, "Annals of the Four Masters," a record of Irish history to 1616, finished in 1636 by Michael O'Clergy, a Franciscan monk, and his associates, two of whom were also named O'Clergy. Pop. 2,647.

Donegal, Ireland (Irish, Dún na nGall, fort of the foreigners, i.e., the Danish corsairs), a maritime county in Ulster province, bounded on the north and west by the Atlantic Ocean, south by Leitrim and Fermanagh and east by Londonderry and Tyrone. Its area is 1,193,641 acres (about 1,808 square miles) and it has a much-indented coastline with numerous islands off shore. The land surface is mountainous and boggy and contains numerous loughs (lakes) and is traversed by numerous streams. About 35 per cent of the land is in pastures. Agriculture is the chief occupation of the inhabitants and is still carried on by primitive methods. Linen and woolen cloths are manufactured. The coastal population occupy themselves with the fisheries. The lakes inland are favorite haunts of the angler, being well stocked with salmon and other food fish. Since 1841 the population has declined steadily, being 290,500 in that year and only 168,537 in 1911.

Donelson, Andrew Jackson, American diplomatist: b. near Nashville, Tenn., 25 Aug. 1800; d. Memphis, Tenn., 26 June 1871. He was graduated at the United States Military Academy in 1820, and entered the army as a lieutenant of engineers. In 1822 he resigned, studied law and also engaged in cotton raising in his native State. He was private secretary to his uncle, President Jackson, in 1829-30; Minister Plenipotentiary to Persia and later to the federal government of Germany (1846-49); was editor of the Washington Union in 1851-52; was candidate of the American party for Vice-President, and after his defeat retired to private life.

Donetz, dô-nyets', or Severnoi Donetz, a river in Russia which, rising in the government of Kursk, flows almost due south about 670 miles into the Don, of which it is the principal affluent. It was navigable down to the 17th century, but in numbers of years except in time of floods, owing to forest denudation. In its basin are valuable coal mines.

Dongan, Thomas, Earl of Limerick, English colonial official: b. Castleton, County Kildare, Ireland, 1634; d. London, 14 Dec. 1715. After serving in the British and French armies he was appointed colonial governor of New York by the Duke of York in 1682. He gave the city of New York its first charter in 1686, and also conferred the first charter on Albany. He succeeded to the earldom of Limerick in 1698 on the death of his brother. A Catholic in religion, it was expected that, in conformity with his instructions, he would show great respect for French claims in America, but instead he disapproved the expectations of the French court by strenuously supporting the English colonists and claimed for England territory to the south of the Saint Lawrence and the Great Lakes, including sovereignty over the Iroquois. In 1688, after the treaty of neutrality between the French and English kings had been signed, Dongan was forced to resign, and was succeeded by Andros. After the dethronement of James II he suffered some persecution, and did not return to England until 1691.

Doniphon, Alexander William, American military officer: b. Mason County, Ky., 9 July 1808; d. Richmond, Mo., 8 Aug. 1887. He was three times elected to the Missouri legislature. He served in the Mexican War, capturing Chihuahua after an unexpected encounter with an army of 4,000 men. He was one of the peace commissioners at the convention which met at Washington previous to the Civil War.

Donizetti, döniti, Italian composer: b. Bergamo, 25 Nov. 1797; d. there, 8 April 1848. He studied music at Bologna under the distinguished Abbe Mattei, and was for some time in the military service of Austria. His first opera, "Enrico di Borgogna," was presented at Venice in 1818. In 1822 his "Zoraide di Granata" gained him the honor of being crowned on the capitol. In 1830 appeared his "Anna Bolena," which first, with "Lucrezia Borgia" (1834) and "Lucia di Lammermoor" (1835), the latter the most popular of his works, acquired for him a European fame. In 1835 Donizetti was appointed professor of counterpoint at the Royal College of Naples, but removed in 1840 to Paris, bringing with him three new operas, "Les martyrs," "La favorita," and "La fille du régiment." Of his other Operas none except "Linda di Chamouni" (1842) and "La Favorita" (1838) achieved any special triumph. During the last four years of his life he suffered from insanity. He showed amazing fecundity in composition and was the author of 64 operas. He also composed with great success the cantatas "Il pannello di Notte" (1836) being composed (musical and libretto) and performed all within nine days; and the last act of "La favorita," his
DONKEY. See Ass.

DONNAY, dô'nè', Maurice Charles, French dramatist; b. Paris 1859. In 1881 he made his début with 'Phryne,' a Greek shadow play, and in 1892 produced an adaptation of the 'Lysistrata' of Aristophanes. In his later works he has abandoned the frivolous attitude so characteristic of his early work. He was elected to the Academy in 1907. His plays include 'Amants' (1895); 'Douloureuse' (1897); 'L'Affranchie' (1898); 'Le torrent' (1898); 'La bascule,' (1901); 'L'Autre danger' (1901); 'L'entrecasteaux de l'ambiance' (1903), a caricature of Max Nordau; 'La Patronne'; 'Menage de Moliere.' (1912).

DONNDORF, dôn'dôrf, Karl Adolf, German sculptor; b. Weimar 1835. He was a pupil of Rietschel in Dresden, and finished the Luther monument at Worms from this master's designs. Famous statues from his hand are those of Savonarola, Frederick the Wise, 'Valudes' and 'Mourning Magdeburg,' the equestrian statue of Grand Duke Karl August in the Fürstenplatz, Weimar. He also designed and executed the tomb of Robert Schumann in Bonn, the Kestner family monument at Dresden, the statue of Peter Cornelius in Düsseldorf and of Bach in Eisenach, the 'Angel of the Resurrection' at Reineck Castle and the James fountain in New York. Among his most celebrated works are the busts of Bismarck and von Moltke in the National Gallery, Berlin, which are considered as the most characteristic likenesses of these leaders. Recent works of Donndorf are the equestrian statues of William I at Saarbruck (1904) and at Heidelberg (1905) and the national monument at Hohenenburg, Westphalia. In 1876 Donndorf was appointed professor at Stuttgart and in 1910 a Donndorf Museum was established at Weimar.

DONNE, dôm, John, English poet and divine; b. London 1573; d. 31 March 1631. His father, John Donne, of a Welsh family, was an ironmonger; his mother, Elizabeth, was the daughter of John Heywood. His father died in 1575, leaving six children, whom the mother brought up in the doctrines of the Church of England. In October he entered Hart Hall, Oxford, where for a while his roommate was Sir Henry Wotton. After three years at Oxford he seems to have traveled on the Continent. In May 1592 he was admitted at Lincoln's Inn. For some time he shared his rooms with Christopher Brakespeare, the poet, through whom he apparently became one of the group of young London poets, and who later suffered a brief imprisonment for complicity in Donne's marriage. In 1593 Donne suffered for the first time some of that persecution which had pursued his family because of their Roman sympathies; his brother, Henry was charged with Inns of Court erery, and the confining priest, William Harrington. Harrington was put to death at once and a few weeks later Henry Donne died of disease contracted in prison.

John Donne joined the expedition of Essex to Cadiz in June 1596. In August of that year he became secretary to Sir Thomas Egerton. Five years later he made a clandestine marriage with Anne, daughter of Sir George More and niece of Lady Egerton. His patron and his wife's father were exceedingly angry; he and the friends who had connived at the elopement were imprisoned, and all hope of advancement through Sir Thomas Egerton was lost. In a short time Donne was released from prison and forgiven, but he was penniless. For the next few years he lived on the charity of his friends, and at the beginning of the new reign he sought the king's favor. James recognized his ability, but, insisting that Donne was fitted for the Church, he promised only Church preferment, and Donne seems to have waited, in hope of a worldly career.

In 1611 he traveled on the Continent as the guest of Sir Robert and Lady Drury, upon the death of whose daughter Elizabeth he wrote the quaint 'Anatome of the World,' remembered now by the three exquisite lines about 'her pure and eloquent blood' that 'spoke in her cheeks.' On his return the following year he gave himself seriously to the study of theology. Ordained by the bishop of London in 1615, he became rector a year later of Keyston and of Sevenoaks. But a more important opportunity came at the same time, in the appointment as preacher to Lincoln's Inn. Here he immediately proved himself the most eloquent pulpit orator of his day. The death of his wife in 1617 saddened his life permanently, but he seems to have found a new ambition, far from worldly, in the use of the great powers he had discovered so late. His reputation as an orator was wide. While on a visit to Germany in 1619, as chaplain to Lord Doncaster, he preached in Germany and Holland to the admiration of his hearers. Shortly after his return to England he was made dean of Saint Paul's.

The last 10 years of his life were years of honor. His sermons as he published them were of extraordinary popularity, and still justify his fame. His great mind and broad experience of life had the added grace of the poet's temperament, and time sweetened his nature, which, in youth at least was intellectually hard. Toward the end of his life his health gradually failed, and at his last sermon, preached before the king at Whitehall on Ash Wednesday, 1631, his hearers and he were conscious that he would never preach again. A few weeks later he died.

Donne's poems were published posthumously in 1633. Some of the pieces can be dated approximately by their context; most of them might have been written any time before the last 15 years of his life. The sacred poems, however, are naturally referable to the end and the secular poems to the beginning of his career; the satires probably belong to the time when he was seeking court favor and the epistles to the same time or slightly later. The
funeral poems are comparatively easy to date; the amatory elegies, it is to be hoped, were the work of youth.

Donne's reputation as a poet was great during his life, before his poems were published, and his love poetry shows not only marked individuality, but also the influence of minor schools of the time. In his early work he is clearly a Cavalier poet, yet his genius was not by nature fitted for that kind of song-writing. It has been said that he had no ear; his verse is harsh; and in spite of vigorous defense on the part of his admirers, the criticism constantly recurs. But perhaps it is true that Donne had too much intellect for the kind of verse he wrote in; the brief Cavalier song was no room for his robust mind. Except for occasional lines of great beauty, such as those mentioned in the 'Anatomie of the World' and those of the lovely 'Break of Day,' his form of expression is cramped, and the poem as a whole displays no convincing proportion. So strong is the intellect in his verse, and so low is the emotional temperature, that thought and image, or even thought and word, are infrequently: main stubbornly unmade, however interesting each may be in itself. This is equivalent to saying that most of Donne's verse is fanciful rather than imaginative; and if it be added that he had little taste in selecting the image for his thought, it will be seen that he was by nature fitted to be one of the fantastic school — indeed, the chief fantastic poet in English. At his worst, as in the ironical verses, 'The Indifferent,' in praise of inconstancy in lovers, he seems to search for novelty of idea at all costs, and the difficulty of his crowded lines offers little reward at last to the reader's patience. At his best, as in the famous 'Valediction Forbidding Mourning,' in which he compares the parted lovers to the pair of compasses, the ingenuity of the fancy gives it strength, while its defect as poetry is clear in the fact that the attention is diverted from the poet and his poem to his astonishing conceit. The vague of fantastic poetry gave Donne his audience; yet sounds very coarse and commonplace and rare in him — such as the almost perfect song, 'Sweetest love, I do not go,' and the vigorous lines, 'The Broken Heart,' containing the ingenious image of the broken mirror, which Byron turns to his own good account.

An intellect so energetic as Donne's would not ignore such a strange fashion of thought as the Precieux movement, transplanted from France by Henrietta Maria. The fantastic problems of that school as to the place of love in society, their perversions of Platonism, appealed to his genius. The influence is felt in several of his poems, but chiefly in 'The Ecstasy.'

Donne's sacred poems show the same general characteristics as the secular verse; the intellect is strong, so that their intellectual end to be theological rather than religious; and the lack of constructive lyric form still mars any total effect. But the note of trifling, which went with the early fantastic images, is absent from this sacred verse; a great nature speaks seriously throughout, even though it is of the poet's poems memorable. The best perhaps is the 'Litany.'

Of the elegies the ninth is the best, written in honor of George Herbert's mother. The others, like the Satires, are made upon Latin models, perhaps as academic trifling, but with the coarseness which the age easily forgave in Latin imitations. The epistles or Verse Letters are interesting for the persons to whom they were addressed — Christopher Brooke, Sir Henry Wotton, Isaak Walton, Ben Jonson.

It has been the fashion to praise Donne's poetry highly and to make a merit of its eccentricity. Its real merits, of an intellectual kind, are great, and were recognized by his age, but he was best known as a preacher. In the pulpit his keen intellect, his gift for striking expression and the force of a great personality deepened by time and suffering, found room for just expression.

Bibliography. — The best editions are those by Grosart, in Fuller's 'Worthies' Library'; Chambers, with an introduction by Saintsbury, in the 'Muses' Library'; and Grierson. For criticism, consult 'Introduction to the Poems of John Donne,' by W. Gosse, 'Life and Letters of John Donne'; and Ward's 'English Poets.' An annotated edition, edited by C. E. Merrill, Jr., of Donne's 'Letters to Several Persons of Honour' was published in 1912.

JOHN ERSKINE,
Professor of English, Columbia University.

DONELLY, Eleanor Cecilia, American author: b. Philadelphia, Pa., 6 Sept. 1838. Among her volumes of verse are 'Out of Sweet Solitude'; 'Domus Dei'; 'Legend of the Best Beloved and Other Poems'; 'The Gold Stars'; 'Hymn of the Sacred Heart'; 'Children of the Golden Sheaf and other Poems.' She has also written several prose works, including 'Life of Father Felix.'

DONELLY, Ignatius, American prose writer and politician: b. Philadelphia, 3 Nov. 1831; d. Minneapolis, Minn., 2 Jan. 1901. He was prominent in Minnesota politics, being at one time lieutenant-governor of the State, and from 1863-69 a member of Congress, but was best known as an author. Among his writings are 'An Essay on the Sonnets of Shakespeare'; 'Atlantis, the Antediluvian World' (1882); and 'Ragnarök' (1883). In 'The Great Cryptogram' (1887), he endeavors to prove by means of a word-cipher that Francis Bacon was the author of Shakespeare's plays. His theory was further elaborated in 'Cipher in the Shakespeare Plays' (1900). His best-known novel is 'Cæsar's Column' (1890).

DONELLY, Samuel Bratton, American printer and labor leader: b. Concord, Pa., 7 Nov. 1866. He was educated in the high schools of Lewiston, Pa., and the State Normal School, Shippensburg, and taught in the country schools of Franklin County, Pa., in 1883-86. In 1886 he began learning the printing trade and in 1895-98 was president of New York Typographical Union No. 6 and in 1898-1900 of the International Typographical Union of Indianapolis. He was secretary of the National Civic Federation 1901-02, and of the Joint Arbitration Board of the New York Building Trades Employers' Association from 1902 to 1906. From 1901 to 1906 he also served as commissioner on the New York city board of education and from 1908 to 1913 was public
DONNER—DOOLITTLE

printer at Washington. Since 1913 he has been again serving as secretary of the Joint Board of the New York Building Trades Employers' Association.

DONNER, dōn'ner, Georg Raphael, Aus-
trian sculptor: b. Essling, Austria, 25 May 1692; d. Vienna, 15 Feb. 1741. He studied at the Vienna Academy of Architecture, and was employed at the imperial court and also by Prince Esterhazy. Among his best works are the fountains on the Mehlmarkt and at the city hall, Vienna, a group of the Crucifixion in Gurk Cathedral and a statue of Charles VI.

DONNER, Johann Jakob Christian, Ger-
man classical scholar: b. Krefeld 1799; d. 1875. He was educated at Tübingen and from 1843 to 1852 was professor at Stuttgart. He resigned to devote himself exclusively to literary work. He translated the Greek and Roman poets into German in their original metres. These translations include the satires of Juvenal (1821), Persius (1822), Sophocles (1838–39; 11th ed., 1889). This work is still the basis for nearly all the metrical translations of Sophocles. Other translations followed: Euripides (1841–53), Æschylus (1853), the Ælian (1857), the 'Odyssey' (1859), Pindar (1860) and Aristophanes (1861), Terence (1864), Plautus (1865) and Quintus Smyrnaeus (1866).

DONNYBROOK, Ireland, a parish now included within the parliamentary borough of Dublin, on the river Dodder. It was famous for its fairs, abolished since 1855, which used to attract vast multitudes and seldom passed off without riot and bloodshed. Pop. 19,472.

DONOGHUE, John, American sculptor: b. Chicago, Ill., 1857; d. New Haven, Conn., July 1903. He won a first prize over many com-
petitors at the Chicago Fair for a classical group, 'Sophocles Leading the Chorus After the Battle of Salamis,' one of the finest speci-
mens of the nude in American art. He designed the 'Saint Paul' in the Congressional Library in Washington, the 'Saint Louis of France' in the Appenzell Division building in New York, and busts of Governor Ames and John Boyle O'Reilly in the Boston Public Library. Other works were his 'Venus' and 'Diana,' and best known of all, his 'Egyptian Isis.'

DONOUCOLI, one of the small species of the South American monkeys of the genus Nysitiphas, of which several species are to be found between Nicaragua and the Amazon; also called night monkeys and devil monkeys. They are small, rather thinly built, with short, round faces encircled by a ruff of whitish fur, very large, staring, yellowish eyes, and hair close, soft, woolly fur, and bushy, non-prehen-
sile tails. All are arboreal and nocturnal in habit, secreting themselves by day and hunting at night for the insects, small birds and fruits on which they feed; and uttering loud, cat-like howls. They make amusing pets, but are very delicate.

DONTENWILL, Augustin, Canadian bishop: b. Birschwiller, Alsace, 4 June 1857. He was educated in his native province and at Ottawa University. He entered the Oblate order in 1880; was consecrated coadjutor bishop of New Westminster, 20 Aug. 1897; bishop in 1899; first archbishop of Vancouver, 7 Sept. 1908; and resigned on his appointment, on the 20th of the same month, as superior-general of the Oblates, with the title of titular archbishop of Ptolemais. Resident in Rome.

DONUS, Pope from 676 to 678. He is known as a patron of architecture and adorned many of the churches of Rome; he also com-
pelled the architect of Ravenna to recognize his authority. The only work recorded as Pope for a short time in 974, but this is recognized as a mistake, due to an error of a copyist.

DOO, George Thomas, English line-engraver: b. Christ Church, Hants, 6 Jan. 1800; d. Sutton, Surrey, 13 Nov. 1886. He made him-
self best known by his famous plates of 'Knox Preaching,' after Wilkie; of Eastlake's 'Italian Pilgrims Coming in Sight of Rome,' by his ex-
quisitely finished heads of women and children, after Lawrence, and by his engravings from Raphael, Correggio and others. His plate of the Calmady children, titled 'Nature,' after Lawrence, produced in 1830, ranks as his master-
piece. He was court engraver to William IV and Queen Victoria, and in 1857 he was elected a member of the Royal Academy. About 1853–55 he published, of his work of this class being mainly portraits. In 1864 he completed, after eight years' work, a large en-
graving of the 'Raising of Lazarus,' by Sebasti-
tiano del Piombo, his last important work.

D'OOG, dō'gē, Benjamin Leonard, Amer-
ican university professor: b. Grand Rapids, Mich., 1860. He was educated at the Uni-
versity of Michigan in 1881, and also studied at the University of Bonn. He was principal of the High School at Coldwater, Mich., in 1881–83, was instructor in Latin at the University of Michigan in 1884–85, and in the following year became professor of ancient languages at the Michigan State Normal College. He traveled and studied abroad in 1899–1901, and again in 1908–09. He edited 'Colloquia Latina' (1888); 'Virì Romæ' (1895); 'Easy Latin for Sight Reading' (1897); Caesar's 'Gallic War' and 'Second Year Latin' (1889), with J. B. Greenough and M. G. Daniell; 'Helps to the Study of Classical Mythology' (1899); Cicero's 'Select Orations' (1901); 'Latin Composition' (1901); 'Latin Composition for Secondary Schools' (1904); 'Latin for Beginners' (1910). 2d ed., 1911.

D'OOG, Martin Luther, American classical
scholar: b. Zonnenarie, Netherlands, 17 July 1839; d. 12 Sept. 1915. He was graduated at the University of Michigan in 1862 and received the degree of D.Ph. at the University of Leipzig in 1873. From 1870 to 1912 he was professor of Greek in the University of Michigan. In 1873 he entered the ministry of the Congregational Church and was director of the American School of Classical Studies at Athens in 1887–88, and president of the American Philological Association in 1884. He edited Demosthenes' 'De Corona' (1888), and Sophocles' 'Antigonê' (1885), and wrote 'The Acropolis at Athens' (New York 1909). He contributed also to various periodicals.

DOOLEY, Mr. See DUNNE, FINLEY PETER.

DOOLITTLE, Charles Camp, American soldier: b. Burlington, Vt., 16 Mar. 1821; d. 1903. He entered the volunteer service during the Civil War, becoming colonel in 1862. He led
a brigade at Nashville, and was commander of the northern district of Louisiana in 1865. In June 1865 he was made major-general of volunteers and was mustered out of service in November of the same year. He moved to Toledo, Ohio, where he was cashier of the Merchants' National Bank.

DOOLITTLE, Charles Leander, American astronomer: b. Ontario, Ind., 12 Nov. 1843. In 1873-75 he took part in the survey of the northern boundary of the United States from the Lake of the Woods to the Rocky Mountains; during the 20 years following he was professor of mathematics and astronomy at Lehigh University, and from 1895 to 1912 was professor of astronomy in the University of Pennsylvania. His principal work has been in the branch of astronomy known as practical astronomy, on which subject he has written a well-known textbook for the use of advanced students. He was one of the first systematic observers of the variations of latitudes upon the earth, his research observations in this field having been begun in 1876 and continued with almost no interruption for a period of 35 years. During the last eight years observations were made on each night, both with the zenith telescope and with a very unusual instrument called a zenith tube, for the purpose of finding whether certain observed, small changes in the latitude of a station were real or whether they were due to imperfections in the instrument employed. It was found that these changes were indicated by the observations of both instruments. Dr. Doolittle is now professor emeritus of astronomy at the University of Pennsylvania. He was treasurer of the Astronomical and Astrophysical Society of America from 1899 to 1905, and after 1909, a vice-president of the American Association for the Advancement of Science in 1893 and a curator of the American Philosophical Society.

DOOLITTLE, Eric, American astronomer: b. Ontario, Ind., 26 July 1869. He was graduated at Lehigh University in 1891, and became instructor in astronomy there in 1891-92; in the State University of Iowa 1892-93, and assistant professor of astronomy in the University of Pennsylvania 1896-1912, and professor of astronomy and director of the Flower Astronomical Observatory in the University of Pennsylvania since 1912. His principal contribution to astronomy from the theoretical side was a computation of the secular perturbations of the elements of the orbits of the four inner planets, employing in this work a method first fully developed by G. W. Hill and not hitherto applied in this connection. Outstanding, minute errors in the motions of these bodies, not fully accounted for by the disturbing gravitational pull of the known planets, were verified by the new computation. His work in practical astronomy consists of a continuous series of measures of double stars, begun in 1895 and published in several volumes by the University of Pennsylvania, and in the later volume of the General Catalogue 3 of S. W. Burnham (q.v.) and keeping this work complete to date.

DOOM, the old name for the "Last Judgment," a subject usually chosen for paintings over the chancel arch in parochial churches in England. Dooms were executed in distemper, and are of constant occurrence. In the reign of Edward VI these representations were effaced, or washed over, as superstitious.

DOOM PALM, or DOUM PALM, a palm-tree, Hyphaene thebaica, whose branches terminate in a tuft of large fan-shaped leaves. It is a native of Arabia, is prevalent in Upper Egypt and central Africa and sometimes reaches a height of 50 feet. The fruit is about the size of an apple; it has a fibrous mealy rind, which tastes like gingerbread (whence the name gingerbread-tree sometimes applied to this palm), and is eaten by the poorer inhabitants of Upper Egypt, where it grows. An infusion of the rind, gently aperient, is also used as a cooling drink in fevers. The seed is horny and is made into beads and small ornaments. Ropes are made of the fibres of the leaf-stalks.

DOOMSDAY or DOMESDAY BOOK, the record of a statistical survey of England, made by royal authority in the reign of William the Conqueror. The origin of the name has been much disputed. Popularly it has often been associated with the final day of judgment. There was a dooms-book or dom-boc (q.v.) composed in the reign of King Alfred, which contained a collection of the laws and customs of the kingdom, and the doomsday book is conjectured to have taken its name from the fact of its containing the authoritative data on which legal decisions in regard to land and other collateral property were to be given. The general survey of the kingdom was ordered at Christmas 1085, and completed in the following year. It was made by commissioners appointed by the king, who collected the particulars at inquests from a sworn jury, consisting of sheriffs, lords of manors, presbyters, bailiffs, villains; all the classes, in short, interested in the matter. The information collected consisted in specifications of the extent of land in each district, their proprietors, tenure and value: the state of culture, namely, the quantity of meadow, pasture, wood and arable land; in some counties the number of tenants, villains, bordar and serf; even the shee and cattle on the different estates were taken, but these were not entered in the permanent record. Northumberland and Durham were omitted and the northern part of Cumberland and of Westmoreland. The original 'Domsday Book' is preserved in the record office. It consists of two volumes; one folio, one quarto. The republication of this valuable record was undertaken in 1767 and completed in 1783. Perfect facsimiles of the whole book in photozimography have also been made.

Taxes were levied on the basis of the doomsday book until 1522, when as a result of another survey, the 'New Domesday Book' was compiled. 'The Victoria County History', gives a translation of the old doomsday text for each county with a commentary and map.

Consult Ballard, 'The Doomsday Boroughs' (Oxford 1904); and 'The Doomsday Inquiry' (London 1906); Ellis, H., 'General Introduction to Domesday Book' (2 vols., ib. 1833); Maitland, F. W., 'Domesday Book and Beyond' (ib. 1897); Round, J. H., 'Feudal England' (ib. 1895); Vinogradoff, 'Village in England' (ib. 1892).

DOOM, a river in Ayrshire, Scotland,
DOOR — DOPPLER'S PRINCIPLE

which after a northwesterly course of 27 miles flows into the Firth of Clyde two miles south of Ayr. It is celebrated in the poems of Burns.

DOOR, a wooden or metal, sometimes stone frame or panel constructed to open and shut on hinges; used for entrances to buildings, rooms, etc. Sometimes made of one piece, but generally of several sections framed together. The doors of ancient Egypt and kindred countries swing upon vertical pintles which projected from the top and bottom of the door into sockets above and below. In China and other Eastern countries doors may be seen today swinging on pivots. In modern carpentry, doors are classified under two general heads: batten-doors and panel-doors. The former are made of two or more boards placed longitudinally and held together by transverse rails. The latter are formed of a skeleton frame work into which are fitted lengths of thin board called panels. Folding and sliding doors have been improvements upon the hinge variety, working on tracks or grooves and having the particular value of saving space. See also SWINGING DOORS.

The doors of antiquity are little known to us; the best in existence, those of the temple at Balawat, now in the British Museum, have their tenons sheathed in bronze. The doors of the Pantheon date from the 2d century; two of the Roman period are in the Lateran Basilica at Rome. The door of the church of the Holy Sepulcher at Jerusalem (19th century) is covered with bronze plates; those of the church of Saint Sophia, Constantinople date from the 8th century. The doors made in Italy during the Renaissance period were of very simple construction; those in Germany and France during the same period were by contrast ornate and elaborately carved.

DOORGA, in Hindu mythology the principal wife (10-armed) of Siva, one of the gods belonging to the Hindu triad. She has many names and varied characteristics. In Bengal the name Doorga is her appropriate appellation, and was given her by transference from the giant from whom she slew. In this presidential and 10 days’ celebration in her honor is annually celebrated. In southern and western India she is called Purwutee, or Parvati.

DOORBOOM (Acacia horrida), a tree common in South Africa. The name “thorn-tree,” given to it by the Dutch colonists, and the botanical specific name are due to the number and sharpness of its spines. It seldom much exceeds 30 feet in height, but its timber is hard and tough, and is much used for house-carpentry, etc. See ACAcia.

DOPE (from Dutch doop, sauce) is a descriptive term meaning any thick liquid like molasses; a thick sauce or gruel or other viscous fluid or pasty thing used for eating is called a dope. By extension used vulgarly for any narcotic or drug. Also (1) a thick paste lubricant like axle-grease. (2) Fillers used in painting to fill the pores of the wood and prevent the absorption of the paint or varnish subsequently applied to the wood. (3) A preparation of pitch, tallow and other ingredients which, when applied to the bottoms of shoes, will enable the wearer to lightly glide over softened snow. (4) Any absorbent material, as cotton waste for holding axle-grease or kieselguhr for holding nitro-glycerine. (5) A stupefying substance like opium or chloral hydrate. For dynamite dopes see EXPLOSIVES.

DOPPLER, Christian, Austrian mathematician and physicist; b. Salzburg, Austria, 30 Nov. 1803; d. 17 March 1853. He was professor of mathematics at Prague 1841–47, and at Vienna held a similar post in the Polytechnikum 1848–51. For the last two years of his life he was director of the physical institute at Vienna University. He published ‘Ueber das farbige Licht der Doppelsterne’ (1842); ‘Versuch einer systematischen Klassifikation der Farben’ (1848); ‘Abhandlungen’ (ed. by Lorenz, 1907), etc., and made known the noted “Doppler’s Principle” (q.v.).

DOPPLER’S PRINCIPLE, a name given to the physical law (first enunciated in 1842 by Christian Doppler of Prague), that the apparent wave-length of sound or light depends upon the velocities of the observer relative to the source from which the radiation proceeds. For the sake of illustration, let the source of the radiation be stationary with respect to the medium that transmits the waves, and let the velocity of the waves in this medium be V. If N is the number of waves of a certain definite wave-length that the source emits every second, then the observer who will also receive N of these waves every second, provided he remains stationary. If the observer is moving, however, the case is different. For example, suppose that he is receding from the source of the radiation with a uniform velocity v, and consider what happens in the course of a single second. During this second N waves reach his initial position, just as before; but at the end of the second he is v units of distance beyond that initial position, and hence it is impossible that all of these N waves can have reached him. The deficit will evidently be equal to the number of waves whose combined lengths would just measure v. But the source sends out N waves every second, and when the last of these N is just leaving the source, the first one of the series has proceeded to a distance V. Hence we know that the length of one wave is V

\[
N \frac{V}{v}
\]

and to find the number of waves that would be required to fill the distance v, we have only to divide v by the length of a single wave; that is, we have to divide it by \( \frac{V}{v} \). Hence the observer’s motion will diminish the number of waves that reach him every second by \( \frac{Nv}{V} \), and, therefore, when he is receding from the source with the velocity v, he will receive only \( \frac{N}{N \frac{V}{V} - v} \) waves per second.

The result will be, that the wave-length of the sound (or light) will appear to him to be longer than it really is. The same line of reasoning will show that if the observer is stationary and the source is receding with a velocity v, the
number of waves that the observer will receive per second will be \( v + \nu \). If the motion is such as to diminish the distance instead of increasing it, the algebraic sign of \( \nu \) must be reversed in the foregoing formula.

The most familiar example of Doppler's principle is afforded by the sudden change in the apparent pitch of a sounding bell or whistle on an express train moving at high speed. If the observer stands close to the track, the pitch falls suddenly and very markedly, as the locomotive passes him. The most important applications of the principle, however, are in astronomy, in connection with the measurement of the velocities of the celestial bodies, by observing the displacement that their motion produces in the positions of the lines of their spectra. (See Spectroscope.) If the earth is approaching a heavenly body, the lines in the spectrum of that body are all shifted slightly toward the red end, owing to the apparent shortening of each wave length by the motion. If the earth and the heavenly body are receding from each other, there is a similar displacement of the lines toward the red end. The rotation of Saturn's rings has been experimentally demonstrated in this way, and the velocities of approach and recession of many of the brighter fixed stars have also been determined. Certain stars have been demonstrated to be double, by the discovery that the lines of their spectra are periodically double and single; the lines appearing single when the relative motion of the two components is perpendicular to the line of sight, and double when the positions of the component stars are such that one star is approaching the earth while the other is receding. The orbits of certain of these stars have been determined by such measurements, even when the components of the systems are so close together that no telescope can show them separately, nor make them move with the velocity of a single point of light. See Double Stars.

DOPPLERITE (named after Christian Doppler, the first to bring it to notice), an amorphous mineral occurring in elastic or partly jelly-like masses found in peat-beds in Styria and Switzerland, and regarded as a fossil peat. When fresh it is a brownish-black, with a dull brown streak and greasy sublustrous lustre, insoluble in alcohol or ether. Dopplerite is also the name of a related mineral, grayish, earthy and plastic in the fingers when fresh.

DOR, or BONGO (q.v.), the names given to a mixed tribe of negroes living in north central Africa, in the lowlands of the Bahr-el-Ghazal, Anglo-Egyptian Sudan. The race is of medium size, attaining splendid muscular development. Their skin is red-brown; they live in well-built huts, their main employment is agriculture, and they have the reputation of being industrious and amenable. The women tattoo the upper part of the body, and as ornaments wear rings and straws through the lips and nostrils. They are noted for remarkable productions in iron (which is their currency) and wood work. (J. B. Swettenhurth, 'The Heart of Africa') (London 1873).

DOR, or DORR, a species of beetle, belonging to the family of earth-borers; the cock-chafer of Europe. It is of a glossy violet, black or deep greenish-black. The club of the antennae is yellowish, the elytra smooth, but slightly punctated, as is the thorax. It may often be seen flying about in the summer evenings. Its size and weight render it very unwieldy on the wing, so that it has but little power of guiding itself, and apparently none of checking its course quickly, for it strikes against all kinds of objects, but without suffering any hurt. The female in autumn digs up patches of cow-dung. It is about an inch long. It is also called dor- or dorr-beetle, dor-fly and buzzard-fly.

DOR, or MONT DORE, moh' dör (often written Mont d'Or), a chain of mountains in France belonging to the group of the Auvergne Mountains, in the department of Puy-de-Dôme. They are of volcanic formation. The Puy-de-Sancy, the highest peak of central France, is 6,190 feet.

DORA, a facetious abbreviation of the British Defense of the Realm Act.

DORA D'ISTRIA, dés'trè-ä, pseudonym of ELENA GHICA, Rumanian author: b. Bucharest, 22 Jan. 1829; d. Florence, 9 Nov. 1888. She married the Russian Prince Kolzow-Massalsky. Her first work, 'Monastic Life in the Eastern Church,' alleges monasticism to be the principal obstacle to civilization in eastern and southern Europe. Her other works include 'German Switzerland,' 'Women in the East'; 'Women, by a Woman.' She contributed many literary and historical essays to German, Italian, French, and Greek periodicals. Her studies on Albanian poetry gave rise to a nationalistic and literary movement among the Albanians.

DORCAS GAZELLE, the best known of the genus of gazelles, very common in northern Africa, Asia Minor, Arabia and Syria. It attains a height of two feet; has tapering ringed horns from 9 to 10 inches long; and is of a tawny color with white under parts. It is noted for its speed, is naturally very wild, but easily becomes domesticated, and owing to its beauty and gracefulness is frequently alluded to in Oriental poetry. Its name is derived from the Greek, δόρκας, through δορκετής, to look, owing to the size and brightness of its eyes.

DORCHESTER (ancient Roman Durnovaria or Durinum), England, a municipal borough, the county town of Dorsetshire, six miles north of Weymouth. It has a considerable agricultural trade, and cavalry and infantry barracks. In March 1645 Cromwell held the town as his headquarters with 4,000 men, and in 1685 Judge Jeffreys held his "bloody assize" here, when 292 received sentence of death as being implicated in Monmouth's Rebellion. A Roman amphitheatre, in a good state of preservation, is near the town. Pop. 9,842.

DORCHESTER, Mass., dating 1670 one of the wards of the city of Boston. Dorchester, originally called Mattapan, was settled in 1630 by the Puritans, but the name was soon changed to Dorchester in memory of the English home of some of the settlers. Dorchester was settled before Charlestown and Boston. In 1633 its territory or township extended almost to the borders of the Rhode Island Colony, over 35 miles distant, and was then known as
"ye greatest towne in New England." Here the form of special township government, since so characteristic of New England, was first instituted. The town of Windsor, Conn., was founded in 1636 by Roger Ludlow and a company of Dorchester citizens and toward the close of the century, in 1695, it sent another colonizing company to South Carolina. It was by fortifying Dorchester Heights in March 1776 that Washington forced the evacuation of Boston by the British army. The place is noted as the birthplace of Edward Everett. The population is counted as a part of that of Boston.

DORCHESTER, New Brunswick, town, county seat of Westmoreland County, at the junction where two small rivers enter Shepody Bay, and on the Intercolonial Railway. The industries are principally ship-building and nearby quarrying, from which great quantities of building stone are exported. Coal and lumber are also exported in large quantities. It contains a woolen mill and the penitentiary of the Maritime Provinces. It has an excellent harbor. Pop. 1,080.

DORCHESTER HEIGHTS, now SOUTH BOSTON, Mass. This hill on the peninsula, southeast of Boston proper, across a navigable channel, commands the city; and in the Revolution, when Boston was held by Howe in the winter of 1775-76, it was obviously of the first importance to fortify it. Howe neglected to do so, and on the evening of 4 March 1776, under Washington's orders, Gen. John Thomas, with some 2,000 men and the proper implements, took possession of the heights, and by the next morning a sufficient entrenchment had been thrown up. Howe promptly agreed to evacuate Boston if un molested, and did so on the 17th, leaving all his guns and supplies unharmed for the Americans.

DORDOGNE, dór'dônyèt', a department of southwestern France, which includes the greater part of the ancient province of Périgord, and small portions of Limousin, Angoumois and Saintonge. Area, 3,550 square miles, of which about a third is fit for the plow. The chief minerals are iron, which is abundant, slate, limestone, marble and other stone. Mining, iron manufacture, etc., are carried on to a considerable extent, and there are a number of vineyards. Also noted for its production of wines and truffles. The climate is mild, but somewhat changeable. The river Dordogne, principal river of the department, rises on the flanks of the Puy-de-Sancy, flows west-southwest, and after a course of 305 miles unites with the Garonne in forming the Gironde. Pop. 437,432.

DORDOGNE, a river of south central France, formed by the union of the Dor and Dogue at the base of Mount Dore and flowing west for 305 miles, uniting with the Garonne about 15 miles north of Bordeaux. The river is navigable for steamers for nearly 190 miles.

DORDRECHT, dór'dréxt'. See Dort.

DORÉ, dó'rè, Paul Gustave, French artist: b. Strasbourg, 6 Jan. 1832; d. Paris, 23 Jan. 1883. He early showed signs of remarkable artistic talent: after his fourth year he was seldom without a pencil in his hand, and in his 11th year he executed drawings on borrowed lithographic stones. In 1847 he was sent to the Lycée Charlemagne at Paris and presently his remarkable skill as a designer and draughtsman of humorous and satirical subjects gained him a place among the illustre of Intemperance, the Journal pour Rire. From 1848 to 1853 he contributed to the Salon a series of pen drawings which attracted much attention. In 1857 he obtained honorable mention for his landscapes and a prize in the battle of Intemperance. Meantime his fame as an illustrator of books was rapidly rising, and it is in this branch of art that his fame is mainly founded — one in which his strongly marked individuality, pictorial and decorative sense, grotesque humor and vivid imagination found full play. He began his embellishment of the world's literary masterpieces by his drawings for Balzac's 'Contes drolatiques' (1856); followed by illustrations for Montaigne (1858), the 'Inferno' (1861), 'Don Quixote' (1862), and the 'Paradiso' (1864-66); and the Bible (1865-67). His productivity was extraordinary, and included paintings in water colors and oils and sculpture. After 1870 he painted for the most part Scriptural subjects, and on the strength of his large canvases in the Pretorium, he was hailed in England as a great poet-preacher and enjoyed a great vogue in that country, and a permanent gallery of his work was established in London. Some of his canvases were so large that he had to erect ladders and scaffolding in his studio in order to reach them. In sculpture his most successful essays were the colossal vase now in the Golden Gate Park at San Francisco and the monument to Alexandre Dumas in the Place Malesherbes, Paris.

Doré's juvenile and adolescent successes reacted disastrously on his after-career. They prevented him from applying himself steadily to a mastery of the technique of drawing; he lacked self-control; from first to last he was deficient in interpreting the emotion and expression; he attempted to excel in too many fields; and so great was the market demand for his work that he wore himself out by overproduction. He was appointed a Chevalier of the Legion of Honor in 1861 and an officer of the Legion in 1879. Consult Berard, 'Les graveurs du 19ème siècle' (Paris 1885); Delorme, 'Gustave Doré' (ib. 1879); Jerrold, B., 'Life of Gustave Doré' (London 1891); Roosevelt, 'Life and Reminiscences of Gustave Doré' (New York 1885).

DOREMUS, Charles Avery, American chemist: b. New York City, 6 Sept. 1831. He was graduated at the City of New York in 1870 and took the degree of D.Ph. at the University of Heidelberg in 1873. In 1874-79 he was a member of the faculty of Bellevue Hospital Medical College; from 1879 to 1882 was professor of chemistry and toxicology at the University of Buffalo. In 1882-92 he was professor of chemistry at the American Veterinary College, New York, and from 1892 to 1904 was connected with the department of chemistry of the College of the City of New York.
author of 'Report on Photography, Vienna Ex-
position' (1873); section on gaseous poisons in 'Oeuvres de l'Académie des Sciences' (1903); and contributions to various scientific
journals.

DORÉZ, dô'drɛ, Léon (Louis Marie), French author and librarian; b. Villemaur, Aube, 1864. He was educated at the École des Hautes Études, the Sorbonne and the École des Beaux-Arts. In 1893 he was connected with the French School at Rome, and later received the appointment of assistant in the Bibliothèque Nationale, and in 1905 became librarian of the manuscript department there. He edited the 'Revue des Bibliothèques' and the 'Bibliothèque littéraire de la Renaissance.'

DORIA, dô'ri-â, one of the most powerful families of Genoa. It became distinguished about the beginning of the 12th century and shared with the families Fieschi, Grimaldi and Spinola the early government of the republic. These four, who were known as Magna quattuor prosapia, the four great families of this republic. The Doria and the Spinolas belonged to the Gibelline, the Fieschi and the Grimaldi to the Guelph faction; but as this division does not affect the combinations of which the number four is the caple, the two distinct sections entertained their own private jealousies and quarreled among themselves, Guelph with Guelph and Gibelline with Gibelline, making, as it were, a barrier of the dark and deep streets of the intractable dynasty.

DORIA, Andrea, Genoese admiral; b. Oneglia, 30 Nov. 1468; d. Genoa, 25 Nov. 1560. He entered the Pope's guards and afterward passed into the service of the Duke of Calabria, who commanded in Italy for the king of Aragon. He was rapidly promoted, and Alphonso II gave him a command against Ludo-
vico Sforza, Duke of Milan. When the French had left Italy the Genoese entrusted the recon-
struction of their fleet to Doria. He was the first employed in suppressing the Barbary pirates, from whom he captured a large boat, but was soon after exiled, and entered the service of Francis I, who named him admiral of the French galleys. Displeased with some demands of the French king, who in answer to his complaints deposed him from his command, he entered the service of Charles V in 1528. His defection proved disastrous to the French
cause in Italy. He occupied Genoa without resistance on 12 Sept. 1528, and his further successes contributed to the re-establishment of peace. He re-established order in Genoa and organized the government on a new basis, which became permanent during the independ-
ence of the republic. Charles bestowed on him the highest honors and received in exchange the services. In 1532 he took Koron and Patras, in Greece, from the Turks, and in 1535 assisted in the capture of Tunis. He assisted next year in a descent on Provence, took Toulon and ravaged the coasts of the Gulf of Lyons. The emperor and the king of France had afterward an interview with him, but the interview has become historical, on board his galley, with a view to the conclusion of peace. This interview took place at Aigues-Mortes in July 1538. In 1547 he narrowly escaped assassination in a con-
spiracy raised in Genoa by the Fieschi. His nephew was killed in this conspiracy, which
excited him to some severities approaching to the barbarity of earlier times. Doria has been accused, probably with justice, of spoiling his sword too freely, and to too many opposing interests; but his services to his country have earned him the titles of father and liberator, which were conferred on him, together with the censorship for life, by the Senate of Genoa in 1528. Consult Guerazzi, 'Vita di Andrea Doria' (Milan 1874); Petit, 'André Doria' (Paris 1887).

DORIAN MODE, the standard Greek and ecclesiastical mode, the first of the authentic Church tones or modes, from D to D, with its dominant note of A. It was the first in the order of D minor, but with the B natural and no C sharp. It is characterized by its severe and austere progressions and is especially adapted to religious or warlike music. Many of the old German chorals are written in this mode.

DORIANS, one of the four great branches of the Greek nation. They derive their name, according to legend, from Dorus, the son of Hellen. They dwelt first in Histiaeotis, were then driven by the Perrhebii into Macedonia, forced their way into Crete, where the lawgiver Minos sprang from them, and finally settled in the towns (Doria Tetrapolis) at the foot of Mount Etia, between Thessaly, Ætolia, Locris and Phoci, and subsequently, together with the Heraclidæ, made a settlement in the Pelopon-
nesus, where they ruled in Sparta. Colonies emigrated from them to Italy, Sicily and Asia Minor. The Doriens were in many ways the reverse of the Ionians. The Doric manner always retained the antique style, and with it something solid and grave, but at the same time hard and rough. The Doric was broad and rough; the Ionic delicate and smooth; it was the form made use of in solemn odes, for example, in hymns and in choruses forming part of the national celebrations and the acting of the drama at Athens. This use of the word has been perpetuated; i.e., the Scottish dialect, in contrast with the more polished literary English, being called Doric. The Cretan and Spartan legislative codes of Minos and Lycurgus were much more rigid than the mild Athenian institutions of Solon. The Spartan women wore the light tuck-up
tucking-dress, while the Ionic females ar-
rayed themselves in long sweeping garments. Both have been idealized by artists: the one in Artemis and her nymphs, the other in Pallas Athene and the Cephale. The same contrast appears no less strikingly in their architecture, in the strong, unadorned Doric and the slender, elegant Ionian columns. See Müller, 'Die Dorier'; Grote, 'History of Greece.'

DORIC ORDER, in architecture, the second of the five orders, being that between the Tuscan and Ionic.

GRECian Doric.—The Doric column was first adapted to edifices having the proportions, strength and beauty of the body of a man. The trunks of trees probably suggested the first idea of columns, but in the Doric style the pro-
portions of a man appear to have been adopted. A man was found to be six times the length of his foot, hence the plain Doric columns were made six diameters in height. From the middle of the 7th century to the end of the 6th century B.C., the Doric appears to have been the only
DORIDE—DORN

style of architecture used by the Greeks, and its highest example is the Parthenon of Athens.

DORIAN. An imitation of the Greek, with a true Greek entablature and a molded base. The column is slenderer than that found in the best Greek examples, and is possibly of Etruscan proportions.

DORIDE, in natural history. See Sea-LEMON.

DORIGNY, dô-rên-yé, Louis, French engraver: b. Paris 1654; d. Verona, Italy, 1742. He was a son of Michel Dorigny (q.v.). He entered the school of Lebrun and made a journey to Italy, where he copied the great masters.

DORIGNY, Michel, French painter and engraver; b. Saint Quentin 1617; d. Paris 1665. He was a pupil of Simon Vouet, whose works he etched and whose drafts in drawing he copied. His style of execution is bold, and his management of light and shade good. He became professor in the Academy at Paris.

DORIGNY, Sir Nicholas, French engraver: b. Paris 1638; d. there 1746. He was a son of Del Dorigny (q.v.). He spent 28 years in Italy studying the most illustrious masters and eight in engraving the famous cartoons of Raphael at Hampton Court, for which he received the honor of knighthood from King George I. In 1725 he became a member of the Academy at Paris. One of his best engravings, besides his cartoons, is the 'Transfiguration,' from Raphael, and the 'Apologia of Saint Petronilla,' after Guercino. His engraving is easy and strong and the work of the needle and the graver happily united.

DORION, Sir Antoine, Aimé, Canadian statesman and jurist: b. Saint Anne de la Perade, P. Q., 17 Jan. 1818; d. 3 May 1891. He was called to the bar in 1842 and became chief justice of the province of Quebec in 1874. He held various cabinet positions, formed with George Brown the short administration of 1858, and was knighted in 1877. He was the leader of the French-Canadian Liberal party of the province of Quebec during the period of the Union.

DORIS, a small mountainous district of ancient Helias, was the home of the Dorians (q.v.). It is now a part of the modern government of Phocis. Doris was also the name of a district in Asia Minor on the coast of Caria, inhabited by colonists from the Peloponnesus.

DORKING, England, town in Surrey, 22 miles southwest of London, noted for its breed of fowls. It is the scene of the fictitious 'Battle of Dorking.' Its principal trade is in flour, lime and chalk. Pop. about 8,000.

DORKING, a fowl. See Poultry.

DORMANT STATE. See Hibernation.

DORMER WINDOW (Old French dormer, a sleeping-room), a vertical window usually flush with the wall of the house and standing a good way out to receive it from a sloping roof. In ordinary house-building it serves as an ornament and at the same time lighting and enlarging an attic chamber. It is very picturesquely used throughout France, Belgium and the Netherlands. In Gothic and Renaissance architecture the dormer window effect was often employed on beautiful stone edifices.

DORMEUR, a fish, one of the triple tails (Labolete surinamensis), found in most warm seas and common in the West Indies. It may reach a length of three feet and is regarded as good food.

DORMITORY (Fr. dormitoire, from Lat. dormire, "to sleep"), formerly in a monastery or nunnery sleeping quarters either divided into cells or cubicles, opening upon a corridor, or one great apartment divided by partitions or curtains. In connection with American colleges and similar institutions the dormitory is often an entire building divided into bedrooms.

DORMOUSE, the common name given to the family Myoxidae, natives of the Old World. They are pretty little creatures, with soft, fine fur and long squirrel-like tails; but, unlike the squirrels, which they somewhat resemble in habits, they have no check-pouches. There are in all four genera of the Myoxidae, containing about a dozen species, the best known of which is the red dormouse (Muscardine), which lives in the woods in most parts of Europe. It is about the size of the common house mouse; has a rather large head, a pointed muzzle, large, prominent eyes and a hairy tail. It is reddish in color above and white below. Its food consists of acorns, nuts (especially hazel nuts) and grain, which it stores for winter use, much as squirrels do. In the coldest weeks of winter it curls up and sleeps, waking, however, at intervals in milder days to feed upon its gathered stores. Its nest is usually made of tangles of herbage, with an opening at the top, and hidden in the underbrush. The fat dormouse (Myoxus gris) is larger than the red dormouse, and droller in coloring. It inhabits the forests of southern Europe, where it may be found leaping with remarkable agility from tree to tree. The garden dormouse (Eliomys nitela) lives nearer to man, being found in gardens, and often in barns. It destroys fruit growing along walls and trellises. The French call it lerot; the Germans "Gartenschäfer".

DORN, Alexander von, Austrian economist: b. Wiener-Neustadt 1838. He was made editor of the Triester Zeitung in 1872, and 12 years later founded the Volkswirtschaftliche Wochenchrift in Vienna. In 1880 he started a commercial yearbook of the Austro-Hungarian monarchy entitled 'Exportkompass.' He edited Die Seehäfen des Weltverkehrs after 1889 and published 'Kriegsmarine und Volkswirtschaft in Oesterreich-Ungarn' (1885), and 'Americanisches' (1900).

DORN, Johanna Albrecht, Bernhard, Russian Orientalist: b. Schenerfeld, Coburg 1805; d. 1881. He was educated at Halle and Leipzig and in 1826 became professor of Oriental languages at Kharkov, at the Oriental Institute of Saint Petersburg in 1835, and in 1842 was appointed director of the Asiatic Museum. In 1843 he became chief librarian of the Imperial Public Library. He has specialized on the history and language of Afghanistan and Cazaucia. His published works include 'Ueber die Verwandtschaft des persischen, germanischen, und griechisch lateinischen Sprachstammes' (Hamburg 1827); 'Auszüge aus muhammedischen
DORNER, August Johannes, German philosopher and theologian, son of I. A. Dornier: b. Schiltbach, Baden, 24 January 1813, where he received his education at the universities of Berlin, Göttingen and Tübingen. In 1839 he became minister of the German congregations in Lyons and Marseilles. After some years of travel in the Orient he settled down at Tübingen as teacher in 1870, visited America in 1874 and on his return was appointed professor and director of the Wittenberg Theological Seminary. He removed to Königsberg in 1890 and was rector of the university there in 1908-09. He edited his father's 'System der christlichen Sittenlehre' (1855) and his correspondence with Martensen (1888) and wrote 'Augustinus' (1873); 'Kirche und Reich Gottes' (1883); 'Predigten vom Reiche Gottes' (1880); 'Dem Andenken von I. A. Dornier' (1885); 'Das menschliche Erkennen' (1887); 'Das menschliche Handeln, philosophische Ethik' (1895); 'Grundriss der Dogmengeschichte' (1899); 'Encyklopädie der Theologie' (1901); 'Grundriss der Religionsphilosophie' (1903); 'Heilsglaube und Dogma' (1905); 'Die Entstehung der Freiheit' (1907); 'Friedensphilosophie, Nietzsche, und Naturalismus' (1911); 'Die Metaphysik des Christentums' (1913) and contributions to theological journals.

DORNER, Issaak August, German Protestant theologian: b. Württemberg, 20 June 1809; d. Berlin, 8 July 1884. He studied theology and philosophy at Tübingen, and had already filled the chair of Königsberg, Bonn and Göttingen, when in 1861 he was called to be professor at Berlin. His greatest work is the 'History of the Development of the Doctrine of the Person of Christ' (1861-63). Among his other works are: 'History of German Theology' (1871); 'System of Christian Doctrine' (1880-84); 'Christian Ethics' (1887). Consult Pfeiderer, 'The Development of German Theology Since Kant' (New York 1890).

DORNIC, or DORNICK, a species of coarse, figured linen, named from Tournai or Dornick in Flanders. The manufacture, introduced into England by the Dutch who fled from the persecutions of Alva, was long confined by law to inhabitants of Norwich and Pulham. A similar cloth called dornock was made at Dornock, Scotland.

DORNOCH, dōrnŏk, TIRTH, an arm of the sea, on the east coast of Scotland, separating Switzerland from Ross and Cromarty. The royal burgh of Dornoch is near the entrance. There is a famous old cathedral dating from the early 13th century. Skibo Castle, the residence of Andrew Carnegie, is four miles west of Dornoch. Fishing is valuable but navigation is difficult. Pop. about 750.

DORNCK. See Dornick.

DORNOHOI, dōrŏ-hōi', Rumania, a town in the northwest of Moldavia, near the Austrian frontier. The principal trade is in timber. Pop. 15,000, half being Jews.

DORPAT, dōrĕpăt, or DÖRP'T (Russian official name Yuriy, Letish Tehrp), Russia, city in the government of Livonia, on the Embach, about 135 miles northeast of Riga. Dorpat is chiefly remarkable for its university, which was founded in 1632 by Gustavus Adolphus, when the Swedes were masters; it was suppressed, in 1656, by the Muscovites; and re-established by the Emperor Alexander, in 1802-03. In the northwest section of the city there formerly existed a citadel, an episcopal palace and cathedral. The place of these is today occupied by the observatory, which the labors of Dr. Struve have made famous, a library and several university buildings. Dorpat contains also botanical gardens, several boulevards and promenades, a town-hall, several churches and a monument to its famous son, Barclay de Tolly. A levee system protects the city from the periodical overflow of the Embach. Other educational institutions located here are a veterinary school, a training school for teachers, gymnasia and secondary schools. It has also a large number of industrial establishments and as a commercial centre is second only to Riga in the Livonian region. Dorpat first fell to the Russians in 1559 and in 1582 was taken over by Poland. Later the Swedes held it for a time, and next came the Poles and in 1704 it finally became a part of Russia. Four years after its occupation by the latter they removed the inhabitants to the interior and dismantled the city. While Russian is the official language, German is the common means of intercourse between the inhabitants. Consult Hausmann, 'Aus der Geschichte der Stadt Dorpat' (1872). Pop. 45,000.

DÖRPFIELD, derp'fält, Wilhelm, German archeologist: b. Barmen 1853. He received his education at the Bauakademie, Berlin. In 1877-81 he was a member of the exploration and excavation party at Olympia, director of operations there in 1878. In 1887 he received the appointment of secretary to the German Archaeological Institute at Athens. He directed excavations in many parts of Greece, particularly in regard to ancient amphitheatres and theatres. With Reisch he wrote 'Das griechische Theater' (Athens 1906). He completed Schliemann's excavations at Troy and collaborated with Curtius and others on 'Ausgrabungen zu Olympia' (1877-81). He assisted Schliemann in preparing 'Troja' (1884) and 'Tiryns' (1886). He contributed numerous articles to archaeological journals on professional topics and wrote 'Troja und Ilion' (2 vols., 1902). Consult Goodell (in American Journal of Philology, Vol. XVIII, 1897).

DORR, Rheta Childe, American editor: b. Omaha, Neb. For two years she studied at the University of Iowa. In 1902-06 she was editor of the woman's department of the New York Evening Post. In 1908-11 she was on the staff of Hampton's Magazine. She also made special investigations in factories, mills, stores, etc., to study the conditions of labor there for women and children. She
DORR—DORR'S REBELLION

wrote "What Eight Million Women Want" (1910) and magazine articles.

DORR, Thomas Wilson, American politician: b. Providence, R. I., 5 Nov. 1805; d. there, 27 Dec. 1854. He was a member of the assembly of Rhode Island in 1833-37, and was the leader of Dorr's Rebellion. See Dorr's Rebellion.

DORR'S REBELLION, 1840-42. Rhode Island after the Revolution continued under her charter of 1663 for nearly three-quarters of a century (see Constitutions, State), it being already that of a self-governing democracy. But it had two features growingly undemocratic, one of them sure to end in an explosion; the town representation in the legislature was based on 17th century ratios of importance, since then greatly changed — thus Newport with some 8,000 people had six members, Providence with 23,000 had four, Smithfield with 9,500 had two; and the suffrage constituted a proportionately small minority with property qualification, being restricted to holders of $134 worth of real estate or $7 annual rentals, and their eldest sons. Of 22,000 to 23,000 taxable polls, only 9,500 were freemen; Providence with above 23,000 inhabitants had 1,610 voters, Woonsocket with some 3,000 had 150, etc. Over $1,000,000 of personal property in Providence was unrepresented. That city was naturally the focus of discontent; Newport as naturally the champion of the established order.

From 1834 on, when he was first chosen to the legislature, the discontent was voiced by Thomas Wilson Dorr (q.v.). He formed something like a suffrage party organization; but it dissolved from discouragement in 1838. A convention representing only the landholders meantime threw out with only seven votes a proposition to extend the suffrage and the Whigs smothered the agitation till after Harrison's election in the fall of 1840. Then Dorr, who had joined the Democrats, organized mass meetings and the suffrage became the burning question of the hour during the winter. As the legal organs of relief were packed against them by the very system against which they protested, the disfranchised had no recourse but revolution; and when in May 1841 they held a convention in October 1841, drafted a constitution and called for a popular vote upon it; only their own party voted, but by fictitious lists a vote of some 14,000 was computed, about twice the actual number cast. This being a majority of the legal voters, the suffrage party proclaimed the "People's Constitution" as the lawful régime of the State, 13 Jan. 1842. Meantime the landholders' party had called a legal convention, which met in November, split into angry factions and adjourned to 14 Feb. 1842. But the proclamation of the revolutionary constitution sobered them down; they drew up one practically as liberal as the other, and for the first time allowed those qualified under it to vote on it. The suffrage party was now offered all it claimed; but it was too much committed to its new principle of mass-rule to recede and the "Landholders' Constitution" was voted down, 8,680 to 8,013. On 13 April the suffragists held an election under the People's Constitution, at which only their own party voted and chose Dorr governor, with a legislature and corps of State officials. Of course all these proceedings were legally null, and the "Law and Order Party" as they called themselves, recognized them only as treasonable attempts to overturn the legal government.

At an extra session in March the legislature had made the taking of office under the Dorr government treason, and acting as moderator or clerk at their elections a serious misdemeanor; a law dubbed by the Dorr party the "Algerine Act." At the regular April elections Samuel W. King was chosen governor; and another extra session empowered him to proclaim martial law and call on the Federal government for his help against domestic treason, the latter deemed by the Constitution. President Tyler replied that help should be furnished when violence had actually supervened, but the government could not interfere on a mere apprehension. On 3 May Dorr and his party marched into Providence, and after debating a forcible occupation of the state-house, began legislative sessions in a disused iron foundry. They sat two days, formally repealed the "Algerine Act," demanded of Governor King the custody of the State property, notified the Federal government of their formation of the state government, etc., and adjourned to 5 July, but never met again. The regular legislature met at Newport 4 May, and the governor again appealed to the President, receiving the same answer; but the military commanders of the vicinity were ordered to keep in touch with the State authorities. Dorr went to New York and elsewhere for recruits and funds, came back on the 16th and on the night of the 17th-18th undertook to capture the Providence arsenal, but his own men were tied to his cannon and his force Captured — his chief adherents by this time being sick of the farce, when the other party were ready to grant all their demands. Dorr escaped into Connecticut (where the governor refused to give him up on requisition) and prowled around the border for several weeks, gathering men and stores together — the former mainly young fellows on a "lark"; finally late in June he crossed the border and the President decided that the time had come to order United States troops to interfere. On the 20th a crushing force marched at "natural rate" at Dorr and his men on that and the next day dispersed without waiting the event. Dorr remained in hiding for some weeks and a reward was offered for him; in October he returned and gave himself up for trial, was convicted of high treason in March 1844, and sentenced to life imprisonment. He was pardoned in 1847 and restored to civil life in 1852. Meantime, in November 1842, a new convention had been held by the regular authorities, adopted by the people November 1842 and became operative in May 1843. The suffrage was practically made universal. The proceedings of the State government were held legal by the United States Supreme Court in Luther v. Borden, argued by Webster and decided by Taney. It must be said for Dorr that but for the prevalence of civil war the suffrage never would have been extended; after the offer of the "Landholders' Constitution," however, he and his party became inexcusable disturbers of public order, risking bloodshed for the question of the legal remedy under which the rights already obtained should be held. The treat repository of material on this subject is the
DORRIT - DORT

House Report of the 28th Congress (1st session. No. 546); the best single summary is Francis Bowen's in the North American Review (1844).

DORRIT, Amy, the "Little Dorrit" of the novel of the same name, by Charles Dickens.

D'ORSAY, dör'sä', Alfred Guillaume Gabriel, Comte, French leader of fashion: b. Paris, 4 Sept. 1801; d. there, 4 Aug. 1852. In 1822 he became acquainted with Lord and Lady Blessington, and renounced his military career for the pleasure of their society. In 1827 he married Lord Blessington's only daughter by a first marriage, but a separation shortly followed, and Lord Blessington having died in 1829, D'Orsay returned to England with Lady Blessington, where they became the centre of a circle distinguished for art, rank, literature and accomplishments. They returned to Paris in 1849, where D'Orsay occupied himself with portrait painting and the making of busts and became director of fine arts.

DORSE, a small codfish found in the Baltic. Formerly supposed to be a distinct species (Gadus callarias), but now believed to be the young of the common codfish.

DORSETSHIRE, a maritime county in the south of England, between Devonshire and Hampshire on the English Channel; area, 967.9 square miles. Portland stone is quarried in the county. Other industries are agriculture and stock-raising. There are interesting ancient ruins dating from prehistoric times. The surface is irregular and there are many high ranges. Picturesque watering places make the county famed as a summer resort. Among these places may be mentioned Lyme Regis, Charmouth, Bridport, Weymouth and Swanage. The Stour, Cale, Liddon, Frome, Yeo and Char rivers traverse the county. The capital is Dorchester. Pop. (county) about 225,000.

DORSKY, George Amos, American anthropologist: b. Hebron, Ohio, 6 Feb. 1868. He was graduated at Denison University in 1888 and at Harvard in 1890. He traveled and conducted anthropological investigations in South America for the Chicago Exposition, 1891-92, and was superintendent of archaeology in the department of anthropology at the Exposition in 1893. In 1894-95 he was assistant in anthropology and in 1895-96 instructor at Harvard University. He was assistant curator of anthropology in 1896-98 and curator in 1898-1915 at the Field Museum of Natural History, Chicago. From 1898 to 1913 he served also as professor of comparative anatomy at the Northwestern Dental School. In 1905-08 he was assistant professor of anthropology, and since 1908 associate professor at the University of Chicago. In 1914-15 he made motion pictures in Japan, China and India. In 1909-12 he was on the staff of the Chicago Tribune, investigating sources of emigration in Italy, Austria, Russia and Germany, and studying political conditions in Asia, Japan, China, Japan, Australia and South Africa.

DORSEY, Sarah Anne Ellis, American author: b. Natchez, Miss., 16 Feb. 1829; d. New Orleans, La., 4 July 1879. She received a careful education and enjoyed the advantages of extended foreign travel. In 1859 she married Samuel W. Dorsey of Maryland. She began her literary career by writing for the New York Chuchman, receiving from that period the nom-de-plume of "Filia Ecclesiae." In 1850 she sent to New York for publication the choral services that she had arranged and used successfully among her black pupils for years; but the war suspended the publication. Her family suffered severely in the Civil War. She removed to Texas with her slaves and there served as nurse in a Confederate hospital. After her husband's death in 1875, she removed from her plantation in Tensas parish to Beaufoir, on the Gulf shore. Here she continued her literary labors, acting as amanuensis to Jefferson Davis in the preparation of his "Rise and Fall of the Confederate Government." She afterward removed to New Orleans. Her published works are "Recollections of Henry Watkins Allen, ex-Governor of Louisiana" (New York 1866); "Lucia Dare" (1867); "Agnes Graham" (1869); "Atalie or a Southern Villeggiatura" (1871); "Panola: A Tale of Louisiana" (1877).

DORSEY, Stephen Wallace, American politician: b. Benson, Vt., 28 Feb. 1842; d. Los Angeles, Cal., 20 March 1916. He served in the Federal army during the Civil War and subsequently removing to Arkansas went into politics. He was a member of the Republican State and county committees; was elected to the United States Senate in 1873; and was secretary of the Republican national committee for the campaign of 1880. At the time of his first route exposures he was accused of having influenced legislation in the Senate, was indicted before the grand jury in Washington; but was acquitted on his second trial. After 1880 he withdrew from politics.

DORSTENIA (named after Dr. Dorsten, a German botanist), a genus of plants of the family Moraceae, natives of tropical America. The genus is remarkable for the receptacle in which the numerous small flowers are sunken, the female flowers being the most depressed. The rootstocks of various species are used in the preparation of a medicinal tincture reputed against low fevers and as a mild stimulant and diaphoretic, also as efficacious against snake bites, whence the Spanish name, contrayerba.

DORT, dör, or DORDRECHT, dör'drēkt, Holland, city in the province of South Holland, on the Meuse delta, 10 miles southeast of Rotterdam. An inundation in 1421 in which upward of 70 villages were destroyed and 100,000 people drowned, separated the site on which Dort stands from the mainland. It was founded in 1013. It was an important commercial centre in the Middle Ages and a member of the Hanseatic League. Here, in 1572, the states of Holland, after the revolt from Spain, held their first assembly; and at 13 Nov. 1618 to 19 May 1619, the conclave of Protestant divines known as the Synod of Dort (q.v.). Dort is the birthplace of the brothers De Vries and Ary Scheffer; to the last a statue was erected in the market-place in 1862. There is a fine old Gothic church with a tall tower. The principal industries are oil, grist and saw manufactures, foundries and cordage-works. Pop. about 40,000.

DORT, Synod of, an assembly of Protestant divines convoked at Dort (Dordrecht)
in 1618-19. Besides the Dutch and Wallon divines, it included representatives from England, Scotland, Switzerland and part of Germany. There were 84 clerical and 18 secular representatives. It was chiefly occupied in considering the doctrines of Arminius (see Arminianism). It confirmed the five points of Calvinism: (1) Predestination; (2) Death of Christ; (3) Corruption of Man; (4) Divine Grace; (5) Perseverance of the Saints. It originated the project of translating the Bible into Dutch, which was executed a few years later. The translation is known as the 1 Dort Bible. As a result of the Synod, Barneveldt, the leader of the Arminians, was executed. Consult Schaff, 'Creeds of Christendom' (Vols. I and III, New York 1884).

DORTMUND, dort'moot, Germany, city in the province of Westphalia, on the Em, 73 miles north-northeast of Cologne. In 1809 it was connected by canal with the canalized Em (giving a waterway to Emden on the North Sea) and extensive harbor accommodation has been provided. It owes its recent great and increasing prosperity to its becoming the centre of two important railway systems, to the opening of extensive coal mines in the vicinity and to the active manufactures of iron, steel, machinery, railway plant, etc. It was once a free imperial and Hanseatic town, and the seat of the chief tribunal of the Vehe. The city was once fortified by a great wall, which gave way in the last century to fine promenades. It contains several splendid churches, gymnasia, industrial schools, a municipal theatre and several primary schools. Dortmund began to decline after the Thirty Years' War, but within the last 50 years, especially since the war with France, it has again advanced rapidly. Consult Sievers, 'Ubersichtskarte de Berg und Hüttenwerke im Oberbergamtsbezirk Dortmünd' (Leipzig 1890); Shadwell, A., 'Industrial Efficiency' (London 1906).

DORY, or JOHN DORY (Zeaus faber), a fish belonging to the family Zemida, somewhat allied to the mackerel, and celebrated for the delicacy of its flesh. It has the spinous portions of the dorsal and anal fins separated by a deep eminence from the soft-rayed portion, and has also the base of all the vertical fins, and the carina of the belly anterior to the anal fin, furnished with spines or serratures; color, yellowish-green, with a blackish spot on each side; dorsal and anal fins with fuscate spines and a long filament produced from behind each dorsal spinous ray. The dory has exceedingly protractile jaws, which enable it to capture small fish, etc., when concealed in the ooze or weeds, after slowly moving upon them in a stealthy, catlike manner. It is found on the coast of England, and on the Atlantic shores of Europe, and in the Mediterranean. A related species (Zemopsis acetilus) has been once taken on our coasts at Provincetown, Mass. Also a North Atlantic species of rock-fish (q.v.).

DOES PASSOS, John Randolph, American lawyer: b. Philadelphia 1844. He is of Portuguese descent. He studied law; served in the Federal army during the Civil War, and after practising law in Philadelphia for some time went to New York in 1867, where he was very successful in the criminal branch of practice. Later he became an authority upon banking, corporate and financial law. He has written considerably. Among his published works are 'A Treatise on the Law of Stock Brokers and Stock Exchanges' (1882; 2d ed., 1905); 'The International Commercial Trusts' (1901); 'The Anglo-Saxon Century' (1903); 'The American Lawyer' (1908), and various pamphlets on political economy and financial topics.

DÖSEH, do'seh, an Arabic word meaning "treating" denotes a remarkable ceremony, which, until its suppression in 1884, used to take place in Cairo annually on the feast of the Prophet's birth (Moolid), in the third month of the Mohammedan year. A party of dervishes of the Sa'di order, to the number of a hundred or more, lay down on their faces, side by side, with their arms doubled under their foreheads. A dozen more ran along upon their comrades' prostrate backs, beating drums, and shouting "Allah." Then the sheikh, mounted, rode along upon the line of bodies, from whom audible prayers could be heard proceeding. It was in consequence of the suppression of the Dúshe died insinuated by the iron-shod hoofs that the Khedive Tewfik suppressed this singular religious rite. Consult Lane, E. W., 'Modern Egyptians,' xxiv; Butler, 'Court Life in Egypt.'

DOSITHEANS (from their founder, Dosithaeus), a sect founded by Dosithaeus, a Jewish heresiarch of the 1st century A.D., whose life and labors were in Samaria. The popular belief is that he was the first Christian heretic. Mosheim, on the contrary, thought that he was not a Christian at all, but a false Messiah, who lived at or about the time of our Lord. He is said to have been very rigid in his Sabbataianism, and to have died of excessive fasting. His other opinions were partly Samaritan, partly Sadducean.

DOSITHEUS, a grammarian who lived in the 4th century, and wrote a Latin grammar for Greek boys. See also DOSITHEANS. Consult Keil, 'Grammatici Latini' (Vol. VII, Leipzig 1871).

DOSSO DOSSI, dós'sö dós'së (properly Giovanni di Nicolo Luterio), Italian painter: b. near Mantua 1470; d. Ferrara 1542. He was one of the leaders of the Lombardo-Ferrarese school and studied under Lorenzo Costa or Panetti (a disputed point). His brother, Giovann Battista (d. 1546) was less distinguished as a painter. He assisted in executing many of the larger paintings. The brothers are said to have spent six years at Rome and five at Venice. Under the patronage of the Gonzagas at Modena, and later of the dukes of Ferrara, they executed many decorative paintings for palaces and churches and likewise numerous minor works. (See also Ventidiothelomew and Saint John at Patmos' (1527) at the cathedral of Ferrara is ascribed to Dossi Dossi. Together they painted the 'Labour of Hercules' in the Court of the Ducal Palace of Ferrara, a 'Madonna with Saints' at the cathedral at Modena, and frescoes in the Castle of Trent, since destroyed. They are mentioned by Ariosto in 'Orlando Furioso' (XXXIII, 2) with the highest praise. In manner Dossi Dossi
resembles Titian. His pictures are distinguished by their bright coloring and imaginativeness. Other paintings are ‘The Bacchanal’ in the Palazzo Pitti, Florence, and at the Dresden Museum; ‘Justice’; ‘Diana and Endymion’; ‘One of Fortune’; ‘Peace’; ‘A Dream’; ‘Judith’, and ‘The Dispute of the Four Doctors of the Church’, which is generally considered his masterpiece. His ‘Circe’ was painted for the Palazzo Borghese, Rome, and his ‘Saint Sebastian’ is at the Victoria e Albert at Milan. The brothers excelled in landscape painting, and are said to have introduced the painting of independent scenes. Consult Zwanziger, ‘Dosso Dosso’ (Leipzig 1911).

DOST MOHAMMED KHAN, dost mö-häm-méd kân, founder of the dynasty of the Barakzai in Afghanistan: b. 1793; d. 1863. His brother Fatteh Khan proceeded to avenge his death by destroying Mahmoud and dividing the territory among themselves. Ghazi was given to Dost Mohammed, who conquered and gained control of the entire province. Numerous disputes followed with Ranjit Singh, the Sikh prince of Punjab, which finally resulted in the defeat of the latter, who, however, seized the fortress of Peshawar. The Amir desiring to regain this now appealed to England, but his advances were rejected and he turned to Russia. Troops were sent against him in 1838 under Sir Willoughby Cotton, and the troops of Dost Mohammed were defeated, while he himself was captured 1840. After the assassination of his rival Shah Sujah whom the English desired to restore and the subsequent resolve of the British to withdraw from their intervention in international affairs in Afghanistan, Dost Mohammed was re-established at Kabul and set up a strong government. His last participation in hostility to the British was in the Sikh war against them. He finally concluded a treaty with the Anglo-Indian government in 1855. The rest of his reign was occupied with his attention to the encroachments of the Persians and the capture of Herat. He was succeeded by his son Shere Ali Khan.

DOSTOYEVSKY, dös-tō-yē’ski, Feodor Mikhailovitch, Russian novelist: b. Moscow, 11 Nov. 1821; d. Saint Petersburg, 9 Feb. 1881. He was educated at Moscow and at the Military Engineering Academy of Saint Petersburg. He graduated there in 1843, with the grade of sub-lieutenant. On his father’s death in 1814, he resigned to devote himself to literature, and began a long struggle with ill-health and poverty. He made his literary début with ‘Poor People’ in 1846, in which may be discovered the germ of all his imaginative work. Dostoyevsky now became a regular contributor of short stories to the *Annals of the Country*, but he was wretchedly paid, and his work, while hevaling extraordinary power and intensity, is wanting in finish and proportion. In 1847 he became a member of the revolutionary reunions of the agitators, Petrachevski, and for his sedition he was sentenced to death in 1849. On the scaffold the novelist’s sentence was commuted to four years’ exile in Siberia, and enforced military service in the ranks for life. He was transported to Omsk, Siberia, and spent four terrible years there. He has left a graphic narrative of his experiences in ‘The House of the Dead’ (1858). He was subjected to fresh indignities as a common soldier after his release from Siberia, but in 1858, through the intercession of General Podleben, an old schoolfellow, he was made an under-officer, and in 1859 was pardoned by Alexander II. His association with the worst criminals gave him an insight into the dark and seamy side of Russian life. He formed new convictions of brutal and character and gave expression to his new views in ‘Crime and Punishment’ (1866). It showed the author to be possessed of a rare mastery over the emotions of terror and pity. This work was his greatest, for while his later works showed great tragic and analytic power, they are deficient in measure and proportion. The chief of them are ‘The Insulted and Injured’ (1867); ‘The Idiot’ (1869); ‘A Raw Youth’ (1875); ‘The Brothers Karamazov’ (1881). After 1865 he became an ardent Slavophile and mystic, with a tendency to absolutism. He was engaged in a succession of journalistic enterprises and suffered severe pecuniary losses. For a time he was editor of the *Russian Word* and after 1876 published a review, the *Correspondance littéraire*. Toward the end of his life he became very popular and his latest years were spent in comparative prosperity at Saint Petersburg. The last edition of his works, in six volumes, was issued at Saint Petersburg in 1904. English translations of the following works have been issued: ‘The Brothers Karamazov’ (New York 1910); ‘Crime and Punishment’ (ib. 1911); ‘The Idiot’ (ib. 1912); ‘The Possessed’ (ib. 1913); ‘House of the Dead’ (ib. 1914); ‘The Insulted and Injured’ (ib. 1915); ‘A Raw Youth’ (ib. 1915); ‘The Eternal Husband’ (ib. 1917); ‘Poor Folk’ (London 1894); ‘Letters from the Underworld and Other Tales’ (New York and London 1914). (See CRIME AND PUNISHMENT, Consult Brande, G., ‘Dostojevsky’ (Berlin 1889); Hoffmann, ‘F. M. Dostojevsky’ (ib. 1889); Koni, ‘Dostojevsky criminéliste’ in *Revue Internationale de Sociologie* (Paris 1898); Lloyd, ‘A Great Russian Mind’ (New York 1912); Merezhkovsky, ‘Tolstoi and Dostojevsky,’ in ‘Tolstoi, as Man and Artist’ (ib. 1902); Phelps, W. L., ‘Dostojevsky’ in ‘Essays on the Russian Novelists’ (ib. 1912).

DOTEN, Carroll Warren, American statistician: b. Panton, Vt., 27 Jan. 1871. He was graduated at the University of Vermont in 1895, was successively instructor, secretary and register there until 1903, when he became instructor in economics at the Massachusetts Institute of Technology. In 1905 he became assistant professor and in 1914 associate professor there. He also directed the research work of the Boston School for Social Workers, 1907–09; was special agent for the United States Census Bureau in 1909. In 1910–12 he was chief investigator of the Massachusetts Commission on Compensation for Industrial Accidents. He has published monographs, addresses and reports, including ‘Recent Railway Accidents in the United States.

DOTHAN, dō’thān, Ala., city and county seat of Houston County, 120 miles southeast of
Montgomery, on the Atlantic Coast Line, the Central of Georgia and other railroads. It is an important trading centre and contains saw and door factories, lumber, ice, cotton, cottonseed-oil mills and fertilizer factories. It is well built and has fine public buildings. The waterworks and electric-lighting plant are the property of the municipality. Dothan was first settled in 1885 and is governed, under a charter of 1901, by a mayor and council of nine. Pop., 7,016.

DOTHEBOYS HALL, the school which figures in Dickens' novel, 'Nicholas Nickleby.' It was kept by Squeers. The name is a rendering of Do-the-Boys Hall. The effect of the exposure by Dickens of the conditions prevailing in some of the English boys' schools was a complete reformation in their methods and management.

DOTTEREL (Charadrius or Eudromias morinellus), a species of plover (q.v.) which breeds in the north of Europe and returns to the south for the winter. It is found all over Europe and northern Asia. The dotterel has always been highly esteemed for the table, but its delicate flavour is more likely to result from the aspidity of the egg collector than of the sportsman, a consummation likely to be hastened from its habit of laying but three eggs instead of four like most plovers. It likewise differs from all other species of plover in having the sternum fencestrated instead of notched posteriorly, and in the larger size and brighter colors of the female.

DOTY, Alvah Hunt, American physician; b. Alburnett, N. Y., 27 July 1834. He is a graduate at Bellevue Hospital Medical College in 1878. Until 1911 he was health officer of the port of New York and lecturer on quarantine sanitation at Bellevue Hospital Medical College. In 1913 he became medical director for the Employees' Benefit Fund Committee of the American Telephone and Telegraph Company, the Western Electric Company and the Western Union Telegraph Company. He wrote 'Prevention of Infectious Diseases' (1911); 'The Mosquito: Its Relation to Disease and Its Extermination' (1912); 'Manual of Instruction in the Principles of Prompt Aid to the Injured' (1889; 6th ed., 1913).

DOU, Gerard. See Dow, Gerard.

DOUAL. See Douay.

DOUARNENÉZ, dou-ar-né-z or no-néz, France, a port in the department of Finistère, on the Bay of Douarnenez, eight miles north-west of Quimper by rail. It is important for the sardine fishery, rope and net making and shipbuilding. Pop., 13,750.

DOUAY, doo’a', Felix Charles, French general; b. 1816; d. 1879. He served in the Crimea, in Italy and in Mexico. For distinguished services at Magenta and Solferino he was made a brigadier-general. He was commander of the Seventh Army Corps in the Franco-Prussian War of 1870 and was made prisoner at Sedan. He was the first to enter Paris on 22 July 1871. As Chief of the Fourth Army Corps, organized against the Commune. His timely arrival saved the Louvre from utter destruction.

DOUAY, or DOUAL, France, city in the department of Nord, on the Scarpe River, 20 miles south of Lille. It is one of the oldest towns in France. Its manufactures and trade are quite important. It is noted for the schools which were established here in the 16th and 17th centuries. In 1592, Philippe de Champaigne established a university. English, Scottish and Irish colleges and novitiates of English Franciscans and Benedictines were all affiliated with this university. Printing presses and libraries furnished the books for English Catholic seminaries. The university property was confiscated in 1793 during the revolutionary period; students and teachers fled to England, and to this migration the Roman Catholic college at Ushaw, near Durham, owes its origin. The English Benedictines still have an establishment at Douay. The library now in the town contains about 96,000 volumes and many valuable manuscripts. Pop., 36,314. See Douay Bible.

DOUAY BIBLE, the name commonly given to the version of the Vulgate text of the Scriptures made at Rheims in France, for the use of English-speaking Catholics. The translators and revisers included Sir John Davies (Cardinal) Allen, Dr. Gregory Martin, Dr. Richard Bristow and John Reynolds, all of them alumni of Oxford University. The work of translating was done mostly by Dr. Gregory Martin, a scholar of distinguished attainments, both in Greek and Hebrew, says the eminent biblical critic, Dr. Westcott. The New Testament was published at Rheims in 1852 and the Old at Douay in 1609-10, both in quarto. The text has since that time undergone numerous revisions, chiefly for correction of its literary form which was faulty because of the employment of words of Latin origin and unintelligible for readers unacquainted with Latin, instead of the homely English equivalents, for example, "comissions" (revelings), ebriety, impudicity, agnition, conspunction, contrite, donary, exinanite, suasive: all mere Latin words with English terminations. This very serious fault was in revision after revision corrected with greatest thoroughness by Dr. Challoner (q.v.), whose first edition of the Old Testament was published in 1749 and that of the Old Testament in the following year. Challoner's final revision has itself undergone revision several times since, but only for correction of minor errors and oversights. Despite its very serious defects the original Rheims translation has elicited from a most competent judge, Dr. Westcott, 'History of the English Bible,' the praise of great fidelity to the text of the Vulgate. "The Rheims," he says, "in their scrupulous and even servile adherence to the text of the Vulgate ... frequently reproduced with force the original order of the Greek, which is preserved in the Latin; and even while many unpleasant roughnesses occur there can be little doubt that in this version the Latin was by the faithfulness with which they endeavored to keep the original form of the sacred writings. ... The same spirit of anxious fidelity to the letter of their text often led the Rheims to keep the phrase of the original when others would have altered it; if this were capable of guiding them the Rheims seem to have followed out their principles honestly; but whenever it was inadequate or ambiguous,
they had the niceties of Greek at their command.\textsuperscript{9}

\textbf{DOUBLE BASS or BASE}, sometimes called contrabass, is the largest and deepest voiced of the violin family. Though seldom used in solo work it is counted one of the foundations of the modern orchestra. Originally it had only three strings, but used to-day with four, from the pitch of the third E below the violin clef. The strings are tuned a fourth apart. It probably derives its name from the fact that it sometimes doubles the bass given to the 'cello or similar instrument in a score. It first appeared in the 16th century and has been attributed to the inventive genius of Gasparo da Salo.

\textbf{DOUBLE BASSOON}, also known as contrabassoon, stands in the same relation to the oboe family as the double bass (q.v.) does to the stringed instruments, being the largest and deepest toned. It has a compass of more than three octaves upward from the third C (and even) below middle C; an octave lower than the contrabassoon. It has a conical tube 16 feet in length, but bent up so compactly that it causes no inconvenience to the player. Many great masters of orchestration have written liberally for it, especially Haydn, Beethoven, Spohr and Mendelssohn.

\textbf{DOUBLE CITIZENSHIP}, a term signifying both State and national citizenship as defined by the 14th Amendment to the Federal Constitution, which states: \textit{“All persons born or naturalized in the United States and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside.”} A court ruling says that \textit{“there is a citizenship of the United States and a citizenship of a State, which are distinct from each other and which depend upon different characteristics and circumstances in the individual.”} The same is true of the individual’s relationship to the Federal government, which has the right to naturalize, but the State can grant extensive privileges of State citizenship, even the suffrage, to a foreigner, if the State is fully naturalized.

\textbf{DOUBLE CONSCIOUSNESS}, a peculiar mental condition, illustrated and much overdrawn by the celebrated story of Dr. Jekyll and Mr. Hyde, which describes a type of phenomenon practically never met with in real life, although much utilized by the novelist, dramatist and careless observer. By double consciousness is usually meant that at certain times, in the waking consciousness of the individual, certain dominant ideas control and impart to the individual a definite personality, known and recognized as such by his friends and associates, and that, at other times, also in a distinctly conscious state, an entirely different series of ideas may govern the individual in a manner entirely different from that of his former personality. No such phenomenon is really known except in conscious acting, where good actors or actresses can portray many personalities. What really happens in the bona fide situation is a dissociation of consciousness.

The so-called double state, which may be multiple, is a split or part of the unconscious state of the individual.

The best examples of this dissociation states are seen in alcoholism, where the disintegrated person becomes quite a different type of individual. His unconscious trends are released from a type of conscious control and come out into action. In hysteria similar dissociations are frequent. The so-called classical types of multiple personality, which have been much written about, are various mixed mental states of hysterical dissociation and shrewd duplicity. The physician is often made the dupe of a clever person. Most shrewd women have this capacity to mingle unconscious hysterical fantasy with conscious reality. The unconscious hysterical part of the phenomenon is bona-fide and not consciously known or controllable. This must be emphatically emphasized. In certain epileptics, an automatic mental state may arise in which the individual may carry on complex motor and intellectual activities, apparently normal and conscious—to the lay observer—and yet these are dissociated mental states absolutely unknown to the waking healthy conscious state of the individual in question. During such automatic unconscious states crimes may be committed—such as larceny, murder and yet the patient is not cognizant of the act and is irresponsible. These dissociated mental states are frequent in dementia praecox and at times in anxiety hysteries and compulsion neurosis.

The usual hypnotic seances, in which such dissociated states are demonstrated, are largely fraudulent. When bona-fide they are usually examples of hysterical dissociation which is an extremely interesting and widespread mental state. Nearly all individuals are partly capable of a certain amount of hysterical dissociation. Excessive anger and weeping are widespread illustrations of these partly dissociated states.

Consult Janet \textit{‘Mental State of Hystericals’}; Freud, \textit{‘Hysteria and the Psychoneuroses’}; Jelliffe and White, \textit{‘Diseases of the Nervous System’}.

\textbf{DOUBLE DRAGON}, Order of the, a military order of China, established to honor foreigners who had served China in a military capacity. In 1882 it was made to include other foreigners who had rendered service to the nation.

\textbf{DOUBLE EAGLE}, a United States coin of the value of $20, the eagle being $10. The name is a book-word, the popular term being \textit{twenty-dollar gold piece}.\textsuperscript{3} The piece was authorized by Congress in March 1849, and the first ones were struck in 1850. The name refers to the figure of the eagle upon it. It was one of the coins authorized by the Act of 1873.

\textbf{DOUBLE FLOWERS} are flowers which, usually through cultivation, have their stamens and pistils developed into petals, by which the beauty of the flower may be enhanced, though its reproductive powers are sacrificed. All the intermediate stages between sing-stamens and petals can be seen in double-flowered roses and carnations. It is frequently observed that a multiplication of the leaf accompanies the conversion of stamens into petals; so that a single stamen may be represented by two or more petal-like leaves. Double flowers remain fresh
two, three even eight days longer than similar normal single flowers.

DOUBLE MAJORITY. In Canada under the Union there sprang up a demand — urged by each of the political parties while in opposition but not regarded as practicable when they held the reins of government — that an administration to hold office should possess a majority in both Lower and Upper Canada. Owing to the sharp divergence in race, religion and political ideals between the two provinces, this was unrealizable. The “double majority” was never accepted either as a principle or a convention of the constitution; it received no sanction from the governors; and was finally disavowed at Confederation.

DOUBLE STANDARD, in economics the phrase used to signify a double standard of monetary value fixed by legislative enactment. It implies the existence of what is known as the gold standard on the one hand, and the silver standard on the other. Wherever the double standard in its integrity is in use a creditor is bound to accept payment of any sum in coins of either of the metals, gold or silver, which the debtor may choose to tender. See Bimetallism.

DOUBLE STARS are stars which, while they may appear single to the eye, are known, by telescopic observation, to consist of two constituents that are near enough together to justify the assumption of a physical connection.

DOUBLE SHUFFLE. An expedient by which John A. Macdonald and his colleagues of the Canadian Macdonald-Cartier administration, when they succeeded the short-lived Brown-Dorion ministry in 1858, evaded the necessity of vacating their seats and going before their constituencies for re-election. The Brown-Dorion ministry had only lasted three days; and the statute governing the case stated that if a minister should resign within one month accept another office in the ministry, he should not vacate his seat. Accordingly Macdonald and his colleagues changed portfolios, took the oath in their new offices, and immediately thereafter resumed their former places in the ministry.

In many such cases it is afterward found, however, that the two stars are not members of one system but that one of them is vastly farther away from us than the other, their seeming close proximity being only apparent and not real. Such pairs are called “optical” pairs. As it is not until measures have been accumulated for at least several years that a distinction can be made in any case between an optical pair and a true binary system, all discoveries are tentatively catalogued as double stars. About 20,000 such pairs are now known. The first systematic study of these objects was made by Sir William Herschel, who, between the years 1779 and 1784, made extensive catalogues of them, because he thought it likely that they...
were only optically double. If that were the case, the earth's orbital motion about the sun might be great enough to make an appreciable variation in the distance or direction of one star from the other, if the system were viewed at different times in the year. After recording the distances between many of these stars, as well as the direction of the line joining the two components, he went over them again to see if any changes could be noted; and in so doing (as his son, Sir John Herschel, has recorded) he discovered the "true orbit" of each star, a discovery from the original object of the inquiry by phenomena of a very unexpected character, which at once engrossed his whole attention. Instead of finding an annual and alternate increase and decrease of the distance, and a corresponding periodic variation in their direction, he saw that in many cases there was a continuous change in both, advancing steadily in one direction. If this were due to the fact that the solar system and the two components of the double star were moving independently through space, we should expect the motion of either of the components, relatively to the other one, to be sensibly rectilinear. After the lapse of 25 years Herschel became satisfied that this is not always the case, for in some instances he found good evidence of actual orbital motion, and in 1802 he announced that there exist sidereal systems, composed of two stars revolving about each other in regular orbits, in the same manner that the earth revolves about the sun, or the moon about the earth. About the year 1819 William Struve took up the systematic study of these stellar systems, and made a long series of most excellent measurements of them covering a period of many years. Subsequently the work was taken up by other skilled observers, and we now have a vast mass of data of this sort, from which fairly good orbits of some 60 of the systems have been obtained. A beginner's book on the subject is Crossley, Gledhill and Wilson's 'Handbook of Double Stars,' which contains methods for computing the orbits of double stars, as well as advice concerning the making of observations. The standard and authoritative work is W. G. Struve's 'General Catalogue of Double Stars,' which contains the description of every pair discovered, and references to all measures ever published, and to all proper motions and orbits computed, up to the year 1906. In reality, both of the components of a double star are in motion, each revolving about the common centre of gravity of the two; but it is known that in a system composed of two bodies revolving about each other no error is committed, so far as the relative motion of the two is concerned, by regarding one of them as fixed, and assuming that the other revolves about it. It is customary, therefore, to regard the brighter component of such a star as fixed. The diagram shows the orbit of the pair known as F. 70 Ophiuchi, in which one star is of about the fourth magnitude, while the other is of about the sixth. The large black spot at the intersection of the two straight lines represents the larger star, the straight lines themselves representing, respectively, an hour-circle and a declination-circle passing through it. The ellipse represents the apparent orbit of the component star, as determined by Burnham from all the available data up to the year 1905. The dots that appear irregularly along the ellipse, being sometimes within it and sometimes without, represent the observed positions of the companion star. According to the computations here cited, the period of revolution of 70 Ophiuchi is 87.75 years. The stars that are visibly double when viewed through the telescope, numerous stars are now known which have been proved to be double by means of spectroscopic observations. (See DOPPLER'S PRINCIPLE). The periods of revolution of some of these systems are exceedingly short. Thus, one of the components of the spectroscopically double star Kappa Pegasi is itself a spectroscopic binary with a period of only six days. At least one of the spectroscopic double stars (Epallion Hydrae), is also a visual double in the telescope; the orbit computed from the direct measures agrees remarkably well with that found from the spectroscopic observations, thus affording a proof (if one were needed), that the displacement of the spectral lines in these cases is due to a true duplicity and is not the effect of some other, unknown, cause.

DOUBLEDAY, Abner, American soldier: b. Ballston Spa, N. Y., 26 June 1819; d. Mendham, N. J., 26 Jan. 1893. In 1839 at Cooperstown, N. Y., he aided in drawing up the first baseball rules in the United States. He was graduated at the West Point Military Academy in 1842 and was assigned as brevet second lieutenant of artillery the same year. During the Mexican War he served in the First Artillery and was present at the battles of Monterrey and Buena Vista. He was also engaged in suppressing the uprising of the Seminole Indians. He participated in the memorable defense of Fort Sumter, firing the first gun in reply to the enemy's attack. From the Shenandoah Valley to the Rappahannock, at Manassas, South Mountain, Antietam, Fredericksburg and Chancellorsville, he added lustre to his name and justly earned the command of an army corps with the rank of major-general. At Gettysburg General Doubleday fought valiantly and made a name for himself in his active military career. The acknowledged hero of the first day's fight, he contributed as much toward the final result achieved as any other commander in the entire engagement. He continued to serve in the army after the war, but retired in 1873. A bronze statue of the general was unveiled on the Gettysburg battlefield 23 Sept. 1917. He published 'Reminiscences of Forts Sumter and Moultrie in 1860-61' (1876), and 'Chancellorsville and Gettysburg' (1882).

DOUBLEDAY, Frank Nelson, American publisher: b. Brooklyn, N. Y., 8 Jan. 1862. He was educated at the Brooklyn Polytechnic Institute; entered the employ of Charles Scribner's Sons, publishers, in 1877 and remained with that house until 1895; during that time he reorganized and edited The Book Buyer (1884), and was appointed manager of Scribner's Magazine in 1886. From 1897 to 1900 he was a member of the publishing firm of Doubleday and McClure Company. Since 1900 he has been president of Doubleday, Page & Company, publishers of The World's Work, Country Life in America, The Garden Magazine and Farming.

DOUBLEDAY, Neltje De Graff ('Neltje Blanchan'), American author: b. Chicago, 23 Oct. 1865. She was married to F. N. Doubleday
Doubleday, Russell, American author: b. Brooklyn, 26 May 1872. He was educated in private schools and served in the United States navy during the Spanish-American War 1898. He has written 'A Gunner Aboard the Yankee' (1898); 'Cattle Ranch to College' (1899); 'A Year in a Yawl' (1901); 'Stories of Inventors' (1904).

DOUBLET, a close-fitting garment, covering the body from the neck to a little below the waist. It received its name from being originally lined or wadded for protection. At first it had short shirts, but these diminished as the body of the garment became fuller and more elaborate under the reign of Queen Elizabeth. During the period of Charles I and after Charles II it lost all pretense and dwindled into a sleeveless jacket, the forerunner of our modern waistcoat. Originally it was introduced from France into England in the 14th century.

In a secondary work, a counterfeit stone composed of two pieces of crystal, with a color between them, so that they have the same appearance as if the whole substance of the crystal were colored. It is accomplished another way by taking a thin layer of polished gem and fastening it on the line of the girdle to a piece of glass colored to match. Some invisible cement is employed for the purpose, such as gum mastic.

DOUBLING THE CUBE. See QUADRATURE OF THE CIRCLE.

DOBLOON, dob-loon', a gold coin of Spain, equal in value to two pistoles. It was worth 1730 to 1772 about $8.24, from 1772 to 1786, $8.38, and from 1786 to 1848, $7.87. Although the coinage of the doubloon has ceased in Spain, coins still current are valued at $2.

DOUBS, doo, France, (1) department which is traversed by four chains of the Jura. Area, 2,030 square miles. Pop. 299,935. Doubs is traversed by the river Doubs, a tributary of the Saône, the Dessoubre and the Loue. The climate is more rigorous than in most similar latitudes of Europe. Pine, walnut and common orchard trees thrive well; mines of iron and coal are worked; and gypsum, building stone, lime and marble are abundant. The trade is principally in iron, cattle, horses and dairy products. It is famous for its cheese. The department was formed out of part of the old Franche-Comté. The capital is Besançon. (2) Doubs, a river 250 miles in length, rises in this department.

DOUBTING CASTLE, the castle in 'Pilgrim's Progress,' where Christian and his companion, Hopeful, are imprisoned for a time by Giant Despair.

DOUC, dook, a species of small monkey (Sempithecus nematus), native to Cochin-China. It is curiously marked with red, white and black.

DOUCET, doós', Charles Camille, French dramatist: b. Paris, 16 May 1812; d. there, 1 April 1895. He became in 1833 a government official in the theatrical department; was elected to the Academy in 1876, and soon after made its standing secretary. The best known of his many very successful comedies are 'Un jeune homme' (1841); 'L'Avocat de sa cause' (1842); 'Le fruit défendu' (1857); 'La considération.' His lyric pieces, for the stage, (Velasquez) (1847), and 'Le Barque' (1849), were crowned by the Academy.

DOUCET, Henri Lucien, French painter: b. Paris, 23 Aug. 1856; d. Saint Leu d'Essonne, 31 Dec. 1895. He was a pupil of Lefebvre and Boulanger, and won the Prix de Rome in 1880. Among his paintings are 'Adam and Eve'; 'Atala'; 'Après le bal'; 'Hagar'; and a number of portraits, including one of Mme. Galli Marie of the Opéra Comique.

DOUDNEY, Sarah, English novelist: b. Portsmouth, 15 Jan. 1843. She began writing when quite young and has published 'A Woman's Glory' (1885); 'The Missing Rubies' (1886); 'When We Two Parted' (1887); 'Where the Dew Falls in London' (1890); 'Through Pain to Peace' (1892); 'A Romance of Lincoln's Inn' (1894); 'Katherine's Keys' (1895); 'Pilgrims of the Night' (1896); 'A Cluster of Roses' (1897); 'Lady Dye's Reparation' (1899); 'Silent Strings' (1900); 'One of the Few' (1904); 'Shadow and Shine' (1906).

DOUGALL, Lily, Canadian novelist: b. Montreal, Canada, 16 April 1858. She has published 'Dégras All' (1891); 'The Mermaid' (1895); 'The Madonna of a Day' (1896); 'A Dozen Ways of Love' (1897); 'The Mormon Prophet' (1898); 'The Spanish Dowry' (1906); 'Paths of the Righteous' (1908); 'Voluntas Dei' (1912); 'The Practice of Christianity' (1914).

DOUGHBIRD, a name given to several species of curlew (q.v.), but more especially to the Eskiimo curlew (Numenius borealis).

DOUGHFACE, a nickname applied to Northern politicians who were inclined to yield to the Southern States in the antebellum agitation over States' rights and nullification. It is traced back to 1820, when it was applied to the Northerners who supported the Missouri Compromise (q.v.).

DOUGHTY, dōt, Arthur G., Canadian archivist: b. Maidenhead, Berkshire, England, 1860. He was educated at Eldon School, London, and at Oxford University, removed to Canada in 1886 and entered the service of the Legal and Commercial Exchange, Montreal. In 1897 he became private secretary to the Minister of Public Works, Quebec, and two years later to the Treasurer of the province of Quebec. From 1901 to 1904 he was joint librarian to the Quebec legislature and in the latter year was appointed Dominion archivist at Ottawa. He has written 'Life and Works of Tennyson' (1893); 'The Rose Leaves' (1894); 'The Life of Francesca and Beatrice' (1896); 'Nugae Cano- re' (1897); 'The Fortress of Quebec' (1904); 'The Cradle of New France' (1908); 'The Siege of Quebec,' with Dr. Parmelee (6 vols., 1902); 'Quebec under Two Flags,' with Dr. Dionne (1903); 'Canada and Its Provinces,'
with Professor Shortt (12 vols., 1916); 'A Daughter of New France' (1916); articles in 'The Catholic Encyclopedia,' the 'Encyclopedia Americana,' and the 'American Historical Review;' and his United Knox's 'An Historical Journal of the Campaigns in North America.'

DOUGHTY, Charles Montague, English explorer: b. Theberthall, Suffolk, 1843. He was educated at Cambridge, spent two years in Arabia making a study of the archaeology, ethnography and geography of the country, the results of which were given to the public in 'Travels in Arabia Deserta' (1888). He published also 'Documents épigraphiques' (1884); 'The Dawn of Britain' (6 vols., 1906); 'Adam Cast Forth' (1908); 'The Cliffs' (1909); 'The Clouds' (1912).

DOUGHTY, William Henry, American surgeon: b. Augusta, Ga., 5 Feb., 1836; d. 1905. He received an academic education in Augusta, was graduated at the medical department of the University of Georgia in 1855 and in the same year began practice in Augusta, giving special attention to gynecology. From March 1862 to April 1865 he served as a surgeon in the Confederate army, being exclusively employed in hospital duty. He was successively surgeon-in-charge in the general hospitals at Macon, Ga., at Lauderdale Springs and at Augusta. In the course of this long service he tied the subclavian artery at its external third twice, which operations have passed into the permanent records of military surgery. From 1867 to 1875 he was professor of materia medica and therapeutics in the Medical College of Georgia. In 1876 he was a member of the International Medical Congress. His contributions to medical journals were numerous and embraced a wide range of subjects.

DOUGLAS, Scottish noble family. Their origin is unknown. They were already territorial magnates at the time when Bruce and Baliol were competitors for the crown, and like most of the Scottish nobility did homage and took oaths of allegiance to Edward I. They had estates both in England and Scotland but chiefly in Scotland. Eight miles from Lanark lies a village named Douglas, near which is the old church of Saint Bride and the site of Douglas Castle, their ancestral home. One of them, William Douglas, joined Wallace, was captured at Irvine in 1297, and died in the Tower of London in the following year. As their estates lay on the borders they early became guardians of the kingdom against the encroachments of the English, particularly of the Percies, who occupied a similar position on the English border, and acquired in this way power, habits and experience which frequently made them formidable to the Crown. The most important members of this family in chronological succession are:

JAMES, son of the William Douglas who had been companion of Wallace, and is commonly known as the good Sir James, early joined Bruce, and was one of his chief supporters throughout his career, and one of the most distinguished leaders at the battle of Bannockburn. He fell in battle with the Moors while on his way to the Holy Land with the heart of his master in 1330. He had fought in 70 engagements, 53 of which were victories, and was buried in the church of Saint Bride.

ARCHIBALD, youngest brother of Sir James, succeeded to the regency of Scotland in the infancy of David. He was defeated and killed at Haldon Hill by Edward III in 1333.

THE EARLS OF DOUGLAS.

WILLIAM, son of the preceding, was created first earl in 1357. He recovered Douglasdale from the English, and was frequently engaged in wars with them. He fought at the battle of Poitiers. He died in 1384.

JAMES, the second earl, who, like his ancestors, was constantly engaged in border warfare, was killed at the battle of Otterburn in 1388. After his death the earldom passed to an illegitimate son of the good Sir James, Archibald the Grim, Lord of Galloway.

ARCHIBALD, son of Archibald the Grim, and fourth earl, was the Douglas who was defeated and taken prisoner by Percy (Hotspur) at Homildon, 14 Sept., 1402. He was released and made a prisoner at Shrewsbury, 23 July 1403, and did not recover his liberty till 1407. He was killed at the battle of Verneuil in Normandy, in 1427. He was known as 'Tineman' (the loser) because of his persistent ill-luck in war. Charles VII created him Duke of Touraine, which title descended to his successors.

WILLIAM, sixth earl, b. 1422, together with his only brother, David, was assassinated by Crichton and Livingstone at a banquet to which he had been invited in the name of the king, in Edinburgh Castle, 24 Nov., 1440. Jealousy of the great power which the Douglases had acquired from their possessions in Scotland and France was the cause of this deed.

WILLIAM, the eighth earl, a descendant of the third earl, restored the power of the Douglases by a marriage with his cousin, heiress of another branch of the family; was appointed lord-lieutenant of the kingdom, and defeated the English at Sark. Latterly having entered into a treasonous league, he was invited by James II to Stirling and there murdered by the king's own hand, 22 Feb., 1452.

JAMES, the ninth and last earl, brother of the preceding, took up arms with his allies to avenge his death, but was finally driven to England where he continued to hold his earldom for many years. Having entered Scotland on a raid in 1484 he was taken prisoner and confined in the abbey of Lindores, where he died in 1488.

THE EARLS OF ANGUS.

The estates of the ninth earl, which had been forfeited in 1455, were bestowed on the fourth Earl of Angus, the "Red Douglas," the representative of a younger branch of the Douglas family, which continued to flourish long after. Thus, "the Red Douglas put down the Black." The fifth Earl of Angus, Archibald Douglas, was the celebrated "Bell-the-Cat," one of whose sons was Gavyn Douglas, the poet (q.v.). He died in a monastery in 1514. Archibald, the sixth earl, married Queen Margaret, widow of James IV, attained the dignity of regent of the kingdom, and after various vicissitudes of fortune, having at one time been attained and forced to flee from the kingdom, died about 1560. He left no son, and the title of Earl of Angus passed to his nephew, David James Douglas, brother of David, married the heiress of the Earl of Morton, which title he received on the death of his
DOUGLAS

father-in-law. His nephew, Archibald, known as the "Gild," eighth Earl of Angus and Earl of Morton, died childless, and the earldom of Angus then passed to Sir William Douglas of Croydor, and the title went on in the Douglass line till William, 11th Earl of Angus, who was created Marquis of Douglas by Charles I. Archibald, the great-grandson of William, was raised in 1703 to the dignity of Duke of Douglas, but died unmarried in 1701, when the ducal title became extinct.

THE DOUGLAS CAUSE.

When the dukedom became extinct, the title of Marquis of Douglas and Earl of Angus went to the nearest heir-male, the Duke of Hamilton, a descendant of the first Marquis of Douglas. The estates, however, did not go with the title, and their disposal formed the subject of one of the most celebrated of Scottish lawsuits, known as the Douglas cause. The Duke of Douglas had a sister, Lady Jane, who at the age of 48 married Sir John Stewart of Grand Tully. After the marriage they lived abroad. When in 1815 Lady Jane, it was alleged, had given birth to twin sons in Paris. At the Duke's death in 1761 both father and mother were dead, and the surviving child became the heir to the ducal estates. The succession was at once disputed by the Hamiltons, whose contention was that the story of the birth of the twins was false, and that in reality they were the children of French peasants, obtained for fraudulent purposes. For six years the contest went on in the Scottish courts; by the casting vote of the Lord President, Dundas of Arniston, in the final trial before 15 judges, decision was given against the claimant; but two years after the House of Lords reversed this judgment, and young Stewart became proprietor of the Douglas estates. The new heir was made a peer as Baron Douglas; his eight sons all died childless; but his eldest daughter married the 11th Earl of Hamilton, whose son, the 12th Earl, now owns the property. Thus the Duke of Hamilton is head of the Douglas family, and the Earl of Hamilton is Lord of Douglasdale.

In the Douglas family are to be found the Marquis of Queensberry, who descends from a natural son of the second Earl of Douglas slain at Otterburn; and the Earl of Morton, who descends from Douglas of Lochleven, the jailer of Mary Queen of Scots. Consult Sir William Fraser, "The Douglas Book" (20 vols., Edinburgh 1899); and Sir J. H. Maxwell "History of the House of Douglas," with the principal authorities prefixed thereto.

DOUGLAS, Alice May, American writer: b. Bath, Me., 28 June 1865. She has done editorial work for "Harper's Young People" and has been editor of "The Acorn" and "The Pacific Banner," and is active in temperance and Sunday school work. She is also interested in peace work and was a delegate to the Boston Peace Congress. Her writings include in verse: "Phlox," "May Flowers," "Gems Without Price," in prose: "Howel Gatherers," "The Peacemakers," "Self-Exiled from Russia," and "A Friend Indeed.

DOUGLAS, David, Scottish botanist: b. Scone, Perthshire, 1798; d. Hawaii, 12 July 1834. In the botanical garden at Glasgow, he attracted the notice of Sir William Hooker, who recommended him as a botanical collector to the Horticultural Society of London. He was accordingly, in 1823, sent by the society to the United States, where he procured many fine plants, and in particular increased the society's collection of fruit-trees. In 1824 he was sent on a second mission to explore the vegetation of the country adjoining the Columbia River, and southward toward California. In making the voyage he never lost sight of his real object, and, during the short time the vessel touched at Rio Janeiro, to collect many rare orchideaceous plants and bulbs. He arrived at Fort Vancouver in April 1825, and sent home, from time to time, many beautiful plants, with seeds and dried specimens. A species of pine of gigantic size, one of several which he discovered, bears his name, Pinus Douglasii. In 1827 he crossed the Rocky Mountains and reached Hudson Bay, met Sir John Franklin and returned with him to England. The years 1829-32 were spent in California, and 1832-34 on the Fraser River. While on a visit to the Sandwich Islands he died of typhus fever by a wild bull.

DOUGLAS, Gavyn, Scottish poet and bishop: b. about 1474; d. London 1522. He was the son of Archibald, Earl of Angus ("Bell-the-Cat"). Having taken orders in the church he received the living of Prestonkirk, and was also made provost of Saint Giles, Edinburgh, in 1501. In 1516 he was installed bishop of Dunkeld, but had an uneasy tenure of office; and while in England on a political mission was deprived of his bishopric and died of the plague. Gavyn Douglas' great work is a translation of the "Aeneid" of Virgil (with the supplementary book of Maphæus) in heroic verse. It is the first translation of a Latin classic into any British tongue. It is executed with great spirit, and considering the age, with extraordinary elegance of diction. It was written about 1512, and is said to have been completed in 16 months. To each book is prefixed a highly poetical prologue. It was first published in 1553. Douglas also wrote "The Palace of Honor," an allegory of the virtuous life, and "King Hart," an allegory held in the struggles of life against the temptations of the flesh. A complete edition of his poems, edited by Small was published 1874. Consult the "Cambridge History of English Literature," Vol. II, and J. H. Millar's "Literary History of Scotland" (London 1903).

DOUGLAS, George William, American clergyman: b. New York, N. Y., 8 July 1830. He was graduated at Trinity College, Connecticut, in 1851 and at the General Theological Seminary, New York 1874. He also studied at Oxford and at Bonn during 1874-76, was ordained to the Protestant Episcopal ministry in 1875 and became tutor at the General Theological Seminary in 1877-78. In 1878-79 he was assistant at Calvary Church, New York; was vicar of Trinity Church there in 1879-86. He became rector of Saint John's Church, Washington, and trustee of Washington Cathedral 1888-91. In 1892-98 he was rector of Trinity Church, New Haven. In 1908 he was elected preacher for Grace Church, New York, and instructor in the Training School for Deaconesses 1898-1904. Since 1904 he has been examining chaplain of the diocese of New York and senior canon of the cathedral of Saint John the Divine.
He has published 'Hints to Sunday School Teachers' (1883); 'Prayers for Children' (1884); 'Sermons Preached in Saint John's Church, Washington' (1893); 'Essays in Appreciation', 1912; also occasional public sermons, addresses, magazine articles, etc.

DOUGLAS, Henry Kyd, American author and jurist: b. Shepherdstown, W. Va., 29 Sept. 1840; d. Hagerstown, Md., 18 Dec. 1903. He was graduated at Franklin and Marshall College (1859), at the time when James Buchanan, afterward President of the United States, was a member of the faculty. He enlisted at Harper's Ferry in the Confederate army as a private in Company B of the noted Stonewall Jackson Brigade. He took part in the battle of Bull Run, and for his bravery was promoted until he rose to be a captain. In March 1862 he made a ride of 103 miles in order that General Ewell might at once join Jackson. This ride became celebrated in history. Horses were changed five times, and the ride was made through rain and mud. On his return he was promoted to inspector general by Stonewall Jackson, with whom he served in every battle. At Gettysburg he was seriously wounded and was in prison nine months. His brigade was the last to surrender. Douglas was wounded nine times.

DOUGLAS, Sir Howard, English soldier and administrator: b. 1776; d. 1861. He entered the army and was present at the battle of Corunna. He was lieutenant-governor of New Brunswick 1823-29, and founded King's College, Fredericton, now the University of New Brunswick. He was commissioner of the Ionian Islands 1835-39, and represented Liverpool in the House of Commons, 1842-46.

DOUGLAS, James, American mining engineer: b. Quebec, Canada, 1837. He was graduated at Queen's University, Kingston, Ontario, in 1858. He taught chemistry for some time in Morrin College, Quebec, but removed to the United States in 1873, settling in Phoenixville, Pa., where he had charge of the copper works. He achieved a brilliant success as mining engineer and became president of a number of mining corporations and also of railroads in southwestern United States and northern Mexico. With the late Dr. T. Sterry Hunt he did much original work in hydrometallurgy of coppers. He is member and has served two terms as president of the American Institute of Mining Engineers. He published 'Canadian Independence'; 'Imperial Federation and Annexation'; 'Old France in the New World'; 'New England and New France' (1905), also numerous technical articles, reports, etc.

DOUGLAS, Sir James, English colonial administrator: b. West Indies 1803; d. Victoria, 1 Aug. 1877. He was educated at Lanark, Scotland, and Chester, England; was apprenticed to the North-West Company of Montreal; joined the Hudson's Bay Company in 1821, and in 1845 succeeded Dr. McLoughlin as head of the western department. He founded Fort Camosun, now Victoria, Vancouver Island, in 1843; was governor of Vancouver Island, 1851-62, and of British Columbia, 1858-64. In these offices he displayed in a remarkable degree tact, resource and firmness in dealing with all classes of settlers, held in an uncommon measure the confidence of the Indian tribes and as a road builder made a permanent contribution to the welfare of the colonies.

DOUGLAS, John, English prelate: b. Pittenweem, Fifeshire, Scotland, 14 July 1721; d. Salisbury, England, 18 May 1807. He was educated at Oxford and in 1766 he was made canon of Windsor, which benefice he exchanged for a residendency canonry of Saint Paul's. In 1751 he wrote 'Milton Vindicated from the Charge of Plagiarism.' In 1777 he prepared for the press the journal of Captain Cook's second voyage, to which he added a well-written introduction and added notes; and in 1781 he edited the account of Captain Cook's third voyage. In 1787 he was raised to the see of Carlisle and in 1791 was made bishop of Salisbury.

DOUGLAS, Robert Langton, English author and critic: b. 1864. He was educated at New College, Oxford, taking a degree in modern history. He was a lecturer on the University Extension Scheme and was formerly in holy orders in the Church of England. He executed a deed of relinquishment under the provisions of the Clergy Disabilities Act 1840. He died in 1902. Heresided mostly in Italy; in 1900-02 was professor of modern history in the University of Adelaide, Australia. He also lectured on artistic subjects at the Royal Institution and the Society of Arts. He enlisted in the new army in 1914, was made captain in 1915 and transferred to the war office in the same year. Douglas has written much for magazines and reviews and is known as an authority on Sienese art. He has published 'Fra Angelico' (24 ed., 1902); 'History of Siena' (1908); 'Le Maioliche di Siena' (1904); a new edition of Crowe and Cavalcaselle's 'History of Painting in Italy' (1903); 'Illustrated Catalogue of Pictures of Siena and Objects of Art' (1904). He is a Fellow of the Accademia di Belle Arti, Milan.

DOUGLAS, Stephen Arnold, American politician: b. Brandon, Vt., 23 April 1813; d. Chicago, 3 June 1861. His father, a physician, died three months after his birth, and his mother was left with scanty means of support. At the age of 15 he apprenticed himself to a cabinet-maker and worked for two years at the latter's trade. Then, after a short term of study at the Brandon Academy, he accompanied his mother, who had married again, to a new home, near Canandaigua, N. Y., where he finished his schooling at an excellent academy, and where he began the study of law. He was interested deeply in political questions, even in these years, attaching himself both ardor to the new party of Democracy which General Jackson was then molding into form. In 1833 he left Canandaigua to seek a career in the West, and, after several months of ill-health and hardship, found employment for the winter in school-teaching at Winchester, Ill. In the spring of 1834 he was admitted to the Illinois bar and settled himself at Jacksonville, in that State. From that time his rapid rise to prominence was extraordinary, even among careers of ambition in the young West. Physically delicate and short in stature, his small body was so strikingly in contrast with the power massed in a big brain and exercised by an indomitable will that admiring Jacksonville promptly gave
him the name of the "Little Giant," which clung to him through life. Almost at once he became the acknowledged leader of his party in the town. A winning personality, an elastic temper, a fearless and indomitable spirit, confidence and surpassing energy of intellect and will, were qualities that carried him always to the place of command. Within a year from his settlement at Jacksonville he was prosecuting attorney for his district; within two years he was elected to the legislature of the State; and from his service of a session in that body he passed into the office of United States Register of Public Lands, at Springfield, to which he was appointed by President Van Buren in 1837. His residence was at Springfield for the next 10 years, and there he came to acquaintance with Abraham Lincoln, his great political antagonist of a later time, whose rise to eminence was much slower than his own. In 1838 the bold young Jacksonian very nearly won an election to Congress in the strongly Whig district to which Springfield belonged. In 1841 he was appointed to a judgeship in the Supreme Court of the State, but resigned his seat on the bench two years later, to present himself again as a candidate for Congress, and with success. At that time (1843) he had just passed his 30th year. Most newcomers in Congress, even the ablest, need time to make a position of influence for themselves; but Douglas was prominent among the Democratic representatives of the Northwest from the first. The vigorous activity of his mind and the remarkable quickness of its working made him formidable in debate, while the unhesitating resoluteness with which he threw himself into whatever he undertook carried him always to the front of the fighting line. At the beginning of his second term in the House of Representatives he was made chairman of its Committee on Territories; and when, at the end of that term, he was elected to the Senate (1845), he received the chairmanship of the same committee in that body. This gave him the direction of subjects in legislation, and he found more important and more exciting than any others in the politics of the time. Texas had just been annexed; the country was on the eve of a war of conquest with Mexico and Great Britain was negotiating a fair settlement of the Oregon dispute. Should an expansion of the national territory mean expansion of slavery, and, if so, to what extent? were the questions now rising in angry debate. They were brought into Congress by the famous resolution called the "Wilmot proviso," which declared that no slaves should be held in any territory acquired as the result of the Mexican War. Extremists on the pro-slavery side set up the opposing doctrine that slave-holding was a constitutional right in any territory, since slaves were a species of property recognized by the Constitution of the United States. A second ground of opposition to the Wilmot proviso was discovered, apparently first by General Cass, who contended that the inhabitants of each Territory should admit or exclude slavery as they pleased, by their own votes. This doctrine of "popular sovereignty," or "squatter sovereignty," as it was branded scornfully by Calhoun, commended itself to Douglas' mind. His attitude toward slavery was that of indifference to the right or wrong of the system, which he regarded confessedly as a problem in politics, and no more. Practically, the "squatter sovereignty" doctrine triumphed in the compromise measures of 1850, which added yet another absurdity to the free-State constitution that her people had framed, and organized New Mexico and Utah as Territories with no restriction concerning slavery. Excepting Henry Clay, no one did more than Douglas in the framing of those measures, which were now so conspicuous among the chiefs of the Democratic party that he could aspire to its nomination for President in 1852. From the North he received strong support; but the less known and more pliant Franklin Pierce was preferred at the South. Douglas, not yet 40 years of age, could afford to wait. At some time within the next two years he conceived his project for a more complete and final settlement of the slavery question than the compromise of 1850 had brought about. This, in his view, could be accomplished by a frank and bold adoption of the principle of "popular sovereignty," applied to the whole national domain. Accordingly, in 1854, he startled the country by reporting from his committee what was known in its formal form as the Kansas-Nebraska Bill, repealing the Missouri Compromise of 1820 (which excluded slavery from the territory of the Louisiana Purchase, north of 36° 30') and leaving "the inhabitants thereof perfectly free to form and regulate their domestic institutions in their own way." At the North the bill raised a storm which even the bold spirit of Douglas must have watched with alarm. His own party was torn by it; that of the Whigs had already gone to pieces, and two new parties, "Know Nothing" or American, and Republican, now emerged from what seemed to be a general wreck of all in politics that belonged to the past. But Douglas, with no sign of faltering, fought a wonderful battle for his bill and carried it through. Then came the test in practice of his policy, applied in a struggle between anti-slavery and pro-slavery forces to control the settlement and the constitution-making of Kansas. The test was not favorable to the prestige of Douglas. He had heated instead of cooling the agitation of the slavery question and made it more dangerous than before. As a candidate for the presidency he was hardly so strong in 1856 as in 1852; but after Buchanan, then elected, had driven Douglas to revolt, by countenancing the fraud of the Lecompton constitution, making a farce of "popular sovereignty" in Kansas, the manly course of the Illinois Senator gave him more of popularity in the free States than he lost in the South. The hostility of the administration, combining with the opposition of the new Republican party, already powerful in the Northwest, could not defeat his re-election to the Senate in 1858. Over any antagonist but Lincoln he would probably have won a great triumph; as it was, he came wounded from his debates with that extraordinary man. He had been forced to declara- tions that offended his party in one section of the country more than they satisfied it in the other, and no one, and he aspired to the breach between the two. Nominated for President at last in 1860 by one wing of a divided party, he fought his last political battle with
all of his old obstinate valor, and went down in defeat. He was at the end of the small gift of bodily strength that he received at his birth; he was worn out. The last years of Lincoln only long enough to stretch a loyal and supporting hand to his successful rival in the crisis of rebellion that ensued. His last words to his followers were: "There can be no neutrals in this war." Consult Johnson, Allen, 'Stephen A. Douglas' (New York 1908); Bruce, 'Douglas' (Boston 1902); Carr, E. C., 'Stephen A. Douglas' (Chicago 1909); Sheahan, J. W., 'Life of Stephen A. Douglas' (New York 1860); Rhodes, J. F., 'History of the United States from the Compromise of 1850' (7 vols., New York 1906).

DOUGLAS, Sir William Fettes, Scottish painter: b. Edinburgh, 12 March 1822; d. 20 July 1891. As a painter he was mainly self-taught. On first devoting himself to art he practised chiefly as a landscape painter, but he soon turned to figure subjects, producing 'Hudson River,' 'The Arrival of the Astronomer' (1856); 'Lovell and the Antiquary' (1857); 'The Summons to the Secret Tribunal' (1860); and 'The Magic Mirror' (1872); works distinguished by excellent coloring and by especially firm, careful and refined handling. His later years were entirely devoted to landscape water-colors. He is represented in the National Gallery of Scotland by 'The Messenger of Evil Tidings'; 'The Spell'; and 'The Bibliophile.' He was elected president of the Royal Scottish Academy in 1882 and was knighted in the same year.

DOUGLAS, William Lewis, American manufacturer and public official: b. Plymouth, Mass., 22 Aug. 1843. He was educated in the public schools, began work in a shoe factory at the age of seven, removed to Colorado in 1865 and returned to Brocton, Mass., in 1876. He established a shoe factory there in the latter year, from which he has built up a business with a capacity of 17,600 pairs of shoes daily to supply his 85 retail stores in the large cities. In 1884-85 Douglas was a member of the Massachusetts house of representatives, and of the State senate in 1887. He was elected mayor of Brocton in 1890 and governor of Massachusetts in 1905. He also served as delegate to the Democratic national conventions of 1884, 1892, 1896 and was delegate-at-large in 1904.

DOUGLAS, England, capital of the Isle of Man, and a popular summer resort. Pop. 21,183.

DOUGLAS CITY, Alaska, town on Douglas Island, opposite Juneau. It is occupied chiefly by miners from the nearby Treadwell gold mines. There is a government school in the native quarter for the instruction of the Tlingit children. Pop. 1,722.

DOUGLAS FIR. See Fir.

DOUGLASS, Frederick, American lecturer and journalist, the son of a negro mother who was a slave: b. Tuckahoe, Md., 21 Feb. 1817; d. Washington, D.C., 20 Feb. 1895. Although his father was a white man, he was, according to the law, reared as a slave. In 1832 he was purchased by a Baltimore shipbuilder, but made his escape in 1838. He had taught himself to read and write, and changed his name from Frederick Augustus Bailey to Douglass. He worked as a day laborer in New York City and in New Bedford, Mass. At an anti-slavery convention at Nantucket in 1841 he showed talent as an orator, and was employed by the Anti-Slavery Society as one of its lecturers. In 1845 he published his 'Autobiography,' and afterward made a successful lecturing tour in England. His freedom was bought while he was abroad. In 1870 he edited a journal entitled The New Era. In 1871 he was appointed secretary of the commission to Santo Domingo; in 1872, presidential elector; in 1877, marshal for the District of Columbia, then commissioner of deeds for that district, and in 1889, United States Minister to Haiti. His autobiography was revised and enlarged in 1882 under the title of 'Life and Times of Frederick Douglass.' Consult Washington, Booker T., 'Frederick Douglass' (Philadelphia 1907).

DOUKHOBORS, du'khô-bôrz (Russian du khobôr'tsy, "spirit wrestlers," from their vanquishing the doctrine of the sect which started in Kharkov, Russia, about 1740, and spread rapidly in the Don province who now call themselves Christians of the Universal Brotherhood. The founder's name is not preserved: he was a Prussian subject who settled in Russia when his term expired. He and his successors, Kolesnikoff, Kapustin, etc., taught the familiar doctrine of the "inner light," with logical but socially inconvenient extensions: that as God in the soul is the one guide to action, the Bible is not infallible (though they accept the 10 Commandments), and it is not only superfluous but sinful to read and write, printing being a snare of the Devil; that Godmanifests himself in the fullest power in the human soul, and as they had that power, they were embodiments of God, and to be worshipped and obeyed as such; that Christ was only a sinless man, and the sinless leaders were his equals and successors. Every one's action being dictated by God, it cannot be wrong, and civil rulers are needless and their rule a usurpation; all being equal before God, churches are needless and they do not enter them; marriages need neither ceremonies nor permission, being of inclination only. It is easy to see that these tenets brought them in conflict with the authorities, who tried to restrict them to theory instead of practice, and imprisoned numbers for contumacy; but in 1801 a commissioner's report to Alexander II that they were well-behaved citizens induced him to order them left alone. The first colony was founded at Milky Waters, Sea of Azov, in 1801, and by 1816 the community numbered 3,000 souls. Crimes committed in the internal management of the colony led to their deportation (1841-44). The report of an imperial commission was so shocking that they were deported to the desert wilderness of Transcaucasia; a high bleak plateau unfit for agriculture, where they became almost wholly cattle-raisers and eaters, and increased to some 15,000. The government gradually put down the civil disorders of a large part of the people, and enforced decency of life; but it was not done without much petty tyranny, and doubtless corruption and abuse, of which they complained. Then came Pobiedonostess's policy of unifying the elements of the empire, and
enforcing conformity to the Greek Church; and in 1887 a bitter faction fight between two pretenders to the Doukhobor leadership rent the community. In 1895, as a sign that they regarded war as sinful, a large number destroyed all weapons of offense, and on account of this about 4,000 were deported from their homes and scattered among the Georgian tribes. Championed by Tolstoi, an agitation in their favor sprang up in England and other countries; and in 1898 the Russian government agreed to permit their emigration. About 1,000 went to Cyprus, these afterward joining the main body in Manitoba, where between January and June 1899 7,363 landed, settling in the vicinity of Yorkton, Swan River and Prince Albert. They would not take lands in severally, but only in communities; but they were prospering and learning English, filling the schools with their children, and appearing to trash off their unassimilable characteristics. Suddenly they adopted the tenet that all use of animals or their products for human service is sinful, and refused to eat milk, butter or eggs, wear woolen or leather garments, or use draft animals. Then one settlement refused to pay school taxes, till the government seized and sold their cattle. In the summer of 1902 they all at once turned their stock loose on the prairies and began hauling their own loads to market, sometimes 50 miles off, and themselves drawing the waggons. They sold the stock, sold it and placed the proceeds to the credit of the communities. While crippled in power to work for lack of animals, the rumor spread that Jesus was shortly to appear at Winnipeg, 300 miles east, to lead them to a new land. To prevent the government rounded up the stock, sold it and placed the proceeds to the credit of the communities.

DOULOT, Sir Henry, English potter: b. Lambeth, 24 July 1820; d. 19 Nov. 1897. At 15 he entered his father’s establishment there, where he devoted himself to the most technical branch of the industry, and worked for many years at the potter’s wheel. In 1846 he commenced the manufacture of stoneware pipes for sewage and drainage, for which a special factory was erected near Lambeth Palace, and thus initiated the substitution of impervious pipes for the old flat-bottomed brick drains. Sir Henry Doulton, however, is chiefly noteworthy as having been mainly instrumental in bringing about the revival in art pottery which has since spread into every civilized country; and his firm’s works in art stoneware, silicon, impasto, terra-cotta, faience and Doulton wares, have since 1870 gained the highest awards of judges at every exhibition of note throughout the world. John Bennet of the Lambeth works introduced the ware into the United States. He was created a Chevalier of the Legion of Honor (1878); was awarded the Albert medal in 1885; and in 1897 was knighted on the occasion of the queen’s jubilee.

DOUMUT, the seed of the common palm (Hyphaen thebacia) found throughout northern Africa. It is used as a substitute for vegetable ivory in the manufacture of buttons. The palm itself is a small tree, rarely over 30 feet in height, and often forked. The fruits grow in clusters of from 1 to 200 each. The nut is known to commerce under the trade name of gingerbread doum, doom or dum. It is softer than the tagua or corozo ivory nut of South America, has a thicker coating and a large hole in the centre. To offset this it is available in much larger quantities and is much cheaper, the price on the market fluctuating from two to three cents per pound. The quantity exported from Africa is constantly increasing. It is now much used in Italy, France and Germany, and is gradually finding favor in the United States.

DOUMER, doo’mä’, Paul, French statesman: b. Aurillac, Cantal, 1857. In 1885 he was appointed chief assistant to Floquet, president of the Chambre des Deputes. In 1888 and again in 1890 he was elected to the Chambre as a Radical. In 1895-96 he was Minister of Finance in the Bourgeois Cabinet and in the latter year was appointed governor-general of French Indo-China. Here he put through several important public works and placed the finances of the colony on a secure basis. In 1902 he was again a member of the Chambre, and served as head of the Budget commission in 1909, and in 1905, as president of the Chambre. In 1906 he was the candidate of the Moderates and Reactionaries for the presidency, but was defeated by Armand Fallieres, receiving only 371 votes to 449 for the latter. He was again head of the Budget commission in 1909, as a result of re-election in 1910. He is the author of ‘L’Indo-Chine française’ (1904) and ‘Livre de mes fils’ (1905).

DOUMERGUE, doo’mär’g, Emile, French Protestant historian: b. Nimes 1844. He re-
ceived his education at Geneva, Montauban, Erlangen and Berlin. From 1871 to 1880 he was professor of the Theological and Historical Department of the Protestant theological faculty at Montauban. His greatest work is his biography of Calvin, "Jean Calvin: les hommes et les choses de son temps" (5 vols., Vol. I, 1887; Vol. IV, 1910). Another important work is "Iconographie Calvinienne" (1909).

DOUMERGUE, Gaston, French statesman: b. Aigues-Vives, Gard, 1863. He studied law, practised at Nimes in 1885-90, served as colonial magistrate in Cochín-China in 1888 and in Algiers in 1890-93. He was elected to the Chamber of Deputies as a Radical-Socialist in 1898, 1902 and 1906. In 1895-96 he was secretary and in 1903-06 vice-president of the Chamber. In 1902-05 he was Minister of the Colonies in the Combes Cabinet, in 1906 Minister of the Colonies in the Sarrien and Clémenceau cabinets, and in 1908-10 was Minister of Public Instruction in the Clémenceau and first Briand cabinets. Afterward he became a member of the Senate and in December 1913 was made Premier, holding the same office from 1913 to 1914. He resigned the premiership in June 1914. In 1915 he became Minister of the Colonies in the Briand Cabinet.

DOUMIC, doo'mèk, René, French literary critic: b. Paris 1850. He was educated at the Lycée Condorcet and at the Ecole Normale Supérieure. He came to America, where he served as professor at Stanislas College; he lectured in Canada and at Harvard University in 1898. He has become known internationally through his criticisms in the leading journals of France. He was made a Chevalier of the Legion of Honor and was elected member of the Academy in 1909. He has published "De Scribe à Ibsen" (1893); "Écrivains d'aujourd'hui" (1894); "Études sur la littérature française" (4 vols., 1896-1905); "Les jeunes" (1896); "Essai sur le romantisme contemporain" (1897); "Hommes et idées du XIXe siècle" (1903); "Les lettres d'Elvire à Lamartine" (1905); "Le théâtre nouveau" (1908); "George Sand" (1909); "Lamartine" (1912); "Histoire de la littérature française" (30th ed., 1913).

DOUNES, Scotland, village of Perthshire, on the Teith, nine miles north of Stirling. Doune Castle, a fine specimen of Scottish baronial architecture, now a ruin, is described in Scott's "Waverley." Pop. 893. At Deanston, a mile west, are large cotton-mills, long managed by James Smith, a noted inventor and philanthropist.

DOURINE, or MALADIE DU COIT, a specific infectious disease of the horse and ass, transmitted by the act of copulation. It is caused by the protozoan parasite (Trypanosoma equiperdum). A symptom of the disease is an irregular period of incubation and it is characterized by the confinement of the first symptoms to the genital tract, the chronic course which it runs, and by the final complete paralysis of the posterior extremities, terminating fatally in from six months to two years. The disease is common in Asia, Africa and Europe and has been introduced into the United States several times with imported stallions. The United States Department of Agriculture is still engaged in eradicating the disease in certain sections of the West and the" XIXe Siècle." He also received the appointment of professor of Church history and dean of the Protestant theological faculty at Montauban. His greatest work is his biography of Calvin, "Jean Calvin: les hommes et les choses de son temps" (5 vols., Vol. I, 1887; Vol. IV, 1910). Another important work is "Iconographie Calvinienne" (1909).

DOURO, dö'roo, or DUERO, doo'ärō (ancient DURiUS), one of the largest rivers of the Spanish Peninsula, which, flowing west, traverses about one-half of Spain and the whole of Portugal, and, after a course of 500 miles, flows into the Atlantic three miles below Oporto. It is not of much navigable importance, but small vessels ascend about 70 miles from its mouth. In the Middle Ages it was celebrated for the gold that was found in its bed.

DOUROUCOULI, doo-roo-koo’lē, a small Brazilian monkey, of nocturnal habits, which sleeps by day, and preys fiercely by night upon insects and small birds. It is of the genus Açaúciriaca, of which various species are known, all South American. They are about nine inches long, with tails somewhat longer than their bodies; and have soft grayish fur; their voices are discordant and disagreeable. They are known also as "owl-monkeys," and "night-monkeys."

DOUSA, Janus (Latinized from JAN VAN DER DOES), Dutch statesman, philologist, historian and poet: b. Noordwyk, Holland, 6 Dec. 1545; d. there, October 1604. In 1572 he went as Ambassador to England to obtain the support of Queen Elizabeth for the cause of the Dutch and subsequently became governor of Leyden. As chief commander, during the siege of Leyden by the Spaniards, he conducted himself with prudence and courage in the midst of the horrors of famine, plague and civil dissensions. He was sent to England again in 1584 and 1585. The stadtholder, William I, compensated the city for its sufferings by the establishment of the university, of which Douua was the first curator. His best-known work is "Batavia Hollandiæque Annæales" (1599).

DOUX, Gerard. See Dow, Gerard.

DOUZETTE, dow'zhet, Louis, German painter: b. Triebssee, Pomerania, 25 Sept. 1834. He received a gold medal at Berlin in 1886. He is a landscape painter almost exclusively, and is particularly noted for his moonlight effects. Among his works are "Moonlight on the Fjord" (1883) in the Dresden gallery; "Swedish Coast by Moonlight" (1866); "Harbor of Lübeck by Moonlight" (1891). He was especially influenced by the Dutch.

DOVE, dö've, Alfred, German historian: b. Berlin 1844. He was son of Henry W. Dove (q.v.) and studied medicine and the physical sciences at Heidelberg and Berlin in 1861-66. Entering the journalistic field he was successively editor of the "Grenzboten" (1870) and of the periodical "Im Neuen Reich." From 1874 to 1884 he held the chair of German history at Bonn, and the same chair at Bonn from 1884 to 1891. In the latter year he returned to journalism and
DOVE—DOVEKIE

for a short time was editor of the Allgemeine Zeitung, in which he published 'Weltgeschichte im Zeitalter Friedrichs des Grossen und Joseph II.' but the literary world is especially indebted to him for publishing the posthumous manuscripts of Von Ranke, completing in four years the 'Weltgeschichte' and editing the 'Deutschische Werkte' (1890). In the year following he edited the last volumes of Bisмарк's parliamentary speeches.

DOVE, Heinrich Wilhelm, German physicist and meteorologist: b. Liegnitz, 6 Oct. 1803; d. Berlin, 4 April 1879. He was educated at Breslau and Berlin, and in 1845 he was appointed professor of natural philosophy at the university of the latter city, a post which he held till his death. He was also director of the Royal Observatory. Among his numerous works are 'Meteorological Researches' (1837); 'Distribution of Heat on the Surface of the Globe' (1852); 'Law of Storms' (1857); 'Optical Studies' (1859), and many papers in various journals.

DOVE, originally applied in England to several native and domiciled species of the genus Columba; the name dove is now used generally for the smaller species of the pigeon family (Columbidae, q.v.), but in many cases interchangeably with pigeon. The name applies to about 10 native North American species, of which the most important are the mourning dove (Zenaidura macroura), the white-winged dove (Melopelia leucopaea), the ground dove (Columbigna passerina), and several species of ground dove, of which only the first extends its range northward, the others being more especially derived from the West Indian and Mexican fauna, which included many species of the pigeon family. The mourning dove, so-called on account of its plaintive call, and unadorned plumage, ranges and breeds throughout temperate North America. The nest is a loose structure of twigs in which two eggs are deposited. In the late summer and autumn, when congregated in small flocks, doves are sometimes destructive to crops, and are much sought by gunners in localities where the game laws permit.

Several species of European and other exotic doves are well known in this country in the domesticated state. The ring dove (Columba palumbus) occurs throughout Europe, collecting in large flocks during the winter and depredating fields of turnips and other crops. The rock dove, or rock pigeon (C. livia) is considered by Darwin ('Animals and Plants Under Domestication') to have been the original stock of our domesticated pigeons, which, as a result of careful selection, have diverged into many races, arranged by Darwin in four principal groups: (1) Pouters; (2) Carriers, Runts and Barbs; (3) Fantails, Tumblers, Turbits, etc.; and (4) Trumpeters — which lead through some little modified varieties to the original stock still existing on the coasts of Europe and North Africa.

The turtle dove (Turtur communis) of Europe has been universally adopted in Christian countries as the emblem of gentleness and love, and figures much in poetry. It also symbolized loveliness, and was applied in this sense to women. The dove was the bird of Venus; Babylon was the city of the dove; it was a dove that whispered into the ear of Mohammed, and was his oracle. It was em bodied in the pagan worship of ancient Rome, and held a place in funeral rites. The dove was a sacred bird to the Israelites, typifying innocence, and Jerusalem was the city of the dove. In Christian times it was the attribute of the Virgin Mary; was a symbol of the Holy Ghost, and carved on baptismal font handles as the tombs of martyrs as a figure of the resurrection.

DOVE IN ART. Semiramis was symbolized by the ancient Assyrians and Babylonians by a dove, the form she is supposed to have assumed on leaving the earth. Venus (Astarte) is generally found accompanied by a dove as an attribute, in mythological art. In Christian symbolism the dove is figu rative of the Holy Spirit. In this sense it figures in pictorial representations of scenes as the baptism of Christ, the annunciation of the Virgin, the creation of the world; with the same intent artists have introduced the dove hovering over the heads of saints. Again, for the same reason the dove form was carved on most baptismal fonts of the older churches.

As Noah's messenger returning to the Ark with an olive branch, the dove has become a symbol of peace, and accompanies the inscription *Pax* in the Catacombs. Figuring on tombs or sarcophagi the dove is said to represent grief and martyrdom. In prolate symbolism the dove usually represents love or affection: Giovanna de Medici adopted two turtle doves as her device to represent conjugal fidelity.

In ecclesiastical furniture the pyx (containing the consecrated Host) suspended from the ciborium over the altar in the earlier Roman Catholic churches frequently took the form of a dove; it was known as the peristerion, from the Greek peristerion — a dove-cote. Dr. Rock says they were used in many French churches up to a century or so ago; the custom appears to have died out generally long before as none are known to have been produced later than 1200 a.d. The dove stood, usually, on an enamel-decorated dish from which it was detachable. Very few specimens of these ecclesiastical doves are extant. In Germany, the Salzburg and Erfurt cathedrals and the monastery church of Gottweih each possess one. Numerous saints have been depicted as accompanied by a dove, such as: Saint Thomas Aquinas, Saint Fabian, Saint Gregory the Great, Saint Louis, Saint Dunstan and a number of others.

DOVE-PLANT, or HOLY GHOST PLANT (Peristeria elata), an orchid of Central America, much revered by the pious natives because of its resemblance to a dove with outstretched wings, the symbol of the Holy Ghost; called also Holy-Spirit flower.

DOVE-TICK, a bird parasite (Argas reflexus), the blind tick which infests doves and other birds. Some of the species are said to cause death by their sting. See Tick.

DOVEKIE, düv̄'kē, the little auk (Alle alle), one of the smallest of the family Alcida, a bird of high northern latitudes, living and breeding gregariously, on rocks and cliffs of the North Atlantic and Arctic oceans. A single egg is laid by this bird on the bare rock. In winter, it is found along the coast of New Eng-
1 Domestic Turtle-dove (Turtur rivosiorus)
2 European Wood-pigeon (Columba palumbus) at the left; and Stock-dove (C. oenas) at the right
3 American Wild or Passenger Pigeon (Ectopistes migratorius)
4 Papuan Crowned Pigeon (Goura albertisi)
5 Crested and Common Australian Bronze-winged Doves
6 Blue Rock-dove (Columbia livia)
land and the Middle States, and is occasionally blown by storms as far inland as Michigan. The dovekie, or sea dove, as it is also sometimes designated, is from eight to nine inches long; of a glossy blue-black above, with the underparts, and two patches on each wing, white. The adults have a small crest on the base of the beak.

The name is also sometimes applied by fishermen to one or more species of guillemot.

DOVER, Del., city, capital of the State and county-seat of Kent County, on Jones Creek, and the Philadelphia, Baltimore and Washington Railroad, 75 miles south of Philadelphia. It is the seat of Wilmington Conference Academy and has a handsome monument erected to the memory of Caesar Rodney, one of the signers of the Declaration of Independence. It is the centre of a large fruit-growing region. It is on high ground; is laid out with wide, straight streets that cross each other at right angles; and is built up chiefly with brick. Among its noteworthy buildings are a handsome State house, last occupied by Lord Baltimore, and new United States government building. Connected with the State house is a State library with upward of 50,000 volumes. There are several churches, a national and a State bank, fruit evaporating and packing establishments, steam flour-mill, foundry, machine shops, sash, fruit crate, glass and carriage factories. The city has valuable gas and waterworks, weekly newspapers and good schools. Dover was laid out in 1717, became the capital of Delaware in 1777 and was incorporated as a town in 1817. The government is vested in a mayor and eight councilmen. Pop. 3,720.

DOVER, England, a Cinque port and parliamentary and municipal borough in the east of Kent, England, 78 miles southeast of London by rail and 22 miles from Calais. Owing to its mild and equable climate, it is a favorite seaside and pleasure resort. Its trade is almost entirely with the Continent, to and from which there is a great passenger traffic. The Duke of York's School, formerly at Chelsea, is now located here. It is the headquarters of the South-Eastern District of the British army, and the nearest point of the English coast to France. The fortifications comprise Dover Castle, which occupies a commanding position on the chalk cliffs, 375 feet above the level of the sea, and still includes some of the old Saxon and Norman work and three modern forts of great defensive strength have recently been constructed. As the gateway of England fronting the Narrow Seas, Dover has always held an important place in schemes of national defense. One end of the submarine net which was constructed across the English Channel during the great European War was at Dover. Among the antiquities of Dover are a Roman pharos and a Roman-British fortress church. The borough returns one member to Parliament. Pop. 44,000.

DOVER, N. H., city and county-seat of Strafford County, 11 miles by rail northwest of Portsmouth, at the head of minor navigation on the Cochecho River, and on the Boston and Maine Railroad. The city has fine power facilities derived from the river, which here has falls over 30 feet high. It contains cotton and woolen mills. Printing press fac-
tories, machine works, boot and shoe factories, leather belt works, iron castings works, cutlery works, brick and lumber yards, etc. The United States census of manufactures for 1914 recorded within the city limits 58 industrial establishments of factory grade employing 2,678 persons; of whom 2,453 were wage earners, receiving annually $1,219,000 in wages. The capital invested aggregated $5,703,000, and the year's output was valued at $5,682,000: of this, $1,425,000 was the value added by manufacture. Its principal public buildings are the city hall, public library, opera house, two hospitals, home for the aged, two orphan homes and three banks. The total value of its taxable property is estimated at $10,686,000. The government is vested in a mayor, elected for two years, a board of aldermen and a common council. The waterworks are the property of the city and are operated by the Municipal Water Commission. Dover was settled in 1623 and is the oldest city of New Hampshire; was organized as a township in 1679, as a town in 1764, and received its city charter in 1855. In its first century of existence it experienced all the anxieties of a frontier town, being often attacked by the Indians, the worst affair of this nature occurring in 1689 when several buildings were burned, 29 persons taken prisoners and 23 slain. Pop. 14,000.

DOVER, N. J., town in Morris County, 39 miles by rail west of New York, on the Rockaway River, the Morris Canal, the Delaware, Lackawanna and Western and the Central of New Jersey railroads. It has large iron works, stove and furnace factories, boiler works, flouring mills, drill and range factories, silk mills, knitting mills, hosiery factories, overall factory and a government munition depot. It is governed by a mayor, elected biennially, a recorder, board of aldermen and a common council. All these together form the Municipal Council. In 1826 the place was incorporated as a village, and as a town in 1869; its present charter was granted in 1875. Its chief public buildings are the town hall, two banks, several churches and public schools. The total value of all its taxable property is placed at $80,000. Pop. 11,000.

DOVER, Tenn., town and county-seat of Stewart County, 100 miles west of Nashville, and 15 miles from the Kentucky State line, on the south bank of the Cumberland River. It is about 16 miles from the Louisville and Nashville and five miles from the Tennessee and Cumberland River railroads. The county is almost wholly agricultural. Dover is the market for practically the entire county. It has two banks, a public school, courthouse and an assessed valuation of $200,000. It is governed by a mayor and board of aldermen. Dover is located about half a mile from the site of Fort Donelson, where a three days' battle was waged in February 1862. The Fort Donelson National Cemetery is in the suburbs of the town. Dover was almost destroyed during the Civil War. The house in which General Grant received the surrender of the fort is still shown in the town. It was first settled in 1806. Pop. 600.

DOVER, Straits of, the narrow channel which connects the North Sea with the English Channel, and separates England and France. At the narrowest part from Grisnez to Dover—
it is only 21 miles wide. The depth of the channel at a medium in the highest spring tides is about 180 feet. On both the French and English sides the chalky cliffs show a correspondence of strata which leaves no room to doubt that they were once united. Various projects for connecting Dover and Calais more closely have been advanced, as by bridge or tunnel or by trains on submerged rails. When making examinations for the tunnel scheme, coal was discovered in the bed of the Strait.

DOVETAIL, a term used in carpentry; the fastening of boards together by letting one piece into another, in the form of the tail of a dove. The dovetail is the strongest of jointings, because the tenon, or piece of wood which is put into the other, goes widening to the end, so that it cannot be drawn out again. Dovetails are either exposed or concealed; the latter being of two kinds, lapped and mitred. There is also a dovetail hinge, dovetail saw, dovetail file, and in Roman architecture an ornamented molding in the form of a dove's tail.

DOVIDIO, dò-vide′jë, Francesco, Italian philologist and critic: b. 1849. In 1876 he became professor of Romance philology at the University of Naples. With Ascoli and D'Ancona he holds a prominent place in the development of philological science and in the criticism of literature from the historical viewpoint.

DOW, or DOUW, Gerard, Dutch painter: b. Leyden, 7 April 1613; d. there, February 1675. He studied under Rembrandt and was distinguished for the excellence of his coloring and chiaroscuro. He surpassed his master in diligence and nothing can be more finished than his small pieces, which are so delicate that a magnifying-glass is necessary to see distinctly the work in them. His softest figures are full of life and he never neglected, in his representations, the almost invisible minutiae of nature. He is regarded as the inventor of the ingenious mode of painting large pictures on a reduced scale, by covering the original with a frame, including a space divided into small quadrangular parts by means of threads and then transferring the parts into an equal number of similar divisions drawn on the new ground. He made use of the convex mirror to represent objects on a reduced scale. Among his best paintings are 'The Evening School,' a fine study in candle-light effect, now in the Rijks Museum, Amsterdam; 'Young Mother, at The Hague'; the 'Schoolmaster' and the 'Hermit' at Dresden. He numbers among his pupils Gabriel Metsu, Franz van Mieris, Schalken and Van Slingeland. Consult Van Dyke, 'Old Dutch and Flemish Masters' (New York 1895).

DOW, Lorenzo, American preacher: b. Coventry, Conn., 16 Oct. 1777; d. Georgetown, D. C., 2 Feb. 1834. Adopting the doctrines of the Methodists, 1796, he finally received a regular license to preach, and, in spite of contumely and rebuffs and ceaseless hardships and dangers of all kinds, persevered for nearly 40 years, with an enthusiasm which never relaxed and often with astonishing effect. In the course of his ministry he traveled over many parts of the United States and Canada, and in 1799 and again in 1805 visited England and Ireland, where his peculiar eloquence attracted much attention and on several occasions subjected him to persecution. Dow's eccentricity of manner and dress for a long time excited a prejudice against him, and in many parts of the country he was familiarly known as 'Crazy Dow.' But to the class to whom he most frequently addressed his simple sermons, though coupled with illiterate phraseology, supplied the place of eloquence, and he seldom failed of having attentive hearers. His journal, containing the history of his life to the 30th year, together with his miscellaneous writings, was published in 1850. His wife was Peggy Dow, who was likewise well known for her religious eccentricities.

DOW, Neal, American temperance reformer: b. Portland, Me., 20 March 1804; d. 2 Oct. 1897. He was the author of the bill which prohibited the manufacture and sale of intoxicating liquors in the State of Maine, widely known as the 'Maine Law.' During the Civil War he was colonel of a Maine regiment and a brigadier-general of volunteers. In 1880 he was the Prohibitionist candidate for the Presidency and lectured widely on the subject.

DOWAGER, a widow with a dowry. The word is commonly applied only to the widows of persons of the titled aristocracy.

DOWAGIAC, dò-wa′jäk, Mich., city in Cass County, on the Michigan Central Railroad, 35 miles southwest of Kalamazoo. It is the centre of a prosperous farming region and contains flour and lumber mills, a canning factory, a gashouse and a public library. There are manufactories of grain drills, stoves, gloves, furnaces and bait. Pop. 5,088.

DOWDEN, Edward, English literary critic and historian: b. Cork, Ireland, 3 May 1843; d. 4 April 1913. He was educated at Trinity College, Dublin, and from 1867 until his death held the professorship of English literature in that institution. He had a commanding position as a critic, especially in the field of Shakespearian criticism. His works include 'Shakespeare: His Mind and Art' (1875); 'Poems' (1876); 'Shakspeare Primer' (1877); 'Studies in Literature' (1878); 'Southeby' (1880); 'Life of Shelley' (1886), the chief authority on the poet; 'Transcripts of a Lecturer's Copy'; 'Introduction to Shakspeare' (1893); New Studies in Literature' (1895); 'The French Revolution and English Literature' (1897); 'History of French Literature' (1897); 'Puritan and Anglican' (1900); 'Robert Browning' (1904); 'Montaigne' (1905); 'Essays: Modern and Elizabethan,' (1910).

DOWDEN, John, Scottish prelate: b. Cork, Ireland, 29 June 1840; d. 30 Jan. 1910. He is a brother of E. Dowden (q.v.). He was educated at Queen's College, Cork, and Trinity College, Dublin, and taking orders in the Scottish Episcopal Church, became bishop of Edinburgh in 1886. He has published 'The Apostoled Scottish Communion Church in Scotland'; 'History of the Theological Literature of the Church of England'; 'The Workmanship of the Prayer Book'; 'Further Studies in the Prayer Book'; 'The Medieval Church in Scotland.'

DOWELL, Stephen, English author: b. Isle of Wight 1833; d. 1898. He was educated at Oxford, where he was graduated in 1855.
DOWER — DOWLAS

He studied law and in 1863 was appointed assistant solicitor to the Board of Inland Revenue, in which office he remained until 1896. He wrote several works on taxation, on which subject he was regarded as one of the greatest authorities in England, also legal and historical tracts and pamphlets. His longer list includes: 'The Income Tax Laws' (1874; 3d ed., 1890); 'A Sketch of the History of Taxes in England' (1876); 'A History of Taxation and Taxes in England, from the Earliest Times to the Present Day' (4 vols., 1885; 1880), the standard work on this subject.

Dower, in law, the share or portion of the real estate of a deceased husband which passes to his wife for her natural life. At common law it consists of one-third of all the lands and tenements held in fee simple or fee tail by the husband at any time during coverture to which any issue of the marriage might have by possibility become heir. This right attached during the life of the husband and was not subject to his debts.

Dower is of ancient origin and has been subject to frequent change. In England it was known before the Norman conquest, and records show it to have been in vogue there in 1100, at the time of Henry I, and it was recognized in the Magna Charta of King John in 1215. It is known to Mohammedan law as well as to many other systems of law.

In England it was early found that the common-law dower generally served as an obstacle to the free alienation of real property, and this led to various methods of barring it, among them being cases to bar dower, which prevented purchasers from acquiring estates of inheritance. At the time of Henry VIII a statute was enacted to bar dower by the grant to the wife of a jointure before the marriage. This practice was superseded and the whole subject reformed by the statute of 1834, the terms of which permit the husband to defeat the dower, as by will or deed, thus leaving subject to dower only the real property of which he was seized at his death. Other changes were made by this act, including the extension of dower to embrace equitable estates of inheritance.

In the United States many jurisdictions follow the rules of the common law, at times somewhat modified by judicial interpretation, by statute or by constitutional limitations. However, in other jurisdictions some very valuable changes have been introduced. In a number of States dower has been superseded and a different interest substituted. By some of these statutory changes property acquired by the husband during coverture becomes community property, belonging jointly to husband and wife, vesting absolutely in the latter on the death of the husband. Statutes have been enacted in some States which make personality, unlike the rule at common law, the subject of dower. Dower is not a contract right, but is founded upon public policy, the object being the support of the wife and the care and education of the younger children after the death of the father. Dower in real property is determined by the law of the place where such property is located, but dower in personal property is governed by the law of the domicile of the husband. Statutes abolishing the right of dower after it has vested by the death of the husband have been declared unconstitutional.

Dower at the present day may be barred by a fair antenuptial or postnuptial agreement in lieu of dower, by a reasonable separation agreement, by acceptance on the part of the wife of a devise or bequest in lieu of dower, and by the wife's elopement and adultery. See Husband and Wife.

DOWIE, John Alexander, American leader of a religious sect: b. Edinburgh, Scotland, 1847; d. Chicago, Ill., 9 March 1907. He studied for the ministry and held two pastorates in Sydney, Australia, but subsequently became an evangelist preacher. While in Australia he organized the International Divine Healing Association of which he became president. In its behalf he traveled in England and America and finally settled in Chicago in 1890. Here he built his wooden tabernacle in Woodlawn, which was opened in 1893, and attracted large crowds by his preaching and faith cures. He later organized the Christian Catholic Church in Zion, which grew rapidly, adding many auxiliary lines of work, such as a college for Zion preachers, a training school for deaconesses and a number of charitable institutions. Dowie had already established a publishing house, which became a part of the organization, and had full control of a bank, known as the Zion bank. He finally organized a land association and purchased a large tract of land on the shores of Lake Michigan, where he and his devotees built Zion City, the centre of all the numerous activities of the Christian Catholic Church; here he also established a lace industry. In this city he was practically dictator, forbade smoking, drinking, card playing, etc., and oversaw all branches of the work. He also preached frequently and gave special attention to the healing of the sick. In 1901 he made the claim of being Elijah the Restorer and in 1903 he built the new tabernacle at Zion City, near Chicago. On 2 April 1906, he was suspended by his followers from the leadership and from membership in the church on charges of fraud, tyranny and polycamous tendencies. Consult Bulletin and Classified, Century Magazine Vol. LXIV, pp. 928-932; Napes, John Alexander Dowrie and his Zion (Independent, Vol. LIII, pp. 1786-1791); Napes, John Alexander Dowie (Century Magazine, Vol. LXIV, pp. 933-944).

DOWITCHER, dow'ich-er, a sporting name for birds of the genus Macrotramus, which are related to the snipes and are much hunted along the beaches of this country during the season. Two species, breeding far north, winter in South America and Mexico. The birds are from 10 to 12 inches long, with a bill nearly one-fourth the length of the body. The upper parts are dark while the under feathers are reddish.

DOWLAS, a kind of coarse linen, very commonly worn by the lower classes in the 16th century; also a strong calico made in imitation of the linen fabric. The name is said to be derived from Doullens, a town in the department of Somme, France. Before the introduction of machine-woven cotton cloth, dowlas was manufactured largely in Yorkshire, England, and in the south of Scotland.
DOWN, maritime county of Ireland, in the province of Ulster, area, 610,730 acres. It possesses good agricultural land, is rich in minerals and manufactures fine linens. Oats, wheat, potatoes and flax are the principal crops. The Mourne Mountains in the south reach to an altitude of nearly 2,800 feet in Slieve Donard. The county returns four members to the House of Commons. Capital, Downpatrick. Pop. 204,303; 31 per cent Roman Catholic.

DOWNCAST, in a mine, is a shaft or opening, that opening through which fresh air from the surface enters the mine. Unless a fan or other contrivance is used to force the air down, the direction of the ventilating current changes with the temperature of the outside air.

DOWNERS GROVE, Ill., village in DuPage County, 20 miles west of Chicago, on the Chicago, Burlington and Quincy Railroad. It has a public library and manufactures furniture and tools. It has also dairy and greenhouse interests. The waterworks and electric-lighting plant are owned by the village. Pop. 2,600.

DOWNES, William Howe, American journalist, art critic: b. Derby, Conn., 1 March 1854. He has been a staff writer on the Boston Transcript for many years. He has published 'Spanish Ways and By-ways'; 'The Tin Army of the Potomac'; 'Arcadian Days'; 'Twelve Great Artists'; 'Boston Painters and Paintings'; 'Life and Works of Winslow Homer' (1911), and written many papers on art matters for various magazines.

DNFPALL, The ("LA DÉNACLE"), a novel of the Franco-Prussian War, by Emile Zola, published in 1892. The siege of Sedan forms the dramatic centre of the story, which is concerned chiefly with the friendship of Macquart and Levasseur, and the love of Macquart and Levasseur's sister Henriette.

DOWNING, Sir George, English soldier and political intriguer: b. Dublin about 1623; d. 1684. His uncle, Gov. John Winthrop, sent him to be educated at Harvard and Downing was graduated as a member of the first class there in 1642. After a few years he went to England and joined the Parliamentary army. He was a member of both Parliaments during the Protectorate, and was a leader in the movement to offer the crown to Cromwell. In 1655 he was sent to France to protest against the Vauquois massacre and two years later was appointed British resident at The Hague. He curried favor from the exiled royal family and after the Restoration was well received by them, being knighted in 1660, and made a baronet in 1663. He also served as Secretary of the Treasury and as Commissioner of Customs. His name is perpetuated in London in the well-known Downing street, where are situated most of the high offices of government, whence the British government is often popularly alluded to as "Downing Street."

DOWNING COLLEGE, one of the colleges of the University of Cambridge founded in 1800 and opened in 1821. Its founder was Sir George Downing, a Cambridgeshire gentleman, grandson of the politician after whom Downing street in London was named. The college is composed of a master, two professors (one of English law and one of medicine), six fellows and six scholars. There were 34 matriculations in 1913–14 and 19 in 1914–15.

DOWNING STREET, a short street in Whitehall (named after Sir George Downing, Secretary to the Treasury in 1637), London, England, where are the colonial and foreign offices, with the official residence since 1735 of the First Lord of the Treasury. Here Cabinet councils are held, hence the term is sometimes employed as a synonym for the British government.

DOWNINTOWN, Pa., borough in Chester County, on the Pennsylvania and the Philadelphia and Reading railroads, 33 miles west of Philadelphia. It contains brickyards, knitting mills, machine shops and paper mills. Pop. 3,326.

DOWNPATRICK, or DOWN (Gael. Dun, fort), Ireland, a municipal borough and county-seat of the County Down, near the mouth of the Quayle, on Strangford Lough, 20 miles south of Belfast. Linen, muslins, leather, liquors and soap are manufactured. Vessels of 100 tons approach a quay about a mile below the town. It is a cathedral town. The present structure was restored in 1790 on the site of the church erected in 1412 and destroyed by fire in 1538. Downpatrick is probably the oldest town in Ulster. It was for a time the residence of the kings of Ulster and was a place of importance even before the arrival of Saint Patrick, who built the abbey of Saul nearby. By many it is thought that Saints Patrick, Brigid and Columkille are buried here. Consult 'Ecclesiastical Associations or Downpatrick' (Belfast 1897).

DOWNS, a term applied to hillocks of sand cast up by the sea or wind along the sea coast; also to hilly tracts of grassy land suited for pasture; especially two parallel ranges of grassy hills in the south of England, the North Downs running east to west from Hants through Surrey and Kent to Dover, the South Downs in Hants and Sussex, terminating at Beachy Head. Botley Head (880 feet) is the highest summit in the North Downs, and Ditchling Beacon (858 feet) of the South. Between the two ranges lies the valley called the Weald. The celebrated Southdown sheep pasture on these hills.

DOWNS, The, a celebrated roadway for ships, eight miles long and six wide, along the southeast coast of Kent, in England, between the North and the South Foreland, the largest natural harbor of refuge on the English coast. It affords excellent anchorage with depths of from 25 to 70 feet and is sheltered by Goodwin Sands, a natural breakwater, with from one to four fathoms of water, but is open to the south. Deal, Dover and Sandown castles are its defense. An obstinate but indecisive sea-fight took place here in 1666 between the English and Dutch.

DOWRY, the property which a wife brings to her husband at her marriage; dot. In localities in which the civil law has been adopted, as Louisianna, it usually forms an important part of the law of property. It is also recognized by common law, and in England is known chiefly in connection with marriage settlements. Dowry is under the absolute control of the hus-
hand, subject to the conditions that he cannot convey it if in the form of real estate and that he must use it for expenses of the family.

While (Gloria exspectata, Glory to God in the highest) and the Lesser Doxology (Gloria Patri et Filho, etc., Glory be to the Father and the Son; etc.). The Greater Doxology, as is seen, opens with the words of the evangelist Saint Luke when he recounts the circumstances attending the birth of Jesus at Bethlehem; the heavenly host chanting Glory to God in the highest, and on earth peace among men of good will. This Greater Doxology has a place in the Roman Catholic liturgy and in the common service of the Anglican Church. Its introduction into the liturgy dates only from the time of Pope Symmachus (beginning of 6th century); previously it had been customary to recite it after the Mass. The Lesser Doxology had its origin among the early Christians and was sung; the Apostles (Matt. xxviii, 19) to teach all nations, baptizing them in the name of the Father, Son, and Holy Spirit. An ancient form of this Doxology is "Glory to the Father in the Son, and that was considered to be consistent with orthodoxy until the Arians favored it as expressing their view of the relation of Jesus Christ to God the Father; then the orthodoxy rejected it and employed the other formula exclusively. In the Roman Catholic breviary at the end of each of the psalms of the daily office the Gloria Patri, etc., is always pronounced. The latter portion of this doxology, as it was in the beginning, is now, and ever shall be. Amen, was appended as a protest against certain heretics of the 6th century who denied the Son's eternity. Another doxology called the Trisagion is also in use. It is the seraphic hymn from Isaiah. The Protestants sometimes apply the term to the hymn written by Bishop Thomas Ken. Its opening line is "Praise God from whom all blessings flow."

DOYEN, dwá-yán, Eugène Louis, French surgeon: b. Rheims, Marne, 1859; d. Paris, 22 Nov. 1916. He became noted for his discoveries in surgery and his investigations of cancer. He introduced many innovations in surgical technique and in 1875 established a private clinic in Paris, which soon became a study centre for surgeons, both from France and other countries. His improvements were widely adopted, and Doyen thus became the leader of a new school of surgery. He made a special study of the treatment of cancer, and claimed to have isolated the germ of the disease, but other investigators have repudiated his claims. He long resisted bitter attacks made against his treatment, maintaining that cancer could be cured providing treatment was begun early enough. He published "Traité de l'Infection" (1904); "La malade et le médecin" (1906); "Traité de thérapeutique chirurgicale et de technique opératoire" (1907); "Le cancer" (1909).

DOYEN, dwá-yán, Gabriel François, French painter: b. Paris 1726; d. Saint Petersburg, 5 June 1806. After study with Van Loo, he obtained the Grand Prix de Rome, and spent many years in Italy. His 'Triumph of Amphitrite' is in the Louvre, and an 'Adoration of the Magi' in the museum at Darmstadt. Other noted productions are in various churches, his most famous production, 'Miracle des Ardens,' painted in 1767, being in that of Saint Roch, Paris. At the invitation of Catharine II and Paul I, he went to Saint Petersburg, where he was employed in decorating the Winter Palace and the Old Hermitage.

DOYLE, Alexander, American sculptor: b. Steubenville, Ohio, January 1858. He was educated in Italy and in American public schools. He qualified for Cambridge University, but did not enter. He began the study of sculpture in the academies of Carrara and Florence, Italy, followed by several years' study at Rome and Paris. Among his notable works are the marble portrait and pedestal at the grave of John Howard Payne at Washington; the marble statues of Bishop Pinkney; Margaret Haughey, Senator B. H. Hill and General Garfield; the marble portrait group of the two Cupples children at Saint Louis, Mo.; bronze statues of Gen. A. S. Johnston and Robert E. Lee at New Orleans; Sergeant Jasper to the Statue of Liberty, Ga.; Gen. Philip Schuyler for the National Revolutionary Monument, Saratoga; Gen. James B. Steedman, Toledo; Horace Greeley, New York; Mrs. Emma Willard, Troy, N. Y.; senators T. H. Benton, F. P. Blair and J. E. Kenna for the Capitol at Washington; Franklin Scott Kent at Frederick, Md.; the Soldiers' Monument at New Haven; the Soldiers' Monument, Montgomery, Ala. From 1899 to 1909 he was engaged in quarrying building stone in Indiana, resumed sculpture in 1909, and has since executed a statue of E. M. Stanton, Steubenville, Ohio, and the equestrian statue of Gen. G. T. Beauregard for the city of New Orleans.

DOYLE, Sir Arthur Conan, English novelist: b. Edinburgh, Scotland, 22 May 1859. He is a nephew of Richard Doyle (q.v.). He was educated at the Roman Catholic College at Stonyhurst, Lancashire, and at the University of Edinburgh. After practising as a physician at Southsea (1882-90), the success of several of his books induced him to give up the profession for that of literature. His works include "A Study in Scarlet" (1887); "Mycro Clarke's" (1888); "The Sign of the Four" (1889); "The White Company" (1890); "The Adventures of Sherlock Holmes" (1891), a very popular series of detective stories; "The Great Shadow" (1892); "Memoirs of Sherlock Holmes" (1893); "Round the Red Lamp" (1894); "The Stark Munro Letters" (1895); "Exploits of Brigadier Gerard" (1896); "Rudyard Stone" (1896); "The Tragedy of the Korosko" (1898); "Songs of Action" (1898); "A Duet with an Occasional Chorus" (1899); "D'Entrechat" (1900); "The Great Boer War" (1900); "The Hound of the Baskervilles" (1902); "Return of Sherlock Holmes" (1904); "Sir Nigel" (1905); "Through the Magic Door" (1908); "Songs of the Road" (1911); "The Lost World" (1912); "The Poison Belt" (1913); "The Valley of Fear" (1915); "His Last Bow" (1917); "The History of the Great War" (1917); "The New Revelation" (1918). He has also written the plays, "A Story of Waterloo" (1884): "Halves" (1899), etc. He was knighted in 1902.
DOYLE, Sir Francis Hastings Charles, English poet: b. Nunappleton 1810; d. 8 June 1866. He was educated at Eton and Oxford, and held the post of receiver-general and next of commissioner of customs, and in 1867 he was elected to the chair of poetry in Oxford University for the term of five years, being then elected for a second term of the same duration. He has published 'Miscellaneous Verses' (1841); 'Two Destinies' (1844); (1866); and of the Guards and other Poems' (1866); and he subsequently published his Oxford lectures (1869 and 1877), and 'Reminiscences and Opinions' (1875) (1886).

DOYLE, John Andrew, English historian: b. 14 May 1844; d. 5 Aug. 1907. He was educated at Eton and Balliol College, Oxford. He was an authority on the history of the English colonies in America, and wrote 'The American Colonies' (1869); 'A History of the United States' (1882); 'The English in America' (1882); 'The Puritan Colonies' (1887); 'The Middle Colonies' (1907); 'The Colonies under the House of Hanover' (1907).

DOYLE, Richard, English artist: b. London, September 1826; d. there, 11 Dec. 1883. His father, John Doyle (q.v.), the author of the celebrated 'H. B.' caricatures, initiated him into the mysteries of his art, and the young draughtsman became one of the founder-illustrators of Punch, the current design on the cover of which was invented by him. His sketches of the 'Manners and Customs of ye English' in that periodical, and the 'Bird's-eye View of London' were highly esteemed in its early pages of the 'Cornhill Magazine' illustrate the mode of life and manners of London men and women of his time with rare felicity and fidelity. In 1850 he severed his connection with Punch on account of his frequent attacks on the Pope and Doyle's coreligionists and Roman Catholics. His water colors are equally well known. Among them may be mentioned 'Under the Dock Leaves' (British Museum); and 'The Triumphant Entry,' a fairy pageant (National Gallery, Dublin). DOYLESTOWN, Pa., borough, county-seat of Bucks County, 34 miles north of Philadelphia, the terminus of a branch of the Philadelphia and Reading Railway. It is in a fertile farming section and has a thriving local trade. It has a courthouse, public library, an academy, a female seminary, graded schools and handsome churches and private residences. The town is lighted by gas and electricity. Its chief manufactures are wagons, carriages and farm implements, flour, lumber, soap, woolens and cabinet woods. There is a mill, foundry, creamery, tannery and clay works. Doylestown has a national bank, a trust company and daily and weekly papers. It is a popular residence town and has a large summer population. Pop. 3,300.

DOZY, dō'zē, Reinhart Pieter Anne, Dutch Orientalist and historian, of French Huguenot descent: b. Leyden, 21 Feb. 1820; d. there, 29 April 1883. He obtained the degree of doctor from the University of Leyden in 1844. The following six years were spent in study and writing, and in preparing a catalogue of the Oriental manuscripts in the university. He was made an extraordinary professor of history in 1850, and full professor in 1857. He was considered one of the most learned and critical of the time, and Arabic of his time; was an authority upon Oriental language and history, and spoke and wrote almost all of the European languages with facility. He is known chiefly by his great work, 'Histoire des Mssulmans d'Espagne, depuis la conquête de l'Aandalousie par les Arabes' (1851, 2d ed. 1881), and its supplementary volume, 'Recherches sur l'histoire et la littérature de l'Espagne pendant le moyen âge' (1849, 2d ed., 1860, 3d ed., 1881), which remain the standard works upon this period of Spanish history, and by his 'Supplément aux dictionnaires arabes' (1877–81). Other important works are his 'Dictionnaire détaillé de noms des vêtements chez les Arabes' (1845); 'Schriftum Arabum loci de Abbaditis' (1846); 'Commentaire historique sur le poème d'Ibn Abdoun par Ibn Badroun' (1846); 'Histoire de the Almohades' (1847); 'Histoire de th'Arifque et de l'Espagne' (1848); 'Al Makkari, analectes sur l'histoire et la littérature des Arabes d'Espagne' (1855–61); 'Het Islamisme' (1863); and 'De Israe1iten te Mekka' (1864).

DRAA, drā, or WADY DRAA, a river of Morocco, rising in the Atlas Mountains and flowing southward till it penetrates the Anti-Atlas at Shagherun. Beyond this point it flows sluggishly through the desert, at first south and then west, forming the shallow lagoon El Debba.

DRACÉNA, drah'sē'na, a genus of tropical plants of the family Liliaceae. The species are characterized by woody stems, which bear numerous sword-shaped leaves crowded together near the summit, and bright-green, white, or yellowish, flowers in panicles or heads. A few of the species are cultivated in bothouses, for their attractively colored foliage. The most notable species is probably D. draco, the dragon-tree of the Canary Islands, which attains a height of from 30 to 50 feet, though in one notable specimen, at Teneriffe, the height was 70 feet, and the diameter of its trunk was more than 5 feet. This tree was treated as sacred, and the symbol visited the island. When this tree was destroyed by a storm in 1868 it was estimated to be about 6,000 years old. It was not only an object of worship, but its sanctity was inside its own trunk.

DRACENFELS, dra'rin-fels, the castled crag of Drachenfels, as Byron calls it, one of the hills known as the Siebengebirge, in the government of Cologne, in Rhenish Prussia, about eight miles southeast of Bonn. It is the most remarkable of the group, which are all evidently volcanic: rises about 900 feet above the Rhine, and is crowned by the old castle of Drachenfels, commanding a magnificient view. It takes its name (Dragon Rock) from the legend of a dragon which occupied a cavern in it, and was slain by Siegfried, the hero of the Nibelungenlied.

DRACHMA, drak'ma, the unit of weight and of money among the ancient Greeks, both as a weight and a coin contained six oboli, and was itself the one hundredth part of a mina, and the six thousandth part of a talent. The weight of the Attic drachma was 6.75 grains, or English troy weight, and the Attic talent 703 pounds. There were several other kinds of drachma and
talent in use: those of Eigion were the heaviest. Whenever no particular kind is designated, the Attic talent is meant. The drachma was the principal Greek coin. It was of silver, and was divided, like the weight, into six oboloi (silver). The tetradrachma (of four drachmas) was called the stater, but other coins also bore this name. These coins differed much in value in the different states of Greece and at different periods. The Attic drachma and stater occur most frequently. The value of the former may be stated as 17 cents, of the latter at about 80 cents. The drachma was regarded as equivalent to the Roman denarius. Besides these silver coins there were also the stater (or dirachm) of gold, equal in value to about $5.63. In the time of Solon a sheep could be bought for one drachma, an ox for five. In the time of Demosthenes a fat ox cost 80 drachmas, a lamb 10. The drachma has an important position in the coinage and currency of modern Greece, being the standard unit of reckoning, and a silver coin equivalent to the French franc.

DRACHMAN, Bernard, American rabbi: b. New York, 27 June 1861. He was educated at Columbia University and the University of Breslau and has been professor of biblical exegesis and Hebrew philosophy in the Jewish Theological Seminary of New York from 1887, and rabbi of the congregation Zichron Ephraim in that city from 1889. From 1902 to 1906 he was professor of Bible and Rabbinical codes. In 1909 he became rabbi of the congregation Ohab Zedek. He is a staunch supporter of orthodox Judaism and is the author of 'The Place and Importance of Jehovah in the History of Hebrew Grammar' (1885); 'From the Heart of Israel: Jewish Tales and Types' (1905); a translation into English (1899) of S. R. Hirsch's German work 'The 19 Lectures of Ben Uziel.'

DRACHMANN, drām’mán, Holger Henrik Herholdt, Danish poet, painter and novelist: b. Copenhagen, 9 Oct. 1846; d. 14 Jan. 1908. He published about 40 volumes, in narrative and lyric poetry, drama and prose fiction. In poetry as in painting his forte was the sea, and he excels in descriptions of seafaring folk. Radical in his youth, he was intensely nationalist in his later years. He published five volumes of poetry and was also a notable playwright. His novels include 'Condemned' (1890); 'Once Upon a Time'; 'Paul and Virginia' (1879); and 'Sea Tales.' Drachmann visited the United States in 1898.

DRAKO, drā’kō, Athenian legislator: fl. about 621 a.c. His name has become proverbial for severity, and his laws were hence said to have been written in blood, not ink. It seems, however, probable that Draco only put in writing the laws of his time and nation, which punished petty theft, and even idleness, no less severely than the robber of the temples and the murderer. Subsequently years afterward, Solon was commissioned to draw up a new code. Tradition relates that Draco, on his appearance in the theatre at Eigion, was suffocated by an enthusiastic audience, who according to their custom, threw their garments and caps upon him.

DRAKAON, a bright star nearly in the solstitial colure, was used in determining the coefficient of aberration of the fixed stars.

DRACOCEPHALUM, a genus of odoriferous annual or perennial herbs, of the mint family (Menthaeae), numbering about 40 species, natives of the northern hemisphere. The name is Greek for dragonhead, which is a reference to the resemblance of the flowers to the head of the dragons of myth. Of the species comprised in the genus, but two are American. American Dragonhead (D. pavoniflorum) is an annual, one to two feet high, with light blue flowers, common in stony soil from Ontario, through northern New York, to Minnesota and Alaska, and in the Rocky Mountain region to Mexico. The other species is found only in a restricted area in Nebraska and northern Mexico. It was introduced from Europe and is listed as Moldavian dragonhead.

DRAFT, a written order for the payment of a sum of money addressed to some person who holds money in trust, or who acts in the capacity of agent or servant of the drawer. Documents of this kind often pass between one department of a bank or mercantile house and some other department, and are distinguished from bills of exchange and checks, in being drawn upon a debtor. One reason for using them is the convenience in keeping accounts and having vouchers for payments. See BANKS AND BANKING — COMMERCIAL PAPER.

DRAFT RIOTS, in New York, July 1863, were serious disturbances caused by the military conscription or drafts (q.v.) of that year, which met with a storm of denunciation from Democratic leaders and followers alike. The former proclaimed it unconstitutional, because military service was due only to the State; dangerous, as liable to absorb all the State militia and civil officials into the Federal service; and partisan in execution, the quotas having been gerrymandered to throw an enormous disproportion on the Democratic districts. This last was true, but was the work of subordinates, and was corrected by the War Department on protest. The rank and file executed it as a personal business, shifting the burden from the rich, to whom $300 was a trifle, to the poor, who could pay only with their blood, and were least able to leave their families. The only answers were the nation's need, the law of nature that all burdens fall thus on the poor, and the government's wages, bounties and pensions which strained it to relieve distress. But the legal and party arguments reinforced the class hatred and anti-war prejudice, and Gov. Horatio Seymour, the head of the Democratic party, sent his adjutant-general to Washington about 10 July to urge the postponement of the draft, on the ground of this popular excitement. The drafting began, however, on Saturday morning, 11 July, at each provost-marshall's or assistant's office; which in the ninth district, a Democratic stronghold, was at Third Avenue and 46th street. The method was to place the enrolled names in a wheel and turn it, the first names coming out up to the assigned quota being the conscripts. A large crowd assembled, but made no disturbance; and the names drawn were published in the Sunday papers. Many of the poorer ones, incited and organized by political leaders, met secretly and formed associations
to resist; and on Monday morning, parties went around the shops compelling workmen to leave their tasks and join the procession. The drawing was resumed at 10 A.M.; in a few minutes several paving-stones, one after another, were hurled through the windows into the midst of the crowd, smashing the furniture; and in another moment the mob broke in the door, wrecked everything inside but the wheel, beat one of the deputies into insensibility, and set fire to the building. Two buildings above it were burned. The whole block was shortly in flames; and when the firemen arrived, the hydrants were denied them till the conflagration was past help. The militia were nearly all in Pennsylvania, where Gettysburg had lately been fought, and the few garrison regulars and marines were under different commands; so that the Federal General Wool, the State General Sanford and Mayor Odpyke held separate authority with no deciding power. The mob increased, and began wreaking vengeance on political opponents and their property, burning and pillaging; and thieves and toughs, seeing their opportunity, flocked out and joined. Fifty marines, sent to disperse the 46th street mob, fired blank cartridge, and were instantly routed and chased far along the streets by the mobs, men, women and children. This changed the mob's attitude from defense to aggression; a squad of police was set upon and one killed. Then their wrath was turned on the negroes, as the "Black Republican War." These were beaten and stoned to death, and hanged to lamp-posts; hotels and restaurants having colored servants were invaded in search of them, and the movable smashed or stolen. In the afternoon the Colored Half-Orphan Asylum, with 700 to 800 children and nurses, was broken into, gutted and set on fire, the inmates being driven into the street while the women of the mob carried off the furniture. The armory on Second Avenue was broken open with stones and sledge-hammers to secure the arms, the police who bravely defended it driven out, and it was fired. All business and trade were suspended. In the lower part of the city the office of the Tribune, the chief Republican paper, edited by the abolitionist, Horace Greeley, was attacked and about to be set on fire, but the police drove out the rioters. The entire block on Broadway which held the draft office was burned, with the provost-marshal's and the postmaster's private residences, a station-house, a hotel whose proprietor refused liquor to the mob, and other dwellings; and other houses were burned in the upper part. All that day and night the city was protected only by the police, many of whom lost their lives. At midnight a heavy rain dispersed the rioters for the time.

Tuesday was far worse, though the forces of order had begun to gather. The mobs too had swollen so that an army was needed; when hands were dispersed by the military, they gathered elsewhere and continued murder and despoliation of negroes. Probably had been murdered Monday; far more perished Tuesday, and whole negro neighborhoods were burned out. Lieutenant Wood with 150 regulars from Fort Lafayette fired hall cartridge into a mob, killed a dozen and broke it up, but no officer could be ubiquitous. Colonel O'Brien, who had dispersed a mob, sprained his ankle and stepped into a drug store; ordered out by the terrified proprietor, the mob murdered him, and dragged his carcass up and down the street, mutilating and tearing on it. Governor Seymour issued a proclamation summoning the rioters to disperse, but it was so insufficient that he was forced to issue another putting the city under martial law. Meantime the Secretary of War had ordered home the militia regiments in Pennsylvania to the way back to New York by Wednesday; the draft was announced as temporarily suspended; and the mob was so thoroughly beaten and cowed on Wednesday afternoon that cavalry regiments paraded the city at night without meeting any resistance. Isolated gangs prowled about even on Thursday, but they were mere criminals and soon sunk away. The property-holders had formed associations for self-protection, and the danger was mainly at an end by Thursday morning. The losses of these four days were never known. The bills of mortality for the week were 450 above the average; 90 deaths from gunshot wounds were reported; and it was said that many rioters were secretly buried by their friends. Claims for property damage were filed to over $2,000,000; though the rioters, many of whom had less than $200,000 was paid. The draft was resumed on 19 August, and ended on the 28th. Consult 'Official Record (XXVII, Pt. 2, 1889); Fry's 'New York and the Conspicuation of the 1863,' (1863); Greeley's 'American Conflict' (Vol. II, 1866).

DRAFTS or MILITARY CONSCRIPTIONS, in the history of the United States, aside from the drafts of the Confederate States of 18 July 1863, and the sweeping one of 17 Feb. 1864, which was in action all through the latter part of the Civil War, are those of 1814, 1863 and 1917. In the Revolution, the regular armies of the United States were recruited by drafts from the State militias (see CONTINGENTS), but these transfers were made by requisitions on the States, who furnished and officered their quotas in such bodies as they chose. The Constitution (Art. I, Sec. 8) confers twofold power to "raise armies," and to "organize and arm the militia." Knox in 1790, and Jefferson in several annual messages urged a thorough plan for the latter, classifying the militia independently of the State organizations, and drafting one from each section as needed; but jealousy of the States' rights over the militia was too strong. In the War of 1812, requisition was made on States for militia to replace coast garrisons, denuded for invasion of Canada, but Connecticut and Massachusetts refused on the ground that as this country was not invaded, there was no constitutional right to summon the militia. When this excuse failed, others were found; in 1813 a militia organization bill passed the House, but failed in the Senate. In 1814 the increasing exigencies forced a bill through Congress (Senate 10 Nov.; House 9 Dec.), on suggestion of the New York and Virginia legislatures; but even its Democratic supporters doubted its being either constitutional or useful, and the House loaded it with an amendment on which the Senate disagreed, as doubtless intended. The war ended shortly after. In the Civil War, volunteering filled the armies during the first two years, the quotas being apportioned by congressional dis-
DRAGO DOCTRINE

tricts; then the numbers grew scant, and on 3 March 1863 the "Conscription Bill" passed. The intent was the old plan of militia classification and draft, but the Democrats held it unconstitutional, and their arguments were unanswerable. The Republicans therefore fell back on the broad power to "raise armies," as implying the right to fix the method of so doing; this in turn was intolerable, and upheld by the Supreme Court. The State militias were ignored. All able-bodied citizens between 18 and 45 were summoned to the national defense, and were to be enrolled from 1 April on by the provost-marshal; quotas under future calls not filled by volunteers after a certain period were to be made good by lot from the enrolment; conscripts could furnish substitutes or buy exemption for $300; all persons refusing obedience to be punishable as deserters. Early in May 300,000 more troops were called for; many Eastern cities were already in arrears, and the poorer classes, especially those politically hostile to the war, grew very bitter at the real hardships and the real and alleged unfairness of the conscription. The invasion of Pennsylvania by Lee had drawn the Northern State militia thither in June and early July, and the mob in several places undertook to resist the draft. The police easily put down the rising except in New York, where the great numbers of the rioters, reinforced by the criminal classes, gave the city into their hands for two days, 13 and 14 July, and they were not suppressed till the 15th. (See DRAFT RIOTS). The drafts interrupted by these disorders were resumed and carried through. But their chief value was in goading the districts into filling the quotas by volunteers; however legal, they were incredibly scanty of direct results. The commutations were toward a third of the whole, the exemptions nearly a half, and the number held and their substitutes together were but a sixth to a fifth. Also, many of the substitutes turned deserters or "bounty-jumpers." It has been estimated that of over 3,000,000 enrolled, less than 100,000 men were obtained by the drafts.

In 1917, upon the entry of the United States into the European War, it was decided by the Administration to have recourse to a draft for the raising of a large Army. The bill authorizing this was passed on the 28th of April, with remarkably little opposition. The draft applied to all citizens and those with first papers between 21 and 31, inclusive. No exemption by purchase nor by substitute was allowed, and clergy, diocesan students, and those belonging to recognized sects forbidden military service were exempted. Registration took place on the 5th of June. There was very little resistance shown toward the draft, and the resistance which occurred was readily controlled. The order of service was determined by lot. The men began to go to camp in October. In December those who had registered were made to fill out questionnaires that they might be more readily classified for service. Married men were granted the privilege of being drafted later than single men, and other similar delays were allowed for those concerned in necessary occupations. Throughout 1918 other great movements of men continued toward the camps. On the whole, the so-called National army recruited by the draft was a marked success in contrast to the unfortunate experiences of Civil War times. See CONSCRIPTION.

DRAGO, drá̄'go, Geoffrey, English publicist: b. 1860. He was educated at Eton and Oxford and is a barrister of Lincoln's Inn and the Middle Temple, but has never practised. He was Secretary of the Royal Commission on Labor, (1891-94), and Unionist M.P. for Bushey (1952-1900). He has published "Criminal Code of German Empire" (1885); "Cyril," a novel (1889); "Eton and the Empire" (1890); "Foreign Reports of Royal Commission on Labor"; "Eton and the Labor Question" (1894); "The Unemployed" (1894); "The Aged Poor" (1895); "The Labor Problem" (1896); "Trade Unions" (1905); "The Imperial Organization of Trade" (1911); "The State and the Poor" (1914); etc.

DRAGO, Luis María, Argentine diplomat, jurist, and publicist: b. Buenos Aires, 6 May 1859, and educated at the university in that city. He entered the profession of the law, became a judge in the native court, and was appointed by President Roca as Foreign Minister under President Roca. As Foreign Minister, he sent to the Argentine Minister in Washington (1902) instructions that embodied a principle, advocated in his own country and through the publications of Carlos Calvo (q.v.), which became known as the Drago Doctrine (q.v.). He was one of the Argentine delegates to the second peace conference; one of the arbitrators nominated by agreement between the United States and Great Britain for the hearing of differences in regard to the North Atlantic coast fisheries; member of the Permanent Court of Arbitration at The Hague, his works are "La Literatura del slang"; "La Idea del Derecho" (with D. Martínez); "Colección de Fallos en Materia Civil y Comercial"; "Los Hombres de Prensa"; "Cobro Coeractivo de Deudas Púlicas"; "La República Argentina: il caso de Venezuela"; "Les Emprunts d'Etat et leur Relations avec la Politique Internationale".

DRAGO DOCTRINE, the principle laid down by a renowned Latin-American publicist, Luis María Drago (q.v.), in line with the teachings of his predecessor Carlos Calvo (q.v.), the meaning of which was and is substantially that "no state ought to be invaded for the collection of money claims" (Albert Bushnell Hart, "Cyclopedia of American Government," Vol. II, "Monroe Doctrine" — The Drago Doctrine). This Drago Doctrine, which was pressed upon the United States in the Pan-American Congresses of 1890, 1901, 1906 and 1910, received President Roosevelt's formal adherence; and, as Professor Hart says, "European nations reasonably look to the United States to find some way of securing reparation of their injuries and claims, so long as this country [the United States] holds it as part of the Monroe Doctrine that such reparation may not be directly sought. Such a use of the Monroe Doctrine would make the United States responsible for the good behavior of all the Latin-American countries. This question was much accentuated from 1911 to 1914 by revolutions in Mexico, involving the property, lives and interests of citizens of many countries, and the United States, by extorting other powers, made itself responsible for securing good order in Mexico."
DRAGOMAN, the general name given in Levant countries to an interpreter, or to a guide to foreigners. The Dragoman is, however, much more than the Italian cicerone, or the French commissionnaire. It is actually a man of wide and encyclopedic learning. In Syria, for example, he is a contractor for the management of expeditions, and undertakes to solve all the difficulties that arise between the traveler and the natives. The dragomans attached to embassies have a special degree. A Dragoman is a term sometimes given to student interpreters preparing for the British consular service in the Orient. The dragoman to the Porte, through whom diplomatic negotiations with foreign powers were formerly carried on, used to be a very important dignitary.

DRAGOMANOV, dra'gô-mâ'nôv, Mikhail Petrovitch, Russian author; b. Hadatchy, Poltava, 1841; d. 1895. In 1865 he became lecturer at the University of Kiev and was professor of general history there until 1876. He criticized the educational system introduced by Dmitri Tolstoi because of its being based on German classic models. Dragomonov refused to resign when his Ukrainophil activity brought him into conflict with the authorities. Alexander II appointed a commission which found him guilty and he was forbidden to reside in Little Russia or to engage in literary pursuits. Other measures of repression were at the same time enforced against the Ukrainians. Dragomonov went to Geneva, and in 1888 was appointed professorial history at the University of Sofia, Bulgaria. He stood forth in his generation as the foe of autocracy and oppression in every form; he advocated a complete reorganization of Russia along the line of federated states, with every nation securing equal representation. His literary and historical works deal mainly with Little Russia. He published 'The Historical Songs of Little Russia,' with Professor Antonovitch (1874); 'The Question of Little Russian Literature' (1876); a popular series of pamphlets in the dialect of Little Russia: 'Homada (the Commune)', a periodical (1878-82); 'Le tyrannicide en Russie' (Geneva 1870); 'La Pologne historique et la démocratie moscovite' (1881); 'The Political Socialization of the Ukrainian Language in the Eighteenth and Nineteenth Centuries' (London 1883-85).

DRAGOMIROV, dra'gô-mê'rov, Mikhail Ivanovitch, Russian army officer; b. 1830; d. 1905. He was educated at the War Academy in Saint Petersburg, and abroad, and in 1858 was appointed professor of tactics there. His lectures attracted considerable attention. He participated as military attaché in the Austro-Prussian War and in 1869 was made major-general and chief of the general staff at Kiev. He commanded the advance guard in the war with Turkey in 1877-78, and distinguished himself at the crossing of the Danube at Sis-tova. He was wounded in the fighting at the Shipka Pass and was obliged to retire from active service. Later he was appointed director of the War Academy, where his influence on military training and organization was wholesome and widely extended. He wrote 'Lectures on Tactics' (1864); 'The Austro-Prussian War' (1866); 'Discipline and Subordination' (1894); a translation of the Novel 'War and Peace' (1895); 'The French Soldier' (1897); 'War is an Inevitable Evil' (1897); 'Joan of Arc' (1898); 'Duels' (1900).

DRAGON, a genus of arboreal lizards, of which the most familiar is Draco volans. The general appearance is quite distinctive. The nuchal and neck muscles are particularly well developed, and the skin of the sides on the prolonged posterior ribs. A parachute is thus formed which enables the dragon to take rapid swoops from branch to branch. The tail is very long; the skin of the eyes is loose and wattle-like. The colors are particularly brilliant. There are several species inhabitants of the East Indies, not including Ceylon. The term dragon has also been applied in modern times to a large lizard (Tharchis draco) found in Brazil and Guiana. It attains a length of three feet, most of which goes to the tail. Tejus and Ameiva are allied genera.

DRAGON. This mythological monster is often confused with the equally fabulous griffin. A distinguishing feature is the characteristic bat wings (with ribs and web) of the former while the griffin has none. With its supposed terrible fighting powers—having scaled armor and breathing flames—it is not surprising that the ancient Greeks and Romans utilized its figure as expressive of power. The Roman armies termed their standard bearers draco, and they carried this animal as an ensign. But Meyrick says Trajan adopted it from the Dacians, after their defeat. The Grecian dragon (termed hydra) was specially formidable from its having seven ferocious heads. The dragon was a Celtic symbol of sovereignty and figured in the English standard from pagan times to the reign of Henry VII. It is found as a device on some of the knights' shields in the Bayeux tapestry. In the early part of the 17th century a certain short musket which was hooked to a swivel attached to the soldier's belt was so termed, because a dragon's head formed the muzzle. Such soldiers were termed dragoons. In medieval alchemy the dragon was the emblem of Mercury, hence the beast figured among the signs found on the chemist's and apothecary's drug-pots. A stuffed crocodile is seen hanging from the ceiling of the drug shops in old pictures; it did service for the fictitious reptile. In astronomy this animal (as Draco) figures in the northern constellation.

In Byzantine art the dragon was the personification of evil—public calamity, such as pest, famine, etc. In Christian archaeology the dragon has a very active presence. The great dragon, Gargouille, lived in the Seine and ravaged Rouen. It was slain by Saint Romulus in the 7th century. The French word gargouille means waterspout, hence the spouts draining off the water from the walls of churches and large edifices were usually in the decorative form of an open-mouthed dragon. Various races and countries have their special dragon and dragon-slayer legends. The French dragon of Languedoc, Tarasque-gargouille, was slain by Saint Martha, and the city of Tarascon is said to have derived its name from the event. The most favored dragon-slaying legend of the artists, past and present, is that of Saint George (the English patron saint slaying the dragon). Menelli, Trintoretto, Pisanello, Domenichino, depicted this subject (paintings
are in the London National Gallery), and it is found carved and in stained glass in a great number of the old churches. Another similar picture frequently seen is that of the conflict between the Greek hero Michael and the dragonflies, which is often depicted as having the head of a camel, the horns of a deer, the eyes of a rabbit, ears of a cow, neck of a snake, belly of a frog, scales of a carp, claws of a hawk and palm of a tiger. This marvelous creation has whiskers on each side of its mouth, also a beard (in which is often depicted a bright pearl). The sea-dragon appears in waterspouts and the Chinese fishermen worship him in fear (Williams). Mayer accounts for four Chinese dragons: *(1) The Celestial dragon, which guards the mansions of the gods and supports them so that they do not fall. (2) The Spiritual Dragon, which causes the winds to blow and produces rain for the benefit of mankind. (3) The Dragon of the Earth, that marks out the courses of rivers and streams. (4) The Dragon of the Hidden Treasures, which watches over the wealth concealed from mortals.*

A dragon is the emblem of the Emperor of China, and has five claws (others four), and is forbidden to be represented except on imperial goods. As the dragon is one of the chief decorative features of Chinese arts, this latter fact is of value to connoisseurs, since the presence of the five-clawed dragon on bronzes, pottery, tapestry, etc., is proof of the article having been made for the Imperial court.

In the Chinese zodiac the dragon is sign for the month of March.

The Japanese dragon *(rio or tatsu)* while probably, derived from the Chinese, differs from it. It has but three claws, one of which usually supports the speck instead of a pearl. The Japanese dragon is supposed to have the power of rendering itself invisible; it may shrink to silkworm dimensions or increase its size till the universe is covered with its presence. Pictorially illustrated in multitudes of Japanese decorative work the *tatsu* is seen floating among the clouds or rising from stormy waves on the ocean. The Persian dragon has cloven hoofs.

CLEMENT W. COUZER.

**DRAGON, in astronomy, one of the ancient northern constellations, in Latin, Draco. The name is derived from a serpent with several small coils. It appears at a very ancient date to have had wings in the space now occupied by the Little Bear. Fable says that Juno translated to the heavens the dragon which kept the golden apples in the Garden of the Hesperides, and which was slain by Hercules. See Hesperides.**

**In Zoology, a lizard of the oriental genus Draco.**

**DRAGON-FLY, an order of insects, the Odonata, allied the may-flies and ephemeriids, with long, slender bodies, very large mobile heads, immense eyes, short antennae, and two pairs of long, nearly equal wings of a firm and glossy texture, and closely netted with many veins. The mandibles are powerful, the mouth-parts being so fused and solidified as to form a most effective means for catching the small insects upon which dragon-flies feed. The prothorax is small, the meta-thorax and meso-thorax large, and the meso-thorax slopes over the meta-thorax, by which arrangement the spinous legs are thrust forward, so that they project under the body. There, therefore, are unfitted, and are never used, for walking, but as instruments for catching and holding prey or for clinging to plants. The hind body is proportionately longer than in any other group of insects; it has 10 evident segments, the hindmost carrying a pair of stiff unjointed cercopods. The male genital armor is situated on the second abdominal segment—a position unknown in any other insect; and the intromittent organs are separate and extend into the epiphallus ducts, the latter being near the extremity of the abdomen. Therefore, as Howard explains, before copulation the male curves his abdomen around beneath, so that the ninth segment of the abdomen is brought into contact with the second, thus transferring the intromittent organ. The tip of the abdomen of the female is bent around and joins with the underside of the second segment of the male's abdomen, the male frequently grasping the female around the neck with certain appendages at the extremity of his abdomen. This complicated embrace commonly observable where these flies are numerous in midsummer, once obtained is likely to be held during the whole process of egg-laying, even in many cases when the deposition takes place under water. Dragon-flies are semi-aquatic in all their life and habits. The eggs are laid in the stems of submerged plants by some species, which are provided with an instrument for cutting through the bark, each egg being pushed into the cutting as the female moves down the stem. As a rule, however, the eggs are dropped into the water, or washed off by dipping the tip of the abdomen. The number of eggs laid is large, exceeding 100,000 in the case of one species. When the eggs hatch the young immediately begin a life of activity and predation. Molts follow one another rapidly, and the first larval form soon changes into a "nymph," a form equivalent to the pupa stage of other insects, but differing in the fact that activity continues. These young remain under water, have short, broad hinder bodies, walking legs, feelers, and breathe by means of *rectal gills.* They prey upon everything edible, including their own weaker brethren. To assist them in doing this the mouth-parts are modified into an insect-catching trap, forming an innocent-looking mask, within which are concealed grasping organs, ready to be shot out when an unsuspecting little animal creeps too near and the mask is suddenly lifted. When the broad and flattened nymph has become full-grown it crawls out of the water upon some warm rock, where presently its skin splits open and the adult dragon-fly emerges. These changes are easily studied by breeding dragon-flies. The voracity of dragon-flies is notorious. They seize and devour all sorts of insects, including smaller species of their own race, and sometimes moths, butterflies and wasps. Flies
DRAGON ROOT—DRAGON'S BLOOD

form their principal fare, however, and they consume vast quantities of house-flies and mosquitoes, but their service in killing the latter pest is small during the larval stage. They abound, in midsummer, in most parts of the world, and sometimes appear in enormous swarms, millions moving across the country in company; such swarms are the result of various local conditions and are not migrations, properly speaking. The great beauty which most of the species have, glittering in metallic hues and skimming through the sunshine on brilliant, gauzy wings, has made them objects of universal admiration; but this admiration is strangely coupled with a popular fear and superstition toward them. Thus they are commonly known among American children as "devil's darning-needles," and are accused of an intention to sew up the ears of bad boys, or work mischief in the hair of naughty girls. The negroes of the Southern States call them "snake-washers," and say they feed on nurse ailing serpents. In Great Britain, they are known as "horse-stingers," "flying-adders," or "penny-adders," and are believed to carry a poisonous sting in their tails. All these superstitions are calumnies upon harmless and beneficial insects.

About 2,000 species of dragon-flies have been described of which an eighth are peculiar to the United States. The order contains two well-marked groups: the Libellulidae, or dragon-flies proper, and the Agrionidae, demoiselles or damsel-flies, distinguished broadly by the fact that in the former the front wings are dissimilar, and are held horizontally in repose; while in the latter the wings are alike and are held vertically when the insect rests. Another distinguishing feature is the fact that in the Libellulidae the eyes are sessile, sometimes meeting on the top of the head, while in the Agrionidae the eyes are constricted at the base and peduncled. An important subdivision of the Libellulidae, regarded by some as a separate family, is the Aeshnidae, which is characterized by the eyes being on the top of the head. To this group belong many of the largest and most gaudy dragon-flies.

An excellent illustrated account of North American dragon-flies will be found in L. O. Howard's "The Insect Book" (1901), which contains further references. For British species consult Lucas' "Handbook of British Dragon-flies" (1899).

DRAGON ROOT, or GREEN DRAGON (Arisaema dracontium), a plant of the Arum family, occurring in wet woods and along streams, from Maine west to Minnesota and southward to Florida and Texas. The spathe envelops the greenish spadix, the upper part of which tapers into a long, slender appendage, extending beyond the apex of the spathe, sometimes as much as six inches. The corm contains an acid or pungsant sap, which is supposed to possess curative properties, and is much used as a household medicine in the region of its growth.

DRAGONET, the common name of certain fishes of the family Gobiidae. The gemmous dragonet (Callionymus lura), a beautiful fish with a large head and a smooth tapering body, is found in the British seas. See Goby.

DRAGONNADES, drag-ô-nâdâ', the name given to the persecutions directed against the Protestants chiefly in the south of France, during the reign of Louis XIV. They abound, in midsummer, in most parts of the world, and sometimes appear in enormous swarms, millions moving across the country in company; such swarms are the result of various local conditions and are not migrations, properly speaking. The great beauty which most of the species have, glittering in metallic hues and skimming through the sunshine on brilliant, gauzy wings, has made them objects of universal admiration; but this admiration is strangely coupled with a popular fear and superstition toward them. Thus they are commonly known among American children as "devil's darning-needles," and are accused of an intention to sew up the ears of bad boys, or work mischief in the hair of naughty girls. The negroes of the Southern States call them "snake-washers," and say they feed on nurse ailing serpents. In Great Britain, they are known as "horse-stingers," "flying-adders," or "penny-adders," and are believed to carry a poisonous sting in their tails. All these superstitions are calumnies upon harmless and beneficial insects.

The corm contains an acid or pungsant sap, which is supposed to possess curative properties, and is much used as a household medicine in the region of its growth.

DRAGONET, the common name of certain fishes of the family Gobiidae. The gemmous dragonet (Callionymus lura), a beautiful fish with a large head and a smooth tapering body, is found in the British seas. See Goby.

DRAGONNADES, drag-ô-nâdâ', the name given to the persecutions directed against the Protestants chiefly in the south of France, during the reign of Louis XIV. They abound, in midsummer, in most parts of the world, and sometimes appear in enormous swarms, millions moving across the country in company; such swarms are the result of various local conditions and are not migrations, properly speaking. The great beauty which most of the species have, glittering in metallic hues and skimming through the sunshine on brilliant, gauzy wings, has made them objects of universal admiration; but this admiration is strangely coupled with a popular fear and superstition toward them. Thus they are commonly known among American children as "devil's darning-needles," and are accused of an intention to sew up the ears of bad boys, or work mischief in the hair of naughty girls. The negroes of the Southern States call them "snake-washers," and say they feed on nurse ailing serpents. In Great Britain, they are known as "horse-stingers," "flying-adders," or "penny-adders," and are believed to carry a poisonous sting in their tails. All these superstitions are calumnies upon harmless and beneficial insects.

About 2,000 species of dragon-flies have been described of which an eighth are peculiar to the United States. The order contains two well-marked groups: the Libellulidae, or dragon-flies proper, and the Agrionidae, demoiselles or damsel-flies, distinguished broadly by the fact that in the former the front wings are dissimilar, and are held horizontally in repose; while in the latter the wings are alike and are held vertically when the insect rests. Another distinguishing feature is the fact that in the Libellulidae the eyes are sessile, sometimes meeting on the top of the head, while in the Agrionidae the eyes are constricted at the base and peduncled. An important subdivision of the Libellulidae, regarded by some as a separate family, is the Aeshnidae, which is characterized by the eyes being on the top of the head. To this group belong many of the largest and most gaudy dragon-flies.

An excellent illustrated account of North American dragon-flies will be found in L. O. Howard's "The Insect Book" (1901), which contains further references. For British species consult Lucas' "Handbook of British Dragon-flies" (1899).

DRAGON ROOT, or GREEN DRAGON (Arisaema dracontium), a plant of the Arum family, occurring in wet woods and along streams, from Maine west to Minnesota and southward to Florida and Texas. The spathe envelops the greenish spadix, the upper part of which tapers into a long, slender appendage, extending beyond the apex of the spathe, sometimes as much as six inches. The corm contains an acid or pungsant sap, which is supposed to possess curative properties, and is much used as a household medicine in the region of its growth.

DRAGONET, the common name of certain fishes of the family Gobiidae. The gemmous dragonet (Callionymus lura), a beautiful fish with a large head and a smooth tapering body, is found in the British seas. See Goby.
been about 5,000 or 6,000 years old. An astringent resin, obtained from the Eucalyptus resinifera of Australia, sometimes gets the name of dragon's blood in that country. Consult The Geographic Magazine (April 1918).

DRAGON'S MOUTHS, a strait on the coast of Venezuela, running between the Island of Trinidad and the Paria Peninsula, and leading into the Gulf of Paria.

DRAGOON, a mounted soldier, first introduced into the French army about 1585, and trained originally to fight chiefly on horseback, but, if necessary, on foot also, and mounted, armed, and exercised accordingly. Experience proving that they did not answer the end designed, they were hardly ever used in infantry service latterly, and now form a useful kind of cavalry. The term dragoon probably comes from dragon, a short species of caribine carried in 1554, on the muzzle of which, from the old fable that the dragon spouts fire, the head of the monster was wrought. The first dragoon regiment in the army was the first Royal, the oldest cavalry of the line regiment in the army, raised in 1661 to garrison Tangier, Morocco. There are at present in the British army three regiments of dragoons, and seven of dragoon guards, all being mounted and accoutered more after the fashion of heavy (or medium) cavalry than the hussar regiments. The three dragoon regiments are the 1st (Royal) Dragoons, the 2d Dragoons (Royal Scots Greys), organized 1685), and the 6th (Inniskilling) Dragoons. Both dragoons and dragoon guards are armed with caribine and sabre, and have metal helmets (except the Scots Greys). Consult White, C., 'Our Regiments' (London 1915).

DRAGOON BIRD. See UMBRELLA-BIRD.

DRAGOUMIS, Stephan, Greek statesman: b. Athens, 1842. He was educated in Athens and Paris and in 1879 became a member of the Lower House of Parliament at Athens. He was Foreign Minister in 1886-90 and again in 1892. In February 1910 he became Premier, but his cabinet was overthrown the following October. During his term of Premier he calmed the Military League and succeeded in having convoked a National Assembly to deal with important public issues. He was opposed to the movement to have Greece openly allied with the Thessalians in their difficulties with Turkey. In 1912 Dragoumis was sent to Crete to take over the government of that island.

DRAIGUIGNAN, drä-gân-yaan, France, town, capital of the department of Var; 41 miles northeast of Toulon. It was founded in the 5th century. It contains a prefecture, courthouse, hospital, a fine museum, zoological gardens and a public library. The principal manufactures are woolens, leather, hosiers, silks, soap, lumber, brandy, oil and earthenware. Pop. about 10,000.

DRAHS, drâms, August, American Congregational clergyman: b. Yarmen, Pomerania, 4 March 1849. His parents emigrated to the United States in 1856. His father's education was received in the public schools of Geneva, Ill. In 1863, he enlisted in the 17th Illinois cavalry and served to the end of the war. He afterward studied at Wheaton College, and the Garrett Biblical Institute at Evanston, Illinois, and entered the Congregational ministry at Oakland, California, 1878. He served as pastor in Martinez, Cal., and was for 18 years resident chaplain of San Quentin prison. He is pastor of the First Congregational Church of Hilo, Hawaii. He has written 'The Criminal: a scientific study; with an introduction by C. Lombroso' (New York 1900).

DRAIN-PIPE, a pipe used in draining, commonly of tile, but sometimes of wood or metal. See TUNES.

DRAINAGE, in agriculture, a method of improving the soil by withdrawing the water from it. Though practised by the Romans, and though the value of drainage was expounded by Walter Blithe in the middle of the 17th century, it was not till after the middle of the 18th century that the importance of drainage began to be understood in Great Britain. The public attention is said to have been then excited by the practice of Elkington, a farmer of Warwickshire, England. But it was James Smith of Deasnton, Perthshire, Scotland, who in 1783 led the way in modern practice of thorough draining.

The successful practice of draining in a great measure depends on a proper knowledge of the various strata of earth; on their composition, as well as of their relative degree of porosity or capability of admitting or rejecting the passage of water through them and likewise of the modes in which water is formed and conducted from the high or hilly situations to the low or level grounds. In whatever way the hills or elevations that present themselves on the surface of the globe were originally formed, it has been clearly shown, by sinking large pits and digging into them, that they are mostly composed of materials lying in a stratified order, and in oblique or slanting directions downwards. Some of these strata, from their nature and properties, are capable of admitting water to percolate or pass through them, while others do not allow it any passage, but force it to run or filtrate along their surfaces without penetrating them in any degree, and in that way conduct it to the more level grounds below. There it becomes obstructed or dammed up by meeting with impervious materials of some kind or other, by which it is readily forced up into the superincumbent layers, where they happen to be open and porous, soon rendering them too wet for the purposes of agriculture; but where they are of a more tenacious and impenetrable quality, they only become gradually softened by the stagnant water below them; by which the surface of the ground is, however, rendered equally moist and swampy, though somewhat more slowly than in the former case.

Where grounds are in a great measure flat, and without degrees of elevation sufficient to permit those over-proportions of water that may have come upon them from the higher and more elevated grounds to pass readily away and be carried off, and where the soils of the land are composed or constituted of such materials as are liable to admit and retain the excesses of moisture, they are exposed to much injury and inconvenience from the retention and stagnation of water. Such lands consequently require artificial means to drain and render them capable of affording good crops, whether of grain or grass.
DRAINAGE

Wetness of land, so far as it respects agriculture and is an object of draining, may generally depend on the two following causes:—first, on the water which is formed and collected on or in the hills or higher grounds, filtrating and sliding down among some of the different beds of porous materials that lie immediately upon the impervious strata, forming springs below ground flowing over the surface, or stagnating underneath it; and, secondly, on rain or other water becoming stagnant on the surface, from the retentive nature of the soil or surface materials, and the particular nature of the situation of the ground. The particular wetness which shows itself in different situations, the forms of bogs, swamps and morasses, for the most part proceeds from the first of these causes; but that superficial wetness which takes place in the stiff, tenacious, clayey soils, with little inclination of surface, generally originates from the latter.

Drains.—The drains used in land drainage may be divided into two classes—open and covered drains. These again may each be subdivided into drains intended merely to act as water-courses and drains which, in addition to acting as water-courses, are also intended to carry off the surplus water from the land through which they pass.

Open Drains.—The rudest forms of open drains are the deep furrows, lying between narrow, high-backed ridges, which are still to be found in some parts of the country with their accompanying water-furrows ("gaw" furrows or "grips") for discharging their streams. These are only meant to carry off the surplus water after the soil is completely saturated. In doing so, water is also carried along with it all the best portions of the soil and of the manure which may have been spread upon its surface.

Open Drains as Water-courses.—The ordinary ditch (dike) is the common form of this kind of drain, which, though necessary to a certain extent, ought, nevertheless, to be sparingly seen where a perfect system of drainage has been effected. They are constant sources of annoyance and expense from their sides crumbling in, the numerous weeds which they harbor and the thorough scouring which they require every year. Open drains are important in the early stages of draining bogs; but after the bog has become consolidated the greater portion of them may be dispensed with and their places supplied by large covered drains.

Open Drains for Collecting Water from the Land through which they pass (Sheep-drains).—These are employed in drying the surface of mountain pastures, where a more expensive and perfect system of drainage would not yield an adequate return for the outlay. They consist of trenches of 12 or 16 inches in depth and 18 in width, placed so as to intercept all the water which may flow from portions of land above them. They are opened at intervals in a direction nearly transverse to the line of the slope and should have sufficient inclination to keep the water flowing toward the mains or leaders. These latter should be cut in the hollows or in such other places as will permit the small drains or feeders to empty themselves most readily into them, and be made to discharge into the nearest water-courses.

Covered Drains.—We now come to the consideration of the more important description of drainage—the removal of water by means of covered drains. The simplest of all forms of these are what are called mole-drains, and they are formed by means of a machine called the mole-plough. This machine consists of a wrought-iron frame on four wheels, the front pair being arranged as a chain steering-axle. A coulter with pointed sock, capable of being raised and lowered to regulate the depth of the drain, is attached to the frame. The "mole," an oval piece of iron three and one-half inches in diameter, follows the sock, to which it is attached by a short chain. The track which the mole leaves in the ground is the water channel. This machine is dragged through the soft clay, which is the only kind of land on which it can be used with propriety, by means of a windlass on the fore end of the frame and a double length of wire-rope wound by an engine on the higher part of the field. A team of horses returns it to the lower side, out of work.

Wedge-drain.—The wedge-drain, like the mole-drain, is merely a channel formed in the subsoil, and it can only be used in pasture lands. In forming wedge-drains, the mole, with the turf attached, is laid on one side, and the earth removed from the remainder of the trench is laid on the other. The last spade that is used is very narrow, and tapers rapidly, so as to form a narrow wedge-shaped cavity for the bottom of the trench. The turf first removed is then cut into a wedge, so much larger than the size of the lower part of the drain that, when rammed into it with the grassy side underneath, it leaves a vacant space somewhat triangular in shape in the bottom of six or eight inches in depth.

Permanent drains are of two kinds, stone and tile drains.

Stone-drains.—These are either formed on the plan of open culverts of various forms, or of small stones laid in a cement or other potting quantity to permit a free and speedy filtration of the water through them. As a specimen of the former of these, we may instance the box-drain, which is formed of flat stones neatly arranged in the bottom of the trench. The largest and flattest stones are used in laying the bottom, smaller ones are placed on the sides, the whole forming an open tube. The second description of stone-drains, generally known as the broken-stone or rubble drain, is not so thoroughly effective as the first.

Tile-drains or Sewer-pipe drains.—Of all the materials which have yet been brought forward for forming the conduits of drains, none are so well fitted for the purpose as tiles or pipes of burnt clay. Draining tiles, especially those in the form of pipes, possess all the qualities which are required in the formation of drains, affording a free ingress to water, while they effectually exclude vermin, earth, and other injurious substances. When first introduced they were of clumsy construction, and being handmade, sold at a high price. They are now made of ordinary clay and vitrified clay to resist the moisture, and also of concrete. The vitrified are most durable but the concrete or cement pipe is largely used; the best form appears to be the cylinder. Good pipes are straight, smooth and free from flaws, and when struck should
ring clearly. Durability is shown if the wet pipe will dry quickly before a hot fire without crumbling. Where a sudden descent occurs in the course of a drain, or where there is a running sand or a boggy place, pipes of one size should either be entirely sheathed in larger ones, or they should be furnished with collars. These collars are merely short sections of pipes of such a size as to fit upon smaller ones, by which means other ones may be joined end to end as to prevent them from slipping down past each other.

The drawing off of the pent-up waters which are the sources of springs is a department of draining which requires a considerable knowledge of the different varieties of strata. In the laying out of drains, the first point to be determined is the place of outfall, which should always afford a free and clear outlet to the drains, and must necessarily be at the lowest point of the land to be drained. This should be ascertained by a leveling instrument; and where a large extent of work is to be done, a competent surveyor should always be employed. A simple form of level for this purpose is a length of ordinary garden hose, with a glass tube in each end of it. In each end of the hose the height in the two end tubes will be equal. Two persons with such a level can easily mark desired heights on a row of stakes, and so get any desired inclination. The outfalls should be as few as possible, and each one should be carefully set in brickwork and covered by a grid hinged at the top to prevent the ingress of rats and moles, but capable of giving way to a sudden rush of water from drains above. The next point to be determined is the water level or water table. This may be ascertained by digging test holes in different parts of the field and noticing the height to which the water rises in them. In an undulating field the height will vary in different places, but the knowledge gained by means of the test holes shows the nature of the soil and subsoil and will indicate the depth of draining required. In general it will be found that in clay land the drains should be shallow and close together, and in sandy or light land deeper and wider apart; the looser nature of the lighter soil permits, the height of the soil and subsoil, and also the amount of water which may be allowed to drain from a wider area.

Drains in arable land must be beyond the influence of agricultural implements; not only out of the reach of plough or cultivator, but too deep to be displaced by their passing weight. Less than two feet six inches from the surface is unsafe, except in very stiff clay pasture land which is never disturbed. The depths usually adopted in practice for the various classes of soils are as follows:

- **Suff day**: 4 ft. 6 in. to 3 ft.
- **Medium**: 3 ft. 6 in. to 6 ft.
- **Light soils**: 3 ft. 6 in. to 4 ft. 6 in.

As to the distance apart, experience has established a rule that in clay soils a drain will drain an area of from 5 to 6 times its depth, in medium soils 9 to 12 times, and on light soils 8 to 10 times its depth. Thus 3-foot drains in the first case might be 15 feet apart, in the second 24 feet, and in the third 40 feet apart. Sub mains may be necessary in an undulating field and in all cases they are desirable where the minor drains would otherwise be more than 10 chains in length. The rate of fall of any drain must not be less than 1 in 200. All drains should be kept as far as possible from the roots of trees, and curves are to be avoided, except at the junction of minor with main drains or sub mains, when the junction must form an acute angle, the smaller drain curving toward the larger drain and entering it from above. Two minor drains must not enter a large drain opposite to each other, for the stoppage thus caused will result in the deposition of silt and consequent choking of the drain.

Drains are cut from the lowest point upward and the pipes laid in each section day by day. To ascertain if the pipe bed is being laid perfectly true, three leveling staves or "boning" rods are used. Each consists of a staff and crosshead, and by placing them at various points in the drain and sighting over the crossheads, uniformity of the bed is determined. The surface soil in cutting the drains ought to be laid on one side of the trench and the subsoil upon the other side, and each should be returned carefully to its original position. The size of the pipes to be used is dependent upon a number of factors, such as character of soil and subsoil, gradient, rainfall, length of drains; but in practice it is found most profitable to use 2½-inch to 3-inch pipes for minor drains, and 6-inch, 8-inch or 10-inch for mains and sub mains. The number of pipes required per acre is found by dividing the area of an acre in square feet by the distance between the drains in feet, provided the pipes are one foot in length. The following table will be of value in this particular:

<table>
<thead>
<tr>
<th>Name</th>
<th>Lengths up to 500 feet, 1 in.</th>
<th>Lengths 400 to 700 feet, 2½ in.</th>
<th>Lengths 500 to 1,000 feet, 3 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minor</td>
<td>2 to 3 acres... 3-inch tile.</td>
<td>4 to 6 acres... 3½-inch tile.</td>
<td>6 to 10 acres... 4-inch tile.</td>
</tr>
<tr>
<td>Main</td>
<td>10 to 15 acres... 5-inch tile.</td>
<td>20 to 40 acres... 6-inch tile.</td>
<td>40 to 100 acres... 10-inch tile.</td>
</tr>
</tbody>
</table>

The tools used in the formation of drains are few in number, and of a very simple description. They consists of four spades—generally three of different sizes—gradually diminishing in width to suit the different parts of drains. For taking out the last nod of spit, to form the seat for the draining pipe, long, narrow, triangularly shaped spades, called bottoming tools, are used. There are also scoops of various widths, furnished with long handles, and rounded or flattened in the soles according as they are required to finish the bottom of the drain for the reception of stones, a horse-shoe tile and sole, or a draining pipe. For the purpose of laying pipes in minor and deep drains an instrument called a pipe-layer, consisting of a short rod attached at a right angle to a long handle, which enables the workman to lay the pipes without going into the drain or reaching the bottom with his hand, is employed. Where the subsoil is strong or indurated, a hand-pick or a foot-pick is required to loosen it before it can be shoveled out.

**Benefits of Drainage.**—The following are among the benefits arising from thorough drainage:

1. Removal of superfluous water. Not only is the standing water at the surface carried off, but the water-table is lowered, increasing the
DRAINAGE OF MINES — DRAKE

depth of soil. Energy that would otherwise be required for evaporation of water is thus saved for other beneficial purposes.

2. Improves soil texture. Drained soils are more friable, less lumpy, offer less resistance to plant roots, and are of better texture in every way, than undrained soils.

3. Increases root pasturage. Agricultural literature is full of testimony to the benefits of deep tillage. The deeper the soil is stirred the greater its productiveness. Plant roots penetrate to a depth of several feet under favorable conditions such as drainage supplies. Root pasture is also increased by the increase of surface moisture imparted by the much finer division of soil particles.

4. Increases soil fertility. It prevents loss of fertility by water passing over the surface. It adds to the fertility by sending summer showers down through the soil, instead of over them, enabling the crop to use the nitric acid and ammonia brought down. It increases the effect of manures by bringing them more quickly into solution and into more intimate contact with plant roots; and it increases the absorptive power of the soils for fertilizer matter of all kinds.

5. Makes tillage easier. By clearing up waste places and covering the ditches the field is brought into better shape for use of labor-saving machinery. Waste land is reduced, and the better texture of soil, its finer tilth and greater friability decrease draft and increase the effectiveness of tillage implements.

6. Lengthens the growing season for crops. Frost comes out earlier in the spring and the land becomes earlier warmed. Evaporation lowers temperature, but drainage removes water without evaporation. A well-drained soil is 12° to 14° F. warmer than a soil full of stagnant water. The sun’s rays penetrate to a greater depth, and warm summer showers have a greater effect. The season is lengthened by adding the days in summer after heavy rains when undrained soils cannot be tilled, and crops come to a standstill; coming of the autumn is delayed until later, and the soils are warmer throughout the season.

7. Assists disintegration. Frost penetrates deeper in winter in drained soils, assisting in unlocking the stores of mineral plant food. More surface is exposed to the action of disintegrating agents, and the soil presents conditions more favorable to their action throughout the season.

8. Favors nitrification and bacterial action. Plants are largely dependent on the decomposition of organic matter in the soil for their supply of nitrogen. This change is brought about by the action of ferments or bacteria which thrive only under certain conditions of temperature and moisture. Drainage supplies the most favorable condition for their development; it also favors the growth of the nitro-bacteria found on the roots of leguminous plants, which by their means appropriate free nitrogen from the atmosphere.

9. Prevents heaving. The effect of stool-ice in throwing out young plants in winter is often to diminish seriously and even destroy the crop. Drainage dries up the surface soil and prevents the formation of stool-ice.

10. Lessens washing and diminishes violence of floods. By increasing the absorptive power of the soil less water is left to pass over the surface in a rainy season, so that washing and floods are materially lessened.

11. Improves the quantity and quality of crops. That the yield of crops is much greater on drained soils hardly needs to be substantiated, while the more vigorous growth of plants renders them much less susceptible to the attacks of fungi of the ravages of insects, improving the quality. Rust, mildew, blight, etc., are much less prevalent in crops on drained soils.

12. Diminishes the effect of drought. By making the season earlier tillage can begin sooner and save moisture from wasting. Plants are given a better start and root deeper, thus being less affected by a dry surface. The soil is deeper and has greater capacity for moisture. Its finer texture nearly doubles its capillary power over undrained soils. Ordinarily drainage increases the capillary power of soils from 25 to 40 per cent. A drained soil holds water like a sponge, an undrained clay like a dish.

13. Healthfulness improved. So well known is this fact that large towns have undertaken the drainage of as a preventive to render the region more healthful.

See AGRICULTURE; SANITARY ENGINEERING; SANITARY SCIENCE and PUBLIC HEALTH.

DRAINAGE OF MINES. See MINES, DRAINAGE OF.

DRAINAGE TUBES, in surgery, an appliance invented by a distinguished French surgeon, M. Chassaignac. They are composed of India-rubber, from one eighth to three-eighths inch in diameter, perforated with numerous holes, and of various lengths. They are introduced into the abscess or wound so that one end is in contact with the seat of discharge, while the other reaches to the surface of the skin. They are especially useful in chronic abscesses, but also in large wounds, such as those made by amputation, and in all cases where there is apt to be a deep accumulation of discharge.

DRAKE, Alexander Wilson, American artist and critic: b. Westfield, N. J., 1843; d. New York, 4 Feb. 1916. He studied and practiced wood engraving and later drew on wood for engravers. He also studied oil and water color painting and taught drawing at Cooper Institute. He was in business for himself as a wood engraver from 1865 until 1870 and was head of the art department of Scribner’s Monthly when it became the Century. He remained with the Century until 1913.

It was to Mr. Drake's knowledge of wood engraving and of pictorial arts and to his distinguished taste that the reputation of Century Magazine on the artistic side. He was known as the 'Father of American Wood Engraving' because of the experiments he made in the reproduction on wood of the many processes of illustration, such as paintings in oil and water colors, etching, crayon drawing, etc. He was a connoisseur of painting and the allied arts and his collections, which were unique
and varied, included paintings, copper and brass and many other articles of beauty and curiosity.

**DRAKE, Charles Daniel, American lawyer:** b. Cincinnati, 11 April 1811; d. 1 April 1892. He served several years in the navy, was admitted to the bar in 1833, and in 1854 took up the practice of law in St. Louis, where he became prominent in politics. In 1864 he was a member of the convention to revise the Constitution of Missouri; in 1867–71 he was United States Senator; and in 1871–85 Chief Justice of the Court of Claims. He wrote 'Law of Suits by Attachments' (1854); 'Life of Daniel Drake' (1871); and published a collection of his speeches under the title 'Union and Anti-Slavery Speeches' (1864).

**DRAKE, Daniel, American physician:** b. Plainfield, N. J. 20 Oct. 1785; d. Cincinnati, Ohio, 6 Nov. 1852. He was graduated from the University of Pennsylvania in 1813, and settled for a time in Cincinnati. He was professor of materia medica in Transylvania University, Ky., and taught in other medical schools till 1820, when he organized the Medical School of Ohio in Cincinnati; he was professor there, and in 1823 he became the University of Louisville, Ky. He wrote 'Pictures of Cincinnati and Miami County' (1815); 'Practical Treatise on the History, Prevention and Treatment of Epidemic Cholera' (1832); 'Systematic Treatise on the Principal Diseases of the Interior Valley of North America' (1850–54); and was editor of the *Western Medical and Physical Journal*.

**DRAKE, Sir Francis, English navigator:** b. probably in Tavistock, Devonshire, England, about 1540; d. off Porto Bello 28 Jan. 1596. When very young, he served as an apprentice to a sea captain and later became a coast trader. He joined Sir John Hawkins in his last expedition against the Spaniards (1567), losing nearly all he possessed in that unfortunate enterprise. Having gathered a number of adventurers round him, he made a voyage round Africa, in which he made two successful cruises to the West Indies in 1570 and 1571. In 1572 with two small ships he again sailed for the Spanish main, captured the cities of Nombre de Dios and Vera Cruz, burned two Portuguese ships, and carried the news of his victory to the highest point of the dividing ridge, where, climbing a tree from whose tops the guides told him both seas could be seen, he gazed upon the vast waters of the South Seas, and with that touch of romantic enthusiasm that reigned all his pirates, besought Almighty God of His goodness to give him life and leave to sail once in an English ship in that sea. Drake arrived in Plymouth on Sunday, 9 Aug. 1573, during sermon-time, when the news of his return did so speedily pass over all the church, and surpass their minds with desire and delight to see him, that very few or none remained with the preacher, all hastening to see the evidence of God's love and blessing toward our gracious queen and country.

In 1577 he fitted out a small squadron, consisting of his own ship the *Pelican*, the *Elizabeth* and three smaller vessels, and with these sailed from Plymouth on 13 December. On 20 August the squadron, now reduced to three ships, entered the Strait of Magellan, and here Drake changed his own ship's name from the *Pelican* to the *Golden Hind*. In 16 days they made the passage, then followed violent tempests for 52 days, during which the *Monogold* foundered with all hands and the *Elizabeth* parted with the admiral and resolved to return home. At Valparaíso Drake provisioned his ships from the Spanish storehouse, reached Callao on 15 Feb. 1579, found a rich prize off Cape Francisco (1 March) and another on 4 April. Drake now determined to return home by crossing the Pacific. He touched land at a creek on the northern side of the Golden Garden, then for 68 days together had no sight of land until he made the Pelew Islands. After refreshing three weeks at Ternate, and a thorough refit on the southwest coast of Java, he held for the Cape of Good Hope, and arrived in England 20 Sept. 1580. The queen paid a visit to his ship at Deptford, and knighted him on its deck.

In the autumn of 1585 Drake sailed with a fleet of 25 ships against the Spanish Indies, harrying Hispaniola, Cartagena, and the coast of Florida, and brought back supplies for the Virginian colonists, with tobacco and potatoes. Early in 1587 he set sail with a strong squadron to cripple the king of Spain in his own seas, and retard his preparations for invasion—a support which he called a single nail in Spain's beard. Sailing right into the harbor of Cadiz, he sank or burned as many as 33 ships, and made his way out unscathed. The seeming recklessness of his tactics was no devil-may-care bravado, but due to consummate seamanship no less than promptitude and courage.

Drake next sailed to the Azores, capturing a rich homeward-bound Portuguese carack worth £100,000. In the face of the impending struggle for which Philip II had long been preparing, his persistent plan was to follow up the policy of harassing the enemy on his own coasts—"to seek God's enemies and her majesty's where they may be found."

Drake's division in the threefold arrangement of the English fleet was at first stationed off Ushant, until all the ships were brought together to Plymouth by the same storm that carried the Spaniards across the Bay of Biscay. Here, on the Hoe, the admirals and captains were playing the famous game of bowls, when the news was brought that the enemy was off the Lizard. Howard was eager to put to sea at once, but Drake would first finish the game, saying "there's plenty of time to win this game, and to thrash the Spaniards too." The story, whether true or no, is in perfect keeping with the character of the man. Early next morning the battle began, and raged along the Channel throughout the week. Drake's consummate seamanship and audacious courage covered him with fresh glory, and inspired new terror in the Spaniards. On 29 July occurred the final action so disastrous to the Spaniards, after which they came to their fatal determination to return to Spain round the Orkneys. Two days later Drake wrote to Walsingham, "There was never anything pleased me better than the seeing the enemy flying with a southerly wind to the northward. God grant you have a good eye to the Duke of Parma, for with the grace of God, if we live, I doubt it not, but ere it be long so to handle the Dutch and Spaniards, as he shall wish himself at Saint Mary Port among his orange trees." It was not long before want of ammunition compelled Drake and Howard to fall back from the chase, but the
storms of the northern seas took up their work and swept the Spaniards to destruction. Next spring a great expedition under him and Sir John Harveys sailed for the coasts of Spain and Portugal, but had little success beyond the damage inflicted upon the Spanish shipping, while sickness and actual hunger carried off thousands on board the crowded and ill-ventusled ships. In August 1595, he sailed from Plymouth on his last expedition to the West Indies. Ill-fortune followed the fleet from the beginning; Hawkins, the second in command, died off Porto Rico in November, and Drake himself fell ill and died off Porto Bello. Consult the 'Life' by Barlow (1843); Froude, 'English Seamen of the 16th Century' (1895); Julian Corbett, short 'Life' (1890); and his 'Drake and the Rise of the Tudor Navy.'

DRAKE, Francis Marion, American capitalist and lawyer: b. Rushville, Ill., 30 Dec. 1830; d. Centreville, Ia., 20 Nov. 1903. In 1837 his family moved to Iowa, where he was educated. In 1852 he crossed the plains to California with ox-teams, engaged in cattle-raising and defeated a band of Pawnee Indians on the route, and in 1854 crossed again with a drove of cattle. In 1855 he engaged in mercantile business in Drakeville, Ia., and in 1861 entered the army as a private. He served through the Civil War, attaining the rank of brigadier-general of volunteers. After the war he studied and practised law, and engaged in the railroad business, particularly the building of new roads. He was the first president of the Missouri, Iowa and Nebraska Railroad, and was later president of the Albia and Centreville Railroad. In 1880 he founded Drake University (q.v.) which he liberally endowed, and was president of the board of trustees till the time of his death. He was one term (1896-98) governor of the State of Iowa, being elected on the Republican ticket.

DRAKE, Francis Samuel, American historical writer: b. Northwood, N. H., 22 Feb. 1828; d. Washington, D. C., 22 Feb. 1885. He was a son of S. G. Drake (q.v.). He prepared a 'Dictionary of American Biography' (1872). He also published 'Life of Gen. Henry Knox' (1875); 'Life of Daniel Webster' (1884); and 'Indian History for Young Folks' (1885). Before his death he had gathered material for a new edition of his 'Dictionary,' which was incorporated in 'Appleton's Cyclopedia of American Biography.'

DRAKE, drâ'ké, Friedrich, German sculptor: b. Pymont, 23 June 1805; d. Berlin, 6 April 1882. He was the son of a mechanic, and after an apprenticeship in cabinet-making turned to clay modelling and studied under Rauch. He traveled also in Italy, where he met Thorwaldsen (1836-37) by whom he was influenced somewhat. Among his works are 'The Eight Provinces of Prussia' (colossal allegorical figures adorning a hall in the royal palace at Berlin), and a 'Warrior crowned by Victor,' which is reckoned one of the masterpieces of German sculpture. Noteworthy also are his portraits of Goethe, Schiller, Rauch, and the marble statue of Frederick William III in the Thiengarten, Berlin; that of Christian Rauch, at Berlin; and the colossal bronze representing William I, on the Hohenzollern Bridge of Cologne, for which he was awarded the cross of the Legion of Honor. His work is marked by virility and classic simplicity. He was professor of the Academy of Art at Berlin, and a member of the academies of all the leading countries. He had little success beyond the fame of his 'Tell' in Switzerland, 'Rauch, Reitschel and Drake' (Basel 1884).

DRAKE, Joseph Rodman, American poet: b. New York, 7 Aug. 1795; d. there, 21 Sept. 1820. He studied medicine, traveled in Europe, and after his return in 1819 contributed under the signature of 'Croaker' many pleasant and effective verses to the New York Evening Post. His friend Fitz-Greene Halleck joined him in this series, signing his own pieces at first 'Croaker, Jr.' but soon they both adopted the signature of 'Croaker & Company.' The novelist Cooper was also one of the intimate associates of Drake and a conversation between them as to the poetical uses of American rivers, in the absence of historical associations, as much to belong to the streams of the old world, was the occasion of Drake's longest and most imaginatively poetic poem, 'The Culprit Fay.' This, with his other poems, was published in 1838. His later poems, published with Halleck appeared in book form in 1860.

DRAKE, Samuel, American actor: b. England, 15 Nov. 1768; d. Oldham County, Ky., 16 Oct. 1854. He may properly be called the pioneer of the drama in the west. It is said that his name was Bryant, but he assumed that of Drake on the stage. In early life he was apprenticed to a printer, but ran away before his term had expired and went on the stage. Previous to his coming to the United States he was manager of a country theatre in the west of England. He arrived in America with his family in 1809 and appeared at the Boston theatre the same year, remaining there until 1813, when they joined a company at Albany, N. Y., where Mr. Drake became stage-manager. Mrs. Drake died in 1814 and her husband removed the following year to Kentucky, having previously arranged to take over theatres in Frankfort, Lexington and Louisville. On the way his company gave several performances in towns of western New York. Among the company were N. M. Ludlow and Miss Denney, who later were prominent on the American stage. From Olean to Pittsburgh, Pa., the company floated on a flat-boat down the Alleghany and in Pittsburgh gave the first regular theatrical performance ever seen in that town. From Pittsburgh the company went to Maysville (Limestone) and thence overland to Frankfort. Drake was very successful in Kentucky and afterward managed houses in Ohio, Tennessee, Missouri and Indiana.

DRAKE, Samuel Adams, American journalist and writer: b. Boston, 20 Dec. 1833; d. Kennebunkport, Me., 4 Dec. 1905. He entered journalism in 1858. In 1861 he joined the army and served throughout the war, becoming brigadier-general in 1863. He returned to Boston in 1871 and resumed literary work. His most important publications are 'Old and New Marks of Boston' (1873); 'Nooks and Corners of the New England Coast' (1875); 'Around the Hub' (1881); 'Heart of the White Mountains' (1882); 'New England Legends and Folk Lore' (1884); 'The Making of New England' (1886); 'The Making of the Great West,'
DRAKE.—DRAMA

(1887); 'Burgoine's Invasion' (1889); 'The Taking of Louisville' (1891); 'The Pine Tree Coast' (1891); 'The Battle of Gettysburg' (1892); 'The Making of Virginia' (1893); 'An American of the Colonial House' (1894); 'The Campaign of Trenton' (1895); 'The Watch Fires of '76' (1895); 'On Plymouth Rock' (1898); 'The Myths and Fables of To-day' (1900); 'The Young Vigilantes' (1904); etc.

DRAKE, Samuel Gardiner, American antiquarian: b. Pittsfield, N. H., Nov. 11, 1807; d. Boston, Mass., 18 June 1873. He received common school education and from 1815-25 was a school-teacher in a country district. In 1828 he removed to Boston and there opened one of the first antiquarian book-stores established in the United States. He was one of the founders of the New England Historical and Genealogical Society, acted as its president in 1858, and was editor of its quarterly 'Register' for many years. He published 'Indian Biography' (1832), 'A Book of the Indians' (1833); 'The History of Indian History in the States of Boston' (1856); 'History of the French and Indian War' (1870); 'Old Indian Chronicle' (1836); 'Indian Capivities' (1839); 'Annals of Witchcraft in the United States' (1846). He also edited a churchly 'History of King Philip's War' (1825); Mather's 'Indian War of 1675-76' (1862); 'Early History of New England' (1864); Hubbard's 'Indian Wars' (1865).

DRAKE UNIVERSITY, a co-educational institution in Des Moines, Ia.; founded in 1881, under auspices of Church of Christ. It was named for Gen. Francis Marion Drake, its benefactor, whose gifts amounted to $230,000, and who served as president of the board of trustees from the board's organization until his death, 20 Nov. 1903. Linked with the name of Drake as founder, is the name of D. R. Lucas, through whose influence the institution was located in Des Moines, and that of George Thomas Carpenter, its first chancellor and the moving spirit of the new enterprise. Total assets of the university, $520,000. Available income about $90,000 annually. There are eight organized colleges; liberal arts, Bible, law, medicine, normal, conservatory of music, pharmacy, dentistry, also eight special schools. Enrolment for year 1915-16 was 1,466. General control is vested in board of trustees, composed of: (1) life members; (2) members elected by Iowa Christian Convention; (3) members elected by Alumni Association. The president of the university, under direction of board, is head of the school.

DRAKENSBERG, a mountain range of South Africa, which extends from the eastern part of the Cape of Good Hope province along the Orange State frontier to the northwest frontier of Natal. The range is steep on the side facing the sea but slopes gradually inland to the South African plateau. It attains a height of from 10,500 to 12,000 feet in the peaks Mont-aux-Sources and Champagne Castle and Giant's Castle is 9,600 feet high. Its two passes of Van Reenan (5,400 feet) and Lang's Nek (4,100 feet) are traversed by railroads.

DRAMA, a Greek term meaning action, and applied to that form of literature which is suited for performance, or action, before an audience. A drama tells a story by means of speeches and dialogue, and these are to be spoken by actors impersonating the characters and performing the actions of the story. Speech, gesture, facial expression, make up, stage "business," music, dancing, scenic painting are some of the theatrical accompaniments by means of which the dialogue has been made to imitate scenes from life. (See THEATRE). Since mimicry is as old as the race, it is evident that there have been from primitive culture dramatic elements in games, sports, dances, religious ceremonies and other mimetic performances; but it is only late in the development of civilization that the drama takes an important place in literature. Nor can the use of dialogue, as in the Book of Job or in medieval, be taken as constituting a dramatic literature. The dramatic tendencies in life and literature have resulted in the various nations in definite literary forms, given regular a dramatic presentation; and it is the history of these that this article discusses.

Although in modern times dramas have frequently been written in prose, the drama in classical times was regarded as one of the three divisions of poetry, and so differentiated from epic, the narration of events, and lyric, the expression of emotion, and the same distinction is still applied in a general way to literature. An other distinction due to the Greek is the division of drama into two species, tragedy and comedy; the former dealing with the more serious themes of life and especially with suffering and death, the latter with life's follies and absurdities, fun and sentiment. This distinction was not made in Indian, Chinese or medieval drama, and the two species have varied in different countries and centuries; and there have always existed dramas which stand outside the strict limits of either class; as satyric in Greek, morality in the Middle Ages, trag-comedy and pastoral in the Renaissance, drama in modern French, and melodrama at present denoting a mixed and uncritical form. Nevertheless the two species survive and remain fairly comprehensive, the commonly accepted distinction between the two depending in the presence of a happy or an unhappy ending.

The drama of India has been the object of much interest to Western scholars since the translation by Sir William Jones in 1789 of 'Sakuntala,' one of the masterpieces of Kalladasa, the greatest of Sanskrit dramatists. The drama of China, of much later development, offers, like that of India, many points of difference from European drama. The earliest examples of the drama, however, are found in Greek, and with these we may begin our survey of the historical development and the general characteristics of the literary drama of Athens, Rome, the Middle Ages and Modern Europe.

Athena.—Greek drama had its origin in the dithyrambic songs chanted by the choruses who impersonated the satyr followers of Dionysus in the festivals in honor of the god. Spoken verses and dialogue were after a time introduced in the midst of the chorals, and from this beginning both tragedy and comedy evolved. To Thespis (650 B.c.) is credited the addition to the chorus of an actor to fill in with speech and mimicry the intervals of singing and dancing. He was the founder of Attic tragedy, which continued to develop
rapidly during the next century. The connection of the drama with the worship of Dionysus was maintained; and tragedies were performed in the prize dramatic contests instituted in honor of the god, supported by the state, and witnessed by vast concourses of citizens. No plays survive from before the time of Aeschylus (b. 525 B.C.); and to him and to his immediate successors, Aeschylus, Sophocles, and Euripides, in the 5th century, Attic tragedy owes its highest development and its long-continued eminence and influence in the dramatic literature of the world.

The dithyrambic chorus, originally of 50 men, was separated into four choruses of 12 or 15 each, and played a simple part in the drama. The chorus, consisting of four, three tragedies, sometimes forming a trilogy on one subject but later usually on disconnected themes, and a fourth satyr play, retaining the satyr's of the ancient festivals. Each play consisted of a series of passages of dialogue interspersed by the odes of the chorus. The dialogue introduced various persons and developed a complete story, usually taken from mythology and dealing with the life of some particular hero. Not more than three actors sang the dialogue in the dithyrambic, but in the second century, when the second actor having been introduced by Aeschylus, and the third by Sophocles. The chorus occasionally took part in the dialogue, but its main function was the singing of odes with accompaniment of music and dancing. In Aeschylus the chorus is of great importance, and its explanations, advice, and lamentations are essential to the representation of the action; but by the time of Euripides, its part is subordinate and its odes often have no connection with the dialogue. Although subjects were drawn from mythology in modern times, they were often treated by several dramatists, large freedom was permitted in the treatment of the myths, and consequently there is development in subject matter as in form. Aeschylus treats the myths as supernatural revelations and deals with the course of fate or Nemesis rather than with the conflict of human motives. Sophocles is interested in human nature and in moral law, in human life rather than in the supernatural. Euripides treats the myths with free invention and a realistic and even satirical touch, transforming gods and heroes into men and women of the day, delighting in situations of emotional intensity, and making the passion of love for the first time of capital importance as a dramatic motive.

The symmetry and unity of Attic tragedy were in part the result of limitations imposed by the conditions of the theatrical performance, resulting in the three unities, the value of which has been the subject of much controversy in modern times. The unity of action involved the restriction of the incidents of a play to those strictly concerned with the main action; the unity of time confined the events of the action to a single day; and the unity of place to a single place. In spite of these and other restrictions, already noted, all the plays, though varying the wealth of incident and the variety and surprise common to the best modern plays, are by no means lacking in human interest. Moreover, they represent the height of poetic style. The splendor and beauty of their language and the poetic perfection of their versification as well as the power and truth of their representa-

tion of human character and deed, place them among the consummate products of the imagination. After the 5th century tragedies continued to be numerous and popular not only in Athens but in other Greek towns; and later the plays of the great dramatists and of some of their successors were performed in Alexandria and Rome. Only fragments of later tragedy, however, have survived.

Comedy, like tragedy, sprang from the worship of Dionysus, developing from the frolic and buffoonery of the harvest festival. Farces were exhibited early in the 6th century, but the first great comic writer was Aristophanes. His comedies were satirical and burlesque criticisms of the life of Athens in his day, dealing with political and intellectual tendencies and fashionable follies, and putting no limit to direct personal satire. Socrates, for example, was caricatured in the 'Clouds' and Euripides in the 'Frogs.' Aristophanes, however, was a lyrical poet as well as a great humorist; and his comedies are medleys of satire, caricature, wit, humor, buffoonery, wisdom, fantasy and poetry. This, the "old comedy" of Athens, was followed by the "New Comedy," which avoided political and personal matters, and by "new comedy" (320-250 B.C.), the ancestor of the modern comedy of manners. The chief representative of the new comedy was Menander, whose work down to to-day survived only in fragments and in the translations and imitations of the Roman Terence, but who may be better understood if recently announced discoveries answer to the expectations raised.

Rome.—The early development of the drama in Rome seems to have been similar to that in Greece and other countries; but as no representatives of the early folk drama or the Attellan farces have survived, it is impossible to trace any peculiarities in its national development. Roman drama is, indeed, known to us only in the works of three writers, the comedies of Plautus and Terence and the tragedies of Seneca. In this late development it is only a borrowing from the Greek. Terence, aiming at literary excellence and protesting against the coarseness and brutality of his audiences, seems to have imitated or even translated Menander without attempt at any departure. Plautus while he also followed the new comedy of the Greeks, appears to have derived some of his characteristics from the earlier Roman farces, and at all events exhibits a coarseness and directness of humor suited to his audience and characteristic of Roman taste. These Roman comedies served as models and incentives for the dramatic writers of the Renaissance, and its stock characters and lively intrigue have had an influential existence down to the present day. In the same way the tragedies of Seneca served as models for the humanists and became the main classical influence upon modern tragedy. Probably never acted, they were rhetorical imitations of Euripides and later Greek tragedies. Modern writers, however, seeing in the plays of Attic tragedy, dealing with the most sensational and bloody stories from Greek mythology and abounding in extravagant declamation and sententious philosophizing. Still another inheritance for future ages came from the very door of the Roman theatre, the Mimes. The theatre in the later empire ceased to be the home of the
Drama, and was given over to bloody spectacle and indecent pantomime. Attacked violently by the early fathers, it ceased with the triumph of Christianity; but it had left the ancestors of the traveling entertainers of the Middle Ages, and the traditions of clownery and farce were handed down from generation to generation.

The Middle Ages.—After the destruction of the theater by the Christians, all knowledge of the classical drama or theater practically disappeared. An extensive and multiformal drama arose without dependence on classical precedent, never in any nation attaining much literary value, but of interest to the student both as a most significant illustration of the life of long centuries and as a potent influence upon modern drama. The origins of this medieval drama are various. Games and sports offer their share of mimetic performances, tracing back apparently as did the Dionysiac festival at Athens to early celebrations of spring and harvest; and the popular entertainers, the direct descendants of the Roman mimes, seem to have exercised an effect, not easily traceable, on comedy, especially on the farces and soiûtes in France. The main stimulus, however, came from the so-called 'miracles.' The development of its characteristic form in the Church liturgy. The Church service contained many manifestly dramatic elements; and the "offices," especially those for Easter and Christmas, were gradually expanded into little plays that grew into the mysteries, miracles and morales of later times. The steps in this growth cannot be traced with chronological exactness, but the process was one of secularization, the removal of the play from the service, from the Church itself, and eventually from the hands of clerical actors, and the intrusion of the vernacular and its final triumph over the Latin of the Church service. The institution of the Festival of Corpus Christi (1264, confirmed 1311) gave new support to these plays, and during the 14th and 15th centuries their vogue was so great that dispersed mimes became enormous, in spite of the protests of the Church, which began to look askance at the realistic and spectacular treatment of the holy writ.

The earliest vernacular play is the Norman Adam written apparently in the 12th century; and the earliest examples of Miracles date in the 13th. The typical Miracle was a dramatic adaptation of a saint's life with the intercession of the Virgin on behalf of the suffering saint. In French drama, the miracles are to be distinguished from the Mysteries, which dealt with stories from the Bible and which ran to inordinate length, the entire Bible history being treated in a cycle of short scenes. These cycles in France were huge conglomerates, that of the Acts of the Apostles lives on. After the institution of the Corpus Christi celebration, miracles came into the hands of the town guilds, the cycle to be performed being divided into small plays and each assigned to a particular guild. Four great collections exist, York plays (48 in number), Townley (37), and Coventry (42), all dating in the 14th or early 15th century. Each follows the scriptural story from Creation to Judgment Day. There were also other cycles and many separate plays, and the performance of plays by the guilds extended to nearly every town of importance in England.

In Italy in place of miracles there were Sacre Rappresentazioni, and in Spain and Germany the development from the liturgical to the full-fledged miracle or mystery did not differ greatly from that in England. In France did the drama depart extensively from religious themes, both in the secular mysteries and also in farces of which 'Pathelin' is the best example. In spite of the sameness and artlessness of the religious drama, certain elements of development are manifest. A desire to bring the story home to illiterate audiences led to, both realistic and spectacular enforcement; and the addition of episodes furnished a needed comic relief and gave opportunity for some inventiveness. Another tendency, not so clearly progressive, was didacticism which combining with the fondness for allegory led to the Morality, a presentation of a moral lesson through personified abstractions. Apart from its allegory, however, the morality was an advance in requiring its several plays and in centring the interest on a moral conflict.

The Renaissance.—The medieval drama had reached a stage that held some promise of further development, when the revival of classical learning introduced entire new elements and immensely hastened dramatic progress. In the conflict and amalgamation of these humanistic and medieval elements, modern drama had its origin. The medieval drama, mainly religious in theme, servile in its adherence to sources, ignorant of any distinction between a narrative and a dramatic fable and blind to the absurdity on the stage of much which might be essential in a story, permitted the presentation of all kinds of action and delighted in discordant combinations of the comic and the tragic. Against such a drama the humanists protested and opposed their knowledge of the classics, the rules and proprieties of which they sought to impose on the theatre of their day. Their models, however, were not the Athenians, but Seneca and the tragic; and Plautus and Terence in comedy; and their imitations lacked the authority of great masters as well as suitability to current theatrical conditions. The classical influence proved powerful, not through direct imitations, but rather in modifications of medieval forms and methods, in widening the range of subjects, and most of all in encouraging innovation and experiment. The last of the 15th and the whole of the 16th centuries witnessed in the various nations of Europe this conflict between medievalism and humanism in the drama as it was in literature and life. Neo-Latin plays, vernacular imitations of Seneca and Plautus, miracles, moralities, interludes and farces, every variety of form, jostled together and led at last to recognized standards and great achievement. In Spain and England, especially, national dramas arose that carried on medieval traditions, though with much indebtedness to classical feudation.

Italy.—Though Italy, as the home of the Renaissance, was the first of European nations to experience a revival of the drama under
humanistic influence, the varied imitations and experiments of the 15th and 16th centuries failed to result in a national drama of importance. The *commedia dell'arte*, comedy of masks, continued to hold popular favor, and the *rappresentazione sacra* had an early successor in Politian's 'Orfeo' (1502); but in the main the medieval forms were discarded. Neither tragedy, though adopted by tragedy, Dole, Gualtieri Cinthio and others of international reputation in their own day, nor comedy, which attracted to its services Aretino, Machiavelli and Ariosto, achieved, with a few exceptions, either literary or dramatic excellence. More distinctive in national in character and of wider influence on other literature than either tragedy or comedy was a new dramatic genre, the pastoral. It had an early beginning in Politian's 'Orfeo', and the 'Aminta' of Tasso and 'II Pastor Fido' of Guarini created a dramatic form for the pastoral tradition so powerful in the Renaissance.

In the 17th century tragedies and pastoral plays continued in abundance, but not until the 18th century was the Italian drama again of European importance. *II comico trionfale* (1714) attracted European recognition, and the operas of Apostolo Zeno and Metastasio attained literary rank and vast popularity. The *commedia dell'arte*, which had spread beyond Italy and was maintaining itself in Paris, took a new departure in the dramatic fairy tales of Carlo Gozzi (1720-1808). Meantime Goldoni revived classical comedy of manners, waged war on the *commedia dell'arte* and won for himself the title of the Italian Molière. The tragedies of Alfieri (1744-1803) also won a European reputation and resulted in a return of classical tragedy. This achievement of the 18th century was largely under the influence of French taste, and the reaction to other models was felt in Italy as elsewhere under the impulse of the Romantic movement. The influence of Shakespeare, perceptible in the classic tragedies of Monti and Foscolo, became marked in the Romantic innovations of Manzoni (f. 1820). During the middle of the century the popular plays of Pietro Corsa illustrated the general program, and at the close of the century the work of D'Annunzio and others gave new promise for the poetic drama.

Spain.—The Renaissance resulted in a more complete survival of mediæval conditions of the drama in Spain than in any other nation of Europe. The imitative attempts of the humanists made little impression on the public; and the real founder of the Spanish theatre, Lope de Rueda (fl. 1558), though not influenced by classic and Italian literature, was a practical playwright who wrote for small traveling companies and adapted the current mediæval forms to please the taste of an illiterate public. Most notable of his dramatic forms was the *pasó*, an interlude presenting some simple incident in a national *drama* of importance. The poet-dramatist Juan de la Cueva, who declared open warfare against Seneca and chose national themes, and the great Cervantes, who wrote plays without much success. Toward the end of the 16th century the great period of the Spanish drama began, with the career of Lope de Vega. In the course of his lifetime the theatre was firmly established at Madrid, professional activity improved, the national characteristics of the drama determined, and the plays of Lope awarded a popularity no other dramatist before or since. The number of his plays almost passes belief, rising perhaps to 1,800 full-length plays without counting many shorter entertainments, and it is on record that he composed an entire play in a single day. His work is consequently marked by carelessness and repetition; it is often hardly more than improvisation, but criticism itself is, breathless when it considers the variety of his invention and the cleverness of his technic. He made use of every kind of subject, humorous,严肃, romantic or realistic; and attempted with success every form of current drama, tragedy, history, miracle, morality, pastoral, and most notably of all, the *comedia de capo y espada*, the cloak and sword play. The use of the "point of honor" as a motive in these plays of gallantry and intrigue, the importance given to women in the action and the employment of the *gracioso*, a comic servant of the type of which Sancho Panza is the great representative, are a few of the Maffeios. 'El compadre' (1742) is an invention; but it is useless to analyze his contributions to a drama that he practically made anew.

The height of Lope's activity was at the beginning of the 17th century, and the great period of Spanish drama closed with his death in 1666. In Calderón the national drama reached its acme. Less of a creative genius than Lope and inferior to him as a playwright, he had the advantage of a generation of theatrical and dramatic progress and he possessed great genius as a lyric as well as a dramatic poet. The themes of loyalty to the king, devotion to the Church and the point of honor receive greater emphasis in his hands than they had before; in fact, a narrowness of motive and a sameness of character detract somewhat from the dramatic power of his plays. Perhaps his genius is the most characteristically displayed in his autos, brief allegorical expositions of the miracle of transubstantiation performed on Corpus Christi day, and late successors of the old religious drama.

In the 18th century the Spanish drama, like that of the rest of Europe, came largely under the influence of French taste and models, though not until French dramatists had found inspiration in the plays of Spanish masters. Moratin was the most successful follower of Molière; and in opposition to French supremacy, Ramón de la Cruz composed some hundreds of farces or *soainetes*, very like the old *pasos*. In the 19th century the romantic movement made itself felt in the drama, and the *Dona Elvira* of the Duque de Rivas achieved a triumph in 1835 similar to that of *Hernani* in Paris. Later in the century José Zorrilla was perhaps the most popular of dramatists, and at the present day the plays of Echegaray have attracted international interest.

France.—Although in the Middle Ages, both the religious and secular drama received a higher development in France than in any other nation, yet in the 16th century the influence of Italian humanism turned French men of letters away from the national to borrow from the more comic drama. Indeed continued, but in tragedy the Senecan exotic was for the time triumphant. Jodelle's 'Célepatre' and 'Didon' were strict
imitations of Seneca, retaining even the choruses; and the plays of Garnier and Mont-christien, highly esteemed by the litterati of Europe, were similarly misdirected efforts. Toward the end of the 16th century Alexander Hardy, a skilful playwright, made use both of the national drama and of Spanish romanticism and gave vogue to the genre of tragi-comedy and established the rhymed Alexandrine asplays of Diderot. Hardy’s plays aided in interesting people of culture in the professional theatre and were followed by a generation of dramatic activity.

A well-established theatre and a cultivated audience consequently awaited the arrival of a great dramatic poet. Corneille’s (1606-89) first play of importance, the ‘Cid,’ was based on a Spanish original and, though constructed with admirable coherence and condensation, did not adhere to the three unities. For this it was censured by the French Academy, recently instituted by Richelieu, and henceforth Corneille adopted their cramping limitations. French tragedy by his powerful example was thus committed to the form exemplified by Seneca and defined by character, noble sentiments, extraordinary situations. Racine, who followed him, chose less unusual stories, simplifying the action even more than Corneille, and excelled in the analysis of passion. Love is the dominant motive in his plays and the heroines are the persons for whom he seeks our sympathy. Melodious and dramatic as his verse is, it carries an impression of artificiality, at least to foreigners, perhaps largely on account of the conventionalized language demanded by the courtly and sophisticated audience or the more modest character, noble sentiments, extraordinary situations. Racine, who followed him, chose less unusual stories, simplifying the action even more than Corneille, and excelled in the analysis of passion. Love is the dominant motive in his plays and the heroines are the persons for whom he seeks our sympathy. Melodious and dramatic as his verse is, it carries an impression of artificiality, at least to foreigners, perhaps largely on account of the conventionalized language demanded by the courtly and sophisticated audience or the more modest character, noble sentiments, extraordinary situations.

The greatest French dramatist, however, was a writer of comedies. An actor, and a manager of a strolling company of players that finally established itself at Paris, Molière grew slowly to the full employment of his powers. His early experience taught him the means of winning his audience, and he availed himself of every known resource in strengthening his dramatic facility. The Italian comedy of masks, the plays of Plautus and Terence and the methods and themes of Spanish drama were all drawn upon by him in his conquest of every department of comedy. His masterpieces, at once triumphantly effective on the stage and most penetrating in their revelation of the absurdities and weaknesses of human nature, have a fresh appeal to every reader to-day through their humor and their philosophy, and they have remained these 200 years the unapproached models of modern comedy.

Corneille, Racine and Molière continued the great models of drama through the 18th century everywhere in Europe, and naturally most of all in France. Lesage, Marivaux and Beau-
the presentation of the story upon the stage. The primary aim of each dramatist was to tell his story so as to please his audience, but each was also a poet, thrilled with the spirit of the years of the Armada and ardent for the glories of the new poesy.

After these innovators came Shakespeare. This is no place for even a summary of his achievement, but it may be noted that, beginning as a poet, thrilled with the spirit and adapter of the various popular types, he was throughout his career conditioned by the efforts of his fellow dramatists and the demands of the London theatres. His masterpieces are the culmination of a most varied and virile dramatic period. The most marvelous of his gifts, his faculty of expression and his knowledge of human nature correspond to the two great excellencies of Elizabethan drama, its poetry and its characterization. The blending of a keen, drollery, sentiment and fantasy that makes his comedy so enchanting and the enormous range of situation and character that displays his creative genius as supreme were the outcomes of the freedom of the stage from restrictions and of the adventurous audacity with which the Elizabethan playwrights tried their hands at everything.

The development of Shakespeare's art was in a measure paralleled chronologically by the general development of the Elizabethan drama. During the last half of his career, perhaps in part from the survival of classical influences, the other dramatists were like him, freeing themselves from much of the lawless absurdity of earlier days. Foremost among the reformers was Ben Jonson (q.v.) who sought to impose on the popular drama as much as possible of classical regularity and propriety. He was at his best in a kind of drama that Shakespeare did not attempt, the "comedy of humours," plays dealing with the manners of the day; sometimes conventionalized by too close adherence to the model of the old Italian comedy, as in "Bartholomew Fair," transcending anything else in English drama in the humor and truth of their realism. Of the other great names of the period there is hardly space here even for mention. But in Spain, and in the extraordinary cleverness of invention and facility of expression and like their contemporaries in Spain, relied on complexity of plot and ingenious alterations of suspense and surprise. The heroic romances of their collaboration and the lively comedies of Fletcher's later years, though long popular and influential on the stage, lacked the moral vigor that had been characteristic of the 16th century drama and thus supply one of the earliest symptoms of the decline of the drama. Under James I, indeed, the drama no longer reflected a vigorous national spirit, but rather a corrupt and immoral society, and the poets no longer felt the stimulus of a free field for exploration and discovery, but wrote under the overshadowing influence of the great masterpieces of their immediate predecessors, Massinger, Ford, Middleton, Webster, Shirley and others produced plays of great beauty and power, but their best work exhibited no marked departure from the past, and in one way or another marked a moral and artistic decline.

Though the Restoration brought in French tastes and models, the influence of the great Elizabethans continued potent. The heroic plays, written in rhymed verse and drawn from French romance, the spirit of the Armada and ardent for the glories of the new poesy.

In the 18th century, while French examples dictated English literary drama, they never won much hold on the theatre. Frigid imitations of the pseudo-classical form such as Addison's "Cato" and Johnson's "Irene" were abundant, but even these literary imitations soon began to reflect Elizabethan models. In comedy Steele's sentimental plays correspond to the tearful comedy of France, and Lindavié's, based on Elizabethan predecessors and of importance abroad as well as at home in breaking the classic fetters, correspond to the tragédie bourgeoise. The vigour of the sentimental in comedy was broken by Goldsmith's "She Stoops to Conquer," and Sheridan's "Rivals" and "School for Scandal," English comedy of manners reached a height not since surpassed. The Romantic Movement dealt the death blow to the vestiges of pseudo-classicism still surviving, but was peculiarly sterile in positive achievement. The romanticists essayed the drama, but neither Lamb, Wordsworth nor Coleridge succeeded on the stage, and Byron and Shelley wrote without the stage in view. English writers in the 19th century were too indifferent to theatrical taste for produced plays. Tennyson, Browning, Arnold and Swinburne have all written dramas, but they belong to the hybrid "closet drama" that separates itself from the stage. At present in the poetical plays of Mr. Swinburne, possessed of the skilful studies of social conditions by Mr. Pinero we may discern signs in England as on the Continent of a renewal of serious dramatic activity and of the reunion of literature and the theatre.

GERMANY.—The modern drama had no independent development in Germany until the second half of the 18th century, when Lessing took the lead in the attack on the prevailing French conventions. His own plays gave support to his preaching and Goethe and Schiller in their early plays followed him in turning to England and Shakespeare for inspiration. Their later dramas take high rank as literature, Schiller's "Wilhelm Tell" and "Maria Stuart" being perhaps the best of the romantic dramas. Most of the drama of the storm and stress period was intended for readers rather than for spectators; but the plays of Kotzebue, though with little pretensions as literature, were skilful in their adaptation to the temper of the time and to requirements of the theatre, and carried everything before them in the theatres of Europe and America. The literary drama had a host of more worthy followers through the 19th century, the career
of the Austrian Grillparzer (1791-1871) being the most notable. Recently romanticism has given way to the realism of Ibsen, and perhaps the most brilliant accomplishments of the present have come from the renewed activity in the German drama, especially in the plays of Sudermann and Hauptmann.

**Scandinavia.**—The Scandinavian drama first becomes of European importance in the work of Ibsen. Beginning with historical dramas following the prevailing romantic fashion, he advanced to the astonishingly fantastic and original "Peer Gynt," and then, in self-imposed exile from Norway, produced the series of social dramas that are influencing so pervasively the theatre of the modern world. Both by their profound criticism of modern life and by their technical reforms, they seem likely to mark the beginning of a new era in the history of the drama. Written in concise, unadorned prose, free from the soliloquies and lyrics and embellishments that romanticism confirmed, they return to the simplicity and directness of the Greek and Shakespearean plays; at the same time they are as modern in technic as in the problems and the psychology that they present.

**America.**—America has long had a theatre of importance but not a drama. The first theatre in 1766 was followed after the Revolution by the first important acted play by an American — the "Contract" by Royall Tyler, afterward chief justice of Vermont. William Dunlap, the first dramatist of influence, translated from the popular Kotzebue and produced many plays of his own. The visit of Ibsen in 1880 marked the establishment of the theatre as a social institution of importance and has been followed by frequent visits from most of the great European actors; and, since Forrest played Othello in 1836, there has been a famous succession of distinguished American actors. The drama, however, has in the main continued servile imitation of European models. After Kotzebue, Scribe and Sardou were translated or imitated here as elsewhere, and the reproduction of foreign plays to the discouragement of American authors was fostered until 1891 by the absence of any international copyright. The development of the drama in Europe during the 19th century has, however, been paralleled in some degree in the United States. There has been the same advance in technic; the same conflict between romanticism and realism, and the same powerful influence of the novel upon the drama. This last influence has been perhaps stifling rather than stimulating and has led recently to a great popularity of dramatized novels, of which "Uncle Tom's Cabin" at least has had an international vogue. More promising for the future of a national drama has been the tendency to present various phases of American life illustrated by the success of the "Old Homestead," and by the many worthy plays of Mr. Bronson Howard and Mr. Augustus Thomas.

**The Twentieth Century.**—The 20th century has witnessed a remarkable development in the drama of Europe and America, and this has been marked by a theater which may be described as revolutionary. The revolution of the theatre is still in process, and no one can say with certainty what will be its outcome. But the artistic productions of Reinhardt in Germany, Barker and others in England, have been accompanied by great popular interest in the drama and many efforts to suit the theatre to the proletariat. In the United States, the changes in the stage have lagged somewhat behind the European experiments, but they are manifest in two quite opposite directions. First, the number of "little theatres" with stage and auditorium suited to literary or intellectual drama have multiplied rapidly. Second, the giving of great spectacles or outdoor pageants indicating a step in bringing the theatre to the people. Manifestly, the old theatre of the nineties no longer suffices for the many dramatic enterprises of our day, and there is in the process of creation a new theatre far more varied and flexible, and more consonant with dramatic originality.

It is indeed a vast development of dramatic originality which has caused the theatre to change its forms and manners. Everywhere young men of imagination have been turning their talents to the drama and finding in it the potentials of popular appeal; not even by the novel and the short story. Undoubtedly a great influence in this modern dramatic revival has been the work of Ibsen. The stage of every country has felt the force of his inspiration and has welcomed realistic studies of current manners, intellectual discussions of social problems and symbolic interpretations of life, all of which owe something to the great Scandinavian. But the dramatic revival has not been distinguished merely by the realism, social discussion and symbolism which Ibsen initiated. Poetry has reasserted its place, and Romance has never yielded its hold on the stage. Moreover, the drama of the 20th century has by no means had a uniform international development. One of its most striking characteristics has been the reappearance of strong national peculiarities. These have been most marked in Ireland and Russia; but there is no nation in Europe where playwrights are not striving to express national peculiarities and aspirations upon the stage; and in the United States the chief merits of the new drama are its observation and interpretation of American life.

In Ireland the Celtic renaissance resulted in the establishment of a literary theatre and the appearance of a national drama distinguished by the plays of Yeats, Synge and a group of enterprising lesser dramatists. In Russia, Tolstoi, Gorky and other novelists have enriched the drama, and the stage has attracted in Andreyev a writer of fantastic but powerful originality. In Scandinavia Ibsen's pessimism has been carried on in the morbid work of Strindberg, who may perhaps be credited with bringing to the fore one of the characteristic dramatic forms of the time — the one-act play. In Germany neither Sudermann nor Hauptmann has quite realized his early promise, and in men like Fulda and Wedekind, or in the Austrian Schnitzler, it is difficult to discover any notable advance. In French, however, among a multitude of clever and intellectual playwrights there are at least three of great international influence — Brieux the propagandist who sacrifices art to moral causes, and to special causes at that, but he has succeeded in stirring the world. Rostand and Maeterlinck are romanticists,
and the former by his poetic virtuosity, and the latter by the versatility of his theatrical experiments, have done much to maintain romance and fantasy on the modern stage. The problems of sex and the disasters of love continue to be the chief themes of continental drama, and this preoccupation with a neurotic eroticism finds its most sensational exponent in the Italian D'Annunzio, who mingles great lyrical beauty with abnormal brutality. In Spain the chief figure has been Echegaray, whose melodramatic and rhetorical romanticism was tainted in his later works by Ibsen-like symbolism; but a swarm of plays are maintaining the popularity of the theatres.

In England Jones and Pinero, who were among the first to feel the inspiration of Ibsen, have continued to write copiously; and brilliant studies of satire and contemporary manners have been contributed by Galsworthy and Bernard Shaw, while romance and sentiment have found a notable spokesman in Barrie. Shaw's plays have been so successful in Germany as in France that these three dramatists have found an enthusiastic public on this side of the ocean.

In the United States no dramatist of international eminence has emerged, but the individual plays of Thomas, Gillette, Sheldon, Walter, and others have given evidence that the new methods and ideas are at work. There are many signs that America will take an active part in the further advances which seem sure to distinguish the drama of the 20th century.

Bibliography—For criticism of dramatic technique and theory: Schlegel, Lectures on Dramatic Art and literature (English translation, London 1846); Freytag, The Technique of the Drama (English translation, 1885); Price, The Technique of the Drama (New York 1892), Archer, Play-Making (1910); Hamilton, W., Studies in Stagecraft (1914); Matthews, A Study of the Drama (1910); Pagnout, Drame ancien, drame moderne (Paris 1898); Hennequin, The Art of Playwriting (Boston 1910); The History of the Drama: Creizenach, W., Geschichte der neueren Dramen (4 vols., 1893-1903, still incomplete, but the best work on the modern drama); Ward, A. W., A History of English Dramatic Literature (new ed., 1899); Schelling, Elizabeth, Drama (2 vols., 1908); Thorne, The Shakespeares Theatre (1916); Haigh, The Attic Theatre (new ed., 1898); Haigh, The Tragic Drama of the Greeks (Oxford 1896); d'Ancona, Origini del Teatro in Italia (2d ed., 1891); de Julleville, Histoire du théâtre en France au moyen âge (1882); Chambers, The Medieval Stage (Oxford 1903); Matthews, Brander, French Dramatists of the Nineteenth Century (New York 1891), and The Development of the Drama (New York 1902); Thorne, Tragedy (1906); Archer, English Dramatists of Today (London 1882); Genest, History of the Stage (Bath 1832); Fitzgerald, A New History of the English Stage (London 1882); Baker, The London Stage (London 1899); Dunlap, History of the American Theatre, new York 1832; Jusserand, Le théâtre en Angleterre (2d ed., 1881); Lowe, A Bibliographical Account of English Dramatic Literature (London 1888). Ashley H. Thorndike, Professor of English, Columbia University.

DRAMA, Censorship of, official supervision of plays and stage productions in the interests of public morality. In the United States this is covered by the law governing public morals, which enables a play to be suppressed if any overt act is committed which is considered immoral. In England preventive censorship of the drama dates from the reign of Henry VIII, and under Elizabeth in 1545 the master of the revels was appointed dramatic censor. In 1624 the appointment was transferred to the lord chamberlain's office. The necessity of placing a curb upon the license of the theatre in the use of political satire led to the act of 1737 which legalized the lord chamberlain's authority and established a regular censorship which became particularly active in the early years of the reign of George III. By the provisions of Acts 6 and 7 Vict., c. 68, new plays or additions to old plays must not be acted for hire at any theatre in Great Britain until they have received the sanction of the lord chamberlain, under a penalty of $250 for each performance and the forfeiture of the building's license. This power is vested in the official examiner of stage plays attached to the lord chamberlain's office. The licensing of theatres is vested in the county council, and is usually exercised by the presiding justice of peace of the district.

DRAMA LEAGUE OF AMERICA, an organization founded at Evanston, Ill., 25 April 1910. Its aim is to crowd out vicious plays by attending and commending good plays and building up audiences for them through study classes, reading circles and lectures; to aid in the restoration of the drama to its honorable place as the most democratic medium for the self-expression of the people. As new plays are produced, the play-going committee attends them and reports by means of bulletins or that conform to certain critical standards. These bulletins are sent by mail to all members of the league and to all affiliated clubs or other organizations that belong to the league. The league does not censor. If it approves a play, the members are urged to support it—if it disapproves, it remains silent. The circuit committee organizes audiences in advance of a league play in a small town so that the managers are assured of sufficient support to venture to bring to a town a play which otherwise would not have visited it. The educational department of the league is made up of experts who endeavor to introduce drama through its study courses in all study clubs of the country, to equip libraries with suitable working tools, and to create by every means a better understanding of drama. The league has made rapid progress, having now a total of 60 branches, with members in 48 States, in England, France, China, Australia and in Canada. Its total membership is 50,000, and it has affiliated clubs over 200,000. The fee for direct membership for the individual is $1, for a club $2, for a supporting member $5, for a life member $100. The Drama League Monthly, its official organ, is published
Drama Society — Draper

each month except June, July and August, and is sent free to all members. Wonderful pageants have been successfully conducted in many cities under its auspices, and the League was entirely responsible for the nation-wide celebration of the Shakespeare Tercentenary with pageants and masques in over 2,000 different cities. The national headquarters of the League are in Washington, D. C.

Drama Society, The, a New York organization of art-loving players on a basis that secures to regular members of the Society the best seats, for the best productions only, at the box-office price. There are no dues and no initiation fees. The only condition imposed is that the members yearly attend 10 productions found worthy of the intelligent players, within the first month after production. By ensuring that intelligent plays receive immediate attendance and financial support, the society encourages the better forms of dramatic art. Every intelligent play receives at once an intelligent hearing, financial support and the very best advertising — the report of discriminating people who have seen it. Artistic plays are thus guaranteed a considerable measure of success. In this way it is ensured that good plays are produced and that no really excellent play shall fail. Instead of attempting to organize an artistic theatre, the Society aims to organize an artistic and discriminating audience. The treasurer of the society is Mr. Thomas W. Lamont, 23 Wall street, New York.

Dramatic Art, Schools of. See Schools of Dramatic Art.

Dramatic Arts, American Academy of, a school of dramatic arts, established by Franklin Sargent in New York in 1884 and chartered by the regents of the State of New York in 1889. Its object is to train pupils for the stage. It offers a two years' course, including opportunities for public appearances. The Academy is in charge of the dramatic school of the Empire Theatre in 1897. Several plays are produced annually by members of the graduating class.

Drämmen, dräm’mên, Norway, seaport at the mouth of the Drämmen River, on an arm of the Christiania Fjord, 33 miles southwest of Christiania. The town, which has been practically rebuilt since the fires of 1865 and 1875, is picturesquely situated between two chains of high hills. The river divides the town into three parts which are connected by bridges. The principal manufactures are woolen and cotton goods, iron work, lumber and tobacco, and there are also several saw-mills and ship-yards. Its trade is chiefly with Holland and England. It is the second port in the kingdom for the export of timber. It also exports zinc, nickel and cobalt. Nearby are large salmon fisheries. Pop. 25,091.

Dranesville, Battle of. Dranesville is on the Alexandria and Leesburg turnpike, 16 miles northeast of Washington; and 20 Dec. 1861, a force of cavalry under Col. Gen. E. O. C. Ord, with his brigade of Pennsylvania Reserves, the First Pennsylvania Rifles, a battery of four guns and a detachment of cavalry — in all about 3,900 men — moved from camp near Langley's. Driving a few Confederate cavalry from Dranesville, he entered it. It happened the same morning Gen. J. E. B. Stuart started from the Confederate lines at Centreville with a brigade of infantry, 150 cavalry, four guns and about 300 wagons, to gather cavalry near Dranesville; and it was engaged when he heard that Ord was approaching. Fearing for the safety of his train, and believing that the only way to save it was to attack Ord, he advanced for that purpose, at the same time ordering his wagons back to Centreville. Stuart attacked with great impetuosity, and after a severe fight of two hours was defeated and retreated to Centreville, with a loss of 186 killed and wounded. Ord's loss was 67 killed and wounded. Compared with subsequent events, Dranesville was a small affair, but it gave encouragement to the Union cause and stands greatly to the credit of the Pennsylvania Reserves. Consult "Official Records" (Vol. V).

Draper, Andrew Sloan, American lawyer and educator; b. Westford, N. Y., 21 June 1848; d. Albany, N. Y., 27 April 1913. He attended the public schools of Albany until 1863, when he won a prize scholarship in the Albany Academy. Upon graduating in 1866 he became instructor there, and principal of a graded school, through the next four years. During these years he had been reading law, and, after graduating from the Albany Law School and the School of Law of Union University, he was admitted to the bar in 1871, and practised in Albany till 1887. In 1881 he was elected to the legislature, and for several years was actively engaged in politics. In 1884 he was appointed by President Arthur one of the judges of the United States Court of Alabama Claims, serving until the duties of that court were concluded.

It is, however, for his long and distinct service to the administration of American education that Dr. Draper is best known and appreciated. From 1878-81 and again from 1890-92 he was a member of the board of education in Albany; when in the legislature in 1881 he was a member of the committee on public education; in 1882 he became one of the board of the State Normal School in Albany; in 1887 he was elected President of the North Central Association of Colleges and Secondary Schools, and on 9 March 1904 was chosen commissioner of education of the State of New York. He was chairman of the Department of Education of the International Congress at Saint Louis 1904 and was awarded the grand prize of the exposition for the preparation of educational exhibits from Illinois and New York. Dr. Draper wrote largely on historical and educational matters and in 1905, besides contributing many articles himself to the work, became editor of the educational department of the "Encyclopedia Americana." (See article Education.) A large bronze memorial tablet to Dr. Draper...
was unveiled at the 53d convocation of the University of the State of New York in the State Education Building in Albany on 18 Oct. 1917. Among his numerous publications are 'How to Improve the Country School' (1887); 'Powers and Obligations of Teachers' (1887); 'School Administration in Large Cities' (1888); 'The Indian Problem in the State of New York' (1888); 'History of the New York Common School System' (1889); 'Legal Status of the Public Schools' (1890); 'He of the State in Education' (1890); 'A Teaching Profession' (1890); 'American Schools and American Citizenship' (1891); 'The Spirit of the Teacher' (1891); 'Science in the Elementary Schools' (1892); 'The Pilgrims and Their Share in the National Life' (1892); 'American Universities and the National Life' (1893); 'The Illinois Life and the Presidency of Lincoln' (1894); 'The Rescue of Cuba' (1895); 'Bankers and the Community Life' (1896); 'John Marshall and the March of the Constitution' (1897); 'Memorial of President McKinley' (1897); 'Coeducation in America' (1898); 'The Personal Equation in the Medical Profession' (1898); 'The Recovery of the Law' (1899); 'The University's Return to the State' (1899); 'The Element of Inspiration in the Schools' (1899); 'Educational Tendencies, Desirable and Otherwise' (1899); 'University Questions concerning the Common Schools' (1899); 'Organization and Administration of American Educational Systems' (1899); 'Conserving Childhood' (1900); 'Holiday Papers' (1912), etc. He was also editor-in-chief of 'Self-Culture for Young People' (10 vols., 1906).

DRAPER, Daniel, American meteorologist: b. New York, 2 April 1841. He studied science under his father, J. W. Draper (q.v.), acting as his assistant and amanuensis for years. He helped his brother, Henry Draper, to construct the telescopes, grind the mirrors and build his observatory at Hastings-on-the-Hudson. From 1860 to 1911 he was director of the New York Meteorological Observatory, the self-recording instruments in use there being of his design. He has written a 'Treatise on the Causes of Pneumonia' and also helped his father in the preparation of the intellectual development of Europe.

DRAPER, Eben Sumner, American manufacturer and political leader: b. Hopedale, Mass., 17 June 1858; d. 9 April 1914. He received his education at the Massachusetts Institute of Technology, became a member of the firm of George Draper and Sons in 1880 and selling agent of the Draper Company in 1886. He acquired interests in several manufacturing corporations and was chosen president of the Manville Company and vice-president of the Massachusetts Hospital Life Insurance Company. He took an interest in politics, was chairman of the Republican State committee in 1892 and of the Massachusetts delegation to the Republican National Convention of 1896. He was a presidential elector in 1900, was lieutenant-governor in 1906-08 and governor of Massachusetts in 1909-11.

DRAPER, Henry, American scientist: b. Prince Edward County, Va., 7 March 1837; d. New York, 20 Nov. 1882. He is a son of J. W. Draper (q.v.). He studied in New York from 1852 to 1854 and began the practice of medicine in 1858. He was then professor of physiology in New York University from 1860 to 1866, professor in the medical school from 1866 to 1873 and afterward professor of chemistry. He constructed large telescopes and devoted himself to celestial photography, rendering important service to astronomy and astrophysics. The first direct photographic investigation of the stars which was cut short by his death was provided for by the bequest of the Draper Memorial at Harvard Observatory by his widow in 1886. The construction of the Silvery Glass Telescope (1864; 1904), and 'A Text-book on Chemistry' (1866). DRAPER, John Christopher, American physician: b. Prince Edward County, Va., 31 March 1835; d. New York, 20 Dec. 1885. He was graduated from the medical department of the University of Pennsylvania in 1858 and professor of physiology in that institution 1858-60 and professor of chemistry in the medical department 1866-85. He was also professor of chemistry at Cooper Union and professor of physiology and natural history at the College of the City of New York. He edited the 'Year Book of Natural Science' (1872-73) and for three years edited the natural science articles in 'Scribner's Monthly.' He wrote 'Production of Urea' (1856); 'On Respiration' (1856); 'Text-book on Anatomy, Physiology, and Hygiene' (1882); 'Conserving Childhood' (1899); 'Holiday Papers' (1912), etc. He was also editor-in-chief of 'Self-Culture for Young People' (10 vols., 1906).

DRAPER, John, William, American physician and chemist: b. Saint Helens, Lancashire, England, 5 May 1811; d. Hastings-on-the-Hudson, N.Y., 4 Jan. 1882. He obtained his early schooling at Woodhouse Grove in a Wesleyan Methodist institution and then took up courses in chemistry, physics and higher mathematics under a private tutor. In 1833, when 22 years of age, he came to the United States and entered the University of Pennsylvania, there taking a course in medical studies and graduating with his degree of M.D. in 1836. Shortly after graduating he received an appointment to the chair of chemistry, natural philosophy and physiology in Hampden-Sidney College in Virginia, continuing in that capacity until 1839. It was then that he commenced the experimental researches which rendered his name famous, and during those years he contributed the results of his experiments to the American Journal of Medical Sciences. In 1839 he was called to the chair of chemistry and natural history in the academic department of the University of New York and also gave lectures on physiology to the more advanced undergraduates. In 1841 he became professor of chemistry in the University Medical College and in 1850 professor of physiology. Draper made many improvements in the art of photography. Following out the principles as invented by Daguerre in 1839, he commenced experimenting along the same lines and became the pioneer of photography in America; and it was he who first applied photography to the portrayal of the human face, his first photograph being that of his daughter, taken in 1839. He also discovered and described "miser's images" or orifices and figures and about the same time applied the use of ruled glasses and spectacles to the study of chemical action of light. Dr. Draper's writings were numerous, among the most important of them being 'A Treatise on the Forces which Produce the Organizations
of Plants' (1844), in which the author demonstrates that the most intense action of sunlight is produced by yellow rays; 'Text-book on Chemistry' (1846); 'Text-book on Natural Philosophy' (1847); 'Human Physiology, Statistical, Dynamical, and Miscellaneous Observations and Course of the Life of Man' (1856); 'History of the Intellectual Development of Europe' (1862), a work of great importance and very widely read, later being translated into 10 languages, the purpose of the book being to show that social advancement is as entirely dominated by natural law as is bodily growth; 'History of the American Civil War' (1867-70); 'History of the Conflict between Religion and Science' (1873). His collected works were published in 1878, entitled 'Scientific Memoirs, Being Experimental Contributions to a Knowledge of Radiant Energy.'

DRAPER, Lyman Copeland, American historian: b. Hamburg, N. Y., 4 Sept. 1815; d. Madison, Wis., 26 Aug. 1891. He removed to Wisconsin in 1853, became corresponding secretary of its State Historical Society, and it was mainly through his efforts that the State secured its library and its important antiquarian collection. He published 'Collections of the State Historical Society' (10 vols., 1853-87); 'Madison the Capital of Wisconsin and its Heroes' (1857); 'King's Mountain and its Heroes' (1881).

DRAPERY. See Costumes.

DRAPIER LETTERS, a series of letters published by Dean Swift over the signature M. P. DRAPER in 1724. They were called out by the proposal to impose upon Ireland a debased coinage from which a court favorite and a king's minister were to get the profit. The opposition to the action excited by these letters defeated the project and gave Swift a reputation he never lost. See also Swift, Jonathan.

DRAUGHTS. See Checkers.

DRAVE, drä've, or DRAU, a European river which rises in Tyrol, flows east-southeast, part of its course between a boundary on the left to and Croatia and Slavonia on the right and after a course of 400 miles joins the Danube 14 miles east of Essek. It is navigable for 200 miles.

DRAVIDIAN, a term applied to the people who inhabited the southern part of what is now India previous to the advent of the Aryans, and also to the language spoken by these same people. The Dravidian languages are generally considered to belong to the Turanian class—a family of languages said by some authorities to include all the Asian languages in general, outside the European and Semitic families. The Dravidian languages include the Tamil, Telugu, Canarese, Maylayalam, Tulu, Tuda, Gond, Rajmahal and Orason. There are other minor subdivisions made by some authorities. Only the first four mentioned have a literature. The Dravidians now occupy the greater part of the peninsula of India. The Tudas, or Todas, in the region of the Nilgiri Hills, belong to the lowest of civilized people or races, while among the Tamils are found many who have attained a high place in literature.

The Dravidians proper are quite distinct from the Aryans, but they have been assimilating with those around them, so that now among them may be found traces of the Caucasians, and their literature partakes much of the Aryan culture; but they have kept their speech comparatively pure for centuries. In the southeastern part of the peninsula and in Ceylon live those who speak the Tamil; estimated to be about 18,130,000 people. North of the Tamils and on the east, are the Telugus, 23,540,000 in number. The Canarese is spoken by about 10,530,000 people who live in the western part of the peninsula; and the Malayalam by about 6,790,000 people who live in the southwestern part of the peninsula. The Dravidian population totals 62,720,000.

In the Tamil and Telugu languages there are a number of excellent literary productions; not all original, some are modeled on or adapted from the Sanskrit. Two of the poems which may be traced to at least the 10th century—but which the Tamils claim are much older—are the 'Kintaman' and the 'Nalayir.' The latter has been translated by Pope. The Tamils claim also that Agastya lived before Christ and that he was the first teacher of science and literature. In about the 12th century, the poet Kambar made, in Tamil, an adaptation of the Sanskrit poem 'Ramayana.' One of the two great epics of India; and in the 16th century the poet Ati-vira-Rama Pandya, a native king, wrote works of merit. The Tamil poet Tuyumanavar wrote in the beginning of the 18th century; and at about the same time an Italian missionary, a Jesuit named Bechi, wrote in the Tamil both prose and poetry. The work of this literary priest has done much toward directing the attention of Eastern scholars to the Tamil language and literature.

The oldest poem extant in Telugu language is a version of the Sanskrit poem, the 'Mahabharata,' the other of the two great epic poems of India. This poem was written in the Telugu by Nannaya Bhatta, in the 12th century. A poet named Cesava of the 12th century wrote in the Canarese. In the Malayalam there is one poem based upon the Sanskrit, an account of Rama, a heroic prince who belonged to a royal house of India. There are also versions of both the 'Mahabharata' and the 'Ramayana,' consult Arden, 'Grammar of the Telugu Language' (Madras 1873); Bronn, 'Dictionary of Telugu' (Madras 1852-54); Caldwell, 'Comparative Grammar of Dravidian' (2d ed., London 1875); Carr, 'Collection of Telugu Proverbs' (Madras 1868); Dalton, 'Descriptive Ethnology of Bengal' (Calcutta 1872); Graul, 'Tiruvalluvar's Kural' (Leipzig 1865); Hultsch, 'South Indian Inscriptions, Tamil and Sanscrit' (Leipzig 1890-95); Hunter, 'Dictionary of the Non-Aryan Languages' (London 1869); Kingscote, 'Folk-Lore of Southern India' (London 1890); Oppert, 'Original Inhabitants of India' (London 1893); Pope, 'First Lessons in Tamil' (Oxford 1891); Recul, 'Primitive Folk' (New York 1890).

DRAW BAR PULL. See Locomotive.

DRAW-LOOM. See Damask.

DRAWBACK, in common law, an allowance or rebate made by the United States government to merchants on the re-exportation of certain imported goods, liable to duty. This drawback in some cases consists in the surrender of the whole duties collected on the goods; in other cases, only a part of the duties paid on the importation is returned to the
importer. Goods can thus be sold in a foreign market at their natural cost in the home market.

**DRAWBRIDGE**, a bridge with a lifting or sliding floor, such as may be used for crossing the ditches of fortresses or may be constructed to cross navigable waters where the height of the roadway is insufficient to allow vessels to pass underneath. There are various kinds of drawbridges. One is the lifting bridge, which is raised bodily on one end. For fortifications this is the kind commonly employed, the platform forming or strengthening the gate when raised. For detailed history see *Movable Bridges* under **BRIDGE**.

**DRAWING**, Art. Pictorial Representation and Decorative Design. See ART DRAWING.

**DRAWING, Mechanical**, the art of representing objects on paper, or other flat surface, by means of projections of the objects on imaginary planes. A drawing of this sort is executed with the aid of instruments, such as compasses, scales, T-squares, triangles, etc., especially designed to facilitate its production. The projections of the objects are areas of the imaginary planes which represent the object and are obtained by drawing imaginary lines from the points of the object to the planes. These imaginary lines may meet in a point or be parallel. In the former case the representation obtained on the plane is a conical projection of the object; in the latter, the projectors may be either perpendicular to the plane of projection, giving us orthographic or orthognal projection, or oblique to the plane of projection, giving us oblique projection.

Drawing made on the principle of conical projection is known as perspective drawing and is the basis of all artist's work. This is used chiefly, in a technical way, by architects in making preliminary sketches, in studying problems in design and in showing clients the finished appearance of a proposed building. Perspective is, however, unsuited for working drawings as it does not aim to convey precise detailed information. The term, mechanical drawing, often indicates the type of drawing used in the industrial world by engineers and designers to express and record the ideas and information necessary for the construction of machines and structures. This type of drawing may better be called engineering drawing. Through it the draftsman, using orthographic projection, gives exact and positive information regarding every detail of the proposed machine or structure. By this graphic means any operation may be

![Diagram](image-url)
are revolved into the plane of the paper. Since the object is placed with its principal lines or dimensional axes parallel to the planes of projection, each view shows two dimensions of the object in true size; and any line which runs in the direction of the third dimension is represented by a point. Likewise, any surface in the direction of the third dimension will be represented by a line. If the plane of projection is parallel to the front of the object the resulting projection is called the front view and shows the dimensions of height and length. If parallel to the top or bottom of the object the view shows the dimensions of length and depth. The former is called the top view and the latter the bottom view. If the plane is parallel to a side of the object it is called a side view, which shows the dimensions of height and depth. Any combination of two or more adjacent views may be used to express the object.

It is the manner of arranging these views which determines whether the drawing is made in accordance with first or third angle projection. The former method was abandoned in this country more than 25 years ago and is now almost obsolete. It is occasionally met in old drawings and in foreign drawings and therefore should be understood.

Figs. 1 and 2 show an object made of sheet metal drawn according to first and third angle methods of mechanical drawing.

In both, the following principles are evident: the top view is directly over or under the front view, the side views are in the same horizontal line as the front view and the width of the side views is the same as the width of the top view.

An object is sometimes composed of a combination of units whose dimensions are in different directions and can be shown to better advantage by combining some of the other views with one taken on a plane so placed as to show the dimension of the part not shown in the regular views. Usually it is not necessary to project the entire object on this auxiliary plane, but only the part to be shown in true shape. (See Fig. 3, which is a detailed drawing of a bearing bracket). It is often not possible to show the internal construction of an object clearly by using dotted lines to express the invisible parts in an outside view. In such cases the object is drawn as if parts were cut or broken away. Such a view is called a "section." (See Fig. 4). In it the exposed portions of the cut surface are indicated by section lining, composed of diagonal lines, usually at 45 degrees and spaced uniformly to give an even tone. It must be understood that the portion sectioned to show the interior in one view is not removed from the other views, but is indicated on the view to which the cutting surface is perpendicular, by a broken line consisting of alternate long and short dashes. When a figure is symmetrical along an axis, half only may be sectioned and the other half shown in an outside view. This shows in one view what would otherwise require two.

Working drawings are drawings which give all the information necessary for the complete construction of the object represented. They are divided into two main classes, assembly drawings and detail drawings, which are generally made in accordance with the principles of orthographic projection.

An assembly drawing shows the object with all its parts in their proper positions. A few of the principal dimensions are given and the parts may be indicated by distinguishing marks.
or numbers which serve as a guide to the erector. The over-all dimensions are serviceable in determining the space required. Detail drawings give minute particulars regarding the form and construction of each part of the machine and must be made clearly to be self-explanatory.

All dimensions should be accurately shown (Fig. 3) and it must be borne in mind that the dimensions given are those necessary and most convenient for the workman who is to make the piece. Therefore, the draftsman must put himself in the place of the pattern maker, blacksmith or machinist and must mentally construct the object represented. He must foresee whether the object can be cast or forged practically and economically and must know which dimensions would give in the best way the required information.

All unnecessary labor in drafting should be avoided. The drawing should give the instructions explicitly, but should not be so elaborate as to require a waste of time in its execution. Accordingly, if there is a way of representing an object by a few lines, without sacrificing clearness, that method should be used. There are many details such as screw threads, springs, bolts, rivets, gear wheels, etc., which occur so frequently in working drawings, that easy methods of representation or conventions have been universally adopted.

The steps to be taken in making a working drawing may be summarized as follows: (1) Pencilling on paper.

(a) Choice of views — Make only as many views as are necessary to describe the object. Some thought will be involved as to which view will show the object to the best advantage: whether a section will explain the construction better than an exterior view; whether an auxiliary view will save one or more other views.

(b) Choice of scale and size of paper — Since the drawings are to be filed for reference it is necessary to establish some sheets of standard size, which would determine the scale.

(c) Block in all views and take care that the location of views on sheet will allow for title and notes.

(d) Complete outline.

(e) Dimension.

(f) Add section lines, notes, title, border, trimming line. (2) Tracing on cloth.

(a) Stretch cloth on pencilled drawing. Dust with chalk or prepared pounce and rub off with a cloth to remove any traces of grease which sometimes prevents flow of ink.

(b) Ink all circles, arcs, irregular curves.

(c) Ink-in horizontal lines with T-square and vertical lines triangle. Work from top to bottom and left to right.

(d) In this order ink-in inclined, dimension, extension and centre lines; arrow heads, figure notes, title, section lines and border.

Before sending to the shop, a working drawing must be checked for errors and omission, by an experienced checker.

To be effective the checking should be done systematically and with thorough concentration which allows nothing to distract attention. Observe this method: (1) Be sure that the views completely represent the object to be constructed and that they are properly arranged with respect to each other, according to the third angle method; (2) check all dimensions by scaling, and where advisable also by calc-
lation. Dimensions of parts which go together should be compared. Also see that there are no interferences with adjacent parts and that proper clearances have been allowed. This is especially true in connection with mechanical movements, which should be laid out to scale so that the clearances are maintained; (3) the dimensions should be given as required by the shop, that is, the shop should not be obliged to add or subtract to obtain any dimensions; (4) the proper finish marks should be indicated and likewise the character of the finish designated; (5) all the necessary specifications of materials should be correctly given; (6) all small details, screws, bolts, pins, keys, rivets, etc., should be standard and where possible stock sizes should be used; (7) the title or record strip should be checked to make sure that it contains in complete yet concise form all necessary details; (8) in connection with any points that have suggested themselves during this checking, the drawing should be reviewed in its entirety; (9) add any explanatory notes which from experience will enhance the efficiency of the drawing; (10) before placing your initial on the title space and assuming the responsibility for the accuracy of the drawing answer the question, "Am I willing to sign this drawing as checked?"

Several kinds of one plane projection which result in a conventional picture have been devised, so that the pictorial effect of perspective drawing is combined with the possibility of measuring directly the principal lines.

The third dimension is shown by turning the object in such a way that three faces are visible. Although these methods of representing objects have pictorial advantages their usefulness is limited, and there are some limitations. The representations are distorted until the appearance is often unreal and unpleasant. Only certain lines can be measured and the execution requires more time, particularly if curved lines occur. Nevertheless these methods are often used to great advantage in technical illustrations, patent office drawings, piping lay-outs, etc. The simplest of these systems is isometric drawing. If a cube is considered to be placed with one of its diagonals perpendicular to a plane, the edges of the cube will make equal angles with the plane of projection; and if an orthographic projection of the cube is made on the plane, the projection of the edges will be equal in length. The projections of the three edges which intersect (AB, CB, DB) at B will make an angle of 120 degrees to one another, as shown, Fig. 5. These lines are called isometric axes and are parallel to the directions of the three dimensions of the object. The representations of edges which are parallel to these in space will be parallel to the isometric axes and are called isometric lines. In this projection all the lines have been shortened owing to the fact that they make angles to the plane of projection. If this foreshortening is disregarded and the full lengths laid off on the axis, the figure will be slightly larger but of exactly the same shape. This is known as isometric drawing and is used almost exclusively instead of isometric projection. It has the advantage of measuring the lines directly with ordinary scale, and the increased size is usually of no consequence. Lines not parallel to one of the isometric axes are called non-isometric lines. Measurements can be made only on isometric lines. If a non-isometric line is to be drawn, it must be drawn by reducing it to a system of isometric co-ordinates. In this way curves of any shape may be constructed.

Oblique Projection (see Fig. 6), sometimes called cavalier projection, is based on the principle that one face of the object is placed parallel to the plane of projection. The projectors make angles of 45 degrees with it in any direction. Thus lines perpendicular to the plane of projection will be projected in their true length. Oblique projection is similar to isometric drawing because it has three axes representing three mutually perpendicular lines; upon these lines measurements can be made, and two of the axes will always be at right angles to each other and will represent lines parallel to the plane of projection. The third axis may be represented at any angle, but 30 degrees is generally used. One face of the object will be represented without distortion. This is one of the advantages of oblique projection over isometric, particularly in representing objects with circular or irregular outlines. There are general rules in connection with drawing of this sort: First, place the object so that its irregular outline or contour will be parallel to the plane of projection; and second, if possible have the longest dimension parallel to the plane of projection.

Axonometric Projection.—The principle of isometric projection was shown to be based on the orthographic projection of a cube whose axis is perpendicular to the plane of projection. The cube might be placed in any other position with respect to the plane of projection, so that its projection would show three faces, and the angles and proportionate foreshortening of the
axes used as a basis for a pictorial representation. This system is known as axonometric (or axometric) projection. This is the general system and it will be noticed that isometric projection is a special case in which the axes are foreshortened equally. When two axes are equal and the third unequal the system is called "dimetric" projection, an example of which is shown in Fig. 7. Here the ratios are 1:1:½ and this makes the tangents of the angles one-eighth and seven-eighths as shown.

Other positions of the object, which would show less distortion, can be found but are not often used because there is greater difficulty in execution.

In drawing the crystal figures in mineralogy a system known as "clinographic" is used. This is based on oblique projection. The object is placed with its vertical axes parallel to a vertical plane of projection; and it is rotated about this axis until the horizontal axes make angles to the plane of projection, whose tangents are respectively one-third and three. The object is then projected on the vertical plane of projection, as shown (Fig. 8), by profile lines which make an angle to the plane of projection whose tangent is one-sixth. The result is a pleasing representation of the object.

Machine Design.—A machine is a combination of mechanical movements constructed to transform energy directly or indirectly from natural sources into useful work. The design must be thought out with a view toward the economy of this transformation together with the economic manufacture of the machine. It may therefore be stated that machine design is a problem involving the proper co-ordination of the following elements: Required work; available power; mechanism or kinematic mo-
There are, of course, no set rules which can be laid down for the method of procedure in completing a mechanics are enclosed here are right and wrong ways of attacking the problem, and since the same principles of design are applicable to all machines the following general plan of solution is given.

1. Given — (a) Kind of work to be done. (b) Available power, mechanical, steam, gas, electric or hydraulic and the method of application of the power to the machine, i.e., whether belt or direct. (c) Capacity and limiting proportions.

2. Determine the kinematic train with which to connect the available power so that the required extent may be produced with a minimum energy loss. The design and selection of a combination of material elements so connected that motion in any one involves definite, relation, constrained motion of the others for a given machine, is governed by the manner in which the energy is supplied and the character of the work to be performed; for the energy may be supplied in one form of motion and the work done with quite a different one. If a mechanism which will accomplish the desired results already exists the problem is one of selection and arrangement of parts. But if a new type of machine is desired or a new mechanism necessary, the problem may become one of the nature of invention. While it is true that the mechanism can usually be designed without reference to the energy transmitter it is necessary to analyze the kinematic energy cycles before any definite dimensions of the parts of the mechanism can be fixed. Furthermore as stated above the methods and available facilities of construction control the design to a certain extent. Lay out the center lines of the machine according to the above determinations and check for limitations of motion, interference, etc.

2. Clothe the mechanism decided upon in metal by determining the general form of the elements and the materials best suited for their construction together with the allowable working stresses. Complete the sizes of such parts of the mechanism as a simple layout will permit. Lay out the principal joints of the mechanism. When mechanisms are enclosed built from the inside out. Don't design the frame first and try to put the mechanism inside, the frame must conform to the mechanism.

In many cases the forces acting on the machine element are very complex, owing to any combination of the following conditions: (a) Transmission of force from one element to another. (b) Internal restraint due to circumstances in manufacture. (c) Restraint due to energy transmission. (d) Forces due to the inertia of moving parts.

Therefore the theoretical design is not always clear and our knowledge of materials and their laws is limited in many respects so that in many cases we must rely on judgment and empirical data, the result of experiments. Even where the conditions are clear the design must always be controlled by practical modifications and construction considerations. The designer must therefore be a man of judgment, thoroughly familiar with the production of machinery, and the relation thereto of the allied commercial departments so that he may give each factor its proper weight and obtain the best results at the least possible cost.

The last step, specification and drawing, is a necessary and important supplement to the process of design. It is a powerful aid to the mental process of the designer and is the best and easiest way of showing the work done. Often how the machine is to be constructed, and also of making a record of what has been done. The drawing is the machine design itself, as machines may be designed and built without drawings. It is, however, an essential part of the designer's equipment because the mere act of putting the results of his thought on paper is one of the greatest helps to force systematic and definite thought.

Design which stops short of exact working drawing is only half done. In fact the crucial test of practicability of a piece as part of a machine is the possibility of its being exactly detailed. It is more easy to generalize than to get down to exact detail and there is nothing more productive of trouble, delay and waste of time and money than poor detail drawing.

Very often written specifications to accompany the drawings are not only useful but necessary, and as the writing of these specifications presupposes a most intricate knowledge of design and selection of materials, the highest skill of a designer is often needed clean and fully to specify in writing just what is to be done.

The actual process of drawing in the development of a design may be outlined as follows: Rough sketches merely representing ideas, not drawn to scale, are made to determine the mechanical ideas concerned in the design. These are followed by layout drawings in which the design is developed and the general detail established. This drawing contains the principal dimensions to fix and control the detailed design. Each part of the machine is then detailed and a working drawing showing every small detail of its shape together with dimensions and specifications is made so that the workman may be definitely informed as to its construction. Assembly drawings are then made and constitute the last step in the representation. They show the parts assembled in the complete machine. The layout mentioned above may be finished up into an assembly drawing, but it is usually safer and the latter a separate drawing, as changes in detail are often necessary, and it will serve a valuable aid to the draftsman in checking up the dimensions of his detail drawings.

GEORGE C. AUTENRIETH,
The College of the City of New York.

DRAWING-BOARD, a board on which paper is strained for water-color painting. It is made of a flat piece of wood held together and
prevented from warping by an edging of other pieces, the grain of which runs in an opposite direction. The inner side of the paper is first dampened and then attached to the edges of the board with thin glue, gum or paste, and when dry becomes perfectly tight and flat. In charcoal or crayon drawing the board is used, but the paper is merely pinned on the board.

DRAYTON, Michael, English poet: b. Heversham, Warwicksire, 1563; d. London 1632. His first appearance as an author was in 1591, by the publication of 'Harmony of the Church, Containing the Spiritual Songs and Holy Hymns of Godly Men, etc.' followed in 1593 by 'Isa, the Shepherd's Garland,' and 'Roland's Sacrifice to the Nine Muses,' a series of elegies. In the same year appeared his 'Legend of Piers Gaveston,' and in 1594 his 'Matilda.' Drayton's great poem is his 'Polyolbion' (1613), a sort of topographical description of England. It is generally extremely accurate in its details, with, at the same time, many passages of true poetic fire and beauty. It is frequently, however, tedious and obscure, and its extreme length is sufficient to deter many from undertaking its perusal. The gem of Drayton's poems is his 'Nymphidia, the Court of Fairy,' edited by Sir E. Brydges in 1814. His other works comprise several historical poems, such as the 'Barons' Wars' (1603, first issued in 1596 under the title 'Mortimeriado'); 'England's Heroical Epistles' (1597); the 'Legend of Great Cromwell' (1607); the 'Battle of Agincourt' (1627); besides numerous legends, sonnets and other pieces. He was buried in Westminster Abbey, where there is a monument to his memory. His complete works appeared in 1748. Morley published selections from his 'Poems' (London 1878). consultant Elton's 'Introduction to Dayton,' (Manchester 1895), and 'M. Drayton, a Critical Study' (London 1906).

DRAYTON, Thomas Fenwick, American military officer: b. South Carolina about 1807; d. Florence, S. C., 18 Feb. 1891. He was graduated at the United States Military Academy in 1828, and resigned from the army in 1836. He entered the Confederate army upon the outbreak of the Civil War and played a prominent part during the attack on Fort Royal, commanding a force in Fort Walker which he was forced to evacuate.

DRAYTON, William, American jurist: b. South Carolina 1733; d. June 1790. He was educated for the bar in the Middle Temple, London, where he studied four years. He returned to America in 1754, and was appointed chief justice of the province of East Florida in 1768. During the war of the Revolution he was suspended from his office and reinstated in it, and went with his family for a time to England. Later he became successively judge of the Admiralty Court of South Carolina, associate justice of the State and a judge under the Federal government.

DRAYTON, William, American politician: b. South Carolina; d. Philadelphia, 24 May 1846. He was a representative in Congress from South Carolina from 1825-33, and in 1830 was a leader of the South in the slavery question. He became successively judge of the Admiralty Court of South Carolina, associate justice of the State and a judge under the Federal government.

M. Biddle as president of the United States Bank, the affairs of which he found it impossible to retrieve.

DRAYTON, William Henry, American statesman: b. Drayton Hall, S. C., September 1742; d. Philadelphia, 3 Sept. 1779. He was educated in England at Westminster School and at Balliol College, Oxford. Returning to America in 1764, he became an active writer on political affairs and published letters on the abuses of the government, which brought him into controversy with Christopher Gadsden and other patriotic leaders. As the Revolutionary crisis approached he espoused the popular cause. In 1774 he was appointed judge of the province, and when the Continental Congress was about to sit he published a pamphlet under the signature of 'A Freeman,' which substantially marked out the line of conduct pursued by the Congress. In 1775 he was president of the Provincial Congress, and in 1776 was elected chief justice of South Carolina. He was a member of the Continental Congress from 1778 till his death. His 'History of the Revolution' appeared in 1821 in greatly expurgated form. His son, John Drayton, governor of South Carolina in 1800-02 and 1808-10, was a signer of the Articles of Amity and Commerce with Great Britain of 1786, and was a member of the Continental Congress from 1778 to 1781, when he died.

DREAM OF GERONIUS, The. Cardinal Newman's 'Dream of Gerontius' is a poem of the passing of the faithful soul from earth to purgatory. Gerontius in the horror of dissolution girds himself to his last preparation among his praying friends and fades into his last sleep. The next stage, the soul passing, is a penetrating intellectual conception realized imaginatively in the simple and graceful utterances of the soul and the guardian angel. The third stage, the soul passed, brings the two together in dialogue. Still conversing with the angel, Gerontius then on his way to God meets jeering demons. The final stage is expressed in the praises of angelic beings and in the soul's cry before the face of God. 'Take me away, that sooner I may rise.' The verse is perhaps Newman's highest achievement in variety and range. The simple stanza of 'Praise to the Highest in the Height' is carried forward in successive stanzas to effects of piercing simplicity. The dignity of the iambics, the weaving in of litany and psalm and the use of various stanza forms, constitute an exquisite adaptation, and the poem is no less remarkable in its total movement. It unites with exceptional power the intellectual and the emotional values of poetry. Without sacrifice of precision, theological conceptions are transmuted imaginatively into personal experiences. Infinity and purgatory pass from abstract idea into intense feeling. The poem has been set to music by Sir Edwin Elgar.

CHARLES SEARS BALDWIN.

DREAMS. These are mental activities, carried on during sleep, which are at times brought into consciousness by a process of secondary elaboration. They are as necessary a part of the brain's activity as is the movement of the heart or the storage of glycogen in the liver, functions of these two other organs respectively. All people dream during sleep, but not
DREAMS

all the dream activities come into consciousness. In some, the memory of the dreaming is very distinct. In others it is less so. Careful attention to the subject shows the universal accessibility of the brain phenomena, and modern investigation is showing that the functional activity of the brain during sleep is of equal if not greater importance than the same activity during the waking state. The dream is the index or the mode of activity of the unconscious. Logical thinking, so-called, that of the conscious.

Cabanis, in his 'Rapports du Physique et du Moral de l'Homme,' says of Condillac, that he is often brought to the conclusion in his dreams concerning the issue of events which at that time occupied his mind.

Coleridge thus describes the circumstances under which the fragment called Kubla Khan was composed. He had fallen asleep in his chair, and during this condition, huge fragments of a palace built by Khan Kubla, and remained in that state for about three hours; during which he could not have composed less than from 200 to 300 lines, if that can be called composition in which all the ideas rose up before him as things with a parallel production of the correspondent expressions, without any sensation or consciousness of effort. On awaking he instantly sat down to commit the poem to paper. After he had written the lines subsequently published, he was interrupted for a time, and when he returned to the poem the poem had vanished from his memory. These are illustrations, by no means rare, of the fact that the real creative capacity of the brain is largely an unconscious product.

We may seem to live a weary lifetime in the dream of a minute; the sprinkling of a few drops of water on a gentleman's face was accompanied by a dream in which the events of a whole life passed before him, ending with a protracted struggle on the borders of a lake into which he was plunged. The whole process must have taken place in a second or two, as the dreamer was aroused from sleep by the application of the water. Some authorities declare that all our dreams take place when we are in process of going to sleep or becoming awake, and that when deep sleep the mind is totally inactive. This is denied by the majority of philosophers, and with apparent reason.

Freud, one of the most acute and painstaking of all the students of the dream phenomena, has truly stated that all men are great in their dreams. The dream is the primary creative art. Its great rapidity is due to the fact that in the unconscious all of the individual's life accumulated experiences are on view, as if in a cinematographic flash. The stream of the unconscious contains the entire urge of the individual's life, which when it would come into consciousness is immediately blocked off and only a tiny jet of it, as it were, permitted to pass beyond the portals into consciousness. It is a brain function to push back almost the entire force of this accumulated impulse and permit only a little of it to enter into real action—i.e., to do useful work. By useful here is meant the purposeful work demanded by the rules of the herd.

The dream is a fragment of this great urge of the individual's inside activity, hence Freud called it a wish-fulfilment, as Heraclitus, the original pragmatist, did 500 B.C. This Greek philosopher truly said, "For the waking there is one common world, but for those asleep, each one retires to his own privacy. And do you imagine we could do with impunity what we dream? Is it not because we lie still and do not act we can indulge our fantasies?" This statement of Heraclitus versus Freud is accepted by the chief activities of the dream process, namely, that it is a compensation in fantasy for what is denied the individual in reality, hence it is a great balance wheel for cultural repression. The dream seems chaotic and meaningless, however simple, because it is expressed by a special type of symbolic thinking. All thinking is symbolic, but ordinary logical thinking proceeds along conventionalized and disciplined community thinking. It is thinking which deals largely in terms of herd agreements. Dream thinking is highly individualistic and only deals with primitive types of resemblance. It is related to animistic thinking. It is guided largely by individual egoistic strivings and like any foreign language needs a key for its interpretation.

Since the two primary wishes which have ever been present in all living matter have been to live and to reproduce, a rigid application of such a formula to the dream will bring out the nature of its wish-fulfilling fantasy of the individual, hence any dream may be said to contain a medley of these two motives. It may not be possible to construct a full measure of the dream wish from the fragment which is remembered because this remembered fragment presents only a much distorted, revamped account of the primary wish activities of the patient. One can understand a dream by picturing oneself an inverted cone. From the bottom of this cone a stream of feeling arises. This feeling stream is unharnessed, undirected, it is just plain urge of the individual's organic cravings. But such cravings need outlets, and in some kind of action, so as the cravings, which are highly dynamic, rise more and more insistently for expression, they catch up symbolic forms of things through which they can express themselves. They become dramatized as it were, and thus the feelings get related to ideas and to objective forms. As the dream is intensely creative, the objects first chosen may not be considered consciously eligible for expression, hence a form of camouflage takes place; these are technologically termed psychoanalytic literature distortions or displacements, condensations or secondary elaborations, so that by a process of caricature the original cravings
come to a process of expression in a form which
the cultural level of the individual will permit.
This completed product is termed the manifest
content of the dreamer. It is the elaborated,
modified caricature of the original type of striv-
ing for freedom that can be understood almost
intelligible to the dreamer. Yet it has done its
work. It has helped to conserve sleep and dis-
charged the energy which lay behind the

craving.

Children's dreams are apt to express their
cravings with but little symbolic distortion.
As the individual grows up, however, these more
childish strivings take on more definite char-
acter, but in the dream are subjected to greater
and greater distortion. Hence in most adults
the wish is much modified in its presented and pre-
sentable form. All dreams mean something. It
may not be possible to find out, or it may not
be worth while, but it is certain that they have a
physiological function just as much as does
respiration, circulation, digestion, etc. The
analysis of these latter functions is still very
important, but also is the analysis of the dream
function. Human knowledge of human activi-
ties is still far from satisfactory, but in dream
comprehension a great advance has been made
by recent psychoanalytic investigation. For
the literature to 1917 and full discussion, consult
Jelliffe, 'Technique of Psychoanalysis' (Ner-
gowda and Munn Interactive Disease Monograph Series, New York and Washington).

SMITH ELY JELLIFFE

DREBBEL, Cornelis van, Dutch philos-
opher and inventor: b. Alkmaar, North Hol-
land, 1572; d. London 1634. He lived in Lon-
don from the year 1620, devoted entirely to
scientific labors. He invented several philo-
sophical instruments, among which, it is said,
were the compound microscope and a ther-
ometer consisting of a glass tube containing
water connected with a bulb containing air.
His contemporaries say that he displayed to
King James a glass globe in which by means of
the four elements he had produced perpetual
motion, and that by means of machinery he
imitated rain, thunder, lightning and cold, and
was able quickly to exhaust a river or lake.
He discovered a bright scarlet dye for woolens
and silks which was introduced into France by
the founders of the gobelin manufactures; and
the invention of the telescope has been ascribed
to him, but on no good grounds. Drebbel left
treatises which appeared first in Dutch (1608),
and afterward in Latin, under the title
'Tratatus duo: De Natura Elementorum; De
Quinta Essentia' (1621). It was also translated
into French (1623).

DREBER, Heinrich, known as Franz-
1822; d. Anticoli di Campagna, near Rome, 3
Aug. 1875. He began his art education at the
Dresden Academy, and became a pupil of Lud-
wig Richter whose idealistic style he copied.
He went to Rome in 1843 at the expense of
the city, and his pictures are in the Berlin
National Gallery, namely,
'An Autumn Morning in the Sabine Moun-
tains'; and 'The Hunt of Diana.' A land-
scape, with the figure of the 'Good Samaritan,'
is to be found in the Dresden gallery.
public excitement over the slavery question was so intense and menacing to the Union (just after the Buchanan-Fillmore election), that it was deemed wise to have Chief Justice Taney write a full and careful review of the whole law on the subject of slavery, in hope of making the members of the free-soil party accept it contentedly and cease their agitation. Taney and six assistant judges concurred against Scott; Curtis and McLean dissented.

The written decisions were withheld from the public till 6 March 1857, two days after the inauguration, to avoid embroiling Pierce's last months. The decision proper was essentially the same as that of the Supreme Court of Missouri; that Dred Scott as a negro was not a citizen of the United States within the intent of the Constitution, and therefore the Circuit Court had no jurisdiction and the suit should be dismissed. This decision remained United States law, an irremovable barrier in the way of granting civil rights to the colored race, till the passage of the Fourteenth Amendment (see Constitution—Amendments).

Unfortunately, the court did not confine itself to the case before it; but for the reasons above mentioned, and to answer for the propriety of the arguments brought forward by counsel, who went out of their way to deliver a series of obiter dicta (personal judgments not needed or relevant for the case in hand, and therefore not law), which inflamed the public wrath immeasurably. The aggravation of the slave power, have remained in public memory as the only interesting points in the case, and are, in fact, by far the most important aspects of it. These were three: in essence, that African negroes had never been recognized in American law or custom as persons; that Congress had no power to make regulations for the Territories acquired after the Constitution was adopted, except under the Constitution, which recognized slaves as property; and that the Missouri Compromise, already repealed by the Kansas-Nebraska Bill, had never been constitutional.

(1) Of course no exception had been taken by Scott's counsel to the circuit court's ruling that negro blood was no bar to citizenship; but the Supreme Court dragged it in and overruled it. In the counsel's statement of the condition of public opinion at the time of framing the Constitution, they used a phrase which is immortal in public memory, and usually supposed to be their own decision as a point of present law; that negroes were then regarded as "so far inferior that they had no rights which the white man was bound to respect," and to be rightfully made slaves for white men's benefit. The court held that they were regarded in the Constitution as only chattel property; were not included in the words "people of the United States" in the Declaration of Independence, the Articles of Confederation or the Constitution, remained in this condition of civil nullity even when emancipated, had no rights except such as each State chose to grant them, and could not become citizens capable of suing and being sued. The dissenting judges pressed the notorious distinction between citizenship and suffrage (See Citizen); called attention to the Constitution's repeated mention of the negroes as "persons," and to the fact that free negroes were actually voters in five of the States in 1878, and were so even yet save where the States had changed their Constitution to disfranchise them; and held that the civil rights of free negroes were the same at least as those of women and minors. (2) As to the Territories, the obiter decision was that as the Constitution admitted slaves to be property, and by the Fifth Amendment Congress had no right to take away a State's property without compensation, it had no right to make laws barring slave property from the Territories more than any other; that its rules and regulations must be in conformity with the Constitution. The dissenting judges held that both by common law and the Constitution slavery was a purely State institution (cf. Art. IV, § 2, par. 3: "No person held to service or labor in one State, etc., sustainable only by State law and State police power of quelling resistance; that once out of the State's power, a slave instantly became free by the law of nature, and that State law could not follow him to the Territories. (3) The decision that the Missouri Compromise was unconstitutional, as interfering with the natural right of a slaveholder to take his property with him, and with the constitutional equality of citizens of different States, followed from the court's opinion on the second point. The dissenting justices held that the Compromise was a rightful exercise of the constitutional power of Congress to legislate for the Territories, and never before questioned since the government was founded; and that it did not violate the equality of citizens because citizens could only hold slave property in States that permitted and enforced it.

The whole question was soon decided by the war. Scott and his family were inherited by Calvin S. Chaffee of Massachusetts (then in Congress), were conveyed by him to Taylor Blow of Saint Louis for emancipation, and were emancipated 26 May 1857. Consult decision in Howards' "Report in the Case of Dred Scott" (1857); Benton, "Examination of the Dred Scott Case" (1860); Corwin, "The Dred Scott Decision in the Light of Contemporary Legal Doctrines," in American Historical Review (Vol. 17, No. 4); "Life of Taney" (Baltimore 1872); Curtis, G. T., "Life of B. R. Curtis" (Boston 1880). The Missouri Historical Society has a portrait of Scott, from a photograph.

**DREDGE**, a machine for excavating mud, rock, or other solid material from the bottom of a body of water. Essentially the dredge consists of a scoop of some sort to pick up the material to be excavated, and a derrick-like mechanism to lift the scoop with its load up to and above the water level, and dump it. There are many ingenious modifications of this essential idea, by which the movements of a shovel, of a grasping hand, or of an ice-tongs are imitated with great precision and with immense power at points 40 feet below the water level. The machinery which operates the dredge is built upon a scow or boat which is floated over the place where the work is to be done. The dredge is held in position by heavy posts called "spuds" which go down loosely through openings in the deck of the scow and rest on the water bottom. There are usually three of these, two at the shovel or bow end
of the dredge and one (sometimes two) at the stern. The bow spuds are much larger, having to withstand the strains of the working shovel. In some large dredges the bow spuds are built up timbers upwards of 40 inches square and over 50 feet long, with a heavy iron shoe at the bottom. To the shoe is bolted a "foot" of timber, covering an area of 10 by 12 feet, to give a substantial bearing on a soft mud bottom. To add to the grip on the bottom some dredges have tackle attached to the bow spuds by which the scow may be hoisted upon them above its natural floating level, thereby shifting a part of the weight of the dredge and its machinery upon the spuds, and thus pressing them down the more firmly. When the dredge has finished the work it can reach from one position, the spuds are raised clear of the bottom, and the machine is moved by a tugboat or by pulling on chains attached to anchors.

Dredges are of two general classes: intermittent and continuous. The former operates a single bucket or scoop, and alternately digs and lifts the load; the latter digs continuously, raising the material at the bottom. To the intermittent class belong the dipper dredge and the grapple or grab dredges. To the continuous class belong the ladder dredges, the hydraulic or suction dredges and the scouring dredges.

Dipper Dredge.—The dipper dredge is similar to the steam shovel used in earth excavation on land, except that it is worked from a float, and that the dipper or bucket is much larger—up to 15 cubic yards capacity. The dipper is a part of the weight of the dredge and in use in the United States, and is effective in depths of less than 50 feet of water, and in the greatest variety of bottom material. It will dig economically in stiff clay, hardpan and even soft rock. For such work the dipper is armed with teeth of appropriate size and shape, and a small bucket is used. Generally the material is placed upon a scow moored beside the dredge. In some instances the handle of the dipper has been lengthened so that the spoil may be dumped upon a nearby bank. With a dipper of such capacity the output of one of these dredges working in ordinary earth is about 5,000 cubic yards per day of 10 hours.

Grab Dredges.—These are of two models, with, respectively, the clam-shell bucket and the "orange-peel" bucket. The former has a bucket composed of two great scoops which close together at the bottom like the valves of a clamshell. They are hinged at the top. They are spread wide open as they descend, close upon the material at the bottom, and remain closed as the bucket is lifted until released to drop its contents upon the scow tender alongside. The orange-peel bucket is of hemispherical shape, divided into three or four sharp, curved triangular sectors, resembling the sections of peel removed when peeling an orange in the usual manner. With a bucket of such capacity the output of one of these dredges working in ordinary earth is about 5,000 cubic yards per day of 10 hours.

But their weight to drive them into the material they have to dig. One advantage of the grab bucket has over the dipper is the speed with which it gathers its load and drops it. The largest of these buckets have a capacity of 12 cubic yards, and their output on a long job averages about one bucket per minute, two-thirds of a ton of 10 by 12 feet.

Ladder Dredge.—The ladder dredge operates an endless chain to which many buckets are attached, the chain traveling around a ladder-shaped frame, hinged to the superstructure of the vessel at the top. The lower end of the ladder is close to the bottom when it touches the bottom, and the chain of buckets is then run at high speed, scooping up the material of the bottom as the dredge moves forward—usually under its own motive power. The buckets have a capacity of about one cubic yard and are raised at a speed of 10 per minute. The dredged material is carried to the top of the ladder and is there dumped into chutes which discharge it into scows alongside; or it may go into hoppers constructed in the hull of the boat itself. Another modification for canals provides that the material be delivered directly by which the material is delivered on the canal banks. The ladder dredge is extensively used in mining operations in the streams of Alaska, California, South America, Siberia and South Africa, digging up the gold-bearing sand and gravel from the creek bottom and laying it on the dredge where the gold is recovered and the waste returned to the stream. Tin and platinum are recovered in the same way.

Hydraulic Dredge.—The hydraulic dredge sucks up the material of the bottom down through a powerful centrifugal pump. Where the bottom is hard a revolving cutter head is attached to the inlet pipe of the pump and this breaks up the bottom and mixes it with the water so that it will be of the right degree of fluidity to flow or may be thrown through pipes into about 15 parts of water to one part of solid material. The cutter head may be pushed ahead of the vessel on a boom dragged by a flexible suction pipe. The hydraulic dredge works well in sand, gravel, alluvial deposits and earth free from stone. With a six cubic yard capacity the output of one of these dredges working in ordinary earth is about 5,000 cubic yards per day of 10 hours.

Sometimes a long pipe line is laid from the dredge to a point on shore where the spoil may spread out and settle into solid land as the water drains away. In this way much marsh land is filled in and made available for use, and the cost of the dredging not only recovered but a substantial profit secured. In some cases the dredge float has hoppers into which the discharge is poured, the solid matter settling and the water running out at the scuttle holes. Sea-going dredges of this type work well in harbor water. When their hoppers are full they sail 8 or 10 miles out to sea and dump them.

Universal Dredge.—This title is given to large sea-going dredges which are fitted with both the ladder with its endless chain of buckets and a great hydraulic pump and pipe line. Some of these vessels are of the diminu-
sions of small steamships, with hoppers capable of carrying 2,500 cubic yards of dredged material.

Bearing Dredge.—The scouring dredges are simply submersible harrows, scrapers and agitators used to stir up light silt bottoms and bars so that the natural current of the stream may carry the material to a point where it is not objectionable. The same result has been attained by the use of water jets and aeration with compressed air.

Dredges are employed in some cases in land excavations, a pool sufficient to float the dredge being artifically formed, water being supplied to preserve the pool level as the digging proceeds. This method has been successfully used in digging irrigation canals in the arid regions of the Western States. Along the Mississippi and Ohio rivers dredges are used to secure sand and gravel for commercial purposes, the hydraulic dredge being used for sand, and the ladder dredge for gravel. Incidentally the river channels are improved, as the operations are conducted under the directions of government engineers. Consult Fowler, C. E., Practical Treatise on Submerged Foundations (New York 1914); McDaniel, A. B., "Excavating Machinery" (New York 1913); Prelini, C., "Dredges and Dredging" (New York 1911).

DREDGING, the operation of removing mud, silt and other deposits from the bottom of rivers, docks, etc., by mechanical means. The most simple dredging apparatus is the shovel apparatus, which consists of a strong iron ring or hoop, properly formed for making an impression upon the soft matter at the bottom, so as to scoop it into a large leather bag attached to the ring and perforated with a number of small holes. The means for working it is a long handle, a suspending rope, and a crane or sweep-pole planted in a boat. This primitive apparatus was formed on in the canals and ditches of the Netherlands. Much more effective is the steam dredging-machine now in common use. It is said to have been first applied by Boulton and Watt for use on the weir at Sunderland, England, in 1796. It has a succession of strong iron endless chain running on a frame, the lower end of which is vertically adjustable so as to regulate the depth at which it works. The buckets tear up the matter at the bottom, raise it and discharge it into barges or hoppers stationed close to the dredging vessel. The Suez Canal was excavated by means of a ladder dredge with a long chute and supporting girder. The material excavated was carried in boxes on a sort of tramway and tipped out on the bank.

In excavating at Hell Gate and Flood Rock Reefs, at New York, a barge measuring 120 feet in length, 44 in beam, and 15 in depth, used a grapple which weighed 15 tons and lifted boulders of 70 tons. In some cases the current of river or tides has been utilized in dredging channels. In bottoms of mud or loose sand the steam pump or hydraulic dredger may be used. The watery material is pumped out and deposited on the shore; the water drains away, leaving the sand or mud. By this means more than 3,000 cubic yards a day can be excavated at an extremely low cost. Great improvements have been made in hydraulic dredges, and some built in recent years for use in the Mississippi River have a capacity of over 1,000 cubic yards per hour.

Dredging is also the operation of dragging the bottom of the sea in order to bring up oysters, or to procure shells, plants and other objects for scientific observation. The oyster dredge is a light iron frame with a scraper like a narrow hoe on one side, and a suspending apparatus on the other. To the frame is attached a bag made of some kind of netting to receive the oysters. The dredges used by naturalists are mostly modifications of or somewhat similar to the oyster dredge. Scientific dredging has of late assumed a high importance, as making us acquainted with the life of deep-sea areas. See DEEP-SEA LIFE.

WILLIAM H. HEUER,
Corps of Engineering, United States Army.

DREIBUND, dri·bünd. See TRIPLE ALLIANCE, THE.

DREIKANTER, dri·kant-ér, or WINDKANTER, rudely triangular polished pebbles, which have been worn smooth by drifting sand. They may be seen in most regions of sand dunes, but especially in deserts.

DREISER, dri·sér, Theodore, American editor and author: b. Terre Haute, Ind., 27 Aug. 1871. He received his degree at the University of Indiana, and in 1892 began his career as a journalist on the staff of the Chicago Daily Globe. In 1892-93 he was successively dramatic editor and special correspondent of the Republic of Saint Louis. His next work was on special assignments for various magazines. In 1905-06 he edited Smith's Magazine, and in the following year was managing editor of the Broadway Magazine. From 1907 to 1911 he was editor in chief of the Butterick periodicals. He wrote several magazine articles and also "Sister Carrie" (1900); "Jennie Gerhardt" (1911); "The Financier" (1912); "A Traveler at Forty" (1913); "The Titan" (1914); "The Genius" (1915); "Plays of the Natural and the Supernatural" (1916). His novels are of the realistic type, eager in the portrayal of social facts. His critical analyses of their principal characters. Mr. Dreiser presents American life in terms of its materialism, its lesser personalities. His descriptions are melodramatic and often cheap, but he is nevertheless powerful and vigorous and is given a high place by many modern critics. Because of his frank, often crude, handling of sex problems several of his works have been censored by the United States Press Censorship Board.

DREISSENES, dri·sé-nə, a genus of freshwater lamellibranch mollusks of the Dreissena family, so named from Dreyssen, a Belgian naturalist. They are allied to the mussels. *D. polymorpha*, a native of the Caspian and Aral rivers and seas, is a well-known species in the rivers and estuaries throughout western Europe, including Great Britain, where they were accidentally introduced, probably on imported timber.

DRELINCOURT, dré·lín·kör', Charles, French Calvinistic clergyman: b. Sedan, 10 July 1595; d. Paris, 3 Nov. 1669. He was the author of many controversial works and of a book entitled "Les Consolations de l'âme fidèle contre
les frayeurs de la mort, translated into English under the title 'The Christian's Defense Against the Fear of Death' (1675). To promote the sale of the English translation of John Trollope's 'De Foe', it is said, wrote his 'Apparition of Mrs. Veal,' which was published along with the fourth edition of it in 1706. His son Charles (1633–97) became professor of medicine and anatomy at Leiden, and was appointed to William, Prince of Orange, afterward William III of England.

DRESDEN, Germany, capital of Saxony, situated in a valley on the river Elbe. On the left bank are Altstadt (Old Town), Friedrichstadt and other quarters, and on the right the Neustadt (New Town) and the Antonstadt. The municipal area received a large extension in 1897. The portion on the right bank, called the Neustadt since 1732, is really the older, and was formerly known as Old Dresden. Among the structures worthy of notice are the five bridges across the Elbe, noted for their solidity, the first built in 1173; the Sophienkirche or Protestant Court Church; the Roman Catholic Court Church, which contains several fine pictures; the church of Our Lady, an imposing edifice; the church of Saint John; the royal palace; the law courts; the museum, a beautiful building containing a famous picture gallery and other treasures, and forming a wing of the building known as the Zwinger, which contains zoological and other collections; the Japanese Palace (Augusteum), containing the public library of about 570,000 volumes besides a rich collection of antiquities; the Johannineum, now containing the collection of porcelain and the historical museum, a valuable collection of arms, armor, domestic utensils, etc., belonging to the Middle Ages. The royal palace is unattractive externally, but has a fine interior adorned with frescoes, and the Green Vault contains a most valuable collection of jewels and small works of art. There is a fine park of 300 acres. The city is distinguished for its excellent educational, literary and artistic institutions, among which are the Polytechnic School with 1,500 students, organized much on the plan and scale of a university; an important military academy, Dresden being the headquarters of the Army Corps of the Conservatory and School of Music; the Academy of Fine Arts; the Royal School, for drawing, modeling, etc. It is an important centre of the drama; the municipality owns three theatres; and the Court Theatre, a large and splendid edifice opened in 1878, which specializes in the adequate production of masterpieces in drama and opera, is one of the most famous in the world. The manufactories of Dresden are not unimportant and are various in character; the porcelain, for which the city is famed, is made chiefly at Meissen, 14 miles distant. In Dresden are made articles in gold and silver, mathematical and surgical instruments, straw hats and plait, artificial flowers, gloves, leather, cigars and cigarettes, musical instruments, chemicals, perfumes, minerals, waters, chocolate, playing-cards, etc. There are large breweries, and in the neighborhood there are coal mines, iron and glass works and manufactories of machinery, chemical stuffs, etc. The commerce is considerable and of late years, since the development of the railway system, the trade with foreign parts has considerably increased. A good deal of business is done with the upper parts of the Elbe by means of the steamers, which ply as far up as Tetschen.

The gallery of pictures, one of the most rich in the world and especially rich in the works of Italian and Dutch masters, was begun very early, but first became of much importance under Augustus II, king of Poland and elector of Saxony, and was applied to William, Prince of Orange, afterward William III of England.

He purchased the greater portion of the gallery of the Duke of Modena for $900,000, and many single pictures, among them Raphael's masterpiece, the 'Madonna di Sisto,' a prodigious work, which exhausted his country by its extravagances. He purchased the greater portion of the gallery of the Duke of Modena for $900,000, and many single pictures, among them Raphael's masterpiece, the 'Madonna di Sisto,' a sublime work, is particularly distinguished. Of the French school there are many, and of Clouet, Poussin, Le Brun and others. Of the Italian school the gallery is rich in pictures of Correggio, including his famous 'La Notte' or 'Holy Night'; of Raphael, the 'Madonna di Sisto,' the 'Madonna della Seggiola'; and others. There are also works of Leonardo da Vinci, Giulio Romano, Andrea del Sarto, Battoni Titian —his famous 'Venus' and 'The Tribute Money,' Garofalo, Paolo Veronese, Guido Reni, Carracci, Carlo Dolce, and every distinguished Italian painter. Many modern painters are also represented, among them Holman and several specimens from the Düsseldorf school. Murillo and Velasquez are represented by one picture each. This collection is liberally open every day to all visitors. Besides this fine gallery of pictures the museum contains also a collection of engravings and drawings, in all amounting to upwards of 350,000. There is here also a rich collection of casts exemplifying the progress of sculpture from the earliest times and including copies of all the most important antiques, made under the direction of Raphael and others. The collection of antiques in the Japanese Palace contains some excellent statues, among which are distinguished three female figures from Herculanenum. The Johannineum Museum contains a historical museum and a large variety of specimens of Chinese, Japanese, East Indies, Sèvres, Meissen, etc., porcelain ware, arranged chronologically. Dresden being thus rich in treasures of art and favored by a beautiful natural situation is the summer resort of many foreigners.

Dresden is of Slavonic origin and first came under German and Christian influence after the subjugation of the Slavs, about the year 922. At the beginning of the 13th century it is mentioned in documents as a city and as a residence of the margraves of Meissen, from the time of the residence of the rulers of Saxony. In the first half of the 18th century it was greatly embellished, but suffered much in the Seven Years' War. In 1760 for nine days it was bombarded by Frederick the Great. The Austrians occupied the city in 1809 without injury to it. The campaign of 1813 was most ruinous for the city.
In 1709 or 1710 Böttger succeeded in getting kaolin, the porcelain clay of the Chinese, from Aue and Colditz. True porcelain pieces were now produced. Böttger's vicious and drunken habits brought about his death in 1719.

Meissen's output from 1707 to 1719 is known by experts as First Period ware. The porcelain was quite plain at first or had simple applied reliefs, all without color decoration, the chemistry and practice of porcelain (grand feu) colors being then unknown. Goldsmith Funcke, of Dresden, had decorated some pieces of the red stoneware in gilt and some gold ornamentation was done on the early porcelain, which, otherwise, attempted to reproduce the Chinese white porcelain (blanc de chine).

Characteristics.—Two different clays were used in making this early porcelain ware. One was called bleue Masse (a blue clay) and the other was a white clay. Hence two kinds of body are found, the blue clay making a white paste and the white clay producing a body of yellow tinge and having little lustre and needing to take underglaze blue decoration. Later this trouble was overcome. Some pieces copy the forms of silverware of the period; the court goldsmith, Lrminger, designed them. The Chinese styles found on other wares were taken from examples in the fine collection of Oriental porcelains belonging to Augustus. A mark, the caduceus wand, no doubt referred to Böttger's alchemistic transformation, but was used later than this period.

Second Period (1719—35).—Called also painting period. Dr. Nehmitz, Böttger's furnace and glaze manager, was von Holzbrink, J. G. Mehnhorn and Steinbrück straightened out the confused condition Böttger left behind. The king died and, under Augustus III, his successor, Graf Bruhl headed a commission to regulate the business and factory. Decoration, paste and glazing were much improved, and, with more scientific firing, much of the great losses from crazing were obviated. Cobalt being discovered in the Saxony mines, Köhler (who later became manager) commenced, unsuccessfully, blue underglaze decoration; the color ran into the glaze and was defective. Johann Gregor Herold, an expert on colors and painting at the Vienna factory, fled to Meissen (about 1719). His all-round knowledge of the technique of porcelain making soon procured him the directorship of the entire factory. On his retirement in 1765 he had given the factory a high reputation for finely painted wares, besides having greatly advanced the potting technique.

Characteristics.—Numerous qualities of body appear in specimens of this period. It was a period of experiments in clays. Styles were continued from last period, but breakfast services were a specialty. Applied molded decoration was favored. Vases for chimney, small figures, etc. Some pieces received enamel-color, gold and silver decoration. This Böttger ware was soon being made in several localities (Plauen, Bayreuth, etc.).
flowers to the next, figures to another, and so on. Decoration now extended to overglaze colors as well as underglaze blue. A yellow ground color was in use by 1725. Starting with imitation of Japanese and Chinese examples, and white reserve panels, etc., Parian artists were next copied. Elaborate gilt borders and backgrounds of violet, heightened by gold network, etc., came into vogue; scenes à la Watteau, etc., became the order of the day. The rococo, accompanied by rococo scrollwork, A. Bottengruber and Preussler were prominent artists of this time.

The Third Period (1735-40).—This is often termed the "plastic period." The sculptor, Johann Joachim Kändler, brought great renown with his masterly human figures and groups ("crinoline groups") and other relief work. Herold was forced to let flat color decoration take second place.

Characteristics.—Elaborate moulded Baroque ornament produced a plainer body, human heads, swans, cups, dolphins, acted as handles. While continuing to some extent, the Oriental forms and painted motifs, European decoration was preferred. Cobalt blue decoration was now a success. Figures innumerable were executed, classical gods and goddesses, shepherds and shepherdesses, street hawkers, the Seasons and the noted "monkey orchestra."  

Fourth Period (1740-56).—Called also "rococo period." The Louis Quinze rococo style began to displace the former baroque earlier in this period. Groups found their fullest play now. The Seasons were followed by the Senses, Quarters of the Globe, Arts and Sciences. Watteau groups, cups (amorini) became the rage, "Dresden" flower decoration for card-labor.

Characteristics.—The rococo "scroll" appears and the former ground color gives place to "scale" and other motifs in purple, green, yellow. Paris prints are found in the decoration; cameo is popular. Underglaze blue was discontinued and armorial bearing decoration made to order was popular with the wealthy.

Fifth Period (1756-63).—Prussia, under Frederick the Great, ravaged the country now and forced a tribute of great quantities of porcelain, besides depleting many of Meissen's best workers. Nothing new in style or decoration appears in this time except the commencement of Greco-Roman antique tendencies.

Sixth Period (1765-74).—The factory now had to be revitalized and the rivalry of porcelain factories at Sévres, Vienna, Berlin, etc., contended with. Michael Victor Acer, the Paris sculptor, was engaged in 1764 to give new life to the modeled forms, as Kändler's work had lost in popularity. He created the figures of French street urchins, etc., and assisted Meissen's prosperity. Lovely, delicate lace effects were produced in this period. Search was made for improved colors in other factories, Sévres bleu de roi especially. Meissen's fame was waning.
