It still has a large fish trade, but the city is now known for its society life, and its industries and commerce are of little value. Pop. (1890), 19,457; (1900), 22,034. Consult: Brooks, "The Controversy Touching the Stone Mill"; Greene, "The Providence Plantation"; "Newport in the Revolution," an article in the "New England Magazine."* Newport, Vt., village, county-seat of Orange County; on Lake Memphremagog, and on the Boston & Maine and the Canadian Pacific R.R.'s; about 50 miles in direct line north by east of Montpelier. In the summer season it has regular steamer communication with all the villages and towns in the west. It is a favorite summer resort on account of its climate, the scenery in the vicinity and the opportunities for fishing. Its trade is chiefly in farm products; its manufactures are principally to supply local wants. It has fine church and school buildings and the Goodrich Memorial Library which contains (1904) about 7,000 volumes. Pop. (1890) 1,720; (1900) 1,874.

Newport News, Va., city and port of entry in Warwick County, on the James River and Hampton Roads, and at the terminus of the Chesapeake & Ohio railroad; situated 70 miles southeast of Richmond and 14 miles north of Norfolk. The city lies in the centre of a rich vegetable and fruit country. It is connected with Hampton and Old Point Comfort by electric railways. In the heart of the city facing the James River is Casino Park, which has become a popular resort.

Trade and Commerce.—With several foreign and coast lines of steamships sailing hence, and with a fine harbor and excellent shipping facilities, Newport News has very recently become an important port and the centre of large commercial interests. The foreign trade in 1901 amounted to $36,658,000; the exports amounting to $32,598,000. The foreign commerce of the port is largely carried on by the Chesapeake & Ohio Railroad and the United States Shipping Company, making direct connection with England and the continent. The city has become fourth in the United States in the shipment of grain. There are two national banks, each with a capital of $100,000; six private banks, and several trust companies. The city has three weekly and four daily newspapers.

Manufactures.—Here is an extensive shipbuilding plant, giving employment to 7,000 workmen: two asphalt plants, two paper mills, two butter factories, two flour mills, two tanneries, two meat packing plants, a fruit freezing plant, a shipbuilding plant, a brick and tile works, a paper mill, a hosiery mill, a flour mill, a sugar refining plant, a distillery, a tobacco factory, and a flour mill.

Population.—Newport News is a young town practically lacking in history. It was first laid out in 1882 and incorporated in 1896. Its growth has been very rapid; the population in 1890 was 4,449; in 1900 it was 19,500, and in 1910, 35,000.

F. J. King.

Secretary Newport News Chamber of Commerce.

News-Letter, a popular name applied to the printed sheets or letters issued weekly in the early part of the 17th century, the news for which was collected in the coffee houses. Originally they were literally letters of news written by professional newsmen, and sent by them to their employers weekly. Many early printed newspapers took News-Letter as a title, as the "Boston Newsletter," etc.

Newspaper, a daily or other printed paper containing news or intelligence of past, current, or coming events, together with comment, criticism, or discussion of such events by editors and contributors. The total number of newspapers published in the world at present is estimated at about 60,000, distributed as follows: United States and Canada, 26,300; Germany, 8,000; Great Britain, 8,000; France, 4,300; Japan, 2,000; Italy, 1,500; Austria-Hungary, 1,200; Asia (exclusive of Japan), 1,000; Spain, 850; Russia, 800; Australia, 1,000; Greece, 600; Switzerland, 450; Holland, 350; Belgium, 300;
all others, 1,000. Of these more than half are printed in the English language. A detailed history of the newspaper in America will be found under A MERICAN N EWSPAPERS.

Early Roman Bulletins.—The newspaper had its origin several centuries before the Christian era. The Romans published The Acta Diurna, the Acta Publica, the Acta Senatori and other journals. The Acta Diurna was a bulletin in which accounts were given of the progress of the imperial arms. The intelligence was communicated by the generals who received it from the officers under their command, and thus the contents became known throughout the army. The Acta Diurna, however, recorded other than military matters, such as trials, punishments, deaths, and sacrifices. The Acta Senatori contained accounts of the various matters brought before the senate, the opinions of the chief speakers, and the decisions of the house, published regularly by command of Julius Cæsar, as part of the government gazette. The Acta Publica was a still nearer approach to the true newspaper form. During the later times of the republic, and under the empire, it was published daily at Rome by the authority of the government. It contained a register of the births and deaths in the city; an account of the money paid into the treasury, from the provinces, and everything relating to the supply of corn, and a list of daily circular. The register was an amount of the births, deaths, festivals, and movements of the imperial family. Such details of public affairs as it was deemed expedient to publish were also included in it. The speeches in the senate and the public assemblies were taken down by the early Roman short-hand writers called actuarii. These, assisted by clerks and notaries, drew up the Acta, under the superintendence of censors, questors, and other magistrates. The publication consisted in posting them in some public place, that any one who pleased might read them.

First Printed Journals.—The Peking Gazette was probably the first printed newspaper, and is the oldest of the class. It was first issued about 1340 A.D. The Gazette is still in existence, and is an official journal, forming a pamphlet of 20 to 40 pages of coarse paper, printed on wooden types on one side only. It is the organ of the government and the Daily Courant. At this time appeared Defoe's journal, the Review. The first number of the Tatler was published on 23 April 1709, and of the Spectator on 1 March 1711. Though not fine paper, it covered a wide field. Toward the close of the 15th century, soon after the invention of printing, small sheets, usually in the epistolary form, appeared in Augsburg, Vienna, Ratisbon, and Nuremberg. They were called Relationen and the Neue Zeytung, and gave accounts of the discoveries of America and of other important public events, and like modern newspapers they chronicled the more interesting and startling local incidents. The Notizie Scribiti, published monthly in Venice, in 1562, is said to have been the first Italian newspaper. Its price was a small coin called gazetta; hence the word gazette which came to be the popular name for the modern newspaper. The war which Venice waged in Dalmatia gave rise in 1563 to the custom in Venice of having military and commercial information read at a particular place by those desirous to learn the news, who paid for this privilege. The Venetian papers, covering a period of 60 years, is still preserved in the Magliabechi Library at Florence.

English Newspapers.—A printed bulletin entitled Relation was published in England as early as 1602, and in 1627 there was one called New Tidings, but neither of these presented more than a single piece of intelligence. A pamphlet called The News from Spain made its appearance in the reign of Queen Elizabeth in order to convey to the people the tidings of the approaching armada from Spain, and the various counter-movements on the part of the British army and fleet. A more pretentious journal was issued in 1622, under the title, The Weekly News from Italy, Germany, etc., published by Nathaniel Butter, Nicholas Bourne, and Thomas Archer, and this may be regarded as the first specimen of the regular newspaper in England. Numerous other news journals followed, but it was not till the beginning of the parliamentary wars that the newspaper first acquired political influence. One of these, published in November 1641, under the title of Diurnal Occurrences, or the Heads of Several Proceedings in both Houses of Parliament, is noticeable as the first which furnished information of the doings of the Parliament. The other papers which followed this were the English Post, England's Memorable Accidents, The Kingdom's Weekly Intelligence, The Spy, The Parliament's Scout, The London Post, The Rider the Bradstone, and were most of them published weekly. In Cromwell's time the principal journals were the Mercurius Politicus and the Public Intelligence. The publication of newspapers without license was prohibited in the reign of Charles II, and an office was created called License of the Press. Advertisements first appeared in English newspapers in 1652. The first copy of the London Gazette was issued 7 Nov. 1665, at Oxford, whether the court had retired in consequence of the plague then raging in London. It has since been uninterruptedly published twice a week as an official court circular. The first London daily paper was in 1702, a weekly in 1709, and of the Daily Courant. At this time appeared Defoe's journal, the Review. The first number of the Tatler was published on 23 April 1709, and of the Spectator on 1 March 1711. Though not fine paper, it covered a wide field. Toward the close of the 15th century, soon after the invention of printing, small sheets, usually in the epistolary form, appeared in Augsburg, Vienna, Ratisbon, and Nuremberg. They were called Relationen and the Neue Zeytung, and gave accounts of the discoveries of America and of other important public events, and like modern newspapers they chronicled the more interesting and startling local incidents. The Notizie Scribiti, published monthly in Venice, in 1562, is said to have been the first Italian newspaper. Its price was a small coin called gazetta; hence the word gazette which came to be the popular name for the modern newspaper. The war which Venice waged in Dalmatia gave rise in 1563 to the custom in Venice of having military and commercial information read at a particular place by those desirous to learn the news, who paid for this privilege. The Venetian papers, covering a period of 60 years, is still preserved in the Magliabechi Library at Florence.

English Newspapers.—A printed bulletin entitled Relation was published in England as early as 1602, and in 1627 there was one called New Tidings, but neither of these presented more than a single piece of intelligence. A pamphlet called The News from Spain made its appearance in the reign of Queen Elizabeth in order to convey to the people the tidings of the approaching armada from Spain, and the various counter-movements on the part of the British army and fleet. A more pretentious journal was issued in 1622, under the title, The Weekly News from Italy, Germany, etc., published by Nathaniel Butter, Nicholas Bourne, and Thomas Archer, and this may be regarded as the first specimen of the regular newspaper in England. Numerous other news journals followed, but it was not till the beginning of the parliamentary wars that the newspaper first acquired political influence. One of these, published in November 1641, under the title of Diurnal Occurrences, or the Heads of Several Proceedings in both Houses of Parliament, is noticeable as the first which furnished information of the doings of the Parliament. The other papers which followed this were the English Post, England's Memorable Accidents, The Kingdom's Weekly Intelligence, The Spy, The Parliament's Scout, The London Post, The Rider the Bradstone, and were most of them published weekly. In Cromwell's time the principal journals were the Mercurius Politicus and the Public Intelligence. The publication of newspapers without license was prohibited in the reign of Charles II, and an office was created called License of the Press. Advertisements first appeared in English newspapers in 1652. The first copy of the London Gazette was issued 7 Nov. 1665, at Oxford, whether the court had retired in consequence of the plague then raging in London. It has since been uninterruptedly published twice a week as an official court circular. The first London daily paper was in 1702, a weekly in 1709, and of the Daily Courant. At this time appeared Defoe's journal, the Review. The first number of the Tatler was published on 23 April 1709, and of the Spectator on 1 March 1711. Though not fine paper, it covered a wide field. Toward the close of the 15th century, soon after the invention of printing, small sheets, usually in the epistolary form, appeared in Augsburg, Vienna, Ratisbon, and Nuremberg. They were called Relationen and the Neue Zeytung, and gave accounts of the discoveries of America and of other important public events, and like modern newspapers they chronicled the more interesting and startling local incidents. The Notizie Scribiti, published monthly in Venice, in 1562, is said to have been the first Italian newspaper. Its price was a small coin called gazetta; hence the word gazette which came to be the popular name for the modern newspaper.
The provincial English press began with the Norwich Postman, published in 1706, and followed by the Norwich Courant in 1714, and the ‘Weekly Mercury, or Protestant’s Packet’ (at Norwich) in 1720. The Worcester Postman appeared in 1708, the Newcastle Courant in 1711, the Kentish Post in 1717, and the Leeds Mercury in 1718.

Ireland and Scotland.—The first newspaper published in Ireland was the Dublin News-Letter, in 1685, followed by the Dublin Intelligencer in 1690. The Belfast News-Letter, still flourishing, first appeared in 1737. The Freedom’s Journal commenced in 1763. In Scotland on 31 Dec. 1660, appeared at Edinburgh the first number of the Mercurius Caledonius, which had an existence of only three months. The Edinburgh Evening Courant was started in 1718. The Caledonian Mercury commenced in 1720 and existed 150 years. The Edinburgh Gazette dates from 1700. The first paper published in Glasgow was the Glasgow Courant, on 11 Nov. 1715, followed by the Glasgow Journal in 1729. The Edinburgh Scotsman was first issued in 1817, and the Glasgow Herald in 1782.

France.—The first French newspaper, the Gazette de France, appeared in 1631, edited by Theophraste Renaudot, a physician, who had been in the habit for some time previously of preprinting to his patients a printed account of the various occurrences of the day. The Gazette had a most successful career and existed until 24 Aug. 1848, when it was suspended. Two weeks later it was resumed under the title of Le Peuple Français, which title was again altered to L’Étoile de la France. The Gazette Burlesque, a newspaper in verse, was commenced in 1650, under the management of the poet Jean Loret. The Mercure Galant was started by Donneau de Visé in 1672, and under the title of the Mercure de France, to which it was changed in 1717, continued to exist until 1853. After the Revolution a host of new papers appeared. Among these were the Courrier de Paris, the Lettre du Peuple, the Pére Duchesse, and Ami du Peuple. All of the newspapers, however, commenced at this eventful period, the only ones which have survived are the Journal des Debats and the Le Moniteur. Napoleon the Great was subjected to a rigid censorship, which was continued until 1819. During the reign of Louis Philippe appeared La Presse and Le Sicle, both of which commenced in 1836. Since that date the growth of the newspaper press in Paris has been rapid. In 1903 over 4,000 newspapers were regularly published in Paris alone, some 60 of these being daily political organs. The most important of all is the Temps, with politics of moderate republicanism. The Petit Journal, a cheap popular journal, has a circulation of over 1,000,000 daily.

Germany.—Egenolf Emmel, sometimes called the father of journalism, established at Frankfort in 1615 Die Frankfurter Oberpostamtzeitung. A second journal was commenced at Hildesheim in 1610, and a third at Herford in 1630. At the end of the 17th century there were at least 30 daily newspapers in Germany. The Hamburg Zeitung, of other great merit in 1648, was as a continuation of the Holsteinische Zeitungs correspondence, established in 1712. It was the first German newspaper which received news of foreign affairs from correspondents resident abroad. The Allgemeine Zeitung was published in 1798, and soon rose to the highest position in German journalism. Other important journals are the Norddeutsche Allgemeine Zeitung, the National Zeitung, the Neue Preussische Zeitung, the Volks-zeitung, the Vossische Zeitung, the Kölnische Zeitung, etc.

Russia.—The first journal in Russia appeared in 1763, and was followed by several others during the first half of the 18th century. The press in Russia is under very strict supervision, and thus naturally has but little influence in public affairs. The Journal de St. Petersbourg, in French, has a considerable circulation outside of Russia.

Holland and Belgium.—The pioneer newspaper of Holland was first published in 1656. The early Dutch newspapers were distinguished by the accuracy of the information furnished by them. It was not until 1830 that they began to comment on public occurrences, their criticism having been previously directed to items of commercial intelligence. The principal Dutch journals are the Algemeene Handelsblad of Amsterdam, Het Haarlemmer Courant, the Journal de la Haye, and Staats-Courant, the two latter published at The Hague. Among Belgian papers the Indépendance Belge, the Journal de Bruxelles, and the Etoile Belge are distinguished for the ability with which they are conducted.

Australia.—There are nearly 1,000 papers published in Australia. The daily issues are excellent imitations of the London newspapers. The Sydney Gazette was established in 1803.

India.—The first Indian newspaper in the English language appeared in Bengal in 1780. There are upwards of 300 newspapers published in the various vernacular tongues.

In Turkey the first newspaper appeared in 1795 in French, and the first daily journal in Spain was published in 1704. The modern newspapers of Norway, Sweden, Denmark, Italy, South Africa, Switzerland, Portugal, Greece, China, Japan, and South and Central America, are of less importance than those of the other countries heretofore mentioned, being largely local in character.

Will M. Clemens, 
Editorial Staff, 'Encyclopedia Americana.'

Newstead (núst’éd) Abbey, England, on the border of Sherwood Forest, 10 miles northwest of Nottingham, was an Augustinian Canons institution founded in 1170 by Henry II. in atonement for Becket's murder. In 1540, after the dissolution, it was given to Sir John Byron the Little, and is celebrated in connection with Lord Byron, the poet, who made the semi-ruinous edifice his home in 1808, but sold it in 1818. The abbey has since been restored, and has many carefully preserved relics of the poet. Consult: Irving, 'Abbotstard and Newstead.'

Newt, a small tailed batricean of the genus Diemycia, or a related genus, but sometimes considered to constitute a distinct family, under the name Pleurodelidae. News are sometimes called elfs or tritons, and the name is often applied erroneously to salamanders of other genera not closely related. Among the technical characteristics of the news in general are the bony carpus and tarsus, the bony ball- and-socket joints of the vertebræ, and the nar-
row bands of palatine teeth. The species are more strictly aquatic than most salamanders, and the males of most species undergo remarkable seasonal changes in the development of high dorsal crests, papillae, or other appendages on the arms and elsewhere, and of brilliant colors. About 20 species belonging to this group of genera are known, of which more than half are European, several Asiatic, and only two North American, while none have been found elsewhere. The eastern American species (Dermatomyctylus viridescens), of which a quite distinct variety occurs in Texas and Mexico, is abundant throughout the Eastern States, and extends into Canada. It may be distinguished by the rather narrow arched head marked with a pair of longitudinal keels, and the handsome greenish red color of the back, the pale yellow below, and the row of conspicuous scarlet, black-bordered spots on each side. In the adult stage just described this animal is about 3½ inches long and completely aquatic. A terrestrial form is somewhat smaller, lacks the dorsal crest altogether, has a rougher skin and a bright vermilion color. This is the pretty little creature common in fasts dark woods, which later returns to the water and assumes the greenish garb. Newts are chiefly nocturnal, and when abroad swim actively, not merely crawling on the bottom in the manner of most salamanders. They feed on a wide variety of larvae, worms, small mollusks, and crustaceans, and are very voracious. During the breeding season in the spring the male develops a broad cutaneous fin, richly provided with sense organs on the back and tail, and becomes otherwise modified. The fertilized eggs are deposited singly, each in a gelatinous capsule whose adhesive nature permits of their attachment to water-plants, some of the leaves of which are drawn about each egg. The larvae are strictly aquatic and possess three pairs of external gills, but after metamorphosing, leave the water and assume the red terrestrial phase, when they live in the woods under stones and logs, appearing at night or during rain. This stage lasts for several years, when they seek the water either in spring or fall and soon acquire the adult color and characteristics. Whether or not they can again enter the red phase by leaving the water is not certainly determined. Like frogs, newts swallow the skin after molting, which appears to take place most readily while the animal is immersed in water.

The Pacific newt (Dermatomyctylus torosus) is nearly twice as large, and is further distinguished by the wide, flat, keelless head, and brown, unspotted color. It is very abundant in California, and ranges from the southern part of that State to Alaska. Its habits are essentially similar to those of the eastern species. It feeds on earthworms, snails, slugs, insects, and its own sloughed skin, eggs and young. In this species the eggs are deposited in clumps.

The numerous European species present many interesting differences in detail in habits, especially in the mode of reproduction. Some of them live habitually away from the water and move long distances to it in the spring, and one species is remarkable from the fact that the ribs penetrate the skin. All of the newts make very interesting and satisfactory aquarium pets.

J. Percy Moore, University of Pennsylvania.
a partner in the firm of Wittlesey Brothers, piano-makers, Salem, Conn., whom he left six years later to form the New York firm Light and Newton; this new company greatly improved the manufacture of pianos. Newton was later connected with the Bradburys in the piano trade; in 1844 he became Virginia Piano Wire Company, and in 1847 he established a journal in the Virginia. In 1850, he invented a permanent collodion emulsion and of the other details of the dry-plate process in photography dates from 1875. Educated a Presbyterian, Newton joined the Methodist Church, then the Unitarian, and finally allied himself with the Spiritualists. A society formed by him in 1875 for psychic research was, he claimed, the first Theosophical Society, from which Mme. Blavatsky and Henry S. Olcott took the ideas which they falsely proclaimed to be of Indian origin.

Newton, Hubert Anson, American astronomer and mathematician; b. Sherburne, N. Y., 12 March 1830; d. New Haven, Conn., 30 Aug. 1890. He was graduated at Yale in 1850, and in 1855 became professor of mathematics there. He spent one year in foreign study and for the remainder of his life quietly in New Haven. He was far better known as an astronomer than as a mathematician, because of his remarkable researches as to meteorology, and meteoroids, undertaken to verify Olmsted's hypothesis that meteors were the more visible portions of a great stream of bodies with a fixed orbit about the sun, and his hypothesis he proved correct by a brilliant and painstaking series of mathematical computations. He wrote on meteors for several encyclopedias, and published most of his original papers on that subject in the Memoirs of the National Academy and in the American Journal of Science, of which he was long editor. The National Academy awarded him the Smith gold medal for his work on meteors. Newton did much to introduce the study of the metric system into the public school curriculum; was an authority on the theory of transcendent curves; and wrote various tables for life insurance companies. He was a simple, genial, modest man, and deeply interested in the material advancement of Yale College.

Newton, Sir Isaac, English mathematician and natural philosopher; b. Woolsthorpe, Lincolnshire, 25 Dec. 1642; d. Kensington 20 March 1727. He was sent at an early age to the village school, and in 1654 to the free grammar school of Grantham. He was entered at Trinity College, Cambridge, in 1661. He had the good fortune to find in the celebrated Dr. Barrow, professor of Greek (1660–3) and from 1663 Lucasian professor of mathematics, an assistant in his mathematical studies. He appears to have found particular interest in Wallis' treatise, 'Arithmetica Infinitorum.' He was graduated in 1665. While absent from Cambridge in 1665–6, during the plague, he discovered the binomial theorem. In the Havet and inverse methods of fluxions (q.v.) (that is, differential and integral calculus); computed the area of the hyperbola; and first turned his attention to the subject of gravity. The familiar story, first given by Voltaire, is that the fall of an apple led him to reflect on the nature of that remarkable principle which attracts bodies to the centre of the earth. He considered that if the moon was retained about the earth by terrestrial gravity, the planets, which move round the sun, ought similarly to be retained by Newton's great body by their gravity toward that body. Having determined the law of the gravity of the planets toward the sun he endeavored to apply it to the moon, that is, to determine the velocity of its motion round the earth by means of her distance, as settled by astronomers, and of the intensity of gravity, as shown by the fall of bodies at the earth's surface. To make this calculation it was necessary to know exactly the distance from the surface to the centre of the earth; but unfortunately at that time there existed no correct measure of the earth's dimensions. Newton was obliged to employ the imperfect measures then in use, and found that they gave for the force which retains the moon in her orbit a value greater by one sixth than was allowed by observed facts. This small difference seemed to his cautious mind a strong proof against his bold conjecture. He imagined that some unknown cause modified, in the case of the moon, the general law of gravity indicated by the motion of the planets. Yet he did not abandon his leading notion, but determined to wait till study and reflection should reveal to him this supposed unknown cause. In 1669 he returned to Cambridge as Master of Trinity, and in 1668 constructed a reflecting telescope. In the latter year Mercator published his Logarithmotechnia, in which he had obtained the area of the hyperbola referred to its asymptotes by expanding its ordinate into an infinite series, a discovery which became the main secret of Newton's method. Barrow showed this work to Newton, who immediately gave him his own treatise, but did not yet publish.

In the course of 1666 his attention had been accidentally drawn to the phenomena of the refraction of light through prisms. His experiments led him to conclude that light, as it emanates from the radiating bodies, is not a simple and homogeneous substance, but that it is composed of a number of rays, endowed with unequal refrangibility and velocity and possessing different coloring properties. More than two years elapsed before he returned to his researches on this subject; and in 1669, he was appointed Lucasian professor of mathematics, and preparing to lecture on optics, he endeavored to mature his first results, and composed a complete treatise, in which the fundamental properties of light were unfolded, established, and arranged by means of experiments alone, without any mixture of hypothesis—a novelty at that time almost as surprising as these properties themselves.

In 1672 Newton was chosen a fellow of the Royal Society, to which he communicated a description of a new arrangement for reflecting telescopes, which rendered them more convenient by diminishing their length without weakening their magnifying powers, and soon after, the first part of his labors on the analysis of light, in which he advocated the material theory (that is, that light consists of small particles shot out by a luminous object), the society appointed three members to study it fully and report upon it. Hooke undertook to draw up the report. Instead of discussing the new facts as presented by the experiments of Newton, he examined them merely in relation to his own hypothesis—now known as the undulatory theory, and ac-
NEWTON

excepted as the true one — and concluded by allowing whatever appeared reconcilable with his own hypothesis, and by advising Newton not to seek any other explanation of the facts. Newton in reply adduced new experiments confirming his material (or corpuscular) theory and retuded the objections to the production of whiteness by the mixture of all the rays. He addressed another paper (1675) to the Royal Society, completing the account of his results and of his views on the nature of light. This treatise, united with his first paper on the analysis of light, afterward served as the base of the great work, 'Treatise on Optics' (1704), in which, however, the experimental investigation of the phenomena is more extensive and more strictly separated from all hypothesis. It is now known that Newton was wrong, and that light results from wave-motion in a pervading medium called ether. But Hooke's explanations were vague, and his theory remained untenable until the discovery, a century later, of the principle of interference (q.v.). In 1679 Newton had occasion to write to Hooke about a system of physical astronomy on which the Royal Society had asked his opinion. Hooke and Newton held conflicting opinions, and Newton, having examined by mathematical calculations a position maintained by Hooke, found that an attractive force, emanating from a centre, and acting inversely as the squares of the distances, would produce motions exactly resembling the planetary motions both in regard to the form of the orbit and the velocity of the body at each point. This was the secret of the system of the world; but it still remained to account for the discordance of the moon's motion, which had before (1665) embarrassed Newton. But in 1682 he learned the results of a new measurement of the arc of a meridian. Two years were spent in following up the consequences of this discovery, and preparing his immortal work 'Philosophiae Naturalis Principia Mathematica'; but it was not till 1686 that he concluded to present his work to the society, and it was printed in 1687 at the personal expense of Halley, the secretary. Newton's teachings were introduced at Cambridge and at Oxford in 1704, but were not admitted by the French scientists for half a century.

In 1687 Newton was one of the delegates sent by the University of Cambridge to maintain its rights before the High Commission court when they were attacked by James II., and in 1689 he was elected by the university to the convention parliament, but never distinguished himself in that body. He had always taken great interest in chemistry, and constructed a small laboratory for prosecuting his investigations, and seems, after the publication of the 'Principia,' to have devoted almost his whole time to them.

In 1696 he was appointed warden of the mint, a general-recoinage having then been undertaken. In this office he rendered essential service, and in 1699 was made master of the mint. In 1701—2 he again sat in Parliament for his university; in 1703 he was chosen president of the Royal Society; in 1705 he married Anne, the daughter and sole heir of Sir Isaac Asman. In 1704 he gave to the world his 'Optics,' which contains all his researches on light. Later works were his 'Arithmetica Universalis' (1707; more complete 1712); 'Methodus Differentialis' (1711); and his 'Analysis per Equationes Numero Terminorum Infinitas' (1711); 'Chronology of Ancient Kingdoms Amended' (1728); and 'Observations on Daniel and the Apocalypse' (1733), an attempt to show the fulfilment of the prophecies. In 1705—12 he was involved in a controversy with Flamsteed; and in 1705—24 in one with Leibnitz as to priority in the discovery of fluxions. The splendid genius of Newton has often been testified to, among many by Macaulay, who declared that in no other person did the demonstrative and inductive faculties ever exist in such perfect co-ordination. His statue, by Roubiliac, stands in Trinity College, Cambridge. Horsley's edition of his works (1779—85), with the 'Opuscula,' collected by Castillon (1744), and his 'Letters,' inserted in the 'Biographia Britannica,' contain nearly all his printed works. Three editions of the 'Principia' were published in his own lifetime; the last reprinted at Glasgow in 1871 by Sir W. Thomson (Lord Kelvin) and Professor Blacken. The standard 'Life of Newton' is by Sir David Brewster, who had full access given him to the great mass of Newton's papers (1855; 2d ed. 1860).

Newton, John, English astronomer and mathematician: b. Oundle, Northamptonshire, England, 1642; d. Ross, Herefordshire, England, 25 March 1727. He was graduated from Trinity College, Cambridge University in 1662 and engaged in mathematical and astronomical work, remaining loyal to the king during the Protectorate. After the Restoration he was made king's chaplain in 1661 and became canon of Hereford in 1673. He wrote: 'Institutio Mathematica' (1664); 'Geometrical Trigonometry' (1679); 'Introduction to the Art of Logic' (1671); 'Cosmography' (1679); etc.

Newton, John, English clergyman: b. London in July 1725; d. there 21 Dec. 1807. He led a wandering life on the sea in 1725—55, but in 1748 underwent strong religious experiences, the effects of which were increased by the preaching of Wesley and Whitefield, and after a period of private study was ordained priest of the Church of England in 1764. From 1764 to 1780 he was curate of Olney, Buckinghamshire, and then became incumbent of Saint Mary Woolnoth, London, where he preached until the year of his death. His evangelical influence was very strong there, and he preached to large congregations. He is best known, however, for his connection with the poet Cowper, who settled at Olney in 1767, and who was kept occupied by the good man in an almost unintermitted round of religious exercises. Newton seems to have foreseen the outcome, and endeavored to provide congenial occupation for the poet in seeking from him contributions to the 'Olney Hymns.' Newton received his D.D. from the College of New Jersey (Princeton) in 1790. Among his publications are 'Review of Ecclesiastical History' (1770) and 'Cardiphonia' (1781). See COWPER.

Newton, John, American military engineer: b. Norfolk, Va., 24 Aug. 1823; d. New York City, 30 May 1905. He was graduated from West Point in 1842 and was appointed to the engineering corps. At the beginning of the Civil War he was chief engineer of the department of Pennsylvania and in September 1861 was made brigadier-general of volunteers. He served with
distinction through the war and in 1865 was promoted brigadier-general and major-general in the regular army. He was mustered out of the volunteer service in 1866 but continued in the regular army, and in 1884 was made chief of engineers. He engineered the removal of the obstructions at Hell Gate Channel in the East River, New York; was commissioner of public works in New York, and in 1886 was retired at his own request.

**Newton, Richard Heber**, American Protestant Episcopal clergyman: b. Philadelphia 31 Oct. 1840. He was son of the rector of Saint Paul's, Philadelphia, studied in the Philadelphia Divinity School, was assistant to his father (1860–2) and, after a short time in a church at Sharon Springs, N. Y., succeeded his father in Philadelphia, leaving this charge in 1865 to go to All Souls' Church, New York. In 1903 he was appointed teacher to Leland Stanford, Jr., University but soon resigned this position. He is a broad-churchman, and has several times been threatened with trial for heresy. He took a prominent part in the Congress of Religions held in 1873 in Chicago; he is now vice-president of the organization of this congress. He wrote: 'The Morals of Trade' (1870); 'Womanhood' (1880); 'Philanthism' (1885); 'Social Studies' (1886); 'Church and Creed' (1891); and 'Christian Science' (1898).

**Newton, William Wilberforce**, American Episcopal clergyman: b. Philadelphia, Pa., 4 Nov. 1843. He was graduated from the University of Pennsylvania in 1865 and has held important rectorates in Newark, N. J., Boston, Mass., and Pittsfield, Mass. He has published: 'The Pilgrim Series of Sermons to Children'; 'A Run Through Russia'; 'The Child and the Bishop'; 'Summer Sermons from a Berkshire Pulpit'; etc.

**Newton, Ill., city, county-seat of Jasper County; on the Embarrass River, and on the Peoria, D. & E., and the Illinois S. R.R.'s; about 100 miles in direct line southeast of Springfield. It is in a productive agricultural region, and in the vicinity of large coal fields. The chief manufactures are dairy products, flour, brick, tile, lumber products, and woolen goods. The city has considerable trade in farm and dairy products, fruit, coal, and its manufactures. Pop. (1890) 1,428; (1900) 1,630.

**Newton, Iowa, city, county-seat of Jasper County; on the Chicago, Rock Island & P. and the Iowa Central R. R.'s; about 30 miles in direct line east by north of Des Moines, the capital of the State. It is the commercial centre of a rich agricultural section in which considerable attention is given to stock-raising. The chief manufactures are flour, foundry and machine-shop products, agricultural implements, tile, and brick. The trade is chiefly in farm products, live-stock, and manufactures. The city owns and operates the waterworks. Pop. (1890) 2,564; (1900) 3,682.

**Newton, Kan., city, county-seat of Harvey County; on the Atchison, T. & S. F., the Gulf, C. & S. F., and the Missouri P. R.R.'s; about 115 miles southwest of Topeka. It is in the south central part of the State, in the Diamond Belt, one of the most fertile sections of Kansas. It was settled in 1871 and incorporated a city in 1886. The chief manufacturing establishments are flour mills, drill factory, separator factory, creamery, large ice plant, and stock yards. It is a division point of the Santa Fé Railroad and has repair shops. The number of railroad employees who are residents of Newton is about 590; and about 200 men are employed in the manufacturing establishments mentioned. There are 15 churches for white people and two for the colored. It is the seat of Bethel College, the only college in America under the auspices of the Mennonite Church (1904). It has a high school, good public and parish schools, and a Carnegie library. The three banks have a combined capital of $160,000. The government is vested in a mayor, who holds office two years, and a council of eight members, also elected biennially. The majority of the people are native born; the foreign born are Germans, Irish, a few Swedes and French.

**J. C. Mack**, Manager, 'Kansas Republican.'

**Newton, Mass., city in Middlesex County; on the Charles River, and on the Boston & & A. railroad; six miles west of Boston. The area is 2.11 square miles. The city was incorporated in 1631 and was part of Cambridge until 1688, when it was incorporated as a town under the name of New Cambridge, which name it retained until 1692; the city charter was granted in 1672. Newton is a beautiful residential city; within its limits is a part of the Metropoitan Park; its own city parks cover an area of about 120 acres. A large cemetery, in a prominent part of the city, contains the graves of many people noted in history. Newton has some manufacturing establishments, chiefly of which are boot and shoe factories, silk mills, fire-alarm supply works, rubber works, paper-box and curtain factories, printing works, worsted mills, and cordage factory. It has the Lasell Seminary for women (1851); the Allen School for boys (1853); Saint John's Industrial School, the Newton Theological Seminary, opened in 1825 under the auspices of the Bap- tists, and a public library which has 62,000 volumes. The prominent public buildings are several beautiful churches, the high school, the elementary and parish schools. Near the site of Waban's Wigwam, where John Eliot began to preach to the Indians, 28 Oct. 1646, stands the Eliot Memorial.

The annual municipal expenditures for maintenance and operation are about $1,000,000. The chief items of expense are: for public schools, $300,000; for streets, parks, sewers, $172,000; interest on debt, $254,000; police department, $50,500; fire department, $59,000; municipal lighting, $54,000; health department, $22,000; charity, $26,000. The government is administered under a revised charter of 1902, which provides for a mayor who holds office two years; and a board of aldermen consisting of 21 members, three from each ward. The mayor and aldermen appoint or elect the administrative officers, except the school committee, which is chosen at a popular election and for a term of three years. The city owns and operates the waterworks. Pop. (1890) 24,379; (1900) 33,587. Consult Smith, 'History of Newton.'

**Newton, N. J., town, county-seat of Sussex County; on the Delaware River; about 40 miles northwest of Newark. It is in an agricultural region, and in the vicin-
ity are slate quarries. The chief manufactures are roofing slate, silk, paper boxes, shoes, and dairy products. It is the seat of the Newton Collegiate Institute and it has the Dennis Library, which contains about 9,000 volumes. Newton is known as a summer resort. The town owns and operates the waterworks. Pop. (1890) 3,003; (1900) 4,376.

Newton Theological Institution. See Newton, Mass.

Newtonian Philosophy. See Newton, Sir Isaac.

Newton, N. Y., since 1828 a part of the borough of Queens in New York city; formerly a separate town in Queens County. It was settled in 1652 by people from New England, and was first called Middleburgh. In 1664 it became a part of Connecticut and was then called Hastings. The following year it came into possession of New York and the name was changed to Newton. Consult Riker, Jr., 'The Annals of Newton.'

Next Friend, in law, an adult, other than a guardian, who represents in an action, another person not legally competent to maintain a suit in his own behalf. The practice originated in England in the time of Edward I. A next friend is not a party to an action but acts solely for another, and is considered an officer of the court.

Ney, nā, Michel, Duke of Elchingen, Prince of the Moskva, French soldier: b. Sarre-Louis (Moselle) 10 Jan. 1769; d. Paris 7 Dec. 1815. In 1787 he entered the military service. He soon attained great distinction for bravery, was quartered over by Kleber and Jourdan as to who should have his services, and obtained great participation to the victory of Hohenlinden, and obtained the marshal's baton in 1804. He opened the campaign of 1805 against Austria by a brilliant victory at Elchingen 14 October (whence his title Duke of Elchingen), and brought about the capitulation of Ulm. He occupied the Tyrol, and marched on to Carinthia, when stopped in his career by the Peace of Pressburg. In 1806 and 1807 he fought at Jena, and after the capture of Magdeburg at Eylau and Friedland. In 1808 he maintained his high reputation in Spain. Napoleon recalled him, but kept him at a distance till the commencement of the campaign against Spain, when he received the chief command of the 3d division of the imperial forces. He commanded the centre at the battle of the Moskva, and so distinguished himself as to earn the title of Prince of the Moskva. In the conduct of the retreat, in which he commanded the rear-guard, his ability, valor, and devotion were conspicuously manifest, and he exerted himself to the utmost to save the wreck of the army Napoleon and Murat had deserted. In 1813 he decided the victory of Lützen, assisted at Bautzen and Dresden, but was defeated by Bernadotte at Dennewitz. He was now obliged to retire to Torgau, but soon took the field again; chased the Swedes from Dessau; and fought at Leipsic and Hanau. When the enemy entered France he disputed every step of their progress. Brienne, Montmirail, Craonne, and Châlons-sur-Marne are shining names in the history of his battles.

After Napoleon's abdication, Ney took the oath of allegiance to the king, was made a peer, and received the cross of Saint Louis and the command of the cuirassiers, dragoons, chasseurs, and light-armed lancers. He enjoyed marked distinction at court, and appeared to be entirely devoted to the Bourbons. When Napoleon landed on his return from Elba Ney collected a large force, was appointed its commander, and with many assurances of his zeal and fidelity to the king marched against the invader. But noticing the desertion of his soldiers and their inclination for Napoleon he submitted to the cause of the Bourbons as lost. He joined Napoleon at Lyons on 13 March, and thus opened his way to Paris. Napoleon gave him the command of his left wing, which engaged with the British at Quatre Bras. At Waterloo he led the last charge of the Old Guard, and had five horses shot under him. His clothes were full of bullet-holes, and he fought on foot till night in the midst of the slain. He was tried for treason, sentenced (15 December) to death, and shot in the Luxembourg garden. *After the execution,*

says Lamartine, *bitter shame seized on every soul.* It was universally regretted that Ney, the brave, had been chosen to suffer. Consult: Memoria de la Vida de Ney (1836) by Rousset; *Vie du Maréchal Ney* (1833) by Nollett-Fabert. *Eloge Historique* (1892).

Neré Percé (nā pér-sā) Indians. See Chippewa; Sahniant.

Ngami, ngāmē, Lake, Africa, in Western Rhodesia, north of the Kalahari Desert, a portion of a great prehistoric inland sea; when first visited by Livingstone and Oswell in 1849, about 20 miles long, 10 miles broad, and very shallow. Its only feeder was the Tegeo or Kubango and its outlet the Boteteli or Zaga. In the rainy season the water was fresh, but in the dry season the lake became a mere brackish marsh. Since 1890 the waters have gradually disappeared, the site of the lake now being marked by an extensive reedy marshland, some portions of which are utilized for growing corn.

Ngan-Hwai, n-gān-hwāi, or Nangan-Hwai, n-gān-hwāi, China, an eastern inland province, intersected by the Yang-tse-kiang, separated from the sea coast by the provinces of Che-kiang and Kiang-su, and bounded north-west by Ho-nan, west by Hu-pêh, and south by Kiang-si. Area 54,810 square miles; pop. (1901) 23,670,314. Capital Ngan-king-fu (q.v.).

Ngan-King-Fu, n-gān' king' foo', China, a city and river-port, capital of Ngan-hui (q.v.), on the north bank of the Yang-tse-kiang, about 200 miles above Nanking; since 1897 open to foreign trade. It suffered severely during the Tai-ping Rebellion. Pop. about 50,000.

Ngoru, n-gōr'nōo, or Angorr, Africa, a town of Bornu, British Northern Nigeria, on the southwest shore of Lake Chad, 15 miles south of Kuka, the capital. It is on the trade route communicating with the interior and the coasts, and its fairs are of great commercial importance. The town is subjected to inundations from the lake during the wet season. Pop. (est.) 40,000.

Niagara, nl'-āg'a-ra, Battle of. See Lundy's Lane, Battle of.

Niagara Falls, Canada, a town of Welland County, Ontario, on the west bank of the Niagara Gorge, just below the Falls, and opposite Niagara Falls, N. Y. It communicates with
NIAGARA FALLS

the United States by three bridges, has electric and steam railroad service, and is a station on the Michigan Central, Grand Trunk, and Saint Catharine's & Niagara Central R.R.'s. It commands the best view of the Falls from Queen Victoria Niagara Falls Park, extending above and below the Falls for two and a half miles. Enormous power traversing the river on the United States side, to utilize the water power, are being constructed. The town was originally named Clifton or Suspension Bridge after its English prototype at the Severn Gorge, Bristol (q.v.). Pop. (1901) 4,444.

Niagara Falls, N. Y., city in Niagra County; on the Niagara River, and on the New York C. & H. R., the Wabash, the Erie, the Michigan C., the Grand T., the West S., and the Lehigh R.R.'s; about 25 miles north by west of Buffalo. Until 1892 what is now the site of the city was two separate villages, Niagara Falls and Suspension Bridge; they were consolidated in that year and chartered as a city. (For the New York State Reservation and the bridges connecting the city with the town of Niagara Falls (q.v.), see Niagara Frontier.) The manufacturing establishments have increased and are increasing since the utilization of the power of the river by the new methods. The chief manufacturers are paper, wood, dressed lumber, soft biscuit, electro-chemical products, foundry products, machinery, chemicals, and wood products. It has a public library, the building for which was donated by Andrew Carnegie, a high school, business schools, public and parish schools, the De Veaux College (P. E.), and the Niagara University (q.v.).

On account of the Falls, one of the scenic wonders of the world, the city is visited annually by thousands of tourists. The government, administered under the original city charter, provides for a mayor, who holds office one year, and a council. The administrative officers are appointed or elected by the mayor and council. The city owns and operates the waterworks. Pop. (1892) 4,444. See Niagara Frontier.

Niagara Falls. The Niagara River is about 52 miles long from the beginning at Buffalo to its termination at Fort Niagara; it connects Lake Erie, 573 feet, with Lake Ontario, 247 feet above the ocean, and carries the drainage of Lakes Superior, Huron, Michigan, Saint Clair, and Erie, estimated at a flow equal to 20,000,000 cubic feet of water per minute by the way of the Saint Lawrence into the ocean. About 20 miles from Buffalo and 12 miles from Fort Niagara are situated the Falls of Niagara, in 42° 55' N. and 79° 5' W.; the "Thunder of Waters" of the aborigines; the "most awe-inspiring spectacle" ever seen by Father Hennepin in all his travels, when he first viewed them in 1678; the point toward which the streams fall principally from all parts of the American continent and from Europe. Here the waters which have descended 50 feet in a series of rapids within half a mile make a sudden plunge of 165 feet in two divisions. The American Fall, with its or less straight crest of 1,060 feet in length, extends along the eastern bank of the river in a north-northeast and south-southwesterly direction; while the other division, the Horseshoe or Ca-

nadian Fall, with a deep curve in the centre, runs at right angles to the course of the river. The crest of the latter measures 3,010 feet and carries by far the largest volume of water. The line of deepest water is accepted at about the middle of the Horseshoe Fall, and as that is more or less imperceptible, the boundary between the United States and the Dominion of Canada, the islands at and near the Falls of Niagara are all United States territory. From the foot of the Falls the river descends among cliffs of 200 to 350 feet high in a series of rapids for a distance of three miles until it reaches the Whirlpool, a circular excavation in the west-erly bank of the river, the boundaries of which are rocky cliffs 300 feet high for about two thirds of its circumference, while the other third, its northerly bank, is made of an accumulation of sand, gravel, and clay. Into this hole the river rushes with tremendous force and speed, in a northwesterly, but has to turn at right angle and leave it in a northeasterly, direction. The impact of the surging water striking against the banks, meets in its recoil, new waters looking for an outlet, and the meeting of these different currents produces the rotary movements of the waters from which the Whirlpool derives its name, and as an exhibition of wonderful water-power the Whirlpool and the Whirlpool Rapids are looked upon by many visitors as more interesting than the Falls themselves. A further series of rapids carry the water to Lewiston, at the foot of Lewiston escarpment. Here the gorge ends and the river flows in a low plain down to Lake Ontario. The width of the gorge varies from 700 feet at the Whirlpool Rapids to 1,700 feet opposite the centre of the American Fall. These measurements are for the tops of the gorge; at the water line these figures are usually reduced one half on account of the talus which has accumulated; thus, the gorge at the inlet to the Whirlpool measures 1,000 feet at the top and 550 feet at the water. The outlet of the Whirlpool has a width of 900 feet at the top and 450 feet at the water. After the river leaves the gorge at Lewiston it has a fairly uniform width of 2,000 feet. The narrows of the river is at Foster's Flats, about one mile below the Whirlpool, on the Canadian side. Although the tops of the banks here are 1,500 feet apart, the river is scarcely 300 feet wide. A platform of limestone projects out into the river, and from its base a well-marked dry channel leads northward for about one third of a mile to the edge of the water. The floor of this channel is strewn with huge limestone blocks, and its westerly bank is continuous with the steep wall of the present gorge.

The depth of water on the crest of the American Fall is fairly well known, and measures from 4 to 10 feet; northerly and easterly winds at times set the water back in Lake Erie, and the fall has been known to dry up. The depth of the Horseshoe Fall is not known. The only attempt to obtain any approximate idea was made many years ago; an old vessel was loaded down with stones until it drew 20 feet of water, and then started down the river; it went over the edge without touching, hence the conclusion was that the deepest water on the edge of the Horseshoe Fall is at least 20 feet.
NIAGARA FALLS

The depth of water in the river has been usually overestimated by hundreds of feet until the United States Lake Survey has given us a series of soundings as follows:

<table>
<thead>
<tr>
<th>Depth (Feet)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fall</td>
</tr>
<tr>
<td>Through the upper gorge to the Whirlpool</td>
</tr>
<tr>
<td>Rapids</td>
</tr>
<tr>
<td>Whirlpool</td>
</tr>
<tr>
<td>Whirlpool outlet</td>
</tr>
<tr>
<td>Gorge below Whirlpool</td>
</tr>
</tbody>
</table>

Of course, with such tremendous currents, twisting and whirling in all directions, soundings cannot be much more than approximate, but they dispel the idea of the many hundreds, and even thousands, of feet of depth entertained before.

If we make an imaginary ascent from Lake Ontario for a geographic study, we find a vast plain, seven miles long from north to south and as far as the eye can reach east and west, which brings us to the so-called first limestone terrace of New York, more populous.

The life history of Niagara Falls is of supreme importance to the geologist to-day, as its complete elucidation would give a measurement of the time elapsed since the disappearance of the northern ice sheet of the Glacial period. Since the time of Hall and Lyell, in 1842, up to the present of Walcott and Grabau, the problem has been attacked with vigor and care, and viewed and reviewed from every possible standpoint and according to the varying theories of the time. Spence, Pohman, Upham, Taylor, Wright, Hitchcock, Bishop, are the names of but a few of those who have studied the problem, and there is still variety enough of opinion to interest many more. As a matter of estimates of the age of the Falls, the consensus of geological opinion varies between 5,000 and 50,000 years, and demonstrates that this absorbing study is far from being exhausted.

The site of the present Niagara Falls and river was in general outlines determined in preglacial times, when the American continent stood at an elevation of from 2,000 to 5,000 feet higher than at present. A system of large rivers had excavated the present basin of Lake Erie, and the combined drainage of these valleys found its way into the present basin of Lake Ontario by the way of the Dundas Valley and the city of Hamilton, Ontario. These rivers could not have drained along the present Niagara River, because the inlet at Buffalo was closed by the limestone terraces, the top of which was from 100 to 150 feet higher than the river-bed which had been excavated to the south of it, the valley of which now forms the eastern end of Lake Erie. The rock bottom of Lake Erie is almost everywhere covered by a deposit of clay and gravel to the height of 100 to 300 feet and at its eastern end the real lake bottom is from 80 to 100 below its apparent bottom. The present Niagara River flows at Buffalo over rock at a depth of from 14 to 16 feet.

With the continent at several thousand feet higher above the ocean level than to-day, these large river valleys could excavate their beds deeper down than at present, and we can understand why the bottom of all the Great Lakes, with the exception of Lake Erie and Lake Saint Clair, is about 500 feet below the ocean level. During the same period the present Tonawanda and Chippewa creeks have excavated a shallow east and west valley in
Mou
NIAGARA FALLS

soft shale of the Onondaga Salt group, and combining their waters, they found their way north by the way of Goat Island, upper gorge, Whirlpool, and Saint David's Valley into the basin of Lake Ontario.

The action of small streams under similar conditions, excavating their gorges and finding their way north over the same strata as those at Niagara, can be studied to advantage in the 14-mile creek at St. Catharines, Ontario, or at Oak Orchard Creek or in the Genesee River of New York. Beginning at the mouth of these creeks and traveling up-stream, we find three falls, one over the sandstone layer of the Medina group, one over the Clinton limestone, and the largest over the Niagara limestone, near the top of the escarpment. These falls are connected with each other by a longer or shorter series of rapids. In an attempt to reconstruct the preglacial Niagara Valley by the data learned from a study of these creeks, we ascend the valley of Saint David, and find our first fall over the Medina sandstone at the Whirlpool and the second and third higher up, perhaps somewhere near the present railway bridges. Whether this little stream originally outlined the Falls' islands, must remain a matter of conjecture at present; suffice it to say that beginning at the northerly part of Buffalo, we have a continuous preglacial valley draining northward by the way of the Whirlpool and Saint David, while the lake basin to the south of the Buffalo watershed was at least 150 feet below the top of the limestone terrace, and drained to the west.

![Cross Section between Lakes Erie and Ontario.](image)

The geologic section of the Niagara region from Lake Ontario to Lake Erie exposes the following strata of the Silurian: The Medina series, sandstones and shales, distinguished in this section by their bright red color; the Clinton series, shales and limestone; the Niagara shale and limestone; the Salina series, gypsum and shales in varying thickness; the Waterline group. Of the Devonian: the Corniferous and Heldeberg limestones. As the strata dip in this section about 30 to 25 feet to the mile from north to south, and our ascent is from north to south, we successively meet all the series from the Medina group to the Niagara limestone as we travel up the gorge along the course of the New York Central Railroad; but for a comprehensive view of an ideal geologic section the walls of the gorge at Lewiston must be studied. Beginning at the water's edge we have about 230 feet of shales and sandstones of the Medina series, of red color; above this 32 feet of Clinton limestone and shale, of greenish and white color; or, laid over by 70 feet of gray colored Niagara shale, and 20 feet of drab colored Niagara limestone. This layer of limestone thins out in thickness as we ascend the gorge until it reaches about 130 feet at the head of the rapids above the falls. The upper 50 feet of this limestone is thin-bedded and offers but little resistance to erosion, but below these are 70 feet of thick-bedded resistant stone, and the falls rush over the edge of this, making profile of the Falls: compact Niagara limestone 70 to 80 feet; Niagara shale 70 feet; Clinton limestone 10 feet. Ascending in our geologic series from the Falls southward, we have the valley of Chipewa and Tonawanda creeks excavated from the soft shales of the Salina series; the southern boundary of these valleys consists of bold cliffs formed by the Waterline, Corniferous, and Heldeberg groups, and is succeeded on the south by the erosion of the basin of Lake Erie in the soft shales of the Hamilton group.

With the advent of the ice period the drainage system of the North American continent underwent a change. In the Niagara section the ice, advancing from the north and east, filled the basin of the Ontario Valley, and the streams flowing into it had to find an outlet toward the south. This was undoubtedly the time when the combined Tonawanda and Chipewa creeks, set back on the north, overflowed their southern boundary at Buffalo, the second limestone terrace, and drained into the valley of Lake Erie, 150 below, which overflow finally eroded the present inlet of the river.

The disappearance of the ice sheet in its recession northward gave birth to immense glacial lakes whose northern drainage was stopped by the southern face of the ice. With the constant increase of these water masses by the more or less rapid melting of the ice sheet, the outflow was at different times in different places of the divide to the south by the Mississippi or the Mohawk valleys. At times slowly, at times faster, the level of these glacial lakes lowered; the continent which previous to the Glacial epoch had stood several hundred feet higher, lowered in a general way and tilted in circumscribed areas. While the ice slowly retreated, the main outlet of the area which covered Lake Erie and its surroundings was by the Wabash River into the Ohio, 200 feet above the present level of the lake. The shore lines of this vast body of water can be traced for hundreds of miles, and like similar shore lines around Lake Ontario, were early chosen for highways or for the founding of settlements.

When finally the lake level had lowered down to Lewiston Height, we would have Lake Erie at about 30 feet higher than at present, pouring its waters in a broad lake-like expanse through the gap at the present site of Niagara Falls and islands, and flowing in a broad expanse over the edge of the escarpment. As Lake Ontario lowered, the overflowing waters found the lowest point in the escarpment near the site of Lewiston and commenced to erode the present gorge. It will hardly do to speak about Falls at Lewiston in the proper sense of the word, because the comparatively thin layer of Niagara limestone on top of vast masses of soft shale beneath did not offer resistance enough to the immense drainage for
the formation of a fall, but made the work of erosion easy and formed a series of rapids as the level of Lake Ontario lowered. This newly formed gorge, beginning to form a new gorge. In this way we can account for the right angle formed by the river between its inlet and its outlet at the whirlpool.

Whether the peculiar short valley at Foster’s Flats gives us the place where the great cataract halted for a while divided by an island; whether it was the full force of the present current which produced this peculiar phenomenon, or whether a mass of water, much reduced on account of the tilting of the lake outlets, gives a more satisfactory explanation, must be left to future investigations.

Beyond doubt the immense volume of water eroded its way southward in the preglacial channel. After a small fall over the Clinton limestone, it left the fall which originally tumbled over the Medina sandstone as a long series of rapids both at the inlet and the outlet of the whirlpool and traveled to the south along the ancient gorge as one fall. The increasing thickness of the Niagara limestone retarded its southward progress more and more, hence any attempt to speak about the age of the gorge at the present time must be accepted with a wide margin. Receding southerly as one fall until probably opposite the northern end of the American fall, Goat Island and the other small islands on the American side, came into consideration and the Falls divided. The largest volume of water remained in the clearest and deepest channel, westerly of Goat Island, while the lesser volume divided itself among the islands and remained on the American side. From this time on, the Falls, looked upon as one, ceased to travel straight southerly, but swung round in a circle with the northern point of the American fall as the centre. The Horseshoe Fall, owing to its clearer channel and larger volume of water, receded faster, eating away the westerly side of Goat Island, and at present it is almost wholly on the southerly side of Goat Island, indicating that at some near future geologic time, it will draw away all the water from the American side, leaving the present American Falls and the islands high and dry and wending its way southerly and easterly again as one cataract.

The oldest drawing and description of the Falls of Niagara have been handed down to us by Father Hennepin, the first white man who saw them, in 1678. He says they are "above six hundred feet high," and we can forgive his exaggeration in view of his enthusiasm, for very few people of to-day, when seeing the falls for the first time, and not having their minds biased by figures, are capable of forming an estimate of the height from which the waters tumble down; one half will over-estimate it immensely, while the other half will err to an equal extent on the other side.

Very much depends upon the spot from which one first views it. The first scientific survey of the Falls was made by Prof. James Hall, State geologist of New York, in 1842, and his work has formed the foundation of all subsequent surveys. The most interesting part of all these surveys is that they demonstrate the changes which have taken place in recent times in the crests of the Falls. A comparison of the surveys of 1842, 1875, 1886 and 1890 shows that the American Fall has receded at the rate of 0.64 foot per year, or 30.7 feet between 1842 and 1890, and the Horseshoe Fall during the same period 2.18 feet annually, or 104.51 feet in 49 years, a very much higher rate of recession than was dreamed of prior to the second survey in 1875 and its discussion in 1883. Of course the Falls do not recede evenly, some parts of the crest remain more or less stationary while others change rapidly. The figures above represent the points of greatest activity. The total area of rock surface which has disappeared at the American Fall between 1842 and 1890 represents about 33,000 square feet or three fourths of an acre; at the Horseshoe Fall there has disappeared during the same period 275,000 square feet or 6.3 acres. In all descriptions of the American Fall we speak of one, although there are two; but the second one, the Luna Fall, is so small that it is ignored. It is interesting only as it affords the visitor an opportunity to go in behind the falling waters into the so-called "Cave of the Winds."

Geologists have often indulged in speculations regarding the future of Niagara Falls, and how many thousands of years it would take before the increasing thickness of the Niagara limestone and the decreasing exposure of the soft underlying shales would reduce the height of the Falls to a minimum or even to a mere series of rapids. Judging from present indications, the utilitarian spirit of the age will destroy this wonder of nature long before any changes produced by the natural course of events can mar its beauty or diminish its grandeur. With the discovery of long distance electric transmission there have sprung up, on both sides of the river above the Falls, water power plants fed by the production of electricity, each one of which robs the Falls of a certain amount of water; these will multiply unless the
State of New York and the Province of Ontar-rio co-operate and adopt laws to prevent any additional withdrawal of water by the plants now existing, as well as by the formation of new power companies.

Twenty years ago New York State paid $1,500,000 for the present reservation and placed it under State control to preserve the scenery of the Falls of Niagara, for in all that is grand and sublime in the wonders of nature, there resides a power to educate and refine which is of inestimable worth. The Province of Ontario took the same course very soon after; and it behooves the present century to see to it, by the most stringent laws, that this source of water, that the waters of the Falls of Niagara do not belong to a few companies, or to New York State or to the Dominion of Canada, but they belong to mankind, irrespective of nationality or color.

Niagara Fort. See Fort Niagara.

Niagara Frontier. Normal designation of the region bordering the Niagara River, 37 miles long, between Lakes Erie and Ontario, presenting features of exceptional scenic, scientific, historic, political and industrial interest.

Geographical and Scenic.—The general course of the Niagara is a little west of north, through a flat country from Lake Erie north for more than 300 miles. Some soils under the southern part of Lake Ontario, in the main parallel with it, in the Niagara region, is an abrupt declivity, approximately a prehistoric shore-line, the country north of it being some 400 feet lower than the general level to the south of it. From this escarpment to Lake Ontario the country is exceedingly fertile, famous for its peach, quince, plum, and apple orchards, and other fruits. Through this section the river flows with a slacker current and is subject to smaller alluvial banks. From the escarpment, southerly, the river has cut a gorge 200 to 400 feet deep, back seven miles, through which the Falls of Niagara have receded to their present position. This portion of the river, except for a navigable mile below the Falls, a wild rapid, and includes the Niagara Whirlpool. From Lake Erie to within a mile of the upper rapids, less than two miles from the cataract, the Niagara is navigable. At the northerly end of the city of Buffalo, it branches, embracing Grand Island, area 17,381 acres (8 miles long, 6 miles wide), a township of Erie County, N. Y. The international boundary line lies in the middle of the river, following the west channel and passes through the apex or principal angle of the Horseshoe Fall. With the exception of Navy Island, which belongs to Canada, in the west channel near the foot of Grand Island, the islands belong to New York State; principal ones are Saw, Rattlesnake, Strawberry and Cayuga, New York side; Beaver, near head of Grand Island; Buckhorn, foot of Grand Island; and Tonawanda. The Niagara receives, from the east, Gill, Cayuga, Tonawanda and Scajaquada creeks, the last-named flowing through the city of Buffalo and making its principal Park Lake. (See Buffalo.) From the west, the Welland is the chief tributary, an important navigable route in pioneer days, and still popular with canoists.

The scenically famous part of the Niagara begins, on the north, at the edge of the escarpment, and runs southerly seven miles, culminating in the great cataracts. The general form of the precipices is such that the river plunges into that of an irrational horseshoe, divided by Goat Island. The eastern or American Fall has nearly a straight contour line, width 1,060 feet, height 167 feet. Luna Island separates a small part of the American Fall, on the Goat Island side, from the main body. Behind this Luna Fall is the Cave of the Winds, a natural chamber eroded by the water (projected against the cliffs by air-blasts) about 100 by 75 feet in dimensions. The gorge opposite the American Fall is 1,250 feet wide. The Horseshoe or Canadian Fall, the grandest single feature of the Niagara region, was in 1890, 3,010 feet long; continued recession has no doubt increased the length; the height at the apex of the curve is 58 feet. Adjacent the cataracts on both American and Canadian sides are groups of islands, surrounded by rapids, presenting many minor features of great beauty and interest. On the American side, Green Island (formerly Bath), Goat, the Three Sisters, Little Brother, Ship, Brig, Robinson, and others (the last four named inaccessible to visitors) are included, with a strip of the mainland 106 acres in all, in the New York State Reservation. On the Canadian side, Cedar Island and the Dufferin Islands, above the great fall, are a part of the Queen Victoria Niagara Falls Park. About three miles below the Falls the river turns from northwest to northeast and at the elbow forms the Whirlpool, of greater interest to the geologist than to the casual tourist. Between the Whirlpool and the end of the gorge, points of interest are, on the New York side, the Devil's Hole, a wild ravine, lateral to the main gorge; and on the Canadian side, Niagara Glen, formerly Foster's Flats. The view from the edge of the escarpment, Canadian side, overlooking the village of Queenston and the low interval to Lake Ontario, is celebrated.

The level of Lake Ontario is 326 feet below Lake Erie; from Lake Erie to the rapids above the Falls, the descent is 10 feet; from the beginning of the rapids to edge of American Fall, 40 feet; from foot of American Fall to Lake Ontario, 100 feet. The discharge of the river is estimated at 15,000,000 cubic feet per minute, or one cubic mile per week.

On the edge of the escarpment two and one half miles east of Lewiston is the Tuscarora Indian reservation, 5,790 acres; a well-to-do farming community of descendants of the Tuscaroras who, being refugees from the South, joined the Five Nations Indians in 1715.

Geological.—The floor of Lake Erie at the mouth of the Niagara is Corniferous limestone. The dip is to the south, and as one proceeds northerly on the course of the river there are successively the Tuscarora and Corniferous limestones, the Salina group, including the hydraulic limestone; Niagara limestone, Clinton shales, Medina sandstones (upper gray, red, and gray quartzose), and red shales and sandstones, extending to Lake Ontario. Esti-
NAIGARA FRONTIER

mates by careful students as to the time occupied by the falls in cutting the gorge from the escarpment to their present position vary from 5,000 to 10,000 years. But there is altogether insufficient and unreliable data of recession. In that year James Hall, New York State geologist, made a trigono-
metrical survey of the Falls, marking the stations of observation with permanent monuments. Recent observations show that for the 48 years prior to 1890 the mean retrogression of the American Fall has been 7.68 inches per year; of the Horseshoe Fall 26.16 inches; a total area of recession for the American Fall of about three fourths of an acre, and for the Horseshoe Fall, of 6.32 acres. Erosion goes on most rapidly at the apex of the Horseshoe Fall.

Botanical.—The flora and silva of the Niagra region are remarkable only for the large number of species found in a small area. On the New York State reservation (106 acres), and in the immediate neighborhood of the river, have been found 909 species of flowering plants, ferns and other cryptogams, 758 of which are native. Goat Island (13.9 acres) is especially rich in species. Here, and at a few other stations in the vicinity, occurs Hypericum Kalmanianum, L., which perpetuates the name of Peter Kalm, a Swedish botanist whose description of Niagara is his visit in 1750. Among the ferns of the Niagara gorge, rare or not occurring elsewhere in Western New York, are the walking-fern, Camptosorus rhizophyllus, Link., Aspidium Lonchites, Swartz, and Aspidium Boreale, C. Rich. These ferns were observed at a hundred miles northward: also Pellaea gracilis, Hook., and P. atrupurpurea, Link. The only sasaffas trees of the region grow at the Whirl-

pool.

History.—The world's first knowledge of Niagara Falls and river was had from Samuel de Champlain's work, 'Des Sauvages,' 1604; but Champlain never saw the cataract, basing his al-

culation on reports of Indians. The oft-repeated statement that Jacques Cartier, in 1535, was the first man to pass the Falls is disproved, it being shown that statements attributed to him, and quoted by Marc Lescarbot ('Histoire de la Nouvelle France,' 1609), are really from Cham-

plain's work of 1604. The first known visit of white man to the Niagara region was that of Joseph de la Roche Dallon, a Franciscan, who attempted missionary work in the Niagara penin-

sula in October 1626, and appears to have crossed the river, from west to east, near Lewis-

ton. Two priests of the Society of Jesus, Jean de Brébeuf and Joseph Chaumonot, visited the Indians in the Niagara region, 1640-1; the Sul-

picians, François Dolière de Casson and René de Bréhant de Galinee, passed the mouth of the Niagara, July 1661; but they did not explore the Niagara, entering Lake Erie by the Grand River, to the westward. With them was René Robert Cavalier, known as La Salle, who turned back, and seems to have become familiar with the Niagara region in that year. In December 1678, La Salle again came to the Niagara, and above the Falls built the Griffon, the first craft larger than a bark canoe, to navigate the upper lakes. The Griffon sailed 7 Aug. 1679; the site where the vessel was built, near the present village of La Salle, N. Y. (pop. 661), is marked with a large boulder and bronze tablet, suitably inscribed. With La Salle was Father Louis Hen-

nepin, a Franciscan (Recollect), whose book ('La Louisiane,' 1683) contains the first de-
tailed description of the Falls. The first picture of Niagara the Griffon left, and are there the original prints of La Salle's 'Nouvelle Découverte,' etc., first published 1697. La Salle was several times on the Niagara, as were his lieutenant Tony and other followers of historic fame. La Salle made no permanent establishment, his attempt fort at the mouth of the river (Fort Conti), his stock-

ade at Lewiston and house above the Falls being soon destroyed. In 1687 the Marquis de Denon-

ville, after a campaign against the Iroquois in Central New York, came to the Niagara and built a fort at the mouth of the river, east side, called it Fort Denonville, and garrisoned it with 100 men. Sickness depleted the garrison and in 1688 the post was abandoned. No attempt to re-

occupy the region was made by the French until 1719, when Chabert de Joncaire the elder built a trading hut at the present site of Lewiston. In 1725-6 Fort Niagara was built at the mouth of the river, and for 34 years it was the centre of French influence throughout a wide region, an important link in the chain of posts by which the subjects of Louis XIV, sought military and trade control of the Lakes and Ohio Valley. The original mess-house or "castle," somewhat modified, is still standing. Among the oldest buildings in the northern United States west of the Mohawk; two other buildings of the French period remain, adjoining. French domination on the Niagara ended 25 July 1759, when Fort Niagara and dependence—abandoned and razed by" Pouchot to Sir William Johnson.

Under the British, the Niagara was a centre of British-Indian alliance until the close of the Revolution. During the period of Pontiac's up-

rising, a band of Indians ambushed and massa-
cred a British force returning from Fort Schlosser above the Falls to Fort Niagara, also a relieving force, in all about 100 men. This af-

fair, 14 Sept. 1763, took place on the banks of the waters of the Niagara at the Devil's Hole ravine, to which many of the victims were thrown or driven alive. It was the last Indian demonstra-
tion against the British in this region. From the outbreak of the Revolutionary War parties were sent from Fort Niagara against the frontier settlements of New York and Pennsylvania. Here were planned the expeditions which re-
sulted in the massacres of Wyoming, Cherry Valley, Bowman's Creek, and others. Sullivan's retaliatory expedition of 1779, against the Sen-

ecas of Central New York, drove in upon the British at Fort Niagara some 5,000 refugees, who became dependents on the British. To re-

lieve this burden, the British, until the close of the war, were zealous in equipping and dispatch-

ing from Fort Niagara scaling parties against the American settlers in the Mohawk, Susquehanna, and other frontier sections. Several hundred of the Senecas who fled from Sullivan, sum-

mer of 1779, settled the next spring on Buf-

falo Creek, thus making the first Indian village on the present site of Buffalo. (See BUFFALO.) The British maintained a garrison at Fort Niag-

ara, and virtual control over the whole region, until 11 Aug. 1796, or for 33 years after the close of the war. During this 'hold-over' period the present town of Niagara, Ont., at the mouth of the river, west side, was settled, beginning 1783, with people from the United States who re-
mained loyal to Great Britain. These United Empire Loyalists, many of them families of culture and energy, gave a high character to society in the district, still maintained by their descend-ants. The development of the Canadian side of the Niagara was begun earlier than that of the New York side. Lieutenant-Governor Simcoe made Niagara the capital of Upper Canada (now Ontario) in 1792, the seat of government being moved to York (Toronto) in 1796. Queenston, Canada, opposite Lewiston, was founded as West Landing, 1780, by Robert Hamilton; in 1792 named by him Queenston, in honor of Queen Charlotte.

The War of 1812 paralyzed the development of the region, and the banks of the Niagara became the theatre of the most important land conflicts of that war on the northern frontier. On 12 Oct. 1812 the Americans under Van Rensse-lear attempted to gain the heights at Queens-ton; owing largely to cowardice and insubordi-nation of the militia the attempt failed, and the Americans were defeated; the British commander, Gen. Isaac Brock, was killed in the engagement; Winfield Scott, of the American regulars, was taken prisoner. On 13 May 1813, the American land forces under Dearborn and the land forces under Chauncey operated together against Fort George, nearly opposite Fort Niagara. Dearborn falling ill, the command devolved upon Scott. Fort George was taken, with the nearly village of Newark (near present-day Niagara-on-the-Lake). The British posts at Chippewa and Fort Erie were abandoned, and the entire Canadian frontier from Lake Erie to Ontario was in the hands of the Americans. In December the British compelled the evacuation of Fort George. The American general, McClure, in retiring, blew up the fort and burned Newark. In retaliation, the British crossed the river, captured Fort Niagara, and burned and laid waste the entire American frontier, the villages of Youngstown, Lewiston and Tuscaraora, culminating in the destruction of Black Rock and Buffalo, 30–31 Dec. 1813. On 3 July 1814, the Americans under Scott and Ripley captured Fort Erie. On 5 July, Chippewa Creek, the Americans were again vic-tors. On 25 July was fought the battle of Lundy's Lane, also called Bridgewater or Niagara Falls, overlooking the cataract. The Americans, with a total force of less than 2,600, attacked the British (4,500 strong in all) with artillery and charged, driving the British, and they took the British guns (46 guns including one pole with a 24-pound gun and some small cannon). The British losses in this battle are unknown, but on both sides there were casualties. From 1802 the American side of the Niagara was opened for settlement under the operations of the Holland Land Company, which founded New Amster-dam, now Buffalo. Black Rock, four miles from Buffalo Creek, was merged in Buffalo in April 1833. The opening of the Erie Canal, 1825, gave great impetus to the whole region. The towns of Tonawanda (q.v.) and North Tonawanda (q.v.) owe their origin to the canal, and are now important as a point of lumber manufacture and of cargo trans-shipment from lake vessels to cars and canal-boats. Niagara Falls, N. Y. (formerly Manchester), now embracing Suspension Bridge (pop. 19,457) has evolved from its long-famous aspect of a tourist resort to a unique position among manufacturing towns. Lewiston (pop. 697), named for Gov. Morgan Lewis, on the site of La Salle's stockade of 1678, was a place of some importance prior to the railroad era, and a station on a much-traveled highway to the West. It now shares in the general immunity from business which characterizes Youngstown (pop. 547), five miles below, and Niagara and Queenston, opposite; the shipment of fruit and farm produce and the care and transportation of tourists are the chief industries of the old Niagara river. Fort Niagara, at the mouth of the river (reservation 288 acres), is a United States military post with modern buildings, rifle range, etc. Here are also standing several structures of the British and French period of occupancy. The old history magazine (1757) in which William Morgan was confined in 1786, for his anti-Masonic publication, is still shown. The Canadian side of the Niagara has no large town, the villages of Niagara-on-the-Lake (Ontario), Queenston opposite Lewiston, Saint David's, three miles west of Queenston, Stamford, one mile from the Whirlpool, Niagara Falls, Ont. (Drummondville), Chippewa, Bridgerburg and Fort Erie (formerly Waterlawn), being either quietly rural or devoted to tourist and railroad interests.

Grand Island, a township of Erie County, a farming community, with numerous country seats, clubhouses, hotels and resorts on the shores, was the proposed site of Ararat, City of Refuge for the Jews, which was advocated by Dr. Manuel Noah zealously advocated. A cornerstone for the new city was prepared, 1845, but the project came to naught. Tonawanda Island, in the American channel opposite Tonawanda Creek, is almost wholly covered with yards and mills; connected by bridge with the mainland. Navy Island (304 acres), in the Canadian channel, was the principal rendezvous of William Lyon Mackenzie and his followers during the uprising of 1837–8 known as the Upper Canada Rebellion, or Patriot War; the principal event of which on the Niagara was the burning of the steamer Caroline, in service for the rebels, by the Canadians, 29 Dec. 1837. Fort Erie village, near the ruined fort of the same name at outlet of Lake Erie, and Ridgeway, a few miles inland, were the field of exploit by the Fenians whose attempted raid into Canada was quickly suppressed, 1–12 June 1866.

Bridges — The Niagara River is spanned by several notable bridges. The International (railway only), at Buffalo, was built by Sir Casimir Stanislaus Gzowski and Sir David L. Macpherson; begun July 1871, opened for trains 3 Nov. 1879. It is 1,671 feet long, 3,651½ feet high, supported by eight piers, three
NIAGARA FRONTIER

of 197 feet span, three of 248 feet, and a double draw 362 feet long. The piers are in water from 9 to 48 feet deep, with a current varying from 5 to 12 miles an hour, the level of the river and falls, andf the current, chiefly defected by wind, which raises or lowers Lake Erie, the outlet of which is three and one half miles above the bridge. Originally of single-track width, it was widened and its capacity doubled, 1901-3. The upper steel arch bridge, below the falls, occupies the place of a suspension bridge, built 1895, destroyed by a gale in 1899, restored as a suspension bridge, and in 1895 replaced by the present structure, 1,240 feet long, height of floor above water 192 feet, width of floorway 46 feet, length of arch span 840 feet, said to be the longest bridge of its kind. One and a half miles below, spanning the gorge at the origin of the upper whirlpool rapids, is the steel cantilever bridge of the Michigan Central Railroad, built 1883; length 910 feet, height above water 245 feet; for railway only. A few rods below it is the lower steel arch bridge of the Grand Trunk Railway, which replaces the suspension bridge built 1871. The present structure, completed 1897, is 1,080 feet long, with a centre span 550 feet, the centre of the arch 226 feet above the water; upper track for railway, lower for carriage and foot passengers. At the north end of the gorge, between Lewiston and Queenston, a suspension bridge was erected 1895, replacing the first suspension bridge across the Niagara, built here in 1851 by Capt. E. W. Serrell, and destroyed by wind 1864. The present structure has a cable span of 1,040 feet, suspended span 800 feet, height above river 65 feet; opened for traffic 1889; one floor for foot, carriage and electric railway traffic.

The scenery of the vicinity of the Falls was rescued from vandalism and proprietary greed by the action of the Mayor of New York and the Government of the Province of Canada. Many enlightened minds had regretted but were powerless to stay the deterioration of the environs, long before the meetings in 1878 of Capt. Robinson of New York and Lord Dufferin, then Governor-General of Canada. To the latter is ascribed the first official expression which led to legislative action in both countries, for the preservation of the Falls. In 1885 the New York State paid $1,437,429.50 for Prospect Park, adjacent lands bordering the river, Goat and other islands; now constitute the New York State Reservation at Niagara Falls, opened to the public 15 July 1885. The wise policy of the State has been to restore the environment to a condition of nature, with as little artificial work as consists with its use and enjoyment by the public. The park is free, maintenance coming from rentals of concessions and a modest annual appropriation from the State. The park is visited by more than half a million people yearly. The Queen Victoria Niagara Falls Park, on the Canadian side, embraces 154 acres in the vicinity of the falls, including the Caledonia and Dufferin islands, bought by the Dominion Government in 1885 for $436,000; and also, subsequently acquired, a strip 66 feet wide along the river from Queenston to Fort Erie, about 90 acres at Niagara, and further at the Fort Erie battle-field; and the site and ruins of Fort Erie. Franchises, especially to power plants, produce a large income. By thus controlling the entire river front from Fort Erie to Queenston,—over 20 miles—the Dominion Government led the van for the preservation of historic sites on its frontier. At Fort Erie the long battle-line of Battery street, 1764, present ruins dating from 1805-14, at Chippewa, and Queenston, battle-fields of the War of 1812 are preserved. On Queenston Heights is the Roman composite column in memory of Maj.-Gen. Sir Isaac Brock; a fluted shaft on a square pedestal, surmounted by a statue, the whole structure 190 feet high; a stairway of 235 steps leads to a gallery at the top. It stands 250 feet above the river; and in its vaults were reinterred, 13 Oct. 1853, the remains of Brock and of Lt.-Col. John McDonell. The shaft replaces an earlier and more modest monument, destroyed by miscreants, 16 April 1840. Near the foot of the hill is a small monument marking the spot where Brock fell; it was unveiled by Albert Edward, Prince of Wales, 18 Sept. 1860. At Lundy's Lane, near the Falls, but not included in the Government reservation, the burying ground contains numerous monuments erected in 1856. Similarly historic are the cemeteries at Niagara, Ont., Fort Niagara and Lewiston. Numerous historic sites on the American side have been marked by bronze tablets erected by the Niagara Frontier Landmarks Association.

Utilization of Power.—Competent estimates place the potentiality of the Niagra current at 7,000,000 horse-power. After many years of more or less impracticable schemes, Thomas Evershed developed a plan which became the basis of the present successful undertaking to use the power on a large scale. In June 1890 an International Niagara Commission was established, authorized to offer prizes amounting to $22,000 for the best plans for the purpose. For turbines the designs of Faesch and Piccard of Geneva were selected, and three experimental wheels were built from their plans by the I. P. Morris Co., Philadelphia. Two-phase alternating current dynamos with revolving field were adopted; three were made and installed by the Westinghouse Company, Pittsburgh. The plan included a surface canal 250 feet wide, 12 feet deep and 1,700 feet long, extending laterally from the river. Parallel with this a wheelpit in New York River 480 feet wide and 178½ feet deep. This work was about a mile above the Falls. From the base of the wheelpit a tunnel was made, 18 feet 10 inches wide, 21 feet high and 6,897 feet long, emptying into the river below the Falls. For the first 5,000 feet from its lower end the grade is .7 per cent; thence to the wheelpit .4 per cent. Construction of the tunnel was begun 4 Oct. 1890. Ten turbines, each of 5,000 horse-power, were installed in the pit, steel penstocks 136 feet long and 7½ feet diameter carrying the water to them, the great tunnel serving as tail-race. Each turbine shaft, connected with the generators above, weighs, with connected parts, 150,000 pounds, and is so supported by the upward thrust of the column of water in the penstock that it revolves without friction on its bearings. The original installation of ten wheels and dynamos was more than duplicated, 1901-3, by the construction of a second line at Queenston Heights, including the battle-field; and the site and ruins of Fort Erie. Franchises, especially to power plants, produce a large income.
feet to the new pit, making the total length of the tunnel 7,437 feet. The new power-house and pit are planned for the installation of 11 turbines and dynamos, each unit of 5,000 horse-power, a total production at this point of 105,000 horse-power. The turbines in pit No. 2 are of the internal discharge type, claimed to add 10 per cent to the effective head. Two types of generators are used: (1) an external field type with nickel steel revolving magnet ring; (2) an internal revolving field type, ground for 2,300 volts, 25 cycles, 2-phase, operated at 250 revolutions per minute.

Power operations on the Canadian side were actively begun August 1902, with the construction of a plant to develop 110,000 horse-power. A notable innovation was the use of dynamos of 10,000 horse-power each. In April 1902 the Dominion Government granted rights to the Ontario Power Company, which then planned to develop 150,000 horse-power. Instead of discharging by a tunnel, the water is received in flumes, carried to the brink of the gorge and dropped to the lower river through penstocks. The first two companies to begin operations at this point were backed largely by United States capital; a third company, largely Canadian, has been granted the present plans of the three companies contemplating a total production at this point of some 600,000 horse-power. The Canadian Government expects that all cases that 1 per cent of the power developed must be supplied to Canadian consumers if called for, the rest may be exported to the United States. On the American side, in the vicinity of the power-houses, a score or more of industries have located, chiefly employed smelting, electrolytic and chemical processes, and using in the aggregate about 25,000 horse-power. The International Railway system (electric) operating throughout the whole frontier, as far east as Lockport and to stations in Buffalo, some of them 32 miles from the generators, is a notable instance of the distributed use of Niagara power, which is also largely supplied for manufacturing establishments in Buffalo and elsewhere. Far-reaching plans are made for rail and road traffic and water supply on the Canadian side, and great developments are predicted for the near future. At Niagara Falls, N. Y., electric power is supplied by hydraulic power. The original power canal, built 1853-8, has been much enlarged, notably since 1892, and now has a working capacity of 100,000 horse-power. Numerous establishments relying on this system use some 20,000 horse-power, with prospective increase. The industrial growth of the Niagara region in the past decade has been great, and indications point to still greater development in the coming decade. Public apprehension that the scenic features of Niagara will be impaired by the diversion of water for power purposes, is not borne out by test observations, the variation in the flow of the cataracts due to a change of wind often being far greater than any deemed possible under present power operations.

Frank H. Severance,
Secy. Buffalo Historical Society.

Niagara International Park, on both sides of Niagara River at Niagara Falls, is a reservation for public purposes established by the joint action of the legislature of the State of New York and the parliament of the Dominion of Canada. See Niagara Frontier.

Niagara-on-the-Lake, Canada, a town of Lincoln County, Ontario, at the mouth of Niagara River, on the west bank, twelve miles below Niagara Falls, and 36 miles by water from Toronto. It is a pleasant summer resort. It was burned by the Irish-American General McClure during his retreat, an unnecessarily savage action that was deplored by both sides and led to cruel reprisals. Pop. (1901) 1,258.

Niagara Series, in geology, the earliest strata of the Upper Silurian era, preceding the Onondaga Series and the lower Heiderberg Series. It, in turn, is subdivided into the strata of the Medina epoch, those of the Clinton group, and those of the Niagara formation. None of these three is continental in extent, but all are important, are very rich in fossils, and consist of sandstones, limestones, and shales. The Medina formation is made of Oneida conglomerate, a hard, light gray rock made up of quartz pebbles and sand, and covering Herkimer, Oneida, and Ulster counties, New York, a part of Virginia, and parts of Tennessee and Kentucky. The Clinton formation is shaly sandstone in New York and Pennsylvania, and more completely limestone further west, occurs in Ohio, Indiana, Wisconsin, Tennessee, Kentucky, Alabama, and Georgia, and is marked by the occurrence of oolitic argillaceous hematite. The Niagara formation is a thick limestone, underlaid with shale; the wearing away of the latter undermines the limestone as at Niagara Falls. The Niagara group occurs in New Hampshire, Connecticut, Ohio, Illinois, western Tennessee, northern Kentucky, Missouri, Arkansas, and (scantily) in the Rockies. The fossils of the series are mollusks, corals, crinoids, etc.; apparently there are no land or fresh-water animals.

Niagara University, a Roman Catholic theological institution at Niagara Falls, N. Y. (q.v.), founded by the priests of the Congregation of the Mission in 1856. In 1903 there were connected with the school 22 professors and 200 students. The library contains about 13,000 volumes; the grounds and buildings are valued at $50,000. The students come from all parts of the country, and after ordination return to their respective dioceses.

Niam-Niam, né-am' n'é-am'. See Nyam-Nyam.

Nian'tic Indians. See Narragansett Indians.

Nias, né-ás', Dutch East Indies, an island in the Indian Ocean, off the southwest coast of Sumatra, from which it is separated by a strait 60 miles wide. It is about 70 miles long, 20 miles average breadth, area 2,100 square miles. The surface is mountainous, attaining a maximum altitude of 1,970 feet. In 1857 when the Netherlands took possession of the island, the population was reckoned at 17,000. The Niassees are of the Malay race, but fairer than the usual type. They are industrious and frugal, expert handicraftsmen, temperate and regular in their habits, but incline to avidity of appetite and expenditure; and sanguinary. The chief vegetable products are rice, cocoaanuts, bananas, tobacco, sugarcane, etc., and annually about 110,000 pounds of pepper. Hogs are reared, and there is a domestic
NIATA—NIBLO'S GARDEN

export trade with Sumatra in rice, yams, beans, and poultry. Pop. est. 200,000.

Nia'ta, or Nata, a breed of Argentine cattle, which long ago started among the Pampas Indians, and is now nearly or quite extinct. They were really deformed, the parts of the face being so proportioned as to give the face a queer pig-like appearance. They were very interesting to the students of evolution as an example of a variant which maintained its peculiarities through a long period, breeding "true," and showing no reversion to the normal type.

Nibby, néb'bé, Antonio, Italian antiquarian: b. Rome, d. there 1839. He was one of the founders of the Academy of the Niger. He and in 1814 was secretary to Louis Napoleon. He later became professor of archaeology in the College of Rome and in the School of France. He was a friend of the French Emperor (1777-1815); "Etamenti di Archeologia" (1828); "Album di Roma" (1834); etc.

Nibelung, néb'be-loong, in Scandinavian mythology, a monarch whose subjects are called Nibelungs, and territory the Nibelungenland. Their ancestors were, two centuries in this realm, against whom Siegfried, Prince of the Netherlands, fought. He slew the 12 giants who formed their paladins with 700 of their chiefs. The word Nibelung is from nebel (darkness), and means the children of mist or darkness.

Nibelungen, néb'be-loong-én, Ring des. See Ring des Nibelungen.

Nibelungenlied, néb'be-loong"en-lét, The (Song of the Nibelungen), or NIBELUNGEN NOTH (Nibelungen's Need), an ancient German epic, ranking among the noblest works of imagination. The subject of this great epic is the dreadful fate of the Burgundians, caused by the passion of two princely pairs. The one pair are Siegried, son of King Sigismund of Saxony, and Chriemhild, sister to Gunther, king of Burgundy; the other, the great Gunther and Brunhild, a heroine of the fabulous North. Siegried—as noble a hero as ever was depicted—is beloved by Chriemhild. Her brother Gunther is enamored of Brunhild of Iceland. But the northern woman can only be won by force, and a successful suitor must conquer her in combat. Gunther promises Siegfried his sister's hand if he will aid him in gaining Brunhild. Siegfried, by means of a cloak which renders him invisible, is enabled to assist Gunther in his encounter with Brunhild, whom he vanquishes and marries. On the night of her nuptials, however, Brunhild has another struggle with Gunther, in which she overcomes him. Siegfried a second time redeems his submission, and takes from her her girdle and ring, in which lay her power. These he gives to Chriemhild, who, after an interval of ten years, in a quarrel with Brunhild, shows her those trophies of her defeat. Brunhild resolves on vengeance, and persuades Hagen of Tronege to murder Siegfried, which he effects with the privity of Gunther. Chriemhild, after 13 years passed in widowhood, in pursuance of a project of vengeance marries the heathen Etzel. After another interval of 13 years, Chriemhild gives a solemn feast to Etzel, she invites the Burgundians or Nibelungen to the court of Etzel, involves them in strife with the Huns, and after several bloody battles both parties are destroyed. Gunther and Hagen, the sole survivors, surrender to Dietrich of Brun, an ally of Etzel, who delivers them to Chriemhild, with an injunction to spare their lives. She puts them both to death, and she in turn is killed by a vassal of Dietrich. The poem thus ends in a tragical scene of revenge and bloodshed. The time in which we find the historical basis of this tragedy is about 430 or 440 A.D.; the scene is on the Rhine, and on the frontiers of Austria and Hungary. The story of the Nibelungenlied belongs to the general body of Germanic and Scandinavian mythology, and it may be traced in the myths of others of the Aryan nations. The author of the poem is not known for certain. Some have attributed it to Henry of Olfterdingen or to Kingssoh of Hungary, but recent investigations make it probable that an Austrian knight was the author (about 1140). The poem does not appear to have been so popular as some others, and after the 16th century it fell into oblivion, so remaining until 1738, when some considerable portions of it were published by Bodmer. Lachmann, in his edition of 1826, first made it the subject of scientific criticism; but his views have not been sustained by later critics. The Saint Gall text, which was regarded as the original, is now considered the best, and the Nibelungenlied is regarded not as a compilation, but as an organic whole, composed by one author, who derived his materials from the rich stores of song and legend in which were the common possession of the German people.

German critics speak highly of the Nibelungenlied, and prefer it in many respects to the Iliad. The language of the Iliad is, they admit, superior to that of the Nibelungenlied both as to the idiom itself and the mastership with which the Greek poet wields it, though the German epic has a childlike and venerable simplicity. On the other hand, they argue that the plan of the latter is vastly superior to that of the former. It is a great plan, from beginning to end, and embraces a whole event; the Iliad but a part of an event. The Nibelungenlied marks the culmination of the great process which had been going on since Rome a great power, and had transformed the invading hordes into a highly civilized people. Not only by reason of its splendid poetic and dramatic power, but also as a monument in the history of the human race, the Nibelungenlied takes rank as one of the great national epics of the world's literature.

Nib'llack, Albert Parker, American naval officer: b. Vincennes, Ind., 25 July 1859. He was graduated from the United States Naval Academy in 1880; served with an expedition of survey and exploration to Alaska in 1884-8; was inspector of naval militia in 1895-6; and writer and lecturer on signaling and naval tactics at the Naval War College in 1893-6. He was then naval attaché at Berlin, Vienna, and Rome till the Spanish-American War; during this war he served on the blockade of Spanish ports, being engaged in the battle of Nipe Bay. In 1898 he was transferred to the Philippines and took part in the suppression of the native insurrection; and in 1901 he was appointed secretary of the naval commission in the Philippines. He has written 'The Coast Indians of Alaska and Northern British Columbia' (1889).

Nib'l'o's Garden, a former theatre in New York, in Broadway, near Prince Street. It was
opened in 1838 under the name of the Sans Souci and a year later was a concert garden. Nilo's theatre was opened in 1839 and was demolished in 1895.

Nicaea, ni-sē'a, or Nica, Asia Minor, an ancient city, capital of Bithynia, on the east shore of Lake Ascania, 45 miles southeast of Constantinople. The town is dedicated by its people to the god Isnik. As Ancore or Hellicore, it is said to have been colonized by Boeotians, and destroyed by the Myrians. Antigonus rebuilt it 316 B.C., and named it Antigonea; but Lysimachus, having conquered this part of Asia, changed its name to Nicæa, in honor of his wife Nicæa, daughter of Antipater. Under the Roman Empire it retained long an exalted rank among the eastern cities, and is renowned in ecclesiastical history for the famous councils held here in the reign of Constantine (325 A.D.); and by desire of the Empress Irene 785 A.D. In the year of the first council Nicæa was overthrown by an earthquake; it was restored by Valens in 368. After the foundation of the Latin Empire in Constantinople in 1204 the Greek Emperor Theodorus Lascaris made Nicæa the capital of his empire, which it continued to be until 1261 the Greek emperors recovered Constantinople. It was finally taken by the Turks in 1330.

Nicæa, or Nica, The Council of, an ecclesiastical council held at Nicæa, in Nicomedia, in 325. Of the method of summoning the first ecumenical council Gibbon says, "The archbishop or metropolitan was empowered by the laws to summon suffragan bishops of his province, to revise their conduct, to vindicate their rights, to declare their faith, and to examine the merit of the candidates who were elected by the clergy and people to supply the vacancies of the episcopal college. The primate of Rome, Alexandria, Antioch, Carthage, and afterward Constantinople, who exercised a more ample jurisdiction, convened the numerous assembly of their dependent bishops. But the convocation of the provincial councils, was the prerogative of the emperor alone." Constantine before his conversion convened a council at Arles (314 A.D.). The object of the Council of Nice, likewise convened by him, was to settle the laws to summon the Christians of the empire to the divinity of Christ, and to contradict and condemn the views of Arius. The bishops who attended the council are variously estimated: Gibbon gives 318; Eusebius, 250; other early authorities, 300 and 320. The Eastern bishops attended in person; the Western Church was represented by seven delegates, the most important of whom was Hosius of Cordova, who attended and presided as the pope's delegate. The number of ecclesiastics of all kinds present was over 2,000. The session lasted about two months. It was frequently attended by the emperor in person. According to some accounts the earlier sittings were very stormy, and Constantine had to use much address to reconcile the disputants. Finally the council declared it to be and to have ever been the teaching of the church Catholic, in conformity with the apostolic tradition in all the churches, that Jesus Christ, the Son of God, is "consubstantial" of the same substance or nature — with the Father: and accordingly in the creed called of Nice (otherwise the Nicæo-Constantinopolitan creed) are the words, predicated of the son of God *consubstantialis pater*, the word consubstantial being a rendering of the Greek word of precisely the same meaning and of analogous formation, *Homousios*.

Though the membership of the Council of Nice was, as already said, almost wholly eastern, nevertheless its principal was Hosius, who represented the western empire of Rome. Gesasius, bishop of Cesarea, in Palestine, in his history of that council writes of the presence of Hosius and that he was the delegate of Silvester, bishop of Rome (in the Latin version, *Silvestri episcopi maxime Roma locum obtinet*); and naturally enough Hosius' name is the first among the signatures of the bishops to the Council's decrees. See Council.

Nicander, ni-kând'er, Greek physician and poet of the 2d century B.C. He was born in Claros, near Colophon, in Ionia; was hereditary priest of Apollo in his native city; and may have spent part of his life in Italy. He wrote various didactic poems now lost; one of these was Virgil's model for the "Georgics," and another the "Heterœumenä" or "Transformationes," suggested Ovid's "Metamorphoses." "Theriaca," on dangerous wild animals, and "Alexipharmacæ" on antidotes, his two extant works, were edited by Schneider (1816 and 1792).

Nicaragua, ni-kär-gwa', or nē-kär-gwā, Republic of, a country of Central America, bounded on the north by Honduras, on the east by the Caribbean Sea, on the south by Costa Rica, and on the southwest and west by the Pacific Ocean. Its area, according to conservative estimates, was formerly given as 40,000 square miles; including Mosquitia (see next paragraph) it is approximately 40,000 square miles.

Political Divisions.—The departments enumerated in the presidential decree of 12 Dec. 1902 were: León, Granada, Managua, Chinandega, Rivas, Masaya, Matagalpa, Carazo, Jinotega, New S Naked, Boaco, and Matagalpa. The last including, for the purposes of that decree, the territories of Cape Gracias a Dios and San Juan del Norte. The strip of Caribbean coast now called Zelaya was formerly the Mosquito Reserve, or Morro negro, regarded by Great Britain as having withdrawn in Nicaragua's favor her claim to exercise jurisdiction there. This eastern coast is now regarded as one of the most valuable parts of the republic; it contains gold mines, its fruit industry is already profitable, large plantations of rubber trees are being cultivated, and rosewood, cedar, and mahogany are taken from its forests.

Physical Geography.—The Sierra de los Morabios, running from the Gulf of Fonseca to the western shore of Lake Maragua, appears to the centre of volcanic energy in Nicaragua. It has the following vents: Cosiguina (famous on account of the terrific explosion of 2 Jan. 1855), Chonco, El Viejo (quiet since 1884), Santa Clara, Telica, San Jacinto, Rota, Las Pilas (eruption in 1890), Asososca, and Momotombo (eruptions in 1870 and 1886); and though only two of these may be described as active, the others are dormant, rather than extinct. This ridge is near the Pacific coast, and its southeasterly trend is continued by the isolated volcanoes Masaya (active), Apoyo (extinct),
NICARAGUA

Mombacho, Ometepe, and Madera (extinct). The two last are on an island near the western shore of Lake Nicaragua, and but a few miles from the nearest point in Costa Rica. In other words, practically the entire Pacific coast range is intensely volcanic; the only exception being found at Brito and the neighborhood southwest and south of Ometepe and Madera, where, according to the views of some geologists, the internal fissure in the earth's crust that gave rise to the several volcanic vents of Central America is completely built up and healed. Hence the low gap in the grand American cordillera found at that place, which has a mean height of about 150 feet above sea-level, the lowest gap from Alaska to Tierra del Fuego. Through this gap, over this "healed fissure," the Nicaragua Canal was to have been cut. The volcanic characteristics are not found far inland, but are restricted almost entirely to the western border; nevertheless, the principal cities are built in this narrow strip of land between the Pacific and the lakes. Chinandega, near the coast in the northwest, has 20,000 inhabitants; León, 45,000; Managua, capital of the republic, 300,000 to 400,000; Granada, on the west shore of Lake Nicaragua, 25,000. Of these the largest and most beautiful city, León, contains the cathedral of St. Peter which, it is said, was built at a cost of $5,000,000 when labor was worth one cent a day. A very good view of this great church can be seen in one view 13 volcanoes. In the central region the largest town is Matagalpa (4,000). The western strip, despite its insecurity and oppressive climate, has been preferred as a place of residence by the majority of the Nicaraguans on account of its facilities for communication and transportation—among which are to be reckoned the great lakes, Nicaragua (over 100 miles long) and Managua (about 25 miles), connected by a river which could, without difficulty, be rendered navigable. The greater part of the republic, stretching eastward from the lakes to the department of Zelaya, is of a different geologic formation. It is covered with a chain of mountains of moderate height, and transverse spurs which are not volcanic extrusions but Antillean folds (see CENTRAL AMERICA). Many parts of the central uplands are comparatively cool and well watered, with very rich soil and nearly untouched terraces in forest and mine; but they have remained undeveloped hitherto chiefly on account of the lack of good roads. The earthquake shocks of Nicaragua are less severe than those of Guatemala and Salvador, and dangerous fevers prevail chiefly, though not exclusively, in the lowlands or near stagnant water. The large rivers, rising in the central mountains and emptying into the Caribbean Sea, are the Segovia, also called Coca or Wanks, which forms the boundary with Honduras, the Grande, the Kuringwas, and the Bluefields, near whose mouth is the town of Bluefields (pop. about 2,000). The San Juan flows from Lake Nicaragua to the Caribbean, and in part forms the boundary with Costa Rica on the south. The route of the Caribbean section of the canal, for which the waters of the San Juan would have been utilized, included a cut through Costa Rican territory west of Ochoa.

Mineral Resources. — Among the Central American republics, Nicaragua is first (Honduras being first) in respect to mineral wealth. Gold and silver are found in the departments of New Segovia, Chontales, Zelaya, León, Matagalpa, and Jinotega; copper in León, New Segovia, and Matagalpa; lead and iron in New Segovia and Matagalpa; mercury, salt, sulphate of lime, sulphur, and combustible minerals in León; tin in New Segovia; nickel and zinc in Matagalpa. Up to 1903 only gold mines, or those in which gold was found mixed with silver, were worked. The principal investors were citizens of the United States.

Forests, Agriculture, and Fauna.—The forests produce rubber, mahogany, ebony, cedar, quebracho, light rosewood, mora, brazilwood, vanilla, sarsaparilla, vegetable wax, ijecuauhna, quinquina, copalba balsam, rhubarb, etc. In many parts of the republic—near both coasts, in the valleys, on the slopes and plateaus near the lakes and rivers—soils of exceptional value for agricultural purposes are found; and though the system of cultivation is rudimentary, extraordinary results are sometimes achieved. Thus, it is said on good authority that sugarcane produces at least two annual crops, and sometimes three; cotton planted in October is picked the following year. A large field of rice produces abundantly on central and eastern slopes. The systematic cultivation of rubber has been undertaken recently. Bananas are grown in the west, principally in the departments of León and Managua, for home consumption; in the east, on a large scale, for export. The annual yield of cacao is insufficient to supply the local demand; in quality, however, it is so excellent that it brings a higher price in the home market than the imported chocolates. Tobacco and aguardiente (made from sugarcane) are government monopolies. A large number of the coffee estates are controlled by Germans. The fauna includes the puma, deer, jaguar, monkeys, alligators, armadillos, ant-eaters, guatuso, pectaries and wild hogs, and many species of reptiles. There are large herds of cattle. Prominent among avifauna are macaws, parrots, buzzards, wild turkeys, and humming-birds.

Commerce.—Exports consist principally of coffee, rubber, bananas, coined silver, coined gold and gold in bars, gold ore and amalgam, hides, sugar, buckskin, and fine woods. Imports are: cotton goods and other textiles, firearms, provisions (dried, salted, or canned), glassware, window-glass, candles, matches, iron and steel in various forms, nails, machetes, crockery and chinaware, furniture, paints, musical instruments, agricultural implements and tools for workshops and domestic use, tanned hides, lamps, wines and liquors, and art objects. Shipments of gold in 1900 amounted to 18,500 ounces. The total foreign commerce for that year, as shown by the records of the minister of the treasury, was: exports, $2,865,577, and imports, $4,487,952. The amount of foreign merchandise imported into Nicaragua during 1902 was less in quantity and value than in any of the previous 10 years, the decline being noticed especially in the amount of British trade. Exports to the United States in the year 1902 from Nicaragua were valued at $1,000,000; imports from the United States for
NICARAGUA

the same period, $1,300,000. An analysis of the foreign trade for 1901 shows percentages of exports and imports, as follows: Exports to the United States, 60 per cent, and imports from the United States, 59 per cent; to Germany, 14 per cent, and from Germany, 7 per cent; to Great Britain, 9 per cent, and from Great Britain, 20 per cent; to France, 8 per cent, and from France, 8 per cent.

Shipping, Railways, Roads, etc.—Corinto, the principal western port, has the advantage of the Pacific coast lines of steamships, American, Chilean, British, and German. Bluefields, on the eastern coast, has regular communication with the United States by means of the vessels of New Orleans and Mobile steamship companies. In November 1902 the Central Division of Nicaragua's railway system was practically completed. There is now a continuous line from the port of Corinto to Granada, and several branch lines are projected. The total system in operation is 160 miles long. In 1901 an American syndicate undertook the construction of cart roads to supply communication with Matagalpa, New Segovia, and other points in the interior; a concession was also granted to a citizen of the United States for a line of railway to connect Matagalpa with the head of navigation on the Rio Grande. There are in operation about 2,400 miles of telegraph lines. The number of post-offices was 145 in 1901.

Weights, Measures, and Money.—The metric system of weights and measures is in use. The unit of value is the silver peso, worth $0.384 in U. S. currency. The note circulation amounted to little more than $1,000,000 in 1900.

Government.—The presidential term is 4 years; but Gen. Zelaya, who was first elected as a result of the civil war of 1893, retained office continuously, and was in power during the term 1902-6. Constitutionally, the president shares authority with the legislature, a single house, consisting of 40 representatives elected for two years by universal suffrage, and the judiciary (supreme court of justice, two courts of appeals, and inferior tribunals); in practice, however, political influence must be taken into consideration. The president is elected by the legislature (or any body he may designate), and he is responsible to the legislature if he be impeached by the legislature. The judicial body consists of a supreme court, the court of appeals, and the inferior courts. The executive is vested in the president, who is aided by a cabinet of five ministers, namely, the minister of foreign affairs, the minister of war, and the ministers of the interior, justice, and police.

Finance.—The revenue of the nation from January to September, 1902, amounted to $4,752,375 pesos, and authorized expenditures to $4,603,736 pesos, according to Pres. Zelaya's statement. In 1900 and 1901 public revenues exceeded public expenditure. The main sources of income are customs duties and the tax on liquor and tobacco; the largest expenditures in 1900 were for the ministry of war and marine. The foreign debt is approximately $1,350,000; in the interior in 1902 the government owed $12,000,000, or money of the country.

Population, Ethnology, and Education.—The number of inhabitants, formerly given as 800,000, is now estimated at 900,000, including Indians of Mosquitia and uncivilized natives of the interior. A very large proportion are descendants of the aborigines, and there is a mixture of African blood, especially in the east, but the white element is increasing. Though the population of Nicaragua is so much greater than that of Costa Rica, it has nevertheless a smaller number of schools. Costa Rica has twice as many teachers in her schools as soldiers in her army; Nicaragua, three times as many soldiers in her army as teachers in her schools. Instruction in the higher branches is given at two universities and ten colleges.

History.—(For some of the main events, see DISCOVERIES, CENTRAL AMERICA, and Isthmian Canals.) On 21 Jan. 1522 Gil Gonzalez Dávila with four vessels sailed westward from Panama in search of the Spice Islands. Proceeding along the Pacific coast, after many mishaps, he reached the home of an Indian chief whose name was Nicaragua, and converted him to Christianity. On the same day 9,017 natives, if we may believe the commander's assertion, accepted baptism. Nicaragua's town stood on the shore of the lake to which his name has been given. Gil Gonzalez heard from the pilots he had with him that, by way of the lake and river, there was easy communication between the "North Sea" and the "South Sea"; and he wrote that only 2 or 3 leagues of very level road separated the ocean from the lake. Until 1718 the isthmus, including the province of Nicaragua, was subject to the viceroy of Peru; after that to the Spanish representative at Bogotá. New Granada (Colombia) continued to claim certain rights in the entire isthmian territory, even up to Cape Gracias. The most interesting period is that in which occurred the invasion and temporary conquest of Nicaragua by William Walker, of Nashville, Tenn., with his 50 "emigrants." Walker became virtually dictator in 1856. His aim, disclosed to one of his associates, was to found an empire embracing Central America and Mexico (see Bibliography). In 1865 the short-lived "Greater Republic of Central America," formed by the association of Nicaragua with Salvador and Honduras. It could hardly be called a genuine union.

MARRION WILCOX,

Authority on Latin-America.

Nicaragua, Lake, in the republic of the same name, is situated in the southwest of Nicaragua, 110 feet above the Pacific Ocean, from which it is separated by a strip of land 12 miles wide. It is over 100 miles long from northwest to southeast, has a mean breadth of 30 miles and a maximum of 40 miles, and ranges from 50 feet to 200 feet deep. It receives the waters of Lake Managua to the northwest by the Tipitapa River, and discharges by the San Juan River into the Caribbean Sea. There are numerous islands in the lake, the largest being Ometepe, noted for its two active volcanoes. There is steamy traffic, the lake forming a link in the route across the isthmus of Central America. See Canals and Nicaragua for the
NICARAGUA WOOD — NICENE CREED

projected interoceanic waterway via Lake Nicaragua.

Nicaragua Wood, a bright-red dye-wood native to Nicaragua, and a species of Caesalpinia. It resembles Brazil wood botanically and in its properties, but yields a smaller amount of coloring matter.

Nica'tor. See DEMETRIUS II.

Niccolini, Giovanni Battista, jō-ván'ni bätt-tē'sē-tē' nēk-kō'le'ni, Italian dramatist: b. San Giuliano, near Pisa, 31 Oct. 1801; d. Florence, 20 Sept. 1861. He studied at the University of Pisa; published his first poem in 1804; and became in 1807 professor of history and mythology in the Academy of Fine Arts in Florence. His chief writings are his patriotic tragedies and his lyric verse. Among the former are: 'Nabucco' (1819); 'Antonio Foscari' (1827); 'Giovanni da Bocida' (1830), and 'Arnoldo da Brescia' (1843), the last a bitter attack on the Guelp party. Niccolini wrote also several volumes of criticism. The best collected edition is by Gargioli (1862 et seq.). Consult the biography and critique by Vanucci (1866).

Nic'colite, a native arsenide of nickel, having the chemical formula NiAs. The crystals, when found, belong to the hexagonal system, but the mineral usually occurs massive. It is reddish in color, and opaque with a metallic lustre. It has a hardness of from 5 to 5.5, and a specific gravity of from 7.3 to 7.7. Niccolite occurs in Saxony, Sweden, Cornwall, Scotland, and the North America. It is found at Chatham, Conn., at Franklin Furnace, N. J., at Silver Cliff, Colo., and at Tilt Cove, Newfoundland. (Also known as 'Kupfernickel,' 'false copper,' or 'devil's copper.')

Nic'colis, Samuel Jack, American Presbyterian clergyman: b. Greenfield Farm, Westmoreland County, Pa., 3 Aug. 1838. He was graduated from Jefferson College in 1857; studied theology at Western Theological Seminary, and was ordained to the Presbyterian ministry in 1860. He was subsequently pastor at Chambersburg, Pa., and chaplain of the 12th Pennsylvania volunteers in 1862, and in 1865 became pastor of the 2nd Presbyterian Church, St. Louis. He was moderator of the Presbyterian General Assembly in 1872, and has published 'Women's Position in the Church,' 'The Eastern Question in Prophecy.'

Niccolo (nēk-kō'lo) of Arezzo, ë-rēt'sō, Italian painter: b. Arezzo 1350; d. 1417. He worked on the sculpture of the cathedral at Florence, and executed two statues for the campanile (1383). His relief of the Virgin in the façade of the Santa Maria della Meriscordia is remarkable for a freedom and elegance which point to a distinct advance in Italian sculpture.

Niccolò de' Niccoli, dō nēk-kō'lo, Italian humanist: b. Florence 1636; d. there 23 June 1437. He rendered literature the most important service by ransacking Europe for manuscripts of the principal Greek and Latin works. At his death he presented to the public his library, which became the basis of the Marcian library, one of the most famous of Italy. Niccolò copied and corrected numerous MSS. with his own hand, and thus came to be regarded as the originator of textual criticism of the ancient authors.

Nice, nīsē, a Greek goddess. See NIKI.

Nice, nēs, Asia Minor. See NICEA.

Nice, France, a city, seaport, and health resort, capital of the department of the Alpes Maritimes, beautifully situated near the base of the Maritime Alps, on the Mediterranean, and on both sides of the Paillon or Paglione, a mountain torrent of short and rapid course, 140 miles east by north of Marseilles. It is divided into the Old Town, on the left bank of the Paglione, and the New Town, on the right. Both quarters, but more especially the New Town, have of late years been much extended. The streets of the former are mean-looking compared with those of the latter, in which there are wide streets and boulevards, and lofty and handsome houses. The quays that border the Paglione are lined with gay shops, and between these and the sea the stream is entirely covered over, leaving a wide space or square where is a handsome public casino, with fountain, garden, and another square adorned by a statue of Masséna in bronze. At the mouth of the stream there is a public garden, and westward along the sea-front a fine promenade bordered with handsome hotels and villas. On a pier or jetty projecting from the public garden is a fine new casino. There are no remarkable public buildings in the city. There are places of worship for English, Scotch, Germans, Russians, and Americans; natural history museum, laboratory, several theatres, public library, etc. Nise possesses some silk, cotton, and paper mills; many oil-mills, and manufactories of leather, soap, liqueurs, essences, perfumery, etc. Immense quantities of flowers are grown. The harbor or port is separated from the rest of the town by the Castle Hill (330 feet), which has been laid out into beautiful grounds commanding magnificent views and crowned by the remains of a former castle. The harbor has recently been greatly improved, but it is not deep enough for the largest class of steamers. The exports by sea consist principally of olive-oil. Nice is much resorted to in winter by foreigners, particularly English. Owing to sudden changes of temperature, its climate is unsuitable for those laboring under pulmonary and bronchial complaints. Pop. (1901) 125,000. The ancient Ligurian town of Nicea, founded by a colony of Phocceans from Massalia (Marseilles), became subject to Rome in the 2nd century B.C. It was in the hands of the Saracens during the greater part of the 10th century. Then, after existing as an independent city, it acknowledged the supremacy of the Counts of Provence and the House of Savoy (1388). In 1543 it was taken and pillaged by the Turks. Later, from 1600 onward, it was repeatedly taken by the French; and they kept possession of it from 1792 to 1814. In 1860 it was ceded to France by Sardinia (Savoy). Massena was born near the city, and Garibaldi in it. Consult: Moris, 'Nice' (1899); Nish, 'Guide to Nice' (1884).

Nice, Councils of. See NICEA, COUNCILS OF.

Nicene (ni'sēn) Creed, a somewhat detailed statement of Christian doctrine used
in their liturgies by the Roman Catholic, Oriental and Anglican Churches. The first part was formulated at the Council of Nice (q.v.). The final clauses after "And 1 believe..." in the Holy Glosses were added at the Council of Constantinople 381. See CREEDS; FILIQUES; ARIUS.

**NICEPHORUS, nǐ-sē′fō-rōs, Greek historian:** b. 758; d. 830. He is generally known as Nic- ephorus Constantinopolitanus, was secretary to the Empress Irene, and in 806 was elected patriarch of Constantinople. The violent em- peror Leo V. deposed him, and he retired to a cloister in 805. To this retirement we owe his invaluable 'Chronologia Compendiaria' and 'Breviarium Historicum.'

**Nicephorus I., Byzantine emperor of the first decade of the 9th century A.D.:** d. 6 July 811. He is often called "Logothetes," this being his title as financial secretary to Irene, whom he succeeded on the throne October 802, thanks to a sudden revolution. His experience in finance con- tinued him to lay heavy taxes, and he sided with the iconoclastic party. These two courses won him unpopularity, which was increased by his unsuccessful foreign administration; in 803 he gave up all of Italy to Charlemagne; in 806 was forced to sign a humiliating treaty with the Arabs; and in 811 was defeated and killed by the Bulgarians under Khan Krum.

**Nicephorus II., Pho'cas, Byzantine emperor:** b. 912; d. 10 Dec. 969. He was of Cap-падadian descent, and, like his father, Bardas Phocas, proved himself a great general. Dur- ing the reigns of Constantine VII. and Romanus II. he fought the Arabs in Asia and southern Italy, and in 951 recaptured the island of Crete from the Saracens. In 963 he returned to Constantinople after the death of Romanus II., was proclaimed emperor 16 August, and 20 September married Romanus' widow, Theo- phano. As emperor Nicephorus' military career was no less brilliant than before; he renewed the war against the Arabs, won all of Cilicia, and in 969 captured Antioch; and was equally successful against the Bulgarians and Macedonians. At home his heavy taxes to carry on the campaigns and his bold tampering with ecclesial discipline aroused hatred and pry against him. He was assassinated by his wife's paramour and his own -kinsman and general, John Tzimisces. Nicephorus was not only a general but a statesman and diplomat; witness his work 'Legatio,' edited by Fertz (1830). Consult Schlumberger, 'Nicephore Phocas' (1890).

**Nicephorus III., Botonai'tes, Byzantine emperor of the 11th century.** He was a general, who had grown bold in the service, when in 1068 he successfully plotted against Michael VII. and became emperor. His reign of three years was filled with contention against his rivals at home and with Robert Guiscard abroad. He was forced to abdicate in favor of Alexis Comnenus in April 1081, and spent the rest of his life in a monastery.

**Nicetas Acomnatis, nǐ-sē′tās ā-kōm-nā′tās, Byzantine historian:** b. Chone (hence called CHONIATES) in the middle of the 12th century. He was a resident and official of Constantinople up to 1204, when the city was captured and he removed to Nicea. His excellent history of the Byzantine Empire from 1118 to 1206, completing Zonaras, is his most important work; it is edited by Bekker (1835).

**Nichiren, nich'i-rēn, Japanese religious re- former:** b. 1228 u.c.; d. 1282. He founded a Buddhist sect, the Nichi:ven-shu. He appears to have been a fanatic religiousist, and to have quarreled bitterly with other sects. Two ex- iles were imposed upon him for his disturbances. The central feature of his teaching is that all life may attain to being a Buddha by re- peated transmigrations. Final salvation is reached by prayer and obedience to the law. Nichiren is revered, but not worshipped, by his followers, whose chief shrines are at Tegami, near Tokyo.

**Nichol, nik'ōl, John, Scottish lecturer and author:** b. Montrose, Forfarshire, Scotland, 8 Sept. 1833; d. London 11 Oct. 1894. He was educated at Glasgow University and Balliol Col- lege, Oxford, being graduated with honor from the latter in 1859. From 1862 to 1890 he was professor of English literature in Glasgow Uni- versity, and later lectured widely in England and Scotland on literary subjects. He visited the United States several times, and during the Civil War was a prominent peace-worker. He prepared the article on 'American Literature' for the 'Encyclopaedia Britannica,' which has been separately published; and also wrote 'Fragments of Criticism' (1866); 'Hannibal' (1872), a dramatic poem; 'Tables of European Literature and History' (1876); 'Byron' in the 'English Men of Letters' series (1880); 'Robert Burns' (1882); 'Francis Bacon, his Life and Philosophy' in 'Philosophic Classics for English Readers' (1886-8); 'Kant' (1889); and 'Carlyle' in the 'English Men of Letters' series (1892). Consult his 'Memoir' by Knight (1896).

**Nichol, John Pringle, Scottish astronomer:** b. Brechin, Forfarshire, 13 Jan. 1804; d. near Rothsay 10 Sept. 1860. Originally educated for the Scottish Church, he turned his attention to astronomy, and in 1836 was appointed professor of astronomy in Glasgow University, a post which he retained with great credit till his death. Among his works may be mentioned 'The Architecture of the Heavens' (1838); 'Con- temptations on the Solar System' (1838); 'The Planet Neptune, an Exposition and History' (1848); 'The Stellar Universe' (1848); and the 'Planetary System' (1851). These have the merit of being written in a very attractive and interesting style, and obtained a wide popu- larity. He likewise edited a 'Cyclopedia of Physical Sciences' (1857).

**Nicholas, nik'ō-las, a proselyte of Antioch, one of the seven deacons (Acts vi. 3). He is sometimes charged, though on insufficient evidence, with founding the sect of Nicolaitans alluded to in Rev. ii. 15.

**Nicholas, Saint, of Myra, one of the chief saints of the Greek Church, called the Wonder- worker, and venerated by the Roman Catholic Church:** b. Paphos, province of Lycia, toward the end of the 3d century; d. Myra 6 Dec. 342. He was a bishop of Myra, imprisoned during the Diocletian persecution, and set at liberty by Constantine the Great. He is venerated in the East and West as a saint and miracle worker, the patron of little children, unwedded
NICHOLAS

maids and sailors. In 1087 his body was translated and arrived in his native city of Patara amid great rejoicings, 9 May. His festival, the anniversary day of his death, is still kept with special ceremonies in Germany, Switzerland and the Low Countries. He is the original of the Christmas present-bringer, "Santa Claus." Consult: Praxmarer, 'Der Heilige Nikolaus und seine Verehrung' (1894).

Nicholas, the name of five popes, as follows:

Nicholas I, Saint: b. Rome; d. there 857. He succeeded Benedict III, in 858. He was of a resolute disposition and successfully upheld the papal authority. He excommunicated Photius, patriarch of Constantinople who had usurped that see after the deposition of Ignatius by the emperor Michael III. Consult: Lämmer, 'Papst Nikolaus I. und die byzantinische Staatskirche seiner Zeit' (1857); Leroy, 'Saint Nicholas I.' (1888).

Nicholas II (Gerhard, gér'hart, Fr. zhär-rær): b. Burgundy; d. Florence 19 July 1061. A cardinal-archbishop, he became bishop of Florence in 1046 and succeeded Stephen X. in the papal chair in 1059. He was opposed by a rival, called Benedict X., the choice of some of the Roman nobles, but being disavowed by the council of Satri; Benedict was obliged to forgo his claim. Hildebrand was the counsellor of Nicholas throughout his pontificate, and through his direction a council was assembled at Rome in 1059 which restricted the papal election to the college of cardinals.

Nicholas III. (Giovanni Gaetano degli Orsini, jô-vänt'no ga-tä-tô'no ôr så'në): d. 1280. He came of a noble Italian family and in 1277 was elected in succession to John XXI. From the emperor, Rudolph of Hapsburg, he succeeded in obtaining the cession of Romagna and the exarchate of Ravenna and he deprived Charles d'Anjou, king of Naples, of the vicariate of Tuscany. He was succeeded by Martin IV.

Nicholas IV. (Gerolamo, já-rôlo-mô': b. Ascoli, Italy; d. 1292). While very young he entered the order of Saint Francis and in 1274 became its general. He was made a cardinal by Nicholas III, and bishop of Palestrina by Martin IV. and in 1288 was elected pope. He was the first Franciscan pontiff. He excommunicated James of Aragon and his followers in Sicily and promoted the claims of Charles II. of Anjou to that kingdom. His unsuccessful efforts to excite a new crusade are supposed to have hastened his death.

Nicholas V. (Tommaso Parentucelli, tôm-mäs'ô pär-ren'toô-chel'ë): b. probably at Sarzana, near Pisa, 1397; d. 1455. He was the cardinal-bishop of Bologna and succeeded Eugenius IV. in 1447. He was one of the most learned men of his time, collected books and manuscripts, and ordered translations to be made of the Greek classics. The Vatican library was also founded by him, and he embellished Rome with numerous fine edifices. In 1428 the name of Nicholas V. was assumed by Peter de Coquesa, a Franciscan whom Louis of Bavaria set up as antipope against John XXII. This eclesiastic, however, soon made his submission, and died in 1433.

Nicholas I. Pavlovitch, czar of Russia: b. near St. Petersburg 6 July (25 June) 1796; d. St. Petersburg 2 March 1855. He was third son of Paul I. The crown was relinquished by his elder brother, Constantine, and on 24 Dec. 1825 he entered upon his reign and 3 Sept. 1826 was crowned at Moscow. On 26 Dec. 1825 the military conspire of the Dekabrist, which had been for several years in operation, broke out. Nicholas suppressed this revolt with great energy and personal courage; but the ultimate result was to arouse a policy of strong autocracy, based largely on the army, and bent on strictly maintaining internal peace. The civil administration was placed under military supervision; and the laws subsequently promulgated for the relief of serfdom were largely ineffectual. Nicholas' foreign policy was aggressive. A war with Persia (1827-8) was concluded by a peace which gave Russia an important increase in territory; and one with Turkey (1828-9) by the peace of Adrianopole which secured to Russia the eastern coast of the Black Sea, and brought about the establishment of the Grecian kingdom. In 1840 Nicholas aided Austria in the conquest of the Hungarian revolutionists. His attitude toward Turkey brought on the unfortunate Crimean war. In 1853 he demanded the protectorate over the other Turkish subjects of Greece. The Sultan refused, and was supported by England and France. The Russian army proved to be unprepared, and was defeated at the Alma and Inkerman. Nicholas died before the end of the contest (see CRIMEAN WAR). During his reign conformity to the Orthodox Greek Church was imposed. He was probably the most prominent sovereign of his time and in many ways a rather moderate despot. Consult: Smucker, 'Nicholas I.' (1866); Lacroix, 'Histoire de la Vie et du Règne de Nicholas I.' (1864-75); Edwards, 'The Romanoffs' (1890).

Nicholas II, czar of Russia: b. St. Petersburg 18 May 1868. He was the eldest son of Alexander III. by his wife, the Danish princess Dagmar, known as czarina by the name Maria Feodorovna. His education under General Pavlovitch was military; it was concluded by a trip through the East, in 1891, during which he was nearly killed by a sabre stroke from a Japanese fanatic. His father's death 1 Nov. 1894 brought him (much against his will) to the throne; he married Princess Alice of Hesse 26 Nov. 1894; and in May 1896 was crowned with great pomp at St. Petersburg. His policy he proclaimed would be the peaceful one of his father, and this is certainly proved true as regards his relations with the European powers. His visits to Vienna, Breslau, and Paris in 1896, and the visits paid him in return in 1897 by the Emperor of Austria, by William II. of Germany, and by President Faure of France have shown his willingness and the eagerness of Austria, Germany, and France that there be a peaceful European policy. Even more striking was the Czar's note to the powers, published by Count Muraviev 24 Aug. 1898, inviting them to a Peace Congress, looking to the disarmament of the Powers. The Hague Congress in 1899 was followed by another visit to Paris by the Czar 18-21 Sept. and by President Loubet's trip to St. Petersburg 20-23 May 1902, and by a Franco-Russian convention intended to offset the Anglo-Japanese entente.

Upon his accession, Nicholas II was hailed as a liberal, if not a radical. Whether there has
been internal reform during his administration is uncertain; even the rescript in favor of religious freedom seems a doubtful reform in the eyes of some critics, who urged that although freedom is granted to all present sects the death penalty still holds for any Greek churchman who leaves the Orthodox faith for any other. How far the Emperor is personally responsible for the acts of his government is also doubtful; he is often described as the mere tool of his narrow procurator-general, Pobedonostseff, and sometimes as a prey to morbid melancholia and the dupe of spiritualists and quacks. The strong measures taken to Russianize Finland, and the slack treatment of those guilty of the Kishineff massacres, seem—to say the least—unlike the Czar as he was gloweringly pictured at his accession. Consult: Ukhomsky’s description of the trip through the Orient (English 1896-1900), Notovitch, L’Empereur Nicolas II. et la Politique Rustique (1893), and Leudet, ‘Nicolas II. interim’ (1899).

Nicholas I. Petrovich Njegoosh, prince of Montenegro: b. 7 Oct. 1841. He succeeded his uncle, Prince Danilo, 14 Aug. 1860. In 1862 he undertook a war against Turkey which ended in an unfavorable peace 13 September; but most of the more burdensome conditions were removed by the Powers, and his partial independence was recognized. In 1876-8 with the aid of Russia, which supplied him provisions, money, and munitions, he waged a second and successful war against Turkey; and at the Berlin Congress he obtained a large increase in the area of his dominion and the recognition of his independent sovereignty. He gave the state a sort of constitution. He wrote several dramas and other verse.

Nicholas, Sir Edward, English secretary of state: b. Wiltshire, England, 4 April 1593; d. East Horsley, Surrey, England, 1 Sept. 1669. He was graduated from Queen’s College, Oxford, in 1611, and in 1627-8 he was a member of Parliament. In 1641 he became secretary of state under Charles I. and nominally remained in that office until the king’s execution. Upon the restoration of Charles II. in 1660 he resumed his former office, from which age compelled his resignation in 1665.

Nicholas, Wilson Cary, American soldier and legislator: b. Hanover, Va., about 1757; d. Milton, Va., 10 Oct. 1820. In 1774 he was graduated from William and Mary College, and at the beginning of the Revolutionary War joined the Continental army. He became officer in command of Washington’s life guards and served in this position till 1783. He was a member of the Virginia State Convention which ratified the Constitution of the United States, and was one of those who favored ratification. In 1799 he became United States Senator, and in 1804 resigned from the Senate to become collector of the ports of Norfolk and Portsmouth. In 1807 he was elected to Congress, serving till 1813, and in the latter year was elected governor of Virginia for two years. He was one of the most influential supporters of Thomas Jefferson.

Nicholas of Clémanges. See Clémanges.

Nicholas of Cusa. See Cusa.

Nicholas of Lyra, il’ra, called “Doctor Planus et Utilis,” mediaeval French monk and Biblical scholar: b. Lyre, Normandy; d. Paris 23 Oct. 1340. He entered the Franciscan order in 1291, became an instructor in theology; and later provincial of his order in Burgundy. His Hebraic and rabbinical learning was profound. His chief work is the ‘Postilla Perpetua’ (1471-72), a running commentary on the Scriptures, which, on account of his linguistic knowledge, is on a much sounder basis than similar works of the period. It was much used by Luther; but can hardly be justly credited with the influence once ascribed to it in the rime:

“Si Lyra non lyrasset, Lutherus non saltasset.”

(If Lyra had not played, Luther would not have danced).

Nicholas Nickleby, nik’l-bi, a well known novel by Charles Dickens which appeared serially in 1838 and 1839. It contains in Dotheboys Hall a realistic description of the condition of cheap boarding schools of that period, and the author’s strictures accomplished not a little toward reform in this direction.

Nicholasville, nik’o-las-vil’, Ky., county-seat of Jessamine County, on the Cincinnati, N. O. & T. P., the Louisville & N., and the Louisville & A. R.R.’s; about 10 miles south by west of Lexington and 70 miles east by south of Louisville. It was settled in 1799 and in 1835 was incorporated. It is the commercial center of a productive agricultural region, in which tobacco is one of the chief crops, and considerable attention is given to horse-breeding. It has flour and lumber mills, tobacco storage plants, and wheel works. The Jessamine Female Institute, opened in 1854, is located here. Pop. (1890) 2,157; (1900) 2,393.

Nicholls, nik’olz, Charlotte. See Bronté, Charlotte.

Nicholls, Francis Tillon, American lawyer and politician: b. Donaldsonville, Ascension Parish, La., 20 Aug. 1834. He was graduated from West Point in 1855, and in 1856 served in the campaign against the Seminole Indians. He then resigned his commission in the army to study law, and was admitted to the bar in 1858, beginning his practice in Napoleonville. In 1861 he entered the Confederate army as captain, and was promoted lieutenant-colonel in the same year, and brigadier-general in 1862. He had charge of the defenses of Lynchburg, Va., and in 1864 was superintendent of the trans-Mississippi conscript bureau. After the war he resumed his law practice in Ascension Parish, La., and later removed to New Orleans (1880). In 1876 he was the Democratic candidate for governor, his party claimed the election by about 8,000 votes, but a Republican returning board declared his opponent elected. He, however, took his seat, and was subsequently recognized as governor by the Federal government. In 1888 he was again elected governor, and during his administration actively opposed the Louisiana Lottery Company, and vetoed the bill granting it a new charter with increased privileges. In 1893 he became chief justice of the Louisiana State supreme court.

Nicholls, Edward Tatnall, American naval officer: b. Augusta, Ga., 1 March 1823; d. Portfret, Conn., 12 Oct. 1886. He studied at the United States Naval Academy, became commander in 1862, in the Civil War commanded the Winona of the West Gulf squadron, and re-
Nichols, George Ward, American writer: b. Mount Desert, Maine, 21 June 1837; d. Cincinnati, Ohio, 15 Sept. 1885. He was art critic on the New York Evening Post under William Cullen Bryant, and was aide-de-camp to General Sherman in the Civil War. He was president of the Cincinnati College of Music for several years and greatly improved its educational and financial standing. He wrote: 'The Story of a Great March' (1866); 'Art Education Applied to Industry' (1877); 'Poetry' (1878); etc.

Nichols, Henry Ezra, American naval officer: b. New York; d. off Paranaque, Philippine Islands, 10 June 1899. He graduated from the United States Naval Academy in 1865 and served in the navy with steady promotion. He was engaged on the Coast Survey in 1876-7 and in 1880-4, and in 1897 took command of the Bennington, which became one of Admiral Dewey's fleet in 1898. In 1899 he was transferred to the command of the monitor Monadnock and rendered valuable assistance at the capture of Paranaque. Captain Nichols was overcome by the heat during the bombardment and died while his ship was still in action.

Nichols, William Ford, American Protestant Episcopal bishop: b. Lloyd, N. Y., 9 June 1849. He graduated from Trinity College, Hartford, Conn., in 1870, and from the Berkeley Divinity School, Middletown, Conn., in 1873. He entered the priesthood the next year and was successively rector of churches at West Hartford, Conn.; Newton, Conn.; Christ Church, Hartford (1877-87); and St. James, Philadelphia (1887-90). He declined the bishop-coadjutorship of Ohio in 1888, but in 1890 was consecrated bishop-coadjutor of California, becoming bishop of that diocese in 1893.

Nicholson, nîk'ôl-son, Sir Francis, English colonist and governor: b. England 1660; d. London 5 March 1728. In 1684 he came to America as lieutenant in the English army and in 1688 was commissioned lieutenant-governor of New England and represented the governor, Sir Edmund Andros (q.v.) at New York. At the time of the accession of William and Mary in England and of the Leisler rebellion in New York, he was obliged to abdicate his office and return to England. (See LEISLER, JACOB.) In 1700 he was appointed lieutenant-governor of Virginia, and went to Jamestown to take charge of the affairs of the colony. During his administration, which was most successful, he gave especial attention to bettering the condition of the es- tablished church and colony; he was one of the founders of William and Mary College, to which he gave £300. When Andros succeeded Lord Howard as governor of Virginia, Nicholson, disappointed that he had not received the appointment, resigned as lieutenant-governor, and was made governor of Maryland. Here he aroused opposition by changing the capital from St. Mary's to Annapolis, and also by his intolerant attitude toward the Catholics and others not connected with the Church of England. In 1698 he was appointed governor of Virginia, but failed to attain his former success in that colony. His constant menacing and tyrannical attitude aroused the opposition of the Virginians, and he particularly angered Governor Berkeley by his removal of the capital from Jamestown to Williamsburg; he was recalled from Virginia in 1705. In 1710 he commanded an expedition against Canada and captured Port Royal, and in 1713 was made governor of Acadia. In 1716 he resigned his appointment as governor of South Carolina, being the first royal governor of that colony, and filled the office with ability and success. He returned to England in 1725, when he was promoted lieutenant-general. He wrote 'Journal of an Expedition for the Reduction of Port Royal' (1711); and 'An Apology or Vindication of Sir Francis Nicholson, Governor of South Carolina' (1724).

Nicholson, Henry Alleyne, English scientist: b. Perne, Cumberland, 11 Sept. 1844; d. Aberdeen, Scotland, 19 Jan. 1899. He was educated at Göttingen and Edinburgh, was professor of natural history in the University of Toronto in 1871-4, of physical science in the Durham College of Medical Science in 1874-5, and of natural history at St. Andrews in 1875-82. From 1882 to 1890 he was regius professor of natural history at Aberdeen. He was elected F. R. S. in 1897. His chief work was done in the paleontological department of zoology. Among his writings are 'A Manual of Paleontology' (1872; 3d ed. with Lydekker 1889), 'Introduction to the Study of Biology' (1872), and many scientific papers.

Nicholson, Isaac Lee, American Protestant Episcopal bishop: b. Baltimore, Md., 18 Jan. 1844. He was graduated from Dartmouth in 1869, took priest's orders in the Episcopal Church in 1872, and held rectorieships at Baltimore 1872-5; Westminster, Md., 1875-9; and St. Mark's, Philadelphia, 1879-91. He declined the bishopric of Indiana in 1883 and in 1891 was consecrated bishop of Milwaukee.

Nicholson, James, American sailor: b. Chestertown, Md., 1737; d. New York city 2 Sept. 1804. He went to sea when a boy, and was engaged in the capture of the Continent. In 1776 he was given command of the Defence, fitted out by the colony of Maryland, and retook some vessels which the British had captured. In June 1776 he was assigned to the command of the Virginia in the Continental navy, and while his vessel was blockaded in Chesapeake Bay he with his crew joined the army and took part in the battle of Trenton. Later when the Virginia attempted to put to sea she went aground and was taken by the British, though Captain Nicholson and most of his crew escaped; an official inquiry acquitted him of all blame. In January 1777 he was made commander-in-chief of the Continental navy, holding that position till the close of the war. In June 1780, when in command of the frigate Trumbull, he fought a severe battle with the British ship Wyoming, without decisive result; and in August 1781 was taken prisoner in the Trumbull by the British vessels Iris and General Monk, though he made a most gallant resistance and did not surrender until his ship was completely disabled. He was exchanged shortly before the close of the war, and in 1801 was appointed commissioner of loans for the State of New York.
NICHOLSON — NICK OF THE WOODS

Nicholson, James William Augustus, American sailor: b. Dedham, Mass., 10 March 1821; d. New York 28 Oct. 1887. He entered the navy as a midshipman in 1838, served in the Mexican War as a volunteer, and as lieutenant was Perry s Chief of the Japan expedition. In the Civil War he commanded the steamer Isaac Smith in the operations against Port Royal (1861); in 1862 was promoted to the rank of commander, and had charge of the monitor Manhattan in the battle of Mobile Bay; and later took part in the bombardment of Fort Morgan. In 1873 he was promoted commodore, and from 1876 to 1880 was in command of the Brooklyn Navy Yard. In 1881 he was made rear-admiral and was assigned to the Mediterranean, where he protected the United States consulate during the English bombardment of Alexandria, Egypt, and had much influence in restoring order. In 1883 he was retired from active service.

Nicholson, John, British officer in India: b. Dublin 11 Dec. 1821; d. near Delhi 23 Sept. 1857. He went to India in 1839 in the employ of the East India Company; showed great bravery in the defense of Ghazni in 1841 and during the treacherous attack made by the Afghans immediately afterward; served in the commissary during the first Sikh war, and actively in the second Sikh war; and was very successful as deputy commissioner of Lahore, doing especially good service during the Mutiny. He was mortally wounded in the assault on Delhi and died nine days afterward.

Nicholson, Joseph Shield, English political economist: b. Wragby, Lincolnshire, 9 Nov. 1850. He was educated at the University of Edinburgh, at Trinity College, Cambridge, and at Heidelberg; and in 1886 became professor of political economy at Edinburgh. Among his writings on this subject are: 'Effects of Machinery on Wages' (1873); 'The Silver Question' (1886); 'Principles of Political Economy' (1893-1901); 'Strikes and Social Problems' (1896). He wrote also some fiction, including 'Thoth' (1888); 'Tozar' (1890; and edited (1884) Adam Smith's 'Wealth of Nations.'

Nicholson, Louisa Margaret (LOUISE MARGARET), American singer: b. Pittsburgh, Pa., 1872. She was educated abroad, where she made her debut in 1889 with marked success, and became prima donna at the Paris Opera in 1890. The roles in which she has achieved most success are: 'File du regimant'; 'Traviata'; 'Pagliacci'; etc.

Nicholson, Meredith, American author: b. Crawfordsville, Ind., 9 Dec. 1866. He entered journalism and in 1885-97 was reporter and editor on the Indianapolis News. In 1897-1901 he was treasurer of a coal-mining company in Denver and then returned to Indianapolis, where he has since devoted himself to literature. He has written: 'Short Flights,' verse (1891); 'The Main Chance' (1903); 'The Hoosiers' (1900); etc.

Nicholson, Reynold Alleyne, English Orientalist: b. 19 Aug. 1868. He was a son of H. A. Nicholson (q.v.). He was educated at the University of Aberdeen and at Trinity College, Cambridge, continuing his studies in Germany. He was examiner in classics at Aberdeen in 1897; and since 1901 has been professor of Persian in University College, London, and lec-
turer in Persian at the University of Cambridge. He has published: 'Selected Poems from the Divani Shamsi Tabriz' (1898).

Nicholson, William, English artist: b. Newark-upon-Trent 1872. He began his artistic education under Pericle ll, death, became completed it under Bouguereau and Constant in Paris. He collaborated with James Pryde in the designing of posters, whose brilliant originality at once attracted attention and established his reputation as a great wood engraver. Among his productions the most notable are: 'An Alphabet' (1898); 'An Almanac of Twelve Sports' (1898); 'London Types' (1898); and 'Characters of Romance.' His portrait woodcut of Dr. Johnson is celebrated. He died 10 Nov. 1922.

Nicias, nis'sha, Greek painter of the 4th century B.C. He was renowned for the loveliness of his woman figures in encaustic (q.v.). He was a contemporary of Apelles, the painter of Alexander the Great, and Praxiteles, the painter of a statue of a young boy on whom he assisted in coloring his statues. He is said to have invented encaustic painting.

Nicias, Athenian general in the Peloponnesian war (q.v.): b. Sicily 443 B.C. He inherited great wealth from his father, Niceratus, and, entering politics after Pericles death, became leader of the aristocratic party and the enemy of all demagogues, notably Cleon. He won popular favor, however, by his lavish use of his wealth. His natural cauntry and timidity was a proverb among the comic poets of the day, and he seems to have been the prey of blackmailers. In 425 he led the troops that hemmed the Spartans in at Sphacteria; in the next year captured Cythera; in 423 was in command in Thrace; and, after Cleon's death, brought about the famous Peace of Nicias (421). Cleon's place as a leader of the war party was to a certain degree taken by Alcibiades, who won consent to his plan for the Sicilian expedition largely by his clever suggestion that Nicias, the opponent of this project, the tried general, and the well-known conservative, should be one of the commanders of the expedition. The recall of Alcibiades soon after the expedition started left matters largely in Nicias' hands. After the death of his colleague Lamachus this was less true, since the new general Demostenes boldly urged open attack on Syracuse. Nicias saw that this would be fatal, and influenced by superstitious fear of an eclipse of the moon refused to act for all a month. He was terrified defeated; weakly surrendered; and in spite of the promises of his enemies was put to death. He had been mortally sick throughout this trying campaign. Consult Church, 'Nicias and the Sicilian Expedition' (1899).

Nick of the Woods, a romance by Robert Montgomery Bird, M.D., published in 1837. It is a tale of Kentucky during the "dark and bloody" days, and was very popular about the middle of the 19th century. A play, founded upon this narrative, was received with boundless applause, held the stage (a certain grade of stage) for many years, and was a forerunner of the dime novel® in stimulating a desire among boys to run away from home and go West to kill Indians. The author was taken to task by some critics who complained that he pictures the red man upon a plane far below that of the noble
NICKEL — NICKEL-STEEL

savage described by Cooper and others. Bird replied that he described the cruel, treacherous, and vindictive Indian as he existed, and not the ideal creation of a novelist.

Nickel, a metallic element resembling iron in its appearance and general properties, discovered in 1751 in cupprenickel (syn. Niccolite), a mineral which resembles copper ore, but from which copper cannot be extracted, and whose name appears to signify "devil's copper." Metallic nickel occurs in the form of grains along the bed of the Fraser river, and it is also a common constituent of meteorites. The commercial supply, however, is obtained by the reduction of certain nickel-bearing minerals, of which niccolite and garnierite are the most important. The latter mineral is especially valuable because it is free from cobalt, a metal with which nickel is almost always associated, and from which it can be separated only with much difficulty. Garnierite is a hydrated silicate of nickel and magnesium, of variable composition, which occurs in vast quantities in the vicinity of Noumea, New Caledonia; similar deposits also exist in Douglas County, Oregon, and Jackson County, North Carolina, and also in the province of Malaga, Spain. The New Caledonia mines are worked by a French company, which ships the nickel to Europe both as matte and as ore.

Physically, nickel is a hard, ductile, malleable metal, white in color, but with a yellowish tinge, and susceptible of a fine polish. Its specific gravity varies from 8.36 to 9.26, according to the physical treatment to which the metal has been subjected; its specific heat is about 0.109, and its specific electrical resistance is about one seventh of that of mercury. It melts at a high temperature,—probably at about 2,500° F. Next to iron and cobalt, nickel is the most magnetic substance known, the magnet attracting it very strongly, though less strongly than either of the other two metals mentioned. (For full data concerning the magnetic qualities of nickel, consult Ewing, 'Magnetic Induction in Iron and Other Metals.') Nickel is greatly used for electroylating, both for protection against rusting, and on account of the lustrous polish that can easily be given to articles coated with it. It is also largely coming into favor for the manufacture of cooking utensils. When alloyed with other metals, nickel is used for coinage, and for other purposes past enumeration. With iron it forms alloys that are collectively known as "nickel-steel," certain of these being of the highest value for the manufacture of armor plate. The nickel-iron alloys are anomalous in many respects. It has been found, for example, that although nickel and iron are two of the most highly magnetic elements known, it is possible to form alloys of these two metals alone, which are practically non-magnetic. Iron-nickel alloys are also anomalous with respect to their coefficient of expansion and of the magnetic with particular (kown as "invar") has a coefficient of expansion which is almost inappreciable, although iron and nickel, separately, have coefficients of considerable magnitude. Chemically, nickel is a dyad. It has the chemical symbol Ni, atomic weight of 58.7 if O = 16, or of 58.5 if H = 1. Its most important oxides are the monoxid, NiO, and the sesquioxid, Ni2O3. The metal itself does not oxidize in air at ordinary temperatures, but only when strongly heated in contact with air or with steam. The monoxid, NiO, may be prepared by the direct oxidation of the metal at a high temperature in an atmosphere of steam, or by precipitating a solution of a nickel salt with caustic potash, and then heating the green nickel hydrate, Ni(OH), which is thrown down. The monoxid is a green powder, which becomes yellow when heated, and from it the various nickel salts may be prepared. The sesquioxid, Ni2O3, is a black substance, and is most conveniently prepared by adding a solution of bleaching powder to a solution of nickel salt. Nickel bromide, NiBr2, nickel chloride, NiCl2 and nickel sulphate, NiSO4 + 7H2O, are used in medicine to a limited extent. Sulphurised hydrogen gas precipitates nickel from acid solutions in the form of a black sulphide, having the formula NiS. (See CHEMICAL ANALYSIS.) Finely divided nickel absorbs dry carbon monoxid at 85° F, with the formation of a singular compound called "nickel carbon monoxid," having the formula Ni(CO). This substance is a volatile liquid which boils at -1.7° F, below zero, and boils at 109° F. Its vapor explodes violently when heated to 140° F, and deposits pure nickel when mixed with an inert gas and passed through a heated tube. Advantage is taken of this strange compound for the preparation of metallic nickel for chemical purposes, when great purity is essential.

Nickel Glance, a name applied to two nickel ores, one marked by the presence of arsenic, and the other by that of antimony. The first (NiAsS2) is grayish, isomorphic or amorphous; consists of 35.5 parts nickel, 14.5 parts arsenic, and 19.3 sulphur; and is found in Loos, Sweden, Ems, Germany, and Schladming, Styria. The second (NiSbS4) is a chemical analogue of the first, found in Montenerba, Sardinia, Waldenstein in Carinthia, etc. It occurs in dodecahedral and tetrahedral crystals, but more frequently is amorphous. Its color varies from bluish to steel gray.

Nickel-Steel. Following the hint offered by iron and nickel alloys in meteorites, experiments in making nickel-iron and nickel-steel began 80 years ago when Faraday and Storit tried alloyed nickel and iron (1822). Further experiments, to mention only a few names, were made by Wolf in Schweinfurt (1830), by Bessemer (1858), and by John Garugee of Connecticut (1881). The first systematic and practical tests of the value of nickel-steel were made by James Riley of Glasgow in 1888-9. The experiments of C. E. Gualiaume of the International Bureau of Standards reported in 1890 showed that in addition to its previously known characteristics, the most notable of which were resistance to corrosion much greater than that of carbon steel and the remarkable combination of high resistance to stresses with great malleability and ease of working, nickel-steel, if containing more than 36 per cent of nickel, has the lowest coefficient of expansion known, thus proving an invaluable material for instruments of precision. Much more widespread, of course, is the chemical symbol Ni55 for armor plate largely adopted because of its increased hardness and toughness and because its loss of strength from punching is only 15 to 20 per
cent of the original strength, whereas carbon steel loses about 33 per cent when punched. A second and more important use, though apparently limited by the expense of nickel-steel, is for rails. In 1912 the Pennsylvania Railroad on the Horseshoe Curve resulted so favorably that about 10,000 tons of nickel-steel rails (3.5 per cent nickel) were ordered by the company at a cost nearly double that of the carbon steel rails. Extensive use of nickel-steel was impracticable because of the limited annual production of nickel, the world's total for 1902 being only 8,600 metric tons. However, for ordinary uses only a very small percentage of nickel is required. The alloys with less than 25 per cent of nickel can be made non-magnetic. Nickel in 1869 it was found to be more stable than carbon; between 25 and 35 per cent the alloys have magnetic varying with temperature; and above 35 or 36 per cent the magnetism stays at its maximum for ordinary temperatures.

Nicker, in Teutonic mythology, waterfall, or cataract, built in rivers and falls as well as in the sea. Mention is made of them in the poem of Beowulf. The word seems originally to have been used as an indefinite name for any water-monster. Traces of it may be found in Old Nick, nix, and nixy (borrowed from German Nixe).

Nicobar (nik-ö-bär) Islands, a group of 19 islands in the Bay of Bengal, between lat. 6° 45° and 9° 15° N. and lon. 93° and 94° E. with the Andamans (q.v.) to the north,(53,863),(353,879) forming a province of British India. The Nicobars consist of two groups—a southern group, composed of the islands Great and Little Nicobar and several smaller islets, and a northern group, separated from the southern by Sombrero Channel, about 36 miles broad. The largest island is Great Nicobar, 30 miles long by 12 miles broad, and the next Kamorta, which is the largest of the northern group. They yield coconut, plantains, tea, sassafras, and pineapples. The thick forests and heavy dews render the climate unhealthy, and the coast people, about 20,000 in number, who are of mixed Malay blood, but idle and lazy. They collect and export trepang and edible birds' nests. The archipelago was occupied by Denmark, 1756–1856, and was annexed by Great Britain, to put a stop to the piracy of the people. A penal colony for India exists at Nancovory on the island Kamorta.

Nicobar Pigeon. See Pigeons.

Nicon demus, nik-ö-dë'müs, ruler of the Jews, that is, a member of the Sanhedrin, who belonged to the sect of the Pharisees, came to see Jesus secretly by night, and eventually after the Resurrection is traditionally said to have become one of his disciples. He protested against the injustice with which Christ was treated by the council (John vii. 50) and after the crucifixion joined with Joseph of Arimathea in giving fitting sepulture to the body of Christ. Some commentators have fancifully identified Nicodemus with the rich young man (Mark x. 17–24), but there seems to be no solid ground for the conjecture.

Nicol, nîk'ol, Erskine, Scottish artist: b. Leith, near Edinburgh, 3 July 1825. He was educated in art at the Trustees' Academy, Edinburgh, under Sir William Allan. He resided some time in Dublin, where he painted portraits and subjects of humorous genre. Here he gathered material for his numerous clever pictures of Irish peasant life, among which may be mentioned 'Donnybrook Fair' (1859); 'Paddy's Mark' (Corcoran Gallery, Washington); 'Paying the Rent' (Vanderbilt Collection, N. Y.).

Nicol Prism, a piece of apparatus invented in 1826, by William Nicol, for the production of a beam of plane-polarized light. Its operation is based upon the fact that when a beam of ordinary light enters a crystal of Iceland spar (crystallized calcite), from certain directions, it is decomposed into two beams, each of which is plane-polarized. One of these beams is called the "ordinary ray," and the other the "extraordinary ray"; and as the mineral exerts a different refractive power upon the two, they are divergent within the crystal. Nicol conceived the idea of introducing a surface of discontinuity within the crystal, disposed at such an obliquity that one of these rays would be totally reflected, while the other would be transmitted, and allowed to emerge from the crystal in a direction parallel to that in which the incident beam entered it. His prism is made by cutting a rhomb of Iceland spar as indicated by the plane ABCD, in Fig. 1, which passes through the obtuse angles of the crystal. The surfaces being then polished, the parts are cemented together again with Canada balsam, as shown in Fig. 2. The ends are ground so as to make an angle of about 68° with the length of the rhomb, and a ray of ordinary light, upon entering the crystal as indicated at AB, in Fig. 2, is separated into two rays. Both are refracted, but the "ordinary ray," BD, is refracted more than the "extraordinary" one, BC; and BD strikes the plane of section of the crystal at such an obliquity that it is totally reflected to E, while BC, striking it at a less obliquity, passes through and emerges from the crystal at F. The sides of the rhomb
are usually blackened, so that the ordinary ray is absorbed at E, and destroyed. The Nicol prism is exceedingly valuable, as it gives a beam of light that is completely polarized, and entirely without color, when the incident light is white.

Nicola, nè-kò-la, Lewis, American soldier; b. Dublin, Ireland, 1717; d. Alexandria, Va., 9 Aug. 1807. He entered the English army in 1840, rose to the rank of major, but resigned and emigrated to America, where he settled in Philadelphia. During the American Revolution his military experience was of great assistance to the Colonies, and in 1783 he became brigadier-general. It was he who wrote to Washington what is known as the 'Nicola Letter,' in which it is suggested that the latter should be made king. He wrote 'A Treatise of Military Exercise' (1776).

Nicolai, nè-kò-li, Christopher Friedrich, German publisher and author; b. Berlin 18 March 1733; d. there 8 Jan. 1811. From his father he inherited in 1752 the business of the Nicolai press, which was one of the first and foremost in Berlin. In his youth he was a friend of Lessing and of Moses Mendelssohn, with whom he founded the 'Bibliothek der schonen Wissenschaften' (1757), a critical review, and another literary journal, the 'Briefe die neueren Litteratur betreffend' (1761). But little by little he broke with the leaders of German thought and began to attack both the critical school and the romantic movement. Goethe and Schiller replied in 'Keniz' to his parodies of 'Werther' (1775), etc. Nicolai wrote a novel with a rationalistic purpose, 'Sebaldus Nothanner' (1773), and merits praise for his excellent 'Description of a Trip through Germany and Switzerland' (1786), and for the historical value of his 'Anecdotes of Frederick II.' (1788-92). Consult the autobiography, edited by Lowé (1806) and the 'Life' by Göcking (1820).

Nicolai, Otto, German composer: b. Königsberg, Prussia, 9 June 1810; d. Berlin 11 May 1849. He received his musical education from B. Klindworth in Berlin, and his first work performed in public was a 'Te Deum' performed at the Singakademie in 1833. In 1833 the Chevalier Bunsen obtained for him the post of organist at the chapel of the Prussian embassy in Rome, where he made careful study of Italian church-music. He was kapellmeister of the Court opera at Vienna 1837-9 and 1842-8, and subsequently of the Berlin opera. He founded the philharmonic concerts at Vienna for the purpose of securing worthy renderings of the Beethoven symphonies. His best-known work is his 'Die lustigen Weiber von Windsor' (libretto by S. Mosenthal), first performed at Berlin 9 March 1849, which won and maintained great success by its humorous characterization, invention, and technical skill. Consult Mendel, 'Life' (1866), which contains a list of all Nicolai's works, printed and in MS.

Nicolaiéf, nè-kò-liéf. See Nicolaiéf.

Nicolaïants, nè-kò-liant, a sect mentioned in Rev. ii. 6, 15, as given over to idola-

trous practices and impurity of life. They thus concurred in the death of the Jews in Aegypt, Acts xx. 20-29, and were accordingly ac-

counted heretics. There seems to be no ground for supposing that this sect was founded by

Nicolas, the proselyte of Antioch, who was one of the seven deacons.

Nicolardot, Louis, 1oo-è nè-kò-lár-dò, French author: b. Dijon, France, 26 Nov. 1822; d. Paris, France, 21 Nov. 1868. His literary work is favorably known and among his more notable publications are: 'Journal of Louis XVI.' (1873); 'The Impeccable Theophile Gautier' (1883); 'La Fontaine and the Human Comedy' (1885); etc.

Nicolas, nè-kò-la-s, Sir Nicholas Harris, English antiquarian: b. Dartmouth 10 March 1799; d. near Boulogne 3 Aug. 1848. He was of French Protestant descent; served eight years in the navy (1808-16); studied law; and became the leading genealogist of his day. Hood, for instance, says that Miss Kilmanship's ancestry 'Were enough in truth, to puzzle Old Nick, not to mention Sir Harris Nicolas.' Among his many works are: 'Notitia Historica' (1824); 'History of Agincourt' (1827); 'Proceedings and Ordinances of the Privy Council of England, 1388-1542.' (1824-91); ' Dispatches and Letters of Lord Nelson' (1844-6), and 'History of Royal Navy' (down to Henry V., 1847).

Nicolaus (nèkò-làs) of Damascus, Greek historian. He lived in the time of Herod the Great and was intimate with that monarch. He tutored the children of Antony and Cleopatra. Of his writings, a 'Universal History' in 144 books, and his biography of Augustus, fragments of great value, remain. Consult Müller 'Fragmenta Historicum Graecorum,' Vol. III., pp. 343-454.

Nicholas, nèkò-li-à, John George, American author: b. Easening, Bavaria, 26 Feb. 1832; d. Washington, D. C., 26 Sept. 1901. He came with his family to the United States in 1838 and settled in Illinois where he was educated in the public schools. He entered the office of the 'Free Press' in Pittsfield, Ill., when 13 and later became its proprietor and publisher, soon making himself a political power in the State. In 1856 he entered the office of the secretary of state at Springfield, Ill., where he became a devoted adherent of Lincoln. When the latter was elected to the presidency Nicolay was appointed his private secretary, and as the duties of the office increased John Hay (q.v.) was selected as assistant secretary. Together they formed the plan of writing a biography of President Lincoln and gained his approval of their project. In 1865 Nicolay was appointed by the President to be United States consul at Paris, where he remained until 1869, and in 1872-87 he was marshal of the Supreme Court. In 1874 he began in collaboration with John Hay 'Abra-

ham Lincoln, a History,' published serially (1886-90), and in book form, supplemented by Lincoln's 'Complete Works' in 12 vols. (1894). He also wrote 'The Outbreak of the Civil War' (1881).

Nicolay, François Léon Etienne, frän-swa là-ôn a-të-ên nè-kòl, Haitian poet: b. near Grande Rivière 1731; d. Cape Français 1772. Educated in a Jesuit College, he went to Paris in 1750, where Voltaire introduced him to the Encyclopedists and Got a recognition in recognition of his talents. In 1769 he returned to Haiti, where he was in the governor's employ. He published: 'The Romance of the
NICOLE — NICOPOLIS

Nicolls, Sir Richard, English colonial governor: b. Amphill, Bedfordshire, England, 1624; d. at sea 28 May 1672. During the civil war in England he joined the king's army, was placed in command of a troop of cavalry, and when the royalists were defeated fled to Holland, where he entered the service of the Duke of York, serving with him in the Continental wars. On the accession of Charles II, he was appointed gentleman of the bed-chamber to the Duke of York. In 1664 the king made him the chief of a commission appointed to settle the affairs of the New England colonies and to take New Netherlands from the Dutch. He sailed from England in the same year, and after stopping at Boston for a short time reached New Amsterdam on the 25th of August. The Dutch surrendered to him without resistance; he took formal possession of the city on 8 September, the Dutch officials shortly after taking the oath of allegiance to the English king. Nicolls changed the name of the province and the city of New Amsterdam to New York; and also gave Albany its present name. In 1665 he proclaimed the 'Duke's Laws' of 1664 which had been extended to New Netherland; this was the first code of laws in New York, and combined features of the English law with the Roman-Dutch law formerly prevailing in the province. In the same year he gave an English form of city government to New York City. His administration was efficient, and especially moderate and considerate toward the Dutch, and he was respected and trusted by English and Dutch alike. In 1666 he successfully settled some difficulties with the French and Indians; in 1667 resigned but did not leave the colony till the arrival of his successor, Lovelace. He returned to England in 1668, and taking part in the war between England and Holland, was killed in the naval battle against De Ruyter in 1672.

Nicomachus, ní-kó-má-kús, surnamed Ge-rasenus, Pythagorean philosopher: b. Gerasa, Palestine, about 1st century A.D. He was one of the earliest writers on mathematics and music and his name became a synonym for mathematical accuracy. You number like Nicomachus of Gerasa* being a Philosopher proven. He wrote a life of Pythagoras and several musical and mathematical works now lost. Enough, however, remains of his work to have greatly influenced the learning in the 15th and 16th centuries.

Nicomedes, ní-kó-mé'déz, Asia Minor, an ancient city of Bithynia, its site occupied by the modern Izníd or Izmitkud (pop. 30,000), at the northeast corner of the Gulf of Izníd — the ancient Astacenum, — an arm of the Propontis or Sea of Marmora. It was named after its founder Nicomedes I. (276–250 B.C.) and was a residence of the Bithynian kings, a city of great splendor, and in later times a favorite place of resort with the emperors Diocletian and Constantine the Great. Arrian, the historian, was a native, and Hannibal committed suicide here. There are numerous interesting remains of the city.

Nicopolis, ní-kó-pál-ez, meaning 'City of Victory,' the name of many ancient cities. (1) Nicopolis in Epirus on the northern side of the Ambracian Gulf (Gulf of Arta), was built by Augustus in commemoration of his naval victory over Antony at Actium, the opposite promontory, which made him master of the Roman Em-
pire. Augustus built at the same time a temple on the neighboring hill in honor of Apollo, and instituted games to be celebrated every fifth year. It was probably the place where Saint Paul passed the last winter of his life, Titus iii. 12. Ruins of this city are still to be seen near Prevesa. (2) Now Nicopoli, a city on the Danube, in Mæsia Inferior, built by Trajan in the joy of a victory over the Dacians. There is still an important town here, in the principality of Bulgaria, capital of a district of same name, 54 miles west of Rustchuk and 234 miles northwest of Constantinople. It is the seat of a Greek archbishop and a Roman Catholic bishop. Bajazet I, the Turkish emperor, gained a victory here over Sigismund, king of Hungary, in 1396; the place was taken by the Russians in 1810, 1827, and 1877. Pop. 20,000. (3) A city in Lower Egypt, a little to the east of Alexandria, built by Augustus to commemorate his final victory over Antony.

Nicot, Jean, zhoén nê-kÔ, SIEUR DE VILLEMAIN, French diplomat: b. Nimes 1530; d. Paris 5 May 1600. He studied in Paris, was a courtier of Henry II., and acted as envoy of Francis II. to Lisbon (1560), whence he introduced tobacco into France. To this circumstance the scientific name for tobacco, Nicotiana, is due. Nicot wrote a French dictionary, ‘Trésor de la Langue Française’ (1606).

Nicotiana, nê-kô-shî-âña, a genus of plants in the potato family (Solanaceae), represented by the two species of tobacco (N. tabacum and N. rustica). These plants abound in all their parts with poisonous elements, th: special and characteristic one in this case being the alkaloid nicotine, to which tobacco owes its peculiar narcotic properties. See TOBACCO.

Nicotin, or Nicotine, the characteristic alkaloid element of tobacco. For its properties and effects see TOBACCO.

Nicoya, nê-kô'-yâ, a gulf on the west coast of Costa Rica, extending inland north by west about 60 miles and from 20 to 30 miles in width. Along the shore are high mountains, and many picturesque inlets. Cape Blanco is at the entrance. Punta Arenas, on the east shore, is a port of entry.

Nichtigery, nê-tâ'-rê'-zâ, Brazil, a town of Rio de Janeiro, prior to 1804 the capital of the state, on Praia Grande Bay in the Bay of Rio de Janeiro, opposite the city of that name. It is noted for its elegant suburban residences. Pop. (1888) 26,000.

Nicum, nik'-ûm, John, American Lutheran clergyman: b. Winnebago, Wurttemberg, Germany, 6 Jan. 1851. He was educated at Muhlenberg College, Allentown, Pa., and the Theological Seminary, Philadelphia, and, entering the ministry, held Lutheran pastorates at Philadelphia and Syracuse, and since 1887 has had charge of St. John’s Lutheran Church in Rochester, N. Y. Since 1894 he has also been professor of mental and moral science in Wagner Memorial Lutheran College at Rochester. He has published: ‘Gleichnisse-reden Jesu’ (1884); ‘Conferential History of the Lutheran Church in the United States’ (1891); etc.

Niebelungen Lied. See NIEBELUNGEN LIED.

Niebuhr, nê-boôr, Barthold Georg, German historian and classical scholar, the founder of modern historical method: b. Copenhagen 27 Aug. 1776; d. Bonn 2 Jan. 1831. He was son of Karsten Niebuhr (q.v.); was educated by his father in his early youth; studied at Kiel (1794-6), at London and at Edinburgh (1798-9); and in 1800 entered the employ of the Danish government. He became director of the government’s bank in 1804, and showed in this post a Prussian service, which he entered in 1806 much business ability, due, so he thought, to his life in England and Scotland. A quarrel with Hardenberg made Niebuhr’s retirement necessary in 1810, soon after he had been engaged in financing a Prussian loan in Holland; he taught Roman history at Berlin for three years with such success that he was led to publish the first two volumes of his ‘Roman History’ (1811-12). But in 1813 he re-entered the Prussian government employ, took a prominent part in rousing national opposition to Napoleon; but his temper was overbearing and he soon broke with his superior, Stein. In 1816 he was sent as minister to the Vatican, brought about the understanding between Prussia and the Pope, signaled by the Bull ‘De Salute Anima- rum’ in 1821, and had his first opportunity of testing his critical theories as to early Roman history by topographical and other detail. In 1823 he retired from the diplomatic service and settled in Bonn, where he lectured on ancient and modern history. Niebuhr’s great work was his destructive criticism of early Roman legend, and his reconstruction of this same period from the same mass of myth and legend; or, to put it more broadly and more truly, it was his application of this higher critical method to history. His ‘Roman History’ (1811-32, English version, Hare and Thirlwall, 1851), carrying the story of Rome down to the Punic Wars, was completed in an English form by Leonhard Schmitz in ‘Lectures on the History of Rome from the First Punic War to the Death of Constantine’ (1844). These two parts form a great collection of facts and material, and a wonderful exemplification of method, but the more popular and brilliant style of Niebuhr’s pupil, Theodor Mommsen (q.v.), has made Niebuhr’s work to a certain degree antiquated. He collaborated with Platner and Bunsen in their ‘Description of the City of Rome’; founded with Bock and Brandis the ‘Rheinisches Museum,’ a classical review; edited the ‘Corpus Scriptorum Historie Byzantine’; and wrote many minor philological and historical studies, besides editing new fragments of Gaius, Cicero, and Merobaudes. His ‘Stories of the Greek Heroes’ (‘Griechische Heroengeschichte,’ 1842), originally written for his son, Marcus, is a famous juvenile. Niebuhr was a man of broad scholarship and catholic taste, as may be seen by his personal reminiscences and correspondence in Hensler’s ‘Lebensnachrichten über Niebuhr’ (1838-9). Critical biographies by Classen (1876) and Eyssenhardt (1886).

Niebuhr, Karsten, German traveler, father of B. G. Niebuhr (q.v.): b. Ludwingworth, Hanover, 17 March 1733; d. Meldorf, Prussia, 26 April 1815. In 1760 he entered the Danish service as lieutenant of engineers, and in 1761 joined the expedition sent by the King of Denmark to explore Arabia. All his companions in this expedition having died within a
NIECKS—NIEPE

year after their departure, he went on alone, and in 1606 returned to Copenhagen. The works in which he gave the world the result of his researches are remarkable for their accuracy. They include: 'Beschreibung von Arabien' (1772); 'Reisebeschreibung von Arabien und anderen umliegenden Ländern' (1774–8). Consult his son's 'Karsten Niebuhrs Leben' (1877).

Niecks, né Diederich, Amg, German composer and critic: b. Düsseldorf, Germany, 3 Feb. 1845. He was educated at Leipsic University and was a violinist and music teacher in his native city till 1865 when he settled in Scotland, where he was for some years engaged in teaching music, and since 1875 he has written much for musical journals. Since 1891 he has been Reid professor of music at the University of Edinburgh. He has published: 'A Concise Dictionary of Musical Terms' (1884); 'Chopin as a Man and Musician' (1889).

Niedermeyer, né Dyer-mi-er, Louis, Swiss composer: b. Nyon 27 April 1802; d. Paris 14 March 1861. He studied under Moscheles in Vienna, and in Italy with Fioravanti and Zingarelli; settled in Paris; and, having met with no great success in operatic music, such as 'Mari Stuart' (1844) and 'La Fronde' (1853), devoted himself to religious music, not only composing but teaching and editing a journal called 'La Maitrise.' His opera 'Stradella' and his melody for Lamartine's 'Lac' are his best compositions of a secular sort. His training school for religious music was aided by the French government.

Niederwald, né Dyer-vai, Germany, the western terminus of the Taunus range in the Prussian district of Wiesbaden, abutting on the Rhine opposite Bingen. On a commanding site near its summit was erected, 28 Sept. 1883, the national memorial commemorating the successful war of 1870–1. An extended pedestal, ornamented with allegorical figures, is surmounted by a bronze figure of Germania, 34½ feet in height. The whole was designed by Schilling, a Dresden sculptor. Toothed-railways carry visitors up to the monument from the villages of Rüdesheim and Assmannshausen at the foot, both noted for their wine.

Niehaus, né Hous, Charles Henry, American sculptor: b. Cincinnati, Ohio, 24 Jan. 1855. He learned his art in the Royal Academy of Munich, Germany. He was there awarded a medal. A high award was received by him at the World's Columbian Exposition. His work is seen in the Congressional Library, Washington; Trinity Church, N. Y.; and the Appellate Court House, in the same city.

Niel, né-èl, Adolphe, French marshal: b. Muret, Haute-Garonne, France, 4 Oct. 1802; d. 14 Aug. 1869. He was educated at the Ecole Polytechnique, Paris, and the Military School, Metz, and in 1835 became captain of engineers. He took part in the expedition against Constantine in Algeria 1836–7; commanded the engineers at the siege of Rome in 1849 during the revolutionary movement under Garibaldi, and as chief of engineers planned the operations against Sebastopol in 1854–5. He figured prominently at Alma in the Crimean campaign of 1859, was made a marshal of France by Napoleon III. in return for his services, and in 1867 became minister of war.

Nieilo Work, in art, a method of ornamentation much practised in the Middle Ages, and to which may be traced the origin of engraving. The design consists of a design of gold or silver; it is then covered with a black composition consisting of copper, silver, lead, and sulphur, and a little borax is sprinkled over it by subjecting it to heat over a fire, the composition becomes liquid and runs into the lines of the design; the whole is then allowed to cool, when the surface of the metal is scraped and burnished, leaving the drawing in black upon the metal. The art is still practised as a mode of ornamenting ware, but its principal use is for door-plates, plates for shop fronts, etc., in which the brass or zinc plates are engraved and the depressions filled with wax. The term is also applied to impressions in a viscid water-ink on paper from metal-plate engravings taken by the early fathers of copperplate printing for testing the state of their work. See ENGRAVING.

Niemann, né män, Albert, German operatic tenor: b. Erzleben, near Magdeburg, 15 Jan. 1831. At first a chorister in a church near Magdeburg, he became an actor in 1840; was trained in singing by Schneider, Hofkapellmeister at Dessau, and by Musch, a baritone; appeared at Berlin, Stuttgart, and Königsberg; and after further study under Duprez at Paris, was made Kammer-sänger to the emperor and attained great success throughout Germany. From 1866 until his retirement in 1889 he was connected with the court opera of Berlin, where he was distinguished in heroic roles. Wagner selected him to impersonate Siegmund in 'Die Walküre' at Bayreuth in 1876. He appeared with success in the United States in 1887–8.

Niemen, né'men or nyem'en, a river of Russia, with 70 miles, the lower part of its course of 500 miles, lying within the province of East Prussia, where it is called the Memel. It rises a few miles south of the city of Minsk. It is navigable to Grodno; below Tilsit it divides into two branches, which reach the Kurisches Haff each by four mouths.

Niemeyer, né mi-er, Felix von, German physician, grammarian of the period of the Logan August Hermann Niemeyer: b. Magdeburg 31 Dec. 1820; d. Tübingen 14 March 1871. He was educated at Halle; practised in Magdeburg 1844–55; was professor of pathology and therapeutics at Greifswald, and from 1860 to Tübingen; was military surgeon during the Franco-Prussian war; was ennobled for his services to the king of Württemberg; and wrote a 'Text-Book of Special Pathology and Therapeutics' (1858), often republished and distinctly valuable.

Niepe, Joseph Nicéphore, zhô-zéf née-sâ-far né-éps, French inventor: b. Châlon-sur-Saône 7 March 1765; d. Gras, near Châlon, 5 July 1833. He served in the French army, was administrator of the district of Nice 1795–1801, then devoted himself to chemical and medical studies at Châlon, and from 1811 to lithography. His researches in photography began in 1813, and by 1824 he was successful in obtaining permanent impressions of the images of the camera obscura. In 1826 he joined Dauguerre in a further prosecution of the investigations. An article of their agreement seems to
Nietzsche—Nigeria

make it clear that the real credit for the discovery of photography belongs to Niepce, and that Daguerre was merely an important aid in its development. Consult Fouqué, 'La Vérité sur l'Invention de la Photographie' (1867). See also DAGUERRE; PHOTOGRAPHY.

Nietzsche, néz'tshē, Friedrich Wilhelm, German philosopher; b. Rocken, near Lützen, 15 Oct. 1844; d. 25 Aug. 1890. He was educated at Bonn and Leipzig, and on the recommendation of Ritschl obtained a professorship in classical philology at Basel in 1869, became known as a brilliant writer of increasingly philosophical tendency, and was compelled by troubles of eye and brain which had asserted themselves as early as 1876, to retire on a pension in 1879. For the rest of his life he lived chiefly at health-resorts, until in 1888 he was pronounced incurably insane. The circumstances of his career must be included in a judgment of his writings. He developed no system and no body of sustained thought. His works are rather a series of aphoristic presentations of unconnected and often contradictory viewpoints. Thus, he dislikes the modern democratic idea, and becomes an aristocrat; but he equally dislikes the idea of the sovereignty of the state, and is an anarchist. He denounces Schopenhauer for pessimism, but does not get beyond Schopenhauer. His is a consistent philosophy only in its universal revolt. He is an atheist and regards the consideration of aught but strength as a remnant of Christian superstition. The catalogue of Christianities he admires is that of Richard Wagner, whom later he quite as enthusiastically attacked. So counter is Nietzsche to the best thought of the 19th century that it may be doubted if he would be much read were it not for the epigrammatic brilliance of his style. Among his works are: 'Unzeitgemässe Betrachtungen' (1873-6); 'Moral Wissenschaft' (1881); 'Also Sprach Zarathustra' (1883-4); 'Götterdämmerung' (1888). The last two have appeared in English renderings. There is a complete German edition (1895-1901), and an incomplete English-Nietzsche (Vol. I. 1895). Consult also Kaatz, 'Die Weltschauung Fr. Nietzsche's' (1891-2); Dolsen, 'The Philosophy of Nietzsche' (1901); Cornell Studies in Philosophy, No. 3; Drews, 'Nietzsche's Philosophie' (1904); Blandes, 'Friedrich Nietzsche' (1888); Kronenberg, 'Nietzsche und seine Herrenmoral' (1910).

Nièvre, né'vr, France, a central department, bounded by Yonne, Cher, Allier, Saône-et-Loire, and Côte-d'Or; area, 2,658 square miles; capital, Nevers. It receives its name from the Nièvre, a small tributary of the Loire. It is a generally hilly, is only of indifferent fertility, produces some good wine, and has nearly a third of its surface covered with wood. Its minerals include iron and coal, and the chief manufactures are: woolen cloths, linen, cutlery, etc. Pop. (1901) 323,783.

Nifflheim, nif'il-him, in Scandinavian mythology, the region of endless cold and everlasting night, ruled over by Hela.

Nigel, nīg'el, English satirist of the close of the 12th century, sometimes called WIREKER.

A monk at Christ Church prior to Canterbury, he wrote various verse, the most important of his poems being the 'Speculum Stultorum,' in which as in the prose work 'Contra Curiales et Officiales Clericos,' he boldly attacked the vices of his fellow ecclesiastics. The 'Speculum Stultorum' or 'Mirror of Fools,' with its story of the ass Burnellus who wished his tail was longer, enjoyed great popularity.

Niger, nī'jēr, or Joliba, jōlt'ba, a river of West Africa, the third in size of the African continent, known by various native names throughout its course, being the Joliba in its upper reach, the Mayo Balleo and Ila Eghirin in the central reach, and the Kwarra or Quorra in its lowest reach. The upper and central reaches are politically controlled by France, and the lower reach, through Northern and Southern Nigeria, by Great Britain. The Niger rises on the eastern slope of Mount Yenkina on the boundaries of Sierra Leone and Liberia, about 175 miles from the west coast, its headwaters being contiguous to those of the Senegal which flow in an opposite course. It flows northeast as far as Timbuktu, 300 miles above which it is joined by the Bani, a large tributary, and splits up into numerous diverging channels and lakes. After passing Timbuktu, it flows east for 400 miles, then turns southeast through a rocky country past Say. At about 11° 40' N., just above Illo, it enters British North Nigeria, at Giri being joined by the Sokoto River from the east. At Bassa navigation is impeded by dangerous rapids. Finally after large falls, making a great curve to Bida, it bends more to the south and is joined by a tributary of first-class size, the Benue, or Mother of Waters, a rival in volume which has its source in a sourceless miles to the east. The united stream now "passes through a series of bold picturesque hills by a narrow gorge," and eventually breaks up into one of the most remarkable mangrove-covered deltas of the world. This delta, malarious and unhealthful, covers an area of about 14,000 square miles, completely intersected by branches of the river, the principal of which, the Nun, runs through the middle of the delta. The westernmost branch, the Benin, has a bar, which presents a great difficulty to navigation. Other branches are the Bonny, New Calabar, Brass, and Forcados, distributing the Niger's waters into the bights of Benin and Biafra in the Gulf of Guinea. In its course the Niger passes through much fertile valley land, while numerous towns and villages stand on its banks, and a considerable canoe commerce is prosecuted. Slaves were formerly nearly the only article of export from the Niger, but palm oil is now the principal staple, the delta outlets being known as Oil rivers. The whole course of the river is about 2,500 miles, and the area of its basin is estimated at 584,000 square miles. Mungo Park was the first European traveler most unknown part of this river (1796-7) and was drowned in the Bosua rapids. The honors of modern exploration are divided between French, British, and German travelers. Consult: Bindloss, 'The Niger Country' (1868); Hourtou, 'Sur le Niger' (1899); Moodie-Ferrymen, 'Up the Niger' (1892).

Nigeria, nī-jē'ra, or Niger (nī'jēr) Territories, West Africa, an extensive British colonial possession on the lower Niger, organized
since 1900, within the boundaries arranged by the Anglo-German Agreements of 1885, 1886, and 1893, and the Anglo-French Agreements of 1889, 1890, and 1898. It comprises the Lagos Protectorate and Southern and Northern Nigeria, being bounded on the east by German Kamerun and on the north by the homey and the French military territories. Nigeria includes the whole course of the Niger from a short distance above Illo to its mouth, and also the left bank for a few miles higher up. The northern boundary runs irregularly eastward to a point on Lake Chad. Nigeria also includes the whole course of the Benue from a point above Yola to its confluence with the Niger at Lokoja. The coast-line extends from the Rio del Rey on the east, to near the mouth of the Benin River on the west, and thus includes all the mouths of the Niger. The total area is about 900,000 square miles; the mixed negro population may amount to 30,000,000, chief of which are the Fulani or Fulani of the Hausa states. For administrative purposes the territory is divided into Northern and Southern Nigeria, the boundary line being drawn due east from Owu, on the Lagos frontier. The country is mainly a level or rolling plateau, but in the central districts there are mountain ranges and isolated peaks, many of them forest-clad, of considerable elevation. The Niger and the Benue are the chief rivers, the latter being especially valuable for navigation. The Gulbin-Sokoto is a perennial left-bank tributary of the Niger, and the Waube, flowing into Lake Chad, is also of some importance. The climate is tropical, with a dry (October–May) and a wet season. During the latter the rains are often extremely heavy and accompanied by severe thunderstorms. The mean annual temperature is about 80° F., but at some periods of the year the temperature in the shade may exceed 100°. The delta lands are unhealthy, and the same may be said of much of the interior, but the climate of the elevated districts is generally quite suitable to Europeans. Geologically, the region is formed mainly of granite and various metamorphic rocks, but sedimentary formations, chiefly sandstones and shales, entirely belonging to the older periods, are also found. Silver, tin, antimony, lead, iron, and other minerals occur. Among the vegetable and agricultural products, most of which are exported, are cotton, indigo, palm-oil, palm kernels, ground-nuts, India-rubber, ebony, camwood, gums, and coffee. Ivory and hides are also important exports, and among the native industries leather-working deserves mention. The chief towns of Southern Nigeria are: Asaba, Onicha, Akassa, Idda, Wari, Burutu, Brass, New Calabar, Bonny Island, and Old Calabar, all ports with custom-houses; Ado and Benin. The chief towns of Northern Nigeria, which consists mainly of the former Sokoto empire and the larger part of Bornou, are Lokoja, the capital of the Niger and Benue; Kano, Sokoto, Gando, Ilorin, Yakoba, Kuka, Yola, Ilo and Katsena. The greater part of Nigeria was administered by the Royal Niger Company till 1 Jan. 1900, when it was bought out by the Government. The company was formed in 1882 as the National African Company, and four years later it received its royal charter. Most of what is now Southern Nigeria was not under the rule of the company, but formed from 1884 till 1893 the Oil Rivers Protectorate, and from 1893 till 1899 the Niger Coast Protectorate. The kingdom of Benin was incorporated in the Niger Coast Protectorate in 1897. The company's abolition of the legal status of slavery, and its prohibition of the importation of spirits into Northern Nigeria, are to be maintained by the imperial government.

Consult: Bindloss, 'In the Niger Country' (1899); Mockler-Ferryman, 'British Nigeria' (1902).

**Nigger Chub**, or **Nigger Dick**, a dark-green chub (q.v.) of the Mississippi Valley, distinguished by the three-lobed condition of the under jaw. See Cylindraspis.

**Nigger Toes**. See **Brazil Nut**.

**Night**, in Greek mythology, Night (Nyx) was personified as a powerful goddess, who, by means of sleep exercised power over men and gods. She was the daughter of Chaos, wife of Erebus, and mother of Both and Hemera (Day), of the Fates, Sleep, Death, Dreams, Hunger, Fear, Nemesis, and Strife. Every day she dwelt in Tartarus enveloped in thick clouds.

**Night-ape**. See **Douboucouli**.

**Night-blindness**, a defect of vision; nyctalopia (q.v.). See **Sight**, **Defects of**.

**Night-hawk**, or **Bull-bat**, an American nightjar or goatsucker (Chordeiles virginianus). It arrives in the northern States about the end of April, and is crepuscular and nocturnal in habits, pursuing insects on the wing with great activity, and often at a great height in the air, frequently over towns and cities. It retires in the daylight hours to the woods, or an orchard, and sleeps sitting lengthwise on some large horizontal limb, or on a log, where its grayish-mottled plumage, blending with the color of the old bark, makes it unnoticeable. When flying it often utters a harsh scream, and also, when dropping suddenly through the air, as it often does, it produces a strange booming sound. The night-hawk attains a length of 9 or 10 inches. It is blackish-brown on the upper parts, barred and mottled with grayish and buffy; a large wing-spot, bar across the tail and V-shaped blotch on the throat, are white in the male, but tawny or obscure in the female. The tail is forked, and is a little shorter than the wings when in repose. The gape is large and the rictal bristles are inconspicuous.

The eggs, two in number, oblong shape, and dirty bluish-white sprinkled with dark olivembrown, are produced about the middle of May, and are deposited on the bare ground in a dry situation, no nest being constructed.

**Night-heron**. See **Heron**.

**Night Schools**. See **Evening Schools**.

**Nightgale**, nit'ing-gäl, Florence, English philanthropist, best known for her work in the hospitals during the Crimean war, when she revolutionized army nursing: b. Florence 15 May 1820 she early became interested in hospital work, examined various hospitals through Europe, and was trained as a nurse by the Protestant Sisters of Mercy at Kaiserwerth-on-Rhine. In 1854 she went to the Crimea, having organized a band of trained nurses in a week, and established the great hospital at Scutari, where
she showed rare gifts of organization and heroism. Her health failed suddenly because of her severe efforts; but she refused to accept for herself the subscription of £50,000 raised for her, preferring to use it for the foundation of the Nightingale Home at St. Thomas Hospital. She was frequently consulted by Royal Commissions in regard to field- and camp-hospitals, and gave valuable advice during the American Civil War and the Franco-Russian war. She wrote: "Notes on Hospitals" (1859); "Notes on Nursing" (1860); "Lying-In Institutions" (1871), and "Life or Death in India" (1874). Consult Edge, "A Woman's Example" (1864).

**Nightingale**, a celebrated song-bird of the family Sylviidae or Warblers. The nightingale (Daulias luscinia) is attractive for its lustre or brilliancy of plumage, the upper parts of the body being rusty-brown tinged with olive, and the under parts pale ash, blending into white at the throat and belly. Its average length is about 6 inches. In habits the nightingale is active and lively; it frequents trees of small size and bushes, and subsists chiefly upon an insectivorous diet. It is a migratory bird, and occurs throughout Europe, but in Great Britain is limited to certain districts; it is never or rarely heard in Wales nor in the most western districts of England, nor in Ireland or Scotland. The song continues until the middle of June, when the young are hatched. The male bird sings during the day, and the night also; and perhaps more frequently, while the female is incubating; and the flood of song poured forth in the stillness of the evening forms one of the chief sources from which the reputation of the nightingale has been derived. The nest is of rough construction. It is generally formed of leaves and grasses, and is situated mostly in damp places or in the neighborhood of water. The eggs number from four to five, and are of an olive-green color. These birds live in confinement. The bird-catchers, if possible, take the mates before the arrival of the females. Birds trapped after the pairing season are said to languish and die. Another species, formerly regarded as identical with the above, is *D. philomela*, which has a more easterly distribution, extending far into western Asia. This is the bird most often referred to in literature as the Persian bulbul, and it has a prominent place in classic mythology. Nightingales endure captivity well and are kept as cage-birds in all parts of the world. See *Cage-Birds* and the authorities there mentioned; consult also Newton, "Dictionary of Birds" (1896) and the writings of British ornithologists.

**Nightjar**, a bird of the family Caprimulgidae (q.v.). This name was first given to a single species, that common in the British Islands, on account of the jarring note it utters after dark; but most of the members of this nocturnal family produce similar sounds, and the term seems preferable in many respects to the erroneous designation "goatsuckers" traditionally applied to them in southern Europe and which should long ago have been abandoned. American representatives are known as whippoorwills, whippoorwill's, and chuck-will's-widow, elsewhere described. The British nightjar is much like the American whippoorwill in appearance, and is known by many provincial names, such as dor-hawk, quarr-owl, fern-owl, etc. Consult: Montagu, "Dictionary of British Birds"; White, "Natural History of Selborne."

**Night-mare**, a sensation of oppression or of suffocation which sometimes occurs during sleep. The sufferer experiences a short period of intense anxiety, fear, horror, etc.; feels what seems an enormous weight on his breast; is pursued by a phantom, monster, or wild beast, which he cannot escape; is on the brink of a precipice from which he cannot remove, or is perhaps, rolling down it without being able to make any exertion; for his safety and his bodily members refuse to do their office, until he suddenly awakens himself by starting up, or by a loud cry; he is then in great terror, and the body is often covered with sweat. Nightmares are often preceded by an hour's sleep, and his head is low. A person subject to nightmare should carefully observe moderation in eating and drinking, should avoid heavy meals shortly before retiring, and likewise overrich food. Alcoholic excess may lead to nervous disorders characterized by conditions, physical and psychic, which increase liability to nightmare and similar forms of disturbance. See DELIRIUM TERTIUM; MELANCHOLIA.

**Nightingale Abbey**, a novel by Thomas Love Peacock, the hero of which is a caricature of Shelley. It was published in 1818.

**Nightshade**, any of several plants of the order Solanaceae, sometimes called nightshade family, especially distinguished for toxic properties, and constituting the typical genus *Solanum*. The common or black nightshade is an annual or biennial, with erect angular stem, ovate, sinuate-dentate leaves, drooping lateral umbels of white flowers, and globose black berries, grows as a weed in waste place in most parts of the world. It is only slightly narcotic. The leaves in a fresh state are said to be injurious to animals which eat them, but seem to lose almost all narcotic property by boiling, and are used as spinach, particularly in warm climates. The berries formerly, or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid solanine found also in the shoots of the potato. Several comparatively poisonous species such as the horseradish or apple of Sodom (*S. carolinense*) with orange-yellow berries, are natives of the dry western portions of the United States and Canada, and one, the bittersweet, blue birdweed, felon worth, poison-flower or woody nightshade (*S. dulcamara*), is naturalized all over the eastern half of the country. (See *Dulcamara*.) The deadly nightshade (see *Belladonna*) is a member of an allied genus, whose toxic principle is atropine (q.v.).

**Nigidius Figulus, Publius, Roman scholar: b. about 68 B.C.; d. 44 B.C. He took part in political affairs during the closing days of the Republic; became praetor in 59 B.C.; and having sided with Pompey in the civil war was compelled by Caesar to live in exile. In philosophy he was a Pythagorean; and for the scope of his learning he was ranked by Aulus Gellius next to Varro (q.v.). His fame as an astrologer was great, and in the 'Chronicle' of Eusebius he is styled 'Pythagoricus et magus.' Gellius complains of the obscurity and
NIGRITIA—NIHILIST

sublety of Figulus' writings, but the examples he adduces in proof are not thought by critics to support the assertion. The fragments extant have been edited by Svoboda (1889); Consult also Rohrig, 'De Nigidio Figulo' (1887).

Nigritia, ni-grish't-ya. See Sudan.

Nihilism, from the Latin nihil ('a trifle, nothing'), the state or condition of nihilism, being nothing. A general term used to define a Russian socialist movement, and a name also applied in metaphysics to the doctrine that refuses a substantial reality to the existences of which man is conscious. In Russia the word Nihilist was first applied by Ivan Tourgenieff to the hero of his novel 'Fathers and Sons,' who was intended to be the personification of a movement in Russia for the emancipation of women, the independence of children, and the spread of natural religion.

Doctrife of Nihilism.—Followers or believers in Nihilism are those who disbelieve in any improvement in the social condition of progress of man; particularly members of any association devoted to the work of destroying the present form of the Russian government without any hope or definite theory of substituting another government in its place. Nihilism appears to have started in the very stratum of Russian society, and its recruits and followers are gathered from every social grade, alike from the nobility, the army and the peasants.

Early History.—As early as 1818 a party of freedom, so-called, was organized in Russia, and on 14 Dec. 1825, occurred the rising of the Decembrists among the officers and soldiers of the army. These revolutionists aimed at the emancipation of the serfs and the introduction of constitutional government. The revolt was quelled, and six of the leaders were executed and 125 others imprisoned or exiled. About 1850 liberal ideas received an impetus from the study of socialist writers of other countries. On 23 April 1849, some 40 persons were arrested who belonged to an association formed by Petrashevsky, an official of the Foreign Office. These were sentenced to death, but the sentences were commuted to imprisonment and banishment. In 1872, Alexander Herzen founded a journal, the 'Kolokol,' in London, which had a remarkable influence upon the Russian youth. In the same year there arose in Russia a movement, under the leadership of Tschenshevsky, which criticised existing society. In 1864 he published a novel entitled 'What is to be Done?' which proved a revolutionary firebrand among the peasantry. Another writer, Shapoff, urged the introduction of self-government and local autonomy. Numerous organizations sprang up in the universities, and in 1863 the various secret associations united under the name of 'Land and Freedom.' In 1868, Bakunin commenced the publication of a newspaper in Geneva. In this journal he advocated the total abolition of the state and the substitution of small communes.

The Socialistic Propaganda.—In the early part of 1870, a number of young men and young women of the lower classes were secretly going to work in the fields and the factories so as personally to carry on a Socialistic propaganda and distribute Socialist literature. Their organs were the 'Forward' of London and the 'Workingman' of Geneva. This work continued about six years, during which time there were 23 political trials of 417 persons, half of whom were condemned to exile in Siberia or to hard labor in the mines. During this period there existed a more moderate party, but it failed to satisfy the demands of the young men of the universal societies. In 1875 the 'Narodniki' became a prominent organization. The government became active, and during 1876 and 1877 the prisons were filled with propagandists.

The Party of Removal.—In 1877, former adherents of the Nihilistic movement organized a new and stronger secret party, which aimed at the removal by force of crowned heads, and a warfare against the government. On 24 Jan. 1878, a young woman of 28, named Vera Zasulitch, shot at General Treppo, who had caused a prisoner to be whipped for refusing to take off his hat to him. She was tried before a jury, and strangely enough, was acquitted. The government was enraged and had the verdict annulled. On 4 Aug. 1878 General Mesentzoff was killed, and 22 Feb. 1879, the Governor of Kharkov, Prince Kropotkin, was assassinated. On 2 April 1879, an attempt to assassinate the Emperor, Alexander II., was made by Soloviev. He was captured and hanged. Alexander II. (q.v.) was assassinated 13 March 1881.

The Will of the People.—Some time later at a secret congress held at Lipezk, the acquisition of political freedom was declared to be the first necessity. It was hoped to gain this by the formation of a legislative body, elected by the people, with guarantees for electoral independence, and liberty to agitate for reforms. This was demanded from Alexander II. (q.v.) shortly after the assassination of his predecessor as the price of cessation from violence. This new party, the 'Narodnaia Volia,' or 'Will of the People,' sought to overthrow despotism by the communist instincts of the peasants. It set forth the following demands: (1) A representative assembly having supreme control in state matters; (2) provincial self-government with elective officers; (3) village communes; (4) freedom of conscience, association, and political agitation; (5) suffrage; (6) a national militia instead of a standing army; (7) nationalization of land; (8) measures to socialize factories. This movement proved a total failure as the party could not be united.

Latter-Day Conditions.—The present condition of Nihilism in Russia has been likened to a sleeping volcano. There have been no successful outbreaks nor assassinations although the secret party is said to exist in larger numbers than ever before. Within recent years the discoveries of the police show that Nihilism is widely spreading in Russia, not only among the working classes but among the aristocracy, and even in the army, especially in Saint Petersburg, and in many of the principal cities and towns. Secret affiliations are known to exist between the Russian Nihilists and the French and Italian anarchists.

Bibliography.—Kennon, 'Siberia and the Exile System' (1891); Kropotkin, 'Memoirs of a Revolutionist' (1890); Stepinak, 'Underground Russia' (1883); Tikhomiroff, 'Russia, Political and Social' (1887); and 'Russia under the Tsars' (1885).

Nihilist, in theology, one who taught 'Christus, secundum quod est homo, nihil est,'
that is, the human nature of Christ had no existence, so far as it could be called his. In other words Christ did not become anything different from what he was before, by assuming human nature, because no change can be wrought in the unchangeable God, and a man is not to be called a cloak because he puts one on. This was the view of Abelard, and John of Damascus, and was held to be tenable, at least, by Peter Lombard, Paris. It was condemned in the Lateran Council of 1179.

Nihongi, nē-hōn-gē, a Japanese historical work embracing records of ancient Japan. It was first issued in 712 and was fashioned on the model of Chinese histories.

Nīgata, nē-gā-tā, Japan, a seaport city, capital of the province of Echigo, on the west coast of the island of Honshū, nearly opposite the island of Sado, at the mouth of the Shinanogawa. It was one of the treaty ports opened in 1859, but owing to its unsuitable harbor, its foreign trade is nominal, its coating and internal trade, however, is important and increasing, the province being rich in petroleum and minerals, and agriculture being well developed. Pop. (1896) 53,306.

Nīmegeen, nīmā-bēn. See NIMEGEN.

Nījne-Tagil, nīzh'nē-tā-gīl'sk', East Russia, the chief town of the Ural Mountains mining region in the government of Perm, on the Tagil, 135 miles east of Perm. Its chief industrial establishments are the ironworks founded by Demidoff; iron, gold, copper, and platinum are mined in the surrounding district, which has a population of about 30,000.

Nījni-Novgorod, nīzh'nī-nōv'gō-rod', or Nizhni-Novgorod ("Lower Novgorod"), Russia, a government bounded north by the governments of Kostroma and Viatska, east by Kazan and Simbirsk, south by Penza and Tamboff, and west by Vladimir; area, 19,704 square miles. The capital is Nijni-Novgorod (q.v.). The surface forms an extensive plain, occasionally broken and diversified by low undulating hills, almost invariably composed of limestone, which is largely developed over the whole government. The only metal found is iron; gypsum prevails in every quarter. The entire government belongs to the basin of the Volga, which, entering it on the northwest, and traversing it in one vast curve to the east, drains a considerable portion of it directly, all the other drainage being brought to it by the Oka and its tributaries on the west, the Sura and its tributaries on the east, and the Senets and Veligena on the north. The soil is of remarkable fertility, rendering this government the granary of Russia. The principal crops, in addition to the ordinary cereals, are hemp and flax. Much attention also is paid to the production of fruit. The extent of forest is equal to that of arable land, and there are tracts of excellent timber. Both manufactures and trade have made great progress. Several governments possess much larger establishments, but in none is the spirit of activity and enterprise more universal. The principal manufactures are coarse cloth, canvas, cordage, glass, soap, and leather. The same articles form important branches of trade, which includes besides corn, flour, hemp, and flax, iron and ironmongery, etc. The central position of this government, and its large navigable streams are highly favorable to its trade. Pop. (1897) 1,600,304.

Nijni - Novgorod, Nizhni - Novgorod, or simply Nijmiy, Russia, the capital of a government of the same name, at the confluence of the Oka and Volga, 225 miles east of Moscow. It is of world-wide celebrity in connection with its great commercial fair which has been held here annually since 1816, lasts from 15 July to 1 September, and is attended by an average of 150,000 dealers and visitors. It is the chief outlet between Germany and China. There is an upper city containing the Kremlin, a lower city, and a suburb. The Kremlin, finely situated on the loftiest point of the high town, is surrounded by a lofty wall flanked with towers, round or square, and contains the principal edifices, particularly two cathedrals, the governor's palace, and an episcopal seminary. With the exception of these, the elegant church of the Holy Women, and a few other public edifices, all are built of wood, and possesses little interest. It is, however, becoming noted, also, for its educational institutions, including schools, libraries and museums. For the convenience of those frequenting the fairs there is an enormous market hall, an electric street railroad, and 60 blocks of buildings for booths, containing more than 2,000 apartments separated by fireproof walls. The value of goods sold at one of these fairs often exceeds $60,000,000. At these fairs all foreign goods are supplied in smaller quantities, those of Russian production showing an increase. Nijni-Novgorod, founded in 1221, was devastated on several occasions by the Tartars; its prosperity dates from 1816 when the great fair was removed to Nijni-Novgorod from Makariev, after a great fire. Pop. (1897) 95,124.

Nika Riot. See JUSTINIAN I.

Nike, nīkē, in Greek mythology, the goddess of victory; called by the Romans Victoria. In art she is generally represented as a winged female figure. Her attributes are a palm branch, a garland and sometimes a herald's staff.

Nike Apterous, or Athene Nike, a small but beautiful Doric temple standing on a bastion flanking the entrance to the Athenian Acropolis. It was torn down by the Turks in the 17th century.

Nikisch, nēkīsh, Arthur, Hungarian orchestral conductor: b. Szentmiklos, Hungary, 12 Oct. 1855. He studied violin, composition and piano under Hellmenberger, Dessoff, and Sedlner, respectively, in the Vienna Conservatory; was first violin in the Vienna Royal Opera orchestra for a year; and then in 1878 became musical director of the City Theatre of Leipsic. He directed the Boston Symphony Orchestra, 1880-93, the Royal Hungarian Opera in Budapest 1893-5, and the Philharmonic concerts in Leipsic from that date up to the present. In Leipsic he conducts the famous Gewandhaus concerts. Nikisch wrote 'Die Christnacht,' and other music. Consult the study by Pfohl (1900).

Nikita, nē-kī-tā, Louise. See NICOLAH, LOUSIA MARGARET.

Nikolaieff, nē-kō-li'ēf, or Nikolaiev, Russia, a seaport, and the chief naval station on the Black Sea, at the confluence of the Ingul and Bug, 36 miles northwest of Kherson. It occupies a large space, is fortified and well built,
Nikon, a river of northeastern Africa, celebrated from remote antiquity as the Egyptian Hour or Aur-Aax, thrusts between the Hebrew Sibor, and the Greek Nikes, the largest river of the African continent, and the second in length of the rivers of the world. Its length is estimated at 4,000 miles, and the area of its basin at 1,200,000 square miles. A map drawn to 35 degrees of latitude, or 2,450 miles in a direct line. The White Nile or Bahr-el-Abiad flows from Victoria Nyanza, and is joined at Khartum by the Blue Nile or Bahr-el-Azrek which has its source in the Abyssinian highlands, in lat. 11° N.; lon. 30° 30' E. It flows first north into Lake Dimbea or Tsana, then emerges from it in an easterly direction, describes a great arc to the south, extending below lat. 10° N., then turns to the west, after some distance receives its southern tributary, the Dedesha, and lastly takes a northerly course. After receiving from the east the rivers Dender and Rahad, it joins the White Nile at Khartum. The united Nile then flows first to the northeast till at lat. 17° 30' N. it receives its last tributary, the Atbara, from the north, with which its junction with the Atbara the Nile flows north, having on the west or left bank the desert of Bahiuda; on the east Meckhery, which is commonly called Barber. Lower down it forms several islands, one of which is called Kandake (Candace), and also one or more cataracts, it then bends west by south, and passes by Jebel Barkal, where stand the remains of a temple, repaired by Tirhaka (700 B.C.), but probably 1,000 years older. Resuming its northern course it enters the plains of Dongola, and forms several islands of great extent. Quitting these plains by a cataract the river flows through the districts of Mahas, Sukhut, Wadi, Keskud, and Batn-el-Hajar (or the Glen of Rocks), at the head of which is the second or great cataract, and entering Egypt at Philæ — the Pi-lakh or limit of the Egyptians — it descends the lowest (in ascending the first) cataract to Syene or Asouan, which is in lat. 24° 5' N. From Philæ, lat. 24° 31' N., the Nile flows through Egypt in a single stream as far as Batn-el-Bakara, the ancient Cercus, at the head of the Delta, in lat. 30° 15', where it divides into two branches, leading down respectively to Rashid (Rosetta) and Dinyat (Dam-
NILES

ietta), and entering the sea in about lat. 31° 35' N. These two mouths correspond, as is supposed, to the Phнатitic and Bolbiticin mouths of the ancients, which, however, in ancient times were not the most important, as the Pelicid mouth on the east and the Canopic on the west, between which, proceeding from east to west, there were other five mouths, named respectively the Taneic, Mendesian, Phehatic or Bucolic, Sebeneitic, and Bolbitic.

The Nile received divine honors from the Egyptians, and at a later period also from the Greeks and Romans. By the Egyptians he was represented as a hermaphrodite, with a beard and woman's breasts, and a skin of a blue color. The Upper Nile was distinguished from the lower by a peculiar floral symbol. The Nile had a temple dedicated to himself at Nilopolis, and his principal festival is mentioned under the name of Niloa. In Greek and Roman art he is depicted in the attitude of a river god reclining, around whom sport 16 children, an allegorical representation of the height in cubits of the inundations of the river.

Rain scarcely ever falls in the valley of the Nile from the 18th nearly to the 30th parallel, and very scantily even lower down, the river owes its supplies wholly to the copious rains of the countries wherein it rises. In Egypt it begins to increase in June, attains its greatest height in three months, and then subsides as gradually as it rose. The ordinary rise at Cairo is about 25 feet. During the flood a great portion of the Delta and of the valley of Egypt higher up, is inundated. In Senmaar also, and Dongola, extensive tracts are watered immediately by the river; but, in general, the banks of the Nile above Egypt are irrigated by means of the water-wheel. In early times the case was different, as is shown by the composition of the soil formed of alluvial deposits in places no longer reached by the stream, even in its highest state of flood. The changes of level which have taken place in relation to the river are demonstrated by the hieroglyphic inscriptions at Senmam, a day's journey beyond the second cataract, which attest that 4,000 years ago the average height of the Nile at its utmost flood was 23 feet higher than at the present day, while inundations of the river in Egypt are continually raising the level of the whole surrounding valley.

The Nile reservoir, for which the great dams at Assouan and Assiout have been constructed, will enable wide tracts of land to bear two crops a year instead of one, will bring waste districts into tillage, and will greatly increase the area of sugar cultivation. The reservoir will supply 1,000,000,000 cubic metres of water annually. See article and illustration under ASSOUAN, Vol. II.; also EGYPT; IRRIGATION.

Niles, Hezekiah, American publisher: b. East Bradford, Chester, Pa., 10 Oct. 1777; d. Wilmington, Del., 2 April 1839. From 1800-5 he was engaged in the publishing business in Wilmington, Del., then moved to Baltimore, Md., where with George Bourne he edited and published the Evening Post. In 1811 he founded 'Niles' Register,' a weekly journal, which in 1837 he moved to Washington and published under the same name of 'Niles' National Register.' While in Washington he obtained a position in the Pension Office, and gave up the editorship of the 'Register,' which was moved back to Baltimore in 1838 and continued by his son and others till 1849. He published: 'Quill Driving,' a series of humorous essays; and 'Principles and Acts of the Pelican' mouth. 'Niles' Register' was devoted chiefly to the discussion of politics, and is regarded as one of the most valuable sources for the study of the American history of the period; the volumes for 1812-27 have been reprinted.

Niles, John Milton, American journalist and politician: b. Windsor, Conn., 20 Aug. 1787; d. Hartford, Conn., 31 May 1856. At 20 he began the study of law, and in 1817 settled in Hartford, Conn., where with the co-operation of others he established the Hartford Times, of which he was principal editor for several years, and to which he contributed for 30 years; through this paper he warmly supported Andrew Jackson and the Democratic party. Appointed postmaster of Hartford in 1829 he resigned on receiving the exact appointive to the U.S. Senate, a post which he retained till 1839. In 1839 and 1840 he was Democratic candidate for governor of Connecticut, and in the latter year was postmaster-general under President Van Buren. He was again elected to the Senate in 1842, and on the expiration of his term retired from public life. He published 'The Independent Whig' (1816); 'Gazetteer of Connecticut and Rhode Island' (1819); 'Life of Commodore Oliver H. Perry' (1820); 'History of South America and Mexico and a New of Texas' (1839); 'The Civil Officer' (1840); etc.

Niles, Nathaniel, American statesman: b. South Kingston, R. I., 3 April 1741; d. West Fairlee, Vt., 31 Oct. 1828. He was graduated from Princeton College in 1766 and subsequently studied medicine, law, and theology, and he preached in various Congregational churches in New England. He settled in Vermont after the American Revolution and there conducted religious services in his own house for nearly 40 years. He served in the Vermont legislature and was its Speaker in 1784, was a judge of the State supreme court and was a member of Congress in 1791-5. As "censor" he assisted in the revision of the State constitution and he was six times presidential elector. He wrote the popular war song 'The Trooper' after the battle of Bunker Hill and published: 'Four Discourses on Secret Prayer' (1773); 'The Fountain of Good' (1777); etc.

Niles, Nathaniel, American lawyer: b. South Kingston, R. I., 15 Sept. 1835. He was educated at Phillips Andover Academy and was admitted to the bar in 1857. He has served for several terms in the New Jersey legislature of which he was Speaker in 1872 and where he has introduced important measures, notably those establishing 1,200 free school libraries and a free school fund of $3,000,000.

Niles, William Woodruff, American Protestant Episcopal bishop: b. Hatley, P. Q., 24 May 1839. He was graduated from Trinity College, Hartford, Conn., in 1857 and from the Berkeley Divinity School at Middletown, Conn., three years later. Entering the Episcopal ministry in 1860 he was rector at Wiscasset, Maine, 1861-4, and at Warehouse Point, Conn., 1868-70. He was for six years professor of Latin at
NILE.

1. Rapids of the first cataract.
2. Nile boats near Cairo.
NILES — NIMBUS

Trinity College, and in 1870 was consecrated bishop of New Hampshire.

Niles, M. D., city in Berrien County; on Saint Joseph River, and on the Michigan C., and the Cleveland, C., & St. L. R.R.'s; about 110 miles southwest of Lansing and 90 miles east of Chicago, Ill. Niles is in the region traversed by the earlier explorers who followed the rivers which were inlets and outlets of the Great Lakes. The French missionaries founded here a mission in 1697. On the site of the city, or nearby, was Fort Saint Joseph, the ruins of which are still in existence. In 1822 Spain claimed the land for miles around Niles on the account of the capture, in 1781, of this fort by a force of Spanish soldiers. In 1828 a colony of eastern home-seekers located at Niles; in 1838 the village was incorporated, and was chartered as a city in 1839.

Niles is the commercial centre of a productive agricultural region, and its good water-power has made it a manufacturing city. The chief manufactures are windmills, flour, lumber, paper, lithographer's materials, and other useful and durable products. There is considerable trade in farm products, fruit, and the manufactured articles. The government is vested in a mayor, who holds office one year, and a council. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 4,197; (1900) 4,287.

Niles, Ohio, city in Trumbull County; on the Mahoning River, and on the Baltimore & O., the Erie, and the Pennsylvania R.R.'s; about 50 miles southeast of Cleveland. It is a manufacturing centre; the chief manufactures are mine and mill supplies, galvanized iron, foundry and blast furnace products, automatic presses, boilers, electric and steam cars, chinaware, incandescent lamps, metal malleable iron roofing, sheet iron, and tin. The government is administered under a charter of 1895, and provides for a mayor, who holds office two years, and a council. The electric-light plant and the waterworks are owned and operated by the municipality.

Nill'gai, a large bluish-gray antelope (Boselaphus tragocamelus) of the grassy plains and less forested parts of India, where it forms one of the principal game animals of the country. The short conical horns and general appearance of the head and body are somewhat ox-like; but the legs are long and slender, and a large tuft of hair depends from the chest. Nilgai both graze and browse, feed during the day, and are able to thrive with very little water. Where they are not much hunted they become so tame as to be troublesome to visitors; but when much disturbed grow shy and wary. Their chase is therefore often interesting, but the small horns make so poor a trophy that they are not often shot. The best sport is obtained by running them down on horseback and killing them by spearing. Consult works on East Indian zoology and sport, especially Kinloch, 'Large Game Shooting' (1895), and Baker, 'Wild Beasts' (1890).

Nilgiri, nil-gér'e, or Neilgherry, Hills, India, a southern range of Madras, giving its name to the range and to a race of cattle. An elevated situation, delightfully cool climate, much resorted to by invalided Europeans resident in India, the principal health-station being Ootacamund. The hills rise abruptly from the plains 40 miles from the west coast, to an average height of 6,000 feet, individual peaks shooting up to 8,750 feet. The mass is isolated, with the exception that a precipitous granite ridge leaves its western face and connects with the Western Ghâts. The surface consists of grassy uplands with large groves of forest trees; but the lower slopes are heavily timbered. Coffee, tea, and cinchona are cultivated. The Nilgiris are inhabited by five distinct tribes, of whom the Todas are the most interesting. They speak a Dravidian dialect and practise polyandry. The men are tall and athletic, with Roman noses, black bushy beards and eyebrows, but they are dirty in their habits. Their sole occupation is tending cattle. The Nilgiris district has an area of 997 square miles; pop. (1901) 111,449.

Nilom'eter, in hydraulics, an instrument for measuring the rise of the Nile during its periodical floods. On the island of Er-Rodah is a graduated pillar, upon which the height of the water is read off. The pillar stands in a well which communicates with the river. In the time of Pliny, a height of 14 cubits made 13 scarcity, 15 safety, and 16 plenty. At present the canals are cut and distribution commences when the river reaches 18 cubits; 19 cubits is tolerable, 20 adequate, 21 excellent, 22 abundant, and 24 runaway. See Nile, Obs.

Nilsson, nil'sön, Christine, Swedish operatic soprano: b. Hassaby, near Wexio, Sweden, 3 Aug. 1843. She was educated for the operatic stage by Berwald at Stockholm, and Masse and Wartel at Paris. In 1864 she made her first appearance at the Theatre Lyrique, Paris; and she appeared in 1867 in that role for the first time in England at London. She sang in the United States in concert in 1870, in opera in 1871; and appeared there again in 1873 and 1882. She was last heard on New York on 16 April 1883. Among her most famous impersonations are Ophelia in Thomas 'Hamlet,' and Margaret in Gounod's 'Faust'; Elvira in 'Don Giovanni' and Elsa in 'Lohengrin.' In 1872 she married M. Auguste Rouaud, who died in 1882; and in 1886 she married Count A. de Miranda. Since 1888 she has lived in retirement. Her voice was a soprano of moderate power, but very brilliant and even.

Nimapu, nim'a-poo. See Sahaptian Indians.

Nim'bus, (1) in painting, the halo or collection of rays with which artists surround the heads of sacred persons, in Christian art, of Christ, and the angels and saints. The use of this ornament is both ancient and widespread, being exemplified in the Indian, Egyptian, Etruscan, Greek, and Roman religions. The ancient poets speak of their deities as being crowned with such a nimbus in their occasional appearances on earth, and in paintings this nimbus was represented in the same way as in the paintings of Roman Catholic artists. The nimbus of Christian art is usually circular in form, but sometimes it is triangular; sometimes in the form of three rays, one proceeding from the summit of the head, the other two from the sides, so that the three form three arms of a cross. The triangular nimbus symbolizes the Trinity; it is sometimes enclosed in a circle, which symbolizes eternity. The nimbus with three rays
is also a symbol of the Trinity. Another form of the nimbus is that in which one of the common circular shape supports a cross. (2) In meteorology, the word is applied to a rain cloud; sometimes classed as if forming a primary or fundamental variety of cloud; it is really a mixture of the stratus, the cumulus, and the cirrus. It has a uniform gray tint and fringed edges.

Nimeguen, nim-'a-gén. See Nimwegen.

Nimes, ném, or Niames, France, a southeastern city, capital of the department of Gard, 62 miles northwest of Marseilles, noted for its ancient buildings and monuments of Roman origin, which are second only to those of Rome. It is situated in a delightful plain, and handsome boulevards occupy the site of the former ramparts. The city proper is small and irregularly laid out, with narrow streets and ill-built houses; but its three suburbs, one of which, called the Cours-Neuf, is larger than the city itself, present a finer aspect, having wide, straight avenues, fine public walks, and handsome buildings. Among the edifices of the Christian era are the cathedral, begun in the 13th century and completed by Vauban in the 17th, occupying the site of a temple of Apollo; the church of St. Paul; the new palace of justice; the general hospital; the Hôtel Dieu, rebuilt in 1830; the public library; the central house of detention, which is the citadel built by Vauban over the remains of the old Fort Rohan erected in 1629 by the Calvinists; and the fine monumental fountain of Pradier, erected in 1851, on the esplanade. The public garden, where is still to be seen the fountain that furnished the Roman baths with water, and the beautiful promenade known as the Cours Feuchères, are also attractive features. Nimes is the seat of a Roman Catholic bishop, of a Protestant consistory, and has tribunals of primary jurisdiction and commerce, a departmental academy, several learned institutions, a lyceum or college, a normal school, a theological seminary, schools of drawing, chemistry and physics, geometry and mechanics as applied to arts, a society of medicine, a Bible society, and a museum of natural history. The monuments of the Roman period are the Maison Carree, so called from its rectangular form, a beautiful Corinthian temple nearly in the centre of the city. It stands on a stylobate, and is approached by 15 steps; the platform is 82 1/2 feet long and 40 1/4 feet wide, and the building and platform together are 58 1/2 feet high. It is surrounded by 30 columns, 10 of which are detached and form the portico. It suffered greatly during the Middle Ages, but since 1789 it has been taken care of, restored, and surrounded by an iron railing. In 1823 it was converted into a museum of paintings and antiquities. The amphitheatre, or Les Arènes, is the most perfect of its kind extant. Its height outside is from 68 to 104 feet, and its external circumference 1,174 1/2 feet. It has from 32 to 35 ranges of seats, and was capable of accommodating from 17,000 to 23,000 spectators. It was used as a fortress by the Visigoths and the Saracens, when attacked by the Franks; during the following centuries it was also occupied as a stronghold. No fewer than 2,000 persons had established their abode within the walls of this building, when in 1809 it was cleared by order of the prefect; and it has since been protected against encroachments. The Tour Magne (torris magna) is the remnant of a tower which flanked the ancient walls. The boulevards now occupy the site of the armament, but portions of them are still extant in the Porte d'Auguste and Porte de France, two Roman gates, the former of which is ornamented with sculptures. To these monuments must be added a ruined nymphæum, a fountain dedicated to the nymphs, which communicated with a neighboring bath for women, the remains of which have been mistaken for those of a temple of Diana. The magnificent aqueduct, known as the Pont du Gard, is in the vicinity of Nimes. (See Gard, Pont du.)

In point of industry and commerce Nimes holds a distinguished rank; it is the great southern mart for raw and manufactured silk. Its manufactures are principally silk shawls and gros de Nîmes and velvet; the leading trades are woolen stuffs; blonde lace and tulles, galloons, ribbons, and carpets. There are several large dyeing and printing establishments, vinegar factories, and distilleries. Its trade is mostly in wine, brandies, vinegars, sugar, and coffee. Nimes has a university.

Nimes is supposed to have been built by a Greek colony, and was afterward for about 500 years in the possession of the Romans. In the 16th century it became a stronghold of Calvinism, and suffered much during the civil wars. The treaty known as the Pacification of Nimes, concluded here in 1629, granted freedom of worship to the Huguenots, but deprived them of their fortified towns. In 1815 it was the scene of religious violence, in consequence of the reaction of that period. Guizot and Daudet were natives of this town. Pop. (1901) 80,355.

Nimravus, a genus of large Tertiary fossil cats, typical of the family Nimravidae, or Machaerodontidae, which includes the various sabretoothed tigers (q.v.).

Nimrod, according to the Mosaic scriptures, the founder of the Babylonian monarchy, son of Cush. He flourished about 2450 B.C. He is styled a mighty hunter "before the Lord," a somewhat vague expression, but evidently referring to a taste for and conquest of the chase. All that is definitely known about Nimrod is that he was a Cushite, that he established a kingdom in Shinar, the classic Babylonia, the chief towns being Babel, Erech, Accad, and Calneh, that he extended his kingdom northward along the Tigris over Assyria, where he founded a second group of capitals, Nineveh, Rehoboth, Calah, and Resen. In the Chaldean epic of the deluge Nimrod has by some scholars been identified with Gilgamesh, the heroic figure whose history is dated about 2200 B.C. (5) "Varius Aids to the Bible Student" (1868).

Nimrud, nim'rood, Asiatic Turkey, the name given to a mound which is supposed to be the site of an ancient Assyrian city; on the east bank of the Tigris River at the confluence of the Tigris and the Zab Aya; and 18 miles below Mosul. It is supposed to be the city Calah, mentioned in Genesis x. 11, a suburb of Nineveh. See Nineveh.

Nimwegen, nim'wa-gén, or Nimwegen, nim'wa-gén (ancient Noviomagus; Dutch, Nijmegen), Netherlands, city in the province of Gelderland; on the Waal, about 12 miles south of
Ninde — Nineveh

Arnhem. Built in the form of an amphitheatre, on a series of hills, it overlooks a beautiful valley. It is in a productive agricultural region in which grain and grapes are prominent productions and much attention is given to stock-raising. The chief manufactures are leather, tin, wine, eau de cologne, flour, and cigars. It has an extensive trade in wine, grain, and cattle.

Nimwegen possesses many ruins showing its Roman origin. It was originally a Roman camp; by means of which control was exercised over the Teutons living northeast of the Rhine. It was one of the Hanse towns. From 1585 for nearly 100 years it was the scene of much of the contentions, and also of the peace-making among the Spaniards, Swedes, French, and Dutch. The "Peace of Nimwegen" in 1678-9, was the ending of the contest between the French and the Dutch, the great event in the life of Louis XIV. It marked the time when France became one of the Great Powers. Pop. (1900) 44,546.

Ninde, William Xavier, American Methodist bishop: b. Cortland, N. Y., 21 June 1832; d. Detroit, Mich., 3 Jan. 1901. He was graduated from Wesleyan University, Middletown, Conn., in 1855, and was for a time engaged in teaching, receiving ordination in 1856. He was in charge of various churches in Ohio and in 1870 was transferred to the Detroit conference. He accepted the chair of practical theology at Garrett Biblical Institute, Evanston, Ill., in 1873; in 1879-84 he was president of the Institute. In 1884 he was elected bishop. He was the first president of the Epworth League.

Nindemann, Wilhelm Friedrich Carl, German-American Arctic explorer: b. Ginsig, Germany, 22 April 1850. He removed to the United States in 1867 and in 1881 accompanied the Polaris expedition. When the Polaris was wrecked in the ice he with 18 of the crew drifted on an ice-floe for seven months. They were rescued by the Tigress in 1873 and he subsequently joined the crew of the Jeannette and when the vessel was wrecked in 1881 he was elected captain by the crew. In 1886 he published "Eines deutschen Matrosen Nordpolafahrten" (1885).

Nine-bark, an American shrub (Opulus pubifolium), of the rose family, was common throughout the eastern part of the United States. It has an unisexual form, glabrous twigs, bright green, three-lobed, crenate-lanceolate leaves, and small white or purplish flowers in terminal corymbs. Its bloom, remarks Mrs. Lounsberry, is not very pretty, but it redeems itself by the beauty of the ripening pods. "They, hanging in quantities at the ends of its long, curving branches, produce something the same effect as the fruit of a species of opulus or cranberry-tree. . . . The common name which would naturally recall one of the hydrangeas, is in reference to a trick of the bark in peeling not nine but many times into dilapidated-looking strips." The hydrangea (q.v.) referred to is H. radiata, a showy wild shrub which is given this name by the mountaineers of the Southern States on account of the ragged peeling of its bark. Both shrubs flourish in rocky and swampy places, and both are susceptible of cultivation. Consult Lounsberry, 'Southern Wildflowers and Trees' (1900).

Nine-Pins, a game with nine pins or bottle-shaped pieces of wood set on end, at which a large wooden ball is rolled for throwing them down. See Bowls; Bowling.

Nine Worthies, romantic heroes grouped together in Arthurian legend, especially in the 'Triomphes des neuf Preux,' where the author describes a vision in which he saw three Jews (Joshua, David, Judas Maccaheus), three pagans (Hector, Alexander the Great, Julius Cæsar), and three Christian (Abraham, Charlemagne, Godfrey of Bouillon). These worthies, with occasional a tenth, Bertrand du Guesclin, and with Guy of Warwick sometimes substituted for Godfrey of Bouillon, may be traced back to old Welsh legends; Brunet says the three triads are of Spanish origin; and Dunlop showed that the list appeared in an old Low German poem on Alexander. Shakespeare makes them the butt of some fooling in 'Love's Labour's Lost.'

Ninekiller. See Butcher-Bird.

Ninety-six, a fort, a former Revolutionary fort in Abbeville County, S. C., near the Combahee River. It was so-called on account of being 96 miles from the frontier fort of Prince George.

Ninety-three ('Quatre-Vingt-Treize'), a novel by Victor Hugo, published in 1824. It bears the sub-title: 'Premier Recit. La Guerre Civile,' and was intended to form the first part of a trilogy. The edition of 1882 contains several remarkable designs signed by the author. The story deals with an episode of the Vendean and Breton insurrection.

Nineveh, nin'i-e-vé, the ancient capital of the Assyrian empire. The site of the city, which was destroyed about 660 B.C. by the Babylonian Nabopolasar and the Mede Cyaxares, has been identified with the modern Kouyunjik. It stands on the left bank of the Tigris, opposite to the town of Mosul. The first historic notice of Nineveh is in Genesis x.; it is described as "a great city in the time of the prophet Jonah (about 865 B.C.). Ezekiel at the beginning of the 5th century B.C. speaks of its desolation in the most vivid imagery. "The Assyrian was a cedar in Lebanon, with fair branches; the cedars of Eden that were in the garden of God envied him;" but "strangers, the terrible of the nations, have cut him off;" "upon the mountains and in all the valleys his branches are fallen and his boughs are broken by all the rivers of the land; and all the people of the earth are gone down from his shadow and have left him." It was known to travelers that vast mounds covered the banks of the Tigris opposite Mosul and extended to a considerable distance inland. They were long considered to cover the ancient site of the Assyrian capital, but it was not until 1841 that M. Botta, the French consul at Mosul, began excavations with the result that he obtained a few fragments of brick and alabaster. He renewed his efforts at Khorsabad, 12 miles to the northeast, in 1843 and discovered an Assyrian edifice which had remained buried in the sand for thousands of years. The work was continued by Layard, who explored the lofty mounds of Nimrud, situated 18 miles south-southeast of Mosul at the point where the tributary Zab joins the Tigris. This was the beginning of a series of the most remarkable discoveries. He immediately came upon numerous slabs covered with cuneiform inscriptions of
NINEVEH — NINIAN

unique importance. A chamber in the ancient ruins was lined with these; they were in excellent preservation. He unearthed, moreover, gigantic figures of various kinds—winged bulls and lions with human heads and winged sphinxes, which stood as guardians at the gates of stately palaces. It was evident that the old city had been destroyed by fire, for the stone images in many cases were calcined and crumbled into dust on exposure to the air. The fire had not, however, desolated what the explorer designated the northwest palace. Here he discovered in excellent preservation 28 rooms, decorated with bas-reliefs, carvings, and moldings which told the tale of the art and civilization which had flourished at Nineveh in its palmy days. Returning to Kouyunjik Layard met with even more important results from his excavations. When he pierced the mounds at this point he was enabled to explore nine vast rooms, one of them 130 feet long, and all replete with interesting and valuable sculptures, inscriptions, and carvings. In 1849, after returning to England and arousing the interest of the learned world in his magnificent discoveries, he renewed his work at Kouyunjik and found a almost inexhaustible treasury of antiquities in the sand mounds of the plain. He was now acting as agent for the British Museum, whose Assyrian collection he enriched with some of its most precious examples of art and inscriptions. Loftus and Hormuz Rassam continued the work in 1853 and the excavations at Nimrud were renewed by George Smith in 1873. There can be no doubt that some of these monuments represent the remains of ancient Nineveh, and scholars have arrived at the conclusion that the city of Ninus occupied the site of Kouyunjik and Nebbi Yunus on the left bank of the Tigris at the confluence of the Zab. Asur, an even earlier capital of Assyria, was undoubtedly built on the site of the modern Kalah Shergat. The palaces of Sennacherib and Assurbanipal have been unearthed from the mounds of Kouyunjik, and a second palace of Sennacherib and Esarhaddon from the mound of Nebbi Yunus. It is concluded from these discoveries that Nineveh proper was one of a cluster of cities and royal residences that stood on the banks of the Tigris. This city was square in shape, and each of the four sides was a mile in length. The palace of Sargon at the northern angle had a façade 400 yards in width. The chief sculptures and inscriptions which are now stored in the British Museum belong to palaces and temples in the northwest of the city. The principal palace was built in the 9th century B.C. by Assurnasirpal. Near by he built a great tower, rising with narrowing stages. His son Shalmaneser II. built the central palace of the group. The statue of Nebuchadnezzar in the British Museum was brought from what has been called the southeast palace, but was really a temple.

Nineveh was not the earliest capital of Assyria and only came into importance in the time of Sennacherib, who is recorded on the inscribed bricks he built its walls. From his time it was the chief seat of empire, and gave its name to the whole group of cities between the Tigris and the Zab. Hence Jonah describes this Nineveh as a city of three days' journey, and Diodorus says its circuit was 240 stadia. Consult the works of Layard, Botta, and Flandin; also Oppert, 'Expedition en Mesopotamie'; Smith, 'Assyrian Discoveries.'

Nineveh, Pa., Cavalry Engagement at. After the battle of Cedar Creek (q.v.) in Virginia, Gen. Sheridan on 9 Nov. 1864 withdrew his army to Kernstown, and Gen. Early followed him as far as Middletown. Sheridan next ordered Horbert, commanding his cavalry, to move on Early at early noon of the 12th, Merritt's and Custer's divisions to the right, on the Back and Middle roads, against Rosser, and Powell's division to the left, on the Front Royal road, against Lomax. Powell moved down the road as directed, and thence across toward Middletown, and at Nineveh met McCausland's cavalry brigade, which charged him; but he made a counter-charge and routed it, capturing two guns, three wagons, two battle-flags, and 161 prisoners, and pursuing eight or nine miles up the Luray Valley. Six regiments were engaged on either side. The Union loss was 2 killed and 15 wounded; the Confederates lost 20 killed and 35 wounded. Meanwhile the column on the right drove Rosser across Cedar Creek, and under cover of the night Early again retreated up the valley to New Market. Consult: 'Official Records,' Vol. XII. Ill.; Pond, 'The Shenandoah Valley in 1864.'

Ningpo, ning'po\, China, a city and treaty-port in the province of Che-Kiang, in a fertile plain on the left bank of the Taikia or Ningpo River, 16 miles from its mouth, and about 100 miles south of Shanghai. It was opened to foreign trade by the Treaty of Nanking in 1842. It is surrounded by walls 5 miles in circuit, 25 feet high, and 15 feet wide at top, and, besides, has extensive suburbs outside. Though highly exalted by the Chinese as one of the most beautiful cities of the Celestial Empire, it consists of narrow filthy streets and one-storied houses, sometimes of stone, but mostly of brick. Its most remarkable edifice is a brick tower, formed of seven stories, and above 160 feet high, but now a mere ruin, and it contains numerous temples, colleges, etc., chief among them the temple of the Queen of Heaven, founded in the 12th century, but the present building, elaborately and richly ornamented, dates from 1680. Shops and immense eating-houses occupy the quarters near the river, while eating-houses and tea shops abound near the gates and in the suburbs. A medical hospital, opened by a missionary society in 1843, has been found very beneficial. The manufactures consist chiefly of silk and cotton goods, carpets, furniture, etc. The native trade is very extensive. The principal exports are tea, silk, and raw cotton; and the principal imports, besides manufactured goods, sugar and opium. The average value of the trade of Ningpo for 10 years past has been about $14,000,000. The great bulk of the trade is carried on with the other treaty ports. Ningpo was taken by the British without resistance in 1841. Pop. estimated at 200,000.

Ninian, nin\-\an, Saint, the apostle of the southern Picts. He labored in evangelizing northern England and southern Scotland at the end of the 4th and the beginning of the 5th centuries. He was a Briton by birth, but had been thoroughly educated in languages and philosophy at Rome. The field of his activity extended as far north as
the Grampian Hills, and his see was Candida Casa, Whithorn, the modern Wigtounshire, the southwestern county of Scotland. His death is placed by hagiologists in 432 and his festival is 16 September. The only church building which he is recorded to have founded is dedicated to St. Martin of Tours.

Ninigret, an American Indian sachem of the Niantics, one of the Algonquin tribes. In 1637 he assisted the colonists in the Pequot war. In 1667 he sold much of his land on Long Island to the colonists. He died in 1677.

Niño, Pedro Alonso, pa’drō ál’on-sō né’nó, Spain, and navigated as b. Moger, Spain about 1455; d. about 1505. He accompanied Columbus on his third voyage in 1498 to Trinidad and the coast of Paria, and returned to Spain filled with the project of making an expedition to the new country in search of treasure. He was granted the royal permission, one fifth of the spoils to be the share of the Crown. The voyage was a successful one; he peaceably obtained from the Indians a great store of treasure, but was accused of withholding the greater share for himself. He was sent to the king and died before the suit was ended.

Ninon de l'Enclos, né’nōn de lō’n-klu, or Lenclos. See Lenclos, ANNE.

Ninus, ninûs, eponymous king of Nineveh and founder of that city. His name is nowhere mentioned, apparently, in Assyrian monuments, and the story that he extended the Assyrian empire to India and to Egypt is historically false. But he figures largely in Greek myth and "history," where Nineveh is said to have been founded by him and named for him; he married Semiramis, wife of Onnes, but his wife murdered him and declared his son Ninias, who is as mythical a personage as his father. For Semiramis alone in these stories does history show any actual existence.

Niobe, niō-bē, in Greek mythology, the daughter of Tantalus, was the wife of Amphion, who, in common with Zethus, built the walls of Thebes, which they had built. According to the common accounts she had seven sons and seven daughters, and, proud of her blooming offspring, she so far forgot herself as to exalt herself above Latona, the mother of only two children—Apollo and Artemis; and in punishment of her presumption she had to witness the destruction of her children by the arrows of the twin deities. Anguish and despair transformed the wretched mother, after long wanderings, into a stone. Amphion and Zethus also fell, pierced by the arrows of Apollo, when, full of wrath, they penetrated into the sanctuary of the god. This is the most common account of the fate of Niobe, in the circumstances of which poets frequently differ, who have taken this story for a subject as often as artists. The origin of the fable seems to lie in the ancient figure of speech by which it was said of young people who died suddenly that they had been struck with the arrows of Apollo or Artemis; and in almost all languages, petrification is the natural image of the highest degree of torpid despair.

Niobe of Nations, The, a name applied to Rome, the "lone mother of dead empires."

Niobiум, in chemistry, a metallic element discovered in 1801 by Hatchett, but more fully investigated by Rose, who named it. Niobiunm is present in columbite, euxenite, pyrochlore, and in other minerals. The metal may be prepared from the fluoride of niobium by heating it in a covered crucible with sodium, and dissolving out the soluble salts with water. It is insoluble in nitric acid, difficult soluble in hydrochloric acid but dissolves in hot hydrofluoric acid. It forms two oxides of a chlorous character, unting with basylos oxides to form salts.

Niobrara, niō-brā’rə, a river which has its rise in Laramie County, Wyo., and which flows east into Nebraska, crossing the northern part of the State, making regular, long north and south curves, and flows into the Missouri River at Niobrara in Knox County. It is about 400 miles long, flows rapidly in the upper part of its course, but moves slowly through the almost level prairie country of the northern part of Nebraska.

Niobrara Stage, in geology, a subdivision of the upper Cretaceous division, forming with the Benton stage the Colorado Epoch. It occurs in Kansas and South Dakota as well as in Colorado and Wyoming. The rock is mostly shelly, belonging to the king and died before the suit was ended.

Nipan, nē-pān’. See NIPAL.

Nipher, Francis Eugene, American physicist and electrical engineer; b. Port Byron, N. Y., to Dec. 1847. He was graduated from the Iowa State University in 1870, and became instructor there. He afterward went to Washington University as professor of physics and electrical engineering. In 1877 he organized the weather service of Missouri and in 1878 the Magnetic Survey. In 1889 he showed that positive photographic pictures could be developed in the full glare of sunlight instead of in a dark-room; and he also made the discovery that a photographic plate over-exposed could be developed as a positive and that a zero point exists between the negative and the positive which cannot be developed at all. He wrote: Theory of Magnetic Measurements" (1886); "Electricity and Magnetism" (1896); "Introduction to Geographical Algebra" (1898). He has also contributed scientific articles to the "Transactions" of the St. Louis Academy of Science, of which he is a member.

Niphon, nī-fōn’, Nippon, Nipon, or Nihon, the various Japanese pronunciations of Jih-peon (whence Japan), signifying sun-origin, the Chinese name for the island empire, and locally adopted by Japan in the 7th century. Nippon was long used by foreigners to designate the principal island Honda. See JAPAN.

Nipigon, a lake in Canada. See NEPIGON.
NIPISSING — NIPPUR

Nipissing, nip'τ-sing, or Nepissing, Lake, in Ontario, Canada, lies at an altitude of 000 feet above sea-level, northeast of Georgian Bay, Lake Huron, with which it communicates by French River. It is irregular in coast-line, is 48 miles long, and has a maximum breath of about 30 miles. Its chief feeder is Sturgeon River, draining from the north a group of smaller lakes. The lake contains numerous islands, one of which is an Indian reservation. The Canadian Pacific railroad skirts the northern shore, and has stations at North Bay, and Nipissing Junction, on the lake shore. Steamers ply on the lake and the region has become a favorite sporting and hunting ground.

Nipissing Indians, an American tribe of the Algonquin family residing on the shores of Lake Nipissing, in northern Ontario, Canada. In the 17th century they were one of the most important tribes of British America and were regarded by the Jesuit missionaries as the typical Algonquins. A few survivors remain in the vicinity of Montreal.

Nip'muc Indians, or “fresh water people,” an American tribe residing in colonial days in Massachusetts. The majority of the Nipmucs did not at first join with Philip in his war against the colonists, but were active against the English during the struggle in Connecticut in 1675. In January 1676 the remnant of Philip's tribe, with the Narragansetts, the Quaboag, and Pocumtucks, effected a junction with the Nipmucs. On the overthrow of Philip the Nipmucs fled to Canada.

Nip'per, Susan, in Dickens’ ‘Domby and Son,’ a young maid, nur...e Florence Domby. She marries Toots. The sharpness of tongue whereby she justifies her name is offset by fidelity to her charge.

Nipperdey, nip'per-dy, Karl Ludwig, German philologist: b. Schwerin, Germany, 13 Sept. 1821; d. Jena, Germany, 2 Jan. 1873. He was educated at the universities of Berlin and Leipzig and in 1852 accepted a professorship at Jena. He made translations of Cesar, Nepos, Tacitus, etc., with critical notes, which have been widely used. See Scholl's biography (1875), and his collection of works, ‘C. Nipperdei Opuscula’ (1874).

Nippur, nip'poor', Asiatic Turkey, an ancient city of Babylonia, between the Tigris and Euphrates, 120 miles southeast of Bagdad, its site now marked by the numerous mounds and excavated ruins at Nippur. Nippur was a great and flourishing city 4000 B.C., and the tablets of its great library discovered since 1888 antedate Abraham’s departure from Ur of the Chaldees for the Promised Land. Nippur is identified with the Calneh of Genesis x. 10, and was the most northerly and easterly of the four conspicuous centres of Babylonian civilization and religion, literature and science. It was the seat of the worship of Bel, or the sun, the angry En-Lil, or Lord of the Storm, the cause of all the weather troubles of mankind, and the original conception of a god of anger and a religion of fear.

Nippur was overthrown and its buildings ruined by the Elamite hordes under Kudur-Nankhundi, 2285 B.C., who destroyed nearly every city of Babylonia. Favoring the permission and protection of the Sultan and his administration, the University of Pennsylvania has since 1888 excavated and laid bare many of its important ruins. The work was supervised first by Dr. John Punnett Peters, and latterly by Prof. H. Haynes and Professor H. V. Hilprecht. Considerable attention was paid to the excavation of the great temple of Bel, the foundation of which was laid between 6000 and 7900 years before Christ. An ancient government palace of immense proportions, where the kings lived, belonging to the fifth millennium before Christ, and one of the ancient gates and walls of the city, were uncovered. A government palace erected about 3000 B.C. was completely and systematically excavated, besides numerous other buildings of less importance. Most valuable inscriptions in stone belonging to the earliest rulers of Babylonia, by the help of which the early history of mankind in the valley between the Tigris and Euphrates will be reconstructed, were discovered. Antiquities in coins, jewelry in gold, silver, and bronze in great quantities; vases in enameled and plain pottery of all periods; seals and seal cylinders, such as the Babylonians used in connection with their business transactions: images of gods, playthings in terra-cotta, bas-reliefs, weights, utensils in bronze, iron, and silver, etc., were also found. These were a few of the important relics recovered, without mentioning the numerous facts ascertained and the many questions solved through study in the trenches, which have important bearing upon the religious ideas and customs of the daily life of the Babylonians. But chief of the important discoveries made during 1888—1900 were those in connection with the famous library of the sanctuary, which was found beneath 25 feet of accumulated debris, representing several millennia of history. In the uppermost stratum of this mound the excavators found coffins which had been buried in the early centuries of our Christian era. A great many antiquities were also gathered which belonged to the Jews who continued to live at Nippur after the return of Ezra and Nehemiah. Prominent among them were terracotta boxes containing incantations and charms inscribed in Hebrew and Mandaean. At a depth of 25 feet were found a series of rooms, a number of which contained ledges or shelves built out from the wall, for the purpose of laying out the tablets in rows. The library seems to have been divided into two parts. There was a business section for keeping accounts, and the educational quarters, with a vast library of a literary character.

Nearly 20,000 tablets were recovered, illustrating practically every branch of literature known to the Babylonians. Among the inscriptions are hundreds of historical texts, dictionaries, or lists of Sumerian words with Semitic equivalents; lists of birds, animals, plants, and stones; lists of words for chairs, stools and other articles of furniture; hymns, astronomical and mythological inscriptions, tablets which refer to the service and functionaries of the temple — how many garments the god Bel wore, how many temples and shrines there were at Nippur besides those dedicated to Bel, and what the revenues of the temples were; tablets containing grammatical sentences written by students, arithmetical calculations, etc.

In appreciation of Professor Hilprecht’s valuable services, the Sultan presented him with,
among other important antiquities, the larger part of the find of the library, which is now deposited in the University of Pennsylvania, and is undergoing systematical decipherment.

Only a small portion of the mounds at Nippur has thus far been explored, and considerable work yet remains to be done on the whole. Only one side of the ancient government hall has been cleared, and about one twentieth part of the library, but arrangements have been effected for a continuation of the work of excavation until completed. See Assyria; Babylonia, and illustrations Vol. II. Consult: Hilprecht, Old Babylonian Inscriptions, Chiefly from Nippur (1893-6) and Explorations in Bible, E. Dugd's, Cent. Mem. (1903); Peters, Nippur, or Explorations and Adventures on the Euphrates (1897).

Nirukta, nī-rook'ta. See ĒDA.

Nirvana, nir-vā'ṇa, a term which originally denotes the blowing out or extinction of a flame, and is used in the metaphorical language of Buddhistic philosophy to mean that condition with which success to the long process of metaphysical purification to which imperfect souls are subjected before they reach the end of Karma, the active life of earthly effort and struggle after perfection. Nirvana, according to Rhys Davids, was originally intended by Buddha to indicate extinction of existence, annihilation, as an escape from the perturbations of passion, and the miseries of life. The utterly negative character of this conception seems later on to have undergone a change, and Buddha has said of the soul of man that it is never to be known that Nirvana is an advance beyond life; it is a condition of fearless security and happiness. But there is no definite implication that this happiness is conscious, or that a sense of personal identity accompanies it. Annihilation may be quite consistent with "Freedom from the pang of earthly existence" and even prove a condition of peace. This peace in Nirvana results from the fact that no transmigration of biseres takes place, since the essential spirit is pure and selfless, and without desire of any kind.

Nishet, nī-zhet. See Nīzh-position.

Nishet, John, Scottish forester: b. Edinburgh 2 Oct. 1853. He was educated at Edinburgh University, where he is now examiner in forestry, and also studied at Munich. Entering the Indian forest service in 1875, he became conservator of forests, Burma, in 1895, retiring in 1900. He has published "British Forest Trees" (1893); "Studies in Forestry" (1894); "Our Forests and Woodlands" (1900); "The Management of Forests in Theory and Practice" (1901); "Burma under British Rule, and Before" (1901).

Nisbet, Robert Buchan, Scottish painter: b. Edinburgh 1 July 1857. He was educated at the Edinburgh Institution and chose as his profession that of landscape painter in water colors. His success was attested by the awards made to him at three international exhibitions—Dresden (diploma) 1892; Antwerp (medal) 1894; Vienna (medal) 1898. Among his most notable works are: "Evening Stillness" (purchased by the Chantrey Bequest, 1890; "Thundery Weather"; "Harrowing"; "Waiting for the Tide" (1898); "Between Showers" (1898).

Nish, nîsh, or Nisêa, nîš-sa, Servia, a fortified city on the Nishava, a tributary of the Morava, 130 miles southeast of Belgrade. It has Turkish and Servian sections, but as an increasing commercial and railway centre is rapidly becoming modernized. It was the seat of the National Assembly until 1901, and is the seat of a Greek bishop. It has hot springs and baths, celebrated since the Roman era, when Nish is mentioned as Naissus by Ptolemy. Constantine the Great was born at Nish. Situated at the junction of many of the main highways of the Balkan Peninsula it has had a turbulent history, in 1456 being captured by the Turks; in 1878 it was taken by the Servians under King Milan. The unsuccessful attack in 1899 is still perpetuated by the "Tyke-Koul" (Tower of Skulls), erected by the Turks half a mile east of Nish, and consisting of the heads of Servians killed during the battle. Pop. (1895) 21,524.

Nishan el-Aaman, nî-shân' el-ā-mân' (Ar. Nishan el-āman, order of the best), Tunisian order of honor founded by Mohamed-es-Sadok in 1899. It commemorates the adoption of the constitution and has but one degree.
NISHAN EL-IFTIKHAR — NITRATE OF SILVER

Nissan el-Ifthkhar, ēlf-tī-kār, a Tunisian order of merit, the data concerning which is not complete, but of which several medals were distributed by the bey on his visit to France in 1846. The degree seems to be indicated by the personal name of the medal.

Nishan el-İftikhar, Turkish order founded by Sultan Selim III. and revived in 1827. It is conferred upon foreigners who have rendered services to the Turkish state. There are no classes of honor, but the value of the medal differs with the degree of the recipient.

Nishan-i-İmtesâ, ēm-te-ās, Turkish order of merit founded in 1879 by Sultan Abdul Hamid. It is conferred upon Turkish officials who have displayed at least three of the attributes: patriotism, fidelity, bravery, and zeal, those names being engraved on the medal.

Nishan-i-Sheikhât, ē-shē-kāt (Ar.-Pers. Nishān-i-i-shīqāt, order of clemency), Turkish order of three degrees established by Sultan Abdul Hamid in 1878. The medal is conferred upon women who have rendered aid to their country in times of war or peril.

Nissapour, nīš-ā-poor, Persia, the capital of a province of Khorasan, situated in a fertile plain at an altitude of 4,000 feet, 50 miles west of Meshed. Anciently it was of great commercial and political importance. An active domestic trade is still carried on, and the city has long been celebrated for the quality of the turquoise found in the district.

Nish'tar, See NASS INDIANS.

Nisibis, nīs-i-bīs, Asia Minor, an anciently an important town, the capital of Mygdonia, Mesopotamia, now the town of Nishin, in the vilayet of Diarbekir (pop. 10,000). The cuneiform inscriptions found here refer to it as Nasinba. It was frequently taken and retaken in the wars between the Romans and the Parthians, and afterward between the Romans and Persians, until it was given to the latter by the Emperor Tiberius in 363. The Persians were defeated here by Belisarius in 541, and by Marcian in 573.

Nisqualli (nīz'kwā-lē) Indians, an American tribe of the Salishan family formerly residing on Puget Sound, Washington. They joined the Puyallup and other tribes in signing the Medicine Creek Treaty of 1854. In 1858, the Nisquallis took part in the general Indian war in the Northwest. There are to-day less than 100 survivors of the tribe.

Nisroch, nīz'rok, in Assyrian mythology, a god, in whose temple, and in the very act of idolatry, Sennacherib was slain by his own sons (2 Kings xix. 37). The name signifies “the great eagle”; and the earlier Assyrian sculptures exhumed at Nineveh have many representations of an idol in human form, but with the head of an eagle. Among the ancient Arabs, also, the eagle occurs as an idol. Historians have, however, long accepted Joseph Halyvy’s conjecture that the word is a corruption of Nusku; while it has also been held to be identical with Marduk of the later Babylonian pantheon.

Nissa, nēs'sa, Servia. See NISH.

Niessen, Heinrich, hē-nrīh nēz'ān, German archaeologist: b. Habersleben, Germany, 3 April 1839. He was educated in Kiel and Berlin, and in 1869-76 was professor in Marburg and subsequently held the chair of classical philology in Göttingen, Strasbourg, and Bonn. He wrote: “Kritische Untersuchungen über die Quellen der 4. und 5. Decade des Livius” (1863); “Italische Landeskunde” (1883); “Griechische und Romische Metrologie” (1877); etc.

Niuss, ni'zūs, Greek mythological king of Megara. His life depended upon a lock of gold or purple hair and of this his daughter Scylla deprived him when Minos, her lover, laid siege to Megara. This act of treachery enabled Minos to take the city, but he was killed by the conduct of Scylla, he had sent to the stern of his ship and by some accounts she was drowned in the Saronic Gulf. Another legend makes her swim after Minos’ ship and she is then punished by her father in the form of a sea-eagle, whereupon she changed herself into the sea-bird Ciris, and is ever after pursued by him.

Nithard, nē-tār, Frankish historian: b. about 795 A.D.; d. near Angouleme 15 May 843. He was a grandson of Charlemagne. He was in the service of Louis the Pious, and later of Charles the Bald, whose cause he espoused during the dissensions between the sons of Louis. He fought in the battle of Fontenay, and was killed in a battle against the Northmen. At the command of Charles the Bald, he wrote a history of the times “De dissensionibus auctoribus Ludovici Pii ad annum usque 843,” which though naturally partisan, is a valuable source for the study of early medieval history. It is contained in the “Monumenta Germaniae Historica,” published by Pertz (1870); and was also published by Holder (1882), and in German by Jasmund (1889).

Nithsdale, nīs'tīdl, William Maxwell, 5th Earl of, Scottish Jacobite: b. Scotland 1676; d. Rome, Italy, 20 March 1744. He joined the Jacobites in 1715, and served under Forster and Derwentwater at Preston where he was captured. He was imprisoned in the Tower and sentenced to death, but assisted by his wife he made his escape in woman’s clothing the night preceding the day set for his execution, though had they known it he had been reprieved. They then went to Rome where Nithsdale joined the followers of the Pretender. He was the “Willy” of “Kenmure’s up and awa’; and the story of his escape written by his countess will be found in “Transactions of the Societies of Antiquaries of Scotland,” Vol. I.

Nitocris, ni-tō'kris, Egyptian queen, the last of the Sixth Dynasty. She succeeded her brother Menthuhotep, whose assassination she avenged by drowning all who had any complicity in it. She was buried in the third in size of the greater pyramids, which she had enlarged. She was supposed by the Greek historians to be Rhodopis, “rosy-cheeked,” a Greek courtesan, with whom the king fell in love from the sight of her lost slipper.

Nitrate of Silver, a compound of silver and nitric acid, having the formula AgNO₃. It may be prepared by dissolving pure silver in warm nitric acid that has been diluted with two or three times its own weight of water. The solution is evaporated to dryness, and the resi-
NITRATE OF SODA—NITRIC ACID

due gently heated until all the nitric acid has been expelled, after which it is dissolved in water and crystallized; the silver nitrate being then obtained in the form of white tabular crystals belonging to the triclinic system. Nitrate of silver is readily soluble in water and in alcohol. It melts at $424^\circ$ F., and when cast into sticks it constitutes lunar caustic, being used in this form as a cauterizing agent. Its cauterizing effect depends upon the fact that it forms, with the albumen of the flesh, an insoluble albuminate of silver. Nitrate of silver, especially in the presence of organic matter, is blackened by exposure to light, and on account of this property it is used in the preparation of indelible inks for marking linen, and as a basis for dyes to color the hair black. It was much used in photography in the days of the old "wet-plate" process, and is still employed in sensitizing the paper upon which the positive pictures are printed. The black stains that it leaves upon the hands may often be removed by the application of cyanide of potassium; but it should be remembered that cyanide of potassium is a violent poison, and that it must be used with extreme care.

Medical Uses.—Nitrate of silver is official in two forms, the heavy crystalline salt, readily soluble in its own weight of water, and the lunar caustic above mentioned. Applied to the skin, it produces a brownish-black stain due to the formation of oxide of silver. The crystals only are used internally either in pills or solutions. Nitrate of silver as ordinarily applied to an inflamed mucous membrane is more of an astringent than of an irritant. Applied locally as a caustic, its action is superficial, coagulating the albumen and so forming a protective coating. Internally it is used (combined with an anodyne) in gastric ulcer, gastritis, intestinal ulcerations and dysentery. Salt and soap checks its action. Externally in stick form, it has been used to prevent the pitting of smallpox. In solution it is employed to quiet the pain and relieve swelling in cases of felon, orchitis, and epididymitis; in inflammation of the mouth, pharynx, and larynx; in whooping cough, pulmonary hemorrhage, and dermatitis. In conjunctivitis, etc. Nitrate of silver should not be used internally for too long a time, as it is slowly eliminated from the body. Argyria or chronic poisoning is liable to result from such use of the remedy. See Silver-Poisoning.

Nitrate of Soda, Sodium Nitrate, or Chile Saltpeter, a compound of sodium and nitric acid, having the formula NaNO₃. It may be prepared by neutralizing nitric acid with sodium hydrate or sodium carbonate, and evaporating the solution; but it occurs native and in large quantities, in the northern part of Chile, and in the neighboring parts of Peru and Bolivia. Deposits of it are also known in Humboldt County, Nev., and in San Bernardino County, Cal. The Chilean deposits occur at a height of 3,300 feet above the sea, but they are undoubtedy of marine origin, since they contain the remains of recent shells. Nitrate of soda, as it occurs in nature, may be purified by repeated crystallization from its aqueous solution. It crystallizes in rhombohedral forms, and is isomorphous with calcite; but in nature it is usually found massive, or in beds, or as an incrustation. The crude sub-

stance is valuable as a fertilizer (see MANURES AND MANURING), and it is also used extensively as a source of nitric acid and of nitre (qq.v.).

Nitrate salts of nitric acid. See NITRATE OF SILVER; NITRATE OF SODA; Nitre; Nitric Acid.

Nitre, niter, Niter. Nitrate of Potash, Potassium Nitrate, or Saltpeter, a compound of nitric acid and potassium, having the formula KNO₃. It occurs native in many places as an incrustation upon the soil, notably in Spain, Egypt, Persia, and India. It also occurs in considerable quantities in the caverns of Kentucky and Tennessee, and elsewhere along the Mississippi Valley. It is obtained on a commercial scale from these various sources, but it is also prepared in vast amounts from native nitrate of soda (qq.v.). When hot concentrated solutions of nitrate of soda and potassium chloride are mixed, nitrate of potash and chloride of sodium (common salt) are formed, the latter separating out in the form of crystals when the solution cools, while the nitrate of potash remains in solution. Nitrate of potash has mild antiseptic properties, and it is also used in dyeing, in metallurgy, in medicine (as a diuretic and diaphoretic), and in the preparation of fluxes. It is used in the arts most commonly, however, in the manufacture of gunpowder (q.v.). For "sweet spirits of nitre" see NITROUS ETHER.

Nitric Acid (Latin, *from nitre*), in chemistry, a compound of nitrogen, oxygen and hydrogen, having the formula HNO₃, and possessing strong acid properties. It appears to have been discovered in the 9th century, by Geber, the "father of chemistry." He describes a method of preparing it by distilling a mixture of nitre, alum and cupperas (sulphate of iron). The modern method of preparing it by the action of free sulphuric acid upon nitre was apparently first described by Glauber, about the middle of the 17th century. Lavoisier proved that the acid contains oxygen, and Cavendish, in 1785, succeeded in preparing nitre by passing electric sparks through a mixture of oxygen and nitrogen, in the presence of a solution of caustic potash. Free nitric acid occurs in rain-water in exceedingly small amounts, and its salts are formed, in the soil, by the bacterial oxidation of nitrogenous organic matter. (See NITRICATION.) Commercially, nitric acid is prepared by distilling sodium nitrate ("Chile saltpetre") with strong sulphuric acid. The sulphuric acid (H₂SO₄) unites with the sodium nitrate (NaNO₃) to form nitric acid (HNO₃) and acid sulphate of sodium (H₂NaSO₄), as indicated by the equation: NaNO₃ + H₂SO₄ = HNO₃ + Na₂SO₄. When the temperature is sufficiently raised, the acid sulphate of sodium combines with another molecule of the sodium nitrate to form sodium nitrate (NaNO₃), another molecule of nitric acid being liberated at the same time, as indicated by the equation:

$$\text{H}_2\text{NaSO}_4 + \text{NaNO}_3 = \text{Na}_2\text{SO}_4 + \text{HNO}_3$$

The temperature is not always carried to the point where the last reaction occurs, however, because although the yield is larger, the product is more largely contaminated with objectionable impurities, and the residual "cylinder cake," or "nitre cake," left in the retorts, is harder to remove. The distillation is commonly carried
NITRIDES — NITRIFICATION

out in iron retorts, iron not being seriously attacked by concentrated sulphuric or nitric acids. The nitric acid which distills off is washed by passing it through a series of double-necked iron bottles ("Woulfe’s bottles"), containing each a small quantity of water. The distillate is finally condensed, then constituting the crude, fuming acid. Nitric acid, as thus manufactured, is yellowish in color, and contains, as its principal impurities, chlorine, hydrochloric acid, iodic acid, peroxid of nitrogen, sulphuric acid, sodium sulphate, and iron compounds; some of these being distilled over, and others carried over mechanically. Most of the impurities may be removed by re-distillation. A third distillation then follows, after the addition of an equal volume of concentrated sulphuric acid to retain the major part of the water. By this means a tolerably pure nitric acid can be had, though it is still yellowish from the presence of lower oxides of nitrogen. These may be removed by warming the acid slightly, and passing through it a stream of air, or (preferably) of carbon dioxid gas. Any nitrous acid that may be present may be removed by distillation with a small quantity of urea, which decomposes the nitrous acid with liberation of carbon dioxid, water, and free nitrogen.

Nitric acid, perfectly free from water, has not yet been prepared, although specimens have been obtained containing from 99.3 to 99.8 per cent of HNO₃. When free from all impurities except water, nitric acid is a colorless liquid, which gradually decomposes in a strong light, with evolution of oxygen, water, and nitrogen per-oxid (NO₂), becoming yellow from the presence of the peroxid. The most highly concentrated acid freezes at about 50° F. below zero, and boils at about 187° F., although it begins, below the boiling temperature, to decompose into nitrogen peroxid, water, and free oxygen. Concentrated nitric acid may have a specific gravity as high as 1.552. Nitric acid was formerly known as "spirit of nitre," and (when diluted) also as "aqua fortis" (that is, "strong water"). It is an active oxidizing agent, especially when warmed, owing to the facility with which it parts with oxygen. When mixed with hydrochloric acid, it is known as "nitrohydrochloric acid," "nitromuriatic acid," or "aquea regia," the latter name being given on account of the resemblance of the mixture of dissolving gold. The powerful solvent action of nitrohydrochloric acid is due to the fact that it contains free chlorine gas, liberated from the hydrochloric acid by the oxidizing action of the nitric acid upon the hydrogen of the hydrochloric acid. Nitric acid and nitrohydrochloric acid are both used in medicine, in a highly diletate state, as appetizers and diuretics.

Nitric acid is used in large quantities in chemical industries of all kinds. It is of the greatest importance in the manufacture of the coal-tar colors, and of many of the modern high-power explosives. (See, for example, Nitroglycerin and Gun-cotton.) With the metallic bases it forms a series of exceedingly important compounds, known as "nitrates." Practically all of the nitrates are crystalline and readily soluble, and they are characterized by marked decrepitation when heated upon charcoal before the blowpipe. Several of the nitrates are used in dyeing, notably those of aluminum, iron, and lead. Aluminum nitrate, Al(NO₃)₃, may be prepared by dissolving aluminum hydrate in dilute nitric acid, and crystallizing by evaporation. It crystallizes in rhombic prisms which contain nine molecules of water, are readily soluble, and melt at 108° C. Ferric nitrate, Fe(NO₃)₃·9H₂O, is prepared by dissolving ferrous sulphide in dilute nitric acid, and slowly evaporating the solution at as low a temperature as possible. Ferric nitrate, Fe(NO₃)₃·9H₂O, crystallizes in rhombohedrons, and may be prepared by dissolving metallic iron in nitric acid, adding more acid, and finally cooling the solution. It is readily soluble in water, but nearly insoluble in cold dilute nitric acid. Normal lead nitrate, Pb(NO₃)₂, may be obtained in the form of octahedral crystals, by evaporating a solution of lead carbonate in dilute nitric acid. The nitrates of barium and strontium are used to a large extent in pyrotechny, on account of the beautiful colors that they yield. They may be prepared by adding, to the corresponding carbonates, not quite enough dilute nitric acid to decompose the whole of the salt, and subsequently filtering and crystallizing. See also Nitrate of Silver; Nitrate of Soda; Nitre.

NITRILE — NITRO-COMPOUNDS

In 1862, however, Pasteur suggested that nitrification is effected through the agency of bacteria, or other forms of microscopic life; and in 1877 Schlosing and Müntz established this view upon a firm foundation, by means of many ingenious experiments. It has also been further and most convincingly established by Warington, Munro, Winogradsky, P. F. Frankland, G. C. Frankland, and others. It has been shown, for example, that nitrification is arrested by powerful antisepsics, and that it proceeds most actively at about 100° F., and less rapidly both at higher and at lower temperatures. Furthermore, if soil or sewage be raised in temperature to 212° F., so as to destroy all life that may be present, nitrification at once stops, and it will not proceed again when the temperature is restored to 100° F., even in the presence of a moderate abundance of air that has been passed through germ-proof filters. If the sterilized mass be sown with the nitrifying agents, however, by the addition of a small quantity of unsterilized soil or sewage, nitrification is at once resumed, and thereafter proceeds normally. Certain conditions are essential to active nitrification, in addition to a suitable temperature, the free access of oxygen, and the actual presence of a sufficient number of the live and active organisms. It is essential, for example, that the soil or other medium in which the nitrification occurs shall be slightly alkaline, and this implies the presence of a base such as potash or carbonate of lime, in sufficient quantity to fix the nitric acid as it is formed; for if no such base is present, the medium soon becomes acid, so that the organisms cease their activities. It is usually held that some quantity of organic carbon must also be present, in order to furnish food for the nitrifying organisms; but it appears that this is not essential in all cases, because certain forms of life have been found to be capable of nitrifying inorganic solutions, obtaining their carbon from carbon dioxide gas. In the presence of a considerable amount of organic carbon, especially when the conditions are otherwise unfavorable to nitrification, an inverse process, known as denitrification, is likely to result, such as may happen to be present being thereby reduced to compounds that are less highly oxidized. Denitrification also appears to be due to the activities of special microorganisms, and whether the nitrates of a soil increase or decrease depends upon which of the two antagonistic kinds of organism is most highly favored by the conditions. Moisture is essential in both cases; but its absolute amount is of the greatest importance. Nitrification may be proceeding rapidly in a soil that is moderately moist and well aerated, and yet the same soil, when thoroughly waterlogged, may be a vigorously denitrifying medium. Nitrification proceeds best in the dark, and strong light checks it in a marked manner, or even stops it altogether. In nature, nitrification is most active within a few inches of the surface of the ground, and it takes place only with exceedingly slowness at a depth of two or three feet. Some microorganisms transform nitrites into nitrates, and some transform ammoniacal salts into nitrates, and some transform nitrates into nitrites. In nature, it is probable that all these processes go on simultaneously. It was long believed that the free nitrogen of the air does not take part in the nitrification processes of the soil. It is now pretty generally admitted, however, that certain microorganisms actually possess the power of absorbing free nitrogen, and fixing it in the form of a chemical compound. We do not yet know how general this, but it appears to be exhibited, beyond dispute, by some of the microscopic forms of life that live, perhaps parasitically, upon the roots of the pea and certain similar plants.

Consult: Ainsworth, 'Manures and Manuring'; Conn, 'Agricultural Bacteriology'; Roberts, 'Fertility of the Land.'

Ni'trile, in chemistry, a compound which may be regarded as derived from ammonia, NH₃, by replacing the three hydrogen atoms by a single trivalent organic radical. (Compare AMIDE.) They have the general formula XCN, where X represents methyl (CH₃), ethyl (C₂H₅), or some similar monovalent aliphatic radical, and they may therefore be regarded as alkyl cyanides. They may be prepared by distilling potassium-alkyl sulphates with potassium cyanide, or by the general reaction being XKSO₄ + KCN = K₂SO₄ + XCN. Acetonitrile, for example, which has the formula CH₃CN, may be prepared by distilling dry potassium-methyl sulphate, CH₃KSO₄, with dry potassium cyanide, KCN. Acetonitrile is also known as methyl cyanide, and is a colorless, inflammable liquid with an ethereal odor, mixing readily with water and with alcohol, having a specific gravity of 0.80, and boiling at about 178° F.

Ni'trite of Amyl. See AMYL NITRITE.

Nitrites, salts of nitrous acid (q.v.).

Nitro-benzene, or Nitro-benzol, a liquid chemical substance having the formula C₆H₅(NO₂), which is formed by the action of fuming nitric acid upon benzene. See ANILINE and BENZENE.

Nitro-cellulose, a compound of nitric acid with cellulose, in which the hydroxyl of the cellulose is more or less completely replaced by molecules of NO₂. An exchange of NO₂ for OH always occurs when cellulose is treated with nitric acid, but the extent of the nitration depends upon the circumstances of the treatment. The nitro-celluloses are more properly described as cellulose nitrates, and five of them are known. Of these, collodion pyroxyline and gun-cotton are the most important. Collodion pyroxyline is a mixture of the tetra-nitrate and trinitrate, and gun-cotton (which is sometimes described as the tri-nitrate) is really the hexa-nitrate, its chemical formula being C₆H₅(NO₂)₆.

Ni'tro-Compounds, in chemistry, compounds in which one or more atoms of hydrogen are replaced by an equal number of nitroxy (NO₂) radicals. The nitro-compounds are directly connected with carbon by means of their nitrogen atoms. Many of the nitro-compounds are of great importance in the chemistry of coal-tar derivatives. Nitro-benzene, C₆H₅(NO₂), for example, which is obtained by the action of nitric and sulphuric acids upon benzene, is the source from which commercial aniline is manufactured. See ANILINE and BENZENE. Consult, also: Benedikt, 'Chemistry of the Coal-Tar Colors.'
NITRO-HYDROCHLORIC ACID—NITROGEN

Nitro-hydrochloric Acid, Nitro-muriatic Acid, or Aqua Regia, a mixture of nitric and hydrochloric acids, formerly known as "aqua regina," or "royal water," on account of its power to dissolve gold. See Nitric Acid.

Nitrogen (Greek, "producing nitre"), a gaseous, non-metallic element existing in nature in the free state, and also occurring, in chemical combination, in numerous minerals. It is an essential constituent of many of the animal and vegetable tissues, especially of the protoids, or albumen-like substances. It exists in the free state in the earth's atmosphere, of which it constitutes 77 per cent by weight, or about four fifths by bulk. Nitrogen is a colorless gas, without taste or odor, and it will neither burn nor support combustion. It is not poisonous (as is evident from its presence in the air), and when inhaled in the pure state it produces asphyxia only by excluding oxygen from the lungs. Nitrogen is slightly lighter than air, its density being approximately 0.97247, when that of air is taken as unity. According to Jolly, a cubic decimetre of nitrogen, under a pressure of 760 millimetres of mercury at the sea-level in lat. 45°, weighs 1.25746 grams. The specific heat of nitrogen at constant pressure, as compared with an equal weight of water, is 0.2368; and, according to Chappuis, if a given mass of the gas, at an initial temperature of 32° F. and a pressure of one metre of mercury, be heated at constant volume to 212° F., its pressure will be equal to 1.70645 millimetres of mercury. (This last-given constant was determined with the greatest care, as it is of the highest importance in modern precise thermometry by means of the nitrogen thermometer.) Nitrogen can be liquefied by the simultaneous application of great cold and great pressure. Sarrau gives its critical temperature and pressure as 191° F. below zero, and 42 atmospheres, respectively. Rutherford, in 1772, showed that the expired air of men and animals contains a gas which will not support combustion, and which is nevertheless different from carbon dioxide, since caustic potash will not absorb it. Shortly afterward Lavoisier proved that the gas, which exists in the air, and is formed in the lungs, will not support life he called it "azote" (Greek, "not supporting life"), a name by which it is still known in France, and some of whose derivatives also survive in English. (*Azo-benzene,* for example.) The modern word "nitrogen" is due to Chaptal.

Chemically, nitrogen has the symbol N, and an atomic weight of 14.04 if O = 16, or 13.93 if H = 1. It may be prepared in a state of approximate purity from the atmosphere, by the following process: A slow stream of air is passed through tubes of moistened potassium hydrate to absorb carbon dioxide, then through tubes of calcium chloride to absorb moisture, then through a tube containing red-hot copper turnings to remove the oxygen, then through a solution of chromium chloride to remove the last traces of oxygen, then again through tubes of calcium chloride to remove moisture, and lastly over phosphorus pentoxide, to complete the removal of moisture, and also to absorb any ammonia that might be present. The nitrogen so obtained will still contain argon, helium, neon, and the other recently discovered inert gases of the atmosphere, however; and if these are objectionable, it is best to prepare the nitrogen from some of its compounds, from which argon and similar gases are necessarily absent, on account of their chemical inertness. Ammonium nitrite, NH₂N₃O, is a convenient substance for this purpose, because it is resolved by heating into water and free nitrogen, as indicated by the equation NH₂N₃O + 2H₂O + 2N. Free nitrogen does not exhibit any marked chemical affinity, though it can be made to combine with other elements in various ways, and its compounds are often exceedingly active, as is familiarly illustrated by nitric acid and by ammonia. Five oxides of nitrogen are known. (1) Nitrous Oxid, NO₂, for which see the article Nitrous Oxide. (2) Nitrogen Dioxide, or Nitric Oxid, NO, discovered by Priestley, who called it "salt-peter-gas." This is a colorless gas, prepared by acting upon metallic copper with cold dilute nitric acid, HNO₃, copper nitrate, nitrogenous acid and water being formed, as indicated by the equation 3Cu + 8HNO₃ = 3Cu(NO₃)₂ + 2NO + 4H₂O. Nitrogen dioxide combines directly and readily with oxygen, the combination taking place promptly upon contact with common air, higher oxides of nitrogen being formed. The dioxide may be liquefied by the application of cold and pressure, but there is still much uncertainty about its critical point. The liquefied gas freezes at about 270° F. below zero. (3) Nitrogen Trioxid, or Nitrogen Sesquioxide, N₂O₅, may be prepared (though not in a strictly pure state) by the action of nitric acid upon starch, or upon arsenic trioxid. It is a reddish gas, which condenses to a volatile blue liquid upon being cooled by a freezing mixture to 0° F. Nitrogen trioxid also dissolves in ice-cold water with the formation of a blue liquid containing nitrous acid, HNO₂. (See Nitrous Acid.) (4) Nitrogen Peroxid, NO₃, formerly known as the "dioxid." This oxide may be prepared by heating dry nitrate of lead, which then breaks up into lead oxide, oxygen, and nitrogen peroxide, as indicated by the equation 2Pb(NO₃)₂ = 2PbO + 4NO + O₂. It is a dark orange-colored gas, which has the molecular formula NO₂, but does not contain any oxygen; for which reason it is often called the "tetroxid." At 300° F. the gas has the molecular formula NO₃, as is proved by its density; and at ordinary temperatures it consists of a mixture of NO₂ and N₂O₅. At about 370° F. a further change in the gas takes place into NO and O begins, this increasing as the temperature rises, until, at about 1,150° F., the dissociation into NO and O is complete. Nitrogen peroxide is easily liquefied and solidified. At temperatures lower than 14° F. it is a white, deliquescent, crystalline solid. At 16° F. this melts to a colorless liquid, which becomes yellow when warmed to 32° F., and orange at 90° F. Under ordinary atmospheric pressure it boils at about 70° F., with the evolution of the gaseous peroxide. (5) Nitrogen Pentoxid, or Nitric Anhydride, NO₅, may be prepared by dehydrating concentrated nitric acid by the cautious addition of phosphorus pentoxide, or phosphorus pentoxide to a gas over dry silver nitrate. In the latter case the reaction is 2AgNO₃ + 2Cl = 2AgCl + N₂O₅ + O. The pentoxid is solid at ordinary temperatures, and may be obtained in the form of white, lustrous, translucent prisms, which have a specific gravity of
NITROGLYCERIN

about 1.64, and melt at 86° F. with partial de-
composition into the peroxid and free oxygen.
At about 115° F. the liquid obtained by melting
the crystals boils. The pentoxid combines with
water to form nitric acid (q.v.).
Nitrogen combines directly with certain of the
other elements to form compounds known as
nitrides (q.v.). With chlorine it forms an
oily liquid known as chloride of nitrogen,
which has the formula NCl₃ and may be pre-
pared by passing chlorine gas through a solu-
tion of sodium chloride. Chloride of nitrogen
is one of the most dangerous explosives known,
decomposing with fearful violence upon the
slightest touch, and often with no assignable
cause whatever. Several compounds of hydro-
gen with nitrogen are known, of which ammo-
nia, NH₃, is the most familiar and also the most
important.

See AMIDE; AMINE; AMMONIA; NITRIC
Acid; NITRIFICATION; NITROUS Acid; NITROUS
Oxide; etc.

Nitroglycerin, or Glacon, a powerful ex-
plodive discovered by Ascanio Sobrero in 1846,
and first produced commercially by Emmanuel
and Alfred B. Nobel, at Heleneborg, Sweden,
in 1862. The process of manufacture was much
improved by George M. Adams, of North-
ampton, Mass.; and Walz, N. Hill, of the U. S.
Torpedo Station, at Newport, R. I., these im-
provements yielding a product of greater purity,
and also overcoming many of the dangers at-
tending the manufacture, transportation and use
of the substance. Nitroglycerin is manufactured
by treating glycerin with a mixture of con-
centrated nitric and sulphuric acids, but the propor-
tions of the material used and the
methods of operation are different in different
countries. In the United States the acids are
usually mixed in the proportion of 2 parts by
weight of nitric to 3 parts by weight of sul-
phuric, so as to contain 61.5 per cent of real
H₂SO₄, 34.5 per cent of HNO₃, and not more
than 0.7 per cent of N₂O₅. These "mixed acids" are
shipped from the acid works in iron drums
holding 1,500 pounds each, this weight being a
convenient charge for one run in the nitro-
glycerin converter. The converter is a closed
cylindrical vessel of lead, stand-
ing within a wooden one. The mixed acids are
introduced by a pipe at the top of the converter,
and the glycerin is forced into the vessel at the
bottom, by means of compressed air. The fumes
produced by the reaction are carried off through a
"fume pipe," which is provided with a window
to view the gases. The reaction between the
glycerin and the acids causes the evolution of
considerable quantities of heat; and to prevent
the temperature of the converter from rising to
the danger point, cold water is continually
passed through the space between the lead cy-
linder and the wooden one, and also through a
cold water coil pipe which is placed within the
lead cylinder. Compressed air is also in-
jected directly into the mixture to aid in the
cooling, and extra air pipes are provided, for use
in case the rise of temperature cannot be
controlled by the means already men-
tioned. The temperature of the mixture is con-
tinuously observed, by means of sensitive, spe-
sially constructed thermometers, which enter
the converter through the top. In operating the
process, the mixed acids are run into the con-
verter first, the cooling water is next turned
on, and, lastly, the glycerin is slowly introduced
at the bottom. When the materials are pure,
and no particle of water is allowed to enter the
mixture, and the temperature is not permitted
to rise above 80° F., this part of the operation
may be regarded as reasonably safe.

When the conversion is completed, the
charge of the converter is run off into a "sep-
arator," which is a cylindrical leaden vessel
provided with windows, with a vent pipe for the
escape of vapors, and with an injector pipe,
through which compressed air may be intro-
duced for cooling purposes, in case any tendency
toward rise of temperature is observed. When
the charge is allowed to stand, the nitroglycerin
rises to the top of the separator, and the spent
acids, by reason of their greater density, sink
to the bottom. The separation being nearly
complete, the nitroglycerin is drawn off through
an upper spigot, and the spent acids are drawn
off at the bottom and passed to a second sep-
arator, for the removal of the last traces of
nitroglycerin that they contain. The nitro-
glycerin is now repeatedly washed with water,
then with a solution of soda ash, and again with
water, until the last traces of acid are removed
from it. The spent acids are sent to the "re-
gaining" works, where the sulphuric acid (which
is not destroyed in the process) is recovered for
further use. The small quantity of nitric acid
that remains unneutralized is also recovered in
dilute form, and used for other purposes. Theoret-
ically, 100 parts by weight of glycerin should
yield 246 parts of nitroglycerin; but the yield
in the United States is only from 200 to 220 parts.

Nitroglycerin is also known as "glacon,""Nobel's blasting oil," and "trinitro-
glycerin." It was originally supposed to be a nitro-substitution
compound, like many other substances pro-
duced by the action of nitric acid upon organic
compounds, and hence the name it now com-
monly bears. But Berthelot has shown that its
reactions are those of a salt or ester of nitric acid,
and its correct chemical name is now ad-
mitted to be "glyceryl trinitrate," or "propenyl
trinitrate," or "nitroglycerin," the name of the organic radical CH₃
and ordinary glycerin, C₂H₃(OH)₂, is the hydrate of this
radical. Nitroglycerin has the formula CH₃
(NO₃)₂ and is formed from nitric acid and
glycerin in accordance with the equation
C₂H₃(OH)₂ + 3HNO₃ = CH₃(NO₃)₂ + 3H₂O.

When chemically pure, glyceryl trinitrate is a
colorless, odorless, transparent, oily liquid,
but commercial nitroglycerin varies in color be-
tween a hock-wine and a dirty yellow. It has
a specific gravity of 1.590 when liquid, and 1.735
when frozen. It freezes at 46° F. if exposed for
a long time to this temperature, forming long,
whitish crystals, which melt again upon pro-
longed exposure to a temperature of 52° F.
According to Hess it volatilizes completely upon
continuous exposure to a temperature of 158° F.,
and Guttmann has found that dynamite (see
below) loses 10 per cent of its nitroglycerin by
an exposure of several days to a temperature of
104° F. Nitroglycerin is almost insoluble in
water, but dissolves readily in wood alcohol,
graft alcohol, ether, benzene, and many other
organic liquids. It undergoes dangerous de-
composition with explosion upon contact with
NITROUS ACID—NITROUS ETHER

sulphuric acid (except under the conditions of manufacture described above), and it is also decomposed by alkali and by alkaline sulphides. The safest way to destroy it is by treating it with a solution of ammonium sulphide, or, where the quantity is large, with spent lime from the purifiers of gas works. Nitroglycerin has a sweetish, burning taste, and is poisonous, producing extremely violent headaches when taken by the mouth, absorbed through the skin, or inhaled as vapor; though some persons, by constant association with it, become immune to its physiological effects. The antidotes are cold compresses, fresh air, black coffee, and morphia. It is used in medicine as a heart stimulant, in the treatment of angina pectoris, in the revival of the drowned, and as an antidote in cases of poisoning by carbon monoxide and water gas.

The critical temperature of decomposition of nitroglycerin is between 113° F. and 122° F. At 113° F. it keeps indefinitely if free from acid, but between that temperature and 122° F. it begins to decompose, and at 160° F. decomposition goes on actively. Pure nitroglycerin is not very sensitive to friction or moderate percussion, except when placed between metallic surfaces, or struck a glancing blow. If placed upon an anvil and struck with a hammer, only the particle struck, as a rule, explodes, the remainder being scattered; but this is an unsafe experiment to try without a quantity of the explosive, because in some cases the whole mass will be exploded. Frozen nitroglycerin is in general less sensitive to shock than the liquid, but explosions have occurred which were believed to be due to the breaking of a crystal of the solid substance. When a small quantity of nitroglycerin is freely exposed to a flame, it burns brilliantly and without explosion; but when the experiment is tried with a larger quantity, explosion is likely to follow. A drop of nitroglycerin, when placed upon an iron plate and slowly heated, may volatilize completely without exploding; and if the drop is placed on an iron plate that is previously heated to redness, it will assume the spherical condition and volatilize without explosion; but if the plate be heated to a temperature just below incandescence the drop explodes violently upon contact with it. Nitroglycerin was at first expunged by means of a gas, but the trials of the powder fuse, and this method is still used to a limited extent with dynamite; but it is chiefly fired by means of a powerful detonator, by which its greatest explosive efficiency is realized.

Nitroglycerin is principally used in the manufacture of dynamite, explosive gelatine, gelatine dynamites, and smokeless powders such as ballistite and cordite. The liquid substance is used in torpedoes for oil wells, to remove the paraffin which clogs them or to shake the oil-bearing sandstone so as to secure a better flow of oil. Owing to the difficulty and danger of transporting and handling liquid nitroglycerin, attempts were early made to absorb the liquid by means of some substance which would not interfere with its explosive action, but which would form with it a solid body, or a powder, which could be handled more conveniently and safely. Many such absorbents have been tried, charcoal being the first; but Nobel found that a kind of infernal soil, consisting chiefly of the silicious remains of diatoms, and known as "kieselgur," is much superior to charcoal, and this substance is now largely used as an absorbent in the manufacture of common "dynamite." Sawdust, especially in combination with certain chemical substances, is used as an absorbent to a considerable extent. "Duafin," for example, is a mixture of 50 parts of nitroglycerin, 30 of sawdust, and 20 of saltpeter, and "Atlas powder" and "Hercules powder" consist of nitroglycerin, carbonate of magnesia, wood fibre, and sodium nitrate. Blasting gelatine, invented by Alfred Nobel, consists of nitroglycerin gelatinized by the addition of nitrated cotton and from trinitro-cellulose ("gun-cotton"), dissolves in warm nitroglycerin with the formation of a gelatinous substance. "Gelatin dynamite" consists of a mixture of thin blasting gelatine with wood meal and saltpeter.

During 1900 the United States produced 35,482,947 pounds of nitroglycerin, of which 31,601,890 pounds were used in further manufacture.

CHARLES F. MUNROE
Professor of Chemistry, The Columbian University, Washington, D. C.

Nitric Acid, an acid which has the formula HNO₃ but which is too unstable, in the free state, to admit of isolation. A blue, aeous solution of it may be prepared by dissolving nitroglycerin in ice-cold water (see Nitrogen); but when this solution is warmed the nitric acid decomposes into nitric acid, nitric oxide and water, as indicated by the equation 3HNO₃ = 2H₂O + NO + NO₃. The salts of nitric acid (which are known as "nitrates") are more stable, and certain of them occur in the soil and in the body of the plant as a result of the oxidation of organic matter. (See Nitritification.) The nitrates of the metals are mostly soluble in water and in alcohol, their solutions being decomposed by boiling, or by the addition of dilute sulphuric acid. Potassium and sodium nitrates may be prepared by melting the corresponding nitrates with metallic iron, and crystallizing from solution in water. Silver nitrate, AgNO₃, may be prepared by heating starch with nitric acid, passing the resulting gas into a solution of caustic potash, neutralizing this with acetic acid, and finally adding a solution of silver nitrate. It crystallizes in small white crystals, is one of the most insoluble nitrates, and may be used in the preparation of many of the others. Ammonium nitrate, NH₄NO₃, for example, may be obtained by adding a solution of silver nitrate to one of ammonium chloride (sal ammoniac). Nitrate of ammonium is used as a source of nitrogen, since it is decomposed by the action of heat into water and free nitrogen. Many of the organic derivatives of nitrous acid are also of importance. (See, for example, Amyl Nitrite and Nitrous Ether.)

Nitric Ether, or Ethyl Nitrite, the nitrite of the organic radical "ethyl." It has the chemical formula C₄H₇NO₂ and is usually prepared by acting upon ethyl alcohol with nitric acid. It is a yellowish liquid having a specific gravity of about 0.837 at 60° F. It mixes readily with alcohol, but only to a slight extent
with water. It decomposes when kept in contact with water, evolving nitrous oxide (NO). When mixed with about 20 times its own volume of alcohol (rectified spirit), it is known as "spirit of nitrous ether," or "sweet spirit of nitre," and is used in this form as a diuretic and febrifuge.

Nitrous Oxid, or Nitrogen Monoxid, a gaseous substance having the chemical formula N₂O, and obtained by heating ammonium nitrate, NH₄NO₃, as indicated by the equation

\[ \text{NH}_4\text{NO}_3 \rightarrow \text{N}_2\text{O} + 2\text{H}_2\text{O} \]

Care must be exercised in its manufacture, as ammonium nitrate, when heated, is liable to explosive decomposition. Nitrous oxide is a colorless gas, with a slightly sweet taste. It supports combustion nearly as well as oxygen, and when subjected to a pressure of 30 atmospheres at 32° F., it condenses into a colorless, mobile liquid. When inhaled, it is apt to produce exhilaration, for which reason it is commonly called "laughing gas." Sir Humphry Davy, in experimenting with nitrous oxide about the year 1801, discovered that it produces insensibility when inhaled for a sufficient time, and in recent years it has been used as an anesthetic for dental work and other minor surgical operations. Davy himself suggested this use in the following words: "As nitrous oxide, in its extensive operation, seems capable of destroying physical pain, it may probably be used with advantage in surgical operations in which no great extension of force is required;" and, "It does not appear that the gas was so used, however, until 1844. On 10 December of that year Dr. Gardner & Colton gave a lecture on "Laughing Gas," in Union Hall, Hartford, Conn., administering the gas to several of his auditors, for the purpose of illustrating its peculiar properties. Horace Wells, a Hartford dentist, was present at the lecture, and was impressed by the practical possibilities that appeared evident to him. On the following day Wells obtained a supply of the gas from Colton, inhaled it himself until he became unconscious, and while he was in this condition Dr. Riggs extracted one of his teeth. When consciousness returned, a feeling of bliss followed. He exclaimed, "I do not despair! The greatest discovery of the age!" About the same time Dr. William T. G. Morton and Dr. Chas. T. Jackson, of the Massachusetts General Hospital, at Boston, introduced ether as an anesthetic, and a patent for its use was issued to them in November 1846. There has been much bitter controversy concerning the priority of Wells and of Morton and Jackson, as regards the introduction of anesthetic methods in surgery; but so far as nitrous oxide is concerned, the evidence appears to favor Wells. Morton and Jackson experimented chiefly with ether, a substance which Wells appears to have used in his practice only upon one occasion. Consult "The Locomotive" for November, 1880.

Nitzsch, nǐtsch, Karl Immanuel, German theologian: b. Borna, Germany, 21 Sept. 1787; d. Berlin, Germany, 21 Aug. 1868. He was a son of Karl Ludwig Nitzsch and was educated in Wittenberg, becoming professor of a theological seminary in Berlin in 1817. In 1847 he was professor at Bonn. He then returned to Berlin where he was professor, university preacher and a member of the high consistory. He published: "System der christlichen Lehre" (1829); "Praktische Theologie" (3 vols. 1847-67); etc.

Niuchuang, nū-chwāng', New-chwang, or Ying-tse, China, a city of Manchuria, on the Liao-ho River, about 35 miles from its mouth. It is practically an inland city, but was chosen as one of the ports to be opened to foreign commerce by the treaty of Tien-tsin (1886). The foreign settlements and the trade however, are at Ying-tse, near the river's mouth, which is known to Europeans as Niuchuang. The port is connected by railway with Tien-tsin, and also with the great Siberian Railway. Though closed by ice in the winter months, it carries on an important trade. Ying-tse imports cotton, woolen, and silk goods, sugar, paper, metals, opium, tobacco, etc.; total value of imports in 1901, $2,146,866; and exports beans, silk, ginseng, minerals, and skins; total value of exports in 1901, $3,651,880. The import of Indian opium has fallen from $2,860,000 in 1866 to about $40,000. Large quantities of salt are manufactured in the vicinity. The port was captured by the Japanese in March 1905, and was occupied by the Russians in 1900. See MANCHURIA. Pop. 60,000.

Niuié, né-o'óa, Niuié-Fekai, or Savage Island, in the South Pacific Ocean, politically dependent to New Zealand since 1900, is of ancient coral formation, 14 miles long, 10 miles wide, with a maximum altitude of 200 feet, and an area of 36 square miles. The soil is very productive, yielding cocoanuts, taro, yams, and bananas. Copra, horses, and straw hats are exported. Pop. (1903) 4,400. Malayo-Polynesiens, all Christians, due to the labors of the London Missionary Society.

Niv'en, William, American mineralogist: b. Bellskill, Larne, Ireland, Scotland, 6 Oct. 1850. After a common-school education in Scotland, he came to the United States in 1879, and pursued his studies. He discovered four new minerals—yttrilite, thoriumite, and nihongite in Llano County, Texas, in 1889, and angularite at Guanaquito, Mexico, in 1891. In 1891 he also found the remains of a new species of prehistoric people in a cave at 21 square miles in the state of Guerrero, Mexico. He was assistant commissioner of Arizona to the New Orleans Exposition.

Nivernais, né-vern-né, France, an ancient province corresponding nearly to the present department of Nièvre.

Nix, or Nixie, in German folk-lore, the name of water spirits (male and female), haunting rivers, brooks, ponds, and lakes. See also Nicker.

Nixon, John, American military officer: b. Framingham, Mass., 4 March 1725; d. Middlebury, Vt., 24 March 1815. In the expedition against Cape Breton in 1745 he fought under Sir William Pepperrell and was at the capture of Louisburg. He joined the colonial forces at the outbreak of the American Revolution and fought at the battle of Lexington, and at Bunker Hill he commanded a regiment. He was made brigadier-general in 1777 and was given command of Governor's Island in New York harbor. He served under General Gates in the battle of Stillwater, and in 1780 failing health compelled his retirement.
NIXON—NIZAM'S DOMINIONS

Nixon, John, American soldier: b. Philadelphia, Pa., 1733; d. there 31 Dec. 1808. He was early prominent in opposing the taxation demands of England, and in 1774 became a member of the first committee of correspond- ence in Pennsylvania; and was also a member of the committee of safety. In 1775 he became a lieutenant-colonel of a battalion which he led at the battle of Princeton in 1777. In 1776 he commanded at Fort Island, and later in the same year was placed in command of the guard of the city of Philadelphia; he was the first to publicly proclaim the Declaration of Inde- pendence in the city on 8 July. He served in the army till 1780, and was a member of the navy board and director of the provision sup- ply. He was one of the organizers of the Bank of North America, and its president from 1792 to 1808.

Nixon, Lewis, American shipbuilder: b. Leesburg, Va., 7 April 1861. He was gradu- ated from the United States Naval Academy in 1882, and was then sent to the Royal Naval College, Greenwich, England, to take a special course in naval architecture from which he was graduated in 1885. In 1884 he had been appointed to the construction corps of the navy, and on his return from abroad was ordered to duty in connection with the building of the new cruisers Chicago and Boston; he was later superintending constructor for the navy at the Cramp shipyard, and assistant constructor at the Brooklyn Navy Yard. In 1890 he designed the battle-ships of the Indian coast, and when the contract for these vessels was awarded to the Cramp shipyard, he resigned from the navy to become superintending constructor there. He retained this position until 1895, when he leased the Crescent shipyard at Elizabeth, N. J., where he built 100 vessels within six years, including the submarine torpedo boat Holland. In 1902 he became president of the United States Ship- building Company, which includes the Crescent shipyard, the Eastern Shipbuilding Company, and others; and he is also connected with other manufacturing interests. In politics he has been allied with the Democratic party; was appointed a commissioner of the East River Bridge in 1897, and in November of that year succeeded R. T. Armour and Croker as leader of Tammany Hall, resigning the position in May of the next year; he has also been chairman of the finance committee of the Democratic Congressional Campaign Com- mittee.

Nixon, Oliver Woodson, American journalist: b. Guilford County, N. C., 25 Oct. 1825. He was graduated from Farmers' College, Ohio, in 1848, and from Jefferson Medical College, Philadelphia, in 1854. During the Civil War he was medical director of the Army of Missouri and in 1871 established the Cincinnati Evening Times. With his brother (q.v.), he merged it with the Cincinnati Times, and in 1878 they purchased the Inter-Ocean of Chicago, of which he has since been literary editor. He has published 'How Marcus Whit- man Saved Oregon for the Union' (1895).

Nixon, William Penn, American journalist: b. Fountain City, Wayne County, Pa. He was graduated from Farmers' College, Ohio, in 1854 and from the law school of the University of Pennsylvania in 1859. He practised his pro-

fession in Cincinnati till 1860 and sat in the Ohio Legislature 1865-8. He was business man- ager of the Cincinnati Chronicle, 1868-72, and since the date last named has been associated with the Chicago Inter-Ocean, which he pur- chased with his brother O. W. Nixon (q.v.) as publisher, manager and editor. In 1897 he was appointed collector of the port of Chicago.

Niza, Nietzsche, Marcos de (also called Fray Marcos), Italian missionary in America: b. Nice at the beginning of the 16th century; d. between 1550 and 1570. He gets his name, de Niza, from the city of Nice, where he lived and entered the Franciscan Order. His governor- general Antonio de Mendoza, on the request of Marcos's bishop and friend Bartolome de las Casas, sent him about 1531 to New Galicia in order to reassure the Indians there that the pur- poses of the Spaniards was not to enslave, but to assist the natives, not to enslave or conquer them. Fray Marcos lived successively in Peru, Guate- mala and Mexico, and in 1539 undertook to explore the Northwest and to discover the truth of the story of the seven cities of Cibola and their golden wealth. Niza probably made his way into Arizona, and is fre- quently called the "discoverer of Arizona." Upon his return he published a book locating the "seven cities." He must have made contact with the Zuñi pueblos. But the hopes to which he roused Mendoza were shattered by the expedition led by Coronado in 1540, which found no gold in Cibola. Niza's 'Descubrimiento de las siete ciudades' was edited by Ramusio, but is most accessible in a French version (1838).

Nizam, niz-ā-mā (full name Abu Moham- med Ben Yusuf Sheik Nizam-ed-Din), Persian poet: b. Western Persia 1141; d. Ganjah 1203. Besides a 'Divan,' or collection of lyrics, he wrote five larger poems, upon which his poetic fame rests, and which in Persia are regarded as masterpieces which no successive poets have been able to equal. These poems are (1) 'Ma- khzan-al-asrar,' ('Storehouse of Mysterries'), a didactic poem, in which theoretical doctrines as to ethics alternate with historical details, anecdotes, and fables; (2) 'Khusrav va Shirin,' a romantic epic, which has for its subject the love of the Persian king Khusrav for Shirin; (3) 'Laila and Majnum,' which describes the love of Majnum, a son of the Arabian desert, for the beautiful Laila; (4) 'Haft Pa' (Seven Portraits'), a collection of seven nov- els in a kind of poetical heptameron. The most famous of these tales is the 4th, called Turan- docht, which, after being subjected to various changes, when the materials of Goethe and Schiller's well-known dramas; (5) 'Iskandar Namah' (Alexander Book'), a traditional and embellished history of Alexander the Great, taken from the Greek poem on that subject by the pseudo Callisthenes. These five have been assembled in a collection known as 'Panj Ganj' ('The Five Treasures'). Nizami is not so familiar to western nations as Firdausi, Hafiz or Sa'di; but in Persia he is among the fore- most classics, and, in his peculiar field, may be placed second to Firdausi. (Laila and Majnum) was rendered into English couplet verse by Atkinson (1836).

Nizam's (ni-zāmz') Dominions. See HY- DERRADB.
NIZHAN — NOAH

Nizhan, nyɛ'zhan, or Nyeshin, nyɛ'zhen, Russia, city in the government of Chernigof; on a branch of the Desna which flows into the Dnieper. It is in a fertile agricultural region in which tobacco is one of the principal products. It has a large trade in grain and tobacco. Pop. 33,000.

Nizhni-Novgorod, nɛzh'nî-nov'go-rôd. See Njinj Novgorod.

Njord, nyɛrd, in Scandinavian mythology, god of the wind and waves. See Mythology.

No Am'mon, or No, the Hebrew designation for Thebes, the Disopolis Magnus of the Greeks. It is mentioned in Nah. iii. 8 (אמסם) and in Ezek. xxx. 14-16; Jer. xlv. 25 (דמשק). The shorter form, No, seems to have prevailed generally among the Hebrews, and the Assyrian records call the city Ni, while in Egypt after the 21st dynasty it is written Nt, doubtless pronounced ne-t. Nahun's reference to it as "part of Ammon" makes its identity with Thebes positive. See THEBES.

No-body Crab, or Sea-spiders. See Pan-tophoda.

No Man's Land, a name applied to outlying districts in various countries; at one time to what is now mainly Griqualand East; also to a territory of 80,000 square miles in South Australia; to a small island near Martha's Vineyard, Mass.; to a strip of land bordering on Pennsylvania, Delaware, and Maryland, still in dispute between these states because of the disqualification of the early boundary stones. Most commonly, however, the name is applied to Oklahoma in the following connection: In 1845 Texas, on being admitted into the Union, ceded to the United States that strip of her land which lay north of lat. 36° 30' N. This piece, 167 miles by 35, was without government until 1890, when it became a part of Oklahoma. At one time there was a great rush of prospectors and settlers to this section.

No Name, a novel by Wilkie Collins (q.v.) published in 1862.

Noachian (nö-â'kîn) Precepts, seven canons or laws which, according to the Talmud, were given by Jehovah to the sons of Noah. These precepts are analogous to what among the Romans was classed as Natural Law or Majus Gentium, a code revealed by the consensus of conduct among the Mediterranean nations. The seven Noachian Precepts enjoin: 1. Submission to civil authorities, kings, judges, etc. 2. Avoidance of idolatry and sacrilege. 3. Reverence to the name of God, as in taking an oath. 4. Proper restraint and direction of the human sexual instinct. 5. Reverence for life, even of animals, by refusing to consume the blood of beasts as food. 6. Respect for the rights of property. 7. Refusal to eat the member of a living animal. The expanding and refining genius of the Rabbins sometimes adds four others to these seven, namely: 1. The blood of a living animal is not to be drawn for the purpose of drinking it. 2. Animals are not to be mutilated. 3. Magic and sorcery are unlawful. 4. The crossing of animals and grafting of trees are also unlawful. No stranger was allowed to dwell in an Hebrew territory unless he conformed to the Noachian Precepts and became a "prostrate of the gate"; in contradis-
NOAH — NOBEL

and settling in New York city he published a volume of his 'Travels in England, France, Spain and the Barbary States,' and founded the 'National Advocate.' In 1822 he was elected high sheriff of the city and county of New York. After the disestablishment of the 'National Advocate,' he began the 'New York Enquirer,' which merged with the 'Courier' and became the 'Courier and Enquirer,' in partnership with James Watson Webb, but political differences soon dissolved their connection. Appointed by President Jackson surveyor of the port of New York, he established in 1834 the Evening Star and became judge of the court of sessions. In 1842 he started a daily, The Union, which became a weekly and under the title, 'Noah's Sunday Times and Messenger,' was edited by him until his death. A most interesting project in which he engaged in 1820 was to re-establish the Jewish nation and form a place of refuge for Jewish emigrants on Grand Island, in the Niagara River, near Buffalo. In 1825 with impressive ceremonies, he laid the cornerstone of the proposed city at White Haven, but the new 'Arrarat,' as it was termed, failed. His literary activity was varied; it included a large number of addresses and essays, a translation of the 'Book of Yashar,' and many plays, some of them popular in their time. He was ever broad-minded and charitable, and a picturesque figure of his time. Consult: Wolf, 'Mordecai Manuel Noah: A Biographical Sketch' (1897); Moraš, 'Émigrant Israelites of the 19th Century' (1886).

Noah, Samuel, American soldier: b. London, England, 19 July 1779; d. Mount Pulaski, Logan County, Ill., 10 March 1871. Of Jewish descent and a cousin of M. M. Noah (q.v.), at 20 he emigrated to America, and was appointed 5 May 1805 cadet in the 1st Regiment of Artillery. He was graduated 9 Dec. 1807, was promoted ensign in 2d Regiment and after desultory service in the Gulf States resigned (13 March 1811) his commission of 1st lieutenant in the army. He joined Magee's Mexican forces which were besieged at Fort Bahia (14 Nov. 1812) by the Spanish royalists. On Magee's death, Noah in command of the rear-guard routed the enemy and captured San Antonio. War having been declared by the United States against England, Noah left Texas to re-enter the United States. President Madison's refusal to re-commission him, volunteered as a private soldier to defend Brooklyn and served to the end of the war. At the time of his death he was the oldest graduate from West Point. Consult: Cullom, 'Biographical Sketches of Deceased Graduates of the U. S. Military Academy.'

Noah Claypole. See CLAYPOLE, NOAH.

Noah, Book of, a legendary pseudoeupigraphical book purporting to throw fuller light on the antediluvian and post-diluvian years of Old Testament history. Its date and authorship are equally uncertain.

Noailles, nò-A, French family from Limousin, dating from the 11th century. Its most important members are as follows: Antoine de Noailles, b. 1504; d. Bordeaux 11 March 1562. He was ambassador to England 1551-6, the king's agent in the Truce of Vaucelles, and governor of Bordeaux.

His grandson, Anne Jules de Noailles, b. Paris 1650; d. Versailles 1708; was a servile courtier of the French king, who made him marshal of France in 1693. His son, Adrien Maurice, Duc de Noailles, b. Paris 29 Sept. 1678; d. there 24 June 1760, like his father was marshal of France (1734). Before this he had made his reputation by his financial policy and his opposition to Law. He fought in the war of the Polish Succession, became commander-in-chief of the army in Italy in 1735, and in the war of the Austrian Succession was crushingly defeated at Dettingen. His memoirs were edited by Millet (1777) and his correspondence by Rousset (1865). His son Louis, b. Versailles 21 April 1713; d. Paris 22 Aug. 1793; fought in Flanders and Germany; became marshal of France in 1775. Louis Marie, Vicomte de Noailles, b. Paris 1756; d. Havana 1804; married a sister of Lafayette's wife and with Lafayette urged French intervention, and fought in America in behalf of the American Colonies, in which he took refuge during the darkest days of the Revolution. He returned to France soon afterward, but resigned from the army in 1792, again captivated by the, and fought bravely in the French army in Spain; Dublin, and in the brilliant capture of an English war vessel off Havana. Paul, a great-grandson of Louis, b. Paris 4 Jan. 1802; d. there 12 May 1885; upheld the tradition of his name as Histoire de Mon Repeint (1848-58) and Histoire du Maitre de Maintenon' (1858-63) and Histoire de la Maison de St. Cyr' (1865). His great-grandson, in turn, Emmanuel Henri, Marquis de Noailles, b. 15 Sept. 1839; was French minister to the Papal Curia 1873, to Rome 1876-82, to Constantinople 1882-90, and 1896-1902 to Berlin; and wrote on Polish history. His brother Jules Charles Victor Dur, Duc de Noailles (1826-95), was a well-known economist, one of the editors of the Revue des Deux Mondes, and author of many economic and historical studies, notably 'Cents Ans de République aux Etats-Unis' (1886-91).

Nobbe, nò'bë, Friedrich, German plant physiologist: b. Bremen, Germany, 20 June 1830. He was educated at Jena and Berlin, and in 1861 was called to a professorship at the Industrial School in Chemnitz. In 1868 he was appointed to the faculty at the Academy of Forestry and Agriculture at Tharandt, where he founded an experimental station for plant physiology, and he originated, in 1869, scientific seed testing. He has published: 'Wider die Waldgrassem für die Wiesenultur' (1878); etc.

Nobel, nò'bël, Alfred Bernhard: b. Stockholm, Sweden, 21 Oct. 1833; d. San Remo, Italy, 10 Dec. 1896. He was the third son of Emanuel, and in 1842 his father moved with his family to Saint Petersburg, Russia. In 1850 he sent Alfred to the United States to study under the famous engineer John Ericsson. On reaching his 21st year the son returned to Saint Petersburg trained as an engineer and moreover able to speak fluently Swedish, Russian, English, German and French. Later he took up the study of chemistry and showed a marked preference for that science in its technical applications. Emmanuel Nobel went to Russia under contract to prepare mines and torpedoes for the Russian government, and erected on the Neva works for their manufacture which eventually
were extended to include the manufacture of firearms and agricultural implements. After Alfred returned from America he was constantly engaged with his father in pursuing some invention. Among other substances nitroglycerin especially occupied their attention, and in 1862 they had erected a works at Helsinki, Sweden, where nitroglycerin was manufactured on a commercial scale for the first time in its history. In 1864 the works were destroyed by an explosion which at Aspinwall on the Isthmus of Panama attracted such attention, that its transportation was interdicted by many governments. In the latter part of 1866 Nobel discovered dynamite which replaced it and which was manufactured in Swedish and German factories. In 1868 at a factory which he started near San Francisco, Calif. In 1871 he erected at Arde, Scotland, the works which are now the largest dynamite works in the world. From this dynamite many agreements were made with such acceptance that works sprung up in all civilized countries, and while in 1867 but 11 tns were made, in 1882, 9,100 tons were produced and in 1900 the United States alone manufactured 48,923 tons. In 1875 Nobel invented explosive gelatine and the gelatine dynamites. In 1888 he invented ballistite. Alfred Nobel was interested in many other arts than that of explosives, having taken out in England alone 129 patents. With his brothers, Ludwig and Robert, he formed in 1878 the famous firm of Nobel Brothers that operated the petroleum wells at Baku, Russia, and has proved the most active competitor of the Standard Oil Company. He also purchased the large underground works at Bofors, Sweden, that he thought the more readily carry out his inventions in ordinance and his investigations in metallurgy. At his death he left an estate worth over nine millions of dollars, and in his will, after leaving small legacies to his already wealthy relatives, directed that the residue should constitute a fund the interest from which should be divided into five equal amounts and awarded as prizes to the person who shall have made, (1) the most important invention or discovery in the domain of physics; (2) in chemistry; (3) in physiology or medicine; (4) who shall have produced in the field of literature the most distinguished work of an idealistic tendency; and (5) who shall have most or best promoted the fraternity of nations, the abolishment or diminution of standing armies and the formation and increase of peace congresses. Prizes (1) and (2) are awarded by the Royal Academy of Science in Stockholm; (3) by the Caroline Medical-Chirurgical Institute in Stockholm; (4) by the Swedish Academy in Stockholm, and (5) by the Norwegian Storting (Parliament). The statutes approved by King Oscar of Sweden require among other conditions that every candidate for a prize be proposed as such in writing by some duly qualified person. A direct application for a prize will not be taken into consideration. All written work, to qualify for a prize, shall have appeared in print. No work shall have a prize awarded to it unless it has been proved by the test of experience or by the examination of experts to possess the pre-eminent excellence that is manifestly signified by the terms of the Will. The announcements of the awards are made on 10 December when the prize is given together with the diploma and gold medal. It is expected that within six months thereafter the prize-winner will lecture upon the subject for which the prize is awarded at Stockholm, or, in the case of the Peace prize, at Christiania.

The will was contested by heirs but a compromise was effected on condition that a portion of the property be devoted to the founding of institutions for research known as Nobel Institutes, which has been done. The income from the residue of the estate permits, however, of five prizes, each approximating closely to $50,000 in value, being awarded annually. Awards were made for the first time to Dec. 1901, prizes being given to Conrad Röntgen of Munich, discoverer of the Röntgen rays; in chemistry to Jacob Henry Van't Hoff of Berlin, founder of the science of stereochemistry; in physiology and medicine to Emil von Behring, discoverer of diphtheria serum; in literature to Armand Sully-Prudhomme of Paris, author of 'Justice' (1878) and other poems, and 'De l'expression dans les beaux-arts' (1884) and other prose works. The prize for peace was divided between Henri Dunant of Switzerland, prime-mover of the Geneva Convention and of the Red Cross societies, and Frederic Passy, founder of the Universal Peace Union.

The prizes for 1902 were awarded in physics jointly to H. A. Lorentz and P. Zeeman of Holland for researches on radiant energy; in chemistry to Emil Fischer of Berlin for synthesis of sugars; in physiology and medicine to Donald Ross of Liverpool for the dissemination of malaria by the mosquito; in literature to Theodore Momsen of Berlin for his works on Latin inscriptions and Roman history; and for peace to Frederick de Martens of Russia for promoting the Franco-Russian Alliance and the Venezuelan Arbitration. The peace prize may be awarded to an institution or association as well as to individuals.

Charles E. Munroe,
The Columbian University, Washington, D. C.

Nobel's Test-plates, finely-ruled glass plates so named from F. Nobel, a German optician, used for testing the power of microscopes. The rulings are executed on the under surface of a piece of exceedingly thin glass by means of a diamond point. Some of these ruled plates have the almost incredible number of 225,187 spaces to the inch. As means of testing the power of the microscope they are superior to any other object.

Nobility, in European countries, a certain rank or class of society which possesses hereditary honors and privileges above the rest of the citizens. Such a class is found in the infancy of almost every European nation. Its origin may be attributed to military supremacy, to the hon-
ors paid to superior ability, or to the guardians of the plebeians, consisting of those who had Romans the patricians originally formed the majority; but a new order of nobility arose out of the plebeians, consisting of those who had held curule magistracies and their descendants, enjoying the right of having images of their distinguished ancestors. Among the ancient German tribes only obscure traces of hereditary nobility are found. The dignity of the counts of the Franks, the aldermen and great thanes of England, as also of the jarls (in England eorlars) of Denmark, were accessible to every one distinguished by merit and favored by fortune. In Venice a civic nobility grew up consisting of a series of families who gradually acquired all political power and kept it to themselves and their descendants. In England hereditary nobility, the nobility belonging to the titles of duke, marquis, earl, viscount, and baron, is now entirely feudal, though formerly, as a result of the Norman conquest, it was connected with the holding of lands.

In Spain and Italy still the same rank depends in greater measure upon property; and in France and Germany it depends to no small extent upon titles, points to the same fact. In France and Germany nobility is common to all the members of the noble family, and the German nobility form a very exclusive caste. In France and Germany the nobles long formed a class of petty sovereigns within their own domains. The French Revolution first deprived the nobles of that country of their privileges and exclusive rights, as that of jurisdiction, etc.; and the decree of 19 June 1790 abolished hereditary rank entirely. Under Napoleon I. arose a new hereditary nobility, with the titles of princes, dukes, counts, barons, and chevaliers, which descended to the eldest son. After the restoration of the Bourbons (1814) the ancient nobility reclaimed their former rights and privileges. Nobility was again abolished in 1848, but was restored by Napoleon III. In Norway the parliament abolished nobility by the three successive decrees of 1815, 1818, and 1821.

In Great Britain titles of nobility can only be conferred by the sovereign, and that by patent, in which they become hereditary. Peersages also are occasionally conferred. The nobility, as the term is commonly used, consists of those holding the titles already mentioned (or all above the rank of baronet) and their more immediate connections; but if the term were to be used as generally in Europe the gentry would also be included, or all families entitled to bear coat armor. Those of the nobility who are peers of England, of Great Britain, or of the United Kingdom, have a hereditary seat in the House of Lords, while the Scottish peers elect 10 of their number to represent their order, and the Irish peers elect 28 representatives for the same purpose. There is no nobility in America, the Federal Constitution declaring that "No title of nobility shall be granted by the United States; and no person holding any office of profit or trust under them shall, without the consent of Congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign state." Congress sparingly gives its consent for a person in the service of the government to accept a decoration or other mark of honor from another government.

Noble, nô'bl, Alfred, American civil engineer: b. Livonia, Mich., 7 Aug. 1844. He was graduated from the University of Michigan in 1870, since when he has been engaged in civil engineering. He was a member of the United States board of engineers on deep waterways in 1897-1900 and of the Isthmian Canal Commission in 1899-1903.

Noble, Sir Andrew, English physicist: b. Scotland 13 Sept. 1832. He was educated at Edinburgh Academy, and is an authority on army ordnance and explosives. He was assistant inspector of artillery in 1859, and since 1860 has been a member of the firm of Sir W. G. Armstrong, Whitworth & Company. He became chief sheriff of Northumberland in 1896.

Noble, Annette Lucile, American author: b. Albion, N. Y., 12 July 1844. She was graduated from Phipps Union Seminary in 1863, and has since devoted herself to literature and traveling. She has published: "Uncle Jack's Executors" (1888); "After the Failure" (1887); "The Crazy Angel" (1901); etc.

Noble, Edmund, American author and journalist: b. Glasgow, Scotland, 8 Jan. 1853. He was educated in Lancashire, and entered journalism in 1872 as reporter on the St. Helen's Newspaper and Advertiser. In 1882 he became proprietor of the Liverpool City News, and was in Russia as correspondent of the London Daily News, and other London journals, in 1882-4. He was a foreign editorial writer of the New York Herald in 1889, and edited the American edition of 'Free Russia' 1892-4. He has published 'The Russian Revolt' (1885); 'Russia and the Russians' (1900); 'Before the Dawn' (1901).

Noble, Frederick Alphonso, American Congregational clergyman: b. Winthrop, Maine, 17 March 1832. He was graduated from Yale University in 1858, and from Andover Theological Seminary in 1861. He held various important charges until 1901, when he resigned. He has been permanently connected with the leading missionary conferences of his church, and has written: 'Divine Life in Man' (1890); 'Typical New Testament Conversions' (1901); etc.

Noble, John Willock, American lawyer: b. Lancaster, Ohio, 26 Oct. 1831. He was graduated from Yale University in 1851 and engaged in law practice. He was city attorney of Kokuk, Iowa, at the outbreak of the Civil War, when he enlisted and served through the war, rising to the rank of brevet brigadier-general. In 1867-70 he was United States attorney for Missouri at Saint Louis, and in 1889-93 secretary of the interior in President Harrison's cabinet. He has resumed his law practice in Saint Louis.

Noble, in numismatics, an ancient English gold coin, six shillings and eightpence, or $1.06, first struck in the reign of Edward III., 1344. Half-nobles and quarter-nobles were also in circulation at the same period.

Noblesville, nô'bliz-vil, Ind., county, county-seat of Hamilton County, on the White River, and on the Lake Erie & W. and the Chicago & S. E. R.R.'s; about 18 miles north by east of Indianapolis. It was settled in 1824, and in 1839 was incorporated. It is in an agricultural region and in a natural gas belt. Its chief manufactures are flour, foundry products, and strawboard. It
NODULAR DISEASE

has grain elevators, enameling and carbon works. There is considerable trade in the manufactured articles and farm products. The charter of 1890 provides for a mayor, who holds office four years, and a council. Pop. (1890) 3,054; (1900) 4,792.

Nobunaga, nô-boo-nâ-gâ, Japanese general and statesman: b. Owarî 1533; d. Kioto 1582. He was son of a soldier and small landholder, and to the little property left him in 1549 by his father rapidly added more, so that in 1559 he had control of the entire province of Owarî. Thenceforward a practical and unscrupulous politician, Hideyoshi, he made bold forays into neighboring provinces. In 1567 he made an alliance with Yoshiaki, younger brother of the lately assassinated Shogun, and, having put him upon the throne in 1568, was appointed vice-shogun, in which office he put down all opposition, crushed the political power of Buddhism, and encouraged the Jesuit missions, no doubt merely to counterbalance the influence of the Buddhists. Thenceforward glorifying an alliance against Nobunaga, was deposed in 1573, and Nobunaga took the powers but not the titles of the shogunate, thus forwarding the work of political reform. In 1582 one of his lieutenants, angered, says legend, by a practical joke of Nobunaga, turned against him, hemmed him in in a temple in Kioto, and set fire to the building. Nobunaga committed hari-kari. Consult: Dening, ‘Life of Hideyoshi’ (1890); Brinkley, ‘Japan’ (1901).

Noctes Ambrosianae, nôk’têz omb-rô-sê’nî. See Blackwood, William; Wilson, John.

Noctiluca, a luminous flagellate protozoan (Nemce, with the assistance of his lieutenants, throughout all seas, and one of the chief causes of the phosphorescence of the waves. It is a spherical animal — large for an infusorian (0.2 inch in diameter) — and moves by means of a long flagellum, in which the whole length represents, with a similar form (Leptodiscus), the order Cystophagellata. See Flagellata.

Noctuidae. See Moths; Owllet-Moths.

Nocturne, (1) in art, a painting exhibiting some of the characteristic effects of night. Whistler has produced various nocturnes which have given rise to considerable controversy. (2) In music, the term denotes a composition in which the emotions, particularly those of love and tenderness, are developed. The nocturne was invented by John Field (q.v.), and has become a favorite style of composition with modern piano-forte composers. Chopin is the most famous of nocturne composers. See Chopin; Field, John.

No'dal Lines and Points. See Note; Harmonics.

No’d’dy, a dark brown tern (Anous stolidus,) widely diffused through the northern and southern hemispheres, and well known to sailors for its fearless, regarded as stupidity, allowing itself even to be taken by the hand; but this is true only of birds rarely or never disturbed by men. The noddy is a rare visitor to northern shores, but is very abundant in warmer climates, as in the West Indies and South Seas, where its eggs are gathered from certain lonely islets in immense quantities and used as food.

Node, (1) in astronomy, the two points in which the orbit of a planet intersects the plane of the ecliptic; the one through which the planet passes from the south to the north side of the ecliptic being called the ascending node, and the other the descending node. As all the bodies of the solar system, whether planets or comets, move in orbits variously inclined to the ecliptic, the orbit of each possesses two nodes, and a straight line drawn joining these two points is called the line of nodes of each body. It is scarcely necessary to add that as the earth moves in the plane of the ecliptic she has no nodes. The places of the nodes are not fixed points on the plane of the ecliptic, but are in a constant state of fluctuation, sometimes advancing (eastward), and at other times receding (moving westward). This motion is produced by the mutual attractions of the planets, which tend to draw each of them out of the plane of its orbit; and it depends upon the relative positions of the planets with respect to another planet whether that planet’s nodes shall advance or recede. (2) In physics, a point in a vibrating body, or system of vibrating particles, where there is no movement. When a body is vibrating, the vibratory motion is conveyed from one place to another by the action of the molecular forces of the particles on one another. If a plate of glass or metal be held in the hand, and a bow be drawn across the edge, particles of fine sand, previously placed on the plate, will arrange themselves in lines, along which it is evident no vibration has taken place. These lines, called nodal lines, generally form geometrical figures. (3) In botany, the joint of a stem, or the part where a leaf or several leaves are inserted.

No’diak, a Papuan animal. See Echidna.

Nodier, Charles, shâr l nó-de-à, French author: b. Besançon, France, 29 April 1780; d. Paris 27 Sept. 1844. At an early age he proceeded to Strasbourg, where he studied under Eulogius Schneider, and, returning to his native town, gave much of his attention to natural history. In 1798 he became assistant librarian at Besançon. Soon drawn into connection with royalist clubs, he wrote with that scrupulous fidelity. These philippics subjected him to persecutions, and even to imprisonment. For several years he lived concealed in the Jura, and then fled to Switzerland, where he supported himself as a corrector of the press until, after many adventures, he returned to France. In 1814 he went to Paris, where Louise XVIII. rewarded him with a title of nobility and the cross of the Legion of Honor. In 1824 he was appointed librarian to the arsenal, and in 1824 admitted a member of the Académie. As a critic he is known by a series of excellent editions of the French classics with notes. As a grammarian and lexicographer he published: ‘Dictionnaire des Onomatopées de la Langue française’; ‘Examen critique des Dictionnaires de la Langue française’; ‘Dictionnaire universel de la Langue française’; and ‘Elements de Linguistique.’ Among his many other works, many of them fictions of the romantic school, are: ‘Stella ou les proséris’ (1802); ‘Triiby ou le Latin d’Argail’ (1828).

Nodular Disease. See Sheep; Diseases of.
NOÉ — NOLLE PROSEQUI

Noé, Amédée de, à-mâ-dâ de nô-â. See Cham.

Noël, nô-âl, Baptist Wriothesley, English clergyman: b. Leighton, Scotland, 10 July 1799; d. Stanmore, Middlesex, 20 Jan. 1873. A brother of the first earl of Gainsborough, he was graduated at Cambridge University in 1826, entered the Anglican ministry and was incumbent of Saint John's, Bedford Row, London. In 1848 he quitted the Establishment for the Baptist fold, became widely known as a Baptist minister in London, and was prominent in philanthropic labors in the metropolis. He published 'Essay on Christian Baptism' (1849); 'The Union of Church and State' (1848); 'Freedom and Slavery in the United States of America' (1863); 'Hymns About Jesus' (1866); etc.

Noel, Roden Berkeley Wriothesley, English poet: b. England 1834; d. Mainz, Germany, 26 May 1894. He was a son of the Earl of Gainsborough. He was educated at Cambridge, and though never a popular poet his work appears to highly educated readers and is much of it rich in melody, though too voluminous to keep entirely to his best standard. His published volumes include 'Behind the Veil and Other Poems' (1863); 'A Little Child's Monument' (1881); 'A Modern Faust and Other Poems' (1888); etc.

Noel, Thomas, English poet: b. Kirkby-Mallory, England, 11 May 1799; d. Brighton, England, 16 May 1861. He was graduated from Merton College, Oxford, 1824 and was the author of the famous poem 'The Fauper's Drive', often credited to Hood. Among his other works are: 'The Cottage Muse' (1833); 'Rhymes and Roundels' (1841).

No'emi, a romance by Sabine Baring-Gould, published in 1895. It is a tale of Aquitaine, during the English occupation, in the early 15th century.

Noetians, nô-è'shi anz. See PATRiPASSIANS.

Noet'ic Consciousness. See Metaphysics.

Nogales, nô-gâ-lês, Mexico, town, in the state of Sonora; on the Santa Cruz River, on the boundary between Mexico and Arizona, and on the Sonora Railroad. A United States consular station.

Nogaret, Stanislas Henri Lucien de, stân-ê-s-las ön-ô-lô-sôn de nô-gâ-râ, French colonist in America: b. Marseilles 1682; d. Paris 1759. He studied law; ran away from college; served in the army in Canada until 1716; and then was sent to Louisiana where he became Bienville's lieutenant in the bloody wars with the Natchez Indians described by Nogaret in his 'Précis des Établissements fondés dans la Vallee du Mississippi par le Chevalier Le Moyne de Bienville' (1738). From 1735 until his death Nogaret resided in France and acted as director of the Louisiana Company.

Noiré, nô-râ, Ludwig, German philosophical writer: b. Alzey, Hesse, Germany, 26 March 1829; d. Mayence, Germany, 26 March 1889. He was educated in Giessen and taught for many years in the gymnasium at Mayence, giving himself meantime to philosophical study. He wrote: 'Die Welt als Entwicklung des Geistes' (1874); 'Einleitung und Begründung einer monistischen Erkenntniss' (1877); 'Logos' (1885).

Noiseless Powder. See Explosives.

Noiserville, nô's-vêl, France, a village five miles east of Metz, celebrated as the scene of Bazaine's attempt to break through the line of German besiegers 31 Aug.–1 Sept. 1870. With 120,000 men and 138 guns, drove him back and took the villages of Montoy, Servigny, and Courcy, but German reinforcements arriving on the second day, Bazaine was compelled to fall back on Metz.

Nola, nô-lâ, Italy, city in the province of Caserta; 16 miles east by north of Naples. It is said to have been founded by the Etrurians before Rome was built, and in 313 B.C. it became a part of the Roman territory. It successfully resisted an attack of Hannibal in the Second Punic war. Nola claims to have made, in the 5th century, the first bells used in Christian churches. Giordano Bruno (q.v.) was born in Nola and Augustus died here in 14 A.D. Pop. (1901) 14,622.

Nöideke, nô-de-kê, Theodor, German orientalist: b. Harburg, Germany, 2 March 1826. He was educated at the gymnasium of Lingen, Hanover, and at the University of Göttingen. In 1859 he won the prize offered by the French Académie des Inscriptions with his history of the Koran, which he wrote in French and translated into German in the following year. He was privat-docent at Göttingen in 1861–4 and then was appointed assistant professor there. In 1866–72 he occupied the chair of theology at Kiel and was then called to the professorship of Oriental languages at Strasbourg. A scholar of wide attainments he has made a specialty of the Semitic languages and of Oriental philology and history, in which departments he is a leading authority. He is a voluminous writer and much of his work is intended for specialists only, yet much of his writing is intended for the general public and he has contributed to several encyclopedias. He has published: 'Über die Mundart der Mandâr' (1862); 'Die Geschichte des Urwa ibn Alward' (1863); 'Das Leben Muhammeds' (1863); 'Die Altestamentliche Litteratur' (1864); 'Grammatik der Neusyrischen Sprache' (1868); 'Untersuchungen zur Kritik des Alten Testamentes' (1869); 'Mandâr' (1872); 'Aufsätze zur persischen Geschichte' (1887); 'Orientalische Skizzen' (1892), translated into English in that year and revised by him; etc.

Nolhac, Pierre de, pê-ár de nôl-âk, French historian: b. Ambert 15 Dec. 1859. He studied at the French school in Rome, worked for a year in the Bibliothèque Nationale, in 1886 became professor of history and classical philology in the Ecole des Hautes Études, and in 1892 was appointed conservator of the Versailles Museum. Among his literary and historical studies are: 'Lettres de Joachim du Bellay' (1884); 'La Bibliothèque de Fulvio Orsini' (1887); 'Erasme in Italie' (1888); 'Marie Antoinette' (1890); 'Petrarque et Humanisme' (1892); 'Histoire du Château de Versailles' (1895–1900); and 'Louis XV. et Marie Leszczinska' (1901).

Noll, nôl, a name by which Oliver Cromwell (q.v.) was popularly known.

Nolle Prosequi, nôl'ô-prô-sk'wi (to be unwilling to prosecute) in law, is a stoppage of proceedings by a plaintiff, and is an acknowledgment that he has no cause of action. It is
NOLLEKENS—NON-COMMISSIONED OFFICERS

resorted to for the most part when the plaintiff has misconceived the nature of the action, or the party to be sued. In the United States the government—Federal, State or Municipal—through its attorney often enters a *nolle prosequi*, especially where there exists a lack of evidence for the prosecution. In addition to the usual forms of papers there are special forms of order for the withdrawal of suits. Nollekens, nó̆l-kén̆z. Joseph, English sculptor: b. London 11 Aug. 1737; d. there 23 April 1823. He was the son of a painter of Antwerp, who had settled in England and after studying sculpture at Rome became very successful. In Italy he became commonly taken place by degrees. Some of the greatest revolutions in history have been effected by these wandering tribes. North Africa, the interior of South America, and the northern and middle parts of Asia are still inhabited by nomadic tribes. Different tribes, however, possess different degrees of civilization. Some are little better than bands of robbers.

*Nou'mada. See Can curs Ón ís.*

Nomads, a general name given roaming or wandering people or tribes without fixed home or lands upon water to quit their wandering life until they are compelled to do so by being surrounded by tribes in settled habitations, or unless they can make themselves masters of the settlements of a civilization. India and China are common places of nomadic tribes. Some of the greatest revolutions in history have been effected by these wandering tribes. North Africa, the interior of South America, and the northern and middle parts of Asia are still inhabited by nomadic tribes. Different tribes, however, possess different degrees of civilization. Some are little better than bands of robbers.

Nom'archy, or Nom*archy, the largest political division of Greece; a subdivision of a nomarchy is an *oikos* or *polis*, and the division of an *oikos* is an *oikistes*. There are 26 nomarchies in Greece. The government appoints the nomarch who rules or governs a nomarchy. The time which he holds office is indefinite, but the members of the council, who assist him, are elected by the people for a certain definite time.

Nombre de Dios, nó̆m-brá dâ dé-os, Mexico, city in the state of Durango; about 150 miles from the Gulf of California, and 30 miles southeast of Durango, the nearest railroad station. It is noted for its extensive deposit of silver ore. Pop. 10,826.

Nomo, nó̆m, Alaska, city in the western part; on the north shore of Norton Sound (q.v.) at the mouth of Snake River; 14 miles west of Cape Nome. It is the commercial centre of an extensive gold mining district in the western part of the Territory, including a large part if not all of Seward Peninsula, as the gold mining district which contributes to the wealth of Nome increases in extent as new fields are prospected. Old placer gold fields, so dependent upon water for their development, are not continuous; rich deposits may have long intervening stretches where as yet no gold has been found. Nome came into existence as a mining camp in 1868. It was discovered in the creeks and streams of the vicinity, and the value of the beach deposits was recognized. Angelo Heilprin, president of the Philadelphia Geographical Society, is authority for the statement that out of 3,000,000 old placer sand bars more than two months' has been taken over $1,000,000 by the crude method of "rocking." Nome is the shipping point for Council City, second in size to Nome. The tin found in the vicinity of Cape Prince of Wales, and at Cape York, 90 miles northwest of Nome, is of industrial interest to Nome. Short narrow gauge railroads connect several of the mining camps with the city. The gold output for 1901 was about $7,000,000. The harbor is closed by ice the greater part of the year, so that the city is active only from June to October. The city government is well organized, with all the departments essential for proper maintenance and operation. The streets are lighted by electricity; it has a good water system, free mail delivery, and many of the modern conveniences found in cities in older settlements of the United States. The population in summer is much larger than in winter. Pop. (1900) 12,488. See ALASKA, RECENT DEVELOPMENT OF.

Nome, Cape. See Cape Nome.

Nome, (1) in music (especially in ancient Greek) any melody which was made up from or depended on natural or inviolable rules. (2) A province or other political division of a country, especially ancient Egypt and modern Greece. See Nomarchy.

Nominalism, in the Middle Ages, a name of one of two rival schools of philosophy dating from the time of Plato. The discussion arose respecting the nature of our general or abstract ideas, or of "universals." It was contended by some that abstractions—as a circle in the abstract, beauty, right—had a real existence apart from round things, beautiful objects, right actions. This was called realism. Those who held the opposite view were called Nominalists, because they maintained that there is nothing general but name; the name "circle" is applied to everything that is round, and is a general name; but no independent fact or property exists corresponding to the name. Specifically the controversy was as to the existence of "universals" or of genera and species, and arose out of a passage in the Latin translation of Porphyry's "Isagoge." Roscellinus, canon of Compiègne, in the latter part of the 11th century, was the first advocate of nominalism, and maintained, in opposition to his advocates of "universals" or general ideas have no separate entity. He was charged with holding heretical opinions concerning the Trinity, for which he was cited before the Council of Soissons, and condemned 1092 A.D. His first great opponent was Anselm, Archbishop of Canterbury, and later Abelard, who had been a pupil of Roscellinus, modified his master's views into what is known as conceptualism.

Nomination. See Caucus.

Nomocanon, in the Greek Church, a systematic collection of ecclesiastical laws, including certain secular enactments, especially imperial decrees, which have an ecclesiastical bearing. The most important is the Nomocanon of Photius (883) which was republished at Rome 1842 in the "Spicilegium Romanum." Non-activity. See Neutrality.

Non-combatants, a term used in warfare for officers and privates charged with administrative duties and who do not fight unless in self-defense.

Non-commissioned Officers, in the army are officers intermediate in rank between the commissioned officers and privates or marines.
NON COMPOS MENTIS—NONPAREIL

They are selected from among the latter, and are generally the most meritorious of these. They vary in rank, and comprise sergeants-major, sergeants, drum-majors, corporals. Their duties are various, but the chief of them is to attend to the discipline of the men. They may be relieved by the colonel-commandant or by court-martial. A grade of officers above non-commissioned officers are the warrant officers. See Army of the United States.

Non Compos Mentis, nōn kōmp'sēs mēntīs ("not of sound mind") an expression used of a person who is not of sound understanding. See Insanity.

Non-Euclidean Geometry. See Geometry.

Non-intrusionists, those members of the Scotch Established Church who contended for the principle that no minister should be intruded on a parish contrary to the will of the congregation. The name originated in a resolution, bearing this import, proposed by Dr. Chalmers and seconded by Lord Moncrief in the General Assembly of 1833. It was to meet these views that the General Assembly, in 1834, passed the veto Act, which brought the Church into conflict with the law courts, and produced the disruption from which the Free Church of Scotland came into being.

Non Possumus, an expression said to have been used by Pope Clement VII. in reply to Henry VIII.'s demand for the dissolution of his marriage with Catharine of Aragon; used in general expression for the refusal of the Roman Catholic Church to yield to the demands of the temporal power.

Non-resistance, Doctrine of, is, that it is unlawful, on religious grounds, to resist the commands of a ruler or magistrate. The New Testament writers urge the necessity of obedience to those in authority, although, as usually understood, this teaching refers only to lawful commands; this, however, has been maintained that obedience is to be rendered to all the commands of a ruler without exception. The doctrine is closely connected with —may indeed be said to proceed from—the doctrine of the divine right of kings. Hobbes placed the absolute supremacy of kings, and their right to exact unquestioning obedience from their subjects. This view was the outcome of his social contract theory. In modern times the doctrine has become completely exploded.

No'nane, or En'nane, the ninth number of the series of the saturated fatty hydrocarbons, or paraflins. It has the chemical formula C_{30}H_{62}, and is theoretically capable of existing in no less than 35 different isomeric forms, a number of which have been already identified. Two of these, having a common specific gravity of about 0.742, and boiling at 286° F. and 277° F., respectively, are known to exist in ordinary petroleum.

Non-conformists, those who refuse to join the Established Church in England as by law required. The first Act of Uniformity was passed under Edward VI. 1549. But the term was particularly applied to these clergymen who were ejected from their livings by the Act of Uniformity passed under Charles II. in 1662. Their number was about 2,000. The act required that every clergyman should be ordained by a bishop; should assent to everything in the Book of Common Prayer; take the oath of canonical obedience; abjure the Solemn League and Covenant; take an oath of allegiance to the king; The Presbyterians, Independents, etc., refused to conform, and were exposed to persecution. By the Five Mile Act (1665) no dissenting teacher who would not conform, could approach within 5 miles of any corporation, or of any place where he had preached after the act of obligation; and should thus be deprived of all means of subsistence. The term was subsequently widened so as to comprehend not only the pastors but their flocks. On the accession of William III. all was changed by the Toleration Act. Some of those oppressive provisions were revived during the reign of Queen Anne, but were finally repealed in 1718. The name Non-conformists was under these altered circumstances changed to that of Dissenters. The Report of the Corporation and Test Acts in 1828 removed the civil disabilities under which Dissenters had previously been placed; and other grievances in regard to marriage, church rates, burials in parish churchyards, and the like, were subsequently redressed. See Puritans; Dissenters.

Nones, nōnz, in the Roman calendar, the fifth day of the months January, February, April, June, August, September, November, and December, and the seventh day of March, May, July, and October. The nones were so called as falling on the ninth day before the ides, both days included. See Calendar.

Nonius, nōn'īūs, Marcellus, Latin grammarian: b. Thubursicum in Numidia at the opening of the 4th century A.D. His 'De Compendiosa Doctrina,' originally consisting of 20 books, is greatly esteemed on account of its many quotations from earlier writers whose works are lost. The 16th book is no longer extant. Consult editions by Quicherat (1871) and L. Müller (1888); also Nettelship, 'Essays in Latin Literature' (1885).

Nonius, See VERNIER.

Nonju'ra, in British history, those who refused to take the oath of allegiance to the government and crown of England at the Revolution, who are called by Hakluyt among the nonjurors. The nonjurors numbered upward of 400 clergy, including one archbishop and eight bishops.

Nonnus, nōn'ūs, Greek poet of the 5th century of our era. He wrote the 'Dionysiaca,' an epic poem in 48 books relating the journeys and expeditions of Dionysus in lively and poetic style, full of taste and learning. He was a Christian and produced a poetic paraphrase of St. John's Gospel. Consult: Ludwich, 'Beiräge zur Kritik des Nonnos' (1873).

Nonpareil, a small and beautiful finch (Cyanopsis cyanus) of the South Atlantic and Gulf States. It is nearly related to the indigo-bird (qu.), and is frequently kept as a cage-bird, especially by the French people of southern Louisiana, who call it le pape (the pope). It is about the size of a canary, and, in the male, ultramarine blue over the whole head and neck, excepting a narrow stripe from the chin to the breast, which, with the under parts generally and the rump, is vermillion red; there are touches of green about the shoulders. The female is clear dark green above and yellowish on
the lower surfaces. Its song is a series of melodious warblings, and its nest is placed in bushes and low trees, and contains pearly white eggs marked with purplish and reddish brown.

_Nonsense, Fort_, in American history, the name of a former fort near Morristown, N. J., projected by Washington to keep his discouraged and famished army from revolting during the winter of 1779-80. The Washington Association of New Jersey erected a memorial stone on the site of the earthworks in 1888.

_Non'suît_, in law. See _Nolle Prosequi_.

_Non'yl, or En'nyl_, in chemistry, the organic radical CH₃N, whose hydride is the paraffin nonane (q.v.). Nonyl is analogous in its chemical behavior to ethyl and methyl, and, like these, it cannot exist in the free state. The derivatives of nonyl have been very little studied as yet, because they are of no commercial importance, and their relations are exceedingly complicated, owing to the large number of possible isomeric forms that each of them can have. Several of its alcohols, amines and chlorides have been prepared, however.

_Nonylene, or En'nylene_, the ninth member of the olefine series of fatty hydrocarbons. It has the chemical formula C₈H₁₆, and is capable of existing in many isomeric modifications. All of these modifications that are known are liquid. One of them, which may be prepared from one of the nonyl chlorides (see _Nonyl_), has a specific gravity of 0.853, and boils at 275° F. Another, which occurs in the distillates from bituminous shales, has a specific gravity of 0.753 and boils at 250° F. A third, which occurs among the products obtained by distilling anil alcohol with zinc chloride, boils at 284° F.

_Nootka_ (noot'ka) _Indians_, a name given to several North American Indian tribes of the Wakashan family, residing on Vancouver Island. In 1792 they were called Wakash Indians. About 2,500 of them remain, over half of whom are nominally Christians.

_Nootka Sound_, Canada, an indentation on the west coast of Vancouver's Island. See _Vancouver Island_.

_Nor'burt, Saint_. See _Premonstratensians_.

_Norchia, nor'che-a_, The _Bega of_, in archaeology, a name given to the remains of a big, or two-horse chariot, discovered in 1901 in the course of some excavations undertaken by a country builder at Norchia, a small town almost 30 miles north of Rome, in what was once a populous part of Etruria. With it were found a number of bronze vessels and some pieces of pottery, of a character familiar among Etruscan remains. These remains were purchased by the Metropolitan Museum of Art in New York, and placed on exhibition. To set the fragments up it was necessary to reconstruct the original chariot. The wheels alone retained their shape. This entailed a work of great delicacy and difficulty, which was accomplished with great skill.

_Nord, nör, France_, a northeastern frontier department bordering on Belgium and the North Sea; area, 2,229 square miles. Capital, Lille. The coast, marked by a long chain of sandy hillocks, furnishes the two harbors of Dunkirk and Gravelines. The interior is a monotonous but fertile alluvial flat, intersected by sluggish streams and canals. The department is essentially agricultural, upward of four fifths of the area being under cultivation. The principal mineral is coal. The iron mines are also very productive. Pop. (1901) 1,877,647.

_Nordau, nör'dów_, Max Simon, German physician and author: b. Budapest, Hungary, July 1849. He studied at the University of Budapest, receiving his degree in 1872; he then traveled for six years, visiting the principal countries of Europe, and in 1878 began the practice of medicine in Budapest. In 1886 he went to Paris, and after two years of study resumed the practice of his profession there. He began his literary career at Budapest before entering the University as contributor and dramatic critic for 'Der Zwischenacht'; he subsequently was an editorial writer and correspondent for several other newspapers. His newspaper writings were collected and furnished the material for his earlier books, including 'Pariser Studien und Bilder' (1878); 'Seifenblasen' (1879); 'Vom Kremi zur Alhambra' (1886); 'Paris unter der dritten Republik' (1887), which are mostly criticisms of political and social conditions. In 1883 he published 'Die konventionellen Lügen der Kulturmenschheit' (English translation, 'Conventional Lies of Society'), in which he shows what he believes to be the essential falsity of some of the social, ethical, and religious standards of modern civilization; and in 1892 published 'Entartung,' translated into English under the title 'Degeneration.' This is his best known work and provoked much criticism; in it he maintains that the civilization of the present, the new inventions, and the growth of great cities have resulted in the degeneration of man, especially of the higher classes; that this degeneration is seen particularly in the lower-class, the degraded, standard of literature, art, and music; and that the authors and artists of the day whose work is in accordance with these standards, are themselves mental and moral degenerates. His other works include: 'Paradoxen' (1885; in English, 'Paradoxes'); 'Die Krankheit des Jahrhunderts' (1889; in English, 'The Malady of the Century'); 'Seelen Analysen' (1892); 'Die Dronenschlacht' (1897; the novel, 'Gefühlskomödie' (1891; in English, 'A Comedy of Sentiment'); and the dramas, 'Der Krieg der Millionen' (1832); 'Das Recht zu lieben' (1893); 'Die Kugel' (1894); and 'Dr. Kuhn' (1895). Dr. Nordau is a Jew and has been one of the prominent leaders of the Zionist movement. An attempt to assassinate him was made in the latter part of 1903.

_Nordenfelt_, nör'dên-felt, Torsten Vilhelm, Swedish inventor: b. 1842. He received a thorough technical training: from 1862 to 1866 was engaged in powder factories, and later in the manufacture of ammunition, machine guns, torpedo boats. Soon after-
ward with Hiram S. Maxim (q.v.) he formed the Maxim-Nordenfelt Company. Oscar II. of Sweden named him royal chamberlain in 1885. Nordenfelt’s best known invention is a machine gun, which was used by the American forces against the Apache indians. It was made with from 2 to 12 barrels, from any one of which the supply of ammunition can be shut off without interfering with the other barrels.

Nordenfelt Machine Gun. See ORDNANCE.

Nordenskiöld, nörd'en-sköld, Adolf Erik, Baron, Swedish Arctic explorer: b. Helsingfors 18 Nov. 1832; d. Dalbyo, Sweden, 12 Aug. 1901. He was educated in Finland at the University of Helsinki by his father, Nils Gustav Norden- sköld (1792—1865), a mineralogist, with whom he explored parts of the Urals. He was graduated in 1857, and in 1858 became superintendent of the mineralogical department of the Swedish Royal Museum in Stockholm, having been forced to leave Finland by the Russian authorities, who took umbrage at his political views. In all subsequent Arctic expeditions sent out by the Swedish government he took part, accompanying Tor- rell in 1858 and 1861, and being leader himself in 1864 and in 1868, when he attained to 81° 42', the farthest north at that time reached on board ship. Oscar Dickson, a wealthy gentleman of Göteborg, who had contributed to previous exploration funds, made it possible for Norden- sköld to explore Greenland in 1870, a preliminary expedition, which, however, made important discoveries of algae and meteorites and penetrated the island farther than had ever been done before. In 1872, after serving two years in the Swedish lower house of parliament, where he allied himself with the Liberal party, Norden- sköld set out on the fifth Swedish expedition, which wintered in Mosell Bay, whence with a few comrades he pushed north in the spring of 1873 on sledges. In 1875 and 1876 he led the expeditions sent out by Dickson across the Kara Sea and up the Yenesei River, a journey repeated in 1876. These were mere preparations for his great exploit in 1878—9, when he circum- naunched the Eurasian continent, leaving Karls- krona 22 June 1878; wintering in the ice near Bering Strait, after a successful northeast pas- sage, thus accomplishing a project planned three centuries before; reaching Yokohama 2 Sept. 1879, and thence making the round of the Sea Canal. In 1883 he again explored Greenland from the west coast, beating his previous record of the farthest inland. The remaining years of his life were spent in the study of early cartography, his publications in this field being 'Periplus, an Essay on the Early History of Charts and Sailing Directions' (1897); an edition of Marco Polo, in French with facsimile (1892); 'Bidrag til Nordens åldst historia' (1892), in honor of the American-Columbian celebration, and accompanied by the earliest maps of North America. Most of his important explorations were also de- scribed by his pen. Consult: Leslie, 'Arctic Vengeance of Nordenskiöld' (1880); and 'The Life,' in Swedish, by Andersson (1901).

Nordenskiöld, Gustav, Swedish explorer, son of A. E. Nordenskiöld (q.v.): b. Stockholm 1868; d. Mörsil 6 June 1895. He explored Spitzbergen in 1890 and the Colorado canions in 1891, and described the latter in a work translated by Morgan under the title 'The Cliff Dwellers of the Mesa Verde' (1893).

Nordenskiöld, Nils Otto, Swedish explorer and geologist, nephew of A. E. Nordenskiöld (q.v.): b. Smaland 6 Dec. 1869. He was educated at Upsala, where he was graduated with a doctor's degree in 1894. In 1895—7 he accom- panied the scientific expedition to Patagonia under Ohlin; in 1898 traveled through the Klondike; in 1900 was a member of the Danish expedition under Amstrup to the eastern coast of Greenland. In October 1901 he sailed for the Antarctic to explore the south polar regions. His ship was sunk in Erebus and Terror Gulf in the early part of 1902, and he and his men encamped on Paulet Island, where they were rescued by the Uruguay, a gunboat sent out by the government of Argentina.

Nordemey, nörd'er-ni, Germany, one of the East Friesian Islands, three miles from the coast of Germany and belonging to the province of Hanover. It is about eight miles long and a little over one mile wide. It is treeless, cov- ered with dunes which are from 10 to 75 feet in height. At the southwest extremity is a vil- lage which is protected from the sea by a wall, and the lighthouse in the centre of the island may be seen many miles. The island is the most important of the group on account of its being a favorite sea-bathing place. Pop., permanent, about 3,878.

Nordhausen, nörd'hau-zên, Germany, city in the province of Saxony, on the Zorge, 40 miles north-northwest of Erfurt. It is at the base of the Harz Mountains and the west end of the fertile 'Goldene Aue,' that is, 'golden plain.' It has 70 large distilleries of corn brandy, 'Nordhäuser schnaps,' tanneries, chemical works, and tobacco factories. A quaint town-hall, a Gothic cathedral, and the Church of Saint Blasius, which has two paintings by Lucas Car- nach, are all of interest. Pop. (1901) 29,100.

Nordheimer, nörd'he-im' er, Isaac, American Orientalist: b. Memelsdorf, Germany, 1809; d. New York 31 Nov. 1842. His fondness for learning was early displayed and his mature education was received in Wurzburg and Munich, where he gained his degree in 1834. In 1835 he came to New York and was instructor in sacred lit- erature in Union Seminary (1838—42), and pro- fessor of Hebrew at the New York University (1836—42). His 'Hebrew Grammar,' an elab- orate work in two volumes, appeared in its 2d edition in 1842. His other works include: 'A Grammatical Analysis of Scripture or a Chris- tomyth' (1838); 'A Philosophy of Ecclesi- ases' (Biblical Repository July 1838). He left in MSS. valuable grammars of Syriac and Arabic.

Nordhoff, nörd'hof, Charles, American journalist and author: b. Erwitte, Westphalia, Prussia, 31 Aug. 1830; d. San Francisco, Cal., 15 July 1867. He came to the United States in 1835, and in 1843 was apprenticed to a printer in Cincinnati. In 1844 he joined the United States navy and served three years, in which time he made a voyage round the world. He continued to sea in merchant, whaling, and fishing vessels until 1853, and was then employed in newspaper offices, first at Phila- delphia, and later at Indianapolis. From 1857 to 1861 he was engaged in editorial work in a New York publishing house; and from 1861—71 he was on the staff of the New York Evening Post;
and also contributed to the New York Tribune. From 1871 to 1873 he traveled in California and Hawaii, and in 1874 became Washington correspondent for the New York Herald. He has described his experiences as a sailor in his 'Man of War Life' (1855); 'The Merchant Vessel' (1855); 'Whaling and Fishing' (1856); and 'Nine Years a Sailor' (1857). His sociological and political writings include: 'Secession is Rebellion' (1860); 'The Freedmen of the South Carolina Sea Islands' (1863); 'America for the Free Working Men' (1865); 'Politics for Young Americans' (1875); and 'The Communitistic Societies of the United States'; this last is a description and history of different communistic colonies, and is a valuable contribution to descriptive sociology. His other works are: 'Stories from the Island World' (1857); 'Cape Cod and All Along Shore' (1868); 'California for Health, Pleasure, and Residence' (1872); 'Northern California, Oregon, and the Sandwich Islands' (1874); 'The Cotton States in the Spring and Summer of 1875' (1876); 'God and the Future Life' (1881); and 'Peninsular California' (1888).

Nordica, nórdi-ka, Lillian, American opera singer: b. (Lillian Norton) Farmington, Maine, 1859. She studied in the Boston Conservatory and under O'Neill made her first appearance in 1876 as a concert artist, in 1878 went to Europe with Gilmore's Band, studied at Milan under Sangiovanni, and made her operatic début at Brescia in 'Traviata.' Her success was great; she was immediately engaged for the Imperial opera at St. Petersburg, and after two years there appeared in Paris in 1882. In the same year she retired from the stage to marry Frederick A. Gower, whom she sued for divorce in 1885, but who disappeared at about the time of the suit, probably having been killed in a balloon accident. She first appeared in London in 1887, and in New York in 1895. In 1894 she played Elsa in 'Lohengrin' at the Wagner Theatre in Baireuth, and in 1896 married the Hungarian tenor, Döme, who took the title role in 'Parsifal' at Baireuth in 1894. She obtained a divorce from him in 1904. Her repertoire is large and she is especially successful in Wagnerian opera and in 'Les Huguenots' as Aida.

Nördlingen, nörd'ling-ën, Germany, town in the western part of Bavaria; on the Eger River, 75 miles northwest of Munich. Its history dates back to the year 900, and some of the buildings still remaining bear evidence of an even earlier date. Two of the decisive battles of the 'Thirty Years' war were fought in Nördlingen; one 16 Sept. 1634, where Ferdinand, the king of the Romans, was unsuccessful, and South Germany was freed from foreign rule; and the other 13 Aug. 1645 between the Imperial forces and the French, the French were victorious. Nördlingen has considerable manufacturing interests; linen and woolen goods, carpets, leather, agricultural implements, furniture, and toys are among the manufactures. It has schools of note and a national library. Pop. (1902) 10,568.

Nordmann, Johannes Rumpelmair, yö-hän'nës room'pél-mi-ér nört'män, Austrian writer: b. Landersdorf, Austria, 13 March 1820; d. Vienna, Austria, 20 Aug. 1887. He was an actor in early life, but after the success of his first book 'Aurelie,' a volume of poems published in 1847, he devoted himself to travel and literature. He wrote: 'Zwei Frauen' (1850); 'Ein Wiener Bürger' (1860); Frühlingsnächte in Salamanca' (1860); etc.

Nordstrand, nórdstrënt, Germany, an island belonging to the North Frisian group, in the North Sea; area, about 21 square miles. Prior to 1634 the area was about 210 square miles; but that year a flood swept over the island, destroying the greater part of the land and drowning 4,600 people. Many people of the islands of the vicinity were drowned. Pop. about 3,000.

Nore, nör, a river in Ireland which has its rise in the mountains in the northeastern part of Tipperary, flows northeast into Queens County, then southeast through Kilkenny, and joins the Barrow River about two miles above New Ross. It is navigable for steamers of considerable size as far as Inistoge about 20 miles from Waterford Harbor, and smaller craft to Thomastown. Kilkenny is the largest city on its banks.

Norfolk, nór-fök, England, Howard, 11th Duke of, English politician: b. 5 March 1746; d. London 1815. Breaking with the traditions of his family, notably his father, a Roman Catholic and author of pamphlets on penal laws against the Catholics, he son became a Protestant and a Whig; sat in Parliament 1775 and became lord of the treasury in the Portland Cabinet in 1783; and was dismissed in 1798 from the lord-lieutenancy of the West Riding for toasted the "sovereign English people" in terms displeasing to the Crown. At his death the title passed to Bernard Edward Howard, the first Roman Catholic lord to sit in the House after the Act of Emancipation.

Norfork, Henry Granville Fitzalan Howard, 14th Duke of, English politician: b. 7 Nov. 1815; d. Arundel Castle, Sussex, 25 Nov. 1880. He studied at Trinity College, Cambridge; became a zealous Whig and was always an ardent Catholic. He was a member of the House of Commons from 1837 to 1854, then breaking with his party on the Ecclesiastical Bill of 1850; spent several years in Paris, where he was known as a friend of Montalembert; and in 1856, upon his father's death, entered the House of Lords, where he vigorously opposed Palmerston. He wrote various pamphlets on the Catholic question and the 'Lives of Philip Howard, Earl of Arundel, and of Anne Dacres, His Wife' (1857).

Norfolk, Henry Howard, 6th Duke of, English nobleman, friend of Evelyn, the diarist: b. 12 July 1628; d. Arundel, Sussex, 11 Jan. 1664. He was a younger son of the 2d Earl of Arundel, lived abroad until the Restoration, and in 1667 presented the Arundel Library to the Royal Society and the famous Arundel marbles to Oxford University. He was envoy to Morocco in 1660 and succeeded his brother as duke in 1670. Consult Evelyn, 'Diary.'

Norfork, Henry Howard, 7th Duke of, English politician, son of the 6th Duke: b. 11 Jan. 1655; d. London 2 April 1701. He studied at Magdalen College, Oxford; became lord-lieutenant of Norfolk, Berkshire, and Surrey; and was so strong a Protestant that in spite of his personal attachment to James II., he signed the petition for the Convocation Parliament in 1668 brought over the eastern counties to William of Orange, and was made privy councillor in 1669.
NORFOLK

NORFOLK, 15TH DUKE OF, English politician: b. Carlton Terrace, 27 Dec. 1847. He succeeded to the title in 1860 upon the death of his father, whom he resembles in his zeal for the Roman Catholic Church. He is president of the Catholic Union of Great Britain; acted as special envoy to the Pope in 1887; with the Unionists he opposed Gladstone’s Home Rule programme; and from 1895 to 1900 was paymaster-general. He served in the South African war.

NORFOLK, John Howard, 1ST DUKE OF, English admiral, supporter of the House of York: b. about 1430; d. Bosworth, Leicestershire, 22 Aug. 1485. He was a great-grandson of Sir William Howard, founder of the family and chief justice of common pleas under Edward I. and Edward II. He served in France, was elected to the Commons in 1455 by the interest of John Mowbray, last duke of Norfolk of that name, thus becoming allied to the House of York, and was knighted upon the accession of Edward IV., fought again in France and against the Lancastrians, and in spite of this was made a baron by Henry VI. He became a lieutenant of Richard III., who made him duke of Norfolk, earl marshal, and admiral of England in 1483; and fighting for Richard at Bosworth he was killed. The title of Duke of Norfolk re-

NORFOLK, Thomas Howard, 2D DUKE OF, English soldier and statesman, son of John Howard, 1st Duke of Norfolk (q.v.): b. 1443; d. Framlingham, Suffolk, 21 May 1524. Like his father he fought for Edward IV. at Barnet (1471) and for Richard III. at Bosworth (1485), but in 1514 recovered his attained title, becoming one of the most trusted generals of the day. He put down the Yorkshire rising of 1489, defeated the Scotch at Flodden (1513), and on the “Evil May Day” of 1517 repressed with terrible severity a riot in London. His adherence to the Crown was shown by his concurring in the condemnation of Buckingham for treason, after acting as lord high steward of the court which tried his friend.

NORFOLK, Thomas Howard, 3D DUKE OF, English statesman, son of 2d Duke (q.v.): b. 1473; d. Kenninghall, Norfolk, 1 Aug. 1515. He married Anne, daughter of Edward IV., and served in the navy and in 1513 under his father at Flodden. He opposed the policy of Wolsey and angered the king against him; was less successful in his opposition to Thomas Cromwell, and in 1540 with his son Henry, Earl of Surrey, was accused of high treason. He was con-
demned to death and rescued only by the death of Henry VIII. He remained in the Tower durk. He was a Vimian, but was restored to favor under Mary; and in his last year showed equal bravery and rashness in leading the forces against Wyatt. His grandson THOMAS HOWARD, 4TH DUKE OF NORFOLK, son of the Earl of Surrey: b. 1536; d. Tower Hill 2 June 1572; became duke in 1554; gave largely to the foundation of Magdalene College, Cambridge; was sent to Scotland in 1568 to inquire into affairs there; attempted to marry Mary, Queen of Scots; and as head of the English nobility played a prominent part in the Ridolfi plot on his master’s behalf. He was tried for treason and executed.

NORFOLK, Thomas Mowbray, 1ST DUKE OF, (of the first creation), English statesman: b. about 1366; d. Venice 1399. He was elected to Parliament in 1383; served in Scotland in the following year; joined in the prosecution of the favorites of Richard II. by the Merciless Parliament; but was soon reconciled to the king and assisted him greatly in his tyrannical policy to-
ward the nobles. Norfolk arrested Gloucester, Arundel and Warwick, and when the latter was to be pro-
duce Gloucester for trial he said that the prisoner was dead, and very possibly he was responsible for Gloucester’s death. He was made Duke of Norfolk in the same year, 1397; but in 1398 was accused of treason and banished from England.

NORFOLK, Va., city, port of entry, and United States naval station in Norfolk County; the second largest city of Virginia; on the Elizabeth River, which is an arm of the Chesapeake Bay, the Albemarle and Chesapeake Canal, and Dismal Swamp Canal. It is 116 miles by water and 90 miles in a direct line southeast of Richmond, on the Atlantic Coast Line railroad, the Seaboard A. L., the Chesapeake & O., the Norfolk & W., the Norfolk & S., the Southern and the New York, P. & N. R.’s, Portsmouth and Berkley, which are practically a part of Norfolk, are just across the Elizabeth River.

Topography and Climate.—The city covers an area of about four square miles and is laid out on rather level ground. The climate is genial, being tempered by the Gulf Stream, which runs nearer the shore off Capes Henry and Hatteras than at any other point along the Atlantic coast.

Public Buildings.—Among the prominent buildings here are Saint Paul’s Church, built in 1737; Public Library (12,000 volumes), Carnegie Library, City Hall, Custom House, Saint Vincent’s Hospital, Protestant Hospital, Post-office, Monticello Hotel, Atlantic Hotel, Norfolk Mission College; upward of 30 churches, an academy for young ladies, an institution for colored students, and there is a beautiful public park embracing 492 acres.

Government.—Under the revised and amended charter of 1884, Norfolk is governed by a mayor, elected every two years, and a city council, with two branches, select and common. The administrative officers elected by popular vote include the school trustees, city treasurer, attorney, street inspector, revenue commissioner, collector of taxes. The cost of maintenance for the city departments amounts to $600,000 annually; the principal items being interest on debt, $175,000; fire department, $60,000; schools, $60,000; street, sewer and drain department, $90,000; and police department, $73,000. The municipal waterworks were built in 1872 and cost $1,230,000. There are 75 miles of street mains in the system. In 1903 the assessed valuation of the city was $30,487,000.

The Naval Station.—Norfolk is 8 miles distant from Hampton Roads and 17 miles from the Atlantic Ocean. Norfolk and Portsmouth, on the opposite side of the Elizabeth River, constitute the largest naval station in the United States. The Norfolk navy yard is located at Portsmouth. The coaling station here handles over 2,500,000 tons annually. The harbor is commodious, accessible for the largest warships.
NORFOLK ISLAND—NORMAL COLLEGE OF NEW YORK

and has a main channel 30 feet deep. The defenses include Fortress Monroe.

**Customs.**—There is a United States Customs District here, embracing both Norfolk and Portsmouth. The foreign trade in 1900 was represented by imports valued at $318,401 and by exports to the amount of $11,505,000; in 1901 the imports were $594,000; exports $106,306,000; in 1902 imports were $501,501; exports $7,110,000; in 1903, imports $927,482; exports $516,603.

**Trade and Commerce.**—Norfolk is the terminus of many steamship lines, transatlantic and coastwise; and has a large boat traffic with the interior by canal. It is already an important commercial centre and is growing rapidly in this direction. The commerce of the port includes lumber, coal, grain, cotton, peanuts, and vegetables. It is the leading peanut market of the world, is the fourth cotton port of the United States, with a business of 600,000 bales annually; an oyster trade of $4,500,000 and a trucking business of $6,000,000. There are 2 national banks, 6 state banks, chamber of commerce, board of trade, cotton exchange, real estate exchange. The Union stock yard has an annual business of $2,500,000.

**Manufactures.**—Many large manufactories were established here in 1901, 1902 and 1903. In 1900 the manufactures represented capital to the amount of $6,425,000, with a production valued at $5,397,000. The industries include cotton mills, cotton combers, mule spinning mills, fertilizer factories, ship yards, tobacco and cigar factories, iron foundries, machine shops, steel works, carriage and wagon shops, lumber mills, silk mills, barrel, box and crate factories, brick yards, breweries, bottling works, grain elevators, electric supply works and numerous minor concerns. There are gas and electric light plants here, an electric traction system and daily and weekly newspapers.

**History.**—The town of Norfolk was first settled in 1680. It was bombarded and nearly destroyed by the British under Lord Dunmore, Jan. 1, 1776. In 1736 the town was incorporated as a borough and was chartered as a city in 1845. The city suffered severely in 1855 from an epidemic of yellow fever. During the Civil War, in April 1861, General Tyler entered the city with a large body of Virginia troops. In May 1862, the Federal army took possession of the city and during the interval from April 1861 to May 1862 the city was the chief Confederate naval station.

**Population.**—In 1850 Norfolk had a population of 14,620; (1860) 21,666; (1870) 34,872; (1900) 46,024. Est. pop. (1904) 55,000. The three cities of Norfolk, Portsmouth and Berkeley, which practically form one municipality, have an aggregate population, within a radius of three miles from Norfolk, 118,000 in 1900.

**Bibliography.**—Burton, "History of Norfolk" (1877); Forrest, "Historical and Descriptive Sketches of Norfolk and Vicinity" (1843); "Norfolk and Our Twin Cities of the 19th Century" (1888); W. H. Lumsden, Secretary Chamber of Commerce, Norfolk, Va.

Norfolk Island, in the Pacific Ocean, 400 miles northwest of North Cape, New Zealand, nearly midway between that colony and New Caledonia, and about 800 miles east of Australia, is six miles long, and has an area of 8,528 acres, rising in Mount Pitt to a height of over 1,000 feet. The climate is healthful, and the soil fertile and well watered; diverse and luxuriant is its flora are the Norfolk Island pine, growing to a height of 200 feet, and the Norfolk Island cabbage, a dwarf pine. Norfolk Island was discovered by Cook in 1774. Between 1788 and 1865, and again between 1865 and 1855, it was a penal settlement for convicts sent from New South Wales. In 1865 many of the inhabitants of Pitcairn Island (q.v.) were transferred hither by the British government. The people govern themselves, under the superintendence of the government of New South Wales, but are indolent, and, owing to intermarriage, a decaying race; they fish, farm, and supply provisions to passing vessels. Pop. (1895) 882.

**Norfolk Island Pine.** See Araucaria.

**Norfolk Spaniel.** See Spaniel.

**Nor'ia.** A hydraulic machine used in Spain, Syria, Egypt, and other countries for raising water. It consists of a water-wheel with revolving buckets or拉丁 pitchers; and the height of construction and operation are various. As used in Egypt it is known as the sakieh. These machines are generally worked by animal power, though in some countries they are driven by the current of a stream.

**Norici, Jules, zhiul nôr-ê-kh, pseudonym of Claude Antoine Jules Cayron:** b. Limoges, France, 1827; d. Paris, France, 1 Oct. 1882. His novels have won a high reputation and among the most widely known are: 'The Countess of Bruges' (1878); 'The Chevalier de Cerny' (1879); etc.

**Normal, nôr'mal, Ill., city in McLean County; at the junction of the Chicago & A. and the Illinois Central R.R.'s; two miles northeast of Bloomington and about 60 miles northeast of Springfield. It was settled about 1840, incorporated in 1856, and chartered as a city in 1867. It is in a productive agricultural region in which considerable attention is given to the cultivation of fruit and nursery stock and to the raising of Norman and French draft horses. It has canning factories, novelty works, and a large trade in farm products, nursery stock, and horses. It is the seat of the Illinois State Normal University and the Illinois Soldiers' Orphans' Home. It has five churches, graded schools, and a library. The bank has a capital of $100,000. The government is administered under special charter and is vested in a president and a council of five members, all elected annually. Pop. (1890) 3,459; (1900) 3,795.

B. H. McCANN, Editor 'The Advocate.'

**Normal College of the City of New York,** founded in 1869, for the training of teachers. The first attempt in New York city to provide public means for teachers to procure professional training was in 1856, when a daily normal school was established, which remained in existence only three years. This was followed by the Saturday Normal School, which proved a source of inspiration to the teachers, and made them strong advocates for more thorough professional work. In 1869 the Normal and High School for young women was established by the Board of Education; in 1870 the name was...
NORMAL SCHOOL—NORMAN FRENCH

changed to Normal College. Graduates of grammar grades were then admitted and the course was for three years. The first president, Thomas Hunter, still (1903) continues as the head of the school. The board of trustees consists of the president of the college and the Board of Education of the public schools of the city. The entrance requirements and the course of instruction have been raised. Since 1903, the institution has a professional course of six years and a collegiate course of seven years, with power to grant degrees. It has a model kindergarten and a model elementary school, an excellent library and five well equipped laboratories. From 1870 to 1903 there have been about 10,000 graduates. Of this number, 1,870 were graduated between 1870 and 1890; 2,517 between 1880 and 1890; and 3,579 between 1890 and 1900. A large number of the teachers in New York city are graduates of this college.

Normal School, Manila, established in 1901 by the superintendent of public education for the Philippines. From 10 April to 10 May 1901, a preliminary term of school was conducted under the direction of the superintendent of schools for the city of Manila. Arrangements were made to secure favorable rates of transportation for teachers distant from Manila, and students came from all parts of the archipelago. There were in attendance 600 students, 10 per cent of whom spoke English. Considerable attention was given to subject matter. The average daily attendance was 98 per cent. Many of the pupils remained as regular attendants at the normal school; and the work was most satisfactory during 1901 and 1902, although subject matter was given much more attention than methods. A practice school, well equipped, is one of the strong features. In 1903 there was a large class sufficiently advanced in English to begin regular professional work. The method department was placed in charge of Gertrude Robinson, a teacher from the Indiana State Normal at Terre Haute. The classification in the practice school is first based almost wholly upon speaking, reading, and writing English. The number enrolled in the regular normal department up to 1 Jan. 1902 was 310. The number of provinces represented was 24.

In conjunction with the Manila Normal School, there are four tribal normal schools: at Vigan, province of Ilocos Sur; Nueva Caceres, province of Camarines Sur; Iloilo, province of Panay; Cebu, province of Cebu; and Zamboanga, province of Mindanao. The pupils spend three years in the provincial school and then one year of final training in the Manila school.

In the capital of each province, a normal school is held during the long vacation; attendance is required of all the native teachers. The division superintendent in each district has charge of the vacation normal school held in his district. This vacation normal school must continue four weeks, but a six weeks' session is recommended. The normal school at Manila is practically the head centre for all the public method schools of the archipelago.

Normal Schools. See Schools, Normal.

Norman, nór'man, Henry, English traveler and author: b. Leicester, England, 19 Sept. 1858. He was graduated from Harvard in 1881 and later studied at Leipzig. In 1882 he began the public agitation for the preservation of Niagara Falls, which resulted in the purchase of land on both sides of falls by the State of New York and the Dominion of Canada for use as a public park. He was for several years on the editorial staff of the Pall Mall Gazette; and in 1895 became assistant editor of the London Daily Chronicle, resigning this position in 1899; he has also been London correspondent of the New York Times and Chicago Tribune. He has traveled widely in the United States and Canada, and also in Japan, Russia, Siberia, Central Asia, Korea, China, Siam, the Malay Peninsula, Egypt and the Balkans. In 1902 he founded the "World's Work," an illustrated monthly of which he has since been editor. In 1990 he was elected to the British Parliament from South Wolverhampton. He has written "An Account of the Harvard Greek Play" (1881); "The Preservation of Niagara Falls" (1882); "The Real Japan" (1892); "The Peoples and Politics of the Far East" (1895); "The Near East" (1899); "All the Russians" (1902); and "Delhi" (1902).

Norman, Okla., city, county-seat of Cleveland County, on the Atchison, Topeka & S. F. railroad; about 48 miles south of Guthrie and 30 miles south of Oklahoma. It is in an agricultural region in which the cultivation of wheat and cotton, and cattle-raising are the chief occupations. The principal manufactures are cottonseed-oil, and ice. It has considerable trade in wheat, flour, cotton, cottonseed-oil, and live-stock. It is the seat of the University of Oklahoma (q.v.) and it has the Territorial Insane Asylum. There are 11 churches and two public schools. The two banks have a combined capital of $100,000. The government is vested in a mayor and a board of aldermen of eight members. Pop. (1890) 787; (1900) 2,225.

Norman Architecture. See Architecture.

Norman Conquest, in English history, the successful attempt made by William of Normandy in 1066 to secure the English crown from his rival Harold, son of Earl Godwin. It was no real conquest of the land and people by an alien race, but rather a blending of the two races, wherein the English people were assimilated into the Norman-Saxon stock that now forms the majority of the population. The Normans were a branch of the ancient Franks, known as the Normans or Norsemen. The Norman Conquest of England was made by Duke William of Normandy, who defeated King Harold at the battle of Hastings, Oct. 14, 1066. The Duke of Normandy then became king of England, and the Normans ruled England for the next 300 years. The Norman Conquest was a great event in English history, and it marked the beginning of a new era in the country. The Norman Conquest led to the development of a new social and political order in England, and it had a profound effect on the country's culture and language. The Normans brought with them a new system of government, a new legal code, and a new style of architecture, which was later known as the Norman Romanesque style. The Norman Conquest also led to the spread of the Normans across Europe, and it marked the beginning of the Norman Conquests of other countries, such as Sicily and parts of Italy.

NORMAN LAW — NORMANS

native population of the Channel Islands (q.v.), the remnant of the Norman possessions belonging to Great Britain. See NORMANDY.

Norman Law, See LAW; NORMANDY.

Norman, nôr'mân-â, Constantine Henry Phipps, 1st MARQUIS OF, English statesman: b. England 15 May 1797; d. South Kensington, England, 28 July 1863. He was educated at Trinity College, Cambridge and in 1818 entered Parliament. He was appointed captain-general and governor of Jamaica and in 1835 was made lord-lieutenant of Jamaica, where he was extremely popular. He was secretary of war and of the colonies in 1839 and later was transferred to the home secretaryship which he occupied until 1841. He wrote: 'The English in Italy' (1825); 'A Year of Revolution' (1857); 'Vindication of the Duke of Modena' (1861); and several novels, one of which is 'Contra' (1853).

Normand, nôr'mand, Henrietta Rae, English painter: b. London 30 Dec. 1859, daughter of T. B. Rae; married Ernest Normand, painter, 1884. She was educated in London art schools, and was awarded a medal at the Paris and Chicago Universal Expositions. Since 1890, when she first exhibited at the Royal Academy, she has been represented there every season. Some of her most important pictures are 'Ariadne' (1885); 'A Naïad' (1886); 'Evrydie' (1886); 'Death of Procris' (1889); 'Ophelia' (1890); 'Apollo and Daphne' (1895); 'Diana and Callisto' (1899); 'Sir Richard Whittington and his Charities', a fresco for the Royal Exchange (1900).

Normand, Jacques Etienne, zhâk a-tâ-â nôr'mân, French communist: b. Abbeville, France 1899; d. San Antonio, Texas, 1897. He was a Saint Simonist, and during the revolution of 1848 in France, petitioned the legislature for permission to establish a communist colony; he was banished from France when Louis Napoleon became president, and came to the United States. Buying considerable land near San Antonio, Texas, he established a communist colony called Réunion, which prospered for a time, but which was finally suppressed by the Texas legislature. While trying to establish another colony, he was arrested and imprisoned. He wrote: 'Principes de Socialisme' (1846); 'Théorie de la Commune Naturelle' (1855); 'Théorie de la République Communiste Universelle' (1860).

Normandy, nôr'mân-di, France, an ancient province bordering on the English Channel, now divided into the departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche. It is a fertile region, well cultivated fields and fruitful orchards, and the people are intelligent and industrious, ranking among the best and most energetic of French provincials. Under the Romans this portion of the country formed part of Gallia Lugdunensis Secunda; after the Franks' invasion it made a constituent part of the kingdom of Neustria, and was given by Charles the Bald to the Duke of Paris. From the middle of the 9th century its coasts were harried by the Vikings or Northmen (see NORS, X), who early in the 10th century established themselves in such force along the Seine that Charles, king of the Western Kingdom, was glad to arrange a treaty with their leader Rolf (Rollo, Rou) at Clair-sur-Epte in 912, practically ceding the region which henceforward was known as Normandy. Its capital was Rouen, and it comprised Upper Normandy, with the towns of Dieppe, Evreux, Harfleur, Havre, Honfleur, Lisieux, Rouen, and Yvetot, and Lower Normandy with Caen the chief town, Alençon, Auranches, Bayeux, Carentan, Vire, etc., and moreover the ancient districts of Falaise, Granville, and Saint Lo. Rollo's most distinguished successor was William I, Duke of Normandy, who invaded England in 1066, and established a Norman dynasty, thereby uniting Normandy with the latter country. Philip Augustus conquered Normandy in 1204, the French holding it till 1417, when it was recovered by the English, who held it till 1450, when it was finally wrested from them by Charles VII. The Channel Islands (q.v.) are a remnant of the Norman possessions still belonging to the descendants of the Norman kings of England, where down to the present day the law administered in the royal courts is virtually the Grand Coutumier de Normandie, or the old customary law of Normandy. One feature survives in the Cry of Haro. This ancient customary law of Normandy seems to have been collected in writing on three separate occasions. The earliest collection was apparently written down by private persons in 1200 and about 1220, and had no official character; the third collection (1585) is a revised edition of the second, the Grand Coutumier, completed early in the 14th century. Consult: Freeman, 'Norman Conquest' (1877); Palgrave, 'History of Normandy' (1878); Spence, 'Dreamland in History' (1900).

Nor'mans, or Northmen, a general name given the people of ancient Scandinavia, or Norway, Sweden, and Denmark. This name was given to them in the Netherlands, in Germany, and France; in Great Britain they were called Danes. They were fierce and warlike tribes, who made piratical expeditions to all parts of the European seas, plundering by land and by sea, and often overrunning large tracts of country, in which they practised every enormity. "They had scarcely any inducements," says Mackintosh, the English historian, "to spare countries which they visited only to plunder, and where they did not hope to dwell; they were less than others liable to retaliation, and they had neither kindred, nor family, nor home. They were, perhaps, the only barbarians who applied their highest title of magistracy to denote the leaders of piratical squadrons, whom they termed vikings or sea-kings. Not contented with their native and habitual ferocity, some of them sought to surpass their companions by working themselves into horrible and temporary insanity by vikings does not, however, mean sea-kings, but is derived from vik, a bay or creek. The poverty of their country compelled them to adopt this means of subsistence, and their religion inspired them with a love for daring enterprises, since it taught them that warriors fallen in battle were admitted to Valhalla, the northern paradise. In 795 some Norwegians established themselves in the Faroe Isles and in Orkney; toward the middle of the 9th century the governments of Novgorod and of Kiev, in Russia; and after the discovery of Iceland certain powerful Norwegian families, taking refuge from the
NORNS — NORRIS

persecutions of Harold, king of Denmark, settled in that island. The Northmen began their piracies in the first part of the 9th century, and soon covered the sea with their boats, and ravaged the coasts of England, Germany, Friesland, Flanders, and France. Under the feeble reigns of Charles the Bald and Charles the Fat they ascended the rivers to the very heart of France, and plundered Paris itself. It became necessary to purchase their retreat with gold. Their incursions into France were afterward renewed, and Charles the Simple was obliged (912) to cede to them a part of Neustria, which was afterward called, from them, Normandy (q.v.), and to give his daughter in marriage to Rollo, their chief. Rollo embraced the Christian religion, was baptized under the name of Robert, and became the first Duke of Normandy, and a vassal of the King of France. His followers received the religion of their leader, and abandoned their roving and piratical habits; though they still retained, as also did their descendants for a long time, marks of their Scandinavian origin, and that warlike arder which had rendered them so terrible to those against whom they directed their attacks. Great Britain was, for about two centuries, desolated by the Northmen, who were there called Egbert, in the beginning of the 9th century, had no sooner made some approaches toward a regular government, and the establishment of tranquility, than the "Scandinavian heathens," as the Saxons termed them, made their appearance. Alfred (871-901) finally delivered the country from the invaders, after they had subdued the whole land except the "isle of the nobles," into which the king had retreated with a few nobles. But the relief was only temporary; they returned, under his successors, in greater force, obtained possession of the northern and eastern part of the country, and in the beginning of the 11th century three Scandinavian princes (Canute, Harold, and Hardecanute) ruled over all England for the space of about 25 years. The Saxon line was then restored; but in 1066 William, duke of Normandy, obtained the English throne. This conquest, as it is commonly called, had a most important influence on the English manners, language, and constitution, which had hitherto escaped with little change, and is therefore one of the most important epochs in English history. In the year 1000, according to the Saga narratives, Leif, son of Eric the Red, leaving Greenland, which had been discovered and settled by his father, a Norwegian, proceeded southward in a ship, accompanied by 35 men, and discovered the American coast, to which he gave the name of Vinland. In 1007 a rich Greenlander, with a following of 60, emigrated to Vinland, and there planted a colony, which seems to have thriven, but after a time we hear nothing more about it. The Normans also established a new kingdom in Naples in 1016. The foreign expeditions of the Northmen gradually diminished their numbers and strength at home, and rendered them less formidable.

Consult Depping, "Histoire de l'Expédition des Établissments en France au Xe Siècle" (1826); Du Chaillu, "Le Viking Age" (1890); Freeman, "History of the Norman Conquest of England" (1877); Kearly, "Vikings in Western Christendom" (1891).

Norns, nörnz, in Scandinavian mythology, the three Fates, representing the past, the present, and the future, part in the destiny of men. They were represented as three young women, named respectively Urd, Verdandi, and Skuld. They sit by the well of Urd, under the world-tree Ygdrasil in Asgard, and there determine the fate of boys and men. Besides these there are many inferior norns, both good and bad, answering to the genii of classical mythology; to such are attributable the unequal destinies of men in the world. Women who possessed the power of prediction or magic also bore this name.

Nor'ridgewock Indians, an American tribe of the Algonquin family. They formerly lived along the Kennebec River in Maine, and were frequently called Kennebec Indians. They were patrons of the French missionaries and were regarded as dangerous enemies of the English colonists. The latter sent an expedition against the Norridgewocks in 1724, and the tribe was practically annihilated.

Norris, nörz, Edwin, English linguist: b. Taunton, Somerset, England, 24 Oct. 1795; d. Brompton, England, 10 Dec. 1872. His early youth was spent in tutoring, and in 1818-37 he was a clerk with the East India Company. In 1837 he became assistant secretary of the Royal Asiatic Society and in 1859 its secretary. His time was principally devoted to the study of the Semitic languages and the Celtic dialect, and he was an authority on cuneiform writing. His greatest work is his "Assyrian Dictionary" (1868-72).

Norris, Frank, American novelist and journalist: b. Chicago 1870; d. San Francisco 25 Oct. 1902. He studied at the University of California and at Harvard, after three years as an art student in Paris; was war correspondent of the San Francisco Chronicle in South Africa in 1895-96; edited the San Francisco Wave 1886-7; wrote articles for Cuba for McClure's in 1898; and was the author of several virile realistic novels: "McTeague" (1899), "Moran of the Lady Letty," a romantic story (1900), "The Octopus," a story of wheat raising and transportation (1901), and "The Pit," dealing with wheat exchange and gambling. The two last named stories are epical and Zolasque in manner, and were to have been concluded by "The Wolf," a story of European famine.

Norris, Henry, English courtier: b. London, England, 17 May 1536. He became a member of the court in early youth and was a favorite of Henry VIII., holding under him many important offices. He was instrumental in accomplishing the downfall of Wolsey and was a friend of Anne Boleyn while she was gaining her foothold at court. Later he was suspected by the king of an undue intimacy with Anne and though doubtless innocent was imprisoned in the Tower and executed.

Norris, Mary Harriott, American novelist: b. Boonton, N. J., 16 March 1858. She was graduated from Vassar College in 1870, was principal of a private school in New York 1880-95, and dean of the woman's department of Northwestern University, Evanston, Ill. 1896-9. Among her published books are: "A Damself of the 18th Century" (1889); "The Gray House of
the Quarries' (1868); 'The Grapes of Wrath' (1901).

Norris, William Edward, English novelist: b. London, England, 18 Nov. 1847. He was the son of a former chief justice of Ceylon; was educated at Eton, and admitted to the bar in 1874, but never practised. His first novel, 'Heaps of Money,' appeared in 1877, and was successful. It was succeeded by 'Mademoiselle de Mersac' (1879); 'Marinomy' (1881); 'No New Thing' (1882); 'His Grace' (1892); 'A Deposed Wife, a Sketch' (1895); 'A Victim of Good Luck'; 'Billy Belloc'; 'A Dancer in Yellow' (1896); 'Clairissa Furiosa' (1898); 'Marietta's Marriage'; 'The Widower' (1897); 'Giles Inglby' (1899); 'An Octave' (1900); 'Lord Lyons, the Luckless' (1903); and other fictions, all of which have enjoyed popularity both in England and this country. He has shown not a little skill in character drawing and his dialogue is entertaining and natural.

Norristown, Pa., borough, county-seat of Montgomery County; on the Schuylkill River, the Schuylkill Canal, and on the Philadelphia & R. and the Pennsylvania R.R.'s; about 15 miles northwest of Philadelphia. It was settled about 1688 by a colony from Wales, laid out in 1785, and incorporated as a borough in 1812. It was named in honor of Isaac Norris, who owned a large tract of land in what is now Montgomery County. It is in an agricultural and mining section of the State, and has extensive manufacturing interests. The chief manufactures are knitting machines, hosiery, men's and women's garments, silk and woolen goods, machine-shop products, agricultural implements, iron and wood furniture. It has considerable trade in manufactured articles and farm products. Some of the prominent buildings are the county court-house, city building, Montgomery Masonic Temple, and the county prison. It has a State Hospital for the Insane, Charity Hospital, Saint Joseph's Protectors (R.C.) for girls, Friend's Home, and the Agnes Stinson Home for Aged Ladies. The educational institutions are a high school, public and parish schools, the Montgomery Historical Society, and the McCann library. The tomb of Winfield Scott Hancock (q.v.) is here in Montgomery Cemetery, also a memorial shaft to John F. Hartranft. Valley Forge (q.v.) is only six miles west by north, and many other places of historic and scenic interest are in the vicinity. The government is vested in a burgess, who holds office three years, and a council. The electric-light plant is owned and operated by the borough. Pop. (1890) 19,791; (1900) 22,285.

Norrköping, norr-kéé-ping, Sweden, seaport, on the southeast coast, on the Brälk River; about 80 miles southwest of Stockholm. It was founded in 1384, but it has several times been destroyed by fire. The Motala, a rapid river, flows through the city and furnishes extensive water-power, which is used for manufacturing. In 1902 there were over 100 manufacturing establishments, whose annual products were valued at over $10,000,000. It is an important commercial city, and has an extensive trade in its manufactures of cotton and woolen goods, pottery, paper, etc., and in the imports which are re-shipped at Norrköping for the interior. Pop. (1902) 43,128.

Norrland, norr-länd, Sweden, the largest of the three historical divisions of Sweden; in the northern part; area, 80,785 square miles. It has a cold climate, well-wooded in the south, scanty vegetation in the north. The towns and villages are chiefly in the southern part; but few settlements are in the northern part. Pop. (1901) 800,254. See Sweden.

Norse, the language of Scandinavia, especially in its earlier forms. Old Norse is represented by the classical Icelandic, and still with wonderful purity by modern Icelandic. See Iceland; Scandinavia.

Norse Mythology. See Mythology.

Norseman, or Northman. See Normans.

North, Christopher, the pseudonym of one of the authors of the 'Noces Ambrosiana.' See Wilson, John.

North, Sir Dudley, English financier and economist, 3d of the 4th Lord North: b. Westminster 16 May 1641; d. Covent Garden 31 Dec. 1691. He early entered the employ of a merchant in Turkey; became treasurer of Turkey Company; returned to England in 1680; was one of the sheriffs of London in 1682 and a commissioner of customs in 1683; and retired from public life shortly after the accession of William and Mary. He was a man of great ability, one of the first Englishmen to urge the doctrine of free-trade, and the author of an important pamphlet on the 'Currency.'

North, Francis, Baron Guilford, English lord chancellor, brother of Dudley and Roger North (qq.v.): b. Kirtling, Cambridgeshire, Oct. 1707; d. Wroxton, Oxfordshire, 5 Sept. 1785. He was educated at Cambridge, and studied law at the Middle Temple. His rise was rapid: in 1671 he was knighted; in 1673 became attorney-general; and from 1675 to 1682 was chief justice of the court of common pleas. In 1682 he became lord chancellor, was created Baron Guilford in 1683, and died soon after assisting at the coronation of James II. His uncompromising royalism made him the object of contemporary attack and present misunderstanding, notably in Lord Campbell's 'Lives of the Lord Chancellors.' It is to an early attack of this nature, namely, that in Kennett's 'Complete History' that we owe Roger North's 'Apology' for his brother, which grew into the 'Lives of the Norths.' The conflict of testimony makes his personal character problematical, but it is certain that he was a learned lawyer and a patron of literature, the arts, and the sciences.

North, Frederick, Lord, Earl of Guilford, English statesman, George III's prime minister during the American Revolution: b. London 13 April 1732; d. there 5 Aug. 1792. His father was Francis, 1st Earl of Guilford. He was educated at Eton and Oxford; studied and traveled abroad for three years; and in April 1754 was elected to the House of Commons for one of his father's pocket-boroughs. From June 1759 to July 1766 he was a junior lord of the treasury; and in 1767 became chancellor of the exchequer and leader of the House of Commons upon the death of Townshend, whose measures taxing the American colonies Lord North carried through, and in this particular as in general showed himself the "King's friend" and entirely indifferent to the wishes of the people. Early in 1770 he became
NORTH — NORTH ADAMS

prime minister, but was none the less merely the King’s tool; in March 1774 he succeeded in passing the celebrated Boston Port Bill and Massachusetts Bill; and though he seems to have seen soon after the King’s policy was a mistaken one and could result only in the loss of the colonies, and although he urged in 1775 that the colonies, if they taxed themselves, should not be taxed by Parliament, he still supported the King’s obstinate policy and remained in office, while his government grew steadily weaker because of the defection of men whose scruples, identical with his, carried some force with them. On 20 March 1782 he resigned, just in time to forestall a motion for the dismissal of the cabinet. In February of the next year by a dexterous coalition with his old enemy, Fox, he secured the dismissal of Shelburne, was a member of the coalition cabinet of 1783, and thereafter acted with the opposition against Pitt. The last five years of his life Lord North was blind, but still took some interest in politics, and spoke occasionally in the House of Lords, of which he became a member upon his father’s death. Personally he was clumsy, awkward, very short-sighted, with an unintelligent puffy face, expressionless eyes, and heavy lips, closely resembling George III. As prime minister he was the King’s agent; indeed, he refused to be called prime minister, denying the place of any such office in the British constitution. After his coalition with Fox he broke with the Crown, however, and refused George III.’s urgent offers to make him premier in 1783. He was neither a great statesman nor a great orator, but had a gift of humor, wit, and pleasant temper. Consult: Donne, ‘Correspondence of George III. with Lord North’ (1807); Lecky, ‘History of England’ (1882-7); Lewis, ‘Administrations of Great Britain’ (1804).

North, Roger, English colonist in America; b. about 1585; d. 1652. He was the son of Sir John North, and a grandson of Roger, 2d Baron North, and in 1617 accompanied Sir Walter Raleigh to Guiana, did good service against the Spaniards on the Orinoco, and remained faithful to his commander to the last. In 1619 he applied for a patent to trade along the Amazon, and, when this was denied him because of Gondomar’s influence with the King, sailed from Plymouth without leave in May 1620. Hence he was imprisoned upon his return. In 1627 he received letters-patent to found Guiana, but spent the last years of his life in England. North planted the English power in South America and was one of the most notable colonial projectors of his day.

North, Roger, English lawyer and historian, brother of Dudley North and Francis North (qq.v.): b. Tostock 3 Sept. 1653; d. Rougham 1 March 1734. He studied at Jesus College, Cambridge; became a barrister at the Middle Temple; rose rapidly in the practice of law, becoming attorney-general to the Queen in 1682; left political life upon the accession of William and Mary; and spent the rest of his life in retirement. He was a famous book-collector, but is best known for his ‘Life of the Norths,’ an invaluable picture of the life of the period, as is his ‘Autobiography.’ Both these books are included in Bohn’s Library (1890). His strong Tory sentiments are to be seen in the ‘Examen,’ a critical inquiry into the truth of White Kennett’s ‘History of England.’ North also wrote ‘Memoirs of Music’ (ed. by Rimbaud in 1846).

North, Sir Thomas, English translator of Plutarch, son of the 1st Baron North; b. about 1553; d. about 1601. He studied at Peterhouse, Cambridge; entered Lincoln’s Inn 1557; and in 1579 published his version of Plutarch’s ‘Lives,’ actually a version from the French of Amyot. It was dedicated to Queen Elizabeth, was very popular in her day, and was the immediate source of most of Shakespeare’s classical plays, notably ‘Antony and Cleopatra,’ ‘Coriolanus,’ ‘Julius Caesar,’ and ‘Pericles,’ some of which have entire speeches taken scarcely with a change from North. North also translated Guevara’s ‘Libro aureo,’ a Spanish adaptation of the ‘Meditations of Marcus Aurelius,’ thus rendering Euphuism out of Spanish into English; and a collection of Oriental fables from the Italian of Doni. Consult: Skeat, ‘Shakespeare’s Plutarch’ (1875); and Leo, ‘Four Chapters of North’s Plutarch’ (1878). The complete version is to be found in the ‘Temple Classics,’ and in a splendid reprint in the ‘Tudor Translations’ (1895).

North, William, American soldier; b. Fort Frederick, Pemaquid, Maine, 1755; d. New York 3 Jan. 1836. He entered the Revolutionary army in 1775 and served under Arnold in the Quebec expedition. In 1779 he was aide-de-camp to Baron Steuben whom he greatly assisted and who at his death bequeathed to North the bulk of his property. He was present at the surrender of Cornwallis and remained in the army after the war, rising to the rank of brigadier in 1798. He sat in the New York State assembly and from 1799-99 was a United States Senator. He was mustered out of service in 1800. He wrote a biography of Baron Steuben.

North Adams, Mass., city, in Berkshire County; on the Hoosac River and on the Boston & M. and the Boston & A. R.R.; about 50 miles northwest of Springfield. It was settled in 1765 and was part of Adams until 1878 when it was incorporated as a town, and in 1895 was chartered as a city. It includes the villages of Brayton, Greylock, and Beaver, and Bostwick. It is situated in a beautiful section, amid the Berkshire Hills, at the base of Greylock, the highest peak in the State. In the western part of the city may be seen the site of old Fort Massachusetts, captured in 1746 by French and Indians under command of Vaudreuil. Hudson Brook and its natural bridge are points of interest, and near is the famous Hoosac Tunnel. The chief industrial establishments are machine-shops, cotton and woolen mills, boot and shoe factories, print goods factories, creameries, and cigar factories. The trade is chiefly in manufactures, farm and dairy products. It has a city hospital, good municipal buildings, and a number of fine church edifices. The educational institutions are a State Normal School, high schools, public and parish schools, and the North Adams Library. The charter of 1895 provides for a mayor, who holds office one year, and a council. The school committee, assessors, and library trustees are elected by popular vote. The city owns and operates the waterworks. Pop. (1890) 16,074; (1900) 24,200. Consult: Spear, ‘History of North Adams’; ‘Berkshire Hills.’
NORTH AMERICA—NORTH ANNA

North America. See America; Canada; Central America; United States.

North American Phalanx, the most important colony founded by the Fouriers in the United States. It was organized in 1843, and located in Monmouth County, N. J., about 40 miles south of New York. The organization was on the joint stock principle, and all the members were engaged in the co-operative labor of the colony; they were paid a certain amount for labor, for talent (or administration) and for capital invested; the rule was to pay the highest prices for the hardest and most disagreeable labor. The labor was at first mostly agricultural, products being sold outside the colony; but later mills were built and a considerable amount of manufacturing done. A common school education was provided. The life was simple and pleasant, there was a library and reading room, but the colony lacked many of the elements of culture that distinguished the life of Brook Farm (q.v.). The management was good, and for many years the colony prospered; in 1853 dissatisfaction in a secession of some of the members, and the founding of a new phalanx; in 1854 the mills were burned down, a serious loss that badly crippled the colony; and in 1856 the organization was formally dissolved. Consult Noyes, 'History of American Socialisms.'

North Andover, Mass., town in Essex County; on the Boston & M. railroad; about 30 miles north of Boston. It was a part of Andover until 1855 when it was incorporated as a town. It is a manufacturing place, but a large portion is reserved for residential purposes, and it is noted for its beauty and healthfulness. The chief manufacturers are woolen goods, mill machinry, and wood products. The government is administered by town meeting. The watersworks are owned and operated by the town. Pop. (1890) 3,742; (1900) 4,243.

North Anna, Operations on the. After the defeat of the men in assaulting Gen. Lee's lines at Spottsylvania Court House, Gen. Grant concluded to turn Lee's position by a movement that would bring him nearer to Richmond, and possibly interpose his army between Lee and the city. He therefore made preparations for a movement on the night of 20 May 1864 by Hancock's Second corps, which, preceded by Torbert's cavalry, marched for the Mattapan and North Anna rivers. Torbert attacked and drove Kemper's brigade from an intrenched position at Milford Station and across the Mattapan, Hancock following and intrenching beyond the river on the 21st. Other corps followed Hancock, and Grant's advance reached the North Anna in the forenoon of the 23d at Island and Jericho fords and Chesterfield bridge, the latter a mile above where the Richmond and Fredericksburg Railroad crosses the river. But Lee was in his front. He had detected the movement and put his army in motion for Hanover Court House, and on the morning of the 23d was south of the North Anna, in position covering the roads and railroads leading to Richmond. Here he was joined by Gen. Breckinridge from the Shenandoah Valley, and by Pickett's division from near Richmond. Ewell's corps was on the right, Anderson's in the centre, and A. P. Hill's on the left. Breckinridge and Pickett were in reserve. Gen. Warren, with the Union Fifth corps, crossed the river at Jericho Ford, constructed a pontoon-bridge, and at 4:30 P.M. of the 23d his entire corps was in line of battle about half a mile from the river and on the edge of a wood next to it, the front being covered by the wood. Cutler's division was on the right, Griffin's and Cook's at the centre, and Gardner's on the left, its flank resting on the North Anna. About 6 p.m. Wilcox's division of A. P. Hill's corps fell upon Cutler's division and part of Griffin's, driving back Cutler in some disorder, following him, and uncovering Griffin's right; but Griffin drew back his right, Bartlett's brigade hastened to his support, and Wilcox was driven back with a severe loss in killed and wounded, and nearly 1,000 prisoners. Warren lost about 350 men. About the same time Hancock had prepared to force a passage at Chesterfield bridge. A part of Kershaw's division held a bridge-head north of the stream; that was charged and carried about 6 P.M. by the brigade of Cols. Pierce and Egan, with the loss of 150 men, the Cols. and Egan retreating. The Confederates retreated from the bridge and fell back toward the high ground on the river. The crossing of the river by Warren, and Wilcox's unsuccessful effort against him, forced Gen. Lee to change and shorten his line during the night of the 23d, until it was nearly in the form of a right-angled triangle, with the right-angle opposite Ox Ford and extending down the river three fourths of a mile, then southeast to near Hanover Junction. The left, under A. P. Hill, ran from Ox Ford southwest across the Virginia Central Railroad to Little River. On the morning of the 24th Hancock crossed the river unopposed, and began to intrench within 700 yards of Lee's line, where about 6 P.M. Smith's brigade was attacked and became sharply engaged. Barlow's division was got ready to attack, but Lee's intrenchments were so strong that the attack was abandoned. At the same time Wright's Sixth corps crossed the river at Jericho Ford and joined Warren. Burnside's Ninth corps arrived at Ox Ford but could not cross in front of Lee. The line of Lee's line holding the south side, upon which Potter's division was sent to the left and crossing lower down, formed on Hancock's right, while Crittenden's division moved up stream to near Ox Ford. He then joined Crawford's division of Warren's corps. Crittenden, supported by Crawford, moved forward to connect with and open the way for Wilcox's division to cross, but was attacked by Mahone's division and driven back with severe loss. Everywhere Lee was found well intrenched. Grant found himself in a false position; his two wings on one side of a stream, difficult at all times to cross, and liable to sudden rise by heavy rains, while his centre was on the other side, with Lee's centre like a blunt wedge, standing ready to receive him, and interposing between his wings, neither of which could support the other. The trains were ordered to recross the river on the 25th, and on the night of the 26th Grant recrossed and, marching to the left 32 miles, crossed the Pamunkey at and near Hanover Town by the afternoon of the 28th, and was in connection with his new base of observation from the middle of the river near Richmond. The Virginia Campaign of 1864-65; Walker, 'History of the Second Army Corps'; Grant, 'Personal Memoirs,' Vol. II.; Pennypacker, 'Life of
NORTH ATTLEBORO—NORTH CAROLINA

Gen. Meade; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

North Attleboro, åt’l-bär-ô, Mass., town in Bristol County; on the New York, N. H. & H. railroad; about 30 miles southwest of Boston. It includes the villages of Oldtown, Adamsdale, Falls Village, and Robinsonville. It was settled in 1637 and incorporated in 1887. The chief industries of the town are connected with the manufacturing and sale of jewelry. It has establishments for the manufacture of boxes, buttons, braid, cotton yarn, rope, silverware, machinery and supplies for the jewelry business. Some of the prominent buildings are the G. A. R. Memorial Hall, the Holmes Memorial building, the high school, and the Richards Memorial Library. The government is administered by town meetings. The town owns and operates the electric-light plant and the waterworks. Pop. (1890) 6,727; (1900) 7,253.

North Bay, Canada, town in Nipissing district, in the Province of Ontario; on the north shore of Lake Nipissing, and on the Grand Trunk and the Canadian P. R. R. A United States consulate is stationed here. It is a favorite resort for sportsmen on account of the abundance of fish and small game. Pop. (1901) 2,530.

North Berwick, bêr’ik, Scotland, a fashionable watering-place, formerly a fishing village of Haddingtonshire, at the entrance to the Firth of Forth in the northern parts of Edinburgh. Behind it rises conical North Berwick Law (612 feet). Tantallon Castle three miles east fronting the Bass Rock is a magnificent ruin, finely described in Scott's 'Marmion.' Pop. (1901) 2,789.

North Borneo. See BORNEO.

North Brabant, brâ-bânt or brâ’bant, Netherlands, a frontier province bordering on Belgium. See BRABANT; NETHERLANDS.

North Bradock, Pa., borough in Allegheny County; on the Pennsylvania railroad; about six miles east of Pittsburgh and two miles east of Homestead. It was a part of Braddock until 1868. It has an extensive rail interest, but a portion of the borough is a residential reserve. The government is vested in a burgess, who holds office three years, and a council. Pop. (1900) 6,535.

North Cape. See CAPE NORTH.

North Carolina, kâr-ô-l’n’a, one of the original 13 colonies, midway between Maine and Florida; bounded by Virginia on the north, by Tennessee on the west, by South Carolina and Georgia on the south and southwest and the Atlantic Ocean on the east. It extends from lat. 35° 51½’ to 30° 33’ N., and lon. 75° 27’ to 84° 20½’ W. from Greenwich, taking the greatest width each way. Tennessee originally was part of North Carolina, but in 1790 was ceded by it to the United States.

Area.—North Carolina ranks the 17th State in size in the Union, and is the largest on the Atlantic coast save Georgia and Florida. It contains 52,286 square miles (including the area 3,620 square miles of its sounds and rivers) and is slightly larger than England. Its surface is very nearly a one thousandth part of the land area of the globe. Its greatest length from east to west, from 'Cherokee to Currituck' is more than 500 miles and its greatest width north and south is 188 miles.

Topography.—The State is divided by nature into seven divisions—Eastern, which is generally level, with many swamps and sandy, farther back with two great sounds near the ocean, the Albemarle and Pamlico; the Central or hilly regions; and the Western which is mountainous. The coast line of more than 300 miles runs at first east of south, then to west. Along the whole ocean coast stretches a chain of narrow, barren sand banks, broken occasionally by inlets which are constantly changing, occasionally filling up entirely in the course of years and new ones being opened by storms. The Eastern Division extends inland from the ocean about 150 miles. The dividing line between it and the Central Division trends southwestwardly and was once the shore line of the ocean, all east of it having been in prehistoric ages the bed of the sea. This line is clearly marked by the falls of the rivers. This Eastern Division contains the two great sounds already named into which the Chowan, the Roanoke, the Tar, the Neuse and other rivers pour their waters. Farther south, the Cape Fear and its tributaries empty directly into the Atlantic. The Central Division, beginning at an elevation above sea-level of about 200 feet, extends an average width of 200 miles westwardly, rising gradually to an average elevation of 1,200 feet or more at the foot of the Blue Ridge. The western part of this Central region is called the 'Fiedman section.' The Western Division contains 6,000 square miles and has an average elevation of 2,500 feet. The highest peaks east of the Rocky Mountains are to be found here. The highest of them, Mount Mitchell, is 6,686 feet. There are no less than 24 peaks which are higher than Mount Washington in New Hampshire. The principal mountain ranges are the Blue Ridge and Great Smoky Range, but there are also, the Black Mountains and the Balsam. The general trend is from northeast to southwest.

Rivers.—The rivers of North Carolina are numerous, but they are navigable only to the falls, the old shore line of the ocean in the east, hence the grand total of near 3,500 miles (of which scarcely more than 400 miles is navigable) indicates a vast water power which marks out the future of this State as one of the greatest manufacturing States in the Union. Indeed it may be well doubted if there is another which equals it in water power. At the 'narrow of the Yadkin' the river has a fall of 50 feet in a distance of two miles.

Sounds and Lakes.—Besides the two great sounds, Albemarle and Pamlico, there are smaller ones, Currituck, Croatan, Roanoke, Core and Bogue. There are many lakes, the largest being Alligator, Phelps, Mattamuskeet, Pungo and Waccamaw. The largest (Mattamuskeet) has an area of 100 square miles, and Lake Phelps is about half as large.

Capes and Bays.—From the shore line jut out Cape Hatteras and Cape Lookout, between which is Raleigh Bay. Lower is Cape Fear, between which and Cape Lookout lies Onslow Bay. South of Cape Fear is Long Bay. The ocean front of North Carolina is considered the most dangerous on the Atlantic seaboard.
NORTHERN CAROLINA

Islands.—Roanoke Island between Albemarle and Pamlico sounds is the largest in the State and has an area of about 25 square miles. This island was the scene of the first English settlement on this continent, in July 1585. Here also was born the first child of the English race on this continent, Virginia Dare, 18 Aug. 1587. This colony made under the auspices of Sir Walter Raleigh (for whom the capital of the State is named) was soon abandoned. Cedar Island is nearly as large. Smith's Island at the mouth of the Cape Fear has nearly 15 square miles.

Climate and Rainfall.—The mean temperature is 59 degrees or about the average temperature of the Northern hemisphere. The State is on the same isothermal line as middle California, southern France and northern Italy. The rainfall is 60 inches for the eastern belt, 45 inches for the central and 38 inches for the western.

Geology.—The Eastern Division is covered with a stratum 50 to 300 feet thick of Tertiary sands and clays. It shows numerous marl depressions and thrombolites. The Central part of the State is a three foot seam of trissic, not carboniferous, coal which is estimated to cover 70 square miles. The Western part of the State shows azoic formations only.

Soil.—The soil of the eastern division is generally sandy. Along the rivers are extensive bottom lands of clayey loam, which are very fertile, while the swamp lands have a deep, peaty black soil, and when drained are exceedingly fertile. In the central and western divisions the soil is clay, and gravelly or sandy loam.

Agricultural products.—North Carolina is the only State that fills every blank in the Census of farm products, yielding all the crops grown in both the northern and southern sections of the Union. Its greatest crops, however, are corn, cotton and tobacco. Cotton is grown in the Eastern Division and in the southern half of the Central Division. The yield in 1902 was 500,000 bales; twice the quantity produced by this State in 1861, being the largest percentage of increase shown by any State since the Civil War, save Texas. In tobacco production North Carolina is second only to Virginia and the area has been steadily increasing. Nine tenths of the tobacco known in the markets of the world as "Virginia Brights" is grown in North Carolina. Corn is grown in every county. Rice is produced in large quantities in the Eastern Division and in the production of sweet potatoes the State stands first. In the last few years there has sprung up a great trucking industry, which extends from Currituck to Brunswick. Grape culture has largely increased of late years and a small quantity of wine is produced and shipped.

Timber.—The extent and value of the forests are especially noteworthy ranging from the palmetto, magnolia and live oak around Wilmington to the fir, hemlock and white pine in the mountains of the west. The vast quantities of pine and cypress, and of hardwoods specially oak, hickory, ash, walnut and gum have not only attracted saw mills but have created large furniture factories at High Point and at other places. Of the various species of trees found in the States east of the Rocky Mountains all the eight varieties of pine, the seven varieties of magnolia, the five varieties of maple, and both varieties of walnut are found in North Carolina, while its product of the 20 varieties of oak, four out of the five varieties of spruce, three each out of the five varieties of elm and birch respectively and six of the eight varieties of hickory. Immense quantities of turpentine, tallow, tar and pitch are also produced from the vast tracts of pine forests.

Fauna.—Deer, red and gray foxes, raccoons, squirrels, opossums and rabbits are numerous, while wolves, bear, wildcats, beavers and others are still to be found. Swan, geese, brant and wild duck swarm in the sounds, bays, and rivers of the east in the cold months, while in all parts of the State quail, woodcock, snipe, doves and wild pigeons, larks, and many other birds are numerous. The attraction to sportsmen has been so great that a close season for game has been enacted by the legislature, and recently an Audubon Society has been authorized by the legislature for the protection of birds.

Fisheries.—More than 12,000 men are employed in the fisheries on the sounds and at the mouths of the rivers. More than 500,000 dollars capital is invested. The shad and herring fisheries are especially valuable. Many of the seines are from a mile to three miles long and are operated by steam power. There are 26 counties interested in this industry, the principal ones being Currituck, Pasquotank, Chowan, Bertie, Beaufort, Dare, Pamlico, Craven, Carteret, Onslow, New Hanover and Brunswick. Herring are mostly cured in salt and shipped in barrels, but the salt, striped bass, chub, perch, and other fish are shipped on ice, the large fisheries having each its own ice factory. The State in 1856 organized its fish commission, establishing fish hatcheries which largely increased the catch of fish. Of recent years the United States government has taken over this work and has a shad and herring hatchery at Edenton and a similar establishment for rock bass and salmon at Weldon, at the falls of Roanoke River.

The young fish hatchery at Weldon is in the main a commission under the State Fish Commission which owns a steamboat and has many agents to encourage and protect this industry. The oysters are of fine quality, those of New River being especially prized. Diamond-back terrapins and turtles are found all along the coast and are shipped north and inland, as are also large quantities of clams.

Navigation.—Vessels drawing 24 feet can ascend the Cape Fear River 30 miles to Wilmington, while the river is navigable 120 miles further to Fayetteville, to which point the Federal government contemplates deepening the channel to 8 feet. Th Roanoke is navigable 130 miles to Weldon, the Tar and the Neuse about 100 miles each and the Chowan for 75 miles. Two canals connect the Albemarle and Pamlico Sounds with Chesapeake Bay, and Congress has before it a bill to establish an inland water-way along the whole front of the State by deepening the sounds which lie behind the sand banks which fringe the seaboard.

Manufactures.—The water power of the
NORTH CAROLINA

State owing to the great non-navigable length of its rivers and streams is very great, in fact menacing to goods by canal. Chief to manufactue, the entire cotton crop of the South. Already the State has more cotton factories than any other in the South and is a large manufacturer of tobacco. Other factories of all kinds have greatly increased. The number of persons employed in tobacco manufacturing and over 40,000 in the cotton factories. Child labor under 12 years of age is forbidden by law in factories of all kinds. The chief manufactories of tobacco are to be found at Durham, Winston, Reidsville, and Henderson. There are also cotton factories at those points and at Charlotte, Raleigh, Concord, Salisbury, Fayetteville and at other towns as well as at many points on the streams remote from towns, especially in Alamance and Gaston counties, which counties have the largest number of cotton factories of any in the State.

Minerals.—The State has areas of coal, copper, gold, mica, iron, corundum, kaolin and marl. The last is to be found only in the eastern part of the State, the others in the centre and west. Silver, lead, zinc, zircon, graphite and manganese are also found. The deposits of iron are widely distributed over the State, the most abundant kind being the magnetic. The Cranberry iron mine in Mitchell County yields an ore unsurpassed in the world. There are two bituminous coal fields—one in Chatham and Moore counties and the other in Stokes and Surry counties. Both are close to extensive deposits of iron. Gold is found in 29 counties, mostly in the centre and west of the State, and more than 40 mines are being worked. Up to the discovery of gold in California, North Carolina was the largest gold producing State in the Union; the total yield up to date has been about $30,000,000. Tin has been found in Cleveland County. At one time three fourths of all the mica in the world was mined in this State and largely in Mitchell County. It is produced in 10 counties and is sold at three and four feet across are not unusual. Beautiful marble underlies large sections of Cherokee and Clay counties in the extreme west. Granite, sandstone, and porphyry are to be met with in large quantities, and superior stone for grist mills is quarried in Moore County. Near Wilmington are valuable phosphate beds. The State produces more corundum than any other locality in the world and of the best quality. The valuable gems, diamonds, emeralds, rubies, garnets, amethysts, opals, agates and hiddenites are found. A fine exhibition of minerals, gems, marbles and stones of all kinds is to be seen in the Museum of the State Agricultural Department at Raleigh. At Dunn’s Mountain near Salisbury is an exhaustless supply of granite almost as white as marble, and at Mount Airy is an equally large quarry of light gray granite. Near Raleigh is the granite quarry from which the material for the State Capitol was taken. Indeed granite quarries of good quality are to be found in most of the counties and sandstone quarries are numerous. Mineral springs are numerous, the most noted being the Panacea Springs between Hillsboro and Danville, the Hot Springs in Wayne in the east, while in the centre and west are the Hot Springs in Madison, the Sulphur Springs in Jackson, the Glen Alpine and Connelly Springs in Burke, the Vade Mecum Springs in Surry, the Lithia Springs in Forsyth, the Clarksville Springs in Yadkin county of that name, Jackson Springs in Moore, and there are many others. Among natural objects of interest are Mount Mitchell, the highest peak on this continent east of the Rocky Mountains; Linville Falls and Collassaja Falls; Hickory Nut Gap and the adjacent Chimney Rock; Table Rock and Paint Rock.

Railroads.—There are now about 3,800 miles of railroad in operation and several hundred miles more under contract or in contemplation. There are street railways in all the larger towns and a few miles of rural trolley lines with many more proposed. The three principal railway systems are the “Southern” the “Seaboard Air Line” and the “Atlantic Coast Line.” The railroads are valued for taxation at $70,000,000, but this is much less than half their true value, as they were returned in the census of 1890 as then worth $151,000,000.

Government.—The present constitution, adopted in 1868, amended by a convention in 1875 and by several amendments submitted by legislatures since and ratified by the people, provides for an executive department consisting of a governor (not re-eligible), a lieutenant-governor, secretary of state, treasurer, auditor, superintendent of public instruction, commissioner of agriculture and commissioner of labor, all elected by the people for four years. There is also a commissioner of insurance elected by the legislature, and a corporation commission of three members elected by the people for a term of six years. The legislative department consists of 50 senators and 120 members of the house of representatives elected by the people every two years. The judicial department consists of a supreme court composed of a chief justice and four associates chosen by the people for eight years and 16 superior court judges, who are chosen for the life period by the people and who ride in rotation each year of the superior court districts into which the State is divided.

Education.—North Carolina was the second State to establish a State University, which it did in 1789 at Chapel Hill. It has now the State Agricultural and Mechanical College at Raleigh and a State College for Women at Greensboro. These three constitute a complete system of higher education by the State. There is also a State Agricultural and Mechanical College for the colored at Greensboro. There are also many sectarian colleges, of which the Baptists have one at Wake Forest, the Presbyterians at Davidson, the Methodists at Durham, and there are others. There are also several colleges for women, and three colleges for the colored people. As early as 1825, the State provided a public school fund and in 1840 established a public school system. This now provides instruction in primary and intermediate grades, the number of schools between the ages of 6 and 20. There is an annual appropriation for normal institutes for the instruction of both white and colored teachers. The public school system supported by State appropriations is the support of teachers and of schools for free education maintained in all the larger towns by local appropriations. The public funds for education are divided between the
NORTH CAROLINA

whites and blacks per capita. Besides the State Library of 40,000 volumes, and the Law Library of the Supreme Court of 20,000 volumes, both at Raleigh, several towns have public libraries and the University and all the colleges maintain libraries. The State has also established libraries for the public schools in the rural districts.

Penal and Charitable Institutions.—The State has established a penitentiary at Raleigh, three insane asylums—one at Goldsboro for the colored people, the other two for the whites at Raleigh and Morganton. There is an Institute for Defect Mutes for the whites at Morganton and one for the colored deaf, dumb and blind at Raleigh and an Institute for the Blind for the whites also at Raleigh.

Counties.—There are 97 counties, of which Robeson is the largest and New Hanover the smallest. Wake has the largest population and Graham the smallest. There are railroads in all the counties except seven.

Cities.—The principal towns are Wilmington, the chief seaport, 30 miles above the mouth of the Cape Fear River; 110穹 Gunter on which vessels can come drawing 24 feet; Raleigh, the State capital, named in honor of Sir Walter Raleigh; Charlotte, Greensboro, Salisbury, Statesville, and Winston in the central part of the State; Asheville, Kings Mountain, and Monroe; in the west and Fayetteville, Goldsboro, Washington, Elizabeth City, New Bern and Beaufort in the east, the last four being like Wilmington, seaport towns.

Colonies.—There is a growing stream of immigration from the North, which in some instances has taken the form of colonies, the most successful and prosperous of which is at Southern Pines in Moore County. This State has the smallest per cent of foreign population in the Union, and indeed irrespective of percentage the smallest foreign population of any State.

Population.—By the census of 1900 North Carolina had a population of 1,893,810; of which 1,263,603 were whites; 624,606 were negroes; 5,694 Chinese; 558 Indians. There were 938,677 males and 955,133 females. There were something more than two whites to every negro. The bulk of the negro population is in the eastern division and the southern half of the central division. There are few negroes in the mountain country which constitutes the western division.

History.—The coast of North America was first seen by John Cabot in 1497, and 87 years later the first attempt by the English to establish a colony on this continent was made by Sir Walter Raleigh, whose exploring expedition of two ships arrived at Wokokon Inlet on the coast of North Carolina 4 July 1584. This expedition landed at Roanoke Island and carried back two savages, Wanchese and Manteo. The next year Raleigh sent out a fleet of seven ships under Sir Richard Grenville which settled 108 colonists on the Island under Gov. Ralph Lane. Failing into straits for want of food, these colonists were taken home in June 1586 by Sir Francis Drake, who was returning with his fleet from a raid upon the Spaniards in the West Indies. Soon after they left, Sir John Grenville arrived with relief but not in time to save the colony and return home. In 1587, a new colony consisting of 89 men, 17 women and 2 children came out under Gov. John White. His daughter, the wife of Ananias Dare, on Aug. 15, 1587 gave birth at Roanoke Island to Virginia, the first child of English parents born on this continent. Gov. White soon returned to England, but the Spanish Armada of 1588 prevented aid being sent to the colony till 1590, at which time the colony had disappeared and the fate of the "Lost colony of Roanoke" remains an unsolved problem of history. The next settlement by the English was made at Jamestown, Va., in 1607. In 1629 a grant of Carolina was made to Sir Robert Heath and an abortive attempt at settlement was made in 1639. Gradually scattering settlers came into the Albemarle and Pamlico region from Virginia, and in 1660 a New England colony bought land from the Indians and settled near the mouth of the Cape Fear. They soon left, but were succeeded in 1663 by a colony from Barbados under Sir John Yeamans, who repurchased the land from the Indians. This settlement was abandoned in 1690. On 24 March 1663 Charles II. granted to the Duke of Albemarle (the restorer of the monarchy) and to the Lords Proprietors, all the country between the Atlantic and Pacific Oceans and between latitudes 36° and 31°, and William Drummond was appointed Governor. In 1665, a second charter to the same Lord Proprietors was granted, extending the limits to lat. 36° 30' on the north. The first legislature was held in 1665. In 1669 the "Fundamental Constitutions of Carolina" drawn up by the famous John Locke were adopted by the Lords Proprietors and were sent out to the colony. They proved too elaborate and cumbersome for the handful of pioneers, residing mostly in the northeast of the province, on Albemarle Sound, and after a nominal existence they were repealed in 1693. Twenty proprietary governors followed in rapid succession. For the most part, save Drummond and Archdale, they were very unfit, and often unworthy men. The sturdy colony deposed six of them and sent them back. One (Soethel) they put into prison and forced him to clear the area of land by abdication. In 1677 under Gov. Culpeper there was open rebellion on account of undue taxation on tobacco and interference with trade regulations. Again in 1708 under Thomas Cary there was a rebellion on account of the taxation of Quakers and Dissenters for the support of the Established Church. For more than two years there was no government of any kind in force, the farmers attending to their crops and "doing and saying what they list." In 1701 was adopted a system of having one governor for Carolina with a lieutenant-governor each for Albemarle and Charleston, the two principal settlements. In 1708, Bath was incorporated as the first town. In 1710, Gov. Hyde, a cousin of Queen Anne, came out as the first governor of North Carolina. On 20 Sept. 1711 the Tuscarora Indians, by preconcert, fell upon and massacred the settlers on the Roanoke, Neuse and Pamlico. The war lasted two years but with the aid of troops from South Carolina the power of the Indians was broken with the capture of their fort at Nahucke in the spring of 1713. In 1718, Edward Teach, commonly known as "Blackbeard," the leader of the pirates, left the main body of the colony, was killed in a sea fight off Bath, which put an end to piratical depredations. In 1728
the long boundary dispute with Virginia was settled, the line being surveyed to the foot of the mountains. In the same year seven of the Lord Proprietors sold out their interest to the crown for $87,500. Earl Granville retained his one eighth which was set off to him as a strip of land, 70 miles wide, next to the Virginia boundary, though he surrendered all right to share in the government. At this time there were three counties in Albemarle, Bath and Clarendon, divided into eight precincts. In 1729 the above counties were abolished, the precincts becoming counties, and the colony being definitively divided into North Carolina and South Carolina. The population of North Carolina was then about 40,000. The Royal government thus established continued until the Revolution. There were five Royal governors, George Burgin 1729-34; Gabriel Johnston 1734-44; Arthur Dobbs 1734-1765; William Tryon 1765-71; Josiah Martin 1771-75. During this period immigration came in rapidly, mostly from Virginia and Pennsylvania, so that at the outbreak of the Revolution the population had risen to 95,000 and three counties were up in the mountains and beyond. There were Scotch settlements made after Culloden on the Cape Fear. Germans and Moravians came in by way of Pennsylvania, from which also and from Charleston came many Scotch-Irish. In 1755 the Province sent a battalion to join the English expedition against Carthageana in South America. In 1749 the first printing-press was set up. The first book was printed in 1752 and a crude postal service was established in 1755. In 1758 the colony set a regiment under Col. James Innes to Winchester, Va., to take part in the war against the French and Indians, and soon after sent other troops under Hugh Waddell against the Cherokee in the west of the province. The colony openly resisted the Stamp Act and on 16 Nov. 1765 forced the stamp master, William Houston, to resign his office and to swear not to receive stamps. In February 1766 under the leadership of Hugh Waddell and John Ashe the inhabitants of Wilmington, without using any disguise, boarded the Viper, sloop of war, and demanded and obtained the release of certain merchant prisoners which had been taken on account of failure to observe the Stamp Act. A few days later 700 armed militia surrounded the house of Gov. Tryon and took therefrom in his presence the comptroller of the province and forced him to do what Houston had done. In 1765 an agitation began against the exaction of exorbitant official fees, and poll-tax, which culminated in open war, known as the Regulators War, in which the insurgents were crushed by Gov. Tryon at the battle of Alamance 16 May 1771. This was really the first bloodshed in the Revolution. In August 1774 a Provincial Congress was held in New Bern in defiance of Gov. Martin's prohibition, which elected delegates to the Continental Congress. In Edenton 57 women held the famous "Tea Party," subscribing to a paper to boycott the use of East India tea and to abide by the action of the Provincial Congress. Patriotic meetings were held in many counties. Soon after the receipt of the news of Lexington and Concord the people of Charlotte assembled, 20 May 1775, and declared the country independent of Great Britain and by special messenger sent a copy of their proceedings to the Continental Congress. This was the first declaration of the kind in America. In honor of this fact Gadsden, Bath and Clarendon were henceforth on the State seal. Gov. Martin fled from New Bern 14 June 1775 and took refuge on a British man of war. On 12 April 1776 the new State instructed its representatives in the Continental Congress to vote for independence, being the first State to do this. A Federal Constitution was adopted in that year. The first victory for the patriot cause was that gained by the North Carolina militia at Moore's Creek 27 Feb. 1776. The State furnished ten regiments of "Continental" Regulars and many thousands of militia for shorter "tours of duty." In 1780-1 the State was invaded by Cornwallis. On 7 Oct. 1780 a most damaging blow was inflicted on him by the destruction of Ferguson and his detachment at King's Mountain, the bulk of his assailants being from North Carolina and Tennessee (then a part of North Carolina). On 15 March 1781 was fought the battle of Guilford Court House. The Americans under Greene's settlements in the west and in the south secured a tactical defeat for Cornwallis, who fell back to Wilmington, whence he marched to his fate at Yorktown. North Carolina was represented in the Federal Constitutional Convention at Philadelphia in 1787, but was an last State but one to ratify the Constitution, which it did not do until assured for the adoption of the first ten amendments to that instrument. It rejected the United Constitution in 1788, but ratified it in November 1790. Thus it did not participate in the first election for President. At the census, 1790, it was the third State in point of population (391,000), coming after Virginia and Pennsylvania only, and ahead of New York and Massachusetts.

One of the first acts of the State as a member of the Union was the cession of Tennessee, which was accepted by the United States 2 April 1790. The permanent capital was located at Raleigh by a statute in 1791. There soon set in a tide of emigration to Tennessee, then to other Southern and Western States, so that North Carolina which in 1790 ranked third in population was only eleventh in 1840. This tide showed no abating tendency until after 1850. In the War of 1812 the State furnished nine regiments, two of which went to Norfolk, and one to Jackson's aid in the Creek war. Capt. Johnson Blakely of Wilmington commanded the United States sloop Wasp and destroyed many English ships. Among its many privateersmen who preyed on the enemy's commerce Capt. Otway Burns was the most famous. In the Mexican War the State sent a regiment and two companies.

North Carolina was the next to the last State to enter the Federal Union in 1789 and she was the next to the last to leave it in 1861. The State voted against Secession in February of that year, but when President Lincoln called for troops to coerce the seceding States and Virginia had seceded, North Carolina on 20 May 1861 followed her example. The die was cast, she did her full duty to the cause she had espoused. With a voting population (white) of 112,000 in 1861 she sent over 127,000 men to the Confederate armies. Some 5,000 or more (whites and blacks) joined the Union forces.
The first man killed on the Southern side in battle was a soldier from this State, and historians claim that the dead left nearest the enemies' lines at the pivotal battles of Gettysburg and Chickamauga were North Carolina's sons, and they fired the last volley at Appomattox. The captures of Fort Hatteras, Fort Fisher, of Plymouth, the battle of Bentonville—20 March 1865, and the surrender of Joseph E. Johnston 20 April 1865 were the most notable events of the war which took place on her soil. Wilmington was famous as a port for blockade running and was the last to be closed. Her war governor was Zebulon B. Vance, afterward for many terms United States Senator. The State lost 42,000 killed and wounded, or about one third of the troops she furnished to the Confederacy. In 1868 began the era of Reconstruction, when the blacks were first allowed to vote and the "carpet bag" rule began. The Ku-klux Klan (q.v.) was organized as a protest against this in 1869, and a black congressman in a turmoil with the whites regained full control of the government. In 1870 Gov. Holden was impeached and removed from office. The State has grown rapidly in population and development since the war. In 1894 and 1896 the Populist and Republican parties combined and carried the State. In 1898 the State again became Democratic and the General Assembly submitted a Constitutional Amendment disfranchising the uneducated negroes, which was ratified by the people in 1900.

WALTER CLARK, Chief Justice Supreme Court of North Carolina.

North Carolina College of Agriculture and Mechanic Arts, founded in 1889 at West Raleigh. Four years' courses are offered in agriculture, civil, mechanical, electrical, and chemical engineering, textile work, cotton manufacturing, and dyeing; the degrees conferred for the completion of these courses are bachelor of agriculture and bachelor of engineering; there are also graduate courses, two years' courses in agriculture, mechanical arts, and cotton manufacturing, and twelve weeks' courses in agriculture, machine shop work, engine and boiler tending, and machine drawing and designing. The experiment station is also connected with the college, and receives an annual Federal appropriation. The college controls the national land grant of 1862, and also receives State and Federal appropriations; in 1903 the income amounted to $35,000. The library contained 4,000 volumes; the students numbered 500, and the faculty 35.

North Carolina, University of, the State University chartered in 1789 and opened in 1795, situated at Chapel Hill. Its organization includes: a school of medicine (1836), and established 1846), a medical school (1861), a school of pharmacy (1867), and a department of mining (1901); there are also post-graduate courses, and a summer course intended primarily for teachers. The work in the collegiate department is almost entirely elective in the last two years, and leads to the degrees of A.B., B.S., and Ph.B.; the corresponding masters' degrees, and Ph.D. are conferred for post-graduate work; the medical school has only a two years' course and does not confer a degree, but its certificate admits to all other medical schools. Women are admitted to the university, but form only a small proportion of the students. The charge for tuition is small, and instruction is given to students who are graduates of universities and colleges; there are also a number of scholarships, and a loan fund has been established for the aid of poor students. The campus contains 48 acres, and the grounds and buildings amount to $500,000 in 1903; the income in the same year amounted to $8,000. The general library numbered 33,000 volumes; and there are also several departmental libraries; the number of students was 651, and of professors and instructors, 69.

North Dakota, da-kō' ta, a northwestern State (No. 26 in the Union), abutting on Canada (Assiniboia and Manitoba), and bounded south by South Dakota, east by Minnesota, and west by Montana. It extends 360 miles east and west and 210 north and south. Area, 70,795 square miles, of which 600 is water. Capital, Bismarck. Pop. (1903 est.) 360,000.

The State is part of the great prairie region, extending far into Canada. Its surface is mostly level or gently rolling. The only tract of considerable elevation as a whole is the Turtle Mountain district in the north, a rock and iron range of mountains, 40 miles in length, a small part in Canada, a district of low hills, whose highest points are Butte St. Paul, 2,500 feet, and Bear Butte, 2,400 feet. A great number of isolated buttes, with some short ranges of hills, are scattered through the southwestern portion beyond the Missouri. The generally even surface of the State renders it best classified by the valleys and watersheds of its rivers: (1) The Red River of the North, forming its entire eastern boundary, flows into Lake Winnipeg, through a valley of rich bottom land 50 to 60 miles wide, elevated beyond the reach of overflows, and rising in the north to the Pembina highlands. The chief affluent is the Sheyenne in the south, the Goose in the centre, and the Pembina in the north. (2) The Dakota or James River (French, "Riviere de Jacques"), in the south, is half way between the Red and the Missouri. This is the longest navigable river in the world and flows (600 miles) from the central plateau through South Dakota into the Missouri. Its valley is one of the most noted arsion districts on the globe, being underlain by the Dakota sandstone, a great water-bearing stratum which occupies a large part of the State. (3) The Mouse or Souri River in the north, west of the centre, flowing south by east down from Canada, weaving around in a great loop and then running north into Canada again, joining the Assiniboine. It is noted for its valuable coal deposits and stock ranges. (4) The Missouri has a navigable course of about 300 miles in the State. Its coteau or plateau, a rocky upland separating its bed from that of the Dakota, extends in a huge curve through the centre of the State and is dotted with small alkaline lakes. (5) The southwestern triangle beyond is a country of broad semi-arid valleys and scattered buttes. It contains two main watersheds lying at right angles to each other: the Little Missouri, running north and south in the extreme west for 150 miles, then turning east for another hundred to join the Missouri, and the Knife River, a tributary of the Heart and Knife, which flow into the Missouri from the west. The Missouri has no considerable affluent from the east within the State. At
the extreme west, north of the centre, the Yellowstone runs its last few miles in the State before joining the Missouri. Up and down the centre are hundreds of small lakes. In the northwest are one or two larger ones, but the one great group is northeast of the centre, its chief member being Devil's Lake (Indian, Minnewaukan), a wildly irregular body of salt water some 50 miles long by 1 to 12 wide, about 400 square miles in area, 1,407 feet above the sea, and with no visible outlet. Hurricane Lake and Lake Irwin drain into it. North and east lie the Sweetwater Lakes and Stump Lake.

**Geology and Minerals.**—The entire surface of the State has been worn by glacial action and having been afterward repeatedly submersed, is covered with the mud of extinct lakes. One of these was the vast Lake Agassiz (q.v.), larger than all the Great Lakes together, of which the Red River Valley forms a part. The southwestern triangle of the State is entirely underlaid with lignite or half-made coal (the soft coal of Germany), which is so abundant that the farmers often dig their own supplies from the hillsides. The fuel is also to be found in quantities sufficient to be of economic importance thoughout the entire portion of the State lying west of the hundredth parallel. Lignite is a free burner, and an excellent gas coal, but has been thought too light for the strong draft of locomotives. The coal famine of 1902, however, stimulated invention, patterns in stoves have made it available and satisfactory for household purposes, and the process of briquetting promises well to remove most of the objections to it for locomotive uses. Many new mines have been recently opened, and there are now 46 in the State. The cheap power to be derived from this source is expected to make large irrigation works possible and is largely relied upon, not only by those interested in local and private irrigation but by those entrusted with the expenditure and use of the moneys, now amounting to nearly $3,000,000, apportioned to the State as its share of the national irrigation or "reclamation fund."

The production of lignite has risen from 35,997 tons in 1890 to 160,704 tons in 1891, and 166,656 tons in 1902. So also, although there is comparatively little building stone in the State, with the exception of some excellent qualities of sandstone to be found in the western portion and the granites in the southeastern corner, the glacial soil area, the soil is rich in valuable clays. Not only is nearly all of the brick used in the State made within its borders, but a large and growing trade is carried on with the Canadian Northwest, and large quantities of high grade facing and firebrick are shipped throughout the West and Northwest of the United States. Pottery clays are also to be found in great abundance, while in the neighborhood of the Tongue River in Cavalier County are to be found rich deposits of argilaceous limestone which are being made into high grade Portland and natural hydraulic cements.

**Flora and Fauna.**—The forested area of the State is very small, mainly in the Pembina, Turtle Mountain, and Devil's Lake regions, where great oak and ash, asp, aspen and birch, willow and box-elder, plum and bull-cherry, and other deciduous trees. Along the Missouri are large cottonwoods. The characteristic wild animals are nearly all in the southwest, where are brown bears and a few grizzlies, timber and prairie wolves, panthers, and wildcats, besides gophers, prairie-dogs and deer. Trappers also find otter, mink, beaver, raccoon, and badger. Sportsmen shoot much grouse and prairie chicken, wild geese and wild ducks.

**Climate and Rainfall.**—The weather is severe in the winters, sometimes as low as —40°, but the very dry atmosphere—the precipitation during the winter not averaging over five inches—makes it less trying than damper climates with higher temperatures. The summer heat ranges to about 95°. Spring usually begins in March. The rainfall steadily decreases from east to west, being about 20 inches in the Red River Valley and 10 at the Yellowstone. Three fourths of it falls in the growing season, April and August. The rain is sufficient for profitable farming for 100 miles west of the Red River; beyond that, the region is better suited to ranching. Irrigation is contemplated in the arid parts, and will greatly increase their agricultural development.

**Soils and Agriculture.**—The soil is by far the richest in the Red River Valley, a wonderful bottom-land, where the black rich top soil of decayed vegetation overlies alluvium and glacial drift to the depth of sometimes 300 feet, down to a clay subsoil where the whole surface is itself a rich farming ground. The soil grows thinner to the westward on the plateau, and to the southwest. The great crop of North Dakota is wheat: the No. 1 hard spring wheat of the Scotch variety, which ranks as the foremost in the market and makes the best flour. In 1901 the crop was 62,872,241 bushels, valued at $36,456,900. Other cereals were grown in immense volume: oats, 29,347,402 bushels; barley, 15,861,557 bushels; corn, 1,064,980 bushels. The value of these four crops together was over $50,000,000. The next most important specialty to wheat is flaxseed, of which the State raises more than all the rest of the United States together: in 1902, 15,552,500 bushels, valued at $16,018,500. The crop of potatoes was about 2,500,000 bushels. The garden produce nearly doubled in 1901 from 1900. Small fruits and grasses also grow in abundance; but orchard fruits are not much raised. In 1902 the State had 150,000 and 200,850 tons of milk. In 1901, 166,656 milk cows, 827,381 sheep, and some 175,000 swine. The wool clip in 1902 was 3,030,470 pounds. The exports of hay were very large. There are still over 15,000,000 acres of unappropriated land the grazing of which is itself a great reserved, and the growth of the farming section has a large future before it.

**Manufactures.**—The State being a predominantly agricultural and cattle-raising one, the only considerable manufacturing industries which are not "neighborhood" manufactures, consumed near the point of production, are those of flour, potteries, and bricks. In 1900 there were 70 flour-mills, producing a value of $1,134,023, or 45 per cent of the total manufacturing product of the State; in 1902 there were 84. In 1901 there were eight cheese factories and 38 creameries, and 92,605 tons of feed were turned out. Fargo and Grand Forks were the chief centres of manufacture, producing over 35 per cent of the total value of products, and Minneapolis over 42 per cent of the wage-earners. There were in all 1,130 establishments, employing 2,398 hands, paying $1,222,472 in wages, and turning out a product valued at $9,133,114. The articles included besides the grain products, harness and -dilly
NORTH DAKOTA

(always important items in a ranching country), dairy products, brick and tile, pottery, fire-clay, and terra-cotta, furniture, and wooden goods, paper and tow, wire rope and cable and other wire work, carriages and wagons, car-shop work, furniture, lumber, timber, soda and mineral waters, tobacco, cigars, cement and binding-twine.

Banking.—All private banks have been compelled by a recent statute to take out charters as State banks. On 31 Oct., 1901, the number of national banks in operation was 36; their capital was $1,762,500, their outstanding circulation $783,676. There were also 143 state banks. The total deposits of the 176 banks (an increase of 38 within the year) were over $10,000,000; reserves, $6,063,699.96; notes, $13,437,076.88; loans and discounts, $8,482,721.64, an increase of nearly 30 per cent in the year. There were six building and loan associations, with over 2,000

Transportation Lines.—The Missouri is navigable throughout its length in the State, but needs a clever pilot. The Red River is navigable from Fargo to the mouth, but boats ordinarily run only from Grand Forks. The railroad systems are three, besides small local lines: the Great Northern and the Northern Pacific cross the entire State from east to west as part of their through lines, the former mostly north of the parallel of 48°, the latter a little south of 47°, and the Minneapolis, St. Paul & Sault Ste. Marie cuts it diagonally through the centre, connecting at the Canadian boundary with a branch of the Canadian Pacific. The Chicago & St. Paul and the Chicago & Northwestern also enter the State with short branches in the south; and the Bismarck, Washburn & Grand Forks has a section from Bismarck to Washburn open 45 miles along the Missouri. There were 3,300 miles of main track in the State at the end of 1902, an increase of 219 miles in two years, and business sections are well served.

Education.—The schools are managed by boards of commissioners composed of the governor, the superintendent of public instruction, and the president of the State University. The public schools of the State have a land endowment valued at $50,000,000. One eighteenth of all lands leased for them is paid over to the constitution; making 2,531,200 acres, besides other gifts. None of these lands may be sold at less than $10 per acre, and the State is obligated to make good any shortages. In 1902 there were 3,852 schools and 4,319 teachers, with 103,728 enrolled pupils; the expenditures on them by the State were $1,670,003.28. The estimated value of the public school buildings and furnishings was $2,388,000. There were, of institutions for higher and special education, an Agricultural College at Fargo, largely supported by Congress; a State University at Grand Forks, with a School of Mines connected therewith; a State Normal School at Valley City, and another at Mayville; a School of Forestry at Bottineau, and a Scientific School at Wahpeton, all provided for by the constitution and possessing large land grants. There are nearly 100 traveling libraries in use in the State. There are about 225 periodicals and newspapers published in the State.

Churches.—In 1902 the chief bodies were the Swedish and Norwegian Lutherans, with 237 societies; the Methodists, with 215; Roman Catholics, 121; Presbyterians, 115; Congregationalists, 104; Baptists, 67; Episcopalians, 35. Charitable and religious institutions. There is a State Insane Hospital at Jamestown; an Asylum for the Blind at Bismarck; an Institution for the Feeble-Minded at Grafton, with a new building lately opened; a Deaf and Dumb Asylum at Devils Lake; Soldiers' Home at Lisbon; an Industrial School and School for Manual Training at Ellendale; a State Penitentiary at Bismarck; and a State Reform School at Mandan.

State Government and Finances.—The governor is elected for two years, and receives $3,000 a year. He has a veto by items. The State officers are elected in November of the even-numbered years. The legislature is composed of a Senate to consist of 30 to 50, and a House of Representatives to consist of 50 to 140; it now has 103. It meets biennially in January of the odd-numbered years, and the sessions are limited to 60 days. The supreme court has three justices, a chief and two associates; when the State has 600,000 people it may increase the number to five. Women may vote for school offices, and may hold them. Under the new apportionment of the census, the State sends two Representatives to Congress. It has been heavily Republican since its admission, except in 1892, when the Democratic-Populist fusion barely carried it; it is so at present by nearly two to one. The Democratic platform (1876) especially favored adequate taxation, and denounced "government by injunction." The State constitution makes it a misdemeanor for any one to interfere with another's obtaining, or enjoying after having obtained, employment from any one. It also provides for the prohibition of the liquor traffic. The assessed valuation of the State for 1903 was $133,880,414. The State, by its constitution, is limited to a 4-mill tax, but the interest on the bonded debt, school tax, etc., raises it to 7.2. The balance in the treasury on 1 Jan., 1903 was $670,403.35; the bonded debt was $682,300. The income during 1902 was $2,125,243. A permanent sinking fund was established during the year; the interest-bearing warrants for current expenses, which had been much overdue and shunned by investors, were taken up, and the finances of the State put on a sound footing.

Population and Civil Divisions.—In 1880 the population of this section of what was then Dakota Territory was 36,305, excluding Indians; in 1890, it was 174,545, or 182,719 altogether; in 1900, 319,146 altogether; the government estimate for June 1903 is about 360,000, but the rapid development of coal mining and recent heavy immigration to the State may have raised it beyond that figure. Of this total, 311,712 were white, 286 colored, 6,698 Indians, and 180 Chinese and Japanese. The foreign-born were 113,001; but as of these 25,004 were Canadian English, 2,000 English from England, 1,800 came from Scotland, 2,670 from Ireland, of whom probably a third, or 800 to 900, were English and Scotch from the North; there were not over 70,000 of really alien blood. Of this mass, more than half were Scandinavians,—30,992 Norwegians, 8,419 Swedes, and 3,953 Danes; 14,977 Russians; 12,677 Germans from Germany and Austria; 3,162 French Canadians; 2,670 from Ireland altogether; 1,445 Bohemians;
NORTH DAKOTA AGRICULTURAL COLLEGE — NORTH PLATTE

700 Italians, and 353 Romanians (Jews, as were nearly all the nominal Russians and some of the Germans). The two chief places of the State are Fargo and Grand Forks, both on the Red River of the North, at the crossing respectively of the Northern Pacific and the Great Northern railroads. Fargo had 9,580 in 1900, having nearly doubled since 1890; Grand Forks had 7,532 in 1890, and 10,849 in 1900. The other towns of importance are Bismarck, the capital, 3,319, on the Missouri; Jamestown on the Dakota (James) River, and the N. P., 2,853; Valley City on the Sheyenne at the crossing of the N. P. and the M., St. F. & S. Ste. M., 2,446; Graffon on the Park west of the Red River in the north, 2,128; Wahpeton on the Red River in the south, 2,228; Dickinson on the Heart River in the southwest, on the Northern Pacific, 2,076, and Minot in the northwest. The Indians are nearly all on four reservations: Standing Rock, on the Missouri in the southern centre: Fort Berthold, around the junction of the Little with the main Missouri; Devil's Lake, and Turtle Mountain. There are also several military posts; the largest is Fort Lincoln near Bismarck, and contain 62 buildings.

The State has 39 counties, as follows, with their capitals:

History.—The old Territory of Dakota took its name, as did its river, from the Dakotas ("allies"), another name for the Sioux confederation. It formed a part of the Louisiana Purchase (q.v.) and when Lewis and Clark (see Lewis & Clark's Expedition), were sent to explore the region in 1804, they wintered in the Mandan camps and were at the mouth of the Yellowstone in the spring. Lord Selkirk built a fort at Pembina in 1810, supposing it a part of his purchase from the Hudson's Bay Company. The first steamers ascended the Missouri in 1830. Frémont in his explorations penetrated to Devil's Lake in 1839. In 1841 George Catlin was here, and painted some of his famous Indian portraits. The first purchases of land from the Sioux were made in 1831. In 1857 the first settlement in Dakota was made at Sioux Falls, in South Dakota. When Minnesota was organized as a Territory in 1849, a portion of this district was formed into it. The Territory of Dakota was organized in 1861, and included Montana and parts of Wyoming and Idaho. The limits of the present North and South Dakota were fixed in 1868. Settlement was long checked by Indian wars, and the shelter taken here by the Sioux tribes expelled from Minnesota after the bloody outrages committed during the Civil War. In

1876 it was proposed to set off the northern part as the Territory of Pembina, but political antagonisms had arisen, and the population of the Territory had increased to half a million before final action was taken dividing it into the two States. The great Scandinavian immigration began about 1885. The State was admitted into the Union 2 Nov. 1889.

ANDREW A. BRUCE, Associate Dean University of North Dakota.

North Dakota Agricultural College, opened in 1891, at Fargo. The regular four years' courses include agriculture, general science, and mechanical engineering; the shorter courses are agriculture and steam engineering, two years, and a "farm school" of three months; there are also courses in domestic science and military science. The college is open to women, and there are women on the faculty. The campus includes 640 acres; a new sewerage system connecting all buildings and grounds with the main sewer of Fargo was completed in 1901. The income, which in 1901 amounted to $70,500, is derived mainly from State and Federal appropriations. The college organizes farmers' institutes in all parts of the State, under the supervision of the faculty; in 1901 18 such institutes were held, with an attendance of over 7,000. The faculty in 1901 numbered 26, and the students 604, of whom 259 were women.

North Dakota, University of, the State University opened in 1884 at Grand Forks. Its organization comprises a collegiate department, conferring the degree of A.B., a graduate department, a normal department, school of mines, department of military science, and a preparatory department; a business course is also provided. The State work in university extension is connected with the university and lectures are given throughout the State. Women are admitted on equal terms. When North Dakota was admitted to the Union, a grant of land was made to the university by Congress, and a separate grant to the school of mines. The land grants comprised 30 acres, and ground and buildings in 1902 were valued at $350,000; the income in 1903 amounted to $64,500. Tuition is free to residents of North Dakota. In 1903 the library contained 10,000 volumes; 255 students in attendance numbered 550 and the faculty 57.

North Foreland, förland. See FORELAND, NORTH AND SOUTH.

North German Confederation, the union of German states in 1866 under the leadership of Prussia, which followed on the defeat of Austria, and the dissolution of the German Confederation and led to the consolidation of the German Empire during the Franco-German war (q.v.), when on 18 Jan. 1871 the King of Prussia was invested with the title of German Emperor at Versailles. See GERMANY.

North Holland, Netherlands, a maritime province, bordering on the North Sea, and bounded south by the provinces of South Holland and Utrecht. Area 1,000 square miles; pop. (1899) 968,105. See NETHERLANDS.

North Island. See NEW ZEALAND.

North Platte, plât, Neb., city, county-seat of Lincoln County; at the confluence of the North and South Platte rivers, and on the
NORTH POLE—NORTHAMPTON

Union Pacific railroad; about 220 miles in direct line west of Lincoln, the capital of the State. It is in a productive agricultural region where irrigation has been introduced, and in which there is a large acreage of alfalfa, sugar beets, corn, and wheat. Considerable attention is given to stock-raising. The railroad machine shops here employ several hundred men. It has grain elevators, a cold storage plant, stock yards, brick, coal, and lumber yards. It is the seat of a United States land office. The Y. M. C. A. library has about 2,200 volumes. Pop. (1890) 3,055; (1900) 3,640.

North Pole. See Arctic Regions; Polar Research.

North River, the name given to the lower course of the Hudson River. This name was applied to the stream when the Delaware was called the South River. See Hudson River.

North Sea, or German Ocean, a northeastern extension of the Atlantic Ocean lying between Great Britain and the continent of Europe; lat. 51° to 61° N.; lon. 2° 30' W. to 7° 30' E.; Great Britain with the Orkney and Shetland travelers; the North Sea north of the Dutch coast and part of Norway on the east; Strait of Dover, part of France, Belgium, Holland, and Germany on the south; and the Arctic Ocean on the north. Extreme length, from the Strait of Dover to Unst, the most northern of the Shetland Isles, about 700 miles; greatest breadth, between Haddingtonshire, Scotland, and Denmark, about 420 miles; area, over 140,000 square miles. The shores of all the countries that surround the North Sea are deeply indented with bays, harbors, and large estuaries; but its most remarkable arm is the Skager Rack, between Denmark and Norway, which commutes through the Kattegat with the Baltic Sea. The North Sea is deepest on the Norwegian side, where the soundings give 100 fathoms; but the mean depth of the whole basin may be stated at no more than 31 fathoms. The bed of this sea is traversed by several enormous banks, one of which trends from the Firth of Forth to the coast of Denmark, a distance of 110 miles; others run from Denmark and Jutland upward of 105 miles to the northwest; while the greatest of all, the Dogger Bank, occupies the center of the sea, from lat. 57° 30' N. and lon. 1° 10' to 6° 7' E. The great oceanic tidal wave which originates in the Atlantic, after having swept the west coasts of Great Britain and Ireland, enters the northern extremity of the North Sea, giving high water nearly simultaneously to the opposite shores of Scotland and Norway. Pursuing its course along the coasts of the former and of England, it rules the tides as far south as the Thames, making the tour of Great Britain in 18 hours. On entering the North Sea, on the north of Scotland, the tidal wave does not exceed 12 feet; but gradually increases to 14, 16, 18, and in the Humber to 20 feet: a difference of height depending on the figure of the shore, the form of the bottom, and the direction of incidence of the wave. The fisheries in this sea are extensive, especially on the Dogger Bank, celebrated for its cod fishery, on all the shores that border it; and in the direction of the Orkney and Shetland Isles. The North Sea has been from the earliest times one of the most important highways of the world. Lights both stationary and floating are placed along the difficult parts of the coast for the convenience of traffic, which of late years has increased enormously.

North Sea and Baltic, or Kaiser Wilhelm Canal. See Canals.

North Sea Canal, or Amsterdam Canal. See Canals.

North Shields. See Shields, North and South.

North Star, in astronomy, the north polar star, of the constellation Ursa Minor, also called Polaris. It is close to the true pole, never sets, and is therefore of great importance to navigators in the Northern hemisphere. The line joining the stars of Ursa Major, or the Great Bear, nearly passes through it. See Ursa Major.

North Star, Order of. See Orders and Decorations.

North Tonawanda, tōn-ə-wōndə, N. Y., city in Niagara County; at the confluence of Niagara River and Tonawanda Creek, on the Genesee, Erie Canal, and the Delaware; site of the Erie, and the Lehigh V. R.R.'s; opposite Tonawanda, and 10 miles above Buffalo. Several other railroads, using leased tracks, and electric lines connect the city with Buffalo, Niagara Falls, and other places. North Tonawanda is in an agricultural region, but the city is noted for its manufacturing and commercial interests. It has large lumber yards, and the chief manufactures are steam pumps, merry-go-rounds, pig iron, bolts, nuts, steam piping, and a variety of lumber products. The public library has about 6,000 volumes. The charter of 1897 provides that the government shall be vested in a mayor, who holds office two years, and a council consisting of two members from each ward, and three at large. The city owns and operates the waterworks. Pop. (1890) 4,793; (1900) 9,059.

Northampton, north-ām′pən, England, a city, capital of the county of same name, 66 miles northwest of London, on the left bank of the Nen, and on the London and Northwestern, and Midland R.R.'s. Northampton was formerly walled and defended by a castle built soon after the Conquest, the ruins of which remain. The principal buildings are the ancient Abby, or county hall, the county and borough jails, corn exchange, barracks, infirmary, theatre, etc. There are a free library, museum, schools of science and art, grammar school, mechanics' institute, an atheism, and other literary and artistic societies. The beneficent institutions include the infirmary, a lunatic asylum, the Royal Victoria Dispensary, St. John's and Thomas-à-Becket hospitals, etc. The principal churches are All Saints', rebuilt in 386 after the designs of Sir Christopher Wren; St. Peter's, built about the same time as the castle, restored in 1850; St. Giles', dating from the 12th century; St. Sepulchre's, also of the 12th century, a round church on the model of the Church of the Holy Sepulchre at Jerusalem; and the Roman Catholic cathedral. The staple manufacture is boots and shoes for home and export trade, which employs about 12,000 hands. The curing of leather is also carried on on a large scale. The races, held on a race course north of the
NORTHAMPTON—NORTHEAST BOUNDARY DISPUTE

town, attract great numbers of visitors. Besides two weekly markets there are 11 annual fairs. Pop. (1901) 87,021.

Northampton, Mass., county, city-seat of Hampshire County; on the Connecticut River, and on the New York, N. H. & H. and the Boston & M. R.R.'s; 18 miles north of Springfield, 100 miles west of Boston, and about 140 miles from New York city. The largest part of the city is known as the “Center,” and the remainder includes the villages of Bay State, Florence, and Leeds. Nearby are Mount Holyoke and Mount Tom, both with electric railroads to the summit. The city is on a height which commands a fine view of the river valley. It was settled 14 May 1654 by English colonists, and was named after Northampton in England. Jonathan Edwards (q.v.) lived here for some years. It was incorporated on 18 October of the same year, and chartered as a city 1 Jan. 1884. It is in a productive agricultural section, but it has extensive manufacturing and commercial interests. The chief manufacturing establishments are saw-mills, basket and paper box factories, lumber mills, brush factory, hardware works, hosier mills, sewing machine and furniture factories, machine shops, pulp mills, emery wheel works, and foundries. There are about 3,000 employees in the manufactories. The trade is principally in the manufactured articles and farm products. It has a number of fine buildings and prominent institutions, among which are the Dickinson Hospital, the State Asylum for the Insane (1903, 700 patients), and the opera house. The last mentioned, a gift from a native of the city, is owned and managed by the municipality. There are a number of fine church buildings. The educational institutions are Smith College (q.v.); the Burnham Classical School for Girls; the Clarke Institute for Deaf Mutes, endowed by John Clarke; public and parish schools; three public libraries, gifts of natives of Northampton, and the "Home Culture Club," founded by George W. Cable (q.v.), and assisted by a gift of $50,000 from Andrew Carnegie. The educational advantages of this club have been of great benefit to a large number of men and women; unique features are the instructions in household arts and amusements. The three national banks have a combined capital of $560,000, and the three savings banks have a total deposit of $4,075,000. The "Smith Charities" has peculiar features that make it a remarkable and beneficent institution. It was founded by the will of a public benefactor, who desired to aid a special class of worthy persons. On certain conditions young men and women and widows receive annual gifts of money, young women receive gifts when they marry, and young men, who learn a trade, receive a certain sum of money when they attain the age of 21. The charter of 1883 provides for a board of aldermen and a council of 21 members elected annually by the people. The board of education and the trustees of the Forbes Library are chosen by popular vote. The city owns and operates the water works (1880) at $14,050; (1900) $18,643. Consult Trumbull, "History of Northampton."

JAMES H. HUNTINGTON,
Editorial Staff, 'Daily Hampshire Gazette.'

Northbridge, Mass., town in Worcester County; on the Mumford and the Blackstone rivers, and on the New York, N. H. & H. railroad; about 10 miles southeast of Worcester. It was settled in 1662 and remained a part of Mendon until 1772 when it was incorporated as a separate town. Its chief manufacturing establishments are large cotton and woolen mills, machine shops, furniture and cigar factories. The government is administered by annual town meetings. Pop. (1890) 4,603; (1900) 7,036.

Northbrook, See Baring, Thomas George.

Northcote, nor'lth'kot, James, English artist; b. Plymouth, England, 22 Oct. 1746; d. London 13 July 1831. He early showed a taste for drawing and was encouraged to go to London, where he arrived (1771) with a letter of introduction to Sir Joshua Reynolds, under whom he worked for five years. He visited Italy in 1777 where he spent his time in copying the old masters, especially Titian. He returned to London in 1780, and six years later exhibited his first historical work, 'The Young Princes Murdered in the Tower.' Between 1783 and 1831 he exhibited no less than 250 historical paintings, taking subjects from English history or Shakespeare; these are chiefly remarkable for highly effective composition. The faces are Greek, the costumes absurd, the chiaroscuro fantastic and exaggerated, and the coloring inharmonious. His greatest skill is shown as an animal painter. His portraits are uneven, but those of men are better than those of women, while some of his children's and angels' faces are beautiful. This will be seen from his 'Portrait of Sir Simon Taylor'; 'A Dog and a Hawk'; 'Prince Arthur and Hubert'; 'Four Infant Angels in the Clouds."

Northcote, Sir Stafford Henry, 1st Earl of Iddesleigh, English statesman; b. London 27 Oct. 1818; d. there 12 Jan. 1887. He was educated at Eton and at Balliol College, Oxford, became private secretary to Gladstone in 1843; was called to the bar in 1847, and in 1851 succeeded his grandfather in the baronetcy. He sat in Parliament in 1855 for Dudley, in 1858 was elected, and in 1860 for North Devon, which he represented till 1885. In 1862 he published 'Twenty Years of Financial Policy.' In 1866 he became president of the Board of Trade; in 1867-8 was secretary for India; in 1871 a member of the high joint commission, which arranged the Treaty of Washington; and in 1874-80 was chancellor of the exchequer in the cabinet of Disraeli. After the Liberals returned to power in 1880 he became Conservative leader in the Commons, and in 1885 he was raised to the peerage, and appointed first lord of the treasury. Consult his published 'Letters and Essays' (1887); Lang, 'Life, Letters, and Diaries of Stafford Northcote' (1890).

Northeast Boundary Dispute, the disagreement between the United States and Great Britain from 1783 to 1842 respecting the northeast frontier. The Treaty of 1783 defined the northeast boundary of the United States, toward Canada, as extending from the source of the St. Croix due north to the highlands or watershed between the Atlantic and St. Lawrence systems, thence along those highlands to the northwesternmost head of the Connecticut River.
Northeast Cape. See Chelyuskin Cape.

Northeast Passage. See Arctic Regions.

Northern. See Cold Wave.

Northern Bear, in international politics, a name often applied to Russia.

Northern Drift, in geology, an obsolete name for the boulder-clay of the Pleistocene Period. The deposits were popularly supposed to have been brought by the polar currents from the far North.

Northern Giant, a name frequently applied in Europe to Russia, alluding to its size, growth, and population.

Northern Illinois College, a coeducational institution, in Fulton, Ill.; founded in 1861, opened in 1865; reported in 1903; has 9 professors and 37 instructors, 12; students, 220; volumes in the library, 1,000; value of grounds, buildings, and scientific apparatus, $110,000; total income, $8,000. The departments are preparatory, collegiate, and the summer school. The courses lead to the degrees of A.B., B.S., Ph.B., and B.L. There is no endowment fund.

Northern Lights. See Aurora Borealis.

Northern Mythology. See Mythology.

Northern Territory. See South Australia.

Northfield, Mass., town in Franklin County; on the Central Vermont railroad; about 12 miles northeast of Greenfield and 30 miles northwest of Fitchburg. It is famous as a centre of religious training. It is the birthplace of Dwight L. Moody (q.v.) and was his home and the scene of much of his work. The annual conferences of Christian workers and of students are held, in summer, in Northfield. The town is the seat of the Northfield Training School and of the Northfield Seminary for young women. The Mount Hermon School for Boys, in the adjacent town of Gill, is connected with the Northfield educational work. The town is in an agricultural region and its industries are connected with farm products. The government is administered by town meetings. Pop. (1890) 1,869; (1900) 1,666.

Northfield, Minn., city in Rice County; on the Cannon River, and on the Chicago G. W. and the Chicago, M. & St. P. R.R.'s; about 40 miles south by west of Saint Paul. It was settled in 1856 and in 1875 was chartered as a city. It is in a fertile agricultural section in which wheat is one of the principal crops. The chief manufactures are knit goods, dairy products, flour, and brick. It has considerable trade in grains and live stock. It is the seat of Saint Olaf College, opened in 1875 under the auspices of the Lutheran Church, and of Carleton College, opened in 1870 by Congregationalists. Other educational institutions are the Scoville Library, the Goodsell Observatory, and the public schools. It has the Odd Fellows' Orphans' and Widows' Asylum, a Y. M. C. A. building, and several fine churches. The city owns and operates the waterworks. Pop. (1890) 2,659; (1900) 3,210.

Northfield, Vt., village in Washington County; on the Dog River, and on the Central Vermont railroad; about 36 miles northwest of Montpelier. It is in a valley surrounded by low hills and mountains, Bald and Paine mountains are near. In the vicinity are black slate and granite quarries. The chief industries are connected with the quarrying of granite and slate, and with farm and dairy products. It has flour and lumber mills and woolen factories. It is the seat of the Norwich University, opened in 1854. The village owns and operates the electric light plant. Pop. (1890) 1,222; (1900) 1,508.

Northington, nör'thîng-ton, Robert Henley, 1st Earl of, English statesman: b. about 1708; d. Grange, England, 1 Jan. 1722. He was educated at Oxford; in 1733 was called to the bar, and in 1737-57 sat in Parliament for Bath. In 1756 he was appointed attorney-general, and in the next year became lord keeper of the great seal and took his seat as speaker of the House of Lords over which he presided for three years. In 1759 he was made lord chancellor, and owing to ill-health resigned in 1770.

Northmen. See Normans.

Northrop, nör'thûp, Birdseye Grant, American educator and clergyman: b. Kent, Conn., 18 July 1817; d. Clinton, Conn., 27 April 1898. He was graduated at Yale in 1841; and from its divinity school in 1845; and was subsequently a pastor of a Congregational Church at Saxonsville, Mass., for 10 years. He was agent of the Massachusetts State Board of Education 1857-67 and secretary of the Board of Education of Connecticut 1857-67. He introduced the observance of Arbor Day in schools, and was considered as the "father of Village Improvement Societies." In 1872 he was invited by the Japanese government to establish a system of public education in Japan. Although he declined the offer, he rendered such valuable service to that country that he was received as the guest of the Japanese nation.

Northrop, Cyrus, American educator: b. Ridgefield, Conn., 30 Sept. 1834. He was graduated from Yale in 1857, from its law school in 1859, and was admitted to the bar in 1860. He was clerk of the Connecticut House of Rep-
NORTROP—NORTHWEST FRONTIER PROVINCE

resenatives in 1862 and of its Senate in 1863. He became editor of the New Haven ‘Palladium’ in 1863 and in 1863–84 was professor of rhetoric and English literature at Yale. From 1869–81 he was collector of the port of New Haven, and in 1884, he accepted the presidency of the University of Minnesota which he has since held.

Nortrop, Harry Pinckney, American Roman Catholic bishop: b. Charleston, S. C., 5 May 1842. He was graduated from Mount Saint Mary’s College, Emmitsburg, Md., in 1860, studied four years in the theological seminary there and at the American College in Rome, and was ordained to the priesthood in 1865. He held several pastores in his native city and elsewhere, and was consecrated bishop in 1882 as bishop of Rosalia. In 1883 he was transferred by papal brief to the see of Charleston.

Northumberland, nør-thæm-bed land. John Dudley, Duke of, English statesman: b. England 1502; d. London 22 Aug. 1553. During the war with France 1544–5 he commanded the English ships and later was one of the executors of the will of Henry VIII. He schemed against Somerset, the Protector, and in 1550 was the dominant influence in the council. The next year he was created Duke of Northumberland, lord high steward, and earl marshal. His fourth son, Lord Guilford Dudley, married Lady Jane Grey in May 1553, and the duke persuaded Edward VI. to name her as his successor. Through Northumberland’s influence she was placed on the throne 10 July, but on the 22d of August following he was executed for high treason.

Northumberland, Robert de Mowbray, Earl of, English warrior: d. about 1125. He was a son of Roger de Mowbray, a follower of William the Conqueror, and was made Earl of Northumberland some time not far from 1080. He was constantly engaged in feudal quarrels in the course of which he burned Bath and ravaged Wiltshire, and when Malcom, king of Scots, invaded the country for a second time in 1093 he was met and slain by Mowbray at Alnwick. He raised an insurrection in 1095 and endeavored to wrest from the Conqueror’s sons the crown and give it to their cousin, Count Stephen of Auvergne. At first successful he was finally forced to retreat to his great castle of Bamborough where, after a stout resistance, he was finally taken, and though reports conflict, it is reasonably certain that the remaining 30 or more years of his life were spent in prison. He founded the priory at Tynemouth.

Northumberland, Earls of. See Percy.

Northumberland, England, a maritime county bordering on Scotland and on the North Sea; area 2,015 square miles. The county-seat is Newcastle-upon-Tyne, and other large towns are Wallsend and Tynemouth. The surface is diversified with hill, moorland, and valley, and its principal river is the Tyne. Coal mining and its supplemental industries place Northumberland high among the most productive counties of England. Pop. (1901) 602,859.

Northumbria, England, an ancient Anglo-Saxon kingdom, one of the Heptarchy, which extended from the Humber to the Forth, and was bounded on the west by the kingdoms of Strathclyde and Cumbria. The kingdom was founded by Ida, an Anglian chief, who invaded the country in 547. On the death of Ida in 560 part of it was incorporated in the kingdom of Deira, which occupied also what is now Yorkshire. Bernicia and Deira were united under Ethelfrith in 553. In 792 it was ravaged by the Danes, and again in 814 and 857, when they permanently settled in the country. Halfdane became overlord, and portions of the land among his followers. In the treaty which Alfred made with the invaders Northumbria was included in the Danelagh. Against Alfred’s successors the Danes carried on a series of petty wars, till the dissolution of the kingdom of Northumbria in 950. It was then divided into the three earldoms or counties of Bernicia, Deira, and Lothian.

North-west Boundary Dispute, the disagreement between the United States and Great Britain from 1814 to 1846, respecting the north-west frontier. The territory bounded north by latitude 54° 40’, east by the Rocky Mountains, south by latitude 42°, and west by the Pacific Ocean had been claimed at various times and to various extents by Russia, Spain, Great Britain, and the United States. The Russian claim, which rested mainly upon occupation by fur traders, was settled by a treaty 11 Jan. 1825. Under this treaty the United States were to make no settlements north of latitude 54° 40’, and Russia none south of that latitude. Great Britain and Russia agreed upon the same terms. The Spanish claims were confined south of latitude 42° by the treaty which ceded Florida in 1819. Great Britain had little or no claim by discovery. The United States’ claim rested upon the voyage of Gray up the Columbia River in 1792 and the explorations of Lewis and Clark through the Rocky Mountains and through the Oregon country in 1805–6, under the orders of Jefferson. By the treaty of 20 Oct. 1818 the whole territory west of the Rocky Mountains was to be opened to both countries for 10 years, and, in 1827 the joint occupation for an indefinite period was agreed upon. Later this produced dissatisfaction, and it was considered the negotiation, Great Britain was induced in 1846 to accept latitude 49° as the boundary from the Rocky Mountains to the channel between Vancouver’s Island and the mainland. See BOUNDARIES, AMERICAN; ALASKAN BOUNDARY COMMISSION.

Northwest Company, the, an organization of French-Canadian traders who, in the 18th century, entered the fur trade as a rival of the Hudson’s Bay Company, which had enjoyed a monopoly for 200 years. In 1806 the Northwest Company established trading posts on the Pacific coast and in 1813 absorbed the Pacific Fur Company, established by John Jacob Astor. In 1821 the Northwest Company consolidated with the Hudson’s Bay Company. See FUR TRADE, THE.

Northwest Frontier Province, British India, a new political division formed in November 1901, out of the northwestern portion of the Punjab province, and comprising mainly the Peshawar district, and portions of other districts lying beyond the Indus. Besides Peshawar, the capital, the province contains the towns of Kohat, Dera Ismail Khan, Edwardes-
NORTHWEST PASSAGE—NORTHWEST TERRITORY

abad, Kalabagh, Abbottabad, Yank, and Kulachi. Area 13,197 square miles; pop. (1901) 2,044,000.

Northwest Passage. See Arctic Regions; Polar Research.

Northwest Provinces, India, until 1901, the designation of a political division now the United Provinces of Agra and Oudh (q.v.).

Northwest Territories, Canada, the political division comprising the organized territories of Assiniboia, Alberta, and Saskatchewan, and the unorganized regions of Athabasca, Mackenzie, Ungava, and Franklin (q.v.). The designation also in a general sense includes Kewatin, a district of Manitoba since 1876, and the Yukon Territory established in 1901. The political division has an area of 2,377,481 square miles. This immense district (excluding Labrador) was known as the Hudson Bay Territory up till 1870, when the Hudson's Bay Company surrendered it to Canada for the sum of $300,000. The territories are governed by a lieutenant-governor and executive council, and a legislative assembly. Regina is the seat of government. The climate generally is of an Arctic character with long and rigorous winters, and short summers; the agricultural capabilities of a part of this region to the south, however, are very great. The fertile belt of the Saskatchewan alone contains an area of 65,000 square miles in one continuous strip of 500 miles long, with an average breadth of 80 miles. But the best and largest wheat area is beyond the Saskatchewan, in the valleys of the Athabasca and Peace rivers, and extending through the Peace River Pass to the western slope of the Rocky Mountains, and north to lat. 60° N. The lakes and rivers west of Lake Superior are bordered by rich prairies and luxuriant woods. Coal is abundant and is now worked; petroleum is plentiful; copper, silver, iron, salt, and gold have been found, the last especially on the Klondike River in the Yukon district. Great quantities of furs are obtained. The Canadian Pacific Railway crosses the southern part of this territory, and there are several other railways made or to be made. In the towns and villages springing up along the lines of railway free schools are established. From the Rocky Mountains in region five tracts of land have been reserved as national parks. Pop. (1901) 220,000, of whom 27,057 were Indians.

Northwest Territory, the name given by the Continental Congress of America, in 1787, to a region east of the Mississippi, north of the Ohio, south and west of the Great Lakes, and west of Pennsylvania. The greater part of this territory belonged to France prior to 1763, when, by treaty, Great Britain became possessor of all the domain east of the Mississippi, in North America until it was ceded to France by the Treaty of Paris in 1778. This region was ceded to the United States. Its area was about 265,878 square miles, and it bordered on all the great interior waterways of North America which had then been explored; the Saint Lawrence River because a part of the Great Lakes not excluded. The exact status of this territory was a subject of dispute for several years, on account of the conflicting claims of ownership of New York, Virginia, Connecticut, and Massachusetts. The States mentioned cited in support of their claims various early grants from the Crown, and conquests of Indian tribes. The original Colonial charter usually gave definite north, east, and south boundaries, but that of the west was often the sea, the South Sea, the ocean, etc., which was interpreted as Pacific Ocean. The other States of the Union refused to recognize the claims based on charters and acts as cited, but held that the lands in question should belong to the whole Union and should be administered for the common good. Congress in session, in 1789, gave a pledge to the Union that if the States claiming this western territory should cede it to the Confederation it should be used for the good of all the States, and should, in due time and under proper conditions, be admitted as States of the Union, with equal rights and privileges with the original States. New York was the first to cede her claims, in 1781; three years later Virginia ceded her claims, except a section north of the Ohio River (now the southern part of the State of Ohio) ceded for the time the "Virginia Military District." In 1785 Massachusetts gave up her claims, and in 1786 Connecticut ceded all except a strip extending from the Pennsylvania boundary westward 120 miles, comprising about 6,000 square miles, and called the "Western Reserve" (q.v.). Connecticut retained jurisdiction over this territory until 1800. A tract of 500,000 acres, in the western part of the "Western Reserve," was donated by Connecticut as "Fire Lands" to be divided as directed among such of its citizens as had been damaged by incursions of the British troops during the Revolutionary War. On 13 July 1787 the "Northwest Territory" was established by the Continental Congress. The ordinance was prepared by the chairman of the committee, Nathan Dane of Massachusetts. This ordinance provided for the enactment of certain rules deemed necessary for the public good, the chief provisions of which were: (1) that not less than three nor more than five years should be required for the formation of the "Northwest Territory"; (2) that slavery should be prohibited forever within its borders; (3) that religious freedom should be wholly and entirely established and maintained; (4) that schools and means of education should be forever encouraged; (5) that the writ of habeas corpus and trial by jury should be guaranteed to all its inhabitants. A form of government was provided for and the territory was divided. It was further provided that when any one of the divisions had a population of 60,000, it might be admitted into the Union as a State. Certain conditions of admission were exacted in accordance with the Ordinance of 1787. The Continental Congress which established the "Northwest Territory" and so wisely provided for its admission into the Union, had its last roll-call 10 Oct. 1788. The new Congress confirmed the Ordinance relating to this territory. At first the government was administered by means of a governor, secretary, and three judges appointed by Congress, who governed the whole as one district. The governor and judges sitting together had power to make and execute such laws as they
NORTHWESTERN COLLEGE—NORTON
deemed needful for the district, subject to the approval of Congress, until such time as the territory would have a legislature of its own. Provision was made for a legislature when there were in the territory 5,000 free male inhabitants of full age to be voters. This legislature was to consist of a Legislative Council of five members, chosen by Congress, and a House of Representatives chosen by male inhabitants who were freeholders. The first governor of the Northwest Territory, Arthur St. Clair, was appointed October 1787. He arrived at Marietta, the capital, July 1788. His first official act was the founding of Washington County. He appointed magistrates, established courts, arranged for defense against the Indians, and in every way sought to promote the advancement of the country. The first legislature of the Territory met 24 Sept. 1790. The House of Representatives had 22 members, representatives of the nine counties of the whole Territory. In May 1800, upon petition, Congress divided the Northwest Territory into two territorial governments; the boundary between which was a line extending from the mouth of the Kentucky River north to Canada. The portion east of this line was called "Territory Northwest of the River Ohio," and its capital was Chillicothe. The portion west of this line was called "Indiana Territory" and the capital was Vincennes. William Henry Harrison was the first governor of the "Indiana Territory." Virginia completed its articles of cession 1 March 1784. On that same day Jef- ferson, as chairman of a committee, proposed a plan which was adopted by Congress 23 April 1784. The territory was to be divided into States, each State two degrees wide and the lines to be intersected by two meridians, one passing through the falls of the Ohio and the other through the mouth of Kanawha River. The States were to be named, Chersonesus, Asensimia, Sylvania, Pelisipia, Illinois, Poly- potamia, Washington, Mesopotamia, and Michi- gania. The plan or report of the committee stated further, that after 1800 there should be in the States either slave or involuntary servitude except as a punishment for crime. The plan never went into effect, and was superseded by the Ordinance of 1787 whereby the Northwest Territory was established as men- tioned above, the year Massachussets yielded her claims, Congress provided for a survey of the lands in dispute. Ohio, the first State formed out of the Northwest Territory, was admitted in 1803, and was the 17th State of the Union. Michigan Territory was created January 1805, and Will- iam Hull was first governor. It was admitted as a State in 1837. Illinois Territory was organ- ized in 1809; Kaskaskia was the capital. It was admitted as a State on 3 Dec. 1818. In- diana was admitted as a State in 1816. A part of Michigan Territory was in 1836 organized as the Territory of Wisconsin. It became a State in 1837. A part of the Territory of Wis- consin is now the eastern part of Minnesota. Consult: Higginson, 'History of the United States,' pp. 309-344; Hart, 'Source Book,' ch. xi.; Thomas, 'History of the United States,' pp. 182-183; Hinsdale, 'The Old North- west'; Moore, 'The Northwest Under Three Flags.'

Northwestern College, a coeducational in- stitution in Naperville, Ill.; founded by the Evangelical Association in 1861. In 1903 there were connected with the school 25 professors and instructors and nearly 400 students. The library contained about 6,000 volumes; the grounds and buildings were valued at $128,000; the amount of property funds was $114,000; the income, about $20,000; and the benefactions, $11,500. The number of graduates is about 500.

Northwestern University, Ill., chartered under the auspices of the Methodist Episcopal Church in 1851, and first opened in 1854. The first department organized was the collegiate department; the present organization includes (1) the College of Liberal Arts; (2) the Medi- cal School; (3) the Law School; (4) the School of Pharmacy; (5) the Dental School; and (6) the School of Music; the College and School of Music are at Evanston, Ill., and the professional schools in the city of Chicago. The university also maintains two secondary schools, the academy at Evanston and the Grand Prairie Seminary at Onarga, III. The Garrett Biblical Institute, a theological school, though under separate management, is located on the college campus, and is in close affiliation with the university; the Norwegian-Danish Theologi- cal School and the Swedish Seminary are also affiliated with the institute. The work of the College of Liberal Arts is mainly elective, the courses being arranged for major work in one department and minor work in another; the degrees of A.B. Ph. B., B.S. and B.L. are conferred, but after June 1904 the latter will be discontinued; the corresponding master's degrees and Ph.D. are conferred for graduate work. The government is by a board of 44 trustees chosen by church conferences. Women are admitted, and dormitories on the campus are provided for their use. The campus contains 45 acres on the shores of Lake Michigan; the buildings include the Old College, the first building erected, University Hall, the Fayer- weather Hall of Science, the gymnasium, the observatory, and the library. There is a large athletic field, and the athletic affairs of the col- lege are under the management of a committee of nine, consisting of the faculty, the alumni, and three from the Students' Athletic Association. The students' debating society is affiliated with the Central Debating League, in- cluding the students' societies of the universities of Michigan, Chicago, and Michigan State, the Northern Oratorical League, including so- cieties from the universities of Michigan, Wis- consin, Iowa, Chicago, Minnesota, and Oberlin College. The university library contains over 90,000 volumes, besides 35,000 pamphlets, and the professional schools have also special li- braries. In 1903 the productive funds amounted to $2,950,- 000; and the annual income was $218,269. The number of students in attendance was 3,200, and the number of professors and instructors 322.

Norton, nohr'ton, Andrews, American Uni- tarian theologian: b. Hingham, Mass., 31 Dec. 1786; d. Newport, R. I., 18 Sept. 1853. He was graduated at Harvard in 1804, and after studying theology was a tutor in Newbury Col- lege in 1809. He returned to Harvard in 1811 as mathematical tutor there; and became in 1813 librarian of the university and lecturer on Bibili- of critical and interpretation. In 1819-30 he was Dexter professor of sacred literature. He
Norton was among the most eminent exponents of Unitarianism, equally strong in his protests against Calvinism and the naturalistic theology represented by Theodore Parker. He published "Reasons for not Believing the Doctrines of Trinitarianism" (1835); "The Genuine of the Gospels" (1837-44); "The Latest Form of Infidelity" (1839).

Norton, Caroline Elizabeth Sarah Sheridan, English poet and novelist: b. London 1808; d. there 15 March 1877. A granddaughter of Richard Brinsley Sheridan and a sister of Lady Dufferin, she showed her talent at 13 with "The Dandies' Rout." She was married to George Chapple Norton in 1827; procured for him a police magistrate by her influence with the Home Office; broke with her husband in 1836, when he accused Lord Melbourne (q.v.) of criminal intercourse with her; and was vindicated entirely of this charge in a famous suit, the basis of Dickens' Bardele v. Pickwick, in the "Pickwick Papers." Her differences with her husband were not then ended, for he claimed the custody of her children and the income from her writings. She wrote "English Laws for Women in the Nineteenth Century," a pamphlet which contributed to the awakening of English law as to the status of women. Two weeks before her death Mrs. Norton married Sir William Stirling Maxwell. Her principal works are: "The Tower of Rosalie" (1859); a Byronic poem; "The Dream" (1840); "The Lady of La Garaye" (1862), her best poem, which has much the tone of Campbell; "A Voice from the Factories" (1856); and "The Child of the Islands" (1845), both attacking social conditions; and the novels, partly autobiographical, "Stuart of Dunleath" (1851), "Lost and Saved" (1863), and "Old Sir Douglas" (1867).

Norton, Charles Eliot, American scholar: b. Cambridge, Mass., 16 Nov. 1827. He was a son of Andrews Norton (q.v.) and after he was graduated from Harvard in 1849 was for a time in the employ of a Boston establishment in the India trade. Except a voyage to India in 1849 and various trips to Europe his life has been passed in the house where he was born. During the winter of 1870-71 he edited, and with his friend, J. R. Lowell, edited the "North American Review" 1864-8. From 1875 to 1900 he was professor of the history of art at Harvard, becoming professor emeritus in the year last named. As a Harvard professor he has exercised a salutary influence over successive generations of collegians before whom he has placed the highest ideals of both scholarship and citizen- ship. Hundreds of young men have been helped by him to quicker perception of what culture really is as well as to discriminate discernment between true and false culture—between thoughtful, intelligent citizenship, and the noisy, puppishy assertion that so often passes itself off as patriotism. Few Americans have been sterner critics than he of whatever in American life falls below an ideal standard, and as a consequence few men, not possibly politicians, have met with more adverse criticism; but he has met it all as has Professor Norton. Stigmatized often as unpatriotic he has risen to a much higher level of patriotism than his critics. He has enjoyed the friendship of many of the foremost personages of his time and has been the literary executor of such men as Lowell, Carlyle, Emerson, Curtis, and Ruskin. He is the foremost of American Dante scholars and was the foremost of the American Dante Society, as well as of the Archaeological Institute of America, of which he was the president for many years. His published books include: "Considerations on Some Recent Social Theories" (1863); "The New Life of Dante" (1859, a partial translation with essays, followed by a complete translation); "Notes on Travel in Italy" (1860); "Historical Study of Church Building in the Middle Ages" (1880); "The Divine Comedy of Dante" (1891-2), a much-prized prose translation. He has also edited "The Early Letters of Thomas Carlyle" (1883); "Letters of James Russell Lowell" (1894).

Norton, Charles Ledyard, American author: b. Farmington, Conn., 11 June 1837. He was graduated at Yale in 1859; served in the Federal army during the Civil War; was editor of the "Christian Union" 1869-79, and in 1868 became editor of "Outing." He has published "Canoing in Kanuckia" (1878), with J. Habberton; "Handbook of Florida" (1890); "A Medal of Honor Man; or, Cruising among the Blockade-Runners of the Legion"; "The Queen's Rangers"; "Political Americanisms" (1890); etc.

Norton, Charles Stewart, American rear-admiral: b. Albany, N. Y., 10 Aug. 1836. He was graduated at the United States Naval Academy in 1855; became commander in 1870, captain in 1881, commodore in 1894; and was promoted rear-admiral in 1897. During the Civil War he served with honor at Charleston, Hampton Roads, and Port Royal. After the War he served on the board of inspection and survey; commanded the South Atlantic station in 1894-6, and was in charge of the Washington navy yard and station 1896-8. He was retired in the year last named, having reached the age limit.

Norton, Frank Henry, American journalist: b. Hingham, Mass., 20 March 1836. He was connected with the "Astor Life" for New York (1855-65) as assistant librarian and assistant superintendent, and entering journalism in 1872 was editor and owner of the New York "Era" 1879-81, and from 1883 to 1891 on the staff of the New York "Herald." Besides such dramatic burlesques, etc., as "Alhambra," "Cupid and Psyche," he has written "Life of Alexander H. Stephens" (1883); "The Malachite Cross" (1894); etc.

Norton, John, American colonial clergyman: b. Shiford, Hertfordshire, England, 6 May 1666; d. Boston, Mass., 5 April 1669. He was educated at Cambridge University, entered the ministry and in 1635 left England and came to Boston. He was pastor at Ipswich in 1636-52; then he succeeded John Cotton as colleague of John Wilson in the pastorate of the First Church of Boston. In this charge his influence steadily increased and his opinions came to be sought by officials of both church and state. He was still in this position when the colonies decided to send their petition to George I, in 1662, and was selected to accompany General Bradstreet; though the petition was nominally granted and Norton had without doubt performed his delicate task with fidelity, the colonies were dissatisfied with the results and hencefor-
ward his popularity waned. This change in public feeling was without doubt the cause of his death in the following year. He wrote: "Responso ad Totam Questionum Syllogen"; The Orthodoxy Evangelist (1654); 'The Heart of New England Rent by the Blasphemies of the Present Generation' (1660); etc.

Norton, Lillian. See NORICA, LILLIAN.

Norton, Sidney Augustus, American chemist: b. Bloomfield, Trumbull County, Ohio, 11 Jan. 1835. He was graduated from Union College, Schenectady, N. Y., in 1856 and from Miami Medical College in Cincinnati 1867, in which latter institution he was professor of chemistry 1867-72. In 1873 he became professor of chemistry in Ohio State University. He has published: 'Elements of Natural Philosophy' (1870); 'Essays and Notes' (1874); 'Elements of Physics' (1875); 'Elements of Inorganic Chemistry' (1878); 'Organic Chemistry' (1884); etc.

Norton, Thomas, English dramatist: b. Bedfordshire, England, 1532; d. England 1584. He composed, with Sackville, the tragedy 'The Tragedy of Gorbovitch' (1560) which was the first English blank-verse tragedy.

Norton, Thomas Herbert, American chemist: b. Rushford, N. Y., 30 June 1851. He was graduated from Hamilton College, Clinton, N. Y., in 1873 and afterward studied at Heidelberg. From 1878 to 1889 he was manager of important chemical works in Paris, France, and was professor of chemistry in the University of Cincinnati 1883-1900. In May 1900 he was appointed to establish the United States consulate at Har-put, Turkestan.

Norton Sound, an arm of Bering Sea indenting the west shore of Alaska. It is about 220 miles long and 200 miles wide from Cape Nome to Cape Dyer. The Yukon is the largest river flowing into the Sound, a number of short streams enter from the north. The coast is irregular, the largest indentations are Golofin and Norton bays and Golofin Sound. A number of islands are along the coast, the largest are in the eastern part of the Sound. Nome (q.v.) is the most important city on the coast. Captain Cook sighted the coast in 1778.

Norumbega, nô-rûm-bë'ga, a name given by the early explorers to various parts of the eastern coast of North America, also to a river, and to an Indian city. In 1539 the name was applied to the whole coast from Cape Breton to Florida, but this seems to have been on the authority of an anonymous narrative called 'Dieppe Captain.' The map of Verrazano's voyage, published in 1529, locates Aranbega on the coast of New England; Mercator's map, published in 1541, locates Norumbega near the Hudson River; Gastaldi's map, 1556, locates Norumbega near Cape Breton. Other accounts mention Norumbega as a large river, brackish near the mouth; and still others picture it as a city with high towers and substantial houses. The rivers mentioned are supposed to have been Penobscot, Connecticut, or Hudson. Champlain, in 1605, applied the name to Maine and also to the Penobscot River. Humphrey Gilbert (q.v.) in 1583, began an exploration of the beautiful country of Norumbega, and ascribed it to the existence, that he took with him a poet to sing its praises. A map of 1582 makes Penobscot River a stream connecting the Saint Lawrence with the ocean at the mouth of the Penobscot. The country between was called Norumbega. The original name was given by the Indians in many languages; as an Indian word meaning "still water"; a Spanish word meaning "fields"; a Norse word, Norveg, meaning Norwegian; etc. In 1889 Prof. Horsford caused the erection of a memorial tower at the confluence of the Charles River and Stony Brook, near Watertown, Mass., in memory of Norumbega, a Norse city which once existed here. Considerable research has been given to the matter, and some historians claim to have reasonable proof of the origin and location of what by many is considered a mythical city or a name applied by different explorers to different rivers and locations on the coast between Cape Breton and Florida. Con- sult: Fiske, 'Dutch and Quaker Colonies in America'; Horsford, 'Defences of Norumbega'; and 'Discovery of Ancient City of Norumbega'; Beauvais, 'La Norabregue.'

Norval, nôr-val, Young, son of Lady Randolph and her first husband, Sir Malcolm Douglas, in Homes' tragedy, 'Douglas' (1757). He is regarded as an enigma and his identity is revealed to Lady Randolph only after he has saved the life of his stepfather. Glenalvon, the latter's heir, jealous of Norval, incites Lord Randolph's jealousy against him and a duel ensues in which Glenalvon is killed and Norval dies immediately after, whereupon Lady Randolph flings herself from a precipice. The part was much favored by both Kemble and Macready.

Norwalk, nôn-wôk, Conn., city in Fairfield County; on the Norwalk River, near Long Island Sound, and on the New York, N. H. & H. R.R.; about 30 miles east by north of New York city and 12 miles west by south of Bridgeport. Steamers ply regularly between Norwalk and New York. It was settled in 1649, and in 1851 was incorporated as a town. It is now South Norwalk (q.v.). Norwalk was incorporated as a borough in 1836 and in 1893 was chartered as a city. In 1779 it was plundered and burned by a British force under Generals Garth and Prevost. The chief products are silks, felt goods, air compressors, locks, hats, shirts, corsets, shoes, worsted goods, and machinery. The coastwise trade, the oyster interests, and the shipping of farm products engage the attention of a number. Norwalk has a State Armory, the Fairfield County Children's Home, and the Norwalk Hospital. The Carnegie Library and the public and parish schools are the principal educational institutions. The city owns and operates the waterworks. Pop. (1900) 6,135. Consult: Byington, 'Ancient and Modern Norwalk' in the 'Connecticut Quarterly,' Vol. I.; Selleck, 'Norwalk.'

Norwalk, Ohio, city, county-seat of Huron County; on the Wheeling & L. E. (main line, and also Huron branch), Lake Shore & M. S., and Cleveland & W. R.R.'s; situated on the south of Cleveland and 10 miles south of Lake Erie. Huron County is one of the 10 counties which composed the "Western Reserve" or the "Connecticut Reserve." (See Western Re- serve.) The city is connected with a number of villages, and cities by electric railroad. It was
settled in 1816 by Platt Benedict, Elisha Whittlesey, and others; incorporated in 1828 and chartered in 1840. It is in a productive agricultural region, and has extensive manufacturing interests. The factories and works have 3,300 employees; piano factory, 400 employees; railroad shops, 400; printing works, 250; pyrography works, 150; canneries, 50; machine-shops, 100. There are a number of smaller industrial establishments each having from 5 to 25 employees. Norwalk has a large trade in its own manufactures and in farm and dairy products, fruit, and live-stock. It has a fine court-house, several well-built business blocks, and a number of handsome residences. The educational institutions include two parish schools, two parish schools (R.C.), and a Carnegie Library. There are 10 churches. The four banks have a combined capital of $250,000; the amount of the annual business is $1,350,000. The population of the city in 1890 was 7,195; in 1900, 7,074; in 1903, 10,250.

J. H. WILLIAMS,
Editor ‘Norwalk Chronicle.’

**Norway** (Norwegian Norge; Swedish Norrland or Norrlandet, signifying North Kingdom), the western kingdom of the Scandinavian peninsula in the north of Sweden, united since 1814 with Sweden (q.v.) so as to form the single monarchy of Sveriges och Norge—Sweden and Norway.—and ruled since 1872 by Oscar II. Norway is bounded on the northeast by Russian Lapland, east by Sweden, and on all other sides by the sea, the Arctic Ocean being on the north, the Atlantic and the Barents Sea on the northwestern and west, and the Skager-Rack on the south. From the Naze on the south, to a point adjoining the North Cape, the length southwest to northeast is about 1,000 miles; greatest breadth, measured from the stifts of Finnmark to the sea outside which averages 200 fathoms: Sogne Fjord, for instance is 2,820 feet deep; Hardanger Fjord 930 feet; and Vest and Nord Fjords 840 feet. Some of these fjords penetrate great distances inland and send off numerous branching arms. The Sogne Fjord cuts its way to the foot of the Jotun Fjeld, 106 miles from the ocean, and Hardanger Fjord (q.v.) encircling the Folgefond is 68 miles long; the Justedal lies between the Nord and Sogne Fjords. These three are the most characteristic of the fjords and offer some of the most sublime and accessible scenery in Norway. The surface generally is mountainous, particularly in the west and north, the mountain masses, however, assuming the form of great plateaus or tablelands called fylde, fields of fell, as the Hardanger Fjeld, Dovre Fjeld, etc. The main range, the Kjolen, is about 1,000 feet high, runs parallel to the coast from the place of Finnmark in the north to 63° in the south and then divides, as the backbone of the peninsula forming the boundary with Sweden. The highest summits belong to the Sogne Fjeld, a congeries of elevated masses, glaciers and snow fields in the centre of the south division of the kingdom, where rise Galddhopingen 8,400 feet, the Gjettrend 8,384 feet and Skagastolstind 7,879 feet. The line of perpetual snow ranges from 5,000 feet in the south to 3,000 feet on the north. In general the valleys are short and abrupt; and the streams, flowing down impetuously through rocky gorges, form numerous cascades. The leveler portions of plateau regions consist of dreary moors, covered in winter with snow and in summer with coarse grass and heather, studded with numerous tarns and forest belts of conifers, birches, willows, etc. The grass affords pastureage for the sheep and the dalemen. The setre or huts of the herdsmen and the wood-cutters are the only habitations in the mountain solitudes.

**Hydrography.**—The short distance from the western slope to the western coast gives rise to a great number of minor streams, which proceed directly to the shore or the fjords. On the eastern slope the streams do not properly assume the character of rivers till they have run a considerable distance. The few important rivers of Norway have a southerly direction in accordance with the general slope already referred to, and discharge themselves into the Skager-Rack; of these the longest are the Glommen 350 miles, Drammen 250 miles, with its tributary the Hallingdal 113 miles, Numedal Laagen 143 miles, and Otteren 140 miles. Some of these streams in their lower courses expand into long narrow lakes of considerable size: Lake Ringsjøen is 22 miles long and its bottom is 1,080 feet below the level of the sea; others are Randse fjord (43 miles long), Tyrifjord (19 miles), and Fjæmund (35 miles long and 2,300 feet above sea-level). The most important rivers in the kingdom are: the Mor, a stream part of the boundary between Russia and Norway, and falls into the Arctic Ocean; and the Namsen, which falls into the Atlantic.

**Geology and Mineral Resources.**—The prevailing rocks of Norway are gneiss and mica-slate, of which all the loftier mountains are composed. Granite is of comparatively rare occurrence. On some of the plateaus blocks of conglomerate occupy a large part of the surface. Porphyry, argillaceous schist, and limestone occur, but in very limited quantities, and rocks of volcanic formation are rare. Almost all parts of the country bear traces of the grinding action to which the structural rocks were subjected during the Glacial period. The minerals are numerous and abundant; the most important are iron, copper, silver, and cobalt, others are nickel, feldspar, and marble. For a century down to about 1970 the copper and iron mines of Roros and the silver mines of Kongsberg yielded considerable outputs; but have since declined. The principal mine is at Vignes na Karmø, at the entrance to Bukken Fjord, which yields $300,000 worth of pyrites in the year. The total mineral
output of Norway, iron pyrites, silver, copper, apatite, nickel, was valued at $1,567,575 in 1900, showing an increase over preceding years. The silver mined was valued at $94,500. Barely 2,000 men are employed in this occupation.

Climate.—Known as "The Land of the Midnight Sun," one third of Norway lies within the frozen zone and the greater part between the same degrees of latitude as Greenland. It would in all probability be still covered with a snow cap from November to Greenbraid, as it was in the end of the Tertiary period, were its shores, west and north, not washed by the Gulf Stream. It is mainly owing to this warm oceanic artery that Norway is habitable; its influence, together with the direction of the parallel range, the distribution of the atmospheric pressure, and the presence of deep-sea banks off the coast, determines the predominant climatological features of the country. The isotherms do not run from west to east, but parallel to the coast. The harbors on the west are never blocked with ice; while in places more inland, though much farther south, as at Christiania, this regularly happens. Hammerfest, for instance, on the north coast, in lat. 70° 40' N., has a winter mean of 32° F., 5° higher than Christiania, which has virtually an inland site, in lat. 59° 55' N. In winter the west coast districts are the warmest, and the cold increases in intensity according to the distance inland; whereas in summer the reverse is the case, though latitude is then a more potent influencing factor than in winter. The places that have the lowest winter mean (118°) are all inland, as Elverum and Røros (Roraa), near the Swedish frontier, Kautokeino (in southern Finmark), and Nyborg (at the head of Varanger Fjord); at all these places the mercury has been known to freeze (—40° F.). The places which have the highest summer temperature are Christiania, the southwest extremity of the country, the head of the western fjords, and the interior of Finnmark. The prevalent southwest winds bring considerable rainfall, 40 to 70 inches in the year, to the west coast of southern Norway. In the interior only 12 to 16 inches fall during the year.

Flora.—In general, the mountain slopes up to a certain height are clothed with magnificent pine forests, and at lower elevations the oak and the beech are by no means uncommon. In the loftier altitudes, below the snow line, willows, lichens, and numerous wild berries — cranberries, raspberries, bilberries, and cloudberries — are found in summer. Among wild animals are the bear, wolf, lynx, fox, wild reindeer, and lemming; buzzards, kestrels, and owls prey on the smaller animals and birds; snipe, loon and teal abound in the lakes; lapwings and plovers breed in the tarns; in winter the ptarmigan is plentiful, and the eagle, sparrowhawk, woodcock, raven, and crow are common throughout the kingdom.

Forestry.—The forests cover about 26,300 square miles, of which 73 per cent are pine trees; 4,000 square miles are under state control. The area of late years has greatly diminished, but trees are being systematically planted in several parts, especially in the southern and eastern parts of the country. The trees are cut down principally in winter and floated down the streams in early spring to the sawmills at their mouths. The saw mills, wood pulp, and cellulose factories, give employment to about 12,000 people. The export of manufactured lumber in 1901 amounted to over $9,530,000, and of wood pulp over $4,600,000.

Fisheries.—The fisheries are of great value, and contribute mainly to the support of the inhabitants along the seaboards, from the Naze to the entrance of the White Sea. The fisheries are divided into three chief divisions — Lofoten, Romsdal, and Finnmark. They include cod, herring, mackerel, salmon, shark, walrus, seal, and lobster fisheries, the cod and herring fisheries being by far the most important. Over 100,000 persons are employed in the fisheries, and the annual total value of the products of the fisheries considerably exceeds $5,000,000, more than two thirds of which is for cod. The rivers and lakes abound with salmon and salmon-trout, and make Norway one of the best angling countries in the world.

Land Tenure, Agriculture, etc.—The farms are generally the property of those who cultivate them, small proprietors being common in Norway. They often include a large stretch of mountain-pasture, perhaps 40 or 50 miles from the homestead, to which the cattle are sent for several months. Among the crops cultivated for food the principal is barley, which ripens at 70° of latitude; rye is successfully cultivated up to 69°; oats to 68°; but wheat not beyond 64°, and that only in the most favorable seasons. Another most valuable crop is potatoes, grown with success even in Finnmark. Some hemp and flax are also produced, and in the southern part of the country some tobacco is grown. Fruit, too, particularly the apple, pear, and cherry, is raised generally in all the lower localities of the south and the centre. The grain raised fails far short of the consumption. One of the most extensive and profitable branches of rural economy is the rearing of cattle, for which many parts of the country are well adapted. The breeds, however, are inferior. The milk of the cows, however, is good, and enters largely into the food of the inhabitants; and butter is produced in such quantities that there is a considerable export trade of that commodity. Sheep are less numerous than goats, and yield a coarse though abundant and warm wool; swine are not viewed with much favor. The horses are vigorous and sure-footed, but of diminutive size; they are among the best of their kind, and are often exported. Another domestic animal of great value is the reindeer, which forms the principal stock of the northern provinces.

Commerce.—The export trade is chiefly confined to raw produce. The principal items are timber, with wood-pulp and cellulose; fish, smoked and dry, with ice, fish-oil, etc.; also copper ore, iron pyrites, lucifer matches, paper, etc. The chief imports are grain, bacon, and other provisions, coals, textiles, wool, cotton, hemp, salt, sugar, coffee, tobacco, wine, brandy, etc. This trade is chiefly concentrated in the towns of Bergen, Christiania, and Trondheim, though Drammen, Stavanger, Christiansand, and Arendal also engage largely in the foreign commerce of the country. During the latter half of the 19th century the foreign commerce of Norway more than quadrupled; in 1901 the exports amounted to over $41,400,000, and the imports to over $76,900,000.
Manufactures.—These have made comparatively little progress, but are increasing since the protective system adopted by the non-renewal of the customs treaty with Sweden in 1897. The purely industrial establishments are grouped mainly around Christiania, and do not employ more than 45,000 persons. Besides those already mentioned, the more important are textile manufactures, machine-shops, chemical factories, iron and metal works, brick-works, flour-mills, tobacco-factories, breweries, and in a minor degree tanneries, distilleries, and factories for matches, glass, oil (fish and vegetable), and paper. Water is the favorite motive power, only 500 out of 2,000 establishments using steam.

Shipping and Navigation.—For its population, Norway has a large mercantile navy, amounting in 1902 to 6,668 vessels (of which 1,223 were steamships), with an aggregate tonnage of 1,407,889. The Norwegians are among the busiest sea-carriers of the world, nearly 9,000,000 tons of merchandise being carried annually in their ships earning an aggregate sum of $30,000,000. Shipbuilding and supplemental industries are carried on chiefly at Christiania in about 90 establishments employing over 3,000 men. The Norwegian ports were entered in 1900 by 12,401 vessels of 3,110,878 tons and cleared by 12,031 vessels of 3,048,137 tons.

Railways, Communications, etc.—In 1901 there were 3,158 miles of railroad controlled by the state and 140 miles operated by private companies; there were also 8,072 miles of telegraph and telephone lines belonging to the state, and to the state and branch railways 1,363 miles; the national and communal roads had an aggregate length of over 15,000 miles; the principal means of communication, however, are steamboats, which ply along the coasts, on the fjords and inland lakes.

Weights, Measures, and Money.—The metric system (q.v.) of weights and measures was introduced in 1879 and became obligatory 1 July 1882. The unit of value is the Krone, equal to 100 ore, comparative value 25 cents; the 20 Krone note weighed 8.95 grams containing 8,064.5 grams of fine gold, and the silver Krone weighing 7.5 grams contains 6 grams of fine silver.

Banking.—There are two state banks, the Bank of Norway—'Norges Bank' and the 'Kongeriget Norges Hypothekbank' or Mortgage Bank of the Kingdom of Norway. The Bank of Norway, although a joint-stock bank, is largely owned by the state, is governed by state laws, and administered by directors elected by the parliament, excepting the president, who is appointed by the king. It is the only bank authorized to issue bank notes, and besides state business, is a general deposit, discount, circulation, and loan institution. Its assets in 1901 amounted to $26,578,026; its balance to $6,566,485. The 'Kongeriget Norges Hypothekbank' established by the state in 1852 to issue loans on mortgage, had in 1901 a capital of $4,699,000, and a reserve fund of $270,000. The loans on mortgage amounted to $36,150,560, and the bonds issued aggregated $34,062,571.

Private banking was represented by 78 joint-stock banks with a paid up capital of $11,373,500, and there were also 241 savings banks controlled by the minister of finance with over $86,290,000 on deposit and 605,524 depositors.

Government.—Norway being a portion of the Swedish monarchy, its finances, army, and navy do not require to be separately considered. By its constitution fixed at Eidsvold 17 May 1814; and subsequently, on the union of the two crowns, adopted, with some necessary modifications, in an extraordinary diet or Storting, held on the 28th November at Christiania, Norway is a limited hereditary monarchy, united with Sweden as a free, independent, indivisible kingdom, under one common male sovereign, of the Evangelical Lutheran religion, declared to be the religion of the state. The king has the command of the land and sea forces, and makes all appointments; but, with the exception of the governor-general, is not allowed to nominate any but Norwegian subjects to public offices under the crown. The ministry is composed of at least seven councillors, most of whom are entrusted with a department; and two ministers of state. One of the latter, together with two councillors who are annually changed, resides with the king in Sweden; the remainder, with the governor-general, reside in Norway. On a new succession the sovereign must be crowned King of Norway at Trondheim. The members of the legislative assembly, or, as it is called, the Storting, from storg, great, and tinge, meaning that they are elected every three years by the citizens possessing a certain qualification. It subdivides itself into two chambers—one consisting of one fourth of the members, and called the Lagthing, and the other of the remaining three fourths, and called the Odelsting. These chambers meet separately, and each nominates its own president and secretary. Every bill must originate in the Odelsting, but may be proposed either by the members or by the government. When carried in that court it is sent to the Lagthing, and thence to the king, whose assent makes it a law. If the Lagthing disapprove of the bill they must return it, with the reasons of disapproval, to the Odelsting. It carried there again, with or without modification, it comes as before to the Lagthing. If the Lagthing reject the measure a second time the whole Storting meet in one chamber, and the final adoption or rejection is determined by a majority of two thirds. The veto of the king becomes ineffectual against any measure which has been passed without modification by three successive Storthings or parliaments.

Ethnology.—The Norwegians are almost entirely of Scandinavian origin. They are about the middle height, light-haired, and blue-eyed, sober and thrifty, honest and industrious, and where not devoted to a rural life have a strong passion for the sea, and make excellent sailors. The Finns or Lapons dwelling in Nordland, and more especially in Finmark, bear little resemblance to the Norwegians proper. The Qvans, though dwelling in the same localities with the Finns, are very easily distinguished from them both by physical features and habits; being generally tall, and well-proportioned, and remarkable for their cleanliness.

Population.—By the census of 3 Dec. 1900 the population amounted to 2,239,880, of whom 1,087,479 were males, and 1,152,401 females. Illegitimate children were 7,875, or 0.35 per cent of the births. The Laps numbered 19,545, and Finns 7,767. The population is more rural than urban, only about one sixth living in the towns. There is comparatively considerable
emigration, the number in 1901 being 12,745, of whom 12,488 came to the United States.

Education.—Education is compulsory, and is conducted on a national system, according to which gratuitous instruction of an elementary kind, is placed within the reach of all. The schools, designated by the name of almue skoler, or people's schools, are stationed in all towns and parishes. In the country the instruction is only elementary; in the schools themselves an important distinction is made, some being what is called fast skoler, or stationary schools, and others omgang skoler, or ambulatory schools. The latter, as their name implies, shift about at certain periods of the year, from place to place in the more thinly-peopled districts; and thus have the effect of bringing education to those who, but for this arrangement, would be doomed to live without it. Towns possess, in addition to these people's schools, what are called middle schools, middle and royal schools, burgher schools, Latin or learned schools, in all of which superior instruction is given; there are also four cathedral schools, one each in the towns of Christiania, Bergen, Trondhjem, and Christiansted. At the head of all these educational establishments is the Royal Frederick University of Christiania, with five faculties, 63 professors, and 1,400 students. For Language and Literature see Scandinavian Languages and Literature.

Religion.—The great body of the people are Protestants of the Lutheran confession. Though no express law prohibited other religious bodies from meeting for public worship, the popular feeling was for long so decidedly opposed to it that a law, permitting them so to meet, and form regular congregations under their own pastors, was passed for the first time in 1845. In 1900 there were 52,900 dissenters, including 1,969 Roman Catholics. The country is divided into six bishoprics (stifts), corresponding in name and extent with the administrative provinces; and into 902 parishes. With exception of the cathedral of Trondhjem, founded 1180 or 1183 A.D., and a few other churches which are stone edifices, the churches in Norway are generally built of wood. Many of them are very ancient structures, dating as far back as the 11th and 12th centuries.

Justice.—Norway is divided into 108 districts for the administration of civil justice. Of these districts each with an inferior court, 26 are urban, and the rest rural courts, each with one chief, and two other judges, and a Høyesteret, or supreme court, for the whole kingdom, consisting of a president and a minimum of six other judges. In each town and district there is a Forligelseskommission, or court of mediation, consisting of two men chosen by the electors, before which civil cases are generally first brought.

History.—In the earliest times Norway was divided among petty kings or chiefs (jarls), and its people were notorious for their piratical habits (see Northmen). Harold Fair Hair, who ruled from 850 to 933, succeeded in bringing the whole country under his sway, and was succeeded by his son Eric. He was ultimately driven from the throne, which was seized in 938 by his brother, Hakon 1, who had embraced Christianity in England. Magnus the Good, the son of Saint Olaf and Alfhild, a English lady of noble birth, was called to the throne in 1036; and having in 1042 succeeded also to the throne of Denmark, united both under one monarchy (see Denmark). After his death the thrones of Norway and Denmark were occupied by different individuals. In 1319 the crown of Norway and Sweden became for a short time united in the person of Magnus V. Eric of Pomerania succeeded, by separate titles, to Norway, Sweden, and Denmark; and in 1397 was crowned king of the three kingdoms. Sweden then for a time became a separate kingdom; but the union between Denmark and Norway was drawn closer and closer, and very much to the disadvantage of the latter, which was ultimately degraded into a mere dependency of the former. The subsequent history of Norway becomes for a long period a part of that of Denmark. After the defeat of Napoleon by the allies in 1813 it was arranged by the treaty of Vienna in 1814 that Denmark must cede Norway to Sweden, and the result was the union of the two countries under the Swedish crown. The union has been accompanied with a certain amount of friction, partly due to the democratic character of the constitution of Norway, in which country titles of nobility were abolished early in the 19th century. The right claimed by the king to veto absolutely bills passed by elected representatives met with an overwhelming protest by the people, the struggle lasting till 1884. More recently a grave constitutional struggle has arisen between the two countries, from the demand for greater independence for Norway in her foreign policy, which is energetically backed by the Liberals. A motion to introduce a purely Norwegian flag, without the symbol of union with Sweden, was carried by the Storting on 11 Nov. 1898.

Editorial Staff, Encyclopedia Americana.

Norway Rat, the common house or wharf rat, called in England Norway or Hanoverian rat, because it was believed by some to have been imported from Scandinavia; and others to have first arrived at the time of the advent of the then unpopular Hanoverian royal family.

Norway Spruce, a spruce (Abies marina) which abounds in Norway where it is largely used in building. It is extensively grown in the United States as an ornamental tree. See Spruce.

Norwegian Lutheran College, situated at Decorah, Iowa. It was founded in 1861 under the auspices of the Lutheran Church. There is a preparatory department, besides the regular collegiate department. The degree of A.B. is conferred. In 1903 the value of the productive funds was $11,000; the annual income amounted to $6,800; the library contained 11,550 volumes. The students numbered 191, and 15 were at work in the college for the degree of A.B., besides 10 students engaged in the preparatory department.

Norwegian Stove, a square wooden box lined with a soft, non-conducting substance. The
Norwich, Norwich University, a city and civic county, capital of Norfolkshire, on the Wensum, where it joins the Yare, 98 miles northeast of London. It is a picturesque old town, and with its gardens and orchards covers a large area. The cathedral, founded in 1094, was originally in the Norman style, but now exhibits also later styles. It is a fine edifice with extensive cloisters, and a lofty tower and spire 315 feet high. The castle, a noble feudal relic, built by Ulf of about 1066, is finely situated on a lofty eminence, and still surmounted by its massive dungeon tower in the Norman style. St. Andrew's Hall, originally the naves of the Blackfriars' Church, the Guildhall, and the bishop's palace, also are notable buildings. The literary and scientific institutions include the Norfolk and Norwich Library, with about 20,000 volumes; the museum, in the castle; a free library, containing 50,000 volumes; a school of art; and a new technical school. Manufactures, of which worsted and cotton goods are the most extensive, including also mustard and starch, boot and shoe making, iron-working, brewing, etc. The foundation of Norwich cannot be fixed earlier than 446. Rising to the position of capital of the kingdom of East Anglia it had, by the middle of the 10th century, become a large and wealthy town; but in 1066 it was laid in ashes by the Danes. Shortly after rebuilt by the Danes themselves, it had become in the 11th century a large and populous place. In 1296 it began to send representatives to Parliament. In 1328 Edward III made it a staple town for the counties of Norfolk and Suffolk, and conferred upon it other privileges, and induced great numbers of Flemings to settle in it. A still greater number arrived during the reign of Elizabeth. Pop. (1901) 117,728.

Norwich, Norwich, N. Y., village, county-seat of Chenango County; on the Chenango River, and on the Delaware, L. & W., and the New York, O. & W. R.R.'s; about 45 miles in direct line south by west of Cortland and 20 miles north by east of Binghamton. It is the industrial and commercial centre of a productive agricultural region. The chief manufacturing establishments are blast furnaces, railroad shops, furniture factories, ribbon and glove factories, machine-shops and creameries. There is manufactured here also perfumery, drugs, and patent medicines, and in the vicinity are stone quarries. It has a free public library containing about 12,500 volumes, a village hospital, the county buildings, and a number of fine residences. Pop. (1890) 6,524; (1900) 7,004.

Norwich, Vt., town, in Windsor County; on the Connecticut River, and on the Boston & Maine railroad; across the river from Hanover, N. H., and about five miles above White River Junction. The agricultural region and its industrial establishments are connected with the farm products. It is the seat of the Norwich University (q.v.). Pop. (1890) 1,304; (1900) 1,303.

Norwich University, situated at Norwich, Vt. It was first chartered (1819) under the
NORWICH CRESTED CANARY—NOSE

name of American Literary, Scientific, and Military College and was situated at Middle顿; in 1829 it was moved to its present site; and the name changed to Norwich University in 1854. The college has added courses in civil and chemical engineering and military science; military drill is also a part of the curriculum. The chief work of the university has always been in science and engineering, and in 1846 it was made the official State military school, and receives a State appropriation. The degrees of bachelor of arts and bachelor of science are conferred. In 1902 the annual income amounted to $11,700; the students numbered 78, and the faculty 9.

Norwich Crested Canary. See Canary.

Norwood, Mass., town in Norfolk County; on the New York, N. H. & H. R.R.; about 12 miles southwest of Boston. It has a large printing establishment, a railroad repair shop, foundry, tanneries, glue and ink factories, machine-shops, and furniture factories. The educational institutions are the Morrill Memorial Library which contains about 8,000 volumes and the public schools. The government is administered by annual town meetings. The town owns and operates the waterworks. Pop. (1890) 373; (1900) 5,480.

Norwood, Ohio, city in Hamilton County; on the Pennsylvania, the B. O. & S., the Cincinnati, L. & N., and the Norfolk & W. R.R.'s; northeast of and adjoining Cincinnati. It was settled in 1804, incorporated as a village in 1823, and chartered as a city in 1851. It is a beautiful residential hill-suburb of Cincinnati, and also a manufacturing city of considerable importance. The chief industrial establishments (1903) are playing-card factory, which has 2,200 employees; the elastic book-case works, 1,200 employees; electric manufacturing works, 1,000 employees; washing-machine factories, 600; foundry, 200; piano factory, 400; millwork works, 125; tool factory, 125; iron works, 150; enamel sign works, typewriter works, silver-plating works, and other establishments employing fully 1,000 men. Several of the manufacturing companies have buildings of considerable architectural merit. Other notable buildings are the town hall, Enterprise Block, New Carolina Union, National Hall, the large brick building on the square, and the eight churches. The educational institutions are five public schools (fine buildings), one parish school, and there are branch libraries of the Cincinnati public library. The First National Bank has a capital of $1,000,000. The government is vested in a mayor, a council of eight members, and a board of public service consisting of three members, all elected by the people. The population is mostly native born Americans, some are of German descent. Pop. (1900) 5,480; greatly increased in 1904.

Sanford Kline,
Editor 'The Norwood Enterprise.'

Nose, that part of the face of man and the higher animals which is included in the mechanism of respiration, containing avenues for the passage of air to the lungs, and which also contains and accommodates the organs of smell; in a broader and looser sense, the muzzle. The nose in most animals is the most prominent feature of the face; but so in monkeys and lemurs, not much prolonged in the cats, but an important part of the prolonged muzzles of other carnivora, and of the long-headed herbivorous animals generally. In several kinds of animals, otherwise widely diverse in structure and relationship, the fleshy part of the nose has been extended, through similarity of required service, into a more or less prolonged proboscis, as in the pigs, some shrews, certain seals, and, most prominently, the elephants. In these cases the nose performs other services than its usual functions, and becomes a tool for rooting, an organ of prehension, etc.

In structure, the nose consists of a series of bones of the face (see Skull), together with certain cartilages, forming a tube or tubes holding the paired olfactory surfaces and nerves. The cavities of the nose are the two anterior nares, which open externally by the nostrils (in some of the lower animals, as the cetaceans, anterior of the latter muscle is that of a true posterior nares, which are within the bones of the face and open interiorly into the mouth at the top of the windpipe. These cavities are separated by a more or less continuous cartilaginous plate, while their secretion, which is perforated by apertures for the transmission of blood-vessels and nerves. Occasionally the two nasal fossae or cavities communicate with each other.

The muscles which are concerned in the movements of the nasal cartilages include the triangularis (or compressor) nasi, which arises by its apex from the superior maxillary bone, and is inserted into a fibrous aponeurosis spreading over the front ridge of the nose; the fibres of the muscle of one side may unite with those of the opposite and companion muscle. The depressor alae nasi of each side also arises from the superior maxillary bone, and is inserted into the septum and posterior part of the alae of the nose. The former of these two muscles appears to increase the breadth of the nose, and thus may open, dilate, or expand the nostrils; the action of this muscle dilates the nose, raises the upper lip and alae of the nose; its use being well seen in the expression of a derisive smile, and in the wrinkling of the skin at the angles of the nose and mouth.

The skin of the nose is of delicate and smooth character. The papillary or minute elevations of the true skin in the neighborhood of the nose are described as being of smaller size than ordinary, while the under skin or cuticle is of more than usually thin nature. The hairs of the skin are also of finer nature than in the other regions of the body; and the sebaceous or skin glands are very numerous, and possess short ducts, while their secretion is generally present in very abundant quantity.

There are three meati or compartments of the nose, which are formed in the outer wall or side of each of the nasal cavities by the turbinated bones. These compartments are of unequal size, and they communicate by apertures with certain spaces known as air-cells or sinuses, existing in the frontal, sphenoid, superior maxillary, and ethmoid bones. The upper or superior meatus is the smallest compartment, and occupies the posterior part of the nasal wall. It
NOSE AND THROAT

communicates with air-cells known as the posterior ethmoidal and sphenoidal sinuses. The middle meatus is a little larger. It communicates anteriorly through a passage or infundibulum, which is termed the frontal sinus. The inferior meatus is the largest cavity, and occupies the greater part of the outer nasal wall. Into the front part of the inferior meatus the nasal duct opens; this canal conveys the tears or lacrimal secretion from the eye to the nose. (See EYE.) Posteriorly to the extremity of the inferior meatus the aperture of the Eustachian tube, leading from the ear, may be seen.

The mucous membrane lining the nostrils and nasal cavities is also known as the pituitary membrane. It extends throughout the nasal sinuses, into the pharynx, into the nasal ducts and orbits, and through the Eustachian tubes, into the tympanum and mastoid cells of the ear. (See MUCOUS MEMBRANE.) In the upper part of the nose, corresponding to the upper and middle turbinated bones and the ethmoidal portion of the nasal septum, the olfactory region, from the distribution at this part of the olfactory nerves—the mucous membrane has a covering of epithelial cells of the columnar variety, but non-ciliated. And beneath this layer, and also between the columnar epithelial cells, nucleated or olfactory cells are found. These latter cells form the terminal points as it were of the delicate ultimate filaments of the olfactory nerves, or the nerves of smell (see NOSE AND THROAT); and in this way the odoriferous particles drawn into the nostrils, and brought in contact with these cells, stimulate through them the olfactory nerves, and produce the sense or impression of smell.

The study of the comparative anatomy of the nasal organs shows us that man possesses a sense of smell greatly inferior in very many instances to that possessed by the lower animals. The distribution of the olfactory nerves in man is of a very limited nature when compared with what obtains in such animals as the dog, sheep, etc. And among these lower forms great differences are apparent in the kinds or qualities of odors most readily perceived or appreciated. The carnivorous mammals will in this way be more sensitive to the odors of other animals, and the herbivorous forms to those of plants.

Nose and Throat, Diseases of. In treating of the various aspects of the subjects here naturally combined, attention is first drawn to matters of anatomical structure, and the parts first presented for consideration are the anterior nasal cavities. These cavities mark the commencement of a continuation of passages which extend from the external orifices of the nose to the lungs. These are subdivided into anterior nares, naopharynx, pharynx, and larynx. These cavities of continued passages constitute what is known as the respiratory tract. (See RESPIRATION.)

The anterior nares are the two nasal cavities (nostrils) separated by the nasal septum. The septum also serves to define this space, since its posterior border marks the dividing line between the anterior and posterior nares. Each naris consists of a nearly horizontal floor, an internal or septal wall, and two side walls tending to converge in the upper portion, leaving a narrow and irregular roof. The external wall serves as an attachment for the series of the three turbinated bones.

Turbinated Bones.—These are scroll-like processes of bone attached to each lateral wall of the nasal cavity, one over the other, and projecting well into the lumen of the cavity. In the order of location they are known as the superior, middle, and inferior, the inferior being the largest and the longest of the three. The spaces between these bones, looking antero-posteriory, are known as the superior, middle, and inferior meatuses.

The Nasal Septum.—The septum divides the anterior nasal cavity antero-posteriory. It is partly cartilaginous and partly covered by the portion being made up of processes of the ethmoid bone and the vomer.

Accessory Sinuses.—Four groups of accessory sinuses communicate with the anterior nares. They are in pairs and are named as follows: The maxillary sinuses or antra of Highmore, the frontal, the ethmoidal, and the sphenoidal. The maxillary sinuses are situated one in each side of the face, the most part occupying the space in the prominence of the cheek. They are irregular cavities, rather pyramidal in shape. The roof of the sinus constitutes the floor of the orbit, its floor being the alveolar process, and it projects into this cavity. The maxillary sinus opens into the nasal cavity in the middle meatus through a small tortuous canal, known as the ostium maxillare.

The frontal sinuses are located between the two tables of the skull, just over the orbit, and give rise to the prominence over each eye. They communicate with the nose.

The ethmoidal, better named ethmoidal cells, are in series, and are located in the middle anterior and posterior portions of the ethmoid bone. These open into the nasal cavity.

The sphenoidal sinuses are located in the body of the sphenoid bone. They are each about the size of a bean, and open into the superior meatus. The opening of the lacrimal or nasal duct which leads from the lacrimal sac to the nose is in the anterior portion of the inferior meatus. The bony walls of the anterior nares together with the sinuses above described are completely covered by mucous membrane. This membrane is richly supplied with blood-vessels, lymphatic nerves, and glandular structures. The olfactory nerves descend through the cribiform plate of the ethmoid bone and a porous surface of the septum, the superior and middle turbinated bones. Most physiologists regard the function of the nasal cavities as three-fold in characters relating to respiration, olfaction, and phonation. The secretions are supposed to have a bactericidal power.

Rhinoscopv.—This term denotes the methods used for examining the nasal passages, either directly or with the aid of reflectors. Various methods have been employed, the commonest being the student-lamp or ordinary gas-jet, with a reflector or head-lamp, enables the examiner to throw a light directly into these cavities. An electric head-light which does away with the use of a burner or indirect apparatus may be employed. When an anterior naris is examined the nostril is opened wide by the means
of a nasal speculum. For examining the pos-
terior naris a tongue-depressor and small hand-
mirror must also be used.

Cautions.—The term catarrh is used quite
generally to designate the varieties of inflamma-
tion of the upper respiratory tract. This is con-
trary to the strict meaning of the term. It may,
however, be used to define certain varieties of
inflammation, which are no less distinctly recog-
nized.

Inflammation.—The varieties of inflammation
in the nasal cavity include: 1. Catarhhal inflam-
mation, of which the acute variety is a simple
inflammation, and is caused by irritation, ex-
sulting from irritants, exposure to cold, or from
infections (measles, scarlet fever, typhoid, diph-
theria, grip, etc.), while rheumatism and gout
sometimes induce catarrhal inflammations of the
upper respiratory tract. Croupous catarrhal
inflammation may result from a series of acute
attacks, but is more particularly found as a local
indication of systemic diseases such as phthisis,
Bright’s disease, gout, rheumatism, malaria, etc.
2. Membranous inflammation, of which there are
three varieties: (a) croupous or pseudomem-
branous, an exudate without material organiza-
tion and not due to specific bacteria, and which
may be produced by escharotics or infectious
fevers; (b) fibroplastic inflammation, which is
characterized by the formation on the sur-
face of the membrane of plastic material that
seems to organize in layers, but is nonbacterial in
origin; (c) diphtheritic inflammation, a more
deep-seated exudate due to a specific germ, the
Klebs-Löffler bacillus, or Bacillus diphtheriae.

Unlike the foregoing this false membrane
when removed leaves a bleeding surface, show-
ing that large masses of crusts imbedded in the
nasal cavities.

3. Hemorrhagic inflammation, a violent in-
flammation of the mucous surface, character-
ized by interstitial hemorrhage.

4. Gangrenous inflammation, a type of inflam-
mation which sometimes follows the acute in-
fected diseases in children. It may be due to
burns, scalds, etc.

Specific Inflammations (Chronic Infectious
Inflammations; Specific Granulatoma).—These
include actinomycosis, glanders, leprosy, syphilis,
tuberculosis (q.v.), and rhinoscleroma, which is
characterized by excessive thinning and swelling
of the skin and mucous membrane of the nose
to-supposed to be due to Bacillus rhinoscleromatis.

Nasal Bacteria.—Owing to the peculiar con-
struction and functions of the nasal cavities,
together with the moist condition of the mem-
brane, the nasopharynx is supposed to be most
bacteriologist to possess considerable germicidal influence, as
may be instanced by the fact that they are found in
much larger numbers in the anterior nares than in the
rhinopharynx. It may also be noted that
the more virulent types, especially the
Staphylococcus pyogenes, Micrococcus pneu-
moniae (Frankel), Bacillus tuberosus, Fried-
lander's pneumococcus, Klebs-Löffler bacillus
(diphtheritic), and the streptococcus may be
found and still not result in the development
of the specific diseases of which they are sup-
posed to be the causative factors.

Diseases of the Anterior Nasal Cavities.—
Of these one of the most frequent is acute rhin-
itis (acute nasal catarrh, acute rhinorrhea, ca-
tarrhial rhinitis, cold in the head, snuffles), an
acute inflammation of the lining membrane of
the nasal cavities, supposed to be due to lowered
vitality, confinement in overheated rooms,
and prolonged mental strain, to which is
added exposure to draft or sudden chilling of the
body. Contributing causes may also be men-
tioned, such as deviation of the cartilaginous
septum, stenosis, rhinorrhea, gout, chronic
hypertrophy, and unsuitable clothing. Irritant
drugs, the inhalation of dust, clippings, etc.,
may be considered as exciting causes.

Simple chronic rhinitis (chronic blednor-
rhea, chronic nasal catarrh, chronic coriza,
chronic rhinorrhea) is a chronic inflammation
of the nasal mucosa characterized by infiltration
of the tissues and resulting from changes in
the secretions and repeated acute attacks. In
its hyperplastic form, owing to the increase
of connective tissue in the nasal mucosa, it is
accompanied by more or less nasal obstruction.

Ozena.—This is usually spoken of as a dis-
ease, but in reality is only a symptom. The con-
ditions giving rise to its characteristic stench
are not fully understood. By some it is con-
sidered to be simply a decomposition of the
various fatty acids set free from certain intra-
nasal inflammations. A more generally accep-
ted opinion, however, is that the retained altered
secretions undergo a putrefactive process as a
result of the presence of saprophytic bacteria.
The conditions usually present in the nose
are those of atrophy and disease of the accessory
sinuses. The odor is mainly confined to the
large masses of crusts imbedded in the nasal
cavities.

Atrophic Rhinitis.—This disorder, also
known as atrophic catarrh, dry catarrh, dry
rhinitis, fetic rhinitis, nasopharyngitis, ozena,
and rhinitis sica, may be described as atrophy
of the nasal mucous membranes, accompanied
by lessening of both the blood-supply and gland-
ular secretion. The atrophic state has usually
been preceded by a succession of inflammations
accompanied by more or less hyper trophy of
the tissues. In a large proportion of atrophic
cases ozena is present.

Purulent rhinitis is a rare condition resulting
from direct infection, and often mistaken for
purulent conditions of the accessory cavities.

Nasal hydromyrhea is an obstructed nasal con-
dition accompanied by an excessive flow of
watery fluid from the nose, probably of reflex
origin.

Nasal Syphilis.—A disease also called speci-
cific catarrh, specific rhinitis, and syphilitic rhin-
itis. It is an intranasal manifestation of syph-
ilis, usually of the tertiary variety, accompanied
with more or less necrosis of both soft tissues
and bone. Occasionally the nasal mucous mem-
brane may form the seat of the initial lesion.
The intranasal lesions of the tertiary stage are
severe and extensive and may involve the car-
tilaginous septum or the bony framework of the
nose, resulting often in serious and extensive
deformity. Whether there are masses of ex-
cruciating bone the odor is exceedingly offensive,
and frequently large pieces of broken down bone
may be removed en masse.

Lupus (q.v.) is a skin-disease of which there are
two distinct forms.

Furunculosis (phlegmonous rhinitis) is the
formation of abscess in any part of the nasal cavities.

Ulcers.—Small ulcers may form in various portions of the nasal cavity, but are usually found upon the septum, and result from foreign bodies, picking of the nose, and from a general systemic disturbance like diabetes. Malignant growths occur in the nose and do not differ essentially from those found elsewhere in the body. Infected ulcers, when occurring in nasal cavities, are superimposed on the intranasal form of disease like syphilis, glands, diphtheria, scarlet fever, smallpox, typhoid fever, or typhus fever, the type depending upon the nature of the accompanying disease.

Neuromoses.—Neuromoses of olfaction (smell) is a perversion of olfaction, a perception of imaginary odors frequently amounting to hallucination. Hypersmia, overacuteness of olfaction, is supposed to be due to impairment of nerve-casts, as is also anosmia. Sneeze is a forcible and audible spasmodic expulsion of air through the nose and mouth caused by inhalation of irritating substances or by irritation of the vasomotor centres. See Hay Pattison's "Respiratory Disease." Neurasthenia.

Non-Inflammatory Diseases.—Of these, one of the most common is nosebleed (q.v.). Several varieties of foreign bodies are occasionally found in the anterior nasal space. Rhinoliths are concretions of lime or other mineral salts which, by their weight, may push a portion of the nasal mucosa formed from the deposit of mineral salts. Various animate foreign bodies may be found in the nose, such as insects, maggots, and intestinal worms. Of other foreign bodies, those placed in the nostrils by malingerers and children form the greater part, and consist chiefly of buttons, beans, peas, seeds, rags, etc.

Neoplasm of the Upper Respiratory Tract.—Non-malignant neoplasm (papilloma) is a benign wart-like growth made up of hypertrophied papillae, appearing rarely in nasal cavities, but occasionally seen in the pharynx and larynx. Adenoma is a benign tumor made up of connective tissue enclosing a large space filled with blood. Enchondroma in the nasal passages is a cartilaginous growth, sometimes called chondroma, and is an offshoot from the cartilaginous septum. Exostosis is a bony growth projecting outward from the bony border of the nasal bone in the framework. Myxoma (nasal polypus) is the lower grade of adult connective-tissue tumor; being a soft translucent growth made up of connective tissue and capillary vessels enclosed in a jelly-like matrix. They are usually pedunculated, multiple, and sometimes of large size, grayish in color, translucent, and have a small surface. They give rise to symptoms of intranasal pressure and obstruction, asthma, laryngeal cough, anosmia, and excess watery discharge. As a rule the growth is associated with diseases of the accessory sinuses.

Malignant Tumors.—Carcinoma may have its origin in any part of the upper respiratory tract. It rapidly assumes in the proportions, and is amenable to operative interference only during incipient. The same may be said of sarcoma, which is a highly malignant tumor, having its origin in the deep connective tissue and gradually extending to the mucous surface. It is nodulated and fungoid in appearance and tends to ulcerate in the later stages. See Tumor.

Diseases of the Anterior Nasal Cavities.—Owing to the prominence of the nose and its peculiar anatomical conformation, the septum becomes peculiarly liable to injuries and malformations, the most common of which is deviation or deflection. A deviated or deflected septum (usually limited to the cartilaginous portion) is a permanent change from the peculiar to varying deformities. The deformities assume various shapes, with an occasional offshoot of a cartilaginous mass heretofore described as enchondroma. These often result in severe intranasal discomfort and cavities are radical operative interference for relief. Synchia is a cartilaginous or fibrinous band extending from the septum to the nasal wall. A synchia may sometimes form between the turbinals. Septal ulcers are either due to the desire for which may be induced by irritants, foreign bodies, and the inhaling of poisonous gases. They may also be syphilitic in origin. Septal perforations are openings through the cartilaginous septum. They are of varying size and are due to extension of ulceration. Abscesses of the septum is a collection of pus in the septal tissues, due to injuries or general systemic diseases. Depression of the nasal cartilage is a nasal deformity following extensive loss of septal tissue or of nasal bones, usually due to syphilis or injury.

Diseases of the Accessory Sinuses.—The maxillary sinuses are occasionally the seat of purulent inflammation and may become chronic. The collection of pus gives rise to pain, a sense of fulness, and discharge into the nasal cavity of the affected side. The condition is caused either by various teeth, infectious rhinitis, or from the introduction of infection through abnormal communications from other diseased sinuses.

Transillumination is a method of diagnosis of antral diseases. By having the patient in a dark room, a strong electric light is placed in the mouth and a comparison of the illumination made with the opposite side. Acute cases frequently recover by local treatment, but chronic cases usually require operative measures. The antrum may also become the seat of both benign and malignant growths.

Diseases of the Ethmoidal Cells.—These groups of cells, located in the ethmoid bone and communicating with the nasal fossae, are subject to both acute and chronic inflammatory and purulent diseases, the most common being the acute catarrhal inflammation occurring with general purulent rhinitis. The purulent form may occur on one or both sides, and may be associated with a supplicative condition of other accessory sinuses. When far advanced, it results in an enlargement of the middle turbinate bone, the walls of which become cystic, forming with the bony border of the ethmoid, large cysts filled with pus or polypoid degeneration.

The sphenoidal sinuses are less frequently the seat of disease, although they may be the seat of the same diseases heretofore described as occurring in the other sinuses.

The anatomical relation of the frontal sinuses to the nasal cavities renders them liable to the development of both acute and chronic inflammatory conditions, purulent infections, and tumors.

Catarrhal inflammation, both acute and chronic, with its attendant supra-orbital pain and sense of weight and fulness in the fore-
NOSE AND THROAT

head, is occasionally present in connection with the same condition in the nasal cavities. Acute suppurative inflammation (empyema) is an acute suppuration brought about by the introduction of infection from the nose through the sinuses. When long continued, the purulent process takes on the form of chronic purulent inflammation, in which there may be more or less necrosis of the bony walls and the development of polypoid degeneration. The severest forms are usually quite curable by means of operation.

Nasopharynx.—The nasopharynx is that section of the upper respiratory tract between the posterior border of the vomer and the level of the soft palate. The nasopharynx may be the seat of the following affections: (1) acute nasopharyngitis (acute postnasal catarrh, acute rhinopharyngitis); (2) chronic nasopharyngitis; (3) atrophic pharyngitis (see Atrophic Rhinitis above); (4) hyperplastic nasopharyngitis; (5) growths. Each of these affections is described below.

Pharynx, a separate article; (6) adenoid vegetations (see Tonsils below).

Acute nasopharyngitis is an acute inflammation of the mucous membrane lining the nasopharynx, usually accompanied by similar inflammations in the nose, pharynx, and larynx. Chronic nasopharyngitis is a chronic catarrhal inflammation resulting usually from repeated acute attacks and with the same causal relations. It is characterized by the presence of tenacious mucus, with more or less continuous efforts on the part of the victim to "hawk" and clear the throat. In the later stages the secretion becomes a tenacious, thick, forming scabs and inspissated masses. This affection may result from the inflammation of irritating gases. Hyperplastic nasopharyngitis is a chronic inflammation resulting in the development of congestion in the mucous membrane.

Pharynx.—The pharynx is that portion of the upper respiratory tract bounded above by the soft palate and below by the upper borders of the larynx and eosophagus. The uvula, when normal, should be about 1 inch long. It is occasionally bifid, and when it is greatly relaxed or enlarged the condition is described as elongation of the uvula. The uvula may be subject to inflammations, ulceration, tuberculosis, and the erosions. The pharynx should be said said of the soft palate, which is also subject to adhesions, in which there is an attachment or adhesion between the soft palate and the posterior wall of the pharynx. Adhesions of this character are due to the ravages of syphilis.

Tonsils.—The tonsils are a series of glands known as (1) the pharyngeal or Luschka's tonsil, also called adenoid vegetation; (2) the faucial tonsils, located on either side of the pharynx between the faucial pillars; (3) the lingual tonsils, a series of glands at the base of the tongue. Taken as a whole, they have been known as Waldeyer's ring. A visible hypertrophy or enlargement of any one of the series is usually accompanied by similar enlargement of the others. They form a part of the normal anatomical structures of the locality and, when diseased, call for operative interference.

Adenoid vegetation in the vault of the pharynx is an enlargement or hypertrophy of the glandular structures of the vault, due to disease. The presence of this condition is indicated by interference with nasal respiration, resulting in mouth-breathing, especially at night, snoring, restlessness, "dead" voice, and often with considerable arrest in the progress of physical development. With these symptoms are frequently found narrowing of the nasal orifices, attacks of middle-ear suppuration, and narrowing of the chest-walls. The cause appears to be due in part as climatic, inherited tendency, confinement in badly ventilated quarters, and neglect. The masses are found in the vault and on the posterior wall of the nasopharynx. Enlargement of these glands is considered to be extremely detrimental to child-life, and complete removal by operation offers the only means of cure and should always be done.

The faucial tonsils are located between the anterior and posterior faucial pillars, and normally are not visible to the eye. The lymphatic structure, however, is liable to pathological changes resulting in enlargement or hypertrophy. The enlargement may be slight, but the tonsils may become so much enlarged that they meet in the median line of the pharynx. The enlargement becomes much aggravated during the attacks of the various acute inflammations which may occur in this region and which are subject to acute inflammation occurring with general pharyngitis.

Tonsillar and peritonsillar abscess (quinsy, phlegmonous tonsillitis) is a suppurative inflammation of the tonsil, accompanied by severe pain, fever, and swelling in the tonsillar or peritonsillar region, resulting in formation of abscess. Follicular tonsillitis (lacunar and cryptic tonsillitis) is an acute inflammation of the tonsil attended with swelling of the tonsil and its crypts. It is accompanied by constant pain, chills, high temperature, and is supposed to be due to exposure to cold, climatic changes, and lowered vitality.

The causes of hypertrophied tonsils are chronic inflammation, inherited diathesis, gouty or rheumatic conditions, climatic influences, and the infectious diseases of childhood. The condition is accompanied by interference with respiration, masses, which eventually squeeze out of the Eustachian tube, anemia, languor, and retarded physical development, all these symptoms being aggravated by the recumbent position. Tonsillectomy should be performed where there is sufficient enlargement to interfere with deglutition, respiration, or phonation. The instrument generally used for the removal of hypertrophied tonsils is known as the tonsillectome.

Caseous tonsillitis is a condition resulting from acute or chronic inflammation of the tonsils, in which the crypts show a tendency to fill up with various secretions. These masses show a tendency to ferment and form small foul-smelling caseous masses, which eventually squeeze out of the crypts. They may be removed by the means of a curet.

Mycosis of the tonsil and pharynx is an affection characterized by the development of small yellowish-white, clearly defined masses forming around the tonsillar crypts and frequently extending over the surface of the pharynx and the glands at the base of the tongue. It is supposed to be caused by Lepto-therix buccata.

Fish-bones, pins, and other foreign bodies occasionally find lodgment in the tonsil-crypts. Lingual tonsil is made up of a mass of
NOSE AND THROAT

adenoid tissue located between the circumvallate papillae at the base of the tongue and the attachment of the soft palate. Disease of the Pharynx (acute inflammatory diseases of the pharynx, acute catarrhal pharyngitis), an inflammatory process, catarrhal in character, results from exposure to cold, and is usually attended with a like condition in the nose and larynx. It may also be due to gastric disorders and lowered vitality. There are many contributing causes, among which may be mentioned the exanthemata, bad ventilation, bad hygiene, insufficient clothing, overindulgence in alcohol and tobacco, and the inhaling of noxious gases. The disease is indicated by a certain dry painful condition of the pharyngeal walls, congested vessels, swelling, and sometimes edema. Later, given a more or less profuse secretion gradually becoming more tenacious and mucopurulent.

Infective pharyngitis (hospital sore throat, phlegmonous pharyngitis) is an inflammatory condition, attended with more or less exudate, occurring in individuals who are exposed for a prolonged period to septic influences. It is frequently found in the throats of physicians and nurses who care for diphtheria and scarlet-fever patients. Croupous or simple membranous pharyngitis is an inflammation of the pharynx or tonsils attended with the development of a false membrane without the presence of any specific germ. Clinically, the disease resembles diphtheria, but is in no sense to be considered as the same. (See DIPHTHERIA). A positive diagnosis can be established only by bacteriological examination.

Ludwig's Angina.—This is a supplicative cellulitis occurring in the tissues of the neck, due to secondary infection from within the throat. Diphtheria, scarlet fever, and grip may be followed as exciting causes.

Chronic Inflammatory Diseases.—Simple chronic pharyngitis (clergyman's sore throat) is an inflammation of the pharynx resulting either from frequent acute inflammations or from chronic irritation. Public speakers and singers are peculiarly liable to its development. It may also result from lesions of the liver, kidneys, lungs, and heart, or from the use of stimulants. The marked symptoms are hyperemia or congestion, with dryness, hoarseness, and a feeling of throat-tire.

Follicular pharyngitis (granular pharyngitis) may be defined as an inflammation in which the granular structures of the pharynx become chiefly involved. It is accompanied by hoarseness, irritation, and cough, together with the appearance on the posterior wall of small granular enlargements. The disease is supposed to result either from voice-strain or improper vocalization.

Atrophic pharyngitis (dry pharyngitis, pharyngitis sicca, atrophic pharyngitis) may be defined as a chronic inflammation resulting in pathological alterations in the structure of the mucous membrane of the pharynx and impairment of the mucous membranes of the upper respiratory tract. Rheumatic pharyngitis (gouty sore throat, rheumatic sore throat) is an affection that may be acute or chronic, and is due to the presence of some irritant in the blood. The uric-acid diathesis may be considered an exciting cause, and the disease responds to antirheumatic or antiguout treatment.

Tuberculosis of the pharynx is a rare involve- ment, always secondary to pulmonary tubercu- losis. Its presence is indicated by the formation of small tubercles upon the soft palate or pillars of the fauces. A positive diagnosis may be made by microscopic examination of the secretions.

Syphilis.—All three forms of syphilitic lesions may appear in the pharynx. The primary lesions are occasionally found upon the tonsils or other surfaces of the pharynx in the form of chancre. The mucus-patch is usually present at some period during the history of every case. The tertiary lesion or gumma may also develop in any of the pharyngeal structures often resulting in extensive ulceration and adhesion.

Glanders.—An infectious disease due to the Bacillus mallei, and communicated to man from animals, usually horses.

Retropharyngeal Abscess.—A supplicative inflam- mation in the posterior wall of the pharynx resulting in the development of abscess, which may burrow upward or downward, causing serious danger to life. The primary infection is usually due to inherited tuberculosis or syphilis.

Foreign Bodies in the Pharynx.—The exposed location of the pharynx, with its irregular surfaces, renders it peculiarly liable to the lodgment of foreign bodies. Among those rather frequently observed are fish-bones, pieces of other bone, shells, coins, pins, needles, sharp objects of various kinds, false teeth, etc.

The Larynx.—That section of the upper respiratory tract which occupies the space between the root of the tongue and the upper end of the trachea is called the larynx (q.v.). It is subject to a variety of diseases, among which are malformations and deformities. Congenital deformities in the larynx are rare. Congenital stenosis is a narrowing of the calibre of the larynx due to the formation of webs or bands stretching across the interior. Acquired stenosis is due to cicatricial contraction, traumatism, or syphilis. Tubercular ulceration may also be mentioned as a cause of stenosis of the larynx.

Acute catarrhal laryngitis (spurious cough) is an acute inflammatory process involving the mucous membrane of the larynx, and attended with hoarseness, dryness, and slight dyspnea. The disease is caused by cold, exposure, gastro-intestinal disturbances, nasal obstruction, bad ventilation, inhalation of irritating gases, and overuse of the voice. There is usually slight fever, cough, and in the later stages considerable expectoration.

Acute laryngitis in children (spasmodic cough, false cough) does not differ in etiology and pathology from ordinary acute laryngitis. The symptoms, however, are much more marked. The small calibre of the larynx in childhood, together with the greater elasticity of the tissues, renders the condition more serious. The engorgement is more rapid, and the symptoms of suffocation rapidly develop. The peculiar stridulous breathing, with frantic respiratory efforts and a hoarse barking cough, gives the disease an appearance of unusual severity.
The disease usually continues for three days, and is relieved by steam-inhalations, emetics, and laxatives.

For spasm of the glottis see LARYNGISMUS STRIDULUS.

Acute epiglottitis, inflammation of the epiglottis, is rarely entirely local except when due to swallowing an irritating substance. It is usually associated with inflammation of contiguous membranes. The chief symptom is a burning, smarting sensation, with a tendency to edema.

Edema of the larynx is an acute inflammation of the larynx accompanied by serous infiltration of the tissues, and resulting in marked interference with respiration.

Membranous laryngitis (true croup, membranous croup, diphtheritic croup, fibrinous croup, croupous laryngitis, laryngeal diphtheria) is an inflammation of the mucous membrane lining the larynx, manifesting the appearance of true croup, but usually without the presence of Klebs-Löffler bacilli. Various forms of pathogenic bacteria are usually present. It may occur at any season of the year, and clinically it approaches so nearly to diphtheria that a positive diagnosis is most difficult. Many observers believe the condition to be exceedingly rare, and that true diphtheria is nearly always present wherever true membrane is found in the larynx.

Laryngeal diphtheria, without the presence of membrane in the pharynx or nose, sometimes occurs, the symptoms being quite similar to membranous laryngitis. The characteristic odor, however, is usually present, and the Klebs-Löffler bacilli may be found.

Hemorrhagic laryngitis may occur as a result of acute laryngitis, or from syphilis, tuberculous or malignant disease, or from rupture of a blood-vessel.

Chronic laryngitis (chronic catarrh of the larynx) is an inflammation involving both the superficial and deeper layers of the mucous membrane, with more or less of tissue-changes. The disease is supposed to result from repeated acute attacks. A subacute variety may be mentioned, but it cannot be clearly defined beyond stating that it is the commencement of the chronic form. Among other causes are the inhalation of irritating gases or dust, nasal obstruction, and improper use of the voice. The marked symptoms of this condition are hoarseness, a tickling sensation, with a tendency to clear the voice, slight cough, with considerable secretion, and occasional loss of voice.

Dry laryngitis (laryngitis sicca, atrophic laryngitis, laryngeal ozone) is always associated with a similar condition in the nose and nasopharynx, the symptoms of which have all been described.

Anemia of the larynx, when marked, is usually a local manifestation of general anemia.

Singers' nodes (chorditis tuberosa, trachoma of the vocal cords) are new-growth formations appearing on the margin of the vocal cords and usually at the site of the middle and anterior thirds. They are small oval masses, sometimes developing upon both cords. While resulting from inflammation, the exciting cause is no doubt the improper use of the vocal apparatus. There is marked interference with phonation and sometimes complete loss of voice. Treatment consists either of rest or the adoption of a system of vocal exercises which bring other series of muscles into activity. Local astringent applications have been employed by the development of gummatas, with destructive ulceration and subsequent cicatrization.

Tuberculosis of the Larynx.—This disease, also called consumption of the larynx, consumption of the larynx, and laryngeal syphilis, is a specific inflammation of the larynx, the direct result of the tubercle bacillus. Tuberculosis of the larynx is rarely, if ever, a primary affection, and usually occurs as a manifestation of general tuberculosis of the lungs. Great suffering results, dysphagia, continuous irritation of the larynx, progressive hoarseness, and irritating cough with excessive expectoration. In the late stages hemorrhage may occur. This form of tuberculosis is rapidly fatal, with but little hope of the patient's recovery.

Foreign Bodies in the Larynx.—Accidental entrance of foreign bodies into the larynx occasionally occurs. Foreign bodies usually enter during the process of swallowing, speaking, or breathing. The resulting danger depends much upon the character and size of the foreign body, and also upon its location. Liquid food and even small portions of solid food are usually dislodged with little difficulty unless the entire calibre of the larynx is shut off. Foreign bodies may usually be seen by the ordinary methods resorted to for examining the interior of the larynx. They are removed by the aid of specula, forceps, etc., or by external operation. Unfortunately the masses are sometimes drawn beyond the larynx into the bronchial tubes with fatal results.

Neuralgia of the Larynx.—Of the various laryngeal symptoms sometimes resulting from impaired nerve-supply or from brain-lesions is spasmodic cough. This occurs more frequently in persons of nervous type, although it may be seen in retired persons. The irritable larynx, or hyperesthesia of the larynx may be mentioned under this type of affections.

Hysterical aphonia is usually described as a sudden and complete loss of voice, occurring in unmarried females. The irritable state is usually shock, fright, anger, or some other sudden emotion. The condition may remain for some time, and recovery may be sudden and unexpected and without treatment.

Laryngeal Vertigo.—This is a neurosis in which the dominant symptoms are a sudden strangling cough with vertigo and momentary loss of consciousness. It is a rare affection, and is usually associated with acute or chronic inflammation of the larynx, strongly influenced by fatigue or nervous excitement. The disease quickly responds to treatment.

Paralysis of the Vocal Cords.—Temporary
interference with the nerve-supply of the various muscles controlling the larynx, especially from local causes, is not infrequent. The paralysis following diphtheria and accidental poisoning is typical. A more severe form results from pressure from aneurism, cancer, phthisis, and syphilis. But lesions of the brain are by far the most destructive in results. Paralysis in this location may be either motor or sensory. Bilateral paralysis of the superior laryngeal nerve is both motor and sensory. The gravity of these conditions depends upon the cause. Bilateral abductor paralysis, on account of the approximations of the vocal cords without the muscular power to separate them for proper inhalation, is dangerous to life, inasmuch as a fatal attack of dyspnea may occur at any time.

**Intubation of the Larynx.**—This process was devised and perfected by the American physician, Joseph O'Dwyer. It consists in placing a hollow tube within the larynx for the purpose of relieving dyspnea. Intralaryngeal tumors sometimes tend to occlude the lumen of the larynx, and intubation is resorted to for the relief of the attendant dyspnea. Intubation also serves as a method of relief in cases of laryngeal stricture. The operation is never attempted unless the patient's life is threatened by occlusion of the larynx or sudden spasm. The most common cause giving rise to the necessity for intubation is diphtheritic laryngitis.

**Tracheotomy.**—An operation whereby an external opening is made into the trachea below the larynx, through which a tube known as the tracheotomy-tube is inserted. It is performed for the relief of any obstruction to breathing. The site selected for entrance into the trachea may be high or low according to the nature and location of the obstruction.

**Operations on the Larynx.**—Thyrotomy consists of splitting the thyroid cartilage in the median line for the purpose of opening the larynx and removing growths or foreign bodies. Laryngectomy is an operation for complete removal of the larynx, and is performed only in cases of malignant growth. In cases where only part of the larynx is removed it is called partial laryngectomy. An artificial larynx is an instrument which in certain cases may be introduced after a laryngectomy, and which serves to fulfill some of the functions of the larynx. Consult: Kyle, 'Diseases of Nose and Throat' (1900); Bosworth, 'Diseases of Nose and Throat' (1886); Knight, 'Diseases of Nose and Throat.'

Wendell C. Phillips, M.D.,
Professor of Diseases of the Ear, New York Post Graduate Medical School.

**Nosebleed,** hemorrhage from the nose; epistaxis. This is the most frequent form of bleeding from a mucous membrane. It may be caused by direct injury, as from a blow upon the nose, a scratch within the nostril, etc., or may result from ulceration or other morbid growth in the nasal cavity. It is most common in children and young adults. When an active hemorrhage, it may be preceded by a feeling of tension and heat in the nostrils, pain in the forehead, giddiness, buzzing in the ears, flushing of the face. These symptoms are seldom all present in the same case, and in many instances the flow of blood is not preceded by any apparent disorder.

Nosebleed may also be of a passive character, as when due to a morbid state of the blood, for example, in typhoid fever, scarlet fever, purpura, scurvy, etc., or to obstruction of the circulation by disease of the heart and liver. In persons advanced in life it must be more cautiously interfered with than in the young. If the person so affected is plethoric, the hemorrhage is evidently of an active character, and is a natural relief. Usually it will stop by the clotting of the blood in the nostril, or upon pressure of the wing of the nostril against the nasal septum. It may, however, go to an extreme extent, and require other means for checking. There are many methods of affecting this, but the application of cold water, snow, ice, etc., to the forehead, spine, or other parts of the body is the most general. Raising both arms suddenly above the head has been said to stop the flow quickly; or a small quantity of solution of alum, as strong as it can be made, may be thrown up with a syringe, or a piece of linen soaked in the solution may be stuffed up the nostril. From 10 to 15 drops of dilute sulphuric acid may be given in water at intervals, according to the nature and persistence of the attack. Intubation may be resorted to by means of a sponge, tampon, alum, etc., may be necessary under direction of a physician, who, in desperate cases, is needed for discovering the bleeding-point, and by whom plugging of the nostril may be resorted to.

**Nosophy,** in medicine, that science which treats of the systematic arrangement or classification and nomenclature of diseases. Many systems of nosology have been in use at different times, some of which have been founded on the nature of the ascertained cause of disease; others on the pathological conditions which attend diseases; and still others on the differences between structural and functional diseases, and so on. The system introduced by William Farr, the London medical statistician, has in recent years been accepted as the most advantageous for statistical purposes. It is expanded most fully in the nomenclature of diseases issued in 1884 by the Royal College of Physicians and Surgeons. Ten years later this work was revised, and it is used in the United States as well as in Great Britain.

In Farr's system of nosology diseases are divided into four primary classes, which are subdivided into various orders. The classification is as follows:

**First Class.**—This class includes zymotic diseases, diseases which are either epidemic, endemic, or contagious, induced by some specific body, or by the want of food or by its bad quality. In this class there are four orders: (1) Miasmatic diseases, such as smallpox, measles, scarlatica, diphtheria, croup, whooping-cough, scarlet, typhus, typhoid, and yellow fevers, cholera, plague, boil, erysipelas, dysentery, rheumatism, diarrhoea, etc.; (2) endogenous diseases such as syphilis, gonorrhrea, hydrophobia, leprosy, glanders, etc.: (3) dietetic diseases, such as famine, fever, scurvy, rickets, cretinism, delirium tremens, etc.: (4) parasitic diseases, as itch or scabies, worms, scald-head, etc.

**Second Class.**—In this class are included constitutual diseases, those affecting several organs, in which new morbid products are frequently deposited; sometimes hereditary. This class is divided into two orders: (1) Diseases...
NOSSAIRIANS—NOTABLES

Nostalgia (Greek, "homesickness"), a feeling of depression and anxiety due to absence from home or country. The victim of this disease is possessed with the desire to return, often filled with despair when the desire is without early prospect of being gratified. The condition is apt to be attended by loss of sleep, loss of appetite, often by emaciation, and various forms of physical malady. While the psychic disturbance at times leads to melancholia ending in mania and death. Nostalgia is especially liable to occur in cases of unwilling absence from home, as those of conscripts, etc. Even soldiers voluntarily serving far from home are often great sufferers from this disease, insomuch that army medical officers have come to recognize it in its extreme severity as a disability warranting furlough, or even discharge, in order to save the patient's life. This aspect of nostalgia has recently been impressively illustrated in the United States army in the Philippines.

Nostradamus, nös-tra-dámüs (true name MICHEL DE NOTREDAME), French physician and astrologer; b. Saint Remy, Provence, 14 Dec. 1503; d. near Aix, 2 July 1566. He was of Jewish descent, studied first at Avignon, and then at the medical school of Montpellier, and after taking his degree acted for some time as a professor, but afterward settled as a medical practitioner at Agen. Finally, after traveling in Italy, he established himself at Salon, near Aix, about 1544, where he wrote his famous 'Prophéties' (Centuries) or astrological predictions written in rhymed quatrains. They obtained great success; Catherine de' Medici invited him to court to cast the horoscope of her sons; and on the accession of Charles IX. he was appointed royal physician. In 1550 he published an almanac containing weather predictions. Consult: Bareste, 'Nostradamus' (1842).

Nostrils. See Nose and Throat; Nosebleed.

Nos'trum, a derogatory term for quack remedies and medicines, and for certain patented remedies which have proven worthless or injurious.

Not'a,Alberto,Italian dramatic poet; b. Turin 15 Nov. 1755; d. there 18 April 1847. He was carefully educated and after studying law practised for a long time as an advocate, and held important appointments under government until the political circumstances of Italy obliged him to retire from public life. The comic element is weak in him, the plot usually very simple, and the events taken from ordinary life. On the other hand he excels particularly in his delineations of character, and most irregular nature are presented with extraordinary skill. Of his numerous dramas 'La Fiera' (1836), a graphic and amusing description of manners, is perhaps the best. Among others may be named 'Il Filosofo celebre' (1811); 'La novella sposa' (1826); 'Il Torquato Tasso' (1826). Twelve editions of his works appeared between 1816 and 1843, the last Italian edition 'Comedie di Alberto Nota' (8 vols.) appearing 1842-3.

Notables, Assembly of, in French history, signifies the deputies of the states who were appointed and convoked by the king. In the early history of France mention is several times made of the notables; but the first assembly of any
NOTARY — NOTATION

importance was in 1558. From 1626 no such assembly was again called, till in 1786 the minister and comptroller-general Calonne conceived the idea of summoning the notables for the purpose of effecting several arrangements which he considered necessary; and they were accordingly assembled 7 princes of the blood, 9 dukes and peers, 8 field-marshal's, 22 noblemen, 8 counselors of state, 4 masters of requests, 11 archbishops, 37 chief justices, 12 deputees, the civil lieutenant, and 25 magistrates of the different cities of the kingdom, making in all 1,444 persons. This assembly forms an epoch in the modern history of France. A second meeting of the notables was called in November 1788 to consult on the manner of assembling the States-General. See FRANCE, History.

Notary, or Notary Public (Latin, notarius, from nota, mark), originally denoted, with the Romans, those slaves or freedmen who acted as stenographers (making use of certain abbreviations, signs, nota), particularly in the meetings of the senate. In later times the notarii were the secretaries of public authorities. From the Romans the name passed over to the nations of Western Europe; and in modern times a notary is a witness, appointed as such by government, whose testimony is in some cases a legal, to give credibility to instruments; in other cases he is required by law to give them full validity, as, for instance, in protests of bills of exchange, etc. In France the importance of the notary was, and still is, greater than anywhere else. He is not only a public witness for every one who wishes his testimony, but he is also the great witness of government. He makes all contracts, mortgages, and other deeds and conveyances where the property in question amounts to more than 150 francs.

In Great Britain and the United States, a notary public is a person who publically attests deeds, or writings, to make them authentic in another country; but he principally acts in business relating to commerce, making protests of bills of exchange. His testimony is not accepted or not paid; attests the statements of masters of ships in regard to the damage which their vessels have suffered, etc. Notaries are usually commissioned by the executive of their States, and derive their powers incident to the administration of oaths (of Rhode Island they are elected annually by the general assembly. In New York the statute which defines their powers in respect to foreign and inland bills, drafts, and notes, confers upon them the further authority "to exercise such other powers and duties as by the law of nations and according to commercial usage, or by the law of any other state, government, or country, may be performed by public notaries." In New Hampshire, in addition to the usual powers of the office, notaries may take depositions, and acknowledgments of deeds before them have the same validity as those made before justices of the peace. Similar provisions are found in the statutes of Connecticut and Rhode Island. In New York State women are occasionally appointed notaries by the Governor.

Notation, Arithmetical, any mode of designating number by marks or figures. Modes of arithmetical notation are more ancient than modes of representing ideas and concepts by ideographs, hieroglyphs, or alphabetic characters. Doubtless the first step toward a system of numerical notation was that of designating unity by a single stroke or score, and additional units by additional scores or strokes. The Roman system of notation plainly had its origin in this primitive method, in which all numerical quantities were noted by strokes, one for each unit. But, so to speak, the instinctive mode of counting by means of the 10 fingers (digitus) would suggest the division of a long line of strokes into groups of 10, answering to the 10 fingers; and it is supposed that each group of 10 would be marked off by two intersecting diagonal lines forming a cross or X, thus, $. The group once thus marked off, the X would become its representative abbreviation and would express 10. Similarly, half of 10, 5, would be represented by the upper half of X, which is V. And as it came to be a principle of Roman notation that a smaller number prefixed to a greater was to be subtracted from it, 4 would be represented by IV and 9 by IX: in some instances 8 and 18 would be represented respectively. Ten X groups were represented in Roman notation by L, or (rounded) C, the initial letter of Lat. centum, hundred; and as V (five) was formed of X, being half of X, so by cutting off the upper limb of X a symbol was found for 50 or 50,000, and for 500,000 respectively. Ten hundred was represented by M, the initial letter of milia, thousand, and this M was commonly written (M); half of this symbol was used to designate half a thousand and was written either D or D; the sign for thousand, too, was currently written CD. These are all the signs used in Roman numeration—seven in all. Higher numbers, up to a million, were expressed as follows: 10,000, (M); 100,000, (C)M; 1,000,000, (M)C; and 5,000,000, (M)D. The symbol for 10,000, (M), being cut in two, the latter half, D, represented 5,000; in like manner D, represented 500, and D, represented 50,000. With this cumbersome method of notation all arithmetical operations involved great difficulty, and hence for any but the most trifling calculations the ancient Romans had to resort to the use of abacuses.

That, like the Romans, the primitive Greeks employed a method of notation by strokes appears from rude inscriptions on archaic monuments and on vases; but, unlike the Romans, the Greeks at an early period abandoned that clumsy mode and resorted to the alphabet for number-symbols, adopting the method of notation which was in use among the Phoenicians and the Hebrews. Neither the Phoenician nor the Hebrew alphabet had the requisite number of letters (27), and the lack (51) was supplied by five arbitrary signs. The Greek alphabet had 24 letters, and to these were added three other characters, namely, for six, 9 or 9, for 90 and 900. The Greek notation parallels the Hebrew, letter for letter from alpha (α), one, to omicron (ο), 40; Hebrew Phoenician and Greek agree in employing the first nine letters or symbols to designate units; the second nine to designate tens, and the third to designate hundreds. The Greek scheme is as follows:
NOTCH — NOTHOSAURUS

To express thousands, the letter iota (ι) or an accent mark (') is subscribed to the numeral letters, for example, $\pi = 1,000$, $\beta = 2,000$, etc. to express a number multiplied by 10,000, the capital letter M is subscribed (M standing for μπλον, 10,000), for example, $\delta_\pi = 40,000$, $\iota_\pi = 80,000$. Fractions are written with the numerator on the line and the denominator a little above, and a small space left between the integer and the fraction, thus: $\chi \iota = 21\iota$.

In view of the adaptability of the Arabic notation and expression to the numerals, whether integral or fractional, it is singular that the common use of decimal fractions was first proposed as late as 1585, by Simon Stevin or Stevinus, native of France, but employed in the military service of Maurice, Prince of Orange. But had it been necessary to explain his awkward method of writing the decimal notation, the decimal system could hardly have come into general use. He expresses thus the decimals in 237.528: 237 $\cdot$ 507 $\cdot$ 68. Even Napier, to whom the credit is usually given of having first employed the decimal point, expresses the decimals of 1993.273 thus: 1993.273, though in another place he uses this form: 1993.273. Later, Napier substituted the point (.) for the comma as a sign of a decimal fraction.

The Chinese system of notation was originally in principle the same as the Roman, but has been much simplified and variously improved, so that it is almost as expeditious a means of representing very large numbers as our own notation. But it is still almost or quite as cumbersome as the Roman system in the representation of numbers under 20. In it, 1, 2, 3, 4 are represented by strokes, 5 by a special symbol and 6, 7, 8, 9 by that symbol followed by the requisite number of strokes: there is a symbol for 10, and from 10 to 19 the numbers are written after the same manner as those from 1 to 10. But while in the Roman system the series of tens is represented by XX, XXX, XXXX (or XL), etc., in the Chinese the successive decades are expressed by the symbol for 10 with the symbols for 2, 3, 4, etc., to the left of it as multipliers; and in like manner multipliers of hundreds, thousands, etc., are affixed.

The decimal system of notation by the nine "Arabic" numerals and the cipher appears to have been introduced into Europe through the Arabs in the 11th century; but the system had been employed centuries before in India. Though evidence exists of its use in Spain and in Italy in the 13th century by learned men, it was fully 300 years before it displaced the clumsy Roman system even in England. Though the digit-signs themselves, by their simplicity, are infinitely superior to the Roman symbols, and by their small number, ten, are far more efficient than the 27 Greek letter-numbers, the preeminent advantage of the decimal system over all other systems consists in the fact that in a line of figures, however long, the value of each, whether in units, tens, hundreds, thousands or millions, is determined by its place in the line. A figure standing alone represents never more than nine; a figure in the first place to the left of the last figure in a line represents always its own digit value multiplied by 10; in the third place, the same multiplied by 100, and so on; each move to the left raises the value of the figures tenfold. The use of the cipher is to keep the figures in their due places in the line; thus in 100 the cipher keeps the nine in the place of the tens; in 2043, the cipher keeps the 2 in the place of the thousands. Before the decimal system of notation had displaced the Roman system writers often combined the two, putting, for example, X3 for 13, or L9 for 59; or, being ignorant of the function of the cipher and of the significance of the mere position of a figure in a line they would write 502 for 52, as they would write in Roman numerals LII, or in Greek letter-numbers $\alpha$β.

Notch, The. See Crawford Notch.

Note. (1) in law and business. (See Promissory Note.) (2) In music, a character which, by its place on the staff, represents a sound, and by its form determines the relative time or continuance of such sound. See Music.

Notosaurus, a genus of small sauropterygian reptiles, allied to the plesiosaurs, and the type of a family which includes several genera confined to the Triassic period, and prevalent as fossils in the Old World, especially in the German Muschelkalk formation. Their necks were long and terminated in an elongated skull with crocodile-like jaws; the limbs were comparatively long and slender. Consult: Zittel-Eastman, "Text-book of Paleontology," Vol. II. (1902).
NOTKER — NOTT

Notker, nōt'kər, two Swiss monks of the monastery of Saint Gall. Saint Notker Balbulus (the Stammerer): b. Thurgau about 840; d. St. Gall 6 April 912; is best known for his adoption of the simple Roman or Gregorian chant, and for his motets and hymns, the most famous being ‘Media vita in morte sumus.’ He was canonized 1513. Notker Labeo (Thick Lipped; sometimes called ‘Teutonicus,’ the German); b. about 950; d. 1022; founded a great school of translators, who, working under his name translated into German Boethius, the Psalter, etc., and thus left important documents for the study of Old High German in the 10th and 11th centuries. The versions of Labeo and his school are edited by Ritter (1889-94). Consult Kelle, ‘Die Sankt Gallen deutschen Schriften und Notker Labeo’ (1888).

Noto, Sicily, a city and episcopal see, three miles from the Mediterranean, and 27 miles by rail southwest of Syracuse. Its chief buildings are a fine cathedral and town hall. It has manufactures of olive oil, vegetable fibre, wine, and macaroni, and quarries of limestone. Noto dates from 1703 when it replaced the ancient Netum overthrown in 1693 by an earthquake. Pop. (1901) 18,500.

Notochord, or Chorda Dorsalis, a rod of gelatinous tissue forming the main skeletal axis in the young of all Chordata (q.v.) and in some persisting as the only support of the body throughout life. It arises in development from the mid-dorsal line of the entoderm (see Embryology), becomes cut off from this parent layer and comes to lie as a continuous unsegmented structure between the digestive tract and the central nervous system. Around it is formed an envelope, the notochordal sheath, and in the vertebrae the body or centrum of the vertebrae arise. In the lower vertebrates parts of the notochord persist throughout life (for example, filling the cavities in the ends of the vertebrae in fishes), but in the higher forms the notochord is almost entirely replaced by bone and the intervertebral ligaments, the sole remnants of this structure in man being the so-called nucleus pulposus of these ligaments. See Amphioxus; Ascidian.

Notonec’tidæ. See Fresh-water Insects.

Notor’nis, a genus of gigantic rail-like birds of the South Island of New Zealand without the power of flight. The genus was first known by fossil remains named Notornis mantellii. Subsequently living examples were found; but it is supposed that none now exist. Norfolk Island formerly had another species, pure white, but it was exterminated by early white visitors to the island. Consult Newton, ‘Dictionary of Birds’ (1896).

Nototh’èrium, a genus of fossil marsupials found in Upper Pliocene deposits in Greenland and South Australia, allied to Diprotodon (q.v.) but smaller.

Notre Dame, nōtr děm, University of, a Roman Catholic institution in charge of the Fathers of the Holy Cross, at Notre Dame, Ind. It was founded in 1842 and chartered two years later. It has 13 full collegiate courses besides courses in art and music. The courses lead to the degrees of A.B., B.S., Ph.B., and B.L. The equipment for all laboratory and applied science work are exceptionally good; the science building and furnishings are valued at $500,000. The departments of natural science received great assistance in their foundation work from the personal attention of the scientist, Very Rev. J. A. Zahn (q.v.). The frescoes, and a number of the oil paintings are by Gregori, and are of remarkable beauty and power. To encourage good works along spiritual and intellectual lines, the University presents each year a medal called the ‘Letture Medal’ to a Catholic layman or woman who has done some special good work for the benefit of humanity. Two regular publications are issued from the University, but one, ‘Ave Maria,’ is not a distinctively university periodical affiliated with the university. There are several schools for the brothers, novices and young priests of the Congregation of the Holy Cross, and on the grounds is the Provincial House of the Order for the United States. The University has also several preparatory schools in different parts of the United States. In 1903 there were connected with the university 60 professors and instructors; 1,000 students, 200 of whom were in the preparatory department. The library contained 50,000 volumes valued at $76,000; the scientific apparatus, machinery, and furniture was valued at $205,000; and the grounds and buildings at $2,010,000.

Notre Dame de Paris, dé pá-re’. See PARIS.

Notre-Dame de Paris, a romance in prose by Victor Hugo, published in 1831. The scene is placed in Paris at the close of the reign of Louis XI. The cathedral seems to fill the author’s vision and dominate his mind from beginning to end. Among his different conceptions of Notre-Dame he brings out most clearly of all the truth that the cathedral of the Middle Ages was the book of the people, and that since the dawn of printing, books have taken the place of those marvelously involved and inexhaustible of the multitude, their humor and irreverence as well as their religion and the intense and passionate expression. To the reader who loses himself in the atmosphere thus created, the world is France, France is Paris, Paris is the cathedral. He is taken through the aisles and galleries, out on the roof, up in the towers, then down again, majestically through the squares or cross-roads of the old city, along crooked streets that have vanished, and thoroughfares still existing, like Rue Saint-Jacques or Rue Saint-Denis, which it calls the arteries of Paris. Thus it may be taken as a 15th century guide-book of the town, answering all the purposes of a Baedeker; not only giving the general topography, but touching on nearly every structure then standing. Like Walter Scott’s ‘Quentin Durward,’ and Théodore de Banville’s play ‘Gringoire,’ ‘Notre-Dame’ contains a searching study of the treacherous but able monarch, Louis XI.

Nott, nōt, Charles Cooper, American jurist: b. Schenectady, N. Y., 16 Sept. 1827. He is a grandson of Dr. Eliphalet Nott (q.v.) and of Dr. Charles D. Cooper. He was graduated from Union College in 1848, studied law at Albany, N. Y., and began the practice of his profession in New York in 1851. Through his means, in Feb. 1850, Abraham Lincoln came to New York to deliver the ‘Cooper Institute Address,’ which resulted in Lincoln’s nomination for the Presi-
NOTT — NOURMAHAL

dency. During the Civil War he served as captain in the 5th Iowa cavalry, and colonel of the 170th New York volunteers. Taken captive at Brashear, La., in June 1863, he was held prisoner until July 1864. In February 1865 he was appointed judge of the court of claims, and in November 1866 was appointed chief justice of the court by President Cleveland.
He has published: 'Mechanics' Lien Law Cases' (1883); 'Sketches of the War' (1883); in German (1883); 'Sketches of Prison Camps' (1885); in German (1884); and has edited and compiled 'The Seven Great Hymns of the Medieval Church' (1866, 8th ed. 1902), and the 'Court of Claims Reports' (38 vols. 1867–1903).

Nott, Eliphalet, American clergyman and educator: b. Ashford, Conn., 25 June 1773; d. Schenectady, N. Y., 29 Jan. 1866. He was graduated from Brown University in 1795 and entered the Presbyterian ministry the same year. After holding pastorates in Cherry Valley and Albany, N. Y., he became president of Union College in 1804, where he remained till his death. He published: 'Counsels to Young Men' (1810); 'Lectures on Temperance' (1847). His funeral sermon on the death of Alexander Hamilton was widely famous. By his inventions of stoves and other warming apparatus he acquired a fortune, much of which he devoted to the assistance of Union College.

Nott, Josiah Clarke, American ethnologist and physician: b. Columbia, S. C., 24 March 1804; d. Mobile, Ala., 31 March 1873. In 1824 he was graduated at the South Carolina College and from the medical school of the University of Pennsylvania in 1827. After further study abroad he established himself in Mobile, and in 1858 founded a medical school there. During the Civil War he was for a time on the staff of the Confederate General Bragg. With G. R. Glidden (q.v.) he wrote 'Types of Mankind' (1850), and 'Indigenous Races of the Earth' (1857), the purpose of which was to oppose the theory of the unity of mankind. He was also sole author of 'The Connection Between the Biblical and Physical History of Man' (1849); 'The Pharaohs and the Jews of the Jewish Race' (1850).

Nottebohm, nöt-te-bôm, Gustav, German composer: b. Liéhenscheid, Westphalia, Prussia, 12 Nov. 1817; d. Grätz, Germany, 1 Nov. 1882. He served in the German army at Berlin in 1838–9, but continued his musical studies, and there formed a friendship with Schumann and Mendelssohn, through the influence of the latter obtaining his discharge from the army and becoming a composer of note. Among his works are: 'Ein Skizzenbuch von Beethoven' (1865); 'Mozartiana' (1880); etc.

Nottingham, nöt-tông-am, Henage Finch, 1st Earl of, English statesman: b. Kent, England, 23 Dec. 1621; d. London 18 Dec. 1682. He was educated at Oxford, studied law and was admitted to the bar of the Inner Temple in 1645. At the Restoration his reputation as a lawyer was sufficiently great to bring him to the attention of the court. In 1651 he was elected member to Parliament for the University of Oxford, and was made a baronet, in 1670 became attorney-general, and in 1673 lord-keeper. He was made high chancellor in December 1674. In the same year he was made Baron Finch, and in 1681 became earl of Nottingham. His powers as an orator were highly rated; and Dryden has given to posterity his portrait in 'Absalom and Achitophel,' under the character of Ammi. Several of his speeches on the trials of the judges of Charles I. have been published, as have also some of his parliamentary orations.

Nottingham, England, a city and civic county, capital of Nottinghamshire; on the Leen, near its junction with the Trent, 110 miles northwest of London. It occupies a picturesque site overlooking the Vale of Trent. The castle, which crowns the summit of a rock, rising 133 feet above the level of the Leen, was originally built by William the Conqueror as a means of overawing the outlaws frequenting the recesses of Sherwood Forest. Dismantled during the Protectorate, it subsequently became the property of the Duke of Newcastle, who in 1674 erected a large mansion on part of the site. This, after being partly burned in riots connected with the reform movement in 1831, now contains the Midland Counties Art Museum, free library, etc. The principal educational and literary institutions are the University College and Technical and Further Education School, the School of Art, the People's Hall, and the Mechanics' Institute. An arboretum covering 18 acres is a feature of the town. The staple manufactures are cycles, hosiery, and lace, the latter being a specialty. There are also manufactures of cotton, woolen, and silk goods, and of articles in malleable and cast iron. Nottingham was a place of importance in Anglo-Saxon times, and was twice or thrice taken by the Danes. Charles I. raised a garrison in 1642, and next year the town and castle were taken by the Parliamentarians. Serious riots, occasioned by the introduction of machinery, took place in 1811–12 and 1816–17. Pop. (1901) 239,753.

Nottoway (nót-ô'-wâ) Indians, an American tribe of the Algonquin family, formerly residing along the Nottoway River, in Virginia. They were very similar to the Tuscaroras of North Carolina. In 1785 about 400 survivors of the tribe occupied a reservation of 27,000 acres.

N'otus, the south wind or southwest wind.

Nuèe, François de la, frâ-n-swâ délâ nôo, French Huguenot captain: b. near Nantes 1531; d. Montcontour 4 Aug. 1591. He was a member of an old Breton family, fought in Piedmont under Brissac, and became a Protestant in 1557, and was one of Coligny's bravest lieutenants. In 1570, at the siege of Fontenay-le-Comte, he was wounded in the left arm, and after its amputation wore an iron mechanism to hold the blade, thus winning the nickname of "Bras de Fer," or "Iron Arm." He fought in Flanders with great success from 1578 to 1580, when he was captured by the Spanish. His five years of captivity were occupied with the composition of his 26 'Discours politiques et militaires' (1587). He fought under Henry of Navarre at Senlis, Arques, Ivry, and Lamballe, and was mortally wounded in the last fight. Consult the biography by Hauser (1892).

Nourmahal, noor-ma-hâl, 'Light of the Harem,' the heroine of Thomas Moore's poem, 'The Light of the Harem,' in Lalla Rookh. Her quarrel and reconciliation with the caliph
NOUVELLE FRANCE—NOVA SCOTIA

Harun al-Rashid form the theme of the story; afterward she is known as Sourjehan—"Light of the World."

Nouvelle France, noo-vel frahn, or New France, the original name given to Canada (q.v.) by the early French settlers.

Nova Cæsarea, the Latin name for New Jersey.

Nova Constellatio Coinage, two silver coins proposed by Robert Morris in 1783 for national coinage, but not accepted by the Continental Congress. They were called the Mark and the Quint. See Numismatics.

Nova Scotia, no'va sko'shi-a, one of the three maritime provinces of the Dominion of Canada, comprises a long, narrow peninsula, on the eastern coast of North America, lying northeast and southwest, and the island of Cape Breton, separated from the peninsula on the northeast by the gut of Canso, 16 miles long and from 1/2 mile to 2 miles wide, and Chedabucto Bay. The dangerous Sable Island, surrounded by a sand bank on which many ships have been wrecked, is a dependency of Nova Scotia, from which it is distant about 90 miles in lat. 43° 59' N. at its eastern end, lon. 59° 45' W. The whole province, including Cape Breton, lies between lat. 43° 25' and 47° N. and lon. 59° 40' and 66° 10' W. The greatest length of the peninsula is about 280 miles and its greatest width from 50 to 100 miles. It is bounded north by the Straits of Northumberland and the Gulf of Saint Lawrence, south and southeast by the Atlantic Ocean, and northwest by the Bay of Fundy. The island of Cape Breton, whose extreme length is 100 miles, extreme width 85 miles, is almost equally divided by an inland sea, the Bras D'Or Lake. The peninsula has an area of 12,300 square miles, and Cape Breton 3,120 square miles. Sable Island is 25 miles long and 1/2 wide, and consists of sand hills thrown up by the sea, on which grasses grow which maintain many wild horses known as Sable Island ponies.

Geography.—The surface of Nova Scotia proper is undulating, and the scenery varied but not grand. Three ranges of highlands, with a general direction of southwest to northeast, their general features clearly showing them to belong to the Appalachian Range, diversifying the surface. These, roughly, are the ranges extending along the Atlantic coast from Cape Sable to Cape Canso, which are chiefly of Lower Cambrian formation, except for a belt of intrusive granite that stretches from Cape Sable to Chebucto Head, near Halifax; the Cobequid Mountains, which rise to a height of about 1,050 feet and extend from the Bay of Fundy on the north or isthmian side of the province, through the counties of Colchester and Cumberland to the vicinity of Pictou; and a detached, narrow ridge of trap, known as the North Mountain, about 700 feet high, which extends along the Bay of Fundy, from Digby County to the steep headland of Blomidon, in Kings County, near the entrance of Cobequid Bay. The rock formation of Cape Breton is similar to that of Nova Scotia proper, but is more irregularly distributed. The chief features of the surface of Nova Scotia were left marked as at present by the great earth storms of the later Devonian period. The fertile valleys between the three ranges of hills are respectively of Upper Silurian, Devonian, and Carboniferous origin. The northwest side of the peninsula is deeply indented by large arms of the sea, separated by steep promontories. The Atlantic coast is penetrated everywhere by inlets of greater or less size, the most important of which are Chedabucto Bay, Halifax Harbor, and Chester Basin. The north shore, on the Gulf of Saint Lawrence, is comparatively smooth and uniform in its coast line, and this is true also of the eastern coast of Cape Breton, while the other sides of this island are very irregular. The peninsula has about 400 lakes, of which Rossignol in Queen's County is the largest. The Bras D'Or Lake in Cape Breton covers an area of 300 square miles, or about one sixth of the entire area of the island. The climate of Nova Scotia, tempered as it is by the Gulf Stream, which flows very near its southwesterly end, is comparatively mild, and especially in the sheltered Cornwallis and Annapolis valleys is favorable to comfort and health. The average temperature is 65° F. in summer, 25° F. in winter. The average snowfall for 27 years (1874-1900) was 38.1, average snowfall for the same period 75.4, total precipitation 45.6. On account of its freedom from extreme heat Nova Scotia has lately become a popular summer resort for United States people of the eastern and middle States. The province contains many rivers, but few of them are over 50 miles in length. In the valleys the soil is of great richness, and Nova Scotia is noted for its vast tracts of inexhaustibly fertile dyked marsh land, in earlier or later times by patient industry reclaimed from the sea. This marsh land lines the head waters of the Bay of Fundy and spreads far inland up the valleys of its river tributaries. In general, alluvial deposits are formed in river basins by materials washed down from higher levels by fresh-water floods; here the whole deposit is of tidal origin, the result of a landward rather than a seaward transportation. Every incoming tide is freighted with a finely comminuted sediment, the wearing action of the currents upon the sides and bottom of the bay. The elements of this sediment are trap and new red sandstone, the latter being the greater element. Its detritus consists of sand, silt, diatomaceous earth, clay, the iron which mainly determines the reddish color of the deposit, and the calcareous matter which served as cement in the parent rock. The great fertility of this alluvium may be seen in the fact that the Annapolis, Cornwallis, Grand Pré, and Cumberland marshes have been producing annually for over two centuries from two to four tons per acre of the finest hay. After the hay has been removed the dikes are converted into autumn pastures for cattle, which fatten more rapidly on their luxuriant after-growth than on any other kind of food. The reclaiming of these dikes from the daily tides, which if permitted to rush in will destroy the grass for a year, was begun by the Acadia French and energetically pursued by their successors, the New England people who came in 1760-1. The flora of Nova Scotia is much the same as in other sections of Canada south of the Saint Lawrence. The woods are maple, elm, willow, birch, hazel, birch, Willow, and elm.
NOVA SCOTIA

Agriculture.—The most important industries of the province are agriculture and fruit growing. The latter has been increasing, but recently, however, a good deal of activity has been shown in manufacturing of various kinds. Nova Scotia has an area above tide line of 13,483,671 acres, of which 5,086,901 are occupied. Of this, 34,240 acres are covered by orchards of apples, pears, plums, and cherries; 554,371 acres are hay land, 16,334 are in wheat, 37,459 in potatoes, and 91,087 in oats. In the last 20 years the fruit industry has greatly increased, cold storage making possible large shipments, especially of apples, to the British market. The total yield of apples in 1891 was 1,051,592 bushels; of plums, 9,246 bushels; of peaches, 534 bushels. In 1901 the yield was, apples 2,065,104 bushels; plums, 28,361 bushels; peaches, 3,231 bushels.

The total value for 1902-3 of agricultural products, including fruit was $853,106, of apples alone $188,910, of animals and dairy products $711,207, of woods exported $1,048,160.

Fisheries.—The fisheries have always been active, salmon, cod, shad, mackerel, lobsters, and other fish abounding off the shores and in the rivers. The value of the total catch in 1901 was $2,212,022, an increase of $300,188, or nearly 23 per cent, over the value of 1890. The number of men employed in fishing vessels and boats in 1900 was 25,212, of persons employed in lobster canning factories, 6,447. The value of all fisheries for the fiscal year ending June 1903 was $8,000,000, and the number of men employed 29,520. Fishing receives from the Dominion government a subsidy outside of bounties of about $400,000 a year. In many parts of the province game is plentiful, bears, foxes, deer, and smaller animals being found in considerable numbers.

Minerals.—Nova Scotia is remarkably rich in minerals, the coal fields being almost inexhaustible, and gold, lead, copper, manganese, gyspum, and iron ore found in most parts of the province. For the year ending 30 Sept. 1901 the sales of coal aggregated $3,119,635, the Province of Quebec being the largest consumer. The province has 11 coal mines, 5 of which are in the peninsula and 6 in Cape Breton. In 1900 the mines employed 8,652 persons. There are more than 20 districts where gold is mined, the most important mine being at Sherbrooke in Halifax County. Between 1900 and 1901 the number of tons of ore crushed was 1,358,664, and the value of the gold extracted about $14,274,054. The value of the gyspum yield in the same year was $119,278. The mine royalties in 1902-3 reached the large figure of $487,948.90.

Manufactures.—In 1902-3 the value of manufactured products exported from Halifax reached the sum of $766,164. Among the chief manufactures are agricultural implements, biscuits and breads, coke, drugs, and chemicals, extract of hemlock bark, fertilizers, furniture, iron and steel, leather, and wood pulp. The canning of fruits, milk, and meat is receiving much attention. In Cape Breton and the western part of the peninsula considerable leases of crown lands have lately been made for the development of the hemlock bark industry, part of the growning, tanning, to the abundance of hemlock bark, tanning is actively carried on, and some attention has long been given to sugar refining and rope and twine making.

Finances.—The revenues of the province come chiefly from a Dominion subsidy of about $433,000 annually. The expenditures exceed this sum; from the lease of crown lands, which in 1901-2 amounted to $74,735; and from succession duties and other miscellaneous sources. The total revenue from all these sources in 1902-3 was $4,146,216. The expenditures were less than the revenue by about $53,000. At the close of the fiscal year ending 30 Sept. 1902 the debt of the province was $3,700,300. Nova Scotia supports a school for the deaf and dumb and one for the blind, an insane and a general hospital, and 24 poor-houses. Criminals are sent to the provincial penitentiary at Dorchester, N. B. The public charities in 1902-3 cost the province $40,573.

Transportation.—In 1901 the province had in operation 943 miles of railway; since then this has been increased to 1,055. There are now under construction 182 miles more. Telegraph and telephone lines run everywhere and the province has two daily newspapers and one at Sydney. At the close of 1901 Nova Scotia had in registration 1,980 vessels with a tonnage of 214,560. In that year she had registered 133 vessels with a tonnage of 14,660. The total number of ships arriving from foreign ports during the fiscal year ending 30 June 1901 was 3,103; tonnage 419,031. This registration includes the ships arriving at 85 ports. Of these Halifax heads the list, with 1,185 vessels and 899,079 tons, Sydney coming next with 361 vessels and 541,455 tons. Halifax is the third port in Canada, Victoria, B. C., being first and Montreal second.

Banks.—The banks in operation with their branches are: The Union of Halifax, Royal of Canada, Bank of Nova Scotia, Bank of British North America, and Commercial of Windsor. The clearing house transactions in 1900 amounted to $77,000,000.

Population.—The population is greater than that of any province of the Dominion except Ontario and Quebec. Ontario has over 2,000,000 inhabitants, Quebec over 1,500,000, and Nova Scotia, 459,574. Of this number 162,141 are reckoned as of English descent, 142,207 as Scotch, 55,830 as French, 55,830 as German. The increase in population between 1891 and 1901 was 8,800. Halifax, the capital, has a population of 47,987; in 1891 it was 38,495. The next town in size is Sydney, the seat of the recently established steel industry in Cape Breton. In 1901 this town had a population of 9,008. In 1891 it had only 2,447. The number of incorporated towns in all is 28; of these the largest are Glace Bay, Yarmouth, Truro, Springhill, Amherst, New Glasgow, Windsor, and Pictou.

Government.—Since confederation the province has been represented at Ottawa by 10 senators, and 20 members of the lower house. It has its own local legislature, meeting at Halifax, and a lieutenant-governor appointed by the governor-general and his council. The local legislature consists of a council of 21 members and a legislative assembly of 38. The executive consists of three ministers with salaries and six without portfolio. The house of assembly is elected by the counties, the municipal units of government being counties and
towns. In each of the 18 counties the people elected a county council, which in turn appoints the other county officers. It is necessary to secure the sanction of the people in order to borrow money, and the lieutenant-governor has a right of veto upon the money-borrowing powers granted by the laws passed by the council.

Education.—New Scotia has an admirable free school system, which was introduced in 1836, but there are no separate schools as in Ontario and Quebec, under denominational control, receiving government support. In each of the 18 counties of the province there is a county academy, the highest grade of the public schools, the curriculum of which contemplates the fitting of pupils for college. In Truro there is a normal school, in which 1,044 teachers serving in 1901–2 were trained for their work. The whole number of teachers in that year was 2,492, and the number of pupils enrolled was 99,059. The schools are supported by local taxation and by subsidy, about two fifths of the necessary cost being met by government grant and municipal aid. The total expenditure per pupil in 1900–1 was $15.75. Education is controlled by a Council of Public Instruction, of which the Superintendent of Education is the head. The council is composed of the members of the Executive Council. The province has besides the schools already mentioned a school of agriculture, a school of mechanical and domestic science, several manual training schools, a school of art and design, a summer school of science and five chartered colleges, and one divinity college having the power to confer degrees. The colleges are Kings at Windsor, Dalhousie at Halifax, Acadia at Wolfville, Saint Francis Xavier at Antigonish, and St. Anne's at College Point in Digby County. The divinity college is controlled by the Presbyterians and is at Halifax. The only college that is undenominational is Dalhousie at Halifax. In all these colleges together there are not more than 700 students. In Halifax, Windsor, Wolfville, Horton, and Annapolis there are private schools for boys and girls.

Religion.—The chief religious denominations are the Roman Catholic Church with 129,578 adherents, Presbyterian, 106,319, Baptist, 74,978, Anglican, 37,987, Free Will Baptist, 8,355, Lutheran, 6,572, Congregational, 2,038. No part of the population is without church attachment.

Distinguished Citizens.—Nova Scotia has reared many distinguished men, chiefly officers of the army and navy. Such are General William Cochran, Sir John E. W. Inglis, hero of Lucknow, Admiral Sir Provo W. P. Wallis, and Sir Fenwick Williams, hero of Kars. The humorist, Judge T. C. Haliburton ("Sam Slieck"), was a Nova Scotian, as are also his son, Lord Arthur Haliburton, and Sir Charles Tupper, Bart., the well-known statesman. Among the writers of the province have been Thos. B. Akins, Sir John G. Bourinot, John B. Calkin, Arthur W. Eaton, George M. Grant, Sir J. W. Dawson, George W. Hill, Joseph Howe, Mrs. M. J. Lawson, Arthur Lockhart, Beamish Murdoch, J. MacDonald Oxley, Benjamin Rand, Silas T. Rand, Thomas Reid, E. M. Saunders, Marshall Saunders, and T. Watson Smith.

History.—The Nova Scotian peninsula was the most important part of the ancient Acadia, and its little town Annapolis Royal, in French times called Port Royal, while the province remained in the hands of France was the chief Acadian seat of authority and centre of influence. The name Acadia or Acadie is first found in the petition of De Monts to the French king for leave to colonize this portion of the new world. The province of New Brunswick was included in Acadia, but since the island of Nova Scotia's authentic history begins with the landing at Port Royal in the spring of 1604 of Sieur de Monts, a gentleman of the bedchamber of Henry IV. of France, who had previously accompanied Chauvin and Pontgrave to the Saint Lawrence. There is a French tradition that a little settlement was made in Cape Breton as early as 1541, but Port Royal was the first settlement ever attempted on any part of the peninsula. De Monts held a commission as lieutenant-general of Acadia with full powers to cultivate and hold the land, to discover mines, and to convert the Indians. In his first expedition another nobleman, Baron Poutrincourt, accompanied him. Owning to the failure of the trading company in 1607, the colony they founded at Port Royal was suspended for nearly three years. In 1610, however, Poutrincourt again came to Port Royal and from that time the town has had a continuous history. When Poutrincourt came the second time he took possession of the houses his people had built in 1604, and it may therefore be said that Port Royal is the oldest town in all North America, except Saint Augustine in Florida, which was founded by Spaniards in 1565. Jamestown, Va., was founded by the English in 1607, and Quebec by Champlain in 1608. Shortly after 1610 other explorers came to Port Royal, in their wake coming first Jesuit, then Recollect priests, who soon converted all the native Micmacs (an Algonquin tribe) to the Roman Catholic faith. In 1613 Argal (afterward deputy governor of Virginia) destroyed the fort at Port Royal. In 1621 Acadia was granted to Sir William Alexander, who named it Nova Scotia and helped James to establish the order of Barons of Nova Scotia. In 1628 Sir David Kirk captured Port Royal for England, but in 1632 the province was restored to France. In 1654 Acadia was surrendered to the English, and in 1660 to Cromwell, but in 1667, by the treaty of Breda was restored to France. In 1710 Col. Francis Nicholson finally conquered Port Royal for England, and in 1713 the treaty of Utrecht confirmed Nicholson's conquest. In 1749 Col. Edward Cornwallis brought out an English colony and founded the town of Halifax, immediately afterward establishing a civil government there in place of the military government at Annapolis. In 1755 because of their persistent refusal to take the oath of allegiance, the Acadian French were removed, and in 1760–1 their lands were occupied by 6,000 or 7,000 New England planters, who founded many of the best known families of the province. In 1758 a constitution, with an elective assembly, was granted. In 1763 Cape Breton and Prince Edward Island were annexed to Nova Scotia, but in 1770 Prince Edward Island was separated. In 1773 began the large Scottish emigration, which has given certain counties of Nova Scotia the character of their population. In 1776 and 1783 from 30,000 to 35,000 Loyalists, chiefly from New England and New York, poured into the province,
the New York Loyalists founding the town of Shelburne and creating in Nova Scotia the first colonial see of the English Church. In 1754 New Brunswick and Cape Breton were both separated from Nova Scotia, but in 1820 the latter was re-annexed. In 1848 responsible government was introduced and in 1867 Nova Scotia became a province of the Dominion of Canada. In its history as an English province Nova Scotia has had to the present 32 governors (since Confederation they have been, of course, lieutenant-governors), many of them more or less famous military men. Before the appointment of Lord Dorchester as governor-general of Quebec, Nova Scotia, and New Brunswick in 1766, she had also 11 lieutenant-governors, of whom Gen. Edmund Fanning, a Loyalist, was the last.

Bibliography.—Akins, ‘Selections from the Public Documents of Nova Scotia’ (1865); Bourinot, ‘Builders of Nova Scotia’ (1893); Brown, ‘History of the Island of Cape Breton’ (1866); Calkin, School Histories and Geographies of Nova Scotia, of various dates; Campbell, ‘History of Nova Scotia’ (1873); Dawson, ‘Acadian Geology’ (1888); Eaton, ‘The Church in England and Nova Scotia’ (1892); Haliburton, ‘Historical and Statistical Account of Nova Scotia’ (1829); Murdoch, ‘History of Nova Scotia’ (1897); Parkman, ‘Montcalm and Wolfe’ (1875); papers in the Nova Scotia Historical Society’s ‘Collections’ (1878–98); and various county histories.

Novabia Zembla, nô vá zëmbla (Russian, Novabia Zemlia), two islands in the Arctic Ocean, belonging to Russia, and forming a dependency of the government of Archangel; lat. 70° 30’ to 77° N.; lon. 52° to 69° E. They are separated by the narrow Matotchkin Shar Strait, and from the Isle of Vaigat on the south and from the mainland on the east by the Sea of Kara. Their greatest length, northeast to southwest, is about 740 miles; breadth, about 80 miles. The greater part of the interior is unexplored. The general slope of both islands appears to be toward Matotchkin Strait, on which the mouths of at least 15 small streams have been counted. Lakes also are numerous. The whole territory is wild and desolate. The coasts swarm with seals, various kinds of fish, and vast flocks of water-fowl. The interior, which is partly covered with stunted shrubs, short grass, and moss, is frequented by reindeer, white bears, ermines, and Arctic foxes. In 1596 Nova Zembla was reached by Barentz, who wintered there. It was circumnavigated by Johannesen in 1869 and 1870, and the Kara Sea found comparatively free of ice. It was again circumnavigated by Captain Carlsten in 1871, and partially explored by Lieutenants Weyprecht and Payer in the same year, and again in 1872–4. Other explorations have been made since, and two or three settlements of Samoyedes have been established. Pop. (1897) 90.

Novalis, nô-vâl’îs. See Hardeenber, Fried- rin, von.

Novara Italy, (1) a town, capital of the province of Novara, situated between the Agogna and Terdoppia, 51 miles northeast of Turin. It has an ancient and magnificent cathedral with a lofty tower, an episcopal palace, two colleges, a ruinous old castle, and a remarkably fine market-house. The manufactures include sweet biscuits, which have a large sale. The rice and grain markets are the most important in Piedmont. Pop. (1901) 44,926.

Novara is famous for the battle fought there on 23 March 1849, between the Sardinians and Austrians, in which the former were completely defeated, and Charles Albert, in consequence, abdicated in favor of his son Victor Emmanuel. (2) The province consists generally of a large and fertile plain, watered by the Po and several of its tributaries, and well adapted for the growth of rice. Pop. (1901) 745,347.

Novati, Francesco, fraң-chê’skô nô-vâ’të, Italian philologist: b. Cremona, Italy, 1859. He was a professor of the Academy of Milan in 1883, and has since held professorships at Parma and Genoa, returning to Milan in 1892. His frequent contributions to the scientific magazines have greatly furthered knowledge of philosophy, his articles and books being devoted to the study of the Renaissance. He has published ‘Studj critici e lettereare’ (1899).

Novatianism, nô-vâ’tsh-an-izm, the doctrine of Novatianus, a priest of the Church at Rome in the 3d century. Novatianus was a Stoic philosopher and carried out the stern, harsh views of that sect in his ministry as a Christian teacher. The schism called after him originated as follows: After the Decian persecution, a controversy arose about the manner of dealing with those who apostatized before the threat of torture or death (lapsi). Novatian at first inclined to advocate their absolution after due penance, but when Cornelius, the Roman bishop, followed this course, Novatian opposed his authority, and was chosen and ordained bishop by three country bishops in opposition to Cornelius, and thus became the first anti-pope. He was condemned in councils at Rome and Carthage. The party who shared his views were called Novatians. They held that, in the case of idolatry through fear of persecution, the Church could not absolve the penitent: and this doctrine they extended, at a later period, to all grievous sins. They claimed for themselves a character of especial purity, and gave to the name Puritans (Cathari). Their views continued to be taught in Italy and Africa up to the 6th century. See CYPRIAN.

Novel Italian, novella, from Latin novus, new), a prose narrative of a series of fictitious events connected by a plot, and involving portraiture of character and commonly descriptions of scenery. The word novel seems to express a species of fictitious narrative somewhat different from a romance; yet it would be difficult to assign the exact distinction, and in French, Italian and German the same name (roman, romanzo, and roman) is used for both species of composition. In English the term novel is generally applied to narratives of everyday life and manners; roman, to adventures of a marvelous kind, and occurring in distant lands and past ages; while the name tale denotes generally a shorter production, which may include probable or improbable events, and is equivalent to the Italian racconto, and conte, the German novelle and märchen, and the French conte. All these kinds of prose narrative are here included.
Oriental.—Romances have existed from the remotest antiquity among the principal Oriental nations, but as most of the literature of these Chinese are to be found parables, marvelous fictitious tales, and epics; and for many centuries they have had novels of social life similar to those of Europe. They only, among the Asiatic nations, have delighted the phenomena of common life, recounting the conversations, cares, and habits of the household without introducing incidents of a marvelous nature. The romance of the Hindus is perhaps of equal antiquity, but consists mainly of fantastic and improbable narratives, etc. The character of Hindu fiction has led some writers to believe that the Persian and Arabic tales were derived from India, as many of the fables no doubt were. The Arabian tales of the ‘Thousand and One Nights’ are examples of romantic narrative, highly esteemed in Europe, the recital of which is still more fascinating and general among the people of the East than is the perusal of printed novels among the Western public.

Greek.—The earliest Greek compositions are the ‘Milesian Tales,’ attributed to one Aristeides. None of these tales are extant, either in the original or in the Latin version, made about the time of Mitридат and Sulla; but there remain about 46 stories by Parthenius Niccas, which are supposed to be, to a certain extent, adaptations from them. The ‘Cyropæia’ of Xenophon resembles in many respects a historical romance. Clearchus, a disciple of Aristotle, wrote a series of love tales, which have been also lost. Shortly after him came Antonius Diogenes with a romance in 24 books, entitled ‘Of the Incredible Things beyond Thule,’ founded on the loves and adventures of Dinias and Dercyllis. Photius gives an outline of its contents in his ‘Bibliotheca Codicum.’ An interval of several centuries now elapses before we come upon another Greek writer of fiction. Lucius of Patra, and Lucian, who flourished under Marcus Aurelius, under the new names we meet with. The works of the former are simply accounts of magical transformations, not properly developed tales, and Lucian merely makes use of his plots, as Bayes in the ‘Rebus,’ by bringing them under the form of satirical, and moral. We now come upon the most notable name in Greek prose fiction, that of Heliodorus, bishop of Tricca in Thessaly, who lived about the end of the 4th century. His ‘Aethiopica,’ or, as it is often called, ‘The Loves of Theagenes and Charicleia,’ though deficient in those characteristics of modern fiction which appeal to the universal sympathies of our nature, is extremely interesting on account of the rapid succession of strange and not altogether improbable adventures, and many and various characters introduced, and the beautiful scenes described. There can be little doubt but that his style and manner were closely imitated by Achilles Tattius and all the subsequent writers of erotic romance, and there is almost equal certainty that he formed a model to the ponderous historical romance writers of the school of Mademoselle Scudéri. Next to Heliodorus in point of merit stands Achilles Tattius, (flourished about 450–500 A.D.), whose romance in eight books, ‘The Loves of Leucippe and Clitophon,’ is a mine of marvelous incidents, which has been thoroughly ransacked by various

French and Italian authors. Most of these classical romances relate the adventures of lovers carried off by pirates or otherwise separated, witnessing rites of magic and religion, secret orgies, and infamous revelries in the cities of the Mediterranean shores, and at last reunited by extraordinary coincidences. Unlike the modern novel, they were neither so numerous nor so highly reputed as to form an important part of the literature.

Medieval.—The first medieval romances of western Europe were metrical. Whether their materials and spirit were derived from Scandinavian and Teutonic sources, especially through the Normans, or from the East through the Spanish Moors and Crusaders, or whether they were products of the ancient Celtic genius, are questions not yet definitely settled. The wandering minstrels invented, translated, and amplified stories in order to satisfy the craving for the marvelous prevalent in the hut and in the castle, rehearsing known facts and genealogies, transforming chronicles and legends into romances of chivalry, in which Alexander the Great figures as a knight-errant, and Virgil as a mighty magician; adapting Byzantine tales, and devising humorous and scandalous stories of real life. The romances of chivalry introduced knights whose deeds, courage, and sentiments of honor and delicacy were praised in the most extravagant manner. The transformation of metrical into prose romance was partly owing to the invention of the art of printing, the advance of the printer's art, the preference of the commoner being thus superseded, and partly to the evolution of prose forms out of metrical beginnings, as had taken place in the history of classical literature. Prose narratives celebrated Arthur, Charlemagne, Amadis de Gaul, and other heroes of chivalry, and were as wearisome and naïve as their predecessors, though composed with more regard to probability, and to some extent depicting manners instead of being mere rhapsodies of fierce events. The first important romance of the Arthurian cycle, which is in its essence of Welsh and Armoric origin, are those of ‘Merlin the Enchanter,’ of ‘Arthur,’ of the ‘Holy Graal,’ of ‘Percival,’ of ‘Lancelot of the Lake,’ of ‘Tristram,’ of ‘Triumph of the Island of the Skies,’ exploits and loves of the Knights of the Round Table; the scenes are generally laid in Wales, Cornwall, Brittany, Ireland, or Scotland; only in one or two of the series are we transferred to Egypt or India.

Scandinavian.—Scandinavia abounded in legendary romances, both metrical and prose, on national subjects, as the ‘Volsunga Saga,’ the ‘Winkina Saga,’ the ‘Fristhio's Saga,’ the ‘Saga of King Ragnar Lodbrok,’ and others, all having a bold, vigorous, gloomy character peculiar to themselves.

German.—Germany also had a peculiar cycle of heroes derived from her traditional history as heir of the Roman empire, such as Siegfried, Theodor, king of the Goths, Dietrich of Bern, Attila (Etzel), king of the Huns, Günther, king of Burgundy, etc. The German romances are of a more fierce and unrefined character than the French, from which they differ, too, in employing the preternatural arts of the subterranean Duergar or dwarfs.

Italian.—The Italians originated no romances of the kind described above. They adopted
from the French the tales of Charlemagne and his paladins, which, however, attracted little attention till Boiardo, Berni, Pulci, and Ariosto made them the groundwork of poems that were diffuse and rambling in style, but far superior in regularity and beauty of diction to the earlier romances. These romances had been known in France two centuries before they were introduced into Italy. The French ‘Contes and Fabliaux,’ facetious tales of real life, found more favor in Italy, whose political features during the Middle Ages were mercantile and lettered republics instead of feudal chivalric institutions. The first work of this sort is the ‘Cento Novelle Antiche,’ otherwise called ‘Il Novellino.’ It is a collection of stories current among the Italian people, or taken from the ‘Fabliaux,’ the ‘Gesta Romanorum,’ and some of the more graceful episodes in the chivalric romances, and was executed by unknown authors about the end of the 13th century. It was followed by the ‘Decameron’ of Boccaccio (1358), which is a collection of 100 tales drawn from all sources, and transcribed in a charming style, but for the most part too indicative to suit modern taste. Their success was immense, and brought into the field a host of imitators, among whom we can only mention Sacchetti, Ser Giovanni (to whom Chaucer, Shakespeare, and Molière are indebted), Massuccio di Salerno, Agnolo da Firenze, and others, whose works Shakespeare and his contemporaries largely drew. Gazzini, Straparolo, Bandello (in whom we find the original of Massinger’s ‘Picture’ and Shakespeare’s ‘Twelfth Night’), Malespini, Campeggi, and others. In the 15th century the romances of chivalry had run their course in France, but the tales of love intrigue continued. The principal of these are the ‘Cent Nouvelles’ and ‘Heptameron’ of Marguerite of Navarre. A totally different class of fiction popular in this era deserves a word in passing, the spiritual romances. The greatest medieval work of this character is unquestionably the ‘Golden Legend’ of Voragine, consisting of 177 sections, devoted to a particular saint or festival. Besides this there was a species of spiritual tales, the ‘Contes Dévots,’ written by the monks themselves, probably with the intention of countering the influence of the licentious stories of the troubadours, but sometimes falling below their own moral standard. During the 16th and 17th centuries the romance writer began to alter and extend their sphere. The power of the Church had been rudely shaken, the institutions of feudalism were crumbling into decay, and the uniformity which reigned to a great extent in the former modes of life and thought was rapidly disappearing, and a tendency to the other extreme of individuality is clearly discernible.

**Spanish.**—The ‘Don Quixote’ of Cervantes was a death-blow to the exaggerated interminable chivalric romances. About the same time the first of the ‘picarosque romances’ was given to the Spanish public. It was written by Matteo Aleman, and entitled ‘The Life of Guzman Alfarache;’ the hero is successively beggar, swindler, pander, student, and slave. It gave birth to a host of Spanish romances with beggars and scamps as the central figures, and is said to have suggested to Le Sage the idea of ‘Gil Blas.’

**English.**—The more complete development of the English novel is almost contemporaneous with the decline of the tragic drama. As the more violent passions and impulses of society gradually became restrained, the narrative style was called in to give expression to more even and detailed development of sentiment and incident than is possible in the drama. The first name of note is that of Mrs. Aphra Behn (the ‘Aspasia of the Dunciad’), whose tales are as licentious as the plays of the contemporary dramatists, and as also are those of her successors and imitators, Mrs. Heywood and Mrs. Manley. The only effect of the time evincing high poetic talent are Bunyan’s allegories, the ‘Pilgrim’s Progress’ and the ‘Holy War.’ The modern English novel may be said to date from Defoe. The effect of his ‘Robinson Crusoé,’ ‘Colonel Jack,’ ‘Moll Flanders,’ etc., is caused by the delineation and skilful combination of practical details, which give to the adventures the force of realities commanding the interest and sympathy of the observer. The satirist of the age was Swift, the English Rabelais, whose ‘Gulliver’s Travels’ are equally interesting whether read with or without reference to the science underlying the surface. The novel of everyday life was further improved by Richardson, Fielding, and Smollett. Though the productions of Richardson are of great length, yet their accumulation of delicate light and shade, the knowledge of human sentiments and passions they display and the earnestness with which they enlisted the passions on the side of virtue, made them a great advance on their predecessors. The novels of Fielding have a less sentimental tendency, are marked by less delicacy of perception and command of pathos, and more by a flow of wild animal spirits, vivacity of manner, grasp of character, and thorough knowledge of all sections of English life. Unlike Fielding, Smollett seized upon the eccentric rather than the common features of character, dealing in humorous exaggeration, grouping together burlesque personages, incidents and oddities of speech and action. His humor belongs more to farce than to genuine comedy. The ‘Tristram Shandy’ of Sterne dispenses with the phase of human comedy that of his contemporaries, than which it must be admitted to be deeper and finer in quality. ‘Tristram Shandy’ has little plot or continuous action, its interest depending on its characters and sentiments; it abounds in happy phrases, keen glances into the depths of human character, and in pathos which is occasionally closely allied to mawkishness. Four years after this work, appeared Goldsmith’s ‘Vicar of Wakefield,’ which possesses a higher moral tone than any that had preceded it. From this time till the beginning of the 19th century no work of fiction of high rank appeared. Then came the works of Miss Edgeworth and Miss Austen, who described domestic life with good sense, a clear moral aim, and charming simplicity of style. During the era of the French Revolution a tendency to embody social speculations and aspirations, and to discuss matters connected with religion and morality, especially in the novels of Bage, Holcroft, and Godwin.

**The Modern Novel.**—Sir Walter Scott may be said to have created the historical romance as a new department of English literature. His retrospective cast of mind, genial sympathies,
antiquarian research, and creative imagination enabled him to give a vivid, if not always a truthful, reproduction of past characters, manners, thoughts, and passions. He raised a higher standard of novel writing than had been before known, and substituted for the mawkish sentimentalism and ridiculous extravagance which had been long popular, good sense, genuine feeling, power and beauty of description, and life-like impersonations of manly and womanly character in all ranks from the court to the throne.

Since his day the English novelists are the most numerous class in the list of authors; and we can but mention a few of the more prominent names from that time till the present day. In the novel of English life and manners — besides the great names of Dickens and Thackeray — there are Mrs. Gore, Theodore Hook, Charlotte Brontë, Mrs. Trollope, Anthony Trollope, Mrs. Craik, Disraeli, Lord Lytton, George Eliot, Mrs. Oliphant, James Payn, Charles Reade, Miss Thackeray, Thomas Hardy, Richard Blackmore, George Meredith, etc.; in the historical novel, G. F. R. James, Ainsworth, Lytton, Kingsley, Weyman, etc.; in the nautical world, Marryat, Captain Marryat, W. Clark Russell, etc. Among the sensational novels, Wilkie Collins, Miss Braddon, etc. In the novel of sentiment, we must not leave out Elizabeth Gaskell, Hogg, Moir, George MacDonald, R. L. Stevenson, J. M. Barrie, S. R. Crockett, etc. In the Irish novel, Lady Morgan, Banim, Crofton, Croker, Carleton, Lover, Lever, Mrs. S. C. Hall, etc. The most celebrated of the French novelists of the 19th century were Madame de Staël, Chateaubriand, Victor Hugo, Dumas (father and son), Balzac, Paul de Kock, Alphonse Karr, Georges Sand (Madame Dudevant), Feydeau, Feuillet, Prosper Mérimée, Edmond About, Eckermann-Chateauneuf, A. de Vigny, Zola, Daudet, G. Ohnet, Pierre Loti, etc. The more noteworthy names in the German literature of fiction are those of Gutzkow, Willibald Alexis (Wilhelm Hauff), Wilhelm Haßelbach, Gottfried and Johanna Kinkel, Rodenberg, G. zu Putlitz, Auerbach, Gustav Freytag, Paul Heyse, Georg Ebers, Peter Rosegger, Louisa Muhlbach, E. Werner, Julius Wolff, and others. Among the most important novelists in other languages are those in the Italian by Manzonì and De Amicis, in Danish by Hans Christian Andersen, in Swedish by Frederika Bremer and Madame Carlen, in Norwegian by Bjornson and Jonas Lie, in Hungarian by Maurice Jokai, and in Russian by Ivan Turgeniev and Tolstoi. The novel in America will be found treated at length under the title FICTION IN AMERICA.

Novel Constitutions, or Novels, in law, were the supplementary constitutions of some Roman emperors, and, especially those of Justinian, so called because they appeared after the authentic publications of law made by such emperors. The Novel Constitutions (also called Novels), together with the Institute, Digest, and Code, constitute the whole body of law which passes under the name of Justinian.

Novelette, (1) in music a term denoting certain compositions in free form, characterized by a great number of short themes introduced without regular succession. Schumann (q.v.) was the inventor of this composition. (2) An abbreviated novel, or short work of fiction; a short story usually contains from 1,000 to 20,000 words; a novella from 20,000 to 40,000, and a novel from 40,000 words upward.

Novellino, nó-vél-nó, II, or Cento Novelle Antiche, a 13th century collection of Italian stories of a very miscellaneous character, taken from every possible source, biblical, classical, chivalrous, and historical. The style is simple and natural and often distinguished by a charming naïveté. Consult: Carbogni, 'Il Novellino' (1890); d'Ancona, 'Le Fonti del Novellino'; and Biagi, 'Le Novelle Antiche' (1880).

Novello, nó-vél’lo, Clara Anastasia, Countess Gigliucci, English vocalist: b. London, England, 10 June 1818; daughter of Vincent Novello (q.v.) and sister of Mary Victoria Cowden Clarke (q.v.). She made her debut in 1833, and later sang with brilliant success in the great cities of Europe. In 1843 she was married to Count Gigliucci, and her final public appearance was in 1860.

Novello, Vincent, English composer: b. London, England, 6 Sept. 1781; d. Nice, France, 9 Aug. 1861. He was one of the founders of the Philharmonic Society of London, and of Novello, Ewer & Company, London music publishers. His contributions to cathedral music are valuable, and in editing the unpublished compositions of great musicians he accomplished an important work.

November (from novem, nine), the eleventh month of our year and the ninth month of the Roman year when it consisted of 10 months. It has 30 days, and in Great Britain is generally regarded as perhaps the gloomiest period of the year. The first day of the month is All Saints' Day. (See Calendar.) In the United States Thanksgiving Day comes in November.

Noverre, Jean Georges, zhon zhorzh nó-vär, French musician and dancing-master: b. Paris, France, 29 April 1727; d. Saint Germain en Laye, France, 19 Nov. 1810. He directed his attention to dancing and the composition of ballets, and in 1777 was appointed ballets en chef at the Académie at Paris. His savings were swept away by the Revolution, but his old age was dignified and respected though poverty-stricken. He wrote: 'Observations sur la Construction d'une nouvelle Salle de l'Opéra' (1787); 'Lettres à un artiste sur les Fêtes publiques'; etc.

Novgorod, or Veliki-Novgorod ('Great Novgorod'), Russia, (1) a town, capital of the government of Novgorod, on the Volfikoff, near the point where it issues from Lake Ilmen, 190 miles southeast of Saint Petersburg. It is divided by the river into two parts, which communicate by a stone bridge. The portion of the town on the right bank contains in its centre the Kreml, or citadel. Within it is the cathedral of Saint Sophia, built after the model of Saint Sophia at Constantinople; besides which there are numerous churches and several monasteries. The town-hall, post-office and commercial buildings stand on the left bank of the river. The manufactures are of little importance, and consist of sail cloth, leather, tobacco, candles, vinegar, etc. The trade in corn, flax, and hemp, carried on chiefly with the capital, is considerable.
Novgorod was in early times the capital of an independent state. So great was its power and wealth that it excited the jealousy of the Moscovite princes, and in 1453 the Czar Ivan III. nearly destroyed the city, deprived it of its liberties, and banished its most influential citizens. On the opening of Archangel to English traders, but more especially after the founding of St Petersburg, the town rapidly declined. Pop. (1897) 26,995. (2) The government of Novgorod has an area of 47,236 square miles. Pop. (1897) 1,392,033, chiefly engaged in agriculture and stock-raising.

Novibazar, or Novipazar, Turkey, the capital of the sanjak of Novibazar, Kossovo, on the Rashka, 130 miles southeast of Bosna-Serai. There are no public buildings worthy of notice except the ruined citadel. It is the chief point of communication between Bosnia and Turkey; several of the chief roads of the country cross each other. By the terms of the Treaty of Berlin of July, 1878, the liva or district of Novibazar is maintained under a dual Austro-Turkish control. Pop. 12,000.

Novice. See Neophyte.

Novikoff, nôvîkôf, Nikolai Ivanovich, Russian author; b. near Moscow, Russia, 27 April 1844; d. there 30 July 1878. He entered the imperial service, but soon turned his attention to literature, and became editor of the Moscow 'Gazette.' He established in Moscow a Typographical Society, whose purpose was to further expensive reprints of valuable books, and he also founded there the first circulating library in Russia, and in various ways endeavored to promote the cause of education. He was imprisoned for writing 'A History of the Jesus,; and his other works include: 'The Painter,' 'Russian Biography'; etc. See Gretch, 'Essai sur l'Histoire de la Littérature Russe.' Consult: Luginoff, 'Novikoff and the Moscow Martinists' (1867).

Novikoff, Olya Kireeff ('O. K. '), Russian political writer; b. Moscow 1840. Her parents belonged to the nobility, and at 12 was married to Gen. Novikoff. She removed to England and there found friends among the most eminent statesmen of the day. Her political writings signed 'O. K.' are in further Anglo-Russian alliance and continued the work of her brother who was killed in the Turkish war. She has published: 'Is Russia Wrong?'; 'Friends or Foes'; 'Skobeloff and the Slavonic Cause'; etc.

Novo Cherkaska, nôvô chêr-kâs'kâ, Russia, city, capital of the province of the Don Cossacks; near the Don River, about 40 miles from its entrance into an arm of the Sea of Azof. Anthracite coal mines and rich farm lands are in the vicinity. Two large fairs are held here each year, which bring considerable trade to the city. It has a number of manufacturing establishments, several excellent schools, and a large library. Pop. (1901) 55,000.

Novum Organum (literally, new method or instrument). A famous work by Francis Bacon, published in 1620. It forms the second part of Bacon's philosophical work entitled 'Instauratio Magna,' 'The Great Restoration' of Sciences. The first part, 'De Augmentis Scientiarum,' is an extension of the previous work on the 'Advancement of Learning.' The third is the 'Historia Naturalis.' The 'Novum Organum' contains the outlines of the scientific or inductive method; namely, that of proceeding from facts to general laws, instead of inferring facts from assumed general principles which have never been proved. This latter, the philosophical and metaphysical method, was repudiated by Bacon, and together with the 'superstitions' he had discovered, have no place in the new learning. The 'New Method,' therefore, is an attempt at an interpretation of nature from direct observation.

Novy, Frederick George, American chemist: b. Chicago, 111., 9 Dec. 1864. He was graduated from the University of Michigan in 1886 and studied in Berlin. In 1891 he became assistant professor at the University of Michigan, and was several times promoted until in 1902 he was made professor of bacteriology. He was at Pasteur Institute in Paris in 1897 for the prosecution of his studies, and in 1901 he formed one of the United States commission to investigate the plague in the Orient. He has written: 'Cocaine and Its Derivatives' (1887) and several books in collaboration.

Nownagar, nôwâ-na-gâr', or Nawannagur, na-wân-NA-gûr', India, the seaport capital of a native Gujarate state in the Kathia war peninsula, at the mouth of the Nanga, on the Gulf of Cutch, 54 miles east of Rajkot, with which it is connected by a branch railway line. It is noted for its textile manufactures, pearl fisheries, and carries on an active export and import trade. Pop. (1901) 53,844.

Nowell, nô'el, Increase, English colonist in America: b. 1590; d. Boston 1 Nov. 1655. One of the original patroons of the Massachusets Bay Company, in 1630 he came to New England; about 1632 was dismissed from Boston because of his urging the separation of Church and State; and became one of the founders of Charlestown. He was outlawed by the English authorities for failure to appear before them. Nowell was secretary of the colony 1644-9, and was chaplain to the force sent against the Narragansett Indians. He died in poverty, but a large land grant in New Hampshire was voted by the colony to his widow and his son, Samuel (1634-88), who had distinguished himself in the swamp fight with the Narragansetts.

Nox. See Nyx.

Noyades, nôwâ-yâd', in French history, the name given to the execution of political offenders by drowning them, practised during the Revolution, especially during the Reign of Terror, by Carrier et Nantes. The method adopted was crowding the victims into a boat, withdrawing a plug in the bottom, and casting it adrift. The boat having sunk, the victims drowned. The method was equally practised on the French Fleet.

Noyau, nôwô-yô', a French liqueur prepared from white brandy, bitter almonds, sugar-candy, grated nutmeg and mace, and sometimes flavored with the kernels of apricots, peaches, the peel of oranges, etc.

Noyes, noiz or nois, Arthur Amos, American chemist: b. Nauset, Cape Cod, Mass., 13 Sept. 1868. He studied at the Massachusetts Institute of Technology and at Leipsic University, and became instructor 1887, assistant professor 1894, and professor of theoretical and organic chemistry 1901, in the Massachusetts Institute of Technology. He made valuable original
NOYES — NUDIBRANCHIATA

studies of the relation of the law of mass action to the solubility of salt mixtures, contributed other papers to the Zeitschrift für physikalische Chemie, and wrote: 'A Detailed Course of Qualitative Chemical Analysis of Inorganic Substances' (1895); 'Class Reactions and Identification of Organic Substances' (1899, with Maury); 'The General Principles of Physical Science' (1902).

Nobis, John Humphrey, American author and founder of the Oneida Community (q.v.): b. Brattleboro, Vt., 6 Sept. 1811; d. Niagara Falls, Canada, 13 April 1866. His father was a representative in Congress 1815–17, and his mother an aunt of President R. B. Hayes (q.v.). He studied at Dartmouth, took theological courses at Andover and Yale, was licensed to preach in 1833, and soon lost this license, having professed second conversion, a belief in the dual sexual nature of God, and the doctrine that the Christian is bound by no rule of duty or conduct. With these tenets and an attempted return to the communistic of the primitive Church, he gathered round him a Perfectionist Community at New Harmony, Vt., whose practice of complex marriage forced them to migrate to Oneida, N. Y. But there, too, they outraged public sentiment, so that they gave up their peculiar tenets in 1880, and Noyes and some of his adherents went to Canada. He wrote: 'The Berean,' which may be called the 'Bible of the Oneida Community' (1847); 'The Second Coming of Christ,' that is in 70 A.D. (1849); 'Salvation from Sin' (1862); and 'History of American Socialism' (1874). See PERFECTIONISTS; ONEIDA COMMUNITY.

Nobis, William Albert, American chemist: b. near Independence, Iowa, 6 Nov. 1857. He was graduated from Iowa College in 1879, and in 1883–6 was professor of chemistry in the University of Tennessee, since when he has occupied the chair of chemistry at the Rose Polytechnic Institute, Terre Haute, Ind. He has edited the 'Journal of the American Chemical Society' since 1902, and is the author of: 'Organic Chemistry for the Laboratory' (1897); 'Organic Chemistry' (1903); etc.

Nobis, William Curtis, American lawyer: b. Sodaville, N. Y., 19 Aug. 1805; d. New York 25 Dec. 1884. He was admitted to the bar in 1827, was appointed district-attorney of Oneida County, and later established a law practice in New York. He was one of the strongest advocates at the New York bar, and earned a reputation for highest integrity, and at the time of his death was engaged in codifying the laws of the State. He will his extensive law library to Hamilton College, Clinton, N. Y.

Nub, noo', or Nu (later form Nm), Egyptian deity. It was from Nun, the primeval flood, that Re, the sun-god, rose to his throne over the world. Nun was the personification of the original and eternal stuff or protoplasm from which gods and men were formed, but in a later age represented the life-giving waters of the Nile. Consult Wiedmann, 'Religion of the Ancient Egyptians' (1897).

Nuba, noo'ba, an ethnological name given to the negro tribes of Kordofan, in Eastern Sudan. The Nubas are true negroes. Consult Stanford, 'Africa' (1895).

Nubar Pasha, noo'bar pāshā, Egyptian statesman: b. Smyrna January 1825; d. Paris 14 Jan. 1889. A student of Chemistry, educared in Switzerland and France, in 1842 became secretary to Boghos Bey, Egyptian minister of commerce and foreign affairs, later rose to be bey, and was sent on important diplomatic missions. Under Said Pasha he was in charge of the transport service through Egypt to India, and built the railway across the desert from Cairo to Suez. After the accession of Ismail Pasha, who at first strongly relied upon him, he was Egypt's first minister of public works, and from 1866 minister of foreign affairs. He success fully concluded at Constantinople and Paris the negotiations toward the construction of the Suez Canal, obtained for Ismail the title of Khedive, and strove to introduce European culture and methods of administration. At that time in Egypt the consulates of 17 various powers administered as many different codes of law, and to these courts alone the subjects of the said powers were amenable. Nubar prevailed upon the powers to allow the organization of international courts with a uniform code, perhaps his greatest achievement. He was dismissed in 1884, but on demand of the powers was at the head of the ministry in 1889, directing the financial reforms. In 1884–5 he was again premier. He was very adaptable, not to say pliant, and readily became the administrator of a British policy of which he did not approve.

Nubia, nū'bi-a, Africa, a comparatively modern name for a large region, formerly a portion of Ethiopia, and extending on both sides of the Nile from Assuan to Abyssinia; touching the Red Sea on the east and the desert on the west. Nubia proper, or Lower Nubia, extends from Assuan on the Egyptian frontier to Dongola; beyond that is Upper Nubia. But of late the name of Egyptian Sudan, properly applicable to a section of Upper Nubia, has come to be used for Nubia in its widest sense, together with the once Egyptian territory actually in the Sudan, and the equatorial provinces. The great Nubian desert lies east of the Nile, opposite the great west bend of the river. See EGYPT; SUDAN.

Nuble, ūoo'bla, Chile, an inland province; bounded on the north by Linares, on the east by Argentina, on the south and west by Concepción; area, 3,566 square miles. It is an agricultural region in which the chief product is wheat, and considerable attention is given to raising cattle. Capital, Chillán. Pop. (1903) 160,832.

Nucleopro'teids, products of the compounding of nuclein with proteids. They are compounded in varying proportion, but nearly all cell-nuclei contain them. On digestion with gastric juice an insoluble residue of nuclein is left by nucleoproteids.

Nuddea, nūd'dé-a. See NADIA.

Nudibanchi'a'ta, one of the two primary divisions (orders, or sub-orders) of the class Nudibranchiate gastropods. The name is in allusion to the absence of the primary gills or ctenidia, which in mollusks occur typically within the mantle cavity, and the functional substitution for them of external processes or cerata which perforate the mantle when the latter is present. The cerata differ greatly in form and arrangement, and their peculiarities characterize the dif-
férrent families. They may be retractile or not; armed with stinging cells or without them; simple, pronged or arborescently branched, in the latter case usually penetrated by portions of the complexity ramifying liver. In their arrangement they the Pampanga dorsal or lateral rows, or a circle about the arms. Frequently they are most beautifully colored, and in many cases closely resemble the object on which the animal lives. The young are provided with a nautiloid shell, which is lost early in life, leaving the adult devoid of this protection. A mantle may or may not persist, and the integuments are frequently filled with calcareous spicules. On the head are found a pair of minute sessile eyes, and a pair of often retractile tentacles, which are olfactory in function and are known as rhinophores; in addition to which there may be a second pair of tactile tentacles. The mouth is provided with a radula and sometimes with jaws. Because of the usually elongated form of the body and their strictly marine habit, the nudibranchs are known popularly as "sea-slugs."

With the exception of a few free-swimming, pelagic forms, the vast majority of the species belong to the litoral zone, where they creep upon algae, hydroids, polyps, and similar organisms, which afford them concealment and a place to attach the gelatinous capsules in which the eggs are deposited, besides furnishing the animal or vegetable food on which the particular species subsists. Most, if not all, of them are hermaphrodites. Upward of 1,000 species have been described and arranged in 17 families. On the Atlantic coast of the United States 21 genera and 33 species occur in the region north of Cape Hatteras.

**Nueces, nmwá-sés,** a river in Texas, has its rise in a ridge of low mountains in Edwards County, flows south into Dimmit County, then east, northeast, and southeast into Corpus Christi Bay. It formerly marked the boundary of the province of Texas in Mexico. It is about 400 miles long and navigable only a short distance from the Gulf.

**Nueva Cáceres,** nmwá ká̱th-ká̱y-rés, Philippines, formerly Naga, a pueblo and capital of the province of Ambos Camarines, situated on the southern part of the province on the Naga River at the head of navigation for large vessels, 10 miles inland from San Miguel Bay. It is a port of entry and an important road centre, and has an excellent trade. It is well built, contains a government house, a cathedral and episcopal palace, a seminary, hospital, parochial school, and a normal school for girls. It was at one time the seat of the episcopal see of the Philippines. Pop. 11,550.

**Nueva Ecija,** á̱th-ká̱h-hah, Philippines, a province of central Luzon, having a coast line of 23 miles on the Pacific, and bounded on the north by Pangasinán and Nueva Vizcaya, and on the south by Infanta and Bulacán. The surface is mostly low, but is broken in the northeast and south by foothills of the Cordilleras; the Grande de La Pampanga River crosses the province from north to south, the Canarén tributary of the Agno follows the northwestern border, the Canarén tributary of the Agno follows the northwestern border, the Canarén tributary of the Agno follows the northwestern border, the Canarén tributary of the Agno follows the northwestern border, the Canarén tributary of the Agno follows the northwestern border. Many smaller rivers are tributary to these. The soil is very fertile, the larger rivers frequently overflowing and fertilizing the fields with their deposits. Rice is raised in the southern and central portions; other important products are corn, tobacco, sugar, and papaya. The chief industry is agriculture; there are some manufactures for home consumption only; sugar is in some cases manufactured and refined on the sugar plantations. Cattle are raised in the central part of the province. A road parallels the entire course of the Grande de la Pampanga River; there are numerous other roads, and a large boat traffic along the Pam- panga and its tributaries. Civil government was established in Nueva Ecija in June 1901, and at the end of that year the governor reported that the province was "free from insurrectionary movement." Pop. 156,610, mostly Tagalogs.

**Nueva Esparta,** á̱s-pár-tás, Venezuela, a state composed of islands off the northwest coast of the republic. Margarita is the largest island of the group. Nueva Esparta was a part of the state of Guzman Blanco until 1901, when it became a separate state.

**Nueva Leon, lá-ón** ("New Leon"), Mexico, a state in the northeastern part, bordering on the United States; area, 23,502 square miles. It is crossed by low mountain ranges, but has many fertile valleys, in which the chief products are cotton, rice, and fruits. The chief minerals which are mined are gold, silver, salt, and lead. The capital is Monterrey (q.v.). Pop. (1895) 309,252; (1900) 326,940.

**Nueva San Salvador, sán sál-vá-dór,** Salvador, Central America, city in a mountainous region a little northwest of the center of Salva- dor. The chief occupation is mining. Pop. (1901) 13,000. See SALVADOR.

**Nueva Vizcaya,** véth-ká̱y-yá, Philippines, a province of the island of Luzon, situated south of the center of Northern Luzon, bounded on the east by the province of Isabela, and on the west by Pangasinán and Bicol; area, 1,072 square miles. The surface of the province is uneven, being broken by the foothills of the Sierra Madre, the Cordillera Central and the Caraballo range. The Magat tributary of the Grande de Cagayan River crosses the province from northwest to southeast, and there are numerous smaller rivers and streams. The only crop raised to any extent is rice; sugar, chocolate, and tobacco are also raised, but in quantities to supply the inhabitants of the province. Several kinds of building stones, granite, sandstone, etc., are found in the mountains, but quarried only to a small extent; there are also valuable forests containing resin and gum trees, but these products are not gathered on account of the difficulty of transportation. A few simple fabrics are woven for domestic use. The main highway of Luzon from Manila to Aparri passes through this province, but there is but little traffic on account of the difficulty of reaching the interior. Civil government was established for the province in January 1902; and a special form of municipal government organized for a few of the larger towns, which is to be extended to other towns when they are prepared for it. Pop. 60,630, mostly non-Christian tribes.

**Nuevitas,** nmwá-véth-tás, Cuba, seaport in the province of Cienfuegos, in the northeastern part of the province, on the coast, and on the railroad which extends 39 miles to Puerto Prin- cipe (q.v.). It has an excellent harbor and a large trade with other seaports of Cuba, the
**NUEVO LAREDO — NULLIFICATION**

**Nuevo Laredo**, nwäl’vä lä-rä’dô, Mexico, town on the Rio Grande, and on the Mexican National Railroad. It is opposite Laredo, Texas, and about 160 miles north by west of Monterey. Pop. 2,500.

**Nuisance**, in law, a term used to denote whatever is a serious annoyance to one's neighbors, or in a general sense to the public at large, in the exercise of their rights of property. Nuisances are of two kinds — public or common, and private. Public nuisances are: Annoyances in the highways, bridges, and public rivers, by rendering the same difficult or dangerous to pass, either by actual obstructions or by want of repair; injurious and offensive trades and manufactures, which, when hurtful to individuals, are actionable, and when detrimental to public health or convenience, punishable by public prosecution. The subject is, in fact, according to the nature of the offense; keeping hogs in a city; disorderly houses, unlicensed plays, gaming houses, and brothels; lotteries; making and selling fireworks in unlicensed places; mining for petroleum; and also strictly regulated. Suffering any miscible dog to go loose, to the danger of neighbors or passengers, is an indictable offense, and an action for damages will also lie against the owner; but it will not lie unless the owner has had notice of the dog having bitten somebody at least once before. In general, the owner of any vicious animal seems bound to secure it at all events, and is liable for damages to a person subsequently injured if the mode he has adopted to secure it proves to be insufficient. A private nuisance may be defined as an injury or annoyance to the person or property of an individual. If a person builds a house so near to that of his neighbor that the roof of the new building overhangs that of the other, and throws the water on it, this is a private nuisance, for which an action will lie. And if a house is built so near that it will obstruct the light and windows of another, the owner of the new house subjects himself to an action. But depriving one of a mere matter of pleasure — as of a fine prospect, this, as it abridges nothing really necessary or convenient, is not an injury for which there is legal remedy.

To keep hogs near one's house, or to carry on any offensive trade — as a tanner, tallow-melter, soap-boiler, or the like — are all nuisances for which an individual has remedy by action. So also is it a nuisance if life be made uncomfortable by the apprehension of danger, or by employing a steam engine, which produces a continual noise and vibration in the apartments of a neighbor. Besides the remedy by action, injured parties may, in a clear case, take the law into their own hands, and remove or abate the nuisance, but it is never advisable to take this course. In all municipal codes there are elaborate provisions with reference to sewers and drains, the disposal of sewage, scavenging and cleansing, water supply, cellar dwellings, and lodging houses, the prevention, abatement, etc., of nuisances, offensive trades, unsound meat, infectious diseases, and hospitals, mortuaries, highways and streets, lighting of streets, public pleasure grounds, markets, and slaughter houses, police regulations, prosecution of offenses, alteration of areas, etc. The overcrowning of houses may be stopped. Provisions are also made to prevent the spread of diseases in times of epidemics, and to prevent common lodging houses from being kept in an unclean state. The inspector of nuisances or the medical officer of health has at all times power to inspect any animal, carcass, meat, poultry, game, fish, vegetables, corn, bread, or flour, and if found unfit for food, or diseased or unsound, they may be carried away and destroyed, and the owner or dealer fined. The local authority may order house proprietors to provide proper water closets, to cleanse gutters and cesspools, and to remove any pool, ditch, drain, urinal, or privy injurious to health.

**Nukha**, noo-köät’fâ, Russia, town in Transcaucasia, about 120 miles east by south of Tiflis and 150 miles northwest of Baku. It is near oil fields and is the industrial and commercial centre of a silk-producing region. The inhabitants are mostly Armenians and Russians. Pop. (1903) 29,750.

**Nukualofa**, noo-köök’ä-lëf’ä, Friendly Islands, the capital of Tonga, the largest island of the group. See FRIENDLY ISLANDS.

**Nüll, nül, Edward van der**, Austrian architect, b. Vienna 6 Jan. 1812; d. there 3 April 1868. He was professor of architecture and ornamentation in the Vienna Academy, and a prominent practising architect. Most of his designs were executed with August von Sicardsburg. These include the Larisch palace and the Opera, at Vienna. Nüll's style was largely Renaissance, inclining to late Renaissance and rococo, and he exercised a decided influence on the architectural development of Vienna.

**Nullification**, in American history, a political doctrine first suggested in the Kentucky Resolutions of 1798. Its fundamental principle was accepted by the Hartford Convention of 1814, but it was not until 1832 that the theory was fully developed by the master mind of Calhoun, and acted on by South Carolina in its famous Nullification Ordinance of 24 November of that year. The Federal Constitution recognized both the Union and the States as bearers of power, but did not clearly apportion it between them, nor clearly determine in cases of disputed claims which of the States possessed it. The nation possessed only delegated authority, while to the States remained the residuary powers. Calhoun in elaborating this doctrine claimed that historically the States came into being first, and were the creators of the Union, the grantors of power to their agent, the Federal government. It followed, therefore, as a natural consequence, that the final judge of the amount of power granted could not lie with the created — the agent — but must remain with the States as the creator. Also at this point the question arose in regard to the remedy should the agent of the States exceed the authority delegated, and pass laws that were contrary to the rights of the partners in the Union. The fundamental basis then of nullification as Calhoun developed it was State Sovereignty (q.v.); and, in cases where the Nation was encroaching on the reserved rights of the States, he found in nullification a peaceable remedy. Succession and revolution were thus to be made unnecessary. The Union was as perfect after as before nullification. All rights and duties of the States and the Union remained unchanged except in regard to
THE CAUSE OF NULLIFICATION

The one nullified and therefore void law. Should any of the co-States desire to test the matter a constitutional convention might be called, and the question be settled by process of amending the constitution; but till overruled in this way the law was void in the nullifying State.

The cause of nullification is bound up in a compound of the protective tariff and sectional slavery. The former offered the immediate occasion for its promulgation, while the conditions that made protection popular in one section, and hated in the other, were found in the latter. As late as 1816 the South was not radically opposed to a protective tariff. But under the slave system manufactures and commerce did not develop. The South therefore could not profit by the protective system, and gradually developed a strong opposition to its continuance.

By 1828, under the teaching of President Thos. Cooper, of the University of South Carolina, public opinion in that State had come to hold that the producer and not the consumer paid the tariff duty. It was also noted that about three fourths in value of all exports from the United States consisted of the products of the South, consequently the South would suffer. Therefore, in harmony with Cooper's teaching, the South paid approximately three fourths of the government revenues derived from imported goods. Hence the demand for lower duties grew apace. But instead of lower rates the tariffs of 1824 and 1828 raised them. The tariff of 1828—"the tariff of abominations"—aroused Calhoun to seek a remedy. In that year he set forth his nullification theory tentatively, but did not press for action under it. By 1832 the National debt having been extinguished, the South at once began to demand a lower tariff, insisting that the extinction of the public debt removed all excuse for the longer continuance of high duties—of protection. Instead, however, of revising the tariff in 1832 in such a way as to reduce it to a revenue standard, the duties in the new law were placed on a protective basis, and that principle affirmed to be adopted as a permanent one. In South Carolina, for some years, a struggle between the nullifiers and the anti-nullifiers to control the legislature had been in progress. The tariff act of 1832 for the first time gave the necessary two thirds majority to the nullifiers, and on 18 March 1833 the senate by a vote of 20 to 13, and the house by 29 to 25 resolved to call a convention to meet 19 November. On 24 November the convention voted 136 to 26 to declare the tariff acts of 1828 and 1832 null and void, because beyond the powers delegated to the United States. The convention also authorized the legislature to pass all laws necessary to enforce the ordinance of nullification. Laws were accordingly passed to prevent the collection of the tariff within the State, to give the governor the power to call the state militia to give the State courts full control of all cases involved under the tariff laws.

President Jackson in his annual message of December 1832 barely noticed this nullification action, but in 1833 he celebrated the 4th of July. He was pleased that the nullifiers had not attempted to establish a separate state. He denied the possibility of nullification being a peaceable remedy. He asserted the National as opposed to the States Rights interpretation of the Constitution, and concluded with an earnest plea for the Union. He appealed to the people of South Carolina not to be misled, not to be deceived into thinking that their action could end short of war and treason. He pictured their fate and the fate of the Union should they persist in their policy. In the meantime Congress had taken no action. The great Webster-Hayne debate of 1830 had awakened the people to a realization of the issue. Now in February 1833 Calhoun and Webster were pitted against each other in the Senate of the United States, in the greatest constitutional discussion concerning the nature of the Union and the powers of the States that had ever occurred in the American Congress. Webster supported Jackson in his national views, while Calhoun reaffirmed the constitutionality of nullification, as a peaceable remedy, against the usurpation of power by Congress. Webster presented the Supreme Court as the final arbiter in disputed cases. Calhoun claimed that this would be making the agent the judge of his own powers—an impossible principle. The request of the President that he be granted increased powers was now met by the introduction of the so-called Force bill 21 January. The bill, however, was not presented to Congress until 13 February. Clay's Compromise Tariff bill 12 February. The two measures then moved forward with equal step. The one gave the President power to collect the revenues in South Carolina, using the whole power of the government for the purpose, if necessary; the other provided for a gradual reduction of the tariff duties, until by 1842 no duty should exceed 20 per cent, a revenue basis. The two measures reached the President at practically the same time—he signed them both 2 March 1833, and on 16 March South Carolina repealed her ordinance of secession. Both parties could thus claim a victory; the administration and its friends, as well as Clay, in that the protective tariff still existed; the nullifiers in the fact that provision was made to reduce the tariff to a revenue basis, thus in fact yielding to South Carolina, at the very moment of adopting the Force bill.

Nullification as a constitutional and peaceable remedy against oppression was never again asserted, but on the basis of the 'nullification' doctrine that the States were sovereign—was not abandoned. In fact it was advocated even more strenuously than before. Instead of nullification in the Union, as a remedy, the doctrine of secession—a separation from the Union—gradually became the accepted principle of the States Rights school of statesmen. The advocates of the latter view held that to nullify a law and remain a member of the Nation was absurd; but affirmed that in case of a breach in the compact to withdraw from the Union was a constitutional right that flowed naturally from the character of the Union. H. W. CALDWELL.
University of Nebraska.

Nullipore, a name given to certain more or less massive sea-weeds of the family Rhodo-
NUMA POMPILIUS — NUMERICAL APERTURE

phyceae, common on rocky shores in warm climates, and especially about coral islands, where they serve to protect the corals somewhat against the beating of the waves. From secreting lime on their surface, and hence resembling coral, they were formerly supposed to be a kind of zoophytes. Some small species occur on the northern Atlantic coasts.

Numa Pompilius, nú'ma pom-plü'tüs, 2d king of Rome, belonging to the legendary period of Roman annals. According to ancient accounts he was from Cures, in the land of the Sabines, and was distinguished for wisdom and piety. He was elected king after the year's interregnum following the death of Romulus. His length and a quiet reign devoted to the adequate establishment of religion; and to him the Romans ascribed their whole system of worship. He also founded the temple of Janus, which during his rule remained closed. The sacred books of Numa, containing the unprescribed manner of observance for the rites and ceremonies of religion, were said to have been entombed, and to have been discovered in 181 B.C. This story is now regarded as a forgery.

Numantia, nú'mán-thi'-a, Spain, an ancient town, situated on the Duero, near the place now called Soria in Old Castile. It is famous for its resistance to the Roman power. While the neighboring places yielded to the Roman the Numantians were firm in refusing submission. Large forces under the prætor Pompeius Aulus (137 B.C.) and the consul Hostilius Mancinus were repulsed. Scipio Africanus, the younger, with an army of 60,000 was sent to subdue them. He surrounded the town and famine compelled them to yield after a siege of 14 months. The conqueror destroyed the town, 133 B.C.

Numbering Machine, in printing, a machine for impressing consecutive numbers on account or record books, coupons, railway certificates, bank-notes, railway tickets, etc. The invention is that of Blaise Pascal (1659), and consists of disks or wheels, each numbered on its peripheries, the whole mounted on one axle upon which they turn freely, acting upon each other in serial order, and being the series containing the units is moved one figure between each impact, and when the units are exhausted the tens come into action, and act in coincidence with the units, which continue their action.

Numbers, Book of, the fourth book of the Pentateuch, named in the Hebrew Bible 'The Wilderness,' from a word which appears in the first verse. The English title is a rendering of the Septuagint designation, which refers to the "numberings" of the people narrated in chapter i. 26. As the book opens at Sinai, like Leviticus, so it contains a continuation of the enactments given in that book. It is also connected with Deuteronomy, which takes up the narrative at the plains of Moab and follows the people's wanderings at which Numbers ends.

Contents of Numbers.—The book may be divided into three parts, each of which places the scene of its incidents in a different locality. (1) The scene of the Bakhuran crossing of the desert march is to begin by a numbering of the people. A separate census of the Levites is taken, as also of the first-born males. This is followed by regulations for the lepers' banishment from the camp; the law of restitution; the "waters of jealousy"; the law of the Nazarite; the form of priestly blessing. The offerings made by the princes at the dedication of the tabernacle are then enumerated. The Levites are set apart for their sacred office; the Passover is observed by all; a ceremonially, fit for the observance; the guidance of the pillar of cloud described. (2) The second part relates the incidents of the journey from Sinai to the plains of Moab, and extends from the 20th to the 40th year after the Exodus. It is made up of the following disjunct episodes: the murmurings at Taberah and Kibroth-hataavah; the institution of the seventy elders; the spying out of the land; the result of Miriam and Aaron; with the consequent leprosy of Miriam; the stoning of the sabbath-breaker; the judgment of Korah and his company; the enactment of certain ceremonial laws. These events took place at Kadesh. The narrative proceeds with the journey from Kadesh to Edom, relating the victories over Sihon and Og and from Edom to the plains of Moab, relating the death of Miriam; the faithfulness of Moses and Aaron at Meribah; the death of Aaron at Mount Hor; and the opening of the Midianite serpents. (3) The third part narrates the incidents that occurred in the plains of Moab; Balaam's prophecy; the idolatry at Shittim; the second numbering of the people; the appointment of Joshua to succeed Moses; the partition of the Promised Land; appointment of Levitical cities and cities of refuge; encounter with the Midianites.

Lithological Characteristics.—These recall Exodus in its chronological dislocation and mixture of narrative and legislation. The Book of Numbers contains some remarkable fragments of old Hebrew poetry. It is brief in comparison with the length of time covered, being little record of about thirty-eight years spent in the wilderness. The beginning of the narrative is a pretty full account of the first fourteen months of the journey, this completeness of detail is again resumed in the record of the closing year.

Numeration, the art of expressing in characters any number proposed in words. The chief terms used for this purpose are the names of the digits from one to ten, a hundred, a thousand, a million, etc. The term billion is of uncertain use in Britain it is a million of millions; in France, America, etc., a thousand millions.

Numerical Aperture, a term used in optics; the method by which the illuminating and resolving power of high-power microscopic objectives is calculated. Since it became customary to interpose water, oil, or other fluid between the object and the lens, it was found that a water immersion lens of 97%, and an oil immersion of 82%, give equal results to a dry or air lens of 180°. This obviously depends on the diameter of the back lens of the objective, and this on the refractive index of the medium between lens and the object. By the formula, \( n \sin u \), where \( n \) is the refractive index of the medium — air or fluid — and \( u \) the semi-angle of aperture. It is thus found that an oil lens of 180° has a numerical aperture of 1.52 against 1.00 for 180° in air. This only repre-
NUMERICAL NOTATION — NUMISMATICS

sents the comparative diameters of the effective pencils, and the relative illumination is, of course, obtained by squaring the numerical aperture to get the comparative areas of the pencils. We thus find that an oil-lens of 180° gives the illumination of a dry object of 180°.

Numerical Notation, in music, a modern system of indicating single tones or entire chords by means of numerals. The system is especially used in indicating the range of various instruments. Roman numerals are used in violin music and Arabic figures in compositions. The system was first introduced by G. Weber. See Music; Tones.

Numidia, nú-ści-dīt-ə, Africa, the ancient Roman name for the region now corresponding roughly with modern Algeria. It was divided among various tribes, but after the second Punic war, one of these tribes, the Teutis, overthrew its several of its rulers became noted in Roman history, more especially Jugurtha. In 46 B.C. it became a Roman province. Under the Roman emperors Numidia attained a high degree of prosperity and Christianity was in a flourishing condition here. It was afterward conquered by the Vandals, later by the Arabs, and in modern times by the French.

Numismatics, the science which treats of coins and coinage and the authorized government issue of money from the archaeological, historical, artistic and economic viewpoint. The word is derived from the Greek nomisma, through the form sometimes found in Latin, numisma, signifying coin. The name of the coin is given to the pieces of metal on which the public authority has impressed different marks to indicate their weight and value, to make them a convenient medium of exchange. The study of coins is regarded as indispensable to archaelogy, and to a thorough acquaintance with the fine arts. They indicate the names of provinces and cities, determine their position, and present pictures of many celebrated places. It is from coins that we derive all our information of some of the most celebrated works of ancient art, particularly of ancient statuary. Coins likewise fix the period of events, determine sometimes their character, and enable us to trace the series of kings. They enable us to learn the different metallurgical processes, the different alloys, the mode of gilding and plating practised by the ancients, the metals which they used, their weights and measures, their different modes of reaching, the names and titles of the various magistrates and princes, and also their portraits; the different divinities, with their attributes and titles, the utensils and the ceremonies of their worship.

Design and Form.—The parts of a coin are the two sides. (1) The obverse side, face, or head which contains a portrait of the person at whose command or in whose honor it was struck, or other figures relating to him. This portrait consists either of the head alone or the bust, or of a half or full length figure of a coin. The reverse contains mythological, allegorical, or other figures. The words around the border form the legend; those in the middle the inscription. The lower part of the coin, which is separated by a line from the figures or the inscription, is the basis, and contains subsidiary matter, as the date, the place where the piece was struck and other data. In ancient as in modern times the empires or kingdoms were distinguished by the head of the reigning prince, those of republics and free states were distinguished by some symbol, and sometimes these symbols are found along with the head of a reigning prince. These symbols were sometimes chosen on account of an accidental similarity between the name of the symbol and that of the state. Thus, a rose was the symbol of Rhodes; a heart that of Carthage; a pomegranate that of Pamphylia. More frequently, however, the symbols had some local reference. Thus, Egypt was distinguished by a sistrum, an ibis, a crocodile, or a hippopotamus; Arabia by a camel; Africa by an elephant; Athens by an owl; Crete by a bull; and Italy and Spain by a head of a man. Italy was represented by a head of a man with a diadem, or a head of a woman, or a head of a youth, or a winged figure. In shape most coins are circular, although some have been oblong, oval, octagon, and even square. Coins are usually of gold, silver or copper, and occasionally of bronze. Some coins are of brass, lead or bronze. More rarely an alloy of gold and silver, or an alloy of silver and tin, were used. There were also coins made with the main body of copper, but with a thin covering of gold or silver, either laid on the form of a thin plate, or by dipping the coin in the molten metal.

Numismatic Science.—The study of coins appears to have been entirely unknown to the ancients. It does not appear from any ancient works that any value was set upon coins as curiosities by the collectors of works of art in the times of Augustus, though there were at that time several coin-collectors, some of which have come down to us, and attract attention on account of their antiquity and the beauty of their execution. In the 15th and 16th centuries kings and queens, and private individuals of wealth and culture, particularly in France and Germany, rivalled each other in zeal for collecting these remains of antiquity, at first principally with a view of obtaining portraits of the chief characters of Roman history. The earliest treatises on the science of numismatics were published in the 16th century. In the 17th and 18th centuries, the investigations into the mixtures of metals and the execution of the dies; the form, size, weight, value, and number of the ancient coins; their genuineness or spuriousness, became susceptible of more detailed examination by the accumulation of materials of comparison; and the understanding of the types and legends was also facilitated by similar means. The coins of the Middle Ages have been sought for with zeal, and along with the ancient coins have been made to throw light upon subjects which manuscript writers left unexplained. The literature of numismatics has now become very extensive, but much of it is comprised in periodicals and pamphlets. From a number of individual points, the value of a coin depends largely upon its condition. There are 11 classes, namely: Proof, Uncirculated, Circulated Very Fine, Fine, Very Good, Good, Very Fair, Fair, Poor and Very Poor. Proofs are those coins struck for
collectors and not designed for general circulation. They have a polished mirror-like surface and bring the highest prices when offered for sale. Uncirculated coins are strictly unused, being in the same condition as when first issued from the mint; the rim has not been rubbed or worn. Circulated coins are those which have been in circulation barely long enough to wear off the mint lustre without rubbing the metal. The size of coins is reckoned by numismatists in the United States in sixteenths of an inch.

Ancient History.—We have no accurate knowledge of the beginning of coinage. Abraham returned from Egypt nearly 2000 years before Christ, and his purchase of the cave of Machpelah he weighed out the consideration agreed upon, “400 shekels of silver, current money with the merchant.” The use of metals, however, in the form of wedges or bars, though a great advancement upon simple barter, or the use of grain, cattle or other commodities, was still attended with inconveniences. “At every transaction the weight of metal must be computed; a hammer and chisel must be at hand to cut it off and a balance to weigh it. The fineness of the metal was also to be ascertained.” The method of shaping the metal into pieces of convenient size and stamping upon each its exact value ended all these troubles. He who first did this was the inventor of coins; but history is silent respecting his name, his country or the date of his invention. Homer speaks of the workers in metals but makes no mention of coined money. Herodotus says that the invention was Asiatic and that as far as he knew, the Lydians were the first who struck money, and although the oldest coins now extant have usually been supposed to be Grecian, there are reasons for thinking that the invention was Asiatic. Bricks of clay were a primitive coin employed by China, Arabia and Siam before copper money came into general use. The images, stamped with a stamp, after having been made into small bricks. Egypt in ancient days made money of several substances. Parchment, leather, paste-board, wood, covered with wax, and papyrus were among the forms used. There were stones and pieces of clay molded into the shape of beetles and tortoises. This was 2500 years before Christ. Unless marked by authority they passed only at their commercial value; if marked, they were enhanced in value.

Greek and Roman.—The coins of Greece and Asia Minor are the earliest known to the numismatist. The coins of the kings of Macedon are the most ancient bearing portraits; and Alexander I, who commenced his reign about 500 years before Christ, is the earliest monarch whose coins have yet been found. Then succeed the sovereigns who reigned in Sicily, Caria, Cyopsis, Heracles, and Pontus. Afterwards comes the series of kings of Egypt, Syria, the Cimmerian Bosporus, Thrace, Parthia, Armenia, Damascus, Cappadocia, Phrygia, Pergamos, Galatia, Cilicia, Sparta, Epirus, Illyricum, Gaul, and the Alps. This series reaches from the era of Alexander the Great to the Christian era, comprising a period of about 330 years. A perfect and distinct series is formed by the Roman emperors, from Julius Cesar to the overthrow of the empire by the Goths. The Roman coins may be resolved into three great divisions, those of the older republic, the consul, and imperial. The consular coins seldom or never bore the names or titles of consuls till toward the close of the republic; nevertheless they are not improperly called consular, because they were struck in the consular times of Rome. These have also been denominated “coins of families,” and are arranged according to the names inscribed on them. The brass consular coins are rather uninteresting and few. The imperial coins were those struck after the conclusion of the republican era of Rome down to the fall of the Roman Empire. Some of these coins are artistic; but they are for the most part rude and uninteresting. The materials of which they were composed were, as in modern times, gold, silver and the various modifications of copper.

The Middle Ages.—The money of the Byzantine Empire forms a link between ancient and modern coinage. The gold solidus or nomisma was circulated in the west as well as the east of Europe. Then came the silver piece or penny. The Scottish copper coinage, which was of an earlier date than that of England, was preceded by money of bullion, called black money, consisting of copper washed with silver. There are many coins of William I, in 1165, and a large hoard of his pennies was found in 1780. The only silver coin was the penny until the year 1293, when Alexander III. coined also half pence; and there are silver farthings of Robert I. and David II. The groat and half-groat were also introduced by the latter. These all ceased to be coined in the time of Queen Mary, when shillings were first coined, with the bust of the queen on one side and the arms of France and Scotland on the other. The silver crown was first coined in 1562. At the union of the kingdoms all the Scottish coins were called in and recoined at Edinburgh. In France the earliest coins are those of the Merovingian kings. In the 13th century gold coins were issued. In Italy appeared the gold florins of Florence, and in Germany coins of the emperors, the electors and the smaller princes. The coins of Spain began with the Gothic princes. The Hungarians began in the 16th century, and the Russians in the 14th. The coinage of Norway and Sweden at first resembled the British type and afterward the German.

Oriental.—In India the first coins of the Hindu princes were of the 7th century. Iron coins were minted in China as early as 2454 b.c., and in 14 A.D. a new kind of iron money was coined. These pieces were called yik-tesu, meaning “bended round and surrounded with red,” on account of the raised edge of the coin, which was made of red copper. An imperial mint was established, and the officers of the
Sanglin (Academy of Science) were appointed mint masters. The pieces of 5 tsu were then issued, remaining the principal money in circulation for 800 years. After this came a new issue. The coins were circular with a square hole in the centre, in accordance with the Chinese belief that the "heavens are round and the earth square." This coin was called "kai-guen-t'-ling-pao," remaining until the present day. Upon the obverse the inscription reads: "Current money of the newest beginning," and in the exergue the date of the year of the emperor's reign. The principal gold coin was called "kin," a pound of gold.

**American Colonial Coinage.**—The earliest American coins were executed in 1612, for the Virginia Company, at the Sommer Islands, now called Bermudas. The coin was of brass, and bore on the obverse the words, "Sommer islands," and a "hogg on one side, in memory of the abundance of hogges which were found on their first landing." On the reverse was a ship under sail, firing a gun. The earliest Colonial coins were made in Massachusetts in 1652, when a mint was established at Boston and coins of the value of threepence, sixpence, and twelvepence were struck. These coins were to be of the fineness of "new sterling English money," and every shilling was "to weigh a threepenny troy weight, and lesser pieces proportionately." They were soon after in circulation, but owing to the excessive planeness of their finish they were found to be greatly exposed to "washing and clipping." To remedy this, in the same year "henceforth both shillings and smaller pieces shall have a double ring on either side, with the inscription (Massachusetts) and a tree in the centre, on the one side, and New England and the date of the year on the other side." In 1662 a twopence piece was added to the series. These coins are now known as the "pine tree shillings," etc. The Massachus-

presses for coining which were imported arrived during September and in the beginning of October 1795. The first used in striking half dimes. All of the pieces struck during this year were classed as pattern pieces, the regular coinage not beginning until the next year, when the Chief Coiner reported on 1 March that 17,738 cents had been struck. The first deposit of gold bullion received for the mint for coinage was in February 1795. Moses Brown, of Boston, Mass., made the deposit which consisted of ingots to the value of $2,276.22. The Chief Conner reported that the first return of gold coins was on 31 July 1795. It consisted of 544 half eagles. Nine deliveries of this same coin were reported during the year. The first eagles delivered was on 22 Sept. 1795, the delivery consisting of 400 pieces. During the 19th century various experiments were made in the value of the American coins, and half cents, three-cent pieces, two-cent pieces, and 20-cent pieces were issued and discontinued. In 1903, the coinage was: dollars, half dollars, quarters, half dollars and ten-cent pieces of silver, nickel and silver alloy, and one cent in copper and bronze. See Coin; Coinage; Mint; Medal; Token.

Editorial Staff, 'Encyclopedia Americana.'

Nunútor, nú'nútor. See Romulus.

Num'mulite, a genus of Foraminifera, mainly extinct, which forms vitreo-calcareous, many-chambered shells having much the form of a doubly convex lens, which when flattened by pressure as in fossil examples, led to their being likened to little coins (nummuli). They varied in size from that of a pinhead to that of a silver dollar. The group originated in the Carboniferous, increased, and flourished at its maximum during the early part of the Tertiary period, when these foraminifers swarmed in the seas in incredible abundance. Their shells constitute the bulk of the Eocene Nummulitic Sandstone of the Old World, where it is one of the most important, if not the principal formation of the Tertiary series of rocks, in point of extent. Attaining a thickness of many thousands of feet, it ranges from the Alps and Atlas to the Carpathian Mountains; appears in Egypt, Asia Minor, Persia, and can be traced through India and China into Japan. The pyramids of Egypt are built in greater part of this nummulitic limestone. Consult as to text-book of Geology (1882), and the writings of Lyell, Prestwich and other geologists.

Nun of Kenmare. See Cusack, Mary Frances.

Nun of Kent. See Barton, Elizabeth.

Nunc Dimittis, nunki di-mi'tis, the first two words of the Latin version of the Song of Simeon (Luke ii. 29, 32), 'Lord now lettest thou thy servant depart in peace, according to thy word: For mine eyes have seen thy salvation. This shall be a sign unto thee; thou shalt call his name John.' It was not used in the Vespers or Compline services of the Eastern and Western Churches, and is found in the Book of Common Prayer as part of the evening service.

Nuncio, nún'shi-o, a papal commissioner who permanently represents the Pope abroad, and corresponds to the Secular ambassador at a foreign court. A papal commissioner who is sent on a temporary mission is styled a legate and, if a cardinal, is styled a legate, a later, that is, sent immediately from the side of the pontiff. Previously to the Council of Trent the papal nuncios acted as judges in the first instance of matters which lay within ecclesiastical jurisdiction; since that time they have been formed into a kind of court of appeal from the decisions of the respective bishops.

Nuneaton, nún'é-tôn, England, a town of Warwickshire, on the Anker, 17 miles northeast of the town of Warwick. It has two churches, a free grammar and several other schools. Cotton and woolen manufacturing is carried on to some extent. By the amalgamation of Chiver's Cotone, a suburb, in the last decade of the 19th century, the population increased from (1891) 11,580 to (1901) 24,995.

Núñez, Pedro de Villavicencio, Spanish painter: b. Seville, 1635; d. 1706. He was of noble birth and early became a pupil of Murillo (q.v.) and one of the best Spanish painters of the Seville School which Murillo preeminently represented. At Malta, where he resided as one of the Knights of the Order of St John of Jerusalem, he studied under Mattia Preti (q.v.), called 'Calabrese.' Returning to Seville he lived on the closest terms of intimacy with Murillo who expired in his arms. After the death of his great teacher he went to Madrid and there produced the picture, 'Beggars Boys Playing Dice,' which is altogether in the best style of Murillo. This work he presented to Charles II., king of Spain. 'Scenes from the Life of the Virgin' between 1696 and 1703 is in the Carmelite Convent at Seville, while his fine likeness of Archbishop Spinola at Seville gives a good idea of his power and style as a portrait painter.

Núñez, noo'nêshs, Rafael, Colombian statesman: b. Cartagena 28 Sept. 1825; d. there 18 Sept. 1894. After holding posts in the Colombian cabinet and consular service, he was elected governor of the state of Bolivar, and president of Colombia in 1879, 1883 and 1891. He was also a journalist, editing the 'Porvenir' in Colombia and 'El Continental' in New York, and published several volumes of prose and verse.

Núñez de Arce, noo'nêsh dê ahr'the, Don Gaspar, Spanish poet: b. Valladolid 6 Aug. 1834. He studied at the University of Toledo, became a deputy in 1865, a member of the Academy in 1875, and minister for colonial affairs in 1882. Subsequently he became a senator and president of the Society of Spanish
Nuñez de Balboa. See Balboa.

Núñez, Cabeza de Vaca, kā′bă-thā dā vā′kā, Alvar, Spanish explorer in America; b. Estremadura, Spain, 1475; d. Sanlúcar, Seville, Spain, 1553. He sailed from Spain in the ill-fated expedition of Pánfilo de Narváez for glory and plunder, but was captured by Indians and carried about by them in western Louisiana and eastern Texas. He was successful in trade, exchanging the shell and wampum of the coast for hides and other inland commodities. During his eight years' captivity he also gained considerable reputation as a sorcerer, and the reverence in which he was held was sufficiently held to an aid to his safety. He finally escaped, fell in with three other survivors of Narváez' undertaking, ascended the Rio Grande, crossed Chihuahua and Sonora to the Gulf of California, and finally (May 1536) reached Culiacan. The pilgrimage was one of 2,000 miles, and involved every sort of vicissitude. One result of the journey was to reveal to Spanish knowledge a great territory north of Mexico and to lead to the strange quest for the seven cities of Cibola. A joint account of their travels, given by the travelers at Santo Domingo was printed in Oviedo's 'Historia General y Natural de Indias.' De Vaca was sent as administrator of La Plata in 1540, and was the earliest explorer of Paraguay. In 1544 he was arrested on the charge of Irala, a follower; sent to Spain; exiled to Africa; and in eight years pardoned. He published an account of his adventures twice appeared in English version in 'Purchas his Pilgrimes' (1625); as well as in a translation by Smith (1857-71).

Nunivak, noo′niv-′vāk, Alaska, an island off the west coast, in the Bering Sea; separated from the mainland by the Etoil Strait, about 48 miles wide. It is about 55 miles long and 40 miles wide; area, about 1,200 square miles. It is fertile and well wooded on the west and south; the inhabitants are Eskimos. They have considerable trade in ivory, skins, and fish.

Nun's Priest's Tale, The, one of the stories in Chaucer's 'Canterbury Tales.' Its origin is a fable by Marie de France which was subsequently amplified in the 'Roman du Renart.' It relates the escape of Chanticleer from the jaws of the fox by inducing the latter to open its mouth for speech. Dryden modernizes the story in 'The Cock and the Fox.' In Asop's Fables a similar narrative occurs.

Nuphar, a genus of yellow water-lilies, order Nymphaeaceae. See WATER-LILY.

Nur-and-Spell, an old English game, peculiar to Kent, with a nut, played with a large nut, which is 'risen' from a trap, and hit with a bat made for the purpose. The ball, called the *nur,* is made of wood, a little bigger than a walnut. The bat, called a 'tripstick,' as it is also used to spring the trap or *spell,* consists of a piece of hard wood, 6 by 4 inches, and 1 inch thick (with a pommel), attached to a handle from 3 to 4 feet long, which the player grasps with both hands, giving the full swing of his body with the stroke. The game consists of the cumulative process of a given number of strokes, the player who has the greatest number of yards being the winner.

Nur-Ed-din El-Betruji, noor-ed′-dēn ′el-bē-troö′jē, Arabian astronomer: b. Morocco, 12th century. He was known also by the name of Alpetragius and was an authority upon astronomy in his day. He disproved Ptolemy's theory of the epicycle. See 'Alpetragii Arabis Planet. Theorize phys. Ratiobtionbus Probata' (1531).

Nureddin - Mahmud, noo′-rēd-′dēn mā′moōd, Malek al-Adel, sultan of Syria and Egypt, styled 'Al Shihād, * the Martyr*; b. Damascus 21 Feb. 1116; d. there 15 May 1174. He succeeded his father as emir of Aleppo in 1145 and repelled Jobelin de Courtenay's attack on Edessa. He held the armies of the second crusade 1147 at battle of Hattin; departure, invaded Antioch and speedily wrested from the Christians all northern Syria, making Damascus his capital. The alliance of the Greeks and Franks against him came to nothing, and Nureddin extended his power to Egypt. But there his lieutenant Shirkoh was succeeded by the great Saladin (q.v.), who gradually made himself independent of his master. Nureddin was on his way to Egypt to punish Saladin when he died. He was highly praised by Christians and Mohammedans as a just, charitable and noble character.

Nuremberg, nōr′ēm-bər′g or Nürnberg, Germany, a city of Bavaria, in Middle Franconia, the second city in the kingdom, and once the greatest and most wealthy of all the free imperial cities of Germany, on the Pegnitz, 93 miles northwest of Munich. It is surrounded by an ancient wall flanked with towers and pierced with 10 gates, the closest being by a dry ditch 100 feet wide and 50 feet deep; parts of these fortifications have been removed to make way for great extensions and improvements. The Pegnitz, traversing the town from east to west, divides it into two nearly equal parts—the north, or Sebalderseite, and the south, or Lorenzerseite, connected by numerous bridges. Notwithstanding modern improvements the city remains the quaintest and most interesting of Germany, owing to its many picturesque mediæval features. The Burg or royal palace, built (1024-1158) by Conrad II. and Frederick Barbarossa, commands a glorious view of the surrounding country, and is rich in paintings and wood-carvings. Among conspicuous public buildings the town-house, an Italian building of three stories, with a fine front, and a great hall, the walls of which are decorated with paintings in oil, many of them by Durer. The German National Museum was built in 1852 in a suppressed Carthusian monastery, a Gothic building of the 14th century, with extensive cloisters, and since much extended by the addition of the rebuilt Augustinian monastery adjoining, now ranks among the first in Germany, and is exceedingly rich in works illustrative of the arts and industries of the Middle Ages. The most remarkable edifice is Saint Se-
bald's Church, which gives its name to the north division of the town, a Gothic structure of great elegance externally and internally (its older parts dating from the 10th century), containing the shrine of Saint Sebal, a tomb in bronze of Saint Vitus, with his five sons, labored upon it for 13 years, and adorned it with nearly 100 figures, among which those of the apostles are conspicuous for size and beauty. Other buildings deserving of notice are the church of Saint Lorenz, containing a remarkable pyx by Adam Kraft, exquisitely sculptured in white stone, 64 feet in height. There are several public fountains, the chief being the schöne Brunnen, in the form of a graceful Gothic cross 63 feet high, adorned with figures. There are statues of Dürrer, Hans Sachs, Melanchthon, and others. There is also a monument of the war with France, erected in 1876. The town library contains 80,000 volumes, and educational institutions are numerous. Communication between the various parts of the town and with the suburbs is facilitated by electric tramways. Before the passage to the East Indies was made, Hope was for some time regarded as the great mart of the produce of the East coming from Italy and going to the North. The manufactures are still considerable, and again rapidly rising in importance. Among the most important at the present day are toys, lead-pencils, colors, chemicals, clocks and watches, brass and steel wares, playing cards, tobacco and cigars, railway-carriages, machinery, electrical apparatus, musical and scientific instruments, beer, etc. The toys made here and in the neighborhood go to all parts of the world. Printing, lithographic work, type-founding, and book-binding are also extensively carried on. There are schools for the training of mechanists; and there is a large industrial museum. The town is celebrated, in connection with its industry, for the invention of watches, wheel-locks (used in discharging old muskets), gauge-plates for drawing brass-wire, clarinets, and air-guns.

Nuremberg, though an ancient city, does not carry its origin so far back as Roman times. It had acquired considerable importance by the 10th or 11th centuries, and was frequently visited by the emperors of Germany. It was greatly enlarged by Conrad III, and received several embassments and important privileges from Frederick Barbarossa. In 1219 it was raised to the rank of a free city of the empire. It early took part in the Reformation. Subsequently it suffered during the great European wars, and being repeatedly laid under contribution by both parties, became so exhausted that the sources of its prosperity were almost dried up, and the population rapidly decreased by extensive emigration. Having finally incurred a load of debt, which made it an acquisition of little value to any state, it was formally taken possession of in 1806 by Bavaria, which undertook the settlement of its debts, and by judicious arrangements, has considerably increased its trade. Many distinguished individuals have been born here, and scientific institutions, the painters Albert Dürrer (whose house may still be seen), and the sculptors Peter Vischer and Adam Kraft. Pop. (1900) 261,022.

Nurhag, ancient round towers on the island of Sardinia. They are about 50 feet high and about 90 feet in diameter, measured at the base and outside of the platform on which the largest of them are founded. The materials are limestone, trachyte porphyry, granite, or volcanic rocks, obtained from neighboring quarries. Each block forms a cube about 3 feet each way, and the surface is an irregular line, such as the blows of the hammer in shaping it may be supposed to have made; the walls are without cement, within as well as without. A wall of 10 feet, built like the main structure, is surrounded by a parapet 3 feet high. The roof of each apartment is arched; the entrance terminates in a flat architrave, and is sometimes so high that a man can enter without stooping, and sometimes so small that he can only creep into it on his stomach, though it gets wider as he proceeds. Hence the low chambers are mere cells formed in the thickness of the wall, while the high chambers are supported by pillars. In the cells broken human bones and also pieces of ordinary stones, have been found. It is many centuries since these remarkable monuments attracted attention. The origin and aim of these structures is still, however, not free from doubt. They were, however, regarded as tombs, constructed so as to be available, in emergencies, for purposes of defense.

Nurse, Trained, is one who has followed a course of training in a school for nurses connected with large city hospitals, for two years or more, and who has received a diploma after a severe examination, and has been graduated. It was not until the early part of the 17th century that a so-called school for nurses was organized, by the Abbess Hildegard, among her friends and associates for service in the hospitals. From this small beginning grew the system of a special training for nursing, which, however, remained in its infancy until the middle of the 19th century. In 1840 there was an organization of nurses in London which cared for the sick poor, but it remained for Florence Nightingale to give the impetus to a movement toward securing a more efficient training for nurses. This movement Miss Nightingale started in 1853. In 1870 Miss Louise Lee Schuyler, who was the founder of the New York State Charities Aid Association, graduated from the Bellevue Training School for Female Nurses in New York city, and in 1872 the first class of trained nurses in this country was graduated from Bellevue Hospital. Now nearly every large hospital in the country has its training school.

The term of study, in most of the schools, is two years. In some of the small towns the course may be one year or 18 months, and in some schools three years is required. Application is made to the superintendent of the training school, and after a physical examination, the applicant is received on a two months' probation term. During this period the applicants receive board and lodging, free of charge, and are not allowed to receive wages. At the end of the probation period, if they are found to be satisfactory and to meet the requirements of the hospital, they have their name placed on the regular list of nurses, and are all subjects of the rules and regulations of the hospital and remain in the school until the term is ended. This agreement can be terminated for cause by either party. Pupils reside in the "home" connected with the hospital, wear a uni-
NURSE

form, while on duty, and receive board, lodging, laundry work and a small compensation, generally $10 or $12 a month. Lectures are given by the members of the staff of house physicians, the visiting physicians and surgeons, and head nurses. The lectures by the physicians cover anatomy, physiology, materia medica and all departments of medicine. The head nurses teach bandaging and the dressing of wounds. Obstetrics and the care of the insane are also taught. Massage is taught in a degree; but if a nurse wishes to take the full course, it requires a six month term in a regular massage school. A diet-kitchen, where proper food for the sick is prepared, is generally under the charge of one of the head nurses. The first three months are occupied by the pupils in a general observation of the work of the hospital ward's head nurse and the assistant nurse. The care of the beds of the patients is one of the first duties learned. Taking the pulse, temperature and respiration of a patient and making a record of it on a chart provided are the next steps. In the surgical wards the dressing of slight wounds is a part of the duties, and probably the nurse must assist in the care of the operating room and making ready the dressing to be used after operations have been performed. The pupil is then examined and, if the examination is satisfactory, advancement to assistant nurse for six months more comes another examination, and at the end of a year, still another. The pupil then is a full fledged nurse and is placed in charge of a ward, and full responsibility for the condition of the patients is placed upon her. She must receive the new patients sent from the receiving ward, note their condition, and if she thinks it warranted, send for the house physician at once. Otherwise the patients wait until the regular call. She must go with the house physician, when he makes his visits to the bedside of each patient, carefully note his diagnosis of each case; make a memorandum of the medicines prescribed and see that the medicine is properly administered. She must note the least sign of change in the patient's condition, and, if for the worse, call the physician at once, or in extreme emergency, be ready to know what to do and do it at once. She must be extremely self-reliant and be ready to know how to act on the instant, as the life of the patient very often depends on quick action. After graduation she goes into private practice and must be prepared any hour, day or night, to respond to a call. The salary received varies from $25 to $50 a week, according to the severity of the case.

In December 1887, D. O. Mills of New York, after a visit to the city hospitals, decided that the number of infirm and sick men who were in the hospitals made it a necessity to educate male nurses, and he organized the Mills Training School for Male Nurses of Bellevue Hospital, put up a building on the Bellevue grounds and gave it to the City of New York to be used as a "Home" for the male training school. The first class of male nurses was graduated from Bellevue in 1890. The male training school idea was taken up by the physician in charge of the City Hospital, on Blackwell's Island, and the first class graduated from there in 1890, shortly after the Bellevue class. The training is the same as in the female schools, the only difference being that greater attention is bestowed upon diseases of men. When the male nurse begins private practice his salary ranges from $5 a day of 12 hours to $10; and, in contagious or infectious diseases, to even more.

State registration of trained nurses is now a law in New York, Virginia, North Carolina and New Jersey. The Legislatures of these States passed bills in 1903 requiring trained nurses to register their names and addresses with the county clerk of their respective counties. In the State of New York registered nurses are entitled to use the abbreviation "R. N." after their names, and it is made a misdemeanor punishable by fine for any person not a trained nurse to use the abbreviation. Nothing, however, contained in the acts is considered as conferring any authority to practise medicine or to undertake the treatment and cure of diseases.

Examinations are held under a commission of five members of the New York State Nurses' Association, appointed by the Regents of the University of the State of New York. They grant certificates which may be revoked for insufficient work. A written notice to the certificate holder, and no person is allowed to practise as a registered nurse after such certificate has been revoked. The law in the other States is virtually the same as in New York. The best known training schools are those conducted with the Bellevue, Presbyterian, Mount Sinai and City Hospital in New York city; the Massachusetts General Hospital, in Boston; Philadelphia and Pennsylvania Hospitals in Philadelphia; Johns Hopkins Hospital in Baltimore; and the Illinois Training School for Nurses, Chicago. The first class of young negro women ever graduated as trained nurses was sent from the Lincoln Hospital and Home, New York city, in December 1903.

The buildings of the New York City Training School for Nurses, of the City Hospital, Blackwell's Island, were dedicated 3 Dec. 1903. There are three buildings; the first named "Jones Hall," in honor of Mrs. Cadwallader Jones, was chairman of the advisory board of the school since its organization in 1875, and its reorganization on more distinctively educational lines in 1888 was directly due to her efforts. The building is a four-story structure 35 by 107. The first story contains a class room, drawing room, and two rooms for the isolation of contagious cases of sickness among the nurses and their cure. Each of the other three stories contains rooms for the accommodation of 18 nurses. The second building is named "Rice Hall," in honor of Mrs. William B. Rice, who is a member of the advisory board of the City Training School and of the Board of Managers of the Bellevue Training School. This building contains, on the first floor, the offices of the school, the chemical and bacteriological laboratories and a room for the classes in dietetics. The other three stories contain rooms for 16 nurses. The central building was christened "Schuyler Hall," in honor of Miss Louise Lee Schuyler, the founder of the Bellevue Training School for Nurses, and contains the kitchen, dining room and rooms for 20 nurses.

FRED H. ADAMS,
Staff of the New York City News Association.
NURSE-FROG — NURSERY FOR CHILDREN

Nurse-frog, any of various frogs and tree-frogs which have or make special arrangements for the care of the eggs or young, or of both. The most widely known example is probably the European obstetrical frog (Malea), the male of which takes charge of the eggs as soon as laid by the female, and carries them with him until they hatch. Many other species, especially among those living in the American tropics, take precautions as to their offspring. Thus one, the Brazilian ferreiro (Hyla faber) makes beneath the water in the ponds where it goes to spawn, small walled-in basins of mud, within which the spawn is deposited and the tadpoles are reared in safety. Other man-eating enemies that would attack them were they running at large. Several kinds of frogs have their few eggs placed upon the back of the female, in pits or pouches in the skin, and keep them there until they hatch; and in one well-known genus (Phyllobates) the tadpoles cling to the mother's back, and are carried about and cared for until able to transform and care for themselves. From other species (Hedronotus, Ameisphila and Reptiles) (1902). See Frog; Marsupial Frog.

Nurse-shark, a name given by American fishermen to several different kinds of shark, as the Sleeper (Somniosus microcephalus), and especially a voracious tropical shark (Ginglymostoma cirratum) abundant about the coral reefs of the West Indies and the coast of Mexico, where it is called gata. The Port Jackson shark (Cestracion) is sometimes called nurse-shark.

Nursery, in agriculture, a place where shrubs and trees are raised for transplanting or for sale. In America the term excludes florists' establishments and other places where herbaceous plants are grown, being restricted to places where woody plants are propagated, the division resulting from the earlier development here of the orchard and other fruit interests, and from the different kinds of equipment required by the two branches. There is apparent a further division of the nursery business proper into establishments for growing (a) ornamental, and (b) useful plants. The commercial history of this is confined to the 19th century, paralleling and fostering the development of the fruit industry, and extending westward and southward from western New York which has long been the centre of the business, with headquarters at Rochester. According to the census statistics of 1900, the industry represents a capital investment of $32,500,000 in 4,500 nurseries, covering an acreage of 172,800 acres. To operate this area there were required 45,600 men, 2,279 women, 1,400 horses, mules, etc. Of the 3,400,000 plants grown 518,000,000 were fruit trees, of which 240,500,000 were of apple alone. Grape vines and small fruits aggregated 685,000,000. It is estimated that in most species less than half of the plants grown in nurseries reach maturity; for instance, the census of apple trees in 1900 was 201,794,704, of which a large proportion are young trees not in bearing.

The great majority of trees raised in the fruit nurseries of America are for orchard planting and are trained erect; whereas in European nurseries they are trained in many forms, such as espaliers, dwarfs, standards, bushy forms, etc. Ornamental trees are largely grown from cuttings, layers, etc., fruit trees from scions, either by grafting or budding (see graftage). The former method is preferred in the western States, first, because more than one tree may be obtained from one root, used as stock, and second, because the long scion placed upon the foster stock will take root if placed far enough below the surface, a process which eliminates much of the uncertainty felt with respect to the hardness of the scion stock. In the East fruit trees are generally budded, since budding supplies whole roots in full activity at the time of performing the operation.

To supply the nurseries with stocks for the various fruit trees, specialists have arisen, particularly during the closing decade of the 19th century, and the nurseryman who raises his own stocks, except of peaches, is the exception. France supplies much of the fruit industries with its stocks, and many stocks of other kinds; the prairie States furnish the great bulk of the apple stocks. The fruit tree nurseryman therefore confines his efforts largely to the propagation of the products of his own State and of the nearest States. He is thus enabled to bend his energies to the production of large trees in restricted time, a process which is believed to exhaust the soil to such an extent that two crops of nursery trees are rarely grown on the same land oftener than once in five years, during which time the land is devoted to clover or other crops which tend to improve the texture of the soil and the content of humus. Hence nurseries are likely to change their situation more frequently and nurserymen are often compelled to rent land. Ornamental and forest trees are believed to be less exhaustive and are thus more stable in their establishment. Commercial nurseries seem to be slower in bringing "treeed" land into cultivation, again than are stable manure and green crops.

Prior to the establishment of the agricultural experiment stations, nurseries exercised a profound influence on the fruit industries throughout the country. Though they still play an important role they have a narrower scope, much of the variety-testing at present being conducted by the experiment stations. The leading nurseries are still looked upon as authoritative information, and they still seek to maintain and foster their business by honest and conservative methods and the sale of correctly named and healthy stock only.

Since the introduction of new fruits from abroad, or even from other localities in the United States, has been found to bring into action new insect and fungus enemies, State legislation has established inspectors of nursery stock. The most progressive nurserymen, accordingly, have adopted methods of control such as fumigation-houses. Badly infested stock is generally destroyed as the best means of preventing the spread of the pests to new, infested localities.

For the unification of interests and the improvement of methods the American Association of Nurserymen was formed, and a monthly magazine, "The American Nurseryman," is published at Rochester. Consult Bailey, "The Nursery-Book" (1869).

Nursery for Children, Hygiene of the. There is no particular of the home requiring more particular and intelligent care with respect to the conditions of health than that which is assigned to the children of a household. The
NURSERY LORE AND NURSERY RHYMES

Nuisances and Sources of Contamination.—There should be no imperfect plumbing in the nursery—in fact, all plumbing would better be in an adjacent place. Excessive use of sunlight can be averted by blinds, awnings, or dark-colored (preferably green) window-shades. The room should be above the first floor, in a well-built house, on dry ground, and should have good plumbing. The furniture of a nursery should be comfortable, but simple and easily cleaned. The floor is best covered with a carpet or rug which can be readily removed for cleansing, or when a contagious illness prevails. The walls should be either painted (preferably a light gray), varnished, or covered with a varnished paper which can be washed. Dirt must be kept out of the nursery. There should be no heavy furniture. All cupboards and closets should be kept clean and well aired. There should be no "tuck-away" places. Dusting, as ordinarily carried out—that is, the transferring of dust from one place to another—should be unknown. Dust should be removed by hand, with a slightly moistened piece of cheese-cloth, and with the cloth fastened in a metal grasping-fitted to the end of a pole made for that purpose. The floor should be swept after moistened tea leaves or sawdust have been sprinkled over it. The corners of the room should be rounded so that no dust can lodge in them.

Ventilation and Warming.—While a nursery should be always comfortably warm, it should be well aired or ventilated, and fresh air must come from out of doors. Few houses are equipped with such a good system of heating and ventilation that the opening of a window to admit air is not necessary. But cold air should not blow upon the child. In fact, in cold weather children should not be allowed to stay near a window, even if closed, as it is the cold air that comes through crevices that "cuts like a knife." As the current of cool air is greatest along the floor of a room, in cold weather children should not sit upon the floor. The room may be frequently ventilated by opening a window for a short time at the top, the children meanwhile being clad. Or the air may be admitted through an elbow tube, or through the space between the upper and lower sash, the lower sash being raised several inches and having under it, along its entire length, a board (window-board). A stout piece of cloth, decorated if desired, may be fastened across the lower part of the window, with the window raised nearly to the upper edge of the cloth, the air comes tempered through the cloth, and also between the upper and lower sash. The upper sash may be lowered a few inches, and a frame covered with one or more layers of cloth fitted in between the sash and the window-frame. As lamp and gas light readily pollute the air of a room, protected candles are better.

The temperature of a nursery should be from 65° to 70° F. Once the windows are open, the Franklin and barrack stoves, or hot-water pipes are frequently better for heating purposes than close stoves or furnaces, which unduly dry the air. If close stoves are used they should have no dampers. All heating and lighting apparatus should be well protected, so that children cannot burn themselves or set fire to anything.

Nursery Lore and Nursery Rhymes are songs and jingles for children handed down from past generations. These folk-lore jingles are mechanically repeated in the play-room and on the play-ground, the children having little if any knowledge of the significance or origin of the rhymes. Being in verse form they are easily preserved, either as mere traditional rhymes, or as formulas to be used in games; and, as unconscious survivals of a remote antiquity, they not infrequently preserve for the scientific inquirer fragments of ancient incantations for healing diseases or revealing the future, and invocations combined with ceremonial observances, while the intimate nature of the religious conceptions involved points back unmistakably to a medieval origin. Children with all their inventiveness and imagination are slaves of the letter, and most of the rhymes are handed down from generation to generation along with the games themselves. In their characteristic directness, point, and quaintness of phrase, they defy imitation, and in their faculty of arresting the imagination from age to age they reveal the instinct of perpetuity. Many of them are beyond doubt survivals among children of May games.
ring-songs and dances, rounds, and kissing games which in old England were played by grown-up people, and these of the higher grades of society. Many of these are still current in America which are now forgotten in the mother-country, although they not infrequently have equivalents on the continent of Europe. Under the same general head are included nursery rhymes proper, and counting-out rhymes, cumulative rhymes, courting and love games, playing at work, flower oracles, and riddle and guessing games; while on the other hand popular mottoes, old saws and maxims relating to husbandry, the weather, or the like, and all the wealth of local rhymes and sayings belong to the popular rhymes of folk-lore generally. The verses usually consist either of a rhyming couplet, or of four lines in which the second and fourth rhyme; they are often accompanied by a refrain, which may be a single added line, or may be made up of two lines inserted into the stanza; and in place of exact consonance, any assonance, or similarity of sound, will answer for the rhyme.

Upon the subject of nursery rhymes upward of 70 volumes have been published and none of these are more authentic than "The Games and Songs of American Children" by W. W. Newell, published in 1884. Other works are: Chambers, 'Popular Rhymes of Scotland' (1842); Halliwell, 'Nursery Rhymes of England' (1860). See also FOLK-LORE; PROVERBS; Riddles.

Nus, Eugène, ε-ζάν nûs, French dramatist, b. Châlons-sur-Saône, France, 1816; d. 1894. He was an ardent Socialist, and his first success as a dramatist was with his 'Jacques le Coraïse' (1844). Among his works are: 'L'Enseignement mutuel' (1846); 'Choses de l'autre Monde' (1890); 'Vivisection du Catholisme' (1894); etc.

Nuaku, noos'koo, in Assyrian mythology, a solar deity who afterward became a fire god. He was regarded as a messenger of the gods.

Nussbaum, noos'bowm, Johann Nepomuk, German surgeon; b. Munich, Bavaria, 2 Sept. 1829; d. there 31 Oct. 1890. He studied in Munich, Würzburg, Berlin, and Paris, and in 1856 became a professor at the University of Munich. He published: 'Die Therapie der Ankylosen' (1862); 'Die Verletzungen des Unterleibs' (1880); 'Über Chloformwirkung' (1885); etc.

Nút, noot, in Egyptian mythology, the goddess of the sky, wife of kid, the god of earth.

Nut, a piece of metal tapped, and adapted to be screwed on the end of a butt. It is used for many purposes, but especially on the end of a screw-bolt, in order to keep it firmly in its place.

Nutt Brown Maid, The, an old English ballad, the earliest extant form of which is found in Arnold's 'Chronicle' (1502). It is based on the legendary story of Henry Clifford, known as "The Shepherd Lord." Consult Percy, 'Reliques,' series 2, book 1, 6.

Nut-gall, a hard, nut-like gall (q.v.), especially those from the Asiatic oaks, used in ink-making and for other purposes. The Chinese and Japanese nut-galls of commerce, however, are from species of Rhum, and are large and very irregular in form. They contain from 30 to 60 per cent of tannin, and are the source of gallic acid (C₇H₄O₄H₂O) which appears in white silky needles, soluble in alcohol, less so in ether, and sparingly soluble in cold water; it is precipitated blue-black by ferric salts, the color disappearing on boiling, and is not affected by gelatine, except in the presence of gum. Consult Maisch, 'Materia Medica' (2d ed. 1885).

Nutgrass, or Chufa, a sedge of the genus Cyperus, especially C. esculentus, of the Eastern and Southern States, whose root-stocks bear small tubers, like nuts, which are edible to man, and of good flavor when roasted; and which are highly nutritious to hogs who eagerly search for them. Consequently these sedges are planted in some parts of the country as a food-crop for swine. An oil may be expressed from these tubers, or "ground-ammonds," which is an excellent substitute for olive-oil for table use.

Nut-lock, a means for fastening a bolt-nut in place preventing its becoming loose by the jarring or tremulous motion of the machinery. Such are used upon fish-plates of railways, upon harvesters, etc.

Nut-weevil, a snout-beetle of the genus Balaninus, which deposits an egg in the kernel of a nut, when it is young, where the egg hatches and the grub feeds until the kernel is destroyed, when it bores its way out through the shell. Several species infest the various commercial nuts.

Nutation, a term used in astronomy. The motion of the earth on its axis is one of precessional rotation. On a celestial globe the axis of the earth describes a curve round the pole of the ecliptic, because of its precession. Superimposed on this motion of the axis is its nutation, which, if existing alone, would cause the axis to describe an ellipse every 19 years on the celestial globe, its major axis being directed to the pole of the ecliptic. The effect of nutation is to cause a wavy line to be described by the axis round the pole of the ecliptic. Precession causes the nodes of the earth's equator to describe a revolution in 25,866 years; nutation causes the nodes to move 6.8° alternately in advance and behind the mean position due to precession. Bradley discovered and explained nutation not long after his discovery of the aberration of the fixed stars.

Nutcracker, the English name of a species of crow (Musifraga carvocatae) found ranging over a wide area in the pine forests of northern and sub-Alpine Europe and Asia. It is dull brown, thickly speckled with white spots, and is about the size of a jay. The nutcracker is gregarious, wandering in bands of 50 or 100 in the autumn, but scattering to remote regions and becoming silent during the breeding season. Its chief food is nuts and seeds of conifers. It is said to hold nuts and cones with its foot and to extract the kernels by repeated blows of the bill.

A closely related American bird is Clark's crow (Picocorvus columbianus), discovered by the Lewis and Clark expedition in 1804-6. It is about one foot long, of a generally gray color, the wings and tail black with large white areas. It inhabits the coniferous belt of the Rocky Mountain slopes and congregates in great flocks,
NUTHATCHES—NUTRITION OF FARM ANIMALS

which rove in search of food. The well-concealed nest is built in the tops of pine trees in the higher mountain ranges. Consult Coope, 'Birds of the Northwest' (1874).

Nuthatches, small passerine birds forming the family Sittidae, related to the titmice, from which, and from the creepers, they are readily distinguished by the long, straight, slender bill. The typical genus (Sitta), with about 15 species, is found in Europe and Asia, but some related genera are found in the Southern hemisphere. In the United States we have four species and several sub-species. The common resident eastern species (S. carolinensis) is nearly six inches long and has the under parts white. The red-bellied nuthatch (S. canadensis) is an inch shorter, with the under parts rusty brown and the glossy black cap cut by a pure white stripe on each side. This is a migratory species, which breeds in the northern States and Canada and on mountain tops, but in winter extends its range to the Gulf coast. Two still smaller species, the brown-headed nuthatch (S. pusilla) and the pigmy nuthatch (S. pygmaea), are rare in the mountains, and the other two species, and S. pygmaea may be distinguished by the black and white markings on the middle tail-feathers, which are plain in S. pusilla. The habits of all are similar; they spend their time in traveling restlessly up and down the trunks and limbs of trees in the most nimble manner, hanging in any attitude supported by their strong, large feet alone and without the assistance of the tail. Consequently they display greater freedom of movement than either the woodpeckers or the creepers. Their food consists chiefly of insects and their eggs. In the autumn and winter they have the habit of wedging acorns and nuts firmly in crevices, and hacking them with the bill till they break open: this is done partly for the kernels and partly for the grubs which they frequently contain. From this habit the common name is derived. Their only nest is a hole in a tree, or they nest in holes in trees, often in crevices beneath bark, and lay four to eight speckled eggs.

Nutmeg, the hard kernel of the fruit of various species of Myristica, especially M. fragrans or moschata, of the order Myristicaceae. The common nutmeg-tree grows about 25 feet high, bears oblong, entire leaves, axillary racemes of small flowers, followed by golden yellow pear-shaped fruits which split in halves, exposing the kernel surrounded by a false aril which forms the mace (q.v.) of commerce. The fleshy halves of the fruit are used as preserves in countries where the trees are cultivated. Various species are cultivated in the tropics, particularly the East Indies, West Indies, Brazil, and Spice Islands. They are among the most important spices as which they are chiefly used. A fatty oil called mace is expressed from the seed, and a nearly colorless essential oil is obtained by distillation. The tree thrives in the West Indies up to elevations of 2,000 feet, but is less productive there than at lower altitudes. It does best in well-drained, rich loam, in warm, protected valleys.

Nutmeg-bird, a name among bird-dealers for an East Indian mina (Munia undulata), also known as cowry-bird; it is brown, with white streaks above and spots below, a yellow rump, and a white middle to the under parts. An eastern fruit pigeon (genus Myristicetos) is also so called, because it feeds upon the nutmeg fruit.

Nutmeg Melon. See Melons.

Nutmeg State, a popular name for the State of Connecticut, derived from the alleged ingenuity of Yankee inventors who were facetiously charged with manufacturing wooden nutmegs to be sold as genuine.

Nutria. See Coypu.

Nutrition of Farm Animals. The. The common domestic animals are fed for a variety of purposes. With cattle, sheep, and pigs, it is the object to induce gains in weight, that is, to fatten them, or in the case of milch cows, to produce gains in the form of body secretion,—milk, rather than fat on the body. In a similar way, sheep are fed for the production of wool; goats for milk or their fleece, and poultry, for the market and the production of eggs. Cattle are sometimes, and horses are almost universally, fattened. Horses and cattle, with young require food for their development and after birth the young animal needs it for growth and the development of the body as well as for maintenance.

A great deal of information regarding food requirements has accumulated from the experience of countless generations, and for many years the problem has been studied experimentally at agricultural colleges, experiment stations, and similar institutions, in this and other countries. It is fair to say, at the present time, that the feeding of farm animals rests upon quite well defined general principles, derived from the studies of the chemist and the animal physiologist, concerning the composition and functions of food and the way it is utilized after it is eaten. Such studies show that the materials composing the body are constantly breaking down and being consumed, and that to keep the animal in a healthy and vigorous condition requires a constant supply of new material; if this is lacking or is insufficient, hunger, and finally death, result. To supply the needed materials is one of the chief functions of food, but in addition to this it must furnish a suitable temperature and also furnishes the force or energy which enables the animal to do work, and to perform the necessary functions of the body, such as keeping up the beating of the heart, the respiratory movements, and so on. Since it furnishes heat and energy, the food may be said to serve as fuel. If, in addition to maintaining the system, growth is made, as in case of a young animal, or milk is secreted, more food is needed than for maintenance. If the supply is in excess of all demands, some is stored as a reserve material, principally in the form of fat. To supply food in the right proportions to meet the various requirements, without waste, constitutes scientific feeding. By carefully studying the composition of feeding stuffs, the proportion in which they are digested and the requirements of different animals when at rest, at work, producing wool, giving milk, etc., the principles of feeding have been deduced. In applying these in practice, the cost and special adaptations of different feeding stuffs must also be taken into account.

NUTRITION OF FARM ANIMALS

It will be seen that the cereal grains resemble one another quite closely in composition, being characterized by a fairly low water content and a considerable amount of protein and nitrogen feeding stuffs. Some of the crude fibre content is rather high, and the nutritive ingredients are principally protein and carbohydrates. The large proportion of crude fibre is due to the fact that these products represent the outer layers of the grain which are more hard and firm in structure than the interior portion which consists quite largely of starch. Beans, peas, and leguminous seeds resemble the cereal grains in having a low water content, though in general they furnish a higher proportion of the food value. Such foods are known to be useful and valuable, but with the possible exception of cowpeas, they are not very commonly fed in the United States, although much used in Europe.

Cereal Feed. Most of the various cakes, gluten meals, and similar feeding stuffs are, generally speaking, commercial by-products. Thus, cotton-seed cake is the material left after the oil has been expressed from the cotton-seed. In the same way linseed meal is obtained from flaxseed in the manufacture of linseed oil. When this is ground it becomes linseed meal. In the manufacture of beer the malted grain remaining is known as brewers’ grains, and is best fed after drying. When starch is manufactured from corn, the nitrogenous portion of the grain is rejected and constitutes gluten feed and gluten meal. There are a number of mixed feeds on the market which are made up of shrunken grains, branny material, and other residues obtained in the manufacture of cereal breakfast foods, etc. These vary in feeding value, some of them containing hay very favorably with more or less vegetable stuff. Some are more prized than others for a particular purpose. Thus, oats are a favorite food for horses, especially in the Eastern United States, and other regions where they are a staple crop, but in the South an middle West, corn is the food important feed. For fattening cattle, sheep and hogs, corn is undoubtedly the most important grain in the United States.

Forage Crops.—The various forage crops—grass, clover, meadow hay, corn, etc., all have a high water content when fresh, that is, they are more or less succulent and juicy. They contain, however, considerable nutritive material, chiefly protein and carbohydrates, and are valuable feeding stuffs. The leguminous forage crops—alfalfa, clover, cowpeas, soy beans, vetch, etc.—are richer in protein than the grasses. When forage crops are dried and cured the resulting hay is richer in proportion to its bulk than the green material; in other words, it has been concentrated by the evaporation of the greater part of the water present. However, this is not the only change which has taken place. When hay is properly cured, it undergoes a certain sort of fermentation and oxidation materially affecting its composition, improving the hay by diminishing the quantity of crude fibre, and by increasing the relative amount of other nutrients, especially nitrogen-free extract. Hay which has undergone proper curing has a better flavor and agrees better with animals and is apparently more digestible than hay which has dried quickly in the sun without fermentation.

The feeding value of different forage crops, fresh and cured, depends in considerable degree upon the stage of growth, the nutritive value of the crop, generally speaking, increasing until the growth is complete and diminishing somewhat as the crop ripens. Such feeds as Straw, the fully ripened stalk of cereal grains contains some nutritive material, but is less nutritious than the same portion of the plant cut before ripening. In the perfectly ripe condition the nutritive value, elaborated in different portions of the ordinary forage plants, has been largely conveyed to the seed and used for its development or stored as reserve material.

Silage. Green forage crops are frequently preserved by the process of ensiling or fermentation. The material undergoes a peculiar oxidation which correspondingly changes it in composition and food value. Some of the carbohydrates are changed into alcohol, acetic and other acids, and crude fibre is undoubtedly softened somewhat and possibly the silage is thus rendered more digestible. Bodies having peculiar flavor and odor are also formed. The green crops, hay, straw and other cured crops and silage are frequently called "coarse fodder" or "roughage.

This term is due to the fact that they contain a comparatively small amount of nutritive material and a high proportion of crude fibre as compared with their total bulk. Although inferior to concentrated feeds in composition, they are an essential part of the ration of farm animals, serving to give the required bulk to the food and being useful in other ways. It is believed that the cattle, especially when the stomach is comparatively bulky and the mass is more or less loose in structure, it is not readily acted on by the digestive juices.

The outcome of many experiments made with farm animals is in accord with the observation of careful feeders, namely: that the various common coarse fodders may be fed very largely as circumstances demand. Although timothy hay is regarded, in some regions, and corn fodder in others, as the best corn feed, yet, experience has shown that both these feeds, and also hays from wheat, barley and other cereal grains, and from clover and alfalfa, are all of great value. Fresh herbage was, of course, the original food of domestic animals, and in early times, natural pasturage was almost entirely depended upon to support them during a considerable part of the year. The importance of pasturage is still conceded, but the fact is also recognized that it, owing to drought or other cause, the supply is insufficient, other food will be needed. When green feed is cut and fed fresh to farm animals, more or less confined, the practice is called "soiling," and is becoming quite prevalent, especially in older countries.
where land is expensive. It is coming into use in some localities of the Eastern United States to such an extent as to entitle it to recognition as one of the systems of feeding. Partial soil- ing is much more common, being relied upon to carry animals through the period when pastures are short. Under the soiling system, a larger number of animals can be kept upon a given acreage, and by allowing open air exercise in a large yard or pasture, the practice has been demonstrated as entirely feasible for dairying animals. On an average, carrots, Swedish turnips or rutabagas, and other roots and tubers, green vegetables, and fruits contain a high percentage of water and small amounts of the different classes of nutrients. The percentage of crude fibre is smaller than in the green forage crops; but since the proportion of nutritive material is small in comparison with the total bulk, they are ordinarily referred to as coarse fodder. The establishment of beet-sugar factories in this country has led to an increase in production of immense quantities of sugar-beet pulp as a waste material, sometimes called “diffusion residue,” or “beet chips,” which consist of the residue of the beet after the extraction of the sugar under pressure in the diffusion batteries. Sugar-beet molasses is another product of the beet-sugar manufacture, which accumulates in large quantities, and both this and cane molasses are coming to be regarded as an important feed for cattle and hogs. Preparing Feed.—It is often claimed that cooking feed increases its palatability and digestibility. The general opinion drawn from experiments with farm animals is that this belief is not warranted and that the cost of cooking is not made up for by the increased value of the ration. Soaking feed, especially hard grain, renders it more easily masticated, and possibly increases its digestibility, but the general conclusion is that the importance of soaking feed for most farm animals is overestimated, although soaking wheat for pigs is quite generally recommended. Sprinkling or wetting dry hay lays the dust and is a practice often resorted to, particularly when a large amount of grain is fed, especially clover, is believed to cause heaves. Opinions differ as regards the advantages of grinding grain, but from the results obtained in a large number of tests with farm animals, it does not appear that the amount of grain over unground is sufficient to pay for the cost of grinding, provided the animals have good teeth and sufficient time to chew their food thoroughly. Chaffed or chopped coarse fodder occupies less space for storage than uncut hay or straw and can be readily handled. Shredding corn fodder is an economical practice, and more of the stalks and harder portions will be eaten than when fed whole, but for most farm animals in general, the practice of cutting or chopping coarse fodder is much less followed in the United States than in Europe. Precaution should always be taken to avoid feeding stuffs which are in a fermenting state, as they become harmful. Dirt, small stones, etc., should be removed from grain by proper screening and all feeding stuffs should be clean. Moldy feeds and those which are more or less decomposed are unwholesome, and may prove a cause of various diseases. Plants which are infested with ergot are also harmful. There are a number of plants which are poisonous to stock, such as rattlesnake (Crotalaria sagittalis), larkspur (Delphinium sps.), death camas (Zygadenus venenosus), water hemlock (Cicuta sps.), etc., and care should be taken to prevent animals from securing them. An explanation of the poisoning of stock by young sorghum and other green plants ordinarily wholesome, is offered by the discovery of a peculiar glucosid, which with the aid of a special ferment, also present in the plants, liberates prussic acid. This is doubtless always present in at least minute traces, but apparently becomes dangerous when the plant is arrested in dry weather at certain stages of its growth. Sunlight such as prevails in the arid and semi-arid regions of the United States sometimes causes the development of the poison in excess.

Digestibility of Feeds.—The real value of any feeding stuff is determined not alone by its composition, but also by its digestibility; that is, by the amount of material which it gives up to the body during its passage through the digestive tract. It is evident that if two feeding stuffs have practically the same composition, but one gives up more material to the body than the other—that is, is more thoroughly digested—it must actually be considered more valuable than the other. The bulk of the substance of almost all feeding stuffs is insoluble when eaten. Only material in solution can pass through the walls of the stomach and intestines into the circulation and be utilized by the body; therefore, digestibility consists chiefly in rendering insoluble materials soluble. This is effected by the aid of digestive ferments and also to a less extent by bacteria. The usual method of ascertaining the digestibility of a given material is to feed it for a longer or shorter time, the amount and composition being determined. From the total nutrients consumed, the amounts excreted undigested in the feces are deducted, showing the amount of each retained in the body. It is the usual custom to express the amounts digested in percentages, the results thus obtained being termed coefficients of digestibility. As regards the results of digestion experiments with farm animals, it is said that the percentage of protein digested is fairly high, being greater in grains and seeds than in hay or grasses. Generally speaking, the value obtained for the digestibility of fat is rather low, but there are results recorded with the analytical methods commonly followed which render the results obtained with fat not altogether satisfactory. Nitrogen-free extract is quite thoroughly digested by farm animals, but crude fibre is not very thoroughly assimilated. Farm animals differ considerably as regards the thoroughness with which they digest their foods. It seems fair to say that in general, ruminants digest a larger percentage of fats, carbohydrates, including crude fibre, than horses, the difference being most marked in the case of the crude fibre. Pigs ordinarily digest their food quite thoroughly. These results are in accord with what might be expected from differences in the digestive organs of the different classes of animals.

Food Requirements.—Attempts have been made to ascertain the food requirements of various kinds of farm animals under different conditions, and large numbers of feeding experiments have been made under conditions with this end in view. From the results feeding standards have been deduced which show
the amounts of digestible protein, fat, and carbohydrates, supposed to be best adapted to different animals when kept for different purposes.

The feeding standards prepared by Wolff, a German investigator in animal nutrition, have been the most widely used for many years. Wolff's standards have recently been modified by Prof. E. Lehmann, as the result of additional experiments and practical experience, and also in the attempt to adapt them more closely to the practical needs of the animal. A number of these standards are as follows:

It should be borne in mind that feeding standards are simply a concise and approximate statement of the amounts of the different nutrients required by animals, as indicated by the results of experiments and observation, and are intended to apply to the average condition. No single standard can be laid down for all conditions. Good judgment and intelligent observation on the part of the feeder are also necessary. The value of any ration which may be determined upon may be calculated with the aid of the feeding standards and the figures in Table 1. Suppose four pounds of oats constitute one of the ingredients of a ration. According to the table, it is evident that if 100 pounds of oats furnish 9.25 pounds digestible protein, one pound will furnish 0.0925, and four pounds will furnish 0.37. In the same way, if 100 pounds of oats supply 1247.60 calories of energy, one pound will furnish 12.4760 calories and four pounds will furnish 49.88. The sums of the protein supplied by all the feeds show the total amount in the ration, and so on, with all the other nutrients, and with the energy. In making such calculations, it is a common practice to consider only the protein and energy value since these factors show the essential features of the food and the calculation is somewhat simplified without materially lessening the value of the results. It is not necessary that a ration should furnish each day the exact amount called for by the standard but rather that it should approximate it through long periods, a slight deficiency at one time being made up by a corresponding excess at another. In calculating rations it is essential that weights be used rather than measures. It is often inconvenient to weigh the grains, but the weight may be calculated with sufficient accuracy by the figures given below, which show the weight of a quart of a number of common feeding stuffs.

Some of these materials, especially by-products like wheat bran, vary considerably in weight, and the given figures cannot be regarded as strictly accurate. Weighing is, of course, always the safer way where it is desired to feed quite definite amounts. In selecting feeding stuffs for his stock, the farmer will naturally be governed by the conditions of the market. The cost of feeding stuffs is controlled by other factors than the actual amounts of food materials which they contain; indeed, there often appears to be very little connection between the two. Bearing in mind that the protein is the most expensive ingredient, and the one especially sought in concentrated feeds, the farmer can make his selection with the aid of such data as are given in Table 1. Of course, the special adaptability of some materials to different kinds of animals and different purposes will also be taken into account.

Another important consideration where fertilizers or manures have to be relied upon is the manural value of a feeding stuff. If the manure is carefully preserved a large proportion of the fertilizing constituents of the feed is recovered in the manure, and goes to enrich the land. (See Fertilizers.)

**Feeding Stuff Inspection.**—A number of dif-
different States have passed laws requiring that the composition of certain classes of feeding stuffs be guaranteed by the manufacturer, and providing an inspection of these goods to see that the guaranty is complied with. These laws in general apply only to the so-called concentrated feeding stuffs, especially the by-products and mixed feeds, and not the cereal grains sold as such. The inspection is usually in charge of the Agricultural Experiment Stations; and is managed very similarly to the fertilizer inspection. The need for this inspection arises from the quite wide variation in the composition of many of the by-products, the confusion of names, as in the case of the by-products from starch manufacture, the large number of mixed and proprietary names, and the occasional tendency to mix with the material substances of inferior value. The feeding stuff inspection protects the farmer from fraud in the same way as the fertilizer inspection, and from him the benefit of a guaranteed composition in buying. The result of this inspection, which has been in operation a number of years, has been quite marked in driving inferior grades of goods, like adulterated corn meal, out of the market, and tending to bring about greater uniformity in composition in the case of standard by-products.

C. F. LANGWORTHY,
Department of Agriculture, Washington, D. C.

NUTRITION OF MAN.

To be properly nourished, man must be supplied at suitable intervals with the foods which will best serve to keep him healthy, maintain it in the best possible condition, and afford the possibility of a greater increase of his powers. Food supplies, therefore, with the exercise of temperance, may be considered as the materials of the human body, and their consumption as food must be re-supplied by the body. The food supply is just sufficient for the needs of the body, the weight remains constant, except for the occasional fluctuations dependent upon the water taken or not taken, or the contents of the intestinal tract, etc. If the food supply is insufficient, the body loses weight, while if more is consumed than is needed, reserve material, usually fat, is stored and the body gains in weight. In one sense, the body is a machine of a superior sort. Like other machines, it needs materials to build its several parts, to repair them when worn out and to serve as fuel. It uses this material like a machine in some ways, and in others differently. The raw materials come from fuel and so does the body,—in the one case, coal or wood, and in the other, meat, bread, milk, etc., serving this purpose. In both cases, the energy latent in the fuel and called potential energy is transformed into heat and power. When coal is burned in a furnace, some of its potential energy is transformed into the mechanical power used by the engine for its work; the remainder is wasted in the heat not utilized by the engine. In a similar way, the potential energy of food is transformed in the body into heat, to keep the body warm, and into mechanical power employed for muscular work, but this is done more economically than by the engine. If more heat is generated than is required, it is wasted, just as in the case of the engine. The human machine differs in one important particular from the steam-engine, namely, it is self-building, self-repairing and self-regulating. Then, too, if need be, the body can get its own benefit of stored fat, for instance, as fuel, and the engine cannot. But besides all this, the body is more than a machine. It has not only organs to build and maintain, but has a nervous organization as well as sensibilities and the higher intellectual and spiritual faculties, and it seems fair to insist that the right exercise of these depends upon the proper nutrition of the body.

Composition of Foods.—The study of foods has shown that although they differ so much in texture and appearance, they are in reality made up of a few chemical constituents, namely, protein, fat, carbohydrates and ash, together with a larger or smaller amount of water. The latter can often be seen, as in the juice of fresh fruits or meat. In flour or driers, no water or juice is visible, but a small amount is contained in the tissues in minute particles, and may be separated in the laboratory. Protein is the name given to the total group of nitrogenous materials present. The group is made up mainly of the true proteins such as the gluten of wheat, the albumen of egg, etc., and nitrogenous materials such as amides which are believed to have a lower food value than the albumens.

The group *carbohydrates* includes the starchy meals as suet and lard, the fat of milk (butter), true vegetable fats and oils like olive oil or the oil in corn, as well as vegetable wax, some chlorophyll (the green coloring matter in leaves, etc.), and other vegetable coloring matters, in brief, all the materials which are extracted by ether in the usual laboratory methods of estimating fat. The name *ether extract* is often and quite properly applied to this group.

The group *carbohydrates* includes starches, sugars, crude fibre, cellulose, pectens, and other bodies of a similar chemical structure. This group is usually subdivided, according to the analytical methods followed in estimating it, into "nitrogen-free extract" and "crude fibre", the former including insoluble ingredients of the intestinal tract, etc. The former subdivision includes the sugar, starches, and most of the pectens, and the latter cellulose, lignin, and other woody substances which very largely make up the rigid structure of plants. The carbohydrates occur chiefly in vegetable foods, though some are found in animal foods, milk-sugar being a familiar example.

The group *mineral matter* includes the inorganic bodies present in the form of salts in the juices and tissue of the different food, the principal chemical elements found being sodium, potassium, calcium, magnesium, chlorine, fluorine, phosphorus, and sulphur. The term *ash* is often and very appropriately used for this group, since the mineral matter represents the incom bustible portion which remains when any given food is burned.

Food, as we buy it at the market or even as served on the table, contains a large or smaller amount of material which cannot be eaten, and which would have little or no nutritive value if it were eaten, such, for instance, as the bones of meat and fish, the shells of eggs, and the skins and seeds of vegetables and fruits.
NUTRITION OF MAN

In discussing the chemical composition of foods, such portions are usually spoken of as refuse, but they form an important item when the actual cost of the nutrients of food is considered. Similarly, the materials comprising it either as refuse or as edible portion contain the same ingredients as the edible portion, though generally in quite different proportions. Thus bones are largely mineral matter with a little fat and protein. Bran of wheat contains a large amount of crude fibre or woody material, with a little starch, etc. In some cases, material which is edible is classed as refuse because the flavor is objectionable. Thus peach or plum pits are too highly flavored to be palatable, and if eaten in quantity are undoubtedly actually injurious. The edible portions of food which are rejected in its preparation or at the table are spoken of as waste. The chemical composition of a food serves as a basis for judging of its value for building and repairing body tissue. Its value as a source of energy must, however, be learned in another way. The most usual way of measuring energy is in terms of heat, the calorie being taken as a unit. This is the heat which raises the temperature of 1 kilogram of water 1° C., or 1 pound of water 4°F. Instead of this, the unit of mechanical energy, the foot-ton (the force which would lift 1 ton 1 foot), may be used, but it is not as convenient. One calorie corresponds very nearly to 4 food-calories.

Fuel Value of Food.—The fuel value of any food is equal to its heat of combustion less the energy of the excretory products derived from it, and may be learned by taking into account the chemical composition of the food, the proportions of the nutrients actually digested, and oxidized in the body, and the proportion of the whole latent energy of each, which becomes active and useful to the body for warmth and work. However, the fuel value may be and often is calculated from the composition of the food material supplied, on the assumption that 1 gram of protein furnishes 4 calories, 1 gram of fat 9 calories, and 1 gram of carbohydrates 4 calories, or one pound of protein 1,820 calories, one pound fat 4,040 calories, and one pound carbohydrates 1,820 calories.

The relation between the quantities of nitrogenous and nitrogen-free nutrients in the ration is therefore the nutritive ratio. By calculating this ratio, 1 pound of fat is taken as equivalent to 2.25 pounds of carbohydrates — this being approximately the ratio of their fuel values — so that the nutritive ratio is actually that of the protein to the carbohydrates plus 2.25 times the fat.

All the organs and tissues of the body contain nitrogen. Protein is the only nutrient which supplies this element, and is therefore essential for building and repairing body tissues. The other elements required, namely carbon, oxygen, and hydrogen, may be supplied theoretically at least, by protein, fat or carbohydrates; but a well-balanced diet should contain all the nutrients in proper proportion. Protein, fat, and carbohydrates may be burned with the formation of carbon dioxide and water, and therefore all may serve as a source of energy, but protein is less important, and probably less usual function. The fats and carbohydrates by being themselves used as fuel, leave the protein for its indispensable work of tissue forming. In an ordinary mixed diet, meat, fish and milk, among animal foods, and cereals among vegetable products, are the chief sources of protein. About nine tenths of the fat in the animal food and about one ninth of the fat in the vegetable food are saturated fats, while approximately nine tenths of the carbohydrates are furnished by vegetable foods.

The mineral matter in food is required for a number of different purposes, a considerable amount being needed for the formation of the skeleton. Some is also present in the organs and tissues. It cannot, however, be regarded as a source of energy, according to commonly accepted theories, since it cannot be burned with the formation of carbon dioxide and water. The water present in the food is not a nutrient in the sense that it serves for building tissue or yielding energy, but it is essential, serving for carrying the food in the digestive processes, for diluting the blood, and for many other physiological purposes. The oxygen of the air is required by man as by all living animals for the combustion or oxidation of the fuel constituents of food.

The average composition of a number of common foods and the energy which one pound will furnish when burned in the body, are shown in Table I., on the following page.

It will be seen that meats, fish, eggs, milk, fresh vegetables, and fruits contain the most fat and water; that protein is most abundant in the animal foods and in the dry legumes, and occurs in considerable quantities in the cereals; that fats occur principally in the animal foods; that carbohydrates are found almost exclusively in the vegetable products and milk; and that small quantities of mineral matter are found in practically all food material. The fuel value varies within wide limits, being greatest in those materials which contain the most fat and the least water.

Digestibility of Foods.—One of the most important considerations in fixing upon the value of any given food is its digestibility, in other words, the proportion of its nutritive ingredients which the animal can retain. Frequently employed, the term digestibility has several other significations. Thus, to many, it conveys the idea that a particular food "agrees" with the user, in other words, that it does not cause digestive indisposition. In cooking, it is also quite commonly understood to mean the ease or rapidity of digestion, and one food is called more digestible than another, because it is digested more easily or in less time. However, the term digestibility, as most commonly used in scientific treatises, refers to thoroughness of digestion. In brief, digestibility consists in rendering insoluble materials soluble, and is accomplished with the aid of digestive ferments and perhaps, though to a smaller degree, by micro-organisms. The principal digestive ferments are contained in the saliva, in the gastric juice of the stomach and the pancreatic juice of the intestine. The saliva has the power of changing starches into sugar. The gastric juice acts upon protein, and the pancreatic juice upon the protein, fat, and carbohydrates. Digestion is aided by fine division of the food in chewing, and by muscular contractions, that is, by grinding on the teeth, and by the stomach and intestine, which helps to mix the digestive juices and their ferments with the

NUTRITION OF MAN

Food. The digested food passes through the walls of the alimentary canal into the blood and then and later undergoes marked chemical changes. The heart pumps the blood containing the nutrients of the digested food, and the oxygen which it gets in the lungs, all over the body, and thus the organs and tissues are supplied with the materials which they need for their particular functions. At the same time, the blood carries away the waste which the exercise of these functions has produced. The living body tissue has the power of selecting the necessary materials from the blood and building them into its own structure, but just how it does this it is not possible to say.

The parts of the food which the digestive juices do not or cannot dissolve, and which therefore escape digestion, are periodically given off by the intestine. Such solid excreta, or faces, include not only the particles of undigested food, but also the so-called metabolic products, that is, residues of the digestive juices, bits of the lining of the alimentary canal, etc. The other excretory products are the urine, respired air and perspiration.

The chemical elements of which this bodily waste is composed are, of course, the same as those making up the body and its food, namely, carbon, oxygen, nitrogen, calcium, etc. Most of the carbon and part of the oxygen are given off from the lungs as carbon dioxide. Hydrogen unites with some oxygen to form water, which is excreted in the form of vapor from the lungs, in the perspiration from the skin, and urine from the kidneys, which latter contains also nearly all the nitrogen, most of it in the form of urea. Waste mineral matters are given off to some extent in the perspiration but mainly through the kidneys and intestine. Although sometimes studied by methods of artificial digestion, the digestibility of any food may be most satisfactorily learned by actual tests, the method being, in general, the same as in experiments with animals. (See Nutrition of Farm Animals.) From a large number of experiments, it has been calculated that on an average the amounts per pound which foods may for convenience be divided, have the following coefficients of digestibility:

As a general rule, it may be said that carbohydrates are more completely digested than proteins and fat, and that the protein of animal foods, as meat, milk, fish, and eggs is more digestible than that supplied by vegetable foods. In determining the value of food, more complexated experiments are frequently resorted to. Thus the income and outgoing of nitrogen or carbon forms a means of judging of the processes which are going on in the body. Some of the most valuable experiments have been made with a special device called the respiration calorimeter (q.v.), which permits of the measurement of the total income and outgoing of matter and energy.

The information gained from a study of the composition and nutritive value of foods may be turned to practical account by using it in planning diets for different individuals or classes of individuals or in estimating the true nutritive value of foods actually consumed by families or individuals, that is, by making dietary studies. The plan followed in making dietary studies which may be of any convenient number of days' duration, is as follows: Exact account is taken of all the food materials (1) on hand at the beginning of the study; (2) purchased during its progress; and (3) remaining at the end. The difference between the third and the sum of the first and second is taken as representing the amounts used. The amounts of nutrients and energy furnished by the total quantity of each food material are calculated through the aid of figures obtained from analyses of samples of the different foods or from tables of average composition like Table I. above. Deducting from the total amounts of the several nutrients and energy the amounts found in the kitchen and table refuse, the quantities actually consumed are obtained. Account is also taken of the number of meals eaten by different members of the family or group studied and by visitors if there are any. From the total food eaten by all the persons during the entire period, the amount eaten per person per day can be calculated. Observation has shown that as a rule, a woman requires less food than a man and that young children require still less, the amount being dependent upon the age. The amount required by a person varies too with the amount of work performed, more food being evidently needed when a man is engaged at hard labor than when he is at rest. The factors which are commonly used in computing the results of dietary studies follow; a man at moderately active muscular work being taken as the standard:

FACTORs USED IN CALCULATING THE RESULTS OF DIETARY STUDIES.

Man at hard muscular work needs per meal or per day 1.2 the food of a man at moderately active muscular work.
NUTRITION OF MAN

Man with light muscular work and boy 12-16 years old needs 0.9 the food of a man at moderately active muscular work.

Man when sedentary occupation, woman at moderately active work, boy 13-14, and girl 13-16 years old need 0.8 the food of a man at moderately active muscular work.

Woman at light work, boy 12, and girl 13-14 years old need 0.7 the food of a man at moderately active muscular work.

Boy 10-11 and girl 10-12 need 0.6 the food of a man at moderately active muscular work.

Child 6-9 years old needs 0.5 the food of a man at moderately active muscular work.

From results of many investigations and many physiological experiments, a number of so-called dietary standards have been suggested which are designed to show the amount of nutrients and energy which are required by persons of different occupations and habits of life. The European dietary standards proposed by Voit and the American standards proposed by Atwater, follow:

<table>

(*) Fats and carbohydrates in sufficient amounts to furnish, together with the protein, the indicated amount of energy.

Preparation of Food.—The preparation of food has much to do with its nutritive value. Thus, many articles which, owing to their mechanical condition or other cause, are unfit for nourishment when raw, become nutritious and palatable when cooked. It is also a matter of common experience that well cooked food is appetizing and wholesome, while the same material if badly cooked is unpalatable. Cooking is of importance for at least three reasons: It changes the mechanical condition, so that the food material may be acted upon more freely by the digestive juices; it makes it more appetizing by improved appearance or flavor, or both; and it kills by heat disease germs, parasites or dangerous organisms if such be present. Food which is attractive to the taste quickens the flow of saliva and other digestive juices, and thus aids digestion. The cooking of meats develops the pleasant taste and odor of extractives and that due to the browned fat and tissues, and by softening and loosening the protein (gelatinoids) of the connective tissues, makes the meat more tender. Extreme heat, however, tends to coagulate and harden the albuminoids of the lean portions, and also to weaken the flavor of extractives. If the heating is carried too far a burned or charred product of bad flavor results. Quite generally foods lose weight in cooking. In the case of meat, a small part of the loss is due to the escape of meat juices and fat, but the chief loss is simply water. The material removed when meat is boiled need not constitute an actual loss if utilized as soup or gravy. In ordinary meat broth, the substances, with the exception of fat, which are dissolved out of the meat, bones and muscle by the water, consist almost wholly of inextractives and salts, which are very agreeable and often most useful as stimulants but have little or no value as actual nutriment. In the case of vegetable foods also, the principal material lost in cooking is water driven off by the heat. If vegetables are boiled some sugar and mineral matter is almost always extracted, but such loss is too small to be very important. Heating often changes the structure of food materials very materially so they may be more easily chewed and more easily and thoroughly digested. In many vegetables,
albumen encloses air in bubbles which expand, and the walls stiffen with the heat and thus render the food porous. Cleanliness should always be observed in keeping, handling, or serving food. This is required to insure health, as well as for other more obvious reasons. Cleanliness, in this sense, applies not only to freedom from visible dirt, but also from undesirable bacteria, etc.

Cost of Food—Although the cost of food is one of the chief items in the living expenses of the large majority of the people, very few have any clear ideas regarding the actual nutriment in the different materials they purchase, and too frequently those who wish to economize have little knowledge of the combinations which are best suited to their needs and of the real nutritive value of different foods as related to their cost. In this connection, it is necessary to take into account not only the price per pound, quart or bushel of the different materials, but also the kinds and amounts of nutrients which they contain and their fitness to meet the demand of the body. The cheapest food is that which supplies the most nutriment for the least money, and the most expensive is that which is the cheapest and at the same time most adapted to the needs of the hour. It is quite evident that the market price is not regulated by the actual food value. Thus, an ounce of protein or fat from the end of the beef is not more nutritious than that from the round, although it costs considerably more. The attractive appearance of a given food or the buyer's fancy has much to do in regulating the demand and selling price. It is well worth while for housekeepers to become familiar with the true nutritive value of different foods, and to take this into account, as well as flavor, appearance and cost, in the selection of the daily menu.

Diet.—For persons in good health and with good digestion there are two important rules which should be observed in regulating the diet. The first is to select those things which agree with the person and avoid those which experience has shown them they cannot digest without harm. The second is to insist on fresh and wholesome food as will supply the materials which the body needs and at the same time will not burden it with superfluous material which must be disposed of at the cost of health and strength. For guidance in this selection, Nature has provided us with instinct and taste which have been trained by experience. Physiological chemistry adds to these the knowledge, still new and not at all adequate, of the composition of food and the laws of nutrition. It is a common practice to be influenced too much by taste, or in other words by the dictates of the palate. Though there may be differences among abnormal persons, for the great majority of people who are in good health, the ordinary food materials such as meat, milk, butter, eggs, cheese, fish, flour, meal, sugar, fruits, potatoes, and other vegetables, make a fitting diet, the main question being to use them in such amounts and proportions as are suited to the actual needs of the body.

Too much food is as bad as too little, and entails a waste of energy as well as a waste of nutritive material. While in the case of some food purchased, notably meats, more or less waste is unavoidable, the pecuniary loss can be diminished, both by buying those kinds in which there is the least waste, and by utilizing more carefully than is commonly done, portions which are ordinarily classed as refuse. Then, too, much of the waste may be avoided by carefully planning the diet so as to provide a comfortable and appetizing meal in sufficient amount, but without excess. If strict economy is essential, the dearer cuts of meats and the more expensive fruits and vegetables should be avoided. With reasonable care in cooking and serving, a varied and pleasing diet can undoubtedly be furnished at moderate cost. It must be remembered that the real cheapness or dearness of a food depends not only on its market price, but also on the cost of its digestible nutrients, and that the ideal diet is that combination of foods which, while imposing the least burden on the body, supplies it with exactly sufficient material to meet its wants, and that the disregard of such a standard must inevitably prevent the best development of our powers.

C. F. Langworthy,
Department of Agriculture, Washington, D. C.

Nuts, hard-shelled fruits, indehiscent, with a hard, dry pericarp, growing on certain trees and bushes in most temperate and tropical regions. The shell, which is often enclosed by woody or leathery husks, does not open of itself when the nut is ripe. Common examples are hazel and hickory nuts. Peanuts and other ground nuts properly belong to another class of fruits. The more important nuts may be divided into two classes: (1) those used for food, and (2) those used for oil, dyeing, and other purposes, medicinal, ornamental, and commercial.

The principal kinds of edible nuts are sweet and bitter almonds (Amygdalus communis), native to Asia Minor, northern Africa, southern Europe, and successfully cultivated in California; Brazil-nuts, or niger-toes, the seeds of a majestic tree (Bertholletia excelsa), whose habitat is Venezuela and northern Brazil; bread-nuts growing on a tree (Brosimum alicastrum) of Central and South America, the American (Castanea americana) in the Eastern and Southern States, the Spanish (Castanea sativa) in southern Europe, northern Africa, and western Asia, also species found in Australia and Tahiti; coconuts, the fruits of the cocoanut palm (Cocos nucifera) in the East Indies, West Indies, Florida, South America, and Hawaii; cola, or kola, nuts, the seeds of a tree (Cola acuminata) native to West Africa and cultivated in tropical America; hazelnuts, filberts, or cobnuts (Corylus avellana) in England, Spain, Sicily, and other parts of Europe, also the American hazel (C. americana) and the California hazel; hickory nuts (Carya alba and other species) in the United States (from Maine to Texas), and Mexico; pecans (Carya illinoiensis), in Indian Territory, Texas, Louisiana, and other southern States; pistachios or green almonds (Pistacia vera), found in southern Europe, southwestern Asia, and northern Africa; souari or suwarrow nuts (Carya nuciferum), also called the butternut of Demerara, native to Brazil and Guiana; walnuts (Juglans regia), commonly named English or Persian walnuts, native to central Europe, Chile, and California, also the black
walnut (J. nigra) and the white walnut (J. cinerea) or butternut of the United States.

Certain edible nuts are used as sources of oil. The principal kinds are the almond (sweet and bitter), the cashew nut of the South Sea Islands, the candle nut of the West Indies, the cocoanut of the East Indies, the dika nut of West Africa, the palm nut of West Africa, the pine nuts of Europe and Asia, the physic nut (Carcass peregrina) of tropical America, the English walnut and the American butternut.

Of nuts having medicinal qualities are the seeds of Strizchnas nux-vomica, of southern Asia and the East Indies, from which the poisonous drug nux-vomica is obtained, and the betel nuts, fruit of the areca palm (Areca catechu), in the East Indies and the Philippines, used as a vermifuge, also said to have stimulant and tonic properties. Some kinds of nuts are turned to account for various practical and ornamental purposes. The boombah nut (Pycnocoma macrophylla), of Africa, is used for tanning; nut galls (Quercus infectoria), of the Levant, for dyeing; and sassafras (Sassafras albidum), of the West Indies, in washing. The horse chestnut (Aesculus hippocastanum), of Europe, contains starch. The cumara nut (Dipterix odorata), of Brazil, is valuable for its perfume. The sassafras nut (Scleria pub-chury), of Brazil, is used in flavoring chocolate. Ravensara nuts, also called the Madagascar clove nutmeg, are useful for seasoning. Many species of nuts are prized as ornaments. Betel nuts are utilized as coat buttons; bladder nuts (Staphylea pinnata), of Central Europe, are worn as beads in necklaces; also the bonduc nut (Guilandiera bonduc), of India, and the grugru nut (Acrocomia schistorcarpa), of South America, are used as broads. The corozo nut or vegetable ivory, of Brazil and Colombia, is made into toys, and the coquilla nut (Attalea funifera), of Brazil, is valuable for decorative turnery.

The demand for nuts as an article of commerce is constantly growing. The value of nuts, domestic and foreign, annually marketed in the United States, is about $7,000,000. The consumption of home-grown nuts cannot be accurately estimated. The yearly exports of domestic nuts amount to nearly $5,000,000, of which pecans (the most important of native nuts) form a considerable item. Imports during the fiscal year 1902-3 amounted to nearly $5,000,000, the bulk being of three kinds: almonds ($1,377,717), walnuts ($1,106,033), and coconuts ($280,244). The most popular varieties of almonds are from Tarragona and Isca, Spain, and from Formigetta, France. Shelled almonds, which are largely used by confectioners, for the most part come from Spain, Sicily, and Italy. The walnuts from Grenoble, France, are said to be the best, and those from Naples have a fine flavor. Importations of cocoa-nuts are chiefly from South America and the West Indies. Of other nuts, filberts or hazels come principally from Italy, Sicily, and Spain, chestnuts from France and Italy, and Brazils from South America.

Recent experiments tend to show that the food value of nuts is much greater than was formerly supposed. Many wild and wild animals depend largely upon nuts for sustenance through long periods of the year. According to a missionary of the Kongo, the natives subsisted almost entirely upon cola nuts during a famine lasting months. Among civilized people nuts have been looked upon as accompaniments to a feast, and Indians are made pleasant talk. They serve this purpose and more, for as sources of protein and fat they furnish considerable nutritive material and energy. Where other provisions are deficient in protein or albuminoids and fat, almonds and walnuts supply this lack. The chestnut may be used as a substitute for the cereals, because of its high proportion of starch, sugar, and dextrin. In some parts of Asia nut oil is used considerably in cooking.

Almonds, Brazilnuts, filberts, hickory nuts, pecans, walnuts, chestnuts, and other nuts contain in concentrated form a great deal of nourishment. When bought at ordinary prices, they should not be considered luxuries but fairly economical articles of diet. Investigations carried on at the Agricultural Experiment Station of the University of California in 1901-2 emphasize the fact that nuts are to be regarded as true foods rather than as luxuries.
reducing the abdomen and increasing agility. The fact that Americans do not appreciate the food value of nuts as much as Europeans and Asians do, is attributed to the abundance of fruits and cereals in this country. The increasing demand, however, is encouraging nut culture in California and other States. The number of nut-trees and their products in the United States as reported by the Twelfth Census was as follows:

<table>

EUGENE PARSONS,
Author and Editor.

Nutt, nüt, Alfred Trubner, English folklore scholar: b. London 22 Nov. 1856. His education was obtained at University College School and the Collège de Vitry François, and afterwards he received in 1873 a three-years' apprenticeship in the book publishing business on the Continent, succeeded to that of his father, David Nutt, in London, in 1877. He joined the Folk Lore Society soon after and was elected its president in 1897. He founded the English Goethe Society in 1886 and was one of the founders of the Irish Texts Societies in 1868. He has written 'The Legend of the Holy Grail with Special Reference to the Hypothesis of its Celtic Origin' (1888); 'The Voyage of Bran' (1895–7).

Nuttall, nüt'al, Thomas, English-American naturalist: b. Long Preston, settle, Yorkshire, England, 5 Jan. 1786; d. Nutgrove, near St. Helens, Lancashire, England, 10 Sept. 1859. He learned printing, came to the United States in 1807; traveled widely; made numerous discoveries in botany; ascended the Missouri River in 1811, the Arkansas in 1819, and in 1825–34 was professor of natural history and curator of the botanic gardens at Harvard. In 1834 he explored the Oregon and Upper California. From 1842 he resided in England. Among his publications were: 'The Genera of North American Plants' (1818); 'A Journal of Travels into the Arkansas Territory' (1821); 'Introduction to Simple Physiology of the Botanical World' (1827); 'A Manual of the Ornithology of the United States and Canada' (1834) and 'The North American Sylva: Trees not Described by F. A. Michaux' (1832–9).

Nuttling, nüt'ling, Mary Olivia, American writer: d. Randolph Centre, Vt., 1 July 1831. She was born at Mount Holyoke Seminary (now College) in 1851, taught there 1851–70, was librarian of the institution 1870–1901, and since the last-named date, librarian emeritus. She has published 'Steps in the Upward Way' (1867); 'Our Summer at Hillside Farm' (1867); 'The Story of William the Silent' (1869); 'The Days of Prince Maurice' (1894); etc.

Nuwas, noo'väs. See Abu-nuvas.

Nux Vom'ica, the popular name for the seeds of a tree (Strychno nus-vomica) of the natural order Loganiaceae. The tree is a native of Ceylon, Coromandel, and residential parts of southern Asia. It is of medium size, bears oblong, entire smooth leaves, and flowers in terminal corymb, followed by one-celled berries as large as oranges. They have brittle shells, white gelatin, pulp, and flat, disk-like, hairy gray seeds which are tough, odorous, and very bitter. The pulp is a favorite food of many birds. The seeds have long been used in pharmacy and medicine, and are the source of the alkaloids strychnine and brucine. Under the name false Angostura bark the bark of this tree has been used to adulterate the true Angostura bark, from which it differs in its properties.

Nyack, ni'äk, N. Y., village in Rockland County; on the Hudson River, where the expansion is called Tappan Bay, and on a branch of the Erie Railroad. It is connected by ferry with Tappan on the opposite shore of the Hudson, and it is about 26 miles from the Grand Central Station in New York. It was settled in 1700, incorporated as a village in 1873, gave up its charter in 1876, and was again incorporated in 1893. It is a beautiful residential village, but has some manufacturing. The chief industrial establishments are boot and shoe factories, wagon, carriage, and sleigh factory, yacht, boat-building, and cloth finishing works. For many years it has been a junctional centre; it is the seat of the Nyack Military Academy, the Hudson River Military Academy, and the Rockland Military Academy. It has public and parish schools, a public library, and several good church buildings, notably Saint Ann's (R.C.), the interior of which is beautifully decorated. The village owns and operates the waterworks. Pop. (1890) 4,111; (1900) 4,275.

Nyam-Nyam, nyäm-nyäm'n, Ni'am-Niam, or Zande, an African nation, composed of numerous petty tribes dwelling in the basins of the Shari and Welle rivers. They number upward of 2,000,000. They are a branch of the Sande tribes, who all belong to the stock of the negroid Nubas. The men devote themselves to hunting and war; the women cultivate the fields and elusine, manioc, sweet potato, gourds, yam, banana, etc. These with game are the chief food, though a portion of the people are notorious cannibals. They have no cattle. Considerable manual and artistic skill is shown in the forging of iron, making of pottery and baskets, and the carving of wood. They are passionately fond of music, and play a kind of mandolin. Polygamy prevails. The weapons are spears, knives, a species of iron boomerang, and shields.

Nyian, ni'an, a large wild sheep (Ovis hodge-soni) of the Tibetan Mountains, with the great spiral horns on the head of the ram, and yielding excellent mutton. It is called argali by British sportsmen, and is one of the prizes of the chase in the Himalayan region.
NYANGWE—NYMPHS

Nyangwe, nyâng’wê, Africa, a trading station in the Kongo Free State, on the Kongo River; lat. 4° 15' S.; lon. 26° 20' E. In 1871 it was visited by Livingston, and in 1876 Stanley made the place his headquarters while exploring the Upper Kongo. It is connected by road with Albertville on Lake Tanganyika. By caravan route, rivers, and steam cars from Leopoldville connections exist with the Atlantic.

Nyanga, nyân’ça, a Bantu word meaning "great water." It is used as the English word "lake" in the zoology of the three large bodies of water in Central Africa: as, Albert Nyanza, Victoria Nyanza, and Albert Edward Nyanza.

Nyassa, nyâs’sâ or nyâs’sâ (from the Bantu word nyansa, that is, "great water"), a lake in southeastern Africa, nearly 400 miles from the Indian Ocean, and west of German East Africa. It extends north and south about 350 miles, and east and west from 20 to 50 miles; area, about 14,300 square miles. It is about 700 feet deep at its southern point, but to north, or its source, it is quite shallow. Toward the south the bed sinks below the level of the Indian Ocean, and at its head the surface is over 1,000 feet above the ocean level. The outlet is the Shiré River, which flows south into the Zambezi. With the exception of Murchison Falls and Rapids, 70 miles long, in the Shiré River, there exists unbroken water communication between the head of Nyassa and the Indian Ocean. The African Lake Company have launched steamers on the lake, investigated the coast, and made a road in the noon end of the lake up to the heights to the plateau between Nyassa and Tanganyika (q.v.). Another road has been made around the rapids in the Shiré River. On the west and east coasts are mountains, those on the east are from 4,000 to 11,000 feet in height. In some places low sandy land extends between the water and the mountain, and in other parts, as at the north, the mountains come down to the water. A number of rivers flow into the lake from the east, they have broken through the mountain barrier. Livingstone (q.v.) on the south, Bandawe on the west, and a number of other small villages or hamlets have been established along the coast.

Nyâya, nyâ’ya. See HINDUISM.

Nyc'tipite'cua. See DOUBROUCQ.

Ny'dia, a character in Bulwer's "Last Days of Pompeii." She is a blind flower girl, of good birth, rescued from slavery by the hero.

Nye, nî, Edgar Wilson, American humorist: b. Shirley, Maine, 25 Aug. 1850; d. near Asheville, N. C., 22 Feb. 1896. He removed when a young man to Wyoming Territory; studied law, and was admitted to the bar in 1876. Subsequently he made his home in New York and became widely known as a humorous lecturer and writer under the pseudonym of "Bill Nye." He was the author of "Bill Nye and Boomerang" (1881); "Forty Liars" (1883); "Remarks" (1886); "Fun, Wit, and Humor" (1886), with J. W. Riley; "Comic History of the United States" (1894); "Comic History of England" (1896); "Baled Hay"; etc.

Nyxzhin, nyê'zhên. See NIZHAN.

Nyerzgyhâza, nyê-rêd-y’ha’zô, Austria-Hungary, town in the district of Szabolcs, on the Nyir River, and at the junction of two railroads, about 60 miles by rail northeast of Budapest. It is in a productive agricultural region in which wheat, grapes, and a variety of fruits grow luxuriantly. It is in the vicinity of the Tokay wine region. There are a number of manufacturing industries, among which are the manufacturing of matches, soda, and salt peter. Pop. (1902) 35,110.

Nykköping, nû’tê-pping, Sweden, seaport, on a bay of the Baltic Sea; about 60 miles southwest of Stockholm. In the 13th century this was one of the most important places in Sweden. The castle, now a ruin, ranked in strength with those of Stockholm and Calmar. In 1719 the town was captured and nearly destroyed by the Russians. It has regular steamer communications with Stockholm and other ports, and is of considerable manufacturing and commercial importance. Pop. (1901) 7,375.

Nyl’ghau. See NILGAI.

Nym Crinklé. See WHEELER, ANDREW CARPENTER.

Nymph. See PUPA.

Nymphæa'cean, an order of aquatic plants, the water-lilies. They are generally large, floating on the surface of the water, and having a stem which forms a subterraneous creeping shoot. The flowers are very large, solitary, with cylindrical peduncles as long as the petioles of the leaves; the perianth is colored, petaloid, composed of a great number of petals, arranged in several rows, and often inserted, as well as the stamens, in the lower part of the sides of the ovary; the outermost of these petals seem to constitute a calyx, while those within form a kind of corolla. The stamens are very numerous; the anthers are turned toward the centre of the flower. The ovary is simple, covered almost throughout by the perianth-segments and by the stamens; it is glochular, with several cells, each containing a great number of ovules; the stigma is radiated, peltate, sessile. The fruit is glochular, resembling externally a pod or capsule, indehiscent, fleshy within, divided into a great number of cells containing seeds immersed in a fleshy pulp. This order furnishes one of the best examples of the gradual passage of petals into stamens and of stamens into petals; the transition is so insensible that many intermediate bodies are neither precisely petals nor precisely stamens, but part of both. The principal genera of the order are Euryale, Victoria, Nymphaea, and Nymphar. See LOTUS; VICTORIA REGIA; WATER-LILY.

Nymphs, in Greek mythology, youthful goddesses of inferior rank to the other divinities who dwelt in Olympus. Begotten by Oceanus, or by Zeus and others, they preserve and nourish the woods, rivers, springs, and mountains. They are therefore distinguished according to their offices, as Oceanides, nymphs of the ocean, regarded as daughters of Oceanus; Nereides, or nymphs of the Mediterranean, who were regarded as daughters of Nereus; Lemoniades, or nymphs of the meadows; Dryades or Hamadryades, or nymphs of trees, whose lives were regarded as beginning and ending with those of the trees with which they were asso-
NYRO — NYX

ciated; Melides, or nymphs of fruit-trees; Oreades or Orestiades, or nymphs of mountains and grottoes: these, dressed lightly, as huntresses, were the companions of Artemis (Diana), who was herself originally an Arcadian nymph; there were also Naiades, who presided over fountains, Potamides over rivers, and Limniades over lakes. The nymphs hold a middle station between gods and mortals, and, without being immortal, yet live longer than is permitted to man. At their death the substance which they have supplied with nourishing moisture perishes also. This first notion of nourishment, which is supposed in the very idea of a nymph, seems to have given origin to the second representation of them as nurses of young children entrusted to their care.

Nyoro, nyôrō, a Bantu tribe living on the shores of Lake Albert Edward, in Africa. As a race they are well built, tall and good-looking. They live in cone-shaped, thatched huts and make dugout canoes and rafts. They lived principally on sweet potatoes, fish and game. They are said to number about 125,000.

Nyrén, nü-rän', Magnus, Swedish astronomer: b. Wermland, Sweden, 21 Feb. 1837. He was educated at Upsala and became an instructor in the Pulkova Observatory in 1868. His astronomical researches have been of great value and he was made vice-director of the Observatory at Pulkova in 1890. He has published: ‘Bestimmung der Nutation der Erdachse’ (1873); ‘Variations de la latitude de Poulkova’ (1893); etc.

Nys'sa, a genus of trees. See Tupeo.

Nystagmus, involuntary motion of the eyeballs. The movement is usually lateral, but is sometimes rotatory, and in rare cases vertical. It may be induced by inflammation and other disorders of the eyes, and in miners is not infrequently caused by long-continued work underground in obscure light. Very little in the way of cure is possible.

Nyx, niks, in Greek mythology, the goddess of night or darkness. She was the daughter of Chaos. Her brother was Erebus.
the fifteenth letter and the fourth vowel of the English alphabet. Its form may have been suggested by that assumed by the lips in producing the sound. It is called the labial vowel because of the part the lips have in its pronunciation: for analogous reasons the third vowel in (ee) is called the palatal and a (ah) the guttural vowel. In early Latin writing the o was square ⊙. In the Greek alphabet there are two characters to represent this vowel, namely, great ο (omega, Ο, ω) and little e (omicron, ο, ρ). The vowel sounds in our language which are represented by o are numerous, namely, (1) The sound it has in oh, lo, cone: this is the regular, long sound of o, and it is common to English with most other languages. Curiously, English seems to lack the vowel sound corresponding to this long o: what is usually called the short o, the vowel sound in on, odd, log, is not the o of loan shortened, but rather the sound of a in all shortened. But though orthoepists hold that the true short open vowel sound of o is unknown in English, natives of New England almost invariably in many words shorten the open o (as in go) without changing its quality; in their pronunciation of bone, home, coat, toad, etc., the vowel is the true o shortened. This short o is not recognized by Alexander J. Ellis as an English vowel sound. The editors of Webster’s Dictionary (edition of 1879) remark of this local pronunciation that “its rise and growth are interesting facts, and its final prevalence is a thing he (the theoretic phonologist) would rather desire than depurate.” The long o sound is variously represented in English; by o (lo), by ow (low), by ou (hautboy), by ew (beau), by eo (yeman), by eu (sew), by o (roam), by oe (hoe), by oo (door), by ugh (dough), by ou (shoulder), and by owe. (2) The vowel sound commonly called short o, as in odd, cob, is really, as we have seen, the shortened vowel sound represented by a in all, fall. (3) The obscure short vowel sound heard in done, son, ton; this sound is usually represented by u, as in dun, sun, tun. (4) The sound of u in rune, for example, move, prove. (5) The same sound shortened, as in wolf, woman; the vowel sounds 4 and 5 are the sounds of the fifth vowel in a standard alphabet. (6) The sound usually rendered by broad a in all, call: examples, order, former, north.

O’, in Irish proper names, a patronymic prefix corresponding to the Mac of the Highlands of Scotland; thus O’Connell means “the son of Connell.” It is a corruption of the Irish o (Gaelic, ogha), meaning a grandson.

O. P. Riots, or Old Price Riots, a public disturbance in London in 1800, occasioned by the opening of the New Covent Garden Theatre. The management increased the prices of admission, and the crowd mobbed the theatre demanding that the old tariff for admission be retained.

Oahu, ʻō-ā’ho or ʻō-wā’ho, one of the Hawaiian Islands, the northernmost large island of the group; length 38 miles, average width about 20 miles. It has an irregular coast line, several small harbors, one excellent harbor on the west coast, upon which Honolulu (q.v.), the capital of Hawaii is situated. Two mountains range across the island, and between is a large dry plain which is productive when irrigated. Mount Kaala, 3,890 feet, is the highest point on the island.

Oak, a genus (Quercus) of trees and shrubs of the order Cupulifer. The species, of which there are about 300, are characterized by simple deciduous or evergreen leaves, inconspicuous monoeocious flowers, the staminate, usually in slender pendulous catkins, the pistillate usually nearly sessile and generally solitary or in groups of two or three and developing into “acorns” which are more or less globular or obovate nuts set in the hardened, scaly involucres (caps) which sometimes nearly surround them. Nearly all the species are natives of the northern hemisphere, especially the temperate and colder portions in the latter, of which even the larger species, when present, become reduced to mere shrubs, a peculiarity also exhibited in very sandy, dry or rocky soils. Some species are natives of the warmer parts of the temperate zone, but few are actually tropical. Most of the oaks are noted for strength, durability, longevity and striking individuality of appearance; and on account of these qualities they have been used as symbols by many races, and enter into literature and tradition. Some of the species reach maturity only when 50 to 100 years old, and others even exceed this maximum before reaching a size suitable for lumbermen’s purposes. Specimens are known which have reached nearly 1,000 years, and others of half that age are common.

Oaks are generally propagated by seeds planted as soon as mature in the autumn; choice varieties are grafted or budded; and evergreen species are often increased by means of cuttings or layers. In general they thrive best upon well drained, fairly moist, loamy soils, especially such as are well supplied with lime. They are, however, found in all kinds of habitats, including almost pure sand, clay, rocky mountain sides and the muddy soils of undrained swamps. With few exceptions the valuable species are easily grown and readily transplanted while young.
Among the oaks are some of the most valuable trees of the temperate zone. Their acorns furnish a valuable food for swine, and in some instances are used for human food; their bark is one of the most important barks used in tanning; and their timber, which is noted for its soundness, beauty, hardness, moisture, and durability, is one of the most important woods of the world. It is used largely in ship-building, but less now than before the introduction of iron and steel vessels; in railroad and mill construction, bridge building, etc., and, because of its handsome graining and its ability to receive polish, it is extensively employed in interior finish of houses, in furniture, etc. The galls which grow upon certain species and the bark are widely used as a source of tannin for ink manufacture. Some of the more rapidly growing species are planted largely in Europe in copse, the stems being cut every few years for fuel and for the bark. Few trees are more highly prized by horticulturists and landscape gardeners; but usually the specimens must be in place before the gardener lays out the ground because with most species little effect can be expected under ten years. For another reason oak galls are grown, the same growth are planted with oaks and are removed when the oaks need the space.

About 50 species and half as many hybrids and varieties are natives of the United States, some extend from Nova Scotia to Minnesota and southward to the Gulf States, others being limited to very restricted localities. In general these species belong to two groups, the black oaks and the white oaks. Those of the first group grow in the north and the west, the white oaks in the south and east. Among the most noted are the oak-tree pruner (Elaphidion villosum), a beetle which lays its eggs in the twigs, in the pith of which the larva develops, and when they chew out a ring of wood near the bark, retire to the semi-severed twig, plug up the burrow and pupate. The wind snaps the twigs; hence the name. The moss-cup or bur oak (Quercus macrocarpa) resembles the white oak in size, appearance and distribution, but its timber, being of coarser grain, is less valued. The chestnut-oak (Quercus prinus) is a smaller tree, with a broad irregular head and dark brown bark deeply furrowed, and with leaves like those of the chestnut. It ranges from Nova Scotia to Alaska and southward to southern Michigan, Ontario, and Pennsylvania. It is especially valued for its bark, which is exceptionally rich in tannin. The live oak (Q. virginiana) is a broadly spreading tree, seldom more than 60 feet tall. It is noted throughout its range, which extends from Virginia southward, for its glossy green leaves and dense shade, for which it is widely planted in the South for ornament. It is usually draped with Spanish or Florida moss (Tillandsia) which also adds to its striking appearance. The red oak (Q. rubra) which has a range similar to the white oak, is a rapidly growing, handsome tree sometimes reaching 150 feet and forming a broad round head. Its timber is very heavy, durable and hard, but is coarse-grained. It is less used for the finer work than the white oak.

A close relative, the turkey oak (Q. laevis), is smaller than the preceding, but is similar in range, uses, etc. Both kinds are remarkable for their autumn colors. The water-oak (Q. nigra, popularly known as Q. aquatica) is common in Florida, where moisture, and rapid growth it is frequently planted as a street tree in the South. In the North it is not hardy.

The European or British oak (Q. robur) has two well marked botanical varieties, one with stemless acorns, the other with acorns on stems. It is a native of western Asia and northern Africa as well as of Europe. About 50 horticultural varieties of this species are in circulation for ornament, some being introduced into America for this purpose. This is the oak of legendary lore, under whose branches the ancient Druids held their religious ceremonies. It is also the oak used by the navies of Europe, more than a thousand years. The cork-oak (Q. pseudo-suber) is a native of the Mediterranean region and is noted for its bark which furnishes the cork of commerce. The gill-oak (Q. ilex) is a shrub native to Western Asia, and is chiefly useful for its nut-galls (q.v.) which occur upon the leaves as the result of insect attack. The Valonia oak (Q. agiophora) common in the same region, is noted for the astrignency of its acorns, which are largely used in tanning. The holm, holly or evergreen oak (Q. ilex) is a native of southern Europe, and bears acorns used for food. A very large number of insects live upon the oak, its timber and its decaying wood. One estimate for the United States places this at 1,000; the number actually recorded being between 500 and 600. In Germany, according to Kaltenbach, there are 537. These belong to all orders and include borers, leaf-chewers, sap-suckers, and fruit-eaters. Among the most noted are the oak-tree pruner (Elaphidion villosum), a beetle which lays its eggs in the twigs, in the pith of which the larva develops, and when they chew out a ring of wood near the bark, retire to the semi-severed twig, plug up the burrow and pupate. The wind snaps the twigs; hence the name.

Oak Apple, any large gall (q.v.) on an oak; specifically, in England, a spongy excrecence on the twigs of Quercus pedunculata.

Oak Crown, Order of the. See Orders and Decorations.

Oak Grove, Battle of. After the battle of Fair Oaks or Seven Pines (q.v.) 31 May 1 June 1862, Gen. McClellan remained inactive.
Oakeley, Sir Herbert Stanley, English composer: b. Ealing 22 July 1830; d. November 1903. He was educated at Rugby, and at Christ Church, Oxford, studied music in England and at the Leipsic Conservatory under Moscheles and Pia tied, and later devoted himself to the organ, working with Breidenstein in Bonn and with Schneider in Dresden. In 1863 he was musical critic to the 'Guardian,' in 1865–91 professor of music at Edinburgh, and for many years composer to the Queen in Scotland. In Scotland he furthered orchestral and organ music, and established Students' Choral Associations in the universities. His compositions are principally religious, including anthems, cantatas, hymn tunes, chants, and service-music; but he also wrote some pieces for the piano-forte.

Oaken Crown, Order of the. See Orders, Royal.

Oakes, òkès, Urien, American colonial scholar and clergyman, 4th president of Harvard College: b. England 1631; d. Cambridge, Mass., 25 July 1681. He was brought to America in 1634, showed himself an able mathematician and astronomer when at Harvard, graduated at Harvard in 1649, studied theology, preached for several years in England, and in 1671 became pastor of the church in Cambridge and fellow of Harvard College. His ambition is supposed to have urged him to rouse dissension against President Hoar, upon whose resignation in 1674 he became acting president, being inaugurated in 1680. He wrote much Latin verse and a famous 'Elegy upon the Death of Thomas Shepard,' selections from which may be found in Tyler, 'History of American Literature.'

Oakland, òk'land, Cal., city, county-seat of Alameda County; on the San Francisco Bay, and on the Southern P., the Santa Fé, and the Western P. R.R.'s; across the bay from San Francisco, and at the centre of the coast-line of the State. It is connected by the electric railway system with the chief towns and villages of the county, and with a number of places along the coast. The land-locked harbor, six miles along the southern front of the city, can accommodate the largest ocean vessels; the city has 15 miles of water-frontage. The jetties erected by the Federal Government in the western part of the harbor have greatly increased traffic. The high-tide jetties, forming the harbor entrance, are built of rubble stone. The South Pacific Coast Railway has built a solid mole alongside the south jetty.

Oakland is walled on the north and east by the Coast Range, and the city slopes down to the bay, making a location of great scenic beauty, forming an almost perfect natural drainage, and so protecting the city from cold but not cool breezes as to give an ideal climate. The mean temperature for the years 1880 to 1904, was 52° F. It was settled in 1850; Don Luis Maria Peralta and other Spaniards, was incorporated in 1852, and chartered as a city in 1854. It is the commercial centre of a large agricultural region, and its excellent facilities for transportation (ships and cars meet at the waterfront) are greatly appreciated by the citizens. The central of its shipments each year. Its chief industrial wealth is derived from its manufactures, shipping, and the agricultural products of the country. The principal industrial establishments are iron works, which have 800 employees; ship...
building works, 700 employees; canneries, over 4,000; flour mills, 150; candy factories, 200; gas works, 250; planing mills, 650; and lumber yards, 375. There are in the employ of building contractors over 2,000 men; the paving companies have about 350 employees; the coal and grain handlers number about 175, and the water company has 250 employees, the street railroads, 900, and other industries of the city have in all 1,700 employees. The average wages paid to the employees of industrial establishments is about $10,300,000. Some of the prominent buildings are the post-office, banks, hospitals, Home for the Blind, Y. M. C. A. and Y. W. C. A. buildings, theatre, Saint Joseph's Home for Deaf Mutes, the church, school, and library buildings. The educational institutions are 19 public and 10 parish schools, California College (Baptist), Saint Mary College (R.C.), Saint Joseph's Academy (R.C.), Our Lady of Lourdes Academy (R.C.), a public library which contains nearly 40,000 volumes and is housed in a Carnegie building which cost $50,000, on a site that cost $20,000. Connected with the public high school is a well equipped observatory. Berkeley (q.v.), which is the seat of the University of California, adjoins Oakland, on the north. There are eight public parks, and a water park in which at the base of the foothills and within 10 minutes' walk of the centre of the city is Lake Merritt, a natural salt-water lake of 190 acres, whose waters are replenished with every tide. The nine banks have (1903) a combined capital of $2,750,000; the deposits amount to $22,382,143. The government is vested in a mayor and a council of 11 members, who hold office two years. Berkeley on the north, Alameda on the southwest, and a number of smaller adjoining places are practically one with Oakland commercially and industrially, but each has a separate municipality. Pop. (1880) 34,555; (1890) 48,682; (1900) 66,960.

Edwin Stanton,
Secretary Oakland Board of Trade.

Oakum, in shipbuilding, threads of hemp rope picked to pieces, to be used when mixed with pitch for calking the seams of wooden vessels. Until recently old men, women, and children were employed to pick oakum, but this is now chiefly done by machinery. The rope or junk is old rigging and cables bought up for its purpose. It is first cut by a powerful knife into short lengths, and these are thoroughly steamed to dissolve out the tar. The strands being then pulled apart, they are spread in the sun to dry. After this they are torn in pieces and cleaned of dust in carding machines, a succession of which are used, until the oakum is obtained in clean light fibres. Since the passing of the wooden ship, oakum is very little in demand.

Oannes, ô-ân'nez, in Babylonian mythology, a god of the sea, described as having the head and body of a fish, to which were added a human head and feet. In the daytime he lived with men to instruct them in the arts and sciences, but at night retired to the ocean.

Our Fish, or Band-fish, one of the ribbonfishes (Regalecus bocconii), a peculiar deep-sea fish, 1 1/2 feet in length, with a narrow and extremely compressed body of a silvery color. It is only rarely met with and usually in a dying condition, as its proper home is in the depths of the sea.

Oás, ô-as', Philippines, a pueblo of the province of Albay, Luzon, situated in the Inaya River, 15 miles northwest of Albay, the provincial capital. It is on the main channel between Ligao and Polangui, has a considerable river trade, and is the centre of one of the finest hemp-growing districts of the province. Pop. 15,987.

Oásis, a fertile place in a desert, usually found where lack of vegetation is caused by lack of moisture. Some of the mountains in the Sahara are of sufficient height to cause condensation of moisture and rainfall; and as much of the soil has all the ingredients necessary for productiveness, an oasis is formed. Springs sending out enough water to moisten the soil aid in the formation of fertile spots; and artificial means are now used; the artesian wells are assisting in making productive places in the Sahara. See SAHARA.

Oat Grass. See GRASSES OF THE UNITED STATES.

Oates, ôts, Titus, notorious English purger, the fabricator of the story of the Popish Plot: b. Oakham 1649; d. London 12 July 1705. The son of a clergyman of the Church of England who had become an Anabaptist preacher and in 1664 was expelled from a chaplaincy in the Parliamentary army, he was turned out of successive schools and took no degree at Cambridge, but was ordained and became vicar of Babbing in 1673. Soon after he was vicar to his father, with whom he circulated such outrageous stories against a schoolmaster of the parish that they were expelled from the living. After various ups and downs, about 1676 he conceived the idea of informing against the Roman Catholics; he became a Roman Catholic in 1677, studied at Valladolid and St. Omer, but was expelled from both, and 1678 gave information as to a Popery Plot against Charles II, intended to seat upon the throne James, Duke of York, and turn the country over to the Jesuits. He received a large governmental pension and his story was implicitly believed, resulting in the judicial murder of 35 innocent persons. But in two years the excitement somewhat subsided; and upon the accession of James II, Oates' pension was withdrawn and he was put on trial for perjury, was found guilty, fined, condemned to stand in a pillory, and be imprisoned for life after a terrible flogging, which he survived as by a miracle. His sentence was reversed after the accession of William and Mary; he was set free and received an annual pension of £300. In 1693 he married a rich widow and a few years later joined the Baptist congregation and preached among them, but was soon expelled. Consult: Roger North, 'Examen,' and 'Lives of the Norths'; Thomas Seccombe, 'Lives of Twelve Bad Men' (1844); Burnet, 'History of My Own Time' (1881); and the English histories of Hallam, Lingard, and Macaulay.

Oaths and Affirmations (Judicial). A judicial oath is a solemn declaration made in some form warranted by law, before a court of justice or some officer authorized to administer it, by which the person taking it promises to tell the truth, the whole truth, in relation to his knowledge as to the matter then under consideration, and appeals to God to wit-
ness his sincerity. It is distinguished from an extra-judicial oath by the fact that the latter is not made under any warranted form of law, and has no binding force, except in the conscience of the one taking the oath. An affirmation is made in place of an oath by a person conscientiously opposed to an oath, and it is a declaration which is equivalent in law to an oath. Oaths are of extremely ancient origin, and are not peculiar to Christianity, having been used by nearly all nations in the world. Affirmations in place of oaths were the result of a statute first enacted in England for the benefit of those to whom the invocation of the Deity was objectionable. Generally under the present laws, only those persons included within the statutes permitting an affirmation to be made in place of an oath, have such right. Authority to administer oaths is an incident to judicial officers. All persons having sufficient intelligence to appreciate the nature of an oath and believing in the existence of a Supreme Being, who demands a moral obligation to speak the truth, when under oath, are competent to take an oath.

In nearly all of the United States, through statutory enactment, it is provided that every person believing in a religion, not the Christian religion, to which he can conform himself, without renouncing or sacrificing any of his religious tenets, is qualified to administer oaths, and for the purpose of performing such ceremonies as his religion may have; a substantial compliance with the provisions of the statute as to the form of an oath is usually sufficient, the test generally being as to whether or not the person administering the oath is acting in accordance with the statutory provisions under which he may be indicted. See also Evidence; Law, Criminal; Witness.

Oats, various grasses of the genus *Avena*. The best known species is often subdivided into Tartarian oats (A. orientalis) and common oats (A. sativa). In the former variety the panicles are one-sided and somewhat contracted; in the latter they are loose and spreading. The origin of common oats is in doubt, but many writers suppose that they were derived without hybridizing from a Tartarian species now unknown to botanists. The numerous varieties of this species vary greatly in color, size of grain, height, etc., and more or less in composition. Other species are cultivated to a small extent but are mostly considered weeds. The best known of these are probably animated oats (A. sterilis) whose seeds move with varying amounts of moisture; wild oats (A. fatua) valued in some places, for example, California, for pastureage, but generally regarded as a noxious weed; bristle-pointed oats (A. strigosa) used sometimes like the preceding but also considered a weed; and short oats (A. brevis) cultivated at high altitudes for its seed which matures where other cereals fail. The adaptation of soils of if these are well supplied with moisture. They will not do well in wet soil nor in hot countries, though in warm regions they succeed if the soil is moist enough. They thrive best in temperate climates, in many of which they rank as one of the most important cereal crops. The land is plowed and harrowed usually in spring, and the seed either sown broadcast or drilled in at the rate of about three bushels to the acre. In the western United States the seed is commonly sown broadcast upon corn-land which has been prepared only with the harrow. In the eastern States the ground is usually plowed previous to sowing. Since the plants are very hardy the seed may be sown as soon as the ground can be worked in spring, or the sowing may involve an early development of the plants under favorable conditions. In about three months the harvest usually occurs in northern countries; in southern regions a somewhat longer time is necessary because of the shorter days and usually drier conditions. Though the average yield per acre in the United States was, during the last decade of the 19th century, 26.14 bushels, yields of more than 50 bushels are common under good management, especially in Europe.

Oats are rather exempt from the attacks of specific insect enemies; and the means of combating the general cereal enemies are the same as for wheat, barley and other grass and grain insects. They are subject to the attacks of some mild or so-called plant diseases, of which the best known are rust and smut. Since these are less troublesome upon early maturing varieties, these are chosen in regions which seem to be infested. They also have another advantage in that they are less likely to lodge than taller and later growing varieties.

The oat has long been considered one of the most valuable of cereal grains. Treated as a grass it makes good pasturage for cattle, forage, fodder or hay; and as a grain it is one of the standard feeds for domestic animals, particularly the horse, and is widely used as human food, especially for making porridge. In the manufacture of what are called "breakfast foods" the oat takes an important part, and the by-products, such as hulls (the outer covering), bran, middlings, and "oat dust" are largely sold to stockmen for mixing with other feeds. The whole grain has the following average composition: Nitrogen-free extract, 59.7; protein, 11.8; water, 11.0; crude fibre, 9.5; fat, 5.0; ash, 3.0. Since analyses have failed to reveal the presence of a supposedly stimulating principle called "avenin," chemists and other investigators have concluded that such a principle does not exist.

Consult Morrow and Hunt, 'Soils and Crops of the Farm' (1892), and books upon general farming.

Oaxaca, wá-há'ká, Oaxaca de Juárez, dā hoo'-á-rēth, or *Oajaca*, Mexico, a maritime state, bordering on the Pacific Ocean, and bounded on the north, east, and west by the states of Puebla, Vera Cruz, Chiapas, and Guerrero. Area about 28,778 square miles. The principal mountain ranges are the Sierra Madre, which crosses the whole state, and Sierra del Sur, near the coast. Of its ports, the most important are Salina Cruz and Puerto Angel. Minerals found are: silver, gold, iron, lead, coal, marble, and salt. Among its agricultural products are cereals, seed grains, coffee, and tobacco; the annual value of the crops being about $15,000,000. The Southern Mexican railroad runs from Puebla to Oaxaca on its way to the Guatemalan frontier, with a branch to Puerto Angel. The starting point of the railway which is to connect the Pacific Ocean and the Gulf of Mexico is Salina Cruz. Communication with the adjacent states is maintained by means of
highways, telegraph, telephone, and mail routes. The ports of Salina Cruz and Puerto Angel are visited by vessels of the Pacific Mail Steamship Company. Oaxaca is on the Mexican line. Population of the state 884,999.

The capital and chief town, also called Oaxaca, which has 34,437 inhabitants, is one of the handsomest cities in the republic, containing fine public buildings, a good public library, cathedral, etc. Historically, the place is interesting from its association with the leading characters in the Mexican annals, beginning with Cortes. It was injured by earthquakes in 1787 and 1861. In 1872 it was captured by Morelos. Diaz surrendered it to Bazaine in 1865, and recovered it Nov. 1, 1866. Gen. Fidencio Hernandez, after taking the city in 1876, proclaimed himself governor of Oaxaca, and Forfrio Diaz, general-in-chief of the revolutionary army. The antiquities of the state of Oaxaca reveal an advanced and somewhat mixed culture in this part of the ancient Nahuan-Zapotecan province, formerly the home of Mixtecs, Zapotecs, and other tribes. The finest group of ruins is that at Mitla, about 38 miles southeast of the capital; Mitla, however, is not the original name, but an Aztec word, signifying "dwelling of the dead," or "heli." Zachila, nearer to Oaxaca city, was the site of the Zapotec capital. The ruins of Monte Alban were explored by Garcia in 1855, by the German traveler Muller in 1857, and by Charnay in 1858-59. Near Tejuantepec are remains of fortifications built by Zapotecs to resist the advance of Aztec forces. At Cempoal is a cyclopean bridge of aboriginal construction.

MARRION WILCOX.

Oban, o-ban, or Obi, o-bé, Siberia, a great western river with its head-streams, the Biya and the Katun rising in the Altai Mountains within the frontiers of the Chinese dominions. The river flows northwest and north for 2,120 miles to the Arctic Ocean, which it enters by three mouths at the great Gulf of Ob, an inlet of the Kara Sea, between Nova Zembla and the mainland; the gulfs of irregular form extends beyond 90° N. and 72° E., and lon. 68° and 72° E., and is ice-bound from October to June. The chief tributaries of the Ob are the Irtish, Tcharysh, Tom, and Tehulym, all navigable. On the banks of the Ob are the towns of Barnaul, Tomsk, and Tarym. At present only a few steamers ply on the great water-system of the Ob, of which over 9,000 miles are navigable, but its commercial importance is increasing. The accessibility of this great Siberian navigation system to Western European commerce during the summer months was demonstrated as early as 1874 and subsequently by the voyages of Captain Wiggins from Dundee, Scotland, through the Kara Sea to the Gulf of Ob.

Obadiah, o-ba-d'î or o-ba-dî'a ("the Servant of God"), one of the minor prophets. His date may be gathered from the fact that in his brief prophecy he rebukes the Edomites for exulting over the destruction of Jerusalem by Nebuchadrezzar, which took place 587 B.C. Nothing else is known about this prophet.

The Prophecy.—A single chapter contains the whole utterance of Obadiah, which is yet of lyrical point and symmetry. It consists of two parts; the first (ver. 1-21) foretells the destruction of Edom. The rocky strongholds of Esau's progeny, their noted sagacity and wisdom, even the number of their allies will avail nothing to help them. Obadiah gives the reason of this sudden judgment, namely Edom's cruelty to Israel. The prophet earnestly warns them to cease from this unfeeling persecution; urging upon them the fact that Jehovah's punishment on a guilty people is salt: When the day of wrath comes, Judah shall be united with Joseph, bring Edom to destruction and regain possession of its hereditary domain.

Character and Style.—The dictum of the prophecy is terse energetic, but of the severest plainness, and this brief and direct utterance seems in harmony with the single purpose of the prophet which recalls Nahum's unity of design and subject. Consult: Perowne, 'Obadiah and Jonah' in the Cambridge Bible for Schools and Colleges (1882); Caspari, 'Der Prophet Obadja ausgelegt' (1842); Peters, 'Die Prophetenzeit Obadjas' (1892).

Oban, o-ban, Scotland, a fashionable watering place of Argyllshire, on the beautiful and almost unloacked bay of Oban, 92 miles northwest of Glasgow, and 136 miles from Edinburgh. It is the great tourist headquarters of the West Highlands, with about 30 hotels, and splendid steamboat facilities, and its spacious lake-like haven is crowded in summer by yachts and steamers. In the vicinity are the picturesque ruins of Dunollie and Dunstaffnage castles, and a prehistoric cave-dwelling discovered in 1892. Permanent pop. (1901) 5,374.

Obando, José Maria, hō-sō' mā-rē'ā o-bān'dō, Colombian soldier and politician: b. Garcia 1797; d. Cruz Verde 29 April 1861. He served for several years in the Spanish army, joined the patriots in 1822, defeated the dictator Urbanea 1831, and established a constitutional government, the republic of New Granada, of which he was vice-president 1821-2, secretary of war 1832-7, and, after his return from exile consequent upon the unsuccessful rising against Marquez, president 1853. In 1854 he was proclaimed dictator, but his army was beaten. In 1861 having joined the Federalist revolution he was assassinated by a personal enemy.

Ob'beak. See Fetish; Obi.

Obeid, El, 'el o-bā'ēd or o-bā'ēd', Egyptian Sudan. a town, capital of Kordofan, 220 miles southwest of Khartum. It consists of a number of villages, originally separate and inhabited by distinct races, but now united in one town. Gum-arabic, ivory, gold, and ostrich feathers are the chief articles of trade. Near this place, in 1883, a force of Egyptians under Hicks Pasha, with a British staff, was exterminated by a large army of the Mahdi. Pop. (est.) 35,000.

Ob'elisk (Greek, obelos and obeliskos, both literally signifying a spit or pointed instrument of any kind, and hence a pointed pillar). Obelisks belong to the oldest and most simple monuments of Egyptian architecture, and are high four-sided pillars, diminishing as they ascend, and terminating in a small pyramid called the pyramidion or cap. They seem to have been peculiar to Egypt, and although two structures resembling obelisks, and the apex of a third, have been discovered in Assyria, these differ from the true Egyptian obelisk in this respect, that their summits, instead of being of a pyramidal form, are
OBER—OBERLÄNDER

step-shaped. The obelisks of ancient Rome were not the work of Roman hands, but were brought there from Egypt. In more recent times several other obelisks have been brought from Egypt to adorn other European capitals. They are all monoliths, and vary in height from a few inches to above 100 feet. They are mostly of red granite or rather syeneite, from the quarry of Syene in Upper Egypt. For the most part they bear hieroglyphical inscriptions recording the names and exploits of Egyptian kings, whence they are called in Coptic by a name signifying "written columns." Those which are without such inscriptions may probably be regarded as unfinished. The sides of some of the obelisks are slightly convex, the intention of which is to obviate the effect of the play of light on polished granite surfaces in making them appear concave. An obelisk still lying in an unfinished state in the quarry of Syene shows the way in which they were made. The obelisk was cut out in the solid rock, and polished on three sides before the fourth side was disengaged. A deep fissure was then made along the under side where the separation was to be made, and wooden wedges introduced into it, which, being frequently moistened and gradually expanded, effected the separation without any shock. When thus disengaged from the quarry the obelisks were conveyed on rafts to their destination during the inundations of the Nile, or where this means did not serve, were laid on a rude kind of carriages made of logs and draggled over the ground by long trains of men or animals. On reaching the place where they were to be erected the sculptors set to work to engrave on them the inscriptions they were intended to bear. The inscriptions are read perpendicularly. Sometimes there is only one, and sometimes more than one column of inscriptions on each side. The engraving being finished, the obelisks were erected on their pedestals, which are quadrangular blocks of stone of considerably larger area than the base of the obelisk.

The first obelisk is said to have been erected by Rameses, king of Egypt, in the time of the Trojan war; it was 50 cubits high, and employed 2000 men to build it. There are about a dozen Egyptian obelisks erected in Rome. One was erected by the Emperor Augustus in the Campus Martius, on the pavement of which was a horizontal dial that marked the hour, about 14 B.C. Of the obelisks brought to Rome by the emperors, several have been restored and set up by various popes. The largest is that from Heliopolis. It is of granite, and now stands before the portico of the Church of St. John Lateran, where it was erected in 1588. Its whole height is about 149 feet; without the base, 105 feet. It was removed to Alexandria by Constantine, and to Rome by his son Constantius, and placed in the Circus Maximus. The obelisk at Luxor was presented to the French nation in 1829 by Mehemet Ali, and was re-erected in Paris in 1833. Its height is 75 feet. The obelisk presented to the English nation was removed to England and set up on the Thames embankment in London. It is 58 feet 5 1/4 inches in height, with a width at the base of 7 feet 10 1/4 inches by 7 feet 5 inches. Of Egyptian obelisks 42 are known. One of the best known of these is one in Central Park, New York, removed from Alexandria in 1880.

For details concerning this obelisk see the article Cleopatra's Needle.

The Washington Monument (q.v.) or obelisk at Washington is 555 feet high, and was dedicated 22 Feb. 1885. The Bunker Hill Monument (q.v.) in Boston may also be properly called an obelisk, and that with the Washington are the two most famous of American construction. The battle to commemorate which the Boston monument was erected took place 17 June 1775. Just 50 years later the Marquis de Lafayette laid its cornerstone. It is 30 feet square at base and 231 feet high. It was dedicated in 1824. See also STANDING STONES.

Ober, öbér, Frederick Albion, American author: b. Beverly, Mass., 13 Feb. 1849. He was educated in the public schools and made a study of ornithology, traveling extensively in the pursuit of his studies and has discovered 22 new species of birds. He has written: 'Camps in the Caribbees' (1880); 'Travels in Mexico' (1883); 'Montezuma's Gold Mines' (1885); 'Under the Cuban Flag' (1886); 'A Brief History of Spain' (1890); 'The Last of the Ara-waks' (1901); 'Two Boys with Columbus' (1903); etc.

Oberammergau, öbér-am'mër-gow, Bavaria. See AMBERG; PASSION PLAY.

Oberhausen, öbér-høw-zên, Germany, a town of Rhenish Prussia, in the Rhine Valley, a few miles northeast of Duisburg, an important railway centre and seat of industry, having blast-furnaces, rolling-mills, forges, etc., and productive coal mines. Pop. (1900) 42,148.

Oberholzer, öbér-holt-sër, Ellis Paxon, American journalist; son of Mrs. S. L. Oberholzer (q.v.): b. Philadelphia 1868. He was educated at the University of Pennsylvania, was on the editorial staff of the Philadelphia Evening Telegram 1889-96; editor of 'The Manufacturer' (1890-1900), and has been literary and dramatic editor of the Philadelphia Public Ledger from 1902. He has published: 'The Referendum in America' (1863); 'Die Beziehung zwischen dem Staat und der Zeitungspresse' (1895); 'The New Man' (1897).

Oberholzer, Sara Louisa Vickers, American author: b. Uwchland, Pa., 2 May 1841. She was educated in the Millersville Normal School and in 1862 was married to John Oberholzer. She is an authority on school savings banks and on economics. Her publications include: 'Violet Lee and Other Poems' (1873); 'Hope's Heart Bells' (1884); 'Souvenirs of Occasions' (1892); etc.

Oberländer, öbér-lân'dër, Adolf, German artist: b. Regensburg 1 Oct. 1845. In 1861 he entered the Munich Art Academy and later became a pupil of Pilotys, making brilliant progress under the instruction of that master. He found that historical painting did not suit his particular talent which he early revealed in a humorous cartoon published in 'Fliegende Blätter' (1863). He subsequently abandoned painting and devoted his entire time to humorous and satirical drawings, with a striking virtuosity that he became the leading artist on the staff of 'Fliegende Blätter.' He is strong as a caricaturist, and exquisitely delicate as a draughtsman, and his use of satire and ridicule is good-natured and avoids the coarseness
and brutality sometimes too apparent in the pages of the comic papers. The majority of his cartoons have been collected and published in the "Oberländer Album."

Oberlin, Jean Frédéric, zbožn-frá-dárk ó-bér-lín, Alsatian clergyman and philanthropist; b. Strasbourg 31 Aug. 1740; d. Ban-de-la-Roche 1 June 1826. He was educated at Strasbourg and in 1767 became pastor at Ban-de-la-Roche. There he spent the rest of his long life in labor for the material and spiritual improvement of his degraded parishioners. He practised medicine among them, founded a loan and savings bank, introduced cotton manufacture, helped the people build better roads, and brought in modern agricultural methods. His orphan asylums were the beginning of the many "Oberlinverine" for the protection of children. Besides all this he was a man of rare spirituality, being frequently styled "a saint of the Protestant church," and an excellent pastor, who preached the Sundays each month in French and once in German. Oberlin College (q.v.), Ohio, was named in his honor. Consult the biographies by Butler (English, 1882); Lutteroth (French, 1826; a German version, 1890); and Hackenschmidt (German, 1902); and the life and works of Oberlin as edited by Hilpert and Stoebner (German, 1843).

Oberlin, ó-bér-lín, Ohio, town in Lorain County; on the Lake Shore & M. S. railroad; about 30 miles west by south of Cleveland. It was settled in 1833 as a college town, and Oberlin College was founded the same year; it was incorporated in 1846. It is in a fertile agricultural region; and its industries are chiefly connected with the farm products; but it has continued as an educational centre. Besides the college there are business schools and well-organized system of public schools. Connected with the kindergarten system is an excellent training class. Pop. (1890) 4,376; (1900) 4,082.

Oberlin College, at Oberlin, Ohio; educational, founded in 1833 under the name Oberlin College Institute. In 1851 the name was changed to Oberlin College. The preparatory was the first department opened, but within two years the collegiate department and the theological school were organized and in operation. It was one of the earliest colleges in the United States to adopt coeducation; and to admit colored students. Oberlin College was a noted centre from which emanated strong anti-slavery sentiments, and in the vicinity was the "Underground Railroad" (q.v.), so much used in slavery days by the Abolitionists (q.v.). There are departments of music and art, courses in physical training for women, and summer school courses. In 1903 there were connected with the college 84 professors and instructors and about 1,500 students, nearly 1,000 of whom were women. The library (1904) contains about 70,000 bound volumes and 100,000 pamphlets. The grounds and buildings are valued at $660,000; the scientific apparatus, etc., $51,000; and the productive fund is $1,068,800. The annual income from tutions and fees is about $90,000, from the productive funds, $50,000. In 1901 the contributions were $154,700, and the total income from all sources for the same year was $210,143.

Oboron, ó-bér-rón, in medieval mythology, the king of all the fairies and husband of Titania. Oberon is said to be derived originally from the Scandinavian. He has been repeatedly adapted to romance, poetry, and the opera.

Obesity, an abnormal state of nutrition characterized by an undue deposition of adipose tissue beneath the skin and within the tissues and organs of the body. In states of health the body is more or less covered with a layer of fat, which ordinarily increases and decreases as the state of nutrition varies. Obesity becomes a disease when the increase of adipose tissue constitutes an unwholesome or morbid state leading to interference with the functions of the body in its various parts. The condition may be inherited or acquired. The inciting cause of most but by no means of all cases of obesity is the ingestion of more food than is required by the body. This is particularly true of the foods that are readily converted into adipose tissue—the carbohydrates (starches and sugars), fat, and alcohol. Mental labor consumes comparatively little of these elements, and in those who lead sedentary lives or are naturally indolent these substances, unless sparingly indulged in, are not oxidized and cause the fatty accumulations. There is also an interrelation between the sexual life and obesity, as seen at the time of puberty and at the menopause in many women, and by the deposition of fat in animals after castration. In ordinary cases of obesity the fat accumulates in the form of tiny droplets between the tissue elements; in fatty degeneration the tissue elements are changed into fat. Fatty degeneration is found in the organs of those not afflicted with obesity, but in the late stages of the disease under consideration this very serious morbid change may come about.

Two chief classes of the obese are commonly observed, the plethoric and the anemic. In the plethoric type there is a general over-nutrition; the muscles are large and well developed; the blood is very rich in hemoglobin. The heart enlarges, and at first acts vigorously, but sooner or later there is a weakening of the heart-muscle, changes in the blood-vessels begin, and there may be disorders in the liver and kidneys suffering with their functions. Sudden death from "heart-failure" and apoplexy are common to these cases. In the anemic type there is general flabbiness of the muscles and impoverishment of the blood. Individuals thus affected are troubled with an incapacity for exertion, palpitation of the heart, and shortness of breath. They are not excessive eaters, nor always great drinkers. The tendency to obesity is maintained and increased by the deficiency of hemoglobin and consequent lack of oxygenation of the tissues. This class of obesity is much more serious than the plethoric, whose subjects may remain in a condition of comparative health for years, in spite of their adiposity.

Obese persons bear disease and accidents badly, and if their body weight is in undue proportion to the height they are recognized as undesirable risks for life insurance on the ordinary terms.

The underlying causes of these disturbances in metabolism are not always clear; while the excess of food consumed to the amount used in physical and mental labor is frequently accountable for the trouble, there is in many instances an undiscovered factor. It is possible that de-
ficiencies in the internal secretions from the thyroid and other glands may be in some way connected with the trouble. In myxedema (q.v.) there is a disorderly deposit of fat through the body, and this disease is apparently due to atrophy of the thyroid gland. Moreover the gland extract has been responsible for a decided diminution of adipose tissue. This is the only treatment with medication that is of any value, reliance usually being placed on dietetic and hygienic measures with success in a large proportion of cases.

Various plans of diet have received their originators' names. Among the first was that practised by William Banting (q.v.) on himself at the advice of Harvey. According to "Bantingism," the patient partakes of only 20 ounces of dry food in 24 hours and over half of this allowance is meat, while the fluid is reduced to 35 ounces. This plan, while it removes the food most likely to form fat, gives to the individual a large amount of nitrogenous matter difficult of digestion and assimilation, and deprives the body of heat-producing substances. Furthermore, the normal fat-supply of the brain is seriously reduced. A small proportion both of fat and carbohydrate must be combined with nitrogenous matter in order to insure normal metabolism.

The Ebstein treatment recognizes the fact that fat is more easily disposed of in the body than starches and sugars, and that meat substances may be converted into fatty tissue when in excess. He therefore allows some fat, a moderate amount of meat, and almost entirely eliminates carbohydrates from the dietary. He also greatly restricts water and forbids alcohol. An ordinary diet-list made up according to this system is as follows: Breakfast, tea without sugar, and dry buttered toast; dinner, meat soup or roasted fat meat with fat gravy, one or two fresh vegetables in moderation, salads, and dried fruits; supper, an egg, moderate allowance of ham or fat meat, and an ounce of thin well-buttered toast or dry bread.

The Oertel plan is much like the Ebstein, but the latter allows more given, and the carbohydrates not so sparingly. Great reliance is placed on graduated exercise to strengthen the heart's action, and thus the condition of the patient is improved and the fat oxidated. Patients under his care are made to climb carefully graded mountain paths for specified distances, which increase as the heart becomes stronger. Patients showing respiratory embarrassment are allowed only about 25 grams of fat, 90 grams of carbohydrates, and 150 grams of protein; those showing no respiratory embarrassment are allowed less protein and more fat and carbohydrate.

The table prepared by Yeo contrasts these diets with the normal average:

<table>
<thead>
<tr>
<th></th>
<th>Albuminates</th>
<th>Fats</th>
<th>Carbohydrates</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Oertel</td>
<td>155-179</td>
<td>25-40</td>
<td>70-110</td>
</tr>
</tbody>
</table>

Schweiniger's system is practically the same as Oertel's, differing in withholding all fluid until two hours after meals, allowing very little then. Germain See allows a diet of protein and fat, and requires his patients to take large amounts of fluid. This plan seems to be well suited to individuals afflicted with gout and rheumatism. Others rely on rest and passive exercise, in the form of Swedish movements, etc., with a skimmed-milk diet and gradually replacing the ordinary food until the skimmed milk becomes the only article allowed. The patient is confined to a single room and for 10 days is allowed to walk but little. Careful watch must be kept that the patient's strength be not overtaxed.

Of these treatments that of Oertel is best adapted to the majority of patients. After treatment is discontinued they evince less disposition again to put on fat, because of the improved oxygenating powers of the blood. The anemic obese are less benefited than other types, but much can be done for them if the disease has not progressed too far. See Corpulence.

**Obi, őbí, Obe, or Obeah**, a species of witchcraft practised among the native African and the West Indian negroes. The law of Jamaica, enacted in 1760, which prohibited under severe penalties the practice of obi, enumerates among the materials used for fetishes or spells, blood, feathers, parrots' beaks, dogs' teeth, alligators' teeth, broken bottles, grave dirt, rum, and egg shells. Balls of earth or clay mixed with hair, rags, or feathers, and bound with twine, or in some cases blended with the upper section of the skulls of cats, or stuck round with cats' teeth and claws, or with human or dogs' teeth, and with glass beads, were also used. In 1762 the influence of the obi men produced a formidable insurrection among the slaves in Jamaica, and several of these sorcerers were hanged by the authorities. See Fetish; Witchcraft.

**Obit, őbit or őbít (Lat. obitus, decease),** the service in the church at the solemn interment of the dead; in the Roman Catholic Church an annual religious service, founded for celebrating the memory of a deceased person, and for the expense of which an endowment was left in many European countries. It is also called an annual, or a person's memory. The origin of obits is said to be an ancient one in the church. It is attributed to the practice in the primitive church of commemorating the martyrs, on the anniversary of their deaths. During the period of prosperity following the persecutions similar commemorations were extended to benefactors of the church, and to private individuals by friends and relatives. A like institution, called the commendation of benefactors, is observed in the English universities.

Object-glass, or Objective. See Lens; Microscope; Telescope.

Object, Philosophical. See Metaphysics.

Object Teaching, a modern name given to a revived method of teaching the young by using objects. The history of educational methods shows that "object teaching* antedates the use of books, as would naturally be inferred from the modernity of the printed and popular book. Books telling about objects — explaining the laws of nature and describing experiments made by scientists — replaced in many schools of the world the observation work which had been done earlier, and which is recognized as neces-
sary for the proper development of the young. A study of the methods used by the teachers mentioned in Old and New Testaments shows that the thing was studied as they learned about "the beginning and ending and midst of the times, the alterations of their courses, and the changes of the seasons, the revolutions of the year and the dispositions of the stars; the nature of living creatures and rage of wild beasts, the force of winds and reasoning of men, the diversities of plants, and the virtues of roots." The leaders among educators always taught that "the concrete should precede the abstract," that observation, thought, and expression are essential for individual development, and that the learner must see, hear, feel, and exercise his senses in order to learn. Comenius (q.v.) said: "Let the senses be applied to the subject as often as possible." Pestalozzi (q.v.) introduced into modern primary teaching a systematized method of using objects for the cultivation of the senses; he was education of the young, but not aiming to stop at observation. Froebel (q.v.) and Rosmini (q.v.) contributed valuable information on the subject, the former living long enough to give the world a famous educational system. Comenius is credited with aiding "object teaching" by giving, in his "Orbis Pictus," the first school picture book for the young; but a picture book cannot take the place of natural objects, although it does aid in the verification of the work. Object teaching, as introduced into the schools of the United States has been replaced by Nature Study (q.v.), and incorporated into the work in the natural sciences, drawing, and manual training. Consult: Sheldon, "Object Lessons"; Calkins, "Manual of Object Teaching"; Barnard, "Object Teaching"; Ricks, "Object Lessons." 

Oblates. See ORDRS, RELIGIOUS.

Oboe, õbò-ë, an Italian musical wind instrument resembling a clarinet in shape, and sounding through a double reed. It consists of three joints besides the mouthpiece, and like many other wind instruments, produces a series of overtones.

Obôlus, a Greek coin of silver or copper, the sixth part of a drachm, about 21 cents in value.

Obongo, õ-bông'go, or Abongo, a tribe of pigmies who live in different parts of French Congo in West Africa. See PIGMIES.

Obrenovitch, õ-brë'n-o-vitch, Servian princely family, rivals of the Karageorgevitches, who hold the throne since the assassination of Alexander I. (q.v.). See SERVIA.

O'Brien, õ-bri'en, Cornelius, Canadian Roman Catholic archbishop: b. New Glasgow, P. E. I., 4 May 1837; educated at Saint Dunstan's College, Charlottetown, P. E. I., and at the Propaganda College in Rome, and was for some time professor in Saint Dunstan's College and rector of Saint Dunstan's Cathedral. In 1882 he was consecrated archbishop of Halifax. Among his published works are: "After Weary Years," a novel; "Aminta," a book of dramatic verse; etc.

O'Brien, Fritz-James, Irish-American journalist and poet: b. Limerick, Ireland, 1828; d. Cambridge, Mass., 6 Apr. 1892. After study at Dublin University, he went to London, where he soon got rid of a fortune, and in 1852 came to the United States. He wrote for Broughton's "Lantern" and became also one of the valued contributors to Harper's "Monthly" and "Weekly." His imaginative short stories, "The Diamond Lens" and "The Wondersmith," first printed in the "Atlantic," are notable for originality and ingenuity. In 1861 he entered the 7th New York Regiment, and was sent to the defenses of Washington. Later he was appointed to the staff of General F. W. Lander, won praise from McClellan, and on 26 Feb. 1862 received in a skirmish the wound from which he died. He was a true, if a minor, poet, and wrote some very striking prose fiction. William Winter, poet and critic, collected his most worthy work (1891).

O'Brien, Jeremiah, American patriot: b. Scarborough, Maine, 1740; d. Machias, Maine, 5 Oct. 1818. He was in the lumber business at Machias at the outbreak of the Revolution. Shortly after Lexington, the British cruiser Margaretta appeared in Machias harbor seeking lumber for the defenses at Boston. Sixty volunteers soon set out in a lumber-sloop, under the leadership of O'Brien, to capture the British vessel. In the following hand-to-hand encounter, O'Brien's first sea-fight of the war, they were completely victorious. The sloop took on board the Margaretta's armament, and renamed the Machias Liberty, coasted about, with O'Brien as captain, for 18 months, and took several prizes. O'Brien was later in command of the privateer Hannibal, was captured, and was for some months imprisoned in the Mill prison, England, but made his escape.

O'Brien, Lucius Richard, Canadian painter: b. Shanty Bay, Ontario, 15 Aug. 1832. He began life as an architect and civil engineer and spent much time sketching in the open air as an amateur. In 1872 he joined the Ontario Society of Artists; in 1880 was appointed president of the Royal Canadian Academy of Art, and in 1895 president of the newly formed Provincial Guild of Sculpture. He is preeminently a portraitist of Canadian scenery and the two pictures of Quebec which he painted by order of Queen Victoria, his views of the Rocky Mountains and Selkirk Range, and his "Surprise on the Saguenay." (Art Gallery, Ottawa) are the most characteristic of his works.

O'Brien, Richard Barry, Irish author: b. Kilrush, County Clare, Ireland, 1847. He was educated at the Catholic University, Dublin, was admitted to the Irish bar in 1874 and to the English bar the next year, and after practising his profession for a short time in England turned his attention to politics and writing. He has published "The Irish Land Question and English Public Opinion" (1879); "The Parliamentary History of the Irish Land Question" (1880); "Fifty Years of Concessions to Ireland" (1880-5); "Irish Wrongs and English Remedies" (1881); "Life of Charles Stewart Parnell" (1890); "Life of Lord Russell of Killowen" (1900); etc.

O'Brien, William, Irish journalist: b. 2 Oct. 1852. He was for several years a contributor to various journals, in 1880 founded "United Ireland," entered Parliament as a Nationalist in 1883, retired in 1895, and was re-elected in 1900. In 1898 he started a new agr-
OBSERVATORY — OBSTETRICS

rian movement, called the United Irish League, with the 'Irish People' as its organ. Among his works is 'Irish Ideas' (1894).

O'Brien, William Smith, Irish politician: b. Drumeland, County Clare, Ireland, 17 Oct. 1823; d. Bangor, North Wales, 17 June 1864. He was educated at Harrow and Cambridge, in 1826 entered the House of Commons as member for Ennis and in 1835 was returned for Limerick and retained his seat for 13 years. He was for some time an ardent supporter of O'Connell but on O'Brien becoming the head of the Young Ireland party the friendship was broken. He was active in the insurrection of 1828 and was arrested, tried for high treason, and sentenced to imprisonment for life at Tasmania. He was pardoned in 1856. He was the author of 'The Principles of Government' (1855). Consult: Sullivan, 'New Ireland' (1877); Duffy, 'Young Ireland' (ad ed. 1883).

Obsidian, a vitreous glass of volcanic origin, usually black, but sometimes brown, red, gray, or banded with combinations of these colors, varying from opaque to translucent. It is chemically a rather complex silicate, most commonly of aluminum. Next to its vitreous appearance the most striking physical characteristic is its conchoidal fracture, which was utilized by primitive races for the making of knives, and weapon-heads, notably by the Mexicans, who called the material sitsti and quarried it in their mountains. The principal American variety is the chatojante or cat's-eye, which contains a ruddy golden or silvery white gleam. The liparobsidians, or those resembling liparites, are best typified by the famous Obsidian Cliff in Yellowstone National Park; other acid obsidi- dians are found in California, Mexico, Hungary, the Lipari Islands, and New Zealand. More basic sorts averaging 65 per cent of silica are found in Iceland, the Azores, and Milo. The vitreous type (with about 53 per cent of silica) occurs in volcanic districts, notably Kilauea and Réunion.

Obstetrical Frog, or Midwife Toad, a small European frog (Alytes obstetricans) which has the general appearance of a smooth toad. The upper parts bear many warts and are variegated in color, reddish spots becoming conspicuous in the males at the breeding season, and the under parts are dull white. It is found in Spain, Portugal, southern France and Switzerland, on high mountains as well as in the lowlands, and in town gardens and parks as well as in the remotest wilds, wherever a little water is available for a home. The species is thus very numerous, yet is rarely seen, for it is nocturnal, hiding quietly by day in some dark nook, or in a little hole dug in the ground by itself. At night, during all the warmer months, the males call to one another incessantly in a tinkling note which is not loud enough to be annoying. This frog gets its names from its peculiar manner of carrying its eggs. When the female feels the time approach for the discharge of her eggs, the male mounts upon her back and waits, assisting her efforts, for the extrusion of the ova, which at last happens sud- denly. This takes place on land, not in the water. The eggs are comparatively large, and from 50 to 100 in number, enclosed in a continu- ous cord into two strings; and they are caught and retained, as in a dish, by the thighs of the female, which are extended straight be- hind her, close together. The male immediately fertilizes the eggs, and then proceeds to wind them about the upper part of his own legs, by thrusting his feet back and forth through the mass until they are fastened upon his thighs to his satisfaction. The female is then released, and the male carries his burden to his hole, where he remains, going abroad at night in search of food and to moisten the eggs in the dew, or occasionally in a puddle or pond. After about three weeks, the embryos are nearly mature, and the father takes them to the nearest water and remains within it until (soon) the tadpoles emerge. They are in a more advanced stage than in most frogs, but do not complete their metamorphosis until the following spring. Consult: Fischer-Swigart, 'Zoologischer Garten,' Berlin, 1885; Gadow, 'Amphibia and Reptiles' (1901).

Obstetrics, that department of medical practice which deals with the care and treatment of women during and after pregnancy and child- birth, and with the care of the child when born. It is one of the most important branches of medicine. The study of all of the parts of the female body concerned in the processes of procreation, the normal and abnormal functions during pregnancy and childbirth, beside the care of the mother and child during the early weeks following birth, all fall within its province. Although the function of child-bearing is strictly physiological, it is a process of great complexity and shows many abnormal features, so that in ancient as well as in modern times it has always caused an immense amount of sickness and suf- fering. Happily the art of obstetrics is being established on a rational and scientific basis, and the mortality, suffering, and carelessness due to child-bearing are being reduced to a minimum. As would be natural with such a universal fact as reproduction, many and curious myths and customs have had their day, to give way to equal and magnificent ideas. In ancient Assyria and Babylonia peoples obstetrics had its special workers, and among savages at the present time a crude ob- stetric art is practised. Among the Chinese in prehistoric times (3000 B.C.) midwives were the chief attendants on pregnant women. The length of pregnancy is given in the oldest exist- ing works on medicine as 270 days. Women were then compelled to stay in bed at least three days and for 14 days were not allowed to see visitors. In ancient Assyria and Babylonia midwives were many, and to these women helpers was entrusted the care of the preg- nant woman. This custom has continued to the present time, but with the gradual in- crease in education the better qualified physi- cian is called upon with increasing benefit both to the mother and child. Physicians have also, however, been employed in this work since the earliest times. The modern era of obstetrics covers scarcely more than 30 years. The prac- tical annihilation of puerperal fever by observ- ance of cleanliness has revolutionized the whole sub- ject of obstetrics, as the knowledge of bacterial infections has done with every branch of medi-
OCALA — OCAÑA

cine. As the fetus is practically under the control of the obstetrician at the present time, and as the danger of blood-poisoning can be eliminated, obstetrics, in the hands of the properly qualified, has risen to the level of an exact science. Women still die of childbed fever, but lack of proper care is the cause. Cleanliness is salvation. Dirty hands or finger-nails on the part of the nurse, midwife, or doctor may be fatal, and every mother should know it. In different lands and in varying races the age of child-bearing varies from about 10 to 18. In European races the average is about 14 to 15. Women of warmer climates mature more rapidly than those of the temperate zones. The general period of cessation of child-bearing is about the 45th year. Eight years is about the earliest authenticated record of age of pregnancy, and women of 60 or 70 have been known to have children. One case of pregnancy, with birth of child, is said to have occurred in a woman of 103 years, but the authenticity of this is doubtful. Following impregnation, which occurs normally only as a result of coitus, the ovum, which in the great majority of cases has previously come from the ovary, descends in the Fallopian tube and becomes fastened to the wall of the uterus. Here a rich supply of blood-vessels grows up and around it to nourish the developing fetus. This set of blood-vessels subsequently becomes the placenta, or afterbirth, and constitutes the chief medium of blood-supply between mother and child. Following impregnation a characteristic series of symptoms occur in the pregnant woman. Menstruation ceases, as a rule, the breasts begin to give peculiar sensations, the woman urinates more freely, and her nipples have darker lines about them. These are the early signs. Later — from six weeks to a few months — she notes morning discomfort, with perhaps nausea and vomiting; constipation begins to annoy her; the abdomen begins to swell; the breasts become tender; and the bladder grows troublesome. Still later the nausea may disappear; the swelling uterus makes itself more and more prominent; the breasts become fuller, firmer, and have a more exudating appearance. At the end of about nine months — 270 to 280 days — labor begins. This is usually preceded for about two weeks by a distinct drop of the child in the pelvis, whereby the waist-line sinks very perceptibly. Labor is brought on in some by premonitory cramp-like growls, with inability to hold the urine, and by the escape of a certain amount of fluid in which the child has floated for the final three or four months or more. Irregular pains, which slow increase in severity, cramp-like in character and intermittent, continue for from 4 to 24 hours or more. These constitute the first stage of labor, and are premonitory and useful in dilating the opening of the uterus (q.v.), the cervix. The pains become more severe and frequent, and longer in duration, and the second stage of labor, during which the child is to be squeezed out of the uterus, begins. This is a very distressing time, and, if it happens in the interval, the intermissions in the pain, would be unendurable. The pains become faster and harder, the bag of water usually bursts, and with further cramps the child progresses, head-first, through the vagina of the body from which he came, he reflexly cries out and, with cleansed mouth, takes his fill of air.

Following the birth of the child there is a quiescent period for a few moments to half an hour, then with further pain the uterus squeezes out the afterbirth, and the third stage of labor is completed. The cord connecting the child and the placenta is cut between two knots and the infant becomes an entity. The length of time of the second stage varies widely. In first children, and in older women, with the first baby particularly, it is apt to be longer. From two to six hours may be said to be the average. Following the birth, the mother should lie in bed, and the child be put to her breast at regular two-hour intervals. Although the milk will not come for a few days, the child begins a regular habit, and the breast receives its normal stimulus. It is wise for the young mother to remain in bed at least 10 days, as this favors the return of the uterus. The deviations from this normal course may take place.

Ocala, ó-kâ'la, Fla., city, county-seat of Marion County; on the Florida Central & P. and the Plant System R.R.'s; about 160 miles in direct line southeast of Tallahassee and 70 miles southwest of Saint Augustine. The noted Silver Spring is about five miles east of Ocala. It is in a region in which are raised large quantities of cotton, oranges, and vegetables. Other products which are sent to northern markets are lemons and sweet-potatoes. It has considerable trade in phosphate found in the vicinity. The sewerage system is most unique, it being formed by a subterranean river, which was accidentally discovered while drilling for a well. Neither the source nor the mouth of the river have been discovered. The city owns and operates the electric-light plant. Pop. (1890) 2,904; (1900) 3,380.

Ocala Platform, in American politics, a series of resolutions passed at the national congress of the Farmers' Alliance, held at Ocala, Fla., 8 Dec. 1890. It demanded the abolition of national banks; the establishment of substreasures which should lend money directly to the people at low rates of interest, free coinage of silver, low tariff, the prohibition of alien ownership of land, and a graduated income tax.

O'Callaghan, ó-kâ'la'-hán, Edmund Bailey, American historian; b. Mallow, County Cork, Ireland, 27 May 1797; d. New York 27 May 1880. He was educated in Ireland and in France, removed to Canada in 1823, where in 1827 he became a medical practitioner, and was editor of the 'Vindicator' in 1814. He was elected to the assembly of Quebec in 1836, but after the insurrection (1837) he removed to the United States, where he spent many years in the office of the secretary of state at Albany employed in editing the records of the State. He wrote: 'History of the New Netherlands' (1846); 'A Calendar of the Land Papers' (1864); 'Voyages of the Slavers St. John and Arms' (1867); etc.

Ocaña, ó-kâ'-ña, Colombia, a town in the department of Santander, on the Taira River, 230 miles north of the wapant of the body from which he came, he reflexly cries
lead, coffee, and other products of the district. Pop. 6,000.

Ocarina, ők-a-rê'nâ, a musical instrument originally used in Calabria by the peasants. It consists of a gourd-shaped clay bulb, pierced with a number of small holes and a mouthpiece. Its tone was sweet, but the range was exceedingly limited — less than an octave — but in the course of subsequent development its compass and power were greatly augmented.

Ocam, őkâm, or Ockham, William of, medieval constitutionalist, of the Franciscan order, known as "Venerabilis Inceptor" and "Doctor Invincibilis"; b. Ockham, Surrey, 1270; d. Munich 7 April 1349. He was educated at Oxford, where he studied under Duns Scotus, and subsequently proceeded to the University of Paris. He took part (1321) in the controversy on the subject of "evangelical poverty," and was present at the general chapter of Perugia, which decided it in the following year. Pope John XXII. condemned the decision of the chapter, and Ocam defended it against him, for which he was by order of the Pope imprisoned at Avignon. He escaped, however, 1326, and a vessel sent by Louis the Bavarian conveyed him to Italy. The Pope excommunicated the fugitive, and vainly tried to get him sent back to Avignon, but Ocam from that time resided at the court of Louis and engaged in polemical warfare with papal authority. He charged John XXII. with teaching heresies, and when Louis in 1348 declared the imperial accession independent of papal confirmation Ocam supported him. On the death of Michael da Cesena in 1342 he became the Pope's confidant, though not recognized by the Pope. In logic and philosophy Ocam occupies a distinguished place. His principal work is "Summa Totius Logices." Consult: Eichler, "Die literarischen Widersacher der Pâpste zur Zeit Ludwig 6. [Baier's]" (1874), and Poole's article in the "Dictionary of National Biography," Vol. XLI.

Oc'aneechi Indians, an American tribe of the Siouan family residing in southern Virginia in the 17th century. They aided the whites in the invasion of the northern Indians in 1676. In 1701 they removed to North Carolina, near the present town of Hillsboro, and disappeared by uniting with other tribes.

Occasional Causes. See DESCARTES, RENÉ; METAPHYSICS.

Ocelove, ők'lêv, or Hocceley, Thomas, English poet of the 15th century; b. about 1379; d. about 1450, both dates being based merely on the internal evidence of his poems. He evidently knew Chaucer, and the famous portrait of Chaucer on the margin of the Harleian MS. of the "De Regimine Principum" may have been drawn by Ocelove himself. Besides this poem, which was edited by Wright in 1860, Ocelove wrote the autobiographical sketch "La Male Regle de T. Ocelove," and various shorter poems, the most notable being the "Mother of God," a description of the Virgin, long attributed to Chaucer. Ocelove's poems are edited by Furnivall (1892-7).

Oclusion, in chemistry, a name given by Graham to the property of metals to absorb, or hold in solution, gases. This property is more remarkably displayed by platinum and palladium in their affinity for hydrogen, of which platinum will absorb 114 times its own volume and palladium between 700 and 800 times its own volume. The entire class of oxides illustrates again this special kind of absorption. The term is also used in the case of surface condensation, as of ammonia or oxygen in charcoal.

Ocrom, ők'om, Samson, Indian preacher: b. Mohegan, New London County, Conn., about 1723; d. New Stockbridge, N. Y., 14 July 1792. He entered the Indian school of Mr. Wheelock at Lebanon, remained there four years; in 1748 kept a school in New London, but shortly after removed to Montauk, Long Island, where he taught and as a licensed Congregational minister preached to the Indians. In 1759 he was ordained to the Presbyterian ministry, with which he remained connected. In 1766 Mr. Wheelock sent him to England as an agent for an Indian charity school. Being the first Indian preacher who had visited that country, he was successful in attracting large audiences and obtaining donations exceeding £10,000. After his return to America Ocrom preached at various places, passing his latter years within the bounds of the New Hampshire presbytery. An account of the Montauk Indians, printed in the (Mass.) Historical Society collections (1st series, vol. x.), and published a sermon on the execution of an Indian at New Haven in 1772.

Occulation. The occultations of stars and planets by the moon as in its fastward motion during the month it passes in front of star or planet, and blots them for a while from view, have, in a measure, their counterpart in occultations of stars by planets, or by comets, and also in the occultations of satellites by their primaries.

Occultations of the Moon.—The general theory of occultations is analogous to that of solar eclipses. (See Eclipse, Bibliography.) For stellar occultations, however, considerable simplification occurs because the apparent radius of the occulted body is indefinitely small and there are but two instants to be computed, namely, the immersion or disappearance of the star, and its emersion or reappearance from behind the moon's disk. The elements for the prediction of the occultations of stars are given in all the national ephemerides, chiefly according to Bessei's method. In the "American Ephemeris" these elements are given for stars down to 7.5 magnitude. Observations of the occultations of stars are chiefly valuable as furnishing indispensable data for determining the distance, size, and motions of the moon. (See Moon.) The accuracy of a lunar position thus determined is many times that of the ordinary meridian observations of the moon's limb. The occasion of a total lunar eclipse offers special facilities for determining with great accuracy the occultations of a number of small stars. The best lunar method of determining the longitude of a place is that of observing the occultations of stars, and it has only been superseded by the telegraphic method of the comparison of signals.

The immersion and emersion of stars in occultations by the moon are accompanied by phenomena of a varied character, which have been the subject of much discussion. Some astronomers have been willing to dispose of all of these phenomena as due to physiological causes, without attempting any scientific explanation, and without
satisfying the experience of the more acute and sensitive observers. The various phenomena noted may be scheduled as follows: (1) Instantaneous disappearance or reappearance of the star. (2) Apparent projection of the star upon the moon's limb. (3) Sudden change of magnitude. (4) A slow disappearance or reappearance, sometimes described as "gliding." The instantaneous immersion or emergence of the dark limb is naturally to be expected, and is readily accounted for by the assumption that the moon has no appreciable atmosphere, and that the apparent angular diameter of the stars is insensibly small. The disappearance is very usual under conditions of good seeing, although under such conditions also, when the star apparently approaches closely to the moon's serrations along the dark north or south limb, it has been seen to maintain itself and reappear in the next valley, and so on. Such instances have been particularly noted by the elder Bond and by Davidson. These disappearances and reappearances are to be distinguished from those not associated with the finest definition. Sensible displacement of stars with respect to the moon at occultation, or a "clinging" upon the lunar limb, has frequently been observed, and although the position is attributed by Innes to improper focusing, or focusing on the red star so as to throw the moon's image out with respect to it, it is probably, as Davidson suggests, due to the formation of a "faint" or "spurious limb" of the moon by irregular reflection, upon which the star is projected through the unconsciously selective action of the eye on the star image. It is chiefly large, bright, and mostly red stars, like Aldebaran and Antares, that have been maintained as a disappearance very unusual in small telescopes with low power. With this phenomenon the true immersion is still instantaneous. Sudden decrease in the magnitude of the disappearing star, as if in two distinct stages, has long been observed by expert observers. In certain instances this distinct phenomenon has been proved to be due, and in all cases is probably due, to the occultation of a double star. It seems likely that a very close observation of these light changes at occultation will more and more be deemed a valuable means of detecting very close double stars lying in the moon's path. The "gliding" or gradual occultation of stars is, with some show of probability, attributed by Innes to occultation of double stars too close to make a separate physiological impression. He thinks that close doubles of a period too long for spectroscope discovery and yet too close for visual detection, may thus reveal themselves by the magnification due to the appreciable interval taken by the moon in traversing an arc too small for direct measurement. In both of the cases of "disappearance in two distinct stages, and of "gliding" the position angle of the double star with respect to the moon's path, as well as the angular separation of the components, enters as a factor of the delicate phenomenon.

**Occultations of Planets.**—The phenomena attendant upon occultations of planets by the moon differ somewhat from those of stars. The beautiful and startling appearance which Venus and the new moon present to the unaided eye at the time of this planet's occultation, and the early association of the new moon with religious festivals, has led to the crystallization of this phenomenon as a symbol on the Turkish flag and is also thrice emblazoned on the Egyptian. The phenomenon of an occultation of Jupiter, photographed and observed at Pergamos in 1824, led W. H. Pickering to an interesting discussion of the apparent effect of a slight lunar atmosphere. Of an occultation of Saturn 3 Sept. 1900, G. G. Tupman says that it "disappeared at the dark limb and maimed and reappeared in the next valley, and so on. Such instances have been particularly noted by the elder Bond and by Davidson. These disappearances and reappearances are to be distinguished from those not associated with the finest definition. Sensible displacement of stars with respect to the moon at occultation, or a "clinging" upon the lunar limb, has frequently been observed, and although the position is attributed by Innes to improper focusing, or focusing on the red star so as to throw the moon's image out with respect to it, it is probably, as Davidson suggests, due to the formation of a "faint" or "spurious limb" of the moon by irregular reflection, upon which the star is projected through the unconsciously selective action of the eye on the star image. It is chiefly large, bright, and mostly red stars, like Aldebaran and Antares, that have been maintained as a disappearance very unusual in small telescopes with low power. With this phenomenon the true immersion is still instantaneous. Sudden decrease in the magnitude of the disappearing star, as if in two distinct stages, has long been observed by expert observers. In certain instances this distinct phenomenon has been proved to be due, and in all cases is probably due, to the occultation of a double star. It seems likely that a very close observation of these light changes at occultation will more and more be deemed a valuable means of detecting very close double stars lying in the moon's path. The "gliding" or gradual occultation of stars is, with some show of probability, attributed by Innes to occultation of double stars too close to make a separate physiological impression. He thinks that close doubles of a period too long for spectroscope discovery and yet too close for visual detection, may thus reveal themselves by the magnification due to the appreciable interval taken by the moon in traversing an arc too small for direct measurement. In both of the cases of "disappearance in two distinct stages, and of "gliding" the position angle of the double star with respect to the moon's path, as well as the angular separation of the components, enters as a factor of the delicate phenomenon.

**Occultations by Planets.**—The observation of the occultations of stars by planets may be utilized in determining the position and diameter of the planets, and in securing some knowledge of the effect of their atmosphere on the phenomena. The prediction of these occultations by planets was for some time annually made by Verberich of the Astronomisches Jahrbuch. The phenomena of immersion and emersion have, in the cases of Mars as observed by South, and of Venus by Cerrulii, been practically instantaneous. Only a slight hesitancy in reappearance was noted in the latter case. An occultation of a 6.5 magnitude star by Jupiter, as recently observed by H. W. Buhl, was not visible except on the planet and ring. It seems undesirable to speculate on this phenomenon further than to class it with similar phenomena of displacement of stars at the occulting limb of the moon.

**Occultations by Satellites.**—The occultations of Jupiter's satellites by the planet are a part of the general theory of the configuration of the Jovian System as seen from the earth, and are regularly predicted in the 'American Ephemeris' and 'Nautical Almanac,' and other Ephemerides. The project has been noted by Mr. Innes. The apparent limb of Jupiter at occultation, has been seen by many observers and is satisfactorily explained by the effects of atmospheric disturbances on the planetary edge just as in the case of the stars' projected on the disturbed and spurious limb of the moon.

**Occultations by Comets.**—The passage of comets over stars, as visually and photographically observed, has disclosed some facts of interest in this class of occultations. Until quite recently, all observers agreed that the nebulous envelopes of comets do not absorb the light of stars, and long ago Olbers had shown that there was no evidence of refraction by comets. One eminent observer after another has recorded the occultation of a star or cluster of stars by a comet without sensible diminution of the light of the stars, and this phenomenon has also been markedly attested by the photography of comets. A few observers have noted the diminution or even the complete extinction of stellar light in their occultations by comets. Max Wolf has, moreover, recently demonstrated by photography that the envelope of Comet 1905c exercised a selective absorption on a 6.5 magnitude star and that the same comet failed to absorb the light
OCCUPANCY.—OCCUPATION.

of a less brilliant star of a different type. The projection of the stars upon the envelopes and the origin of occultations means an accurate measurement of the position and form of these objects, but promises to supply occasional hints of the cometary absorption of stellar light.

Bibliography.—Bessel’s method of treating predictions of occultations is given in ‘Astronomische Nachrichten’ (No. 145). A number of graphical, or partly graphical, methods, useful to observers in predicting occultations, have been published in recent years. Among these may be mentioned the suggestions of G. W. Hough in ‘Popular Astronomy’ for 1897; Major Grant’s diagram given in ‘Hints to Travellers’; M. G. Bijourdan, ‘Occultations’ in the ‘Annales de l’Observatoire de Paris’ (Vol. XXIII.), and the graphical method of Rigge, No. 3786, ‘Astronomische Nachrichten’. In the same journal, (No. 2388), Seeliger has discussed the conditions of frequency of occultation of stars by planets.

MOnroE B. SNYDER.

Occupancy. See Possession, Law of.

Occupation, Hygiene of. This subject covers a consideration of the health of those who labor as affected by the varieties and conditions of their work, as well as a consideration of disease or deterioration arising from trades and pursuits. Its consideration, therefore, includes much that has been discussed under hygiene and sanitation (qq.v.), such as a proper amount of sunlight, adequate air-space, in proportion to the number of people in a room, frequent or constant ventilation, the removal of waste products, the condition of the soil under dwelling or factory, the regulation of temperature, water-supply and drainage, etc.

In the special field of hygiene of occupation are included maladies resulting from harmful influences in certain occupations, whether due to poisons, infections, or irritants. Legislation has, in many countries, been directed toward the improvement of all the conditions of labor, and has resulted in shortening hours, prohibiting the young or immature from certain work, and neutralizing poisons; and the tendency of paternal legislation to protect injured workers has the sanction of the courts. In making laws workers are using in making colors, calico-printing and photography, as they are excellent mordants for wool. They cause bronchitis, asthma, and ulcers, especially ulcers of the nasal cartilages. Copper and brass workers suffer from laryngitis, depression, cold perspiration, nausea, muscular pains, headache, fever, and great debility. India-rubber workers are poisoned by the bisulphide of carbon used. Tobacco and cigar-smokers, especially when tyros, suffer from headache, nausea, dizziness, faintness, transient loss of sight, and catarrh, and patches of induration appear in their lungs. The makers of drugs and chemicals suffer from the fumes of acids and irritating gases, from high temperatures, and from alkali dust.

Mining and Quarrying.—These occupations involve danger to life and health from accidents, such as being crushed by rock or coal, or injured by machinery, explosions, falling from ladders, etc.; and from gases and foul drinking-water.

Workers in Compressed Air.—These suffer from caisson disease (q.v.).
OCEAN

Trades Risking Infection.—Such trades are the working in hides or horsehair, wool-sorting, whereby anthrax (q.v.) is contracted; also rag-sorting and grinding, those who work at which are being liable to any disease prevalent in the country from which the rags come.

Occupation Neurouses.—Disorders so classed are nerve affections whereby the worker is incapacitated as a result of muscular spasm. Overuse causes a constant fatigue in certain groups of muscles. The most prevalent examples of this class is writers' cramp, which dates from 1820, when steel pens displaced quills. It is oftener found in men than in women, and occurs mainly between the ages of 25 and 40. Continuous writing, especially under mental pressure, operates as the exciting cause; but like all occupation neurouses, it is grafted on an underlying neurasthenia, runs a chronic course, and is difficult to relieve. During the use of the pen, the hand clenches involuntarily, and the pen is driven into the paper and downward toward the wrist. The use of a typewriter is the only remedy found, for any apparatus has been devised to obviate the trouble. In some cases neuritis follows. Other forms of these neurouses are telegraphers' cramp, affecting one in 200 operators; musicians' cramp; milkers' spasms; sewing spasm, etc. In these cases the underlying neurasthenia must be treated. Rest, massage, electricity, and hydrotherapy are useful.

In the treatment of all trade diseases removal of the cause is imperative. In nearly all of them ventilation and sanitary precautions are essential. Organic conditions must be treated separately, according to their nature. Consult Aclidge, 'Pathogenic and Diathetic Diseases of Occupations' (1872); Oliver, 'Trade Diseases' (1903).

Ocean, The, or Sea, comprises the continuous body of water which covers the greater part of the earth's surface, the area being 2½ times that of the dry land. The latter is for its greater part aggregated on the Northern hemisphere, the Southern is preeminently oceanic. The ocean is divided into the great divisions which have partly natural, partly imaginary boundaries.

The Pacific, the largest one, is bounded on the east by America and the meridian of Cape Horn, on the west by Asia, the Great Sunda Islands, Australia and the meridian of Tasmania, on the north it terminates in Bering Strait and on the south at the Antarctic circle.

The Atlantic Ocean, the next in size, is bounded on the east by the coasts of Europe, Africa and the meridian of Cape Agulhas, on the west by America and the meridian of Cape Horn, and on the north and south by the Arctic and Antarctic circles respectively.

The Indian Ocean is bounded on the east by the Great Sunda Islands, the west and south coast of Australia and the meridian of Tasmania, on the west by the coast of Africa and the meridian of Cape Agulhas, on the north by the coast of Asia and on the south by the Antarctic circle.

The Arctic and Antarctic Oceans comprise the waters between the Arctic circle and the North Pole, the Antarctic circle and the South Pole respectively. The actual boundaries of the oceans do not always agree with these theoretical ones; thus the northern coasts of America, Europe and Asia are the actual boundaries of the Arctic Ocean; Hudson Bay and the White Sea are included, although they reach far into the temperate zone. Furthermore, the Arctic circle is not the actual boundary between the Arctic Ocean and the Atlantic, but a line drawn from Greenland to Norway by way of Iceland, the Faroe and Shetland Islands. From a geological point of view, there is no such thing as an Antarctic Ocean; there are no land surfaces or submerged ridges that separate it from the adjoining oceans. The area should properly be divided among the adjoining great oceans—the Atlantic, Pacific and Indian; when we speak popularly of Antarctic Sea and Antarctic expeditions we refer to the entire region that lies south of the extreme southern points of the land masses, Cape Horn, Cape Agulhas and Tasmania, in latitudes 56°S, 34°51' S, and 43°49' S, respectively.

Areas.—The areas of the three great oceans are given at 67.7 million square miles for the Pacific, 34.2 for the Atlantic, and 18.6 for the Indian. The two Polar Seas are much smaller, but no exact figures can be given. It is known that there are about 3.1 million square miles in the North Pole regions and 8.3 in the South Pole regions wholly unexplored. The highest latitudes reached in the eastern Arctic Ocean are 86°13' in lon. 60°72'E. (by Nansen, 1900), 86°34' in lon. 64°15'E. (by Cagni), in the western Arctic Ocean 84°17' to the northward of Greenland (by Peary, 1902). In the Antarctic Ocean the highest latitudes are 74°15' in lon. 34°W. (Weddell, 1823), 71°30' in lon. 88°W. (the Belgian Expedition, 1898), and 78°50' in lon. 167°W. As to dimensions, the Pacific is the widest, with 9,400 nautical miles between Panama and the Philippines; the Atlantic is much narrower, about 3,700 nautical miles between Cape Agulhas and the La Plata, or 4,500 miles between Cape Bojador on the African Coast and the Rio Grande, if we include the Gulf of Mexico. The Indian Ocean has its greatest width between the southern capes of Africa and Australia, over 6,000 nautical miles. The distribution of islands plays a prominent part in the physiognomy of the oceans. We have to distinguish between oceanic and continental islands. The open Atlantic is rather poor in oceanic islands, more so is the eastern part of the Pacific, and especially poor is the northern part of the latter ocean and the eastern part of the Indian Ocean. The South Pacific is unsurpassed for its wealth of oceanic islands; "small size" is a characteristic feature of these islands, in fact the hundreds and thousands of Polynesian Islands have a total area less than that of Celebes. Each ocean has its share of continental islands, which includes not only those near continents, but also such as have a continental structure, of which New Zealand is a type. The Pacific has its East Indian Archipelago, New Guinea, etc.; the Atlantic, the British Islands, the Antilles; the Indian Ocean, Madagascar and Ceylon; the Arctic, Spitzbergen, Nova Zembla, etc. According to size Greenland with 0.81 million square miles heads the list of large continental islands, with New Guinea, Borneo, Madagascar, Sumatra, Nipon, Celebes, Java and Cuba following. In the order of their size there is yet another element which imparts diversity of character, not only to different oceans, but to
different parts of the same ocean—the development of the coast line. An ample development, the presence of deep incisions, is considered a great factor in the promotion of culture. Europe with the Mediterranean, Baltic, North Sea and English Channel; the eastern coast of North America with the Gulf of Saint Lawrence, the Gulf of Mexico and Caribbean Sea, are especially favored in this respect, while the absence of deep incisions is noticeable in the contour line of the same areas in Africa and South America. A very peculiar feature in this respect is the border seas which line the eastern coast of Asia, these are in succession, commencing at Bering Strait, the Bering Sea, Okhotsk Sea, Japan Sea, East Sea, and South China Sea. A very rich development, though on a smaller scale, is imparted by glacial action to coast lines in northern regions; we notice this especially on the coasts of Norway, Iceland, Greenland, and the northeast and northwest coasts of America.

Depth.—The mean elevation of the land surface is estimated at about 383 fathoms, and the mean depth of the sea at between 1,900 and 2,000 fathoms, hence the latter is about five times as great as the former; but in spite of this disparity, the culminating heights of the land (the Gaurisankar with 29,000 feet) approach very nearly the greatest depths of the sea (the Guam trench with 5,260 fathoms or 31,614 feet). The mean depth of the three great oceans is about the same, the Pacific is slightly deeper and the Indian rather shallower than the Atlantic Ocean.

The bed of the Atlantic has a peculiar form; instead of one deep basin separating the Old and New Worlds, as it was thought to be fifty years ago, there are two separate troughs, one on the American and the other on the European side, separated by a rise which commences at Iceland and passes through the middle of the ocean, taking in on its course the Azores, St. Paul and Ascension Islands, and has been traced as far south as lat. 40° S. This rise was formerly designated the Dolphin Rise, but in modern nomenclature it is Atlantic Rise. The trenches, which are divided by gentle swells into smaller basins, terminate on the northern side in cross ridges, the Rio Grande and Whale Ridges, and on the north in a ridge stretching from Greenland to Iceland and thence to the Shetland Islands. It is called the Icelandic Ridge and has a depth of less than 328 fathoms. The depth of the basins exceeds 3,000 fathoms (3,825 southeast of the Bermudas). The greatest depth, however, 4,662 fathoms, is not found in these basins, but in a trench off Porto Rico which terminates in the Old Bahama Channel. It has been noticed that the arms of the North Atlantic in the higher latitudes, like the Baltic, North Sea and English Channel on the European side, and Hudson Bay and the Gulf of Saint Lawrence on the American side, show that the greater number of them in lower latitudes have comparatively great depths, the Mediterranean 2,406 fathoms, the Bay of Biscay 2,625 fathoms, the Gulf of Mexico 2,119 fathoms, and the Caribbean Sea 3,428 fathoms. The highest of these basins in the north part distinctly deeper than the southern. In about lat. 20° N. are the Hawaiian Islands rising from a plateau of over 1,000 fathoms depth and to the northward and southward of it are basins with over 3,000 fathoms depth which extend in an east and west direction over the greater part of the width of the ocean. The southeastern Pacific or, more definitely speaking, that part to the eastward of the Marquesas and other coral islands, appears to have been more charily located by the explorers and surveyors than any other part of the great oceans. We have no exact knowledge of the disposition of its basins and ridges, but may form some conception of the depths from the observation that, barring the immediate vicinity of the coast, the General soundings recorded of less depth than 1,450 fathoms, or more than 2,711 fathoms. Further west we notice the groups of innumerable coral islands which have become historic from the investigations of Forster, Darwin, Dana and A. Agassiz. They rise rather precipitously from depths of between 1,000 and 3,000 fathoms. Only passages of very moderate depth lead from the deep parts of the western Pacific into the Indian Ocean through the archipelago of islands which separates Asia from Australia, but within this archipelago there are several basins which show rather remarkable depths—the China Sea with 2,715 fathoms, the Sulu Sea with 2,950 fathoms, the Celebes Sea with 2,795 fathoms, the Banda Sea with 4,000 fathoms, the General Sea with 2,518 fathoms. The uniformity of these depths appears to indicate that these successive basins were at some remote period parts of a continuous sea and that their separation is due to volcanic eruptions. The discovery within the last thirty years of several areas of local depression in different parts of the Pacific whose depth is far in excess of those of the large basins, also leads to the supposition that they are the result of violent volcanic action. They are found in close proximity to the coast of the mainland or close to chains of islands in the shape of longitudinal depressions, designated as trenches. The deepest one of these trenches is the Guam with 5,260 fathoms (the deepest sounding ever recorded), the Kermadec-Tonga with 5,155 fathoms, the Japan with 4,650 fathoms, the Aleutian with 4,037, and the Atacama, off the coast of Peru and Chile, with 4,175 fathoms depth.

Of the three great oceans the Indian appears to be the least complicated in form, having only one great basin of 3,532 fathoms depth; this is found in its eastern part, in the bight formed by the west coast of Australia and the Great Sunda Islands.

The Arctic Ocean may properly be divided into two parts, separated by Greenland, which descends into the temperate zone to latitude 60°. The eastern part lies north of Europe and Asia and the western part north of America. This ocean was formerly credited with very moderate depths, less than 700 fathoms, this mainly for the reason that the regions earliest known, those just north of the continents, were very shoal, but late Arctic investigators have noticed the existence of a deep trough, 2,650 fathoms between Greenland and Spitzbergen, which is taken as a continuation of that of the Atlantic beyond the Icelandic ridge, and also depths of over 2,000 fathoms far to the westward and baying shores than any Spitzbergen, indicating the existence of another large basin. In the western part we find at Davis Strait, in about the latitude of the Arctic circle, a barrier of 360 fathoms depth which separates the trough of the western Atlantic.

Vol. 11-31
OCEAN

from Baffin Bay. Except Baffin Bay, which has depths of over 1,000 fathoms, the entire region to the westward as far as Bering Strait seems to be a shallow; in Bering Strait the greatest depth is only 28 fathoms.

Since the time of the Antarctic expedition of Wilkes and James Ross (1839-43) the opinion has prevailed that the Antarctic Ocean was one of the shallowest parts of the great oceans, and that gradual shoaling would have to be expected from the southern parts of the great oceans toward the Antarctic continent. This opinion was based upon the nature of the soundings which Ross took near the newly discovered land and which indicated a rapid shoaling, but has been dispelled by the results of the recent Antarctic expeditions which show depths of over 3,000 fathoms to the southward of Africa in about lat. 60° S., 2,975 fathoms between Madagascar and Kerguelen Island, and between the latter and the Antarctic Continent 2,540 fathoms. We are rather interested in the depths existing between the southern capes of the continents and the nearest land to the southward in order to ascertain if any of these shallow regions exist, such as we have traced between North America and Asia on one side and Europe on the other. Between the Cape of Good Hope and Bouvet Island, 2,902 fathoms have been found, between Cape Horn and the New Shetland Islands 2,106 fathoms; there are no soundings between Australia and the Antarctic continent, but rather less than 2,000 fathoms are expected.

Composition and Density of Sea Water.—The briny taste and higher specific gravity of sea water than fresh water is due to the presence of salts, held in solution, and although the absolute quantities of these salts are very variable, the relative proportions are always very nearly the same. In 1,000 parts of sea water are found on an average 26.9 parts of chloride of sodium (common salt), 3.2 parts of chloride of magnesium, 2.2 parts of sulphate of magnesium, 1.3 parts of sulphate of lime and 0.7 residue.

The salinity is increased by evaporation on the surface, and although this is supposed to be always active, it is greatly promoted by high temperature and strong dry winds. The salinity is lowered by the addition of fresh water either from rivers, rain or melting ice. The highest salinity is found in the regions of the trade winds with the following results: 37.9 in the North Atlantic, 37.6 in the South Atlantic, 36.4 in the Indian Ocean, 35.9 in the North and 36.9 in the South Pacific, each in 1,000 parts of water. Between these regions of high salinity in approximately latitudes 20° to 30° both north and south, there is found in the neighborhood of the equator a zone of low salinity, 35.5 to 35.0 in the Atlantic and 34.5 to 34.0 in the Pacific, and this is attributed to heavy rains and weak, humid winds. In the higher latitudes a rapid decrease of salinity is noticed with increase of latitude, except in regions that are reached by the Gulf Stream, and there is a density of the sea found beyond lat. 76° N. between Spitzbergen and Norway, while in the southern oceans this density is not met with far beyond lat. 40° S., and not so far in the North Pacific Ocean. The Gulf Stream is fed by water of highly saline waters which both the north and south trade winds convey to the eastern shores of North America, has a density at least as high as the North Atlantic in the trade-wind region, while several arms of the sea in the Bahamas has a density of nearly 1 degree lower.

The greatest densities, exceeding those of the open ocean, are found in land-locked basins in warm and dry climates; thus we find 41 in the Red Sea, 48 in the Persian Gulf, 37 in the Mediterranean. Copious additions of river water reduce the salinity, and for this reason we find low densities along the eastern and Gulf coasts of the United States, and when such waters empty into basins with narrow entrances we observe even lower degrees of salinity, thus 15 to 18 in the Black Sea and from 5 to 8 in the Baltic. Salinity is also reduced by melting ice, as we notice especially in the North Atlantic, where two mighty currents, the East Greenland and the Labrador, carry vast quantities of ice in the shape of bergs and floes from the Arctic regions toward the south. Concerning the vertical distribution of salinity, it has been noticed that it decreases to the depth of 200 to 300 fathoms; in those regions where currents take place, like the trade-wind regions, and increases to the same depths where a dilution occurs; that beyond these depths it decreases slowly to the depth of 1,400 to 1,830 fathoms, thence increases again until the bottom is reached. In the inland seas, however, the density generally increases as the depth to the bottom.

Temperatures.—The rule holds good generally that the mean annual temperature of the surface waters is somewhat higher than that of the air, and that it fluctuates much less. The warmest water is found at the equator, and here the Indian Ocean and the western Pacific exceed in heat the Atlantic and eastern Pacific. From these equatorial regions there is a gradual decrease in temperatures north and south, but the temperatures of northern regions are generally higher than those of the southern in corresponding latitudes for the reason that the warm water which is carried by the southern trades across the equator is replaced by cold water from the Antarctic regions, which is assumed to be the coldest on earth. Furthermore, in the higher northern latitudes the eastern parts of the oceans are warmer than the western, the drift being from the North Atlantic is much warmer than the northeast Pacific for the reason that the Gulf Stream is a much more powerful stream than the Kuroshio. The warm waters which we meet at the equator reach to the depth of only about 50 fathoms, the cold waters which we meet beyond that depth are assumed to come from the Antarctic regions. In the regions of the trade winds the surface water, made heavy by evaporation, descends, and hence we find here in depths of from 20 to 250 fathoms the water from 4° to 6° warmer than in the equatorial regions. But this water moves not only downward, but drifts to greater distances from the equator. The last traces of these tropical waters we find in the benighted parts of the Arctic Oceans; this water has parted with nearly all the heat with which it started on its journey, by supplying cold currents and by melting ice, but still retains enough salt to betray its origin. From the Pacific Ocean, parts of the Arctic Oceans; there is a slow movement of the water toward the equator, and although that from the north
polar regions starts with much lower temperatures, between $-2^\circ$ to $-3^\circ$ C, it rapidly gains heat and shows temperatures of from $+1^\circ$ to $+2^\circ$ C in middle northern latitudes, while under the equator and farthest south on the bottom, the temperatures do not vary greatly from 0$^\circ$ C. This distribution leads to the assumption that the cold waters which in the equatorial regions rise toward the surface, are of Antarctic origin. The ice of the North Pole should be formed on the surface of sea water until the whole body of water has been reduced to less than $-25^\circ$ C, but in the Arctic regions freezing generally takes place before this temperature is reached, on account of the slowness of vertical circulation, and warm layers are often found under the surface ice. For seven or eight months of the year the entire Arctic Ocean, with the exception of the southern parts of the Greenland Sea and Baffin Bay, is covered with ice. In the Atlantic, Iceland, the British Islands and the coast of Norway; in the Pacific the Pribilof Islands and Aleutian Islands are free of ice all the year round. Thawing in the Arctic regions commences about the end of May. The Arctic summer is rather short, and ice begins to form in September. The discovery of a "northwest passage" from the Atlantic to the Pacific furnished the motive for the greater number of expeditions commencing with those of Cook (1776) and Vancouver (1792-4) on the Pacific side of America, and those of Parry (1819-24) and Ross (1831-3) on the Atlantic side; these undertakings were finally abandoned only after human endurance had been put to its severest tests and many lives sacrificed in the vain endeavor. Nordenskjöld in 1878-9 successfully accomplished the northeasterly passage by way of the Siberian coast; but the experience of subsequent expeditions teaches that the chances for finding an open passage all the way through are rather uncertain. In the Atlantic two great currents convey the melted ice with its freight of bergs and floes from the Arctic regions, the East Greenland and Labrador currents. The first one, after following the east coast of Greenland to Cape Farewell, turns north along the eastern side of Davis Strait, crosses over to the western side before reaching Baffin Bay and joins the Labrador current. The latter flows southward through the Strait of Belle Isle; but the principal part passes along the Newfoundland coast and banks, and if not dissipated by the warm waters of the Gulf Stream, dips under it. Here on the southern edge of the Banks of Newfoundland we witness the most rapid change of temperature found in any part of the ocean, in May 10$^\circ$, from 5$^\circ$ to 15$^\circ$, within two degrees of latitude, or from the temperature off the coast of Iceland to that off the coast of Spain. There are no, after following the east coast of Greenland, and in southern latitudes the temperature of temperature in enclosed basins is essentially different from that in the open ocean by decreasing from the surface downward to the depth of the channel which opens into the ocean and remaining constant thence to the bottom. Thus in the Celebes Sea a uniform temperature of 38$^\circ$ is found between 800 fathoms and the bottom (2795 fathoms), while in the adjoining Sulu Sea, with about the same depth, the temperature is 30.3$^\circ$ below 400 fathoms. In the Gulf of Mexico and the Caribbean Sea a uniform temperature of 42$^\circ$ is found below 900 fathoms, and in the Mediterranean, with a depth of less than 200 fathoms in the Strait of Gibraltar, the temperature from about 270 fathoms to the bottom is 13$^\circ$.

The Bottom of the Sea is different in many respects from the surface of the land. The mantle of sea water protects it from subaerial disintegration and erosion which gives such a varied shape to the landscape, and although sea water may decompose the bottom of the ocean, there are no currents strong enough to transport the residue to distant regions. While the land surface is constantly reduced by denudation, the bottom of the sea receives constant accretions. The materials which contribute to this process are either of continental or pelagic origin. The first are either such as the ceaseless actions of the waves remove from exposed parts of the land or material from the coast by the rivers. The currents carry these materials out to sea, and while the heavier ones, such as gravel and coarse sand, remain near the shore, the lighter ones, as fine sand, silt and mud, are transported to considerable distances before they sink to the bottom. In this way the coast is lined with a fringe of continental deposits which may be quite narrow, but often attains a width of 100 miles or more. This fringe is designated as continental shelf; when broad it has a moderate slope, and is generally assumed to terminate with the 100 fathom curve. It is succeeded by a well defined steeper slope called the continental slope. Continental or terrigenous deposits are often found at considerable distances from the coast, disconnected from the shore deposits; in such cases they are formed by conflicting currents losing their velocity and depositing the sand and silt which they carry. These deposits, called sand banks, often constitute dangers to navigation. In the higher latitudes melting icebergs and floes produce banks; in this way the large Newfoundland Banks, 270 miles wide, are supposed to have been formed.

The finest terrigenous material, designated as mud, is carried to sea far beyond the 100 fathom limit, and in the shape of blue, red, green, volcanic and coral mud, covers about one seventh part of the ocean's bottom to depths of over 1,000 fathoms. These "muds" also cover the bottom of the large continental basins with the exception of the Gulf of Mexico and Caribbean Sea, and prevail in the Arctic Seas. The continental slope generally descends very gently from the "shelves" to the troughs near the sea. The Pacific, the ice generally disappears a short distance south of the Pribilof Islands. In the Southern hemisphere we have a vast region of ice the limit of which is lat. 57$^\circ$ S. off Cape Hoorn, and in Southern latitudes the ice begins to form on the vertical distribution of temperature in enclosed basins is essentially different from that in the open ocean by decreasing from the surface downward to the depth of the channel which opens into the ocean and remaining constant thence to the bottom.
component. Globigerina ooze, composed mainly of the microscopic shells of a genus Foraminifera, covers over one third of the ocean’s bottom, it prevails in the medium depths and especially where their currents are warmed, as, for example, like the Gulf Stream. The largest area is found in the Atlantic Ocean; it predominates in the northwestern part of the Indian, but is restricted to the Poleynesian Plateau in the Pacific Ocean. A variation of this ooze, which contains large numbers of shells of mollusca, principally those of Pteropods, is called Pteropod ooze, and is found on the central ridges of the Atlantic, in depths not exceeding 1,400 fathoms, and also in the Gulf of Mexico and Caribbean Sea. The red clay occupies the greater depths of the ocean, and a larger area than any other deposit, more than one fourth of the earth’s surface. It is a genuine clay and assumed to be the result of the decomposition of pumice and other volcanic materials. The absence of shells in this deposit is not thought to be of proof of the absence of animal life; apparently the shells have been dissolved by the free carbonic acid of the sea water and absorbed by the clay before reaching bottom. In some parts of the deepest parts of the Indian and in the eastern Pacific, silicious radiolarian remains are found in such quantities in the red clay that this kind of deposit has been designated radiolarian ooze.

See OCEAN CABLES—OCEAN CURRENTS. ADOLPHUS LINDENKOHL. Of the U. S. Coast and Geodetic Survey.

Ocean Cables. See CABLES, SUBMARINE.

Ocean Currents. The surface of the ocean is very rarely in a state of perfect rest. We make a distinction between vertical and perceptible horizontal motion; the latter we call currents. Near the coast, in channels and estuaries, the currents are referred to a variety of causes, among which the tides are the most important, but in the open sea the winds are recognized as the primary cause of all the great currents. A regular and continuous wind blowing over the surface of the ocean will induce motion in its surface, but the velocity communicated to the water is always far less than that of the air producing it. In consequence of the viscosity of the water the motion of the surface will be transmitted in part to greater or less depth but generally diminishing rapidly below the surface. The rate of this motion in a body of water and the depth to which it penetrates are altogether a question of time, and it has been demonstrated that if the winds act continuously upon an unconfined ocean the entire body of water from surface to bottom will have motion imparted to it. Furthermore, the momentum acquired by the water in motion will carry it on in its course for a considerable time with slowly diminishing velocities, should the wind cease to blow.

The trade winds are those which in the Atlantic and Pacific oceans blow with great regularity all the year round on both sides of the equator in the Northern hemisphere from the northeast and in the southern from the southeast. In the Atlantic the southeast trades are the prevailing winds between the Cape of Good Hope and Rio de Janeiro to the equator, the northeast trades between lat. 12° N. and about lat. 30° N. The two regions are separated by a region of light changeable winds and calms called the equatorial calms or doldrums. The trade winds induce currents on the ocean’s surface called the North and South Equatorial Currents respectively. Their limits approximate those of the corresponding trade winds: the northern lies between lat. 10° and 28° N. and has a mean velocity of 14 miles per day, the southern between lat. 15° S. and the equator and has a mean velocity of 10 miles per day. The South Equatorial Current from about lat. 20° S. passes north of the equator; this may be due partly to the southeastern trades which extend into the Northern hemisphere and partly to the configuration of the South American coast which compels the current to take a northwesterly course. It finally enters the Caribbean Sea through the different passages among the Lesser Antilles; a small portion, however, separates from the main body and moves south, following the South American coast. Between the two Equatorial Currents we find the Guinea Current which belongs to a secondary class, called compensating currents, which always run in an opposite direction to the primary, and are explained by the need to restore equilibrium disturbed by the primary current. The Guinea Current commences about 35½° W., attains a velocity of 15 miles, and on reaching the coast of Africa near Cape Palmas, passes into the Gulf of Guinea, along part of the waters which the North Equatorial Current conveys to the American shores enters the Caribbean Sea and joins those of the South Equatorial; the other part moves along the Bahamas toward the northwest. The waters which the Equatorial Currents carry into the Caribbean Sea are assumed to acquire their motion partly from the impulse of the trades, partly in consequence of the prevailing easterly winds and to pile up against the western shores. Very little doubt is entertained at present that the current through the Strait of Yucatan into the Gulf of Mexico, which is one of the strongest on record (from 60 to 120 miles per day), is solely due to the difference of level between the Caribbean Sea and the Gulf. But these currents do not tarry in the Gulf of Mexico, its level being in turn higher than that of the Atlantic; they are, consequently, forced toward the Strait of Florida where they find an outlet, enter the Atlantic as the celebrated Gulf Stream, a name first used by Franklin. In the narrowest part of the channel, off Cape Florida, it approaches the coast to within 15 miles, occupies the entire width (40 miles) and depth (482 fathoms) of the channel and attains velocities of 60 to 100 miles per day at the surface. By calculation it has been shown that a current of the velocity of the Gulf Stream requires a difference of elevation of at least 0.7 feet of the Gulf over the Atlantic, which difference agrees very nearly with that found by direct leveling across the Florida Peninsula. After leaving the Straits, the Gulf Stream moves to the northward over a rocky bottom with a depth of 450 to 570 fathoms, and distant from the coast about 300 to 350 miles. In lat. 34° it enters the deep water of the ocean, when off Cape Hatteras, it again approaches the coast, being distant only 35 miles and in depths of over 1,500 fathoms. Its temperature there is between 31° C. in summer and 26° C. in winter, having lost only about 3° since
Leaving the Straits of Florida, it is readily recognized by its high temperature and dark blue color, being particularly well defined. It is not a deep current; at the depth of 250 fathoms its temperature is 10° C., and its temperature is 10° C. under the water in the South Atlantic. This depth of 15.6° is found. This suggests the presence of a current at 15° N. that moves over a wedge of cold water which comes from the north and west and descends toward the east into the depths of the ocean. The width of the Stream off Hatteras is about the same as in the Straits of Florida, 40 miles, and its velocity is between 50 and 73 miles per day. After leaving Cape Hatteras it gradually changes its northeasterly direction into due west with constantly diminishing velocity and temperature until it reaches the southern edge of the Banks of Newfoundland which it does in summer in lat. 42° N. and in winter in 41° N., with temperatures of 22° C. and 10° C. respectively and velocity of 24 to 30 miles per day. It is here no longer considered as an ocean current but a drift, and is called the Gulf Stream drift. The deflection of the Gulf Stream toward the east is attributed partly to the rotation of the earth and partly to the direction of the prevailing winds. While the central part of the Gulf Stream drifts northward and produces an open channel to the southern part of Baffin Bay during winter; another one passes to sink and to reach the Iceland and Greenland and the Gulf Stream, but it soon sinks into the depths of the sea. A more persistent branch passes between Iceland and the British Isles and the coast of Norway, and has been traced to the eastward as far as the west coasts of Spitzbergen and Nova Zembla during the summer season. The southern part of the Gulf Stream drift, more properly called Atlantic drift, leaves the main body south of the Azores and, as the North African Current, follows the coast of Africa to Cape Blanco where it joins the North Equatorial Current. The vast oval-shaped area enclosed by the North Equatorial Current, the Gulf Stream and the Gulf Stream drift is one of calms and weak drifts, and is called the Sargasso Sea from the sea-weed which accumulates about its borders.

Turning to the currents that descend from the polar region into the Temperate zone, we find in the removal of vast bodies of water from the western part of the ocean to the eastern by the Gulf Stream the cause of other currents, compensating currents, whose function it is to move waters in the opposite direction, from the northeast to the southwest, for the purpose of restoring equilibrium, as in the Labrador Current. The prevailing northwesterly winds in Baffin Bay assist such a movement along the coast of Labrador and Newfoundland to the southward, and this direction is maintained until Cape Race has been passed where Cape Race Current is set off to account of the rotation of the earth. This current is active during the season of melting ice. Field ice generally appears on the Banks as early as February and disappears about the end of May. Icebergs are most abundant in May and are found in diminishing numbers until the end of August. The majority of bergs come from the west coast of Greenland (some few come from Frobisher Sound and Hudson Strait), and move at the rate of about 10 miles per day. Similar conditions to those described produce a southerly current along the east coast of Greenland, called the Greenland Current, which rounds Cape Farewell and turns to the northward toward the depression which the Labrador Current has created in Baffin Bay. After skirting the ice barrier which usually exists in Davis Strait in the spring, it merges into the Labrador Current. The temperature of these currents is very low, but their density is comparatively high for the reason that they are shallow and rest on warm and heavy waters and have been constantly gaining salt during their progress. Being comparatively heavy the Labrador Current sinks under the Gulf Stream. The cold waters which extend along the western edge of the Gulf Stream as far as Cape Florida have sometimes been considered a continuation of the Labrador Current, but it appears that the movement of these waters toward the southwest is extremely slow and disguised by the more powerful motion produced by the winds and tides. Furthermore, the movement of this littoral band is retarded by cold currents making their way into the Gulf of Saint Lawrence and Gulf of Maine. In cold years its drift is directed toward the western shores of Europe and moderates their climate, one part enters Davis Strait and produces an open channel to the southern part of Baffin Bay during winter; another one passes to sink in and reach the Labrador Current as well as the cold waters of the coast regions pass beneath the edge of the Gulf Stream (which is very thin) and continue to sink to form the slope of the continental plateau as they drift slowly southward until they reach the bottom of the ocean with a temperature of 2.2°. The existence of a cold wall along the western edge of the Gulf Stream and cold bands within its limits, which were discovered by the early Gulf Stream explorations and which have since been denied and reaffirmed, can hardly be considered as permanent features; similar bands are often noticed in thin supercritical currents and are the consequence of underlying cold water being forced to the surface either by lateral pressure or by the sinking of the warm water by reason of evaporation or loss of heat.

That part of the South Equatorial Current which turns to the southward off Cape San Roque, called the Brazilian Current, is quite weak, having a velocity less than 20 miles per day; off the Falkland Islands it is joined by the Cape Horn Current which comes from the southern Pacific and crosses the South Atlantic. When off Cape of Good Hope this "Westwind drift" turns to the northward and as a cold current, the Benuefa Current, flows along the west coast of Africa with a velocity of 12 to 20 miles per day. Off the mouth of the Kongo it turns to the westward and joins the South Equatorial.

The currents of the Pacific are similar to those of the Atlantic. The North Equatorial has its origin near the Revillagigedo Islands off the coast of Mexico, in lon. 110°, flows between the datums of 10° and 15° S. at a westward direction across the entire width of the ocean to the Philippines, about 7,500 miles, with a velocity of 12 to 18 miles per day. The South Equatorial extends from lat. 15° S. to the equator and has its greatest velocity near its northern edge. It has a mean velocity of 24 miles per day, but this is often more than doubled in the eastern part. In the neighbor-
hood of the Fiji Islands it divides, one part, the
northern, known as the Rossel Current, passing through the passes between the Fijian and the Torres Strait and the north coast of New Guinea; the southern branch, called the Australian Current, trends toward the east coast of Australia with a velocity of 24 miles, but gradually loses strength and is deflectected toward the southeast. The Equatorial Counter-Current, setting toward the east, commences at Mindanao in the Philippines and extends to the Bay of Panama and is especially strong during the period from June to October.
The Japan Current, or Kuroshiwo, is a continuation of the North Equatorial and is the Gulf Stream of the Pacific. Starting from the east coast of Luzon, it passes the east coast of Formosa; changing its course to the northeast, and makes for the southwestern point of Japan. Off this point the current divides, the major portion passes through Van Diemen Strait and the passages between the Linschoten Islands, and runs parallel to the southern shores of the Japanese Islands, attaining its greatest velocity of 48 to 72 miles per day. It leaves the coast of Japan after having reached Cape Maboye, to the eastward of Yokohama, and turns to the northeast, like the Gulf Stream off Cape Hatteras, without, however, reaching beyond the latitude of 40° N. One branch of the Kuroshiwo parts from the main stream before Van Diemen Strait has been reached, enters the Japan Sea through the Korea Channel and follows the west coast of Japan to La Perouse Strait, through which it passes into the Okhotsk Sea and flowing along the west shores of the Kurile Islands it can be traced to the west shore of Kamchatka Peninsula. The strength of the Kuroshiwo is greatly influenced by the winds of the western Pacific; during the summer months, between the middle of May and the beginning of October, the southwest monsoon blows on the coast of China to lat. 25° N., and is followed during winter by the northeastern monsoon as far south as 30° N., hence it has its greatest strength in August and its least in March when it is hardly recognized as a warm stream. It is an open question whether a branch of the Kuroshiwo enters the Japanese Current, or the current is a single one and so much influenced by the winds and tides that their record does not convey any definite information; but from the fact that the southwestern, or deeper, part of this sea is always free of ice while the northeastern, or shoaler part, during the winter months is covered with an impenetrable mass of ice we may safely conclude that warm water from the Pacific enters the sea, if not as an active current, at least as an infrequent drift. In confirmation of this supposition we find in the deeper parts of the sea during August a mean surface temperature of 7.4°, at the depth of 100 fathoms a minimum of 2.9°, at 200 fathoms a maximum of 3.4°, and at 1,000 fathoms 1.9°, with salinity limited to 35 parts in 1,000. The breaking up of the ice for some distance northward of Bering Strait indicates that a portion of the current passes through the strait. In lon. 150° W. the Kuroshiwo can no longer be considered as a separate current, it assumes a more southerly direction and passes the coast of California as a cold current, the California Current, and finally merges into the North Equatorial in about lon. 130° W. The east Australian Current, corresponding to the Brazilian on the Atlantic, is represented by a cold current; it has a width of 40 miles, with its inner edge about 20 miles off shore, and shows velocities of from 12 to 72 miles. South of Tasmania and New Zealand we find the same westward winds and easterly drift that we noticed in the South Atlantic. On reaching the South American coast a branch of this drift turns to the northward past the coast of Chile and Peru and joins the South Equatorial southward of the Galapagos Islands. This current has a velocity of only 15 miles and is generally supposed to produce the comparatively low temperatures prevailing along the west coast of South America, but these are more correctly attributable to the cold water which rises from the bottom to the surface near the coast. There are no arctic currents in the Pacific on the grand scale of the Labrador, no icebergs, and the ice in Bering Sea is not very compact. In fact the trips over the ice by the natives of both Asia and America in the depth of winter to visit their kinsfolk on Diomed Island, in the middle of Bering Strait, are considered hazardous ventures. The ice in winter extends from Bristol Bay to some miles to the northward of St. Paul Island, thence northwest to Cape Navarin, in the summer months, August, September and early October the arctic pack ice extends from Icy Cape on the coast of Alaska to Herald Island. Floating ice is found as far south as 55° N., 35 miles to the southward of the Pribilof Islands and to about 60° lat. off the coast of Kamchatka. Along this coast there is a cold current in spring and early summer, this is reinforced by cold water which by strong tidal currents may reach the eastern shores of the Kurile Islands through Amphitrite and other straits from Okhotsk Sea. This cold current, the Kurile Current, carries quantities of arctic ice, and is noted for its low temperatures from surface to bottom. It follows the east coast of Japan as far as Van Diemen Strait, is interposed between the shore and the Kuroshiwo and is known as Oya Siwo (green water).

The Indian Ocean shows different conditions from those of the two other great oceans for the reason that there are no currents from the Equator to the Torrid zone. During the summer months the southeast trade winds pass the equator and are changed into southwest winds or southwest monsoon. During the rest of the year, from October to April, the northeast monsoon, which corresponds to the northeast trade winds of the other oceans, blows over the northern part of the ocean. During this period the currents north of the equator have a northwesterly direction, attaining especially great velocities off Ceylon (80 miles) and the east coast of Africa. During the southwest monsoon the water north of the equator moves in the opposite direction, from west to east toward Sumatra, and again attains its greatest velocity off Ceylon. In the Southern Hemispher the latitude of the latitudes of 7° and 20° S. the Equatorial Current flows to the west during the whole year with velocities of between 12 and 36 miles, sometimes as much as 60 miles. Off the east coast of Madagascar the gradient increases between eastern and southern branch. A part of the northern branch turns to the northwest, reaching the Bay of Zanzibar during the southwest monsoon.
OCEAN GROVE—OCEANIDS

and turning into the Equatorial Counter-Current during northeast monsoon. The other part rounds the northern Cape of Madagascar with velocities of 18 to 48 miles and enters the Mozambique Channel as the Mozambique Current. During the northeast monsoon the Equatorial Counter-Current is found between the equator and lat. 7° S. with velocities of from 12 to 18 miles. Its function is to restore the equilibrium by carrying back part of the waters removed by the Equatorial Currents from the eastern part of the ocean. During the southwest monsoon the eastern flow extends over the whole ocean north of lat. 5° S., with velocities of more than 48 miles at the equator. The Agulhas Current is a continuation of the Mozambique Current; it has a velocity of 40 to 51 miles and off Cape of Good Hope meets the cold waters from the vicinity of Cape Horn. The collision of the two currents produces streaks of alternate warm and cold water, differing 8° or more in temperature, a feature which has attracted the attention of many navigators.

The most noticeable feature of the currents in the Arctic Ocean is the almost universal eastward and southeastward set north of the American Continent and the generally westward set north of Siberia, although at a considerable distance from the mainland. Both currents seem to originate north of Bering Strait, and the fact that they set out from this locality in nearly opposite directions has suggested the existence of a large island or continent between the Pole and Bering Strait.

In the Antarctic regions, or rather those to the southward of Tasmania, Cape Horn and the Cape of Good Hope, the drift is generally from west to east, in conformity with the prevailing westerly winds.

In conclusion it may be of interest to notice one or two currents which in a strict sense may not be considered ocean currents but which may explain the function of difference of density in the production of currents. In the Mediterranean we have noticed a higher density in consequence of evaporation than is possessed by the adjoining ocean. In consequence of this difference there is surface inflow of ocean water in the Mediterranean, with a velocity of 48 to 72 miles and an undercurrent of the denser water into the ocean. On the other hand the density of the Baltic is less than that of the adjoining North Sea; hence we have a surface current from the Baltic into the North Sea and an undercurrent in the opposite direction.

A. LINDENHOF.

Of the U. S. Coast and Geodetic Survey.

Ocean Grove, N. J., town in Monmouth County; on the Atlantic Ocean, and on the Central of New Jersey and the Pennsylvania Railroad; about 30 miles south of New York. It is a famous summer resort on account of its fine beach and the ease of access from New York, Philadelphia, and other cities. It adjoins Asbury Park (q.v.); Wesley Lake is on the boundary. The Ocean Grove Camp Meeting Association of the Methodist Episcopal Church controls the town and regulates its laws. The sale of intoxicants and tobacco and theatrical performances are prohibited. The Sunday laws are strict and rigidly enforced. The prominent buildings are the Auditorium, which seats 10,000 persons, cost $75,000, and was dedicated August 1, 1894; the public school building, and the post-office. Religious meetings are held in the Auditorium. The school building, called the Neptune Township High School, cost $72,000. The association owns and operates the electric light plant and the waterworks. The association was organized in 1899; but the first permanent building was not erected until 1875, a wooden frame covered with green boughs, was its appearance when first used. In 1874 a stand for the speakers had been erected, and the audiences sat on temporary seats made by placing planks on treestiles. There are (1904) large hotels and boarding houses and a large number of summer cottages. In the summer months the population varies from 20,000 to 30,000. Pop. (1890) 2,754; (1900) 4,251.

Oceanids, o-shē-ə-nids, or England and Her Colonies, a work of travel by James Anthony Froude, published in 1886. This is the record of a journey made by the author via Cape Town to Australia and New Zealand, and home by way of Samoa, the Sandwich Islands, San Francisco, Salt Lake, Chicago, and New York, in 1884-5.

Ocean’s Life. See Benthos; Deep Sea Exploration; Fishes, Geographical Distribution of; Gloeigerina Ooze; Plankton; Seaweeds; Zoogeography; etc.

Oceanida, o-shē-ان-lί-k∅, or Oceanis, the name given to the land division of the world which is composed of islands in the Pacific Ocean. The limits of Oceanica are not well defined; some geographers include in this division all the oceanic islands in the Pacific, others include the East Indian Archipelago. A subdivision of Oceanica adopted by many is into Western Oceanica or Malaysia, corresponding with what is better known by the name of the Malay Indian or East Indian Archipelago, Micronesia or Northern Oceanica, Polynesia or Eastern Oceanica, and Melanesia or Southern Oceanica. The islands and peoples of Oceanica will be found described under their respective titles.

Oceanids, in Greek mythology, a class of nymphs, daughters of Oceanus and Tethys.
They were 3,000 in number, and were said to have an equal number of brothers. See Mythology.

Oceanus, Οἰκενος, in Greek mythology, the eldest of the Titans, and a personification of the sea. He was called the son of Gaia (the earth) and of Uranus (heaven). Oceanus and Tethys were the parents of rivers, and of the race of goddesses called Oceanids (q.v.). According to another account he was the father of all gods and men. The physical idea attached by the Greeks to the term Oceanus, was that the earth was a flat circle surrounded by a river (Oceanus), out of which the sun and stars were supposed to rise and set, and on whose banks were the abodes of the dead. The term ocean was thus applied especially to the Atlantic, or sea beyond the Pillars of Hercules, in contradistinction to the Mediterranean or internal sea.

Oceanus, a structure found in various groups of invertebrate animals, consisting of a spot of pigment enclosed in a capsule or cavity, generally supplied with nerve-filaments, to which the function of sight is attributed. See Eye.

Ocellus Lucanus, Ὁκελίνθος, a 10th-century abbot. His works are: 'On Law'; 'On Kingly Rule and Piety'; and 'On the Nature of the Whole' (1104 and 1105, 1020). The last of which is the only one of his treatises now extant, excepting some fragments found in Stobæus, written in Doric. 'On the Nature of the Whole' is in Ionic, which fact leads some critics to doubt its authenticity. It is divided into four chapters, in which the author maintains that the whole, that is, Nature, the Universe, has no beginning nor end, and that men have always existed. Consult: Mullach, 'Fragmenta Philosopherum Graecorum' (1800); Taylor, 'Ocellus Lucanus,' translated into English (1831).

Ocellot, Ošé-lot, a tropical American wildcat (Felis pardalis), averaging about three feet in length exclusive of the tail, and about 18 or 20 inches tall. Its body color is a variable and handsome fawn or grayish-brown, marked with lines and spots of similar colors. The ocelot ranges northward as far as Louisiana, and is found in forests, where it preys largely upon birds. It is commonly seen in menageries, and in Mexico it is often found in a semi-domesticated condition about farm-houses.

Ochakov, Ošá-kóf, or Ochakof, Russia, a town in the government of Cherson, on the black Sea, at the mouth of the Dnieper, formerly an important Turkish fortress, with a citadel, the walls of which were 25 feet high. In 1737 it was stormed by the Russians, who lost 18,000 men in the attack. The Turks attempted to recover it with a force of 70,000 men, but were repulsed with the loss of 20,000. In 1738 it was given up by the Russians, who had previously destroyed the works. The Turks fortified it anew in 1743, and held it until 1778, when, after a siege of six months, it was stormed by Suvaroff, who razed it to the ground. By the Peace of 1792 it was ceded to Russia. It has modern fortifications, and some coasting trade. Pop. (1807) 10,784.

Ochil Hills, Scotland, a mountain range on the borders of Perth, Clackmannan, Kinross, and Fifeshire; average breadth, about 12 miles; highest summit, Benleuch, in the southwest, about 2,300 feet above sea-level. The Ochils are of basaltic and greenstone, and contain copper and iron ores.

Ochre, őkér, or Ocher (Greek, οχρος, "yellow," ωχρος, "yellowish green," ωχρος, "shade"), friable clay with an admixture of iron oxides, giving it a color varying from yellow to red, as the iron peroxide is hydrated (yellow) or anhydrate (red). The reddish color may be deepened artificially by burning. Rarely manganese takes the place of iron in the composition of ochre, or occurs in addition to iron, the brownish variety thus formed being called "Sienna" (from its famous source in Italy) or "umber" (Latin, umbra, "shade"). The coloring of these two shades again is deepened by their being burnt. Umber and sienna are largely found, outside of Italy, in New York, Pennsylvania, Missouri, and Tennessee; and the leading States in the production of ochre are Pennsylvania, Georgia, California, and Vermont. But the United States produces lesser ochre and iron oxide pigments than France or Germany. Until recently the home product was inferior to the foreign, being only 50 per cent pure, a fault now remedied by specially designed crucible furnaces, which insure the purity of the increased output. The best yellow ochre is that coming from Oxford, England.

Och'tro, same as Okra (q.v.).

Ochs, őks, Adolph S., American publisher: b. Cincinnati, Ohio, 12 March 1858. His early life was that of a country lad, and he obtained a common school education at Knoxville, Tenn., where for a year he served as carrier and newsboy. In 1871 he was grocer's clerk at Providence, R.I., attending a night school meanwhile. He then returned to Knoxville, where he was a druggist's apprentice for a year and then a printer in 1873. In 1878 he became publisher of the Chattanooga Times, where his ability was distinctly shown. In 1896 he secured a chief interest in the New York Times and as its publisher developed its resources; his purchase of the Philadelphia Times and the Public Ledger followed in 1902.

Ochtman, ők't'man, Leonard, American artist: b. Zonnemare, Zeeland, Holland, 21 Oct. 1854. He settled in Albany with his family in 1886, and became a draughtsman in an engraving office; had a studio at Albany for two years and subsequently took a winter course at the Art Students' League, New York. As a landscape painter he is self-taught, but has traveled through England, France, and Holland for the purpose of study. His powers and skill are shown in such paintings as 'Night on the Miusus River'; 'Autumn Moonlight'; 'Moonlight Night in Spring'; 'A Morning Symphony.' Vivid color, depth of imagination and breadth of treatment characterize his paintings whose truthfulness reveals a genuine love of nature in their author.

Oc'imun, a genus of plants. See Basil.

Ocmulgee, ők-mül'ge, a river in Georgia which has its rise north of the central part of the State, flows south, southwest, and east, uniting with the Ocoee to form the Tennessee. It flows through an agricultural region; its length is about 260 miles. The upper course has many
rapids and small cascades, and the lower course is through a more flat country, covered with pine forests. It is navigable for small steamers for about half its distance from the mouth, to Macon (q.v.).

Oconee, ò-kō'né, a river in Georgia which has its rise in Hall County, flows southeast and unites with the Ocmulgee to form the Altamaha. It is only for about 100 miles from its mouth. Milledgeville, the capital of the State, is on the Oconee.

O'Connell, ò-kôn'ël, Daniel, Irish patriot: b. Cahirc, County Kerry, Ireland, 6 Aug., 1775; d. Genoa, Italy, 15 May 1847. He studied in France at the colleges of Saint Omer and Douay, and in 1793, on his return home, began the study of law. In 1798 he was admitted to the bar, and soon began to distinguish himself both by legal skill and oratory. After a speech made at Dublin in the beginning of 1800, at a meeting held to petition against the union, he was regarded as one of the most promising and energetic of the Catholic leaders. The question of Catholic emancipation being seriously agitated, he was active in every attempt to remove the national grievances, and in 1824 founded the Catholic Association which carried on active agitation in spite of government measures against it. The chief grievance was that Catholics could not sit in Parliament without taking an oath contrary to conscience; in 1828 O'Connell took a decisive step by becoming candidate for Parliament in the county of Clare; he was elected but could not take his seat because he refused to take the preliminary oath. His election, however, was a fact that could not be ignored, and as the feeling in favor of emancipation continually increased, the ministry with the Duke of Wellington at its head decided they must concede it, or risk a civil war. In 1829 therefore the Catholic Emancipation Bill was passed, and under its provisions O'Connell took his seat, and became the leader of the Irish party in the House of Commons. While carrying on this agitation he could hardly avoid making a considerable sacrifice of his practice as a lawyer, and for four years the amount of fees received of a large sum contributed by his countrymen. In 1842 he began the agitation for the repeal of the union between Great Britain and Ireland, holding monster meetings at which he was the chief speaker; in 1843 he was arrested on a charge of conspiracy and sedition; he was convicted and sentenced to fine and imprisonment, but the House of Lords reversed the judgment on 4 Sept. 1844. He then resumed his seat in Parliament, but his influence was lessening as a new Irish party had arisen — called Young Ireland — which advocated more radical measures, and did not favor O'Connell's moral force policy; in 1846 he supported the Whig ministry which still further alienated him from the younger party. His health was failing, and in 1847 he went to Italy, intending to visit Rome, but died at Genoa. He was a most eloquent and forcible speaker, and a leader greatly beloved by his people.

Consult: Cusack, 'The Liberator, his Life and Times' (1872); Dunlop, 'Life of Daniel O'Connell'; Fitzpatrick, 'Correspondence of Daniel O'Connell' (1888); McCarthy, 'History of Our Own Times'; O'Connell (his son), 'Life and Times of Daniel O'Connell' (1846); Wendell Phillips, 'Daniel O'Connell.'

O'Connor, ó-kôn'ór, Arthur, Irish political leader: b. Mitchelstown, County Cork, Ireland, 1763; d. near Nemours, France, 25 April 1852. He was admitted to the bar in 1788, was elected to the Irish Parliament, and as a member of the United Irishmen served as one of their directory of five, in consequence of which he was tried for high treason, but finally discharged. He went to France and on his return to Ireland was again arrested, but made his escape and entered the service of Napoleon as a lieutenant-general in 1804 and later general of division. He published: 'Letters to Earl Camden' (1798); 'The Present State of Great Britain' (1804); etc.

O'Connor, Feargus Edward, Irish political leader: b. near Cork, Ireland, 1796; d. in an insane-asylum 30 Aug. 1855. He was educated at Portarlington and Trinity College, Dublin, and was admitted to the bar. In 1832 he sat in Parliament for Cork and at first supported O'Connell, but later advocated more vigorous methods in reforms for the working-classes, and an estrangement followed. He founded the Chartist party and edited, at Leeds, in its interest, the 'Northern Star.' He was returned to Parliament for Nottingham in 1847, and presented to the House of Commons the famous monster petition for a national charter. He became hopelessly insane in 1852.

O'Connor, John, Canadian jurist: b. Boston, Mass., January 1824; d. Cobourg, Ont., 3 Nov. 1887. He removed with his parents to Canada in 1826 when he was educated, and in 1854 admitted to the bar. He sat for Essex in the Canadian parliament 1867-72, and in the last named year was president of the council in Sir John Macdonald's administration. Later he was minister of inland revenue and postmaster-general, and became queen's counsel in 1873. In 1878 he was reappointed president of the council and in 1880 became a second time postmaster-general, was secretary of state for a time, and in 1881 to the office of postmaster-general. He was a commissioner revising the statutes of Canada and Ontario, and in 1884 was appointed judge of the high court of justice of Ontario.

O'Connor, John Joseph, American Roman Catholic bishop: b. Newark, N. J., 11 June 1855. He was educated at Seton Hall College, in the American College of Rome, and in Paris, and in 1877 he was ordained to the priesthood. He has held important charges and in 1901 was consecrated bishop of Newark, N. J.

O'Connor, Joseph, American journalist: b. Tribes Hill, N. Y., 17 Dec. 1841. He was graduated from the University of Rochester in 1863 and though admitted to the bar in 1869 never practised. He was attached to the staff of the Rochester Democrat and Chronicle 1870-3; edited the Irish-American. Senator 1873-5; was editor of the Buffalo Courier 1879-85; and has been editor of the Rochester Post Express from 1886. He has published a volume of 'Poems' (1895); etc.

O'Connor, Thomas Power, Irish journalist and politician: b. Athlone 5 Oct. 1848. He entered journalism in Dublin, went to London in
1870, was for a time in the London office of the New York Herald, entered Parliament for Galway in 1880, and has represented the Scotland division of Liverpool from 1885. He founded and edited The Star, The Sun, and the Weekly Sun, and later became editor of The Daily Mail (now The Scottish Mail). His works include a biography of Beaconsfield.

Oconomowoc (5-korn 6-m-w-k), Wis., city in Waukesha County; on the Chicago, M. & St. P. railroad; about 25 miles west by north of Milwaukee. It is in the midst of a region of beautiful lakes, the largest of which are Belle and Fowler, and it is noted for the good fishing in the vicinity. Fertile farm lands are in this part of the State, and the industries of the city are connected chiefly with farm and dairy products. The city owns and operates the electric light plant and the waterworks. Pop. (1890) 2,729; (1900) 2,880.

O'Connor, 6-korn'ar, Charles, American lawyer and politician; b. New York 22 Jan. 1804; d. Nantucket, Mass., 9 Feb. 1884. He studied law, was admitted to the bar at 20, and soon became one of the leading lawyers of the country; the Forrest divorce suit, the Slave Jack case (1835), the Lippencold will case (1843), and the Jemul case (1871) were the most important litigations he took part in before the great Tweed suits in which he acted for the prosecution with William M. Evarts and W. H. Peckham. O'Connor wrote 'Peculation Triumphantly,' a record of the Tweed ring. A Southern sympathizer during the War, he went bail for Jefferson Davis together with Horace Greeley. In 1872 he was nominated for the presidency by the wing of the Democracy opposed to the nomination of Horace Greeley; he refused the nomination, but polled nearly 30,000 votes. In 1876 O'Connor acted as counsel for Samuel J. Tilden before the electoral commission.

O'Connor, John Francis Xavier, American educator; b. New York 1 Aug. 1852. He was graduated from St. Francis Xavier College in 1872, continued his studies in Europe, entered the Jesuit Order and was ordained to the Roman Catholic priesthood in 1885. He has been a professor in West Park College, Georgetown University, Boston College, and St. Francis Xavier College, and has lectured on ancient and Assyrian inscriptions. He has written: 'Lyric and Dramatic Poetry' (1883); 'Jesus Missions in America' (1892); 'Christ, the Man of God' (1900); 'Education in the Schools of New York' (1901); etc.

Oconomota, a Cherokee Indian chief; b. about 1782; d. 1810. He was one of the six delegates who in 1730 visited King George II. He was for many years an ally of the British, his one act of treachery being so severely punished that he ever afterward maintained their friendship. Oconomota in 1768 signed a treaty of peace with the Indians and has been their life-long enemies. He took no active part in the Revolutionary War, being infirm and a semi-invalid. He resigned his chieftship in 1782 in favor of his son. See CHEROKEES.

Oconto, 6-korn'6, Wis., city, county-seat of Oconto County; at the mouth of the Oconto River, on Green Bay, and on the Chicago, M. & St. P. and the Chicago & N. W. R.R.'s; about 30 miles north by east of the city of Green Bay. It was settled in 1850 and in 1882 was incorporated. It is in an agricultural and lumber region and has considerable trade in farm and dairy products, also in fish and lumber. Its chief industrial establishments are flour and lumber mills, canneries, creameries, a brewery, and a wagon factory. It has a good public library, a high school, court-house, and a number of fine residences. Pop. (1890) 5,219; (1900) 5,646.

Ocotea, a genus of tropical trees of the mountain-laurel family (Lauraceae, q.v.), the wood of which is strongly and usually disagreeably scented. Prominent species are the stinkwood (O. bullata) of the Cape of Good Hope; til-wood (O. fastigata) of Madagascar, and the cinnamon-yielding O. cupulata of Mauritius. Some of these trees yield valuable timber.

Ocracoke (5-kra-kok) Inlet, on the coast of North Carolina, between the islands of Portsmouth and Ocracoke, and forming a passage from the Atlantic into Pamlico Sound. Just at the western end of the inlet is a lighthouse, and on each side are dangerous shoals. Cape Hattera is about 20 miles northwest.

Ocrea, among the ancient Romans, a legging covering the foreleg from the knee to the ankle. It was made of tin, bronze, or other metal, modeled to the leg of the wearer, and fastened behind by straps and buckles, and generally richly ornamented.

Octagon, in geometry, a polygon of eight angles or sides. A regular octagon is an octagon all of whose sides and angles are respectively equal to each other. See GEOMETRY.

Ocathédrite, dioxid of titanium in the crystal form, so called because of its tetragonal crystalization; sometimes styled Anatase. Its chemical composition (TiO2) is that of the amorphous rutile and Brookie. Ocathédrite is yellow, brown or gray, blue, or black; has a quasi-metallic lustre; is unaffected by acids and in soluble with chlorine; becomes incandescent if gradually heated; has a density of 3.83 to 4.37; and a hardness of 5.5. It occurs in the granite fissures of Switzerland, of Dauphiné at Bourg d'Oisans (whence the French name Oisanite), of the Brazilian diamond fields, and in the United States in Burke County, N. C., and Smithfield, R. I.

Octahedron, in geometry, a solid contained by eight equal and equilateral angles. It is one of the five regular bodies. See GEOMETRY.

Octant, the 'Octant' in astronomy, the constellation surrounding and including the South Pole of the heavens, and one of the 14 added to the heavens by Lacaille in connection with his work at the Cape of Good Hope.

Octant, in astronomy, an instrument, is the eighth part of a circle divided into degrees, and used in calculating the amplitude of the stars, but is now little used.

Octave, the eighth day after a festival, and the intervening days, all of which partake of the nature of the festival. In the Roman Catholic Church octaves are privileged and non-privileged, with many degrees and subdivisions of the former. The octave is a period of grace, and the octave following the Epiphany only the feast of patron saint, title or dedication of a church may be kept, and that not on the eighth or octave day, on which the
1870, was for a time in the London office of the New York Herald, entered Parliament for Galway in 1886, and has represented the Scotland division of Liverpool from 1885. He founded and edited The Star, The Sun, and the 'Weekly Sun,' and later became editor of 'M. A. P.' (Mainly About People). His works include a biography of Beaconsfield.

Oconomowoc, o-kōn'-ō-mō-wōk, Wis., city in Waukesha County; on the Chicago, M. & St. P. railroad; about 25 miles west by north of Milwaukee. It is in the midst of a region of beautiful lakes, the largest of which are Belle and Fowler, and it is noted for the good fishing in the vicinity. Fertile farm lands are in this part of the State, and the industries of the city are connected chiefly with farm and dairy products. The city owns and operates the electric-light plant and the waterworks. Pop. (1900) 2,272; (1900) 2,880.

O'Connor, o-kōn'-or, Charles, A lawyer and politician; b. New York, 1804; d. Nantucket, Mass., 9 Feb. 1885. He studied law, was admitted to the bar, and soon became one of the leading lawyers of the country; the Forrest divorce case (1839), the Lispenard divorce case (1843), and the Jumel case (1871) were important litigations he argued. He was a great Tweed supporter in the prosecution with William M. Peckham. O'Connor was a member of the Southern sympathizers in the civil war, and he went half for Jefferson Davis and half for Horace Greeley. In 1874 he was appointed for the presidency of the American Bar Association. Greeley; he refused the nomination. He later served as U.S. senator. He was a member of the New York bar, and was in private practice for more than 20 years. He was one of the most prominent lawyers of the city, and was held in high esteem by all who knew him. He died in New York, Nov. 20, 1885.

Octavus, a Greek word meaning eighth, and used in astronomy, etc., to denote the eighth day after a festival, and is used in the month of August to denote the eighth day of the month. See Octave.

Oceania, sea, a large body of water extending from the Arctic to the Antarctic, including all the islands in the world between these limits, excepting the African and American continents. See Ocean.

Octave, the eighth day after a festival, and the intervening days of the week period of the nature of the festival. In the Roman Catholic Church, octaves are privileged and jubilaeums, with many ceremonies and solemnities, as of the former. The octave of Easter and Christmas are specially privileged, and in the Greek Church only the feast of Ascension, or description of the church may be kept, and not on the eighth nor octave day, on which the
DECAPODS AND OCTOPODS
services of the festival are to be repeated. In the Church of England the only festivals mentioned as having octaves are Christmas Day, Easter Sunday, Ascension, and Whit Sunday. Dr. Sparrow, in the 'Rationale,' says that our whole life being spent in the revolution of seven days, the eighth or octave signifies eternity. On the other hand Du Cange declares that the eighth day was observed with solemnity, insomuch that our Lord’s resurrection took place on the eighth day, counting the period of his Passion as beginning on one Sunday, when he entered Jerusalem in triumph, and ending on the next, when he rose in triumph from the grave.

Octave in Music. See Harmony.

Octavia, Roman matron, wife of Mark Antony, the triumvir, and sister of Octavian, or Augustus: d. 71 b.c. She was married (before 54 b.c.) to Gaius Claudius Marcellus, who became consul in 50 b.c. Julius Caesar, her great uncle, wished to divorce her from Marcellus so that Pompey might marry her and thus be chosen as her son to seize the life of Julia, his first wife and Caesar’s daughter; but Pompey and Marcellus both objected. After Marcellus’ death in 41, however, she was married to Mark Antony, thus cementing the bond between him and her brother Octavian, the future Augustus. Antony’s passion for Cleopatra and his complete enslavement to her in spite of the remarkable beauty and matchless virtue of Octavia had much to do with precipitating the civil war between Antony and Octavian. She was actually divorced by Antony in 32 b.c., but cared tenderly for her children after his death. Her son by Marcellus was Marcus Marcellus, adopted by Augustus as his heir; he died prematurely in 23 b.c. bitterly bewailed by his mother and pathetically sung by Virgil in the sixth Æneid. Her daughters by Antonius became, respectively, the grandmother of Nero, and the mother of Caligula. The porticus Octaviae, built in her honor by Augustus, enclosed the temples of Jupiter Stator and of Juno.

Octavia, Roman empress, wife of the Roman emperor Nero: b. 42 A.D.; d. Pandataria 62 A.D. A daughter of the emperor Claudius and of Messalina (thus a grand-daughter of Octavia, the wife of Antony); she married in 53 her cousin, Nero, then only 16. He was soon unfaithful to her, first leaving her for Acte, a freedwoman, and then for Poppea-Sabina, whom he married in 62, only 16 days after his divorce from Octavia. But Octavia’s popularity was so great that Nero was forced to recall her to Rome, where she was so enthusiastically received as to rouse the jealousy of Poppea. She was exiled to Pandataria on a false charge of infidelity, and was there killed by Nero’s emissaries. A tragedy, telling her story and bearing her name, was long attributed to Seneca; its author may have been Curiusius Maternus, but it is still printed among Seneca’s plays.

Octavius. See Augustus.

Octavo, in printing, the size of a sheet of paper, which has been folded so as to make eight leaves; some modern printers take this size as distinguished from the smaller folio leaves with eight leaves to the sheet. It is generally written 8vo, and varies in size according to the sizes of paper employed; as, foolscap octavo (or 8vo), imperial octavo (or 8vo), etc. See Paper.

October, the tenth month of the year, originally the eighth month in the Roman calendar, whence its name, which it still retained after the beginning of the year had been changed from March to January. An old name in Germany for October was "wine month." It has long been in England the principal month for brewing. See Calendar.

October States, in American political history, certain States like Ohio and Indiana, whose elections were held in October instead of November. In presidential years these October elections had peculiar bearing on National results in November.

Octooic Acid, or Caprylic Acid, an organic acid having the chemical formula C6H12O6, or CH3CO.OH, and occurring, in the form of a glyceryl ether, in common butter, and also, in much larger quantities, in cocoanut oil. It may be obtained in the form of white crystals, which melt at 63° F. Octoic acid is almost insoluble in cold water, but dissolves in boiling water. Various isomers and compounds of the acid are known, but none are of any commercial importance.

Octopoda, the eight-armed cuttlefishes. See Cephalopoda; Octopus.

Octopus, a genus of the dibranchiate Cephalopoda (q.v.), or cuttlefishes, forming the type of the family Octopodidae, the members of which group are familiarly known as "poulpe." These forms possess eight arms of equal length, united to each other by a web varying in extent in different forms. The arms possess two rows of sessile, wholly fleshy suckers. The prominent head is joined to the body by a distinct "neck," and the body itself is short, generally more or less rounded in shape, and unprovided with side or lateral fins. The shell is internal, and is represented by two short "styles," which are embedded in the mantle. In the octopods the third right arm of the male animals becomes developed to form a "hectocotylus" or sexual organ (see Argonaut); and in some this modified arm is detached from the body and thrown within the mantle cavity of the female for the purpose of fertilizing the eggs, a fresh arm being developed as occasion requires.

The poulpe attained a popular notoriety from the tales which were formerly circulated of gigantic members of this group which had no existence in reality. Some forms spread their limbs 12 or 14 feet, like great spiders, and might, under favorable circumstances, hold under water a person whom they had seized until he had drowned, at the same time biting him with their horny parrot-like jaws; no doubt such accidents have occasionally happened to pearl divers and the like. Ordinarily, however, the octopus does not attain one half these dimensions, and many species, as that which yields "cuttlefish bone," have bodies no larger than an ordinary pear. These animals live in rocky places along shore and about reefs, protecting their soft bodies by sitting in holes and crevices with arms extended, so that it still retained after the beginning of the year had been changed from March to January. An old name in Germany for October was "wine month." It has long been in England the principal month for brewing. See Calendar.

in various parts of the world, and the common one (*Octopus vulgaris*), of the Mediterranean and neighboring Atlantic coasts, has been speared and taken to market from a time immemorial, and is still a regular object of pursuit, especially in Italy. A deep-water species (*Eledone moschata*) is trapped for market in from 10 to 20 fathoms of water by lowering earthen jars and leaving them a few hours. The creatures creep into these jars, as a fine hiding-place, and allow themselves to be drawn to the surface. The flesh is eaten boiled, fried, and in salads, and is preserved by pickling. Sepia (q.v.) is the substance in the "ink-bag"; and "cuttlebone" the supporting calcareous plate beneath the skin of certain species. Of the American species *O. bairdii* and others of the eastern coast dwell in deep water or about the tropical coral reefs. On the Pacific coast several species are taken near shore and were always utilized by the Indians. Since the settlement of California their flesh is regularly supplied to the San Francisco market, where it is bought by Italians and Chinese. Some specimens brought in there are among the largest known, measuring 14 feet across the outstretched arms. Consult book on cuttlefish, especially Cooke, *Mollusca* (1895); and *Standard Natural History*, Vol. I. (1884). See ARKONAUT; CEPHALOPODA; CUTTLEFISH.

**Octopus, The**, a novel by Frank Norris, published in 1901. It was the intention of its author to write a trilogy of novels which should symbolize American life as a whole, with its hopes, aspirations, possibilities, and problems. This book, which is the first of the three, has for its central motive Wheat, the great source of American power and prosperity, and also the literal staff of life. *The Pit*, the second of the proposed trilogy, appeared in 1902, not far from the time of the author's death.

**Octostyle**, a term in architecture applied to a temple or portico having eight columns in front. The most perfect example was the Pantheon at Athens, a building of the Doric order. Few remains of Greek buildings of this style exist, the common practice having been to construct temples of the hexastyle or six-column order. Another notable example of the octostyle is the portico of the Pantheon at Rome.

**Octroi, ök-trów', or Octroy**, an old French term particularly applied to the commercial privileges granted to a person or to a company. In a like sense the term is applied to the constitution of a state granted by a prince in contradistinction to those which are derived from a compact between the ruler and the representatives of the people.

**Ocu'ba-wax**, a vegetable wax obtained from the fruit of a nutmeg (*Myristica occula*), growing abundantly in the marshy grounds on the shores of the Amazon and its tributaries. It is easily bleached, and is used extensively in Brazil for the manufacture of candles.

**O'Curry, ö-kúr'i, Eugene**, Irish scholar: b. Dunaha, County Clare, 1796; d. Dublin July 1862. He was son of a rather gifted farmer; though lame worked on the farm until 1834; was for three years employed on the Ordnance Survey for several years employed on the Ordnance Survey for several years employed on the Ordnance Survey for several years employed on the Ordnance Survey for several years employed on the Ordnance Survey for several years employed on the Ordnance Survey for several years employed on the Ordnance Survey. He is noted especially in copying Gaelic manuscripts and writing translations became in 1855 professor of Irish history and archaeology in the Catholic University of Ireland, then just founded. His lectures, published in 1860 as *Manuscript Materials of Irish History*, are accounted the best single work on medieval Irish literature. A second series of his lectures, *The Manners and Customs of the Ancient Irish People*, appeared in 1873. O'Curry prepared the catalogue of the Irish manuscripts in the British Museum.

**Od or O'dic Force**, a force associated with magnetism, and alleged to explain the phenomena of mesmerism or animal magnetism and many other natural phenomena, supposed by Baron Reichenbach to have been discovered by him, and which is treated of at great length in his works. Od, according to him, pervades all nature, and is akin to the great physical forces of electricity, magnetism, chemical affinity, heat, light, etc., and always accompanies them, so that wherever they are in action od is developed, and the strength of its most active development is often in proportion to their action. In living animals, in effervescing and fermenting liquids, in putrefying substances, in magnets, and in galvanic batteries, od is briskly generated. It radiates from the generators, and its rays pass through all known matter at the speed of about 100 feet per minute, slower than light and more rapid than heat. As in electricity and magnetism there is a polar dualism, so also there is in od; it has two poles, the positive and negative, and the general administration of its laws is designated by the generic term Odd Fellowship. The origin of the society and the source of its peculiar name cannot now be historically traced. Until nearly the close of the 17th century it had few matters, and for years that Defoe,—the English novelist,—mentioned 'Odd Fellows' as early as 1745 A.D., but modern research has relegated this, as well as many other alleged incidents of the order's early days, to the realm of tradition. It is known, however, that a society grew up in England during the 18th century, almost rivaling in numbers and influence the Masonic Fraternity, and that this Antient and Most Noble Order of Buck's, began to decline about the year 1773, and passed out of existence. A reasonable supposition attains among antiquaries that these lodges furnished the nucleus of the Odd Fellows, into one lodge of which George IV. of England, while Prince of Wales, was quite unceremoniously admitted one night, and became a member thereof at a date subsequent to 1780. This is the first authentic reference to the society of Odd Fellows by name. The earliest ritual extinct is dated in 1797, and was used by the Patriotic Order. It appears from English
1. Allopusus mollis, male. Side view, showing the sac containing the hectocotylized arm, cut open so as to expose the partly developed arm.
2. Hectocotylized arm, enlarged.
3. Same animal, ventral view.
4. The common Octopus (O. bairdi) of the North Atlantic coast (male).
4a. Terminal part of sexual arm.
4b. Section of the lingual ribbon, showing flinty teeth.
ODD FELLOW

contemporary history that an Improved Order existed prior to this, and the title, Most Noble Grand, for the presiding officer of the "Antient," as well as the subsequent Orders of Odd Fellows, would imply a common bond or succession. The Patriotic Order was followed by the Union, or United Orders, and the Loyal Order. In 1813 various lodges of the Union Order met and organized the Manchester Unity of Odd Fellows, now the principal Friendly society in Great Britain. In 1810 the American Order was founded, and was afterward affiliated with the Manchester Unity. This continued until 23 Sept. 1842, when the Odd Fellows of the United States resumed their original independence, reaffirming the resolution in 1843 and adopting a distinctively American ritual in 1845.

Rise of the American Order.—The first lodge established on this continent was Shakesper, No. 1, New York city, 26 Dec. 1806. The members were zealously worked, and the moving spirits were Solomon Chambers, and his son John C., English mechanics from the south of London. The early members were zealous workers, and many of their sons were also. In 1809 the roll of membership, in the six New York city lodges, comprised 36 prominent citizens and business men, as well as many others of less influence. In 1819 George Pope Morris was appointed to the council of the order in the State of New York, and in 1820 he was elected to the council in the State of Pennsylvania. The lodge did not reach its destination until late in January 1823, although dated 4 Nov. 1822. Meantime Columbia Lodge had moved to New York. It at once assumed sovereign jurisdiction, and this led to conflict with other lodges, and with Morris and others to establish a supreme government with headquarters in New York. At this juncture Pennsylvania applied to the Order in New York and Maryland for recognition. It is recorded that the evidence of regularity received from New York city was more satisfactory to the Odd Fellows of Philadelphia than that of Baltimore; and it is also stated that the lodges in Boston, New York, and Baltimore were not aware of one another's existence before this event. The Order made history rapidly during the succeeding six months. Each locality was dominated by a master mind: Willey, in Maryland; Morris, in New York; Barnes, in Massachusetts; Paperback, in Pennsylvania. The question of supremacy, however, was soon settled. Massachusetts readily surrendered its claims to priority, and accepted a charter from the Grand Lodge of Maryland and the United States of America. The Grand Lodge of that commonwealth was duly opened 11 June 1823,—all the lodges participating. Morris was overthrown as Grand Master, in New York, by the dissensions mentioned above, and was lost to Odd Fellowship. The Order in that State accepted a like charter, dated 4 June 1823, and the Grand Lodge was duly instituted 24 June 1823. It having become known that Willey, as Grand Master of the United States of America, Odd Fellows of Massachusetts and New York, overtures were also made to Pennsylvania, and these were immediately accepted. The charter is dated 13 June 1823, and the Grand Lodge of the Keystone State was organized on 15 June. The consolidated Order became at once homogeneous and prosperous. As a prelude to these momentous events, coincident with the actual foundation of the American Order, the grand lodges in Maryland had organized, under the Duke of York Lodge charter, the Grand Lodge of Maryland, and of the United States, 22 Feb. 1821, which relegated Washington and others, in Maryland, to the condition of subordinate
lodges. Following the centralization of the government of the four pioneer commonwealths, the "Grand Lodge of the United States" was evolved, on 15 Jan. 1825, by the representatives of the Grand Lodges of Massachusetts, New York, New Jersey, and Maryland—the last named taking her place with the State Grand bodies, subordinate to the sovereign head. This theory of a government composed of one head,—the source and repository of all true Odd Fellowship,—with subordinate State bodies, and lodges subordinate, in contradistinction to the English system of a governing movable committee, was due to the genius of John Pawson Entwistle,—a scholarly gentleman,—who had joined the Order in 1820, becoming the brain of the young organization; while Wildey and his compatriots, unlettered men, may be likened to the body of the vigorous institution. Entwistle was the first Deputy Grand Master, and was afterward Grand Secretary, but his career as a "builder" was cut short by his early decease. The last link in the chain of regularity was formed 15 May 1826, when the American body was chartered by the Manchester Unity. Significantly, the early English chapters were issues to the Order of Independent Odd Fellows, and the branches originating in the United States were organized irrespective of the consent of the English body even prior to 1842-3, the date of official separation.

Government and Degrees.—Between 1826 and 1885 the government of the Order had been revolutionary in its nature. The inheritance from England in ritualistic matters was the meager outline of a possible utility. The degrees were crude in structure, and unsuited to the genius of a modern fraternal society, being copies from orders of other origin,—notably from Masonry. When the foundations of government had become settled, attention began to be paid to degrees of higher significance than the lodge system. Entwistle gave the first impulse to this part of the fabric of Odd Fellowship. After his death the work was continued by such distinguished Odd Fellows, including such American citizens as James L. Ridgely, Grand Secretary from 1838 to 1881; James B. Nicholson, Isaac McKendree Vetch, Schuyler Colfax, who may be said to have been the fathers of the system. The Rev. Dr. Chapin, D.D., Rev. James D. McCabe, D.D., Tal. P. Shaffner, who, together with Entwistle and Ridgely, were largely the authors of the present Americal ritual. Two English degrees and one American, finally, made up the encampment series. As early as 1821-2 these were conferred in connection with the lodge department. The final separation of the encampments into a distinct branch, higher than the lodge, and governed by Grand Encampments, did not occur until 1841. In 1851-2 the Rebekah degree was adopted, its author being Schuyler Colfax. This is a branch to which both sexes are admitted. The sequence of degrees was completed in 1885 by the adoption of the Patriarchs Militant, and organization of the uniform or display branch. The Grand bodies followed the sequences of the degrees. In 1879 the name of the supreme body was changed to the Sovereign Grand Lodge, a title resonant with its inherent powers, especially in its jurisdiction without the United States of America. The Sovereign Grand Lodge is made up of Grand Representatives from the Grand Lodges and Grand Encampments of the United States and Canada. Grand Lodges possess jurisdiction over State and Provincial Rebekah Assemblies, and Rebekah lodges, as well as in the governments of foreign items, in the Orient, with the local unit, called Canton, is organized like the United States Army, with Department Councils,—all under the immediate government of the Sovereign Grand Lodge. In Australasia, Denmark, Germany, the Netherlands, Sweden, and Switzerland, Quasi-Independent Grand Lodges govern the Order. These hold an allegiance to the Sovereign Grand Lodge, use the American ritual modified, and a common bond exists in connection therewith; but they do not enjoy a representation in the sovereign head. They, however, govern the Order in the countries named, and conform to the laws and usages of the civil governments thereof. The development of this dual system was the labor of many years and varied experiments. The dates of the introduction of American Odd Fellowship without the United States were these: Canada, 1843; Australasia, 1868; Denmark, 1871; Hawaiian Islands, 1877; Sweden, 1884; Switzerland, 1871. As early as 1846 lodges were instituted in the Hawaiian Islands; in Cuba, in 1883; in Mexico, in 1882; and the Order has followed the flag into the Orient, having been established,—including South America,—in 22 nationalities, provinces, and territories,—in 18 of which Grand Lodges have been chartered. In 1902, however, of the entire lodge membership of 1,068,732 only 37,333 were enrolled outside of North America.

Other Organizations of Odd Fellows.—The largest body is the Manchester Unity, numbering 950,000 members. It has lodges throughout Great Britain and its colonies,—a few in the United States,—and is, in effect, a chartered benefit society. Annual reports are made to the government, under the laws regulating Friendly societies, and actuaries determine the solvency or insolvency of Odd Fellows, corresponding accordingly. In ritual matters, likewise, it has nothing in common with American Odd Fellowship. The Grand United Order ranks next in relative importance. This body is the parent of the confederacy of Odd lodges in the United States and elsewhere, and is of English origin. Other Friendly societies exist in Great Britain, and are of more or less importance as health insurance associations.

Beneficent Features.—The American Order has not incorporated into its polity any features of health or life insurance; indeed, it has, on the contrary, refused to recognize voluntary associations of Odd Fellows, the object of which was to enlarge the benefit systems of regular relief. Nevertheless, the Order has always insisted upon "stated weekly and funeral benefits," distinct from voluntary charity,—these payments to members who are ill, or in affliction, being of "right," not a donation. This characteristic is a distinguishing trait of the American Odd Fellow. On the great seal is emblazoned: "We command you to visit the sick, relieve the distressed, bury the dead, and set apart to alleviate distress, by the proceeds of the benevolent institution." The beneficent work of the Order was early attracted to the founding of institutions of learning, several of which have survived. The dual motive of fra-
ODD FELLOWS.

Thomas Wildey, Founder of the Order.
ternity and stated relief led to the establishment of homes for the aged, the indigent, the widow, and the orphan. Pennsylvania has 6 of these homes, New York has 4, Illinois 2, California 2, and several other States possess two, with more in prospect. Every Grand Lodge in the United States and Canada has one or more of these homes, or has taken measures to find such an institution. This benevolence has been fostered in foreign jurisdictions as well; and the Order in Denmark has purchased the palace of the Crown Prince for this purpose, going into the "home idea" on a scale that eclipses all previous efforts. Other nationalities are in no wise behind their fellows in this beneficence.

The Reunion of 1865.—During the Civil War of 1861-5 the roll of the Southern jurisdictions was regularly called during the annual sessions of the Sovereign Grand Lodge. At the close of hostilities, the officers and members in the South were welcomed to the chairs and seats which had been held for them during the four years of strife and separation. The roll was taken, and on the 18th of Sept. 1865, by the venerable Grand Secretary Ridgely, was notable even in fraternal circles. Every survivor answered to his name, and appointments had been made to fill vacancies so that the representation was complete. Attempts had been made through out the States composing the Southern Confederacy,—with varying success,—to keep up the organizations of the Order; but, at this reunion, measures were unanimously adopted whereby the hands and hearts could be assisted in rebuilding the waste places. This was the first fraternization of the Blue and the Gray. The procession in the streets of Baltimore the next day,—occupying more than one hour in passing any given point,—attracted national attention. The marshals were: Joseph Kidder of New Hampshire, and John Q. A. Herring of Maryland.

Statistics.—In 1903 the relative strength of the Order was reported as follows:

- Sovereign Grand Lodge
- Quasi-Independent Grand lodges
- Grand encampments
- Subordinate lodges
- Subordinate encampments
- Rebekah Lodges
- Sisters
- Annual relief
- Relief from 1870
- Invested funds

$4,088,510.66

L. U. S. and S. G. L. (Vols. I. to XX.).

H. L. STILLSON,
Official Historian.

Ode, a lyric poem, supposed to express the feelings of the poet in the pressure of high excitement, and taking an irregular form from the emotional fervency which seeks spontaneous rhythm for its varied utterance. The Greeks called every lyrical poem adapted to singing— and hence opposed to the elegiac poem—an ode (ōdē, that is, song). The principal ancient writers who employed this form of verse were Pindar, Anacreon, Sappho, Alcaeus, among the Greeks, and Horace among the Romans. As employed by English writers the ode takes either the Pindaric form of strophe, antistrophe, and epode irregularly arranged and contrasted; or, as in its later development, the form of a regular series of regular stanzas. The former style is found in Dryden's 'Ode for Saint Cecilia's Day,' while the latter is seen in Shelley's 'Ode to a Skylark.' The masters of English poesy who have carried the form of the ode into their works are Milton, Dryden, Collins, Gray, Coleridge, Wordsworth, Keats, and Shelley.

Ode, ο-δέλ, Benjamin B., Jr., American political leader: b. Newburgh, N. Y., 14 Jan. 1854. He was educated at Bethany College, W. Va., and at Columbia, leaving the latter after three years to enter the ice business with his father in Newburgh. He proved successful in business, acquired an interest in his father's establishment, and also became president of the Consolidated Gas, Electric Light, Heat and Power Company of Newburgh and treasurer of the Central Hudson Steamboat Company. He early took an interest in politics and soon became a prominent local leader of the Republican party; in 1886 he was a candidate for State senator, but was defeated. In 1894 he was elected Comptroller from a district which had formerly been controlled by the Democrats; in 1896 he was re-elected, and declined the nomination in 1898; during his last term in Congress he was chairman of the committee on accounts and a member of the committee on the District of Columbia. Before his first election to Congress he had been chosen chairman of the executive committee of the Republican State Committee, and in 1898 was made chairman of the State Committee; the election of Roosevelt as governor was in large measure due to the energy and skill with which he conducted the campaign. In 1900 he was unanimously nominated for governor by the Republican party, conducted his own campaign, and was elected by a plurality of over 111,000. At the time of his election he was but little known to the people at large, but from the first of his administration gained a reputation which has become national, and made the policy of the reduction of direct taxes and strict business-like administration of public funds, as well as for his growing power as leader in his own party. Under his leadership laws were passed that reduced the assessable property, and reduced the direct tax to $1.3 of a mill, and at the same time appropriations for roads and schools were increased; the administration of State insane asylums was also simplified by abolishing the board of managers and centralizing control under the Commission on Lunacy. In 1902 Governor Odell was unanimously re-nominated and was re-elected. In the first year of his second administration a referendum vote of the people authorized enlargement of the Erie Canal which he had consistently urged. He has opposed special legislation and has vetoed a large number of special and personal bills, has favored home rule for cities, and given valuable aid to tenement house reform. In 1900 Columbia University conferred upon him the honorary degree of I.L.D. in recognition of his public services.

at what is now Princeton University, studied medicine, was surgeon in the British army, and, after several years spent in England, where he was ordained a deacon of the Church of England, and in 1767 became a priest, was made rector of Saint Ann's, Burlington, N.J. He assured the colonial authorities that he would keep his loyalist sentiments to himself in the exciting times before the Revolution, but on June 1770 wrote his famous birthday ode to the King, which may have suggested in part the phraseology of 'Hail, Columbia,' as it begins 'O'er Britannia's happy land.' The New Jersey Convention holding him an enemy to the American cause, exacted from him a parole to keep on the east side of the Delaware and within eight miles of Burlington. He was driven from home by the patriot forces, took refuge in the home of Margaret Morris, who hid him in a secret chamber, and escaped to New York, where he took a prominent part among the Loyalists, notably by his acrid and venomous satiric attacks on Congress and its individual members, as in 'The Word of Congress' (1779), 'The Congratulation,' 'The Feu de Joie,' and 'The American Times' (1780). Upon the evacuation of New York he lived in England for a time and then removed to New Brunswick, where he, his son, and his grandson were held as hostages and gave up much interest in politics. Consult the chapter on Odell in Tyler, ' Literary History of the American Revolution.'

Ödenburg, é'dën-boor (Hungarian Soprony), Hungary, the capital of a county of the same name, near the southwest shore of the Neusiedler See, 40 miles southeast of Vienna. It dates from the Roman Scarabanta and has several interesting ecclesiastical and other edifices. Its industries comprise woollen, linen, and cotton cloth, sugar refining, cutlery, glass, and earthenware; and it has a trade in these, and in corn, cattle, wool, wine, etc. Pop. (1900) 33,478.

Odenheimer, ö'den-hi-mér, William Henry, American Protestant Episcopal bishop: b. Philadelphia 11 Aug. 1817; d. Burlington, N.J., 14 Aug. 1879. He was graduated from the University of Pennsylvania in 1835 and after taking orders in the Episcopal Church in 1841 was rector of St. Peter's Church, Philadelphia, till 1859. In the year last named he was consecrated third bishop of New Jersey. On the diocese of the diocese in 1877 he chose the diocese of northern New Jersey (now Newark). He was prominent as a hymnologist, and among his published works are: 'Origin and Compilation of the Prayer Book'; 'The Devout Churchman's Companion'; 'Private Prayer Book.'

Odense, ö'den-sé, Denmark, a seaport town, capital of the Island of Fünen, on the Odense Aa, near the fiord of same name. It is well built, and has an ancient and magnificent cathedral, in which several of the Danish kings are buried, a royal palace, an old state house, and a richly endowed hospital. The principal manufactures are cloth and iron castings; and the trade, much facilitated by water communication, is considerable. Pop. (1901) 40,138.

Odenwald, ö'den-vält, Germany, a forest and chain of mountains between the Neckar and the Main, in the territories of Hesse-Darmstadt, Baden, and Bavaria. The Neckar divides the Odenwald from the Black Forest. The Odenwald is about 50 miles in length, contains 1,740 square miles, and in Katzenbuckel attains a maximum altitude of 2,057 feet. It presents charming scenery and in literature is associated with much interesting tradition.

Ode'n, é'dé-on, among the Greeks and Romans, the name applied to a public building devoted to poetical and musical contests. The first odeon was built at Athens by Pericles, and was afterward used for popular meetings and the holding of courts. At a later period two others were erected in Athens, besides those in other Greek cities. The first odeon at Rome was built in the time of the emperors. The odesons resembled the theatres, except that they were inferior in extent and were covered as with a fourth roof. The odeon is occasionally given in the United States to a music hall or theatre, as is also orpheum.

Öder, ö'dër, a river of Germany, which rises in Moravia, in the southern branch of the Sudetic Mountains, flows through Silesia, becomes navigable for small boats at Ratibor, passes by Breslau, where it is navigable for barges of 40 to 50 tons, enters Brandenburg and Pomerania, and empties into the Baltic. Its whole course is above 500 miles; it receives numerous navigable streams, communicates with the Elbe by several canals, and is of great commercial importance. The principal towns on its banks are Breslau, Frankfort, and Stettin. Before reaching the sea it forms the large maritime lake called the Stettin Haft, and divides into three branches—the Peene, Swine, and Dive-now.

Ödessa, ö'dës'a, Russia, a town and seaport in the government of Kherson, on the Black Sea, between the mouths of the Dnieper and Dniester, about 950 miles south of Saint Petersburg, ranking as the fourth city of the empire. It is built principally of stone, and is thoroughly modern in appearance. Among the promenades and squares of the city are: the Nikolai Boulevard, beside the harbor, a bronze statue of the Due de Richelieu; the Cathedral Square, with the monument of Prince Voronzoff; the Catharine Square, with a monument of the Empress Catharina II.; the Alexander Park, with a pillar in honor of the Emperor Alexander II. Among the Greek churches are the Cathedral or Sobornaja church, built in 1704-1848. The other buildings and institutions of the city comprise: the town-hall; the Voronzoff palace; the archiepiscopal palace; the public library; the chief passenger railway station; the university; the large and splendid town theatre; the post-office; the custom-house; the institution for noble ladies; the barracks, etc. The university, founded in 1834 as a development of the Richelieu gymnasium, has a large library, museums, an observatory, etc. There are numerous other educational institutions of different kinds and grades, including several technical schools. There are also hospitals, an orphanage, a foundling institution, and a bacteriological institute. Tramways and omnibuses facilitate internal communication; the town is well supplied with water from the Dniester, and is electrically lighted. The harbor is situated on the southeas of the town, by a long mole with a lighthouse at the end, and by a breakwater, consists of several sections separated by shorter moles, and has a floating
dock. The port is usually icebound for a few days in winter, but an ice-breaker is now in use to keep it open. Strong batteries protect the harbor basins from seaward attacks. Odessa is the chief grain exporting seaport of Russia. Other articles of export are sugar, timber, flour, oil-seeds and oil-cake, beans, peas, and fish. The principal imports are coal, tea, fruits, agricultural implements and machinery, iron and steel, and raw cotton. The chief industrial establishments are the sugar refineries, flour-mills, oil-mills, engineering works, tanneries, tobacco factories, soap works, jute works, breweries, etc. Odessa, named after Odessus, an ancient Greek settlement on this site, dates practically from the Turkish state of Khdibi-Bey, built in the 15th century and captured by the Russians in 1789. Odessa was bombarded during the Crimean war. Pop. (1897) 405,041.

O'dum. See ODON.

Od'gers, William Blake, English barrister: b. Plymouth, Devonshire, 15 May 1849. He was the son of a Liverpool minister, W. L. Odgers, and was educated at Cambridge University. He became a barrister of the Inner Temple in 1873, was recorder of Winchester 1897-1900, and of Plymouth from the last-named date. He has published "King Arthur and the Arthurian Romances" (1872); and such well-known legal works as "Odgers on Libel and Slander" (1881); "Odgers on Pleading Practice and Procedure" (1891); "Outlines of the Law of Libel" (1897); "Odgers on Local Government" (1899).

O'din, Teutonic god, called Wóman by the Saxons and Wotan by the High German. He held a high place among the "aæs" or secondary gods of the Scandinavian mythology at first, and later came to be held the centre of the system of the German mythology, the patron and source of all sciences, inventor of runic writing, of poetry, and of magic (hence identified with Mercury Hermes by the Roman writers on Germanic customs and religions), and, Minervula, a protector of art, science, and the arts, and of heroes. Probably in origin he was a storm-god; his name seems to mean "the mad, or raging one" (see WOTAN and modern German "wütten"); and in this aspect he is portrayed as riding a one-footed horse Sleipnir. As a wind-god his functions were various: he presided over the harvest and over the sailing of ships, and was god of battles and of the dead. In battle he was accompanied by the Valkyries, who brought to Odin's banquet the hall, Valhalla, the slain heroes. Sometimes, Apollo-like, he is the sun-god, the sun is his eye, the heaven his canopy, and the mountain of Hidskjalk his throne, at the sides of which are his raven messengers, Hugin ("Thought") or "Reflection" and Munin ("Memory"), who bring him news of all that happens in the world, and the two wolves, Gere and Freke. Odin's wives were three: Jord (the inhabited earth), Frigg (the cultivated earth), and King (the winter-locked earth). Snorre Sturleson and Saxo Grammaticus make Odin a chief, who in alliance with Mithridates fought the Romans unsuccessfully. To the Roman identification of Odin with Mercury is due the use of his name for the fourth day of the week, the German Dienstag, the English "Wednesday," that is, Odin's or Wadan's day.

Odoacer, 6-dô-å'sër, king of Italy: d. 5 March 493. The son of Edecon or Edicon, who may be identical with one of Attila's lieutenants, and a Scyrian or Rughian by birth, he became a leader of the Rughian Scyrians, and Turdullians, entered the Roman army about 470, and in 476 was a member of the imperial bodyguard. When Orestes deposed Nepos and made his own son, Romulus Augustus, emperor, Odoacer headed the rising of the disaffected German soldiers, killed Orestes, forced Romulus to retire, received the title of patricius from the Eastern emperor Zeno, but no recognition as king of Italy, yet in spite of this played the part of king ably for a time. He conquered Dalmatia in 482 and defeated the Rugians in 487 and 488. But in 489 Theodoric, king of the Ostrogoths, was sent against him by Zeno, and after repeated defeats forced him to surrender, promising him a share in the rule of Italy. The defeated king was assassinated at a banquet a week after his surrender. Consult Hodgkin, "Italy and her Invaders," Vol. III. (1885).

Odometer, a small clock-like mechanism employed for registering the number of revolutions of a carriage, automobile, bicycle, or other wheel, to which it is attached. The workings of the odometer are very simple: Two wheels of the same diameter, and turning freely on the same axis, are placed face to face; the edge of one is cut into 100 teeth, and that of the other into 99 teeth, and an endless screw works into the notches in each wheel. When the screw has turned 100 times around, the wheel having 99 teeth will have gained one notch on the other, which gain is shown by an index attached to one wheel, which passes over a graduated arc on the other. Every 100 turns are thus registered on the second wheel, and all turns less than 100 are shown by a separate index. Now, instead of the screw turning on its axis, it is found more convenient to have the screw fast, and to allow the weight of the machine to be suspended freely, so that as the carriage wheel turns, the effect is the same as turning the screw on its axis.

Odona'ta. See DRAGON FLY.

O'Donell, 6-don'el, Leopold, Duke of TETUAN, Spanish marshal: b. Santa Cruz, Tenerife, Spain, 12 Jan. 1869; d. Bayonne, France, 5 Nov. 1867. He entered the Spanish army and supported Maria Christina, the queenmother, in her struggles against the Carlists, and by intrigue secured the appointment of governor-general of Cuba in 1843. In 1854 he was war minister under Espartero and in 1856 and 1858 was prime-minister. He was recalled in 1863 and again in 1865-6, but never held the confidence of the country.

O'Donoghue, 6-don'6-hu, David J., British biographer and editor: b. London, England, 22 July 1866. He was educated in Roman Catholic schools and entered journalism in which field he has written principally on Irish art, music, and literature for leading Dublin newspapers. He founded the Irish Literary Society in London and is vice-president of the National Literary Society in Dublin. He has published: 'The Poets of Ireland' (1891-3); 'Traits and Stories of the Irish Peasantry' (4 vols. 1896-7);
'Life of William Carleton' (2 vols. 1898); 'Life of Robert Emmet' (1902); etc.

O'Donou, Juan, hoo-an' 6-don-6-hoo', Spanish soldier; b. Spain about 1755; d. Mexico, 8 Oct. 1821. He entered the Spanish army when he attained the rank of lieutenant-general and was in 1821 appointed captain-general and acting viceroy of New Spain. Upon his arrival at Vera Cruz he found the country in the hands of the revolutionists and his authority only nominal. He accordingly resolved to treat with the insurgents and on 23 Aug. 1821 he signed with Iturbide at Córdoba a treaty which recognized Mexico as an independent state over which a Bourbon prince was to reign. The council remained in the hands of the revolutionists and O'Donou died before the nullification of his treaty by the Spanish Cortes.

O'Donovan, 6-don-6-van, John, Irish scholar; b. Attateemore, County Kilkenny, Ireland, 9 July 1805; d. Dublin 9 Dec. 1860. He was educated in Dublin, entered the Irish Record office in 1826 and was appointed in 1829 to the historical department of the Irish survey. He was connected with the Irish Archeological Society from its foundation in 1840, in 1847 was called to the Irish bar, and from 1852 was in the employment of the commission for the publication of the ancient laws of Ireland. Of the many editions of Irish works issued by him, the greatest is that of 'The Annals of the Four Masters' (1848-51). He also wrote an authoritative 'Grammar of the Irish Language' (1845).

O'Donovan, William Rudolf, American sculptor; b. Preston County, Va., 28 March 1824. He served in the Confederate army in the Civil War and at its close opened a studio in New York. His work, though his art is self-taught, soon gained a reputation and in 1878 he became an associate of the National Academy. He executed the statue of Paulding at Tarrytown, the statues of Washington for Caracas, Venezuela, Newburgh, N. Y., and for the Trenton battle monument. The equestrian statues of Lincoln and Grant for the Soldiers and Sailors' arch in Prospect Park, Brooklyn, are his work, likewise also the memorial tablet to Bayard Taylor at Cornell University, etc.

Odontoglos'sum, an extensive genus of orchids, natives of Central America, much prized by cultivators for their magnificent flowers, which are remarkable both for their size and the beauty of their colors. A considerable number of species have been introduced into Europe, and grow well in a moderate temperature. O. crispum or O. Alexandre is a superb flower, and was named after Queen Alexandra when Princess of Wales. See ORCHID.

Odonor'nhites, a sub-class of birds, extinct and known only from remains in the Cretaceous rocks, which had the jaws furnished with true teeth and the wings well developed in some, in others rudimentary. It contains two orders, Odontoleca, comprising the Ichthyornis (q.v.) and its allies, whose teeth were set in continuous grooves; and Odontotorma, such as Hesperornis (q.v.) and its allies, in which each tooth was set in a socket. See Marsh, 'Odontornithes' (1880); Evans, 'Birds' (1900).

Odyssæus, ði-dis'sus. See Ulysses.

Odyssæus, ði-dis'sus, The, an epic poem attributed to Homer, in which the adventures of Odysseus (Ulysses) are celebrated. See Ithaca.

Ecolampadis, ek'-ö-lam-pâd'-dis ("Light-of-the-House"). Graecized name of Johannes Hüsken, German religious reformer; b. Weinsberg, Württemberg, 1482; d. Basel 24 Nov. 1531. He began by studying law in Bologna, and after a further course in philosophy, history, and the classical tongues in Heidelberg, Tübingen, and Stuttgart, he returned to Weinsberg. He was appointed preacher at Basel in 1515 and assisted Erasmus in producing his edition of the New Testament. After two years' residence at Augsburg (1518-20) he entered the monastery of Saint Bridget at Altenminster, near Augsburg. Coming upon Luther's writings he left the monastery, and joining the reform movement, eventually went to Basel (1522) where he was appointed professor of theology and occasional preacher in Saint Martin's Church. He vigorously pushed forward the Reformation by his disputations, addresses, and writings; especially by his controversial activity at Baden in 1526, and at Bern in 1528; he did the same service at Basel, where as rector of the Cathedral he occupied the leading ecclesiastical position. He was in 1531 called to Ulm and worked there with Blarer and Blarer in the cause of ecclesiastical reformation. He entered upon a stubborn controversy with Luther on the subject of the Lord's Supper, and espoused the view of Zwingli in his 'De Genuina Verborum Domini, Hoc est Corpus Meum, Interpretatione.' In 1529 he held a public dispute with Luther on the same subject at Marburg. He was one of the kindest-hearted and most liberal-minded of the reformers. Weak in health from his early days he overtasked his strength, and by his premature death, was in some degree a martyr to his own zealous activity. He was buried in the cloister of the Cathedral at Basel. Consult: Herzogen, 'Leben von Johannes Hüsken' (1843); Hagenbach, 'Leben von Johannes Hüsken, mit ausgewählten Schriften' (1889).

Eccumenical, ek'-u-men'i-kal (Greek, oikoumenikos, of, or pertaining to, the whole inhabited or civilized world, generally the Mediterranean basin, universal). This epithet is generally applied to the general councils of the church, or councils to which all the bishops throughout the world were invited. According to the theologians of the English Church there have been only six eccumenical councils; namely, that of Nicea, 325 A.D.; Constantinople, 381 A.D.; Ephesus, 431 A.D.; Chalcedon, 451 A.D.; Second of Constantinople, 553 A.D.; and Third of Constantinople, 680 A.D. In the Roman Catholic Church it is applied to those councils whose members are convoked from the whole world under the presidency of the pope or his legates, and whose decrees, confirmed by the pope, bind all Christians. In the case of the first eccumenical council, that of Nicea or Nice, the Emperor Constantine summoned the bishops and Hosius presided as Pope Sylvester's legate. Toward the end of the 6th century the patriarchs of Constantinople assumed the title *Eccumenical* in the same sense as the epithet Catholic in the Western Church. But the Roman popes, always refused to sanction it. See COUNCIL, and NICAEA, COUNCIL OF.

Ede'ma. See DROPSY.
Edenburg, e'dén-boorg, Hungary. See Edenburg.

Edipus, ed't-pús, the principal character in three tragedies of the Greek dramatist Sophocles. He was the son of Laius, king of Thebes, and his wife Jocasta. As Laius had been warned before the child's birth that he was to die in the hands of his son, he was exposed to be, mounted Citharon, his feet having first been attached together by a transfixing pin. The effect of this cruelty was that he was afterward known as "the man with swollen feet" (Edipus). The herdsman to whom the task of exposing the child was committed compassionately gave him to the shepherd of Polybus, king of Corinth, who was childless, and Edipus became that monarch's adopted son. The young man, who considered himself a prince of the Corinthian royal house was once taunted with his origin by a drunken companion; his suspicions were roused, and he fled from Corinth. The oracle at Delphi in answer to his inquiries as to his birth would only tell him that he was fated to slay his father and marry his mother. Leaving the oracle he pursued his journey and met Laius and his servants. The king of Thebes had just to try to force Edipus from the road and was slain by the young man, who slew all the attendants also, as he supposed. In course of time he reached Thebes, where Creon, brother of Laius, had succeeded to the throne, and was offering the hand of the widowed Jocasta as well as the kingdom to the man who should release the city from the sphynx, a monster which devoured every one failing to find an answer to her as yet insoluble riddle. Edipus answered the riddle and slew the sphynx. He had many years of prosperity as King of Thebes and husband of Jocasta, but eventually a pestilence visited the land which, according to the Delphic oracle, could only be checked by expelling from the country the assassin of Laius. When at last it was brought home to Edipus that he was the man he put out his eyes and Jocasta hanged herself. Then Edipus went forth a wanderer led by the hand of his daughter Antigone, who had entered the stage, until he reached Athens, entered the grove of the Eumenides and there was called without death or pain, into the other world.

Edipus Coloneus, kō-lō-né'ús, "Edipus at Colonus," Greek tragedy by Sophocles, first presented at Athens after his death by his son Sophocles in 401. (See Edipus.) The play has pathos and beauty, but little dramatic power. Legend says that Sophocles by reading aloud the finest passages in it proved his sanity when brought before judges by his children, who were eager to administer his property.

Edipus Tyrannus, ti-rán'ús, "Edipus the King," a tragedy by Sophocles (q.v.), played first at Athens about 415 B.C. (See Edipus.) The same theme was treated in Latin by Seneca, in English by Dryden, and in French by Corneille, Voltaire, Chauvigner, and Lacroix.

Oehlenschläger, ehl-en-shle-gár, or Oehlen- schläger, Adam Gottlob, Danish poet: b. Vestervø, near Copenhagen, 14 Nov. 1779; d. Copenhagen 20 Jan. 1850. He was son of the organist of the Danish royal palace at Frederiksborg; began to write poetry at 9; attracted the attention of Storm, who assisted in the boy's education; made unsuccessful ventures in commercial life and as a comic actor; and under the patronage of the Oersted brothers (q.v.) again devoted himself to study and to literature. Strongly imbued with the spirit of the Old Norse sagas and with modern German romanticism, his first published poems, "Digte" (1823); "Tors Reise til Jotunheim"; "Vaulundurs Saga," and "Aladdin, eller den forunderlige Lampe," gained him a national reputation at 26 and won from the government a pension for foreign travel. In Halle, where he lived with Steffens, he wrote the great historical tragedy, "Hakon Jarl"; and upon his return to Denmark was elected professor of aesthetics in the University of Copenhagen (1810). His best work was done by 1830, the later volumes being far below the average. Oehlenschläger is the great national poet of Denmark, a leader of the romantic movement, who did much for renewed interest in early Teutonic and Norse literature and legend and who was spiritually akin with the English romanticists of the first half of the 19th century. Oehlenschläger's "Aladdin" is accessible to the English reader in "The excellence of Goodness," the "History of Danish Literature," by Sir Theodor Martin (1863). His other important works include: "Correggio," a tragedy written in German (1809)—it is to be noted that Oehlenschläger himself translated all his works into German—a Norse romantic cycle "Helge (1814);" another Oriental theme, "All og Gulhyni;" the tragedy "Stärkodder" (1812); the poetic cycle "Frederikberg" (1817); the tremendous epic "Nordens Guider" (1819), to which "Hakon," "Valkyrien," and "Tors Reise" paved the way; "Erik og Abel," a tragedy (1820); and "Dina" (1842), almost the only one of his late works with a gleam of the old fire. Consult his autobiography (1850-1), and "Life" by Arensen (1897).

Oehler, ehl'ér, Gustav Friedrich, German theologian: b. Ebingen, Württemberg, 10 June 1812; d. Tübingen 19 Feb. 1872. He studied at Berlin and Tübingen, subsequently taught at Basel and Tübingen, in 1840 became professor in the theological seminary in Schonthal, and in 1845 was appointed the professor of theology at Breslau. In 1852 he became head of the theological seminary at Tübingen. He was one of the most prominent Old Testament scholars on the conservative side. Among his works are: "Introduction to Old Testament Theology" (1845); "Outlines of Old Testament Knowledge" (1854); "Relation Between Old Testament Prophecy and Heathen Soothsaying" (1861); "Old Testament Theology" (1873-4); in English translation (1874-5); and "Manual of Symbolism" (1876). Consult: Knapp, "Ein Lebensbild von Oehler" (1876).

Oehme, e'mé, Ernst Erwin, German painter: b. Dresden 18 Sept. 1831. He was the son and pupil of Ernst Friedrich Oehme, the landscape painter, who attended the Dresden Academy of Art, and for a short time worked under Ludwig Richter; after which he made an artistic tour through Germany, Switzerland, England and France. He painted, in oils and watercolors, landscapes, architectural details and portraits. The Court Theatre at Dresden was decorated by him; a series of tapestries was also painted by him in water-color, in imitation of Gobelins tapestry. His "Stone Quarry in Saxony" (1860) is in the Dresden Gallery; and
he executed for Queen Carola of Saxony a collection of views of Compiègne. The most important of his remaining pictures include: 'Funeral in Spreewald'; 'Bear Hunt' (in which he represents the Wittenbergers), and 'The Monkey'. His work is poetic in conception, but sometimes borders on the namby-pamby and the affected.

Oeil-de-Bœuf, a small round or oval window. Such a window in the palace of Versailles gave the name Salle de l'Oeil de Bœuf to the king's ante-chamber. Since the window has been used frequently with decorative intent as in friezes along the upper parts of buildings, and it is largely with such significance that the term is used in English.

Oeland, eland, Sweden. See ÖLAND.

Oelwein, ölwin, Iowa, city in Fayette County; on the Rock Island & P. and on four lines of the Chicago G. W. R. R.; about 65 miles in direct line west by north of Dubuque. It was settled in 1873 by August Oelwein; was incorporated January 1888, and chartered as a city in 1890. It is in a rich agricultural region, but it has considerable manufacturing interests. The Chicago Great Western railroad shops have 700 employees, and the trainmen, and those employed in the yards and roundhouses number about 300. The foundry has 100 employees.

The educational institutions are the public schools and the Oelwein Business College. There are nine churches. The three banks have a combined capital of $155,000. The government is a mayor and council of eight members, who are elected biennially. The city owns and operates the waterworks. Pop. (1890) 830; (1900) 5,142; (1903) 7,000.

FRED S. ROBINSON,
Editor 'Oelwein Register.'

Önanthol, ö'nån'thöl, in chemistry, a product of the dry distillation of castor-oil preferably in a vacuum. The immediate product of the distillation is mixed by shaking with a solution of carbonate of potash and then heated, when oenanthol (C₁₅H₂₅CHO) separates as an oily colorless fluid with a strong aromatic odor, and slight solubility in water, a boiling point of 154° C., and at ordinary temperature, say 17° C., a density of 0.827. By oxidation of oenanthol, or by reduction of castor-oil, oenanthelic acid (C₁₅H₂₅CO.HO) is prepared; this is a fairly volatile acid now known to be a mixture of esters of capric and caprylic acids (see Octric), but originally supposed to be the acid giving the aster flower its odor.

Oenanthelic Acid. See ÖNANTHOL.

Öneus, ö'neüs, in Greek mythology, the king of Pleuron and Calydon in Äetolia. He was the husband of Althaea, and by order of Diana his country was ravaged by the Calydonian boar. He was dethroned and imprisoned by the sons of his brother Agrius, but was rescued by his grandson Diomedes who restored the kingdom to his son-in-law Andromus. Öneus being then too old to rule. He was afterward killed by the sons of Agrius.

Örsted, ör'stõd, Anders Sandöö, Danish statesman, 1802-1875; b. Rudkjöbing 21 Dec. 1778; d. Copenhagen 1 May 1850. He studied philosophy and law at Copenhagen, was admitted to the bar in 1799, and became a famous jurist, was appointed attorney-general in 1825, drew up the Constitution

granted in 1831, was cabinet minister 1842-8, and from October 1853 to December 1854 was prime minister, his speedy resignation being forced by his unpopular conservatism, a distinct departure from his earlier politics. He was imprisoned with his entire court but still were acquitted. Örsted wrote on Hegelian philosophy, on Danish and Norwegian law (1822-3), on Scandinavian politics (1857), and an interesting autobiography (1856).

Örsted, Hans Christian, Danish physicist: b. Rudkjöbing 14 Aug. 1777; d. Copenhagen 9 March 1851. His father was an apothecary and the boy assisted him, studied at Copenhagen, where he became assistant in the medical faculty in 1800, traveled in Europe 1801-4 and again 1812-13, and in 1806 was appointed professor of physics at Copenhagen. In 1828 he became director of the new Polytechnic of the same city, and in 1850 a privy councillor. His greatest work was the result of experiments on the magnetic needle with the electric current, which established the intimate interrelation of electricity, galvanism, and magnetism, and which were described in his 'Experimenta circa Effectum Conflictus Electrici in Acum Magnetice' (1820). Örsted also wrote a valuable 'Manual of Mechanical Physics' (1844) and various studies in chemistry, physics, metaphysics, aesthetics, and popular science, all pervaded with his predominating thought of the unity of the sciences and their position as the servants of religion. His style was clear, picturesque, and attractive, and his works have been popular both in the original and in German versions. Consult the biography by Hauch and Forchhammer (1883).

Örtest, ör'tsäl, Johannes Adams, German-American Episcopal clergyman and artist: b. Fürth, Bavaria, 3 Nov. 1823. After studying art in Germany he practised engraving until 1848, in which year he set up as a painter in New York. He painted 'Rock of Ages,' which became very popular and was reproduced in millions of photographs and chromolithographs. He held holy orders in 1867, had had more than one pastoral charge and was appointed professor of Christian Art in the University of the South; he is also a successful carver, confining himself to ecclesiastical and religious subjects in both departments of his activity.

Ösel, ö'sel, a Russian island. See OSSEL.

Oeser, ö'sær, Adam Friedrich, German artist: b. Pressburg, Saxony, 17 Feb. 1717; d. Leipzig 18 March 1799. He was trained for his profession under the influence of Raphael Donner 1730-9; he afterward was a pupil of Mengs and Dietrich at Dresden where he designed the decorations of the court theatre. Here he made the acquaintance of Winckelmann. In 1764 he was appointed director of the newly founded art school at Leipzig. Besides his professional activity as a teacher he did a great deal of decorative work, and won a reputation as a painter of ceilings. Among other things he executed a picture for the church of Saint Nicholas, and also two minor decorative panels and drawings. As a sculptor he shows to advantage in the statue of Frederick Augustus the Just in Leipzig and of the Danish Queen Matilda in Celle (Aisne-et-Nord). His versatility is proved by his masterly etchings, 45 in num-
ber, some after the manner of Rembrandt, some in a highly original style of his own. He shared in Winckelmann's efforts after a reform in art through a study of the antique, but his own canvases give little evidence of Greek influence, and by his passion for allegorical compositions he is sometimes betrayed into the extravagances of the rococo school.

**Cesophagotomy**, ĉ-oŭf-a-gô't-a-mi, a surgical operation for the relief of stricture of the cesophagus and the removal of foreign bodies lodged in it, when dilatation and other measures are of no avail. The operation, external and internal. External cesophagotomy consists in cutting into the cesophagus in front between the thyroid cartilage and the sternum, and extracting the foreign body with forceps, or dividing the structure with a knife. Internal cesophagotomy is usually resorted to for the relief of stricture, especially when of cicatrinal origin. The stricture is divided by a cutting instrument (the cesophagoscope) passed through the mouth. After the operation bought and was used to procure reconstruction. When the cesophagotomy cannot be used, or an incision is imminent, gastrotomy (q.v.), or opening the stomach so that food can be given, is resorted to.

**Cesophagus**. See Digestion.

**Oessey, es'-tèr-li, Karl** (son of the following), German painter: b. Göttingen 23 Jan. 1839. After studying in the Hanover Polytechnic he went to Düsseldorf 1857 and began under Deger his essays as a religious painter. On a visit in Lübeck (where he copied Hans Memling’s 'Madonna of the Blues') 1865 he was attracted to landscape and architectural pieces, and was so successful in this domain that he thenceforth devoted himself to landscape. Since 1870 he has generally derived his motif from Norwegian scenery. His pictures are distinguished for their dazzling color, transparent atmosphere, distinctness in light and texture, and grandeur of conception. Among them are 'Midnight near Lofoden'; 'Mountain Gorge in Norwegian'; 'Romsdal'sfjord'; 'On the Coast of Northern Norway' 1879 (in the Museum at Breslau); 'Fishing on the Norwegian Coast'; etc.

**Oesterley, Karl Wilhelm**, German painter: b. Göttingen 20 June 1805; d. Hanover 28 March 1891. He was a pupil of Mattheus in Dresden, studied in Rome 1824-9, in 1831 was appointed professor of the history of art in the University of his native town and, in collaboration with Ottfried Müller, published 'Monuments of Art.' Meanwhile he was extending his artistic studies in Düsseldorf, Munich, and Paris. On the completion of his picture, 'Christ and Ahasuerus' (1844), he was appointed court painter of Hanover. The chief of his remaining works are 'Jephthah’s Daughter' (1836); 'Christ Blessing Little Children' (1841); 'The Ascension' (in the chapel royal at Hanover), completed 1838; Scene from Bürger’s 'Lenore.' He produced also altar-pieces and portraits and designed stained-glass windows.

**Oettinger,  {?}-ting-ér, Friedrich Christoph**, German: b. Göttingen, Württemberg, Germany, 1702; d. Murrhardt, Germany, 10 Feb. 1782. He was educated at the University of Tübingen and became reader of theology at the University of Halle. In 1738 he took charge of the parish of Hirschau and gained the leadership of the Pietists in that section. A translation of several of the works of Swedenborg brought upon him ecclesiastical censure, but he was protected by the Duke of Württemberg and later was appointed superintendent of the churches in the district of Württemberg. Subsequently he held the same position in Herrenberg and afterward became prelate in Murrhardt. He wrote many theological treatises which have been edited by Ehmann (1858-63). Consult 'Monumenta' (1848); Ehmann (1852); and Wächter (1885).

**O'Farrell, Michael Joseph**, American Roman Catholic bishop: b. Limerick, Ireland, 2 Dec. 1832; d. Trenton, N. J., 2 April 1894. He was educated at the Seminary of St. Sulpice, Paris, and ordained to the priesthood in 1855. He went to Montreal where he was pastor of St. Patrick’s and St. Bridget’s churches and in 1869 accepted a call to New York as assistant in St. Peter’s church. In 1881 became the first bishop of the then newly formed diocese of Trenton, N. J.

**Offa**, king of the Mercians: d. 796. He succeeded to the throne after Ethelbald, on defeating the usurper Beornred, 757 a.d. Kent and the East Saxons were brought under his rule, and the power of Wessex was crushed by a defeat in 779. He likewise defeated the Welsh, wrested from them part of their border lands, and to retain them within their new limits erected here the rampart known as Offa’s Dyke (q.v.). With the consent of Pope Adrian I. he raised the see of Lichfield to the position of an archbishopric; and he had diplomatic intercourse with Charlemagne. Ethelbert, king of East Anglia, was murdered by his instigation and Offa then seized his kingdom. He founded the Abbey of St. Albans, and a grant by him to the See of Rome is supposed to have been the origin of Peter’s Pence (q.v.).

**Offa’s Dyke**, England, said to have been built by King Offa of Mercia in the 8th century, as a boundary between his dominions and those of Wales. It extends from the vicinity of Newmarket, in Flintshire, and traverses the counties of Flint, Denbigh, Salop, Radnor, Hereford, and Monmouth to Beachley, at the mouth of the Wye. Another dyke of a similar kind called Watts’ Dyke, runs at distances of from 3/4 mile to three miles apart from Offa’s Dyke, in the same direction, through the counties of Flint and Denbigh. These dykes are supposed to mark the neutral ground on which the Welsh and Britons were at liberty to meet for transacting business.

**Offenbach, Jacques**, zhàk ɔf-èn-bôk, French Hebrew composer: b. Cologne 21 June 1819; d. 5 Oct. 1880. He entered the Paris Conservatoire in 1833, became proficient on the violoncello, and for some time played in this instrument in the orchestra of the Opera Comique. Later he was conductor of the orchestra at the Théâtre Français, and in 1855 opened the Bouffes Parisiens, where he enjoyed immense popularity. There were presented many of his most popular works, 'Orphée aux Enfers' (1858); 'Genéviève de Brabant' (1860); 'La Belle Hélène' (1865); 'La Barbe Bleue' (1866); 'La Grande Duchesse' (1867); 'La
OFFENBACH—OFFERINGS AND SACRIFICES

Princesse de Trebizondel (1870); 'Madame Favart' (1878). From 1866 he devoted himself entirely to opera, and the one that he considered his best, was 'Les Contes d'Hoffman' (1881), successfully produced at the Opéra Comique after his death. Offenbach was a clever musician, but wrote for the passing hour, and probably did not do himself full justice. He was the originator of the opera-bouffe, and was imitated by many who never attained his melody or comic force. Consult Martinet, 'Offenbach, sa Vie, et son Œuvre' (1892).

Offenbach, offen-bau, Germany, a town in the Grand-duchy of Hesse, five miles southeast of Frankfort, on the left bank of the Main. It is well and regularly built, and has an old castle, formerly the residence of the princes of Isenburg, the modern palace of the prince of Isenburg-Birstein, a town-house, several churches, a synagogue, and theatre. Offenbach is the most active manufacturing town in the state. Its industries include fancy leather goods, such as pocket-books, portfolios, and traveling bags, among them are manufactures of anilines, celluloid, perfumery, stearin, vaseline, lacquer, and other chemical products, sewing and other machines, and machine tools; paper of various kinds, boots and shoes, type-founding, printing. Pop. (1900) 50,468.

Offerings and Sacrifices, gifts offered to the Deity. Sacrifice differs from almsgiving as a religious service, or from contributions made merely for the purpose of supporting a system of external religion, in being offerings made directly from the worshipper to the Supreme Being. They may, however, under proper authority, be devoted to charitable or religious uses; to the maintenance of the priesthood, or to the celebration of solemn feasts in which the worshipper and his friends, together it may be with the priests, and under the presiding presence of the Deity may partake.

The origin of sacrifice is a point much disputed; the two opposed views being that of a primaeval appointment by the Deity, and that of a spontaneous occurrence on the part of man to draw near to God. The universality of sacrifice has been urged in favor of the hypothesis of a primitive institution by Divine command, but the more legitimate inference from this circumstance appears to be in favor of the opposite view. Of the symbolic character of sacrifice there are various kinds or degrees, all having in common the acknowledgment of dependence on the one hand and of protective power on the other. These may be represented under three heads—(1) propitiatory, or designed to conciliate generally the favor of the Deity; (2) eucharistic, or symbolical of gratitude for favors received; (3) expiatory, or offered in atonement for particular offenses. To a different class may be assigned deprecatory sacrifices designed to avert the arbitrary wrath or appease the wicked disposition of deities.

Among the customs of various peoples in regard to sacrifice, those of the Jews stand out as preeminently worthy of attention. The motive of their very express and explicit claims to a divine origin; secondly, because of their singular and remarkable character; and lastly, because of their connection with the Christian religion. The origin of the Jewish sacrifices is traced to the earliest times. We are told in the book of Genesis that first Cain and Abel brought each an offering to the Lord, and the different characters and results of these offerings are recorded. After the flood Noah offered a sacrifice "of every clean beast and of every clean fowl," an apparent intimation that the distinction between clean and unclean animals had already been made, and consequently of a prior divine appointment of sacrifice. Abraham, Isaac, and Jacob offered sacrifices in which appeared a circumstance peculiar to the Jewish economy, that of a covenant between the offerer and the Divine being, of which the sacrifice was accepted as a sign. When Moses demanded the manumission of the Israelites from their bondage in Egypt, the plea which he presented to Pharaoh was that they might go three days' journey into the wilderness to sacrifice to the Lord. It was when the deliverance had actually taken place, and during their sojourn in the wilderness, that the Jewish ceremonial law with its elaborate ritual of sacrifice was given (accepting the ordinary traditional view regarding the so-called Mosaic legislation). Into the details of this ritual, with its surrounding observances, so amply detailed in the book of Leviticus, we cannot enter. The burning upon the altar of animals offered in sacrifice is among the commonest of the forms of sacrificial rites both among the Jews and Gentiles. The Jewish sacrifices consisted mainly of burnt-offerings (of clean animals) daily, with double offerings on sabbaths, and special offerings at festivals, unlimited in extent, and which, being partaken of by the people, were called peace-offerings. Such sacrifices, called hecatombs, were also common among the Greeks and Romans. Meat-offerings (of flour, oil, and wine) accompanied the burnt-offerings. Sin-offerings (various) at special feasts and at each new moon were general expiatory offerings, besides which trespass-offerings were made privately on certain specified occasions, as well as in expiation of particular offenses. The most remarkable sin-offering was the well known one of the high priest on the day of atonement. Incense was offered every morning and evening. Offerings were made separately, first for the priests and afterward for the whole people. What is most remarkable about the Jewish sacrifices was their restriction to one particular place, the tabernacle, and later the temple (but see Ex. xx. 24). Offerings on high-places were forbidden, and are always noticed with reprobation as the indication of a rebellious spirit. The view of Maimonides among the Jews, and of Warburton and others among Christian divines, was that sacrifices were not so much divinely appointed, as divinely permitted under restraints among the Jews, "lest," as it is expressed by Ephraim Syrus, "they should despise a naked religion and attach themselves to false gods." It is added in support of this view, that when religion was more fully established the prophets constantly deprecated sacrifice, but this is hardly a fair account of what the prophet's worth was anathematized in one voice unite in affirming the views of sacrifice represented by Samuel in his exhortation to Saul, that "to obey is better than sacrifice," and of our Lord, who, according to Saint Matthew,
repeatedly cited the authority of the prophets for the saying that God will have mercy and not sacrifice, but it is clear that these statements were not directed against the established usage of sacrifice, but against an unreasonable reliance on them as a substitute for moral virtues.

Of the sacrifices of the Gentile nations space will not permit us to say much. They were evidently, as has been said, in many cases at least, the result of natural impulses developed by tradition, or cultivated by priestly care into a system. The powers of nature, or the most prominent objects, celestial or terrestrial, in which those powers resided, were commonly their exciting causes; while the terror of natural convulsions, and still more the disorders and miseries of human life, conjured up malevolent beings, whose wrath was only to be deprecated by blood, and sometimes by the blood of those dearest to the offerer. Here, again, human ingenuity came into play, and not animals alone, but slaves and captives, were sacrificed freely to redeem the lives of friends and kindred.

Among many of the eastern nations surrounding the Jews human sacrifices were common. They were so particularly among the Phenicians. Some traces of this barbarous custom may be found in legendary times among the Greeks and Romans. Numerous legends hang upon the circumstance that the wrath of some divinity is only to be appeased by the sacrifice of a human victim to be recognized in some special way, or sometimes of a continued series of such victims. In one other respect only do the heathen sacrifices, including those of the Greeks and Romans, demand special notice, as differing materially from those of the Jews in the frequent inclusion among them as a sacrifice acceptable to the Deity of the chastity of women. This is always denounced in the strongest terms by the Hebrew prophets. The sacrifices of the Greeks and Romans, like those of the Jews, were either bloody or bloodless, the former usually accompanied by libations of wine and by incense. They were frequently used as a means of consulting the gods, procuring omens, etc., and consequently for political purposes.

Of the universality of sacrifice the annals of almost every people bear record. The ancestors of nearly all the existing races in Europe practised human sacrifices, and similar usages widely prevailed in Africa and America, as well as in Asia. Few religions, whether ancient or modern, have omitted sacrifices from among their rites. The Buddhists offer only first-fruits and flowers; the Mohammedans give alms, but offer no direct sacrifices. The Roman Catholic, Greek and Anglican Churches make the service of the Eucharist a service of sacrifice each in a somewhat different sense or degree. The introduction of Christianity had the effect of indirectly putting an end to Jewish sacrifices, and of directly abolishing heathen sacrifices in the Roman Empire. These latter were prohibited by the Emperor Theodosius in 381.

Oftertory, in the Roman Catholic Church, is that portion of the service of the mass in which the priest offers to God upon the altar the bread and wine which are to be consecrated.

In the music of the mass the term ofterty is used to designate the antiphon or music appropriated to that part of the service above designated.

In the Anglican Book of Common Prayer the term ofterty is applied to that portion of the service during which the alms are collected among the people, whether during the service of the Holy Communion or not, while certain prescribed sentences from Scripture are being said or sung. The alms are then offered by the officiating clergyman, being laid on the altar usually with an ascriptive address to God. When the Lord's Supper is celebrated the unconsecrated bread and wine are offered at the same time.

Office, Divine (Lat. Officium divinum) in the Roman Catholic Church, a general designation since the 9th century for the services of the canonical hours (q.v.). These services or offices are prescribed to be said each day by bishops, priests, deacons and subdeacons in the Roman Catholic Church. See BREVIARY; LITURGY; MISSAL.

Office Fixtures. See LITERARY LABOR-SAVERS.

Official Plants (Lat. officinalis, of the shop, from Lat. officina, shop), plants which are used in medicine, and therefore sold in the druggists' and apothecaries' shops. The term "officinal" was formerly—though erroneously—used as a synonym of "official," meaning preparations recognized by the officials in charge of the compilation of pharmacopoeias. Many drugs and plants which are not official are sold in the shops, and are therefore official.

Official plants include the antimetics—pinkroot, wormseed, kossoo, santonion, malefern, pumpkin-seed, etc.; the astringents—galls, catechu, kino, oak-bark, roses, geranium, blackberry, etc.; the bitterns—quassia, gentian, bone-set, goldthread, dogwood, wild cherry, cinchona, chamomile, snakeroot, angostura, etc.; the aromatics—cinnamon, cloves, nutmeg, allspice, cardamom, ginger, eucalyptus, etc.; the cardiacs—digitalis, veratum, arnica, aconite, etc.; the antispasmodics—yerberian, Asiafruticus, comphor, hops, etc.; the alogicis, opium; the mydratics—belladonna, hyoscymus, stramonium; the excitomotor, nux-vomica; the depressomotor—calabar bean, lobelia, gelsemium, etc.; the alteratives—colchicum, squaw. sassafras, etc.; the emetics—ipecacuanha, squill, bloodroot, etc.; the cathartics—tamarinds, castor-oil, rhubarb, aloes, senna, colocynth, elaterium, podophyllum, etc.; the diuretics—broom, buchu, uva ursi, juniper, copaiba, cubeb, cantharides, etc.; the diaphoretic, jaborandi; the expectorants—lobelia, senega, benzoin, etc.; the demulcents—slippery elm, Iceland moss, licorice-root, sassafras, tapioca, arrowroot, sago, barley; the emmenagogues—savine, rue, parsley, apiol, etc.; the oxytocics—ergot and cotton-root; besides many others, all these being also official. Certain other plants are official, such as catnip, tansy, skullcap, liverwort, etc. Consult Potter, 'Materia Medica, Pharmacy and Therapeutics' (1902).

Og, according to the Hebrew Scriptures, the king of Bashan, defeated by the children of Israel at Edrei (Num. xxii. 33). He is said by rabbinical writers to have been one of the giants who lived before the flood, and escaped the deluge by climbing to the roof of Noah's
ark. Noah fed them that they might be to men of after times a proof of the power of God, who had created and destroyed such monsters. In the war of Og against the Israelites he took up a mountain four miles in circumference to throw down upon Israel, when it was honey-combed by ants sent by Jehovah, fell and over-whelmed him. His teeth grew so quickly that they entered the mountain and held him fast, so that Moses could kill him. To give an idea of his gigantic size, the rabbins say that Moses, who according to their account was 6 ells high, and had a battle-ax of the same length, was obliged to make a leap of 6 ells in order to strike his ankle-bone. He bled to death of the wound.

Ogam, ògam, or Ogham, an ancient alphabet or system of lettering, formerly in use among the Celtic peoples of Ireland, Scotland, and Wales, chiefly found in inscriptions on stone, but also, though more rarely, in books. Ogamms consist chiefly of straight lines, mostly vertical and oblique. horizontal lines and curves being sparingly used. They derive their significance partly from their position on a continuous horizontal stem-line along which they are written, some of the characters being drawn resting on the horizontal line as a base, others depending from it, and others intersecting it. This horizontal line, however, really represents a perpendiculalr line, namely that formed by the angle of the upright stone on which ogams were originally cut. Authorities differ as to the total number of letters represented in the alphabet, some making 16, others 25. According to some scholars a single straight line resting on the line represents h; two contiguous strokes d; three t; four c; five qu. A single horizontal stroke depending from the line stands for b; two for i; three for w or f; four for s; five for m. The letters x, y, z, r, q are represented by one to five oblique strokes right to left crossing the line; the vowels a, o, u, e, i, by one to five vertical strokes crossing the line. Diphthongs are represented by curves or compound letters.

The age of this alphabet has been the subject of considerable discussion. The best authorities seem now to be agreed that it cannot be traced beyond the introduction of Christianity. The object of its construction seems not to be explained, but the most ancient ogams are all inscribed on stone. Ogams are found chiefly in Ireland, but some have been found also in Scotland, Wales, the Shetland Islands, and even in England, the total number known only amounting to about 300. The Celtic names in the inscriptions are frequently Latinized. There are numerous papers and discussions regarding them in the publications of archaeological societies.

Og'den, Aaron, American soldier: b. Elizabeth-town, N. J., 3 Dec. 1756; d. Jersey City 19 April 1839. He was graduated at Princeton College in 1773; in 1777 joined the army, and served with distinction during the whole Revolutionary War, serving at one time under Lafayette and obtaining the personal commendation of Washington. On the close of the war he was discharged with the rank of major, afterward practised law, and was a Presidential elector in 1800. He was one of the commissioners for adjusting the disputed boundary between the States of New York and New Jersey; from 1801 to 1803 was United States Senator; and in 1812 was governor of New Jersey. He was president of the Society of the Cincinnati during the last decade of his career.

Ogden, Francis Barber, American inventor: b. Boonton, N. J., 3 March 1783; d. Bristol, England, 4 July 1857. He was aide-de-camp to General Jackson in the battle of New Orleans; is said to have been the first to apply the principles of the expansive power of steam, and the use of right angular cranks in marine engines. In 1813 obtained a patent for condensing engines of low pressure and with two cylinders, in which the above principles were utilized. In 1817 the first engine ever built on these lines was constructed by him in Leeds, England. The first screw propeller successfully introduced into practical use was launched by John Ericsson on the Thames, May 1837, and was called the Francis B. Ogden. The building of the first screw propeller for American waters, the iron F. Stockton, was superintended by Mr. Ogden in Liverpool, where he was United States consul in 1829–40. In 1840–57 he was consul at Bristol.

Ogden, Frederick Nash, American military officer: b. Baton Rouge, La., 25 Jan. 1837; d. New Orleans, La., 25 May 1886. After engaging in mercantile life from boyhood he entered the Confederate army at the outbreak of the Civil War, and subsequently became major of heavy artillery and lieutenant-colonel of cavalry. At the close of the War he resumed commercial life, and in 1868 founded the Crescent City Democratic Club, a powerful political organization. He was made major-general of State militia; and was president of the Red Cross Association of Louisiana during the yellow fever epidemic of 1878.

Ogden, Herbert Gouverneur, American cartographer: b. New York 4 April 1846. He was educated in private schools; in 1863 was appointed an aid in the United States Coast and Geodetic Survey and an assistant in 1869. He served with the army on the defenses of Washington in 1864, accompanied the Nicaragua expedition in 1865, and the earliest naval explorating expedition to the Isthmus of Darien in 1870 as topographer, and had charge of the party sent to locate the international boundary between British Columbia and Alaska, in 1893. He is a recognized expert in topography and cartography.

Ogden, Robert Curtis, American merchant and philanthropist: b. Philadelphia, Pa., 20 June 1836. Since 1885 he has been a retail mercer, as a member of the John Wanamaker firm. He is best known by his work in behalf of the cause of education in the South. He is president of the board of trustees of Hampton Institute, a trustee of Tuskegee Institute, and president of
ROBERT C. OGDEN,

PRESIDENT OF THE SOUTHERN EDUCATION BOARD.
the Southern Educational Board and the Conference for Education in the South. His work in this line has been everywhere recognized as most efficient, his efforts being directed chiefly toward providing education for both negroes and illiterate whites through Southern spellers and in friendly co-operation between Northerners and Southerners. In 1903 Tulane University gave him the degree of LL.D. in recognition of his services. He has published 'Samuel Chapman Armstrong,' the Founder's Day address at Hampton Institute, 1894; 'Few Rents and the New Testament' (1892); 'Sunday School Teachers' (1894).

Ogden, Ruth. See Ide, Fannie Ogden.

Ogden, Utah, city, county-seat of Weber County; at the junction of the Ogden and Weber rivers, and on the Southern R.; Union P., Rio Grande W., Oregon S. L., and Ogden & N. W. R.R.'s: about 35 miles north of Salt Lake City, and 10 miles from Salt Lake. It was founded in 1848 and in 1850, under the direction of Brigham Young (q.v.), it was laid out as a city. In 1851 its first city charter (1894) governing the city is in accordance with the general law of the State for the government of cities and was passed by the Legislature in 1858. It is in a fertile agricultural region, and in the vicinity of valuable mines. The opening of the Ogden Canion is at the city limits, and its grand and picturesque scenery brings many tourists to the place. The water-power of the falls is used for the electrical works which supply the city and for grain and salt Lake City. The chief industrial establishments are canneries, pickle factories, beet-sugar factory, woolen mills, broom factory, and brick and tile yards. It has an extensive trade in its manufactures and farm products, and is the distributing centre of quite a region with which Ogden is connected by railroads. The educational institutions are the State Industrial School, State Institutions for the Deaf, Dumb, and Blind, the Weber State Academy (Mormon), the Sacred Heart Academy (R.C.), and public and parish schools. The government is vested in a mayor, who holds office two years, and is elected by the people subject to the approval of the council, the administrative officials except the treasurer, clerk, auditor, police justice, and attorney, who are elected by the people. Pop. (1890) 14,889; (1900) 16,313.

Ogdensburg, N. Y., city, port of entry, in Saint Lawrence County; at the confluence of the Saint Lawrence and Oswegatchie rivers, and on the New York C. & H. R., and the Rutland R.R.'s; about 170 miles, in direct line, northwest of Albany, the State capital. It is connected by ferry with Prescott, Ont. It is at the foot of the deep-water navigation of the Great Lakes, and has unusual facilities for transportation. It has direct connection by rail with New York city and Boston, and steamer connection with all the lake and river ports. Shipping and wholesale dealing in lumber, grain, coal and the most prominent industries. Several fleets of vessels are owned here. Other important industries are the manufacturing of silk, flour, gloves, dress shoes, and other similar articles. The exports are $17,521,641; exports, $4,543,346. The value of the raw silk imported was $1,524,596. The amount of lumber cleared was 113,315,000 feet. The number of vessels which arrived was 1,880; departed, 1,757, with aggregate tonnage of 925,399. The custom duties amounted to $204,266.89. The prominent public buildings are the custom-house, a beautiful town-hall, an opera-house, two handsome club houses, a State asylum, and several large churches, including the Roman Catholic Cathedral. Among the charitable institutions the most prominent is the Saint Lawrence State Hospital for the Insane; established and equipped at a cost of several millions, and supervised and superintended by specialists, it is an exponent of world's most effective and humane treatment of the insane. Other institutions are the City Hospital, United Helpers' Home, Saint John de Deo's Hospital (quarantine hospital), an orphanage and a home for the aged. The educational institutions are Saint Mary's Academy (free), public school free academy, public and parish schools, and a public library. The library is built on a site of great beauty, on the river front, and surrounded by several acres of green lawn and trees. The building cost $50,000 and was paid for by the citizens of the city. By an act of the Legislature the corporate limits of the city were extended. Pop. (1890) 11,662; (1900) 12,633; (1904) over 14,000.

Fred Van Dusen, Ph. D., Principal Ogdensburg Free Academy.

Ogé, Jacques Vincent, zhàk vân-sënt ô-zhài, Haitian revolutionist; b. Dondon, Haiti, about 1755; d. Hayti 1791. He was a mulatto, but was born free and as a young man served in a German army there. In 1780 he represented Haiti in the Constitutional Assembly and when he returned to Haiti he took up the cause of the slaves. Unsuccessful in his petitions to the Assembly, he formed a company and in 1790 led a revolt. He was victorious in several battles, but was ultimately defeated; the plea that his life should not be forfeited if he surrendered was disregarded and he was tried and sentenced to death.

Ogee, ô-jê', in architecture, a molding consisting of two members, one concave and the other convex. An ogee arch is a pointed arch, the sides of which are in the form of an ogive or curve. It is generally introduced over doors, niches, tombs, and windows, its inflected curves weakening it too much to permit of its application for the support of a great weight.

Ogeechoe, ô-gëchë, a river in Georgia, has its headwaters in Greene County, flows southeast into Ossawah Sound, a course of about 200 miles. Savannah is 17 miles north of the mouth of the river. Where the waters enter the sound a number of islands have been formed, largest of which is Ossawah. The river is navigable for small steamers for some distance from the ocean.

Oggione, ôd-bin', Marco da, Italian painter; b. Oggiono, Lombardy, about 1470; d. between 1530 and 1540. He studied religious painting under Leonardo da Vinci to early as 1490, and was the oldest of that master's scholars. One of the finest of his pictures is 'The Three Archangels' in the Brera at Milan. He is, however, best known for his painting 'The Last Supper' of Leonardo, one of which is at the Royal Academy, London, another in the Convent of Castellazzo, near Milan, and a third at Saint Petersburg. The pretty picture at
OGILVIE—OGYES

Hampton Court of 'The Infant Christ and Saint John Kissing,' generally attributed to Leonardo, is undoubtedly the work of Oggione whose creations are not unfrequently credited to his greater teacher.

Ogilvie, òg'-l-ví. Clinton, American painter: b. New York 28 Dec. 1838. After studying under James McDougal Hart (q.v.), he started on his student-travels in Europe, and spent much time in the art galleries and studios of Paris (1866, 1874-3). In 1864 he was elected an associate of the National Academy. He has been successful as a landscape painter and has generally gone to Switzerland or France for his subjects. His best known pictures include: 'The Valley of Schwytz, Switzerland'; 'Lake Como near Bellagio'; 'Among the Adiron-dacks'; 'At Eaux Bonnes, France'; 'Argelles'; and 'Saint Barthelemy, near Nice.'

Ogleby, òglz'-bi. Richard James, American soldier and lawyer: b. Oldham County, Ky., 25 July 1824; d. Elkhart, Ill., 24 April 1890. He removed with an uncle to Decatur, Ill., in 1836, studied law there while engaged in the carpenter's trade and gained admission to the bar in 1845. He served in the Mexican War with Lieut. John Adams, after whom he entered the Louisville Law School, where he was graduated in 1848. In 1851 he resumed his law practice in Decatur, Ill., and in 1850 was elected to the State senate from which he resigned to enter the Union army. At Forts Donelson and Henry he performed distinguished service and in 1862 was promoted brigadier and later major-general of volunteers. He was at the battles of Pittsburg landing and Corinth and was compelled to resign in 1864 because of his wounds. In 1865-9 he was governor of Illinois, and in 1872 was re-elected but declined the office to become United States senator in 1873-9, and was again governor in 1885-9.

Oglethorpe, òg'l-thórpe. James Edward, English soldier and colonist: b. London 21 Dec. 1696; d. Cranham Hall, Essex, 1 July 1785. In 1714 he joined the army of Prince Eugène, as aide-de-camp, whom he served with distinction in the campaign against the Turks, 1716-7, entering at the Battle of Székesfehérvár (q.v.). In 1722 he was sent to Parliament as member for Haslemere. Becoming acquainted with the abuses of the debtor's prison in London, he made them known to Parliament, and was appointed chairman of a committee for their investigation. His work in behalf of insolvent debtors, thus begun, was continued in his project for their colonization in North America, in connection with which he also aimed at an asylum for oppressed Protestants of the European Continent. With others, in 1732, he obtained a charter for a tract of land between the Altamaha and Savannah rivers, and in January 1733 Oglethorpe, with a party of colonists, arrived at Savannah; soon afterward he founded Savannah (q.v.), and for 10 years he served as governor of the colony of Georgia, named in honor of George II. By his defense of the colony and neighboring territory of the Spanish in the讧 north of the Spanish line and Indians from Florida, and his efforts to secure the trade of the Cherokees, he rendered services to England quite beyond the ordinary work of colonial administration, and for Georgia laid the foundation of a stable commonwealth.

Besides the defenses which he gathered in the colony, in 1738 he brought a regiment of volunteers from England, and in the war of Jenkins' Ear (see Colonial Wars in America), he vigorously laid siege to Saint Augustine, but the inadequacy of his force prevented him from capturing the place. He achieved an important success in holding Amelia Island against the Spanish attack, and another by his victory at Frederica. In 1743 Oglethorpe returned to England, and two years later was made major-general, having been acquitted of charges brought against him for the failure of his attempt at Saint Augustine. He had brought himself into financial straits by advancing money for defensive needs in Georgia. In 1745 he served against the Stuart invaders, and pursued the Jacobite fugitives, was court-martialed for failing to accept them, but honorably acquitted. Oglethorpe and his fellow trustees of Georgia surrendered their charter in 1752; and when Georgia became a royal province, in 1760 he was raised to the rank of general in command of all the king's forces. His interest in American affairs never abated, and he was one of the first to visit upstart Gen. Washington in England as ambassador, to whom he expressed his esteem and regard for America, and his satisfaction at the termination of the difficulties between Great Britain and her colonies. Consult: Sparks, 'American Biography,' 2d ed., 1886-9; Asher Brown Durand, travel memoir of Oglethorpe by W. B. O. Peabody; Wright, 'Memoirs of James Oglethorpe' (1867); and Lecky, 'England in the 18th Century,' Vol. I. (1879).

O'Gorman, Thomas, American Roman Catholic bishop: b. Boston, Mass., 1 May 1843. He was educated in the United States and in France; entered the priesthood and held pastorates at Rochester, Minn. (1867-78); and at Paribault, Minn. (1882-5). He was first president of the College of St. Thomas, St. Paul, Minn., and professor of dogmatic theology; and professor at the Catholic University of America, Washington, D. C., 1890-5. In 1896 he was consecrated bishop of Sioux Falls. He has published 'A History of the Roman Catholic Church in the State of South Dakota' (1957).

Ogowai, ò-gô'-wá, or Ogowe, ò-gô'-wá, Africa, a river of the French Congo, with a densely forested and wide delta on the western coast near Cape Lopez. Its sources are in the Cristal Range, about 300 miles west of Stanley Pool, and it reaches the Atlantic after a northwesterly course of about 700 miles, 200 miles of which from the mouth are navigable by small steamers, the remainder being impeded by numerous rapids. It has several tributaries, the chief of which are the Lualaba and the Lualwe. The river was discovered by Du Chaillu in 1869, and has been explored by French travelers, including De Brezze, Fourneau, and Lesieur.

Ougl'onian Law, in ancient Roman history, a law passed by the tribunes about 300 B.C., by which the office of pontiff and augur were thrown open to the common people.

Ogyges, 6j'-jé-á. In Greek mythology, the most ancient ruler of Attica. The building of Thebes is ascribed to him, and one of the gates of the city was named after him. Under the reign of Ogyges happened the Ogygian deluge, which lasted waste all Attica.
O'HARA—OHIO

O'Hara, Ó-här′a, Thaddeus, American soldier and poet: b. Danville, Ky., 11 Dec. 1800; d. near Guerryton, Barbour County, Ala., 6 June 1867. At one time an officer in the United States Navy, he was connected with the Lopez and Walker movements, and served as captain and major in the Mexican War. During the Civil War he was a colonel in the Confederate service. His famous poem, 'The Bivouac of the Dead,' was written in commemoration of the Kentuckians killed in the battle of Buena Vista during the war with Mexico.

O'Higgins, Ó-hig′inz (Sp. Ó-ég′génz), Ambrosio, South American administrator: b. County Meath, Ireland, about 1730; d. Lima, Peru, 18 March 1801. His real name was Ambrose Higgins. His uncle, who was a Spanish priest, had charge of his education and sent him to South America. He went to Buenos Ayres first and then to Chile, where he was a trader and peddler for several years. He entered the Spanish army, distinguished himself in the Araucanian wars, and rapidly rose in rank until in 1788 he was made captain-general of Chile. His rule was very successful, he was given the title of Marquis of Orosino, and appointed viceroy of Peru in 1796, where he also proved an excellent ruler.

O'Higgins, Bernardo, Chilean soldier and dictator: b. Chillan, Chile, 20 Aug. 1776; d. Lima 24 Oct. 1814. He was a natural son of Ambrosio O'Higgins (q.v.). He was educated in England, where he became a republican under the influence of Miranda and others. He returned to Chile in 1802, and in 1810 joined the Chilean revolutionists; in 1813, when Carrera was deposed from the supreme command of the army, O'Higgins was appointed to succeed him. He met with constant opposition from Carrera and his faction, and civil war was imminent, when a Spanish army from Peru entered the country, and the two factions combined to withstand the Spanish attack. The Chileans under the command of O'Higgins met the Spaniards at Rancagua, 2 Oct. 1814, and were defeated on account of Carrera's failure to bring the reinforcements expected. The leaders fled across the Andes, but O'Higgins in 1817 joined the invasion under San Martin, as one of the chief lieutenants. The charge under his leadership decided the Chilean victory at Chacabuco, 12 Feb. 1817. He was then made dictator of Chile — after San Martin had declined the office — and under his rule the independence of Chile was formally declared and the Spaniards driven out. His administration was an efficient one, but his republican sentiments and his attempts to establish a representative constitutional government aroused the opposition of the aristocrats. The aristocratic party, joined by the adherents of Carrera, rebelled and finally deposed him in 1823, and he then went to Lima, Peru.

O'Higgins, Chile, an inland province bounded north and west by Santiago, Argentina on the east, and by Colchagua on the south. Area, 2,524 square miles. Capital, Rancagua (q.v.). The surface is hilly, and devoted to agriculture and pastureage; in the east the country is on the slope of the Andes and in this mountainous region gold and other metals are found. The principal rivers are the Maipo and the Rapel. Pop. (1895) 85,277.

Ohio (Iroquois, Ohionhi, "beautiful river," popular name, Buckeye State), a State in the north central part of the United States; bounded on the north by Michigan and Lake Erie, on the east by Pennsylvania and West Virginia, on the south by West Virginia and Kentucky, on the west by Indiana. The boundary lines dividing Michigan and Indiana from Ohio, and Pennsylvania from Ohio to the Ohio River, are straight lines, the southern and southeastern boundaries are formed by the Ohio River. The State is between lat. 38° 27' and 41° 57' N. and lon. 80° 34' and 86° 40' W. The maximum length, north and south, is 210 miles, and east and west, 215 miles. The area is 41,060 square miles, of which 300 square miles are water surface. In size it ranks thirty-second among the States, and was the fourth State admitted into the Union.

Topography.—That portion of the State bordered by the Ohio River and Lake Erie has an irregular boundary. The course of the Ohio along the border is 436 miles; the late show is 230 miles, giving the State a navigable water front of 666 miles. The largest inlets from Lake Erie are Sandusky and Maumee bays. In the portion of the Lake between those bays are a number of islands, several of which belong to Ohio. The general surface of the State is a rolling plain, from 300 to 500 feet above Lake Erie, or from 900 to 1,200 feet above the sea. Some portions have an altitude of 1,500 feet; in Logan County, the western part of the State, is the highest point, 1,540 feet altitude, and the lowest is the shore of the Ohio near Cincinnati. The divide between the rivers of Lake Erie and those of the Ohio River is a low ridge which crosses the State from the middle of the western border, in Mercer and Darke counties, to near the northeastern boundary, in Trumbull County. The river channels are cut deep in many parts of the State and many of the banks are massive rugged rocks and huge boulders. The best harbors on the lake shore are Ashatabula, Cleveland, Sandusky, and Toledo.

Hydrography.—There are two drainage basins in the State; the one sloping north toward Lake Erie, and the other south toward the Ohio rivers flow through valleys, some of which were at one time flood plains, but many of the streams have cut channels from 100 to 200 feet in depth and flow through low valleys. The Ohio River is in some places from 500 to 600 feet below the tops of the banks. The streams which flow south are the longest and deepest. The largest are the Muskingum, Mahoning, Hocking, Scioto, Little Miami and Great Miami. The longest wholly within the State is the Muskingum. This river has been made navigable by slack water and other improvements for about 100 miles from its mouth. The chief rivers in the northern basin are the Maumee, Portage, Sandusky, Huron, Vermilion, Black, Rocky, Cuyahoga, and Chagrin. Many of the rivers of the State furnish considerable water-power and are a great aid in the development of manufacturing interests. There are no large lakes in the State, but in many parts there are groups of small lakes noted for their beauty. In Summit County there are several small lakes. The buried river channels which are found in many places in Ohio are of interest to the geologist.
These channels have been filled in by sand, gravel, etc., and now the waters of rivers that once followed deeply excavated channels, are flowing over beds far above their former bottoms.

Geology.—There are no great breaks of the strata, nor any great variations in the geological structure of the whole State; the underlying sedimentary rocks show only a slight inclination from the horizontal. There is a broad fold whose axis extends from the northeastern part of Indiana southeast to near Cincinnati, then crosses into Kentucky, extending to the central part. This is called the Cincinnati Arch or anticline. From this arch the strata dip westward to the coal fields of Illinois and south and southeast under the Alleghany coal fields. The elevation of this arch must have occurred at the close of the Lower Silurian period and prior to the beginning of the Upper Silurian period.

The geological formations which are exposed are the Lower and Upper Silurian, the Devonian, the Carboniferous, and the drift. In the Lower Silurian near Cincinnati may be found the oldest rocks of the Cincinnati Group but far to the north in localities is there found such a variety and richness of the fossil remains as in the beds of limestone and clay or marl in this vicinity. On the crown of the Cincinnati Arch, near the northern part, the formations of the Upper Silurian area may be seen. Near Sandusky is the Salina group, the formation containing salt as at Syracuse, N. Y. Here also are beds of gyspum. In the western part and on the islands of Lake Erie is the water lime which is found in the Helderberg region of New York State. It flanks the Cincinnati Arch on each side. The corniferous limestone, the chief element of the Devonian in the State, forms two outcropping belts on opposite sides of the Cincinnati Arch, one crossing the northwest corner of the State, and the other extending from Sandusky to Columbus. Corniferous limestone forms the surface rock of Kelleys Island. This same rock is quarried at Kelleys Island, Sandusky and God, and other places in the State. The capitol at Columbus is built of this stone. In the corniferous rocks at Sandusky and Delaware are found the remains of fossil fish. The black shales of the Portage and the Upper Sandusky Valley in New York State, is in the northwest corner of the State, and also a belt from 10 to 20 miles wide, extends from the mouth of the Huron River to the Ohio. It is a black bituminous shale containing from 10 to 20 per cent of carbonaceous matter. It is the source of a large part of the oil and gas of Ohio. In this shale are found the remains of large fossil fishes. Bordering on the lake shore from the Pennsylvania line is a mass of shale, the upper member of the Devonian, and the continuation of the formations found in the Portage and the Chemung Valley of western New York. The eastern part of the State is underlaid by the Carboniferous formation, an extension of the great Alleghany coal fields. The coal measures are composed of strata of shale, sandstone, coal, limestone, and fire clay with iron ores are found in the eastern and southeastern part. These coal measures have an area of 4,000 square miles in Ohio. There are no formations later than the Carboniferous until the period of the Glacial drift. All the State except the southeastern portion was covered with ice. The drift deposit in many places is several hundred feet deep. The Great Lakes once overflowed much of the State, as may be traced by the existing raised beaches.

Climate.—The climate while temperate is variable, and great extremes occur; but neither excessive heat nor cold is of long duration. The
maximum temperature is 107.9° and the minimum 34° below zero. The northern part of the State has a longer and colder winter than the southern part; but the winters are not severe in any part of the State. The climate near the Lake, sudden changes of temperature occur, especially during the summer season. The mean temperature for July is 73°, for January 26°. The rainfall is evenly distributed and of an amount generally conducive to the growth of farm products. The annual rainfall averages 39.35 inches. The climate is healthful; the winds which are at times a disturbing element as regards temperature, serve to keep the climate of the State as a whole remarkably healthful.

Soil.—The soil of nearly two thirds of the State is the deposit of the drift or quaternary, and nearly all of such soil is fertile. In the southeastern part the soil is composed of the decomposed sub-rock structure. In the north-east the clay soils are found in many counties and in the west there is a large percentage of limestone; along the rivers are alluvial soils.

Forests and Forest Products.—The western part of the State was once covered with forests, but the great demand for timber, was abundant. The ash, elm, beech, and varieties of cedars, pine, chestnut, maple, oak, and in some parts walnut were found. In the western part the prairie zone begins. The total extent of forests in 1900.9,300 square miles, which was 23 per cent of the total area. The wood products of Ohio were noted for their good quality, when the raw material was obtained from the forests of the State. In 1900 there were 2,044 lumber and timber manufactures, and the value of the product for the same year was $20,790,854. The value of the lumber and planing mill products, including sash, doors, and blinds, for the same year was $11,666,671; the value of the furniture products was $9,514,704; and of paper and wood pulp, $6,543,513.

Flora.—See United States.

Fauna.—See United States.

Agriculture.—The Federal census of 1900 reported 3,790,381 acres devoted to farming, and the improved land as 78.5 per cent of the farm area. The waste land has been reduced to a minimum. The large number of manufacturing towns and cities, making a ready market for agricultural products, has encouraged the agricultural development of the State, and has been one of the chief causes of the increase of improved land acreage from decade to decade since 1850. The average size of the farm in 1890 was 125.2 acres, and in 1900, 88.5 acres. In 1900 the number of farms occupied and operated by tenants was 27.5 per cent of the whole number in the State. There were, in 1900, about twice as many farms leased on shares as were rented for cash. Fertilizers are in general use, and are increasing. In 1900 the cost for fertilizers averaged about $10 per farm.

The agricultural products are varied, some seem to grow well in all parts of the State. The clay soil of the northeast is well adapted to wheat, but wheat is raised in other sections. In 1900 the leading crops were corn, wheat, and hay. The corn acreage was 8,386,013; the wheat, 3,200,074; the hay, 3,013,461. Oats ranked next with 1,110,110. The average acreage was 71,422; potatoes, 167,590. Rye, buckwheat, and barley had a combined acreage of 64,714. From 1890 to 1900 the corn acreage had increased 20 per cent, the wheat acreage 41.4 per cent, and tobacco, 61.2 per cent. Nearly one half of the area devoted to tobacco, in 1900, was in Darke and Montgomery counties. The tobacco product is large and of an excellent quality. Other vegetables grown extensively are cabbage, sweet corn, and tomatoes. The State is noted for its extensive orchards. In 1900 the apple crop was 20,000,000 bushels. Peach, pear, plum, and prune trees had increased greatly in number from 1890 to 1900. Large vineyards are in the region near Lake Erie, and small fruits are cultivated in all parts of the State.

Stock-raising.—The receipts from the dairy products, in 1900 were $15,484,840. Of this amount $8,903,626 was from sales of milk. From 1890 to 1900, the amounts derived from the sales of milk had increased 30.3 per cent. The number of dairy cows increased from 794,933 in 1890 to 818,339 in 1900; and other cattle from 963,554 in 1890 to 1,235,074 in 1900. During the same decade there was a decline in the number of horses, mules and asses, and swine. For several years Ohio led in the number of sheep. In 1890 the number was 250,000; in 1900, 264,250; the flocks had increased in weight. The sales from wool, in 1899, amounted to $4,269,025. Poultry is increasing, especially near the large cities. The laws of the State looking to the prevention of the spread of diseases among stock, are rigidly enforced, as are also the laws relating to purity of dairy products.

Manufactures.—According to the census of 1900, Ohio ranked first in the United States in the manufacture of carriages, wagons, and supplemental materials, and in pottery and clay products: it was second in the manufacture of agricultural implements of iron and steel, and of food preparations; third in flouring and grist mills products, in the roasting and grinding of coffee and spices, in foundry and machine shop products, distilled liquors, soap and candles, and tobacco, cigars and cigarettes; fourth in the factory product of boots and shoes, of women's clothing, in the manufacture of leather, and elastic goods, in refining petroleum, and in cars and general shop construction and repairs by steam railroad companies; and fifth in the factory product of men's clothing, electrical apparatus and surgical instruments. In 1900 there were 11,386 planing mill products, including sashes, doors, and blinds, in book and job printing and publishing, and in the printing and publishing of newspapers and periodicals. In the value of all manufactures, Ohio ranked fourth among the United States from 1840 to 1880, but in the latter year was surpassed by Illinois, and became fifth, holding that rank ever since. From 10,022 manufacturing establishments with a capital of $29,019,538 in 1850, Ohio had increased to 20,000 establishments with a capital of $188,093,614 in 1880, and to 32,398 establishments with a capital of $603,792,266 in 1900; the average number of wage-earners in the years stated were, respectively, 51,401, 184,000, and 345,800, and the total value of products, including custom work and repairing, was respectively, $62,690,279, $3,482,098, and $32,045,113.

The establishments of 27 leading industries,— including besides the above the above paragraph, slaughtering and meat packing, the manufacture of furniture, and of paper and wood
Ohio

pulp.—had increased from 7,997, with a capital of $288,343,244, and an annual output valued at $462,134,862 in 1890, to 30,157, with a capital of $903,506,111, and an annual output valued at $547,619,814 in 1900. The manufacturing importance of the State is due to its ample natural resources as detailed under Minerals and Mining, and their accessibility by waterways and rail, which led to an early introduction of domestic manufactures along with the chartering of a trading and banking company in 1803. Cleveland and Cincinnati are the chief industrial centres. Cincinnati long held the lead, but has apparently attained its maximum, while Cleveland is still increasing. From 1800 to 1850 Cincinnati was the centre of an extensive hog raising region, and during that period was the most important meat-packing city in the United States. The manufacture of tobacco is also a leading industry of Cincinnati. The manufacture of foundry and machine shop products, including engines, boilers, and machinery of many varieties, is carried on extensively in all the leading cities of the State, chiefly at Cleveland and Cincinnati. Youngstown, in the Mahoning Valley, is the leading city in the State in the iron and steel industry. Mining machinery is made at Columbus and Akron, machine tools at Hamilton. Pottery is produced at Cincinnati, Akron, Zanesville, Roseville, and East Liverpool, the last town manufacturing over 49 per cent of the white granite ware and semi-vitreous porcelain of the United States. Toledo is one of thegranaries, or the centres for the storage of corn, in the State. These cities, together with Canton, Elyria, Sandusky, and Fremont, account for over 4,000,000 bushels of wheat shipped annually. Sugar refining is a large industry in the State, and the manufacture of glass is also of some importance. Springfield and Canton lead in the manufacture of agricultural implements.

Commerce and Transportation.—The foreign commerce of the State carried on through Cleveland, Cincinnati, Toledo, and Sandusky, the four ports of entry of the United States customs districts of the region, is practically unimportant, compared with the enormous domestic commerce over the waterways and the railways of the State. The Ohio River, forming the southern boundary of the State for 436 miles, and its tributaries, the Muskingum River, navigable for several miles above Zanesville, have formed for over a century one of the great highways of internal commerce, affording communication with western Pennsylvania and the entire Mississippi Valley; notwithstanding the advent and competition of railroads, their waters still bear the larger freight of coal, lumber, and the heavier articles of transport. Two canals originally connected Lake Erie with the Ohio River, one from Cleveland to Portsmouth, and the other from Toledo to Cincinnati, but at the present time there is no connection with the Lake and river by either, owing to abandonment and decay. Lake Erie and the Erie Canal afford water communication with the Atlantic seaboard; and the northwest States are reached via the western Great Lakes and the Sault Sainte Marie Canal. The construction of railroads dates from 1832 and the incorporation of the Mad River & Lake Erie railroad, now absorbed in the Big Four system. The railway mileage of the State in 1900, including main line, second line, branches, and side lines, was over 10,000 miles. The railways of the State are the Baltimore & Ohio, the Lake Shore & Michigan Southern, the Pennsylvania, the Erie, the Cleveland, Cincinnati, Chicago & Saint Louis, and the New York, Chicago & Saint Louis. The consolidation of the railroads is proceeding gradually, and nearly all the rail lines together with the Lake Shore & Michigan Southern and the Baltimore & Ohio are now controlled by larger corporations. The State is provided also with a network of interurban electric railroads connecting the many busy landside centres, and ranking first among the United States in the extent of its mileage.

Banks.—The first bank of the State was a private institution, which was virtually a private company to which the privilege of doing a banking business had been granted. Five banks were established before 1813, all by special act of the legislature. The first government bank in the State was established in Cincinnati in 1817. This "innovation," as it was called, met with great opposition, and various methods were suggested whereby the United States bank might be suppressed or induced to leave the State. From 1817 to 1836, there were 25 banks established. In 1836 an effort was made to establish a second United States bank, but the legislature passed a special act preventing its establishment. A number of private and unauthorized banks were established between 1840 and 1850. The failure of several of those banks caused losses to many people, to the passage of prohibitory laws regarding the establishment of unauthorized banks by the legislature of 1845. The laws proved ineffective, and a free banking law was passed in 1851. So much had public opinion changed in 1863 nearly all the State banks became National banks. In the panic years of 1873, 1884, and 1893 there were many bank failures in the State, nearly all of which were confined to private and State banks. In 1900, the high prices of United States bonds and other reasons caused a reaction in favor of State banks. From Nov. 1900 to Nov. 1902 inclusive, there were established in the State 42 banks, savings and loan associations. During the same period there were established 20 building and loan associations. In 1903 there were in the State 371 State banks and trust companies; 30 private banks; 331 National banks; making in all 1,022 authorized banking institutions, with a total capital of $70,051,584, and with deposits amounting to $527,824,500.

Finances.—Prior to 1825, Ohio had no debt. The first State debt was contracted that year, for the construction of canals (see History). Later the debt was augmented for other canals, subscriptions toward railroads and roads, and in 1833 the State debt was $18,880,000, in 6 and 7 per cent bonds. The incomes from canals and a special tax were devoted to the public debt. The State credit remained unimpaired, so that when necessary it was able to borrow further sums. The years 1838-40 brought financial ruin to many enterprises throughout the Union, and made the borrowing of large sums a matter of difficulty. To have discontinued the public works would have caused great loss, so in 1843 the State issued 7 per cent bonds. The canals absorbed the school fund, the sinking fund, and the proceeds from sale of public lands, and by 1856 the debt had been reduced nearly $3,000,000. A further debt of $1,287,000 was incurred in 1856, after which the whole was gradually decreased. In 1880 the State debt was $6,475,805. In
Москва
1903 the remaining portion of the funded debt $200,000, matured and was paid, together with $4,000 of interest money. A special university fund was created in 1892. The income of the State is derived from a general tax; about 60 per cent comes from the general property tax, and nearly 18 per cent from the excise tax. The income was in 1903, $6,323,667.15 which includes amounts paid on funded debt and interest. The balances in the four funds, 15 Nov. 1903, were as follows:

- General revenue fund: $8,414,554.27
- Sinking fund: $148,652.69
- School fund: $318,199.41
- University fund: $75,046.10

Total: $11,372,024.12

Education.—The Territory of Ohio received its first grant of land for public education in 1785; the Continental Congress reserved for school purposes the sixteenth section in every township. Later grants were made by Virginia, the Western Reserve, and certain Government Military reservations. No common school system was established until 1825; the law was passed the same day as the law providing for the construction of canals (see Finances). In 1827 provision was made for selling school lands. Further legislation was enacted from time to time, that of 1873 provided for the classification of school districts, and making obligatory the use of the English language in teaching all branches to be taught in the schools. The German language had been used in many schools. Prior to the establishment of the common school system, there had been a number of schools, some private and others by churches or communities. The Ohio University (q.v.) at Athens was founded in 1804 and the Miami University (q.v.) in Oxford in 1809. The legislature of 1901 passed a bill, which became a law 12 March 1902, establishing normal schools, for the training of teachers. This law provides for two schools in connection with the Ohio University at Athens and the Miami University at Oxford. These institutions, known as State normal schools, are to be supported by an income from the "Ohio and Miami University Fund," created with the bill. The income is derived from a direct tax. The legislature at the same time passed a bill to provide for different grades of schools and provide for examinations for entrance to high schools. The child labor law and the compulsory education laws were rewritten and made to harmonize. Children between the ages of 8 and 14 are compelled to attend school the full time, and children between the ages of 14 and 16, not engaged in some regular employment, are also required to attend; and if the child over 14 and under 16 cannot, read and write the English language he must attend the full time. Heavy penalties are provided for the violation of the compulsory education laws. The centralizing of township schools began in Ohio some years ago, when the matter was optional. The first legislation on the subject, in Ohio, was enacted in 1892. The teachers' institutes, teachers' pensions, the school curriculum, all receive wise and almost constant attention. The principal cities have city training schools for the apprentice to become teachers. In 1902 there were in the State 2,437 school districts, 66 of which were city districts, and 1,135 were township districts, of which latter there were 11,078 subdivisions. The number of children of school age was 1,245,393. The total number of children in public schools, colleges, universities, and public institutions, was 844,728; the number in Roman Catholic parish schools, academies, colleges, and institutions was 74,605, leaving 326,060 children who were in private schools in the State, in schools outside the State, or if between the ages of 16 and 21 they might be in the workshop. The Lutherns have parish schools in nearly all the large cities. In 1902 there were in the State 736 public high schools, 47 private high schools, 13 theological schools, 33 colleges and universities, and 24 professional schools including law, medicine, dentistry, and pharmacy. (The colleges and universities appear under their corporate names.)

Religion.—The Methodists (Federal census, 1900) have about one fourth of all the church members of the State; and the Presbyterians and Roman Catholics have each about one tenth. The other Protestant denominations, in membership, rank as follows: Lutheran, Baptist, Disciples of Christ, Congregationalists, and Protestant Episcopalians. The Protestants have large and well organized Sunday schools connected with all their churches. The Roman Catholics have Sunday schools also, but where the parish school has been established, the attendance at the Sunday school is usually limited to those not receiving religious instruction during the week.

Charitable and Penal Institutions.—The State Board of Charities consists of seven members; six of whom are appointed by the governor, the governor of the State is ex-officio a member and is president of the board. A secretary is appointed by the board. The board has the supervision of all State and municipal institutions, including infirmaries, jails and orphanages, or all institutions for furnishing relief or for correction. The State law further provides that this board shall examine, for criticism or approval, all plans for charitable or penal institutions in the State; and after approval, no other alterations shall be made therein. There are 17 State institutions, as follows: State hospitals at Athens, Cleveland, Columbus, Dayton, Longview, Toledo; the Ohio Hospital for Epileptics, Institution for Deaf and Dumb; State School for the Blind; Ohio Industrial Home for Girls; Industrial School for Boys; homes at Xenia and Sandusky; a State penitentiary and a State reformatory. The municipal institutions are workhouses at Canton, Cincinnati, Cleveland, Columbus, Dayton, Toledo, Xenia, and Zanesville, and a House of Refuge at Cincinnati. The county institutions are infirmaries, homes, and jails. Outdoor relief is given by infirmary doctors, township clerks, and under the direct supervision of the Soldiers' Relief Commission. Changes will be made in the care of epileptics, who are now (1903) in a hospital at Gallipolis. The Juvenile Court, at Cleveland, has shown there are great opportunities for the prevention of the crimes often committed by the young and how they may be reclaimed. The annual State Conference has been productive of much good. Each county has a board of county visitors. The expenses of the State institutions for the year ending 15 Nov. 1902 were $2,624,660.14; for the municipal institutions, $146,175.08; for the
count institutions, $3,126,290.03, making for the whole a total of $4,827,044.25. A National Soldiers' Home is located at Dayton. It has accommodations for 6,000 persons. The Roman Catholic charitable institutions of the State are 14 orphan asylums, having nearly 2,000 inmates; three industrial schools, 450 inmates; 10 hospitals, over 12,000 patients each year; four homes for the aged, about 500 inmates each year; three homes for the friendless, about 200 inmates each year.

Government.—The present (1904) State Constitution was adopted in 1851, and is the second one under which Ohio has been governed. (See History.) Provisions for a constitutional convention are arranged for in two ways. Shall there be a constitutional convention? is a question submitted to the people at a popular election each twentieth year, and a majority vote in the affirmative is followed by the proposed convention. A constitutional convention may be called at any time if two thirds of the members of each branch of the legislature demand it, and if a majority of all the legal votes cast at a popular election favor it. Amendments may be added as follows: The amendment may originate in either branch of the legislature; it must be approved by three fifths of the members of each House and by a majority of the electors voting at a popular election. If there are several amendments, each one must be voted upon separately. The right to vote implies citizenship. The right of suffrage may be withdrawn from any person, by the legislature, for certain causes, as bribery, perjury, and other crimes. Voters are obliged to register as required by law, in cities of 5,000 population or over. The State sends to Congress 21 members. The government of the State is administered by the legislature, the executive, and the judicial departments.

Legislature.—The Senate and the House of Representatives constitute the legislature. The number of members is based upon the population and is determined by the legislature. Most of the counties have only one member in the lower house, but some of the smaller counties have two or three members, according to the population. For Senatorial representation many of the counties are united; but some of the large counties are separate Senatorial districts. A county may be made a separate Senatorial district if it has the population required for a full Senatorial ratio and if a full Senatorial ratio is left in the county or district from which it is taken. The regular sessions of the legislature are biennial, beginning on the first Monday of January each even-numbered year. The members are chosen by popular vote, for two years, the day of election being the first Tuesday after the first Monday in November. The salaried members are fixed by law. Bills may originate in either house; each bill can contain but one subject. The lower house impeaches and the Senate tries all impeachment cases; the concurrence of two thirds of the members of the Senate is requisite for a conviction.

Executive.—The governor and his subordinates, lieutenant-governor, secretary of State, State treasurer, and attorney-general, are elected for two years, at the general State election. The auditor is elected for four years; the board of public works and the school commissioner for three years. The governor appoints the superintendent of insurance, commissioner of railroads and telegraphs, State and law librarians, gas commissioner, and supervisor of public printing. He has the power to call extra sessions of the legislature, and the usual veto and pardoning powers. In the absence of the governor, for any cause, the lieutenant-governor, president of the Senate, or speaker of the House are in the line of succession. Ohio has had 45 governors, two of whom were governors of the Northwest Territory (q.v.).

Judicial.—The judicial power is vested in the supreme court, circuit courts, courts of common pleas, courts of probate, and justices of the peace. Other courts inferior to the supreme court may be established by the General Assembly. The General Assembly may establish courts of conciliation, and limit their duties and powers, but the judgment of such courts is not final except the parties interested agree to abide by such decision. The judges and justices are chosen by popular vote. The judges of the supreme court are chosen for a term not less than five years, the judges of the common pleas for five years, the justices of the peace for three years.

Local Government.—The legislature provides by law, for the organization and powers of cities and incorporated villages, and for the election of county and township officials. The terms of office of county officers do not exceed three years.

Laws.—The legal rate of interest is 6 per cent, but 8 per cent may be obtained by contract. Pure-food laws have been passed and are rigidly enforced. Divorces may be obtained for several causes: wilful absence for three years, extreme cruelty, habitual drunkenness, imprisonment in the penitentiary, adultery, divorce procured by either party in another State, are the chief causes. Restrictions as to time of residence in the State are not enforced.

Militia.—The number of men of militia age in 1900 was 893,327. The militia in 1903 consisted of 416 commissioned officers, 5,955 non-commissioned officers, musicians, and privates, making a total of 6,011. During the Civil War, Ohio furnished one eighth of the Federal troops.

Political Divisions.—There are 88 counties in the State. The Federal census of 1900 gave the population of the nine largest cities as follows: Cleveland, 381,788; Cincinnati, 325,902; Toledo, 131,822; Columbus, 125,560; Dayton, 85,333; Youngstown, 44,885; Akron, 42,728; Springfield, 38,253; Canton, 30,667. Columbus is the capital of the State.

History.—Numerous evidences of prehistoric Ohioan inhabitants are found in the mounds existing in different parts of the State. The study of any one of these mounds, especially of the type of the fort in Adams County, shows the degree of advancement of the people called the Moundbuilders (q.v.). The first appearance of Ohio in history is when Robert Cavalier de LaSalle left his home at LaChine, near Montreal, Canada, in 1669, on a journey of adventure, before his return he discovered the Ohio River, and ascended on its waters near
where Louisville now stands. When LaSalle later vested in France the title of the Mississippi Valley by discovery in 1682, the area of what is now known as Ohio became a French possession and remained such until the Treaty of Paris in 1763 when it became territory of Great Britain. The first English-speaking settlement made in Ohio was established at the mouth of Laramie's Creek on the Great Miami River in what is now Shelby County. This settlement was made in 1740 and was called Pickawillany. In June, 1752, the French, with their Indian allies, the Chippewas and Ottawas, massacred these white settlers and wiped out the first English settlement in what is now Ohio. In 1748 some English and Virginian gentlemen organized what was known as the "Ohio Land Company," for the purpose of settling the newly discovered Ohio Valley. Their settlements aroused the intense antagonism and jealousy of the French, and the result was an attempt on the part of the French to stop these intrusions into her territory, and England to persist in continuing them. In 1753 The Ohio Company complained to Governor Dinwiddie of the interference. When in 1757 the Federal Government sent 700 troops to the frontier to protect this territory and to emphasize to the Indians that the white man's government had commenced. On 5 October Congress elected officers for the new government. Signer Arthur Saint Clair was appointed governor and with him were designated James M. Varnum, Samuel Holden Parsons and John Armstrong, as judges and Winthrop Sargent as secretary of the territory. Mr. Armstrong declined to serve as judge and John Cleve Symmes was named to fill the vacancy. On 9 July 1768, Governor Saint Clair and his associate officers arrived at Fort Harmer where they remained until the 15th when they entered Marietta as the representatives of the National Government. The first settlement in the Northwest Territory was effected under the control and direction of Gen. Rufus Putnam, who had formed "The Ohio Company of Associates (q.v.)" in Boston on 1 March 1786. A little band of emigrants journeyed from Connecticut to the banks of the Ohio in the winter of 1787-8, and on 7 April they landed in the rain at the mouth of the Muskingum River and founded Marietta. Governor Saint Clair, as before stated, inaugurated the reign of law, and on 2 September the first court ever held on Ohio territory was opened with formal ceremonies at Marietta. The second settlement in Ohio was made at Columbus, about five miles above Cincinnati. Major Benj. Stites of Pennsylvania purchased 10,000 acres from Judge Symmes near the mouth of the Little Miami. On 18 Nov. 1788, 20 hardy Pennsylvanians located at this point, erected a block house, laid off a little town and called it Columbia. While the major was laying off the town of Columbus, Mathias Denman, with Robert Patterson and Israel Ludlow laid off a town on the high north bank of the Ohio River and opposite the mouth of the Licking River. About 28 Dec. 1788, Denman and his companions, 15 in number, landed at this site and founded the city of Cincinnati (q.v.). In February, 1789, North Bend, near the Indiana line, was settled by Judge Symmes and his associates. For the protection of the three
settlements at Cincinnati, Columbia and North Bend, Fort Washington was constructed at Cincin-
attain which was then the principal chief of the
This was the beginning of the great State
Cincinnati and North Bend and Columbia, and 1795 its population was
The next settlement in point of time was at
Gallipolis. October 1790, 400 French emigrants
The settlers were unqualified and unfitted for the hardships of pioneer life, and
this fact, in addition to the one that the
title to the lands was defective, broke up the settlement. Many of them drifted further
west to Detroit and Kaskaskia, and some remained and purchased their land from the Ohio
Company. Congress, in 1795, sympathetically
granted 24,000 acres of land to these defrauded emigrants. This land is in the eastern part of
Scioto County on the Ohio River and is known, by reason of its history, as the "French Grant."
At Manchester, on the Ohio River, in 1791,
Col. Nathaniel Massie made the first settlement in the Virginia Military District. This com-
posed the territory between the Scioto and Little Miami which had been reserved in the deed of
cession by Virginia for bounty land for her soldiers.
In 1796 Col. Massie, assisted by Duncan
McArthur, laid out and founded the town of
Chillicothe. The opening to emigration of the
famous land of the Shawnees attracted many
settlers from Virginia, and Chillicothe in a short
time became an important and populous town.
The settlements referred to thus far were in the southern and central portions of the State, and
was not until 1796 that emigration com-
menced in the northern part of the country. On 24 July 1796, Moses Cleaveland, as agent for the Connecticut
Land Company, with 82 Connecticut settlers,
on 4 July 1796, landed at the mouth of Con-
neaut Creek, in Ashtabula County, for the
purpose of settling the Western Reserve. In
addition to being settlers, many of them were
surveyors. On 26 July 1796, Cleaveland and his
associates proceeded to the mouth of the Cuyahoga River and laid out the chief settlement of
the Western Reserve. It was named Cleve-
land, in honor of the leader of the expedition.
The pioneers of the Western Reserve that
settled at these points suffered many privations
and the country did not grow as rapidly as those
further south, and in 1788 there were but 130
persons in the whole Reserve.
Ohio now commenced to grow with consider-
able rapidity and settlements sprang up and
developed in every quarter. In 1799 there were
in existence and enjoying peace and prosperity
the towns of Chillicothe, Columbia, Cincinnati, North Bend, Gallipolis, Manchester, Hamilton,
Dayton, Franklin, Chillicothe, Cleveland,
Franklinton, Steubenville, Williamsburg, and
Zanesville. Their prosperity and safety was ac-
complished through much tribulation and
danger, for during the period of their settle-
ment the territory had passed through its second
war with the Indians, to which a retrospect is
necessary.
Notwithstanding that on 9 Jan. 1790, at Fort
Harmer, Governor Saint Clair made a treaty with the Wyandots, Delawares, Chippewas, Otta-
was, Pottawatomies and Sac, he failed to secure
the good-will of the Indians. Marauding parties
and forays on the part of the savages continued to
be projected against the whites, evidently in-
igated by the English. Accordingly, in Sep-
tember 1790, Saint Clair, with a little army,
gathered from Pennsylvania, Virginia and Ken-
tucky, amounting to about 1,400, of which 300
were regulars, marched against the Indians. He
was overwhelmingly defeated. Owing to a fail-
ure to control the militia and lack of general
discipline the battle resulted in a rout. After
the defeat of Saint Clair, General Anthony
Wayne, one of the most daring officers of the
Revolution, was placed in charge of a campaign
against the Indians and spent the spring and
summer of 1793 at Fort Washington in Cincin-
nat, drilling and recruiting his men. In October
1793 he left Fort Washington with an army of
3,000 well-equipped soldiers and proceeded to six
miles beyond Fort Jefferson, where he erected
Fort Greenvelle, near where Greenvelle, Darke
County, is now situated. He spent the entire
season here and in the spring of 1794, after
making many efforts to enter into a treaty of
peace, he attacked them on 20 August, defeating
them with great slaughter. Nine of the Wyand-
dot chiefs were killed and the Indian question
was solved forever in Ohio. This engagement
was known as the battle of Fallen Timbers, on
account of the breastworks of fallen trees behind
which the Indians were massed. The result of
this campaign was a treaty of peace which was
known as the Treaty of Greenville, which was
signed by the chiefs of the 12 hostile tribes
at Fort Greenvelle, 3 Aug. 1795. By the terms of
this treaty the Indians released extensive
territory between the Lakes and the Ohio River
and the northern parts of the State for
merchandise and $9,000 annually, to be divided
among the several tribes. This was the last
Indian warfare in Ohio.
With peace the population of the territory
began to increase. In 1790 there were about
3,000 white inhabitants in Ohio; five years later
there were 15,000 white persons in the North-
west Territory, and by 1798 there were 5,000
free male persons of full age within its bound-
daries, and under the Ordinance of 1787 this
entitled the people to a territorial legislature.
Accordingly on 29 Oct. 1798, Governor Saint
Clair issued his proclamation fixing the day for
electing territorial representatives on the third
Monday of December following. Thus the Ter-
ritory of the Northwest passed into its second
or legislative grade of government.
During the years preceding this change, bar-
ing the Indian troubles, the settlers were pro-
gressing satisfactorily. Religion and literature
were progressing satisfactorily. Religion and literature
were progressing satisfactorily.
name of "The Sentinel of the Northwest Ter-
ritory." The first territorial legislature met at Cin-
cinnati 4 Feb. 1799. Edward Tiffin of Ross
County was elected Speaker of the first General
Assembly of the Northwest Territory, and
Henry Vanderburgh President of the Council.
William Henry Harrison, afterward President
of the United States, was elected the first dele-
gate to Congress from the territory. A bitter
conflict between the governor and the legislature
commenced at this time. Saint Clair was a
Federalist and he was opposed by the followers
of Mr. Jefferson in the territory. At this time
the vast Territory of the Northwest was divided
into two districts—the dividing line ran from the
mouth of the Kentucky River to Fort Recovery,
and northwest to the boundary line between
Canada and the United States. West of this line
was erected the Territory of Indiana, of which
Mr. Harrison was appointed governor, and east
of the line was the Territory of the Northwest,
of which Chillicothe was designated the seat of
government. On 19 Dec. 1799, Governor Saint
Clair, exercising the power vested in him by the
Ordinance of 1787, dissolved the territorial legis-
lation and fixed the first Monday in Novem-
ber 1800 as the date of its next session.
The second session of the territorial legisla-
tion met at Chillicothe on 3 November, and
after being in session five weeks adjourned on
9 December. William Henry Harrison having
resigned his position in Congress, William M.
Millan of Cincinnati was elected to fill the
vacancy and Paul Fearing of Marietta to serve the
succeeding term. At this time Ohio had a
population of 42,000. Transportation and trade
were increasing on all hands. On the Ohio River
there were packets running regularly for
mail and traffic between Cincinnati and Pittsburg,
making the round trip in about four weeks. The
first vessel of any size or importance was the
brig Saint Clair, built at Marietta, of 110 tons
burden. It was loaded with provisions, sailing
down the Ohio, Mississippi and across the Gulf
of Mexico and finally landed safely in Philadel-
phia. Transportation by land was by the heavy
and slow pack train, mules for the heavy loads,
and six horses. Cincinnati was a great distribut-
ing point for the southern and central part of
the territory.
The iron used in the territory came from
Pittsburg and Baltimore, and when from the
latter cost $200 a ton for transportation to the
interior of Ohio. The southern and central parts
got their supply of salt from the "Ohio Salt
Works," located in what is Jackson County of
to-day. It sold at the works for two and three
dollars a barrel, and after the journey home-
ward of 100 miles the purchaser sold it to his
neighbors for seven dollars a barrel. These
were some of the general conditions of the
people in what is now Ohio in 1800. There
were no vehicles except for burden in the terri-
tory. Marietta was the stronghold of Federalism
and Chillicothe was the seat of Republicanism,
and there were bitter conflicts between the fol-
lowers of Alexander Hamilton and Thomas
Jefferson. Cincinnati was divided almost equally
in politics.
The third territorial legislature commenced
on 24 Nov. 1801. At this session Cincinnati and
Chillicothe were incorporated and the seat of
government changed from the latter town to the
former.
On 3 April 1802, Congress passed an act
enabling the people of Ohio to form a constitu-
tion and State government. This was the result
of a persistent controversy between the followers
of Jefferson and the Federalists. In pursuance
to that law of Congress the constitutional con-
vocation met at Chillicothe 1 Nov. 1802 and
adopted a constitution for the State. It was
never submitted to the people. The intense
feeling against Saint Clair on account of his
vetoes eliminated the veto power from the gov-
ernor. The convention fixed the capital at
Chillicothe until 1808, and named the bound-
aries of the State. On 19 Feb. 1803, Congress
of the United States extended the jurisdiction
of the Federal courts over Ohio.
On the second Tuesday of January 1803, the
election for governor was held. Edward Tiffin,
the candidate of the anti-Federalists, was elected.
On Tuesday, 1 March 1803, the first legisla-
ture met at the State capitol at Chillicothe. Na-
thaniel Massie was elected Speaker of the Senate
and Michael Baldwin Speaker of the House.
Officers provided under the constitution were
appointed as follows: Secretary, William
Creighton, Jr.; Auditor of State, Thomas L.
Johnson; Treasurer of State, William McFarland;
Judges of the Supreme Court, Return J. Meigs,
Jr., Samuel Huntington, and William Spriggs.
At this session Thomas Worthington and John
Smith were elected United States Senators from
Ohio.
In 1805 Aaron Burr (q.v.), the ex-Vice-Presi-
dent, visited the west and spent considerable
time in Ohio, accumulating boats, provisions
and accoutrements for the carrying out of his
reasonable designs, which were frustrated
through the activity of Governor Tiffin. For
this act Tiffin received the thanks of the Presi-
dent of the United States. On the ground of
being suspected as an accomplice of Burr, John
Smith, one of the senators from Ohio to the
United States Senate, was charged with treason,
and after a complete investigation by the Senate
a motion was made to expel him, 9 April 1808,
but failed for want of five votes SHORT two thirds
vote. He resigned, however, at the request of
the General Assembly of Ohio, and Return J.
Meigs, Jr., was elected in his stead.
The first seven years of Ohio's estate was a
period of marvelous advancement. The popula-
population in 1810 was 230,760, an increase of more
than 400 per cent over that of 1800. The
immigration was healthy and valuable. New
New counties were erected and out of the
wilderness came wealth, so that in 1810 the
taxable property of Ohio was valued at
$25,000,000. The natural resources of the State
became known and developed. The first blast-
furnace was operated in Mahoning County;
coal was first mined in 1810 in Summit County.
Education advanced materially (see para-
graph on Education). By 1810 there were four-
teen newspapers in Ohio, representing the two
contending parties of the day. The populations
of the towns throughout Ohio continued to in-
crease. Cincinnati ranked second in population
and in size. Its population had increased to
2,540. On the whole, Ohio was occupying a
positive and prominent position in the Union.
The first steamboat to navigate the Ohio
Ohio

River was launched at Pittsburgh and called the New Orleans. It descended to Louisville and continued to make trips between that place and Cincinnati. With this event began a new era in the business development of the Ohio, and the value of the Ohio River as a channel of transportation became more apparent than ever to the people of the new State. In 1810 as a result of political feeling in the legislature, the seat of government was transferred from Chillicothe to Zanesville.

On 14 Feb. 1812, the legislature changed the seat of government from Zanesville to Chillicothe, but at the same time provided for the permanent establishment of the capital at Columbus.

In the second war with England, which was finally declared by the United States 18 June 1812, Ohio played an important and patriotic part. She furnished regiments to Gen. Hull at Detroit and resented his cowardly surrender. Under Gen. William Henry Harrison the soldiers of Ohio were chief in his movements in the northwest in the war against England. Governor Meigs in the meantime calling out, as necessary, the quota of men assessed upon Ohio. At Fort Meigs, at Fort Stephenson and at other points throughout the State there were conflicts with the British, and at Lake Erie, through Oliver H. Perry, a young sea-captain from Rhode Island, the English supremacy upon the northern lakes and upon the line of the northwestern boundary was destroyed forever. The battle of Lake Erie was the last engagement of the War of 1812 that occurred within the territorial limits of Ohio. To the expense of this war Ohio contributed over $300,000. Governor Meigs, on account of his patriotic services to the country, was made postmaster-general in President Madison's cabinet.

The General Assembly met for the first time in Columbus on 2 Dec. 1816, and it has assembled there ever since. In this year the State Library was founded by Governor Worthington and from a few volumes gathered by him grown to be a fine collection of more than 100,000 volumes.

The second United States bank, when rechartered in 1816, opened branches in Ohio at Cincinnati and Chillicothe. This was the occasion for a long and severe controversy between the officials of the State of Ohio and the United States government over the right of the former to tax branches of the United States Bank. The General Assembly passed a law taxing each bank $50,000 and authorized the State government to collect it by force. After a long litigation it was ended in 1824 by the Supreme Court of the United States declaring the Ohio law taxing banks unconstitutional. The controversy was carried on largely by the advocates of the State banks on one hand and the opponents on the other.

In 1825 the State of Ohio commenced the construction of her canal system. The work was formally commenced 4 July 1825. Governor DeWitt Clinton of New York and Governor Jeremiah Morrow of Ohio initiated the labor of breaking the ground. After ten years all that energy, men and money could do was directed to the canals. The Federal government aided and encouraged the construction by the donation of 1,100,351 acres of land. This land was sold and the proceeds, about $2,200,000, were used for the construction of the canals. At the same time of the inauguration of the canal system the public school system was developed. By the association of the friends of internal improvement and popular education both of the great movements were accomplished.

Lafayette visited Ohio in 1825 and was made the formal guest of the State for days, amid the thundering of cannon and the acclamation of a grateful people.

Commencing in 1831 Mormonism flourished several years in Ohio. Joseph Smith with his followers settled in Kirtland, Lake County, in 1832. They built a building here in 1835 which was dedicated on 27 March 1837, in a ceremony witnessed by thousands of people. The Mormon Church grew in numbers, wealth and power for five years in this State; but it finally, under the condemnation of public opinion and the enforcement of the law, crumbled away until its leaders and people, in 1838, fled from the State to beyond the Missouri River.

What is known in Ohio history as the "Toledo War," culminated in 1835. It was a dispute between Ohio and Michigan over the boundary line between these two States. There was involved in this controversy a strip of land the whole length of the northern Ohio boundary, five miles in width at the west end and over eight miles at the east end. It was rich agricultural land, but its chief charm was the harbor where Toledo now stands. Both sides, through their governor and legislative bodies, asserted their respective jurisdictions over the mooted territory. So strong was the determination of each State to secure possession of the strip of territory which each claimed that the militia of both States were called out for a time and conflict was imminent. On 31 March Gover- nor Lucas with his staff and 600 of the militia of Ohio appeared at the debated boundary line. In the meantime Governor Mason, with 1,000 men, arrived at Toledo, and there encamped fully determined to assert the jurisdiction of Michi gan. In the meantime, however, two peace commis sioners from the President of the United States arrived on the scene. The dispute was finally terminated on 29 Aug. 1835, by the re moval of Governor Mason from his position as governor and delegate to Congress, at its next session in June 1836, decided in favor of Ohio. As compensation for the loss of this fertile strip of land Michigan was given the large and fertile peninsula between Lakes Huron, Michigan and Superior. Ohio thus set tled her northern boundary and Michigan was given one of the richest beds of mineral ore in the world.

On 4 July 1839, the cornerstone of the present State house was laid in the presence of many citizens. The occasion was made one of public display and demonstration. Ex-Governor Jeremiah Morrow delivered the address and laid the cornerstone.

The census of 1840 found Ohio the third State in point of population, having 1,519,467 inhabitants; being an increase of 63 per cent over the population of 1830. At this time nearly one third of the population was employed in manufacturing and trade. Cities, while increasing in number, were still small in size. Cincinnati had 46,338 inhabitants; while Cleveland was a town of 6,000 and Columbus the same. In this
The railroad system of Ohio was commenced.

In common with the rest of the country, Ohio was much agitated by the nomination and election to the presidency of Gen. William Henry Harrison in 1840. This was the first impression in a political way that Ohio made upon the country. Up to this time the State had but little influence at Washington. But the nomination of her citizen, General Harrison, at once made Ohio the battle-field of the contest. Great meetings, never equaled up to this time, were frequent in the State. General Harrison's march through Ohio was one triumphal procession of oratory, display and song. At Dayton a political meeting, addressed by General Harrison, numbered 80,000. At Chillicothe he spoke to 50,000 people. Political meetings at this time lasted for several days, just according to the number of orators. The "Log Cabin" campaign resulted not only in the election of General William Henry Harrison to be President of the United States, but also Hon. Thos. Corwin was elected governor of Ohio.

In 1846 Ohio was again called to play an important part in the military affairs of the Union. The War with Mexico was declared 13 May 1846, and Ohio sent out four regiments of volunteers and three independent companies. The total number of men furnished was 5,536; more than any other northern State.

In August 1846 the introduction of raw coal as fuel other than charcoal, for iron-smelting, was an industrial event the effect of which on the wealth and growth of the State cannot be justly estimated. It gave a fresh impetus to iron manufacturing and allayed the painful doubt about its reliability, raised by the diminution of the timber supply for the charcoal blast furnaces.

In February 1850, an act calling a second constitutional convention was passed. Nearly 50 years had passed since the forming of the first constitution and in the stupendous development of the State it was generally admitted that the instrument needed change and revision. After a session of 135 days the convention adjourned, and on the third Tuesday of June, 1851, the new constitution was submitted to the people and it was adopted by a pronounced majority.

The last vestige of what is known as the "black laws," that is, laws that discriminated against the negro in Ohio by preventing him from being a witness in court if a white man was party to the case, and by preventing his settlement in Ohio without giving bond and by imposing other restrictions, both unjust and unjustifiable, were repealed in 1849. Anti-slavery sentiment was strong in Ohio and the legislature of this period was known as the "anti-slavery legislature." Out of the public discussion of those days grew the Republican party, which held its first State convention in the State of Ohio in Columbus, 13 July 1855. In the election which followed Salmon P. Chase was elected governor, and on 14 Jan. 1856 commenced the first gubernatorial term. Governor Chase's administration was signalized by the reorganization of the militia of the State. During this period the State was noted for its "Underground Railroad" (q.v.).

With the approach of the Civil War and in that crisis Ohio met every patriotic demand made upon her. When President Lincoln issued a proclamation, 15 April 1861, calling for 75,000 of the militia of the several States of the United States, the response was immediate from Ohio. Within 24 hours after the President's call 20 Ohio companies had offered their services. Within 36 hours they were on their way to Columbus, where they were organized, 18 April, into the First and Second regiments of Ohio volunteers. The next day they started for Washington city. All this preparation was actively sustained by the legislature. On the day after the call to arms the Senate passed a million-dollar appropriation bill for war purposes exclusively. Within three days it passed the House unanimously. The late President Garfield was at that time a member of the Ohio Senate and took advanced ground in sustaining the Federal government. In the summer of 1863 the State of Ohio was subjected to the attacks of Gen. John Morgan, a daring Confederate raider, who entered the southern part of the State near Cincinnati and passed through southern Ohio; but after inflicting considerable damage, was eventually captured at Salineville, Ohio, 26 July 1863. Morgan's raid cost the people of Ohio $897,000.

The history of Ohio since 1865 has been one of unbroken progress and prosperity. No stirring events have entered into her records save the marvelous developments of her people.

For the third time, 14 May 1873, a constitutional convention assembled to prepare and present to the citizens of Ohio a new organic instrument of law; but they were satisfied with the constitution of 1851 and they rejected, on 18 Aug. 1874, the proposed constitution by a majority against it of 147,284.

Of the Presidents since 1876 four, Rutherford B. Hayes, James A. Garfield, William McKinley and Benjamin Harrison were native Ohioans.

In the growth of population of Ohio she maintained her position as third State in the Union for 50 years, from 1840 to 1890; when she became the fourth in rank, having been outgrown by Illinois; but, notwithstanding, the percentage of increase for as old a State has been marvelous. From 1820 to 1890 the increase of population was over 700 per cent, and it was more than doubled from 1850 to 1900. The population during the last three decades was (1880) 3,198,662; (1890) 3,673,216; (1900) 4,157,545.

DANIEL J. RYAN,
Attorney-at-Law, Columbus, Ohio.
Ohio — Ohio State University.

Ohio, one of the largest tributaries of the Mississippi River. It is formed by the junction of the Allegheny (q.v.) and Monongahela (q.v.) rivers, at Pittsburgh, in the western part of Pennsylvania. The Allegheny brings to Ohio the waters of Chautauqua Lake, and the drainage waters from the southwestern part of the State of New York. The headwaters of the Allegheny in New York are only a few miles from Lake Erie. It is navigable 120 miles from the Ohio. The headwaters of the Monongahela have their rise in the Allegheny Mountains in West Virginia, near the source of the Potomac River. It is navigable for about 60 miles from the Ohio. The Allegheny and Monongahela are large rivers at Pittsburgh, where they blend their waters to make the new stream. Here the Ohio is 1,021 feet above sea-level, and at its confluence with the Mississippi it is 322 feet above the sea. At first the Ohio flows north by west, the valley broadening out to a flood plain. At Beaver the river turns and flows south by west, then almost south, forming the boundary between Ohio and West Virginia; changing its course west, north-west, forming the boundary between Ohio and Kentucky, then forming the boundary between Kentucky on the south and Indiana and Illinois on the north. Along its course are a number of large curves, but it has no falls nor rapids that obstruct navigation except at Louisville (q.v.), where a coral reef is found, but the rapids formed have been overcome by lateral canals. The descent here is about 22 feet in two miles. The river is now navigable for its whole course of 975 miles; but a direct line from Pittsburgh to the mouth of the river is about 614 miles. The area of the Ohio basin is about 214,000 square miles. The average rate of flow is a little over three miles an hour. The chief tributaries are the Muskingum, Scioto, and Miami in Ohio, and the Wabash, which is the largest affluent from the north. The largest tributaries from the south are the Tennessee and the Cumberland; other large streams are the Kanawha, Licking, and Kentucky. The largest tributaries of the Ohio have their headwaters in the mountains, and thus they become the deposits of vast quantities of the melted snows and heavy rains of spring which cause floods in the Ohio. The Ohio is a great river of navigation, and even loss of life is caused by these floods. There are times in the dry season when the water is so low at Pittsburgh and in places below, even as far as Cincinnati, that navigation is hindered or retarded. The Ohio and its tributaries have 2,300 miles of navigable waters. The coal from Pennsylvania, West Virginia, and Ohio, the building stone, and the grain and other farm products, the iron, steel, clay, and lumber products, make a large amount of freight which is carried over the Ohio and its tributaries. The average annual amount of freight is 15,000,000 tons. There are a number of large cities on the banks of the Ohio, some of which are Cincinnati, Louisville, and Evansville.

The Ohio River has been prominent in the history of the United States. From the first it was recognized as one of the important waterways of the country. The short portages from Lake Erie to the navigable tributaries of the Ohio brought trade from the Gulf of Mexico, made the river an important route for the explorer, missionary, and settler. See United States, History; Northwest Territory; Ohio. Consult: Bliss, 'Dr. Saugrain's Relation of his Voyage Down the Ohio River,' in 'American Antiquarian Society Proceedings' (Worcester, 1857); King, 'History of Ohio'; Ohio, Army of the, in American military history, a division of the Federal army in the Civil War; organized in 1861–2 by General Buell; afterward under the command of General Rosecrans and incorporated with the Army of the Cumberland. A second department of the Ohio was formed, and was also in 1865 incorporated in the Army of the Cumberland.

Ohio Company, The, in American history, a western colonial enterprise known as the Ohio Company the first and Ohio Company the second established by George II. George II. granted to a party of wealthy Virginians a tract of land containing 500,000 acres, lying mostly to the west of the mountains and south of the Ohio River. Thomas Lee was the projector of this company, but it was later conducted by Lawrence Washington. The conditions of the grant were that 100 families should be established there and a garrison maintained. It was short-lived. (2) On 3 March 1786 at the suggestion and in the house of Rufus Putnam (q.v.), of Rutland, Mass., Putnam, Curtis, Brooks, Sargent and Cushing organized an association of 1,000 shares, each of $1,000 in Continental certificates, or $125 in gold. A year was allowed for subscription. Land was to be purchased from Congress, in tracts lying between the Ohio and Lake Erie, on 9 March 1787 Parson, agent for the company, appeared before Congress and was well received. Congress granted certain lots free of charge, and an enormous tract was bought at about eight or nine cents per acre in specie. Colonization was immediately begun, and slavery was prohibited. The company had much influence in shaping the ordinance for the government of the Northwest Territory. See Ordinance of 1787.

Ohio State Archaeological and Historical Society, The, was first organized at Mansfield, Ohio, in 1875 as the Archaeological Society of Ohio. Subsequently it was reorganized at Columbus and incorporated March 1885, as the Ohio State Archaeological and Historical Society. It is managed by a board of trustees, of whom are appointed by the governor and partly elected by the members of the society. E. O. Randall of Columbus has been its secretary since 1893. The headquarters are at Columbus. It has a library and very extensive archaeological museum in Page Hall, Ohio State University. It is managed by a board of trustees, part of whom are appointed by the governor and partly elected by the members of the society at their annual election. The society is supported with appropriations by the General Assembly of the State. It publishes an annual volume of biographical, historical and archaeological matter pertaining to Ohio. It has published some fourteen volumes. It conducts archaeological researches each summer amid the sites and remains of the prehistoric mound builders. Prof. W. C. Mills is the curator. It has some 300 members, divided into three classes, namely, honorary, life and ordinary.

Ohio State University, opened at Columbus in 1873. In 1886 an act passed the Ohio legislature authorizing the establishment of the Ohio Agricultural and Mechanical College, in accordance with the provisions of the Federal
Ohio University — Ohm's Law

land grant of 1862. But nothing further was done until 1870, when a second law was passed by which the college was established at Columbus. It was reorganized in 1876 and the name changed to Ohio State University. The present organization includes six colleges: (1) the College of Agriculture and Domestic Science, offering courses in agriculture, horticulture and forestry, and domestic science; (2) the College of Arts, Philosophy and Science, which confers the three degrees, A.B., B.S., and Ph.B.; (3) the College of Engineering, offering courses in civil, mining, mechanical, and electrical engineering, ceramics, industrial arts, chemistry and architecture; (4) the College of Law; (5) the College of Pharmacy; and (6) the College of Veterinary Medicine. The work is arranged for the group system of electives. There are also shorter courses offered in agriculture, dairying, domestic science, mining, clay working and ceramics, and industrial arts; and provision for graduate work. The instruction in agriculture, engineering, and science has always been a prominent feature of the university's work; and its laboratories, and museums of geology, agriculture, mechanics, and metallurgy are especially well equipped. The biological study is maintained at Sandusky. Military drill is a part of the curriculum for men. Women are admitted to all the departments. The governing body is a Board of Trustees, appointed by and with the approval of the State Senate for seven years. The campus contains 345 acres, of which 235 are set apart for the work in agriculture and horticulture. The income is derived from the land grant of 1862, from the annual Federal appropriation, and from a permanent annual grant from the State, established in 1891, and doubled in 1896. In 1903 the total income was $120,000; the students numbered 1,516, and the faculty 136.

Ohio University, a State institution at Athens, Ohio, opened in 1809. The present organization includes the collegiate department, a school of music, a school of commerce (business course), a normal and a preparatory department; post-graduate work is also provided for. The three degrees of B.A., B.S., and Ph.B. are conferred, and the corresponding master's degrees. The university was founded in accordance with a provision in the terms of purchase made by the Ohio Company of Associates with the United States government and by the same provision was endowed with two townships of land; it also receives a State appropriation annually; in 1903 the income amounted to $61,236; the library contained 17,000 volumes; the students numbered 419, and the faculty 39.

Ohio Wesleyan University, founded at Delaware, Ohio, in 1842, under the auspices of the Methodist Episcopal Church. The Ohio Wesleyan Female College was united with the university. Besides the collegiate department, there are schools of music, and of fine arts, a commercial department, a preparatory department, and a school of medicine. The bachelor's degrees conferred are bachelor of arts, bachelor of science and bachelor of letters. The school of medicine is located at Cleveland, and was formerly an independent school (founded in 1863), and was united with the university in 1896 under the title of the Cleveland College of Physicians and Surgeons of Ohio Wesleyan University. Women are admitted to all departments. The grounds and buildings in 1903 were valued at $740,000; the library contained 50,000 volumes; the productive funds amounted to $350,460. In the same year the students numbered 1,550, the faculty 75; the total number of graduates was 25,000, many of whom have entered the ministry.

Ohm, Öhm, Georg Simon, German physicist: b. Erlangen 16 March 1787; d. Munich 7 July 1854. He was educated at the University of Erlangen. In 1817 he became a teacher at the gymnasia in Cologne, and in 1826 at Berlin; from 1833 to 1849 he was director of the polytechnic school at Nuremberg, and in 1849 went to Munich as professor of physics at the university. His researches were chiefly concerned with galvanic currents, and he formulated the law which is known as Ohm's law; that, the current is directly proportional to the electromotive force and inversely proportional to the resistance. This law was first stated in his "Bestimmung von Gesetzen, nach welchen die Metalle die Kontaktelektrokrizität leiten" (1826), and was further developed and proved in his "Die galvanische Kette mathematisch bearbeitet" (1827); in English "The Galvanic Chain Mathematically Worked Out" (1841). He also wrote "Beiträge zur Molekularphysik" (1849), and 'Grandzüge der Physik' (1854); his collected writings were published by Lommel in 1892. His name was given to the practical unit of electrical resistance in 1881. Consult Mann, 'Georg Simon Ohm' (1892).

Ohm, the practical unit of electrical resistance, adopted in 1881 by the International Congress of Electricians at Paris, the centimetre-gram-second unit formerly in use having proved too minute for convenient reckoning. The ohm, named after the German physicist Ohm (q.v.), equals 1,000,000,000 (10^8) C. G. S. electro-magnetic units of resistance; a microhm is a resistance of one millionth of the ohm; and the megohm is a measure 1,000,000 (10^6) times the ohm. The ohm may be independently defined as the electrical resistance to an unvarying current offered by a uniform column of mercury at 0° C, 106.3 centimetres in length, with a mass of 14.4521 grams.

Ohm's Law, a fundamental principle in the mathematical theory of electricity, discovered in the early part of the 19th century by Dr. Georg Simon Ohm, a professor of physics at Cologne. It was first published in 1826. The law may be stated in the following manner: In any closed electrical circuit of resistance R, the current I, produced by an electromotive force E acting around the circuit, is given by the formula \( I = E / R \); C being measured in amperes, E in volts, and R in ohms. Some authorities regard this simple equation as a sort of truism, pointing out that the ampere is a basic unit of measurement, a current generated by one volt in a circuit whose resistance is one ohm. Ohm's law is much more than a truism, however, because it states not only that one volt generates a current of one ampere in a circuit whose resistance is one ohm, but also that P volts, acting in a circuit whose resistance is Q ohms, generate a current of \( P/Q \) amperes. Ohm's law was first given for the case in which a constant electromotive force
acts in a simple linear circuit, but it may readily be generalized so as to apply to branched circuits and to circuits in which the electromotive force is variable. See Electricity; Resistance; Ohms.

Ohmann-Dumas-nil, Amant Henry, American dermatologist. b. Dubuque, Iowa, 30 Sept. 1857. He was graduated from the Missouri State University in 1877, and from the Saint Louis Medical College in 1886, and has since made dermatology his specialty. He is editor and proprietor of the Saint Louis 'Medical and Surgical Journal,' and has published 'Hand Book of Dermatology' (1898); 'History of Syphilis' (3 vols. 1899).

Ohnet, Georges, zho-rzhe o-ni, French novelist and dramatist. b. Paris, France, 3 April 1848. He was educated for the law but abandoned it for journalism, and in 1875 made his first success as a dramatist with Regina Sarpi. His novels deal with the life and characteristics of the French bourgeoisie, and are extremely popular in his own country; several of his works have been translated into English successfully and he has dramatized many of his novels. Among his works are: 'Serge Panine' (1895); 'La Grande Marmite' (1885); 'Le Droit de l'Enfant' (1894); 'Gens de la Noce' (1900); etc.

Oil, an animal, mineral, or vegetable liquid, of more or less viscid consistency; nearly insoluble in water, but dissolves in alcohol or ether, and takes fire when heated in air, burning with more or less luminous flame. Oils are of various kinds, mineral, vegetable, essential, animal, and fixed or fat oils. Petroleum and naphtha come under the head of mineral oils.

Oils in Chemistry are all neutral fatty substances which are liquid at ordinary temperatures. The mineral oils, and many of the volatile oils of vegetable origin are simply compounds of carbon and hydrogen, but the larger proportion of vegetable and animal oils contain oxygen in addition, while a few also contain nitrogen and sulphur, as in oil of mustard. The vegetable and animal oils containing oxygen are mostly glycerides of fatty acids, and are characterized by being insoluble in water, slightly soluble in ether, readily soluble in alcohol or ether. Oils in Botany are those in the form of minute drops in the cells of many, if not of nearly all, plants. They are of two kinds, essential and fixed oils, the former being special secretions in glands, glandular hairs, and hairs on parts exposed to light. Fixed oils are found chiefly in the cells of tissues, and have a relation to, or, at times, seem to occur as substitutes for starch. Some fruits contain oil in their pericarp; spores of certain parasitic plants and pollen grains have it in abundance.

Oils in Art are the fixed oils used in painting on canvas, etc., such as linseed, walnut, and poppy. They are expressed and purified in various ways, and rendered drying by the addition of the oxides of lead or zinc. Cold drawn linseed oil is the best for use, especially after being boiled upon charcoal to separate the mucilage and other impurities. These oils are the vehicles or media in which the pigments are ground and mixed. They render the pigments pale in color, limpid, and transparent, and should dry quickly. The essential oils used in painting are those of turpentine for diluting the pigments ground in oil, and of spike or lavender for wax and enamel painting.

Essential Oils.—The essential oils have been arranged into four classes: (1) The hydrocarbon oils. (2) The oxygenated oils. (3) The sulphur oils. (4) The artificial oils or volatile oils, prepared by destructive distillation, fermentation and other processes. (For a detailed account of essential oils used in perfumes, soaps, etc., see the article Aromatic Compounds.) The essential or volatile oils chemically considered do not form a natural class, for under them are included bodies of quite different constitution, and very frequently they are mixtures of different bodies. Thus oil of wintergreen is an ether, oil of cloves a phenol, oil of cinnamon an aldehyde, and so on. When they are mixtures they usually contain a hydrocarbon and an oxygen compound, which are sometimes separable by fractional distillation. At other times they may be separated by taking advantage of some striking property of the class to which one of the constituents may belong. Fixed or fixed oils are of two classes, drying and non-drying oils. The former class includes all oils which thicken when exposed to the air through the absorption of oxygen, and are converted thereby into varnish. They are all of vegetable origin, such as linseed, nut, poplar, and hemp-seed oil. Among those of the non-drying class are olive, cottonseed, colza, rape, ground-nut, castor, croton, etc. The non-drying oils (whether of vegetable or animal origin) when exposed to the air also undergo a change, resulting in the formation of acrid disagreeable smelling acid substances; this decomposition, which is only partial, seems to be brought about by the presence of cellular matter derived from the plant or animal which has yielded the oil, this substance acting as a ferment on the fatty matter, such acids as butyric, caproic, valerianic, etc., being thereby produced. The fixed oils are for the most part glycerides, that is, ethers of the triatomic alcohol also contain nitrogen and sulphur, as in oil of mustard. The vegetable and animal oils containing oxygen are mostly glycerides of fatty acids, and are characterized by being insoluble in water, slightly soluble in ether, but readily soluble in alcohol or ether. Oils in Botany are those in the form of minute drops in the cells of many, if not of nearly all, plants. They are of two kinds, essential and fixed oils, the former being special secretions in glands, glandular hairs, and hairs on parts exposed to light. Fixed oils are found chiefly in the cells of tissues, and have a relation to, or, at times, seem to occur as substitutes for starch. Some fruits contain oil in their pericarp; spores of certain parasitic plants and pollen grains have it in abundance.

Animal Oils.—The animal oils comprise neat's-foot oil, train-oil, seal-oil, sperm-oil, porpoise-oil, cod-liver oil, shark-oil, etc. The uses of the fixed oils are very various. Many form important articles of food, others are used in medicine, numbers as lubricants, some in the composition of paints and varnishes. Others again are important sources of artificial light, or are extensively employed in the manufacture of soap, for this purpose being treated with an alkali.

Mineral Oils.—See Kerosene; Naphtha; Petroleum.

Oil Gas.—Various oils, wax, tallow, and other substances when passed through heated tubes are resolved into combustible gases, which burn with a rich light. Oil gas was commonly used before the advent of petroleum and the introduction of electricity.

Oil as Fuel.—The production of successful

OIL-BEETLE—OIL PAINTING

Oil burners has resulted in the application of oil fuel to locomotives and marine transportation on a rapidly increasing scale; the locomotives of the roads that pass through the petroleum fields being in some cases almost exclusively operated by oil, while there are lines of steamers in the colonies where oil fuel is also nearly exclusive. The most important tests in this country were those carried out on the steamship Mariposa, in a report on which Rear-Admiral Melville expressed his conviction that by future experimental work the engineering features of the problem would undoubtedly be solved, so as to render the fuel satisfactory to commercial interests, if not for use in the navy.

See PETROLEUM.

Oiled Roadbeds.—A modern plan of making roadways dustless by incorporating crude oil into the dust of an ordinary earth road for the purpose of holding the dust down and securing a permanent roadbed has been introduced successfully on highways in various parts of the country, particularly in California, and the same scheme is now being utilized to secure dustless roadbeds on several of the principal railroads of the country. The system has proved so satisfactory that it is being rapidly extended, and at the present time there is an aggregate of over 1,000 miles of oiled roadbed on the various railroad lines of the United States. See PETROLEUM.

Oil-beetle. See BLISTER-BEETLE.

Oil-bird, or Guacharo, a remarkable South American bird, allied to the nightjars, but not a member of the family Caprimulgidae, which contains only one species (Steatornis caripensis). It has the general form of a large nightjar, but differs in having a strong bill and in feeding on hard and dry fruits. It is about the size of a common fowl; the plumage brownish gray, with small black streaks and dots. The guacharo is found from Trinidad southwestward through Venezuela to Peru, and is widely known as the oil-bird, on account of the large amount of fat which the bird usually has, especially when young. It spends the day in deep and dark caverns, where great numbers congregate and make their nests on ledges in the shape of clay bowls, in which two dull white eggs are laid. Consult Newton, "Dictionary of Birds" (1896).

Oil Cake. See FLAXSEED.

Oil City, Pa., city, in Venango County; at the junction of Oil Creek and the Allegheny River, and on the Pennsylvania, the Lake Shore & M. & S., and the Erie R. R.; about 130 miles north by east of Pittsburg. It was settled about 1825, but was only a small place, with but few local manufactories, until the oil wells of the vicinity were developed in 1860. It was incorporated as a borough in 1863, and chartered as a city in 1874. A terrible catastrophe occurred on 5 July 1882; burning oil came down Oil Creek from Titusville, a distance of 18 miles, and swept over the city. More than 100 persons were killed and property to the amount of about $1,010,000 was destroyed. The city is in the midst of the celebrated oil fields of Pennsylvania, and many of its industries are connected with the marketing of petroleum.

Some of the prominent buildings are the Oil Exchange, the Standard Oil Company office buildings, the city hospital, church and school buildings, and several building blocks. The educational institutions are the public and parish schools and the Carnegie Free Library. The government is vested in a mayor, who holds office three years, and a council. The school board, assessors, treasurer, and comptroller are elected by the people. The city owns and operates the waterworks. Pop. (1890) 10,933; (1900) 13,264.

Oil Cloth. See FLOOR-CLOTH.

Oil-fish, the colloquial name of several fishes notable for yielding oil, as the menhaden (q.v.) of the eastern United States. Specifically, the Russian golomynka (q.v.).

Oil Fuel. See OIL; PETROLEUM.

Oil Gas. See Oil.

Oil of Mustard, a volatile pungent and irritating oil formed in mustard by fermentation when it is wet.

Oil Painting, a method of painting in which the pigments used are ground in linseed oil, made from the seed of the flax plant, or in poppy oil; in many respects the most valuable of the various processes at the command of the artist who works in color. Apparently unknown to the ancients, and but little used by the earlier painters of the Renaissance in Italy, it has gradually come into wider use in succeeding schools of art, and at the present day has very largely superseded the older methods of tempera, encaustic and fresco, even for monumental mural paintings. In the important art of scene painting (q.v.) the use of distemper still prevails, for various reasons of practical convenience. The technical disadvantages under which the artist painter labors are probably reduced to a minimum by the use of oil colors, but they are by no means entirely removed. The oil itself is a yellow vehicle, and has a tendency to cause the colors to both yellow and darken with age; the pigments—even with all the science of modern chemistry applied to their fabrication—are frequently unreliable, being affected by time, by exposure to the atmosphere, smoke, gas, etc., by being rubbed with each other, or even by contact with the steel of the palette knife, and, many of them, having a tendency to become useless by drying in their tubes. Paintings executed in this medium, liable to deterioration through all these causes, are also frequently injured by unskilful or careless technical methods—cracking when the glazing or over-painting has been applied before the first painting was thoroughly dry, or because of the use of a medium, a varnish or a dryer, which does not dry nearly simultaneously with the pigments. Many of the paintings of the modern French school, executed in the highest period of the contemporary art, and by the recognized masters of the school, have cracked within twenty-five years of their execution. The use of bitumen—a great temptation to many painters because of its luminous, warm, dark tones—very frequently causes the painting to crack, as notably in the works of Munkacsy (q.v.). To prevent the yellowing of the oil it is usually thinned with turpentine, or is replaced in the painter's palette cups by a mixture of Siccatif de Harlem and turpentine, or turpentine alone, of refined kerosene, or even by some of the retouching varnishes. The use of an ab-
sorbent ground to paint upon also lessens this danger (while diminishing very considerably the lustre and beauty of the colors); Puvis de Chavannes (q.v.) used the common oil colors on a canvas prepared with plaster. Want of sunlight also causes oil paintings to yellow, and they can be partially restored by exposure to that light. Zinc white is much the safest white to use with oil. Oil painting cannot be used directly on a plaster wall because of the combination of the caustic nature of the oil, thereby forming a soap which destroys the durable qualities of the pigments and causes them to redden or yellow. The modern mural painters adopt the safer method of painting their pictures on canvas, which is then fastened to the wall with white lead. This method has the advantage of dispensing very largely with the disagreeable necessity of working on scaffolds, frequently at a great height from the ground, as the old painters did. In general, heavy impasto, or the application of much color by many repaintings, and scrambling or glazing of thin color over another underneath, are more apt to lead to deterioration of the painting than the use of nearly pure colors applied sparingly and with little thinning of the medium. The slow but gradual destruction of many of the world's masterpieces in this manner is a heavy loss; the paintings in the great Louvre galleries in Paris, left uncleaned, darken very perceptibly in the course of twenty years.

The invention of oil painting was ascribed in Vasari's time to the Flemish painter Jan van Eyck (q.v.) (died 1440), but something, at least, of the art had been known much earlier. In a technical work, the 'Book of Art' by Cennino Cennini, one of the later followers of Giotto (q.v.) (1267-1336), the mixing of pigments with boiled linseed oil is mentioned, though not with reference to artistic works.

The brothers Van Eyck (Hubert and Jan), seem to be entitled to the honor of having first availed themselves of the great advantages possessed by the oil pigments with their slow drying qualities, which permitted the mingling of the colors very freely and with little thinning of the medium. In the old tempera painting, the colors were laid on and dried, practically, one at a time. In the first half of the 15th century the painters of northern Italy heard of the new method of the Van Eycks in Flanders and derived much benefit from it; Antonio da Messina (q.v.), a Sicilian painter (1414?-1466?), saw in the possession of Alphonso, king of Naples, a painting by Jan van Eyck, and was so much impressed by it that he journeyed to Bruges to study the new art, and brought it back to his compatriots in 1465. It was practised in Tuscany earlier than in Venice, and with different methods in Florence and Venice, but its adoption was gradual. It is related that Sebastiano del Piombo lost the friendship of Michelangelo (q.v.) by endeavoring to induce him to adopt this method for his 'Last Judgment' in the Sistine Chapel; and the almost complete destruction of Leonardo da Vinci's (q.v.) 'Last Supper' (1498) is attributed to the use of oil on the plaster wall, while the fresco (buon fresco) of the 'Crucifixion' by Donato Montorfano, painted in 1495, is still in good condition, though exposed to the same unfavorable conditions. Some of the Italian painters, including Perugino (q.v.), Pollajuolo (q.v.), and Andrea Verrocchio (q.v.), employed a mixed method, partly oil and partly a species of tempera, in their easel pictures. A few of the moderns, as Gustave Moreau (q.v.), have combined this method with water-color, or other processes. It is remarkable that the earliest oil paintings, those by the Van Eycks and their Flemish contemporaries, are among the most perfectly preserved of any that have come down to us.

Several attempts to discover a satisfactory substitute for oil have been made in modern times, as, the water-glass (stercorichromy) invented by the German chemist Von Fuchs, and practised by Kaulbach and his school and by the English painter Maclise, used for mural painting; the mixture of copal, wax, resin and oil by Lord Leighton and some of his compatriots in mural work, and, the latest, the 'solid oil colors' of Jean François Raffaelli, the Parisian painter, for easel pictures. For the preference displayed by modern artists for this medium, there is no doubt advantage of convenience and ease of handling, and certain properties in the oil medium which seem to enable the painter better to represent—or, at least, suggest—the material aspects of Nature and of both animate and inanimate objects, real or imaginary. The materials and processes of tempera (q.v.), fresco (q.v.), water-color (q.v.), and pastel (q.v.), all possess various advantages, both material and artistic, for general use.

Consulat: De Dolloy et de Marney, l'Ecole d'Uranie ou L'Art de la Peinture (1753); Blanc, Grammaire des Arts du Dessin; Couture, Methode et Entretiens d'Atelier; Vibert, Peinture à l'huile; Estlake, Materials for the History of Oil Painting; Cennini, Treatise on Painting.

WILLIAM WALTON.

Author of 'Chefs d'Œuvre; Exposition Universelle' 1889.

Oil-palm. See PALM-OIL.

Oil Shark, a small shark ('Galeorhinus zyopterus') of the southern Pacific coast, allied to the topecs, grayish, and often six feet in length. Its live yields a large quantity of valuable oil, and its fins are highly prized by the Chinese as a material for soup; hence this fish is sometimes called "soup-fin shark."

Oil-stone, a slab of fine-grained stone, set in a wooden block and provided with a wooden cover, used for imparting a keen edge to tools; it is so called because oil is used for lubricating its rubbing surface.

Oil Wells. See PETROLEUM INDUSTRY, THE.

Oiled Roadbeds. See OIL; PETROLEUM.

Oise, wá̃, (1) a river of France, which rises near Selongne on the frontier, in the forest of Thiérache, among the Ardennes, Hainaut, Belgium, flows southwest across the departments of Aisne-et-Oise, and joins the Seine about six miles below Pontoise in the department of Seine-et-Oise. (2) A northern department of France named after the river. Area, 2,372 square miles; pop. (1901) 407,988. Capital, Beauvais.

Ojèda, o-hà-dà, Alonzo de, Spanish cavalier and explorer: b. Cuenca about 1468; d. Santo Domingo 1515. He sailed with Columbus on his second voyage in 1493, and thereafter identified himself intimately with the exploration and occupation of the New World. In 1495 he performed a feat of great boldness in
the capture of the cacique Caonabo, whom he took by means of a stratagem from among the Indians of his tribe, thus preventing a probable alliance of the aborigines against the Spaniards. In 1499, with Juan de la Casa, former pilot of Columbus, and accompanied also by Amerigo Vespucci, he explored the northern coast of South America from a point probably on the north of the present Brazil westward to the Gulf of Venezuela (q.v.), trading for pearls and gold with the Indians whom he found. On a charge of trespassing, during a second voyage in 1502, upon territory belonging to Portugal, he was arraigned after his return, and punished by censure and fine. After being imprisoned for debt in Spain, he sailed for the third time for South America in 1505, and explored to the Gulf of Darien. In November 1509, with over 300 men, he set sail from Hispaniola for Nueva Andalucia, between the Gulf of Darien and the Gulf of Venezuela, of which territory he had been appointed governor. Landing with about 75 men near the site of the present Cartagena, he attempted to capture Indians for slaves, but his intended victims turned the tables, overwhelmed their assailants, and killed the party with the exception of Ojeda himself and one other. Ojeda next established a colony at San Sebastian, but the Indians were resentful toward him; the Spaniards, mainly confined within their defensive quarters, suffered privation, and their leader, sailing for Hispiniola in quest of reinforcements and supplies, was shipwrecked on the coast of Cuba, and although he finally reached Santo Domingo, found himself unable to accomplish the object sought, and ended his days in poverty and wretchedness.

Ojeda, Emilio de, Spanish diplomat. After holding several minor diplomatic posts he became first secretary of the Spanish embassy at London in 1586, was charged d'affaires in Bolivia, and in 1883 minister resident in Montevideo, in 1884 at Lima, and at Athens 1888. In 1890 he was promoted minister plenipotentiary to Peru, and to Morocco in 1894. He was appointed secretary of the Spanish commission to arrange a treaty of peace with the United States in 1898, and succeeded the Duke de Arcos as minister to the United States in June 1902.

Ojibway (ô-jib'wâ) Indians. See CHIPPEWAS.

Oka, ô-ka', Canada, a Catholic mission settlement of Iroquois, Algonquin, and Nipissing Indians, on the Lake of Two Mountains, near Montreal. It was settled by some 900 Iroquois Catholic converts from Sault au Recollet, in 1720, who were shortly afterward joined by Algonquin and Nipissing from the Isle aux Tourtes. The Mohawk and Algonquin languages are short by the respective bodies, who inhabit different sections of the village and number over 400. A branch settlement exists at Gilson, Ontario, since 1881.

Oka, ô-ka', two rivers of European and Asiatic Russia. (1) Oka, in Europe, rises in the Governorate of Orel, flows north-north-till near the town of Kaluga, then east past that town, east-northeast across Riazan and the east of Vladimir, and after a course of about 600 miles, navigable from Orel, joins the Volga at Nijni-Novgorod. (2) Oka, Asiatic Russia, rises in the mountains between China and the government of Irkutsk, flows north-northeast for 400 miles, and joins the Angara at Bratsk.

Oka'pi, the native African name of a large animal (Ocapia johnstoni) of the giraffe family which inhabits the forests of the upper Kongo Valley. It had been vaguely known previously, but the first specimen and description given to science were obtained by Sir Harry Johnson in 1899, in the Semiliki forest, near the Uganda border. The animal has many of the features of a giraffe, such as dropping hindquarters, a short tufted tail, and a skull of similar shape, with vestiges of three horn pedicels or cores, but, of course, no external horns. The neck is short, thick, and maneleless. The head is long and narrow, the ears large, the eyes far from ears, and the lips prolonged and mobile, suited to grasping the leaves of trees, upon which they are said by the negroes to feed. The size is that of a medium antelope, about 4½ feet tall at the withers. The colors are remarkable. The head, neck, and body generally, are a reddish-brown; Johnson, range in color from warm purplish red to sepia and jet-black; but the cheeks are yellowish-white; the legs are cream-white on their lower part, and above broken into rings or stripes of alternation of black and white extending on the hams up to the root of the tail. A single stuffed and mounted skin is deposited in the British Museum.

These animals seem uncommon, and dwell in almost inaccessible forests, from which they are said to go about alone or in pairs. It is probable that they may be the lingering survivors of a species now nearly extinct which formerly ranged far more widely, especially to the northward, since Egyptologists at once recognized this animal as the prototype of the figure of the ancient Egyptian deity Set, whose curious head has heretofore eluded identification. For the discovery of the okapi, consult 'Transactions' and 'Proceedings' of the London Zoological Society (1901, 1902); and for its identification with the figure of Set, consult 'Scientific American Supplement' (28 March 1903), and the writings of Wiedemann.

Okayama, ô-kâ-yamâ, Japan, a town and capital of a prefecture of Bizen, on the island of Honshu, near the shore of the Inland Sea separating it from Shikoku, about 70 miles to the west of Kôbé. Pop. (1898) 58,029.

Okeechobee, ô-ke-chôibe ("Big Water"), a lake in Florida, in the southern part of the State. It is about 40 miles long and 28 miles wide; area, about 1,185 square miles, and depth from a few inches to 13 feet. It is on the northern border of the Everglades (q.v.), and it seems to be changing slowly, as no doubt the Everglades have changed. Vegetation is increasing within the lake and the marshy shores are encroaching upon the lake boundaries. Caloosahatchee River, by means of canals, has been made an outlet, but considerable of the water spreads over the Everglades. The canals mentioned have reduced the area of the lake and drained portions of the Everglades so as to make them suitable for raising certain crops. Okeechobee is the largest lake in the Southern States.

Okehinoke (ô-ke-fî-nö'kê) Swamp, in the southeastern part of Georgia, occupying nearly
all of Charlton County, and parts of Ware and Clinch counties, and extending into Baker County in Florida. The area is about 500,000 acres. In the eastern part is a lake containing several small floating islands, the marshy shores of which show the same formation as on Che-chooe (q.v.) Lake in Florida. In some parts of the swamp are large trees and a dense low vegetation. Alligators and moccasins inhabit this swamp in large numbers.

O‘KELLY — OKLAHOMA

O‘KELLY, James, American Methodist Episcopal minister: b. Ireland about 1757; d. 1806. He came to this country, where in 1778 he became a Methodist preacher, traveling from place to place to preach. When the Methodist Episcopal Church in the United States was organized (1784) he was one of the elders ordained, and later he held the position of presiding elder in the church. He afterward found in opposition to his denomination regarding the life-tenure and powers of the bishops, and the General Conference of 1792 was followed by his withdrawal, which led to the defection from it of several churches and ministers joining with O‘Kelly to form the Republican Methodist Church. After this his attitude toward his former connection became more hostile, and he publicly declared his opposition. In 1795 the defections from the Methodist Episcopal Church caused by O‘Kelly’s agitation reached almost 6,500. His Republican Methodist Church changed its name to Christian Church, but in less than a quarter of a century afterward it dwindled away. Consult: Buckley, ‘History of Methodism in the United States’ (1897).

Oken, Oken, Lorenz, German naturalist: b. Bohlsbach, Württemberg, 1 Aug. 1779; d. Zürich 11 Aug. 1851. His real name was Ockenfuss, abridged to Oken when he became a private teacher at Göttingen, having previously studied natural history and medicine at the University of Würzburg. In 1802 he published ‘Grundriss der Natur-Philosophie,’ in which he reduced to a system the materials Fichte and Schelling had previously undertaken to systematize. In this he maintained that animal classes are simply a representation of the organs of sense, and divided the animal kingdom accordingly into five classes. In ‘Die Zeugung’ (1805) he advanced the doctrine that all organic beings originate from and consist of vesicles or cells. In 1807 he became extraordinary professor of the medical sciences of the University of Jena, giving for his inaugural discourse the famous essay ‘Über die Bedeutung der Schädelknochen,’ or ‘On the Signification of the Bones of the Skull.’ In 1808 he announced the propositions that organism is a combination of the activities of the universe within a single individual body, and that world and organism are one in kind; that light is only a polar tension of the ether evoked by a central body in antagonism with the planets, and heat only the motion of this ether. His ‘Lehrbuch der Natur-Philosophie’ appeared 1809–11. In 1816 he began the publication of his ‘Periodical, the ‘Istis,’ devoted principally to natural science, but occasionally commenting on the politics of the German states; the criticisms on the latter led to complaints, and the court of Weimar required him either to suppress the ‘Istis’ or to resign his professorship; he chose the latter alternative, and published his journal at Rudolstadt uninterruptedly until 1848. In 1821 he originated the annual general meetings of German naturalists in different cities, the first of which was held at Leipsic in 1822; the British and American associations for the advancement of science have been since then instituted more or less after the German model. In 1833 he was appointed professor of natural history in the University of Zürich, which position he retained until his death.

Okhotsk, ő-ňōtsk’, Sea of, a considerable portion of the North Pacific Ocean, indenting the eastern coast of Siberia, and partly enclosed by Kamchatka, the Kurile Islands, and Saglek Island. It is named after the seaport of Okhotsk on its shores.

Oklahoma, ő-kă-ho‘ma, a Territory of the United States, in the south central part; bounded on the north by Colorado and Kansas, on the east by Indian Territory, on the south by Indian Territory and Texas, and on the west by Texas and Colorado. The northern boundary is lat. 37° N., and the point farthest south on the irregular southern boundary, is at 34° N. The Territory lies between lon. 99° and 103° W. Its extreme length from east to west is 383 miles, and its width from north to south is 205 miles. Across the southern part from east to west is 190. The area is 39,030 square miles, of which 200 square miles is water surface (U. S. Census, 1900).

Topography.—The surface of the eastern part of the Territory is rolling land; on the east side of the North Fork of the Canadian River, and nearly parallel with the stream, are the Chautauqua Mountains, which are really a chain of hills. In the southern part of the Territory are the Wichita Mountains, a group of granite mountains, some of the peaks 1,000 feet from the base. The highest land is in the extreme northwestern part, a portion of the Great Plains which increase in altitude toward the west until they reach the Rocky Mountains. Along the northwestern boundary are peaks from 1,000 to 5,000 feet in height. The divides extend southeast and northeast, and the valleys within the Territory are long and narrow. The Arkansas River crosses the northeast corner of the Territory. The Salt Fork of Arkansas River enters the Territory from the north, a little west of the center of the northern boundary, and flows eastward into the Arkansas. The Cimarron, whose headwaters are in the southeastern part of Colorado, enters the Territory from Kansas and flows southeast and northeast and enters the Arkansas on the Indian Territory boundary. The Canadian enters Day County from Texas, crosses into the Territory, and flows into the Indian Territory. The Red River forms the southern boundary, and receives a number of large tributaries from Oklahoma, principally the Washita and the North Fork of the Red.

Climate.—The records from 1892 to 1900 show a maximum temperature of 115° F. and a minimum of 25° F. below zero. In both cases the temperature was in the interior of the continent. The extreme. The average for July is 81.2° and for January, the coldest month, 36.9°. The cold season is short. The rainfall is distributed over all the year, averaging 31.7 inches. The rainfall is greater in the eastern part; the smallest
amount falls in Beaver County. The rivers tend to increase the moisture, so that the climate on the whole is suitable for agriculture in all parts of the Territory.

Geology and Minerals.—In the eastern part is the Carboniferous area, as in a large portion of the central part of the United States; the high land of Beaver County in the northwest is covered with Neocene deposits; but the most of the Territory has a surface rock of Triassic sandstone. In the southern part, are found Silurian strata and Archean rocks. Coal is found in the eastern part of the angle formed by the Arkansas and the Cimarron rivers, copper in Beaver County, building stone in many parts of the Territory, also salt, gold, silver, iron, and gypsum. Flora.—The timber is found in the east and chiefly near the streams. In 1900 there were 4,400 square miles, or about 11 per cent of the total area, covered with timber, consisting almost entirely of black-jack and post-oak. The western part is almost treeless; various grasses grow wild and numerous flowering plants. The cactus, sage brush, and yuca are found in the extreme west. Fauna.—See United States.

Soil and Agriculture.—The soil of the river valleys is very fertile; it is mixed with a rich black alluvium, making a contrast to the red clay and rock formation of the uplands. A large portion of the Territory is covered with a soil suitable for agricultural purposes and at present not needing fertilizers. Agriculture and stock raising are the natural occupations for a region so situated as Oklahoma. Wheat and corn are the chief products as yet (1904). Cotton is easily cultivated, the yield per acre is excelled only by Texas. The Federal census of 1900 gives the number of farms as 62,495, valued at $123,041,235, or including farm implements, machinery, and stock, the value given was $185,343,818 for the total farm property. In 1890, the average size of the farms was 251.5 acres, and a little over 35 per cent was improved land. There were seven times as many farms in 1900 as in 1890, with nearly 10 times as great an area devoted to agriculture. The number of farms is operating farmers was six times as great in 1900 as the number reported in 1890. In 1900 the largest incomes were received from hay and grain: $86,328,015. Dairy produce amounted to $6,442,276. cotton: $6,572,916. The most valuable crops were vegetables, fruit, tobacco, sugarcane, flowers (plants, seeds, and blossoms), and nursery products. Potatoes, onions, and fruit are receiving especial attention (1904). There were 5,733,385 acres of vacant government land, in the Territory in 1900; but a large portion of this land, subject to homestead entry, was in Beaver County, sometimes called "No Man's Land." Stock-raising.—The live-stock on the farms in the Territory in 1900 were valued at $74,101,850. In the eastern counties more than half the beef cattle are given to stock-raising; and in the more fertile portions of the east, horses, cattle, mules, swine, and some sheep are raised in all parts of the Territory. Other Branch Lines.—While Oklahoma is an agricultural and stock-raising region, the manufacturing industries are increasing. The chief manufacturers are flour and gist mills, cotton-gins, cottonseed-oil mills, fruit canneries, cracker factories, meat-packing establishments, machine-shops, agricultural implement shops, railroad shops, tobacco factories, and creameries.

Transportation and Commerce.—The Atchison, Topeka & Santa Fe Railroad crosses the Territory and has branch lines extending to large cities. Other railroads that enter many of the counties are the Chicago, Rock Island & Pacific, the Saint Louis & San Francisco, the Chicago, Oklahoma & Gulf, and with other lines which do not cross any large section of the Territory, furnish a market for the crops and the trunk lines of the country. (See Oklahoma City.) The rivers are not navigable. The products exported from the Territory in large quantities are wheat, cattle, corn, cotton, hogs, coal, and manufactures.

Banks and Banking.—A strict banking law was passed in January 1898. It defines the minimum of capital invested, and the liabilities of the officers, prohibits private banking, makes quarterly reports obligatory, and provides for a bank commissioner who has well defined duties, and who is punished severely for any violations. When Oklahoma was organized as a Territory there were only three l. £ within the limits. In 1902 there were 219 banks, of which 67 were National and 152 State banks. The combined capital of all the banks, in 1902, was $3,518,000; the loans, $11,380,000; and the deposits, $17,017,000.

Finances.—The main sources of income are the rentals of public lands and the general tax. The total receipts in 1902 were $1,054,704, and the expenditures for the same year $778,460. The assessed value of the Territory in 1902 was $80,000,000.

Education.—A public school system has been established and provisions are made for its maintenance and operation. The income derived from rental of public lands is mainly devoted to schools; two sections of land in each township has been set apart for the support of schools. It has the University of Oklahoma (q.v.) at Norman, a Mechanical and Agricultural College at Stillwater, the Northwestern Territorial Normal School at Alva, the Normal School for Indians at Bristow, and the Colored Agricultural and Normal University at Langston. In 1901 there were 13 high schools in the Territory, two of which were for colored pupils, one at Guthrie and one at Oklahoma. There were four private colleges, and a number of private academies doing elementary and secondary work. Indian schools are supported by the Federal Government. The Chilocco Industrial School in Kay County, in the northern part of the Territory, is for Indian pupils. There were 14 reservation boarding schools in 1901; and 12 mission schools for Indians and two for colored pupils, under the auspices of the Roman Catholic Church; one industrial school for the Pottawatomie Indian boys, in charge of the Benedictine Fathers, and five other mission schools under the auspices of different denominations. The people of the Territory aim to have a school house in every place where it is needed. In the larger towns and cities, there are separate public schools for Indians and negroes.

Charitable and Penal Institutions.—The insane wards of the Territory are cared for in an institution at Norman; the deaf-mutes are provided for by private institutions or are supported by Territorial funds, but cared for in the
OKLAHOMA

private institutions. Oklahoma has no penitentiary (1903), but has made arrangements with Kansas whereby prisoners belonging to the Territory are sent to Kansas to be guarded, fed, and put to work until such time as their sentences expire. In January 1903 one of the convicts confined in Kansas, instituted habeas corpus proceedings before the Supreme Court of Kansas, claiming that the State of Kansas had no right to hold him prisoner for a crime committed outside the limits of the State, and that the Territory of Oklahoma had no right to sentence him to prison in the State of Kansas. At the time the question was raised there were 285 convicts belonging to Oklahoma serving sentence in Kansas.

Religion.—The Federal census of 1900 gives the number of church organizations as 900 with a membership of 70,000, and property valued at $500,000. The leading denominations were Roman Catholic, 18,804 members; Methodist E., Baptist, Missionary Baptist, and Christian, each about 7,800; and Methodist E. South, 6,340. The Protestant Episcopalans, Presbyterians, Congregationalists, and other denominations have organizations.

Government.—The government of Oklahoma is administered under the Territorial laws of the United States. See TERRITORIES.

Population.—The majority of the population, about 55 per cent, are native born Americans. The Federal census for 1890 shows a population of 61,834 and for 1900, 398,331. The school census for 1902 gave a population of 570,000. The increase from 1890 to 1900 was more than 543 per cent. The Indian population is in places decreasing or changing but little. In 1900 it was 13,873.

Political Divisions.—There are 25 counties and four reservations which will be organized counties. The counties with county-seats are as follows:

Beaver, Beaver.
Blaine, Watonga.
Canadian, El Reno.
Cedar, norman.
Custer, Arbapah.
Day, Grand.
Dewey, Engadine.
Garfield, Enid.
Grant, Pond Creek.
Greer, Mangum.
Kay, Newkirk.
Kingfisher, Kingfisher.
Kiowa, Lincoln.
Lincoln, Chandler.
Logan, Guthrie.
Noble, Perry.
Okfuske, Okfuske.
Payne, Pownee.
Payne, Stillwater.
Pottawatomie, Tecumseh.
Roger Mills, Cheyenne.
Washita, Cloudchaser.
Woods, Altiva.
Woodward, Woodward.
Kaw Indian reservation.
Kiowa, Comanche, and Apache Indian reservation.
Osage Indian reservation.
Wichita Indian reservation.

*Organized since last census.

The principal cities are Oklahoma, Guthrie, Enid, Kingfisher, Hennessey, Blackwell, Chandler, Perry, Pownee, Ponca, Newkirk, Stillwater, Shawnee, Tecumseh, Alva, Osage, and Weatherford. The rapidity of growth of some of the towns and cities has been remarkable, as well as the way in which they came into existence. The site of Thomas, in Custer County, was chosen by persons who went into the Territory on an excursion train. The train was stopped when a suitable place was found, and before night it was a good sized town with a daily newspaper.

History.—The earliest mention of the country included in Oklahoma is that by Don Diego Dionisio de Penalosa, a Spaniard who traveled through this region in 1662. He reported it as "pleasant and delightful," far exceeding in beauty the "New Spain." The Louisiana Purchase of 1803 included all the land now in the Territory, except Beaver County, which was originally a part of the United States, and Texas became a part of the United States, the lands north of lat. 36° 30' N., the northern boundary of slave territory, were ceded to the United States, and Texas came into the Union as a slave State. Oklahoma was a part of the original Indian Territory (q.v.). The official act whereby this portion of the Reservation has become a home for white settlers, has to do with the third article of the treaty of 14 June 1866 (14 Stats., 786), wherein the Creeks ceded and conveyed to the United States to be used as homes for other civilized Indians an area estimated to contain 3,250,560 acres. The United States agreed to pay the sum of 30 cents per acre amounting to $975,168. When the ceded lands were surveyed and subdivided it was found that the area ceded contained 151,870.48 acres in excess of the estimated amount and Congress, by the act of 7 July 1884 (23 Stats., 212), appropriated money to pay for the excess.

By article 3 of the treaty of 21 March 1866 (14 Stats., 756), the United States ceded to the Seminoles 200,000 acres of the lands obtained from the Creeks under the Creek treaty above mentioned. Under the provisions of the act of 18 Aug. 1882 (22 Stats., 265), 175,000 acres lying east of the line dividing the Creek country purchased from the Creeks for the Seminoles, were also bought from the Creeks for the Seminoles. By the act of 1 March 1889 (25 Stats., 579), the Creeks ceded to the Government the entire western half of the domain of the said Muscogee (or Creek) Nation lying west of the division line surveyed and established under the treaty of 1866, and by the act of 2 March 1889 (25 Stats., 980), section 12, the Seminoles ceded to the Government lands estimated to contain 2,167,000 acres, being the lands ceded to them by the treaty of 1866. The survey subsequent to the treaty of 1866 showed that the lands ceded aggregated 2,037,414.62 acres. These lands together with cessions from certain other bands constitute what might be termed "Old Oklahoma." By section 10 of the Act of 3 March 1893 (27 Stats., 612), the Creek Reservation was either sold to the Government what was then known as the Cherokee Outlet. The lands ceded by the cessions above mentioned and those referred to constitute Oklahoma as it now exists.

Prior to the final settlement granting permission to the "whites" to secure "homesteads" or hold farms in this Territory, there were various attempts made to obtain forcible possession of the rich agricultural lands. United States troops on several occasions had to remove the intruders. In April 1879 and in February 1880 President Hayes issued proclamations ordering the intruders from the land and directing their removal by military power if necessary. In 1884 the would-be-settlers became more persistent and organized themselves into an armed body prepared to resist removal. They surrendered to the Government forces in January 1885. The next year Congress authorized the President to begin negotiations with the Indians for the purchase of lands, with results as has been stated.

The crop failure the first year after organization was a check to Oklahoma. Congress sent aid and the railroads loaned to the settlers, with...

2. Interior View of Overholser's Opera House, Oklahoma City.
OKLAHOMA — OKUBO

out interest, 25,000 bushels of seed wheat. The
cession and purchase of the different tracts of
land added to the Territory, have already been
mentioned. Greer County in the southwest,
where nearly all of the Federal
Government and Texas, was added to Oklahoma
in 1866. The Kiowa, Comanche, and Apache
and Wichita reservations, were opened for set-
tlement in July 1901. The Fort Sill Military
Reservation, 60,000 acres, is situated in the
Wichita Mountains and in Comanche County.
The Oklahoma Territory was created 2 March
1890, and 27 August of the same year the first
legislature met in Guthrie. In 1891 Congress
was petitioned to admit Oklahoma as a State.
In 1903 another attempt was made to obtain
Statehood. Oklahoma has had seven governors,
two of whom were re-elected (1 Jan. 1904).

Consult: U. S. Government surveys and doc-
uments referring to the purchase of Oklahoma.

Oklahoma, University of, the Territorial
University opened in 1892 at Norman. Its de-
departments include the (1) College of Arts
and Sciences, which offers beside the regular
collegiate courses, a combined collegiate and med-
cal course; (2) the School of Pharmacy; (3) the
School of Fine Arts; (4) the preparatory de-
partment. The collegiate department confers
two bachelor degrees, A.B. and B.S. The uni-
versity is coeducational, and women are mem-
bers of the faculty. It is supported mainly
from the income of lands reserved and an
annual territorial tax; tuition is free to residents
of Oklahoma and Indian territories; in 1903
the income amounted to $60,400. The students in
attendance that year numbered 400, and the fac-
ty 30.

Oklahoma City, Okla., county-seat of
Oklahoma County; on the North Fork of the
Canadian River, and on the Atchison, T. &
S. F., the Choctaw, O. & G., the St. Louis
& S. F., the Oklahoma City & W., the Missouri,
K. & O., the Texas & O., Oklahoma Terminal,
and Oklahoma City & N. I. R.R.'s; about 30
miles south of Guthrie. It was settled 22 April
1889 by 3,000 men who came on railroad trains
and on horseback from the territory line, after
noon on 22 April 1889, when, by proclamation,
the country was declared opened to settlement.
It was incorporated July 1890 and chartered
as a city April 1891. It is the commercial and
industrial centre of a productive agricultural
and stock-raising region. It has a large number
of wholesale houses which 1 Jan. 1904 had
1,500 employees. The chief manufacturing
establishments are cotton mills, flour mills, brew-
eries, box and cracker factories, patent medicine
factories, iron works, soap factories, woodwork-
shops, and others having in all 1,250 employees.
The railroads have 1,100 employees who are
residents of the city. It has an extensive trade
as it is the distributing centre for a large
region; and the grain, cotton, and live-stock
of the surrounding country is mostly shipped
from Oklahoma City to eastern and southern
markets. It is the seat of the Epworth Uni-
versity, and leaders of Mary College for Girls, and
the Oklahoma Military Institute. It has public
and parish schools, and a Carnegie Free Public
Library. There are a number of good church
buildings, the Sacred Heart Abbey, and Saint
Anthony's Hospital. The eight banks have a
combined capital of $750,000. The government
is vested in a mayor and a council of 10 members
elected every two years. The city owns and
operates the waterworks. The population is
nearly all white people, about 2 per cent are negroes and 3 per cent Indians.
Pop. (1890) 4,151; (1900) 10,037; (1903)
30,000.

E. E. Brown,
Editor 'Times-Journal.'

Oklahoma Agricultural and Mechanical
College, founded in 1891 at Stillwater. Its
regular courses, for completion of which the
degree of B.S. is conferred, include general
science and literature, agriculture, mechanical
engineering, chemistry, and biology; shorter
courses are offered in agriculture, horticulture,
mechanic arts, printing, and stenography and
typewriting; there is also a preparatory depart-
ment with a two-years' course. Women are
admitted to the college, and there are also women
on the faculty. The college receives the greater
proportion of its income from the Federal
appropriation provided for by the law of 1890,
and from territorial appropriation, and it is
free. In 1902 the income amounted to $35,570;
The students numbered 304, of whom 135 were
women, and the faculty numbered 20.

Oklawha ("crooked water"), a river in
Florida which has its rise in the central part
of the State, flows almost due north for about
80 miles, turns abruptly, and flows eastward,
and the St. John about 20 miles south of Palatka.
The country through which the river flows is
so flat that the waters spread out into the forests
on either side. It is about 200 miles long.

Ok'ra, a vegetable, the "gumbo" of Louisi-
ana, and the "gombo" of France (Hibiscus
esculentus). It is a native of the West Indies,
but flourishes in all tropical and sub-tropical
countries and is common in the United States,
where its pods are employed green as an esculent.
Its mucilaginous pods are used in Louisiana
to thicken the soup called chicken-gumbo.
During the Civil War the seeds were utilized in the
South as a substitute for coffee. A few years
ago the fibre from the okra stalks was tried as
a substitute for jute in the manufacture of
cotton bagging, but it was demonstrated that
the culture of okra for its fibre could not be
made a paying industry in this country. In
India the fibre has been used in a small way
for the manufacture of rope, twine, sacking and
paper. It is less than half as strong as common
hemp and is inferior to jute. Consult authorities
mentioned under Fibre, especially 'Report No.
6,' Office of Fibre Investigations, U. S. Depart-
ment of Agriculture. See Hibiscus.

Okubo, Ōkūo-bō, Toashimichi, Japanese
statesman; b. Province of Satsuma 1830; d.
Tokyo 14 May 1878. He was early active in
the opposition to the Tokugawa Shogunate and
one of the most prominent leaders in the revolu-
tion of 1867-8 which resulted in the restoration
of the emperor to power. From 1870-8 he was
the most influential member of the cabinet, and
always an advocate of progressive measures.
He was a member of the embassy which visited
the civilized nations of the world, in 1872-3;
and in 1874 was sent as envoy extraordinary to
China, and successfully settled the difficulty in
regard to Formosa. In 1877 a rebellion broke
OKUMA—OLD AGE

out among the Satsuma clan, but Okubo retained his position in the cabinet and assisted in suppressing the rebellion. He was killed in revenge by six members of the clan, when going to the imperial palace in Tokyo. A monument to his memory has been erected on the spot.

Okuma, ők'oo-mâ, Shigenobu, Japanese statesman: b. province of Kiushiu, Hizen, 1837. Early in life he became an advocate of advanced reforms, the abolition of the feudal system, the restoration of the emperor to power, and a new system of education; and his persistent and courageous advocacy of these reforms was influential in bringing about the revolution of 1867-8. After the reorganization of the Japanese government he was appointed to a position in the foreign office, and in 1872 was made minister of finance, in which position he brought the national finances into order and established a national currency. In 1881 he withdrew from office to assist the Liberal party, which urged that a constitutional government be immediately organized, and that the ministry be subordinated to the parliament, of which he was the recognized leader during its political career. As a result of this parliament was established, he became minister of foreign affairs, but his liberal attitude toward the revision of the treaties with foreign countries aroused so much popular opposition that he retired from office in 1885. He was for a short time in the cabinet, and in 1898 organized a cabinet of which he was premier, but resigned within a few months and retired from public life. After his withdrawal from office in 1881, he founded the Senmon-Galko, a school for the study of law, literature, and political economy; and he has always been an advocate of the higher education of women.

Olaf, Olaf, Saint, Norwegian king: b. 995; d. Sticklestad, Norway, 1030. He was a great-grandson of Harald Haarfager, a son of Harald, chief of the district of Gränland, and early made himself famous by his military expeditions to England, successfully assisting King Ethelred against the incursions of the Danes. After the death of Eric and the expulsion of his son, Olaf caused himself to be proclaimed king. He began his reign by introducing a special code of law called the Hirdska, and restored the ancient boundaries of Norway and Sweden, but above all was a zealous supporter of Christianity and may indeed be called the real convertor of Norway. The severity which he employed for this purpose afterward exposed him to a formidable retaliation at the hands of his own subjects. Having engaged in war with Canute the Great, king of England, he allied himself with King Magnus of Sweden, but was so completely defeated in battle that he fled to Sweden and Russia. In 1028 he was induced by a dream to return to Norway, where he found the people so alienated from him that he could only bring 3,000 m. into the field to oppose the forces of the mighty Canute. The armies met at Sticklestad, near Drontheim, in 1030, and Olaf lost both the battle and his life. His body was buried in the cathedral of Drontheim, and he has since 1164 been honored as the patron saint of Norway. Many legends respecting him are current throughout the North, and his name has been given to an order of knighthood founded by King Oscar I. in 1841 as a reward for services to king and country, art and science. Consult Longfellow’s poem, The Saga of King Olaf (1853). It is his feast day is 20 July.

Olând, ö-lân'd, or Oeländ, Sweden, an island off the east coast, in the Baltic, separated from the mainland by Kalmar Sound, from 3 to 10 miles wide. It is 85 miles long with an average breadth of four miles, and a maximum of 10. It is well-wooded, and has much land devoted to agriculture and pasture; the chief products are cereals, flax, cattle, fish, building stone, lime, alum, and cement. There are various villages besides the chief town, Borrhus (pop. 1900, 2926) which ranks as a town, has interesting ruins of a celebrated castle, and is becoming a summer sea-side resort. Pop. (1900) 30,408.

Olathe, ö-lat'hè, Kan., city, county-seat of Johnson County; on the Atchison, T. & S. F., the St. Louis & S. F., and the Missouri, K. & T. R.R.; about 20 miles south of Kansas City. It is in an agricultural and stock-raising region. The chief manufactures are flour, furniture, shoes, brick, and agricultural implements. The State institution for the Deaf and Dumb is located here. The city owns and operates the waterworks. Pop. (1890) 3,594; (1900) 3,451.

Olbbers, öl'bër's, Heinrich Wilhelm Mathaus, German astronomer: b. Arbergen, near Bremen, Germany, 11 Oct. 1758; d. Bremen, Germany, 2 March 1849. He was educated at Göttingen, and practised medicine in Bremen with great success until his death. The study of astronomy, however, formed his ruling passion, and he invented a new method of defining the course of comets by means of three observations; the comet which bears his name is named by him, as were also the planets Pallas (1802) and Vesta (1807). His calculations and observations, published in the Astronomisches Jahrbuch in 1782, 1825-33, are of great value and still in use.

Olcott, Henry Steel, American theosophist: b. Orange, N. J., 2 Aug. 1832. He was educated in the University of the City of New York and in 1858-60 was agricultural editor of the New York Tribune. In 1863-6 he was special commissioner in the United States War and Navy departments and was admitted to the bar in 1866. He was one of the founders in 1875 of the New York Theosophical Society, and is its president; he has edited the magazine Theosophist since 1879, and in recognition of his services to Hindu philosophy has received the unique honor of the sacred thread of the Brahman caste. He has published: 'Sorgho and Umphere' (1857); 'People from the Other World' (1875); 'The Buddhist Catechism' (1882); 'Old Diary Leaves' (1890-1900); etc.

Old Abe, a nickname applied to Abraham Lincoln.

Old Age, Diseases of. The advent of age and the decline from the prime of life are characterized by certain physiological conditions which are due to pathological changes resulting from slow processes and which may be reached in middle life, and are then premature. They may be postponed till the subject has reached a great age, and he may pass away without evi-
OLD AGE PENSIONS—OLD CATHOLICS

dence to the lay eye of their existence; but nevertheless they are present, and age itself is never a cause of death. Arteriosclerosis (see Arteries, Diseases or) is probably present in every case of old age. The senile kidney is very frequently a cause of death. Its tissues are altered, and its power to perform its functions is much diminished. It becomes accustomed to eliminating the decreased excretory substances which result from a generally lowered vitality, but it is unable to perform the added labours demanded during an attack of indigestion or of an ailment accompanied by fever. Bronchitis is frequent in the aged, and when prolonged is followed by emphysema. Chronic pneumonia is frequently found in the aged lung at necropsy. During digestive disorders or infective diseases of the urinary tract (commonly cystitis) fever frequently arises, and in such an event respiratory failure is prompt and dangerous. The aged heart fails to contract completely during systole, owing to weakness of its muscle, and circulatory disturbances result. In the aged death often occurs with the heart in the condition of asystole. The nerves functionate with diminished power. General sensibility for heat, cold, touch, and pain is preserved, and all the special senses, hearing, smelling, tasting, and seeing, are impaired. Muscular decay and increasing fragility of the bones invite accidents, and old persons sustain frequent fractures of bones. The fragments in these cases unite slowly, and often fail to knit at all. Aged patients bear very badly the enforced quiet necessary during repair of fracture of the thigh-bone, a common accident with such. They suffer at once from loss of sleep, impairment of appetite, marked muscular atrophy, and derangement of digestive and urinary organs. The perils that accompany these conditions are often seriously complicated by hypostatic pneumonia. The aged are unusually prone to attacks of gout and rheumatism, and these diseases are fairly intractable. They are also very susceptible to the infection of erysipelas. Attacks of grippe are accompanied with marked prostration, alarming organic weakness is still more apparent in the bronchial and pulmonary implication in grippe in the aged is less severe, it is apt to remain. Typhoid fever of irregular type and with insidious invasion is a common cause of death in the aged. foremost among the digestive system, the intestine is not uncommon. Arteriosclerosis, already mentioned, leads to rupture of arteries, and apoplexy from cerebral hemorrhage is not infrequent. As a lesion of gout, chronic endarteritis occurs in many instances with secondary cerebral softening.

The treatment of the diseased conditions of old age does not differ in many respects from that in younger subjects, except that supportive measures are more essential. Resistive power and recuperative effort are naturally much diminished, and the decreased functioning power of all organs must be considered. Much can be done to prevent the early approach of age. Probably the use of alcoholic beverages is the most frequent and potent cause. Alcohol should be avoided at every age. Moderate eating, especially after middle age has been reached; avoidance of sudden or violent physical exertion after the age of forty; calming stress and strain, bodily or mental; limiting exceptional outbursts, esp.

cially those of anger and grief; wearing suitable clothing, adjusted to climatic conditions; and leading an out-of-door life, guarding against exposure—these are precautions which may advance the battle of old age for many years.

ALBERT WARREN FERNS, M.D., Assistant in Neurology and Medicine, Columbia University.

Old Age Pensions. See Pensions.

Old Bailey, London, England, a historic criminal court, prior to 1903 adjoining Newgate Prison, between Holborn Viaduct and Ludgate Hill, where now stands the Central Criminal Court. In the Old Bailey the surviving judges of Charles I. were tried after the Restoration, in 1660, and it witnessed also the trials of the patriot Lord William Russell in 1683, Jack Sheppard in 1724, Jonathan Wild in 1725, the poet Savage in 1727, Dr. Dodd in 1777, Bellingham, the assassin of the statesman Perceval, in 1812, the Cato Street conspirators in 1820.

Old Bay State, a name given to Massachusettts, whose shores are washed by Cape Cod Bay. Prior to the adoption of the United States Constitution Massachusetts was known as *the Colony of Massachusetts.*

Old Bullion, a name familiarly applied to Thomas Hart Benton (q.v.) because of his persistent defense of gold and silver currency.

Old Castle. See New CASTLE.

Old Catholics, religious denominations formed by certain seceding Roman Catholics in 1870, whose basis of belief and practice was declared to be the revival of the traditions of the Apostolic Church and the recognition, as authoritative, of the first seven ecumenical councils of the Church and none others.

The Cause of the Revolt.—An ecumenical council, commonly known as the Vatican, was convened at Rome and assembled 8 Dec. 1869, which included 49 cardinals, 9 patriarchs of the Eastern Church, 4 primates, 121 archbishops, 479 bishops, and 52 abbots and other monastic dignitaries. On 15 Jan. 1870 the number present had increased to over 700. When the object of the council was made known, the definition of papal infallibility, a protest was made, outside the council, by Dr. Döllinger, the most illustrious scholar of Roman Catholic Germany, supported by the President of the German Minister, Darn and the Austrian Von Buesch and a small party of bishops. Nevertheless the dogma was at length promulgated and received the assent of the Roman Catholic hierarchy throughout the world. Its terms were as follows:

"We teach and define . . . that the Roman pontiff, when he speaks ex cathedra, that is, when in discharge of his office of Pastor and Doctor of all Christians he defines, in virtue of his supreme apostolic authority, a doctrine of faith or morals to be held by the Universal Church, is endowed with the divine assistance promised to him in Blessed Peter, with that infallibility with which our divine Redeemer willed that the Church should be furnished in defining doctrine of faith or morals, and, therefore, that such definitions of the Roman pontiff are irrefromable of themselves and not in virtue of the consent of the Church." This dogma was promulgated 18 July 1870.

The universities of Germany alone opposed
the new Vatican decree. Dr. Von Schulte, professor at Prague, was first to utter a written protest. At Nuremberg a vote of dissent was passed by a meeting of Roman Catholic professors and scholars in August 1870. A Father Hymontin (M. Charles Loysin) issued his "Appel aux Evques Catholiques" denying that the decree was binding on the Church. The learned Dr. Döllinger set forth in a letter his reason for dissent as a "Christian, a theologian, an historical student, and a citizen." His communication was immediately proclaimed from all the pulpits of Munich. He was, however, supported by the professors of the University, and an address to the king, written in the same spirit of protest, received 12,000 Roman Catholic signatures. Finally an assembly of the dissentients was held at Munich the following September and attended by 500 delegates from all quarters of Europe. The lectures of Reinkens delivered in 1871 made the issues plain to the world, and his arguments were endorsed in the inaugural address delivered by Dr. Döllinger as rector of the University of Munich.

Constitution of the Old Catholic Church.—The movement gradually gained such momentum that organized action was forced upon its supporters. On 4 June 1873 Dr. Reinkens consecrated their bishop at Rotterdam by the Jansenist Bishop Heydekamp of Deventer and, as the cause was spreading rapidly in Switzerland, a congress was held there and was attended by both English and American theologians (12-14 September). The election of Bishop Reinkens was recognized by the German government, and in the following year a synod and conference were held at Bonn. The results of these discussions were embodied in canons by which the clergy were allowed to marry, compulsory fasting and confessions were abolished, the vermaecular was ordered to be used in public worship, and it was made permissible in the churches to administer the communion in both kinds. In Switzerland the Old Catholics, or as they there preferred to style themselves, Christian Catholics, chose Professor Herzog for their bishop and he was duly consecrated by Bishop Reinkens 18 Sept. 1876. Thus was founded the Old Catholic faculty and in 1888 and in 1900 were reported to number 16,000 souls. In France a Gallican Old Catholic movement was set on foot by Père Hyacinthe under the jurisdiction of the Armenian archbishop of Utrecht. The Old Catholics in Italy were led by Count Campello, those in Spain by Cabrera and in 1870 and 1892 there was an enthusiastic international Congress of Old Catholics in which the progress of the movement was said to show a marked advance. On the death of Bishop Reinkens in 1896, Vicar-General Theodor Welker was elected to take his place and consecrated in Bonn with a jurisdiction extending over the whole German Empire. In this large diocese, the whole of Germany, the Old Catholics number 61 priests (four of them retired to leading professors) and from 45,000 to 50,000 lay members; and are building numberless churches, parsonages, and seminaries. At Bonn and Essen they have founded hospitals and poorhouses. The Church has several organs, the chief of which are 'Deutscher Merkur,' published at Munich since 1870 and at Bonn since 1899; 'Altkatholische Kirchenzeitung,' founded in 1874. In Holland it is represented by 'Oud Katholiek'; in Italy by 'Il Labaro'; in Spain by 'La Luz.' Its quarterly review of theology (a scientific and learned volume of essays and notes) is the 'Internationale Theologische Zeitschrift,' founded in 1893.

Consult: Goetz, 'Die geschichtliche Stellung und Ausgabe des deutschen Altkatholizismus' (1880); Mayor, 'Facts and Documents' (1857); and Mullinger ('Theodorus'), 'The New Reformation.'

Old Colony, a name applied to the southeast part of Massachusetts, the section occupied by the Plymouth Colony, and later given to the State.

Old Curiosity Shop, a novel by Charles Dickens which first appeared by weekly instalments in 'Master Humphrey's Clock,' 1840-1. Little Nell, Dick Swiveller, Quilp, and The Marchioness are prominent members of the dramatis persona.

Old Dominion, a name given to Virginia. In the original charters pertaining to the lands of Virginia, it was frequently called "the colony and dominion of Virginia." Massachusetts was given the name "Old Colony," and Virginia "Old Dominion."

Old-field Lark, a local name in the Southern States for the meadow-lark (q.v.).

Old Folks at Home, a famous Southern plantation song, written in 1859 by Stephen C. Foster (q.v.). The song realized some $15,000 for the author.

Old Forge, Pa., borough in Lackawanna County; on the Lackawanna River, and on the Lehigh Valley, the New York, S. & W. and the Delaware, L. & W. R.R.; about five miles southwest of Scranton. It was settled in 1830 and remained a part of the Old Forge township until 1890, when it was incorporated as a borough. It is in the anthracite coal region; a large number of the men and boys of the borough are engaged in coal-mining. The chief industries besides the mining and shipping of coal are glass-blowing, manufacturing silk goods, and making chemicals and fertilizers. It has a fine high school building and good grade schools. The government is administered by a burgess, who holds office three years, a borough council, and subordinate officials. Pop. (1900) 5,630.

Old Glory, a popular name for the flag of the United States. It was first applied in 1831 by William Driver, a sailing captain of Salem, Mass., who died at Nashville, Tenn., in 1836. Previous to the outbreak of hostilities between the North and South "Old Glory" was flung to the breeze every day from the window of Captain Driver's Nashville house, but when the conflict began the old flag had to be hidden. It was kept out of sight till General Nelson's wing of the Union army appeared in Nashville 27 Feb. 1862, when Captain Driver presented it to the general to be hoisted on the Capitol. It was run up and Captain Driver himself did the hoisting. Its name and history soon became...
familiar to all the soldiers in General Nelson’s command.

Old Grimes, the hero of a popular humorous American ballad and song, by Albert Gorton Greene (q.v.). The title is an adaptation from one of the metrical tales by George Crabbe, but the personage described in the ballad is an exact study of an eccentric New Englander who flourished in the earlier half of the 19th century.

Old Guard, The, a popular name applied to a body of French troops in the army of Napoleon I. The Guard consisted of five regiments; was distinguished for bravery, and at the battle of Waterloo made the final charge of the French army.

Old Hickory, an affectionate nickname given to Andrew Jackson (q.v.) by his militia troops, on account of his toughness and endurance of hardship. It seems to have been first conferred on occasion of his march back from Natchez in February 1813, when, after having sent him there to foil an expected British attempt on New Orleans, Secretary Armstrong ordered him to disband his men. Jackson in great wrath marched them home in a body, undergoing great discomforts on the way.

Old Hundred, a popular religious hymn tune adopted from a 15th century melody. The tune is found in the Flemish Psalter (1540) and in the Dutch Psalter (1601). In England it was originally sung to the 100th Psalm. Consult Fitzgerald, ‘Stories of Famous Songs’ (1897).

Old Ironsides, a name applied to the United States frigate Constitution (q.v.).

Old Kentucky Home, a famous plantation song, written and set to music by Stephen Collins Foster, in 1850.

Old Line State, a popular name for the State of Maryland, which in the early colonial days was the dividing line between the Crown land grants of William Penn and Lord Baltimore.

Old Man; Old Woman, ornamental and culinary herbs. See Artemisia.

Old Man of the Mountain, a name given to a huge rock on Profile Mountain, in the Franconia Range, N. H. When viewed from certain positions it bears a marked resemblance to a man’s face. The name is sometimes given to Profile Mountain.

Old Man of the Mountain. See Mohamemedanism.

Old Man of the Sea, (1) frequently in Greek poetry, an epithet applied to Nereus. (2) In the ‘Odyssey,’ an epithet also of a sea-deity, Phorcys, or Phorcus. (3) In the 5th voyage of ‘Sinbad the Sailor,’ in the ‘Arabian Nights Entertainments,’ an old man, who, under pretense of being carried by Sinbad across a brook, fastened himself upon the latter’s back and could not be dislodged. Sinbad finally made him intoxicated, threw him upon the ground, and broke his head with a stone. In a derived sense, the expression is often used of a bore, or of a burden that cannot be escaped.

Old Mortality, a novel by Sir Walter Scott published in 1816. It deals with the struggle between the Covenanters and the forces of the crown under Claverhouse (see Graham, John, Viscount Dundee), about 1679. The title is the nickname given to Robert Paterson (q.v.), who bestowed years of care upon the gravestones of Covenanters.

Old Nick, popular sobriquet of the Devil, derived both from Saint Nicholas (Ger. Nicolaus, diminutive Nickel, often used of the Devil) and from Necker (or Nikker), a Teutonic water-sprite whose appearance to sailors foreboded death and drowning. Old Harry, Old One, Old Scratch are other names similarly used.

Old North State, The, a name sometimes given to North Carolina.

Old Oaken Bucket, The, a poem by Samuel Woodworth (q.v.), an American poet, written in 1817 and first published as ‘The Bucket.’ The air to which it is set is an adaptation of the music of Moore’s song ‘Araby’s Daughter.’

Old Orchard, Maine, town in York County; on the Atlantic Ocean, and on the Boston & Maine railroad; about 10 miles southwest of Portland. It is a famous summer resort, on account of its smooth ocean beach 12 miles long, where surf bathing is safe, and there are good opportunities for fishing. Deep-sea fishing is a favorite sport, but those who prefer still-water fishing go to Biddeford Pond nearby. The Methodist camp-meeting grounds are visited annually by a large number. Thirty-one years (1909) of evangelistic work is claimed for Old Orchard. It is becoming a summer convention place. In 1903 conventions were held here under the auspices of the Christian Workers’ League, the Christian Alliance, and the Woman’s Christian Temperance Union. There were held also in the month of August the same year, a Musical Festival, a White Cross Convention, and a Methodist Convention. The population is several thousand in the summer months, but the regular residents number about 1,000.

Old Point Comfort, Va., a famous watering place in Elizabeth City County; on the point of a small peninsula where Chesapeake Bay and Hampton Roads enter the Atlantic Ocean. It is near Fort Monroe and about five miles north of Norfolk. The climate is equable, the opportunities for bathing, boating, andailing are excellent; the garrison at the Fort, and the cities of Norfolk and Portsmouth nearby all add to the attractions.

Old Probabilities, a popular nickname for the head director of the United States Weather Bureau; a personification of weather prophecies generally.

Old Put, a popular sobriquet bestowed upon the American general, Israel Putnam (q.v.).

Old Red Sandstone, in geology, a name loosely used by Hugh Miller (q.v.) in his ‘The Old Red Sandstone’ and ‘Footprints of the Creator,’ for the formation below the Carboniferous (q.v.); New Red Sandstone (q.v.) was by contrast used of similar strata above the Carboniferous system. Miller’s books did much to draw the attention of scientists to his group of Paleozoic rocks, and the term became popular. In scientific usage it was soon ousted by ‘Devonian’ (q.v.), which suggests Devonshire the typical English locality is less misleading than Old Red Sandstone, inasmuch as these rocks
OLD RELIABLE — OLD TESTAMENT

consist of other sandstones than red, for example, white, yellow and green, and of many beds of clay and limestone. The Devonshire rocks are not sandstone but chalk; the identity or similarity of geological genera between the rocks of Devon and Miller’s Scotch sandstones was proved by the similarity of fossil remains. In America the main groups falling under the head of the Devonian or Old Red Sandstone System are those of New York and the Catskill, Chemung, Portage, Hamilton, Marcellus, Upper Helderberg, Schoharie and Oriskany groups (qq.v.).

Old Reliable, in the American Civil War, a nickname applied to Gen. George H. Thomas (q.v.).

Old Rowley, nickname of Charles II. of England, said to have been derived from the name of one of the king’s famous racehorses, whence, also, a part of the Newmarket racecourse is known as ‘Rowley mile.’

Old Squaw, or Old Wife, the long-tailed duck (Clangula hyemalis), a sea-duck present in the nesting season in all boreal regions, and visiting the United States in winter where it is white and whitish; head, neck and lower parts mostly white in winter; a patch of gray on the head; breast brownish black; bill black and orange; tail very long — a means of instant recognition of the drake. The tail of the female is short, and her plumage is mostly grayish brown. Gunners sometimes call the drake old injun and the female alone old squaw; also south-southerly, etc. Most of the names are taken from its noisy habits, for it is almost continually calling, but its cries are musical. They are favorite with gunners more from the skill required in shooting them, on account of their swift flight and wary ways, than for excellence of flesh; they rarely present themselves for a shot except when they come into the bays and river mouths for food at sunrise, flying in long lines. They also occur on the Great Lakes.

Old Testament, the, the canonical books of the Scriptures which were composed and published before the Christian era.

Origin and Formation.—It is impossible to be very certain about the date of composition and the authorship of most of the books of the Old Testament, or the manner and time of bringing them together into the collection in which they now appear. Few of them contain any statement in regard to their authorship, which we can reasonably suppose to have been made by the author himself, so that, who he was, and when he lived, must, for the most part, be determined by the evidence to be found in the contents of the book itself, or by references to it contained in other Biblical books. When the formation of the collection now known as the Old Testament, began, how it was carried on, and when it was completed, are matters, no one of which can be determined with certainty. For more detailed statements on these points, see Bible, Genesis of the Old Testament, and Canon of the Old Testament.

Very important Ancient Versions of the Old Testament are the Greek Versions (especially the Septuagint); the Aramaic Versions, called Targums; the Syriac Versions (especially the Peshitto); and the Latin Versions, especially the Vulgate of Jerome.

For an account of these versions, see Bible, Versions of the Old Testament.

Literary Elements.—The Old Testament cannot be correctly understood or rightly used, unless a profound knowledge of the literary elements, or forms of literature, which it contains. There are to be found in it books which, for want of a better term, may be called historical works, as, for example, the books of Samuel and Kings. These, however, are not histories in the modern sense of this word, but are works of religion, in which the lessons of history are used to bring men into harmony with the will of God. There are also in the Old Testament poetical works, as, for example, the Psalms and the book of Job, which exhibit all the phenomena that characterize poetry in general. We find also, in its contents, works of a practical philosophy, as, for example, the books of Proverbs and Ecclesiastes, all of which have the form, and, in some measure, the substance of poetry. Another, and a large element, of its contents is to be found in the collections of the sermons, or discourses, of the prophets, which form the main part of the prophetic books, as, for example, the Book of Amos. Each of these different kinds of literature has a nature and characteristics of its own, and must be interpreted, if interpreted correctly, in harmony with its own peculiar form and characteristics. This is especially true of the poetical and prophetic portions of the Old Testament, concerning which, therefore, something more in detail will follow.

The Poetry of the Old Testament. Under this head, it is proposed to consider simply the form in which the poetry of the Old Testament appears, that is, the Hebrew rhythm and the Hebrew verse.

All rhythm in language is due to the repetition of certain uniform measures marked by a certain regular and recurrent stress. Thus the rhythm of the classic languages was secured by the use of poetical feet. Feet were combinations of syllables, all of which, in the same kind of verse, occupied the same time in utterance, but differed in the number of syllables composing them. In the Hebrew rhythm, the place taken by feet in the classic languages was held by sentences. Thus a Hebrew rhythm consisted of sentences of the same, or nearly the same, length, but composed, each one, of different words. As an example of this Hebrew rhythm, may be cited Psalm xviii. 2. Jehovah is my rock, and my fortress, and my deliverer; My God, my rock, in whom I will take refuge; My shield, and the horn of my salvation, my high tower. (All quotations and citations in this article are made from the American Revision of 1901.)

It will be seen from this example, that the equality of length in the different sentences, which is the basis of the rhythm, is secured, as would be expected, by having each sentence express the same thought, although the common idea is expressed each time by other words. To all such rhythms is given the name of Parallelism. So that we may define a Parallelism in Hebrew poetry as a combination of sentences, all of which are of the same, or nearly the same, length, and each of which expresses, in some way or other, the same idea. Each of the sentences so combined is called a Member of the Parallelism.
Parallelisms are classified both according to the number of their members, and according to the manner in which the common idea is expressed in all the members. In the classification according to the number of members, parallelisms are either simple or compound, a simple parallelism having two members, and a compound parallelism three members. In the classification according to the manner in which the common idea is expressed, parallelisms are either anaphorical, antithetic, or synthetic. A synonymous parallelism is one in which all the members express, each one, exactly the same idea, but with some change of words in each member. Such a parallelism appears in the simple parallelism of Psalm iii. 1:

Jehovah, how are mine adversaries increased! Many are they that rise up against me.

An antithetic parallelism, which is always a simple parallelism, is one in which the common idea is expressed in one member positively, and in the other negatively. Such a parallelism is Psalm iv. 2:

Yea, none that wait for thee shall be put to shame: They shall be put to shame that deal treacherously without cause.

A synthetic parallelism is one in which the common idea is expressed in all the members in such a manner that, in each member, a different side, part, or element, of the common idea, is made prominent. Such a parallelism is the compound parallelism of Psalm xiv. 4:

Have all the workers of iniquity no knowledge, Who eat up my people as they eat bread, And call not upon Jehovah?

Hebrew verse is sometimes constructed by using parallelisms of different kinds, or even of the same kind, in a continuous succession. But very frequently, instead of thus employing successive parallelisms, stanzas are used in the making of the Hebrew verse. A stanza is a combination of parallelisms, or of parallelisms and single members, which are called, when used in this way, odd members, in which each one of these elements expresses the same general thought in the way in which each one of the members of a parallelism expresses the same idea, so that these elements are related to one another synonymously, antithetically, or synthetically. It is to be noted, however, that two odd members cannot immediately succeed each other in a stanza. But it is common to use the term stanza in a more general and somewhat inaccurate sense, and thus to denote by it any one of the structural divisions of Hebrew verse, whether the portion so indicated is really a stanza as defined above, or only a parallelism. In this sense of the term, it is both correct and necessary to say that, in the present editions of the Old Testament Scripture, except in those cases in which the Masoretic division and accentuation of the Hebrew text are to be rejected as not correctly indicating the real structure of the verse, each Scripture verse in the poetical books and passages is a stanza. Among the different forms of the true stanza occurring in the Old Testament, we find stanzas consisting of two parallelisms, as, for example, Isaiah i. 3:

The ox knoweth his owner, And the ass his master's crib; But Israel doeth not know, My people do not consider.

We find also stanzas of this kind which are so arranged, that the two first members of the parallelisms immediately follow each other, and then the two second members follow each other in immediate succession, as, for example, Deuteronomy xxii. 42:

I will make mine arrows drunk with blood, And my sword shall devour flesh; With the blood of the slain and the captives; From the head of the leaders of the enemy.

The real meaning here is:

I will make mine arrows drunk with blood, With the blood of the slain and the captives; And my sword shall devour flesh From the head of the leaders of the enemy.

We also find stanzas consisting of two parallelisms and one odd member, as, for example, Hosea xiv. 9:

Who is wise, that he may understand these things? Prudent, that he may know them? For the ways of Jehovah are right, And the just shall walk in them, But the transgressors shall fall therein.

Other forms of the stanza also occur, which it is not necessary to specify in this place.

In addition to the rhythm of sentences which has now been described, the Hebrew verse has, according to some scholars, an accentual rhythm. Those who adopt this view, assert that every poem, or each portion of a poem, in which the rhythm remains the same, has the same number of accents in each member of every parallelism. It is, however, claimed that an irregular number of accents may occasionally occur in a member, especially if force or energy of thought is thus secured, just as irregular feet and lines are sometimes allowed in the classic poetry. The most weighty objection to this theory is the fact that, while it is, of necessity, founded upon the Masoretic accentuation of the Hebrew text, as this now exists, it requires frequent and considerable arbitrary changes of this accentuation in order to make the number of the accents conform to its claims. But it is not safe to accept as valid and sufficient the testimony of a process which in the next moment to be declared untrustworthy. It would seem better to think that the equality in the number of accents so often to be seen in the different members of a parallelism in the Hebrew text of the poetical portions of the Old Testament, is a coincidence due to the equality of length and the sameness of the thought in these members.

Some scholars have thought that, in addition to its rhythm of sentences, the Hebrew verse possesses a rhythm of quantity, and has, therefore, feet and metre in the same manner as the Greek and Latin verse. Various theories have been proposed in relation to this matter; but no one of them has yet been established in such a way as to meet with general acceptance among scholars. It is not too much to say that it is still a matter of doubt whether or not the Hebrew verse possesses a rhythm of quantity. In some Hebrew verse, the stanzas are so combined as to form strophes. These are combinations of stanzas, including parallelisms used as stanzas, which are so constructed that each combination contains the same, or nearly the same, number of members, and expresses a natural and important division of the thought of the poem. More frequently, when a poem has the strophic form, strophes constructed according to different standards
appear in it. But, in all such cases, the combination of the different kinds of strophes is made according to some definite plan and some mathematical law. Such a composite, strophic structure may be seen in Psalm lvi., in which there are six strophes. The number of members in each of these strophes, and the plan according to which they are arranged, may be indicated by a line of figures, called a strophic scheme, by the following way: 4-5-6-4-5-6. The first strophe is a call for help, verse 1:

Be merciful unto me, 0 God, be merciful unto me; For my soul taketh refuge in thee; Yea, in the shadow of thy wings will I take refuge, Until these calamities be overpast.

The second strophe is an expression of confidence that God will give the desired help, verses 2 and 3:

I will cry unto God Most High, Unto God that performeth all things for me. He will send from heaven, and save me: When he that would swallow me up reproacheth; God will send forth his lovingkindness and truth.

The third strophe sets forth the great need of help, verses 4 and 5:

My soul is among lions; I lie among them that are set on fire: Even the sons of men, whose teeth are spears and arrows, And their tongue a sharp sword. Be thou exalted, 0 God, above the heavens; Let thy glory be above all the earth.

The fourth strophe sets forth the coming overthrow of the enemies of the poet, verse 6:

They have prepared a net for my steps; My soul is bowed down: They have digged a pit before me; They are fallen into the midst thereof themselves.

The fifth strophe is an expression of gratitude to God for the help and deliverance which are surely to be given, verses 7 and 8:

My heart is fixed, 0 God, my heart is fixed: I will sing, yea, I will sing praises. Awake, psaltery and harp: I myself will awake right early.

The sixth strophe expresses the writer's joy because he can be sure of the goodness and faithfulness of God, verses 9:

I will give thanks unto thee, 0 Lord, among the people; I will sing praises unto thee among the nations. For thy lovingkindness is great unto the heavens, And thy truth unto the skies.

Be thou exalted, 0 God, above the heavens; Let thy glory be above all the earth.

Some writers use the term strophes, in speaking of Hebrew verse, to denote any portions of a poem which express natural divisions of its thought, without any regard to the number of the members contained in these portions of the verse. But such a use of the term seems to be faulty. For it means but little when so used, since almost every poem is strophic in this sense. Moreover, in such a use of the term, no sufficient account is made of the fact that there are some poems constructed, as already indicated, according to definite mathematical plans.

Some Hebrew verse has a choral form. That is, it consists of divisions intended to be sung responsively by different persons, either choirs or individuals. Such verse appears in Psalm xxiv., which seems to have been composed to be sung, or as if to be sung, at the removal of the ark by David from the house of Obed-edom to the fortress on Mount Zion. In this psalm, the choral structure seems to be the following:

(The full choir, as the procession moves up the hill, verses 1 and 2)

The earth is Jehovah's, and the fulness thereof; The world, and they that dwell therein, For he hath founded it upon the seas, And established it upon the floods.

(A single voice, or a part of the choir, asks, verse 3)

Who shall ascend into the hill of Jehovah? And who shall stand in his holy place?

(A part of the choir replies, verses 4 and 5)

He that hath clean hands, and a pure heart; Who hath not lifted up his soul unto falsehood, And hath not sworn deceitfully, He shall receive a blessing from Jehovah, And righteousness from the God of his salvation.

(The full choir sings, verse 6)

This the generation of them that seek after him. That seek thy face, even Jacob.

(The full choir before the gate of the fortress, verse 7)

Lift up your heads, O ye gates; And be ye lifted up, ye everlasting doors: And the King of glory will come in.

(A single voice, or a few singers, in the fortress, verse 8, a.)

Who is the King of glory?

(The full choir without the fortress, verses 8, b and 9)

Jehovah strong and mighty, Jehovah mighty in battle. Lift up your heads, O ye gates, Yea, lift them up, ye everlasting doors: And the King of glory will come in.

(A single voice, or a few singers, in the fortress, verse 10, a.)

Who is this King of glory?

(The full choir without the fortress, verse 10, b.)

Jehovah of hosts, He is the King of glory.

Prophecy in the Old Testament.—In treating of Hebrew verse, we have described the one thing which is peculiar in the Old Testament in the matter of literary form. In the prophetic discourses, or sermons, of the Old Testament, we find the one thing which separates it as a book of religion from all other literature. The essential and distinguishing thing about the sermons and writings of the prophets was, that they were messages received directly from God, which were to be given to the men of the prophet's time for the purpose of changing, in some way or other, existing conditions in the national life. Hence, the prophetic discourses were always occasioned by a definite and actually existing historical situation. By them, the prophet sought to accomplish some result in the life and conduct of his hearers. Therefore, the motives he urged, and the truths he presented, were those naturally suited to secure the desired result. If he made predictions, he did so for the same reason that now causes preachers and ethical teachers to predict, that is, to show what consequences would follow certain lines of conduct in order to incite men to, or dissuade men from, some particular way of living. Prediction, therefore, was merely incidental, and not at all essential, to prophecy. Moreover, since the constant aim of the prophet was to secure some desired spiritual condition on the part of his hearers, and much that was predicted by the prophets, was only to come to pass in the future in consequence of the existence of this
desired spiritual condition, it follows that there was a very large conditional element present in all the predictions of the Old Testament prophets. The desired condition was not always in existence at the time to which the prediction related, and, consequently, there is much predictive prophecy which, so far at least as the letter of the prediction is concerned, has not yet been fulfilled, and cannot now ever be fulfilled. This is why the prophets was a teacher, and not a soothsayer, or a fortune-teller.

This fundamental law of prophecy is clearly set forth by the prophet Jeremiah, speaking in the name of Jehovah, in chapter xviii., verses 7-10, of his book. The word of Jehovah to him was:

At what instant I shall speak concerning a nation, and concerning a kingdom, to pluck up and to break down, and to destroy it; if that nation, concerning which I have spoken, turn from their evil, I will repent of the evil that I thought to do unto them. And at what instant I shall speak concerning a nation, and concerning a kingdom, to build and to plant it; if they do evil in my sight, that they may obey not my voice, then I will repent of the good, wherewith I said I would benefit them.

This may seem an illustration of the working of this law in the case of the apparently positive and unconditional declaration of the prophet Jonah in regard to the fate of Nineveh. Yet forty days," the prophet proclaimed, 4 and Nineveh shall be overthrown. But it was not overthrown; for "they turned from their evil way; and God repented of the evil which he said he would do unto them; and he did it not."

We find also a progressive element in the Old Testament prophecies. The same progressive character appears in this part of the divine revelation as is to be seen in revelation as a whole. The later prophets often presented some great fact in a higher and more complete way than those who had preceded them. If, for example, we study Psalm cx. and Isaiah ii. 2-4, in connection with each other, we shall find that they both present to us the fact that Jehovah, either in His human-plus, or as the Mesianic King, who shares His throne, and represents His authority, is to be the acknowledged Lord and sovereign of the nations. But the two passages do not represent this fact as coming to pass in the same way. The first passage, Psalm cx. declares that this fact will come to be, because Jehovah will, in His wrath, by the exercise of His might, make the enemies of His appointed king a footstool for His feet, while the passage in Isaiah presents to us this same fact as resulting from the joyful admission of the nations to the rule of Jehovah on account of the high estimation which they will put upon His law. These two views are not necessarily mutually exclusive, or even inconsistent with each other; but the latter may reasonably be regarded as presenting the higher and more spiritual side of the one great fact.

The same progressive element may be noticed in those predictive passages which relate still more directly to the work of the Messiah. In the earlier days of Israel's history, when the kingdom was still in a more or less flourishing condition, the Messiah was generally presented, in the preaching of the prophets, as a great and victorious king. But, in the discourses of the prophets of the exile and the post-exilic period, the most common representation is that the Messiah will accomplish His work of salvation through humiliation and suffering. This, however, does not mean that the ideas relating to the character and work of the Messiah to be found in the work of the prophets were developed from natural growth, springing from the national consciousnss in a purely human way, under the stimulation of the varying hopes and fears of the national history. They were not the less truths received from God, because, in giving them to men, He had regard to the ability of men to receive them. They did not cease to be revelation, because they were revealed according to a national receptivity conditioned by national circumstances.

Another element which appears not infrequently in the prophetic writings, is due to the fact that the prophets were often poets, and, like all poets, they set forth purely ideal creations of the imagination. Hence, we find sometimes in the prophetic predictions an ideal element, which could not have been expected by the prophet ever to be realized in actual experience or history. For example, it is clear that the prophet who spoke or wrote in Isaiah lii. 7-10, intended to predict that Jehovah would cause the city of Jerusalem to be rebuilt, and would bring back the exiles of Judah to their own land. In making this prediction, however, he tells us that a welcome messenger will be seen upon the hills near Jerusalem, bringing to the ruins of the city, and to some mysterious beings who will be seen watching over these ruins, the news of the speedy return of the people and the future rebuilding of the city. When these watchmen shall see Jehovah bringing back the nation to its own land, they will, the prophet declares, gaze into one another's face with gladness, and raise a song of joy. But we know from the account of the return from the Babylonian exile contained in the books of Ezra and Nehemiah, and also because of the natural possibilities of the case, that these events which are foretold in verses 7 and 8 of the passage in question, never actually occurred, and, indeed, never could have occurred. These events were, therefore, only creations of the prophet's imagination, ideal additions of a poetic nature to the facts of the case.

Old Testament Theology.—The teachings of the Hebrew prophets which are to be found in the Old Testament, and the other teachings of inspired men, which it contains, form the material from which is constructed the science of Old Testament theology. This science is a history as well as a science, and may be termed a historical science. The method of investigation and determination employed in it is the historic, but the results obtained by the historic method are classified according to their scientific theological relations. We may, therefore, define Old Testament theology as the science which consists of the inspired statements and teachings of the Old Testament that set forth facts and doctrines of revealed religion, classified according to their scientific theological relations, and presented so as to show their historic succession. Its aim is to show the progress of revelation by determining what inspired ideas and teachings belonged to its several stages of the world's history by exhibiting in their historic succession the religious ideas and teachings of each of the in-
OLDCASTLE

spired authors and teachers of the Old Testament, and by showing what ideas of this kind belonged to each epoch in the nation's history. The definition, of course, assumes that there is a religious spirit, or the effect of which are supernatural, and the truths of which have been made known to men by God. It also assumes that the Old Testament consists of inspired writings in which facts and truths of this kind are authoritatively and correctly stated by men who wrote and spoke as they were moved by the Spirit of God. It is necessary, therefore, according to this definition, to distinguish between Old Testament theology, and the history of the religion of Israel. The former is the history of revelation, the latter the history of religion. The former sets forth the things which were given to men from God, as the things they ought to believe and do; the latter tells us what were the religious beliefs and practices of the whole nation, in which beliefs and practices there was much, throughout the whole Old Testament age, which was common both to the Hebrew people and the other nations of the Semitic race. If all allowance should be made to the Old Testament writings, it would still be necessary to make this distinction between the history of the religion of Israel and Old Testament theology, in order to be scientifically accurate. For it would still be true that there is a great and striking difference between the religion of the great teachers of the nation, and the religion of the nation itself; and a scientific account of the religious faith and life of the people could not ignore this fact, or treat it as of little account.

As a historical science, Old Testament theology will depend, for the form in which its material will be arranged, upon the dates which may be assigned to the writings from which this material is derived. Even though this material remains absolutely unchanged in substance, yet each new theory about the dates of the books of the Old Testament will produce a new Old Testament theology. Whatever particular work on Old Testament theology shall be, will be determined in no small degree by the conclusions previously made by its author in the department of higher criticism. It is for this reason that no attempt is made in this article to present any particular scheme of Old Testament theology. It seems better, for the present, to indicate the true nature of the science, and to show how the final construction of it must be made, when at last this shall be possible. The religious teaching of each of the Old Testament books will naturally be given in the various articles relating to these books. The time has not yet come for constructing, from this material, a final Old Testament theology. When the dates of the Old Testament books and the order of events in the history of Israel have been finally determined, it will be possible to construct a final Old Testament theology by employing either one of two methods, each of which has its advantages and its disadvantages. One of these methods, which may be called the scientific method, gives special prominence to the scientific theological relations of the material. Taking, in their scientific order, each of the books described in the Old Testament, it sets forth the form in which this doctrine was taught in each of the different periods of the nation's history, and, so far as may seem desirable, in each of the books and writings of this period. The great advantage of this method is that it secures a clear view of the historical succession of teaching in the case of each particular doctrine; but the principal disadvantage of using it is that we do not obtain by it a good idea of the whole body of the doctrines taught in any one period, or by any individual teacher. The other method, which may be called the historical method, gives special prominence to the historical relations of the material. It first determines what were all the religious teachings of each period of the nation's history, and, so far as may seem desirable, of each book and document produced in this period. Then it distributes these teachings into groups according to their scientific theological relations. The chief advantage of this method is that, by it, there is secured a clear view of the whole body of the teaching set forth in any particular period, or by any individual teacher; but its great disadvantage lies in the fact that it does not make very evident what was the historical inspiration of their teaching in the case of any particular doctrine.

SYLVESTER BURNHAM, D.D.,
Dean of Hamilton Theological Seminary, Colgate University.

Oldcastle, old'kæs-1, Sir John, Lord Cobham, English nobleman: b. Herefordshire in the 14th century. He attained his peerage by marrying the grand-daughter of Lord Cobham. A zealous adherent of
Wickliffe, he collected and transcribed his works and distributed them among the people. In the reign of Henry IV., at the head of an English army in France, he obliged the Duke of Orleans to raise the siege of Paris. Under Henry V. he was accused of heresy, and not being able to satisfy his accusers he was condemned as a heretic, and committed to the Tower, but escaped. It was then reported to the king that some of his writings were to assemble at St. Giles' for his destruction, with Lord Cobham at their head. This accusation seems to have been credited by Henry, and there certainly was an abortive attempt at a Lollard rising, with which Oldcastle was probably connected. He avoided capture for a time, but at last was taken, and as a convicted heretic and traitor was "hung and burnt" in St. Giles' Fields. In later days he was represented as "the blessed martyr Lord Cobham," though on the other hand, he figured as the boon companion of young Prince Henry, a roysterer and a coward. Hence his name was originally adopted by Shakespeare in his 'Henry IV. Part 2,' instead of that of Falstaff. The old play of Oldcastle (1560) adopts the favorable view of his character.

Oldenburg, Henry, öl'dén-bär' (Ger. öl'dén-boo'rg), German writer and courtier; b. Bremen, Germany, about 1615; d. Greenwich, England, September 1677. He was graduated from the Gymnasium Illustre, Bremen, in 1639; sent as consul for Bremen to London and served in that capacity during the "Long Parliament" and Cromwell's Protectorate, and in addition to his diplomatic duties devoted much time to literature. He was one of the first members of the society organized in 1660 which later became the Royal Society and was a friend of Milton, Spinoza, Bayle, and many other leaders in the world of learning. He edited the 'Transactions' of the Royal Society (1664-77) and published numerous translations. Among them are: 'A Genuine Exposition of the Book of the Revelation,' by A. B. Pignani (1671); 'The Life of the Duchess Mazarine'; etc.

Oldenburg, Germany, (1) a town, capital of county of the same name, 24 miles northwest of Bremen, on the Hunte, which here receives the Haaren, and forms a harbor. It has fine promenades on the site of the old fortifications, two grand-ducal palaces or residences, one of them containing a library of over 50,000 volumes; a handsome grand-ducal picture gallery; a modern town-house; a public library of about 100,000 volumes; a museum of Germanic and other antiquities, fine theatre, railway-station, gymnasium, commercial school, etc. There are manufactures of tobacco, glass, leather, soap, earthenware, musical instruments, etc., and important horse-markets. Pop. (1900) 26,635.

(2) The grand-duchy of Oldenburg, comprising the duchy of Oldenburg, and the principalities of Birkenfeld and Lübeck, has an aggregate area of 2,479 square miles. It borders on the North Sea, and is surrounded east, south, and west by Hanover. In the Diet or Reichstag of the German Empire, Oldenburg is represented by two delegates, and in the Bundesrat or Federal Council by one member. The ducal house of Oldenburg dates from the commencement of the 12th century, and among its branches are the kindred Houses of Denmark and Greece. Pop. (1900) 318,434.

Oldfield, old'feid, Anne, English actress; b. London, England, 1683; d. there 23 Oct. 1730. Her dramatic powers attracted the attention of Farquhar, the dramatist, and through his influence she made her appearance at Drury Lane. She soon overcame adverse criticism and rapidly rose to be the leading actress of her day. Her preference was for roles in plays of the "gentle comedy" order, but when finally persuaded to take heavier parts, she did not visibly startle even her fellow actors by her power. Though received in the highest social circles her private life furnished ground for censure as she openly lived with Arthur Mainwaring and after his death with General Charles Churchill. She was buried in Westminster Abbey with high honors. Her most famous roles were: Lady Betty Modish in 'The Careless Husband'; Jane Shore; Cleopatra; Sophonisba; etc.

Oldham, old'am, John, American colonist; b. England; d. Block Island, R. I., 1636. He came to Plymouth from England in 1623, but because of designs against the Plymouth government entertained by him with John Lyford, a Church of England clergyman, he was banished from the colony. He subsequently made his peace with the colonists and was of service to them on several occasions. Removing to the Massachusetts Bay Colony he settled in Water-town, which he represented in the first General Court. His murder by Indians on Block Island in 1636 was the chief incident leading to the Pequot War.

Oldham, England, a town in Lancashire, 6 miles northeast of Manchester. From an insignificant village in the 18th century, Oldham during the 19th century became one of the chief seats of the cotton industry, and an important coal-mining centre. Its numerous other industries include wool-weaving, hat-making, iron founding, and the manufacture of engines, machines, gas-meters, etc. Although irregularly built on hilly ground and of no great architectural pretensions, Oldham is distinguished for its municipal enterprise and the administrative ownership of its various public utilities as gas, water, electric light, tramways, street railroads, etc. Pop. (1901) 137,238.

Oldham, a genus of carboniferous brachiopods, known as fossils in the rocks of India and China. The name has also been applied in Great Britain to some remains of indeterminate character, probably of sea weeds.

Oldmonx, old'monk-sön, John, English political writer; b. Axbridge, Somerset, 1673; d. 1742. In his 'Essay on Criticism in Prose' (1728), he attacked Pope, who returned the compliment by abusing Oldmonx in the 'Dunciad.' He published also: 'The British Empire in America' (1708); 'A History of England' (1730-9); 'Memoirs of the Press' (1742); etc. He was distinguished for his hatred of the Stuart family.

Old'town, Maine, city in Penobscot County; on the Penobscot River, and on the Bangor & A. and the Maine C. R.R.; about 11 miles northeast of Bangor. It was settled in 1820, and was a part of Orono until 1840 when it was incorporated as a town, and was charted as a city in 1891. It is in a lumber region, and the chief manufactures are wood products, machinery, and foundry products, pulp, boots and
shoes, woolen goods, and large quantities of lumber in different forms. Some of the prominent buildings are the Odd Fellows building, the city hall, and the high school. It has a free public library and a city hospital. The revised charter provides for a mayor and council elected annually. Pop. (1890) 5,312; (1900) 5,763. Consult Howard, 'History of Penobscot County.'

Olefin. See BULL, OLE BORNEMANN.

Olean, o-le-an', N. Y., city in Cattaraugus County; on the Allegheny River at the mouth of Olean Creek, and on the Pennsylvania, the Erie, the Pittsburg, Shawmut & N. R.R.'s; about 68 miles in direct line south by east of Buffalo. It was settled in 1804 by Major Hooper and David Hewston, was incorporated as a township in 1808, as a village in 1854, and was chartered as a city in 1893. It is in a fertile agricultural region, and near the Pennsylvania oil fields. In the vicinity is a mass of rocks of peculiar formation known as "Rock City." It is a distributing point for large quantities of petroleum which is brought by pipe lines from the oil fields south of the city, and considerable of it is sent by the same means to other cities. The lumber and leather interests are important. The chief manufacturing establishments are lumber mills, tanneries, oil-refineries, glass factories, machine shops, railroad shops, cooperages, wagon and carriage factories, brewery, brick yards, flour mills, and furniture factories. The number of employees is about 3,000. It has a large trade in oil, lumber and lumber products, leather, and glass. It has a hospital, a State armory, a city park, and a driving park. The educational institutions are eight public schools, one parish school, a Commercial College, and the Foreman Library. There are about 20 church buildings; the Methodists and Roman Catholics have each three. The two banks have combined capital of $250,000, and the total assets are over $4,000,000. The government is vested in a mayor elected for two years, and 12 aldermen, six of whom are elected each year. Pop. (1890) 7,358; (1900) 9,462.

HERBERT D. GIBLEY, Editor 'Evening Herald.'

Oleander, a genus of shrubs (Nerium) of the order Apocynaceae. The two or three species have narrow, leathery, evergreen leaves and terminal cymes of flowers, usually pink, followed by pods containing twisted seeds. The common oleander (N. oleander) is a native of subtropical and tropical Asia and of the Mediterranean region, whence it has been introduced into other warm countries as an ornamental shrub and hedge plant, and into greenhouses for growing in tubs. In the Bermudas it is so abundant that the landscape is perceptibly tinted by its bloom at some seasons. Otherwise the shrub seems to have few uses though charcoal from its soft light wood is used in Algeria for making gunpowder. The plants are easily grown from cuttings placed in water or in wet sand. They thrive best in rather moist soil, but will also do well upon high land if they obtain a good root-hold. The sweet-scented oleander (N. odorum), a native of Japan, India and Persia, is less starchy than the common species, and is less cultivated.

Oleaster, or Silverberry, a shrub (Elaeagnus angustifolia) of the order Elaeagnaceae (q.v.), an ornamental plant introduced from western Asia and southern Europe into temperate climates as an ornamental plant. It grows about 20 feet tall, is often spiny, has narrow light green leaves about two inches long, small, fragrant bell-shaped flowers, followed by yellow, oval silvery-scaly fruits. It seems to prefer well drained limy soils and sunny situations. It is very popular in cold climates, especially in the Dakotas and Minnesota, where it has proved hardy.

Olefin. See ETHYLENE.

Oleic Acid, C_{17}H_{33}O_{2}, the most important member of the "oleic" series of acids occurring as the glyceride triolein, C_{17}H_{33}(C_{17}H_{33}O_{2}), in most liquid and solid fats as olive, almond, and cod-liver oils, lard, tallow, etc., olive oil being about 72 per cent pure olein. To obtain the free acid the fat is saponified with alkali, the soap so formed dissolved in water and the fat acids liberated by the addition of dilute hydrochloric or sulphuric acids. This impure oleic acid is heated for a time with powdered lead oxide (litharge) and the lead salts extracted with ether which dissolves only the lead oleate. On acidifying the ethereal solution with dilute hydrochloric acid the lead is precipitated as lead chloride, leaving the pure oleic acid in solution from which it can be obtained by evaporation of the ether. The decomposition of triolein into oleic acid and glycerine may be accomplished by other means such as heating with superheated steam or with water and sulphuric acid. Oleic acid is a thin colourless oil at ordinary temperatures but solidifies when cooled to 4° C. (39° F.). Crystallizes from alcohol in silky needles melting at 14° C. (57° F.). Specific gravity at 19° C. (66° F.) is 0.857. It decomposes when heated to boiling at ordinary atmospheric pressure, but may be distilled unchanged under diminished pressure or with superheated steam. Insoluble in water, very soluble in alcohol, ether, and most other organic solvents. It is a monobasic acid forming many well defined salts, many of which are of use in the arts or in medicine. Sodium oleate is the chief constituent of castile soap; potassium oleate is found in soft soap; lead oleate is the "lead plaster" of the pharmacist. When well cooled oleic acid is treated with nitrogen trioxide, it is changed to a solid isomeride, elaidic acid, which is used to some extent in making candles.

Olein. True olein is the glyceride of oleic acid. Composition, C_{17}H_{33}(C_{17}H_{33}O_{2}). It occurs in most vegetable and animal fats, notably in olive oil, lard, and tallow. A colorless, odourless, nearly tasteless oil, insoluble in water, only slightly so in alcohol, soluble in ether. Alkalis saponify it to the alkali salt of oleic acid (soaps) and glycerine. Nitrogen trioxide changes it to its solid, isomeride elaidin. It is difficult to obtain it perfectly free from the glycerides of other acids occurring with it. The term "olein" is applied to various commercial products, such as the liquid fats used by the soap-maker and the liquid fatty acids utilized by the candle manufacturer.

Olenek, ő-le-nyŏk', a river of northern Siberia, which rises between Mounts Boldiso and Dsholokon, and after a tortuous northeastern course of about 1,000 miles enters the Arctic Ocean 100 miles to the west of the Lena delta. It is six miles wide and 20 feet deep at its
OLEOMARGARINE — OLERON

mouth, on the left bank of which is the village of Ust Olenkoe.

Oleomargarine, a mixture of fats used as a substitute for butter. Oleomargarine was invented by a Frenchman, Mége-Mouries in 1870. His idea was to produce a substance very like butter in physical properties and chemical composition that would be more wholesome than and as cheap as poor butter. He used the best of beef-suet as a basis; 1,000 parts of well washed and finely chopped fat were digested at 45° C. (113° F.) with 300 parts of water, 1 part of carbonate of potash and two stomachs of sheep or pigs. After two hours the membranes had dissolved under the influence of the pepsin of the stomachs and the melted fat had risen to the surface. It was drawn off, salted and allowed to cool whereupon most of the stearin and palmitin crystallized out. This semi-solid mixture was subjected to hydraulic pressure and the fluid oleo 50-60 per cent pressed out. The oleo was churned with 10 per cent of its weight of milk curd, but with a little butter it could be used as butter. Many changes have been made in the manufacture of oleomargarine since its invention by Mége-Mouries. The process given below as described by Armbruster (Science) 47, p. 471, is essentially the same as that described by Armour and Swift and is a fair representative of that followed in this country. From the beef-tallow is prepared the oleomargarine oil of Mége. The cold fat of freshly killed cows is after thorough washing first in tepid water and then in iced water, allowed to stand in a cold room until thoroughly cold. It is then rendered at a temperature between 130° and 175° F. The resulting oil is allowed to solidify slowly until a considerable portion of the stearin and palmitin has crystallized out, and the pasty mass is then subjected to hydraulic pressure. The still fluid (about two thirds of the whole) is then put into a tank of cold water, where it solidifies into a granular mass which is known to the trade as "oleo" oil or simply "oleo." The name "oil" is somewhat misleading as the product is a granular solid of a slightly yellow color. It is leaf large, transparent, and the same color as the beef tallow yields the "neutral lard" or "neutral" of the trade, also a granular solid of a white color. The objects of this treatment are twofold, first, to produce fats as free as possible from taste or odor; second, to remove some of the difficulty fusible stearin and palmitin, in order that the finished product may melt readily in the mouth. Having thus secured the fats in the proper condition, the manufacturer proceeds to mix "oleo" and "neutral," the proportions varying according to the destination of the product: a warm climate requiring for more "oleo," a cold one for more "neutral," and to flavor the mixture with a little butter. Flavoring is conducted in large steam-jacketed vessels provided with revolving paddles, by which their contents can be thoroughly agitated. Here the "oleo" and "neutral" are melted and thoroughly agitated with a certain proportion of so-called "schrup." The latter is a proper amount of butter-color. Forty-eight gallons of milk to 2,000 pounds of product are stated to be a common proportion. After sufficient agitation, the melted mass is run into cold water and as it cools is broken up by paddles so as to granulate the mass. After thorough washing it is salted and worked exactly like butter. The product is known as oleomargarine. Although it contains hardly more than a trace of butter, the latter flavors the whole mass so strongly that when well salting as it usually is, it must readily pass with an inexpert or careless consumer for rather flavorless butter. Oleomargarine is the cheapest product made. By adding to the material in the agitator be "schrup" more or less pure butter what is known as butterine is produced, two grades of which are commonly sold, namely, "creamy butterine" containing more and "dairy butterine" containing less butter. Certain other substances such as cottonseed-oil, sesame oil sugar, and glucose are used to some extent by a few, usually unimportant makers. On the question of the wholesomeness of artificial butter there is a wide difference of opinion, but most authorities say that a butter substitute carefully made from the fresh clean fat of healthy bees or swine is wholesome.

The physical properties of oleomargarine are so similar to those of butter that it is very difficult to distinguish between them by any superficial test. For a good test that can be applied in the household, consult 'Farmers Bulletin' (No. 131) United States Dept. of Agriculture (to be obtained for the asking from the Secretary, Washington, D. C.) that is able to detect oleomargarine by making use of the fact that it contains a large percentage of fatty acids not soluble in water and a lower percentage of those volatile with water vapor than butter does. This has been both Federal and State legislation regarding this substance. The Federal law of 1886 imposed a special tax on the manufacturer ($600 per annum), the wholesaler ($480) and the retailer ($48). In addition the manufacturers, and glucose are added to packages, the stamps making an extra tax of two cents a pound. The act of 1902 abolished this tax of two cents but established new rates, namely, 10 cents a pound on artificially colored oleomargarine, while oleomargarine free from any color that would cause it to look like butter was rated at one fourth of a cent a pound. The special taxes on the maker, etc., were not changed. Most States have an extra tax of their own. They vary widely and change frequently. Some merely add a few cents a pound, while others fix so high a rate or such conditions of manufacture or sale as to be practically prohibitory.

The production of oleomargarine in this country in 1888 was 34,355,527 pounds which increased to 126,316,427 pounds in 1902. Only about 3 to 4 per cent of it was exported. "Oleo oil," however, was exported in large quantity (161,651,413 pounds in 1901), more than half going to the Netherlands.

VICTOR J. CHAMBERS, Columbia University, New York.

Oleometer, ô-ô-lôm-i-ôr, a species of hydrometer adapted for determining the relative densities of oils.

OLERON, ô-lô-rôñ, France, an island in the Bay of Biscay, its nearest point two miles from the coast of the department of CharenteMaritime, opposite Rochefort. It is 72 miles long by about five broad, and is very fertile. On it are the port of Le Château and the small towns of Saint Pierre d'Oléron and St. Georges d'Oléron. In history, the island is noted for the Jugemens ou Rôles d'Oléron — Judgments or
Laws of Olérón, a code of maritime law compiled by command of Eleanor of Guienne before she married Henry II. of England, and modeled on the 'Book of the Consulate of the Sea' (a maritime code compiled by the Venetians in the 13th century and into Flanders in the 13th. The usages and decisions upon which it was based were those observed in the wine and oil trade between Guienne and the ports of England, Normandy, and Flanders. The code formed the basis of modern maritime law. It was published for the first time in the 'Collections des Lois Maritimes' of M. Par- des. An English translation was published as 'Rutter of the Sea.' See COMMERCIAL LAW.

Oliveanu, or-lé-viâ-alh'nus (Ger. ol-lé-viâ-ah'nus), Kasper, German religious reformer: b. Treves 10 Aug. 1536; d. there 15 March 1587. He studied law in Paris, Orleans, and Bourges, where he became acquainted with the teachings of Calvin. Further theological learning was acquired by him in Geneva and he began to teach the Reformation doctrine in Treves in 1559, and to promote the spread of the new movement under the inspiration of Calvin. This roused the hostility of the archbishop, and the reformer was compelled to retire to Heidelberg, where he was appointed member of the church consistory, and court preacher. He now in collaboration with Ursinus produced the Heidelberg Catechism. His Lutheran sympathies led Louis VI. to depose him from his ecclesiastical preeminent in 1576; and he went to Berleburg and thence in 1584 to Herborn, where he advocated the doctrines of the Reformation in the territories of Count von Wittgenstein and Nassau. His special contribution to the progress of the Reformation was of a practical and administrative character, and from him the Reformed churches received that Presbyterian type of organization and polity which has become permanent in Europe and America, where his method of government by synods has become universal. Consul: Harbaugh, 'Fathers of the German Reformed Church'; Hagenbach, 'Väter und Be- gründer der Reformations Kirche' (1877).

Olfactory Nerve. See NOSE AND THROAT.

Ol'ga, Saint, a peasant girl taken to wife by the Grand-duke Igor of Kiev, who met her by chance when on a hunting party in Pskoff. She possessed remarkable talents and an exalted character. After her husband had lost his life in battle (963), she managed the government for his son, a minor. Then going to Constantinople, she was baptized by the Patriarch Theophylacte and took the name of Helen. After her death in 969 she was canonized by the Greek Church under her original name and her festival is kept on the 11th day of July (O. S.).

Olb'an (more fully Olibanum), a gumresin which flows from incisions in certain species of Boswellia, a genus of trees of the family Burseraceae, noted for the production of aromatic gum, growing on bare rocks in the mountains of southern Asia and northeastern Africa. Olibanum is the lebannah of the Hebrews, libanos or libanos of the Greeks, thus of the Romans, of all which terms the ordinary English translation is 'frankincense' (q.v.). It is produced mainly or altogether by B. serrata, a large tree growing on dry and rocky hills from Abyssinia and southern Arabia to northwestern India; but liban comes principally from Somalia (the 'aristal' of the Arab), and from Arabia. Aden is the chief point of collection, exporting from 1,500,000 to 2,000,000 pounds annually, much of which goes to India and China. The gum occurs in large conchoidal masses and yellowish-white teeth and masses; has a bitter nauseous taste; is hard, brittle, and capable of being pulverized; and diffuses a strong aromatic odor when burned. It was formerly used in medicine, but now is chiefly employed as an incense in Roman Catholic churches and Indian temples. It contains 56 per cent of resin soluble in alcohol, 30 per cent of gum soluble in water, and from 4 to 8 per cent of an aromatic oil. Another species of Boswellia supplies in India an inferior gum of similar properties, used both as incense and as a substitute for pitch.

Olid, Cristóbal de, krés-tô-bál'dal ó-lé, Spanish soldier: b. about 1400; d. Naco, Honduras, 1524. He was brought up in the retinue of Diego de Gavião, governor of Guatamala. In 1518 sent him with a small force to find Gri- ja, of whom nothing had been heard since his setting out for Yucatan. In Yucatan he met Cortez and was induced by him to desert Velazquez and join the other in his adventurous schemes, but in 1524 was captured and beheaded by one of Velazquez's kinsmen.

Oliger'shy. See Government.

Oligocene System, in geology, a name introduced by Beyrich (1855) for beds in North Germany, especially at Mainz, including portions of formations of the upper Eocene and the lower Miocene, and so forming a fourth subdivision of the Tertiary (q.v.), namely into Eocene, Mio- cene, Oligocene, and Pliocene. The rocks of the Oligocene are freshwater, brackish, or marine in origin and display a quasi-tropical flora: they occur in the Paris Basin, in Switzerland, where they are called Molasse, and rather rarely in North America, where the more important beds identified with the Oligocene occur in the North-west Territory, North Dakota, along the White River, and from Florida to Texas in the hinterland of the Vicksburg beds by Conrad and the Orbitoidic beds by Heilprin, who first called attention to the frequent occurrence in it of fossils of foraminifers, Orbitoides mantelli.

Oligocha'eta, an order of chaetopod annelids (see CHAETOPODA) of which the earthworm (q.v.) is the most familiar example. The species are almost solely inhabitants of the earth or of fresh water, have the segments of the body similar and differ from the marine chaetopods (Polychaeta, q.v.) in their greater simplicity of structure, doubtless the result of degeneration. Thus they lack all appendages — cirri, palpi, tentacles, etc. — as well as parapodia, the bristles arising directly from the body-wall, either distributed regularly or arranged in four bunches on each segment. Usually eyes are lacking and there is no metamorphosis in development. These animals are hermaphroditic, and usually some of the segments are markedly glandular, forming a girdle (clitellum) which secretes the cocoon in which the eggs are laid. The group is divided into the aquatic or parasitic species (Limnoria or Microdrile) and the terrestrial
forms (Terricola or Macrodrile). The aquatic species are mostly minute.

Oligoclase (Greek, slight fracture), one of the feldspar insolubilicates, with the possible formula (CaNa3)Al2(SiAl)O8. It crystallizes in the triclinic form; has a single clean fracture; is not affected by acid; varies in color from white to greenish; has a specific weight of 2.62–2.65 and a hardness of 6; occurs in granite and other early rocks in Switzerland, Germany, Sweden, and in the United States in New Hampshire, Connecticut, North Carolina, and elsewhere. A reddish variety with fine iron oxide crystals is used as a gem and is called sunstone.

O'lin, Stephen, American Methodist clergyman: b. Addison County, Vt., 7 March 1797; d. Middletown, Conn., 16 Aug. 1861. He was graduated at Middlebury College, Vt.; was appointed president of the Abbeville Seminary, S. C., and subsequently entered the ministry of the Methodist Episcopal Church. In 1828 he was appointed professor in Franklin College. In 1823, when he was transferred to the Virginia conference, and elected president of Randolph Macon College. Later he spent some time in foreign travel, and in 1842 became president of Wesleyan University, Middletown, Conn. He was an accomplished preacher, and a prominent advocate of the evangelical alliance. He wrote 'Travels in Egypt, Arabia Petraea, and the Holy Land' (1843), and 'Greece and the Golden Horn' (1854). Consult his 'Life and Letters' (1853).

Olinda, ó-lěn'dă, Brazil, a seaport town of Pernambuco, five miles north of the city of Pernambuco, which replaced it as the capital and commercial centre of the state, after the Dutch burned Olinda in the 17th century. Olinda was founded in 1535. Pop. 8,000.

Oliphant, òl-fánt, Laurence, English traveler and author: b. Cape Town, South Africa, 1829; d. Twickenham, near London, 23 Dec. 1888. He was the son of a chief justice of Ceylon, and after a boyhood spent in England went to Ceylon in 1841 and was subsequently private secretary to his father. Although later called to the bar he spent much of his time in travel, visiting the Crimea in 1852, and Canada and the United States (1853–4) as private secretary to Lord Elgin, and in 1855 he served under Omar Pasha in the Crimean war. The next year he joined Walker, the filibuster, at New Orleans, and was attached to Lord Elgin’s China mission 1857–9. The year 1860 saw him with Garibaldi in Italy and the year after he was first secretary of legation at Yedo, Japan, where he was wounded by assassins. He sat in Parliament for the Stirling Burghs 1865–7, but having by this time come under the influence of the mystic, Thomas Lake Harris (q.v.), he resigned his seat and entered the brotherhood which Harris had founded at Brocton, Chautauqua County, N. Y. At Brocton, under the orders of Harris, he was forced to do the hardest kind of farm labor, and there his mother joined him, but he succeeded in holding to any confidential intercourse with her. Both mother and son gave up their private means to the community. In 1870 Oliphant returned to Europe and was Times correspondent during the Franco-Prussian war. In 1872 he married and the next year, with his wife and mother returned to Brocton. All three of the Oliphants were now the obedient slaves of Harris, and while his wife and mother were employed in menial duties Oliphant was called upon to engage in ceremonial enterprises for the good of the community. Husband and wife were presently separated by the command of the inexorable Harris, the wife being removed to a branch of the community in California. At last, in 1882, they emancipated themselves from the Harris influence, and after more wandering Oliphant finally settled at Haifa, in the Bay of Acre, and busied himself with schemes for assisting the Jews to return to Palestine. Although he had broken with Harris he still retained visionary beliefs not easy to define. In spite of his singular mysticism he was a shrewd man of business, a polished man of the world, and a writer of rare talents. That he was insane hardly credible, though this is sometimes urged, but that he was more or less unbalanced is evident. Among his many books are: 'The Russian Shores of the Black Sea' (1853); 'The Tender Recollections of Irene McGillivreedy' (1868); 'Roundabout novel' (1865); 'Alitorea Peto' (1883); 'Episodes in a Life of Adventure' (1887); 'Haifa, or Life in Modern Palestine' (1888); 'Masollam' (1886). Consult 'Memoir of Laurence Oliphant and Alice, his wife,' by Mrs. Margaret Oliphant (1891).

Oliphant, Margaret Oliphant Wilson, English novelist: b. Wallowford, near Musselburgh, Scotland, 4 April 1828; d. Wimbledon, Surrey, England, 25 June 1897. She removed with her parents to Liverpool in childhood and in 1852 was married to her cousin, Francis Wilson Oliphant, an artist in stained glass, who died in 1859. She began literary work early, publishing 'Passages in the Life of Mrs. Margaret Maitland' in 1849, and this was quickly followed by several other tales of Scottish life. After the death of her husband her family was supported entirely from the earnings of her pen, and during her long literary career she published 120 books and quite as many contributions to periodicals, the Chapbook of reviews, etc. Few women of her time have surpassed her in the amount of work accomplished and the even excellence of what she wrote. Of her many novels among the best are the five comprising 'The Chronicles of Carlungford' (1863–76) — of which 'Salem Chapel' (1863) and "Miss Marjoribanks" (1866) are the most important. 'Within the Precincts' (1879); 'Harry Joscelyn' (1881); 'The Ladies Lindores' (1883); 'The Sorcerer'; and 'The Cuckoo in the Nest' (1892). She was not a great novelist, for she lacked constructive power, and her plots are not always effective; but her careful and sympathetic analysis of character, her humor, pathos, invention, and naturalness entitle her to a high place among novelists of the second rank. Of several tales of the supernatural by her 'A Little Pilgrim in the Unseen' (1882), is the best known, but she surpassed in power by 'The Redeemed Criminal' (1889); and 'Old Lady Mary' (1884). In addition to her work in fiction she produced a large number of biographies and works of literary history, such as the 'Life of Edward Irving' (1862), a remarkable piece of sympathetic biography;
OLIVAREZ—OLIVE

'The Makers of Florence' (1874); 'The Literary History of England 1700-1823' (1882).
'The Victorian Age of English Literature,' with her son F. R. Oliphant (1892); 'Historical Chronicles of the Roman Emperors' (1894); 'Annals of a Publishing House' (1897); etc. In spite of much sorrow in her life her outlook upon existence was cheerful and tolerant, and her influence upon English fiction was wholesome in every respect. For a half century her admirable fictitious works were the delight of a wide circle of cultivated readers in this country and her own, and her 'Chronicles of Carlingford,' at least, have in them something of the same quality which renders Trollope's Dorsetshire tales so enduring. Consult 'Autobiography and Letters of Mrs. Oliphant' edited by H. Coghill (1899).

Olivarez, Gaspar de Guzman, gás'pär dâ gooth-män 6-le-vâ'reth, Spanish prime minister: b. Rome 6 Jan. 1587; d. Toro, Spain, 22 July 1645. He was educated at the University of Salamanca, was a gentleman of the bed-chamber to the Prince of Asturias, and gained the favor of his royal master to such an extent that when after the latter succeeded to the throne as Philip IV. Olivarez was appointed prime minister. For 22 years (1621-43) his power was almost unlimited. His sole object soon became the extortion of money from the people to supply the expenses of the war with Holland, France, and other powers. His severity occasioned revolts in Catalonia and Andalusia, and the Portuguese threw off the Spanish yoke, and acknowledged the Duke of Braganza king in 1640. The foreign wars were so fatal to Spain, whose armies were defeated by the French, and whose fleets were destroyed by the Dutch, that the king was compelled by universal public discontent to dismiss his minister.

Olive, Princess of Cumberland, title assumed in 1821 by Mrs. Olivia Serres: b. Warwick 3 April 1772; d. 21 Nov. 1834. Her maiden name was Wilmot; she married John Thomas Serres in 1791 and was separated from him in 1803. She wrote poetry and fiction and several pamphlets (1815-17) urging the claim of her uncle, 2nd Viscount Wilmot, for the author of 'Junius Letters.' In 1821 she was arrested for debt, and moved a stay as being daughter of the Duke of Cumberland. She asserted that £15,000 had been left her by George III., who recognized her as Cumberland's daughter, but she died without being able to see the King's will. Her claims were continued by her daughter Lavinia (1797-1871), who married Thomas Ryves, a portrait painter, was divorced from him in 1841, and in 1866 procured a verdict that her mother was not the daughter of the Duke of Cumberland. This cause célèbre was built upon most outrageous forgeries, but both Mrs. Serres and Mrs. Ryves succeeded in interesting Sir Gerald Noel and others in their pretensions.

Olive Thorne. See Miller, Harriet Mann.

Olive, one of the leading fruits of the world. It is borne by a small tree (Olea europaea) of the order Oleaceae, and is the most important member of its genus, which includes between 30 and 40 species. This tree is a native of western Asia and probably of the Mediterranean region, and attains a height of about 25 feet, bears small lanceolate leaves and axillary racemes of fragrant yellowish-white flowers followed by oblong or ovoid fruits (drupes). From remote antiquity it has been cultivated as a food-plant, especially for the oil pressed from its fruits. Throughout the sub-tropical parts of the Old World the olive has been grown upon a commercial basis for many centuries, individual trees being known to be more than 1,000 years old. It was introduced during the 18th century into California, which is now the leading producing State. Of the United States, but part of Arizona and New Mexico are adapted to olives and are gradually coming into notice. The assumption is made that seed was introduced in 1769 from Mexico and planted at the San Diego Mission, whence cuttings were taken to other missions throughout California; and this olive, the only one known in the State until about 1880, was called the "Mission" variety. Since 1880 numerous varieties have been introduced from olive-growing countries of Europe.

The olive succeeds best in warm dry climates. It will withstand some frost, but at blossoming time this is believed to impair if not to destroy the crop; and the same result is often attributed to high winds. The heavy dew at night is injurious. A rich, well-drained soil is preferred, but the tree will succeed and produce excellent crops upon a very great variety of soils; it is usually a mistake, however, to plant it upon rocky hillsides, as too numerous failures in California prove. While not exacting as to food, the trees must have an adequate fertilizer. The return to the soil of the pomace after the oil has been expressed, together with slight dressings of commercial fertilizers and judicious cultivation, will keep the trees in lusty bearing condition. The trees are usually set about 30 feet apart either in hexagons or in squares, the former plan being preferred in California because it is more economical of land, and permits of plowing in three directions instead of only two. The land is kept cleanly cultivated throughout the season.

The olive is propagated by layers, suckers, sprouts, cuttings, tips of twigs, grafts, buds, and seeds. The cuttings, the roots, and, to a less extent, the seeds, are rarely employed. The favorite method is by means of tips. These are obtained from small dormant branches, partly defoliated, rooted in moist sand and then transplanted in nursery rows. The trees should begin to bear when about eight years old and reach full productivity when about 30.

Olive Oil.—The principal uses of the olive are for oil production, for picking, either green or ripe, and for drying. For the production of oil, the ripe fruits are carefully gathered by hand, bruised as little as possible and preferably crushed at once, otherwise they are partially dried in very thin layers through which air must circulate freely to avoid molding and fermenting, unsound fruit being prone to decay and impair the flavor and odor of the oil. An old practice was to crush the fruit by means of heavy mill-stones in pits, but the oil thus extracted from the kernel was found to injure both the flavor and the keeping quality of the oil obtained from the pulp. Modern crushers, therefore, do not break the stones. The crushed pulp is then pressed in linen sheets, the pressure being applied very gradually. A
second pressing is made after the pulp has been mixed with cold water. Other pressings are sometimes given, each one resulting in a grade of oil inferior to the preceding. The two first grades are sometimes mixed. Since the separation of the oil from the juice by gravity is hazardous on account of its liability to sediment, the impurities are washed out quickly by special apparatus in which a current of cool water comes in contact with a small quantity of the juice, mixes with it, separates the larger particles of pulp and allows the oil to rise through a tall column of water which further washes the oil-globules as they rise. After being allowed to stand for a time in a cool room this oil is racked off and sold as "new oil," or may be again allowed to stand for further clarification. Since the American market demands a clear oil, however, much of the domestic oil is filtered, a process which, especially if often repeated, impairs the flavor and makes the oil seem greasy. Throughout the process, scrupulous cleanliness is essential, because all olive oil is prone to absorb any taint either in the utensils or in the air. The oil is pale yellow, inodorous, and has a specific gravity of 0.918 at a temperature of 15° C. It is largely used in cookery and pharmacy, for lubricating and illuminating purposes, and for making Castile and other kinds of soap, for which purpose the lower grades are most employed. In the United States it is often adulterated with cottonseed-oil. Gallipoli oil, which is used in dyeing, is made from the fermented fruit.

Olive oil also has important medical uses. In doses of from one to two ounces for adults, and one teaspoonful for infants, it acts as a laxative. It is also used in intussusception of the bowels; as an antidiote in cases of acute poisoning; as a local neutral protective from the atmosphere; in place of suet, lard, etc., as an injection to increase the fat of the body, or to reduce the heat of the skin, and by workmen in lead factories as a laxative, and to prevent the absorption of lead. Combined with camphor, morphine, etc., it is applied to wounds, burns, and bruises, and forms the basis of many liniments. It is used to allay the pain of insect bites, and (warmed) in the ear, to destroy insects. It is also employed as an application to swellings as a lubricant of surgical instruments, sounds, pessaries, etc., and as an injection in cases of constipation; but for this last purpose it is inferior to castor oil. In large doses, it is believed by some physicians to hasten the discharge of gall-stones, sometimes apparently softening them.

Pickled Olives.—For pickling the fruits are gathered by hand before they are likely to become soft during the process, a degree of maturity not readily described except by saying that the fruit is just before the fronds change from green to the mature fruit tint, which varies with the variety from yellow to almost black. They are first placed either in pure water, which must be changed each day, or in a weak solution of salt. This is to remove the tannins and serity and to soften the skin. After the latter process, which may occupy from one to three months, the lye is removed by soaking in pure water. Then the olives are subjected to a series of immersions in salt solutions of gradually increasing strength, the maximum being dense enough to float an egg. They will now keep for years if properly stored. Pickled green olives are much less a food than a table delicacy or relish; but pickled ripe olives, which are prepared by much the same process and are gaining in favor, contain substantial nourishment and are a food. Dried olives are popular in some Mediterranean countries, but are little known in the American market.

The average composition of pickled green olives is: water, 78.4; fat, 12.9; carbohydrates, 1.8; protein, ash, etc., 6.9; that of pickled ripe olives: water, 65.1; fat, 25.5; carbohydrates, 3.8; protein, ash, etc., 5.6.

Besides the species mentioned above, several other related species are valued more or less, Olca chrysophylla, a tropical African species, has been introduced into southern California, where it is planted for ornament, the under surfaces of the leaves being bright golden yellow. Olca, or Oenethus, fragrans, is the fragrant olive of China and Japan, where its flowers are used for perfuming tea. It is also cultivated in greenhouses for its inconspicuous but exceedingly fragrant flowers.

In ancient Greece the olive was sacred to Pallas Athene and was a symbol of chastity and peace. Like the laurel it was used for making wreaths for crowning the victors in athletic sports.

Consult: Bailey, 'Cyclopedia of American Horticulture' (1900–2); Hayne, 'California Experiment Station Bulletin No. 129' (1900).

Olive-back, an American thrush (q.v.).

Olive-shell, the polished and often beautifully colored shell of, nearly the size and shape of an olive, of a marine gastropod mollusk (family Olivida), allied to the volutes and cones, many species of which inhabit the warm seas, creeping about the bottom in search of animal food at considerable depths. The front of the foot is developed into a strong sort of fender, and fleshy flaps (mesopodium) are reflected laterally over the shell. An allied genus of smaller size is Olivella, one species of which has been used in the South Pacific islands as a kind of shell-money. Consult Cooke, 'Mollusca' (1853).

Olivine, natural hydrated arseniate of copper, occurring in most copper ores. It varies in color from brown to green; and in form from crystal, usually oblique tetrahedral prisms, the common form in the English copper mines, to amorphous, being then styled "wood copper" or "wood arseniate" because of its fibrous nature. Both forms occur in the Utah copper mines.

Oliver, Andrew, American colonial official: b. Boston 28 March 1706; d. there 3 March 1774. He was graduated at Harvard College in 1724, was elected to the general court, and became secretary of the treasurer. When the Stamp Act was passed by the English Parliament, he made himself obnoxious by accepting the office of distributor of stamps, and on 14 Aug. 1765 was hanged in effigy from the "liberty tree." In the evening of the same day, the mob cut down the effigy and burned it in front of Oliver's house. Oliver was so much alarmed that the next day he publicly resigned his office.

In 1771 he was appointed lieutenant-governor. He was a brother-in-law of Governor Hutchin-
son, and pursued the same public course, promoting, as far as possible, the designs of the British ministry. This was proved by his letters obtained by Franklin in England, and sent back to America in 1772. When, therefore, the general court petitioned the king for the removal of Hutchinson, Oliver's name was also included.

Oliver, Paul Ambrose, American military officer: b. on board in the English Channel 18 July 1831. He was educated in Germany, and was engaged in business in the United States till the outbreak of the Civil War, when he entered the army as 2d lieutenant in the 12th New York Volunteers. He was in some of the hardest fighting of the War, and was brevetted brigadier-general of volunteers 13 March 1865. Since 1870 he has been a powder manufacturer near Wilkesbarre, Pa., and has there put to use machinery of his own invention to minimize the dangers of explosion.

Oliver, Peter, American jurist: b. Boston 26 March 1713; d. Birmingham, England, 13 Oct. 1772. Oliver was a bishop of the New England (q.v.), and was graduated at Harvard College in 1730; held several offices in Plymouth County, Mass.; and in 1756 was appointed a justice of the superior court, although he had never become a lawyer. In 1771 he was made chief justice. Oliver was a Loyalist, and when, in 1774, the legislature ordered the judges to refuse a fixed salary from the king, he alone declined to comply, and was impeached in consequence. He wrote in favor of the British rule in a Loyalist publication called the 'Censor,' and went to England in 1776, when the British troops evacuated Boston. There he passed the remainder of his life. He possessed considerable literary skill, and was a collector of antiquarian materials.

Oliver Twist, a novel by Charles Dickens, published in 1838, the name of its principal character, a workhouse orphan, being the same as the title. There are nearly 20 other characters of typical significance. The abuses of the workhouse in which Oliver was born and where he passed his childhood, and the life of crime into which he was forced by the Artful Dodger and by Fagin in his training-school for thieves are described with the painful vividness of tragedy. But the characteristic humor of Dickens is present to relieve the diabolical villainy of Fagin, the brute ruffianism of Bill Sykes, and the degradation and wretchedness of the whole environment, Bumble, the self-important parish beadle, contributing freely to this mitigating element; while through Nancy, bound as she was in the same bundle of misery, the soul of good in things evil shines out to light the way to Oliver's deliverance.

Olives, Mount of, or Mount Olivet, the historic hill on the east side of Jerusalem, separated from the mountain of Jehoshaphat and the brook Kedron, and rising to a height of over 2,700 feet. It is celebrated as the scene of many biblical incidents especially in the ministry of Jesus Christ. It has four eminences extending from north to south, known respectively as Galilee or Viri Gaultiae, Mount of Ascension, Prophets, and Mount of Offense. The northernmost of these derives the name by which it is known among Christians from the fact that it is supposed to be the hill on which two angels addressed the apostles after the Ascension, as 'Ye men of Galilee.' The next in order proceeding southward, gets its name of Mount of Ascension from the supposition, originated by the Empress Helena, that this was the scene of our Lord's ascension, a supposition at variance with the narrative of Luke (xxiv. 50, 51), where it is said that Christ 'led them out as far as to Bethany.' This was the most important of all the eminences. At its foot lay the garden of Gethsemane. The next eminence southward is rather a portion of the previous one than a separate height, and is remarkable for containing a celebrated catacomb, known as the 'Tombs of the Prophets' (perhaps in allusion to the words of Christ in Matt. xxvii. 50). The southernmost eminence is called the Mount of Offense, because it is supposed to be the "Mount of Corruption" on which Solomon erected the high places for strange gods (1 Kings xi. 7; 2 Kings xxii. 13). On the hill is the small village of El Tour on the road to Jericho, and a ruin of a church said to be the site of the Ascension belonging to the Mohamme-
dans but used on festival occasions by Chris-
tians. On the east are several Russian buildings, including a handsome church, a hospice for pil-
grims, and a tower from which a magnificent view is obtained, especially of the Dead Sea, Jordan Valley, etc. South of the village are the Paternoster Church, or Church of the Lord's Prayer, belonging to the Roman Catholics, and also a Carmelite convent. Modern olive trees represent the historical trees from which the mount derived its name, and which were cut down during the siege of Jerusalem 70 A.D. From the village of El Tour a road to the south-
est leads to Bethany, passing Bethphage, Consult Rothier, 'Ancient and Modern Palest-
ine' (1808).

Olivet College, located at Olivet, Mich. It was founded in 1844 as Olivet Institute, and first chartered as a college in 1859. It is closely allied with and largely supported by the Congregational denomination, but is not under direct sectarian control. Besides the collegiate department, there is a preparatory department, and a school of music. A course in pedagogy is also offered. The college confers the one bachelor's degree of A.B. Women are admitted and numbered fully half of the student body. The campus contains 15 acres, and the grounds and buildings in 1902 were valued at $158,751; the library contained 28,000 volumes. In that year the students numbered 268, and the fac-
ulty 23.

Olivets. See Orders, Religious, of the World.

Olive, natural silicate of iron and mag-
nesium (Mg,Fe,SiO3), also called chrysolite, occurring in olivina and as a principal component of basaltic rocks. It is possibly an original magnesium component of rocks now altered to ser-
pentine. Olivine is transparent, olive green or brown, with a colorless streak and conchoidal fracture.

Ollivine. See O DESCRIBED.

Ollivine. See O DESCRIBED.

Ollivine. See O DESCRIBED.
French pot pourri. The words are often used metaphorically to denote a miscellaneous collection.

Ollendorf's System, an educational term applied to a 19th century method of learning languages, invented by H. G. Ollendorf (1803-65), and designed for those who teach themselves. The grammars are intended to give the learner the mastery of the conversational forms of language, grammatical rules being few.

Olviant, Alfred, English soldier and author: b. 1874. Educated at Rugby and the Royal Military Academy at Woolwich, he received a commission in the Royal Artillery in 1893, but resigned in 1895 on account of injuries received from a fall and turned his attention to writing. His 'Owd Bob' and 'Danny' have been widely circulated in this country and his own.

Ollivier, d'E.-v-á, Olivier Emile, French statesman: b. Marseilles 2 July 1825. He studied law and began the practice of his profession at Paris in 1848. Having taken part in the revolution of 1848, he was appointed commissary-general at Marseilles under the republic, afterward becoming prefect at Bouches-du-Rhône and then of Haute-Marne. In 1857, he entered the legislative assembly, where he became one of the leaders of the Liberal opposition and was one of "The Five" who were distinguished for eloquent and often successful opposition to the policy of Napoleon III. Gradually, however, he severed himself from his former political associates, and the severance was final when in January 1870, he accepted Napoleon's invitation to form a ministry. It was this ministry which declared war with Germany in July 1870, and was overthrown with disgrace in August 1870. Since then M. Ollivier has several times been a candidate for election to the Chamber of Deputies but without success. Beyond that he has taken no part in politics, but has devoted himself to writing works on legal and other subjects. These include 'Lamartine' (1874); 'Principes et Conduite' (1875); 'L'Eglise et l'Etat au Concile du Vatican' (1879); 'Thiers à l'Academie et dans l'Histoire' (1885); 'Le Congo, est-il respecté' (1885); 'Nouveau Manuel de Droit Ecclésiastique Francais' (1885); 'Michel-Ange' (1892); 'L'Empire Liberal' (3 vols., 1894-8), a defense of his career; 'Solutions Politiques et Sociales' (1894); and 'Olympe de Gouges' (1896).

In 1870 he was elected a member of the French Academy.

Olmedo, José Joaquin, hō-sāh' hō-ā-kēn ǒl-māf'ē, Ecuadorian poet: b. Guayaquil, Ecuador, 20 May 1781; d. there 19 Feb. 1847. He was educated in Quito and Lima, taught law for a time in the University of Lima and then practised in his native city. He engaged actively in public affairs, was vice-president of Ecuador and governor of the department of Guayas, and in '81 directed a successful revolution against General Flores, but though he directed the provisional government he was defeated for the presidency. But his fame as a poet will outlast his political record, and few poets have been more widely read than Olmedo. One of his best poems is a 'Song to Bolivar' (1826). His 'Collected Works' (Valparaíso, 1886; Paris, 1883; and Mexico, 1902) have been widely circulated. Consult: Herrera, 'Apuntes Biograficos de D. J. J. Olmedo' (1887).

Olmstead (əm-stəd or əm-stəd) Claim. The in American history, a celebrated case in admiralty law. Originally it was a case of capture on the high seas, and involved questions of prerogative regarding which the decisions of the Federal commissioners were set at naught by a State Court of Admiralty. One Olmstead and others, of Connecticut, being pressed into British service aboard the sloop Active in 1777, took possession of the sloop, and were in turn captured by Houston, commanding the Pennsylvania armed brig Convention. The Pennsylvania State Court of Admiralty awarded a large share of prize money to the State, and to the officers and crew of the Convention, and the owners, officers and crew of a privateer which assisted in the capture. Olmstead and others appealed to the Federal commissioners of appeals and received a favorable verdict. This the Pennsylvania State court set aside and deposited the moneys with David Rittenhouse, state treasurer. His executors were sued in 1802 before the newly organized United States Supreme Court, and judgment was executed in favor of Olmstead and others, in 1809, against violent opposition from Pennsylvania.

Olmsted, Şm-stə or Şm-stə, Charles Sanford, American Protestant Episcopal bishop: b. Olmstedville, N. Y., 8 Feb. 1819. Educated at St. Stephen's College, Annapolis, N. Y., and the General Theological Seminary, New York, and was ordained priest in 1837. He was subsequently rector of St. Asaph's Church, Bala, Pa., and in May 1902 was consecrated bishop of Colorado. He has published 'December Musings,' verse (1889); 'The Discipline of Perfection' (1902).

Olmsted, Charles Tyler, American Protestant Episcopal bishop: b. Cohoes, N. Y., 28 April 1812. He was graduated from Trinity College, Hartford, Conn., in 1835, and after studying for the ministry at St. Stephen's College, Annapolis, N. Y., took orders, was assistant in Trinity parish, New York 1835-8; rector of Grace Church, Utica, N. Y., 1838-99; and vicar of St. Agnes Church in New York in 1899-1904. In October of the year last named he was consecrated bishop-coadjutor of the diocese of central New York.

Olmsted, Frederick Law, American landscape architect: b. Hartford, Conn., 26 April 1822; d. Waverly, Mass., 28 Aug. 1903. He was some early instruction (1836-8) in civil engineering, went to sea, after a year before the mast studied agricultural science and engineering at Yale, and later was for seven years a farmer and horticulturist upon his own land. In 1850 he made a tour, largely on foot, of Great Britain and parts of the Continent, for the study of methods of agriculture and landscape gardening. In 1852-3, 1853-4, and 1856-7 he traveled in the South and Southwest, investigating the effects of slavery upon the economic and social condition of slave States. The results of his observations appeared in three successive volumes, 'A Journey in the Seaboard Slave States' (1856); 'A Journey in Texas' (1857); and 'A Journey in the Back Country' (1861). In 1861 a compiled work, based upon the three preceding, appeared in London as 'The Cotton Kingdom,' an account, says H. T. Tuckerman, 'copious, specific, and authentic,' which,
it is stated, was frequently quoted by such leaders of English opinion as favored the Northern viewpoint in the Civil War. In 1850 he again visited the country giving particular attention to parks; and three other trips were subsequently made. In 1855 the State legislature of New York passed an act for the construction of a large central park in New York city, and in 1857 Olmsted was made superintendent of the preparatory work. With Calvert Vaux (q.v.) he presented a plan for the park which was selected for the prize from 33 plans submitted in competition. Olmsted then became architect-in-chief, with Vaux as assistant, and despite political difficulties he was in partnership with Vaux and Withers at New York in the practice of landscape architecture in 1865–72, for a time president and treasurer of the New York park commission, and later for about six years was landscape architect to the commission. In 1878 he removed to Boston and there continued his professional practice. This was very large, and in the pursuit of it he visited every State in the Union, and eight times crossed the Continent. In 1895 he retired. A list of the public and semi-public grounds formed wholly or largely after his plans would be very extensive. It has been estimated that among the expressions of his art are more than 80 public parks, including nominally, besides Central Park, the Mount Morris, Riverside, and Morningside parks of New York; the Prospect and Washington parks of Brooklyn; the Washington and Jackson parks of Chicago; the Back Bay Fens of Boston, and the most interesting plans of the kind in America; also in Boston, Leverett, Jamaica, Franklin, and Marine parks; Belle Isle Park of Detroit; the Cherokee, Shawnee, and Iroquois parks of Louisville; Delaware, South, and Carenovia parks of Buffalo; Lake, West Side, and River parks of Milwaukee; and Washington Square in Baltimore. He laid out the grounds for the World's Columbian Exposition at Chicago in 1893, whose landscape features were so remarkable a success. He designed the general scheme for the preservation of the natural scenery at Niagara Falls. He planned the grounds of the Capitol at Washington, besides the marble terrace, and the grand staircase and other structures exterior to the building. Among his further works are designs for the grounds of numerous suburban land divisions, railway stations, schools, colleges, and private estates. It is somewhat difficult to express in concise form Olmsted's distinctive service to the landscape division of the Union League Club, and yet it may perhaps be defined as having been the originating of the use of natural landscape resources, existing under urban or partially urban conditions toward the making of pleasure-grounds. He studied the genius of American scenery, and in the adaptation of his methods toward a real if unconscious contribution to the art of the United States. In his public parks he avoided the formal and the monumental as he had seen it in Italy and France, and combined with a natural system an unusual result which is distinctive. It has been said that one of the secrets of his success was that he never endeavored to make unsuitable conditions conform to preconceived ideas, but made logical use of such conditions as they were. At the time of his death it was asserted with pardonable exaggeration, if exaggeration it were, that he had done more than any other of his generation to develop the aesthetic possibilities of the country. He was a founder of the Metropolitan Museum of Art, of the American Museum of Natural History, and of the New York State Charities Aid Association, of which for many years he was vice-president. In addition to the books above cited he wrote "Walks and Talks of an American" (in England frequently reprinted, and papers and reports on special problems of his profession. For an account of Olmsted's work on the Sanitary Commission, consult Still's "history of that organization" (1860).

Olmsted, Frederic Law, American landscape architect, son of the preceding: b. Staten Island 24 July 1870. He was graduated from Harvard in 1894 and studied landscape architecture under his father. Since 1898 he has been the landscape architect of the Metropolitan Park system of Boston, and of the Biltmore estate of G. W. Vanderbilt near Asheville, N. C., from 1896. He was an instructor in his profession at Harvard 1901–3, and became professor in the last named year. He has published "Park System of the District of Columbia" (1902).

Olmsted, John Charles, American landscape architect, nephew of F. L. Olmsted (q.v.): b. Geneva, Switzerland, 14 Sept. 1852. He was graduated from the Sheffield Scientific School of Yale University in 1875 and studied landscape gardening under his uncle. In 1891 he has designed parks in Cambridge, Mass., Hartford, Conn., Newport, R. I., and elsewhere, and with F. L. Olmsted since 1875 has designed many parks and private country seats.

Olmütz, Olmütz, Austria, a city of Moravia, 38 miles northeast of Brunn, on the March, which almost encircles it. Since 1886 the defensive works have given place to promenades and pleasure-grounds. It has a fine Gothic cathedral erected in 1306; one or two other interesting churches; a remarkably fine townhouse, the ancient residence of the archbishops; several good modern educational buildings, etc. Its industries and trade are unimportant. Olmütz is the see of an archbishop, and the seat of several courts and public offices. It formerly possessed a university, but this is now abolished except the theological faculty, connected with which is a library of 75,000 volumes. Olmütz was taken by the Swedes, under Torstenson, in 1642, in the Thirty Years' war. Frederick the Great besieged it between 1755 and 1756 with out success. The Conference of Olmütz was held here 28–29 Feb. 1850, between Russia and
OLNEY—OLUSTEE

Austria respecting the affairs of Germany and especially in reference to the revolts in Hesse and Schleswig-Holstein against their rulers, the Elector of Hesse and the King of Denmark. By the mediation of Russia, Schleswig-Holstein was given to Denmark and the Elector of Hesse was reinstated. Pop. (1900) 21,933.

Olney, ől'ní, Jesse, American geographer and educator: b. Union, Conn., 12 Oct. 1798; d. Stratford, Conn., 31 July 1872. In 1828 he published 'A Geography and Atlas,' which was a standard work for 30 years, and effected a revolution in the methods of teaching geography. He taught school in New York State and Hartford, Conn., sat in the Connecticut legislature for ten terms and in 1867 became State comptroller. He published 'The National Preceptor' (1831); a series of text-books (1831-52), including a series of 'Readers,' a 'Common School Arithmetic,' a 'History of the United States,' and a volume of poems, 'Psalms of Life.'

Olney, Richard, American lawyer and politician: b. Oxford, Mass., 20 Sept. 1835. He was admitted to the Harvard Law School in 1856 and from the Harvard Law School in 1858. In 1859 he was admitted to the bar and practised law in Boston, being particularly successful as the chief counsel for the Boston & Maine and other railways. In 1874 he was elected on the Democratic ticket to the Massachusetts legislature, but was not especially active in politics. In 1893 he was appointed attorney-general by President Cleveland, and was instrumental in breaking the railroad strike of 1894, by obtaining an injunction against the strikers from the United States circuit court of Illinois, enjoining them from interfering with interstate commerce and the United States mails. This injunction was enforced by the use of national troops, and was sustained by a decision of the Supreme Court, it being the first case of "government by injunction" (q.v.) in case of a strike. In 1895 he became secretary of state, in which position he had charge of negotiations with England in regard to the boundary dispute with Venezuela; and wrote a remarkable official note, sustaining the right of the United States to interfere and giving a proper interpretation to the Monroe Doctrine (q.v.). In 1896 he withdrew from the Democratic party on account of the free silver plank in the platform, but in 1900 he supported Mr. Bryan, publicly declaring his reason for so doing to be because he could not support the Republican policy in regard to the tariff, trusts, and imperialism. In 1903 he was prominently mentioned as Democratic presidential candidate in 1904.

Olney, Ill., city, county-seat of Richmond County, on the Illinois C., the Baltimore & O. S. W. R.R.'s; about 115 miles east of Saint Louis. It was settled in 1843. It is in an agricultural region. The chief manufactures are flour, brick, and tile, and dairy products. It has a large trade in its manufactures, and in hay, seeds, and fruits. It has a sanatorium and a free public library. The government is vested in a mayor, who holds office two years, and a council. Pop. (1890) 3,831; (1900) 4,260.

Olonetz, ő-loné'ts, Russia, a northern government bounded north and east by Archangel; southeast by Vologda, south by Novgorod, southwest by Saint Petersburg and Lake Ladoga, and west by Finland; area, 57,439 square miles. The administrative headquarters is Petrozavodsk. The surface of this government is generally flat; although in the northwest some hills occur, while part of the south is traversed by the ridge which forms the water-shed between the basins of the Baltic and the Volga. The most marked natural feature is the large number of lakes, streams, and morasses. The number of lakes—one of them, Onega, nearly 5,000 square miles in superficial extent—has been calculated at 1,500. The climate is rigorous. The winter is long, the summer heat, though of short duration, great. Timber constitutes an important part of the wealth of the government; pothuym and marble are extensively quarried between Lakes Ladoga and Onega; iron-ore and copper are worked; and hemp and flax thrive in many of the swampy districts. The chief means of support of the inhabitants are for expection were not fishing. The principal manufacture is that of leather. Education is very backward. Pop. (1897) 366,715.

Olsten, ől'sén, William Whittington, American Episcopal clergyman: b. New York 11 May 1827. He was graduated from Columbia in 1846 and from the General Theological Seminary in 1849, and entered the Episcopal ministry the next year. He was rector of St. James' Church, Scarsdale, N. Y., 1851-71; and from 1871 to 1901 held several professorships at St. Stephen's College, Annandale, N. Y., retiring in 1901. He published: 'Personality: Human and Divine' (1882); 'Revelation: Universal and Special' (1885); 'Sermons' (1903).

Olsson, ől'sön, Olof, Swedish Lutheran clergyman and educator: b. Björntorp, Sweden, 31 March 1841; d. 1900. He was educated at the University of Upsala, entered the Lutheran ministry in 1863, and came to this country in 1869. He was professor of Augustana College, Rock Island, Ill., 1877-88, and after holding a pastorate at Woodhull, Ill., in the interior, returned to Augustana College in 1891 as its president. He edited two Swedish journals, and published 'At the Cross' (1897); 'Greetings from afar'; travels in England and Germany' (1888); 'The Christian Hope' (1887), works which have been translated into Swedish and Norwegian.

Olustee, ő-lús'te, or Ocean Pond, Battle of, the most sanguinary battle of the Civil War in point of numbers. On 5 Feb. 1864 Gen. Gillmore, commanding Department of the South, ordered Gen. Seymour to embark about 6,000 men in transports at Hilton Head and sail for Jacksonville, Fla. The transports were accompanied by five gunboats under command of Admiral Dahlgren. The object of the expedition was to procure an outlet for cotton and lumber; to cut off one of the enemy's sources of commissary supplies, beef cattle; to obtain recruits for colored regiments; and to inaugurate measures for the speedy restoration of Florida to her allegiance to the Union, and to assist in the latter purpose. John Hay, President Lincoln's private secretary, was given a military commission and accompanied the expedition. Seymour arrived at Jacksonville on the 7th, disabled a small guard, and occupied the place. On the afternoon of the 8th Col. Guy V. Henry, with cavalry and mounted infantry, moved out about eight miles, and late in the evening surprised about
350 cavalry, under Lieut.-Col. McCormick at Camp Finegan. They were about retiring as Henry charged them, who then followed, capturing four guns, with caissons. Henry reached Baldwin, 20 miles from Jacksonville, on the 9th, where he captured another gun, and a considerable quantity of cotton. Baldwin was at the junction of the two railroads from Jacksonville and Fernandina. On the 10th Henry advanced to Little Saint Mary's and encountered Maj. Harrison, with two companies of cavalry, and drove him with slight loss on either side, and then marched to Sanderson's, thence to within three miles of Lake City, where on the 11th he had a skirmish with the Confederates, and under Seymour's order fell back to Barber's at the South Fork of the Saint Mary's, where Seymour concentrated his entire command, and where he had received orders from Gillmore not to risk a repulse in advancing on Lake City, but to hold Sanderson's, unless there were reasons for falling back. Seymour was delayed for want of transportation, but on the morning of 20 February left his camp at Barber's with the intention of advancing on Lake City and, if successful, of destroying the railroad communication between Jacksonville and west Florida and the Suwannee River. He had the mounted brigade of Col. Henry, the three infantry brigades of Cols. J. R. Hawley, W. B. Barton, and James Montgomery, and three batteries of artillery, in all about 5,500 men and 16 guns. When Seymour landed in Jacksonville, Gen. Joseph Finegan, the Confederate commander in east Florida, had an insignificant force to oppose him, but by the 13th had collected at Lake City about 4,600 infantry, 600 cavalry, and three batteries of 12 guns. Col. C. Smith commanded the cavalry, and Gen. A. H. Colquitt and Col. G. P. Harrison the two infantry brigades. Thirteen miles east of Lake City Finegan threw up defensive works, a short distance east of Olustee station, crossing the railroad, the left near Ocean Pond, the right near a bay or jungle. Smith's cavalry, supported by two regiments of infantry, was sent to the front to skirmish with Seymour's advance and draw it on to the intrenched line. Col. Henry, with his mounted force, the 7th Connecticut infantry, and Elder's battery, led Seymour's advance, and after a march of 15 miles, about 3 p.m., came upon Smith's pickets. Two companies of the 7th Connecticut, of Hawley's brigade, were deployed as skirmishers, and drove them back upon their supports, which opened fire, Elder's battery was pushed forward and opened fire, the rest of the 7th Connecticut was deployed and developed the Confederate position, and Henry's cavalry was disposed on the flanks. The ground was favorable for the movement of troops. It was level and, although covered with pine timber, was free from underbrush. Colquitt, with three regiments of his brigade, had been sent forward to support Smith and Hawley. On the front line had quickly formed line with his infantry, sending the cavalry to the left. This was the line that the 7th Connecticut developed, upon which Seymour massed his artillery in the center, and sent the 7th New Hampshire to turn the Confederate left, but the regiment got confused in its movement and, coming under a heavy and deadly fire, broke in disorder and was with difficulty rallied to take part in the action at a later hour. The 8th United States colored infantry became hotly engaged on the left, its commanding officer was mortally wounded, and more than half its men had fallen, when the remainder retreated in disorder. Colquitt's men advanced and delivered a very close and telling fire upon the artillery. The Confederates were checked by the unremitting fire of the guns and by Barton's and Montgomery's brigades, now brought up, and under whose fire the left of the Confederate line began to fall back. Meanwhile Finegan had sent everything to reinforce Colquitt, and on both sides the entire forces, except the cavalry, were desperately engaged, the struggle continuing until dusk, when Seymour withdrew, abandoning his dead and many wounded, and five guns, whose horses had been shot. He was pursued about two miles that day, and withdrew in good order to Sanderson's and thence to the Saint Mary's and Jacksonville. The forces numbered about 5,100 on each side. The Union loss was 203 killed, 1,152 wounded, and 506 missing. The Confederate loss was 93 killed, 847 wounded, and 6 missing. Consult: "Official Records," Vol. XXXV.; The Century Company's "Battles and Leaders of the Civil War," Vol. IV.; E. A. Carman.

Olympia, 6-im-pi-a, a valley or plain lying in the middle of ancient Elys, in the western part of the Peloponnesus (Morea). Here were collected thousands of statues of the gods and of victors in the games, treasure-houses full of votive offerings, temples, altars, tombs, and in a word the most precious treasures of Grecian art. The elder Pliny states that in his time the statues were as many as 3,000 in number. Here also were preserved important public and private documents, treaties, and inscriptions of all kinds. The Altis (an old Elean form of alaoa, a grove), in which were situated the Olympium or great temple of Zeus, containing the colossal statue of the god by Phidias, the Heraeum or temple of Hera, the Metroum or temple of the mother of the gods, the statues of the different states which had sent votive offerings to the Olympian Zeus; the Prytaneum, in which the Olympic victors dined after the contests were finished; the Bouleuterion, in which all the regulations regarding the games were made; buildings, altars, sacred objects, formed a quadrangle surrounded with walls, and having a length of about 1,800 feet and a breadth of 1,500; and the Exedra, a splendid building containing the reservoir of an aqueduct, erected by the Athenian orator and statesman Herodes Atticus, and furnished by him with statues of the families of the emperors Antoninus Pius and Marcus Aurelius, and by the Eleans out of gratitude to the builder with statues of the family of Atticus himself. On the north it was bordered by rocky but gently swelling hills, the most southern of which was called Mount Cronius, or the Hill of Kronos. On the south it extended almost to the Alpheius, and on the west stretched to the Cladeus, a tributary of the former. Outside the walls, but in the immediate neighborhood of the Altis, were the hippodrome, or race-course for chariots and for single horses; the stadium or foot-race course, and a theatre. After being buried for ages under the soil washed down from the higher grounds, and conveyed by the inundations of the two streams between which it lies, the plain of Olympia has
OLYMPIA—OLYMPIC GAMES

again been brought to view by a series of excavations begun in 1875 by the German government at the instigation of Ernst Curtius, and continued till the spring of 1881. Nearly all the buildings above mentioned have been discovered, but unfortunately all in a much injured condition. Thousands of fragments of sculpture, bronzes, coins, terra-cottas, as well as numerous coins and inscriptions, are also among the discoveries. All the originals are now in the possession of Greece, but Germany bargained for the right to take the first casts from them, and a museum of Olympic casts and duplicates has been formed at Berlin.

Olympia, Wash., city, capital of the State of Washington, county-seat of Thurston County; on Budds Inlet at the mouth of Deschutes River, and on the Northern Pacific railroad. The inlet is at the head of Puget's Sound, and the city has steamers communication with Tacoma, Seattle, Victoria, and other places on the Sound and on the Pacific coast. It was settled in 1846 and chartered as a city in 1859, the year Washington was admitted as a State. It is the commercial centre of a region in which there are extensive lumber and agricultural interests, also fishing and to some extent mining. Large quantities of oysters are shipped from Olympia. Deschutes River has here several falls, three quite large, which in all have a descent of about 85 feet. The water-power contributes toward making Olympia a manufacturing city. The chief manufacturing establishments are lumber mills, salmon canneries, a brewery, iron works, machine shops, cooperages, and cold storage plants. It has an extensive trade in lumber and lumber products, and in farm products, fruits, its own manufactures, and oysters. The principal buildings are the State Capitol, built at a cost of $400,000, the county courthouse, some of the bank buildings and business blocks. It has Saint Peter's Hospital (R.C.), Saint Amable Academy, public and parish schools, and the State Library, which contains nearly 30,000 volumes. Pop. (1890) 4,698; (1900) 3,863.

Olympiad, in ancient Greece, the computation of time based on the period of four years between each celebration of the Olympic games (q.v.). The historian Timaeus is said to have been the first to adopt this mode of reckoning time, and later Greek historians almost all followed his example. In reckoning by this era the year in which Corebus gained the victory in the foot-race, corresponding to 776 B.C. of the Christian era, was taken as the first year of the first Olympiad. This mode of reckoning ceased when the games were abolished in 394 B.C., the second year of the 293rd Olympiad. The interval between two Olympiads was four of our years, or a Greek tetraëdrus of 48 moons and two intercalary months. To reduce from the Olympic to the Christian era, multiply the next number below the given Olympiad by four, and add the number of the year in the given Olympiad, if the sum is 776 or less, subtract it from 777, and the remainder is the year B.C.; if it is greater than 776, subtract that number from it, and the remainder is the year A.D.

Olympias, first wife of Philip II. of Macedon and mother of Alexander the Great; d. 316 B.C. B.C. The name of Olympias is so dear to the Greek mind that some might marry Cleopatra, a niece of King Attalus. Olympias may have been cognizant of the plot against Philip's life which resulted in his death in 336. She played no part in politics during Alexander's rule, but about 319 regained a part in the government, where it was rumoured that she was besieged at Pydna by Cassander, who put her to death upon capturing the city.

Olympic Games, in ancient Greece, a general name given one of the four great national festivals. The games were usually celebrated on the plain of Olympia, and were sacred to the Olympian Zeus, who had a temple and statue there. The festival was a quadrennial one; the period elapsing between two celebrations was called an Olympiad. Their origin reaches back into a remote antiquity, prior to the commencement of the historical era in Greece, and by the Greeks themselves was attributed in various traditions to a divine source. The season of the year at which the games were held was about midsummer. In later times, when the contests were numerous, they lasted five days, and on the fourth day was the day on which the first full moon after midsummer fell, and therefore, according to the Greek mode of dividing the year, the 14th day of the month. The games thus lasted from the 11th to the 15th inclusive. The number of the judges varied at different times, but ultimately was fixed at eight. Their decision was not final, but might be revised by the senate. Under the judges was a set of police called Aythe, who kept order during the celebration of the games. None but Greeks of pure descent were allowed at any time to take part in the games, until the conquest of Greece by the Romans, when they also were admitted to the contests. If, however, a man could boast of pure Hellenic blood, it did not matter to what city he belonged, or whether he was rich or poor, he had in any case an equal right to be recognized as a competitor, provided he compiled with the regulations of the judges. Barbarians were permitted to be spectators of the games, but slaves were not allowed even this privilege. Women also were entirely excluded, and were not even allowed to cross the Alpheus while the games were going on. For the first 13 Olympiads there was only one contest, a foot-race. In course of time the number of contests increased to 24, including shorter and longer foot-races, wrestling, boxing, chariot-racing, horse-racing, foot-racing in heavy armor, chariot-racing with mules, and games for boys corresponding to most of those in which men engaged. The prize awarded to the victor was merely a garland of wild olive, but the honor of gaining such a prize was so highly esteemed that a victor in the Olympic games was regarded as bringing glory not only to himself but to his family, and even the city or state to which he belonged. The victor received his crown standing on a table made of ivory and gold, his own name, and that of his father, and his native state, were proclaimed by a herald to the assembled multitude. The city was also honored by religious ceremonies and processions, and by banquets in honor of the victors. On returning to his native city the victor was honored with a triumphal procession, and heard his praises celebrated in lyric verse, which was sometimes the production of some that might marry Cleopatra, a niece of King Attalus.
were usually conferred on them for life. A place of honor was allowed them in all public assemblies, statues were erected to them, and so forth. At Athens they were maintained for the rest of their life at the public cost.

Olympus, a mountain situated in Thessaly, at the eastern extremity of the range called the Cambunian Mountains. It is now generally called by the Greeks Elymbs or Olympos. The Turks call it Semavat-Evi, the abode of the celestialis. It rises to the height of 9,754 feet, being the highest in Greece. The earliest Greeks looked upon it as the highest of all mountains, and as the central point of the earth’s surface. The gods of Homer dwelt on its summit. In after times the gods were said to reside in the exterior sphere of the heavens, above the firmament, and this seat of the blessed received the name of Olympus. Hence the gods themselves were called Olympian gods, and, as such, formed a body of which Zeus was the head. The 12 great gods composed the council of Olympos, and the others the general assembly. They did not dwell together, but separate in several mansions built upon the different heights of the many-peaked Olympus. At the highest summit stood the palace of Zeus, where all assemblies and feasts were held. From thence he could look down upon the earth, fill the heavens with clouds, and hurl his thunderbolts.

Olyanthus, ő-lin’thůs, now Ais Mamas, Saloniki, Turkey, an ancient town of Chalcedice, Macedonia, at the head of the Toronae Gulf, the modern Gulf of Cassandra. It was early inhabited by Greeks, was taken by the Persians under Artabazus, one of the generals of Xerxes, was next subject to Athens, and regained its independence when the Spartan general Brasidas extinguished the Athenian power in Chalcedice. From its excellent maritime position, it grew in wealth and importance, until, becoming too powerful, the Spartans captured it in 379 B.C. In 352 the Olynthians formed an alliance with the Athenians, which provoked the hostility of Philip of Macedon, and in 347 the city was betrayed to him, the citizens were enslaved, and every building was demolished.

Olyphant, ôl’f-phant, Pa., borough in Lackawanna County; on the Lackawanna River, and on the New York, O. & W. and the Delaware & H. R.R.’s; about six miles above Scranton. It was settled in 1857 and incorporated in 1877. It is in the anthracite region, and its chief industries are connected with mining and shipping coal. It manufactures blasting powder, and has machine-shops and iron works. Its chief trade is in coal. The government is vested in a burgess, who holds office three years, and a council. The borough owns and operates the electric-light plant. Pop. (1890) 4,083; (1900) 6,180.

Om, ôm, a Sanskrit word to which the Hindu religion attaches peculiar sanctity. It is pronounced at the beginning and end of every lesson in the Veda, and is also the introductory word of the Puranas. In the Vedas it is said to comprehend all the gods.

Om Mani Padme Hum, ôm mā’ni pād’mē hoom, in the Buddhist religion, a sacred formula, known as the "formula of six syllables," used especially in Lamaism. Among the Tib- etans and the Mongols it is repeated on all occasions, important and unimportant, and is found written on all sorts of objects on which inscriptions can be made. It is the first thing which a child learns to repeat and in the form of a monogram its sacred character is exalted. The formula is explained to mean either, "Oh, the jewel in the lotus: Amen"; or "Salvation in the jewel-lotus: Amen," referring to the devoted saint Avalokiteshvara or Padmapani, the reputed author of the formula, who was believed to have been born from a lotus. In later times a mystical meaning was given to each of the six syllables composing the phrase.

Omaha, ô’ma-ha, Neb., the largest city in the State and county-seat of Douglas County, is situated on a slightly eminence on the west bank of the Missouri River, 600 miles from its confluence with the Mississippi. Although a superficial survey of the city had been made in June 1853 no attempts were made toward a permanent survey. The Indian title had not been extinguished, and the Indians were very tenacious of their rights, and viewed with suspicion all the movements of the white men.

History.—It was not until March 1854 that a treaty was concluded with the Otoes, Missouris and Omaha Indians, ratified 21 June, and promulgated 24 June, whereby the title of the Indians was surrendered, and left the land to be taken up and enjoyed by the white man. In the spring of 1854 some settlers arrived and the first building was erected. The first general election in the Territory was held 20 Dec. 1854, and on 16 Jan. 1855 the first Legislative Assembly was convened at Omaha, and on 24 January commenced a contest (which lasted for 12 years), when the member from Cass County gave notice that, at an early day, he would introduce a bill to locate the capital of Nebraska. The struggle was long and bitter, often at the expense of needed legislation, producing much ill feeling, and was more troublesome to manage than any question the Legislature had been called upon to decide. After a long debate upon the proposition of the Legislature from Cass, the question was decided in favor of Omaha by a vote of 14 to 11 in the lower house, only to be renewed at every subsequent meeting of the Legislature, until Nebraska became a State, when the capital was removed to Lincoln. On 2 Feb. 1857, by an act of the Legislature, Omaha became an incorporated city, it having been up to this time a county organization, and an election was held on the first Monday in March in that year, when a mayor, nine aldermen and other city officers were elected. The council held its first session 6 March. Under the direction of the council the mayor proved up the claim of the city, east of the 6th principal meridian, and the same was surveyed and laid out into city lots, streets and alleys.

The discovery of gold in Colorado in 1858 made Omaha the best point for outfitting for the mines. The streets were filled with emigrants on the way to the gold fields, and daily trains left to cross the plains in search of gold. At the breaking out of the Civil War Omaha was made military headquarters, which greatly increased its business and importance. From the day that President Lincoln decided that the initial point of the Pacific Railroad should be
OMAHA
a point on the western boundary of Iowa, opposite section 10, township 15, north of range 13, east of the 6th principal meridian in the State of Nebraska, the success of Omaha was assured, and from a city of 320 blocks it has grown to one of 24 square miles.

Government.—The city is divided into nine wards, the Government being confided to a mayor, city council, composed of two aldermen from each ward, an advisory board of eight members, board of public works (three members), board of public health (four members), park commission (five members), and board of fire and police, with five members. The police department consists of a chief of police and 102 men. The fire department is under the charge of a chief and two assistants, and has four steam fire engines, three hook and ladders, eight hose companies and one water tower.

Public Parks.—The chief suburban attractions of the city are its parks, seven in number, which are connected by a boulevard system. Hanscom Park, the oldest, contains 60 acres. Riverview, in the bluffs overlooking the Missouri, contains 70 acres. Council Bluffs Park contains 10 acres; Elmwood contains 215 acres; Miller Park, 80 acres, and Fontenelle Park, 110 acres. Prospect Hill Cemetery is located in the northwest part of the city on high and eligible ground. For about seven miles northwest of business centre of city; others are Mount Hope Cemetery, Jewish Cemetery, Bohemian, Ever-Green, Springwell, Holy Sepulchre, Saint Mary's and Cassidy's Roman Catholic Cemeteries.

Buildings.—The Douglas County Court House, a stone structure in Farnam Street, was completed in 1885 and is admirably adapted for the purpose for which it was erected. The cost of the building, land and furniture, was about $225,000. The Omaha Bee Building was completed in 1883, an imposing substantial building of stone and pressed brick, seven stories in height, covering an area of 134 square feet. The New York Life Insurance Co. Building, a 16-story edifice of brick and stone, is one of the landmarked of the city, and was erected at an expense of $1,000,000. The Paxton Block was completed in 1888 at a cost of $51,000; in the same year the Barker Block and Granit Block were erected at a cost respectively of $70,000 and $40,000. Boyd's Theatre is a structure of stone, iron and pressed brick, has a seating capacity of 2,000 and cost $250,000. The City-hall, seven stories in height, is the home of all the city officers, and is one of the best arranged structures in the West. It was erected at a cost of $350,000. The United States Custom-house, Post-office and Court-house, was commenced in 1881 and completed at an expense of $1,845,000. It is of the Romanesque style of architecture. The main entrance is on 16th Street, with a loggia 15 by 50 feet enclosed by a balustrade, has a façade of five arches, embellished by polished granite pillars. The first floor is devoted exclusively to the post-office; the second floor is occupied by the customs, internal revenue, district attorney's office, railway mail service, and rural free delivery service; the third floor is used as United States district and county courts, and contains a reception room, jury room, and marshal's room; the fourth has rooms for grand and petit juries, weather bureau and civil service, with dormitories for railway clerks.

Churches.—Omaha is the see of the Roman Catholic and of the Protestant Episcopal churches. The latter has a fine stone cathedral building costing $50,000, with a chime of eight bells. They are in the city, 9 Baptist organizations; 3 Christian; 8 Congregational; 6 Evangelical; 1 Free Methodist; 3 Hebrew synagogues; 12 Lutheran; 13 Methodist Episcopal; 14 Presbyterian; 10 Protestant Episcopal; 2 United Presbyterian; 12 Roman Catholic; 1 Unitarian; 1 Christian Scientist; 1 Latter Day Saints; 1 Seventh Day Adventist; 1 Salvation Army; 1 Volunteers of America; 1 Universalist.

Charities.—These institutions include the Creche, the Childs Savings Institute, Immanuel Orphan Home, Clarkson Memorial Hospital, Convent of Mercy, County Hospital, the Nebraska Institute for the Deaf, and the Roman Catholic Orphan Asylum. Saint Joseph's Hospital of three stories and basement and costing $150,000, is known as the Creighton Memorial, the name of its chief donor. The Bishop Clarkson Memorial Hospital was established in 1881, and its new building was completed in 1884.

Banks.—The statement for 1902 made to the comptroller of the currency has the following showing:

Libraries.—The libraries are those of the New York Life Insurance Company, Law Library (2,500 volumes); Omaha Public Library (65,000 volumes); the library of Young Men's Christian Association; two Catholic libraries at Creighton College, one for the use of the faculty (8,000 volumes, being composed in part of rare and old books and manuscripts of the 15th, 16th, and 17th centuries); the other for the use of the students (12,000 volumes). The Masons, Odd Fellows, Swedish, Danish, and Bohemian societies all have valuable libraries. In October 1888 G. W. Lininger erected an art gallery in the Italian renaissance style, at a cost of $15,000, in which to house his judicious collection of paintings and other works of art. The present collection, is valued at about $300,000 and consists of old oil paintings, modern oil paintings, water colors, statues and busts, vases and plaques, porcelain, curios and articles of virtu; and the whole is open to view and inspection of the public two days in the week.

Public Schools.—The schools of the city are under the control of the board of education, consisting of 15 members elected by the votes of the citizens. Women over twenty-one who have children of school age vote for the
members of the board. The superintendent is appointed by the board. There are 50 school buildings in the city, 40 graded and 10 high school, costing in the aggregate $1,500,000. The graduates from the high school are admitted to many of the colleges east and west without examination. In addition to the public schools there are many private and parochial schools.

Industries.—There are many and diversified industries in Omaha. The first brewery was established in 1859 by Fred Krug, who has remained in the business, and is president of the Frederick Krug Brewing Company, with a capital of $1,000,000. The cost of their present building and machinery was $750,000; capacity 200,000 barrels yearly. The Metz Bros. Brewing Company commenced operations in 1864, and occupy a building erected at a cost of $351,000. The Omaha Brewing Association was organized May 1891, with a capital stock of $1,000,000. The brewery buildings, etc., cost $500,000; capacity 150,000 barrels. The Willow Springs Distillery was incorporated in 1882 and is now the third largest establishment of the kind in the United States.

The American Smelting and Refining Company commenced business in October 1870 with a capital of $50,000. In 1882 the Grant Smelting Company was consolidated with the Omaha Company. A reorganization was completed with a capital of $2,500,000. They handle silver, lead, copper ores, from the western States, Mexico and British possessions. The business of the past fiscal year of this plant was as follows: 123,515 tons lead, $988,120; 24,866,068.82 ounces silver, $13,643,348.85; 604,314.79 ounces gold, $124,191,186.37; 21,427,242 pounds copper, $257,126.88; 4,017 tons blue vitriol, $401,900. Omaha is in the center of the great wheat and corn producing portions of Iowa, Nebraska, Kansas, and Missouri, and the largest cattle and hog productions of the country, are marketed here. For the year 1902 one elevator handled 12,000,000 bushels of corn, oats, and wheat.

Railroads.—The geographical position makes Omaha a natural railroad center. Fourteen great trunk systems, with lines connecting to every part of our country, enter the city, thus bringing commerce with all parts of the Union. No western city has greater railroad facilities. Within the past few years two magnificent railway stations have been erected, the Union depot at a cost of $120,000, and the Burlington costing $500,000. The Missouri River is spanned at Omaha by two railroad bridges, and one motor and wagon bridge. The following are the lines out of Omaha for the East: Chicago, B. & Q.; M. & St. P.; C. & N. W.; C. R. Is. P.; Illinois Central; Chicago & Great Western. To the North and Northwest, C. & N. W.; Illinois Central; St. P. M. & O. West and Southwest, B. & M.; U. P.; C. R. Is. P.; K. C., St. L. & C. B.; M. & P. South and West, B. & M.; M. & P.; Wabash; K. C., St. L. & C. B.

Trade and Commerce.—Over 300 firms, covering every line of mercantile industry known in the United States are engaged in wholesale and jobbing. The business extends east to the Mississippi River, north to Manitoba, south and southwest to Texas and Mexico, west to the Pacific. Omaha is a port of immediate transportation of foreign goods, which has permitted the merchants to receive merchandise and pay duties at home without the delay of the sea board. The ingrowing business in 1890 was $47,000,000, and in 1902, $95,000,000. The value of productions of factories, industry, packing houses and smelters was (in 1890) $68,000,000; (in 1902) $105,000,000. At South Omaha are located the famous packing houses and stockyards, where more than $30,000,000 have been invested. The daily capacity of killing and preparing for market is 15,000 hogs, 5,000 cattle, and 4,000 sheep. All meats are subjected to careful investigation and chemical analysis by government inspection before shipping.

The live stock receipts at the stockyards are:

Newspapers.—The first paper published in Omaha was The Omaha Arrow, its initial number being dated 28 July 1854. There are published in 1903, the Morning and Evening World-Bird; the Morning and Evening Bee; the Omaha Daily News, the Omaha Daily Stock Exchange, the Omaha Daily Reporter; Omaha "Excelsior"; 'Mercury'; 'Western Laborer'; 'Bohemian Voice'; 'Commercial Exhibit'; Omaha 'Tribune'; 'Pokok' (Indian); 'Vesna Fostina'; 'Swedish Journal Tribune'; 'Young Men's Journal'; 'Burlesque Pioneer'; 'Westliche Presse'; 'Examiner'; 'Central Farmer'; 'Enterprise'; 'Fraternal Union Advocate'; 'Nebraska Farmer'; 'Protection'; 'Quill'; 'Royal Woodman and Workers Gazette.'

Population.—(1900) 102,553.

GEORGE L. MILLER.

Omaha Indians, or Omahas, a tribe of American Indians of the Dhegiha family residing in eastern Nebraska. The name is derived from an Indian word meaning "those who go up the stream, or against the current." They number about 1,200.

O'Mahony, Ó máo-máo, John Francis, Irish politician: b. Kilbeheny, County Cork, Ireland, 1816; d. New York 7 Feb., 1877. He was educated at St. Patrick's College, Dublin, and entered the diplomatic service with a zeal for Ireland's cause, entered the ranks of the Young Irelanders in 1845 and took part in the insurrection of 1848, after which he was compelled to seek refuge in France. In 1854 he came to the United States. He was active in founding the organization of the Fenian Brotherhood, acted as its president for several years, and though personally taking no part in any of the insurrectionary movements in Canada or Ireland his advice was never withheld. He devoted his later years to literature, but endured great poverty. At his death his body was taken to Ireland, where he was buried with honors in Glasnevin Cemetery, near Dublin.

He published: 'History of Ireland by Geoffrey Keating' (1872), which he translated from the Gaelic and annotated copiously. See Webb, 'Irish Biography' (1888).

O'Malley, Ó máli, Thaddeus, Irish Roman Catholic clergyman: b. Garryowen, near Limerick, 1796; d. Dublin 2 Jan., 1877. He was ordained in 1810 at St. Patrick's, Toronto, and in 1827 he became assistant at the cathedral under Arch-
M~AU
OMAN — OMBAY

bishop Daniel Murray and worked indefatigably for the passage of poor-laws for Ireland. He was appointed by the government rector of the Catholic university at Malta, but because of the reforms introduced by him among the students he was dismissed. In 1845 he founded the 'Social Economist,' and later the 'Federalist,' both of which he used in the interest of Ireland and to unite the Old Ireland and Young Ireland parties. He was often under ecclesiastical censure for the freedom with which he attacked the discipline of the Church; was an earnest advocate of the home-rule movement, and published: 'A Sketch of the State of Popular Education in Holland, Prussia, Belgium, and France' (1840); 'Harmony in Religion' (1870); 'Home Rule the Basis of Federation' (1873); etc. See Webb, 'Irish Biography.'

Oman, ō-man, Charles William Chadwick, English historian: b. Mozufferpur, Bengal, India, 12 Jan. 1860. He was educated at Winchester and Oxford, and has been a fellow of All Souls College, Oxford, from 1885, and deputy proctor of modern history at Oxford from 1900. He is the author of: 'A History of Greece' (1888); 'Warwick, the King Maker' (1891); 'A Short History of the Byzantine Empire' (1892); 'A History of Europe 476-914 A.D.' (1895); 'Short History of England' (1895); 'History of the Art of War in the Middle Ages' (1898); 'History of the Punic War, Vol. I, 807-9' (1902); 'Seven Roman Statesmen' (1902).

Oman, ō-măn, Arabia, a sultanate at the eastern extremity of the peninsula, generally comprised in the maritime district extending along the Persian Gulf, the Gulf of Oman, and the Arabian Sea, from El Hasa to Mebrat, near the Hadramut frontier. Area, 82,000 square miles. Although mainly a maritime kingdom, Oman proper is the richest part of the Arabian peninsula, both in agricultural products and in mineral treasures. The working of gold and silver filigree, with which daggers, belts, cups, and pipes are often adorned in Oman, supports great numbers in the large towns. The inhabitants are tolerant, but superstitious and immoral. The form of government is a monarchy, limited by a powerful aristocracy with hereditary privileges, and the prescription of popular rights. The ruler is called the Imam or Sultan, and the capital of the state is Muscat (q.v.), a name also given to the sultanate. The present dynasty secured possession of the throne in 1741, and for some time Socotra, Zanzibar, and parts of the east coast of Africa were attached to Oman. A British Resident is stationed at Muscat, the sultanate being virtually a British protectorate. Pop. (est.) 1,500,000.

Omar I, ō-mar, 2d caliph after Mohammed; b. Medina 3 Nov. 644. See Caliph.

Omar II, 8th caliph of the Umayyads. See Caliph.

Omar Khayyám, k̄hi-yām', Persian poet and scholar: b. Naishâpur, province of Khorassan, latter part 11th century; d. (according to tradition) 1123 (?). He was given as Ghâzâl, but Abul Fazl calls him Ibrahim al-Khayyám. The epithet Khayyám, signifying 'tent-maker,' is indicative of his calling previous to the time when he was able to devote himself to science and literature. Nizâm ul Mulk, the great vizir of Al Arslân and Malik Shâh, offered him preferment at court, but he requested instead the means of living in retirement and occupying himself with learning. He accordingly received a pension, and pursued researches especially in mathematics and astronomy. Subsequently he was made astronomer royal at Merv, and in that capacity prepared certain astronomical tables. He was also active in the revision of dates (from 15 March 1074) of the ancient Persian calendar, a work comparable to the revision of the Julian calendar by Gregory XIII., to which it was similar in principle, and superior to which it has been ranked by some authorities. Among his mathematical writings are a work on algebra and a study of 'The Difficulties of Euclid's Definitions,' both still preserved. In his religious views he was unorthodox, and therefore viewed with suspicion by many of his contemporaries. He is best known to the West in later times as a poet somewhat in the manner of Lucretius, but more in that of Ecclesiastes. This philosophy he set forth in 'Rubâ'iyât,' of which, according to convention, the first, second, and last stanzas (râma, rim being in many cases even quintuple), while the third line was for the most part blank but rarely followed the rime of the other lines. Each Rubâ‘i was distinct, and in extant manuscripts is placed in an alphabetical arrangement dependent upon the letter concluding the rime. About 500 quatrains are assigned to Omar; many are probably not his. Perhaps his heretical views had something to do with the fact that a comparatively small number of MSS. exists, and none can be made an authority. The MSS. also vary more or less in the number of quatrains which they include. Edward FitzGerald made of a selected portion of the quatrains an ingenious mosaic, which presents something of unity, but probably gives too consistent a structure to the pessimistic side of Omar. The Persian seems to have been of changeful mood, sometimes humble before Allah, again scornful of the degenerate; hopeful and fatalistic; rebellious and acquiescent. He often ridiculed the orthodox, and perhaps he liked to confuse and perplex them. 'For this,' says Fitzgerald, 'he is said to have been especially hated and dreaded by the Sufis.' The Sufi poets, however, found it convenient to borrow of Omar, whose material they presented in their own mystic guise. Nevertheless, Omar had training in the Sufi doctrines, and some have detected a symbolic and mystic significance in his work. The generally known rendering into English is that by FitzGerald (1859; later ed.), whose version was republished (1900) by Batch and Ross with commentary and introduction. There are also translations by Whinfield (2d ed. 1893) and his edition of Omar's works, a scholarly work; Payne (1868); and Horon Allen (1868). There is a volume on the 'Sufi Interpretations of the Quatrains of Omar Khayyam and Fitzgerald' by Bjorregaard (1902). There are numerous versions in other languages, and Elihu Vedder published (1884) a series of illustrations which have been much praised.

Ombay, ōm-bi’, or Allor, Malay Archipelago, one of the Sunda Islands, about 20 miles
northwest of Timor, from which the Ombay Pass, in the line of one of the best routes from Europe to China, separates it. It is about 900 square miles in extent, 65 miles long, and 15 broad. It is surrounded by hills and lofty interior. The mountains are covered to their summits with lofty trees. It is inhabited by savage tribes, said to be fierce and treacherous, and carries on some trade with Timor in birds' nests and provisions, exchanged for iron-work, Chinese wares and linen, Allor on the northwest and Bailoko on the southeast being the chief settlements and ports. It belongs to the Nether- lands, and is included in the residency of Timor.

Ombre, ôm'ber, a game of cards originating in Spain. It is usually played by three persons, with 40 cards (the eights, nines, and tens having been removed), and each player receives nine cards, three by three. The game is often mentioned in English 18th century literature.

Omdurman, óm-door'mán, Sudan, a native town on the White Nile, opposite Khartum. It was built as the capital of the Mahdi's successor, when Khartum was destroyed in 1883, and extends for four miles along the river bank. Under the Khalifa Abdullah it had a population of 50,000 inhabitants, living in one-storied mud huts, lining streets laid out on an orderly system, and guarded by a walled enclosure flanked with towers, accommodating 10,000 warriors. When the Khalifa was defeated, 2 Sept. 1898, Omdurman was hastily deserted, but with returning trade and prosperity has (1901) an estimated population of 60,000. Omdurman is the great mart of the gum-arabic, ivory, and ostrich-feather trade of northeastern Africa, and representatives of over thirty tribes congregate in its markets.

O'Meara, ó-mê'ra, Barry Edward, English physician: b. Ireland 1778; d. London 3 June 1836. He was household physician to the Emperor Napoleon I. at Saint Helena, and published 'Napoleon in Exile' (1822). Originally a surgeon in the British navy, he was serving on the Bellerophon in that capacity, 7 Aug. 1815 when Napoleon went on board. Napoleon nothing of this, and knowledge of Italian, desired the surgeon to accompany him to Saint Helena. Having obtained Admiral Keith's permission, O'Meara remained with the ex-emperor till July 1818. He was then recalled and de- prived of his rank, for having accused Sir Hudson Lowe before the admiralty of cruel and arbitrary conduct.

Omega, ó-me'ga or ó-mé'ga, the last letter of the Greek alphabet; hence, figuratively speaking, the end or last of anything. See Alpha.

Omen, a sign believed to prognosticate a future event, between which and the event foretold there appears no relation of cause and effect, but which is usually received as an intimation from a superior power. Omens have been common among most nations, and are often remembered and mentioned after they have ceased to be acted upon. Though generally classed among superstitions, they are founded on some hidden relation in things, some natural law of sequence the ground of which is unknown. They have been chiefly in vogue in the rude ages and communities, though under the name of auguries they retained their influence during the whole period of pagan antiquity, and though eminent warriors and other popular leaders in moments of extreme doubt and peril have given notable examples of faith in them. Sneeze was deemed ominous in the time of Homer, and Eustathius states that it was lucky or unlucky according as it was directed to the right or the left. Aristotle discusses the problem why sneezing from noon to midnight is good, and from midnight to noon bad. At noon it was propitious. Among the ancient Persians sneezing was esteemed fortunate, a sign of contest between the fiery soul and the earthly body, and of the victory of the former. When the emperor of Monomotapa sneezes, says Codignas, it is proclaimed through the whole land as a signal for general joy. The itching of the nose implied that a stranger was coming. Burton, in his 'Anatomy of Melancholy,' states that "to bleed three drops at the nose is an ill omen." The spots on the finger nails were all ominous; the itching of the palm of the right hand promised a receipt of money; the doubling of the thumb within the hand was believed to have efficacy in avoiding approaching danger, and therefore the fingers and persons were so folded. The way in which fires, candles, or lamps burned suggested divers omens. The superstition still prevails in many places that the howling of a dog by night presages a death in the neighborhood. Duncan Campbell expresses his faith in this omen, and adds: "Odd and unaccountable as it may seem, those animals scent death, even before it seizes a person." The screeching of the owl and the croaking of the raven have both in ancient and modern times been regarded as omens of some dire calamity. Divers presages concerning the weather have been derived from the habits of birds, bees, wasps, gnats, etc. Pennant states that many of the great families of Scotland received monitions of future events, especially of death, by spectres, wraiths, and shrieks. Fishermen and sailors discover omens in echoes, flashes, shadows, and other visible appearances. To throw a cat overboard, or lose a bucket, is believed to be unlucky. Whistling is supposed to stir up the wind. Stumbling has been the subject of numerous superstitions. Gaius Gracchus stumbled at his threshold on the morning of his death. To stumble on going out, says Bishop Hall, was mischievous; to stumble up stairs, says Grose, was lucky.

At the present day, in many parts of England and the United States, a superstitious belief in omens exists. It is regarded as unlucky to see first one magpie and then more; but two denote marriage or merriment; three, a successful journey; four, an unexpected piece of good news; five, that you will shortly be in a great company. To kill a magpie is to incur some terrible misfortune. When a person goes out on any important business, it is lucky to throw away an old shoe after him. To present a knife, scissors, razor, or other sharp or cutting instrument to one's friend is unlucky, as they are apt to divide love and friendship. The falling of salt towards themselves is fraught with misfortune. The spillage of wine on their clothes, are evil omens. Breaking a looking glass betokens the death of the best friend of the person to whom it belonged. The burning of the cheek, or tingling of the ears, that others were talking of us; if of the
Omer Pasha—Onager

left cheek or ear, ill; the right, well. A sow crossing the road before a person going on a journey, is believed to indicate a disappointment, if not a bodily accident to such person; but if the sow be attended by her litter of pigs, it denotes a successful journey, etc. See Superstition.

Omer Pasha, Ömer Paşa, Turkish general: b. in the Austrian village of Pliskov 24 Nov. 1806; d. Constantinople 18 April 1871. His real name was Michael Lattas, and his parents were Christians. Educated for the Austrian army, for some unrecordered reason he fled in 1828 to Bosnia, and, embracing Mohammedanism, obtained the post of writing-master to Abd-ul-Medjid, the heir-apparent to the Ottoman throne. In 1842 he was appointed military governor of the Lebanon, in 1843 suppressed an insurrection in Albania, and in the following years others in Bosnia and Kordistan. He defeated the Russians in 1853 at Olteniza, again at Silistria in 1854, and entered Belgrade with the army in Feb. 1855; he was wounded and lost great loss 40,000 Russians who attacked him at Eupatoria. In October of that year he was sent to relieve Kars, but arrived too late. In September 1861 he was charged with the pacification of Bosnia and Herzegovina, which were again in insurrection. This being accomplished, he attacked the Montenegrins, captured Cetinje, and overran the country in 1862. He was made field-marshall in 1864, was sent to suppress the rebellion in Crete in 1867, and was minister of war from 1869.

Ommiades, ٧-ماثة, 7th-11th century CE Arab dynasty founded by Moawiyah, 661. Merwan II, 14th and last caliph of this race, was slain 10 Feb. 750, when the Abbasides came into power. See Caliph.

On'nhubus, a Latin word signifying "for all," and now applied in several languages to the well-known vehicle used for the conveyance of passengers at a cheap rate. The famous mathematician, Blaise Pascal, is said to have introduced the vehicle in Paris. Unlike most other men of learning, Pascal was more or less interested in the affairs of practical life. He was the inventor of the push-cart that now perambulates our streets. In 1661 he had large wagons built for regular traffic in the heart of Paris. He provided himself in this undertaking with several influential friends, among whom was the Duke de Roanes. In 1662 Louis XIV granted letters patent to Pascal, in which it was said that these carriages were intended for the comfort of poor people who had to go to courts of justice, or who were sick and so poor that they could not afford to pay the two pistoles exacted by the chairmen and the drivers of coaches. At first the use of the vehicle was not generally permitted. A royal decree forbade its use by soldiers, pages, lackeys, and other liveried servants, as well as artisans and porters. Pascal, in spite of the fact that he only lived to be 39, is said to have made no considerable sum out of his invention. After the vehicle had been in use for some 16 years it was abandoned for various reasons. It was not until 1812 that it was again introduced, this time in Bordeaux, which city was followed in 1821 by Nantes and in 1827 by Paris. The vehicle was improved and rapidly became popular. In modern times the vehicle was called an omnibus simply for the reason that it was intended for the carriage of all, without any restrictions as to lackeys, pages, or footmen. A Mr. Shilibur started the first omnibus in London in 1829, and they were introduced into New York in 1830, and Amsterdam in 1839.

Omnibus Bill. See Compromise of 1850.

Omphag'ic Rites, or Omophagia (Greek, ὀμφαγία, eating raw flesh), religious rites in which uncooked flesh was eaten. In such religious ceremonies cannibalism sometimes formed a part, as in the Orphic rites, in which the passion of Zagreus (q.v.), the infant Dionysus, was commemorated by the sacrifice of a man, who was dismembered and eaten. These rites were celebrated at Chios and Tenedos, and from them Dionysus obtained the title of eater of raw flesh. Dionysian rites were introduced into Italy about the end of the 3rd century B.C., and in 188 b.c. the senate, informed of their nature by a freedman who had been marked out as a victim, issued the decree Concerning the Bacchanalian Rites, which banished the Orphic Mysteries from Italy. A race of profane Bacchantes afterward substituted for a human victim in the Dionysian celebrations. See Dionysus; Bacchus; Orpheus.

Omphale, ὀμφάλη, daughter of Iardanus, king of Lydia and wife of Tmolus, after whose death she reigned as queen. Heracles (Hercules) was sold to her for a slave and performed some remarkable exploits in her service. Omphale bore to him several children, and he was so enamored of her that, to please her, he assumed woman's dress, wore gold rings, had his hair curled, and spun among her slave-girls while she wore the lion's skin and carried the club. Omphale governed with severity, and was no less licentious and extravagant than cruel.

Omsk, Asiatic Russia, the former capital of western Siberia, now capital of the General-Governorship of the Steppes and of the province of Akmolinsk, on the Irish, at the confluence of the Om, and on the Trans-Siberian railway, 1890 miles south of Tobolsk. It has modern fortifications in the form of the regular polygon, flanked with five bastions, and is the most important military station on the line of the Irish. It contains a school for interpreters and a military school for the Cossacks. The trade, carried on chiefly with the Kirghiz, is of considerable extent, and consists chiefly in brandy, tobacco, etc., for which cattle are given in exchange. Pop. (1897) 37,470.

Oña, Pedro de, pár'dro ña, Chilean poet: b. Conches, Araucania, about 1555; d. Lima about 1620. He was educated at Lima (then Los Reyes del Peru), and there wrote his great epic and apparently his first poem, 'Arauco Domado' ('Chile Conquered,' 1596; re-edited 1849), which is reckoned a Spanish classic, being included in the Spanish Academy's Catalogo de Autoridades de la Lengua, as well as various sonnets and the descriptive poem, 'Temblor de Lima el Año de 1607' ('The Lima Earthquake of 1607,' 1606).

Onager, ña-jér, or Ghokhar, the small pale variety of wild ass (q.v.) of western India and Beluchistan. See Kang.
ONAGER—ONEIDA COMMUNITY

Onager. See ORNAMENT.

Onagra'ceem. See EVENING PRIMROSE.

Oñate, Juan de, hoo-an' då ő-hät'a, Spanish explorer: b. Guadalajara, Mexico, about 1555; d. about 1615. He was a man of position and influence in the colony, a son of the founder of Guadalajara, and married a granddaughter of Cortes. In 1595 permission was granted him by the viceroy Velasco to colonize the district north of the Rio Grande, but Monterey, Velasco's successor, withheld full powers as governor until 1598, when Oñate set out on his expedition with a large force of soldiers and Indians, and many wagons and cattle. He crossed the Rio Grande, founded San Juan, the first capital of New Mexico, and, notwithstanding conflicts with the Indians, the colony flourished. In 1599 and 1604 Oñate explored Arizona, and though records show that he was not governor of the colony after 1608, there is nothing by which to accurately determine the date of his death.

Onawa, ôn'w-â, Iowa, town, county-seat of Monona County, within five miles of the Mississippi River, on the Illinois C., Chicago & N. W., and Sioux City and P. R.R.'s; 37 miles southeast of Sioux City. It is the center of an excellent agricultural and stock-raising region and has a considerable local trade. It has public schools and a public library (founded in 1897). Pop. (1900) 1,933.

Oncarhyn'chus, the genus of the Salmonida which includes the salmon of the North Pacific. See SALMON.

One Hundred Committees, the name given an organized body of New York citizens, who during the occupation of Manhattan by Lord Howe, were intent upon maintaining their independence. Governor Tryon, the British commander, was so intimidated by the Committees he dared not proceed with his attack. The Committee gave courage to the Sons of Liberty who removed the cannon from the royal battery at the foot of Broadway to a place of safety for the use of the people.

Onega, ôn'g-ga (Russ. ô-nyę'gă), (1) a lake in Russia, near the center of the government of Olonetz, after Lake Ladoga the largest lake in Europe, covering an area of about 4,900 square miles. It is of irregular shape, has generally rocky shores, and numerous creeks, bays, and islands, and is well supplied with fish; numerous shoals and sand-banks interrupt its navigation. It is fed chiefly by the Niga, Shuia or Shuis, Vodka, and Vytegra, and discharges itself into Lake Ladoga by the Svir. A canal between the Vytegra and the Kaya, an affluent of Lake Bielo, gives it an opening into the basin of the Volga. (2) A river to the east of Lake Onega, which, issuing from Lake Lacha, government of Olonetz, flows first northeast, then northwest, and after a course of about 270 miles, so much broken by falls and rapids that it cannot be considered as navigable, falls into the White Sea at the southeast extremity of the Gulf of Onega.

Oneida, ôn'ı-da, N. Y., city in Madison County, New York C. & H. R., the West Shore, and the New York, O. & W. R.R.'s; about 110 miles in direct line west by north of Albany, the State capital. The place was settled in 1839, at the opening of the Utica & Syracuse Railroad, now the New York Central & Hudson River Railroad, and incorporated as a village 20 June 1848. It was granted a city charter 28 March 1901. It is the commercial center of a fertile agricultural region, and has considerable manufacturing interests. The chief manufacturing establishments are chair factories, bush cart works, casket and carriage factories, knitting mills, steel pulley works, cigar factories, canneries, iron works, and sash and blind factories. There are about 1,800 employees in the manufactories. It has a large trade in its manufactories and in farm and dairy products and fruit. It has a city hospital, an Old Ladies' Home, an excellent high school, and eight churches.

Oneida Lake (q.v.), five miles north by west, is a peculiarly pleasing lake. The Oneida Community (q.v.) is located two miles to the south, and Oneida Castle, the site of the ancient headquarters of the Oneida Indians, is about four miles south. The four banks have a combined capital of $235,000, and the annual income of the business is about $30,000,000. The government is vested in a mayor and six aldermen. The city owns and operates the waterworks. Pop. (1890) 6,683; (1900) 6,364. Consult Durant, 'History of Oneida County.'

S. A. NIXON, Editor 'Oneida Union.'

Oneida, a lake in New York, on the boundaries of Oneida, Oswego, Madison, and Onondaga counties; about 18 miles south of the eastern part of Lake Ontario. It is 20 miles long and about 5/2 miles wide. Several small streams flow into the lake; the head-waters of those from Oneida County are near the source of the Mohawk River. The outlet of the lake is Oneida River, whose waters enter Lake Ontario through Oswego River. Sylvan Beach, on the east shore, is a favorite resort. A number of small villages are along the shore, and the lake has a few islands.

Oneida Community, a settlement of Communists (see COMMUNISM) at Oneida, Madison County, N. Y., sometimes called Perfectionists. The community was founded in 1847 by John Humphrey Noyes (q.v.). He had originally formed a small settlement of his fellowmen at Putney, Vt., in 1838. During the first 10 years the settlement at Oneida made slow progress, but eventually became very successful, as a result of numerous industries and manufactures. The community followed a complex marriage system, there being no ceremony nor permanent ties between couples, and the community assumed all responsibility in the support and education of children. Outside opposition, principally from the Protestant churches, arose, and the marriage system was abolished in 1879. The community then reorganized and a joint stock company was organized in 1881. The co-operative plan was followed in financial and domestic matters. In 1882 the community had property valued at $600,000. Since the reorganization branch manufactories have been established at Niagara Falls, Sherrill, and Kenwood, N. Y., and in 1903 the total valuation of the property was said to exceed $2,000,000. There are upward of 300 persons in the community.
ONEIDA INDIANS—ONIONS

Consult Hills, 'American Communities' (1902).

Oneida Indians, an American tribe of the Iroquois confederacy formerly living on the shores of Oneida Lake, N. Y. They were friendly to the French and the Jesuits, but they took sides with the Americans in the Revolutionary War. Subsequently they were attacked by the Iroquois under Brant, who burned their villages and forced them to take refuge in the American settlements. A considerable number of them settled on the Thames River, Ontario, Canada, where about 800 survivors lived in 1903. Others resided in New York, and on the Grand River, Canada. There are about 3,000 of them now living. See also Six Nations.

O'Neil, merchant, Charles, American rear-admiral: b. England 1842. He entered the United States navy as a midshipman in 1861; was on the Cumberland at the capture of Forts Hatteras and Clarke in August 1861, and served in the engagement with the Confederate ironclad Merrimac, 8 March 1862, as well as during the two attacks on Fort Fisher. He was promoted to the rank of captain in May 1887, and had been chief of the naval bureau of ordinance from June 1897. He was promoted rear-admiral in April 1901.

O'Neill, Eliza, Lady Becher, Irish actress: b. Ireland 1791; d. there 29 Oct. 1872. She made her first appearance at 12 as the Duke of York in her father's company, and her formal début at Covent Garden in 1814 as Juliet. She was an emotional actress and suited for tragedy roles, in which she played for five years as England's most popular actress. She retired from the stage on her marriage to William Becher, M.P., who later became a baronet.

O'Neill, Owen Roe ("Red Owen"), Irish warrior, d. 6 Nov. 1649. He commanded the Irish forces in the wars against the English in the first half of the 17th century. On 5 June 1646, with 5,000 men he drove the English army of 7,000, killing one half of the enemy.

Oneonta, ñ-ne-ôn'tà, N., Y., village in Otsego County; on the Susquehanna River, and on the Delaware & H., the Ulster & D., and the Oneonta, C. & R. S. R.R.'s; about 70 miles southwest of Albany. The town of Oneonta was settled prior to the Revolution, but the first settlement within what is now the village limits was made in 1790 by Frederick Brown. It was incorporated as a village in 1848. It is in an agricultural region and has several important industries connected with farm products. The chief manufacturing establishments are Delaware & Hudson shops, which have 750 employees; the cigar factories, 100 employees; knitting-mill, 150 employees; flour-mill, 100; silk-mill, 100. It is the seat of the Oneonta State Normal and Training School, which had enrolled in 1904 nearly 1,000 pupils. It has the Aurelia Fox Memorial Hospital, a State armory, a public library, and 10 churches. The government is vested in a president and a board of six trustees, two of whom are elected each year. Pop. (1890) 6,272; (1900) 7,147.

F. M. H. Jackson, Business Manager 'The Star.'

Onias, a Jewish high priest, the son of Simon. About 188 B.C. he fled to Egypt, where he rebuilt the temple of Leontopolis, or rather he remodeled an old pagan temple given to him by the Egyptians. This Leontopolis was located near Helopolis, 180 stadia from Memphis, and must not be confounded with the Leontopolis of the Delta. There is more or less obscurity regarding Onias, and from various accounts there appears to have been three of this name. Josephus declares that the builder of the Leontopolis was a son of Onias who fled to Egypt in the time of Antiochus V., about 164 B.C. Another account says that Onias III. was murdered by Andronicus in a sanctuary near Antioch. In Isaiah (xix. 18-25) reference is made to five cities in Egypt, occupied by Hebrews, one of them called Leontopolis (the city of the Lion); and also to an altar and sacred tower at the border of Egypt where the Egyptians are expected to offer sacrifices to Yahweh.

Onion, a river in Vermont. See Winooski.

Onions, and Onion Culture, various species of Allium, a genus of the lily family; specifically, A. cepa, a bulbous-rooted biennial herb with hollow radical leaves and a leafless, hollow, usually swelling stem, which bears an umbel of small six-segmented bell-shaped white or purple flowers, replaced in some cases by bulbs. It has been so long in cultivation that its original form is not definitely known. Probably it is a native of western Asia and adjacent parts of Africa, since it is mentioned in old Egyptian writings, the Pentateuch, etc. It has spread to all countries occupied by civilized man, by whom its bulbs (and to some extent its leaves) are used as a vegetable and for flavoring various culinary preparations.

Being very hardy, the onion may be planted as soon as the ground can be worked in early spring, or it may be cultivated during the winter where the temperature does not fall to the freezing point. In the Southern States it is generally cultivated as a winter crop. The essentials of its cultivation are a well-drained, light, friable soil, rich in all plant food and humus, and, above all else, free from weeds. Onions, especially while little, cannot compete with weeds. Reclaimed marshy land such as alluvium, are highly valued also as onion fields. Every effort having been made to make the soil as loose as possible, the seed is sown in drills about 12 inches apart, machines being used for the purpose. Since the plants are somewhat slow in making their appearance, and are very inconspicuous, planters often mix a few radish or turnip seeds with the onion seed, the young radishes being quick to appear, conspicuous, easy to remove, and serving to indicate the positions of the rows until the onion plants can be seen. Throughout the growing season the onions are kept free from weeds, thinned to distances about three inches apart, and the soil between the rows is kept loose and open by frequent cultivation. When the necks of most of the bulbs have turned yellow in the autumn the bulbs are pulled, four or five rows being combined in one window, and the "scallions," or thick-necked, immature bulbs, discarded. After drying in the field for a few days the bulbs are gathered in crates, which are piled under cover for further drying before sorting and shipping them to market. Dryness, coolness (just above freeze-
ONKELOS—ONONDAGA

ing), and soundness are essentials in storing onions during the winter.

Onion cultivation has several modifications of importance. Improved methods of culture consist in starting the plants in hotbeds or coldframes, and transplanting them to the field when four or six inches tall, and thereafter cultivating them as above described. The advantages claimed for this method are that the plantlets are under complete control while small—the precarious time; that they are readily transplanted under ordinary conditions; that the cost of transplanting is not greatly in excess of that of weeding in the other method; and that not only is there a more even stand of the plants in the field, but that the bulbs are larger and of more uniform grade. Another frequent practice is the sowing of seed in the autumn where the plants are to remain; and a still more common one is the planting of "sets,"—little onions which have been specially grown for this purpose, the seed being sown very thickly the year previous. These sets are especially valuable for the production of "bunch onions," which appear in the markets during the early spring and summer months.

Some varieties of the onion are remarkable for their method of propagation. The potato or multiplier onion has two or more "cores" or "hearts," each of which will send up leaves when the bulb is planted. If separated from its fellox, each core will produce a new compound bulb and sometimes send up a flower-stalk. This variety is therefore a perennial which resembles garlic in its method of propagation, and is intermediate in flavor between garlic and the common onion. Another botanical variety is the "top" or "tree" onion, which develops bulblets instead of flowers, or both, at the top of the flower-stems.

Of the varieties of the common onion grown in America, the red ones are usually of strongest flavor, the yellow ones next, and the white ones mildest. But still milder and better flavored are the foreign varieties known as Bermuda, Spanish, etc., which are less hardy than the common onions and are little grown in the North. They are largely cultivated in the South and in California, whence the markets derive their chief supply.

The Welsh onion or "celib" (Allium fistulosum) native of Siberia. It resembles the leek in the absence of a distinct bulb, but differs from the leek in its hollow, onion-like leaves, which are cut like those of the shallot and used for flavoring. It is of dwarfer growth than the common onion and has more clustered leaves. It may be propagated by division of the bulbs or by seeds. In the United States it has not become very popular.

Onions are occasionally seriously attacked by so-called parasitic plants, which may devastate whole fields and which are not of easy control by any devised method. Bordeaux mixture has been recommended, but rotation, the crop being planted upon smut-free land, is perhaps most satisfactory.

Among the insects which prove destructive to the onion are several species of cut-worms, all of which may be held in check by poisoned baits, such as sweetened bran or clover, or by trapping in early spring when the insects revive after passing the winter in the larval stage. The onion thrips (Thrips trifolii), a tiny sucking insect, sometimes devastates whole fields by appearing in great numbers, puncturing the leaves, which turn yellow wherever pierced. It is especially troublesome in Bermuda. Kerose ne emulsion has been most frequently recommended as a remedy. The most serious pest, however, is perhaps the onion maggot, the larva of a fly (Agrotis messoria) which lays its eggs close to the young onions in early spring. The larvae burrow into the young bulb, causing the plant to wilt and decay, a result which follows even slight injury. In late spring the maggots pupate and in about two weeks appear as adults, which lay eggs for a second brood. This brood winters partly as adults and partly as pupae. The best remedy is probably ground tobacco-stems liberally applied to the young plants in early spring. This acts as a repellant, an insecticide, and as a fertilizer, and may be applied without fear of its injuring the plants. Another good plan is to pull and burn the plants of the early sowing when found to be wilting, which will lessen the number of flies able to lay eggs for the second brood. Nitrate of soda and lime are recommended to be burned just after the removal of the wilted plants: these are thought to act as insecticides and fertilizers.

Consult Bailey, 'Cyclopedia of American Horticulture' (1900-2) and the special literature therein mentioned under the article Onion.

M. G. KAINS, Horticulturist.

On'kelos (Aramaic for the Greek name Akylas), author of the Targum or Chaldee paraphrase of the Pentateuch which bears his name. According to the Babylonian Talmud he lived in the time of Gamaliel, but is not earlier than the 2d and not later than the 3d century. His Chaldee is purer than that used in Palestine, and he may have been a Babylonian. His version is good, and continued until the beginning of the 16th century to be chanted in the synagogues alternately with the Hebrew. It has often been printed with or without the Hebrew text. See TARGUM.

Onomacritos, Ín- Í- mák'ri- tís, Greek soothsayer and poet, who lived in the time of the Pisistratidae, 6th century B.C. He was the head of an Orphic sect and expounded the mysticism, poetry, and theology of Museus, while his pupils arranged the Homeric poems in connected series in accordance with the suggestions of Pisistratus. Having been detected making an interpolation in one of these oracles, he was banished from Athens by Hipparchus about 516 B.C. He withdrew to Persia, where the Pisistratids employed him to encourage the Persians to invade Greece by repeating to the king such oracles as seemed to promise success.

OnomasticoN, a Greek term properly meaning a list of names or words, denotes particularly a dictionary or encyclopedia in which individual subjects or things are mentioned and explained under their own names or heads. The oldest work under this name is the "Lexicon" of Pollox, executed in the 2d century B.C., in the Greek tongue.

Onondaga, Ín-í-ndà'ga, a lake in New York, near Syracuse. The outlet is Seneca River. Onondaga Castle, the headquarters of the Onondaga Indians (q.v.), was near this lake.
Onondaga Indians, an American tribe of the Iroquois confederacy residing in central New York, on the shores of Onondaga Lake. In 1600 there were about 1,600 in the tribe, and fully 1,000 still survive. About one half of the original tribe followed the Canadian and settled on the Grand River, in Ontario.

Onondaga Period, in geology, the central division of the Upper Silurian (see Silurian), coming between the Niagara and the Lower Helderberg periods. It may be divided into two formations, which seldom occur together, namely, the Salina and the Water-Lime group. The former reaches its maximum thickness in New York, near Syracuse, and is characterized by the great salt-mines of central New York; in western Ontario it is 1,400 feet thick, containing limestone shale and dolomite as well as salt. The Water-Lime group is a hydraulic limestone, containing valuable gypsum quarries near Syracuse, and in Cayuga and Genesee counties, and at Gypsum, Ohio, near Sandusky; hydraulic cement is produced in Ulster County, N. Y. There are few fossils in the Water-Lime group and scarcely any in the Salina formation. The rocks of the Onondaga period run south from central and eastern New York into Pennsylvania, and thence through parts of Ohio, Michigan, and Wisconsin.

Ononsander, more correctly Onesander, a writer on military tactics who lived at Rome in the middle of the 1st century after Christ, and composed in Greek, under the title of Strategikos, an excellent work on the art of war.

Onospin, in chemistry, Ca₂H₅O₆. Produced, together with formic acid, by boiling ononin with baryta water. On passing carbonic acid gas into the solution, and digesting the precipitate in boiling water, onosin deposits on cooling, as a white, interlaced, crystalline mass, insoluble in water but soluble in alcohol and the alkalies. It is colored crimson-red by sulphuric acid and binxioxide of manganese. Melts at 162°.

Ontario, Canada, the most populous province of the Dominion, formerly called Upper Canada, or Canada West, bounded on the north by Keewatin, the Albany River, and Hudson Bay; on the northeast and east by the province of Quebec and the Ottawa River; on the south by the Saint Lawrence River, Lake of the Thousand Isles, Lake Ontario, Niagara River, and Lake Erie; and on the west by the Detroit River, Lake Saint Clair, Saint Clair River, Lake Huron, Lake Superior, and Manitoba. Area 260,862 square miles, of which 40,354 square miles are water. For administrative purposes the province is divided into 44 counties, subdivided into townships and 98 electoral districts, including the three unorganized districts of Algoma, Thunder Bay, and Rainy River. The capital is Toronto (q.v.), and the province also contains the Dominion capital, Ottawa (q.v.), situated in the eastern part of the province. Other important cities and towns are Hamilton, London, Kingston, Brantford, Guelph, and Saint Catharines (q.v.).

Topography and Physical Features.—The surface generally is an undulating plateau land with no considerable elevations. The Laurentian Hills with a maximum altitude of 1,200 feet extend westward from the Thousand Islands near Kingston to north of Lake Simcoe and include the watershed separating the rivers flowing into the Great Lakes, from those entering Hudson Bay, and the Ottawa and Saint Lawrence Rivers. The chief rivers are those already mentioned, with the exceptions of James Bay, and the Niagara, the celebrated falls and gorge of the latter belonging partly to the province and partly to the United States. Besides the Great Lakes numerous smaller lakes, including Nipissing, Nipigon, Simcoe, and Muskoka, belong to the province.

Natural Resources.—About one half of the province is covered with timber, chiefly pine, spruce, tamarack, oak, and hickory, with the latter water ground for moose, caribou, and other large game. The fisheries are important, the catch consisting of trout, whitefish, herring, pickerel, etc., and in 1901 being valued at $1,426,078, of which over $550,000 worth was exported. The province is rich in minerals, which are found chiefly in the Huronian rocks which with the Laurentian series, both of Archean crystalline formation, constitute the principal geological characteristics of the region. The minerals include iron, copper, lead, plum-bago, apatite, arsenic and antimony, while gypsum, marble, and building stone are abundant; gold and silver deposits exist, the latter very extensive in the country along the shores of Lake Superior, and the westward to the Lake of the Woods. In 1883 nickel was discovered at Sudbury, the deposits since proving to be among the richest in the world. The province is rich in petroleum, the wells in the southwest, especially in Lambton County, yielding immense and apparently inexhaustible supplies, over 30,000,000 gallons annually, while the same may be said of the salt wells on the shores of Lake Huron. Natural gas fields in the east near Niagara, and west near Detroit, supplying Buffalo and Detroit respectively, have been exploited to the value of about $300,000 annually. In 1899 the government reserved to itself the right to prohibit the export of natural gas. The nickel output from the years 1898-1900 was exported to the United States, chiefly for use in naval construction. In 1902 the nickel mines produced 10,693,410 pounds, valued at $5,325,903. The value of Ontario's mineral production in 1901 was $457,585. A bureau of mines was created in 1891.

Climate.—The climate is inclined to the extremes of heat and cold during summer and winter respectively, but owing to the dryness of the atmosphere it is always healthful and bracing. Extreme cold is felt only in the northern part, the vicinity of the Great Lakes in the south greatly modifying the extremes of temperature. The average temperature for January in the south is 21°, minimum 10° below zero; the average for July is 68°, maximum 90° but rare, the ordinary maximum being 80°.

Agriculture.—Farming is an important occupation, especially in the south, where soils of black loam, with clay and chert, of excellent quality, and highly productive. The richest, most thickly settled, and most highly cultivated portion of the province is the peninsula between the Ottawa River and Lakes On-
ONTARIO

tario, Erie, and Huron. The crops raised are chiefly wheat, barley, oats, Indian corn, potatoes and some tobacco, and the fruit-growing farms of some districts yield a plentiful crop of apples, plums, pears, peaches, and grapes. In 1902 there were 60,080,024 bushels of spring wheat raised and 20,033,669 of fall wheat; 21,900,602 bushels of barley, 106,431,439 bushels of oats, 20,512,194 bushels of Indian corn (in the ear), and 12,912,250 bushels of potatoes. Stock raising, dairy farming and bee culture are among comparatively recent industries of the province which have been attended with encouraging results, largely due to the easy accessibility of markets by rail, supplemented by the lake, river, and canal navigation. The value of live-stock sold or slaughtered in 1901 was $38,457,018; the wool clip of the province in 1901 was $5,834,057 and the products of 1,167 cheese factories amounted to $12,269,073.

Manufactures.—The manufactures are numerous and abundant, chiefly owing to the favorable position which the province occupies with regard to water-power, although steam-power has been introduced to a large extent and is making notable inroads on the Lakes, from Pennsylvania and also from Nova Scotia. Chief among the supplies of water-power are the falls on the Ottawa River and the rapids of the Saint Lawrence, which are rapidly being developed. The water power on the Ontario side of the Niagara Falls will give the province the most extensive water-power works in the world. The principal manufactures are lumber and its by-products, agricultural implements, iron and woodwork, wagons and carriages, railway rolling-stock (including locomotives), cottons and woolens, leather, furniture, flax, ordinary iron and hardware, paper, soap, etc. The value of manufactured goods, agricultural products, animals and their products, timber, minerals, etc. in 1902 was $48,597,480. The imports, of which the chief was coal, amounted to $36,255,418, the duty on which was $14,577,343. The United States and Great Britain share the bulk of the foreign trade.

Railways, Canals, and Shipping.—Ontario has a perfect network of railways, in 1902 over 6,000 miles of which have been laid down. The system has proved an advantage in the development of the manufacturing and agricultural industries. In summer it is supplemented by the means of transport provided by the Lakes and by a magnificent system of canals. The principal canals are the Sault Sainte Marie Canal, and the Welland Canal, the latter 27 miles long, east of and parallel to the Niagara River, connecting Lakes Erie and Ontario. In 1900 the provincial shipping consisted of 176 vessels of 54,000 tons, together with an aggregate of 141,112 tons.

Government.—The provincial government is administered by a lieutenant-governor appointed by the governor-general for five years, assisted by a council and executive council. There is only one chamber, the Legislative Assembly, elected by ballot for four years, which had 98 members, by the apportionment of 1901; on the same basis the province sent 24 senators and 92 representatives to the Dominion Parliament. The government's policy is to encourage the development of provincial resources. Among pending measures are those for the drainage of swamp lands, for the encouragement of cold storage, for reservation and preservation of forests, for game protection, and for the establishment of sanatoriums for consumptives. The revenue of Ontario is made up of subsidies and contributions from the Dominion treasury, land and lumber sales, licenses, stamps, etc. The expenditure is invariably under the revenue, and the finances of the province are in a thoroughly satisfactory condition. The total government receipts for 1901 were $4,440,044; total expenditures, $4,038,834. The per capita expenditure is one of the most perfect in the world, and affords a pattern followed in many other countries.

Population.—The total population in 1901 was 2,167,598, as compared with 2,114,321 in 1871, an increase of 5.3 percent, although the province contains about two fifths of the whole population of the Dominion. The majority of the population is of English descent, Scotch, however, predominating in Bruce, Grey, and Glengarry counties. There is a sprinkling of German, and other nationalities are found around Toronto. There are about 21,000 Indians.

Education.—The school system of Ontario is admirable, and is under the control of a minister of education, who is a member of the Provincial Cabinet. The schools are supported by a tax on property, with state grants, and are free to all. They include kindergartens, public schools, and high schools or collegiate institutions. The Roman Catholic bishop of Toronto, under the care of the board of education. At the head of the educational system stands the University of Toronto. The total expenditure for school purposes in 1900 was $5,202,918; total expenditures, $4,372,039.

Religion.—There is no state religion. The membership of the principal denominations according to the census of 1901, was: Methodists, 666,306; Presbyterian, 447,383; Roman Catholic, 390,355; Church of England, 367,940; Baptist, 116,420; other denominations, 156,000.

History.—Ontario was first settled by the French about 1633, and they abandoned most of their settlements in 1665. The French occupation was marked by the wars with the Iroquois Indians or Five Nations in which the Huron allies of the French were almost totally annihilated. In 1763 with the rest of Canada Ontario passed into the hands of Great Britain, who organized the province of Quebec in 1774 and in 1791 divided it into Upper and Lower Canada. At the close of the American Revolution in 1783, Ontario received a notable immigration of United States Loyalists from the United States. Upper and Lower Canada were reunited in 1841, and again separated when the Dominion of Canada was organized in 1867, the west province being the province of Ontario. Prior to this, the chief incidents of its history were several battles of the War of 1812, notably those of the Thames, of Lundy's Lane, etc., and an unsuccessful rebellion in 1837.

CHARLES LEONARD-STUART, B.A.,
Editorial Staff, 'Encyclopaedia Americana.'

2. Kingston, from old Fort Henry.
ONTARIO — OLOGY

Ontario, Lake, North America, the smallest and easternmost of the five Great Lakes in the Saint Lawrence basin, forming a portion of the boundary between and partly belonging to the United States, and partly to the Dominion of Canada. It is of elongated, oval shape, 185 miles long, with a maximum central breadth of 60 miles, a circumference of about 480 miles, and an area of 7,400 square miles. Its surface level is about 334 feet below that of Lake Erie (see NIAGARA FRONTIER), and 231 feet above the tide level of the Saint Lawrence. Its depth is said to average 490 feet; but in some places it is upward of 600 feet in depth, and it is navigable throughout its whole extent for vessels of the largest size. It receives the waters of Lake Erie through the Niagara River (q.v.) with its phenomenal falls and gorge on the southwest, and discharges at its northeastern extremity through the Lake of a Thousand Isles, by the Saint Lawrence (q.v.). It also receives numerous rivers, including the Trent and Humber on its north, and the Black, Genesee, and Oswego from its southern shores. Lake Ontario has many good harbors; and as it never freezes at the surface, where the water is shallow, its navigation is not interrupted like that of Lake Erie. It is, however, subject to violent storms and heavy swells. It communicates by the Genesee River and Oswego Canal with the Erie Canal, and, consequently, with the Hudson River and New York city; the Niagara River and the Welland Canal, at its southwest extremity, unite it with Lake Erie, and the Rideau Canal connects it with the Ottawa at Ottawa city. Toronto, Kingston, Newcastle, and Niagara are the principal towns on the British side; and Oswego, Genesee, and Sacket Harbor on the American bank.

Ontogeny, in biology, the individual development of an organized being, as distinguished from phylogeny. These terms were first introduced as divisions of *biogenesis.*

Ontology (Greek αντολογιον, being, and λογος, discourse). In the science of being, that is, metaphysics. Aristotle did not employ the word, but called this branch of science the "First Philosophy," defining it as the science of being, of that which exists, as far as it may be said (πρώτη φιλοσοφία: πρώτος, first). The science is, the science of the essence of things; of things, not with regard to their accidents, qualities, physical or mathematical, but merely as being; the word being included not only whatever actually is, but whatever can be.

The word ontology was first introduced into philosophy by Christian Freiherr von Wolff (q.v.). He divided metaphysics into four parts: ontology, psychology, rational cosmology, and theology. Kant denied that one can have any knowledge of existences but only of appearances or phenomena. He believed that there was a rational science of principles and causes of the principles of being and knowing, and his system of metaphysics was merely an exposition of this rational ontology. Rational ontology may be treated in two different ways according as we postulate one existence or many. If there is one existence, there must be one cause, and all phenomena not modifications of this one existence, and effects of this one cause. This reduces metaphysics to a rational theology, the one substance or existence, and the one cause, being the Deity, the Absolute. If many existences or causes be postulated, three co-ordinate branches of inquiry are at once opened up, namely, rational cosmology, rational psychology, and rational theology. These are all a priori investigations, and deal with essence, not phenomena; and with God as cognizable by reason in his essential nature, as distinguished from the indications and evidences given by his works. (See NATURAL THEOLOGY.) Kant's 'Critik' is the best exposition of this view. The ontological argument for the existence of God was employed by Saint Augustine, and Boethius. It was, however, most fully developed by Anselm (q.v.) in the 11th century. Consult, Anselm, "Proslogion"; McCosh, "Intuition of God"; Baur, "Dogmengeschichte." See METAPHYSICS, TELEOLOGY.

Onyx (Greek ονυξ, "finger-nail," "veined gem"), a hard variety of agate, and hence a sub-variety of chalcedonic quartz, with layers, usually curvilinear, of white, alternating with red (sardonyx), gray (chalcedonyx), black (onicolo), or green or brown. Mexican onyx is actually an aragonite and is softer than the real onyx. The true ancient onyx was much praised as a gem and particularly in making cameos. Most modern onyx, so-called, is artificially colored; Algerian onyx, for instance, being only a variety of calcite. Apart from its use in jewelry, onyx has long been used in architecture, for table-tops, columns, and, in part or entire, stair-cases, being often used with white marble. Many onyx pillars quarried in Roman times are now used in Arab mosques; and in more distinctly Occidental buildings it is sometimes used, as in the stairway of the Opéra at Paris.

Oolachan, oo'la-kahn, or Oulachan. See CANDLE-FISH.

Oolite (Greek ολιθιον, "egg-stone," so called from its resemblance in size and shape to the egg of a fish), a geological term signified by the presence of minute concretionary grains or spherules, usually formed about a bit of sand or the body of a minute foraminifer; the term may also be applied to one of these tiny spheres. In this sense it may be described as a microconcretion. Oolite Period was marked by frequent precipitations of muddy sediment (calcareous or ferruginous) which killed and enclosed many minute organisms. This period is the later part of the Jurassic; and in England oolite limestones are so frequent and so typical of the Upper Jurassic that the Jurassic is often divided by English geologists into the Liasic Group and the Oolitic Group, and the latter subdivided into the Lower or Bath Oolite, the Middle or Oxford Oolite, and the Upper or Portland Oolite. Oolite is still in process of formation on the Florida banks.

Oology. The collecting of birds' eggs has always possessed a peculiar fascination for some men, and in the attempt to claim for their pursuit a legitimate place in scientific work they have coined for it the term Oology. A famous naturalist once said that when the oologist prepared his specimens he blew all the scientific out through the hole in the shell, and there is much truth in the statement. The oology gains from the study of a cabinet full
of empty egg-shells is so slight that it is not worth the sacrifice of bird-life that the collecting entails. While the relationship between certain groups of birds is indicated in the character of the eggs, this is not necessarily so between the shore-birds and the gulls and terns, nevertheless the variability, in size, shape, and color is so great, within many groups, that it is impossible to form any systematic arrangement from a study of eggs alone, and it is only now and then in connection with other characters that they prove of assistance in defining a natural arrangement of birds. The significance of their shape, colors, etc., is discussed under Egg.

In collecting eggs for scientific purposes the greatest care should be exercised in positively identifying the bird to which they belong, without which data they are absolutely worthless. The nest, which is quite as important as the egg, should also be preserved with great care, keeping it in situ, if possible, and all details of its location, the date of the collecting, etc., should be recorded. The method of preparing egg-shells for the cabinet is explained in many books, and in this case has been devised for the purpose. Suffice it to say that a round hole should be drilled with an egg-drill on one side of the egg, the size depending upon the degree of advance in incubation, and the contents should be removed by the use of a fine-pointed blow-pipe. Jets of water may be used effectively to aid in emptying the shell, and should be used in washing it out, while various chemical solvents may be of assistance in dissolving well-formed embryos. Every egg-shell should bear a number corresponding to its record. Directions for the collection, preservation and care of birds' eggs are published by the Smithsonian Institution.

Probably the finest illustrated work on the oology of any region is Bendire, 'Life Histories of the Birds of North America' (1892; unfinished). Other works are: Lefèvre, 'Atlas des Œufs des Oiseaux d'Europe' (1845); Hewitson, 'Eggs of British Birds' (1856); Badeker, 'Der Europäischen Vogel' (1863); 'Des Murs Traité général d'Oologie Ornithologique' (1866).

WITMER STONE,
Academy of Natural Sciences, Philadelphia.

O'o, or Uri. See LIMPOPO.

O'orial, Urial, or Sha, a large wild sheep (Ovis vignei) of the high Himalayas and Tibetan plateaus and eastward to Persia, the chase of which calls for the greatest endurance, skill and resolution on the part of the hunters. The rams have immense, rounded, coiling horns; and both sexes vary much in color, and are in the habit of wandering widely.

Ostacumand, oo-tä-kä-mänd', India. See UTAMAND.

Ooze, fine sticky mud, almost entirely of organic origin, covering great parts of the seafloor, and constituting one of the most important of the Oceanic Deposits (q.v.). The various oozes are made up mostly of the remains of various foraminifers, and hence furnish a valuable means for the study of deep-sea microorganisms, even apart from their role in the building up and strewning over of ocean beds. According as one variety or another remains predominates or occurs characteristic, the oozes are usually classified as Globigerina ooze, Pteropod ooze, Diatom ooze and Radiolarian ooze. But it must be borne in mind that no one oozc consists entirely of any one sort of the foraminifers mentioned. The division of the oozes into groups is partly arbitrary and partly according to division, since we may speak of the calcarceous oozes (including the Globigerina and the Pteropod) and the silicious (including the Radiolarian and Diatom oozes), a more suggestive classification, though still one that is based only on predominant characteristics, since the Globigerina ooze, for example, is never free from silicious organisms. Murray says that the silicious element even here varies from traces to 20 per cent. But the Globigerina ooze usually averages 40 per cent of carbonate of lime, sometimes reaching 95 per cent, and its most characteristic component is the foraminifer Globigerina, besides which it contains other pelagic Foraminifera, as Pseudulina, Orbula, etc. The predominant color is pale gray, with occasional red and brown tints due to the peroxides of iron or manganese. The Globigerina ooze occurs near the equator both in the Atlantic and Pacific Ocean, and in the latter it occurs in special varities of it marked by the presence of comparably few rhizopods and more pteropods and heteropods, though these latter shells never predominate, is found in tropic depths of less than 2,000 fathoms near the Fiji Islands and elsewhere in the Western Pacific, and is called Pteropod ooze. Radiolaria occur both in the Globigerina ooze and in the Diatom ooze, but where they predominate the ooze is named from them; a great strip of this silicious mud spreads between 15° N. and 10° S. to 140° E. and 130° W. in the Pacific. The color is reddish and brownish because of the presence of manganese and iron; the composition otherwise is mainly silicious, though as much as 20 per cent of carbonate of lime may occur. The other silicious variety is marked by the presence and predominance of Diatoms, with occasionally 25 per cent of Globigerina shells and other calcarceous matter. Its color is that of pale straw, and, when dried, dirty white. These various classes merge into each other on the ocean bottom, and there is no hard and fast line between them. Their deposit has been slow and constant, and apparently not such as to effect continental areas, or even, markedly sea depths. See OCEAN DEPOSITS. Consult Murray, 'Challenger Reports—Deep Sea Deposits' (1891). See GLOBIGERINA.

Opasite, in mineralogy, black opaque grains or scales, usually of minute size, found most commonly with magnetite. They are incapable of microscopic identification and seem to vary in composition, some being graphic, and others metallic oxides or silicates. O'pah, King-fish, or Sun-fish, a large and beautiful sea-fish (Lampris luna) of the dory family, a native of the Eastern seas, but found in the Atlantic and Arctic oceans, and, rarely, on the North American coasts. It is about 4½ feet long and weighs 140 to 150 pounds. Its colors are very rich, the upper part of the back and sides being green, reflecting both purple and gold, and passing into yellowish-green below, the fins bright vermilion. The body is oval and laterally compressed, and the scales are small. It has a toothed upper jaw, and a mouth opening below. It is believed to feed on cuttlefish and similar animals. The flesh is highly esteemed.
OPAL—OPEN DOOR

Opal, hydrated amorphous silica, used as a gem-stone even in ancient times, when it was supposed to have magical virtues, as of making its possessor invisible if he carried it wrapped in a bay leaf, or of making him generally beloved so long as he trusts in its virtues. From the point of view of the mineralogist the opal is remarkable for never occurring in crystal form, and as differing from quartz only in having 3 to 13 per cent of water in its composition. Its fracture is conchoidal, and occasionally very perfect; its lustre vitreous, pearly, or sometimes resinous; its color variable, white, red, yellow, green, gray, and blue, occurring; its density 1.9 to 2.3, and its hardness 5.5, that is, less than quartz; it is perfectly soluble in hot caustic potash, another dissimilarity between it and quartz; and it is infusible by the blow-pipe. The principal varieties of the opal are: the precious opal, with splendid coloration due to fine fissures, varying from translucent to transparent, and occurring, especially in Carwenta, Hungary, and in Australia, in conglomerate, basalt, or porphyritic quartz. Its color varies with climate and temperature, and sometimes disappears permanently, the opal then being called dead opal. The stone is not hard, being too brittle, but is set en cabochon. The variety usually called Mexican is actually a sub-variety of the precious opal, occurs in Guatemala, the Faroe Islands, and in southern Australia, and should not be confused with the fire opal, which is the commonest opal of Mexican provenance, occurring there at Zunapan, and in Washington County, Ga., as well as in the Faroe Islands. It is a hyacinth red. The girasol is a Mexican and has a variety with a russet tinge and red reflections. The common opal is widely distributed, has a great range of colors like the more valuable varieties, and differs from them in having neither reflections nor color-play: it is found at Lesnig, Saxony, at Kostemir, Silesia, at Dubnik, Hungary, in the Faroe Islands, in Iceland, and in America at Cornwall, Pa., Idaho Springs, Colo., and Calaveras, Cal. Semi-opal is more opaque than common opal, with which it often occurs, as well as in company with chalcedony; it is sometimes considered to include wood-opal, which resembles petrified wood in its origin, but has the peculiar marking of the opal. A forest of opalized wood was discovered in Montana in 1903. Interior varieties are hydraphane, which is transparent only in water; mother-of-pearl opal, used, especially when found with chalcedony, for cameos; glass-opal or hyalite, made up of glassy concretions; and melinite, a gray, tuberous or reniform mass.

Opata (ō-pā-tā) Indians, a tribe of American Indians living in the Mexican state of Sonora. They have long been Christianized, are a quiet and industrious people, and are devoted to agriculture. They are found chiefly in the central parts of the state, where they are domiciled in villages. This modus of life has given them a fairer complexion than that of the Indians who dwell entirely in the open air. They are the only Indians who have successfully contended with the savage Apaches. On many occasions they aided the Mexicans in fighting other tribes. They number about 5,000.

Opechancano, ō-pēch-an-kā'nō, an American Indian chief of the Powhatan confederacy of Virginia. He died in 1648 after a very strenuous career. Under cover of being friendly to the English he united all the tidewater tribes in Virginia, and 22 March 1622 an attack was made on the colonists. Over 400 men, women and children were massacred. After a long term of peace, Opechancano again attacked the English in 1644, and 300 persons were put to death. The chief was afterward captured and was shot at Jamestown by a sentry appointed to guard him.

Opelika, ō-pēl'ī-kā, Ala., city, county-seat of Lee County; on the Central of Georgia and Western of Alabama R.R.'s; about 60 miles in direct line west by north of Montgomery. It was settled in 1839 or 1840. It is in an agricultural region in which cotton is one of the chief products. The principal manufactures are cotton products, brick, fertilizers, flour, and lumber. It has considerable trade in its manufactures and the farm products of the surrounding region. Pop. (1890) 3,703; (1900) 4,245.

Opelousas, ō-pē-lōo'sas, La., town, county-seat of Saint Landry County; on the Bayou Teche, and on the Southern Pacific railroad; 55 miles west of Baton Rouge. It is the trade center of a cotton, rice, and live stock raising district, and contains a cotton compress and a cottonseed-oil mill. It has a high school and the Academy of the Immaculate Conception (Roman Catholic); the high school has a free library of over 1,000 volumes. Pop. (1900) 2,951.

Open-bill, an African bird (Anastomus lamelligerus) of the stork family, so named from the odd formation of the beak, which at the anterior end exhibits a gap between the mandibles; it also is furnished with lamellations forming a sifting apparatus analogous to that of the bills of ducks. Another species (A. oscitans) inhabits the East Indies. The beak is yellow, and the general plumage black with dashes or suggestions of green and purple throughout. The open-bills are also called shell-storks or shell-ibises on account of their ordinary food, which consists of mollusks.

Open Door, The, a term of diplomatic significance applied to the unrestricted maintenance of international commercial relations. It came into general use in the 19th century in regard to conditions in Eastern Asia, and indicates an arrangement binding by general consent rather than by treaty, whereby all nations are allowed to trade in China and its dependencies upon equal terms. The European Powers controlling spheres of influence in the Chinese Empire tacitly admit foreign traders into their spheres on the same conditions as traders of their own country. This agreement, so far as the United States and other Powers are concerned, places China, commercially, in the same relation to the rest of the world that she had before the spheres of influence were recognized. Her tariff rates are to be uniform, and treaties with which she signed trade treaties, as the Spanish Powers on their side, agree to respect existing treaties, a condition of considerable importance to the expansion of commerce in that of the United States in particular. See article on TREATY PORTS: AMERICAN EXPORTS AND IMPORTS: FOREIGN TRADE; FREE TRADE; TRADE; TARIFF.
Opequon, 0-pé'kan, Battle of the (also called the Battle of Winchester). On the night of 18 Sept. 1864 Gen. Early had Ramseur's division and Nelson's artillery in position about 1½ miles east of Winchester, Va., across the Berryville road, along an elevated plateau between Abraham Creek and the Dunkard Red Run on the north. Rodes' and Wharton's divisions, with Braxton's and King's batteries were at Stephenson's Depot, and Gordon's division at Bunker Hill, under orders to join Rodes and Wharton by sunrise next morning. Cavalry-picketed the Opequon and the roads northward and westward on the left, and on the right along the Millwood and Front Royal roads to the Shenandoah. Early had about 15,000 men. Gen. Sheridan, with about 36,000 cavalry and infantry, was at Berryville, east of the Opequon. He had ordered a movement south of Winchester to Newtown, but when he heard that parts of Early's army were at Bunker Hill and Stephenson's Depot, ordered a direct attack on Winchester. Early's cavalry, followed by the Sixth and Nineteenth corps, was to move on the Berryville road, while Torbert, with Merritt's cavalry division, moved to Stephenson's Depot, to join Averell's cavalry division, which was to move up from Darksville. Crook's and Eighth corps was to be in reserve at the crossing of the Opequon. Early on the morning of 19 September Wilson was on the road, crossed the Opequon and cleared the way for the infantry. The Sixth corps came up and, under a heavy artillery fire formed line in front of Ramseur's batteries, its batteries, laying down to those of the Confederates. Wilson formed on the left of the Sixth corps. It was nearly noon before Grover's division of the Nineteenth corps was formed on the right of the Sixth, with Dwight's division in reserve. Meanwhile Early had concentrated his army. When Wilson drove in his cavalry pickets on the Opequon at daylight, and the Union movement developed itself, he ordered Gordon and Rodes from Stephenson's Depot, and both arrived before the Union lines were formed and took position on Ramseur's left, under cover of a piece of woods, Gordon being on the left of Rodes, who had three brigades. At near noon the Union line moved forward; Nelson's artillery opened a destructive fire; and Braxton's left opened a destructive fire; Early ordered Rodes and Gordon to advance from the woods and attack the Union right; and the two lines met in a deadly struggle. Rameur and Rodes were driven steadily back by the Sixth corps, and Grover's division of the Nineteenth struck Gordon's left, held by Evans' brigade, and drove it back in disorder through the woods from behind which it had made advances. Grover followed to the rear of the woods, and to within musket-range of Braxton's artillery, which was without support; but Braxton's guns stood to their ground and opened with canister, which checked Grover's advance; and at this moment the battle's brigade of Rodes' division came up, moved forward through the woods, and struck a point in the Union line, where the right of the Ninth corps joined the left of the Nineteenth, and joined by the rallied brigades of Rodes' and Gordon's divisions, drove back Ricketts' division of the Sixth corps and Grover of the Nineteenth, and caused the remainder of the defeated line of the Sixth corps to fall back to the ravine from which it had advanced. But while the Confederates were pursuing Grover, Russell's division of the Sixth corps, which was in second line, charged forward to fill the gap made by the withdrawal of Ricketts, and struck the Confederates in flank, driving them back with heavy loss, and the Union line was re-established, and there was a comparative lull in the engagement, which had been very bloody, and in which Gen. Rodes, one of Early's best division commanders, and Gen. Russell, one of Sheridan's best, had been killed. Crook's Eighth corps, which had been intended to be used on the left to seize the Valley pike south of Winchester, was now brought to the right and its two divisions, forming on the right of the Nineteenth corps, charged and broke Gordon's division. Meanwhile Wilson's cavalry on the left had driven Lomax's cavalry back toward the Valley pike. On the right Merritt's cavalry division, after severe skirmishing, had crossed the Opequon at a railroad crossing but was quickly held in check by Wharton's division of infantry and King's battery, which had advanced from Stephenson's Depot to meet it. A severe combat ensued, lasting for some hours, both sides gaining and losing ground; but Averell, moving up the pike from Darksville to Stephenson's, driving two cavalry brigades before him, came into the rear of Wharton, while he was engaging Merritt, causing him to abandon his position and fall back at 2 P.M. to Winchester, where two of his brigades were in reserve, in rear of Rodes' division, one remaining to support the cavalry north of the town. Merritt now advanced and joined Averell, and both moved down on Early's left, driving back the Confederate cavalry, until Merritt joined the right of Crook's troops. Averell and Merritt swung around to the rear of Early's left, driving his cavalry through the infantry lines and compelling him to send two of Wharton's brigades to check them. Crook, who had driven Gordon, now advanced on Wharton's flank and was himself struck by a flank fire. Early was now obliged to yield ground. The Sixth and Nineteenth corps were steadily driving Ramseur's and Rodes' divisions back to Winchester, and Averell's and Merritt's cavalry divisions were charging around his left flank, forcing back his cavalry in some confusion, and attacking his infantry, taking many prisoners from both, until finally, after an unsuccessful effort to hold an intrenched position covering the town, his road to Newtown being threatened, the whole line gave way and retreated, near sundown, some of it in confusion and disorder, some of it in orderly manner, followed by Sheridan's cavalry to Kernstown, where Ramseur, who was rear-guard, checked pursuit. The Confederates lost 297 killed, 1,872 wounded, and 338 missing, an aggregate of 541. The Confederates lost 297 killed, 1,872 wounded, and 338 missing, an aggregate of 541. They lost also five guns and nine colors. Consult: 'Official Records,' Vol. XLIII; Pond, 'The Shenandoah Valley in 1864'; Sheridan, 'Personal Memoirs,' Vol. II; Early, 'A Memoir of
the Last Year of the War for Independence; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Opera, from the Italian signifying a composition or musical work, is a dramatic music, or as the Italians, the originators of the modern opera, term it, *dramma per musica.* In opera or musical drama, music enriched by the accessories of instrumental accompaniment, costumes, scenery, dancing, etc., is an essential part of the work distinguishing it from ordinary drama accompanied by music. According as the serious or comic quality prevails in the opera, it is termed *opera seria* or *opera buffa.* There is also a style—mezzo stile or semi-seria—between both, the limits of which it is practically impossible to define. The component parts of an opera are recitatives, solos, duets, trios, quartets, etc., choruses, and they are usually preceded by an instrumental overture, containing a characteristic blending of the operatic themes or *leit-motiven* throughout the opera.

French *opéra comique* and *vaudeville,* the *opereetta* of Great Britain, and the United States, the German *singspiel,* and the Spanish zarzuela, are short musical dramas of a lighter and more topical character—partly spoken and partly sung; they are in direct contrast to the melodrama of German origin, in which music is introduced either by itself or in connection with the dialogue, no attempt being made to confine music and song with scenic accessories, the recitative or *recitativo* (q.v.) being an essential part of the music. While the opera remains a drama and should never lose this character, song and music may be considered its poetical attributes, the lyric quality of the music being principally directed to the expression of feelings and passions, as comparatively little display of character and action can be expected from opera. An opera, like every work of art, must bear the stamp of unity; one characteristic must prevail through the whole, as the solemn or grave in Mozart's 'Magic Flute,' the inexpressible various naivete of Gluck's Le coq d'or, the explicit realism of 'Figaro,' the sublime elevation of Gluck's 'Alceste,' and the heroic in Wagner's various music-dramas— as he preferred to call them.

The opera proper is of modern date and Italian origin. The ancient Greek dramas were operatic in character, and the attempts to reproduce the wonderful effects of old Greek music—confused remembrances of which lingered along the Mediterranean littoral during the Dark Ages, and to break the fetters of over-elaborated counterpoint, are perceived in the middle of the 16th century by the efforts of Willaert, De Rore, Vincentino, and Venosa to introduce *chromatics* (q.v.), or an intensification of expression, needless of old rules. About 1600 a powerful impulse was given to music generally by the renaissance and vogue of *monody* with instrumental accompaniment in chords for dramatic singing (*stile rappresentativa* music). In the mysteries of the Middle Ages. These pieces frequently had songs introduced into them and sometimes in a tower, the close of the period of their prevalence, whole pieces were sung or rather chanted. The first piece performed in this way was 'The Conversion of St. Paul,' produced in 1440. In 1508 a piece called 'Calandria,' set to music, was performed at Urbino, and in 1514 the same piece was performed before Leo X. at Rome. Several years later, the father of the astronomer Galileo produced at Florence his 'Ugolino,' a kind of lyric drama, closely resembling the modern opera, the subject of which was taken from a well-known episode in Dante. About this period, however, pastoral dramas, in which only the prologues and choruses were sung, almost entirely displaced all other modes of theatrical representation, and as already stated, it was not till near the close of the 16th century and about the commencement of the 17th century, that the invention of monody and recitative or spoken music came in to complete the Italian opera. About this time three young noblemen of Florence, who were attracted to each other by a similarity of tastes and pursuits, a love of poetry and music, and are known to posternity as *La Camera,* conceived the idea of reviving the chanted declamation of the Greek tragedy. They induced the poet Rinuccini to write a drama on the story of Daphne, which was set to music by Peri and Caccini, the most celebrated musicians of the age, assisted by Count Giacomo Corsi, who, though only an amateur, was also, for the period, a good musician. The piece was performed privately in the palace of Corsi; the interlocutors or singers being the authors, and his friend, the orchestra of this first opera consisted of four instruments, a harpsichord, a harp, a viol di gamba, and lute. There was no attempt at airs, and the recitative— if such it could be called —was merely a kind of measured intonation, which would appear to us insufferably languid and monotonous; yet at the time of its production in 1595 it created an extraordinary sensation, and was frequently repeated. Five years later, 6 Oct. 1600, the first public opera, entitled 'Euridice,' written by the same poet, and with two different musical settings by the same musicians, Peri and Caccini, appeared, both settings being received with equal favor on their production in the Pitti Palace, Florence, during the festivities at the marriage of Maria de' Medici with Henry IV. of France. The introduction of Anacreontic stanzas, set to music, and a chorus, at the end of each act were the first imperfect indications of the airs and choruses of Monteverde (q.v.), a Milanese musician, improved the recitative by giving it more flow and expression, and is the master who displayed genius in operatic composition; he is regarded also as the father of the art of instrumentalization. For the court of Mantua, he composed the music to the opera of 'Ariodante,' by Rinuccini (1608); having the year previously produced the brilliant success 'Orfeo.' At Rome, the first performances of *opera seria,* consisting of scenes in recitative and airs, were given from a cart during the carnival of 1666 by the musician Quaglia, and four or five of his friends. The first regular serious opera was performed at Venice in 1625; it was entitled 'Amor non ha leggi' ('Love not Bound by Law'). The first *opera buffa* is said to have been represented at Venice in 1624, where also the first stage for opera was erected in 1637. In the opera *Giasone,* set by Cavani, for Cipocognini, for the Venetians (1649), occur the
OPERA

first airs connected in sentiment and in spirit with the dialogue, opening a new path for opera in which the first bright star is Alessandro Scarlatti, the composer of over 100 operas, the chief of which is the 'Rinaldo' (1669); 'Teodora' (1693), in which Scarlatti first introduced the da capo of the grand aria, and replaced secco recitativo by recitativo accompagnato; 'Pirro e Demetrio' (Naples 1694); 'Laodicea e Berenice' (1701); 'Ligrane' (1715); and 'Griselda' (1721). During the latter half of the 18th century, however, opera did not improve but degenerated in Italy, becoming what it was in France later, during the 18th century, a grand spectacle addressed to the eye, in which the poetry and music were the last things considered, while the scenery, mechanical illusions, and pantomime were on the most splendid scale. As Goldoni said long afterward of the grand opera at Paris, 'C'était le paradis des yeux et l'enfer des oreilles.' (It was paradise to the eyes, and hell to the ears).

Meanwhile opera had been transplanted to France, to Germany, and to England. In France arose Lully, whose chief operas are 'Cadmus et Hermione' (1673), 'L’Orontide' (1675), 'Alceste' (1674), 'Thésée' (1675), 'Atys' (1676); 'Isis' (1677), 'Psyché' (1678); 'Belle- rophon' (1679); 'Proserpine' (1680); 'Le Triomphe de l'Amour' (1681); 'Persée' (1682); 'Phaéton' (1683); 'Andromaque' (1683); 'Roland' (1685); 'Armide et Renaud' (1686); 'Acis et Galatée' (1687). In Germany arose Keiser with 116 operas, the most popular of which are 'Stortebecker und Goedje Michel'; 'Die Leipziger Messe'; 'Der Hamburger Jahrmarkt'; 'Die Hamburger Schlachtzeit.' In England, Purcell originated a national opera with 40 stage-works, chief of which are 'King Arthur,' text by Dryden (1691); and 'The Faerie Queen' (1692). Outside Italy these are the chief operatic composers of the second half of the 17th century. In the 18th century Handel appeared, and settling in England, by his long list of stage-works, too numerous to detail here (see his biography), he effected a complete revolution in the English opera, but did not exert a permanent influence, for his forte finally discovering itself in oratorio. After Handel, Arne (30 operas), and Shield, are the chief of the English operatic composers. Much of the genuine English opera to attain popularity was 'The Beggar's Opera' (1728), set to Gay's libretto by Pepusch. The creation of opera buffa (1751), by Pergolesi, 'Sera Padrona,' and 'Maestro di Musica,' and by Logroscino, 'Il vecchio marito,' 'Tanto bene tanto male,' and 'Il governatore,' in opposing itself to the mere manufacture of operas on antique subjects, rejuvenated and revived Italian opera; Cimarosa and Paisiello followed in their footsteps, while in France opéra comique, first called opéra buffon (1752), had its representatives in Duni, Gossec, Monsigny, Phillidor, etc., and in Germany appeared the singspiele of Hieron, Schenk, and Italian opera did not penetrate into Germany until the second half of the 18th century: during this period also, Gluck appeared in Germany, and he made an influence on opera seria, which has holly ceased. At this time the dramatic was apt to be sacrificed to the musical, and the attention to be placed on the invention of songs connected by recitatives. Gluck endeavored to make the opera a well-balanced whole in which the music should be subservient to the action of the drama, though he by no means discarded appropriate airs, and introduced also appropriate choruses and other connected pieces.

The Italians draw the line between the opera seria and the opera buffa much more distinctly than the Germans, so that Italian opera seria appears almost insipid to a German; the buffa, on the contrary is quite national, and produces a lively effect, when played by Italians. What has been called the romantic opera is of German introduction. It its comic or light and amusing scenes alternate with those of a more serious cast. It was Mozart who brought this class of opera to perfection, and his 'Don Giovanni,' 'Magic Flute,' and 'Mariage de Figaro' are unsurpassed, perhaps, are unsurpassable in their genre. Beethoven's single opera, 'Fidelio,' in some respects may be said to stand alone. At the head of the modern school of German operatic composition stands Richard Wagner (q.v.), whose master-mind raised romanticism to its highest power, and while enriching the means of musical expression, it accomplished a reaction against the overgrowth of the melodic element similar to that of the Florentines and of Gluck, depriving the vocal music of the piece of the prominent place formerly ascribed to it, and making it subordinate to the other three elements of an opera — text, instrumentation and scenic decoration. His magnus opus is the magnificent tetralogy, 'Der Ring des Nibelungen,' comprising a sequence of four musical dramas, 'Das Rheingold,' 'Die Walküre,' 'Siegfried,' and 'Götterdämmerung,' first performed entire at Baireuth in 1876. Other notable works are 'Tannhäuser,' 'Lohengrin,' and 'Parsifal.'

The chief Italian operatic composers include, besides those already mentioned, Sacchini, Piccini, Buononcini, Forporra, Jomelli, Cherubini, Rossini, Bellini, Donizetti, and the versatile maestro Verdi, whose 'Otello' (1887) and 'Falstaff' (1893), are among the last of the time of the last of the chef-d'œuvres of opera. Among contemporaneous Italian composers are Boito, Puccini, Franchetti, Giordano, Spinelli, Mascagni, and Leoncavallo. The German composers, throughout the 19th century, Wagner, include Handel, Hasse, Theile, J. W. Franck, Keiser, Mattheson, Telemann, Weber, Spohr, Flotow, Marschner, Lortzing, Cornelius, Nicolai, Johann Strauss, Von Suppé, etc., and among contemporaneous celebrities are Richard Strauss, D'Albert, Burgert, Humperdinck, Goldmark, Schillings, Kienzl, Weingartner, Siegfried, Wagner, and others. Meyerbeer, though German by birth, belongs rather to the French school, the chief representatives of which are Gounod, Moniuszko, Mélhu, Le Sueur, Boieldieu, Aubert, Berlioz, Halévy, Herold, A. Thomas, Gounod, Saint-Saëns, and César Franck (a Belgian). Among the composers of French opéra comique are Offenbach, Lecocq, Bizet, Hervé, Planquette, Audran, Delibes, Massenet, Théodore, Bruneau, Charpentier, D'Indy, and Lalo. Among Russian operatic composers are Borodin, Cui, Glinsky, Rimsky-Korsakoff, Rubinstein, and Tschaikowsky. Poles are represented by Scharwenka, Matusic, and Pacieniec. Among the Slavic are Smetana and Dvorak. In the British school of
modern opera are Balfé, Wallace, Benedict, Macfarren, Sullivan, Mackenzie, Thomas, Cellier, Stanford, and MacCunn. Chief of these is Sir Arthur Sullivan, whose operatic fame rests on a long list of opera buffa, composed to the sparkling libretti of W. S. Gilbert. His opera erna, the 'Golden Legend,' and scholarly 'Ivanhoe,' not meeting with the success due to their merits.

Italian opera was first introduced into the United States in the autumn of 1825, when Garcia's daughter, afterward famous as Malibrán, appeared in Rossini's 'Barber of Seville,' at the Park theatre in New York. Among the earliest attempts to create an American national opera were those of Luigi Arditì and Max Maretzko who, about 1850 and subsequently, produced 'Rip Van Winkle,' 'The Spy,' 'Sleepy Hollow,' and 'Uncle Tom's Cabin,' described as 'the four best American operas ever written,' which 'had they been first brought out in Paris or London would have become popular there, and would have been imported into this country with a flourish of trumpets.' These may be added 'The Scarlet Letter' of Walter Damrosch. The modern native productions of opera buffa partake more of the character of musical farces; notable exceptions are the works of Reginald de Koven and Victor Herbert, due chiefly to the clever libretti of H. B. Smith.

Charles Leonard-Stuart, B.A., Editor, 'Encyclopedia Americana.'

**Opera Bouffe** (boof), a farcical form of opera in which the characters, subject-matter, and music is intended to burlesque the more serious style of opera. Pergolesi was the creator and Offenbach the most master in this art. The comic operas of Gilbert and Sullivan, both in the character of the music and the libretti, stand by themselves. Comic opera is the generally accepted present day term for opera bouffe.

**Opera-glass** (Fr. lorgnette), a double telescope, used for looking at objects that require to be seen more clearly than by the same magnification, such as adjoining scenery and buildings, the performers at a theatre or opera, etc. The opera-glass is short and light, and can be easily managed with one hand. Its small magnifying power (from two to three at the most), and the large amount of light admitted by the ample object-glass, enable it to present a bright and pleasant picture, so that the eye is not strained to make out details, as in telescopes of greater power, which generally show a highly magnified but faint picture. It allows the use of both eyes, which gives to the spectator the double advantage, not possessed by single telescopes, of not requiring to keep one eye shut (a somewhat unnatural way of looking), and of seeing things stand out stereoscopically as in ordinary vision.

The opera-glass is the same in principle as the telescope invented by Galileo. It consists of two lenses, an object-lens and an eye-lens. The object-lens is convex, and the eye-lens concave. They are placed before the eyes and the difference of their focal lengths from one another (see Telescope). The opera-glass need not be set to a precise point, as is necessary with ordinary terrestrial telescopes, for the lengthening or shortening of the instrument does not produce so decided an effect on the divergence of the light; the change of divergence caused by screwing the opera-glass out or in is so slight as not much to overstep the power of adjustment of the eye, so that an object does not lose all its distinctness within the range of the instrument. There is, however, a particular length at which an object at a certain distance is most easily looked at. The two telescopes of the opera-glass are identical in construction, and are placed parallel to each other. The blending of the two images is easily effected by the eyes, as in ordinary vision. The cheapest opera-glasses consist of single lenses; those of the better class have compound achromatic lenses. A very ordinary construction for a medium price is to have an achromatic object-glass, consisting of two lenses, and a single eye-lens. In the finest class of opera-glasses, which are called field-glasses, both eye-lenses and object-lenses are achromatic. Pößl's celebrated field-glasses (Ger. Feldstecher) have 12 lenses, each object-lens and eye-lens being composed of three separate lenses. See LENS; OPTICS; TELESCOPE.

**Operations, Dental.** See DENTISTRY.

**Operations, Military.** See MILITARY SCIENCE; TACTICS, etc.

**Operations, Surgical.** Measures other than medical for relief of conditions resulting from disease or accident, and generally involving the use of cutting instruments or of apparatus. Surgical operations include those mentioned below.

**Reduction of Fractures.**—This process consists in so manipulating the fragments of bone as to bring them into proper position and free them from intervening tissue, and then, by immovable apparatus, retaining them in position till union takes place from the growth of new bone or of ligament. Flat or rounded splints of wood, of sole-leather, of prepared felt, or of plasterboard are used, or bandages are saturated with silicate of soda (water-glass), or with plaster of Paris.

**Reduction of Dislocations.**—The displaced bone is manipulated by the surgeon in such a way as to force it to re-enter its socket through the tear made in its capsular ligament in its exit. Leverage is used, with a hand or foot or opposing muscles as a fulcrum, and retaining apparatus is applied to secure rest till swelling and other inflammatory symptoms cease.

**Amputations and Disarticulations.**—Amputations consist in the removal with the knife of some part of the body, as an arm, a breast, etc. In the amputation of a limb, the soft parts, after being cut through, are retracted so as to allow the bone to be sawed off as far back in the flesh as possible. This procedure provides, after tying all bleeding arteries and cleansing the surfaces, for covering in the bone deeply with muscle and skin flaps. Before beginning the amputation of a limb, a tight rubber band is applied about it, so as to prevent hemo- cease when the arteries are severed. After the band is tied, the band is removed. A disarticulation is an amputation through a joint; the flaps are provided, and the bone's end is covered. In all amputations of limbs the goal is so done that the scars resulting shall not be located so as to prevent the adjustment of an
OPERICLUM—OPERETTA

artificial limb. Many ingenious amputations of special parts of the body have been devised, as of the foot. In one of these, parts of two bones are removed, and the remnants are brought into apposition, so that they unite. This is termed osteoplasty.

Ligation of Arteries.—This is an important and very frequent procedure in surgical operations. An artery may be tied in continuity in cases of hemorrhage, or aneurism, etc. In such cases the artery is exposed and a blunt-end needle, with an eye near its tip, is loaded with the chosen ligature, and hooked under the vessel. The ligature is caught by the surgeon with a forceps, and pulled through while the needle is withdrawn. The ends of the ligature are then tied above the artery. An artery may be tied when bleeding in the stump of an amputation. Catgut, silk, kangaroo tendon, and silk-worm gut are the chief varieties of ligature used. An artery is sometimes held with pins thrust through the adjacent flesh, so as to compress the vessel (acupressure), or it may be closed by being twisted at its extremity (torsion).

Excision and Resection.—Excision is the removal of a portion of the body by cutting it from the surrounding tissues. If a portion of bone or a joint be removed, the operation is termed a resection. Excision may be desirable in the case of a tubercular joint or a necrotic bone, or in hip-joint disease, for example.

Besides these general measures, many special operations are performed. These include, beside many others, those mentioned below:

Plastic Operations Upon the Face.—In these, skin from forehead or cheeks is taken to repair, for example, a nose or a lip which has been lost or excised because of disease. In some cases a finger, or the skin of the arm, may be used for this repair, the hand being fastened to the head for a few days before the transplanted part is entirely severed from its original site.

Tracheotomy.—This is the operation of opening into the trachea or windpipe through the neck in order to insert a tube through which the patient may breathe during closure of the throat from diphtheria, or swallowing a foreign body, or other cause. A modification of this is laryngotomy, in which the opening is made through the larynx below the vocal cords.

Paracentesis.—Puncture into the pericardial or pleural cavity to draw off fluid thence.

Operations on the Kidney.—These include that of cutting the kidney open to remove a stone, or a new growth, or to drain off fluid (nephroscopy); suture it to the abdominal wall to prevent floating; incising and stripping off the capsule in cases of Bright's disease (nephropexy); and removal of a kidney (nephrectomy).

Appendectomy.—This is removal of the vermiform appendix, a procedure necessary in many cases where the acute inflammatory process of appendicitis is in progress. In some cases where appendicitis has not occurred, an "interval operation" is done, after the subsidence of the attack and before the incidence of another. An incision is made a few inches above the navel, in the right side of the abdomen; all parts of the appendix are dissected free; the appendix is found, and is cut off close to the point of emergence from the caecum, and its stump is inverted into the intestine and fastened with sutures of catgut. The peritoneal cavity is then washed out, and the abdominal wound is closed around a drainage tube. It is now advised that operation be done very early, and the possibility of fatal peritonitis be avoided.

Operations on the Nerves.—These may be necessary to suture divided nerves together, to resect parts of nerves, or to remove ganglia in severe neuralgic affections.

Trehoming.—This is opening the skull by means of the trephine, an instrument which removes a button of bone. Resort is had to it in order to explore the brain with needles or canulæ in search of abscess, hematomata, or cysts; to elevate depressed portions of a fractured skull, and to pick out fragments of bone; to expose a sinus because of thrombosis or suppuration; or for intracranial hemorrhage. The operation is also performed for the purpose of exposing various arteries and nerves. The "mastoid operation," which is frequently undertaken for middle-ear suppuration, is substantially as follows: An incision is made through the soft parts down to the bone back of the auricle or other affected side, from the tip of the mastoid process to a point opposite the upper limit of the auricle. Bleeding vessels are secured, and the periosteum is separated from the bone as far forward as the meatus. A bony projection which is thus uncovered is cut away with a chisel or gouge, and some of the cortical layer of the bone over the antrum is removed. The mastoid cells are easily reached, softened bone is scraped away, and exudate is removed from the tympanum. In some cases two of the small bones of the ear, the incus and malleus, must be removed. (See Ear.) Proper drainage is arranged through the wound and the meatus, and sutures are put in. Consult Park, 'Surgery by American Authors' (1901); Kocher, 'Text-book of Operative Surgery' (1903).

Operculum, in conchology, the horny or limy plate developed upon the "foot" of many gastropods, serving to close the aperture of the shell when the animal has withdrawn into its abode. The operculum is generally an outgrowth on the dorsal side of the foot, behind the shell. It is present in nearly all land, freshwater and marine Prosobranchia, is absent in all Opisthobranchia, in the adult state, except Acteon, and in all Pulmonata except Amphibulia, and has been lost in several familiar families, as the cones, mitres and cowries. As a rule the operculum exactly fits the aperture, and hence it varies in outline in different groups; but in some cases where the aperture is very large it closes it only in part. Other abnormalities exist; and in general the operculum is a variable character of little if any value in classification. The theory formerly held that this excrecence was homologous with a second valve, or with the byssus of bivalves, is not now considered justified by facts. Use has been found for certain round, thick, and concentric opercula, to represent the eyes in rude human figures made by South Sea islanders; and as eyestones—small lenticular and smooth ones, as of small turban-shells, which may be slipped easily around the ball of the eye beneath the eyelid, and bring out intruding and painful objects caught there.

Operetta. See OPERA.
OPERTI—OPHTHALMIA

Operti, ö-par-te, Albert (Jasper Ludwia Roccabigleri), Italian artist: b. Turin, Italy, 17 March 1852. He entered the British navy as midshipman, but resigned in 1868. He then elected the career of a painter; was illustrator, caricaturist and scenic artist in New York, and afterwards went on Arctic expeditions, during which he acted as New York Herald special correspondent (1866–7). From the studies made during his northern voyages he executed his well known 'Rescue of the Greely Party' and 'Farthest North' (for the Army and Navy Departments, Washington); 'The Schwatka Search'; 'Finding De Long in the Lena Delta'; and 'Dr. Kane.' He was selected as artist by the United States government to the World's Columbian Exposition.

Ophelia, ö-fel-á, in Shakespeare's play of 'Hamlet,' the daughter of Polonius. Hamlet, with whom she is in love, having unintentionally killed her father in his madness, turns away from Ophelia, whose reason is now overthrown, and in the various phases of her derangement the drama presents its tenderest scenes of pathos. While gathering flowers, Ophelia is drowned.

Ophicleide, öfik-líd, a brass wind-instrument of music invented about 1790 to supersede the serpent. It generally consists of a wide conical tube bent double with a bell-mouth, and has eleven keys and a cup-shaped mouth-piece. Its compass ranges a little over three octaves (or thirty-eight semitones), namely from the B flat one semitone below the lowest note of the violoncello to C in the treble stave, and it is capable of very accurate intonation. It is used in orchestras, and is capable of very pleasing effects as a solo instrument, but is all but superseded by the saxhorn (q.v.).

Ophid'ia, an order of reptiles containing the serpents,—saurians in which the right and left halves of the lower jaw are connected by an elastic band. (See Lizards.) The appendages and shoulder-girdles are typically absent, although in certain families rudiments of the posterior appendages and pelvis still persist. The quadrato is not fixed, and, acting as the suspensor of the lower jaw, gives a surprising facility for swallowing. The number of vertebrae is great. The skin is covered with horny scutes, which are periodically shed with the cuticle. The eyes are without lids. The sense of smell is acute. The left lung is smaller than the right and may be quite rudimentary. A few snakes are viviparous. The Ophidia seem to have arisen from lizard-like ancestors in tertiary times. They are now nearly cosmopolitan, only the coldest countries and certain large islands (New Zealand, Ireland) being devoid of them. See SERPENTS.

Ophi'oceph'alus, the type-genus of the family Ophiocephalidae, containing the curious East Indian fishes called Serpent-heads.

Ophi'glossa'les, the grape fern. See Ferns.

Ophir, ö'fér, a place mentioned in the Old Testament scriptures from which the ships of Solomon brought large quantities of gold, sandal-wood, and ivory wherewith to adorn the king's house, then building at Jerusalem. There are different opinions about its exact situation. Some scholars place it in northern Asia, others in India, and America has likewise been mentioned as comprising Ophir. Later it has been located in the East Coast of Africa.

The explorer and traveler Baer identifies Ophir with Malacca. Lassen's view that Ophir is the Semitic name for the "Abhira," a pastoral people in Northern India, seems best grounded, and the land of Ophir is the territory they inhabit. This Ophir has no connection with the same word occurring in Genesis x. 29.

Ophite, in mineralogy, formerly a synonym for serpentine (q.v.); now a basic rock of greenish color with a characteristic exterior resemblance to serpentine, occurring especially in the Pyrenees. Its texture is intermediate between granite and porphyry, and its structure is characterized by the incomplete crystallization of its parts, some being completely crystallized and others entirely amorphous, a phenomenon called ophitic structure.

Ophites, öf'l'tz (Gr. φίτας, a serpent), a Gnostic sect of the second century who worshipped a living serpent. They considered that the serpent in Eden was a misleading seducer of man, and an agent of the will of Jehovah, whom they regarded with abhorrence. See SERPENT-WORSHIPPERS.

Ophichthus, ö-fi'küs, in astronomy, an ancient northern constellation, representing a man holding a serpent; called Serpentarius, the Serpent-bearer. It has about 80 stars visible to the naked eye.

Ophi'turo'idéa, a class of the phylum Echinodermata, embracing the slender-armed sand-stars. It is divisible into two orders: (1) Ophiurida, in which the arms are called Brittle-stars; and (2) Euryoidida, in which the arms are branched (see Basket-Fish).

Ophthal'mia, inflammation of the eye; a general term used by the older writers, but at the present day either not employed by oculists, or applied by them only to conjunctivitis (inflammation of the conjunctiva) or to conjunctivitis and inflammation of the eyelids. There are various grades and types of conjunctivitis, all of which have to a greater or less extent the following symptoms in common: photophobia — aversion to or intolerance of light; an increased and usually altered secretion; and injection of the blood-vessels, accompanied sometimes with a slight velvety opacity, or special products, a false membrane, granulations, etc. In all forms of conjunctivitis there is need of cleanliness, antiseptic washes, poultices, protection from excess of light and injuries, dust, etc. In most forms the case should be under the care of a physician.

Simple Conjunctivitis.—This is catarrhal conjunctivitis, characterized by congestion, a feeling as of the presence of a foreign body, lassened transparency of the conjunctiva of the lids, and a discharge, at first watery, then acrid, excoriating the cheeks, may become mucous or mucopurulent, gluing the eyelids together. Usually the vision is clear, but it may be hazy, if the secretion is more than watery. Necrotic organisms, necrotic process of treatment, melancholy scrofulous diathesis may convert a simple conjunctivitis into a purulent and more or less communicable or infectious disease. Usually the prognosis is good, recovery occurring in a few days.
OPHTHALMIA

Varieties of Simple Conjunctivitis.—Associated conjunctivitis occurs sometimes with eczema, facial erysipelas, bronchitis, and other disorders; exanthematous conjunctivitis (ophthalmia scarlatinosa, ophthalmia scarlatina, etc.) may accompany or follow exanthematous diseases such as measles or scarlet fever; mechanical conjunctivitis is caused by wind, tobacco smoke, dust, or injuries; toxic conjunctivitis by exposure to the influence of certain chemicals, aniline dyes, chrysophanic acid, etc., or by the prolonged use of atropine, e sine, cocaine, etc.; and symptomatic conjunctivitis from the strain of the eyes in defective vision. For treatment, remove the cause, if possible, and alleviate associated conditions. Wash the eye frequently with cold or hot water, as agreeable, but do not rub it. As a wash or spray, ten grains of bor acid to an ounce of water will be of service. When the discharge is mucopurulent, stronger applications are necessary.

Acute Contagious Conjunctivitis.—Known also as acute mucopurulent conjunctivitis, epidemic conjunctival catarrh, and pink-eye, this was formerly classified as a severe form of simple conjunctivitis. It is now believed to be a specific bacillus, resembling at first simple conjunctivitis, then the discharge is mucopurulent, the conjunctiva is much swollen, and even chemotic, and the lids may be edematous and glued together. Prognosis is good, but relapses are common, recovery taking place usually in about two weeks. Treatment is similar to that of simple conjunctivitis. The affection being contagious, all sources of such contagion as is due to towels, sponges, etc., must be discarded.

Purulent Conjunctivitis.—This acute bullous conjunctivitis of the conjunctiva is of two forms, that of the new-born (ophthalmia neonatorum), and the gonorrheal conjunctivitis of adults. Conjunctivitis neonatorum, characterized by severe pain, great swelling of the eyelids, serous infiltration of the conjunctiva, and a copious discharge of pus, is introduced into the eye of infecting material (sometimes gonorrheal), usually from some portion of the genito-urinary tract of the mother, at the time of or shortly after the child's birth, or from the hands, towels, etc. There is cohesion of the eyelid and eyeball, opacitiy, and sometimes perforation. Prognosis is grave, but treatment is generally successful if a competent physician has charge while the cornea is still clear. Cold compresses at first, then hot fomentations, constant gentle removal of the discharge, at first a mild eye wash, as before indicated, later the introduction of a solution of nitrate of silver (Crede’s plan) or other substances, absolute cleanliness, and the destruction of lint, cotton, or any infected substance, comprise the measures of relief.

Gonorrheal Conjunctivitis.—This affection (purulent ophthalmia, acute bullous conjunctivitis in adults) is usually caused by contagion from an acute conjunctivitis of the eyes, or from a similarly affected eye, through fingers, linen, towels, etc., though it may arise from a vaginal leucorrhea, phthisia, and other causes. The symptoms are similar to the above, which appear in the purulent conjunctivitis of the new-born but more severe, and the treatment should be entirely in the hands of the physician. The vitality of the cornea is in constant danger; ulceration and matting together of the iris and cornea, inflammation of the choroid, iris, etc., and even destruction of the eye may occur. This disease may become chronic and one of the forms of chronic conjunctivitis.

Croupous or Pseudomembranous Conjunctivitis.—Of this, which is a chronic membranous conjunctivitis, there are two forms, one quite mild, usually attended by a soft, painless swelling of the lids, a membranous exudation upon the conjunctiva, and generally a scanty seropurulent discharge occurring before the seventh year. The cause is not known. The second form is rapid in development, is attended with much swelling and discharge, and may quickly destroy the cornea. Frequent removal of the discharge with a solution of common salt, cold compresses, and the use of nitrate of silver, etc., are the measures employed for relief. The affection occurs with measles, scarlet fever, influenza, and non-febrile disorders.

Diphtheritic Conjunctivitis.—This form usually occurs in young children, either mildly with pseudomembranous conjunctivitis, attacks persons of all ages, is believed to be due to specific bacilli, resembles at first simple conjunctivitis, the discharge is mucopurulent, and the conjunctiva is much swollen, and even chemotic, and the lids may be edematous and glued together. Prognosis is good, but relapses are common, recovery taking place usually in about two weeks. Treatment is similar to that of simple conjunctivitis. The affection being contagious, all sources of such contagion as is due to towels, sponges, etc., must be discarded.

Phlyctenular Conjunctivitis.—Also called phlyctenular ophthalmia, scrofulous ophthalmia, eczema of the conjunctiva, characterized by one or more grayish, sometimes purulent elevations, generally on the eyeball portion of the conjunctiva. It occurs in strumous and badly nourished children, and tends to a disease of the cornea (phlyctenular keratitis) and to its opacity. Attention to hygienic measures, good food, etc., tonics, mild eye-washes, followed by the application of an ointment of the yellow oxide of mercury, are requisites of treatment.

Spring Conjunctivitis.—Considered by some writers as an epidemic caused by the introduction of the eye of infecting material (sometimes gonorrheal), usually from some portion of the genito-urinary tract of the mother, at the time of or shortly after the child's birth, or from the hands, towels, etc. There is cohesion of the eyelid and eyeball, opacitiy, and sometimes perforation. Prognosis is grave, but treatment is generally successful if a competent physician has charge while the cornea is still clear. Cold compresses at first, then hot fomentations, constant gentle removal of the discharge, at first a mild eye wash, as before indicated, later the introduction of a solution of nitrate of silver (Crede’s plan) or other substances, absolute cleanliness, and the destruction of lint, cotton, or any infected substance, comprise the measures of relief.

Granular Conjunctivitis.—Granular ophthalmia, Egyptian ophthalmia, military ophthalmia, known as trachoma, and, popularly, as granular lids. It occurs in acute and chronic forms; is infectious and sometimes widespread, and
OPHTHALMOSCOPE — OPIE

although affecting mainly persons of poor health and in bad hygienic surroundings, it may attack those in good health. The symptoms of the acute form are: swollen lids; reddened conjunctiva; hypertrophied papillae, between which are non-vascular, roundish granulations; scalding tears; intense photophobia; pain in the brow and temple; and mucopurulent or purulent discharge. In the chronic form, there is less of pain, redness and other results of inflammation; the conjunctiva is roughened; the granulations degenerate and soften. In both forms there is danger of cloudiness and ulceration of the cornea, and of scars with consequent deformities of the lid and its border. The sufferers should shut out the light and keep the eyes most of the time partly closed. The treatment in earlier stages calls for soothing remedies; in chronic or severe cases, caustics and astringents, operative procedures, and general medication.

So prevalent is trachoma in cities, especially in the crowded tenement districts, that the health authorities now treat affected children at the schools and in their homes, thereby greatly limiting the spread of the disease and checking its effects in vision. The work done on these lines in the city of New York since 1902 has been particularly noteworthy. Trachoma, mainly brought here by Russian Jews and other immigrants from unclean environments, and which rapidly spreads by contagion, was making inroads among the most exposed districts of the public schools, and threatening not only the health of New York, but, more remotely, that of the country at large. The board of health took various steps to check its spread.

Every child in the public schools was subjected to medical examination by experts appointed by the board, and in cases of slight affection parents were notified and instructed in the necessary precautions to cleanliness, etc.; in more advanced cases the children were taken out of school, isolated at home, and there treated; and in extreme cases still more rigorous methods were adopted. At the same time all teachers in the public schools were required to observe and report upon the slightest condition of the eye, in order that affected children might be promptly excluded. Within two years the most remarkable results were attained; trachoma was almost eradicated from the city, and it has been demonstrated that the disease, under vigilant administration of public health officials, can be brought and kept under control.

Subacute Conjunctivitis.—Sometimes chronic, this appears in association with a diplobacillus, is insidious, runs a course of six weeks to six months, is characterized by redness of the edges of the eyelid, congestion, and hypersecretion of the conjunctiva. Treatment is the same as in simple conjunctivitis, with the addition of zinc-sulphate solution.

Pavinaud's Conjunctivitis.—This form, usually unilateral, is rare. It was first described by Pavinaud and believed to be due to infection of animal origin. The symptoms are swelling of the lids, mucopurulent discharge, large polypoid granulations, with ulceration between them, and lymphatic involvement. It usually lasts from one to several months. Treatment includes antiseptic washes — nitrate of silver or sulphate of copper — and surgical removal of granulations.

Chronic Conjunctivitis.—Chronic ophtalmia: it may be either an independent affection or the result of an acute blepharitis. As an independent disorder, it occurs mainly in elderly people. The symptoms are hyperemia, soreness and thickening of the edge of the tarsus, conjunctiva, swelling of the caruncle, and slight mucopurulent discharge. Treatment: antiseptic lotions, astringents, attention to the tear ducts and refractive errors, and cleanliness. Lacrimai conjunctivitis is a form of the above, depending upon obstruction of the lacrimal passages.

Egyptian and Military Conjunctivitis.—These are terms loosely used for all forms of conjunctivitis occurring in barracks and crowded assemblies, more or less epidemic in chronic, and attended by a mucopurulent or purulent dischage.

Ophthalmoscope, an instrument for observing the structure of the eye. The first of the kind was invented by Helmholtz in 1851, but improved instruments are now generally in use. Most of these consist of a mirror by which a ray of light is directed on the eye of the patient, and a double convex lens, by which the illuminated parts of the structure of the eye are enlarged in order that they may be more easily examined. The observer looks through a hole in the centre of the mirror. The examination must take place in a room lighted only by a single lamp, which is placed on the side with the patient's eye on his right or left hand, according to the eye which is to be examined is the right or the left one. The patient's eye is prevented from receiving the direct rays of the lamp by the interception of a metal plate. The operator having placed the patient in front of him, and with one hand directed the light reflected from the mirror on the eye which he wishes to observe, adjusts the convex lens, which he holds in the other hand until he gets the proper focus. He then looks for the entrance of the optic nerve, which he sees as a white disk, from which proceed the central vein and artery of the retina, giving off six or eight branches. This is the part through which it is now necessary to look, and the other parts of the internal structure of the eye may be observed in the same way. The patient must change the position of his eye until the observer has the part he wishes to examine within the range of his right or left hand. Whatever instrument is used, considerable practice is required in the observation of sound eyes before the operator is able to use it effectively in detecting disease in the eye. See Eye; SIGHT, D E F E C T S O F.

Opié, 6'pf., Amelia Alderson, English novelist: b. Norwich, England, 12 Nov. 1760; d. 2 Dec. 1853. She was married to John Opié, the well-known portrait painter, in 1798, who greatly encouraged her in her literary work. In 1801 she published 'Father and Daughter,' a novel which at once attracted attention, and she steadily gained in popularity by her subsequent work which delineated with pathos and interest the English home-life of the day. She was also a poet of the ability. After the death of her husband in 1807 she returned to her father's home and subsequently joined the Society of Friends. She published: 'Adeline Mowbray' (1804); 'The Warrior's Return and Other Poems' (1806); 'Madeline' (1822);
OPIE—OPIUM

'Lays for the Dead' (1833); etc. Consult the Life of Mrs. Opie by C. L. Brightwell.

Opie, John, English painter: b. Saint Agnes, Truro, Cornwall, May 1761; d. 9 April 1807. When about 19 he was taken to London by Dr. Wolcott ('Peter Pindar'), who befriended him in various ways. Through the influence of his patron he acquired great fame as a portrait painter, became known as the 'Cornish Wonder,' and while this season of favor lasted, realized a moderate fortune. He then turned to historical painting, and produced his 'Murder of James I. of Scotland'; 'Slaughter of Rizzio'; 'Jeptha's Vow'; etc. His 'Slaughter of Rizzio' was exhibited in 1767, and secured his election to the rank of associate to the Royal Academy. In 1788 he was appointed a Royal Academician. In 1805 he was elected professor of painting in the Royal Academy, but only delivered four lectures before his death, and these with a memoir by his wife, were published in 1809. He is also the author of the biography of Sir Joshua Reynolds in Wolcott's edition of Pilkington's 'Dictionary of Painters' and of 'An Inquiry into the Requisite Cultivation of the Arts in England,' which among other influences led to the formation of the National gallery.

Opisthognphv'a, one of the two groups, the other being Proterognphv, into which veno- nomous serpents (q.v.) are divided according to the position of the posterior portion respectively of the poison-conducting teeth. The snakes of the first group are included in the family Colubrida, and are represented by the neotropical tree-snakes (Dipsas), the European cat-snake, and the Oriental Homalopoma. In their case one or a few of the posterior maxillary teeth have a groove or furrow in front, which conducts the secretion of the enlarged upper labial glands into the wound. These opisthognphvs comprise about 300 species and are of considerable morphological interest, since they connect the Colubrida with the Viperida, the characteristic (proterognphv) poisonous apparatus of which seems to have been derived from that of the Ophida by the reduction or shortening of the anterior portion of the maxillaries and the harmless teeth so that the posterior or poison fangs come to the front. The Proterognphv, then, are those serpents, such as the cobras and cobra-like sea snakes (Hydrophina), vipers and rattlesnakes, whose poison fangs are in the front part of the mouth.

Opitz, 6'ptis, Martin, German poet and critic, the 'Father of modern German poetry': b. Bunzlau, Silesia, 23 Dec. 1597. He was educated at Heidelberg, where he became the centre of a circle of young poets, fled to Holland in 1620 to escape the plague, returned to Silesia in 1622, taught for a time, in 1625 was exiled and crowned with laurel for his poetic fame by the Emperor, from 1628 to 1632 was secretary of Dohna, the persecutor of Silesia, and then became the client of Ulrich of Holstein, as ardent a Protestant as Dohna was a Catholic. But the story of his life, with its changing of sides and its petty flattering, is less important than his literary work. When scarcely 21 he wrote 'Aristarchus, sive de Contemptu Lingue Teutonicae,' urging the infusion of classical imitation into German poetry; and in 1624 this German Boileau published 'Das Buch von der deutschen Poeterey,' which insisted on accent in place of mere numbered syllables and in many other respects made possible the revival of German poetry in the 17th century. His poetical work was by Rohiguet in 1814, and var. (near colorless octahedra), discovered in 1832 by Rohi- quet and described by Grimaux in 1881: prepared from morphine by heating it with methyl iodide and soda, it is methylmorphine; narcene or narceine (long quadrangular prisms or white
OPium

silky needles, odorless), discovered in 1832 by Pelletier; pseudomorphine (fine crystalline powder, derived from morphine), also called phormine and oxydormorphine, discovered in 1835 by Pelletier and Thibourney; thebaine or paraphormine (silver scales or prisms with stypitic taste) discovered in 1835 by Thibourney; paparenine (colorless needles or prisms), discovered by Merck in 1848; rheodine (white tasteless prisms), discovered in 1865 by O. Hesse; cryptopine (minute prisms), discovered in 1867 by T. and H. Smith; oxynarotine (isolated from the mother liquor of narcine), discovered in 1876 by Wright and Beckett; gnoscopine (woolly needles, obtained from narcine), discovered in 1878 by T. and H. Smith. In 1870–8 O. Hesse announced the discovery of lanthopine (finely crystallized), meconidine (amorphous, not stable), laudanine (large crystals), codamine (crystalline), deuteropine, laudanosine (crystallizable), and proto- pine (crystallizable). The discovery of hydrocataramine (crystallizable) was announced in 1890 by Mathieson and Wright. Apomorphine or apomorphan, derived from morphine or codeine, although a depressant, is a prompt and valuable emetic.

Of the alkaloids of opium, morphine, codeine, and narcine are of most importance. Morphine in its action on the body very nearly represents that of the crude drug. The average dose of opium for an adult is one grain; of morphine, $\frac{1}{4}$ to $\frac{1}{2}$ grain. Codeine acts like morphine, but is weaker, and is less likely to be followed by headache, constipation, and other unpleasant symptoms. It is used principally to allay pain and coughs. "Codeine, paparenine, cryptopine, and narcine have a certain soporific action, but the remainder of the alkaloids are almost devoid of it."

Official Preparations of Opium.—The principal preparations (including the alkaloids) are the acetate, hydrochlorate, and sulphate of mor- phia, sulphate of codeine, powered opium, pills of opium (opium and soap), Dover's powder (opium, ipecac, and sugar of milk), troches of licorice and opium, tincture of opium (laud- nasine tincture), MacPhee's elixir, camphorated tincture (paregoric), tincture of ipecac and opium (liquid Dover's powder), vinegar and wine of opium, and opium liniment.

The use by the physician of one or other of these preparations is to a certain extent a matter of personal habit. The alkaloids are generally considered to act more promptly than opium itself and its solid and liquid preparations, and to be less constipating. Solutions of opium are more prompt in action than solid preparations and salts of morphine than morphine itself.

Properties and Use of Opium.—Opium is a stimulant narcotic; in small doses, stimulant; in larger, a sedative; and in still larger, a narcotic poison. It is readily absorbed from the stomach, less quickly from the intestine (McMullen, 1844). It is very little from the skin, if it is not abraded. When injected under the skin (subcutaneous, hypodermic, or hypodermatic use), its action, as a rule, is rapid. Opium is used by many nations for its exalted properties, being either eaten, smoked, or used as a substitute for alcoholic drinks. Medically, it is used to relieve pain, to produce sleep in certain low conditions, to allay nervous irritation, as in coughs, to check excessive secretion, as in diarrhea, dysentery, and diabetes, and to support the system when sufficient food cannot be retained. The action of opium is not always uniform. With some individuals, due to age, race, temperament, condition of health, personal idiosyncrasies, etc., opium produces effects different from the ordinary results, such as delirium, cramps, vomiting, severe headache, and itching of the skin. Young children, old people, and persons of a nervous temperament are particularly susceptible to the influence of opium; small doses sometimes producing in these coma and even death. On the other hand, severe pain, flooding, etc., sometimes requires three to four times the ordinary dose. Many of the soothing syrups and carminatives contain opium. It is believed by many physicians that morphine should never be given to a child under 10, nor a hypodermic injection to a child under 15. In frogs small doses of opium produce tetanus; in mice, convulsions; they stupify dogs and rabbits; while it requires large doses of poison ducks, chickens, and pigeons. In small doses, opium usually excites or stimulates, increasing the fulness, force, and frequency of the pulse, the temperature of the skin, the power of the muscles, arousing mental action, and affording bodily and mental calm. In a variable time, usually within an hour after the opiate has been taken, there is a disposition to sleep or repose. On arouses from sleep there is frequently head- ache, with nausea, tremors, etc., until the body recovers its energy. Most of the secretions are diminished by opium, the peristaltic action of the bowels lessened, pain and muscular contractions or spasms allayed, and nervous irritation relieved, but always with the risk of repetitions of the dose and the formation of the opium habit.

Opium-Poisoning.—This is quite frequent, due to the overuse of the drug to relieve pain or produce sleep, or as an indulgence, it being unfortunately too easy to procure opiates, Poisoning is principally from the salts of morphine, either used alone or in patented compounds. The primary or stimulant effects may be loquacity, restlessness, high color, and rapid pulse; although the period of exaltation may be short, if present at all, the symptoms of the second or intermediate period rapidly appearing. These are similar to those of congestion of the brain, weariness, dulness, drowsiness, a sense of weight in the extremities; the face is pale, suffused, or cyanotic; the pupils are slightly contracted; the breath is slow, and may be deep and stertorous; the skin may be dry and warm, or cool and wet; the pulse is generally normal; the patient is unconscious, but may be roused by shaking, by the infliction of pain, or by loud talking; and when aroused, his breathing becomes more rapid. In the third period, that of narcosis or coma, the patient cannot be aroused; the face is pale and cyanotic (flushed, especially the lips); the pupils are insensible to light, usually contracted to the size of a pinhead, sometimes dilated toward the end of life; the pulse is rapid and feeble; breathing is slow and shallow, with interval influence, the skin is bathed at first in warm perspiration, then becomes cold and clammy. Convulsions are rare. Recovery may even now take place, or death occurs from failure of
**OPIUM — OPIUM TRAFFIC**

respiration and arrest of the heart's action. A post-mortem examination may reveal nothing abnormal; or the brain may be congested, the vessels of the cerebro-spinal axis gorged with dark blood, the lungs, heart, liver, and spleen distended with dark fluid blood, and serum may fill the ventricles and be beneath the arachnoid.

*Treatment of Opium-Poisoning.*—Produce emesis, with copious drafts of warm water, with a tablespoonful of salt or a teaspoonful of mustard well stirred in; by tickling the throat with a feather; or by use of a stomach-pump; apply cold affusions to the head and spine, and flagellation to the palms, soles, and calves, and with a damp towel to the back; keep the patient walking briskly, though he begs for rest; give strong coffee and aromatic spirits of ammonia; frequently use the Faradice current upon the limbs; and resort to artificial respiration if necessary.

The Opium-Habit.—Indispensable as opium is in certain affections, in the hands of the thoughtless and weak it is too often a curse. It is the most seductive of all the narcotics. *"By its soothing and exhilarating influences it gains a hold on the moral and physical nature that the strongest will is unable to emanate the victim from its enchantment, and moral degradation results."* With children, its frequent use in cough-mixtures, carminatives, etc., interferes with the assimilation of food, enervates the system, and prepares the way for depraved appetites. The opium-habit seems to be a disease of comparatively recent times, dating, as some believe, from the invention of the hypodermic syringe in 1853. Undoubtedly the consumption of opium has increased steadily within the last 50 years. This is due largely to the fact that neuroses have increased, owing partly to a more and more hurried and intense mode of living, and in part to the ease with which opiates are obtained and the attractive forms in which they are presented—granules, triturates, etc. The habit is often induced by the frequent use of opium to relieve pain or depression of the spirits, or simply through yielding to sensuous enjoyment, as in opium-smoking. It may also be due to defective will-power, transmitted sometimes in a neurotic taint from opium-taking parents and grandparents.

The opium-habit frequently become so demoralized as to need care in an asylum. They lie, steal, lose self-respect and ambition, are forgetful, may be subject to delusion, fear, and superstition, and are careless as to clothing and necessary habits, while still thinking highly of themselves. The great nerve-centres tolerate stimulation to a certain point. When the limit is reached, the time varying in different persons, the action of the various organs and tissues is disturbed. The victim of opium suffers from imperfect digestion, faulty appetite and assimilation, and consequent malnutrition. The red blood corpuscles diminish, he is pale, has nausea, muscles are flabby, and endurance weakens. The kidneys become affected, the skin is congested, and when the disease is advanced, purpura appears. There is often a malaria-like fever. The functions of the testicles in the man and of the ovaries in the woman are suspended. Primarily there is functional derangement of the brain, then permanent deterioration. He becomes a slave to his depraved appetite. When the time draws near for his allotted dose he is nervous, yawns, may have neuralgia, is weak, breaks out into a perspiration, and is miserable. He takes his dose, and is happy again; but nearer the time the dose has to be increased, and if relief from his craving is not obtained he sinks lower and lower and dies a wretched death. Two methods of cure are employed; one is the gradual reduction of opiates, the other is their sudden withdrawal in either case acting in their stead but a few narcotics, stimulant carminatives, such as ginger, and certain stimulants and medicines. The law holds opium habitués, as it does drunkards, responsible for crimes which they commit. Consult 'United States Dispersary and Reference Handbook of the Medical Sciences' Potter, 'Handbook of Materia Medica, Pharmacy, and Therapeutics' (1901).

Opium, Wild, an American wild lettuce (Lactuca canadensis) noted for its tallness, reaching a height in some plants of ten feet.

**Opium Traffic.** The. The habitual use of opium as a narcotic drug is common in most countries, and particularly so in China, India, Turkey, the Philippines and the Malay Archipelago. The great source whence China has always derived its opium has been India, where since 1793, the drug has been a government monopoly, the cultivators, in Behar, Benares, and Malwa being paid at a fixed rate for their crops for exportation to China. The trade was contraband, the Chinese government having in 1793 prohibited the importation of opium. Through the connivance of the Chinese local officials, the importation about trebled in the 20 years between 1816 and 1836. In March 1839 the Chinese authorities forbade all foreigners to quit Canton, and ordered them to deliver up the opium in their possession, which was destroyed. The War with Great Britain resulted, which ended in the defeat of the Chinese, who were obliged to pay indemnity for the opium they have since been compelled to admit it, and the Indian revenue derivable from its growth has risen to about $45,000,000 annually. The imports of opium into Great Britain averaged 600,000 to 700,000 pounds annually. This has recently been reported — about 140,000 pounds to the United States, and over 200,000 pounds to South America and the West Indies. The United States imports nearly 600,000 pounds of crude opium, and from 45,000 to 75,000 pounds of opium prepared for smoking.

Opium in Asiatic countries is chiefly smoked and not eaten, a special pipe and lamp being employed. Before it is suited for smoking it goes through several processes, which bring it into the form of a blackish paste. The pipe, or rather the stem of the pipe, is made of heavy wood, and is about the length and size of an ordinary soup-spoon; the bowl is of earthenware. The smoker, who is reclining, takes a small portion of opium about the size of a pea on the end of a spoon-headed needle, heats it at the lamp, and then places it in the bowl of the pipe, which has previously been perforated with the needle. He then brings the opium to the flame of the lamp, inhales the smoke in several inspirations, and is then ready to repeat the process with a fresh quantity of opium. The smoke is exhaled through the nostrils. Old smokers are able to
fill the lungs with it. The smell of the burning opium is rather sickening to those unaccustomed to it.

In China probably about 1 per cent of the entire population smoke opium, but the habit is growing rapidly. Fines, penalties, and even death have been found ineffective to stop the practice. The Japanese government has always steadfastly opposed opium. In Formosa, since that island has become Japanese territory, the Japanese have restricted, and hope eventually to abolish, opium smoking. By a local law of the church, all Roman Catholics in China are forbidden to engage in the cultivation, sale, or smoking of opium. It is universally recognized as a great evil throughout China, the stress being most severe upon the laboring classes, who spend on the drug a large portion of their earnings, and so bring ruin on themselves and their families, too little income being left for food or clothing. Moreover, the habit diminishes energy and lowers the moral tone.

The habitual consumption of opium other than smoking, is known as opium-eating, the opium habit, morphine habit, or morphism. Opium, the lawless, chloroanane, black dragon, nepenthe, morphine, and other forms are all used. They are most commonly taken by the mouth and by the subcutaneous injection of morphine. The habit is usually begun to relieve pain or sleeplessness; and the morphine's constant use of the drug is said to be sufficient in many cases to confirm the habit. The amount consumed by different individuals varies greatly. Of morphine habituates take about three grains daily, some five or six grains, while a few go much higher. De Quincey says that at one time of his life he consumed 8,000 drops of laudanum daily, but his ration was very excessive.

In the Philippines the opium traffic, which is a deep-rooted evil, is a question of prohibition versus some form of license. A measure proposed by the United States government for the regulation of the traffic was supported in consequence of a vigorous outcry raised in the States against the legalization of the traffic in the drug, and against any form of governmental participation in the profits realized from its sale. Under the Spanish rule in the Philippine Islands for years before the American occupancy, the Filipinos were forbidden to smoke or use opium, and all dealers in opium were forbidden to sell the drug to the Filipinos or to permit it to be sold to them. The Spanish system provided for the sale of the privilege of selling opium to Chinasmen in each province to an opium farmer or contractor. It provided that opium should only be used on the town's premises which were under the surveillance of the police, and if a Filipino was found in such resorts he was arrested and the owner of the resort was subjected to punishment. This was the system at the time of the American occupation. The Spaniards recognized the habitual use of the drug by Chinasmen and the futility of attempting its prohibition, surrounded it with laws which kept it under governmental control, and virtually prevented its sale by Filipinos, who showed no disposition to acquire the habit. These laws were not continued by the American authorities, and for nearly five years the only checks upon the sale and use of the drug was a duty imposed in the custom-house and a provision in the municipal code requiring municipal councils to pass ordinances punishing the keepers of dives in their respective towns. The result of this system is presented by Gov. Taft in a statement of the yearly imports of opium, in tons:

First four years.

The falling off in 1902 is attributed by some to extensive smuggling, by others to heavy imports made in 1901 in anticipation of an increase in tariff rates.

In the United States there are said to be over 1,000,000 persons who are habitual users of opium. In all the larger cities opium dens are to be found, while in San Francisco and New York, the habit has become an alarming public evil. It is used in the form of pillows, in nearly every prison and penitentiary in America. In one prison among a population of 1,600 convicts, over 1,200 are habitual users of the drug in the form of pills, which are prepared outside of the prison walls and smuggled in the prisoners. In this instance the market price of an opium pill varies from 10 cents to $5, according to the supply of smuggled pills inside the prison walls. The evil has grown rapidly, and apparently no effort has been made to abolish or control the traffic. Upward of 300 persons are engaged in the business of opium smuggling on the Pacific coast and along the Canadian border, and it is estimated that opium to the value of $2,000,000 is annually smuggled into the United States.

Opodl'doc, a medicinal plaster, said to have been invented by Mindererus, and used for external injuries. The name is now applied to a liniment which is much used as an anodyne application in sprains, bruises, and rheumatic pains. It is prepared by dissolving 3 ounces of common soap in a pint of alcohol by the heat of a sand bath, then adding an ounce of camphor, and a fluid dram each of oil of rosemary and oil of origanum. It concretes into a soft, translucent, yellowish white mass, of the consistency of soft ointment; but it becomes liquid when rubbed upon the skin.

Opon, δ'pın, Philippines, a pueblo of the province of Cebu, situated on the northwestern shore of Mactán Island, three miles across the channel from the town of Cebu. In 1521 Magellan was killed here in a conflict with the natives. Pop. 11,506.

Opinanax, a gum resin with a peculiar acid odor, the produce of an umbelliferous plant, Opinanax chirorum. This plant is a native of southern Europe and Asia Minor, and the granular gum is brought to market from the Levant. The physicans of ancient times highly esteemed it for its purifying and aperient virtues, and it still continues a famous medicine in the East, where it is looked upon as a cure for all diseases.

The perfume known as opinanax is not derived from this gum-resin. There is a commercial opinanax, a kind of perfumed myrrh, obtained from a Balsamodendron, largely exported into Germany, where an essential oil is distilled from it.

Oporto, δ-pört'tó (Port. oo-poor'too), Portugal, a large city and seaport, capital of the
province of the same name, on a steep declivity on the right bank of the Douro, about 2 miles from its mouth, and 170 miles north of Lisbon. The river is crossed by a long and striking railway bridge, and a high and low level bridge for trams and foot passengers. The houses rise one above another in terraces, and there are well-built quarters with broad and straight streets, public gardens, promenades, and other attractive features. The chief religious buildings comprise the Gothic cathedral, and some interesting churches; the bishop's palace, the exchange, the town-house, the custom-house, the English club, the great hospital, the opera-house, theatre, crystal palace, etc. One of the most striking architectural objects is the Torre dos Clerigos (Tower of the Clergy), attached to the church of the same name. The principal trade of Oporto is in manufactures of excellent cottons, silks, woolen and linen stuffs, pottery, lace, buttons, gold and silver plate, when other taxes, such as tobacco and soap works, iron-foundries and sugar-refineries are also in operation. In ancient times the site of Oporto was occupied by the harbour town Portus Cale afterward Portu Cale, from which the name of the country, Portugal, is derived. Oporto was capital of Portugal till 1174, when the seat of government was transferred to Lisbon. It was taken and sacked by the French in 1805, who retained possession of it till 1809, when the British crossed the Douro and compelled them to retire. Having sided with Dom Pedro, it was besieged in 1831-2 above a year by the troops of Dom Miguel, when much of it was destroyed, and its trade was for the time annihilated. Pop. (1900) 174,421.

Opossum, the name, adopted from the Indian name of the northern species, for the family of American marsupial mammals Didelphyidae, more particularly for the typical genus Didelphys, and specifically for D. virginiana of the United States. The place of this family in the order is among the higher polyprotodonts associated with the caymuses and bandicoots (Perameles); and their greatest peculiarity lies in the fact that, with a single exception, this group contains all the marsupials existing outside of Australia; while the family itself is not represented there. For various reasons marsupials are carelessly called "opossums" in Australia are not members of this family, which is confined to America, and mainly to its tropical parts, where doubtless it is a survivor from the Mesozoic Age when marsupials were generally distributed over the whole world. The opossums are arboreal omnivorous animals, ranging in size from that of a cat to that of a mouse. They have 50 teeth, having 10 incisors in the upper jaw, and eight in the lower, one canine tooth on each side in each jaw, three compressed premolars, and four sharply-tuberculated molars on each side. The head is long, muzzle pointed, ears large and naked. The fur is long, coarse and grizzled. The tail is long, prehensile, and bare. The feet are plantigrade, with five toes on each foot, their claws long and sharp; but the inner toe of the right foot converted into a thumb, destitute of a claw, and opposable to the other digits. The pouch, so characteristic of marsupials, is absent in the familiar northern and most other species, the nipples opening between folds of skin which represent a marsupium. To these the minute young are attached by the mother as soon as born, which is after only about 20 days of embryonic life, and when still in a very undeveloped condition; and there they cling five or six weeks until able to run about. The young are numerous and remain with the mother until well grown, clinging to her fur and hind legs and even in conducing at the branches, with their tails tightly wound about hers, or about her limbs or neck. Their prehensile rope-like tails are of vast service to these animals, enabling them to use all four feet in ascending while suspended by this useful fifth member.

In habits the opossums generally are nocturnal. The food consists chiefly of insects, small mammals and birds; most species are fond of fruits; and the Brazilian crab-eating opossum (D. cancrivora) obtains its name from its partiality for the flesh of crabs, which the northern species will also eat, as well as frogs, small birds, and eggs. Hunting the opossum with dogs is customary in the southern states, and they are kept as pets and game animals. Frightened they assume a formless position, and indulge in a most heart-rending squeal, as if to feign death to escape danger. The fear of the opossum is of very long standing, it has been kept in many parts of the United States as a pet, and is in some cases a common game, the capture and destruction being considered a matter of sport. It is said that when the oposum is killed, the flesh is eaten raw when fresh, or roasted and eaten when dried. It is considered a delicacy, and is often served at the opossum pot, a favorite dish at the races.

The flesh of all the larger species is eaten, and that of the Virginia opossum is regarded as one of the woodland delicacies of the Southern States. It is the food of the opossum. It is said that wild opossums are a delight to the American of the woods. The opossum is said to be a favorite food of the North American Indian, and is said to be a favorite food of the American opossum. It is eaten raw when fresh, or roasted and eaten when dried. It is considered a delicacy, and is often served at the opossum pot, a favorite dish at the races.

Consult writers upon American mammals, as Audubon and Bachman, Goodman, Allen, Merriam, C. C. Abbott, D. L. Sharp, etc. For the family generally consult, Beddard, 'Mammalia' (1902); Alston, 'Biologia Centrali.
OPOSSUM-MOUSE—OPTICAL PHENOMENA

Opossum-mouse, one of the diminutive, active, very mouse-like phalangers of the genus Acrobatidae.

Opossum-rat, a book-name, translated from the local name 'raion runcho,' in Ecuador, of a rare little marsupial inhabiting the northern Andean region, which is of special interest because it represents in America an entirely different branch (the diprotodont) of marsupials from the marsupials, and is the sole survivor of an extinct family (Epanorthidae) formerly prevalent in Patagonia. It looks like an opossum of the size of a rat, lives in high brush-wood, feeds mainly on birds and their eggs, and specimens are obtained rarely and with difficulty. It was first described in the 'Proceedings' of the Zoological Society of London for 1890, by R. F. Tomes, in working out a collection of small mammals in a store in by Louis Frase. In Ecuagun he published the first notice of Canoodles, which he described under the name Hyaconodon fuliginosus. Oldfield Thomas, F. Z. G., rediscovered Tomes' genus in a specimen obtained near Bogotá. This specimen Thomas found it necessary to consider as representing a new species. The name Hyaconodon having been found to be preoccupied, Thomas suggested Canoletes, calling his specimen obscurus and Tomes' fuliginosus. Consult Thomas, 'Proceedings' Zoological Society of London for 1895, p. 870.

Opossum-shrimp, a small, shrimp-like marline crustacean of the order Schizopoda, so called because of the egg-carrying pouches between the thoracic legs of the female. See Crustacea.

Oppenheim, öp'én-him, E. Phillips, English novelist. He was educated at Leicester, England, and among his published works, several of which have had many readers in this country, are: 'Enoch Strone'; 'A Man and his Kingdom'; 'A Millionaire of Yesterday'; 'The Survivor'; 'The World's Great Snare.'

Oppenheim, Nathan: American physician: b. 17 Oct. 1845. He was a graduate of Harvard (1868), and of the College of Physicians and Surgeons (1891), he has made a specialty of the diseases of children. He has published in that field: 'The Development of the Child' (1890); 'The Medical Diseases of Childhood' (1900); 'The Care of the Child in Health' (1901); 'Mental Growth and Conditions of Children' (1902).

Op'per, Frederick Burr, American illustrator: b. Madison, Ohio, 2 Jan. 1857. He left school at 14, worked in a newspaper office and then in a store in New York, soon succeeding in getting his humorous sketches published. He was employed upon the Frank Leslie publications three years, and was associated with Puck 1880-99. In the last named year he joined the staff of the New York Journal. He has published several of his series of humorous drawings in book form.

Oppert, öp'pert (Fr. ö-párr), Jules, French Orientalist: b. Hamburg, Germany, 9 July 1825. He was of Jewish descent, and was educated for the law at Heidelberg, but abandoned that calling to study Oriental languages at Boun and Berlin. His first literary work, 'Das Lautsystem des Altpersischen,' was published in 1847, and in 1848 he accepted a professorship at the Lyceum of Lavel. In 1857 he was professor of Sanskrit at the schools of the National Library, and in 1874 took the chair of Assyriology in the Collège de France, receiving election to the Académie des Inscrcriptions in 1881. He published: 'Les Inscriptions des Achéménides' (1832); 'Grande Inscription du Palais de Khorsabad' (1861); 'Le Peuple et la Langue des Médes' (1879); 'Etudes sumériennes' (1881); 'Le Calendrier perse' (1899); etc.

Oppian, öp't-an, Greek poet: b. (at Korylos or Anazarbus in Cilicia) in the 2d century A.D. He wrote a didactic poem of five books on Fishing (Halieutica) in lively but often tumid diction, and with correct and polished versification. Another poem on Hunting (Cynegetica) has been falsely attributed to him; but the diction is rough and the verse halting, and the work is no doubt the production of a writer of the time of Caracalla, 3d century A.D. Consult: Miller, 'Oppians des Jüngern Gedicht von der Jagd' (1885).

Opposition, (1) in politics, the party who, under a constitutional government, are opposed to the existing administration, and who would probably come into power on its displacement. A fair and temperate opposition is a wholesome check upon the party in power, as it is for its interest to demonstrate the injustice, impracticability, or insufficiency of the laws or procedures of the government; but, on the other hand, the despatch of public business may be seriously delayed by the conduct of a factious or obstructive opposition. (2) In astronomy, the situation of two heavenly bodies when they are diametrically opposed to each other, or when their longitudes differ by 180°. Thus there is always an opposition of sun and moon at every full moon; also the moon, or a planet, is said to be in opposition to the sun when it passes the meridian at midnight. Signified by the symbol of the opposition of Jupiter to the sun. (3) In logic, opposition of judgments is the relation between any two which have the same matter, but a different form, the same subject and predicate, but a different quantity, quality or relation. There are five kinds of opposition, namely, contradictory, contrary, inconsistent, subaltern, and subcontrary.

Opa, Roman female divinity of plenty and fertility. She was supposed to make her abode on the earth as the protectress of agriculture, and was worshipped usually in the temple of Saturn, whose wife she was believed to be. Newly born children were especially recommended to her care, and her festivals were called Opalia and Opicinavia.

Optimum (Lat. optimum, best), the opinion that this world, physically, socially, and morally, is the best that could possibly exist. It is opposed to pessimism (Lat. pessimus, worst), the opinion that this is the worst possible world. The optimist looks upon existence as a great and unmixed good. Some advocates of optimism have maintained that while the Author of all things was not compelled to produce the best and happiest order of things, he has in fact actually done so, because the presence of evil teaches mankind to discern and choose the good, by striving through suffering and self-exertion to attain the blessedness which is within the reach of all alike. Other optimists reason a priori that it is impossible that God could produce anything that was not the best; that in spite of evil and suffering, it harmonizes with the idea of His perfect goodness to infer that the motive for the creation of man is stronger than that for non-creation, in that life affords means of enjoyment which are unquestionable and give the opportunity and capability of attaining perfection.

The controversy between optimism and pessimism is as old as the beginning of philosophy. In the East it engaged the followers of Zoroaster, the Gnostics, and the Manichean speculator. The discipline of Thales and his school, of Parmenides and the Eleatics discussed the question; Democritus was an optimist, Heraclitus a pessimist; the Stoic, the Peripatetic, and the Platonic joined in the controversy.

There was a great deal of optimism in Aristotle, and Socrates was a pronounced optimist. The discussion as to the preponderance of good or evil in the world and their admixture was maintained by the fathers of the Church and by the schoolmen. In modern philosophy optimism was advocated by Descartes, Malebranche, and Spinoza, but the full development of the theory was left to Leibnitz (q.v.), who in his ‘Thedicee’ elaborately expounds the thesis that the present world is the best possible creation, and the most perfect that omnipotence would produce. In recent times optimistic theory has been associated almost entirely with the ideas of improvement and progress (q.v.). See Pessimism; Schopenhauer.

Oquas'sa, or Quasky, Trout. See Trout.

Orach, or Orache, a weed. See Goosefoot.

Oracles, responses believed to be given by a deity to a worshipper or inquirer. We read of ancient Egyptian oracular shrines or oracles, but by far the most celebrated were those of Greece. The oracle at Dodona, in Epirus, the oldest in Greece, appears to have originally belonged to the Pelasgians. Everything points to a native origin, but at a later period Egyptian influence produced important changes, notably the substitution of priestesses for the earlier male interpreters known as Selli. At this oracle Zeus himself was supposed to speak to men through the rustling of the leaves of a lofty oak, but other forms of divination were introduced from time to time, such as the striking of metal basins; and from Plato we learn that in his time the priestesses, following the example of those at Delphi, made their pronouncements in a state of religious frenzy. Dorimachus, an Athenian general, razed the temple of Zeus here to the ground in 219 B.C., and the oracle appears never to have recovered from the blow. Not so old, but far more important, was the oracle of Apollo at Delphi, in Phocis, where the oracular declarations were made during a period of frenzy by the Pythian priestess seated on a tripod over a chasm from which a peculiar exhalation was supposed to issue. This was the chief national oracle of the whole Hellenic race, and its influence on Greek history must have been considerable. It was sometimes consulted also by foreigners, and attained the zenith of its power in the 6th century B.C. From the time of Alexander the Great its influence was of little account. Other noteworthy oracles of Apollo were those at Abae in Phocis, at Thebes in Boeotia, at Hysiae in Boeotia, at Claros in Miletus, at Gryneia in the Aeolian territory of Asia Minor, at Argos, and at Delos. Oracles of other gods, such as Dionysus, Hermes, and Pan, are mentioned, and there were also oracles of heroes such as Atalanta, Hercules, Trophonius (a famous one at Lebadea, in Boeotia), Tiresias, Amphiarus, Mopsus, and Colchos. The spirits of the dead were supposed to utter oracular sayings in certain places, especially near Lake Aornos, near Protians and at Tenarus in the south of Laconia. In Italy the only oracles in the strict sense of the term were the temples of Fortune at Freneste and Antium. The oracles were consulted at the outset of every great undertaking, such as the founding of a city or colony, the declaring of war, or the conclusion of peace; but their responses were generally expressed in more or less ambiguous language. Consult: Bouchez-Leclercq, ‘Histoire de la Divination dans L’Antiquite’ (1879-82); Schneider, ‘Die Divinationen der Alten mit besonderer Rucksicht auf die Augurien der Romer’ (1882); König, ‘Das Orakelwesen in Alterthum’ (1882).

Oran, ő-rân’ (Fr. õ-rón’). Algeria, (1) a town, capital of the department and on a bay of the same name in the Mediterranean, 209 miles by rail southwest of Algiers. It rises in the form of an amphitheatre, on the side of Mount Murdjadjo, has quite the appearance of a French town, and is mostly modern. It is strongly fortified by works of recent construction. Among the buildings may be mentioned the cathedral, the grand mosque, the citadel or castle, the Kasbah or old citadel, and the large military hospital. There are two harbors, an old or inner, 10 acres in area, and a new or outer of 60 acres area. The principal articles of export are Esparto grass, cereals, wine, olives, tobacco, hides, and skins, etc. Considerable quantities of cigarettes are manufactured and exported. Pop. (1901) 88,235, of whom three fourths are Europeans, about 25,000 being French and 34,000 Spanish. The town was built by the Moors. It was captured by the Spaniards in 1500, by the Turks in 1700, and again by the Spaniards in 1732. It was destroyed by an earthquake in 1791, and shortly after abandoned by the Spaniards. In 1831 it came into the possession of the French, and has
ORANG-UTAN (Simia satyrs).
been developed by them into a large and prosperous town. (2) The department, forming a long belt along the Mediterranean, bounded on the east by the province of Algers, south by the Sahara, and west by Morocco, has an area of 44,616 square miles, and a population (1901) of 1,103,188.

Orang-utan, the Malay name, signifying "man of the woods," of the large anthropoid ape (Pongo pygmaeus) of Borneo and Sumatra. The orang belongs to the typical genus Simia of the family Simiidae, and there is probably but one species (S. satyrus), though some naturalists believe otherwise. The face and skull of the young are very human, but in the adult the jaws become protruding and the crown elevated. The body is short and massive, the legs short and bowed, and the arms and hands disproportionately long, reaching to the ankle, but the thumb is very short. Except the face, hands, and feet, the body is thickly clothed with reddish-brown hair, which is especially long on the arms, where it converges to the elbow, the thighs, and the back of the male. There are no ischial callosities, and no tail. Cheek-pouches are absent, but old males have the face much broadened but the development of prominent fibrous warty protuberances, and in this sex the canine teeth become much enlarged. In some respects this ape approaches man more closely than any other existing species, but in others it differs widely and resembles the lower apes. In size it is much inferior to the gorilla of equatorial Africa, seldom exceeding four feet in height, and it lacks the high sagittal crest, and particularly the prominent superciliary ridges, which give to the males of that species so ferocious an aspect. At the present time the orang is confined to the deep swampy forests of Borneo and Sumatra. It is arboreal in habit, and builds nests of boughs and leaves among the branches of the trees. For this mode of life its structure is eminently adapted, its long arms, crooked legs, and great strength enabling it to travel through the treetops with the greatest facility. To an equal degree these structures ill adapt it to terrestrial locomotion. It does not stand erect, as often represented, except now and then for a short time, and when supported, but in a semi-erect attitude, resting on the side of the inturmed feet and on the knuckles of the hands, which, as a consequence, develop callosities. The orang lives exclusively upon a vegetable diet, consisting chiefly of fruits. The males especially have powerful voices, made possible by the great development of the larynx. Naturally they are sluggish and sullen, but the disposition is mild. Stories of their great ferocity, and particularly of their habit of lying concealed in the branches of trees above pathways, from which they reach down a foot to grasp men by the throat, are pure fables. In confinement one of their most interesting characteristics is their teachabili and the changing expression of the face resulting from the mobility of the lips. Con- sult: Hartmann, 'Anthropoid Apes' (1886), in which many other authorities are given; Forbes, 'Allen's Natural History,' Vol. I. (1897); and the books of Wallace, Forbes, Hornaday, and other scientific travelers in the Malay region.

Orange, o'rën, Prince of. See William the Silent, Prince of Orange; William III., King of England; Maurice of Nassau.

Orange, Mass., town, Franklin County, on Millier's River and on the Fitchburg railroad; 37 miles north-northeast of Springfield. The town includes the villages of Orange, North Orange, and Tully. The town was incorporated in 1810. The surface is very hilly, the village of Orange being built on a hill that rises abruptly from the river. Orange is one of the most enterprising manufacturing towns of the county; the manufactures include sewing machines, motors, wagons, machinery, furniture, boxes, shoes, and vests. It has three handsome parks and a public library. Pop. of town (1890) 4,508; (1900) 5,520.

Orange, N. J., city in Essex County, on the Delaware & L. and the Erie R.R.; about four miles west by north of Newark. It has electric railroad connections with Newark, Jersey City, East Orange, South Orange, Bloomfield, Montclair, and other cities and towns in the vicinity. Orange was settled about 1665 by a colony from Connecticut. At first it was a part of Newark and was called "Newark Mountain." The residents of "Newark Mountain," in 1718, established a separate church, and the organization was known as "The Mountain Society." This same church was known in 1781 as the "Second Church of Newark," and now (1904) as the "First Presbyterian Church of Orange." In 1790 a further separation took place, and the place was called Orange Dale. In 1866 Orange became a separate town, incorporated under the name of Orange, and all elections were made, and South, West, and East Orange were established in the years 1861, 1862, and 1863, respectively.

Orange is on an elevation, the lower slope of Watchung Mountain, a ridge extending northeast and southwest, rising in some places 650 feet above tidewater. Adjoining the city or in the near vicinity are Hemlock Falls, in South Orange; Llewellyn Park, which contains 750 acres, and many fine residences on Orange and Eagle Rock, an eastern crest of the mountain, is now within the limits of the Essex County Park System. The city and vicinity have miles and miles of good roads, many shade trees, and long lines of well-kept lawns, and all the "Oranges" are residential sections for New York business men, many of whom have their homes here, while others remain only during the summer months. The city has considerable manufacturing interests. The chief manufacturing establishments are hat factories, for which Orange is noted, printing plants, and the Edison laboratory near Llewellyn Park. The number of employees in the manufactories is about 4,500. The city has an extensive trade in hats and considerable trade in other manufactures and fruit. Some of the prominent buildings are the Metropolitan building, Music Hall, Masonic Temple, Decker building, the First Presbyterian Church, already mentioned, the original school building, which has been remodeled, and the church, school, and library buildings. It has a House of the Good Shepherd, an orphanage, and the Orange Memorial Hospital. The educational institutions are pub-
lic and parish schools, the Stickler Memorial library, a city library, the Orange Training School for Nurses, and at South Orange, Seton Hall College, a Roman Catholic institution for boys and men. The Locke College for Boys, and other private schools are in the "Oranges." There are 29 churches representing a number of denominations. The city has a number of organizations whose objects are educational and charitable, as the Mendelssohn Union, a Bureau of Associated Charities, a New England Society, and several literary societies. It has also a number of athletic and social clubs. The three banks have a combined capital of $450,000. The government, administered under a revised charter of 1879, is vested in a mayor and council, who appoint or elect the administrative officials, except the board of education, which is chosen by popular vote. The city owns and operates the waterworks. Pop. (1850) 18,844; (1900) 24,141. Conant, White, 'History of the Oranges from 1666 to 1860' (1892); Whittemore, 'The Founders and Builders of the Oranges' (1896).

Orange, Texas, city, county-seat of Orange County; on the Sabine River, at the head of navigation, and on the Southern Pacific railroad; 85 miles northeast of Galveston. It is the shipping centre for the surrounding region, exporting rice, cotton, oranges, and live stock. It has several large lumber mills, shingle and saw mills, and also cotton gins and a rice mill. The public schools include a high school for the colored race. The city owns and operates the waterworks. Pop. (1900) 3,835.

Orange, Port, a former fort built in 1623, on the site of the present city of Albany, N. Y. It was erected by the Dutch as a defense work against the Indians.

Orange City, Iowa, town, county-seat of Sioux County; on the Chicago & Northwestern railroad; 40 miles north-northeast of Sioux City. It is in an agricultural and hog-raising district. Its most notable public building is the county courthouse. It is the seat of the Northwestern Classical Academy (coeducational) and a junior college. Pop. (1889) 1,000; (1900) 1,457.

Orange Free State. See ORANGE RIVER COLONY.

Orange and Orange Culture, various species of the genus Citrus (order Rutaceae), and their fruits. The most important species is C. aurantium, which is the parent of most of the commercial varieties. It is a small, branching, long-lived tree or shrub, with oval or elliptical evergreen indistinctly compound leaves, and very fragrant white flowers. The fruits are globular or elliptical, and vary considerably in size. Botanically considered they are berries divided into eight or ten cells, filled with a juicy and mealy or less acid pulp. The tough, yellow rind is valued, especially in some varieties, for its oil, which is extracted for use in flavoring and in perfumery. The flowers also are employed in decoration and in the significant ornament, especially by the bride at her wedding. But it is as a dessert fruit, and for the manufacture of preserves, marmalade, etc., that the orange is of chief importance. For these purposes the tree has been taken from its native home in southeastern Asia to all tropical and sub-tropical climates in the civilized world, and is cultivated extensively in many places not only to supply the local demands, but for the shipment of its fruits to climates beyond its range. Of cultivated fruits the two important commercial regions of orange growing are Florida and southern California. In the former the region of successful cultivation has been restricted by experience of killing frosts to the southern counties, although previous to 1895 the orange-growing region extended over most of the peninsular parts of the State. In many places the trees were growing wild when the State was settled, and it is surmised that these trees were the progeny of specimens introduced by the Spaniards in the early days. A third region is the delta of the Mississippi River. Parts of Texas, Arizona, and New Mexico are promising.

The species mentioned above has developed several well-marked botanical varieties, each of which has more or less horticultural sorts. The most important botanical variety is sinensis, which is the immediate parent of the common sweet orange, and the Portugal or Malta orange. In the United States about 70 of the numerous varieties are cultivated. They are characterized by usually round fruits, which are generally sweet or slightly acid, and have a sweet aromatic skin highly valued in cookery for flavoring. Its juice makes a superior wine. To this group belong the famous Bahia or navel varieties, which are extensively cultivated in California, and usually are seedless. The initial trees, originally native to Brazil, were introduced in 1870 by William Saunders of the United States Department of Agriculture at Washington, and distributed by him throughout the orange-growing sections of the country. It is, therefore, often called the Washington navel. Its peculiar formation is due to the development of a secondary axis with more or less cells in the centre of the fruit. The bitter, sour, or Seville orange (variety amara), is so named from its pulp. Few of its horticultural varieties are cultivated in the United States. It excels as a source of bud varieties of sweet orange, lemon, and pomelo,—a use for which they seem especially well fitted. The flowers, immature fruits, and young twigs of this variety are extensively employed in the manufacture of an etherial oil, and the skin of the ripe fruit in making Bigaradia oil. In southern France the flowers are widely used for making perfumery. The Bergamot orange (variety bergamia) is a small tree or shrub rarely seen in the United States, but cultivated in Europe for more than 200 years. The rind of the fruit furnishes Bergamot oil. The mandarin or tangerine orange (variety nobilis) is a very small tree or a shrub with dense foliage and small fruits most noted for the looseness of the skin which is barely attached to the pulp. Because of easy removal of the pulp it has received its commonest name,—kid-glove orange. Its varieties are gaining in popularity in the United States. The quince variety (variety ovaliifolia) is considered by some botanists as a variety of the common sweet orange. Others think it may be a hybrid between the lemon and the orange. It is a very popular pot-plant in greenhouses, on account of its
ORANGE, FRUIT, LEAF AND BLOSSOM.
ORANGE AND ORANGE-CULTURE

diminutive size, free blooming and fruiting qualities.

The only other important species of orange is the three-leaved or trifoliolate (C. trifoliata). This is a small, thorny Japanese tree, whose chief use is as a hedge-plant. It is hardy as far north as New York, and is popular southward. Its small, yellow, downy juiceless, bitter, sour fruits are sometimes used in preserves. The plant is also valued as a stock upon which a bud variety is grafted. The fruits, especially the kumquat (kin-kin, or kin-kits, C. japonica) and the satsuma orange, a variety of mandarin orange. It is said to make the more tender varieties somewhat hardier, and to reduce the size of the larger growing sorts. It seems to be a promising species for hybridizing with other kinds; a large number of hybrid varieties have been produced, but are not cultivated except experimentally. The osage orange (Toxylon pomiferum, better known as Maclura aurantiaca) is a member of the natural order Rutaceae. It is therefore not properly an orange at all. (See Osage Orange.)

The orange was formerly propagated almost wholly by means of seeds but since the sweeter orange varieties so produced seemed to be seriously affected with root-disease ("foot-rot") and were variable both in habit of growth and value of fruit, propagation by means of buds has very largely replaced the more primitive methods. The stocks preferred are the Seville and trifoliolate orange and the so-called "rough lemon," apparently a natural hybrid, which resembles the lemon in foliage and flower, but whose fruit looks like the sour orange, being large, round, and distinctly acid. These stocks are grown from seed, and when the seedlings are of suitable size they are budded with the desired variety. After growing in the nursery for a year, after being budded, the trees may be set in the orchard. The distances usually chosen vary between 25 and 30 feet, but varieties upon trifoliolate stock may be set closer together. When transplanted the tops are rather severely cut back so as to balance the loss of roots and room on the ground is frequently covered with a mulch of straw, pine needles or other loose material. Clean cultivation is also given from the time the orchard is set, at least during the growing and dry season, followed by the sowing of some cover-crop, which will enrich the soil. This crop may be cut for hay, but its equivalent in such cases should be returned to the land in the form of fertilizer and humus. Fertilizers should be applied liberally because the orange is a gross feeder.

As to soil, the orange thrives upon a great variety of land, profitale orchards being found upon the sandy hammock lands of Florida, the alluvial soils of the Mississippi delta, and the red mineral soils of California. Always, however, these lands must be well drained, in respect to both water and air. Indeed, injuries in California are not infrequently due to the settling of cold air in badly located orange orchards, or orchards from which there is inadequate air-drainage at critical seasons. In Florida and the Mississippi delta frost injuries are due to the influx of immense volumes of frigid air brought by continental cycles over the bayous. To protect the trees in these regions against frost, various expedients have been tried. In the delta the trees are banked with earth to protect the trunks. In this case the branches may or may not be injured; where they are, the trunks are relied upon to send out new sprouts. These will remove the plantation in a few years. In Florida the groves are often shielded with high board fences on the side of the expected storm; they may also be covered with canvas or slats. Sometimes these enclosures are warmed during severe weather by means of fires, frequently in improvised stoves. At Deland, Fla., more than 30 acres of orange trees are kept under cover.

Orange trees continue to bear, with reasonable care and under favorable conditions, for many years, reaching profitable age in some cases when less than six years old. The trees bear more or less continuously, and flowers and fruits in all stages of development being found upon the same tree throughout the year. The great mass of the fruit, however, becomes ripe at one time. When ready for harvest, the individual fruits are cut off with scissors, not pulled from the trees. They are then allowed to stand for a few days to dry and soften somewhat before being graded and boxed for market. Each fruit is wrapped in tissue paper before being packed. The standard orange-box contains two cubic feet and usually holds about 200 oranges. Large specimens occasionally reduce the number below 100, while small ones increase it to more than 250. When properly managed both before packing and during shipment the fruits should keep for several months.

Among the difficulties in orange growing are several so-called diseases which also attack other cultivated members of the genus Citrus. Perhaps the most widely distributed and troublesome is the "foot-rot," which seems to be worse upon sweet oranges and lemons. It is feared in Australia, Europe, California, and Florida, in the last-named region having caused annual losses of $100,000 or more. Though its origin has not been satisfactorily explained, it is readily recognized by the abundant exudation of gum near the ground, the yellow leaves reduced in size, shrivels, the bark, and the dead twigs. Ultimately the trees become girdled and die. Good drainage, resistant stocks, the avoidance of over-cultivation, and stimulation with nitrogenous manures have been found the most satisfactory preventative. The removal of soil from the base of the trunk has been recommended as a remedy. Blight is another little understood affection. Only bearing trees seem to be troubled by it. The leaves wilt even in moist weather; watersprouts are produced in profusion on the trunk and main branches, but live only one or two seasons; the trees blossom abundantly the season after the wilting, but fruit fails to set and very little reaches maturity. The result is always fatal, even when only a small branch is originally affected. Scab, attributed to a species of fungus (Cladosporium), appears as excrescences upon the fruit and foliage. It is considered most troublesome upon lemons, and four or five applications of ammoniacal solution of copper carbonate is recommended as a remedy. (See Fungi and Fungicides.) "Die-back" is among the most troublesome pests of Florida orange orchards. It seems to be due to improper preparation and improper cultivation, which are succeeded by
imperfect nutrition. Hence, improved drainage, cessation of cultivation, withholding nitrogenous manures, and reducing the present content of such foods in the soil by cropping the orchards with grasses or clover, has been all urged as remedies. Mulching is also recommended. The characteristics of this trouble are the dying back of the tips of the twigs, reduction in the "set" of fruit, premature ripening, splitting, and shriveling of the fruit. These characteristics may be seen in trees of all ages and varieties. The sooty mold (Meliola canellaria), which also appears upon many other kinds of trees, is not a disease, but because of its presence in abundance may prevent adequate aeration of the leaves. It is a mold that lives upon the honey-dew (q.v.) which is exuded by various species of insects (Arini, q.v.), which may be held in check by various insecticides, notably resin washes and hydrocyanic acid gas. It often covers the fruit with a falty mass which precludes sale.

Among the numerous insects that feed upon the orange are several caterpillars, the most prominent of which are the orange drop, the caterpillar of a butterfly (Papilio cresphontes), the saddleback caterpillar (Emperetia stimulea), and the bag-worm (Oiketius abbotii). The cotton-stainer or red-bug (Dydericus suturellus) and the leaf-footed bug (Leptoglossus phyllopus) puncture the fruit. The Morello orange worm, the maggots of a fruit-fly (Trypeta ludena), does great damage in Mexican orchards, and its possible introduction is dreaded by American orchardists, because the maggots destroy the fruit by tunneling in it. Several species of leaf-rollers and sucking bugs are troublesome, as are also various species of aphids, notably the orange aphids (Siphonophora citrifolia). In Florida and somewhat in Louisiana the white fly (Aleyrododes citri) is sometimes so abundant upon the foliage as to impair aeration of the leaves. It is not only a serious pest because of its sap-sucking habits, but because it contains so much sugar matter upon which the smut fungus mentioned above lives. The rust-mite of the orange, also called the silvery mite of the lemon, because of the appearance of its work upon the two trees, seems to be tenacious upon the fruit, and the spotted mite (Tetranychus sexmaculatus), a close relative of the red spider of greenhouse notoriety, feeds upon the under sides of the leaves. The mites may be controlled by flowers of sulphur, which for the former should be added to kerosene emulation.

The most dreaded group of insects, however, is that of the scale insects, of which there are a very large number that attack both foliage and trunks. With few exceptions the remedies found most satisfactory for these insects are resin washes and hydrocyanic acid gas. The most notable exception is the white or fluted scale (Icerya purchasi), an introduction from Australia. Having become exceedingly troublesome in California, its natural enemy, a lady-bird beetle, was introduced with the result that it is now rarely seen in the State. Other well-known scale-insects in California orange groves are the red scale (Aspidiotus citriola), the burlap scale (Icerya purchasi), of which there are perhaps six hundred varieties, the burlap scale in orange groves, the chaff scale (Parlatoria pergandei) is most important, but the purple scale (Mylialis citricola) is also somewhat troublesome, as is also the orange chionaspis (Chionaspis citri); in Florida groves, the chaff and the purple scale are well-known. The Americanalling scale (Mytilopsis gloveri) and the Florida red scale (Aspidiotus ficus). Many of the insects mentioned occur in Mexico, the West Indies, etc.; some of them in Europe, Australia and other parts of the world; but the insect fauna of foreign countries is rich in species that do not appear in the American list.

Dept. of Agriculture, Experiment Station, Berkeley, Cal.; and publications of the California State Board of Horticulture, especially the one of 1902.

M. G. KAINS, Crop Expert.

Orange Industry, The. From the beginning, the orange has reigned as king in the international fruit trade of the world. The grape has always been and is still, greater in the value of its contribution to commerce and in the distance it safely traverses, but the grape rules not as a fruit, but through its manufactured products, while the orange carries its natural beauty, fragrance and flavor unchanged around the world. From the earliest times the orange has not only been accepted in northern climes as a most expressive exponent of tropical and sub-tropical salubrity, but by its own distinctive characteristics as a fruit it has won recognition as befitting the tropical societies. By the beauty of nature, too, the orange ministers to its own commercial popularity. It endures long shipment; it ripens slowly and through a season of several months which constitute the winter in northern latitudes with the refreshing and the refreshment in the citric juices most welcome. The production of such a commercial commodity has from the earliest times constituted an important industry. It is a significant fact that though the orange thrives in the tropics it does not resent the slight touch of frost which characterizes semi-tropical situations. It is also significant that the fruit grown in semi-tropical countries, especially those which have a more or less distinctly marked two-season climate, differs in character from the strictly tropical orange and is firmer, heavier, more spriynt in flavor and with much better keeping and carrying qualities. The tropical orange has but small commerical importance; the semi-tropical orange rules in the markets of the world. That the semi-tropical orange should have this distinctive character is most fortunate, for it ministers directly to the will for industry which is superior in semi-tropical countries.
ORANGE INDUSTRY

north latitude, through which its fruit freely seeks a market. Because, though the tropical orange would reach most distant markets in some cases, communication for the commercial supremacy which the fruit now enjoys.

The sweet orange is a native of Eastern Asia and was carried thence to India and to Asia Minor. It possibly reached Portugal from India through the early Portuguese navigators. Thus the distribution of the fruit was westward. The history of modern commercial orange growing consists of a series of progressive movements always tending westward and gaining in volume—the newer centres of production outstripping the older and ultimately largely displacing their product from the greatest markets of the upper divisions of the Temperate zone.

When the Moors introduced orange growing into Algeria and Spain they displaced the traffic from Asia Minor and gave the Mediterranean region for several hundred years undisputed possession of the markets of the north of Europe and possession also of the American demand when that arose. When the Spaniards and Portuguese carried the orange to the West Indies and to Florida they laid the foundation for an industry which American enterprise developed in Florida until that district not only contended with the Mediterranean region for American markets, but was planning to invade northern Europe by direct shipments when the demonstration came that the climate of northern Florida and of the Gulf coast westward was too treacherous for commercial ventures in orange growing—at least with the then peculiar varieties and methods of propagation. But as the Florida supply failed through the severe freezing of 1895, California came forward and is now not only supplying four fifths of the oranges consumed in the United States, but is selling the highest priced oranges in the London market against a world of competitors. This competition with the product of California is working hardship in the Mediterranean region because this region can produce more than supply Europe and needs American markets as an outlet. Italy has exported six million dollars worth of oranges and lemons in a year, but recently prices have declined and the interest is declining. Preference for local taxation and from duties imposed by north European countries. The Spanish product of oranges and lemons, which ranks next to the Italian, has to meet heavy tariffs in all countries except the United Kingdom, and the belief at Valencia is (U. S. Commercial Relations, Vol. 2, 1902, page 680) that the limit of British consumption of Valencia oranges at paying rates has been reached; in fact, the British markets collapsed under the heavy shipments of 1901. When it is stated that the value of oranges imported into the United Kingdom in 1900 was $10,603,950 and such a free buyer has more than enough, it can be realized how important it is to the Mediterranean producers that the populous countries of Central Europe should hold less strictly to agrarian interests which aim to hamper the entrance of food supplies even if they cannot themselves produce the product. California's products can only enter such markets with a fancy product which will win an extra price, except as a little difference in the ripening season may afford an opportunity. The commercial position of the orange in the United States is also such as to awaken apprehension. The present strength of the situation in the orange market and the bête noir of growers is the possibility of making gaps in it by reciprocity treaties. The product of the West Indies is a direct menace to the Florida product, which meets it in point of market season, and the Mexican product, which is undergoing expansion at the hands of American capitalists, is constantly feared by the California growers because the Mexican railway will give it quick entrance to the great central States and consequent advantage in distribution to the East and the Northwest. The orange from the West Indies and South Florida is different from the California orange in main ripening season and in character of the fruit, but the differences do not give full relief. With the late ripening varieties, the California grower extends his shipments into the autumn and thus laps upon the early fruit from Florida and Jamaica, while the parts of California which bring earliest maturity to the fruit are shipping before the southern fruit is cleared away. In fact, California can keep the markets supplied with oranges fresh from the trees and in prime condition the year around.

As to the difference in oranges grown under humid and arid conditions, the moisture being supplied by rainfall in one case and by irrigation in the other, there has been shown in the arid-region orange a superior density, thinness and texture of peel, higher sugar and acid percentages and a more sprightly or vinous flavor. The popular conception of the superior sweetness of the orange grown in humid countries is due not to a greater amount of sugar in the juice, but to less amount of acid. The following are the determinations of sugar and acid of fully ripe Southern California and Florida navel oranges:

<table>
<thead>
<tr>
<th></th>
<th>Total sugar</th>
<th>Citric acid</th>
</tr>
</thead>
<tbody>

<td>7.49</td>
<td>1.83</td>
</tr>
</tbody>
</table>

Of course, the quality of an orange is largely inherent in the variety, but all varieties are similarly changed by growth under humid or arid conditions of climate and soil, and this modification becomes a factor of much industrial importance. This fact is strikingly illustrated by the standing of the navel orange in California. This variety has been grown for a century or more as the chief orange in Bahia, Brazil, whence it was taken to California. In Brazil it demonstrated no shipping qualities, and according to Burke (U. S. Special Consular Reports, Vol. 1, page 411) would need to be picked before maturity if to be shipped, while as grown in California and Arizona it is picked at full maturity and is successfully shipped all over the United States and to Europe.

Orange growing in Florida is now (1904) advancing after serious reverses. The product of 1894 was about 6,000,000 boxes. Then came the disastrous freezing in December of 1894 and February 1895, with a temperature of 14° F. at Jacksonville, and in the latter year only 75,000 boxes were shipped. In 1903 the product was about 900,000 boxes. Confidence has been restored by the safety of the trees in the central and southern parts of the State and by the promising results of trial of hardier varieties in
ORANGE INDUSTRY

the older citrus district in the northern part. In Louisiana the freezing of 1895 nearly annihilated the citrus fruit interest and there is thus far no evidence that production on a commercial scale. In the southwestern corner of Arizona there is a small orange industry which is successfully shipping navel oranges to distant markets. Conditions favor early ripening.

In California the shipments of oranges beyond State lines in 1903 were 21,577 carloads or 7,810,874 boxes. Planting during the last few years has been very active and it is reported by county assessors that in 1902 there were in California 5,374,779 orange trees, of which 1,829,374 were not yet of bearing age. The orange industry of the United States is now largely supplying the home demand for the fruit. Imports of oranges reached their highest value in 1883 at $3,010,662.56 and have since then declined. The value in 1902 was $784,040, of which one half was drawn from the British West Indies, one quarter from Italy; one eighth from Mexico, etc.

The orange industry of the United States is unique in the high social and financial standing of those who have engaged in it and in the striking features of its development. Both in Florida and in California large scale production was first undertaken by northern men who had gained wealth and had lost health in pursuit of it. They brought capital and commercial ability to the ventures which they exploited. The professional classes of the North also participated largely in the work, bringing scholarship, insight and experience in organization.

There were a few also who possessed horticultural experience, but the other classes largely preponderated. The result has been the development of an industry characterized by American in spirit and new in methods. It has borrowed very little from the practices of Old World orange growers. Free from tradition and prejudice, it proceeded rapidly upon the results of commercial investigation and experiment, establishing a system of culture and of commercial handling of the product which are without precedent in the older orange regions of the world. There are several essentials to success in orange growing: soil, naturally rich or generously fertilized; temperature, suitable not alone to the life of the tree, but to the soundness and quality of the fruit; moisture, constantly available in adequate quantity, but not in excess; cultivation, to promote root growth by aeration and distribution of moisture; pruning to promote adequate wood growth and leaf action; protection from destructive insects and fungi. And these are indispensable to the commercial success of the enterprise, for though the orange tree is, in everything except the occurrence of low temperatures, hardy and long-lived, there is no profit in orange trees which are subjected to any form of privation or disease. The fruit, which so strikingly should display the signs of content, namely, deep green and glossy foliage, leaves large (according to variety) and heavy, juicy, golden fruit in profusion. The soils which best suit the tree are deep and well drained, with a good slope, although the tree is not fastidious about soil texture if plant food and moisture are ample.

In Florida the orange soils are predominantly light at the surface and are largely sustained by regular fertilization, but a firm subsoil, for moisture retention, is an advantage with each of the soils. The fruits are dug from the roots and yet with drainage to obviate standing water renders light soil acceptable. A leachy subsoil, as for instance a deep sand stratum, is undesirable. In California the soils chiefly used for the grain which are dug to a depth without change in character and which are, therefore, of more enduring richness, but even the best and deepest soils in California are now showing the need of fertilizers to meet the heavy drain of the fruiting tree.

The orange tree is in danger whenever the temperature reaches the freezing point. The degree attained must, however, always be considered in connection with the length of time it prevails; for instance, four degrees of frost for an hour may do less harm than two degrees for two hours. As the temperature falls lower, the duration becomes less important. Five degrees of frost for a very brief interval may injure the ripening fruit and the tenderer leaf growth; one or two degrees will seriously injure the tree. A temperature of 20° F. or a little less, may kill younger trees to the ground and older trees to the stump, while a temperature of 14° F. in Florida in 1895 killed to the ground the oldest trees, some of which were more than half a century old. The root, however, escapes destruction and will send up new shoots providing the injured top is soon removed. Where the temperature does not fall below 25° F., injury has been successfully averted by burning numerous small fires among the trees. In California systematic use of electric alarm bells connected with thermometers to arouse the sleeping workmen and the lighting of small pots of crude petroleum has saved the fruit from injury by six degrees of frost, and such protection has been demonstrated to be profitable in places where such frosts are to be expected. The occurrence of frost is local in California and is not conditioned upon latitude. Oranges are successfully grown in suitable locations between lat. 32° and 40° N.—nearly 500 miles of distance, and the extreme low temperature is practically the same at about the same elevations throughout this distance. It is also true that owing to the intervention of high ranges of mountains giving protection from cold currents of air from the north and northwest, the season is earlier at the north than at the south, and the oranges from northern and central California are marketed in advance of the main crop from Southern California—the fruit being marketed previous to the time of the lowest temperatures (December and January). In Florida much interest is manifested in experiments now in progress in that State under the auspices of the United States Department of Agriculture, to secure by inter-breeding of the sweet orange and the deciduous orange of Japan, which combines in the new variety qualities of the former with the hardiness of the latter. Oranges are grown with moisture from rainfall in Florida, while in Arizona and California irrigation is essential. Even in parts of California points of cold, the tree cannot survive factoring without it, the orange must be irrigated. The amount of water depends upon the
ORANGE-MELON — ORANGE RIVER COLONY

age of the trees, the depth and retentiveness of the soil, the local rainfall, etc. The average amount is an annual total of fifteen inches depth of water over the whole surface of the land occupied by the trees, and the application is made in fractions at intervals of about three weeks during the dry season. Upon the lighter soils the land is laid off for each irrigation with low levees or dykes into squares enclosing one or several trees, according to the slope of the ground, and these squares are filled from an adjacent ditch. In the heavier soils where the water can be distributed well by lateral seepage, the water is turned into several parallel furrows plowed between the rows of trees and is allowed to run in small streams for 24 hours or more. Cultivation follows irrigation as soon as the ground has dried sufficiently to work well, for the purpose of preventing the surface from baking and preventing also the loss of moisture by evaporation. Thus the surface soil of the California orange groves is kept constantly clean and mellow. No growth of weeds or other plants is permitted except when crops of legumes for plowing under green, to promote friability and to increase the humus-content of the soil. Oranges are cultivated on a large scale. The surface promotes deeper rooting of the tree and aeration of the lower soil layers and the general thrill of the tree. California experience amply proves that irrigation and fertilization, unaccompanied by thorough and adequately deep cultivation, do not secure the best results.

The orange tree requires only light pruning after its proper shape is attained, but pruning to maintain the shape and to prevent the foliage from becoming too densely matted is essential. Pruning for shape has been more definitely pursued in California than elsewhere. The trees are grown with very short trunks; in fact, the lowest branches almost touch the ground. Cultivation is extended a certain distance beneath the tree by having a lateral extension to the cultivator. The men and teams never pass under the trees. The trees are encouraged to enclose themselves with a solid wall of foliage and all the work upon the tree and gathering of fruit step-ladders are the space between the trees. It would be well nigh impossible to climb into the branches of such an orange tree, nor is it ever expected to do so. The trees are generally bluntly-conical or pyramidal in form, though some prefer a more roundish outline. The trees of the varieties most largely grown are low and of a semi-dwarf stature: only a few seedling trees of 30 feet or more in height are now to be seen.

Protection against injurious insects has been undertaken by American orange growers to an extent unhithought of in the Old World, and commensurate results have been attained. The most successful methods of controlling orange insects (and they are chiefly of the class known as scale insects) consists in enclosing the tree with a tight canvas cover or tent and generating beneath it fumes of hydrocyanic acid gas by the action of sulphuric acid upon potassium cyanide. This method is the most intelligent operation, and detailed accounts are given in the publications of the Agricultural Experiment Station of the University of California, which also describe the best remedies for other insects affecting the orange tree. Much has also been accomplished by securing and multiplying parasitic and predaceous insects which have proved wonderfully effective in some cases. The details of propagation and culture of the orange differ according to natural conditions prevailing in the different regions and the local publications cited below convey the most accurate information. The same is true of the varieties which constitute the commercial product. The tendency is to concentrate production to a fewer number of approved varieties which are accepted as standards of excellence. In California, for example, the Bahia or Washington navel has constantly advanced in popularity until, by new plantings and by grafting and budding over old trees of other varieties, not less than three fourths of all the oranges grown in California are of that variety.

Current information and publications concerning the development of the orange industry can be obtained from the Bureau of Plant Industry, Department of Agriculture, Washington, D. C., and from the Agricultural Experiment Stations at Berkeley, Cal., and Lake City, Fla. The following books may be consulted: Riso and Poiteau, 'Histoire et Culture des Oranges, Citrons et Pamplemousses' (1856); Spalding, 'The Orange: Oranges and Lemons of India and Ceylon' (1890); Garey, 'Orange Culture in California' (1882); Moore, 'Orange Culture in Florida,' etc. (1883); Manville, 'Practical Orange Culture' (1883); Spalding, 'The Orange: Its Culture in California' (1885); Harcourt, 'Florida Fruits' (1886); Wicksom, 'California Fruits' (1900); Lelong, 'Culture of the Citrus in California' (1900); Hume, 'Citrus Fruits and Their Culture' (1904).

Orange-melon. See MELONS.

Orange oil, an essential oil used in manufacturing perfumes and liquors. It is obtained from the rinds of oranges.

Orange, or Gariep, ga-rép'. River, South Africa, the most important southern river of the continent, rising in the Kathlamba or Drakensberg range, within 100 miles of the Indian Ocean, and traversing the escarpment toward to the Atlantic Ocean, with a slight northerly inclination. It describes numerous wide curves in its course of 1,300 miles, and separates Cape Colony on the south from the Orange River Colony, Griqualand West, Bechuanaland, and German Southwest Africa on the north. Area of basin, 325,000 square miles. Its principal tributaries are the Caledon and the Vaal, both joining it from the right. Its volume varies greatly between the dry season, when it is not navigable, and the rainy season, when it overflows its banks in the upper parts of its course. Its mouth is obstructed by a bar.

Orange River Colony, South Africa, formerly ORANGE FREE STATE from 1854 until 1900, when it was annexed after joining in the Boer invasion of the neighboring British territory, and now forms a British colony bounded on the north by the Transvaal Colony, east by Natal, southeast, south, and southwest by Basutoland and Cape Colony, and west and northwest by Griqualand West and South Bechuanaland. Area, 48,326 square miles, divided into 19 districts. Capital, Bloemfontein (q.v.) connected
by rail with Cape Town and Port Elizabeth, and also with the Transvaal and Natal. The country generally consists of vast undulating plains, lying about 5,000 feet above sea-level, and dotted in many places with rocky hills called kopjes. The country is cold in winter, and in summer is liable to violent thunderstorms and long droughts; the climate, however, is generally healthful. The rivers that intersect the country are all small, and the boundary rivers, the Vaal and Orange, are unavailable for traffic. Agriculture and pasturing are the chief occupations, and wool, hides, and ostrich feathers the principal exports. Diamonds and other precious stones have been found in paying quantities, rich coal mines exist, and the State is said to abound in other mineral wealth. Gold was discovered in 1887.

Prior to 1836 this region was inhabited by Bushmen, Bechuana, and Zulus. The colony was founded in 1856-57 by British settlers from Cape Colony. It was annexed by Great Britain in 1848 in order to put a stop to the Boer out- rages on natives; but in 1854 it was recognized as an independent state. The language of the colony is English, with a Dutch dialect. The Dutch Re- formed Church is the dominant religion. Under its independent régime the executive was entrusted to a president elected for a period of five years by universal suffrage; while the volksraad or parliament, elected for four years, exercised legislative functions. The history of the Orange Free State till 1899 was one of steady, peaceful progress, interrupted by hardly any stirring event, except some fighting with the Basutos down till 1899, and a more serious quarrel with the British government in 1891 concerning the Kimberley region. The latter dispute was settled by arbitration, under which the British government agreed to pay $500,000 to the Free State as compensation for its loss. In 1889 the state was admitted into the Customs Union of South Africa, and in that year also the railway from the Orange through Bloemfontein to the Vaal was completed. The greatest president of the state was Johannes Hendrikus Brand, afterward knighted as Sir John Henry Brand, who held office from 1853 till 1888. His successor was Dr. Francis William Reitz, who was latterly state secretary of the Transvaal republic. The last president of the state was M. T. Steyn, elected in 1896 and re-elected in 1901. In 1897 an alliance with the Transvaal for mutual defense was confirmed. When the war between Great Britain and the Transvaal broke out in October 1899 the Free State Raad decided to stand by its alliance treaty, and joined the Transvaal in the invasion of British territory. After the state had been invaded from the west and Bloemfontein occupied, it was annexed to the British empire under the name of Orange River Colony, by proclamation of date 28 May 1900, but President Steyn and a certain number of his followers still refuse to accept the annexation. (See South African War.) Pop. (1890) 77,716 whites, and 129,787 colored; total, 207,503.

Orange-root. See Golden Seal.

Orange-tip, one of the black and white butterflies of the family Pieridae (q.v.), which are conspicuously marked with an orange spot at the end of the front wings.

Orangeburg, ör'énj'-berg, S. C., city, county-seat of Orangeburg County; on the Edisto River, and on the Atlantic Coast Line and the Southern R.R.'s; 81 miles north by west of Charleston and 50 miles south by east of Columbus. It was settled in 1735 by Swiss and Germans, was incorporated in 1755, and chartered as a city in 1870. It is in an agricultural and lumbering region. The chief manufacturing establishment are lumbering mills, a saw and blind factory, flour and grist mills, ice factory, brick works, wagon and carriage factory, and printing works. There are two colleges, one for colored and one State Industrial institution and the other under the auspices of the Methodist Episcopal Church. There are graded schools for both white and colored and seven churches. The four banks have a capital of $850,000, and the annual amount of business is about $5,500,000. The government is vested in a mayor, elected biennially, and a council of eight members, one half of whom are elected each year. There are courts for the trial of civil and criminal cases. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 2,964; (1900) 4,455.

JAMES L. LINES.

Editor 'Times and Democrat.'

Orangemen, an Irish secret political society, the membership of which is composed exclusively of Protestants. The association aims to support and defend the British sovereignty, the Protestant religion, and the ultimate union of Great Britain and Ireland. The society is named in honor of William III., Prince of Orange. The members appear at first to have been known by the name of 'Pepsi,' or 'One and All,' but the rude and illiterate mob of Pepsi-of-day Boys made way for the rich and influential organization of the Orange Society. Every member must belong to a private or subordinate lodge, and can be admitted only on proof that he is over 18 years of age, a Protestant, and of known loyalty. Any member marrying a Roman Catholic is expelled. Three or more subordinate lodges constitute a district lodge. Next above the district lodge is the grand lodge, then the grand lodge, and finally the imperial grand lodge, at the head of which is the imperial grand master, the chief and supreme head of the association. The society was founded in the north of Ireland in 1755, for the ostensible purpose of counteracting the Catholic secret societies known as Defenders or Ribbonmen. The first Orange lodge was organized in the village of Lougheill, County Armagh, 21 Sept. 1795. As nearly all the peasants of the country belonged to one association or the other, and as feeling ran high, the northern counties were in a very unsettled state for a lengthened period. Whenever the opposite factions met in considerable force insults were exchanged, and riots attended with serious loss of life often ensued. The law was powerless against them, as witnesses were intimidated, and juries sometimes refused to convict offenders belonging to their own order.

In 1808 the society extended its work to England, and in 1821 a grand lodge was founded at Manchester, but was afterward transferred to London. The subject more than once was brought under the notice of parliament, especially in 1813, and in consequence the grand
ORATORIANS—ORATORY

Lodge of Ireland was dissolved; but its functions in issuing warrants, etc., were discharged vicariously through the English lodge. The most memorable crisis, however, in the history of the society was the election of a royal duke in 1827 as grand master for England, and, on the re-establishment of the Irish grand lodge in 1828, as imperial grand master. The Catholic Relief Act of 1828 aroused the slumbering antipathies of creed and race, and the Orange association was provoked to more vigorous action than ever before, not only in Wales and Scotland, but also in Canada and in the other colonies; and it extended its ramifications into the army. At this time the association numbered 20 grand lodges, 80 district lodges, 1,500 private lodges and 200,000 members. In Ireland in 1828 and 1829, numerous bloody conflicts took place in the counties of Clare, Armagh, and Fermanagh, in which considerable numbers were killed and wounded, and it was with great difficulty, and with the military success achieved in suppressing these disturbances. In 1834 it was discovered upon a parliamentary investigation that Orange lodges existed in 34 regiments of the army, and in the following year the society of the Orange Order of Ireland, who had been elected imperial grand-master, was compelled to dissolve the society in Ireland. It was revived in 1845, and has at present many thousands of members in Great Britain and in the United States, especially in Canada, and in the United States. The Catholic Emancipation Act of 1829, the repeal movement of 1848, the disestablishment of the Protestant Episcopal Church in Ireland in 1869, and the Fenian and Nationalist associations were all warmly opposed by the Orangemen. In 1861 the membership in Canada and the United States aggregated 150,000. In New York, 12 July 1871, a serious riot took place and several persons were killed. Other serious riots occurred in Belfast in 1880 and again in 1886. Great demonstrations take place annually on 12 July, the anniversary of the battle of Aghrim and (recalling by old style) of the Boyne, and where the Catholic and the Protestant parties are both in considerable strength the processions of either party are apt to be the cause of serious disturbances. Consult: Libro di Orangeism; its Origin, Constitution and Objects (1862); Lecky, 'History of England (1878).

Oratorian, or Congregation of the Oratory. See Orders Religious; Neri, Saint Philip; Newman, John Henry.

Oratories, The. See Orders Religious.

Oratorio, in music, a sacred composition consisting of airs, recitatives, duets, trios, quartets, and sometimes organ accompaniment, and opened with an instrumental overture. The subject is generally taken from the Bible and the text is often in a dramatic form, as in Handel’s ‘Samson’ or of Or planning to a narrative, as in ‘Israel in Egypt’; at times it is of a mixed character, as in Haydn’s ‘Creation’; and sometimes it consists merely of detached pieces, as in the ‘Messiah.’ Its origin has been usually ascribed to Saint Filippo Neri, who, in 1540, founded the Congregation of the Oratory in Rome, one of the objects of which was to deter the young from profane amusements by rendering religious services as attractive as possible. For this purpose they began by the introduction of canticles, spiritual songs, and choruses, and subsequently, to increase the attraction, Scriptural songs and incidents were formed into dramatic poems, written in dialogue and set to music by the best contemporary composers. These productions were recited and sung, with instrumental accompaniments, before and after the sermon. Stradella was one of the first of those who became celebrated for this exalted kind of composition, his oratorio of San Giovanni Battista being produced in 1670. The increasing popularity of the oratorio at length induced poets of eminence to supply suitable texts. The oratorio was introduced into England in 1730, when ‘Esther’ was sung in the chapel of the Duke of Chandos. It was performed by the children of the Chapel Royal in 1731, and in 1732 was publicly produced. This was followed by ‘Deborah’ in 1733; by ‘Athaliah’ in 1735; ‘The Messiah’ in 1738; ‘The Messiah’, 1742; ‘Samson’, 1743; ‘Judas Maccabaeus’, 1747; ‘Joshua’, 1748; ‘Solomon’, 1749; and ‘Jephtha’ in 1752. Oratorios that have since appeared are: ‘The Creation’, by Handel; ‘The Creation’, by Beethoven (1803); ‘The Last Judgment’, by Spohr (1825); ‘Saint Paul’ (1836) and ‘Elia’ (1846), by Mendelssohn. Among oratorios by English composers may be mentioned: ‘Elia’ and ‘Naaman’, by Sir Michael Costa; ‘John the Baptist’, by ‘Joseph’, and ‘David’, by Sir G. Macfarren; and ‘The Light of the World’, and ‘The Prodigal Son’, by Sir Arthur Sullivan. In London and at the more important musical festivals throughout England, oratorios are performed on a large scale, and with a power, precision, and perfection unknown elsewhere.

Oratory, the art of speaking in public with eloquence and impressiveness; also the exercise of this art, and its product, eloquent speech: the word is from the Latin oratoria or ars orato-rio, from orator, and that from orare, to speak, to plead: the Greek word rhetorikê, rhetoric, has etymologically the same signification. Oratory was first made a subject of study among the Greeks settled in Sicily, the occasion of their directing their education to it being the general unsetlement of all titles to property in Syracuse in consequence of the wholesale confiscations enacted by the three successive despots, Gelo, Hiero, and Thrasybulus, the last of whom was overthrown in 465 B.C., when a democracy was established. The exiles, on coming back to their country, appealed to the new government for restoration of their possessions, but that could be effected only by their appearing and appealing in person to the and arts; tot the profession of legal advocates was as yet a thing unknown: in suits at law no one was competent to plead whether on the side of the complainant or of the respondent save the respective parties themselves. Consequently the dispossessed found themselves in the necessity of making, each for himself, such plea for the restitution of his property as he could, though he might be wholly unacquainted with the art of pleading. In this emergency one Corax, by drawing up a few simple rules for the orderly and effective presentation of their claims, and drafting a skeleton of an address to the court, laid the foundation of the art of oratory on
ORATORY

which, 150 years later, Aristotle reared his immortal work on Rhetoric or Oratory, "incomparably," says Professor Jebb, "the most scientific work which exists on the subject: it may be regarded as having determined the main lines on which the subject was treated by nearly all subsequent writers"—of modern as of ancient times. But between the time of Corax and that of Aristotle was a period of development of the art, both in its theory and its practice, and that period is the golden age of the Greco-Roman, rather Attic, eloquence. Corax had at the first mere imitators who developed the art of logography or of composing speeches or pleadings to be made in the courts by the parties to suits. The first notable logographer at Athens was Antiphon (480-410 B.C.), but he had been preceded by a few years by the exceedingly brilliant but shallow sophist Gorgias, native of Leontini in Sicily, an orator and professor of oratory, who was by his highly oratoric style and his daring paradoxes commanded the interest of all and created a veritable furor: he exacted enormous fees for the privilege of attendance at his lectures in oratory, and had for his pupils the most gifted and aspiring of the Athenian youth. He does not appear to have committed to writing the secrets of his special art; he laid the principal stress on delivery, elocution, and the art of speaking in the popular assembly, and thus he is to be regarded as the founder of the art of forensic oratory at Athens. Never in his life till in its last act did he appear as a regular and as a member of the people or in the courts of law. When he was brought to trial on the charge of high treason he delivered in self-defense a speech, of which, though it proved ineffectual to save him from capital punishment, it left an impression that no attempt at oration was ever made by any man in a like position. There are extant 17 orations composed by him, among them three "tetralogies"—presumably examples of forensic oratory designed to serve as school exercises and models: each of the tetralogies comprises four speeches such as might be delivered in a trial for murder, namely, (1) the charge presented by the accuser; (2) the defendant's answer to this; and (3) the remainder of the accused. The style of Antiphon's orations is rugged and lacks grace and elegance, as compared with that of most of his illustrious successors, but his discourse is ever forceful and convincing. Lysias, the third of the Attic Ten, was also a logographer, but he was besides a man active in public life, and in addition to orations prepared for clients to be delivered by them in the law courts or in the assembly, he composed and himself delivered a great number of political and forensic speeches: more than 160 orations of Lysias are mentioned by ancient authors; of these, 34 are extant, a few of them in fragments. In his simple but refined style he presents a contrast to Antiphon: his vocabulary is simple and pure, the vocabulary of common life; he makes little use of showy rhetorical figures: he excels in vivid description: and he passes gracefully from the full and flowing prose of his argument to the periods of his style in simplicity and precision. He was the first to fit the style of the speeches he wrote to the character of the client, who was to deliver them before the court. Isocrates (430-338 B.C.), an eminent teacher of oratory, and one of the founders of the rhetorical art in its highest development, was also by profession a logographer. Twenty of his orations are extant, marked by great elegance of style, but inferior in natural simplicity to those of Lysias, and in fire and fervor to the orations of Demosthenes. To Isocrates Cicero awards the praise of having brought Attic oratory to perfection. Among his pupils were very many who attained high eminence as orators: from the scant records that are extant are gathered the names of 41 famous orators who are known to have come from the school of Isocrates, among them the great Isaeus (390-353 B.C.), who, like his master was a logographer and perhaps the most eminent representative of that profession: he was deeply learned in the law, and was also a great master in forensic oratory, he was without a peer. Demosthenes is said by some ancient writers to have been one of his pupils. With Demosthenes and Aeschines closes the period of the grand Attic oratory.

After Greece fell under the Macedonian domination, Greek oratory had no longer any arena in public life and it degenerated rapidly. The tradition of the best days was, it is true, preserved in Aristotle's great treatise, and the monuments of Attic eloquence remained, but the virile eloquence of the great orators of Athens was ill fitted for the political circumstances of enslaved peoples. The taste for oratory was industriously cultivated by the Hellenes of Asia Minor and of the Greek cities as an elegant accomplishment in proportion to wealth and culture, but it had become merely one of the arts of decoration. A pompous, florid style, abounding in exquisite figures of speech, extravagant metaphors, and empty but sonorous periods displaced the simple, temperate and effective oratory of the Classical age. The works of great orators of the great theoretic expositors of the art—Isocrates, Aristotle, Theophrastus—were still extant, in which was to be found the corrective of this debased Asian oratory: and it was the good fortune of the greatest of the Roman orators, when he resorted to the Greek schools for training in the liberal arts to have his studies from the first directed to the authentic works of those great masters, and not to the extravaganzas of the Asian school. Cicero's great rival in aftertimes, the orator Hortensius, was caught by the glitter of Hellenism, and sought to win verdicts in the courts by resonant sentences and flowery rhetoric rather than by clear, calm argumentation commended by a chaste, temperate style of which the great Cicero is an example. Of the orators of a more limited fame, 16 are extant, are either deliberative and political, delivered in the Senate or in the Forum, or judicial, forensic, all in defense of accused persons, with the exception of the memorable four or
tions against Verres, in which Cicero acts as accusser and prosecuting attorney. He wrote three treatises on the subject of oratory, De Oratore, Orator, and Brutus, and there are extant two other treatises relating to the art of oratory, De Inventione and Rhetorica which have been ascribed to him as author. In the treatise De Oratore he expresses his view of what the consummately accomplished orator should be: he must not be the mere rhetorician, neither should he be the mere technical lawyer or the keen political partisan; but he should be the man of thorough education and perfect taste, who can speak on all subjects out of the fulness of his mental store, with variety and copiousness. Such is Cicero's ideal orator, an ideal which unquestionably he approached as nearly as any orator in antiquity, though of course even in his time it stood immensely remote. Though Julius Caesar, *the greatest name in history,* was not by profession an orator, he has been justly rated as second to Cicero as a master of the art of oratory: it is not to be doubted that had he devoted himself to forensic practice and the oratory of the Senate he would not have been inferior in that career to any of the great orators of Athens. Julius Caesar owned the unique distinction of having quelled a rebellion by a speech. Quintilian, born about 80 years after Cicero's death, was a very eminent instructor in the art of oratory and wrote on the subject a practical systematic treatise, *Institutiones Oratoriae,* remarkable for its sound criticism and faultless taste.

The triumph of Christianity was in part at least a triumph of oratory: the appointed chief means of disseminating the religion was preaching. The Apostle Paul was an orator of no mean rank. The apologies written in defense of the Christian religion in the 2d and 3d centuries and addressed, most of them, to the Roman emperors by Justin Martyr, Athenagoras, Melito, Apollinaris, Miltiades, Minicius Felix and others were, except that of the last named, in effect harangues written, not spoken: the style is the oratorical style, but it is oftener of the dogmatic kind. Many of the Fathers of the Church, as Tertullian, Cyprian, Athanasius, Basil, Cyril of Jerusalem, the Gregorys (of Nazianzum and of Nyssa), Augustine, Ambrose, were eminent as orators no less than as theologians and controversialists. In the Middle Ages the art of oratory played no inconsiderable part when employed for religious instruction or moral exhortation by Bernard, Dominic and his preaching friars. Bonaventure, Thomas Aquinas, Berchthold of Ratisbon, Vincent Ferrer, Tauler, etc.

Political oratory was meanwhile in abeyance: it had its revival in England in the times succeeding the Revolution of 1688; since that time the English bar and the British House of Commons have been almost continuously illustrated by the genius of orators hardly or not at all inferior to those of ancient Athens. It was a great part of the affairs of the little Syracusan Democracy that gave occasion for the first essay to formulate the laws of the art of oratory; and it is in great crises of states that the highest powers of oratory are called into action. And in India, the question of war against the American colonies, the question of emancipation in India, the war with Revolutionary France, Catholic Emancipation, Abolition of the Corn Laws, Liberation of the Blacks, etc., gave inspiration to orators; so here in the United States the questions of Independence, of forming a Constitution, of Nullification, of Abolition of Slavery, of maintaining by arms the Union, of Tariffs, etc., have called into exercise the oratorical powers of our eminent statesmen, Clay, Webster, Sumners, Philpotts, etc. See Orders, Religious.

**Oratory of Saint Philip.** See Orders, Religious.

**Orb-weaver,** a spider of the group *Orbiularia,* represented most familiar by the garden spiders of the family *Epiridae,* which form their webs on a flat plane in the form of concentric lines of thread sustained by cables radiating from the centre of the coil to various points of support. See Spider.

**Orbegoso, Luis José,** b. Chuquisango, Huamachucu, Peru, 25 Aug. 1795; d. Lima, Peru, 1847. He was educated in the College of San Carlos, Lima, and entered the militia in 1815. He was a man of wealth and high position and, engaging actively into military and political affairs, attained great popularity among his compatriots. In 1835 he was chosen president of the republic and though the election was not strictly legal he held the position without interference until 1838 when his predecessor, Gamarra, raised a rebellion against his authority. Several revolts followed and Orbegoso was defeated. He accepted the intervention of President Santa Cruz of Bolivia, and the Peruvian-Bolivian confederation was formed with Orbegoso as president of North Peru. When the alliance was dissolved in 1836 he was exiled by Gamarra and his followers, but returned to Peru several years before his death. See Communio, Johann von.

**Orbris Pictus.** See Orders, Religious.

**Orbit,** in astronomy, the path of a planet or comet; the curve-line which a planet describes in its periodical revolution round its central body. The orbits of the planets are elliptical, having the sun in one of the foci; and the planets all move in these ellipses in accordance with the law that a straight line drawn from the centre of the sun to the centre of any one of them, termed the radius vector, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. The satellites also move in elliptical orbits. See Astronomy.

**Orca,** a genus of whales. See Killer.

**Orcagna, os-kän-yä,** or Arcagnolo, är-kän-yō’lō, easel names of Andrea di Cione, Italian painter, sculptor and architect; d. probably 1358. He belonged to the school of Giotto as a painter, but his more subdued and dramatic characterization indicate a great advance on the flatness and conventionality of the Giottesque style. His main works are three large frescoes: The Last Judgment; *Hell;* and Heaven* in the enzo chapel of Sant’Maria Novella at Florence. In the same chapel is an altar-piece marked with his name and the date 1357: it represents Christ handing the keys to Peter and a book to Thomas Aquinas. In the London National Gallery is his *Coronation of the Virgin* by Christ,* a large altar-piece which originally belonged to the Church of San Pietro Maggiore.
ORCEIN — ORCHARD CULTURE

at Florence. All these works exhibit powers of exquisite design, graceful composition, and delicacy of coloring. The proportions of the chapel of San Michele and its elaborate tabernacle furnish a magnificent testimony to his powers as a sculptor and architect.

Orcein, C₆H₄NO₆, the chief ingredient of the red and purple dyestuffs known under the name of mordant lake (orcein). It is formed by the action of ammonia and oxygen on orcin, C₆H₄O₃, and consists of two substances, one having the composition C₆H₄NO₄, the other C₆H₄NO₃. When ammonia is added to a solution of orcin, and the whole is exposed to the air, the liquid assumes a dark-red or purple tint by the absorption of oxygen. On acidulating with acetic acid, a dark-red precipitate of orcein is obtained. Orcein is slightly soluble in water and freely soluble in ammonia and fixed alkalies, with a purple or violet color; it is very soluble in alcohol.

Orchard Culture. An orchard is a collection of fruit-bearing trees, especially of those bearing deciduous fruits, as the apple, pear, peach, plum, cherry, apricot, and quince; for oranges, olives and various cultivated nuts, the term "grove" is probably in more general use. American orchard culture differs widely from European. European conditions require conservation of space and make necessary such artificial methods of training as dwarfing, training upon walls, forming cordons, espaliers, etc.; also that the fruit itself shall be of special attractiveness with respect to size, color, flavor, or some other desideratum. As a result, far more hand-work is required in European fruit plantations than in American. In America the intensive methods of Europe are rarely practiced, since land is plentiful and cheap, and since the demand is for a large quantity of fruit rather than for fruit of exceptional quality. The trees therefore are left more nearly to nature, aided by as little hand labor as possible. As a consequence the orchards of America are the most extensive in the world. According to the United States census in 1890 the total number of fruit trees in orchards was 367,184,694, of which 55 per cent were apple, 27 per cent peaches and nectarines, 8 per cent plums, and 45 per cent pears. In that year the yield of fruit valued as they are received is $3,751,800.

During the closing quarter of the 19th century, and especially during the last decade, the management of American orchards was decidedly improved. Prior to that orchards were largely mere adjuncts of the farm, supplying little more than the home need, or at most the small demands of local markets. As a result the trees were allowed, usually, to shift for themselves; harmful insects thrived, plant-diseases spread and the quality of the product was poor. As means of shipment of fruit were improved more distant markets could be supplied and the progressive men began to devote attention to their orchards. Great care is now taken in the selection of the trees, the planting of the orchard; not only must the tree be considered with respect to its nourishment, but the effects of cold, heat, wind, light and other factors must be kept in view. For instance air drainage has been found to be of equal importance to water drainage. Orchards planted in hollows generally fail because of the settling of cold air from the high ground, and good managers now avoid a situation where no draft of air will tend to keep the trees clear of such chilling influences. The land selected is thoroughly prepared by plow and harrow before the trees are planted instead of placing them in separate holes dug in the sod. The trees planted, rarely more than two years of age, are carefully trimmed root and branch, and set in rectangles or hexagons, the latest method permitting cultivation in three directions and being more economical of the land. Instead of allowing the land to grow up with weeds and grass as formerly, modern practice keeps it cleanly cultivated until midsummer, and in many cases a "cover-crop" is planted for plowing under as a green manure in the following spring. During the first three to six or perhaps eight years, according to the kind of fruit, distances between trees, etc., many orchardists plant hickory crops between the trees to offset the cost of cultivation. Cereals and grasses are modernly almost never sown in orchards except to reduce the amount of nitrogenous food in the soil and then only when such food is so over-plentiful that the trees show a great growth of wood to allow of profitable productivity. The cover-crops act more or less as checks to growth and thus help in the ripening of the wood and the buds. They also serve to hold the soil, and to check washing down and leaching of the soil, and if they consist of beans or similar legumes, they enrich the soil with nitrogenous food derived from the air.

Thinning of the fruit has been found of distinct advantage with many kinds, especially when the grower aims to supply the annually increasing demand for finer individual specimens. The objects gained are the removal of inferior, diseased specimens, the destruction of many insect pests, and the saving of plant-food which can be utilized by the tree in the development of finer fruits or other parts. It is practiced most with such fruits as peaches, pears and apricots, these supplying a fancy market; but it is also practiced in favor with apples, plums and even cherries. Often the practice leaves two thirds of the fruits set. But the number lost is usually more than offset by the increased bulk of the crop matured, and by the resultant price.

When peaches, even peaches, were formerly marketed in bulk, they were sold in small individual packages, even apples being sent to market more and more in smaller packages than barrels. This change has been brought about by the demand of consumers who dwell in cities, where they have small facilities for keeping perishable food-materials and must buy their fruit in small quantities, more often than in large amounts. Means of transportation and storage facilities have developed in pace with this change in the market. Refrigerator cars have made possible the carriage of products hundreds, or even thousands, of miles to a final market, and the erection of cold-storage warehouses at both the shipping and the receiving ends of the line has enabled producers and dealers to control the supply and regulate prices to a great degree. The disadvantage in such a method of marketing fruit is the poor quality of fruits shipped long distances; they must be gathered before their flavors have fully developed, and con-
**ORCHARD GRASS—ORCHID**

sumer never learns from the fruit obtainable in his distant market what the fresh article is like.

Consult: Bailey, *Cyclopedia of American Horticulture* (1898—2), and *Principles of Fruit Growing* (1900); Thomas, *The American Fruit Culturist* (1897); and many bulletins of the agricultural experimental stations, especially New York, Michigan, Wisconsin, California, and Vermont; also the annual reports of horticultural and pomological societies, particularly the American Pomological Society, Western New York, Massachusetts, Michigan, and Missouri Horticultural Societies.

**Orchard Grass.** See Grasses in the United States.

**Orchard Oriole.** See Oriole.

**Orchardson, orchard-s-o-n, William Quiller,** English painter; b. Edinburgh 1835. He entered the Trustees' Academy of that city at 15, and encouraged by the success of some pictures exhibited in the Royal Scottish Academy's exhibitions, went to London in 1863 where he contributed to the Royal Academy and other art exhibitions. In 1868 he was elected an associate of the Academy, and in 1877 became an Academician. Orchardson's works consist almost entirely of historical and genre pictures and portraits. Some of his chief works are: *The Challenge* (1865); *Christopher Sly* (1866); *Napoleon I. on Board H.M.S. Belle- rophon* (1880), purchased under the terms of the Chantre Bequest; *Un Mariage de Convenance* (1884); *Salon de Madame Recamier* (1885), in which many distinguished persons are introduced; *The Rift within the Lute* (1887); *The Young Duke* (1889); and portraits of the Bishop of St. Asaph, Prof. Dewar, Viscount Peel, Lord Kelvyn, and others. Almost all his paintings appeared in the Royal Academy exhibitions. He is a painter of brilliant technique with few rivals in certain effects of color and chiaroscuro, but his work sometimes may be said to lack solidity and depth.

**Orchestra.** A term applied to the space in theatres between the seats occupied by the spectators and the stage, appropriated by the Greeks to the chorus and the musicians, by the Romans to the senators, and in our modern theatres to the musicians. The name is also used for the part of concert-rooms assigned to the vocal and instrumental performers; and, lastly, is applied to the instrumental performers, collectively taken. A modern orchestra in the last sense consists of stringed, wind, and other instruments, in varied proportions, according to the number of instrumentalists. The stringed instruments should greatly outnumber the wind instruments. A very effective small orchestra for a moderately sized concert-room may be made up of the following proportions: Six first violins, five second, three altos, two violoncellos, two double-basses; two flutes, two oboes, one clarionet, one bassoon, one cornet, one trombone, two horns; and one kettle-drums—twenty-nine instruments in all. The trombone may be left out without sensibly lessening the efficiency. See Band; Music; Violin; etc.

**Orchestras.** See Musical Instruments, Mechanical.

**Orchid,** or *Urchna* (also called *Tehari*), a native state of Central India, area about 2,000 square miles; pop. 333,020. The town of Orchi, the former capital, is on the river Betwa, not far from Jhansi. It contains an imposing fort with a palace. The town of Tehari, the present capital of the district, is about 40 miles south of Orchi. It contains the fort of Tikamgarh, by which name the town is sometimes called. Pop. 17,510.

**Orchid, orch-oid,** the name of a group of plants (order Orchidaceae) containing more than 12,000 known species and many thousands of varieties, many of which are highly valuable commercially. They are as a whole by far the most interesting order of plants of the entire vegetable kingdom, because of their extraordinary mode of growth and existence, their great age and endurance, their curious habits, and the varied forms of their flowers, which are distinct from all other classes of plants, fine in texture, and of glowing and exquisite colors. They are remarkable also because of their ability and power to exchange and to become changed and free in being without the help of other plants. They are truly self-operating and self-propagating, provided with the facilities for their propagation without the help of other plants, and are capable of living and propagating themselves in the same manner as the vegetable world: hence they are as a whole the most remarkable and the most beautiful of the vegetable kingdom. This fact also accounts for the almost endless varieties of flowers and colors.

The flower of the orchid as a rule is made up of the following parts: sepals, petals, labellum or pouch, and column or crest. The labellum is as a rule the most conspicuous part, and is the most wonderfully constructed, as well as the most important, organ of the flower, since through it insects, when in search of the sweet juices stored inside the spur or walls of the flower, are attracted and guided to the nectar and thus accomplish the benefits of cross-fertilization. It is in this way that so many new varieties are produced by the unconscious work of insects, and these are termed *natural hybrids* and are collected and brought to us from tropical wilds. But under cultivation this important work must be done by experts, using delicate camel's-hair brushes, and with a most careful eye and judgment as to the proper time. In this manner that the most beautiful hybrids have been obtained, known as *garden hybrids.*

Orchids are distributed over a large area of both the Eastern and Western hemispheres, and are divided into two general groups,—the East Indian and the South American. They are also classified according to their habit of growth and subsistence, as saprophytic, epiphytal and terrestrial. The first-named class includes the more inferior species, which grow mostly in wet and marshy places, and, commercially speaking, are of little value except for botanical purposes. The epiphytal group is by far the most valuable and most important of them all in every respect. The species of this section are often erroneously called "parasites," when it is a fact that not one of the whole orchid family is really a parasite. Nearly all the members of this class grow and thrive best upon the trunks and limbs of trees in mid air, simply clinging to a single stem or small limb, and, therefore, sometimes called air-plants. It is this group, too, which contains the most beautiful and most valuable species and varieties and the most varied colors. Their natural habitats are generally confined to
tropical and subtropical climates in both hemispheres, where the moisture-laden and humid atmosphere affords the most congenial nourishment to these wonderful plants. Several epiphytal orchids are found in the extreme southern parts of the United States, some of which are highly interesting and fairly valuable.

The terrestrial orchids are such as grow upon the ground and, therefore, have no need of the pseudo-bulbs or terrated stems, which are peculiarly characteristic of the epiphytal section.

Of the other two classes, Saprophytes and Terrestrial, many varieties are indigenous throughout the United States, even as far north as Vermont and southern Canada. These are what are known as the hardy native varieties, which have their resting season during the winter months, while all the epiphytal (sometimes called celestial) orchids, which are found only in tropical climates, have their periods of rest during the dry season. Therefore the cultivator of these plants under glass must imitate nature as near as possible, giving them their season of rest after their new growth is finished, when water should be withheld gradually and given enough moisture applied to keep them alive until nature itself shows signs of fresh activity. This is the time the plants start in to develop and bring forth their flowers upon and from their pseudobulbs and opened growths. They are simply called pseudobulbs, when moisture is again applied gradually, increasing the supply from day to day; and it is at this period that keen judgment must be exercised.

During the past ten or fifteen years orchids have become one of the most fashionable classes of plants—in fact no other flower has ranked so high in favor or is appreciated more to-day by the better and more highly cultured and aesthetic class of people both in Europe and America than is the orchid. From a commercial standpoint no flowers command the prices for floral decorations, both as plants in bloom and as cut flowers, equal to those of the many beautiful varieties of orchids which are now cultivated. Millions of dollars' worth of these rare plants are imported annually from South American countries, the East Indies, the Philippines and even from Australia. To keep up the supply many practical and experienced collectors are sent out to these distant tropical countries to gather the plants, and the time is fast approaching when it will be almost impossible to collect any more plants within reasonable reach. In fact, so great has been the traffic that several South American governments have put an export duty upon the plants, while others have prohibited their further collection and exportation, entirely from fear of their total extinction.

This is of affairs has brought about the raising and cultivating of thousands of seedling orchids since 1895, and with it the crossing of desirable species and varieties in order to obtain a better and improved class of plants and more beautiful types of flowers. But this is a very slow process, and great patience and many years of time and labor are required to bring them to flowering maturity and size. Carnations and other flowers can be raised in a single year, and even roses in two or three years, but it requires from five, ten or fifteen years to raise orchid plants fit for blooming purposes, so that we may never expect to see orchids in over abundance or a so-called drug on the market.

Treatment and Culture.—It is by no means as difficult a task to grow and cultivate these interesting plants as was supposed when orchids were first introduced to the public in this country during the year 1887, when a prominent florist, who practically is the pioneer in orchid culture, gave the first exhibition of these plants in mid winter in the city of New York. This was followed by annual exhibitions for several years, and people became interested in these wonderful plants. It was then thought next to impossible for anyone except an experienced gardener to manage them, and also that it would require large spaces of glasshouses; but many fine flowers have been produced by laymen in ordinary greenhouses—even in light and sunny windows many varieties thrive so well that thousands of people are cultivating orchids there. They like other greenhouse plants, require plain but careful treatment. They can be grown in ordinary flower-pots in a compost of a certain fibrous peat. The lower half of the pot is to be filled with potsherds and pieces of charcoal intermixed; then place the roots and rhizome of the plant in the peat, and fasten and pack it well. These plants can also be grown in earthen pans or wooden cribs, so that the plants may be thus suspended from the ceiling or in the windows. They require a continuous temperature of from 55 to 70° F., not lowered during the night. Water should be applied sparingly at first, when the plants start into growth, and gradually increased as the plants require it. Frequent spraying or syringing, especially during the spring and summer season, is highly beneficial. This should be done, however, in early morning or after 3 o'clock in the afternoon. In the winter or during the time of rest, when the recently made new growth is maturing, it must be given with judgment and only enough to keep them from shriveling.

Nearly all orchids delight in sunlight, but of course are not to be exposed to direct burning hot sunshine. A judicious shading is beneficial to their welfare. If such treatment is observed the plants, if healthy and thirsty to start with, will grow and flower as successfully as any other plants.

Following is a list of the most popular varieties of orchids named in the order of their commercial importance, with the countries from which they are obtained.

Cattleya.—The orchids of this genus undoubtedly rank as the most popular and most valuable among all orchids. They also contain more species and varieties than any other, and are confined entirely to South America, where they are known by their common name of "fleur de mayo," because the majority of these varieties produce their gorgeous flowers in the
month of May, generally the beginning of the wet season. Following are the principal named varieties:

- **C. moccasin**, C. speciosissima, C. percevaliana, and C. lauraeana, all of Venezuela; C. labiata, C. warneri, C. schroederi, C. harrissonii, C. intermediata, C. gaskelliana, and C. leopoldii, each Brazilian, and several other kindred varieties; also C. trianna (and many varieties), C. mendeli, C. gigas, and varieties, all of the Andes or New Grenada; C. maxima, of Peru; C. dowiana, one of the most valuable and richly colored species, of Costa Rica; C. citrina, of Mexico; C. skinneri, of Guatemala and Costa Rica; and C. bourriniana, of Honduras.

**Laetia**—This genus is closely allied to *Calla*, and includes the following species: L. purpurea, often called "queen of orchids," a native of Brazil; L. elegans, and its varieties; L. karpophila and others, also of Brazil; L. anceps and its many varieties; L. autumnalis; L. gouldiana, L. alba, L. albida, L. majolila, L. digitiata, all of Mexico.

**Oncidium**—This genus embraces many beautiful and valuable species and varieties, among which the following are most prominent: O. varicosum and rogersii, the golden butterfly orchid; O. crameri, mottled butterfly; O. saccodes, O. macranthus, O. marshallianum and many others, all of Brazil; O. papilio, the "butterfly" of the West Indies and South America; O. splendidum and O. coveissidchianum of Mexico and Guatemala; O. tigrinum of Mexico, and many others.

**Odontoglossum**—This genus includes some of the most beautiful and grandest orchids in existence, and the only difficulty is that up to the present time their successful cultivation under glass is still unsolved in this country, although they are very successfully grown in some sections of Europe, where they command a higher value than almost any other orchid. The most important varieties of this species are: O. crispum, O. pescatora, O. albopurpurea, O. harryanum, and kindred varieties, all of New Guinea or Colombia; O. grande, the "baby" orchid of Guatemala and Mexico; O. citrosum, of Guatemala, and O. incisefoli leopardinum, of Guatemala and the Pacific slope of Mexico.

**Peristeria**—Flower of the Holy Ghost (Peristeria elata), of Central America.

**Lycaste**—Several species of Guatemala and Mexico.

**Catasetum**—These are South American and more interesting than beautiful, except C. bungeothii, which is ivory white and very fragrant.

**Stanhopea**—A genus including one of the most curious of orchids, throwing its sweet-scented large flowers from the rhizome downward through its receptacle. Some six or seven varieties exist, natives of South and Central America.

**Chysis**—Four or five species are found in Guatemala and Mexico, very curious plants and flowers, one of which is the "laughing orchid." *Schomburgkia*—A genus of very large and curious plants with great flowers. *Schomburgkia crispum* and *S. undulatum* are well known species of South America and the West Indies.

**Gardneria**—A very curious genus with numerous varieties, bearing highly interesting flowers.

**Epidendrum**—A very large genus with many valuable and showy varieties, nearly all of which are highly epiphytal in character. Many of this group are not very desirable.

Of East Indian orchids, first in importance is the genus *Dendrobium*, a very large and valuable group, which includes a large number of species and varieties, all of which are found in the East Indies, Moluam, Assam and Burma, except two, found in Australia. The principal species are as follows: D. nobilis and its many sub-varieties; D. wardianum, D. crassinode, D. chrysotoxum, D. thysiforum, D. densiflorum, D. deconium, D. falconeri, D. farmeri, D. chrysanthum, D. dalhousianum, D. formosum, and many others of less importance, except D. bigibbum and D. phalenopsis of Australasia.

**Phalanopsis**—A genus of East Indian species called moth orchids. This is one of the very rarest and most valuable genera and also the most difficult group to cultivate successfully, but their beautiful and really fantastic miniature bird-like flowers render them very desirable. Most of them are natives of and found in the Philippines, Archipelago, and in Burma and Siam. Following are the most valuable varieties: P. amabilis, P. grandiflora, P. schillerianum, P. sonderianum, P. luddemanniana, P. casta, P. stuartianum, P. violacea.

**Vanda**—This genus represents the tribe or order of Vandaeeae, which includes the *Zeides*, Saccoblimium, and *Angraecum*. Prominent species are *Vanda caryota*, *V. tricolor* and its varieties; *V. insigni*, *V. lovii*, *V. batemanii*, *V. cathartii*, *V. vanderriana*, *V. teres*, *V. kimbali*, *V. amestosa*; *Zeides* odorata, *A. reginii*, *A. lobbii*, *A. virens* and many others; *Angraecum sesquipedale*, *A. eburneum-virens*, *A. articulatum*, *A. ellisia* and *A. leoni*; *Saccoblimium* giganteum, *S. blumei*, *S. guttatum*, *S. ampulaceum* and others. Other semi-terrestrial forms are *Calanthe* veitchi, *C. vestita* (varieties occulata and rubra), *A. turneri*, *A. reginii*, *A. gigantea* and a few other hybrids; *Cymbidium*lovancum, *C. eburneum*, *C. giganteum*, and some others; *Geslayne* crystalla, *C. alba* (race), *C. lemoniana*, *C. flaccida*, *C. dayana*, and *C. pandurata*; *Phajus* grandiflora, *P. tuberculosa*, *P. walichii*, *P. maculatum* and *P. humboldii*.

**Cypripedium**—This genus, embracing the ladies' slipper, or slipper orchids, is the most important group of terrestrial orchids, and includes a vast number of species from which have been raised a greater number of rare hybrid varieties than from any other class. While not as showy as many of other genera they are highly interesting to the hybridist, and from this standpoint are very valuable. Sometimes a single small plant of a new hybrid will sell for $500.

HENRY A. STIRREICH.

**Orchis**, the typical genus of the order *Orchidaceae*. The roots of several species, as those of the *O. mascula* and *O. morio*, when dried, form the European or indigenous sape. That prepared from the first-named species is said to be the best. Sape contains the principle called bassorin, a little starch, possessing similar properties to those of starch and mucilaginous substances generally.
ORCHIL — ORDEAL

Or'chil. See Archil.

Orchomenus, ör-kom'ë-nös, Greece, (1) an ancient Boeotian city, capital of the kingdom of the Minyae, situated at the northwestern corner of Lake Copais (now封闭), where it is joined by the Cephissus. The town extended from the marshy edges of the lake up the face of a steep rock hill, on which stood the acropolis. It sent 30 ships to the Trojan war, and at a later date became a member of the Boeotian confederacy. Its government was thoroughly aristocratic, and after the Peloponnesian war the jealous democratic Thebans destroyed it by fire, and sold its inhabitants as slaves. It was rebuilt in the reign of Philip of Macedon, but never recovered its position. It was famous for its musical festival in honor of the Graces, who were specially worshipped in the city. In 1880 Schleinemann excavated there a royal tomb or mausoleum, larger than the Treasury of Atreus at Mycenae (v.q.v.), (2) a former city in Arcadia north of Tripolitza, on a hill dominating the road to the north. During the wars of the Macedonians and Achaeans it was a fortified city of considerable strategic value.

Orcin, ör'sin, in chemistry, also called orcinol, $\text{C}_6\text{H}_4\text{O}_3$. It exists ready formed in some of the lichens which produce colorless substances themselves, but which yield coloring substances by reaction with water, ammonia, or air. Orcin is also prepared artificially from oxalic acid by boiling in water, $\text{C}_2\text{H}_4\text{O}_4 \equiv \text{C}_6\text{H}_4\text{O}_3$ (orcin) + $\text{CO}_2$. On evaporation the orcin crystalizes in the form of colorless, six-sided, monocline prisms, which are soluble in water, alcohol, and ether, and have a nauseous sweet taste, but no odor. In the hydrated state it melts at 58° C, and in the anhydrous state at 108° C. It is a di-oxy-toluene represented by the formula $\text{C}_8\text{H}_5\left(\text{CH}_3\right)(\text{OH})_2$. It yields rhombic crystals and forms substitution products with bromine, chlorine and iodine. Orcin gradually turns red on exposure to the air.

Orcus, ör'küs, the Latin name for Pluto, hades, or the infernal regions. See Pluto.

Or'cutt, William Dana, American author: b. West Lebanon, N. H., 18 April 1870. He is general manager of the University Press, Cambridge, Mass., and has published 'Good Old Dorchester,' a narrative town history (1893); 'Princess Kallisto' (1903); 'Robert Cavalier: the Story of the Romance of the Sieur de La Salle' (1904).

Ord, ör'd, Edward Otho Cresap, American soldier: b. Cumberland, Md., 18 Oct. 1818; d. Havana, Cuba, 22 July 1883. He was graduated from West Point in 1839 and served in Florida and in California until the outbreak of the Civil War when he was promoted brigadier-general of volunteers and assigned to a command in the Army of the Potomac. In 1862 he was made major-general and transferred to a command under General Halleck and distinguished himself under Grant at Corinth. He was present at the capture of Vicksburg and in 1865 was appointed to the command of the Army of the James and the Department of Virginia with which he was present at the capture of Rich- mond. Subsequently he was given charge of the Department of the Ohio, and in 1866 he was mustered out of the volunteer service. He remained in the Regular Army in command of the Departments of Arkansas, California, Plate, and Texas successively and in 1881 was retired with the rank of major-general.

Or'deal, certain acts which a person suspected of crime was made to perform solemnly and which would in the ordinary course of things be hurtful or fatal to him; if, however, he performed them without being injured, he was declared to be innocent. These tests were called ordeals or judgments of God. As the results of them often depended on those who made the preparations, there was abundant opportunity for deceit and malice.

The following ordeals were actively in vogue throughout Europe: The duel or wager of battle (see Combat), in which the conqueror was held guilty; the ordeal of fire; the ordeal of water; the ordeal of cross; the trial of the eucharist; the test of the cross; and the judgment of the bier. In the ordeal of fire the accused walked barefooted over coals of fire, or over red-hot coals, and in the 13th century they were supposed to pierce a hole in his hand; or was made to walk through fire, in the last case he was dressed in cloth covered with wax (the trial of the waxen shirt); if he was unhurt by the fire, and the wax unmelting, he was considered innocent. In the 15th century by cold water (often applied to witches) the test would be whether the accused sank or floated; if the latter, he (or she) was guilty; or the accused party had to put his hand into boiling water; and lift something from it, if the accused killed a man or woman in the course of a trial; if he succeeded, he was declared guilty. In the crosswise or crosswise, and who first moved his hands or suffered them to fall was held to be guilty. Or the accused was placed before relics, and two dice were then produced, one marked with a cross. Of these one was tossed into hazard. If it happened to bear the sign of the cross the accused was acquitted. Finally the judgment of the bier was used in the trial of murder; the murdered person was laid upon the bier and the accused made to touch the body. If blood flowed out, or foam appeared at the mouth, or the dead body changed its position, the suspected person was considered guilty. Superstition and artifice gave to these ceremonies the highest authority: and even the emperors were unable to abolish them. The papal chair restrained them by improving the judicial system; after the 14th century ordeals became un借口 commanding and in the 16th century the universal use of the Roman law also tended to abolish trials by ordeal. In the 16th century only the trial of the bier survived, and this continued even to the 18th. Besides this ordeal of cold water for sorcery (found in Prussia in the 17th century and in the neighboring countries in the first half of the 18th), witches were burned, and if found to be light they were pronounced guilty. These foolish customs were gradually
ORDER—ORDERS IN ARCHITECTURE

Order of Solomon’s Seals. See Orders, Royal, Abyssinian.

Orders in Architecture, the different styles of classic architecture as distinguished by the character of the column, its base, shaft, capital and the superimposed entablature. These elements constituting the unit of a colonnade are taken account of in distinguishing the various orders, of which there are five, the Doric, Ionic, Corinthian, Tuscan and Composite. Each type of the column seems to have persisted in its main characteristics from the earliest times while undergoing minor modifications in the way of refinement in proportions and details.

The column of the Doric order presents a tapering shaft resting upon a stylobate or platform. The shaft generally consisted of several parts called drums but in rare instances it was monolithic. It was grooved with semicircular channels meeting in a sharp edge or arris. Surrounding the shaft the capital consisted of a circular cushion or echinus, so named from the sea-egg from which its curve was derived, and a square flat stone called the abacus. The capital formed the support for the entablature, comprising the architrave, frieze, and the cornice. The architrave or epistyle was the first series of horizontal stones, usually unornamented, and forming a solid basis for the frieze above, which was divided by alternating parts called triglyphs and metopes. The triglyphs were blocks, slightly projecting, carved with two vertical grooves and chamfered edges. These, save the two end ones, were placed above the centre of the columns and in the space midway between. The metopes were intervening square panels, often carved with architectural sculpture. Resting on the frieze was the cornice, consisting of a series of projecting moldings, the under side of the bed-molding being ornamented with square mutules having each eighteen gutte depending from its under side. The gutter molding above protected the sculptured metopes from water.

The Ionic order, a development of the 6th century B.C, is characterized by greater slenderness of proportion. The shaft was placed upon a base composed of one concave and two convex moldings of semicircular profile; these in turn sometimes rested upon a square base block or plinth. The fluting of the shaft was semicircular, consequently deeper than the Doric, and was separated by fillets. The capital comprised a bead, an echinus, and an upper and characteristic band ending on both sides in a volute or scroll. The entablature was formed by an architrave of two or three flat faces and a frieze without triglyphs. The superimposed moldings introduced a new feature in the row of narrow blocks or dentals under the cornice.

The Corinthian order was a late development of the Ionic, resembling it in base and shaft, but differing in the form of the capital, which was ornamented with circles of acanthus leaves surmounted by branching scrolls meeting at the corners in spiral volutes.

These three orders were invented by the Greeks, but were appropriated by the Romans who modified them in certain unessential details into types that pass as Roman Doric, Roman Ionic and Roman Corinthian. The latter,
ORDERS IN COUNCIL—ORDERS, RELIGIOUS

however, was the favorite order of Roman architecture. To the Romans belong, in addition, two other orders; the Tuscan, resembling the Doric, but without fluting in the column or triglyphs in the cornice; and the Composite, whose capital consisted of volutes modified from the Ionic and a lower circle of acanthus leaves derived from the Corinthian. This order admitted a great variety of ornamentation.

Orders in Council, orders issued by the English sovereign in accordance with the advice of the Privy Council, an assembly which has no legislative power, excepting so far as Parliament may grant it. In times of emergency, however, the Privy Council has issued orders of a legislative character. Those who were instrumental in issuing such orders out are generally relieved from all liability by a subsequent act of indemnity. It was by orders in council that Napoleon’s famous Continental System was met. See Continental System; Berlin Decree.

Orders, Holy. See HOLY ORDERS.

Orders, Religious. The primary conception upon which the theory of the monastic life is based is an extremely old one, the belief that it was possible for man to perfect his moral nature and to attain the highest degree of spirituality by resorting to austere discipline and bodily mortification having been common among both Jews and Pagans long before the beginning of the Christian era. In fact, one has but to turn to the Essenes, the Stoics, or the Therapeutes to find the germ of thought that was not only to influence the early Christian times, but that was to grow and expand into the more purposeful religious orders of our own day; for the ascetics, with their mortifications of the flesh, and the anchorites, or hermits, who retreating from the world to strive to find spiritual strength in desert places, were the forceful influences in religious life, the examples of spiritual contemplation, without which the great monastic orders could scarcely have been instituted. The first ascetics as a rule did not separate themselves from society, but sought to find the spiritual perfection to which they aspired by means of prayer and mortification of the flesh, not by withdrawing from the company of men; and even then, in the 3d century, the more zealous Christians were driven by persecution to find a place of refuge in the desert, they lived apart, in separate cells, such an idea as that of a common life or community of interests being entirely foreign to their purpose. It was St. Anthony who first gathered a class of disciples about his feet that he might teach them, from his own wisdom and experience, how best to attain the spiritual heights upon which their longing eyes were set, and yet St. Anthony formulated no hide-bound rule of life and announced no principles that would lead one to imagine that he had thought of uniting his individual disciples into a formal congregation. Saint Pachomius, who about 315 A.D. built his first monastery in the Thebaid, had only a vague idea of the value of the community life, and not the least conception of the possibilities for which he was so firmly laying the foundation, the religious orders of the Middle Ages that were at last to become such a powerful influence in the evangelistic work of the world. Although the rule of Saint Benedict was practically the only one that had been adopted at the beginning of the 10th century, the monasteries up to that time had been under the control of bishops. In the 10th century, however, several separate communities formed themselves into congregations under the direction of a common superior, and it was then only that the word “order” could be properly applied to any of the monastic institutions. This rule of Saint Benedict, which remained the popular monastic rule for centuries, provided a year’s probation for novices, and bound each member after that period to constant residence within the monastery, unconditional surrender to the superior, canonical prayer, regular labor, and lives of chastity and complete renunciation of the pleasures of the world. The rule of Saint Augustine, another formular for the religious life which was quite widely adopted during the early centuries, was at first intended exclusively for the clergy and was not adapted for the use of the monks, who were then reckoned among the laity. It was not until the 8th century, therefore, when monks came to be regarded as entitled to clerical rank, that it was assumed by other than regular clergy. The desire to give more austerity to religious life, a movement which began to be noticeable in the 11th century, resulted in the establishment of several new orders. In almost each instance, while the rule of Saint Benedict was adopted, it was made more strict by special statutes, and to those who aspired to great asceticism in these congregations appealed strongly. On the other hand, institutions like that of the Trinitarians, the Order of Grace, and others that mingled more freely with the world, were adopted by those who felt drawn to lives of action rather than to silent contemplation. To the mendicant orders, which appeared at about this time, many special immunities and privileges were given, and these were exercised everywhere without regard to parochial rights or jurisdictions.

From the beginning of the 10th century the multiplication of these religious associations of men bound together by vows to lead a devotional life separate from the world has been continuous. Local prescriptions, like the Reformation in England, Germany and other parts of Europe, the Revolution and the later "Law of Associations" in France, the attacks of the Liberals in Spain, and other forms of suppression have, from time to time, driven certain orders into extinction, but reorganization and rejuvenation, as well as the institution of new orders upon more modern rules of life, have tended to obliterate nearly all traces of the damage done by the passage and enforcement of such unfriendly statutes. The most numerous bodies of monks, of course, are those of the Roman Catholic Church. In the Eastern Church nearly all orders follow the rule of Saint Basil, while the monastic orders in the Church of England or the Protestant Episcopal Church in the United States have either adapted old rules of living to their own use or have formulated rules suitable to themselves. In the Roman Catholic Church, however, monastic orders of men or women have been founded for almost every purpose. The following is a list of male orders and congregations that have attained any great degree of prominence in the religious world:
ORDERS, RELIGIOUS

ORDERS OF MEN.

Alcian Brothers.—A pious society founded in the beginning of the 14th century by one who is simply known as "Inocent." The regulations of the order were as follows: The sanctification of the Brothers, and the active exercise of charity toward the neighbor. (See CLEITANS.)

Atonement, Society of the.—A religious order for the conversion of sinners under the aegis of the Protestant Episcopal Church. Its objects are educational and charitable.

Antonines.—An order of monks founded by Gaston, a French nobleman, in the 11th century, for the purpose of serving those who were attacked by a mortal sickness. They assumed the order of the Franciscan and that finally resulted in the institution of the order of Capuchins. The reformer was Matteo di Rocco of Urbino, a lay brother who, becoming convinced that the cowl worn by the friars of that day was not the cowl prescribed by Saint Francis, not only adopted a capuche of different shape, but, in 1526, obtained permission of Pope Clement VII. for himself and his companions to wear this cowl and also to adopt the life of hermits, preaching the gospel in all lands, under the provision that they should present themselves annually at a general chapter of the Observantines. Matteo began his preaching, and was so successful in it that the public took occasion of his order having him arrested for apostasy. He was released from prison through the intervention of relatives of the Pope, and shortly afterward (1528) a bull was obtained which authorized the union between the reformers and the Conventual branch of the Franciscans, allowing them to adopt the hermit life, sanctioned the wearing of habits, and permitted the use of the long-pointed cowl. From that time the order of the Capuchins was rapidly extending. Although still subject to the Conventuals, and under the rule of the Franciscans, the order in 1589 adopted separate statutes in which all the hours for religious service, for mental prayer, for silence, for taking books and writing the prescribed. It was also stipulated that the order should have no monks, but should confine itself to friars and everything about its churches and convents should be as poor and mean as possible. As to food, the friars were permitted to eat one piece of bread and one glass of wine was not forbidden, but it was specified that nothing should be said to discourage any member who might desire to live more strictly. Under this rule the order has produced many men eminent for their eloquence, their learning, or their Christian virtue, one of the most illustrious being Saint Fidelis of Sigmaringen, who was martyred in 1622. Strangely enough, however, the founder Matteo died before the order because the Pope had decreed that Capuchins who did not remain in their monasteries should not be permitted to wear the long cowl. In 1617 the Capuchins were made exempt from obedience to the Conventuals, and, under the present title of the order, stood the Revolution and other similar movements, and is widely represented to-day.

Carmelites.—Founded in the middle of the 12th century by a crusader named Berthold who vowed to embrace the religious life if the Crusades were to be side victorious in battle. (See CARMELITES.)

Carmelites.—An order of monks founded in the 11th century by Saint Bruno of Cologne, who resigned his position as scholasticus of the episcopal school of Rheims and established the order of the Carmelites in France. The foundation of the new order was directed at Chartres, an upland town more than 4,000 feet above the sea. Although almost unapproachable, being surrounded on all sides by high cliffs, and while the soil was poor, the temperature low and the air charged with fog at almost all times, the site was gladly accepted, and here Bruno and his companions built their mother house, after the approval of the ancient Lauras of Palestine. In 1098 Bruno was summoned to Rome by Pope Clement III., who had been one of his pupils; and he never returned to Chartreuse, spending the remainder of his life in founding convents and promoting the interests of his order. Although it was many years before any statutes were fixed, the Carmelites, after 1144, had been canonized by divine revelation. Its rule was written by Peter of Courbe in 1145, and adopted throughout the European countries.

Camaldoli.—An austere order founded by Saint Romuald, who was of the monks and the Cistercian order, except that their life was one of great austerity even without the written rule. Their dress was of the Cassian fashion, and scarlet and so rough, that the very sight allured one. They wore coarse homespun garments next their skin and fast almost perpetually. Their constant occupation is praying, reading, and agricultural labor, reported in transcribing books. "In spite of this rule, a rule so strict that the Church permits members of other mendicant orders to live under it for a time, or the life of the Carmelites while the Cistercian can pass no law for the perfect life has been marked by great success." Since 1508, in accordance with the decree of Pope Ju-
ORDERS, RELIGIOUS

lius II., the Carthusian monasteries in every part of the world have been under obedience to the prior of the monastery and the chapter general of the order.

Carthusians.—An ancient branch of the Franciscans that ceased to exist early in the 14th century.

Carthusians.—Before the elevation of Celestine V. to the pontificate, 1294, and when he was known merely as Peter of Morone, he founded an austere order which took the name of the monastery of S. Bruno. In spite of its strict rule of life, which provided for perpetual fasting from meat and three days of fasting a month, the membership increased rapidly, and the order, which extended into almost every part of Europe except England, enjoyed great prosperity until it was suppressed, in Germany by the Reformation, and in France by the revolutionary Edict of 1790. At present the order exists only in Italy.

Charity, Brothers of.—The congregation of the Brothers of Charity, founded by St. Vincent de Paul, was founded in Belgium, about 1809, by Rev. J. Triest, canon of St. Bavon, Ghent. Founded for the purpose of procuring the sanctification of its members by the practice of the three simple vows and the observation of its constitutions, and to maintain and minister to the sick and the insane; in sheltering poor workmen; in education; in the instruction of children; in the support principally of the poor, the orphan, juvenile offenders, and the deaf, dumb, and blind; and by performing any other work of charity that they may be called upon to do.

Charity, Brothers of the Institute of. (See Rosminians.)

Chariters. (See Carthusians.)

Christian Instruction, Brothers of the.—This institute was founded for its proper Christian education and instruction of youth, was founded at Saint Brieuc, France, 1237, and at Lys-lez-Lannoy in Mechlin, 1237. In 1811 it was approved by the Holy See.

Christian Brothers. (See Brothers of the Christian Schools.)

Christian Brothers, Irish.—A religious congregation founded in 1844, by John Ignatius Rice, for the purpose of improving the education of the poor. The rule is fundamentally founded on the Catholic education. The rules and system adopted were those of the institute founded by De la Salle, and the first school was opened at Mount Stion, in Waterford, 1 May 1804. The success of this venture was so great that similar establishments were opened in Dublin, Limerick, and other cities, and the results were so satisfactory that on 5 Sept. 1820, Pope Pius VII., acting upon the memorial of the bishops of Ireland, confirmed and granted it a constitution. At the time of the establishment of the system of national education, in 1831, the Brothers placed their schools under the direction of the Board, but in 1865 they received a dispensation regarding its absolute separation of secular and religious teaching which was not in accordance with the spirit under which they had been founded, they withdrew their connection with the Government and have since conducted their schools on the same system as the Protestant schools of the Church. The Brothers are bound by the usual religious vows and are under the direction of a superior-general.

Christian Schools, Brothers of the.—An educational institute founded by Abbé J. B. de la Salle in the 17th century. (See Brothers of the Christian Schools.)

Christian Doctrine, Fathers of the Congregation of. —The Congregation of Christian Doctrine is the outgrowth of a society which was founded by Marco Cusani for the purpose of adopting some systematic methods in the teaching of the doctrines of the Church. When organized in 1590, the membership was composed of a number of priests and laymen who confined their efforts to teaching the catechism to children on Sundays and to instructing the faithful on Church holidays and such other times as it was possible to reach them. The object of the society was strongly for good that it attracted the attention and approbation of Saint Pius V. Both Clement VIII. and Pius VIII. in 1619, made the confraternity the object of their favor, the latter issuing an order providing that all leaving the society should incure the penalty of a tax, as monks. Pope Paul V. made the society an archconfraternity, and as such received the annual tithe from every diocese of the kingdom.

The Congregation of Citeaux, founded in 1098 by Saint Robert as an offshoot from the Benedictines, eventually became one of the most flourishing and illustrious orders of the Church, nearly extinct that but few traces remain, the storms of the Reformation and Revolution leaving few of its convents in Europe. The order was founded in 1098 in the desert at Citeaux, near Dijon, by Saint Robert, who took the name of Benedict, and founded on the model of St. Benedict but for himself only. Together they entered upon a most austere rule of life, for never was the rule of Saint Benedict followed more faithfully. Saint Robert lived in the monastery, 14 September until Easter, little sleep and much hard labor, with prayer and religious observance as the only relaxation. This was Saint Robert's ideal of the religious life, but he was not permitted to follow it for long, being succeeded by his brother, Saint Eudes of Molesme, his former charge. He obeyed the order promptly, and, with a successor at Citeaux, and it was he who drew up the first statutes of the order, and who changed the color of the habit from brown to white. During more modern times there have been several reforms of the order, the most celebrated being that which was instituted at La Trappe. (See TRAPPISTS.)

Chiny, Congregation of. (See Brothers of the Christian Schools.)

Church, Order of.—An offshoot from the Benedictine order which attained influence and greatness during the Middle Ages, and to meet extinction later. Founded in 912 by Saint Benno, abbot of Gigny, the order soon attained great wealth and political influence, the succession of great and mighty men who were associated with its work being sufficient to make its reputation widespread. Among these were Saint Mayuel, Saint Odilo, Saint Hugh, Pope Urban II., who preached the first crusade, Peter the Venerable, and many others.

Commons, Order of.—An institute founded by Gerhard Groot, a deacon of Deventer, in 1264, for the purpose of caring for men who desired to live an austere Christian life in common without taking perpetual vows. The influence of the first house, instituted at Deventer, was recognized by church authorities, and other houses were founded throughout the Netherlands and in Germany, and it was from these institutions that many good and wise men went forth to preach and teach, Thomas a Kempis and Thomas of Aquin being among the number.

Convictuals. (See Franciscans.)

Cordeliers. (See Franciscans.)

Crushed Friars. —The Crushed or Crossed Friars are sometimes regarded as a branch of the Trinitarian order, but they were a separate order founded by a prior of Saint Mary's, at Bologna, about 1270, and were recognized by church authorities, and other houses were founded throughout the Netherlands and in Germany, and it was from these institutions that many good and wise men went forth to preach and teach, Thomas a Kempis and Thomas of Aquin being among the number.

Discalced Trinitarians. (See Trinitarians.)

Divine Word.—The Society of the Divine Word was founded by Rev. Arnoldus Janssen in 1875, its object is the propagation of missionary work among the heathen and the education of the world's children. (See Franciscans.)

Dominicanos, Order of or Preachers. (See Dominicanos.)

Earliest. (See Sisters.)

Eduths.—A congregation of secular priests founded by Pere Edmund de la Buissonnaye in 1661. Established under the names of Jesus and Mary, the congregation had for its object the training of the clergy and the giving of religious instruction to the people, and they wear the ordinary dress of the secular clergy.

Eastertide. (See Franciscans.)

Eucharist.—Originally a strict branch of the Cistercian order it began to assume sectarian characteristics, for which it was condemned by the Council of Constance in 1274. It is still observed in some countries.

Eucharists. (See Franciscans.)

Franciscans established by Saint Francis of Assisi in the early part of the 13th century. (See Franciscans.)

Franciscelli, or Little Brothers.—Originally a strict branch of the Cistercian order it began to assume sectarian characteristics, for which it was condemned by the Council of Constance in 1274. It is still observed in some countries.

Friars Minor. (See Strict Observance.)

Gilbertine. (See Semibrigman.)

Grandmontines.—A monastic order established in Limousin, France, by Stephen, a gentleman of Aurigny, about 1175. The membership was composed of a number of priests and laymen who confined their efforts to teaching the catechism to children on Sundays and to instructing the faithful on Church holidays and such other times as it was possible to reach them. The object of the society was strongly for good that it attracted the attention and approbation of Saint Pius V. Both Clement VIII. and Pius VIII. in 1619, made the confraternity the object of their favor, the latter issuing an order providing that all leaving the society should incur the penalty of a tax, as monks. Pope Paul V. made the society an archconfraternity, and as such received the annual tithe from every diocese of the kingdom.

Holy Cross, Congregation of the.—The Congregation of the Holy Cross was founded in Le Mans, France, 1793, by Rev. James F. Dujarie. Its object was the rehabilitation of the priesthood, and it was almost destroyed by the Revolution. At first it was composed only of Brothers, but, in 1837, candidates for the Holy Orders, led by Rev. John B. Moreau, who became the first superior-general. The General Chapter received the approval of the Holy See 13 May 1857, as a religious society of priests and brothers, devoting their lives to educational work in universities, colleges, and parish schools, and the missions in foreign countries. The Congregation was introduced into the United States in 1860 by Rev. E. Sorin, after whom to become the head of the society throughout the world, established a college in the heart of Notre Dame, the College of the Holy Cross, Notre Dame. From this humble beginning grew the University of Notre Dame, one of the largest and most

Fratelli. (See Cistercians.)

Grandsermont. (See Franciscans.)
ORDERS, RELIGIOUS

advanced Roman Catholic educational institutions in America. The original band of 11 has developed into a community of Catholic priests and religious, educating children in various parts of the United States and Canada. Its members also have charge of large missions in India, and a number of their missionaries have been placed in charge of the zealous work and scholarly attainments of its members.

Holy Cross of Westminster, Order of the.—A religious order for priests and laymen of the Protestant Episcopal Church, founded in 1881 by Father John B. G. de la Salle, Venerable Joseph Benoit Marcelin Champagnat. The object of the education of the clergy and laity in the countries to which the order has been sent.

Marist Brothers, or Little Brothers of Mary.—An order founded at Lourdes, France, in 1816, by Venerable Joseph Benoit Marcelin Champagnat. The object of the education of the clergy and laity in the countries to which the order has been sent.

Marist Fathers.—The Marists, otherwise known as the Society of Mary, is a religious order founded, about 1816, by Very Rev. Father Constant, who devoted himself to the education of the clergy and laity in the countries to which the order has been sent. The order is extensively represented in all countries. The society is known as "Brothers of Mary."
ORDERS, RELIGIOUS

Most Precious Blood, Congregation of the.—The Congregation of the Most Precious Blood, otherwise known as the Benedictine Fathers, was founded in 1833 by Saint Jean Baptist de la Salle at the Venerable Caspar del Buffalo. The object of the new congregation was to counteract the evil effect that the spread of the Deist and Protestant movements throughout Europe had had over the minds of the people. Hence the Congregation gave retreats and training to men who were giving retreats, called brothers, who were to afterwards instruct the children and young men in Christian doctrine. These persons were known as Oblates of the Sacred Virgin of Saint Ambrose. The experiment proved satisfactory that several other congregations have since been organized, conspicuous among which are the Oblates of Mary Immaculate, and the Oblates of the Sacred Heart of Jesus, founded by Saint Francis de Sales. The first institution of this congregation was founded in 1857, when Saint Charles Borromeo, archbishop of Milan, organized bands of secular priests as the congregation of "Oblates of the Blessed Virgin of Saint Ambrose." The experiment proved satisfactory that several other congregations have since been organized, conspicuous among which are the Oblates of Mary Immaculate, and the Oblates of the Sacred Heart of Jesus, founded by Saint Francis de Sales.

Observantines. (See Franciscan.)

Strict Observance of its members by.—A congregation of women who desired to institute an order whose life should be strictly governed by the rule of the Christian society of the young, especially in the case of the poor, and for the augment of the Holy Church's glory. By a Bull of Innocent III, dated 18 July 1218, Pope Frederick, gave their full approbation to the order, which is widely repre

Our Lady of Mercy, Military Order of. (See Theatins.)

Passionists, or the Discalced Clerks of the Most Holy Cross and Passion of our Lord Jesus Christ.—At Rome, founded by Saint Paul the Hermit, assumed the habit of the order with the sanction of the bishop of Alesandria, in 1720. A year later, having formulated his rule of life, he went to Rome seeking permission to found his order. Although he was not looked upon with favor it was 1737 before the last obstacle was removed and the first monastery established. In 1746 the rules of the order were confirmed by Benedict XIV, and, shortly afterward, Clement XIV, favored the Fathers by conferring upon them the Church of Saints John and Paul, on the Caten Hill. From that day the congregation rapidly extended, first throughout Italy and, afterward, into other parts of Europe, even obtaining a good foothold in England by 1642. Ten years later the order was imported into the United States by Father O'Connor of Pittsburgh. There are few orders that form themselves into communities more rapidly than did the Passionists. They have three daily exercises, as well as divine service, and a considerable number of nuns. Their habit is simple, and is not shown. The name is not derived from the fact that they wear no shoes, but is taken from the custom of having the entire body in a state of humility, to express the idea of penance and mortification. They are known as "Sons of the Sacred Heart of Jesus, Brothers of the Holy Redeemer." A congregation founded by Saint Alphonse Maria de Liguori at Naples, founded in 1732, as the result of his Order of the Holy Ghost. The congregations are divided into various provinces, and the work is carried on in a most meritorious manner. Both in the great cities like Naples and in the rural districts, where the people are more ignorant, the passionists are known for their eloquent preaching, their charitable works, and their good example of evangelical work among the poor and needy, that led to the formation of this congregation. The order is divided into provinces for various parts of the French colonies, and in the United States, where they are found in the dioceses of Philadelphia and New York.

Paulists. (See Paulists.)

Pignatelli. The regular clerks of the Scuole Pietà, or religious schools, instituted at Rome during the 17th century.

Picpus. There have been two congregations of Picpus, the first a reform of the Third Order of Saint Francis, which was instituted by Vincent Mussart in 1694; the second a congregation founded by Pierre Coudrin, in the latter part of the 18th century. Having received the dispensation of the French government, Coudrin planned the formation of a congregation of a religious superior to the men of the Holy See, and the mission, and should protest against any act of injustice or maintaining perpetual adoration of the Blessed Sacrament. So well did he plead his cause that he aroused the sympathies of the people, and in 1809, he was able to open the first house of his congregation in the Faubourg Saint-Marcel. In 1818, the approbation of the Holy See was obtained, the Fathers of Picpus were in control of several important educational institutions, and, in 1851, a company of thirty priests of the order were sent to the Pacific Islands by Leo XII., in the hope that they might convert the savage natives to Christianity. From that time most of their activity has been devoted to missionary endeavor. The headquarters are in Washington, D.C., and the members include such men as Father Damien, whose work among the lepers will never be forgotten, explains the reason for this and the subsequent work of the Order. The Congregation of the Sacred Heart, which has been in existence since the end of the 18th century, and an abode of Carmelites, has been sufficiently known as "White Canons." While its foundation lies in the United States and established communities throughout the Middle and Western States.

Preachers, Order of. (See Dominicans.)

Presbyterians, Order of. The "Canons Regular," consisting of about 140 secular canons founded by Saint Norbert at Premontre, near Leon, in 1119. The rule of the order is that of Saint Austin, its habits being those customary until a more regular, if less correct, system of life was not included such men as Father Damien, whose work among the lepers never will be forgotten, explains the reason for this and the subsequent work of the Order. The Congregation of the Sacred Heart, which has been in existence since the end of the 18th century, and an abode of Carmelites, has been sufficiently known as "White Canons." While its foundation lies in the United States and established communities throughout the Middle and Western States. The Revolution, at the close of which only eight houses remained undisturbed. Since that time a few more houses have been opened, especially in England, and there is no comparison between the present almost unprecedented in the religious life of Europe.

Recollects.—A branch of the Franciscan order which has been in existence for more than three centuries. The early orders of the Jesuits and the Dominicans were the result of the reform movement led by the friars of the order, and followed a rule of life which was dictated by the desirability of their need to be shaped to the requirements of the order. The rule of the order was reformed in the convent at Jerusalem. The Congregation of the Most Holy Redeemer.—A congregation founded by Saint Alphonse Maria de Liguori at Naples, founded in 1732, as the result of his Order of the Holy Ghost. The congregations are divided into provinces for various parts of the French colonies, and in the United States, where they are found in the dioceses of Philadelphia and New York.

Rosmini, or Fathers of Charity. (See Congregation of the Most Holy Childhood.)

Sacred Heart, Brothers of the.—A congregation founded in 1849 by Father Jean Baptiste Coindre, a member of the Society of Missions. The two objects of the institution are (1) a self-sacrificing and devoted service to the sick, who are cared for in hospitals, and in general literary labors. During this period the order of Saint Francis de Sales was extended to England and it is now represented by houses in the dioceses of London, New York, and the four new provinces established in France, two new provinces were established, one for the United States and the other for Canada. A novitiate was opened at Metuchen, N. J., in June 1901, and this is now the official residence of the provincial of the order.
ORDERS, RELIGIOUS

Saint Charles Borromeo, Congregation of the Missionaries of. — A congregation founded by Bishop Scalabrini at Piacenza, Italy, in 1857, its object being to provide priests and missionaries to North and South America. Although the scope of work and aims of the Congregation were fixed in 1857, the priory of Malpensa, one of the few houses, was not established until 1892. Growth of the Congregation, however, has come even more slowly than that in any other of the American missions, and so only recently has it become a more important factor in the life of the Church.

Saint Francis Seraphicus, Poor Brothers of. — An institution founded in 1862 by Father Gonzaga, the principal of Saint Francis' parish school, Aix-la-Chapelle, Germany. Its object is the promotion of the Christian education of youth.

Saint Gabriel, Brothers of. — An institute founded in 1872 by Father and Mother Genz, of France, for instruction of the deaf. The object is to provide schools and institutions for the education of the deaf and dumb. The brothers also care for the deaf and dumb in institutions and orphan asylums.

Saint John of God, Order of. — The Order of Charity, founded by Saint Vincent de Paul, in 1643. It was originally established for the care of the sick poor, but in course of time, the objects of the original foundation have been extended, and the Order now includes hospitals, orphanages, schools, and similar institutions.

Saint John the Evangelist, Society of Mission Priests of. — Founded by several ritualistic clergymen of the Church of England, at Cowley, England, in 1832. It has always been a religious order devoted to the mission of the poor in the colonies under the influence of the Church of England.

Trappists. — A reform of the Cistercian order instituted in 1862 by Armand Jean le Boutillier de Rancé. Assuming control of the abbey of La Trappe, in 1860, he found in it a more practical and adaptable form of monasticism. The Cistercian rule had been so far relaxed that many of its members had ceased to live in community, and Devotion to the church was one of the efforts to the restoration of the monastic life and regularity and order. Establishing what he called the "Strict Observance of the Cistercian Order," he succeeded in persuading its members to observe in strictness the rule to come to his assistance, and together they completely reorganized and reformed the monastery. From La Trappe this austere rule spread into other parts of Europe where it met with such instant favor that some of the houses of the old world are now those of the Trappist reformers.

Trinitarians. — A religious order founded by Saint John of Matha and Felix of Valois, an aged French hermit, its object being the release of Christians — many of them Jews, captured by the Turks who, having taken Jerusalem, were holding their prisoners in slavery for the order of their service for the life of the captives. The rule adopted by the Trinitarian monks was that of Saint Augustine, made acceptable by peculiar statutes that were original with the monks. Immediately after the foundation of the first monastery the work was commenced with great vigor, and at one time it was estimated that fully 31,000 Christian captives had been rescued through this agency. In 1218 the Military Order of Our Lady of Mercy, which had the same general purpose as that of the Trinitarians, was founded and later, when it had thrown off its military character and adjusted itself more closely to the rule of Saint Augustine, it assumed, as a result of the order with the older order. In 1599 a reform of the first order was instituted by Father Father Boccard, under the name of Discalced Trinitarians. This reform was approved by the Holy See, but its houses, as houses of all religious orders, were suppressed by Queen Isabella II of Spain. Vinculanthus. (See Lazarists.)

White Fathers. (See Carmelites.)

Xavier Brothers. — A teaching institute founded at Brussels, Belgium, by Theodore James Ryken, in 1847. The purpose of the founder was to organize "a congregation of men who would willingly sacrifice their lives to the Christian education of youth," an object which has been adhered to so closely that the order has long been regarded as one of the most successful teaching institutes of the Church.

ORATORIES

The Oratory, which has been such an important factor in the history of the Catholic Church, especially in England, had its inception in the mind of Saint Philip Neri, a native of Florence in Italy, who, according to his own account, was moved to the purity of his life and the desire to do good for young men, he believed there was need for a community of sympathetic souls who were ready to follow his guidance in order that they might lead a life of greater religious regularity. He himself was preaching to them in private, teaching them how to show more reverence to the holy Sacrament of the Lord's Body in the Church. In 1551, upon the advice of his confessor, Philip received holy orders, but even then he continued to receive students into his own room or in a larger chamber, and it was from these daily contacts of equal ages in communities of evening exercises which has always been maintained by his Congregation. This consists of a popular devo-
ORDERS, RELIGIOUS

The following is a list of the most prominent orders of women that have been or are now in existence in the Roman Catholic and Protestant Episcopal churches:

**All Saints Sister of the Poor Order** — established in the Church of England in 1851 by Rev. W. Upton Richards, and introduced into the United States by the Bishop of New York. The order has undertaken all kinds of charitable and educational work, ranging from fashionable boarding schools for young ladies to the care of neglected children.

**Angelicals** — An order of nuns, followers of the rule of St. Augustine, founded by the Countess of Guastalla, in 1530.

**Annunciation of the Blessed Virgin Mary, Sisters of** — a society incorporated in 1853 to receive and care for the destitute girls between the ages of 4 and 16 years.

**Apostolatas Sisters** — An order founded at Lodi, Ill., 15 Aug. 1884, by Rev. Louis Heidemann. Its object is the education of youth.

**Assumptionists**, **Sisters of the, the** — An order founded by Msgr. Affre, bishop of Paris, in 1839. It is chiefly an educational order. The Little Sisters of the Assumption nurse the sick poor in their own homes and hospitals, and in 1852, opened schools for young girls.

**Basilian Nuns** — The Basilian nuns were founded in 1815, and in 1817, a small group of them went to Latin America, where the order was continued.

**Beguine Nuns** — The female branch of the Beguine order of religious women, founded in the 13th century by St. Clare. They were the first order of women to be recognized as religious in the Church.

**Bethany, Sisters of, of** — An order founded in New Orleans, La., in 1817, and now under the direction of the Bishop of New Orleans, is an order of the Episcopal Church.

**Blessed Sacrament Sisters** — The orders of the Blessed Sacrament nuns are of recent origin. Those of the Perpetual Adoration, as their name implies, devote their entire time and energy to the adoration of the Blessed Sacrament.

**Blessed Virgin Mary, Institute of** — One of the few Roman Catholic religious orders that was recognized by the Church at the time of the Reformation. It was founded by Mary Ward, the daughter of a gentleman of large estate, in 1611. A teaching order of the highest class, it prospered from the first, and it is still a flourishing religious institute, being popular in the French and English countries.

**Calvarian Nuns** — There have been two congregations of Calvarian nuns, both of which still flourish. One was founded at Pavia in 1656, the other by the Jesuits in 1727. Both of these orders were suppressed in the 18th century.
ORDERS, RELIGIOUS

Less girls, was instituted at Genoa, in 1619, by Virginia Braccelli.

Chaldeans,—The female branch of the austere order of the Chaldeans.

Charity, Sisters of.—There are many orders and branches of this religious order, for girls; the Callas of the Church, which bear the name of Sisters of Charity. Some of the famous were the "Daughters of Charity," Sisters of Saint Vincent de Paul, etc. The oldest order was founded in Paris in 1643, by Saint Vincent de Paul and his assistant, Mlle Louise le Gras, and its constitution has never been changed. Instead of making perpetual vows, the Sisters took a temporary one, which are renewed annually, when they also add a fourth vow, binding themselves to care for the sick. The order of Sisters of Charity in the United States was founded by Mother Seton, who, by her consecration to the Roman Catholic faith, devoted her life to the charitable works of the Church. Her first community, which was known as the Sisters of Charity of Saint Vincent de Paul, at Emmitsburg, Md., July 1809. The Sisters of Charity of Cincinnati, Ohio, are a branch of the order founded by Mother Seton. The Sisters of Charity of Saint Paul are a congregation largely devoted to teaching. The order was founded in 1704 by M. Chauvet, a French curé, assisted by Mlle de Tyll. The Sisters of Charity (Irish) are an order which is very similar in宗旨 that founded by St. Vincent de Paul, its mission minister to the sick and poor in hospitals and orphanages. The order was founded in Philadelphia, Pa., by Very Rev. Thomas Clarke, on March 15, 1815, by Mrs. Mary Francis Aikenhead. The congregation of Sisters of Charity of the Blessed Virgin Mary devote themselves to the education and care of the sick. The order was founded in Philadelphia, Pa., by Very Rev. Thomas Clarke, on March 15, 1815.

Holy Child Jesus, Sisters of.—A cloistered sisterhood devoted to the care and education of children. Holy Child Jesus, Sisterhood of the.—An order established by the Protestant Episcopal Bishop of Albany for the purpose of conducting educational and charitable works in his diocese.

Holy Communion Sisters.—There are two branches of the Holy Communion in the Episcopal Church, and both are established in New York City. The older branch, which was organized by Rev. Dr. Muhlenberg in 1852, was the first order of Episcopal Sisters to be established in America. Its members are engaged in parish visiting, nursing the care of the sick, and clerical vestments, and in various Kindred of educational work. The order in the United States is devoted to the care of children, hospitals and orphanages. The order of Sisters of Charity of the Blessed Virgin Mary is the first superior-general, on 1 Nov. 1830. The Sisters of Charity of Saint Joseph, Sisters of the Holy Family, are an order of the Holy Family, and the oldest, the Congregation of the Sisters of the Holy Family, was founded in 1842. The Congregation of the Holy Family is a community founded at Memramcook, N. B., in 1874. Its one purpose is the temporal care of educational institutions.

Cistercians.—The female branch of the order of Cistercian monks.

Cluny, female branch of the Congregation of Cluny.

Carmelites.—The female branch of the order of Carmelite monks, reformed by Saint Theresa in 1542.

Cross, Daughters of the.—A congregation founded by Saint John Vianney, archbishop of Utrecht, in 1854. Its work is mainly educational, including the care of the sick, and the education of young girls.

Dovecote, Society of.—A congregation instituted in Italy for the purpose of caring for the sick in their homes.

Epiphany, Society of the.—A Protestant Episcopal congregation, established in 1867 by the Bishop of Washing- ton, D. C. Its objects are: the protection and training of young girls, and the giving of spiritual assistance to the sick and orphaned.

Discolored Carmelites. (See Carmelites.)

Divine Service, Society of.—A congregation instituted in Italy for the purpose of caring for the sick in their homes.

Epiphany, Society of the.—A Protestant Episcopal congregation, established in 1867 by the Bishop of Washington, D. C. Its objects are: the protection and training of young girls, and the giving of spiritual assistance to the sick and orphaned.

God Shepherd.—There are several sisterhoods of the Good Shepherd. The oldest order, the Sisters of the Good Shepherd, was founded in 1887, by the Eudist Fathers, assisted by Margarette F'ami, in 1641. The Sisters of Our Lady of Charity of the Good Shepherd were founded in 1887, by Mother Mary of Saint Euphrasia Pelletier, in 1887. The Sisters of Our Lady of Charity of the Good Shepherd were founded by Père Eudes (1651) and were introduced in America by Rt. Rev. John Timon, bishop of Buffalo, N. Y. They have at least 100 houses in the United States for working girls, mental and training schools for deaf-mutes, and orphanages.

Good Shepherd, Sisters of.—There are now two branches of the sisterhood of the Good Shepherd in the Protestant Episcopal Church in the United States. The Saint Louis branch, incorporated in 1867, has charge over Bishop Robertson Hall, the diocesan school for girls; the Callas of the Church, which bear the name of Sisters of Charity. Some of the famous were the "Daughters of Charity," Sisters of Saint Vincent de Paul, etc. The oldest order was founded in Paris in 1643, by Saint Vincent de Paul and his assistant, Mlle Louise le Gras, and its constitution has never been changed. Instead of making perpetual vows, the Sisters took a temporary one, which are renewed annually, when they also add a fourth vow, binding themselves to care for the sick. The order of Sisters of Charity in the United States was founded by Mother Seton, who, by her consecration to the Roman Catholic faith, devoted her life to the charitable works of the Church. Her first community, which was known as the Sisters of Charity of Saint Vincent de Paul, at Emmitsburg, Md., July 1809. The Sisters of Charity of Cincinnati, Ohio, are a branch of the order founded by Mother Seton. The Sisters of Charity of Saint Paul are a congregation largely devoted to teaching. The order was founded in 1704 by M. Chauvet, a French curé, assisted by Mlle de Tyll. The Sisters of Charity (Irish) are an order which is very similar in宗旨 that founded by St. Vincent de Paul, its mission minister to the sick and poor in hospitals and orphanages. The order was founded in Philadelphia, Pa., by Very Rev. Thomas Clarke, on March 15, 1815. The Sisters of Charity of Saint Joseph, Sisters of the Holy Family, are an order of the Holy Family, and the oldest, the Congregation of the Sisters of the Holy Family, was founded in 1842. The Congregation of the Holy Family is a community founded at Memramcook, N. B., in 1874. Its one purpose is the temporal care of educational institutions.

Holy Ghost, Sisters of the.—An order founded in 1850 by the late Archbishop Hennessy of Dubuque, Iowa. Its objects are: (1) The glory of the Holy Ghost, and (2) the promotion of Christian education. The order of the Sister-Servants of the Holy Ghost was founded in Stell, Holland, in 1859. There is no affiliation between these orders.

Holy Heart of Mary, Sister-Servants of the.—An order founded by Rev. R. J. Grafton, Protestant Episcopal bishop of Pond du Lac, Pennsylvania, are engaged in various kinds of missionary and parochial work.

Immaculate Heart of Mary, Sister-Servants of the.—A congregation founded in Quebec, in 1850, by Most Rev. P. P. Turgeon, bishop of Quebec. Its objects are: (1) The reformation of fallen women, and (2) the education of children. The Immaculate Heart of Mary, instituted in France, perform all kinds of charitable works, conducting academies, orphanages, female and orphan homes for working girls, and training schools for deaf-mutes, and orphanages.

Incarnate Word and Blessed Sacrament, Sisters of the.—An order founded by the Rev. J. M. H. de la Pouy, a Jesuit, and known as Sister Jane Chezard de Matel, in 1825. The American foundation was made at Brownsville, Texas, in 1854.
ORDERS, RELIGIOUS

Although the order has many houses in various parts of the world they are independent of each other. The Sisters of Charity of the Incarnate Word are an American religious community, having been founded by Rt. Rev. C. M. Dubois, bishop of Texas, in 1852.

Jesusistes.—An institution of women who aspired to live under the vows and rules of the Jesuits. It was founded in 1610.

Jesus, Society of the Faithful Companions of.—A congregation founded in 1622 by the Jesuit Peter Favre. Its objects are to educate young women, especially in boarding schools.

Lay Sisters of Mary.—An order founded in 1703 by the Blessed Louis M. Grignon de Montfort, assisted by Miss Louise Trichet, afterward Sister Mary Louise of the Holy Ghost.

Little Company of Mary.—An order founded about 1789 in England, its purpose is the care of the sick in their homes and in hospitals.

Little Sisters of the Poor.—An institution established in 1854 by M. la Paillere, the curé of Saint Servan, in Brittany, and formally approved by the Holy See in 1856. It is the establishment of permanent homes for the aged and infirm of both sexes without distinction as to age or nationality. The Sisters of the Poor of Nazareth is an English offshoot from the Little Sisters of Loreto Nuns.

Loreto Nuns.—There are several orders of Loreto Nuns, the oldest being that of the Ladies of Loreto, founded at Munich, Bavaria, by Mme. de Bort, in 1649. Its first American house was established at Toronto in 1847. The Society of Sisters of Loreto, or Friends of Mary of the Cross, was founded by M. Charles Nerincz, a Flemish missionary, in 1812. Another branch of the Sisters of Our Lady of Loreto was established by M. Theresa Ball, at Rathfranham, near Dublin, Ireland, in 1822. It was from this foundery that the many convents the Loreto nuns in Ireland. Although not affiliated the objects of the orders are very similar. Their work is educational and missionary.

Marist Sisters.—An order founded by Father Colin de I'Hermitage, whose objects are educational.

Mercy, Sisters of.—An order founded in Dublin, Ireland, in 1827 by Miss Catherine McAuley, afterward mother superior. Besides the three vows the Sisters took a fourth to devote their lives to the service of the poor, the sick and the ignorant, an obligation which has been observed so zealously that the order has become one of the most important communities in the world. The sisterhood was introduced into the United States in 1846, and since then the Sisters have come to be an established institution. The sisters of England order of Sisters of Mercy was founded about 1845 by Miss Lydia Sellon at Devonport. The only vow exacted is that of poverty, while the community of life, and membership are permitted to withdraw from the convents at will.

Mission Helpers, Institute of.—Founded at Baltimore, Md., in 1866, its sisters visit the sick and poor in their homes and give religious instruction to children and adults. The direct object of the community is to advance the perfection and assist in the sanctification of the priesthood.

Missionaries of Mary.—There are several orders of the Sisters of Notre Dame. That of the School Sisters of Notre Dame was founded in 1843 by the Venerable Julie Billard, assisted by her friend, the Viscountess de Gezaincourt. Its object is the salvation of souls. Its objects are chiefly educational.

Our Lady of the Holy Rosary, Congregation of.—Founded in 1879 by the Jesuit Fr. Joseph de la Croix, Superior General of the Jesuits in France, and approved in 1880. It is the Congregation of Sainte-Therese of Lisieux, which has for its object the care of the sick and the orphan as well as to general educational work. The Congregation of Notre Dame Counsel, Sisters of.—A community founded in 1864 by Bishop Labreque of Canada. Its object is the Christian instruction and education of the poor.

Our Lady of Perpetual Help, Sisters of.—An order founded at Saint Damien, Province of Quebec, Canada, by Rev. J. O. Brousseau, assisted by Mlle. Virginie Fournier, afterward Sister Saint Bernard, the first superior of the community. Its objects are educational.

Our Lady of Sorrows, Congregation of.—Founded at Breslau, Germany, in 1848, under the direction of Mme. de Bonnault d'Houtet (née de Bengy). While its main objects were and are the sanctification of souls and the training of young women, the order has been engaged in parochial school work for many years.

Poor Clares.—(See Saint Francis, Sisters of.)

Poor Handmaids of Jesus Christ.—A congregation of Sisters founded at Dernbach, Germany, in 1851, by Mlle. Christine Kaspers. Its rule, which was composed by Rt. Rev. J. P. Blum, bishop of Limburg, and its objects, which are in the highest sense charitable, were approved by the Holy See in 1859.

Presentation of the Blessed Virgin Mary, Order of the.—An order founded in Ireland, 1777, by Miss Nance Nunn, afterward Sister Mary of the Precious Blood. The foundress took simple vows only, which were renewed annually, but, in 1805, Pope Pius VII. raised it to the rank of a religious order with a solemn enclosure. A fourth vow was then added by which the members promised to devote their lives to the work of instructing poor girls in the precepts of the Christian faith.

Presentative Sisters of Providence.—The Sisters of Providence, who also devote themselves to the instruction of young girls, were founded in Lorraine, in 1801, by the Venerable Jean Marie Vianney. The first institution of the order in America was opened at Saint Mary's, near Terre Haute, Indiana, in 1842. The branches of the Sisters of Providence, including the Oblate Sisters of Providence, the Sisters of Divine Providence and the Sisters of Providence of Kentucky, are active in educational and missionary work.

Redemptorists.—The Sisters of the Order of the Most Holy Redeemer are a Congregationalist order of monks. They are strictly enclosed and contemplative and assist the missionaries by their prayers.

Resurrection Sisters.—There are two orders of Resurrection Sisters, the Holy Spirit Congregations of the United States. The Sisters of the Resurrection were instituted by the Bishop of Florida in 1832. Its members conduct an educational and industrial school for orphans. The Sisters of the Order of the Holy Resurrection were founded by Mgr. Bourget in 1841, and the Sisters of England order of Sisters of Mercy was founded about 1845 by Miss Lydia Sellon at Devonport. The only vow exacted is that of poverty, while the community of life, and membership are permitted to withdraw from the convents at will.

Sacred Heart, Ladies of the.—The Society of the Sacred Heart was founded at Amiens, France, in 1841, by Mme. Madeleine Sophie Barat, in 1800. The community, which is the only one of its kind, has for its object the Christian education of youth in boarding and parochial schools. The Missionary Sisters of the Sacred Heart devote themselves to the care of the sick and the orphan as well as to general educational work. The Sisters of the Sacred Heart operate a college at Douai, France, in 1828, by the Abbé Debray, who restricts its efforts to works of educational character. Its rule and constitution were arranged from the somewhat mild rule prescribed for the Visitation Nuns by Saint Francis de Sales.

Saint Agnes.—The Sisters of Saint Agnes were founded at Douai, France, in 1879, by Mgr. Ignace Bourget, in 1830. Its objects are chiefly educational.

Saint Augustine, The Sisters of. The order was founded at Quebec, Canada, by Mgr. Ignace Bourget, in 1830, its objects are chiefly educational.

Saint Catherine of Siena, The order is the order of Saint Augustine in now in charge of the House of the Providence of the Lord in Rome. It was founded by St. Catherine of Siena in 1848. In this case the first case came from Dieppe, France.

Saint Benedict.—The order of Sisters, corresponding to the mission of Saint Benedict, is the Congregation of the United States by Rt. Rev. Boniface Wimmer in 1846. The first colony of Benedictine Sisters came
ORDERS, RELIGIOUS

eichstätt, Bavaria, and established their convent at Saint Mary's, Elk County, Pa. Many other convents were also established in the area, including houses of the orders of the Benedictines, Sisters of Perpetual Adoration, and the Oblates of Mary Immaculate. The Sisters of Saint Bridget.—The Sisters of Saint Bridget, or the Order of the Holy Handmaid of Jesus, were founded in Dublin, Ireland, in 1863. It is their mission to care for the religiously educated of poor girls and boys. The community of the Sisters of Saint Bridget, corresponding to the monks of Saint Dominic, was introduced into the United States by Miss M. E. Lovett, who established this house at Springfield, Ky., from which mother house convents have been established throughout the country. Their objects are educational and charitable. The Dominican Sisters of the Third Order of Saint Dominic were brought to this country in 1868 by P. F. O. T., then provincial of the order. The Sisters conduct parochial schools and orphanages. The community of the Dominican Sisters known as the Congregation of Saint Catherine of Siena, was founded in New York in 1865. The mission of the Sisters of the Perpetual Rosary as the name implies, are in charge of the management of the Perpetual Rosary Church at West Haverstraw, N. Y., was established in 1861 by sisters from Boyle, France. The Sisters of Saint Francis.—The first mother house of the Franciscan Sisters to be instituted in this country was the convent of Saint Francis established in 1875 by the late Bishop Neumann at Glen Ridge, Pa., in 1853. At the present time the Franciscan Sisters of Saint Francis are represented in the United States: The Little Franciscan Sisters of Mary, founded at Ladywood, N. Y., 1855; the Franciscan Missionaries of Mary, founded in British India about 1850; the Little Franciscan Sisters founded by Very Rev. Rev. Patissi, of Magnifico, O. F. M.; the Little Franciscan Sisters of Mary Immaculate, founded in 1865; the Little Franciscan Sisters of Saint Francis, founded at Buffalo, N. Y., in 1874; the Little Franciscan Sisters of Saint Francis, founded in 1865; the Little Franciscan Sisters of the Third Order Regular of Saint Francis, incorporated as the Sisters of Saint Francis of Oldenburg, in 1861; the Little Franciscan Sisters of the Sacred Heart; the Franciscan Sisters, founded in 1872; the Little Franciscan Sisters of Saint Francis of Assisi, M. C. of the Franciscan Sisters of Saint Francis, founded in 1875; the School-Sisters of Saint Francis; the Franciscan for Colored Mission, established in 1881; the Little Franciscan Sisters of the Perpetual Adoration, founded by Rt. Rev. M. Hieus, in 1866; the Franciscan Sisters of Christian Charity, founded in Wisconsin in 1869; the Franciscan Sisters of the Sacred Heart, established in 1869; the Franciscan Missionaries of Holy Cross, founded in 1875; the Poor Sisters of Saint Francis of the Perpetual Adoration, founded by Rev. Fr. Da: the Holy Family, founded in 1872; the Poor Sisters of Saint Francis of the Poor of Saint Francis; the Little Franciscan Sisters, founded in 1890; the Franciscan Sisters of the Immaculate Conception of the Blessed Virgin Mary, founded in 1893; the Little Franciscan Sisters of the Immaculate Conception of Jesus, founded in 1894; the Conventual Franciscans, founded 1879; the Little Franciscan Sisters of the Congregation of Our Lady of Lourdes, established 1880; and others. The Order of the Poor Clares is also well represented in the United States, the first sisters having come from Rome, Italy, to open a house in Cleveland, Ohio, in 1875. As the Second Order of Saint Francis, the Clares are the oldest of the Franciscan orders for women, its foundress, the virgin Saint Clare, having been received by Saint Francis in 1212.

Saint John the Baptist.—An order established in the Church of England, founded at Clewer, England, in 1851, and introduced into the United States in 1881. The province of New York was established in 1883. The province of New York, its province and diocese of Long Island is an American order in the Episcopal Church. Its work is chiefly charitable.

Saint Joseph.—There have been several sisterhoods of Saint Joseph, some of which have attained important proportions. For example, the Daughters of Saint Joseph, was once one of the great orders of France. It was founded by Marie Delpech, at Bordes, and established in 1659. It is a superior order that was never able to establish itself in the United States, for its first house being established at Wichita, Kan.

Sorrowful Mother, Sisters of the.—An order established by the Bishop of Springfield, Ill., for the purpose of instituting an association of widows for intercessory prayer, religiously. It was established in 1890. The order of nuns corresponding to that of the Theatine Monks. It was founded by the Blessed Ursula Benincasa in the latter part of the 16th century.

Transfiguration, Sisters of the.—A Protestant Episcopal sisterhood engaged in the care of homeless
ORDERS AND DECORATIONS OF HONOR

children and old ladies. Its labor is confined to Cincinnati, Ohio.

The first order of nuns corresponding to the Trinitarian order of monks. Branches, the founding order of the Ursulines was founded by Saint Angela Merici of Brescia, in 1537. Organized in Angela’s kitchen as “The Congregation of Saint Ursula,” the Ursulines were devoted to the nursing of the sick, the teaching of young girls and the sanctification of their lives. At this time the members of the congregation, in the world, took no vows, and received communion in common once each month. The entrance into the religious order, which was chiefly the work of Mme. de Sainte Beuve, a French woman, who built and endowed a convent for the congregation at Paris in 1610. Two years later Pope Paul V. enclosed the nuns, placed them under the rule of Saint Vincent, with sorrowful instructions as a fourth, binding them to devote their lives to the instruction of the young. The Irish Ursulines were established at Cork in 1771, by Miss Namo Nagle, and the first Ursuline convent instituted in the United States was founded by nuns from France at New Orleans 7 Aug. 1727.

Visitation Nuns.—The Order of the Visitation was founded at Fontainebleau, France, in 1610, by Saint Francis Sales, assisted by Saint Jane Frances, Mme. de Chantal, their object being to form retreats for persons desirous of the religious life, but who were too weak, or otherwise indisposed, to enter an austere order. At first the nuns wore few or no head coverings, and were of no fixed number, their numbers varying from five to twenty. The original objects of the enclosure were: to instruct the poor in the knowledge of the faith, and to provide religious knowledge for those who desired to lead a religious life. In 1618 the primary object of the enclosure was adopted, and, although teaching was not a part of the founder’s plan, all the American convents of this order have, at some time or another, given definite religious instruction to children. The first Visitation convent in the United States was established at Georgetown, D. C., in 1799.

DEACONESSES

The office of deaconess was one that was well recognized in the apostolic church, for while it may be questioned whether the certain references in the New Testament which have been generally associated with the guidance of deaconesses are authentic or not, the fact remains that some of the earliest writers of the Church recognized their usefulness and formulated rules of conduct for them. According to the ancient authorities, it was their duty to be, and should be, the widow of one husband and that she should have borne children. It is true that exceptions were sometimes made and that virgins were occasionally admitted to these organizations, but this was a rare honor, it being the opinion of the church authorities that no woman who had not been a wife and a mother would be able to feel that sympathetic devotion to her work which was so necessary to its success. As time passed, the instruction of the sisters and deaconesses continued until the middle of the 4th century. In the Greek Church such orders existed until the 12th century. Gradually, however, the sisters took their place in the church, and it was not until the 12th century that they were again revived, this time by the Protestant churches who felt the need of the assistance of women in conducting their religious work. The first order of deaconesses to be instituted in the modern church was in 1835 when Pastor Fleider of Kaiserswerth, Prussia, established such an order. It might perhaps be an organized corps of nurses at his new infirmary, and the experiment was so successful that it was immediately copied by the London Times, and other parts of Europe. As is indicated by Pastor Fleider the “Order of Deaconesses of the Diocese of Westphalia” was composed of three classes of members. The first class devoted themselves to the care of the sick poor and the rescue of those who perished in the homes of the second class were engaged in teaching; while the third class, of ripe age and religious determination, assumed the responsibilities of the regular parochial work. The members took no vows, and while plainly dressed, wore no distinctive habit. In 1840, at the request of the American church authorities, Pastor Fleider brought four nurses to the United States where he established a home in Pittsburgh. In the Episcopalian Church the work of the deaconesses is almost as important as that of the parishes, not being of less moral influence and character. It is largely represented in the South, the branches of the Southern,.signals of Walhalla being important factors in the religious work of the denomination. The revival of deaconess work in the Middle West was due to the efforts of the Bethany Society, organized in Chicago, Germany, and the Order of Visitation, established by Pastor Fleider. Its members were devoted chiefly to nursing, a work which they conducted so successfully that there are now more than 50 hospitals and other religious institutions at present in operation. The first effort to introduce the order into the United States was in 1846, when Mrs. Robinson, at a conference held at Bellefontaine, Ohio, urged the advantage that the Methodists of this country would gain from the institution of a deaconess home or training school. As a result, Miss Jane M. Bancroft, now Mrs. Robinson, was sent to Germany to acquaint herself with the work of the organization and, in October 1857, a Deaconess Home was opened in Chicago. The next session of the General Conference approved its full approval of the movement and, in 1888, the present system of permanent deaconess work was inaugurated under the direction of the Woman’s Home Missionary Society. According to the rules of conduct the purpese of the deaconesses is to act as pastors’ assistants; to visit from house to house; to assist in evangelistic work; to conduct meetings, especially those for women and children; to conduct kindergartens, kitchen-gardens; and other industrial and educational schools; to visit the sick and the poor; to establish orphanages, hospitals and other institutions of mercy; to nurse the sick among the poor, in the office and clerical work.” The Deaconess Society of the Methodist Episcopal Church was organized in 1862. It consists of hospitals, orphanages as well as other charitable works under the direction of its licensed deaconesses. The German deaconesses and hospitals are under the control of the German Central Deaconess Board. The work of its deaconesses comprises the care of hospitals and orphanages in private families, parish work, free dispensaries, kindergartens, and other charitable institutions. It has 78 deaconesses, who operate five hospitals. The "Martha-Maria" Deaconess Society in Germany, which now operates in association with the Bethany Society, was originally organized by the Wesleyan Church. While it was not necessary that a woman in the organization should be a deaconess, this office may withdraw from the service of the Church at any time without reproach to themselves. They are usually disciplined during two probationary years, and, while they are unlicensed they are assured of ample support, with a good home and tender care during sickness or old age. It is now customary in the United States to deaconesses to have a home of their own, of recognition and protection, and, generally, they now live in communities or homes.

JOHN R. MEADER, "American Almanac.”

Orders (Royal) and Decorations of Honor. The desire to possess honorary distinctions has shown itself in one form or another since the earliest days of civilization. The ambition to wear something that shall distinguish one from one’s fellows is scarcely stronger to-day that it was when the Egyptians, Assyrians, Persians, Greeks and Romans were the great nations of the earth. In the old days rings, gold chains, belts, "triumphal gifts," etc., conferred the distinction on personal merit as discriminated from official rank and hereditary nobility, but the ribbons, chains and jeweled badges of later centuries convey the same meaning and represent the "triumphs of nobility" no more highly as if they had never been ridiculed as foolish forms of masculine vanity. It was the appreciation of this sentiment that influenced Napoleon in the institution of the "Arms of Honor," which were conferred on distinguished Frenchmen by their new prerogatives, protested against what seemed like the re-establishment of a "gegaw of vanity," suitable perhaps for an effete monarchy but unworthy of the serious consideration of citizens of a new republic. The Const
ORDERS AND DECORATIONS OF HONOR

however, was not to be dissuaded. "You call them toys?" he answered, "Well, learn that it is through such toys that men are led."

Concisely stated, the organized and duly constituted bodies of knighthood are of two classes: (1) the associations, or fraternities, possessing property and rights of their own as independent bodies, and (2) honorary associations established for specified purposes by sovereigns within their respective dominions. To the former belong the three great religious orders created during the Crusades, the Templars, the Hospitallers, and the Teutonic Knights. (See OrdeRs, Religiouis.) To-day the strictly religious orders are comparatively extinct, but the more secular orders which they inspired exist under almost every flag. Switzerland being the only nation of importance which has nothing that resembles an order of distinction.

The Knights Hospitallers of St. John the Baptist in Jerusalem, afterwards known as the Order of Saint John of Malta, formed the most powerful of all the religious orders. It was about the middle of the 11th century that the organization had its inception, when a number of merchants from Amalfi erected a large hospital near the city of Jerusalem. In 1104 the "Last Supper" was held there. In 1104 these Pilgrims of the Hospital were constituted Knights by Baldwin I., and their rule, which was that of Saint Augustine, was confirmed by Pope Pascal II., in 1113. Driven from Jerusalem and afterward, from place to place by the martial vicissitudes of the times, they finally seized upon the Island of Rhodes, which they retained until 1522, when, upon being expelled, they went to Malta, which, with Gozo and Tripoli, was granted to them in fee by Emperor Charles V., in 1530. During the period of the Reformation, as well as in subsequent years, the Order was abolished in some portions of the country, and, in 1798, having been dispossessed from Malta by Napoleon, the Knights settled in the Papal States, from which headquarters the Order has been to some extent revived. Originally the Order maintained a class for women, "The Ladies of the Order of Saint John," which was founded by Agnes, Abbess of the House of Saint Mary Magdalene, in 1099.

Of the early fraternities, the Order of the Holy Sepulchre was one of the most ancient. Since the restoration of the nucleus of the Church to Saint Helena, it is generally believed that this Order was instituted by Baldwin I., King of Jerusalem, about the year 1110. As originally founded it was restricted to the priesthood, and this restriction was not removed until 1484, when Pope Innocent VIII. incorporated it with the Order of the Knights of Saint John of Jerusalem. Two ineffectual attempts were made to sever the bond of union, but in 1460, Pope Alexander VI., who took so much interest in the Order (he was regarded as its real founder, transferred the power of admitting Knights to the Holy See, and, from that time, the Order was changed from a religious association to a fraternity of chivalric character.

The Knights of Malta originated about 1125, under Baldwin II., when nine gentlemen and two nobles appeared as Pilgrims at Jerusalem. Adopting the rule of Saint Augustine they took up their abode in the Holy City, and gradually extended their influence until they became one of the most powerful confraternities, under the name of "Brethren of the Militia of the Temple."

In an evil hour, however, they incurred the animosity of Philip le Bel and of Pope Clement V., and, in the year 1312, the latter announced the suppression of the Order. In France, although it is still doubtful whether the action of Pope Clement was just or unjust, his example was followed by the whole of Europe, and the final blow was struck when the last Grand Master, Jacques de Molay (q.v.), was executed at the stake, in France, in 1313. The Order has never been revived.

The Teutonic Order, the last of the great religious fraternities, was founded at Jerusalem, in the 12th century. Prior to its organization German pilgrims had received scant attention at the Holy City. Needy pilgrims from France and Italy found the Templars and the Hospitallers ready to receive them, so this new Order was formed with the object of attending to sick and wounded Germans. In 1190 Frederick of Swabia gave the Order a constitution which established the rule of Saint Augustine and adopted regulations governing the practice of all duties. Regarding the treatment of the sick and the poor the regulations were similar to those of the Knights of St. John, while the regulations respecting peace and war were identical with those of the Templars. With the sanction of Pope Celestine III., Frederick gave the association the name of "Teutonic Order; German House of the Holy Virgin at Jerusalem."

The Teutonic Order achieved the height of its power soon after its renovation, in the 13th century, but this period of luxury was followed by one of anarchy, and, in the 15th century, after the Twelve-Year war, it became feudatory to Poland. After the Peace of Cracow, 1525, the original Order was abolished and its territories were given as fief of Poland to the Grand Master Albert, Margrave of Brandenburg, who assumed the title of "Administrator in Prussia and Grand Master of the Teutonic Order in Germany," and this condition continued, with various interruptions, until 1805, when, at the Peace of Pressburg, the Austrian Government invested with all the rights, dignities, etc., pertaining to the Grand Mastership. Four years later, however, Napoleon abolished the Order in the Rhenish Province and apportioned all its lands among the numerous nobles who attended the Congress of Vienna. The Austrian Empire. At the head of the great secular orders which still maintain their pristine reputation stands the Most Noble Order of the Garter, membership in which is still restricted to English and foreign royal and imperial personages and to such peers of the realm as it may be desirable to recognize. Next in rank and antiquity is the Order of the Golden Fleece, which is not only the most important of the Austrian Orders but which is the principal decoration of the Spanish crown. Founded by Philip, Duke of Burgundy, in 1429, the Grand Mastership remained in his house until Charles the Bold died without male issue, when it passed to Emperor Maximilian of Germany, the son-in-law of the Duke. When the House of Hapsburg ceased to rule in Spain, at the beginning of the 18th
ORDERS AND DECORATIONS OF HONOR

century, the Golden Fleece became the subject of a violent quarrel. The new king insisted that the Order was a possession of Spain, while the Order of Mercy, as recognized by the German Emperor, refused to relinquish the honor, claiming that it belonged exclusively to their House. There the matter rested, for while both claimants still persist in exercising the right to bestow the Order on no person who has not the Fleece of the hands of Spain is permitted to display the insignia at the court of Austria.

The third of the great medieval Orders is that of the Most Sacred Annunziata, the principal order of Italy, which was created by Amadeus of Savoy in 1362. Called by Favin, "the Order of the Snares of Love," and known at various periods as "the Collar" and "Love-knots," for the reasons for which one must turn to a later period than Lestocq's. In fact, it is during the life of the chevalier are styled "cousins of the King," all of whom, with their wives, participated in the honor of this relationship to royalty.

The only insignia of distinction ever authorized for the decoration of the United States are the medals of honor for exceptional bravery in war and for life saving, which from time to time have been sanctioned by the government. France, too, continues to show a distaste to give the decorations in question and satisfy with the republican decoration, the Legion of Honor, which, however, is not nearly so closely restricted as are the awards of honor made by the United States.

The following is a complete list of the Orders and other decorations worn by the citizens of the various nations of the world, those which are sometimes worn but which are no longer conferred being specified:

ABYSSINIA. The Order of Solomon's Seals, also known as the Order of Saint George, was founded by Emperor John in 1874. The Emperor also confers a decoration known as the Order of the Star, but it is impossible to learn the date of its origin or to discover authentic data respecting its history; by the fact the its chevaliers are styled "cousins of the King," all of whom, with their wives, participated in the honor of this relationship to royalty.

AUSTRIA-HUNGARY. The chivalric Order of the Golden Fleece which was founded by Philip the Good, Duke of Burgundy, on 10 Jan., 1338, and was extended under the statutes of 27 Nov., 1480, is regarded as of such a dignity that its knights have precedence over all others at court functions, both in Austria and in Spain. The military Order of Maria Theresa, founded in 1769, is divided into seven classes, the highest, a Commander's Class, having been added by Emperor Joseph II. The Order of Saint Stephen of Hungary, which was created by his predecessor, was founded in 1007, and its most important reward for civil merit, was founded by Maria Theresa, 5 May 1767. While the Order of the Iron Crown was founded by Napoleon, in his capacity of King of Italy, on 5 June, 1805, and originally bore the title of "Ordine della Corona di Ferro," it was extinguished in 1814, and was re-established until two years later, viz., 22 Feb., 1816. Emperor Francis I, assumed the office of Grand Master and declared it to be inseparably united to the Imperial Crown of Austria, a circumstance which has led several authorities to hold that it should be termed as a new order rather than the revival of an old one, especially as both the form of its decoration and its statutes have been changed. The Order, which now comprises three classes, is open to personal merit without other qualification. The Order of Leopold, was founded by Emperor Francis I, 2 Dec., 1859, The Order of Military Merit, established by Emperor Francis Joseph I, 2 Dec., 1867, and the Order of the Iron Cross, a civil decoration, which was founded 21 July, 1867, but which originated in the Decoration of the Iron Cross of Merit for ordinary soldiers, founded by Emperor Joseph I, 29 Nov., 1851, and the Cross of Merit for officers, created by Emperor Francis Joseph 29 Nov., 1849. By a statute adopted 7 July, 1874, it was provided, in the case of death, that after the death of the person decorated the decoration should revert to his heirs. The Medal of Honor of Austria-Hungary is the decoration bestowed upon those who excel in the arts and sciences. It was founded 18 Aug., 1874, by Emperor Francis Joseph, while the Souvenir Medal of the Jubilee was created by Emperor Francis Joseph on 18 Aug., 1898. The Order of Leopold, civil and military, which was founded 3 Dec., 1822, by Emperor Leopold I, is still worn, but the Order is limited to the following three classes, estates, respectively:

BELGIUM. Belgium possesses but few orders: The Order of Leopold, civil and military, which was founded 3 Dec., 1822, by Emperor Leopold I, is still worn, but the Order is limited to the following three classes, estates, respectively:

BOLIVIA. The insignia of the Order of the Cross of Christopher Columbus, which was founded in 1672, is still worn, but the Order is limited to the following three classes, estates, respectively:

BOKHARA. The reigning Amir of Bokhara still conforms three orders, that of Alexander III, founded in 1868; the Order of the Crown of Tadsch, founded in 1886 and afterwards sanctioned by Russia, and the Order of the Star of Bokhara, in three classes, instituted 23 Aug., 1886.

BRAZIL. Although all the Brazilian decorations with the exception of the two medals of merit were suppressed by the Constitution of 1823, a few of the practically extinct Orders are sometimes referred to: The Imperial Order of the Southern Cross, founded 1 Dec., 1822 by Emperor Pedro I., the Order of Pedro I., founded 16 April 1826 by Emperor Pedro I., and re-organized, by his son Oct. 10, 1842; the Imperial Order of the Rose, founded Oct. 17, 1829 by Emperor Pedro II., the Order of Christopher Columbus, created 6 June, 1890, and the Medal of Merit, which was founded 15 Dec., 1889. In addition to these the sovereigns of Brazil formerly conferred the decorations of the Orders of Christ, Saint Benito of Aviz, and Saint James of the Sword, all of which were of Portuguese origin and were adopted as Brazilian Orders 9 Sept., 1843.

BULGARIA. By the force of circumstances the orders possessed by Bulgaria must be of extremely recent origin, but all are distinguished by the fact that they are conferred "for bravery in time of war, or for meritorious achievements in the arts and sciences." The military Order of Bulgaria, for bravery in time of war, was founded 17 April 1879 by Prince Alexander. It includes at present five classes and four classes for soldiers. The Order of Alexander, to which is added the Medal of Merit with sword of honor for officers, and the Medal of Merit, in three classes, was founded 25 Dec., 1881 by Prince Alexander I., and extended 14 Aug., 1888 by Prince Ferdinand. The Medal of Merit for the arts and sciences was founded by Prince Alexander I., 24 March 1883. Both the Order of Civil and the Order of Military Merit were instituted by Prince Ferdinand. The Order of Merit of Bursa, a civil order created in the latter 30 May, 1871, the Military Cross, the order for civil merit, was also created in 1871, and was extended in twenty years, applied to private soldiers as well as to officers, the medals for officers being of silver, while those for private soldiers were of bronze.

CHINA. The only order which is bestowed in China is that of the Imperial Dragon, which was founded in 1862, under the name of the "Order of the Precious Star," its purpose being the reward of foreigners who perform meritorious services in China. In some respects it was modeled after the British Order of the Bath, and the British Order of the Garter (see Orders, British). The first rewarding of this decoration was in 1871. The Tenontic Order has already described. Austria-Hungary also possesses two orders to which women only are admitted. The older, the Order of the Starry Cross, was founded upon religious principles by the Dowager Empress Maria Theresa, 18 Sept., 1768, under the name of "The Order of the Community of Noble Ladies of the Starry Cross," and was sanctioned by the Empress Josephine 7 Sept., 1780, after the assumption of the title. It is intended as a reward of merit for women who have achieved distinction in the various professions. The less exalted Austrian decorations are Cross of Merit for ordinary soldiers, founded by Emperor Joseph, 18 Nov., 1851, and the Cross of Merit for officers, created by Emperor Francis Joseph 29 Nov., 1849. By a statute adopted 7 July, 1874, it was provided, in the case of death, that after the death of the person decorated the decoration should revert to his heirs. The Medal of Honor of Austrian-Hungary is the decoration bestowed upon those who excel in the arts and sciences. It was founded 18 Aug., 1874, by Emperor Francis Joseph, while the Souvenir Medal of the Jubilee was created by Emperor Francis Joseph on 18 Aug., 1898. The Order of Leopold, civil and military, which was founded 3 Dec., 1822, by Emperor Leopold I, is still worn, but the Order is limited to the following three classes, estates, respectively:
ORDERS AND DECORATIONS OF HONOR

The Order of the Lion of Zähringen (1765) was founded by Grand Duke Charles Frederick in memory of the baptismal day of his consort, the Order of the Cross of Zähringen was formerly the title of the class of the Grand Cross in the Order of the Lion of Zähringen, but was proclaimed a separate order in 1863. It is so ancient that its origin is lost in tradition. It is known that it was so ancient that its origin is lost in tradition. By some it has been attributed to the period of the First Crusade, in the 11th century, while others refer its institution to the 15th century. Its title is so ancient that its origin is lost in tradition.

The Order of Dannebrog, which is conferred only on Danes, also dates from the 13th century. It is said that it was founded by Waldemar II, in 1219, in commemoration of a miraculous intervention in battle, which was repeated in a later battle. In the heavens, there appeared a white cross upon the field. The brave cross in the heavens revived the courage of the Knights of the Teutonic Order, and they were defeated. The Cross of the Order of the Elephant was founded by Christian VI, in 1765. The Danish medals are: the Medal for Life-saving, founded 29 Aug. 1798; Medal of Honor, founded by King Christian VII; 24 July 1814; Medal of Reward, founded by King Christian IX, 26 May 1886; Medal of Arms, founded by King Christian VIII, 15 May 1843; The Order of Christian VIII, 1862; and the Military Medals awarded to the non-commissioned officers of the army and navy for bravery in the performance of duty, founded 1809, and the Medal of Honor, in silver, for commercial work, founded 1849.

The Order of the Lion of Bavaria was founded by Napoleon 15 May 1802. France has the following medals of decoration: The Military Medal, founded by Napoleon III; the Medal of Merit, founded by Maximilian II; the Medal of Honor, founded by Napoleon III; the Order of the Lion of Bavaria, founded 15 May 1802; the Medal of Honor, founded by Maximilian II; the Cross of the Order of the Lion of Bavaria, founded 1802; and the Cross of Merit, founded by Maximilian II.

The Order of the Lion of Bavaria was founded by Napoleon 15 May 1802. France has the following medals of decoration: The Military Medal, founded by Napoleon III; the Medal of Merit, founded by Maximilian II; the Medal of Honor, founded by Napoleon III; the Order of the Lion of Bavaria, founded 15 May 1802; the Medal of Honor, founded by Maximilian II; the Cross of the Order of the Lion of Bavaria, founded 1802; and the Cross of Merit, founded by Maximilian II.

ORDERS AND DECORATIONS OF HONOR

In 1669 by the Landgrave Frederick II., and the Order of the Iron Cross, founded 18 March 1814 by the King of the Netherlands. The Grand Orders of Hesse are still conferred and recognized. They are: The Order of Louis, for civil and military merit, founded 12 May 1807 by Grand Duke Louis IV.; the Order of the Golden Lion, conferred only upon persons of princely rank in Hesse-Kassel, founded on 14 Aug. 1811 by Grand Duke Louis II.; the Order of Merit of Philip the Good, founded 1 May 1840 by Grand Duke Louis IV.; the Order of Military Merit, founded 12 Sept. 1870 by Grand Duke Louis III.; the Order of the Military Merit of Hessen, founded 14 Aug. 1771 by King George II. of Great Britain; the Cross for distinguished services to the sick, created by Grand Duke Louis IV. on 18 April 1841; a Medal of Merit for the arts, sciences, industries and agriculture, founded 25 May 1853 by Grand Duke Louis III.; a Medal for Law and Science, founded 12 Nov. 1840 by Grand Duke Louis II.; a Cross for Merit, founded 14 Nov. 1849 by Grand Duke Louis III.

Hohenlohe.—The Order of the Phoenix of the House of Hohenlohe is self-concerning and perpetual with the permission of the sovereign. It was founded 29 Dec. 1751 by Prince Leopold von Batzenstein, and was created with new statutes in 1793 by Prince Leopold of Hohenlohe-Bartenstein.

Mecklenburg-Schwerin and Strelitz.—The Order of the Cross of Honor was founded in common by Grand Duke Frederick Francis II. of Mecklenburg-Schwerin and Grand Duke William of Mecklenburg-Strelitz 12 May 1864. It consists of three classes and one Cross of Merit; in Schwerin-Lippe five classes are also established. The Order of the Cross of Honor for distinguished services to the arts, created by Grand Duke Francis II. 28 Feb. 1859; medals for life-saving and merit, created by Grand Duke Frederick Francis III. 19 March 1855; a Medal of Honor for life-saving during times of flood, created by Grand Duke Frederick Francis III. 22 June 1888; medals in memory of Grand Duke Frederick Francis III., instituted by the Duke Robert I., founded 31 Jan. 1897; a Medal of Honor for devotion and fidelity in time of war, founded by Grand Duke Peter 12 July 1871.

Oldenburg.—The Order of Merit of the Ducal House of Peter Frederick Louis, founded by Grand Duke Paul Frederick August, in memory of his father, 29 Nov. 1838; a Medal of Merit for life-saving, created 12 Jan. 1840; and a Cross of Merit for devotion and fidelity in time of war, founded by Grand Duke Peter 12 July 1871.

Although the Orders of Prussia are not of great antiquity, several of them rank high among the decorations of the world. The Order of the Black Eagle, which was founded by King Frederick I. 17 Jan. 1701, in commemoration of his coronation, is one of the most important. Its membership is limited to 30 knights, exclusive of princes of royal blood, and is probably limited to no more than four generations. The Order of the Red Eagle was created 17 Nov. 1705 by George William, Crown Prince of Prussia, and the Order of St. George, 12 June 1763. The Order of Civil and Military Merit was created in 1766 by George II. of Great Britain, as the "Order of Merit and Sincerity." In 1712 it was organized as an order of five classes by William I. 18 Oct. 1861, and was extended by the addition of a royal crown to the crosses of the first class. The Order of Civil and Military Merit was created in 1866 by George V. II. of Great Britain, as the "Order of Merit and Merit to the Crown." In 1850 it was reorganized by Frederick II. as the "Order of Merit," in 1850 by William I. 18 July 1884, and extended to the civil class for science and arts, to include 30 Germans and an equal number of foreigners. The Royal Order of the House of Hohenzollern was founded by Prince Frederick I. 12 Feb. 1844; the Order of Hohenzollern-Sigmaringen 5 Dec. 1841; the Order of the Crown of Prussia was created as an Order of the Iron Cross and founded 27 Aug. 1807 by Grand Duke Friedrich August; the Order of Military Merit, founded 8 July 1811 by Grand Duke Louis II.; the Order of Merit of the Iron Cross was founded by King William III. 12 June 1871; the Order of the Iron Cross, founded 19 March 1875, and the Order of William were founded for decorations in the service of the Holy Roman Empire. The Order of the Crown of Hessen, which is bestowed upon women in recognition of service in war, was founded by Frederick William II. and, in 1832, the Order of Saint John was created to which the knights of the abolished Order were received, was founded by Frederick William III., and, in 1832, the Order of Civil Merit, founded by William I. 22 March 1832. In 1813 the new Commandery of Brandenburg of the Order of Saint John of the Hospital of Jerusalem, a "Royal and Protestant Order of Saint John" into which the knights of the abolished Order were received, was founded by Frederick William III., and, in 1832, the Order of the Black Eagle, founded by William II. 18 Jan. 1866, and the Cross of the Medal of Honor, founded by William II. 27 Jan. 1900.

Rewa, Senior Branch,—The only decoration is the Cross of Honor of Rewa, founded 29 Dec. 1751 by Prince Augustus, 1st son of George II. of Great Britain, and the Cross of Honor of the Order of the House of Saxe, instituted at the suggestion of Napoleon at the time of Saxon's elevation to a kingdom, was founded by King Frederick Augustus I. of Saxony 20 July 1807; the Military Order of Saint Henry was founded 23 July 1815 by King Frederick Augustus I., 1 Oct. 1736; the Order of Merit was created by King Frederick Augustus I. 7 June 1815; the Order of Henry XIX. was founded by King George IV. 24 May 1819; the Cross of Henry XIX. was founded by King George IV. 23 May 1821; the Medal for Life-saving and the Medal of Honor for 30 years of faithful service, both of which were founded 25 Jan. 1814, were confirmed by King George IV. 1 April 1866.

Saxony.—The Order of the Crown of the House of Saxon, instituted at the suggestion of Napoleon at the time of Saxon's elevation to a kingdom was founded by King Frederick Augustus I. of Saxony 20 July 1807; the Military Order of Saint Henry was founded 23 July 1815 by King Frederick Augustus I., 1 Oct. 1736; the Order of Merit was created by King Frederick Augustus I. 7 June 1815; the Order of the House of Ernestine was created in 1691 by Duke Frederick I. of Saxe-Coburg-Altenburg, under the name of "The Order of German Integrity." It is the reward of high ducal functionaries and its qualifications are chiefly administrative and executive service.

Sachsen-Rudolstadt-Sonderhausen. — The Cross...
ORDERS AND DECORATIONS OF HONOR

of Honour of Schwarzburg was created 20 May 1833 by Prince Frederick Gontier for the Principality of Schwarzburg-Rudolstadt and was changed, 28 May 1857, to the House of Schwarzburg.

Waldeck.—The Order of Civil Merit was founded 23 May 1782 for the benefit of the poor. The Cross of Military Merit for officers was created 14 June 1854, and the Cross of Honor and Medal for the arts and sciences was created by King William II. 30 Sept. 1878.

Württemberg.—The Order of the Crown of Württemberg, for public services, was created 15 June 1835. The Cross of Honor for women, created by King William I. 30 Nov. 1861, was merged in the Order of Ofelia in 1863, making the decoration apply to both sexes. A Medal of Merit (1892), a Military Medal, a Medal for Life-saving (1907), and a Cross of Merit (1909) are also conferred.

Great Britain.—The English order of highest distinction, of course, is the Order of the Garter, a decoration which owes its origin to King Edward III., who is said to have founded it about 1330. While this is a matter of record, however, all other facts in regard to the institution of the Order are "wrapped in mystery," and it is not known whether King Edward's desire was to revive the glory of the Round Table, to justify his claim to the throne of France, or to strike a blow at the Black Prince, who had been killed at Crécy, or to bruit abroad his devotion to a lady, Elizabeth de Clare, whom he desired to marry in honor of the Holy Trinity, the Virgin Mary, Saint George of Cappadocia, and Saint Edward the Confessor, and he instructed his Knights of the Garter to visit the garter at all times, to be present at Windsor each Saturday afternoon in the summer to make offerings of prayers and money in the chapel; on the following day to participate in the annual festival, and, for certain days thereafter, to be ready to meet all worthy comers in the lists for the honor of the Order and the glory of its patrons. The Order of Saint John of Jerusalem was introduced into England during the 12th century, or about 1230. When the Order was divided into seven languages, England received the sixth place, but the organization received comparatively little attention until 1830, when it was revived and, in 1888, it was again reorganized, this time under a royal charter. The Order of the Bath, which was founded by King Henry IV. in 1340 as a distinction for civil and military services, is also one of Great Britain's most notable orders. It owes its peculiar name to the fact that in olden times the taking of a bath constituted one of the most important features of the investiture of the bishops of the Church, and is therefore known as the Order of Saint Andrew, which is the patron of the Order, and is a constituent of the Order in the year 287; in 1887, it was re-established by King James VII. of Scotland (James II. of England). The Order of Saint Patrick, of Thistle, which is Scotch, and included in its membership the leading Irishmen, was by King Albert, 15 Feb. 1907. The Order of Saint Michael and Saint George is of even more recent origin and has generally been identified with the colonial interests of Great Britain. It was founded by King George III. 27 April 1818. Of the British Orders and decorations are: The Order of the Star of India, founded by Queen Victoria 23 Feb. 1861; the Order of the Indian Empire, founded by Queen Victoria 1 Jan. 1876; the Distinguished Service Order, for the reward of individual instances of meritorious service in war, was founded by Queen Victoria, 1866; the Order of St. Michael and Queen Victoria, for services rendered, 23 April 1866; the Order of St. Michael and Queen Victoria, for women, 10 Feb. 1862; the Imperial Order of the Indian Empire, founded by Queen Victoria, as a recognition of the services of women nurses, 31 Dec. 1877; the Order of the Red Cross, for women of the Empire, 28 Feb. 1864; the Order of the National Flag (Tai Keuk), were founded by Royal decree 17 April 1900; the Order of the Purple Falcon, for special merit, of theRhodesia, founded by Royal Decree 26 April 1882; the Order of the Red Cross, for women of the Empire, 28 Feb. 1864; the Order of the Two Heads, founded by Royal Decree 26 April 1896; and the Order of the African Star, founded 30 Dec. 1888; the Order of the Lion, founded 9 April 1871; the Order of the Crown, founded 15 Oct. 1897, and the Star of Honour of the African Empire, founded in 1889.

Italy.—The Order of the Annunziata, which ranks third in the list of the orders of merit of Italy, and which, it is claimed, was created by Amadeus VI. of Savoy in 1356, in commemoration of the exploits of his troops against the Saracens, introduced the Star of Honour, 11 Sept. 1815 by Charles III., and was again modified by Victor Emmanuel II., who increased the number of knights to 20 in addition to the sovereign, the princes, and some others. The Order of Saint Maurice and Saint Lazarus was founded 17 May 1867 as the result of a union of two orders, the Order of Saint Maurice, which was founded by Saint Amadeus V. in 1139, and the Order of Saint Lazarre, which is claimed to have been instituted in Jerusalem in the latter part of the 13th century, or about 1260. The Order was reorganized by Victor Emmanuel, who decreed new statutes and withdrew the limit upon the number of knights. Other Italian orders are: The Military Order of Savoy, founded 14 Aug. 1815 by King Victor Emmanuel, the Civil Order of Saint Maurice, founded 18 Oct. 1811 by King Charles Albert of Sardinia; the Order of the Crown of Italy, founded 20 Feb. 1868 by King Victor Emmanuel II., and the Order of Agricultural Merit, founded 9 May 1901 by King Victor Emmanuel III.

Japan.—Japan has several orders, all of recent origin: The Supreme Order of the Chrysanthemum, which is worn by the Mikado himself and is conferred almost exclusively upon foreign sovereigns and princes of the blood, was founded by Emperor Mutsuhito 27 Dec. 1877. The Order of the Red Eagle, otherwise known as the Order of Saint Andrew, which is the patron of the Order, and is a constituent of the Order in the year 287; in 1887, it was re-established by King James VII. of Scotland (James I. of England). The Order of the Sacred Black forces of Thistle is to Scotland, and included in its membership the leading Irishmen, was founded by King Albert, 15 Feb. 1907. The Order of Saint Michael and Saint George is of even more recent origin and has generally been identified with the colonial interests of Great Britain. It was founded by King George III. 27 April 1818. Of the British Orders and decorations are: The Order of the Star of India, founded by Queen Victoria 23 Feb. 1861; the Order of the Indian Empire, founded by Queen Victoria 1 Jan. 1876; the Distinguished Service Order, for the reward of individual instances of meritorious service in war, was founded by Queen Victoria, 1866; the Order of St. Michael and Queen Victoria, for personal services rendered, 23 April 1866; the Order of St. Michael and Queen Victoria, for women, 10 Feb. 1862; the Imperial Order of the Indian Empire, founded by Queen Victoria, as a recognition of the services of women nurses, 31 Dec. 1877; the Order of the Red Cross, for women of the Empire, 28 Feb. 1864; the Order of the National Flag (Tai Keuk), were founded by Royal decree 17 April 1900; the Order of the Purple Falcon, for special merit, of the Rhodesia, founded by Royal Decree 26 April 1882; the Order of the Red Cross, for women of the Empire, 28 Feb. 1864; the Order of the Two Heads, founded by Royal Decree 26 April 1896; and the Order of the African Star, founded 30 Dec. 1888; the Order of the Lion, founded 9 April 1871; the Order of the Crown, founded 15 Oct. 1897, and the Star of Honour of the African Empire, founded in 1889.

Kongo Independent States.—The Kongo Independent States confers three orders and one medal for service, all of which are instituted by Leopold II., King of the Belgians. These are: The Order of the African Star, founded 30 Dec. 1888; the Order of the Lion, founded 9 April 1871; the Order of the Crown, founded 15 Oct. 1897, and the Star of Honour of the Kongo Independent States, created 16 Jan. 1899.

Korea.—Korea possesses five orders, three of which, the Order of the Golden Rule (Keum Ch'ok), the Order of the Red Cross (Ch'a-Ma Gu), and the Order of the National Flag (Tai Keuk), were founded by Royal decree 17 April 1900. The Order of the Purple Falcon, for special merit, of the Empire, founded by Royal Decree 26 April 1882; the Order of the Eight Elements (Pa Koi), founded 16 April 1901, and the Order of the Crown, founded 15 Oct. 1897, and the Star of Honour of the African Empire, founded in 1889.

Liberia.—The Order of the Beneficence of Liberia was founded by the Legislative Corps of Liberia in 1853; the Order of the Elephants (Pa Koal), founded 16 April 1901, and the Order of the Red Cross, for women of the Empire, 28 Feb. 1864; the Order of the Two Heads, founded by Royal Decree 26 April 1896; and the Order of the Two Heads, founded by Royal Decree 26 April 1896; and the Order of the African Star, founded 30 Dec. 1888; the Order of the Lion, founded 9 April 1871; the Order of the Crown, founded 15 Oct. 1897, and the Star of Honour of the African Empire, founded in 1889.

Lucca.—The following orders formerly bestowed by the Duchy of Lucca are: The Order of the Two Heads, founded by Duke Charles Louis 7 May 1841, and the Order of the Merit of Saint George, for military merit, founded by Duke Charles Louis 22 Dec. 1836.

ORDINAL—ORDINANCE OF 1787

portrait of the king, is conferred only upon natives. It was founded, 16 Nov. 1873. The only minor decoration bestowed by Siam is a medal for servants and ancients of the household.

SICILY, or THE TWO SICILIES.—The following order of Grand Master of the Military Order of Saint Ferdinand and of Merit, founded 1 April 1800 by King Ferdinand IV.: the Order of Saint James, founded in 1723, and the Royal Order of Constantine, said to have been instituted in 1511 by Emperor Isaac Ange Commene; and the Royal and Military Order of Saint George of the Reunion, founded 1815 by King Francis I. of Naples, 24 Feb. 1808; the Order of Francis I., created by King Francis I. 26 Sept. 1809; and the Order of the Sicilies founded by King Joseph Bonaparte, 2 Feb. 1808.

SPAIN.—In addition to the Golden Fleece (see Austria) and the Military Order of Malta, which the Spanish branch of the Order of Scint John of Jerusalem, Spain possesses several important and ancient decorations. The Military Order of Calatrava was founded by King Sancho III. in 1138 to commemorate the victory over the Moors in 1044. In 1243 King Charles VI. bestowed the grand membership of this Order, as well as that of the Orders of Alcantara (founded in 1150) and Saint James (confirmed in 1279) in the crown of Spain. They are of the purely military type. The Military Order of Saint Ferdinand was founded by royal decree 31 Aug. 1811, and is bestowed upon soldiers of the line of the army. The Military Order of Our Lady of Montesa was created 22 July 1319 by King James II. of Aragon and Catalonia. Other Spanish Orders are: The Military Order of Saint Hermengild, instituted 28 Nov. 1814 by King Ferdinand VII. in the American Order of Isabella the Catholic, for the defense of the American possessions, founded 1821; the Order of Francis I., founded 1813; the Order of Isabelle II., for officers below the rank of "Chef de Battalion," founded by King Ferdinand VII. in 1814; the Incomparable Royal and Military Order of Charles IV., instituted by King Charles III. 19 Sept. 1771; the Order of Merit, founded 22 Aug. 1804; the Order of Naval Merit, founded 3 Aug. 1866; the Order of Marie-Victoire, founded by King Amadeus 7 July 1853; the Order of the Beneficence for human and useful public service, was created by Queen Isabella II. 11 May 1848; the Military Order of Marie-Christine, founded in 1890, and the Order of Marie-Louise, for women only, instituted by Marie Louise, wife of Charles IV., 21 April 1792.

SWEDEN AND NORWAY.—Swedish and the distinction of possessing the only Masonic Order in the world, the Masonic Order of Charles XIII., which was founded by King Charles XIII. 27 May 1811, being bestowed only upon Freemasons. The Order of the Seraphim, or the Blue Ribbon, is of great antiquity, having been instituted at least as early as 1288 by the king of Sweden, who specified that no one beneath the rank of lieutenant-general should be admitted to the Order. The Order of the White Ribbon, or the Yellow Ribbon, is supposed to have been founded by Gustavus Vasa in 1522. On 28 April 1743, the Order of the Pole Star, or the Black Ribbon, was founded by Frederick I. 28 April 1743, for civil merit. The Order of the Vasa, or the Green Ribbon, was created by King Gustavus III. 26 May 1772. The only Norwegian Order is that of Saint Olaf, which may be bestowed, for special merit, upon all classes. The Order was founded by King Oscar I., 27 Aug. 1847, in commemoration of the deeds of Saint Olaf, who freed the land from Denmark in the 11th century.

TURKEY.—The most important Turkish Orders are: The Imperial Order of the Medjidie, for faithful service for the state, founded in August 1754 by Sultan Abdul Medjid; the Nishan-i-Shelkhat, instituted in 1878 by Sultan Abdul Hamid II., in honor of the "Turkish Impression Money" of 1821, and bestowed only upon women, and the Imperial Order of the Medjidie, for faithful services in military services by Sultan Abdul Aziz 4 Jan. 1862. Other Turkish Orders are: The Order of Hanedani-All吉-Orphans, for the establishment of the Imperial family, founded by Sultan Abdul Hamid II., in 1895; the Order of the Medjidie, founded 21 Sept. 1879, by Sultan Hamid II.; the Order of Glory Nishan-i-Ilthakar), founded 19 Aug. 1831, by Sultan Mustafa IV.; the Order of Glory (Ilthakar), founded in 1861, by Duke Como de' Medici; the Order of Merit of Glory (Ilthakar), founded in 1850 by Sultan Abdul Medjid.

TUSCANY.—The Tuscan Orders, no longer confessional and Ecclesiastical Order of Saint Stephen, Pope and Martyr, founded 15 March 1561, by Duke Como de' Medici; the Order of Merit of Saint Joseph, founded in 1514; the Order of the White Cross, founded 1814, and the Order of Military Merit, founded 19 Dec. 1853, by Grand Duke Leopold II., 10 July 1835.

VENEZUELA.—The Order of the Bust of the Liberator, otherwise called the Order of the Red Rose, founded 15 March 1854; The Order of the Red Cross, founded 29 Aug. 1861, and the Medal of Public Instruction was founded by the constitution of the republic. The declaration creating the Order of the Cosmos, founded by President Paez, Dec. 1822, and the Medal of Public Instruction was founded by the constitution of the republic.

ZANZIBAR.—Zanzibar's single decoration is the Order of the Jeweled Star, founded by Sultan Bargash Ben Seid 23 Dec. 1876.

New York 'American Year Book.'

Or'dinal, that portion of the Anglican Book of Common Prayer (see Prayer Book) which contains the offices for the consecration of bishops and the ordination of priests and deacons. So far it corresponds with certain offices in the Pontifical (q.v.) of the Roman Catholic Church.

Ordinance of 1787, in American history, an act of Congress passed in July 1787, to regulate the government of the western lands granted to the states by the Compromise, has been called "the most notable law ever enacted by the representatives of the American people." It marks the beginning of one of the most remarkable growths ever known in territorial expansion, and it has furnished the bases for the constitutions for several States. It is especially noted for three great provisions of all good government,—its guaranty of entire freedom of worship,—its perpetual prohibition of human slavery,—and the great prominence given to the matter of schools and education in the words "Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools, and the means of education shall forever be encouraged. Three more important principles could hardly be found in any law. The "Ordinance of 1787." more than a mere law passed by Congress, which might be changed or repealed. It does not say "Be it enacted," but it says "Be it ordained by the United States in Congress assembled that said territory, for the purposes of temporary government, be one district, subject, however, to be divided into two districts, as future circumstances may, in the opinion of Congress, make it expedient," This introduces the first section of this great state paper, and it is followed by 13 other sections, making 14 in all, the first 12 of which provide for the management of affairs under a temporary government of the Northwest Territory. After providing for temporary government of the Northwest Territory, the great purpose of this remarkable state paper is set forth in plain but unmistakable terms, when it says:

And, for extending the fundamental principles of civil and religious liberty, which form the basis whereon these republics, their laws and constitutions, are erected to fix and establish these principles as the basis of all laws, constitutions, and governments, which forever hereafter shall be formed in said territory to provide also for the establishment of public schools and permanent government therein, and for their admission to a share in the federal councils on an equal footing with the original states, at as early periods as may be consistent with the general interest:—It is hereby ordained and declared by the authority aforesaid (United States) That the articles shall be considered as articles of compact between the original states and the new states in the said territory and forever remain unalterable, unless by common consent.

The articles referred to are six in number, and form a definite compact between the United
ORDINATION — ORDNANCE

States as it then existed, and the people of the Northwest Territory and the States that might afterwards be formed from it.

Ordination, the ceremony by which bishops, priests and deacons, candidates for the minor orders and ministers of any denomination are admitted to their specific office in the church. The Roman Catholic doctrine of ordination is confirmed by John xx. 21, 22, and the power of ordination is believed to be descended from the apostles through the bishops. Ordination is reckoned one of the seven sacraments. Orders in the Roman Catholic Church are normally conferred by bishops and the higher orders can be conferred by no other functionaries. Holy orders are conferred normally on the Saturdays in any of the four Ember weeks, on the fifth Saturday in Lent, on Holy Saturday; but two grades cannot be conferred the same day on the same person. A bishop is normally ordained on a Sunday or on the festival of an apostle. The English Church also considers ordination as a real consecration, the power of communicating which has descended from Christ through the apostles and bishops (see APOSTOLIC SUCCESSION). There is, however, a diversity of opinion on this point, the high-church party maintaining the dogma, the broad and some of the low church party denying it. For ordination in the English Church, subscription to the 39 articles and the declaration that the Book of Common Prayer is conformable to the Holy Scripture, are required. The ceremony of ordination is performed by the bishop with the imposition of hands on the person to be ordained. In the English Church ordination is a requisite to the exercise of a ministerial office, but in some denominations ordination is not necessary for that purpose. In the Presbyterian Church ordination means the act of settling or establishing a licensed preacher over a congregation with pastoral charge and authority, or the act of conferring on a licensed preacher the powers of a settled minister of the gospel without the charge of a particular church, but with general powers wherever he may be called upon to act. The Congregationalists believe that the call of a congregation gives ministerial authority to a preacher. In the Methodist Episcopal churches the form of ordination closely follows that of the Protestant Episcopal Church, with the same sort of form and expression which may appear to favor sectarianism.

Ornance (variant of ordinance, form Lat. ordinaire, to order). The word owes its application to military machines to an ordinance of Henry VIII. of England, regulating the manufacture of cannon, and establishing a board charged with the care of the crown fortifications. In time, cannon manufactured according to the specifications of the decree came to be known as ordinance or ordnance. In its present usage, the term comprehends all machines designed to hurl projectiles of any kind, shape, or size, by the agency of explosives. More particularly, it is understood to refer to mounted cannon as distinguished from those pieces such as rifles, shotguns, or smooth-bore naval guns, usually held in the hand while being fired. Prior to the 14th century, ordnance consisted of a great variety of machines for hurling large and heavy missiles which were propelled by the reaction of a tightly twisted rope of hemp, catgut, or hair, or by the action of a lever and sling. Of the former, the most important and powerful were the ballista, catapult, scorpion, and the onager. They threw large stones and heavy arrows or darts; the catapaults, especially, being credited with the throwing of stones weighing up to 75 pounds at a distance of half a mile. Of the sling machines, the trebuchet, mate-griﬃon, and the matefonda, throwing stones and small arrows, were the most effective and in general use. About the latter part of the 14th century a small portable ballista, throwing shot and small arrows by the action of a bow string arrangement, came into general use. The string was pulled back to a state of tension either by the foot or a mechanical device worked by the hand. It was discharged while held against the shoulder, the propelling string being liberated by a trigger worked by the ﬁnger. The arbaele may be considered as the fore-runner of the modern musket and riﬀle, but the relation is wholly that of a similarity of purpose. In the ancient blow-gun, however, some analogy to the modern pneumatic gun is found, but the lesson taught is not of much importance. Early in the 14th century the ﬁrst arms and machinery for the production of the gunpowder agency came into use, gradually replacing with gunpowder cannon all of the earlier types of ordnance. The exact date upon which they were ﬁrst used is not known. Cannon called "craks of war" were used by the English against the Scots in 1327, and by the French against the Flemish in 1338. They were made of bars arranged like the staves of a barrel, which were bound together by iron hoops and wrappings to give the necessary strength. They were very short and thick, and wide in the bore. They resembled bowls or mortars, the latter term being applied even at the present time to a particular type of ordnance. They hurled stone projectiles with slow velocity and little accuracy of aim. At ﬁrst their effectiveness was not as great as that of the catapults either in accuracy or power, but later, improvements in shape and mountings and longer cylindrical bores, increased the accuracy of aim, while thicker walled, higher powder chambers increased the powder gas, giving greater velocity to the projectiles. In the 15th century the use of cannon increased, great improvements being made in shape, size, and power. Bombards, verins, and serpentines, with bores 20 to 25 inches in diameter, weighing over 18 tons, and throwing stone projectiles ranging in weight from 200 to 1,000 pounds, were sometimes used. The constructive effort, however, was not conﬁned to the larger types. The arquebus, the ﬁrst form of hand gun or small arm which may be compared fairly with the modern musket or riﬀle, was invented about the earlier part of the century. In the 14th forms the material was applied in the touch-hole but in 1476 a contrivance suggested by the trigger of the mediaeval arbaele was employed for that purpose with greater speed and certainty. About this time the method of casting replaced the method of smelting, usually held in the hand while being ﬁred. Prior to the 14th century, ordnance consisted of a great variety of machines for hurling large and heavy missiles which were propelled by the reaction of a tightly twisted rope of hemp, catgut, or
ORDNANCE

ances in these matters were made by France from 1460 to 1482. Stone projectiles were re-
placed by cast-iron shot with increased range and effect, but their greater density required
greater power. The cast iron was bored out and placed in a pole which reduced in calibre (the diameter of the bore)
and a corresponding increase in the thickness of the walls of the tube. The diameter of the bore
and the substitution of poles for shafts, facilitated limbering and unlimbering. Travelling trunnion poles were introduced to
bring up the weight of the piece over the four wheels; the horses were harnessed in pairs
instead of tandem; and the prolong-rod was used to refine the gun trail to the limber in slow retirement. For garrison ordnance, carriages with wheels in front and rear-trucks were used, while those of coast fortifications
were mounted on traversing platforms pivoted in front, and with a truck in the rear running on a circular track. The system of uniformity
of construction and interchangeability of parts was applied to the guns also, while their service
was greatly improved by the adoption of cross-headed elevating screws and tangent scales, to-
gether with the use of fixed ammunition in which the powder, cartridge, and projectile were
united.

Near the close of this century, short cast-
iron guns called "carronades" were introduced by Gascogne, of the Carron Iron Works (Scotland). They were lighter than the ordinary guns; had powders chambers like mortars, and
were especially adapted for naval use. They were generally carried on the upper decks;
were more easily handled and loaded than the longer guns, and threw heavy shots at low velocities, with great battering effect. The
sailors, with whom they were great favorites, called them "smashers." They were very effective in the close engagements of their time, but are not represented by any type of modern ordnance; the present demand being for high-
power guns developing high velocities for projectiles, with great powers of penetration at
long ranges.

About the beginning of the 19th century these requirements forced a return to guns with longer barrels and larger calibres. Of this type, the "columbiad," invented by
Colonel George Bomford (U. S. Army), did effective work in the War of 1812, and up to
about 1850, was the standard armament on the Rodman guns. Abroad General Paixhans of the
French Army developed the idea still farther and produced the "Paixhans gun," the extensive use of which, together with the columbiads, prac-
tically compelled the adoption of armor for ships. From the middle of this century, the
construction of ordnance received a higher order of scientific thought and investigation. The
requirements of high velocities and flat trajectories, without lightening the weight of the pro-
jectiles, formed the basis for all design.

In 1856 Admiral Dahlgren (U. S. Navy),
designed the "Dahlgren guns" with shapes pro-
portioned to the "curve of pressures," heavy at the breech and light at the muzzle. They rep-
resented a distinct advance in power with the minimum of weight, and were especially adapted for naval use. On the other hand, higher ve-
locities required the development of greater pressures, which soon grew to such proportions that they excited types, which were re-
presented by the tensile strength of cast iron. Another inherent weakness of castings was due
to the fact that they cooled from the outside inwardly, thus placing the inside metal in a state of tension and the outside in a state of compression. To obviate this condition Gen. Rodman, Chief of Ordnance, U. S. Army, suggested the casting of guns hollow and cooling them from the inside outwardly, by circulating a current of cold water while the outside surface was kept at a high temperature. This method placed the metal inside in a state of compression and that on the outside in a state of tension—the proper condition to successfully withstand the pressure of the powder gas, which tends to expand the inner portions beyond the normal diameter and throw the strain on the supporting outer layers.

This system was universally employed and gave the best results obtainable from cast iron for many years, and was only superseded by that of "built up" guns, when iron and steel were made available by improved processes of production. The first built-up guns were made by Chambers and Treadwell (Americans), and Blakely of England. They made guns consisting of wrought-iron tubes with strengthening hoops shrunk on under initial tension; but Sir William Armstrong of England was the first to successfully produce guns, in which the hoop was removed after being stretched to all parts of the piece. Recognizing that wrought-iron bars were twice as strong in the direction of the fibre than across, he made hoops by winding rectangular bars around a mandrel into hoop form, which were subsequently welded together. These hoops were expanded by heat and shrunk on over the inner tube and over each other, so that the inner tube and hoops were placed in a state of compression and the outer hoops under initial tension. It is clear that the most effective gun of this character would consist of a large number of very thin hoops shrunk on over each with such initial tensions that all of them would be equally strained by the discharge. An approximation to this was first made by Longridge of England, who produced a gun consisting of a steel tube wound around with steel wire under tension. The method was farther developed by Woodward in 1872, who recommended a thin steel tube wrapped with wire which was subsequently brazed together with melted bronze; and by Crozier in 1889, who employed a forged steel tube compressed beyond its natural elastic limit before being wound with square tinned steel wire under tension. The wire-wound system, although possessing a great deal of ingenuity, fails to give longitudinal strength. Perhaps the best representative of the system is the Brown segmental tubular wire-wound gun. It was of 5-inch calibre, and consisted of a thin steel tube of high elastic limit which formed the interior of the breech and extended a little beyond the base of the projectile, while the main tube, consisting of longitudinal steel bars, extended the full length of the piece, and was entirely wound with wire at such a tension that even under maximum pressure the tube was in a state of compression. While this condition was necessary to prevent the separation of the bars, it is possible to use the unavoidable feature of using a tube under an initial compression beyond a natural elastic limit. Although wire-wound guns of considerable size were made, some weighing as much as 23 tons and throwing a projectile of 600 pounds with fair velocity, the inherent weakness of the gun to withstand longitudinal strains will, in all probability, prevent much further development of the system. The application of rifling to heavy ordnance, and the adoption of steel as the best material to withstand the enormous pressures developed in rifled guns followed each other closely and firmly established the "built up" system as the best for the construction of heavy ordnance. It was not carried to its highest development, however, until the large stocks of smooth-bores owned by the various nations had been temporarily utilized in the form of converted rifles. In 1860 Parsons, of the United States, suggested the method of converting smooth-bores into rifles by inserting a rifled steel tube through the breech, the rear end of which was finally closed by a permanent screw plug. The forward movement of the tube was prevented by shoulders at several points. In 1863 Sir W. F. Paliser, of England, brought forward the method of inserting a coiled wrought-iron tube through the muzzle end, the forward movement of which was prevented by a collar fastened to the muzzle of the gun, and the tube subsequently rifled. The Paliser system, although more expensive as that of Parsons, was cheaper and was adopted in England and America, where, between 1874 and 1880, many 10-inch smooth-bores were thus converted into 8-inch rifles that compared favorably with rifles of the same bore by other European powers at that time. The underlying principle of the Paliser method was subsequently applied to the original construction of guns, and together with that of the "built-up" system comprises the method employed in the manufacture of modern heavy ordnance, while the Parrott rifles and the Whitworth guns serve as connecting links between the application of rifling to and the adoption of steel as a material.

The Civil War in the United States created a demand for a quickly made rifle. The West Point Foundry (Parrott's) at Cold Springs, N. Y., supplied this demand with a gun consisting of a hollow cast-iron rifled tube, strengthened by a coiled wrought-iron hoop shrunk on the breech under initial tension. They were 100, 200, and 300 pounders, and rendered effective service, but the unreliable cast-iron component stood in the way of any further application of the system.

From 1873 to 1890 attempts to construct large guns of steel, cast in one piece, were comparatively unsuccessful; while the method of expanding hoops by heat produced grave weaknesses in the guns constructed by the built up system. To eliminate these shortcomings, Sir J. Whitworth perfected a system of fluid-compression to improve steel ingots, and constructed guns by forcing steel hoops over a central tube and over each other by hydraulic pressure. Since 1890, however, the manufacture of steel ingots has progressed to such an extent, that first-class steel forgings weighing over 25 tons are now more readily produced than were those weighing 5 tons. Improvements in the manufacture of improved methods of tempering and annealing have also removed weaknesses due to the expansion of hoops by heat for constructive purposes, 50
ORDNANCE

that steel is now exclusively used in the manufacture of ordnance.

Classification.—The various forms of modern ordnance are classified and named according to size and weight; kind of projectiles used and their velocities; angle of elevation at which they are fired; use; and mode of operation.

Guns.—Now designated as " breech-loading rifles" (B. L. R.), to distinguish them from the obsolete smooth-bore and muzzle-loading rifles still in existence, are from 3 inches to 13 inches in calibre, from 12 to 39 feet in length, and from 1 to 70 tons in weight. They fire solid shot, or shells, weighing from 13 to 1,100 pounds, at high velocities (2,800 to 2,300 feet per second) and low elevation (about 12° max.).

Their projectiles are capable of penetrating the best steel armor, from 2.3 to 19.4 inches in thickness, at the distance of 2,000 yards. The terms, field, siege, and sea-coast guns, indicate no essential differences in the guns themselves, but prescribe limits of weight according to the required mobility. For field use about the most effective size is that of the 3.2-inch breech-loading steel rifle; for siege purposes, that of the 5-inch siege mortars and guns; while the largest and heaviest types of ordnance are employed on the sea-coast fortifications.

Howitzers are shorter than guns of equal calibre, are fired at low velocities and higher angles. The most powerful being about 20°.

Mortars are still shorter, are fired at still lower velocities and higher elevations, ranging from 45° to 60°. They are used to throw shells over intervening obstructions against objects and into camps unreachable by gun fire at low elevations.

Rapid-fire guns are those in which the operation of opening and closing the breech is performed by a single motion of a lever actuated by the hand. They are charged with fixed ammunition, the projectile, explosive, and primer being contained in a single metallic case, so that loading also is done by one motion, and differentiates them from that class of ordnance in which the projectile, explosive, and primer are separately introduced. In the United States the term "rapid-fire," and in England, implied similar qualifications, but now, in the United States Navy, a rapid-fire gun is officially defined as one in which a quick-working breech mechanism is operated by a single motion of a lever; in which fixed or separate ammunition may be used, but if the latter, prescribes a metallic case to hold the explosive; while a quick-fire gun is defined as one in which a quick-working breech mechanism is operated by one motion of a lever; is fitted with an automatic lock, and in loading uses a powder charge put up in a cartridge bag. These guns are made in various forms and are operated by several different systems of breech mechanism generally named after their respective inventors. Those best known are the Vickers-Maxim and the Armstrong, mostly used in England; the Canet, used in France and Russia; the Krupp in Germany; the Skoda and Krupp in Austria; the Bofors in the naval service of Norway and Sweden and of Denmark; while in the United States the Dashiell, Fletcher, Hotchkiss, Driggs-Schroeder, Maxim, and others have been introduced. The Nordenfeldt, one of the first designed, is not much used by any country. Rapid-fire guns vary in size from 1-pounders to 13.5-inch rifles, and in speed of fire from 60 rounds per minute, in the Vickers-Maxim 1-pounder, to 1 round in 2 milliseconds, in the 13.5-inch B. L. R. The speed of the smaller guns depends upon the drill of the crew, while that of the larger guns depends practically upon the mechanism of the mount. The accompanying table gives the best speed of fire of modern guns of various calibres:

The development of rapid-fire guns practically dates from 1881, at which time the British Admiralty called for a gun not to exceed 1,120 pounds in weight, and capable of propelling a 6-pound projectile with a muzzle velocity of 1,800 feet per second, to use fixed ammunition, and to be served by not more than three men. About the same time the French authorities called for a three-pounder to fulfil similar conditions. Hotchkiss, an American, living in France at that time, responded by producing a series of one-, three-, and six-pounders, while Nordenfeldt brought out similar guns in England. These guns were intended for use against torpedo boats, and the calibres chosen were considered sufficiently large for that purpose, as the torpedo boats at that date were weak and slow, but the advent of smaller and stronger torpedo boats and destroyers, with their coal arrangement practically amounting to a protective armor, caused an increase in calibre, and quick-working breech mechanisms were soon applied to guns of all sizes up to and including the six-inch breech-loading rifles. At this point fixed ammunition became unwieldy, necessitating the separation of the projectile from the powder charge. This condition, however, has not reduced the speed of the larger guns, as the ammunition thus separated is easier handled. In the effort to satisfy the requirement of increased speed of fire a new type of the Vickers-Maxim was introduced in 1897, in which a quick-working breech mechanism automatically ejects the primer and draws up the loading tray into position as the breech is opened. This system was quickly applied to the new guns of the United States Navy and materially increased the speed of fire in all calibres. That of the five-inch guns was especially improved and to them the system will probably be applied universally, while it is safe to state that the general improvement in the breech mechanisms of all guns during the last five years has more than doubled their speed of fire. A comparative
description of the Fletcher and Vickers-Maxim systems will be sufficient to give a general idea of these mechanisms. In the Fletcher, which is a development of the Parrot system, a worm-wheel on a vertical spindle works on a rack attached to the breech plug. To operate, the slotted-screw breech plug is first rotated by a crank to disengage the threads, then moved rearward and turned clear out of the breech. It is probably the simplest and strongest of all breech mechanisms. In the Vickers-Maxim a short arm driven from the vertical axis of the operating lever shifts its centre during the motion. In the six-pounders and smaller guns the Hotchkiss breech-block, consisting of a vertically sliding wedge, and the Driggs-Schroeder mechanism, in which the block is dropped to clear it from the housings of the breech and then revolved to the rear around a horizontal axis, are practically the only systems used.

Machine Guns are rapid-fire guns in which the speed of fire is such that it is practically continuous. Attempts to construct multiple-firing guns may be traced back to the earlier part of the 19th century. Small guns of this kind have been found bearing dates as early as 1807. They are necessarily of crude construction and consist of two parallel barrels re-inforced at the breech ends with three hoops each of which has a vent, showing that the piece is arranged to fire three shots successively out of each barrel. From the middle of the 17th century to the middle of the 19th century, frequent efforts were made to produce rapid-firing guns, but with indifferent success. The introduction of fixed ammunition about 1860, however, contributed greatly toward their successful construction. During the Civil War in the United States, a great many forms of magazine and repeating rifles, pistols, and machine guns of a more or less effective character, were quickly produced, of which the “Gatling gun” was by far the best. It was invented by Dr. R. J. Gatling of Indianapolis in 1860 and assured for many years a prominent place in armaments. Machine guns may be more precisely defined as those in which the operations of loading, firing, and extracting the empty cartridge shells, are wholly or in part accomplished by automatic means. There are three classes: (1) those operated by hand-power, electric-motor, or any other form of exterior force; (2) the semi-automatic, in which, although the energy of recoil is partially used to actuate the breech mechanism, each round of ammunition is inserted by the hand and the trigger is pressed for each discharge; (3) the automatic, in which the energy of recoil, or a part of the powder gas pressure at each discharge is fully utilized to operate the piece, which fires the rounds continuously while the trigger is pressed. To the first belong the Gatling and Gardner guns, the Nordenfeldt and the Hotchkiss revolving cannon.

The Gatling gun consists of a number (usually 10) of parallel barrels grouped around and secured firmly to a main central shaft, to which is also attached the grooved cartridge carrier and the lock cylinder. Each barrel is provided with its own lock or firing mechanism, independent of the others, but all of them revolve simultaneously with the barrels, carrier, and the inner breech, when the gun is in operation. The rotation of the gun gives a reciprocating motion to the locks, the forward and backward movement being effected by a cam actuated by the turning of the operating crank. In firing, one end of the feed case containing the cartridges is placed in the hopper on top and the operating crank turned. The cartridges drop one by one into the grooves of the carrier, and are locked in the forward motion of the locks, which also closes the breech, while the backward motion extracts and expels the empty shells. When first invented it was entirely different in principle and action from all other multiple-fire guns, admitting of faster discharges and heavier projectiles. It has passed through some stages of alteration and improvement, mainly in the arrangements for feeding the ammunition. At different elevations the original tin feed cases worked irregularly, so that the cartridges did not always fall into their proper positions in the grooves of the carrier, and jamming was of frequent occurrence. Various devices were designed to obviate this defect. The Bruce feed case, constructed on the gravity principle, was a great improvement, though not the irregularity of action at different angles of elevation, and was superseded by the Achilles feed drum. This was a positive feeder, which rotating with the revolving barrels and lock cylinder, fed the cartridges with perfect regularity at any angle of elevation. It had, however, two serious drawbacks—its weight and the large amount of exposed surface, which if struck by a single bullet would at once put it out of action. In the latest method of feeding employed, the cartridges are attached to long strips of flexible metal and are fed into the openings in the hopper. As the gun is revolved by the operating crank, the projections in the grooves of the carrier act upon the cartridges and force the strips through the hopper, each cartridge being deposited in its proper position in the grooves of the carrier block and the empty strips thrown out to the right. In the latest forms an automatic traversing arrangement for scattering the bullets is attached, which can be thrown in or out of gear as may be desired, regulating the amplitude of the arc through which the breech is moved so as to spread the bullets. In its present state of efficiency the Gatling gun fires at the rate of 1,200 shots per minute, a speed of fire, by separate discharges, not as yet equaled by any other gun.

The Nordenfeldt, a contemporary of the Gatling, proved very efficient as a ship’s gun. In it the barrels (usually 10) are placed horizontally side by side, and are immovable. Each barrel has its own firing mechanism, but all the locks, bolts, strikers, and spiral springs are contained in one box which is moved backward and forward by the operating lever. When the box is moved backward the cartridges fall out of the hopper on top and are deposited simultaneously in the grooves of the carrier. The forward motion of the box pushes them into the barrels, the cocking catches compress the spiral springs which are subsequently released by the lever in quick succession and produce a continuous fire. In this gun careful aiming is not a moving platform is placed so that the right instant all the barrels may be fired at the object almost simultaneously, therefore its use-
fulness as a naval weapon. Its speed of fire is about 600 shots per minute.

The Gardner Gun closely resembles the Nord-
enfeldt. It consists of two or more barrels fixed immovably side by side in the same hori-
zontal plane. The loading, firing, and extract-
ing mechanism is moved backward and forward by a crank turned by the hand. Shortly after the appearance of the Gatling in the United States the "mitrailleuse" was produced in Belgium, and subsequently adopted by France. It consisted of several barrels (usually 25 or 37) arranged around a central shaft and covered with a metal casing. The barrels were loaded through the breech by the use of a metal disk pierced by holes to correspond with the number of barrels, a cartridge being held in each hole or chamber. In firing, this disk was placed against the breech-end of the barrels, then the box containing the strikers was placed against it and all of the cartridges discharged at once. It was used to some extent in the Franco-German war of 1870, but was not very successful, and has been completely superseded by the Gatling and other types. The speed of fire of the Belgian gun was about 440 shots per minute, but that of the French varied from 550 to 750. The Gatling, Nordenfeldt, and Gardner guns, as also the various forms of mitrailleuse, were generally made in rifle calibre (.45-inch), but Gatlings of .65-
inches, and Nordenfeldts of 1-inch calibre, were constructed about the time the Hotchkiss one-
pounders were put in production in response to the call of the English and the French authorities in 1887, for rapid-firing machine guns to be used against torpedo boats. The larger Gatlings and Nordenfeldts fire respectively about 200 and 100 shots per minute, with sufficient velocity to penetrate the light iron plates generally used in the construction of torpedo boats. The five barrels of the Hotchkiss fire a total of 25 rounds per minute, but as its size has been in-
creased up to the 6-pounders, which is capable of firing explosive shells or canister, its speed of fire has been relatively increased to-
gether with additional powers of penetration.

Semi-automatic Guns belonging to class 2 are represented by those of the Driggs, Maxim and Maxim-Nordenfeldt patterns, the last-named being the best known and the most effective. It has been adopted by the United States Navy to the exclusion of all other guns of the semi-
automatic type, and is in fact the only gun of this character employed in the naval service of any country. Semi-automatic mechanisms are applied to guns too heavy to be operated by that of the ordinary machine gun. In them the recoil of the barrel is utilized as the actuating energy. The backward movement compresses the spring, which in turn pushes it forward again and forces the breech downward while the extractor throws out the empty cartridge case. In this position of the barrel the breech block is held open until a fresh cartridge is inserted which slides the extractors into the bore and allows the breech block to rise and close the breech, the gun being again ready to be fired. These mechanisms are most extensively used in guns of 2.24-inch and 3-inch calibre, giving them a speed of fire from 20 to 17 shots per minute, respectively.

Automatic Guns belonging to class 3 are the Hotchkiss, Colt, Yamanouchi (Japanese), and the Maxim. They are made in rifle calibres and are operated by the pressure of the powder gas upon a level or piston when the piece is discharged. The larger types are the Maxim-Nordenfeldt one-pounder, called "pom-pom" in the British-Boer war of 1899-1902; the Skoda automatic gun, and the Dawson-Silverman three-
 pounder. In these, excepting the last named, the recoil of the barrel or breech-block operates the mechanism. A description of the construc-
tion and operation of the Colt automatic gun will serve to give a general idea of those in which the pressure of the powder gas is used to actuate the mechanism. Near the muzzle the barrel is perforated radially by a small hole which is covered by a cylindrical lug at-
tached to the front end of a vibrating lever piv-
oted on the gun. When the piece is discharged and the bullet passes the hole, the pressure of the powder gas in the barrel throws back the lug of the lever with enough force to reload and fire. The walls of the barrel are more than half of an inch in thickness, and it contains enough metal to prevent overheating without the use of a water jacket. The cartridges are at-
tached to a bandolier or belt of woven cotton (.250 to a belt), which is fed into the machine from a box at the side. The speed of fire is from 250 to 300 rounds per minute, so that when firing continuously a fresh belt of cart-
ridges has to be placed in position every min-
ute, but the consequent loss of time amounts to only a few seconds. For naval use those of .303- and .303-inch calibres, weighing about 42 pounds, are the most effective, generally being mounted on the ship's rail or on the rails of the fighting tops. A description of the Maxim 303-inch calibre automatic gun will be sufficient to explain the construction and operation of the type in which the recoil of the barrel is the actuating energy of the breech mechanism. It consists of a movable barrel and recoiling lock frame carrying a crank with a projecting arm and fuse to which a chain is attached. The fore end of a spiral spring is fixed to the non-
recoiling breech casing, its rear end being con-
ected with the recoiling crank and fusee. When the piece is fired the barrel is forced backward together about an inch, then the barrel is pushed forward again by springs and sepa-
rated from the lock, leaving a space between them. This space is filled first by the extracted cartridge case and then by a fresh cartridge which is forced into the barrel and fired by the subsequent forward motion of the lock, actuated by the stored-up energy of the fusee spring. It is provided with a water jacket and fires from 300 to 350 rounds per minute. In the field machine guns are used to deliver a destructive fire along a wide front, or a concentrated fire into massed troops. In the former case the traversing gear is employed, while in the latter the barrels are fired in a stationary position. The relative efficiency of the rifle calibres and the larger automatic guns may be more clearly understood by comparing a .303-inch gun, which fires about 350 bullets per minute and has a maximum range of 2,500 yards, with a one-
 pounder, which fires six rounds of shrapnel shells per minute, and has a range of 6,000 yards. As each shrapnel shell contains 212 bullets the number of bullets delivered at the target amounts to 1,272 per minute. As naval
ORDNANCE

weapons, machine guns of small calibre are the most efficient. Mounted on light draft vessels they are very useful in close-range operations on rivers and on the waters of narrow harbors, while as boat guns they render efficient service to drive off the enemy preparatory to the landing of troops, or to cover their re-embarkation. The efficiency of the larger calibres, however, is more questionable. The effect of the bursting of a one-pounder shell against the unarmored side of a cruiser, much less against the heavy armor of a battleship, is absolutely nothing; while against modern torpedo boats even the six-pounders are quite ineffective. Probably the best weapons for use against torpedo boats are rapid fire guns of about 3 to 4-inch calibre, throwing shrapnel shells, and capable of being carefully aimed. The impression that the projectiles discharged from a machine gun of any type can be directed like the jet from a hydraulic hose is absurd. The jump and jerk of recoil of the guns of even the smallest calibre is so powerful that good aim is out of the question at any range. On this account the larger machine guns are so constructed that they can fire single shots whenever desired—a capability which probably defines their most efficient use.

The organization of machine gun details and the method of their employment as attachments to regiments of cavalry and infantry, differ in the various countries. The lessons taught by their use in the Franco-German war, or in the operations of the British in the Egyptian and Indian campaigns, are quite inconsequential. The British-Boer war afforded an opportunity for the use of every form of modern machine guns, but under conditions unfavorable for a determination of their use in the future. That the noise of the "pom-poms" exerted a demoralizing effect greater than that of bursting shrapnel shells is undoubtedly a fact, and, although the "moral effect of gun-fire" is one of the important problems of military science, it is hardly worth more than an incidental mention in this connection. One fact, however, is clear on account of their great mobility they will be advantageously employed in the future as auxiliaries to the regular field batteries, which they never can be expected to supersede.

The manufacture of ordnance requires the solution of a great many scientific and practical problems involving the adaptations of means to ends, and the exacting quality of the adaptations increases with the increase in the size of the guns and their required greater efficiency.

So complex a subject is more conveniently treated by grouping the various operations into a number of general classes, as follows: Requirements for Efficiency; Principles of Design; Materials and Methods of Construction; Rifling; Systems of Loading; and Carriage and Mounts.

Requirements for Efficiency are, safety, accuracy of fire, destructive effect of projectile, and speed of fire. To these may be added that of mobility, especially applicable to field ordnance.

Principles of Design.—In designing a gun as an engineering structure, two distinct sets of conditions have to be considered—those regulating its proportions, influenced by the character of its intended use—and those pertaining to its mechanical construction, to withstand the strains it may be subjected to under the requirements for efficiency.

The three principal strains that a gun has to withstand are, (1) a circumferential tension caused by the outward pressure of the powder gas, acting radially with a tendency to enlarge the bore and split the gun open longitudinally; (2) a longitudinal strain having a tendency to stretch the gun or pull it apart in the direction of its length; and (3) a transverse strain caused by the weight of the parts of the gun overhanging beyond the point of support; all of which are brought into action the instant the gun is fired. The calibre of the gun having been determined, together with the conditions of loading—the weight of the projectile and the powder charge necessary to give it the required velocity; the pressure that will be exerted on the surface of the bore is determined by calculating its amount at a certain number of given points and a "pressure curve" plotted. Such a curve shows that the maximum pressure is exerted before the projectile has moved more than a few inches, and decreases rapidly as it approaches the muzzle. With the pressure as a known factor in the problem, the material having a tensile strength sufficient to sustain the forces that will be exerted is selected, and methods of construction determined, to dispose it economically and safely, consistent with the production of the requisite results.

Materials and Methods of Construction.—In the development of ordnance increasing pressures compelled the employment of materials of greater and greater tensile strength and higher elastic limits. Wooden barrels and forged iron hoops gave way to cast-iron, which in turn was superseded by bronze, brass, wrought-iron, and steel, until finally the pressures exceeded the inherent strengths of the materials and forced the adoption of methods of construction by which additional powers of resistance were derived from the arrangement of the material. In hollow cast-metal guns there is a limit beyond which increase in thickness does not give additional strength to resist bursting pressure. If the metal employed was incompressible, the resistance to the pressure by each concentric layer of the metal would be inversely proportional to the square of its distance from the axis of the bore. But as all metals possess not only the inherent elasticity, but that of extensibility as well, the interior layers are supported by those on the outside to a very great degree. Therefore the great object in construction is to so arrange the material that the exterior layers will take up as much as possible
of the pressure exerted upon the interior layers. Dahlgren first suggested the construction of guns in which the disposition of the materials was in accordance with the data obtained from the curve of pressures, while Rodman introduced the principle of initial tension. In the construction of modern built-up guns these principles are carried into effect as follows: An ingot of low steel is cast and allowed to cool slowly to avoid strains. It is then bored in a lathe, re-heated, and forged on a mandrel. Consequent strains are removed by annealing, and the forged tube is turned and bored in a lathe to about the required size. After being oil-tempered, to give toughness, and re-annealed to remove strains induced by the tempering, it is re-bored in a lathe and smoothed by a reamer. In the meantime different parts of the outside of the tube are turned to sizes slightly exceeding the calculated shrinkages of the hoops intended to encircle them. This difference is about three thousandths of the corresponding diameters, the shrinkages being so calculated that under no circumstances will any portion of the metal be strained beyond its elastic limit. Jackets and hoops are constructed in a similar manner and the various parts assembled into a complete gun. In the operation of assembling the tube is placed in a vertical position in a pit; the hoop or jacket to be put on is subjected to a temperature of about 700° F. Its diameter expanded to a size about .06 inch greater than that of the part it is intended to surround. In this condition it is lowered over the tube until it rests upon the shoulder which fixes its position. It is then cooled. The water is first poured on and around it near the shoulder (to prevent the jacket drawing away from the shoulder when it cools), then progressively upward, over the entire hoop. The gun is then put on the lathe and its surface turned preparatory to the shrinking on of the next hoop, the operation being repeated until all the hoops are in place, including the trunnion hoop, onto which the trunnions are forged solid. The gun is then finish-bored to the required calibre, turned to the specified form and rifled.

Rifling.—When a spherical projectile is fired from a smooth-bore gun, the probability of its following the direction corresponding to the aim is very small. The tendency of such a projectile to follow the mean trajectory (path of flight) depends upon the amount of "windage" (the difference between the bore and that of the projectile), and the exact sphericity of the projectile. Large windage is the principal cause of error, since it allows the projectile to rebound along the sides of the bore as it is driven forward, the direction of its departure from the muzzle being that of the last bound, instead of that of the axis of the bore; while the lack of exact sphericity in the shape of the projectile causes an unequal pressure of the air on the different parts of its surface, still farther deflecting it from the aimed direction. Accuracy of manufacture can reduce these errors, but cannot remove them entirely. Therefore by rifling the bore the projectile is caused to rotate around its own axis, which is coincident with that of the bore. Thus, the errors due to windage are completely eliminated and the effects of unequal air pressure are neutralized. Rifling is effected by furrowing the surface of the bore with a series of spiral grooves of uniform or increasing twist. The number of grooves and the amount of twist depends upon the calibre and length of the gun, the required muzzle velocity of the projectile, the length of the projectile, and the velocity of rotation necessary to keep it point-first while being driven through the air. The earlier muzzle-loading guns were rifled with grooves of a uniform twist, and the projectile was provided with ribs or studs which fitted into the grooves and caused it to rotate while being driven forward. As the size of the guns increased the greater strain of imparting rotation at starting tended to force out the studs and wear away the driving edges of the grooves. The casting-on of ribs was found to be impracticable on account of difficulties of manufacture, and all attempts to use expanding projectiles were unsuccessful. Therefore the system of increasing-twist, based upon the principle of the semi-cubical parabola, was devised and practically met all the requirements of the case. Studded projectiles were replaced by those with copper bands fitted around the base. These bands being slightly larger than the bore were forced into the rifling grooves and not only gave rotation to the projectile as it was driven toward the muzzle, but by cutting off all the windage acted as an effectual gas-check. The various systems of rifling, designated "single-groove," "double-groove," or "polygroove," according to the number of grooves employed, are here stated in the chronological order of their development and adoption, but the last-named is the one now used, exclusively.

For example—the guns of the United States Navy are rifled under a poly-groove system in which the twist increases from 0 to 1 turn in 25 calibres. The grooves start parallel to the axis of the bore, but quickly incline to the form
of a parabolic spiral, the twist increasing to a point near the muzzle, from which point the curve is uniform. Upon discharge the strain of rotating is thrown forward toward the muzzle, the point of least pressure; the projectile enters the bore without a rending shock; it is rotated with increasing velocity as it moves forward, and leaves the muzzle, rotating at the rate of one revolution in a distance equal to 25 times its own diameter. In general the number of grooves is determined by multiplying the caliber, expressed in inches, by four. A 10-inch gun would have 40 grooves. In depth, they are about .05 inch, and several times as wide, being comparatively broad and shallow at the start, but gradually decrease in width toward the muzzle.

**Systems of Loading.**—Attempts to employ breech-loading systems may be traced farther back than even the earlier part of the 16th century, but until about 1880 they were attended by a comparative loss of safety and power in the larger guns. The theoretical superiority of the breech-loading system over that of muzzle-loading was unquestionable, but the conditions involved in closing the rear end of the bore (the seat of greatest pressure), temporarily, presented a problem very difficult of practical solution. As early as 1838 Armstrong introduced breech-loading guns into the English Navy, but, although his rifled breech-loaders, constructed in the early 70's, proved very powerful as compared to the old muzzle-loading smooth-bore, they also showed many serious defects of construction, and the English reverted to muzzle-loading. The experience of the other European powers was somewhat similar, but they continued experimenting on breech-loading lines, Krupp, in Germany, making especial advances. Since 1880, however, due to the great progress in mechanical construction, and in the production of suitable material, breech-loading systems have been universally applied to all classes of ordnance. The three principal and best-known types are those developed by Armstrong, in England; by Krupp, in Germany; and the Refye system, the basic idea of which was originated by Chambers, in the United States in 1849, and subsequently developed by France about 1870.

In the Armstrong system a breech-block with a vent in it works vertically in a slot cut through the top of the breech into the tube of the gun, and is pressed firmly against the lip of the bore by a longitudinal breech-screw operated by a pair of powerful handles. The contact surfaces are of copper and they are renewed from time to time when worn out by the erosive effect of the escaping hot gas. It represented a great advance in gun construction, but was not a practical success. The inability to make the contact surfaces gas-tight, and the unwieldy weight of the sliding breech-block, even in guns of moderate size, constituted its chief faults. In the Krupp system, which is the most important of those employing a transversely sliding breech-block, a wedge of D section slides in a slot cut through both sides of the breech and across the bore. To load, the wedge is pulled out to the left, the charge is inserted through the rear of the breech, the wedge is pushed back into position and pressed hard against the end of the bore by a screw with powerful handles. For a gas check the "Broadwell ring" is used. This device is a ring of L section which fits into a recess formed by enlarging the rear end of the bore. The pressure of the gas expands the ring, one flange of which is pressed against the walls of the powder-chamber and the other against the face of the wedge, thus completely sealing the joint and effectually cutting off the escape of gas to the rear.

In the French system, better known as the "interrupted or slotted screw system," the breech is closed by a longitudinal screw-plug working from the rear and swung on a vertical hinge permitting it to be revolved horizontally to the side when it is withdrawn. The screw on the plug and the engaging screw on the breech are each divided circumferentially into six sectors, in three of which the screw threads are cut away, leaving the sectors alternately threaded and plain. To close the breech, the screw-plug is revolved around the vertical axis of the hinge to a position opposite the hole in the breech; the threaded sectors of the plug are made to coincide with the plain ones of the engaging screw in the breech and the plug pushed straight in, its threaded sectors being made to engage with those in the breech by one sixth of a turn of the translating crank. This system employs the De Bange gas-check, consisting of a plastic pad of asbestos flour and suet, held in a ring-shaped canvas bag by two flat metallic rings. The stem of a mushroom-shaped spindle or obturator passes through the holes in the pad and rings to the rear end of the screw-plug. Through the axis of this stem the vent is driven. When the breech is closed, the mushroom head enters the tube and the pad and rings are held in position against the face of the screw-plug. Upon discharge the spindle is forced back by the pressure of the gas, while the pad, squeezed and forced out radially, presses itself and the outer lips of the metallic rings tightly against the surface of the bore, thus preventing the escape of gas to the rear. This device, although very effectual, had a tendency to stick or jam in the bore. This is obviated by the use of split rings which constitute one of the most important improvements of the modified form of this system, exclusively used by the United States.

**Gun Carriages and Mounts.**—Gun carriages are divided into two general classes, stationary and mobile. Their mode of landing is signified by the designations, barbette, casemate or turret, motor carriage, and disappearing carriage; to any or all of which the additional qualifications — recoil or non-recoil — may be applied. Stationary carriages are used with sea-coast

ORDNANCE

ordnance. The modern type consists of a cast-iron base ring solidly imbedded in concrete, upon which is mounted a circular racer or turn-table, carrying the chassis. A top carriage of some form, on which the gun is directly mounted, moves back and forth upon the chassis, its motion in recoil being controlled by a hydraulic brake. This brake consists of a cylinder with a piston working in oil, the former attached to the top carriage and the latter fastened to the chassis. When the gun is fired and the recoil of the top carriage moves the cylinder backward, the oil passes from one part of the cylinder to the other through holes in the piston head. The size of these holes is regulated by taper-rods, rotating-disks, or throttling-bars, so that the varying pressure of the recoil is transformed into a constant pressure in the brake. The gun is returned to firing position by the power of springs, compressed, or by gravity. Elevations for range are obtained by revolving the gun around the axis of the trunnions (at or near the centre of gravity of the piece) by a screw or a rack and pinion device at the breech, while traversing is accomplished by rotating the turn-table.

Carriages for Disappearing Guns are best represented by the "Cromer-Buffington" used in the United States, and the "Elswick" used in England. In the former, the trunnions rest in the upper ends of a pair of lever arms, to the lower ends of which a counterweight is attached. The axle connecting the centres of the lever arms rests upon a top carriage, the motion of which is controlled by a hydraulic brake. In firing position, the lever arms are almost vertical, the top carriage and brake cylinder well forward, the gun lifted up and its muzzle thrust over the parapet. The breech of the gun is held at the proper height by a frame, the sides of which are pivoted at the top to the breech, and at the bottom to a movable slide which is raised or lowered for changes of elevation by an adjusting rod. When the gun is fired, the force of the recoil moves the top carriage to the rear, causing the lever arms to rotate backward and assume a horizontal position. By these motions, the gun is first moved to the rear almost horizontally until its muzzle is clear of the parapet, then sharply downward into the position for loading, and held in that position by pawls which catch on the counter weight cross-head. Return to firing position is accomplished by the action of a lever which drops the counter weight by releasing the pawls. Thus, all the loading, elevating, and traversing operations are performed while entirely protected from the enemy's fire, under directions received from a distance by telephone, or from the man on the sighting platform, who is the only one of the gun crew exposed to fire. The basic principle of this carriage was suggested by Gen. Buffington, Chief of Ordnance, U. S. Army, in 1872, but the credit of its development to the present state of efficiency belongs to one of his successors, Gen. William Crozier.

In the Elswick carriage, the lower ends of the lever arms are held by fixed pivots, and their rotation is controlled from their centres by a rod to the end of which the piston of a hydro-pneumatic cylinder is attached. The force of recoil is thus resolved into the energy of compressed air, which returns the piece to firing position. Mortar Carriages originally consisted of simple iron boxes provided with trunnion beds, but now they are composed of a turn-table and chassis, the mortar being mounted on the end of a lever pivoted at its lower end to the turn-table. A hydraulic buffer placed under the lever receives the downward recoil consequent to the high elevation at which the piece is fired, while an arrangement of spring columns returns it to the firing position. Mortar carriages for field or siege purposes are generally of the stationary type, transported from place to place in wagons. Mobile Gun Carriages are of two types — those used for field, and those used for siege purposes. They are similar in principle but differ in size and detail. Both types have two wheels with an axle-tree, in front, and a trail to give a third point of support on the ground, behind. Up to 1860, they were all made of wood, with iron axle-trees and metal bracings. The trunnion beds were formed in the front ends of the flasks (sides) of the trail, and the recoil of the gun was checked by the resistance of the ground and by a friction brake as the carriage moved backward. Wood, however, was gradually superseded by iron, and since 1880, all gun carriages have been made altogether of iron or steel. To increase rapidity of fire, and to enable the carriages to bear guns of greater power without too much recoil, brakes have been devised which are set by the recoil, and released by the forward movement of the gun. In the Ehrhardt carriage, adopted by England, the gun is carried on a slide attached to a hydraulic brake, or to a
cylinder surrounded by a helical spring, which allows it to recoil about 45 inches and then returns it to the firing position, quickly and without shock. The carriage is unmovable by the discharge, its backward movement being checked by a spade with a sure hold in the ground, and it is so stable that the operators are able to sit on the trail and perform the various duties of sighting, etc., while the piece is being fired. Similar forms of carriages are manufactured by the Bethlehem Steel Company, the Vickers-Maxim Company, and several others, all of which are of a very efficient character. In the carriages adopted by the United States, the best points of the Ehrhardt are combined with improvements suggested by Captain Wheeler, of the Ordnance Department. In it the gun recoils through a bronze cradle to a distance of 40 inches. Two cylinders containing oil check the backward movement, while helical springs return the piece to firing position.

Siege Gun Carriages for field use are generally attached to platforms which help to control the recoil. In the stationary form they are much heavier than the field carriages, and are built high enough to allow the gun to be fired over a six-foot parapet. The greater weight (about 6,000 lbs., as against the limit of 4,000 lbs., prescribed for the field carriage), is required by the greater energy of the recoil.

Gun Mounts, including those used for all forms of rapid fire guns as well as those employed with the larger types of ordnance, will be found described under the title Naval Guns.

A fair consideration of the subject of ordnance would hardly be complete without a brief mention of the maximum size and power of the guns constructed from time to time, since the introduction of gunpowder cannon up to the present day, or a reference to some constructions embodying certain novel features which at one time promised types of ordnance of great destructive power. The largest gun constructed in the 15th century appears to be the onomat 11.² by the Turks, which required 200 men and 30 pairs of oxen to move it, and threw a projectile weighing 600 pounds. Larger pieces, capable of throwing projectiles weighing over 1,000 pounds, are still in existence in the forts along the shores of the Dardanelles, but the time of their manufacture is somewhat uncertain. The largest gun made in the 17th century, was the cast-iron gun named the "Malick e Meidan" (Lord of the Plain). It was constructed at Bejaipour, India, by Arunzebe, or by the Mahrattas. It was 14 feet in length, 28 inches bore, and fired a projectile weighing 1,500 pounds. In 1850, the English made guns weighing from 100 to 110 tons, of about 18 inches bore, which fired a projectile weighing 2,000 pounds, with a velocity of 1,640 feet per second. About the same time, the United States produced a gun weighing 127 tons, of 16 inches bore, and 148 caliber; this was the largest date weighing 2,000 pounds, with a velocity of 2,934 feet per second. It was the most powerful gun ever built, and will probably be the last of the great guns, as the opinion of the present time, molded by the experience of the late wars, is adverse to the construction of guns above the 12-inch calibre, and even this limit will probably be reduced by the experience of the future.

As a matter of fact, the most effective "all round" gun at the present time, appears to be the 8-inch breech-loading rifle, firing a projectile weighing 250 pounds, with a velocity of 2,334 feet per second, and capable of discharging six aimed shots per minute. Of guns embodying novel features, that invented by Capt. Zalinski, of the United States Army, appears to be the pioneer of large pneumatic ordnance. In the larger form, it consisted of a smooth-bore tube about 50 feet long, and of 15 inches calibre. By the propelling agency of compressed air, used in the gun at a pressure of 1,000 pounds per square inch, it was capable of throwing a projectile containing 100 pounds of high explosives, such as dynamite or nitro-glycerine, to a distance of about 5,000 yards. It was designed for coast-defense purposes, but has also been employed in the U. S. cruiser Vesuvius, equipped with three tubes, was employed at Santiago during the Spanish-American war, but did not attain the success anticipated. The Sims-Dudley, another form of pneumatic gun also used about this time, appears to have been a little more successful. It throws a much smaller projectile, containing about four pounds of high explosives, by air compressed in an auxiliary barrel located under the main tube. The Gathmann gun, another type of ordnance designed to throw projectiles containing large quantities of high explosives, appears as yet to be in the experimental stage of construction, while as a matter of fact, the development of pneumatic guns in general, up to the point of a permanent place in armaments, is extremely problematical.

Bibliography.—For more specific information on ordnance matters, the following named publications are recommended: 'Journal of the United States Artillery' (Fortress Monroe, Va.); Holley, 'Ordnance and Armor'; Ingersoll, 'Text-book of Ordnance and Gunnery'; Atwood, Reports of the Chief of Ordnance (U. S. Army and Navy); Bruff, 'Ordnance and Gunnery'; Greener, 'Modern Breech-loaders and Choke-bore Guns'; Text-books on ordnance, ammunition, and the like. Ordovician, őr-dō-vish'ān, in geology, a term introduced in 1879 by Lapworth for what Murchison had called the Lower Silurian as early as 1815; the term Silurian, being used thereafter for the most part only of the Upper Silurian in Murchison's nomenclature. Hence the Ordovician System may be defined as the rocks of the era after the Cambrian and before the Silurian, the latter term being used in the sense explained above. The name Ordovician is derived from a Welsh tribe. The system in America subdivides into the Trenton and Canadian periods; the former contains the Hudson, Utica and Trenton epochs, with the last of which the great Cincinnati antiline is to be connected; and the Canadian Period being represented by the Chazy limestones and the Cincinnatian epoch (or Beekmantown sub-group). In Great Britain the Ordovician includes the
ORDWAY — ORE DEPOSITS

following epochs: Arenig; Llandeilo flags; Bala; or Caradoc Sandstone; and Lower Llandovery. Shaly and sandy strata occur in the upper and lower parts of the Ordovician, and occasionally, as in the central part of North America, the same extremes are calcareous; but these are slight exceptions to the rule, which is that the system is predominantly limestone. For the distribution of the Ordovician rocks see the articles CANADIAN SERIES; CHAZY STAGE; CINCINNATI ANTICLINE; TRENTON STAGE; UTICA STAGE; etc.

Ord'way, John Morse, American educator and chemist: b. Amesbury, Mass., 25 April 1823. He was graduated from Dartmouth College in 1844 and engaged in chemical work. In 1847 he was superintendent of the Roxbury Color and Chemical Company’s works at Roxbury, and in 1850 accepted a professorship in Grand River College, Trenton, Mo. After 1854 he re-engaged in chemical work; in 1869 was appointed professor of industrial chemistry and metallurgy at the Massachusetts Institute of Technology, and since 1884 has held a professorship at Tulane University and its branch for women, Newcomb College, N.O. Ore. An ore may be defined as any mineral or aggregation of minerals from which a metal or metals can be extracted at a profit. This definition is not exact, but is one often used by geologists and mining engineers. Since the prospect of profitable extraction is involved it follows that a mineral containing a certain per cent of a metal may be considered an ore in one region and not an ore in another. Thus pyrrhotite containing two per cent copper would be called copper ore if situated where it could be worked to advantage, and would not be called a copper ore if situated, say, in Tibet. Again certain minerals formerly not considered as ores are not now, and other minerals not ores now will be considered such in the future. Bauxite is an ore of aluminium, but aluminium was not known a century ago. Similarly clay will be an ore of aluminum with the progress of metallurgy. Ores containing a relatively small proportion of the metal sought are termed lean or low grade, those containing a high per cent rich higher grade; the relative percentages depend on the value of the metal. Ore containing one per cent of gold would be extremely rich. In the Lake Superior country iron ores containing less than 50 per cent iron are low grade. Metals may be disseminated through a rock in the native state or as chemical compounds of sulphur, oxygen, carbonic acid, etc. Gold and silver, the noble metals, occur native as does copper. An ore carrying native gold is called free-mining. In general it may be said that nine tenths of the commercially important ores are sulphides, oxides, hydroxides, carbonates and native metals. For information on methods of extracting metals from ores see METALLURGY, and COPPER; GOLD; IRON, etc. For a discussion of methods of occurrence of ores see below under ORE DEPOSITS. Samuel Sanford, "Engineering and Mining Journal.

Ore Deposits. It is impossible to draw a fixed boundary between those occurrences of metalliferous minerals that are to be regarded as ore deposits and those that are not. Generally speaking an ore deposit is any occurrence of metalliferous minerals, large enough and rich enough to be worked at a profit. It thus appears that a body of mineral might be properly regarded as an ore deposit under some conditions and not under others. The reason why a certain place is an important one of iron ore is often found scattered through granite, yet no one would regard a granite ledge as an iron ore deposit. The exact point at which rocks containing iron oxides become iron ore bodies is determined by the factor of cost of extraction. A ledge containing a small percentage of iron favorably situated might be profitably worked, if situated in some remote locality it could not.

Two views of the origin of metalliferous deposits are held. Accepting the nebular hypothesis of the origin of the solar system, we may believe that (1) when the earth cooled so far that water could rest on its surface, this hot primeval ocean held in solution or suspension all the metals. These were subsequently deposited as various minerals in the sedimentary rocks, and in the ages since these rocks have been partly or completely fused, and worked over many times, so that in brief, all deposits of ore far enough to the earth’s surface searched by man, contain metallic atoms that were once in solution in the ocean. Or we may believe (2) that as the earth cooled from a vapor to a gaseous solid and finally to its present state, the atoms of the heavier metals, or those of least chemical activity, were the first to collect, to form the nucleus of the earth, and hence that the metalliciferous deposits worked to-day and the metals in suspension in the ocean were derived originally from molten rocks or rock magmas that came from the unknown depths of the earth. A strong reason for this belief is that the specific gravity of the earth as a whole is considerably greater than what is indicated by the average rocks which compose its crust. The results of recent investigations of rare metals of high specific gravity point in the same direction. Metals once thinly disseminated through a rock may become concentrated into deposits when the other bodies are removed by a variety of ways. In a molten magma slowly cooling at great depths as the minerals crystalize out they may collect in aggregates, either from unequal cooling of the magma or from what we may call a chemical attraction. If, in a certain that bodies of chrome iron ore, of nickel-copper sulphides, of magnetite and possibly platinum have formed by cooling from fusion. Again suppose the minerals distributed thinly through a cooled magma—or igneous rock—they may be concentrated into workable ore bodies, (1) by the decay of the rock when, after overlying strata have been uplifted and eroded, its constituent minerals are broken up and removed by air and water and only the more resistant are left. Thus are formed the so-called placer deposits, whence has come much of the world’s supply of gold, also the principal tin deposits. The minerals removed in suspension or solution in surface water and the contained metals may be precipitated chemically or in some form of organic life. Thus have beds containing various iron compounds been formed, the bog iron ores, and those silicates which after a long history of pressure, heat, and partial solution are now represented by the Lake Superior iron ore deposits. Again the still-buried igneous rock
OREADS — OREGON

at its contact with other rocks may cause all manner of chemical reactions. In regions where the earth's crust is deeply disturbed and the rocks bent, twisted and fractured by mountain building forces, there also may igneous rocks well up from regions of partial or complete fusion, and through the rock fractures hot waters or vapors charged with metals can penetrate. By far the greater number of mineral deposits have probably been formed by the reaction between such heated waters and the adjacent rocks.

Classification.—Many attempts at classifying ore deposits were based on form and mode of occurrence. Later geologists have realized that the form of a deposit was from a scientific standpoint less important than its origin. Schemes of classification have been devised which take into consideration both form and mode of origin, but the latest classifications are based wholly on origin. The following scheme is that proposed for metallic ore deposits by C. R. Van Hise.

1. Sedimentary
   (a) Chemical precipitates
   (b) Mechanical concentrates
      (i) Residual deposits
      (ii) Stream deposits
   (j) Beach deposits

2. Igneous
   (a) Magmatic segregations

3. Metamorphic
   (a) Deposited from gaseous solution
   (b) Deposited from aqueous solution
      (i) Ascending waters
      (ii) Descending waters
      (j) Ascending and descending waters

See Geology.

SAMUEL SANFORD,
MnOU
ward, and its affluent, the Umatilla, John Day, and Des Chutes rivers, on the east side of the Cascade Range, and the Willamette on the west side, all flowing into the Columbia. The Columbia has a drainage area of 245,000 square miles. The head of navigation for sea-going ships is at Portland, about 100 miles inland. From here to the Cascades navigation is open excepting for a short time in the winter when the river is frozen over. Above The Dalles the Columbia is navigable for 190 miles and 800 miles on the Snake River for 180 miles. The Columbia is noted for its beautiful scenery and the great number of salmon taken from its waters. Other well known rivers in the State are the Rogue, Coquille, Umpqua, Susalaw, Alsea, Yaquina, Nestucca, Nehalem, Lewis and Clarke, Clatskanie, Youngs, Sandy, Hood, Owybee, Malheur, Burnt, Powder, and Grande Ronde. The principal lakes are, Klamath, Goose, Warner, Salt, Christmas, Albert, Summer, Silver, Henry and Malheur. Crater Lake in the Cascades, 8000 feet above sea-level, is the crater of an extinct volcano, 10 miles in circumference, and surrounded by bluffs 2000 feet high. It is the deepest body of fresh water in America. Goose Lake lies partly in California.

Climate.—A warm oceanic current from Japan flowing southward along the Pacific coast gives western Oregon a very mild winter climate. In the summer the north winds are cool. On the coast the mean temperature for January is 42.2°, and for July 62.9°, while great extremes are rare. In the eastern part of the State the mean temperature is 29.6° for January and 66.9° for July. In winter the extremes fall below zero, and sometimes nearly 30° below. In the west the rainfall averages 89.6 inches, in the Willamette Valley, 59.8 inches, in the east, 27.7 inches, and in the south-central portion only 6.5 inches. The wet season is from October to March. Thunderstorms are rare.

Zoology.—Since Oregon has been populated and developed the grizzly bear, black bear, cinnamon bear, gray wolf, coyote, panther, catamount, wildcat, polecat, deer, antelope, elk, and mountain sheep, all formerly very numerous, have not treated to the mountains or gradually disappeared. There are still to be found in more or less abundance such animals as silver foxes, martens, raccoons, squirrels, raccoons, porcupines, bears, and rabbits. The lakes and rivers are salmon, herring, trout, hali, smelt, and other fish. There are also oysters, shrimps, crabs and clams. The birds include the eagle, hawk, pelican, cormorant, gull, crane, albatross, vulture, buzzard, raven, crow, jay, robin, swallow, sparrow, rice-bird, hummingbird, swan, goose, duck and pigeon. Reptiles and insects of the more common varieties are numerous.

Minerals.—Oregon abounds in mineral wealth, but gold is the only product extensively mined. It is found mostly in the northeast, in the Blue Mountain range. Silver, lignite, coal, zinc, cinnabar, mercury, platinum, iridium, lead, antimony, iron, copper, magnetite and nickel are also found here. 1901 the principal mineral productions included gold, 81,980 fine ounces, valued at $1,604,700; silver, 115,400 fine ounces, valued at $71,548; and coal, 58,804 short tons, valued at $220,001. The building stones were granite, valued at $5,313; sandstone, $3,150; and limestone, $10,000. The production of mineral waters was 49,300 gallons, valued at $1,600, and the clay products had a value of $327,374.

Fisheries.—The canning of fish ranks second among the industries of the State, with products valued at $1,798,809 in 1900, as compared with $1,643,324 in 1890. This industry, which is almost entirely the canning of salmon caught in waters of the Columbia River and its tributaries, has its centre in the city of Astoria, and is carried on almost exclusively by the Chinese. The industry dates back to 1866, and reached its maximum production in 1883. It is carried on also on the north side of the Columbia River, in the State of Washington, the value of the product of this latter State in 1890 being nearly a third of that of Oregon. The Columbia River has long been famous for its salmon, the product for the year 1895 exceeded in value that of any other river in the United States or the world. The exhaustion of these fisheries has been averted by more rigid laws against improvized fishing, and by the artificial propagation of fish. The value of the fish taken in Oregon in 1900 amounted to over $2,000,000, and 8,000 persons were employed in the industry. Since 1898 several refrigerating and freezing plants have been erected, and these, together with the use of refrigerator cars, have made possible the shipment of hundreds of tons of fresh fish annually from Portland to the east and to European cities. From 1898 the salmon canning has increased in the canned product during recent years.

Timber and Forest Products.—The mountains and highlands are heavily covered with evergreens, yellow, sugar, and scrub pine, yellow and white fir, red and white cedar, several varieties of spruce, yew, juniper, tamarack, maple, alder, ash and oak. In the eastern part there are dwarf pine and juniper. In the valleys are cottonwood, willow, birch, aspen, poplar, dogwood and wild cherry. The Oregon myrtle is a common tree. Out of a total area of 96,030 square miles, 28,843 square miles, or about 30 per cent, are covered with timber of merchantable size and quality; 40,285 square miles, or 43 per cent, are wooded. The crest of the mountain range, forming the dividing line between two very different portions of Oregon. West of this the rainfall is heavy, and consequently the forests are, as a whole, dense and in parts extremely luxuriant. East of that boundary the rainfall is lighter, and the forests are comparatively scanty and open, and the stand of timber is small. The total area of that part of the State west of the crest of the range, is 28,842 square miles, of which 15,089 square miles, or 52 per cent, are occupied by merchantable timber, and 24 per cent is open country. In contrast to this, the eastern part of the State comprises 65,683 square miles, of which 13,754 square miles, or only 21 per cent, are timbered, and 68 per cent is open country. The most startling feature shown by the land classification of this State is the extent of the burned areas, especially in the coast ranges and in the northern half of the Cascades. These burned areas comprise altogether not less than 7 per cent of the area of the State. Out of a total area, at one time timbered, not less than 18 per cent has been destroyed by fire. The present stand of timber in the western portion of the State being approximately 154,713 million feet, and the burned area being about one third of the
timbered area, the destruction of timber by fire in this part of the State has been approximately 51,000,000,000 feet. Similarly, it appears that in the eastern part of the State the destruction amounted to about 2,000,000,000 feet, a total of 54,000,000,000 feet in the State. Thus, at $1 per 1,000 feet, the average stumpage price, gives a total loss by fire of $54,000,000. Much of this burned country is rapidly reforesting, and in 1904 was covered with a dense stand of young trees. The earliest burns in the State of which we have record occurred in 1843. From that time down to 1903, fires of greater or less magnitude have occurred yearly, mainly in the late summer and early fall, when everything is dry. The total stand of timber in the State is estimated at 213,398,000,000 feet. West of the crest of the Cascades, the total stand of timber is estimated at 171,780,000,000 feet. The total stand of timber upon the area east of the Cascades is only 41,618,000,000 feet, and the average stand per acre is 4,700 feet. In 1900 there were 4,084 wage-earners employed in this industry and the products were valued at $10,352,167, as compared with 4,044 wage-earners and the products valued at $6,530,757 in 1890. There were 776,978,000 feet (board measure) of lumber, exclusive of custom sawing, sawed in 1900, as compared with 470,146,000 feet in 1890. The importance of this industry is due to the remarkable forest lands of the State, over 4,500,000 acres of which have been recently set off by the United States government as a forest reserve.

Agriculture.—In western Oregon, notably in the valleys of the Willamette, Umpqua, and Rogue rivers, the soil is a rich, dark loam. The hills have a heavier soil and the mountains are suitable only for grazing. In the eastern part, the soil is sandy in general, and contains much alkali, but is very fertile under irrigation. In the northeast, extensive areas of naturally fertile wheat lands are found; in the southeast, the cultivation of crops is of very little importance, but the land is extensively used for grazing purposes. The total number of farms in Oregon in 1900 was over 30 times as great as in 1850, and 40 per cent greater than in 1890. The total acreage has also increased rapidly, being over 23 times as great as in 1850. In 1900 the principal farm crops were corn, 317,147 bushels, valued at $8,968,907; oats, 3,282,770 bushels, valued at $1,345,036; hay, 1,677,085 tons, valued at $11,401,178; potatoes, 1,092,020 bushels, valued at $761,409; and barley, 928,928 bushels, valued at $380,490. The total value of crops, cereals, including corn, distributed 42.5 per cent; hay and forage, 28.2 per cent; vegetables, including potatoes, sweet potatoes, and onions, 10.5 per cent; fruits and nuts, 6.7 per cent; and all other crops, 12.1 per cent. The average values per acre of the various crops were as follows: Flowers and plants, $1,653; miscellaneous seeds, $232; onions, $190; grapes, $157; nursery products, $149; small fruits, $111; sweet potatoes, $79; hops, $61; miscellaneous vegetables, $59; potatoes, $40; sugar beets, $25; orchard fruits, $13; and cereals, $8.

The fruit-growing industry is most extensive in the region lying between the Cascade and Coast Ranges. The value of orchard products in 1900, $606,000, of which Jackson and Douglas counties contributed more than one third. From 1890 to 1900 the total number of orchard trees in the State increased from 1,757,893 to 6,314,232. Of this increase the gain in plum and prune trees constituted 49.8 per cent, and that in apple trees, 34.2 per cent. The value of all vegetables grown in the State in 1900 including potatoes, sweet potatoes, and onions, was $2,286,405. Aside from the land devoted to potatoes and onions, 15,404 acres were used in the growing of miscellaneous vegetables. Of this area 924 acres were devoted to the cultivation of cabbages; 601 to sweet corn; 573 to carrots; 372 to turnips; 331 to watermelons; 308 to tomatoes; 228 to beets; 110 to cucumbers; 101 to squashes; and 350 to other vegetables. In 1900, floral products, valued at $95,872; sugar beets, to the value of $63,332; hops, $53,753; and small fruits, $386,632, were sold by the farmers of Oregon.

Irrigation.—In western Oregon there is a very heavy rainfall and irrigation is not used for general crops, but water is artificially supplied in summer by a number of truck farms, and a few cases of irrigation of hay lands (resulting in an extra cutting) are reported from the southern part of this section. The greater part of the eastern section is arid, or semi-arid, but the soil, as a rule, is very productive when there is sufficient moisture. There are numerous rivers, and the available water supply of the section as a whole is large. In the counties bordering on the Columbia River, irrigation is not generally practised, and except in occasional years of small rainfall, it is unnecessary for most crops. A greater part of the territory south and west of these counties is useful, without irrigation, for grazing purposes only. In the Rogue River valley in Jackson and Joseph counties hay is the only crop usually irrigated, but a number of systems have been started or projected for the purpose of supplying orchard lands with water. The total number of irrigators in Oregon in 1900 was 4,636. The total area irrigated was 388,310 acres, of which 388,111 were irrigated from streams and 199 acres were irrigated from wells by the use of pumping plants. Of the total number of crops grown on irrigated land, 69.4 per cent represents the value of hay and forage; 15.0 per cent, the value of cereals; 9.6 per cent, that of vegetables; 9.1 per cent, that of orchard fruits; 2.1 per cent, that of small fruits; and 0.8 per cent, that of other crops. The total value of the crops grown on irrigated land constitutes 7.7 per cent of the total value of farm products for the State.

**Live Stock.—** There is excellent pasture in Oregon, and horses, cattle, swine and sheep are raised in large numbers. On 1 June 1900 the total value of all live stock on farms and ranges, was $33,917,048, of which 32.6 per cent represents
OREGON

The value of neat cattle other than dairy cows; 25.5 per cent, that of horses; 22.3 per cent, that of sheep; 3.1 per cent, that of swine; and 4.4 per cent, that of all other live stock. The following table shows the changes since 1850 in the numbers of the most important domestic animals:

The number of dairy cows in Oregon in 1901 was almost 13 times as great as in 1850, and 7.3 per cent greater in 1890. Nearly 18 times as many neat cattle, other than dairy cows, were reported in 1900 as in 1850.

Manufactures.—Oregon is destined to become one of the great manufacturing States of the West, if not of the entire country. The natural advantages of the State are extensive, furnishing material for its various manufacturing enterprises, and its streams furnish abundant power at The Dalles, Cascades, and Oregon City. The principal industries include railroad car and shop construction, canning, flouring mills, lumber and timber, printing, paper-making, shipbuilding, slaughtering, meat-packing, and the manufacture of woolen goods. In 1900 there were reported by the United States census, 3,088 manufacturing establishments, employing $33,422,293 in capital, and 17,235 persons; and paying $69,098,858 for raw materials, and $8,333,433 in wages; and having an annual output valued at $46,000,087. The 16 shipbuilding plants in the State in 1900 reported 338 wage-earners, and products valued at $654,885, as compared with 149 wage-earners in 1890, and products valued at $320,715 in the same industry in 1890. Flour-milling reflects the large wheat-growing interests of the State, the production of this cereal amounting to 16,198,012 bushels in 1900. The flour-milling industry gave employment to 443 wage-earners in 1900, and had a product valued at $6,304,023, as compared with 281 wage-earners in 1890, and products valued at $4,184,473. The woolen manufacture gave employment in 1900 to 507 wage-earners, and had products valued at $377,824, as compared with 358 wage-earners and products valued at $614,032 in 1890. The importance of the woolen manufacture in Oregon is largely a result of the extensive stock-raising interests of the State.

Commerce.—Before 1868, the exports from Oregon were mostly to San Francisco and Honolulu, gold dust and ores forming three fourths of the shipments. Now the exports reach almost every part of the globe, and consist largely of wheat and timber products. The foreign commerce of the State from 1850 to 1900 has fluctuated from $5,000,000 to $15,000,000, about three fourths being exports. The largest exports are to Great Britain, China, and Japan. The principal port is Portland, on the Willamette, 12 miles above its junction with the Columbia. Another port is Astoria, at the mouth of the Columbia itself. There are excellent harbors at Port Orchard, Rogue River, Coos Bay, Tillamook Bay, and Yaquina Bay. The imports of foreign goods are valued in 1890 at $3,519,517; and the exports, $69,098,858.

Banks and Banking.—There was a private bank in Portland as early as 1858. In 1865 the First National Bank, the first west of the Rocky Mountains, was established at Portland. In 1901 there were 39 national banks in operation, having $3,356,000 in capital, $1,194,734 in outstanding circulation, and $1,154,560 in United States bonds. There were also 21 State banks, with $812,920 capital, and $114,350 surplus; and two private banks with $56,000 capital, and $1,850 surplus. The exchanges at the United States Clearing House in Portland, during the year ending 30 June 1901 amounted to $113,728,149, an increase over those of the previous year of $11,068,839.

Transportation.—In 1865 there were but 19 miles of railroad in the State; 248 miles in 1875, and 582 miles in 1880. The total length of railroads within the State in 1901 was 1,695 miles, of which 58 miles were constructed during the previous year. Steamship lines ply regularly between San Francisco and Portland, and other Oregon ports, and river lines operate on the Columbia, Willamette, and Snake rivers. The Union Pacific and the Southern Pacific are the two principal railroad lines.

Governments.—New York and Iowa statutes were the models for the provisional government of Oregon, and subsequent legislation followed these lines. The governor is elected for a term of four years and receives a salary of $1,500 per annum. Legislative sessions are held biennially, and are limited to 40 days each. The legislature has 30 members in the senate and 60 in the house, each of whom receives $3,00 a day, and mileage. There are two Representatives in Congress. There is a supreme court, with appellate jurisdiction, the court consisting of five judges, who are elected for six years. There are nine circuit courts, having civil and criminal jurisdiction, and appellate jurisdiction from the county courts. There are county courts, with one judge, elected for four years, who is also judge of probate. The circuit court judges are elected one third every two years. There are also United States district and circuit courts. Justices of the peace are elected in every township or mining district, and municipal courts may be created. The constitution authorizes any male citizen of the United States, 21 years old, and 6 months a resident of the State, to be a voter, and any like foreigner who shall declare his intention to become a citizen one year before an election and shall have been a resident of the State for 6 months. New ballot laws, modeled on the Australian system, were adopted in 1891.
OREGON

State Finances.—There is no public debt in Oregon, with the exception of $1,239 in unclaimed bonds. In 1901 the amount held in irreducible trust funds was as follows: School fund, $3,637,591; agricultural college fund, $157,302; and university fund, $103,435. The gross property valuation in 1900 was $125,738,761; exemptions, $7,933,887; net taxable valuation, $117,804,874; tax rate, $5.70 per $100. The State receipts for 1900 were $1,894,004, with an expenditure of $1,650,697. The constitution prohibits the legislature from contracting any State debt exceeding $50,000, or assuming the debt of any county, town or corporation, except for purposes of war or to suppress an insurrection. The cash balance in the State treasury in 1902 was $1,137,575.

Public Institutions.—At Salem are located the School for Deaf Mutes; State Insane Asylum; School for the Blind; Boys’ Reform School; and the Oregon State Penitentiary. At Roseburg is located a Soldiers’ Home.

Education.—In 1848, Congress gave the State an area of 3,887,520 acres of the public domain for free schools, and also gave 500,000 acres for a State university, and 90,000 acres for an agricultural college. The free school system has extended to every township in the State. In 1900 the children of school age numbered 111,490; the enrolment in public schools, 89,405; and the average daily attendance, 65,411. There were 2,079 public school buildings, public school property valued at $2,024,443, and 3,742 teachers. The receipts for the year amounted to $1,636,656, and the expenditures, $1,594,420. For higher education there were 14 public high schools, 19 private secondary schools, 4 private normal schools, and 9 universities and colleges for men and for both sexes. The colleges include the University of Oregon, at Eugene; Pacific University, at Forest Grove; Willamette University, at Salem; Portland University, at University Park; Tualatin Academy, at Forest Grove; McMinnville College, at McMinnville; Pacific College, Newberg; Philomath College, Corvallis; and Blue Mountain University, at La Grande. Washington is a State agricultural college at Corvallis, and an Indian training school at Chemawa.

Religion.—The religious denominations of the State are given in the order of their strength and influence, Catholic, Methodist Episcopal; Regular Baptist; Disciples of Christ; Presbyterian; Congregational; Methodist Episcopal, South; Protestant Episcopal; and United Brethren. In 1900 there were 1,223 Evangelical Sunday-schools, with 11,963 officers and teachers and 80,017 scholars.

Indian Reservations.—There exist in Oregon the remnants of a large number of Indian tribes, most of which are aboriginal to this region, representing more than 10 distinct linguistic stocks. They have been collected largely upon five reservations, namely, Grande Ronde, Klamath, Siletz, Umatilla, and Warm Springs, while some still live along or near the Columbia River and depend upon fish and game for their support. Grande Ronde reservation is situated in the northwestern part of Oregon, in Polk and Yamhill counties, and contains an area of 934 square miles. Approximately 10,000 acres are arable, being a fair quality of land, lying in the small valleys along the tributaries of the Yamhill River. The Indians at Grande Ronde represent the remnants of nine small tribes: the Clackamas, Cow Creek, Lakmiut, Mary’s River, Rogue River, Santiam, Umpqua, Wapete, and Yamhill, numbering in all 402. The larger number cultivate their own allotments and those of the fathers of many members of their families. Oats and wheat are their principal crops. Klamath reservation lies east of the Cascade Mountains, in Klamath and Lake counties, and embraces an area of 1,690 square miles. The tribes here are the Klamath, Modoc, Paiute, and Pit River, with a total population of 1,136. The Klamath and Modoc, who constitute the larger part of the population, have so intermarried that they can no longer be distinguished, and now form a single band. They are progressing in agricultural pursuits, and are giving more attention to their cattle than in former years. Umatilla reservation, comprising an area of 125 square miles, is situated in Umatilla County. Three tribes are located here, the Cayuse, Umatilla, and Wallawalla, the total population of the reservation being 1,397. Only 20 of the 65 farms on the reservation are operated by Indians, the others being leased to white men, or are the allotments of Indian women. Wheat is the principal crop, but barley, corn and oats are also grown. Warm Springs reservation lies in Wasco and Crook counties, in the north-central part of the State, and has an area of 77 square miles. The tribes at Warm Springs are the Des Chutes, John Day, Paiute, Tenino, Warm Springs, and Wasco, with a population of 837. Their farms are fairly well equipped with stock and implements, and a few are quite prosperous.

History.—There is much uncertainty surrounding the early explorations of the North Pacific coast. Spanish and English navigators undoubtedly reached the Oregon coast in the 17th century. Captain Cook landed at Mooka Sound in 1778, and the French navigator, Lapérouse, sailed along the coast in 1786. In 1789, two Americans, John Kendrick and Robert Gray, were sent out by Boston fur merchants, and in 1791 Grays Harbor was discovered by Capt. John Meares. In 1805-6, the Lewis and Clark expedition explored considerable of the Oregon region. (See Lewis and Clark Expedition.) In 1811 the American Fur Company established trading posts at Fort Clatsop (Catholic). The northwestern boundary between the United States and Canada was fixed by the convention of 1818, as the line of 49° from the Lake of the Woods to the Rocky Mountains. West of this point the territory was to be open to both parties for 10 years. (See Northwest Boundary.) By the convention of 1827, ratified in 1828, joint occupation was continued indefinitely. The Oregon question (q.v.) occupied the attention of Congress from 1820 to 1824. The Methodists founded a mission under Jason Lee in 1834, and the Presbyterians, under Marcus Whitman (q.v.) in 1836. In 1839 the emigration of New Englanders commenced overland by way of the South Pass, and the Territory continued to receive settlers yearly till 1846, when the epidemic of "gold-fever" attracted a large quota of her citizens away. In 1850, however, the land-donation law, passed by Congress, had the effect of registering 8,000 citizens in Oregon, which was formally organized as a Territory on 3 March 1849.
Oregon—Oregon Question

On 2 March 1843, Washington Territory was formed out of the northern half of Oregon. On 5 Nov. 1857, a State constitution was adopted; and 14 Feb. 1859 the State was admitted into the Union by Act of Congress under the constitution previously ratified. From 1845 till 1865 a desultory warfare was kept up with the Indian aborigines, and a resumption of the same occurred in 1858, and again in 1866-68, when occurred the Shoshone war, and in 1864-73, when the Modoc war prevailed. Since 1875 the Indians have been confined on their reservations. Since 1890 Congress has made numerous large appropriations for river and harbor improvements.

Politics.—Under the provisional government 1843-5, adopted by the people 5 July 1843, the executive power was vested in a committee of three persons; the legislative power was vested in a committee of nine persons, elected by the qualified electors, giving to each district representation in ratio of its population, excluding Indians; the judicial power was vested in a supreme court, consisting of one supreme judge and two justices of the peace, and a probate court. Oregon had a provisional governor (1845-6) and seven Territorial governors (1849-59). The first governor under the State constitution was a Democrat, and there have since been 4 Democratic governors, 5 Republican governors, and 1 Democrat-Populist. In Presidential elections the State is regarded as safely Republican. In 1876 it was discovered that one of the Republican electors held a Federal office, and was consequently ineligible. The Democratic governor issued a certificate to the minority candidate, but the two Republican electors filled the vacancy, and their position was sustained by the Electoral Commission (q.v.). The State elected a Democratic governor in 1903.

Population.—There are 32 counties in Oregon, as follows:

Baker, Benton, Clackamas, Clatsop, Columbia, Coos, Crook, Curry, Douglas, Grant, Harney, Jackson, Josephine, Klamath, Lake, Lane, Lincoln, Linn, Malheur, Marion, Morrow, Multnomah, Polk, Sherman, Tillamook, Umatilla, Wasco, Washington, Yamhill.

The principal cities and towns are as follows: Portland (90,426); Astoria (8,381); Baker City (6,603); Salem, Oregon City, Albany, Corvallis, Eugene City, Roseburg, The Dalles, Pendleton, Union, and La Grande. In 1901 there were 890 post-offices of all grades; and 193 periodicals, of which 17 were daily, 7 semi-weekly, 144 weekly, 1 bi-weekly, 2 semi-monthly, and 22 monthly. The total population of the State in 1850 was 13,204; (1860) 52,465; (1870) 90,923; (1880) 174,788; (1890) 313,757; (1900) 413,536. Of this number 65,748 are of foreign birth, Chinese 10,307, and Indians 8,527.

Bibliography.—Barrow, 'Oregon, the Struggle for Possession' (1882); Bancroft, 'History of the Northwest Coast' (1884), and 'History of Oregon' (1888); Bullfinch, 'Oregon and El Dorado' (1866); Gray, 'History of Oregon' (1870); Greenbow, 'History of Oregon and California' (1844); Mosely, 'Oregon, Resources, Climate and Products' (1878); Mowry, 'Marcus Whitman and the Early Days of Oregon' (1901); Nash, 'Two Years in Oregon' (1882); Nicolay, 'Oregon Territory' (1846).

C. A. Dolph,

Oregon, Ill., city, county-seat of Ogle County; on the Rock River, and on the Chicago, Burlington & Quincy railroad; about 85 miles in direct line west of Chicago. It has considerable manufacturing interests. The chief manufactures are foundry and machine-shop products, flour, pianos, street-sprinklers, and dairy products. It has good schools and a public library. Pop. (1890) 1,566; (1900) 1,577.

Oregon, a river in the western part of North America. See Columbia.

Oregon, University of, the State University chartered in 1872, and opened in 1876 at Eugene. Its organization comprises (1) the College of Literature, Science and Arts, which offers courses in law, journalism, business, and pedagogy; (2) the College of Science and Engineering, with courses in civil, chemical, electrical, mining, and sanitary engineering; (3) the School of Music; (4) the Graduate School; (5) the School of Law (founded in 1884); (6) the Medical School (founded in 1897); the two latter are located at Portland; there is also a University Academy. The bachelors' degrees conferred are A.B. and B.S. The University is coeducational, number of women students being about 30 per cent of the total. It is supported mainly by State appropriation; tuition is free; the income in 1903 was $59,702. The library (1903) contains 15,500 volumes; the students number 470, and the faculty 71.

Oregon City, Ore., county-seat of Clackamas County; on the Willamette River, and on the Southern Pacific railroad; about 14 miles south of Portland. The falls in the river, 40 feet in height, furnish extensive water-power which is used for the electric-light works and for the development of manufacturing industries. The chief manufactures are flour, lumber, woolen goods, soap, paper, pulp, and furniture. It has a House of the Good Shepherd, public and parish schools, and a public library. The city owns the waterworks. Pop. (1890) 3,062; (1900) 3,494.

Oregon Brook-trout, the rainbow trout (q.v.).

Oregon Question. The. The Oregon question of boundary between the United States and Great Britain involved the right to the territory upon the Pacific coast of North America extending inland eastward to the Stoney, now called Rocky Mountains, and bounded upon the South by the parallel of 42° north latitude, upon the north by the parallel of 54° 40' marking the southern limit of what was formerly Russian America. The claim of the United States to this territory was based upon the discovery, 11 May 1792, of Captain Robert Gray of Boston, who, in the ship Columbia, entered the river called Oregon by the Indians. He passed its bar and anchored in the river, ten miles above its mouth, and afterwards sailed up the river 12 or 15 miles and left it on the 20th of the same
Oregon Question

In 1793 Mackenzie, a British subject, had crossed from the Rocky Mountains to the Pacific, exploring the upper waters of Fraser's River, which in process of time was traced to its junction with the sea near the 49th degree of latitude, thus forming in point of exploration a counterpoise to the exploration of that part of the Columbia which was first visited by Lewis and Clark. (R. Pakenham.) An English expedition intended to anticipate the Astoria settlement armed, agree, some of them not reaching Astoria till July 1811. Great Britain denied the validity of the Spanish claim to the Oregon country, practically on the ground that she was so much stronger than Spain that Spain could not make good her claim. The above claims and counter claims, with various modifications, were discussed at times by the diplomatic representatives of Great Britain and the United States from 1826 to 1846.

The Oregon question as an issue in American policy was made prominent by a plank in the platform of the national convention of the Democratic party at Baltimore, the latter part of May 1844, which read, "Resolved, That our title to the whole of Oregon is clear and unmistakable, that no portion of the same ought to be ceded to England or any other power, and that the reoccupation of Oregon and the reannexation of Texas at the earliest practicable period are great American measures which this convention recommends to the cordial support of the Democracy of the Union." The words reannexation and reoccupation implied that the territory in question had belonged to the United States, Texas under the Louisiana purchase and Oregon by discovery, exploration, etc., till the United States left the claim to sovereignty over Oregon in abeyance by the convention of joint occupancy with Great Britain. It must be recognized that in 1844 the United States had no undisputed sovereignty over the territory on the Pacific coast now belonging to the United States. Joint occupancy with Great Britain of the Oregon country was not sovereignty over it. The California country belonged to Mexico. If the United States, which had not sovereignty from the ocean to ocean, that power must acquire the California country from Mexico or exclude England from Oregon. The settlement of the Oregon boundary had been discussed for some time previous to 1844, and a treaty which was negotiated in 1842 between Mr. Webster and Lord Ashburton, fixing the line between Maine and Canada, would also fix the Oregon line, but such was not the case. James Buchanan, in a speech in the Senate, on March 1844, upon a resolution requesting the President to give notice of the termination of the joint occupancy of the Oregon country, pointed out clearly that England leased that territory to the Hudson's Bay Company in December 1821 for 21 years and in 1838 renewed the lease for 21 years more; that the Hudson's Bay Company had 6 permanent establishments on the coast, 16 interior, and several migratory hunting parties; 6 armed vessels, one of them a steamer; that they hoped to keep British interests on the ascendant in the Pacific. Mr. Buchanan also showed that Great Britain was content to keep the status quo and that the only way to force her to act was to give the notice. The speech in the Democratic platform was considered de-
Oregon Robin — Oregon Agricultural College

cidedly aggressive in some sections of the country. As might be expected, the New Englanders, whose cities and shipping would be more at the mercy of the enemy in case of war were not so enthusiastic for an aggressive foreign policy as those States in the centre, west and south of the Union which were more remote from the “fire line” and which were deeply interested to see the flag of the Union sweep through from sea to sea. The discussions in Congress revealed calculation of the probabilities of war as the result of the notice. It was urged that Ireland was hostile to England and there might be a rebellion. Far more important was the fact that England received nine tenths of her cotton from the southern United States, that war would cut off this supply and close the English mills with all the social distress involved, to say nothing of the loss of the market the United States afforded for English manufactured products. In 1844, one third of the foreign trade of the United States was with Great Britain. After Mr. Polk's nomination, it was brought out in the proceedings of Congress in June 1844, that so far back as the session of 1828-1830, he had laid out a definite plan of policy for the United States including giving the “continental line” and taking the consequences. When, therefore, Mr. Polk was elected in November 1844, the Democratic party considered its platform approved by the country and it proceeded to carry out its policy of continental expansion. The cry out of “54° 40’ or fight” phrased the ultra aggressive sentiment on the part of the United States looking to push its territory to the Russian line, while Great Britain seemed equally determined to force the line of the Columbia River. War with Great Britain might involve the loss to the United States of all the Pacific coast. Mr. Blaine in his ‘Twenty Years of Congress’ attributes the emergence from a difficult situation to the foresight and ability of Mr. Calhoun and of Mr. Buchanan. These gentlemen as well as Mr. Clay and Mr. Webster, when occupying the post of Secretary of State, had been willing to continue the line of 49° to the Straits of Fuca. There were no objections to the Columbia River line. The most important of these, barring considerations of national honor and pride, was the fact that there were no good harbors in the territory left to the United States south of the Columbia, whereas, if the line ran, as it does at present, on the 49th parallel to the Straits of Fuca, all Puget Sound with its waters sheltered from the storms of the Pacific and its branches accessible to a very large territory, would belong to the United States. San Francisco harbor then belonged to Mexico. Within the United States, sentiment was divided. War with England would hurt the South seriously by cutting off her cotton market and possibly limiting what might become slave territory to the Southwest. The anti-slavery sentiment of the North had defeated Mr. Clay for the Presidency for his willingness to compromise on an issue on which it would brook no compromise. President Polk followed General Jackson's pacific and peace was not an idol at whose shrine Jackson worshipped. The influence of other public men looking toward peace, their interests and rivalries, were to be considered. The Administration escaped from its “54° 40’ or fight” position by taking the advice of the Senate in advance of the treaty. His course, unusual and in some cases highly unadvisable, was a badge of responsibility for action upon the shoulders of the Senate, at the same time allowing the Secretary and Great Britain to feel that the instructed action of the Secretary could not consistently be rejected by the Senate. In cleverly rescuing the Administration, for if the Whigs insisted upon the line of 54° 40’, they put themselves squarely upon democratic ground. If they were willing to compromise on 49° for the sake of peace, it would hardly seem reasonable to taunt the Democrats with cowardice for acting upon Whig advice. When the resolution of notice passed the House in February 1846 the country at once became alarmed by the growing rumors that the resolution of the House was a direct challenge to Great Britain for a trial of strength as to the superior title to the Oregon country. (J. G. Blaine.) The resolution, amended by the Senate and given a conciliatory tone, passed Congress 23 April 1846. By that time the Administration must have seen its future course clear, for by the middle of June the diplomatic representatives of Great Britain and the United States had come to an agreement which was ratified by the representatives giving the country the assurance claimed in force in August 1846. The line agreed upon was the parallel of 49° to the Straits of Fuca, thence following the middle, roughly speaking, of that Strait to the Pacific. War with Mexico was averted. The United States entered into a treaty with the amended Oregon notice to Great Britain and as a result of the war with Mexico and the Oregon treaty with Great Britain, the United States acquired its present sovereignty over the great territory west of the Rocky Mountains with a frontage of some 1,500 miles on the Pacific.

E. Benjamin Andrews,
The University of Nebraska.

Oregon Robin. The “varied thrush” (Oreosils nutula) which represents the eastern robin in Oregon and northward to Alaska west of the mountains. It is dark slate-blue above and orange-brown in the lower parts, with a crescent of black on the breast, from the horns of which a little black hair escapes under the neck and through the eye. It makes its nest in bushes, and lays greenish blue eggs, clearly marked with spots and spots of dark brown. It is a sweet singer.

Oregon Snow-bird. See Snow-birds.

Oregon State Agricultural College, founded in 1870 at Corvallis. The four years courses include agriculture, domestic science, mechanical, electrical, and mining engineering, and pharmacy, there are also a two years’ course in mining, a two years’ business course (added in 1901), and a winter course of four to six weeks in agriculture; and a preparatory department with a one year’s course. The college is coeducational, and there are women on the faculty. The Experiment Station is connected with the college, though separately supported; and the farmers’ institutes are a part of the supervision of the faculty; in 1901, 11 such institutes were held with an attendance of 3,100. The income is derived chiefly from the land grant fund of 1862, and from Federal and State appropriation; tuition is free; in 1903 the annual income
OREGON STURGEON — OREOPITHECUS

 amounted to $86,531. In that year there were 480 students in attendance, and 30 members of the faculty.

Oregon Sturgeon. See Sturgeon.

O'Reilly, ó-réllí, Alexander, Spanish soldier: b. Dublin 1725; d. Murcia 23 March 1794. He entered the Spanish army when a boy, fought the Austrians in Italy, joined the Austrian army in 1757, and the French in 1759, and then returned to Spain. He served in the war with Portugal (1762), acted as governor of Havana, rebuilding the fortifications dismantled during the British occupation, became governor of Louisiana in 1769, and acted there with great severity until his authority was established, when he showed himself attractive and liberal. He was governor of Madrid during the rising of 1765, commanded an unsuccessful expedition to Algiers in 1775, but still retained his king's favor. After the death of Charles III. (1788) he was disgraced and retired from the army; he was subsequently appointed to the chief command of the Spanish army in 1793, but died suddenly before reaching his army.

O'Reilly, John Boyle, Irish-American author and journalist; b. Dowth Castle, County Meath, 28 June 1844; d. Hull, Mass., 10 Aug. 1890. He was apprenticed to a printer at nine, became a compositor and a reporter, and was an active member of the Fenian Society, in whose interests he enlisted in May 1863 in the 10th Husars. Three years later he was tried for treason and sentenced to death, a sentence commuted to 20 years' penal servitude. From Dartmoor he was transported in 1867 to Australia, whence he escaped and, having been picked up by an American ship, made his way to Philadelphia, where he was naturalized. He removed to Boston almost immediately, and became editor of the 'Pilot' in 1870 and part owner in 1876. He accompanied the Fenian raid of 1870 as press correspondent, and was a prominent advocate of Home Rule for Ireland, to the end. His most popular and best known work is the humorous verse, notably that on Australian themes: 'Songs of the Southern Seas' (1873); 'Songs, Legends, and Ballads' (1878); 'America' (1882), and 'In Bohemia' (1886); and in prose, 'Moonshine' (1879); 'Desert dealing with penal life' (1879); 'The King's Men' (1884, with Robert Grant, 'J. S. of Dale,' and J. F. Wheelwright); 'The Irish Question' (1886); 'Ethics of Boxing and Manly Sport' (1886), and 'Stories and Sketches' (1888). Consult the biography by Roche (1891).

Orel, ó-rél, or Orloff, Russia, (1) a town, capital of the government of same name, on the Oka, 201 miles southwest of Moscow. It consists of narrow streets and houses built principally of wood, and has manufactures of linen, tanneries, rope-works, worsted-mills, etc. It is well situated for trade, communicating by water with the Black Sea, the Caspian, the Baltic, and forming an important entrepôt, especially for Saint Petersburg and Moscow. Pop. (1897) 60,328. (2) The government has an area of 18,600 square miles, the surface being diversified with hill and valley, and watered by the Oka, the Desna, the Don and its tributary the Sosna. Stock raising and agriculture constitute the chief industries. Pop. (1897) 2,054,749.

Orell, Max. See Blouet, Paul.

Orellana, Francisco, frán-thés'koó ó-rèl-yán'na, Spanish explorer of the Amazon: b. Truxillo, Spain, about 1500; d. Brazilian Guiana 1550. He was a friend and fellow townsman of Pizarro, fought under him in Peru, founded the city of Guayaquil in 1537, and in 1540 accompanied his expedition across the Andes in search of El Dorado, and sailed down the Napo River with a few men to the Amazon, which he followed to its mouth, and, because of the stories he heard of women warriors and women chiefs along its course called it the Amazon. Upon his return to Spain he told amazing stories of the richness of the country he had explored and received its government in 1544. He was killed soon after his return to South America, where his expedition was entirely unsuccessful. Consult the contemporary account of his travels by his chaplain, Gaspar de Carvajal, reprinted at Seville in 1894.

Orenburg, ó-rén-boorg, Russia, (1) a town, capital of the government of the same name, on a slope above the right bank of the Ural, 990 miles southeast of Moscow. It has spacious and regular but ill-kept streets. The principal buildings are several stone churches, two mosques, a governor's house, exchange, customs-house, merchant-house, and Bashkir caravansary. The chief manufactures are woollens, particularly for army clothing, leather, and soap. There are also many large grain-smelting houses. The trade, carried on principally by caravans from Khiva and Bokhara, is very extensive. Pop. (1897) 74,740. (2) An eastern government in the southern Urals, with an area of 73,816 square miles. It has celebrated deposits of gold, copper, silver, coal, iron, and salt, which are extensively worked. Pop. (1897) 1,609,388.

Oreodonts, an extinct family (Oreodontidae) of ungulates, the remains of which occur in the early Tertiary deposits of North America, and are among the most primitive of hooed mammals. Their skeletons abound in the Lower Miocene formations of Colorado and northward, especially in the White River beds. They are mainly animals not larger than sheep, with a very long tail, and with four functional toes on each foot. The dentition is usually complete, though the incisors are sometimes rudimentary or even wanting in the upper jaw; and all the generis exhibit, says Woodward, one very peculiar feature, namely, the degradation of the lower canine to the rank of an incisor, while the foremost premolar is enlarged to usurp its function in opposing the moderately large upper canine. The best known genera are Oreodon and Agroecherus of the eastern foothills of the Rockies, and the larger Eooreodon of the Pacific coast. Consult Woodward, 'Vertebrate Palaeontology'; Osborn, 'Evolution of the Ungulate Foot', Trans. Amer. Philosophical Soc., U. S., Vol. XVIII. (1886); Cope, 'The Artiodactyla,' Amer. Naturalist, 1888, and 1889.

Oreopithicus, the generic name given to the oldest known fossil ape, fragments of whose skeleton (jaws and teeth) have been recovered from the Middle Miocene of Tuscany. They are interesting as exhibiting a comparatively large animal (O. bamboli), showing resemblances both to the Cercocecidiae and to the Simidae,
ORESTES—ORGAN

as if... remarks Woodward, "they represented an anninctant ancestral type..."

Orestes, ɔrɛstɛz, in Greek mythology, the son of Agamemnon and of Clytemnestra. In several Greek tragedies he is represented as the deliverer of his sister, and the avenger of his father, by becoming the murderer of his mother. Orestes, saved by his tutor with the assistance of Electra from the fate of his father, was brought up in the house of his uncle Strophius, prince of Phocis, and formed with his son Pylades that intimate friendship which has become proverbial. Called upon by the Delphic oracle to avenge his father, he hastens back to Mycenæ. To conceal himself he has recourse to artifice. His tutor and Pylades appear with an urn, which they pretend contains the ashes of Orestes. Clytemnestra hears the news of her son's death with a joy which she can hardly conceal; but she soon falls under his dagger. Ἀγισθὺς undergoes a similar fate. According to the Greeks, the murderer of his mother became a prey to the Eumenides or Furies. These three undaunted, unrelentingly pursued the unhappy prince, and at last drive him to madness.

Orfila, ɔrˈfɛlə, Mathieu Joseph Bonaventure, French chemist, founder of the science of toxicology both in its therapeutic and legal bearings: b. Mahon, Minorca, 24 April 1787; d. Paris 15 March 1853. He served in the merchant marine, studied medicine at Valencia, Barcelona, and Madrid; was sent to Paris by the Spanish government in 1807; and after the loss of his pension consequent on the war between France and Spain lived there in poverty for a time. By 1811 he had become doctor of medicine, and his successful practice and marvelous knowledge of chemistry made him quickly famous. He was naturalized, became professor of toxicology (1819) and of chemistry (1823), and was dean of the medical faculty from 1830 to 1848. He was famed as an expert witness, did much to reform French medical education, and wrote: 'A Treatise on Poisons' (1813); 'Treatise on Legal Medicine' (1847); 'Elements of Medical Chemistry' (1847); 'Treatise on Exhumation' (1830), his most able work; and 'Researches on Arsenic Acid Poisoning' (1841).

Orford, ɔrˈfɔrd, Earl of. See WALPOLE, Sir Robert, an active part of living being. It is an essential quality of a living being (see LIVING) that it shall exhibit activities, the expression or product of organic constitution. Hence, in fact, living beings are said to be organic or to have an organization as distinguished from the homogeneous, non-vital character of inorganic matter, which are inorganic. Any living being, either vegetable or animal, is hence termed an organism—the broadest possible name for the animate world as opposed to the inanimate. Not so, however, the erroneous notions which formerly prevailed in regard to the nature of organic functions belong to the history of the science of physiology and of chemistry, and need not be dwelt upon here further than is necessary. Orestes, ɔrɛstɛz, he early part of the 19th century it was believed that certain chemical compounds which were produced as the results of vital processes occurring within the tissues of animal and vegetable organisms could not be obtained by the ordinary methods of the chemical laboratory; and these compounds were, for this reason, designated as organic. Wöhler, in 1828, however, discovered that urea, the most important solid constituent of urine, could be obtained "artificially" as it has been called, from inorganic materials. Since that date a very large number of so-called organic compounds have been prepared artificially, so that the original signification of the term "organic" does not hold any longer; and the old conception of an organism as an engine-like collection of organs with fixed functions is disappearing before the doctrine that it is the protoplasm or living stuff in all parts of the body that is the basis of all vital activities. The title "organic chemistry," is now commonly applied to the chemistry of the compounds of carbon, whether these compounds are obtainable only as the products of vital processes or not.

Nature of Organs.—Organs may be spoken of in two senses. In common speech they are large functional parts of gross anatomy, such as the roots, the leaves, or the blossoms of plants, the limbs, the heart and blood-vessels, the lungs, the stomach, the liver and excretory glands, the generative parts, etc., of animals; these are termed, properly enough, the respiratory, digestive, locomotive, or reproductive organs, and so on. But each is made up of many parts which unite to effect the great functions which characterize the group as a whole, and all are more or less interdependent. The number and diversity of these structures, large and small, visible and invisible, vary enormously in different plants and animals, and are the result of an organic evolution, that is, a struggle for existence among organs, or intra-evolution, as it has been termed by some German naturalists. Where the organs are few and simple, in some cases more than one distinct function being performed apparently by the same part, the animal or plant is said to be of simple or synthetic structure or organization; where the subdivision of labor in the organism is extensive, separate structures doing each a more particular work for the benefit of the whole, the organism can be complex or specialized. Increase of specialization is regarded as an advance, hence we speak of lower and higher animals, referring to the less or greater degree of complexity and specialization of their organs, or considering their organizations as a whole. Comparison of existing organisms, considered with reference to their activities, and a study of the phylogeny of animals and plants as revealed by palaeontology and embryology, establishes the truth of this standard of comparison, and throws light upon the evolution of organs. Tracing backward any particular group, as, for example, that of the digestive system, we find it less and less complex as we descend the scale of organization until we arrive at the simplest forms—the one-celled moners (see MONERS; PROTISTA), in neither plant nor animal, which have no structure that our power is able to detect, the drop of undifferentiated protoplasm which constitutes their whole being accomplishing all the work of nutrition, locomotion and reproduction. A little higher stands the amoeba (q.v.) and other protozoans and protothynes, in which a beginning of differentiation and
structure appears in the presence of a nucleus, a vacuole, microsomes, etc. Still higher stand the sponges, colonialtarians, and so on, whose comparative superiority is manifested by the assignment of certain parts with gradually increasing definiteness to perform distinct offices. But the higher organisms primarily differ from the lower ones only in the fact that they are composed of many cells in more and more complicated arrangement, while the lowest consist of only a single cell; hence in the last analysis, an organ can be defined only as a cell or group of cells devoted to doing a special part of the labor required for the continued life, activities, and prosperity of the organism. This is only a corollary of the general doctrine of the cell as the seat of life (see Cell). Of the origin of function or organic activity we know nothing.

Form and Symmetry.—Returning now to the ordinary sense of the word "organ" as a functional part, certain general facts may be considered. Among these are the form and symmetry of organs. The form is determined by the laws to be obeyed in any system of mechanical laws, the application of mechanical laws, Mechanical principles, controlling, to begin with, the original cell-division of the egg, and regulated in growth by external conditions, as gravity, air or water pressure, strains, muscle-leverage, etc., are no doubt at the basis of the symmetry which so remarkably characterizes the arrangement of organs throughout the living world. Two general types may be recognized—radial symmetry and bilateral symmetry. The former is most characteristic of plants, where the majority of organs occur in circles around an axis (see Anatomy of Plants; Flowers; Phyllotaxis; Venation; etc.); and of such animals as the echinoderms, colonialtarians (coelenterates), and many worms, with the organs radially disposed about a central axis, as in polyps and starfish. The superior orders generally, and the arthropods and vertebrates particularly, display bilateral symmetry in a marked degree in all their outward parts, the organs being in pairs (with one important exception in the higher forms) and these approximately, though not absolutely, alike. The internal organs of the vertebrates are by no means symmetrical at present, although they seem to have reached their asymmetry by evolution from a primitive paired condition. In insects and arthropods generally the internal parts show much more bilateralism. Among mollusks the bilateral arrangement of the organs is normal, but one side is often developed at the expense of the other, even to the complete loss of the latter.

Correlations.—As might be expected under such circumstances certain definite correlations exist between organs as to form and relative proportions in the human frame, the limbs are equal in length, the head is one seventh of the total height, the internal organs must be of a relative size in respect to one another and to the frame, and so on. This symmetry and correlation of organs is necessary to the continuance of healthful interacting functions.

At the same time homologous parts—that is, those structurally alike—may vary greatly among animals of the same class, according to the varying requirements of habits and environment, as for instance among vertebrates, the locomotive organs are in the form of fins or paddles for aquatic species, wings for aerial creatures, and legs and feet for those of terrestrial habit; and these may be vastly modified among the different groups, adapted to diverse habits, giving all the difference, for example, between the massive, shovel-like, digging-paws of the mole and the long slender legs of the antelope, or even the total disappearance of homologous parts, as in the snakes and limbless lizards. Such alterations of form adaptive to the requirements of environment and habit, come about gradually, and are likely to require a corresponding change in other organs, directly or indirectly; since all or many organs in the frame are dependent upon the co-action of others, and conditions of space, gravity, etc., require mechanical as well as physiological conformity. The stomach, lungs, etc., of a long slender animal will be elongated and narrow, while those of a related but more compactly built species will be more globular. Sometimes, however, the changes render some secondary organ unnecessary, and it continues disuse results in gradual reduction and perhaps extinction, as has happened in the case of the loss of eyes by many burrowing or cave-dwelling animals. When such a loss has become permanent in a type the remains may occur only in the embryonic stage, or may exist in adulthood, quite useless to the animal in its present condition. Such obsolete structures, of which the false hoofs of many ungulates, the "balancers" of flies, and the appendix vermiformis in man are examples, are called vestigial organs, and were most difficult of explanation until this relationship was recognized.

Function Change.—Organs may not only change their form, but may also change their function, one organ performing more than one function, even in the higher animals, and often, especially in the case of the limbs, this has produced a change of form as between the fore and hind limbs, relegating to one pair, say the hind limbs, the main purpose of the swimming-bladder of fishes; teeth came into existence as a relic of the hard scales of ancient fishes whose function was purely as an armature, the structure and office surviving only in a few such forms as the gar (see Gar); the three pairs of "jaws" of crabs are structures which, in the early history of the
crustacean type were primarily swimming and breathing organs, but long ago lost those functions altogether and became fitted wholly for mastication of food. Similar examples in great number might be drawn from both animals and plants. Indeed, it might be said that most if not all of the successful and persistent variations have involved change of function on the part of organs, the result of which in many cases was greater specialization.

For the development of organs in the embryo see Embryology.

**ERNEST INGERSOLL**

**Organ** (Gr. ὄργανον, Lat. organum, an instrument), a name at the present time applied to several musical instruments that are in construction and principle somewhat closely allied; but more distinctively appropriated to the largest of these, the church organ, which may be briefly described as a wind instrument, the sounds of which are those of a great number of pipes of varying lengths, and are produced by the admission to these (as determined by the keys and stops moved by the performer) of compressed air conveyed to them along certain channels, from a bellows worked by electricity, human or other motive power. This, which from its essential feature of construction is also named the pipe organ, and, from the mode of playing, the finger organ, is incomparably the noblest and most imposing of musical instruments, being in majesty of tone and grandeur of effect quite without a parallel. As in the human voice, the tones of the organ are produced by the vibrations of the air in the tubes or pipes through which it is propelled. The three essentials of an organ are: (1) a chest of compressed air; (2) a set of pipes in communication with this chest; and (3) a clavier or key-board, by means of which this communication may be opened or closed at pleasure. The air is forced into the wind-chest by means of bellows. To the upper part of each wind-chest is attached a sound-board, a contrivance for conveying the wind to any particular pipe or pipes at pleasure. It consists of two boards laid horizontally. On the upper board are arranged parallel rows of pipes, the pipes in each row, regarded longitudinally, being of the same height; the pipes in the transverse rows, however, are of different lengths, and on the sides of the board is a mezzotone, the tone of which is produced by prolonging the sound of the pipes above it by the fall of a register. The pipes communicate with the grooves. Air is admitted into these grooves by means of valves or pallets, which are connected with the keys. On the depression of a key the valve is opened, and the compressed air rushes into the groove, and would, if obvious, cause all the pipes communicating with that particular groove to sound their respective notes were it not for the register.

The register is a slider which moves in other grooves in the sound-board, cut at right angles to those above mentioned, and communicating by perforations with the longitudinally arranged pipes; it contains holes to correspond with these pipes. By drawing the register or stop the holes of one of these rows are opened, as the figure shows. The slide is under the entrance to the pipes, and by pushing it they are closed. From this it is clear that by drawing several of these registers corresponding rows of pipes are opened. When a register is open air can be admitted into any of the row of pipes under which it is placed by simply pressing the key that opens the value of the groove with which it communicates. The series of pipes above each slider is called a stop. The principal stops of an organ are the open, stopped, and double diapasons; the principal, dulciana, twelfth, fifteenth, flute, trumpet, clarion, bassoon, cremona, oboe, and vox humana. Those pipes of the various registers that open into each channel are so constructed that while one shall give a fundamental note, the others shall give the chords of that note. An organ may have several wind-chests filled by the same bellows, and several key-boards, each key-board and wind-chest representing a distinct organ. In the largest instruments the number of these organs generally amounts to five. The most powerful of these is called the great organ; a smaller one the choir organ; another is called the swell organ, from the circumference of its being enclosed in a wooden box with a front of louvre-boards, which can be worked by the player so as to give diminuendo and crescendo effects to the sound; a fourth is called the solo organ, being employed for special solo stops, such as the hautboy, the flute-stop, the vox humana, and others; lastly, there is the pedal organ, so called from its key-board being played by the feet. The key-boards for the hand are termed manuals, that for the feet the pedal. The most usual compass of the manuals is from CC (8 feet) to F in all, four octaves and a half; that of the pedal from CCC to E or F, two and a quarter to two and a half octaves.

There are two kinds of organ pipes—flute pipes and reed pipes, of each of which there are several species. Flute pipes consist, first, of a foot, which is hollow, and receives the wind that sounds the pipe; second, of a body which is attached to the foot. Between the foot and the body of the pipe is a diaphragm or partition, having a small narrow aperture to let out the wind; over this aperture is the mouth, whose upper lip, being horizontal, cuts the wind as it escapes through the aperture and sets it in vibration, so causing the sound. The pipes are made either of pewter, of lead mixed with tin, or of wood. The metal pipes are generally cylindrical, open at their extremities, and clear in their sound. The wooden pipes are square.
ORGAN MOUNTAINS—ORGANO-METALLIC COMPOUNDS

and generally stopped at their extremities by a plug covered with leather, so as to be air-tight. The sound of these is softer. The longest pipes yield the gravest, the shortest, the most acute sound. In St. Peter's, which is 103 feet long, they have only half the length of those that are open for the same sound. The pipes vary in length from 32 feet or so, to the size of the pipe of a very small key. The reed pipes consist of a foot to carry the wind to the reed, a thin tongue of hard brass, one of the extremities of which is fitted into a kind of mold by a wooden plug, and the other is left free to vibrate; and in proportion to the length of that part of the tongue which is at liberty is the depth of the sound. After passing the reed the wind traverses a long pipe, whose dimensions and shape give character and quality to the sound.

The hand or barrel organs consist of a movable, turning cylinder, called a barrel, on which, by means of keys, pins, and staples, are set the tones it is intended to perform. These pins and staples, by the revolution of the barrel, act upon the keys within, and give admission to the wind from the bellows to the pipes. The hand-organ is generally portable, and so contrived that the same action of the hand which turns the barrel gives motion to the bellows.

The invention of the organ is attributed to Ctesibius of Alexandria, about 200 A.D. An organ was presented by Emperor Copronymus to Pepin, king of France, about 755; and in 867 a water-organ was erected at Aix-la-Chapelle. The use of organs, however, was not common before the 14th century. At the beginning the instrument was very imperfect; it had only from 12 to 15 broad and large keys, which were struck with the fist and produced the tones of the diatonic scale. The keys in time became smaller, and between the diatonic tones of the semi-tones were inserted. In 1444 H. Drossdorf of Mayence built a great organ with a pedal. According to others, Bernhard, a German, organist to the Doge of Venice, built the first organ with a pedal between the years 1470 and 1480. Improvements succeeded quickly in the 16th century; the division of all the pipes into different stops was now invented, and the instrument was adapted to the tone of the choir. The bellows were particularly improved, as till then 20 to 24 pairs had often existed in one organ, requiring from 10 to 12 men to tread them. But the present degree of perfection could not be obtained until Christian Fromer had invented in the 17th century the wind-chest, by which an equal pressure of wind can be obtained in all the bellows. A hydraulic engine has been adapted, with success, to the purpose of acting the bellows, and it is now generally adopted. By an ingenious piece of self-acting mechanism, the pump works only when the wind-chest is empty, or only partially filled, ceasing when it is full. Mr. Barker, inventor of the pneumatic lever, patented in 1863 a contrivance for transferring some of the work from mechanism to electro-magnetism. An organ built on this principle is termed an electric organ. Several improvements have since been made on Barker's patent. The first electric organ was constructed by Brannigan and used at Drury Lane in 1867, and many others have since been erected throughout the world.

The principal advantages of this description of organ are that it facilitates the playing, and enables the organist to sit at a key-board at a distance from the organ. One of the largest organs in the world, which is at the Royal Albert Hall, London, is 50 feet long, has 300 stops; that of the Seville Cathedral has also 100 stops and 5,300 pipes; one at Weingarten, in Swabia, has 50 stops and 6,000 pipes; one at Haarlem, 60 stops and 5,000 pipes. The organs of Notre Dame and Saint Sulpice, in France, are likewise very large. The largest organ in England is that built in 1870 for the Royal Albert Hall, London. There are five rows of keys for the choir, great, swell, solo, and pedal organs; 138 stops, and nearly 10,000 pipes. The largest organ in existence is in Sydney, New South Wales.

There was but slight interest taken in organ construction in the United States until about the middle of the 19th century. The erection of the great organ in the Music Hall, Boston, by a German builder, Walcker of Württemberg, gave the first impetus to public interest in the matter. Roosevelt of New York, and Jardine, likewise of New York, soon became two of the best-known organ-builders in America. Roosevelt invented "the automatic adjustable combination," which enables the player to place any required combination of stops under immediate control, and to alter such combinations at will as desired. By his construction of the wind-chest, also, each pipe has its own valve, actuated by compressed air. Among the largest organs in America are the organs of the Roman Catholic Cathedral, Montreal, the cathedral of the Holy Cross, Boston, which possesses 83 stops; the Music Hall, Cincinnati, with 56 stops and 4 manuals, and the Tremont Temple, Boston, with 65 stops. Consult: Dixon, (Practical Organ Building, 1881); Hinton, 'Organ Construction' (1900).

Organ Mountains, or Serra dos Orgãos, Brazil. See ÓRGÃOS, SERRA DOS.

Organ-Point, or Pedal-Point, a musical term derived from the medieval organicus punctus, and applied to the single tone, usually the tonic or dominant, held or maintained by one of the voice parts, while the other parts move freely, without reference to the sustained tone, except at the beginning and the end of the passage. In modern composition the organ-point is usually in the bass, hence the alternative term pedal-point, the organ pedal being best adapted to sustain the long note. When an organ-point occurs in any other part than the bass, it is said to be inverted, and if in the soprano it is called the "holding-note," this term being also of mediæval conception and the origin of tenor from tenere, to hold, the voice by which the organicus punctus was generally sustained to an effective contrapuntal climax. In many modern compositions, especially pastoreales, a double-organ or pedal-point on both tonic and dominant is frequently used.

Organic Chemistry, the chemistry of the carbon compounds in which the hydrogen or nitrogen of the substance is directly united with carbon. See CARBON COMPOUNDS.

Organo-Metallic Compounds, in chemistry, compound consisting of carbon and a metallic base in combination with a metallic base. The alkyl radicals—methyl, \( \text{CH}_3 \); ethyl, \( \text{C}_2\text{H}_5 \); propyl,
ORGANOTHERAPY

C₄H₇; etc.—are the most familiar examples of organic bases which enter into combinations which combine with them. Zinc-ethyl, Zn(C₂H₇)₂, may be prepared by mixing zinc in a volatile ethyl iodide, C₂H₅I. A non-volatile, crystalline compound having the formula C₂H₅ZnI is formed at first, but under the influence of heat this decomposes into iodide of zinc and zinc-ethyl. As thus prepared, zinc-ethyl is a colorless liquid, which boils at 244°F. When exposed to the air it takes fire spontaneously, burning with a greenish flame. It may be converted, by slow oxidation, into ethylate of zinc, Zn(OCH₃)₂. Three compounds of ethyl and tin are known, and two compounds of ethyl and lead. Boron and silicon form compounds with ethyl, and these, although they contain no metal, are also called organo-metallie bodies. Silicon-ethyl has the formula (C₂H₅)₃Si, and may be prepared by reacting silicon ethyl with silicon tetrachloride. It is a colorless liquid, boiling at 302°F. Several of its derivatives have a considerable theoretic interest, among these being a substance which has the formula C₂H₅N₂. Small doses of this haves, chemically, like an alcohol. Sodium-ethyl has not been isolated in the pure state, but a double compound of this substance and of zinc ethyl has been prepared, having the formula Na₂C₂H₅Zn(C₂H₇)₂.

Organotherapy, the medical use of animal organs or glands, or of their extracts. The use of the extracts of many of the viscera of lower animals for their remedial effects is one of the most remunerative and ancient forms of medical practice. As early as the Arthurian age, the use of animal organs and glands as remedies was well known. The use of these substances was based on the belief that the organs and glands of animals possessed certain therapeutic properties that could be used to treat human ailments. The use of animal organs and glands as remedies was well known. The use of these substances was based on the belief that the organs and glands of animals possessed certain therapeutic properties that could be used to treat human ailments.

The peculiar symptoms that resulted from the taking out of the thyroid gland in men and animals drew attention to this organ and its effects on secretion. The close resemblances of certain diseased persons to man and animals deprived of this gland was noted, and it was soon established that myxœdema and cretinism (q.v.), two hitherto intractable diseases, were really due to diseases of the thyroid function. It was but a step, after finding the cause, to apply the remedy, thyroid extract, and these two previously hopeless incurable diseases became amenable to treatment. At first fresh glands were used; later, extracts; still later, the active principle, called by a variety of names iodothyroin, thryoidin, thyroglobulin, etc. Thyroid extract causes, in addition to its effects in metabolism, a fall of blood-pressure through dilatation of the blood-vessels, and a slight depressing action on the heart in large doses. It also increases the nervous irritability of the heart-muscle by reason of its action on the vagus nerve. Small doses of the drug administered during a considerable period of time cause symptoms comparable to exophthalmic goitre (q.v.). The diseases for which it is used are: Cachexia strumipriva, following surgical removal of the thyroids; goitre of the hyperplastic follicular variety, a form which is associated with diminished formation of thyroid substance; myxœdema, sporadic cretinism; certain obscure skin-diseases, and obesity. It is also used as a general metabolic stimulating. Within a few years an extremely active and powerful substance has been discovered in the suprarenal gland, which has received various names, myxœdema, suprarenin, adrenalin, etc., all of which are closely allied products that represent as nearly as possible the active principle or principles of this gland. This substance in the body is of great importance in maintaining the tension of the blood-vessels, and it also bears some relation to the sugar-oxidizing properties of the liver or pancreas, or both. The effects of adrenalin, used hypodermatically, are immediate. It causes...
ORGANIZE — ORIBE

a marked rise in the blood-pressure, due to its stimulating the mechanism that constricts the blood-vessels; it slows the heart and causes it to beat more strongly; it depresses the breathing centres somewhat, dilates the pupils, and slows down the peristaltic movements of the intestine. In medicine it is extremely useful as a local application to constrict blood-vessels, lessening hemorrhage, reducing inflammation, stopping discharges of the mucous membranes. It is thus particularly valuable in sore throat, running from the nose, inflammation of the eye, hemorrhage from the nose, or from the stomach. It has a decided action in acute forms of diabetes, especially in bronzed diabetes, in rachitis, in spasmodic asthma, and in the treatment of shock of any description, particularly if associated with loss of blood-pressure. The use of the active principle of the suprarenals is only just begun.

In the sexual glands substances rich in nucleins and phosphorus are present. Many of these have received names, but few have been isolated in sufficiently pure form to be useful in therapeutics. Those that are now (1904) available stimulate metabolism, and some are of value for counteracting the undesirable effects of the removal of some of the organs of generation, as in castration or in ovariotomy.

Editor "Journal of Nervous and Mental Disease."

Orgânis. See Silk.

Orgâos, Serra dos, sâr'tâ dôsh òrg-gownsh', or Organ Mountains, Brazil, a portion of the Serra do Mar cordillera, lies northeast of the city of Rio de Janeiro, so called from their resemblance to the pipes of a church organ, as viewed from the sea. The highest peak is 3,800 feet.

Orgaz, òrgâs, Francisco, Cuban poet: b. Havana, Cuba, 1815; d. Madrid, Spain, 1873. He was educated in Havana, entered journalism and in 1839 went to Madrid where he took up his residence. His first volume of poetry, 'Preludios del Arpa' (1841), won for him recognition as one of the best lyrical poets of Spanish-America; he also wrote two dramas and several historical works besides a second volume of verse 'Los Tropicales' (1850).

Orgreat, a flavoring substance much used in medicinal and other drinks. It is essentially a syrup of sweet and bitter almonds, and possesses a rich almond flavor, but it is often modified by the use of other ingredients.

Orgetorix, òr-jêtô-rîks, Helvetian chief: d. about 62 a.C. He was a man of vast wealth and power and intrigued to gain sovereign power, endeavoring to persuade the Helvetii to emigrate to Gaul. His designs were suspected and he was brought to trial, but died, supposedly by his own hand, before a decision was rendered. Consult Cesar's 'Commentaries,' book I.

Orgheeff, Russia, district town in the province of Bessarabia. It is situated about 90 miles north of Kishineff railway station. The ruins of an old Dacian fortress, Petrodava or Orhei, are near the town. It was annexed to Russia in 1812. Pop. 13,356.

Orgies, ór'jîs, or Orgia. See Bacchus.

Orguneth, òr-gi'nëth. See Musical Instruments, Mechanical.

Oria, Italy, a town in the province of Lecce, and the district of Brindisi, on the Brindisi-Taranto Railway, 22 miles west-southwest of Brindisi. The town is built on a hill between two small lakes; it is the site of a bishop and has a cathedral, a medieval townhouse, a library, hospital, and gymnasium. It carries on a trade in wine and oil. Oria was the ancient Greek settlement Uria or Hyria. Pop. 7,100.

Oriana (1). The mistress of Amadis de Gaul, the legendary hero of mediæval chivalry. According to romance she was the daughter of Lisuarte, the English monarch. Queen Elizabeth was often styled "The peerless Oriana" in the complimentary poems of her day. (2) The chief personage in Fletcher's comedy, 'The Wild Goose Chase' (1621), and in Farquhar's comedy 'The Immortal Hour' (1697). (3) A character in Beaumont and Fletcher's play, 'The Woman Hater' (1607). (4) The title of a poem by Tennyson in which the name is introduced as a constant refrain (1890).

Oriana, The Triumphs of, the title of a book of madrigals composed in honor of Queen Elizabeth, which Thomas Morley compiled and printed in 1601.

Oriani, ó-rè-a'nè, Barnaba, Italian astronomer: b. Garegnano, Italy, 1752; d. 1832. He studied astronomy under Lagrange, assisted Reggio and De Cesari in measuring the arc of the meridian and his calculations proved Ceres, which Piazzi discovered in 1801, to be a planet, not a comet as Piazzi had supposed. He was director assistant in Brera Observatory at Milan in 1802, and was editor of the 'Effemeride Astronomiche' in 1778-1830. He was created a count by Napoleon and published: "Tables of Uranus" (1785); "Spherical Trigonometry" (1806); etc.

Oribasius, or-i-bče'shîs, Greek physician to the emperor Julian: b. Pergamon (or Sardis) about 325 A.D.; d. about 400. He studied in Cyprus under Zeno, became attached to Julian during the Oriental exile of the latter, accompanied him to Gaul, and, after his accession in 361, was appointed questor of Constantinople. But after Julian's death, when the Christians again obtained the upper hand, he was banished among the Danubian barbarians. He was recalled during his last years. Oribasius is reputed the discoverer of the salivary glands. Under Julian's direction he summarized the medical lore of the day. A Latin version of the 6th century has been edited by Bussemaker, Daremberg, and Molinier.

Oribe, ó-rè'bâ, Manuel, Uruguayan soldier and politician: b. Montevideo, Uruguay, about 1802; d. there November 1857. When but a boy he entered the patriot army, where through his ability he won high rank; he was minister of war under José F. Rivera in 1833-5, succeeding him in the presidential chair the latter year. Rivera raised a revolt against him in 1837 and finally succeeded in defeating and forcing him to leave the country. Oribe gained
the support of the dictator Rosas, at Buenos Ayres, and in 1842 began the Nine Years' war, intending a foreign subjugation of Uruguay. The intervention of France and Brazil prevented the success of his scheme, and his plan to coronate himself in 1855 was rendered futile by the foreign powers.

**Oriel College**, Oxford, England, founded in 1326 by Edward II, on the suggestion of Adam de Brome, his almoner, for a provost and ten fellows, and first named the College of Saint Mary, its present title being probably derived from La Oriole, the name of the house presented by Edward III., into which they moved two years later. The buildings of Oriel College are among the finest in Oxford. The college now consists of a provost, 12 fellows, and has 10 scholarships, tenable for 5 years, and 4 exhibitions tenable till the end of the twentieth term from matriculation. The value of each of these scholarships and exhibitions (during residence) is 260 per annum. Candidates for these exhibitions must be deserving persons in need of support at the university. No one is eligible to a scholarship who has attained the age of 20 years, or who, being a member of the university, has exceeded two years from his matriculation. The college has presentations to 15 livings. Among its distinguished alumni are Matthew Arnold, Barclay, Butler, Clough, Hampden, Thomas Hughes, Langland, Pryme, Sir Walter Raleigh, Cecil Rhodes, Wilberforce, etc., and several leaders of the Tractarian movement; Arnold, Keble, Newman, Pusey, and Whately.

**Oriel Window**, a bay window of an upper story supported by brackets or corbels. In some cases the support is derived from a pier or engaged column carried from the ground with the upper part corbeled out to meet the floor of the projecting window. Formerly no distinction was made between this and a bay window which rose from the ground.

**Orient, Joseph**, Austrian painter: b. Burbach, Westphalia, 1677; d. Vienna 1737. He studied painting under Paistenberger, and was appointed veterinari of the imperial collection of pictures at Vienna. He painted a large number of landscapes, which were much appreciated in his time, partly on account of an unusually brilliant and refined coloring. Several of his pictures were engraved by Leichsenring and Rosel and became very popular.

**Oriental Region**, one of the primary divisions of the earth considered with reference to its fauna; a zoogeographical province. It embraces the whole of southeastern Asia south of the Himalayan watershed, from Beluchistan to the Philippines and including the Moluccas and archipelago as far as Celebes. It is separated from the Australian region by "Wallace's Line." See ZOO GEOGRAPHY.

**Oriental Research**, the investigation and interpretation of literary remains in the East. **Egypt**—Modern Oriental research commences with the expedition of Napoleon Bonaparte to Egypt in the summer of 1798. This expedition was accompanied by scientists and artists, who published the results of their observations in a great work entitled 'Description de L'Egypte' (1800-13). The antiquities collected by that expedition became the property of the conquering British and formed the foundation of the Egyptian collections in the British Museum. Among these was the famous Rosetta stone. This was a slab of black granite containing a portion of a decree in honor of Ptolemy V. Epiphanes, 205-181 B.C., written in the ancient Egyptian hieroglyphics, the more modern Egyptian demotic script and in Greek. By means of this trilingual inscription the hieroglyphic characters were deciphered by Young in England and Champollion in France, almost at the same time—1821-2, and finally, at a later date, the demotic script was also deciphered. This inscription, therefore, became the key to the interpretation of all Egyptian literature and civilization. The decipherment of the Rosetta stone led to a desire to obtain more inscriptions, and in 1826 a Franco-Italian expedition was sent out, headed by Champollion and Rosellini, to examine the most important ruins of Egypt and copy pictures and inscriptions. The published results of this expedition remain to this day a store-house of material for Egyptologists. In 1840 the Prussian government sent out a similar expedition under Lepsius. Taking advantage of the work already done, Lepsius was able to arrange the monuments discovered in historical order, and to place the study of Egyptian art and civilization on a permanent and scientific basis. The expedition was particularly interested in the question of the relation of Egypt to Bible story, so that in addition to the exploration of Egypt and Ethiopia, the peninsula of Sinai was visited, its ancient copper mines and Egyptian inscriptions dating back to the time of the old empire discovered, and an effort made to trace the route of the Exodus.

The period of extensive excavations commenced in 1850, with the mission of a French scholar, Auguste Mariette. The first and greatest of his discoveries was the Serapeum, or tombs of the sacred Apsis bulls at Memphis, 64 in all. The erection of these tombs extended through the period from 1300 to 50 B.C. Here were found also thousands of memorial stones erected by pious pilgrims, amulets, funeral figures and so forth. In 1857 the Khedive established a museum at Cairo, appointed Mariette director, and gave him authority to conduct excavations where he would in Egyptian terri-
ORYEAL RESEARCH

tory. From this time until his death, in 1880, Mariette exercised the exclusive privilege of excavation in Egypt. His explorations were extensive; he visited all the well-known ruins, and more of the great discoveries of Egyptology were made by him than by any other one man. No systematic report of his excavations as such has ever been published. He was concerned principally in the discovery and recovery of antiquities, a method of excavation which inevitably results in the destruction of a great amount of material archeologically valuable, and his publications concern themselves with the antiquities discovered, not with the method of their discovery. Since his death the direction of antiquities in Egypt has remained in the hands of the French. A careful system of protection and preservation of antiquities and ruins has been introduced, a large new museum constructed (1902), and excavations systematically conducted at numerous sites on behalf of the Egyptian museum.

Reversing the policy of Mariette, permission was given by his successor, G. Maspero (now serving a second time as director of antiquities), to representatives of other nations and to private persons to conduct excavations under reasonable restrictions and to acquire and export antiquities. Taking advantage of this change of policy, the Egypt Exploration Fund was organized in 1883, and has been supported from that day to the present day by funds collected in almost equal parts in England, and America, although the direction has been entirely in the hands of the English contributors. The first work of this Fund was done in the Delta, in the excavation of the biblical store-city of Pithom and the Greek city of Naukratis, since 1891 these excavations have been conducted in upper Egypt. The most famous name connected with the excavations of the Egypt Exploration Fund is that of W. Flinders Petrie. Working at times for the Fund (regularly since 1890) and at times on account of private persons, Petrie has achieved astonishing results, and claims to have carried back Egyptian history to an almost incredibly early period. Certainly he has proved that the first Egyptian dynasty was, a real person, by discovering inscriptions of his reign, and he and others have found remains of a civilization long antedating even this period of Menes. To give young Egyptologists a chance to excavate on their own account, Petrie organized in 1890 the Egyptian Research Account.

The last decade has been one of especial activity in Egyptian exploration, and, even in comparison with the great discoveries of Mariette's time, fertile in results. In those years independent expeditions have been conducted by Swiss, Germans and Americans, among whom may be mentioned Mrs. Hearst; while since 1899 the German "Orient Gesellschaft," organized somewhat after the method of the Egypt Exploration Fund, but covering a larger field, namely, the whole Orient, has conducted systematic excavations at various points.

The objects found in excavations in Egypt are almost incredibly numerous. Besides the magnificent collections in the museum at Cairo, there are important collections of Egyptian antiquities in the British Museum, the Louvre, the Berlin Museum, Turin (here is the famous Papyrus Frisse), and smaller collections in various museums in Switzerland and elsewhere. Besides the monuments and papyri belonging to those periods which we commonly call Egyptian, written in Egyptian characters, there have been found, especially in the last decade, mainly in the Fayum, large numbers of papyrus fragments, containing parts of Greek manuscripts, some like Aristotle's 'Constitution of Athens' and the poems of Bacchylides: others, like the Logia of Jesus, various heretical gospels, apocalypses and the like, of theological value. Great quantities of letters, deeds and documents of various descriptions, written on fragments of papyrus, potsherds and the like, have also revealed with photographic minuteness the every-day life of the people of the Fayum district in the centuries immediately preceding our era. Of late also renewed attention has been paid by explorers to the Christian (Coptic) and Moslem remains with which Egypt abounds, but which earlier generations of explorers and scholars had overlooked.

Assyria and Babylonia.—Assyrio-Babylonian research may be said to begin with the tentative excavations of Rich at Babylon in 1811. Others had before Rich identified the ruins of Babylon and Nineveh, and copies of Babylonian and Persian cuneiform inscriptions had already made their way to Europe, but Rich made the first serious survey of the mounds of Babylon. In America, although the direction has been entirely in the hands of the English contributors, the French government was induced to create, for purposes of investigation, a vice-consulate at Mosul, nearly opposite Nineveh, and Paul Emil Botta was sent out to fill this post; he made some remarkable excavations at Kuyunjik, on the site of ancient Nineveh, Botta was led by the reports of the natives to undertake excavations at Khorsabad, 20 miles to the northeast. Excavations were conducted at this site by Botta from March of 1843 to October of 1844, and by his successor, Victor Place, from 1851 to 1855, at the expense of the French government, which also published the results in monumental form. These results were the systematic and scientific excavation of a palace of Sargon, king of Assyria, 721-705 B.C., which was adorned with a large number of magnificent bas-reliefs and other works of art. The French expedition also discovered a considerable number of inscriptions in the cuneiform script on stone and clay.

Shortly after Botta commenced his work of excavation, Austen Henry Layard visited Mosul on his return from Persia to Constantinople. His enthusiastic report secured for him a small sum of money from Lord Strutt, the British ambassador, with which he returned to Mosul in the autumn of 1845 and commenced excavations on a very small scale at the mounds
ORIENTAL RESEARCH

of Nimroud, on the banks of the Tigris, a few miles below Mosul, the remains of the one-time Assyrian capital city of Calah. With very limited resources but with remarkable success in the discovery of sculptures, bas-reliefs, inscriptions and the like, Layard continued to excavate at Nimroud, Kalah Shergat, the most ancient capital of Assyria, still further to the southward, and at Kuyunjik (Nineveh), until midsummer 1847. In 1849 he was again sent out to Assyria and for almost three years conducted excavations for the British Museum at the sites already mentioned, making one brief and unsatisfactory expedition to Babylonia. The wonderful success which Layard achieved in monumental results, and possibly still more the remarkable ability with which he presented these results in graphic form, connecting them also with the Bible story, aroused an interest which has continued to the present day, and which will forever make the name of Layard illustrious in connection with Assyrian exploration.

In 1851, while Place was excavating at Khorsabad, an admirably equipped expedition, sent out by the French government under the direction of M. F. de Morgan, was exploring Babylonia and conducting tentative excavations at various sites in that region. The material results of this expedition were, unfortunately, lost by the over-turning of a raft on the River Tigris. At the same summer the attention of a Frenchman was called to Babylonia by the work of Loftus, who, sent out as an attaché of the Turco-Persian Frontier Commission, took occasion to explore Babylonia and conduct some small excavations at Warka (Erech). The Assyrian Excavation Fund was organized in 1852, and under the general direction of Sir Henry Rawlinson, excavations were carried on by Loftus, Taylor and Rawlinson himself at various sites in Babylonia, including Erech, Ur, Eredu, Larsa and Borsippa, the sister city of Babylon, and by Hormuzd Rassam at Nineveh. None of these explorers undertook the scientific excavation of sites, but rather sought to recover inscribed material, which, in the form of clay tablets, could be purchased in large quantities, especially Rassam, who, without knowing it, excavated a large part of the library of the Assyrian king, Ashurbanipal (606-626).

From 1855 to 1872 there was a long period of silence as far as the investigations were concerned, the attention of scholars being directed to the study of the numerous inscriptions which had been brought back to England and France, the key to the decipherment of which had just been discovered. As in the case of the Egyptian inscriptions, so here, it was a trilingual inscription which furnished the clue to the decipherment. As early as the commencement of the 19th century various scholars had essayed to read the cuneiform inscriptions brought back from Persepolis and elsewhere, and different scholars succeeded at various times in deciphering a few characters, but not in reading an inscription. On the face of a cliff, in a huge space especially prepared for the purpose, its lowest part some 300 feet above the ground, in the mountain pass at Behistun in Persia, Darius, so tradition said, had caused a long inscription to be engraved. Of this inscription Sir Henry Rawlinson on various occasions, between the years 1835 and 1839, at considerable expense and much risk of life and limb, succeeded in obtaining complete copies. In what languages the inscription was written was unknown, but Rawlinson assumed that the first column was Persian, and the language of the Avesta. It was not until 1846 that he was able to complete and publish the decipherment of this first column, the Persian cuneiform text. The Persian cuneiform proved to be syllabic, an adaptation vastly simplified from the complex Semitic Babylonian of the third column. This third column, the most important text for students of Assyriology, Rawlinson did not succeed in deciphering for five more weary years (1851). The second column, the Median or Susian text, was not satisfactorily deciphered until 1890. The decipherment of these inscriptions was naturally an epoch-making event, and for this as well as for the great service which he rendered in publication (he was the general editor of the Cuneiform Inscriptions of Western Asia, published by the British Museum), Rawlinson's name stands deservedly at the head of the honor list of Assyriology.

In 1872 George Smith, then an employee in the British Museum, published a few fragments of clay tablets brought by Rassam from Nineveh, an Assyrio-Babylonian flood legend, strikingly similar in many respects to the flood story of the Hebrew scriptures. The publication of this story aroused such interest that the Daily Telegraph of London at once put at the disposal of the British Museum a thousand guineas to send Smith to Kuyunjik to search for more fragments. This expedition opened a new era of excavation. In the following year Smith was again sent to Kuyunjik by the British Museum. In 1875 he was sent out for the third time, but died, without accomplishing anything, in 1876. He was a most acute student of the cuneiform texts, but no explorer. Rassam then consented to take up once more the work of excavation for the British Museum. Besides excavating at Nineveh and Calah, he explored in this campaign (1877-82) the hitherto unknown Assyrian site of Balawat, where he found the great stone quadrangle with the inscriptions and relics of Shamanser II, 859-826 B.C. He also conducted excavations at a number of Babylonian sites, Borsippa, Cutha, Sippara and others, from which he secured an almost incredible number of tablets with the inscriptions. His work was conducted, like that of English explorers in general, for the purpose of obtaining inscriptions, with no attempt at a complete and scientific excavation of the sites explored.

At the same time that Rassam resumed his work of excavation, De Sarzec was appointed French consul at Bassorah in southern Babylonia. Led by reports of the natives, he commenced excavations at some ruin mounds in that region, known as Telloh, where he found a quantity of statues dating from the third millennium B.C., executed with remarkable skill in hard diorite and covered for the most part by inscriptions in cuneiform characters, the first monuments of art discovered on the soil of Babylonia. These monuments were purchased at once by the French government for the Louvre Museum, and De Sarzec commenced a systematic exploration of Telloh (Sippar), which was conducted at intervals until the time.
ORIENTAL RESEARCH

of his death, in 1903. The result of these excavations was the discovery of an enormous quantity of inscribed clay tablets belonging to a most remote period, as well as statues, inscribed bronze and silver figures, vases and other objects, showing a remarkable development of art in that region at an extremely early period.

American interest in Babylonian exploration dates from the year 1884, when an expedition headed by Dr. William Hayes Ward, called the Wolfe Expedition, from the fact that the funds were provided by the liberality of Miss Catherine Lorillard Wolfe, of New York, was sent out under the auspices of the Archaeological Institute of America, to examine ruin sites in ancient Babylonia and report on the prospects, scientific and practical, of excavations in that region. In 1887 a somewhat similar German expedition was sent out, which conducted tentative excavations in two burial mounds, Hhiba and Surghul, in southern Babylonia. Both of these expeditions reported favorably on Nuffer, the site of the ancient Nippur, as a place for excavation. In 1888 the Babylonian Exploration Fund was organized in Philadelphia and an expedition was sent out under the auspices of the University of Pennsylvania, with the present writer as director. The site selected for excavation was Nippur. The systematic exploration of this site has been continued, with intermissions down to the present time, under Peters, Haynes and Hilprecht, the last period of actual excavation ceasing in 1900. The main work of the excavation at Nippur has been directed toward the great Temple of Bel, the chief religious centre of that region from a period long antedating 4000 B.C. Some 40,000 or more inscriptions, clay tablets and fragments of clay tablets, stone monuments and the like have thus been recovered, and our knowledge of the history and civilization of Babylonia carried back 2,000 years or more.

The success of the Americans in securing remains of such great antiquity aroused new interest both in England and Germany. In 1891 the English expedition of investigation was sent out by the Germans, and in 1890 the German ‘Orient Gesellschaft’ was organized, and excavations commenced at Babylon under the direction of Dr. Koldewey. From that time until the present the work of systematic excavation has continued at that site, while supplemental excavations have been undertaken at various ruin mounds in Babylonia and Assyria. The interest aroused in America led to the organization in 1900 of the Ur Expedition, through the energy and enthusiasm of Dr. E. J. Banks, and permission was applied for to excavate at Mugheir, the ancient Ur of the Chaldees. For three years this permission was held up by the Turkish government, although during that period similar permission to excavate at various Babylonian sites was freely granted to the Germans. At last in 1903 the Ur Expedition was disbanded. Just at that moment the despatch of American ships to Beirut led unexpectedly to the issuance of the firman which had been so long delayed. Simultaneously a new organization was formed, called the ‘Oriental Exploration Fund’ by the University of Chicago, which accepted the firman in behalf of the Ur Expedition, and in the autumn of 1903 excavations were commenced by the new American expedition at Bismaya, the site of an ancient Babylonian city, supposed to be Isin, not far from the ancient Nippur, under the direction of Dr. Edgar J. Banks. In that same year also the English resumed the work of excavation at Nineveh, so that at the present writing four nations are concerned in the excavations in Babylonia and Assyria. The principal collections of Babylonian-Assyrian antiquities are to be found at London, Paris, Constantinople, Philadelphia and Berlin.

Persia.—Research in Persia is closely connected with research in Babylonia, and it was through the decipherment of the cuneiform inscriptions found in Persia that the key to the decipherment of the Babylonian inscriptions was discovered. Rich visited and described Persepolis as well as Babylon and Nineveh, and other early explorers copied inscriptions there and elsewhere in Persia; but no excavations were conducted until 1851. These first excavations, conducted by the English explorer, Loftus, and Col. Williams, head of the Turco-Persian Frontier Commission, were, however, of very small extent. Thirty years later M. and Mme. Dieulefroy conducted an expedition of a more extensive character at the same place, enriching the Louvre museum in Paris with very many beautiful colored tiles, and published an account of their discoveries in their ‘L’Acropole de Susa’ (1890); but even these excavations were very superficial.

In 1895 the French government concluded a treaty with Persia, by which it received exclusive rights of excavation, and in 1897 M. J. de Morgan, at that time director of antiquities in Egypt, was appointed director of excavations in Persia. Since that date systematic and expensive excavations have been conducted at Susa by M. de Morgan and his associates for the French government, and the results have been published with remarkable promptitude and in admirable form for the student. The explorers have been remarkably successful in discovering a large amount of inscribed material, and recently civilization of Elam in the third millennium B.C. was practically identical with that of Babylonia, from which it was derived. The most important discovery made in the excavations up to this time, and one of the very few discoveries which have come from Orient research, was the discovery in the winter of 1901–2 of a large stele, carried off by the Elamites from Babylonia, containing the code of laws of Hammurabi, king of Babylon, about 2250 B.C., the earliest code of laws by much more than 1,000 years, discovered anywhere up to this time, and one which profoundly influenced the legislation and civilization of all western Asia.

Palestine.—While the keenest interest in Egyptian and Babylonian excavations was aroused by their relation to the Bible, exploration in Palestine, the Bible land proper, commenced at a much later date and has been prosecuted with less energy than the similar work in those regions. The first important work was done by an American, Rev. Dr. Edward Robinson of New York. In 1838 (and again in 1852), accompanied by Eli Smith, an American missionary, he explored the Holy Land, identifying for the first time on
ORIENTAL RESEARCH

rational grounds the greater part of the ancient sites of the country, a work of historical topography. The second move in the exploration was also made by America, the United States government sending out an expedition in 1847 under Lieutenant Lynch of the Navy, to explore the Jordan and the Dead Sea.

It was not, however, until 1865 that an organized effort was made to undertake a scientific and complete examination of the country. In that year the Palestine Exploration Fund was organized in England, and undertaken to explore and map Palestine west of the Jordan, and shortly after a similar organization was formed in America to explore Palestine east of the Jordan. The American society accomplished very little and soon passed out of existence. The English society, which continues in existence to the present time, conducted a thorough survey of the west Jordan territory and made an accurate map of the country, and has published a monumental series of reports dealing with the climate, the fauna, the flora, the antiquities, etc., of the territory surveyed, and latterly also the excavations accomplished.

Excavations were conducted by the Fund at Jerusalem, from 1867 to 1870, under the direction of Sir Charles Warren, which were valuable in determining the topography of the temple area, although almost nothing was found in the way of antiquities. For the next 20 years no systematic work was done in Palestine, although some small surveys were undertaken. In 1878 a German Palestine society was organized on the same plan and with the same objects as the English Exploration Fund. In the employ of this society Dr. Schumacher, of Haffa, an American citizen, has, since 1882, worked and mapped the greater part of the eastern Jordan region; and it may now be said that, so far as the surface is concerned, Palestine has been more thoroughly explored than any Oriental country. So far, however, it has been singularly lacking in important monuments and inscriptions, and such as have been found have been found by the natives or by accident. These are first the inscription of Mesha, a king of Moab in the 9th century B.C., found by a German missionary, Klein, at Dibon, in 1868, and later largely destroyed by the Arabs; secondly, a Hebrew inscription, possibly of the time of King Hezekiah, found in the Siloam tunnel, beneath the hill of Ophel, and dealing with the construction of that tunnel; and thirdly, a Greek barrier inscription from the temple of Herod, found by Clermont-Ganneau in use as a tombstone in an old graveyard in Jerusalem. More important for the history of Palestine, however, than any of these inscriptions found in Palestine itself, was the discovery in 1889 by natives, at Tel el-Amarna in Egypt, of about 300 clay tablets written in the Babylonian cuneiform script, from kings, petty princes and Egyptian representatives in Palestine, northern Syria, Mesopotamia and Babylonia to the Egyptian over-lord, about 1400 B.C. The discovery of these inscriptions made it plain that at that date, antedating the Hebrew conquest, Palestine possessed a civilization largely identical with that of Babylonia, and that writing on clay tablets was practised in that region.

This discovery led to the belief that excavations in Palestinian sites would result in the discovery there of similar inscriptions on clay, and probably also of stone inscriptions like the Mesha monument and the Siloam inscription from the Hebrew period. On behalf of the Palestine Exploration Fund, Petrie, the Egyptian explorer, made a reconnaissance in 1889, and conducted tentative excavations at the mound of Tel el-Hesey, the ancient Lachish, in the extreme western part of Judaea, on the borders of the Philistine plain. In the following year the Palestine Exploration Fund entered upon a systematic campaign of excavation under the direction of Dr. F. J. Bliss of Beirut, an American.

After a short period of work at Lachish, 1890-3, at Jerusalem, 1894-7, where the southern wall of the city was excavated and traced, and from 1898 to 1900 at various sites in the Shephelah, the foot-hills between Judaea and Philistia, including Tel es-Sanis, Hebron, Hezeth, Gath, and Tel Sandahannah, the ancient Marias-sa. At the last named place a Seleucidan city was thoroughly explored. Later, the natives unearthed the necropolis of this city, and in 1902, Dr. Thiersch of Munich working for the Fund, the writer had the good fortune to discover, in that necropolis, elaborately decorated tombs containing Greek inscriptions, belonging to a Sidonian colony settled at Mariassa in the Seleucidan period, the only discovery of this sort yet made on Palestinian soil. In 1902, under the direction of Mr. R. A. S. Macalister, formerly Dr. Bliss' lieutenant, excavations were commenced at the site of the ancient Gezer, which are still in progress. The results of the excavations up to date have been, on the whole, disappointing. They have given us a general insight into the history of the civilization of the country from the prehistoric period onward, but almost no inscribed material has been found and very little which bears directly upon Biblical story. At Gezer the excavators have unearthed a pre-Israelitic, open-air temple or place of worship, consisting of huge stones set up in alignment. At Lachish one inscribed clay tablet was found of the same period as those from Tel el-Amarna; and at Ta'anach, on the plain of Megiddo, four more clay tablets of the same period were discovered by Dr. Sellin of Vienna in the course of excavations conducted by him in 1902.

Following the example of the Palestine Exploration Fund, in 1903 the German Palestine Society, in conjunction with the Oriental Research Society also commenced a campaign of excavation. The site selected for the first work, which is now in progress, was Muteselim and the neighboring Lejjun, presumably the site of the ancient Megiddo of the exiles, of the Hebrew, and Legio of the Roman periods, on the southern edge of the plain of Esdraelon.

In 1900, through the efforts of the late Prof. Thayer of Harvard, an American Oriental School, similar to the school of archaeology at Rome and Athens, was established at Jerusalem, to give American students an opportunity for study and research in the Holy Land itself, and to secure continuous and systematic inves-
tigation, and in 1903 a similar German institution was also established at Jerusalem.

Outside of Palestine, excavations were conducted at various points on the Phoenician coast in 1860 and 1861 by a French expedition under the direction of Renan, without important results. In 1888 native stonecutters at Sidon discovered the so-called Alexander sarcophagi, which, with the sarcophagus of a Sidonian king, Tabnith, were excavated by Hamdy Bey and carried to Constantinople. These Sidon sarcophagi rank among the art treasures of the world. In 1901–2 a Phoenician temple was excavated at Sidon for the Turkish government by Macridi Bey. Through the interest in Oriental archaeology aroused in the German emperor by his visit to the East, a German expedition was sent out in 1901 to explore and restore the ruins of the temples at Baalbek. At the same time the Sultan presented to the Kaiser the small but remarkable ruins at Meshettia in Moab, and in 1903, under the direction of Dr. Schumacher, these were removed bodily to Berlin to adorn the New Friedrich Museum.

In northern Syria, which abounds in ruins, but upon which no excavations have been conducted as yet. Some very superficial work was done at Carchemish (Jerabis), the ancient Hittite capital on the Euphrates, by the English about 30 years ago, and in 1887 the Germans conducted a systematic excavation at the mound of Sinjirli, northward of Aleppo, which resulted in the discovery of Aramean and Hittite inscriptions and sculptures, in the 8th and 9th centuries B.C.; but for practical purposes this region is still virgin to the excavator. The surface antiquities of northern Syria southward to the Hauran were explored, inscriptions collected and the like about 40 years ago by two French scholars, de Vogüé and Waddington, and various scholars have visited and described the Palmyrene region. The latest and most complete work in the surface exploration of Syria is that done by the American Archaeological Expedition to Syria in 1890–92, under the direction of Howard Crosby Butler.

Asia Minor.—The only excavations so far conducted in Asia Minor have been those at points along the coast. The famous excavations of Schliemann at Hisarlik, the site of ancient Troy, and our first glimpses of the civilization of the Mycenean period, and showed us the existence of long eras of city building preceding even the 15th century B.C. Excavations at Pergamos, Assos and Ephesus, with smaller excavations at Cyzicus, Halicarnassus, etc., conducted by English, Germans, Americans, and Austrians, have revealed remains of the later Greek and Graeco-Roman periods. No excavation has been as yet conducted in the interior, but various travelers have explored the country for inscriptions and surface antiquities. Besides Greek and Latin inscriptions of the Christian and classical period, there have been found, cut on the rocks, rude figures and hieroglyphic inscriptions, belonging to an earlier civilization, the so-called Hittite, dating back perhaps as early in some cases as the 13th or 14th century B.C. These remains have been discovered all over Asia Minor, from the Mediterranean on the east to Armenia on the west and from a point a little south of the Black Sea on the north, far into Syria on the south. The inscriptions have not yet been satisfactorily deciphered, and the language and affinity of the people who used them are not yet known, but from information derived from Babylonian and Egyptian sources we are able to fix the approximate date of the Hittites, to whom they seem to have belonged, from the 13th or 14th to the 8th century B.C. From the distribution of the inscriptions it would seem that the centre of this civilization in the time of its flower was Cappadocia or Cilicia. From Cappadocia there have also been brought since 1865 a considerable number of clay tablets with cuneiform inscriptions, some of which are at Philadelphia but the larger part in Saint Petersburg. These show the influence of Babylonian civilization and culture in Asia Minor. Further eastward, through Armenia, inscriptions have been found in cuneiform characters, cut in the rock, partly in the Assyrian language and partly in the native language of the country, which have now been deciphered, giving evidence of the existence of powerful kingdoms in that region in the 10th and following centuries, rivals of the Assyrian power.

Arabia.—Up to the present time no work of excavation has been done in Arabia. Various travelers have explored and mapped the country, from the time of the Danish Niebuhr (1761-4) onward. These include Burckhardt (1814-16), Burton (1853, 1857-9), Palgrave (1880). These travelers explored the country, visited Mecca and studied Arabic life and habits, but did little in the way of collecting or copying inscriptions. This was done principally by Halevy (1870-1), Doughty (1872-8) and Glaser (1883-94) in the south and Euting and Huber (1883-4) in the north. These explorations were conducted under the greatest difficulties. Halevy traveled as a poor Jew, Doughty lived as a Bedouin, others professed Islam to accomplish their purpose, some, like Huber, lost their lives at the hands of fanatical natives. The inscriptions collected by Euting in northern Arabia show us the Arameans, still inhabiting that region in the 6th century B.C. The inscriptions from Arabia reveal the existence there as early as 1000 B.C. of civilized peoples using alphabets derived from the so-called Phoenician alphabet. We are able to trace the successions and names of certain generations of the conquerors and the way the political and religious practices of the Arabs. Beyond this research in Arabian antiquities has not proceeded up to the present time.

General Results.—The general results of oriental research in Egypt and western Asia, covering in all a period of somewhat more than a century, have enabled us to trace the history and development of civilization from about 3000 B.C. onward. At about that date, research has now shown, there existed independent centres of civilization in Egypt and Babylonia, and those countries were at that time occupied by city-building and civilized peoples. By 900 B.C. a conventionalized script had been developed out of picture writing, independently in each of these countries, and the civilization of each region had assumed those definite types which we know respectively as Egyptian and Babylonian. From this point on we have in both cases written records, but no well determined system of chronology until a much later date. The civilization of Egypt, while attaining in the matter
As to the dark ages of the Christian era we owe two great discoveries, one material and the other spiritual, which largely changed the character of the succeeding civilization, namely, gunpowder and the printing-press, so to these dark ages of the earlier time we owe the discovery of iron, or perhaps its adaptation to practical use, and the invention of a real alphabet, the so-called Phoenician alphabet. These two discoveries conditioned the new civilization which came into being at about 1000 B.C. and which found its highest development to the westward in Greece and Rome from 500 B.C. onward.

ORIENTAL SOCIETY — ORIENTATION

Orientation, the adjustment and maintenance of itself by an organism in its proper position toward its environment; the acts of perceiving, assuming, and controlling its normal attitude and movements in reference to gravitation, direction, equilibrium, and other requirements of its relations to space. The ability to keep right side up, to face or move in a determined direction, to place one's self as a whole in any desired attitude, to bring the various parts of the body into definite relations with other parts, to maintain equilibrium, and constantly to control and utilize this power, are the elements of the faculty of orientation, which seems in some degree necessary to every living thing, and whose phenomena in their higher manifestations surpass present human powers of explanation.

The faculty is essentially a mental perception of a necessity for a muscular act; but so incessant and habitual is it, at least in animals possessing the power of moving, that its exercise is ordinarily unconscious, and belongs to the realm of automatic reflexes, or at least to that of subliminal consciousness.

The proof of this appears in the partial inability of young animals, notably of the higher classes, to adjust themselves to their surroundings. Babies have to acquire a knowledge of relative direction, distance, and proportion by slow degrees. So simple a matter as bringing the hand to the mouth must be learned; the first difficulty in learning to walk is to acquire the power of maintaining equilibrium; and this must be acquired anew when a grown person attempts some novel method of locomotion, as skating or the riding of the bicycle. Proof appears also in the loss or destruction of the power of orientation which follows the disarrangement of the brain or nervous system by certain drugs or diseases. A symptom of intoxication is staggering, and when the intoxication is excessive, the patient cannot stand or to use the limbs definitely disappears—the power of coordination is lost. Forms of insanity have as a symptom a characteristic of disease locomotor ataxia is that it deprives its victim of the power of control of equilibrium (q.v.) and of the muscles used in walking; it is not muscular weakness but disorganization of the power of coordination. If the affected person is able to walk at all he finds it impossible to turn without falling; or when he moves will start off at right angles to the course he intended to take. A similar defect of power accompanies great sleepiness—our heads droop and we totter and progress lamely until well aroused. Persons walking in the dark, with nothing to guide them but the touch of the feet upon the floor, find it hard to walk straightly or firmly. Orientation, then, that is the power to maintain a relative attitude to comprehend direction, and to control locomotion, depends originally upon sensation and experience, combining many factors, both psychical and physiological, often not easily separable.

At the basis lies the faculty for equilibrium, the ability to feel and to keep one's self right side up. It is a notable fact that animals stricken with death when free to turn, as are those in the water, turn upon their backs—the part of the body that in life is kept away from the ground. This is a matter of gravity—the dorsal half of the body is lighter, the ventral heavier. How do such creatures as fishes and low marine animals know how to resist this inclination in life, and hold themselves in the opposite or whatever may be their normal attitude toward the plane of the horizon? The only explanation is that they possess a sense of equilibrium which is supposed to reside primarily in certain organs, whose office is supplemented by various sensations, as of feeling, sight, and hearing, the influence of each varying in proportion according to the degree of nervous organization of the animal, its structure, size, shape, the medium in which it operates, etc. In the case of man and the animals nearest to him, balance is maintained by constant muscular response—in large part unconsciously, of course—to the waverings of suggestions of pressure upon the soles of the feet or upon the bones and flesh of this side of the body or that, as the weight is shifted; to suggestions from the eyes in view of fixed points, or from the inner ear, which vary in intensity, or even from the interior of the body, where organs or contained fluids report movements which must be corrected to restore the centre of gravity. The broad examples of this, which are matters of commonplace experience, such as the leaning away from a weight carried in one hand, or the outstretching of an arm to counteract a slip of the foot, or the swerving outward when rounding a curve at a rapid pace, are only large illustrations of the minute adjustments which go on incessantly in maintaining the equilibrium of animals. Underlying these adjustments, however, is the faculty, before alluded to, of perceiving when the body is in equilibrium, and this is believed to reside especially in certain organs represented in man by the labyrinth of the ear, and in the lower animals by the homologues of this structure. These are sufficiently described and illustrated in the article Labyrinth, and consist essentially of some movable sphere at the end of an flexible tube, which, by its change of place as the body moves, informs the mind of the direction and degree of the departure from a state of equilibrium. Prominent among these special organs are those of the lateral line in fishes (Lateralline Organs), whose perceptions of vibrations make them akin to organs of hearing; but the higher purpose of which is believed to be equilibrative. With these and similar organs in the lower ranks of animals the complicated labyrinth of the ear in the higher vertebrates and in man is allied by descent; and unquestionably the semicircular canals are the seat of our perception or sense of levellness, change of direction, relative position, acceleration of movement, rotation and motion, and all the rest. The orientation of the body thus depends primarily upon the index furnished by the inner organs of the ear.

Whether this is to be regarded as a *sixth sense,* as it is often styled, is by no means clear; but some of the manifestations of the power of animals and some men to perceive, take, and keep a course in the entire absence of anything in the way of guidance visible to human understanding transcends our present comprehension at present. The extraordinary faculty which savages have inherited from primitive men of
ORIFLAMME—ORIGINAL SIN

finding their way through extensive forests or over wide plains that present no landmarks cannot be explained by the men themselves—they say they feel that the direction they follow is the right one, and become uneasy when they deviate from it. A similar explanation will alone account for the unerring manner in which birds migrate across hundreds of miles of open ocean to some island or point of coast annually revisited.

The literature of the subject is mainly French and German, the latest summary being Hartmann, ‘Die Orientierung’ (Leipsic 1902); and Loeb, ‘Comparative Physiology of the Brain’ (New York 1902).

Oriflammé, the former royal standard of France, originally the church banner of the Romans, and the azure, the banner of which the two colors formed the abbot to the lord protector of the convent whenever it was necessary to take up arms for the preservation of its rights and possessions. It was a piece of red taffeta fixed on a golden staff, crowned with a banner, and suspended by four points, each of which was adorned with a tassel of green silk. When Philip I. afterward unified Vexin to the possessions of the crown, it fell to him to bear the banner as protector of the abbot and his church. But he was eventually the great standard of the kingdom. Since the time of Charles VII. it has never been carried into battle.

Origen, ōr-chē-jẽn, ecclesiastical writer, named ADAMANTUS: b. Alexandria 185; d. Tyre 254. He was early instructed by his father in the Christian religion. His teachers were Clement of Alexandria and Ammonius. In his early youth he gave proofs of greatness of soul. When his father was thrown into prison during the persecution of Severus, Origen exhorted him to die rather than apostatize. After the martyrdom of his father in 202 he maintained his mother and sister by giving instructions in grammar. At 18 he was appointed to instruct the believers in Alexandria. Males and females crowded to his lectures. To escape calumny he mutilated himself, thinking the act justified by the New Testament, though afterward he expressed sorrow for the act. After the death of Severus (211) Origen went to Rome, where he gained friends and admirers, and subsequently, at the request of Bishop Demetrius continued his instructions at Alexandria. A popular tumult compelled him to flee to Palestine. He was permitted by the bishops to preach there in their assemblies. On his way to Cesarea, in Palestine, he was ordained presbyter by the bishops who were there assembled. This laid the foundations for the persecutions which embittered the remainder of his life. Demetrius maintained that he alone had the right to ordain Origen. He deprived Origen of his priestly office, prohibited him from teaching in Alexandria, whither he had returned, banished and excommunicated him. This sentence was confirmed at Rome and by most of the other bishops. But the Churches of Greece and Asia sustained Origen, who denied that he was guilty of the errors on which he was accused. In the year 231 Demetrius died, and Origen enjoyed tranquillity. The persecution under Maximin forced him to remain for two years in concealment. When peace was restored to the Church in 237, he took advantage of it to travel to Athens. He then went to Arabia to refute Bishop Beryllus, who affirmed that the divine nature of Christ did not exist before his human nature. Beryllus recanted, and thanked Origen for his instructions. In the Decian persecution Origen was thrown into prison, and subjected to the extreme sufferings, from whose severity he died. Few authors have written so much as Origen; few men have been attacked with such virulence, both during his life and after his death. He was reproached with blending the Christian doctrines with Platonism, particularly in his book, ‘De Principiis’; but he gives his opinions only as a possibility; moreover, ‘heretics,’ he says, ‘corrupted his writings.’ He has been accused, without reason, of favoring materialism. Of his works, besides the one just mentioned, there are extant only ‘Exhortation to Martyrdom,’ commentaries, homilies, and scholia on the Holy Scriptures, nothing more of which we have than free translations. His ethical talent is shown in his ‘Hexapla,’ of which an edition was published by Montfaucon, and afterward by F. Field (1875). In 1866 further portions of the ‘Hexapla’ were found at Milan. His work against Pelus is the most complete and trustworthy of antiquity of which antiquity can boast. His works were edited by Lommatsch in 25 volumes. Consult: Möller, ‘Geschichte der Kosmologie der Griechischen Kirche bis auf Origines’ (1866); Thomasius, ‘Origines’ (2 vols.); Frepel, ‘Origene’ (1868); Farrar, ‘Lives of the Fathers’ (1886); Fairweather, ‘Origen and Greek Patristic Theology’ (1901).

Origin of Species. See D ARWINIAN THE ORY.

Original Package, a term used in American Inter-State Commerce, arising from certain decisions of the United States Supreme Court, and having to do with the packages in which goods are shipped. In 1890 the Supreme Court, in the case of Leisy & Company v. Hardin, held that the plaintiffs, brewers in Illinois, had the right to bring beer into Iowa and sell it, provided the original packages, regardless of the Iowa prohibitory law. Their decision rested on the right of Congress to have exclusive control of interstate commerce. Congress passed an act, known as the Wilson Law, 8 Aug. 1906, giving the State control of the liquors so imported, though in the original packages.

Original Sin, the sin which all the descendants of Adam inherit from their first progenitor. The doctrine of Original Sin is a first postulate of Christianity in the scheme of man’s redemption by Christ. The first explicit statement is to be found in Saint Paul (Rom. v. 12 et seq.) : ‘As through one man sin came into the world, and death by sin, and so death penetrated to all men, because all sinned in the spirit of St. Paul’s statement, that all mankind fell in Adam, and that through this sin death entered into the world, the will became weakened, reason obscured, and concupiscence disordercd. There is also little to be gathered
from the Latin Fathers of the ante-Nicene Age, for the doctrine had not become the subject of controversy, and so awakened but slight theological discussion or formulation. Wherever mentioned by them, the prevailing idea at bottom was the Pauline doctrine of the fall of the human race in Adam, with its dire consequences, which are to be remedied only by the grace and merits of Christ.

Saint Augustine (q.v.) was the first Latin Father to treat it systematically and extensively in his controversy with Pelagius in relation to grace, free-will, predestination, etc. His teaching is succinctly stated in the following passage: "He (Adam), exiled after sin, bound his offspring also, which by sinning he had corrupted, as it were, in the root, under the penalty of death and condemnation, so that all progeny born of himself and his wife should draw to itself original sin, and thence be drawn through diverse errors and pains to that last and endless torture with the angels, who deserted and corrupted (others), and with them were put to death and share in the portion." (Enchirid. ch. 10). Saint Augustine's exposition of the doctrine exercised a great and lasting influence throughout the subsequent centuries, and has been, in its broader outlines, followed by the theologians of the Middle Ages. A more definite and scientific formulation grew up with the development of the stricter methods of scholastic philosophy, which reached its complete expansion in the 13th century. Saint Thomas Aquinas (q.v.), the greatest theologian of his school, explicitly declares that the essence of original sin consists in the "privation of original justice," understanding by original justice that state in which Adam was created and lived prior to the fall, with all the graces which God had bestowed upon him with the view to his supernatural end in ultimate possession of the Divine Vision. All this Adam forfeited when he fell, and that forfeiture passed by natural generation to all his descendants. In this view original sin is not a positive evil added to human nature, but the deprivation of a supernatural good originally bestowed upon the race in the headship of Adam. Following this original loss, as a penalty of Adam's transgression, came the dire consequences of sin, viz., the confusion and disorder of all the human faculties, and the sting of concupiscence. This is the accepted teaching of the Roman Catholic Church, and the Council of Trent defines as of faith, that Adam lost original justice, not only for himself, but also for us; that he "poured sin, which is the death of the soul, into the whole human race," and that this sin comes, not by imitation of Adam's transgression, but by propagation from him.

The reformers of the 16th century generally held to a very strict interpretation of the Augustinian view, and regarded original sin as a complete corruption of the will and reason. Luther held that it consisted in concupiscence. The Lutheran and the Reformed Churches both held similar views regarding original sin, following Calvin rather than Zwingli, who looked upon it as an evil or disease, and only as a sin when a commandment was thereby transgressed. The Arminians and Socinians, on the other hand, discountenanced the ecclesiastical view of the doctrine. While the Protestant Church maintained that Jesus alone was absolutely free from original sin, the Roman Catholic Church exempts the Virgin Mary from its dominion. Uniform adhesion to the Augustinian dogma on the part of the reformers was by no means the case. From Luther's dispute with Erasmus, who would only admit a weakness of the free-will and not its destruction, up to the present time the doctrine has been variously defended and attacked, philosophers as well as theologians taking part in the controversy. Kant showed the moral signification of the doctrine, and represented original sin as an inherent tendency in man's nature to evil. Rationalism, on the other hand, taught with Pelagius that it was only a weakness of man's nature with regard to knowledge and his power for good. According to Hegel original sin is nothing else than the necessary finitude and limitation of our nature. In recent times orthodox theologians, such as Olshausen, Hengstenberg, and others, have stood up for the Augustinian doctrine, while those of the liberal school have modified it in various ways. Consult: Müller, "Christliche Lehrre von der Sünde" (1888); J. Thumm, "Christliche Sünde" (1897); Hodge, "Systematic Theology" (1871); Landis, "The Doctrine of Original Sin" (1885).

Original, the moose (q.v.), so called among the French-speaking people of eastern Canada.

Orilla, ór'il-l'a, Canada, a town and port of entry of Simcoe County, Ontario, at the head of Lake Couchiching, 64 miles north of the Grand Trunk railway. Owing to the beauty of its surroundings and other attractions, it has become a favorite summer resort. It has steamboat communication with other points of the lake and on Lake Simcoe, connected with Lake Couchiching by a narrow strait. The United States is represented by a consul. Pop. (1901) 4,907.

Orinoco, ór-nó'kó, Venezuela, one of the three great South American rivers, rising in the Sierra Parima, on the Brazilian frontier, near lat. 3° 40' N., lon. 64° W., and after a winding course of over 1,500 miles, during which it forms part of the boundary with Colombia, flowing into the Atlantic through a many-mouthed delta between lon. 60° 20' and 62° 30' W., opposite the island of Trinidad. The area of the drainage basin is estimated at 306,600 square miles. Its exact sources were not discovered until 1886. It flows at first west by north, a mountain stream, as far as lon. 67° W. A little below Esmeralda, in lon. 65° 50' W., it divides and sends off to the south, the Cassiquiare, a natural canal 180 miles long with a rapid trend to the Rio Negro, a tributary of the Amazon. The Orinoco and Amazon are also connected by the Pimichim stream and the Terni branch of the Atabapo, an affluent of the Orinoco. Other important tributaries are the Guaviare, the Meta, Apure, Arauca, Gauja, and Caroni. Two remarkable rapids occur in the upper parts of the Orinoco, called the Atures and Maypures, the one in lat. 5° 8' N., the other about 36 miles lower down. These rapids consist of a countless number of little cascades succeeding each other like steps, and, where numerous, islands and
Original, the moose (q.v.), so called among the French-speaking people of eastern Canada.

Orinoco, ñrinokó, Venezuela, one of the three great South American rivers, rising in the Sierra Parima, on the Brazilian frontier, in lat. 3° 40' N., long. 64° W., and after a windleg course of over 1,500 miles, during which it flows part of the time in the Brazil of its main current, it flows into the Atlantic through a many-mouthed delta between long. 66° 20' and 62° 30' W., one hundred and of Trinidad. The area of the deltaic plain is estimated at 30,600 square miles. No exact sources were not discovered until the Río Negro, a tributary of the Amazon, joins the Orinoco and Amazon are also connected by the Amazonian stream and the Tero branch of the Gua catapu, an affluent of the Orinoco. Other important tributaries are the Guairi, the Arapu, the Aragua, the Caura, and the Caron. Remarkable rapids occur in the upper portion of the Orinoco, called the Atures and Maporos, the one in lat. 5° 8' N., the other about 50 miles lower down. These rapids consist of a series of little cascades, which look like steps, and, where numerous, is called

On the other hand, the doctrine of the Trinity and the Second Commandment, as an example of the doctrine of personal religion, on the one hand, and of God's nature with regard to knowledge, love, and power for good. According to St. Thomas, it is nothing else than the necessity, the cause, and action of our nature. In recent times, some theologians, such as Oehler, have stood up for a Christian doctrine, while others, such as Hodge and others, have modified it in various ways. Cf. Müller, "Christliche Lehre von der Seele," Comm., "Christliche Lehre," Hodge, "Systematic Theology," 3rd ed., Liard, "The Doctrine of Original Sin."
ORIOLE—ORISKANY STAGE

rocks so restrict the bed of the river that out of a breadth of 8,000 feet there only remains an average channel of 400 feet. From these rapids the river is navigable to its mouth, a distance of about 870 miles.

At 600 miles from the ocean it is from 5,000 to 6,000 yards wide; at Angostura or Ciudad Bolivar, 370 miles from its mouth, 7,500 yards; and in March 65 fathoms deep. About 120 miles from the Atlantic its delta of 8,500 square miles begins. Of the numerous mouths which reach the ocean over 165 miles of coast line, only seven are navigable. They are buoyed up by ocean-going vessels, which penetrate up to Ciudad Bolivar (Angostura), is the Boca de Navios, varying in width from 3% to 23 miles. Most of the larger affluent are also navigable for considerable distances, the Meta, for instance, to within 60 miles of Bogotá, the capital of Colombia. As a rule the river floods the districts adjoining its banks from May to January, the country under water sometimes measuring 100 miles across. The magnificence of the scenery on the banks of the Orinoco is beyond description. Forests of great extent are filled with aromatic trees; birds of beautiful plumage are common, and hordes of monkeys dispense themselves among the branches. Beyond these forests enormous plains extend their verdant surfaces farther than the eye can reach. The whole course of the river is in Venezuela.

O'riole, any of certain passerine birds, distinguished by the predominance of a golden hue in their colors. The orioles of the Old and New World have a very distinctly marked black and yellow tinge, and cowsbirds, the family Icteridae, of which they are often considered to form a subfamily (Icterinae), and which is related on the one hand, through the meadow-larks, to the starlings (Sturnidae) of Europe, and on the other, through the bobolink, to the finches (Fringillidae). From the other members of the family the orioles may be distinguished by the slender, acute, slightly decurved bill, weak feet, and strongly contrasting black with yellow, golden or reddish colors of the males, and the usually plainer females. Practically all of the 40 or so species of American orioles belong to the typical genus Icterus whose species abound in tropical America, where they are called troupials. Within the limits of the United States seven species occur, but three of these are really Mexican birds which wander over our southwestern border, and another is a rare straggler from South America. Several of the tropical species are imported as cage-birds. The Baltimore oriole, golden robin or hangnest (I. galbula), the male of which bears the rich golden and black colors of Lord Baltimore's livery, is one of the best known and most conspicuous migratory birds of the east. It occupies the entire territory east of the Rocky Mountains, and northward into Canada, and in winter migrates to Central and South America. From the Rocky Mountains to the Pacific it is replaced by the closely related I. bullocki. The Baltimore oriole is noted alike for its great beauty, its vivaciousness, its clear, loud whistle constantly repeated in May and June, and its skillfully woven, pensile nest, formed of grasses and fibres and suspended from the endmost twigs of high branches, often of elm and sycamore trees.

The orchard oriole (I. spurius) has a similar range somewhat curtailed northward and westward. It is a smaller bird, and the adult male is black and reddish chestnut, but assumes these colors only when three years old; the young male resembles the female in being dull yellow, but in the second year has a black face and throat. In habits it generally resembles the Baltimore oriole, but is preeminently a denizen of orchards, and its song, nest and eggs all present specific differences.

The orioles of Europe and of the Old World generally, except Africa, belong to the family Oriolidae, which is related to the birds-of-Paradise. The best known species is the golden oriole, which has a stout bill and bright yellow plumage with black wings and tail. Like our orioles it constructs a hanging nest. Certain species of orioles of the genus Mima, inhabiting islands of the Marajó Archipelago, so exactly resemble associated species of friar-bird (Philemon) that Wallace considers them to be true mimics.

Consult American and European Ornithologies generally; Jordan, 'Birds of India' (1862); Wallace, 'Tropical Nature' (1878).

Orión, ó-ré-ón', Philippines, a pueblo of the province of Bataán, Luzon, situated near the west shore of Manila Bay, five miles south of Balango. It is on the principal road of the province. Pop. 1,370.

Orion, ó-ri-'on, (1) in astronomy, one of Ptolemy's constellations and the most marked in the heavens. It is divided by the equator into two nearly equal portions. When all its bright stars are known, many of the surrounding ones may readily be found by alignments; (2) in Greek mythology, a heroic youth, son of Hyrieus of Hyria. Eos became enamored of him. The gods were jealous of her love, and Artemis slew him with her arrows in the Island of Ortygia. He was of such gigantic size that when standing in the middle of the sea the water only reached his shoulders. According to another legend, he died of the sting of a scorpion.

Oriskany, ó-ris-ká-nil, Battle of, in American history, an engagement between the British and Indians and the American forces, near Oriskany, N. Y., 10 miles from Fort Stanwix, 6 Aug. 1777. The opposing forces each numbered about 800 men. The Americans, under General Herkimer, started to relieve Fort Stanwix, which was besieged by Saint Leger, Brant and his Indians. At Oriskany he halted and attempted to concert an attack and a sortie. The plan miscarried. Herkimer advanced and was attacked by the Indians and Tories in a deep ravine. The battle raged furiously for hours, despite a terrific thunderstorm, and was one of the most cruel and bloody of the Revolutionary War. Each side lost a third of its number. The Americans remained masters of the field, although badly disabled. The sortie from the fort was a success, and badly crippled the enemy. Gen. Herkimer was mortally wounded in the battle and died several days later.

Oriskany Stage, in geology, the lowest group of the Devonian system, so called from Oriskany Falls, N. Y., northeast of Utica, and
apparently the northern limit of the stage in New York, the name being due to the New York Geological Survey. In Maine it is several thousand feet thick, but is much thinner in western New Jersey, eastern Pennsylvania, Maryland, of Puebla and Vera Cruz. It is also occurs in Ontario, and crops out in southern Illinois. Its rocks are calcareous sandstone or arenaceous limestone, containing a few fossils such as crinoids, cystoids, brachiopods, gastropods, and trilobites. Iron ore is found in the rocks of this stage in Virginia.

Orizaba, ör-ré-sābā, Mexico, a town of Vera Cruz, the former capital of the state, 70 miles by rail southwest of Vera Cruz, and 180 miles southeast of Mexico. It is situated at an elevation of 4,030 feet above sea-level in a fertile garden country surrounded by mountains, chief of which is the volcanic Orizaba (q.v.), 25 miles to the northwest. It is a rapidly-improving trade centre; tobacco grown in the neighborhood is extensively manufactured, and there are also cotton factories, flour and paper-mills, and railway shops. Orizaba occupies the site of the Nahua town, Ahanializapan, signifying "pleasant waters." Pop. (1895) 31,512.

Orizaba, Mexico, a volcanic peak, 60 miles west of Vera Cruz, on the boundary between the states of Puebla and Vera Cruz. It was called by the ancient Mexicans Citlaltipetl, or Mountain of the Star (from citlal, star, and tepetl, mountain), probably from the circumstance that when in a state of eruption the flame at its summit appeared, when seen from a distance, like an immense star on the verge of the horizon. It has an altitude of 18,200 feet, and is the first land visible on approaching the coast in the direction of Vera Cruz. Its most considerable eruptions known to history took place between 1545 and 1566. In common with the other great volcanoes of Mexico, Popocatepetl, Tuxtla, Jorullo, and Colima, it seems to have lost most of its activity, and to be in a state of repose. The form of Orizaba is that of an exact cone, truncated at its summit. From the forest line of 13,500 feet its top is covered with eternal snow, and the sides are so steep as to be very difficult of ascent. The first ascent on record was made in 1838 by Lieutenants Tabol and Maynard of the United States Army.

Orkney (örk'n) Islands, Scotland, an archipelago forming a single county, separated from the northern coast of Caithness, by the Pentland Firth, from six to eight miles broad. There are in all about thirteen islands of considerable size, with a number of smaller dispersed over the archipelago. They extend from lat. 58° 42' to 59° 23' N.; lon. 2° 22' and 3° 25' W.; aggregate area, 390 square miles, or 245,656 acres, of which about 107,000 are under culture. The larger islands are Pomeroy or Mainland, Hoy, South and North Ronaldsay, Westray, Sanday, Eday, Stronsay, Ronsay, and Shapinsay. Of the whole about 28 are usually inhabited, although five or six do not contain a dozen inhabitants each. Hoy is the only island of the group that can be called mountainous, and here the highest elevation is but 1,000 feet. With the exception of a granitic district near Stromness, the islands are of old red sandstone, and peat-moss; in many places marl, and in some bog-iron ore. There are no streams deserving the name of rivers, but springs of good water are abundant; and there are many lakes, the largest of which, Stennis, in Mainland, is 14 miles in circumference. Chalybeate springs are not uncommon. The climate is moist, but not cold, being tempered by the Gulf Stream that sweeps around the shores. In winter storms of sleet and rain are frequent, but in summer the weather is generally fine and steady. Oats, turnips, and hay are the chief crops, and 100,000 acres of land are devoted to permanent pasture. The common breeds of sheep, cattle, and horses were small, but since the introduction of good stock from the south, have become large and valuable. Rabbits and poultry are numerous. The herring and cod fisheries compensate in some parts the absence or defective development of other resources, and large numbers of lobsters are annually sent to London. The principal manufactures are hosiery, made by the females, and the building of boats, making of sails, nets, and cordage. The chief town is Kirkwall, which has regular steam communication with Aberdeen and Leith.

As the Orcades mention is made of the islands by several ancient geographers and classical writers, Ptolemy, Pliny the Elder, Mela, Solinus and others; the prehistoric monuments include the Stennis monoliths, the Moshowe tumulus, and a Pictish fort. It is probable that the Picts possessed the islands until the subversion of the Pictish kingdom in Scotland by Kenneth II. In 1099 they were assigned by King Donald Bane to the king of Norway and remained in possession of the Norwegians until the middle of the 13th century, when Magnus, king of Norway, transferred them to Alexander, king of Scotland. The inhabitants are to a considerable extent of Scandinavian blood. Pop. (1901) 26,998.

Consult: Tudor, 'The Orkneys and Shetland' (1883); Wallace, 'The Isles of Orkney' (1884).

Orlando, ör-lân'dō, Florida, city, county-seat of Orange County; on railroads owned by the Seaboard Air Line Railway Company and the Plant System, about 100 miles south by west of Saint Augustine. It is in a fruit growing region and its principal industries are connected with the marketing of the fruit of the surrounding country. It is a favorite winter resort on account of its climate. Pop. (1890) 2,856; (1900) 2,481.

Orlando Furioso, ör-lân'dō foo-rĕ-sô' (Italian, 'Orlando Mad,' or "Mad Roland"), a romantic poem by Ariosto, of which 40 cantos were published in 1516, and to which the author added six more, the whole poem being published in 1532. It is a continuation of Orlando Innamorato? ('Orlando in Love?'), and is a somewhat ironical romance of chivalry. See ARIOSTO, LUDOVICO; BOIARDO, MATTEO MARIA.

Orlando Innamorato, ön nā-mō-ră'tō (Italian, 'Orlando in Love'), a poetical romance by Matteo Maria Boiardo (q.v.), the subject of which is the love of Orlando or Roland for Angelica. Unfinished by the author, it was continued by Ariosto in his 'Orlando Furioso' (q.v.).

Orléans, ör-lé-an' (Fr. ör-lâ-àn'), the name of several princely houses of France. Lords of the county (later the duchy) of Orléans.
MnoU
ORLÉANS

1344 it was an appanage of the cadet branch of the reigning Valois, and under the Bourbons it held a corresponding place. The various families of Orléans may be distinguished as follows: 1st, dating from 1344, containing the single name of Philippe, who was the 4th son of Philip VI, and died in 1375, his 40th year, without legitimate heirs, the duchy therefore reverting to the crown; 2d, dating from 1391, when Louis, Count of Valois, b. 1372, d. 1407, received the duchy from his brother, Charles VI, and terminated in 1408 by the accession of the then incumbent to the throne as Louis XII.; this Louis (q.v.) was son of the poet Charles of Orléans (see ORLÉANS, CHARLES, DUKE OF); the 3d, like the first, began and ended with a single duke, Jean Baptist Gaston (q.v.), brother of Louis XIII., who held it from 1626 to 1660; the 4th important grant of the title was to Philippe, brother of Louis XIV., b. 21 Sept. 1640; d. 9 June 1701, the founder of the House of Orléans-Bourbon, of which only one member has been king of France, namely Louis Philippe (q.v.). To this house the Orleanist claimants of the French throne belong.

Orléans, Charles, Duke of, commonly called Charles d'Orléans, French poet and statesman, count of Angoulême, b. Paris 25 May 1394; d. Amboise 1465. He succeeded to the duchy in 1407 on the death of his father, Louis, and like him took a prominent place in French politics, becoming a leader of the party opposing Burgundy and England. Wounded at Agincourt in 1415, he was taken captive to England and imprisoned there, probably with little or no severity, being so important a hostage, until 1439. He then married Marie de Clèves, niece of Philippe the Good of Burgundy and thus aroused suspicion against himself at court, where alliances with Burgundy were not looked upon with favor. Charles d'Orléans spent his last years in seclusion from public activity, but was famed as an entertainer and hospitable patron of poets and artists. His poems, including chansons, rondesaux, ballades, etc., some in French, some in Latin, and some in English, written during his captivity, are intensely subjective, entirely free from patriotic feeling or any thought for his own sorrows, joys, and loves; they were edited by d'Héricault (1874). Consult Beaulots, 'Étude sur la Vie et les Poésies de Charles d'Orléans' (1861).

Orléans, Hélène Louise Elizabeth, Duchess of, wife of the Duke of Orléans, Ferdinand, son of Louis of Orléans: b. Ludwigsburg 24 Jan. 1814; d. Richmond, England, 18 May 1858. The daughter of Friedrich Ludwig, Grand Duke of Mecklenburg-Schwerin, she married 30 May 1837, lost her husband 13 July 1842, and devoted herself to the education of her sons, the Comte de Paris (see PARIS, LOUIS ALBERT PHILIPPE, COMTE DE) and the Duc de Chartres, in whose behalf in 1848, after the abdication of Louis Philippe, their grandfather, she appealed in vain to the National Assembly. She removed, first to Ems, then to Eisenach, and finally to England. She was a model German, wisely virtuous and a woman of many accomplishments. Consult the popular biography in German by Schubert (8th ed. 1877).

Orléans, Henri, 5th Duke of, French explorer, eldest son of Robert, Duc de Chartres: b. Ham, near Richmond, Surrey, England, 6 Oct. 1807; d. Saigon, Indo-China, 9 Aug. 1901. At 22 with Bonvalot he traveled through central Asia to Tonquin; received the medal of the French Geographical Society in 1850, having traveled through India, Afghanistan, and Japan in the interval; explored Abyssinia (1801), Laos and Siam, Madagascar (1804), and Tibet and Yunnan (1805-6), discovering the sources of the Irrawady on this last journey. He gained great popularity in France, notably by his bold colonial policy, which was a constant source of irritation to England; and yet his bid for the favor of the army in his defense of it during the Dreyfus case was unsuccessful, being rather too open. His experiences in Abyssinia led him to criticize harshly the Italian officers in captivity there, and in 1897 he was challenged to a duel and wounded by the Count of Turin. Early in 1901 he left France for Annan, where he died in August. He wrote 'Les Mots aux Indes' (1880); 'De Paris au Tonkin et revint du Thibet inconnu' (1891); 'Une Excursion en Indo-Chine' (1882); 'Autour du Tonkin' (1893); and 'À Madagascar' (1895).

Orléans, Jean Baptiste Gaston, zhon bâtèst gā-tōn, Duke of, third son of Henry IV. of France, and brother of Louis XIII.; b. Poitou, 27 May 1602; d. Blois 2 Feb. 1660. His character was weak and yielding, and he was continually involved in plots, first against his brother, Louis XIII., and Richelieu, and then against Anne of Austria and Mazarin. In 1626 he refused to marry Mlle. de Montpensier at Richelieu's bidding, being a mere tool of the Cardinal's enemies at court, and entered a conspiracy against Richelieu's life, which was discovered and crushed. The Duke lived temporarily at peace with Richelieu, only to join Marie de' Medici, his mother, in a new intrigue against the minister in 1631, which resulted in the complete triumph of Richelieu, and the flight of the Duke to Lorraine. There in 1631 he married Marguerite, sister of Louis IV., Duke of Lorraine. He returned to France in 1634; plotted to kill Richelieu in 1636, purchasing his own pardon by sacrificing the lives of his accomplices; joined the plot of Cinq Mars in 1642, but was spared. Escaping under the death of Louis XIII. became lieutenant-general of the realm (1643). But his part in the Fronde, where he was clearly the tool of De Retz, was too flagrant to be passed over and in 1652 he was banished from court to Blois. Consult his 'Mémoirs,' written by Mlle. de Montpensier (q.v.).

Orléans, Louis Albert Philippe, Comte de Paris. See PARIS, LOUIS ALBERT PHILIPPE, COMTE DE.

him for his part in the battle of Ouessant and the refusal to make him grand admiral, in spite of his hereditary right to that post, made him a bitter foe of the court. In 1787 he was a member of the Assembly of Notables, and was exiled as a result. With the approach of the Revolution he gave up his rank, became a prominent republican, joined the Jacobins (1789), and was a member of the court of constituent Assembly, but in the convention joined the Mountain and voted for the death of the king. This action seems to have opened the eyes of his brother against his apparent duty to make him king himself, and 6 April 1793 the arrest of all members of the Orléans family was voted by the Convention. He was declared innocent by the tribunal of the Department Bouches du Rhône; but was found guilty of conspiracy against the integrity of the Republic, upon no good evidence, it seems, by the Revolutionary Tribunal, and died bravely. Consult the exhaustive article by Monin in 'La Grande Encyclopédie,' and the biographies by Tournois (1836), De Balsac (1846), and Créteil (1862); also Carlyle, 'French Revolution.'

Orléans, Louis Philippe Robert, rô-bār, Duke of, present Orléanist claimant to the French crown, son of the Comte de Paris: b. Twickenham, England, 6 Feb. 1809. He was educated in France, was exiled by the law of 23 June 1886, and in 1890 to rouse Orléanist sympathy returned to France and attempted to enter the army. He was sentenced to four years' imprisonment on 6 Feb. 1890, but was pardoned by the law of 21 June 1890. The law of 21 June 1890, the government realizing that his punishment might aid the royalist cause. In 1894 upon the death of his father he became the recognized leader of the Royalists; he married 5 Nov. 1896 Maria Dorothea, archduchess of Austria.

Orléans, Philippe, Duke of, son of Louis XIII, styled 'Monsieur' during the reign of his brother Louis XIV.: b. St. Germain 21 Sept. 1640; d. St. Cloud 9 June 1701. Originally Duke of Anjou, in 1660 he succeeded Jean Baptiste Gaston, Duke of Orléans (q.v.), his uncle; in 1661 married Henrietta, sister of Charles II. of England, of whom he was very jealous, even resenting the favor shown her by Louis, who made use of her in effecting his alliance with the English king in 1670. Henrietta died in the same year, possibly poisoned; and in 1671 the Duke married Charlotte Elizabeth, daughter of the Elector Palatine. He fought in the Netherlands against William of Orange with such success that his royal brother relieved him of command, fearing his growing prestige. His two daughters by his first marriage were Marie Louise (1662-86), wife of Charles II. of Spain, and Anne Marie (1669-1728), wife of Victor Amadeus of Savoy; by the second marriage he had a son, Philippe (q.v.), and a daughter Elizabeth Charlotte (1676-1744), who married in 1698 Leopold of Lorraine.

Orléans, Philippe, Duke of, son of the preceding, and regent of France: b. St. Cloud 2 Aug. 1674; d. Versailles 2 Dec. 1723. According to the custom established by his father he bore the title of Duc de Chartres as eldest (only) son. He was able but somewhat prolix and loquacious; much time was spent by him in his official duties and in his correspondence. He married 15 May 1687 Mlle. de Bios, the king's daughter by Mme. de Montespan; quickly made himself famous as a soldier by his exploits at Mons (1691), Steenkirk (1692) and Neerwinden (1693); and like his father was practically removed from the army because of the spite of Louis XIV. until his father's death. He was defeated at Turin in 1706 by Prince Eugene, but more than regained his laurels in Spain in 1708 by the brilliant capture of Lerida. His success and the rumor of intrigues with the English to make him king of Spain enforced renewed retirement in 1708. The successive deaths of the Dauphin and the Duke and Duchess of Burgundy and their son in 1711-12 were laid by gossips to his door, but he seems to have been more occupied at this time with alchemy, arts, letters, and a life of pleasure than with politics. By right of birth he became (1715) regent during the minority of Louis XV. His political activity was limited to the casting of details from that of Louis XIV.; he restored the power of the nobles; withdrew laws against Protestants; aimed at canceling the revocation of the Edict of Nantes; joined the Quadruple Alliance; and in other ways showed himself a friend of England; attempted to reform French finance, but made bad worse by acting on the advice of John Law (q.v.); and even after 1723 when the king came of age retained much actual power for a time through Dubois, whom he had made prime minister. His vicious and debauched habits were not broken nor changed in his later years, and he was accused, apparently with right, of criminal intercourse even with his own daughter, the Duchesse de Berry. Consult the biographies by La Motte, Capetigue, and Baudrillart; and the histories of the regency by Lemontey, Plossens, Marmontel, Lacretelle, and Wiesener; as well as the 'Mémoires' of St. Simon, Marais, and Buvat.

Orléans, France, a city, capital of the department of the Loiret, situated on the right bank of the Loire, 68 miles southwest of Paris. A magnificent bridge of nine arches connects it with the populous faubourg of St. Marceau. The houses are well-built, but the streets in general are narrow and crooked, through the wealth of handsome public squares, a Gothic cathedral; two hôtels-de-ville; the Palais de Justice; the Musée, containing a curious collection of local antiquities; the theatre, and other edifices worthy of notice. The manufactures and trade of the place are considerable, but have lost much of their former importance; there are several worsted and cotton mills, numerous sugar-refineries, vinegar works, breweries, and manufactures of hosiery, ironmongery, pottery, etc. Orléans was the Gallic Genoa and destroyed by Caesar 52 B.C., and rebuilt as Aurelianum, whence the corruption Orléans. Philip of Valois erected Orléans into a duchy and peerage in favor of his son, and Orléans has since continued to give the title of duke to a prince of the royal line of France. Philip the Fair instituted a university here in 1312, which formerly had great celebrity. In 1428 the city sustained a siege against the English, and was relieved by
the Maid of Orléans (see Joan of Arc), whose statue in bronze stands in one of the public squares. It was taken and retaken more than once in the Franco-German war in the latter part of 1870. Pop. (1901) 69,539.

Orléans, Isle of, Canada, in the St Lawrence River, below Quebec and Levis, at the head of the estuary, 650 miles from the ocean at Capot Strait. It is dependent on Montgomery County, is about 22 miles long by five to six broad, and has an area of 20 square miles. On account of its numerous grape vines Jacques Cartier first named it the Isle of Bacchus, in 1535. The soil is fertile, well-wooded, and fruit culture is the chief industry. The villages along its shores are popular picnic and summer resorts, and include Beauharnois, St. Pierre, Ste. Famille, St. François, St. Jean, St. Laurent, d'Orléans being usually affixed to particularize them. General Wolfe encamped here in 1759 before the siege of Quebec. Pop. about 6,000.

Orleans, Territory of, in American history, a name formerly applied to a section of the United States. When the large tract of northwest territory was purchased from France by the United States in 1804, under the name of Louisiana, the district was divided by Congress into territories, called the District of Louisiana and the Territory of Orleans, the latter being the present area of the State of Louisiana. In February 1811, an act was passed "to enable the people of the Territory of Orleans to form a constitution and State Government," and on 12 April 1812 an act was passed for the admission of the State of Louisiana into the Union. See Louisiana.

Orley, oIr-lē, Bernaert (Barend, Bernhard) van. Dutch painter. b. Brussels 1491 or 1492; d. there 6 Jan. 1542. He studied in Italy between 1509 and 1515 and imitated the Italian masters, especially Raphael. Returning to Brussels he was appointed court painter to Margaret of Parma (1515) and to her successor Maria of Hungary (1527). While he began his career as a follower of Gerard David he altered it after his Italian travels, but in his modeling and color scheme he never forsook the traditions of the Dutch school. His works indicate keen power of observation and a delicate perception of beauty in form and expression. Among the best of them are: "Scenes from the Life of Saint Thomas and Saint Matthew" (altar-piece), in the Imperial Museum, Berlin; "Sorrows of Job" (tripych) in the Brussels Museum; "The Flight into Egypt" (in the Liverpool Royal Institution); "Worship of the Holy Trinity" (Lübeck, Saint Mary's Church); and "The Holy Family" (in the Dresden Gallery). He also furnished designs for wall hangings which were executed in Brussels tapestry, of which there is an example in the Louvre, "The Imperial Hunt," executed for the Emperor Charles V.

Orloff, oIr-lōf, a Russian noble family, founded 1689 by Ivan, who was condemned to death by Peter the Great but pardoned for his bravery and coolness. His grandson Grigorii (1734-83), fought in the Seven Years' war, became the paramour of Catherine II., to whom he gave the famous Orloff diamond, or Koh-i-Nur, weighing 193 carats, and now a crown jewel. But she dismissed him for Potemkin. His brother Alexei (1737-1808) plotted against Peter III., and in 1770 won the battle of Tcherny and the name Tchernomensky. The Orloff breed of horses is named after him and is a cross of his introduction into Russia. Grigorii Vladimir (1777-1845) spent his last years in Paris, wrote in French on Italian history, and edited a polyglot Kryloff. Alexei Fedorovitch (1781-1861), a general in the Napoleonic wars, and a famous diplomat, in 1833 effected the Treaty of Unkia-Skelessi, giving Russia the sole right to pass the Dardanelles. His son Nikolai (1827-83) advocated religious toleration and the abolition of corporal punishment.

Orloff (oIr-lōf) Diamond, The. See DIAMOND; ORLOFF.

Orlop-deck, in naval architecture, the lowest deck, consisting of a platform laid over the beams in the hold of a ship of war, wherein the cables were usually coiled, and containing also cabins and storerooms. In merchant vessels it is often a temporary deck.

Ormazd, oIr-māzd. See ORMUD.

Ormerod, oIr-mē-rōd, Eleanor Anne, English entomologist: b. Sedbury Park, Gloucestershire, 11 May 1838; d. St. Albans, England, 10 July 1901. She acquired her knowledge of entomology through her own investigations, devoting herself especially to the study of injurious insects. Her advice was sought, and specimens of harmful insects were sent her from all over the world. In 1878 she was elected to a fellowship in the Meteorological Society, the first woman to be thus honored, and in 1882 was appointed honorary consulting entomologist to the Royal Agricultural Society. She published: "Cobham Journals" (1879); "Guide to Insect Life" (1884); "Annual Reports of Observations on Injurious Farm Insects" (1877 et seq.); etc.

Ormoc, oIr-mōk, Philippines, a pueblo of the island of Leyte, situated on the Bay of Ormoc, on the western coast of the island, 35 miles southwest of Tacloban. It is surrounded by a stone breastwork with three ruined forts. It has an important hemp trade. The Bay of Ormoc affords the only safe anchorage on the west coast of Leyte during typhoons. Pop. 8,200.

Or'molu (French or moulé, "ground gold"), in the etymological meaning of the word, ground gold leaf used as a gilt pigment; and by an extension of the term a compound of copper, zinc, and tin (sometimes called "mosaic gold"); or a paste of mercury and gold, used for gilding.

Ormond, oIr-mōnd, Alexander Thomas, American philosophical writer: b. Punxsutawney, Pa., 26 April 1847. He was graduated from Princeton in 1877; was professor of philosophy and history in the University of Minnesota 1880-83; of mental science and logic at Princeton 1883-98; and Mcosh professor of philosophy at the latter institution from the last named date. He has published "Basal Concepts in Philosophy"; "Foundations of Knowledge" (1900).
ORMOND — ORNITHOLOGY

Ormond, Duke of. See BUTLER, JAMES.

Ormulum, or'mul-üm, in early English literature, an English metrical translation of the Gospel history. See ENGLISH LITERATURE.

Ormus, or'müz, or Hormuz, an island in the Persian Gulf, on the north side, near its entrance. A strait about 15 m. in circumference, has a rugged appearance, is entirely destitute of vegetation, has several of the high peaks white from an incrustation of salt, and abounds in iron, copper-ore, and rock-salt. Ormuz was once the emporium of all the riches of India, the receptacle for the gems of Samarkand and Bokhara, and for the manufactures of Europe and Asia. The Portuguese had possession of it from 1515 to 1622, when it was captured by the English, given to the Shah of Persia, who dismantled the city, transferring its commerce to Bender Abbas, on the opposite coast. The town of Ormuz stood on a plain on the north side of the island; and although now only a few scattered ruins, it once contained 4,000 houses.

Ormuzd, or'müz déd, or Ormazd, supreme deity in Law and Zend-Avestan religion. The word is a broken down form of the Avestan "Ahura Mazda" and the old Persian "Auramazda," and these three forms are interchangeable in modern usage. He is the good principle, who is continually at war with Ahriman, the bad principle, and the Zoroastrian conception of him was a very noble one, free from any traces of anthropomorphism and from many recollections of nature worship. The influence of this concept on Judaism and Christianity was undoubtedly great, and Ormuzd approaches closely to Jehovah as a high type of the ideal of a national religion. Consult: Darmesteter, 'Ormazd et Ahriman' (1887). See AVESTAN; ZOROASTER; ZOROASTRIANISM.

Ornamental Grasses. See GRASSES OF THE UNITED STATES.

Ornithology, the science which treats of birds. It is susceptible of such a broad interpretation that it is difficult to define its limits without at least some certainty of its branches have become to such an extent maters of popular interest that we are coming to use the term "bird study" to distinguish them from purely scientific ornithology. Ornithology proper, then, may be said to treat of the classification of birds — both the phylogeny of the group as a whole and the definition of the numerous species and varieties — which involves anatomical, morphological, embryological, and physiological investigations and studies of both the living and dead bird. Geographic distribution and migration also form an important branch of ornithology, and though the former pertains equally to other branches of zoology, as well as to botany, it has nevertheless been studied very largely from the side of the birds.

Structure. — Birds, being eminently aerial, the anterior pair of limbs are modified into wings, and the bones of the hand are so much reduced that portions of two digits only remain. The peculiarities of feathers and other sterneum and breast-bone, which is expanded into a broad, flat
General structure of birds. See Ornithology.

Ornithology, the science which treats of birds. See Ornithology. Many birds are winged, but it is not the possession of wings but the use made of them that distinguishes birds from other animals. The feathers are very valuable and are used for various purposes. The eggs of many birds are highly esteemed as food, and the young are much sought after for various purposes. The birds are of various kinds and are generally divided into three classes: the waterfowl, the land birds, and the birds of prey. These classes are further subdivided into various families, genera, and species. See Birds.
ORNITHOLOGY

structure. Sometimes, as in the ostriches and their allies, it is smooth on the anterior surface, but in other living birds it is provided with a vertical keel. It is to this that the great flight-muscles of the breast are attached, and while the presence or absence of a keel was formerly looked upon as of primary importance in tracing the ancestry of birds, it is now regarded more as an indication of the extent to which the power of flight has been lost. On the back of the body cavity is another solid, bony structure known as the sacrum, formed by the fusion of the lower vertebrae and the pelvis. The clavicles or "collar bones" of a bird also present a peculiar appearance, being usually firmly ossified at their lower extremities, forming a V-shaped bone known as the furculum or popularly the "wish-bone."

As to the soft anatomy of birds, a characteristic avian structure is seen in the thick-walled muscular gizzard, which is a prominent feature of the stomach of all birds which devour hard substances such as grain, horn, insects, etc., though practically absent in birds of prey and fish-eating species whose food is soft. All birds with well-developed gizzards swallow small particles of gravel, sand, etc., which, by the action of the muscular walls grind up the food that they have swallowed and render it suitable for digestion, performing, as it were, the work of the molar or grinding teeth of mammals.

The complicated voice-organ or syrinx, comprising the lower portion of the larynx, is another organ peculiar to birds, and the arrangement and number of the muscles that contract the horny rings by which the vocal chords are controlled, have recently been found to be of fundamental importance in avian classification. This organ is only highly developed in the singing-birds (Oscines).

Classification. Owing to the great amount of attention that has been devoted to systematic ornithology through long periods of years, we find that it is through this branch also that the "science" of nomenclature has reached its present formidable development. Although of equal importance to all systematists, it is the ornithologists who have been responsible for the earlier and the more important codes that have been formulated to govern the formation and adoption of our technical systematic names. From the earliest attempts to resolve the wondrous and complex development of the male and female into the different species, the classification has been full of attempts to classify birds. The earlier schemes naturally dealt with external characters only, and as feathers were common to all, the only available parts were the bill and feet. There were two grand divisions, Water Birds and Land Birds, while under these came the wading birds, swimmers, divers, etc.; the birds of prey, gallinaceous birds, Fissirostris, Controrsis, Tenuirostris, etc.

In 1833 Meredith proposed to separate the birds with a smooth breast-bone (struthion, etc.) from the rest of the class — which all possess a keel on the sternum. This was an important advance, and the first recognition of the modern groups of Reptilia and Carnivora. In 1837 a Frenchman, Heine, made an extended study of the skeletal structure of birds and brought to light many points of relationship between birds hitherto regarded as distinct and *vice versa*. The *cranes* and herons were shown to be wrongly associated, and similarly the gulls and petrels, while the relationship between the gulls and the plover tribe was pointed out. Thus were the long accepted groups of "waders" and "swimmers" rudely shattered and the external resemblance in foot-structure was shown to be superficial.

The classification of birds, always a puzzle, now became still more complex, and all parts of the avian structure were investigated in the hope of reaching some set of characters that would prove the solution of the problem. The idea seemed to be then prevalent — and is still so in the minds of some systematists — that some one part of the bird's structure would furnish characters upon which a satisfactory classification could be established. Nitzsch made numerous anatomical investigations, but his most important discoveries were in connection with pterylography, showing that the number and shape of the feather-tracts differed widely in different groups. McGillivray and Müller studied the soft anatomy, and the latter was the first to divide the passerine birds into Oscines (singing birds) and Cliamantes, by pointing out the difference in the number and parts of the vocal muscles. Sundeval considered the physiological side of the subject and was the first to define Altricial and Precocial birds — those respectively that were hatched helpless and reared in a nest and those that run about as soon as leaving the egg. Up to this time classification meant a search for similarities with the object of arranging species in definite groups and families. In the minds of some the whole matter was one of mathematical exactness and in this connection the circular system outlined by Swainson in his 'Geography and Classification of Animals' is interesting reading. There now came a revolution in the classification of birds, as well as of other groups. In 1850 Darwin published his 'Origin of Species,' and his work, as well as that of Alfred Russel Wallace, soon put classification in a new light. It was realized that the birds of to-day are the terminal branches of a great family tree of birds, but trunk and early limbs are far back in the geological past, where they merged into the trunk which has produced the modern reptiles. Some of our present bird-families, notably those most numerous in specific characters, are comparatively recent developments, suited in every way to prevailing conditions; while others, usually with few representatives, are the remnants of ancient groups which belong much farther back on the tree, and have barely survived to the present day. The significance of fossil-forms now became evident, as well as the fact that birds could not be arranged in a linear series and preserve their proper relationship. It was also clear that in tracing the phylogeny of birds all sorts of characters must be taken into consideration, since modification in one part may have been important at one time, or in one group, while in another group some other part was the seat of variation.

The principal contributors to the modern classification of birds are as follows:

Huxley in 1867 made a study of birds' skulls and demonstrated the importance of the arrangement of the bones of the palate as an aid to classification, defining the several character of palatal structure known as dromeognathous, desmognathous, schizognathous and ægithognathous.
ORNITHOLOGY

Garrod and Forbes made important additions to our knowledge of the muscular anatomy of birds, and in 1888 Fübringer published probably the first attempt at a bird phylogeny that has yet appeared. One of his most important discoveries was that of the descent of the ostriches and their allies from flying ancestors, showing them to be a degenerate and not a primitive group.

In spite of the vast amount of attention that has been given to the subject, we are still far from solving the problem of avian classification. The great rarity of fossil birds leaves gaps in the system which it is almost hopeless to expect to fill; and although ornithologists are pretty well agreed upon a number of the leading groups, their exact phylogeny will remain a matter of guesswork unless comparative embryology shall solve the problem. It is a well-known fact in zoology that the embryonic development of the individual in the main represents the palaeontological development of the species; and if embryo birds had been saved and studied by zoologists, instead of the empty shells of the eggs, we might to-day be much farther along on our way.

The present views of bird-classification are briefly as follows: We have two distinct branches of existing birds, the degenerate Ratitae and the Corinatae. The former represented by four orders: 1, the Apteryxes of New Zealand; 2, the cassowaries and emus of the Australian region; 3, the rheas of South America; and 4, the ostriches of Africa and Arabia. Among the Corinatae we have, first of all, the tinamous (Cryphur), a sharply defined group of birds recalling the gallinaceous type in external appearance, but with many points of resemblance to the Ratitae. The penguins (Spheniscæ) are a degenerate group of somewhat doubtful affinity, which Dr. Steneger regards as differing more from any of the remaining birds than they do from each other; while other authorities place them as a distinct order, but in alliance with the loons. The latter, together with the grebes, form a natural order Podicipedæ, while the petrels and albatrosses form another, Tubinares. The relationship of the auks (Alcidae) has been in some doubt, but they are now most frequently placed near the gulls (Gætæ). The latter have much in common with the plover and sandpipers (Limicolæ), and the sheathbill (Chionia) is in many respects intermediate; together with the bustard (Otisidae) they seem to form another natural order. Three other groups of "water-birds constitute well defined groups: 1) The Anseriformes, ducks and geese, with the outlying horned screamers (Palamedæa) and flamingos; 2) the storks and herons; and 3) the Seiagonopodes, or toti palamate swimmers; that is, cormorants, pelicans, etc. The last-named bear affinity to the hawk-tribe (Accipitres), which, with the American vultures, form a distinct group, their only other alliance being a possible one with the herons through the secretary bird (Serpentaria). We have left the cranes (Gruida), rails (Rallidae), and trumpeters (Psophiidae), which form an order Gruidæ; and several very puzzling forms which are generally placed in the neighborhood of the rails, though they have no nearer relatives, and some, at least, are generalized forms descended from earlier branches of the family tree and consequently exhibiting characters possessed by several distinct modern families. Such birds are the seriemas, sun-bittern and kagu.

We next have the great gallinaceous assemblage, near which are placed the sand-grouse (Pterocles) and the pigeons (Columba). While that curious bird, the hoatzin, the representative of a distinct order, seems in some respects a connecting link between the gallinaceous type and the plantain-eaters (Musophagæa), which stand near the cuckoos. From this point we pass to a number of groups, some of them very sharply defined, others less so; as, for instance, the woodpeckers (Pici), parrots (Psittaci), owls (Strigæ), whip-poor-wills, etc. (Caprimulgæ), swifts (Cypseli), humming-birds (Trochilæ), etc. The complete separation of the owls from the hawks seems borne out by all modern researches, and their true position is probably in the neighborhood of the Corinæ. Last of all come the Passeres, divisible into two sub-orders and comprising far more species than all the other orders combined, but so hopelessly are the species interrelated that only a very few clearly defined familiar groups can be distinguished, of which the swallowies (Hirundinæ) are one of the best. Just which species of passerine birds are the highest; that is, the most specialized, is a matter concerning which there is much difference of opinion, and the thrushes, crows and finches have each been awarded the honor.

The following scheme, slightly modified from that of Dr. H. Gadow, will show approximately the present ideas of classification. Phylogenetically we may regard the Colymbomorpha and Pelagomorpha as branches of one stock, while the Electromorpha came away independently. The Coracimorpha have branched off from the last named, the hoatzin and the plantain-eaters representing one point of alliance. The Ratite, on the other hand, are a degenerate group probably from the same ancestry as the tinamous. Ratitæ.

The Ostrich tribe and certain Fossil allies. Carinæ.

Colymbomorpha: I. Sphenisciformes,—Penguins.
II. Colymbiformes,—Grebes and loons.
III. Procellariiformes,—Petrels and albatrosses.

Pelagomorpha: I. Ciconiiformes,—1, Cormorants, etc.; 2 herons; 3 storks.
II. Anseriformes,—1, Palamedæa; 2, ducks and geese; 3, flamingos.
III. Falconiformes,—1, Cathartæ; 2, hawks, etc.

Electromorpha: I. Tinamiformes,—Tinamous.
II. Galliformes,—1, Hemipodæ; 2, gallinæ; 3, hoatzin; 4, sand grouse; 5, pigeons.
III. Gruidæ,—1, Sun-bitterns; 2, rails; 3, cranes; 4, trumpeters; 5, seriena.
IV. Charadriiformes,—1, plovers, etc.; 2, gulls and auks.

Coracimorpha: I. Cuculiformes,—1, cuckoos, etc.; 2, parrots.
II. Coraciiformes,—1 Coracie; 2, owls; 3, caprimulgæ; 4, swifts; 5, colies; 6, trogons; 7, woodpeckers.
III. Passeriformes,—1, Eurylæmide; 2, cimatores; 3, menuride; 4, oscines.
ORNITHOPTA — OROGRAPHY

The number of species of birds is enormous, and a very large portion of ornithological literature has to do with their description, a work which is still progressing. For though it is probable that nearly all the distinct forms of bird-life have been discovered and described, there is still an abundance of closely allied geographic races to be distinguished. This refinement in separation of species and "varieties" in ornithology early reached a point far in advance of that attained in any other group of vertebrates, and the effects of peculiar environment and isolation in the evolution of species was apparently first clearly recognized from the study of birds. In some countries, notably in North America, the birds have been so closely examined over large areas that it is possible to trace the exact effect of peculiar climatic conditions upon color, and parallel anomalies are furnished by several different types of birds. The recognition of large numbers of closely allied geographic races, while deployed by those who would keep our nomenclature within the limits of convenience, is of the greatest importance in broader scientific research. Not only are valuable data thus obtained for the study of the evolution of species in its relation to geographic distribution and environment, but by recognizing certain peculiarities, however slight, as characteristic of birds breeding in a certain district, it is possible to identify the same form in its winter quarters or en route; and already data are being collected in the United States which before long will throw much light upon the exact course of the migration. The recognition of these geographic races in ornithological nomenclature resulted in the adoption by many ornithologists, notably Americans, of a trinomial system instead of the binomial system of Linnaeus, and geographic forms are now denoted by a "subspecific" name attached to the generic and specific ones, as, for example, Melopelia melodia fallax. This very materially alters our old conception of a species, just as the theory of evolution modified the conception of orders and families, and we are now coming to recognize that species and subspecies (they differ only in degree) as we find them to-day, are forms differentiated from one another in variable degree, some perfectly distinct, others so slight as barely to be appreciable. The attempt to denote the degree of variation by any system of names is bound to express merely individual opinion, and this explains much of the constant controversy over nomenclature.

The beauty of birds has appealed to the artistic side of many men, and many early ornithologists were artists and regarded the colored plates in their books as of perhaps more importance than the text. As examples of ornithological works of this sort may be mentioned Catesby's "Natural History of Carolina," Wilson's "American Ornithology," and Bonaparte's supplement to it; the elephant folios of Audubon, and the many sumptuous works of John Gould. Of recent years the perfection of photographic apparatus has made possible the photography of living birds in all the functions of life, which has proved of great scientific value. By thus bringing together accurate and actual portraits of all the scattered species we have material from which valuable deductions are likely to be made.

Bibliography.—General works are Gadow, Brehm's "Thierreich" (Vogel); Newton, "Dictionary of Birds"; British Museum, "Catalogue of Birds"; Couse, "Key to North American Birds"; and Cassells, the Royal, the Standard and the Cambridge "Natural Histories," especially Evans, "Birds" (1900), in the last named series. Newton's "Dictionary" (1856) contains an important bibliography relating to systematic and faunistic ornithology. For the United States the early standard works were the "Ornithologies" of Audubon, Wilson and Nuttall. The publication by Spencer F. Baird (1859) of the 8th volume of the "Pacific Railroad Reports," dealing with the birds of the country in accordance with advanced knowledge, started a new epoch in the study. This was supplemented again by the publication, first in 1872, of Elliott Coues' "Key to North American Birds," which has since passed through many editions. The most important and latest manual is Robert Ridgway's "Birds of North and Middle America," begun in 1901.

WITMER STONE,
Academy of Natural Sciences, Philadelphia.

Ornithopus, a group of dinosaurs, now included in the Orthopoda (q.v.).
Or'ithorynchus. See DUCKBILL.
Or'nithosaurus, the pterodactyls. See PTEROSAURIA.

Or'nithoscelida, a group named by Huxley to include certain genera of dinosaurs (Iguanodon, Megalosaurus, etc.), which present a large series of modifications intermediary in structure between reptiles and birds.

Ornithosoma, the generic name of a huge pterodactyl from the Cretaceous rocks of Kansas, which is probably identical with Pteranodon. See PTERODACTYLS.

Or'obanchaceae, the broom-rape family. The general properties of this family of plants are astringency and bitterness. The calyx is divided, persistent, inferior; the corolla hypogynous, irregular, persistent, stamens imbricate; ovary four; ovules free, one-celled, with two carpels; style, one; stigma two-lobed, divided transversely to the carpels; fruit capsular. The Orobanchacea are herbaceous parasites, with scales in place of leaves. They attach themselves to the roots of different plants, and have received the name of "broom" from the ravages they are supposed to commit among plants of the broom family. The different species attach themselves to different plants, as the Orobanche major to broom and furze, O. ramosa to hemp, O. rubra to thyme, O. heterocea to ivy. The central cellular portion of the stems is surrounded by fibro-vascular bundles, which connect themselves with those of the plants to which they attach themselves. They have also tubers and ordinary roots, from which it is supposed they may derive nourishment from the soil. See CANCER-ROOT; BROOM-RAPE.

Or'obus. See BITTER VETCH.

Orography, a term applied to the study of mountains, their chain, branches, etc. The study includes the method of measuring the heights of mountains by trigonometrical survey. The great difficulty here is to ascertain in this method of measurement arises from the optical delusion occasioned by the different states of
the density of the atmosphere, causing a pro-
portionate change of refraction, which may, how-
ever, be corrected by hygrometric observation.
In modern times, the use of the barometer and the
temperature recorder has enabled us to ascertain
the heights of mountains by barometrical obser-
vation, as being much more convenient and suffi-
ciently correct for all practical purposes.
There is a proportionate relation between the
height above sea level and the barometric pres-
sure; the higher the place, the lower the barome-
ter reading, and the lower the place, the higher
the barometer reading. This is easily shown by
marking the barometric pressure on a map and
noting the altitude of the point of observation.

**Orohippus**. See Horse,** Evolution of**.

**Orono**, ör'o-nô, Maine, town, Penobscot
County; on the Penobscot River, and the Maine
Central railroad, 7 miles northeast of Bangor.
It was settled in 1774, and became a town in 1806.
Its chief industry is the manufacture of lumber,
and it contains a number of lumber mills, also pulp
and paper mills. It is the seat of the University of
Maine, including the agricultural college and the
experiment station. Pop. (1900) 3,027.

**Orontes**, ö'rón'tész, Syria, the classic name
for the modern Aasi, or Nahr-el-Asi, a river
rising on the east of the Anti-Lebanus, in a
natural basin of rock, the site being marked by
an ancient monument. It flows north through
the plain of Hamah to the Lake of Antioch, and
thence southwest into the Mediterranean.
Its entire course is about 200 miles.

**Orosius**, ö'rös'ës, Paulus, Latin historian
and theologian: b. Tarragona, Spain, about 390
A.D. He became a Christian presbyter, resided a
considerable time with Saint Augustine at
Hippo, and wrote at his suggestion a general
history of the world, ‘Adversus Paganos His-
toriarum Libri VII,’ to prove that the Chris-
tians were not to blame for the downfall of
the Roman empire as the heathen alleged. He
tries to picture the wretchedness and evils of
the heathen period in as dark colors as possible,
making use of the works of Sallust, Tacitus, San-
tonius, and other Roman writers. His history,
however, is regarded by scholars as being of
little value, though it long enjoyed a great
popularity, and was translated into Anglo-Saxon
by Alfred the Great, with modifications and
additions. Orosius is also said to have written
a work on the errors of Priscillian and Origen,
and still other writings are attributed to him.
His history has been edited by Xangemeister
(1882), and several English translations and
editions of Alfred's translation have been pub-
lished.

**Orotava**, ö'rótä'vâ, Canary Islands, a
town in the northwest of the island of Tenerife,
formerly the capital and court of the principal
kingdom of the Guanches. It is regularly built,
and contains a great number of beautiful
buildings and gardens. It contains a beautiful
church with three naves, and an English church.
In a valley east of the town is a botanical garden.
Orotava is a summer resort much frequented by
European health seekers. It has an export
trade in bananas and cochineal. Pop. (1900) 9,000.

**Orozco y Berra**, ö'rôz'kö'é bër'rá, Manuel,
Mexican historian: b. City of Mexico 8 June
1816; d. there 27 Jan. 1881. He studied both
law and engineering and became editor of 'El
Farver' in 1846, and in 1852 was appointed
director of archives. Among his published
works are 'Geografía y Geografía
ychronológica de México' (1864); and 'Historia
de México,' his most famous work (1880-1).

**Orphan Asylums, Orphanages, and Homes
for Orphans**, are the terms variously ap-
p lied to establishments in which orphans who
have not relations able to support them are
provided for and educated. The care which so-
ciety at large is bound to take of destitute
orphans is in many countries considered as an
important point of political economy. The ques-
tion of most consequence in relation to the public
support of orphans, is, whether it is best, in
a moral, physical, and economical point of view,
to bring up large numbers of orphans in great
establishments, where they live together; or to
put them out singly in trustworthy families,
paid by the community. In Germany this ques-
tion has been long and thoroughly discussed;
and it appears that the majority of persons in
that country conversant with the subject prefer
the plan of bringing up orphans in
families. This plan has also been tried with success
in Switzerland. Both systems have their incon-
veniences and advantages. It would appear to
be cheaper, as well as better for the morals of
orphans, to educate them in separate families;
and in the way in which orphans have been
generally conducted on the continent of Europe,
the health of the children has appeared not
to be so well taken care of as in families. Some
asylums, however, form brilliant exceptions,
as the great asylum at Potsdam, near Berlin.

**History.**—The history of the origin of or-
phan asylums is uncertain. What the Romans
understood by *pueri et puella alimentarii*
cannot properly be compared to our publicly sup-
ported orphanages. Trajan did much in favor of
orphans, and both the Antonines and Alexander
Severus established foundations for them; but
such institutions do not seem to have become
frequent till the introduction of the Christian
religion. In the Middle Ages, to which so
many institutions beneficial to mankind origin-
ated within the walls of thriving and opulent
cities, orphan asylums became frequent in such
places, particularly in the larger commercial
towns of Italy and the Netherlands. In
the early Middle Ages orphan asylums were
found in the free cities, yet their origin does not
extend before the 10th century. One of the most famous asylums in the world
is that established by A. H. Francke at Halle
in 1668. There are also some considerable or-
phanages in Italy, and in France they are very
numerous. In Great Britain there are few asy-
lus exclusively appropriated to orphans, these
being generally disposed of in poor-houses, etc.

**United States.**—In this country the orphan
asylums are in the main supported as private
institutions, assisted by legislative appropriation.
They are fostered also by the religious denomina-
tions in almost every State. In many individual
counties throughout the Union, county asylums
have in late years been established. In the South
there are several colored orphanages, and in
New York State there is the Thomas Asylum
for Orphan and Destitute Iroquois Indian chil-
dren, established on the Cayuga Reservation
in Erie County. The care of orphans by
the State had its origin in Michigan in 1871,
ORPHAN ASYLUMS

when the State Public School for Dependent Children was established. Since then one fourth of the States and Territories have followed Michigan's example. Following is a list of the State orphanages thus established:

The various States and Territories care for the orphaned children, according to the reports obtained in 1902 by the National Association of Charities and Correction, as follows:

Alaska.—In the care of destitute orphan children in the territory nothing has been done by the government, but various religious denominations have established homes where native orphan children are taken, fed, clothed, taught, trained, and cared for.

Colorado.—The government supports a State Home for Dependent and Neglected Children at Denver to which children are committed under the law, and from whence they are placed in private families under State supervision. In 1902, there was established the Cherry-tree Home Orphanage, at the Salvation Army farm in Prowers County; and the Sacred Heart Orphanage by the Sisters of Saint Francis at Pueblo.

Connecticut.—A temporary home is provided in each of eight counties for the care of dependent and neglected children, until suitable family homes can be found for them. There were 716 of such children in 1902. Private asylums and orphan homes cared for 1,200 children during the same year.

Delaware.—In this State the institutions include the Home for Friendless Children; Saint Peter's Female Orphanage and Saint James Parochy.

District of Columbia.—A Board of Children's Guardians in the District care for 605 children annually.

Illinois.—There is here a Home for Soldiers' Orphans. In Chicago there are several orphanages with 4,000 inmates; the city, however, has laws which prevent the placing neglected children in family homes in preference to bringing them up in an institution.

Indiana.—The State has a Soldiers' and Sailors' Orphans' Home, numerous private orphan asylums, and there are Boards of Children's Guardians in seven counties. In 1902 there were about 1,800 orphans in the various State institutions.

Iowa.—In several counties there are homes for orphans and the State controls the Iowa Soldiers' Orphans' Home at Davenport.

Louisiana.—The sectarian orphan asylums in this State cared for 2,037 children in 1902.

Maine.—There is a Temporary Home for Children in Portland, and a fast growing tendency is manifest in this State to care for orphans outside of the poor-houses, where they have been heretofore received.

Massachusetts.—In 1902, there were 3,500 destitute children cared for, two thirds of whom were placed in private families.

Michigan.—There is a State Public School at Coldwater for dependent children, the first State home of this kind established in the United States. Since 1874 over 5,000 children from this institution have been placed in homes. Several private orphan asylums in the State care for upward of 1,000 children.

Minnesota.—There is a State Public School in this State which cares for 220 children annually and about 750 are housed in orphan asylums.

Mississippi.—There are six orphanages in this State, each in charge of a religious denomination. The Natchez Presbyterian Orphan Asylum was established in 1880. There is a Baptist orphanage at Jackson and a Waifs' Home near Biloxi.

Montana.—The State supports an orphan's home at Twin Bridges.

Nebraska.—There is a Home for the Friendless at Lincoln and a Christian Home for Children at Holdredge. The Lutheans support the Tabitha Home at Lincoln and the Episcopal Church has a home at York. The Saint James Orphanage is located at Omaha.

Nevada.—The government supports a State Orphans' Home at Carson City, which was established in 1873.

New Hampshire.—The law provides for the removal of orphans from county almshouses within 60 days after their admission. They are mostly placed in private families.

New York.—There are numerous public and private orphanages in New York State, and over 40,000 children are housed in such institutions. The asylums and homes number perhaps 100, all of which are under State supervision and many of them are partially supported by legislative appropriations.

North Carolina.—The Orphan Asylum at Oxford has 220 inmates, and the Colored Orphan Asylum in Granville County 110 inmates. Buncombe County has a Home for Orphans supported by county funds.

Rhode Island.—The State Home and School for Destitute Children cares for 200 children annually. It is located at Providence.

Texas.—The State Orphans' Home was established at Corsicana in 1887.

Wisconsin.—A State Public School is maintained at Sparta with 200 inmates.

Porto Rico.—The island colony has a Boys' Charity School with 300 pupils and a Girls' Charity School with 200 pupils.

State Laws.—The law in New York State providing for the care of orphan children may be cited as what is generally the enactment in most of the States. The law provides

1. The guardianship of the person and the custody of any indigent child may be committed to any incorporated orphan asylum or other institution incorporated for the care of orphan, friendless, or destitute children, by an instrument in writing signed by the parents of such child, if both such parents shall then be living, or by the surviving parent, if either parent of such child shall be dead, or if either one of such parents shall have, for the period of six months then next preceding, abandoned such child, by the other of such parents, or if the father of such child shall have neglected to provide for his family during the six months then next preceding, or if such child be a bastard, by the mother of such child; or if both parents of such child shall then be dead, by the guardian of the person of such child, legally appointed, with the approval
ORPHANS — ORPHEUS

of the court or officer which appointed such guardian to be entered of record; or if both parents of such child shall then be dead and no legal guardian of the person of such child shall have been appointed, and no guardian of such child shall have been appointed by a last will and testament, or by a deed by either parent thereof, or if the parents of such child shall have abandoned such child for the period of six months then next preceding, by the mayor of the city or by the county judge of the county in which such asylum or such other institution shall be located, upon such terms, for such time, and subject to such conditions as may be agreed upon by the parties to such written instrument. And such written instrument may provide for the absolute surrender of such child to such corporation. But no such corporation shall draw or receive money from public funds for the support of any such child committed under the provision of this section, unless it shall have been determined by a court of competent jurisdiction that such child has no relative, parent, or guardian living, or that such relative, parent, or guardian, if living, is destitute and actually unable to contribute to the support of such child.

It shall not be lawful for any county superintendent or overseer of the poor, board of charity, or other officer, to send any child between the ages of 2 and 16 years, as a pauper, to any county poor-house or almshouse for support and care, or to detain any child between the ages of 2 and 16 years in such poor-house or almshouse; but such county superintendents, overseers of the poor, boards of charities, or other officers shall provide for such child or children, in families, orphan asylums, hospitals, or other appropriate institutions, as provided by law. The boards of supervisors of the several counties of the State are directed to take such action in the matter as may be necessary to carry out the provisions of this section. When any such child shall be so provided for or placed in any orphan asylum or such other institution, such child shall, when practicable, be so provided for or placed in such asylum or such institution as shall then be controlled by persons of the same religious faith as the parents of such child.

3. All institutions, public or private, incorporated or not incorporated, for the reception of minors, whether as orphan or as pauper, indigent, destitute, vagrant, disorderly, or delinquent persons, are required to provide and keep a record in which shall be entered the date of reception, and the names and places of birth and residence, as nearly as the same can reasonably be ascertained, of all children admitted in such institutions, and how and by whom and for what cause such children shall be admitted therein, and the names, residence, birthplace, and religious denomination of the parents of such children so admitted, as nearly as the same can be reasonably ascertained; and whenever any such child shall leave such institution, the proper entry shall be made in such record, showing in what manner such child shall have been disposed of, and if apprenticed to or adopted by any person, or family, or other wise placed out at service or on trial, the name and place of residence of the person or head of the family to or with whom such child shall have been so ap-

prenticed, adopted, or otherwise placed out. The Supreme Court may, upon application by a parent, relative, or legal guardian of such child, after due notice to the institution and hearing had thereon, by order direct the officers of such institution to furnish such parent, relative, or legal guardian with such extracts from such record relating to such child as such court may deem proper.

4. While any child which shall have been placed in such asylum, or other institution, as a pauper, in pursuance of the second section of this act, shall remain therein at the expense of the county or town to which such pauper child is chargeable, the superintendents of the poor of such county, or the overseer of the poor of such town, may, in their discretion, remove such child from such asylum or other institution and place such child in some other such institution or make such other disposition of such child as shall then be provided by law. The name of no child shall be changed while in such institution as in this section aforesaid. But no parent of such pauper child, so in such asylum or other institution as in this section aforesaid, shall be entitled to the custody thereof except in pursuance of a judgment or order of a court or judicial officer of competent jurisdiction, adjudging or determining that the interests of such child will be promoted thereby, and that such parent is fit, competent, and able to duly maintain, support, and educate such child.

5. No person or corporation specified in the first section of this act may bind out any indigent or pauper child, if a male, for a period which shall not be beyond his 21st year, and if a female, for a period which shall not be beyond her 18th year, which shall have been absolutely surrendered to the care and custody of such corporation in pursuance of the provisions of the first section of this act, or which shall have been placed therein as a pauper in pursuance of the provisions of the second section of this act, or which shall have been left to the care of such corporation with no provision by the parent, relative, or legal guardian of such child, for its support for a period of one year then next preceding, to be a clerk, apprentice, or servant.

6. Any child which a corporation specified in the first section of this act is, by the fifth section of this act, authorized to bind out, may be placed by such corporation, by adoption. See FOUNDLING.

Orphans, See Hussites.

Orphans' Court, in Pennsylvania and a few other States, a court similar to that of the surrogate; devoted largely to probate affairs, such as the granting of letters of administration; to take proof of wills and to direct and control estates and the settlement of accounts of executors and administrators. See also Court.

Orpheus, or'fús, in Greek mythology, an important personage, surrounded by a multitude of legends, which invariably associate him with Apollo. His name is associated with the application of music to the worship of the gods. Apollo presented him with his lyre, and the Muses instructed him to use it, so that he
ORPHEUS C. KERR — ORSINI

moved not the beasts only, but the woods and rocks with its melody. Having lost his wife Eurydice by the bite of a serpent he descended to Hades to try and get her back. His music so moved the infernal deities Pluto and Proserpine that they consented to her return to earth, only her husband, whom she was to follow, must not look back till they had reached the upper world. This condition the impatient Orpheus violated and lost his wife forever. He is said to have met his death at the hands of a band of furious women engaged in the mystical rites of Bacchus. He is represented as one of the Argonauts, and to him is ascribed the origin of the so-called Orphic mysteries connected with the worship of Bacchus. The bulk of the poems attributed to Orpheus in modern times have been proved to be forgeries of Christian grammarians of the Alexandrian school. A portion of them, however, belong to the time of Onomarchus and include hymns, a theogony, a poem called 'Minyas, or the Descent Into Hades'; oracles and songs for initiation, and sacred legends. Among those who have investigated the Orphic writings are Otfried Müller, Grote, and Lobeck. See also Apollo; Bacchus; Eurydice; Musaeus.

Orpheus C. Kerr, the pseudonym of Robert Henry Newell (q.v.).

Orpiment, the native mineral, yellow sulphide of arsenic, As₂S₃. It forms rhombic triclinic crystals of translucent lemon-yellow color. Its specific gravity is 3.45. It is very poisonous. It was formerly used as a pigment and was known as king's yellow.

Orpine, or Live-forever, a perennial herb (Sedum telephium) of the natural order Crassulaceae. It is a native of Europe and northern Asia, whence it has been introduced in cool climates throughout the civilized world. In the United States and Canada it is of frequent occurrence among rocks and in sandy, dry and poor soils, often being the only herbage in such places. Though it produces few blossoms it spreads rapidly by means of its roots. Thrifty specimens attain heights of 1 to 2 inches, being obtuse, heart-shaped toothed, fleshy leaves, and pink or sometimes white flowers in dense rounded cymes, both terminal and lateral. Several horticultural varieties are used in rock gardens and places where little attention is required or can be given.

Orr, lr., Hugh. American inventor: b. Lochwinnoch, Renfrewshire, Scotland, 13 Jan. 1717; d. Bridgewater, Mass., 6 Dec. 1798. He came to America in 1737 and settled at Bridgewater, where he began work as a gunsmith and manufacturer of edged tools. In 1753 he invented a machine for dressing flax, and his other inventions were many. He was an ardent patriot in the Revolutionary War, and erected a foundry where he cast cannon and shot for the army.

Orr, James, Scottish theologian: b. Glasgow 11 April 1844. He was educated at Glasgow University and the Theological Hall of the United Presbyterian Church. He entered the ministry and was pastor of East Bank United Presbyterian Church, Hawick 1874–91; in 1895 lectured in Chicago on German theology, and in 1897 lectured on the Elliot and Morgan foundations at Allegheny, Pa., and Auburn, N. Y. He was also professor of church history in the United Presbyterian Theological College, Scotland, 1891–1901. He has published: 'The Pulpit Commentary' (1891); 'The Christian View of God and the World' (1893); 'The Supernatural in Christianity' (1894); 'Early Church History and Literature' (1901); 'The Progress of Dogma' (1902); etc.

Orr, James Lawrence, American legislator: b. Claytonville, S. C., 12 May 1822; d. Saint Petersburg, Russia, 5 May 1871. He graduated from the University of Virginia in 1842, admitted to the bar in 1843, and established a law practice in Anderson, S. C., also editing the Anderson 'Gazette.' He was elected to the State legislature in 1842, served two terms, and in 1848–50 was a member of Congress, officiating as speaker of the House in the 33rd Congress. A strong opponent of secession, he opposed it as long as possible, and then followed the lead of his native State. He commanded one of the first Confederate regiments raised in South Carolina, but in 1862 entered the Confederate senate, of which he was a member until the close of the war. He was the first governor of South Carolina after the restoration of her rights as a State of the Union, serving from 1868–8, and in 1871 was appointed minister to Russia, where he died in the following year.

 Orrery, or're-ri, Earls of. See Boyle.

Orrery, in astronomy, a machine for representing the motions of the planetary bodies. Distinct names have been given to various modifications of it: the planetarium, which exhibits the orbital paths of the planets and their satellites; the tellurium, which shows the motions of the earth causing day and night, the seasons, and the variable length of the former as dependent upon the latter; the lunarium, which shows the motions of the moon; and the satellite machine, chiefly intended to represent the motions of Jupiter and his satellites. The ordinary orrery was invented by George Graham about 1700, and first patronized by the Earl of Orrery. Steele, probably supposing the earl to be the first promoter if not the inventor of it, called it by his name. The contrivance is useful rather in aiding the conceptions than in elucidating truths; but it is mischievously faulty owing to the impracticability of representing in model anything like the proportions subsisting among the planetary bodies.

Orris Root, the rhizome or underground stem of a white flowering species of iris, the I. Florentina, a native of the south of Europe. In a dried state it is well known on account of its communicating a grateful odor, resembling that of violets. It was formerly much employed in medicine, but is now little valued except as a perfume. It is exported from the Mediterranean in considerable quantities, and, among other uses, is employed in the manufacture of tooth powder. Compare Iris.

Orsini, or-sé-në, Italian noble family dating back to the 10th century. In the 11th century the Piedmont branch were prominent among the members of the Guelph party, even opposing Frederick Barbarossa. But the Roman branch is better known, especially for its rivalry with the Colonna family, beginning at the close of the 13th century: the first great name in this
branch is Nicholas III., who was pope from 1277
to 1280. Even in the city of Rome the Orsini
built strong fortresses, thanks to the connivance of
Boniface IV, one of them covering the site of
the Marcellus Theatre. They boldly opposed
the attempt of Henry IV, to assert his power in
Rome, and the most notable part of their strug-
gle with the Ghibelline Colonnas was the mad
and unrestrained sallying out of 1233-5, which by
its abuses paved the way for the brief Roman re-
public under Cola da Rienzi. The important
members of the next centuries were: Virgino:
d. 18 Jan. 1497, a famous condottiere, who
fought for the king of Naples,
and finally for Charles VIII.; Niccolo, count of
Petigliano: b. 1442; d. 1510; head of the Angevin
party, and later leader of the Venetians against
the League of Cambrai; Vincenzo Maria, who
became Pope Benedict XIII. (q.v.) in 1724;
and Fulvio Orsini (1520-1600), an antiquarian and
author of ‘Famiglia Romana’ (1577).

Orsini, Felice, fà-lè-chã, Italian revolution-
ist: b. Meldola December 1819; d. Paris 13 March
1858. He studied at Imola and Boulougne, took
part in several plots against the pontifical gov-
ernment, was condemned to the galleys for life
at 25, when pardoned by Pius IX., became a leader
of the rising of 1848, and after the fall of the
republic engaged in several unsuccessful plots.
He was arrested and imprisoned in 1855;
escaped to England, where he made a living as a
lecturer on the papyri, and as the author of ‘Aust-
rian Dungeons in Italy’ and ‘Memoirs and Ad-
ventures’ (1857). Hoping that the death of
Napoleon III. would be followed by a general
Italian rising, he made his way to Paris in
December 1858, with his two
accomplices, threw three bombs at the emperor
and empress in the Opéra. Many were killed by
the explosions, but Napoleon and Eugenie were
unhurt. Orsini was executed with one of his
accomplices, the other being pardoned at the
empress’ request.

Orsova, õr’shô-vô, Hungary, a frontier
town on both banks of the Cerna at its con-
fuence with the Danube, near the Vaskapu or
Iron Gates, 92 miles east of Belgrade. Old Or-
sova, the Roman Tienna, on the west bank of
the Cerna, has a modern harbor, is a station for
the Danube steamers, and an important railway
junction. Pop. (1900) 4,610. New Orsova
(pop. about 3,500), on the Rumanian side, is a
fortified town held by Austria since 1878, who
also were masters of it between 1716 and 1738;
the Turks held it both before 1716 and after
1738. In 1890-6 a costly canal and other works
were made for facilitating navigation at the
rocky bend called the Iron Gates.

Ortegal, õr’tê-gal (Sp. õr-ta-gål’), Cape. See Cape Ortegal.

Orth, õr’th, Bertrand, Canadian Roman
Catholic prelate: b. Rhine Province, Prussia, 5
Dec. 1838. He received a theological educa-
tion at the American College in Louvain, Bel-
gium, and was ordained in 1872, when he was
sent to Oregon as missionary to the Indians.
He remained in that position until 1890, when
he was appointed United States post chaplain
at Camp Harvey. In addition to his missionary
work he has edited the ‘Catholic Sentinel’ of
Portland and taught in various Catholic colleges.

In 1900 he was consecrated bishop of Vancouver
Island, and in 1903 was elevated to the arch-
bishopric.

Orth, Godlove Stoner, American legis-
lator: b. near Lebanon, Pa., 22 April 1817; d.
Lafayette, Ind., 16 Dec. 1882. He was gradu-
ated from the Pennsylvania College at Gern-
burg, admitted to the bar in 1839, and began
his law practice in Lafayette, Ind., where he at
once interested himself in politics. In 1849 he
was a member of the State senate, and in 1861
he was appointed one of the five free commis-
sioners to consider the possibilities of a peaceful
solution of the impending troubles. His sympa-
thises were on the Union side, and after a brief
term of military service he was elected to Con-
gress in 1862-67; he supported the policy of
President Lincoln, was re-elected to the 43d,
45th, and 47th Congresses, and in 1875 was
appointed minister to Vienna.

Orth’sia, a large genus of paleozoic brach-
ioPods, typical of the strophomenaceous family
Orthidea, which lived in such abundance and
variety in the Ordovician and Silurian geolog-
icous periods that they are known from all over
the world and the Ordovician and Silurian for-
formations alone have yielded no less than 40
species. American specialists, it should be said,
subdivide the genus into a dozen or more sub-
genera. The orthids have a shell, squarish in
outline, with the surface covered with radiating
striae or costae. The valves more or less convex;
the small or dorsal valves, sometimes nearly flat
or slightly concave. A distinguishing feature of the
genus is that the well-developed shell is usually
divided by a large open delthyria. A
deltidium is developed only in younger growth
stages. Consult: Zittel-Eastman, ‘Text-book of
Palaontology’ (1900).

Orthite, natural hydrated silica of
aluminum, with long, straight prismatic crys-
tals (hence its name), which occur in feldspar.
Its specific gravity is between 3.37 and 3.8, its
hardness between 6 and 6. Orthite occurs in
granite, gneiss, syenite, and other rocks; usually
is of a brownish or yellowish color, and con-
tains many rare elements, such as cerium, lan-
thanum, yttrium, and didymium. It is found in
the Urals and in Sweden, Norway, and Green-
land.

Orthoceras, ôr-thôs’é-ras, a genus of fossil
cephalopods, allied to the nautilius, having
straight, tapering, smooth-chambered shells,
with the siphuncle central, which occur from
the Silurian to the Trias. It forms the type of a
family Orthoceratida, some of the species of
which must have been more than six feet long
and one foot wide. Related groups had shells
curved in various degrees, thus approaching the
coiled nautilius form.

Orthoclace, a variety of feldspar, called
common or potash feldspar, owing its scientific
name to the rectangular cleavage of its crystals;
it is a silicate of aluminium and potassium, with
the general formula KAlO2Si3; and, occa-
sionally has some sodium in place of the potas-
sium. The percentage of silica is usually 65, and
of potash about 12. The color is white or green,
sometimes rose or yellowish; its specific gravity
is 2.53 to 2.59, and its hardness 6. It is un-
affected by acids, save hydrofluoric; but is de-
ORTHOGRAPHY — ORTOLAN

composed by water containing carbonic acid, the
alkali being removed and clays being formed.

Orthography. See SPELLING.

Orthopa'edics (Greek, ὀρθός, straight, + παις, child), a branch of medical science
relating to the cure of natural deformities; not,
as the name implies, restricted to children, although childhood is usually favorable to treat-
ment. The practice of orthopaedics includes
prophylactic or preventive treatment and cura-
tive treatment. The object of the first is to
prevent deformities in children who, from the
delicacy of their constitution, are exposed to
them. Its means are hygienic; and its aim is
to aid by natural means the symmetrical develop-
ment of the body. Among these means one of
the most important is pure air. Children have
been known to recover from an incipient de-
formity of the spine or members merely by
being sent to the country. The compressed-air
bath has been used with success as an auxiliary
in this branch of treatment. Muscular exercise
muscular in character is another result of great
importance. It has the advantage not only of
developing the muscles, but of aiding digestion
and secretion. Treatment by curative ortho-
paedics has been applied with success to a great
variety of malformations both of the spine and
members. The manufacture of apparatus for
the mechanical treatment of deformities has be-
come a distinct branch of business, and there
are in various countries numerous institutions
where such treatment is systematically given.
See Bow Legs; Club Foot; Deformities; Joint;
Pott's Disease.

Orthophosphoric Acid. See Phosphoric
Acid.

Orthop'o da, an order of herbivorous dinos-
aurs (q.v.), in the classification of Gadow,
which includes as subordinate groups the planti-
grade Stegosauri and the digitigrade Ornitho-
poda of Marsh. The group-characters are
anatomical, especially those of the pelvis, which
are very bird-like, and of the jaws, the pre-
maxilla having no teeth. Consult: Gadow, 'Am-
phibia and Reptiles' (1901).

Orthop'tera, or straight-winged insects,
one of the Linnaean orders of Hexapoda, which
has undergone least change in the hands of
modern systematists. The three regions of the
body are distinct; the head is large, with strong
biting jaws, and long or short filiform anten-
nae; the prothorax is usually greatly developed,
and may form a shield partly covering the meso-
thorax; and the abdomen is usually full and ter-
ninated by a pair of claspers in the male and a
more or less prominent ovipositor in the female.
The anterior pair of wings are of little use in
flight, but they are thickened and serve as covers
to protect the broad, membranous, netted-veined
hind wings, which, when not in use, are folded
longitudinally like fans and concealed beneath
the covers. In some genera wings are absent.
Being of terrestrial habits and seldom flying
far, the legs are well developed for running,
leaping, or, as in the mole-crickets, for burrow-
ing. There is a gradual change without any
sudden metamorphosis from the larva to the
imag, the pupa being active and differing from
the adult only in the undeveloped wings and
reproductive organs; nor do the larvae differ
greatly in appearance. The eggs are usually

laid on the ground and sometimes, as with
the grasshoppers, in nests or cells. With the strik-
ing exception of the mantids, almost all of the
species are strictly herbivorous and among them
are some of the most serious pests with which
the husbandman has to contend. One character-
istic of this group is the presence of sound-
producing structures, by means of which, in
some families by rubbing, in others by concus-
sion, or by a combination of both methods, are
produced the noises familiar to us as the chirp-
ing of crickets (q.v.), the 'calling' of katyd-
dids, 'whirring' of grasshoppers, etc. Examples
of how such sounds are made are furnished by
the locusts and grasshoppers, which produce
sounds in several ways. Certain species rub the
inner surface of the hind femora, upon which
there is a row of minute spines, against the
outer surface of the fore wing. In this case each
fore wing serves as a fiddle and each hind leg
as a fiddle-bow. Second, other species rub to-
gether the upper surface of the front edge of
the hind wings and the under surface of the
fore wings. This is done while the locust is
flying, and the result is a cracking sound.

Third, the male of various kinds of grasshoppers,
including the katydids, are provided with an elaborate musical apparatus, by
means of which they call their mates. This
consists of a peculiar arrangement of the veins
and cells of a portion of each fore wing near its
base. This arrangement differs in the different
species, but in each it is such that by rubbing
the fore wings together they are made to vibrate,
and thus produce the sound. The principal
families are the Blattidae, or roaches, the Pha-
midae, or walking-sticks, the Mantidae, or pray-
ing insects, the Gryllidae, or crickets and mole-
crickets, the Locustidae, or locusts and the
Acrididae, or crickets, all of which are else-
where described. Consult the 'Text-books' of
Comstock, Packard, Carpenter, and others; and
Howard, 'The Insect-book' (1901), which con-
tains an extensive bibliography of the group.

Orter-Spitze, őrtl'er-spit'sé, or Ortler,
Austria, a mountain in the Tyrol, on the borders
of the Engadine, 70 miles southwest of Innsbruck.
It is about 12,800 feet high, and the loftiest peak
in Austria. This summit commanding one of the
most extensive views in the Rhaetian Alps was first ascended in 1802.

Or'tolan, a European yellowish-brown
bunting (Emberiza hortulana) famous as a
dainty. It is migratory, spreading over northern
Europe in summer to breed, and making its
nest in bushes or small trees, and singing
pleasantly. Toward autumn, when it begins to
migrate southward, it is plump, and regarded as
excellent eating. These birds are caught in
great numbers at that season along the shores
of Italy and the eastern Mediterranean, and are
re kept in confinement and fed for some time until
they become exceedingly fat and delicate, and
form a table luxury. The favorite method of
preparing the ortolans for table consists in
roasting them in egg shells — a mode of cookery
borrowed from the ancients, among whom these
birds brought very high prices. In former times
the Island of Cyprus formed a chief depot for
the exportation of these birds, which were
picked in spices and vinegar and packed in
casks containing from 300 to 400 each. From
ORTON — OS

400 to 500 casks are annually exported from Cyprus.

Orton, ör'ton, Edward, American educator and geologist: b. Deposit, N. Y., 9 March 1839; d. Columbus, Ohio, 16 Oct. 1899. He was graduated from Hamilton College in 1854, and later studied at Andover and at Harvard. In 1856-65 he occupied the chair of natural science at the Albany State Normal School, accepting in the latter year the same chair at Antioch College, Yellow Springs, Ohio, where in 1873 he was elected president. In that year he was called to the presidency of the newly founded Ohio latter year the same chair at Antioch College, which has since become the Ohio State University. His university work was of great value, as he was a natural teacher and organizer in addition to his scholastic attainments. He was assistant on the geological survey of Ohio in 1869-75, and in 1881 was appointed State geologist, which position he filled until his death, and he frequently served on United States geological surveys. He resigned his presidency of the college in 1881, but continued to fill the chair of geology during his life. Among his works are: 'Economic Geology of Ohio' (1883-8); 'Petroleum and Inflammable Gas' (1887); etc.

Orton, James, American Congregational clergyman, naturalist, and traveler: b. Seneca Falls, N. Y., 21 April 1830; d. on Lake Titicaca, Peru, 25 Sept. 1877. He was graduated from Williams College in 1855, pursued theological studies at Andover and entered the ministry in 1860. He was a professor of natural science in Rochester University in 1866 and the next year conducted an exploring expedition across South America. He was professor of natural history in Vassar College 1869-73, and at the time of his death was attached to an exploring expedition in Peru. His works include: 'The Andes and the Amazon' (1870); 'Underground Treasures' (1872); 'Liberal Education of Women' (1873); 'Comparative Zoology' (1875).

Or'tygan. See Button-quail.

Oruro, ö-roö'rö, Bolivia, a department lying in the western part, bounded on the west by Chilu, on the south by the department of Potosi, and on the north by the department of La Paz; area, 21,350 square miles. The Andes Mountains follow the western boundary, and the Cordillera Real the eastern; the department lies in the Titicaca basin. The surface is mostly an elevated plateau, rarely sinking below the level of 12,000 feet; the salt lake of Allugas is situated in the eastern part. There are numerous marshes and saline plains, the soil in general is unfitted for agriculture, and the climate is cold. There is considerable mineral wealth, particularly in tin, silver, and copper, and mining is the chief and most profitable industry; cattle are also raised in some sections. Pop. (1868) 130,000, of which a considerable portion are Indians.

Oruro, Bolivia, city, capital of the department of Oruro; within four miles to the east of the Desaguadero River; 125 miles southeast of La Paz. It is on a plain over 12,000 feet above sea-level, about 10 miles north of Lake Allugas. It was founded in 1592, and during the 17th century was very prosperous, owing to the mines in the vicinity, having at that time over 70,000 inhabitants. Later the mines were abandoned, the population declined rapidly, and a portion of the city fell into ruins. During the last decade of the 19th century, a railroad connecting it with Antofagasta, Chile, has been the means of reviving its prosperity to a certain extent. Tin is mined in the vicinity, and considerable quantities of tin, as well as copper and silver, are exported. Pop. (estimated) 15,000.

Orvieto, ör-vé-ätö, Italy, a city and episcopal see in the province of Perugia, Umbria, 78 miles by rail northwest of Rome. It is built on an isolated tufa rock, 1,347 feet above sea-level, and 765 feet above the junction of the Paglia and Chiana, is surrounded by mediaval walls, and is reached from the railroad depot by a funicular or inclined railway. The cruciform cathedral (1200-1338), one of the most beautiful and richly adorned specimens of Italian Gothic, is built of black and white marble, and measures 295 feet by 109. The façade is unsurpassed in richness of material, and in the beauty of its mosaics, sculptures, and elaborate ornamentation. The interior also is magnificently decorated with sculptures and with paintings by Luca Signorelli, Fra Angelico, etc. Two other churches of the 11th century, the bishop's palace, the Jesuit College, St. Patrick's Well (1327-1410), with its 250 steps, and the palaces Petrungeli and Guflieri deserve special notice, the former for its fine collection of paintings, and the latter for its cartoons by Domenichino, Annibale Caracci, and other eminent masters. Orvieto, called in the 7th century A.D. Urbis Vetus — of which its present name is a corruption — is supposed to occupy the site of the Etruscan Volsini. It was created an episcopal see in 509 A.D., and in the Middle Ages it gave shelter to 32 popes; the papal palace converted into a municipal museum in 1898, has numerous interesting local antiquities, including the contents of an Etruscan necropolis discovered on the east side of the town in 1877. Pop. (1901) 18,543.

Or'yx, a genus of antelopes represented by the addax, Beatrix antelope, beisa, and other species, found chiefly in northern Africa. The gemsbok of southern and central Africa is another ally. These antelopes are of comparatively large size. The horns are very long, curved, and ringed. They are large and effective weapons for defense, and a wounded oryx is a dangerous animal for a man to approach. Their desert habitat is indicated by the prevalent reddish-white uniform tint of their coats, almost the only distinguishing color-marks being upon the face. These antelopes are now greatly reduced in numbers, and some of the northern species are nearly extinct. One or another species is often depicted upon the monuments and mural paintings of ancient Egypt, most frequently, probably, the beisa (q.v.).

Os, Gregorius Jacobus Johannes, van, Dutch painter: b. The Hague 20 Nov. 1728; d. Paris, France, 11 July 1861. After taking a prize at Amsterdam (1809) and being awarded a gold medal at Paris (1812) he accepted employment as a designer and enamel painter at the porcelain manufactory at Sevres. He was eminently successful in the portrayal of flowers, fruit, and other still-life, but he also produced several landscapes. He was loved by his French admirers as the "Rubens of flower paint-
Os, Jan, van, Dutch painter (father of the preceding): b. Middelharnis, Holland, 1744; d. The Hague 1806. His studio was at The Hague throughout his artistic career; here he was director of the Académie des Belles Lettres, being a poet as well as a painter of flowers, fruits, landscapes, marines, and animals. His flowers are inferior to those of Van Huysum, whom he made his model, but his works are to be found in all important collections, and a picture of his entitled 'Flowers in a Vase, with a Cat on the Table' sold in 1883 for $1,217.

Os, Pieter Gerardus, van, Dutch painter, son of the preceding: b. The Hague 1776; d. there 1839. Although he was trained in art by his father, the flower painter, he made Paul Potter his model, and painted many famous landscapes with cattle in the foreground, and his works were eagerly sought by connoisseurs from all parts of Europe. In the campaign of 1813-14 he produced several battle scenes, some of which are in the Museum at Amsterdam. He was also an excellent etcher.

Osage, &sacute;âor or &sacute;sâj, Iowa, city, county seat of Mitchell County; on the Red Cedar River, one of the Great Western rivers of the Illinois Central R.R.'s; about 95 miles in direct line north of Fort Dodge. It is the commercial and industrial centre of a large productive agricultural region in which there are extensive dairy, stock-raising industries. It is the seat of the Cedar Valley Seminary, and it has the Sage Public Library. The city owns and operates the waterworks. Pop. (1890) 1,913; (1900) 2,734.

Osage, a river which has its rise in the eastern part of Kansas and enters the State of Missouri at Bates County, flows east and northeast, and joins the Missouri River about 10 miles below Jefferson City. It is about 495 miles long, and navigable, part of the year, 200 miles from the Missouri. It is a winding stream with many deep curves of nearly parallel sides.

Osages, a tribe of North American Indians of Siouan origin, now as the Osage Nation occupying a reservation in northeast Oklahoma on the east bank of the Arkansas River. In the 17th century they were inhabiting an extensive region between the Arkansas and Missouri rivers, and were early allies of the French, trusted by, and in frequent warfare with, the neighboring Cherokee, Chickasaw, Creek, Choc-taw, and other Indians. The Osage Nation is said to be the richest community in the world. They own nearly 1,500,000 acres of land, worth not less than $10 an acre. Besides this they have in the United States Treasury nearly $8,000,000, the result of their claim from the judicious sale of superfluous lands, and drawing interest at the rate of 7 per cent. Each Osage Indian, man, woman and child, is worth at least $15,000, and each family on a division would possess on an average $20,000. The property is held and owned in common, and all their industries are nationalized. Their prosperity, however, has led to decadence and they are fast diminishing in numbers. From over 7,000 at the commencement of the 19th century they numbered in 1901, 1,790.

Osage Orange (\textit{Voxylon pomareum}) a tree of the order of \textit{Urticaeae}, growing wild in the southwestern parts of the United States. It was first found near a village of the Osage Indians, which fact, connected with the globular form and gold color of its fruit, originated its popular name, but it has no botanical relationship to the true orange. The Osage orange, also called bow-wood (by French-American writers bois d'are) and yellowwood is a striking and beautiful large tree, growing to over 90 feet high; its foliage is not unlike that of the orange tree, but more glossy and polished and of a bright green color. Its branches spread widely into a broad head; its flowers are dioecious, small, pale yellowish green; the barren are about 12 in number, borne in a very short, almost sessile, racemose panicle. The fruit has about the size and appearance of a large orange, yellow when ripe and roughened on the outside, containing a mucilaginous fluid, insipid and inedible. The sap of the young wood and leaves is milky, and contains a large proportion of caoutchouc; the color of the wood is a bright yellow; its grain is fine and elastic, on account of which property it is employed by the southern Indians for bows. The young branches, beset with sharp, straight thorns, have suggested the employment of the tree for making live hedges, which succeed admirably where the winters are not so severe as to kill the thorns. As a hedge plant, it has many excellent characters but in order to form a compact growth, two shearings in a season are requisite. It is easily cultivated and propagated, and pieces of the root planted out in the nursery, with the tips just exposed above the earth, will readily grow; seeds procured from fertile trees may be sown in broad drills, a quart of seed producing at least 5,000 plants. The bark affords a strong fibre of a flaky character and the bark of the root is used by the country-people of the Southern States as the material for a yellow dye.

Osaka, &sacute;âka, or Osaka, Japan, the second largest city of the empire, and one of the three imperial cities, on the island of Hondo, at the mouth of the Yodo in the Gulf of Osaka, 20 miles by rail northeast of the center of 27 mi. southwest of Kioto. It is of great commercial and industrial importance, and has been likened to Chicago, on account of its progressiveness and modernization, to Glasgow for its industry and thrift, and to Venice for its beauty and quaintness. The city covering an area of 27 square miles lies upon either bank of the River Yodo and upon an island in the middle of the river; the many intersecting canals and the bridges (over 1,000) spanning these give the Venetian effect. The rich business and manufacturing section on the south bank of the river is Chicago, and the western quarter, monopolized by the shipping interests, is Glasgow. The island in the midst, which is the heart of the city, bears the poetical name of Nakano-shima, while anciently Osaka itself was known as Naniwa, meaning 'dashing waves.'

In the upper town, the fine castle, the stones of its walls of astonishing size, was constructed by Hideyoshi's orders in 1583, and the palace, built afterward in its precincts and destroyed in the civil war of 1668, was perhaps the most magnificent structure in Japan. Another notable edifice is the Sumiyoshi temple and by the
consort of the 14th emperor. The fine modern harbor protected by a mole has a depth of 28 feet at low water, and hundreds of steamers and sailing craft ply between its wharves and the ports of Formosa, Korea, and China. Cotton spinning is the principal of its numerous manufacturing industries; in 1903 there were fourteen cotton mills, employing 20,000 operatives—three fourths of them women and girls; other important manufactures are those of iron and steel products, glass, boots and shoes, chemicals, matches, tobacco, and clocks; shipbuilding is also a considerable industry. The foreign settlement is on the deltaic island of Kawaguchi. Osaka was opened to foreign trade and residence in 1868. Pop. (1898) of city, 821,235, with suburbs, 1,311,909.

Osawatomie, ō-sä-wōt'-ē-mè, Kan., city in Miami County, near the Osage and Pottawatomie rivers, and on the Missouri Pacific railroad. Its name comes from the two rivers mentioned. It is in a stock-raising and agricultural section, and in a natural gas belt. A few settlers were in this section about 1850, but in 1855 the place was organized by the Emigrant Aid Society as a "free-State" settlement. John Brown (q.v.) was interested in this settlement, and for a time lived on a farm nearby. On 30 Aug. 1856 the town was attacked by a band of pro-slavery sympathizers; John Brown and his friends made a vigorous resistance, but were finally overcome. The city is the division headquarters for the Missouri Pacific railroad, and has the railroad shops, machine-shops, flour mills, and large stock yards. It is the seat of the State Insane Hospital opened in 1866, which has over 1,000 patients each year. Some of the prominent buildings are the city library, city-hall, the Agnew Opera House, a Masonic temple, the churches, and schools. The charter of 1883, revised in 1890, provides for a mayor and council who appoint or elect the administrative officials. Pop. (1890) 2,662; (1900) 4,191.

Os'bon, Bradley S., American naval officer: b. Rye, N. Y., 16 Aug. 1828. He went to sea, and served in the Chinese navy as coxswain, in the Argentine navy as commander, and was an admiral in the Mexican navy. In the Civil War he served under Du Pont, Warden and Farragut, receiving honorable mention by the latter. As volunteer naval scout in the Spanish-American war he was the first to discover the proximity of Cervera's fleet off Cúragoa, 14 May 1898, for which he received the thanks of the government. He has since served in the Arctic and Antarctic oceans and in 1906 he became flag-officer commanding the United States Veteran Navy with the rank of commodore. He has published: "Osbon's Hand Book U. S. Navy" (1864); and "U. S. Veteran Navy List" (1900).

Osborn, 62'born, Henry Fairfield, American palentologist: b. Connecticut 1857. He was graduated from Princeton University in 1877 and in 1880 was assistant professor of anatomy there. Later he became professor of zoology at Columbia University which post he still holds as vice-president of the American Museum of Natural History, and since 1900 has been paleontologist of the United States Geological Survey. He has published: "From the Greeks to Darwin" (1894); numerous scientific papers, addresses, etc.

Osborn, Herbert, American biologist: b. Lafayette, Wis., 19 March 1856. He was educated at Iowa State College and was professor of zoology and entomology there 1880–96. Since July 1898, he has been State entomologist of Iowa, and has filled the chair of zoology and entomology at the Ohio State University. Among his professional writings are: "Pediculì and Mallophaga of Man and the Lower Animals" (1891); "Insects Affecting Domestic Animals" (1896); "The Hessian Fly in the United States" (1898); "The Genus Scaphoideus" (1900).

Osborn, Laughton, American poet: b. New York 1869; d. there 12 Dec. 1878. He was graduated from Columbia in 1877, devoted his attention chiefly to literature, but was also an amateur musician and painter of good ability. His verses in French and Italian he wrote with a facility almost equal to that which he displayed in English. A large part of his work appears anonymously. Of his books, many with impressive titles, but the most of them not little read, may be cited: "Sixty Years of the Life of Jeremy Lewis" (1831); "Handbook of Oil-Painting" (1866); "Bianca Capello, a Tragedy" (1868); "The Montanini—the School for Critics—Comedies" (1868); "Ugo da Este—The Cid of Seville—Tragedies" (1869); "Melagros—the Tragedy of the Cabiries" (1871); "Marianne" (1873).

Osborn, Sherard, English author and navigator: b. Madras, India, 25 April 1822; d. London, England, 6 May 1875. He entered the navy in 1837 and was ordered to the East Indies where at 17 he commanded a ship in the blockade of Quetta. In 1849 and in 1852–5 he was in command of one of the ships in the expedition sent in search of Sir John Franklin. He served in the Crimean war; in China, and Japan in 1857–59; and in 1862 commanded a fleet for the suppression of piracy. He superintended the laying of the submarine telegraph between Australia and Great Britain and in 1873 was made rear-admiral. He wrote: "Stray Leaves from an Arctic Journal" (1852); "The Career, Last Voyage, and Fate of Sir John Franklin" (3 vols. 1860); "The Past and Future of British Relations in China"; etc.

Osborn, Thomas Ogden, American lawyer: b. Jersey, Ohio, 1832. He was graduated from the Ohio State University in 1854, studied law and in 1859 established a practice in Chicago, Ill. At the outbreak of the Civil War he organized and became colonel of the 39th Illinois Volunteers; commanded four regiments at the capture of Fort Sumter, and rose to the rank of major-general of Volunteers. He returned to his practice after the war, was treasurer of Cook County, Ill., and manager of the "National Soldiers' Home;" he served as member of the commission appointed to settle disputed claims between United States and Mexico, and in 1873–85 was United States minister to Argentina.

Osborne, (Samuel) Duffield, American novelist: b. Brooklyn, N. Y., 20 June 1828. He was graduated from Columbia in 1879 and from the Columbia Law School in 1881 and 1882. He has published
OSBORNE HOUSE — ÖSEL

'The Spell of Ashtaroth' (1888); 'The Robe of Nessus' (1890); 'The Secret of the Crater' (1900); 'The Lion's Brood' (1902).

Osborne House, a large English villa, formerly the residence of Queen Victoria, situated near East Cowes (q.v.) in the Isle of Wight. The estate was willed to the Prince of Wales on the day of his coronation as Edward VII. announced his intention of presenting it to the nation, the building to be used (with the exception of the apartments that Queen Victoria had personally occupied and that are to be kept open to the public) as a convalescent home for officers of the army and navy.

Osbourne, Lloyd, American author: b. San Francisco, Cal., 7 April 1868. He was educated at Edinburgh University, traveled extensively and was at one time United States consul at Samoa. He wrote in collaboration with Robert Louis Stevenson: 'The Wrong Box' (1889); 'The Ebb Tide' (1894); etc. Among his own works are: 'The Renegades'; 'The Queen vs. Billy' (1900); etc.

Oscar. I. (Joseph Francois Bernadotte), king of Sweden and Norway: b. Paris 4 July 1779; d. 8 July 1859. He was educated at the Lycée Louis le Grand and after his father had been chosen Prince-Royal of Sweden (see Bernadotte) he joined him in that country, and was proclaimed Duke of Svedermania. During the reign of his father he was three times, in 1824, 1828, and 1833, viceroy of Norway, where he made himself popular by his good administration. He afterward continued to study in 1841. Oscar II. (q.v.), the present king, is his third son.

Oscar II, king of Sweden and Norway: b. Stockholm 21 Jan. 1829. He was a great-grandson of Napoleon I's famous general, Marshal Bernadotte, the first king of the new independent kingdom of Norway. He was trained in the navy and at the University of Upsala, and ascended the throne in 1872, in succession to his brother, Charles XV., and was crowned 11 May next at Stockholm and 18 July at Dront-heim. He was recognized as a talented sovereign, speaking, it is said, at least 10 languages with readiness, being well versed in naval and military history and general literature, and winning laurels as critic and poet. Among his writings are 'Some Contributions to the Military History of Sweden 1711-13' (1880-65); 'Memories of the Swedish Fleet' (1888), and translations from the German of Goethe's 'Tasso,' and Herder's 'Prometheus.' He was elected an honorary member of the Berlin Academy of Sciences and of the Imperial Society of Naturalists of Moscow. His collected works appeared in 1875-90. They were rendered into German by Jonas (verse 1877, 1888; prose 1891).

Oscarala, ös'-ö'la', or As-se-be-ho-tar, that is, "Black Drink." Seminole chief: b. near the Chattahoochee River, Ga., 1804; d. Fort Moultrie, S. C., 30 Jan. 1858. He was a half-breed, his father being William Powell, an English trader, and his mother the daughter of an Indian chief; with her he was taken to Florida when he was four years old. His mixed blood made him no fonder of the whites than were the other members of his tribe, with whom he soon became an influential leader because of his personal bravery and his hatred and contempt of his father's people. He showed his boldness in opposing the cession of the Seminole lands in Florida. But his passive opposition was roused in 1835 to open hostility; his wife, the daughter of a fugitive slave, was seized and carried into slavery; in his anger Oscarala threatened the Indian agent, General Thompson, so rudely that he was seized, imprisoned, and kept in irons for six days. Oscarala precipitated the second Seminole war by massacring Thompson and four others a few months later, 28 Dec. 1835. His men who had killed Major Dade and his 110 soldiers on the same day were unsuccessful 31 December in a fight with Clinch, but they took refuge in the Everglades, emerging now and then again, as in the assaults on Micanopy and Fort Drane, never winning a battle, but always led with great skill and daring, and keeping the country in terror for years. Later, 27 Dec. 1837, he was seized by General Thomas Jesup, with whom he was conferring under a flag of truce, and who excused his treachery by Oscarala's alleged disregard of treaties. With several followers he was imprisoned at Saint Augustine, and then at Fort Moultrie, where he died in a few months.

Oscella's Rebellion. See SEMINOLE WAR.

O'sci, or Oscans (Greek, Opikoi), an Italian people who appear to have been the original occupants, at the earliest known period, of Central Italy from Campania and the borders of Latium to the Adriatic. They are supposed to have been subdued by the Sabines, a people from the Apennines on the north, of whose previous history little is known, and who probably adopted the language and customs of the conquered, with what modifications cannot be ascertained. The Oscan language was closely allied to the Latin, of which it was probably a parent stock. It appears to have been spoken in the provinces long after Latin became the official language, and it was used officially long after the Roman conquest.

Oscines, ös't-ën'éz, a group of passerine birds possessing highly developed vocal organs, and including most of the "singing-birds" of the world. See ORNITHOLOGY.

Oscott (ös'köt) College, a Roman Catholic institution founded in 1752 as a college and seminary for priests. It played a considerable part in the education of English Catholics when they were yet excluded from the English universities. The school is also called Saint Mary's Seminary. The course in secular subjects qualify for the degree of B.A. in the London University.

Ösel, è'zél, or Oesel, Russia, an island of the government of Livonia, in the mouth of the Gulf of Riga, and after Seeland the largest island in the Baltic; area, 1,998 square miles.
The principal town Arensburg (pop. 1897, 4,021) is on the southeast coast. The coast is generally bold, and the interior undulating. The soil, generally and not naturally rich, becomes productive by careful culture, and raises corn for export, hemp, and flax. The pastures are good, the forests large, and the fisheries valuable. Pop. (1897) 58,859.

Osgood, oz'gud', Samuel, American soldier and legislator: b. Andover, Mass., 14 Feb. 1748; d. New York 12 Aug. 1813. He was graduated from Harvard in 1770, engaged in a mercantile career, but public affairs absorbed much of his attention and in 1775 he was a captain of minutemen at Lexington. For a time he acted as aide to General Artemus Ward, but in 1780 entered the Continental Congress where he served until 1784. In 1785–9 he was commissioner of the United States treasury, the first to occupy that office; and in 1789–91, postmaster-general. Later he was speaker of the New York assembly and in 1801–3 supervisor in New York. From 1803–13 he was naval officer at the port of New York.

Osgood, Samuel, American clergyman and author: b. Charlestown, Mass., 30 Aug. 1812; d. New York 8 April 1886. Graduated from Harvard in 1832, and from the Cambridge divinity school in 1835, he was later editor at Louisville (Ky.) of the 'Western Messenger,' was pastor of a Unitarian Church at Nashua, N. H., in 1837–41, and of the Westminster Church, Providence (R. I.) in 1841–9. From 1849 until his resignation in 1869 he was pastor of the Unitarian Church of the Messiah, New York. In 1870 he took orders in the Protestant Episcopal Church, but he did not take up parochial work in that communion. From 1870 until 1880 he was chiefly active as corresponding secretary of the New York Historical Society, a contributor to periodicals, and an occasional lecturer. Among his publications were: Studies in Christian Biography (1851); 'God with Man' (1853); 'American Leaves' (1867).

O'Shaughnessy, o' sha'n-ee-si, Arthur William Edgar, English poet: b. London 14 March 1844; d. 30 Jan. 1889. In 1861 he became a junior assistant in the library of the British Museum, and in 1863 assistant in the zoological department. He won recognition as an authority in herpetology. But he was better known as a poet, his volumes being: 'An Epic of Women' (1870); 'Lays of France' (1872), a free paraphrase of the lais of Marie de France; 'Music and Moonlight' (1874); and 'Songs of a Worker' which appeared posthumously. O'Shaughnessy showed great promise, though his later work evinced increase rather in metrical and verbal facility than in intellectual force.

Oshiba, o sheh'ba, or Osiea. See Fans.

Oshima, o sheh'ma, Japan, a name signifying 'great island.' applied to numerous island dependencies of the empire. The chief are (1) Oshima or Vries Island, southwest of the eastern point on which stand Tokyo and Yokohama; (2) Oshima off the southwest extremity of Hokkaido, opposite Fukuyma; (3) Amami-Oshima one of the largest of the islands of the Liu-Kiu Archipelago (q.v.).

Osh'tosh, Wis., county-seat of Winnebago Co. Supercilious and toughness are the bywords of the Winnebago at the mouth of the Upper Fox River, and on the Chicago & N. W., the Chicago, Milwaukee & S. P., and the Wisconsin Central R.R.; about 75 miles northwest of Milwaukee and 85 miles northeast of Madison, the State capital. It was settled in 1836, and in all 1876, became productive by careful culture, and raises corn for export, hemp, and flax. The pastures are good, the forests large, and the fisheries valuable. Pop. (1897) 58,859.

Osier, o zee'an-dair, Andreas (classified form of Hosemann), Lutheran theologian: b. Gunzenhausen, near Nuremberg, 19 Dec. 1568; d. Köthelberg 17 Oct. 1552. As first evangelical preacher at Nuremberg, he exerted himself in furthering the Reformation and Lutheranism, taking part against Zwinglius on the subject of the Lord's Supper. He was also present in the conference at Marburg in 1524, and at the Diet of Augsburg (1530). His refusal to consent to the Augsburg interim in 1538 cost him his position at Nuremberg. By Duke Albert of Prussia, on whom one of his sermons produced a strong impression, he was appointed preacher and first professor of theology in the newly erected University of Königsberg, and vice-president of the bishopric of Samland. Meanwhile, in 1549, he became involved in a theological dispute, which was embittered by his obstinacy. In a discussion, 'De Lege et Evangelio,' he maintained that justification is not a judicial or forensic act in God, but contained something of a subjective nature, as the imparting of an interior righteousness, but brought about in a mystical manner by the union of Christ with men. These views he continued to maintain till his death. Consult Moller, 'Andreas Oslanders Leben und ausgewählte Schriften' (1870).

Osier, the popular name of those species of willow (q.v.) which are used chiefly for basket-making and other wickery. They are of low bushy growth, and they are the more valuable in proportion to the length, thickness, and toughness of their branches. The common osier (Salix viminalis), a common native of wet alluvial grounds in many
parts of Europe, is cultivated to supply material for basket-makers, and also is often planted to prevent the banks of rivers from being washed away. There are great varieties in cultivation, not easily distinguished except by a very practised eye, but much more useful than the original or wild kind, which is apt to break, and therefore of little value. See Willow.

Osiris, ő-si-ris, in Egyptian mythology, meaning "full of eyes," a son of Isis, or as is claimed by some authorities, the brother and husband of Isis, and the father of Horus. He is styled the Manifestor of Good, Lord of Lords, King of the Gods, etc. In the Egyptian theology he represented the sum of beneficent agencies, as Set of evil agencies. The struggle between these opposing agencies was thus personified in two individuals, as in the later theology of Persia. Osiris, after having conquered all Egypt, and established good laws and institutions, fell a prey to the intrigues of his brother Set, the Typhon of the Greeks. He became afterward the judge of the dead. There are a multitude of traditions, both Greek and Egyptian, about Osiris. He is represented under many forms: once in company sometimes to the sun and sometimes to the Nile. In particular his soul was supposed to animate a sacred bull called Apis, and thus to be continually present among men; for when the bull Apis died the priests selected another, into which the divinity entered. Sometimes he is represented as a man crowned with a mitre, a globe, a lotus-flower, or an elephant's trunk; sometimes with the body of a man and the head of an ox, ibis, or other animal; sometimes he holds a stick, sometimes a phallus, in his hand. He holds, in some representations, a whip in one hand and a scourge in the other. He has frequently the horns of a bull. The worship of Osiris was introduced into Rome, but the rites proceeded to such an extent of licentiousness that it was at length prohibited by law.

Oskaloosa, ős-ka-loo'sa, Iowa, city, county-seat of Mahaska County; on the Chicago, Burlington & Q., the Iowa Central, and the Chicago, Rock Island & P. R.R.'s; about 65 miles N.W. of Missouri City. It was settled in 1843 and incorporated in 1853. It is the commercial centre of a fertile agricultural region in which stock-raising is given much attention. In the vicinity are large coal-fields, and deposits of limestone and fire-clay. The chief industries are flour and gist milling, manufacturing vitrified brick, wagons, iron and brass goods, heaters, and woolen goods. It has a large meat-packing plant, and coal and brick yards. The principal buildings are the post-office, the church, school and library buildings. The educational institutions are the Penn College, opened in 1873 under the auspices of the Friends, the Oskaloosa College, under the auspices of the People of Christ, and a business college, a public library. The Society of Friends of the State of Iowa hold their annual meeting in this city. Pop. (1890) 6,558; (1900) 9,212.

Oster, ős'tër, William, American physician: b. Tecumseh, Ont., 1849. He was graduated at the University of Pennsylvania, and was professor of medicine there in 1874-84. In 1884 he was professor of clinical medicine at the University of Pennsylvania and since 1889 has been professor of medicine and surgeon to the hospital at Johns Hopkins Medical School. He has written: The Cerebral Palsies of Children (1889); 'Cancer of the Stomach' (1900); etc.

Osman Digna, ős-mán' dig'ná ("Osman the Bearded"), Sudanese chief: b. 1836. His early history is not known; a romantic story tells that he was of French birth and came from Rouen with his parents, named Nisbet, in 1849 to Alexandria or Suakim, where his mother married an Arab merchant named Osman; but it seems quite as likely that he was an Arab himself and a native of Suakim. He was a slave-trader; suffered financial losses because of English interference with his ships; raised an army of 20,000 men in 1881-2 to assist Arabi Pasha against the English; became chief of the sheiks of Eastern Sudan; fought the English with varying success, contributing largely to Gordon's capture and death by blocking the approach to Khartoum, through Suakim; was the hero of a long and costly siege at Tokar in 1889-90; joined the Mahdi in the rising of 1899; and in 1900 was taken by the emperor (or treachery) and imprisoned at Rosetta.

Osman Nuri Pasha, noo're pâsh'a, called Ghazi, "the Victorious," Turkish general: b. Amasia, Asia Minor, 1837; d. Constantinople, April 1900. Educated at Constantinople, he became lieutenant of cavalry in 1854 and served in the suppression of the revolt of the Druses in 1860 and of the rising in Crete in 1867, fought under Redif Pasha in the Yemen campaign of 1877, became marshal after the war in Servia in 1876, and in the war with Russia, after bold and brilliant maneuvers, occupied Plevna, which he was forced to surrender to Dec. 1877, in spite of his heroic attempt to break through the forces of his besiegers. He was carried a prisoner to Russia, returned to Turkey after the Treaty of San Stefano, was entrusted with the reorganization of the Turkish army, and served as minister of war 1880-5, and as a marshal of the palace from 1886 until his death. Consult Levav: Osman Pacha, Souvenirs historiques (1891).

Osmanie, ős-má-ne'-è, Imperial Order of. See Orders, Royal.

Ös'melite, the same as Pectolite (q.v.).

Ösmium, a metallic element of the platina group, commonly found with iridium (q.v.). It was discovered by Tennant in 1804. Osmium-iridium is found in the minerals called Neoyansite and Sylferskite in the form of very hard black grains; as a cubic or obtuse rubbohedra it is bluish white, with violet lustre, and greater hardness than glass. The element has the atomic weight 191, and the high specific gravity of 22.5; it gets its name from the peculiar odor of osmotic acid. Osmium is very fusible, but can be fused by the heat of an electric arc. It forms three chlorides, OsCl₂, OsCl₃, and OsCl₄. The oxides, OsO₂, OsO₃, and OsO₄, commonly called osmic acid, which has pungent and poisonous vapors, is extremely volatile, and is a powerful oxidizer. In alloy with iridium, osmium is used for pointing gold pens, lamp, and Auer von Welsbach yields a pure white light, and gives little heat.
OSMOSIS — OSORIO

Osmosis, the diffusion of fluids through membranes. If a septum composed of either organic (such as a bladder) or inorganic (such as porous earthenware) be interposed between two liquids holding different substances in solution, the liquids will pass through the septum carrying some of the matter in suspension with them; that is, they will diffuse one into another. This phenomenon is called osmosis. The liquids pass through the interposed medium at different rates, gradually getting slower, until they are said to be balanced. If a bladder filled with a solution of sugar be immersed in water, seven parts of water (by weight) will enter the bladder while one part of sugar escapes into the water. The action of the liquid parting with its soluble matter is called endosmosis, the flow of the liquid receiving it exosmosis. Both must act simultaneously, one cannot exist independently of the other; together they constitute the phenomenon of osmosis. Sugar has the strongest power of endosmosis among the vegetable substances and albumen among the animal. Endosmosis usually takes place in the direction of the clearer liquid, although there are some exceptions, such as ether, alcohol, etc., which act like liquids heavier than water. This diffusion has variously been explained by capillary attraction, unequal absorption, and chemical action. The latter theory would seem to be the most plausible as the septum is generally found to have been acted upon and in a state of corrosion. The laws of osmosis apply also to gases. Diffusion of dissolved substances takes place only to the limit of saturation of a liquid and exerts an osmotic pressure comparable to gas pressure and subject to the same laws. In order to have osmosis take place the liquids on either side of the interposing septum must be of unequal osmotic pressure. (See Chemistry.)

Osmosis plays an important part in plant physiology. The plant cell consists of a mass of protoplasm enclosed within a flexible organic membrane (the cell wall) which encloses a fluid called the protoplasm, and generally to all substances it may hold in solution; but the protoplasm itself is only permeable to water and generally to all substances it may hold in solution; but the protoplasm itself is only permeable to water containing such substances as it requires for its nutrition — it would seem to be able to control the power of selection. The cells in different plants, or cells in different parts of the same plant, possess very different powers of osmosis. Water is the only solvent in plant life. When a cell becomes full or swollen it is said to be turgid, but this turgidity is constantly relieved by osmosis taking place from cell to cell and by final evaporation. As soon as the osmotic pressure in one cell falls below that of a cell or cells with which it is in juxtaposition, osmosis takes place, and thus a fair degree of equilibrium is maintained. Osmotic pressure is enhanced by electrolytic dissociation (see Association) which takes place in plant life on account of the presence of acids and salts (electrolytes) of various kinds which are found in solution both in and surrounding all plant life. The phenomena of osmosis still present a fertile field of research for the scientific mind. See Absorption; Solutions.

Arthur S. Witherspoon, Editorial Staff, 'Encyclopedia Americana.'

Os'mun, Thomas Embley ("Alfred Ayres"), American orthopaist: b. Montrose, Ohio, 26 Feb. 1834; d. New York 26 Oct. 1902. He was graduated from Oberlin College and later studied medicine in Paris and Berlin. In 1869 he returned to the United States and settled in New York. Resolving to make a life work of the purification of the English language as used in the public press, he became an authority on the use of English, and also attained distinction as a dramatic critic. Subsequently he taught education and in 1891 he appeared as Shylock in Boston and other New England cities. He published: 'The English Grammar of William Cobbett' (1884); 'The Orthoepist' (1884); 'Some Ill-Used Words' (1901); etc.

Os'mun'da, a genus of tall swamp ferns with free capsules (sporangies) opening by a longitudinal slit. The root-stocks are large and erect or creeping. The sporangias are large, globose, naked, and situated on the margins of their rachis-like divisions. The spores are copious and green. One species, the royal fern ('O. regalis'), is cultivated in various parts of the world on account of its elegant appearance. It grows in clumps of 2 to 5 feet in height, and is well adapted for open moist places, where the soil is rich and shade thin, or even where full sunlight falls. Consult Bailey, 'Cyclopedia of Horticulture' (1901).

Os'nambrück, ös'nän-brück, Germany, a town of Hanover, Prussia, on the Haase, 70 miles west of Hanover. In the old town the streets are generally narrow and the houses low; but the new quarters have wide and handsome streets and fine residences. The chief buildings are the ancient Protestant churches of Saint Catherine and Saint Mary; the Roman Catholic cathedral; the Protestant and Roman Catholic gymnasia, the town-house, with states (1889-90) of German emperors on the facade: the Friedenssaal (Hall of Peace), restored in 1890; the museum (1889), the new hospital, and the commercial school. Osnambrück has iron and steel works, railway workshops, machine-shops, iron-foundries, wire-works, paper-mills, flax and cotton mills, bleach-fields, tile-works, breweries, etc. Osnambrück gave its name to the coarse linen known among English-speaking people as osnabrugs. It was created a see in 888, and in 1022 was surrounded by walls. It afterwards entered the Hanseatic League, but it became a free imperial city. The negotiations for the Peace of Westphalia, which ended the Thirty Years' war, were carried on here. Pop. (1900) 51,574.

Osorio, Manoel Luiz, mä'nó-él lö-oo-t'hô-dô-sô're-t'ô, Brazilian soldier; b. near Pelotas, Brazil, 10 May 1808; d. Rio de Janeiro, Brazil, 4 Oct. 1879. He entered the army at an early age and in the civil war in Rio Grande do Sul. 1839-45, he attained distinction. In the campaign in Uruguay in 1851-2 he was again prominent and at the outbreak of the Paraguayan war in 1865 was made commander-in-chief, but was superseded by Caxias in 1866. He was made lieutenant-general in 1867 and continued to serve until 1890 when he was seriously wounded. He entered politics after the war, became senator in 1877 and from 1878 until his death was minister of war. He was created Marquis of Herval by the government, but his chief title of honor was "O Legandario" (the Fabulous) bestowed upon him by his soldiers for his bravery.
OSPREY — OSSIFICATION

Os'prey. See Fish-hawk.

Ossa, 58′, a, Greece, the classic name of Kissavos, a mountain 6,408 feet high, in the northeast of Larissa, overlooking the Gulf of Saloniki. The Vale of Tempe separates it from Olympus, 9,754 feet high, and to the southeast Mount Pelion, in elevation 5,308 feet high. These three mountains are renowned in Greek mythology, and the classic phrase *sailing Ossa upon Pelion* refers to the giants Ephialtes and Otus arranging to place Ossa upon Pelion to aid them in reaching the summit of Olympus. This conception is said to have been suggested by the conical form of Ossa and the flat summit of Pelion. The seats of the Centaurs and Giants are located in the neighborhood of Ossa and Pelion.

Ossian, osh′-ə-en. The organic basis of bone allied to gelatine. If a bone is placed in acid, 20 per cent hydrochloric, the inorganic matter (salts, etc.) is dissolved out and by repeated washings only the organic matter remains. This retains the shape of the bone without its hardness. It will not dissolve in cold water, but if boiled it reduces to gelatine. See Bone.

Ossian, osh′-ə-an, or more correctly, Oisín, appears in Gaelic literature and legend as the son of Finn, or Find, the hero of what has been styled the Fennian or Ossianic cycle of tales and poems current in Ireland and the highlands of Scotland. Finn is the hero of all these tales and poems, as Arthur is of the Arthurian cycle; Oisín is his poet and bard, as well as his son. This Ossianic cycle exists side by side with a hero cycle which consists of about 30 tales, forming one of the most complete epic cycles to be found in any literature. They are tales of battle, narratives of adventure, all circulating the round the person of the hero Cuchulain. They are mixed prose and verse and many of them are extant in manuscripts written about the 12th century. The Ossianic cycle is of a different period. Finn, the heroic figure, is a less legendary and mythological personage than Cuchulain; he lives in the 3d century at the time when the Romans occupied Great Britain and moves through the story almost like a historical character; the supernatural is almost entirely lacking in his adventures, and he fights his battles as a leader of mercenaries engaged, after the country has been conquered, in keeping the native races of Scotland in check. These stories are found in good manuscripts of the 15th century and their style points to the fact that a stage of culture has been reached by the rude inhabitants of North Britain very different from that described in the heroic cycle, where Medb, queen of Connaught, contends with Mac Nessa, king of Ulster, for the possession of the brown bull of Cualnge, and Cuchulain disperses Ulster single-handed and discomfits with his unaided sword the valor of whole armies. In the heroic cycle the characters are completely mythological, but they are distinctly described as to their dress or arms. In the Ossianic cycle the figures of the actors become more vague; there is an emphasis in the reported exploits of the warriors, although the excitement of the hunt, and the riot of the royal drinking bout, as therein depicted, are evidently clear transcripts from the primitive life of their period. There is one important point to be noted with regard to these two types of ancient Celtic literature in Scotland. They are as distinct in style, color, and development as in their dramatis persona. They belong to different eras, and their heroes never meet on the same stage; the hero of the earlier cycle has vanished when Finn, the Oisianic warrior, comes from the battlefield.

This is a very important point in deciding one of the most angry literary controversies of the 18th century. The Celtic legends as they were preserved orally or in manuscript attracted the fancy of James MacPherson (q.v.), a Scotch schoolmaster, who published what he averred to be translations from "the Gaelic or Erse" in the shape of "Fragments of Ancient Poetry" (1760) and subsequently produced "Fingal" (1762) and "Temora" (1763), afterward collected into a single volume under the title "The Poems of Ossian." There was much merit in these works as poems. The descriptions of scenery were often beautiful, and approaching the sublime, and the wildness of highland mountain and lake was vividly portrayed. But apart from the want of detail in the account given of the dress, buildings and social life of the personages introduced there was one circumstance that proved these poems to be anything but translations of a connected Gaelic or Erse composition. The heroes of the heroic cycle were made to mingle with the heroes of the Ossianic cycle in the narrative. And this was not all. MacPherson never produced during his lifetime the original poems which he averred were in his possession. After his death, however, some manuscripts were found in which fragments from both periods of genuine ancient poetry were found patched together in a cento with some very indifferent Gaelic of his own, and so arranged as to form a sort of counter-part to his "Poems of Ossian." The more recent studies in Gaelic literature have furnished us with this solution of the Ossian controversy; and have made it apparent that, while MacPherson might have been at liberty to fuse certain ancient poems, as Fitzgerald has done in his Omar, to produce a beautiful romance of his own, he committed a grave and unpardonable error in attempting to forge originals to support his claim that his work was a translation—pure and simple. Consult: Simpson, "Poems of Ossian" (1857); MacLauchlin, "The Book of the Dean of Lismore" (1862); Nutt, "Ossian and the Ossianic Literature"; Windisch, "Die Altrührige Sage und die Ossianischen Gedichte" (1877).

Oss"iifica'tion, the process of bone formation, which in all cases essentially consists of the deposition of earthy or calcareous matter. It may exhibit two modes of occurrence. Bone may be formed by the deposition of earthy or osseous material in fibrous membranes, that is, in tissues composed of fibres and cell elements. The flat bones of the skull or cranium are developed in this first manner. No granular or intermediate stage is observable in this process, the earthy matter being simply deposited in spaces which result from the reported exploits of the warriors, although the excitement of the hunt, and the riot of the royal drinking bout, as therein depicted, are evidently clear transcripts from the primitive life of their period. There is one important point to be noted with regard to
OSSINING — OSTADE

lage, just as in the previous case it began in membrane. The process of ossification in cartilage exhibits activity at several distinct and marked points of its extent. These points are the chief centers of bone-growth, and are hence called centres of ossification. The limy material is therefore diffused from these centres throughout the extent of cartilage, the blood-vessels of the adjoining parts bringing supplies of matter through which the bony vessels are deposited within the cartilaginous tissue. The corpuscles of the cartilage are seen to be arranged in vertical rows, and the calcareous matter, deposited in the form of granules, is thrown in around them. The nuclei of the cartilage cells are left unossified, a space also being kept free around each nucleus, which becomes one of the lacuæ or minute cavities seen in a microscopic section of bone-tissue. The first deposits of bony matter are of an irregular and thick description, this form of ossification, if persisted in, producing cancellated bony tissue; while by a subsequent process of absorption of the spaces in the cancellated tissue, and by the further deposition of bony matter, the irregular tissue is converted into compact bone. The gradual growth of the newly formed deposit depends on the centres of ossification in the cartilage, and in this new basic earthy matter is as continually being formed. Ossification may also occur abnormally in living tissues, and as the result of diseased conditions. Deposition of limy matter thus take place within the coats of blood-vessels, rendering them friable and readily ruptured. The valves of the heart may become calcareous, and calcareous degeneration may even affect tumors and other products in themselves of abnormal nature. A distinction ought to be made between mere calcification as just indicated, and true ossification, or the formation of bone. But in either case the deposition of limy matter forms the basis or essential feature. The gall-bladder may thus be converted into a hard limy sac or bag, and even the pericardium or investing sac of the heart may occasionally exhibit a high degree of calcification. See Bone.

Ossining, 05'sin-ing, formerly Sing Sing, N. Y., village in Westchester County; on the Hudson River and on the New York Central & Hudson River railroad; about 30 miles north of New York. It was settled about 1698, incorporated as a town 2 May 1845, and as a village some years later. The name Sing Sing, by which it was known until 1901, comes from an Indian word meaning a stony place. One of the State prisons is located here, just outside the village limits, and is known as Sing Sing prison; hence the villagers desired a change of name, and chose Ossining. The village, located upon rocky bluffs overlooking Tappan Bay and a long and beautiful part of the river. In the early part of the 18th century silver, copper and some gold was found here, and considerable capital was expended in developing mines which never produced results of commercial importance. The trade is chiefly in its own manufactures and farm products. Some of the places of interest are the Croton Aqueduct Arch, 88 feet span and 70 feet above water, and the arched high-way bridge. The State prison, a large white building, made of dolomite, a coarse marble quarried nearby, was founded in 1826. Capt. Elam Lynds brought here 100 convicts from the State prison at Auburn and put them to work to wall themselves in. Men only are confined here. The village has long been noted for its educational institutions; it has Holbrook, St. John's, and Mount Pleasant Military academies, Ossining Seminary for young women, public and parochial schools, and a public library. There are six churches. The two banks have a combined capital of $200,000. The government is vested in a president and nine trustees. The president and three trustees are elected each year. The village owns the waterworks. Pop. (1900) 7,039. Consult: Ingersoll, 'Hudson River and Catskill Mountains'; Scharf, 'History of Westchester County.'

M. MORAN,
Editor 'Democratic Register.'

Ossoli, 05'sol-ë, Sarah Margaret Fuller, Marchioness, American writer: b. Cambridgeport, Mass., 23 May 1810; d. off Fire Island beach 16 July 1850. She was remarkable for her precocity and her association with Emerson and other eminent literary men, rather than for her own productions. She was taught at six to read Latin, and early made herself acquainted with English and continental literature. She taught in public and private schools in Boston and Providence, and frequently visited Brook Farm (q.v.), though she never resided there, and had no confidence in the final success of that enthusiastic experiment. In 1840-2 she was editor of the 'Dial,' which numbered Emerson and other distinguished writers among its contributors. In 1844 she removed to New York, and became literary critic of the Tribune. In that capacity she worked effectively toward the increase of public interest and the improvement of public taste in literary, artistic, and other matters. She visited Europe in 1846, met there leaders in literature, art, and philanthropy, married in 1847 the Marquis d'Ossoli; was in Rome during the siege of 1849, when she served in the hospitals; embarked with her husband for New York, but perished in a storm in sight of land. Over her grave, the position she took in the American literary world of the time would perhaps be not wholly intelligible to one now reading much of what she wrote. Her critical articles are her best by far, many being brilliant and exact. It was Higginson who calls 'the power of putting a high thought into a sentence.' She sought to abolish the colonial spirit in American thought and letters, and contemporaries bear witness to the reality and excellence of the service. Consult the 'Memoirs' by Emerson, Clark, and Channing (W. H.) (1852); and the biographies by Howe (1883); and Higginson (1884) 'American Men of Letters' series.

Ossuna, 0-soo'nah, Duke of. See Ossuna, Pedro Telegz y Girón, Duke of.

Ostade, 0'shà-de, Adrian van, Flemish painter of Taft Haurractures the city; d. there 2 May 1865. He studied under Frans Hals. His pictures exhibit an exact imitation of nature, and contain realistic representations of subjects which in other hands would have been mean or commonplace, such as the interiors of ale houses or kitchens, with Dutch peasants smoking.
quarreling, or drinking, and he puts such ex-
pressions into the heads of his characters that
their coarseness is lost in our admiration of their
truth and animation. His coloring is rich and
clear, his touch spirited and free, and all his
works are highly finished. He was also a good
eater. Among his pictures (which are gen-
erally small) may be mentioned 'The Smoker';
'The Drinker'; 'The Dancer.' He also painted
many portraits.

**Ostade, Isack van,** brother and pupil of the
preceding. Flemish painter: b. Haarlem 2
June 1621; d. there 16 Oct. 1649. He at first
applied himself to paint the same subjects as
those which had brought such a brilliant reputa-
tion to his brother, but soon abandoned taverns
and kitchens for scenes in the open air, both
summer and winter landscapes, and with such
success that at the time of his death at 36 he
was rapidly rising to be a rival to his brother.
Original in style, his pictures are remarkable
for good composition, masterly drawing and
solid painting. Most of them are in England,
where they were valued before his fellow coun-
trymen came to a knowledge of his genius.
Among the most valued of them are: 'A Vil-
lage Inn'; 'View of a Frozen Canal'; 'Land-
scape and Cottages'; 'Village Scene' (show-
ing a cottage, horses with red cloak and post
wagon); 'Winter Landscape in Holland.' The 'Halte de
Voyageurs' and 'Vue de Village' were sold (1865) for
upward of $5,000 each.

**Osteitis,** inflammation of the substance of
bone. In its chronic forms it may result in
sup-
uration; in caries, a decay of the bone in parti-
cles; or in necrosis, a decay of the bone in
slices. In acute cases low diet, apertients, leeches,
etc., are employed; but in chronic cases, tonics,
good air, and possibly removal of the diseased
bone may be required.

**Ostend,** öst-tend', Belgium, a seaport town
and pleasure resort, in the province of West
Flanders, on the North Sea, 67 miles northwest
of Brussels. Ostend is connected by rail with all
parts of Belgium, France, and Germany; and
steamers ply regularly to and fro from London and
Dover. It was strongly fortified prior to
1865, since when the fortifications have been re-
placed by fine promenades. It has a healthful
situation, although on a low sandy coast, and is
resorted to for sea bathing, etc., by about 50,000
visitors annually. Along the sea front is a mas-
vie digue or esplanade of stone and terra-cotta,
three miles long, forming a fine promenade.
The public buildings include the Hotel de Ville,
three churches (one finished in 1800), an Eng-
lish church, large Kursaal, barracks, etc. The
harbor is not easy of access, but has been greatly
improved since 1868; the basins within are ex-
tensive, and form the termination of a magnifi-
cent line of canals stretching like a network
into the interior, and furnishing admirable facili-
ties for commerce. The manufactures are un-
important, the chief being linen, sail cloth, and
tobacco. Shipbuilding is also carried on. Cod
and herring fishing are considerable industries,
and fish are canned here in large salt reservoirs,
and transported as far as Paris. Ostend was founded in
the 9th century, walled in 1445, and regularly
fortified in 1585 by the Prince of Orange. In
the great struggle to throw off the yoke of Spain
it sustained a memorable siege from 4 July
1601 to 28 Sept. 1604, during which the besieged
lost about 50,000 men, and the Spanish besiegers
more than 80,000. Pop. (1900) 39,541.

**Ostend Manifesto,** The, a term used in the
diplomatic history of the United States since
1864. In that year 9 October, a despatch was
forwarded to the United States government by
the American ministers at the courts of Great
Britain, France, and Spain, who had met in the
city of Ostend, by the government's request, to
discuss the Cuban question. The despatch de-
clared, that if Spain would not sell Cuba, self-
preservation required the United States to take
the island by force, and prevent it from being
Africanized like Haiti. The suggestion was not
approved in the United States by statesmen or
politicians and was strongly condemned.

**Osteolépis,** a genus of fossil long, slender
crossopterygian fishes, peculiar to the Older
Old Red Sandstone of Scotland. It is characterized
by smooth rhomboidal scales, by numerous
sharply pointed teeth, and by having the two
dorsal and anal fins alternating with each other.
This, with Diplopterus, etc., constitutes the fam-
ily Osteólide, represented in America by the genus
Megalichthys of Carboniferous and Per-
manian formations.

**Ostéomala'cia** (also called MALACOSTEON
and COLLITIES OSSUM), a disease occurring
most frequently in women, but sometimes in
men, characterized by softening of the bones
through progressive disappearance of the earthly
salts. It affects the different parts of the skele-
ton, and deformities are often caused by it. It
is mainly confined to adults, does not ordinarily
attack the aged, and among women is likely to
be associated with pregnancy, or to follow child-
bearing, abstinence from which affected women
should strictly practise. It may progress for
years, and then end in fatal complication with lung
disease, or through exhaustion. The causes
assigned are many, but the principal one as
yet incomplete. Surgery has sometimes proved
more efficacious than medical treatment in this
disease, which demands the most thorough hy-
gienic care in all cases.

**Osteology,** that branch of anatomy which
treats of bone or of bones. The bony element
of the body is for the maintenance of form and
motion, support of weight and muscles, and the
protection of the internal organs. It is one of
the hardest structures of the body, possessing
a certain degree of toughness and elasticity.
(See Bone.)

**Development of Bone.**—In the foetal skele-
ton the long bones of the limbs are cartilaginous.
Hence there are two kinds of ossification, in-
cartilaginous and intramembranous, and to those
must be added the subperiosseal. In intracarti-
laginous ossification the cartilage-cells increase
rapidly in number and arrange themselves in
rows, the cells being closely packed and wedged
together. The intracellular matrix of the carti-
lage is semi-transparent. Lying below this car-
tilaginous layer is another, and over that is a
layer composed of osteoblasts. The intra-
membranous ossification is that by which the
bones of the vertex of the skull are entirely
formed.
OSTEOLEGY

Marrow.—The marrow differs in composition at different periods of life and in different bones. In the young it is a transparent reddish fluid of tenacious consistency, free from fat, and contains minute roundish cells. In the shafts of the adult long bone the marrow is of a yellow color and contains a large quantity of fat and areolar tissue. In the flat and short bones, in the articular ends of the long bones, in the bodies of the vertebrae, in the base of the cranium, in the sternum and ribs, it is of a red color, consisting of albumen and extractive matter with a mere trace of fat.

Nourishment of Bone.—This is derived from the numerous blood-vessels and lymphatic glands. Those of the compact tissue are derived from a dense network of vessels ramifying in the periosteum. From this membrane vessels pass into the minute orifices of the compact tissue.

Bones of the Human Body.—The skeleton of the adult consists of 206 distinct bones. The spine proper or vertebral column, includes 26; the cranium, 8; the face, 14; osphoides, sternum, and ribs, 26; upper extremity, 64; lower extremity, 62.

Long, Short, Flat, and Irregular Bones.—The long bones, found in the limbs, are built to sustain the weight of the trunk and confer the power of locomotion. A long bone consists of a lengthened cylinder, a shaft with two extremities. The principal parts of a long bone are the shaft, the walls consisting of a dense compact tissue of great thickness. They are the humerus of the arm, radius and ulna of the forearm, carpus, metacarpus, and phalanges of the hand; the femur of the thigh; tibia and fibula of the leg; tarsus, metatarsus, and phalanges of the foot. Where a part of the skeleton is intended for strength and compactness and its motion is at the same time slight and limited, it is divided into a number of small pieces united together by ligaments. The separate bones are short and compressed, as, for example, the bones of the carpus and tarsus. These bones in their structure are spongy throughout except at their surface, where there is a thin crust of compact tissue. The principal requirement is either extensive protection or the provision of broad surfaces for muscular attachment, the osseous structure is expanded into broad, flat plates, as seen in the bones of the head, pelvis, foot, and hand. The irregular or mixed bones are such as from their peculiar form cannot be grouped under the preceding heads. They are the vertebrae, sacrum, coccyx, temporal, and sphenoid.

The spine is a flexuous and flexible column formed of a series of bones called vertebrae. They are 33 in number exclusive of those which go to form the skull, and have received the names cervical, dorsal, lumbar, sacral, and coccygeal, according to the position they occupy; seven cervical, twelve dorsal, five lumbar, five sacral, and four coccygeal. The sacral and coccygeal vertebrae consist at an early period of life of nine separate pieces, which are united in the adult, so as to form two distinct bones, the sacrum and the coccyx. Each vertebra consists of an anterior and posterior segment or body, and a posterior segment or arch. The bodies of the vertebrae are piled one upon the other, forming a strong pillar, for the support of the cranium and trunk, the arches forming a hollow cylinder behind for the protection of the spinal cord. The different vertebrae are connected together by means of the articular processes and the intervertebral cartilages, while the transverse and spinous processes form levers for the attachment of muscles. Between each pair of vertebrae apertures exist through which the spinal nerves pass from the cord. The peculiar vertebrae of the cervical are the atlas and axis modified from the other vertebrae to admit of the nodding and rotary movement of the head. The atlas supports the globe of the head, the axis forming a pivot upon which the head is rotated. To the atlas and axis are attached the muscles of the neck and spine.

The large triangular bone situated at the base of the vertebral column at the upper and back part of the pelvic cavity is called the sacrum (q.v.).

The coccyx, the extreme end of the spinal column, in shape resembles a cuckoo's beak. It is formed of four small rudimentary vertebrae. It articulates with the sacrum and is attached to the levator and sphincter ani muscles, the gluteus maximus, and the coccygeus muscles.

The superior expansion of the vertebral column is called the skull, and includes the cranium and the face. (See SKULL.)

The hyoid bone is named from its resemblance to the Greek, upsilon. It is called the lingual bone, it supports the tongue. To it are attached the muscles of the throat.

The sternum is a flat narrow bone situated on the median line of the front of the chest, and to it are attached some of the muscles of the chest and abdomen, articulating with the clavicles and seven costal cartilages.

The ribs are elastic arches of bone which, with the intercostal muscle, form the thorax. They are 12 in number on each side. The first seven are connected behind with the spine, and in front with the sternum through the intervention of the costal cartilages. The remaining five are called false ribs. To the ribs are attached the muscles of the chest, abdomen, throat, back, and diaphragm.

The part of the sternum is called the clavicle, or collar-bone. (See CLAVICLE.)

The scapula forms the back part of the shoulder. It is a large flat bone triangular in shape, situated at the posterior aspect and side of the thorax between the first and eighth ribs. To it are attached the muscles of the shoulder, arm, and thorax.

The humerus is the longest bone of the upper extremity. It consists of a shaft and two extremities, articulating above with the scapula and below with the ulna and radius. To it are attached the muscles of the arm, forearm, and thorax.

The ulna is a long bone placed at the inner side of the forearm parallel with the radius and with it articulating with the humerus, forming the elbow-joint.

The radius is situated at the inner side of the forearm parallel with the ulna, with which it articulates, forming at its lower end the wrist joint, and the ulna a solid segment or body, and a posterior segment or arch. The bodies of the vertebrae are piled upon each other, forming a strong pillar, for the support of the cranium and trunk, the arches forming a hollow cylinder behind for the protection of the spinal cord. The different vertebrae are connected together by means of the articular processes and the intervertebral cartilages, while the transverse and spinous processes form levers for the attachment of muscles. Between each pair of vertebrae apertures exist through which the spinal nerves pass from the cord. The peculiar vertebrae of the cervical are the atlas and axis modified from the other vertebrae to admit of the nodding and rotary movement of the head. The atlas supports the globe of the head, the axis forming a pivot upon which the head is rotated. To the atlas and axis are attached the muscles of the neck and spine.

The large triangular bone situated at the base of the vertebral column at the upper and back part of the pelvic cavity is called the sacrum (q.v.).

The coccyx, the extreme end of the spinal column, in shape resembles a cuckoo's beak. It is formed of four small rudimentary vertebrae. It articulates with the sacrum and is attached to the levator and sphincter ani muscles, the gluteus maximus, and the coccygeus muscles.

The superior expansion of the vertebral column is called the skull, and includes the cranium and the face. (See SKULL.)

The hyoid bone is named from its resemblance to the Greek, upsilon. It is called the lingual bone, it supports the tongue. To it are attached the muscles of the throat.

The sternum is a flat narrow bone situated on the median line of the front of the chest, and to it are attached some of the muscles of the chest and abdomen, articulating with the clavicles and seven costal cartilages.

The ribs are elastic arches of bone which, with the intercostal muscle, form the thorax. They are 12 in number on each side. The first seven are connected behind with the spine, and in front with the sternum through the intervention of the costal cartilages. The remaining five are called false ribs. To the ribs are attached the muscles of the chest, abdomen, throat, back, and diaphragm.

The part of the sternum is called the clavicle, or collar-bone. (See CLAVICLE.)

The scapula forms the back part of the shoulder. It is a large flat bone triangular in shape, situated at the posterior aspect and side of the thorax between the first and eighth ribs. To it are attached the muscles of the shoulder, arm, and thorax.

The humerus is the longest bone of the upper extremity. It consists of a shaft and two extremities, articulating above with the scapula and below with the ulna and radius. To it are attached the muscles of the arm, forearm, and thorax.

The ulna is a long bone placed at the inner side of the forearm parallel with the radius and with it articulating with the humerus, forming the elbow-joint.

The radius is situated at the inner side of the forearm parallel with the ulna, with which it articulates, forming at its lower end the wrist joint, and the ulna a solid segment or body, and a posterior segment or arch. The bodies of the vertebrae are piled upon each other, forming a strong pillar, for the support of the cranium and trunk, the arches form-
OSTEOMYELITIS—OSTEOPATHY

Palm, and the phalanges or fingers. (See Hand.)
The os innominatum, or hip-bone, forms the side of the pelvic cavity. It is divided into three portions, the ilium, ischium, and pubes. It articulates with its fellow of the opposite side, the sacrum, and the femur. It forms the attachment of the muscles of the thigh, abdomen, and pelvis.

The longest bone in the skeleton, to which are attached the muscles of the leg and thigh, is the femur (q.v.).

The patella (q.v.) protects the front of the knee-joint and increases the leverage of the quadriceps extensor muscle. The tibia, situated at the front and inner side of the leg, beginning at the knee, is long, and narrow, with enlarged extremities, articulating with the femur, fibula, and astragalus. The fibula is situated at the outer side of the leg, is smaller than the tibia, and functions with it in the attachment of the muscles of the leg and foot. The bones of the foot consist of three divisions, the tarsus, metatarsus, and phalanges. (See Foot.)

H. H. Biedler, M.D.
Johns Hopkins University Hospital.

Osteomyelitis, inflammation of the inner lining membrane (endostium) and the marrow-cavity of bone, a disease of rare occurrence, mostly following amputations. It also follows wounds whereby the medullary canal is exposed to the air, such as gunshot wounds, compound fracture, etc. The inflammation is due to pyogenic infection, is generally acute, and extends from the marrow to the osseous structure itself. Chills, sweats, and high fever sometimes accompany the usual symptoms of pain and swelling, with a purulent discharge appear sloughs of tissue and dead bone. In children an acute form of osteomyelitis is sometimes seen which it is often difficult to distinguish from rheumatism. Surgery alone is practicable in the direct treatment, with such medical and hygienic accessories as the physician may prescribe.

Osteopathy, a method of treating diseases without drugs, which relies upon the intrinsic powers of the body, where these are made free to act according to their specific constitution, by means of the mechanical engineering of the living machine in its affected parts, and their restoration to the normal condition, relation, and action. Its essential point of departure from the chemical method is the biological postulate that the sole and sufficient remedies for the cure of disease are within the body, and that these may be made operative by anatomical adjustment. It holds that the drug-method is merely external, prescriptive, and regulative, an empiricism for the extraneous life processes of the body; that all cure must be intracorporeal, without imposition of an external force on the concrete processes of life. This brings therapeutics upon the plane of biology rather than chemistry. It establishes a biosis, which is of the essence of growth, repair, and cure. If disease be considered as maladjustment to environment through defective action and reaction in the bodily mechanism, then osteopathy would advocate the correction of such structural defect. There is a provision within the organism by which it may rise superior both to heredity and environment, until it meets and masters the conditions of its environment. This provision is selective adaptation.

By osteopathy the old postulate of evolution that life is a struggle because it proceeds from a poverty of resources, and that, consequently, only the fit may survive before the insurmountable pressure of environment, is set aside, and a new induction, discovered from an investigation of the life-processes, is enthroned in its place, and the contention is made that life is a progress due to a surplus of supplies, and that the unfit do survive when made free to act in possession of their own constitutional endowments in relation to any habitable environment. This biological position makes clear a line of demarcation between osteopathy and all the accustomed theories of medicine. It emphasizes the following principles as of paramount importance in the study of each and every part and power of the body: (1) Its organizing design; (2) its elemental potentiality; (3) its structural integrity; (4) its functional activity; (5) its mechanical adaptability; (6) its readjustive and restorative possibilities.

Osteopathy posits its entire claim to rationality and efficiency upon its philosophy as a critique of chemical medicine, maintaining that its principles, pharmacopeia, and practice are foreign to the body and antagonistic to its own processes. Not only is osteopathy biological, but its philosophy is teleological. It constitutes the philosophy of design that was set aside by the assumptions of materialistic evolution, and lets nature speak and act for itself under the categories of a theistic evolution. Osteopathy co-operates with nature in given cases of deformation, as in disease, by manipulating her own mechanisms and the sources of supply without extraneous chemical aid. The powers of bioplasm, cell, tissue, organ, and system, in their myriad transmutations and differentiations in the human body, are minutely and exhaustively studied and pressed into service in relation to the complex laws of stimulation, action, and reaction; just as the inventor of locomotives calculates the traction strength of iron, brass, copper, steel, and other materials, and fits each pipe, crank, and wheel to its intended function. Osteopathy postulates life as its basal principle, out from which all organization and structure proceed. There are no parts of the body superior to and sovereign over all reactions and constitute the essential impulses and initial conditions of all growth, repair, and cure. These inner actions constitute the substance of life, while the adjustments of these actions constitute the forms of life. Neither forms nor substance can be supplied ab extra to the body. Osteopathy takes both its materials and its methods from life itself. Its products and its processes are internal and constitutive, while the materials and methods, the processes and products of all chemical medicine are arbitrary, external, and prescriptive. Osteopathy reasons that all organized bodies exist as such by virtue of a final cause; that purpose rules as a law governing all facts in organic nature; that in organized bodies nothing is in vain. In virtue of this, osteopathy conceives animals and plants as subject to disease; for disease takes place when the parts do not fully answer their purpose, when they do not do what they were made to do and ought to do. Osteopathy reasons that if a structure is made and endowed to do a spe-
OSTEOPATHY

cific work, and this structure may be known as capable of doing it, if it has ever done it under any conditions, and it does not do this work under a change of conditions, and these conditions are known, and the degree of deficiency from its proper condition is discussed, the question only remains, Can the structure be made to do the work it was constructed to do, and may the conditions marking its failure be controlled to end of restoring the original and specified functions? This question, osteopathy contends, is not settled by a formula of chemistry or a prescriptive or legislative jurisdiction, but is one purely judicial and executive, interpreting the meaning of the organism or structure, and if it is not competent to make a law alien to its constitution and enforce it upon the organism contrary to its own spontaneity, however plastic it may be in a crippled condition; but rational and scientific procedure would dictate that the law already there be revived and set into operation by adjustment of the oppungent difficulties.

The cause of the particular mode of existence which part of a living body resides in the whole, and presides over the whole, while in dead masses each part contains the cause within itself. This explains why a mere part separated from an organized whole generally does not continue to live; why, in fact, an organized body appears to be one and indivisible. Continuity and contiguity of relation of each and every part of the body, or a complete correlation of all the parts, is the prime condition of continuity and harmony of action. Every element of the body, even the most infinitesimal, exists and acts according to an established norm, and the whole body, being the sum of all the parts, realizes a full and finished ideal only when the norm of each is fulfilled in correlation with all the others. The method of procedure in osteopathy therefore is the procedure of nature, and its power as a therapeutic agency is based upon its knowledge and skill in the modes of nature's operation and application. The discovery and application of osteopathic ideas is coeval with the great discoveries of physics, chemistry, biology, and physiology. Indeed osteopathy is the rigid and scientific application of biology and physiology directed to the production of therapeutics. It is also an application of anatomical mechanics. It emphasizes the anatomical ideas and utilities. The mechanical contrivances most conspicuous in man constitute the chief study of osteopathy, together with the purpose of their being and the normal laws of their action. This places osteopathy abreast of all the searching investigations into present physics, chemistry, and biology. Osteopathy seeks, with durable, reagent, and dynamometer, to resolve all things in the body into a unity of substance and of force, and by the laws of its own constitutional action to establish its true relation to heredity, habitat, and habit. The whole body must gravitate or have weight, without which it could neither stand securely nor exert its powers on the bodies around it. But for this, muscular power itself and all the appliances which are related to that power would be useless. As the body must have weight to have power, so must it have a skeleton, in which also are the most admirable and remarkable adjustments and adaptations.

From the lowest form of organized living substance—bioplasma—to the fullest and finest tissue—bone—osteopathy investigates, studies, and reasons. Form, structure, functions, relations, and purpose are the categories of its science, and as every science should take its differentiating principle, and even its name, from the essential body of its facts, so osteopathy takes the bones as its essential and nominal factor. The bones constitute the framework of the body. They give it location, position, locomotion, resistance, and relative action. Every other tissue is so related to the bones that their position and action depend on them. The bones are landmarks by which all other parts, from the most fluid to the most fixed, may move or may be moved. Every other tissue, in its position, composition, action, and destination, stands related to and dependent upon the right relation and action of the bones. The bones are not merely architectural, but architectonic. The bones give structural unity, the union of all the parts of the body which springs from the principles upon which the body depends. The bones supply the mechanical basis which secures to all other tissues their orderly functions. The name osteopathy is therefore scientific and significant. It is descriptive of the science, and embodies the master idea of the science, as it does also of the body's structure. Having ascertainment of the form and law and power and purpose of the organic bases of the body, having viewed these in their relations as a whole, having seen how these relations are discharged in the union of the action of the body, and having embodied all these in its name, osteopathy proceeds to the great questions: Is the law of life and disease and death within the body or without it? Shall the law of the organism dominate the law of environment or be dominated by it? Shall the body assimilate the world to itself, or be assimilated to the world? Is the principle of initiation and spontaneity superior to the state of passivity, reaction, and plasticity? Is the body a product to be reacted upon by the formulatioi of the apothecary, or a product capable of action through its own pathologies? If it is toxic and may produce within itself worse pathological conditions than can be produced without it, is it not also autotoxic, and may it not reduce these pathological conditions? If the body is autotoxic and autochemical, and can produce better formulations within its own laboratories than can be made in the commercial laboratories, why may not the body be autotherapeutic? If there are conditions of self-sufficiency in production, why may there not be conditions of self-sufficient reduction in all the processes that tend to disease or health? If the body in a state of health is de facto et in re a biogen, and with a change of condition may become a pathogenic type, and in turn may reconvert to a biogen under a reversal of conditions, why may not the science of pathology and bacteriology be considered merely as abnormal physiology, and pathogene microorganisms must have weight to have power, so must it have a skeleton, in which also are the most admirable and remarkable adjustments and adaptations.

If design and purpose dominate function, and function determines structure, what is the one and only thing to be done? If purpose abides as an unchanging factor, then the only thing to
be done is to manipulate structure in order to
the maintenance of function.

So osteopathy holds that structural integrity
is the one condition of functional activity. The four factors to be considered are: (1) Func-
tion as design when efficient; (2) the agent; (3) mechanism, by which power is ex-
pressed; (4) manipulation, by which the me-
chanism expresses its power in proper action.
Physiological chemistry constitutes one of the
most important of osteopathic disciplines; but
osteopathy defines this organic chemistry as
the chemistry which the living organs make, and not
the chemistry that makes living organs. There
is no such chemistry. There is therefore noth-
ing in the absolute sense that can embitter,
imitate, supplement, or supplant, aid, keep, or
rightly stimulate the life of the body or any
of the life-processes. Such chemistry is dead;
it not only cannot cure, but it is contrary to the
physiological condition of the body. The similita similitudinis curaturur is, in this
point of view, a contradictory to the pathological condition of the body.
Both are contrary to the body. Osteopathy works concordantly with nature. As disease is
produced in the circle of the natural working of the body, it must be reduced in the same
circle. There is unity of substance and force
both in health and disease, and this is the unity
of nature; so cure must be effected by that
which is natural to all the conditions; and there-
fore osteopathy says natura naturis curaturur.

Osteopathy develops its science into the et-
iology and symptomatology of disease, and
shows how these stand related to anatomical
integrity and the adjustment of organs that on
respiration, imitate, supplement, or supplant, aid, keep, or
rightly stimulate the life of the body or any
of the life-processes. Such chemistry is dead;
it not only cannot cure, but it is contrary to the
physiological condition of the body. The similita similitudinis curaturur is, in this
point of view, a contradictory to the pathological condition of the body.

OSTEOS TRACI—OSTERMAN

produces the desired result of health; (4) the process of manipulation, by which the mechanism is lifted to the power to produce the conditions of cure. All progress is made by realizing the relations between power and function, and manipulating the factors. In the animal realm, as in lower realms, the most potent forces are manipulated; that is, the law of production operates in changing both forms and functions. The trainer of animals demonstrates this. His methods are manipulative, and his results are marvelous. New functions are developed from the old powers, and so great is the production that specific changes which are persistent and transmissible are secured. This is the law in the breeding of animals. The consummations of both science and art are reached through the laws of productive manipulation. The artists who realize their ideals and become masters in music, painting, song, oratory, literature, have specialized power, and they put it to use—this is function. They achieve the relation between them, and manipulate instruments, paints, volume, language, and secure great ends. Then, too, men manipulate men. Youths are fitted—manipulated—for army, navy, bar, pulpit, politics. There is still loftier and more wonderful function which all may exercise—or upon the sphere of the higher nature—the task of transforming and reforming, that is, to all intents and purposes, truly forming each his own inward nature. This power seems greatest in overcoming an established habit. Anybody who breaks through a customary state or habit, already invovened with the intimate fibres of his own life, is a man par excellence. All these processes demonstrate the powers and possibilities of productive manipulation. They are, therefore, known to us a power which can originate actions and functions, a clear spring of volitional creativeness, and manipulation is the scientific means of its arousal, development, and manifestation.

Discovery of Osteopathy.—Andrew Taylor Still is the father and founder of osteopathy. He was a physician of the "old school." After many years of medical practice, including surgery, he became dissatisfied with the chemical methods, and having lost several children by meningitis, he began the study, experimentation, and investigation that resulted in the first announcement of his new method in 1875. For many years he practised osteopathy, limiting himself to dislocations, and at last, after great opposition and ridicule, he succeeded so conspicuously that a growing recognition was accorded him, and he founded a small class for its study. Since it was seen that others could accomplish the same results, and large numbers flocked to Dr. Still when, in 1866, he projected a school. From a dozen or so, pupils soon increased to hundreds.

Institutions, Students, and Practitioners of Osteopathy.—The American School of Osteopathy and the A. T. Still Infrmary, at Kirksville, Mo., was incorporated in 1895, and a large corps of teachers and operators were installed to train and treat the crowds of students and patients. A year later the Northern Institute of Osteopathy was projected in Minneapolis, Minn., and then the Des Moines College, the Southern, the California, the Colorado, and the Atlantic schools were established. These were all organized into a federation of colleges with a uniform curriculum. There are now over 3,000 practitioners in the field, with about 1,000 students in the colleges.

Legislation.—The first statutory recognition and regulation of osteopathy was made in Missouri in 1896, and the following States and Territories have laws regulating its practice: Alabama, Arizona, Arkansas, California, Connecticut, Illinois, Indiana, Iowa, Kansas, Michigan, Missouri, Montana, Nebraska, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, South Dakota, Tennessee, Texas, Virginia, West Virginia, and Wisconsin.

The American Osteopathic Association and State Societies.—There is a national association that meets annually, made up of a select membership, representative of the profession, and which exercises oversight in all pertaining to the science and practice. There are also in most States subsidiary societies with the same objects. Consult: Pressly, "Osteopathy as a Therapeutic Science"; Barber, "Osteopathy Complete"; Davis, "Osteopathy Illustrated"; Hulet, "The Principles of Osteopathy"; Tasker, "The Principles of Osteopathy"; Hazzard, "The Practice of Osteopathy"; McConnell, "The Practice of Osteopathy"; Still, "The Philosophy of Osteopathy" and "The Mechanical Principles and Philosophy of Osteopathy"; Littlejohn, "The Science of Osteopathy" (honorary-medal address before the London Society of Sciences).

MASON W. PRESSLY, A.B., Ph.D., D.O., Professor of Physiology and Principles of Osteopathy in the Philadelphia College of Osteopathy.

OSTERHAUS, öster-haws, Peter Joseph, German-American military officer: b. Coblenz, Germany, about 1840, d. in a steamboat casualty on the Mississippi 2 Feb. 1866. His wide charity and unselfish character made her a unique figure in the annals of Southern womanhood. During the Civil War she was a daily visitor at the Galveston hospitals, giving of her bounty to every sufferer. The German building in Galveston, a monument of her benevolence, was bequeathed by her to the poor of all creeds. At her death
OSTIA — OSTRACOPHORES

the bulk of her large fortune went to Jewish and general causes.

*Ostia*, ò스-tî'-gà, Italy, an ancient city, formerly the port of Rome, at the mouth of the Tiber, six miles from Rome by the Via Ostiensia. It was founded by Ancus Martius, who established salt-works at its site, which long continued to supply Rome and the neighborhood. Ostia also supplied Rome with corn from Sicily and Sardinia. It was not, however, till the wars with Carthage rendered it of importance as a naval station that it appears in history. The decline of Ostia appears to have been due to the constant filling up of the river, from which its site is now two or three miles distant. Claudius constructed a new harbor with great labor about two miles north of Ostia, which communicated with it by a canal. It was called the Portus Augusti, and afterward, when enlarged by Trajan, the Portus Trajani. The new port became the seat of a town called Portus Ostiensis or simply Portus. It communicated directly with Rome, and soon began to encroach on the trade of Ostia, which, however, continued to flourish until its destruction by the Saracens in the 9th century. Its ruins are about half a mile below the modern village, founded by Gregory IV, in 840, and strongly fortified, which is now a place with about 1,000 inhabitants. The ruins of Portus are on the right bank of the Fiumicino, about two miles from the coast.

Modern excavations at both places have revealed a number of interesting remains of ancient public buildings, temples, shrines, and tombs.

*Ostiaaks*, òsh-tî'-aks', a primitive Finnish race, who dwell in the Siberian government of Tobolsk and Tomisk. They consist of three tribes, distinguished from each other by customs and language. Their language, of which the dialects are numerous, is classed as a branch of the Samoedic, a language of Turanian stock. At present their aggregate amount to be estimated at some 100,000. Of uncertain origin, though possibly Mongolian stock, are the Siberian Yenisei Ostiaks, on the Yenisei, between the Upper and Lower Tunguska. They speak an entire different language from all the other Ostiaks, and for a long period have completely adopted Mongolian customs.

*Ostracism* (Gr. ostrakon, shell), an ancient mode of judgment by which, according to the Athenian law, a citizen was consigned to banishment. It was not a punishment for any offense actually committed, but a precaution against the projects of personal ambition and the excessive growth of individual power and influence. When it was decided by the popular assembly and senate that a citizen should be banished, no name being mentioned in the preliminary discussion, the voting took place in the following manner: — A place in the *agora* was enclosed by barriers, with ten gates for the ten tribes. By these the voters entered and deposited their votes, written on a shell or piece of tile. The archons counted the votes, and the person against whom the majority was given, provided it amounted to more than 6,000 votes, was obliged to leave the city within ten days. The period of banishment was usually ten years. Ostracism did not include forfeiture of property. Among the distinguished persons ostracized were Themistocles, Aristides, and Cimon, son of Miltiades.

*Ostraco'da*, an order of *Entomostraca* (q.v.) or small *Crustacea*, in which the body is unsegmented and completely enclosed in a bivalve shell or carapace. The shell is attached to the body only on the dorsal side, where there is an elastic divaricating ligament whose action is opposed by an adductor muscle. When the valves are opened seven pairs of appendages are exposed. These are two pairs of antennae, a pair of stout chewing mandibles, two pairs of maxillae and two pairs of locomotory legs. All of these appendages except the mandibles are more or less concerned with swimming and creeping. Besides tactile organs there is a pair of eyes, which is sometimes a pair of eyes. The sexes are always separate. Sometimes the eggs are carried within the female's shell, but usually they are deposited on water plants. The young pass through a nauplius stage with three pairs of appendages, but are peculiar in the presence of a bivalve shell. Numerous species inhabit both fresh and salt waters and many are known in the fossil state. The most frequent are the species of the fresh-water genus *Cypris* (q.v.), lively little animals found in great numbers in ponds and aquaria. *Cypris* is marine, and has the shell excavated in front to permit the passage of the very prominent antennae. It has both paired and median eyes and a large heart. Consult Packard, 'Zoology' (1897).

*Ostracoder'mi*, a suborder of *Placognath fishes*, according to the classification of Jordan (see *Ichthyology*), composed of the trunk-fishes, puffers, porcupine-fishes, and their allies, which have the body *inclosed in a three-, four- or five-angled box or carapace, formed by polygonal bony scutes, firmly jointed at their edges,* and are without a spinous dorsal fin.

This term has also been used as a synonym of *Ostracophori* (see *OSTRACOPHORES*).

*Ostracoph'ores*, a subclass of small fishes (*Ostracophorii*, or *Ostracodermi*), composed of very early Paleozoic forms with a head-split chord, and endoskeleton not calcified; mandibles and arches for the paired fins are apparently absent. The exoskeleton was well developed, and the head and anterior portion of the trunk was usually covered with plates in many forms solid and extensive shields, making the fish look much like a horse-shoe crab; indeed the remains of many were at first mistaken for those of crustaceans, arachnids, or even gigantic beetles. The mimicry of the contemporary *Eurypterus* (see *EUPTERTERUS*) was very close. Louis Agassiz first recognized them as fishes. None of these fossils exhibit the slightest trace of ordinary jaws, or of a segmented axial skeleton in the trunk, or arches for the support of paired limbs. The dermal armor is remarkable for the extent to which vascular spaces are developed in its middle layer; in the oldest and simplest forms no bone-cells have been found in any part of the armor. There is always a shield covering the top of the head, and usually another over the abdominal region; and opposed to the latter is a ventral armature which meets the dorsal plate at each side in an open suture. The tail seems always to have been flexible, though scaly in some species. The mouth, according to Wood-
ward, must have been on the ventral side, with the nasal sac or sacs just in front of it. The
gill-pouches opened outwardly into a covered
space communicating with the exterior by a
posterior orifice. Eyes are distinct, and other
peripheral organs are also distinct, and a pineal
eye may be inferred from impressions in the interior
of the head-plates. Traquair regards late dis-
coversies as showing some close relationship be-
tween ostracoderms and primitive sharks.
All four orders are recognized in the class.
The oldest and simplest is the Heterostraci, repre-
sented by the family Pteraspidae, whose species
occur in various parts of the world in forma-
tions from the later Silurian and early Devonian
Ages. The hard shield in these fishes, some of
which were a foot in length, is formed of a few
plates, well fused in the adult, each plate of
which is unlike anything else in the Chordata,
for it consists of three layers,—an inner or
nacreous layer of lamellae, a thicker middle
layer of polygonal cancells, and an outer layer
of dentine. Dermal sense-organs are well
developed and arranged in canals within the mid-
dle layer, opening externally by a double series
of pores. Pteraspis and Cyathaspis are well-
known genera. Associated with this group by
Traquair and Zittel-Eastman on later informa-
tion, are the family Calelepidae, formerly con-
sidered sharks; and the more familiar Psammom-
steidae, which extend the range of the group
into the Upper Devonian. A second order,
Anaspida, consists of a few species ornamented
outwardly with tubercles, but no armature of
fused plates. The third order, Aspidodecephali, or
Osteostraci, consists of many forms found in the
Upper Silurian and Lower Devonian, and espe-
cially in the Scotch Old Red Sandstone, which
have a broad solid head-shield, consisting of
three layers, the outer of hard vaso-dentine; the
body of these fishes were covered with quad-
ruangular scales; they had no paired appendages,
but moved by means of a small dorsal fin and the
heterocerical tail. This group is one of those
most studied by Hugh Miller, Murchison, and
other early geologists, and has been the object
of special treatises by Huxley, Lankester,
Brandt, etc. Trinaspis is a genus represent-
ing an allied family.
A fourth order, Antaricha, contains that re-
markable form Pterichthys and allied genera of the
class Asterolepidae. These were small
fishes of robust form, the head and forward
parts heavily armed with large tuberculated
plates united into a solid buckler by lateral
plates. The hinder part of the body, small fleshly
dorsal fin, set near the tail and the heterocerical
tail itself are covered with small scales, except
in the fanny portions. The most extraordinary
feature in this curious primitive fish were the
paddle-like appendages, closely resembling in
shape and action the flippers of a marine turtle,
which were articulated by a complex joint just
behind and beneath the corners of the mouth
and were completely armored. They formed
swimming organs prefiguring the pectoral fins
of later fishes. These and their allies, Astero-
lepis, Bothiolepis, etc., are found in the Dev-
onian rocks of Europe and North America.
Consult: Woodward, 'Vertebrate Paleontology' (1868); Zittel-Eastman, 'Text-book of Paleon-
tology,' Part II. (1902); Traquair, 'Fossil
Ostrich, a great African running-bird (Struthio camelus). The ostriches constitute a
genus (Struthio) and a family (Struthionidae),
of the group Ratitae (q.v.), characterized by
under 100 miles an hour, and a peculiar
which the former is much the larger, and bears
a short hoof-like nail; an almost equally unique
internal feature is the symphysis of the pubic
bones. The ostrich is by far the largest of
existing birds, attaining a height of seven to
eight feet and a weight of 300 pounds, and was
exceeded by only a few more or less closely
related extinct ones. There are no true down
feathers, but the contour-feathers are soft and
lax, with free barbs and no ailerons, and are
distributed uniformly over the skin without any
arrangement into pterygia and apertio. On the
body the plumage is black or blackish, with the
quill plumes of the wings and tail white; the
head and neck are nearly, and the legs quite,
naked. The head is remarkably small for a bird,
the eyes large and the beak flat; the homy
covering of the latter is peculiar in being com-
posed of several pieces separated by soft skin,
instead of being continuous as in most birds.
The gait is straight and remains to a point
beneath the eye. The absence of functional
wings and tail, the elevated back, the stout,
column-like legs with padded toes, the long,
erect, curved neck and the great size, all combine
to produce a very unlike bird—like aspect, and to
give a peculiar appropriateness to the name "camel-
bird," applied to the ostrich by old writers.
Formerly the ostrich was abundant throughout
Africa and a great part of the southern half of
Asia. In the latter region it is now restricted
to a few of the more inaccessible deserts, and
in Africa is no longer found in the wild state,
in Egypt or near the northern and southern
settlements, but is still abundant throughout the
intervening territory wherever sufficiently ex-
tensive and solitary wastes exist. Some zoolo-
gists consider that but a single species ranges
over this whole vast territory; others have dis-
tinguished three: Struthio camelus of northern
Africa, S. australis of southern Africa, and S.
molybdophanes of Somaliland. In the first the
naked parts of the skin are pink, in the second
bluish, and in the last lead-colored; the eggs
of the first have a surface of ivory-like smooth-
ness, in the other two they are pitted. Where-
ever abundant, ostriches live on the plains in asso-
ciation with zebras, hartebeests, gnus, etc.
Like these animals they are extremely alert and
wary as well as timid. So fleet are they that
even the Arab on his blooded steed can seldom
overtake the single-handed, and even when
hunted in relays, as the birds circle about their
favorite territory, one or more horses are fre-
quently sacrificed to the chase. When in full
flight a full-grown ostrich is said to cover 35
feet at a stride. They are also captured for the
sake of their plumes by means of pitfalls,
shooting with poisoned arrows, and in other
ways. During the breeding season they form
family parties consisting of one male and sev-
eral females. The latter deposit their eggs to
the total number of fifty to sixty to a nest, with
a depression surrounded by a slight rampart of
earth. Many of the eggs are broken, some of
Ostrich Fern — Oswald

them to be devoured by the male, others to supply soft food to the young, so that the brood of young seldom exceeds twenty or thirty, many of which fall a prey to carnivorous animals. The male exclusively incubates at night, while during the day the females take turns in guarding their eggs or driving away the intruders. During the breeding season the male protects his family faithfully and if driven to extremities fights viciously, kicking sideways or directly forward so powerfully that men and even horses are reported to have been killed by the blows. Although herbage is their chief food, everything edible is eaten, and their habit of swallowing every kind of hard object, just as other birds do gravel, to complete the grinding apparatus of the gizzard, has given to the digestive capacities of the ostrich a wholly undeserved notoriety. They are very fond of water and bathe when opportunities offer.

Domestication of the Ostrich.—Although the flesh is but little used, the eggs of the ostrich are much sought after in South Africa and their shells serve a useful purpose in the construction of vessels and implements. But it is their plumes which have given a mercantile value to ostriches from ancient times till now. To furnish a ready supply as the wild birds became scarcer in accessible regions, domestication has been resorted to. This is said to have been practised by native tribes for many years, and about the middle of the last century was begun by the French in Algiers and the English in Cape Colony. In the latter place there are said to be now upward of 300,000 domesticated ostriches, yielding an annual revenue of $5,000,000. Ostrich farming in the United States is still in its infancy, but promises to become an important industry. The first experimental importation of ostriches was made into California in 1882, and at the present time about 1,500 of these birds are to be found on the pioneer ostrich ranches of California, Arizona, Texas, and Florida. Large, level, grassy fields are enclosed by strong high fences, in which the general flock runs. The breeding birds are separated in pairs or sets of one cock and two hens in smaller pens. A single pair will sometimes produce as many as 35 young. The average loss of which is as low as 10 per cent in California, but much higher in Arizona. By the removal of the eggs as soon as laid and rearing them in incubators the output is much increased. In Africa a single trio of birds has been known to produce 188 eggs, from which 133 young were raised in a single year. The chief sources of loss are injuries by the parent birds, cold, dry food, and in Africa an infectious disease. The newly hatched young are the size of a full-grown barnyard hen, and when well fed increase in height so rapidly that by the end of six months they nearly equal their parents. At first they are sheltered at night in brooding boxes, but are turned loose during the day to feed on green alfalfa or other succulent plants, which are, with an abundance of water, their nearly exclusive diet. Dryness is especially likely to cause fatal digestive disturbances in the young. The old birds require but little care and are fed on any vegetable matter, but principally upon chopped beets, cabbage, oranges, and corn. The plumes from the wings and tails of the fully grown birds are the most valuable, and are cut or plucked once or twice a year, each bird yielding about $50 worth annually on the American ranches, but very much more than that on the African farms. When the American stock has become thoroughly acclimated this industry will probably yield rich returns, as some of the South African farms are reputed to pay 40 per cent net profit on the investment. Experiments in ostrich breeding are being tried in Mexico, Central and South America.

Consult: Mosenthal and Harting, 'Ostriches and Ostrich Farming' (1877); Martin, 'Home Life on an Ostrich Farm' (1891); Duncan, Report United States Department of Agriculture for 1888.

Ostrich Fern, a genus (Matteuccia) of ferns of the natural order Polypodiaceae. The best known species (M. Struthiopteris), a native of Europe and eastern North America, has fertile fronds which resemble ostrich plumes; its sterile ones, which often attain a height of ten feet, form a handsome vase-like mass of foliage. It may be readily propagated from offsets and is one of the most easily cultivated native ferns. See also Ferns and Fern-allies.

Ostrugoths, osètre-góths, a people of the Gothic race who lived at a very early time in southern Russia. They were conquered by the Huns 375 A.D. In 479 they crossed the Alps into Italy and became incorporated with other nations.

Osuna, ő-soonă, Pedro Telles y Giron, Duke of, Spanish soldier; b. Valladolid 1579; d. castle of Almaceda 1624. His caustic and satiric wit twice forced him to leave the Spanish court, to which he returned through the favor of the Duke of Lerma, after distinguishing himself in the Netherlands. He opposed the expulsion of the Moors, thus bringing upon himself the charge of religious infidelity. In Sicily, where he was viceroys 1611—15, and in Naples, where he held the same position 1616—20, he did much for the improvement of the common people, but was an enemy of the clergy in general and of the Inquisition in particular. He probably aimed to build up an Italian kingdom for himself, and in 1620 was recalled, arrested, subjected to a three years' secret trial, and imprisoned in the castle of Almaceda, where he poisoned himself.

Oswald, őz-wald, Saint, king of Bernicia, in Northumbria, England, from 634 to his death 5 Aug. 642. His father Ethelfrith had been one of the most powerful of the Saxon monarchs, but on his death the kingdom was overrun with invaders and Oswald his son was banished among the Scots in Ireland. Here he became converted to Christianity which he resolved should be the religion of his kingdom. In 636 he recovered the throne of Northumbria and requested the monks of Iona to send missionaries for the conversion of his pagan subjects. In response Aidan (q.v.) came with a band of clergymen and established himself as bishop in the island of Lindisfarne. In a few years the whole north of England was converted to the faith. Meanwhile Penda, king of Mercia, was persecuting the Christians, and at length declared war on Northumberland. A battle took place at Maserfelth, and Oswald was slain. Sub-
sequently the place was called Oswestry or Oswald's Cross, after this zealous and pious monarch, who, before the two armies joined battle, had set up a cross on the ground between them. His monument is still to be seen in Gloucester Cathedral where his relics had been deposited, and he was canonized as a king and martyr, his festival being celebrated 5 August. Consult Churton, 'History of the Early English Church.'

Oswald, Eleazer, American soldier and journalist: b. in England 1755; d. New York 30 Sept. 1795. He came to America in 1770 through sympathy with the patriot cause. In 1775, under Benedict Arnold, whose secretary he became, he served as captain at Ticonderoga and also at Quebec, where, Arnold being wounded, Oswald took command with great efficiency. In 1777 he rose to the rank of lieutenant-colonel. He engaged in the business of printing and publishing in Philadelphia and in New York, and politically was in violent opposition to Hamilton and the Federalists. He entered the French army, in which, at the battle of Jemappes, he commanded an artillery regiment. The French government sent him on a mission to Ireland, after performing which he returned to New York.

Oswald, Felix Leopold, American naturalist: b. Namur, Belgium, 6 Dec. 1845. He was graduated from the University of Brussels in 1863 and studied later at Göttingen and Heidelberg. He became a physician; but later abandoned the practice of medicine, came to the United States and devoted himself to natural history. He has published 'Summer-Land Sketches' (1880); 'Physical Education' (1882); 'The Secret of the East; or, The Origin of the Christian Religion' (1881); 'Days and Nights in the Tropics' (1887); 'The Bible of Nature'; 'Body and Mind'; 'Zoological Sketches'; etc.

Oswegatchie, os-wé-gach'i, Fort, a former French fortification near Ogdensburg, N. Y. It was also called Fort Preservation, and Fort La Gallette. In 1760 it was taken by the British and credited to William Amherst.

Oswego, os-wé-gó, Kan., city, county-seat of Lafayette County; on the Neosho River, and the Missouri, Kansas & T. and the Saint Louis & S. F. R.R.'s; 132 miles south-southwest of Topeka. The river furnishes excellent water-power, and there are a number of mills, including flour-mills. It is also the centre of a grain and live-stock region; and there is some coal in the vicinity. A public library is maintained by the Library Association. Pop. (1890) 2,574; (1900) 2,398.

Oswego, N. Y., city, port of entry, county-seat of Oswego County; on Lake Ontario at the mouth of the Oswego River, and at the northern terminus of the Oswego Canal. It is on the Delaware, Lackawanna & W., the New York, Ontario & W., and the New York Central & H. R. R.'s; about 35 miles north by west of Syracuse. Oswego was founded in 1724, as a trading post and military station. It was incorporated as a village in 1828, and in 1836 was chartered as a city. It was one of the most important places on Lake Ontario and in wars which took place along the northern frontier it was always considered a vantage ground and its possession was contested. In the French and Indian war and King George's war, Colonel

Mercer built here two forts, strong for the times, 1755. In August 1756, the place was captured by General Montcalm, who destroyed the forts. This capture of Oswego was considered one of the most important events of the French and Indian war. About 30 men on each side were killed or wounded and 1,600 of the British were taken prisoners. Oswego was made the centre of the military operations along the lake and in the year 1759, General Amherst started from this place, with a force of 10,000 men, for Quebec where Wolfe was in command. Oswego was the meeting place, in 1766, between Sir William Johnson and Pontiac, and at this meeting the latter submitted to the British. In the War of 1812 this place was again a disputed point. Its good harbor was always an attraction. On 6 May 1814 a British force attacked the place and captured it. After peace was restored, the place prospered and grew steadily as an important lake port and a shipping point for the products of the rich farms of the vicinity. When the West began to develop as a wheat country, and the grain was at first sent East to be manufactured into flour, Oswego was one of the chief centres of manufacture and shipment. The grain elevators and flour mills were then prominent features along the river and canal. The opening of the flour-milling industry in the West, near the wheat-fields, deprived the city of its great industry, from which loss it did not recover for years. The excellent water-power was finally used for manufacturing other products, and the city has now (1904) a large starch factory, machine-shops for oil-well supplies, boiler and engine works, knitting mills, car spring works, match and cigar factories, shade cloth mills, and breweries. The lake trade has increased and the city exports manufactured goods, farm products and fruit. The harbor, with its outer and inner harbor, which can accommodate large steamers, has been so improved that the quantities of coal, lumber, and grain brought here for re-shipment can be handled with great rapidity. The exports in 1903 were nearly $3,000,000 and the imports, nearly $700,000. The beautiful parks, the drives, especially near the lake and along the river, fine residences, and grounds, all make an attractive city. Some of the places of interest are the old Fort Oswego (q.v.), the present Fort Ontario which overlooks the harbor, the government building, the State Arsenal, the court-house, and city-hall. Oswego is noted for its State Normal and Training School, founded by Edward Austen Sheldon (q.v.). It has fine public and parish schools and the Gerrits Smith Library. The government is administered under a charter of 1896 which provides for a mayor, who holds office two years, and a council. The waterworks are owned and operated by the municipality. Pop. (1890) 21,842; (1900) 22,199.

Oswego, a river in New York, formed by the junction of the Oneida and Seneca rivers in the northern part of Onondaga County; and flowing north by west enters Lake Ontario at Oswego. It is 24 miles long and has a fall of 120 feet from its source to the lake. By means of a canal and locks, the river has been made navigable some distance from its mouth.

Oswego Bass, the small-mouthed black bass. See Bass.
Oswego, Fort, the name of the fort built by the French on the site of what is now the city of Oswego. Later Fort Ontario was built on the opposite side of the Oswego River. See Oswego.

Oswego Tea, a name given to several species of labiate plants of the mint-like genus _Monarda_, particularly _M. purpurea, M. didyma_, and _M. calaminia_, natives of North America, because of the occasional use of an infusion of the dried leaves as a beverage. The infusion is said to be useful in intermitents and as a stomachic. Some other species of _Monarda_ are used in the same way, and are not uncommonly cultivated in gardens for ornament, where they are sought by bees.

Osymandias, ὄ-σ-μ-ἄ-δι-α ἄ-σ, Egyptian king, said by Greek writers to have reigned during the period between Menes and Meris, and to have invaded Asia with a great army, penetrating as far as Bactria. According to Diodorus, on his return he erected great works at Thebes, among which was a monument of unequalled magnificence, the Osymandian, but this is supposed to be identical with the Ramesseum on the west bank of the Nile at Thebes, built by Rameses II., with whom, however, there is much difficulty in identifying Osymandias himself, whose exploits appear to be mostly of a fabulous character. Consult: Diodorus, i. 47-9; Tzetzes, 'Chiliades' iii. 892; iv. 620; Budge, 'A History of Egypt' (1902).

Otago, ō-tä-gō, New Zealand, a southern provincial district of South Island, bounded west, south and east by the Pacific Ocean, and north by Canterbury and Westland. Area 25,487 square miles. The capital is Dunedin, other towns are Port Chalmers, Oamaru, Invercargill, etc. Otago was settled in 1848 by a body of Scotch Free Churchmen. Pop. (1901) 173,145. See NEW ZEALAND.

Otahiti, ō-tä-he-tē or ō-tä-hē-tē, an island in the Pacific Ocean, now known as Tahiti. See TAHITI.

Otalgia, earache; specifically neuralgia of the ear. Its attack is usually sudden, the pain coming on at once with full intensity. It is often associated with other ailments of which it may be but a symptom, and frequently arises from disorders of the teeth. Neuralgic pains in other parts of the face often follow it. When otalgia is very intense it extends to the temple and nerves on the same side of the face, in which it causes acute pains. It frequently departs suddenly, and returns again generally to the same ear. The treatment when the disease is symptomatic must depend upon the cause. Ordinarily earache is due, not to otalgia, but to otitis media (q.v.), or inflammation of the middle or tympanic portion of the ear.

Otari, ō-tä-woo, Japan, the chief town on the west coast of Hokkaido on the south shore of Ishikari Bay, and connected by rail with Sapporo and the coal region of Ishikari. It has important fisheries and a large trade. Interesting archaeological remains have been found in the vicinity. Pop. (1898) 56,961.

Otavalo, ō-tä-va-lo, Ecuador, town, province of Imbabura; 25 miles northeast of Quito. It was settled in 1534; in 1668 it was completely destroyed by an earthquake and many of the inhabitants were killed. Since then it has been well rebuilt, and has several mills manufacturing cotton and woolen goods. Pop. about 6,000.

Otechakov, ö-chä-kôf, Russia. See OCHAKOF.

Otero, Miguel Antonio, American capitalist and politician: b. Saint Louis 17 Oct. 1859. He was educated at Saint Louis University, and at Notre Dame University, Ind. From 1880-5 he was cashier of the San Miguel Bank of Las Vegas, N. Mex., and is director and official in several important companies. He has been clerk of San Miguel County, city treasurer of Las Vegas, and clerk of the United States district court for the 4th judicial district of New Mexico. In 1892 he was a delegate to the Republican National Convention; and in 1900 chairman of the Territory's delegation to the Convention. He was appointed governor of New Mexico in 1897, and re-appointed in 1901 for a term of three years.

Otero, Rafael, Cuban dramatist: b. Havana 1827; d. there 1876. His first comedy was performed so enthusiastically in Havana that several others were afterward presented at Matanzas and Havana, among them: 'El Coburgo,' 'Del Agua Mansa,' 'Mi Hijo el Frances,' and 'Un Novia del Dia.' He further wrote two works of fiction, 'La Peria de la Diaria' (1860) and 'Cantos Sociales' (1868). Much of what he wrote remains in the files of periodicals.

Otfried, öf-tréfd, Alsatian theologian and poet: b. about 800; d. about 875. He was the author of one of the earliest specimens of composition in the German language. After having become a monk of the Abbey of Weissenburg, in Alsace, he studied under Rabanus Maurus, abbot of Fulda. He then returned to his monastery, where he opened a school of literature, and wrote a variety of works in prose and verse. The most important of these is a rhymed version or paraphrase of the Gospels in Old High German, still extant, in which there are some passages of lyrical poetry. He completed it about 868, and dedicated it to Ludwig, king of Germany. An edition of it was published by Piper in 1808, and modern German translations by Rapp (1859) and Kelle (1870).

Othello, ö-thel'-ō, The Moor of Venice, The Tragedy of, a drama by Shakespeare based on Schicchi ranks with Hamlet, 'Macbeth,' as one of the poet's four great masterpieces of tragedy. It was acted in 1604, printed in 1622 in a quarto edition, and was included in the First Folio of 1623. The source of the tragedy is the story entitled 'Un Capitano Moro' in Cinthio's 'Hecatommithi;' a collection of tales and novels printed in Italian in 1555. The 'Hecatommithi' appeared in French in 1584, but Shakespeare has followed the Italian version in its general outlines.

Othman, öh-män', or Osman I, surnamed Ghazi, "the Victorius," Turkish sultan, founder of the Ottoman or Osmanli empire, which was named after him: b. Sukut, Bithynia, 1259; d. 1326. In 1288 he succeeded his father Erteogruz as chief of a Turkish horde in Phrygia, and in 1299, after successful campaigns which put the eastern part of Asia Minor in his hands, proclaimed his independence and took the title of sultan. Nicaea (1304), Marmora (1307) and Broussa (1326) were under his sway until last years he made Karahissar his capital and
issued a regular coinage. He was succeeded by his son Orkhan.

Othman, or Osman II, sultan of the Turks: b. 4 Nov. 1605; d. Constantinople 20 May 1622. The son of Ahmed I, in 1618 he came to the throne as 16th sultan and successor of his deceased uncle Mustapha I. He was defeated at Chocizim (1621) by Sigismund III, king of Poland; attempted to suppress the Janizaries; but was captured by them and imprisoned. He was killed in prison by the grand vizier.

Othman Ibn Affan, third Moslem caliph: b. Mecca about 655; d. Medina 656. Mohammed's secretary and lieutenant, he married the Prophet's two daughters, and in 644 after the death of Omar was chosen caliph by the six appointed by Omar, of whom one actually wished Othman's election, each of the others pressing his own claims. Othman was then old and feeble, and not by nature over energetic in his prime, but he seems to have carried things with a high hand. He occupied Persia (645-7), eastern Africa, and Nubia (651), began the spread of Islam in the islands of the Mediterranean, and removed from their offices the tried generals of Abu Bekr and Omar to make room for his kinsmen and favorites, and raised a storm of disapproval by sitting in the very seat of Mohammed instead of two steps below it, like his two predecessors. He attempted to introduce a definitive revision of the Koran. A great plot, embracing all his early rivals and the sectaries who differed with him, was formed; the Caliph was besieged, having broken his promise to appoint new governors, and was assassinated. His rule, though disturbed at home, was the beginning of the imperial growth of Islam, thanks to the conquest of Cyprus, Armenia, North Africa, etc.

Otho I, dòthó (The Great), emperor of Germany: b. 23 Nov. 912; d. 7 May 973. He was son of Henry I, and was crowned king of Germany at Aix-la-Chapelle in 936. His reign of 36 years was an almost uninterrupted succession of wars. After a 14 years' struggle he subjugated the Bavarians, duke of Bohemia; wrested the duchies of Swabia, Bavaria, and Lorraine from the Dukes of Bavaria and Franconia, and gave them (in 949) to his sons Ludolf and Henry, and to his son-in-law Conrad, count of Worms, respectively. He delivered the Italians from the oppressions of Berengar II, married the widow of Lothar, their first king, and was crowned king of Lombardy (951). In 961 he was crowned king of Italy, and in the next year emperor by Pope John XII. But shortly after John made an alliance with Adalbert, king of Upper Italy, to drive the Germans out. Otho, the following summer marched against Rome, drove John out, deposed him and placed Leo VIII. in the papal chair, though this proceeding is recognized as uncanonical and Leo is reckoned an anti-pope. The Byzantine court refused to acknowledge Otho's claim to the imperial dignity; but he defeated the Greek forces in Lower Italy, and the eastern emperor, John Tzimessis, gave the Greek princess Theophania to Otho's son Otho in marriage. He was at once the greatest political and military power of the West.

Otho II, called Der Rote (*The Red*), emperor of Germany: b. Rome 955; d. there 7 Dec. 983. He was the youngest son of Otho I. His elder brothers had all died before their father, who caused him to be crowned king of Rome (967), the first instance of the kind in German history. He assisted Henry II, duke of Bavaria. In Italy he suppressed a rising under Crescentius, and then attempted to drive the Greeks from Lower Italy; but they called in the aid of the Saracens from Sicily, and Otho suffered a total defeat near Cotrone, Calabria, 13 July 982. He died before fresh plans of conquest against Greeks and Arabs could be executed.

Otho III, called Mirabilia Munn (*Wonder of the World*), emperor of Germany: b. July 980; d. 23 Jan. 1002. He was son of Otho II, and the last of the male branch of the Saxon imperial house. He was only three years old when he succeeded his father. In 996 he marched into Italy and crushed a fresh insurrection fomented by Crescentius. He was crowned emperor in 996 by Gregory V. He again crossed the Alps in 998 to suppress a second rebellion under the emperors, who were caused to be beheaded. On the death of Gregory, Otho raised his old tutor, Gerbert, to the pontificate as Sylvester II. Peace in Rome was however, only temporary, and until his death Otho was mostly employed in quelling disturbances in various parts of Italy. Some historians assert that his death was due to poisoning, an act of revenge on the part of the widow of Crescentius. The emperor was a strict mon- archist, much given to penances and pilgrimages.

Otho IV, emperor of Germany: b. 118; d. 19 May 1218. He was the son of Henry, Duke of Saxony. He was chosen by the Guelphs as rival king to Philip of Swabia in 1198, was recognized as sole king in 1208, and was crowned emperor at Rome 4 Oct. 1209. However, the emphasis which he placed upon imperial sovereignty in Italy displeased the Pope, who excommunicated him in 1210, and in 1212declared Frederick II, the true king of Germany. He finally relinquished the struggle against Frederick and retired to his possessions in Brunswick.

Otho, or Otto, I, king of Greece, second son of King Louis of Bavaria: b. Salzburg 1 June 1815; d. Bamberg 26 July 1887. He was educated at the University of Munich, was nominated king of Greece by the London Conference 7 May 1832, and chosen to this office by the Greek National Assembly 8 August. Until 11 June 1835 he was guided by a regency. Upon coming to his majority he showed himself too weak, too easily influenced by his Bavarian courtiers, and, above all, too much under Russian control to win the confidence of the people. Internal disorder, financial difficulties, and open breaks with Great Britain and France followed. And 24 Oct. 1862 he was deposed by a provisional government, and returned to Bamberg. The only work of any importance that he accomplished for Greece was the organization of a system of education; a system of public schools, in his place would probably have benefited by the repeated opportunities given Greece to acquire some territory of Turkey.

Otho, Marcus Salvius, Roman emperor: b. 32 a.d.; d. 69 a.d. He was for a time governor
OTIS

of the province of Lusitania (Portugal) and joined Galba when the latter rebelled against Nero. On Galba's accession in 67 Otho became the royal favorite and was made consul; but when Claudius was appointed Piso as his successor, Otho, securing the allegiance of the pretorian guard, had Galba and Piso murdered, and was proclaimed emperor in 69. The eastern provinces acknowledged him as emperor, but in Germany Vitellius was proclaimed by the legions of the lower Rhine. Having led his army into Italy Vitellius overthrew, at Bebriacum, the forces of Otho, who killed himself after reigning three months and a few days.

O'tis, Bass, American artist: b. New England 1784; d. 1861. He first came into public notice as a portrait painter in New York, and nothing is known about his previous years of study. In 1812 he settled in Philadelphia where his only known genre picture, 'Interior of a Forge,' hangs in the Pennsylvania Academy of Fine Arts. His portraits include those of President Jefferson; Alexander Lawson; the painter Jarvis; and Dr. Physick. He has left a portrait of himself. Some of his works he reproduced in mezzotint.

O'tis, Elisha Graves, American inventor: b. Haliifax, Vt., 3 Aug. 1811; d. Yonkers, N. Y., 8 April 1861. He worked on a farm; was a carriage maker 1838-45; and was head of manufacturing concerns in Albany, Bergen Heights, N. J., and Yonkers. His great invention, that of a safety device for an elevator so that it can not fall even if the cable on which it is hung should break, was perfected for use in the last-named factory, and probably did more to increase the value of city real estate by making tall buildings possible than any other invention of the century. O'tis also invented a special and independent engine for elevators, as well as a steam plow, a steam oven, and a safety bridge, which although without a draw does not impede navigation. The great elevator business begun by him is carried on by his sons Charles Rollin and Norton Prentiss O'tis.

O'tis, Elwell Stephen, American soldier: b. Frederick, Md., 25 March 1838. He was graduated at Rochester University in 1858, and at Harvard Law School in 1861; volunteered in the Union Army in 1862 as captain of the 140th N. Y. Infantry, and took part in many battles in Virginia. Disabled for duty by a wound at Petersburg 1 Oct. 1864, he was discharged from the volunteer service with brevet rank of brigadier in 1865; in 1866 became lieutenant-colonel of the 22d Infantry; served in the West 1867-85, being organizer and head of the Leavenworth School of Infantry and Cavalry from 1881 to 1885. He commanded at Assiniboine, Mont., 1885-90; from 1890 to 1893 was superintendent of the recruiting service, his rank in the latter year being full brigadier; and, after commanding the Department of the Columbia 1894-7 and the Department of the Pacific 1897-8, was appointed commander of the United States forces in the Philippines and military governor. He was a member of the Philippine Commission 1899. In May 1900 he retired from the government of the Philippines; in June was promoted major-general; and in October became commander of the Department of the Lakes; a post which he held until his retirement from active service in March 1902.

O'tis, Fessenden Nott, American surgeon: b. Ballston Spa, N. Y., 6 May 1825; d. 24 May 1900. He was graduated from the New York Medical College in 1845; was surgeon of the New York police department in 1861; lecturer on genito-urinary diseases at the New York College of Physicians and Surgeons 1862-71, and clinical professor there from the date last named. Among surgical instruments in use by him may be cited the urethrometer; and the dilating catheter. He published 'History of the Panama Railroad and the Pacific Mail Steamship Company' (1849); 'Urethral Strictures' (1877); 'Genito-Urinary Diseases' (1883).

O'tis, Harrison Gray, American orator and statesman, nephew of James O'tis (q.v.): b. Boston, Mass., 8 Oct. 1765; d. there 28 Oct. 1848. He was graduated from Harvard in 1783, studied law and was admitted to the bar in 1786. He was a member of Congress, 1797-1801, and United States Senator, 1817-22. He had previously sat in the Massachusetts Legislature; and he took an active part in the Hartford Convention of 1814 and was an ardent Whig in 1829. His published works include: 'Letters in Defense of the Hartford Convention' (1824), and 'Orations and Addresses.'

O'tis, James, American Revolutionary statesman: b. West Barnstable, Mass., 5 Feb. 1725; d. Andover, Mass., 23 May 1783. He was graduated from Harvard in 1743, studied law in the office of Jeremiah Gridley at Boston, was admitted to the bar at Plymouth, but after two years of practice there settled in 1748 in Boston, where he quickly attained eminence in the courts. During his rise in the law, he found an avocation in the study of the classical and English literatures, and published 'The Rudiments of Latin Prosody' (1760), a work of careful scholarship. He was appointed attorney general, but this post he resigned rather than support the writs of assistance, application for which had been made in the Massachusetts supreme court. These writs were warrants permitting general search for smuggled goods, and O'tis was entirely convinced of their illegality. In February 1761 the matter came to a debate before the court. Gridley appeared for the crown and O'tis and Oxenbridge Thacher, another well-known lawyer, for the opposite side. O'tis' speech, occupying some four or five hours and marked by an argument of great learning and intellectual force, has been called the prologue of the Revolution. John Adams, whose notes taken in the court-room and later revised are the only authentic record for the content of this great effort, declares that 'then and there was the first scene of the first act of opposition to the arbitrary claims of Great Britain.' O'tis was entirely convinced of the illegality. In February 1761 O'tis was elected to the legislature, where he gained a high reputation for his eloquence and patriotic earnestness. From this time until 1769 he was the pre-eminent leader of thought in that discussion and development of opinion which preceded the war. In 1762 he published 'A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay,' a brochure of 'exasperating candor,' of which
OTIS — OTTAWA

John Adams said, "How many volumes are concentrated in this little fugitive pamphlet?" This is regarded as a chief source for subsequent attacks against parliamentary taxation and in favor of free speech. It was followed by two others, 'The Rights of the British Colonies Asserted and Proved' (1764), which maintained a conciliatory tone and was therefore displeasing to the extremists, and 'Considerations on Behalf of the Colonies' (1765), increasingly bitter, and satisfactory to his previous critics. Otis was a prominent member of the Stamp Act congress, which met at New York in October 1765; in 1766 he was elected speaker of the general court, but did not assume office because of the negative of the governor. In 1768, after Townshend's bill for the taxation of the colonies had been passed by Parliament, the general court despatched to the remaining colonies a second circular-letter, urging unity in some plan toward common protection. This letter was drafted by Otis and corrected by Samuel Adams. Bernard, royal governor, demanded the recall of the letter as traitorous, and Otis made a speech, advocating non-compliance, which the royalists thought might be the most violent, insolent, abusive, and treasonable declaration ever uttered. But the legislature did not vote for the recall of the circular. Otis was now wholly occupied with the press interests, writing for the press and addressing political gatherings. In 1769 he was accused in England of treason by the customs commissioners, and presumably the commissioners of the Boston 'Gazette.' He had become involved in a quarrel with Robinson, one of the commissioners, during which he received a wound of the head which is supposed to have brought about his subsequent insanity. He was awarded £2,000 damages, but refused to claim the sum upon receipt of a written apology. During the rest of his life he was subject to fits of aberration, and though he was in the legislature in 1771 and for a brief time resumed his Boston practice, he continued in general unequal to public and professional duties. While in an unbalanced condition he took part in the battle of Bunker Hill. He was killed by a flash of lightning, more than any other American. Otis gave the impetus and direction to the struggle for independence. Consult the biographies by Knapp (in 'Sketches of Eminent Lawyers, Statesmen, and Men of Letters' (1821) and Tudor (1823)); also Tyler, 'Literary History of the American Revolution' (1897).

Otis, James. See KALER, JAMES OTIS.

Ottis Med'ia, inflammation, acute or chronic, of the middle ear or tympanum. It is accompanied by an effusion into the tympanic cavity, either of serous fluid, when the affection is catarrhal, or of purulent matter. It may arise from the causes which produce a common cold, sometimes spreading from affections of the nose and throat; and it may result from the intrusion of water or other fluid into the middle ear through the Eustachian tube, which often occurs during the act of bathing or by way of the nasal passages in connection with the use of the douche. Whether acute or chronic, the disease is of serious importance, and requires thorough medical treatment. See Deafness; EAR.

Otoc'y'on. See CAPE FOX.

O'tolith. See Anatomy; EAR.

Otomí, ñ-tó-mé, aboriginal Mexican people now living in the mountains of Guanajuato, Queretaro, and Hidalgo, but in early times inhabitants of the plains of Mexico. A tribe shorter and darker than the other natives they also differ from the other Mexican Indians in their unique monosyllabic language, which is, however, probably distantly related to the other native dialects. The Otomi, or, to use their own name, the Hia-hul, show a high stage of industrial development; their crafts and their arts are an important source for the American ethnologist. They number possibly 200,000.

Otón, ó-tón', Philippines, a pueblo of the province of Ilolo, Panay, situated on the southwest coast of Ilolo Strait, six miles west of the town of Ilolo; it is connected by road with Ilolo and other towns of the province. Pop. 13,630.

Otranto, ó-trán'tó, Italy, the Latin Hydruntum, and capital of the Terra di Otranto, now the province of Lecce, in the extreme southeast of Italy, on the Gulf of Otranto, 20 miles by rail southeast of Lecce. The Strait of Otranto, 45 miles wide, separates it from Cape Linguetta on the opposite coast of Turkey. During the later period of the Roman empire and all through the Middle Ages Otranto was the chief port of Italy on the Adriatic, whence passengers took ship for Greece — having in this respect supplanted the famous Brundisium of earlier times. In 1480 it was taken by the Turks. Its castle, now a picturesque ruin, gives the title to Horace Walpole's well-known story. The town is the seat of an archbishop, and has a cathedral, restored after the siege by the Turks, with fine mosaics and an ancient crypt. Pop. (1901) 2,401.

Otesgo, ó-té's-gó, a lake in Otsego County, N. Y., the main source of the Susquehanna River. It is a beautiful body of water; along its shores are many attractive cottages, but it is noted chiefly for its connection with James Fenimore Cooper (q.v.). Cooperstown (q.v.) is on the south shore.

Otsego Bass. See WHITEFISH.

Otso, ó-tsoo, Japan, a town in the island of Hondo, finely situated at the southern extremity of Lake Biwa, a few miles by rail east of Kioto. It has many religious edifices and a strong fortress. Pop. (1896) 34,225.

Ottar of Roses. See ATTAR OF ROSES.

Ottawa, ót-tá'vá ré'má, a form of versification, favored by the early Italian poets, but long since obsolete. Boccaccio and Ariosto adopted the form for many of their longer poems.

Ottawa, ót's-wá, Canada, city, capital of the Dominion of Canada and of Carleton County in the Province of Ontario; at the confluence of the Ottawa and Rideau rivers, and on the New York & O., the Canadian Pacific, the Canadian Atlantic, and the Grand Trunk R.R.'s; about 120 miles west of Montreal. The Chaudiere Falls, on the Ottawa River, is 600 feet wide and 40 feet high. A railway and a road bridge spans the river near the falls. A second falls in the Rideau River east of the city, is not as large as the Chaudiere but supplies extensive water-power. Four bridges cross the
OTTAWA

Rideau River. The Ottawa River, extending into a vast forest region northwest beyond Lake Nipissing, is the great route by which lumber of the Ottawa district is brought to Ottawa to be manufactured. In 1827 the Rideau Canal was opened; it passes through the city and connects the Ottawa River with the Rideau Lakes, thus opening a short water route to Kingston on Lake Ontario, and bringing Ottawa in close contact with the rest of the country. The lumber from the forest region to the northeast is brought to the mills of Ottawa and Hull (across the river from Ottawa) over the Gatineau River; and the Du Lièvre River connects with the city the region to the east, where are large phosphate deposits. The industries connected with lumber are the most prominent. The cut of timber in the Ottawa Valley has been nearly 700,000,000 cubic feet in one year, and almost every foot was prepared for market in the Ottawa and Hull lumber mills. Other manufacturing establishments are flour-mills, tanneries, match factories, brick and tile works, foundries, machine-shops, paper mills, railroad car and repair shops, furniture factories, carriage works, and wooden-ware factories.

The Parliament and official buildings, 125 feet above the river, on Parliament Hill, covering nearly four acres, are the Italian Gothic style, and are built of Canadian sandstone quarried in the Ottawa Valley and Devonian sandstone from Potsdam, N. Y. The foundation-stone was laid by the Prince of Wales (King Edward VII.) in 1860. The buildings, including Victoria Tower, 180 feet high, and the library, cost about $8,000,000. Other prominent public buildings are Rideau Hall, the residence of the governor-general, the post-office, telegraph offices, city hall, banks, churches, and schools. There are two cathedrals, Protestant Episcopal and Roman Catholic, and hospitals, orphanages, and homes for the friendless. Under the school laws of the province separate schools are maintained for Protestants and Catholics. The chief schools are the University of Ottawa (R. C.), a provincial normal school, affiliated with the Toronto University, Ladies College, Saint Joseph's College, and a number of special schools in charge of the Oblate Fathers, three theological schools, a number of private academies, and public schools under both the Protestant and Roman Catholic school boards. There are several large libraries, chief of which is the Parliamentary library which contains (1904) about 200,000 volumes. Other institutions which contribute to the educational advantages of the city are the geological museum, the national art gallery, music schools, and business colleges. Representatives from many foreign countries, among them a United States consul-general, are in Ottawa. There are a number of banks and demand loan and postal savings banks. Hull (q.v.), across the river and in the Province of Quebec, is one with Ottawa in commercial and industrial matters, but entirely separate in municipal government. The government is vested in a mayor and corporation.

In the last of the 18th century a man named Wright, from Boston, Mass., settled across the river and named the place Hull. Wright claimed the land on the south bank of the river, and he offered to sell it with Ottawa now stands and more, to a man named Sparks, as payment for labor. Sparks, after much persuasion, accepted the land. The British Government sent Colonel By, in 1823, to survey the Rideau Canal. Laboure on the canal settled on the Sparks' land (1827) and the place was called Bytown. In 1854 it was incorporated as a city and the name was changed to Ottawa. In 1858 Queen Victoria selected it as the capital of Canada. The first Dominion Parliament was held here in 1857. Pop. (1891) 44,154; (1901) 59,092.

Ottawa, Ill., city, county-seat of La Salle County; at the confluence of the Fox and Illinois rivers, on the Illinois & Michigan Canal, and the Chicago, B. & Q. and the Chicago, R. I. & P. R.R.'s; about 80 miles southwest of Chicago. It was settled as farm land in the early part of the 19th century, but was not incorporated until 1837. It is in a productive agricultural region, in which are extensive deposits of fire-clay, glass-sand, and bituminous coal. It has considerable manufacturing interests, the chief establishments are glass factories, potteries, agricultural implement shops, saddlaries, carriage factories, and organ and piano factories. It has a large water works, sewer pipe, and other manufactures, and in farm and dairy products. Some of the prominent buildings are the Illinois Appellate Court building, the city and county buildings, the Ryburn Memorial Hospital, and the church and school buildings. Its educational institutions are Pleasant View College, under the auspices of the Lutherans, Saint Francis Xavier Academy (R. C.), public and parish schools, a high school library, and Odd Fellows' and Redickick's public libraries. It has four beautiful parks. The city charter, in accordance with the State law of 1871, provides for a mayor, who holds office two years, and a council. The members of the school board are chosen by popular vote. The city owns the electric-light plant and owns and operates the waterworks. Pop. (1890) 9,985; (1900) 10,588.

Ottawa, Kan., city, county-seat of Franklin County; on Marais des Cygnes River; and on the Missouri Pacific, the Atchison, Topeka & S. F. and the Southern Kansas R.R.'s; about 40 miles southeast of Topeka. It is in a farming and dairy section. The place was named for the Ottawa Indians who emigrated from Canada in 1833. The town was founded by John Tecumseh Jones, a Pottawatomie missionary, who taught the Ottawas. The Santa Fé Railroad shops, employing 400 men, are located here. It has flour mills, carriage works, creameries, grain elevators, and furniture factory. There is considerable trade in live-stock, dairy products, nursery stock, grain, wool, and fruit. It is an attractive, residential city, with well-kept streets and fine parks. It is noted for its moral tone and as being an educational centre. It is the seat of Ottawa University, a Baptist institution which had, in 1903, 700 students. It has the summer educational and social gathering called the Ottawa Chautauqua Assembly, the second (in point of time) "Chautauqua" in the United States. It has also a free public library. There are 22 church edifices, and the place is often called "The City of Churches." Since the State "Prohibitory Law" went into effect, Ottawa has never tolerated the least indication of a saloon or joint, and the city has but one policeman.
Ottawa — Otter

At least 90 per cent of the population are native born white Americans. Pop. (1890) 6,248; (1900) 6,934; (1 Jan. 1904) 8,000.

H. J. Allen, Editor "Ottawa Herald."

Ottawa, Ohio, village, county-seat of Putnam County; on the Blanchard River, and on the Findlay, Ft. W. & W., the Cincinnati, H. & D., and other railroads. It is about 90 miles northeast of Columbus. It is in a farming section, and has several industries connected with farm products and stock-raising. Its chief manufactures are flour, lumber and lumber products, clay products, and dairy products. Pop. (1890) 1,717; (1900) 2,222.

Ottawa Indians, or Ottawas, an important American tribe of the Algonquin family formerly residing in the region of the Ottawa River in Canada. They were the allies and friends of the French, and also of the Hurons, by which latter friendship they incurred the hatred of the Iroquois. During the Revolution they were under British influence. They joined in treaties made in 1785 and 1789, but took up arms with the Miamis soon after, again making peace in 1795. Numerous treaties ceding territory around Lake Michigan to the United States followed. A part went south of the Missouri in 1833, where they lost their identity. A band of Ottawas in Ohio removed to the Osage in 1836. Those remaining became scattered. The emigrants again removed to Indian Territory in 1870. In 1836 the Michigan Ottawas ceded all their lands except reservations. In Canada several thousand Ottawas still survive, scattered throughout Ontario in small tribes.

Ottawa, a river of Canada, the chief affluent of the Saint Lawrence, forming the boundary between the provinces of Quebec and Ontario. It rises in the high land which divides the basin of Hudson Bay from that of the Saint Lawrence in lat. 48° 30' N. and for 300 miles, from its source to Lake Temiscamingu, runs from northwest to southeast. Suddenly changing its direction, it flows to the southeast for 400 miles, widening at its outlet into the expanse of water known as the Lake of Two Mountains, and finally discharges into the Saint Lawrence at the Saint Ann's Rapids, above the island of Montreal. Six miles above the city of Ottawa the rapids begin, which terminate in the Chaudière Falls, 40 feet high. The Ottawa is navigable from its junction with the Saint Lawrence to the falls, which are surmounted by the Rideau Canal, communicating by means of locks with Kingston. The river is of considerable commercial importance, from the immense quantity of fine timber cut on its banks, and on those of its tributaries, the chief of which are the Gatineau, Madawasca, Rideau, and Rivière du Lièvre.

Ottawa University, founded in 1865 at Ottawa, Kan. It was incorporated under the joint control of the Baptists and the Ottawa Indians; the legislature set apart 20,000 acres from the Indians' reservation for the University, with the provision that two of the six trustees should be Indians. This arrangement did not prove entirely satisfactory, and in 1873 an adjournment was made that placed the university entirely under the control of the Baptist denomination. There is a preparatory department, and in addition to the regular college instruction, there are courses in pedagogy and business. The college work is arranged in three courses, classical, scientific, and philosophical, leading to the three degrees of A.B., B.S., and Ph.B. All courses are open to women. The library in 1903 contained 4,000 volumes; the productive funds amounted to $85,000, and the annual income was $43,130. The students (1903) numbered 630, and the faculty 23.

Ottendorfer, öt-týn-dör-fer, Oswald, German-American journalist: b. Zwittau, Moravia, 26 Feb. 1826; d. 16 Dec. 1900. After studying law at Prague and Vienna he came to this country after the revolutionary disturbances of 1848 and settling in New York in 1850, soon became editor of the New Yorker Staats-Zeitung and later its proprietor. Under his management it became the most influential German daily in America and after 1861 was independent in politics. He built and endowed an educational institution in his native town, founded a home for aged and poor men on Long Island, and established the Ottendorfer free library in New York.

Otter, a carnivorous mammal of the weasel family (Mustelidae). The otters differ from the weasels chiefly in their webbed feet and aquatic life. The body is elongated and averages, exclusive of the tail, about 2½ feet in length; the tail being somewhat tapering but flattened, and serving as an efficient rudder to guide the swimming movements of the animal. The legs are short, but muscular, and exceedingly mobile; each foot possessing five webbed toes. The lips are whiskered; the ears short, and the eyes large and prominent. The under fur is short, closely set, and woolly, and the outer coat of longer and coarser hairs, of dark-brown hue. In habits the otters are chiefly nocturnal animals, swimming about at night to prey on fishes, of which they are great destroyers, leaving many mangled after merely eating part of the flesh. They wander about a great deal in winter, going across the fields from stream to stream. The burrow is constructed near the water's edge, the nest being situated at some distance on the bank of the river and lined with grass and leaves. From four to five young are produced in June.

The American otter (Lutra canadensis) averages about four feet in length, inclusive of the tail, the fur is of a lustreous brown. It inhabits America generally, but is most plentiful in Canada, being rare on the Atlantic border of the United States. The Mackenzie River, and other streams running into the Arctic Sea, form noted haunts of the Canadian otter. It is chiefly noted for its fur, which is much valued commercially. A peculiar winter habit of this otter consists in numbers of these animals selecting a sloping bank of a river or a ridge of snow, and sliding down the sloping surface upon their bellies, the fore-legs being bent backward, while by means of the hind legs a swift forward impulse is given to the body. This sport (for such it really is) may be continued for a considerable time, the whole process reminding one of schoolboys similarly amusing themselves. These animals are caught in steel traps, which are set generally near the entrance to the burrow, and they have been exterminated in almost all the easily accessible streams.

The European otter (L. vulgaris) inhabits Europe generally, and is a well-known denizen
of Scotch rivers and streams. To the salmon it is particularly destructive, a pair of otters destroying an immense number of fish, and, as already remarked, leaving large numbers in a mangled condition after each meal. The pursuit of fishes is carried on with great dexterity by the otters, the female accompanying the male quickly to all the turns and gyrations of the finny prey. This otter, although usually of an untamable and somewhat ferocious disposition, can occasionally be domesticated to a very perfect extent. A species (L. mair) is said to be tamed in India by fishermen, and used for hunting fish; and in Great Britain tame otters have occasionally been kept for a similar purpose. The otter is still hunted for sport by means of dogs (see Otter-Hound) bred and trained to their work. When brought to bay the otter will defend itself with great pertinacity, and will successfully meet any single dog of ordinary strength. When forced to the water the otter swims deftly, and remains for considerable periods concealed and swimming beneath the surface. On maigre days the Roman Catholic Church permits the flesh of the otter to be eaten. It is said to be dark-colored, rank, and of fishy taste. The fur is used for making caps of great extent.

Consult: Coues, 'Fur-bearing Animals' (1877); Stone and Cram, 'American Animals' (1902); and works on British and East Indian mammals. Compare Sea-otter.

Otter, or Ancon Sheep, a breed of sheep, which arose in Dover, Mass., in 1701, from a long-bodied ram which was deformed in that its legs were extremely short and bent outward, or bowed, like those of an otter. The progeny of this ram when mated with an ordinary ewe, were often deformed like the sire; and for a long period the breed was easily maintained in that district, where it was esteemed because unable to jump over low walls and fences. This case is of great scientific interest as an example of prepotency (q.v.) in a sire, and also as an example of how a sudden variation or sport may be perpetuated. It is also of interest to note that when, after a time, care was no longer taken to maintain the breed, it disappeared by crossing with ordinary sheep, the last specimen recorded died in 1813. Consult Humphreys, 'Philosophical Transactions' (London, 1813).

Otter Creek, a stream rising on the southern boundary of Rutland County, Vt., flows north-northwest through Rutland and Addison counties and empties into Lake Champlain near Ferrisburg. It is 90 miles long and is navigable for eight miles from its mouth. It supplies excellent water-power to a number of towns. the most important of which are Vergennes, Middlebury, and Rutland.

Otter-Hound, or Otter-dog, a large, rough-haired, powerful, hardy, and courageous breed of hounds, cultivated especially in Great Britain to assist in otter-hunting. These dogs must be able to follow the game into the water and take it into their mouths. A fair specimen will measure twenty feet tall, and weighs 65 to 75 pounds. Consult Lee, 'Modern Dogs' (1897).

Otter-shrew, a very large South African aquatic shrew, which has a strange resemblance in appearance and habits to an otter. See Patamogale.

Otterbein, öt'tér-bin, Philip William, American United Brethren clergyman: b. Dillenburg, Germany, 4 June 1726; d. Baltimore, Md., 17 Nov. 1813. He was ordained in the Reformed (German) Church ministry at Herborn in 1749 and in 1752 was sent as a missionary to America, where he first settled at Chester, Pa., shortly after having charge of the congregations at Tulpehocken and York, Pa., and of Frederick, Md. At Lancaster he experienced what he termed a change of heart and as a result introduced the innovations of class-meetings, open-air meetings, and prayer-meetings, and frequently made lengthy itinerant tours, founding what later became a new sect, the United Brethren in Christ. In 1774 he assumed charge of the parish at Baltimore where he remained for nearly 40 years. He was a man of great learning and wide influence; he co-operated with the Methodist preachers who came to Pennsylvania and Maryland, and at his death the church which he had founded had in its service about 100 preachers and 20,000 members. Consult 'Life,' by Drury (1884).

Otterbein University, founded in 1847 at Westerville, Ohio, under the auspices of the United Brethren in Christ. It was chartered with full university privileges, and was the first educational institution established under the control of the United Brethren; it was named in honor of Philip William Otterbein (q.v.). Its organization includes a college department, a preparatory department, with a three-years' course, and postgraduate, normal, music, and art departments. The college work is arranged in two courses, classical and philosophical, leading to the degrees of A.B. and Ph.B. The university has been coeducational from the first; and there is a dormitory for the women students on the campus. The Christian Association building was the first of its kind in the State. In 1903 the library contained 10,000 volumes; the buildings and grounds were valued at over $50,000; the productive funds amounted to $20,000; and the annual income was $46,260. The students numbered 257, and the faculty 30.

Otley, öt'li, Robert Lawrence, English Anglican clergyman, b. Richmond, Yorkshire, 2 Sept. 1856. He was educated at Oxford, took orders in the Established Church, was principal of Pusey House, Oxford, in 1893, and has been rector of Winterbourne Bassett, Wiltshire, from 1897. He has published 'Lancelot Andrews' (1893); 'The Doctrine of the Incarnation' (1895); 'Aspects of the Old Testament' (1897); 'The Hebrew Prophets' (1898); 'Short History of the Hebrews' (1901).

Otto. See Otho.

Otto of Rose. See Attar.

Ottoman (öt'ó-man) Empire, or Empire of the Osmanis (Osmanlı Völkeri), comprehends all the territories more or less under the dominion of the Turkish Sultan. It includes in Europe a considerable portion of the Balkan Peninsula (the Turkish dominions here have been greatly curtailed in modern times), part being comprised in the principality of Epirus, now united to the principality of Bulgaria; part in Bosnia, Herzegovina, etc., held by Austria; in Asia, the Anatolian Peninsula or Asia Minor, a portion of Armenia and Kurdistan, Syria,
OTTOMANWA — OUANANICHE

Mesopotamia, etc.; besides Samos, Rhodes, Crete, and other islands; in Africa, Egypt, and the vilayet of Tripoli (the Sudan and Tunis being lost to Turkey). The empire extends over 1,580,000 square miles, with a population of about 40,000,000, of which about 11,000,000 belong to Europe, over 17,000,000 to Asia, and about 11,000,000 to Africa. These figures refer to the Turkish empire in the largest sense, including the nominally independent states of Egypt, Bulgaria, Bosnia, Crete, etc. For further geographical details see the different countries, Egypt, Syria, Tripoli, Tunis, Turkey, etc.

Ottumwa, ò-tûm'wa, Iowa, city, county-seat of Wapello County; on the Des Moines River, and on the Chicago, B. & Q., the Chicago, R. I. & P., the Iowa C., the Chicago, M. & S. P., and the Wabash R. R.'s; about 80 miles southeast of Des Moines. It was settled in 1849 and in 1853 was incorporated. It is in a productive agricultural region in which there are extensive coal-fields. It has good water-power which combined with abundance of coal tends to develop manufacturing industries. The chief industrial establishments are mining and agricultural implements, foundries, iron works, pork-packing plant, flour mills, starch factory, coal and lumber yards, and grain elevators. It has a large trade in the manufactures, coal, farm products, live-stock, and fruit. The prominent buildings are the United States Government building, the Y. M. C. A. building, opera-house, the Union Railroad Station, court-house, churches, schools, and library. The educational institutions are Saint Joseph's Academy, a high school, and parish schools, and a public library. The government is administered under a charter of 1892 and provides for a mayor, who holds office two years, and a council. Pop. (1890) 4,400; (1900) 5,716.

Otumba, ò-toom'bā, Mexico, town, state of Mexico, on the Mexican railroad, 30 miles northeast of the City of Mexico. It is the ancient Indian pueblo of Otompan, inhabited probably by the Otomi Indians. Here Cortes defeated the Aztecs in a desperate battle 7 July 1520, during his retreat from the City of Mexico. Pop. (estimated) 2,500.

Ottway, öt'wa, Thomas, English dramatist: b. Trotton, Sussex, 3 March 1652; d. Tower Hill, London, 14 April 1685. He was educated at Winchester College, and at Christ Church, Oxford. An appearance on the stage in Mrs. Aphra Behn's company in London in 1671 was unsuccessful, and he returned to Oxford for a time, only to leave without a degree in 1674, and after a year in the army to return to London as an author. 'Alcibiades' (1675) and 'Don Carlos' (1676), especially the latter, which may be paralleled with Schiller's play, being taken from the same French original by St. Real, were unusually popular, and won for Ottway the favor of Betterton. Adaptations of Molière and Racine followed, and in 1678 Ottway essayed the comic with the prose play 'Friendship in Fashion,' another great success in his own day, though regarded by much later decency. But Ottway did not profit by his success, what with drink and various amours, notably his passion for Mrs. Barry, who played in most of his plays, and was mistress of the Duke of Rochester. He left London for the army (1678–9), and upon his return wrote 'The Orion' (1680), a comedy called 'The Soldier's Fortune' (1681), 'Venice Preserved' (1682), and another comedy 'The Atheist' (1684). The two comedies are little better than worthless; whereas the tragedies of Venice Preserved and the higher, are far by far the most powerful of the contemporary stage, being remarkable particularly for the simple and strong delineation of the passions, and being generally held to be the most perfect, and pre-eminent of tears of the whole dramatica. Ottway wrote much miscellaneous verse, satires, dedications, prologues and epilogues, but all contemporary and early biographers agree that he died in want, though they differ as to details. 'Venice Preserved' enjoyed a European repute, there being versions in French, Dutch, German, Russian, and Italian; with 'The Orphan' and 'The Soldier's Fortune' it is contained in the 'Mermaid Series' (1891). A complete edition of Ottway is that by Thornton (1813). Consult: De Grisy, 'Etude sur Thomas Ottway' (1868); Niesen, 'Ueber Thomas Ottways Leben und Werke' (1875); Löwenberg, 'Ueber Ottways und Schillers Don Carlos' (1886).

Ouachita (wàsh'ú-tá) College, established at Arkadelphia, Ark., in 1886, under the control of the Baptist denomination. The work of the college is in two courses, classical and literary, and the degree of bachelor of arts and bachelor of letters are conferred. There is also a preparatory department. The college is coeducational, and the number of women in attendance averages about one-half the total number of students. The income is derived from tuition fees, there being no endowment; in 1903 the income amounted to $20,000; the grounds and buildings were valued at $50,000. The library contained 3,500 volumes; the students numbered 416, and the faculty 30.

Ouakari, wà-kà'ré, a South American monkey of the genus Brachyurus, remarkable for the extreme shortness of the tail, and for the great length of the whitish hair upon the body, while the head is almost bald and the bare skin of the face is brilliant red. Small monkeys abound in the Brazilian forests, where three species are known, and one of which (B. ouakaria) is among those most often seen and best liked as pets.

Ouananiche, wà-nà-nesh', a land-locked relative of the Atlantic salmon, named Salmo ouananiche, and often written winnimin, wan-aniche, and in various other ways. It inhabits various lakes and ponds in eastern Quebec and Labrador, but is most familiar in and about the Lake Saint John, north of Quebec. From one of its stations it can go to and return from the sea if it pleases, but never seems to do so. This salmon differs very little from a typical salmon except in its smaller size, and most ichthyologists have been at a loss to account for the small size; it may be only local varieties of Salmo salar; but Jordan now regards both as separate species. The largeness of the eye and of the black spots are conspicuous distinguishing characteristics among others. 'As a game fish,' says Jordan, 'those who have had experience with the ouananiche think it has no equal. They may be taken at any time between the going out of the ice and the middle of September, though the best fishing is said to be late in May. During the early part of the season it may be taken with bait of
worn, pork, pieces of chub or even ouananiche itself along the shore of Lake Saint John. It is occasionally taken with the artificial fly, but fly-fishing for the ouananiche is usually not a successful method of capturing it. The literature of American angling abounds with descriptions of this fish and its sport, and special treatises upon it have been written by McCarthy, Chambers, Van Dyke and others.

Oublitte, oo-bi-li-t, a secret dungeon or pit constructed in old castles, forts and other buildings, in which were confined persons condemned to perpetual imprisonment or to secret death. It was usually entered by a staircase or steps reaching to the top of a chamber, in the floor of which was an opening into the dungeon. This opening served also for the admission of light and air.

Oudh, 0udh, or Oude, British India; the town and capital of the province of Oudh, on both banks of the Gogra, 77 miles east of Lucknow. It is greatly venerated by Hindus; but its ancient temples are in ruins, and its only structures deserving notice are a mosque built by Aurungzebe, some Mohammedan tombs, and an iron bridge across the river. Pop. 12,000.

2. A semi-independent province politically attached to and forming with Agra, the United Provinces of Agra and Oudh (q.v.) prior to 1901, known as the North-Western Provinces. Oudh is bounded on the north by Nepal and on the other sides by Agra, the lieutenant-governor of which administers Oudh as chief-commissioner since 1877. Oudh is distinguished by an independent judicial system. The area is 23,000 square miles; the surface mostly level, very fertile, and watered by the Gogra, Gunti, and other tributaries of the Ganges. The Ganges itself forms nearly all its southern boundary. Among the inhabitants are numerous Rajputs; many of the population are Mussulmans. Oudh was formerly a Mogul province, and became subordinate to the British after the battle of Kalpi in 1765. In 1801 Gorakhpur and some other eastern districts were annexed from this territory to the British dominions. In 1819 the viceroy threw off his nominal dependence on the Mogul sovereign, and assumed the title of king. A disputed succession, and partial revolt in 1857, disturbed the government in Oudh until 1858, when complaints of misgovernment led to the annexation of the country to the British dominions, an annual pension of £120,000 being settled on the king. This measure, however, produced much dissatisfaction, and when, in 1857, the Mutiny broke out, most of the Oudh sepoys joined it, and the siege of Lucknow resulted. (See INDIAN MUTINY.) Agriculture has made great advances, the area under crop having largely increased. Wheat, barley, rice, sugar, indigo, and other products are raised in large quantities; in some districts a vast amount of nitre effloresces on the soil. Numerous schools have been established. The leading towns are Lucknow and Faizabad, two divisions of Lucknow and Faizabad. Lucknow is the capital; other towns are Faizabad, Shahabad, and Bharai. Pop. (1901) 1,288,150.

Oudinot, oo-de-no, Charles Nicolas, Duke of Marais, b. Bar-le-Duc, France, 26 April 1767; d. Paris, France, 13 Sept. 1847. Entering the army he had attained the rank of captain at the outbreak of the Revo-

lution. He joined forces with the populace but crushed an uprising in his native district in 1790 and in 1794 was given command of the Languedoc. In the war with Prussia and Austria he won distinction, in 1799 became general of division, and was thereafter much trusted by Napoleon, receiving the command of 10 battalions in 1805. He was at Austerlitz and Jena, and at Ostdenka, Russia, in 1807 he routed the Russians; at Friedland in 1807 and at Wagram in 1809 his bravery was so marked that after the latter battle he was made marshal of France and Duke of Reggio. In 1810 he occupied Holland and in the unfortunate campaign against the Russians in 1812 he earned high praise for his skilful generalship. In the battles between the French and the Allies he played a prominent part and was loyal to Napoleon to the last, but after the restoration of the Bourbons took office under them. In 1823 he led the invading army into Spain, acted as governor of Madrid for a time, and became governor of the Invalides in 1842.

Oudinot, Charles Nicolas-Victor, Duke of Reggio, French general, son of the preceding: b. Bar-le-Duc, France, 3 Nov. 1791; d. Paris, France, 7 July 1863. He was a prominent figure in the war in Algeria, was appointed commander-in-chief, and in 1858 led the attack upon Rome. For his protests against the coup d'etat in 1851 he was arrested, but his release followed shortly whereupon he retired from public life.

Ouida, oo-de'da, pen name of LOUISE DE LA RAMÉE, English novelist: b. Bury St. Edmunds, 1849. She had a French mother and her father was an Englishman of some culture. She began to write for periodicals in the early 60's, using as a pseudonym her Christian name as pronounced by a baby sister. About 1868 she left London for Italy, and has since resided there, mainly in Florence. Her novels, which have been very popular though abounding in over-wrought sentiment are exceedingly dramatic and are not without literary merit. A few of the many titles are: ' Held in Bondage' (1863), 'Strathmore' (1864), 'Under Two Flags' (1867), 'Dorimont' (1869), 'A Dog of Flanders' (1872), 'Two Little Wooden Shoes' (1874), 'In Maremma' (1882), 'Ruffino' (1890), 'The New Priesthood' (1893), 'The Maccarenes' (1897), 'The Waters of Eder' (1900), and 'Street Dust' (1901).

Oustite, wis'ti-t. See MARMOSET.

Ouless, oo-le'ss, Walter William, English painter: b. St. Heliers, Jersey, 21 Sept. 1848. He was educated at Victoria College in his native town, and at 16 became a student at the Royal Academy where he has been a constant exhibitor since 1869. He was elected an associate in 1877, and a full member in 1881. About 1872 he applied himself to portrait-painting, in which he has attained a high rank. Among his sitters have been Archbishop Newman and Manning, Lord Roberts, Frederic Harrison, and the Duke of Cambridge. He was awarded a gold medal at the Paris International Exhibition of 1878, and also at the Berlin Exhibition of 1886.

Ounce, (1) the snow-leopard (q.v.); (2) in South America the jaguar (q.v.).

Ounce, a twelfth part of any magnitude, whether of length, surface, or capacity. In

Our Mutual Friend, a novel by Charles Dickens, published in England in 1864–5. The scene is laid in London and its immediate neighborhood. Among the characters which this story has made famous are Miss Jenny Wren, the doll's dressmaker; Bella Wilfer, "the boober lady"; the Golden Dustman, Mr. Boffin; and Silas Wegg, employed by Mr. Boffin, who is, at first, delighted with the services of "a literary man with a wooden leg."

Ouray, 00-oz, Indian chief: b. Colorado 1820; d. Los Finos Indian agency (Colo.) 27 Aug. 1880. He was the leader of the Uncompahgre Utes, and while protecting the interests of his tribe was friendly to the whites. He spoke and wrote the Spanish language. Several times he visited Washington to appeal on behalf of his people.

Ouray, Colo., town, county-seat of Ouray County; on the Uncompahgre River and on the Denver & R. G. railroad, 75 miles west, southwest of Colorado Springs. It is on an elevation of over 7,000 feet, at the base of Mount Hayden, and in a region of grand mountain scenery. Its hot springs make it a favorite health resort. It is also the local trade centre and shipping point of the surrounding mining region, which is rich in gold and silver. It contains a miners' hospital. Pop. (1890) 2,534; (1900) 2,195.

Ouro-Prêto, 0-prÊ-to, Brazil, city, state of Minas Geraes; 175 miles north of Rio de Janeiro. Rich gold deposits were found in the vicinity and the chief industry was formerly mining, but the mines have mostly been abandoned and the prosperity of the city has in consequence declined. It was originally the capital of Minas Geraes, but the state government was moved to Minas in 1894. It is built on several hills and surrounded by mountains; the streets are narrow and irregular, but some of the modern houses are well built. It is connected with Rio Janeiro by rail, and with the towns to the north and east by highway, and carries on an active trade. Pop. (1903) 16,000.

Ouse, 00z, England, (1) a river of Yorkshire also called the Northern or Yorkshire Ouse, formed by the junction of the Swale and Ure, and after a southeast course of 60 miles, uniting with the Trent to form the estuary of the Humber. It is navigable for large vessels 45 miles to York. Its principal affluents are the Wharfe and the Aire from the west, the Don from the south, and the Derwent from the north. (2) The Great Ouse rises near Brackley in the county of Northampton, flows in a general northeasterly direction, traverses the counties of Buckingham, Bedford, Huntingdon, Cambridge, and Norfolk, and falls into the Wash at King's Lynn, after a course of about 160 miles, for the latter two thirds of which it is navigable. Among its affluents is (3) the Little Ouse or Brandon River which joins it at the confluence of the river Stote, and the New Bedford and Wisbech canal.

Ouseley, 00z'il, Sir Frederick Arthur Gore, English composer and musician: b. London 12 Aug. 1825; d. Hereford 6 April 1889. He was a son of Sir Gore Ouseley (q.v.). He was graduated B.A. in 1846 from Christ Church, Oxford; succeeded to the baronetcy by his father's death in 1844, took orders, and held several metropolitan curacies in 1849–51. Having graduated as Doctor of Music at Oxford in 1854, he was appointed preacher of the University and Cathedral in the following year, and also became professor of music in the University. In 1866 he was made a canon residentiary of Hereford Cathedral. From earliest childhood Ouseley showed remarkable musical ability and extraordinary accuracy of ear. He composed an opera of great promise when only eight. His published compositions include two oratorios, 'The Martyrdom of St. Polycarp' (1855), and 'Hagar in the Wilderness' (1857): a large number of anthems, of which several are very well known: many full church services; numerous chants, hymn-tunes, and carols; a sacred cantata; besides overtures, glees, solos, and quartettes. He wrote three valuable works on musical theory: 'A Treatise on Harmony' (1868); 'A Treatise on Counterpoint, Canon and Fugue' (1869); and 'A Treatise on Musical Form and General Composition' (1875). As a churchman and churchman, and of course, a church college of St. Michael, Tenbury (1865) and to it bequeathed his splendid musical library.

Ouseley, Gideon, Irish Methodist clergyman: b. Dunmore, Galway, Ireland, 24 Feb. 1702; d. Dublin, Ireland, 13 May 1778. At an early age, having become a member of the Roman Catholic faith he became a member of the Wesleyan Church and as a local preacher attained considerable influence over Protestants and Catholics alike although not infrequently assaulted while engaged in street preaching. As an Irish missionary he was held in high regard by the Wesleyans, his preaching being of a most successful character and his zeal unflagging. He wrote: 'A Short Defence of the Old Religion' (1812); 'Rare Discoveries' (1819); etc.

Ouseley, Sir Gore, English diplomat and Orientalist: b. Limerick, Ireland, 24 June 1770; d. Beaconsfield, Buckinghamshire, England, 18 Nov. 1854. In 1797 he went to India, where he engaged in business, and also gave considerable attention to the study of Oriental languages and customs, particularly the Persian, Bengalee and Hindu. On his return to England he was made a baronet (1808), and in 1810 was appointed English ambassador extraordinary to
OUSELEY—OUZEL

Persia, and through his intrepid knowledge of the Persian language and his skilful diplomacy was successful in obtaining a definitive treaty between England and Persia, which was finally ratified in 1814. He was also instructed in 1813 to mediate between Russia and Persia, and through his efforts a treaty was signed, suspending war between the two nations. In 1815 he returned to England, and in 1820 was admitted to the privy council. He was an able Oriental scholar, was one of the founders of the Royal Asiatic Society of London, and in 1842 became president of the Society for the Publication of Oriental Texts. 'The Gulistan of Musle-Huddez Shaik Seddy of Sheerez' was printed under his direction (1869); his own work, 'Biographical and Explanatory Notes on the Persian Poets' was published after his death (1846).

Ouseley, Sir William, English Orientalist; b. Monmouthshire, England, 1767; d. Boulogne, France, September 1842. He was educated privately in Paris, but in 1788 he entered the army. Tiring of military life and desirous of continuing his study of oriental languages he left the army in 1794 and entered the University of Leyden. Thereafter he devoted himself to further study and to literature, but in 1810 accompanied his brother, Sir Gore Ouseley, ambassador to Persia, as his private secretary. He published: 'Oriental Collection' (1797-97); 'Travels in Various Countries of the East' (1810-23); 'Anecdotes from Oriental Bibliography' (1827); etc.

Ouseley, Sir William Gore, English diplomat: b. London 26 July 1797; d. there 6 March 1866. He was the son of Sir William Ouseley (q.v.). He was early engaged in the diplomatic service; and in 1825 was connected with the British legation at Washington, and at that time married a daughter of the governor of Vermont. He later was appointed to several responsible diplomatic positions in South America; and was sent on special missions to the United States and to Central America. He published: 'Remarks on the Statistics and Political Institutions of the United States' (1832); 'Notes on the Slave Trade' (1850); and 'Travels in South America, from Original Drawings' (1852).

Outalibi, wà-té-le-bè, a fish. See Guattver.

Outlanders. See Uitlanders.

Outlawry, an ancient custom in Great Britain of putting a person out of the protection of the law; thus an outlaw could be killed at sight like a wild beast. Outlawry in civil proceedings was formally abolished in 1879. In an act passed in 1870, however, abolishing forfeitures for treason and felony, it was expressly stated that nothing in the act was to affect the law of forfeiture consequent upon outlawry. But there is litigation now for outlawing absconders from justice, since in most cases they can be laid hold of under treaties of extradition with foreign countries. The effect of outlawry is the forfeiture of the goods of the outlaw to the crown, and he cannot receive and hold property given or devised to him. In the United States, outlawry was recognized in the Colonial days, but since the War of the Revolution the practice has been obsolete.

Outram, oo'tram, Six James, English soldier: b. Butterley Hall, Derbyshire, 20 Jan. 1803; d. Pau, France, 11 March 1863. He was educated at Marischal College, Aberdeen, and in 1819 went to India, where after commanding for some time a body of irregular troops he was appointed ad interim to the Bombay Native Infantry. From 1835 to 1838 he was employed in subduing the rebel chiefs of the Mahhi-Kanta. In the last-mentioned year, as adjutant to Lord Keane, he took part in the Afghan war, and distinguished himself at the capture of Khelat, and by his dangerous ride disguised through the enemy's country (1839). In various other capacities he displayed military talents of a high order, as well as admirable administrative qualities. He was made lieutenant-general, and received various and suitable recognition of his important services. A bronze statue of Outram by Noble was erected in the gardens of the Thames embankment.

Out-works, in warfare. See Fortification.

Ouzel, oo'z1, an old name, derived from the German, for several thrush-like birds of Great Britain and the United States. Slaty-backed, it is most often applied in England to the blackbird (q.v.), and to the larger thrush (Turdus torquatus), distinguished by the broad lunate stripe of white across the breast and sides of the neck, which is provincially known as ring, rock, mountain or tor ouzel. The name is also given, in the form "water-ouzel," to a small closely related bird (Cinclus aquaticus), other species of which occur in various mountainous parts of the world, all very similar in appearance and habits. One species (C. mexicanus), is numerous in the Rocky Mountain region—a small, robust, short-tailed short-winged, dark-colored bird which haunts the mountain-streams, and is commonly known as "dipper," on account of its remarkable facility in diving. Its food consists almost exclusively of snails, young insects, and other organisms which live in and about the streams; and it has the power of seeking these under water, not only by diving, but by partly swimming and partly walking with fluttering wings along the bottom in search of its prey, remaining there "two or three minutes" if it
OVAMPO—OVARY

Please. It is a common bird in both the Rocky Mountains and in the Coast Ranges; and makes a large globular nest of mossy materials which it lodges in some crevice near a stream, often beneath the veil of a cataract. Consult: Muir, in 'Scribner's Monthly' (1878); Keyser, 'Birds of the Rockies' (1902); Coues, 'Birds of the Northwest' (1874); and British ornithologists.

Ovampo, ő-vámpó, a people of the Bantu race residing in German southwest Africa. They are divided into separate tribes, and are said to number about 120,000. They are of very dark complexion, tall and robust, and remarkably ugly. The hair is short, crisp, and woolly. The men often shave it off, leaving the crown untouched; but the women stiffen it with a kind of red paste, in the manner practised in many other parts of Africa. The principal ornaments are heavy iron anklets, a profusion of cowries and other shells, and beads of every size and color, so arranged as to hide a considerable part of the person. Their staple food is grain. The houses are of a circular form, with a circuit of 16 feet and a height not much exceeding 4 feet. These huts, arranged in groups are enclosed by strong palisades. The domestic animals are oxen, sheep, goats, pigs, dogs, and poultry. The arms consist of bows and arrows, a dagger, assegais, and knob-knurries. Though thus provided with weapons the Ovampo are peaceably disposed and industrious.

Ovando, ő-vándó, Nicolás de, Spanish soldier and administrator; b. Valladolid, Spain, about 1460; d. Madrid, Spain, about 1518. In 1501 he was appointed successor to Bobadilla as governor of Hispaniola; in February 1502 he sailed from Spain with a fleet of 30 ships and 2,500 persons in his company and landed at San Domingo. Almost his first act as governor was to refuse aid to Columbus whom he would not allow to land at San Domingo and he permitted months to pass without sending aid when he knew Columbus was in sore straits at Jamaica. His treatment of the Indians was cruel in the extreme and one of the blackest deeds in his career was his treacherous massacre of the 84 caciques of Xaragua. He was executed. The principal symptom is sharp local pain, is frequently associated with hysteria or other neuroses, head-ache, intercostal neuralgia, etc. and it may be caused by a local engorgement or induration pressing on the sensitive nerves. Inflammation of the ovary (ovariitis or oöphoritis) may be acute or chronic. The acute form is often preceded by hyperaemia, or an excess of blood-supply at the time of the monthly period, from some obstruction of the venous circulation. Pain in the ovarian region, especially during menstruation, inability to walk, and painful defecation are the principal symptoms of acute ovaritis. The inflammation is frequently associated with pelvic cellulitis and peritonitis, caused by injuries, gonorrheal infection, puerperal sepsis, and the acute exanthemata. Sometimes abscesses form, or sterility results. Chronic ovaritis is usually the result of an inflammation, acute or subacute, but may be caused by self-abuse, sexual excitement, etc. The connective tissue of the ovary thickens, decreasing the size of the organ (cirrhosis) and tends to the formation of cysts, that is to say, cystic degeneration. A sickening pain, tenderness, and reflex neuralgias are symptoms. The tumors of the ovary are carcinoma, fibroma, and cystic tumors.

Ovariotomy.—This is the operation of modern surgery for removal of ovarian tumors due to the rupture and closure of the Graafian vesicles. At undetermined periods, from puberty on, probably at or near the time of menstruation, the fluid (liquor folliculi) within certain ovisacs increases, distention of the sacs occurs, and a rupture at the weakest point, with discharge of the fluid, is the ovulation, the function of the ovary. Most physiologists believe that ovulation is associated with menstruation, but some writers contend that menstruation may occur without accompanying ovulation, and vice versa. Usually the ova, when discharged, are conveyed through the Fallopian tubes (q.v.) to the uterus. If the ovum unites with the spermatozoa of the male it becomes impregnable to further development. After the lapse of 14 days the ovum, the Graafian vesicle usually fits with blood, which coagulates. The coagulum, squeezing out the serum, becomes decolorized. Its corium is yellowish in the body and the resulting clot is the corpus luteum of pregnancy which is formed in the corpus luteum of pregnancy is larger and remains for a longer time than that formed when pregnancy does not occur.

Diseases of the Ovary.—The affections of the ovary may be classified as malformations, displacements, functional disorders, inflammations, and tumors. One or both ovaries may be congenitally absent. This condition is rare, and when it does occur it generally coexists with atrophy of the development of the genitalia, the corpus luteum of pregnancy is larger and remains for a longer time than that formed when pregnancy does not occur.
OVEN.—OVERBECK

or of ovaries themselves. It was first performed in 1806, and long considered exceedingly "beneficial," but has been performed with great and increasing success, especially since the adoption of antiseptic treatment. See Anatomy, Comparative.

Oven, a closed, box-like chamber of any description in which a considerable degree of heat may be retained, used for baking bread, heating, or drying any substance. The term is usually restricted to a close chamber for baking bread and other food substances; but ovens are also used for cooking coal, in the art of metallurgy, in glass-making, paper-making, etc. A long period of time is necessary to produce any great diversity in the shape and materials of construction, and modes of heating ovens. The old type of baker's oven, still very largely used, is a low arched chamber either of brick with a tile roof, or of stone, with a large opening for the fire. The door is in front, and the pans of dough are put in with a long wooden spade. In one class of these ovens the fireplace or furnace is placed in the front corner, with an opening admitting the products of combustion directly into the oven, while there is an exit flue on the side. A remarkable apparatus for the economic preparation of food both as regards the expenditure of fuel and the saving of waste is the Aladdin's Oven, invented by Edward Atkinson, of Boston. This apparatus has been developed from a study of the Scandinavian Cooking Box, much used in Norway and Sweden. The box consists of an outer case of wood or other non-heat-conducting material, lined with hair felt. Into this cavity a metallic box, containing food with sufficient liquid heated to the boiling point, is placed and tightly closed in glass-making, paper-making, etc.

On this basis is devised an outer oven of non-heat-conducting material in which, separated by a sufficient space for the circulation of heat, is placed a metallic oven or cooking chamber. Heat is passed from the top of a round-wound kerosene lamp through a hole in the bottom of the outer oven. This heat passes through the entire inner oven, the products of combustion passing out at the same orifice at which the heat entered. There is no direct communication between the lamp or source of heat and the cooking chamber. This apparatus a normal temperature can be maintained for a definite number of hours, either at the temperature of simmering or stewing at about 100° F., or at the temperature for baking and roasting not exceeding 300° to 320° F. By suitable arrangements thereto very little difference in temperature is found between the top and the bottom of the oven. The heat can be regulated by the size of the lamp and the height of the flame. Meats, fish, vegetables, and puddings can be cooked in the same chamber without the flavor of one being imparted to the other, the heat being kept below the distilling point of the animal fats or of the fruit and vegetable juices. In this apparatus two pounds of kerosene oil are computed to do the work of 120 pounds of anthracite coal burned in the ordinary stove or range and to do it in a more wholesome and appetizing manner. The patents on this apparatus have been dedicated to public use.

Oven Birds, birds belonging to the subfamily Furnariinae, in the family Dendrocopodi- side (tree-sweepers). The oven-birds are found in tropical America, and inhabit a great variety of small size, and feed upon seeds, fruits, and insects. They walk on the ground with great ease. Some of these forms appear to frequent the shore, where they feed upon small mollusks and crabs. They are said to be exceedingly tame: the best-known species—(Furnarius Hin- liginosus) haunting village gardens and seeming to court the company of man. Their popular name is derived from the form of the nest which they construct. It is built of straws and dried leaves mixed with clay, and resembles an oven in its conical shape, being about eight inches in diameter. The walls are about an inch thick. The aperture exists at the side, and the interior is divided by a partition-wall into two rooms, in the inner of which the eggs are deposited. The nest is placed on a high and generally exposed site. Other species make strange nests of various kinds, one being a massive cylinder of mud.

In the United States the name oven-bird is commonly given to the golden-crowned water-thrush, a small terrestrial warbler, which builds a covered nest on the ground in the woods. See Water-thrush.

Oven-shine, Samuel, American military officer: b. Pennsylvania 2 April 1843. He entered the Union army at the outbreak of the Civil War in 1861 and was commissioned 2d lieutenant, rising to the rank of captain in 1864. He continued in the army after the close of the War and in 1868 was appointed brigadier-general of volunteers, and in 1869 was made brigadier-general of regulars and placed in command of a brigade in the Philippine Islands. In the year last named he was retired from active service.

Overbeck, övérbéck, Johann Friedrich, German painter: b. Lübeck 4 July 1789; d. Rome 12 Nov. 1859. He became very early imbued with the spirit of romanticism (q.v.) and on commencing his art studies at Vienna 1806, he found at the Academy congenial friends in Pforr, Vogel, and others of the same school. Their devotion to the old Flemish and Italian masters met with much criticism and opposition in the academy and in 1808 Overbeck had to leave Berlin where he associated himself with Schadow in the development of their common ideals. In the following year Cornelius joined their company and a little later Philip Veit and J. Schorr united with them in the formation of an artistic brotherhood. Their headquarters was the studio in the monastery of Saint Isidore, and they professed their object to be the religious and moral in art. Their aim was the revival of German art on the lines of the eighteenth century and of Italy. They were first known as the Monastic Brotherhood of Saint Isidore and later as Nazarenes (q.v.), of whom Overbeck was the acknowledged leader. The first important work which they executed was the model for the "Joseph in the 'Casa Zuccara" near the Trinità de Monti, then occupied by Consul-General Bartholdy. Overbeck painted there the 'Selling of Joseph' (1816) the cartoon for which is now in the city museum at Frankfort. He also contributed 'The Seven Lean Years' (1851). Five of the frescoes illustrating Tasso's 'Jerusalem Delivered' in the villa of the Marchioness Massimi, are also his work. He decorated with
OVERBURY — OVERTON

frescoes the church of Santa Maria at Assisi, and among his numerous oil paintings examples are to be found in Saint Martin’s Church, Lübeck, the New Picture Gallery at Munich, and the Berlin National Gallery. The last remarkable pictures which he executed were the ‘Coronation of the Virgin,’ now in the City of Mexico; and ‘Jesus Descending from the Hill of Nazareth,’ in the museum of Antwerp. All his work is distinguished by refined drawing, noble composition, and a profound spirit of devotion, and these characterize the 40 well-known designs illustrating New Testament history, all of which have been engraved, and some of them printed in colors. Among the founders of the German Romantic School of painting Overbeck is the only one who kept unalteringly to the original programme of the Nazarenes. His productions are of rare excellence in the perfection of the grouping, in directness and simplicity of expression, and a purity of outline which recalls Perugino and the earlier style of Raphael. A sincere religious spirit pervades every conception, and the corporeal is transfigured by the spiritual in all his refined ascetic forms and faces. It would seem that his love of the ecclesiastical and monastic type of character, and his enthusiasm for medievalism, had much influence in his conversion to the Roman Catholic Church (1813). He exercised great influence as professor in the Academy of San Luca at Rome, and his most noted pupils were S. Steinele and Führich. Consult: Atkinson, ‘Life of J. F. Overbeck;’ Dohmes, ‘Kunst und Künstler des 19. Jahrhunderts’ (1883-95).

Overy, b’ver-bur, Sir Thomas, English author: b. Ilminster parish, Warwicksheir, 1581; d. London 15 Sept. 1613. He was educated at Queen’s College, Oxford. He became adviser to the Earl of Rochester, then Robert Carr, at the court of James I., and provoked the anger of the Countess of Essex by endeavoring to dissuade his friend from marrying her. Rochester had the address to procure the imprisonment of Overy in the Tower of London, where he was slowly poisoned by secret agents. Carr (then Earl of Somerset) and Lady Essex were convicted but pardoned. Overy was highly cultured and was credited by Jonson with the introduction into court circles of intelligent appreciation of literature and art. His best remembered work is his ‘Characters,’ published as an appendix to his poem ‘A Wife’ (1614). Selections from ‘Characters’ were issued in ‘The Cornhill Booklet’ for August 1901.

Overcomers, a name commonly applied to a religious society originated in Chicago, but now dwelling at Jerusalem, where they style themselves the ‘American Colony in Jerusalem.’ They have all property in common and have abolished among themselves the institution of marriage. They profess to have discovered the true interpretation of the Bible, by which all nations are to be brought into liberty, righteousness and love.

Overland Route, a popular term applied to the route to California as distinguished from the route via the Isthmus of Panama. Also a terminal is provided for this route from Europe to India via Egypt, the desert, and Suez. It was in contradistinction to the Cape route which was by water only. It became more applicable in 1837, when the route was across the European continent by Marseilles; in 1845, when that by Trieste followed; and in 1872, when that via the Mount Cenis tunn. Itthence began to come into use. It also came into use in 1859 for the land route from Victoria, B. C., to the Alaskan gold fields.

Overseers of the Poor, in the United States, are county officers whose duty is to make provision for the maintenance of the poor of the county. In New York and a few other States this duty devolves upon superintendents. In Great Britain overseers are public officers appointed annually in every urban district for the purpose of raising by rate on the inhabitants the sums necessary for the relief of the poor, and applying such sums to their relief. They have been appointed since the time of Queen Elizabeth by the important poor law act then passed. Their appointment must take place on the 29th of March or within a fortnight thereafter. Peers, members of Parliament, clergy of any denomination, barristers, attorneys, doctors, military and naval officers, and others whose avocations require continual personal attendance are exempt from serving the office. All who are not exempted by some statute and even women, are liable to be appointed, and it is an indictable misdemeanor to refuse without good cause to serve when duly appointed. The office is gratuitous, and no person is to be appointed overseer who is directly or indirectly concerned in any contract for the supply of any goods, materials, or provisions for the workhouse or for the relief of the poor of the district. In granting relief to the poor the overseers have no discretionary power except in extreme emergencies, and in no case is the relief to be in money.

Overstone, Samuel Jones Loyd, Baron, English financier: b. London, England, 25 Sept. 1796; d. there 17 Nov. 1883. He was graduated from Cambridge in 1818, entered his father’s banking-house and became its head before its consolidation with the London and Westminster Bank. He was member of Parliament for Hythe in 1819-26 and became a recognized authority on questions of finance. He strenuously opposed the introduction of limited liability and of the decimal system, but did not engage in politics after 1835, when he was defeated as candidate to Parliament for Manchester. He was the author of many valuable tracts on questions of finance, and the Bank Act of 1844 was directly due to the influence of his writings. In 1830 he was created Baron Overstone and Fotheringhay.

Overt, in law, evident, undisguised: an overt act signifies an act which may be clearly proved, and was manifestly intended.

Oerton, Gwendolen, American novelist: b. Fort Hays, Kan., 19 Feb. 1876. She was educated in Paris and Switzerland and has published ‘The Heritage of Unrest’ (1901).

Oerton, John Henry, English Anglican clergyman: b. Louth, Lincolnshire, Jan. 1815. He was educated at Oxford, took orders in the English Church, and was curate of Kedgely 1838-40; vicar of Legbourne 1860-83; rector of Epworth 1843-92; and rector of Gunley from 1898. He has been canon of Lincoln Cathedral since 1879 and was Birbeck lecturer on ecclesiastic
tical history at Trinity College, Cambridge, 1902-3. He has published 'The English Church in the 18th Century' with C. J. Abbey; 'William Law: Non-juror and Mystic'; 'Life in the English Church 1600-1714'; 'Life of Christopher Wordsworth: Bishop of Lincoln'; 'Evangelical Revival in the 18th Century'; 'John Wesley'; 'The English Church in the 19th Century 1880-1833'; 'The Anglican Revival'; etc.

Overture, in music, an introductory symphony, chiefly used to precede great musical compositions, as oratorios and operas. The Germans have composed overtures for poetical works, as Beethoven's overture to Goethe's Egmont. Overtures are often played independently of the work for which they were written, as at the beginning of concerts; but their highest office is to convey to the intelligent lover of music the whole character of the following piece or to concentrate its chief musical ideas so as to give a sort of outline of it in instrumental music. The latter mode of composing overtures was first conceived by the French, and such is the character of the overtures of their great composers, among whom may be classed Cherubini, Carl Maria von Weber, in the overtures to the 'Freischütz' and 'Oberon,' in which the general character of the following piece is given, has observed this rule, which did not exist when Mozart composed his admirable overtures to 'Figaro' and 'Don Juan.' In the oldest overtures the fugue was the chief part, preceded by a grave and closing in the dominant. Another form came into vogue at a later period—three musical parts, in different movements—an allegro, an andante, or a presto, were united. At present the most usual form is a brilliant and passionate allegro, preceded by a short, solemn passage. See also PRELUDE.

Overyssel, ó-vêr-iss-e-ll, Netherlands, an eastern province separated by the Yssel River, whence its name, from the province of Gelderland. Area, 1,883 square miles. Capital, Zwolle. Pop. of province (1900) 338,408. See NETHERLANDS.

Ovid (PUBLIUS OVIDIUS NASO), Roman poet: b. Sulmo, among the Pergini, 20 March 43 B.C.; d. on the Eugumus, a.m. He and his elder brother, Licius, enjoyed a careful education with a view of becoming lawyers. Ovid attained considerable skill in declamation. But in spite of his father's opposition he devoted much of his time to poetry. On the death of his brother, at 20, this opposition seems to have diminished,—the property that would have been scanty for two might amply suffice for one. He went to Athens where he gained a thorough knowledge of Greek. He afterward traveled in Asia and Sicily in company with the poet Macer, one of his relations. After his return to Rome he never prosecuted the legal profession with energy, if indeed at all. He never entered the senate, although by birth entitled to that dignity. He was a favorite of Augustus. He was one of the Triumvirii capites, of the Centumviri, and of the Decemviri, but neglected the duties of these offices, being devoted to licentious pleasures. He married twice in early life, but nickly divorced each of his wives. In his 30th year he married his third wife whom he sincerely loved, and by whom he had a daughter, Perilla. Till his 50th year Ovid continued to reside at Rome, when by an edict of Augustus, 8 A.D., he was commanded to leave Rome for Tomi, a town on the shores of the Black Sea, near the mouth of the Danube, the habitation of the rude Gete, and the extreme limit of the empire. According to some the cause of this sentence was his intrigue with Julia, but she had lived seven years before; her daughter, the younger Julia, was exiled at the same time as the poet, and perhaps his fate had some connection with hers. Some critics have supposed that he was acquainted with the licentiousness of the emperor and his family, and had therefore become obnoxious. The change from the luxurious life of a Roman courtier and man about town to that of an exile among barbarians must have been far from agreeable; the climate and the dangers arising from incursions of plundering hordes increased his misery. His humble entreaties to the imperial court to shorten the term or change the place of banishment were of no avail. He sought relief in the exercise of his poetical talents, until worn out by grief and disappointment he died of a broken heart. The following is a list of his works: (1) 'Amor Libri III'; (2) 'Epistole Heroïdæm,' 21 in number; (3) 'Ars Amatoria,' or 'De Amore;' (4) 'The Art of Love,' written about 2 a.c., and ejected from the public libraries by command of Augustus at the time of the author's banishment; (4) 'Remedia Amoris;' (5) 'Nux;' (6) 'Metamorphoseon Libri XV;' the most popular of the poet's works written between the age of 40 and 50. It consists of narratives of all the transformations recorded in legend up to the death of Julius Caesar, whose charge into a star ends the series. (7) 'Fastorum Libri XII,' of which only the first six are extant; (8) 'Tristia' (5 books); (9) 'Epistolæ ex Ponto Libri IV,' both consisting of elegiac poems, in which the exile makes his unhappy lot and supplicates for his recall; (10) 'Ibis.' As a poet Ovid is distinguished for his mastery of versification, his felicity and clearness of expression, his power of highly colored and picturesque description, and his tasteful imagery. His facility however sometimes degenerates into empty trilling, and he often beats out a fancy with tedious prolixity. His elegies often glitter with a sort of cold-blooded eroticism which comes rather from the brain than the heart, and he is much more a rhetorician than a poet, although the marvellous ingenuity of his technique has inspired the versifiers of all modern languages from the Renaissance to the present day. His metamorphoses are filled with clever passages, but marred by palpable artificiality; the episode of Myrrha is indeed tinged with a certain tragic intensity which recalls the Hippolytus of Euripides, but the only trace of deep and exalted feeling in the whole range of his works appears in the 'Tristia,' where he details the circumstances of his setting out from his home for a banishment which was to be perpetual. The best edition of Ovid's complete works is Ewald's (Leipsic 1880-94). There are several good editions of single poems, and an English translation of the whole of them is in the Bohn Library.

Oviedo, ó-vêd-â'thô, Spain; (1) a town in the Asturias, capital of a province of the same name, 230 miles northwest of Madrid. It is walled, and has clean but irregular streets. The
GOIC, cathedral, university, and other educational establishments, court-house and hospital are the chief buildings. The manufactures are hats, arms, linen, etc. In 1809 Oviedo was given up to pilage for three days by Ney. Pop. (1890) 48,374. (a) The province, area 4,091 square miles, is situated on the eastern shore of the Bay of Biscay and bounded by the provinces of Santander, Leon, and Lugo. It has a wild and stormy coast, and a mountainous interior better adapted for pasture than agriculture. Great numbers of cattle, goats, and swine are raised; linens, woolens, leather, etc., are manufactured, and coal is exported. Pop. (1897) 612,663.

Oviedo y Valdez, é vái-dátz, Gonzalo Fernandez de, Spanish historian; b. Madrid 1478; d. Valadolid 1557. In 1513 he received a government appointment in the newly discovered Island of Hispaniola, and with few intervals spent the rest of his life there. As governor of the mines in the island he conducted was cruel to the Indians, and many perished under his brutal rule. Named by Charles V. historiographer of the Indies, he wrote his 'Sumario de la Historia General y Natural de las Islas Occidentales' (1535 et seq.). He wrote also 'Quinquagenas,' so entitled from its consisting of 50 dialogues, in which the author is the chief interlocutor.

Ovipositor, an organ developed in relation to the orifice of the genital ducts of female insects, whose normal function is to place the fertilized egg in a position most suitable to its proper development. When typically developed, the ovipositor consists of three pairs of stiff or membranous unjointed styles or gonopophyses, of which the anterior or lowermost closely ensheathes the other two. The three pairs together form a tube into the base of which theoviduct opens and along which the eggs are conducted to the situation selected for their deposition. The homology of these styles is not fully settled, but the generally accepted and best supported view is that they represent the embryonic appendages of the seventh, eighth, and ninth abdominal segments, from which they are directly developed in at least some cases. In the entire orders of Lepidoptera, Coleoptera and Diptera, as well as in many representatives of other orders, no true ovipositor is developed. In such cases the terminal segments of the abdomen may form a retractile and protractile tube serving as an egg-conductor. The Orthoptera, Odonata, Hymenoptera and Hemiptera exhibit the organ in its highest state of development, and variously modified to meet various conditions. In the locusts it has the form of a stout sickle-blade, permanently exerted, and efficient in splitting plant tissues for the reception of the eggs. The sawflies have the margin of the outer sheath serrated for cutting slits into leaves, etc., while the cicadas completely shatter twigs by the power of their ovipositors. Some of the ichneumon flies (q.v.) have ovipositors adapted to their parasitic habit by wearing in the long-tailed ichneumon-fly, for example, the organ is filamentous and so long and powerful that it is capable of penetrating the solid wood of tree trunks to a depth of several inches, reaching and depositing eggs within the burrows of wood-borers on which the ichneumon-fly larvae subsist.

The most remarkable of all modifications of the ovipositor, however, is found among the ants, bees, and wasps, in most of which it becomes a most efficient and beautifully constructed poisoning apparatus or sting, which consequently is possessed by the females alone. The sting, like other ovipositors, consists of three pairs of styles, but the stylele pair is united into a single barbed piece grooved on the ventral side and partly ensheathing the inner pair of very acute piercing darts. The outer pair form a protecting sheath to the sting proper. Within the abdomen is a tubular venom gland, with a reservoir and duct opening into the base of the grooved piece. When in operation the latter and the two darts work alternately in and out, penetrating deeper and deeper into the wound into which they conduct the venom. The male genital armature of insects is derived from essentially the same embryonic parts as the ovipositor and sting of the female, but never reaches the same structural complexity and serves solely as a clasping organ during copulation. Consult Packard, 'Text-book of Entomology' (1868).

Ovis, a genus of the family Bovidae and subfamily Ovina, including the sheep (q.v.).

Ovule, an outgrowth of the carpel of a plant where, by fertilization with pollen, a seed is formed. The ovules are always enclosed in the cavity of the ovary, or seed-producing organ. They are developed as a rule from the margin of the carpels, but several exceptional modes of development exist. See Seed.

O'Vum, an egg. See Embryology; Egg.

Owatonna, ϟ-wa-tō'no, Minn., city, county-seat of Steele County; on the Straight River, and on the Chicago & N., the Burlington, C. R. & N., and the Chicago, M. & St. P. R.R.; about 65 miles south of Saint Paul. It was settled in 1855 and incorporated in 1865. It is in an agricultural region in which corn, wheat, and nursery stock are important products. The chief manufactures are dairy products, flour, foundry and machine-shop products, woolens, chucks, automobiles, carriages, seeders, engines, and fanning mills. The prominent buildings are the court-house, opera-house, city hospital, the church and school buildings. There are three parks, four steel bridges, and a large number of fine residences. The educational institutions are the State School for Dependent and Neglected Children, the Pillsbury Academy, Sacred Heart Academy, public and parish schools, and a public library which contains about 7,000 volumes. The government is vested in a mayor who holds office one year and a council. The city owns the waterworks. Pop. (1890) 3,890; (1900) 5,501.

Owego, ϟ-wē'gō, N. Y., village, county-seat of Tioga County; on the Susquehanna River at the mouth of the Owego Creek, and on the Delaware, L. & W., the Lehigh Valley, and the Erie R.R.'s; about 30 miles east of Elmira and 20 miles west of Binghamton. It was settled in 1785 by James and Robert McMasters and others. It was chartered as a village in 1827. An Indian village, on the site of the present Owego, was destroyed in 1779. It is in
a farming section, but has considerable manufacturing interests. The steel bridge works have about 150 employees; the mica works, 75; the leather glove factory, 35; the wagon works, 150; cigar factory, 40; saddlery, 50; silk glove factory, 150; piano factory, 15; and other manufacturing industries employ about 100 more persons. Owego has considerable trade in lumber, farm products, and its own manufactures. The educational institutions are the Owego Free Academy, union and graded schools, one parochial school, and the Coburn Free Library. There are seven churches. The three banks have a capital of $200,000; the annual business amounts to $800,000. The government is vested in a president and six trustees; three of the trustees are chosen each year by popular vote. There is a colored population of about 10 per cent of the whole. Pop. (1900) 5,039.

L. W. KINGMAN,
Editor "Owego Gazette."

Owen, Sir Richard, English naturalist: b. Lancaster 20 July 1804; d. Richmond Park 18 Dec. 1892. He studied at the University of Edinburgh, began practice in London as a surgeon in 1826, became lecturer in comparative anatomy at St. Bartholomew's hospital in 1829, later was conservator of the Hunterian Museum of the Royal College of Surgeons until 1856, and in 1836-56 was first Hunterian professor of comparative anatomy and physiology. In 1838 he received the Wollaston gold medal of the Geological Society, and in 1840 became the first president of the Microscopical Society. From 1856 to 1883 he was superintendent of the natural history collections of the British Museum. In 1887 he obtained the removal of these collections from the Museum and their establishment at South Kensington as a museum of natural history. He was the first Rede lecturer at Cambridge in 1850, and received numerous foreign distinctions including the decorations of many orders and the Cuvier prize (1857). In 1857 he assisted David Livingstone (q.v.) in the preparation of the latter's 'Missionary Travels and Researches in South Africa,' and in 1861 published an edition of the posthumous papers of John Hunter. Among the more important of his own works were 'Odontography' (1840-5); 'Lectures on the Comparative Anatomy and Physiology of Invertebrates' (1843); 'History of British Fossil Mammals and Birds' (1846); 'On the Anatomy of Invertebrates' (1851); 'Researches on Fossil Remains of Extinct Mammals of Australia' (1877-8), and 'Memoirs on Extinct Wingless Birds of New Zealand' (1879). By 1856 he had won recognition as the leading anatomist of his time. His scientific labors were extensive and continuous, and he was an active and often bitter controversialist. He was with Cuvier a pioneer in vertebrate paleontology, and made to the study many important contributions, including prominently a paper on 'Archeopteryx' (1863). His discoveries also were numerous, and he was among the first to work toward a concise nomenclature in anatomy. Consult 'Life' by his grandson (1894).

Owen, Robert, English social theorist: b. Newtown, Montgomeryshire, North Wales, 14 May 1771; d. there 17 Nov. 1868. He established a small cotton-spinning works at Manchester, and later became known as a successful manager of large mills. In 1794-5 he organized the Chorlton Twist company, which operated the new Lanark mills, and in 1814 a new company was established. This included the names of William Allen, Joseph Fox, Jeremy Bentham, and other noted philanthropists and reformers, and was organized on the principle 'that all profits beyond 5 per cent per annum on the capital invested shall be laid aside for the religious, educational and moral improvement of the workers and of the community at large.' The employment of children was stopped, a new system of education established, the houses improved and insurance funds established; and the community of New Lanark became noted for the prosperity of the people. He published 'New Views of Society, or Essays upon the Formation of Human Character,' and in
OWEN — OWENS LAKE

1826-44 a 'Book of the New Moral World,' in which he advanced and developed his socialist views, insisting upon an absolute equality among men. In 1817, he presented a report to a Parliamentary committee on the causes of poverty and means of avoiding it, in which he outlined a plan for the establishment of a co-operative village, federations of such villages to form a world republic. In 1829 he gave up the management of the Lanark Mills, and devoted his time and entire fortune to the propagation of his socialist doctrines. He visited the principal towns of Great Britain and the United States, where he was received with favor. He set up two social communities on his own plan, one at Orbiton in Lanarkshire, another at New Harmony, Ind. They proved signal failures, their originator attributing their non-success to their not being sufficiently carried out on his principles. In his later years he became a believer in Spiritualism. He was a man thoroughly sincere and respected for his integrity; he is regarded as one of the founders of English sociology, many of his followers were active in the Chartist movement (q.v.). See Jones, 'Life, Times, and Labors of Robert Owen' (1860); Holyoke, 'Life and Last Days of Robert Owen' (1871); and Owen's incomplete autobiography (1837-8).

Owen, Robert Dale, American social reformer: b. Glasgow, Scotland, 9 Nov. 1800; d. Lake George 17 June 1877. He was educated in Switzerland and England, and came to the United States for the first time in 1825 in connection with the ill-starred communist experiment of the elder Owen (q.v.) at New Harmony, Posey County, Ind. In 1826 he received from Fanny Wright 860 acres of unimproved land at Nashoba, near Memphis, Tenn., for the purpose of establishing under white direction a settlement of liberated negroes. This scheme was as impossible as the other. In 1827 he established at New York with Fanny Wright a journal called 'The Free Inquirer,' a socialist and agnostic publication. In 1832 he returned to Indiana, where in 1835 he was elected to the legislature as a Democrat. He was also chosen to Congress in 1843 and 1845. A measure concerning the Oregon boundary, introduced by him in 1844, became the basis of the settlement of 1846. He was prominent in the founding of the Smithsonian Institution (1845) and in the remodeling of the Indiana Constitution (1850). In 1853 he was made chargé d'affaires at Naples, in 1855 minister. After his return (1850) he was active as an abolitionist. He was, at least in later days, a firm believer in Spiritualism, and in this connection were written some of his most interesting works, such as, 'Footprints on the Boundary of Another World' (1859), and 'Debatable Land between this World and the Next' (1872). Others of his writings are: 'The Personality of God and the Authority of the Bible' (1832), and 'Pocahontas: A Drama' (1837); 'North America' (1874), an autobiography covering the first 27 years of his career.

Owen Meredith. See LYTTON, EDWARD ROBERT.

Owen Sound, Canada, the county-seat of Grey County, Ontario, a town and port of entry at the mouth of Sydenham River, and at the head of its estuary called Owen Sound, an outlet on Georgian Bay, Lake Huron. It is a terminal of branches of the Grand Trunk and Canadian Pacific Railway; it is one of the best harbors on the lake, and steamships communicating with the principal lake ports. It has manufactures of agricultural and mill machinery and implements, sewing machines and furniture, and lumber-mills, flour mills, and grain elevators. A U.S. consular agent is resident at Owen Sound. Pop. (1901) 8,777.

Owens, òéinz, John Edward, American actor: b. Liverpool, England, 4 May 1824; d. near Towson, Md., 6 Dec. 1886. He came with his parents to the United States when three years old, was educated in Philadelphia and made his first appearance as an actor there in 1841. In 1849 he was manager of the Baltimore Museum and in 1852 opened Brougham's Lyceum in New York and was well received; after a tour of Europe he was manager of the Charles Street Theatre in Baltimore and afterward starred successfully for several seasons. In 1864-5 he made a brilliant nine months' run at Wallack's Theatre, New York, in 'Solon Shingle,' afterward playing the same part in London. Upon his return he starred in various stock companies and in 1882-3 made his last engagement in New York at Madison Square Theatre in 'Esmeralda.'

Owens College, Manchester, England, was established under the will of John Owens, a Manchester merchant, who died July 1846, and left about $500,000 for the purpose of founding an institution for providing or aiding the means of instructing youths over 14 years of age, in such branches of learning and science as are now or may be hereafter taught in the English universities, subject to the immutable condition that no student, professor, etc., shall be required to make any declaration or submit to any test of their religious opinions, and that theological and religious subjects shall form no part of the teaching of the college. From 1851 to 1873 the college occupied a private house, when it removed to a handsome Gothic building erected by public subscription. The success of the college led to a proposition, which received considerable ecclesiastical opposition, to incorporate a university, with several affiliated colleges located in different towns, but having its seat in Manchester. In 1880 Victoria University was instituted by royal charter, with power to grant degrees in arts, sciences, and law, a supplemental charter, granted May 1883, giving power to grant degrees in medicine. Owens College is thus the central college of the University. University College, Liverpool, was incorporated with Victoria University in 1884, and the Yorkshire College, Leeds, in 1888. A women's college, under the direction of the professors of Owens College, is also affiliated, and Victoria University grants degrees or certificates to women.

Owens Lake, a lake in Inyo County, southeastern California, east of Mount Whitney of the Sierra Nevadas, 18 miles long and 10 miles wide. It receives the waters of the Owens River (q.v.), but has no visible outlet, and its waters are very salt.
OWENS RIVER—OWLS

Owens River, a river of southeastern California, rises in the southern part of Mono County, flows southeast and then south, and empties into Owens Lake (q.v.); length 175 miles. Its course is through a desert valley and the Sierra Nevada on the west and the Inyo Mountains on the east; its volume of water is considerably diminished during the summer season, some of its branches drying up entirely. A branch of the Southern Pacific Railroad parallels it for the greater part of its course.

Owensboro, o'enz-bôr-ô, Ky., county, county-seat of Daviess County; on the Ohio River, and on the Illinois Central, the Louisville & N., and the Louisville, H. & S. L. R.R.'s; about 41 miles southeast of Evansville, Ind. It has steam connections with all the principal river ports. It is in a farming and stock raising region, and near are forests, coal and oil fields. In the vicinity are deposits of iron, lead, zinc, and flint, and stone quarries are near. The chief manufactures are tobacco products, cellulose, wagons, carriages, whiskey, brandy, brick and tile, and iron products. It has an extensive trade in tobacco products, coal, farm products, live stock, and manufactures. Public buildings are a government building, county court house, jail, and the high school. Its educational institutions are the Owensboro Female College (1850), Saint Francis Academy, public schools. The city has an office four years. The waterworks and electric-light plant are owned and operated by the city. Pop. (1890) 9,837; (1900) 13,189.

Owl Parrot. See Kakapo.

Owlet Moths, a section of the family Noctuidae, containing small species. The Noctuidea is an immense assemblage of night-flying moths made up of hundreds of genera and thousands of species, and represented in all parts of the world. They are as a rule of less than medium size and of dusky tints, and are closely allied to the tiger-moths (Archida), from which they may be distinguished by the subcostal nerve of the hind wing anastomosing with the radial only near the base of the cell. In the fore wing the fourth and fifth radial nerves fork which is connected by a cross-nerve with the second. The frenulum is present and the first maxillae are well developed. The caterpillars are not hairy as a rule, and ten prolegs are usually present. The pupa is sometimes naked and subterranean, lying within a rude cell of clay; sometimes enclosed in a cocoon made partly of leaves, etc., on the surface of the ground.

Owls, nocturnal birds of prey of the group Strigidae. The owls form a compact clearly circumscribed group solidified by many common characters, but the question of their relationship to other birds is one which ornithologists have found most puzzling. Formerly they were united without question with the other birds-of-prey, but the raptorial bill and claws, in which the resemblance to the hawks is most striking, may well be only adaptations to similar predaceous habits. On the other hand it is equally probable that the soft plumage, highly developed sense-organs, etc., are adaptations to nocturnal activity; certainly they are least developed in the more diurnal species. As a result of more fundamental anatomical studies a strong tide of opinion has set in toward a belief in a relationship of the owls to the night-jars (Caprimulgidae) and the peculiar oil-bird (Steatornis), with which they are often united, but as a distinct suborder (Strigidae), in the order Coraciiformes, but many ornithologists refuse to follow this current. The most characteristic physiognomy of the owls results chiefly from the development about the eyes of areas of radiating feathers, or facial disks, supported by a ruff of peculiar stiff rachis feathers of long, erectile feathers called horns or ears, though they have nothing whatever to do with the sense of hearing, but are comparable to the crests found on the heads of many birds. The general plumage is very soft and fluffy, making noiseless flight possible and giving an exaggerated idea of bulk. The feathers have no aftershaft; and some species, like the snowy owl, have the feet and toes thickly feathered to the claws, giving them, a peculiar booted appearance. The head is always remarkably large, and the bill strongly hooked and cered. A peculiarity of the large, strongly clawed foot is the usual outer toe, which may be directed forward, outward or completely backward and paired with the hallux at will. In correlation with their keen senses the sense-organs are greatly developed. The facial skin of owls is movable and forward and, owing to their form, can rotate but slightly in their sockets, a peculiarity which explains the owl's habit of following with the head any object at which its gaze is directed. The somewhat cylindrical or annular form of the eye results from the great development of the bony sclerotic or focusing ring. Unlike most birds the upper, and not the lower, lid is chiefly employed in closing the eye, which is further protected by a lirae membrane. Although many differences in the degree of its development are presented, owls are almost the only birds which may be said to have an external ear approaching that of mammals. It is of course concealed beneath the feathers, but, when best developed as in the short-eared owl, covers the entire side of the head, and is provided with a prominent marginal fold of skin or "operculum." The tympanum is asymmetrical, one being directed upward, the other downward, and in the great gray owl and its immediate allies even the skull bones are asymmetrical. By common consent the barn owls are separated from all the others as a family (Strigidae) or subfamily. They have the furculum complete and ankylosed with the sternum, and the latter with an entire posterior margin. The remaining owls (Bubonidae) have the furculum free from the sternum and either very thin or incomplete in the middle and the posterior border of the sternum notched. Not less than 50 genera and 250 species of owls, varying in size from a sparrow nearly to a small eagle, have been described, and many exhibit several color-phas. The group is absolutely cosmopolitan. Owing to their nocturnal habits, their ways are less well known than those of most birds, but in general they are much the same. With the notable exception of such species as the snowy owl and hawk-owl, they seek concealment during the day in dark retreats, but become active after nightfall. Their prey consists of snails, insects, mice, birds, rabbits or even larger animals, according to the size of the species, which they
OWNERSHIP — OX

approach on noiseless wing and usually grasp with one foot, after which it is borne away to a perch and torn to pieces. A few species feed on fishes, and one even on crabs, but never on vegetable matter. Undigested portions, as bone, hair and hard parts of insects are ejected in pellets from the mouth. Their voices present some variety; some hoot, some whistle, but the cry of many resembles a shrill laugh. Owls breed very early, many of them in late winter, and deposit their nearly spherical, white or whitish, eggs in holes in trees or rocks, in nests deserted by other birds or rudely constructed by themselves on the ground or in trees. One species, the American burrowing owl, nests in communities in or among the burrows of prairie dogs, but the association does not partake of the happy relation sometimes described. The young are interesting objects, thickly covered with down, usually white.

The mystery surrounding their nocturnal habits, and their often lugubrious cries have made owls suitable objects of superstition among all peoples and in all ages. Among the ancients the owl was regarded on the one hand as a portent of dire calamity and its appearance near a sick chamber an omen of death; on the other, it was the bird of wisdom, the symbol of the goddess Athene. Both attributes naturally arose from a knowledge of the owl’s keen senses, which, exaggerated in the popular imagination, enabled it to perceive knowledge beyond the common reach, and even to scent the putrescent effluvia of approaching death in the beginning of an illness. How deeply fixed and widely spread is the belief in the owl as an evil omen is shown by the frequency of its occurrence in all literatures and folk-lore. The Hindus have an interesting myth of the crow (night) and the owl (moon) contending for supremacy. Among the American Indians the owl figures in many legends. One told in the Kootenay tribe is to the effect that the wicked owl was in the habit of carrying off crying children. Through trickery it was finally killed and its body burned by the coyote, but its spirit rose from the ashes as a swarm of blood-sucking mosquitoes.

For an account of the numerous species of owls of the United States consult Baird, Brewer and Ridgway, ‘North American Land Birds’ (1878); Barrows, ‘Standard Natural History’ (1885); Sharpe, ‘Catalogue of Striges of the British Museum’ (1875); and for ancient and medieval superstitions to Gubernatis, ‘Zoological Mythology’ (1872).

See the names of various species as BARN OWL, HAWK-OWL, etc., J. PERCY MOORE, University of Pennsylvania.

Ownership is the dominion of a thing real or personal, which one has the right to enjoy and to do with as he pleases, even to spoil or destroy it as far as law permits, except that he is prevented by some agreement or covenant restraining such right. An owner continues to have the same right although performing no acts of occupancy. Undigested portions, as bones, hair and hard parts of insects are ejected in pellets from the mouth. Their voices present some variety; some hoot, some whistle, but the cry of many resembles a shrill laugh. Owls breed very early, many of them in late winter, and deposit their nearly spherical, white or whitish eggs in holes in trees or rocks, in nests deserted by other birds or rudely constructed by themselves on the ground or in trees. One species, the American burrowing owl, nests in communities in or among the burrows of prairie dogs, but the association does not partake of the happy relation sometimes described. See the names of various species as BARN OWL, HAWK-OWL, etc., J. PERCY MOORE, University of Pennsylvania.
they constituted the great forest oxen, which Caesar found in his campaigns in Gaul and Germany, and to which, not distinguishing them, he gave the general name *urus*. Some survived as late, at least, as the reign of Charlemagne, and from them were derived, no doubt, the modern domesticated races of the Western World, possibly with some small and later admixture from the Eastern species. These cattle were tall, strong, and seem to have differed mainly in the comparative length and shape of the horns; and there seems no doubt that a remnant of *Bos primigenius*, nearly, or, as some believe, quite pure, exists in the white cattle preserved in the Chillingham estates in the north of England (see *Chillingham White Cattle*); it is also regarded as certain that the Holstein breed is a direct descendant of this species. The other (short-horned) species has long been extinct, but was apparently the progenitor of the great body of European domestic cattle, wherein the herds of America, South Africa, Australia, and, in fact, all the world except the Orient.

The domestication of cattle began in prehistoric times; and some Asiatic species now extinct may have supplied the stock represented as in the service of the civilized nations of ancient Persia, Syria, Egypt, and Rome by the early carvings and paintings which have come down to us, but they may have been derived from one or both of the species above mentioned. They were carried to Carthage and westward and to southern Europe when the civilizations of Greece and the Italian peninsula arose, and some were no doubt gradually taken by Roman settlers into western Europe as fast as it was subjugated, where they would be crossed with the larger, harder short-horned local races of Gaul. Apparently the native cattle of the British Isles were of the long-horned (*B. primigenius*) stock only; but when what now is England was conquered and colonized by the Romans and later by the Saxons, Normans, etc., the better short-horned cattle which they brought with them were substituted first in the south of England and gradually elsewhere, replacing the British long-horns everywhere except in the extreme north, where the red Highland cattle perhaps represent them to this day. The Friesian and Holstein breeds of the Netherlands, and the semi-wild Spanish cattle are regarded also as nearly direct descendants of these aboriginal long-horned oxen, and from the Spanish stock, transported to South and Central America in the 16th century, came the vast plains-ranging herds of the Argentine pampas, Mexico, Texas and neighboring States. It was not until comparatively recent and improved methods of breeding began to develop in England, northern France and the Netherlands the improved breeds now so distinct and valuable for beef or for milking. Most of the early cattle brought to eastern North America seem to have been of the short-horned English variety; and these, keeping pace with European development by intelligent selection and the frequent importation of foreign strains of high quality and mingled with the western *scrub* cattle, have produced the excellent varieties now to be seen in the United States and Canada.

Nearest to our domestic cattle are two East Indian species, the gaur and the gayal (*q.v.*), which are domesticated to some extent by the people west of the Bay of Bengal. Closely related is the banting (*q.v.*) of Sumatra. The common humped or Brahman cattle (see *Zebu*) of India and eastward represent a distinct species, of which no wild herds remain, and which has been bred into many distinct varieties, of which one of the most aberrant is the Abyssinian sanga. The yak (*q.v.*) of Tibet, and the diminutive forest-ox (*see Anoa*) of Celebes, bring the list of oxen down to the buffalos. Of these (see *Buffalo*) the East Indian species still exists in wild bands in the jungles of India and the Malayan Peninsula, but has been domesticated for a very long period, and is used as a beast of draft and of burden throughout southeastern Asia, and in many parts of tropical Africa. Africa has two native species, neither in domestication. A fourth species inhabits Mindanao, one of the Philippines, and is found in the writings of Blanford upon the mammals of India, Persia and Abyssinia; Lydekker, *Oxen, Sheep and Goats of the World* (1898); and the authors cited under *Bison, Buffalo*, etc.

ERNEST INGERSOLL.

**Ox-bird, or Ox-eye.** See *Dunlin*.

**Ox-bot, a bot-fly attacking meat cattle; a warble-fly of Europe is *Hypoderma bovis*, and until about 1890 it was believed by naturalists that the very similar flies prevalent in North America were the same, but it is now known that they belong to a second species (*H. lineata*) locally known in the southwestern United States as heelfly. The larvae or warbles are called "grubs" by American stock-raisers, and affected cattle are said to be "grubby." These and various allied species parasitic upon domestic animals, and even upon humanity in certain tropical regions, constitute the family *Extridae*. In the case of the American ox-bot (*H. lineata*) the flies appear early in spring and haunt feeding cattle, hovering especially about their legs, where they deposit their eggs mainly upon the hairs overhanging the hoofs. The egg is barely visible to the unaided eye, is cigar-shaped, and has an end formed into a clasping appendage by which it is attached to the hair. Five or six are placed in a close row on each hair. The cattle lick themselves and gather these eggs upon the tongue, where they hatch, and the maggots make their way into the subcutaneous tissues; when the maggots (q.v.), after a month or so, hatch out of the walls, force their way through by means of the sharp spines about the head, and nest in the wall-tissues of the throat until they have undergone a molt. They remain here many weeks, then make their way to the temples of the neck and work along beneath it to the back, where during winter the presence is shown by the swelling of the hide over them. These grubs are nourished by the pus and serum produced about them by their movements. Some weeks later, or toward spring, the maggots reach maturity, molt again, become nearly an inch long, and at last force their way out through the skin; then they drop

Vol. 11—45
OX-EYE — OXALIC ACID

to the ground, the larval skin dries and stiffens, and the maggot within separates itself from this old integument and turns into a pupa stage, which is speedily completed, allowing the fly to emerge in time to produce a brood before the end of the summer. The knowledge of this life-history was gained only as recently as 1890, mainly through the investigations of Dr. Cooper Curtice; and it is not yet known whether the eggs and young of H. botts pass through a similar series of events.

The damage done by ox-bots is very great, and is due to the perforation of holes by the escape of the maggots; loss of milk and beef due to the fretting and often stampeding of the cattle when the flies are laying their eggs; and general depreciation of the stock. The insect is so uncommon that it may be disregarded east of the Alleghanies; but it is exceedingly numerous and troublesome in the Mississippi Valley and Southwestern States, and the cattle there, especially in Texas, betray the greatest terror in the fly season, rushing headlong when a fly appears, and if possible dashing into the water and staying there. In addition to the harm to beef and milk caused by the nervousness and interference thus produced, one half of the hide that reach market from the infested regions show perforation by warbles, and suffer a discount in price which on the average will amount to a third of the value of perfect hides.

Consult: Howard, 'The Insect Book' (1901); Osborn, 'Insects Affecting Domestic Animals' (U. S. Dept. Agriculture, 1896); Brauer, 'Monographie der Gestrinden' (1863).

Ox-eye, a popular name for several composite plants, especially of the American genus. In America the name is most widely applied to Heliotrope, about ten species of which are distributed from Nova Scotia to Florida and westward to the Mississippi Valley. They are, with one exception, all perennials which bear abundant yellow flowers in the fall, but are not so popular in gardens as members of the genus Helianthus, the sunflowers. The ox-eyes of Europe are species of Buphthalmum, which are sometimes grown in America in hardy borders. They have large flower-heads with long yellow ray-flowers, and resemble sunflowers. Being showy and of simplest culture they are worthy a place in gardens. In the New England States the name is given to the oxide-susans (Rudbeckia hisiosa), and to the ox-eye daisy (Chrysanthemum leucanthemum). See DAISY.

Ox-gall, the bile of the ox, a greenish bitter fluid secreted by the liver of the animal. After being clarified it is suitable for various uses in manufactures and the arts, especially in the mixing of colors for water-color painting, its effect being both to increase their fluidity and to fix them. It is also used in medicine, either in concentrated mass or powdered after drying, as a tonic and for the cure of bilious disease and as a compensation for the lack of the secretion of bile. It is further useful in the form of enemas.

Ox-pecker. See BUFFALO-BIRD.

Ox-warble. See OX-BOT.

Oxalic Acid, a dibasic organic acid whose salts occur in various plants, and which takes its name from the occurrence of the acid potassium salt in common sorrel (Oxalis acetosella). Oxalic acid may be obtained by heating sawdust with a mixture of caustic soda and caustic potash. The immediate product is oxalate of soda, which may be obtained in granular form by exhausting the mass with boiling water, and evaporating the filtrate. To prepare the acid in the free state, the sodium oxalate is boiled with milk of lime, and the calcium salt so obtained is decomposed with sulphuric acid. Much of the commercial supply of oxalic acid, however, is obtained by the oxidation of sugar with nitric acid. Anhydrous oxalic acid may be obtained in the form of octahedral crystals, by allowing a solution of oxalic acid in sulphuric acid to stand for some days. The anhydrous acid has the formula 

\[ \text{COOH}_2 \text{COOH} \]  

or 

\[ \text{H}_2\text{C}_2\text{O}_4 \]  

melts at 306°F, and absorbs water from the air, its crystals then falling into powder. The oxalic acid of commerce contains two molecules of water, crystallizes in the monoclinic system, and is readily soluble in water and in alcohol. The hydrated acid yields off their water of crystallization when heated to 212°F or when allowed to stand for some weeks over concentrated sulphuric acid. The hydrated crystals bear a close resemblance to Epsom salts, with which oxalic acid is distinguished, and results. Heated to about 300°F, oxalic acid decomposes with the formation of carbon monoxide, carbon dioxide, water, and formic acid; a small quantity of oxalic acid also subliming, at the same time, without change. When heated with concentrated sulphuric acid, it breaks up into water, carbon monoxide, and carbon dioxide, the latter two gases being given off in equal volumes. Oxalic acid forms two series of definite, crystallizable salts, according as one or both of its typical hydrogen atoms are replaced. The neutral oxalate of ammonia is used in the laboratory, as a reagent for the detection of lime, since it gives, with a salt of calcium, an insoluble, white precipitate of calcium oxalate. Neutral oxalate of potassium reacts with ferrous sulphate to form a double oxalate of iron and potassium, which possesses powerful reducing properties, and is used as a photographic developer. The acid oxalate of potassium (also known as salt of lemon, or salt of sorrel), is used for different purposes in the arts and is used in calico-printing, and also in various bleaching processes, especially the bleaching of straw.

Poisoning by Oxalic Acid. So commonly is oxalic acid used to polish kitchen boilers, etc. and to remove ink and fruit stains, that it is frequently mistaken for a "harmless powder." There is reason to believe that poisoning sometimes results from the frequent use of some cheap effervescent drinks in which citric acid is adulterated with oxalic acid. Oxalic acid is ranked as a corrosive poison, though, if taken in dilute solution, there may be no evidence of corrosion. The symptoms of this poisoning are heat and severe pain in the throat and stomach, difficulty in swallowing, a sense of constriction, vomiting — perhaps of blood — muscular cramps, sometimes convulsions, and purging, in some cases attended with blood. The lips, mouth, and throat are at first white and later then white. If the poisoning is severe the pulse is small and thready, there is a cold, clammy perspiration, then collapse, and, it may be, death from inanition. For treatment, first neutralize the poison by giving milk of lime, with a large
excess of hydrated lime, chalk, whitening, marble-dust, or even whitewash from the wall, if it can be obtained; then give a purgative dose of castor-oil, allay pains about the bowels if signs of collapse be present. Emetics are rarely needed and any liquid other than milk of lime should be sparingly used, if at all.

Oxalis, a genus of herbs and shrubs of the natural order Geranaceae. The species, of which there are about 300, are mostly native of the warm parts of South America and Africa, but some are well known weeds, called wood-sorrel, in the northern temperate zone; many have tuberous or bulbous roots. The genus is generally characterized by digitate or ternate compound, clover-like leaves which *sleep* at night or in very cloudy weather, that is, the leaflets assume a resting position at such times. The flowers generally close under similar conditions. The seeds, which are contained in a capsular fruit, are thrown to considerable distances when the fruit bursts open. Some of the tuberous species are used like potatoes; other kinds as salads; but the greater number are valued more for ornamental purposes than for food. They are largely cultivated in rockeries, borders, hanging baskets, window-gardens and greenhouses. They are readily propagated by divisions of the underground parts, and more slowly by seeds. They do best in well-drained, rich, sandy loam, those for winter blooming being started in early autumn; those for summer blooming, in early spring, being transplanted to the garden as soon as danger of frost has passed. When frost is expected in the autumn the plants should be removed to a greenhouse or cellar and allowed to dry slowly. Those grown in the house or greenhouse may be allowed to dry gradually when they have ceased to bloom. When the planting time again arrives the old soil should be removed and the clumps divided before being set in fresh soil.

The best known American species is the common wood-sorrel (O. acetosella). It is also a native of Europe and western Asia. Naturally it grows best in shady places and is often found covering the ground as thickly as grass, its little white, rosy-veined flowers appearing in abundance throughout the season. Except in such places the plant is rare as a garden flower it is generally regarded as a weed. Probably the next best known is the violet wood-sorrel (O. violacea), a native of the eastern United States. It inhabits similar localities but has pinkish violet flowers. Both species have an acid taste due to the presence of binoxalate of potash. The leaves are used to a small extent in the United States as a salad, but the former species is very popularly used in Europe, especially in Lapland.

Oxaluria, a morbid condition of the system, in which a prominent symptom is the presence of crystalline oxalate of lime in the urine. See Urine.

Oxenbridge, John, English colonial divine in America: b. Daventry, Northamptonshire, 30 Jan. 1668; d. Boston, Mass., 28 Dec. 1673. He was educated at Cambridge and Oxford. He was called to the temporary Church in the Bermudas, whither he made two voyages, held a curacy at Beverley, was pastor of a church at Berwick-on-Tweed, held a fellowship at Eton from 1652 until 1662, was ejected at the Restoration (1660), and as a preacher was driven from the exercise of his office by the act of uniformity. In 1669 he came to New England and on 4 May 1670 was ordained pastor of the first church at Boston. Anthony a Wood calls Oxenbridge a person "of a roving and rambling head" and "a strange hodge-podge of opinions"; but he is ranked in Boston Congregational annals as a pious and eloquent preacher, and a writer of considerable elegance. Among his works are: "A Double Watch," 1661; "A Sermon at the Anniversary Election of Governor," 1672.

Oxenford, Æsk'n-ford, John, English dramatist and critic: b. Camberwell, London, 12 Aug. 1812; d. London 21 Feb. 1877. He was educated for the law and admitted to the bar in 1832, but chose a literary career. He translated from the German Schlegel's "Autobiography." As a writer of both dramas and songs he gained considerable reputation and for 30 years preceding his death was dramatic critic on the London Times. Among his plays are: "A Serenader" (1835); "The Two Orphans"; "Twice Killed" (1835); "A Day Well Spent." (1835).

Oxenham, Æsk'n-am, John, English novelist. He was educated at Victoria University, Manchester, and was for some time resident in this country. Returning to England he gave up commercial pursuits in which he had been engaged and turned to literature. He has since published "God's Prisoner," 1898; "Rising Fortunes," 1899; "A Princess of Vascovy," 1900; "Our Last Deliverance," 1901; "A Modern Masquer," 1901; "John of Verrius," 1902; "Under the Iron Flail," 1902.

Oxenstierna, Æsk'n-shär-nä, Axel, Count, Swedish statesman: b. Fano 16 June 1583; d. Stockholm 28 Aug. 1654. He studied theology and later law at Uppsala, Wittenberg and Jena; at 20 entered the diplomatic service of Charles IX.; was his minister to Meklenburg in 1606; entered the senate in 1609; was head of the regency during the last days of Charles IX. and through the minority of Gustavus Adolphus; became chancellor of the realm in 1623, and reigned as regent during the prolonged absence of the king; effected the Peace of Stolbova with Russia (1617); and in 1626 was made governor-general of Prussia. After the death of Gustavus Adolphus at Lützen in 1632, Oxenstierna received almost unlimited powers, directed the league against Austria, and held it together for four years. He returned to Sweden in 1636 and became the leading spirit in the regency of Christina, using all efforts to bring about peace with Germany. The Peace of Brömsebro, concluded in 1545 as the result of negotiations undertaken by his son John, the Swedish plenipotentiary to Germany, was highly displeasing to the Queen. His obstinate opposition to Chris- tina's plan of naming her own successor widened the breach between them, and he gradually withdrew from public affairs. Oxenstierna must be reckoned with Gustavus Adolphus as the leader of the Protestant League, and as a great and able statesman. The Swedish Academy of History and Antiquities is editing his correspondence (1888 sqq.). His greatest literary and political monument is the Constitution which he drew up in 1634.

Oxford, Æsk'förd, England, a celebrated university city, the capital of Oxfordshire, 52 miles west-northwest of London (63½ miles
by rail), on an activity between the Cherwell and the Isis, a local name for the Thames. The river is here and are crossed by several bridges, the principal of which are Magdalen Bridge over the Cherwell, and Folly Bridge over the Isis. In early times the city was surrounded by a wall; a considerable section exists, intact, in New College Gardens. The castle of Oxford, famous for the Empress Matilda’s escape over the frozen Thames in 1142, has disappeared, but the keep, built in the time of Rufus, remains entire, and is included in the precincts of the prison. The principal street, colloquially called The High, has a length of about 1,000 yards, and its greatest width is 85 feet. It is adorned by several of the noblest structures of the city, including Brasenose, All Souls’, University, Queen’s, and Magdalen Colleges, St. Mary’s Church, the new examination schools, and a fine bridge over the Cherwell, together with quaint old houses. The Botanic Gardens, dating from the 17th century, add to the beauty of the street.

The most interesting buildings are the colleges, component parts of the University of Oxford (see OXFORD, UNIVERSITY OF), but separate and distinct corporations, possessing property apart from the university. The buildings of the university proper are mainly situated between Broad and High streets. The most remarkable is the Bodleian Library, founded by Humphrey, Duke of Gloucester, built between 1444 and 1480, and restored by Sir Thomas Bodley about 1600. South of the Bodleian is the Bodleian Library, erected in 1749 to contain the books presented by Dr. Radcliffe to the university, and now used as a reading-room for the Bodleian. North of the Bodleian stands the Clarendon Building, built from the proceeds of Clarendon’s ‘History of the Great Rebellion.’ It is the original home of the Clarendon Press, but now contains the offices of the registrar, etc., of the university. Westward of the library is the Sheldonian Theatre, designed by Wren, and presented by Archbishop Sheldon, a large semicircular chamber capable of seating 4,000 persons, and used by the university on great public occasions. The university also possesses the new Botanic Gardens, the Asmolean Museum, with the University Galleries and the Taylor Institution; the Science Museum, in the large and beautiful University Parks, by the side of the Cherwell, and close to the beautiful walk known as “Mopetamia,” which also belongs to the university; the Indian Institute; and the Botanic Gardens. New laboratories have been erected in proximity to the Science Museum, and the new schools are used for university lectures as well as for examination purposes.

The most remarkable of the buildings belonging to the various colleges are those of Christ Church. The great quadrangle is the largest in Oxford; the great tower was begun by Cardinal Wolsey, completed from designs by Wren, and contains the famous bell known as “Great Tom.” Christ Church is also remarkable for its magnificent dining-hall and staircase, and its library, as well as for its cathedral. Not less interesting is Merton College, with its ancient chapel and the “Mob Quad,” the earliest quadrangle in Oxford. New College, a perpendicular building of the late 14th century, is due to the munificence and the architectural skill of the great prelate, William of Wykeham. Its chapel, cloisters, and gardens are among the “sights” of Oxford, and its large quadrangle remains, except for the addition for a third story, much as it appeared to the founder’s eye. Magdalen College is famous for its exquisite tower, the most beautiful of the “spires of Oxford,” its chapel and cloister, and the Water Walks, known as “Adison’s Walk.” The buildings of All Souls’ College are also rich in architectural association, and every college has some feature of peculiar interest. The chapel and garden buildings of St. John’s, the library of Corpus Christi, Johnson’s rooms at Pembroke, and the general effect of the quadrangles of Corpus, Oriel, Wadham, Balliol, and University, are illustrations of this. Modern additions to the architecture of Oxford have not been uniformly fortunate, and an occasional instance of vandalism (as in the destruction of the old porch at Oriel in 1897) is to be deplored. But the latest additions to Brasenose and New College and the Examination Schools are more worthy of the traditions of the university. Several of the colleges, notably Worcester, St. John’s, Wadham, MerTon, New College, and Trinity, have also beautiful gardens, and Christ Church possesses the great Broad Walk in the Meadow. Four colleges for women have been established, Somerville Hall, Lady Margaret Hall, St. Hilda’s, and St. Anne’s; the Radcliffe Science School, founded by Dr. Radcliffe on Headington Hill; the Martyrs’ Memorial, the Bullingdon Barracks; the Pusey Memorial House, with its Chapel of the Resurrection; and the New Theatre.

Oxford is the see of a bishopric constituted at the Reformation. Christ Church, the cathedral church, originally belonged to the priory of St. Frideswide. Besides being the cathedral church of the diocese, it is also the chapel of Christ Church, but is of greater antiquity than this institution having been built in the 12th century. The architecture is of the transition period between Norman and early English, and though the building is one of the smaller English cathedrals, its graceful and dignified interior gives it an important place in ecclesiastical architecture. The exterior, save the ancient spire, is hidden by the collegiate buildings. In the cathedral lie the remains of many eminent men, including Bishop Berkeley and Dr. Pusey. St. Mary’s, used as a University Church, finely situated nearly in the centre of the High Street, is conspicuous by its richly decorated tower, terminating in a beautiful spire 180 feet high. It ranks as one of the finest Gothic structures of Oxford. The church of St. Martin’s or Carfax, was removed in 1896 to afford more room at the crossing of the four great thoroughfares, High Street, Queen Street, St. Aldate’s, and Corn Market. The ancient tower has been preserved. All Saints Church is a Queen Anne building in the classic style, of which it is an excellent example. St. Mary Magdalen presents several beautiful features, and has acquired much additional interest from the Martyrs’ Aisle, added as a fit accompaniment of the Martyrs’ Memorial, which stands close to it.
OXFORD—OXFORD MOVEMENT

near the spot where Ridley, Latimer, and Cranmer suffered martyrdom. The most important of the other ecclesiastical edifices of Oxford are the churches of St. Aldate, St. Giles, St. Peter in the East, St. Thomas, and St. Barnabas, the chapel of Magdalen College, and the Roman Catholic Church of St. Aloysius. The Church of St. Peter in the East is very ancient, and possesses Saxon as well as Norman work; it has a large crypt. Several handsome churches have recently been erected: St. Philip and St. James and St. Margaret's in the north, St. Matthew's in the south, and St. Mary and St. John's in the east, the last served by the Cowley Fathers, an active Anglican brotherhood. The city contains also places of worship for Methodists, Independents, and Baptists. During the 19th century the city has been encircled by extensive residential suburbs. Less than two miles from Oxford stands, close to the river, the Norman Church of Iffley, the most perfect pieces of Norman architecture in England. The prosperity of the city depends mostly on the university, but a considerable trade is carried on in grain. The city is lighted by electricity, and has a modern drainage system; and an excellent, improved, water supply. Pop. (1901) 49,413.

Oxford, Miss., city, county-seat of Lafayette County; on the Illinois Central railroad; 70 miles southwest of Corinth. It was built in 1836, but was burned during the Civil War. It is in a cotton-growing region, and has a cotton gin and mill, and a cotton compress, also a planing mill, canning factory, and grist mill. It has two public graded schools, one for the colored race; it is also the seat of the State University of Mississippi, and of the Woman's College, founded in 1854 under the control of the Methodist Episcopal Church. Pop. (1890) 1,546; (1900) 1,825.

Oxford, N. C., town, county-seat of Granville County; on a northern branch of the Tar River, and on the Southern railroad, 35 miles north of Raleigh. It is in a fertile tobacco-growing region, has a large trade in tobacco, and contains several tobacco warehouses and manufactories, also a saw-mill, furniture factories, and tanneries. It has two orphan asylums, one for colored children, the other under the charge of the Masonic fraternity. It has no public high school (1903), but is the seat of the Horner Military School (non-sectarian) and of the Oxford Female Seminary (Baptist), founded in 1850, which has both secondary and collegiate departments. Pop. (1890) 2,007; (1900) 2,059.

Oxford, Ohio, village in Butler County; on the Cincinnati, Hamilton & Dayton railroad; about 35 miles north by west of Cincinnati. It is in an agricultural region, and the chief industries are connected with farm products. It is noted as an educational centre; it is the seat of Miami University (q.v.), Oxford College (q.v.), and Western College (q.v.). Pop. (1890) 1,922; (1900) 2,000.

Oxford Clay, in geology, a term used by English geologists of the lower division of the Middle Oolitic (see OOLITE), making up with calcareous sandstones the Oxford (or Middle) Oolitic group, and so corresponding to one of the upper sections of the Jurassic. It is a blackish, brownish, or dark blue clay, rich in fossil ammonites and belemnites.

Oxford College, a college for women established in 1849 at Oxford, Ohio. Besides the regular collegiate work, there are courses in music and art, and provision for post-graduate work; there is also a preparatory department. The collegiate course is arranged on a classical, literary, and scientific, leading to the degrees of A.B., B.L., and B.S. In 1902, the grounds and buildings were valued at $75,000; the students numbered 150 and the faculty 17.

Oxford Movement, a religious movement in the Church of England which originated among certain members of Oxford University. Its aim was the revival of religious life and doctrine in England on a purer and more primitive basis. The Church of England in the early part of the 19th century was in a condition in which reform was sorely needed. In many quarters religious life was stagnant, worldliness was rife, and the lower orders of the people had lost all taste for and sympathy with the services and ministrations of the established clergy. The fervid spirit of John Wesley and of the Wesleyan Methodists had kept the spark of spiritual life still glowing in the heart of the masses, and the Roman Catholic Church as a consequence of Catholic Emancipation was rehabilitating itself. There were two main parties in the Church of England. There was the great Evangelical party who whether they were admired as Evangelicals, or abused as Calvinists, or laughed at as Saints, were inheritors not of Anglican traditions, but of those which had grown up among the zealous clergymen and laymen who had sympathized with the great Methodist revival and whose theology and life had been profoundly affected by it* (Church). This party numbered many men of power among its ranks who kept alive the spirit of such pious and earnest leaders as Hervey, Romaine, Cecil, Venn, Fletcher, Newton and Thomas Scott. They trusted less in ordinances, or in ecclesiastical rites and traditions, than in the stirrings of the individual soul toward God, private study of the Scriptures, and constant prayer. They were inclined to entertain anything like a scholastic theology, believing less in dogma than what they loved to speak of as *experimental religion.* In contradistinction to these, the Oxford Churchmen were the old-fashioned High Churchmen who had existed in the Established Church since the time of Laud. They clung to the learning of such theology as had become the heritage of the Church through the teaching of a line of solid divines from Hooker to Waterland. Bishop Wilson of Sodor and Man in his 'Saca Privata' was their model of practical and personal devotion, but they also drew for their religious life upon the stores of Andrews, Jerome Taylor and George Ken. They preached and delivered scholarly sermons, which embodied a gospel of common sense; some of them kept up daily service in the Church and advocated fasting. But there was a certain aristocratic aloofness in this party. They did not appeal to the hearts of the middle or lower classes. Besides these two great parties there was rising in the Church a spirit of free thought which should afterward develop into the Broad Church party of Stanley and Jowett. Commp Thirlwall and Julius Hare
had become strongly tinged by the influence of recent German critical speculation and Whately. Hawkins and Milman were looking for a wider field of religious life and conviction which should be bounded neither by the conventionalities of the Evangelicals, nor the somewhat frigid dignity and strictness of the High Church party.

The two chief leaders in the movement which was to bring a new life into the English Church were men of the very highest gifts—John Keble and John Henry Newman. There were two sides to the spirit of this movement; one was theological, the other moral. As illustrating these two aspects of religious life it is impossible not to cite the 'Christian Year' which appeared in 1827 and embodied the essence of 'Tractarian' theology while it was warmed by the most pure and exalted ethical, if not ascetic, temper and tendency. When Newman began his ministry his sermons were remarkable for this same practical tone and his 'Holiness Necessary for Future Blessedness' was preached in 1826, before he was appointed vicar of Saint Mary's and struck the keynote of all his subsequent pulpit utterances. It was this intense moral earnestness that gave power and impetus to the new movement.

The political condition of England had much to do with the origin of the Oxford movement. The Reform Bill had just been passed and it looked as if the government were about to invade the rights of the Church. It was at this time that a sermon of Keble's seemed to fire the train. "On 14th July 1833," we read in Cardinal Newman's 'Apologia,' "Mr. Keble preached the assize sermon in the University Pulpit. It was published under the title of 'National Apostacy.' I have ever considered and kept the day as the start of the religious movement of 1833." The speaker described England as "a nation which had for centuries acknowledged as an essential part of its theory of government, that, as a Christian nation, she is also a part of Christ's Church, and bound, in all her legislation and policy, by the fundamental laws of that Church." He protested against the violation of these laws by "the direct disavowal of the sovereignty of God. If it be true anywhere that such enactments are forced upon the legislature by public opinion, is Apostacy a word to describe the temper of such a nation?"

The effect of Keble's sermon was to cause a meeting at Mr. Hugh James Rose's parsonage at Hadleigh, Suffolk, between the 25th and 29th of the same July. Next in authority to Rose as leader in the movement (after Keble, Newman and Pusey) was William Palmer, and he has himself described the feelings with which the 'Conspirators,' as they were styled, met on that occasion. "We felt ourselves assailed by enemies from without and foes within." Our prelates—insulted and threatened by Ministers of State. . . . In Ireland—ten bishoprics suppressed. What was to come next? . . . We were overwhelmed with pamphlets on Church Reform. It was Henry brother-in-law of Sir Robert Peel. Dr. Burton, and others of name and influence led the way. Dr. Arnold of Rugby ventured to propose that all sects should be united by Act of Parliament with the Church of England. Reports were prevalent that some of the prelates were favorable to alterations in the Liturgy. Pamphlets were in wide circulation recommending the abolition of the creeds (at least in public reading) . . . the removal of all mention of the Blessed Trinity, of the doctrine of baptismal regeneration; of the practice of absolution. The party pondered over what was the best means of opening the eyes of Churchmen, and it was resolved at Hadleigh that this could only be done by writing, by publishing certain declarations, certain manifestoes, and thus to carry out the spirit of Keble's sermon. In this way were born what Moyle afterward called 'that portentous birth of Time' *The Tracts for the Times.'

The first Tract appeared 9 Sept. 1833. It was written by Newman. He wrote, as he says, under the conviction that ancient religion had well nigh faded out of the land through the political changes of the last 150 years, and it must be restored. In the introduction he asserted the doctrine of Apostolic succession, and the ministerial power to give absolution. The early Tracts produced a profound sensation. They wakened men's minds, and in many quarters the cry was raised that they contained "Romanism" in disguise; yet they quoted the Prayer Book, and the most authoritative English divines and even bishops were puzzled how to regard them. They were supplemented by the 'Churchman's Manual,' which explained the nature and claims of the Church and its Ministers. In the course of 1845 the party was joined by Edward Bouverie Pusey (q.v.) and he early contributed an elaborate tract on 'Fasting.' Between 1835 and 1840 the 'Tractarians,' as the promoters of the Oxford movement were called, had swollen to the dimensions of a large party. As a protest against its so-called Romanizing tendency a monument was erected in Oxford to the martyrs of the Reformation Cranmer, Ridley and Latimer, but the 'Memorial' had little effect in arresting the progress of the movement which was on its way to win the coming generation of English clergy to maintain the doctrines of Apostolic Succession, Baptismal regeneration, Priestly administration, the real Presence in the Eucharist, and the Divine Character of the Church. But in a short time the authorities both of Oxford University and of the Church of England became alarmed. The Bishop of Chester, J. Bird Sumner, was the first to call the movement by denouncing in 1838 'the under-mining of the Protestant Church by men who dwell within her walls . . . who sit in the Reformers' seat and traduce the Reformation.' Yet the Tractarians undoubtedly made mistakes and showed impatience, exaggeration and little consideration for the scruples of those who did not accept their teachings. When the tract was published entitled 'On reserve in communicating Religion.' They ventured on dangerous ground, and touched on topics not relevant to their main crusade, laying themselves open to the charge of avowing the principle of keeping back part of the counsel of God. But the formation of a 'Tory' churchman party was not justifiably charged against them until the publication of Tract 90 in which Newman attempted to show that the 39 Articles of the Church of England could be so inter-
preted as to harmonize with the teaching of the Roman Catholic Church. This was the turning point in the history of the movement. The Tractarian doctrine was condemned by the Heads of Houses at Oxford. The bishop of Oxford forbade the publication of such views, and Newman resigned. The Tractarian candidate for the professorship of poetry, a man of undoubted genius, was defeated, and Mr. Ward, another Tractarian, dismissed from his mathematical lectureship at Balliol, and the climax was reached when Pusey was accused and found guilty of preaching doctrine contrary to that of the Church of England and was suspended from preaching within the University for two years. Finally a movement was set on foot to procure a vote of censure on Ward’s ‘The Ideal of a Christian Church’ in which the Roman Catholic Church was set forth as that ideal, and the English Church condemned as not fulfilling it, was passed by a majority of 58 members of the vote of the Convocation, and only failed of being ratified by the Vice-Chancellor through the interposition of a legal technicality. On the 3d of October 1845 Newman requested the Provost of Oriel to remove his name from the books of the College and University and on the 8th of the same month he completed his ‘Essay on the Development of Christian Doctrine’; two days afterward he was received into the Roman Catholic Church.

Newman was not the only one to leave the Church of England. A host followed him: Oakley, fellow of Balliol, Collyns of Saint Mary the Virgin’s, Oxford; the poet F. W. Faber, rector of Elton; Gordon of Christ Church, Regents Park. By December 1846 150 clergy and laity of the Church of England had entered the Roman Catholic Church.

The Oxford movement was a reaction from torpidity, ignorance and unspirituality in the English Church. Its results were at the time disastrous, but it has quickened religious life, stimulated ecclesiastical activity and stirred up pastoral zeal and activity in the Establishment. The ritualistic movement has accidentally been the outcome of it, but Keble, Newman and Pusey were not ritualists, and over the whole the movement has done good from a Christian standpoint, in putting so prominently to the front Saint Paul’s doctrine of the supernatural connection between the Church and its Head.

The practical result of the Oxford movement must indeed finally be looked to for the creation of a new spirit of earnestness and activity in the episcopate, and the formation of a new type of bishop, as exemplified in men like Samuel Wilberforce; in the revival of Gothic architecture and the multiplication of new church buildings; in the renaissance of ecclesiastical art, and the deepening of reverence and care in the details of public worship; in the founding of theological training schools, and the increased fervor and spiritual zeal in pulpit preaching; in the new taste for patriotic learning, and in the zeal of local missions established in the slums of great cities, together with a long delayed recognition of the vast work done by John Wesley, and of the value of his methods in reaching the hearts of the masses.

Oxford University, England, at Oxford (q.v.), its foundation, by tradition, ascribed to Alfred the Great, who had a mint in the city, is believed to have its authentic origin in the quarrel between Henry II. and Becket, when the king, about 1164, directed an ordinance against the partisans of Becket, to the effect that all clerks possessing revenues in England and resident in Paris had to return in three months “as they loved their revenues.” Philip II. of France was aiding Becket, and Henry forbade English clerks to study at Paris. Just after this the schools of Oxford became very flourishing, and assumed the character of the contemporaneous university. The earliest public document known to exist which applies the title of university (universitas) to the schools of Oxford is one which dates from 1201. Some authorities assert that the university received its first charter as a corporate body in the reign of Henry III. (1216-72), while others represent that its first charter was that granted to it by Elizabeth in 1570, upon which its privileges depended until the passing of the Oxford University Act of 1852. The degree of Doctor of Civil Law was conferred upon the university in 1604, since which time it has returned two members to Parliament.

The collegiate system at Oxford dates from the 13th century. At first the students who congregated at the university had no special places of abode provided for them, but had to find accommodation for themselves. As the students found it cheaper to unite and rent a single house in which they might live together than to provide each for himself, they frequently did so, forming halls, hostels, or inns. Sometimes, for the sake of giving greater facilities to study, sums of money would be given or bequeathed to the university for the erection of buildings in which the students might live without any more expense than was necessary for their maintenance. The first who went further than this was William of Durham, who, dying in 1249, bequeathed a sum of money to the university to provide a college for the maintenance of a certain number of “masters.” The first purchase was made in 1253, and with this purchase originated University College. There were two other colleges founded during the same century—Balliol College, between 1263 and 1268; and Merton College, founded at Maldon in Surrey in 1264, and removed to Oxford before 1274. This last college is said to have been the first in which the collegiate system in its modern form, or a form resembling the modern one, was instituted, the college being made a separate corporation, with a separate charter and separate statutes. The first statutes of University College as a separate corporation are dated 1280. At the beginning of the 14th century, while there were no more colleges than the three just mentioned, there were about 300 halls. As the number of colleges increased, and their growing endowments attracted greater numbers of undergraduates, the halls declined in numbers, especially since the attendance of students diminished in the centuries following the 14th. At the beginning of the
16th century the number of colleges had increased to 12, while that of the halls had sunk to 55. There are now 21 colleges, all of which are separate corporations, and, with two exceptions, have endowed fellowships and scholarships. At Christ Church the fellows are distinctively called "students" (ordinary students being, of course, called undergraduates). All Souls' College has no scholars or undergraduates, except a small number of "Bible-clerks," and Keble College has no fellows. The fellows and scholars at Oxford hold pretty much the same position as at Cambridge (see Cambridge, UNIVERSITY OF, and FELLOWSHIP). Besides the colleges, there is one public hall, St. Edmund Hall. It is not a separate corporation, and has no endowments for fellows, and it will ultimately be absorbed by Queen's College, as St. Mary Hall has been incorporated with Oriel. The following are the names of the colleges according to their rank: University, Balliol, Merton, Exeter (founded 1314), Oriel (1326), Queen's (1340), New (1379), Lincoln (1427), All Souls' (1437), Magdalen (1458), Bishop's (1443), Corpus Christi (1456), Christ Church (1454), Trinity (1554), St. John's (1555), Jesus (1571), Wadham (1612), Pembroke (1624), Worcester (1714), Hertford, and Keble. The two last-mentioned date from last century. Hertford is the restoration of an old foundation, while Keble (which is an "institu-
tion" and not a college in the strict sense) was founded in 1868 for the education solely of members of the Church of England. There are also three private halls, governed by "licensed masters"; and since 1854 four colleges for women have been established, Somerville, Lady Margaret, Saint Hugh, and Saint Hilda's halls, although degrees are not conferred on women. The largest of the colleges is Christ Church, established in 1546 by Henry VIII., from funds collected by Cardinal Wolsey; it is commonly known as "the House" (*Ædes Christi*). In the 15th century an enactment was passed requiring all students who joined the university to reside in one of the halls or college, and this condition continued to be the law until 1868, when persons were permitted, under certain conditions, to enjoy the privileges of the university without so doing, keeping their statute residences for the holding of meetings in the town. Those who avail themselves of this permission are called "unattached students." They have to pay slightly increased university dues, but are exempt from the heavy expenses attached to college life, such as "caution money," the cost of furniture, and large tutorial fees.

The constitution of the university is fixed by the act of 1854, which modifies that granted by the act of Elizabeth. The style or title by which the corporation is known is The Chancellor, Masters, and Scholars of the University of Oxford. The governing bodies are the House of Congregation, the House of Convocation, the Congregation of the University of Oxford, and the Hebdomadal Council. The House of Congregation is made up of the regents, who are either necessario regentes or regentes ad plati-
cum. The former include all doctors and all masters of arts for two years after the term in which they are admitted; and the latter, the professors, doctors residents in the university, heads of colleges and halls (variously known as master, president, principal, provost, or warden) or their deputys and censors, and deans of colleges, all of whom must, however, be members of Convocation to complete their qualifications as regent of Magistri or Doctors. The functions of this body are almost confined to ratifying the nomination of examiners by the vice-chancellor and the proctors, and to the granting of ordinary degrees. The House of Convocation is made up of both regents and non-regents, that is, of all who have been admitted to regency, provided their names have been constantly kept on the books of some college or hall, or of the delegates of unattached students. The functions of this body are numerous and important. It confers honorary degrees and others granted out of the usual course by diploma or decree; it elects to nearly all the offices in the gift of the university; it gives the final sanction to all new statutes; and it transacts all the formal business of the university as a corporate body, except what belongs to the House of Congregation. A residential qualification is necessary to membership in the case of the Congregation of the University of Oxford, except for certain official persons. The House of Congregation is almost confined to legislation, but it also has the election of all the non-official members of the Hebdomadal Council. This last body consists of certain official and certain elected members. The official members are the chancellor, the vice-chancellor, and the two proctors. The elected members are: six heads of colleges or halls, six professors, and six members of Convocation of not less than five years standing. The members of Convocation elected may be either heads of houses or professors. The election takes place once in three years. The elected members hold office for six years, and half of them are chosen on every occasion. They meet every Monday in term time (whence the name of the body), and when convoked by the vice-chancellor. All legislative measures originate with them.

The principal officers of the university are the chancellor, the high-steward, the vice-chancellor, the two proctors, the public orator, the clerks of the market, the keeper of the archives, and the registrar. The dignities of chancellor and high-steward are almost purely honorary, and are held by eminent men. The vice-chancellor, who is nominated by the chancellor from the lists of candidates, holds office for three years, and is now, in fact, the supreme executive and judicial authority of the university. The principal duty of the proctors is to maintain the discipline of the university.

There are about 100 professorships, lectureships, readerships, and teacherships in the University of Oxford, besides the lectureships, etc., in connection with many of the separate colleges. Most of the professors deliver lectures on the subjects for which they hold their professorships, but as attendance on these lectures is compulsory on none of the students, it depends greatly on the popularity of a professor or the usefulness of his lectures for degree purposes, whether he has a large audience or not. But professorial work is increasing.

The old distinctions separating undergraduates into different classes (peers and their eldest sons, fellow and gentlemen-commoners) have
disappeared. "Scholars," however, wear longer gowns than ordinary students or "commoners." Every student on entering his college is assigned to a tutor, who is responsible for the direction of his studies, and to whom he may apply for advice. The morning is devoted to attending lectures, or to private reading; the afternoon is universally surrendered to outdoor exercise; the evening, after "hall" (the common name for dinner), is given by reading men to their studies, as well as to the social and literary meetings which form so much of the charm of college life. There is a university club, known as the Union Society, in whose hall there is held a weekly debate on some public topic. There are also a dramatic club, and various musical societies which give performances regularly during term, besides many social clubs. The expenses of living at Oxford vary as the students; on the most economical system they cannot be brought below $800 per annum. The total number of undergraduates is about 3,400.

There are four terms in the university year at Oxford: Michaelmas term, which lasts from 10 October to 17 December; Hilary or Lent, from 18 January to 15 February; Trinity term, in the twenty-seventh Sunday; Easter term, from the Wednesday after Easter to the Friday before Whitsunday; and Trinity or Act term, from the day before Whitsunday to the Saturday after the first Tuesday of July. Candidates are known by six weeks' residence in each; and Easter and Trinity terms either by three weeks' residence in each, or by 48 days in both jointly.

The degrees conferred by the university are those of Bachelor and Master in Arts; Bachelor and Doctor in Music, Medicine, Civil Law, and Divinity; Bachelor of Letters and Bachelor of Science. The most important function of the university, however, is the conferring of degrees in arts. Twelve terms of residence are required for the degree of B.A., which must be taken before any other degree (except that of Bachelor of Letters and Bachelor of Doctor of Music) can be conferred. No further residence is necessary for any degree, and no residence whatever is required for a Doctor of Laws. Candidates for the degree of B.A. must pass three distinct examinations: Responsions (known among undergraduates as "Smalls") before the masters of the school (six in number); first public examination ("Maturations" or "Greats") before the examiners known as moderators (in the classical school seven, in the mathematical three); and the second public examination (or "Greats") before the public examiners (six in the pass school, five in the school of litterae humaniores, and three, four, or five in each of the other seven honor schools, namely, mathematics, natural science, jurisprudence, modern history, theology, English literature, and Oriental studies). Candidates are admitted to pass Moderations at their fourth, or any subsequent term, and to a Final Pass School at their eleventh or any subsequent term. Honors may be obtained in each of the two public examinations. The first consists of an examination in Scripture, or an alternative Greek or Oriental book, and in either classics or mathematics for a pass or honors. Candidates are admitted to the honors examination only from the fifth to the eighth term from the passing of Moderations. The "University is endangered by a much severer test than candidates for a mere pass. The successful candidates are arranged by the moderators according to merit in three classes, in each of which the names are published in alphabetical order—a feature of Oxford honor lists. In the second public examination honors are conferred in each of the existing honor schools already mentioned. Successful candidates are arranged by the public examiners in four classes according to merit, and their names published in these classes in alphabetical order. Candidates in the Pass School are examined in three subjects chosen from the following four groups: (1) Classics, classical history, Sanskrit, and Persian; (2) Modern languages and history, political economy, and a branch of legal study; (3) Mathematics and six branches of natural science; (4) Religious knowledge. Not more than two subjects may be chosen from any one group, but one of the subjects must either be classics (two books in Greek, or one Latin and one Greek), Sanskrit, Persian, or a modern language (either French or German, with composition and literary history). A B.A. may proceed to the degree of M.A. without further examination or exercise, in the twenty-second term from his matriculation, provided he has kept his name on the books of some college or hall, or upon the register of unattached students, for 26 terms. In the case of all other degrees (except honorary ones) some examination in exercises is necessary.

Affiliated colleges are: St. David's College, Lampeter (1880); University College, Nottingham (1882); Firth College, Sheffield (1886); and several colonial universities. Students accredited from these affiliated colleges are admitted to the Oxford public examinations after a reduced period of academical residence.

The University of Oxford possessed the primacy among the Anglo-Saxon clergy and their rights within 25 of the counties of England and Wales are made over to this university, those in the other 27 counties being conferred on that of Cambridge. Many of the colleges have an ecclesiastical patronage. There are between 30 and 40 scholarships and exhibitions in the gift of the university, besides those belonging to the various colleges and halls. Of international importance are the Cecil Rhodes Scholarships, dating from 1902, each of the annual value of £1,500, to be held by students from every important British colony, and from every State and Territory of the United States of America. There are also several valuable prizes, such as the Stanhope, for a historical essay; the Newdigate, for an English poem; and the Gaisford, for composition in Greek prose and verse. The Radcliffe traveling fellowships are awarded to enable students of Natural Science to prosecute their studies abroad. Consult: Clarke, 'The Colleges of Oxford' (1891); Corbin, 'An American at Oxford' (1903); Fulleylove and Thomas, 'Oxford' (1904); A. Lang, 'Oxford Notes' (1879); Lyte, 'History of the University of Oxford' (1886); Rashdall, 'University of Europe in the Middle Ages' (1905); Goldwin Smith, 'Oxford and Her Colleges' (1805); the series of 'College Histories' and the 'University', 'Merton', 'St. John's', 'Literary Landmarks of Oxford' (1903).
OXYDASE—OXYGEN

Oxidase, any member of a certain group of enzymes, which are distinguished, as a class, by their power of inducing the direct oxidation of sugars and certain other substances. The chemistry of the oxidases is very imperfectly known, but the group appears to be widely distributed in the vegetable kingdom, and it probably plays an important role in the chemical changes that occur in the growing plant.

Oxide, in chemistry, a compound formed by the direct union of oxygen with a metallic base, or with an organic radical. The oxides may be classified, in a general way, as acid, basic, and neutral. An acid oxide is one which has acidic properties, or which combines with the elements of water to produce an acid. Sulphur trioxide, SO₃, is a familiar example of this class of oxides, as it unites directly with water to produce sulphuric acid. Basic oxides are those which have basic properties, or which are capable of uniting with acids so as to produce salts. The oxide of iron (II) oxide, FeO, is of this character. Neutral oxides are those which are neither acid nor basic in any marked degree. The magnetic oxide of iron Fe₃O₄, is an example of this class. The oxides are also classified with regard to their composition, and as such are commonly called suboxides; CuO, for example, may be called copper peroxide, and Cu₂O copper suboxide. These particular terms, however, are not used generally as formerly. The term protoxide is sometimes applied to a neutral oxide which contains a single oxygen atom in combination with one atom of a divergent base, or with two atoms of a monovalent base. An oxide containing one, two, three, or four or five atoms of oxygen, is called the monoxide, dioxide, trioxide, tetroxide, or pentoxide of the corresponding base. Occasional departures from this simple rule will be met with in modern chemical nomenclature, but in such cases the anomaly is due to some peculiarity of the behavior of the oxide or to the difficulty of changing a name after it has once been definitely adopted, even though it be erroneous when judged by correct principles. The gas whose formula is NO, for example, is commonly known as nitrogen dioxide, as though its formula were N₂O₅. A sesquioxide is an oxide containing three atoms of oxygen to two of the base; the name being derived from a Latin word signifying "one and a half." Sesquioxide of iron, for example, has the formula Fe₂O₃.

Oxley, 6ksyl, James Macdonald, Canadian author and lawyer: b. Halifax, Nova Scotia, 22 Oct., 1853. He was graduated from Dalhousie University, Halifax, in 1874, studied at Harvard in 1876-7; and was admitted to the bar in 1878. He practised law in Halifax in 1879-83, when appointed legal adviser in the Department of marine and fisheries. He resigned from this office in 1891 and engaged in the life insurance business in Ottawa and Montreal. Beside "Nova Scotia Decisions" (1880-93), he has written a long series of "boys' books," such as "Donald Grant's Development" (1892); "Archie of Athabaska" (1893); "In the Swing of the Sea" (1897); "Fife and Drum at Louisbourg" (1899); etc., and "Lhasa at Last: A Journey to the Forbidden City of Tibet" (1900).

Oxus, ok'sus, Amu, Ama Darya, a-moo' dar'ya, or Jihoon, je'hooon, a large river in Asia, formed by several small rivers which have their sources in the Pamir Plateau, and which flows through the outlet of a lake 14,000 feet above sea-level. The course at first is winding, then northwest to the Sea of Aral, which it enters by several mouths, forming a large marshy delta. At one time this river flowed into the Caspian Sea. The Oxus is about 1,500 miles long and navigable for about 1,000 miles. A Russian railroad to Samarcand crosses the river by a long bridge.

Oxy-acids, according to older chemical usage, are acids which contain oxygen; those containing hydrogen without oxygen being called hydracids. Nitric acid, HNO₃, for example, was called an oxy-acid, while hydrochloric acid, HCl, was called a hydracid. The term oxygen is not often used in this sense at the present time, but oxy-acids which contain the radical hydroxy, OH, are frequently called oxy-acids, or, more correctly, hydroxy-acids. The organic acids of the lactic acid series, for example, may be regarded as derived from those of the hydroxypinic acid by the substitution of a molecule of hydroxyl for an atom of hydrogen, and they are therefore oxy-acids, or hydroxy-acids, according to the more modern terminology. Acetic acid, for instance, has the formula CH₃COOH, and glycollic acid (which belongs to the lactic acid series) has the formula CH₂OH.COOH. Glycollic acid may therefore be regarded as oxy-acetic acid, or hydroxyl-acetic acid, if considered as being derived by substituting OH for one of the hydrogen atoms of the methyl group in the acetic acid. Lactic acid itself may be regarded as hydroxyl-propionic acid. The formula of propionic acid is CH₃COOH, while that of lactic acid is CH₂OH.COOH.

Oxysac'dic Acid. See GYCOLIC ACID.

Oxygen, a non-metallic, gaseous element, discovered in 1774 by Priestley under the name of "dephlogisticated air." The name oxygen (Greek, *acid-forming*) was given subsequently by Lavoisier, in the erroneous belief that this element is an essential constituent of all acids. Oxygen is one of the most abundant of the elements. It constitutes about one fifth of the bulk of the atmosphere (see Air), where it exists in the free state, mixed with free nitrogen. Water is a compound of oxygen and hydrogen, eight ninths of it, by weight, being oxygen. Most of the rocks of the earth's crust are also rich in combined oxygen, and it is estimated that the crust, as a whole, contains from 40 to 50 per cent of its own weight of this element, while the interior of the earth is the next being silicon, calcium, and aluminum. Physically, oxygen is a colorless gas without odor or taste. It is slightly heavier than air, and Regnault found that one cubic decimetre of the gas at 27° F. and under a pressure of 750 millimetres of mercury at Paris, weighs 1.448 grams. By the application of a pressure of 3,000 atmospheres at ordinary temperatures, Amagat caused oxygen to become denser than water, although it was still undoubtedly gaseous in nature. The coefficient of expansion of ordinary oxygen, under a constant pressure of one
OXYHÆMOGLOBIN — OXYHYDROGEN LIGHT

atmosphere, is given by Jolly as 0.0067413 (Centigrade scale). The specific heat of the gas at constant pressure, as compared with an equal weight of water, is given by Regnault as 0.2175; and Clausius gives 0.1551 as the corresponding value of the specific heat at constant volume. By the simultaneous application of great cold and pressure (see CRITICAL POINT), oxygen may be reduced to a transparent pale-blue liquid, which is markedly magnetic, and which boils at about 306° F. below zero, when exposed to the pressure due to 740 millimetres of mercury. Liquid oxygen has a density comparable with that of water, though it varies considerably with changes of temperature; and when boiled to a point that is something like 400° F. below zero, the liquefied gas freezes to a white solid.

Oxygen is a dyad element, and it combines with most of the other elements with the formation of compounds known as oxides (q.v.). It is also the active ingredient of most of the multitudes of other compounds, both organic and inorganic; and from all points of view it may be said to be one of the most important elements in the entire known list. It is an active supporter of combustion. Though in fact all of the familiar cases of combustion are merely instances in which oxygen is actively combining with other elements to form oxides. Oxygen has the chemical symbol O, and its atomic weight is 15.998 if that of hydrogen is taken as 1. (See ATOMIC WEIGNS.) By taking $O = 16$ instead of $O = 15.998$, it is found that the atomic weights of most of the other elements are also more nearly expressible by integers—a circumstance which tends to simplify all exact chemical computations. The processes of animal life are necessarily accompanied by the gradual oxidation of the tissues of the body, this oxidation being effected within the tissues themselves by means of the oxygen absorbed and transported through the lungs.

When pure oxygen is inhaled, the oxidation processes go on with abnormal activity, and a marked exhilaration almost amounting to intoxication is the result. Oxygen is somewhat soluble in water, and in the blood, in which it is contained, and in the ocean itself, contain more or less of it in solution; and it is from this dissolved oxygen that fish and other marine creatures obtain the supplies that are needed for the normal oxidation of their tissues.

Oxygen may be prepared by the electrolysis of water, or, more conveniently, by heating a mixture of potassium chlorate and manganese dioxide. In the latter case the chlorate is decomposed with the liberation of oxygen gas, while the manganese dioxide apparently remains unaffected. The role of the dioxide is not well understood. Potassium chlorate evolves oxygen when heated alone, but the temperature at which the evolution takes place is much lower when the manganese dioxide is added. Various other methods are in use for the production of oxygen on a commercial scale, one of the most interesting of these being the barioin process, which has been made practical largely through the labors of the brothers Brin. When barium monoxide, BaO, is gently heated in contact with air, it absorbs oxygen and passes into the form of a dioxide, BaO2. The dioxide, so prepared, is then isolated and heated more strongly, whereupon it breaks up again into free oxygen and barium monoxide; the monoxide being thus caused, by indefinite repetitions of the process, first to absorb oxygen from the air at a low temperature, and then to give off the pure gas at a higher temperature. Although the fundamental idea of this process has been known for a long time, it is only in recent years that certain practical difficulties have been overcome, so as to make the process a commercial possibility.

Under the action of the electric spark, or the silent electric discharge, oxygen becomes partially converted into an allotropic form known as ozone, which has a density 50 per cent greater than that of ordinary oxygen. Ozone is also formed in the electrolysis of ice-cold dilute sulphuric acid. Ordinary oxygen is evolved at the same time. Ozone is bluish in color, and has a strong characteristic odor, which may often be noted in the vicinity of induction coils and other pieces of electrical apparatus that are exposed to sparks. Ozone is more magnetic than ordinary oxygen, and is also more active chemically. It possesses powerful bleaching properties, destroying many of the organic dye-stuffs and coloring matters. It also attacks and destroys rubber and other organic bodies that are not actively attacked by normal oxygen. When heated to 520° F. it becomes entirely converted into ordinary oxygen; and this conversion takes place explosively, with the development of a yellowish flame, when ozone is compressed suddenly, without permitting the heat developed by the compression to escape. When cooled to a temperature lower than 220° F. below zero, and subjected to a pressure of something over 100 atmospheres, ozone condenses into a dark-blue magnetic liquid. Traces of free ozone occur in the air of regions that are sparsely populated, but it can hardly be detected in city air, except during thunderstorms.

Medical Uses of Oxygen.—In medicine, oxygen is generally used by inhalation, either pure, or mingled with from one to four volumes of atmospheric air or of nitrous-oxide gas. It acts usually as a stimulant, increasing the velocity of the pulse, and is especially valuable in chronic bronchitis, pneumonia, and other affections where there is dyspnea or asphyxia. It has also been used in chlorosis, albuminuria, dropsy, paralyisis, and various other affections, but its effects have been often disappointing. In appropriate cases it may be given in from one to four gallons at a sitting, two or three times a day. But the gas must be pure, the reservoirs must have proper mouth-pieces, valves, and stopcocks, and the products of respiration must not pass into the reservoirs. Oxygen in too large a quantity relaxes and debilitates the system, producing narcotism. It should not be inhaled in any great quantity except under the direction of a physician, or at least some person understanding its physiological action.

Oxyhemoglobin. See HEMOGLOBIN.
Oxybydrogen Light. See CALCIUM LIGHT.
OXYRHYNCHUS—OYSTERS

Oxyrhynchus, أشكال وروضة، ancient name of a town in Egypt, now known as Belsea. It is at present nothing but a heap of mounds, which cover an area surpassed by few ancient Egyptian towns. The-builder of great mounds have 18 recently been opened and explored and have yielded rich finds in papyri, containing many precious treasures of lost classical and early Christian literature. The Greek papyri unearthed in 1893 include a 3rd-century fragment of the so-called "logia" or "Sayings of Jesus," such as were discovered in the same place in 1897. Among the Latin papyri is a fragment of the epistle of Livy's history covering Books 37-39 and 49-55. On the back of this papyrus is written the largest piece of the New Testament on papyrus yet discovered, namely, the Epistle to the Hebrews. Another fragment comes from the Septuagint version of Genesis—a century older than extant vellum manuscripts of the same book. Among other Greek papyri is a 1st-century B.C. copy of an episcopalian ode, by a poet, perhaps Corinna, the rival and reputed teacher of Pindar; epigrams by Leonidas, Antipater, and Amyntas; part of a philosophical dialogue in which the tyrant Pisos is one of the speakers; a long 2d-century papyrus contained an invocation to a goddess, and on the back an account of a miraculous cure effected by Imhotep, the Asclepius of the Greeks, and the Esculapius of the Romans.

Oxyrhynchus, the name given by the Greeks to a fish of the Nile (Morurus oxyrhynchus), formerly revered by the Egyptians, who refrained from eating it. It was sacred to the goddess Hathor, and is frequently represented on sculptures and coins. The Egyptians embalmed and buried the oxyrhynchus with great pomp. Its modern name is "mizdeh." See Morurus.

Oxy-salt, or Oxi-salt, a salt of an oxy-acid. See Oxy-acids.

Oxyuris, a genus of small thread-worm parasites in man. O. vermicularis is about one sixth of an inch, and the female about half an inch long, and inhabits the rectum of children and of old people in numbers, setting up inflammation. See Nematoda; Thread-worm.

Oyer (o'ér) and Termer, ter'mi-nér, Court of. See Court.

Oyster Bay, N. Y., town in Nassau County, on the north coast of Long Island; on an inlet of Long Island Sound, and on the Long Island railroad; about 15 miles east of New York and 28 miles from City Hall. It is connected by steamers with New York and the large sound ports. Its name comes from its principal industry—cultivating oysters. Sea Cliff, a village, is in the town. It is a favorite summer residential town for New York business men. It is the home of President Roosevelt. The government is administered by town meetings held biennially. Pop. (1900) 1,558.

Oyster-catcher, a shore-bird of the plover family, several species of which constitute the genus Haematopus, characterized by lack of the hind toe; the bill is long, sharp, and terminal at its base, slightly bent upward, and flattened or compressed at the apex, which is truncated. Oyster-catchers frequent both seacoasts and inland waters, picking up small mollusks, crustaceans, sand-worms, etc. They are 18 to 20 inches long, and their plumage is handsomely variegated with black, white and brown, so that the Old World species (H. ostralegus) is often called "sea-pie" in England. The American species have been found in all parts of the country, but are rare northward of the middle parts. Consult: Elliot, "North American Shore Birds" (1895); Sandys and Van Dyke, "Upland Game Birds" (1902).

Oyster-crab, or Pea-crab, a small crab (Pinnotheres ostreum) which dwells inside of the shells of American oysters (see COMMENSALISM). Other species inhabit other host-shells in various parts of the world, one associated with a Mediterranean Pinnia being the subject of some pleasant classical legends. These small crabs are excellent eating, but the difficulty of getting them in any considerable quantity makes them a costly dainty.

Oyster-fish, a local name for the tautog (q.v.).

Oyster Plant, Vegetable Oyster, Salsify, or Salsify, a biennial composite herb (Tragopogon porrifolius). When in flower it is about four feet tall, bears grass-like leaves and shows a clump of yellow flowers, which close before noon. It is a native of Europe, whence it has spread as a weed to many countries. The cultivated varieties are grown for their gray taproots, which are often a foot long and 3 to 6 inches in diameter, and which suggest the flavor of oysters. The seed should be planted in deep, rich, well-drained soil as early in the spring as the ground can be worked, the drills being 15 or 18 inches apart. The plants are thinned and cultivated until their tops cover the spaces between the drills. In late autumn part of the crop should be dug, the remaining part being allowed to stand until spring. Freezing does not harm them; indeed, they are believed to be better flavored if so treated. The stored roots are very apt to shrivel, become tough and lose flavor. Cool, moist storage, or pits, should obviate this difficulty. The plant succeeds best in cool climates and should be in every home garden. As a commercial vegetable it is of far less importance than parsnips and carrots.

Oyster-shell Bark-louse. See Scale Insects.

Oysters, strictly speaking, any species of the family Ostreidae of lamellibranch mollusks, but sometimes the term is enlarged to include other somewhat similar animals, as the pearl oysters (family Ariciidae). In the true oysters (Ostrea) the shells are irregular, the two valves being unequal and the hinge without teeth. The animal becomes attached to some submerged object by the left valve, which becomes hollowed out to receive the body, while the right valve, which is free, is flattened or may be even concave from above. The shells are closed by a single adductor muscle, which extends from the centre of one valve, through the animal, to the other. The edges of the mantle are free from each other and are fringed upon the margin. The gills (called "beard" in cookbooks) are nearly equal, and the labial palpi are triangular. The oysters differ from any other lamellibranch in that the intestine does not run through the heart, while the foot is small or even entirely absent, a result of the sedentary life.
About 70 recent species of Ostra are recognized, mostly inhabitants of the warmer seas. The most important species are the common oysters of Europe, (O. edulis and O. angulata) and the Ostra virginiana of the eastern coast of America. The first mentioned species occurs from Norway and the Baltic to England and into the Mediterranean, another species of less importance (O. Adriatica) taking their place in the eastern Mediterranean and the Black Sea. At one time Ostra virginiana ranged along our whole eastern coast, from the Gulf of Saint Lawrence to the Gulf of Mexico, but since the growth of civilization there it has disappeared from the whole coast between Nova Scotia and Cape Hatteras. As will be seen from the foregoing, the oysters of Chaleur and around Prince Edward Island. On the Pacific coast two species are eaten, O. conchaphila of California and O. lirula of the coasts farther north. In the tropics species belonging to the subgenus Electrotyria have become attached to the roots of the mangroves and are exposed at low tides; these are the so-called "tree oysters." Oysters, like all other mollusks, reproduce exclusively by eggs. Our Ostra virginiana has the sexes separate, but the European oysters are hermaphroditic. From the eggs there hatches out a small, free-swimming larva, which swims about until it finds a space on the shell, and thus aids in the distribution of the species. After a few days this free life ceases and the young becomes attached, and is then known as "spat." It grows rapidly, feeding upon microscopic life, in the water which is conveyed to the mouth by the cilia covering all parts of the body, and especially the gills and labial palpi. When large enough for transplantation the young are termed "seed oysters." When the spat needs some solid support upon which to attach itself, otherwise it would sink in the mud and become smothered. In nature this support is furnished by reefs of rock or by banks of old oysters, but in the usual culture of oysters so-called "collectors" are made of branches of trees, either in their natural state or woven into bundles, or of tiles baked especially for the purpose. Upon these the spat collects and when large enough to form "seed oysters" are either removed for transplantation, or in the case of the tiles, the whole are placed in the beds in the best position for growth. When the oysters are collected from the tiles, the tiles are exposed for some time to the air, and are then painted with lime before being used again as collectors. Another very common form of collection, is to spread upon prepared spaces of bottom clean oyster shells, or pieces of coke, or other similar materials attractive to the spat.

In the United States about forty per cent of the oysters are obtained from the so-called natural beds, the remainder being from beds formed by transplanting the seed from the collectors to suitable spots, in some cases to points where the oyster will not naturally breed as in various parts of Massachusetts Bay. Several States have recognized the importance of the oyster business and have passed laws governing the control of the beds. In Europe, especially in England, France and Holland, the culture of oysters is pursued by a more intensive method than in this country; full information may be found in the publications of the United States Fish Commission.

Oysters are collected from the beds, whether natural or artificial, in two ways. In the shallow waters they are taken by means of oyster-tongs, which are like two long-tined rakes, hinged so as to open and close like shears. In deeper water (down to 15 or 20 fathoms) recourse is had to the dredge. This is a rectangular iron frame-work, about four feet across, with sharp edges, or with long teeth upon one side, while attached to the other is a large open-work bag of cord or iron. This dredge is dragged over the bottom, the teeth or sharp edges, tearing the oysters loose, when they are caught in the bag and brought to the surface.

The latest available statistics of oyster production are of different dates: For the South Atlantic and Gulf States, 1897; for New England and the Pacific Coast, 1899; for the Middle Atlantic States, 1901; for Europe, about 1890.

Ozark (ó-zark') Mountains, a plateau region, from 1,200 to 1,800 feet above the sea-level, extending with gradual upfllings from the southern part of Illinois into Missouri, then sloping down enters Arkansas and Indian Territory and extends into Kansas. The highest point is Pilot Knob, in Iron County, Mo. The hills are in separate peaks or knobs, and not in continuous ridges. The irregularities which show mountain making processes as existing are not visible here; the Ozark Mountains or Ozark Plateau, belong with the oldest mountain regions of the world, and denudation is slowly and surely removing the last remnants of once lofty mountains. The plateau belongs to the Tertiary Period, but Pilot Knob and vicinity belong to the Paleozoic Age. North of the Ozark slope and south of the Mississippi River is an old flood plain. On the southern slope are large forests.

Ozena. See Nose and Throat.

Ozo"crite, or Ozokerite. See Hatchet-tite.

Ozone, a colorless gas like oxygen, having a peculiar odor like that of air and a chemical activity. The density of ozone is one and one-half times that of oxygen and is charged into oxygen only at a high temperature. Ozone is found in country atmosphere to a much greater extent than in cities and towns. It is an intense purifier and is destructive to offensive odors.
the sixteenth letter of the English and various other alphabets, is the sharp labial consonant pronounced when, the lips being closely compressed, they are separated by a forcible emission of the breath. Like k and t, it is a pure mute or surd, involving no action of the vocal chords: it differs from b in that b is sonant: with the same compression of the lips as in p, the effort to pronounce b produces a vocal sound within the oral cavity. The form of this letter, P, comes from the Latin alphabet: the same speech-element is called pi in Greek and its form is Π, while in the Greek alphabet our character P is called rho, equivalent to r. In early Phoenician writing the element p was represented by a vertical stroke curved or crooked to the left at the top (ᴘ): this form was also used in early Greek, but with the crook directed to the right, (ᴘ): afterward the crook was made angular, (ᴘ), and finally the two downward strokes were made of one length (ᴘ). In early Latin the p had the form (ᴘ), but this was changed to (ᴘ) and finally the rounded form was adopted, P. The surd labial p is freely interchanged with b, f, and v, for they are all of the class of labials and dentilabials.

Languages springing from a common original differ from one another in the preference they show for p, b, f, or v. The English language has very few words of Germanc origin beginning with p: such words in English are nearly all of Latin, Greek, or Celtic origin. In German very many words of Latin origin, as patinatus (from patium), papa, palus (stake), persona (person), pavo (peafowl), praebenda (prebend), piper (pepper) become pfalle, pfaffe, pfal, pfarrer, pfau, pfünde, pfefter, etc. The digraph ph was originally used by the Latins to represent the sound of the Greek letter phi (Φ, ϕ), but must have been different from the sound of the Latin letter f; else the Greek words philosophia, pharmakon, phonas- kos, etc., would have been written filosofia, farmacun, fonacus, as the modern Italians write everywhere f for φ — filosofía, fisca, Filomena, etc. There are no native English words beginning with p followed by n, s, or t; but there are many such words of Greek origin: in those words the p is silent. The p between m and t in attempt, contempt, etc., is introduced to facilitate the utterance of the m: but in such words as exception (exemshun), redemption (redemshun), etc., there is no need of this mediating p and it is silent in correct pronunciation.

Paca, pā'ka, William, signer of the Declaration of Independence: b. Wye Hall, Hartford County, Md., 31 Oct. 1740; d. there 1799. He studied at Philadelphia College, where he was graduated in 1758, and in the Middle Temple in London; practised law in Annapolis; became a patriot leader; was a member of the Legislature 1761 and 1771-4, of the committee of correspondence 1774, of the Continental Congress 1774-9, and of the State senate 1777-9. His career as judge began in 1778, when he became chief judge of the Maryland superior court; from 1780 to 1782 he was chief judge of the court of chancery and attorney-general. In 1782-6 he was governor of the State; in 1788 was a member of the State convention which ratified the Federal Constitution; and for the last 10 years of his life was United States district judge. His wealth and influence had been lavishly given to the Revolutionary cause, and he, more than any one man perhaps, overcame the opposition in Maryland to that cause.

Paca, a large agouti-like animal (Cale- genys paca) of eastern South America, robust in form, with a broad, swollen head, caused by the great expansion of the zygomatic arches, and large eyes and ears. It is about two feet long, and a foot tall; the tail is a mere rudent, and the color brown, marked with rows of oblong whitish spots. It lives near water, in which it is much at home, and digs shallow burrows in which a single young one is produced annually. It remains hidden by day, and seeks its plant-food by night, often making destructive forays upon plantations, especially of sugarcane. The flesh is edible, and the hide useful for leather. Two or three other less common species are recorded. Consult: South American authors, and Lydekker, 'Royal Natural History' (1895).

Pacaja (pā-kā-zhā') Indians, a South American tribe of the lower Amazon region, which formerly occupied a large part of the mainland near the island of Marajo. They lived in large villages and were mostly devoted to agriculture. Of recent years they have disappeared as a distinct tribe, having been absorbed by other native bands.

Pacy, pa-kā', a Peruvian leguminous tree (Prosopis dulcis) related to the mesquite. The pure white silky matter in which the seeds are embedded is used as food, and the pods, which are nearly 2 feet long, serve for feeding cattle.

Paccaritambo, pā-kā-rē-tām'bo, or Paccaritampu, Peruvian cave south of Cuzco, on the Vilcamita River, reputed among the Incas as the place where Manco Capa and his brothers appeared first on earth, and styled "House of Dawn," in Quecha Paccaritampu.
Pacchiarioti, Giacomo, jà-kō-mō pák-kē-ā-rō-tē, Italian painter: b. Sienna 1474; d. France 1540. When a boy he showed a taste for devotional art and was placed in the studio of Bernardino Fungai, a Siennese artist of contemporary fame. In 1555 he held a conspiracy against the government of the city and fled for his life to France, where he worked under De Rossi, the famous Italian painter, sculptor and architect, who had been invited to court by Francis I. Pacchiarioti's productions are distinguished for their coloring and technique and no paintings of the period are superior to them in strength of characterization and devotional tone. While his main works in fresco and oil are at Sienna, his 'Francesco d'Annis'1 and 'Madonna and Child'2 in the Munich Pinakothek are among the gems of that collection.

Pace, a measur of length, used as a unit for long distances. The Latin pace was measured from the mark of the heel of one foot to the next point on the foot when it next touched the ground, thus stretching over two steps; while the English pace is measured from heel to heel in a single step. The Latin pace was somewhat less than 5 feet; the English military pace at the ordinary marching rate is 2½ feet, and at double quick time 3 feet. The pace is of course of little service as a unit of measure, except with disciplined troops who are always accustomed to take steps of equal length.

Pacer. See Horse, THE; Horse-Racing.

Pachacamac, pák-ā-kā-māk, ruined city and temple in the district of the same name in Peru. The village now occupying the site is called La Mamacoma and is the terminus of a railway from Lima, 20 miles to the northwest; and is situated near the Rio de Lurin. The ancient city, a sacred city and quasi-Mecca of both the Incas and the earlier Yuncas, was devoted to Pachacamac, the supreme god and creator of all in the Yuncu theogony, and in the time of the Incas to a temple of the Sun. The outlines of the old city are clearly visible; there had broad regular streets and its entire site, a lofty hill, was elaborately terraced. On its top was the temple of Pachacamac, about 200 yards long and 150 wide. A cemetery surrounded this temple and is very well preserved. The Inca convent on lower ground is an adobe building, 112 yards long and 70 wide, and contains 18 cells. The remains of tiny huts at the foot of the hill probably point to pilgrimages to these shrines, being no doubt innns for the entertainment of the pious visitor. Pizarro sacked the shrine in 1523, destroyed a wooden idol, and, it is said carried away 1,700 pounds of gold and 1,600 of silver. Consult: Squier, 'Perú' (1853), and Wiener, 'Pérou et Bolivie' (1886).

The district of Pachacamac is an administrative division of the province of Lima, with about 1,300 inhabitants. The same name is borne by an island off the coast of Peru near Lurin.

Pacheco, Francisco, frán-thēs'kō pák-chē-ā-kō, Spanish painter and writer on art: b. Seville 1571; d. there 1654. As a theoretist in the Pacheco occupies a unique position in the history of the Seville School. His pictures are elaborate in their skilful em-bodiment of the principles he expounded in his 'Arte de la Pintura' (The Art of Painting), but they lack vigor and originality. His treatise, however, did much for art in Spain, and he was the master both of Alonzo Cani and Velasquez, the latter of whom became his son-in-law. In his 'Last Judgment' (painted for the nunner of Saint Isabel) he introduced his own portrait, and ambitious and learned as many of his pictures are his small portraits, some of them in crayon, are among the best of his works.

Pacheco, Gregorio, Bolivian politician: b. Peru. He became prominent in the second half of the 19th century in the politics of Bolivia, where he was the owner of large plantations. In 1864-8, or for the entire legal period of four years, he held the presidency of Bolivia. He strove effectively to rehabilitate the commerce and industry of the nation, which had suffered through the war with Chile.

Pachmann, pāch-'mān, Vladimir de, Russian pianist: b. Odessa 27 July 1848. He studied music with his father, an amateur violinst, and with Dachs at the Vienna Conservatory; made his first appearance in 1869; after eight years of retirement made his first tour; again retired for two years; but then played successfully in Vienna, Paris, and London; came to the United States in 1890; and toured in 1899 and 1900. His strong personality shunts him out of all but solo music; in that field he is best known as an interpreter of Chopin.

Pachomius, pā-kō-mē-ōs, Saint, Egyptian ascetic of the 4th century: b. Thebaid about 270; d. Proii, Egyptian Thebaid, 348. In early life he was drafted as a conscript in the army of Maximin, and at Thebes met with some Christians, whose teaching so interested him that on the conclusion of the campaign of Maximin against Constantine and Licinius he was baptized and embraced the life of an anchorite. His guide in his choice was Palæmon, who accompanied him to Tahenna, an island in the Nile, where they took up their residence. In 326 he founded the first monastic community and he is spoken of by the learned Tillemont (see Tillemont, Sebastien le Nain de) as "the institution not only of the Egyptian monasteries, but of the conventional life itself, and of the holy communities of men devoted to religious life."

Pachuca, pā-choo-kā, Mexico, administrativaive district of the state of Hidalgo; and the capital of the state, lying 55 miles northeast of the City of Mexico, in a mountain pass 8,000 feet above the sea, and at the end of a branch from the railroad between Mexico City and Puebla. It is the centre of the great Real del Monte mining district; and its mines, worked even by the Incas as well as by the Spaniards, are still very productive. A village called Pachuquilla, southeast of the city, is supposed to be older than the city; Humboldt and others claimed that it is the former Spanish settlement in Mexico. At Pachuca in 1557 Bartolomé de Medina discovered the method of amalgamation still in use in the Mexican mines. Pop. 40,000.

Pachyder'matha, the name formerly applied to a division or order of the elephants, tapirs, hippopotamuses, rhinoceroses, swine, and hyraxes—all of which forms were distinguished by their thick skin, by their non-
ruminant habits, and by their possessing more than one hoof on each leg. This classification has, however, given place to a more scientific and natural arrangement, in which the several forms are placed according to fundamental structural affinities. Thus the elephants form a distinct order, the Proboscidea. The rhinoceros and tapirs are included in the division Perissodactyla of the ungulate order; the hippopotamus and swine are arranged in the section Artiodactyla of the same order; while the hyrax has a separate order—Hyracoidea—to itself. See Ungulata.

Pacific Ocean, also formerly called the South Sea, the largest of the five great basins of the hydrosphere, extending for 133° of latitude and 180° of longitude, between the west coast of the North and South American continents, and the east coast of Asia and Australia. It extends in compass the whole of the four continents taken together, and occupies more than a third part of the earth's area. On the west it borders on the Indian Ocean, on the north it communicates with the Arctic Ocean by Bering Strait, on the south it is bounded by the Antarctic Ocean, and on the east it joins the Atlantic at Cape Horn. Within this enormous circumference it includes the numerous islands composing the groups of Australasia, Polynesia, Melanesia, and Micronesia, the islands on the west coast of America, and those on the east and south coasts of Asia. The Pacific Ocean is divided into: (1) the North Pacific, bounded on the south by the tropic of Cancer, and comprising in the north and west the seas of Kamchatka and Okhotsk, the Japanese Sea, the East or North China Sea, and the Yellow Sea, and in the east the Gulf of California; (2) the Central Pacific, stretching between the tropics, and comprehending the greater part of the numerous and beautiful insular groups known by the collective name of Polynesia; and, (3) the Southern Pacific, or South Sea proper, extending from the tropic of Capricorn to the Antarctic Ocean, and not diversified by many islands. The Pacific Ocean receives most of its tributaries from the Asiatic continent, the principal rivers being the Amur, Hoang-ho, and Yang-tse-kiang; while from South America, owing to the proximity of the Cordilleras to the coast, it receives no stream of any consequence, except the Amazon and the Rio de la Plata. The islands of this ocean are so numerous that it is difficult to give an enumeration of them, even in groups. Commencing on the American coast at the Strait of Magellan, and proceeding north, an uninterrupted chain lines the shores of Chile, and terminates in the large island of Chiloe. Many islets occur along the stretch of coast farther northward, and at the equator, about 700 miles west from the mainland is the interesting Galapagos group. Northward along the coasts of Mexico and the United States are the Revillagigedo, Alajos, Guadalupe, and several other small groups, while lining the coasts of Canada and Alaska is a chain of large islands, including among others those of Vancouver and Queen Charlotte. Turning west the Kodiak Archipelago lies at some distance off the east coast of Alaska, and the still larger chain of the Aleutian Islands, forming the extremity of that peninsula, and terminating the groups of the Pacific, so far as belonging to the American continent. On the opposite continent of Asia, the islands commence with the Kurile chain, stretching southwest from the extremity of the Peninsula of Kamchatka, and afterward continued in the same direction by the far more important islands of Japan, the Philippines, and other large islands of the Indian Archipelago. In the south region of the Pacific, as already stated, there are few islands, but the Marquesas, Low Archipelago, Society, Friendly, Fiji, New Caledonia, New Hebrides, and Solomon groups.

The bed of the Pacific is composed largely of Red clay, with extensive deposits of Blue and Coral muds, Globigerina, Radiolarian, Diatom and Pteropod oozes, and in the eastern portion and south of Australia and New Zealand is fairly regular, ranging from 1,000 to 2,000 fathoms in depth. In the north, northwest, and south, east of New Zealand are extensive deeps, the Tuscaraor deep east of Kamchatka, the Kurile Islands, and Japan, having a depth greater than 4,000 fathoms, the Aldrich deep, east of New Zealand, over 5,400 fathoms. Between Guam and Midway Islands (q.v.) the United States telegraph ship Nemo in 1900 sounded a depth of 5,200 fathoms. See Mountains: Ocean.

The general laws regulating winds, tides, and currents suffer fewer modifications in the Pacific, than in narrow seas. The tidal wave, commencing at the equator, diverges from it toward the poles, and, proceeding with great velocity, and without an obstruction, is scarcely perceptible among the central islands of the Pacific. Hence in the Low Archipelago, at Bow Island and Tahiti, the rise is only 1 foot, and at the Sandwich Islands 2 feet. It is only when, by the proximity of a mainland diminishing the depth of the water, or by any similar cause the natural course of the wave is changed, or obstacles to its progress are interposed, that an accumulation takes place, and breakers are formed. In the Pacific, however, these never attain the maximum heights for which some parts of the Atlantic and Indian Oceans are celebrated. In the solitary instance of Cook's Inlet, Alaska Territory, the rise is as much as 28 feet; but on all the west coast of America it is usually below 10 feet, and only in the Bay of Panama varies from 13 feet to 15 feet.

The prevailing winds of the Pacific, like those of other great seas, are divided into regular or trade winds and variables. The trade winds of the Pacific are not so regular in their limits as those of the Atlantic, and this irregularity extends over a much wider region in the case of the southeast trade wind than in the case of the northeast. The cause of this is the greater number of islands in the South Pacific Ocean, which, especially in the hot season, disturb the uniformity of atmospheric pressure by local condensations. The northeast trade wind remains the whole year through within the northern hemisphere. In the middle of summer (about July) the zone within which it blows extends from about the Mariana or Ladroo Islands, in 140° east longitude, to near the
coast of North America (Lower California), and its southern limit begins to the south of the islands mentioned, in about latitude 13° north, gradually descends toward the east to about 8° north, and then rapidly ascends again to about 20° north, near longitude 115° west. In winter (about January) this zone extends from Borneo and the Philippine Islands to the American coast; and its southern limit, beginning about the northeast of Borneo, keeps between 2° and 4° north latitude until about longitude 170° west, when it gradually rises to about 16° north latitude, at about 100° west longitude. The southeast trade wind, on the other hand, advances beyond the equator, both in summer and winter, still preserving its original direction; in summer (July) to about 7° or 8° north latitude, and in winter (January) to about 5° north latitude, at 160° west longitude. In July the zone of this trade wind extends from New Guinea and Australia to the neighborhood of the South American coast; and its southern limit, beginning off the coast of Australia, about latitude 24° south, gradually rises to about latitude 10° south, longitude 130° west, and then sinks again to about latitude 24° south, off the coast of South America. In January, on the other hand, the western limit of the southeast trade wind is about longitude 175° west; and its southern limit, commencing there about the equator, sinks gradually till it touches the Marquesas Islands, and then more rapidly till it reaches about 33° south latitude, off the South American coast. In the region lying to the west of this zone, stretching from New Guinea and the Solomon Islands southeastward, there are no regular winds. West winds, accompanied by rains, here alternate with calms. Sometimes also irregular warm, moist winds reach this region from the north, but the regular north-east trade wind never visits it. The zones of the two trade winds are separated by regions of calms and of light winds, the limits of which vary with the varying limits of these zones. In the Chinese seas the terrible typhoons occasionally rages, and may occur at any season of the year.

The following table exhibits the mean velocity of the currents of the Pacific Ocean in 24 hours.

The periodical current of the west coast of Mexico, occasioned by the monsoons of this coast, resembles them in its alternations. It extends from Cape Corrientes to the Cordillera Islands, preserving a nearly uniform breadth of 350 miles. It was first noticed by Humboldt. See Ocean Currents.

The Portuguese were the first Europeans who entered the Pacific, which they did from the east. Balboa, in 1513, discovered it from the summit of the mountains which traverse the Isthmus of Darien. Magellan sailed across it from east to west in 1520-1. Drake, Tasman, Bering, Anson, Vancouver, Lapérouse, and others, traversed it in different directions in the 17th and 18th centuries. The domination of the Pacific is a political problem of international importance, which is agitating the world as the commencement of the 20th century, and one in which the United States as a commercial factor figures prominently. Consult: Burney, 'Chronological History of Discoveries in the South Sea'; Colquhoun, 'Mastery of the Pacific'; Thomson and Murray, 'The Challenger Expedition' (1880-95).

**Pacific Railroads.** See Railroad.

**Pacific University,** established in 1854, at Forest Grove, Ore., under the auspices of the Congregational Church. The collegiate department confers the degree of bachelor of arts, bachelor of science, and bachelor of letters; there is also a normal course and a preparatory department. The university is coeducational. In 1993 the grounds and buildings were valued at $55,000; the productive fund amounted to $308,000; and the annual income was $16,948. The library contained 10,800 volumes; the students numbered 211 and the faculty 14.

**Pacíficus,** a pseudonym of Alexander Hamilton, under which, in 1793, he published a series of letters advocating the neutrality of the United States as between the European countries then at war. To these letters Madison replied in a series of five essays signed "Helvidius."

**Pacing.** See Horse-Racing.

**Pacíficus Corporusculi, or Pacínician Bodies** (also called corpuscles of Water), elliptical, concentrically striated bodies of cellular tissue, capillary vessels, a watery fluid, granular material, and epithelioid cells; first described by Filippo Pacini in 1830. Into each corpuscle runs the axis-cylinder of a nerve (wrapped round by the sheath of Schwann), terminating in a bulbous enlargement, or bifurcating, each nerve-fibril has a similar terminal knob. These corpuscles are the *peripheral end-organs* of certain sensory nerves and in the human being they are found chiefly in the subcutaneous tissue of the palms of the hands and the soles of the feet, but have been found also in the genital organs, the nipples, and other portions of the body.

**Packard, pák'arding, Alpheus Spring, American zoologist:** b. Brunswick, Maine, 19 Feb. 1839. He was graduated from Bowdoin in 1861; and was for three years a special student under Agassiz at the Lawrence Scientific School, Harvard University. From 1865-6 he was librarian and curator of the Boston Society of Natural History; and from 1867-78 curator, and then director, of the Peabody Academy of Science. In 1871-3 he was State entomologist of Massachusetts; from 1877-82 he was a member of the United States Entomological Commission and took part in several of the expeditions for scientific study under the charge of this commission. In 1878 he became professor of zoology and geology at Brown University. His most important contributions to science have related to the classification and anatomy.
of the arthropoda, especially insects; he proposed a new classification of insects, and re-
grouping of the phyla of the arthropoda. As an alumnus of the founders of the
Neo-Lamarckian school, to which he gave that
name. His writings include: 'Guide to the Study of Insects' (1809); 'The Mammoth
Cave and its Inhabitants,' with F. W. Putnam
(1835); 'Journey to the Orient' (1873); 'Lives
of Animals' (1876); 'Half Hours with Insects'
(1877); 'Injurious Insects of the West' (1877);
'Development and Anatomy of Limulus Polyphemus'
(1885); 'Entomology for College Students' (1886);
'Nature's Law by Nature's Example' (1887);
'Ventura and the Origin of Life' (1890); 'Lamarck,
The Founder of Evolution, His Life and Work.'

Packard, John Hooker, American physi-
cian: b. Philadelphia, 15 Aug. 1832. He was
graduated from the University of Pennsylvania
in 1850; was acting surgeon in the United States
army 1861-5; and surgeon to the Episcopal
Hospital, Philadelphia, 1863-84. He was also
surgeon to two other hospitals in his native city,
and the Pennsylvania (1874-9); and the Woman's
(1876-7). He published: 'Minor Surgery';
'Lectures on Inflammation'; 'Operative Sur-
gery'; etc.

Packard, Silas Saddler, American educa-
tor: b. Cumington, Mass., 28 April 1826; d.
New York, 10 Oct. 1868. He was educated at the
Granville Academy, Ohio, and engaged in
teaching at 17. He originated an admirable
system of commercial training and in 1858 or-
ganized with Bryant and Stratton a business
college in New York; this college later became the
Packard Commercial School. He founded the
'Niagara River Pilot' in 1853 and edited it until
1856, and in 1868-70 published 'Packard's
Monthly.' He was president of the congress of
business education at the World's Fair in
1893, and author of numerous text-books, among
which are: 'The Packard Manual of Book-
keeping and Correspondence'; and 'The Pack-
ard Arithmetical.'

Packer, Dk'r, Asa, American capitalist: b.
Pottsville, Pa., 20 Dec. 1786; d. Philadelphia,
17 May 1879. He worked at the trade of tan-
ing, then as apprentice to a carpenter, went
to Pennsylvania in 1822, and in 1833 took charge
of a boat on the Lehigh Canal, and later con-
ected himself with coal-mining and the trans-
portation system between Pottsville, Pa., and
New York as a builder of locks and boats for
the canal system. In 1844 he was a member of
the Pennsylvania legislature. The Lehigh Val-
ley Railroad was projected by him, and was
completed from Mauch Chunk to Easton
in 1855. As a Democrat he served two terms in
Congress (1853-7). Out of the great wealth
which he acquired he made many generous
public gifts, the founding and endowment of
Lehigh University (q.v.) being his most con-
spicuous benefaction.

Packer Collegiate Institute, a secondary
school for girls, located in Brooklyn, N. Y.
It was chartered in 1853, and opened to students
in November 1854; it stands on the site of the
building of the Female Academy (founded
1845), which was burned in December 1852.
The work of the Institute is in four departments,
primary, preparatory, academic, and collegiate;
the primary work is in two grades, the prepara-
tory in four, and the academic and collegiate in
each three. The degree of Bachelor of Arts, and
confers no degrees, the work of the college
department overlaps the first two years of
a regular college course, including in its curricu-
num logic, first two college years of Latin and
Greek, pathology, advanced physics, and calcul-
us. Omit entering the academic department, a
student may choose one of two courses of study,
with further privilege of choosing among elect-
ive studies in the collegiate department. Stu-
dents are not ordinarily permitted to take more
than three regular studies at a time. The Insti-
tute has a library numbering over 8,000 volumes
(in 1903), well-equipped science laboratories,
and a gymnasium in which instruction in phys-
ical training is given. It is not endowed; the
Alumnae Association (organized 1886) in 1903-4
began the attempt to raise a $100,000 fund for a
new building to adjoin the original building.
The students in 1903 numbered 621. Of these
the great majority in all departments were from
Brooklyn; an attempt is being made to attract
students from outside the city. The Institute
has long ranked among the first of the schools
of its grade, and has had important influence on
the educational life of Brooklyn.

Packing Industry. The packing industry is
usually considered as applying more particu-
larly to the curing and packing of pork products;
but this business also includes the slaughtering,
dressing, and shipping of cattle and sheep, al-
though it is true that only a small percentage of
the product from the cattle and sheep is
"packed," using the term in its most literal sense.

As to the history of the packing industry, it
is said that pork was cured and packed in bar-
rels in Salem, Mass., in 1640, and it is certain
that, about 1690, Boston did quite a trade in
that line; but the paternity of the Western pack-
ing business, as we understand it to-day, belongs
to Cincinnati, where, in 1818, one Elisha Mills
was established. The first drove of hogs ever
received in Chicago was in 1827. But no at-
tempts at packing was made before 1832, when
George W. Dole packed some pork for Oliver
Newbury, of Detroit. In the forties hogs were
packed at Columbus, Chillicothe, Circleville, and
Hamilton, in Ohio; Lafayette, in Indiana; Madison,
Terre Haute, and Vincennes, in Indiana;
Alton, Beardstown, Pekin, Peoria, and
Quincy, in Illinois; and many places of minor
importance. The greatest number of places en-
gaged in the hog-packing business was reported
in 1873-4; 397 places being included in the of-
icial reports; since that time the number has
steadily declined, the process of concentration
in the large centres going steadily on, the num-
ber in 1890-1900 being only 71.

The first season in which the Western pack-
ing reached a total of 1,000,000 hogs was in
1843-4, the number falling below this point dur-
ing the next three years. The table at the top
of the following page shows the number of
hogs packed in the West up to the beginning of
summerslaughtering operations.

Prior to 1872 summer slaughtering had not
reached proportions of importance. In that year
500,000 hogs were killed during the season, and
subsequently, with the introduction of chilling
processes, summer killing developed largely, as
PACKING INDUSTRY

HOGS PACKED.

</table>

The summer season covers the period from March to October inclusive, and the winter season, November to February. For the past ten years the summer packing represents about 58 per cent of the aggregate. It is here shown that from a business of less than 1,000,000 hogs, as the yearly extent of Western packing operations in 1845, the growth of this industry brought the annual average for the following decade to 1,000,000, during which period the highest total was 5,335,000, in 1853-4; for the next decade, 1855-6 to 1864-5, the annual average was advanced to 2,613,000 hogs, the largest number being 4,069,000, in 1862-3; for the following decade, 1865-6 to 1874-5, the annual average reached 3,933,000 hogs, with 6,766,000 as the largest number, in the last year of the period, 1874-5; for the next decade, 1875-6 to 1884-5, there was a more striking advance, the annual average representing 9,075,000 hogs, with 12,243,000 as the largest yearly number, in 1880-1. Again a large increase is shown for the last decade, ending with 1890-1, for which the annual average is 17,200,000, and 23,623,000 the largest yearly number, in 1898-9.

For the ten years ending with 1851-2 the packing at Cincinnati represented 27 per cent of the total for the West, that city reaching 475,000 hogs in 1848-9. Railroads penetrated the West in 1852, and by 1855 several roads were in operation. This influence, tending, as it did, to open up the country to settlement, and facilitating the exchange of commodities, had a marked effect on the extension of the packing business, and in changing its geographical position and its character. At Chicago about 20,000 hogs were killed in 1850-1, and the increase at this point from that time on was rapid. In 1858-9, 99,000 hogs were killed in Chicago; 505,000 in 1861-2; 1,225,000 in 1871-2; 4,000,000 in 1877-8; 5,752,000 in 1880-1; in 1890-1, 6,071,000, and in 1899-1900 7,119,440. The largest yearly total for one city in the history of the industry was that of Chicago for 1898-9 amounting to 8,016,675, Kansas City coming second with 3,107,053 in the same year. Until 1861-2 Cincinnati maintained its position as the leading packing point in the country. In that season the distinction passed to Chicago, where it has since remained. Of the aggregate of 170,200,000 hogs handled by all the cities between 1850 and 1900, Chicago packed over 58,000,000, or about 35 per cent. During the same time Western packers paid out $7,663,130,000 for hogs, or an annual average of about $106,000,000, reaching $212,850,000 for the year ending 1 March 1899. These figures relate only to the manufacture of hog products, and to the business in the West prosecuted for commercial purposes. For slaughtering and packing in general the relative supremacy of Chicago is the same. Of products valued at $968,266,548 for the entire country for the year 1890, Chicago contributed 35.6 per cent, or $248,811,097 worth. Kansas City was second, with 10.5 per cent, and a total of $73,205,027.

While curing operations were carried on in Eastern markets at an earlier period, what may be termed regular packing establishments probably were not established there until after the industry had been developed in the West. The following is a statement of the reported sales of beef-cattle, sheep, and hogs at Boston, Philadelphia, and Baltimore, in the year 1844, most of these animals being undoubtedly slaughtered for local consumption in a fresh state:

The total value of the 6,927,399 animals represented in the foregoing exhibit for 1899 was approximately $135,000,000. There were exported 409,176 live cattle, valued at $30,685,461, leaving approximately 8,500,000 animals for local slaughtering establishments at the seaboard, and representing about $105,000,000 in value. For many years a number of large packing establishments have been in operation in Eastern cities, notably at Buffalo, Boston, Providence, New Haven and Springfield. At about 50 establishments in New England, New York, and Pennsylvania from which returns of packing have been obtained, the total packing for the year ending 1 March 1899 was 3,100,000 hogs. The total of these establishments ten years ago was 2,328,000, which exceeded any previous year. The hogs slaughtered the past year at the seaboard and other Eastern localities represented a value of about $55,000,000, which with the amount paid out by Western packers makes a total of $207,000,000 for the year’s outlay for hogs, or an average of about $900,000 daily.

These statistics indicate in general terms the significant progress of the pork-packing industry in the United States, which we may say really had its beginning about 80 years ago. Naturally, labor-saving devices have been adopted as pressings ne-...

Chicago in the sixties, and enjoyed some little growth; but it was not until the year 1879 that the beef-canning business was taken up on a large scale by the packers. Mechanical ingenuity, in discovering a sure and practicable method of hermatically sealing tin, rendered possible the preservation of food in this way on a large scale; and the facilities already secured by the large packers for disposing of every part of the animal placed the business entirely in their hands. The convenience of canned beef, tongues, potted meats, and soups, and the fact that they could be guaranteed to keep sound in any climate for years, combined to steadily increase this branch of the industry. In 1890, 111,000,000 pounds of canned beef were exported. The dressed beef trade, which now forms so large a part of the packing business, had little importance prior to 1875, and received its great impulsion from the use of the refrigerator car. The exportation of fresh beef had its beginning in a moderately early period of 1876, 10,851,000 pounds being the total for the year. Ending with 1886, the average was 59,000,000 pounds, reaching 100,622,000 pounds in the last year of the period. For the next ten years the annual average was 113,000,000 pounds, reaching 182,500,000 in the last year of the period. For the past 10 years the average was 232,000,000 pounds, reaching 323,000,000 pounds in 1899. At first the cattle were transported on the hoof, and handled in the Eastern cities by local abattoirs; but the long and tiresome journey was bad for the beef, and this method had to give place to something less wasteful and more humane. The packer now slaughters thousands of head of cattle daily, chills the carcasses at a uniform temperature, loads the beef into refrigerator cars, where a uniform temperature is maintained between Chicago and the Eastern markets, delivers the beef into his own cold-storage warehouses in the large Eastern centres, and distributes the carcasses to the local butchers, or if the meat is intended for export, runs his refrigerator-cars alongside the ocean-liners, and transships the meat to the specially constructed chill-rooms of the ship, lands the beef in London, Liverpool, and Glasgow in prime condition and at a low price. There is good ground for the view that the cattle-raising industry of the West has been greatly benefited by this extension of slaughtering and the development of the dressed-beef trade. Definite figures illustrating the growth of the slaughtering of cattle for commercial dressed beef are unfortunately very meagre; but the general pose of such information is served by the introduction of statistics indicating the number of cattle killed at prominent Western markets where this industry is prosecuted. The following compilation shows the average annual number of cattle killed from 1871 to 1900 at the places named, for various periods:

The aggregate value of the 5,211,000 cattle in 1899 in the several markets where they were killed, including the number exported alive (409,176), was approximately $280,000,000.

Incident to traffic in dressed beef, the mutton trade has assumed important proportions in late years, this product being largely distributed in the refrigerator-car shipments of meats. The following figures show the number of sheep killed in the four Western centres and received at the seaboard cities in the years 1871, 1880, 1890, and 1899.

Even after the packing business had assumed fairly large proportions, the packers were not aware of, or did not appreciate, the value of the offal, and the problem of how to get rid of it at the least expense was ever present. In Chicago the blood was allowed to run into the river, and men were paid five dollars a load to cart the heads, feet, tankage, and other waste material out upon the prairie and there bury it in pits and trenches. But gradually there grew up in the vicinity of the packing centres subsidiary enterprises having for their object the utilization of some or all of this waste material, and turning out glue, oil, tallow, and crude fertilizers. In time, however, the necessities of the business, and the growing competition, forced the progressive packer to include these industries in his own establishment. It became less profitable to pack in a small way, and to-day a large packing plant depends largely for its profit on the intelligent utilization of those so-called waste materials which in the early days of the packing business were not only thrown away, but the removal of which was an actual source of expense.

The sweet fat of the cattle forms the basis of butterine, made in their own butterine factories; the sheep pelts are secured, and the wool removed in their own wool-houses, cleansed, and sold direct to the large Eastern cloth-mills. The intestines are cleansed and salted and used for sausage casings in their own sausage factories. In one or two packing houses there has been established a laboratory where the inner lining of the hog's stomach is made into pepsin of great purity and activity than was possible when the sensitive material had to be transported in raw state, and subjected to all the risks of decomposition and consequent loss of digestive power.

Pa'co, a name of the alpaca (q.v.).

Pacotolus, pāk-tō-lūs, Asia Minor, the classic name for the modern Sarabat, a Lydian stream annually celebrated for its golden sand, the reputed source of the wealth of Cresus. It rises on the north side of Mount Tmolus, flows past Sardis, and has its outlet in the Hermus.

Pacuvius, pā-kū-vī-ūs, Marcus, Roman tragic poet, nephew of the poet Ennius: b. Brundesium about 220 B.C.; d. Tarentum about 130 B.C. He was a student under Ennius, and not only a poet but a painter as well, as is shown by the many allusions to a picture of Hercules in Forum Boarium. Most of his tragedies followed Greek models; such were the 'Antiope' and the 'Dulorestes,' the latter being adapted from Euripides' 'Iphigenia in Tauris'; among native plays by him the one most often mentioned is the 'Paulius,' written in honor of Lucius Æmilius Paulus. He also wrote satires, but of this great body of work nothing but a few quotations by grammarians and rhetoricians has come down to us; these are edited by Ribbeck in 'Postex. Select., Sept. 1860'. Consult: Müller, 'De Pacuvii Fabulis' (1890).

Padang, pā-dāng', Sumatra, Dutch residency or province on the west coast of the island; also the province's capital city, on the right bank and mouth of the Aran River, which is very shallow at its embouchure and so makes a poor harbor. The city has government workshops and barracks, schools, hospitals, and churches; and was the earliest Dutch city in Sumatra (1666). It does business with the interior of the island by rail and exported in 1900: nutmegs 2,669 piculs; coffee 15,577 piculs; cinnamon 31,058; copra 53,889; tobacco 10,514; gum 9,836; and 20,076 hides. The city has a European and a Chinese quarter, in which there are a few stone houses; elsewhere bamboo is used. The climate is temperate and healthy; the temperature averages 25° C. for the year and rarely goes above 32° or below 20°. The city has several consulates, one American. Pop. about 12,000; the residency between 1,000,000 and 1,600,000.
PADDLE — PADIHAM

Paddle, a wooden implement consisting of a wide, flat blade with a short handle, by means of which a small boat or raft is propelled, the operator spooning the water toward him. In canoes a double-headed paddle is used, being dipped alternately on either side. Among barbarous nations the paddle is still in use as a substitute for the oar.

Paddle-fish, Spoon-bill Cat, or Spade-fish, a singular fish (Polyodon spathula) of the sturgeon tribe, Chondrogonoidae or Chondrosti (q.v.), which takes its name from the extraordinary spatulate prolongation of the nasal bones and upper jaws into a thin, spade-like, mud-digging instrument, measuring a third to a quarter of the total length of the fish. It abounds in the more sluggish parts of the rivers of the Mississippi Valley and of the Southern States, and occasionally reaches a length of more than six feet and 75 to 100 pounds in weight. In general form it resembles a sturgeon, but the skin is destitute of plates or scales, except on the upper lobe of the tail, and is a dull greenish mud-color in hue. The gill-aptures are of large size, and the gill-covers are prolonged backward nearly to the middle of the body. The tooth is large, and provided with teeth in the young, but they disappear as the fish grows older.

The paddle-fishes feed chiefly on mud and minute organisms contained, stirring it up with the upturned spout. Their swimming habits are little known, but apparently the eggs are voided as soon as the water where each fish lives reaches a fair degree of warmth; at this time they ascend the streams and bayous, swimming near the surface, and are caught by means of seines. At other seasons they may be caught on set-lines. Formerly the flesh, which resembles that of the sturgeon, was eaten only by the southern negroes, but now it finds a sale in many local markets, and is frequently smoked and sold for sturgeon. The greenish black roe is also coming into demand for the making of caviar.

Another closely related form (Psephurus gladius) lives in Chinese rivers, and the two constitute the family Polyodontidae, the fossil remains of which are found in Wyoming as far back as the Eocene. Consult: Jordan and Evermann, 'American Food and Game Fishes' (1902), and other authorities therein cited.

Paddock, pā’dək, Algernon Sidney, American lawyer and politician: b. Glens Falls, N. Y., 9 Nov. 1830; d. Beatrice, Neb., 17 Oct. 1897. He studied law, and removing to Nebraska in 1857 was admitted to the bar there, and became prominent in the political life of the Territory. In 1869 he was delegate to the Territorial Republican Convention, and in 1860 and 1864 to the National Republican Convention. In 1861 he was appointed secretary of the Territory, holding this position till 1867 when Nebraska was admitted to the Union, for a part of this time acting as governor. In 1868 he declined an appointment as governor of Wyoming Territory. In 1875 he was elected to the United States Senate and again in 1887, while between his two terms in the Senate he was for four years a member of the Union Commission. While in the Senate he was a member of several important committees, including the committee on pensions, on public lands, on post-offices and on public buildings, and during his last term was chairman of the committee on agriculture and forestry.

Paddybird, the name among English-speaking people in the East for various birds frequenting rice fields, especially small waifs of several kinds; also a finch, the Java sparrow (q.v.).

Pael'la (Italian, from Latin patella, a small flat dish), a shallow vessel used in illuminations. A number of them are partially filled with oil or grease, and are placed on hay or old straw when lighted the outlines of a building or the slope of a rising ground. The idea originated in Italy.

Pademelon, a small, naked-nosed kangaroo of the genus Halmaturas, specifically H. thetidis, or New South Wales brushy districts, and with others of its race in Australia and Tasmania is hunted for the sake of its hide.

Paderborn, pā’dər-bōrn, Germany, a town and episcopal see in the Prussian province of Westphalia, at the sources of the Pader, 50 miles southeast of Munster. It is an old town, with narrow streets, and antique houses. It has a fine recently restored cathedral, with a tall and massive tower which, as well as the crypt, belongs to the 11th century — both in the Romanesque style; while the body of the church, 345 feet long, is of the 13th century. It has also a fine market place, an ancient town-house, and several other ancient churches and chapels. The industries include the orange-making, flour, soap, glass, beer, and tobacco. The ground on which it stands teems with mineral springs. The university which existed at this place from 1614 was suppressed in 1819. Pop. (1900) 23,502, mostly Roman Catholics.

Paderewski, pā’dər-e’Skē, Ignace Jan, Polish pianist: b. Podoliat, Russian Poland, 6 Nov. 1860. He began serious study of the pianoforte in 1867, continued his preparation from 1872 at Warsaw under Kiel and Roguski, toured Russia, Siberia, and Rumania, and became a professor in 1878 in the Warsaw conservatory, in 1884 in that of Strasburg. After further study with Leschetizky in Vienna, he made his formal appearance as a concert pianist in 1887. He played in London in 1890, and in 1892 in the United States, which he has frequently revisited. He became the best-known pianist of his time, distinguished alike for his technique and his intellectual interpretation. In 1902 he conducted in the United States his opera 'Mamma,' which achieved a great success. His interest in American music was shown by his placing in the care of trustees the sum of $10,000 for the encouragement of the composers of the United States. His compositions are largely for the pianoforte, and include 'Elegie, op. 4': 'Danses Polonaises': 'Chants du Voyageur': 'Minuet'; 'Dans le Desert'; and 'Humoresques de Concert.'

Padiham, England, a town of Lancashire, on the Calder, a northeast suburb of Accrington. It is an industrial centre with cotton mills, coal mines, and stone quarries. Pop. (1901) 12,200.
PADILLA — PEAN

Padilla, Juan Lopez de, hoo-an’ lō’páth dā pā-thel’yā, Spanish warrior: b. Toledo 1484; d. 24 April 1521. At the outbreak of the insurrection of the Castilian towns the Santa Junta entrusted him with the command of the forces of the communeros. After several successes his force was defeated through the treachery of Villalar 23 April 1521. He himself was wounded and taken prisoner, and executed on the following day. The two letters in which, shortly before his execution, he took leave of the town of Toledo and of his wife Maria Pacheco, were known in Spain as models of magnanimous feeling and touching simplicity. Both he and his widow, who defended Toledo for some time after his death, have become the subject of numerous dramas and poems.

Padilla, Bolivia, capital city of the province of Tomina and department of Chuquisaca, 90 miles northeast of Potosí. Originally called Laguna, the city now bears the name of Manuel Asencio Padilla, a patriot of this province, killed at the battle of the Ypacaraí 17 October 1811. Pop. 12,675.

Pa’dishah, in Persia, a title assumed by or applied to the Turkish sultan, derived from pad, padi (protector or throne), and shah (king, prince).

Padua, pā’dū-a, or Padova, pā’dō-vā, Italy, a university city, capital of the province of the same name, 22 miles west of Venice, on the Bacchiglione. It is surrounded by a lofty wall flanked with bastions, and is entered by seven gates. It is connected by canals with the Adige and the lagoons of the Adriatic. The streets and squares are usually lined with colonnades. The largest and finest of the piazzas is the Piazza Vittorio Emanuele, formerly called the Prato della Valle, which is planted with trees, surrounded by a running stream, and adorned with numerous statues of distinguished townsfolk and other Italians. The principal buildings are the town-house or Palazzo della Ragione, an immense pile, extending along the market place, erected between 1172 and 1219, and remodelled in 1420, standing upon open arches, and containing a large hall adorned with mural paintings, about 400 in number; the late Renaissance Duomo or cathedral, built in the 16th century, possessing a fine library, rich in rare books and manuscripts, and of which Petrarch, who was one of the cathedral, is reckoned one of the founders; the baptistery of the cathedral, a fine Lombard building of the 12th century, its walls and cupola entirely covered with frescoes; and the Church of St. Anthony. The most famous establishment in Padua is the university, one of the most ancient in Europe, said to have been founded early in the 13th century by Emperor Frederick II., but according to other accounts not founded till 1260, and sanctioned by Pope Urban IV. in 1263. It was long renowned as the chief seat of law and medicine, and is celebrated for its list of notable professors, including Galileo, Guglielmini, and Falloppius, and for its students, including Dante, Petrarch, and Tasso. In 1902 it had over 1,400 students. In connection with the university is a botanical garden, the oldest in Europe, containing some of the earliest specimens of trees and plants once rare, but now generally diffused; a library of 140,000 volumes, and an observatory. The manufactures include silk fabrics, ribbons, catgut, chemicals, machinery, automobiles, etc., and like the trade in cereals, oils, wines, and cattle, are increasing. Padua is the see of a bishop and the seat of several superior courts and public offices. It claims to have been founded shortly after the destruction of Troy by the Trojan Ajax. Under the Romans it became a flourishing municipal town, but on the decline of the empire was sacked, first by Alaric and then by Attila. Its great modern restorer was Charlemagne, under whose successors it successfully asserted its independence. In 1318 it fell under the domination of the Carrara family, and in 1405 under that of Venice, whose fortunes it has since followed. Among the distinguished men to whom Padua has given birth are the historian Livy, Sperone Speroni, a writer of tragedies in the 16th century; Mantegna; the poet Cesarotti. Pop. (1901) 93,550.

Paducah, pa-du’kə, Ky., city, county-seat of McCracken County; at the confluence of the Tennessee and Ohio rivers, and on the Nashville, C. & St. L. and the Illinois C. R.R.'s; about 35 miles in direct line east by north of Cairo, Ill., and 80 miles southwest of Evansville, Ind. It has steamer connection with Mississippi, Ohio, and Tennessee river ports. It was settled in 1821 by James and William Pore, and was incorporated 11 Jan. 1830. During the Civil War the city was occupied by General Grant in September 1861. It is in a productive agricultural region; in the vicinity are forests of hard and soft wood, and deposits of fire-clay, glass, sand, zinc, and fluorspar; limonite is found within 50 miles, and coal, in rich veins, within 60 miles. It has extensive manufacturing interests; the chief manufactures are pig iron, lumber, veneering, building material, spokes, rims, staves, headings, barrels, curtain poles, furniture, stoneware, pottery, saddles, collars, harnesses, tobacco products, knit goods, canned goods, brooms, brick, proprietary medicines, beer, and flour. It has a large ore milling plant and novelty works, in all 51 manufactories giving employment to about 3,000 persons, and the two railroads employ about 1,200. There is an extensive wholesale trade in clothing and food products, and in its own manufactures. The prominent public buildings are the United States government buildings, municipal buildings, churches, and schools. The educational institutions are Saint Mary's Academy, a high school, public and parish schools, and a number of private schools. There are 23 churches. The six banks have a combined capital of $1,350,000; the bank clearings are annually about $25,000,000. The government is administered under a charter of 1893, which provides for a mayor, who holds office four years, a board of aldermen, eight in number, chosen each four years, and 12 councilmen chosen each two years. The city owns and operates the electric light plant. Pop. (1890) 12,977; (1900) 19,446.

Geo. H. Dains,
Secretary of The Commercial and Manufacturers Association.

Pean, a hymn sung in honor of Apollo. In the hymns to Apollo the phrase io pean was frequently repeated, and hence they were also called paens. They were sung in time of sickness, and on other occasions, when it was desirable to propitiate the favor of the god. Hymns to other deities, or songs in praise of heroes,
were at a later period likewise called pæans. A pæan was sung, previous to battle, in honor of Mars and after a victory, in praise of Apollo.

Pædogenæis, the reproduction of animals while in the immature or larval stage. Thus certain salamanders (Amblystoma) produce eggs which develop into adults when the parents still retain the gills and are aquatic in their habits. More strictly pædogenesis is applied to parthenogenesis (q.v.) in the larval stage. Best known instances are certain flies (Miotrop, where the larvae produce eggs which develop without fertilization, inside the body and these finally escape by eating their way out, the parent being destroyed as a consequence.

Paër, pà-ár', Fernando, Italian composer: b. Parma, Italy, 1 June 1771; d. Paris, France, 3 May 1839. He was educated in Venice, summoned to the court of Vienna in 1795, and in 1801-7 was chapel-master at Dresden. After the battle of Jena he was attached to Napoleon's court, where he was imperial composer; in 1812-14 toured Italy and composed in Milan and in 1831 was elected to the Academy. His work is rich in melody and his greatness as an Italian composer is unquestioned, yet of his voluminous work little is remembered. His best known operas are 'Griseldis' (1796); 'Camilla' (1801); 'Agnesi' (1819).

Pæstum, pës'tüm, ancient Greek city of Southern Italy on the west coast of Lucania and the present Gulf of Salerno (in ancient times Sinus Pæstinensis). Founded as early as the beginning of the 9th century B.C. as a colony of Sybaris under the name of Poseidonia, or Poseidon, and reaching great prosperity in the next century and a half, the city was conquered by the Samnites of Lucania, who probably Italianized its name into Pæstum. It did not regain its old position even when two centuries later (273) it became a Roman colony, but is famed in Roman poetry for its roses. It was devastated in the 9th century B.C. by the victorious Saracens, and in the 11th by Robert Guiscard. The poor village of Pesto, a railway station, now occupies the site, which is, however, two remarkable Doric temples, one to Poseidon, the tutelar god, and one to Demeter. Consult: Labrouste, 'Les Temples de Pæstum' (1877).

Pætus, pë'tës. See AREIA.

Pæx, Jose Antonio, hō-sè' án-tó'né-ò pà'ath, Venezuelan patriot and soldier: b. Araure 13 June 1790; d. New York 7 May 1833. He was of native stock and with a body of lanços, trained like himself as bersdmen, about 1810 joined the patriot army, in which he became division commander in 1819. He administered a severe defeat to the Spaniards in 1821 and in 1823 captured their last port, Puerto Caballo. Jealous of his successor in 1826 he attempted rebellion but was conciliated by Bolívar, who made him military and civil chief of Venezuela, thus paving the way for the war of Venezuelan independence in which Pæx was the prime mover. In 1831-5 he was president of the new republic, and held the same office 1839-43 after acting as commander-in-chief during Vargas' administration and putting down two serious rebellions. In 1846 he was appointed dictator during the race war; in 1848 refused the presidency; in 1860 headed a rebellion against Monagas, but was defeated and imprisoned for several months; spent eight years in banishment; returned to Venezuela in 1858; was minister to the United States in 1866; became commander of the army in 1861; and was again driven into exile in 1863 by a revolution which cast his lieutenants, to whom he had entrusted large powers. The Federalist party was successful and Pæx, leader of the Centralists, passed the remainder of his life in New York. Consult his 'Autobiografia' (1867).

Pagan, pà-gan', India, a town of Upper Burma, on the east bank of the Irrawady, 90 miles southwest of Mandalay. Pagan was founded in 847 A.D., and was the capital of Burma until 1284, when it was abandoned during a Chinese invasion. The remains of Buddhist temples and pagodas cover an extensive area, and are of great archaeological interest. Some of them are still occupied by priests, and the town has a population of about 8,000, chiefly Buddhists.

Paganini, pà-gàn-ne'né, Niccolo, Italian violinist: b. Genoa 27 Oct. 1782; d. Nice 27 May 1840. His father discerning the talents of his son, put him at an early age under the best masters to learn the violin. With this instrument he was able to perform in public at the age of nine. In his 12th year he went to Parma, where he was taught counterpoint by Rolla (see Rolla, Alessandro) and Ghiratti. In 1797 he performed in the cities of Lombardy and afterward in the principal cities of all Italy. He settled at Lucca, in 1805, where he was appointed principal violinist to the court chapel. In 1808 he left Lucca, and for five years lived an obscure and rambling life in Italy. In 1813 he reappeared before the world, and performed at Milan. He remained in Italy till 1826, suddenly appearing, and, after exciting unbounded enthusiasm by his public performances, as suddenly departing. In the year mentioned he visited Austria and Germany, appearing first in Vienna. The wonder which he excited was caused not merely by his extraordinary skill, but also by his personal appearance, which had something weird and even demoniacal in it. His imitation of the flageolet, and his rendering of whole pieces on the G string, were particularly applauded. The emperor of Austria appointed him his chamber virtuoso, and the king of Prussia his director of music. After visiting the great towns of Germany he proceeded to France and Great Britain. In Paris he produced an unprecedented sensation, and, as in Germany, made immense gains. He was equally successful on the other side of the Channel. He returned in 1834 to Parma, where he purchased the villa Gajona. Among his compositions, one of the most celebrated is the 'Carnival of Venice.'

Pagan (Lat. pagani, those who live in the villages, pagnæ), those who remained unconverted to Christianity and the worship of the true God. While the cities were the centres of Christian life the remote villages (pagi) were still in pagan darkness, and their inhabitants kept up the practice of idolatry and the creed of polytheism. The men of the village, pagans, among the Latin races corresponded to the men of the heath, heathens, among the Teutonic races. The term pagan is not properly applied to Jews or Mohammedans since these worship
the one God, the Jehovah, of Christians and Jews.

Page, John, American legislator: b. Rosewell, Va., 17 April 1744; d. Richmond, Va., 11 Oct. 1808. He was graduated from William and Mary College in 1763, where he was intimate with Thomas Jefferson. He served under Washington in an expedition against the French and Indians during the American Revolution as a member of the committee of public safety and as lieutenant-governor of the commonwealth, sacrificing to the cause of the colonies a large share of his private fortune. He served in Congress in 1789-97, and in 1802 was elected governor of Virginia. In 1805 he was appointed by President Jefferson commissioner of loans for Virginia, which position he held until his death.

Page, John Lloyd Warden, English author: b. Minehead, Somerset, 25 Aug. 1858. After a dozen years' practice as a solicitor he retired in order to devote himself to topographical literature. Among his published works are: 'Dartmoor and its Antiquities' (1890); 'Exmoor' (1892); 'The Coast of Devon and Lundy Island' (1894); 'The Church Towers of Somerset,' with E. Piper (1890-1900); etc.

Page, Thomas Jefferson, American naval officer: b. Shelly, Gloucester County, Va., 4 Jan. 1808; d. Rome, Italy, 26 Oct. 1809. In 1833-4 he was lieutenant-commander in explorations of the La Plata region in South America, and in February 1855 his vessel was fired upon from a Paraguayan fort. Resigning in 1861 he then entered the Confederate service, was commissioned commodore in 1863, and went to England to take charge of a cruiser. As, however, he was prevented from taking the ship out he secured the command of a small iron-clad at Copenhagen, which was soon after seized from him while in a Spanish port. Leaving the service he subsequently resided in Argentina and in Florence, Italy. He wrote 'La Plata, the Argentine Confederation, and Paraguay' (1859).

Page, Thomas Nelson, American lawyer and author: b. Hanover County, Va., 23 April 1853. He was educated at Washington and Lee University, studied law for a year at the University of Virginia, was admitted to the bar, and established himself in practice at Richmond. His avocations became literature and lecturing. Perhaps no post-bellum writer has depicted with so rare a skill the negro and white life of slavery, war-time, and reconstruction. His rendering of the Virginia colored dialect in such stories as 'Marse Chan,' first printed in the 'Century' 1884; later in the collection 'In Old Virginia' (1887), assumed a real philological importance. Among his further writings are: 'Befo' de War,' poems by A. C. Gordon (1888); 'On Newfoundland River' (1891); 'Eisket' (1891); 'The Old South,' essays (1892); 'Red Rock' (1892); 'Gordon Keith' (1903).

Page, William, American artist: b. Albany, N. Y., 23 Jan. 1871; d. Tottenville, Staten Island, 1 Oct. 1915. He studied under James Herring and Samuel F. B. Morse, at the Academy of Design, and lived 11 years in Italy, copying the Italian masters and especially Titian. He spent much time in analyzing the methods of that master and was so successful in imitating his style and coloring that one of his pictures was seized by the Florentine authorities, as an original Titian which was being conveyed out of the country. In 1895 he was elected a member of the National Academy, of which he was president, 1911-3. Among the portraits painted by him are those of John Quincy Adams, the Brownings, Charlotte Cushman, and others, including a full-length likeness of Admiral Farragut, which was purchased and presented to the emperor of Russia. His publications include: 'The Holy Family' (1871); 'The Last Interview' (1893); 'Ruth and Naomi' (1880).

Paget, Sir James, English surgeon, younger brother of Sir George Edward Paget (q.v.): b. Great Yarmouth, Norfolk, England, 11 Jan. 1814; d. London 30 Dec. 1899. He studied in St. Bartholomew's Hospital, London, became a member of the Royal College of Surgeons in 1836, and a fellow in 1843. He was consulting surgeon at St. Bartholomew's Hospital, and surgeon-surgeon to the queen, and was created a baronet in 1871. He was vice-chancellor of the University of London, president of the Royal College of Surgeons, London, and delivered many important lectures on his surgical work. He published: 'Lectures on Surgical Pathology' (1853); 'Clinical Lectures' (1857); etc.

Paget, Violet ('Vernon Lee'), English essayist and critic: b. 1856. Since 1871 she has made her home in Italy, devoting herself in the main to the study of Italian art and literature. She is a brilliant though not always a convincing writer, fluent, and discursive, and not infrequently subtle as well, and possesses the power of holding the reader's interest, no matter what subject be chosen. Among her works, all of which have appeared over the signature of 'Vernon Lee,' are: 'Studies of the 18th Century in Italy' (1880); 'Belcanto: Essays on Sundays' (1882); 'Esthetic Questions' (1882); 'Ottillie: an 18th Century Novel' (1883); 'Euphorion,' essays (1884); 'Miss Brown,' a novel (1884); 'Juvenilia,' essays (1887); 'Renaissance Fancies and Studies' (1895); 'Limbo,' essays (1897); 'Genius Locii' (1896); 'Hortus Vite: Essays on the Gardening of Life' (1903).

Pago, pâ'gô, island of the Adriatic in the bay of Quarnero and district of Zara, Dalmatia;
an Austrian possession. The canal of Morlacco separates the island from the mainland. Area, 81 square miles; pop. (1890) 6,203. The capital city, bearing the same name, lies in the deep Vally of the Pag, which is hemmed in on every side save where the Bocca di Pag gives approach; the city has important saltworks, and (1890) a population of 3,554.

Pago-Pago. See Pango-Pango.

Pago'da, a name commonly given to the temples of the Hindus and other nations in Asia. They are built of wood and stone and adorned with obelisks, columns, and other architectural ornaments. Some are of great size and height. The most celebrated pagodas are those of Benares, Siam, Pegu, the Juggernaut, etc.

Pagsan, pāg-sān', a mountain of the Philippines, a peak of the Cordillera del Norte, on the intersection of the boundaries of Abra, Cagayan, and Ilocos Norte provinces; height, 7,330 feet. At Pagsan a spur leaves the main range, which forms the boundary between Abra and Ilocos Norte. The south slopes of Pagsan are drained by the Anayan and the Catigan, which unite to form the Timog River, a tributary of the Abra.

Pagurus, or Paguride. See HERMIT CRAB.

Pahang, pā-hāng', Indo-China, one of the federated Malay states under British protection, on the east coast of the Malay Peninsula, between 2° 28' and 3° 45' N. and 101° 30' and 103° 30' E., to the north of Negri Sembilan and Johore, east of Perak and Selangor, south of Kelantan and Trengganu, and west of the bordering China Sea. The state is 210 miles long, 130 wide, with 112 miles of coast and an area of 15,000 square miles. It takes its name from the Pahang River, which drains the region and is navigable for large river boats 200 miles from its source, but too shallow for commerce of importance. Pahang in ancient times was called Indrapura. It was ruled by the Siamese until the 10th century; later by refugees from Malacca, who founded a royal line, between the members of which there was bitter war in 1855-56. In 1887 a treaty was signed with the British governor of the Straits Settlements; in the year 1888 a British resident was appointed to protect British interests, but disorder broke out again and was only quelled by the armed interference of the Straits governor; in 1895 Pahang joined the Malay Federation. The state is fertile with regular and sufficient rains, and is cooler than the western coast of the peninsula. The important industry of Pahang is gold mining; the Raub mine and other lodes along the river are successfully worked by European capital; electricity is carried to the mines seven miles by overhead wires. The state's imports in 1900 were valued at $973,405; the exports were $2,322,050, including $280,000 worth of gold and a little more than 1,000 tons of tin. The population (1901) was 84,113; 134 being Europeans and Americans; 73,462 Malays and aborigines of other stocks; 8,695 Chinese; and 1,227 Hindus, especially Tamils. The capital is Kuala Liris; there are four administrative districts.

Pahlav, or Maler, a northern section of the Dravidian race, inhabiting the Rajmahal Hills, Bengal, India. See Dravidians.

Pahanpur, or Pahlumur. See PAlANPUR.

Pahlavi (pā-hā'vī) Language. See PERSIA, LANGUAGE AND LITERATURE.

Pahlen, pā-lēn, Peter Ludwig, Count of, Russian statesman: b. Palms, Esthonia, 28 April 1745. He fought in the war with Prussia 1751-2, against Turkey 1759, and against Sweden; was ambassador to Sweden 1770; was governor-general of Courland 1795, and later of Finland; twice made a Russian counsellor, and prime minister, foreign minister, and military governor of Saint Petersburg in 1800. These high offices he used to further the conspiracies against the Tsar Paul I., which resulted in the assassination of that monarch in 1801. Alexander I. distrusted Pahlen and retired him. His son, Peter (1778-1864), a great Russian general, fought in Asia in 1796, against the French 1812-14, and in Poland in 1831. He was Russian minister to Paris from 1799 to 1812, and his younger brother, Friedrich (1780-1863), was minister to Prussia, to Rio Janeiro, and to Munich, a signatory of the treaty of Adrianople in 1828, and later governor of Kherson.

Paileron, Edouard Jules Henri, a-do-ōár zhēl pā-lê-rō. French dramatist: b. Paris, France, 17 Sept. 1834; d. there 20 April 1899. He was a clerk in a notary's office until 1860, when his first work, a volume of satirical poems and a play, was published, after which he devoted himself to literature. His plays are written in both prose and verse, and have attained popularity, the later ones receiving greatest attention though really inferior to his first work. He was elected to the Académie Française in 1884 as a result of the popularity of his 'Le Monde ou l'on s'ennuie' (1883). Among his plays are: 'Le Mur mitoyen' (1861); 'L'Age Ingrat' (1879); 'La Souris' (1887); etc.

Pain, Barry, English author and journalist. He was educated at Cambridge, was for a time an army tutor, and in 1890 removed to London. He has published: 'In a Canadian Canoe' (1801); 'Playthings and Parodies' (1892); 'Stories and Interludes' (1892); 'Graeme and Cyril' (1893); 'Kindness of the Celestial' (1894); 'The Octave of Claudius' (1897); 'Wildmay and Other Stories of Women' (1898); 'Romantic History of Robin Hood' (1898); 'Eliza' (1900); 'Another English Woman's Love Letters' (1901); 'The One Before' (1902).

Pain, a sensation felt in animal bodies, always disagreeable and varying in degree from a slight uneasiness to intense agony. It is a very important sign in some diseases, and is nearly always associated with an inflammation, an ulceration, or a solution of continuity in some of the tissues of the body. But in health also intense sensory stimuli, that is, beyond the individual's natural limit of stimulation, are capable of producing pain. Griesinger states that the essence of pain lies in a disturbance of the organization of the nerve at some point in its course. Stalking, if persistent, may become painful; spasmodic contraction causes severe pain; so also does intense sunlight shining into one's eyes, and high-pitched sounds, if long continued, produce painful sensations. Those parts of the body which are most sub-
ject to injury are supplied with nerves in the largest quantity.

Were it not for sensibility to pain, important parts of the body might be irreparably injured without the knowledge of the individual. This sensibility undoubtedly differs in degree in both men and animals. Persons of a highly excitable temperament usually feel pain intensely, especially if they are predisposed to neuralgia. Pain is called acute, when sharp and violent; lancinating, when of a stabbing or darting character; lacerating, when there is the sensation of tearing; burning, when it resembles the pain of a burn. Pains are also distinguished as smarting, stinging, gripping, bearing-down, gnawing, biting, etc. The degree of pain is not always in proportion to the gravity of a disease, and may be masked by other symptoms in a severe affection. Extensive ulcers may occur in the stomach and intestines, for example, attended with very little pain. Cartilage is believed never to be the seat of pain. Pain is frequently sympathetic or reflex, occurring in a portion of the body remote from the seat of disease or irritation; for example, in disease of the hip-joint pain is felt in the knee. The feeling of pain is always referred to the periphery of the sensory fibres, no matter what portion of the sensory tract has been irritated.

Lesions of the brain are rarely accompanied by sensation in that organ, but often by severe pain referred to the extremities.

While pain is but a symptom, it should, if possible, be relieved, though the cause may not be removed. Painful sensations are associated with a depression of the circulation. Pain exhausts nervous energy, interferes with sleep, interrupts the appetite and digestion, and if long continued may shorten life. For treatment, remove the cause, enjoin rest, apply locally hot water or poultices, sinapisms, counter-irritation, and anodyne liniments. Anodyne or narcotic drugs, although of value, should be used cautiously. Regulation of the diet and attention to the condition of the bowels is of very great importance.

Paine, Albert Bigelow, American author: b. New Bedford, Mass., 10 July 1861. He was educated in the public schools of Xenia, Ill.; was editor of the juvenile department of the New York Herald, and since 1890 has been editor of the League department on St. Nicholas Magazine. He has published: 'The Mystery of Eve-line Delorme' (1894); 'The Hollow Tree' (1898); 'The Deep Woods' (1899); 'The Great White Way' (1901); 'The Van Dwellers' (1901).

Paine, Charles Jackson, American sportman: b. Boston, Mass., 26 Aug. 1833. He was graduated at Harvard College in 1853 and entered the army as captain of the 22d Massachusetts infantry 8 Oct. 1861. He served with distinction during the Civil War; was appointed brigadier-general of volunteers in 1864; and in 1866 was brevetted major-general. He acquired a large fortune in railway enterprises, and became prominent as a yachtsman. The Puritan, Muskingum, and Volunteer, owned by him, were successful defenders of the America's cup.

Paine, Halbert Eleazar, American lawyer and soldier: b. Chardon, Ohio, 4 Feb. 1826. He graduated from Western Reserve University, Ohio, in 1845, and practised law in Cleveland until 1852, when he removed to Milwauk ee, Wis. He enlisted in the Union army at the outbreak of the Civil War, and was commissioned colonel, from which rank he rose to be brigadier-general. At Ft. Hudson in 1862, where he commanded the third division, he lost a leg, and in 1864 he was discharged with the rank of brevet major-general. He was a member of Congress 1865-71, after which he practised law in Milwaukee, and in 1888 was appointed commissioner of patents. He published: 'Paine on Elections' (1888).

Paine, John Knowles, American organist and composer: b. Portland, Maine, 9 Jan. 1839. In 1858-61 he studied in Germany, in 1862-73 was instructor in music at Harvard, and in 1875 became professor of music there. He composed the music for the 'Edipus Tyrannus' of Sophocles, as performed in the original at Cambridge in 1881; the 'Centennial Hymn' to Whittier's words for the Exhibition at Philadelphia in 1876, and the Columbus march and hymn for the World's Columbian Exposition of 1893. Among his further works are: the opera 'Azara'; 'Spring Symphony'; the cantatas, 'The Nativity' and 'The Song of Promise'; choruses to Aristophanes' 'Birds'; symphonies, poems; music to the 'Tempest'; and an overture to 'As You Like It.'

Paine, Levi Leonard, American theologian: b. Holbrook, Mass., 10 Oct. 1832; d. Bangor, Maine, 10 May 1902. He was graduated from Yale in 1856 and from Yale Divinity School in 1861. He then entered the Congregational ministry and was pastor at Farmington, Maine, 1861-69. In 1870 he became professor of ecclesiastical history in Bangor Theological Seminary and held that post until his death. He was the author of an important work entitled 'A Critical History of the Evolution of Trinitarianism and Its Outcome in the New Christology' (1900).

Paine, Robert Treat, signer of the Declaration of Independence: b. Boston 11 March 1731; d. there 11 May 1814. He was graduated at Harvard at 13, studied theology, and, going to May-plain to the New England troops in 1755, and in 1759 was admitted to the bar and began to practise law in Boston. He represented Taunton in 1768 at the convention called to discuss Sir Francis Bernard's dissolution of the general court; conducted the prosecution of Preston and his men for the Boston Massacre 1770, and the impeachment of Peter Oliver for receiving money from the king and not from the colony; served in the general assembly of the State 1773-4, in the Provincial Congress 1774-5, and in the Continental Congress 1774-8, being a signer of the Declaration and a member of various important committees. He was a delegate to the State convention of 1779, which adopted a constitution; was attorney-general of Massachusetts 1780-90; and sat as judge of the supreme court 1790-1804.

Paine, Robert Treat, American poet, son of the preceding: b. Taunton 9 Dec. 1773; d. Boston 13 Nov. 1845. His baptismal name, Thomas, was adopted in 1801 at the suggestion of his mother, that he might bear his father's name and not that of the famous deist. He was graduated at Harvard in 1792, was then in business for a time, but devoted most of his attention
to journalism and poetry. His journal, the 'Federal Orrery,' was given up after two years. His marriage with an actress in 1793 shut him out of Boston society and alienated his father. The son practised law with some success and with much brilliancy, but he soon fell into wayward courses and died in poverty. His best known poems, which were popular, but practically without value, were: 'The Invention of Letters,' 'Cambridge Day,' 'The Ruling Passion' (1797); the patriotic song, 'Adams and Liberty' (1798); and the bitter political poems, 'The Jacobinid' and 'The Lyars.'

Paine, Robert Treat, American philanthropist, great grandson of R. T. Paine (q.v.), signer of the Declaration of Independence: b. Boston 28 Oct. 1835. He was graduated from Harvard in 1858, was admitted to the bar the next year and practised his profession till 1870, when he retired. In 1879 he organized in Boston the Wells Memorial Workmen's Institute, of which he is president, and he is also president of the Workmen's Building Association, the Workmen's Loan Association, and the Associated Charities. He in 1890 created and endowed with $200,000 a charitable trust called 'The Robert Treat Paine Association.'

Paine, Thomas, American political and religious agitator: b. Thetford, Norfolk, England, 29 Jan. 1737; d. New York 8 June 1809. He was a staymaker at Sandwich, Kent, a Methodist preacher in London, a tobacconist at Lewes, Sussex, and an exciseman, before his arrival in America in December 1774. Hostilities having commenced between the mother country and the colonies, he composed his celebrated pamphlet, 'Common Sense' (1776), which was written with great vigor. The object of this tract was to recommend the separation of the colonies from Great Britain. In 1777 he received the office of secretary to the committee of foreign affairs. While in this office he began to publish a series of political appeals called 'The Crisis,' the first number of which contained the words: "These are times that try men's souls." He was obliged to resign his secretaryship in January 1779, being charged with divulging some official secrets in a controversy with Silas Deane, whom he accused of a fraudulent attempt to profit by his agency by conveying the secret supplies of stores from France. But in the following November Pennsylvania testifed her approbation of his conduct on this occasion by appointing him clerk to the Assembly. With his salary of $500 as clerk, Paine started the subscription which resulted in the establishment of the Pennsylvania Bank (later the Bank of North America). In 1785 he received $1,000 from Congress in recognition of his services during the war. He also received 300 acres of land in New Rochelle from the State of New York. In 1787 he embarked for Europe. On the appearance of Burke's 'Reflections on the French Revolution,' he wrote the first part of his 'Rights of Man' (1791) in answer to that celebrated work. The second part was published 1792, and on 21 May in that year a proclamation was issued against wicked and seditious publications, alluding to but not naming of 'Rights of Man.' On the same day the attorney-general commenced a prosecution against Paine as the author of that work. While the trial was pending he was chosen member of the National Convention for the department of Calais, and, making his escape, went to France, where he remained until 1795: King Louis XVI. he voted against the sentence of death, proposing his imprisonment during the war and his banishment to the United States afterward. This conduct offended the Jacobins, and toward the close of 1793 he was exiled from the Convention on the ground of his being a foreigner (though he had been naturalized), and immediately after he was arrested and committed to the Luxembourg. Just before his confinement he had finished the first part of his work entitled the 'Age of Reason, being an Investigation of True and Fabulous Theology.' This he confided to the care of his friend, Joel Barlow (q.v.), and it was published in London and Paris in 1794. By this step he forfeited the countenance of the greater part of his American connections. On the fall of Robespierre he was released, and in 1795 published at Paris the second part of his 'Age of Reason.' In May 1796, addressed to the Council of Five Hundred of the National Convention of the System of Finance in England, and also published his pamphlet, 'Agrarian Justice.' A third part of the 'Age of Reason' was published in 1807. Fearful of being captured by British cruisers, he remained in France till August 1802, when he embarked for America, and reached Baltimore the following October. He was buried on his own farm, but his remains were taken to England by William Cobbett in 1819. The strong part taken by this extraordinary man in religion and politics has produced such extremes of praise and execration that there exist few or no sources of unbiased information either as to his abilities or character except his writings. That he possessed much native vigor of intellect is indisputable, and he was master of a spirited argumentative English style. But much of his work, particularly the 'Age of Reason,' was unscientific, and his attacks on religious beliefs were ill advised. He was not, however, an atheist, as has been popularly believed. His services to the cause were lasting and important. The political pamphlets, letters, and addresses of Paine are numerous, and may be found in the collective editions of his works. Conway published an excellent edition of Paine's work in 1893-6. The 'Life of Paine' by the same author, published in 1892, is the standard one. Consult his works edited by M. D. Conway in four volumes (1894-6) and Conway's life of Paine (1892); also Tyler, 'Literary History of the American Revolution' (1896).

Paine, William H., American engineer: b. Chester, N. H., 27 May 1838; d. Cleveland, Ohio, 31 Dec. 1890. He studied civil engineering, engaged in surveying in Wisconsin, and in 1849 surveyed a wagon road over the Rocky Mountains. He was appointed captain of engineers on the staff of Gen. McDowell in 1861, and was later with the Army of the Potomac, where his services were of much value. He assisted in the construction of the Brooklyn Bridge, for a time exercised entire supervision of the work, and from the date of its completion until 1889 was consulting engineer. The
PAINESVILLE—PAINT INDUSTRY

construction of cable railways in various cities occupied him during his later years.

Painesville, the buzz-oil, Ohio, city, county-seat of Lake County; on the Grand River, and on the Lake Shore & M. S., the Pittsburg & W., and the New York, C. & St. L. R.R.'s; about 25 miles east by north of Cleveland and three miles from Fairport, on Lake Erie. It is in an agricultural region, in which there are extensive deposits of fire-clay. Its chief manufacturing establishments are flour mills, machine shops, brick machine works, vencer machine works, and foundries. It has considerable commerce on account of the fine harbor and large ore docks at Fairport. Lake Erie College, opened in 1859, the public schools, a public library, which contains nearly 6,000 volumes, are the educational institutions. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 4,755; (1900) 5,024.

Paint consists of colors or dyes so mixed with oil, linseed or water, as to spread easily over a surface, and retain its brilliancy after drying. It is usual to add a dryer, and a solvent or thinner to paints before using them. The vehicles employed in painting are various, but the principal oil used in oil-painting is that which is obtained from flaxseed. This linseed oil is purified by settling for about four months in tanks with a temperature of 70° F. No oil but this more freely absorbs the oxygen of the air, by which it hardens into what is termed linolxyn. Tong oil or Chinese wood oil, which absorbs oxygen to about the same degree is unfitted in other respects for use in writing pigments. Dryers are employed to harden the painted surface, by which the dust with which the atmosphere is charged. They take in oxygen from the air with great rapidity, while the air takes up the damp oil. To make a successful dryer, lead and manganese compounds are dissolved in oil, which the paint is suspended in. They absorb oxygen from the air, and transfer it to the oil, which thus becomes solidified. The opposite agents to these dryers are the solvents, the best of which is turpentine. The advantage of using turpentine is that it is cheap, it keeps the paint long enough moist to allow of the brush marks sinking and flattening out into a smooth surface. Benzine, which is sometimes employed as a solvent, evaporates too rapidly, and leaves the surface uneven. Paints can be rendered to a high degree fire-proof by mixing with them boric acid or a soft and readily fusible glass. The heat melts the boric acid or the glass which forms an air-proof sheath to the wood or other substance so painted, and thus protects them pretty efficiently from the flames. Paints vary in the length of time for which they preserve their lustre, and it is absolutely necessary for the artist to select those which are known to be most permanent. The most permanent of blues is ultramarine, while Prussian blue and indigo are apt to fade. Cobalt, however, is the most lasting of all blues. Among the reds the only really unchanging colors are vermilion and the cobalt shades. All cinnabar lakes are likely to fade, the last two very rapidly. Oxide of chromium and terre verte are the only permanent greens; Naples yellow, raw sienna, cadmium, and yellow ochre the only stable yellows. Madder brown and Vandyke brown will fade, but raw and burnt umber and burnt sienna retain their tint forever. All the known blacks and whites are durable excepting when the latter are adulterated with chalk or other impurity. See COAL TAR COLORS; COLORING MATTERS; DYES; LUMINOUS PAINT; MINERAL COLORS.

Paint, Oil, and Varnish Industry, in the United States, had its genesis in a mill for the manufacture of linseed oil established in New York city in 1715. Three years later John Pratt, Jr., erected a similar factory in Connecticut. In 1786, four oil-mills were in operation in Lancaster County, Pa. The rapid growth of the linseed-oil industry had not been without its effect in stimulating the use of paints. By 1795 the use of paint had become common. In the towns even the ordinary householder used paint about his dwelling. If he was too poor to indulge in the luxury of an outside coat, the interior woodwork, at least, was painted, and the churches and public buildings all showed the work of the painter. The white house with green blinds was then and for many years afterward the single type of ultra-aesthetic decoration. The introduction of more tasteful colors and shades and more harmonious tints began early in the 19th century, but their general adoption as seen in present effects is still a comparatively recent matter.

The first successful attempt to manufacture white lead in the United States was made in Philadelphia by Samuel Weatherill in 1804. Red and white lead were made by him of as good quality as that imported, and other manufacturers of these products soon followed him. In 1806 color making was begun experimentally by Anthony Tiemann, who regularly started in the manufacture in 1807. His first products were rose pink, Dutch pink, French green, and blue. The manufacture of Prussian blues was begun in 1809, and in 1820 chrome yellow was added to the products of the firm, which was the first made in this country by William Guest, of Baltimore.

Meanwhile by 1811 there were 22 different colors of paint being made in Philadelphia, while three small red lead factories in Pittsburgh and first west of the Alleghenies, were turning out annually a product valued at $13,000. Chrome paints of the first quality commanded in the early days $3 a pound, and their manufacture was a profitable one. Extensive deposits of chromic iron discovered in Chester County, Pa., gave an added impetus to paint grinding, and its growth was strong and steady. The succeeding decade saw the industry firmly established in New York. By 1820 there were extensive works in Brooklyn and New York producing red and white leads, chrome and other colors, while a factory in Rensselaer County, N. Y., was turning out annually $4,500 worth of Prussian blue. This establishment used the shavings of leather in obtaining its color, after the process described by Dr. John Pennington in 1790. Factories in Albany, Boston, and other cities, as well as the extensive establishments in Philadelphia, showed the progress the paint industry had established itself at this time, and the next 20 years brought the natural and resultant development not only of this but of the related manufactures of varnishes and oils.
PAINTED QUAIL — PAINTING

Prior to 1828 all the varnish consumed in this country was imported. Its use, while less common than that of paint, was nevertheless sufficiently general to recommend it to manufacturers as a profitable product, and accordingly the first establishment for making it was founded by P. B. Smith, New York city, in 1828. In 1830 the second factory was established by Tilden & Hurlbut, and was the first permanent concern in the business.

The first importations of gum copal, direct from Zanzibar and the west coast of Africa, were largely used by Tilden and Hurlbut, and this firm was the first to export American varnish, they consigning a quantity to South America and Mexico in 1836. The quality of the American goods proved so exceptional that they not only competed with, but to a great measure supplanted, the importations of the European manufacturers. The stimulation of a heavy foreign demand joined to increased domestic consumption so augmented the business that the matter of obtaining supplies of the gums used became of great importance. In 1851 such quantities of these raw materials were being used that the manufacturers began the establishment of the system of direct trade relations with the west of Africa.

The growing importance of both the paint and varnish production of the country had meanwhile directly affected the oil mills. Until 1850 these mills used only home-grown seed, and a capacity of fifty bushels a day was a very fair average output. Under the increasing use of linseed-oil new methods were found necessary, and the firm of J. & L. K. Bridge, of Brooklyn, in that year imported the first cargo of flaxseed from Sicily. Odessa, Alexandria, and, in 1846, Calcutta were successively opened as supply points of this rapidly increasing trade.

In 1850 the paint industry in this country entered upon a new era. The zinc deposits of New Jersey, opened in that year, gave an adequate and cheaply worked supply of ore from which the oxide could easily be reduced. This zinc oxide, in the form of a white powder, had been discovered since the last decade of the preceding century as a valuable substitute for white lead as a body for paints. It had up to this time, however, received little attention, owing to the restricted amount available for the market. The American manufacturers seized upon the opportunity to make experiments in this direction, and its use since has been general. Several mines were immediately opened, and the ore reduced and turned in a furnace, where resultant white and powdery zinc oxide floated upward, was caught in bags, pressed, and sold to the paint manufacturers. Mineral paints, too, made from different earths, came into prominence at about this time, much being claimed for their fire-proof and indestructible qualities.

Of the chemical and technical discoveries and appliances by which new colors, finer and more delicate shades, the bright and vitrifiable pigments of the decorative potter and art-tile manufacturer, and the paints of the artist, either in oil or water-color, have been produced it would be tedious to the general reader to speak. The art of mixing colors to produce the almost innumerable tints of to-day has developed with the increased volume and discriminating demand of the trade. The first paints ready for use were made in 1832. They were tinted colors in paste form. To-day almost every conceivable shade of color is found thus prepared in hermetically sealed cans.

About 1857, D. F. Tiemann & Company, who had succeeded Anthony Tiemann, made carmine from cochineal, a monopoly therefore held by France. In 1860 they made a blue soluble in water for laundry use, and free from acid, that previously made having been a mixture of ordinary Prussian blue and oxalic acid. In 1880 they established, also, the manufacture of quicksilver vermilion, which had previously been monopolized by England. The manufacture of oil and varnish meanwhile proceeded along the same lines and in response to causes similar to those affecting the paint industry. By 1860 there were three varnish factories west of the Alleghanies, and many in the Eastern States, while its consumption was steadily increasing both at home and in the foreign trades. Since then its growth in importance and extent has been steady and rapid. The oil, paint, and oil interests of the country have come during late years to certain centralizations of management, tending to greater uniformity and economy. In oils, of which lead still remains one of the most important, but this movement has resulted in the formation of the National Lead Company, which controls the greater part of the output of white lead in this country. In itself this company includes an operation of its own oil-managing mills, as well as the lead factories proper, and with a capitalization of about $30,000,000 is the largest single interest in the paint business, although there are many great individual firms equally prominent relatively to their output. There is also a large interest concerned in the import branch of the paint and color trade, who handle foreign earths, leads, and mixtures.

American colors are found in many foreign countries, and the trade is one that will grow. From a total exportation of only about $20,000 in 1835, the shipments sent abroad in 1900 amounted to over $1,000,000. See LINSEED OIL.

Painted Quail. See Quail.

Painted Terrapin or Tortoise. See Turtle.

Painting, in the fullest meaning of the word, signifies the application of color to any surface, for the purpose of making it more attractive to the eye, or as a preservative of the substance painted, but in this article the word is restricted to the art of painting, that is, the art of representing objects, real or imaginary, on a flat or nearly flat surface by the use of designs in line and color. The origin of this art, like that of several others known to civilization, is lost in the mists of those prehistoric ages on the banks of the Nile, which the researches of modern Egyptologists have pushed back, apparently, to the distance of 80 centuries. Some few traces of it among the unknown autochthonous races who preceded the long lines of the dynasties of the East, the Pharaohs, has been recently assigned to their proper sources; the art of the dynasties of the Pharaohs and the Ptolemies, notwithstanding their duration by centuries, presents certain striking characteristics which distinguish it from all others. It was strictly a conventional and symbolic art, largely
an official art, devoted to the service of the monarch and of religion, and, within these limits, a decorative art. Sculpture was subservient to architecture, and painting—except on the walls of the temples and in the papyri—to sculpture. Our knowledge of painting is derived from the very numerous examples preserved on the walls of the temples and the tombs, on the mummy cases and the sarcophagi, on the funeral tablets, and the illuminations and vignettes on papyrus and linen. The conventions in which the art remained bound—with but few exceptions—were established in the earliest ages; they embraced all design, religious and secular, requiring that human figures and those of animals should be represented in profile, defined by an outline, and in flat color; for landscape and architecture there was adopted a curious and ingenious combination of drawing, both in ground plan and in elevation, to express the scene in the simplest and clearest manner possible. The background was left blank, or filled with a flat tint; the required lucidity and directness of expression forbade the use of linear or aerial perspective, or any attempt at modeling or the rendering of depth of color. On the inner and outer walls of the temples the outlines were incised, sometimes very deeply, the figure within these outlines frequently rounded down to the bottom of this incised outline; on the profile of the tombs the outlines were placed that outline with one made by his brush. He worked directly on a coat of white stucco, applied over a rough-cast to conceal the joints and the roughness of the masonry wall; of colors—derived mostly from mineral sources—he had, at the most flourishing period of the art, as many as 18 or 20, as we know from wooden palettes of the 18th dynasty, which have been found. These colors were mixed with water and gum tragacanth, possibly with honey; some mummy cases of the later dynasties have been painted in encaustic, and in some cases the eyes and eyebrows of the mummy masks are in enamel. These colors have retained their brilliancy to a remarkable degree through the ages; very few of the paintings are eroded. The artist worked with brushes of reeds or rushes, the ends of which were soaked in water until their fibres separated, and they were adapted to the finest and most delicate work. In the papyri—as in the many hundred copies of the Papyrus of the Dead extant—the illustrations stretch along the top of the page, like head-pieces, or are inserted as vignettes, or initials, or full-page pictures. In many cases they are merely outline sketches in black or red. In general, figures of men are colored a dull red and those of women a light yellow, the gods and the genii of the dead may be of positive greens and blues, and the animals are frequently spotted. The colors are always pleasing and harmonious, and on the largest wall spaces a comprehensive and well sustained color-scheme is frequently found, designed and carried out with true artistic skill. On the outer walls, exposed to full sunlight, and in the deepest recesses of the tombs, the colors are most vivid; in the intermediate chambers of the tombs they are more quiet and discreet, to suit the tempered light. (See EGYPT.)

**Greek and Roman Painting.**—In the middle of the 6th century B.C. the art of painting was technically no farther advanced than that of Egypt or Assyria. Greek writers speak with the same enthusiasm of the works of their great painters as of those of their sculptors, but it is only by these descriptions, and by some supposed copies and adaptations in the work of the craftsmen, mural painters and mosaicists, of the decline of the art under the Roman domination, that we can form some definite conception of these masterpieces. It is noticeable that the rhetoricians are especially impressed by the ability of the painters to represent objects so naturally as to mystify the spectator. The development of the art through its various phases can be fairly well traced in the wall paintings discovered in Etruscan tombs; it practically embraced all subjects, mythology, history, scenes from daily life, landscape, marines, portraits, animals, tragic and satirical representations, still-life, ornament and decoration, and miniatures. Composition, order, linear and aerial perspective, chiaroscuro, a knowledge of the human figure extending to foreshortening, action, expression by gesture and by countenance, all were included. The color work was even extended to the tinting or painting of statues (though there seems to have been a certain amount of blue, and parts of their marble statues) and to the moldings, triglyphs and other ornaments of their architecture. Praxiteles (q.v.) when asked which of his works in marble he valued the most, replied: "That one which Nikias (the painter) has set his mark." In Pompeii, the painted portions of the temples are always finished in stucco or plaster. Portrait painting was apparently more in favor among the Romans than among the Greeks. The long series of painted vases—from the earliest examples of the "Pelasgic" or pre-Homeric period down to the disappearance of the art about 65 B.C.—was but one of the features of this comprehensive school of painting. The only examples of easel pictures which have been preserved are a few small paintings on marble and slate, found in Herculanum and in Etruscan tombs. Apelles introduced the use of a glaze or varnish over the completed tempera painting. In the latter, the colors were tempered with a glue, a gum, honey, white of an egg, juice of the fig, milk, or other glutinous substance, soluble in water, that served to bind them; or with wax or some resin, which blended with the asphalt of the Dead extant—the illustrations stretch along the top of the page, like head-pieces, or are inserted as vignettes, or initials, or full-page pictures. In many cases they are merely outline sketches in black or red. In general, figures of men are colored a dull red and those of women a light yellow, the gods and the genii of the dead may be of positive greens and blues, and the animals are frequently spotted. The colors are always pleasing and harmonious, and on the largest wall spaces a comprehensive and well sustained color-scheme is frequently found, designed and carried out with true artistic skill. On the outer walls, exposed to full sunlight, and in the deepest recesses of the tombs, the colors are most vivid; in the intermediate chambers of the tombs they are more quiet and discreet, to suit the tempered light. (See EGYPT.)

**Greek and Roman Painting.**—In the middle of the 6th century B.C. the art of painting was technically no farther advanced than that of Egypt or Assyria. On the outer walls, exposed to full sunlight, and in the deepest recesses of the tombs, the colors are most vivid; in the intermediate chambers of the tombs they are more quiet and discreet, to suit the tempered light. (See EGYPT.)
instrument, a spatula or cestrum (generic name cautérium), at times used very hot. The same instrument is used to finish the painting by taking, while still hot, cold wax colors and blending and grading them into the painting. The colored sticks of wax and resin, softened by the addition of an oil, may be applied from a hot palette with a brush and then melted and modeled with the cestrum. The same sticks, softened by the addition of an oil, may be used directly, like crayons of pastel; or, when dissolved in an essential or volatile oil, applied with a brush; but these two methods, not involving the use of heat, are not, strictly speaking, encaustic painting. In all cases, the ancients prepared their wax very carefully before painting, the final surface receiving a firmness and consistency almost equal to that of marble. Their colors were almost exclusively mineral, the only animal substance known being the slimy matter of the octopus, mixed with chalk,—this purple unknown to the modern palette.

Byzantine and Early Medieval.—The influence of art on that of the early Christian Church is long in disappearing, notwithstanding the wide-spread heretical tendencies of the new religion. Inheriting the Jewish aversion to idolatry, and to works of material imagery, the Fathers of the Church declared against all artists,—Tertullian denounced them as persons of iniquitous occupation. The painting and decorations in the Roman catacombs—rediscovered at the end of the 16th century,—especially those in the earliest centuries, bear a great resemblance to the ancient wall paintings. Orpheus playing on his pipes reappears as the youthful and beardless Christ surrounded by his sheep, and Hermes Kriophoros, carrying a ram on his shoulders, as the Good Shepherd. The bearded type of Christ, with which we are familiar, was not generally adopted till later, in the earliest mosaics. As the Church increased in numbers and power the primitive prejudices disappeared, but early Christian painting shared in the puritanical tendencies of the art of the Empire. Occasional efforts were made by the emperors to check this decadence, by Constantine and by Valentinian, Valens and Gratian in the 4th century; and in the 5th, by Theodosius. The style, in which we are familiar, was nearly all destroyed,—very largely by confabulations. Our insufficient knowledge of the early mediæval painting is principally derived from the mosaics, the most important being at Ravenna and Rome, and from the miniatures and the illuminated manuscripts. In Byzantium, the mosaic wall decorations were not confined to the churches but were also employed to celebrate the deeds and the power of the monarchy, as in the Chalke, the great state hall of Justinian’s palace. With the establishment of the Lombards in Italy, the ideals, the freedom and spirituality of both the Church and its art, fell into even stricter bondage. The subject of the Crucifixion first appears in painting in the latter part of the 6th century, the figure of the Saviour frequently clad in a long purple robe, and sometimes wearing a regal crown. The classical period of early Christian art came to a close with the outbreak of the Iconoclastic schism, in the beginning of the 8th century.

The mediæval style was formed by the gradual union of these classic traditions with the hereditary form of barbarian painting. The colored sticks of wax and resin, softened by the addition of an oil, may be applied from a hot palette with a brush and then melted and modeled with the cestrum. The same sticks, softened by the addition of an oil, may be used directly, like crayons of pastel; or, when dissolved in an essential or volatile oil, applied with a brush; but these two methods, not involving the use of heat, are not, strictly speaking, encaustic painting. In all cases, the ancients prepared their wax very carefully before painting, the final surface receiving a firmness and consistency almost equal to that of marble. Their colors were almost exclusively mineral, the only animal substance known being the slimy matter of the octopus, mixed with chalk,—this purple unknown to the modern palette.

Later Mediæval-Gothic.—It was in France that Gothic architecture took its origin; and there, too, that the other arts took the lead in Europe, in painting gradually escaped from the domination of the priestly order; the painters became specialists, working exclusively at mural paintings,—particularly so in the northern countries. Hence, a certain growth of individuality of conception, a tendency toward selectness of subject and an attempt at realism, including study from nature,—the whole, as yet, much hampered by tradition. After the middle of the 14th century there appeared very definite signs of an appreciation of the full capacities of the art of painting and serious attempts to realize them. In this art, including miniature painting in books, France took the lead, as she had done in architecture. The development of Gothic architecture, as it diminished the spaces for wall paintings greatly increased that of the windows, and thus gave a great impetus to the noble art of glass painting (q. v.). In the 14th century, distinct schools of painting were established, in the contemporary capitals of Prague, of Cologne, of Westphalia, etc., and even the names of individual artists become known; the panel paintings of the French and the Flemings bear a general resemblance to those of the Lower Rhine; but in Italy the art, both in conceptions and in technical methods, followed distinct national lines,—preparing the way for the Renaissance. Foremost among these precursors were the Tuscan, Niccola Pisano (q. v.), the sculptor, and Giovanni Cimabue (q. v.), the painter. The first great epoch in modern painting is considered to have been that signaled by the mature works of Giotto di Bondone (q. v.) (1276-1330), a pupil of Cimabue, who was acclaimed by his contemporaries as the greatest genius in the arts of Italy. To their astonished eyes, Giotto’s power of presenting objects naturally was so great that “the thing itself” was reproduced. With this he combined a great command of the arrangement and execution of monumental mural painting, and a freedom from the traditions both of the Byzantine manner and the Northern Gothic, while reproducing in his works many of the decorative ideas of the ancients. Chief among his followers was Arena di Cione (q. v.), called L’Arcagnuolo, or, in the contracted form, Orcagna. The painters of the school of Sienna ranked almost in importance
with those of Florence; and in the Campo Santo of Pisa are still preserved some of the greatest monuments of fresco painting, executed by various artists, of this closing period of the Middle Ages.

China and Japan.—The technique of the art of painting in China and Japan is founded primarily on the caligraphic dexterity which was the chief ideal of the older Chinese painters and their Japanese followers, and which is still held in high honor. The ancient art of hand-writing was based upon a system of representing or symbolizing the thing indicated, and both it and the art of painting were fettered by traditions that were as binding as those of Egyptian art. Linear design has remained the important element even in painting, the outline being always retained. As an art primarily decorative and suggestive, and not realistic, its fundamental principles differ widely from those of all the European schools. The Japanese themselves compare their art of painting—which they consider the richest and most important, the most intimate expression of the national character—to "sketching."

(La peinture japonaise a la caracter d'une esquisse, says the official work published by the Japanese Imperial Commission at the Exposition Universelle of Paris, 1900.) As a sketch, or, rather, as a work in which only the essentials are retained—appealing to more artistic and more intelligent taste than to the finished realistic picture,—these paintings dispense with careful definition, with chiaroscuro and perspective, qualities neglected by both the Chinese and Japanese masters in their search for idealistic design and decorative feeling. The care bestowed upon the line leads to a very skilled characterization and suggestiveness in design,—marred by the limitations and conventions of both national arts; the generally tempered and restricted color-scheme permits of the most subtle and beautiful tones, and of a very artistic rendering of aerial perspective in the landscapes, especially in the Japanese. The painter does not hesitate to leave his canvas or his paper untouched in spots so as not to concentrate on a single principle or motif; he is in search of an abstract beauty, not of that of the individual—in accord with the Buddhist principle of the social development rather than of that of the individual. This is perhaps the reason for the absence of true Buddhist school, which is distinguished from the works of the secular artists by certain distinctive qualities. In China, notwithstanding the number of epochs which the art of painting has traversed and the varying influences to which it has been subjected, it has retained throughout a general unity of principles. The Japanese claim that in deriving their art from the Koreans, the Chinese and the Hindus, they have bettered their designs and given their own style to the art,—a greater charm and subtlety of line, a greater delicacy and beauty of tone in the color. Both nations refer the origin of their art to a legendary era, the Japanese claiming 13 centuries of duration, and the Chinese historians ascribing the invention of painting to Che-hoan-min, minister of the Emperor Hoang-ti, in the 27th century before Christ, contemporary with the introduction of writing by Tsang-hie—these two persons being discovered by some authority to have been identical. No satisfactory record of an individual painter, however, appears before the 3rd century A.D., nearly 200 years after the introduction of Buddhist pictures and images from India. According to an ancient Japanese writing, the history of pictorial art began in that country with one reigner, Yurikau (457-479 A.D.), introduced by a Chinese painter of royal descent, Nanriu or Shinki. It is probable that Japanese art took its real birth at the period of the introduction of Buddhism in the middle of the 6th century.

Persia and India. It was from China that Persia originally derived the arts of architecture, painting and ceramics; for the second of these, the general principles and the technical methods, even to the vellum upon which the paintings were executed, were Chinese. Later, many of the elements of the art were adopted from that of the Arabian Caliphate, an art which had been born in Egypt and developed in Syria. Under the dynasties of the successors of Genghis Khan (1190-1335 A.D.), painting in Persia assumed definite forms and characteristics; indeed, it is asserted to have been borrowed from Turanian, Dravidian, Greek, Sassanian, Mongol, and European sources. During the Moslem domination its influence was extended to India, where it succeeded the native traditions. The art of the two countries under the Mongol emperors was practically the same; in both, the ancient mural paintings having almost completely disappeared, it is preserved only in the miniatures. Modern Hindu painting and sculpture are both in lamentable decadence; the former, never having even undertaken to represent nature, is content with traditional and decorative formulas.

For painting of Europe after the close of the Medieval epoch, see RENAISSANCE PAINTING: POST-RENAISSANCE PAINTING.

PAIRING—PALEOBOTANY

Pairing, in legislative and other assemblies, a practice by which two members belonging to opposite parties or factions agree that both shall be absent for a specified time, or that both shall abstain from voting on a particular question. Thus a vote is nullified on each side. The terms pairs and pairing-off are also frequently used.

Paisley, pāz’il, Scotland, a manufacturing town of Renfrewshire, on the White Cart, about three miles above its confluence with the Clyde, and seven miles west-southwest of Glasgow. It consists of an old town on the west or left, and a new town on the east or right bank of the river, communicating by three handsome bridges. The most noteworthy building is the restored Abbey Church of a monastery founded in 1163 by Walter, son of Alan, the first of the house of the Stewarts. Other noteworthy edifices are the new county buildings, the old county buildings and prison, a quadrangular pile in the castellated style; the town-hall, an imitated building in the classical style; the Neilson educational institution; the buildings containing the free library and museum; the Coats Observatory, and the Coats Memorial Church (Baptist). Paisley has been long noted for its manufactures, especially of textile goods. The shawl manufacture, introduced about the beginning of the present century, and long a flourishing industry, is not now a staple, but the textile manufacture is still large, though the chief industry is that of sewing cotton, for which Paisley is celebrated all over the world. Wilson the ornithologist, the poet Tannahill, and Prof. Wilson (Christopher North) were natives of Paisley, who possesses a bronze statue of the ornithologist and of the poet. Paisley, the mediæval Paisleth, is a town of ancient origin, having been at one time a Roman station under the name of Pædura. Pop. (1901) 79,355.

Paixhans, Henri Joseph, ön-rē zhō-zēf pāk-sāⁿ, or pāk’anz, French general: b. Metz 22 Jan. 1793; d. Jouy-aux-Arches 19 Aug. 1854. He entered the artillery after being graduated at Polytechnic École Polytechnic, fought under the Empire with great bravery, especially at the siege of Paris in 1814, and in 1848 became division commander. From 1830 to 1848 he was a member of the House of Deputies. Paixhans invented a howitzer called by his name, which carried hollow shot and conically pointed shells, also of his invention. His later years were particularly devoted to the improvement of floating batteries. He wrote several valuable works on army and navy ordinance.

Paixhans Gun. See Ordnance.

Pakawa, pā-kā-wā’. See Pinto.

Pakenham, pāk’n-am, Sir Edward Michael, British soldier: b. County Westmeath, Ireland, 19 March 1778; d. near New Orleans, La., 8 Jan. 1815. He was a lieutenant in the British army in 1794 and served with distinction under his brother-in-law, the Duke of Wellington, in the Peninsular and French campaigns. In 1814, after the death of General Ross at Baltimore, he was appointed to the command of the British forces there. He led the expedition against New Orleans, whose forces were defeated by Gen. Jackson, and was killed in battle 8 Jan. 1815. See New Orleans, Battle of.

Paleobotany, or Fossil Botany, the branch of palaeontology which treats of fossil plants. Under this term is included the study of all dead vegetable matter which has become fossilized or has left its traces in any part of the earth's crust or in its superficial deposits. History.—Fossil remains of vegetation, in the form of petrified wood, were described centuries ago by writers on natural history, and leaf impressions were described and figured by Johann Daniel Major, in his 'Lithographia curiosa, sive de animalibus et plantis in lapides versis,' published at Jena in 1664, and by Eduard Lhwyd, in his 'Lithophylicae Britannicae Ichnographia,' published at London in 1699, but it was not until the early part of the 19th century, when Baron von Schlotheim issued his 'Abhandlung über die Kräuter-Abdrücke im Schieferthon und Sandstein der Steinkohlen-Formation,' and his 'Beschreibung merkwürdiger Kräuter-Abdrücke und Pflanzen-Versteinerungen, ein Beitrag zur Flora der Vorwelt,' at Leipzig in 1801 and Gotha in 1804 respectively, that the study of fossil plants was placed upon a scientific basis. Since then the subject has received constantly increasing attention, and it is now regarded as co-ordinate in importance with palaeozoology, in interpreting the age or the succession of geologic formations, or in discussing the evolution of allied living organisms.

Principles.—The study of the extinct flora of the earth has shown that our living flora has been evolved from simple forms, low in the scale of life, through forms successively higher and more complex. Some reached a maximum of development far back in geological time and then retrograded or became extinct, while others have continued their upward development to the present day. The period of maximum development of any type is known as the "age" of that type, and thus it is possible to divide geologic time as a whole into a succession or serials of plant ages and to designate each age by the name of the particular type of vegetation which was predominant at that time. Such a series, based upon the known facts of paleobotany, would be indicated in the preceding table.

In a similar manner other subdivisions of the vegetable kingdom could have their respective "ages" indicated and the table could be
PALEOBOTANY

made to show when each family, order or class of plants was in the ascendant.

The general character or facies of any fossil flora will always determine the time division to which it belongs; the identification of a few of its component genera is sufficient to determine the period, and the identification of certain typical genera or species will determine the exact or approximate stratigraphic position of the particular floras. Notable or characteristic periods in which they occur. It is the recognition of these facts which has led to the acceptance of the broad principle that "great types of vegetation are characteristic of great epochs in geology, and it is impossible for the types of one epoch to occur in another."

The above principle, however, requires a modified application when floras of widely separated localities are under consideration, for the reason that evolution has not always maintained a uniform rate of progress in all parts of the world. In some localities it has been more rapid than in others, hence the same types may occur at the same time in different parts of the world, but not in such a way that they are not quite contemporaneous; but the order of sequence of types, in all localities, has always been found to be the same.

Botanical Development.—On theoretical grounds plant life is assumed to have preceded animal life, not only for the reason that the latter is dependent upon the former for its existence and sustenance, but also because plants are lower in the scale of life than animals. The evidence of existing under conditions which would be fatal to the latter. If the nebular hypothesis is accepted for the origin of our earth, there must have been a long period of time when its land and its waters were at a temperature too high to admit of the existence of any kind of life; but we know that some of the lowest forms of vegetation, represented by the lower thallophytes, can and do live in water at a temperature which is fatal to all other forms of life, hence it is assumed that these were the first to appear. This assumption is also strongly emphasized by the fact that the earliest recognizable fossil forms are thallophytes. Exactly what the primitive vegetation of the lower Palæozoic could be, we cannot determine, for the reason that its remains were either entirely obliterated, or so altered, by the metamorphism to which all the older rocks were subjected, that its original characters are lost. Its former existence, however, is indicated by the presence of carbon, in the form of graphite, in these rocks, and graphite is known in numerous instances to have resulted from the metamorphism of coal derived from vegetation.

Thallophytes.—The microscopic size of the lower thallophytes and the cellular structure of the others are factors which would make them poor subjects for preservation, and their comparative scarcity may be the result of selection. The schizophytes, representing the agencies of disintegration and decay, must have been present at the very beginning, but their assumed existence is purely theoretical. Fungi also play a very important part in fossil vegetation. A few of the woody forms have been recognized and they are also represented by thallus and mycelium fragments, and presumably by certain indications of disintegration, in the tissues of higher plants, notably in those of the Carboniferous Period, and by spots or other markings on leaves, bark, or wood, from more recent formations. About 400 species, included in about 70 genera, have been described. The lichens are also but little known as fossils, and such as have been described are fragmentary and unsatisfactory. They consist mostly of flakes, attached to pieces of fossil wood, or enclosed in amber, and have not been recognized in strata older than those belonging to the Tertiary Period. Such they had become well established abundantly represented by casts, tracings, and markings of various forms, and occasionally by the remains of the stems, when they were of sufficient consistency for preservation. Many of these forms, originally described as algae, are exceedingly problematic, and very closely related to subsequently shown to be mere inorganic markings or to be due to the tracks, trails or burrows of animals. Even if all the doubtful forms are eliminated, however, a sufficient number remain to demonstrate their existence at least as far back as the Cambrian Period, and they are represented in the rocks of every succeeding period. The diatoms are most abundantly represented, and they are also the most perfect representatives of the thallophytes, by reason of their siliceous tests. They occur from the Cretaceous Period upward, forming beds of "tripoli," in various parts of the world, notably at Bilin, in Bohemia, and Richmond, Va. These genera are largely the same as those now living. The Characeae have been identified, by means of their fruit cases, in rocks of Devonian age in North America, and also by stem fragments in those of the Jurassic and later periods.

Bryophytes.—Mosses and liverworts are but sparingly represented as fossils, and are practically unknown except in Tertiary and more recent deposits. All that have been identified are either the same or very closely related to living species. Peat is largely composed of the remains of mosses, mostly belonging to the genus Sphagnum.

Pteridophytes.—The ferns, and their allies, lycopods and equisetums, compose the most interesting of any group of fossil plants. They had their origin far back in geologic time, probably in the Lower Silurian (Orдовикian) Period.

In the Devonian Period they had become fully established and their maximum of development was reached in the Carboniferous, at which time they probably formed at least 75 per cent of the entire flora. After that they steadily declined, not only in numbers but also biologically, and their present living representatives are mere degenerate descendants of the gigantic forms which preceded them. The ferns certainly began as far back as the Devonian Period, and probably earlier. They are the best known of all the fossil plants, and were the first to receive serious attention and study from palæobotanists. This was largely due to their extensive representation in connection with the coal of the Carboniferous Period and their occurrence as an incident of mining operations, through which they were being constantly brought to light. They probably contributed 50 per cent to the entire flora of that period, but this proportion declined to about 30 per cent in Mesozoic time and in Neozoic to about 5 per cent. In general appearance the Palæozoic forms differed but little, except in size, from those of today, and many of the Mesozoic forms were apparently identical with living genera, while
some Tertiary species are hardly to be separated from living ones. Equisetums, or plants very closely related to them, are definitely recognized in rocks of Devonian age and, like the ferns, they rapidly developed in the Carboniferous Period. These Palaeozoic forms are represented by the extinct genera Calamites, Calamodendron, etc., the genus Equisetum not appearing until later on, in Mesozoic time. The lycopsods probably had their beginning as far back as the lower part of the Upper Silurian Period, and reached their maximum of development in the Carboniferous, at which time they were, next to the ferns, the most important element in the flora. Their gigantic trunks and limbs are known under the generic names, Lepidodendron, Lepidophloios, etc. These genera became extinct at the close of Palaeozoic time and were succeeded by others closely related to or identical with the living Lycopodium and Selaginella. Other types of doubtful botanical relationship, but apparently closely related to one or another of the above groups, were the genera Sphenophyllum and Sigillaria. No rhizocarpous are known, to a limited extent, as fossils; but like their living representatives are small and inconspicuous. Well preserved species of Salvinia have been found in rocks of Cretaceous and Tertiary age and remains of questionable relationship in rocks considerably older.

Spermaphytes.—The time of origin of this sub-kingdom of plants is more or less obscure, but it probably dates as far back as the Upper Silurian Period, and there are sufficiently known about these plants, as well as concerning the development of the vascular system. It is also known that this development or phylogeny follows very closely the modern conceptions of the interrelations, or taxonomy, of plant-life as it now exists, and it is significant that all the changes which have been made in the time in taxonomic arrangement have constantly brought it closer and closer into harmony with the known facts of phylogeny, until, at the present time, all scientific systems of classification are based upon the principle of evolution from lower to higher forms, and nearly all catalogues or lists of plants and manuals or text-books of botany are arranged in accordance with this principle. Palaeobotany has thus been of great assistance to botany in placing it upon a sound and philosophic basis.

The demonstration of the fact that the vegetation now in existence is merely the remnants of that which formerly existed, has been clearly shown, not by making the discovery, or at least in throwing a flood of light upon, many of the problems that puzzled the early botanists. Wide gaps between living genera were bridged by the discovery of extinct forms, and isolated or monotypic genera, such as Liriopedron, of which our tulip tree is the sole living representative, Sassafra, which also contains but the one species, etc., were shown to have been composed, in the past, of a large number of species, and that the present generic isolation is due to the extinction of all but one of their former component species. Many of the apparent anomalies in connection with the geographical distribution of certain living plants have also been cleared away, by the discoveries of palaeobotany. A number of genera, for example, are known to be restricted to the two widely separated regions of Eastern Asia and Eastern North America and impossible theories of migration were proposed in order to account for such phenomena, until the fossil representatives of the genera were found, and the fact was demonstrated that they were once of world-wide distribution but have become extinct in the intermediate regions. The presence of abnormal or apparently useless organs in living plants has also been explained on the theory of atavism or
PALÆOGRAPHY

reversion to former ancestral characteristics and
the changes in form through which all plants pass
to maturity frequently
been shown to be identical with, or closely
similar to, ancestral changes in the development
or evolution of the types to which they belong. These
and numerous other phenomena would have been
impossible of rational explanation
without the aid of the facts made known by
palæobotany.

PALEOGRAPHY
(Gr. χαλαστος, old; γραφειν, to
write), the science of ancient handwriting. It
is occupied with the materials, the characters
and use of written documents with a view to
determine their origin, date, authenticity and place
of production. As a general term palæography proper includes neither epigraphy nor
diplomatics. Epigraphy is the science of inscriptions found on stone, metal or pottery. Diplomatics is concerned only with legal documents, and although it perhaps gave the first impulse to the study of palæography it lost its main importance after the French Revolution, and the science of handwriting is now chiefly occupied with manuscripts of literary or historic interest.

Materials.—In the most rudimentary stage of civilization leaves, bark, or woven cloth were employed for the pages of books or material on which to write matter of any kind. Wax tablets on which letters could be stamped or cut with a stylus, or needle of metal or bone, were used in ancient Italy and through the Middle Ages in France. The black wax was poured on to a rimmed quadrangular piece of wood, mud, or tablet and the letters were often bound together so as to form a codex or volume. Codices of this sort have been discovered among the ruins of Pompeii and elsewhere. A species of paper called papyrus was also employed; it was made of the pith of an Egyptian sedge. This pith was cut into strips which were laid side by side on a flat surface, and a second layer of strips superimposed at right angles. This was then subjected to heavy pressure and the natural gluten of the substance caused the two layers to adhere and form a smooth sheet which, when dried, was ready for use. Many rolls of this paper have come to light in old Italian towns, notably at Herculaneum and Ravena, but papyrus was extensively used in Egypt and Greece as well as in the Asiatic cities on the coast of the Ægean. It was also employed during the Middle Ages, and the popes regularly wrote on papyrus until the end of the 11th century. Parchment took the place of papyrus about the 1st century A.D., taking its name from Pergamos — ραπυρος Perga-
menus, or paper of Pergamos — where it was first made in perfection; although skins of ani-
mals were used for writing upon as early as

least as 500 B.C. Parchment manuscripts are
found in square pages, and take the form of the common book; they are not rolled so as to make what the Romans called evolva, i.e. an unfolding of
volume, but bound together in consecutive pages like wax tablets in the codex. It is of course from Egypt that the earliest papyri come. The
Papyrus Prisse was found in a tomb of the
11th Dynasty and antedates Exodus by several
centuries.

Characters.—It is impossible within the
limits of the present paper to discuss Egyp-
tian palæography (see Hieroglyphics) and the
hieratic or demotic papyri, much less the Chi-
nese, Pali, Indian, Syriac, Hebrew, Persian or
Arabic handwritings and manuscripts. The
principles of palæography may be seen in their
simplest form from an examination of Greek
and Latin alphabets, and a consideration of some
of the most interesting palæographical remains
written in those letters. The first obvious va-
rity which we meet with in both Greek and
Latin manuscripts of the same period, is what
we may call the book hand, and the cursive
hand, which correspond roughly with the mod-
ern printed and written lettering. The book
hand is that of the professional scribe or amanu-
ensis and is stiff and regular but thoroughly
legible. The cursive hand is irregular and care-
less, as if rapidly produced. The one is em-
ploved by those who write out what is to be
permanent and readable by anyone; the other is
for private memoranda, letters, and accounts.

For convenience, the letters in a book hand
may be divided into two classes, majuscule and
minuscule. The majuscule comprise capital
and uncials. The letters employed in epigraphy or inscription writing furnish the
pattern for these capitals, which are square and
stiff. The word uncial means inch-high, and is
a term of exaggeration used by Saint Jerome
in the sense of tall or handsome. The uncial
letter is of the same proportions as the capital
but is boldly curved, and is clear to the eye as
well as often extremely elegant in appearance.
The other book hand, the minuscule, was a com-
bination in its principles of the cursive and
uncial; it derived its name from the fact that
it was never as large as either type of the majus-
cule. The Latin and Greek uncials very much
resemble each other, but in the cursive hand the distinctions are very noticeable.

Greek Palæography.—Greek papyri may be
divided into three classes according to their
period. The Ptolemaic manuscripts were pro-
duced 323-30 B.C.; the lettering is bold and
flowing. The Roman papyri were written in the
period between Augustus and Diocletian (31
B.C. to 284 A.D.) and their lettering was fluent
and finey rounded. Equally recognizable by
the expert is the large and showy style of the
Byzantine manuscript, which belongs to the
period between 360 and 640 A.D. The early
uncials of the Ptolemaic period are the oldest
Greek manuscripts which are extant and have
been found in tombs where the papyri have been
buried. Perhaps the most important is the
first half of the 2d century B.C. Greek
papyri earlier than the Christian era are not
uncommon. Among them are fragments of
Homer and Hyperides, the Athenian orator.
The earliest Greek cursive manuscript which is
extant consists of letters and memoranda made by Ptolemy, son of Glauiscs, who lived as a recluse in the Serapeum or precinct of Serapis 170 B.C. There are extant about 300 vellum codices, the oldest of which may be set at 506 A.D. The three great Biblical codices are considered the highest achievements of this period, the Codex Alexandrinus of the 5th. The earliest minusculue script yet discovered is found on the private papers and business memoranda of Aurelius Pachymius, a purple dye merchant 502-616 A.D. Later, they began to invade cursive calligraphy at the beginning of the 13th century, and were imitated in the earliest printed books.

**Latin Palaeography.**—In Latin manuscripts there were four scripts employed in books, these being, capitals, uncial, semi-uncials and minuscules. Capitals are either Square, having their lines at right angles, or Rustic, in which the ends are twisted and the cross bars oblique and curved. Of the Square capitals the Saint Gall Virgil of the 8th century affords the best example. The Rustic is well exhibited in the four great manuscripts of Virgil, the Codex Vaticanus (4th century), Codex Palatinus (5th century); Codex Romanus (6th century) and the Medicean Virgil (5th century). The Uncial Latin character was a modification of the angular and rigid epigraphic lettering on tombs and monuments. This is especially apparent in E, M, V, H. The tails of P, F, Q and R hang below the line, while the uprith of h rises above it. Good examples of Latin uncial of the earliest type are the Vesceci Gospels, as early as the time of Eusebius the historian; the Codex Bezae (6th century) at Cambridge, England, and the palimpsest Cicerone in the Vatican, also the Vatican Cicerone (4th century) over which is written in smaller uncial (7th century) Saint Augustine in Psalms. The large, regular uncial is supplanted in Latin manuscripts of the 8th century by semi-uncials, sometimes larger in size than uncial, but modified in form by the influence of the old Roman cursive. The Hilary (6th century) of Chapter library of Saint Peter's, Rome, is a good example of this script.

The Latin cursive was unknown to palaeographers, though they had long suspected its existence. It first appeared about 1575, when the modern censimenes were found in the shape of wax-tablets (55 A.D.). This script is hard to decipher, and exhibits forms of which arose modern lower-case G, B, F, M, N, D, R, H. It was employed in a modified shape as well for civil as public uses during the Middle Ages, and many of its forms survive to-day in German script. The official Roman handwriting arose in the 16th century and the last degeneration of the old cursive is seen in the crabbled and illegible lettering of what was styled lettera Sancti Petri, the official script of the popes.

The national alphabets of Europe were modifications of the Roman cursive and uncial. The Irish semi-uncial is the basis of the modern "Roman. A Good examples of Irish alphabet are St. Chad's Gospel at Lindisfarne, and Saint Cuthbert's Gospels; it passed from Ireland to Northumbria where Alcuin of York, tutor of Charlemagne, introduced it into the famous cathedral school in St. Martin's monastery at Tours, whence it was rapidly diffused over all Europe. In the 13th century it was twisted and deformed into the Black Letter or Gothic, still seen in Germany, but after the Renaissance and the invention of printing a return was made to the beautiful minuscule of Charlemagne, improved in the middle of the 16th century by the refining influence of the Italian classicists.

**Palaeontology**, the science of the ancient life that has survived the passage of the vast periods of time which have antedated the age of man. This science dates back only to the beginning of the 19th century, when William Smith, Cuvier, Bronnmiart, Lamarck, Blumenbach and Goethe, treated the fossil and historical life as a distinct branch of scientific research. It was christened "palaeontology" by de Blainville and Fischer von Waldheim in 1834. Erroneous and fantastic ideas regarding the nature and origin of organic fossils had prevailed till the last decade of the 18th century, interesting accounts of which, as well as of the later history of the science, may be read in the works of Zittel, Lyell, Marsh and Weller. Since the early days this science has made rapid progress until now its devotees are numerous, and they attempt to solve some of the most important problems bearing upon the origin and evolution of organisms, and upon the ancient life-history of the earth. The study of palaeontology was carried on by means of fossils (q.v.) which, defined in the words of Zittel, are "all remains or traces of plants and animals which have lived before the beginning of the geological period, and have been preserved in the rocks," and hence the successful pursuit of this science is in large degree dependent upon intimate knowledge of the closely allied sciences, geology and biology. This affiliation of palaeontology to the two sciences mentioned it is easily traced in the literature. The early works were descriptions of fossils, often arranged, as in Sowerby's 'Mineral Conchology,' 1812-15, without reference to their biological classification or to their relation as members of the fauna of a particular formation. In later works the tendency to diverge along two distinct lines is very apparent and at the present day we have two more or less widely separated schools of palaeontologists: (1) those whose work is more intimately associated with that of the geologist; and (2) those who are essentially biologists. The former (stratigraphers, palaeontologic geologists, geological biologists) are more interested
in unraveling the relations of fossils to the rocks in which they are found entombed, in studying the order of succession, the evolution, and migration of fossil faunas in the stratified rocks, in developing the use of index fossils, that is, of particular genera and species of fossil plants and animals as indicators of particular geological formations; and, by the study of the geographic distribution of fossil faunas, in solving the problems of "facies development," and of paleogeography or ancient physical geography. The second group of paleontologists confine their attention almost wholly to description of the morphology, embryogeny, and phylogeny or genealogy of fossil organisms, and give only incidental notice to the geologic associations of the fossils they handle.

Paleontology has been of great aid to zoology and botany in clearing up mooted questions of classification and in explaining the origin of various obscure structures seen in modern plants and animals, and in adding to our knowledge of the determining factors of geographic distribution. The strictly utilitarian side of paleontology, involving the application of knowledge of index fossils to determination of the proximity of beds of ore, coal or building stone, or to ascertainment of the depth of oil, gas, or water-bearing strata, has not yet been accorded due recognition by those most interested in the exploitation of such economic materials, with the result that large sums of money have been expended in fruitless search for non-existent treasures.

The rocks of the earth's crust are classified according to their periods of origin into four great groups, each of which represents an era of immense duration, measured in millions of years. These eras are again divided into periods represented by systems of rock formations, of which 13 are generally recognized, and the periods are again subdivided into epochs, ages, stages, and episodes, each of these smaller elements being represented by its corresponding rock-unit. With exception of the Archean and Algonkian systems at the bottom of the scale, from which no satisfactory fossil remains have yet been obtained, each of the systems has been found to contain an assemblage of fossil organisms quite peculiar to itself, and not found in its entirety in any other system. This assemblage of fossil organisms in any system or in any geological formation constitutes its fossil fauna, which is an imperfect synopsis of the ancient life that formerly inhabited the vicinity of the ocean, lake or land basin in which the particular system or formation originated.

The faunas of two formations of consecutive age have as a rule many species in common, and on the other hand the faunas of two formations representing widely separated periods of time are found to be quite unlike, and to have few species and even few genera in common. The two extremes of such dissimilarity are naturally seen in the Cambrian and Pleistocene faunas at opposite ends of the geologic time-scale.

While formations of different ages contain diverse faunas, it is found that a single formation presents essentially the same fauna in all portions of its area of distribution, whence it follows that the fossil contents of a formation are, in general characteristic of that formation, and that they serve as a means of identifying it in widely separated districts.

These general laws are subject to certain exceptions due to the influence of "facies development," the variations of faunal expression consequent upon changes in the physical and biotic conditions of life. These facial changes, when understood, assist rather than render more difficult the correlation of distant faunas, and their elucidation greatly aids the restoration of the ancient physiographic conditions.

Comparison of the successive fossil faunas with each other and with the modern fauna shows that there has been a slow but continuous progress in the expression of each fauna from that of Cambrian age with its unfamiliar lowly primitive types, to the highly organized animals and plants that form the dominant types of the modern fauna and flora. This progress is manifested in the successive members of the different races of animals that have descended from Cambrian ancestors, by their passing through a particular stage of evolution in each successive period, epoch, and stage. Recognition of this stage of evolution enables the paleontologist to correlate entirely new faunas or species with the known faunas of standard sections or scales. It must not be inferred that all races living at the present day have descended from Cam-
brian ancestors. Many of our well differentiated forms of modern life can be traced back only to the beginning of the Tertiary, or into the Mesozoic, or perhaps late Paleozoic, where they are represented by species whose distinguishing characteristics are less well developed so that they can scarcely be separated from contemporary ancestors of other races. Such early ancestral types which seem to possess in potential state the characters of two or more later descendent races are known as "generalized" types.

There are also numerous groups of fossil organisms that appeared during early days, multiplied, attained their climax, during which they were for a time perhaps the dominant forms of land, sea, and then disappeared, and eventually became totally extinct. Such extinct groups, like the nummulites, graptolites, cystoids, blastoids, long-hinged brachiopods, orthoceratites, ammonites, belemnites, and trilobites among invertebrates; ostracoderms, stemmed echinoids, mosasaurids, ichthyosaurs, dinosaurs, pterodactyls, uinathereus among vertebrates; and the lepidodendris, calamites, sigillarias, tempioperid ferns, and cordaites among plants, are eminently characteristic of particular periods in which they lived.

**Facies Development and Faunal Changes.**

Facies is the peculiar expression of the physical and faunistic characters of a formation at a particular time and place. It is determined by the combination of climatic, physiographic, bathymetric and other conditions reacting upon the organisms of the neighborhood. Some formations, like the Devonian, present several varied facies in a limited area; others, like certain deep-water limestones of Ordovician and Carboniferous age, spread with scarcely any change over vast spaces. The chief types of facies are the littoral, coralline, sub-littoral or pelagic, abyssal, estuarine, fresh-water, and terrestrial. The characteristics of each of these, with the organisms peculiar to it, are here passed in review.

A "littoral" facies is represented by deposits formed at the shore and in the shoal water contiguous to it. It comprises conglomerates, sandstones, shales, and marls, and its organic content consists of the remains of animals and plants of both shallow and shallow water habitats. Such are the heavy-shelled molluscs, notably the brachiopods that feed on marine plants, also abundant worms, heavy-shelled crabs, acorn barnacles, and hydroids. This facies is more common than any of the others, for the larger part of the sedimentary rocks have been made up of the products of continental erosion deposited near the coast.

Fossil coral reefs have been recognized in formations of nearly all ages and constitute a "coralline" facies. They are in all cases of shallow water origin, and their presence in ancient rocks has been generally accepted as evidence of the uniformly warm temperature of the seas in which they flourished. In the ancient reefs the coral structure has usually been obliterated by a metamorphic process called diagenesis, and the coral rock has become a dolomite. Such are the Guelph dolomites of the Silurian of New York and Ontario. Fossil coral reefs often afford faunas of many species and abundant individuals. The coralline facies of a formation is always associated, on its landward side, with a sparsely fossiliferous lagoon or saltmarsh phase, represented by red shales, containing gypsum and salt, by water-limestone, etc., as in the Salina beds of New York, and on the seaward side by a series of highly fossiliferous beds, usually limestones or calcareous shales, which correspond to the deposits of the open ocean. These latter deposits usually abound in fossils of distinct pelagic type, such as cephalopods, brachiopods, sea-urchins, crinoids, crustaceans and thin-shelled mollusks.

A "sub-littoral" or "pelagic" facies comprise the deposits laid down in the deeper water of the continental shelf, and form an intermediate phase between the littoral and abyssal types. The rocks are mostly of organic origin (limestone and lime shales), with fine-grained sandstones and clay shales. As a rule they present an abundance of well preserved fossils, including the remains of all kinds of animals that inhabit the open sea, together with some members of the littoral fauna. Deposits of this class, with their characteristic faunas, such as graptolites, ammonites and pteropod limestones, have often very wide distribution, and are hence of great value for determination of geologic horizons.

The "abyssal" facies is the type characteristic of the greatest depths of the ocean. It is represented in modern time by the foraminiferal and radiolarian ooze, and by green and red muds. It is recognized by the thin calcareous sheets of radiolarian cherts of Paleozoic and Jurassic age of Europe and Australia, by the chalk of Cretaceous age of Europe and North America, and by the Cenozoic age of Greenland, and by the Cenozoic age of the Barbados earth, which latter is evidence of upheaval of great ocean-deeps in comparatively recent times.

The three remaining types of facies, "estuarine," "fresh-water," and "terrestrial," are associated with spread of continental conditions. The estuarine or brackish water facies presents a shallow lagoon, bayou and estuary deposits of sandstones, conglomerates, and clay shales, sometimes alternating with limestones formed during temporary transgression of the ocean. The fossils of such deposits are species that lived in brackish water, mingled with remains of the fresh-water and land fauna and flora that were carried down by river waters and embossed in the estuarine deposits. The nodular shales of Carboniferous age at Mazon Creek, III., is a renowned example of this type of facies. Its varied fauna comprises amphibians, fish, clams, river-snails, land-snails, scorpions, spiders, myriopods, insects, and crabs, together with abundant ferns.

The "fresh-water" and "lacustrine" facies are deposits formed in fresh-water swamps and lakes, important in the Devonian, Carboniferous, Jurassic, and Tertiary systems. The Devonian deposits, known as Old Red Sandstone in Europe and as Catskill sandstone in the United States and Canada, consist mostly of red and gray sandstones and shales containing fish and plant remains. The swamp deposits of Carboniferous and later times are represented by beds of coal, lignite and clay shales, all containing abundant plant remains, and rarely relics of the insect, crustacean, and vertebrate life. During the Cretaceous, Jurassic, and Tertiary Periods, extensive lakes existed upon the several continents, and their sandstone, shales, and limestone deposits have afforded hosts of vertebrate and vegetable remains, specially those of the Rocky Mountain region, and Europe. Occasional beds of this
PALEONTOLOGY

facies abound in fresh-water snails and insects, as notably at Florissant, Colo. Angular breccias, conglomerates, sandstones, shales, and clays comprise the deposits of the terrestrial facies, a type which has not yet been satisfactorily investigated in all its phases. The various deposits originated either as the residues from limnication, or as flood-plain, desert, or prairie deposits. They are important sources of fossils in some cases (flood-plain and prairie phases) but as a rule their mode of origin has not been conducive to preservation of organic remains.

All of these facies are being developed in different parts of the world at the present day, and geologists find that they have been developed more or less completely during all periods of the Tertiary and Cenozoic. This indicates that the various marine facies greatly predominated in the older Paleozoic, that the estuarine and swamp conditions were markedly developed during Carboniferous time in most parts of the world when the environment was favorable for the accumulation of organic matter.

Periods of Geologic Time and their Faunas. — The following sketch of the series of extinct faunas that have succeeded each other as inhabitants of the waters and lands of the earth involves an elementary knowledge of the most important types of animals and plants. (See preceding Table of Systems, etc.) The history actually begins with the close of pre-Cambrian (Algonkian) time when the distribution of land and water was very different from what it is now. Regarding the life of the Agean we know nothing and of that of the Algonkian very little. Many rocks of the latter system were originally clay but may have been so thoroughly metamorphosed that few traces of their organic contents remain. The remnants discovered are of types similar to those of the succeeding Cambrian fauna, and include worms, linguloid brachiopods, and arthropod remains, some of which are referred to the *Eurypteridae*. The extensive graphite deposits of the pre-Cambrian rocks are by some authors considered as evidence of original organic deposits.

Those genera and species marked with an asterisk (or italicized) are indical, that is, characteristic of the formations under which they are mentioned; fossils not so marked may be understood to occur in other periods as well.

During the Cambrian, the Cambrian systems are represented mostly by littoral and shoal-water deposits containing an abundant fauna, which, while of primitive type, is remarkable on account of its high degree of differentiation. Some of the Cambrian species, notably the calcareous shales, in regions of slight metamorphism (New Brunswick, Newfoundland, and Scandinavia) abound in fossils. Elsewhere the sandstones, conglomerates and limestones are poor collecting grounds. This species, comprises representatives of all the seven sub-kingdoms of invertebrate animals, and of 12 out of 30 classes. The entire fauna is marine, and the dominant types were trilobites, inarticulate brachiopods, and hyolithoid shells usually referred to the pteropods. The trilobites form the most interesting elements of the fauna. Compared with those of later times they are more loosely built, and they present many features indicative of primitive life. Some of the lower Cambrian; *Paradoxides*, which contains some of the largest known trilobites, indical of the middle Cambrian; and the flat-shelled *Dikellocephalus* of the upper Cambrian. The calcareous brachiopods of North America species are known, are almost entirely of the inarticulate type, with thin, rounded or spathulate, phosphatic shells, while there were a few members of the articulate group with transverse, calcareous shells. The hyolithoid shells, with triangular or elongate form, are abundant. Sponges of the hexactinellid type with net-work of silicious spicules are recognized in Protopspongia. The corals are doubtfully represented by *Archeocyathus*, and the echinoderms by *Echinodermata* and *Echinoidea*. Among the gastropods there are coiled shells referred doubtfully to *Platyceeras* and *Raphistoma* in the upper Cambrian, and limpet-like forms, *Scenelia*, and *Palesoma* in the middle and upper horizons. The lamellibranchs of the lamellibranch species usually have a single minute genus *Fordilla*, and the cephalopods likewise the minute *Volborthella*. Worm trails and burrows are abundant, and various forms of ostracods (*Hippocantharon*) are found in the finer grained sediments. Radiolarians and foraminifer a have been found, some of the latter (*Orbulina universa*) being indistinguishable from modern species. The only probable plant known is *Oldhamia*, referred to the coralline algae.

The Cambrian fauna in its entirety shows a very advanced stage in the differential evolution of organic types, and there is good reason to believe that long ancestral lines of fossil organisms originally existed in the pre-Cambrian sediments, and further to anticipate that continued search in the less metamorphosed deposits of that remote age will eventually bring to light some of those much sought for initial types.

Ordovician.—The fauna of the Ordovician, or age of graptolites, shows a marked advance in development of all its types over those of the
PALEONTOLOGY

Cambrian. It also shows a more distinct separation into facies, of which the pelagic, embracing orthoceratite, brachiopod, and trilobite limestones, and the graptolite shale facies are the more prominent. Most of the groups of animals which were initiated in the Cambrian, in fact, enjoyed a rapid evolution in the Ordovician time. During that period the trilobites attained their climax in respect of variety and numbers, and were represented by *Asaphus, *Trinucleus, *Asaphides, **.* and by ruderals that extend up into the Silurian. The Ordovician trilobites present considerable advance over their Cambrian ancestors in respect of increased compactness of structure, perfection of the eye and anal fissures, or at least surface above the head, whereby the efficiency of these organs must have been much increased. The cephalopods are represented by numerous orthoceratite genera, with straight or slightly curved shells, some of which were of great size. Orthoceras, *Camaroceras, *Gonioceras, *Piloceras, *Nanno, etc., are associated with closely coiled genera *Trocholites, and other related types with closely resemble nautilus shells. Among the brachiopods the inarticulate types, so common in the Cambrian fauna, occupy a subordinate place, and are represented by numerous species of Lingula, *Trematis, and *Si- phonina. The articulate order attained great an expansion that 325 species of North American Ordovician brachiopods are known. The Polyzoa appear first in the lower Ordovician and are abundant and varied in the upper zones. Gastropods are common, and all have holostomatous shells. Lamellibranchs are common, with several genera of generalized type; corals of various types are common. The hydroid corals (Stromatopora) formed extensive reefs during Cambrian and Silurian times. Eachinoderms included abundant cystoids, several crinoids, and rare starfishes and ophiurians. The cystoids are specially abundant in the lower Ordovician, where their fragmentary remains form solid limestone beds of several feet thick. The stromatoporée allied to Protopspongia, and to the modern hexactinellids, are common in a few localities, and in the Trenton limestone of the Mississippi Valley are found the curious digitate *Brachiospongia, the massive stromatoporées, the generally the discussion *Receptaculites. A pelagic facies is recognized in the radiolarian cherts of Great Britain, France, and Germany. The graptolite facies of the Ordovician, by some authors considered to be pelagic, occurs in the form of gray and black bituminous shales and slates, in which numerous genera and species of graptolites are found arranged in definite zones that occupy the same positions in the widely separated parts of the world. This great dispersion, and regular succession of genera and species render the graptolites the most important index fossils for the Ordovician, an advantage which is, however, somewhat negated by the difficulty attending their study. The group began in the upper Cambrian, attained wide distribution and various evolution during the Ordovician, and declined during the Silurian. These graptolite beds are well demarcated from the molluscan and brachiopod limestones and while they occur between the latter at various horizons throughout the general Ordovician and Silurian formation scales of Europe and America, they are best developed in basins where little of the other facies seem to have existed. The faunas of latest Ordovician time are known in only a few regions, since that period was one of comparatively sudden uplift of continental masses, accompanied in many parts of the earth by formation of mountainous. But the few late remnant faunas that found shelter in protected basins present a transitional phase between the normal Ordovician and the succeeding Silurian faunas. Late Ordovician time is represented in most parts of North America by a marked hiatus of unconformity indicating wide land areas.

Silurian.—The earliest Silurian fauna of North America, that of the Clinton group, contains a few relics of Ordovician types, lingering on among a host of new species and genera, which were introduced with the return of marine conditions over the interior sea basin. The American rocks and faunas of Silurian time indicate a period of great extension of the continental seas, and toward the end of Silurian days the epicontinental seas were again largely drained to form lagoons, tidal mud-flats, and salt lakes of Salina time. Then ensued a short period of wide land emergence before the next transgression began. Facies development is well marked and it is worthy of note that the various facies occur in the same relative order and at approximately the same latitudes as in the Silurian of Great Britain, Bohemia, Brittany, Scandinavia, and New York are all of low Silurian age. Another interesting feature of the Silurian fauna is its division into two well-marked types—northern or Baltic-British-American type, and a southern Bohemian-Mediterranean phase, the species of which are quite distinct. All of the Silurian faunas of North and South America and of Asia are of the northern phase, and the Bohemian-Mediterranean type appears to be merely a local facies. It is of interest that the Silurian fauna of Australia contains representatives of both types. The chief characteristic of the Silurian fauna is the great evolution of the crinoids, corals, and spire-bearing brachiopods, and Eurypterida. Protozoa are rare; sponges and corals attain a remarkable variety and abundance, and in many districts the latter formed extensive reefs. The principal genera are: Favites, Alveolites, *Halyites, Heliolites, Cystihyllum, Acervularia, Omphya, Zaphrentis, Cyathophyllum, *Paleocyclus, and the operculate pyramidal genus *Cymbiphyllum. The graptolites begin to de-
cline. Cystoids take second rank after the crinoids, whose sudden expansion is expressed in the ratio of about 450 Silurian species to less than 50 from the Ordovician. The brachiopod fauna, while no larger, differs from that of the Ordovician in the increase of the spire-bearing types, and in the remarkable development of articulate brachiopods with large, solid shells. Lamellibranches offer no important changes, all the genera being still of integripallitellate types. Gastropods are numerous. Tentaculites, usually referred to the pteropods, occur by myriads associated with ostracids. The extensive Cephalopoda comprise straight-shelled Orthocerids, curved Cyltoceratids, turreted Trochocerids, and coiled Nautilids; also Gomphocerids and Plagiocerids with their restricted apertures, and the aberrant genus Asellacia.

The Arthropods are represented by rare barnacles, numerous ostracods, some phyllocarids, rare scorpions, spiders, and insects, as well as by the early trilobites. The trilobites show a slight decrease in numbers, but a greater diversity of form over their Ordovician ancestors. The water limestones (of mud-flat origin) of the Salina of New York and equivalents in Scotland and England abound. Eremia, Pterhydrops, and *Hughmilleria, some of which grew to be six feet long. These creatures resembled in habits and structure the modern horseshoe crab (Limulus). The earliest forms and insect remains have also been found in the uppermost Silurian lagoon deposits, and they show no very great differences from similar types of the Carboniferous. Their presence indicates the ex- istence of littoral and lagoonal environments in the middle Silurian.

In these highest Silurian rocks, especially in the Ludlow beds of England, Scotland, and Podolia, are found the earliest remains of vertebrate animals in the shape of primitive fish-like creatures of the order Ostracodermi (q.v.).

Devonian.—The Devonian Period was one of constant local physiographic changes, and accordingly its formations and faunas present a greater variety of facies than is seen in any of the older Paleozoic systems. There are two prominent types of the Devonian, each with its distinctive fauna: (1) The marine deposits, of limestones, marls, shales, and sandstones; (2) the continental or terrestrial phase, known as the Old Red sandstone in Europe and as the Catskill shales and sandstones in the eastern United States and Canada. This two-fold aspect of the deposits is more or less prominent in all the geological systems above the Devonian. The Devonian fauna as a whole is distinguished by the development of land vegetation, by rapid evolution of fishes, lamellibranchs, and of goniatite cephalopods, and by the decline of trilobites, and practical extinction of the graptolites and cystoids. Other groups expanded. Hexactinellid sponges (*Dictyonema*) and the modern Venus-flower-basket, flourished in shallow seas, corals are abundant and formed reefs in many regions. The Hydrozoa are represented by numerous reef-building stromatoporans, and by struggling survivors of the graptolites. Among the echinoderms, the cystoids are rare; starfish and ophiuroids occur commonly at a few localities; and the crinoids are the dominant types of this class, though not so abundant as in the Silurian. The blastoids are represented by Eiscracinus, characteristic of the Onondaga limestone. Worm-trails are common in the shales and sandstones of the middle and upper Devonian. A host of new brachiopod appearances, while many Silurian genera run on. The spirifers manifest a marked tendency to develop forked plications and to lengthen the cardinal lines of their shells. Lamellibranches show a great advancement over those of the Silurian, and in certain shales and sandstone formations they outnumber all other types of organisms. *Paxtonia* and the family Capulidae are abundant, and minute pteropod shells (Styliolina and Tentaculites) often form solid limestone beds. Among cephalopods a new type of closely coiled shells, Goniatites, with slashed sutures, appears in the lower Devonian, evolves rapidly and reaches its climax before the close of the period. An extinct group of crustaceans, the Phyllocarida, with long strong caudal spines, reach a considerable development, especially in the Hamilton group. Eurypterids are rare, though represented by the gigantic Stylonurus in the Catskill beds. The trilobites have many large and bizarre members, as well as the scutigerous,一年中 during the early and middle Devonian, when they manifested a strong tendency to develop spines along the margin and on the surface of the carapace.

The Devonian is aptly termed the "age of fishes," for within its limits this class enjoyed a great expansion. The lowest Devonian fish fauna is like that of the upper Silurian with numerous Ostracoderms. This is succeeded by a fauna with *Hexacotyle*, *Holocheilus*, *Ceratodus*, *Cocoseutes*, *Dinichthys*, *Diperus*, and a large number of acanthodian sharks, which are indicated by their spines. No remains of any vertebrates higher than fishes are known in the Devonian.

Plant remains in the form of marine algae are found throughout the Devonian. Some of these, like Nematophyton of gigantic size, were long supposed to be the trunks of coniferous trees. Others of more delicate constitution, bearing foliage leaves are common, especially in the Hamilton, Portage, and Chemung groups. The continental phase of the Devonian has afforded the earliest examples of land vegetation, all prophetic of the succeeding Carboniferous types. Both the fauna and flora of the upper Devonian show marked affinities by gradual transitions to those of the Subcarboniferous. See PALAEONTOLOGY.

Carboniferous.—The early part of the Carboniferous period was marked by a continued recession of the sea, which had begun in late Devonian time, and during the Carboniferous the land areas seem to have reached a greater expansion than they have at the present day. These Carboniferous land masses were of very different form and situation from the present day continents. An Arctic continent occupied the greater part of the Arctic zone and extended by broad peninsulas southward toward the equator, over what are now eastern America, eastern Asia, central Europe, and the eastern Atlantic Ocean. Another, Indo-African continent, covered that part of South America east of the Andes, extended across the south Atlantic, Africa, the Indian Ocean, and Australia. An ocean spread over the present Pacific basin and also over Alaska, all of the United States west
PALEONTOLOGY

of the Mississippi River, Central America and the western part of South America; while a great Mediterranean sea of irregular form encircled the globe and communicated at both ends with the Pacific Ocean. There was also a small Antarctic sea. Toward the close of Carboniferous time the ocean again transgressed and the land mass became for a time somewhat reduced in size. The Carboniferous formations consequently present two well-marked facies: a marine facies with deposits of limestones and shales with mollusks, brachiopods, corals and foraminifers, more widely spread in the lower and upper Carboniferous; and a continental phase of sandstones, shales, and coal-beds, holding abundant plants, and in some localities numerous, Ferns, some of great size, were the most common type. Calamites with fluted many-branched stems of palmiform paleo-creepers of our modern horse-tail rushes (Equisetum). Lepidodendron and Sigillaria, related to clubmosses (Lycopodium), with trunks often five feet thick and 75 feet high; Cordaites with sword-shaped yucca-like leaves on a solid trunk 25 to 30 feet high; and other great tree-like plants intermediate in nature between the ferns and cycads, formed the bulk of the forest growth. In the shelter of these forests lived numerous reptiles, notably primitive cockroaches, also dragon-flies, one of which (Meganeura) had wings 20 inches across; primitive forms of locusts, crickets, grasshoppers and also scorpio-nidous insects much like the modern scorpions. On the shores of the swamps lived large amphibious myriopods whose bodies were armed with branching spines. Some land snails like modern Pupa and Zonites have been found. The freshwater fauna is much like the modern type. The orthoceratites have greatly declined; nautiloids abound, and the goniatites show great advance ment over those of the Devonian, and toward the end of the period transitional types suggestive of the Triassic ammonites appeared. The arthropod fauna of the Carboniferous is poor in trilobites, eurypterids are common in some coal measure shales, the malacostracan crustaceans show some progress, and the phyllopods Leaia and Estheria are found in freshwater deposits between coal beds. The Carboniferous vertebrate fauna is of interest by reason of the sudden expansion of amphibian types in the upper part of the system. The Stegocephalia (labyrinthodonts) are represented by several genera, and consist of various types of acanthodian sharks (Cladoselache). Over 600 species of fish have been described from the Subcarboniferous limestones of America.

Permian.—During Permian time the continental conditions were even more prevalent than during the Carboniferous, and accordingly the marine phase is much restricted in distribution and its fauna diminished in numbers. Both plants and animals are transitional between the Carboniferous and Triassic. Many types characteristic of the Palaeozoic have their last representatives, some of them, it is true, occurring abundantly, in the rocks of this system. Productus, Bellerophon, Orthoceras, Cynocephalus, goniatites and the fenestellid bryozoa, which latter formed extensive reefs in Europe, all become extinct with the close of the Permian. Other types, some of them initiated during the Carboniferous and Triassic, remain forms of the Mesozoic aspect. These are found among the lamellibranchs as well as among the ammonoids, fish and amphibians. The Permian consists mainly of heteroceratid ganooids. Acanthodian sharks reached the climax of their evolution. The stegocephalian amphibians, among which *Brachiosaurus* and *Archegosaurus* are the best known, were largely restricted into the Trias, and also the eminently characteristic genus *Medicoisaurus*. The fauna of the Permian is well known. The Permian flora is in general the same as that of the Carboniferous it contains some types not seen in the latter — broad-leaved ferns, Glossopteris; the conifers Walchia and Voltzia, and the cycad Zamites, which give rise to the flora a strong Mesozoic expression, a great

Mesozoic.—The Mesozoic fauna and flora are distinguished from those of the Palaeozoic by the absence of trilobites, graptolites, orthoceratites, long-legged brachiopods, tetracoralic and tabu-
PALEONTOLOGY

late corals, cystoids, palaeocrinoids, blastoids, phyllocarid crustaceans, eurypterids, palaeoconch lamellibranchs, goniatites, acanthodian sharks and placoderm fishes, and the great brachiopods. On the other hand this era is marked by the introduction of numerous new types and by the expansion of many invertebrate groups, land and marine reptiles, multibuculate mammals, and cycads anable affinitis. During the era a great change in expression of the life is apparent, in that the early Triassic life presents close analogies with that of the late Permian, while during the era an almost complete change takes place, and the vegetation, affords considerable resemblance to the early Tertiary. The wide extension of continental areas continued from Permian into Triassic time with perhaps a slight increase, and in North America marine Triassic fossils have been found in only a few places in the far West. The fauna as a whole is an impoverished one. The continental Trias, consisting of red beds in America, Europe and Asia, abound, notably in the *Seminotus* (*Seminotus*) together with some cycads and conifers. In some regions these beds have afforded also numerous remains of often gigantic stegoccephalian Amphibia, which attained their climax during this period. Some amphibious precursors of the large marine Jurassic ichthyosaurs and plesio-
saurs are found in *Lariosaurus*, *Notosaurus* and others. The Theromorpha, reptiles exhibiting remarkable affinities with the modern mammals, attained a great development in South Africa. The first turtles, crocodiles, and din-
saurs occur here. The earliest mammalian re-
ains consist of fragmentary jaws and multibuculate teeth of the smaller Mesonyx, supposed to be allied to the modern monotremes: Micro-
lestes, Triglyphus in Europe, and Drochamium and Microconod on in North America. The marine Trias is found well developed in the Alps with extensions into Asia Minor, India, Arctic regions, Pacific States and Australia. The number of species is comparatively small, though individuals are abundant. Foraminifera and cephalopodous sponges are abundant. Corals of perforate and aporose genera formed extensive reefs in some regions. Clinoids are repre-
"sented by the eminently characteristic *En-
"crinus liliformis*, and echinoids by the regular sea-urchin Cidaris. Among the brachiopods are a few remnants of Palaeozoic genera, while the families Terebratulide, Rhynchonellide, and Koninckinide are surprisingly developed. The lamellibranchs begin to show considerable ex-
pansion, and the first true fresh-water unions appear here. The marine gastropod fauna is abundant, with some old types and others of later Cretaceous and Tertiary aspect. The am-
monites, which began in the Permian, show a wide differentiation of form and complexity and attain the culmination of their evolution in the upper Trias. Over 1,000 species have been described. Ostracods are abundant, and a true macruran decapod, Pemphix of the Muschel-
kammer, is one of the modern crustaceans. The Jurassic flora is quite similar to that of the Trias, made up of cycads and conifers which are fore-
runners of the recent pines. Among marine in-
vertebrates the sponges and corals, largely of modern type, were so abundant as to form great reefs. Clinoids were abundant in individual 
"uals, though genera and species were few; echi-

moderms and Bryozoa were common, while the brachiopods were restricted to a few families. The lamellibranchs and gastropods include the first representatives of a number of modern fam-
ilies. The ammonites are by far the most abun-
dant and characteristic forms of mollusks, and by means of them the marine Jurassic of Europe has been subdivided into some 13 zones, each characterized by a particular genus of ammi-
ules. Belemnites, the solid cigar-shaped internal shell of squid-like diabranchiate cephalopods, are very abundant and varied, and the fossilized ink-bags of these creatures are common in some forma-
tions. The crustaceous fauna shows a great in-
crease of long-tailed decapods allied to prawns, shrimps, and crayfish, and the earliest true crabs. Insects include dragon-flies, May-flies, termites, grasshoppers, crickets, walkingsticks, and some beetles, and ants occur. The gnoids with heterocerous tails take a subordinate role, while those with homocerous tails and scaly rhombic plates predominate. Sharks and rays and the first teleost fishes complete the Jurassic fish fauna.

The reptiles form the most interesting group of the Jurassic fauna, for during this period they reached the highest stage of their evolution both in variety and abundance. The Triassic stegoccephalians of *Theromorpha* give place to the terrestrial dinosaurs and the marine ichthyos-
saurs and plesiosauras. The latter held some-
what the same relation to reptiles that the whales of modern by the part of the mammals. Those sea lizards swarmed in the Jurassic seas where they preyed upon the fish. The dinosaurs held sway upon the land, not only during the Jurassic Period, but also during the greater part of the succeeding Cretaceous. Another type of reptile prominent during Jurassic time, and continued into the Cretaceous, was the group Pterosauria or flying lizards, of which the ptero-
dactyl is the best known example. Other types of reptiles, as lepidodactyls and ichthyosaurs, are less common. At the same time when the repillian stock developed flying creatures there appeared the earliest known bird. (See Archaeopteryx.) The mammalian remains of Jurassic time are known mostly by isolated teeth and jaws of small size and very rare, and all are related to the marsupials and monotremes.

Cretaceous.—The flora of the lower Creta-
aceous is like that of the Jurassic, but gradually the cycads diminish in importance and a host of angiosperms appear, very similar to the trees and shrubs of to-day. Many genera of recent tropical and temperate zone plants occur in the Cretaceous rocks of Greenland and northern Europe, facts cited as evidence of the mild climate of those parts during Cretaceous time. The ammonites begin to decline and we see numerous degenerate types, last members of various races, with shells loosely coiled, turreted, hook-like, or even straight, many of which are characteristic index fossils. The group becomes entirely extinct with the close of the Cretaceous.

The close of Cretaceous time terminated the middle or Mesozoic period of the history of or-

ganic life, and marked the extinction of a num-
ber of types of animals which had for long
PALEONTOLOGY

Epochs dominated the lands and seas. This extinction is perhaps more evident here than at the end of the Paleozoic, and its causes are wholly unknown. It is true that some groups (Ammonites) had already begun to show marked degenerate tendencies attendant upon race senility, but the majority of the groups became extinct at the height of their evolution, when they were represented by their most highly specialized types. It is possible that this very specialization rendered them more liable to injury by slight though abrupt climatic changes or by sudden variations in the depth of the seas in which they lived. The great land and marine reptiles, the flying lizards, the mesosaurs and toothed birds all became extinct. Likewise the ammonites, belemnites, rudistæ, and the pharetrone sponges, so characteristic of the Mesozoic, have been found above the upper limits of that system.

Cenozoic.—The life of this era is like that of recent time, particularly the marine life, for the terrestrial mammalian life of a large part of the world is much more of that modern animals. The early classification of this system was based upon the increasing percentage of still living species found of both plants and animals fossil in the rocks. (See Table, page iv.) Some of the distinctive types of invertebrates were of larger size than usual. Sponges and corals are abundant only in restricted localities. Foraminifera, Radiolarians, echinoderms, Bryozoa, lamellibranchs, and gastropods are present in great variety while crinoids, brachiopods, and cephalopods are comparative rarities. The preponderance of crabs, with a number of extinct genera, over the long-tailed, lobster-like decapods is very marked. The great land and marine reptiles, the flying lizards, the mesosaurs and toothed birds all became extinct. Likewise the ammonites, belemnites, rudistæ, and the pharetrone sponges, so characteristic of the Mesozoic, have been found above the upper limits of that system.

Cenozoic.—The life of this era is like that of recent time, particularly the marine life, for the terrestrial mammalian life of a large part of the world is much more of that modern animals. The early classification of this system was based upon the increasing percentage of still living species found of both plants and animals fossil in the rocks. (See Table, page iv.) Some of the distinctive types of invertebrates were of larger size than usual. Sponges and corals are abundant only in restricted localities. Foraminifera, Radiolarians, echinoderms, Bryozoa, lamellibranchs, and gastropods are present in great variety while crinoids, brachiopods, and cephalopods are comparative rarities. The great land and marine reptiles, the flying lizards, the mesosaurs and toothed birds all became extinct. Likewise the ammonites, belemnites, rudistæ, and the pharetrone sponges, so characteristic of the Mesozoic, have been found above the upper limits of that system.

The greater interest attaches to the vertebrates of the Tertiary Period. During the early days of this period the placental mammals outstripped the marsupials and monotremes, and became the lords of the land, and toward the end of the period appeared man. The reptiles, which held so prominent a place during the Mesozoic, are reduced to the true lizards, snakes, crocodiles, and turtles. The amphibia which, as Stegocephalia, had become almost extinct during the middle Mesozoic were resurrected in the Eocene as salamanders, toads, and frogs, and continued thence till the present day. The fishes exhibited numerous large sharks and a preponderance of bony fishes of which many belonged to modern genera, such as perch, herrings, carp, pike, catfish, eels, brems, and mackerel. Birds exhibit a continuously expanding evolution during the Tertiary and they are still expanding. See MAMMALIA; TERTIARY PERIOD.

Conclusions.—The dominant types of the consecutive periods present on the whole an increasing degree of perfection of structure, and the dominant types of one age are, as a rule, not related to the dominant types of the preceding age. These dominants are usually the most highly specialized members of the classes or orders to which they belong, and it is further to be noted that dominance and high specialization have in most cases been soon followed by decline and extinction. The small primitive types of one period may evolve into the large dominant types of the next epoch and in their turn decline and disappear. In the invertebrates and lower vertebrates (fish, amphibia, and reptiles) the rate of this evolution, and consequently the diversity of the race, have been very largely dependent upon the presence and continuance of favorable conditions of existence, for these types have little or no ability to surmount physical difficulties. Among the higher vertebrates, enlargement of the brain mass among the primates enables the animals to circumvent unfavorable conditions to some extent, but they also are comparatively helpless. It is in man, with his highly developed intellectual and mechanical skill, that we see the only organism able not only to circumvent unfavorable conditions of life but actually to nullify them, and to practically subjugate all other organisms or render them useful to him in his affairs. We also see that intellectual specialization indicates approaching decline and extinction. That is true in respect of structural evolution, but as regards intellectual evolution, the and the directions in which it may differentiate, we know very little. Beyond all this, the fact that intellectuality has up to the present time evoked with remarkable acceleration. In view of this it seems impossible to conceive otherwise than that man, under strong physical, moral and religious control, will assume any other than a future longer and more brilliant than his comparatively brief existence.

in 'Journal of Geology,' Vols. 3 to 8 (1895—1900); Williams, 'The Scope of Paleontology and its Value to Geologists,' in Proc. A. A. A. Sci., Vol. 41 (1892); Williams, 'The Correlation of Geological Faunas,' Bulletin U. S. Geological Survey, No. 210 (1903). Among the systematic works are: Woods, 'Paleontology, Invertebrate' (Cambridge Press, 3d edition, 1902), the only elementary work on this subject written in the English language; it is, however, devoted wholly to British fossiliferous strata; Zittel-Eastman, 'Textbook of Paleontology' (New York, 1900—2), a more technical, but thoroughly American, work, the best for general purposes; Nicholson and Lydekker, 'Manual of Paleontology,' 2d ed., 1895; and 'Outlines of Vertebrate Paleontology' (Cambridge, 1898), serve more special needs. The more valuable works of a stratigraphic nature are: Dan's 'Manual of Geology,' 4th ed., 1890; Geikie's 'Textbook of Geology,' 4th ed., Vol. II., 1903; Kayser's 'Geologische Formationskunde,' 2d ed., Vol. II. (Stuttgart, 1902); and Frech's 'Lethaea Geognostica,' 3 parts (Stuttgart, 1883—1903). This last work has been completed by the Triassic only, and discusses the successive faunas and formations of the Paleozoic in great detail. GILBERT VAN INGEN, Princeton University.

PALEOZOIC

The third great division of Geologic time and the first one in the sediments of which well preserved organic remains have so far been found. It is preceded by the Pre-Cambrian era (first; Zittel's dawn of life) and by the Azoic (no life) divisions in descending order, and succeeded by the Mesozoic (Medieval life) and the Cenozoic (recent life) and the Psychozoic (mind life) time divisions, in ascending order. The former signifies ancient life and has reference to the character of the plant and animal life of the time, which was markedly unlike that of the present. As a time division, the Paleozoic is generally called an Era, this term having been reestablished by the International Geological Congress at its Bologna convention in 1881. Dana in his 'Manual of Geology' (4th edition) however uses the expression "Paleozoic Æon or Paleozoic Time," and uses it as our next smallest, subdivision. In this he has been followed by several authors. Though in its modern sense primarily used for a time division, the term Paleozoic is also applied to that division of the earth's crust which was formed during that time. And indeed this is the original use of the term, when it was coined for the reception of the fossiliferous rocks below the so-called Secondary or Mesozoic formation. The rocks thus named were formerly included with the crystalline rocks of all ages as "Primary," but later on they were separated at least in part, as "Transition rocks." Lyell, to avoid confusion, spoke of them as the "Primary fossiliferous rocks." The following parallel columns express perhaps as nearly as possible the correlation between the older and newer terms.

In the formation scale the term "group" was recommended by the International Congress as coordinate in rank with that of Era in the time scale. This recommendation has not been very generally adopted in America, where the term "group" is commonly used for a smaller formation, and "series" used for such rock divisions as that corresponding to the Paleozoic æon.

The following subdivisions of the Paleozoic are recognized:

Permian (or Permian) era and system, Carbonic (Carboniferous or Carbonian) era and system, Devonian (Devonian) era and system, Silurian (Silurian, Upper Silurian or Cambrian) era and system, Ordovician (Ordovician, Lower Silurian or Cambrian) era and system.

Characteristic Life of the Paleozoic.—The characteristic life of Paleozoic life were very marked and stamp the æon as boldly contrasted with the succeeding Mesozoic. The Hydrozoa were represented by the group of Graptolites, and by Dictyomena, both of which are wholly confined to the Paleozoic. Among corals the group of rugose corals, or Tetracorollia (so-called from having four primary radiating lamelle or septa with reference to which the others are arranged), the hexacorals, Favosites, and the tube corals, Actinopora, Syringoporæ, Halysites, etc., are characteristic types practically unknown in post-Paleozoic time. Among the Pelmatoozoa or stemmed Echinoderms, the two groups of Cystids and Blastoids are wholly confined to the Paleozoic, while the Crinoids with the exception of the family Articulata, and the genera Marsupites and Ulniarinæ are likewise restricted to the Paleozoic. Asterozoa, or star-fish and brittle stars, and Echinoozoa or sea-urchins and holothurians, while represented in Paleozoic rocks, especially the Echini, are more characteristically known from Mesozoic and later strata. The Bryoza are well represented by such types as Ceramopora and Fistulipora, their congeners among the Cyclostomatous Bryoza; by the Monticuliporidae and related types constituting the sub-order Trepotomata of Ulrich; and by the Fenestelloida and related types constituting the sub-order Cryptoporædivision of the Bryozoa. The crinoids have constructed extensive reefs, and in the Ordovician especially, gave rise to extensive limestone deposits.

Brachiopods are perhaps the most important Paleozoic types, no less than 2,600 species having been described from the Ordovician and Silurian deposits alone. Several archeaic families, that is, the Lingulidae, the Discinidae and the Craniidae, and the family of the Phrynchonellidae, range from the Ordovician to the present time while modern types such as some of the Terebratuloid families and the family Thecidiidæ among the Strophomenoid shells begin in the middle or late Paleozoic. By far the largest number, however, end with the Permian or before, while a few others run on into the Trias. The Spirifer family, so characteristic of the Paleozoic horizons, is represented in both Triassic and Jurassic beds by a few genera.

Leaving out of consideration persistent archeaic families before mentioned, the post-Paleozoic brachiopods belong chiefly to the Phrynchonellid and Terebratuloid families of the most specialized order of Brachiopods, the
P A L E O Z O I C

Telotremata. The only prominent exception is the modern family of Thecidiidae of the Prototremata, which makes its appearance in the Carboniferous rocks.

Turning to the Pelecypods or bivalve mollusks, we find that their principal representatives belong to post-Paleozoic time. The primitivest form of Protodonta, as represented by such modern types as the oyster and scallop (Pecten), alone has a prominent representation in the Paleozoic, where about thirty families are found. Of these more than one half continued to exist beyond the Carboniferous time, with a few exceptions indeed down to the present time. Only thirteen out of forty families of this order (as now understood) are confined to the Paleozoic. On the other hand, post-Paleozoic time is characterized by about eighty-six families. The gastropods are likewise essentially post-Paleozoic Mollusca, those of Paleozoic time being essentially primitive or archaic in character. Among the cephalopods, Paleozoic types are rare, the Pseudotomariidae, Bellerophonidae, Etomophasidae, Trochonematidae and the Platyceroidea. The group of the Conularidae with Myolithes, Tentaclites and Conularia, are also typically Paleozoic only a few representatives of the latter continuing into the Tertiary.

The tetrabranchiate cephalopods were well represented during the Paleozoic by the Nautiloidea. Of forty families belonging to this class, only one, represented in the Mississippian and only one of these, the family of the true Nautilus, continued to the present time. Of the thirty-seven Paleozoic families three have representative genera in the Trias and one is represented by a single genus. The straight-coned nautiloids (orthoceracoids), the bent cones (cycloceracoids), and the loosely-coiled cones (gyrocotacoids) are practically confined to the Paleozoic rocks, the close-coiled nautiloids alone having very rare horizons as well. The ammonoids on the other hand are represented in Paleozoic rocks only by their more primitive types. The Goniatitidae and Climenoidae belong exclusively to the Paleozoic (Devonian to Permian), while the other groups are only represented by the order Phyllocampylida.

Among crustacea, the Trilobites are wholly confined to the Paleozoic rocks, of which they constitute in many respects the most characteristic form. The characteristic type of crustacean was during Cambrian and Ordovician time. The remarkable order of Eurypterid crustaceans is also confined to the Paleozoic, constituting the most characteristic type of certain formations. The only other type of crustaceans abundantly represented in the Paleozoic rocks is that of the small bivalve ostracods.

P a l e o p h y s i o g r a p h y o f N o r t h A m e r i c a. — The physiographic changes which the North American continent suffered during Paleozoic time may be summarized as follows: In early Cambrian time the greater part of the interior of North America was out of water, the eastern shore being probably a short distance east of the present Appalachians, and the western shore on the western flanks of the Rocky mountains. The southern shore was not far north of the present southern boundary of the United States. A narrow gulf extended northward along the western flank of the Appalachian protaxis, and probably connected with a similar gulf extending southward from the present Saint Lawrence gulf.

The fauna of this Appalachian trough was mostly distinct from that of the Atlantic border. In the succeeding periods there was a continuous subsidence of the land, and a transgression of the shore-line, which closed in upon it, especially from the southwest. As the sea in each succeeding epoch reached farther up onto the land than it did before, it replaced the deposit of later date lapped over the earlier ones. This encroachment continued with many interruptions through the early part of Ordovician time, when the great Appalachian Valley, bounded by two parallel folds, came into existence. This separated the interior or Mississippian sea from the Atlantic, until, with the final emergence of the land, this sea was transferred to the Great Plains region of the west.

With the formation of these folds, the interior sea retreated southward, only to readvance again during middle Ordovician time, when it reached far up onto the old Canadian land. Through great part of the Paleozoic, the Atlantic, periodically communications were established across the barriers, allowing the ingress into the eastern area, of the European graptolite and trilobite faunas, in middle Trenton and in Utica time a sea of the close of the Taconic revolution caused the formation of an effectual eastern barrier, and at the same time the waters of the interior sea were largely withdrawn. A gradual resubmergence in Siluric times, re-established the mississippian sea. In mid-Siluric time it was probably entirely enclosed by land, only the region between the Appalachians and the Mississippi River being covered by water. This water body extended northward beyond the present limits of the state of Illinois and the artesian regions beyond. It probably communicated with the European continent by a channel traversing the north polar regions, the north Atlantic being then replaced by a continuous land which connected New England with Scandinavia by way of Labrador and Greenland. This northern channel was later on closed for a period, so that all that portion covering the eastern United States became a saline sea in which the salt became extinct. In this North American dead sea, the great Siluric salt and gypsum beds of New York, Ohio and Michigan were deposited. At the close of the Siluric the whole of the North American continent became dry land, and the Mississippi sea was reduced to a narrow channel along its former eastern border. In this channel the Helderbergian rocks of the New York and the Appalachian region were deposited. Toward mid-Devonian time this sea spread westward again to Michigan and southward to Indiana, and the great Paleozoic coral reefs began to flourish. The westward transgression of the Mississippian sea continued, until finally a northwest channel was established, by which the Eurasian faunas could enter across what is now northwestern Canada. Many fluctuations and adjustments took place, the eastern border of the sea growing in and out of the Mississippi Sea, the Carbonic time, the sands deposited in the eastern part of this Mediterranean sea permitted the existence of only a sparse fauna, while in the region now known as the Mississippi Valley, great reefs of crinoids flourished. In mid-Carbonic time, the interior sea extended to the foot of the Rocky Mountains, while the greater part of the region east of the present Mississippi
PALESTRA—PALATE

River was converted into the fresh water morasses, in which the extensive coal beds of eastern North America were deposited. This condition continued with slight changes through historic time and was terminated by the geologic and physiographic changes which accompanied the formation of the Appalachian Mountains. This resulted in the permanent elevation of the North American continent. Marine deposits of the early Mesozoic age are known only in the north-west. Later in Cretaceous time, the Great Plains region and the Atlantic border were resubmerged, but eastern North America remained continuously above water, with the exception of a slight submergence in the Hudson and Champlain valleys in late Pleistocene time.

AMEDEUS W. GRABAU,
Columbia University, New York.

Palaestra (Greek, “wrestling-school”), originally a school for the training of Greek youth in gymnastic exercises. At first private, such schools were afterward supported by the state. Throughout the restorations it was a public place set apart, and under official direction, for exercises in wrestling and various forms of athletics. In these schools or gymnasiums special privileges were given to athletes training for contests in the public games. The name palaestra is also applied to wrestling and athletics themselves.

Palafox y Melzi, Don José de, dön hō-sä’ də pə-lə-foh’ e mál’thē, DUKE OF SARAGOSSA, Spanish patriot: b. Aragon 1760; d. Paris, France, 16 Feb. 1847. When very young he was appointed an officer of the royal bodyguard and in that capacity accompanied Ferdinand VII. to Bayonne in 1808. Palafox escaped the capture which befell his royal master and fled to Saragossa which he defended in two sieges in 1808-9, but was captured by the French and imprisoned (1809-13) at Vincennes. He then returned with the king to Spain, and was confirmed as captain of Aragon. Later he turned against Ferdinand VII. and in 1833 joined the forces of Queen Isabella. He was created Duke of Saragossa in 1836.

Pailahinnhan, pə-lih’në-hën, or Pit River Indians, an American family comprising numerous tribes living in the northeastern part of California, in the basin of the Pit River, hence the local or common name of Pit River Indians. Seven distinct tribes of these people were known in the days of 1849, but they are now almost extinct. They are of a low type of the American aborigines.

Palais Royal, Fr. pə-la’-rwa’-yal, a collection of buildings in the Rue Richelieu in Paris, composed of a palace, public gardens, shops, cafes, and restaurants. The palace was built in 1634. (See Paris.) Here Napoleon installed the court in 1804, and in 1814 it was re-purchased by the Duke of Orleans. He formed the Cours de Nemours, and built the Gallerie d’Orleans. At the revolution of 1848 the Palais Royal was appropriated as the domain of the state, and called the Palais National. On 23 May 1871, during the struggle between the army of Versailles and the Communists it was set on fire. The left wing and part of the central pavilion were destroyed, but the galleries and the Théatre Français were preserved. The destroyed wing has been rebuilt, and other portions of the palace have also been restored. The Théatre Français and the Théâtre du Palais Royal form part of the buildings.

Palamedes, pə-lə-më-dëz, in Greek mythology, a hero, the son of Nauplius and Clymene. Although figuring prominently in the later accounts of the Trojan war, he is first mentioned in the Homeric writings. Having discovered that the madness of Odysseus was only feigned, and having brought him to the leaders before Troy, Palamedes is said to have become an object of hate to that hero, and to the vengeance of Odysseus, according to some of the varying stories, the death of Palamedes was due. He is represented as skilled in learning, and his name is connected with the invention of letters, numbers, money, weights and measures, checkers, and dice.

Palanan, pə-lə-nən, Philippines, a pueblo of the province of Isabela, Luzon, on a river, five miles from the Pacific coast, at the foot of the Sierra Madre Mountains, 36 miles east of Ilagan. A monte is built near the river and Palalan is the trade centre for the surrounding region. It was here that Aguinaldo was located and captured. Pop. 1,140.

Palanpur, pə-lən-poor’, Pahalnur, or Pahlumpur, native state of India in the province of Gujrat, Bombay division, south of Rajputana. The state is crossed by the Rajputana-Malwa railway, on which the town of Palanpur, capital of the district, is, a junction for the British cantonment of Deesa. The native state has an area of 3,177 square miles and population (1901) of 222,627. A political agency including this and other surrounding states contains 4,775 square miles and has a population of 467,651. The town, with a population (1901) of 17,790, like the state and the agency, suffered terribly from plague, so that the population is one quarter less than 10 years ago.

Palanquin, pə-lən-kən’, Pahankeen, or Palki, a vehicle commonly used in India and Oriental countries. It is a sort of litter or covered carriage, borne on the shoulders of four porters, eight of whom are attached to it, and who relieve each other. It is usually provided with a bed and cushions, and a curtain, which can be dropped when the occupant is disposed to sleep.

Palate, the roof and the superior aspect of the mouth or oral cavity toward its hinder or posterior portions. Anatomiasts are accustomed to speak of the hard and the soft palate. The former is formed by the palate and superior maxillary bones; the latter is the more or less mobile prolongation of the hinder part of the roof or lining membrane of the mouth which is attached to the posterior border of the hard palate. The hard palate supports the tongue when that organ is employed in tasting, in the production of articulate sounds, in mastication, and in swallowing. The membranes and tissues which cover the bones forming the hard palate are of thick conformation, and are closely bound to the surface of the bones. The tissues are thinner toward the middle line of the palate. The palatine glands exist in a row on each side of the hard palate, and are most numerous and larger size as the hard palate is continued backward to form the soft palate. The mucous
membrane of the hard palate is of a whitish color, this appearance being produced by a thick layer of epithelial cells covering the membrane.

The soft palate exists only in the crocodiles out of which the hard palate is derived. It forms a muscular, canal which prolongs the hinder nostrils downward and backward, and is thus adapted to the breathing-process of these aquatic forms. In the ant-eaters the soft palate is nearly eight inches in length. It consists in all of mucous membrane and muscles, and forms a semi-particle between the mouth and the hinder nostrils. In front it is attached to the hard palate. Behind it is free, and in the middle is pointed, the uvula, is situated. Its upper surface, or that next the nasal passages, is convex, and is prolonged to form the floor of the nose. The lower or under surface is concave, so as to adapt it to receive the back of the tongue; and on this surface the soft palate bears a median ridge, showing the early stage of its formation, when it consists of two halves. Non-union of these halves and of those of the hard palate produce the deformity known as Macrostomia, which is abundantly distributed in the membrane forming the soft palate, these structures secreting the mucus which serves to lubricate the throat during the passage of food. Above these glands muscular tissue is found, and the upper surface is formed of mucous membrane of the nasal passages already alluded to. The uvula, depending in the middle of the soft palate, gives to the latter the appearance of a divided or double arch. This structure, the uses of which are undetermined, consists of numerous mucous glands, and a muscle known as the azygous uvula. The uvula varies in length in different subjects and at different times in the same person. Its permanent elongation gives rise to an irritant cough produced by its tickling the throat, and for the relief of this complaint its lower border is frequently excised.

In front the soft palate becomes continuous with the tongue and pharynx or back part of the mouth. The two mandibular folds on either side known as the anterior and posterior pillars of the fauces. The anterior arch of each side exists as a curve from the uvula to the side of the tongue. The posterior arch begins at the uvula, follows the free edge of the soft palate, and ends at the side of the pharynx. The pillars of each side separate or diverge in a triangular manner from their point of origin, and within the triangle of each side a tonsil is contained.

The muscles of the soft palate number five pairs. These are the levatores palati, which raise the soft palate and bring it to the horizontal position in swallowing. The tensors palati draw the soft palate downward and tighten it, and their action also includes the keeping patent and open of the Eustachian tube. The palatoglossi and palato-phaengyae muscles form the bulk of the arches of the soft palate; and the azygus uvula muscle constitutes the last structure of this description included in the soft palate. The tonsils or amygdalae ("almond-like") are placed between the palate arches. The substance of each tonsil contains numerous foramina, opening externally by 12 or more openings, and more deeply placed are masses of adenoid or lymphatic tissue similar to the Peyer's patches (q.v.) of the intestine. The tonsils are liable to inflammatory affections, and are excised for disease without leaving any bad effects. (See Tonsilitis.) Both the hard and soft palate are supplied with pain by the descending palatine branch of the internal maxillary artery, and with nerves by the palatine branches of the superior maxillary nerve. The use of the soft palate is chiefly to close the posterior nares or nostrils, so that food by the nose in swallowing; during which process the palate is elevated by the levator muscles from its usual dependent position to the horizontal position. In the latter position it lies upon the back of the pharynx, and so closes the nares. The arches of the palate assist in swallowing. The anterior arches during deglutition contract, so as to prevent the food from returning into the mouth; while the posterior arches contract at the sides, and so preclude the escape of food into the nose. The whole process of swallowing is performed firstly by the mass of food being brought to the back of the tongue. The lower jaw being next closed to afford a space abundantly supplied with muscles which raise the larynx, the food is sent into the elevated pharynx by the pressure of the tongue on the palate. The posterior palatine arches and soft palate prevent the escape of the food into the nose at this stage; the anterior palatine arches and tongue prevent it returning to the mouth; the epiglottis is shut over the upper opening of the larynx so as to prevent the food entering the windpipe; and by the action of the masticator muscles of the pharynx the food is finally shot into the oesophagus or gullet, along which tube it is propelled to the stomach by the peristaltic or vermicular contraction of its muscular walls. See MOUTH; NOSE AND THROAT; PHARYNX; TONGUE.

Palatinate, The, (1) a comprehensive term for two states of the German Empire, which, until 1620, were united. The name Palatinate (German, Pfalz) was originally given to the imperial castles dispersed over the German Empire, as the emperors resided alternately, with a view to maintain order by their presence, and to administer justice impartially in all the provinces of the empire. The palatine or count palatine was the highest civil and judicial officer in these castles. Finally, the title was retained by only two of the territorial magnates of the empire, whose states were distinguished as the Upper and Lower Palatinate, or as the Palatines of Bavaria and the Rhine. The Upper Palatinate was included in the circle of Bavaria, and was bounded north by the county of Baireuth, east by Bohemia, south by the county of Neuburg, west by Bavaria and the territory of Nuremberg. Its capital was Amberg. The Lower Palatinate (Palatinate of the Rhine) was contained in the electoral palace of the Palatinate on the right bank of the Rhine, one of the most fertile countries in Europe, and of the Principality of Salmers, the Duchy of Luxembourg, the half of the county of Salmers, and the principalities of Waiblingen and Lautern. The counts-palatine of the Rhine,
PALATINE HILL—PALAWAN

whose original seat was Aix-la-Chapelle, in the 11th century were already in possession of the office, and of the lands pertaining to it, and were among the most powerful princes of the German Empire. In 1227 the entire Palatinate fell into the possession of the house of Bavaria and underwent a series of successes until 1619 when Frederick V., of the Sirmian line, who had succeeded in 1610, was put to the ban of the empire for aspiring to the crown of Bohemia. (See Germany; Thirty Years' War.) His Electorate and estates were given in 1623 to Maximilian, duke of Bavaria. Charles Louis, son of Frederick V., recovered the Lower Palatinate by the Peace of Westphalia (1648), and a new electorate, the eighth, was created for him, with the office of high-treasurer. The Upper Palatinate and the former rank of the elector-palatine in the electoral college remained with Bavaria. In 1742 the electorate fell to the Sulzbach line, represented by Karl Theodor, and in 1777 he succeeded to the Electorate of Bavaria, a portion of the estates of which, however, fell to Austria. This was accompanied by the recovery of the old electoral office of the Palatinate, and the transfer of the grand-treasurership to Brunswick. Toward the close of his reign the Palatinate was conquered by the French. He died without issue in 1799, and was succeeded by Maximilian Joseph, duke of Zweibrücken-Birkenfeld (1800-1825) who was compelled to surrender the Palatinate. The possessions on the left bank of the Rhine were annexed to France, a considerable part of the remainder was given to the Grand-duke of Baden, and the rest was distributed among other princes. At the Peace of 1814 Germany recovered her possessions on the left bank of the Rhine, and the Palatinate was redistributed among Bavaria, Baden, Hesse-Darmstadt, and Prussia. The portion belonging to Baden is included in the circles of Mannheim, Heidelberg, and Mosbach; the Darmstadt portion constitutes the provinces of Starkenburg and Rheinhessen. Bavaria received the whole of the Upper Palatinate and the portion of the Lower Palatinate, forming the Bavarian circle of Rheinfalz. The Prussian portion was added to the Prussian province of Rheinland.

(2) The term palatinate or county palatine came into use in England during the 13th century, the counts or earls-palatine ruling over entire counties, acting as independent princes, exacting feudal rights and contributions, and simply swearing homage and fealty to the king. The principal counties palatine were Lancaster, Chester, and Durham. In the colonial days of the United States Maryland was granted to the Baltimore family as a county palatine on the model of Durham.

Palatine Hill (Lat. Palatinium, later Mons Palatinius), the most central, the earliest settled, and (save for the Capitoline) the most famous and important of the seven hills of Rome. About 150 feet above the Tiber and 15 more above the sea-level the hill is an irregular quadrilateral, and to this shape is due the mythical Roma quadrata, the primitive city built by Romulus. The name Palatium, which the Romans connected with the Arcadian city Palantium, is probably related with Pales, an Italian rural divinity. On the Palatine the LupercaUi was celebrated in honor of Romulus; there were the ancient temples (of Victory, Jupiter Stator, and the Magna Mater) in the days of the early republic, the residences of Cicero, Marcus Scaurus, and others in the last period of the republic, and at the beginning of the principate Augustus' own home (to which fact the use of the word "palace" from Palatium is due), the temple of Apollo dedicated in 28 B.C., and the Latin and Greek library. Tiberius and Caligula built additions to Augustus' palace; the latter emperor bridged the Capitoline to the Palatine. The Palatine was no longer used as an imperial residence after the time of Alexander Severus, and there was no more splendid building there until Pope Paul III. built the villa called Orti Farnesiani. Excavations of the hill began in 1762 under Bianchi's superintendence, and was renewed a century later by Rosa at the expense of Napoleon III. The Italian government purchased the Farnese Gardens in 1871, and now has charge of excavations.

Palatka, pa-lat'ka, Florida, city, county-seat of Putnam County; on the St. John's River; and on the Florida E. C., the Florida Southern, the Georgia S. & F., and the Jacksonville, F. & K. W. R. R.'s, 47 miles in direct line south of Jacksonville. It is the center of a prosperous agricultural and fruit region, is in daily steamer communication with Jacksonville, and exports large quantities of oranges, sugar, and cotton. It is a popular as a winter resort. It is the seat of the Putnam County High School, and of the St. Joseph's Academy and Day School (R. C.). Pop. (1890) 3,039; (1900) 3,301.

Palawan, päl'ā-wā'n, Philippines, the most southwestern island of the archipelago, lying west of Mindoro, Panay, and Negros; it is bounded on the west by the China Sea, which it separates from the Sulu or Mindoro seas; area 4,368 square miles, with dependent islands 4,726 square miles. It is one of the largest islands of the Philippines, and from its geographical position one of the most important, as it lies in the trade route between India and China and Mамиa.

Topography and Climate.—The island is long and narrow in shape; the greatest length from northeast to southwest is 278 miles, and the width averages only 17 miles, and is nowhere more than 30 miles. The coast is indented with numerous sounds, gulfs, and harbors. It is an important among them Malampaya Sound (q.v.). A mountain system which divides Palawan into two watersheds, extends the length of the island following the general direction of the coast; the highest summit of this system is Mantaalingahan in the south (6,843 feet); the average height is from 2,500 to 3,000 feet; between the summits are high table-lands. There are a number of rivers, which are all short; in the northern part there is a lake which opens into the ocean by a subterranean river. The climateology of the island shows two seasons, the southwest monsoon or wet season and the northeast monsoon or dry season; the heat is not extreme; malarial fevers are common on some parts of the coast.

Forests and Fauna.—The mountains are very heavily wooded, the forests contain valuable building, dye, and medicinal woods, including ebony, sandal, logwood, bamboo, ipil (a very hard wood), aaply, camphor, gum mastic, mo-
PALAWAN PASSAGE—PALEMBANG

lave; a number of the trees found in Palawan exist nowhere else in the Philippines. Dammar, a gum which exudes from a large tree, is found in many places in deposits in the earth, which have, however, never been fully worked. The nipha palm grows luxuriantly along the rivers, and rattan is an important article of export. There are also numerous plants of varied character, including orchids and pitcher plants; among the latter is a trailing variety, the pitchers of which will hold a pint and a half of water. The wild animals of Palawan are not very numerous; there are several varieties of the monkeys, also the pakda or big ape, and porcupines; the birds are mostly of unusual species. Reptiles are abundant; alligators are commonly found in the lakes and swamps, and the pythons are unusually large, specimens over 22 feet long having been found.

Industrial Resources.—The resources of the island are as yet poorly developed. The chief industry is the raising of cattle, hogs, and goats; goats and fowls are bartered with the ships along the coast. Rice, tobacco, nutmegs, sweet potatoes, and other food products are raised for home consumption, and there are a few primitive manufactures also for domestic use. Edible birds' nests are found in large numbers in the rocky caverns of the coasts; they are of excellent quality, being considered second only to those of Penon de Coron (q.v.), and have brought twice their weight in silver in the Chinese market. Honey and wax are also collected and brought to the coast for trade. There are no roads, except a few portages, but a number of trails; the rivers also afford means of transportation near the coast.

People and History.—The dominating race of the northern and central parts of the island are the Tagbanuas (q.v.); a peaceful and docile race; the Moros predominate in the southern part, south of the 10th parallel of latitude. Previous to the 18th century Palawan was a part of the sultanate of Borneo; in the early part of Palawan the Spanish authorities established several garrisons in the northern part of the island for the purpose of protecting their dominions on the north from the Moro pirates, and the island was soon afterward ceded to Spain. In 1885 a special grant was made by the Spanish government to colonize Palawan by offering settlers free transportation and other privileges, but this failed. An attempt to establish a convict settlement was also unsuccessful, and Spanish authority was recognized only along the coast. The United States troops occupied Palawan in the early part of 1902, and in June of that year civil government was established in that part of the island lying north of the 10th parallel of latitude; the part south of this parallel, known as the Country of the Moro, is as yet (1904) without civil government. The most important town of Moro Palawan is Puerto Princesa, which has not 2,000 inhabitants. The island of Balabac, lying south of Palawan, is governed in accordance with the terms of the treaty with the Sultan of Sulu. Population of the island 50,000.

Palawan Passage, the route through the Balabac Strait and along the east coast of Palawan by vessels from China and Manila during the latter part of the southwest monsoons, because more sheltered than the China Sea route to the west of Palawan. This route was first explored in 1890 by Captain Bates of the British navy, and soon afterward generally adopted.

Palazzo Pitti, pā-lāt’sô pî’tē, a palace in Florence. See Florence.

Pale, The, or the English Pale, Ireland, a name applied in the 16th century to that part of Ireland which was completely under English rule, to distinguish it from the parts where the old Irish laws and customs prevailed. It varied in extent at different periods, consisting of Dublin and more or less of the neighboring country.

Palea, plural Paleæ, the bracts, usually membranous and colorless, on the receptacle of a composite plant between the florets; the chaff. Also, the bracts immediately surrounding the fertilizing organs in grasses. See Bract; Flower.

Paleario, pāl-lā-rē-ō, Antonio, more correctly, Antonio dei Pagliarici, and according to his Latinized title Aontus Palaearius, Italian religious innovator; b. Veroli, Roman Cam- pagna, 1500; d. Rome 1570. He was a teacher of rhetoric, whose reputation had spread over all Italy and abroad, and made his home especially at Sienna, but in 1567 was brought before the Holy Inquisition at Rome and three years later suffered at the stake. His principal work is a long Latin didactic poem, 'De Immortalitate Animarum.' Famous as his poetic and theological writings were, equally popular was the work attributed to him, 'Del Beneficio de Deo Christo Crucifissi' (1543), which was translated into several languages, but in 1549 was suppressed by the Inquisition. It was published at Cambridge, England (1853), and at Leipzig with a German translation by Tischendorf (1856). Ranke maintained it to be the work of a Benedictine monk, Benedetto of Mantua. Consult: Young, 'Life and Times of Antonio Paleario' (1860); Bonnet, 'Aonio Palereo' (1863).

Palembang, pā-lēm-bâng', Sumatra, Dutch residency in the southeastern part of the island; also the capital city of the residency. The country is drained by the Musi (or Moei) River, along the banks of which there are valuable supplies of petroleum. An alluvial plain and plentifully watered, it is very fertile. Its native inhabitants are Moslem Malays, except a race called Orang-Kubu, living by the chase in the thickest jungles and exhibiting a very primitive culture. Palembang residency has an area of 53,497 square miles and a population (1900) of 692,317, of whom 372 were Europeans, 1,876 Arabs and 6,451 Chinese.

Its capital city of the same name lies on both banks of the Musi, 44 miles from its mouth in a swampy region, the houses being sometimes built in the very stream. The old Javanese name for the city seems to have been Malayo, so that it may be the Malajour of Marco Polo and the Mo-lou-yu of the Chinese geographers. An attempt has been made to prove that the town was once held by Hindus, an occupation
like that in Java. The main building is an 18th century mansion. Coffee and pepper are exported; and there is some trade in silks, carvings, and goldsmiths' wares. The Dutch built a factory here in 1618, but the country remained independent until 1812 when it was occupied by the English; the British passed to the Dutch in 1821. Pop. about 55,000.

**Palenque**, Mexico, ruined city in the state of Chiapas, on the Chacamas River, about 60 miles northeast of Ciudad Real, discovered in 1746. The tropical vegetation of the district makes it impossible to know the exact extent of these ruins. Those which have been visited show great artificial terraces or truncated pyramids, forming the level resting place for temples or palaces of calcareous stone, covered with stuccoed decorations, colored carvings in relief and undeciphered hieroglyphics. These buildings have a slightly sloping, Mansard-like roof. Five of the edifices have been stylized temples, though it can not be considered at all certain that they were. The largest of the buildings, which is called the Palace, are divided into two vaulted rooms, there being only the two in each "temple," where, however, the rear chamber is divided into several smaller rooms, whereas in the Palace there are many series of these paired rooms. The vaults of the rooms are corbeled and have a triangular arch, commonly but loosely called Mayan, as it is not the only building of the Mayan empire. The external architecture is too elaborate for brief description and everywhere is covered with stucco figures in alto relievo and brilliant colors, black, blue, red, yellow, green and white. An arched bridge 30 feet wide and 40 long and an arched waterway 10 feet high, 500 feet long and 7 feet wide have also been found and are typical of the massive architecture of "temples" and "Palace"; some of the walls of the latter are 2 and 3 feet thick. Some valuable remains of early implements and personal decorations have been found in graves on the site. But they throw no light on the question as to the identity of the builders, who have been thought by some to be the semi-mythical Toltecs or the Olmecs. Central America (1895); Charny, "Ancient Cities of the New World" (1887); and Morgan, "Houses and House Life of the American Aborigines" (1881).

**Palermo**, päl-lér'mō, Italy, (1) a seaport town, capital of Sicily, beautifully situated on the northern shore of the island on the Gulf of Palermo, surrounded by a fertile plain and partly enclosed by lofty hills. Its numerous spires, domes, and towers give it a very imposing appearance when approached from the sea. Two main streets, the Via Vittorio Emanuele and Via Maqueda, intersect the city at right angles to each other. Near the centre is an octagonal space, the Quattro Canti, lined with elegant buildings in different styles of Grecian architecture. Central and Southern Europe, and the two principal streets are opened into by a great number of others, mostly narrower and of an inferior description; but all well paved with blocks of lava. There is now an extensive system of sewers. Many of the places of resort are provided by the Marina and the Flora—the former a superb terrace about 80 yards wide, stretching about a mile along the bay; the latter, commencing in the east where the terrace terminates in a magnificent public garden regularly and beautifully laid out, and adorned with statues, fountains, and rustic temples. Here is also a botanic garden of some extent, and there are several other public gardens. The public offices are only used, but do not in general display much taste. The most important are the cathedral, the church of San Giuseppe, the church of San Salvatore, La Martorana, and other churches; the royal palace, finely situated and surrounded by beautiful gardens, a large and irregular pile of buildings, among which the only great attractions are the chapel of King Roger (or Palatine Chapel), rich in mosaics, "perhaps the most beautiful palace-chapel in the world," and the observatory; the archbishop's palace; the national museum and picture-gellery; the communal library, with about 220,000 volumes; the national library, with over 150,000 volumes; the university, attended by 1,200 students; the barracks, arsenal, courts of justice, theatres, hospitals, and a dozen literary and charitable endowments. Palermo has a good roadstead and harbor, which has been recently improved, and a well-equipped shipbuilding yard and dry dock have been constructed. The principal articles of export are sumach, wines, oranges and lemons, sulphur, tartar, olive-oil, citrate of limes, tomatoes, tomato paste, asphalt, hides, dried vegetables, macaroni, etc.; and among the imports are coal, grain, wood, petroleum, tobacco, iron, and steel rails, sheets, bars, etc., cement, machinery, sulphates, fish, etc. The total number of vessels that cleared from the port in 1900 was 3,732, with a tonnage of 1,677,234. The manufactures of the town include gloves, marble works, etc., and there is a foundry. The fisheries on the coast are productive, and give employment to numerous hands. Palermo is the see of an archbishop, and the seat of a supreme court with jurisdiction over the whole island; of a criminal court for the province, of a commercial and several other inferior courts, and of several important public offices. Its foundation is attributed to the Phoenicians. From them it passed to the Carthaginians, who made it the capital of their Sicilian province in the 6th century B.C. It became the centre of an extended commerce. The Romans obtained possession of it in 284 B.C., made it a free town, and conferred upon it many important privileges, in consequence of which it increased rapidly and became very prosperous. After the fall of the Roman Empire the Saracens became its masters, and kept possession of it till 1072, when it was taken by Roger the Norman, who founded the kingdom of Sicily. Since then it has always continued to be the capital. It has repeatedly suffered from earthquakes. This and the other vicissitudes which it has undergone is probably the reason why so few remains of antiquity are to be found within it. Some, however, still exist in its environs, which, both on this account and the magnificent and beauty, are in many respects more attractive than the town. During an insurrection which took place in January 1848, the town was bombarded; and Garibaldi seized it in 1860. Pop. 1901, 310,352. 40 by 30 miles, or 1,094 square miles. Its coast consists of a series of extensive bays and bold promontories. Its interior toward the south is traversed, east
to west, by a branch of the Neptunian Mountains. The streams are numerous, but small. The soil is fertile. Pop. (1901) 785,016.

Pales, pâlēz, in ancient Italy, a divinity who presided over fields and meadows, and was worshipped, sometimes as a god, sometimes as a goddess, in which latter character Pales was identified with Vesta or Anna Perenna. The festival of Pailia was celebrated 21 April, the anniversary of the founding of Rome, when milk and cakes of millet were offered. Cognate with Pales are *palatium,* a palace, and *Pala
tinus,* one of the seven hills of Rome, and the divinity, as protector of property, and home, is among the earliest figures that occur in Roman mythology.

Palestine, also called The Holy Land, Canaan, Judea, and The Land of Israel, a classic region of Asiatice Turkey, southwest of Syria, corresponding approximately with the modern meterrasatifas of Lebanon and Jerusalem. Its western shore forms the eastward boundary of the Mediterranean Sea and its north, east, and south boundaries respectively, are the Mountain of Lebanon, the Arabian Desert, and Arabia Petraea. It is situated between lat. 31° 30' and 33° 30' N.; Ion. 34° 30' to 36° E.; has a length north to south of about 140 miles, a breadth of about 80 miles, and an area of about 10,000 square miles.

Topography and Physical Features.—The surface generally is mountainous, traversed by branches from the chain of Lebanon, one of which stretches south in a direction nearly parallel to the coast of the Mediterranean, forming the watershed between its basin and that of the Dead Sea; while another, turning more to the east, stretches along the left side of the valley of the Jordan. The mountains attain their greatest height, of about 9,100 feet, in Mount Hermon, where they first become detached from the principal chain. None of the other heights exceed 4,000 feet; but many are celebrated from the frequent mention made of them in the Bible, and from the events of which they have been the theatre. The highest, with the exception of Carmel, forming a promontory in the Mediterranean, on the southwest side of the Bay of Acre; Tabor, or the modern Jebel Tur, at the northeast extremity of the plain of Esdraelon; Beth-Gerizim, on the plain of Samaria; Gilead and Nebo, or Pisgah, on the east side of the Jordan; and Zion, Moriah, and the Mount of Olives, in and near Jerusalem.

Of limestone formation, the mountains abound in caves of all varieties of size and form, many of them of Scriptural importance. The earliest mention of a cave in Scripture is in the history of Lot (Gen. xix. 30). The next is at the death of Sarah, when Abraham bought the cave of Machpelah for a burying place. This is now contained within the limits of a mosque, at Hebron, and remains in all probability just as it was when the patriarchs were buried in it. The Moslems can give no real information regarding it, for they will not enter it, dread ing immediate death at the hands of the Abrahamic spirit, which they believe to reside in it. Caves are frequently mentioned in the books of Judges, Joshua, and Samuel, but the only one specified is that of Adullam, which has been identified with the cave of Khureitun (the ancient Hareth), some five miles south of Bethlehem—a singular cave, or rather series of caves and chambers, extending for miles, to which the one entrance is an orifice not larger than a door, halfway down the almost perpendicular face of a precipice; this orifice is reached by a ledge of rock, along which one has to find the way cautiously to the cave. The interior is quite a labyrinth, with vaulted chambers remarkably dry and warm, but with no impure air. It could accommodate hundreds of men, all hidden in these far-extending chambers. There are caves at Deir-Dubban, not far from Khurei
tun, about half-way between Jerusalem and Eleutheropolis, but these do not correspond with the scenes in David's history; although these western ones are reputed to be David's cave, and the eastern (Khureitun), near Tekoa, Saul's caves or cave. That these huge caves or grottoes at Deir-Dubban were used both for hiding-places and dwelling-places, both in Jewish and Christian days, is pretty evident; but whether this is the place of the Adullam cave of David is not so plain. There were caves in Galilee also. The "cotton cave," or "Kotton-Meghara, under Jerusalem, is a wonderful cavity, containing under a hundred cubits of city. But though called a "Meghara," it is an old quarry, out of which Jerusalem was partly built, and therefore interesting, especially as the traces of the quarrymen are still visible in every recess.

Palestine has comparatively few plains, but has numerous valleys; it is the country which Moses describes, "a land of hills and valleys." The small plains are numerous, the large few; among them are the maritime plains of Phoenicia and Philistia, the river plain of Jordan, the inland plain of Esdraelon, and the mountain plain of the Bekâ, between the two Lebanons. These are widely different from each other, though within a small territory. The sea plains from Gaza to Beirût are well peopled and tilled. The Jordan plain is nearly a waste of sand, that river making no further impression upon the levels on each side than merely to fringe itself forth with some vegetation. The Esdraelon plain, or "valley of Jezreel," is a fine plain of considerable extent, fertile and well cultivated. In the district of El Huleh or "the Waters of Merom," and in such low-lying districts as Samaria, Gilead, and Nebo; and in the Mar Profile, are marshes and at certain seasons wide tracts rendered almost impassable by the overflow of streams. The heat during the greater part of the year, from April to November, dries up most of the marshes, and scorches plains both hill and plain. In later ages this is more especially true, as formerly the extensive woods, orchards, vineyards, and olive-yards which clothed the country shut out the heat, cooled the soil, and retained the moisture.

Hydrography.—In Palestine from time immemorial, wells and springs have been held in such veneration, that it is as much sacrilege to destroy a well as to defile a mosque or injure a tomb. The places named from the Enspring (or Fountain) by the Kedosha, or most venerable, are numerou s. Among these are "the Fountain of Two Calves," En-Eglaim, near the Dead Sea; the "Fountain of Gardens," En-gannim, of which name there were two cities, one in Judah and another in Issachar; the "Fountain of the Goat,"
PALESTINE

Engedi, now Ain Jiddi, on the shore of the Dead Sea, one of Judah's rocky springs; the Fountain of Sharpness, or Swiftness, En-Haddah, one of the springs of Issacher's plains; En-Rimmon, in the southern extremity of the land; the Fountain of Faur, near Beer-Sheba; the Fountain in Jerzeel, by which Israel pitched in the battle between them and the Philistines; and others. There are the wells of the patriarchs in different places — the Well of Abraham at Beersheba, now represented by two, still well filled and surrounded by large stone troughs; the wells of Isaac, south of Gerar, Simeon, Eshek, and Rehoboth, of which only the last can be said to have a representative, at Ruhaihen on the great Roman road; the Well of Jacob, dug out of a spur of Gerizim, and close by Joseph's tomb; the Well of Bethlem, which David knew so well, as no doubt the well of his shepherd-boyhood; the Well of Sirah near Hebron, where Abner was overtaken and slain by assassins. While these are good wells, many modern wells in use, which, though probably the remains of ancient ones, are unmentioned in Scripture. Few of these wells are properly kept, though none are gratuitously destroyed. Some have become quite unserviceable; and even Jacob's Well is in such a state of disrepair (the masonry in the upper part having fallen in) as to require almost a redigging before it can be of use. Elisha's Fountain still pours out its clear current, though little care is apparently bestowed on it.

There is but one river worthy of the name in Palestine — the Jordan, one of the most tortuous of streams; always supplied with water, though often so considerably beneath the verge of its banks as to be invisible from any distance. The Jordan originates in streams that come from Lebanon and Hermon, and unite in the Waters of Merom. It falls into the Dead Sea after a course of about 70 miles direct, or 200 including windings. Numerous streams find their way westward to the Mediterranean from Libanus and its prolongations or offshoots as far as the Hills of Judah. Equally numerous streams flow eastward from the same range into the Hermon, Sea of Galilee, Dead Sea, and Jordan. Antilibanus, sending its offshoots down the east of Jordan, and forming the Mountains of Golan, Gilead, Ammon, and Moab, is the watershed for a large tract of country between itself and the Ghor or Jordan Valley. Though the rivers are in general small, yet they are not mere summer brooks as many suppose. That but few of the innumerable wadys or water-courses are filled throughout the year is true; but still there are several permanent streams which, though not thoroughly filled, which they pass. Passing by what we may call Lebanon streams, which are always vigorous, there is the Zerka, a few miles north of Cesarea; the Aujel, a little north of Jaffa; and the Runamun, and the two streams which spring from the Mokutt or Kishon (Kutta-Kishon), which is sometimes, however, low enough, so low that when it reaches the sea it is lost in the sands. None of these are navigable, but they are rivers all the year round, and wide enough to allow boats to ply on them for some little distance. There is a vast number of water-courses in every part of the land, which would make its irrigation minute and complete were the rain sufficient to fill these, or rather sufficiently regulated and distributed over the year to keep these always filled; and were the land properly covered and its soil protected by wood, so as to moderate the heat and prevent the excessive evaporation. The words of Moses were true words when he called it "a good land, a land of brooks of water, of fountains and depths that spring out of valleys and hills." The whole land bears marks of having been better watered than at present, and contains everywhere the remains of artificial appliances, such as terraces, cisterns, and wells, by which the rain was regulated and distributed.

The lakes of Palestine are three in number, Merom, Tiberias, and the Dead Sea, the first seven feet above, the last 1,250 below sea-level. For quiet beauty the Huleh, or Waters of Merom, with the adjoining vale, are remarkable, and for subdued attractiveness the Sea of Tiberias; but for brilliance there is nothing to be compared to the Dead Sea — the ancient Salt Sea, now Asphaltitis. What is to be said about the former two, about this last is grandeur, notwithstanding the aridity of its shores, and the discomforts of its exceptionally hot climate. The silvery sparkle of its waters arising from their saline and bituminous composition gives a brightness to the scene which is enhanced, not neutralized, by the dark shadows of the Mountains of Moab. These lakes form three singular depressions or troughs in the great natural groove or gorge extending from the Bekal to the Arabah, about 200 miles. This extraordinary hollow, so far below sea-level, is kept in its present state mainly by its own heat. Were the climate to become temperate, the Sea of Tiberias would rise greatly, and transform the Jordan into a Rhine, in parts of the Ghor into a lake; the Dead Sea would swell up and overflow into the Arabah, producing changes in the whole of the southern region which it is impossible to calculate upon. The length of the Dead Sea is 45 miles; its greatest breadth 12. The density of its waters varies between 1,150 and 1,430 (pure water being 1,000). There are ancient shore-lines at a height of 1,200 feet on the surrounding hills.

Geology.—Along the southern border of Palestine, where the hill-country of Judah begins, to the extreme north, there is almost unvarying limestone. In passing from Sardinia, Italy, Greece, or Asia Minor, there is an interesting resemblance, in color, feature, and composition, between the rocks of these regions and those of Syria. Syria is, as a whole, a rugged, hilly region composed of limestone of the Secondary period; a country seamed and torn by volcanic action from one end to another; long stripes of depression and elevation parallel; the latter broken across and across into wide districts of table-land interspersed with hollows and valleys, with solitary hills or little groups of clustering peaks. The great masses of rock which cover the mountains that enclose Palestine and Lebanon are Jura limestone: compact, hard, not rich in fossils, and full of caverns and grottoes. This rock is everywhere the basis on which have been deposited in some parts extensive tracts of volcanic products; as also chalk
and chalky limestone, magnesian limestone (dolomite), sandstone, conglomerate, marl, etc. On the west of the Jordan and Arabah the chalk formation which prevails through the southern desert terminates with the desert; and the Jura limestone, beginning with the mountains south of Hebrew, and running northward, forms the mass of the western hill-country of Carmel and of Lebanon. East of the Jordan and Arabah, where, around Petra, large masses of porphyry, sandstone, and limestone lie in close proximity, the same Jura limestone extends northward through the Belkah and the mountains of Ajlün; and is likewise the basis on which rest the vast volcanic tracts of Haurán, Jaulán, and Jejah.

Flora and Fauna.—The flora of Palestine is large and varied; about 1,000 species have been noticed, and the whole number is probably at least 2,000. Among the trees are the cedar, oak, ash, olive, palm, sycamore, oleander, walnut, etc. Wheat, barley, and other grains are cultivated; the vine is almost neglected now, though it is no country better suited to its cultivation than Palestine.

The number of mammals inhabiting Palestine is large for the country, amounting to about eighty in number. Of the wild animals mentioned in the Bible, the lion and the rōm or unicorn, that is, the aurochs, are no longer found in Palestine. Among carnivorous animals are the wolf, the hyena, the jackal; the leopard, on the sides of Carmel and Gilead or in the forests of Galilee; and the bear, in Hermon and Lebanon. The wild boar is common, and much dreaded by the husbandmen on account of the ravages it commits. Other Mammalia are the wild goat, the gazelle, the coney, hare, jerboa, rat, mouse, bat, etc. Of the birds of Palestine there are over 350 species; chief among them are the roller, bee-eater, hoopoe, Smyrna kingfisher, belted kingfisher, sun-bird, great shrike, and bulbul. More noticeable than these brightly-colored birds is the immense number and variety of the larger birds of prey—the vultures, eagles, falcons, griffins, kites, peregrines, and buzzards, which abound in every part of the Holy Land, and are at first sight its ornithological characteristics. Reptiles are numerous. They include the lizard and the water tortoises, the crocodile (leviathan), the chameleon, and a variety of lizards and serpents. Fishes are abundant in the Jordan and its affluents, and in the Sea of Galilee are found in immense shoals. The most numerous species are the barbel and the bream. Lower in the scale of animals are the scorpion, the locust, hornet, bee, and grasshopper.

History.—The name Palestine, derived from the Hebrew Pēleṣēḵeth, and meaning the land of the Philistines, occurs in this sense in several passages of the authorized version of the Bible, and in several others in the Hebrew, where it is translated Philistia. It is properly applicable only to the southwest part of the country, stretching along the shores of the Mediterranean. It appears to have been first used in its more extended sense by Greek authors, and derived additional currency from its adoption by Josephus and Philo. The ancient name of the country was Canaan, which it evidently owed to the descent of its inhabitants from Canaan, the fourth son of Ham, and a grandson of Noah. When thus named, in the time of the patriarchs, it was parcelled out among a number of independent tribes or nations; the Kenites, Kenizzites, and Kadmonites, on the east of the Jordan; the Hittites, Amorites, Jebusites, and Amorites, in the hill-country of the south; the Canaanites proper, in the centre, from the Jordan to the coast; the Gergashites, on the east shore of the Lake of Tiberias; the Hivites, in the north, among the ramifications of Lebanon; the Philistines on the south, and the Phcenicians on the north coast. In the time of Moses the country east of the Jordan was conquered and divided among the tribes of Reuben and Gad and the half tribe of Manasseh. Under Joshua the work of conquest was carried on to the west of the Jordan; and the whole territory, though not to the extent originally promised, allotted to the remaining half tribe of Manasseh and the other ten tribes (1445 B.C.); the larger portion of the south falling to the tribes of Judah and Benjamin. Under Solomon the work of conquest appears to have been completed, and all the land which was originally promised was included within the limits of his kingdom. Under his son Rehoboam the kingdom was at first twofold and subdivided into the separate kingdoms of Judah in the south, and Israel in the north (975 B.C.). The latter kingdom was often designated by the name of Samaria, its capital. The division of the country into tribes was completely broken up by the Captivity, which carried away ten of them to Assyria, and supplied their place by a new colony; and by the subsequent transportation of the remaining tribes of Judah and Benjamin to Babylon (584 B.C.). After the destruction of the Babylonian empire Palestine fell under the dominion first of the Persians and then of the Macedonians. When Palestine became the cradle of Christianity with the birth of Jesus Christ, the Romans had established their ascendency, and divided the region into the four provinces of Galilee in the north, Samaria in the centre, Judea in the south, and Perea, which included all the country east of the Jordan. Under Constantine Palestine, now regarded as the Holy Land, acquired new importance, in some degree from the calamities by which it had been laid desolate; and in 396 A.D., on the division of the empire by Theodosius, and the formation of two empires, a Western and an Eastern, Palestine became a province of the latter. This was its condition at the time when Islamism began to make its conquests. Palestine, unable to offer any resistance, soon fell a prey; and Omar, in 636, after taking possession of its capital, converted it into one of the provinces of his caliphate. The severities exercised toward the Christians having roused the indignation of Europe, gave rise to the Crusades, and Jerusalem became for a time the capital of a Christian kingdom. Ultimately, however, Mohammedanism prevailed, and Palestine sunk into a degraded state; from which it is only now recovering. It is only within the latter half of the 19th century that the exploration of Palestine was first seriously undertaken. The most valuable results have been those achieved under the direction of the "Palestine Exploration Fund," a society organized in 1865 for the purpose of making an exhaustive exploration and an exact survey of the Holy Land. The tran-
COUrT OF ANTONIO, JERUSALEM.
gulation of Western Palestine was begun in 1871 and finished in 1877. A large and detailed map of the country has been published and an immense mass of valuable information regarding topography, natural history, its interesting ruins, archaeological remains, and holy places, etc., accumulated. A German society for the exploration of Palestine has existed since 1877. The present population of the country is estimated at 650,000, the Arab element being the prevailing one, and the Arabic language generally in use. The people consist partly of thefellahin or settled cultivators, artisans, etc., partly of the nomad Bedouin, who live by rearing cattle or by other reputable means. The country exports some grain, olive-oil, oranges, etc. Jaffa, Haifa, and Acre are the chief ports. Jerusalem and Nablus the largest towns. Chapels and monasteries belonging to Greek Orthodox, Roman Catholic, and various Protestant churches, abound throughout the land, and especially on and near the sites that are the principal events connected with New Testament history were enacted. A railway has been constructed from Jaffa to Jerusalem and other railways in different parts are projected or in progress. Since 1890, colonies of Jews and also of Germans have been established in the country and are engaged successfully in viticulture and wine-making, notwithstanding the opposition and oppressive taxation to which they have been exposed. A feature of interest is the great amount of property acquired by the Sultan since 1885 in the Jordan Valley and other places, and administered on progressive agricultural principles. The following paragraph from a consular report of 1901, summarizes present economic conditions: "There can be no doubt that the establishment of the Jewish colonies in Palestine...has brought about a great change in the aspect of the country, and an example has been set before the native rural population of the manner in which agricultural operations are conducted on modern and scientific principles." See BETHLEHEM; CRUSADES; JERUSALEM; JEW; NAZARETH; other localities mentioned; and for Bibliography, PALESTINE EXPLORATION FUND.

Palestine, Texas, city, county-seat of Anderson County; on the International & Great Northern railroad, about 135 miles north of Houston. It was settled in 1846, and in 1870, under a State law, was incorporated. It is in an agricultural region in which cotton is one of the principal products. In the vicinity are salt mines and deposits of iron ore. The chief manufactures are cotton products, iron products, and packed-beef. There is considerable trade in grain, cotton, fruit, and vegetables. The prominent buildings are the railroad offices and shops and the Y. M. C. A. building, the churches and schools. A point of interest is Fort Houston. The government is vested in a mayor who holds office two years, and in a council composed of the mayor and aldermen. Pop. (1890) 5,838; (1900) 8,207.

Palestine Exploration Fund, THE, an organization founded in London 22 June 1865, for the purpose of investigating and studying the archeological and other remains of the Holy Land. Excavations were commenced in 1866 and the work has been carried on almost continuously since. Since 1869 the Society has issued a 'Quarterly Statement,' and maintains a Palestinian Museum at 38 Conduit Street, London. The Society has published Conder, 'Survey of Eastern Palestine' (1900); Clermont-Ganneau, 'Archaeological Researches' (1896); Hull, 'The Geology of Palestine and Arabia Petraea' (1886); Tristram, 'The Fauna and Flora of Palestine' (1884), and many other works. See PALESTINE.

Palestrina, Giovanni Pierluigi, jô-van' nê pé-'er-loo-ë-jê pâ-lêz-trê-â' (or Pietro Aloi- si), Da, Italian composer and reformer of ecclesiastical music; h. Palestina (ancient Pre- neste) 1526 (Haberi), or 1514 (others); d. 2 Feb. 1594. He studied in the school of music established in Rome by Claude Goudimel, and in 1551 was appointed by Pope Julius III. master of a choir of boys in the Julian Chapel, and was in 1554 he published a collection of masses dedicated to Pope Julius, who admitted him into the college of choristers of the pope's chapel. He was soon appointed chapel-master of St. John's Lateran, and six years later to the same post in Santa Maria Maggiore, in which he continued till 1571. About this time the Council of Trent, on re-assembling in 1562, had taken up, among other subjects, the abuses which had gradually sprung up in church music and which had grown to an intolerable height. Not only were masses founded on profane airs, often of the most frivolous kind, but the composers of the day, as their manuscripts show, not content with working upon popular airs which suggested the most unbecoming associations, actually imported the words of the profane melodies into their scores. A reform was entrusted to the pope, who appointed a commission to inquire into and regulate the matter. There was no such music in existence as the commission required, and Palestrina, almost the only composer from whose works some illustrative fragments could be drawn, was assigned the task of showing that the compositions of the early church fathers were as consistent with the requirements of art as they were with those of religious usage. In fulfilment of this important task he composed three masses for six voices, which by their artistic beauty and profound spirituality at once settled the question beyond dispute. One of them in particular, the 'Missa Papae Marcelli,' so called in gratitude to his patron, at once established for him a position in the highest rank of musical genius, a place to which the subsequent advance of musical science has only confirmed his claim. In reward for this great achievement of his, Palestrina was appointed in 1571 chapel-master of the Basilica San Pietro at the Vatican, and musical director to the Congregation of the Oratory. He also became teacher of the musical school founded by Nanini. He likewise undertook the revision of the chants of the Missal and the Breviary. A complete edition of his works was published by Breitkopf and Hartel (1856-79). Gollini, Cenni Biografici di Giovanni Pierluigi da Palestrina (1895), and the older work of Bain (1828).

Palestrina, Italy, a town in the province of and 23 miles east-southeast of Rome. It stands upon the slope of a hill and commands a
magnificent view. It was a place of Greek origin, and had become important long before Rome existed. Under the Roman Empire as Rhegium it attained great magnificence, and was often the residence of the emperors. It has numerous ancient remains, particularly those of an immense Temple of Fortune, but the only modern building of note is the Barberini Palace. Pop. 6,000.

Paley, pā'li, William, English divine and philosopher; b. Peterborough, July 1743; d. Bishop-Wearmouth 25 May 1805. He was educated at Cambridge and in 1766 became a fellow and tutor of Christ's College. In 1767 he was ordained a priest. He held the tutorship of his college for about ten years, and his lectures during this period, which were highly successful, contained the elements of his future works. In 1776 he married and gave up his fellowship. Law, bishop of Carlisle, had already presented him with the living of Musgrave in Westmoreland, to which he retired; and he afterward received two other small livings. In 1780 he became prebendary of Carlisle, and in 1785 chancellor of the diocese. In 1794 he was bishop of St. Paul's, and in 1795 sub-dean of Lincoln.

His principal works are: 'The Principles of Moral and Political Philosophy' (1785); 'A Horae Paulinae' (1790); 'View of the Evidences of Christianity' (1794); 'A System of Moral and Divine Theology,' or 'Evidences of the Existence and Attributes of the Deity collected from the Appearances of Nature' (1802).

As a writer Paley was distinguished by clearness and cogency of reasoning, force of illustration, and lucidity of arrangement. He had little claim to originality, and has acknowledged in a general way his indebtedness to others; but what he borrowed he generally set in a clearer light, and developed with the practical sagacity and strong common-sense which characterize the best English writers.

In his 'Moral and Political Philosophy' he follows the principles of Locke. He rejected the theory of a moral sense invented by Hutcheson to explain the probability of the morality of Locke, and founded his system purely on utilitarianism. The idea of the 'Horae Paulinae,' long considered his most original work, is said to have been suggested by Doddridge. The 'Evidences of Christianity' (1794) is founded on Lardner's 'Credibility of the Gospel History,' while Butler and others contributed to its completeness, and his 'Natural Theology' has been shown to be taken, without direct acknowledgment, from a work of Bernard Nieuweny, a Dutch philosopher of the previous century (1654-1718), on the 'Right Use of Contemplating the Works of the Creator,' an English translation of which appeared in 1718-19. The celebrated illustration of the watch is taken almost literally from Nieuweny. Consult: Biographies of Paley by Meadley (1809), Edmund Paley (1824), and Lynam (1825); also Stephen, 'English Thought in the 18th Century.'

Palfrey, pāl'frē, Francis Winthrop, American lawyer and soldier, son of J. G. Palfrey (1751-1821); d. there 5 Dec 1860. He was graduated from Harvard in 1851, was commissioned a lieutenant-colonel in the Civil War and served with gallantry. He resigned in 1863 owing to a severe wound and in 1865 was brevetted brigadier-general of volunteers. From 1872 he was register in bankruptcy. He wrote: 'A Memoir of William F. Bartlett' (1879); 'Antietam and Fredericksburg' in 'Campaigns of the Civil War' series (1882); etc.

Palfrey, John Gorham, American historian and Unitarian clergyman; b. Boston, Mass., 2 May 1799; Cambridge, Mass., 24 April 1881. He was graduated from Harvard University in 1815, studied theology and in 1818 accepted the pastorate of the Brattle Street Congregational-Unitarian Church, Boston, succeeding Edward Everett. He resigned in 1830 to accept the chair of sacred literature at Harvard where he remained until 1839, during which period he was dean of the faculty and one of the three preachers at the university chapel. In 1835-43 he was editor of the 'North American Review' and early allied himself with the anti-slavery movement; he delivered a course of lectures at Lowell Institute, Boston, in 1839 and in 1842, and in the latter year was elected to the Massachusetts legislature where he served until 1843. In 1844-8 he was secretary of the commonwealth of Massachusetts, and in 1847-9 served in Congress; from 1861-7 was postmaster at Boston and subsequently acted as United States delegate to the Anti-slavery Congress in Paris. He wrote much on himself and the slave power, was an editor of the 'Commonwealth' in 1851 and contributed to the Boston 'Whig' a series of articles, 'The Progress of the Slave Power,' which attracted much attention. He allied himself with the Free-soil party and was their candidate for governor in 1851. Among his publications are: 'Evidences of Christianity' (1843); 'The Relation Between Judaism and Christianity' (1844); 'A History of New England from the Discovery by Europeans to the Revolution of the 17th Century' (1865); etc. The last is his greatest work and a supplementary volume was added by his son F. W. Palfrey (q.v.), 'The History of New England from the Revolution of the 17th Century to the Revolution of the 18th Century' (1890).

Palfrey, Sara Hammond ("E. Foxton"), American novelist and poet, daughter of J. G. Palfrey (q.v.); b. Boston, Mass., 11 Dec. 1823. She has published: 'Preambles,' poems (1853); 'Hermann' (1866); 'The Blossoming Bud, and Other Poems' (1887); 'King Arthur in Avalon and Other Poems' (1900); 'Katherine Morn.'

Palghat, pāl-gāt', India, town in Malabar district, Madras, 74 miles east of Bepur, and a station on the Madras railway. It does a flourishing business with the western coast, has a Swiss Protestant missionary station, libraries, reading-rooms, schools, and Victoria Jubilee College. Captured by the English in 1795 it served as base of operations against Tippu Sahib. Pop. (1901) 44,177.

Pagine, pāl'gre夫, Sir Francis, English historian; b. London July 1768; d. Hampstead 6 July 1861. He was son of a Jewish stockbroker; was carefully educated at home; wrote a French version of the 'Homeric Epics,' 'Battic' or 'Chomuchamychaia' at eight; studied law; was married and became a Roman Catholic in 1823, when he changed his name from Cohen to Palgrave,
his mother's maiden name. He practised only in pedigree cases, devoting himself to antiquarian studies; contributed largely to the 'Quarterly' and 'Edinburgh' reviews; edited for the Crown 'Parliamentary Writs', 'Rotuli Curie Regis', 'Calendar of the Treasury of the Exchequer', and 'Documents and Records Illustrating the History of Scotland'; and wrote 'History of England' (1831, only one volume), 'The Rise and Progress of the English Commonwealth' (1834); 'Truths and Fictions of the Middle Ages: the Merchant and the Friar' (1837); 'The Lord and the Vassal' (1844), and 'The History of Normandy and England' (1851-64). He was knighted in 1832. His work, though faulty in some details, did much to revive popular and critical interest in the Middle Ages.

Palgrave, Francis Turner, English poet and critic, son of Sir Francis Palgrave (q.v.): b. Great Yarmouth 28 Sept. 1824; d. 24 Oct. 1897. He was educated at Charterhouse and Oxford, becoming fellow of Exeter College in 1846. He was principal of Southsea Grammar School, and as Gladstone's private secretary for a time, and 1850-5 was vice-principal of Kneller Hall, a normal college at Twickenham. He became a friend of Tennyson with whom he passed many summers in Europe, and in 1884 resigned from the Education office, in which he had risen to the post of assistant secretary. In the following year he succeeded his old friend John Campbell Shairp as professor of poetry at Oxford. He was a man of remarkable sweetness of character, sensitive and cultured; his book, 'The Passionate Pilgrim' (1858), is a spiritual autobiography, which also gives some light on the facts of his life. He is best known as the critical editor of 'The Golden Treasury' of English lyrics (1861; 2d series 1866), the first volume of which ranks as a classic anthology. He edited several other volumes of selections, from Shakespeare (1865), of hymns (1867), of 'Stories for Children' (1868), of lyrics (1871), from Herrick (1877), from Tennyson (1885), etc., and wrote 'Vincent of England' (1881), and 'Amenophis' (1892).

Palgrave, William Gifford, English diplomat and Orientalist, son of Sir Francis Palgrave (q.v.): b. Westminster 24 Jan. 1826; d. Montevideo 30 Sept. 1888. He was educated at Oxford; went to India immediately after graduation; and entered the Bombay native infantry, which he soon left to become a member of the Society of Jesus and to undertake missionary work in southern India. In 1853 he went to Syria as a Jesuit missionary. He narrowly escaped death in the Damascas massacre of June 1861, being saved only by his perfect coolness and his wonderful knowledge of native dialects and customs. In England, Ireland and France he attempted to rouse indignation at the Syrian massacre at Napoleon III became interested in him, and in 1862 sent him across central Arabia to learn the feeling of the Arabs toward France,—an adventurous journey described in Palgrave's 'Narrative of a Year's Journey through the Turkish and Eastern Arabia' (1865). He decided that there was no chance for Christian missions in Arabia, left the Society of Jesus, and entered the English diplomatic service. He was sent to Abyssinia in 1865, was British consul in Tripolitania 1867, in St. Thomas 1873, in Manila 1876, in Bulgaria 1878, and in Siam 1879, and in 1884 became minister to Uruguay. He wrote 'Herman Agha,' an Eastern romance (1872); 'Essays on Eastern Questions' (1872); 'Ulisses: Scenes and Studies in Many Lands' (1887), and 'A Vision of Life' (1891), a mystical poem he had been preparing since 1883, when he wrote 'The Rubaiyat of Omar Khayyam.'

Pali, pālī, one of the most ancient of the Prakrit dialects. Lassen traces it to western Hindustan, and declares it to be related to the S'auraseni and Mâhârâshtri. It was the sacred language of the southern Buddhists, and died out in India with their expulsion, but they carried it to Ceylon, Indo-China, and Burma, where it was superseded as a spoken language by the vernacular. Pāli is derived from a dialect much like Sanskrit, which it closely resembles. Pāli literature embraces the sacred writings of Buddhism, and also many works on ethical, philosophical, historical, and other subjects. The greater part of the Buddhist scriptures, or Pitakas, has been translated into English. One of the most interesting portions is the Jatakas, a complete translation of which was published under the editorship of Prof. Cowell. The Pāli text was edited by Fauböll. The Pāli works of a non-sacred character are: the Dipavamsa, a history of Ceylon to 300 A.D., the Mahâvamsa, another history of Ceylon, written about the end of the 5th century A.D., the Dathavamsa, a history of Buddha's eye-tooth, the Millindapañha, a dispute between a Buddhist priest and the Greek king Milinda of Bactria, and the Rassada Pundita, a work of fables and legends. Consult: Burnouf and Lassen, 'Essai sur le Pâli' (1866); Childers, 'Pāli Dictionary' (1875); Frankfurter, 'Pāli Handbook' (1883); Müller's 'Pāli Grammar' (1884).

Palimpsest Gk. palin, back, again, paeustos, rubbed, a written page prepared by erasure for being filled with new matter. Both the Greeks and Romans erased manuscripts for the purpose of again using the parchment. Cicero bantered his friend the lawyer Trebatius upon his economy in using palimpsests in his correspondence, and expresses the hope that it is his own consultations and not Cicero's letters that he erases. No ancient palimpsests have come down to us. Probably the use of them by the Greeks and Romans was attended with no disadvantage to the literature. With the fall of the Roman commonwealths had been overthrown, and almost all the ancient manuscripts preserved in Europe were in the monasteries, the use of palimpsests began to prevail in the Middle Ages. It is still a matter of controversy whether literature has gained or suffered by the practice. On the one hand, it is held that but for the value of their material, the scraps of ancient manuscripts which have come down to us in the form of palimpsests which have been lost. On the other, it is believed that valuable manuscripts have in this way been ruthlessly destroyed.

It was in the 7th century, when Caliph Omar had cut off the supply of papyrus furnished by Egypt, that a great deficiency of parchment was felt. This deficiency continued until the invention of paper. The use of palimpsests increased until the 11th century, when it reached its height. Some declare that nearly the whole of ancient literature was thus lost in the 8th century. From the time of the Renaissance this
PALINDROME — PALISSY

practice was disapproved; it was forbidden by edicts, but it did not entirely cease until the introduction of printing. In the East the use of calligraphy began much later, and never became so popular. In the West. The scarcity of parch-ment was increased by the demand for legal documents. The monasteries of Bobbio, Fulda, St. Gall, and Mainz were among the most ex- tensive manufacturers of parchment. That which replaced the ancient manuscripts was writ- ing of an ecclesiastical character, lives of the saints, and copies of the church services.

At the Renaissance attempts were made to decipher the ancient and underlying writing on parchment, but it was not till the 18th century that any progress was made. Kniittel (1761) deciphered fragments of a Bible of Ulphilas, and Bruno discovered some entirely new frag- ments of Livy and Cicero. Niebuhr and others made subsequent discoveries, and the subject was taken up systematically and pursued with great success by Angelo Mai (q.v.), librarian successively of the Ambrosian and Vatican li-

The processes employed in deciphering palimpsests vary according to the nature of the manuscripts. Those which are not burned and rubbed with pumice-stone and afterward bleached are nearly indecipherable. Those which have been merely washed with lime-water and dried are revived by chemical processes. Various recipes which have been found successful are used successively until the right one is found. The result of the researches made is on the whole disappointing, because the monks only made use of imperfect copies and fragments of ancient writings for their palimpsests, and carried on the re-manufacture of clean parchments wholesale, mixing up various manuscripts, cutting them into fresh shapes, and thus obliterating forever the connection of the original works. A very large proportion of the discoveries thus made are fragmentary, but many of the fragments are of great value. The most re-markable of a palimpsest in recent times is that of the Syriac version of the four Gospels by Mrs. Agnes Smith Lewis (q.v.) in St. Catherine's Monastery, Mount Sinai (1895).

Palindrome, the name given to any verse or line which reads the same either forward or backward; for example that which is put in the mouth of Satan — Signa te, signa, temere me tangis et angis (cross thyself, cross thyself, you touch and torment me in vain), or as "Madam I'm Adam." 

Palinogenesia. See Recapitulation Theory.

Palinuro, pà-le-noorò, Cape, Italy, promontory in southern Italy, jutting into the Tyrrhenian Sea, northeast of the Gulf of Policastro; about 42° 2' N, and 15° 17' E, in classical times Palinurum Promontorium, and now sometimes called Cape Spartimento. The end of the cape forms a rocky and dangerous peninsula, on which Roman fleets were wrecked B.C. 253 and 96. The name is Greek and is the origin (not the outcome) of the story of the death and burial of Æneas' pilot, Palinurus.

Palïade Cells and Parenchyma, elongated cylindrical cells standing upright between the surface layer of the upper side of a leaf (q.v.) and the thicker layer of loose assimilation cells forming the under side. the palisade cells characterize the "palisade parenchyma," which gives strength to the leaf and contains most of its chlorophyll.

Palisades, The, a rocky cliff on the right bank of the Hudson River (q.v.), extending from Fort Lee, N. J., to the hills of Rockland County, N. Y., a distance of about 15 miles. They are of basaltic trap rock, a formation which was intruded in a rift of the earth's surface between layers of sandstone and shale, and cooling in a columnar form, gave these cliffs their peculiar perpendicular formation. They are from 350 to 500 feet in height, broken and fan-
tastic in appearance, and are considered one of the most remarkable and picturesque cliff forma-
tions in the world. A considerable amount of rock has been taken for building purposes, and it was feared that they would be badly injured and their beauty de-

stroyed. The two States of New York and New Jersey therefore organized a commission in 1900, known as the Commission to preserve the Palisades Inter-
state Park, the object of which is "to secure against vandalism and to preserve the natural beauty of the Palisades." To do this it was found necessary to acquire title to 73,000 feet of shore front; the report of 1909 stated that 35,423 feet of this was yet to be acquired, and that the total expenditures of the commission for land, buildings, improvements and riparian rights up to the date of report had been $305,911.77.

Palissy, pà-le-se', Bernard, English artist and philosopher: b. La Capelle Biron (Lot et Garonne), according to D'Aubigné 1499, according to other biographers about 1510; d. Paris 1589. Having been selected in 1543 to draw up the plan of a government survey in his neighbor-

hood the remuneration he received enabled him to carry on experiments in enamels, to which his attention had been accidentally turned, and on which he had for some time been engaged. Be-
ing ignorant of the art of the potter he had to grope his way, making experiments with all kinds of materials, which for the most part were unsuccessful. He was compelled at last, by his own account, to burn his furniture in order to keep in his oven. The fatigue he endured in con-
ducting himself all the operations necessary to the completion of his designs was his undoing. At length, after 16 years of unremunerated labor (1538-54), he succeeded in producing a pure white enamel, affording a perfect ground for the application of decorative art. He was now able to produce works in which he represented natural objects grouped and portrayed with consummate skill. His reputation rapidly spread, and he acquired a patron in the Duke de Mont-
morncy. His sculptures in clay and his enamelled pottery once known became genuine works of art, and came into demand for the decoration of the houses of the great. Religious persecution, however, which had caused him in obscurity, fastened on him so soon as he had begun to attain to wealth and distinc-
tion. He was first imprisoned at Bordeaux on the charge of being a Calvinistic preacher (1562), and was threatened with death, when he was rescued by the Duke de Montmorency, who, to save him, offered to take him to a foreign court where he secured him the title of inventeur des rusticques figurines du roi, with which he went to establish
himself at Paris. Here he was patronized by Catharine de' Medici, who gave him a site for his furnaces on the present situation of the palace of the Tuileries, where the remains of them were discovered in 1865. Here he continued to work, and gave for several years in Paris lectures on scientific subjects, the substance of which is probably contained in his 'Discours Admirables' (1580). He was the first in France to substitute facts and demonstrations in the teaching of science for mere hypothesis. He established a rational theory of crystallization, and his classification of salts was nearly perfect. His teaching again excited the jealousy of his theological opponents. He was arrested in 1588 and thrown into the Bastille, where he died at the age of 90, according to D'Aubigne, who knew him personally; or of 80, according to his other biographers. His 'Complett Works' (1888) contain his famous autobiography. A monograph on the artistic work of Bernard de Palissy by C. De Lange and C. Borneman appeared in 1863-5. A biography of him has been written by Henry Morley (1852).

**Palissy Ware.** See Palissy, Bernard.

Palk (pák) Strait, the northern and narrow part of the channel separating Ceylon from the southeastern coast of India, the southern and wider part being the Gulf of Manar. The strait is 80 miles long, 40 to 85 miles wide, but shallow and scarcely navigable. The Pamban Navigation, broken with islands connects the two parts of the channel.

Pal'ki. See Palanquin.

Pall (pált. palla), generally, the covering of a bier, but specially applied to the small linen cloth, usually stiffened with cardboard, employed to cover the chalice. The upper part of the pall may be of silk, and colored according to the season. It is often richly embroidered. While part of the corporal is sometimes laid over the chalice as a covering, the pall or palla, according to Pope Innocent III., is not to be considered identical with the corporal.

Pall-mall (pél-mál'l) Game, an ancient pastime in which a round box-wood ball was struck with a mallet or club and sent through a ring elevated upon a pole, standing at either end of an alley. The game was formerly practised in Saint James' Park, London, and gave its name to the street called Pall Mall.

Pallace'ae, the stinkhorn toadstools. See Fungi.

**Palla'dium,** among the Greeks, a statue or image of Pallas (Minerva), which is said to have fallen from heaven, and to have been found by Idus, who placed it in a temple in his new city (Ilium). It was believed by the Trojans that their city would be invincible so long as it contained the Palla'dium. Ulysses and Diomedes, to remove this impediment to the capture of the city, are said to have carried it off. The Romans, however, pretended that it was brought to Italy by Eneas, and preserved in the temple of Vesta at Rome. It was considered holy and the protecting divinity of the city. The term palladium has figuratively acquired the sense of bulwark, protection, sanctuary.

**Palladium**, atomic weight 106.5, a metal resembling platinum, discovered by Wollaston (1803) while preparing a quantity of chromium. Occurs native in platinum ores, but principally alloyed with gold and silver in a gold ore from Brazil. Obtained from these ores by complicated processes which ultimately give the palladium as palladium cyanide. It decomposes on ignition, giving pure sponge metallic palladium. A ductile, malleable, white metal, specific gravity 11.8 and having the lowest melting point of all the platinum metals. It is not acted on by atmospheric oxygen or moisture, slowly attacked by strong nitric, hydrochloric, or sulphuric acids, but very easily by aqua regia. In the spongy form it has the power of absorbing gases. Freshly ignited palladium will absorb about 350 times its own volume of oxygen, at room temperature and nearly twice as much when heated to the temperature of boiling water. It forms two compounds with oxygen PdO, palladium oxide, and PdO2, palladic oxide. Two classes of salts are known related to these two oxides, the palladous salts being the most important. Palladium is used in the manufacture of many fine scientific instruments because of its properties of hardness, color, and resistance to the action of the atmosphere.

**Palladius, pa-lá'di-us** Greek patristic writer of the 4th century. His 'Historia Lausiaca' dedicated to Lausus, chamberlain of
the imperial court, gives us the results of his journeys among the principal districts of the Roman empire, where monks and hermits had settled. He is indeed the Herodotus of the early Church. The inspiration of his work was to travel from one religious house or colony to another, curiously inquiring about the life of each, and picking up from the gossip of the highway or actual observation a rich fund of information which has enabled him to give a living picture of the ascetic phase of church life in Palestine, Egypt and Syria. His works are published in Migne’s ‘Patriologia Graeca,’ Vol. XXXIV. Consult Preusschen, ‘Palladius and Rufinus’ (1897).

Palladius, pà-la’di-às, Rutilius Taurus ☉Emilianus, a Roman writer of the 4th century of our era. He wrote ‘De Re Rustica,’ a didactic work in 14 books on agriculture, the topics being arranged according to the seasons, and arranged in the order of the farmers’ calendar! The first book is introductory, and the last, written in elegiac distichs, is a poem on the art of grafting, the other 12 containing accounts of the agricultural and gardening operations for each of the 12 months of the year. The work is simply borrowed from earlier writers. The poem was popular in the Middle Ages, and there is an English translation of it belonging to the 15th century. An English translation by Thomas Owen appeared in 1803, and others have followed.

Pallah or Impalla, a large reddish, bush-ranging South African antelope (Eugyceros me- lampus), called ‘roibok’ by the Boers. The horns were lyrate, abruptly bent, and were possessed by the males alone. These animals were formerly numerous, but were not only especially a prey to the large carnivores, but were shot wrathfully by Boers and sportsmen, because they were extraordinarily suspicious and alarmed all the game in the neighborhood by loud whistling cries the moment they discovered a hunter’s presence. Now, therefore, they are rare. Consult the works of sportsmen-naturalists in Africa; and Lydekker, ‘Book of Antelopes’ (1890); Sclater, ‘A Fauna of South Africa, Mammals’ (1893).

Pallas, pà-la’s, freedman and favorite of the Roman emperor Claudius: d. 63 B.C. He was a slave of Antonia, mother of Claudius; was set free by his master when he became emperor; together with Callistus and Narcissus was the real power during Claudius’ reign; induced the emperor to marry Agrippina, his own niece, and to adopt Nero; and with the connivance and assistance of Agrippina, now his mistress, poisoned Claudius and brought Nero to the throne. He was subsequently poisoned by Nero’s order.

Pallas, pà-là’s, Peter Simon, German naturalist and traveler: b. Berlin 22 Sept. 1741; d. there 8 Sept. 1811. He studied there, in Leyden, and in England, devoting himself especially to the classification of collections of zoological specimens and in 1768 was invited by Catharina II. of Russia to become adjunct of the St. Petersburg Academy and to lead a scientific expedition through Russia in Asia. This trip of exploration, undertaken with A. Sclater, J. Sibert, and Rytkoff, and lasting more than six years, was his greatest work, the specimens collected forming the nucleus of the Academy’s museum in St. Petersburg. In 1777 he became a member of the Imperial Topographical Survey, and in 1787 was appointed historiographer of the College of Admiralty. He died in 1808 and returned to Berlin not long before his death. His published works include a description of his travels in Asia (1771–6), ‘Flora Rossica’ (1784–1815); ‘Icones Insectorum’ (1781–98), a study of the Mongolian races (1767–1802); and a great and incomplete ‘Vocabularium Linguarum totius Orbis’ (1787–9).

Pallas, pà-la’s, in astronomy, one of the minor planets revolving round the sun between Mars and Jupiter. It was discovered in 1802 by Olbers at Bremen. It revolves round the sun in 4.61 years. The eccentricity of its orbit is 0.23568, and its semi-axis major is 2.77 times that of the earth’s orbit. Its diameter is 172 miles. When nearest the earth in opposition Pallas shows a full seventh-magnitude star, with a decided yellowish light.

In Greek mythology, the goddess of wisdom, see ATHENA; MINERVA.

Pallavicino, pà-la-vè-ne’-kò, Ferrante, Italian satirist: b. Plaisance 23 March 1615; d. Avignon 5 March 1644. He took orders; became a canon of Augustine; had to escape to Venice because of his broken vows; wrote there against Odoardo, duke of Plaisance, but had to leave Venice in turn because of his immoral life and writings; spent some time in Germany; again went to Venice, where he was imprisoned, but soon set free; then broke entirely with the Church and bitterly and foully attacked the Pope in ‘Il Divorzio Celeste.’ Venturing into France he was arrested by the papal officers, found guilty of heresy, and beheaded.

Pallavicino, Sforza, Italian cardinal and ecclesiastical historian: b. Rome 1607; d. there 1667. He was educated in the Collegio Romano; was made governor successively of Lesi, Orvieto, and Camerino by Urban VIII.; at 30 entered the Jesuit order; soon afterward became professor of philosophy and theology in the Roman College; and made such a name by his philosophical treatises that he was chosen by the Catholics to write a party history of Trent which refuted the work of Paolo Sarpi.

Pallen, Condé Benoist, American journalist and author: b. St. Louis, Mo., 5 Dec. 1858. He was graduated from Georgetown University in 1883 and was editor of ‘Church Progress,’ a religious weekly in St. Louis, 1897–07. He has published ‘The Philosophy of Literature’ (1897); ‘Epochs of Literature’ (1898); ‘What is Liberalism?’ (1899); ‘The New Rubaiyat,’ a poem (1896); ‘The Feast of Thalarchus’ (1901); ‘The Death of Sir Lancelot and Other Poems’ (1902).

Palliser, pàl’l-èr, Sir William, British inventor and engineer: b. Dublin 18 June 1830; d. 4 Feb. 1882. He passed through the Staff College at Sandhurst, and in 1855 obtained a commission in the Rifle Brigade, was subsequently transferred to the Hussars, and retired from the army in 1871. Besides inventing the projectiles and guns which bear his name he devised many improvements in fortifications, etc. He wrote ‘General Knaps,’ ‘Out of Way,’ and ‘Rytkoff, and lasting more than six years, was his greatest work, the specimens collected forming the nucleus of the Academy’s museum in St. Petersburg. In 1777 he became a member of the Imperial Topographical Survey, and in 1787 was appointed historiographer of the College of Admiralty. He died in 1808 and returned to Berlin not long before his death. His published works include a description of his travels in Asia (1771–6), ‘Flora Rossica’ (1784–1815); ‘Icones Insectorum’ (1781–98), a study of the Mongolian races (1767–1802); and a great and incomplete ‘Vocabularium Linguarum totius Orbis’ (1787–9).

PALLIUM — PALMA

Pallium, an article of ecclesiastical dress consisting of a band of white wool, some three inches wide, with two narrower bands of the same material, one of which hangs down the back and the other over the breast. It is embroidered with four purple crosses. It is a part of the vestments of the pope, patriarchs, and archbishops. It is sent by the pope to the patriarchs and archbishops as a token that they are invested with the fullness of the episcopal office. It is sometimes, though rarely, also sent to bishops. When a bishop is elected or appointed to a metropolitan see, he at once solicits the pallium from the pope within three months after his consecration or confirmation. The pallium is made from the wool of two lambs annually presented in the Church of St. Agnes, Rome, by the apostolic sub-deacons, and woven by the nuns of Torre de’ Specchi, to whom alone belongs the privilege. The historical origin of the pallium is not known, or, at least, wrapt in such obscurity that no definite conclusion has ever been arrived at. Some writers believe that it was first conferred upon bishops by the emperors as a mark of dignity, and then passed over to a purely ecclesiastical usage. It is only worn solemnly and at special occasions. Consult: Thurston, ‘The Pallium’ (London 1802); Vespariani, ‘De Sacri Palli Origine’ (Rome 1856).

Palm, pâm, Johann Philipp, Bavarian bookseller and publisher: b. Schorndorf, Bavaria, 1768; d. Braunau, Bohemia, 26 Aug. 1805. The firm of which he was a member published a pamphlet ‘A Journey in Her Deepest Humiliation’ (1806), which was hostile to Napoleon and his measures. It was brought to the attention of Napoleon who ordered the arrest of Palm, had him tried by court-martial, and though the pamphlet was to the publisher merely trade matter, he was sentenced to death and executed at Braunau on the following day. This act aroused the deepest indignation in Europe as well as in Germany where the hatred of the Germans for Napoleon was already intense. Consult Schultheiss, ‘Johann Philipp Palm’ (1860).

Palm Butter, Oil, Sugar, Wax. See PALMS.

Palm-cat, or Palm-civet, any of several animals of the civet family (Viverridae), and of the genus Paradoxurus, known also as tree-cats, toddy-cats, from their habit of climbing palm-trees to eat their fruit. They inhabit India and southeastern Asia, the Malay Archipelago, etc., and somewhat resemble large cats with comparatively short legs. The best known is the Indian species (P. siger), which is often kept about houses and subsists mainly on animal food, such as rats, small birds, lizards, etc. Consult: Blanford, Jerdon, Blyth, Wallace, and other authorities on East Indian zoology; and Allen’s Natural History, etc. ‘Article ‘Cats, Civets, and Mungooses’ (1894).

Palm-crab, a large burrowing land-crab which feeds upon cocoanuts. See ROVERE-CRAB.

Palm-kale, a variety of cabbage extensively cultivated in the Channel Islands and also in Italy. It grows to the height of 10 or 12 feet, and with a crown of leaves at top it has much the aspect of a palm.

Palm Oil. See PALMS.

Palm Sunday, the Sunday next before Easter Day, so called because on that day is celebrated Christ’s last entry into Jerusalem before His Passion, where palm branches were strewn in his way by the multitude. In some churches palms are employed as decorations at the service on this Sunday, and fragments of them distributed to the people.

Palm-swift. See SWIFT.

Palm-veevil, or Grugru, a large curculionid beetle (Rhyynchophorus palmarum), 1 ½ inches long, common throughout the American tropics, which places its eggs in holes bored by the beak of the female in the wood of palms, especially the cabbage palms of the genus Euterpe. The grub, as soon as hatched, begins to eat its way forward to the spongy pith of the tree, where it feeds and grows into an exceedingly fat and oily creature, sometimes three inches long by one in diameter, which is eaten roasted by all kinds of people, and eaten with pepper is regarded as one of the delicacies of the tropics. Similar species occur elsewhere in warm countries. The American species mentioned (R. palmarum) also occurs in southern California; and a similar species (R. cruenta) infests the palmetto of the Southern States. Java has a well-known species (R. ferrugineus), whose grub has long been a table delicacy in the East. Consult Kirby and Spence, ‘An Introduction to Entomology’ (1825), and general works.

Palma, Giacomo, jà-kò’mō päl’mà, called Il Vecchio, Italian painter: b. probably, Serin-tola, near Bergamo, about 1490; d. Venice 1528. He is supposed to have been a pupil of Giovanni Bellini, but little is known regarding his life. It may be divined from the pictures that go by his name that he imitated one after another several great artists of the Venetian school and many of his works have been attributed to Giorgione, whose coloring he took for his standard of excellence. The Italian churches have multitudinous examples of paintings called ‘Santa Conversaione’ representing the Virgin and the Child, and the donor of the picture presented to them by his patron saint. Of these large compositions Palma II Vecchio painted very many. He was also successful in mythological subjects and his landscapes are exquisite. His works place him among the foremost painters of his time. Some of his best known paintings are ‘Adoration of the Shepherds’; ‘The Holy Family’; ‘Mars and Venus’; ‘The Mystical Marriage of Saint Catherine’; ‘Divine and Heaten Love’; ‘Portrait of Andrea Palladio in his Youth.’

Palma, Giacomo, called Il Giovane, Italian painter, grand-nephew of the Elder Palma: b. Venice about 1544; d. there 1628. His early work was excellent, comparing in fresh coloring with Titian, who greatly influenced him. Later his vicious mannerism grew so as to be a predominating feature of his work. Hence Lanzi called his the last good and first bad painter of Venice.

Palma, Ricardo, Peruvian author: b. Lima, Peru, 7 Feb. 1831. He was exiled to Chile in 1860 as a result of implication in a political revolt, but upon his return became secretary to President Balta. Later he served as senator and then was assistant in the National Library.
PALMA — PALMER

After the sack of the library by the Chilians in 1881 he reorganized it, gathered the remaining fragments, and assisted by gifts from foreign countries the library was re-opened for public service in 1884. He is the author of several works of fiction, some poetry, and the historical work 'Aanales de la Inquisicion de Lima' (1863). Since 1870 he has been occupied in recording the traditions and legends of the mariners and in marriage law. G. H. Palmer (q.v.) of Harvard University. During her administration the college standard of scholarship was raised, the number of students greatly increased, and several important buildings added. In 1892-93 she served as non-resident dean of the women's department of the University of Chicago. She took an active interest in educational and reform associations, was a member of the Massachusetts State board of education from 1889, and lectured frequently on educational and municipal topics. In 1882 she received the degree of Ph.D. from the University of Michigan, and that of L.H.D. from Columbia in 1887, while in 1895 she and her husband received the degree of LL.D. from Union University.

Palmer, Anthony, American colonial governor: b. England about 1675; d. Philadelphia, Pa., May 1749. He was a merchant in Barbados for some time, but in 1707 purchased a large tract of land in Philadelphia where he then settled. In 1708 he was a member of the provincial council and served until his death. When Lieutenant-Governor George Thomas resigned in 1747 the government deposed upon Palmer, who was president of the executive council, and during the succeeding 18 months he administered the affairs of the colony with much ability. He conciliated the Indians and took precautions for the military defense of the colony against Spain and France, though opposed by the Quaker members of the council. The Kensington District of Philadelphia was originally a portion of his farm.

Palmer, Sir Charles Mark, English ironmaster and shipbuilder: b. South Shields 3 Nov. 1822. He was educated for a commercial career in France; worked with his father, a shipbuilder; was partner in several coal companies; reformed the coal-carrying trade from the north of England by building screw colliers (1852), which drove the sailing barges out of business; and at Jarrow established a great shipyard. Both iron and coal for this yard are supplied by Palmer's own mines. He introduced the use of rolled iron plates for men-of-war, held several important government contracts, was elected to the House of Commons in 1874, and is still a member. He was made a baronet in 1886.

Palmer, Edward Henry, English Oriental scholar: b. Cambridge 7 Aug. 1840; d. Arabia 11 Aug. 1882. He was educated at St. John's College, Cambridge, and later made extensive journeys of exploration in the East. In 1871 he was appointed professor of Arabic at Cambridge, and from that time onward accomplished a vast amount of literary work. In 1874 he was called to the bar. In 1882 he was engaged by the British government to assist in keeping the Arabs of the Sinai region quiet, and preventing them from interfering with the Suez Canal, when he was captured and murdered with two other Englishmen. He had a remarkable knowledge of Oriental life and language, and was a
THOMAS ESTRADA PALMA,

PRESIDENT OF THE CUBAN REPUBLIC.
PALMER

man of very varied gifts. His works include: 'Oriental Mysticism' (1867); a 'Grammar of the Arabic Language' (1874); 'A Concise Dictionary of the Persian Language' (1876); 'The Song of the Reed' (1877), comprising Persian verses, translations and original poems; 'The Poetical Works of Beha-ed-Din Zohier of Egypt, with a Metrical English Translation, Notes, and Introduction' (1876-7); a translation of the Koran ('Sacred Books of the East', 1882); 'Life of Haroun Alraschid' (1881); an Arabic Manual (1881); and a 'Simplified Grammar of Hindustani, Persian, and Arabic' (1882). Consult 'Life' by Besant (1883).

Palmer, Erastus Dow, American sculptor: b. Pompey, N. Y., 3 April 1817. His best known works are 'Morning and Evening' 'The Angel of the Sculpture', 'The White Captive'; 'Landing of the Pilgrims' (a group of 15 life-size figures intended for the Capitol at Washington). He has also executed many portrait busts and statues, including the statue of Robert E. Lee in the National Capitol.

Palmer Frederick, American journalist: b. Pleasantville, Pa., 20 Jan. 1873. He was educated at Allegheny College, Meadville, Pa., and was a London newspaper correspondent 1895-7, during the Greek war, 1897, and from the Klondike and Philippines 1897-8. He has published 'Going to War in Greece' (1897); 'In the Klondike' (1899); 'The Ways of the Service' (1901); 'The Vagabond', a novel (1903).

Palmer, George Herbert, American educator and classical scholar: b. Boston 19 March 1842. He was graduated from Harvard in 1864, studied at the University of Tubingen 1867-9, and at Andover Theological Seminary in 1870; and after serving as an assistant professor at Harvard 1873-83, and professor of philosophy 1883-9, becameVolumes: 11, 49

Alton, Ill., for a year, and later studied law and was admitted to the Illinois bar in 1839. He first entered politics in the campaign of 1840, when he actively supported Van Buren; in 1843 he was elected judge of Macoupin County; in 1847 was a delegate to the State constitutional convention; and in 1849 was elected county judge. In 1852 he was elected to the State senate and re-elected in 1854. His opposition to the Kansas-Nebraska bill, however, led him to sever his connection with the Democrats, and ally himself with the Republican party. He was active in the organization of this party, was president of the Republican State Convention in 1856, and delegate to the National Convention of the same year and that of 1860. He was one of the representatives of his State at the Peace Conference in Washington 1861.

At the outbreak of the Civil War he joined the army as colonel of an Illinois regiment, took part in the Springfield campaign, and in December 1861 was promoted brigadier-general. In 1862 he was made major-general, in 1863 given command of the Fourteenth corps, and later of the Department of Kentucky. He took part in the operations against West Island, and a division at Murfreesboro (1862) and at Chickamauga (1863); as commander of the Fourteenth corps he was engaged in the battles of Chattanooga (1863), Kenesaw Mountain and Peach Tree Creek (1864), and in the Atlanta campaign. After the war he continued his law practice in Illinois, and in 1868 was elected governor of the State; during his administration he steadily resisted special legislation and the granting of special privileges. In 1872 he left the Republican party and supported Greeley for the presidency, and in 1876 was one of the most active supporters of Tilden. In 1890 he was nominated for United States senator by the Democrats, and elected, serving for six years. In 1896 he was nominated for the presidency by the Gold Democrats who refused to accept the regular nominations on account of the free silver plank of the platform. He wrote his autobiography, published under the title 'Personal Recollections of John M. Palmer.'

Palmer, John Williamson, American author: b. Baltimore, Md., 4 April 1825. He was graduated from the University of Maryland as a physician in 1847 and was city physician in Baltimore 1849-50. In 1870 he removed to New York, and subsequently was connected with the staff of the Century and Standard dictionaries. Among his publications are: 'The Golden Dragon; or, Up and Down the Irrawaddi' (1853); 'The New and the Old; or, California and India in Romantic Aspects' (1859); 'After His Kind', a novel (1866); 'The Poetry of Compliment and Courtship' (1867); 'For Charlie's Sake and Other Lyrics and Ballads' (1901); and 'Stonewall Jackson's Way,' one of the most popular ballads of the Civil War.

Palmer, Nathaniel Brown, American seacaptain: b. Stonington, Conn., 1799; d. 1877. He went to sea at 14 and in 1821 he commanded the sloop Hero which set sail from Yankee Harbor in South Shetlands on an exploring expedition. He discovered the land known as the Palmer Archipelago, which at the time was supposed to be a portion of the Antarctic continent. He followed a seafaring life until 1849 and was
afterward a director of the Fall River line of steamers.

Palmer, Ray, American Congregational clergyman and hymnologist; b. Little Compton, R. I., 11 Nov. 1808; d. Newark, N. J., 29 March 1887. He graduated at Yale in 1830; studied theology and entered the Congregational ministry. He was pastor of churches at Bath, Maine, 1835-50, and Albany, N. Y., 1850-66; and secretary of the Congregational Union in New York city 1866-78. He was the author of many sacred poems, of which the best known is the hymn 'My FaithLooks Up to Thee' included in very many collections of church hymns and translated into more than 20 languages. His published volumes are: 'Hymns and Sacred Pieces' (1865); 'Hymns of My Holy Hours' (1868); 'Voices of Hope and Gladness' (1880).

Palmer, Samuel, English painter; b. Newington, Lancashire, 27 Jan. 1805; d. Reidgate, Kent, 24 May 1881. He was a pupil in the antique school of the British Museum, and received some inspiration from his acquaintance with William Blake. His studies were for two years continued at Rome (1837-9) after which he devoted himself to water colors and became a member of the Water Color Society in 1854. While belonging to the ideal school of Turner and Wilson he confined himself entirely to water color and etching, in both of which departments he reached the highest excellence. Among his best-known pictures which are suffused with profound poetic feeling are: 'Dream on the Apennines' (1864); 'Curfew' (1870); and 'The Waters Murmuring' (1872). His finest etchings include: 'The Sleeping Shepherd'; 'The Skylark'; 'The Lonely Tower.' He translated the eclogues of Virgil and intended to illustrate them, but only lived long enough to complete one plate, 'The Opening of the Fold.'

Palmer, Walter Launt, American painter; b. Albany, N. Y., 1854. After studying under F. S. Church at Hudson, N. Y., he became the pupil of Carolus Duran at Paris and developed great skill in landscape painting. He was awarded a gold medal at the World's Columbian Exposition in 1893 and honorable mention at the Paris Exposition of 1900. His Venetian scenes and snowy landscapes are remarkably effective and among his best productions are 'Venice' (1882); 'January' (1887); 'Domes of La Salute'; 'End of a Winter Day'; and 'Under the Pines' (1896). He is a member of the National Academy and of the Society of American Artists.

Palmer, a term in medieval times applied to a pilgrim who had visited the Holy Land and carried on his return a branch of the palm for a staff as a memorial of his journey. The name was also given to pilgrims who wandered from shrine to shrine without a fixed home, probably because many of the pilgrims who had been to Jerusalem were in the habit of doing so.

Palmer, Mass., town, Hampden County; on the Chicopee, Swift and Ware rivers, and on the Boston & A., and Central V. R.R.'s; 14 miles east of Springfield. It includes the villages of Parkinsville, Riverbank, Thompsonville, and Duckville, of which the first two are the most important. It was first settled in 1716 by John Kingston, and was incorporated as a town in 1775; for several years previous to its incorporation (1741-52) it was called Kingston. It is an enterprising industrial town and manufactures cotton and woolen goods, carpets, wire, wire nails, hats, etc. It has a public and an association library. Pop. (1890) 6,520; (1900) 7,801. Consult: Temple, 'History of the Town of Palmer, Massachusetts.'

Palmerin (pāl'mərin) of England (Palmerin de Inglaterra), a romance of chivalry in the style of 'Amadis of Gaul,' and in this class of literature regarded as second only to it in point of merit. It is this book, which, with 'Amadis,' Cervantes saves from the holocaust in 'Don Quixote.' It was long supposed to be the work of Francisco Moraes, a Portuguese, who published it in 1567 as a translation from the French, and in 1807 Southey published an English translation, attributing the original to Moraes, and credited him with modesty in not claiming authorship. It is reduced to the form of the romance after having been the work of Leon Hurtado, and to have been published originally in Spanish, in Toledo, in 1547. This story is in some respects a continuation of 'Palmerin de Oliva' (q.v.).

Palmerin de Oliva, pāl-mā-'rēn' dā ő-lē-vā, a romance of chivalry, a feeble imitation of 'Amadis of Gaul,' first published in Salamanca in 1511. It has generally been considered to be of Portuguese origin; but Ticknor, in his 'History of Spanish Literature,' asserts that the author of it was a carpenter's daughter in Burgos. This is one of the books against which Cervantes inveighs as responsible for the mental condition of Don Quixote; and in the famous scene of the burning of the books of chivalry, he says: 'This Oliva, let it be hewn in pieces and burnt, and let not the very ashes be left.' A continuation by the same author, 'The Second Book of Palmerin,' which treats of the adventures of his sons, Primacleon and Polendos, appeared later.

Palmerston, păm'ər-stōn, Henry John, Temple, Viscount, English statesman; b. Romsey, Hampshire, 20 Oct. 1784; d. Brockett Hall, Hatfield, Hertfordshire, 18 Oct. 1865. He was educated at Edinburgh University and at St. John's College, Cambridge University, being graduated from the latter in 1807. He was the Tory candidate for member of Parliament from Cambridge University, and was both times defeated, but in 1807 was elected to Parliament from Newtown, Isle of Wight. In 1809 he succeeded Lord Castleragh as secretary at war, and in 1811 was elected member of Parliament for Cambridge University. As secretary of war he carried out a vigorous reform of the details of administration; regulated the finances, paid off arrears, and brought about the previous confusion of the war office to order. He mainly confined himself in his parliamentary speeches to the business of his department, but also spoke on Catholic Emancipation, of which he was always a supporter. He retired from office in the Wellington ministry in 1828 with others of the Canning party. In 1830 he became foreign secretary in the Whig ministry of Earl Grey, and from this time continued a member of the Whig party. In 1831 he lost his seat for Cambridge, but was elected to Parliament from Bletchingley, then from South
Hants, and in 1835 from Tiverton, which brought him to the end of his career before he returned to America. He was a man of integrity and was known for his loyalty and trustworthiness. His contributions to the field of science and learning were significant, and he is remembered for his work on palmistry.

**Palmetto Ranch**, Engagement at, the last engagement of the Civil War. On the evening of 11 May 1865, Col. T. H. Barrett, 62nd United States colored infantry, in command at Brazos Santiago, Texas, sent Lieut.-Col. Bronson, with 300 men, to attack some Confederates on the Rio Grande, who were procuring horses to remount their cavalry. Marching by night, Bronson, early the next morning, attacked about 200 Confederates at Palmetto Ranch, on the Rio Grande, seizing their camp and taking some prisoners, horses, and cattle. Bronson then fell back to White's Ranch, where he was joined on the morning of the 13th by Col. Barrett, with about 200 men of the 34th Indiana, under Lieut.-Col. Morrison. Barrett advanced in the direction of Palmetto Ranch, which the Confederates had reoccupied. He was met by cavalry, which was easily driven back; Palmetto Ranch was reached, the buildings and public stores burned, and after following the Confederates some distance Barrett retired to a hill about a mile from Palmetto Ranch where, about 4 P.M., he was attacked by Gen. J. E. Slaughter, with 675 men and six guns. The infantry and four guns attacked in front, while about 250 cavalry and two guns, under cover of a chaparral, flanked him and engaged him in the rear. Barrett had to use artillery, and fell back fighting. About 50 men of the 34th Indiana were cut off and captured. The retreat was covered by a part of the 62nd colored infantry, deployed as skirmishers, who resisted every effort of the Confederates to break the line, repelling several determined attacks. The running fight continued about three hours and then, at sunset, Confederate pursuit ended. Col. Barrett reports: "The last volley of the war, it is believed, was fired by the 62nd United States colored infantry, about sunset of the 13th May 1865, between White's Ranch and the Boca Chica, Texas. The Union loss in the expedition was 115 killed, wounded, and missing. The Confederate loss is not known. Con- sult: 'Official Records,' Vol. XLVIII.; Lossing, 'History of the Civil War,' Vol. III.

E. A. Carman.

**Palmetto State**, a name applied to South Carolina. The palmetto tree appears on the coat of arms of the State. See **South Carolina**.

**Palmistry**, or *Chirography*, is the art of "reading the palm"—the art which professes to discover the temperament and character of any one, as well as the past and future events of his life, from an examination of the palm of his hand, and of the lines traced upon it. As a considerable body of very complicated rules and directions have been laid down by authorities, ancient and modern, to enable the student to read the palm, palmistry claims to be regarded as a "science," or at least as a branch of an interpretative science of the hand in general, to which the name *Chiromancy* has been given. The other branch of this general science has been called *Chiromancy*, and is concerned with the interpretation of the form and character of the hand and fingers, while *Chirography* treats of the palm only. The science was known to the ancient Greeks and was somewhat popular on the continent during the Middle Ages. The chief authorities on palmistry in recent times are two Frenchmen, M. le Capitaine D'Ar-
PALMITIN — PALMS

pentiguy, and M. Adrien Desbarrolles; and it is on their works that modern English books on the subject are chiefly founded. The observation of the fingers and joints on the hand is quite as important to the chemist as that of the palm itself. The thumb is generally regarded as chromogenically the most important part of the hand. The first, or upper phalange of the thumb, when well developed, shows the presence of will and decision of character; the second, according to its development, indicates more or less logical power. What has to be considered by the chemist proper is the "mounts" of the hand, with the marks on them, and the lines in the palm. The "mounts" are the elevations at the base of the fingers and thumb and in the "perception" of the hand — that is, the side of the palm which extends from the root of the little finger to the wrist; it is so called because it is used in striking. They are seven in number, and are named from the planets. When well developed the mounts indicate the possession of the quality associated with the respective planets — for example, Jupiter developed denotes pride and ambition; Saturn, fatality; Apollo, art or riches; Mercury, science or wit; Mars, courage or cruelty; Venus, love and melody; the Moon, folly or imagination. But the effect of a greatly developed mount may be modified by the lines in the palm or by other signs. There are four principal lines, namely, the line of life, which indicates the length of life, and which, if long, indicates a long life; the line of head, the line of heart, and the rascette or the bracelets. These last (the bracelets), if well marked, strengthen the effect of the line of life, each bracelet indicating thirty years of life. The line of heart, if long, clear cut, and well colored, denotes an affectionate and devoted character; and the nearer the line stretches to Jupiter the better the character. If the line end in a fork, so much the better. In actors and mimics this line ascends the mount of Mercury. A good line of head — that is, a clear-cut, long, unbroken line — indicates the presence of superior intellectual qualities. If the line stretch to the mount of Jupiter, it indicates imagination. A winding headline shows folly and indecision of character; a linked line (like a chain) denotes want of concentration. The other lines (which are not present in all hands) are the line of Saturn or the line of misfortunes; the line of Apollo, the line of liver and health; and the line of Venus. A long, clear-cut line of Saturn foretells a happy and prosperous life, breaks or windings in the line foretell misfortunes or obstacles; a good line of Apollo shows that its owner will be successful in art; a good liver-line promises a long and healthy life; while the Venus line, when present, indicates a character very liable to be influenced by the passion of love. Marks on the mounts or lines, such as stars, crosses, etc., have their respective significations. A good open space between the lines of head and heart (the quadrangle) indicates a generous and noble disposition, while a very narrow space in the quadrangle is a sign of avarice and egotism.

Palmitin, or Tri-palmitin, a fatty substance occurring quite commonly in the natural fats and organic oils, and closely analogous to stearin in its chemical structure and deportment. It is especially abundant in palm oil, from which circumstance it derives its name. Tri-palmitin may be conveniently prepared from palm oil by expelling the liquid portion by pressure, washing the solid residue with boiling alcohol to remove such other fats as it may still retain, and finally crystallizing from a solution in ether. By this process it is obtained in the form of white crystals of which is scarcely soluble in alcohol, but readily soluble in ether, and which melt at 144 ° F. Varieties of tri-palmitin are said to exist, however, which melt at 115 ° F. Chemically, tri-palmitin is a compound of palmitic acid, C_{15}H_{31}COOH, with glyc erine, C_{3}H_{8}(OH)_{3}; its three molecules of the acid being combined with one of the glycerin, as indicated by the equation:

\[ 3C_{15}H_{31}COOH + 3C_{3}H_{8}(OH)_{3} = 3H_{2}O + 3C_{18}H_{34}(C_{15}H_{31}COO) \]

the last formula on the right hand side of the equality sign being that of tri-palmitin. Two other compounds of palmitic acid with glycerin are also known, but they are of less importance. Mono-palmitin has the formula C_{15}H_{31}CO(OH)_{3}, and melts at about 115 ° F. It is a mixture of glyc erine and palmitic acid is heated for 24 hours at 400 ° F., all three of the palmitins are formed; and when the product is shaken with lime water and then extracted with ether, each solution is evaporated, tri-palmitin, di-palmitin and mono-palmitin separate out in the order named. The palmitins are readily saponified by heating with caustic alkalis, and free palmitic acid may be conveniently prepared by adding hydrochloric acid to an aqueous solution of potassium palmitate.

Palms, trees, or shrubs of the monocotyledonous family Palmae, ranking in economic importance next to the grasses. The species of which about 1,000 are recognized, belong to about 130 genera. The great majority of these genera consist of only a few species, in many cases only one. Calamus is the largest genus, consisting of about 200 mostly Asiatic species with no representatives in the Western hemisphere. Geonoma and Bactris, American genera, each contain about 100 species. The fourth, Chamaedorea with about 60 species. The Asiatic and Australasian genus, Licuala, contains about 30 species. Cocos, an American genus with the exception of the coca nut, which is cosmopolitan within the tropics, also contains about 30 species, Desmoncus (American), Pinanga and Areca (Oriental) each contain about 25 species. Geologists and botanists are fairly well agreed that the palms represent a once more extensively distributed and more numerous group of plants and that they are now upon the decline. Fossil remains are preserved in the rocks of the Middle Cretaceous, and, in North America, in those of the Upper Cretaceous from Greenland southward; in both Europe and North America they are also found in the Tertiary rocks.

With few exceptions the individual genera and even the tribes which they comprise are restricted in their distribution; certain tribes of African, other Asiatic or American, etc., certain genera are found in very small areas; for instance, Pseudophymous sargenti is found only in certain of the Florida Keys and even
there in limited numbers, and the species of *Hypnea* of the South Atlantic and the species of *Sphacelaria* in the Southern Pacific Ocean. Only one species (Chomerops humilis) is an acknowledged native of Europe. The most noted exception to this rule is the coconut palm (Cocos nucifera), which appears throughout the tropics upon most of two land. It is among the first plants to obtain a root-hold upon newly formed islands. As a group, the palms are almost restricted to tropical and subtropical countries; the European species mentioned, however, extends as far north as latitude 44°; an American species, the palmetto (Sabal palmetto), to 35°; some Asiatic species to 34°. In the Southern hemisphere some American species reach latitude 36°; some African 30°. In Australia, latitude 35° is the limit; but in New Zealand one species reaches 38°. There are, however, a few South American species which approach the perpetual snow line upon the mountains. With respect to habitat, the various species exhibit a wide range of adaptability. Some, like the coconut, growing only upon the sea coast, others wholly inland; some in sand, others in rich alluvial soils; some in swamps, others on dry hillsides; some in exposed places, others in the depths of the forest; some solitary, some in groups, some in forests or jungles to the exclusion of other species of trees.

In general, palms are erect, unbranched trees with buttressed bases. They often attain heights of 30 to 60 feet. Of the one species usually smooth or slightly ringed columns, they bear a rosette of large leaves, each of which resembles in some kinds a fan and in others a feather. In some species of the former type the leaves may exceed 40 feet in length and six feet in breadth; in the latter, 20 feet by four or more, without division. There are, however, exceptions to the ordinary columnar habit of growth; a few species are branching; some are low growing, even creeping; others are slender stemmed plants which climb by means of hooked spines; some have flexible stems which extend from tree to tree in festoons and attain several hundred feet, 500 feet being common, and some with stems much over 100 feet long. In the ordinary species the flowers are borne in huge clusters which appear from within spathes that open in some cases with a report. The fruits are of various kinds, berries and dimples being perhaps most common. They are often enclosed in a fibrous husk, and frequently contain a hard nut. The flowers, which are generally small and individually inconspicuous, bear no relation in size to the fruit, which may be as small as a pea or, as in the double coconut, larger than a man's head.

While the grasses are of widest economic importance among plants, the palms are employed for the largest number of purposes. All parts of the various species are used, but in few do more than two or three parts find extensive employment. Many palms furnish good fuel, some useful timber, others masts and spars. The pith of certain species, especially of Metroxylon and Caryota, supply sago. The thin, plant steams of *Glyptosternum*, grown commercially as rattan, are widely used throughout the world for wickerwork and furniture. The terminal bud of several kinds is cooked and eaten like cabbage, such species being known as "cabbage palms"—for instance, Euterpe oleracea. The leaves serve as the raw material for making thatch, matting, material for walls, mats, screens, shields, clothing, hats, bedding, cordage, twine, nets, etc. The spines of certain species are used for tipping arrows and spears, for tattooing, for fish-hooks, etc. The fibre of the leaves of many species seems to offer useful paper-stock; that of others, for example, the piassaba fibre (q.v.), derived from various species of Attalea (especially A. funifera) is extensively used for brushes of various kinds, ranging from hair-brushes to stable brooms and street-cleaning machines. The sap of several species is used for the manufacture of palm-wine and of arak, the latter a spirituous liquor; it is also employed in making jaggery, a kind of sugar of some commercial importance. For this latter purpose Phanix sylvestris is perhaps the principal species. In some cases the sap is obtained by tapping; in others by cutting the terminal bud or even the trunk near the base.

The fruits of many species are useful. As food the cocanaut and the date are probably the most widely known and important. The former is employed not only as a fruit, but its contained liquid or "milk" furnishes a palatable drink. Whether fresh or prepared in a way, the kernel supplies the "shredded cocoonut" employed in confectionery, cakes and puddings. It also yields cocanaut butter or oil. The fibre of the husk is widely used for matting and is very popular where grass is not available. The stalks of the palms are used for making tables upon the aisles of public halls. The shells make serviceable dippers, bowls, and other utensils, or when carved and polished, attractive ornaments. The date palm supplies the Arab and other peoples of northern Africa and southern Asia with one of their chief foods, for which purpose it is commonly seen near dwellings, besides being planted extensively for commercial purposes. The chief commercial supplies come from Arabia, Persia and Mediterranean Africa.

Oils are obtained from the fruits of a large number of species, especially Elais guineensis. Some of these oils are used for food, others for lubricating and for illuminating; and others for soap and camphor making. Up to 1000 gallons are obtained from each of the seeds. These oils are orange-colored, violet-scented, and sweetish. They are generally obtained by boiling the ripe fruits in water, though also frequently by expression. Like butter, they soon become rancid unless kept cold. Palm butter is a popular name for several of the kinds. A palm wax is secured from species of Copernicia and is used like beeswax.

The seeds of many species are very hard and are used for manufacturing small ornamental and useful articles such as knife handles, collar buttons, etc. Probably the best known of these is the so-called "vegetable ivory" (q.v.) which is derived from the Phytelephas macrocarpa, a South American species with a short or even creeping stem, from which arise pinnate leaves often more than 15 feet long. The seeds of Areca catechu are mixed with lime and pepper leaves to make the notorious "betelnut" (see Betel) of eastern Asia. The product is used as a stimulant.

The most remarkable palm of all is perhaps the palmym, delib or borassus palm (Borassus flabelifer). This species is a native of southern Asia, the Australasian Archipelago and western
PALMYRA

Africa, where it sometimes exceeds 100 feet in height. The leaves, which often exceed three feet in length, have shining, rigid, triangular fruits about five inches in diameter, have a brownish or black, glossy, succulent, fibrous rind, and contain three seeds about as large as goose-eggs. Throughout India this is the commonest palm, and in Ceylon it occurs in extensive forests. It is employed for more purposes than perhaps any other plant, upward of 800 uses being recorded for its various parts. Its wood, palmyra wood, is heavy, dark, hard, durable, easily polished, difficult to cut across the grain but easy to cut with the grain. It is used for house-building, furniture, etc. The wood of some other palms is also known by this name and as porcupine-wood. The leaf stalks make excellent fences. The leaves are employed for thatch, mats, umbrellas, fans, hats, baskets, as writing tablets, for ropes, twine, etc.; the down at the leaf-bases for lint, and for filtering liquids; the sap yields sugar, palm wine and arrack; the fruit is cooked as an esculent; the young seeds are similarly employed, and the young plants serve as pot-herbs. A large part of the population of southern India depends upon this plant to supply its needs — fuel, shelter, food, etc.

Among the most important palms the following with their chief uses may be mentioned: Assai or Para palm (Euterpe edulis), a South American species whose fruits are macerated in water to produce a popular drink called agua de sima, or Bourbon palm, one of the most widely grown of greenhouse and house palms, usually called Latania lontar or florists, but properly Latania commersonii; double Seychelles, or seacocnut palm (Lodoicea maldivica), chiefly noted for its great size, slow growth, enormous seeds weighin more than 10 pounds (even, it is said, more than 30 pounds), which from their seeming malformation but more particularly from their newly unknown origin, gave rise to extraordinary fabulous tales; curly palm (Hoevea belmoreana) one of the best known greenhouse palms, and popularly called Kentia belmoreana; fan-palm, any species with fan-like leaves; fern-palm (Cycas revoluta, etc.) commonly raised in greenhouses, bird of paradise, fish-tail wine, or toddy palm ( Caryota urens), a source of jaggery, arrack and palm wine; flat palm (Hoevea fosteriana), a favorite greenhouse palm popularly known as Kentia fosteriana; raphia palm (Raphia), which furnishes the raphia used by florists and nurserymen for tying up plants; Royal palm (Oreodoxa regia), so named in expression of its majestic appearance, and one of the most popular avenue-palms of warm countries; umbrella palm (Hydronycphora canterburiana); walking-stick palm ( Baculatia monostachya); wine palm ( Caryota urens); Phanix zylvestris; Borassus flabelliformis, and Cocos butyracea); gomo palm ( Arenga saccharifera), which furnishes fibre used for cordage, canvas, etc., and sugar, wine, vinegar, etc.; inaja palm ( Maximiliana regia), the spathes of which are used as baskets and as cooking utensils; doum palm (Hyphana thebaica), one of the few branching palms; talipot palm ( Corypha umbraculifera), noted for its prodigious fertility in flowers, the number of blossoms upon a single tree having been estimated at 60,000,000, the inflorescence attaining a height of 30 feet above the crown of leaves. The "palm" of the Bible is believed to be the date-palm, which is one of the commonest species in Syria at the present time. The so-called Basama hat palm (Caralludovica palma) is not a palm botanically, but a member of the order Cycanthaceae.

With the exception of the date and the coconut, palms are little cultivated, the wild species being relied upon for commercial purposes. Even these species and those used for sugar, arrack, etc., are usually planted in favorable situations and allowed to shift for themselves after once becoming established or even before. For ornamental purposes, however, more or less care is given the young trees used in warm climates for bordering avenues, and as lawn or garden specimens.

During the closing decade of the 19th century palms sprang into popularity as greenhouse and house plants, for which purposes, and for decorating halls, churches, hotels, lobbies, etc., about a dozen species have become deservedly popular, not only because of their graceful appearance, but because of their ease of cultivation. Many other species are also found in private conservatories. In the United States the chief centre of palm production for these purposes is in the Middle Western States, but the South is also increasing its area devoted to ornamental palms. The plants are nearly all grown from imported seeds sown in warm greenhouses. In some cases the seeds require months or even more than a year to germinate, but usually a month or two is sufficient. In many cases the young seedlings resemble one another, whether they will develop into pinnate-leaved or fan-leaved specimens. At all times ample water and good drainage are essential; shading is also generally beneficial. The plants generally succeed best in well rotted sod obtained from rather light soil rich in humus. Scale-insects and the red spider are the chief enemies; the former may be controlled with kerosene emulsion (seven parts water to one by volume); the latter by frequent spraying, moist atmosphere, and by evaporated (not burned) sulphur. The fumes of burning sulphur are fatal to the plants.

M. G. KAINS, Crop Expert.

Palmyra, päl-mîrâ, Asiatic Turkey, the Hebrew Tadmor, City of Palms, an ancient city of Syria, now in ruins, 140 miles east-north-east of Damascus, lat. 34° 24' N., lon. 36° 20' E. It was founded or enlarged by Solomon in the 10th century B.C. It is situated in an oasis of the Syrian Desert, with a ridge of hills to the west, and an extensive plain on the east. It is said to have been a bulwark of the kingdom of Israel against the wandering tribes of the desert, and was an entrepôt for the trade between Damascus and the Mediterranean, from which it drew considerable wealth. Palmyra was little heard of in history until the time of the Roman Empire. It is probable as has been thought by Mark Antony, who hoped to find in it the means to pay his troops; but the Palmyrians transported their goods beyond the Euphrates, and he was compelled to leave without accom-
PALMYRA — PALOS

Phishing his object. During the earlier period of the empire it was independent and carried on a considerable trade with Persia, India, and the Mediterranean. Subsequently, about 130, or according to other authorities later, it submitted to Rome, and became a Roman colony. The protection of Rome against its neighbors, the Parthians and the Persians, was of value, while the yoke of so distant a mistress was not heavy. It became the faithful ally of Rome in her wars against the Eastern powers. During the reign of Gallienus (260-8), Odenathus, the ruler of Palmyra, rendered such effective assistance against the Persians that that emperor gave him the title of Augustus, and recognized him as his colleague. Odenathus was succeeded by his widow Zenobia, to whom Palmyra chiefly owes its fame, and who took the title of Queen of the East. She was besieged in Palmyra by Aurelian, and compelled to surrender. On his departure the Palmyrants revolted, on which Aurelian returned and destroyed the city (271 A.D.) He permitted the inhabitants to rebuild it, but it never recovered its importance. The remains of Palmyra are chiefly of the Corinthian order, with the exception of the Temple of the Sun, which is Islamic. They are so extensive as to be long to the period of Odenathus and Zenobia. See ZENOBIA. Consult Wright, 'An Account of Palmyra and Zenobia' (1805).

Palmyra, Mo., county, city, county-seat of Marion County; on branches of the Chicago, B. & Q. railroad; about 14 miles northwest of Hannibal. It was settled in 1818, laid out in 1819, and incorporated in 1855. It is in a farming country and the chief manufactures are connected with farm products. It has a pickle factory, creamery, flour and grist mill, and a carriage factory. The educational institutions are Centenary High School (M. E. South), founded in 1884, and the Saint Paul's College (P. E.), founded in 1848 as the Ingleside Female College, and public and parish schools. Pop. (1890) 2,515; (1900) 2,393.

Palmyra Fibre. See FIBRE.

Palmyra Wood. See PALM.

Palni (pāl'ni) Hills, mountain range of Southern India, forming the Eastern Ghats of the district of Madura, Madras presidency. The soil is fairly fertile and affords excellent pasturage. The climate is equable, comparatively dry and healthy, and there is a sanatorium at Kodikanal, 47 miles northeast of Madura.

Palo, pālō, Philippines, a pueblo of the island of Leyte, situated on the northeast coast at the mouth of the Maio Malo River, six miles south of Tacloban. It is an important road centre, being connected by road with Tacloban and other important towns to the south and west. Pop. 17,929.

Palo Alto, pālō åltō, Cal., town in Santa Clara County; on the coast division of the Southern Pacific railroad; 33 miles southeast of San Francisco and 18 miles northwest of San Jose. It was settled in 1857 by the opening of the Leland Stanford Jr. University (q.v.) which is located on the south and west of the town. Many of these homes were built by residents of the New World in 1492. The convent at the gate of which Columbus appeared as a poor stranger, and asked bread and water for his
PALPI.—PAMIR PLATEAU

child, is still standing here. Palos is now an unimportant village. Pop. (1900) 1,619.

Palpi, the organs or appendages, consisting of stalked or jointed processes, found in connection with the mouth of many invertebrate animals, and which appear to be chiefly devoted to the exercise of the sense of touch, the means by which the animal explores the surface upon which it walks, and probably in some cases of taste also. Thus, in many insects palpi are borne by the maxillicae or lesser pair of jaws (maxillary palpi), and by the labium* or lower lip (labial palpi). The labial palpi in butterflies form the cushion-like organs by which the elongated proboscis or tongue is protected when at rest; and the small maxillary palpi of these insects are sometimes known as palpus. In bees, etc., the labial palpi are of great relative length. In Arachnida (spiders, scorpions, mites, etc.) the maxillary palpi are largely developed. In the spiders these organs in the males are concerned in reproduction, and in the females they are terminated by hooked claws. In the scorpion the same structure forms powerful nipping-claws or chela. In the higher crustaceans (lobsters, crabs) the tarsus of the jaw-bearing palpi. Con- sult Packard, 'Zoology' (1897).

Palpitation, abnormal movement or beating of the heart, sometimes violent and spasmodic; sensible to the patient, and causing discomfort or even distress. Its immediate cause is an over-stimulation of the excitability of the muscular structures of the heart, due to disturbed action of the ganglia and nerves which control its movements. The predisposing and exciting causes of palpitation are numerous; for example, an excitable temperament; bodily and mental exhaustion; inanition; deterioration of the blood as in scurvy, chlorosis, and spasmia; violent exercise or emotion; mental shock; dissipation; dyspepsia. In short, whatever tends to disturb the orderly action of the nervous system may induce palpitation, which is sometimes accompanied by symptoms of choking (globus hystericus), vertigo, ringing in the ears, impaired vision, partial unconsciousness, a choking of the extremities, and the fear of death, due to general nervous agitation. When palpitation arises from actual or organic disease of the heart it is sometimes spoken of as symptomat; when due merely to disturbed action in the heart or to disturbances elsewhere is frequently called functional, though it is always but a symptom. When occurring with organic disease it often causes more anxiety to the patient than the disease itself. In treatment, remove as far as possible the exciting cause, enjoin absolute rest, keep the feet warm, sometimes give hot drinks—milk, cocoa, and hot water containing a little baking-soda are useful. Valerian and aromatic spirits of ammonia are often valuable. Severe cases should be under the care of a physician.

Palsy. See Paralysis; Paralysis Agitans.

Paldemamentum, a white cloak, which the commander of the Roman army put on in time of war. Sometimes, however, the color may have been crimson, and in the case of the emperor Domitian it was purple.

Paldan-Müller, pail'oo-dan-mü'ler, Frederick, Danish poet: b. Kjerteminde, on the island of Funen, 7 Feb. 1809; d. Copenhagen

29 Dec. 1876. In 1828 he entered the University of Copenhagen, and while a student there attracted attention by his poem 'Raab til Polen' (1831) and a drama 'Kjarlinghed ved Hoffet' (1832). His first poem of note was 'Danske- drinden' (1831), followed in 1834 by the lyric drama 'Amor og Psyche' and by two volumes of 'Poesier' (1836-8). His later works include 'Venus' (1841, a dramatic poem); 'Dryadens Bryllup' (1844); 'Tithon' (1844); 'Tre Digt' (1854), among them the lyric drama 'Kalanus'; 'Nye Digt' (1861); and the two prose works, 'Ungdomskildern' (The Fountain of Youth) (1865); and 'Ivar Lykkes Historie' (1866-73), a novel. His chief work is 'Adam Homo,' a poem in ølven rima. An edition of his poems in eight volumes appeared in 1875-9.

Paludism (Lat. palus, palud-, a marsh), malarial poisoning; disease or disposition arising from malaria (q.v.).

Pamban-manche, or Serpent Boat, the native name for a long canoe used on the Malabar coast. They are from 30 to 60 feet in length, but more than that are rare; and are hollowed out of a single tree. The largest are rowed by about 20 men, double-banked, and can attain a speed of 12 miles an hour.

Pamela, pa-mē'lə, or Virtue. Rewarded, a novel by Samuel Richardson, published 1741-2. It was the first work of its author who began what is called the modern analytic novel. It won instant applause and a wide circle of readers, all classes of society following with close attention the shifting fortunes of the young heroine, who, after several adventures, a serving-maid whom the son and heir of the family dishonorably pursues. Richardson created a new era in fiction when he chose a girl of the humble class for heroine, and made use of every-day contemporaneous persons, and scenes for the purposes of the novelist. Thus the story of incident and the analysis of character came into English fiction, and thus the modern novel traces its development from Richardson. It was satirized and parodied in 'Joseph Andrews' by Fielding.

Pamir (pā-mēr') Plateau, The, or The Pamirs, Central Asia, an elevated region described as a "huge boss or knot," north of the Hindu-Kush Mountains, connecting the Himalayans and Thian-Shan mountain systems. (See Himalaya.) The plateau is about 150 miles long by 150 miles broad, nine tenths of the area being mountainous and the rest pasture-land. The name applied to the valleys is derived from the Persian pāi and mir, signifying "the foot of mountain peaks"; the region is called also by the Persians Bām-i-dunyā ("the roof of the world"). The territories belonging to Russia, China, Afghanistan, and Britain meet in the Pamir region, and until the completion of the Anglo-Russian surveys in 1895 demonstrated its strategic valuelessness, owing to climatic and physical conditions, it was a fertile source of political dispute. The plateau has a general elevation of more than 13,000 feet, dominated by still loftier ridges and summits attaining a maximum altitude of 25,800 feet in Mustagh-ata, in the Sarikol range, and covered with perpetual snow. On the plateau are several small lakes, and the sources of the Oxus. From November to April the Pamirs are snow-bound and prac-
tically inaccessible, while in the spring and summer rains, which winds make traveling very unpleasant. The greater part of the surface is bare and barren; the native Kirghiz, however, find a certain amount of pasture for their cattle in summer, and in favored localities there is some cultivation. The roof of the world is celebrated throughout Central Asia, and notwithstanding its physical drawbacks, two recognized trade routes have traversed it east to west for ages.

**Pamlico**, pàm-lè'kò, a river in North Carolina, really an estuary of Tar River, opening into Pamlico Sound. It is 40 miles long, from one to eight miles wide, and navigable for steamers which can enter the sound. Several small streams flow into the Pamlico River.

**Pamlico**, a sound or lagoon on the coast of North Carolina, the largest lagoon on the east coast of the United States. The point farthest out is called Cape Hatteras. Pamlico and Neuse rivers meet the sound, and the outlet on the east are Hatteras and Ocracoke inlets. The northern part is shallow, the southern part is about 20 feet deep. Fish and wild fowl are abundant. Several small islands skirt the shore. Roanoke, in the northern part of the sound, is the largest.

**Pamlico Indians**, a former American tribe living on the Pamlico River in Beaufort County, N. C. They were greatly reduced in number by the smallpox in 1657, and were practically exterminated by the Tuscarora war in 1711.

**Pampa**, pàm-pà, or **Bamba**, a Quechua word meaning plain, applied to various great plains in South America, and also occurring in proper names, for example, Riobamba, Moyobamba, Ayapampa ("Plain of Death"), and Cochabamba ("Lake Plain"). Rarely, as in Peru along the Río Yavari River, forested plains are spoken of as pampas; the typical pampas are stretches of treeless plain, varied with rolling prairie, their vegetation being annual or perennial herbaceous plants, with a few shrubs. Water courses are absent, but there are many lakes or pools of rather brackish water. The predominance of grasses, especially varieties of the cereals, make the pampas in general an ideal feeding ground for steers, horses, and sheep. A marked botanical feature of the pampas is a huge thistle apparently indigenous to the Northern hemisphere.

In common usage Pampa or the Pampas is confined to a great plain in Argentina, the administrative district of Pampa Central, with General Acha (1,500 inhabitants) as capital, and a total population of 26,000. Here to a certain degree the original nature of the vegetation has been altered by tree planting, so that much of the plain, which 30 years ago was opened up for cattle grazing by Roca's successful expedition against the Indians of this region, now no longer grows the pasto amargo, but only grasses better suited for sheep. These are tended by Gauchos, Spanish and Indian half-breeds. A few years ago there was 300,000 sheep, 300,000 beef cattle, and 221,000 horses, mules, etc., grazed in this great plain. The Pampas have been scientifically studied by d'Orbigny, Darwin, and Roth. Beneath a layer of thin vegetable mold, there is 40 or 50 yards of reddish clay, whose admixture of fine sand of chalky infiltrations, apparently repeated inundations in geological time. There is a rich prehistoric fauna, notably remains of maegatherium, hippidimus, mylodon, megatherium, and mastodons; well on the whitish lacustrine deposits near the surface fragments of tegumentary and primitive tools, as well as bones (some of prehistoric animals), engraved and polished by man. Consult Ameghino, 'La antiguedad del hombre en la Plata' (1880).

**Pampa Aullagas**, owl-yā'gās, or Poopo. See AULLAGAS.

**Pampanga**, pàm-pàng'gà, Philippines, a province of the island of Luzon, situated in the southwestern part of the island, bounded on the north by Tarlac, on the east by Bulacan, on the south by the Bay of Manila, and on the west by Zambales; length 37½ miles from north to south; greatest width 34 miles; area 2,009 square miles. The province is high in the north and mountainous in the northwest and west, but low and marshy in the south; along the shore of Manila Bay and for several miles inland the country is covered by canals and the estuaries of the Grande de la Pampanga River. The principal products are rice (raised in the lowlands of the south), sugar, sweet potatoes, gane, tobacco, and cotton. The whitish lacustrine deposits near the surface fragments of tegumentary and primitive tools, as well as bones (some of prehistoric animals), engraved and polished by man. Agriculture is the chief occupation of the inhabitants, but medical and industries are also quite extensively developed; the most important are weaving and the manufacture of sugar, the fisheries of Pampanga are increasing in importance, and there is a large local trade in rice, sugar, honey, sages, etc. There are roads connecting all the towns, and connecting the province with Manila, Cavite, Tarlac, and Nueva Ecija; the Manilia & Daguapan Railroad crosses the province from southeast to northwest, passing through the larger towns, and has been an important factor in the industrial development of the province. The great majority of the people are Pampanggos (q.v.). Civil government was established in the province in February 1901.

**Pampanga, Rio Grande de la**, rē'gā grān'dà là pàm-pàng'gà, one of the four great rivers of Luzon, Philippines, is formed in the northern part of Nueva Ecija by the junction of a number of streams that drain the western slopes of the Caraballo Sur, flows southwest and south through the provinces of Nueva Ecija and Pampanga, and empties into Manila Bay through a delta of eight mouths. It drains a large territory, and has numerous tributaries, chief among them the Rio Chico de la Pampanga; in the rainy season it overflows its banks in the lower part of its course and these inundations make fertile soil for the cultivation of rice. It is about 100 miles long, and the means of a large local trade.

**Pampanggos**, a group of tribes of the Philippine Islands inhabiting the province of Pampanga, Luzon, and single localities in Nueva Ecija, Bataan and Zambales. They are of the Malay race, and at the time of the Spanish conquest of the islands had a civilization and writing of their own. In Pampanga they use their own language, which is spoken exclusively in that province.
PAMPAS—PAMPLONA

Pampas, pāmp'āz (Sp. pāmp'ās). See PAMPA.

Pampas Cat. See GRASS-CAT.

Pampas Deer, a small deer (Cervus compestris) of the plains of southern South America, having antlers of three points each.

Pampas Grass, the most beautiful and the most important commercial ornamental grass (Gynernium or Cortaderia argenteum). It is a native not of the pampas of South America, but of the well-watered higher lands of Brazil and the Argentine Republic. It grows in large clumps, has leaves often more than six feet long, and flowering stems frequently exceeding two feet in height, surmounted by great graceful plumes (panicles) of silvery-white flowers which may occupy even more than two feet of the stem. This beautiful plant is grown in large quantities in California and sold for use in decoration, the plumes often being dyed with aniline in various tints. Outside of California, which is the only country where this grass is grown for market, the plants are cultivated for ornament in parks and gardens, but in the north they are subject to frost damage and are killed during the winter. They will grow in any good garden soil with no special attention. There are several horticultural varieties whose flowers are pink, carmine, purple, and intermediate tints. Two related species are of some importance: usa grass (G. saccharoides), a native of Brazil, furnishes considerable sugar, and G. jubata, a plant even more graceful than the pampas grass.

Neither is grown in the United States, the former being very tender and the latter little known.

Pampas del Sacramento, pāmp'ās dél sāk-rā-měn'tō, Peru, great plain in the north-eastern part of the republic, between the Ucayali and Aullaga (or Huallaga) rivers. It is crossed by excellent waterways, has a rich vegetation, and was settled in the 18th century by Jesuit missionaries, but is now almost deserted.

Pampeluna, pāmp'-lōo'nā, or Pampelune, pāmp'-lōōn, variant spellings of Pamplona (q.v.).

Pamphilus, pām'mīl-lūs, Greek painter: b. between 390 and 350 B.C. He and Eupompos were founders of the Sicilian school of painting. He was the teacher of Apelles and Melanthus and was famous for scientific accuracy in drawing and perspective. He made his pupils pay him a talent (about $2,000) for a course in painting. Among his works famous in antiquity were 'The Battle of Phlius'; 'The Voyage of Ulysses'; and 'Family Group'.

Pamphilus, Saint, a priest of Cesarba, by birth a Phoenician, who for refusing to sacrifice to idols was cast into prison. He was a theological teacher at the famous catechetical school at Alexandria and collaborated with Eusebius in writing 'The Apology for Origen.' Persisting in adherence to the Christian faith he was condemned to death (300) and suffered martyrdom by decapitation 16 February, the day on which his festival is celebrated.

Pamphlet, a name applied to an ephemeral publication, occasional and not periodical, commonly discussing some question of public or special interest at the time. There are thus two distinct classes of pamphlets, the one addressed to the general public, and discussing some question of immediate though probably temporary interest, the other addressed to a special class of readers, and discussing something connected with their particular interests or pursuits. Pamphlets of both classes are now to a great extent superseded by the opportunities of discussion afforded by regular periodical literature. They still, however, serve many important uses. Pamphlets have at various times since the introduction of printing exercised a very important influence, especially in this country, and in general in all times of political and religious excitement pamphleteers have been both numerous and vehement. They have comprised all sorts of men, from scholars and men of genius to the most vulgar and venal of partisans. Consult Waugh, 'The Pamphlet Library' (1868).

Pamphylia, pām-fil'-i-a, ancient division of Asia Minor, bounded on the north by Pisidia, on the east by Cilicia, on the south by the Mediterranean (Gulf of Adalia), and on the west by Lycia. Its coast line measured 75 miles, and its extent north and south was about 380 miles. The geological formation is peculiar, the entire surface of the country having been greatly changed since classical times by continuous fluviatile deposits of carbonate of lime. The region was never an independent kingdom, so far as we know, but was successively subject to Lydia, Persia, Macedonia, Pergamum, and Rome. The population in early times seems to have consisted of an admixture of Semitic and Indo-Germanic elements. There were Greek settlements at Perge, Aspendus, Side, Cibyra, and Attalia, and remains of Pamphylian inscriptions show that the dialect of Greek used there resembled both Cyprian and Arcadian and hence was a very early form. Consult: Ramsay, 'Historical Geography of Asia Minor' (1890); Rader, 'Les Villes de la Pamphylie' (1890, in 'Revue Archéologique'); and Lanckoronski, 'Städte Pamphyliens und Pisidiens' (1890).

Pamplona, pām-plo'nā, Pampeluna, or Pamplune, Spain, capital city of the province of Navarre, situated nearly 200 miles northeast of Madrid, in a plateau 1,400 feet above sea-level, on the right bank of the Arga River and on the railway from San Sebastian to Saragossa. There is an old and a new quarter. The former with its narrow streets has changed little since the city was the capital of the French kingdom of Navarre; but the new part is regularly laid out. The main objects of interest are a cathedral, begun by Charles III. in 1397, the historic hall where the Cortes of Navarre used to meet, the churches of San Nicolás and San Saturnino, and several fine promenades and boulevards, La Taconera being the best; nearby are the gorges of Mayo and Roncalvales. A citadel built by Philip II. has been reinforced by more modern fortifications; the city is an important point strategically. The main industries are the manufacture of leather, linens, paper, flour, soap, strings for musical instruments, and wines. There is a great market at Pamplona from 20 June to 18 July. The city may have been a Roman colony Pompeiopolis; but the derivation is not certain. It was taken from the Arabs by Charlemagne in 778, passed to Ferdinand of Aragon in 1512, was held by the
PAN

French during the Peninsular war, and figured in the Carlist insurrections. Pop. (1900) 30,699.

Pamunkey, paˌmänkəˌ, a river in Virginia, formed by the junction of the North and South Anna. It joins the Mattaponi at West Point and forms the York River. From the source of the South Anna to the York is 100 miles. The Pamunkey Indians have a reservation on the Pamunkey River.

Pamunkey, paˌmänkəˌ, and Totopotomoy, two streams in Virginia, the banks of which were the scenes of military operations during the Civil War. When Gen. Grant withdrew from the North Anna (q.v.) on the night of 20 May 1864, he moved rapidly by the left to cross the Pamunkey, about 33 miles east. Gen. Sheridan, with Torbert's and Gregg's cavalry divisions, preceded the infantry in the afternoon, and at 9 o'clock next morning had crossed the Pamunkey and occupied Hanover Town, near which place, on the Hanover Court House road, one of Gen. W. H. F. Lee's cavalry brigades was met and forced back toward Hanover Court House. On the morning of the 28th Gregg's cavalry division, advancing on the Mechanicsville road, had a severe engagement with the Army of the Virginia. Gen. W. H. F. Lee, hastening to his aid, drove it back upon the infantry at the Totopotomoy. Gen. Lee had early information of Grant's movements, and on the 27th put his army in motion to interpose between him and Richmond. Early's corps crossed the South Anna, and by midday of the 28th was in position with its right near Beaver Dam Creek, its left on the Totopotomoy, near Pole Green Church, four miles from Hawes' Shop. Anderson's corps formed on Early's right, and covered the road from White House, on the Pamunkey, by Old Church, Bethesda Church, and Mechanicsville, to Richmond. Hill's corps and Breckinridge's command advanced on Early's left toward Atlee's Station, crossing the Virginia Central Railroad a mile north. On the afternoon of the 28th the Sixth and Second Union corps crossed the Pamunkey at Huntley's, four miles above Hanover Town, and took position across the Hanover Court House road at Atlee's Station, and the Fifth corps crossed at Hanover Town, the left near the Totopotomoy, an affluent of the Pamunkey, which it entered two miles below Hanover Town. The Ninth corps crossed at midnight. The Second, Fifth and Sixth corps formed a line in front of Hanover Town, 17 miles from Richmond, the Sixth on the right, the Second in the centre, and Fifth on the left. At noon of the 29th Barlow's division of the Second corps advanced on the road from Hawes' Shop to Atlee's Station, small bodies of Confederate cavalry falling back before it to the other side of the Totopotomoy, where the infantry was found strongly intrenched. Warren's Fifth corps took position on the Shady Grove Church road, skirmishing with the enemy. The Seventh corps moved on the right of the Second, occupying for a time Hanover Court House, and then closing in to the left, and the Ninth corps moved between the Second and Fifth, pushing out on the road to Hanover Court House. The incessant fighting during the 30th in an effort to develop the Confederate position, and late in the day Early's corps attacked Warren's Fifth corps near Bethesda Church and attempted to turn its left, but was repulsed. To relieve the pressure on Warren, Hancock at 7 p.m. was ordered to attack, and Burnside's brigades crossed the line of rifle-pits occupied by the Confederates. On the 31st Birney's division crossed the Totopotomoy and carried the enemy's advanced line on the right of the Richmond road. Gen. Wilson's cavalry division moved to Hanover Junction and destroyed the railroad bridge over the North Anna, at the same time defeating the Confederate cavalry and driving it from Mechump's Creek; and Sheridan, with two divisions of cavalry, was sent to occupy Cold Harbor, driving the enemy out, and was directed to maintain his position at all hazards. On 1 June Warren moved out to develop the Confederate position, and found it intrenched strongly in his front, beyond clear ground, swept by artillery fire. He lost 200 killed and wounded, extended his line some distance to the left, and was attacked in several places during the day, and quite severely on the right just before dark. Everywhere Gen. Grant had found Gen. Lee confronting him in strong works, and determined again to retire from his direct advance toward Richmond and to throw his troops rapidly to the left to Cold Harbor (q.v.). This movement began on the night of 31 May, the corps moving successively from the right. Consult: 'Official Records,' Vol. XXXVI.; Humphrey, 'The Virginia Campaign of 1864'; Wather, 'History of the Second Army Corps'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. Carman.

Pan, in Greek mythology, a rural divinity. Comparative philology, showing that the name is related to pastor (Latin, *shepherd*), agrees with the results of modern mythological study, which traces his various attributes back to an original god of the flocks, so that we can credit neither the decadent explanation of his name, from the Greek word meaning "all," by his being the son of Penelope and all the other stories of the Stoics who made of him a god of the universe, the ever-present spirit of nature in all things. It seems evident that Pan was originally a shepherd god of Arcady; indeed the figure that Arcady cuts in modern pastoral poetry seems to be due entirely to its mention in classic authors in connection with the pastoral god. Considered as a typical shepherd Pan naturally develops into hunter, fisherman, and, in time, warrior; and "panic* and "panic* is explicable as an extension of the unreasoning terror that seizes a flock of sheep. Another school of mythologists stress the fact that Pan was an Arcadian god, make his various rural activities merely those of the normal Arcadian, and explain his warlike functions by noting that the Arcadians were often mercenaries; but this scheme fails to explain the myth of Pan's love of Selene, the moon-goddess, which is perfectly explicable if we reckon the god a shepherd who must "watch by night." The Arcadian myths of Pan's birth are many, the commonest make him son of Zeus and Callisto, or of Hermes and a daughter of Dryopaeus, and appropriate him closely with Dionysus. The myth of Pan's cages of Bacchus spread slowly through Greece. He was not worshipped at Athens until after the battle of Marathon, where the panic of the Persian army
was accredited to him; compare Browning's poem 'Phædippides.' In Rome Pan was identified with Faunus or Innuus and later cohunted with the Satyrs, so that Panes and Panisci were spoken of; moreover his nature was sensu-
alized somewhat, so that in early Christian times he became panexicated as the god of Greec
heathendom. Hence the myth of the death of Pan at Christ's birth; and hence, too, one of the representation in art of Pan as a horned being half-man, half-goat, the popular picture of the devil. Earlier Greek art, it must be remem-
bered, made of him merely a beautiful young shepherd, only occasionally giving him horns, such as were worn by other divinities of nature, notably the river-gods. Consult: Wieseler, 'De Pane' (1875) J. Roscher, 'Ueber Seleine und Verwandten' (1880).

Pan-American Conference. In American history, a convention held in Washington, D. C., in 1889-90 at the instance of James G. Blaine, then secretary of State, at which delegates were present from all the governments of South and Central America. A second conference was held in the City of Mexico 22 Oct. 1901, delegates being present from 19 states. These conferences had for an object the furtherance of international comity and commerce among the races of the American continent. The meetings of the first conference were protracted for nearly six months, the delegates meantime visiting every city of importance in the United States. The conference possessed no legislative or executive functions, its duties being purely advisory. The definite recommendations made by the conference in-
cluded a coinage of uniform weight and fineness, a common method of legalizing of documents, the metrical decimal system, and a uniform sys-
tem of weights and measures, regulation of the fees of consular agents, and certain conveniences of method in customs administration. These were only suggestions to the countries repre-
sented, and they could be made effective only by treaties. Other important propositions were unanimously adopted, such as a great trunk rail-
way, government subsidies for steamship lines connecting the American countries represented; uniform protection for literary and art property, trade-marks, and patents; uniform quarantine regulations; a uniform extradition treaty, and a great international bank.

Pan-American Exposition. A great fair held in Buffalo, N. Y., from 1 May to 1 November 190.1. It was so called from the large num-
ber of exhibits brought from Central and South America. The numerous buildings were made of staff, as were those of the Columbian Expo-
sition, but were tinted a soft greenish-blue, thus
avoiding the glare of the pure white. Power for the electrical exhibit was derived from Niagara Falls. Over 5,000 horse-power and 200,000 incandescent lamps were used. The electrical town was lit by 4,000 electric lights on its sides. The Midway, a section of the grounds devoted to various kinds of shows and entertainments, was very popular. It included a Japanese village, an Indian Congress, panoramas, etc. Financially the exposition was a failure, due largely to Presi-
dent McKinley's assassination, which caused a temporary closing. The total cost of the exposition was $8,800,757.20; the total receipts $5,478,589.37. See Exhibition.

Pan-Presbyterian Council. See Presby-
terian System, Alliance of the Reformed Churches Throughout the World Holding.

Pana, pà'na, Ill., city in Christian County; on the Baltimore & O. S. W., the Cleveland, C., C. & St. L., and the Illinois Central R.R.'s; about 40 miles southeast of Springfield. It was settled about 1845, and in 1867 was chartered as a city. It is in an agricultural region in which hay and corn are important products. In the vicinity are coal deposits. About 1,000 employees work in the coal mines; the hay compress companies have about 40 employees, and other industrial works employ about 50 more. There are seven churches, public and parish schools, and a free public library. The two banks have a combined capital of $250,000. The general law of 1870, for the government of cities, is in force in Pana. The waterworks are owned and operated by the city. Pop. (1890) 5,077; (1900) 5,530.

Panætius Rhodius, Stoic philosopher: b. Rhodes about 180 B.C.; d. Rome about 110 B.C. He spent most of his life in Rome disseminating the tenets of Greek and more especially of Stoic philosophy. Here he enjoyed the friend-
ship of Lelius and the younger Scipio. He sub-
sequently traveled extensively in the East and visited Egypt and on his return opened a Stoic school at Athens. He really belonged to the middle Stoic or Eclectic school and borrowed from Plato and Aristotle. Only fragments of his writings are extant to-day. His chief treat-
ise was one on 'Duty' from which Cicero in his 'De Officiis' has drawn much material. Con-
sult: Van Lynden, 'De Panætio' (1802); Schmekel, 'Die Philosophie der mittlern Stoa' (1892).

Panama, pà-nà-mà, republic of Central America, bounded on the north by the Caribbean Sea, on the east by the Gulf of Darien and the Atrato River, which separate it from Colombia, on the south by the Pacific Ocean, notably on the southwest by the indenting Gulf of Mexico, and on the west by Costa Rica, the boundary being unsettled on the latter point. The interior in general, and especially in the northwest along Mosquito Bay and in the southeast along the Atrato River is marked *unexplored* on the most recent and complete maps of the country. The interior is thick with hills and mountains, a few being extinct volcanoes. These have no connection either with the North American Cordilleras or with the Andes. The only sys-
tematic ranges are a bit of the Costa Rica cen-
tral divide, which runs over into western Pan-
amo, and on the Atlantic coast further east the Cordillera de San Blas. The detached and irregular hills are often separated by streams greatly subdivided. The banks of these streams, and, indeed, the greater part of the country is covered with dense tropical vegetation. The exceptions to this rule are a few treeless up-
lands along the Pacific side between the Costa Rica border and Panama. The smaller streams are unimportant with the exception of the ill-named Rio Grande, emptying into the Pacific near the city of Panama, and the Rio Chagres which flows into Limon Bay near Colon. The importance of Panama is largely in their proximity to the projected canal. This lack of interior waterways and the general impassability of the country make the only outlet for most towns the sea and make other
PANAMA

means of communication (save between Colon and the city of Panama by rail), as well as other location than near the sea, practically impossible. The altitude of the country varies between 200 and 1,500 metres. The climate is warm and damp, and extremely unhealthy. The terrible mortality consequent upon the canal excavations made by the French are so commonly taken to prove that the earth if merely upturned breeds a deathly miasma, the "creeping yellow fever," that of both the new republic of Colombia and their small agriculture. But the high death rate is quite as probably explicable by the lack of sanitation and by the unrestrained use of mountain streams for laundries, drains, cess-pools.

History.—Columbus landed on the isthmus in 1502. Then came further exploration, notably by Balboa, and in train of that colonization, still in the first quarter of the 16th century. In the 17th, their situation as the Isthmus containing in that century and the next the country in general and the city of Panama (q.v.) in particular enjoyed the advantages coming from the shipment of South American silver and gold. But this was the end of the 18th century that Panama was largely isolated from Colombia and took comparatively little part in the various revolts that culminated in Colombian independence in 1819. Two years after the proclamation of the republic of Panama, the last named included the Isthmus. Strangely enough, this forming government of the new republic was practically identical with that which had brought it to revolt against Colombia; and in the new republic of New Granada the central government was equally ill-adapted to its heterogeneous elements. Moreover, there was no simple and speedy means of intercommunication such as might have welded the country into some national unity. In the existence of this type of government is the philosophic key to the disaster which, as the Centralists a provincial government of the colony from down to 1831, and after that date of New Granada and the New United States of Colombia. It was in the very nature of things that as New Granada had broken from Colombia, so Panama, New Granada's remotest part, must break, or attempt to break from New Granada. A state's rights or Federalist party did rapidly rise throughout New Granada. In 1840 revolutions broke out in most of the provinces. An independence of the Centralist party was not an affair of the provinces of Panama and Veraguca, was proclaimed in 1841, but the Centralists were successful, the revolution was suppressed, and the old régime was restored. The sentiment against this method of government steadily increased until in 1855 by an act of the Congress of New Granada at Bogota the autonomous state of Panama was erected out of the Isthmian provinces. But the sincerity of this act may well be questioned and its aim was probably political and the purpose to crush the Federalist party for good and all. But the attempt of the national government to revoke its act, and, it seems, to provoke a revolution, and then in crushing that revolution to put a stop to all Federal agitation, overreached itself. The revolution in behalf of the new constitution was completely successful. For a score of years and more Panama, like the other states in the Colombian Union, enjoyed (more or less interruptedly) its individual rights. A Centralist uprising in 1885, however, effected a return to old conditions. The former state of Panama was again ruled from Bogota, and became a department called Panama. This department was divided into the provinces of Chiriqui, Veraguas, Azuero, and Panama; the last named province occupied the eastern half, approximately of the department of the same name, with which it is very easily confused.

It is an important nation during this revolution in 1885 the United States of North America landed marines to protect the transit of the Isthmus between the cities of Colon and Panama, a circumstance of material assistance to the new government. Power and the act undertaken simply for the sake of interoceanic and trans-Isthmian commerce. That it could have been for any reason other than this is impossible, since the right and duty of the United States — declared that the high act of the Isthmian strip was due to a treaty made in 1846 with the government of New Granada, a government not in existence in 1885. In short the obligation was one to a territory and not to any power; and it was that Panama had proclaimed their independence and became part of the republic of Colombia. This was a strong centrally government held together by little but Bolivar's personal influence and power. It was shattered in 1831, the year after his death, and three new republics were formed, namely, Venezuela, Ecuador, and New Granada. The last named included the Isthmus. Strangely enough, the forming government of the new republic was practically identical with that which had brought it to revolt against Colombia; and in the new republic of New Granada the central government was equally ill-adapted to its heterogeneous elements. Moreover, there was no simple and speedy means of intercommunication such as might have welded the country into some national unity. In the existence of this type of government is the philosophic key to the disaster which, as the Centralists a provincial government of the colony from down to 1831, and after that date of New Granada and the New United States of Colombia. It was in the very nature of things that as New Granada had broken from Colombia, so Panama, New Granada's remotest part, must break, or attempt to break from New Granada. have been sufficient. On 3 Nov. 1903—that is three days after the adjournment of the Colom- bian Congress—the municipal council of the city of Panama proclaimed the independent rep- ublic of Panama. There was no bloodshed. An army of 400 Colombians (mostly boys be- tween 12 and 14) arrived 4 November in Colon, whence its general with his staff went to Pan- ama, was dined there, and upon his refusal to acknowledge the new republic of which he knew nothing until the evening of the 4th, was im- prisoned for a few days, but on the 7th with his army was shipped back to Cartagena from Colon. In the meantime upon the 6th of No- vember, the president, Eusebio Morales; Minister of Finance, Dr. Manuel Amador (the successful candidate for the presidency); Minister of Foreign Relations, F. V. de la Espriella; Minister of Justice, Carlos Vivero; Minister of War, Marine, and E. Obarrio, Jr. On 27 December a general election of delegates to a national convention took place. In most instances municipal au- thorities attempted to prevent the balloting. If there was any opposition it was unimporta- nce. The remarkable haste with which the provisional government was recognized by our own is not without precedent; in a Senate debate 5 Jan. 1904, Senator Lodge pointed out that in 1848 the United States, having been the first to recognize the new republic of which it knew nothing, and that the Republic of Brazil had re- ceived formal recognition within two days after its formation. It is to be noticed also that Panama's government was perfectly justified be- cause, after all, the Central American republics had no intention to protect the trans-isthmian railroad, its defense lies in an appeal to the 'Treaty of 1886, to the precedent of 1885, when the Centralist cause was as much (and as un- intentionally) aided as it was checked in 1903, and to and the principle that it is the Isthmian commerce that we aim to protect by keeping the strip and to the independence of Panama. The objection to this view of the case and the dis- agreement with the actions of the present ad- ministration come from various sources; first, as in the case of the New Haven petition sent to the Senate 11 Jan. 1904, from unpartisan con- stitutional experts; and second from the oppo- sition press, and the opposition parties of the Nicaragua route, who see their last chance to win. The New Haven petitioners simply beg the Senate to make a careful and deliberate in- vestigation. The opposition in Congress (and in the press) urges that the revolution in Pan- ama was fostered if not actually started by the Republican administration and the landing of troops was for the purpose of preventing Colum- bia from subjugating the rebellious department; in other words, that the revolution grew out of pure self-interest in the proposed canal. Whatever the merits of these arguments, the inability of the Democratic caucus to bind its members to oppose the Canal Treaty, the in- structions from the Mississippi Legislature to the Senators from that State, and 11 Jan. 1904 the practical conclusion of the nomination of W. I. Buchanan to be minister to Panama by the telegraph Senator Morgan's motion to recon- sider,—all these things seem to show that the actual opposition to the course of the adminis- tration is likely to come to a speedy end.

The provisional government founded 3 Nov- ember was in the hands of a junta consisting of J. A. Arango, Tomas Arias, and Federico

BoyO. The last-named member of the junta arrived in the United States on 18 December and late the same day a Canal Treaty was signed by Secretary of State John Hay and the minister from Panama to the United States, Philippe Bunau-Varilla (see VARILLA, PHILIPPE BUNAU), who had been formally received at Washington eight days before. This treaty is practically the same as the convention made with the Colombian in 1885, except that the latter was a treaty and the new republic is wider, but the canal strip is made wider and the powers granted to the United States are larger. The junta named above took control of the gov- ernment, being assisted by the following pro- visional officials: President, Eusebio Morales; Minister of Finance, Dr. Manuel Amador (the successful candidate for the presidency); Minister of Foreign Relations, F. V. de la Espriella; Minister of Justice, Carlos Vivero; Minister of War and Marine, M. Obarrio, Jr. On 27 December a general election of delegates to a national convention took place. In most instances municipal au- thorities attempted to prevent the balloting. If there was any opposition it was unimporta- nce. The remarkable haste with which the provisional government was recognized by our own is not without precedent; in a Senate debate 5 Jan. 1904, Senator Lodge pointed out that in 1848 the United States, having been the first to recognize the new republic of which it knew nothing, and that the Republic of Brazil had re- ceived formal recognition within two days after its formation. It is to be noticed also that Panama's government was perfectly justified be- cause, after all, the Central American republics had no intention to protect the trans-isthmian railroad, its defense lies in an appeal to the 'Treaty of 1886, to the precedent of 1885, when the Centralist cause was as much (and as un- intentionally) aided as it was checked in 1903, and to and the principle that it is the Isthmian commerce that we aim to protect by keeping the strip and to the independence of Panama. DR. MANUEL AMADOR,
FIRST PRESIDENT OF THE REPUBLIC OF PANAMA.
Panama—Panama Canal

Panama Canal, an all-water route between the Atlantic and Pacific to run from Colon to the city of Panama. Balboa’s explorations of the Isthmus were made with the particular purpose of discovering a strait which would make possible the longed-for western passage. In 1594, dericksins, $10,000,000, brought to the attention of the King of Spain a plan to cut a canal through the isthmus, but for political reasons the project was suppressed, and the death penalty was attached to any attempt to reopen the matter. A canal at Nicaragua was suggested by Nelson in 1840, and in 1854 Humboldt mapped five routes, one of them between Chagres (near Colon) and Panama.

Spain had determined to begin work when the country was snatched from her control in 1821 by the independence of New Granada, Guatemala, San Salvador, and Honduras tried to interest Louis Philippe in a canal in 1844, but were unsuccessful. The discovery of gold in California in 1849 renewed interest in trans-Isthmian commerce and six years later the railway between Chagres and Panama, practically the route of the canal now planned, was built. An American commission between 1870 and 1875 examined the routes proposed and declared in favor of a canal through Nicaragua.

The investigation was renewed with greater care upon the suggestion of the International Congress of Geographical Sciences which met in Paris in 1875. From the end of 1876 to the spring of 1879 a French commission, led by Bonaparte Wyse, accomplished a total of $193,402. The city is the seat of a bishop and of several consulates, and has a cathedral, ruined convents, a Jesuit college and a university founded in 1751. Panama is the center of the movements in it the revolution against Colombia was carried out 3 Nov. 1903. Pop. about 30,000.

Panama, Isthmus of, the tongue of land connecting the northern and southern American continents and varying in width from 30 to 70 miles. The isthmus runs east and west with a double curve in either coast line, so that the western hollow made by Mosquito Bay on the north side and the eastern indentation of the Gulf of Panama on the south side, each with a corresponding bulge opposite, give the entire isthmus the shape of a recumbent S or of the sign of variation. In this more extended use of the term the words Isthmus of Panama are applied to the entire republic of Panama (q.v.), that is, what was formerly the depopulated Isthmus of Panama. The term is also used of the eastern and narrower part, corresponding roughly with the former province of Panama; to this part the name of Darien was originally applied. The isthmus was reached by Columbus in 1502, and was an immediate field for Spanish civilization. It was conquered in 1513 by Balboa, who "from a peak in Darien" discovered the Pacific. The cities of Panama and Nata were colonized before 1520. The isthmus was also the scene of the Darien scheme of colonization fostered by William Paterson (q.v.). In spite of its having been known so long to European explorers, large parts of the Isthmus to the west of Colon are unexplored. The contour of the isthmus is broken by irregular hills much worn by erosion.
a new commission appointed by President McKinley in 1899 also reported in favor of the Nicaragua route, being influenced to do so by the prohibitive price first set by the French company on its franchise and property in Panama. But a supplementary report in favor of the Panama Canal followed the offer of the French company to sell for $40,000,000, the valuation set by the American Commissioners. Both houses of Congress had previously shown their readiness to vote for the Nicaragua scheme; and in the Senate particularly its adherents under the leadership of Senator Morgan of Alabama, chairman of the Senate's Committee on Canals, seemed pledged to that route. The Senate, however, was quickly won over by the efforts of Senator Hanna, who had become interested in the Panama scheme, it is said, by the efforts of Philippe Bunau Varilla (q.v.), one of de Lesseps' engineers, and now minister of the republic of Panama to the United States. The House of Representatives was brought over by the compromise measure called the Spooner act, which was passed in January 1903. It authorized the President to carry through such negotiations with Colombia as would assure the digging of the Panama Canal, and, if this proved impossible, to treat with Nicaragua and build the canal along the route originally recommended by the Walker Commission. The title of the French company was first investigated and 16 Feb. 1903 the United States accepted the offer of the Panama company to sell out for $40,000,000, on the condition that terms could be made with Colombia. The Hay-Herran treaty was signed by representatives of the two governments after long delay; was sent to the Senate for ratification in January 1903; was successfully opposed by Senator Morgan and his few followers through the session of the 57th Congress; and was passed upon favorably 18 March in special session after a debate of almost exactly a fortnight. This treaty arranged for the payment of $10,000,000 for the concessions, a payment of $250,000 per annum for three years, and an annual payment of $50,000 for the privilege of continued renewal at the pleasure of the United States. The Clayton-Bulwer Treaty had performed its function and was superseded by the Hay-Pauncefote treaty of 1901, so that Great Britain allowed the right of the United States to build and police the canal alone. But all obstacles were not removed even yet, for the Colombian Congress now refused to ratify the treaty which had been signed by its representative in Washington. This obstacle was removed 3 Nov. 1903 by the declaration of the independence of the Republic of Panama (q.v.), which immediately sent one member of its provisional junta to Washington, where 18 November the Hay-Va Rilla treaty was signed. (For a summing up of its details see PANAMA, REPUBLIC OF.) This treaty was ratified in Panama 2 Dec. 1903, and 7 December was submitted to the U. S. Senate for ratification.

For a technical description of the Panama Canal, and for a comparison between it and the Nicaragua Canal, see the article Isthmian Canal.

Panama Congress, a congress of representatives of various American nations held at Panama June 1826, for the discussion of matters of interest to the American peoples. The meeting was originally intended only for South and Central American delegates, but the ministers of Mexico, Colombia, and Guatemala at Washington formally invited the United States to be represented. After some friction in Congress two delegates were appointed, but at the congress 22 June 1826 the American delegates were not present, one having died en route and the other having been delayed in transit. Chile and Brazil approved of the congress but did not send delegates. The congress held 10 sessions, and among other results agreed to a perpetual union for defense against Spain.

Panama Hats. See Hats and Hat Making.

Panathenaea, Greek festivals, celebrated at Athens in honor of Athena. The Panathenaea were distinguished into the greater and the less, in both of which three kinds of games were exhibited, conducted by 10 presidents. On the first day were races with torches in the Ceramicus; on the second, gymnastic exercises, and imitations of naval fights; on the third, contests of music and declamation, and dramatic representations. An olive crown from the groves of Academus and a vessel full of sacred oil were the rewards of the victor. Then followed the sacrifices and the sacrificial feast.

Panay, pá'ní, Philippines, the most northwestern island of the Visayan group, lying a little to the southeast of the centre of the archipelago, bounded on the east by Iloilo Strait, and on the west by Mindoro Sea; area 4,752 square miles, with dependent islands 5,103 square miles. The largest of the dependent islands is Guimaras (243 square miles), lying to the southeast of Panay.

Topography.—The shape of the island is roughly triangular. A mountain range extends from the peninsula of Buruanga in the northwest to the extreme south, and from Maymagu Mountain, in the centre of this range, another mountain system extends to the east and north. The island is divided naturally into three provinces. There are three large rivers, the Panay, Jalaar, and Aclán, and numerous smaller streams. The coast on the east and north is well indented with bays and harbors, 15 of which afford safe harbors for vessels of all sizes; the best harbor is at Iloilo.

Industrial Resources.—The chief industry of Panay is agriculture; cotton, corn, chocolate, pepper, coffee, tobacco, sugar, rice, and copra are raised; the last three are the staple crops, and of excellent quality. The maximum shipment of sugar was in 1892, amounting to 177,467 tons; in 1899, during the insurrection, the amount of sugar shipped was 77,641 tons, and of copra 636 tons. There are also large numbers of live stock raised, cattle, carabaos, and horses. Excellent grazing lands being found in all parts of the island. The horses raised in the province of Iloilo are very highly prized throughout the archipelago. The forests are valuable; among the more important woods are mico, socon, and sibuaco, large quantities of which are exported; honey, wax, and pitch are also gathered in considerable quantities. The mineral resources have not been scientifically developed; gold is found, and is mined in small quantities, and fine marbles and tonalite are quarried to
PANAY—PANCREAS

The ‘Panchatantra’ is one of the works styled in India as ‘Nitisahasra,’ ‘Nitisastra,’ ‘Book of Knowledge,’ ‘Yajnikavali,’ ‘Conduct of kings and all those called to take a share in the government. The five books of which it is made up form as many distinct sections related to each other by a preface in which a king, after taking the advice of his councilors, entrusts to a Brahman the training of his three sons. The Brahman composes the Panchatantra for the edification of the young princes, and by the reading of that work he succeeds in overcoming their idleness and in developing their minds.

The first book has for its title ‘Mitarabhed’ (‘The Disunion of Friends’). It aims at acquainting kings with the danger incurred by lending ear to the insinuations of those who seek to sow divisions between a prince and his faithful subjects. The second book ‘Mitraprapti’ (‘The Acquisition of Friends’) shows how advantageous it is for men to unite and help each other. The third book, ‘Rakulukayit’ (‘The War of the Crows and the Owls’), demonstrates the danger of trusting to untired men or to enemies. The fourth, ‘Labhadaramasa’ (‘The Loss of Acquired Good’) proves that we frequently lose by imprudence what we had acquired with difficulty. The fifth and last book, ‘Aparikshakarakara’ (‘Inconsiderate Conduct’), shows the danger of being precipitate. The narrative is interspersed with sentences, maxims, thoughts, extracts from legal codes, and proverbs.

Consult: Kösegarten, ‘Panchatantram’ (1848–59); Lanceray, ‘Panchatantra,’ French version (1871); Schmidt, ‘Panchatantra, Textus Ornatior,’ German version (1901).

Pan,coast, Henry Spackman, American educator: b. Germantown, Pa., 24 Aug. 1858. He was educated at the Germantown Academy, studied law, and was admitted to the bar in 1882, but retired from practice in 1887 to devote himself to teaching. He has published ‘Representative English Literature’ (1890); ‘Introduction to English Literature’ (1895); ‘Introduction to American Literature’ (1907).

Pan'ciras, Saint, or Pancratus (‘Vic tor in every game’) a Christian martyr, who at the age of 14 defied the decree against Christianity issued by Diocletian and was accordingly put to death (304). There are many churches dedicated to him in England, Italy, France, and Spain, and his festival is celebrated on the anniversary of his death (12 May).

Pancreas, a lobulated racemose gland situated behind the stomach, lying in a nearly straight manner across the spinal column, at the level of the first lumbar vertebra or that of the loins. The head and broader portion or right extremity lies with a loop or curve formed by the duodenum or first portion of the intestinal tract (see Ileocecal Valve); while the tail or lower part or left extremity, is in apposition with the spleen. In man the pancreas is about eight inches long, in thickness it may vary from a half inch to an inch or more; its average weight being about 1½ inch. Its weight is usually three ounces or over. The splenic vein and splenic artery pass along its upper border, while the lower border rests upon the transverse portion of the duodenum. Behind, the pancreas is in contact with the vena cava inferior, with the
kidney of the left side and its supra-renal capsule, and with the portal vein at its commencement. The duct or excretory tube of the pancreas passes from the right to the left of the structure in the front, and at the lower or inferior edge of the gland.

The diseases of the pancreas are few, and do not betray their presence by any very marked symptoms. The most common disease is cancerous deposit in the head of the gland, which frequently induces jaundice by obstructing the common biliary duct near its opening. An accurate diagnosis of disease of this organ is extremely difficult, and cannot lead to efficient treatment; all that can be done in these cases being to palliate the most distressing symptoms. The pancreas of ruminating animals is a favorite article of food under the name of sweetbread. See Anatomy, Comparative; Digestion.

In bears, dogs, and many other Mammalia the pancreas exhibits a structure more complicated than that found in man. In rodents, in the hedgehog and flying fox, etc., it exhibits a branched or arborosepted structure. In the horse and hog, it is irregular. In the cat it is invariable, and in man sometimes double. In birds the sweetbread is narrow and elongated, lies within the duodenal loop, and possess usually two ducts. The pancreas of reptiles and amphibia presents no facts of special remark. In certain fishes a pancreas exists, but its place in the generality of fishes appears to be filled by a greater or less number of caecal appendages (the pyloric ceca), which are attached to the pyloric or hinder aspects of the stomach. In the sword-fish these ceca become aggregated together so as to form a pancreatic-like structure. In the lancelet no pancreas or homologous organ exists. In Invertebrata certain organs connected with the digestive system have had a pancreatic function assigned them. In gastropod mollusks it makes its first definite structural appearance as a long glandular sac.

Pancreatin, a substance secreted by the pancreas, and often administered in medicine, for the treatment of certain digestive disorders. The commercial supply that is used in medicine is mostly obtained from the pancreas of the hog, and is best known in the form of a grayish, amorphous powder, usually white in a tinus of yellow, and with a faint, characteristic smell. Pancreatin is not a definite chemical substance, but contains several distinct ferments. Its composition varies, moreover, with the source from which the substance is prepared, and with the state of activity of the particular pancreas from which it is extracted. One of its normal components, steapsin, is an exceedingly powerful agent for effecting the emulsification of fats, and it is even able to partially separate them into free glycerin and free fatty acids. Another constituent, trypsin, converts coagulated albuminous substances into soluble peptones, resembling pepsin in this respect, although its action is somewhat different. Pancreatin, for example, is effective only in an alkaline medium, while in the case of pepsin the medium must be acid. Another constituent, amylase, converts starches and other amylaceous substances into sugars; and a fourth ferment that is present possesses the power of neutralizing the casein in milk.

Pan'ta, or Wah, an animal (Aelurus fulgens) of the raccoon family, which inhabits the eastern Himalayas to a height of about 12,000 feet. It is equal in size to a large cat, and has remarkably glossy reddish-chestnut fur, darker on the back; with a white face and a long, russet tail. It seems to be the remnant of a once very widespread group which in the early Tertiary Period was numerous in Europe, explaining the present curious distribution of the family, for all other existing races are American. The animal is described as inhabiting forested and feeding almost entirely on vegetable food; but it eats eggs and insects when it can get them. Most of its time is spent upon the ground, but it has semi-retractile claws and is able to climb trees. It is said to be rather a dull-witted, defenseless creature, reminding one of the kinkajou. Consult: Flower and Lydekker, 'Mammalia' (1891); Blanford, 'Fauna of British India: Mammals' (1888).

Pand'an, pan-d'an, Philippines, a pueblo of the province of Antique, island of Panay; on the west coast near the Bugang River; 66 miles north of San José de Buena Vista. It is on the coast road, and has a good anchorage ground. Pop. 13,800.

There is a small pueblo of the same name (pop. 2,13) on the north coast of Catanduanes Island, near Albay, Luzon.

Panda'nuus. See Screeb-Pine.

Pandarus, pan-da-rus, Trojan hero, son of Lycaon. He was given by Apollo a bow with which he became famous as an archer. In the war between the Greeks and Trojans he broke the truce, and after wounding Memelus and Diomedes was slain by the latter. He also appears in Shakespeare's 'Troilus and Cressida' as a procurer, whence the English word 'pander.'

Pandavas, pan-da-vaz. See Mahábhárata.

Pan'dects. The, the most important compilation of the Roman law, prepared by several scholars at the order of the Emperor Justinian (q.v.). It is also called 'The Digest.' It was an attempt to form a complete system of law from the commentaries of the great jurists. The work was done by a committee of the jurists Tribonianus and 16 others learned in law; it was begun in 530 a.d. and completed in 533. The magnitude of the task becomes apparent from the fact that about 2,000 various treatises were consulti, and from these about 9,000 extracts appear. One third of them comes from Ulpian, one sixth from Paulus, one twelfth from Papinianus, and the rest from 36 other writers. The Pandects, with the Codex Justinianus, became the law for the Roman empire. When the Lombards invaded Italy in 568, they overturned almost all the few remaining Roman institutions, the law courts among them. In Ravenna, however, the Roman law was still taught; and the Lombards allowed their Romans to be judged according to the Roman law. The Codex, which begins with an invocation to the Trinity, and contains a great deal of legislation on ecclesiastical matters, was held in esteem by the clergy; but the Pandects were at first ignored, as being the work of pagan jurists. In the last part of the 11th century, however, there was a great revival of the study of Roman law. In the year 1065, the greatest teacher of his time, renewed the study of the Pandects, which is together with the Codex, became the basis of all
medieval legislation. The Pandects may justly be considered the most famous collection of law ever made. In both its central idea of codification and its content and phraseology it has profoundly affected both ancient law, including that of New England and the United States.

Pando'ra, in Greek mythology, the first woman; so called because she received gifts from all the Olympians. She was the creature of Prometheus, and the gods came down to see her, and conferred their gifts on her. The Athena instructed her in all works of female skill. Aphrodite endowed her with beauty and fascination. Hermes inspired her with a desire of pleasing, and taught insinuating words. Athena carried her. The gods saw her, and all admired the work. She became the wife of Epimetheus, a mortal, brother of Prometheus, and brought sorrow into the world by opening, in her curiosity, a box containing the blessings of fortune; but these escaped, save Hope. This is clearly a late and philosophic addition to the myth.

Pandours, pán'doorz, or Pandoors, the name formerly given to the Servian or Raitzian foot-soldiers coming from the village of Pandur, in the county of Sol, in Lower Hungary. They were at first irregular troops. In 1790 they were made regular troops.

Pan'el, (1) in law, a schedule, or roll of such jurors as the sheriff returns to pass upon any trial; and impaneling a jury is returning their names in such schedule of parchment. In Scottish law the persons at the head of the panel is the sheriff.

(2) In carpentry, a tympanum or square piece of thin wood, sometimes carved, framed, or grooved in a larger piece, or between two upright pieces and two cross pieces. (3) In masonry, a face of hollow stone. (4) In bookbinding, a depressed part of the sides within a relatively elevated bordering portion; or a space on the back between bands. (5) In mining, a system of coal mining in which the projected winning is divided into large square plots, each having a number of rows of coal, instead of placing the whole working in one undivided arrangement. The pillars are left very large, the rooms small; the pillars are worked out, props being substituted; these are knocked down, the roof falls, and the floor of the ceiling. (6) In painting, a piece of wood—oak, chestnut, or white poplar—on which, instead of canvas, a picture is painted. The earliest paintings in oil were generally executed on panels, which were composed of various pieces of wood, cemented together with cheese glue; and this glue, or cement, caused each portion to adhere so firmly that such panels were considered stronger than those which consisted of one piece of wood only.

Pangasinán, pán-gá-ré-nán', Philippines, a province of the Island of Luzon, in the western central part of Northern Luzon at the head of the Gulf of Lingayen; length, east and west, 56 miles; width, 33 miles; area, 1,316 square miles. The province is mountainous in the northeast, and also near the western boundary; the rest of the surface is flat, sloping toward the sea, and near the coast is very low and frequently inundated by the rivers. There are numerous rivers, of which the Agno is largest and most important. The staple crop is rice, though this is often injured by floods; sugar, corn, tobacco, and copra nut are also abundantly cultivated; the nipa palm grows luxuriantly. There are abundant deposits of salt, and also gold, copper, iron, magnetite, and sulphur. The important industries besides agriculture, including that of New England and the United States.

Pangasinán, a group of a tribe of the Philippine Islands inhabiting the province of Pangasinán, Luzon and some localities in the province of Zambales, Nueva Ecija, and Benguet. They are of the Malay race, and at the time of the arrival of the Spaniards had a civilization and written language of their own. Their language is now generally spoken in the province of Pangasinán. They are Christians.

Pangen'esis, a theory advanced by Darwin to account for the phenomenon of heredity, and especially to explain the (alleged) inheritance of acquired characters (effects of use and disuse of parts) which formed the basis of the theory of evolution of Lamarck. (See La marck-ism.) The problem was to form a hypothesis by which changes in any part of the body could so affect the germ-cells that the parental peculiarities should re-appear in succeeding generations. Darwin supposed that every cell of the body gives off at every stage of its existence minute particles, or gemmules, which, when furnished with proper nutriment will give rise to parts similar to those from which they were derived. These gemmules are collected from every part of the body to form the sexual elements, and their development in the next generation forms a new being. To explain the fact that characters may skip a generation he assumed that the gemmules may lie dormant for a long time and, when they are produced into another animal they must effect the progeny. Galton introduced into the blood of silver-gray rabbits the blood of rabbits of other colors, in some cases to the extent of half the blood, but the offspring invariably showed no trace of change of color. Brooks in his 'Heredity' (1883) modified the theory so as to avoid Galton's experiment, but the theory has been dropped in later years, and has only a historic interest. Consult: Darwin, 'Variation of Animals and Plants under Domestication' (1868), and the authorities mentioned under Heredity.

Pango-Pango, päng'gō-päng'gō, or Pago-Pago, a harbor on the south coast of the island Tutuila, Samoa. It is L-shaped, with the greatest length (17 miles) from east to west. It is land-locked and in every way one of the finest harbors in the Pacific. It was ceded to the United States as a naval and coaling station in 1872, and the possession was confirmed by a treaty signed in 1878, by which the United States was given the right to establish at the
PANGOLIN—PANJANDRUM

harbor a station for coaling naval supplies, freedom of trade, commercial treatment as a favored nation, and extra-territorial consular jurisdiction. It was occupied by the United States in 1858, with the purpose of utilizing its advantages as a coaling and supply station; and by the agreement of 1869, the island of Tutuila came into the possession of the United States. See SAMOAN ISLANDS.

Pan'golin, or Scaly Ant-eater. See MANIS.

Panguráng, pang-oo-tá-ráng, a group of islands of the Sulu Archipelago, lying in the Sulu Sea, north-west of Mindanao. The group includes 13 islands of which the two largest are Pangutá-rang, 44 square miles, and Panducuan, 14 square miles; the area of the whole group is 72½ square miles. The islands are moderately high, and are very heavily wooded. The chief industries are fishing, and agriculture which is carried on in the rudest and most primitive manner. The island of Pangutarang is low and level; it is thickly populated and carries on a considerable trade with Sulu.

Pan’han’dle, The, a long, narrow strip of land, resembling the handle of a pan, generally projecting from a State or Territory, as the Panhandle of West Virginia, or the Panhandle of Idaho. There is also a well-known projection in Texas called the Panhandle.

Panic, in finance and commerce, a word denoting insecurity and danger to money values and credits. When a panic occurs the banks are besieged by depositors, money is hoarded and general financial distrust ensues. The word is also applied to sudden displays of terror and alarm at public gatherings, theatres, etc., in case of fire. The most noted financial panics since 1750 were as follows:

1773 Holland. Failures exceed $50,000,000.
1799 England. Panic at Liverpool. Government lent £100,000,000 on Exchequer bills on goods.
1847-48 England. 770 banks stopped payment owing to failure of South Sea bubble companies. Owning to the distress occasioned by the consequences of this panic, families in Yorkshire were reduced in 1839 to live on bran. From the same cause about 200,000 families emigrated to the Continent, America, etc., in four years.
1851 Calcutta. Failures. £75,000,000.
1867 United States. "Wild Cat" crisis.
1883 United States. "Wild Cat" crisis.
1884 Grant & Ward and Marine Bank failures.
1885 London. Much temporary disturbance owing to expected Russian war.
1892 Financial crisis in Australia.
1893 United States. The silver crisis, also by some attributed to fear of changes in tariff by the Democratic party.

See also BANKS AND BANKING; FINANCE.

Panicum, an important genus of grasses, the millets. See GRASSES OF THE UNITED STATES.

Panini, pâ-nil-nil, Indian philologist: b. Salaturia (near modern Attock), Punjab, 4th century B.C.; probably the oldest writer on grammar whose works are extant, although he quotes the names of 64 predecessors. He is reckoned among the sages of the Puranas. Nothing is known of his life. His grammar is in eight books, divided into chapters, and containing 3,095 rules or sutras. Its method is wholly different from that of European grammarians. The separate chapters treat the various phenomena of speech; hence the work is strictly a philosophical treatise, requiring to be studied as a whole, and not conveying sectional information in a form classified for reference according to the European model. His style is condensed, obscure, and difficult to the Western student. He is the first who has classified the philological principles of grammar, as distinguished from the mere forms or parts of speech. He did not treat of syntax, and his inflections are not made but must be obtained by a collation of separate rules. The grammar of Panini has been often annotated. Its chief critic is Patanjali (q.v.). The chief edition of Panini is by Bothlingk (1887), and that of Patanjali's 'Great Commentary' by Kiellhorn (1878-85).

Papanat, pâ-nil-nil, or Paniput, India, town in the district of Karnal, Panjab, about 52 miles north of Delhi, on the Grand Trunk and the East I. R.R.'s. It is a strategic centre; and was the scene of the negotiations of Durynhanka and Yusidhithana at the beginning of the 11th century B.C., of the Mogul victory of Baber over Ibrahim Lodi, which established the Mogul power in north India in 1526, of Akbar's victory over the Afghans in 1565, which reassured the existence of the Mogul empire, and of the Afghan victory of 1761 over the Mahrattas, which prepared the way for English rule. It exports a coarse sugar. Pop. (1901) 26,914.

Panit, pâ-nil-nil, Philippines, a pueblo of the province of Càpiz, island of Panay; on the Malinanang River, seven miles south of Càpiz, the provincial capital. Pop. 10,020.

Panizzi, pâ-nil-nil, Sir Anthony, English librarian: b. Brescello, Modena, 16 Sept. 1797; d. London 8 April 1879. He was educated at Reggio and the University of Bologna. Having taken part in revolutionary movements, he went to England in 1822, and became professor in Italian in University College in 1828. In 1837 he was appointed keeper of printed books in the British Museum, succeeding to the principal librarianship in 1856. He contributed very largely both to the increase of the number of books and to the cataloguing and general arrangement of the library and designed the vast reading-room and its annexes. He edited Beard's 'Orlando Innamorato'; Ariosto's 'Orlando Furioso'; and Lord Vernom's reprint of Dante's 'Divine Comedy' (1838). Consult Fagan, 'Life of Panizzi.'

Panjab, pâ-nil-nil, Punjab, or Panjub. See PUNJAB.

Panjan’drum, the name applied to an imaginary personage of power and splendour, in burlesque histories or Great Mogul. The word was originally coined by Samuel Foote in a long string of rimearole as a test for Macklin who boasted of his memory. It is also called the Grand Panjandrum.
PANJNAD — PANSLAVISM

Panjnad. See Punjub.

Panmixia, in the theory of organic evolution, the cessation of the operation of natural selection. The process of the survival of the fittest, says Parker, has a reverse side, which has been termed the elimination of the unfit. Of the varieties that appear, some are less completely adapted to their surroundings than the majority, and these (the conditions remaining the same) tend to become destroyed owing to their unfitness to cope with their environment. The result of this process of elimination (apart altogether from the selection of progressive variations by which evolution, according to the theory, proceeds) is to keep up a certain standard of efficiency in the organs of the members of the species. Under certain conditions this sustaining influence, as we may term it, of natural selection may be suspended; the organism may be placed under conditions in which natural selection acts with reduced effect or does not act at all. There is, under such circumstances, no "elimination of the unfit"; and, as a result, fit and unfit survive indiscriminately, inter-breed, and produce offspring, the ultimate outcome in the course of generations being a gradual deterioration in the whole race.

This suspension of the influence of natural selection or panmixia, acts more commonly on single organs than on the entire organism. Thus, if, owing to some change in surrounding conditions, an organ is no longer kept up to the previous degree of efficiency by the elimination of the individuals in which the organ in question is imperfectly developed, and, as these cross with one another, offspring is produced in which the organ is below the efficient standard; and by a continuance of this process through a series of generations, it is supposed that the organ gradually dwindles in size, and may altogether disappear. The cetaceans furnish good examples of the process. Consult Parker and Haswell, 'Text-book of Zoology' (1897).

Pannonia, pâ-nô'nâ-â, in ancient geography, a Roman province on the Danube, including what is now western Hungary, Slavonia and Bosnia, Lower Austria and Styria. Neither the origin of the name nor of the inhabitants, the Pannonians, is anything certain known, but the people may have been of Illyrian stock with an admixture of Celtic due to a Celtic invasion in the 4th century B.C. They were conquered by the Dacians about 50 B.C. Octavian defeated them in 35-34 B.C., but they rose a generation later and Pannonia was finally conquered in 9 A.D., but not occupied save on the frontier until 107 A.D., by Trajan. The principal cities planted by the Romans were Vindobona (Vienna) Carnuntum (near Deutsch-Altenburg), Savaria (Sżovnathely), Arrabona (Raab), Siscia (Sissek), Petovio (Pettau), Aquincum (Altoleon), and Sirmium (Mitrovitsa). Trajan divided the province into a lower and an upper Pannonia. In the beginning of the 5th century Valentinian III. of the Western empire ceded Pannonia to Theodosius II. of Byzantium, who surrendered it to the Huns. It was occupied by the Ostrogoths about 493 A.D., by the Theotic of Italy in 488, by the Lombards in 547, and by the Avars in 568. Then came the influx of the Slavs. Consult Jung, 'Römer und Romanen in den Donauländern' (1887).

Pano (pâ'nô) Indians, a South American tribe living along the banks of the Ucayali and Huallaga rivers in Peru. They were formerly very numerous but now number less than 2,000. During the 17th century the missionaries persuaded many of them to gather in the mission villages. They were of a rather low grade, but understood hieroglyphic writing on bark. When the missions were broken up, in 1767, most of the Panos returned to their savage life, forming numerous small tribes. They have always been friendly to the whites. They are expert boatmen and build canoes some of which are 40 feet in length.

Pano'an Indians, a South American family comprising upward of 20 tribes and occupying the forest regions of Peru, Bolivia and Brazil. Among the better known tribes are Cashibo, Conibo, Mayornuna, Pano, Remo and Setele. They are a savage race in all that the name implies and several of the tribes practise cannibalism. They have steadily decreased in number during recent years.

Panor'ama, a picture representing a wide or general view, having a large area of ground exhibited at a time by being unrolled and made to pass continuously before the spectator. It was invented in England in 1787 by Robert Barker. See also CYCLOPAMA.

Pannipe, an ancient wind instrument, undoubtedly the precursor of the organ (q.v.). It was formed of seven, eight, or nine short hollow reeds, fixed together by wax, and cut in graduated lengths so as to produce a musical scale. The lower ends of the reeds were closed, and the upper open and on a level so that the mouth could easily pass from one pipe to another.

Panslavism, a general name for the efforts of the Slavonic races in Europe for a unity of civilization and literature. An anonymous work, the European Pentarchy (1839), and the writings of A. Gurovski, made a considerable impression in favor of a union, while later events favored the Austrian headship; but none of these projects ever possessed a reasonable chance of realization. The mere fact that the Slavonic race comprises nations so bitterly hostile to Russia as to speak of geographical and political difficulties, and of such diversities of religious creed as are contained within the range of Christianity and Mohammedanism, made any attempt to unite the scattered elements of such a race in a voluntary political union impracticable. For similar reasons little more real progress has been made with the attempt to promote a literary union.

The most important effort put forth toward the realization of a political union of the Slavs was in 1848, when, stimulated by the rival efforts at union of the German nations, and especially by the summons to Bohemia to send her full contingent to the German parliament, the Slavonic clubs summoned a congress of all the Slavs in the Austrian Empire, with a view to confer on the constitution of the empire. The congress met at Prague on 2 June. The various nations represented were classified in three departments: the Russians, the Poles, the Lithuanians, Moravians, Silesians, and Slovaks or Western Slavs; the Poles and Ruthenians forming the Eastern Slavonians; the Slovenians, Croats, Servians, and Dalmatians the southern
division. Each of these divisions chose 16 members, who formed a committee, with Falacky at their head, who drew up a plan of confederation and alliance among the various nationalities of the empire. The proceedings of the congress, however, which had to be conducted in German, as the only common means of communication, could not be brought to a formal conclusion, and the congress was interrupted by a Slavonic insurrection, which proved futile. Since 1866 renewed efforts have failed, but the scattered Slavonians of Austria to form a union among themselves, in order to counterbalance the preponderance of the German and Magyar races.

Panay, an annual or imperfectly perennial herb (Viola tricolor) of the order Violaceae. It is a native of Europe where it has been in cultivation for at least 400 years, and whence it has been taken to all cool temperate climates of the earth. The plant, which is rarely more than six inches tall, bears long-petioled, heart-shaped leaves, and large irregular flowers which slightly resemble the human face. Its name is a corruption of the French, pensée, though its old folk-name signifies remembrance, a double reason for its popularity. Few flowers show the effects of care in selection more than the pansy. Naturally the blossoms are borne upon rather short stalks, but those of the so-called hybrid variety, which often attain a diameter of three inches. In dry climates fresh seed must be imported annually, since home-grown seed even of improved strains is apt to produce flowers inferior to the imported, each year emphasizing the deterioration. The cultivated pansies are grouped in strains rather than as individual varieties, and as a rule exhibit mixtures of blue, white, and yellow, although some kinds are all of one color. Pansies thrive best upon rather heavy loams well drained and well supplied with plant food and humus. In the United States and other countries where the air becomes very dry during the summer, the plants generally fall during the hot months, even when planted in shady places, the most favorable situations. Hence, in such climates the seed is usually sown in cold frames during August or September, when cool and moist, in mid-march, in loose straw until the plants appear, and then these are protected from drying winds. Being tolerably hardy the plants can be left in the frames during winter, previously having been transplanted from the seed-bed so as to stand about two inches apart. In the spring they may be allowed to blossom where they stand or may be transplanted to garden beds as soon as the ground can be worked. After flowering in these beds for a month or six weeks they should be replaced by geraniums or other heat-loving plants.

Pantheism (Greek, pan, all, and theos, god), in philosophy, the doctrine of the identity of God and the material world. The doctrine stands midway between atheism and dogmatic theism. There are only three ways in which the philosopher can deal with the idea of the existence of God, that is, of a being who is the cause or original sum of all being. He may deny his existence altogether, or may infer psychologically that there is a God, and proceed to the inference that he is the first cause of all things, but leave unexplained the nature of the relation between God as cause and other existences as effects. Finally, he may proceed to reason back from the effect to the cause, and show a necessary connection between them. The last process is the source and explanation of pantheism. The origin of the idea of a God who is the theist and the pantheist is the same. It is by reasoning upon ourselves and the surrounding objects of which we are cognizant that we come to infer the existence of some Superior Being upon whom all human events proceed, or in whom they subsist. Pantheism assumed the identity of cause and effect, and the consequent adequacy of each effect, rightly interpreted, to indicate its cause. Matter, not less than mind, is with it an unnecessary emanation of the deity. The unity of the universe is a unity which embraces all existing variety, as proceeding from it in a way necessarily explicable by the result. Hence each existing thing contains its own existence which it is capable of receiving.

The earliest school of Greek philosophy, the Ionian, in as far as it admitted any theism, was essentially pantheistic; and to the same school of philosophers may also be numbered among the early pantheists, and Giordano Bruno in modern times. The atomic theory, or the origination of all things in conscious atoms, is the culminating theory of this school. The Sankhya of Kapila, one of the earliest of the schools of Indian philosophy, in which probably originated the Buddhist religion, was the chief representative of pantheistic tendencies in the East. Kapila enumerates 25 first principles of things: of which the first (mudaprakriti) is matter; the second (buddhi), intelligence; the third (ahankaara), self-consciousness. Speusippus, the sister's son and successor in the Academy of Plato, might be called an ultra-pantheist. He taught what may possibly be considered the true logical culmination of the doctrine, that the Divine or Best is first indeed in rank, but is chronologically the last product of development. He defined happiness as the habit of conformity to nature. The soul, according to him, was a higher union of the arithmetical and the geometrical, or extension harmoniously shaped by number. The Stoics, differing widely from the school of Epictetus, may also be rather thinly considered adherents of pantheism. Their doctrine was that whatever is real is material. The universe as a whole possesses consciousness, and this consciousness is deity. The world undergoes a constant evolution, the elements of water, earth, and air being evolved out of fire, which again absorbs them, and the process recommences in an eternal cycle. The human soul and the deity, which are one in nature, act and react on each other. Intelligence, whether in man or the deity, they considered as consisting chiefly in force. Perhaps there is nothing which seems more opposed to pantheism than the mysticism of the Alexandrian school, and particularly of Plotinus, which makes of God so pure an abstraction as to have no even thought, without being separated from individuality, cannot attain to it. Yet from the bosom of this school a prolific source of pantheism has arisen. Dionysius, the pseudo-Areopagite, a Christian philosopher of the Neoplatonic school, introduced it among his speculations, in which the particular is derived by a series of gradations, as genus and species, from the universal. John Scotus Eriugena, the founder
of the scholastic philosophy of the Middle Ages, gave this speculation a realistic turn, making God the essence of the world, and the universal, the genus, the species, and the individual so many particular developments which actually succeed each other. Eckhart, a German philosopher of the beginning of the 14th century, also a disciple of Dionysius, and often regarded as the father of German philosophy, taught some views which were developed in a pantheistic direction by some of his followers. Eckhart held that the works of creation were eternally in God in idea or conception; this was developed into a pantheistic doctrine of the eternal existence of ideas or types of all things. Giordano Bruno, like Epicurus and Lucretius, taught that monads are the elements of all existing things. God is the imminent cause of the universe. Power, wisdom, and love are his attributes; but he is the monad of monads, the minimum because all things are external to him; the maximum because all things are in him. He produces the worlds freely, but by an inner necessity of his nature. The worlds are nature realized; God is nature working. Stars are moved by the souls that reside in them. God is in all things and being in things that exist, or beauty in objects that are beautiful.

No modern pantheist has acquired a greater renown than Spinoza, probably because none has developed his doctrines into a system so comprehensive, and with a logic so rigorous. A disciple of Descartes, he founds upon that master’s definition of cause a system in which he develops the relation of God to the universe in a series of propositions, graduated like a succession of consequential demonstrations in mathematics. According to Spinoza the essence of God is existence, and he has two fundamental attributes, extension and thought. All things which exist are modes of God’s attributes. Their existence is necessary, and all changes which take place in them, whether affecting intelligent or non-intelligent beings, are necessary. God alone is free, and he is free because he acts by an inner necessity, and is not controlled by any other being. It may be an accident that Spinoza combines the apparent inference from his doctrine, that the sum of things which exist is God. Things are diverse, complex, and limited, while God is one, simple, and infinite. They are not God, but only the finite forms of his attributes. Among modern pantheists a place is also due to Leibnitz. According to him all souls are monads, or atoms containing active powers consisting in ideas. God is the primitive monad; all other monads are its vulgarizations. Bodies, as plants and minerals, are aggregations of sleeping monads with unconscious ideas. The relations of the monads are purely mechanical, and their co-operation is determined by the theory of pre-established harmony. (See Mind, Human.) Diderot recognized God in natural law, truth, beauty, and goodness; for Leibnitz’s monads he put atoms, and gave them sense in place of ideas, which became thought in organized beings. Finally, the modern doctrine of evolution, when it assumes a transcendental form, and carries speculation as to the origin of things beyond the range of inferences founded on the observation of nature, is necessarily pantheistic.

Panthéon, anciently a name applied to a temple or shrine dedicated to the gods. The most historical pantheon is that erected in Rome by Agrippa about 25 B.C. and dedicated by him as a temple to all the gods. For 13 centuries it served as a Christian church, having been dedicated by Boniface IV. about the year 607. It is 188 feet in circumference and is covered by a dome 145 feet in span. The entire height is 147 feet. Raphael and Victor Emmanuel II. are buried in the Pantheon. Another noted structure bearing this name is the Pantheon of Paris (Church of Saint Genevieve), for a description of which see PARIS.

Panther, some large cat, in North America usually a cougar; in South America a jaguar; in India or Africa, a leopard.

Panther-cat, a name locally given to several spotted wildcats; most often, probably, to the ocelot (q.v.).

Pantograph, an instrument by the aid of which maps, plans, and designs may be copied mechanically, either on the scale on which they are drawn or on an enlarged or reduced scale. It is made in a variety of forms.

Pan-tomime, the name given by the Romans to an actor in a dramatic performance consisting of dance and gesture. This sort of representation appears to have been common in Italy. The modern Christmas pantomime in Great Britain is a spectacular play of a burlesque character, founded on some popular fable, and interspersed with singing and dancing, followed by a harlequinade, the chief characters in which are the harlequin, pantaloon, columbine, and clown.

Pantop’oda, or Pycnogonida, a group of marine spider-like, but hard-shelled arthropods, which is classified near the horseshoe crabs (Limulæ). The body (cephalothorax) is so small and the limbs are so large that the animal, which may span two or three inches in large species, seems all legs, and a popular name along the New England coast is “no-body crab.” There are four pairs of equally large many-jointed walking legs, in advance of which are two pairs modified into chelate mouth-organs, and a third pair upon which, in the breeding season, the male carries the eggs cemented to these appendages. The abdomen is represented by only a small tail-like pair posterior to the legs. A metamorphosis occurs in most species, and the larva looks something like a nauplius, but is not equivalent to it. These curious creatures live from the shore-line to deep water.

Panuco, pän’oo-kö, (1) river of Mexico, rising in the plateau north of the City of Mexico and flowing generally northeast. It forms part of the boundary of Tamaulipas and Vera Cruz and receives the waters of several smaller streams before emptying into the Gulf of Mexico near the city of Tampico (q.v.). Its bar has been removed by elaborate engineering works and the river mouth is now a fair port. (2) A district about this river, so called by Cortez and his followers. It was partially conquered by Cortez in 1522, but in 1526 was granted to de Guzman, who was independent of Cortez.

Panyasis, Greek epic poet of the 5th century B.C., ranked one of the five great epic poets of Greece for his poems on Heracles and on the Ionic migration. He was born in Hali-carnassus, and is thought to be the uncle of
PAOAY — PAOMBONG

Herodotus. His few fragments are edited by Kinkel (1877); the most important are on wine, its use and abuse.

**Paoy, pā-ō'-l', Philippines, pueblo, province of Ilocos Norte, Luzon, three miles inland from the western coast, on a small lake; 12 miles south of Laoag. It is on the main highway. Pop. 11,850.**

**Paola, pā'-ō-lā, Kan., city, county-seat of Miami County; on the Missouri P., the Missouri, K. & T., and the St. Louis & S. F. R.R.'s; about 40 miles south by west of Kansas City. It was settled in 1855 and in 1869 was chartered as a city. It is in a fertile agricultural country and in a natural gas belt. Coal deposits are in the vicinity; cultivating grain and stock-raising are prominent industries in this section. The trade is chiefly in wheat, corn, live-stock, and coal. It is the seat of the Ursuline Academy, and has public and parish schools and a free public library which contains about 6,000 volumes. Pop. (1890) 2,943; (1900) 3,144.**

**Paoli, pā'-ō-lē, Pasquale de, Corsican patriot; b. Morosaglia, Corsica, 26 April 1725; d. near London, England, 5 Feb. 1807. He was educated at the Jesuits' College at Naples, and in 1755 was appointed captain-general by his countrymen, then struggling for their independence against Genoa. By his energetic efforts the government and military resources of the island were reformed, and he maintained a protracted and generally successful struggle with the Genoese. The latter, however, first made an agreement with France to garrison the places held by them in Corsica, and finally, in 1768, sold the island to France. After a brief struggle Paoli was obliged to yield, and fled to England. Here he remained 20 years, till the revolution of 1789, when he was recalled by the national assembly and made lieutenant-general of Corsica. Dissatisfaction with the extreme measures of the revolutionists in France soon led him to throw himself into the arms of England; in 1793 a British army was landed in Corsica, and through his influence the crown was offered to George III., in 1794. Paoli, however, did not obtain the government of the island and withdrew to England and was pensioned by the British government. His remains were removed to Corsica in 1889. Consult Arrighi, 'Histoire de Pascal Paoli' (new ed. 1891).**

**Paombong, pā'-ōm-bōng', Philippines, pueblo, province of Bulacán, Luzon; on the central delta outlet of the Pampanga River; two miles west of Malolos, the provincial capital. Pop. 10,300.**
