KEEFER, Thomas Coltrain, Canadian engineer: b. Thorold, Ontario, 4 Nov. 1821; d. Ottawa, 7 Jan. 1915. He was a brother of Samuel Keef (q.v.). He was educated at Upper Canada College (Toronto), began practice as a civil engineer in 1838, and in 1850 was appointed by the government to survey the rapids of the Saint Lawrence and explore the region between the headwaters of the Saint John and the Saint Lawrence. In 1851 he became engineer-in-chief of the Toronto and Kingston section of the Grand Trunk Railway, and made surveys at Montreal for the present Victoria bridge across the Saint Lawrence. He wrote "The Philosophy of Railways" (1849); and an essay on "The Influence of the Canals of Canada on her Agriculture" (1850).

KEELEER, ke'ler, James Edward, American astronomer: b. La Salle, Ill., 10 Sept. 1857; d. San Francisco, Cal., 12 Aug. 1900. He was graduated from the Johns Hopkins University in 1881, was appointed assistant to Prof. S. P. Langley (q.v.) in the Mount Whitney (Cal.) expedition (1881), was in 1881-83 at the Allegheny Observatory, and after study in Germany (1883-84), was appointed assistant at Lick Ob-
Keeley, Robert, English comic actor: b. London, 1793; d. London, 1869. After playing in comic parts throughout the interior of England he reached the London stage in 1818. He almost at once became a favorite in important comic roles like Touchstone, Jimmy Green (in 'Tom and Jerry'), Mr. Bounceable (in 'What Have I Done?'), Peter Pall Mall (in 'The Prisoner of War') and Sir Andrew Aguecheek. He married Mary Anne Goward in 1829. (See Keeley, Mary Anne Goward). Consult Goodman, 'The Keeleys on the Stage and Off' (London 1895); Lewes, 'On Actors and the Art of Acting' (New York 1878); Scott, 'The Drama of Yesterday and To-day' (London 1890).

Keeley, John Ernest Worrell, American adventurer: b. Philadelphia, Pa., 3 Sept. 1837; d. there, 18 Nov. 1888. In early years he was a carpenter. Prior to 1872 he became interested in music, and afterward claimed that the tuning-fork had suggested to him a new motive power. In 1874 a stock company was formed for the purpose of supplying fun for the perfection and promotion of the alleged discovery. Keeley built and destroyed many models, gave exhibitions at which numerous remarkable and unexplained effects were produced, but never attained any important result. Upon his death it was found that the so-called Keeley motor was operated by an invisible compressed-air apparatus, and that the entire scheme was fraudulent.

Keeley Motor. See Keeley, J. E. W.

Keen, Dora, American explorer: b. Philadelphia, 1871. Educated at Bryn Mawr College, she returned to Philadelphia, to interest herself in civil reforms while holding responsible civic positions. She has traveled extensively throughout the continents of the eastern and western hemisphere and become noted as a mountain climber and as an Alaskan explorer. She has written much for geographical and other magazines and is known as a lecturer.

Keen, William Williams, American surgeon: b. Philadelphia, 19 Jan. 1837. He was graduated at Brown University in 1859, and from Jefferson Medical College in 1862; and during the Civil War period was an assistant surgeon in the Federal army. He then studied in Europe 1864-66; was at the head of the Philadelphia School of Anatomy 1869-73; and at the same time lecturer on pathological anatomy at Jefferson Medical College. From 1873 to 1890 he was professor of artistic anatomy at the Pennsylvania Academy of Fine Arts, and also of surgery at the Women's Medical College 1884-89, and of surgery at Jefferson Medical College till 4 Jan. 1907 when he became professor emeritus. In 1912, on the 50th anniversary of his graduation, the Jefferson Medical College gave him the honorary degree of Sc.D. He has also received the degree of L.L.D. from Brown University (1891), Northwestern and Toronto universities (1903), The University of Edinburgh (1905), Yale University (1906), University of Saint Andrews (1911); an honorary M.D. from University of Greifswald (1906) and honorary Ph.D. from the University of Upsala (1907). He is the senior member of the Corporation of Brown University, having been elected in 1873. He was elected president of the American Surgical Association in 1898; of the American Medical Association in 1899; of the College of Physicians of Philadelphia in 1900; of the Congress of American Physicians and Surgeons in 1903 and of the International Congress of Surgery for the session of 1917, and has been president of the American Philo-
sophical Society since 1907. He is also foreign corresponding member of the Surgical Society of the Belgian Surgical Society, the Clinical Society of London. He is an honorary Fellow of the Royal College of Surgeons of England and the Royal College of Surgeons of Edinburgh, of the German, the Italian, the Palermo Surgical societies, the Berlin Medical Society, the Medical Society of the American Academy of Arts and Sciences and of the American College of Surgeons. He is the author of 'History of the First Baptist Church of Philadelphia.' (1898); 'Surgical Complications and Sequels of Typhoid Fever.' (1897); 'Addresses and Other Papers.' (1905); 'Animal Experimentation and Medical Progress.' (1914). He is also editor of 'Gray's Anatomy'; of the 'American Text Book of Surgery'; of 'Keen's System of Surgery'; and of a number of other similar publications. He has written a very large number of articles in various medical and other journals.

KEENE, Charles Samuel, English artist, illustrator and humorist: b. 1823; d. 1891. He began to study architecture, only to give it up for the study of wood engraving. Gaining some reputation on the London News (Illustrated), he attracted the attention of Punch, the staff of which he joined in 1851 and continued on it until his death. Keene also won a reputation as a book illustrator and etcher. Consult Keene, C. J., 'Four Hundred Pictures of Our People.' (London 1888); Layard, G. S., 'Life and Letters of Charles Keene.' (London 1892); 'The Work of Charles Keene.' (New York 1897).

KEENE, Laura, American actress and manager: b. England, 1820; d. Montclair, N. J., 4 Nov. 1873. Her real name was Mary Moss, and as 'Laura Keene' she became famous in England in the rôle of Pauline in 'The Lady of Lyons' before coming to the United States in 1852, where she made her home the remainder of her life. She was for a time manager of the Varieties Theatre in New York, and 1855-63 was lessee of the Olympic, at first called 'Laura Keene's Theatre.' She was married to H. W. Taylor in 1847, and to J. Lutz 10 years afterward. The most noted play produced by her was 'Our American Cousin,' brought out in 1858 with Jefferson and Sothern in the cast. While he was witnessing this play at Ford's Theatre in Washington, President Lincoln was assassinated.

KEENE, N. H., city, county-seat of Cheshire County, on the Ashuelot River, and on four divisions of the Boston and Maine Railroad, about 45 miles southwest of Concord and 43 miles west of Manchester. Mount Monadnock is 10 miles from the city. The city, known as Upper Ashuelot, was settled in 1734 and incorporated in 1753 when it took the name of Keene. It received its city charter in 1794. Keene manufactures chairs, woolens, shoes, toys, combs, machinery, loose leaf ledgers, manifold books, ornamental narrow web fabrics, wood novelties, overalls, manicure articles, mica, products, etc. There are four national banks and two savings banks in Keene, with combined resources of over $7,000,000. Nearly 2,000 persons are employed in the factories. The annual output of manufactured goods is about $3,500,000. The products of the fertile farms of the vicinity add to the wealth of the city. Pop. 10,068.

KEENER, ke'ner, John Christian, American Methodist bishop: b. Baltimore, 7 Feb. 1819; d. 1906. In 1835 he was graduated with the first class from Wesleyan University. After entering the Methodist ministry in 1841 he preached in Alabama till 1848 and was pastor and presiding elder in New Orleans 1848-61. He edited the New Orleans Christian Advocate (1865-70), and in the year last named was appointed a bishop of the Methodist Church, South. He published 'Post Oak Circuit' (1857; 1875); 'Studies of Bible Truths' (1899); 'The Garden of Eden and the Flood' (1900).

KEENER, William Albert, American jurist and educator: b. Augusta, Ga., 1856; d. 1913. Graduated from Harvard Law School in 1877 he practised law in New York city; became a justice of the Supreme Court of the State of New York and professor of law at Harvard (1883-90) and at Columbia University (1890-1902) and Dean of the Law School (1891-1901). Among his law writings are 'Treatise on the Law of Quasi-Contracts' (1893), and various articles on private corporations and equity jurisprudence.

KEEP, Robert Porter, American writer and educator: b. Farmington, Conn., 1844; d. 1904. Graduated from Yale University in 1865; he became instructor in his alma mater, a position he resigned to become United States consul at the Piraeus, Greece (1869-71). On his return home he continued teaching in various colleges. Among his published works are Arentsifier's 'Homer's Dictionary' (translation 1876); 'Stories from Herodotus' (1879); 'Essential Uses of the Moods in Greek and Latin' (1882); 'Homer's Iliad' (first four books, 1883).

KEEP, William John, American inventor and manufacturer: b. Oberlin, Ohio, 3 June 1842. Graduated as a civil engineer from Union College (1865), he began the manufacture of stoves to which he later added that of testing machines. After many experiments he discovered the relation existing between shrinkage and the chemical composition of cast iron (1885). He has contributed to many technical journals on the chemistry, shrinkage and composition of cast iron. On this subject he published a book entitled 'Cast Iron' (1902).

KEESO, or TEESOO, the flowers of certain species of Butea (q.v.).

KEEWATIN, Canada, a former district lying west and south of Hudson Bay and extending north to the Arctic Ocean. Its original area was 516,571 square miles and it was created in 1876. The northern part of Lake Winnipeg and its outlet, Nelson River, are in Keewatin. There are a large number of small lakes, all of which belong in the basin of Hudson Bay. The district has undergone division and reorganization at different times, and is now partly included in the recently acquired portions (1912) of Manitoba and Ontario, the remainder belonging to the Northwest Territories (q.v.).

KEEWATIN, the earliest epoch of the Archean period, and the series of rocks then formed, consequently the oldest known rocks.
KEFF, or KEF, KEF, or KEF, fortified town in northern Tunisia, over 100 miles from the city of Tunis. Its fortress crowning the rocky height above the town is looked upon as one of the strongest French fortresses in Africa. Keff, which dates back to the days of the Phoenicians and was once occupied by the Romans, contains several interesting ruins of these early days of its history. It is the centre of considerable trade and commerce, especially in olives and grain.

KEFIR, or KEFIR, kef'-ir (Turkish kef, delight), a native drink of the people of the Caucasus. It is made from fermented milk, the fermentation being caused by kefir grains which require from two to three days to complete their action. This fermentation when properly effected, leaves the kefir effervescent. Keif is prescribed for lung diseases, stomach troubles, and anaemia by the Caucasians. It has already become recognized in Europe and the United States as a helpful remedy in cases of intestinal putrefaction and auto-intoxication.

KEGOUSA, a lake in Dane County, Wis., about 10 miles southeast of Madison. It is one of the *Four Lakes* and the farthest south of them.

KEI, ki, or KEY ISLANDS, a group of islands situated in the east of the Banda Sea (east Indian Archipelago). The group consists of numerous islands the most important of which are the Great Kei and the Little Kei, the former of which is rough and mountainous. All are wooded and, with the exception of the Great Kei, low and fertile, as are most of the islands of coal formation. Total area, over 570 square miles. Pop. 23,000, principally natives.

KEIDEL, George C., American philologist, librarian and literary man: b. Catonsville, Md., 16 June 1868. After elementary studies he matriculated at Johns Hopkins University, Baltimore; won competitive scholarships, and in 1889 was graduated B.A. from the Latin-Mathematical group. Continuing studies, especially in French, Italian and Latin, and twice winning the Romance Fellowship, he was made Ph.D. in 1895; and was appointed assistant in Romance languages at his alma mater. Having published a *Manual of Æsopian Fable Literature* in 1896, he was advanced to the position of instructor and associate in the same department. Here he came under the direct personal influence of Prof. A. Marshall Elliott, the nestor of the Romance scholars of America, and for 20 years made investigations in comparative literature in connection with a critical edition of *Les Fables* of Marie de France, upon which the members of the Romance seminar were engaged. Travel abroad in 1897 and 1902 was devoted chiefly to the study of manuscripts and incunabula in the libraries of Belgium, France and Germany. His published writings comprise bibliographical notices, and scores of articles in leading scholarly journals of Europe and America. In 1911 Dr. Keidel resigned his position in the faculty of the Johns Hopkins University to become the foreign language expert of the copyright office in the Library of Congress at Washington, where he has been engaged in preparing for publication an extensive *Drama Index*.

KEIFER, ki'-fer, Joseph Warren, American soldier and politician: b. Bethel, Clark County, Ohio, 30 Jan. 1836. He was educated at Antioch College and in 1856 settled in Springfield, Ohio, where he began to study law. In 1858 he was admitted to the bar, but at the outbreak of the Civil War gave up his practice to accept a commission as major of the 3d Ohio Infantry, and rose to the rank of major-general of volunteers in 1865. During the last campaign General Keifer's troops were among those which compelled the surrender of Ewell's corps at Sailor's Creek, and General Keifer received the surrender of Commodore Tucker and the Marine Brigade, and bivouacked about 2,000 men. At the close of the war he declined a commission as lieutenant-colonel of the 26th United States Infantry. He served in the Ohio State senate in 1868-69, held a number of offices in the Grand Army of the Republic, was chosen a delegate to the Republican National Convention in 1876, and the same year was sent to Congress, of which body he continued to be a member until 1883. During the last two years he was speaker of the House. At the outbreak of the Spanish-American War he was commissioned a major-general of volunteers, and for a time commanded the 7th corps, encamped near Havana. He was re-elected to the 61st Congress, his term ending 4 March 1911. He is a member of the Perry Monument Commission and a life member of the Interparliamentary Union and Conference for Arbitration and Peace of the World. He wrote *Slavery and Four Years of War* (2 vols., 1900).

KEIGHLEY, ke'-li, a West Yorkshire municipal borough, England. It is connected with Hull by the Leeds and Liverpool Canal which has contributed to its commercial and industrial expansion. Among its industrial interests are machinery, tools, worsted goods and paper. Pop. about 45,000.

KEIKI, ka'-kei, or HITOTSUBASHI. See HITOTSUBASHI.

KEITH, Keith, Alexander, Scotch ecclesiastical writer: b. Keith Hall, Aberdeenshire, 30 Nov. 1791; d. Buxton, England, 8 Feb. 1880. Graduated from Aberdeen University, he became a minister of the Established Church of Scotland but joined the Free Church movement in 1843. He became noted as a lecturer and as a defender of the principles of the Free Church party. Among his published works are *Evidence of the Truth of the Christian Religion* (1828); *Signs of the Times* (1832); *Demonstration of the Truth of the Christian Religion* (1835); *The Mission of the Free Church in the Heavens*; and *The Land of Israel* (1843); *The Harmony of Prophecy* (1851).

KEITH, Arthur, American geologist: b. Saint Louis, Mo., 30 Sept. 1864. He received
the degree of A.M., from Harvard College in 1886, and has been geologist on the United States Geological Survey since 1887, having charge of areal geology east of 100th meridian. He is a Fellow of the Geological Society of America and of the American Association for the Advancement of Science. Author of various papers and reports on geology of southern Appalachian region published by United States Geological Survey.

KEITH, Benjamin Franklin, American theatrical manager: b. Hillsboro Bridge, N. H., 26 Jan. 1846; d. 26 March 1914. He began his show life as employee of a circus; and eventually became manager of one. In 1885 he purchased a part interest in the Gaiety Theatre, Boston, to the management of which he brought some of the experience he had gained as manager of the circus. One of his innovations was the continuous performance program. Joining hands with F. Proctor Amusement Company, he formed the Keith and Proctor Amusement Company for the establishment of vaudeville theatres through various cities of the United States. As president of the United Booking Office of America he improved the theatrical situation throughout the United States.

KEITH, George, Scottish Quaker: b. probably in Aberdeen about 1639; d. Edburton, Sussex, England, 27 March 1716. He was educated at Marischal College, Aberdeen; became a Quaker in 1662, and in 1677 he accompanied George Fox and William Penn to Holland on a missionary journey; came to Philadelphia in 1689; and was there accused of heresy and interdicted from preaching in 1692. He then held separate meetings of his followers, known first as Keithites and later as Christian Quakers. Disowned by the yearly meeting of 1694, he established a congregation in which the Quaker externals were observed but the Lord's Supper and baptism were administered. In 1700 he conformed to the Anglican Church, in 1702-04 was a missionary in the West Indies for the Society for the Propagation of the Gospel, and from 1705 until his death was rector of Edburton, Sussex. Among his writings were 'The Deism of William Penn and his Brethren' (1699); 'The Standard of the Quakers Examined' (1702), and 'A Journal of Travels' (1710).

KEITH, George Elphinstone, Viscount, British admiral: b. Elphinstone, Scotland, 7 Jan. 1746; d. Tulliallan, Perthshire, Scotland, 10 March 1823. After continuous and varied service in the navy from his boyhood, he played a prominent part in the war with the American colonies from 1775-80, looking after privateers and evading blockade runners. He was in command of frigate 'Persicus,' which took part in the reduction of Charleston (1780) and in several other American land engagements. In 1793 he was second in command of the Mediterranean squadron and the following year was promoted to the rank of rear-admiral. In 1795, as commander of an expedition against the Dutch colonies, he seized Cape Colony, Ceylon, Cochín, Malacca, the Molucca Islands and captured the Dutch West Africa squadron. These events earned him promotion to the rank of Baron Keith of Stonehaven Marischal (in the Irish peerage) in 1796. Four years later he aided the Austrians in the capture of Genoa; and in 1803 he became commander-in-chief of the North Sea fleet, a position he held until 1807. He continued to operate against the French throughout the Napoleonic Wars and it was the Channel fleet which he commanded that prevented Napoleon's escape in 1815. For his continuous and excellent services he was elevated to the peerage of the United Kingdom as Viscount Keith. Consult Allardyce, 'Memoir of the Honorable G. K. Elphinstone, K. B., Viscount Keith' (London 1882).

KEITH, James, Scottish soldier: b. Inverugie, Aberdeenshire, 14 June 1696; d. Hochkirch, Saxony, 14 Oct. 1758. He was of noble birth, his father being William Earl Marischal of Scotland, and his mother daughter of the Earl of Perth. Educated for law at the University of Edinburgh, he joined the Stuart insurrection in 1715. He was taken prisoner and attainted of treason, but succeeded in making his escape to France. In 1719 he joined the expedition to Scotland which had been fitted out in Spain, and on its defeat he again escaped, this time to Spain. After military service there for some time he entered the Russian army as major-general and fought against the Turks and Swedes. Great tempted him to Prussia with the rank of field-marshall (1747). Keith and his elder brother, the Earl-Marischal and head of the Keith family, became the most trusted of the friends of the great Frederick; and their names are inseparably connected with his campaigns. The elder Keith proved to be a genius of diplomacy, the younger a military master. From the time he entered the service of Prussia James Keith became known as Marshal Keith, the title generally given him in history. For his brilliant exploits in Prussia see the history of the Seven Years' War or any good history of Prussia. Marshal Keith met his death at the battle of Hochkirch at which the Austrians defeated the Prussians. Consult Carlyle, 'The Life of Frederick the Great' (New York 1858).

KEITH, Sir William, British colonial officer: b. near Peterhead, Scotland, 1680; d. 18 Nov. 1749 in Old Bailey prison, London. He was son of Sir William Keith of Ludquairn, Aberdeenshire, Scotland. Like all the Keiths, he was a supporter of the Stuart cause, and spent his life at the French court where he seems to have been known as a profiteer. Making his peace with the British government, he was appointed surveyor-general of customs in the southern colonies of North America. He was governor of Pennsylvania (1717-26) and held other government offices in America. Among his writings are 'A History of Virginia' (1738), and a volume of various subjects (1749). He was in prison for debt at the time of his death.

KEKULE VON STRADONITZ, kāk'oo-lā ḳstrā-'do-nitz, Friedrich August, German chemist: b. Münster, 1829; d. Bonn, 1886. Educated at Giessen and Paris, he became tutor at Heidelberg and professor of chemistry at Ghent (1858) and later held the same position in Bonn. He was one of the great and original thinkers in the chemistry of his day and his influence on the development of the science was worldwide. He established the valence theory, developed the constitutional formula of benzene and applied his knowledge thus gained to the
study of numerous compounds. His work in synthetic dyes gave Germany a start in their manufacture which she held until the European War deprived her of it. Kekulé wrote considerable on chemical subjects.

Kekulé von Stradenitz, Reinhard, German writer on archeological subjects: b. Darmstadt, 1839; d. 1911. Educated at Göttingen and Berlin, he became professor of archæology at Bonn and later at Berlin. Among his published works, most of which are the result of personal investigation, are 'Hebe' (1867); 'Die Balustrade des Temples der Athena Nike' (1869); 'Die Antiken Bildwerke in Theseion' (1869); 'Die Gruppe des Künstlers Menelaos in Villa Ludovisi' (1870); 'Ueber die Entstehung der Gött erideale der griechischen Kunst' (1877); 'Zur Deutung und Zeitbestimmung des Laokoon' (1883); 'Die antiken Terra-cottas' (1880-84); 'Das Leben Friedrich Gottlieb Wilhelms' (1880); 'A History of Greek Art' (1890).

Kulant, or K'lan tan, a native Malay state under British protection. It is situated on the east side of the peninsula and its chief port of the same name maintains steamship communication with Siam, Singapore and all other important ports of the world. The interior of the country and of neighboring Malay states, by means of a branch line of the Federated Malay States Railroad system. The industries of the state are chiefly agriculture, the chief products of which are rice, tapioca, rubber, rubber products, and revealed in seven. Silk weaving is carried on extensively and the manufacture of boats is one of the chief occupations of the port towns. The country is rich in mineral wealth which has, so far, been but poorly exploited; but British capital has begun to develop the best known of its mining regions. Kota Bharu, the state capital, has 12,000 inhabitants while the whole country has a population of 250,000 to an area of 5,500 square miles.

Kelat, kē-lät, a city in Baluchistan, of which it is the capital and the residence of the Khan. See KHELAT.

Kelcey, Herbert Lamb, Anglo-American actor: b. London, England, 1856; d. 10 July 1917. He made his first stage appearance at Brighton in 1877, and three years later he was on the cast of Bow Bells in London. After playing important parts in the principal London theatres he went to the United States in 1882 where he continued to make his home. In New York he was connected with Wallack's Theatre and Daniel Frohman's music company and played important parts in New York and in companies traveling throughout the principal cities of the United States.

Keller-Bela, kēl'-ēr-bē'-lā, Albert Von, Austrian musical composer and violinist: b. Bartfeld, Hungary, 1820; d. 1862. Educated at Vienna, he became leader of the Gungi Band in Berlin. In 1862 he had experience in the orchestra of the Theater an der Wien in Vienna in 1867 he became conductor of the Kur Orchestra in Vienna, a position he held until 1873. He was very popular as a composer of symphonic and dance music and he still looked upon as one of the best writers of violins solos.

Kletti, kēlt'-ē, Gustav Friedrich, Hungarian painter: b. Pressburg, 1834; d. 1902. Graduated in law in Vienna he followed teaching for a while and finally studied painting in Munich. He developed a talent for landscape painting into which he threw a touch of Romanticism; but he was never successful as a painter of figures. He helped establish the Royal Hungarian School of Drawing and the School of Industrial Art of both of which he was head. As a critic he deserves a high place in the history of art in Hungary.

Keller, Arthur Ignatius, American painter and illustrator: b. New York, 1867. His art studies were made at the National Academy, New York, and in Munich. He has won a reputation as one of the best of American illustrators, and he is also a skilful oil and water-color artist. He has illustrated a long list of books, among them 'The Virginian' (Wister); 'Kate Bonnet' (Stockton); 'The Right of Way' (Gilbert Parker); and the stories of Bret Harte. He has won many medals for paintings and some of his oil and water-color productions are hung in prominent galleries at home and abroad.

Keller, Kēl'er, Emilie, French writer and statesman: b. Belfort, 1828; d. 1909. He became leader of the Roman Catholic party among the French deputies, and was commander of a company of volunteers during the Franco-Prussian War. After the war he opposed the union of Alsace-Lorraine to Germany. Among his numerous writings are 'Histoire de France' (1888); 'L'Encyclopédie et les libertés de l'église gallicane' (1860); 'L'Encyclopédie et les principes de 1789' (1865); 'Le général de Lamoricière' (1870); 'Les congrégations religieuses en France' (1880). These works are written from the Catholic point of view and, for this reason, they have been read and are still popular in Catholic circles.

Keller, Ferdinand, German painter: b. Karlsruhe, 5 Aug. 1842. He was educated at Karlsruhe; studied from nature in Brazil in 1857-62; was a student in landscape painting under Schirmer in Karlsruhe. He studied figure painting under Canon in Karlsruhe in 1863; and studied in Rome in 1863-67. His works embrace Brazilian landscapes, allegorical and historical paintings and portraits. Among his sisters are members of the Imperial family. In 1881 he was appointed director of the school of art in Karlsruhe. His 'Death of Phillip II' (1867), was first prize at the International Art Exposition in Rio de Janiero and his 'Burning of Rome under Nero' was awarded a medal at the Vienna Exposition in 1873. Among other works are 'Victory of Margrave Ludwig Wilhelm of Baden over the Turks at Salankamern, 1691' (1879); 'Héro Finding the Body of Leander' (1890); 'Triumphant Progress of Pallas Athena before Elector Ruprecht' (1886), etc.

Keller, Friedrich Ludwig, von, d. German jurist: b. Zürich, 17 Oct. 1799; d. Berlin, 11 Sept. 1860. He was educated at Berlin and Göttingen and in 1825 returned to Zürich where he was appointed professor of civil law in the university. He was a leader of the Liberal Radical party and in 1833 became head of the Swiss justiciary. In 1843-47 he was professor in the University of Halle. He then
removed to Berlin where he was active politically, and was later ennobled. He wrote 'Über Litikontestation und Urtel' (Zürich 1827); 'Der römische Zivilprozeß und die Aktionen' (Leipzig 1826; 6th ed., 1880), etc.

KELLER, Gottfried, the best writer of short stories ('Novellen') in German literature; b. Zürich, Switzerland, 19 July 1819; d. there, 17 July 1890. His father was a lathe-worker from Glattfelden (1791-1824); his mother's maiden name was Scheuchzer (1787-1864). After his father's death, Keller's family lived in constant poverty, and, because of his difficulties with his teachers, in continual disagreement with school authorities. Keller later gave a good rendering of his experiences in this period in his long novel, 'Der grüne Heinrich' (1850-56; 2d version, 1879). His mother seems to have brought him up in as carefree a condition as possible, sparing for him from her scanty meals, and allowing him the greatest possible liberty in the disposition of his time, the choice of a calling, etc. With some changes, a certain amount of her relations to him may be found in his short story, 'Frau Regel Amrain und ihr jüngster' (in the collection 'Die Leute von Seldwyla').

After numerous unsuccessful attempts to find a good teacher of painting, which was Keller's first passion, in his native town, he went in 1840 to study at the Royal Academy of Arts. But he soon recognized that painting was not for him and spent six years at Zürich in almost total inactivity (1842-48), inclining strongly toward radicalism in his politics, but subject to much temptation and self-indulgence. In 1848 he went to Heidelberg to pursue serious studies, coming under the influence of the philosopher Feuerbach and extending his radicalism also to matters of religion. But it was chiefly his stay in Berlin (1850-55) which molded Keller's character into its final shape, toned down his rather bitter pessimism to a more moderate form and prepared him (not without the privations of hunger), in the whirl of a large city, for an enjoyment of the more restricted pleasures of his native Zürich. It was in Berlin that he turned definitely away from other pursuits and took up literature as a career. In this period fall 'Der grüne Heinrich,' and the first collection of 'Die Leute von Seldwyla,' (five stories averaging 60 pages each: 'Pankraz der Schmoller,' 'Frau Regel Amrain und ihr jüngster,' 'Die drei gerechten Kammacher,' 'Romeo und Jullie auf dem Dorfe,' 'Spiegel das Kätzchen'). 'Der grüne Heinrich' is the most personal of all his works; under the influence of J. J. Rousseau's doctrine of a return to nature, this book, at first intended as a short narrative of the collapse of the life of a young artist, expanded, as its composition progressed, into a huge work that treats, in poetically transfigured manner, all the events in Keller's life up to his return to Germany. It revolved, but he turned the world was cool, but the later version (1879) is a rounded and satisfying artistic product. 'Die Leute von Seldwyla' includes at least two stories that are immortal: 'Die drei gerechten Kammacher,' the most satirical and searching attack on the sordid petit bourgeois morality ever penned by any writer, and 'Romeo und Jullie auf dem Dorfe,' one of the most pathetic tales in literature ('Shakespeare's plot in a Swiss village setting'). In 1861 Keller became city registrar (Staatsbeschreiber) of Zürich. The routine duties of this position were a sort of fixed point about which his life could revolve, but he produced little of permanent value in these years. After 15 years at this post he was retired in 1876, and began a period of literary activity that was to last to his death, living the life of an old bachelor with his sister Regula as his housekeeper. In spite of his often unsympathetic manner, his extreme reserve and idiocy in art; dealing with others, he had gained the affection of his fellow-townsmen and an almost universal reputation before his death.

His fame is based chiefly on 15 short stories, the five mentioned above, the five contained in the second volume of 'Die Leute von Seldwyla' (1874); 'Die missbrauchten Liebesbriefe,' 'Der Schmied seines Glücks,' 'Dietegen,' 'Kleider machen Leute,' (Das verlorene Anekdoten-Kapitel, 1878); 'Hadaub, Der Narr auf Manegg,' 'Der Landvogt von Greifensee,' 'Das Fähnlein der sieben Aufrechten,' 'Ursula.' The milieu is always that of an orderly bourgeois existence in the most manifold human destinies, the most humorous relations are progressing, the most peculiar and hardy types of endurance and reticence being formed. Some of the stories contain a note that is new in German literature, that has endeared them particularly to Germans, as embodying an ideal as yet unrealized in their own country: they narrate the development of character under the relatively free conditions of little Switzerland, picturing an unbureaucratic civic life and an independence of business initiative that cannot but attract those who have been denied these privileges. As short stories, they cannot compare with Mauzpassant's or Thomas Mann's for artistic construction; they resemble those of Henry James chiefly in complexity and wealth of detail, not in sophistication and elegance; but they deal intimately and understandingly, often by caricature and exaggeration, with the motives of plain middle class persons, or those on the lower fringe of middle-class Berlin, that he turned away from the Dorf. Physical description of a painfully detailed, yet entrancing variety, is their chief external grace; pages are devoted to the portrayal of the tiled stove ('Dietegen') or a cheap cabinet ('Kammacher'). Keller's most mature collection of short stories is 'Das Singgedicht,' containing 'Die arme Baronin, ' 'Der Geisterseher, ' 'Regine, ' 'Don Correa, ' 'Berlocken' (1882). In the form of what the Germans call 'eine Rahmenerzählung' (a framework story, or an embedded story), it unites a continuous narrative with a number of interposed, independent tales, a device of which Boccaccio is the most illustrious exponent, and which German writers have consciously developed to a high degree of perfection. Die sieben Leben (1877) contains 'Einwander, ' 'Die Jungfrau und der Teufel, ' 'Die Jungfrau und der Ritter, ' 'Das Tanzlegendchen, etc.' is a similar collection, in which the author has adopted his merry art of narrative to an ecclesiastical ostler and scoundrel as a victim of progress, and in which his creative and descriptive powers seem no longer at their full height. It is the old opposition of the risen and the rising generation, in his usual Swiss setting.
The significance of family life and the relation
of the individual to society are well put.

KELLER, Otto, German classical philologist:
born in Tübingen, 28 May 1838. He was educated
at the universities of Tübingen and Bonn
and later specialized in the study of Horace. He
was professor at Freiburg 1872-76, at
Graz 1876-81 and from then until his retire-
ment on a pension in 1909 he was at Prague.

Chief among his critical works on Horace are
'Horatii Opera Rec. Holder et Keller' (1864-
70; Vol. I, 2d ed. 1899); 'Epiglomena zu
Horaz' (3 vols., Leipzig 1879-80); 'Pseudo-
acrouis Scholia in Horatium Vetustiora' (2
vols., 1902-04).

Among other works are
'Tiere des klassischen Altertums in kultur-
geschichtlicher Beziehung' (Innsbruck 1887);
'Lateinische Etyymologien' (1893); 'Kultur-
geschichtliches aus der Tierwelt' (1904); 'Die
antike Tierwelt' (Vol. I, 1909; Vol. II, 1914),
etc.

KELLERMANN, William Ashbrook, American
botanist: b. Ashville, Ohio, 1 May 1850;
d. 8 March 1908. He was graduated at Cor-
nell in 1874, and received his Ph.D. from the
University of Zürich in 1881. He was a pro-
fessor in the State Normal School, Oshkosh,
Wis., five years; in the State College, Lexing-
ton, Ky., one year, and at the University of
Cincinnati College eight years. He was botanist to
the Kansas Experimental Station four years,
and from 1891 until his death was professor of
botany in the Ohio State University. He lec-
tured extensively, contributed to various bo-
tanical journals and investigated parasitic
fungi. He wrote 'Elements of Botany'; 'Plant
Analysis'; 'Spring Flora of Ohio'; 'Catalogue
of Ohio Plants' (1899); 'Non-Indigenous
Flora of Ohio' (1900), etc.

KELLERMANN, Bernhard, German novelist,
author of a number of very sensational
works: b. Fürth, Bavaria, 4 March 1879.
He traveled considerably and lived in a number of
cities: Rome (1904-05), Berlin (1905-06), Grün-
wald bei München (1906-09), Schöneberg bei
Berlin (from 1909). His most famous work is
'Der Tunnel' (1913; English translation, 'The
Tunnel', New York 1914). Almost 100,000
copies were printed in its first year. It is
a romance of iron and steel, a study of com-
mmercial expansion and consequent clash of inter-
ests, centreing about the construction of a tun-
nel joining the continents of Europe and North
America under the Atlantic Ocean; in short, a
typical product of the imperialistic imagination
as molded under the hothouse conditions of
modern industrial life. He has traveled in the
Orient to obtain impressions of Eastern life
and has rendered these impressions in the last
two of the works enumerated below. His
works include 'Yester und Li' (1904); 'Inge-
borg' (1906); 'Der Tor' (1907); 'Das Meer'
(1910); 'Ein Spaziergang in Japan' (1911);
'Sassayo Yassa' (1913). An English transla-
tion, 'God's Beloved', of a story written by
Kellermann in 1911 appears in 'German Classi-
cals' (Vol. XX, New York 1914).

KELLERMANN, François Christophe, from swä krös-tōf käller-män (originally GEORG MICHAEL KELLERMANN), Duke of Valmy, French marshal: b. Wolsfuchweiler-an-der
Tauber, Bavaria, 28 May 1755; d. 12 Sept. 1820.
He entered the Conflans Legion as a Hussar in
1752 and engaged in the first campaigns of the
KELLERMANN—KELLEY

Seven Years' War. In 1792 he received the command of the army of the Moselle, formed a junction in September with the main army under Dumouriez and sustained 20 Sept. 1792 the celebrated attack of the Duke of Brunswick. In the following wars of France Kellermann received various general commands. He became marshal of France in 1804 and Duke of Valmy in 1809. After the Bourbon restoration he was appointed a member of the Chamber of Peers, where he espoused the Liberal side.

KELLERMANN, François Étienne de, Duke of Valmy: b. Metz, 4 Aug. 1770; d. 2 June 1835. Son of François Christophe de Kellermann (q.v.). He served in his father's regiment before entering the diplomatic service in 1791, returning to the army in 1793 and again serving under his father in the army of the First Consul. In 1796 he became Napoleon's adjutant-general and in 1797 his services at Tagliamento won him promotion to brigadier-general. At Marengo he conducted a cavalry charge that won the battle and gained for him rank as general of division. He was at Austerlitz and served in the Peninsula campaign. He remained in the army throughout the Restoration. He died at Rome on 2 June 1835. On his return from Elba. He commanded a cavalry corps at the battle of Waterloo. He was considered the ablest of Napoleon's cavalry generals, but his fame was clouded by his undeniably merited personal unpopularity; Napoleon, however, ever kept in mind de Kellermann's service at Marengo. He sat in the House of Peers from 1820 and vigorously opposed the Bourbons until the fall of Charles X in 1830. His unpublished memoirs were used by his son, François (who was Edmond de Kellermann in the preparation of 'Histoire de la Campagne de 1800' (Paris 1854).

KELLEY, ké′l, Benjamin Franklin, American soldier: b. New Hampton, N. J., 10 April 1807; d. Oakland, Md., 17 July 1871. In 1861 he recruited and became colonel of the 1st Virginia volunteer cavalry. He served in the Pea Ridge andinks, on 17 May became brigadier-general, captured Romney 26 October and was for a time until January 1862, commander of the Department of West Virginia, in November 1863 destroyed the Confederate camp near Morefield, Va., and in August 1864 defeated the enemy at Cumberland, Md., and New Creek and Morefield, Va. He was brevetted major-general of volunteers in 1865, and subsequent to the war was from 1876 superintendent of the Hot Springs (Ark.) reservation, and from 1883 an examiner of pensions.

KELLEY, Charles H., English Wesleyan clergyman and publisher: b. Salford, Manchester, 25 Nov. 1833; d. London, 5 April 1911. He was educated at Didsbury College. He entered the Wesleyan Methodist ministry in 1857 and served as pastor for many years. He was secretary of the Wesleyan Sunday School Union, 1875-89; book steward or manager of the Methodist Publishing House, London, 1889-1907. He was elected to the "Legal Hundred," 1878; president of the Wesleyan Conference, 1889-90, 1906-07; president of the National Council of Evangelical Free Churches, 1900-01. He served as fraternal delegate to the General Conference of the Methodist Episcopal Church, 1888. He was the first Wesleyan minister to conduct services in military prisons under War Office authority. He was a manager of the Wandsworth Boys' Home and Reformatory for many years. He was also vice-president of the British and Foreign Bible Society and of the Sunday School Union. He is said to have preached in over 800 churches and dedicated many churches. He published his 'Memories, or Autobiographical Reminiscences' (1910).

KELLEY, Edgar Stillman, American composer: b. Sparta, Wis., 14 April 1857. He studied with Merriam, Clarence Eddy and Ledochowski in Chicago, 1874-76, and afterward with Seifriz, Krüger, Speidel and Finck at Stuttgart, graduating from the conservatory there in 1880. Upon his return he held several church appointments and for a short period conducted a comic opera. Later he taught in San Francisco, where he became musical critic of the "Examiner." In 1896 he settled in New York, teaching in the New York College of Music and lecturing for the extension department of New York University in 1901-02. From 1902 to 1910 he resided in Berlin. Upon his return to the United States he became professor of music at the Western College for Women in Columbus, Ohio, and professor of composition at the Cincinnati Conservatory of Music. He became a member of the National Institute of Arts and Letters. His works include a comic opera, 'Puritania'; two symphonies; an orchestral suite, 'Aladdin'; a piano quartet; a string quartet; incidental music to 'Ben Hur,' 'Prometheus Bound,' 'Macbeth'; songs; piano pieces, etc. His book 'Chopin the Composer' (1913) attracted wide attention for its scholarly analysis of the master's works.

KELLEY, Florence, American social worker: b. Philadelphia, 12 Sept. 1859. She was graduated in the Pedagogical Department of the University of Pennsylvania, 1885, and LL.B. at the Northwestern University in 1894. She was State inspector of factories in Illinois in 1893-97; served as American editor of the Archiv für Sozialwissenschaft, Berlin, in 1897-98; and since 1899 has been general secretary of the National Consumers' League. Through a marriage, later dissolved, she is known as Mrs. Kelley. She is associate editor of the Survey and a trustee of the National Child Labor Committee. Besides a translation of Friedrich Engel's 'Condition of the Working Classes in England' she has written 'Some Ethical Gains Through Legislation' (1905); 'The Fate of Felix Brand' (1913); 'Modern Industry in Relation to the Family' (1914). She edited Edmond Kelly's 'Twentieth Century Socialism' (1910).

KELLEY, James Douglas Jerrold, American naval commander: b. New York, 25 Dec. 1847. He was graduated from the United States Naval Academy in 1868; became lieutenant-commander in 1893 and commander in 1899. He was successively inspector of merchant vessels at New York, senior aide to the commandant of the navy yard at Mare Island, commander of the Resolve and for a second time was inspector of merchant vessels. He was retired 1
KELLEY — KELLOGG 341

April 1901. He has published 'The Question of Ships'; 'Our Navy'; 'A Desperate Chance'; 'American Men-o'-War'; 'History of the Naval Experimental Battery'; 'American Yachts'; 'Typical Yachts'; 'The Ship's Company'; 'The Torpedo Flotilla'; 'The Navy of the United States 1775–1899'; and is the naval editor of the New York Herald.

KELLEY, William Darragh, American legislator: b. Philadelphia, Pa., 12 April 1814; d. Washington, D. C., 9 Jan. 1890. He was apprenticed first to a jeweler and later to a printer, studied law at Philadelphia and in 1841 was admitted to the bar there, in 1843–46 was attorney-general of Pennsylvania, and in 1846–56 judge of the Court of Common Pleas at Philadelphia. Previously a Democrat, he became a Republican in 1854, and in that year gave at Philadelphia a once well-known address on 'Slavery in the Territories.' In 1860 he was a delegate to the National Republican Convention, and from that year until his death was a member of the House of Representatives, where he was chairman of the Committee on the navigation and commercial exposition and was known as 'Pig-iron Kelley.' For some years he was senior of the House. Among his publications are 'Letters on Industrial and Financial Questions' (1872); 'Letters from Europe' (1880); 'The New South' (1887).

KELLEY, William Valentine, American Methodist clergyman and editor: b. Plainfield, N. J., 13 Feb. 1845. He was educated at Wesleyan University, graduating in 1865. Two years later he entered the ministry of the Methodist Episcopal Church. He served prominent churches in Camden, N. J., New Brunswick, N. J., Buffalo, N. Y., Philadelphia, Pa., Newark, N. J., Brooklyn and New Haven, Conn. Since 1893 he has been editor of The Methodist Review. He has been a member of every session of the General Conference beginning with 1886. He is a manager of the Board of Foreign Missions of the Methodist Episcopal Church and also of the American Bible Society. He is author of 'The Ripening Experience of Life and Other Essays' (1907); 'Down the Road and Other Essays' (1911); 'The Illuminated Face' (1911); 'Glimpses of the Soul of Gilder' (1911); 'Trees and Men!' (1911); 'A Pilgrim of the Infinite' (1914); 'With the Children in Lewis Carroll's Company' (1917).

KELLENGREN, Johan Hendrik, Swedish poet and critic: b. Floby, West Gothland, 1 Dec. 1751; d. Stockholm, 26 April 1795. He was educated at the University of Uppsala and when in 1774 he became a privatdocent there in 1774, he had already gained recognition as a poet. In 1777 he removed to Stockholm and in 1778 with Assessor Carl Lenngren he founded the Stockholmsposten, of which he became editor. He was librarian to Gustavus III from 1780 and in 1785 became his private secretary. He collaborated with the monarch in the production of four operas, Kihlgren supplying the verse. Upon the establishment of the Swedish Academy in 1786 he was made one of its original members. His best known work is a series of patriotic lyrics, which are among the most notable fruits of the Gustavian period of Swedish letters. His earlier work is keenly satirical, controversial and light in tone, but deep feeling and wise sympathy characterize his later writings. Among his most bitter satires is 'Nyt forders til ornmad vers.' Of his earlier work the spring song, 'Vintens valse lyktar, och the satirical 'Mina iljen,' are most notable, while of his later writings the finest are the satire, 'Ljusets fender,' the inspired patriotic song, 'Kantat den 1 januari, 1789,' the ode, 'Till Kristina,' and the song, 'Nya Skapelsen.' He personally revised his collected works, 'Samla skrifter' (3 vols., 1796; later edition, 1884–85).

KELLETCOTT, William Erskine, American biologist: b. Buffalo, N. Y., 5 April 1878; d. Hastings, N. Y., 29 Jan. 1919. He graduated at Ohio State University, 1898; Ph.D. Columbia, 1904. He was instructor in zoology at Barnard College in 1900–06. In 1900–8 he was professor of biology at Goucher College, Baltimore, from 1908–17 was director of the Marine Biological Laboratory, Wood's Hole, Mass.; served for a year on the Federal Food Administration; then became professor of biology the College of the City of New York. He wrote 'Social Direction in Human Evolution' (1911); 'Textbook of General Embryology' (1913); 'Outlines of Chordate Development' (1913).

KELLMER, MAX, American theologian and Orientalist: b. Detroit, Mich., 21 May 1861. He was graduated from Hobart College in 1881, Cambridge Theological School in 1885, took his A.M. at Harvard in 1886 and his D.D. at Hobart in 1895. He was instructor in Hebrew at the Cambridge Theological School in 1887–91; assistant professor in Old Testament language there in 1891–98, and professor, 1898–1907; since 1907 he has been professor of literature and interpretation of the Old Testament. He has written 'The Prophecies of Isaiah' (1900); 'The Standard Inscription of Assurnarrizil' (1893); 'The Assyrian Monuments Illustrating the Sermons of Isaiah' (1900); 'An Outline Study of the Old Testament Literature and Religion' (1902).

KELLOGG, kēl'ōg. Amos Markham, American educator: b. Utica, N. Y., 5 June 1832; d. New Rochelle, N. Y., 3 Oct. 1914. He was graduated from the Albany (N. Y.) State Normal School in 1853 and was instructor there 1852–56. Afterward he held other educational posts and edited the School Journal from 1874 to 1904. He published 'School Management'; 'Life of Pestalozzi' (1891); 'How to be a Successful Teacher' (1901), also numerous school entertainment books.

KELLOGG, Clara Louise, American opera singer: b. Sumterville, S. C., 12 July 1842. She obtained her musical education chiefly in New York, where her first appearance in opera was in 1861 at the Academy of Music, in the rôle of Gilda in 'Rigoletto.' Henceforward she was one of the most popular of American singers, and was also most cordially received in England, where she sang in opera 1867–68 and again in 1872 with Christine Nilsson. Her voice was a pure and flexible soprano and her execution brilliant. She had an extensive repertoire, including 45 operas. In 1874 she organized an English opera company and with it visited nearly every part of the United States. In 1876 she organized an
Italian opera company and later appeared on the concert stage. In 1887 she married her manager, Carl Straksch, and soon after retired from professional life. She published her memoirs in 1913 under the title 'Memoirs of an American Prima Donna.'

KEILLOGG, Elijah, American Congregational minister and writer for the young: b. Portland, Me., 20 May 1813; d. Harpswell, Me., 17 March 1901. He was graduated from Bowdoin College in 1840, from the Andover Theological Seminary in 1843, was pastor of the Congregational church at Harpswell, Me., in 1844-55, in 1855-65 was chaplain of the Boston (Mass.) Seamen’s Friend Society, was later for a time in charge of a congregation at Rockport, Mass., but soon returned to Harpswell, and there devoted himself to literary work. He published over a score of juvenile books, including ‘The Elm Island Series’ (1866-70); ‘Pleasant Cove Series’ (1870-74), and ‘Good Old Time Series’ (1877-82). But he is best known for his familiar blank verse addresses, ‘Sparratus to the Gladiators,’ ‘Regulus to the Carthaginians’ and ‘Pericles to the People.’ Com. Mitchell (‘Elijah Kellogg: the Man and His Work’ (1903).

KEILLOGG, Frank Billings, American lawyer and senator: b. Potsdam, N. Y., 2 Dec. 1856. He removed to Minnesota with his parents in 1865, and was admitted to the bar in 1877. He was city attorney of Rochester, Minn., for three years and county attorney of Olmstead County for five years. In 1887 he went to Saint Paul, joining the law firm Davis, Kellogg and Severance. He was counsel for different railroads and mining concerns and later served as special counsel for the United States government in its cases against the Standard Oil Company, the paper trust, the Union Pacific, Southern Pacific and Harriman railroads. He was elected president of the American Bar Association in 1912 and in 1916 was elected to the United States Senate in 1915.

KEILLOGG, George, American inventor: b. New Hartford, Conn., 19 June 1812; d. there, 6 May 1901. Albert Kellogg, the botanist, was his brother. He was graduated from Wesleyan University in 1837, in 1841 became a manufacturer in Birmingham, Conn., removed in 1853 to New York, was a United States revenue officer in 1863-66, and later was active in manufacturing and experimentation at Cold Spring, N. Y. Among his inventions were a machine for the manufacture of jack-chain, with a capacity of a yard per minute; a type-distributor; an adding apparatus and a dovetailing machine.

KEILLOGG, John Harvey, American physician: b. Tyrone, Mich., 26 Feb. 1852. He was a student at the Michigan State Normal School and received his M.D. from the Bellevue Hospital Medical College in 1875. He studied in Europe in 1883, ’84, ’99, 1902, ’07, ’11. He has practised at Battle Creek, Mich., since 1875 and has served as superintendent and surgeon of the Battle Creek Sanatorium since 1876. He was a member of the Michigan State Board of Health in 1878-90 and 1912-16. He is founder and president of the American Medical Missionary College; and has invented improved apparatus for medical and surgical purposes. He has written many technical papers, and textbooks and charts for the use of schools in addition to ‘The Art of Massage’ (1895); ‘Rational Hydrotherapy’ (1901; 4th ed., 1910); ‘The Home Book of Modern Medicine’ (1906); ‘Neurasthenia or Nervous Exhaustion (1914), etc.

KEILLOGG, Martin, American Latinist and educator: b. Yonkers, Conn., 15 March 1828; d. San Francisco, 26 Aug. 1903. He was graduated from Yale in 1850, from the Union Theological Seminary in 1854; having removed to California about 1855 there held a pastorate at Grass Valley, Nevada County; was professor of Latin and mathematics in the College of California (1860-69); and when the college was merged into the university held the chair of Latin and Greek in the latter institution in 1869-76. In 1876-94 he was professor of Latin language and literature, in 1890-93 acting president, and in 1893-99 president of the university. He resumed his professional duties in 1900. He published ‘Ars Oratoria,’ an edition of selections from Cicero and Quintilian (1872), and ‘The Brutus of Cicero’ (1889).

KEILLOGG, Paul Underwood, American editor and social worker: b. Kalamazoo, Mich., 30 Sept. 1871. He was graduated at the Kalamazoo High School, and took special courses at Columbia University 1901-06, and at the New York School of Philanthropy in 1902. He was reporter, then city editor, on the Kalamazoo Daily Telegraph in 1896-1901; managing editor, associate editor and now editor of the Survey of which he has made a notable success. He was director of the Pittsburgh Survey in 1907-08; and edited ‘Findings of the Pittsburgh Survey’ (6 vols., 1910) for the Russell Sage Foundation. He was one of the directors of the New York City Committee on Congestion of Population and served as chairman of the commission on Occupational Standards of the National Conference of Charities and Correction in 1910. He also served on the board of managers of the Cabot Fund in 1915.

KEILLOGG, Samuel Henry, American Presbyterian missionary and scholar: b. Quogue, Long Island, N. Y., 6 Sept. 1839; d. Landour, India, 2 May 1899. He was graduated at Princeton College in 1861 and at the Theological Seminary in 1864, and after being ordained to the Presbyterian ministry, went as a missionary to India, where he remained till 1877. He was professor of systematic theology in Western Theological Seminary 1877-86, and pastor of Saint James’ Square Presbyterian Church, Toronto, 1886-92. He returned to India in 1892 and remained there till his death. His publications include ‘A Grammar of the Hindi Language’ (1876); ‘The Jews: or, Prediction and Fulfilment’ (1883); ‘The Light of Asia and the Light of the World’ (1885); ‘The Genesis and Growth of Religion’ (1892); ‘From Death to Resurrection’ (1885), etc.

KEILLOGG, Vernon Lyman, American entomologist and zoologist: b. Emporia, Kan., 1 Dec. 1867. He was graduated at the University of Kansas in 1889, from Cornell in 1891, studied at the University of Leipzig in 1893 and 1896. From 1893 to 1894 he was assistant and associate professor of entomology at the University of Kansas in 1890-94 and since 1894 has been professor of
entomology and lecturer at Leland Stanford Jr. University. He has been associate editor of the Philosophy of Nature series since 1911; and in 1915 was in charge of food distribution in northern France and Belgium under the American Commission to Relieve in Belgium. In 1917 Mr. Kellogg was appointed assistant to Herbert Hoover, the United States food administrator. He has written 'Common Injurious Insects of Kansas' (1892); 'Elementary Zoology' (1903); 'American Insects' (1904); 'Darwinism to-Day' (1907); 'The Animals and Man' (1911); 'Beyond War' (1912), etc.

**KELLOGG, William Pitt,** American lawyer and politician: b. Orwell, Vt., 8 Dec. 1830. He was educated at the Norwich Military Institute and removed to Illinois, where he studied law. Being admitted to the bar in 1852 he began his practice at Canton. He became active in the Republican party, was chairman of his delegation from Fulton County at the Bloomington Convention on 29 May 1856. Mr. Lincoln was chairman of his delegation from Sangamon County. In the same convention. Here the Republican party of Illinois was organized. He was a delegate to the National convention in 1860, and one of the presidential electors in the same year, voting for Lincoln. In the Senate appointed him chief justice of the State of Nebraska, then a Federal territory, but later granted him leave of absence that he might raise a regiment of cavalry in Illinois, of which he became colonel. He remained in the army two years, serving in the army of the Mississippi in 1861, and was compelled to resign on account of ill health. He was collector of the port at New Orleans (1863-68). His commission as collector is dated 13 April 1865, the day before President Lincoln was assassinated. He was United States senator in 1868-72, governor of Louisiana in 1873-77, and a member of Congress in 1883-85. He was a delegate at every Republican National Convention from 1876 to 1896. He was one of the 306 delegates who voted for Grant in the Republican Convention of 1880. He was delegate-at-large from Louisiana in 1896, and after the election of President McKinley he retired from active politics. Since 1900 he has resided most of the time in Washington, where he has considerable interest. He is a member of the Loyal Legion Commandery of the District of Columbia.

**KELLOR, Frances Alice,** American sociologist and author: b. Columbus, Ohio, 20 Oct. 1873. She was graduated at the Cornell Law School in 1897, studied at the University of Chicago 1898, 1904, at the New York Summer School of Philanthropy in 1901, and was Fellow of the College Settlements Association in 1902-04. She was secretary and treasurer of the New York State Immigration Commission in 1909; and chief investigator for the Bureau of Industries and Immigration of New York State in 1910-13. She then became managing director of the North American Civic League for Immigrants. She has written 'Experimental Sociology' (1902); 'Out of Work' (1904); 'Education of Women by Athletics' (1909); 'Social Service, a Call to Service' (1916).

**KELOWNA SAFETY POWDER,** one of the explosive combinations of chlorates and perchlorates exploding by friction and supposed by its composition largely to overcome the danger of spontaneous combustion as well as the sensitiveness to percussion characteristic of such mixtures. It is composed of spent gunpowder and tan dust, &c., saturated with some nitrate or potassium and a small quantity of potassium chlorate, to which is added sulphur.

**KELLS, Ireland,** a market town of County Meath, and on the Blackwater, 36 miles north-west of Dublin. The town is noted for its antiquarian remains, chief of which are Saint Columba's house; a round tower of the 12th century 99 feet in height; and several fine stone crosses. Conn of the Hundred Fights resided there in the 2d century and a palace of Dermot, king of Ireland, existed in 544-65. In the 6th century Kells was granted to Saint Columba but there are no remains of the monastery said to have been built. A bishopric founded there about 807 became a noted seat of learning, a testimonial of which exists in the famous 'Book of Kells,' an illuminated manuscript copy of the Gospels in Latin and containing local records, said to be one of the finest of its kind in existence. The manuscript dates from the 8th century and is in possession of Trinity College, Dublin. Pop. 2,395.

**KELY, Edmund,** American lawyer and Socialist: b. Toulouse, France, 28 May 1841; d. Paris, 4 Oct. 1909. He was educated in early years in England and was graduated from Columbia University in 1870, was admitted to the bar and later studied at Cambridge University. He opened a law office in Paris, where he became known as an authority on international marriages and where he served also as counsel to the American legation. Returning to New York in 1890, he was active in municipal reform, founded the City Club, and assisted in the election of Mayor Strong. He made an attempt to organize workingmen into good-government clubs but did not meet with much success, and he returned to his law practice in France. Again in the United States in 1905 he participated actively in Socialist propaganda and made special investigations of the tramp problem. One of his ambitions was to have tramp colonies established in New York State. In Paris he was counsel of Princess de Saar (Anna Gould) in the divorce suit against her husband, Count Boni de Castellane. His writings include 'Evolution and Effort and their Relation to Religion and Politics' (1895; 2d ed., 1898); 'Government, or Human Evolution' (2 vols., 1900-01); 'The Unemployables' (1907); 'Twentieth Century Socialism' (1910).

**KELLY, Howard Atwood,** American gynecologist: b. Camden, N. J., 20 Feb. 1858. He was graduated at the University of Pennsylvania in 1882 and was associate professor of obstetrics there is 1888-89. Since 1889 he has been professor of gynecology in the Johns Hopkins University, and since 1899 gynecological surgeon in the Johns Hopkins Hospital. He founded the Kensington Hospital at Philadelphia, and besides several books contributed to medical journals is the author of 'Operative Gynecology' (2 vols. 1899); 'The Vermiform Appendix and its Diseases' (1905); 'Medical Gynecology' (1908); 'American Medical Botanists,' etc.
KELLY, Hugh, Irish dramatist and poet: b. Killarney, Ireland, 1739; d. London, 3 Feb. 1777. Possessed of little education and originally apprenticed to a staymaker he went to London in 1760 to embark upon a literary career. He secured employment as a newspaper and magazine worker, wrote a novel, five satirical verse and several plays. His adroitness in securing the favor of Garrick doubtless had much to do with the success of his play 'False Delicacy' produced at the Drury Lane Theatre in 1768; the play had little merit but was successful and afterward was translated into French, German and Portuguese. It was followed by 'A Word to the Wise' (1770) which was withdrawn from the Drury Lane Theatre because of fictional enmity engendered by Kelly's service as newspaper writer for Lord North, but was successful in the provinces although of inferior quality. 'Elementina' (1771), 'Covent Garden' was played only nine nights, but 'A School for Wives' was successful on the stage and ran through five large printed editions (1772). On 11 May 1774 'The Romance of an Hour' (1774), and 'The Man of Reason' (1776). Kelly's success was now dwindling and he abandoned playwriting, was called to the bar from the Middle Temple in 1774 and devoted himself to the practice of law. He failed at this and died in poverty. He wrote one novel, 'Memoirs of a Magdalen, or the History of Louisa Mildmay' (2 vols., 1767).

KELLY, James Edward, American sculptor: b. New York, 30 July 1855. He studied at the National Academy of Design, and up to 1881 was known as an illustrator of books and magazines. Since that time he has successfully devoted himself to sculpture, and chosen subjects from American history for treatment by his patriotic chisel; so great has been his success that he has won the title of 'Sculptor of American History.' His well-known works include 'Sheridan's Ride' (1878); 'Paul Revere,' a statuette (1882); 'Momboute Monument,' with five illustrative panels (1883-85); 'Roundhouse Monument' (1887); 'Grant at Fort Donelson' (1886); 'General Devere's' and the 'Sixth New York Cavalry Monument' at Gettysburg (1890); 'Call to Arms'; colossal figure for the Troy 'Soldiers' Monument' (1891); 'Borden Monument' at Gettysburg (1895); 'Battle of Harlem Heights' (executed for the Sons of the Revolution at Columbia University, 1897); and a colossal monument to commemorate the defense of New Haven (1909); 'Count Rochambeau' at Southington, Conn.; 'Father Hecker, Founder of the Paulist Congregation.' A remarkable series of military portraits has also been produced by him. Forty generals of the Civil War, including Grant, Sherman and Sheridan, gave sitting for the sculptor. A series illustrating the leading map makers and publishers of the Civil War has followed, witnessing to his skill and industry as a portrait sculptor. Wheeler, Dewey and Sampson are included in this latter gallery of busts. He was one of the founders of the Art Students' League.

KELLY, John, American politician: b. New York, 21 April 1821; d. there, 1 June 1886. After a public school education, he was apprenticed to the mason's trade, in 1845 established a successful business of his own, was elected alderman in 1854, in 1855-59 was a Democratic representative from New York in the 34th and 35th Congresses, and in 1859-62 and 1863-67 was sheriff of New York County. In 1868 he was the candidate of the Democratic Union or Reformer ticket for mayor, but was defeated by the satiric verse and several plays. His adroitness in securing the favor of Garrick doubtless had much to do with the success of his play 'False Delicacy' produced at the Drury Lane Theatre in 1768; the play had little merit but was successful and afterward translated into French, German and Portuguese. It was followed by 'A Word to the Wise' (1770) which was withdrawn from the Drury Lane Theatre because of fictional enmity engendered by Kelly's service as newspaper writer for Lord North, but was successful in the provinces although of inferior quality. 'Elementina' (1771), 'Covent Garden' was played only nine nights, but 'A School for Wives' was successful on the stage and ran through five large printed editions (1772). On 11 May 1774 'The Romance of an Hour' (1774), and 'The Man of Reason' (1776). Kelly's success was now dwindling and he abandoned playwriting, was called to the bar from the Middle Temple in 1774 and devoted himself to the practice of law. He failed at this and died in poverty. He wrote one novel, 'Memoirs of a Magdalen, or the History of Louisa Mildmay' (2 vols., 1767).

KELLY, Myra (Mrs. Allan MacNaughton), American author and educator: b. Dublin, Ireland; 12 March 1842. She was educated in the United States when a child and was graduated at the Teachers' College, Columbia University, in 1899. She was a teacher in the New York public school system in 1899-1901; and in 1902-03 she was critic teacher at Speyer School, Teachers' College. She came swiftly into prominence as a writer of short magazine fiction; her material, that of the pathetic children of the lower East Side of New York, being handled with charming sympathy and humor. She also wrote several novels. She was the author of 'Little Citizens' (1904); 'The Isle of Dreams' (1907); 'Wards of Liberty' (1907); 'Rosnah' (1908); 'Golden Season' (1909); 'Her Little Ladyship' (1911).

KELLY, Thomas, Irish hymn writer and clergyman: b. Dublin, Ireland, 15 July 1769; d. there, 14 May 1855. He was graduated at Trinity College, Dublin, in 1789, abandoned law for theology and was ordained in the Church of England in 1792; but later he became a Non-Conformist. He wrote 767 hymns, of which in English 'All Ye That Tops Appearing' is one of those still in use.

KELLY, William, American inventor: b. Pittsburgh, Pa., 22 Aug. 1811; d. Louisville, Ky., 11 Feb. 1888. He early turned his attention to invention, engaged in the forwarding and commission business at Pittsburgh, Pa., and from 1846 in the iron business in Kentucky. In 1851 he finally perfected his process in decarbonizing iron by means of a current of air, and thus by a converter directly transforming pig-iron into steel. This method, 'Kelly's air-bolting process,' was the same as that patented by Sir Henry Bessemer in England in 1856 (or 1857), and Kelly asserted that Bessemer had gained knowledge of it through American workmen. Bessemer's application in the United States was refused, if the Spanish-American War has followed, witnessing to his skill and industry as a portrait sculptor. Wheeler, Dewey and Sampson are included in this latter gallery of busts. He was one of the founders of the Art Students' League.

KELLY-KENNY, Sir Thomas, Irish soldier: b. Kilkenny, Ireland, 27 Feb. 1840; d. 26 Dec. 1914. He entered the army as an ensign in 1858 and rose to the rank of major-general
in 1897. He served in China in 1860, in Abyssinia in 1867, was inspector-general of auxiliary forces and recruiting in 1897–99. In 1899–1902 he was lieutenant-general on staff in command of the Sixth Division in South Africa. In 1901 he was at headquarters as adjutant-general to the forces. He was knighted in 1902; received from King Edward his G.C.V.O. in 1906; and retired in 1907.

KELLY'S FORD, Engagements at. This point on the Rappahannock River six miles above its junction with the Rapidan and about five miles below Rappahannock Station was the scene of several engagements between the Federals and Confederates during the Civil War. In August 1862, the Union cavalry of the Army of Virginia had a spirited encounter with the Confederate cavalry, and 17 March 1863 General Averell, with 2,100 Union cavalry and a battery of six guns, crossed at the ford, after a sharp engagement, and moved on Culpeper Court House, under orders to rout and destroy Fitzhugh Lee's cavalry brigade, reported at the place. Lee was found in his immediate front with five regiments and a battery, and when about noon Averell advanced, a hard fight ensued, during which Lee was gradually forced back over a mile; then Averell was checked, finally driven back and recrossed the river at both sides. It was the first purely cavalry battle of the war, and was closely contested on both sides. The Union loss was 65 killed and wounded and 22 missing; the Confederate loss, 99 killed and wounded and 34 missing. Among the Confederate killed was Capt. John Peckham, a young artilleryman of much promise. A portion of Pleasanton's cavalry division crossed the ford and took part in the battle of Fleetwood (q.v.) 9 June 1863. When General Meade began his Mine Run campaign (see Mine Run) two corps of the Army of the Potomac under General Sedgwick forced the passage of the Rappahannock at the railroad crossing, 7 Nov. 1863, while General French, with two corps, forced the passage at Kelly's Ford, five miles below. The advance of the Third corps crossed with a loss of 36 killed and wounded, the Confederate loss being 64 killed and wounded and 295 captured, and the Army of the Potomac was united at Brandy Station. Following these engagements the ford was the scene of many stirring events.

KELOID, or CHELOID, a cutaneous tumor, non-malignant in character, similar in appearance to the ridge-like scar which sometimes completes the healing of a wound. The disease was named by Alibert because of the claw-shaped processes which radiate from its extremities. It is now thought to be due to an injury, although earlier medical authorities attributed its growth to an inherent tendency. Investigations show that it follows an injury to the cuticle such as bruises, scratches, abrasions, undue pressure of clothing, an incision, as vaccination, piercing the ears or a leech bite, and from boil, acne or smallpox scars. The keloid rises about an eighth of an inch above the surface of the skin, is smooth and flat, devoid of hairs and either red or white in coloring. It is often found on the cheeks, the hairs of the neighboring blood vessels so that in removing it the surrounding affected tissue must likewise be taken. Cauterization is sometimes practised for its removal but the keloid usually returns, and excision is not always of permanent value. The growth remains stationary after reaching a certain stage. The keloid occasionally causes pain and the direction of a physician may be relieved by applications of resorcin, lead salicylated plaster or mercurial preparations.

KELOWNA, British Columbia, Canada, village in the Yake and Caribou districts, 30 miles southwest of Sicamous and 28 miles from Okanagan Landing, on the Penticton branch of the Canadian Pacific Railway and on Okanagan Lake. The village had in 1905 a population of 200, which had increased to about 3,000 in 1918 owing to the development of some 30,000 acres of surrounding fruit land. There is likewise a considerable acreage in tobacco and the timber industry is important. The town is modern in its equipment, owning its park, recreation grounds, light, power and water systems, and possesses mills, factories and plants to care for the products of the neighboring fruit, tobacco and timber land. Pop. est. 3,000.

KELP, any of several large broad-leaved fucoid seaweeds (q.v.), which were formerly burned for their content of potash, iodine, sodium, etc., and used for other purposes and which have attracted renewed attention since the German embargo upon Stassfurt potash salts. The ash is known as kelp (or in France as varce), and was formerly produced in large quantities by slowly charring several tons of the weed in shallow pits. The yield in ash was about 5 per cent of the weight of the mass burned. This crude ash contains several salts, especially carbonates and sulphates of sodium and potassium, with other substances in smaller proportions.

KELP-CRAB, a large, squarish, edible crab (Epialtus productus), numerous in rocky weed-covered places along the Pacific coast from Monterey to Puget Sound.

KELP-FISH, a large blenny (Heterostichus rostratus) of the Californian coast, which is sold for food in the local markets. It is reddish brown, much streaked and mottled, so that it is practically invisible among the rocks and weeds (kelp) where it usually lurks. Many other more or less similar fishes are called kelp-fishes in other parts of the world.

KELP GOOSE, a white plumaged goose similar to the brant and closely related to the Magellanic and other southern hemisphere species. It is native to Patagonia and Falkland Islands and is variously classified as chloephaga antarctica and chloephaga hybrida.

KELP PIGEON, a popular name for the sheathbill, either the Chionis minor, or the Chionis alba of the Falklands. It is said to be so called by sailors on account of its habit of resting on the rocks, size and white color. See SHEATHBILL.

KELPIE, or KELPY, the angry spirit of the water, a Scottish mythological personage who figures prominently in folklore. He is described as a fearful water spirit who delights in rushing out of the lake, the river or the sea to catch some poor human victim and to devour him or to drag him down to his death beneath the surface of the water. As he rushes out of his native element the water tumbles from his back with a terrible swishing noise like the
roar of the angry sea. According to some stories the kelpie was so named because he lurked among the kelpie or sea-weed, which grows very high and tangled in many parts along the coasts of Scotland. Blown by the sea breezes and lashed by the tide at high water, it assumes fantastic forms which are pictured by the Scotch story-tellers as taking the form of the kelpie himself whom tradition says has, like the Grecian Cyclops (q.v.), but one eye, but that more fearful than any two eyes. Other authorities claim that the word kelpie is related to the German ‘echel’ or ‘kelt’ derived from the roar which it was supposed to make when it rushed upon its victims. This idea no doubt originated in the roaring of the ocean waves, which seem to have been personified in the person of the kelpie, which is also often represented to be a white horse which frequently presents itself in the most beautiful form, thus inducing people to mount on its back. When this is accomplished it rushes off at such fearful speed that the rider cannot dismount and so is drowned in the sea or eaten by the horse.

An Irish myth makes Mananan, son of the sea-god Lir, and himself Lord of the Sea, ride on the "white horses," a poetical personification of the crested waves of the ocean. His great cloak flapped like the clapping of thunder as he rode his fearful white horses around his island home (the Island of Man), especially at midnight. This island is said to have derived its name from the idea that it was the favorite home of the Lord of the Sea. The devouring or malignant water spirit is a mythological character known to most of the Indian tribes of America. Among the Aztecs the "Crying woman" whom the Spaniards name the "Llorona" (q.v.) hid in deep pools of water to which she attracted people at night by imitating the crying of a lost child. When the victim, following the voice, fell into the pool, she dragged him by the feet down to his death.

The Greeks and the Romans believed in a similar character who, the myth said, lured people to death in the water. The kelpie, like the Mexican "woman with the light," forewarned people of coming death. Often this "fool's light" or "will of the wisp" or "ignis fatuus" (q.v.) lead people on to death. This spirit had no doubt had its origin in the fact that people, following the natural lights that frequently appear in swampy places, sank in the boggy soil and lost their lives. The kelpie, like the Aztec Llorona, was also represented as dragging its victims down to death in the boggy or marshy lands of its habitat. The fact that there were frequent deaths of this kind would easily explain the superstition that the roaring of the kelpie presaged death. That this death should be through the agency of water was quite natural since the kelpie was a water-spirit.

Though this kelpie myth takes various forms among different races it seems to have been a very primitive myth of the great Indo-European family among all the members of which it appears. The special "kelpie" form it assumed in Scotland is easily accounted for by the destructive force of the sea which almost surrounds the country. It seems, therefore, to be but a local development of the great white sea-horses of Mananan (Welsh Manawyddan) in whose sea lay the "Islands of the Dead." This latter belief would also account for the superstition that the roaring or appearance of a kelpie presaged death.

KELSEY, Francis Willey, American educator and writer; b. Ogden, 1858. Graduated from the University of Rochester and after two years' study in Europe, he became professor of Latin in Lake Forest University (1880-89) and later in the University of Michigan (1889). He has edited many Latin and English books for schools. Working conjointly with Prof. Percy Gardner of Oxford University they edited 'Handbooks of Archaeology and Antiquities,' a series to be found in most public and school libraries. Professor Kelsey edited 'Latin and Greek in American Education' (1911), and 'Pompeii: Its Life and Art' (a translation of Augustus Maw's work, 1902). He has been president of the American Philological Association (1907-12), and of the Archaeological Institute of America.

KELSO, James Anderson, American clergyman and educator: b. Rawal Pindi, India, 6 June 1873. He received his college education at Washington and Jefferson College; and his theological training at Western Theological Seminary, Pittsburgh, Pa., supplemented by work in the universities of Berlin and Leipzig. He was ordained to the Presbyterian ministry in 1898. He was instructor in Hebrew in Western Theological Seminary, 1897-1900; since then professor of Hebrew and Old Testament Literature. He was acting president 1908-09, and president since May 1909. He is the author of several articles in Hastings' 'Encyclopaedia of Religion and Ethics'; Hastings' 'Dictionary of the Bible,' and the 'Standard Bible Dictionary.' He has published 'Die Klageleiter, der Masoretische Text und die Versionen' (1910); with Culley, David E., 'Hebrew-English Vocabulary to the Book of Genesis' (1917).

KELSE, KEELSON, a line of timbers on the middle of the floor timbers of a wooden ship over the keel. See KEELSON.

KELT, in Scotch, a salmon that has spawned, or as the local term expresses it, 'spent themselves.' Salmon in this condition are also popularly known as "halibut.

KELTIE, Sir John Scott, Scottish geographer; b. Dundee, Scotland, 29 March 1840. He is editor of the 'Statesman's Year Book' since 1880, was editor of the 'Geographical Journal,' 1915-17, and has written extensively on geographical and scientific topics in newspapers and periodicals. He has published 'History of Scottish Highlands and Clans' (1874); 'Report on Geographical Education' (1886); 'Applied Geography' (1890); 'The Partition of Africa' (1894); and with Howarth, O. J. R., 'History of Geography' (1913). He has also edited 'Works of the British Dramatists' (Edinburgh, 1872); 'The Story of Emin's Rescue As Told in H. M. Stanley's Letters' (New York 1890); 'The Story of Exploration' (3 vols., New York 1903-04), and with H. J. Mackinder and E. G. M. Leitch, 'The Great Explorers' (2 vols., London 1891). He is a member of geographical societies all over the world, has received a number of honorary degrees, holds many medals, amongst them the Cullum gold medal of the American Geographical Society (1915), and was knighted 2 Jan. 1918.
KELTON, John Cunningham, American soldier: b. Delaware County, Pa., 1828; d. Washington, D. C., 15 July 1893. He was graduated at West Point in 1851, received the commission of lieutenant in the infantry and served for six years in the frontier garrisons of Minnesota, Kansas and Dakota. At the conclusion of that period he was ordered to West Point as instructor in the use of small arms. During the Civil War he returned to active service and in 1861 became purchasing agent for the Western Department. The same year he was put in command of the 9th Missouri Volunteers, with the commission of colonel. In 1862 he was appointed to the staff of Major-General Halleck, as assistant adjutant-general, and in 1865 brevetted brigadier-general in the regular army. He was appointed after the war a staff colonel and assistant adjutant-general of the Pacific Department and later at Washington; and invented improvements in military firearms which met with the acceptance of the Ordnance Department. He retired from active service 24 March 1872 from then on till his death was governor of the Soldiers' Home, Washington, D. C. Among his works on military subjects may be mentioned a 'New Manual of the Bayonet' (New York 1861); 'Information for Riflemen, on the Range and Battlefield' (San Francisco 1884).

KELTS. See CELTS.

KELUNG, ké-lúng, KILUNG, the principal shipping port of the island of Formosa. It has an excellent modern harbor, which has comparatively recently been dredged and made to accommodate large ocean-going vessels, especially deep-draught freighters. It is surrounded by excellent coal mines whose output furnishes the chief cause of the harbor activity. Kelung has grown rapidly, within recent years, from a little fishing village of about 1,000 inhabitants, to a flourishing, more or less modern city of over 20,000. This is due principally to its extensive export business in coal, with minor shipments of sulphur and gold from the local mines. Kelung has railway connection with Daitoku (Taipeh), Kagi, Shinchiku and Tansui.

KELVIN, Lord. See THOMSON, Sir WILLIAM.

KEMBLE, Adelaide. See SARTORIS, ADELAIDE KEMBLE.

KEMBLE, Charles, English actor, 11th child of Roger Kemble (q.v.), and younger brother of John Philip Kemble (q.v.); b. Brecon, South Wales, 25 Nov. 1775; d. London, 12 Nov. 1854. He was educated at the English Roman Catholic College at Douai, France, and in 1794 made his first appearance at Drury Lane as Falstaff to his brother Richard's Macbeth. In 1800 he produced at the Haymarket Theatre his adaptation of Mercier's 'Deserteur,' under the title of 'The Point of Honor,' which achieved considerable success. In 1807 his play of 'The Wanderer,' adapted from Kotzebue, and in 1813 his 'Melodeon,' a light burlesque in verse, both successfully brought on the stage. As an actor he gained special celebrity by the performance of such characters as Falcondridge, Edgar, Romeo, Charles Surface, Cassio, Don Felix and Benedick. His impersonations were greatly heightened by the physical advantages which he possessed of a fine voice, handsome features and a tall athletic figure. About 1840 he was appointed to the office of examiner of plays and shortly afterward made his last appearance on the stage. He subsequently gave occasionally public readings from Shakespeare. He was the father of John Mitchell Kemble (q.v.), the philologist, and of Fanny and Adelaide Kemble (q.v.). Consult Fitzgerald, 'The Kembles' (1871).

KEMBLE, Edward Windsor, American caricaturist and illustrator: b. Sacramento, Cal., 1861. After a short time spent at the Art Students' League, in New York city, he became regular artist at the part of Romeo, and later on, to the Century and other New York illustrated magazines. He made a specialty of negro characters; and 'Kemble's Coons' (1898-1900) became very popular. Among his various books of drawings are 'Rosemary,' 'Virginia Creeper,' 'Billy-Goat and Other Country Stories,' 'Blackberries,' 'Kemble's Sketch Book,' 'Coontown's 400' and 'A Pickaninny Calendar.' He was illustrator for Collier's (1903-07) and Harper's Weekly (1907-12). He has also illustrated 'The Knickerbocker History of New York' and other books.

KEMBLE, Elizabeth. See WHITLOCK, ELIZABETH KEMBLE.

KEMBLE, Frances Anne, English actress and author, daughter of Charles Kemble (q.v.): b. London, 27 Nov. 1809; d. here, 16 Jan. 1893. She manifested no special predilection for the stage, but made her début at Covent Garden, then under the management of her father, in October 1829. On this occasion she played Juliet, her father taking the part of Romeo, and her mother that of the nurse, with complete success. For the three succeeding years she performed leading parts in tragedy and comedy with great applause, distinguishing herself particularly in Juliet, Portia, Bianca in Milman's 'Fazio,' Julia in the 'Hunchback' (the latter being originally personated by her), Belvidera, Isabella, Lady Teazle and Louise de Savoy in her own play of 'Francis the First,' written when she was 17 and received with approbation. In 1832 she accompanied her father to the United States and met with an enthusiastic reception in the chief cities. In 1834 she was married to Pierce Butler, a Georgia planter, and retired from the stage. The union proving unhappy, a separation took place at the end of a few years, and Mrs. Butler fixed her residence in Lenox, Mass. In 1849 she secured a divorce and resumed the name of Kemble. Her first work in prose, 'A Journal of a Residence in America' (1835) was chiefly devoted to a description of her tour through the United States. It was followed in 1837 by a drama, 'The Star of Seville,' acted with success; and in 1844 appeared a collection of her poems. Later works were 'A Year of Consolation' (1847); 'Residence on a Georgia Plantation' (1863); 'Record of a Girlhood' (1878-79); 'Records of Later Life' (1882); 'We two'; 'The Poems of Shakespeare's Plays' (1882); 'Poems' (1883); 'Far Away and Long Ago,' a story (1889); 'Further Records' (1891). In the winter of 1848-49 she commenced in Boston a series of Shakespearean readings which drew crowded audiences, and during the next two years
repeated the course in some of the principal American cities. In 1851 she returned to England, reappeared for a brief period on the stage and gave readings in London and other parts of the United Kingdom. In 1856 she returned to the United States and continued for several years at intervals to give readings in Boston and elsewhere. Her grandson, Owen Wister (q.v.), is a well-known American writer.

KEMBLE, Gouverneur, American manufacturer b. New York city, 1786; d. 1875. Graduated from Columbia in 1803, he became United States consul at Cadiz, where he made himself active in the securing of war and other materials needed by the American government during the war with Algiers (1815). While in Europe he took great interest in the study of arms and ammunition, which was partly forced on him owing to the needs of the United States government; and on his return home in 1817, he put his European acquired knowledge into practice by the establishment, at Cold Spring, N. Y., of the West Point foundry for the manufacture of cannon on the latest European models. Kemble was a politician as well as a diplomat and manufacturer, and he was Congressional Democratic member from 1837 to 1841. He was also interested in the study of the history of New York and New Jersey (States) and among his literary friends was Washington Irving, who took Kemble's house in Newark, N. J., as the model for his Cock-loft Hall in "Salamagundi." [1]

KEMBLE, John Mitchell, English Anglo-Saxon scholar b. London, 2 April 1807; d. Dublin, 26 March 1857. He was educated at Trinity College, Cambridge, and having early directed his attention to Anglo-Saxon language and history, employed himself in the ancient MSS. in the libraries of the university. The first fruits of his researches appeared in 1833, in the publication of the Anglo-Saxon poem "Beowulf," in 1834, and issued a pamphlet on the "History of the English Language, First or Anglo-Saxon Period." He edited in seven octavo volumes, for the English Historical Society, a collection of all the known charters of the Anglo-Saxon period, under the title of "Codex Diplomaticus Aevi Saxonic," and in 1849 appeared his most valuable and best-known work, "The Saxons in England." Kemble was for many years editor of the "British and Foreign Review," and in 1840 succeeded his father, Charles Kemble (q.v.), as censor of plays, which office he occupied till his death.

KEMBLE, John Philip, English tragedian, eldest son of Roger Kemble (q.v.): b. Prescott, Lancashire, 1 Feb. 1757; d. Lausanne, Switzerland, 26 Feb. 1823. He was educated at the Roman Catholic seminary of Sedgley Park, Staffordshire, and the College of Douai, France, where he was not only distinguished himself by his proficiency in education. On his return to England he entered immediately upon the profession of an actor and appeared for the first time in London at Drury Lane, 30 Sept. 1783, in the part of Hamlet and was received with great applause. It was not until 1792 that he took a decided lead in tragedy. He afterward obtained the management of Drury Lane Theatre, where his sister, Mrs. Siddons (q.v.), was the leading actress. In 1794 he brought out a musical entertainment of his own, entitled "Lodoiska," which had a great run. In 1802 he became manager of the Covent Garden Theatre, where he continued to succeed with the greatest success till the destruction of the theatre by fire in 1808. In the autumn of 1809 the new edifice which had been constructed opened with an increase of prices, which, with certain obnoxious arrangements in regard to the private boxes, created for a series of nights disturbances known by the name of the O. P. riots. Kemble retired from the stage 23 June 1817. As an actor he was distinguished for dignity, precision and studious preparation. His merits were differently appreciated, but by all he was regarded as a highly gifted actor, and the impressions made in characters more immediately adapted to his style of excellence, such as Cato, Coriolanus, Hamlet, John, Jaques, Penruddock, was very great. Consult Boaden, "Memoirs of the Life of John Philip Kemble" (1825).

KEMBLE, Marie Thérèse de Camp, an English actress b. Vienna, Austria, 1774; d. 1838. Her parents and several of her ancestors had been actors; and while still a child she was taken to England by her parents, who had found an engagement there. She early appeared on the English stage, and in 1800 she married Charles Kemble (q.v.) with whom she continued to appear on the stage for the next 13 years. She understood the technic of the stage well and wrote several plays which were popular in their day. These were of a fragmentary character. Her daughter, Fanny Kemble (q.v.), inherited her dramatic ability as actor and writer.

KEMBLE, Roger, English actor and theatrical manager b. Hereford, 1 March 1721; d. 6 Dec. 1802. John Philip Kemble (q.v.) and Mrs. Siddons (q.v.) were his children. He organized in 1753 a traveling company in which many members of his family appeared. In 1788 he appeared at the Haymarket as Falstaff and the Miller in "The Miller of Mansfield," when, although rated as a mediocore actor, he is said to have played "with very superior effect." [2]

KEMBLE PLAYS, a collection of English dramas made by the English actor John Philip Kemble (q.v.). This collection, which includes many original manuscripts of early English dramatic works, among them first editions of Shakespeare's plays, is now in the library of Devonshire House, London.

KÉMÉNY, ké'mé-ny, Zsigmond, Baron, Hungarian novelist, essayist and political writer: b. Magyar-Kapud, Transylvania, 1816; d. 1875. He combined newspaper work with his serious literary efforts and played politics on the side, being editor of "Pesti Hirlap" and "Pesti Napló" and deputy to the National Assembly. Among his novels, which are generally long and of a semi-historical semi-psychological character, are "Gyulai Pal" (5 vols., 1846); "Ferenc és nő" (1852); "Szigóvérvény" (1854); "Az üreges és lánca" (1856); "Zsidó idők" (1859). A collection of his essays, under the title of "Studies," appeared in English.

KEMEYS, Edward, American sculptor b. Savannah, Ga., 31 Jan. 1843; d. 11 May 1907. He was educated in New York and served in
the Civil War as captain in the artillery. He resigned in 1865 and went west, where he saw something of Indian life, and became familiar with the habits and forms of big game. He returned to New York and worked as a civil engineer in the laying out of Central Park, but did not choose the profession of art until 1870, when he resolved to become a sculptor. He went abroad in 1877 and his exhibits in Paris and London attracted attention, especially his 'Fight between a Buffalo and Wolves' in the Salon of 1878. He made American wild animals his specialty. He was in short the American Barye: his 'Panther and Deer,' his 'Coyote and Raven,' are noteworthy for their fidelity to nature and life-like expression, and he was also remarkably successful in his figures of the North American Indian.

KEMMERER, Edwin Walter, American educator and writer on economics; b. Scranton, Pa., 11th May, 1855. Graduated from Cornell University in 1903, he became instructor in economics at Perdue University (1901-03), assistant professor at Cornell of political economy and later professor of economics and finance (1906-12), professor of economics and finance at Princeton (1912-15). In 1903 he was financial adviser to the United States Philippine Commission and for the following three years was chief of the currency division of the Philippine Islands; and special commissioner to Egypt from the Philippine government (1906) and financial adviser to the Mexican government. He has been a constant contributor to economic publications of various kinds and edited the American Economic Review (1911-14). His numerous published works are all on economic subjects, most of them in connection with the special work in which he has been interested either as university professor or government adviser on economic subjects. Among his latest works are 'Modern Currency Reforms' (1916), and 'The United States Postal Savings System' (1917).

KEMMERTZ or CHEMNITZ. See CHEMNITZ, MARTIN.

KEMP, James Furman, American educator and geologist; b. New York city, 1839. Graduated from Columbia School of Mines in 1864, he became assistant professor of geology there in 1891 and professor in 1892. In addition to his university work he has acted as United States geologist and served in the same capacity for the State of New York. He has also been lecturer on his special subjects at Johns Hopkins, Massachusetts Institute of Technology and McGill University, Canada, from all of which institutions he has received honorary degrees. He has been president of the New York Academy of Science and of the American Institute of Mining Engineers. Among his published works are 'Ore Deposits of the United States and Canada' (1893 and 1900), and 'Handbook of Rocks' (1896 and 1911).

KEMPE, Charles Eamer, English artist in stained glass: b. Ovingdeane, Sussex, 29 June 1837; d. 30 May 1907. He received his early education at Rugby, and was graduated at Oxford University. His principal works were in stained glass of the 14th century style in which were color, drawing and expression of a unique excellence. He was distinctly a religious painter, who chose as his medium the most difficult and intractable of materials, and achieved supreme artistic and devotional success. His principal work in this country is the remarkable Jesse window in the church of the Advent, Boston, which bears comparison with the more famous Jesse window of Troyes, France. He designed and executed many fine windows for the cathedrals of Lichfield and Durham. "The Jane Austen" window in Winchester Cathedral was one of his later creations.

KEMPE, John, English cardinal, archbishop of Canterbury and Chancellor: b. about 1380; d. 22 March 1454. He received his education at Merton College, Oxford; took up the practice of ecclesiastical law, was made castle's trial and became dean of the Court of Arches in 1415. Soon afterward he was attracted to the service of the king, by whom he was given a place in the government of Normandy. Later Kempe was appointed chancellor of the Duchy of Normandy; and in 1419, was chosen bishop of Rochester, and was consecrated at Rouen in the same year. He was translated to Chichester early in 1421 and after a few months to London. In 1426 Kempe was made chancellor and in the same year transeptal archbishop of York. He remained in the office of chancellor until 1432 and succeeded in keeping a close restraint on Humphrey of Gloucester. To placate the latter Kempe's resignation was brought about in 1432. He was still an important member of the council and in 1435 was sent to the Congress of Arras and in 1438 to that at Calais. Kempe was created cardinal in 1439 and for a time remained aloof from politics. In 1450 Kempe for the second time became chancellor, being the most acceptable candidate to the opposing parties. He dealt firmly with Cade's rebellion and vigorously upheld the royal authority. In 1452 he was made archbishop of Canterbury.

KEMPNEER, Peter de. See CAMPAÑA, PEDRO.

KEMPER, James Lawson, American soldier and politician; b. Madison County, Va., 11 June 1823; d. Orange County, Va., 9 April 1895. Graduated from Washington College (Lexington, Va.) in 1842, he studied law at Charlestown (Va.), served in the Mexican War as captain of volunteers, and for 10 years was a representative in the Virginia legislature, during two of which he was speaker of the house. In 1861 he was appointed colonel of the 7th Virginia, C. S. A.; in 1862 fought at Fair Oaks (31 May—1 June), where he was commissioned brigadier-general; and later also at Frayer's Farm (30 June), South Mountain (14 September), Antietam (16 October), and Fredericksburg (13 December). He was severely wounded at Gettysburg, was subsequently detailed to command the forces in and about Richmond, and 1 March 1864 was promoted major-general. After the war he practised law in Madison County, was Democratic governor of the State in 1874-78 and at the close of his term became a planter in Orange County. He published a collection of messages to the State legislature (1870).

KEMPER, Reuben, American soldier: b. Fauquier County, Va., 1770; d. Natchez, Miss., 10 Oct. 1826. He emigrated to Ohio in 1800, and subsequently removed with two of his brothers to the Territory of Mississippi, where
they were leaders in the movement to rid West Florida of Spanish rule. The Spanish authorities caused the Kempers to be kidnapped, but they were rescued by the commander of the American fort at Point Coupee. The Kempers pursued with great ferocity all who were engaged in this wrong upon them, and Reuben devoted himself to the task of driving the Spaniards from the American continent. He was engaged in an attempt to capture Mobile, which failed; and on the fitting out of the formidable expedition of Gutierrez and Toledo, in 1812, against the Spanish authority in Mexico, was assigned the rank of major, and afterward chosen colonel of the force, which co-operated with the Mexican insurgents. The expedition advanced into Texas, fought several bloody battles, in which Kemper and his Americans performed extraordinary feats of valor, and won brilliant victories. Kemper was subsequently engaged under General Jackson in the defense of New Orleans, and added greatly to his reputation as a soldier by his activity and efficiency. At the conclusion of the war he became a planter in Mississippi.

KEMPFF, Louis, American rear-admiral: b. Belleville, Ill., 11 Oct. 1841. He was graduated at the United States Naval Academy in 1861 and served with distinction throughout the Civil War. He was appointed captain in 1891 and became rear-admiral in 1899. When the Boxer troubles began in China in 1900 he was placed in command of the United States naval forces in Chinese waters. On 29 May he sent 108 marines ashore, who co-operated with the Chinese forces in the capture of three foreign warships in the harbor at Taku. When on 16 June the senior naval officers of the other foreign nations drew up and signed a demand for the surrender of the Taku forts Rear-Admiral Kempff declined on the ground that as long as the Chinese Imperial authorities placed no obstacle in the way of his going to the assistance of his countrymen he had no just ground to commit an act of war against a country with which his own was at peace. During the subsequent bombardment by the United States ship **Monsun**, which was some distance up the river above Taku and had her flag flying, was struck by a shot from the forts. When this fact was officially established Rear-Admiral Kempff joined in with forces at hand for protection of life and property of Americans. For the judgment displayed on that occasion a joint resolution was pending in the 57th Congress conferring on him the thanks of Congress. He was retired from active service in October 1903.

KEMPIS, Thomas à, German mystic and devotional writer: b. Kempen, near Cologne, 1380; d. Mount Saint Agnes, near Zwolle, Netherlands, 26 July 1471. His real name was Hamerken or Hamerlein. He was educated at Deventer by the Brethren of the Common Life, a religious order of men who passed a contemplative existence in transcription manuscripts, compiling and writing religious books of various sorts, and religious exercises. In 1399 he entered the monastery of Mount Saint Agnes, near Zwolle, of which his brother was prior, took the monastic vows in 1406, was ordained priest six years afterward and in 1425 was elected sub-prior. He excelled as a copyist, and delighted to transcribe the Scriptures, the Church fathers and works of ascetic piety, while the fame of his eloquence and zeal was widely extended. He owes his present renown to his treatise 'De Imitatione Christi,' which has been translated into every language in Christendom. Over 2000 editions have appeared. It has been wrongly but somewhat naturally attributed to the renowned theologian Gerson, chancellor of the University of Paris, and the question was debated with a view to national honor and the interests of ecclesiastical orders. Evidence in favor of the authorship of a Kempis is overwhelming. Three writers nearly his contemporaries mention him as the author. Moreover several copies written in his own hand are extant, and in one ancient copy he is expressly named as the author. Both the literary style and the tone of refined piety which characterize this work are also distinguishing features of other devotional works of which he is certainly the author. The first English translation of the 'Imitatione' was made by W. Atkinson and Princess Margaret, mother of King Henry VII, and was published in London in 1502. (See IMITATION OF CHRIST.) Consult Bähring, B., 'Thomas von Kempen, der Prediger der Nachfolge Christi' (Leipzig 1872); Cruise, T., 'Thomas à Kempis' (London 1885); also well, S., 'Thomas à Kempis and the Brothers of the Common Life' (London 1884); Wheatley, L. A., 'Story of the Imitation of Christ' (London 1891); Wolfsgruber, 'Giovanni Gerson, sein Leben und sein Werk De Imitatione Christi' (1880); Schaff-Herzog Enzyklopädie of Religious Knowledge (New York 1910).

KEMPT, Sir James, British soldier and administrator: b. 1764; d. 1854. He entered the army in 1783, and saw service in Holland, in Egypt, commanded a brigade in the Peninsula and was wounded at Badajoz, and was in command of a division at Quatre Bras and Waterloo. He was lieutenant-governor of Nova Scotia 1820-28, and governor-in-chief of Canada 1828-30.

KEMPTEN, Kemp'ten, a city in Swabia, Bavaria, about 80 miles southwest of Munich by which it is joined by the United States ship **Monocacy**, which was some distance up the river above Taku and had her flag flying, was struck by a shot from the forts. When this fact was officially established Rear-Admiral Kempff joined in with forces at hand for protection of life and property of Americans. For the judgment displayed on that occasion a joint resolution was pending in the 57th Congress conferring on him the thanks of Congress. He was retired from active service in October 1903.

KEN, or KENN, Thomas, English bishop and hymnologist: b. Great or Little Berkhamstead, Hertfordshire, July 1637; d. Longleat, Wiltsire, 19 March 1711. He was educated at Winchester School, graduated from New College, Oxford and became successively domestic chaplain to Bishop Morley (1665); rector of Brightstone, Isle of Wight (1667); and prebend of Winchester (1669). He spent five years traveling in the United States with his nephew, thus exercising zeal for the causes of the English Church in Paris, and was consecrated bishop in 1675. He was made secretary of the Church, and was also made bishop of Bath and Wells (1684). He was
federal deprivation with other non-jurors (q.v.) on the accession of William of Orange, for maintaining allegiance to James II (1691). He was one of the lights of the English Church in the darkest periods of English social and political life, and by his zeal and devotion did much to maintain the standard of Christian conduct, his personal example of goodness being backed by learning, taste and breadth of sympathy. His theological and devotional writings are principally valuable for the personality with which they are connected, but his famous 'Doxology,' as well as the 'Morning Hymn,' beginning with 'Awake, my soul,' and the 'Evening Hymn' have won him imperishable fame as a guide and inspirer of Christian devotion. Consult 'Dictionary of National Biography' (Vol. XXX, London 1892); Plumptre, Dean, 'Life of Bishop Ken' (London 1890).

**KENA, kən'a. KENEH, GENEH, capital of an Egyptian province of same name on the Nile. See Keneh.**

**KENAL, ke-nl,** a peninsula in the southeastern coast of the United States, 30 miles to the east, Gulf of Alabama east and south and Cook Inlet on the west. It is about 160 miles long and 110 miles across the widest part. It has good harbors, valuable coal fields, and some gold has been discovered.

**KENDAL, Margaret Brunswick Robertson (1815-1889), English actress; b. Great Grimsby, 15 March 1849. She was a sister of T. W. Robertson, the dramatist (q.v.); was known on the stage as "Madge Robertson" and appeared in London as Ophelia in 1855. She soon gained a reputation as an tragic actress, high comedy. On her marriage to W. H. Grimston (q.v.) in 1869 she assumed with him the stage name of Kendal. Together they achieved great success at the Haymarket Theatre in a series of Shakespearean and Old English comedy revivals. Later from 1879-89 they were associated with Mr. (afterward Sir) John Hare. They made several phenomenally successful tours in the United States and Canada from 1889, and retired from the stage in 1908.**

**KENDALL, William Hunter (William Hunter Grimston), English actor; b. London, 16 Dec. 1843, 7 Nov. 1917. After his marriage to Madge Robertson (see Kendall, M. B. R.) in 1869, he played leading parts with her. He commenced his career on the stage at Glasgow in 1852, where he remained till 1856, supporting such stars as Mr. and Mrs. Charles Ken, Helen Faucit, G. O. Brooks, etc.; made his first appearance in London at the Haymarket Theatre in 1866, in 'A Dangerous Friend,' played there such parts as Charles Surface, Captain Absolute, Romeo, Orlando, Pyramus, and in 1879-88 was lessee and manager with John Hare of the Saint James Theatre, where were produced 'The Queen's Shilling'; 'The Square'; 'Impulse'; 'The Ironmaster'; 'A Scrap of Paper'; 'Lady of Lyons,' and 'A Man Like Me.' He toured with Mrs. Kendal in the United States and Canada in 1889-95.**

**KENDAL, KIRBY KENDAL, a town and municipal borough in Westmorland, England. It dates back to 1576 as an incorporated town. It is a noted centre of the woolen trade; and the woolen cloths manufactured there are known as "Kirkins." Kendall also produced excellent carpets, cottons, worsted stockings, doekins, tweeds, lincey-woolieys and linings of various kinds (especially those for coats), machinery, gunpowder, shoes, leather, paper, combs and cards. Pop. 14,000.**

**KENDALL, Amos, American journalist and statesman: b. Dunstable, Mass., 16 Aug. 1789; d. Washington, D. C., 21 Nov. 1849. He was graduated from Dartmouth in 1811, studied law at Groton, Mass., in 1811-14, was admitted to the bar at Frankfort, Ky., in 1814, was postmaster and editor of the "Patriot" at Georgetown, Ky., in 1815-16, and in 1816-20 codirector and part owner of the "Argus of Western America" at Frankfort. In 1829 he was appointed fourth auditor of the United States treasury, and during the Jackson administration he was extremely influential. He aided in the formation of the President's anti-bank policy (see Jackson, Andrew), was a special treasury agent to conduct negotiations with State banks, and is thought to have written several of Jackson's state papers. Appointed Postmaster-General by Jackson in 1835, he was retained by Van Buren, but in 1840 resigned because of his opposition to the Post-Office Department of debt, and introduced numerous reforms. He established Kendall's "Expositor," bi-weekly, in 1841, and the "Union Democrat," weekly, in 1842, but both journals shortly ceased publication. In 1845 he became associated with S. F. B. Morse (q.v.) in the ownership and management of the Morse electric telegraph patents, and by his able direction ensured their commercial success and a fortune for himself. He gave largely in Washington for philanthropic purposes. Though calling himself a Jackson Democrat, he strongly opposed secession. He wrote an incomplete 'Life of Andrew Jackson, Private, Military, and Civil' (1843); 'Full Exposure of Dr. C. T. Jackson's Pretensions to the Invention of the Electromagnetic Telegraph' (1867); and an "Autobiography" (posthumously published, 1872).**

**KENDALL, George Wilkins, American journalist: b. Amberst (now Mount Vernon), N. H., 1809; d. Oak Springs, Tex., 22 Oct. 1867. Settling in New Orleans in 1835, he was one of the founders of the New Orleans Picayune in 1837, which became under his direct control the leading journals of the South. He was one of the earliest war correspondents, seeking most of the fighting in Mexico during the Mexican War as his paper's representative with the United States army of occupation under General Scott. He wrote 'Narrative of the Texas Santa Fe Expedition' (2 vols., New York 1844), an expedition in which he took part; and 'The War Between the United States and Mexico' (New York 1851). Consult Bullard, F. L., 'Famous War Correspondents' (Boston 1914).**

**KENDALL, Henry Clarence, Australian poet: b. Ulladulla district, New South Wales, 18 April 1841; d. Redfern, near Sydney, 1 Aug. 1882. He became a lawyer's clerk at Sydney in 1860, in 1863 a clerk in the Lands Department of the New South Wales public service; later was in the colonial secretary's office in 1871-72. He was active as a journalist at Melbourne; and for some time previous to his death was an inspector of forests. His chief volumes are 'Poems and Songs' (Sydney 1862); 'Leaves from Australian Forests' (Melbourne 1869); and 'Songs from the Mountains' (Sydney 1890). He

KENDALL, William Mitchell, American architect: b. Jamaica Plain, Mass., 1856. After an extended course in architecture at home and in Italy and France, he returned to New York. He has taken part in the designing of many important edifices, among them the post-office, municipal building, Avery Library (Columbia University), School of Journalism (Columbia University) all in New York City. He has also extended his work to Chicago and other American cities.

KENDALL, William Sergeant, American painter and sculptor: b. Spuyten Duyvil, N. Y., 20 Jan. 1869. He began as a member of the Art Students' League of New York, and subsequently was a pupil of Thomas Eakins of Philadelphia, and a student in Paris and at the Ecole des Beaux Arts, and also studied under Olivier Merson. He is equally successful in figure, portrait and landscape, and in recent years also has taken up sculpture with considerable success. His best work, however, is to be found among his many charming portraits of children. He has received many honors amongst which were gold medals at Saint Louis (1904) and San Francisco (1915) and membership in the National Academy since 1905 — and in many domestic and foreign art associations — in acknowledgment of his merit as a fine colorist and powerful draftsman. One of his best pictures is 'The End of the Day,' in which tender sentiment is united with workmanship of excellence. It is now in the National Gallery, Washington, D. C., where may also be seen 'An Interlude.' Other well-known paintings from his brush are 'Psyche' and 'The Seer,' both in the Metropolitan Museum of Art, New York; 'Beatrice,' in the Academy of Fine Arts, Philadelphia; 'Narcissa,' in the Corcoran Gallery, Washington, D. C.; 'Crossroads,' in the Museum of Art, Detroit, Mich.; 'Intermezzo,' in the Rhode Island School of Design, Providence, R. I. Since 1913 he has been director of the School of Fine Arts and William Leffingwell, professor of painting and design at Yale University, New Haven, Conn., have made his home. Consult Caffin, C. H., 'The Art of Sergeant Kendall' (in Harper's Monthly Magazine, Vol. CXVII, p. 568, New York 1908); Mather, F. J., Jr. 'Kendall Painter of Children' (in Arts and Decoration, Vol. I, p. 15, New York 1910).

KENDALLVILLE, a city situated on the Lake Shore and Michigan Southern and Grand Rapids and Indiana railways, about 25 miles north of Fort Wayne, in Noble County, Ind. It is quite a manufacturing town, producing flour, lumber, refrigerators, iron products, pumps, heaters, tiles, bricks and numerous novelties. Pop. 5,100.

KENDRICK, Asahel Clark, American Baptist clergyman and scholar: b. Poulton, Vt., 7 Dec. 1809; d. Rochester, N. Y., 21 Oct. 1895. He was graduated from Hamilton College, Clinton, N. Y., in 1831, and was professor of Greek at Madison (now Colgate) University, Hamilton, N. Y., 1840. He held a fellowship for the University of Rochester from 1850. Besides translations and several textbooks, and revising and editing Olshausen's 'Old Testament Commentary' and Meyer's 'Commentary on John,' he published 'Our Poetical Favorites' (1880); 'The Moral Conflict of His Times.' (1884); etc. He was one of the American committee of New Testament revisers.

KENDRICK, John, American navigator: b. Boston, about 1745; d. Hawaii, 1800. During the Revolution he sailed a privateer, and in 1787, while in command of the Columbia and the Washington, explored the northwestern coast of America and Pacific islands. In 1789 he voyaged to the South Seas, and established the Chinese trade in sandalwood, which for a long time he successfully carried on. He was among the earliest American sailors to attempt voyages for discovery.

KENEALY, kë-nël'l', Edward Vaughan Hyde, Irish poet, writer and barrister: b. Cork, 1819; d. 1880. He became somewhat noted for his prominent connection with the defense of Orton, the claimant in the Tichborne Case, and of the two Fenians, Casey and Burke (1867). His conduct in both cases was considered so unprofessional that he was disbarred, later on by Gray's Inn and expelled from the circuit. Among his publications are 'The Tichborne Case'; 'Brallaghan' (1845); 'Goethe, A New Pantomime' (1850); 'Poems' (1864). 'Enoch, the Second Messenger of God' (1872); Additional poems (1875-79).

KENEH, GENEH, or KENA, kë-në, capital of the Egyptian province of the same name. It is situated on the Nile, about 300 miles north of Thebes and is a place of about 30,000, frequented by pilgrims throughout the year from the interior of Africa, and by tourists from down the river and from various parts of Egypt. The Nile steamers have a station at Keneh and the Nile Valley Railroad has a station on the opposite side of the river from the town. Keneh produces sugar and has some native manufactories, among them distinctive pottery.

KENESAW (kë-në-så') MOUNTAIN, a mountain in Georgia 25 miles northwest of Atlanta. It is famous as the scene of a battle in the Civil War between the Union troops under Sherman and the Confederates under Johnston.

KENESAW MOUNTAIN Battle of. On the night of 18 June 1864, Gen. J. E. Johnston fell back before General Sherman's persistent advance and took a new line with Kenesaw Mountain as its salient, his right wing thrown back so as to cover Marietta, and his left covering the railroad back to the Chattahoochee. Sherman worked to the right of the railroad and was attacked by Hood's corps at Kolb's Farm (q.v.), 22 June. After much study of the ground, Sherman concluded that he had no alternative but to assault Johnston's line or turn his position. Either course had its difficulties and dangers, but as the enemy and his own
officers had settled down to the conviction that he would not assault fortified lines, but would execute flanking movements only, he considered that a successful assault would have a good moral effect and show that he could move against an enemy behind breastworks; so he resolved to attack the left centre of Johnston's position, and orders were given on the 24th that on the 27th McPherson should assault near Little Kenesaw and that Thomas should assault about a mile further south. Kenesaw was strongly intrenched and held by Loring's and Hardee's corps, Loring on the right, opposite McPherson, Hardee, on the left, opposite Thomas. A part of Logan's Fifteenth corps, formed in two lines, fought its way up the slope of Little Kenesaw, carried the Confederate skirmish-pits, and tried to go further, but was checked by the rough nature of the ground and the fire of artillery and musketry delivered at short range from behind breastworks. Logan's assault failed, with a loss of 600 men, and his troops were withdrawn to their skirmish-pits. About a mile to the right Thomas assaulted with Newton's and Davis' divisions. The troops charged up the face of the mountain, drove in the skirmish line and reached the main works, but were unable to carry them under the heavy fire of canister and musketry at short range; after heroic effort and the loss of Generals C. G. Harker and Daniel McCook, commanding brigades, and 1,580 killed, wounded and missing, fell back and intrenched 75 yards from the enemy's works. The assault was over by 11.30 A.M., and was a failure. It was the most serious reverse sustained by Sherman in the campaign. The entire Union loss was nearly 2,500; Johnston admits a Confederate loss of 808 killed and wounded. Consult 'Official Records' (Vol. XXXVIII); Cox, 'Atlanta'; Van Horne, 'History of the American Civil War'; Sherman, 'Personal Memoirs' (Vol. II); Johnston, 'Narrative'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

KENIA, ka'ne-ä, Mount, an isolated extinct volcano situated in British East Africa, a few miles south of the equator. Its summit is covered with snow, and for this reason it is known as Doenybo Ebos or White Mountain. Its height is from 18,000 to 19,000 feet. It was discovered by Krapf in 1849, and its summit was first reached (by Kolb) in 1895.

KENILWORTH, England, a town in Warwickshire, near Warwick, noted as the seat of the famous Kenilworth Castle, the scene of Scott's novel of the same name. It has figured prominently in the history of northern England; and the castle was once the scene of the 19 days' entertainment given to Queen Elizabeth by the Earl of Leicester in 1575. Pop. about 6000. Consult Beck, 'Kenilworth Castle' (1878).

KENILWORTH. Sir Walter Scott's 'Kenilworth,' published 1821, is a historical romance of the time of Elizabeth, involving the relations between the queen and the Earl of Leicester. Leicester is represented as having contracted a secret marriage with Amy Robsart and as being torn between the two motives of love for his beautiful bride and a consuming ambition to rise to the highest position in the royal favor. It is for fear of his jealous sovereign's displeasure that he has concealed his marriage and hidden his wife in Cumnor Hall. At the opening of the story Tressilian, her former lover, discovers her whereabouts and attempts to get her back to her father's house. He is opposed by the machinations of Richard Varney, a retainer of Leicester's. Tressilian appeals to the queen to restore the lady to her parents. Discovery is imminent, but Varney temporarily saves the situation by claiming that she is his wife. Elizabeth commands that Amy be brought before her at her approaching visit to Lord Leicester's castle of Kenilworth. Varney, after trying in vain to induce her to pose as his wife, gives her a drug intended to produce an illness which will make her removal impossible, but,fortified with an antidote administered by a servant of Tressilian's, she escapes from Cumnor Hall and journeys to Kenilworth seeking her husband. During the revels at the castle the queen in-flames Lord Leicester's love by letting him see that he may even aspire to her hand. Varney convinces him that Amy has been unfaithful and he gives orders for her death. Later, learning that Varney has deceived him, Leicester confesses the truth to Elizabeth in a paroxysm of remorse and is subjected to an outburst of the royal anger. The messengers which he has sent to Cumnor Hall, whither Amy has been carried, arrive too late, and the unfortunate countess is killed by falling through a trap door laid at the entrance of her chamber by the hand of Varney. In no novel of Scott's is the historical setting elaborated with more care than in 'Kenilworth.' While indifferent to literal accuracy, Scott has brilliantly rendered the atmosphere of the time by a multitude of characteristic details drawn from his wide reading in the Hebran literature. The revels at Kenilworth, for example, are elaborately described after the contemporary account of Laneham. The delineation of Elizabeth is a fine specimen of Scott's characteristic art of reading the surface and human nature into the outlines afforded by historical record. The Amy Robsart story is based on rumors and traditions current in Leicester's time and recorded in contemporary documents, but Scott has combined the actual circumstances of more than one of Leicester's marriages and has also drawn heavily on his imagination. For references, consult article Isvanhoe. The facts of Leicester's marriage to Amy Robsart are given in the article on Leicester in the 'Dictionary of National Biography.'

JAMES H. HANFORD.

KENITES. The name of a tribe which inhabited the rocky desert region between southern Palestine and the mountains adjoining Sinai. At the time of the exodus of Israel they pastured their flocks around Mount Horeb and Sinai. Jethro or Hobab the father-in-law of Moses was a Kenite. He is also called a Midianite. It may be that the names are interchangeable or that the Kenites and Midianites were closely related. A third conjecture is that the Kenites were the older family of Midianites, the later family descending from
Abraham and Keturah. Because of their great kindness to the Children of Israel on their march from Egypt, they were highly esteemed. When Saul attacked the Amalakites, he warned the Kenites to separate from them. In the time of David they still held their possessions in the south of Judah. In the time of Jehoram, the small number left from the Assyrian outrush over the land took refuge in Jerusalem. They were a gypsy-like people. It is thought by A. H. Sayce and some other scholars that they were blacksmiths and went from place to place pursuing their vocation. This opinion is largely based, however, on the supposed meaning of the Hebrew root from which their name is derived which is "to work in iron."

KENIZZITES. A tribe descended from Kenaz, the grandson of Esaau or from Caleb who is called a Kenizite (1 Chr. iv, 15). He may have been the grandfather of Caleb (Genev. i, 13). The Kenites in Moses and Edomites in Amos had many names in common. The tribe was located somewhere in the neighborhood of Mount Seir. They seem as Bochart suggests to have become almost entirely extinct between the time of Abraham and Joshua.

KENMARÉ, Mary Frances Cusack, Nun of: b. Duleek, Ireland, 1820; d. 1899. She was educated in England in the Episcopal Church. Returning to Ireland she became a convert to Catholicism. She conducted the convent of "Poor Clares" which she herself had established at Kenmare (1861-84). In 1884 she founded, with papal sanction, the order of the Sisters of Peace, a branch of which order was founded by her in Jersey City, N. J., the following year. Among her published works are 'Manual of Irish History' (1870); a biography of O'Connell (1872); 'Woman's Work in Modern Society' (1874); 'The Book of the Blessed Ones'; 'The Trias Thaumaturga' (1877). In addition to these she wrote the lives of many saints, devotional works and articles on Irish Shrines. Consult 'The Nun of Kenmare, An Autobiography' (Boston 1888).

KENNAN, George, American traveler, author and lecturer: b. Norwalk, Ohio, 16 Feb. 1845. He received a secondary education, became a telegraph operator, in 1865 went to northeastern Siberia as an explorer and telegraph engineer, and in 1868-69 superintended the construction of the middle division of the Russo-American telegraph line. In 1870-71 he explored the mountain region of eastern Caucasus and Daghhestan, upon his return to America was active as lecturer and journalist, and in 1877-85 was night manager of the Associated Press at Washington, D.C. In 1885-86, with G. A. Frost, an artist, he accomplished a journey of 15,000 miles through Russia and Siberia in investigation of the Russian exile system. He visited all the mines and prisons between the Ural Mountains and the headwaters of the Amur, and published an account of his observations in 'Siberia and the Exile System' (1891), first printed in the Century Magazine (1889-90). From 1886 he lectured in Great Britain and the United States on his Siberian experiences. He visited the small number of Siberian Jews. In 1898, war, he visited Cuba with the Red Cross Society and as special commissioner of the Outlook of New York, to which he contributed valuable articles.

In 1901 he went to Russia to visit Count Tolstoy and make a further study of Russian conditions. In 1902, in Saint Petersburg, by order of the Minister of the Interior, and sent out of the empire under guard as a "politically untrustworthy" person. In 1902 in company with American scientists he explored Mount Pelee, Martinique, and the scene of the Saint Pierre disaster. In 1904, upon the outbreak of the Russo-Japanese war, he went to the Far East as correspondent of the Outlook; reported the siege of Port Arthur, which he witnessed from the Japanese side; and spent nearly two years in travel through Japan, China, Manchuria and Korea. In 1906-07 he investigated for McClure's Magazine municipal corruption in San Francisco. In 1908 he went to England to translate from the original Russian manuscript General Kuropatkin's 'History of the Japanese War.' In addition to the two volumes of the Siberian exile system noted above he is the author of 'Campaigning in Cuba' (1899); 'The Tragedy of Pelee' (1902); 'Folk Tales of Napoleon' (1902); 'Tent Life in Siberia' (revised and enlarged edition 1910); 'A Russian Comedy, East and West' (1912); and 'The Chicago and Alton Case' (1915). Since 1912 he has been on the staff of the Outlook.

KENNEBEC (kên-e bêk) RIVER, a river in Maine, next to the Penobscot the most important in the State. Its principal source is Moosehead Lake, on the boundary between Somerset and Piscataquis counties. After a course of 20 miles it receives Dead River from the right. It enters the Atlantic in Sagadahoc County through Sheepscott Bay, an irregular indentation of the coast studded with many islands. The largest tributary of the Kennebec is the Androscoggin, which joins it 18 miles from the ocean at Merrymeeting Bay. The outlets of a number of small ponds, and Sebas- tico and Sandy rivers, also flow into it. The most important towns on its banks are Bath, Richmond, Gardiner, Hallowell, Augusta and Waterville. It has falls at Waterville and at three points above, which afford excellent motive power. Its whole length is about 150 miles, in which it has a descent of 1,000 feet. The influence of the tide extends to Augusta, 42 miles from the sea. A dam with locks was constructed at Augusta for the purpose of improving the navigation above that point, and increasing the water power. The structure is 584 feet long and 15 feet above ordinary high water mark, and cost $300,000. It forms a pond 16½ miles in extent, with an average depth of 16 feet. The river is closed by ice at Hallowell from the middle of December to about 1 April; below Bath it is open at all seasons except during winters of unusual severity.

KENNEBUNK, kên-e bûnk', Me., town in York County, on the Kennebunk and Mousan rivers and the Boston and Maine Railroad, west division, 24 miles southwest of Portland. The ample water power here is utilized for various manufacturing industries, among the arts: small number of paper mills, cloth factories, and straw matting factories, leatheroid, sample-cases, shoe-stiffeners, fibre-board and lumber. The town has a free circulating library containing several thousand volumes. It is one of the old
towns of Maine, its settlement dating from about 1650. Until 1820, the year in which Maine became a separate State, Kennebunk was a part of Wells. Pop. 3,500.

KENNEBUNKPORT, Me., town in York County, 25 miles southwest of Portland, on the Atlantic Ocean, at the mouth of the Kennebunk River, and on the Boston and Maine Railroad. It is situated on a good harbor, has an excellent beach, fine boating facilities on the river, and is a favorite summer resort with superior hotel and boarding-house accommodations. Besides Talbot’s Library, the town has public and circulating libraries. Its industries include the manufacture of lumber and the building of boats and canoes. The town was settled in 1629, and incorporated as Cape Porpoise in 1653. Having been nearly destroyed by Indians in 1703, it was reincorporated in 1717 as Arundel, and in 1821 took its present name. The population is about 2,200.

KENNEDY, Sir Alexander (William Blackie), English educator and engineer: b. Stepney, 1847. Graduated from Royal College of Mines he became a marine engineer and established a reputation for inventiveness. Becoming professor of engineering at University College, London, he continued on his experiments there and established the first engineering laboratory. He did special and important work in devising means of testing machines of various kinds and he invented a recording instrument for testing the strength of materials. He has designed lighting and power plants in Edinburgh, Manchester, Loch Leven, Calcutta and Japan. He has also acted extensively in the capacity of consulting engineer and has been chief engineer to the Westminster Electric, Central Electric and Saint James and Pall Mall Electric Supply Companies, member of the Naval Boiler Committee, president of the Admiralty Committee on Machinery Design, associate member of the Ordnance Committee; member of Committee on Wireless Telegraphy; consulting electrical engineer to the London and Northwestern and London and Southwestern railways and to the London County Council Tramways; member of the Advisory Committee of the Ministry of Munitions, of the Munitions Inventions Panel, and vice-chairman of the Anti-Air Equipment Committee. Among his published works are ‘The Mechanics of Machinery’ (1886); ‘Moore’s Alps in 1864’ (1902), and a translation of Reuleaux’s ‘Kinematik.’

KENNEDY, Archibald R. S., Scottish educator and Semitic scholar: b. White Hills, Banffshire, 1859. He was educated at the universities Aberdeen, Glasgow, Gottingen and Berlin (1875–85). In the latter year he became Fellow of Glasgow University (1885–87), going to Aberdeen University three years later as professor Semitic languages (1887–94); and in 1894 to University of Edinburgh as professor in the same capacity (1894–). Among his published works are a series of grammars in the Porta Linguarum Orientalium Series, including Hebrew (1885); Seric (1889); Assyrian (1890), and Arabic (1895); ‘Exodus’ (in Textbooks, 1910); ‘Joshua and Judges’ (1902); ‘Samuel’ (1905); ‘Leviticus and Numbers’ (in Century Bible, 1910). He has also contributed extensively to Hastings ‘Dictionary of the Bible; ’ ‘Encyclopedia Biblica,’ and the ‘Encyclopedia Britannica.’

KENNEDY, Benjamin Hall, English educator and classical scholar: b. Birmingham, 1804; d. 1889. Graduated from Cambridge in 1827 he became Fellow and lecturer in classics at Saint John’s College in his alma mater; assistant master at Harrow, and head master of Shrewsbury School (1836–66). In the latter year he became regius professor of Greek at Cambridge and canon of Eli the following year. In 1870 he became a member of the University Council, and also of the Committee on the Revision of the New Testament. He edited popular classical textbooks; made translations from Greek and Hebrew into English and wrote poetry in Latin, Greek and English, a volume of which was published in 1882 under the title of ‘Between Whiles; ’ Consult Sandsy’s ‘A History of Classical Scholarship’ (Vol. III, Cambridge 1908).

KENNEDY, Charles Rann, Anglo-American dramatist: b. Derby, England. 14 Feb. 1871. He began life as an office boy, largely educated himself and early began lecturing and writing. He later became an actor and press agent and theatrical business manager. This led to the production of dramas for the stage with which he combined the writing of short stories, critical articles and poems. Among his dramas are ‘The Servant in the House’ (1908); ‘The Winter Feast’ (1908); ‘The Terrible Meek’ (1911); ‘The Necessary Evil’ (1913); ‘The Idol-Breaker’ (1914); ‘The Rib of the Man’ (1916); ‘The Army with Banners’ (1917). In the composition of these dramas, all of which deal with problems of society and are of a serious, reforming tendency he has had the advice of his wife, the actress, Edith Wynne Mathison, whom he married in 1898.

KENNEDY, Grace, Scottish novelist: b. Pinmore, Ayrshire, 1782; d. 1825. Her novels, which are of a decidedly religious caste, were very popular in her day, though now when the age has become more liberal, they have lost most of their interest and are very little read. Her works which have been translated into full into German, and in part, into several other languages, show considerable talent and depict the religious spirit of her age in Scotland very well. They will, therefore, be of a secondary interest at least, to students of the religious tendencies of the first quarter of the 19th century. Her most popular story, ‘Father Clement’ (1823) is strongly anti-Roman Catholic, and for this reason and on account of the vividness of the characters and situations, became immensely popular and was translated into most of the languages of Europe. Among her other novels are ‘Anna Ross’; ‘Dunellan’; ‘Jossy Allan, and ‘Decision.’ The best edition of her works is that published in Edinburgh in 1827.

KENNEDY, Sir James Shaw, British soldier and military writer: b. Straiton parish, Ayrshire, 1778; d. 1865. His family name was Shaw and the Kennedy was added afterward. He became a general in 1863 after having seen much military service aroad the Wellington Peninsular Campaigns and in other similar service. His ‘Notes on Waterloo’ were published
in 1865. He also left an autobiography; 'A Plan for the Defense of Canada'; and 'Notes on the Defense of Great Britain and Ireland' (1859), the latter of which has been frequently reprinted.

KENNEDY, John, Scottish religious worker: b. Aberfeldy, Perthshire, 1813; d. 1900. Educated at Aberdeen, Glasgow and Edinburgh universities he became a Congregational minister stationed in Aberdeen (1836-46). In the latter year he went to London to Stephen Congregational (1846-9). There he became professor of apologetics of New College (1872-76) and chairman of the council of that institution (1884-95) and was editor of The Christian Witness (1865-73) and The Evangelical Magazine (1867-90). Among his published works are 'The Divine Life' (1838); 'A Handbook of Christian Evidences' (1880); 'The Gospels; their Age and Authorship' (1884); 'Old Testament Criticism and the Rights of Non-Experts' (1897).

KENNEDY, Sir John, Canadian engineer: b. Spencerville, Ontario, 26 Sept. 1838. He was educated at McGill University, he became assistant city engineer of Montreal in 1863; division engineer (1871) and chief engineer of the Great Western Railways of Canada (1872-75); chief engineer of the Montreal Harbor Commission (1877-1907) and consulting engineer of same since 1907. Among his important public works are the deepening to 27 1/2 feet of the ship canal between Montreal and Quebec and all the improvements made in Montreal harbor for nearly a third of a century. As member of numerous important engineering committees, among them those on Lachine Canal, Floods at Montreal and Trent Valley Canal System, all of them royal commissions, he has influenced strongly many great public undertakings in Canada.

KENNEDY, John Pendleton, American novelist: b. Baltimore, Md., 25 Oct. 1795; d. Newport, R. I., 18 Aug. 1870. He was graduated at Baltimore College in 1812, and in 1814 served as a volunteer in the ranks, taking part in the battles of Bladensburg and North Point. In 1816 he became a member of the law, which he followed successfully for 20 years. In 1818 he commenced authorship, by the publication, in connection with his friend Peter Hoffman Cruse, of the 'Red Book,' a serial of light character in prose and verse issued about once a fortnight, and continuing two years. In 1820 he was elected to the Maryland house of delegates, and re-chosen the next two years. In 1832 he published his first novel, 'Swallow Barn, or a Sojourn in the Old Dominion,' descriptive of the plantation life of Virginia. In 1833 appeared 'Horseshoe Robinson, a Tale of the Tory Ascendancy,' the most successful of his writings. In 1838 he published 'Rob of the Bowl, a Legend of St. Inigoes,' relating to the Maryland province in the days of Cecilius Calvert, second Lord Baltimore. In 1840 he was a member of the United States Congress 1839-45, and was prominent among the Whig members. In 1849 appeared his 'Life of William Wirt, Attorney-General of the United States,' and in 1852 he became Secretary of the Navy. Prominent among his named include 'Annals of Quodlith' (1840); 'Mr. Ambrose's Letters on the Rebellion' (1865). He was a friend of Thackeray, and wrote or sketched in outline the fourth chapter of the second volume of 'The Virginians,' 'Consult Life' by Tuckerman. See HORSESHOE ROBINSON.

KENNEDY, John Pitt, an Irish author, educator and engineer: b. Dunclog, Downpatrick County, Ireland, 1796; d. 1879. He superintended harbor construction in many parts of the world and built lighthouses, roads and quays. He was sub-inspector of militia in the Ionian Isles (1829-31). After a long absence from the army he returned to it in 1849, serving as secretary to Sir Charles Napier whom he accompanied to India. There Kennedy superintended the construction of the military road from Kalka, through Simla and Kumaon to Tibet. John Pitt Kennedy, notwithstanding the importance of his public engineering works, is best remembered on account of his efforts to settle, in a sensible way, the Irish question. He returned to Ireland in 1831; and he was at once struck with the lamentable condition of the people and filled with a desire to remedy it. He realized that the great paramount improvement in the Irish situation must be procured by a betterment of agricultural conditions. He seems to have got nearer the heart of the Irish people than any previous reformer and to have realized that the British methods of dealing with the people had been largely faulty if not vicious. He became convinced that force would never conquer Ireland though it might hold her in subjection indefinitely. In 1835 he published a book which embraced his ideas on Irish relief and he gave to the curious, though very suggestive title 'Instruct; Employ; Don't Hang Them: or Ireland Tranquilized without Soldiers and Enriched without English Capital.' As inspector general of Irish Education, for a time; secretary of the Devon Commission (1843); and the Famine Relief Committee (1845) he labored to improve agricultural and social conditions and to advance public instruction in Ireland. To this end he wrote several works, all dealing with the problems that seemed to him to have no solutions. He also wrote technical engineering works and was publisher and editor of the British Home and Colonial Empire.

KENNEDY, John Stewart, Scottish-American philanthropist: b. near Glasgow, Scotland, 1830; d. 1909. At the age of 24 he came to New York as the representative of a London iron firm. There he entered the firm of Morris K. Jesup in which he remained until 1867. On his retirement he began the reorganization of concerns on trouble through mismanagement or other causes; and was receiver for numerous concerns, among them The New Jersey Central Railroad; and in these enterprises he eventually made a large fortune; the greater part of which he expended in charities and in the encouragement of education. Of the $6,000,000 which he is credited with having disposed of in this way he gave by will to Columbia University, the New York Public Library, the Metropolitan Museum of Art, the Presbyterian Board of Home Missions, the Presbyterian Board of Foreign Missions, the Presbyterian Church and the Presbyterian Hospital, $2,500,000, or a total of $17,500,000. His will also provided for many
KENNEDY, Joseph Camp Griffith, American statistician: b. Meadville, Pa., 1813; d. 1887. He practised law for a time, edited country newspapers, and finally, in 1849, he assumed the reorganization of the United States Census Bureau; and 10 years later became head of the census. He was largely instrumental in the holding of the Congress of Statisticians held in Brussels in 1853. Later on he became examiner of National Banks. To him the United States owes much of her early organization of statistical reports of all kinds.

KENNEDY, Thomas Francis, Scotch reformer: b. Greenan, 1788; d. 1879. Graduated in law from Edinburgh University he went into politics and became a member of the Parliament in 1818. He became greatly interested in political reforms and in these matters he saw more clearly than most of his fellow members of Parliament. He obtained numerous rights for prisoners, among them that of peremptory challenge under a ballot method for the selection of jurors. He was largely instrumental in securing the extension of the franchise, the abolition of religious disabilities, the extinction of the Scottish Court of the Exchequer and the lowering of the duties on corn (that is grain). His efforts in this direction and in others were recognized by his successive appointment as clerk of ordinance (1832), Junior Lord of the Treasury, paymaster of civil service in Ireland (1837); and Commissioner of Woods and Forests (1850-54).

KENNEDY, William, Irish poet and prose writer: b. Dublin, 1799; d. Paris, 1871. Educated at Belfast College, he drifted into literature, working on the Paisley Magazine, Scotland. Following this he followed literature in London until 1838 when he accompanied Lord Durham, as secretary to Canada, going to Texas in 1841 and becoming British consul at Galveston (1842-49). In the latter year he was retired on a pension which allowed him to devote his time to literary work. He returned to London and finally went to reside in Paris. Among his published works are 'Fifty Fanties' (1827); 'The Arrow and the Rose and Other Poems' (1830, both volumes of lyrical poetry for the most part); 'The Siege of Antwerp' (drama); 'The Rise, Progress and Prospects of the Republic of Texas' (2 vols., 1841).

KENNEDY, William Sloane, American author: b. Brecksville, Ohio, 1850. Educated in Yale and Harvard he joined the staff of the Boston Transcript; and later devoted considerable time to literature, doing magazine work, criticisms, translation from French and Italian and published original works. Among the latter are 'Henry Wadsworth Longfellow' (1882); 'John Greenleaf Whittier' (1882); 'Oliver Wendell Holmes' (1883); 'Wonders and Curiosities of the Railway' (1884 and 1906); 'John G. Whittier, the Poet of Freedom' (1892); 'Reminiscences of Walt Whitman' (1896); 'In Portia's Gardens' (1897); 'Walt Whitman's Diary in Canada' (1904).

KENNELLY, Arthur Edwin, Anglo-American engineer: b. Bombay, India, 17 Dec. 1861. Educated at University of London. After extensive experience as an electrical engineer in England, he came to the United States in 1887 as electrical assistant to Thomas A. Edison. Seven years later he established a business for himself in Philadelphia as consulting electrical engineer (1894-1901). In 1902 he was appointed professor of electrical engineering at Harvard University, a position he still holds. He is also professor of electrical engineering at the Massachusetts Institute of Technology. Among the important public works which he has undertaken was the laying, for the Vera Cruz-Frontera-Campeche Cables for the Mexican government in 1903. Among his published works are 'Notes for Electrical Students' (a collaboration with Wilkinson); 'Theoretical Elements of Electro-Dynamic Machinery' (1893); 'Electrical Engineering of Tunnel Switchboards' (in collaboration with Edwin J. Houston, 1897); 'Electro Dynamic Machinery' (1899); 'Electricity Made Easy' (1899); 'The Interpretation of Mathematical Formulae' (1899); 'Wireless Telegraphy' (1905); 'The Application of Hyperbolic Functions to Electrical Engineering Problems' (1911); 'Tables and Atlas of Complex Hyperbolic Functions' (1914); 'Artificial Electric Lines' (1917).

KENNERLEY, Mitchell, American publisher: b. Burslem, England, 14 Aug. 1878. He came to the United States at the age of 18 as representative of John Lane publishing house in London, with headquarters in New York City (1896-1900); after which he became business manager of the Smart Set (1900-01); founder and editor-proprietor of The Reader Magazine (1901-04); and publisher (1905—). In this latter capacity he published The Forum (1910-16); The Papyrus (1910-12).

KENNET RIVER, a tributary of the Thames, in England. It rises in Wiltshire, flowing east through Berkshire, emptying into the Thames at Reading, after a course of 46 miles. It is a part of the waterway connecting the North Sea with the Wash Channel.

KENNE, I (ruled 832-860), a Scottish king belonging to the MacAlpine family. At first his influence extended over a restricted territory in Galloway; but this he gradually extended by successful military expeditions which resulted in the expulsion of the Danes (841) and the union of the Scottish and Pictish principalities. He made Dunkeld the ecclesiastical capital of his enlarged domains; and to this new capital he removed the relics of Saint Columba. This made the city the centre of increased ecclesiastical activity which served as an inspiration to the Christians to maintain a desperate struggle against expiring paganism. Kenneth, among his other warlike activities, made six expeditions against Lothian, into which he penetrated on each occasion. Consult Lang, Andrew, 'History of Scotland,' or any other good history of Scotland.

KENNETT, Robert Hatch, English educator, scholar and writer: b. Saint Lawrence, Ramsgate, 1864. Educated at Cambridge, he served in that institution as chaplain, lecturer in Hebrew and Syriac (1887-93); and lecturer in Aramaic (1893-1903), becoming, on the lat-
KENNET — KENNY

KENNET, Edward, English Episcopalian prelate and writer: b. Dover, 10 Aug. 1660; d. Westminster, 19 Dec. 1728. Graduated from Oxford, he entered the Church of England where he distinguished himself as a preacher, antiquarian, theologian and historian, and also an account of his strongly-pronounced anti-Semitic attitude. Rector of Ambrodisthorpe (1685); tutor and vice-principal of Edmund Hall, Oxford (1691); Archdeacon of Huntingdon (1701); Dean of Peterborough (1707); Bishop of Peterborough (1718); he made his mark in the church politics of his day in England. Among his numerous works are 'Parochial Antiquities' (1695, 1818); 'Compleat History of England' (of which only one volume was published anonymously in 1706); 'A Register and Chronicle, Ecclesiastical and Civil, of the Restoration of King Charles II.' (Vol. I, 1728). Many of his historical and other valuable manuscripts, most of which have not yet been published, are in the Lansdowne collection in the British Museum. His life was written by Newton (London 1730).

KENNEY, Charles Lamb, English author and journalist, son of the Irish dramatist, James Kenney (q.v.): b. Bellevue (near Paris), 1821; d. 1881. He began active life as a clerk in the London general post office; and while there devoted his spare time to writing for the local press, and thus gradually drifted into journalism becoming dramatic critic for the London Times. In the meantime he studied law and was admitted to the bar in 1856. Among his published works are 'The Gates of the East' (in the building of the Suez Canal, 1857); 'M. W. Balfe' (1875); 'Balzac's Correspondence' (a translation, 1878), and light verse, and several very good light operas and musical sketches, which were popular in their day. Consult Clayden, W. P., 'Rogers and his Contemporaries' (London 1889); Genest, John, 'English Stage' (Vols. VII and VIII, London 1832).

KENNEY, James, British dramatist: b. 1780; d. 1849. Beginning as a bank clerk in London, where his father was manager of "Boodles' Club," he gave more attention to amateur acting and play writing than to the banking business, which he soon gave up for dramatic writing. His plays were very popular in his day and some of them are still seen upon the stage. He had excellent dramatic talent, was power of dramatic development. Among his numerous plays the most popular and successful are 'Sweetharts and Wives' (1823); 'Turn Him Out' (a musical afterpiece, 1812); 'Love, Law and Physic' (1812); 'The Illustrious Stranger' (1827); 'Masaniello' (1829); 'Sicilian Vespers' (1840). Consult authorities quoted under Kenney, Charles Lamb.

KENNINCOTT, Benjamin, English clergyman and scholar: b. Totness in Devonshire, 4 April 1718; d. Oxford, 18 Sept. 1783. When his father died he was quite young, but he succeeded as master of a charity school in his home village. Through the kindness of friends he entered Wadham College, Oxford. In his undergraduate days he published two books, the second one 'On the Oblation of Cain and Abel' (2d ed., 1747) won for him his degree before the statute time had expired. Soon after he was elected Fellow of Exeter College. His fame as a scholar rests on a great undertaking which he began in 1753. It was no less a task than the collation of all the Hebrew manuscripts to be found in the libraries of England and on the Continent so that a more correct Hebrew text of the Old Testament might be ascertained. Several persons were employed collating manuscripts for him. Professor Bruni of the University of Helmstadt collated manuscripts in Germany, Switzerland and Italy. After 16 years of the most intense labor, the first volume of his Hebrew Bible appeared. The second appeared four years later. The variations of the text included in it were found in Hebrew and Samaritan manuscripts, the Greek testament and from the former editions of the printed text. Dr. Kennicott was librarian of Radcliffe Library from 1767 until his death, he was also canon of Christ Church at the same time. His works include, in addition to pamphlets and sermons, 'The State of the Printed Hebrew Text of the Old Testament' (2 vols., 1753, 1759); 'Critici Sacri: or Short Introduction to Hebrew Criticism' (1774); 'Ten Annual Accounts of the Collation of Hebrew Manuscripts of the Old Testament, 1760-69' (1770); 'Vetus Testamentum Hebraicum Cum variis Lectionibus' (2 vols., 1776, 1780); 'Dissertatio Generalis in Vetus Testamentum Hebraicum' (1780); 'Epistolae ad celeberrimum professorum Joannem Davudem Michaelum, et alios' (1773); 'Proposita ad socios mihi bibliothecae Hebreae Nobis unam' (1777); 'Editionis Veteris Testamenti Hebraici cum variis lectionibus brevis defensio, contra Ephemeridum, Goettingensium Ciminationes' (1782); 'Remarks on Selected Passages in the Old Testament, to which are added eight Sermons' (1787).

KENNICOTT, or KATALLA, a seaport on Controller Bay, Alaska. It is of importance as the terminus of the Copper River and Northwestern Railway, which, with its other railway connections, connects Cordova, Kennicott and the Nizina valley generally. It thus forms the outlet for the Kennicott-Bonanza Copper Company and the other mining companies of the region through which it passes or which it taps, including the Bering coal fields.

KENNY, Sir Edward, Canadian statesman: b. County Kerry, Ireland, 1800; d. Halifax, N. S., 16 May 1891. He removed to Halifax in 1824, where he engaged in business, and was mayor at one time. He was member for 26 years of the legislative council of Nova Scotia, during 11 of which he was president; served as receiver-general of Canada (1867-69); president of the privy council (1869-70); and senator (1868-76). He was knighted in 1870.
KENNY, Sir Thomas Kelly—British soldier: b. Kilrush, County Clare, Ireland, 1840; d. 1914. He took part in the war in China in 1867, and after continuous military service he took part in the South African War as major general and commander of the sixth division. Promoted for his services there to the rank of lieutenant general; he became, at the war office, adjutant general to the forces (1901-04). Knighted in 1902, he was commissioned general in 1905.

KENO, or KINO, ké-nô, a variation of lotto (q.v.). In its modern form it is used for gambling purposes. For this purpose a hollow globe and 99 balls, each numbered consecutively from one upwards, are used, the balls are well shaken while in the globe, from which they are allowed to issue one by one upon which each number is called by the roller as it appears. The game, which, in its gambling form, is said to be of American origin, is purely one of chance. The players purchase cards upon each of which are printed four rows of five figures each. As the balls make their appearance, they are checked up by the holder of the cards, and the first one getting five numbers in a row on his card calls out "Keno" indicating that he is the winner and, as such, entitled to the stakes of all the players minus the percentage allowed to the "bank". The hollow globe in which the numbered balls are placed is called a "goose". It is so placed that it can be revolved rapidly on its own axis, thus securing a proper mixing of the balls.

KENORA, formerly Rat Portage, Canada, town and port of entry, Ontario, at the outlet of the Lake of the Woods and on the Canadian Pacific Railway, 133 miles by rail east of Winnipeg. It is the chief town of the Rainy River district and the distributing centre for the neighboring gold mines. The Winnepeg River falls 16 feet from the lake, furnishes inexhaustible water power for sawmills, flour-mills and other industrial establishments. The neighboring lake fisheries, especially of sturgeon, are valuable. Telephone, light, water and sewage systems are municipally owned. The town was within the disputed boundaries of Manitoba and Ontario, and in July 1883 serious riots occurred, when policemen belonging to the contestant provinces fought with and arrested each other. Pop. 6,158.

KENOSHA, ké-nô'sha, Wis., city, county-seat of Kenosha County; on Lake Michigan and on the Chicago and Northwestern and the Pere Marquette railroads; about 35 miles south of Milwaukee. It has steamy communication with many of the ports on the Great Lakes. It is a trade centre for quite an extent of country. Its chief manufactures are leather, typewriters, furniture, wagons, lamps, machinery, carriage and automobile lamps, automotive goods, hosiery, underwear, iron bedsteads and flour. It is the seat of Kemper Hall School (P. E.). The Simmons Memorial Library contains about 6,000 volumes. The city owns and operates the water works, obtained from the lake and artesian wells. Kenosha was incorporated in 1841 and chartered as a city in 1850. Pop. 26,062.

KENOSIS, ke-nô'sis (Greek, an-emptying, a depletion), the self-renunciation and self-limitation of the Son of God manifested in the incarnation. Even in very early Christian times there were at least three distinct views held as to the relation of the God-Christ to the man-Christ. These views were derived from the Jewish conception of a traditional Christ, the Egyptian doctrine of the incarnation of Osiris, son of the great sun god, Ra, and the speculations of the Romans, Greeks and Persians as to the nature of their own gods which strangely mingled human with divine attributes from Egypt, Rome and the Eastern Empire. Even views of the Kenosis, influenced by local traditions and the early training and education of the contestants, in the days when Christian theology and dogma were in the making. The mystery of the self-emptying of the divine manner of being that took place at the incarnation of the second person of the trinity; the laying aside of the eternal and the assumption of a time form of existence formed an ever-fruitful subject of speculation in an age long ago given to speculation as to the manner of being of things divine. Christianity introduced a new feature in the speculation, that of the self-abasement of the God-Christ, a feature upon which the Christians laid great stress, no doubt owing to the strong character of Paul and the influence of the earlier fathers who linked the historical Christ firmly with the Jewish traditional Christ. This linking of the two created a wide field for speculation as the subject was viewed from the Jewish or the Christian point of view or it was influenced by the traditions and speculations of the scholars of the Eastern and the Western Empires and the mythological conceptions of the new converts to Christianity in Egypt and from among the Germanic and other races of Europe and southwestern Asia. The relation of the incarnate God to his own self-abasement in the assumption of humanity and the occultation of his own divinity; the restrictions, pains and penalties to which he submitted during his earthly life; and the exhibition of his divine power on noted occasions like the resuscitation, ascension and transfiguration, introduced a new element into the religious speculation of the early centuries of Christianity, an element that proved very attractive to the mystical, speculative spirit of the age with which Paul seems to have been well acquainted. Speculation concerned itself as to what extent the God-Christ laid aside his divine form of existence, dignity and glory on becoming incarnate; and as to how much of the divine essence he divested himself of in the kenosis. Some speculative theologians maintained that the kenosis consisted in the simple laying aside the attributes of divine glory and the divine form of existence. Others held that with these went the divine power which could not be a co-dweller with incarnation; and that Christ's miracles were performed with the power retained from his divine existence, but through the power that came to him from God the father. Other theologians went the extreme limit and upheld the doctrine that, at the incarnation, the Son of God completely emptied himself of the divine essence, thus altogether suspending the union and the divine functioning of the trinity during his incarnate existence.
upon earth. Between these three more or less distinct views of the relation of Christ to his incarnation, there were various different shades of opinion, most of them influenced by the speculative thought of the age and the popular and the priestly doctrine of a paganism still vigorous in many strongholds. The Eastern and Western churches held different views of the *kenosis*; and the opinions of the early church fathers did not agree with those who followed Augustine whose personality, so thoroughly impressed on his *kenosis*, was destined to powerfully influence all future Christian thought.

The word *kenosis*, used by Liebner about 1840, as an appropriate term to designate the field of discussion indicated above, is really the modern application of an old term which, if not nominally so extensively employed, was virtually as widely used. The modern idea of the doctrine of the *kenosis*, which is Protestant, and especially Lutheran, is based on the statement of Paul, who said that Christ "being in the form of God thought it not robbery to be equal with God, but made himself of no reputation and took upon him the form of a servant" (Phil. ii. 6-8).

**Modern Doctrine.**—As early as 1832 Ernst Sartorius and Johann König each separately applied the expression of *kenosis*, almost in the sense of a doctrine, to the Christ. Little by little the term and what it stood for gained ground, especially among Lutheran theologians until in 1845 it had assumed the form of a doctrine widely accepted in Protestant Germany. The position taken by those who adhered to the modern doctrine of *kenosis* was that there is a perfect oneness in the person of Christ; since by his own will and in his divine form he laid aside the fullness of his divine nature in so far as all its external relations were concerned, thus making it possible for him to become fully incarnate, that is human, and capable of human existence and development. The doctrine of *kenosis*, however, recognizes that Christ retained the use of his divine power for such special cases as were necessary for the redemption of his work. Reformed and Unitarian theologians followed the Lutheran leaders in their discussions and explanations of *kenosis*, which its defenders claimed was the natural outcome of the previous development of dogma. In this view they were mistaken since early orthodox exegesis was in no sense kenotic, nor were new theories, for a long time, kenotic. The idea that Christ left all his divine power behind him on his incarnation, obtained no hold in Christian theology previous to the 19th century. In fact the tendency of belief was to hold that, even on earth, the glory and the power of Christ were still intact and that a veil had been drawn over them. This veil might be partially drawn, revealing glimpses of the divine power. Even Calvin, the iconoclast in many other respects, seems to have held this view.

The present doctrine of *kenosis*, which seems to have become articulate in the middle of the last century, as destined to incorporate itself firmly in Christian dogma, has been steadily losing ground, and the strenuous efforts of its champions have only succeeded in bringing out clearly and definitely the fact that Christian ecclesiastical theology has never admitted or held the views propounded by the modern Kenotic creed.

J., 'The Kenotic Theory Considered with Particular Reference to the Anglican Forms' (London 1898); Macbean, 'The Doctrine of the Person of Jesus Christ' (New York 1912); Morgan, R. C., 'God's Self-emptied Servant' (1906); Simon, 'Reconciliation by Incarnation' (Edinburgh 1898); Tomasius, 'Christi Person and Werk' (Erlangen 1861).

**KENRICK, Francis Patrick,** American Roman Catholic bishop: b. Dublin, Ireland, 3 Dec. 1797; d. Baltimore, 6 July 1863. After studying in Rome (1815–21), he was ordained priest in the latter year and sent to this country to take charge of a seminary at Bardstown, Ky. He remained at Bardstown nine years till his appointment as coadjutor bishop of Philadelphia in 1830. Twelve years later he became bishop of Philadelphia and there founded the seminary of Saint Charles Borromeo. In 1851 he was installed archbishop of Baltimore and the next year presided over the first plenary council of American Roman Catholic prelates. He became honorary primate of the United States in 1859. He was prominent as a controversialist and a Biblical scholar, and published 'Dogmatic Theology' (1839–40); 'Moral Theology' (1841–43); a revision of the Douai English Bible, with notes, etc.

**KENRICK, Peter Richard,** American Roman Catholic archbishop: b. Dublin, Ireland, 17 Aug. 1806; d. Saint Louis, Mo., 4 March 1896. After studying at Maynooth he was ordained priest in 1830, and came to the United States in 1833. He was professor of dogmatics in the seminary of the diocese of Philadelphia and subsequently became vicar-general. In 1841 he was appointed coadjutor to Bishop Rosati of Saint Louis, succeeded to that bishopric in 1843, and was created first archbishop of Saint Louis in 1847. He opposed the infallibility but acquiesced in its final decree. He published 'The Holy House of Loreto'; 'Anglican Ordinations'; 'Vaticana,' etc. Consult O'Shea, 'The Two Archbishops Kenrick' (1904).

**KENRICK, William,** American horticulturist: b. 1795; d. 1872. He is noted for his introduction of the mulberry tree into the United States and his attempts to establish there the silk industry. It is interesting to note that his pioneer nursery gardens were planted (1790) on the ground where John Eliot first preached to the Indians.

**KENSAL-GREEN,** a famous London cemetery in which are buried many noted people, among them Thackeray, Leigh Hunt, Sidney Smith, Kemble and Sir Charles Eastlake. The dead in the cemetery, which contains 60 acres, form in themselves a large city, numbering, as they do, over 70,000.

**KENSETT, John Frederick,** American painter: b. Cheshire, Conn., 22 March 1818; d.
New York, 14 Dec. 1872. His uncle, Alfred Daggett, an engraver, gave him his first lessons in art, but in 1840 he went abroad and for seven years traveled in England, Switzerland and Italy. The fruit of this student-ramble was a large number of sketches and paintings, out of which he exhibited in 1845 in the Royal Academy. The sale of one of his pictures, a view of Hyde Park, Castle, encouraged him to persevere. On returning to America he lived chiefly in New York. His 'View on the Arno' and 'Shrine,' exhibited in New York in 1848, established his reputation in America, and he was elected in 1849 a National Academician. His landscapes are more remarkable for sweetness than for strength, but he maintains a uniform standard of merit in all of them. His technique is delicate and refined, especially in his small canvases. He delights in the scenery of the Hudson, and of the sea-coast, and some of his effects are exquisitely charming. Among his landscapes the most interesting are 'Sunset on the Coast' (1858); 'October Afternoon' (1864), both in the Corcoran Gallery, Washington; 'Noon on the Sea-Shore,' which has been in the collection of Mr. Thomas J. Hunt. Several of his pictures are in the Metropolitan Museum of Art, New York, the finest of them being 'White Mountains,' a masterpiece of its class. He was for some years a member of the national art commission appointed to direct the decoration of the National Capitol.

KENSGINGTON, England, a metropolitan and parliamentary borough of West London. Area, 2,291 acres. Owing to its salubrious situation, it became a favorite place of residence in the 17th century when William III purchased a house that afterward became the royal palace. Isaac Newton died at Kensington (1727). Queen Victoria was born in Kensington Palace, and at Kensington Palace her succession to the throne was announced to her. The borough is replete with literary associations, among those who have resided here being Addison the essayist, Talleyrand, Thackeray, John Stuart Mill and Green the historian. Holland House was famous as a social centre during the time of the third Lord Holland. Brompton Road Oraitory is perhaps the most celebrated church of the borough. The South Kensington Museum and the Natural History Museum are the most interesting public buildings. Kensington returns two members to Parliament. Pop. about 172,317. Consult Burt, 'Historical Notices of Kensington' (1871); Faulkner, 'Kensington' (1820); Hunt, Leight, 'Old Court Suburb' (1885); Loftie, 'Kensington' (1888).

KENSGINGTON GARDENS, a celebrated public park in London four miles west of Saint Paul's, and well known for its royal palace. In former times Kensington Palace was a favorite royal residence. King William III, Queen Mary, Queen Anne and George II died here. Kensington Gardens and Hyde Park are much frequented in summer and form a great ornament to the metropolis. They cover about 350 acres. Next to the Albert Memorial in South Kensington the chief attractions are the South Kensington or Victoria and Albert Museum, the Indian Museum, the Natural History Museum and the Imperial Institute. The scene of 'The Little White Bird,' from which Sir James M. Barrie adapted his delightful play 'Peter Pan' is laid in Kensington Gardens.

KENSGINGTON PALACE. See KENSGINGTON GARDENS.

KEN, Charles Foster, American Biblical scholar: b. Palmira, N. Y., 13 Aug. 1867. He was graduated at the universities of Yale (1889) and Berlin (1892), and the following year became an instructor in the University of Chicago. In 1895 he was elected professor of Biblical literature and history at the University, a position which he held until 1901. He is at present Woolsey professor of Biblical literature at Yale University. Among his writings are 'Outlines of Hebrew History' (1868); 'The Wise Men of Ancient Israel and Their Proverbs' (1868); 'History of the Hebrew People, the United Kingdom' (1896); 'History of the Hebrew People, the Divided Kingdom' (1899); 'Messages of the Earlier Prophets' (1893); 'Messages of the Later Prophets' (1893); 'Israel's Historical and Biographical Narratives' (1894); 'The Permanent Value of the Old Testament' (1906; 1912); 'Israel's Laws and Traditional Precedents' (1907); 'The Heroes and Crises of Early Hebrew History' (1908; 1912); 'The Kings and Prophets of Israel and Judah' (1912); 'The Makers and Teachers of Judaism' (1911); 'Biblical Geography and History' (1911); 'Life and Teachings of Jesus According to the Earliest Records' (1913); 'The Songs, Hymns and Prayers of the Old Testament' (1914); 'Testing of a Nation's Ideals,' with J. W. Jenkins (1915).

KEN, Edward Augustus, Duke of, English prince: b. 1767; d. 1820. He was son of George III, and elected to be a soldier, in which capacity he gave very efficient service against the French West India Islands and other campaigns. He was one of the most popular of British princes and numerous places were named after him, among them Fort Edward in Martinique (Fort Royal) and Prince Edward Island (formerly Saint John). Made Duke of Kent in 1799, he became commander-in-chief of the British forces in North America in the same year, rising to the rank of field marshal in 1805. His daughter became queen of Great Britain under the title of Victoria.

KEN, Jacob Ford, American general: b. Philadelphia, Pa., 14 Sept. 1835. He was graduated at West Point in 1861, entered the army as 2d lieutenant 6 May 1861, became captain in January 1864, and was brevetted colonel of volunteers in October 1864 for faithful and meritorious services in the field during the campaign before Richmond. After the war he was assistant instructor in tactics at West Point and from 1869 to 1896 was on frontier and garrison duty. At the opening of the war in Spain he was colonel of the 24th infantry. He was made major-general of volunteers 8 July 1898, and served with distinction in Cuba and afterward in the Philippines. He was retired in October 1898, soon after attaining the rank of brigadier-general.

KEN, James, American jurist: b. Philippi, Putnam County, N. Y., 31 July 1763; d. New York, 12 Dec. 1847. Kent was graduated at Yale College in 1781, studied law, was admitted in 1783 as an attorney, and in 1787 as a coun-
sellar and commenced the practice of his pro-
professions in Poughkeepsie. He soon became re-
minded of the importance of his legal knowledge,
known as the Continental Congress, and in the
and was the first to apply the principles of
and there made some attempts at painting, and
to Rome where he was a pupil of the Cavalier
and whence he was brought to England by the Earl of Burlington, his patron for the
rest of his life. He was employed in portrait-
and decoration of walls and ceilings, but Hogarth said that “neither England
or Italy ever produced a more contemptible
bauber.” However, he did invent a less formal
method of gardening and planting and excelled
as an architect. The Horse Guards and treas-
ury buildings and Devonshire House, Piccadilly,
are his work. He published the ‘Designs of
Inigo Jones’ (1727).

KENT, William, American engineer: b.
Philadelphia, 5 March 1851. Graduated from
Stephens Institute of Technology and Syracuse
University, he became editor of the American
Manufacturer and Iron World (1877–79), at
the same time exercising his profession of engi-
eer from the latter date to 1890. Later he
became editor of Engineering News (1895–
99) when he was chosen a dean of the L.
C. Smith College of Applied Science and Syrac-
use University (1903–08). In 1910 he again
became editor of the Industrial Section of the
Engineering News. He has been lecturer on
engineering subjects in several well-known col-
leges; is the holder of numerous patents on
his own inventions; and is well known as a
contributor to encyclopedias and technical
magazines. Among his published works are
‘The Strength of Materials’ (1879); ‘Strength
of Wrought Iron and Chain Cables’ (1879);
The Mechanical Engineer’sRecipe-book’ (1895); ‘Steam Boiler Economy’ (1901); ‘In-
vestigating an Industry’ (1915); ‘Bookkeeping
and Cost Accounting for Factories’ (1918).

KENT, William Charles Mark, English
poet and journalist: b. London, 1823; d. 1902.
He entered journalism and soon became editor of the Sun (1845–70). He graduated in law
in 1859; but did not give much attention to
law, journalism and literature having much
more attraction for him. He was a constant
contributor to the magazines and literary
columns of daily and weekly papers, among
them Dickens’ Household Words and All the
Year Round. He was editor of the Roman
Catholic Weekly Register (1874–81). He also
gave much of his time to the publication of
complete editions with memoirs and critical
notes of famous British writers, among them,
Burns (1874), Lamb (1875), Moore (1879),
Father Prout (1881), Lord Lytton (1875–98).
Among his more original publications are
‘Poems’ (1870); ‘Leigh Hunt as an Essayist’ (1888); ‘The Wit and Wisdom of Lord Lyt-
ton’ (1883); ‘The Humor and Pathos of
Charles Dickens’ (1884). Consult Francis, J.
C., ‘Notes by the Way’ (1909).

KENT, a county of England, forming the
south-east extremity of Great Britain and ad-
joining the counties of Essex (from which it is
separated by the river Thames), Kent, and
Sussex. The Strait of Dover bounds it on
the southeast. Its area is 1,570 square miles.
Two principal ranges of hills, a continuation
of the North Downs of Surrey and Hants ex-
KENT—KENTUCKY

attend through the county from west to east, terminating in the cliffs of Dover, Folkstone and Hythe, which is in the Weald, a formerly extensive forests. In the north are the islands of Sheppey and Thanet and the mouths of the Medway, Stour and Darent rivers. The products are varied; great quantities of sheep raising, wool manufacture and the manufacture of paper, tiles, pottery, gunpowder, hopbuds, etc., are extensively carried on. The capital is Maidstone. In this county are dockyards, arsenals, the famous cathedral of Canterbury, the ports of Dover and Folkestone and several well-known watering places at Margate, Ramsgate and Tunbridge Wells. It was the ancient country of Cantium (q.v.) and the first established kingdom of the Saxons, heptarchy. It was settled by the Jutes and became prominent when its king Ethelbert was converted to Christianity by Saint Augustine (597). It rapidly declined in power and in the course of the eighth century, lost all of its independence. It has eight parliamentary divisions apart from the borough of Maidstone. Pop. 1,020,965. Consult Hasted, 'The History and Topographical Survey of Kent' (Canterbury 1801); 'Victoria History of the County of Kent' (London 1908).

KENT, a town near Akron, in Ohio. It is in Portage County and is situated on the Baltimore and Ohio Railroad, the Erie, the Northern Ohio Traction and Light and the Wheeling and Lake Erie railways. It is a town of about 4,500 inhabitants and possesses of numerous active industries, for its population. Among these are railroad repair shops, nut, bolt and lock factories, flour mills, concrete mixers, all of which are operated by power supplied by water. The town also possesses a normal school and is the centre of considerable local trade.

KENT, Fair Maid of, wife of Edward the 'Black Prince' and mother of Richard II. See FAIR MAID OF KENT.

KENT ISLAND, the largest island in Chesapeake Bay, Md., some 15 miles long and situated seven miles east of Annapolis. It was here the first settlement in Maryland was made by William Claiborne (q.v.) in 1631. Pop. 2,600.

KENTON, Simon, American pioneer: b. Fauquier County, Va., 3 April 1755; d. Logan County, Ohio, in 1836. At 16 he had an affair with a young man, and believing he had killed his adversary, fled beyond the Alleghenies and became a companion of Boone and the other early pioneers of Kentucky. For a time he acted as a spy of Governor Dunmore, and subsequently participated in the warfare waged against the British and the Indians west of the Alleghenies, showing remarkable courage, sagacity and endurance. In 1782, learning that his former opponent was living, he returned to his native place, and soon after removed with his father's family to Kentucky. He was frequently engaged in Indian warfare, until the expedition under Wayne in 1793-94 restored tranquillity to the western frontier. As the country began to fill up with settlers his lands, to which, in consequence of his ignorance of or indifference to legal forms, he had never secured perfect titles, were taken from him, and by repeated lawsuits he was reduced to penury. He nevertheless in the War of 1812 fought with the Kentucky troops at the battle of the Thames. In 1824 he appeared in Frankfort in tattered garments to petition the legislature of Kentucky to release the claim of the State upon some mountain land owned by him. His appearance at first excited ridicule, but upon being recognized he was treated with much distinction by the legislature; his lands were released and a pension of $240 was procured for him from Congress. He died near the spot where, 58 years previous, he had narrowly escaped death at the hands of the Indians.

KENTON, Ohio, city, county-seat of Hardin County; on the Scioto River, and on the Erie, the Toledo and Ohio Central and the Cleveland, Cincinnati, Chicago and Saint Louis railroads; about 54 miles northwest of Columbus and 67 miles south of Toledo. It is situated on the divide which separates the waters of the Ohio River from those of Lake Erie. It was settled in 1833 and incorporated in 1885. The surrounding country is a farming section, with some large forests. The chief manufactures of the city are hardware, agricultural implements, iron, lumber and dairy products. Its principal public buildings are the armory, jail, court-house and the municipal buildings. The mayor holds office two years. The waterworks plant is owned by the city. Pop. 7,185.

KENT'S HOLE, a station and cave near Torquay, Devonshire, England, noted for its implements of the Paleolithic Age. It has been actively explored several times since 1825. Under successive layers of limestone, black mold stalagmite in red cave earth lie the archeological remains which consist of bones of primitive horses, mammoths, wolves, lions and rhinoceroses, together with stone implements of an early type. On the top of the red clay, in a deposit of black earth, evidently long exposed to the action of the air, are implements of the life of a comparatively early age in the history of human culture, such as flint chisels, scrapers and bone and horn implements. This black deposit evidently represents a very considerable period of human progress, stretching from the rude stone age to the days of Roman occupation which are represented by copper and bronze implements and weapons. The latter naturally form the upper part of the layer.

KENTUCKY (Cherokee, "prairie," the Barrens," and not meaning "dark and bloody ground" as popularly supposed), a south-central State of the Union, one of the "Border States" (q.v.) bounded on the north by the Ohio River; the second district settled beyond the Alleghenies and the first to become a State; admitted to the Union 1 June 1792, next after Vermont. Capital, Frankfort; largest city, Louisville. It is irregular in shape, varying from a breadth of 171 miles between Cincinnati and Cumberland Gap to about 40 miles in the narrow part near the Tennessee, and being 458 miles in length from east to west; 41,283 square miles. Lat. 36° 30' to 39° 9', N.; long. 82° 2' to 89° 40' W. It ranks first in caves and caverns, cannel coal, hemp, race horses and tobacco; third in distilled liquors; fifth in coal production.
Topography and Hydrography.—Its northern boundary is the low-water mark on the north bank of the Ohio River; its western, the course of the Mississippi as described in 1763. The eastern boundary is a large angle formed by the Tug Fork of Big Sandy and the main Big Sandy flowing northwest, the other side lying against Virginia, along the main Cumberland Range to Stone Mountain; thence across a divide to Little Black Mountain, thence by the range northward to Pine Mountain Range, to the breaks of the Russell fork of the Levisa Fork of the Big Sandy, thence northeast to the Tug Fork. The southern line separates it from Tennessee by a boundary which is nearly straight excepting a "jog" of 12 miles at the Tennessee River, where the original surveyors made an error. The surface is mainly a plateau averaging about 800 feet above sea-level, sloping in a northwesterly direction to the Ohio from the southeastern mountains. The Poor Fork Valley of the Cumberland, lying between Pine Mountain and the main Cumberland Range, is 15 miles wide and 30 miles long. From 1,000 feet above sea-level, and is butted by peaks sometimes 3,500 feet high, thus presenting the finest scenic portion of the southern Appalachian Mountains. The Pine Mountain, which is an erosion scarp fault, forms a long even-topped ridge about 2,500 feet above sea-level, with its steep face toward the northwest. The highest points in the State are in Harlan County, from 3,600 to 4,100 feet above sea-level. The great north and central Blue Grass region (limestone) is an undulating plateau circled by a continuous mountain ridge taking many different local names (Muldraugh Hill, King's Mountain and Big Hill), and extending in a great curving sweep from the mouth of Salt River to the mouth of the Scioto. In the west it forms the edge of a limestone plateau, while in the east this limestone is surmounted with the basal conglomerate of the coal measures, giving to it a very rugged aspect. The drainage system is mainly a series of rivers flowing east into the Ohio, following the surface trend: the Big Sandy with its Levisa Fork, the Licking, Kentucky, Salt and Green. In the western end of the State the great rivers Cumberland and Tennessee, after pursuing widely different courses, 43 miles in the same direction to the same goal 15 miles apart. The Cumberland, rising near the eastern edge, flows crookedly through the southern part, dips into Tennessee, and returns to Kentucky. The Tennessee takes a widespread course northward into Alabama, but turning back almost joins the Cumberland. These streams are noteworthy for their rock channels. The Kentucky, in particular, has cut a superb gorge through more than 300 feet of limestone in its lower courses; and where it trenches across the Cincinnati Arch has walls nearly perpendicular, as at High Bridge.

Southwest from the center of the State only the larger stream channels appear on the surface. Here is a "Karst" region, full of deep, clear waterways which the water seeks around, finding subterranean paths to the master stream, the Green River. A clogging of these passages frequently results in forming ponds. This is the great cavernous district of the State, made famous by Mammoth Cave (q.v.), the largest in the world. As in all limestone districts, the underground waters have dissolved the rocks into caverns, tunnels and Sculptures, huge chambers and narrow flumes, making deep pools and cascades, and creating stalactites and stalagmites, pendant and upright shafts. Its magnificent proportions, with the presence of a considerable stream navigable in one of its pools for rowboats, make it convenient for exploration and a fascinating spot for tourists. Colossal Cave and Great White Onyx are equally attractive.

Geology.—This district was at one time the bed of a vast lake of the Lower Silurian period; on its floor were laid several sedimentary deposits: Upper Silurian, Devonian, Subcarboniferous some 5,000 feet deep, and on these Carboniferous, (coal measures) to 3,000 feet more. The great Appalachian uplift raised this some 5,000 feet, the surface forming a dome in the center; then forces of denudation acted planewise across the top, cutting away all the upper strata down to the original Lower Silurian in the middle—whence the outcrop of green sandstone. In the western region—and other strata varying degrees in other parts, leaving the coal measures exposed in two great patches 100 miles apart at the edges. In the southeast the Subcarboniferous limestone is at the top—the region of caves and sinks.

Mineral Wealth.—Bituminous coal mining has grown rapidly in recent years, the output rising in 1917 to 27,809,976 tons, and giving Kentucky fifth place in the Union. While the Eastern field yielded the larger proportion in 1907, the Eastern field produced two-thirds of the total in 1917. Rich veins from six to eight feet thick occur at shallow depths permitting easy exploitation at minimum expense. This condition has invited capital from other States. Practically all the increased railroad mileage along the Louisville and Nashville and Chesapeake and Ohio lines is in the coal districts. Company towns, such as Jenkins and McNeells, grew up quickly to serve the mining communities. The chief markets are the coalports, though the rich content of some of these coals for coking and by-products has created special demand in Saint Louis and Pittsburgh. Cannel, or gas coal, is plentiful in Morgan County; courses, 43 below 50 feet, and gas wells, slightly utilized by the early settlers, and almost undeveloped even a decade ago, sprang into prominence with the outbreak of the World War. Traces of oil and gas occur in more than 50 counties. While gas production is vastly exceeded by the West Virginia fields, the smaller Kentucky field is now tapped by lines which supply Mount Sterling, Winchester, Lexington and other cities of the Blue Grass, and Louisville. Gas production in the coal regions in 1910 attained a value of $891,000. The oil industry, however, has caused much more excitement. The older fields in Wayne County on the Tennessee border, extending northeast through Wolfe County, and served by pipe lines for many years, seemed to be stationary in production; but the high prices created by war demands led to tests in adjoining counties, with most surprising results. At depths rarely exceeding 1,500 feet in Estill and Lee counties in the eastern section, and about Allen County on the Tennessee border, new supplies appeared.

</tbody>
</table>
The old marketing facilities proved utterly inadequate. A pipe line which in 1914 marketed only 480,000 barrels received in 1918 over 4,000,000 barrels, an increase of 800 per cent in four years. To the total of the fields, east and west, now exceeds 8,000,000 barrels annually. The oil is of the best grade, commanding a high price. Iron, which gave good promises of expansion about the year 1880, has faded away before the area of the northwestern ores, which are used in the mills at Ashland. Kentucky iron is profitably mined only near Cumberland Gap, and in Trigg, Lyon and Caldwell counties in the west. Of minor minerals one may mention the limestone products, such as Kentucky River marble, asphalt, sandstones, clays, barites and phosphates used for fertilizers. Extensive mining of fluor spar occurs in Crittenden and Livingston counties adjoining the Illinois field. Mineral springs are numerous but only 12 were ranked as cures in 1913.

Climate and Rainfall.—The Mississippi bottoms are malariaous, but the rest of the State is free from objectionable tendencies. The death rate normally 15.2 per thousand increased to 16.8 and 18.2 during the influenza epidemic in 1918. Mean winter temperature is 35° F, while the annual average is 55° F. Owing to its exposure to storms from southwest and northwest alike, considerable variation may occur, tempered, however, by the proximity of the mountains to the east. Water is abundant in all parts of the State. The average precipitation is 44 inches without a record of excessive drought in any year.

Forests.—About a third of the State is covered with commercial forests. Along the Allegheny slopes there is a great quantity of fine timber, most of it being hardwood of astonishing variety. Oaks of many different kinds—white, red, black, post, overcup, chestnut and black-jack—hickory, black walnut, blue ash, maple, elm, beech, chestnut, poplar, sweet gum, yellow pine, sycamore and hackberry are only a portion of its wealth, still largely virgin, though now being rapidly exploited. Poplar, black walnut and cherry are now rare. Some cypress occurs about Reelfoot Lake.

Soils.—There are 10 main soil areas, corresponding to the chief geological formations. The most fertile of these, the Trenton, includes the best parts of Fayette, Woodford, Jessamine and adjoining counties, 1,200 square miles. This soil is residual, formed by the disintegration of the gray Lexington limestone, which is rich in phosphorus; consequently some fields of this region a century old show no sign of exhaustion. Surrounding this area is the Cincinnatian, 7,900 square miles, with somewhat less phosphorus in their blue limestones. Northeastward from Allen County to the Ohio River stretches the Vevayville area, 4,400 square miles, whose soils wash badly and lack plant food. The western coal field 4,500 square miles, is in need of drainage and proper fertilizers to become valuable agriculturally. Surrounding this is a belt of varying width, equal to 8,000 square miles—one-fifth of the State's area. It contains limestone which, if used in connection with the phosphate beds of Tennessee, would build up its soil to a high degree of fertility. One of these counties, Warren, is the centre of the strawberry industry of the State. Eight counties west of the Tennessee, called the Purchase, an area of 2,300 miles, are composed of transported soils. The largest single area is the Eastern coal field, some 10,000 square miles, or one-fourth of the entire State, mountainous and easily eroded. Throughout the principal areas described thus far, however, are river alluvium sections, highly productive because of overflows. Also, in the best agricultural districts are found belts of poor land, thus presenting problems of scientific soil treatment. (Consult Exper. Station Bull. No. 193.)

Agriculture.—Although Kentucky and Tennessee are apparently artificial divisions of the same body of land, the slight difference in latitude and soils works a complete change in their characteristic products. Tennessee produces large quantities of cotton, while Kentucky produced but 3,469 bales in 1909, some all in one county, Fulton. The leading farm products are corn, tobacco, hay and wheat; and the State raises nearly all the hemp in the United States. Truck farms and orchards are frequent along the Ohio, especially near Louisville and Cincinnati. In 1910, 86.4 per cent of the land surface was in farms, and 64.7 per cent of this was improved. From 1900 to 1910 the number of farms increased 24,518 or 10.4 per cent, compared with 6.6 per cent increase in population. Intensive cultivation decreased the size of the farms to 85.6 acres; over one-fourth ranging from 50 to 99 acres. Those farms over 175 acres are only one-ninth of the total number, which was 259,185. Colored farmers operated only 11,705 farms, or about 2 per cent of the area. The most conspicuous change in the decade was in tenur; the number of cash tenants remained about the same while share tenants doubled. The farms owned by their operators constituted two-thirds of all; the value of all farms was $773,797,000.

The best-known crop is tobacco, of which Kentucky produces far more than any other State, and usually one-third of the total crop of the Union. In 1910 the total crop was 103,000,000 pounds; in 1915 425,000,000 pounds; in 1915 Kentucky raised 356,000,000 pounds, or 33 per cent of the total, North Carolina being next with 198,000,000 pounds. In 1918 the yield was 360,000,000 pounds, marketed at the highest prices ever recorded in the State, about 30 cents a pound, compared with averages as low as six cents in 1907. From the depressed markets of 1907, when good tobacco was sold at three and four cents, or was taken home by angry farmers, the recovery is due first to the unions of growers against the Tobacco Trust in Burley and Dark districts alike. These unions, attempting to coerce reluctant neighbors to join with them, precipitated the Night Riders' disturbances, which led to the posting of sentries by the militia to prevent the destruction of property. Pools, legalized by the legislature in 1910, took charge of the sales and raised prices by collective selling. With the outbreak of war in Europe came a large demand from the armies; and finally the rapid spread of predation among the pools have intensified the civilian demand for tobacco products. Christian and Daviess counties produce large quantities of the Dark or Pryor to-
bacco, much sought by French and Italian buyers, and popularly called *regie* tobacco, while the Blue Grass counties, such as Fayette and Bourbon, raise the sample of Burley leaf variety, sought for its absorptive qualities, and marketed at Lexington first in 1905 in baskets on the floor of warehouses. This practice has made Lexington the largest *loose leaf* market in the world, and has taken the supremacy from Louisville where the marketing is done by hogsheads.

Hemp is almost as famous as tobacco, but its decline is unchecked; in 1859, 78,818,000 pounds; in 1909, only 6,420,000 pounds. The high prices created by the World War revived this industry but little, the acreage for 1917 being 19,200—all in the Blue Grass counties. Other fibres from Mexico and the Philippines have supplanted it in the factories.

The largest crop in value and volume is corn, 124,372,000 bushels in 1917, valued at $160,000,000. Corn has furnished the material for the great distilling interests as well as food, and provender for animals on the farm.

Wheat from 1907 to 1917 yielded 10,000,000 bushels annually, aided by the fine crop of 12,540,000 bushels in 1914, the largest in recent years. The sulphur pastures yield large quantities of hay and forage. Blue Grass seed varies widely in output, from 200,000 bushels in 1910 to 1,500,000 in 1912 and back to 200,000 in 1917. Minor products are butter and cheese, 38,680,000 pounds in 1917; potatoes, 6,420,000 bushels in 1915; wool, 3,550,000 pounds in 1915; sorghum cane, 226,000 tons in 1909. Oats yielded 7,000,000 bushels for the first time in 1917. The value of miscellaneous crops in 1909 was placed in the census at $50,000,000.

Stock-raising.—The mild winter climate, permitting cattle to remain out with little feed, the excellent pastures of blue-grass which grows thick in the shade as well as in the open, and the abundant limestone water which produces a long growth of bone materials, all together promote the rearing of livestock with unexampled success. These advantages were seized by a rare group of breeders who have made Kentucky the centre of the Union for blooded stock. Especially is this true of thoroughbred horses. The old Virginia stock, bred from choice imported English animals, themselves bred to combine speed and endurance, were taken by the Kentucky breeders and kept pure or mixed with equally good fresh blood. Complete records and pedigrees constitute an important part of this work. Kentucky horses have made three-fourths of all the winnings on the American turf. The State Racing Commission, created by a law of 1906, has sustained the breeding industry at a critical period; and the demand for thoroughbred horses for remounts in the army and replacemen in foreign lands now exceeds the supply. Other breeders have applied similar principles to the improvement of sheep, swine and cattle. The number of horses reported in 1919 was 439,000; mules, 231,000; swine, 1,768,000; sheep, 1,274,000; cows, 4,416,000. The total value of all livestock on farms, $177,396,000. Poultry and products are important. Turkeys, in particular, are shipped to the Eastern markets.

Manufactures.—The immense hardwood forests, large coal fields and natural waterways for half a century after her admission to the Union, added impetus to the business of her neighbors industrially. But the rise of steam navigation built up the river cities at the expense of the inland towns, so that Lexington which had 114 factories in 1810, was eclipsed in a short time by her rivals. Other elements contributing to the same end were tardiness in building railroads into the forests and coal fields, and the absence of a wage-earning class such as immigration supplies. In 1850 the number of wage-earners was reported as 21,-476; in 1900 51,735; and in 1914 only 64,586. In 1914 the total value of manufactured products was $230,248,000. This was less than 1 per cent of the total value of the output of the nation in that year. In order of value, distilled liquors stood first, $48,562,526; 157 establishments giving the State second rank in the Union in this trade; the next in value was flour-milling of a value of $21,229,000; third was lumber products, valued at $20,657,000, with the largest number of operatives in any industry; fourth, tobacco products, valued at $17,120,000; fifth, cars and car-shop work, $13,344,000. No other industry reached $10,000,000 in value. The total number of establishments was 4,184, with a capital of $193,423,000. The tobacco industry, which claimed its small grain fields of every town in the 18th century, has declined relatively. Louisville, the principal hogshead market of the world, has some 17 plants for tobacco manufacturing. Owensboro and Henderson have establishments preparing the leaf for shipment. Bourbon whisky, so named from the county of Kentucky to which many Pennsylvania *moonshiners* removed after the suppression of the Whisky Insurrection in 1794 (q.v.), has become famous all over the world. Distilleries were set up as early as 1783 at Louisville, a little later in other towns and in 1787 along Salt River by a Maryland colony. Large establishments found favorable situations in many parts of the State. Their payments for internal revenue, checked by officers of the department, gave the State a first place in the Union in 1916, the total for liquors and tobacco being $35,870,087. The manufacture of malt liquors is concentrated largely in Louisville and Newport. Pork packing was a prominent industry until the growth of the Northwest caused its removal from the Ohio Valley. Nevertheless, Louisville has maintained a livestock market, receiving in 1918, 180,000 cattle, 46,000 calves, 780,000 hogs and 250,000 sheep and lambs. Her packing plants converted a large proportion of these receipts into food and other products. The firm position of the lumber industry is shown at each census. Logging is promoted by river improvement at the expense of the Federal government, whereby rafts may be sent to the cities from the upper courses of the Cumberland, Licking and Kentucky. During the World War some 2,000,000 walnut gunstocks were made for the Allies in the factories about Louisville. Carriages and wagons are made in Louisville. Harrodsport and Owensboro from the easily supplied forest woods. Iron and steel works are declining from their earlier position. The first furnaces were abandoned for lack of transportation facilities; in 1846
others were built at Eddyville on the lower Cumberland by William Kelly; and in 1851, five years before the Braxton boiler was patented, Kelly began his "air-boiling" process, essentially the same, for turning iron into steel. During these years steamboats were built at Cincinnati with boiler plates made by the Kelly process, and the latter finally secured a monopoly.

Louisville is prominent in the manufacture of jeans clothing, now being replaced by the casimères. Her proportion of the total manufacturing of the State is nearly one-half, being $105,000,000 in $230,000,000. Her fuel rates are the lowest in the Union among large cities not located in the coal fields. Her manufactures of sanitary ware, boxes and farm implements are noteworthy. She is the largest importer of mahogany logs in the United States.

Transportation.—Kentucky has 813 miles of navigable waters on her boundaries—the Ohio 643 miles, the Mississippi 50 miles, the Big Sandy 120 miles. The Cumberland and Tennessee are navigable their entire courses within the State. The railroads, as far advanced have made the Kentucky, Licking, Salt and Green much more valuable than formerly. The canal around the falls of the Ohio at Louisville has been widened recently. Still, the supremacy of the railroad is revealed in the statistics of coal shipments into Louisville in 1818: 84,142 tons by river, and 1,636,258 tons by rail. The railroad, however, has not overcome the difficulties of the mountains of the eastern and southeastern regions; until lately, hundreds of square miles of territory had not a mile of railroad track. This mountain area is a part of Appalachian America—picturesque, beautiful, full of survivals of the English of Elizabethan days. Unable to sell the grain from their small fields in the valleys and "coves," they converted it into whiskey in home-made stills and fought off or evaded the revenue collectors until miners, oil prospectors and travelers broke the seclusion of the hills. Then the settlers, in many cases, left their homes and sought places in the Blue Grass or elsewhere as farmers. Branches of the Baltimore and Ohio, Chesapeake and Ohio and the Louisville and Nashville roads have penetrated many of these remote districts. The total mileage in 1918 was 4,200, of which about 200 represented the two electric systems centering at Lexington for the Blue Grass towns and at Louisville for the suburban service. In western Kentucky the Illinois Central affords connection with Chicago and the South. The assessed valuation of all steam and electric lines 30 June 1917, was $160,252,387. Improved roads, especially those of the macadam type, have been common in the Blue Grass counties for nearly a century. When, therefore, a campaign was started in 1908 for a State tax for this purpose, these counties were reluctant to support such a measure. The new law (1912) imposed a road tax of five cents on each $100 of assessed property, created a State engineer and provided for the initiation of highway projects in the state not only county but also national highway projects have been advanced, such as the Lincoln Highway, Jackson Highway, etc. A natural accomplishment is the increase in automobiles and motor trucks. The licenses taken out in 1911 were 2,868; in 1914, 11,746; in 1915, 19,500; in 1917, 47,416; in 1918, 65,870.

Population.—The population of the State at the various censuses has been as follows: 1790, 73,677; 1800, 220,955; 1810, 406,511; 1820, 564,317; 1830, 687,972; 1840, 779,828; 1850, 982,406; 1860, 1,155,664, including 10,664 free negroes, and 210,981 slaves; 1870, 1,332,011; 1880, 1,585,690; 1890, 1,858,635; 1900, 2,147,174; 1910, 2,290,905. The foreign-born numbered 40,162, or 1.8 per cent; half Germans, the Irish following with 5,900. The colored population was 261,656, not so large as in 11 other States; nor are the colored people increasing so fast as the whites, there having been a decrease of 23,200 since 1900. Classified by city and county, 75 per cent is rural, while 25 per cent is urban. There seems also to have been some tendency among the negroes to emigrate, and a large emigration of whites, especially to Oklahoma and Texas, has occurred. The increase was 6.6 per cent and the density is 57 per square mile.

The one great independent city of Kentucky is Louisville (240,408) at the falls of the Ohio, the third in size on the river, excelled only by Cincinnati and Pittsburgh. Covington (59,623), Newport (32,133), Bellevue (6,683) and Dayton (6,979) are virtually suburbs of Cincinnati, the first-named west of the Licking, the last three east of it. Other cities on the Ohio, which monopolizes much the greater part of the urban development and manufacturing of the State, are in the west, Paducah (25,178) at the mouth of the Tennessee, Owensboro (11,070) and Henderson (12,312) in the northwest, Maysville (6,141); on the east, Ashland (12,195), now head of a rapidly growing iron and coke district. Lexington (41,997), the first capital, once called "Athens of the West," is the head of the Blue Grass region. Frankfort (11,179), the capital; Bowling Green (9,900), the head of navigation on the Barren River, a tributary of the Green; Hopkinsville (10,979); Winchester (7,156); Danville (5,420); Mayfield (5,916); Middleborough (7,305); Paris (5,859) and Richmond (5,340) are also over 5,000.

Charitable and Penal Institutions.—There are insane asylums at Lexington, Hopkinsville and Lakeland; a notable institution for the education of the blind at Louisville; a State school for deaf-mutes at Danville; and an institution for feeble-minded children at Frankfort, which, however, restricts the ages to the period of 6 to 18, and requires that they shall not be too feeble-minded for training. The State penitentiaries are at Frankfort and Eddyville, and the Reform School is at Greendale, near Lexington. About 2,000 feeble-minded are maintained in homes at State expense. Confederate veterans are aided by the Home at Pewee Valley, and by pensions voted in 1912.

Government.—The State officers are elected for four years, in the November preceding the Presidential election; they cannot be re-elected. The governor has a veto by items, but a majority vote overrides it. The legislature consists of 39 senators chosen for three years, and 100 representatives for two years. Sessions are biennial, and limited to 60 legislative days. Provisions concerning revenue bills and impeachments follow the model of Congress. Women (by a law of 1912) can hold office on
school boards and vote on school issues. No State, county, city or town officers except mem-
bers of city legislative boards can be elected in
the year of a Presidential election. The judi-
ciary is headed by a Court of Appeals, consist-
ing of not over seven or under five elective
judges, with terms of eight years. There are no
townships, only magisterial districts and the
counties in old Virginia, is the political unit.
There are 120 counties. Each county is entitled
to three sittings of a Circuit Court each year.
The circuit judges are elected for six years.
There is a county judge, and a monthly
court day. County officers are elected for four
years, except a Circuit Court clerk for two
years, and the sheriff is ineligible to re-election
except in alternate terms. Counties must have
a minimum area of 400 square miles, and the
county-seat must be at least 10 miles from the
boundary. There are 11 representatives in
Congress.

**Banks.**—The main features of the banking
history of the State include the Bank of Frank-
fort in 1808, and the Clearing House at Louis-
ville in 1820, which has more than once saved
many of the better banks from disaster in panics.
The clearings at Louisville in 1918 were $1,159,000,000; those at
Lexington, $64,248,000. Not until 1912 was a State Department of Banking legally established,
although Secretary Bruner, under Governor
Willson, in 1910 began to inspect State banks
in consequence of several failures. The re-
port for 1918 included 444 banks and trust
companies, with aggregate capital stock of $19,-
148,690; surplus, $8,030,000; deposits, $131,-
000,000. Including the national banks the total
deposits were $206,951,865.

**Finances.**—The assessed valuation for 1917
was $922,456,000; for 1918, $1,403,978,000, an
increase due to war prices and to new valu-
a tions by the Tax Commission which was
created in 1917, under the authority of a con-
stitutional amendment of 1915. This law re-
quires the classification of property, and ex-
empts certain classes from local taxes. Its
various provisions make Kentucky as pros-
perous and as heavy in taxation as any State in
the Union. The tax rate is reduced from 55 cents to 40 cents per $100.
The income, however, is divided into parts, or
funds, arbitrarily, so that some expenditures
are not fully met, which other departments may
self-sustain. No funded debt is allowed, but
the deficiency of about $3,000,000, mostly
incurred since the construction of a new cap-
tol, is carried as a floating debt in the form
of treasury warrants which are redeemed as
surplus accumulates in the treasury. The
revenues and receipts are close to $10,000,000
yearly, of which sum the city of Louisville con-
tributes one-fourth. Losses of revenue oc-
casioned by prohibition will delay the reduc-
tion of the debt. On the other hand some re-
lief is seen in the growth of public service
corporations now assessed at $70,941,824, as
well as in that of oil companies. Local con-
ditions are among the best in the Union.

**Social Legislation.**—Kentucky’s lawmakers
have in the past 15 years adopted most of the
progressive legislation of the age: Conserva-
ton of natural resources, mine safety appli-
cances, child labor restrictions, compulsory
school attendance, laborers’ compensation acts,
tax reform, high schools, agricultural ex-
tension programs, juvenile courts, prison pro-
bation, care for delinquents and dependents,
bank inspection, training for teachers, fire
prevention and insurance. They have quickly
accepted the various proposals of co-operation
extended by the Federal government in educa-
tional and improvement matters, and ratified
the amendments on income taxes and pro-
hibition. To apply most of these reforms they
have appointed competent commissions.

**Churches.**—The religious census of 1906
placed the church membership in Kentucky in
the following rank: Baptists 06 all bodies, 311,-
583 or 36 per cent of the total number of mem-
biers; Roman Catholic, 165,908 or 20 per cent;
Methodist bodies, 156,007 or 18 per cent;
Disciples of Christ, 136,110 or 16 per cent.
These figures of course include colored as well
as white communicants.

**Education.**—The school census of 1916-17
reported 740,576, of whom 352,059 or 48 per
cent attended school. Those enrolled were
555,568 or 75 per cent of the total number of school
age. Those above the age of 20 and
below 6, in school, were 12,807. The total
number of teachers was 13,031, mostly women.
The number of schoolhouses was 8,616, of
which 7,035, or about seven-eighths, had one room.
Progress was evident, however, in the construc-
tion of 407 new buildings during the year.
The value of all school buildings and ground
was $140,709; of apparatus and furniture,
$1,523,468 more. In 1917-18 the expenditures
on the public schools were $8,142,484.28, or an
average of $14.66 for each pupil enrolled.
The terms have happily been extended. A deter-
mined effort along this line has put the great
majority of schools—7,567—in the seven
months group; 335 have eight months and 306
have nine months. This result is in marked
contrast with conditions a few years earlier.
Obviously, attention has been given to the
matter of attendance, which was 18 per cent in
1916. The child labor laws. The Kentucky Child Labor
Law of 1908, improved since that date, is
one of the most advanced in the Union.
In some of the cities a Juvenile Court with proba-
tion officers, assistants, police court officer
and the school officers in requiring attendance
at school. These results flow from a general
revision of the educational laws and require-
ments in 1908. Volunteer speakers and workers car-
ried on educational campaigns throughout the
State to awaken public sentiment, and each
session of the general assembly since then has
taken deep interest in legislation affecting the
schools. Besides other features one may men-
tion the Truancy Act of 1908; the Illiteracy
Commission of 1910; County High School Act
of 1908; and its modification in 1916 permit-
ting co-operation by two or more counties;
increased sources of revenue by various acts;
addition of agriculture and domestic science
to the curriculum.

The endeavor to eradicate illiteracy, the extent
of which is subject to various estimates in the
absence of accurate figures, was begun in
Rowan County, September 1911, in what were
called "moonlight" schools, intended for adult
illiterates. Volunteer workers taught older
KENTUCKY

Confederate Monument at Frankfort
men and women to read and write. Their work created a better attitude toward the day schools, and has been extended to the army cantonments where illiterate soldiers are taught by workmen from various associations. The legislature voted $5,000 for this commission in 1916. Other States have followed Kentucky in this reform.

High schools are of comparatively recent origin and are operated by private schools and colleges for the wealthy class, so that public education languished. After the reorganization of 1908, the General Education Board provided an inspector and examiner for several years. Under these influences the private schools have given place to high schools, often selling their buildings and equipment to the board of education. County high schools have grown rapidly in the rural counties, about 20 each year since 1909, and the total, city and county, in 1917 was 376, with 20,800 pupils, 1,288 teachers, and 2,208 graduates. Two-thirds of the teachers were college or normal graduates, and libraries were found in 272.

Kentucky provides for colored pupils in separate schools, and the United States Supreme Court upheld the principle by requiring Barren County to remove colored students to a separate place—Lincoln Institute, near Shelbyville. The Kentucky Normal and Industrial Institute is at Frankfort.

In 1916 there were 4 private normals, 17 commercial and 83 private schools of secondary or collegiate rank. Both white and colored schools are supported by taxes which pass through the State treasury, thus making the richer counties assist the poorer. The reports, however, may create a misleading impression because many communities keep local taxes low under cover of State aid. Recent legislation permits counties to levy local taxes up to 30 cents per $100 for their schools. This act, aided by better inspection, will probably complete the reform and give Kentucky schools equal to the best in rural States.

Kentucky's school fund for 1917 consisted of the following: Interest on bonds (perpetual), $138,939; license taxes, $156,000; sheriff's collections, $2,285,000; fines, $30,000; tax on distilled spirits and liquor dealers, $320,000; banks and bank deposits, $200,000; oil (1 percent of market value), $100,000; railroads, $332,000; dog tax, $35,000; race track licenses, $25,000; corporations, $110,000; inheritances, $70,000. Total, about $3,800,000. These sums represent parts or in a few cases the whole of various items named by law for support of the schools. Other portions are devoted to other "funds," as they are called.

The head of the public school system is the University of Kentucky at Lexington, formerly the A. & M. College, founded under the Morrill Act of 1862. In 1878 it was detached from Kentucky (Transylvania) University, and by subsequent acts of the legislature its functions were enlarged. It has colleges of arts and science, agriculture, engineering and mining, and law. In conjunction with the Experiment Station it has a school of horticulture. It has the facilities of 300 acres of land property worth $1,200,000, and a combined income of $900,000 annually. Transylvania University, founded in 1789, once known as Kentucky University, is now under control of the Christian denomination. Both Transylvania and Center College, at Danville, long under Presbyterian control which was broken by various associations. The legislature voted $5,000 for this commission in 1916. Other States have followed Kentucky in this reform.

High schools are of comparatively recent origin and are operated by various associations. The legislature voted $5,000 for this commission in 1916. Other States have followed Kentucky in this reform.

History.—The earliest inhabitants built mounds in the northern and western parts of the State. They left burials in rocky cliffs, caves, or mounds. A fortified hill remains in Madison County (Indian Hill), but no definite proof of Indian occupation, however, are plentiful. A large Indian town existed at Indian Fields, Clark County, but no other town has been identified. Despite an abundance of game no nation held Kentucky in force, but Iroquois and southern tribes knew it well. Their war parties and hunters and even traders came from remote regions as we learn from stone and metal relics. Copper from Lake Superior, hard substances from the Rocky Mountains, shells from the Gulf of Mexico, and other mute evidences of trade and travel attest the popularity of this region before 1750. In that year the Loyal Land Company sent Thomas Walker by way of Cumberland Gap, which he named, into the new country as far as the Kentucky River. He returned without finding good lands and made an unfavorable report. In 1750 also, Christopher Gist (q.v.), a Yadkin man, employed by the Ohio Land Company, traveled from Pittsburgh to a point near the falls of the Ohio (Louisville). Thence he crossed the Blue Grass and returned to the Yadkin. In 1752 a trader, John Finley, on a trip down the Ohio was captured by Shawnees, taken to Indian Fields and held captive several months. The French and Indian War delayed further exploration until 1765. In May 1769 Finley took several Yadkin farmers, among them Daniel Boone, later a hero of both frontiersmen and Indians, on what proved to be a protracted visit to Kentucky. A company from the Holstein and New River district followed in 1770. Stories circulated by these pioneers created an intense desire on the part of many to move there, and surveyors were active in 1773 locating bounty lands for Virginia soldiers. Harrodsburg was founded in 1774; Booneborough, where the fortification was held, was laid off in 1775. In the meantime Richard Henderson purchased from the Cherokees their claim to the vast area between the Kentucky and the Cumberland for the Transylvania Company (February 1775), which began to sell land to actual settlers. Both Virginia and North Carolina disapproved of this policy and in 1776 the former incorporated the region as Kentucky County, suc-
ceeding Fincastle County. Henderson received tardy justice in later years with another grant.

During the Revolution Kentucky was harried by British and Indian attacks on the St. L'Ohio. Many settlers went away but others remained and a few even joined Clarke at the Falls for his expedition to Vincennes. Louisville and Lexington were laid off in 1779 and Lexington colonists founded Cincinnati. In November 1780 Kentucky was divided into Fayette, Jefferson and Lincoln counties, thus losing its name for three years. Indian attacks in 1782 were severe: Estill's defeat and Lower Blue Licks proving disastrous for the whites, and leading to Clarke's retaliatory attack on the Miami towns. Kentucky was born with the Republic in the decade 1782-92. Despite Indian depredations, population rose to 30,000 in a few years. Danville was the seat of the new judicial district of Kentucky. The failure of Virginia on numerous occasions to protect the growing settlements from Indian attack so alienated the people that rumors of separation were rife; moreover, most of the settlers were from Maryland, Pennsylvania and Carolina. Reports of a Cherokee attack in 1784 led to a convention by Danville delegates being chosen according to population. Nine other conventions voiced this demand in petitions to Virginia and Congress. Willinson and Spanish agents thought this sentiment might be turned to Spain's advantage; economic conditions pointed in the same way but the Kentuckians did not respond. On 1 June 1792 the State was admitted with a constitution granting full manhood suffrage—one of the earliest in the Union. For six months Lexington was the capital; then Frankfort replaced her. Kentucky was from the first anocratic and, like all frontier States, sensitive to complaints of injustice and discrimination. The difficulty of shipping produce to the seaboard seemed to support the plots of Wilkinson and Burr. Similarly, the harsh aspects of the Alien and Sedition Acts of Adams drew forth the spirited response of the Kentucky Resolutions of 1798 and 1799. Clay and other young leaders so fanned the embers of their fathers' bitterness against British and Indian warfare that the State raised for the War of 1812 7,000 soldiers though her quota was 5,500. Her troops saw service at the Raisin, the Thames and at New Orleans. In 1818 the western boundary was extended to the Mississippi through the purchase of the United States of the Chickasaw lands west of the Tennessee. This area extended into Tennessee, so that a southern boundary also required accurate adjustment. This was effected by a joint commission. The financial depression after 1818 created a large debtor class to which the legislature promised relief. This it did by chartering the Bank of the Commonwealth and making its notes a legal tender. Opponents, called the Anti-Relief party, secured a decision of the courts declaring the act unconstitutional. Undaunted, the Relief party elected a legislature pledged to destroy the bank and create a new court in its place. After five years' struggle the old judges were restored in 1826. The census of 1820 reported 564,317 inhabitants, which gave Kentucky the sixth place. Keenly alive to the need of an outlet for produce, the Blue Grass built the first railroad west of the mountains, between Lexington and Frankfort, running the first train in 1835. Under the leadership of Clay and Indian agent, Kentucky furnished both presidents of the opposing sections—Lincoln and Davis. Governor Magoffin refused to honor Lincoln's call for troops; yet the State sent 80,000 men to the Union armies, while 40,000 joined the Confederacy. Bragg's invasion of 1862 and Morgan's frequent attacks caused much suffering.

An attempt to install a Confederate government preceded the severe battle of Perryville, after which Bragg retreated leaving the State in Federal control. The emancipation of slaves without the compensation which Lincoln often recommended, caused a loss of $150,000,000; and the harsh measures of Burbridge and other commanders turned many Union men against the government so that the Democrats have carried every election since 1877. In 1896 the Republicans secured 12 of the 13 presidential electoral votes. Kentucky rejected the XIII, XIV, XV and XVII amendments to the Constitution. The Goebel Election Law of 1898 put the supervision of elections in the hands of three commissioners appointed by the legislature. After the election of 1899 these commissioners certified that Taylor had a plurality of 2,383 votes over his opponent Goebel. Irregularities in Louisville and elsewhere caused one commissioner to dissent from this decision, and the Democratic candidates gave notice after Taylor was seated that they would contest his election before the legislature. Two contest committees were appointed, one from each House, and Taylor's supporters, alarmed at the prospect of his losing his seat, gathered in Frankfort. On 30 Jan. 1900 Goebel was mortally wounded by a concealed rifleman. The legislature assembled the next day to hear the report of its committees, which declared Goebel and Beckham had received a plurality of the legal votes. They took the oath of office the same night, Goebel serving as governor until he died, 3 February. These events caused much excitement and confusion, the consequences of which cannot be related here.

The disorders of the Civil War period have died hard. Survivals of guerilla bands appeared in the Regulators of 1888 and in the Ku-Klux of 1871. In 1897 sporadic uprisings against toll gates on the highways ultimately resulted in freeing the roads of tolls in most counties. In 1907 the Night Riders, endeavoring to obtain fair prices for their tobacco, precipitated another crisis during which barns were burned and a costly fire visited Hopkinsville. During the Great War the same spirit was more profitably and patriotically devoted by similar bands to the suppression of German sympathizers. Kentucky used this delusion in our recent wars. The call for volunteers for the Spanish-American War attracted more men than were needed. Lexington was the concentration camp from which after a period of preliminary training the men were
moved to Chickamauga. Of the four regiments organized, the First took part in the conquest of Porto Rico, while the Third was sent to Cuba. Under the Selective Draft Act of 1917 volunteer units were merged in the National army, making it impossible to trace the fortunes of former commands. As in the previous war, Lexington was again made the preliminary camp, though Winchester received the Second Regiment. Upon the completion of the cantonments, however, most of these soldiers were sent to Camp Meade. The largest camp in the army, Zachary Taylor, was prepared at Louisville for the training of infantry; while artillery ranges were provided at West Point and Camp Knox. The various drafts took 58,330 men into the army; 15,934 enlisted in the army and 5,619 in the navy; a total of 77,883. Of these nearly 3,000 made the supreme sacrifice for their country. The civilian population loyally sustained the government in Red Cross work, the sale of bonds and all other activities. A list of Kentucky's distinguished sons would include John F. Harlan; sculptor; Ephraim McDowell, surgeon; N. S. Shaler, geologist; Theodore O'Hara, elegiac poet; Henry Clay (born in Virginia), J. J. Crittenden and J. G. Carlisle, statesmen. Several living authors also enjoy a wide reputation in letters and science.

GOVERNORS OF KENTUCKY.

Isaac Shelby, Democratic-Republican.

James Garrard, Democratic-Republican.

Christopher Greenup, Democratic-Republican.

Charles Scott, Democratic-Republican.

Isaac Shelby, Democratic-Republican.

George Madison, Democratic-Republican.

Abraham Lincoln, Republican.

John Adair, Democratic-Republican.

Joseph Desha, Democratic-Republican.

Thomas Metcalfe, National Republican.

John Breathitt, Democrat.

James T. Morehead.

Charles Wickliffe.

Robert P. Letcher.

William O. Strother.

John J. Crittenden.

John L. Helm.

Lincoln.

Laurens W. Powell.

William S. Taylor, Republican.

William Goebel, Democrat.

T. K. Hymans, Democrat.

Augustus E. Wilson, Republican.

James B. McCreary, Democrat.

Augusta O. Stanley.

EDWARD TUTHILL,

Professor of History and Political Science, University of Kentucky.
by the Cumberland Pipe Line Company, and the greater part of that of Allen County is taken in tank cars by the Indian Refining Company from Scottsville, where the present pipe line now runs, to show about 10,000 barrels per week. The large plants of the Eina Refining Company, the Standard Oil Refining Company of Kentucky and the Stoll Oil Company are located at Louisville. The total Kentucky oil production for 1919 is estimated at 7,500,000 barrels. Geologically the accumulation of petroleum in Kentucky is generally antecilinal below the top of the Mississippi system and synclinal above. Sand porosity is perhaps the greatest accompanying factor in the recently large developed fields. The geological range of production is from Ordovician to Pennsylvanian inclusive.

During the latter part of 1918 and early 1919, the Indian Refining Company and several local pipe line concerns took oil from the Lee County fields, and their totals materially affect the foregoing figures.

**Willard R. Jilson, Kentucky State Geologist.**

**Kentucky, the State University of,** a coeducational institution at Lexington, Ky., founded in 1865, as a part of Kentucky University now known as Transylvania College. It was reorganized in 1878 under the name of the Agricultural and Mechanical College; as the State University of Kentucky in 1908, and as the University of Kentucky in 1916. It has agricultural, engineering, law, scientific, collegiate and graduate courses which lead to the bachelors and masters degrees. The campus contains 72 acres, presented in part by the city of Lexington, and the agricultural experiment station farm contains 250 acres. The income from both Federal and State appropriations is about $520,000. The number of instructors in 1919 was 104, experimental station experts and clubs and agricultural extension staff, 121, and the number of students in attendance was 1,355. The value of the buildings, equipment and land is about $1,200,000. The number of volumes in the library is 40,000. In co-operation with the United States Department of Agriculture, the University carries on a State-wide agricultural extension.

**Kentucky Bluegrass.** See Grasses.

**Kentucky Coffee-Tree,** a large tree (Gymnocladus dioica), allied to the locusts and redbuds of the family Catalpinaceae, and growing rather sparsely throughout the middle region of the Mississippi Valley. See Gymnocladus.

**Kentucky Resolutions,** a famous series of nine resolutions introduced into the Kentucky legislature in 1798, by George Nicholas, though it was afterward known that Thomas Jefferson was the author of them. They were directed against the Alien and Sedition laws, and against acts passed to punish frauds on the Bank of the United States, and emphasized the rights of the several States. These resolutions were the outgrowth, together with a similar series known as the Virginia Resolutions, of a feeling that the Federal party was making a strained and illegitimate use of the powers granted to the Federal government by the Constitution. The Kentucky Resolutions were passed for the purpose of defining the strict-construction view of the relative powers of State and Government. They declared that the Union was not based on the principle of unlimited submission to the General Government; that the Constitution was a compact, to which each State was a party as over against its fellow States; and that, in all cases not specified in the compact, each party had a right to judge for itself, as well as to the mode and measure of redress. They proceeded to set forth the unconstitutionality of the Alien and Sedition Acts, and invited other States to join in declaring them void. No favorable response was evoked. In 1799 the Kentucky legislature went further, and declared a nullification of a Federal law by a State to be the rightful remedy in cases of Federal usurpation. Upon these resolutions the doctrines of nullification and secession were later founded.

**Kentucky River,** a river of Kentucky, formed by two forks which rise in the Cumberland Mountains, and, after a winding northwest course of about 250 miles, enters the Ohio, 12 miles above Madison, Ind., midway between Cincinnati and Louisville. The river runs through part of its course between perpendicular limestone walls. It is navigable by steamboat beyond Frankfort, a distance of 60 miles, and flatboats can ascend 100 miles farther. At High Bridge, Jessamine County, midway between Nicholasville and Harrodsburg, spanning the gorge is the famous old Kentucky River high bridge erected late in the 70s of the 19th century. Its daring construction at the time as one of the first long span cantilever bridges in the United States and its reconstruction in 1910 are notable. The new structure built 31.3 feet above the grade of the old bridge was erected on the line of the old structure without false work and without any serious delay to the traffic of the Queen and Crescent Route over the old bridge. The new structure has three spans, each 353 feet long, resting upon steel towers and abutments, with top spans 55 feet and 69 feet long, one at each end of the bridge. The track crosses the river at an elevation of 30 feet above low water, and the total height of the top chord above the bottom of the foundation of the piers is over 319 feet.

**Kentucky University.** See Transylvania University.

**Kentville,** county town of Kings County, Nova Scotia, Canada. It lies about 70
miles northwest of Halifax with which it is connected by rail. Among its manufactures are sashes and doors, paper and other woodwork, milling machinery, wagons and automobiles. A dominion experimental farm is situated close to the town, and in the neighborhood there is also a military camp while within the corporation is a provincial sanitarium. Pop. 3,500.

KENYON, ken'yôn, Sir Frederick George, English classical scholar: b. London, 15 Jan. 1823. Graduated from Oxford, he became fellow in Magdalen College, there, in 1888 and assistant in the British Museum the following year, and nine years later assistant keeper of manuscripts. In 1917 he was president of the British Academy. When the European War broke out he went as major of the Territorial forces to France where he served through the war. Among his numerous publications are 'Aristotle's Constitution of Athens' (1891); translation of same (1891); 'Classical Texts from Papyri in the British Museum' (1891); 'Orations of Athenagoras and Philipides' (1892); 'Catalogue of Greek Papyri in the British Museum' (1893-1907); 'Our Bible and the Ancient Manuscripts' (1895); 'Bacchylides' (1897); 'Paleography of Greek Papyri' (1898); 'Fragments of Biblical Manuscripts in the British Museum' (1900); 'Handbook of the Textual Criticism of the New Testament' (1901); 'Robert Browning and Alfred Domett' (1900); 'Buildings of the British Museum' (1914). He has also published much about the work of the Brownsings. He was knighted in 1911.

KENYON, James Benjamin, American poet and Methodist clergyman: b. Frankfort, N. Y., 26 April 1858. After his graduation from Hungerford Collegiate Institute in 1875 he studied theology, entered the Methodist ministry and after holding various important pastorates retired in 1906. He was a member of the editorial staff of 'The Standard Dictionary' (1910-12), was associate editor of 'The American Biographical Cyclopaedia' (1912), and has been a member of the editorial staff of 'The National Cyclopaedia of American Biography' from 1913 until the present time. He is a frequent contributor to leading magazines. He is well known among American verse writers of the present, his published collections of poems including 'The Fallen and Other Poems' (1876); 'Out of the Shadows' (1880); 'Songs in All Seasons' (1885); 'In Realms of Gold' (1887); 'At the Gate of Dreams' (1892); 'A Little Book of Lullabies' (1898); 'Poems' (1901). In prose he has published 'Lottings in Old Fields' (1901); 'Remembered Days' (1902); 'Retribution: A Tale of the Canadian Border' (1903).

KENYON, William Squire, American senator: b. Elyria, Ohio, 10 June 1869. Educated in law at the State University of Iowa, he began to practice his profession at Fort Dodge, Iowa. After filling the offices of county prosecuting attorney, district judge, district attorney and general attorney for the Illinois Central Railroad (1907-10), he became assistant to the Attorney-General of the United States (1910-11), and United States Senator (1913-19). In the Senate he advocated considerable progressi-
form of government and has a population of 16,500.

KEOKUK, Moses, an American Indian of the Sac and Fox tribe, after whom the city of Keokuk, Iowa, was named; b. 1818; d. near Kansas City, Mo., October 19, 1863. Probably the best description of Keokuk's boyhood is contained in Drake's 'History of the North American Indians.' It tells of his visit to Washington after the Black Hawk War. Keokuk succeeded to his father's chief of the Sac and Fox tribe, and removed with his people from Quenemo, Kan., to their reservation in what is now Oklahoma, in 1868.

KEPHIR, ké'fér, a native Caucasian drink made from fermented milk. See Kefir.

KEPI, kā'pě', French infantry forage cap. In derivation the word is apparently related to the English cap, though its origin is uncertain. It was first worn by French troops in Algeria; but the use spread to all the French infantry soldiers, and to school boys first in France, but afterward to students of other countries. It has been much affected as a military cap by many countries and schools having a military department and student uniforms in the United States. It varies in style, but is always flat-topped with horizontal or slightly inclined vizzor.

KEPLER, Johann, German astronomer and mathematician; b. Weil der Stadt, Württemberg, 27 Dec. 1571; d. Regensburg (Ratisbon), 15 Nov. 1630. A contemporary of Galileo and Tycho Brahe, Kepler was one of the world's greatest astronomers, the real founder of modern astronomy; the one who first reduced the theory of the telescope to its true principles and laid down the common rules for finding the focal lengths of single lenses, and the magnifying power of telescopes. His excursions in geometry produced epoch-making results; he established the symbolism of the sectio divina or proportio divina, now known as the "golden section," and towered above all his contemporaries in stereometric investigation. Prematurely born of youthful, ill-matched parents, Kepler was physically a weakling, neglected in childhood and spending his early student years between struggling for an education and working in his father's tavern. He worked his way through elementary schools by winning scholarships which enabled him to reach the University of Tübingen. In 1593 he was appointed a teacher of mathematics at Graz (Styria), where he devoted himself with much ardor to the study of astronomy, and attracted the attention of Tycho Brahe (q.v.) by dissertations on celestial orbits. But in 1599 religious persecutions commenced in Styria, and Kepler, being a Protestant, gladly accepted Tycho Brahe's invitation to Prague, to assist in the preparation of the new astronomical tables, called the Rudolphine tables. Tycho died in 1601 and Kepler continued the work alone, being appointed imperial mathematician and astronomer. After many years of incessant labor the tables were completed in 1624 and published in 1627 at Ulm. Kepler had become the possessor of all Tycho Brahe's papers and the mass of observations made by that astronomer during 20 years, with a precision till then unsurpassed, enabled Kepler to establish the famous 'Kepler's Laws' (q.v.), which have proved so fruitful in the development of astronomical science. Kepler enjoyed the patronage of the Emperors Rodolph and Ferdinand, the dukes of Wurttemburg and Walenstein, but his life was a struggle with poverty; his salary was frequently in arrears and he was exposed to much religious persecution, while his domestic relations were equally unfortunate. The latter part of his life was chiefly passed at Linz as professor of mathematics. He wrote much, but the work that has rendered him immortal is his 'Astronomia Nova, seu Physica Coelestis tradita Commentariis de Motibus Stellae Martis' (New Astronomy, or Celestial Physics delivered in Commentaries on the Motions of Mars) (1609). His 'Harmonice Mundi' appeared in 1619; and among other works may be cited 'De Stella Nova in Pede Serpentarii' (1606); 'De Cometis' (1619-20); 'Chilias Logarithmorum' (1624). Consult 'Lives' by Brewster, Gunther and Muller; also Breitschwert, 'Johann Keplers Leben und Wirken' (1831); Hasner, 'Tycho Brahe und Kepler in Praq' (1872); Reitlinger, 'Johann Kepler' (1868); Reusch, 'Kepler und die Astronomie' (1871). An excellent biography of Kepler is given in 'Allgemeine Deutsche Biographie' (Vol. XV, Leipzig, 1862); Bryant, W. W., 'History of Astronomy' (London 1907).

KEPLER'S LAWS, in astronomy, three laws of motion discovered by Johann Kepler (q.v.) on which were founded Newton's discoveries, as well as the whole modern theory of the planets. 1) Every planet describes an ellipse, the sun occupying its focus. 2) The radius vector (line joining the centre of the sun with the centre of the planet) of each planet sweeps over equal areas in equal times. 3) The squares of the periodic times (the periods of complete revolution round the sun) of any planets are proportional to the cubes of their mean distances from the sun. These laws enabled Newton to determine the laws of the attraction of gravitation, while another result of these discoveries was to ensure for the Rudolphine tables an accuracy far exceeding that of any previous ones. Kepler did not apply his theory to comets, as he believed that they never returned. According to his idea the tail of the comet was evidence that the sun was driving the body of the comet away and dissipating its substance forever. See Astronomy; Comet; Law of Gravitation. Consult Astrand, 'Keplersche Probleme'; Closs, 'Kepler und Newton und das Problem der Gravitation' (1908).

KEPEL, Augustus, British admiral; b. 25 April 1725; d. 2 Oct. 1786. He was the second son of the 2d Earl of Albemarle, entered the sea service at an early age, and in 1755 commanded the North American squadron in Hampton Roads. He was placed in command of the Channel fleet in 1778, and in July of that year engaged the French fleet off Ushant. Having become partly disabled he signaled for his van and rear divisions, but Palliser in command of the rear ignored the signal until too late. Palliser accused him of incapacity and cowardice, but Keppel was honorably acquitted. In 1782 he was created Viscount Keppel and Baron Eldon. He was first lord of the admiralty 1782-83.

KEPEL, Sir Colin Richard, British admiral, b. 1862. After long military service in
Egyptian waters and the Mediterranean principally, he became commander in 1895. His services in command of gunboats on the Nile (1897–98) were very effective, as was also his work in the Soudan the following year. He became rear-admiral and was in command of the Atlantic Fleet (1909–10).

**KEPPLE, Frederick**, American writer on art: b. Tullow, Ireland, 1846; d. 1912. Educated at Wesley College, Dublin, he came to the United States on graduation and opened in New York city, a place as an art dealer, in which he acquired a national reputation, especially as a judge of etchings and engravings. He lectured, translated and wrote original works on art. Among his publications are 'The Etched Work of Jean François Millet' (translation: 'Modern Disciples of Rembrandt' [1890]); 'Christmas in Art' (1909); 'The Golden Age of Engraving' (1910). He opened branch houses in Paris and London.

**KEPPLE, Sir Henry**, English admiral and author: b. Kensington, 1859; d. 1904. Son of the Earl of Albemarle, he was educated for the navy, in which he served 1822, becoming successively, lieutenant (1829), commander (1833) and post-captain (1837). He saw service in India, the Mediterranean, South Africa and the Pacific Ocean, and commanded the naval brigade during the Crimean War (1854–55). During his second service on the Chinese coast, he destroyed the Chinese navy at Fatshan. He later held, in succession, the following offices: naval commander in chief at the Cape of Good Hope and on the Brazilian coast (1860–66); vice-admiral and chief of the China-Japanese squadron (1867–69); admiral (1869), stationed in England, where he was knighted for services (1871) and became admiral of the fleet in 1877. Among his published works are 'Expedition of H. M. S. Dodo to Borneo' (2 vols., 1847); 'A Visit to the Indian Archipelago' (2 vols., 1853); 'Reminiscences' (1898); 'A Soldier's Life under Four Sovereigns' (3 vols., 1899). Consult West, Algernon, 'Sir Henry Keppel' (London 1906).

**KEPPLER, Joseph**, American caricaturist: b. Vienna, Austria, 1 Feb. 1838; d. New York, 19 Feb. 1894. He early made his reputation as a satiric artist, and the leading periodicals of his native city were publishing his witty sketches, almost before he had left the Academy of Fine Arts. But art was not then a serious business to him and he took to the stage as a comedian and opera singer, and actually began to study medicine at Saint Louis, Mo., where he made his residence in 1868. But it was in Saint Louis that he found his real vocation. There he established the German Puck, which, while it failed as a commercial enterprise, made his reputation. It was seen at once that a caricaturist of rare skill as a draftsman, of mental fertility and freshness, of witty and incisive satire, had appeared. He was engaged from 1872 to 1877 as caricaturist for Frank Leslie's Illustrated Newspaper in New York, to which city he had removed 1875. He also started a New York German Puck in association with Adolph Schwartzman. This was followed in 1877 by the English Puck. He was the first to use colored cartoons in caricature and drew upon a vast store of classical and historical incidents for adaptation in criticizing modern social and political life.

**KER, John**, Scottish ecclesiastical writer and minister: b. Tweedmuir, 1819; d. 1886. Educated at Edinburgh University, he spent some time in Germany in post-graduate work. He became pastor of East Campbell Church, Glasgow, in 1851; and in 1876 was appointed professor of practical training in the United Presbyterian theological Hall. Among his published works are 'Sermons' (1866–88); 'The Psalms in History and Biography' (1886); 'Scottish Nationality' (1887); 'The History of Preaching' (1888); 'Letters' (1890).

**KERATIN** (from Gr. keras, a horn), a substance obtained from claws, feathers, hair, horn, nails, wool and other epidermal appendages. This tissue or substance is distinguished from gelatinous tissue by becoming soft when acted on by water for some time but no glue is produced. It is insoluble in alcohol and in ether and contains a high percentage of sulphur.

**KÉRATRY, kəˈrɑːtrɛː, Auguste Hilarion de**, French author and statesman: b. Rennes, 1769; d. 1859. During the French Revolution he was twice imprisoned and ran great danger of being executed on account of his high family connections. Later he became a member of the Chamber of Deputies and worked with the Liberals for the overthrow of Charles X. Louis Philippe for this work in his behalf made Kératry a peer of France (1837). Among his published works are 'Inductions Morales et physiologiques' (1817); 'Du beau dans les arts d'imitation' (1822); 'Le dernier des Beau-manoirs' (1824); 'Frédéric Stydall' (1827); 'Saphira' (1835).

**KÉRATRY, Count Émile de**, French soldier, journalist and dramatist: b. Paris, 1832. Entering the army at the age of 22 he served in Africa, Russia and Mexico. After 11 years' military life he resigned from the army and returned to Paris and devoted himself to literature, contributing to the chief reviews of the capital. His articles on the French occupation of Mexico during the Maximilian Empire expedition, which appeared in the Revue Moderne, made his name well known in France. Elected to the Deputies in 1869 he made himself conspicuous by his advocacy of reforms in the suffrage and the national militia. After the fall of the Empire he was successively Prefect of Paris, diplomat in Spain, commander-in-chief of the forces in Brittany, Prefect of Haute-Garonne, Prefect of the Department Bouches-du-Rhône and editor of Le Soir. He wrote political pamphlets, comedies, dramas and other works. Among his published books are 'La Vie du Club'; 'La guerre des blasons,' dramas; 'La Contra-Guerrilla française au Mexique' (1867); 'L'Élétvation et la Chute de l'empereur Maximilien' (1867); 'La Créance Jecker' (1868); 'Le quadrat de Septembre' (1872); Murad V, prince, sultan, prisonnier d'état (1878); 'A travers le passé, souvenirs militaires' (1887).

**KERAULI, or KARAULI, kə-rooˈlɛ, a native state of India which is ruled over by a rajah. It lies northwest of Gwafior and of the Chumbul River which forms its southeastern...**
boundary. The British government maintains an adviser at the court of the rajah. The whole state contains much valuable wooded land which is generally of a more or less hilly nature. The chief industry is agriculture and the principal products rice, barley and wheat, most of which is consumed at home. Area 1,242 square miles. Capital, Kerauli. Pop. about 150,000.

KERBELA, kér'bé-là, Meshhed Hosein, mesh'héd hò sán', city in Bagdad vilayet, and some 50 miles southwest of the city of Bagdad. It is connected by canal with the Euphrates. The city is Persian in the character of its buildings and its inhabitants and is looked upon as a very sacred place by the Shiias. In commemoration of the death of Hosein, son of the Caliph Ali, who was murdered there (680) and whose body is buried in one of the mosques of the city, a passion, or historic play is performed there yearly on the anniversary of his death, just as the greater play is held periodically in Theheran in commemoration of the death of Mohammed’s nephew, claimant for the robes of the Mahdi. For many years the sacred city was a place of refuge for criminals of all kinds who, once they had placed themselves beneath her protection, could not be extradited or brought to justice. The presence of this undesirables was the chief cause of much trouble within the city; and conditions got so bad that finally, in 1843, the right of sanctuary was formally done away with. Being a holy city in the eyes of the Shiias and Sunnis, Kerbela possesses five fine mosques, the most striking of which is that containing the tomb of Hosein, the golden-plated domes and minarets of which can be seen glistening from afar as though beckoning the pilgrims to the sacred shrine to which none but the faithful are permitted entrance. The number of pilgrims visiting the city annually is in the neighborhood of 200,000. More pilgrims probably visit Kerbela because it is en route for Mecca. The mosques are among the richest in Asiatic Turkey and their wealth is steadily increasing from year to year. Kerbela is the centre of an extensive trade and commerce which extends throughout northwest Arabia. Among its manufactures are kneeling-bricks and shrouds. The old city, which forms the central portion of Kerbela, has crooked, narrow, dirty and ill-paved streets. This part is surrounded by a very old massive wall. Outside this wall, which is 24 feet thick, is the new city which is quite modern and attractive.

KEREN-HAPPUCH. The name of the daughter of Job, born in the time of his restored prosperity. The name means horn of the face paint, i.e., a cosmetic box, or as we might say "joy-face." In the Septuagint the word is Amalthea-Keras, meaning horn of plenty, and in that sense has reference to Job's gratitude for his prosperity.

KERENS, kér'enz, Richard C., Irish-American diplomat: b. Killberry, County Meath, Ireland, 1842; d. 4 Sept. 1916. He fought in the Union side throughout the American Civil War. Later he became contractor for the overland mail and interested in railroad construction. From 1892 he was a member of the Republican National Committee until he was appointed ambassador to Austria-Hungary in 1909.

KERENSKY, Alexander Feodorovitch, Russian revolutionary statesman: b. Tashkent, Central Asia, 1881. A lawyer and journalist by profession, a dvoryaneen by birth and in social rank, his early life was a struggle for existence and education. He took a degree at the University of Saint Petersburg and practised in the courts as a "poor man's lawyer." His extreme socialistic and republican tendencies, his hatred of autocracy and strong sympathy with the masses prevented him from attracting clients among the higher range of society. Possessed of boundless ambition and a passionate flow of oratory, he turned to politics and became a member of the Duma of 1912-13. He had a number of prominent opponents, but he was never convicted. Though Kerensky was suggested for a place on the home committee of Kerensky in inciting the workers to struggle for power and for a constituent assembly. For some unknown reason he was not arrested and sent to Siberia, as thousands of his kind had gone before him, and for much less transgression. The Russian revolution of March 1917 and the fall of the tsar — events for which he had long striven, brought Kerensky to the front. In the first provisional government he was made Minister of Justice. Prince Lvov, the Premier, announced that the Grand Duke Michael would be appointed regent. The Soviet, or Council of Workmen's and Soldiers' Delegates, at once demanded a republic, and for an hour or two it seemed as if the new government would disappear in the horrors of a commune. Kerensky saved the situation by breaking in upon the Soviet meeting and with a short speech led the assembly to pass a resolution in support of the provisional government by a majority of 1,000 to 15. "We shall have our republic," he told them, "but we must first win the war, and when we can do what we will." The meteoric rise of Kerensky to the supreme power in the empire, and his dramatic fall and disappearance, are fully recorded under RUSSIAN REVOLUTION (q.v.).

KERESAN, or QUERES, (the aboriginal stock name), a group of Pueblo Indian tribes, in seven permanent villages on the Rio Grande and to the westward thereof, in New Mexico. They form the Queres, or Keresan, linguistic family, speaking a distinct stock language. The Indians claim to have had their origin at Shipapa, a mythic place in the north, from which they gradually drifted southward and occupied, still in prehistoric times, the Rito de los Frijoles, west of the Rio Grande, where they excavated the cavate lodges in the soft volcanic tufta cliffs still to be seen. These were abandoned before the coming of Coronado, in 1540, who found the Queres in seven pueblos (at Querol, Querolito, and probably Sia) forming the province of "Quiris," along the Rio Grande. In 1630 they were reported by Fray Alonso de Benavides to number 4,000, but this and other early estimates did not include Acoma. (See FUZALO.) The present queres pueblos are as follows:
Cochiti (native Kotvitii).—On the west bank of the Rio Grande, 27 miles southwest of Santa Fe, were the natives of Cochiti and San Felipe formed one tribe, but on account of the hostility of the Tewas (see Tewa Family), they divided, the latter building a village near their present pueblo, the former settling in the Potrero Viejo, which they later abandoned, moving to near their present location, where they were found by Oñate in 1598. The Cochiti villagers were active participants in the Pueblo revolt of 1680, killing their missionary, but continuing to occupy their town. On learning of the approach of the Spaniards to reconquer their town a couple of years later, they fled, with the people of Santo Domingo and San Felipe, to the Potrero Viejo, where they remained almost uninterrupted until 1692, when they were induced by Vargas to return to their homes. The Cochiti and Santo Domingo people again fled to the Potrero, however, where they were assaulted by Vargas in 1693 and severely defeated, 200 of their women being captured and their pueblo burned. Cochiti became the seat of the mission of San Buenaventura in the 17th century. Of the 16 clans 4 are extinct.

San Felipe (native name Katishya).—On the west bank of the Rio Grande, 12 miles above Bernalillo. Formerly combined with the people of Cochiti, but independently occupying the vicinity of the present site at least since 1540. It was the seat of one of the earliest missions of New Mexico, its first church being erected prior to 1607. The inhabitants participated with those of Cochiti and Santo Domingo in the great revolt of 1680, but aided Vargas in dislodging the Cochitiños from the Potrero Viejo in 1693. They had no resident missionary at the time of the revolt, but aided in murdering the priests of Cochiti and Santo Domingo. After leaving the Potrero in 1692 the San Felipe people built a new pueblo on a mesa northwest of the present town, where a church (the wall of which are still standing) was erected in 1694. This was abandoned early in the 18th century and the present pueblo established, the fourth to bear the name Katishya. Of the 30 San Felipe clans 9 are extinct.

Jemez (native name Kiwa or Dyiwa).—On the east bank of the Rio Grande, 18 miles above Bernalillo. In prehistoric times the inhabitants occupied successively the Potrero de la Cañada Quebrada and two pueblos called Guipuy, in the latter of which, on the Rio Grande, they were found by Oñate in 1598. Like its predecessor, the second Guipuy, as well as Huashpatzena, the settlement which followed, was swept away by flood, and the present Santo Domingo had three similar but less severe disasters between its founding in 1692 and 1886, when a fresher destroyed its fine old church with carved doors bearing the Spanish coat of arms. At the time of the Pueblo rebellion of 1680, it was an important mission seat and the residence of the custodian of the province, who, with two other priests, were slain. The pueblo has 18 surviving clans.

Santa Ana (native name Tamaya).—On the northern bank of the Rio Jemez, a western tributary of the Rio Grande. Before the Spanish advent the inhabitants lived nearer the Rio Grande and in 1598 resided on a mesa between the present pueblo and San Felipe. They joined the San Felipe and Santo Domingo people in the great revolt, but in 1687 the village was carried by storm and burned, several of the natives perishing. The present town was built after 1692. It became a mission early in the 17th century, but had no resident missionary at the time of the rebellion. Santa Ana has 7 clans.

Sia (native Tsia).—On the north bank of the Jemez River, 16 miles northwest of Bernalillo. It was formerly a pueblo of great importance, and in 1583 was said by Espejo to be the chief of five towns forming the province of *Punames.* It early became the seat of Nuestra Señora de la Asuncion. Its inhabitants made a most determined stand during the revolt of 1680, but in 1689 they were assaulted by the Spaniards, their pueblo wrecked, and the tribe decimated in the bloodiest engagement of the rebellion. Since this time the little town has been declining; Sia formerly had 37 clans, but of these only 16 survive.

Acoma (from Akómo, *People of the White Rock*).—This pueblo and Laguna form the western division of the Queresock. Acoma is picturesquely and strongly situated on a rock mesa, 357 feet high, about 60 miles west of the Rio Grande. It was first mentioned as *Acus* by Marcos de Niza in 1539 and visited by Coronado in 1540. Acoma has the distinction of being the oldest continuously occupied town in the United States. The natives treacherously killed several Spaniards of Oñate's force late in 1598, but in the following January the Spaniards led an expedition against the mesa, stormed and captured the town, killed about half the inhabitants, and burned some of the houses. Acoma became the seat of the mission of San Esteban in 1629; the natives murdered their missionary in the revolt of 1680, and remained in their fortified retreat until 1699, when they were induced to submit to the Spanish authorities. A present large church, with its remarkable cemetery filled in with earth carried from the valley below, dates from the reconquest. In prehistoric times the Acomas lived on the summit of an even loftier mesa, known as Katzima, or the *Enchanted Mesa,* three miles northeastward. Acoma is noted to tradition (verified by an examination of the summit and the surroundings of the mesa by F. W. Hodge in 1897), the only trail was washed away in a storm, leaving some of the inhabitants to perish; the village was henceforth abandoned. Population in 1680, 1,500; in 1760, 1,052; in 1902, 566. Of the 20 original clans 6 are now extinct.

Laguna (Span. *lagoon,* from a lake formerly west of the pueblo; native name Ka-wáik).—The largest of the Queres towns, and the most recently established of all the southwestern pueblos, having been founded in 1697 by refugee Queres from other villages, particularly Acoma, as well as by Indians of other stocks. It is situated on the Santa Fé Pacific Railroad, 17 miles northeast of Acoma. The town is being gradually abandoned, many of its inhabitants having moved westward to reside in their eight farming villages to the north and west. The Lagunas are very intelligent, honest and industrious, and are largely in demand as railroad laborers. The mission name of Laguna is
KERGULEN LAND — KERMES

San José, applied also to the rivulet on which the town is situated. The tribe has 20 clans. The total population of the Keresan Indians is between 4,000 and 5,000. Consult Goddard, P. E., 'Indians of the Southwest' (New York 1913).

F. W. Hodge,
Smithsonian Institution, Washington, D. C.

KERGULEN (kér-ú-lén) LAND, or DESOLATION ISLAND, an island in the Indian Ocean, located by lat. 40° 3' S., long. 68° 18' E.; length about 100 miles; greatest breadth about 50 miles; area, about 2,500 square miles. It has a remarkably barren and desolate appearance, due to the fact that it consists of lofty masses of basalt and other volcanic rocks. These rise to the height of 2,500 feet, presenting numerous bold headlands and ranges of precipitous cliffs, and possessing a very scanty vegetation. The highest point, Mount Ross, is over 6,000 feet. Sea-owl are numerous but no indigenous land animals exist on it. Its indentations furnish several bays and inlets affording good harbors. It was annexed by France in 1893, and some settlers have made their abode there at Port Jeanne d'Arc since 1907. Of the flora, which is arctic, the most noteworthy species is the Kerguelen cabbage (Frangula antarctica), a large edible plant, in many ways resembling common garden cabbage, and which has been valued on account of its antiscorbutic properties. The name of the island is derived from Kerguelen-Trémarec (q.v.), a Breton navigator who discovered it in 1772. Captain Cook (who named it Desolation Island) visited there in 1776, as also did the Challenger in 1874. There are some 300 smaller islands scattered around, and the waters abound in fish, whales and seals.

KERGULEN-TRÉMAREC, kár-é-lá-trá-már’ék, Yves Joseph de, French explorer: b. Brittany, 1734; d. 1797. He served in the navy and in 1771 was sent in command of a corvette by the French government to explore a great continent that was supposed to lie south of Africa. He discovered Kerguelen island (q.v.), took possession in the name of France, and returned home with the news that he had found the "continent." His claim was discredited, though he was promoted as a reward by Louis XV. A second voyage in 1773-74 still failed to convince him that he had only found an island. Various charges were brought against him; he was court-martialed and imprisoned, but pardoned by the king and ordered to write an account of his explorations. Captain Cook explored the archipelago 1766-77 and expelled the continental claim, which led the French government to order the destruction of the copies of Kerguelen's 'Relation de deux voyages dans les mers australes faites de 1770 à 1774', of which very few copies now exist. He was also a scientist and was made vice-admiral during the Revolution.

KERKI, kér-ké, capital and province, in Bokhara, Central Asia. The city is over 100 miles southeast of Bokhara city. Kerki, which has Russian-built fortifications which, a few years ago, were considered very strong, is situated on the Russian frontier and constitutes a center of the caravan trade, a market town of which stretch out from it in different directions. Pop. 5,000.

KERKUK, kér-kook', a city in Mosul, Asiatic Turkey, 140 miles almost straight north of Bagdad. It is the centre of an important trade in petroleum, with which are associated a neighboring oil region. Among the other industries are pottery-making, cotton goods and tanning; while its commerce includes fruit, timber, silk and hides. Tradition says that in the city is the tomb of Daniel the prophet. Pop. 23,000, nearly all of whom are Kurds.

KERLÉREC, kár-lá-rik, Louis Billouart, Chevalier de, French sailor and colonial statesman: b. Quimper, France, 1704; d. in France, 1770. After serving in the French navy and making a brilliant record for himself he became governor of Louisiana in 1752. He strove to defend the colony from the English privateers, the assaults of the Indians and the intrigues of British agents up the Mississippi. He worked under great difficulties for the French king took no interest in his great American possession. On his return to France, Kerlérec was tried and found guilty of malfeasance in office, apparently unjustly. He appealed from the decision of the court but died before the case was decided.

KERMAN, or KIRMAN, Persia, province in the southern part, bounded on the north by Yezid and Khorasan, on the south by Baluchistan and Gulf of Oman, on the east by Seistan and Baluchistan and on the west by Fars. The northern part is largely covered by desert, while the south is a more or less mountainous region. Although the climate varies greatly because of the different elevations, it is generally disagreeable and unhealthful. Cattle raising is extensive, also that of the well-known Kerman goats from whose soft hair is manufactured the beautiful shawls of the same name. The principal exports are the shawls, carpets, cotton, silk, gum and dates. Area, 65,000 square miles. Pop. about 600,000. The capital, Kerman, is located in a fertile region at an elevation of about 6,100 feet. Nearby are the ruins of two ancient forts; in many places the walls are still in perfect condition. Among others of less importance, the two mosques which deserve mention are Masjid i Malik, built in the 11th century, and Masjid i Jama, dating from about the middle of the 14th century. Pop. of city 60,000.

KERMANSHAH, or KIRMANSHAH, Persia, town, capital of the province of same name. It is situated on a small river at an altitude of 5,100 feet, about 250 miles southwest of Teheran. Formerly strongly fortified it is now practically an open town, and its location on the high road between Bagdad and Teheran greatly increases its commercial importance. It is noted for the manufacture of fine carpets, and also for its splendid horses. It has a very good trade for barley, wheat and fruit. Pop. about 40,000.

KERMES, the scarlet mycelium of Poland, cochineal, lac-lake, lac-dye, and all the modifications of gum-lac (see Lac) are either the perfect insects dried, or the secretions which they form. The first-mentioned substance is the Coccus cacti, and it is found in great abundance upon a species of evergreen oak (Quercus coccifera), which grows in many parts of Europe, and has been the basis of a crimson dye from the earliest ages of the arts. It was known to
the Phœnicians before the time of Moses; the Greeks used it under the name of κόκκος, and the Arabsians under that of kermes. From the Greek and Roman terms, and from the Latin name vermiculatum, given to it when it was known to be the product of a worm, have been derived the Latin coccineus, the French cramoisi and vermel, and the English "crimson" and "vermilion." The early Jews, the Greeks, and Romans, and until lately the tapestry-makers of Europe, have used it as the most brilliant red dye known. The scarlet grain of Poland (Coccus polonicus) is found on the roots of the Scleranthus perennis, which grows in large quantities in the northeast of Europe and in some parts of England. This, as well as several other species, which afford a similar red dye, have, however, fallen into disuse since the introduction of cochineal; and the introduction of aniline dyes has greatly injured the cochineal industry.

KERMES MINERAL, a name given to ammonium antimony trisulphide. The native antimony trisulphide occurs in well-developed orthorhombic prisms. When this compound is fused for some time, and suddenly thrown into cold water, its crystalline structure is entirely destroyed. Kermes is a burnt red powder, becoming blackish-gray when washed with boiling water. By fusion it may be obtained as a solid mass, but it is totally devoid of crystalline structure. See Antimony.

KERMES, kør' mês, KERMES, or KERMIS, formerly a church festival held by the Dutch and Flemish, and later in other parts of Europe, on the feast-day of the principal saint of a place or church. In the United States the word has come into general use for entertainments given for charitable purposes.

KERN, John Worth, American senator: b. Alto, Ind., 20 Dec. 1849; d. 17 Aug. 1917. Graduated in law from the University of Michigan (1869); he was city attorney for Kokomo (1871-84); reporter of the Indiana Supreme Court; member of Indiana State senate (1893-97); city solicitor of Indianapolis (1897-1901); candidate for governor of the State (1900 and 1904); governor (1906-1908); United States senator (1911); and floor leader of the senate (1913).

KERN, kør'n, Hendrick, Dutch Oriental scholar and writer: b. Island of Java, 1833. Educated at Leyden and Berlin. He taught Latin in Maastricht Atheneum (1858-62) and from 1865 on has been professor at Leyden. Among his principal published writings are: "Handeling bij het onderwijs der Nederlandsche taal" (1879-83); "Calculta" (1862); "Die Glossen in der "Lex Salica und die Sprache der Salischen Franken" (1869); "A Manual of Astronomy" (1874); "Over de aartelling der zuidelijke Buddhisten" (1875); "Geschiedenis van het Buddhismus in Indië" (1881-83); "De Fijdi-taal vergeleken mil hore verwanten in Indonesien en Polynesie" (1886); "Manuskript der Indischen Buddhismus" (1896).

KERN LAKE, a body of water in Kern County in the southern part of California; part of a small group of basins in the midst of an almost arid part of the State. Part of the year there is no apparent outlet, but at the period of high water the lake overflows into Kern River. The country around this lake and in the vicinity is noted for its large amount of game.

KERN RIVER, a stream in the southern part of California; almost its whole course is among the mountains of the southeast. The country in the vicinity is noted for game, and at one time valuable mining interests. In the western part of Kern County, the slough of the Kern River occupies an area of about 80 square miles. It flows into Tulare Lake. The valuable water power of this river furnishes electric light and power for the city of Los Angeles.

KERN RIVER SHOSHONEANS, a small body of Indians of the Shoshonean family in southern California, isolated from the parent stock. It is so linguistically different from the other members of this very extensive family of languages that it has been classed as a major division of the Shoshonean tongue. The few surviving members of this linguistic branch bear every evidence of having been long separated from the other linguistic groups of the common family. That they were strong enough to find their way to California would seem to indicate that they must have, at one time, been numerous and possessed of considerable military strength. It is still an unsettled question whether the Kern River Indians represent the furthest advance westward of the Shoshoneans; or are the remnants of members of this latter family which once probably held possession of the coast lands of California as they did other vast tracts of the North American continent. The historic Kern River Shoshoneans consist of two tribes, dialectically very similar: The Tubatulabal who live in the valley of the Kern River above the falls, and the Bankalachi who occupy the upper stretches of Deer Creek.

KERNER, kør'nér, Justinius, German poet: b. 1786; d. 1862. He belonged to the Schwabian school. He was at times morbid, fanciful, dreamy, sensitive and poetical and endowed with a strange, fanciful humor that gained him many admirers. He graduated in medicine and practised his profession in several towns of Germany. Among his published works are: "Reiseschatten" (1811), and "Die Seherin von Provost" (1829).

KERNSTOWN, Battle of. Gen. Stonewall Jackson abandoned Winchester, Va., 11 March 1862 and retreated up the Shenandoah Valley, followed by Shields' Union division
KERNSTOWN, second battle of — KERR

Beyond Strasburg. Shields was recalled to Winchester on the 20th, and Jackson followed him, his advance cavalry under Turner Ashby, engaging Shields on the afternoon of the 22d, near Kernstown, in which Shields received a severe shell-wound. Jackson came up on the afternoon of the 23d and, being informed that Williams' division of B. C. Rodes had left Winchester and was moving through the Blue Ridge for Manassas Junction, and that Shields had but four regiments in his front, determined to crush these and thus recall Williams and detain him in the valley. Shields had nearly 8,000 infantry and the cavalry of 27 guns. Two of his brigades on a ridge covering the road half a mile north of Kernstown, both under command of Col. N. Kimball. Jackson had about 3,000 infantry and 27 guns. Kimball was too well posted to be attacked in front, so leaving Ashby with the cavalry and a small brigade of infantry to hold the road and threaten Kimball's centre and left, Jackson seized a low ridge on Kimball's right, and placed on it his artillery and infantry. Tyler's brigade, which had been held in reserve, was brought up and made unsuccessful efforts to dislodge him, upon which Kimball, drawing from his left and centre, formed a column of seven regiments and, under a terrific fire of artillery and musketry, led it forward. came up on Tyler's left and after a fierce combat broke Jackson's line. Kimball pressed his advantage, and as night closed in, Jackson was in full retreat, leaving his dead and wounded and two guns on the field of his first defeat. He said that he considered the engagement 'a fiercer fight during its continuance than any portion of the battle of Manassas.' The Union loss was 118 killed, 450 wounded, and 22 missing; the Confederate loss, 80 killed, 375 wounded and 263 missing. Consult 'Official Records' (Vol. XII); Allan, 'Jackson's Valley Campaign'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. II).

KERNSTOWN (Winchester), Second Battle of. On 22 July 1864 General Crook, with four small divisions of infantry and cavalry, joined General Averell's cavalry division at Winchester, Va., Crook assuming chief command of the united force of 11,000 men. On the 23d Crook advanced four miles south of Kernstown and skirmished with Confederate cavalry, and on the 24th went into position on the same ground held by the Union troops in the battle of 23 March 1862. The infantry divisions of Colonels Thoburn, Duval and Mulligan covered the valley pike, with the cavalry of DuFéé and Averell on either flank. Upon the approach of the enemy Averell was sent down the Front Royal road to turn his right. General Early, who, after his raid on Washington, had recrossed the Potomac and taken position beyond Cedar Creek on the 21st, hearing of Crook's advance, put all his army in motion on the morning of the 24th to attack him. At Bartonsville Ramseur's division moved by a road to get around Crook's right, while the divisions of Gordon, Rodes, Breckinridge and Warfield moved along the valley pike and on either side of it. The cavalry was divided and moved in two columns, one on the right along the Front Royal and Winchester road, the other on the left and west of Winchester, the two to unite in rear of Winchester and cut off Crook's retreat. At 10 A.M. Crook's skirmishers were driven in, and it was discovered that his left extended through Kernstown, and that Averell having left, that flank was exposed; whereupon Wharton's division was moved under cover of some ravines on the right to attack it. The movement was promptly executed, and Wharton struck the left flank and rear of Col. Rutherford B. Hayes command as it was advancing and threw its left into some confusion. Hayes changed front and, forming behind a stone fence, held Wharton in temporary check. Almost simultaneously with Wharton's flank attack, Rodes, Gordon and Ramseur advanced on Crook's centre and right, and the entire line gave way and retreated through Winchester, followed by Early's infantry and artillery beyond Winchester, and by Rodes' division as far as Stephenson's Depot. The retreat was continued on the 25th through Martinsburg to the Potomac, Crook crossing at Williamsport and marching down the north side of the river to Maryland Heights and Harper's Ferry. Early occupied Martinsburg and had begun the destruction of the Baltimore and Ohio Railroad. The Union loss, 23-26 July, was 100 killed, 606 wounded and 479 missing. Among the mortally wounded was Colonel Mulligan, commanding division. The Confederate loss is not accurately known, but it was considerably greater. Consult 'Official Records' (Vol. XXXVII); Pond, 'The Shenandoah Valley in 1864'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

KEROSENE, an illuminating oil; the principal product of the distillation of petroleum, the crude domestic oil yielding 70 per cent of its weight. The oil is colorless, possessing a characteristic taste and smell; insoluble in water, moderately soluble in alcohol, but very soluble in ether, chloroform and benzene. It dissolves camphor, iodine, phosphorus, sulphur, fats, wax and many resins. The flashing point of a safe kerosene should not be less than 34° and the igniting point 43°. The finest quality of illuminating oil is produced from distilled ranging in specific gravity from 0.775 to 0.790. It has a high flashing point, 48°-60°, and contains none of the acids or impurities of the crude oil. A good illuminating oil should neither be too viscous nor too volatile, and it should not take fire when a light is applied to it. See OIL; PETROLEUM.

KERR, Alfred, German critic and publicist: b. Breslau, 25 Dec. 1807, living at Berlin, contributes to the ultra-modernist publications (Neue deutsche Rundschau, and others). His works are 'Hermann Sudermann' (1903); 'Das neue Drama' (1904); 'Schauspielkunst' (1904).

KERR, kér, Michael Crawford, American politician: b. Titusville, Pa., 15 March 1827; d. Rockbridge, Alum Springs, Va., 17 Aug. 1876. He was graduated from the law school of Louisville University in 1851. The next year he moved to New Albany, Ind., and began the practice of his profession; in 1854 he was city attorney, and in 1855 county attorney for the county. In 1856 he was elected to the State legislature; in 1862 he was reporter for the Supreme Court of Indiana, and published five volumes of reports of unusual value. In 1864 he was elected to Congress as a War
Democrat, and served till 1872. In that year he refused the nomination from his own district, but ran as congressman-at-large, and was defeated by a very small majority; in 1874 he was again elected to Congress in spite of much opposition, and was made speaker on the organization of the House. He served, however, only during the first session of that Congress (the 44th), as he died four days after its adjournment. While a member of Congress he served on several important committees, including the committee on ways and means; he opposed the reconstruction policy of the Republican party and was an advocate of free trade. He was also a close student of financial problems, favored the resumption of specie payment, and was strongly against the Greenback movement in regard to which he opposed a large part of his constituency and many of the politicians of his State.

KERR, Orpheus C. See NEWELL, Robert Henry.

KERR, Washington Caruthers, geologist: b. Oxford County, N. C., 1827; d. 1885. Educated at the university of his native State, he became computer in the office of the National Almanac at Cambridge, Mass. (1850); and five years later he was appointed professor of geology, mineralogy and chemistry in Davidson College, North Carolina. Serving through the Civil War on the Southern side, he became, after the war, a member of the United States Geological Survey (1882-83). Among his published works are 'Report of the Geological Survey of North Carolina' (2 vols., 1875-81); 'Report on the Cotton Production of Virginia' (1884); 'Ores of North Carolina' (1888).

KERRIL, a sea-snake (Distira cyanocincta), olive with blue-black bands, numerous along the coasts from Persia to Japan, and considered one of the most venomous of its race. See SEA-SNAKE.

KERRVILLE, ke'r vil, Texas, town, county-seat of Kerr County, on the Guadalupe River, and on a branch of the San Antonio and Aransas Pass Railroad. It is the seat of the Kerrville Sanitarium and the Schofield School for Girls. It is situated in an excellent agricultural region in which cotton cultivation and sheep raising are the principal occupations. The altitude of the town is about 1,800 feet, which accounts for its agreeable climate. The chief industrial establishments are stockyards, flour-mills, cotton gins and, in the vicinity, stone quarries. The town has considerable trade in lumber, cotton, hides, live stock, and is one of the principal wool markets of the State. Pop. 1,843.

KERRY, a county in Munster, Ireland, lying between the Atlantic Ocean on the west and the mouth of the Shannon on the north. It is noted for its beautiful mountain scenery and the far-famed Lakes of Killarney. The county is, for the most part, rugged and inclined to be wild; and the mountains there rise to the highest elevation attained in Ireland, in the peak of Carraun Tual. The chief products of Kerry are cattle, butter, and salmon. The largest town is Tralee; and the other places of importance are Killarney, Listowel, Cahersiveen and Kenmare. Area, 1,811 square miles. Pop. about 160,000.

KERSAINT, kær'sâte', Armand Guy Simon de Contempré, Count of, French naval officer: b. Paris, 29 July 1742; executed 4 Dec. 1793. Following the family traditions he early entered the navy (1753) and was rapidly promoted. Though of noble birth he sided with the party of progress, and became one of the noted figures of the Revolution. Made vice-admiral in 1793 he attempted to effect far-reaching reforms in the navy, but balked by the excesses of the Revolution culminating in the mock trial and execution of the king. Against these acts Kersaint protested vigorously, with the only result that he himself suffered the same fate as his late sovereign.

KERSLEY, kær'sel, a village in Suffolk, England, noted for its trade in woolen goods. The name "kersley" is also given to a light woolen cloth, which is looked upon as characteristic of the town. This cloth is most carefully finished; and this results in giving it a smooth surface and soft touch.

KERSHAW, Joseph Brevard, American soldier: b. Camden, S. C., 5 Jan. 1822; d. there, 13 April 1894. He entered the army at the outbreak of the Civil War, and as brigadier-general commanded a brigade in the Peninsular campaign of 1862. He took part in the capture of Harper's Ferry, 15 Sept. 1862, and was active at Antietam, Fredericksburg, Chancellorville, Gettysburg and Chickamauga. After the war he became president of the South Carolina Senate, and was judge of the 5th circuit of South Carolina, 1877-93.

KERTÉNY, ker'té-né, Karl Maria, Hungarian writer: b. Pest, 1842; d. 1882. Many of his works are laborious and almost purely bibliographical and hence useful, but not of a distinctly literary character. He also translated into German the works of several Hungarian poets. His distinctively original work is found in his essays and literary criticism.

KERTCH, kërch, a Russian seaport in the Crimea, at the farthest eastern point. The town itself is old, dating to the first centuries of the Christian era; but it is built upon the site of a prehistoric city, the ancient mounds of which are still standing close by. Near by there are also some old catacombs the walls of which are covered with inscriptions of an early date. The Church of Saint John the Baptist which dates back to the year 717, shows strongly the Byzantine influence in its architecture. Kertch is a place of some commercial and industrial importance. This is due to its favorable situation between the Azov and the Black Seas, which makes it one of the important carrying ports of the South of Russia. It handles iron, grain, wool, hides, fish, oil and fruit (dried, and in its natural state), in addition to its own manufactured products, the most important of which are flour, lumber, lime, beer, tobacco, soap, candles, cement and leather. The history of Kertch merges into that of Pantikapeum, an ancient city which, in its later days, became the capital of the kingdom of the Bosporus. The Tartars captured it in the 13th century; and it fell to the Genoese in the following century. By the latter it was called Cerchio. Hence its modern name, slightly modified by the Turks, who came into possession of the city the following cen-
KESSEL, Jan Van, The Elder, a Flemish painter, supposed to belong to the famous Van Kessel family of painters: b. Amsterdam, about 1641; d. 1690. He seems to have been a pupil of Jacob Ruysdael and Hobema; at any rate he followed their style of painting. He was looked upon as one of the best landscape painters of his day. Of his surviving works there are canvases in many of the galleries of Holland and Germany, among them Munich, Darmstadt, Amsterdam, Antwerp and Rotterdam.

KESSEL, Jan Van, The Younger, a son and pupil of Jan Van Kessel, the Elder, whom he accompanied to Spain: b. 1654; d. 1708. In Spain father and son seem to have worked together. Jan the Younger, however, seems to have prospered better than the Elder. In six years after his arrival in Madrid he had become court painter to Charles II. He was very popular as a portrait painter and he had the patronage of the court nobility. He followed his father's methods in other lines of painting all of which he did. Like his brother Ferdinand, he also successfully attempted large historical scenes. Owing to the fact that most of his attention was given to portrait painting, there are not so many survivals of his work as there are of his father's (Jan, the Elder), or of his grandfather's (Jeroom Van Kessel); and as most of his active life was spent in Madrid, nearly all of his work remained in Spain. Among his notable works are portrait of Philip IV (Madrid Museum); 'Psyche Surrounded by Wild Animals,' 'Psyche and Cupid' (Alcazar, Madrid).

KESSEL, Jeroom Van, a noted Flemish painter and the founder of the famous Van Kessel family of painters: b. Antwerp, 1578; d. about 1636. He was the most distinguished pupil of Cornelis Floris; and was the son-in-law of Jan Brueghel, the famous landscape painter. Kessel worked considerable in collaboration with his father-in-law into whose landscapes he is said to have infused more animation by a larger number of figures and other objects. He traveled about Germany and the Low Countries painting portraits in various large cities, such as Frankfort, Cologne and Strassburg. He also gained a reputation as a painter of still life and animals. His chief wanderings seem to have begun when he was about 28 and to have lasted some 12 years. After this he probably made his home in Antwerp.

KESSEL, Thedororus Van, Dutch painter, engraver and etcher: b. probably in Holland, about 1620. The date of his death is uncertain. He went to Antwerp in 1652, where he became noted as an etcher of the great masters, especially those of the Low Countries. Van Dyck, Titian, Rubens and Guido Reni were among the painters whose works he reproduced. Copies of his etchings are still held in high esteem.

KESSEL, Paul, American dramatist: b. Delaware, Ohio, 1870. He is a brother of Vaughan Kester. He has been active in prose and verse; but his greatest success has been in the dramatic field. Among his published works are 'His Own Country'; 'Tales of the Real Gypsy'; and the following plays: 'The Counter Rounding' (with Minnie Maddern Fiske); 'Zamar'; 'What Dreams May Come'; 'The
Cousin of the Ring? (with Vaughan Kester); ‘Eugene Aram’; ‘Sweet Nell of Old Drury’; ‘When Knighthood was in Flower’; ‘Made moile Mood’ (with Charles Middleton); ‘Friend Hannah’; ‘Don Quixote’; ‘The Bill Toppers’; ‘The Lady in the Castle’; ‘Beverly’s Balance’; ‘The Tragedy of Edith Cavell.’

**KESTER, Vaughan, American novelist:** b. New Brunswick, N. J., 1869; d. 1911. He devoted his life to literature and much of his best work was contributed to the *Cosmopolitan Magazine* on whose staff he was for some considerable time. Among his more serious published works are ‘The Prodigal Judge’; ‘The Manager of the B. and A.’; ‘The Fortunes of the Landrays’; ‘John o’James-town’; ‘The Just and the Unjust’; ‘The Hand of the Mighty.’ In the latter, which was published after his death, is a biographical sketch of the author by his brother, Paul Kester.

**KESTREL**, one of the smaller of the European falcons (*Tinnunculus alaudarius*), resembling the sparrow-hawk, and formerly much used in falconry by the peasantry. The American sparrow-hawk and sharp-shin (qq.v.) may be called kestrels.

**KESWICK MOVEMENT, The.** In 1874 Canon Harford-Battersby attended a conference at Oxford and there passed through a deep spiritual experience. On his return to his parish, Saint John’s, Keswick, he was very desirous that his people should have the same experience. So the first Keswick Convention was called by the vicar and his helper, Mr. Robert Wilson, in the year 1875. Its title was ‘Convention for the Promotion of Practical Holiness.’ Its purpose was "to help men to be holy." The following directions were given to those coming to the convention:

1. **Come waiting on the Lord, desiring and expecting blessing to your own soul individually.**
2. **Be ready to learn whatever God may teach you by his word, however opposed to human prejudices and traditions.**
3. **Heartily renounce all known evil and even doubtful things ("not of faith").**
4. **Lay aside for the time all reading except the Bible.**
5. **Avoid conversation which has a tendency to divert your mind from the object of the meetings. Do not dispute with each other.**
6. **Eat moderately, dress simply, retire to rest early.**

The convention became an annual affair attended by hundreds of people. The meetings were held in two tents each having a capacity of 2,250. Many subjects were discussed such as ‘The Renunciation of Evil,’ ‘Holiness by Faith,’ ‘Heart Obedience,’ etc. Canon Battersby died in 1883, but the work has been continued. The movement has been productive of considerable devotional literature by such writers as F. B. Meyer, W. H. A. Hay Aitkin, Bishop H. C. G. Moule, Andrew Murray, Hubert Moulton, F. Stuart Holden, Arthur T. Pierson, and G. H. C. Magregnor.

At the Keswick Convention of 1891, those present from Scotland decided to hold a like meeting in their own land. As a result, for many years, beginning with 1892, an annual meeting was held at Bieldside, near Broughton (with George Ferguson). It was called ‘The Scottish National Christian Convention for the Deepening of Spiritual Life.’ The movement is world-wide and of great influence in Christian circles. Consult Harford, Charles F., ‘The Keswick Convention: Its Message, Its Methods and Its Men’ (1907), also Macfarlane, ‘Scotland’s Keswick; Sketches and Reminiscences’ (1917).

**KETCH,** a vessel equipped with two masts, namely, the mainmast and the mizzenmast, and usually from 100 to 250 tons burden. Ketches were principally used in former times as yachts for conveying princes of the blood, ambassadors or other great personages from one place to another. Ketches in use at the present day are chiefly coasters.

**KETCHAM, William Henry, American missionary:** b. Sumner, Iowa, 1 June 1868. He was educated at Saint Charles College, Grand Coteau, La., and the Seminary of Mount Saint Mary’s of the West, Cincinnati, Ohio. In 1885 he became a Roman Catholic, and was ordained a priest in 1892. Until 1897 he was missionary to Creek and Cherokee Indians and other tribes in and about Muskogee, I. T. From 1897 to 1900 he was missionary to the Choctaws at Antlers, I. T., and in the latter year was appointed assistant in the Office of Indian Missions, Washington, of which he was made director in 1901. Since 1913 he has served as United States Indian Commissioner. During his sojourn in the Indian Territory, he founded many schools and churches and converted many Indians to the Christian faith. He helped heal the breach between the government authorities and the Catholic Indian Bureau, and secured the abolition of the rule forbidding Catholic Indian children in government schools from attending Catholic religious services. He founded the *Indian Sentinel* and in 1908 was delegate to the First American Missionary Congress at Chicago. In the same year and again in 1910 he attended the Lake Mohonk conferences of Friends of the Indian.

**KETONES, ke’tōnz.** See ACETONE.

**KETTELER, kē’tē-lēr, Clemens August, Baron von,** German diplomat; b. Potsdam, 1853; d. Peking, 20 June 1900. He served for a time in the army, but entered the diplomatic service, in 1882 as attaché at Peking drew up the first treaty between Germany and Korea, in 1883 was appointed acting consul at Canton, in 1892 became secretary of the German legation at Washington, and when in 1893 the legation was made an embassy was appointed first secretary to the embassy and councillor of state. In 1896 he became Minister to Mexico, in 1899 Minister to China. In 1900, at the time of the "Boxer" disturbance in northern China, he was selected, owing to his familiarity with the Chinese language, to represent the foreign diplomats in their communications with the government. While on such a mission he was shot in the street. Prince Chun, brother of the emperor, was sent to Germany to apologize for the murder, and 18 Jan. 1903 a memorial arch, set up at the expense of the Chinese government, was dedicated at Peking.

**KETTELER, Wilhelm Emanuel, Baron von,** German ecclesiastical leader; b. Münster, Prussia, 1811; d. 1877. Graduating in law after studies at Göttingen, Heidelberg, and Bonn, in 1837, he entered the civil service at Münster. This he soon left to study for the priesthood in the Catholic Church. Ordained in 1844, he became, through his talents and
his family connections, Bishop of Mainz in 1850. He at once became the champion of the Catholic Church whose power and freedom from State control in Germany he labored to build up. He was, therefore, constantly in opposition to the policies of the Chancellor and the royal family, a position he maintained to his death. Among his published works are 'Freiheit, Autorität und Kirche'; 'Die wahren Grundlagen des religiösen Friedens'; 'Des allgemeinen Konzils und seine Bedeutung für unsere Zeit'; 'Der Kulturkampf gegen die katolische Kirche'; 'Die Katoliken im Deutschen Reich'. His works are still read in Catholic circles in Germany, where von Ket-
teler is looked upon as the greatest of modern German champions of the Church.

KeTeNBERG, két'en-bérk, Susanne Katharine von, German essayist and poet: b. Frankfurt, 1723; d. 1774. She was a strong Pietist and her religious tendencies are re-
flected in her essays and poems, which are gen-
erally mystical and poetic even when they are not distinctly religious. She was also strongly mystical, as were many people of religious at-
titude in Protestant circles in her day, and she had a love of alchemic studies to which she devoted considerable time and investigation. A close friend of Goethe's mother, she exercised a strong influence over the youthful poet, who had an ardent admiration for her which is clearly painted in 'Bekenntnisse einer schönen Seele' (in 'Wilhelm Meisters Lehrjahre'). Through Goethe she afterward became ac-
quainted with people notable in the literary life of her time, among them Lavater, who came to admire her very much. Consult Dechent, 'Goethe's Schone Seele' (Gotha 1896), and De-
litzsch's 'Philemon, oder von der christlichen Freundschaft', which contains a number of her religious essays and songs.

KETTERING, city in Northamptonshire, England. It is a place of considerable importance on account of its manufacturing interest, among which are iron ore mines and stone quarries, shoe, agricultural tool and brush fac-
tories, and the making of clothes. It has some good modern buildings, an old church tower dating back to 1450 and excellent municipal edifices.

KETTLE DRUM, a musical instrument, formed of thin copper and has a head of parch-
ment or eelum. Kettle drums are used in pairs, slung on each side of the withers of a cavalry horse. One drum is tuned to the key note and the other to the fifth of the key in which the piece in which they are to be used is written. The tuning is by a hoop and screws. Also a name for a tea party held by fashionable people in the afternoon before dinner.

KETTLE HOLE, a pit or depression in a glacial outwash or morainic plain. These kettles are often occupied by small lakes. They may be merely depressions due to unequal deposition, but are more often caused by the melting of buried blocks of ice.

KETT'S REBELLION, an uprising in England under the leadership of the Kett brothers, in 1549. William and Robert Kett, landowners of Wymondham, Norfolk, were men of considerable influence in their own neighborhood. The people of the district rose in arms against the enclosure of common land and the eviction of tenants therefrom. Robert Ketts, lord of the manor of Wymondham, was induced to join them as their leader and, with him went his three brothers. He soon had at his command 16,000 men under excellent discipline. This force proceeded to petition the Privy Council in London, stating respectfully but fully their grievances. The answer of the government was a proclamation against the insurgents a strong force under the Earl of Warwick. In the meantime Kett had captured Norfolk (1 Aug. 1549). But he was finally defeated at Dussindale, a bloody battle in which both sides suffered heavily. The government forces won the day with the help of German troops provided with firearms which gave them a great superiority over the peasantry provided only with long-
bows and cross-bows. In the battle 3,500 of the insurgents perished and many more met death on the scaffold. Among them the two Kett brothers. Consult Clayton, 'Robert Kett and the Norfolk Rising' (London 1912); Russel, 'Kett's Rebellion' (London 1850).

KETUPA, the generic and vernacular name of a group of the large owls of the East Indies, specifically the Javan one (K. javanensis), which subsists mainly on fish, crabs and the like, which they are expert in catching along the shores of sea and rivers. Their legs and talons are long and not feathered.

KEUKA (ké-u'kà) LAKE, or CROOKED LAKE, a body of water in New York State extending from Steuben County to Yates County, a distance of 20 miles, three miles wide and of irregular form. It has a depth of 200 feet and lies 718 feet above the sea. Steamboats navigate the lake in summer between Hammondport and Penn Yan. The waters flow eastward to Seneca Lake.

KEUPER, koi'per, a red sandy clay, in its primary signification, and in its secondary, the topmost division of the Triassic system in Europe). In Germany it is about 1,000 feet in depth while in England it is 3,000. Throughout it are found bones of animal and other geological deposits. In both Germany and England the chief factors in the Keuper are marl, sandstone and gymsysum.

KEW, kū', England, a village in the county of Surrey, six miles from Hyde Park Corner, on the right bank of the Thames, opposite Brentford, with which it is con-
ected by a bridge. The royal botanical gardens and the connected pleasure grounds, the former covering about 75 acres, the latter 250, are the chief attraction of visitors to Kew. They contain the finest collection of plants in the world, and are decorated with various ornamental buildings, including a Chinese pagoda 163 feet high. The botanical constructions here are really magni-
cient, are of great extent, and have been much augmented in recent years. Kew Palace is close by the northern entrance. Gainborough, the celebrated artist, is buried in Kew churchyard.

KEW OBSERVATORY, a celebrated astronomi-
cal structure in Richmond Park, between Kew and Richmond, Surrey, England. It was built by George III as a private enterprise for the observation of the transit of Venus in 1769 and was then called the King's Observa-
tory. It was transferred to the British Asso-
ciliation as a physical observatory in 1841, and given its present name. In 1871 it was placed under the control of the Royal Society.

KEWANEWEE, ke-wā'nē, Ill., city in Henry County; on the Chicago, Burlington and Quincy Railroad; about 100 miles north by west of Springfield and 131 miles southwest of Chicago, on the Cannon Ball Trail. Kewanee is situated in an agricultural region, and coal fields are in the vicinity. The chief manufactures are valves, fittings, boilers, tanks, radiators, gloves, mittens, pumps, agricultural implements, water supply systems, private electric-lighting plants, seed corn hangers, live stock supplies, steel coal chutes, brooms, core making machines. The tube and boiler works employ about 4,000 men. The public library has about 10,000 volumes. Among hotel accommodations is a modern structure erected at a cost of $100,000. The commission form of government is in operation. The city owns and operates the waterworks. Pop. 17,000.

KEWATIN. See KEWATIN.

KEWAUNEE, ke-wā'nē, Wis., city, county-seat of Kewaunee County; on Lake Michigan at the mouth of the Kewaunee River, and on the Kewaunee, Green Bay and Western Railroad. The first permanent settlement was made in 1850, and the city received its charter in 1882. It is situated in a fertile region; and dairying center. Its chief industrial establishments are foundries, machine-shops, agricultural implement works, pea-canning works and coffin factory. The city owns the electric-lighting plant. Pop. 1,900.

KEWEENAW (kē-we-nā) BAY, an arm of Lake Superior, north of Michigan. It is eight miles long, by two to six miles in width. The town of Baraga lies at the head of the bay.

KEWEENAWAN (kē-we-nā-an) SERIES, a great series of rocks, believed to be of Precambrian age, typically developed on Keweenaw Point, Mich., but found over a large area in Michigan, Wisconsin and Minnesota. Rocks of the same age occur also in Canada, and possibly in the Northern states of New York. They constitute the upper series of the Algonkian system. The series on Keweenaw Point and southward has a maximum thickness of perhaps 50,000 feet; the lower part consists mostly of thick sheets of lava and intrusive rocks with some sandstone and conglomerate; the upper part is a mass of sedimentary rocks. In the series occur the famous Lake Superior copper deposits. See GEOLOGY.

KEY, Sir Astley Cooper, British admiral: b. London, 1821; d. 1888. After varied service in the British navy, in South American waters, the Baltic and China, he became chief of the naval ordnance in 1866, and 12 years later president of the Royal Naval College at Greenwich, which he had organized. The following year he was knighted and raised to the rank of vice-admiral of his admiralty in 1878 after having been commander-in-chief on the North American and West Indian stations. He had been steadily working to increase the efficiency of the British navy which owes very much to his well-directed and sustained efforts. In 1882 in recognition of his services he was made senior naval lord of the Admiralty.

KEY, David McKendree, American jurist and cabinet officer: b. Greene County, Tenn., 27 Jan. 1824; d. Chattanooga, Tenn., 3 Feb. 1900. After studying law he was admitted to the bar in 1849, and in 1853 took up his residence in Tennessee, establishing a successful law practice at Chattanooga. After vainly attempting to prevent the secession of Tennessee when once that step was taken he joined the Confederate army and served through the war, but at its close joined the Republican party, succeeded Andrew Johnson in the United States Senate (1873); in 1877 was made postmaster general; and in 1880 was appointed United States district judge for the Eastern and Middle Districts of Tennessee, a position he held till 1894.

KEY, li, Ellen (Karolina Sofia), Swedish social writer: b. Sundsvall, 1849; of a family well connected and of a line of semi-noble ancestors. At the age of 20 she became secretary to her father who was then a prominent member of the Riksdag. About this time she became noted as a contributor to the magazines and periodicals of her native country, dealing with literary, historical and herological subjects. She was forced to teach in a private school when her father lost his fortune but this did not prevent her from continuing her magazine and newspaper writing which was yearly increasing her reputation. The sale of her writings soon permitted her to give up teaching and to travel and lecture in foreign countries. She was a very advanced thinker and so she became a storm centre between 1890 and 1910. Bitterly assailed by her opponents she was admired and supported and read by every one, with the result that her books have been translated into most of the languages of Europe. Among her publications, all of which have appeared in English, are the following: 'The Century of the Child' (1909); 'Love and Ethics' (1911); 'Rahel Varnhagen' (1913); 'The Renaissance of Motherhood' (1914); 'The Younger Generation' (1914); 'The Misuse of Woman's Power'; 'Woman's Psychology and Woman's Logic'; 'Life Lines.' Consult for her life: 'Rahel Varnhagen' (1913) and 'Ellen Key: Her Life and her Work' (New York 1913).

KEY, Francis Scott, American lawyer and song writer: b. Frederick County, Md., 9 Aug. 1789; d. Baltimore, 11 Jan. 1843. He was educated at Saint John's College, Annapolis, and commenced to practise law in Frederick City. Subsequently he removed to Washington, where he was for many years district attorney of the District of Columbia. As a song writer he is chiefly known by his 'Star-Spangled Banner,' a popular national lyric, suggested and partially written while the author was detained in the British fleet during the bombardment of Fort McHenry, near Baltimore, of which he was an anxious and interested witness. A posthumous collection of his miscellaneous writings, published in 1856. Consult Key-Smith, F. S., 'Francis S. Key' (Washington 1911). See STAR-SPANGLED BANNER.

KEY, in heraldry, a heraldic bearing used in ecclesiastical connections. The idea of its use originally seems to be that the places bearing it were under the protection of Saint Peter, the
traditional bearer of the keys of heaven. It
seems probable that the use of the key grew
out of that of the official insignia of some one
of the ancient heathen deities; and this view is
borne out by the many peculiarly heathen leg-
ends and superstitions connected with the key,
among others, the one already cited, that Saint
Peter is the bearer of the keys of the gate of
heaven. See HERALDRY.

KEY, in music: (1) A mechanical contriv-
ance for closing or opening ventages, as in
flutes, clarinets, ophicleides, etc. By means of
keys on such instruments, apertures too remote
to be reached by the outstretched fingers are
brought under control of the player. (2) A
lever which brings the pallets of an organ under
the control of the hand or foot of an organist.
(3) A lever which controls the striking appar-
atus of a key-stringed instrument. In the harp-
sichord it acted on the jack; in the pianoforte
it acts on the hammer. (4) The wrest or key
used for tuning instruments having metal pegs.
Its end is hollowed out so as to fit over the
four-sided end of the peg, and the cross-bar
with which it is surmounted gives leverage to
the hand of the tuner, so that he is enabled to
tighten or loosen a string, or (in the case of a
drum) slacken or strain a parchment. (5) The
sign placed at the commencement of the musical
stave which shows the pitch of the notes, was
originally called a clavis or key. This sign is
called in modern music a clef. (6) Key, in its
modern sense, is the starting point of the defi-
nite series of sounds which form the recognized
scale. Different starting points require the rela-
tive proportion of the steps of the scale to be
maintained by means of sharps or flats in the
signature. The key of C major requires no flats
or sharps for this purpose, hence it is called the
normal key.

KEY ISLANDS, a group of islands in the
Banda Sea, East Indian Archipelago. See KI
ISLANDS.

KEY WEST, Fla., city, port of entry,
county-seat of Monroe County; about 60 miles
southwest of Cape Sable and nearly 100 miles
north by east of Havana, Cuba. The city is
on Key West Island, one of a group of coral
islands, called Florida Keys. It is the farthest
south of any city in the United States. The
first permanent settlement was made in 1822
and the city received its charter in 1832. Key
West Island is covered by only a thin layer of
soil upon which vegetation grows luxuriously.
The island averages about 11 feet above the sea.
The harbor is excellent; at the main entrance,
on an artificial island, is located Fort Taylor.
The city has regular steamer communication
with the large cities on the Atlantic and Gulf
coasts and with the West Indies and Central
America. It is on the Florida East Coast Rail-
road and is the terminus of the ocean ferry to
Havana. There is through passenger and
freight car service between Havana and New
York via Key West. It is a United States naval
station, with machine shops, dock, marine rail-
way, hospital, barracks, etc., and during the war
with Spain, it was the rendezvous of the United
States navy. The chief industries are manufac-
turing of cigars, gathering sponges and fishing.
There is a large trade in fish, fruit, vegetables,
turtles, turtle-shell ornaments, salt, tobacco, both
raw and manufactured. In connection with the
naval station there are barracks, machine-shops,
marine hospital, docks, etc. Some of the chief
public buildings are the government buildings,
post-office and custom-house, county court-
house, city-hall, and the Martello towers. The
principal educational institutions are a Meth-
odist Seminary and the Holy Name Academy.
The convent of the Holy Name was used as a
hospital for soldiers during the Spanish W.
The free public library and the public and parish
schools are excellent. There are two banks
with a combined capital of $150,000. The gov-
ernment has erected two light-houses in the
harbor and others among the islands, but still
many wrecks occur each year. The city owns
and operates the waterworks. Key West in
1890 was the largest city in the State. Pop.
21,150.

KEYBOARD, the name given to a set of
"keys" through which the tones of certain mu-
sical instruments are produced. The principal
instruments which are at present operated in
this way are the piano and organ. It is in
connection with the latter that keys and key-
boards were first used. Their employment can
be traced back to pre-Christian times, but little
is known concerning them until we come to the
Middle Ages. The organ keys of this time
were huge, unwieldy affairs, each key being
from three to six inches wide and correspond-
ingly long. They were not operated by the
fingers, of course, but the entire fist or elbow
was used in their manipulation, a circumstance
which made it impossible to play more than one
note at a time with each hand. The keyboards
of the period were limited in range, and con-
fined almost entirely to the so-called diatonic
tones (represented at present by the white
keys). Later the sharps and flats (black keys)
were added, and the size of the keys was
gradually reduced to the present dimensions.

The clavichord and harpsichord (precursors
of the piano) were further keyboard instru-
m ents. Here, also, there was a development
from primitive conditions, but essentially the
nature of the keyboard, when once eschew War,was similar to that of the modern piano. Only
the range was smaller and the color was some-
times different, the keys which are now white
being black, and those which are black being
white. The harpsichord also made the use of
a double keyboard, each with its specific tonal
effects.
The piano keyboard, which is shown in the illustration, consists of 88 members or keys, 52 being white and 36 black. As is apparent, the latter are arranged in alternate groups of two and three keys. Thus the keyboard is divided into recurrent sections, known as octaves. More specifically an octave is the distance from one key to the next one that is similarly placed. For example, the distance from the middle one of the three black keys, near the centre of the keyboard, to the same key either right or left, is an octave. The white key immediately to the left of the group of two black keys, B and A, successively follow to the left of this, D, E, F and G to the right. After G a new octave commences with A. The black keys are named after the adjoining white keys, and are called sharps when derived from the white keys immediately to the left, and flats when derived from those immediately to the right. Thus the first of the group of three black keys, counting from the left, may be either F sharp or F, and the G sharp or A flat or A.

The organ keyboard is similar to that of the piano, only the number of keys is smaller. This does not imply, however, that the range is smaller too, for it is possible to raise or lower the pitch of the keys by means of the mechanical devices known as stops. The organ, unlike the piano, generally makes use of several keyboards, which are called manuals. These are placed above each other, and their number may reach up to five. Besides, there is a distinct number of keys to be operated by the feet, which is known as the pedal board. By means of the various manuals it is possible to produce a variety of successive effects; likewise to combine these effects through the use of different manuals for the two hands, and the reinforcement of the same, if desirable, by the pedal board. Furthermore, it is possible to combine all the manuals and pedal board in a grand total effect.

Although improvements and changes have constantly been made in the tone and mechanism of organ instruments, so great in some cases as to result in the formation of new instruments, no change has been made for centuries in the arrangement of the keys. Under the circumstances it is natural that this matter should have excited the attention of innovators. Is it likely, we are asked, that an arrangement which grew up under conditions as primitive as those of the Middle Ages, and which was intended for the crude application of fist and elbow, should also be the ideal one for the delicate fingers, so different in strength and shape? This supposition being rejected, various changes have been suggested, some of a mild nature, some radical in their scope. For example, instead of the straight, side-by-side alignment of the keys, one which is slightly fan-shaped and with an inward curve, has been suggested. But entire redistributions of the keys, too, have been proposed, the most notable recent attempt in this direction being that of Paul von Jankö, a Hungarian inventor. He has produced a keyboard with six parallel rows of keys, one behind the other, and each successive row slightly elevated above its anterior neighbor. One advantage of this arrangement is to be found in the immense simplification of performance in the different keys which it allows. It is necessary to learn only two scales—one major, one minor—instead of the present 24. Furthermore, an octave can be spanned with about the same ease as a sixth on our actual pianos.

The invention is ingenious, and the new keyboard made considerable headway for a time; but the prospects for its adoption are meagre. Whatever the disadvantages of the present keyboard, it has the advantage of actual possession of the field. The substitution of a new system would involve the discarding of present instruments. The relearning of the art by those who were educated in the old way, and the abandonment of valuable pedagogical works adapted to the piano and organ as they are. It would correspond, in the realm of music, to the introduction of radical changes in the system of weights and measures, or in the spelling of entire languages. So great are the difficulties involved, indeed, that it is doubtful whether the change will ever be made. The present keyboard, firmly imbedded in the musical life of the world as it is, seems destined to retain the supremacy which it has so long enjoyed.

Author of 'The Basis of Musical Pleasure,' etc.

KEYES, Charles Rollin, American geologist: b. Des Moines, lowa, 24 Dec. 1864. Educated at State University of Iowa and Johns Hopkins, he became assistant to the United States Geological Survey (1889-90); paleontologist to the State of Missouri (1890-92); assistant geologist for the State of Iowa (1892-94); director of the geological survey of the State of Missouri (1894-97). The following two years he spent in travel and geological studies in Europe, Asia and Africa. On his return he became president of the School of Mines of the State of New Mexico, a position he gave up in 1906 to continue his geological foreign studies. Since then he has been consulting mining engineer in Des Moines, Iowa. Among his published works are 'Geological Formations' (1892); 'Coal Deposits' (1893); 'Organization of Geological Surveys' (1894); 'Paleontology of Missouri' (1894); 'Surveys' (1894); 'Maryland Granites' (1895); 'Origin and Classification of Carboniferous Deposits' (1907); 'Ozark Lead and Zinc Deposits' (1909); 'Deflation' (1910); 'Mid-Continental Erosion' (1911); 'Bibliography of Geology' (1913); 'Mechanics of Laccolithic Intrusion' (1917).

KEYES, këz. Edward Laurence, American surgeon: b. Charleston, S. C., 28 Aug. 1843. He is a son of Erasmus D. Keyes (q.v.) and was graduated from Yale in 1863 and from the medical department of the University of New York in 1866. He practised his profession in New York from 1867, and from 1869 to 1890 was a member of the faculty of Bellevue Hospital Medical College. He published 'Tonic Treatment of Syphilis' (1877; rev. ed., 1896); 'The Venereal Diseases' (1880); 'Treatise on Surgical Diseases of the Genito-Urinary Organs' (1881; 2d rev. ed. by E. L. Keyes and E. L. Keyes, Jr., 1905), etc.

KEYES, Erasmus Darwin, American soldier: b. Brimfield, Mass., 20 Jan. 1827. He graduated at West Point in 1849 and in 1832 he was graduated at the United States Military Academy, West Point, and in the same year was stationed in Charleston, S. C., subsequently he was for several years engaged in suppressing Indian outbreaks on the frontier and in
garrison duty. When the Civil War broke out Keyes was made colonel of the 11th Infantry and deputed to New York to organize the relief expedition to Fort Pickens. In May 1861 he was made brigadier-general of volunteers and two months later participated in the first battle of Bull Run. Subsequently Keyes commanded the Fourth Corps in the Peninsula Campaign during which he was constantly in active service. In 1864 he resigned. General Keyes published 'Fifty Years: An Outline of Men and Events, Civil and Military' (1884).

**KEYES, Henry Wilder,** American public official: b. Newbury, Vt., 23 May 1863. In 1887 he was graduated at Harvard University and thereafter became extensively engaged in farming for many years. He was a member of the New Hampshire house of representatives for six years and of the senate for two years. He served as governor of New Hampshire for the term 1917-19. In 1918 he was elected to the United States Senate for a term of six years, beginning 4 March 1919. He is interested in several commercial enterprises as corporate officer, director or trustee.

**KEYNES, känz,* John Neville, English educationalist and economist: b. Salisbury, 1852. Educated at the universities of London and Cambridge, he served successively as Fellow in both of them, becoming lecturer in moral science in the latter (1884-1911) and secretary of the university senate (1893) and registrar (1910). Among his published works are 'Studies and Exercises in Formal Logic' (1884) and 'Scope and Method of Political Economy' (1891 and 1904).

**KEYPORT,** a town in New Jersey, Monmouth County, known as a popular summer resort. It is about 20 miles southwest of New York City, with which it is connected by railroad and boat. Its principal industries are confined to the manufacture of wagons, carriages, sewing machines and rubber goods and the handling of oysters and clams. Pop. about 3,600.

**KEYS,** the name given to coral and other reefs or slightly sunken rocks off the shores of Florida, Central America and the West India Islands. The term is derived from the Spanish cayo (an islet, rock).

**KEYS, Power of the.** A doctrine based on the saying of Jesus recorded in the gospel of Matthew xvi, 19: "And I will give unto thee the keys of the kingdom of heaven: and whatsoever thou shalt bind on earth, shall be bound in heaven: and whatsoever thou shalt loose on earth, shall be loosed in heaven." On this passage is based the doctrine of ascension after confession as taught and practiced in the Roman Catholic Church. In the history of the Church there have been many variations of the doctrine. Some have held that only a priest of a pure life could absolve from sin, while others have held that any priest could pronounce absolution as the messenger and representative of God. Some have held that the priest could release only from "transitory" punishment and that only God can release from "eternal punishment" and that often by words of the priest. Another difference has arisen; some have declared that the priest is absolving as a judge, and others that he is acting as a mediator, while a third group has declared that he combined both functions. Thomas Aquinas gave the doctrine its importance giving a sacramental power to the keys, and uniting in this central power not only absolution, but penance and discipline. In his various relations to penance the priest holds the relation that water holds to baptism.

The Protestant view is based on an entirely different interpretation of the passage. The power of the keys was given to Peter as a sign of apostolical authority to establish the Church by the preaching of the forgiveness of sin and the establishment of the doctrine of the gospel. The power to bind and loose was not only conferred upon Peter but upon the other Apostles, and also upon their successors, the whole Church (Matt. xviii, 18). The Protestant doctrine of the priesthood of all believers is based in part upon the teaching of the Epistle to the Hebrews.

**KEYSER, Cassius Jackson,** American mathematician and author: b. Rawson, Ohio, 1862. Educated at Ohio Normal University and universities of Michigan, Missouri and Columbia, he taught in public schools and became professor in Washington University, Saint Louis, Mo. (1894-95); and going to Columbia University he became professor of mathematics in 1904 and head of the department in 1910. He wrote 'Science and Religion: The Rational and the Super-Rational' (1914).

**KEYSER, ki'zër, Ephraim,** American sculptor: b. Baltimore, Md., 6 Oct. 1850. On the completion of his academic course in his native city, he studied art at the Royal Academies in Munich and Berlin. When his success was marked. He has had studios in Rome, Italy, New York and Baltimore, where he now resides; in charge of the sculpture and modeling classes at the Maryland Institute School of Art. His most important public works are the De Kalb statue at Annapolis, Md., the Stein memorial in Baltimore and President Arthur's tomb at the Rural Cemetery, Albany, N. Y. He has made numerous portrait busts, among others those of Cardinal Gibbons, Henry Harland, Daniel Gilman and Sidor LaVal. While abroad he received the Michael Beerche scholarship.

**KEYSER, Leander Sylvester,** American Lutheran clergyman, theological teacher, and naturalist: b. Tuscarawas County, Ohio, 13 March 1856. He was educated at several normal schools, the Ohio Northern University and the Indiana University, and was graduated from the Hanna Divinity School, Wittenberg College, Springfield, Ohio, in 1883. He was pastor successively at Elkhart, Ind., Springfield, Ohio, Atchison, Kans., and Canal Dover, Ohio. In 1911 he became professor of systematic theology in Hanna Divinity School, a position he now occupies. He also teaches ethics, theism and Christian evidence in Wittenberg College, which conferred upon him the degrees of A.M. and D.D. Besides theology, he has also been deeply interested in natural history, and has specialized in bird life. He has published, in addition to the works cited below, the following: 'The Only Way Out' (1888, rev. ed., 1906); 'Bird-dom' (1892); 'In Bird Land' (1894); 'Birds of the Rockies' (1902); 'Our Bird Comrades' (1907); 'The Rational Test' (1908); 'A System of Christian Ethics' (1915); 'Elective and Conversion' (1914); 'A System
of Christian Evidence' (1913); 'Theological Outlines and Theses' (1915); 'A System of Natural Theism' (1917).

KEYSER, the county-seat of Mineral County, W. Va. It is situated on the Potomac River, not far from Piedmont, in a stock-raising and fruit district. It is well supplied with railway connections, which include the Baltimore and Ohio, the Western Maryland and the Twin Mountain and Potomac. These facilities have given rise to railway machine shops, woolen and silk mills, furniture and canning factories and other industries. Population about 5,000, which is larger in the summer season as the place is a summer resort. The town contains a State preparatory school.

KEYSERLING, Eduard, Graf (Count) von, German novelist: b. Pelss-Paddermuin Kurland, 15 May 1855. His early dramas showed excellent observation and detailed and impressive mood-painting, but he is stronger in the novel and the short story, in which these qualities are available of better application than in the drama. He has published 'Rose Herz,' novel (Munich 1883); 'Die dritte Stiege,' novel (Munich 1890); 'Frühlingsopfer,' drama (Berlin 1890); 'Der dumme Hans,' drama (Berlin 1901); 'Beate und Mareile,' a novel; 'Peter Havel,' a drama (Berlin 1903); 'Benignens Erlebnis,' a drama (Berlin 1903); 'Schwülte Tage,' short stories (Berlin 1906); 'Dumala,' a novel (Berlin 1908); 'Bunte Herzen,' short stories (Berlin 1908). A translation of the last of these, under the title 'Gay Hearts,' appears in 'German Classics' (Vol. XIX, New York 1914). Consult Martens, Kurt, 'Literatur in Deutschland' (Berlin 1910).

KEYSERLING, Margarethe, Grafin (Countess) von, German authoress: b. Berlin, 22 Feb. 1846. Her maiden name was von Dönniges and she is sister of the famous Helene von Dönniges and wife of Eduard von Keyserling (q.v.), whom she married in 1864. She moved with her parents to Munich in 1847 and to Geneva in 1859. She has lived and worked in various cities: Görlitz (1868-75), Glogau (1875-88), Reichenbach (1888-98) and Breslau, near which she is still living (at Kleinburg). She is a popular novelist, whose works are widely read and soon forgot. The novels include the novels 'Luciola' (1889); 'Sturmheb' (1881); 'Das Fritzsche und Exzentrisch' (1893); 'Der Werwolf' (1899), and the dramas 'Sordello' (1899); 'Ein Todesurteil' (1908); 'auf Ruhmesböhen' (1909).

KEYSTONE STATE, a name given to Pennsylvania, because it was the seventh, or central, of the original 13 States.

KHABAROVSK, khab-a-rof'sk, capital of Primorski (Maritime province), Siberia, and seat of the governor-general of Amur. It is situated at the junction of the Amur and Ussuri rivers, and is therefore a place of considerable commercial importance, which has grown rapidly since its foundation as a military station in 1858. Pop. over 60,000. It was formerly known as Khabarovka.

KHAIBAR (ki'ber) PASS, a high mountain pass between India and Afghanistan. See KHYBER PASS.

KHAKI, kā'kā, a kind of light-brown, drab, or dust-colored cloth, originally used for making the uniforms of British East Indian regiments. In the South African War of 1899-1902 the British troops wore khaki uniforms for purposes of protective coloration, and khaki was also worn by the United States troops in the Spanish-American War. The name is derived from the Persian k̲h̲āk̲ā, earth, dust, hence earth-colored, to render the wearer inconspicuous. Consult Forbes, 'Hindustani Dictionary'; Gubisch, 'Mutinies in Oudh' (p. 260); Yule and Burnell, 'Hobson-Jobson,' a dictionary of Anglo-Indian terms.

KHALIFA, kāl'-ē-fā, The (SAYED ABDULLAH IBN-SAYED MOHAMMED), Arab religious leader: b. Darfur, 1846; d. battle of Omdurman, Egypt, November 1898. He fought against the Egyptian invasion of Darfur, and subsequently, having heard of the troubles of the Mad Mullah (q.v.), Mohammed Ahmed, with the Egyptian authorities, he visited Mohammed and proclaimed that the latter was the divinely-sent Mahdi, or "director," appointed for the regeneration of Islam. In 1883 he was made emir, and in 1884, by the emanicipation of the Mahdi's successor, and from 1885 ruled over the Sudan and such adjacent districts as he brought within his sway. His capital was situated at Omdurman, near which, on 2 Sept. 1898, his army, though fighting with great bravery, was almost annihilated by the British and Egyptian forces under Sir Horatio (afterward Earl) Kitchener (q.v.). He escaped northward, but on 24 Nov. 1899 was slain at the combat of Omdurman. Consult Ohrwalder, Father, 'Ten Years' Captivity in the Mahdi's Camp' (London); Slatin, Sir R., 'Fire and Sword in the Sudan' (London 1895). See also EGYPT—HISTORY; SUDAN.

KHAMA, ruler of Bechuanaland: b. about 1846. He was originally head only of the Bamangwato, a northern tribe of his country, but owing to his struggle against the Boers he came to represent the interests of all of Bechuanaland. In 1884, after 12 years' struggle against the Boers on the part of Khama and other native chiefs, the whole of Bechuanaland was formally taken under British protection. Khama, who had become Christianized, stood the firm friend of the British and assisted them against other insurgent tribes.

KHAMMURABI. See HAMMURABI, THE CODE OF.

KHAN, kān or kān, or CARAVANSARY, an unfurnished inn for travelers common in Turkey and other Eastern countries. There are two kinds, those for poor travelers and pilgrims, where a lodging is furnished gratis, and those for traders, which are usually more convenient, a small charge being made for each chamber. Khan is also the title of an Eastern or Asiatic ruler, as khan of Khiva. Such government is a khanate.

KHANDESH, khān-dēsh', or CANDESH, British India, an inland district in the presidency of Bombay, with an area of 10,041 square miles. In 1906 the district was divided into two new districts called West and
East Khandesh, with headquarters at Dhulia and Jalgaon. The former has 5,497 square miles and pop. about 470,000; the latter 4,544 square miles, pop. about 960,000. Consult "Imperial Gazetteer of India" (London 1908).

KHARGH, El, kahr'g, or KHARGA, Upper Egypt, town, capital of the oasis of the same name in the Libyan Desert. 100 miles west of 28° N., 30° 40' E. Among its numerous ruins are those of a temple of Ammon, and near-by is a remarkable necropolis. Pop. about 6,000.

KHARKOV, här-kôv', or CHARKOV, Russia, (1) a southern government in Little Russia, bounded north by Karask and Voronezh; west and southwest by Poltava; south by Ekaterinoslav; east by the Don Cossacks, area, 21,041 square miles. It is watered by affluents of the Don and the Don. There are forests in a few parts, but the country generally is open, the soil dry and of a mixed loamy and sandy nature, but usually fertile. The climate is mild, though the winter is somewhat severe; the summer is frequently very hot. Agriculture and stock-raising form the chief employment of the inhabitants. Sugar and tobacco are manufactured. Pop. 3,329,700. The principal town is Kharkov, the capital, at the confluence of the Kharkovka and Lopan, 400 miles south-west of Moscow. The houses are mostly of wood, whitewashed, and have a cleanly appearance. The city is the seat of an archbishop, contains a university with an attendance of 1,800 students and a valuable library containing over 175,000 volumes, a museum and botanical garden, a technological institute and a veterinary institute, etc. The inhabitants carry on a considerable trade in soap, candles and leather, and among the chief industries are wool-washing and the manufacture of flour, bricks, iron products, tobacco and cigars. Four important fairs are held each year. Pop. 248,281.

KHARTUM, hahr-toom', or KHAH-TOUM, capital of the Egyptian Sudan, on the left bank of the Blue Nile, near its junction with the White Nile. Founded under Mehemet Ali in 1828, it rapidly rose to be the chief town of the Egyptian Sudan. After its conquest by the Mahdi it was abandoned for Omdurman, on the opposite bank of the river. In the latter part of 1898 it was again occupied by British and Egyptian troops, who found it in a ruined and neglected condition. It was then a straggling place covering a wide area, with irregular streets and houses mostly built of sun-dried bricks. Since the British occupation the town has prospered, great improvements have been carried out, and a handsome broad avenue on the bank of the Blue Nile has been laid out. There are a number of mosques, a Coptic church and the palace of the governor-general. The strong strategic situation of Khartum, with rail connections to Upper Egypt and the Red Sea, and water routes to Abyssinia, Uganda and the Beleian Kongo, make it the natural emporium of a vast region. It was the scene of Gordon's heroic defense against the insurgent Sudanese and of his death in January 1885. The Gordon College, established here after the British occupation, bears his name in honor of him. This college trains aspirants for minor magistracies in their work, has a manual training school and a well-equipped research laboratory. Pop. 69,349.

KHAT, the favorite stimulant of south-western Arabia, especially in the Yemen region. It is leaves from the plant Catha edulis, a thickset, dark-green, leathery shrub, 5 to 12 feet high, growing in the mountains of Arabia mostly between altitudes of 4,000 and 6,000 feet. There are many varieties differing greatly in value. According to Beitter the active principle is an alkaloid, katin. The leaves are chewed and the effect is a prompt stimulation of the brain, relieving fatigue and dispelling gloom.

KATMANDU, kāt-măn-doo', KAT-MANDU, capital of Nepal, situated at the junction of the Vishnumati and Bagmati rivers. It is the largest city in Nepal, and was originally known as Manju Patan, having been named after the Buddhist saint Manjusi, who tradition says cut the barrier of mountains with his celestial sword and released the waters that once flooded the plain of Katmandu. The natives believe that the irregular, crescent-like shape of the city represents the traditional sword of the war-like saint. Previous to the Gurkha conquest of the country (1769) Katmandu was the capital of the Newar sovereigns, who reigned over a considerable part of Nepal and adjacent country. The city was once surrounded by strong, high and imposing walls, but these are no longer of military value and have fallen into picturesque ruins. This picturesqueness is added to by the narrow, winding streets, most of which are obstructed in places and generally only wide enough for foot passengers. The four-story brick buildings which form the chief edifices of the city are closely crowded together and throw their shadows for the greater part of the day upon the filthy streets, making them still more unhealthful. The one redeeming feature in this unsanitary condition is to be found in the many public squares of the city into which the streets lead. In the midst of its filth the city presents a very picturesque appearance owing to the decidedly Chinese atmosphere and style of its architecture and its pagoda-like temples, many of them with brass doors and copper roofs. From the top stories of these they are seen from afar from their many-storied heights. Many of the doorways are also of the same materials. Wood-carving is everywhere in evidence in the temples, and the façades of private buildings and especially in the projecting balconies or Moorish windows. A British residency is stationed just outside the city and in the town is a British post office. Pop. about 80,000.

KHAYYAM, Omar. See OMAR KHAY-YAM.

KHDEIVE, kê'dèv' (Khid'iv), a Persian word signifying lord, the former title of the pasha of Egypt, granted by a firman from the sultan 12 June 1827. In Persia it was at different eras adopted by provincial governors who were independent of the shah. The title, which had fallen into disuse both among Persian and Turkish governors was revived in Egypt to give additional honor to Ismail Pasha (1830–95). After his death, the title was bestowed in the 20th century on his grandson, Mohammed Tewfik and Abbas Hilmi II (q.v.). The latter was deposed 18 Dec.
1914; the title of khedive was abolished and that of sultan substituted in its place.

KHELAT, or KELAT, kē-lāt, capital of Baluchistan, is situated at an elevation of 6,780 feet above sea level on the sloping side of a mountain and is surrounded by an ancient, massive abode wall, in places over 30 feet in height and of great thickness. The chief fortification of the city consists of the citadel surrounding the royal palace, the residence of the khan. The town has few industries but it is the centre of considerable local trade, the latter coming to it through its situation on various caravan routes reaching out to important neighboring industrial and commercial centres. The English forces took possession of Khelat during the Afghan War (1839); and since then the country has continued to maintain more or less close relations with the British government, which obtained by treaty the right to have a British agent and military escort housed in the palace (1877). Since then British influence has been steadily increasing, the British resident being in 1907, 8,000.

KHERASKOV, kēr-a-skōf', Mikhail Matveevitch, Russian poet: b. Pereyaslav, Poltava, of a Wallachian family, 1753; d. 1807. He began life as a soldier, but became assessor of the University of Moscow in 1755, in which institution he remained most of his life (1755–1801), devoting all his spare time to literature, pedagogy and journalism. He attempted almost every field of literary endeavor, but met with most success in the tragic drama, novel and fables. His most lengthy work is the 'Rossyad' (in 12 books), which is written about the invasion of Kazan by Ivan the Terrible. It shows distinctly in form and manner of treatment, the influence of the 'Eneid' but it is quite Russian nevertheless.

KHERSON, kēr sōn', a government and capital of the same name in southern Russia. It lies between Kiev and Poltava on the north, Yekaterinoslav on the east, the Black Sea on the south and Padolia and Bessarabia, and has an area of over 27,000 square miles, of practically flat country lying at a very low elevation. The Black Sea and the Dnieper, much of the country suffers frequently from insufficient rainfall. Among the industries of Kherson are foundries (principally for iron), machine shops, carriage and wagon factories, flour mills, agricultural machinery works, leather, hemp and wool establishments and marble and granite quarries. Stock raising and fruit growing form the chief agricultural pursuits of the south while grain growing is more popular in the north, and tobacco and wine are produced in favored localities throughout the whole "government." Population 3,500,000, principally Russians with an admixture of Greeks, Germans, Bulgarians and Jews. Kherson, the capital, has a population of over 90,000, composed about the same as that of the "government." Kherson is except that Jew and native has an area of 100 miles from its mouth. It is a distributing point for the interior for Odessa and Nikolayev of the imports of these centres of trade; and it helps to furnish exports for the four commercial regions of the district, especially in hides, flour, tallow, beer, wool and soap. Kherson is one of the most progressive cities of southern Russia; it is modern in appearance and pleasing and the buildings are well constructed. It possesses an obelisk erected to the memory of John Howard who died there (1790). Among the industrial establishments of the city are tobacco factories and grain and woolen mills. The city, which was founded in 1778 by Prince Potemkin as a naval port with very strong fortifications, has erected a fine bronze statue to the memory of its founder. The fortifications of the new city were, however, scarcely completed when the plans were changed and Nikolayev replaced Kherson as the great southern naval port.

KHINGAN, kēn gān', a mountain range separating Mongolia from Manchuria, and running from the southeastern end of the Desert of Gobi to the Amur River, passing, in its course, through eastern Mongolia and western Manchuria. In some places the mountains reach an elevation of about a mile and a half above sea-level. Further south in northeastern Manchuria on the southern side of the Amur the continuation of the range is known as the Little Khingan Mountains; while the larger range is known as the Great Khingan.

KHIVA, kē'vā, or CHIVA, a vassal state of Russia, in central Asia. It lies between 43°40' and 40° N. lat., and 57° and 62° E. long. It is bounded on the north by the Sea of Aral, on the east by the river Oxus, and south and west by the Russian Transcaspian province. It formerly occupied a large extent of surface on both sides of the Amu-Daria or Oxus, but since the cession to Russia, in 1873, of its territory on the east of the Amu, is now confined to the west side of this river. Its area is 24,000 square miles. A great part of the surface consists of deserts, thinly inhabited or uninhabitable, but along the Amu the land is of a very different character, consisting of rich alluvial loam of the greatest natural fertility. Owing to the great dryness of the country, however, it soon becomes so stiff and hard that it cannot be penetrated by any ordinary implement. For this the obvious remedy is irrigation; and accordingly, from the earliest period, a mode of culture resembling that of Egypt has been practised. Large branches from the river, with numerous minor branches, intersect every part of the surface, supplying moisture where it is wanted or removing it where it is in excess, and securing the most luxuriant crops of wheat, maize, rice, barley and legumes. Cotton, silk and madder are also generally cultivated. The vine thrives well, but requires to be defended against the winter cold by a covering of straw and earth; all the ordinary fruits, including apples, plums, cherries, apricots, figs and pomegranates, are common. Trade is carried on chiefly with Russia. The principal exports are raw and spun cotton, in return for which are received various articles of European manufacture, as metals and ironware, woolen, cotton and silk goods, etc. The government of Khiva is an unmitigated despotism, and less than a half of the inhabitants are Tajiks and Usbecks, in nearly equal numbers. After these are Persians, Karakalpaks, Jamshids and Turcomans. They are Mohammedan in faith. The designs of Russia on Khiva long caused disquietude in Britain, which has always been jealous of Russian advances in Asia, mainly from a dread of
interference with her Indian Empire. Accordingly Count Schouvaloff was dispatched to England in January 1873, to give explanation respecting an intended expedition to Khiva. Its object was represented as simply the suppression of the worship of a few Russian prisoners, and to teach the Khan to desist from acts of violence in the future. The emperor, it was said, had given positive instruction that Khiva should not be taken possession of. In spite of these protestations, however, Khiva was taken possession of on 10 June; and later in the year, though the nominal independence of the Khan was stipulated for, it was decided to annex to the Russian dominions the Khivan territory on the right bank of the Amu. The Khan also renounced all right of making wars or treaties without Russian sanction. The population is estimated at 646,000. Consult Abbott, 'Narrative of a Journey from Herat to Khiva'; Burnaby, 'A Ride to Khiva' (1887); Colquhoun, 'Russia against India' (1900).

KHLESL, kläs’l, Melchior, or KLESELE, Austrian prelate b. Vienna, 1552; d. 1630. Educated in the Protestant faith, he became, early in life, a very strong Roman Catholic and an advocate of a united Christian faith, but one in which all should bow to the teachings of Mother Church. He soon became looked upon as the champion of Catholicism in Austria, and his influence extended throughout all the German-speaking countries. Owing to his earnestness and ability, he rose rapidly and became bishop of Vienna at the age of 50 and cardinal 13 years later. With each successive dignity his power increased. A great friend of the Archduke Matthias, he was appointed by the latter Chancellor on his coming to the throne. This gave him political as well as ecclesiastical power which he exercised with all his accustomed energy. But unfortunately he became mixed up in politics, took part against the Emperor Rudolph and tried to persuade Ferdinand II and Duke Maximilian of Bavaria to discontinue the war with Bohemia. As a result of this political interference he was imprisoned in the Castle of Ambras (in the Tirol). The case was appealed to Rome and Klesel was acquitted by the papal authority and sent back to Austria, where an armed truce existed between him and Ferdinand (1627). His correspondence and controversial works published in Vienna in four volumes (1847-51) form very valuable material for political and ecclesiastical history of his time. Consult Kerschbaumer, 'Kardinal Klesel' (Vienna 1865).

KHLYSTI, or KHLISTI, klfs’ťi, a Russian sect which made its appearance in the 17th century under the leadership of Daniel Philino-vich, a fanatic soldier, who, deserting the army, wandered about the country proclaiming himself the incarnate God. With him went an adopted son whom he asserted was Jesus, the Christ, and the Son of God; and an adopted daughter whom he put forward as the Virgin Mary. Khlysti was a man of great oratorical power and exercised a strange influence over the country people who followed him and became fanatically attached to him. The sect grew with wonderful swiftness and its presence was everywhere made manifest by hysteria and religious delirium. The government attempted to stamp out the movement; for the adherents met in secret and the sect is still in existence. Out of it grew other sects of similar tendencies, all of which are noted for austerity of life and simplicity of dress. Fasting and other methods of weakening the flesh were adopted by a few their followers from the beginning and still signalizes them. They all look upon themselves as gods, or children in the flesh of God and as such pray to one another and they address one another as God, Saviour, Redeemer and Mother of God. The heretics of the Russian Church now government fell upon them and they were accused of blasphemy. Hundreds of them were exiled to Siberia or imprisoned in Russia. The Khlystes are also commonly known as Danielites, from the baptismal name of their founders.

KHMERS, khmérz, the earliest-known inhabitants of Cambodia. In the course of time they have been forced to retreat to the low, marshy lands of the country and neighboring sections of Cochin-China and Siam. At this late date it is very difficult to tell whether they were originally a pure race consisting of one or two races, or whether they first came into the country they now occupy, or were then a mixed race. It is certain that they are now linguistically and ethnologically made up of different races; but this may be the result of their constant contact with many years with the various races by which they have been surrounded and with which they have come into touch. In their language are to be found traces of Mongolian, Dravidian and Aryan influences; but to which of these races they originally belonged, if any, does not seem to have been definitely decided though much has been written on the subject and extensive investigations, chiefly of a linguistic nature, have been undertaken. These would seem to place the Khmers either among the Malays or Polynesians or among both, making them a hybrid race. Although their language retains many Mongolian affinities, yet their appearance is not typically Mongolian; and they have normally neither Mongolian hair nor Mongolian eyes, the hair being inclined to be wavy and the eyes very like those of the Indo-European races. But these physical characteristics are not a sure indication as they may not have originally been of Mongolian stock; for the Turks, for instance, have lost, through intermarriage and mixture of races, their very marked original racial characteristics. The Khmers are taller, darker and more slender of form than the races among which they live or by which they are surrounded. That they have long been a cultured race there seems little room for doubt; and it is generally conceded that they were the builders of the magnificent ruins of very ancient edifices to be found in what is generally conceded to be the primitive area of Khmers occupation. These consist of noteworthy pyramids, temples, palaces and other buildings executed with considerable taste, skill and knowledge of the principles of art. The Khmers of later times were more primitive stages of Indian culture. These edifices show progressive stages of development, just as do the buildings of pre-Columbian America, more especially those of Yucatan, Central America and Peru. There are indications that the later Khmers edifices were influenced by the lighter and more artistic Ja-
KHNOPPF — KHMORGORY

dian architecture and cultural taste. How far back the earliest existing Khmers ruins date is a much disputed question; some authorities claiming for them an existence in the pre-Christian days, while others as stoutly maintain that they do not date further back than the 1st or 2d century of the present era, if indeed they date as early as the first century B.C. Evidence goes to show, however, that the best of their architectural age stretched from about 700 to 1400 A.D. This span of 700 years was undoubtedly influenced by the then prevailing Indian ideas, but the predominance is all the Khmers building was undoubtedly indigenous and not, as has been claimed, derived from India; and the proof of this rests in the fact that these buildings are so different from anything that India produced at that time or since. The modern Khmers are still skilled mechanics and are especially noted as gold and silver smiths. See CAMBODIA; SIAM; COCHIN-CHINA.

Bibliography.—Aymonier, 'Tentes Khmers' (Paris 1878-91); 'A Khmers-French Dictionary' (Saisson 1876); and various other works on Cambodia and Cochinchina. Perré, 'Le Cam- boré', Les origines du Cambodge et de la province d'Angkor (1902); Combona, 'Les ruines d'Angkor' (Paris 1890); 'Le Siam ancien' (Paris 1895); and various works on Cambodia, Cochinchina and Siam by Garnier, Lemire and Maura.

KHNOPPF, knopf, Fernand, Belgian painter, etcher and sculptor: b. Greemstegen, Flanders, 1838. He began the study of law, but soon abandoned it for that of painting. He early developed excellent technique and breadth of view, in which, however, there is no evidence of marked originality. His work is modern in every way; but it is none the better for that reason. Yet he often comes to the borderland of originality without overstepping it. His failure to go farther seems to be due to his lack of vigor and strength of imagination, as he has frequently shown in his beautiful and harmonious landscapes and executed female figures; but his originality is not of that forceful kind that has the power of creating original conceptions and presenting them in a vigorous and convincing form. His most beautiful creations, therefore, have their birth more often in imitation than in original thought. The best of his works is his portraits; and he seemed to find more than his usual inspiration in many of the faces he was called upon to reproduce. He was a very popular artist, especially as a portrait painter, and, consequently much of his best and most interesting pictures are in the hands of private individuals. Among his better known works are 'The Crisis'; 'The Temptation of Saint Anthony'; 'Lock My Door upon Myself' (Brussels Gallery); 'White, Black and Gold' (Brussels Museum); 'The Idea of Justice'; 'Isolde.' Consult Dumont-Wilden, 'Fernand Khnopf' (Brussels 1907).

KHNUM, knum (khnm, a stem), or CHNUM, a very ancient divinity worshiped in Egypt in primitive times. He was a native god and probably a water deity. He became of great influence as a local divinity and was worshiped as the presiding spirit of the cataract of the Nile. Being a deity of growth and fruition, Khnun was looked upon in the local section, where he was all powerful, as the creator of gods and men. This indicates that he was a tribal god which had been introduced, probably at a very early period, into the hierarchy of the gods of Egypt. He was associated with a number of other deities, Satet and Anuket, which also came into prominence among the deities of Egypt. Khnun is frequently mentioned in the Egyptian texts that have survived, and in them he is generally looked upon as the former and creator; and is represented as turning the new-born child upon the potter's wheel or officiating at the birth of kings and princes. In the course of time the attributes and functions of Khnum were extended and enlarged and he became looked upon as a cosmical deity. Pictorially he was represented and is so presented in the manuscripts in human figure with the horned head of a ram. For this reason his sacred emblem was the ram. Consult 'The Religious Egyptian' (London 1894); 'The Religion of the Ancient Egyptians' (New York 1905); Wiedermann, 'Religion of the Ancient Egyptians' (New York 1897).

KHODAVENDIKYAR, kó-dá-vén-dé-kýär', or BRUSA, a Turkish vilayet situated in the northwest of Asia Minor. It comprises historic ground since it is made up principally of ancient Phrygia and Bithynia which are as noted to-day for their fertility as they were in the days of their ancient renown. The manufactures of the country have been steadily but slowly growing into importance; and under a more liberal rule they would probably be of much more importance than they now are. Area, 26,000 square miles; population nearly 2,000,000, of which about 20 per cent are Armenians. Capital Brusa.

KHKAND, hó-kánd'. See FERGHANAH.

KHOLEM, kölm, a district and capital city of the same name in the government of Lublin, Russian Poland. The city is situated about 45 miles to the east of Lublin, with which it is connected by railway. It is an excellent market for grain, cattle and other local products and is the centre of considerable import trade. Its railway interests are considerable and it possesses a railway school, a fine cathedral and other church and educational facilities. Kholm is written Chełm in Polish. Pop. about 30,000.

KHOMOGORY, kólm-gó-gö-rč, a district and capital city of the same name in the Russian government of Archangel. The city which is situated on an island in the Dvina River is about 50 miles southeast of the city of Archangel. The district is noted for its excellent cattle which it raises in large quantities and exports in considerable numbers. It is said that the origin of these fine Russian cattle dates back to the reign of Peter the Great who brought back with him to Russia from his ship-building trip to Holland a number of fine Holland cattle, and with these the natives of Khomogory so improved the native breed that it soon became noted not only at home but also abroad. To Peter the Great was due the
prosperity of the town as a point of shipping on the line of the White Sea trade. With the decline, in comparatively recent years, of this northern trade, owing to change of conditions of commercial expansion, Kholmogory declined during the latter part of the past century; but it had again begun to improve before the European War broke out. On the outskirts of the town is the village of Denisovka which prides itself on being the place of birth of Lomonosof, who is generally reputed to be the father of Russian literature. Pop. 1,653.

KHOMEYAKOFF, kɔmɨˈjɑː-kɔf, Aleksey Stepanovitch, Russian dramatist, poet and controversial writer: b. Moscow, 1804; d. 1860. He was for a time a soldier and served through the Russo-Turkish War (1828-29). During this period he gained very considerable experience which was of very great use to him in his later career as a literary man, upon which he entered as soon as he returned home from the Turkish campaign. He soon became distinguished as a lyrical poet and a very pronounced Slavophile, a rôle in which he attracted much attention throughout the Slav countries, and little later on throughout all Europe. He became the leader of the pro-Russian school of writers, which was distinguished for its intense love of Russia or, in the case of the imitators, the blatant praise of it to the disparagement of all foreign countries. Khomeyakoff was accused by his enemies and detractors of being "drunk with patriotism" and he himself inclined to admit the charge without cavil. With the strongly imaginative sight of the born poet he sees in Russia the most beautiful, most wonderful, most nearly perfect, most ideal country in all the world. In the Slavs he saw the coming of a new race, destined to take the place of the effete West, the empire founded by the Germanic tribes upon the ruins of the Roman Empire. In the west, in the Germanic-Roman period, he could see nothing good; In the Pan-Slav countries, headed by Russia, he could see only through a vision in which everything was altogether lovely and alluring. Thus he naturally found a very large following of pro-Russians most inclined to listen to flattery that was the naked truth. Yet it would be probably unfair to accuse Khomeyakoff of insincerity or a desire to flatter in his fervent praise of Russia and Pan-Slavism. His was an intense nature incapable of doing anything in a really temperate manner; and he pictured Russia as the all-lovely just as he saw nature in the most lovely of garments through the eyes of the lyrical poet. The same qualities that give life, inspiration and beauty to his masterly lyrics inspired his pro-Slavic love and vision. But many of his followers, who lacked the vision of the master, became blatant, tiresome, insincere, characteristics of the Khomeyakoff school of literature at a later period in its history.

The first notable work of Khomeyakoff appeared in 1832. This was a drama entitled "Yermak," a work distinguished by its poetic touch, vivid imagination and the other qualities which were to distinguish the style of the writer throughout his whole literary activity. It at once attracted attention to the writer and marked him as one of the coming literary lights of Russia. This drama was followed the following year by a second, entitled "Pseudo-Demetrius." This latter drama is built up about the dramatic and romantic career of one of the false pretenders to the Russian throne, who actually succeeded in making good his pretensions for a time and in deceiving a large percentage of the Russian people. The plot itself was dramatic and required only the breath of the creative genius to make it a great drama; and this Khomeyakoff succeeded in doing. He was a great linguist and wrote fluently in Russian, German, French and English, and through these linguistic gifts he was able to keep in touch with the Pan-Russian party wherever members of it were to be found. Naturally all his writings in foreign languages were written with a view to reach his followers or of inspiring a love for Russia or to denounce the "rotten western world," and of exalting Russia as head of the Pan-Slavic world. One of his notable efforts in this direction was his "A Message from Moscow to the Servians," which appeared in Leipzig in 1860 and created intense interest throughout the whole Slav world. In this "message" he embodied his most ultra ideas of the Pan-Slavic question. Khomeyakoff was one of the greatest and most gifted of Russian poets and most felicitous of her prose writers. He wrote, in addition to the fields already mentioned, on historical, philosophical and theological subjects in a masterly manner.

KHONDS, khɒndz, or KUS, a people of Dravidian race living in parts of Orissa and Bengal. They are of low stature, well built and muscular and of a warlike disposition which has made them good soldiers and consequently highly respected by their neighbors. They are less cultured than the races by which they are surrounded. They cling to the ancient Dravidian beliefs, in which nature worship forms the chief rôle. But among them almost every sect of India and some of the European religions have a formal hold, though even where they prevail, they are grafted on the ancient religious beliefs and superstitions. The Khonds are said to have all the virtues of races in their stage of social evolution. They are kind and generous to one another, hospitable, faithful to their friends and averse to making war to their enemies. In one respect they are above the normal standard of many races much more advanced than they, in that they are noted for their morality. Among their picturesque customs which have now practically disappeared were their practice of capture marriages and their human sacrifices which were offered to the earth deity or to the mother of fertility and production. This latter custom seems to have been at one time common to all the Indo-European races, among whom the great Earth Mother was one of the most revered of deities, under one name or another. Pop. about 500,000. Consult Campbell, 'A Personal Narrative of Thirty Years' Service among the Wild Tribes of Khondistan' (London 1864); Dalton, 'Descriptive Ethnology of Bengal' (Calcutta 1872); Lewin, 'The Poetic Touch, vivid imagination and the other qualities which were to distinguish the style of the writer throughout his whole literary activity. It at once attracted attention to the writer and marked him as one of the coming literary lights of Russia. This drama was followed the following year by a second, entitled "Pseudo-Demetrius." This

KHOOZISTAN. See ELM.

KHOPA, kʰoˈpʰa, a seaport in the vilayet of Trebizond, Asiatic Turkey. For many years
previous to the European War of 1914-18 it was a fortified place; but its fortifications were altogether unfit to withstand modern artillery. In the beginning of the war the Russian warships bombarded the port, and the barbouche and the town; set the latter on fire and destroyed great stores of ammunition and parts of the town on the port side. This rendered the place useless, for the time being, to the Turks who had been preparing to occupy it with a heavy military force.

KHORASAN, ko-ras’an, Persia, an extensive northeastern province; area, about 140,000 square miles. The surface is to a great extent uninhabitable. The mountainous region of the north has many well-watered valleys with a fertile soil. The most valuable mineral is the turquoise. In many parts cotton, hemp and tobacco grow freely and aromatic plants and drugs are numerous and valuable. The principal manufactures are silk and wooden stuffs, carpets, firearms and sword-blades. About two-thirds of the inhabitants are Persians; the remainder are Turcomans, Kurds and other tribes, who lead a nomadic life. The chief town is Meshed. Pop. estimated at 660,000.

KHORSABAD, khör-sä-bäd’. See NINEVEH.

KHOSRU, kös’-roo’ (meaning, having good or great renown), a semi-legendary king of Persia, known as Kai (king) Khosru. About his date there are many legends, and attempts have been made to identify him with Cyrus the Great. He belonged to the Kaiani dynasty of Persia, which seems itself to be more legendary than historical in so far as the present records are concerned. See KAIAHIAN.

KHOSRU I, or Husrav, known as Anu-shirvan (“he of the noble soul”), the Sassanian king of Persia, who reigned from 531 to 579. In Byzantine history he was known as Chosroes I. His reign was the most eventful one in the line of his dynasty. Though a younger son he succeeded to the throne by the conditions of the will of his father, Kobad, king of Persia. He was forced to face a rebellion on the part of his elder brother whom he defeated and put to death. In the ninth year of his reign he began war upon the Byzantines, between whom and the Persians there had long been a standing enmity, and a bloody contest opened which was destined to continue for 20 years, to see numerous battles, some of them gigantic for their age and the conditions under which they were fought and of varying fortunes. In the beginning of the campaign the Persians were the victors, but Khosru gained very little but glory out of the campaign, which finally ended in a patched-up treaty in which neither side could claim a real victory. Peace lasted 10 years without the Persians feeling that they were able to renew hostilities, when they were stirred to action by the young Emperor Justinian II, who treated the Persian representatives at his court with notable disrespect and added to this indignity by the seizure of Armenia (570). Khosru was enraged by seizing Dara, which formed the advance garrison of Grecian territory to the east. After over seven years of war and varying fortunes Khosru was very badly defeated at Melitine (577) by Justinian, who was himself routed in Armenia two years later, shortly after the death of Khosro, who died in the midst of the fiercest part of the struggle. He was long remembered as one of the greatest of Persian sovereigns. He divided the country into the four provinces and encouraged trade and commerce; promoted native industries, colonized unpopulated parts of the country, rebuilt cities and restored to normal conditions the parts of the land which had been ravaged by war. He also extended the boundaries of Persia so that it stretched from the Arabian Sea to far into central Asia and from the Indus to the Red Sea. So notably did Khosru impress his personality upon his country that his name passed down into history with a cloud of striking legends and folk-tales surrounding it; so that he became, to the masses of the people, more a legendary than a real historical character. In many of these folk tales he figured as a native Haroon al Raschid, a sort of Aaron the Just, dispensing the strictest if the sternest justice to rich and poor, rich and peasant alike. Consult any good history of Persia or of Greece or of the Byzantine Empire.

KHOSRU II, king of Persia from 590 to 628. He was a grandson of Khosru I (qv.), and was surnamed Parvez (the victorious) on account of his many victories. In the first year of his reign he had serious trouble on his hands through an insurrection stirred up by the Armenian insurgent, Shulab Chubin. This he was enabled to put down through help opportunely rendered him by the Greeks to whom he surrendered most of Armenia and all of Nisibis and Dara which his grandfather had taken from them; and for 12 years he maintained peaceful relations with them. These relations were broken by the Greeks themselves. For 19 years Khosru carried on war against Byzantium with almost unvarying success, inflicting one defeat after another upon the Emperor Heraclius, so that he became almost a legend as they had never before been punished in all their history. He took from them all the land he had given them in the beginning of his reign out of gratitude for services rendered him, and he invaded and conquered Syria (611), Palestine (614), Asia Minor (616) and the following year Chalcedon. Finally the tide of battle began to turn on account of trouble which Khosru found at home where the discontented plotted against him. The war continued to drag on with unvarying successes until finally Khosru was signal defeated and dethroned only to be murdered by his eldest son Shereq, who led the party of discontent (628). Consult Justi, Grundriss der iranischen Philologie (Vol. II, Strassburg 1896-1904).

KHOTAN, ko-tan, or ILCHA, a city on the Khotan Darya, on the outer edge of the desert of the Tarim Basin, at an elevation of 4,600 feet, in the south of East Turkistan, China. Owing to the fact that it is on one of the greatest trade routes of the district it is a place of considerable importance, though it has only
KOTIN — KHYBER

About 50,000 inhabitants and is a straggling, poorly-built town such as may be found on the outskirts of eastern civilization quite frequently. For years the Khotan country was either independent or semi-independent, and during this time the city of Khotan was its capital and the official residence of the khan. For this reason it was strongly fortified in the olden days, and the fortifications still exist. Although strong enough to protect the city from raids of wandering nomads these fortifications would be useless against modern artillery. The chief industry of Khotan is the manufacture of silk, and its principal exports consist of silk, carpets and gold. Throughout the district of Khotan and in the city of the same name the chief inhabitants are Tartars. Round about Khotan are the ruins of very many ancient and once flourishing cities which are now covered up, for the most part, by the sands of the desert. Several excavating parties have been at work among them with interesting results to science. Consult Stein, A. M. (one of the excavators), 'Sand of Khotan' (London 1903); 'Ruins of Desert Cataya' (London 1912).

KOTIN, kok'yon, or CHOTIN, a district and capital city of the same name in the government of Bessarabia, Russia. The city is situated on the Dniester close to the frontier. It is noted historically as the scene of the severe wars which John Sobieski administered to the Turks in 1673. For the most part the district is given over to agriculture, and the town is, in consequence, little more than a centre of local trade, which has increased in importance but little for years. Pop. about 25,000.

KHUEN-BELASI-HEDEBARY, Charles (Koebi), Count, Hungarian statesman; b. Freiswaldau, Upper Silesia, 1849; d. 1914. Soon after graduation he began to take a great interest in public life and, at the age of 25, he became a member of the Hungarian House of Deputies, representing the Liberal party; and several years later he fell heir to the title of Count of Raab. Shortly afterward he became governor of Croatia (1883-1903). In his score of years in this important office, in which he seems to have had the unqualified support of the Austrian government, he displayed a constant, in ability to understand the people and a facility for antagonizing them that amounted almost to genius. Finally, in 1903, he was appointed by the emperor Premier of Hungary. But his national unpopularity and his native tact and constructive ability made it impossible for him to maintain the confidence of the people, and his short-lived government (25 June-3 November) was forced to resign without accomplishing anything. The following two years Khuen held office in the Tiza Cabinet. Through the favor in which he stood with the emperor, he was given the position of Minister of Hungary, a position that gave him great power, which he once more misused. He again failed to agree with the House, which he antagonized by his autocratic conduct and haughty bearing. After constant administration troubles, he was again forced to resign in 1912. From that time on he dropped out of sight, and disappeared from public life.

KHUFU. See CHOPS.

KHUSRAU I, a Sassanian king of Persia who reigned from 521 to 579, and during most of these years carried on wars against the Byzantines. To the Byzantines he was known as Chosroes I. See Khusrau I.

KHUDZIESTAN, koo-zé-stán', Arabian province in western Persia, lying between Luristan, Isphahan, Faristan, Asiatie Turkey and the Persian Gulf. From the lowlands in the east, which are often wet and unhealthful, the country rises into a hilly, healthful climate in the west. Unlike much of the surrounding territory, Khuszistan is but comparatively sparsely populated and most of the inhabitants are Arabs, many of whom are still nomadic. In the more fertile portions of the upland regions rice, barley, wheat, maize and other grains, cotton, indigo and fruit are the chief products. Among the manufacturing activities of Khuszistan are cotton and woolen goods, carpets and silk cloths. This activity is confined, for the most part, to the chief cities, Diezful, Shuster and Mohammerah. Area about 40,000 square miles. Pop. 200,000.

KVOSHTCHINSKAYA, kvos'h schens-kâ', Nadezha Dmitrievna, Russian writer; b. Ryzan, 1825; d. 1889. She wrote under the pseudonym of V. Krestovski, a designation which she long continued to use. She was one of the most notable of the Russian realists of the middle of the 19th century, and her power of vivid description and intimate knowledge of Russian life gained her great popularity with her countrymen, especially with those belonging to the middle classes. The Russian country life she knew intimately and depicted with a vividness never before shown by any native woman writer of Russia. Through the Annals of the Fatherland she appealed to a very large audience for many years, so that at last she became an institution of that publication, which takes, in Russia, the place occupied in the United States and Great Britain by the monthly magazine. Many of her most important works first appeared in this magazine, more especially those depicting rustic life and characters. Many of her stories have been translated into Russian and several of them into most of the languages of Europe. Some have been retranslated from German or French into English. Among her most important published works are 'The Great Bear,' 'In Trust of Better Things,' 'From the Immediate Past.' Numerous editions of her works have been published in Russia, the first appearing in Saint Petersburg in 1883. A fairly complete edition also appeared in Italian shortly before her death, and from this some of the French translations were made. See any good history of Russian literature; also Koltonovskaya, 'Femine Silhouettes' (Saint Petersburg 1912).

KHYBER, k'ber, or KHAIBAR PASS, a mountain pass on the frontiers of India and Afghanistan, leading from Punjab to Jelalabad and Cabul. The pass—a narrow defile—winds northwest through a range of hills, called by the same name, for a distance of about 33 miles and forms the bed of two streams, the one flowing north and the other southwest. It is at one part as narrow as 40 feet in width, ranging up to 450 feet wide, and in
many places the hills on either side are quite precipitous and inaccessible, rising at one point to the height of 1,300 feet. At 9½ miles distance from the Indian entrance of the pass is the high wall, the original of which had been taken by the British from the Afghans, during the wars of 1839-42, 1878-80 and the Afridi campaign of 1897. The highest point of the pass is Lundi Kotal, 3,373 feet above sea-level. The pass forms the northern military route from India to Afghanistan, and is now under British control. Consult 'Imperial Gazetteer of India' (Vol. XV, Oxford 1908).

KI-TSE, ke’sè, CHI-TSE, or KI-JA, Viscount Ki, Chinese statesman who flourished about the middle of the 12th century A.D. Tradition credits him with being the founder of Korean civilization and an ancestor of the Chinese philosopher and religious teacher Confucius. Semi-legendary semi-historical accounts of his life show him as a man of great strength of character and determination coupled with honesty of purpose. According to these accounts he succeeded to the throne of the Chinese Emperor Chow-sin (1154-1123 B.C.), who had developed into a ferocious and bloody tyrant, and being imprisoned for his pains until the overthrow of Chow-sin. Liberated from prison by the conqueror, Wu-Wang, Ki-tse still remained loyal and faithful to his sovereign and sooner than remain under the domination or submit to the government of the new ruler of China, he is represented as going off with his thousands of adherents far eastward and there founding a new kingdom in what is now modern Korea. The capital of this new kingdom was Ping-yang, situated on the Ta-Dong River, where the remains of a very ancient tomb are still pointed out to the tourist and visitor as his. There seems to be some doubt as to whether Ki-tse ever really existed, or if he did, that he performed all the things attributed to him. In fact the catalogue of his doings reads very much like those attributed to the legendary hero ancestors or culture gods of so many races. He was to the Koreans what Moses was to the Jews, the great law-giver, leader, and, in a sense, prophet. He taught them most of the important activities of their national life, among them agriculture, in all its branches, and especially the rearing of the mulberry tree and of silk worms, the manufacture of silk, including its spinning and weaving. Ki-tse seems to have been more than a law-giver and teacher of industrial activity, for he is credited with having formulated the Korean conception of morality, the proper relations of man to man and to society and the court; and he is credited with having laid great stress upon honesty and integrity in all the relations of life. 'The Great Plan' or 'Book of History' (Shu-king) is attributed to him by the Koreans. It is more than probable that Korean chivalry was largely derived from China, but there is nothing in Chinese history which would back the Korean story of the coming of the founder and philosopher Ki-tse. In fact the account of his wanderings and of his forced exile from his own country is exactly in line with the adventures attributed to most of the great culture heroes of the world; and the myths that have become attached to him are in no respect different from those that cluster around the other known culture heroes and failed ancestors of nations. Like most of the culture gods he had to struggle against evil to bring good to the people he had chosen to honor. With his favors and his gifts of the knowledge of civilization. For the legendary stories of Ki-tse consult any good history of Korea; and for 'The Great Plan' consult 'Chinese Classics' (Vol. III, Hongkong 1865).

KIA-K'ING, kyiâ'k'îng, or CHIA-CH'ING, chyâ'ch'îng, the 5th emperor of the last Manchu dynasty of China; began to rule in 1706; died in 1712. It was probably to him more than to any one other ruler of his dynasty that the downfall of the Chinese imperial family was due. He showed little ability for government; he neglected affairs of state in favor of the prosecution of his own dissolute pleasures and he consortcd with people of more than questionable morality in preference to those who might have enabled him to steer amidst the rocks of politics that threatened to wreck the ship of state. Not only did he neglect altogether the business of government but he managed, by his senseless conduct, to stir up family feuds and he thus estranged from him many of his best friends and those who had been supporters of the royal family through a long line of ancestors. This line of action weakened the power of the ruling classes over the masses of the Chinese people and prepared the way for the revolution which followed many years later. His actions and his conduct were imitated by subsequent rulers of China and plunged headlong to her fate. The evidence of the decay of the influence and solidarity of the royal power was seen in the insurrections through the country, in plots against the emperor and the royal family and in the general unrest of the nation. The incompetency of the emperor led to disorganization in the resources of the country and to the maladministration of its laws and affairs. Pirates and smugglers played havoc with the revenue of the crown which soon proved insufficient for the needs of the government and of the dissolute monarch, who was forced to use illegal means to increase his income. This led to further discontent and unrest on the part of the Chinese people and to further plots and insurrections. One of the acts of Kiia-King which brought him to the attention of Europe perhaps more than any other movement of his reign, was his persecution of the Roman Catholic missionaries who had acquired a certain amount of influence during preceding reigns. He accused them of meddling in the political affairs of the country; and on this charge he expelled many of them from China. It may be that our opinion of Kia-King is too highly colored as our information relative to his reign comes, for the most part, from his enemies. But even allowing for all this, the fact remains that he left to his successor, Tao-Kwang, in a thoroughly disorganized condition a throne which he found, on his accession to the throne, fairly prosperous and contented. Consult Giles, 'China and the Manchus' (Cambridge 1912).

KIA-BOUCCA, KIA-BOOCA, KYA-BUCCA, a beautiful mottled wood coming, for the most part, from Moluccas and Guinea, though it is also found in other countries. It is formed much in the manner of curly maple
and other similar woods, by the union of the branch with the tree or through excrescences on the outer part of the trunk and larger limbs. The darker shades of Kiabouccua resemble the stained shades of the gable wood of Mexico a and the Central American countries, while the lighter shades run into varying yellows or reddish yellows and oranges. This gives it a very rich appearance which makes it valuable for cabinet work and fancy caskets of various kinds and among them snuff and tobacco boxes. Wood of a somewhat similar appearance is to be found in India, though the Indian shades are neither so rich in color nor so varied in shades and combinations of shades. These Indian woods are obtained from the *Pterospermum rubiginosum* and the *Pterospermum suberifolium* and several other allied trees all of which produce valuable cabinet or building woods. Some of these have been successfully exported from India to Europe and there employed in the manufacture of fancy furniture. In general the representatives of these Indian woods in Guinea and Moluccas, with the one exception of the kiabouccu, have not been, to any extent, used outside their native country. Kiabouccua is frequently known on the market as Ambouwa wood.

**KIAKHTA**, ké-ä'k'ta, a town in Transbaikalia, Siberia, Russia, not far from the Chinese border. It was originally surrounded by a wooden wall but the growth of the original trading station has been so great that it has spread beyond the fortress enclosure. Previous to 1880 it was the chief point through which the trade between Russia and China passed. The tea trade, which formed the chief international business of Kiatkha, amounted to over $10,000,000 yearly in 1895. Since then this trade has declined to some extent, and with it went, for some time, the prosperity of the city, which had declined in inhabitants to about 5,000 in 1895. But since then Kiakhta has again begun to prosper on account of the rapid growth of Siberia and the general extension of trade, commerce and agriculture throughout the more habitable parts of these great eastern Russian provinces. Pop. 32,000.

**KIAML PASHA**, Turkish statesman: b. Cyprus, 1833; d there, 14 Nov. 1913. The son of an artillery officer, he was educated at the military school at Alexandria, Egypt, devoting himself mainly to the study of languages. Besides his native tongue, he learned English, French, Arabic, Greek and Persian. His first post was that of dragoman (interpreter) to the governor of Crete; after holding various offices in Cyprus and several governorships he became Minister of the Interior at Constantinople in 1878, followed by three other ministerial portfolios. From 1885 to 1891 he was Grand Vizier, and again in 1895 for a few weeks, when he was dismissed and made governor of Aleppo and later of Smyrna. Suspected of liberal views, he was deposed in 1907 and declared exiled. He took refuge at the British consulate, and after the intervention of the British Embassy was allowed to return to Constantinople. He was again made Grand Vizier after the revolution of 1908, but resenting the dictation of the Young Turk Committee he dismissed the ministers of War and Marine in 1909, which led to a censure by the Turkish Parliament and his resignation. For the fourth time he was called to the helm of state in 1912 in succession to Ghazi Mukhtar Pasha. In January 1913 he was driven from office by the Young Turk coup d'etat and resided to Cyprus, where he died the same year. Kiamil Pasha was a cordial friend of Great Britain, and it was his boast that he had been a reader of *The Times* for over half a century.

**KIAN, ké-äng', DZIGGETAI or KULAN**, the large wild ass of Tibet and Mongolia, characterized by its large size (11 to 12 hands high), dark reddish color and the narrowness of the black stripe along the spine; some have faintly barred legs. They dwell upon the lofty, sterile plateau north of the Himalayas, moving about in bands which travel at amazing speed over the stony plains and up and down the steep hillsides, feeding mainly on twigs of woody desert plants, and acquiring great hardiness. They are hunted by the Mongols as game, yet are not shy as a rule, coming close to a traveling party or camp, apparently actuated by extreme curiosity, unless driven away. The voice has been described as like the neigh of a horse; but the general and truer opinion is that it is more nearly the shrieking bray of the ass. The animal is nowhere domesticated, except a few captive specimens in zoological gardens. See ONAGER.

**KIAN-SI, ké-äng'sē, or KIANGSE**, an island province of China. It is bounded on the north by Hupeh and Nang-Hui, on the east by Che-Kiang and Fu-Kien, on the south by Kwang-Tung, and on the west by Kwang-Si and Hunan. The area is 69,480 square miles. The province contains the treaty port of Kiukiang on the Yang-tse-Kiang. The Nan-Ling or Southern Mountains traverse the eastern half of Kiang-Si, and in the north is the large inland lake of Po-Yang-Hu. Here are established famous manufactories of porcelain. The principal river aside from the Yang-tse-Kiang, is the Kin-Kiang. The province produces tea and silk and tobacco. There is great mineral wealth, especially of copper and iron. The English have large railway concessions. There are telegraph lines connecting the treaty port with other centres of commerce. The capital is Manchung. Pop. 16,255,000.

**KIAN-SU, ké-äng'soo, an important maritime province of China proper, bounded north by the province of Shan-Tung; east by the Yellow Sea; south by the province of Che-Kiang and west by the provinces of Nang-Hui and Ho-Nan. Kiang-Su has an area of 38,600 square miles (about that of Pennsylvania). The great commercial importance of this province is denoted by its possession of four treaty ports, Shanghai, Nankin, Su-Chau and Chin-Kiang. Kiang-Su was in fact the first province opened to foreign commerce by means of a treaty port. It is traversed almost its whole length by the Grand Canal, the ancient Chinese system of canalized rivers and lakes. The British have valuable railway concessions and the Germans claim mining rights here. Half the foreign population of China is established in this province. The Yang-tse-Kiang empties into the sea through this province and enables it to control
the trade of all southern China. Possessed of a soil of great fertility it is famous for its production of rice and silk. There are large cotton mills. The capital of the province is Nankin, which was formerly the capital of the Chinese empire. The Tai-Ping rebellion of 1853-54 had its headquarters in this province. Kiang-Su is rapidly becoming the centre of Chinese manufacturing industries, especially in textiles. Commercially, the province is controlled by the English, who have invested largely in railways, mills and government concessions. Pop. estimated 15,380,000.

KIANGANES, a Philippine tribe. See QUIANGANES.

KIAO-CHAU, k'ë-ä'-chow", or KIAO-CHOW, a Chinese walled city and the name of a German leased territory which since 1915 has been held by Japan. The territory lies between the shores of Tiao-Chau and on the east coast of the province of Shan-tung and the city lies outside the German sphere of influence. The bay is some 15 miles from east to west and from north to south, and has deep water anchorages in its southeastern portion. The territory was a Kiao-Chau settlement by Germany in November 1897 in retaliation for the murder of two German missionaries by the Chinese, and in March 1898 Tsing-tau harbor, on the east of the bay, and the district adjoining about 200 square miles, were transferred to Germany by treaty on a lease for 99 years. It was then declared a protectorate of the German Empire, placed under control of the navy department, and declared a free port. The territory comprises 33 townships, with a population of 192,000. Around the leased territory is a neutral zone, 2,500 square miles in area. Great improvements and construction works were then set on foot; a sum of $7,000,000 was expended on the harbor of Tsing-Tau, a great floating dock being constructed. An excellent water supply, electric lighting and telephone service were introduced into the city. The city was placed in 1906 under the Chinese Maritime Customs, 20 per cent of the receipts to be handed over to the German authorities. The railway was constructed from Tsing-Tau to Tsinang, 252 miles in length, through the Shan-tung province, tapping a rich agricultural and mining section. The revenue of the protectorate in 1914 was $636,000, and expenditure $520,500. In 1913, 923 vessels cleared at Tsing-Tau (pop. 34,000), with a tonnage of 1,298,622 tons.

On 16 Aug. 1914, after the outbreak of the Great European War, Japan called upon the German authorities to deliver up the leased territory by 15 September, and on 23 August declared war. The investment began on 27 August, and after a heroic resistance on the part of the German garrison, the city surrendered to the combined Japanese and British forces on 7 November, and since that time it has been occupied by the Japanese. On 25 May 1915, it was announced that, following on negotiations between China and Japan, the territory would be returned to China on the conclusion of peace, on condition that the German privileges in the leased territory be transferred to Japan. The Chinese Maritime Customs was reopened on 6 Aug. 1915. The number of Japanese residents on 20 April 1915, exclusive of military, was 9,264.

KI B I T K A, a covered carriage without springs used in Russia; also the name of a tent used by the nomad tribes of Kirghiz Tartars.

KIBLAH, or KEBLAH, the point toward which the Mohammedans turn their faces in prayer. The term literally means "to lie opposite and is derived from the Arabic "kabala" which bears this meaning, it being understood that the point indicated is opposite to the south. This point, for those at a distance, the temple at Mecca, or rather the Kaab (q.v.) contained therein. It is said that Mohammed changed three times the direction in which his followers should face when praying. Finally he settled upon the Kaab (16 Jan. 624).

KICKAPOOS, a tribe of Algonquin Indians, formerly occupying a portion of the Ohio Valley. They were a powerful nation in the early history of that region, and were constantly in arms against the whites, but in 1819 they were attracted by the Osage River Reservation in Kansas. In 1852 a considerable number of them went to Texas and from there to Mexico; some of these returned to the United States and settled in the Indian Territory. See INDIANS.

KICKHAM, kick'äm, Charles Joseph, Irish novelist: b. Mulmainhine, County Tipperary, 1836; d. 1882. He was very active in anti-government and revolutionary circles; and he appeared, at the age of 22, prominently in the Young Ireland Movement. He received a warning, and later on he was arrested, tried, and convicted of treasonable acts and sentenced to fourteen years' imprisonment (1865), only four years of which he served when he received a pardon. Previous to his arrest he had been active in the editorial department of The Irish People, the Fenian organ; but, on his liberation from prison he did his best to keep faith with the government. Then began the most active and brilliant period of his public career. He possessed a strange, tragic, though somewhat uncontrolled power which required only more mastery on his part to have made of him a notable novelist. Among his published works are 'Sally Cavanagh' (1869); 'Knocknagow' (1879); and 'For the Old Land' (1886). These are all characterized as Irish in their humor, their power of minute and careful observation, and the spirit of romance coupled with a depth of homely feeling which makes him one of the best delineators of Irish peasant and country life.

KICKING BIRD (TEN-I-ANGPÔTE), Kiowa Indian chief: b. about 1810; d. 5 May 1873. His grandfather was a Creek captain who had been adopted into the Kiowa tribe. The youth early distinguished himself by his mental gifts. He also won fame as a warrior but saw the hopelessness of the struggle with the whites and used all his influence to induce the tribe to submit to the inevitable. He signed the first agreement to accept a reservation on 15 Aug. 1865 at Wichita, and the treaty concluded at Medicine Lodge 21 Oct. 1867, definitely fixing the Kiowa-Comanche-Apache reservation in the present limits. In 1867 he took no part in the resistance of the Indians to removal in 1868 nor in their raids into Texas. When the Federal authorities in 1873 failed to carry out their agreement to release the Kiowa chiefs
imprisoned in Texas, he lost faith in the government and was induced to join the hostiles for a short period, but later he induced two-thirds of his tribe to return to the agency at Fort Sill, and thereafter he was recognized as the head chief of the Kiowa. In 1873 Kicking Bird invited and assisted in the establishment of the first school among the Kiowa. He died suddenly, by poison, according to the suspicion of his friends, but at the request of his family was buried with Christian rites.

**KIDD, Benjamin**, English sociologist; b. 9 Sept. 1858. He entered the inland revenue service of Great Britain in 1877, and rose to sudden fame by the publication of ‘Social Evolution’ in 1894. The volume was translated into most of the languages of Europe and gave rise to considerable controversy. President Roosevelt publishing a series of papers in opposition of the views propounded in it. Its main proposition was that high moral and religious development in society was a process that ran exactly contrary to natural evolution and the Darwinian process of survival. He has also published ‘The Control of the Tropics’ (1898); and ‘Principles of Western Civilization’ (1902); ‘Herbert Spencer and After’ (1908); ‘Two Principal Laws of Sociology’ (1909).

**KIDD, John**, English writer and geologist; b. London, 1775; d. 1851. Graduated in medicine at Oxford he became assistant in chemistry at the latter university (1801–03) and professor of the same subject (1803–22); regius professor of medicine (1822–34); and keeper of the Radcliffe Library (1834–51). Though his main work was devoted to chemistry he also lectured on geology and mineralogy in which he took a very active interest and toward the popularization of which he contributed very considerably. Among his published works are ‘Outlines of Mineralogy’ (2 vols. 1809); ‘A Geological Essay on the Imperfect Evidence in Support of a Theory of the Earth’ (1815); ‘Adaptation of Eternal Nature to the Physical Condition of Man’ (1833); ‘Medical Reform’ (1841); ‘Further Observations’ (1842).

**KIDD, William**, American pirate: b. probably Scotland, about the middle of the 17th century, executed London, 24 May 1701. He appears to have followed the sea from his youth, and about 1695 was known as one of the boldest and most successful shipmasters that sailed from New York. At this time the depredations of pirates upon British commerce had become so extensive that a company was organized in England, in which William III and several noblemen were shareholders, to fit out an armed vessel for the purpose of suppressing the practice, as well as of deriving a profit from recaptures. Kidd, who had obtained some experience as captain of a privateer against the French, received a commission signed by the king, and directed to ‘the trusty and well beloved Captain Kidd, commander of the ship Adventure Galley,’ a vessel of 20 gundecks, from Plymouth, England, in April 1696, he cruised off the American coast for some months, occasionally entering New York, and finally sailed for the East Indies and the east coast of Africa. Upon his way he resolved to turn pirate, and finding his crew not averse to the project, forthwith commenced a career of plunder and outrage among the shipping which frequented the coasts of Malabar and Madagascar, returning in 1698 with a large store of booty to New York. He took the precaution to bury a portion of his treasure on Gardiner’s Island at the east end of Long Island, and subsequently went to Boston, where he boldly made his appearance in the streets. Not doubting that under his commission he could clear himself from any charge of piracy, Such, however, had been the scandal which the report of Kidd’s depredations had caused in England, that the Earl of Bellamont, governor of Massachusetts and New York, and one of the shareholders in the enterprise, caused him promptly to be arrested and conveyed to England for trial. The charge of piracy was difficult to prove; but having been arraigned for ‘killing’ one of his crew, named Moore, in an altercation, he was convicted after a grossly unfair trial, and hanged at the execution dock. His name and deeds have been interwoven into popular romance, and form the subject of the well-known ballad commencing: ‘My name is Captain Kidd, as I sailed, as I sailed,’ many of the incidents of which, however, are apocryphal. The treasures he had left, consisting of 738 ounces of gold, 847 ounces of silver, and several bags of silver ornaments and precious stones, were secured by Bellamont. But according to popular belief this inconsiderable amount constituted but a tithe of all he had collected, and down to the present time the shores of Long Island Sound and various parts of the banks of the Hudson River continue occasionally to be explored in the hope of discovering the abandoned wealth of the great pirate.

**KIDDER, Daniel Parrish**, American clergyman and educator; b. Darien, N. Y., 18 Oct. 1815; d. Evanston, Ill., 29 July 1891. He was educated at Hamilton College and Wesleyan University. He entered the ministry of the Methodist Episcopal Church in 1836. He was missionary to Brazil 1837–40. The death of his wife necessitated his return to the United States with his two little children. After brief pastorates in Paterson and Trenton, N. J., he was elected secretary of the Sunday School Union of the M. E. Church, 1844–56. At the same time he was editor of the Sunday School publications and tracts of the Church; professor of Practical Theology in Garrett Biblical Institute, Evanston, Ill., 1856–71; professor of Practical Theology in Drew Theological Seminary, 1871–81; secretary of the Board of Education of the Methodist Episcopal Church, 1880–87, resigning because he was editor of the *Sunday School Advocate*, 1844–56. While secretary of the Sunday School Union he edited 819 volumes. He was a prolific writer. His most important works are ‘Brazil and the Brazilians’ (1868); ‘A Treatise on Homiletics’ (1864; rev. ed., 1868); ‘The Christian Pastor’ (1871); ‘Helps to Prayer’ (1874).

**KIDDER, Frederic**, American historical writer; b. New Ipswich, N. H., 1804; d. Melrose, Mass., 1885. He was an authority on the language and religion of the New England Indians, and published ‘The Expeditions of
Cap. John Lovewell (1865); "History of the First New Hampshire Regiment in the War of the Revolution" (1868); "History of the Boston Massacre" (1870); etc.

KIDDER, Kathryn, the stage and family name of Mrs. L. K. Anspercher, American actress: b. Newark, N. J., 1868. After having studied dramatic art in New York, London and Paris she made her debut as Lucy Fairweather in "The Street of New York" by Mayo, in Chicago in 1885. Her success was almost instantaneous; and she followed it up by playing the leading role in "Davy Crockett" also by Mayo. Among the other characters which she played successfully are Wanda, in "Nordeck"; Rachel McCreery in "Held by the Enemy"; Dearest, in "Little Lord Fauntleroy"; Mme. Sans Gene; "Lady Teazel"; "Lydia Languish"; "The Country Girl"; the Shakepearian characters, Helena, Ophelia, Lady Macbeth, Desdemona, Portia, Hermione, Perdita, Rosalind; Mme. Sans Gene in "Salome"; Salammbô; Elizabeth in "Embarrassment of Riches"; Leonora in "A Woman of Impulse"; Elinor, in "The Glass House" (1911); Catherine, in "The Washerwoman Duchess" (1912).

KIDDERMINSTER, a city in Worcestershire, England, on the Stour River. It is noted for its carpets which are famous the world over. This industry which dates back to 1735 has gradually increased in importance and efficiency until now it is one of the largest and best conducted in the world. Already when the carpet industry first began in Kidderminster, the town was an incorporated place and its own establishment dated back as far as the Norman Conquest of England if not to an earlier date. It is probable that the making of carpets there had really begun before the date usually given as that of the establishment of the industry there, as it was a favorite town with the Norman aristocracy of the neighborhood who were given to patronizing the continental arts and crafts. The city has canal and rail communication with Hull, Bristol and Liverpool with which it does considerable business. Kidderminster has other very active industries besides that of carpets, among them being spinning and weaving mills, tin-plate factories and dye-works. Among the persons of note who were born in Kidderminster are Roland Hill, father of cheap and universal postage, and Richard Baxter, the noted and eloquent nonconformist minister. The trade between the United States and Kidderminster is considerable and the former keeps a consul there. Pop. 25,000.

KIDDERMINSTER CARPET, so called from being made in the town of that name in England. Another of its names, ingrain, signifies that it is made of wool or worsted dyed in the grain; that is, before manufacture. Its names two-ply or three-ply indicate the number of webs which go to the making of the fabric.

KIDERLEN-VAECHTER, kë'ðër-lën-vëch'ter, Alfred von, German Foreign Minister: b. Öhringen, Dec. 2, 1872. The son of a broker, he served in the war of 1870 and afterward studied law. He entered the Foreign Office in 1879 and some years later accompanied the emperor to Russia, Sweden and Denmark. He was minister in the free
town of Hamburg in 1894, in Copenhagen 1895-96, and later at Bucharest. In Rumania he gathered a deep knowledge of Eastern politics, which led to his acting temporarily as ambassador at Constantinople and as chief at the Foreign Office. He became Foreign Minister in 1910. He conducted the Agadir negotiations in 1911 and was severely criticized both at home and abroad for his provocative attitude in the Panther incident. He succeeded, however, in relieving the strained relations between Germany and Great Britain, and endeavored to make a friend of Russia. See Morocco.

KIDNAPPED, by Robert Louis Stevenson, purports to be, as the subtitle sets forth, the "Memoirs of the adventures of David Balfour in the year 1751; how he was kidnapped and cast away; his sufferings in a desert isle; his journey in the wild Highlands; his acquaintance with Alan Breck Stewart and other notorious Highland Jacobites; how he was suffered at the hands of his uncle, Ebenzer Balfour of Shaws, falsely so called." This romance, with a hero bearing a name taken from his own family tree, Stevenson declares to be the only one of his books in which characters took the bit in their teeth and spoke and acted out the story for themselves. "I began it," he confesses, "partly as a lark, partly as a pot-boiler, and suddenly it moved, David and Alan stepped out from the canvas, and I found I was in another world." Because of the author's illness, the story, published in 1886, was broken off short with the return of the hero and the disappointment of the uncle. It was concluded in a sequel published in 1893 under the name of "David Balfour" in the United States, and "Catriona" in Great Britain. "Kidnapped" owed its success largely to the admirable portrayal of the Highlander, Alan Breck. Matthew Arnold was delighted with it, and Andrew Lang pronounced it "a volume containing more of the spirit of Scott than any other in English fiction." — Arthur Gutterman.

KIDNAPPING, though not a legal term, is frequently applied as such in popular language, both in Great Britain and the United States, to the offense of stealing or carrying off by force a child or adult. In its more limited sense, it is applied to the obtaining of slaves or native labor by force, as practised by the Arabs in Africa. This barbarous traffic existed in very recent years in the South Seas, carried on by Europeans, but now happily suppressed by the appointment of government labor agents. In Great Britain this term was formerly also applied to the illegitimate recruiting for the army and navy. See ABDUCTION.

KIDNEY BEAN, a bean of the genus Phaseolus, of which European species and varieties have been cultivated from a time immemorial. (See Bean.) The wild kidney bean of the United States is a high-climbing vine (P. polystachius), bearing small purple flowers. The so-called "kidney-bean tree" is Wisteria (q.v.).

KIDNEY-ROOT, the purple bonnet (q.v.).

KIDNEYS, the principal excreting organs of the body. They are two in number, fixed at
the back of the abdominal cavity by a thick layer of fat and the peritoneum which passes in front of them; their lower border is slightly below the last ribs; they have an outer, upper and lower convex margin and an inner margin deeply indented, allowing the entrance of the renal artery and exit for the veins and ureter. This indentation corresponds to a considerable hollowing of the interior, which is occupied by the funnel-like origin of the ureter (the pelvis). The kidney is surrounded by a firm membrane called the capsule; inside of this is the substance proper, made up of a connective-tissue groundwork, in which are embedded the blood-vessels and the secreting glands called the uriniferous tubules. These tubules start in tiny rounded bodies (Malpighian bodies), and after an orderly arrangement of windings a number of the tubules form slightly larger tubules (collecting tubules), so grouped together as to form striated pyramids which have their apices projecting into the pelvis of the kidney. By a process similar to filtration the excess of water in the blood passes through these walls and out of the body. There is a similar arrangement of the blood-vessels around the winding tubules, but through these the solids in solution in the blood that are of no further use to the body are taken up by the epithelium of the tubules.

uric acid or water is taken up from the surrounding lymph, it is discharged into the cavities of the kidneys, from which it is drawn off by the ureter into the bladder, where it is stored until a time suitable for its ejection. Not only is this the case, but if for any reason too much of any given ingredient has been taken out of the blood it is returned. As an exact measurement it is interesting to note that about 1,700 litres of blood flow through the two kidneys in a living human each 24 hours, and from the blood 30 litres of waste matters are finally taken out and ejected. The ureters are about 16 inches long, with the diameter of a goose-quill; they are lined by a mucous membrane, outside of which there are thin muscular and fibrous layers of tissue.

Urine.—The urine is an amber or yellowish fluid containing about 95 per cent of water, having a specific gravity of 1.018 to 1.025, an acid reaction and rather characteristic ammoniacal odor. The inorganic solids held in solution are the chlorides, phosphates and sulphates of sodium, magnesium, potassium, calcium and iron. More important than these is a group of substances elaborated in the body during meta-
bolism (q.v.), some of which may act as poisons if not properly discharged; the principal ones being urea, uric acid, creatinine, hippuric acid and the xanthin bases. That of most importance is urea, which should in adult men be excreted to the amount of 500 grains daily. In certain forms of kidney disease the deficiency of this substance is taken as an index of the organ's impairment in respect to this one function. Other disturbances of function are tested in urine tests. Thus chloride retention or water retention are other types of disordered function.

Visible Abnormalities of the Urine.—While the average amount of urine passed by a healthy adult in 24 hours is 50 ounces (three pints), there are constant variations from this rule, depending on the amount of water ingested and the amount lost through the skin and bowels; so also do the amount of solids vary with the diet and amount of exertion. White cloudiness of the urine may be caused by the presence of pus, phosphates, mucus or bacterial growths. Reddish or "brick-dust" deposit is caused by an excess of urates, a condition ordinarily of no importance and never an indication of kidney disease. There is apt to be a diminution of the amount of urine in nephritis and a great increase in diabetes.

Albumen in the urine is the serum albumen of the blood. In health the kidneys may allow the passage of faint traces of this substance, but the presence of amounts large enough to be discovered by the "heat and nitric acid" test usually indicates some abnormality of the epithelium of the tubules—congestion of these organs, inflammation of the ureter, bladder or urethra, or an admixture of blood with the urine. Albumen may appear in the urine after severe exertion without apparent congestion of the kidneys. Certain individuals go on for years showing albumen in the urine at certain times of the day and never develop any further evidence of Bright's disease. In some personal certain articles of food, particularly those rich in albumen, cause a temporary albuminuria. Although these forms are called "functional," there is always a possibility that they may indicate some slight kidney impairment and it is the best policy to refuse applicants with albuminous urine.

Urinary casts are tiny cylinders or plugs formed in the uriniferous tubules under abnormal conditions. They are formed of coagulated albumen, blood and epithelial cells, granular matter the result of epithelial cell degeneration, and so-called waxy matter. The clear "hyaline casts" may sometimes be found in small numbers in the urine from normal kidneys, but the constant presence of casts indicates a disease of the kidneys. These bodies are entirely invisible to the naked eye.

Uremia.—This term denotes a group of symptoms that may appear in the course of diseases of the kidneys and during pregnancy. (See PyUERPERAL ECLAMPSIA.) Some toxic substances in the blood and in the blood and causes one or more of such symptoms which may not be characteristic of uremia but to which, because of the general complex of symptoms and the known condition of the urine, the term uremic is applied. The various symptoms which it is customary to include in the category are headache and sleeplessness, hemiplegia and aphasia, general convulsions and spasms of groups of muscles, blindness, delirium and coma, vomiting, dyspnea and increased arterial tension. This last condition is due to spasm of the smaller arteries and to hypotension of the heart.

Diseases of the Kidneys.—Acute congestion may result from sudden obstruction of the veins, certain irritant poisons, exposure to cold, severe surgical operations, overexertion or from the infectious diseases. Besides the changes seen in the urine, albuminuria and casts, if the congestion be severe there may be fever, abdominal pain, nausea and vomiting and partial or complete suppression of urine. The treatment consists in the removal of the cause and the relief of the congestion by hot pack over the lower half of the body. In its severe forms the conditions may be fatal.

Chronic Congestion.—This condition results from obstruction to the venous outflow, as seen in disease of the lungs, heart and liver and from the pressure of tumors: it leads to actual change of structure.

Acute Nephritis, Acute Bright's Disease.—This is an inflammation of the vital part of the kidney structure, the secreting membrane of the uriniferous tubules and of the structures around them. In such a condition exposure to cold and wet, the poisons of scarlet fever, pregnancy, etc., certain causes being undiscoverable. The condition may also be due to other infectious diseases, to the ingestion of poisons, or to the presence of large burns of the body surface.

Some cases are so milk that the kidneys are not suspected, the patient having a slight fever, headache, loss of appetite and general malaise. The ordinary cases show considerable diminution of urine, which is loaded with albumen and casts; there is considerable fever, nausea and vomiting are usual; and these are accompanied by more or less of dropsy, headache and other manifestations referred to under the name of uremia, and by a rapidly developing waxy pallor. The various symptoms are not constant, but the presence is sufficient when the condition of the urine is investigated. As a rule, when this condition lasts only a few weeks these cases recover completely and the kidneys are as good as before, but the cases of longer duration and of great severity may be fatal, or may leave permanent changes in the organ. This last effect is particularly liable to follow when nephritis begins late in the course of scarlet fever, because of the permanent changes of structure induced by some particular poison generated at that time.

The treatment of these conditions consists in absolute rest, diet of the simplest sort, preferably milk, opening of the various emunctories (the bowels and skin) and attending to such symptoms as threaten the life of the patient.

Chronic Bright's, Chronic Nephritis.—This disorder is characterized by a permanent change in the tissue of the kidney, which may follow acute inflammation, or may come on insidiously as a result of poisoning by alcohol, of syphilis, of prolonged nervous strain, with consequent
disturbance of digestion and metabolism, of suppurative inflammations in other parts of the body and of many undiscoverable causes. The changes in the kidneys consist in growth of connective tissue around the glomeruli and tubules, more or less degeneration of the epithelium lining the tubes, and arteritis. The disease may be very insidious in development, albumen and casts being discovered on routine examination of the urine. Loss of nutrition may be noticed, or a disturbance of the gastrointestinal tract may first call attention to the disease. The urine may be increased in amount or diminished, but as the disease progresses the specific gravity grows less from the decrease of urea. Druppys appear around the ankles and spreads usually as the disease advances. Anemia is fairly constant, but not severe. Sooner or later that general condition of poisoning known as uremia is apt to develop because of the inability of the kidneys to excrete the toxic substances. Some cases suddenly develop one or more of the various symptoms, either dyspnea, dropsy, failure of the heart's action, coma, convulsions or hemiplegia, without the nephritis having been observed distinctly previously.

Prognosis in Chronic Nephritis.—The prognosis is not necessarily bad, although as a rule the disease progresses and causes the death of the patient. Intercurrent diseases throw extra strain on the kidneys and may hasten a fatal termination. Many cases live for years in comparative health and are carried off by another affection. The actual prognosis of a case is determined by the work the kidneys are able to do on a known diet and under stated conditions of work. This is best determined by an estimation of the excretion of urea in a 24-hour collection of urine.

Treatment.—Many things can be done for a chronic nephritis. In the first place it should be remembered that the work done by the kidneys is really enormous. Millions of foot pounds of energy are utilized in kidney functioning. Then again it should be recalled that although the term chronic nephritis is a single term, it stands not for one disease, but for a large group of diseases, many of them quite different in causation. Some of these are difficult to treat, others are very fruitful in treatment. The group due to definite irritants, such as alcohol or syphilis, can be handled by getting at the causes of the alcoholism—which are usually mental—and thus relieving the double effect of mental strain and chemical poisoning. The syphilitic cases need proper medicinal treatment. The whole group of hyperadrenale- mia nephritides, often on a mental basis, are particularly favorable to treatment by competent psychoanalysis. Such analysis can be performed only by a well-trained physician acquainted with the dynamics of the kidney function. Consult Cushny, ‘The Secretion of Urine’ (1917). Other types of chronic nephritis are as yet unanalyzed. They usually progress but are held in check largely by diet and hygiene. There are many ups and downs in the course of the various nephritides.

At the time of acute exacerbations symptoms are relieved as they arise and the skin and bowels are called upon to assist the kidneys in the work of excretion by diaphoresis (by the hot pack) and catharsis. When the output of urine becomes small, some benefit may result from the administration of diuretics. For the disturbance of the circulation arterial dilators and cardiac stimulants are employed, and sometimes bloodletting, with the greatest benefits.

Renal Calculi or Kidney-Stones.—See Calculus.

Tuberculosis of the Kidney.—This malady occurs in the form of tiny miliary tubercles scattered through the kidney, usually as a part of a general tuberculosis and in the form of a tubercular pyonephrosis due to extension from the bladder; more rarely the process may be primary in the kidney and then extend to the bladder. The symptoms are frequent micturition, pyuria, hematuria and occasionally the presence of a tumor. The diagnosis is difficult unless there be tuberculosis of the bladder, testes or seminal vesicles. Although the prognosis is always grave, cases have recovered where the kidney has been inspected but not removed. Nephrectomy is not performed unless the other kidney can be proven sound.

Injuries of the Kidney.—Severe contusions of the abdomen or loins may cause laceration of the kidney substance and hematuria, or the kidney may be perforated by stab or gunshot wounds. Slight contusions cause pain and transient hematuria, but the more severe contusions and wounds allow the urine to flow out into the surrounding tissue, sometimes with inflammation following. The wound may require sutures, or the kidney may have to be removed.

Suppuration in and around the Kidney.—This condition is due to the infection of the part with micro-organisms, which may reach the part in three ways—through the blood, from the bladder and through the perforating wounds. It is now commonly noticed that persons in health may pass bacteria through their kidneys without resulting suppuration; and it seems that some injury must take place to allow them to grow there and cause actual damage. Such damage may be made by calculi or contusions. Pyelitis is an inflammation of the pelvis of the kidney and this part is first involved when the inflammation travels up from the bladder. Pyonephrosis is an inflammation of both pelvis and kidney structure. Pyonephrosis is the name used to describe the condition of dilatation of the pelvis and the kidneys with pus: the organ may be entirely destroyed. Perinephritis is an inflammation of the cellular tissue and fat around the kidney. In pyemia there may be many small abscesses in the kidney substance.

The symptoms of these various forms depend on the severity and site of the inflammation: there are the changes in the urine (the presence of pus, blood and epithelium from the various parts), the local signs (pain and possibly swelling) and the general signs of poisoning (fever, rigors, septic look, nausea, vomiting, etc.). An abscess in the kidney may burrow through to the surface; it may drain sufficiently through the normal channels and become chronic; or the patient may die of acute sepsis.

In the treatment of the milder forms it may be sufficient to remove the cause; the bladder may be cleansed by irrigation; or if a penetrat-
KIDO—KIDRON

ing wound be the cause it may be enlarged and cleansed. If there be a perinephritis or a se-
vee pyelonephritis, the abscess-cavity must be
drained. The kidney is removed (nephrectomy)
if destruction has gone too far.

Movable or Floating Kidneys.—By this phrase
is meant a condition in which the kid-
neys leave their fatty bed and travel downward
or otherwise through the abdomen. In the
milder grades of this condition the kidney is
placed downward during inspiration, but in
the more severe grades one or both are con-
stantly low, even down to the pelvis. No symp-
toms whatever may arise from this condition;
but on the other hand the dragging on the ves-
sels and nerves may give rise to pain in the
back and sides, minor disturbances of digestion
or vomiting. The nervous system is so deranged
that it is common to have most confusing symptoms. Occasionally the ureter
becomes twisted and dams back the urine, caus-
ing marked distention of the pelvis of that
organ, a condition called hydronephrosis. When
such a condition occurs, the kidney structure is
generally thinned until its function is
lost. It is customary to have the sufferer from
a floating kidney wear a support around the
abdomen; at times the operation of fixation of
the kidney in its normal place may be advisable.

KIDO, ke’dō, Takayoshi, Japanese states-
man, b. Hagit, Choshiu, 1832; d. Kioto, 27 May
1877. His father, a prominent physician, gave
his son the best education obtainable in Japan
in his day, and the boy, intelligent, quick and
ambitious, made the best of his opportunities.
Comings of a semi-noble family he found al-
most any office open to him that he cared to
aspire to. He had a strong faculty for taking
infinite pains and doing things well; and the
story is told of him that when Commodore
Ferry's forces visited Japan in 1854, he secured
employment with it disguised as a laborer in
order to learn all he could about the western
nation that seemed to be forcing upon Japan
conditions for which she had no love nor in-
clination. He did his work so well and main-
tained his disguise so completely that he was
never discovered. This feat was characteristic of the man. But the adventure seems to have
changed the whole trend of his thought. His
contact with western life in this intimate man-
ner gave him an insight into western ways that
set him thinking in a new direction; and the
result was that he continued to study the new
conditions and civilization that he had thus un-
expectedly discovered, with the result that he
became convinced that Japan could no longer
afford to continue isolating herself from the
world. The natural result was that in 1868 he
finally joined the revolutionary party of which
he became the greatest thinker and planner.
With Okubo, Saigo and Iwakura he worked out
the details of the coup d'etat of 3 Jan. 1868,
which placed a new government in power sub-
ject to the Mikado alone and in reality changed
the power of the Crown. The revolution was
both political and as well as social. 'This revolution overthrow
the power of the daimios and caused the abol-
ishment of the feudal system. As a result 270
daimios relinquished their feudal power and
agreed to hold their landed property directly from
the Mikado. No blood was shed. The revolution
was accomplished with one blow, on the road to that modern progress
which astonished the western world. Kido,
with his eyes ever turned westward, realized
the power of the modern press and he founded
the first real newspaper in Japan, the Shimbun
Zashti, which, under his able management, be-
came a power for progress and modern ideas;
and thus helped greatly to the great task of Japan
along the pathway of western progress. This
paper, founded in 1868, linked him firmly to
western ideas; and turned his face ever west-
ward. It also increased his desire to see and
to know at first hand the civilization of which
he had become, in a sense, in his own country,
the champion. So, in 1873, he started out for
a voyage round the world, as vice-president of
a "traveling Japanese embassy," an idea of
which he had himself been, in a sense, the
sponsor. With him went another notable Japa-
nese character, Prince Tomomi Iwakura
(g.v.), one of the most intelligent of the Japa-
nese revolutionary leaders. This world-wide
trip made Kido a still stronger advocate of
western civilization which he made every ef-
fort, through his councils andのですが,
to introduce to Japan. The translation
which he had made of Montesquieu's
'L'esprit des lois,' which he caused to be pub-
lished at his own expense, and which he largely
advertised, did a great deal to influence the
thinking class of the country. This brought
a new and liberal constitution for Japan, which
was finally secured in 1889. This constitution
did away with the last vestiges of the feudal
system and provided the machinery for a much
more democratic administration of the affairs
of the country, though it left it still firmly
monarchical. Thus the result of his life-long
labors bore fruit 11 years after his death.
On his return to Japan in 1874, from his trip
around the world, Kido became Privy Coun-
celor to the emperor, a position which he re-
tained until his death, and which enabled him
to still further work for*the ideas which had
ever guided his life from the time he first made
the acquaintance with western civilization
through his first hand knowledge gained from
his adventure with the Perry expeditionary
party. His great qualities as a statesman and
his single-heartedness in working for the good
of Japan were recognized by posthumous hon-
ors during the exercises held in connection
with the promulgation of the constitution
of 1889 and in the raising of his son to the rank
of a noble. Consult any modern history of
Japan.

KIDRON, ke’dron, the Valley of Siloah
(Wady Silwan), or the Valley of the Lady
Mary (Wady Sitti Maryam), which lies to
the east of Jerusalem, stretching from the foot
of Mount Scopus north of the city, southward,
then eastward, passing between Jerusalem and
the Mount of Olives to En Rogel, south of the city,
from whence it continues on southward to the
Dead Sea under the name of Wady en Nar.
The Valley of Kidron is frequently mentioned
in Biblical narrative; and it is shown that it was,
at one time, a place of much more importance
than it is at present, for now it is the dried bed of a stream which flowed
in Biblical times. Recent excavations show
that the bed of the ancient stream now lies
buried beneath nearly 40 feet of debris and
water cut into the rock in ancient times was
unearthed in 1880; and since then other evidence of the importance of the valley have been found buried beneath the sands that have blown in upon them. Among the important references to the Kidron are the following. When David fled from Absalom, he is credited with having crossed it; Absalom forbade Shimei to cross it; there Asa burned the idol which his mother had erected; and there Josiah also burned the altar which had been taken from the temple and there Hezekiah is said to have thrown into the Kidron the altars found in Jerusalem. Kidron is now a vast burial place and has been so for many years for both Mohammedans and Jews, because of the belief that this spot is to witness the last judgment; the territory has been divided up between the two creeds, the Mohammedans occupying the side toward the temple, that is to the west, while the Jews occupy that part toward the Mount of Olives, that is to the east. To the Christians the Valley of Kidron is of especial historical interest because, according to the account of John, Jesus visited a garden therein, in company with his disciples, shortly before his betrayal, judgment and crucifixion. Now the Palestine has passed out of the hands of the Mohammedans and that facilities for the excavation of the remains of the valley will undoubtedly be afforded, it is more than probable that work on uncovering the remains of the past importance of the valley will be undertaken.

Bibliography.—Benzinger, 'Hebraisches Archäologico' (Freiburg 1894); Buhl, 'Geographie des Alten Palástina' (Freiburg 1896); Cheyne, 'Kidron' (Encyclopædia Biblica, London 1901); Guteh, 'Jerusalem' (Kurzes Bibelwörterbuch, Freiburg 1903); Kennedy, 'Kidron' (Dictionary of the Bible, New York 1899); Robinson, 'Biblical Researches in Palestine' (New York 1857); Tozer, 'Die Siloamquelle und der Oelberg' (Berlin 1852); Warren and Conder, 'Jerusalem' (London 1852); Wilson, 'The Holy City' (London 1888).

KIEFFER, kérf, Henry Martyn, American clergyman and author; b. Millinburg, Pa., 5 Oct. 1845. He was graduated from Franklin and Marshall College, Lancaster, Pa., 1870, and from the Theological Seminary there in 1873. Enlisting at 16 as a drummer in a Pennsylvania regiment he served three years, his experiences in that capacity appearing in his popular 'Recollections of a Drummer Boy' (1883). He was pastor of a German Reformed Church at Norristown, Pa., 1873-84, and held a similar pastorate at Easton, Pa., from 1884 to 1903. He was received into the Protestant Episcopal Church in 1904, and for a time assistant at the Church of the Ascension at Atlantic City, N. J., but is now retired. His works include 'College Chapel Sermons' (1891); 'First Settlers of the Forks of the Delaware' (1905); 'It is to Laugh' (1907); 'The Funny-Bone' (1910); 'Laugh Again' (1912); 'Short Stories of the Hymns' (1913). He was joint editor of the 'Reformed Church Hymnal' (1890).

KIEFT, këft, William, Dutch administrator in America: b. Holland, about 1600; d. off the Welsh coast, 1647. He came as the fifth governor of New Netherlands, and arrived in the colony 28 March 1638. He was greedy, choleric, and tyrannous; began his administration by concentrating the executive power; and was soon involved in troubles with the Indians. In 1640 he despatched a force to murder the Raritan tribe. He was not wholly successful; the act was avenged, and when in 1643 he arranged for the destruction of the River Hine, which had sought the protection of the colony against the Mohawks, he deemed it wise to obtain sanction for the proceeding through the signatures of three citizens. A desolating war ensued, almost to the extinction of the colony. Public sentiment was strong against him, and he finally conceded the selection of a 'Council of Twelve,' who stood for the beginning of representative government in New Netherland, but practically were figure-heads quite disregarded by the governor. The Puritans at the east and the Swedes at the west were making encroachments upon Dutch territory, and Kieft was finally recalled and succeeded by Peter Stuyvesant. On 16 Aug. 1647 he sailed for Holland with his enemy, Dominie Boer, of the Valley of Kidron. His reception was not cordial, and he was ordered to return. He had despaired of Providence pitying him, and his tyranny, and whose services he had revengefully disturbed by having soldiers make noises under the meeting-house windows. The vessel was wrecked on the coast of Wales, and Kieft, Boer, and the rest on board were drowned. Kieft rebuilt Fort Amsterdam, improved the appearance of the settlement, and effected several administrative reforms.

KIEL, kël, Friedrich, German musical composer: b. Puderbach, 1821; d. 1855. After teaching music and the ordinary branches in a public school and studying music between times, he attained a local reputation as a musician which finally enabled him to become a member of the orchestra of Prince Karl von Wittgenstein, where he made very rapid progress in many branches of music. He followed this up with further studies at Coburg and Berlin from 1842 to 1844. In the latter city he became, 26 years later, professor in the Conservatory of Music, a position he retained until his death. He composed religious music, a 'Requiem,' which is still popular, and numerous pieces for voice, instruments and orchestra. As a teacher of music he had considerable influence on the pupils of his day who centred in Berlin; and he was counted one of the best musical instructors in that city.

KIEL, Prussia, town and chief naval port of Germany in the Baltic. It is situated in Holstein on a deep bay with finely wooded banks, 70 miles by rail north from Hamburg. It was formerly the place of meeting for the Schleswig and Holstein states, and the seat of a superior appeal court for the duchies. The church of Saint Nicholas founded in 1240, and restored 1877-84, is the ecclesiastical building. The university, founded in 1665, has an attendance of some 2,000 students, is famed for its medical school, and contains a library of over 320,000 volumes. There is a museum of national antiquities, and a zoological institute. Kiel is admirably situated for trade as well as for defense, the whole bay on which it stands forming a safe roadstead, and the town being provided with spacious quays. The celebrated Kieler Sproette (smoked sprat) is caught in the bay, and sugar and machinery are manufactured; and there are woolen factories, tanning and tobacco works. It is as a naval dockyard and arsenal, however, that Kiel is most widely
known. The great imperial docks are on the east side facing the city, contain basins capable of accommodating the largest warships afloat, and form the focal point of the great shipbuilding establishments, as well as of other important industries, dependent on a naval station of the first class. It is also the seat of the largest naval hospital in Germany. A famous regatta is held annually in June. The Kaiser-Wilhelm Ship Canal from the mouth of the Elbe joins Kiel Bay at Holtenau, somewhat north of Kiel proper. Kiel became in 1284 one of the cities of the Hanseatic League; in 1773 it became a part of the kingdom of Denmark; and in 1866 it passed, with the rest of Schleswig-Holstein, into the possession of Prussia. In 1814 the Peace of Kiel was concluded, under which Norway was ceded to Sweden. During the Four Years World War Kiel was the headquarters of the German Imperial fleet from which it issued to defeat in the naval battle of Jutland in May 1916, and to surrender in November 1918. The Kiel Canal connects the North Sea with the Baltic. The population has shown rapid expansion; in 1840 it was 43,594; in 1910, 211,627.

KIEL CANAL, a canal connecting Holnau, on the Baltic Sea, with Brunsbüttel, on the Elbe River. It is also frequently known as the "North Sea and Baltic Canal" and as the "Kaiser-Wilhelm Canal." This has become one of the finest shipways in the world and as such it played an important part in the European War (1914–18), owing to the fact that the greater part of the German fleet was sheltered there. The canal, which is 60 miles long, is 36 feet deep, 140 feet wide at the bottom and 360 feet at the top with locks 1,140 feet long, 148 feet wide and 46 feet deep, being thus large enough to accommodate the greatest war vessels afloat. By the Kiel Canal the journey by sea from the Baltic to the North Sea is shortened 200 miles. Originally the Kiel Canal was only 28 feet deep and had a bottom width of 185 feet; but this narrow restriction was removed in order to make the canal more effective, more especially for war purposes. See SHIP CANALS.

KIELCE, kye'lish, a government and capital of the province in Russian Poland. It is the smallest of the Russian-Polish governments, containing as it does only 3,897 square miles. Lying in the southwest it runs into the Carpathians and into the mineral regions which furnish it with coal, iron, zinc, sulphur and other metals which have been only partially developed. It has also valuable deposits of marble and building stone, considerable of which are still unexploited owing to the fact that they are too far from the market, or the transportation facilities and Vistula forms the boundary line between Kielce and Galicia. Kielce, the capital city, situated in the mountains, over a hundred miles from Warsaw, was once noted as a copper-producing centre; but these mines are not being worked to any great extent at present, though attempts have been made during the present century to reopen some of them. The chief industry of the government is agriculture, which embraces the ordinary cereals of Europe, beet-root, mulberries and vegetables. Among the manufacturing activities are the making of paper, spirituous liquors, cotton goods, leather, glass, sugar, brick and machinery of various kinds; while the capital city specializes in brick, paint, sugar and articles made from hemp. Population of the government over 800,000, while that of the city is about 30,000, most of whom are Poles, with about from 15 to 20 per cent Jews.

KIELHORN, kye'lorn, Lorenz Franz, German Sanskrit scholar and writer: b. Osna-bruck, 1840. Educated at Göttingen, Breslau, Berlin, London and Oxford, he became professor of Sanskrit at the Deccan College at Poona (1866–81) and Göttingen in 1882. He gave a great deal of attention to the Sanskrit texts and published several of them with notes and translations; and he founded (with Buhler) the Bombay Sanskrit Series in 1866. He wrote an exhaustive Sanskrit grammar which has gone through several editions and is extensively used in European colleges where Sanskrit is taught. Among his interesting works are 'Report on the Sanskrit Manuscripts' and his contributions to 'Indian Antiquity and Epigraphy Indica. As editor of Grundriss der indo-arsischen Philologie, he did much for the study of Sanskrit and things Indian.

KIELLAND, kye'lerland, Alexander Lange, Norwegian novelist and dramatist: b. Stavanger, 1849; d. 1906. He came of a family occupying a high social position, and he received an excellent education which he completed at the University of Christiania where he was graduated in law. On leaving school he drifted into business instead of following his profession and became the successful manager of a large brick and tile concern. He continued his study of French literature and his reading was wide and varied. In imitation of Daudet, whom he greatly admired, he published 'Novelettes' (1879), which he followed with 'New Novelties' (1880); 'Garman and Worse' (1888); 'Laboring People' (1881). These were followed by other novels in which he appears to be working under varying interests and influences, for the most part French, among them 'Skipper Worse' (1882); 'Poison' (1883); 'Fortune' (1884); 'Snow' (1886); 'Saint Hans' Festival' (1887); 'Jacob' (1891); 'Professor Lofthal' (1904). Among his dramatic works, which are all comedies, are 'Homeward Bound' (1878); 'Three Pairs' (1880); 'Betty's Guardian' (1887); 'Professors' (1888). Kiel- land has dealt with many social questions and problems in his various published works, which are, from this point of view, of considerable interest and importance in the history of the literature of Norway. He attacks conventional religion and the corruption of the classes alike; and he has laid a ruthless hand upon many of the smug customs and fobilities of the age. Naturally, owing to his manner of working and his didactic aims, his novels are better than his plays.

KIELMANSEGGE, kye'lan'seg, (COUNT) Erich von, Austrian statesman: b. Hanover, 1847. On graduation from the university in 1870 he entered the service of the Austrian government and passed through the usual routine of various administrative posts in the provinces and the Ministry of the Interior (1886–89), becoming finally governor of Lower Austria and Minister of the Interior (1895) and later Prime Minister over a temporary
cabinet. In his official capacity he showed himself a man of action, intelligence and desire to better the conditions of affairs as he found them. He extended the confines and increased the size and importance of Vienna by taking into the city limits the suburban towns and villages; and he passed sanitary laws and other measures for the benefit of the capital and for other parts of the country.

**K‘IEN-LUNG**, ké-en-loong', emperor of China; b. 1710; d. Peking, 7 Feb. 1722. He succeeded his father, Yung-Ching, in 1723. He favored the Christian religion in private, but in 1753 interdicted its exercise by a formal order; and the missionaries were, in consequence, obliged to proceed with great caution, although several of them were in the emperor’s service, and treated with great respect as men of science and learning. On the suppression of the Jesuits in 1774 China was less visited by scientific persons than formerly, which induced K‘ien-Lung to send to Canton and invite artists and learned men of all the European nations, and particularly astronomers. Resolving to immortalize the remembrance of his victories by the graver, he engaged French artists to copy some Chinese paintings in which they were represented; but Louis XV had them engraved for him at his own expense. The large collection of agriculture contains several poems of this monarch on rural occupations and incidents; and he established a library of 600,000 volumes, containing copies of all the most interesting works in China. In 1795 he abdicated in favor of his son.

**KIENZL**, ké'nzl, Wilhelm, Austrian musician; b. Waizenkirchen, 1857. Studying music in all its branches under several famous teachers and professors in Prague, Gratz and Munich, he went through Europe on a concert tour (1878-82); and on his return he became head kapellmeister in Amsterdam of the German Opera Company, and he held similar positions in Hamburg, Munich and Gratz. He wrote good operas, a variety of concert and other music, and several books. Among his operas are 'Unvater' (1886); 'Heimkehr der Neri' (1892); 'Der Evangeliamann' (1895) and 'Don Quijote' (1898). Among his other works are 'Die Musikalische Deklamation' (Leipzig 1880) and 'Miscellanea' (Leipzig 1885). He has edited several important and interesting musical works and has contributed extensively to the musical periodicals of Germany.

**KIEPERT**, ké'pért, Heinrich, German writer, geographer and cartographer; b. Berlin, 1818; d. 1899. His life was spent in the interest of geography and map-making in all their branches; and in this connection he did extensive traveling and exploration and thus advanced the science of accurate map-making very materially. He early began his exploration work with Asia Minor (1841-42). This was followed by the publication of his 'Atlas von Hellas' which was begun in 1841 but not finished until 1844. This made his name well known in his particular field. He published several other maps of Asia or parts thereof, among the most notable being his 'Karte von Kleinasiens' (1843-45). The meantime he continued his explorations of western Asia with happy results for his cartography which also included maps and descriptions of arch-

**KIERKEGAARD, kërk'gár'd', Sören Abye**, Danish writer and philosopher; b. Copenhagen, 1813; d. 1855. He was educated at Copenhagen and in Germany; and, on his return to his native city in 1842, he settled down to the life of a student and literary man. Constant ill health made him morbid and inclined him to live by himself. In this way he estranged himself from the world and retarded the acknowledgment due him on account of his genius and originality. He wrote a great deal on theological subjects, upholding the genius and mission of Christianity but not always maintaining the attitude of the orthodox sects. His brilliancy of style, profoundness of thought and ability of argument and presentation of ideas gained for him a large and influential following and enabled him to widely influence thought not only in his own country but throughout Protestant Europe. He wrote under various pseudonyms, which were often convenient for the hiding of his identity when he did not care to reveal it for the time being at least. Among his published works of most interest are 'Either, or' (Enten-Eller 1843); 'Stages of Life' ('Stadier paa Livets Vej' 1845); 'On Christian Training' (1850). Consult Barthold, 'Die Bedeutung der ästhetischen Schriften Sören Kierkegaards' (Halle, 1879); Brandes, 'Sören Kierkegaards' (Copenhagen 1877).

**KIERSY, kyär'sé**, Edict of, a capitulary of Charles the Bald, supposed, without any real autos, to have originated the feudal system. The measure was intended to be merely temporary. It was issued in 877 to protect the interests of the king during his expedition into Italy. While it recognized as hereditary the fiefs of the vassals taking part in the expedition as supporters and Charles, it also maintained the right of the sovereign to dispose of vacant fiefs, two important provisions which became, later on, striking features of the feudal system. This act may have helped to develop the system but the germs from which it sprang had long been in existence; and the growth of society, even before this date, had been toward a concentration of power which could only be attained through some combination that to that of the feudal system. Consult any good history of the period and also 'Monumenta Germaniae Historiae, Leges' (Vol. I).

**KIESEWETTER, kézé-vët'ër, Raphael Georg**, Austrian writer on musical subjects; b. Holleschau, Moravia, 1783; d. Baden (near Vienna), 1850. After having been for a time employed in the military service of the Reich, he traveled extensively before finally settling down in Vienna to continue his historical researches to make a collection of old musical
instruments superior to any other in the city, and to write. Among his published works, in addition to numerous articles on ancient musical instruments, on which subjects he was an excel-

Kiev, ke'jef, a city in Little Russia, capital of the government of the same name. It has long been a fortified place but the fortifications are now of little or no use against modern artillery. The city, which lies amidst hills, is on the Dnieper which annually overflows the lower parts of the place. Kiev is a curious and interesting mingling of the past and the present, of ancient feudal and modern progressive Russia. The main part of the city, which consists of the low-lying sections and numerous suburbs which have been, from time to time, taken into the incorporated part of the town, are overlooked by the castle-crowned heights with their walls and ancient fortifications, which still preserve an air of the past. Kiev may be said to be divided into three parts or sections. Old Kiev, the upper town and the lower town. The fortified part is known as Pechersk, and the business part as Podol. Kiev is one of the oldest cities in Russia and it figures in its history for many centuries so prominently that it is known in Russia as ‘the mother of cities.’ It was already a town in the 5th century; and during the following four centuries it continued to grow in importance and wealth until it finally became the capital and chief city of a principality of the same name. This principality figures in nearly every war in which Little Russia was interested, and for centuries the history of Russia may be said to have been nothing else but one almost continuous war carried on by the ambitious princes of the various independent or semi-independent sections of what is now modern Russia. It has the distinction of being one of the first principalities in Russia to adopt Christianity. This brought it into close connection with Rome and Western civilization and led to contests in Russia and the theatre of other political factions of Russia. Under the famous Vladimir I in the 10th century it became Christian in a characteristic Russian way. The prince had become convinced that connection with Rome would be very much to his advantage; and he decided to become a Christian. But he would not beg for baptism. He would get it the Russian way. He would conquer it by force of arms. So he set out with a large force against the Byzantine Empire, forced the Emperor Basil to give him his sister Anna in marriage and send him the holy cross and the cross and the holy table. He returned to Kiev and sent a proclamation that all who did not come to the river to be baptized should be looked upon as rebels. The people came together to the Dnieper and were baptized in the river and very many were ordered to do; and they were there baptized and their idols broken into pieces by order of Vladimir, who is said to have himself helped in the destruction. Not satisfied with this work in his capital, Vladimir sent word to all the villages, cities and districts of his king-
dom that the inhabitants, without exception, should follow the example of Kiev and become Christians. Riots broke out in many parts of the country, but Vladimir carried through his plan of making Kiev Christian, to all outward appearance, though for many years afterward the peasants continued to worship their ancient gods in the depths of the forest and to be married, baptized and blessed by the ancient heathen rites. (See Vladimir.) At the time of Vladimir Kiev continued to grow and prosper and to attract great attention as the religious centre of Russia and its richest and most famous city. Accumulating great wealth and containing famous palaces and private edifices, it attracted the attention of the conquering Mongols of the 13th century, who descended upon it as they did upon other wealthy centres of Russia. The struggle was long and bitter; but finally the wealth, power and glory of Kiev passed away temporarily before the ravages of the Mongol hordes.

In 1320, however, Kiev, coming under the rule of Lithuania, became a place of some considerable importance and retrieved a part of its past prestige and glory as a commercial and industrial city and the religious centre of Little Russia. When Lithuania became a part of Poland in 1569 Kiev formed still a part of Lithuanian territory. It remained united with Poland until 1681 when it became Russian territory. Peter the Great, remembering its past glorious history, paid considerable attention to Kiev, restored its fortifications and made it one of the strongest fortresses in Russia in his day. Naturally, with so much interesting and momentous history, Kiev has many relics of her past greatness in the shape of buildings. Among these are numerous churches dating to the time when she was the ‘city of churches.’ Of these ecclesiastical remains the monastery of Caves (Pecherskaya Lavra) is one of the most noteworthy, forming as it does in itself a walled town dedicated to the service of God and to the training of monks and its many rows of cells and numerous streets, all overlooking the Dnieper and surrounding the great central church of the monastery, one of the richest ecclesiastical edifices in Russia and the theatre of many processions of note, ecclesiastical and non-ecclesiastical, among them the remains of various saints. These too are found in the cave-like cells of the monks. All this makes Kiev one of the places most frequented in Russia by pilgrims who make journeys to it from all over the country wherever the Greek Church has adherents. Among the other noteworthy ecclesiastical edifices of Kiev are the monastery and church of Saint Vladimir, the cathedral of Saint Sophia, the church of the Three Saints and that of Saint Cyril, the remains of the cathedral of Andrew, the new cathedral of Saint Vladimir, the Imperial Palace, the University of Saint Vladimir and the city hall. The university, which has been steadily growing in importance and usefulness, has a library of over 200,000 books and full arts and other departments usually found in such an institution. Kiev, which is a city of over 300,000, is a place of considerable industrial and commercial importance, its activities finding vent in the sugar beet trade, grain, live stock, timber, fruits, chemi-
crater forms a great cavity on the side of the mountain, 3 miles long, 2 miles wide and 800 feet deep. At the southwestern end is a small lake of boiling lava called Halemanu, or House of Everlasting Fire. Eruptions occurred here in 1789, 1823, 1832, 1840 and 1868.

**KILBOURNE, James**, American pioneer: b. New Britain, Conn., 19 Oct. 1770; d. Worthington, Ohio, 9 April 1850. He was successively employed as an apprentice, clerk, merchant and manufacturer, and having secured a competence, presented himself as a candidate for orders in the Protestant Episcopal Church, and was ordained about 1800. In 1801–02 he organized the Scioto Company, under whose auspices a colony of about 100 persons, under the lead of Kilbourne, was in 1803 established in what is now the township of Worthington, Ohio. Having organized here the Episcopal parish of Saint John's, as well as others in the neighborhood, and procured the establishment of a western diocese by the General Convention of the Church of the United States in 1821, he retired from the ministry in 1834, and was soon after appointed a civil magistrate, an officer of frontier militia, and surveyor of a large portion of the public lands. In 1812 he was one of the commissioners to settle the boundary between the public lands and the great Virginia reservation, and also commissioned as a colonel in the frontier regiment; and in the succeeding year he entered Congress, of which he remained a member until 1817. He was the first to propose donations of lands to actual settlers in the Northwest Territory, and afterward served for some years in the Ohio legislature.

**KILDARE,** kil-dār, parish, county and town of the same name in Ireland. The town, which is 25 miles southwest of Dublin, dates back to the 5th century when the present site was the seat of a monastery said to have been founded by Saint Bridget, daughter of an Irish king or chief, as the legend or story is variously stated. Bridget later became a nun, receiving the veil at the hands of no less a personage than Saint Patrick himself, according to the church legend which claims authenticity. The famous monastery and the town itself are both in a somewhat decayed condition but they are still interesting on account of the many legends, stories and historical associations which cluster around them. Among the historical buildings of the town are the Round Tower, over 100 feet in height, on the top of the most elevated part of the site of the town; the convent of Saint Francis with its abbey and the abbey of the Carmelites. A very interesting relic of the past is the "Fire-house," a part of the chapel of Saint Bridget, in which there was maintained, according to the legend, perpetual fire for centuries, probably a remembrance of the pre-Christian fire worship of the Irish people. Pop. 3,000.

**KILDEER.** See KILDEER.

**KILGO, John Charles**, American ecclesiastic and educator: b. Laurens, S.C., 22 July 1861. He entered the ministry of the Methodist Episcopal Church South in 1882, continuing his college studies afterward so that he was graduated with the degree of M.A. from Wofford College 10 years later. He became agent for Wofford College (1889-94) and professor of...
philosophy there during the same period, and for the following six years he was president of Trinity College, Durham, S. C. This position he resigned on his appointment as bishop (1910). He has been a member of various conferences and has held other important offices in church and educational circles.

KILHAM, Kilham, Alexander, founder of the Kilhamites or New Connection Methodists: b. Epworth, Lincolnshire, 10 July 1752; d. Nottingham, 20 Dec. 1798. He professed conversion at 18, became a preacher in 1783 and two years later was enrolled by Wesley as a regular itinerant. He was strongly in favor of complete separation from the Established Church, a step to which Wesley had always been opposed. On the death of the latter this subject came under discussion. He at once urged separation and sought moreover for the distribution of administrative power between the ministry and the lay members. For several months he was in his 'Progress of Liberty' (1795), the pamphlet in which these views were expounded, he was tried at a conference held in 1796 and expelled from the denomination, upon which he immediately organized the "New Connection Methodists or Kilhamites."

KILIAN, Kilian, or KULN, Saint, the apostle of Franconia. He was of noble Scotch extraction and had entered a monastery in Ireland, when hearing of the spiritual destination of German Franconia he asked and received from the Pope a commission to preach the Gospel to the German idola
tors, and with Colman, his priest, and Toiman, his deacon, was instrumental in converting great numbers at Würzburg, and among them Duke Gosbert. On being rebuked by Kilian for marrying Geilana, his brother’s widow, Duke Gosbert promised to put her away, and hearing this, Geilana caused the three missionaries to be secretly assassinated (690) without her husband’s knowledge. Kilian is honored as the first bishop of Würzburg, and his festival is 8 July.

KILIMANJARO, Kilimaniša, mountain (Great Mountain), a double-peaked, snow-clad mountain of Africa, in German East Africa, about 100 miles inland from the port of Mombasa. The highest peak, estimated at 19,270 feet, is the highest known in the African continent.

KILKENNY, an island capital and county of the same name in Ireland. It is probable that the county received its name from the town since the word means the church of Saint Kenny (Canice). The town, which is itself a civic county, is situated on the Nore some 70 miles south by southwest of Dublin, with which it is connected by rail. It dates back to the 12th century, and like many other towns in Ireland is said to owe its origin to the establishment of a Christian church on the site of the present town; but it is very probable that it is older than the deanery is known to an early period. The Catholic Dioceses Act and the efforts made to destroy all Catholic education in the county also helped to place the interesting buildings of the town in the hands of the Anglicans. Kilkenney has at least two famous schools, and at one of these, the College of Kilkenney, many notable men have been educated, among them Berkeley, Congreve and Swift. The oldest Roman Catholic college of the town is known as Saint Kyrans, but it dates back only to the time of the comparatively recent establishment of Catholic colleges and schools in Ireland. The town which has a population of over 10,000 is of considerable commercial and industrial importance. It is a centre of extensive manufactures of woollen, linen cloths and blankets, and is a distributing centre for provisions of various kinds. A great part of the home trade in this latter industry finds its outlet through Waterford, with which Kilkenney is connected by rail and with which it has water communication. The Kilkenney people have the reputation of being quarrelsome, but this is very largely undeserved, and is due principally to Swift’s famous story of the Kilkenney cats which fought until there was nothing left of either of them but the tails, and also to the fact that they had a long standing dispute over boundary lines with her neighbour Irishtown. This district of Ireland was also noted, in earlier days, for the animosities maintained by local chieftains for one another. But the people of Kilkenney are to-day, notwithstanding this historical reputation, of a very friendly disposition. Consult Donelan, J., 'The Confederation of Kilkenney' (Dublin 1906); Healy, 'History of Kilkenney' (Kilkenney 1893); Hogan, 'Kilkenney' (Kilkenney 1894).

KILLARNEY, capital of Souris District, Manitoba, Canada. Situated on the line of the Canadian Pacific Railway some 160 miles direct west of Winnipeg, it is the centre of an agricultural country with which it carries on commercial relations somewhat important for the size of its population. Its extensive handling of grain from the local farms has necessitated the erection of a number of very modern grain elevators. The town also does a good trade in flour and in such articles as are required by the surrounding farming community. It has lumber yards, a sash and door factory, a cement plant and depots for the reception of agricultural machinery. Killarney is growing and becoming of more interest and importance. Pop. 2,500.

KILLARNEY, Kil-lar-ne, market town in Ireland, in the county of Kerry, on the Great Southern and Western Railway. In summer, Killarney is thronged with visitors to the lakes and the delightful scenery in the neighborhood. Fancy articles of wood, particularly of arbutus, which attains to great perfection in the environs, are made to a considerable extent, and are in great demand by tourists. Pop. 5,796.

KILLARNEY. Lakes of, three connected bodies of water, the lower lake (Lough Leane) is within ½ miles of the town of Killarney, Ireland. These famous lakes are situated in a basin in the midst of the mountains of Kerry, some of which rise abruptly from the water's edge densely clothed with trees from base to summit. In the lower lake (Lough Leane) are a number of finely wooded islands, on the prin-
principal of which are the remains of Ross Castle. Between the lower and the middle lakes is the fine ruin of Muckross Abbey. The upper lake is the most enchanting of the three, and is thickly studded with islets.

KILDEER, the most common and best-known species of American plover (Charadrius vociferus). It is found throughout temperate North America, especially in the western United States, breeding northward to Newfoundland and in winter migrating to South and Central America. It is 9 or 10 inches long and the sexes are similarly colored—brown above with a chestnut tinge on the rump; around the neck a white ring bounded in front by a complete, and behind by an incomplete, black ring; the lower parts are white and there is a white stripe through the eye; the wing-quills and tail are variegated black and white. The killdeer is distinctively a bird of the interior, spreading over the prairie lands and fields, and frequenting the seashore chiefly during the winter. During the summer it is usually found in pairs, breeding in corn and hay fields or along water-courses. The four clay-colored, spotted, pyriform eggs are deposited in a slight depression in the ground. Though always noisy birds, the cry or whistle from which their name is derived is heard in its perfection when the nest is approached, and the frightened hen endeavors by various devices to lead the intruder away. Like that of other plovers, the food is chiefly insects. In the late summer and early autumn the killdeer is sought by gunners, but much less so than related migratory species of the same genus.

KILLER, a kind of whale, or large porpoise, also called orca or grampus, of the family Delphinidae, and constituting the genus Orcinus. It reaches a length of about 25 feet. The head is rounded and the lower jaw is a little shorter than the upper. The dorsal fin is extraordinarily high in the adult males, like a broad sword, nearly vertical and about six feet in length from base to tip; in the female it is prominent but much lower. The pectoral fins are large, broad and rounded, and the flukes, or tail-fin, also broad and thick. The color is peculiarly black on the back, and white below; the margins of the two colors sharply defined. The white of the belly extends forward to the end of the lower jaw, and upward on each side where it forms a large, oblong, white area. Above and somewhat behind the eye is a conspicuous oblong, white spot. In the young the white areas are tinged with yellow. The upper and lower jaws are armed with thick, powerful, somewhat curved teeth, numbering in all from 40 to 56. The killer is the largest and most powerful representative of the dolphin family. It hunts in packs and is rapacious and excellently voracious. Unlike all other cetaceans it feeds upon warm-blooded aquatic animals, and chiefly on young seals, porpoises and whales. It attacks them without hesitation, biting them on the lips and throat, sometimes in order to force them to surrender their young, which are torn to pieces and devoured. In one instance the stomach of a killer was found to contain the bodies of 13 porpoises and 14 seals. The beaked killer or orca (Orcinus Orca) inhabits all seas. A second species is found in the South Pacific. Others have been described, but their validity is doubtful.

KILLIECRANKIE, kil-lir-krang'ki, pass of Scotland, in the Grampians of northern Perthshire, on the Highland Railway, three miles southeast of Blair-Athole. A viaduct of 10 arches carries the railway over the pass. Here Claverhouse, Viscount Dundee, defeated the forces of William III under Mackay on 7 July 1689, but was killed in the moment of victory.

KILLIFISH, one of a group of small fishes of the family Cyprinodontidae. They have broad, depressed, scaly heads, large cycloid scales, no lateral line, small very protractile mouths with several rows of pointed teeth, and a well-developed air-bladder which possesses somewhat of a pulmonary function. The common killifish, mud-fish or mummichog (Fundulus heteroclitus) seldom exceeds three inches in length, and is exceedingly abundant in shallow waters along the shores of bays and estuaries, in brackish pools and tidal rivers from Maine to Mexico. It is extremely hardy and is important economically as food for larger fishes. The sexes differ in color. The larger killifish (F. majalis) reaches a length of five inches, and is found in shallow salt and brackish bays from Florida to Cape Cod. The males have transverse and the females longitudinal black bars. The species of Fundulus are oviparous, but some genera of the family are viviparous and strongly dimorphic, sexually.

KILLING, kil'ing, Wilhelm, German writer and mathematician; b. Burbach, Westphalia, 1847. Graduated from Berlin University, he became a teacher, first privately, and afterward in the gymnasium, becoming finally professor of mathematics in the University of Münster. There he distinguished himself by his works on mathematical subjects which were noted for their depth of thought and accuracy of reasoning. He gave special attention to the field of non-Euclidian geometry in which department he won the Lobachevski Prize. He was a member of the Kazan Academy (1910). Among his published works are 'Die nicht-euclidianen Raumformen' (1883); 'Erweiterung des Raumbegriffs' (1884); 'Die Lichaem Transformationsgruppen' (1886); 'Die Lichaem in der Grundlagen der Geometrie' (1893-98); 'Lehrbuch der analytischen Geometrie in homogenen Koordinaten' (1900-02); 'Handbuch des mathematischen Unterrichten' (1910-13, with Hovestadt).

KILLINGLY, kil'ing-lé, Conn., town, including several villages in Windham County, on the Quinebaug and Five Mile rivers, 25 miles northeast of Norwich, on the New York, New Haven and Hartford Railroad. It is a public library, a high school, churches and town-hall, and manufactures of cotton and woolen goods, harness, mill supplies, boots and shoes, etc. It was settled in 1693, and until 1708 was known as Aspinock. It was the greatest cotton manufacturing town in the State in 1836. Pop. 6,564. Consult Bayles, 'History of Windham County, Conn.' (New York 1889); and Larned, 'History of Windham County, Conn.' (2 vols., Worcester 1874).

KILLINGTON (kil'ing-ton) PEAK, an elevation of the Green Mountains, in the State of Vermont, about 10 miles southeast of Rutland. It is 4,241 feet high, and the view from
its summit is most beautiful; a large number of pretty villages and charming valleys may be seen on a clear day.

KILMAINHAM, kil-mahn'h-am, a township of Dublin County and a suburb of Dublin City. It lies to the west of the city and is known generally throughout the British Empire on account of the military hospital which bears the name of the place itself, and its jail in which numerous political offenders have been confined, among them Parnell, who was placed there in 1882. The hospital, which is as well known in Ireland as Chelsea Hospital is throughout the British Empire, is a very old institution, as hospitals go, having been founded by Charles II for the reception of wounded and pensioned soldiers. Kilmainham has figured in the politics of the British Empire on several occasions, the most notable being probably the secret agreement entered into between Parnell and Gladstone on the question of the commission of agrarian crimes in Ireland, an agreement which has been popularly known as "The Treaty of Kilmainham." 

KILMARNOCK, a town situated on the Kilmaur Burn, is in Ayrshire, Scotland, only 12 miles north of the city of Ayr, and is the largest town in the shire. It is noted for its connection with the national poet, Robert Burns, whose first book was published there. Burns has celebrated many scenes in Ayrshire, and the city of Kilmarnock has taken great pride in its relationship to the Scottish bard and possesses a very interesting museum of things relating to him, his work and his various connections. The neighborhood of the city is given over to the manufacture of cheese and one of the yearly events of its life is a great cheese show to which people come from far and near with exhibits. These amount to thousands of dollars yearly. The city, which has grown rapidly within the past 30 years, has a very active industrial life. It possesses large engineering establishments and factories, including those for the manufacture of calico, machinery, liquors, leathers, woolen goods and carpets. Its blast furnaces also form one of the most prominent features of its industrial life. These are enabled to work at very advantageous conditions owing to the fact that the iron and the coal which keep them running are found in abundance and of good quality in the neighborhood. In addition to its extensive production of cheese Kilmarnock also gives a great deal of attention to all other kinds of dairy products. Pop. about 35,000.

KILN POTTERY. In modern practice, kilns as used in the clay industries may be described in three general types, up-draft, down-draft and muffle kilns. The last named stands alone, as its distinctive feature lies not in the method of firing or the direction of the draft but in the fact that the kiln consists of a single laboratory closed to the direct entrance of flame and heated by radiation through the walls. The type of kiln is used in cases where it is necessary that the contained ware should be protected from dust and smoke, but where it is not convenient to enclose them in saggars. Large ware such as porcelain bath-tubs and sinks, heavy pieces of terra-cotta, etc., cannot be set in saggars as pottery on account of weight and size. They are best burned in a muffled kiln, being set directly upon the brick floor. Muffled kilns are also used for burning painted-wares. These are smaller than the kilns for heavy goods and are burned to a much lower temperature. Such kilns can be set, burned, cooled and drawn in 24 hours, while the large muffles cannot be turned in less than 10 days.

General kilns for pottery burning are of the open type. The wares are enclosed in saggars which are set over one another in tiers (bungs). Saggars are cases made of refractory clay and suited as to size to the wares to be contained in them. The flames and kiln gases pass freely round the saggars and the whole chamber is uniformly heated.

The usual form of kiln is cylindrical with a slightly domed crown. Outside this is the hovel or conical top familiar to the inhabitants of pottery towns. The hovel serves the purpose of a chimney, and collects the smoke from a number of apertures in the kiln crown. The fire mouths range in number from 6 to 10 according to the size of the kiln. In the up-draft kiln the gases simply pass up between the bungs of saggars and find a free vent at the top. In the down-draft type the top of the crown is closed and the gases after passing up the walls and under the crown are led down a centre stack and up again through flues arranged for the purpose. The structure of the down-draft kiln is more complicated than the up-draft, but a considerable economy of fuel is effected. The kiln also cools more rapidly.

Kilns for burning bricks follow the same general lines but vary in form. For this purpose the square kiln is among the most popular, being usually operated on the down-draft principle.

Many plans have been devised for the perfect utilization of heat, but none that is entirely satisfactory. One of the best is that of the continuous kiln. This has been applied in Germany to the burning of porcelain, and its use in America increases. The continuous kiln is a long tunnel built in the form of a parallelogram with rounded ends. This is divided into as many chambers as may be necessary, each chamber having an entrance at each side and two fire mouths. Paper partitions are used in order to secure the correct draft, and as each successive chamber is filled with ware and the proper dampers opened the heat from the burning chambers is drawn through the unburned brick, bringing them up to a high temperature without any additional fuel. Meanwhile the chambers in which the firing has been completed are beginning to cool and so the work goes on continuously. The economy of the method is very great, but a considerable output is necessary in order to avoid stoppage. Kilns are, for the most part, burned with coal, both hard and soft coals being used. Those in the gas belt are successfully burned with natural gas and in some places oil is used. The temperatures at which different wares are burned are about as follows:

Roofing tile and paving brick—1000°-1070°C
Common brick and drain tile—1090°-1170°C
Painless art pottery—glass—1150°C
Painless art pottery—body—1200°C
Sewer-pipe and stoneware—1250°-1320°C
Earthenware dishes—1290°-1370°C
Hotel china—1330°C
Bone china—1380°C
Hard porcelain—1390°-1415°C
KILO. See Metric System.
KILOGRAMME, or KILOGRAM, a French measure of weight—1,000 grammes. See Metric System.
KILOLITER, or KIOLITRE, a French measure of capacity for fluids, 1,000 litres. See Metric System.
KILOWATT. See Electrical Terms; Units; Watt.

KILPATRICK, Hugh Judson, American soldier: b. Deckertown, N. J., 14 Jan. 1836; d. Valparaiso, Chile, 4 Dec. 1881. He was graduated at West Point in 1861, and in the autumn of that year became a lieutenant-colonel of cavalry. He was appointed a brigadier-general of volunteers in May 1863, and in the following March was active in a raid to Richmond for the release of Federal prisoners. He commanded the cavalry of Sherman's army in its march from Atlanta to Savannah in 1864, and in June 1865 was promoted major-general of volunteers. After the War he was prominent as a lecturer and a Republican political speaker. He was Minister to Chile from 1865 to 1870, and was reappointed in 1881. In 1887 his remains were removed from Chile and interred at West Point. Consult Moore, 'Kilpatrick and our Cavalry' (1865).

KILWA (kèl-wá) KIVINJE, kè-vi-n'jè, or QUILOA, kè-lo'a, seaport town in German East Africa. It is situated on the east coast about 180 miles south of Zanzibar, and was, before the outbreak of the European War, the chief port of entry of the German government in German East Africa. At that period its extensive roadstead was frequented by trading vessels from all parts of the world, for its trade and commerce were very extensive. Before the German occupation of the country the city was a place of considerable importance in the native economy, but it was extremely unhealthy for Europeans and not any too salubrious for the natives. The Germans did a great deal to improve the health conditions of the town which they made fairly habitable for white people and blacks alike. All the neighborhood of Kilwa was noted, during the Arab occupation of the coast, as one of the haunts of the slave trade. Kilwa (Kilwa Kisiwani), the centre of these Arab operations, which is some 17 miles further down the coast, has fallen into decay and is almost deserted, and there is little commercial or industrial activity on the island on which it is situated or in the immediate neighborhood. The population of the modern city, which is known as Kilwa Kivinje, is over 100,000.

KILWINNING, an industrial town in Ayrshire, Scotland, quite close to Irvine. It possesses woolen factories, coal mines, iron works, engineering and fire-clay establishments. It is situated in historic ground and the whole neighborhood is rich in Highland and Lowland traditions. Near to the town is Eglinton which possesses extensive iron works and the famous castle of the same name, the scene of the Eglinton Tournament (1839). Kilwinning claims the honor of being the mother of the freemasonry of Scotland. Pop. about 5,000.

KIM, b. Rudyard Kipling, ranked by some critics as "the author's highest attainment in fiction" narrates the colorful adventures of young Kimball O'Hara, son of an Irish soldier in India, reared from babyhood as a waif among low caste Hindus and known among his variegated native acquaintances as "the Little Friend of all the World." Kim attaches himself, as disciple and protector, to a splendid, wise yet simple old Tibetan soldier wandering through India in search of a mystic river that is to wash him clean of all earthly sins, sorrows and penalties. The boy's European parentage is discovered, and Kim, with the lama's aid, is sent to school where he is educated with a view to his employment in the British secret service, for which he is peculiarly fitted by his natural gifts and his intimate knowledge of native life. Then, still in his teens, and unofficially attached to the secret service, he resumes his wanderings with the lama through India and far into the Himalayas, where he is instrumental in defeating the machinations of foreign spies among the native princes. On its first appearance in book form, 19 Oct. 1901, 'Kim' was enthusiastically hailed as a marvelous revelation of Oriental life. Thus a reviewer in The Academy (London) writes, "'Kim' is hardly a novel. It is a kinematograph of a people, telling what they feel—what they have felt through time, and the effect of that immemorial feeling on those of to-day." And Edgar Allan Forbes who followed the route of the tale through India declares "'Kim' is to me the best guide book and the most faithful interpreter that the traveler may find in India. No other book that I know of so clearly unfolds that wonderful land and its mysterious customs."—ARTHUR GUITERMAN.

KIMBALL, Arthur Lalanne, American writer: b. Succasunna Plains, N. J., 16 Oct. 1856. Educated at Princeton and Johns Hopkins universities, he became a member of the teaching staff of the latter institution for a while, being finally called to the chair in physics in Amherst College in 1891. Among his published works, which are almost altogether on physics, are 'The Physical Property of Gases' (1890), and 'College Physics' (1911).

KIMBALL, Heber Chase, American Mormon leader: b. Sheldon, Franklin County, Vt., 14 June 1801; d. Salt Lake City, Utah, 22 June 1868. In 1832 he was baptized into the Church of Latter-Day Saints, in the same year was ordained an elder of the Church by Joseph Smith and in 1835 became one of the 12 Mormon apostles. In 1838 with Brigham Young he led the Mormons from Missouri into Illinois, where they finally settled at Nauvoo, and in 1847 was a pioneer in the exodus to the valley of Great Salt Lake. He was successively chief priest of the order of Melchizedek (1846), a councillor to Young (1847) and chief justice and legislative president of Deseret.

KIMBALL, James Putnam, American geologist: b. Salem, Mass., 26 April 1836; d. Göttingen and Freiberg (Saxony, school of mines), he became professor of chemistry and economic geology in the New York State Agricultural College, (1861-62), and assistant adjutant-general of United States volunteers,
KIMBALL — KIMBERLEY 415

ranking as captain. He took a very active part in the Civil War and was with the Army of the Potomac, serving on the staffs of McClellan, Burnside, Hooker and Meade. At the conclusion of the war he became a mining engineer, serving in the meantime as honorary professor of geology at Lehigh University (1874–85), becoming, upon the latter date, director of the United States Mint (1882–88). He contributed extensively on his special subjects to American and other magazines.

KIMBALL, Martha Gertrude, American philanthropist: b. Portland, Me., 1840; d. 1894. She led a very active life which was marked by charitable impulses. During the Civil War she acted as a nurse with Sherman's army on its march into Georgia. She took a very great interest in the soldiers, and finally became inspector of hospitals. Her first connection with the army in the field was when she accompanied her husband to the front during the early part of the war. The fact that her husband was appraiser of captured cotton, an important position in the army, gave her an opportunity of seeing army life that she could not easily have otherwise obtained without becoming a part of the military organization and she later on actually did. She is credited with being the originator of the decoration idea, which she is said to have suggested to General Sherman, who at once welcomed it and put it into practice.

KIMBALL, Richard Burleigh, American author: b. Plainfield, N. H., 11 Oct., 1816; d. New York, 28 Dec. 1892. He was graduated at Dartmouth College in 1834 and later admitted to the bar; practised his profession at first in Waterford, N. Y., and afterward in New York. He founded the town of Kimball, Tex., and constructed the first railroad in that State, extending from Galveston to and beyond Houston. His publications include 'Letters from England' (1842); 'Cuba and the Cubans' (1850); 'Saint Leger' (1850); 'Romance of Student Life Abroad' (1853); 'Under the Curtain of Wall Street' (1862); 'Henry Powers, Banker' (1868); 'To-day in New York' (1870); 'Stories of Exceptional Life!' (1887).

KIMBALL, Sumner Increase, organizer and superintendent of the United States Life Saving Service, b. Lebanon, York County, Me., 2 Sept. 1834. He was graduated from Bowdoin in 1855; studied law and was admitted to the bar in 1858. In 1859 he served in the State legislature and was a member of the committee on judiciary. In 1862 he became a clerk in the second auditor's office in the Treasury Department at Washington, and in 1871 was made chief of the Revenue Marine Service. In that position he had occasion to investigate the condition of the government stations on the New Jersey and Long Island coast where surf boats and other apparatus were stored under the charge of a keeper for use in case of shipwreck; he found the property badly cared for and the service inefficient. Obtaining an appropriation from Congress he entirely reorganized the service, and so successfully that it was soon extended to Cape Cod stations on the Atlantic Coast. In 1878 the Life Saving Service was organized as a separate bureau and was extended to the Pacific Coast and the Great Lakes. He was made the head of the bureau and introduced many improved methods, including the patrol system and telegraphic inspection between adjacent stations; he also obtained the passage of the law, to the effect that inspectors, keepers and crews in the service should be appointed on a strictly non-partisan basis "with reference solely to their fitness." He has also been acting register, acting comptroller and acting solicitor of the Treasury, and in 1889 he was the United States delegate to the International Marine Conference. He has written 'Organization and Methods of the United States Life Saving Service' (1889), the most complete monograph on the subject, and 'Joshua James — Life Saver' (1909).

KIMBALL, William Wirt, American naval officer: b. Paris, Me., 9 Jan. 1848. Graduated from the United States Naval Academy (1869), he entered at once upon military life and was promoted as rapidly as the service permitted, becoming captain (1905) and rear-admiral (1908). He has seen a great deal of service in almost every water where the United States fleet is stationed. Among his other experiences he was one of the first of American naval officers to see service on an American torpedo boat. Aside from this he gave much attention to the development and perfection of machine and magazine guns and submarines. For this reason he was given command of the American Atlantic torpedo boat flotilla during the Hispano-American War. After the close of the war he was a member of the boards of construction, examination and retirement, and he was in command of the Nicaraguan expeditionary squadron (1909–10), notwithstanding the fact that, by law, he was automatically retired in 1909.

KIMBERLEY, kim'ber-lé, John Wodehouse, Earl of, English statesman, b. London, 1826; d. 1902. Educated at Oxford, he succeeded his father as third Baron Wodehouse while still in his teens, and he soon entered public life as Under Secretary of State for Foreign Affairs (1852–56 and also 1858–61). The intervening time he spent in the employ of the Russian Embassy. He was special envoy to Copenhagen to represent the government in the Schleswig-Holstein affair (1863), and on his return to England the following year he was appointed Under Secretary at the Indian Office, a position he soon relinquished to become Lord Lieutenant of Ireland (1864–66). He was recalled to England by the Gladstone government as Lord of the Privy Seal (1868–70) and Secretary for the Colonies (1870–74). The latter position he again held (1880–85) until he was appointed Secretary of State for India (1882–86), a position he was again called to occupy (1892–94), but relinquished to become Foreign Secretary in the Rosebery Cabinet (1894–95). Two years later he became leader of the Liberals in the House of Lords, and in 1899 he was elected chancellor of London University. In 1866, at a comparatively young age, he was raised to the dignity of Earl of Kimberley, for services rendered to the empire. Kimberley was a man of brilliant executive gifts and his work in Ireland and as Colonial Secretary and Secretary of State for India redounded to his credit and that of the British government.
KIMBERLEY, Lewis Ashfield, American rear-admiral: b. Troy, N. Y., 2 April 1830; d. 1902. He was appointed to the navy 1846, graduated from Naval Academy in 1852. In the Civil War as executive officer of the Hartford, Farragut's flagship, he took part in the contests at Port Hudson, Grand Gulf, Warrington and Mobile Bay, and in 1871 accompanied the United States expedition to Korea. In 1880-83 he commanded the navy yard at New York, in 1884-85 was a member of the examining and retiring board, in 1885-86 was in command of the Boston navy yard, in 1887 was promoted to rear-admiral and in 1892 was retired.

KIMBERLEY, South Africa, town of Cape Colony, the capital of Griqualand West and of the South African diamond fields, is situated 4,012 feet above sea-level at a distance of 647 miles by rail from Cape Town, and close to the western boundary of the Orange Free State province. Kimberley owes its existence and prosperity to the mining of diamonds, an industry that began in 1870. It stands on an open plain, has wide straight streets, good public and other buildings and restaurants, and a supply of water from the Vaal, 17 miles distant. The most important diamond mines are those called Kimberley, De Beers, Bulfontein, Du Toits Pan and Wesseltow. During the South African War Kimberley was invested by the Boers for 123 days, from 15 Oct. 1899 till its relief by General French on 15 Feb. 1900. A fine breed of horses is raised in the neighborhood. Pop. 49,832, of which 17,059 were whites.

KIMBERLEY, Australia, a northern district of western Australia, brought into notice by the discovery of gold fields in 1886. It contains immense tracts of splendid pasture and much land suitable for cultivation. The chief port for the district is Derby, on the Fitzroy River, near King Sound. The district, which has an area of 144,000 square miles, is divided into East and West Kimberley. It is separated from the more populous part of the colony by a stretch of sandy desert.

KIMCHI, kim'kë, David, or Ŕdak (RABBI DAVID KIMCHI), Hebrew philologist: b. Narboune, 1160; d. 1240. He was the most learned member of a learned family, and maintains to-day his reputation as grammarians, lexicographer and exegete. Besides his commentary on Genesis, Chronicles, the Prophets and the Psalms he wrote a grammar, 'Michliot' (Venice 1554); a Hebrew dictionary, 'Sefer Haschotor,' which was practically a list of roots (Naples 1490). He also wrote a tract under the title 'El Sofer,' which treated of the Masora and the Hebrew Accents and was published for the first time in 1864.

KINAH, kī'nā, The, a Hebrew metrical form, usually employed in dirges and songs of mourning, such as the Lamentations of Jeremiah, but also of Hinnom. It is divided by a caesura into two unequal parts, of which the first is the longer. The shorter clause simply enforces the thought expressed in the longer; as in the following example:

"He was unto me as a bear lying in wait || a lion in secret places."
KINDERGARTEN

1 Learning to work and play together in carrying out group plan
2 Learning to wash and iron doll clothes
3 Learning to cooperate. Building two-story houses large enough to play inside
4 Comparison of old and new method of sewing — old, on cards; new, on doll clothes
5 First, second and third attempt at patterns for doll dresses
6 Playing inside of house built of large blocks
7 Building Furniture with small blocks
8 Cooperative play with large floor blocks. Plan initiated and executed by group of three
Physical Apparatus to stimulate play with large muscles of body
Froebel was a remarkably close student of child life, searching eagerly for the causes of difficulty in their early learning and instruction. As he lived, worked and played with boys of school age, he was convinced that much of the difficulty in later education was due to starting education wrong in the first place. As he traced these difficulties back into the earlier years of instruction, his interest in the pre-school period increased. Thus began his study of the pre-school period, which finally resulted in the establishment of kindergartens for the education of children of that period. He thought first of remedying the neglect of children at this pre-school period through educating mothers. It was not until this scheme failed that he decided to try an experiment with a group of young children under his care in an orphanage in Switzerland where he had been called because of his success in teaching in his native land. He accepted this opportunity, because Switzerland offered a freer field for experiments in education than Germany, and he was anxious through this short experiment that some powers go to waste by postponing the education of the child to the sixth year, he returned to Germany to make an investigation as to what was being done for children of this age in any institutions where children of this age were to be found. When he returned to Berlin he found that the creche, or day nursery, had been founded — one as early as 1801. He found that these were opened to give relief to mothers engaged in bread-winning occupations and their families. He also discovered that the day nurseries and orphan homes were the only institutions interested in the pre-school age. When he visited them for suggestion he was impressed with the fact that no effort was being made to develop the intellectual interests and powers of children at this period of development. The care given was almost exclusively along physical lines, and poor care at that.

Had this been a day of international interest and intercourse, Froebel would have found a greater interest in young children in Great Britain and France, where some interesting efforts had been made to rescue young children from neglect and crime. This disintegrating influence on home life was caused by the introduction of steam into industries, transforming the small shop into the factory. In England especially the rural populations had moved into the cities in large numbers in order to secure work in the factories and mines. The lack of proper housing conditions, the crowding of families into limited areas and quarters, due to limited space, higher rentals and the higher cost of food and fuel, soon drove the mothers and older children out of the home, into the back or the factory. And the younger children in the families were deserted and neglected. Disease, filth and crime resulted, and society had to meet this new social problem by some effort to care for, protect and develop the young children who were too small for the school or the factory. Among those philanthropists and religious leaders who made initial efforts to rescue these pitiful specimens of humanity in Great Britain were Robert Owen, James Buchanan, David Stow, Samuel Wilderspin and Joseph Wilson. Pastor Oberlin had tried to do the same work for young children in Alsace as far back as 1767, and Madame Pastoure, Madame Millet and Monsieur Cochin were absorbed in a like effort to solve this social problem for France. Some of these preceded Froebel, while others were contemporaries and successors, but as far as we know Froebel knew nothing of them or their work on the problem which he had in hand.

It would seem from a comparison of the work done by Great Britain and France with that accomplished by Froebel that he was working for the children of the poor from a philanthropic and preventive point of view, Froebel had in mind the development and education of children of all classes. There was no industrial problem to speak of in the isolated locality in which Froebel lived in Germany. He was surrounded by simple plain folk, largely undisturbed by the changed industrial and social conditions which were stirring the municipal centres of Great Britain. There were two movements which stirred Froebel in his experiments with these young children — first, the practical one which grew out of his experiences in teaching older boys. Here he saw the effects of a poor foundation laid in early education, as well as the powers which developed before the school age. In the second place, his interest in the education of women and young children was greatly stimulated by his contact with the Romantic and Idealistic philosophy which was influencing thought and action in Germany at this period. Romanticism particularly, with its emphasis on feeling, intuition and the study of nature, brought a new sentiment toward both women and children — a sentiment which easily slipped into sentimentalism. In his early educational experiments Froebel was distinctly under the influence of Romanticism, but later he came into touch with the Idealistic movement — the kindergarten being the most noted attempt to apply the ideas and principles of this philosophy in education.

While we know that Froebel was unfamiliar with what was being done in Great Britain and France with children of the pre-school age, we have every evidence that he was somewhat familiar with Rousseau and his emphasis upon nature as the surest guide in reconstructing education and social life. We also know that Froebel was familiar with Comenius, and while he studied with Pestalozzi, and was profoundly influenced by him, he was never in complete sympathy with many of his most fundamental ideas. Pestalozzi emphasized the importance of sense impression and industrial training, but to Froebel, self-expression in play and creative work was the keynote of education. In this sense he was in closer sympathy with Rousseau "return to nature" than with Pestalozzi's "A B C of sense perception," and training for the immediate, practical demands of industry.

There are times when Froebel comes very close to the idea that education is a mere matter of removing obstacles, so that the self may have unrestricted freedom in expression; but in practice he puts much time and attention on the educational value of the outer world and environment, especially as it affects young children. In this he is not always consistent, as
there would be no need of planning the externals of environment so carefully for young children with a selected educative stimuli if education consists solely in removing all obstacles. Each child may have his free play and an unrestricted expression. In fact the kindergarten may be defined as one of the first conscious efforts to provide young children with a carefully selected, educative environment—an environment which offers not only the best sensory impressions, but what led to Froebel was a more important point, the very best materials as stimuli to the self-activity of the child. To Froebel, children were by nature good, and he looked up humanity, nature and God as one. He was an optimist, as well as an idealist, and was so convinced of the possibilities in education that he said, "I see in every child the possibility of a perfect man."

While Froebel lived in a day when psychology and the science of education was in a state of dawning, and scientific experiments were unknown, he undoubtedly saw, as no predecessor or contemporary, that the natural powers of the child must be used. He sincerely believed that the native instincts of children could all be utilized so as to gain the child participation in his own education. As he believed that child nature and human nature were inherently good, he looked upon every expression of child life as worthy of respect and reverence. His deeply-rooted faith in the oneness of God, nature and man made him take this new attitude toward the apparently aimless activities of play and the so-called bad child. As Rousseau laid the blame for most of the evils in society upon civilization, so Froebel traced most of the evil tendencies in child life to wrong curricula in the schools. Froebel's theories were his attempt to create a new curriculum—a curriculum made to fit the nature and the needs of the child. He firmly believed that if we could create such a curriculum, the old war between the child and the curriculum, the pupil and the teacher would cease to exist. In his daily contact with children we see practical evidence of his faith in the native instincts and interests of children as worthy of study and utilization. He believed that happiness indirectly resulted when the needs of nature were met with an intelligence and sympathy which provided the right kind of materials for children to act upon.

The keynote of his interpretation of child life was self-activity. He at once set to work to make a self-active school where children could actually learn through activity—through play. As a result, we see a curriculum, not of the three R's simplified for children of the preschool stage as in England and France, but one made up of songs, games, dances, pictures, nature, art and manual training to meet the native tendencies of young children. These were given an honorable place in the curriculum, restricted as highly as the reading and writing approved by all education. Thus the school was transformed; the silent child was allowed to sing and talk; the suppressed child to work and play. The schools under his care were a combination of workshops, studios, playgrounds, laboratories, gardens, where children were singing, playing, talking, looking at pictures, listening to stories, gardening, painting, drawing, modelling, sewing and weaving. While this is commonplace to-day, the transformation was very largely due to Froebel.

It is due to his efforts that the young educator, that the still child began to move, to act, to think, to work, to play; the silent child to sing, to talk, to ask questions, and thus we see the emphasis of education laid upon activity, growth, development, freedom, happiness and its influence.

Froebel's extraordinary sympathetic insight into children stood him in good stead at a period when little was known of the science of child study as we know it to-day. He made many mistakes in applying his theories, but a new epoch was undoubtedly the result of his effort.

The kindergarten was brought to America by a student of Froebel, Miss Meyer, who afterward married Carl Schurz. Through Mrs. Schurz's work with her own children Miss Elizabeth Peabody was interested. Miss Peabody was a member of the celebrated Peabody family of Massachusetts—one sister marrying Nathaniel Hawthorne, the other, Horace Mann. She was prominent in the transcendental group of thinkers in the Concord School of Philosophy which influenced many of the pioneer workers in the kindergarten field. Dr. William T. Harris, Miss Susan Blow and Dr. Denton Snyder, as well as Miss Peabody herself, were profoundly influenced by this school of thought, and all in turn devoted themselves to the promotion of the kindergarten idea. After reading Froebel's theories in 1867, Miss Peabody opened a kindergarten in Boston, but without any training. While her kindergarten was pronounced a success by her patrons, to her it was not a true embodiment of the theories of Froebel as she interpreted them. For this reason she closed her kindergarten and sailed for Germany to study at the fountain source. In the meantime Miss Maria Boeble, a young woman trained in Froebel's schools in Germany, was called from London to New York where she opened a kindergarten in 1872. This was a great success, and finally developed into a training school for kindergartners. Madame Kraus Boeble, after her marriage with Dr. John Kraus, had charge of the work with both children and normal students for many years. She, in New York, Miss Elizabeth Peabody in Boston, Miss Susan Blow in Saint Louis and Mrs. Alice Putnam in Chicago, were the best-known pioneer leaders in the introduction of the kindergarten into America, where it spread with unprecedented rapidity and success. The United States still leads in its appreciation and care of children at the pre-school age, there being between five and six hundred thousand children in the kindergartens in this country in the statistics of 1916. It is a part of the public school system in all of our large cities, and the majority of the cities of the second, third and fourth class.

The training of kindergartners was for many years in the hands of private normal schools, but in the last decade most city and State normal schools in the United States have opened kindergarten departments, and a goodly number of the universities as well. This has
proved to be an effective means in unifying the kindergarten and primary work. In the past the kindergarten child who entered the primary was at a serious disadvantage, due to the different educational ideals held by the teachers of both kindergarten and primary. This great difference in ideals was gradually altered as the kindergarten went into the public schools.

That the kindergarten, in time, reconstructed the practice in primary education is a generally accepted fact by students of educational history. Self-activity came to be the cardinal principle in elementary education as well as in the kindergarten, and in many modern schools the kindergarten and primary are so closely organized that a child passes from one to the other without waste of time or energy in adjusting himself to the new work peculiar to the primary grade. These happy changes are due to several causes: first, to the training of kindergartners in city and State normal schools and in universities, with other teachers, instead of the isolated private schools of the earlier days. Second, to an increasing effort to train teachers of young children in both kindergarten and primary. In the third place, to a movement in favor of training supervisors in both kindergarten and primary, so that the schools may have the advantage of one supervisor who is an expert in each field.

It is unfortunately true that there was a tendency in kindergarten circles for many years to cling too tenaciously to Froebelian theory and practice. In the early history of the kindergarten, it was far in advance of primary education, in both theory and practice. This explains the transformation of primary practice wherever kindergartens were introduced. In time, however, an unwholesome pedagogic self-satisfaction grew up within the kindergarten ranks, which finally resulted in a period of arrested development for the kindergartners and the system. This followed the reconstruction of the primary in the light of kindergarten principles and practice.

When the new science of child study came into education, kindergartners as a whole turned a cold shoulder to its observations and returns, if they did not coincide with the interpretations of child nature made by Froebel and his immediate followers. It must be acknowledged, however, that a small minority of kindergartners gladly gave ear to the new science of child study, especially when it seemed to correspond to their daily experiences in studying and training young children. Difference of opinion was very decided, and gradually and unconsciously, kindergartners divided into two parties — those in favor of modification and reconstruction of kindergarten procedure in the light of modern psychology and child study, and those who clung with loyalty and devotion to the traditions of the past. The progressive movement among kindergartners immediately won the support of psychologists, physicians and the leading educators of the day, all of whom cooperated in reconstructing kindergarten practice. The first form of the reconstructive movement was noticed in the demand for larger handwork for the children in the place of the small processes and materials involved in the perforating, weaving and sewing in use in the early kinder-
servable. With this larger and more durable material the child could make articles which were both interesting and useful in his play and home life. Instead of sewing geometric designs with a large needle, as given in a coarse needle, thread and cloth, with which dolls could be dressed. As a substitute for paper strips which were woven into geometric designs in a flat paper mat which was of no use to him or to society, the children were given opportunities to make things such as make-up bags, or hats, or hammocks for dolls. Instead of folding, cutting and pasting a geometric figure vaguely resembling a kite, the children were given material which made it possible to construct a real kite which could be taken into the open air for experiment. The immediate effect was deepened interest, and marked increase in effort and self-initiative. As a result the necessity for direction and help from the teacher declined and ability to pursue an end with determination and perseverance increased.

All kindergartners who experimented in the reconstruction of the kindergarten were convinced that this new type of work exemplified Froebel's principles of self-activity and creativity far better than the traditional handwork suggested to have been established by Froebel himself. As a time passed, less emphasis was laid upon the practice of Froebel, and more time and attention was given to better applications of his fundamental principles. Froebel's small building blocks were either enlarged, or new ones invented, better adapted to stimulate healthful, active play. The very mediocre music of the children's songs and games composed for Froebel gave place to standard folk music, or modern music written especially for the kindergarten by musicians of high grade. Gradually the whole scheme of practice, including songs, games and stories, building and occupation materials, was reshaped, until, in many of the most progressive kindergartens of to-day, little of the traditional material is left.

The kindergartners grew bolder in throwing off tradition, introducing not only better materials, but better methods, in their effort to meet the nature and needs of young children, untrammeled by the interpretations of Froebel and his followers.

The effort to cling to Froebelian material and methods is dying out, and kindergartners on the whole seem to be more than eager in their study of children, and their search for better means of educating them. This reconstructive movement was greatly increased by the appearance of the first rival institution for educating children of the kindergarten age. At first there was some marked difference of opinion regarding the value of Dr. Montessori's experiment with children of kindergarten age. Some kindergartners utterly denounced the whole movement without investigation, while others, with equal lack of discrimination, went over into the Montessori ranks, with little evidence of distinguishing between the values of the new system of education. It seems fair to say, however, that in America kindergartners have made an intelligent adaptation of the values of the Montessori System to kindergarten practice, making an effort to discard the weaknesses of both, and organizing their strong points into a new and most promising education for children of this period.

To-day it can be truthfully said that there is no body of teachers more earnestly reconstructing their theory and practice than the kindergartners. They are to be found in large numbers in all summer schools—whether in normal schools or universities, and the number of teachers asking for leave of absence to secure their degrees in the universities gives unquestioned evidence of the fact that the ambition of the kindergartner of to-day is to hold as high a place, as far as her preparation as a teacher as that required for the teachers in high schools and colleges.

PATTY S. HILL
Associate Professor in Education, and Director of Lower Primary Education, Teachers' College, Columbia University, New York City.

KINDI, kän'dé, ALCHINDIUS, al-kön'di-ös, Abu Yusuf Ya'kub Ibn Ishak Al-Kindi, Arabian philosopher of the 9th century. b Kufa, c Baghdad. He came of good family and received the best of instruction through the efforts of his father
who was Governor under two famous Arabian rulers, Mahdi (775–85) and harun al-Rashid (789–809). He was a very prolific writer and is credited with having written over 200 treatises on philosophy and science, over the whole field of which as known in his day he wandered. He was a very clever and original thinker and even to-day, after a lapse of nearly 1,000 years, his name stands high among the Arabs. Many of his works are now only a name, having long since been lost; yet some relating principally to astrology and medicine, remain to attest his worth as a philosopher and original thinker. Probably numbers of his works disappeared when his library was seized, during the reign of Motawakkil (847–61). Consult De Boer, ‘Geschichte der Philosophie im Islam’ (Stuttgart 1901); Flügel, ‘Al Kindi genannt der Philosoph der Araber’ (Leipzig 1857); Nagy, ‘Die philosophischen Abhandlungen des al-Kindi’ (Münster 1897).

KINeALY, kl-né-li, John Henry, American engineer and educator b. Hannibal, Mo., 18 March, 1864. Graduated from Washington University as a mining engineer, he became interested in the field of agriculture and, after serving as professor of agriculture and mechanics in the College of Texas (1887–89); professor of agriculture in the North Carolina College of Agriculture and Mechanical Arts (1889–92); and professor of mechanical engineering in Washington University (1892–1902). On the latter date he retired from college work and became consulting and mechanical engineer, first in Boston (1902–04) and then in Saint Louis. He has invented a number of useful devices which are in general use. Among his published works are: ‘Steam Engines and Boilers’ (1895); ‘Charts of Low Pressure Steam Heating’ (1899); ‘Slide Valve’ (1899); ‘Centrifugal Fans’ (1905); ‘Mechanical Draft’ (1906); and numerous magazine articles on similar subjects.

KINeMATICS OF MACHINeRY. Machines may be defined as the study of motion and of the circumstances which influence or affect it. The study of motion alone is a branch of geometry in which the element of time enters. Ampère, ‘Philosophie des sciences’ (1843), gave to this geometry of motion the name ‘Kinematics; Reuleaux, ‘Theoretische Kinematik’ (1875) and others before him called it phoronomics but this term has not been accepted in mechanics. ‘Kinematics of machinery’—also called kinematics of mechanism, theory of mechanism, applied or technical kinematics—is that phase of the subject which is useful in engineering. It deals with the motions of a complex deformable system subjected to such constraints as will make the motion unique or determinate. According to Koenigs, ‘Introduction à une théorie nouvelle des mécanismes’ (1905), it is the study of the constraints in machines, a machine being an assemblage of resistant bodies (rigid, flexible or fluid) under mutual constraint upon which force may act. All the methods necessary for the mathematical formulation of the solutions of the most complicated problems were known long before kinematics existed as a separate science. The first attempt to separate it from mechanics in general was made by Monge in 1794; his program was elaborated and published in 1808 by Lenz and Bétancourt, ‘Essai sur la composition des machines.’ Their system aroused interest, but whatever benefit to the science may have accrued through this stimulus was certainly outweighed by the harm that arose through emphasizing the idea that it was more the province of kinematics to classify and describe machines than to devise simple methods of finding velocities and accelerations. This point of view was strengthened by Willis, who published his famous ‘Principles of Mechanism’ in 1841. To judge from the 20-page preface to his second edition (1870) Willis regarded classification as of first and last importance. Nevertheless he gave proper kinematic descriptions of an enormous number of mechanisms, was the first to investigate velocity ratios—the ratio of the velocity of the driver to that of the follower—and occasionally improved methods of designing and calculating. It is not easy to-day to understand how Willis exerted so deep an influence for a generation. When one considers the brilliant work done in mathematical kinematics by Euler, Lagrange, Laplace, Poisson, Poincaré and Coriolis, it is not unfair to say that Willis was as anticipated in his own time as he is now. The next noteworthy book in the development of kinematics is Reuleaux, ‘Theoretische Kinematik: Grundzüge einer Theorie des Maschinenwesens’ (1875), English edition by Kennedy in 1876. To Reuleaux classification is still of fundamental importance. Willis classifies machines according to the way they transmit motion, for example, by rolling contact, sliding contact, wrapping connectors (belts and chains), linkwork and ratchets, each being subdivided according to whether the velocity ratio or the direction of the velocity is constant or variable. Reuleaux on the other hand examines the elements of which machines consist and finds that they always occur in pairs, a number of pairs being connected to form a chain. In kinematic pairs there may be relative sliding (e.g., crosshead and guide), turning (hinge or pin joint) or sliding and turning (screw and nut). If the contact is between surfaces, as in these examples, the pair is called lower; if there is line contact, as in gear wheels, the pair is higher. Reuleaux showed that independent mechanisms may be made from the same kinematic chain by holding different elements or links fixed. Neither Willis nor Reuleaux had an efficient method of finding velocities in a mechanism; neither attempted to find accelerations and neither gave sufficient emphasis to the fundamental problem of kinematics, namely, to devise general methods for the determination of velocities and accelerations. The most important treatise on kinematics from this point of view is Burmester’s ‘Lehrbuch der Kinematik’ (1888); this is decidedly superior to anything written before that time and has not yet been surpassed.

Fundamental Theorems. Three theorems suffice as a basis for the analysis of velocity and acceleration in mechanisms. On account of their importance a simple, general, solution of the most complicated problems was known long before kinematics existed as a separate science. The first attempt to separate it from mechanics in general was made by Monge in 1794; his program was elaborated
applied to accelerations and sometimes leads to serious mistakes.

In Fig. 1 it is required to find the velocity of any point $P$ of a rigid body moving in a plane, the velocity of $O$ and the angular velocity $\omega$ of the body being given. The body has three degrees of constraint specified by the co-ordinates $\xi, \eta, \theta$, i.e., given values of them will fix its position. If a constraint is removed by permitting the corresponding co-ordinate to vary, the body has one degree of freedom. In the following equations one dot over a letter will denote the first time-derivative. From Fig. 1

\[
\begin{align*}
\dot{x} &= \xi + r \cos \theta, \quad y = \eta + r \sin \theta; \\
\dot{\xi} &= \dot{\xi} - r \omega \sin \theta, \quad \dot{\eta} = \dot{\eta} + r \omega \cos \theta 
\end{align*}
\]

(1)

where $(\dot{\xi}, \dot{\eta})$ and $(\dot{x}, \dot{y})$ are respectively the velocities of $O$ and $P$ with reference to the fixed axes $xy$ and are thus the so-called absolute as distinguished from the relative velocities. $r\omega$ is that part of the velocity of $P$ which is due to the rotation of $P$ about $O$; it is normal to $OP$ and is the relative velocity of $P$ with respect to $O$. Equations (1), giving the components of the relative and absolute velocities of $O$ and $P$, state that $P$ has two superposed velocities: the absolute velocity $(\dot{\xi}, \dot{\eta})$ of $O$ and the linear velocity $r\dot{\theta}$ due to the rotation of $P$ about $O$. Hence

**Theorem I.**—The velocity of any point $P$ of a rigid body having plane motion is the resultant of the velocity of any other point $O$ and the linear velocity due to the rotation of $P$ about $O$. Let $u$ and $v$ be the absolute velocities of $O$ and $P$; then Fig. 2 shows $v$ as the resultant of $u$ and $r\omega$. In symbols

\[ v = u + r\omega, \text{ vectorially.} \]

This theorem is the basis of the graphical method of velocity diagrams devised by R. H. Smith (Royal Society of Edinburgh, 1885) and now in general use. Consult also his ‘Graphics’ (1889); and Burmester’s ‘Kinematik.’

By differentiating equations (1) and denoting the angular acceleration $\dot{\omega}$ by $\alpha$ we find

\[
\begin{align*}
\dot{x} &= \dot{\xi} - r \alpha \sin \theta - r \omega \dot{\omega} \cos \theta \\
\dot{\xi} &= \dot{\eta} + r \alpha \cos \theta - r \omega \dot{\omega} \sin \theta
\end{align*}
\]

(2)

where $(\dot{\xi}, \dot{\eta})$ is the absolute acceleration of $O$, $r\omega^2$ the radial acceleration, directed from $P$ to $O$, due to angular velocity; $r\alpha$ is the tangential acceleration normal to $OP$ due to angular acceleration. Hence

**Theorem II.**—The acceleration of any point $P$ of a rigid body having plane motion is the resultant of the acceleration of any other point $O$ and the linear accelerations of $P$ due to the angular velocity and acceleration of $P$ about $O$. $\omega$ and $\alpha$ specify the absolute rotation of the body. The theorem may be expressed in a vector equation; if $a$ and $\alpha P$ are the accelerations of $P$ and $O$

\[ a = a_P + r \omega + r \alpha, \text{ vectorially.} \]

(3)

Theorem II is the basis of all graphical solutions. It can be put into another form. In Fig. 3 let the point $C$ be fixed and let $O$ be a hinged or pin-connected joint so that $CO$ and $OP$

\[
\begin{align*}
\omega &= \omega_P + \omega_C, \quad \alpha = \alpha_P + \alpha_C
\end{align*}
\]

all quantities being measured in the same sense. By substitution in the previous equation and putting $\omega_C = 0$ we get

\[ a = (l + r)\omega + (l + r)\omega^2 + r\omega + r\alpha + 2r\omega \alpha + (...) \]

The plus signs indicate vector addition; for example, $l + r$ is $CP$. Therefore $(l + r)\omega$ is normal to, and $(l + r)\omega_C$ along, $CP$; $r\omega + r\alpha$ is the acceleration of $P$ relative to the system $CO$. The term $2r\omega \alpha$ is called the *Coriolis acceleration* after Coriolis, who in 1835 discovered the theorem of which equation (4) is a special case. Since it came from $r(\omega + \omega_C)$ it is directed from $P$ toward $O$; if $\omega_C$ and $\omega_P$ are opposite it points from $O$ toward $P$. Hence we have

**Theorem III.**—The acceleration of any point $P$ of a body in motion with respect to a moving system is the resultant of (1) the acceleration of $P$ regarded as fixed to the moving system, (2) the acceleration of $P$ relative to the moving system, (3) the Coriolis acceleration $2r\omega \alpha$, where $\alpha$ is the relative velocity of $P$ and $\omega$ the absolute velocity of the moving system;
**KINEMATICS OF MACHINERY**

2\(\omega_0\) is directed toward the centre of curvature of the relative path of \(P\) unless \(\omega_0 \) and \(\omega\) are opposite. For other demonstrations consult Routh, ‘Advanced Rigid Dynamics’ (1905); Burmester was the first to apply the theorem to mechanisms.

**Analysis of Velocities.**—The following are practically all of the typical velocity problems occurring in the theory of plane mechanisms:

I. Given the velocity of one point of a rigid body, to find the velocity of another point constrained, as by a guide, to move in a given manner.

Fig. 2 illustrates this case; \(u\) is the given velocity, and the direction but not the magnitude of \(v\) is known; the construction determines \(v\) completely. The drawing of the two parallels \(u\) may be avoided by noticing that \(u\) and \(v\) have equal projections on the line between the two points; this means that the line is inextensible.

II. Two rods \(AP\) and \(BP\) are hinged at \(P\), the velocities \(u\) and \(v\) of \(A\) and \(B\) being given and \(v\) that of \(P\), is required. At \(P\) draw the vectors \(u\) and \(v\); from the head of \(u\) draw a line \(v\) a perpendicular \(b\) to \(BP\). Now \(P\) is on the rod \(AP\), therefore if the arrow representing its velocity starts at \(P\) it must, by \(l\), end on \(a\); \(v\) must also end on \(b\). Hence \(v\) goes from \(P\) to the intersection of \(a\) and \(b\).

III. Given the velocities of two points of a rigid body to find that of any other point.

In Fig. 4 \(u\) and \(v\) are given and \(w\) is required. From equation (1) if the velocity \((x, y)\) of \(P\) in Fig. 1 is zero \(\xi/\eta = \tan \theta\); therefore since \(\xi/\eta\) is the cotangent of the angle the velocity of \(O\) makes with \(X\), that point whose velocity is zero at a certain instant lies on a normal to the velocity of \(O\). There is evidently only one such point for if there were two the whole body would be instantaneously at rest. This point is called the instantaneous centre of rotation; it was discovered by John Bernoulli, ‘De Centro Spontaneo Rotationis’ (1742) but Descartes had previously noticed it in studying the cycloid. In Fig. 4 the normals to \(u\) and \(v\) intersect at \(C\) which, being the instantaneous centre, lies on a normal to \(w\). As the body rotates instantaneously about \(C\), the velocities are proportional to the instantaneous radii, which fact furnishes an obvious method for getting \(w\).

When \(C\) lies off the drawing paper proceed thus. Since the body is rigid \(u\) and \(w\) must have equal projections on \(PR\), and \(v\) and \(w\) equal projections on \(QR\). Draw the projections at \(R\) and erect normals at their ends; the head of \(w\) will lie at the intersection of these normals. This method fails when \(P, Q, R\) are collinear. If the instantaneous centre cannot be used note that (a) the projections of \(u, v, w\) on \(PR\) must be equal, and (b) as the body cannot bend, the components of \(u, v, w\) normal to \(PR\), at \(P, Q, R\) must end on a straight line; \(w\) is then found from its two components.

IV. To find the velocity of any point on a rod moving in a sleeve. There are several cases which are shown in Figs. 5–7. In Fig. 5 the sleeve is a tube free to rotate about a fixed axis; the rod slides in the sleeve and turns with it. Suppose \(u\) to be known. The only point, besides \(P\), whose direction of motion is known is that point \(R\) on the rod which is also
at the axis of rotation of the sleeve; it moves along the rod but has no transverse component. Hence the velocity of $R$ is found as in II, and that of any other point as in III.

In Fig. 6 the sleeve slides on $A$ and turns about the end of $B$. The centre of the sleeve has two motions: $s$ along and $u$ normal to $A$.

![Fig. 6](image)

Their resultant $v$ being perpendicular to $B$, so that if one of these three velocities is known the vector triangle in Fig. 6 gives the other two. If, as in Fig. 7, the sleeve is fixed at the end of a rod $B$, any point $P$ on $A$ will have two motions: $s$ along $A$, and $u$ normal to $OP$; their resultant being $v$. The reader should observe that Figs. 6 and 7 were solved by using the principle of superposition.

V. Sliding pieces. These occur in two forms. In an iris diaphragm, a photographic shutter, or a pair of shears, two blades slide over each other, it being required to find the velocity of the point common to the two overlapping edges; in cams and gear teeth two tangential surfaces slide and roll on each other, the problem being to find the velocity ratio of the two pieces.

In Fig. 8 i, $A$ is fixed and $B$ rotates. The velocity $v$ of $P$ is the resultant of $u$, due to rotation, and $s$ due to sliding along $B$; $u$ is tangent to $A$ and $P$. In the toe and lift mechanism, shown schematically in Fig. 8 ii, $v$ is the resultant of $u$, due to rotation, and $s$ due to sliding along the common tangent. If both pieces in Fig. 8 i turn use the method of superposition: hold $A$ and $B$ fixed in succession. Fig. 9 shows two cams or parts of two gear teeth turning about fixed centres $C_1$ and $C_2$; it is required to find the angular velocity ratio $\omega_1/\omega_2$. The point of contact on $A$ has a velocity $v_1$ normal to $C_1P$ and on $B$ the velocity $v_2$ is normal to $C_2P$; these are the actual velocities of points fixed on $A$ and $B$ but coincident at the point of tangency. If the two surfaces are not to separate, $v_1$ and $v_2$ must have equal projections on the common normal. If the normal components are equal the tangential components cannot be, for otherwise $v_1$ and $v_2$ would be along the same line; hence sliding takes place and the motion is not pure rolling. Now suppose the contours to touch at some other point $C$. The velocities there can be collinear only if $C$ lies on $C_1C_2$; if they are equal there will be pure rolling without sliding. In this case the relative motions of $A$ and $B$ are rotations about $C$, hence as the relative velocities at $P$ are along the tangent and are due to relative rotations about $C$, $C$ must lie on the normal at $P$. $C$ is the pitch point and $C_1C$ and $C_2C$ the radii of the pitch circles. The angular velocity ratio is found from $C_1C\omega_1 = C_2C\omega_2$; if it is constant, as in gear wheels, $C$ must remain fixed, whence the normals at successive points of contact of the teeth must pass through the pitch point. This is the basic law of gear teeth design.

VI. Pure Rolling. The simplest case of pure rolling is that of a gear or wheel train;

![Fig. 10](image)

Fig. 10 shows the pitch circles, all centres being fixed in position. By equating rim velocities, $K_{\omega_1} = R_{\omega_1}$, $R_{\omega_2} = R_{\omega_2}$, $R_{\omega_3} = R_{\omega_3}$, the product of which gives

$R_{\omega_1}R_{\omega_2}R_{\omega_3} = R_{\omega_1}R_{\omega_2}R_{\omega_3}$

in which capitals refer to drivers and lower case letters to followers. Sometimes the shafts of all the wheels are mounted in a rigid frame. Let the frame turn $+n$ times around the shaft of the second wheel while this wheel is prevented from turning. The number of turns made by the other wheels is found by the method of superposition as follows. First let $R_1$ (and of course $r_1$) turn with the frame; then $R_2$, $R_3$ and $r_2$ make $+n$ turns, there being however no relative motion of the wheels. Now hold the frame fixed and give $-n$ turns to $R_1$; then $R_2$, $r_2$ and $r_1$ turn respectively $+n$, $+R_1/n$ and $-R_1/n$ times. Superpose the two motions or imagine them to occur simultaneously. Similar considerations lead to the occasional $sd$ case where, if the 25-cent piece is rolled once around the circumference of a fixed 25-cent piece it will make two turns around its own centre.
Quadric Chain; Inversion; Theorem of Three Centres.—The simplest mechanism consists of four pin-connected or hinged links, Fig. 11, called by Reuleaux the quadric chain; it may be regarded as the kinematic unit of mechanisms having surface contact. A considerable number of different mechanisms may be derived from it by inversion; this consists in fixing any two points on any one link. The idea, due to Reuleaux, is useful in giving an insight into the relationships in families of mechanisms. (Consult Durley, 'Kinematics of Machines,' 1903.) Inversion does not change relative motions. The points (12), (23), (34) and (14) are the relative instantaneous centres of the links whose numbers they bear. By holding 4 or 2 fixed we find that (24) is the I. C. (instantaneous centre) of 2 and 4 for motion relative to each other; likewise (13) is the relative I. C. of 1 and 3. Observe that (24), (23) and (34), and (12), (23) and (13) are collinear triplets of the form \((xy), (yz), (zx)\). This is a special case of the theorem of three centres now to be proved. Consider Fig. 12, representing three bodies having relative plane motion.

The I. C. of the relative motion of two pieces is that pair of coincident points (one on each body, extended if necessary) having the same velocity, for their relative velocity is then zero;

each body thus turns about the I. C. relatively to the other. Let (12) and (13) be known in Fig. 12. If (23) is at some such point as \(C\) the velocity of \(C\), considered as being part of 2, is normal to (12) \(C\); when it belongs to 3 its velocity is normal to (13) \(C\). These velocities have different directions and cannot be vectorially equal unless they are collinear, whence (23), the correct position of \(C\), must lie on (12) (13). The utility of the theorem of three centres is illustrated in Fig. 13; the two crosses indicate fixed centres. By the theorem, (13) is collinear with (12) and (23), and also with (15) and (53); therefore it lies at the intersection of two lines through these pairs. The most detailed discussion of the theorem is given by Klein, 'Kinematics of Machinery' (1917).

Kinematically Determinate Mechanisms.—Any system of interconnected bodies is kinematically determinate when the velocity of one point determines the relative velocity of every other point. When the mechanism consists of \(P\) pins interconnected by \(l\) links the criterion of determinateness is found as follows: It takes 3 links to connect 3 of the pins into a rigid triangle; each remaining pin requires 2 links to fasten it rigidly to the frame already formed,

\[
3 + 2 (p - 3) = 2p - 3 \text{ links}
\]

will connect \(p\) pins into a rigid coplanar network. Each link represents a constraint. If one link is removed one degree of freedom will be introduced and the frame will be uniquely deformable. Hence

\[
l = 2p - 4
\]

is the relation between the number of links and pins in a kinematically determinate mechanism.

The criterion requires interpretation in special cases.

(i) Fixed pins are those fastened to some frame of reference. Two such pins are equivalent to one link; for \(f\) fixed pins there are virtually \(2f - 3\) links. If \(f\) of the \(p\) pins are fixed and there are \(l\) actual links

\[
l + 2f - 3 = 2p - 4.
\]

(ii) One link having 3 pins on it counts as 3 links since it may be regarded as a collapsed triangle; a link with \(m\) pins counts as \(2m - 3\) links.

(iii). A crosshead or sleeve is equivalent to a link of zero length; it must therefore be counted as 2 pins and 1 link.

(iv). A point at which there is line contact, as in cams and gears, counts as 2 pins and 1 link.

Centrodes.—The locus in space of the instantaneous centre is called the space centrode; the locus in the body is the body centrode. The term centrode is due to Clifford, 'Elements of Dynamics' (1876); the idea, however, is found in Poinsot, 'Théorie nouvelle de la rotation' (1851) and Reuleaux. The latter used it in
place of the foregoing methods. In Fig. 14
\( C, C_1, C_2 \) and \( C, c_1, c_2 \) represent simultaneous or
Corresponding points on the two centroids.
Since the instantaneous centre will take the
positions \( C_2 \) and \( C_1 \), \( c_1 \) and \( c_2 \) must fall on them
during the motion. No sliding will occur
since the body rotates about the instantaneous
centre, hence the body centroid rolls on the
space centroid. For example, the circum-
ference of a wheel is the body centroid and the
line along which it rolls is the space centroid.

Accelerations.—It is not easy to find accel-
erations except in simple mechanisms;fortunate-
ately only simple cases arise in practice. In
the four-bar linkage or quadric chain, Fig. 15 i,
to \( O, v=\omega_o \) or \( w/l=\omega_o \) ; i.e., \( \omega_o \) is a third
proportional to \( l \) and \( v \) and may therefore be found
by geometric methods; this applies also to \( r_o \)
and \( R_o \). By Theorem II above the acceleration
of \( P \) is the resultant of \( r_o \), \( r_o \), \( l_{nu}, l_{nu}, l_{nu} \); it is also
the resultant of \( R_o \) and \( R_o \), whence the con-
struction in Fig. 15 ii. Other methods are given
by Land “Geschw. — und Beschl. — Plan für
Mechanismen” (Zeit. d. Ver. deut. Ing., 1896)
and Rittenhaus, “Der Civilingenieur” (1880, p.
244). The ordinary connecting rod mechanism
may be solved by special methods which are
quicker. Let the crank in Fig. 16 turn at
constant speed \( \omega \). The velocity of \( C \) is
given according to Fig. 2 by the
construction at \( C \); \( v \) is the velocity of \( C \)
relative to \( P \). Draw \( OQ \) vertical, then \( OPQ \)
is similar to the velocity triangle. If \( w \) is called
unity the triangles will be equal so that \( PQ \)
represents the relative velocity \( v \) and \( OP \)
represents both \( r_o \) and \( r_o \). With \( P \) as centre and
radius \( PO=v \) draw an arc; on the connecting
rod as diameter draw an arc intersecting the
former in two points and through them draw
the chord. Since \( BD \) is a common ordinate in
the two semi-circles on \( CQ \)
\[ BD=v(P+B) = (l-BP) BP \]
or
\[ BP = \frac{v_l}{l} \]
Hence as two sides (\( PO=r_o \) and \( BP \)) and all
directions of the acceleration polygon of \( C \) are
known the remaining quantities are determined;
i.e., \( AO \) is the acceleration of the crosshead.
This construction was found independently by
Kirsch, “Graphische Bestimmung der Kolben-
beschleunigung” (Zeit. d. Ver. deut. Ing., 1890)
and Klein, “Force of Inertia of Connecting
Rods’ (Journal Franklin Institute, 1891). The
following method is due to Mohr, “Konstruktion
der Beschleunigung am Kurbelgetriebe.” Der
Civilingenieur (1880). From where the hori-
zontal through \( O \) in Fig. 16 cuts the crank
draw a vertical \( RB \) and then \( BA \) perpendicular
to the connecting rod. \( AO \) is the acceleration
of \( C \) because from similar triangles
\[ \frac{BP}{v} = \frac{PR}{PO} = \frac{1}{7} \]
or
\[ BP = \frac{v_l}{l} \]
as before.
The acceleration of any other point \( C \) on
the connecting rod is needed in Dynamics of
Machinery (q.v.). \( AB+BP=AP \) is the accel-

---

KINETIC THEORY OF GASES — KINETOGENESIS

The weight of the body is applied obliquely to the end of an arm, within it there is a combination of fibres giving strength with lightness, which forms a frame mechanically adapted for resisting the weight which rests upon it, and so with the astragalus. A certain direction of fibres in all these instances co-exists with a certain direction, or certain directions, of the transmission of pressure. From this constant association of structures and function the inference seems unavoidable, that they are means and ends.

Comparing the bones in question with those of the gorilla and chimpanzee, only "slight traces of the trusswork described in man exist." As they practically exist in man alone, Wyman maintains that "they relate to the kind of locomotion which he alone of the whole animal series can be said to possess, namely, that of walking erect, and which requires in the passive and resting organs subservient to it, in order that it may be effected with ease and grace, a nice combinatorial influence on the characters of individual animals and plants." The influences which thus play a part in evolution fall into two classes. They are either physico-chemical, or molecular; or, they are mechanical, or muscular. A gradual transformation of the parts of an organism is supposed by Cope to be the result of these influences. The two types of influence which thus express themselves in evolution, Cope calls Physiogenesis, which operates through molecular action; and Kinetogenesis, which expresses itself as molar motion. Cope has likewise traced the line of progression in fossil genera as exemplified by numerous series of intermediate forms. But Herbert Spencer also contributed much in this direction by his theory of the mechanical origin of the segmentation of the body in vertebrates, leading (as he thought) to the formation of vertebrae.

This term suggested by E. D. Cope, meaning development by motion, or the exercise of parts or organs, is nearly the equivalent of our development. The examples given by Cope are the development by use of muscles of any hard parts or bone. He claims that muscular tissue is highly plastic, and since it is directly controlled by nervous or equivalent stimuli, the effect of the latter is largely due to the former. Another example, overlooked by late students, is the beautiful study on the mechanical genesis of bone structure published by Wyman in 1857. This anatomist shows that the cancellated structure of the bone (see Bone) in the lumbar vertebra, the thigh-bone, tibia, astragalus and os calcis of man is peculiar to him, and has "a definite relation to the erect position which is naturally assumed by man alone."

The fibres or cancelli of such bones as assist in supporting the weight "are arranged either in the direction of that weight, or in such a manner as to support and brace those cancelli which are in that direction. In a mechanical point of view they may be regarded in nearly all these bones as a series of stringers running parallel, and dealing with the individual bones shows in what direction force or weight is applied to them, and the corresponding direction the cancelli assume. On the lumbar vertebra there is vertical pressure, and the principal bone fibres within are also vertical. On the neck of the thigh bone the weight of the body is applied obliquely to the end of an arm, within it there is a combination of fibres giving strength with lightness, which forms a frame mechanically adapted for resisting the weight which rests upon it, and so with the astragalus. A certain direction of fibres in all these instances co-exists with a certain direction, or certain directions, of the transmission of pressure. From this constant association of structures and function the inference seems unavoidable, that they are means and ends."

The great length and chisel-like incisor teeth of the squirrel and other rodents also illustrate this subject. Their progressive lengthening
through exercise has been explained by Ryder, who shows that the mechanical action involving backward pressure is precisely the opposite of that which has occurred to the carnivora, where the pressure has always been forward owing to the development of the canine.

The direct evidence in favor of the kineto-genetic mode of evolution is greatly strengthened by the discovery of Ameghino in the Tertiary beds of the Argentina of one-toed ungulates with two splint bones, and with teeth strikingly like those of the horse, though the animal belongs to a quite different order. The similarity or divergence in shape of the parts is due to the action of similar mechanical conditions in two quite unrelated groups. The same results of strains involved in digging are seen in the fore legs of the fossorial edentates, in the mole, as well as in the mole cricket. Thus as Cope concludes, "in biologic evolution, as in ordinary mechanics, identical causes produce identical results."

It is to be observed, however, that "ordinary mechanics" does not state that "identical causes produce identical results." The truth appears to be that in the great paleontologist, Cope, we have another instance of a man's thought being much wider and richer than his system. M. Bergson has recently made a point against a mechanical mode of intellectual appropriation and just because he understood the law of causality in the sense mentioned by Cope. The principle, "identical cause, identical effect," which is sometimes said to be the principle of causality, is much narrower in its scope than the principle which really occurs in physics and chemistry,—in science in general. Indeed, the principle "identical cause, identical effect," strictly interpreted, has no scope at all in ordinary mechanics, since the same cause never recurs exactly. Both Cope and Bergson state the law of causation too narrowly. The law does not state merely that, if the same cause is repeated, the identical effect will be repeated. It states rather that there is a constant relation between causes of certain kinds and effects of certain kinds. What is constant in a truly causal law is not the object or objects given, nor yet the object in itself, but both of these which may vary within wide limits, but the relation between what is given and what is inferred. It is not asserted here that the great naturalist was unconscious of the significance of the principle. On the contrary we feel that it was plianly operative in his thought world. But in view of the great ad

KINETOPHONOGRAPHER, an electro-
photographic apparatus combining the prin-
ciples of the kinetograph, the vitascope, and the
phonograph, invented by Thomas A. Edison.
It is a combination of a motion picture machine
and a phonograph operating synchronously. See MOVING PICTURES.

KING, Albert Freeman Africanaus, American
1841; d. Washington, D. C., 13 Dec. 1914. He was graduated from Columbian (now George Washington) University in 1861, and from the University of Pennsylvania in 1863. He was professor of obstetrics in the medical school of George Washington University from 1871 to 1913 and dean 1879-94, and was also professor of obstetrics at the University of Vermont 1871-1913, and was president of the Washington Obstetrical and Gynecological Society 1885-87. He wrote a 'Manual of Obstetrics' (1882; 11th ed., 1910); 'Effect of Ultra-Violet Rays on Malarial Fever' (1902). He urged with enthusiasm the theory of the mosquito transmission of malaria, a claim which was finally accepted in 1883, was accepted in 1899 by the medical world as correct; and he was the first to advocate measures for personal and municipal use in the way of prevention.

KING, Anna Bichberg. See LANE, ANNA
EICHBERG KING.

KING, Basil. See KING, WILLIAM BASIL.

KING, Charles, American journalist, presi-
dent of Columbia College: b. New York, 6
March, 1798; d. Prascati, Italy, 27 Sept. 1867. He was the second son of Rufus King (q.v.), and during the residence of his father as American Minister at Saint James he was sent with his brother to Harrow school. Upon the breaking out of hostilities with Great Britain, King, though a Federalist, deemed it right that the war should be prosecuted to an honorable and successful result; and as a member of the legis-
lature of his native State in 1813, and as a volunteer in the autumn of 1814, he acted upon those sentiments. In 1823 he became associated with Johnston Verplanck in the publication of the New York American, a conservative newspaper, of much political influence and a high literary character, until 1827 when Verplanck retired and Mr. King continued sole editor. After its publication was discontinued Mr. King was associated in the conduct of the New York Courier and Enquirer 1845-49, when he was chosen president of Columbia College, which office he occupied until 1864.

KING, Charles, American soldier and nov-
elist: b. Albany, N. Y., 12 Oct. 1844. He was graduated from West Point in 1866 and was in active service in the United States army till his retirement because of wounds in 1879. In the war with Spain he was a brigadier-general of volunteers and served in the Philippines under Generals Otis, Anderson and Lawton. He has published a long series of popular novels treating of army and frontier life and people, among the best of which are 'The Colonel's Daughter' (1883); 'Between the Lines' (1886) and 'The True Ulysses S. Grant' (1915). For fifty years he has been the instructor of the Wis-
consin National Guard.

KING, Clarence, American geologist: b.
Newport, R. I., 6 Jan. 1842; d. Pheonix, Ariz.,
KING

24 Dec. 1901. He was graduated from the Sheffield Scientific School of Yale University in 1862, in 1863-66 was a member of the California geological survey under the direction of Prof. J. D. Whitney (q.v.), discovered Mount Whitney, the highest group in California, and with J. T. Gardiner executed the first survey of the Yosemite Valley. In 1866 he organized the plan for a survey of the western Cordilleran region at its widest point. This plan was officially sanctioned by the government and under the auspices of the army engineering department and King's direction, was executed as the "survey of the 40th parallel" and completed in 1872. The survey has been characterized as a "signal contribution to the material of science." The volume on "Systematic Geology" (1878), the first of six constituting the report, was written by King and has been highly esteemed. In 1872 certain swindlers stowed a tract in Arizona broadcast with rough gems; the discovery of valuable diamond fields was announced, and companies were organized for the exploration of the field. The "fields" proved to be within the official limits of the 40th parallel survey, and were thereupon examined by King, who detected and proclaimed the fraud. In 1878 King organized the various surveys then active into the United States Geological Survey under the general direction of the Secretary of the Interior, and was appointed director of the survey. He resigned in 1881, attained a large practice as a mining expert, and undertook an uncompleted series of experiments, to determine the action of the primal constituents of the earth under the conditions assumed as existing at the time of its separation from the sun. Partial results were published by him in Stillman's "Journal" (January 1893) in an article on "The Age of the Earth." He wrote also, "Mountaineering in the Sierra Nevada" (1871), a description of his explorations, and a work of literary as well as scientific value.

KING, Dan, American physician, writer, philanthropist and statesman: b. Mansfield, Connecticut, Oct. 18, 1817; died Feb. 11, 1882. He practised his profession in his native town and in Preston, Conn., and Charleston, R. I. He served in the legislature of the latter State (1828-34). Throughout his legislative career he was one of the strongest advocates of suffrage and as such became known in political and other circles throughout the United States. In this same connection his attention became directed to the pitiable condition of the Narragansett Indians. His efforts directed the attention of the State to them, and he was appointed one of a commission to inquire into the condition of the Indians and to report on them and the best manner of dealing with the difficulty. He succeeded in having an Indian school established and other measures of relief made for the Indians. This was practically the beginning of the measures that have since been taken to help the Indians toward American citizenship and a place in the great American community. Dr. King wrote considerable, generally on subjects that interested him deeply; but of all his works none is more important than that entitled "Life and Times of Thomas Wilson Dorr" (1859) the leader of the suffrage movement which King so strenuously supported. He did not agree in every particular with Dorr, and he disapproved of the manner in which the latter acted after the signal defeat of the party.

KING, Edward, Anglo-Irish poet: b. Ireland, 1612; d. in shipwreck off Welsh coast, 1637. Educated at Cambridge University, he became Fellow there in 1631. He was a great lover of scholarly attainments and good poetic taste which was shown in his Latin poems. He met Milton at Cambridge and the two became very close friends. Milton had a strong influence over King and, had the latter lived, he would have produced some literary work of more general interest than that which he left at his premature death. As it is, he is chiefly noted as being the inspiration of 13 poems by Milton published under the title of "Obsequies to the Memory of Mr. Edward King" (1638), among these being "Lycidas."

KING, Edward Viscount Kingborough, Irish writer and archaeologist: b. 1795; d. 1837. He was the eldest son of the third earl of Kingston and was educated at Oxford. Leaving college he became a member of Parliament (1818-26); but after eight years of public life he resigned his seat in favor of his brother, who took a great deal more interest in politics than did the elder member of the family who had already become a confirmed antiquarian, deeply attracted toward the ancient civilizations of Mexico. In fact Kingsborough, as he is usually called, is one of the most interesting of all the collectors of the remains of the ancient Mexican civilizations. After several years spent in the work of examining and collecting the Aztecs and other manuscripts of the pre-Columbian Mexican civilization, he began, in 1830, the publication of his monumental work on "The Antiquities of Mexico," which was gradually issued in London in nine superb volumes, profusely illustrated. No author probably in all history has accomplished so much in a direction he was not consciously working as Kingsborough. He set out with the intention of proving that the people of Mexico were of Jewish origin and the descendants of the lost 10 tribes of Israel. In this he based his reasoning, his undoubted erudition and his enthusiasm combined with his diligence were directed. From all the libraries of the Old and the New World he collected manuscripts and codices and other remains of pre-Columbian life supplemented with other documents following the conquest of Mexico. All the documentary material in the form of codices and several most valuable documents of post-conquest days, he included in his publications, the codices being reproduced in color at an enormous expense. In fact so great was the cost of collection, examination and publication of this material that it exhausted Kingsborough's fortune, and he was arrested by his printer and cast into a debtor's prison in Dublin where he died of typhus contracted in one of the most insanitary prisons of the British domains. Among the valuable texts published in Kingsborough's work is the "History of New Spain" by Sahagun, which is the most fruitful and interesting of the existing documentary evidence of the pre-Columbian civilization of Mexico and Central America, with perhaps the one exception of the existing codices relating to pre-Columbian Mexico.
was looked upon as a marvel of the printer's and engraver's art in his day; and the present generation is little inclined to dispute this esti-
mate, when the circumstances under which it was executed are taken into account. How
canny and on what a grand scale the work was done may be gathered from the fact that,
though the edition with colored plates sold for £175 and the uncolored for £210, yet the author
came far from meeting the expenses incurred in the preparation. The Mexican Antiquities
is a storehouse of material and documents relating to native Mexican civilization, and is
for this reason invaluable to the student of this period in the history of America and of the
civilization of the western hemisphere. But there is little order in the arrangement of the
contents of the work which contain the comparatively few interpretations of the manu-
scripts existing in Kingsborough's time. The author has added copious notes of his own, which
lose a great part of their authority and effectiveness owing to the fact that he bent
every argument and investigation to prove his
theory of the Jewish origin of the Mexican
people. Thus his erudition and his industry run
too often to waste. His work itself is generally
in a disorder bordering on chaos and his notes
and explanations are frequently tiresome, for
this reason and the fact that he intrudes every-
where, in the most serious discussion, his pet
theory. Yet so great is the amount of valuable
material of a past age that he has brought within
reach of the student and the antiquarian, that
the world of science readily acknowledges its
debt to him; for in presenting the civilization
of pre-conquest Mexico he has furnished docu-
mentary evidence and material for the investi-
gator into all the civilizations of America in the
ages preceding the middle of the 16th century.
Consult Bancroft, 'Native Races'; Kings-
borough, 'Mexican Antiquities'; Prescott,
'Conquest of Mexico.'

Oxford University (1851), he was educated and was ordained priest four years later.
He joined the Tractarian movement and, after holding several churches, became canon of Christ
Church, Oxford, and professor of pastoral theology in the university there (1873). He was
extremely high Church and was charged with
practices of a ritualistic nature *not in accord with
the Laws of the Church* and tried before
the bishop of Canterbury. In the con-
test he had rather the better of his oppo-
te. That he did not suffer in the estima-
tion of the public is seen in the fact that
he was very popular and had a great influence over
young men. He became bishop of Lincoln in
1885. Among his published works are 'Medita-
tions on the last Seven Words' (1874); 'The
Love and Wisdom of God' (sermons, 1910);
'Counsell to Nurses' (1911); 'Duty and Con-
sience' (1911); 'Sermons and Addresses'
(1911).

KING, Grace Elizabeth, American writer:
b. New Orleans, 1852. She was educated in
New Orleans, contributed much to periodicals,
and wrote for 'The Missouri' in 1866-88 Creole sketches which won considerable
reputation and constituted the story
'Monsieur Motte' (1888). Among her further
works are 'Tales of Time and Place' (1888);
'Earthlings' (1889); 'Chevalier Alain de Triton'
(1889); 'Jean Baptiste Lemoine, Founder
of New Orleans' (1892); 'Balcony Stories'
(1893); 'New Orleans: The Place and the Peo-
ples' (1896); 'Dr. Soto and his Men in the
Island of Florida' (1898); 'History of Louisiiana'
(1893), and 'Stories from Louisiana History'
(1905).

KING, Helen Dean, American biologist:
b. Oswego, N.Y., 1869. Graduated from Vass-
sar and Bryn Mawr colleges, she taught biology
at the latter school (1897-1907), during a part
of which time she was fellow in research
work at the University of Pennsylvania and she
became assistant, in this latter institution, in
anatomy (1908-9). She has also been con-
ected with other colleges and has devoted
much of her time and efforts to the determi-
nation of sex and the problems connected therewith, a subject on which she has written and
lectured extensively.

KING, Henry Churchill, American theo-
logian and educator: b. Hillsdale, Mich., 18
Sept. 1888. He was graduated from Yale
College in 1879, from the Oberlin Theological Seminary
in 1882, studied also at Harvard and Berlin,
was associate professor of mathematics at Ober-
lin in 1884-90, associate professor of philosophy in 1890-91, and professor of philosophy in 189197. In 1897 he was appointed professor of
theology, and in 1902 president. In 1893 he
was a member of the National Educational
Association's committee of ten. He lectured at
Yale (1907), Harvard (1909), and Columbia
(1913) universities and in Japan in 1909-10. His works are 'Outline of Erdmann's History of Philosophy' (1892);
'Outline of the Microcosmus of Hermann
Lotze' (1895); 'The Appeal of the Child' (1900);
Reconstruction of Theology' (1901); 'Theology and the Social Consciousness' (1902);
'Personal and Ideal Elements in Education' (1904); 'Rational Living' (1905);
'Letters on the Greatness and Simplicity of
Christian Faith' (1906); 'The Seeming Unreality of the Spiritual Life' (1908);
The Laws of Friendship, Human and Divine'
(1909); 'The Ethics of Jesus' (1909);
The Moral and Religious Challenge of Our Times'
(1911), and 'Religion as Life' (1913).

KING, Henry Melville, American Baptist
clergyman: b. 3 Sept. 1838. He was educated at
Bowdoin College and Newton Theological Insti-
tution. He was ordained to the Baptist ministry
28 Aug. 1862. He was instructor in Hebrew in
Newton Theological Institution, 1862-63, and
then served in turn Dudley Street Church, Bos-
ton, 1863-82; Emmanuel Church, Albany, N. Y.,
1882-91, and First Church, Providence, R. I.,
1891-1906. Since then he has been pastor emeritus. He has been an officer and trustee of
several church societies and institutions. He
was president of the Northern Baptist Educa-
tion Society, 1875-82, and of the Rhode Island
Baptist State Convention, 1891-95. He is an
authority on the history of his denomination.
His works include 'Early Baptists Defended'
(1880); 'Mary's Alabaster Box' (1883); 'Our
Gospel's' 'Princeton Review' (1891); 'The Rhode Islanders to Massachusetts Bay' (1896);
'The Mother Church' (1896); 'The Baptism of
Roger Williams' (1897); 'The Messiah in
the Psalms' (1899); 'Why we Believe the Bible' (1902); 'Religious Liberty' (1903); 'John Myles and the founding of the first Baptist Church in Massachusetts' (1905); 'Historical Catalogue of the First Baptist Church in Providence' (1908); 'Sir Henry Vane' (1909); 'Prayer and its Relation to Life' (1912); 'Thinking God's Thoughts after Him' (1914).

KING, Horatio, American statesman: b. Paris, Me., 21 June 1811; d. Washington, D. C., 20 May 1897. He learned the printer's trade and published The Jeffersonian in his native town, and subsequently in Portland, 1831–38. The next year he was appointed clerk in the Post Office Department in Washington; became First Assistant Postmaster-General in 1834; was Postmaster-General January–March 1861; and was the first man in public office to deny the power of a State to withdraw from the Union. He published 'An Oration before the Union Literary Society of Washington' (1841); 'Some Roads to Travel; or Twelve Months in Europe' (1878).

KING, James Marcus, an American clergyman: b. Girard, Pa., 18 March 1839; d. Philadelphia, Pa., 3 Oct. 1907. After graduating from Wesleyan University, 1852, he taught six years in the Fort Edward Collegiate Institute, of which his brother, Rev. Joseph E. King, was principal for 59 years. He entered the ministry of the Methodist Episcopal Church in 1866. After serving various important churches in the Troy and New York conferences, he became in 1881 the corresponding secretary of the Board of Church Extension, and the following year became secretary, following Dr. W. A. Spencer. The work of the society was enlarged in 1897 and became the Board of Home Missions and Church Extension of the Methodist Episcopal Church. Dr. King was the first corresponding secretary and served until his death. He was a member of the Ecumenical Conferences of 1881, 1891 and 1901. He was honorary corresponding secretary and chairman of the National Society for the Promotion of the League for the Protection of American Institutions as its secretary from 1889 until his death. He was the author of several pamphlets and "Facing the Twentieth Century — Our Country: Its Power and Peril" (1899).

KING, John, American eclectic physician an author: b. near New York city, 1 Jan. 1813; d. North Bend, Ohio, 19 June 1893. Received a liberal education and was graduated in medicine at the Reformed Medical College of the city of New York, in 1838, under the celebrated Dr. Wooster Beach. In 1848, he was the first secretary of the National Eclectic Medical Association, and, in 1878, president of that body as reorganized in 1870. From 1849 to 1851 he was professor of materia medica, therapeutics and medical jurisprudence in the Memphis Medical Institution, and from 1855 to 1859 and 1859 to 1890, professor of obstetrics and diseases of women and children in the Eclectic Medical Institute of Cincinnati, Ohio. From 1856 to 1859 he taught obstetrics in the Cincinnati College of Eclectic Medicine and Surgery. Dr. King was the discoverer of the substances (podophyllin) and macrotys, and the oleo-resins of capsicum and iris. He wrote 'Urologic Dictionary,' 'American Dispensatory' (1853); 'American Obstetrics' (1855); 'Women: Their Diseases and Treatment' (1858); 'The Microscopist's Companion' (1859); 'The American Family Physician' (1860); 'Chronic Diseases' (1866), and the 'Commercial Register' (1866), the last named in behalf of the laboring classes and dedicated to the Knights of Labor. He is regarded as the father of American Materia Medica.

KING, John Alsop, American politician: b. New York city, 1788; d. 1867. He was the son of Rufus King (see); was educated at Harrow, England, then returned to New York to study law, and was admitted to the bar. In 1812 he served as lieutenant of cavalry, was elected to the State assembly in 1819, and several times re-elected till 1823, when he was elected to the senate. Though an opponent of Clinton, he strongly favored the building of the Erie Canal. In 1825 he went with his father to England as secretary of the legation, and on his father's return to the United States on account of ill health, he remained as charge d'affaires. In 1838 he was again a member of the New York legislature for several terms; and in 1849 he was elected to Congress as a Whig and there opposed all compromise measures, especially the Fugitive Slave Law. He was one of those active in the formation of the Republican party; presided at the Syracuse convention of 1855; and was a delegate to the Philadelphia convention of 1856. In 1857 he became governor of New York State and in that office gave special attention to local matters and internal improvements; he declined a renomination in 1860. He was one of the presidential electors in 1860, voting for Lincoln, and in 1861 was a member of the Peace Convention.

KING, Jonas, American missionary and writer: b. Hawley, Mass., 29 July 1792; d. Athens, 22 May 1869. After graduation at Williams College and Andover Seminary, he turned to home missionary work; but, after a while he determined to prepare himself for the foreign mission field. To this end he went to Paris to study Arabic under Dr. De Sacy, one of the great Arabic scholars of his day. On his return he entered Amherst College as professor of Oriental Languages (1822–28). Resigning his position at Amherst he went as a missionary to Greece, where he was soon in the trouble with the Greek Church which ordered his arrest on the charge of profaning things sacred. He seems to have been very aggressive and to have had very little tact in the prosecution of his work, which promised well in the beginning but which virtually went to pieces toward the end. He was a man of scholarly attainments and wrote in both English and Greek. His miscellaneous works in the latter language were published in Athens. His best-known work in English, 'The Oriental Church and the Latin' was published in 1859. An account of his life and work was published in New York in 1879, the writer signing himself F. E. H. H.

KING, Leonard William, English writer on Semitic subjects and educationalist: b. London, 1869. Educated at Rugby and Cambridge, he became greatly influential in the teaching of the civilizations of western Asia; and in 1903-04 he was commissioned by the British Museum to carry on for its excavations at Nineveh;
which he did successfully, collecting many very interesting and valuable rock inscriptions dating back to a comparatively early period of Assyrian civilization and culture. Through this and other work of a like nature he was chosen lecturer in King's College, London, and assistant keeper of Egyptian and Assyrian antiquities in the British Museum. In connection with this position he prepared a guide of the treasures under his care (1874-1900). Among his published works are 'Babylonian Magic and Sorcery' (1896); 'Cuneiform Texts in the British Museum' (1896-1914); 'Assyrian Chrestomathy' (1898); 'Letters and Inscriptions of Hammurabi' (1898-1900); 'Babylonian Religion and Mythology' (1899); 'Assyrian Language' (1901); 'Annals of the Kings of Assyria' (1902); 'Inscriptions of Darius on the rock of Behistun' (1907, with R. C. Thompson); 'Egypt and Western Asia in the Light of Recent Discoveries' (1st ed. with H. R. Hall); 'A History of Sumer and Akkad' (1910); 'Boundary Stones and Memorial Tablets in the British Museum' (1912).

**KING, Lida Shaw**, American educator: b. Boston, 1868. Graduated from Vassar College, and did post-graduate work at Brown, Vassar, Radcliffe, Bryn Mawr and the American School of Archaeology, Athens, Greece (1894-1901). In the meantime she was professor of classics at Vassar (1894-97) and the Cackes' Collegiate Institute (1898-1902). In 1903 she became assistant professor of classical philology at Brown University, and dean of the Woman's College, and in 1910 professor of classical literature and archaeology.

**KING, Philip Parker**, English writer and naval officer: b. Norfolk Island, in the Pacific Ocean, 1793; d. 1856. Entering the naval service at the age of 14, he had been raised to the rank of lieutenant by the time he had attained his majority, and by the time he was 24 he was given complete charge of an important survey in Australian waters which covered five years and greatly improved the Torres Strait and Sydney routes. Later on he spent four years in making surveys and charts of the southern coast of South America (1826-30). This expedition consisted of two vessels of which King was in charge of one, the Adventure, and Capt. Robert Fitzroy of the other, the Beagle. Some time afterward King went to Australia where he identified himself with the interests and progress of the country. He settled in Sydney, capital of New South Wales, where he became, among other things, a legislative councillor and manager of the Australian Agricultural Company. Later on he was raised to the rank of rear-admiral and placed on the retired list, an honor which was probably intended to be shown as much to Australia as to himself, for he was the first Australian to attain the rank. Among his published works are 'Narrative of the Survey of the Intertropical and Western Coasts of Australia' (2 vols., 1827); 'Sailing Directions to the Coasts of Patagonia' (1830); 'Voyages of the Adventure and the Beagle' (3 vols., of which King wrote the second only. Robert Fitzroy, the writing one and Charles Darwin the other, 1839). He also made many very important charts which were long in use and upon which some of the charts of to-day are based. These charts were issued by the Admiralty Hydrographic Department in 1825, and at subsequent dates. Some of his later charts saw publicity through other sources.

**KING, Preston**, American statesman: b. Ogdensburg, N. Y., 1806; d. New York, 12 Nov. 1865. Graduating in law he practised his profession for some time in Saint Lawrence County, but constantly with an eye on politics and a hand in it. In 1830, prompted by his political inclinations, he founded the Saint Lawrence Republican as the organ of the Jackson party in northern New York. This paper he edited vigorously in the interest of party politics, and he received his reward at the hands of Jackson in the shape of the postmastership of Ogdensburg (1833). The following year he was elected a member of the New York legislature, and in 1842 a member of the United States Congress (1843-54). Throughout all this time he had been a member of the Democratic party though he held different views than those of the majority of his party on the slavery question. Finally he separated from the Democrats and joined the Republicans in 1854. He continued doing strenuous political work for the party of his adoption, and again he had his reward by being elected to the United States Senate (1857-63). As a delegate to the Republican Convention at Baltimore in 1864 he was largely instrumental in securing for Andrew Johnson the nomination for the Vice-Presidency of the United States. Later on King became a senator of the port of New York. While holding this latter office he became deranged and finally committed suicide by jumping from a ferryboat on the Hudson River.

**KING, Rufus**, American statesman: b. Scarborough, Me., 24 March 1755; d. Jamaica, L. I., 29 April 1827. He was graduated from Harvard in 1777 and admitted to the bar in 1778. In 1782 he entered the Massachusetts legislature, and Congress in 1784. He took an active part in the convention which framed the Federal Constitution, and removing to New York in 1788 became a senator from that State the next year, serving 1789-93. In 1797 he was appointed United States Minister to Great Britain (1796-1803), and after some years spent in partial retirement was sent for the third time to the Senate in 1813, and won renown as an orator by the brilliant speech he made on the burning of Washington by the British. In 1819 he was again elected to the Senate, serving till 1825, when he was appointed the second time Minister to the court of Saint James. He was the Federalist candidate for the Vice-Presidency in 1804 and 1808. In collaboration with Hamilton he wrote the 'Camillus Letters.'

**KING, Rufus**, American journalist and soldier: b. New York, 26 Jan. 1814; d. there, 13 Oct. 1876. He was graduated from West Point in 1833, entered the engineer corps, resigned from the army in 1836, became assistant engineer of the New York and Erie Railway, and was adjutant-general of N. York State 1839-43. He was associate editor of the Albany Evening Journal, and in 1841-45 editor of the Albany Advertiser. Having then removed to Wisconsin, he was editor of the Milwaukee Sentinel and Gazette in 1845-61, and
in 1847–48 a member of the State Constitutional Convention. In May 1861 he was commissioned brigadier-general of Wisconsin volunteers and was commanding the Third Army corps in the Department of the Rappahannock in March-August 1862, was a member of the court-martial for the trial of Maj.-Gen. Fitz-John Porter (1862–63), resigned 20 Oct. 1863, and was Minister in Rome in 1863–67. In 1867–69 he was deputy customs collector of New York port.

**KING, Samuel Archer**, American aeronaut and scientist: b. Philadelphia, 1828; d. 1914. At the age of 21 he began making balloons in which he took a great interest. This led him to make ascensions himself two years later at Philadelphia. His interest in the matter created interest in others, so that balloon ascensions became features of expositions, traveling shows and other affairs in which many people were collected together. King himself sometimes made ascensions at such places, notably at the World's Columbian Exposition (Chicago 1893). Between this date and his ascensions at the Centennial Exposition in 1876 much had been done by himself and others of his followers to increase the general interest in the science of ballooning. King led the way in the scientific study of the means of air navigation and in the photographing of objects, especially towns and cities, from the air.

**KING, Thomas Starr**, American Unitarian clergyman and lecturer, generally known as Starr King: b. New York, 17 Dec. 1824; d. San Francisco, 4 March 1864. He was a clerk in a dry goods store at Charlestown, Mass., in 1836–40, a teacher at Boston and Medford in 1840–42, studied theology with Hossen Ballou at Medford, preached for a time in a Universalist congregation of Boston, and in 1846–48 was pastor of the Universalist Church at Charleston. In 1848–60 he was pastor of the Hollis Street Unitarian Church of Boston, and during this period gained great popularity as a lyceum lecturer in the Northern States. Best known was his Substante and Show, but other familiar subjects were 'Goethe,' 'Sight and Insight,' 'The Laws of Disorder,' 'Socrates.' He became pastor of the First Unitarian Society of San Francisco in 1860; was among the first, by newspaper article and lecture, to call attention to the Yosemite Valley, and when, in the Presidential campaign of 1860, the idea of the establishment of California as an independent Pacific republic was discussed, denounced the project from the lecture platform and preserved the State to the Union. During the Civil War he was active in obtaining in California large and necessary funds for the Sanitary Commission. His name was at one time associated with the White Mountains, which he thoroughly explored, and which became known chiefly through his writings, particularly 'The White Hills: Their Legends, Landscape and Poetry' (1859; new ed., 1887). One of the peaks of the White Mountains has been called Starr King's. A memorial to him was set up in Golden Gate Park, San Francisco, Cal., in 1889. King was one of the leading figures of the American Lyceum in the most flourishing days of that institution. 'Patriotism and other Papers' appeared posthumously (1865), as did the sermon 'Christianity and Humanity' (1877), with a memoir by E. P. Whipple, and the collection of lectures, 'Substance and Show' (Boston 1874). He was also a friend of Frothingham, 'A Tribute to Thomas Starr King' (1865), and Whipple, E. P., 'American Literature and Other Papers' (Boston 1887).

**KING, William**, English author: b. London, 1663; d. 1712. Graduating from Oxford in 1665 he spent five years in preparing for literary life. He soon proved himself a caustic critic who unerringly found the weak spots in human nature. Yet there was enough of humor in his work to lighten his caustic vein and to make it popular. His first dramatic effort, which was directed in favor of the Tory High Church Party, was entitled 'Dialogue Showing the Way to Modern Preferment.' He was, from this time on, in favor with the court and the recipient of successive political preferments, among them the judge of the Admiralty Court in Ireland, vicar-general of Armagh and keeper of the records of Dublin Castle. These offices all left him plenty of time for his literary labors which he did not employ to the best of advantage. Nor did he wisely use the time he did obtain in the all-important science of navigation. Thus his undoubtedly great talents were often misdirected or not directed at all. His indolence went even to the neglect of the preservation and publication of his manuscripts, some of which were lost and others of which were not published during his lifetime of the author. Among his published works are 'Journey to London in the Year 1698,' 'Animadversions,' 'Dialogues of the Dead,' 'The Art of Cookery,' 'The Art of Love,' 'Useful Transactions in Philosophy and Other Sorts of Learning,' 'Historical Account of the Heathen Gods and Heroes,' all sparkling with humor and originality. It was not until more than half a century after his death that his works were published as a whole, that is, such as were still preserved. This edition was due to John Nichols, who issued it in three volumes in 1776.

**KING, William**, American politician, first governor of the State of Maine: b. Scarborough, Me, 1768; d. Bath, Me, 17 June 1852. He was, during the greater part of his life, the leader of the two years of which were passed in Bath, an active and successful merchant, but is better known by his public services in his native State. At an early period of his career he became a member of the Massachusetts legislature, and in that capacity was distinguished by his efforts in behalf of religious freedom, and of securing to original settlers upon wild lands the benefit of their improvements. He was an early and ardent advocate of the separation of Maine from Massachusetts, and upon the adoption of that act presided over the convention which met in 1819 to frame the constitution of the new State. He was subsequently elected the first governor of Maine, and, after holding office a little more than a year, became one of the United States commissioners for the adjustment of Spanish claims. He also held other offices of importance under the general and State governments, including that of collector of the port of Bath.

**KING, William Frederick**, Canadian astronomer and surveyor: b. Stowmarket, Suffolk,
England, 1854. He was brought, as a small child, by his parents to Canada, and received his education in Toronto. In 1874, on graduation, he entered the employ of the Dominion government as land surveyor in the great Northwest, becoming finally chief inspector of surveys in 1886. Four years later he became chief astronomer of the Department of the Interior, and in 1905 director of the Dominion Astronomical Observatory at Ottawa, and in 1909 superintendent of the Geodetic Survey of Canada. For this and other work for the encouragement of science he was knighted in 1908. Among his numerous writings is 'Astronomy in Canada.'

KING, William Lyon MacKenzie, Canadian statesman and economist: b. Berlin, Ontario, Canada, 1874. He was named after his grandfather, William Lyon MacKenzie. Educated at Toronto and Harvard universities, he entered journalism as a member of the editorial staff of the Toronto Globe (1895-96). In 1896 he went to Europe as a commissioner of the Dominion to report on the execution of contracts let by the government, a position he held for three years when he became instructor in political economy in Harvard University and Deputy Minister of Labor in the Canadian Parliament (1900-08). Elected Liberal member of the Dominion Parliament in 1909, he became Minister of Labor in the Laurier Cabinet (1911). He was the author of the Canadian Industrial Disputes Investigation Act, and he served on important industrial and other commissions, and was government conciliator in strikes, all of which offices he performed with distinction. He was a Royal Commissioner appointed to settle the losses of the victims of the Japanese riots in Vancouver, British Columbia (1908); delegate to the International Opium Commission, Shanghai, China (1909); delegate to the International Social and Industrial Congress, The Hague (1910), and delegate to the International Peace Conference, Lake Mohonk, N. Y. (1911), and three years later he was commissioned by the Rockefeller Foundation to investigate the relations between labor and capital. The British government conferred upon him, in 1906, the decoration C.M.G. for services done in behalf of society and the betterment of the relations between labor and capital.

KING, William Rufus, American statesman, 13th Vice-President of the United States: b. Sampson County, N. C., 6 April 1786; d. in Dallas County, Ala., 17 April 1853. He entered the University of North Carolina at 12 and was graduated in 1803. He then commenced the study of law and was admitted to the bar in 1806. In 1806 he was elected to the legislature from his native county, and again in 1809. In 1810 he was elected to Congress and was twice re-elected. In Congress he united himself with Clay, Calhoun and others who advocated the war policy of Mr. Madison's administration, and voted for the declaration of war in 1812. In the spring of 1816 he resigned his seat to become secretary of legation to Naples under William Pinckney. The latter was afterward transferred to Saint Petersburg, and was accompanied to that court also by King as secretary. Having removed to Alabama, he was elected in 1819 one of the United States senators from the new State, and was successively re-elected in 1823, 1828, 1834 and 1840. In April 1844 he was appointed Minister to France. The proposition for the annexation of Texas was then pending. England was known to be decidedly opposed to the scheme and there was a general belief that her government was urging France to join in a protest against it. King was an active advocate of the annexation, and upon reaching Paris directed his efforts to prevent this joint protest, in which he was successful. He returned to the United States in November 1846. In 1848 Senator Arthur P. Bagby was sent as Minister to Russia, and King was appointed to fill the vacancy thus created. In 1849 the term for which he was appointed having expired, he was elected for a full term of six years. In 1850, at the accession of Vice-President Fillmore to the Presidency, King was unanimously elected president of the Senate. In 1852 he was elected Vice-President of the United States, at the time Franklin Pierce was elected President.

KING, a person vested with supreme power in a foreign state, territory or nation. According to feudal usages the king was the source from which all crown and authority flowed, and he delegated to his followers the power by which they exercise subordinate rule or authority. There is now no very clearly marked distinction between a king and an emperor. A queen-regent, or a princess who has inherited the throne of countries where female succession to the throne is recognized, possesses all the political rights of a king.

KING-AT-ARMS, an officer of great antiquity, whose business it is to direct the heralds, preside at their chapters and have the jurisdiction of armory. There are three kings-at-arms in England, Carter, Herring and Norroy. The first is called the principal king-at-arms, the other two provincial kings-at-arms.

KING CHARLES SPANIOL. See Dog; SPANIEL.

KING CONCH, the great wing-shells of the genus Strombus, especially S. gunas of the West Indies and S. papuana of New Guinea and large helmet-shells (Cassis) of the same region are often called "queen conch." 9

KING COTTON, a popular name given the cotton plant in the United States. "Cotton is king" was a frequent declaration before the Civil War, when the supremacy of cotton in commerce and politics was strongly asserted by public men, especially in the South.

KING-CRAB. See HORSEFOOT CRAB.

KING-CROW. See DRONGO.

KING-DORY, a bird-dealers' name for the Australian penguins of the genus Aptenodytes.

KING DUCK, the spectacled eider. See EIDER DUCK.

KING GEORGE V LAND, a name given recently to a part of the Antarctic Continent discovered by Sir Douglas Mawson in 1911 and explored by him in that and the following two years. It covers a very considerable extent of country, stretching as it does from
KING GEORGE'S SOUND — KING HENRY THE FIFTH

long. 144° E. to 153° E.; and the whole region is covered by a great cap of ice.

KING GEORGE'S SOUND, an inlet in western Australia, five miles broad; it is an excellent roadstead and contains two land-locked recesses, the Princess Royal and Oyster harbors. Albany, on Princess Royal Harbor, is a port of call for mail steamers.

KING GEORGE'S WAR, a war of Great Britain and its American colonies, against France and its Indian allies (1743-48), so named from King George II. See COLONIAL WARS IN AMERICA.

KING HAAKON VII LAND, the name given by its explorer, Hansen, who spent the years 1903 and 1904 there. This territory, which forms the northeastern coast of Victoria Land, lies opposite Melville Sound.

KING HENRY THE FOURTH. This play in its first and second parts may be considered as one play, though as in all sequels, the second is lacking in the freshness and perfection of the first. The two plays were written at the time when Shakespeare was completing his series of historical dramas and comedies. By combining these two types in one play, he achieves one of his greatest triumphs. At first sight the two types of drama might be thought incompatible, but by the connection of Prince Hal with Falstaff and his companions on the one hand and with the great historical characters and incidents on the other, the success is complete.

In the two plays Shakespeare's ability to reproduce for his age the outstanding figures of English history reaches its climax. They are not only a link in the chain of his other historical plays, but they throw a light over them. We have here all the pomp and circumstance of war—chivalry reaching its climax in the figures of Hotspur and Prince Hal. We have revolutions, wars, conspiracies and rebellions; in fact every incident is connected with some great and memorable movement. If Henry the Fourth is cold and restrained and his court conventional, he yet represents the unity of England, against which the fiery Hotspur and his comrades fight in vain. But the real hero of the plays—and one of the heroes of English poetry even since they were written—is Prince Hal, who passes from the gay and giddy youth of idle pleasure into wise counsel, magnanimous sentiment and heroic action. In these plays, as in 'Henry the Fifth,' he is Shakespeare's ideal man of action, with a hold upon the life of the nation and a personal magnetism that have endeared him to English hearts. Popular as were the historical portions of these plays, from the very beginning Falstaff was perhaps the chief point of interest. In the little pages to both plays the humorous conceits of John Falstaff were fostered. The traditional story of Prince Hal in relation to the boisterous companions of his youth and the complete change in his life when he came into manhood was a challenge to Shakespeare. It is clear that the genius of Falstaff, his inexhaustible humor and imagination, is a sufficient reason for the fascination that he had for Prince Hal. The companions of Falstaff—real figures conveying the manners of their class, not only in the Middle Ages but in the Elizabethan Age—are necessary instruments in the plot, but they furnish no adequate explanation of the Prince's wild escapades. Falstaff is as supreme a comic character as Hamlet and Lear is in his resourcefulness. He openly assumes the character of braggart, coward and glutton that he may enjoy the play of his imagination; he is an actor in himself. His physical properties are in perfect harmony with his intellect; this resourcefulness is inexhaustible. Whether disputing with the hostess about his bills or his promises of marriage, or explaining his running away from the robbers, or justifying his words against the Prince, or answering the condemnation of the Chief Justice, or characterizing his ragged regiment of soldiers, he has a range of ideas, a happiness of fancy and a genius of expression that are beyond all praise. He is a comic Hamlet, stronger in practical resource and hardly less rich in thought and wit than any of his melancholy. He is the exuberance of good humor and good nature; he nourishes his mind with jest as he does his body with sack and sugar. He is not only witty, but the cause of witlessness that is in others. His sayings have become proverbial, and the terms of derision with which any of his melancholy are almost beyond the power of any actor to reproduce.

The difficult problem in the relation of Prince Hal and Falstaff is the almost cruel speech that the former makes when he becomes king and banishes his old comrade. This is clearly anticipated, however, in the opening act of the first part when the Prince compares himself to the sun, and his companions to the 'base, contagious clouds that smother up his beauty from the world.' Without the words in which his father and Hotspur are so prolific, the Prince has inherent in him a substantial seriousness that must eventually cause him to escape from the irresponsibility of his youth. He is a judge of Falstaff's humor, even as the dramatist was himself, and he could not be a square, and Falstaff land in the coruscate away the realities of life; he believes that the facts and laws of the world may be bated or set at defiance, if only the resources of inexhaustible wit be called upon to supply by brilliant ingenuity the deficiencies may be found in character and conduct. Therefore Shakespeare condemned Falstaff inexorably, and so did Prince Hal when he faced the responsibilities of leading a great nation.

EDWIN MIMS.

KING HENRY THE FIFTH. 'King Henry V' is the last of the group of history plays to which were devoted so large a part of Shakespeare's energies during the first decade of his career. It brings to culmination the exposition of national issues which eight earlier adaptations of chronicle history had assimilated with steadily increasing power. After 'Henry V,' Shakespeare entered this field only once again—when 'Henry VIII' was produced a dozen years later; but the nature of Shakespeare's concern in this last play is problematical and it should be clear that the earlier group of histories. 'Henry V' is the final fanfare of Elizabethan patriotic exultation and marks the close of the dramatic epoch inaugurated in the time of the Armada by 'Tamburlaine' and 'The Spanish Tragedy.'
From this play Shakespeare himself passed to the treatment of more philosophic questions in the subsequent dramas of "Julius Caesar" and "Hamlet," and save for a few weak echoes the note of nationalism on the English stage died away.

"Henry V" was printed in 1600, and was clearly popular. A second quarto edition, of which only two copies seem now extant, appeared in 1602, and a third (falsely dated 1608) in 1619. Modern texts, however, are not based upon any of these, but upon the much more complete and accurate version of the folio of 1623. Composition of the play apparently preceded the first quarto by a very short interval, for the allusion by the Chorus at the opening of Act V to "the general of our gracious empress . . . from Ireland coming, Bringing rebellion broached on his sword" must from the context have been written during the reign of the Earl of Essex in Ireland (15 April-28 Sept. 1599). The fact that this passage and all the other speeches of the Chorus are wanting in the quarto versions is probably of no significance except to show the imperfection of those versions.

It is likely that "Henry V" was one of the very first plays acted at the Globe Theatre (constructed in the spring of 1599) and that the first speech of the play alludes specifically to the new playhouse:

"Can this cockpit hold
The vasty fields of France? Or may we cram
Within this wooden O the very casques
That did applaud the air at Agincourt?"

While not one of the most permanent favorites, the play has been frequently revived. The most memorable performance in America was that of Richard Mansfield in 1900. By the reading public "Henry V" has been generally beloved as one of the heartiest and sincerest of the poet's works. Recently, however, the king's character, as Shakespeare depicts it in this play, and in the two parts of the Henry, has been subjected to unsympathetic scrutiny by three very distinguished critics: W. B. Yeats ("Ideas of Good and Evil," 1903); Prof. A. C. Bradley ("The Rejection of Falstaff," 1907); and John Masefield ("William Shakespeare: Homer to University Library, 1911"). They all protest against the strain of calous selfishness in Henry, finding distinct discomfort in the idea that Shakespeare could have intended him as a hero. The limitations in the king, when compared with such characters as Hamlet and Brutus, are undeniable, and perhaps they explain in part why Shakespeare abandoned the patriotic history play for works of greater moral depth. Yet it certainly appears that in "Henry V" the dramatist accepted in good faith the encomiums of Holinshed and permitted his satisfaction in the performances of the conquering hero to blind him to the lack of qualities with which he regularly endowed his great ideal figures. As in the case of most of Shakespeare's "errors," the matter is a question for academic speculation only; the ordinary reader or spectator is too much fired by the lambent brilliance of the piece to admit any qualification of his hero-worship. The subject has been judicially treated by Prof. J. W. Cunliffe ("The Character of Henry V as Prince and King" in the Columbia University "Shakesperian Studies," 1916).

TUCKER BROOKE.

"King Henry the Sixth.

The three parts of "King Henry VI" offer some of the most complex problems in Elizabethan drama; and it is indeed rather as problems than as literature that they now attract most readers. Nearly all the dramatists conspicuous during the period from 1590 to 1600, Shakespeare, Marlowe, Greene, Peele, Nashe, Lodge—have been conjecturally associated with their authorship, but the many resultant difficulties, like others connected with their respective dates of composition and precise relationship to one another, are in large part still unsettled.

The first part of "King Henry VI" is extant only in a single form, that found in the Shakespeare Folio of 1623, but the second and third parts each appeared during the preceding 30 years in at least three different versions. Under the title of "The First Part of the Contention betwixt the two famous Houses of York and Lancaster," Thomas Millington published, in 1594, the earliest known text of "Henry VI," a text containing only about half as many lines as that of the Folio. In the following year (1595), the same publisher brought out "The True Tragedy of Richard Duke of York," which bears an analogous relation to "3 Henry VI." Both these early plays were reprinted in 1600 with only inessential changes, and again, with slightly greater alterations, in 1619. In the last edition they were for the first time combined under the title of "The Whole Contention between the Two famous Houses, Lancaster and York," and for the first time the phrase "Written by William Shakespeare, Gent." was introduced. All editions previous to 1619 are anonymous.

Of the three plays as printed in the Folio, the first part contains fewest evidences of Shakespeare's authorship. Modern critics have been inclined to recognize his hand, with varying degrees of assurance, in the scene that depicts the plucking of roses in the Temple Garden (II, iv), in the next one (II, v) which introduces the dying Mortimer, in several, at least, of the series of scenes with Falstaff's death (IV, ii-vii), and possibly in Sufolk's wooing of Margaret (V, iii).

More positive is allowable in regard to the second and third parts, where Shakespeare's hand seems perceptible in virtually all the extensive Folio additions to the text of the "Whole Contention" of 1619. Study of this added material, carefully inlaid upon the original drama, leads to valuable inferences regarding Shakespeare's early style and mode of composition. Accept, in general, writing the "First Part of the Contention" and "True Tragedy" themselves is not likely, though the Jack Cade scenes of the former bear a general similarity to his work and particularly resemble a comic scene in the contemporary play of "Sir Thomas More," plausibly ascribed to Shakespeare. Hardly more convincing are the specific evidences hitherto adduced in support of Greene's or Peele's part authorship of the early plays. The trend of recent investigation is to justifi the dictum of the judicial Hallam ("Introduction to the Literature of Eu-
The greater part of the plays in question ('First Part of the Contention' and 'True Tragedy') is in the judgment of all competent critics, far above the powers either of Greene or Peele, and exhibits a much greater share of the spirited versification, called by Jonson the 'mighty line' of Christopher Marlowe. In short, the lion's share in the two fundamenal dramas seems to be Marlowe's, while the amelioration by which they were converted into 2 and 3 Henry VI is largely, if not wholly, the work of Shakespeare. Further discussion of most points alluded to above will be found in the following recent articles: Gray, H. D., 'Shakespeare's Contribution to 1 Henry VI' (Publications of the Modern Language Association of America, September 1917); Brooke, C. F. T., 'The Authorship of the Second and Third Parts of King Henry VI' (Yale University Press 1912).

TUCKER BROOKE

KING HENRY VIII is certainly one of the latest plays with which Shakespeare was concerned. It was performed, apparently for the first time, at the Globe Theatre, 29 June 1613. A spectator on that occasion, Sir Henry Wotton, described of it as "a naus of all the principal pieces of the reign of Henry the Eighth, which was set forth with many extraordinary circumstances of pomp and majesty, even to the matting of the stage; the Knights of the Order with their Georges and Garters, the guards with their embroidered coats." The elaborateness of the production proved disastrous, for the eyewitness continues: "Now King Henry, making a masque at the Cardinal Wolsey's house, and certain cannons being shot off at his entry (civ. 1, iv, 49, s. d.), some of the paper or other stuff wherewith one of them was stopped, did light on the thatch, where being thought at first but an idle smoke . . . it consumed within less than an hour the whole kindled inwardly and ran round like a train, house to the very ground." Thus perished the Shakespearean Globe Theatre in the first modern theatrical configuration. The building was reconstructed the next year, but in the meanwhile it is probable that Shakespeare's company continued the performance of 'Henry VIII' at their other theatre of Blackfriars, where, it has been pointed out, they would have been acting the scene of Queen Catherine's trial (II, iv) in the very building in which the actual trial had taken place 84 years previously. 'Henry VIII' was first published in the Folio of 1623. There it appears as the last in order of the history plays and in conformity to the others is entitled 'The Famous History of the Life of King Henry the Eighth.' The Prologue, 11, 18-22, evidently alludes to the other title, 'All is True,' under which it is natural that the drama should have been originally advertised since at the time of its presentation in 1613 interest in the strict history play had been dead for a dozen years. In 1613 Shakespeare's active participation in the affairs of the King's Company had virtually or entirely ceased, and his post of chief poet for the company had fallen upon John Fletcher. It was Fletcher, undoubtedly, who wrote most of 'Henry VIII,' though Shakespeare's hand and the features of his latest style are clear in some of the earlier scenes (I, i, III, iv) and occasionally elsewhere. In III, ii, the great scene of Wolsey's fall, Shakespeare appears to have written the first 200 lines and Fletcher the remainder. Here the continuator cannot be said to fall short of his pattern. It is Fletcher who contributes Wolsey's soliloquy, 'Farewell! a long farewell, to all my greatness!' and his seven more famous lines to Cromwell, of which the concluding lines, "Cromwell, I charge thee, fling away ambition, etc., form the best-known passage in the play. The brilliance of this part of the work, which rises above Fletcher's usual level, gives even the cold suggestion that Shakespeare was here paying his collaborator the compliment of showing what he could himself do in Fletcher's particular style. Other theories regarding the play which deserve mention, though controverted by the evidence in the case, are that Shakespeare originally wrote the play before the death of Queen Elizabeth in 1603 (consult Elze, K., Jahrbuch of the German Shakespeare Society, Vol. IX, 55-80) and that Fletcher's collaborator was not Shakespeare but Massinger (compare Hale, R., 'Transactions of the New Shakespeare Society'). It is quite possible that Fletcher and Massinger were both employed in revising and completing the play when Shakespeare's retirement left it a fragment. The part of King Henry in the play is said to have been created by John Lowin (1576-1659), acting presumably to the Wolsey of Burbage. Sir William Davenant passed on his recollection of Lowin's interpretation to Betterton who performed the part after the Restoration. In 1727 an elaborate performance was given even with the coronation of George II. The most notable modern productions were those in which Sir Henry Irving (1892) and Sir Herbert Tree (1910) respectively took the part of Wolsey.

TUCKER BROOKE

KING JOHN. 'The Life and Death of King John' is mentioned among Shakespeare's works by Francis Meres in 1598, but was not printed till the appearance of the Folio in 1623. In historic time it stands at the head of the history plays, and in date of composition it probably preceded all except 'Henry VI' and 'Richard III.' Critics assign it to 1593 or 1594. This play is an interesting innovation from Shakespeare's earliest manner to his mature mode of composition. Like the second and third parts of 'Henry VI,' it is based upon an earlier drama in two parts. This latter work was printed in 1591 under the title of 'The Troublesome Reign of John, King of England.' Shakespeare's increasing independence is shown in 'King John' in that, though making few important changes in the story, he retains practically nothing of the original language. The plot, therefore, of the later play is essentially that of the unknown author of the 'Troublesome Reign,' while the language and in great degree the psychology are Shakespeare's own. The condensation of 10 acts of the original into five chapters has been skilfully done, but evidences of cramping appear, especially toward the close, where the entire second part of the 'Troublesome Reign' is shortened into Act IV, sc. iii, and Act V of 'King John.' As might be assumed from the circumstances
of composition, the dramatic value of 'King John' lies less in structure or even characterization than in the emotional beauty of many speeches. Typical of Shakespeare's earliest period of real mastery are, for example, the famous sentimental scene between Hubert and Prince Arthur (IV, 1); the expressions of Constance's mother-love, e.g., III, iv, 93ff: 'He is the son of my absent child: Lies in his bed, walks up and down with me'\(^\text{9}\), and the closing patriotic declaration of the Bastard Faulconbridge, 'This England never did, nor never shall Lie at the proud foot of a conqueror,' etc.\(^\text{9}\)

Of the first passage mentioned, Hazlitt writes ('Characters of Shakespeare's Plays,' 1817): 'If anything ever was penned, heart-piercing, mixing the extremes of terror and pity, of that which shocks and that which soothes the mind, it is this scene.\(^\text{9}\)

There seems to be no record of any actual performance of 'King John' before 1737. Garrick acted the role of Drury Lane in 1744, and in 1755 took the part of the Bastard with less success. On the whole, the play offers more opportunity for actresses than for actors, many heroines of the stage—among others, Mrs. Cibber, Mrs. Siddons and Ellen Terry—having won fame either as Constance or as Prince Arthur.

\section*{Tucker Brooke.}

\textbf{KING LEAR.} The important editions of 'King Lear' are the first quarto (1607), the second quarto (1608) and the first folio (1623). The various readings of these texts constitute interesting problems of textual criticism. The record in the Stationers' Register, 26 Nov. 1607, indicates that the play was acted before the king at Christmas the preceding year. Certain internal evidence, such as the reference to the "late eclipses" (October 1605) and the Gunpowder Plot (5 Nov. 1605), would point to a probable earlier date. The verse, the dramatic technique and the high seriousness of the tragedy all indicate that Shakespeare wrote the play at a time when his genius had reached its highest point of development.

The story upon which the play is based had been current since Geoffrey of Monmouth's 'Historia Britannorum,' and Laymon's 'Brut.' Shakespeare was mainly dependent, however, upon Holinshed's 'Chronicles' (1577), Spencer's version of the second book of the 'Faerie Queene,' and an older play 'The True Chronicle History of King Leir and His Three Daughters' (1594). The story of Gloucester and his two sons was not a part of the original story, but had been set forth in Sidney's 'Arcadia.' No play illustrates better the dramatist's indebtedness to his sources, and at the same time the dramatic power with which he changed all the details into a dramatic unity.

"'The little more and how much it is, The little less and what worlds away!"'

'King Lear' in its complexity of plot, its large number of characters, and its immense psychological background, is the best possible illustration of the difference between the romantic drama and the classic. A detailed comparison with 'Orestes' suggests the difference between a complex and a simple play. The Greek dramatist is enabled by a few simple characters and the simplest of plots to produce a clear and definite impression. The very variety of 'King Lear' is bewildering; there is a combination in the play of the fabulous, the fairy story, the chronicle history and the tragedy of blood. And yet this varied wealth of character, passion, pathos and high philosophy, all subordinated to one harmonious whole, constitutes the glory of the play.

While many of the details of character and plot deserve consideration, it is well to emphasize the nature of the play as a tragedy. In no other play does Shakespeare represent or interpret so well the tragedy of the universe. All that is evil in man and woman comes to the surface. The animal world in all its ferocity, and nature, red in tooth and claw, are blended with the representation of man at his worst. The serpent, the wolf, the vulture, the wild boar—monsters of the deep that tear each other in their slime—are the counterparts of evil human creatures. Humanity preys upon itself, while the winds and the storms and sheets of fire turn upon human creatures to complete the ruin they have wrought upon themselves. When the light begins to break toward the end of the play, the storm comes again as Cordelia is hanged and Lear comes upon the stage with his daughter in his arms, crying, "Never, never, never, never, never." In their importance Gloucester and Lear appeal to the higher powers—the stars, the heavens, the gods—but in vain. One thing alone is evident from the play—namely, that evil finally comes to define defeat and that good, though mutilated and sacrificed, is its own reward. Tragic suffering is the privilege of great souls. But we remain confronted with "the inexplicable fact, or the no less inexplicable appearance, of a world travelling for protection, but bringing to birth, together with glorious good, an evil which it is able to overcome only by self-torture and self-waste. If this is, as Professor Bradley has suggested, the essence of tragedy as Shakespeare conceived it, surely 'King Lear' is the supreme expression of the dramatist's genius.

\section*{Edwin Mims.}

\textbf{KING LOG.} a log that, in one of Aesop's fables, was given to the frogs to be their king or ruler. The character of the log was to become famous in literature. When the frogs found out what had been foisted upon them as a ruler by the god they petitioned him to remove this wooden king and to send them another in his place. This Jupiter did, replacing the log with a stork who at once began eating his subjects. Thus the frogs experienced the truth of the saying that a stupid ruler is better by far than a vicious and evil-disposed one.

\section*{King of the Mackerels.} a strange oceanic fish of the genus \textit{Ranzania}, allied to the ocean sunfish (\textit{Mola}), various species of which are superstitiously so-called in various parts of the world. One kind (\textit{R. pygmaea}) is taken in the north Atlantic; and a Hawaiian and Japanese species is \textit{R. makua}. Consult Goode and Bean, 'Oceanic Ichthyology' (1895).

\section*{KING-MONKEY.} a monkey of the African semnopithecine genus \textit{Colobus}, of which there are several species, one of which is the guereza (q.v.).

KING RENÉ'S DAUGHTER (La Hiya del Ray Renté). Henrik Hertz's lyrical drama, 'King René's Daughter,' was written in 1845. Besides 'Sven Dyrings Hus' it is the best known of all the dramas, about 40 in number, by this Danish author. The play met at once with great success and has been translated several times into German and English, also into Polish and Spanish. It is based on an event in the life of René, king of Provence in the 15th century, celebrated as a troubadour. His daughter, Yolande, married Tristan. In the play Yolande is blind, and the plot turns on her being awakened by Tristan and informed of her blindness, of which she has been brought up in ignorance, on the very day when such a proceeding was necessary to the recovery of her sight by the arts of a Moorish physician. 'King René's Daughter' is an exceedingly beautiful poem, as effective on the stage as psychologically interesting and charming by the grace and glow of the language. To those who can read the Danish original the fascination lies principally in the fine, chivalrous tone of the style, the lyrical soaring of the expressions, the courteous and choice language. It is a dainty piece of dessert for fastidious palates, as Brandes says in his critical analysis of the play. It is not to be criticized, but read and enjoyed. Tschaikowsky, in the opera, 'Yolande,' has used this poem for a libretto. There is an English translation by Theodore Martin.

GISELE bothne.

KING RICHARD THE SECOND. 'King Richard II' seems to have been composed after Samuel Daniel's 'Civil Wars' (1595), a narrative poem from which the play takes several hints. In 1597 the latter was printed with the title of 'The Tragedy of King Richard the Second.' The appearance in all of three editions (one brought to light in 1916) before the close of 1598 testifies to the interest of the reading public, an interest explainable on three grounds: the growing fame of Shakespeare, who was just becoming widely known; the easy florid beauty of the poetry; and the distinct novelty with which a popular dramatic type is here embellished. The material is taken chiefly from Holinshed's 'Chronicle' and deals with only the last two years of Richard's life (1398-1400). This tragedy is distinguished from Shakespeare's other history plays by the strain of imaginative fantasy that everywhere pervades it. There is much rime and no pace at all; it is more like Shakespeare to make the genre (III, iv) do double duty with the moralizing in Miltonic verse, or to find no place whatever for humor. A youthful leaning toward artificiality exposes itself also in the mock chivalry of the tournament scenes (I, i and II, i, 1597), which read like dramatized versions of a Waverley novel. The poet's tem-

porary obsession with sentimental, as opposed to strictly dramatic issues, appears again, and more effectively, in his characterization of the king. The real Richard II, though infamous in purpose, was not the charming hero pictured: he was a man of wild and ruthless violence and remarkable physical courage, whose troubles were the retribution for a long period of the most treacherous misgovernment. His wild death scene, in which Shakespeare follows history, was quite in keeping with the real king's life, but involves a reversal of the poet's psychologic values. It cannot be reasonably doubted that in fashioning his material Shakespeare was under the influence of Marlowe's 'Edward II,' where the reign of a genuine sentimental weakness had been magnificently interpreted. However, in thus rendering a hardly legitimate homage to his model, the young poet was also yielding to a natural temptation, evidenced also in his version of 'The Labourer's Lost' and in Romeo, to daily with the charms of emotional fancy at the peril of losing touch with the truer purposes of life. Yet the essential justice meted out, almost unwillingly, to the prosaic, efficient Bolingbroke gives the play a firmness it would otherwise lack and argues the fundamental soundness of the author's philosophy. Editions of 'Richard II' published before Queen Elizabeth's death in 1603 omitted the abdication scene (IV, i, 154-318) out of respect for the queen's objection to such themes. On 7 Febr. 1601, adherents of the Earl of Essex attempted to move public opinion in favor of their purposeless insurrection by securing the performance of what was then an old play of King Harry the Fourth and the killing of King Richard the Second. This was acted at the Globe, and also, it is said, 'in open streets and houses.' The play in question (which failed of its design to predispose the people toward the queen's deposition) can hardly have been any other than Shakespeare's 'Richard II.' Through the 17th century the tragedy's implied negation of the divine right of kings continued to render it unpalatable to the censors. Nahum Tate's effort to stage a modified version under the influence of the 'The State Tragedy,' 'The Sicilian Usurper' (1681) failed, as did also Theobald's adaptation in 1718. In recent times 'Richard II' has been elegantly produced by Sir Henry Irving, F. R. Benson, Sir Herbert Tree, and other actors; but its theme is not one which to-day vitally interests Anglo-Saxons, and it lacks the complexity of story and broad range of mood which audiences look for in Shakespeare.

TUCKER BROOKE.

KING RICHARD THE THIRD. 'Richard III' is probably Shakespeare's first unaided effort at dramatizing history. It may have been written as early as 1593, but specific evidence of date is lacking. It was first printed (like 'Richard II' and 'Romeo and Juliet') in 1597; by 1634, eight editions had been called for. The features of this tragedy are most conspicuous when it is compared with 'Richard II,' and the date of composition cannot long have followed it. 'Richard II' is marked by reflective grace, 'Richard III' by force. Neither yet shows much variety of interest or any humorous power. It happens that each play belongs to a tetralogy. 'Richard III' points back to
the three parts of 'Henry VI.' concludes and interprets them; 'Richard II.' points forward to the two parts of 'Henry IV.' and to 'Henry V.' stating the problem of kingly responsibility out of which those plays grow. Like 'Richard II.,' 'Richard III.' owes much to Marlowe's influence, but, while the later play emulates the cool judiciousness of Marlowe's mature 'Edward II.,' the earlier lies still under the spell of the spirit of 'Tamburlaine.' The material of the play under discussion comes for the most part from Holinshed's chronicle, but the influence of three earlier dramas on the same subject is probably traceable (1) Dr Thomas Legge's Latin play, 'Richards Tertius' (acted at Cambridge 1580), (2) 'The True Tragedy of Richard III.' (published 1594), (3) 'The True Tragedy of Richard Duke of York' (published 1595). The last work, which Shakespeare rewrote as the Third Part of 'Henry VI.,' evidently suggested 'Richard III.' as its natural sequel. Through (1) and (2) doubtless came, at least in part, the marked reminiscence of Senecan melodrama.

This shows itself in 'Richard III.' in the special emphasis laid upon soliloquy, the power of which the author of 'Queen Margaret in I., ii and IV., iv.) and ill omen. Like Seneca, Shakespeare here makes much of evil dreams. Three of the most notable passages centre about nightmares: Clarence's in I., iv, Stanley's in III., ii and Richard's in V., iii. More than 'Hamlet,' 'Richard III.' is a one-man drama. The entire play unravels around the single figure of the villain-hero, and — by means of devices which Shakespeare was to employ more subtly in later works — Richard is made far more significant and interesting than he is in '3 Henry VI.' His hypocritical, sardonic assumption of guilelessness, the attractive power which he owes solely to his blazing intellectual fire, the frankness with which he confesses his villainy to himself, and the casuistical wit with which he seeks to explain away crimes he has committed or he is accused of, are to be found in the Gloucester of 'Henry VI.' and all mark him as the first real precursor of Iago. This play is crude and immature; some critics, among them Lowell, have wished to deny that Shakespeare wrote it. It lacks moderation and true wisdom and even life-likeness; but it has power beyond measure, it bears the indubitable stamp of genius and the promise of higher things. Very few of Shakespeare's plays enjoyed a wider popular success. In the Elizabethan Age it passed through as many editions as the first part of 'Henry IV.' but may have more influence than any other Shakespearean play. Richard was one of Burbage's greatest roles, and two centuries later became one of the greatest of Edmund Kean's. There have been various adaptations, one of which by Cibber still holds the stage in performances of Mr. Mantell.

TUCKER BROOK.

KING OF OCKHAM, Peter, FIRST BARON. English statesman and writer: b. Exeter, 1669; d. 1734. Graduated in law in 1698, he became a member of Parliament three years later for Beeralston, Devonshire, as a member of the Whig party. His advancement was rapid because of his active and aggressive character and in 1708, was created chief justice of Common Pleas in 1714 and a member of the Privy Council in 1715. For the following 10 years he continued very active in politics, becoming in that year, in succession, speaker of the House of Commons, Lord Chancellor, a position he held until 1733 when paralysis forced his resignation. Among his published works are 'An Inquiry into the Constitution, Discipline and Unity and Worship of the Primitive Church' (1691); 'A History of the Apostles' Creed' (1702); Consult Campbell, 'Lives of the Lord Chancellors' (London 1858); Welsby, 'Lives of Eminent English Judges' (London 1846).

KING OF OCKHAM, Peter, SEVENTH BARON, English writer and economist. Educated at Eton and Cambridge, he succeeded to the family title in 1793, entering the House of Lords three years later. Like the first baron of the same name (q.v.), he was a Whig, though not of such a determined and uncompromising type. He took a great interest in the finances of the country and especially in the currency, to the study of which he gave much of his time. He was also in favor of the removal of the restrictions then still placed upon Roman Catholics and deeply interested in the welfare of Ireland which he clearly saw was not being either fairly or wisely handled by the British government. His liberality of thought is also shown in his opposition to the Corn Laws. Among his published works are 'Catholic Emancipation'; 'On the Conduct of the British Government toward the Catholics of Ireland'; 'A Short History of the Job of Job's'; 'Life of John Locke' (2 vols.).

KING SALMON, or QUINNAT, the most important of the several species of salmon found on the Pacific Coast of the United States; called also Chunook or Columbia River salmon (Oncorhynchus tshawytscha). It is especially abundant in the Columbia and Sacramento rivers, and its great economic importance is due to the fact that it enters the rivers in large numbers in the spring. See SALMON OF THE PACIFIC.

KING SNAKE, a large colubrine snake of the southern part of the United States (Oceola doliiata, of which the northern house-snake is a variety), so called on account of the belief in its power and prowess, especially in overcoming rattlesnakes. It is grayish white, marked by a series of black rings in a manner so variegated that many color-varieties have been named. It sometimes reaches a length of 10 feet, is extremely muscular and swift, and preys upon frogs, toads and upon snakes, including poisonous ones. Hence this serpent is much respected and rarely killed in the less settled parts of the Southern States. Several other species are known, one of which (O. cocinco) is red with black bands, and called the red king snake. These snakes are reproduced by eggs buried in sandy soil or loose dust, like that of a rotting stump. The chain-snakes (q.v.) of the allied genus Ophiobolus, have an equal right to the name "king snake," and frequently receive it. Consult Holbrook "North American Herpetology" (Vol. III, Philadelphia 1842); Ditmars, "Reptile Book" (New York 1907).

KING VULTUR. See CONDOR.
KING WILLIAM'S WAR — KINGDOM OF GOD

KING WILLIAM'S WAR, a war waged by Great Britain and its colonies in America against France and its Indian allies in 1689-1697. See COLONIAL WARS IN AMERICA.

KINGBIRD, one of the most familiar representatives in the United States of the tyrant fly-catchers (Tyrannidae). The typical genus is distinguished by the concealed flame-colored crest, attenuate outer primaries and square tail and contains many species. The eastern king-bird (Tyrannus carolinensis) is found throughout the United States but rarely in the Southwest or west of the Rocky Mountains; it also enters the British provinces and breeds throughout this range; in winter it migrates into Mexico, Central and South America. It is a plain little bird about eight inches long, nearly black above and quite so on the head, this color contrasting greatly with the brilliant flame color of the crest, which can be concealed or erected at will; the tail is tipped with white and the under parts are wholly white. The young lack the highly colored crown. The most distinctive trait of the king-bird is pugnacity, and during the nesting season no bird may come near its home without being attacked and almost invariably routed. Even crows, hawks and eagles fly before its fearless and vigorous onslaughts. On account of the large gape of the mouth, the spreading bristles at its sides, and the flat, broad bill, the king-bird, in common with related species, is an adept in capturing flying insects, which constitute its most exclusive food. In some localities it is known as the bee-martin, and has gained a bad reputation as a destroyer of honey-bees, but it destroys a thousand noxious insects for every bee it eats. The nest is a crude, bulky structure saddled in a conspicuous position on a limb or fork usually of an apple-tree, and the eggs are usually rose white, boldly spotted with brown and lilac. Two additional species of king-birds are found in the West and two in the South. Consult Wilson, 'American Ornithology' (1834); Baird, Brewer and Ridgway, 'History of North American Birds' (1874); Coues, 'Birds of the Northwest' (1874).

KINGDOM OF GOD. The idea of the Kingdom of God is prominent in the Old Testament, but especially so in the New Testament, finding its centre in the teachings of Jesus. The Kingdom of God is a goal set before the race; not a Utopian dream, but a realization through character development. It is also a philosophy of history. The phrase Kingdom of God or Kingdom of Heaven is not found in the Old Testament, but the idea was early developed (Judges xvii, 6, xviii, 1, xxi, 25) and all the prophets foretold it. Back of their belief in a coming Kingdom of God was faith in God himself and their earliest political unity was theocratic. Their faith was built on a future in which there was to be a more perfect kingdom. The idea of the earthly reign was carried from the prophets into Apocryphal literature where it is sometimes strongly stated. Archibald Robertson well sums up the Jewish faith in the Kingdom of God as Christ found it: 'These beliefs and hopes took shape, not doubt, to make human and political aspirations. But among the stricter Pharisees — or at least the more spiritually minded of them, they comprised the following elements:

1. Israel was ideally the Kingdom of God, and destined to become what it already was in idea.
2. Israel as it was not the Kingdom of God, for it contained unworthy elements. The existing faithful Jews are the nucleus of the future kingdom.
3. The future kingdom was to be on earth, with Jerusalem as its seat and centre. It was variously conceived as (a) eternal or (b) of limited duration.
4. It was to include the faithful who are dead, and will be raised again.
5. It was to be inaugurated by a Day of Judgment, which appears to be identified with the day of the Messiah's appearance.
6. It was to be an embodiment of all elements of national well-being — social, ethical, spiritual.
7. It was to embrace all peoples, who would come to worship as Jerusalem.

From the beginning Jesus connected his own person with the Messianic Kingdom and distinctly taught that it was to be a spiritual kingdom, culminating in the heavenly kingdom. The members of the kingdom were to be, first of all, his immediate followers, and then their successors in the years to come. The fully developed kingdom cannot have been the earthly one, only in heaven. In the Book of Revelation began the idea of the millennial reign of Christ on earth before His final reign in heaven. The Gnostics and Montanists held their own views of the Kingdom of God — a schismatical rigor of morals was fundamental. The millennial idea continued until it was superseded under Constantine with the idea of a Christian empire. Monasticism next arose as a possible method for the seeker after the Kingdom of God.

Augustine developed the idea that the Church is the Kingdom of God on earth. This was in two parts — the visible and invisible. The mediæval theologians built on that conception the idea of an omnipotent Church with its complete centralization of power, culminating finally in the work of Gregory VII and Innocent III.

Dante combed this idea in his 'De Monarchia' in which he argues for the divine sanction for the secular life apart from the spiritual, and demands that the Pope be only the spiritual head of the spiritual Church. And again, as in the early Church, monastic poverty was sought as a means for entrance into the kingdom and so the Orders of Friars flourished. William of Ockham and Marsilius continued to develop the idea of Dante. John Wyclif was the first to oppose the mediæval idea theologically. Then came the Reformation following the intellectual awakening of Europe, in which many voices protested against an omnipotent Church. As a universal idea it was a failure. The Reformation, however, did not put an ideal in its place. The Counter-Reformation and the Renaissance were Catholic attempts to reconstruct the idea. The present-day tendency in Protestant circles is to reinterpret the biblical sources of the doctrine. It is a part of the growth of the new science of biblical theology. The present idea is that 'the Church is the Kingdom of God in the making' as far as she represents the ideals of the sources of the doctrine. The bibliography of the subject is very extensive. Consult Robertson, Archibald, 'Regnum Dei — Eight Lectures on the Kingdom of God in the History of Christian Thought' (1901).
KINGFISH, the name of various fishes of notable power or superior excellence, especially the game fish of Europe, called *Scabarbus scomberus* Linnaeus. One, the cavalla or *King cero,* is a favorite game fish in Florida (see *Cero*). The kingfish of New York waters (*Menicterus saxatilis*) is one of the whittlings, of the family Scombridae, closely allied to the dogfish (see *Warraing*). It is a moderately large migratory marine fish, dusky gray above, sometimes blackish, the back and sides with distinct dark oblique cross-bands running down and forward, and a V-shaped blotch on each side of the nape. It is also known as *sea-mink,* and is an excellent food-fish, but has become rare, although formerly ascending the Hudson River in schools, in early spring, for 40 miles or so. Other fishes so called are the little roncador (q.v.) of California, and the opah (q.v.). Consult Jordan and Evermann, 'American Food and Game Fishes' (New York 1902).

KINGFISHER, city, county-seat and county of the same name in Oklahoma, some 30 miles west of Guthrie. The town is situated on the Chicago, Rock Island and Pacific Railroad, its shipping facilities and central position made it a centre of distribution for imports and for the products of the surrounding country which are mainly agricultural, devoting considerable attention to stock-raising. Pop. 3,000.

KINGFISHER, a bird of the family Alcedinidae, characterized by the short, compact body and large head, with a long, straight, acute bill; the somewhat usually short, square tail of 12 rectrices, the short rounded wings having 10 primary quills; the short, weak legs and nearly unique cohesion of the middle and outer toes. Two sub-families are commonly recognized, the Dacelominae, or "Kinghunters," with a broader, depressed, sometimes curved bill and usually insectivorous habits; and the Alcedinidae, or true kingfishers, with a compressed, carinate bill, and usually piscivorous. About 20 genera and 250 species have been described, half of which are confined to the Australian region. About five genera and 50 species are distributed between tropical Africa and Asia, one species alone, the brilliantly colored *Alcedo teysii,* is found in Europe; while all of America has only eight species of *Ceryle,* three of which extend their range into the United States. Of these three, two (*Ceryle torquata* and *C. americana*) are really Mexican and Central American, but the third, the belted kingfisher (*C. alcyon*), is a widely distributed and highly characteristic member of the North American avifauna. Throughout North America, from the shores of the Arctic Ocean to the Gulf of Mexico, and from the Atlantic to the Pacific, is the summer home of the belted kingfisher, which, in winter retreats south of the limit of freezing. The large, crested head, very large bill and deep blue color, with black and white markings and largely white under parts, give to this bird a very characteristic aspect, which is heightened by its peculiar habits. Each pair selects a hunting-ground somewhere in the vicinity of water, and other pairs seldom intrude upon this preserve. There the kingfisher perches on a tree overhanging the water and watches for the passage of a fish, when it plunges headlong and usually emerges with a small fish held firmly in the beak. As it rises a spasmodic shake dispels the water from its compact oily plumage, and on returning to its perch, the fish is usually tossed into the air and swallowed head first. Sometimes the kingfisher hunts more in the manner of a tern and plunges from a suspended position in mid-air. The only call is a peculiarly loud, harsh, rattling cry. A burrow six to nine feet long, dug horizontally into a bank, serves as a nesting place, in the slightly enlarged end of which the six or eight pure white eggs are laid on a bed of regurgitated fish bones.

The daceuline kingfishers have very different habits, and might more properly be called kinghunters. They are usually woodland birds, caring little for the neighborhood of water, since their food consists of insects caught mainly on the wing, or else of tree-frogs, lizards and other small reptiles found on the ground or about trees. The jackass kingfisher (q.v.) of Australia is a prominent example. A peculiar group of the Papuan Islands (genus *Tanyptera*) has long, ratlike tails and an extremely long, pointed, falcate feathers and other peculiarities of plumage. The small East Indian species have only three toes. Those of Africa are inhabitants of deep woods, but when hard pressed for food will resort to streams and pick up small fishes. All these breed in holes in trees and not in earth-burrows.

Consult Coues, E., 'Key to North American Birds' (Boston 1903); Evans, 'Birds' (Cambridge Natural History, Vol. IX); Sharpe, 'Monograph of the Alcedinidae'; and American and European ornithologies.

KINGHUNTER, a kingisher of the subfamily Daceloine; specifically the jackass kingfisher (q.v.).

KINGLAKE, Alexander William, English historian: b. Taunton, Somerset, 5 Aug. 1809; d. 2 Jan. 1891. He was educated at Eton and Cambridge, was called to the bar in 1837 but ceased to practice in 1856. He represented Bridgewater as a Liberal in Parliament from 1857 to 1868, when Bridgewater was disfranchised for bribery. His distinction as a writer rests upon two books: 'Eothen, or Travels in Persia, Smyrna, and the East' (1844); and 'The Invasion of the Crimea,' in eight volumes (1863-87). The former is marked by truth to nature, poetry, humor and imagination; the latter (which is partly the result of personal observation) is an equally brilliant performance, in its own way, almost exhaustive in its details, picturesque and telling in description and narrative, but open to the charge of prejudice in some points, his great dislike of Napoleon III frequently appearing. (See Eothen.) Consult Tuckwell, 'Alexander William Kinglake' (1901); 'Dictionary of National Biography' (London).

KINGLET, a very small bird of the thrush family dwelling in northern forests and visiting southern Europe and the United States only in winter. These smallest of songsters, hardly more than half of the size of the common green and gray in color, with a half-concealed yellow crest in one of the two species, the goldcrest (*Regulus saturapaceus*), and a flame-colored one in the other (*R. calendula*), called ruby-
KINGMAN — KINGS, BOOKS OF

These tiny birds go about in small lively flocks and have no hesitation in attacking a crow, jaay or hawk with the spiteful fury that being ago won them their name."Kingman" among European peasants. Both, especially the ruby-crown, sing sweetly in the spring before going to some mountain-top or northern forest to make their cup-like nests in some evergreen tree. See GOLD-TOP.

KINGMAN, Kansas city and county-seat of Kingman County, situated on the Atchison, Topeka and Santa Fe and the Missouri Pacific railroads, some 45 miles west of Wichita, in the midst of a rich agricultural and cattle district. It has butter and salt factories, flour mills and grain elevators and is well supplied with water motive power. Pop. 3,200.

KINGS, Books of. These two books in the Hebrew Bible formed originally one work. In the Greek version (the Septuagint), Kings and Samuel were reckoned as four Books of Kingdoms. This fourfold division passed into the Gospels, ascended through the Vulgate, and was adopted in the printed editions of the Hebrew. Jerome, however, preferred the title Kings, hence our present name for the second twofold work.

Like Judges, Kings is a product of the era of historical interpretation inaugurated by the publication of Deuteronomy in 621 B.C. (See DEUTERONOMY and JUDGES). The reign of Solomon and the history of the divided kingdom furnished more abundant and varied illustration of the central principles of the prophetic law book than even the age of the Judges. The dependence of national prosperity upon absolute loyalty to Jehovah was illustrated more impressively by the division and downfall of the kingdom than by the vicissitudes of the early struggles, while the second great principle, the sinfulness of worship in the high places and the duty of centralization in the Jerusalem Temple, was exemplified constantly in the history from Solomon to the exile. For the period included in Kings, the writers of the books cited did not have, as they did for the time of the Judges, a completed history already at hand, which they needed only to edit. For this era, they must themselves compile the earlier documents. Kings is the first original contribution of the Deuteronomic school of historicists. Some passages, implying that the Temple is still standing and the Davidic dynasty uninterrupted, suggest that the compilation was undertaken in pre-exilic days, but the work as a whole carries the history in detail to the events following the destruction of Jerusalem in 586 B.C., and cannot have been finished before the exile.

The completed work falls into three great sections: (1) The reign of Solomon (1 Kings i-x); (2) The divided kingdom (1 Kings xi-xv and 2 Kings xvi-xvii); (3) Judah after the fall of Israel (2 Kings xvii-xxv). At the close of the first and second sections, the compilers introduce at length their own interpretation of the preceding events in characteristic Deuteronomic terms. At the opening and close of each reign they give their judgments on the successive kings in stereotyped formulas. These formulas include also the chronological data in accordance with which they arrange the synchronisms of the reigns. For their sources the compilers had on hand a book of the Acts of Solomon and separate Chronicles (Hebrew, Acts' of Days) of Israel and Judah. They also had collections of stories from Deuteronomic and other prophets. Reference is made by title to the Acts of Solomon and the Chronicles of Israel and Judah for additional information not included in Kings. Whether these books were the original state documents we cannot be sure. From the time of David a First Remembrancer (Naboth, Remembrancer) seems to have been a regular officer of the court. Directly or indirectly his records may be supposed to underlie the sources on which the compilers rely for information concerning the public activities of the kings. But it is commonly felt that the Chronicles to which they refer were not the original court records. They seem, rather, to have been compositions based on these and including also materials that would find no place in official annals. The narratives concerning Elijah, who appears so prominently in the fateful reign of Ahab of Israel, were doubtless composed in prophetic circles not long after his death. The sudden way in which the prophet is introduced (1 Kings xvii, 1) implies that the stories are taken out of a larger work in which the fuller life of the prophet is given concerning him. Some of the other stories in which prophets appear show more traces of the accretions which indicate oral transmission; those may have been handed down by word of mouth for some time before they were committed to writing. As a whole, the books of Kings give the national history for a period of 400 years from the death of David to the exile, in a form that commends itself as affording one of the most reliable histories compiled in the Christian times. Taken in connection with the books of Judges and Samuel, they give a comprehensive survey of Hebrew history, covering a period of nearly 600 years, from the struggles of the tribes for the possession of the land, through the federation into the monarchy, the division into two kingdoms, their inter-related history, and the separate history of Judah after the fall of Israel until her own downfall. In this series of books, Samuel was already in a form which so satisfied the exilic historians that they made very little change to it, but Judges received much editing from their hands, and Kings, as has been indicated, is their own compilation. When their work was accomplished, a century before the time of Herodotus, their nation had a history of remarkable completeness and reliability, as compared with other ancient peoples.

In literary form, the books of Kings offer an interesting study. The 11 chapters concerning Solomon's reign centre in the description of the building and dedication of the Temple. To this central part are prefixed the account of the king's accession and notices of his wisdom, power, and wealth, and there are appended further notices of his wisdom and splendor and of his apostasy and adversaries. The histories of the divided kingdom are most skillfully interwoven so that the contemporary events are kept in close connection and yet the distinction between the two kingdoms is made clear. From the downfall of Israel in 722 B.C., the compilers' task was comparatively simple as they dealt with the records of Judah alone.
The brief epitomes of many of the reigns afford little scope for literary art, but the fuller narratives concerning Elijah and Ahab are among the best told and most inspiring stories of antiquity. Other narratives which show the vigor of Israel's early prose concern the wars with Damascus (1 Kings xx, xxii). The sections in which the compilers pass their judgment upon Solomon or Israel are marked by the solemn earnestness and rhythmic speech so characteristic of Deuteronomy and of the writers influenced by its noble style and profound convictions. Even the monotonous formula, condemning all the kings of Israel for walking in the way of Jeroboam, and in his sin wherewith he made Israel to sin, gives something of the impressiveness of the tolling of a deep toned bell, that adds its own element to the effect of the whole work.

HENRY THATCHER FOWLER, Professor of Biblical Literature and History, Brown University.

KING'S BENCH, Court of. See COURT.

KING'S CHAPEL, a religious edifice in Tremont street, Boston, Mass., built in 1745 on the site of an older church. During the War of the Revolution it was for a time forsaken by its Loyalist congregation. In the burial ground adjoining which has been in use since 1630 many of the early Puritans, including Governor Winthrop, are interred.

KING'S COLLEGE, a college of Cambridge University, England, founded by Henry VI in 1441, as the College of Saint Nicholas for a provost and 70 scholars, with Eton College as a preparatory school. Exemption from the jurisdiction of the archbishop of Canterbury, the bishop of Ely, and even of the university in matters scholastic, were some of its unusual privileges, and until 1857 members of King's College could take a degree without passing the university examinations, a course which did not conduce to a high standard of scholarship. In its roll of celebrated alumni are Archibald Sumner, Bishop Pearson, Richard Coke, the Greek scholar, the first Sir William Temple, Sir Robert Walpole and Lord Strangford de Redcliffe. The college had in 1915-16 a provost, 46 fellows, 48 scholars, 156 undergraduates. The college chapel is the finest in the world in size, form and decoration. It contains some of the best stained glass and wood carvings in England.

KING'S COLLEGE, London, a college established by private subscriptions and incorporated in 1829, its constitution being amended by an act of Parliament in 1882. It was established for the purpose of providing an education in accordance with the principles of the Established Church. Education is imparted in the departments of theology, general literature and science, applied sciences and engineering, laws and medicine. The department of general literature compiles once a year to prepare candidates for the universities, for the army and the Indian and home civil service; and there are also special classes for civil service candidates. There is a department for women. The college possesses a library and a museum, the latter containing Habbage's calculating machine and King George the Third's collection of philosophical instruments and mechanical models. It is now a constituent college of London University. Among its celebrated scholars are Prof. Thorold Rogers and Cayley, Sir James Fitzjames Stephen, Dean Farrer, Dante Gabriel Rossetti and his brother William.

KING'S COLLEGE, Windsor, is the oldest university in what is now the Dominion of Canada, and, with the exception of the French foundation of Laval (q.v.) at Quebec, is the oldest college. It has the distinction of being the oldest university in the British dominions overseas. Its establishment was the work of British Loyalists, chiefly from the State of New York, after the close of the War of the Revolution. Of these about 18,000 settled in the Nova Scotia Peninsula. As early as 3 March 1783 a meeting of Loyalists was held in New York, and "A Plan of Religious and Literary Instruction for the Province of Nova Scotia" was drawn up and forwarded to the colonial secretary; and when Dr. Charles Ingles, who had formerly been rector of Trinity Church, New York, was consecrated first bishop of Nova Scotia in 1787, one of his first cares was to carry the scheme into effect. First, a grant was obtained from the provincial legislature for an academy at Windsor. This academy (now known as the Collegiate School) was opened 1 Nov. 1788, and the following year an act was passed for "the permanent establishment and effectual support of a college at Windsor," and the sum of $400 sterling per annum granted toward its maintenance. By this act King's College was opened in 1790 in temporary quarters, and the erection of a building of wood was begun the following year. The first president of the college was Rev. William Cochran, a graduate of Trinity College, Dublin, who had been professor of Greek and Latin in King's (now Columbia) College, New York, but who, on account of his Loyalist sympathies, resigned and came to Nova Scotia in 1788.

A royal charter, giving to King's College full university powers, was granted by George III in 1802, and was accompanied by an imperial grant of £1,000 a year, which was continued until 1834. The board of governors under this charter was a political body, consisting of the lieutenant-governor, the bishops and other members of the government. The task of framing statutes for the college was entrusted to a committee of three, two of whom were uncompro- mising Tories, and by their rigid adherence to the Oxford model in the matter of religious tests inflicted a lasting injury upon the college and almost effected its ruin. The requirement
was made that all students, on matriculation, must subscribe to the Thirty-nine Articles. To this the bishop strenuously objected, and sent his protest to the archbishop of Canterbury, who was, under the charter, patron of the college. The archbishop compromised by withdrawing the test at matriculation, but requiring it of all those who were admitted to degrees. In publishing this amendment, the governors kept the matter quiet, and Lord Dalhousie, who became governor of the province in 1816, seems not to have heard of it until after he had arranged for the establishment of another institution (Dalhousie College) (q.v.) in Halifax.

Although the religious tests were finally removed in 1829, in spite of repeated attempts to secularize it and amalgamate it with Dalhousie College, Halifax, King's College still retained its connection with the Church of England, and indeed the requirement that the president should be a clergyman was only abolished in 1902. Of the three King's Colleges established at Windsor, N. S., Fredericton, N. B., and Toronto, it is the only one which has maintained its original statutes, the other having relinquished their charters and become secularized.

In 1846 a meeting of alumni of the college was held, and it was determined to form an association for furthering the interests of the college. Accordingly a provincial act incorporating "The Alumni of King's College, Windsor," was obtained in 1847, and six years later another act abolished the old political board of governors and constituted a new board, the members of which were, for the most part, to be elected by the alumni. The provincial grant of £400 was discontinued in 1849, and for some years the smaller grant of $1,000 a year was continued, but this ceased in 1881, and since that time the college has been thrown upon its own resources. The progress of the college was rapid under the new regime. The number of students increased. A beautiful stone convocation hall and library was erected in 1861 and a chapel in 1877.

The library of the college, which owes its inception to John Inglis, who went to England in 1802 to collect books, contains some of the most valuable bibliographical treasures in Canada. There are no less than 18 volumes from the famous Aldine Press, including the Aristotle of 1495-98. Then there are 20 volumes from the Elzevir Press and 16 from that of Stephens of Paris. One of the treasures is a copy of the Coberger Bible of 1475, of which there is perhaps not another copy in America. Among the valuable books of a later date may be mentioned the Boydell edition of Shakespeare and Milton, and a presentation copy of the Marquis of Buckingham's "Homer."

The present teaching staff of the college consists of a president and professors of divinity (2), classics, philosophy and ethics, science, English literature, mathematics, and engineering. Degrees are given in arts, divinity, engineering and science, and a school of law, established at Saint John, N. B., in connection with the University of King's College, in 1892, is doing good work. The Engineering School, which was removed from the campus in 1904 to the Sydney's to take advantage of the splendid plant in operation in the Cape Breton metropolis. In 1915-16 there were 57 students in attendance, and at the Law School 27 students. The university is affiliated with Oxford, Cambridge and Dublin universities.

**King's (Queen's) Counsel** in England, Ireland and several of the British colonial possessions, a title given to a barrister at law, by letters patent, to be the counsel of the Crown. It is a title much prized by the legal profession, simply because it is now largely one of advancement in the profession. There is no general law title and dignity which correspond to the British King's Counsel, because the latter is based upon the privileges of the Crown, which, in this respect, are little more than nominal.

**King's Daughters and Sons, International Order of,** an organization of men, women and children of all religious denominations, whose object is to minister to the sick and needy wherever found, and to do good to all with whom they come in contact. The original circle (of women) was formed in New York in 1886, and its members are found in 32 States in the Union, and in provinces and circles in China, Japan, India, etc. It is organized in circles, county and city unions, chapters, national, state and provincial branches, and a central council. The badge is a small silver Maltese cross, generally suspended by a purple ribbon and bearing the initials "I. H. N." (In His name). The Society publishes a weekly paper, "The Silver Cross." The membership is 58,000. The order has established and is supporting several hundred institutions of different kinds in different localities. Consult the "King's Daughters' Yearbook (New York)."

**King's (or Queen's) Evidence,** the British equivalent of State's evidence. See Informer.

**King's Evil.** See Scrofula.

**King's Lynn** or **Lynn Regis,** a port town in Norfolk, England, near the mouth of the Great Ouse. It is noted for its fine docks covering more than 100 acres, and its excellent harbor. King's Lynn was once strongly fortified by a massive wall and moat, the ruins of which still exist. Of these ruins one of the interesting features is the so-called "South Gates," a handsome Gothic structure. The town is one of the oldest in England. After years of life as a local municipality, it received a charter as an incorporated place in the reign of King John (1204). During its official civic career it has been variously known as Lynn Episcopi, Bishop's Lynn, Lynn Regis and King's Lynn. It was several times, during the European War, the victim of aerial attacks on the part of the German air fleet, the first of which took place in 1914. King's Lynn is noted for its fine churches and schools and other public buildings, some of which are of considerable age. Among the industrial establishments of the town are iron foundries, machine shops, beer and malt establishments, oil mills and shipyards. It does a very considerable export and import business. Among the famous natives of the place were Eugene Aram and Frances Burney.
KING'S MOUNTAIN, N. C., a village in York County, 80 miles northeast of Columbia. In one of its hills there was a battle fought 7 Oct. 1780, between about 1,000 Americans, under Sevier, Shelby, Campbell and Williams, and 1,100 British, under Ferguson. The latter were defeated with a loss of 25 killed and wounded, among whom was the commander, 164 taken prisoners after an hour's fighting. Ferguson, shouting to his men: "Crush the damned rebels to the earth," prepared for one final charge, and fell at the head of his regulars pierced by seven bullets, dying, according to tradition, by the hand of Colonel Williams, who was also slain. His men, disheartened by his fall, surrendered. The Americans lost only 28 men killed, although a large number were wounded. After the battle 10 of the prisoners notorious for their crimes were hanged, having first been regularly tried and condemned by their captors. This was one of the most brilliant victories of the war, and exercised an important influence in precipitating the downfall of British power in the South. The 75th anniversary of the battle was commemorated in 1904 by a great celebration on the ground. Consult Draper, 'King's Mountain and its Heroes' (Cincinnati 1881) and McCready, 'South Carolina in the Revolution' (New York 1901).

KING'S PEAKS, the highest points in Utah, two nearly summits of Uintah Mountains in northern part of the State. Altitude 13,496 and 13,498 feet. Named from Clarence King, director of the 40th Parallel Survey. Nearby are Emmons Peak, 13,428 feet, and Gilbert Peak, 13,422 feet.

KING'S SPEECH, The, in British Parliamentary procedure, is the speech read from the throne in the House of Lords at the commencement of each session. It reviews the political situation and outlines the ministerial legislative program. The Parliament is opened by the king in person, accompanied by the dean, who reads the speech, which is composed by the Prime Minister in consultation with his Cabinet. In the absence of the king Parliament is opened by commission, when the speech is read by the Lord Chancellor. The reply to the speech is called the address. Consult Anson's 'Law and Custom of the Constitution.'

KINGSBROUGH, Viscount, Edward King, Irish writer and antiquarian, generally known as Lord Kingsborough, a title which he held only by courtesy: b. 1795; d. 1837, in a debtor's prison in Dublin. He is noted for his great work 'Mexican Antiquities,' the publication of which was begun in London in 1830 and continued for several years. See King, Edward Viscount KINGSBROUGH.

KINGSFORD, Charles Lethbridge, English historical writer: b. Ludlow, Shropshire, 1802. Educated at Oxford, on graduation he became a member of the editorial staff of the 'Dictionary of National Biography.' From that time on he devoted most of his time to literary work in one form or another. He was assistant secretary and examiner in the Education Department, until a high position which latter date he has given still greater attention to historical writing and to matters historical. He takes a great interest in the Royal Historical Society of which he is one of the most active members. Among his published works are 'Songs of the New World' (1871); T. A. Archer, 1894); 'Henry V, in 'Heroes of the Nations' (1904); 'Chronicles of London' (1905); 'Stow's Survey of London' (1908). This contains an introduction and notes; 'Sir C. Odo de Grandisson' (1909); 'J. Pecham, De Pauperibus in Colloboration with Leland and Tocco, 1910); 'The First English Life of Henry V' (1911); 'English Historical Literature in the Fifteenth Century' (1913); 'The Grey Friars of London' (1915). Much of his work, which appeared in the 'Dictionary of National Biography,' 'English Historical Review,' 'Encyclopedia Britannica,' Camden Miscellany, Archeology and London Topographical Record, has not reappeared in separate book form.

KINGSFORD, William, Canadian historian: b. London, England, 12. July 1819; d. Ottawa, Ontario, 29 Sept. 1898. He entered the army and came to Canada in 1837 with the 1st Dragoon Guards, receiving his discharge in 1841. He then took up surveying and engineering, and was at various times employed upon the construction of the Hudson River and Grand Trunk and Canadian Pacific railways. He made his home in Canada and published 'Plank Roads in the United States and Canada' (1851); 'The Canals: Their History and Cost' (1865); and 'The History of Canada,' a voluminous work in 10 volumes which was published in 1880, and on which he was engaged for 13 years.

KINGSLEY, kings'li, Calvin, American clergyman, educator and editor: b. Amesville, N. Y., 8 Sept. 1812; d. Beirut, Syria, 6 April 1870. He entered the ministry of the Methodist Episcopal Church in 1841, the same year he graduated from Allegheny College. He was professor of mathematics in his Alma Mater (1846-56), editor of the Western Christian Advocate (1856-64). The General Conference of 1864 elected him bishop. In 1867 he visited the mission stations in Europe and two years later he set out to visit all the mission stations of the Orient, beginning with Japan. It was on his home journey that he was suddenly stricken at Beirut, where he is buried in the Protestant Prussian Cemetery. He is the author of 'The Resurrection of the Dead' (1847, several eds.); 'Round the World: a Series of Letters' (2 vols., 1871).

KINGSLEY, Charles, English clergyman, novelist and poet: b. Holne Vicarage, near Dartmouth, Devonshire, 12 June 1819; d. Eversley, Hampshire, 23 Jan. 1877. He was a pupil of Derwent Coleridge (q.v.) from whose care he passed to King's College, London, and thence to Magdalen College, Cambridge, where he was graduated with high honors in 1842. Soon after graduation he took orders in the Established Church and obtained the curacy of Eversley, and became its rector in 1844. This living he retained till his death, but he also held in succession two canonries, one in the cathedral of Chester (1869-73), and one in the chapter of Westminster from 1873 till his death. From 1821 till 1841, as he was in short, history at Cambridge. Early in his career as a clergyman of the Church of England, he associated himself with F. D. Maurice, Julius Hare
and others, both in their religious views and in their social aims. With them he considered it his duty to the Church to improve the condition of the working-classes not only by inspiring them with Christian feeling and Christian principle, but also by encouraging and aiding them in bettering their material position. With the latter object he was a strong advocate of co-operation, and association. His first literary works of importance, 'Alton Locke, Tailor and Poet' (1850), and 'Yeast, a Problem' (1851), gave expression to his sentiments on social questions, and both of them, but especially the first, made a great impression when they appeared. The principal of his later novels are 'Hypatia' (1853), 'Westward Ho!' (1855), perhaps the most popular of his stories, and 'Hereward the Wake,' 'Last of the English' (1866). Other works of his are 'Glaucus, or The Wonders of the Shore'; 'Town Geology'; 'The Roman and the Teuton,' historical lectures; 'The Water Babies,' a fairy-tale of science; and 'At Last,' a visit to the West Indies. He was also the author of numerous sermons, lectures and essays, and of various poems, the chief of which are 'The Saint's Tragedy,' and 'Andromeda,' the latter one of the most successful experiments in English hexameter. He was a strong opponent of the Tractarian movement in the Church of England. A statement he made in a review, especially directed at John Henry Newman, that regard for truth for its own sake was not a characteristic of Roman Catholic theologians, was followed by some sharp correspondence, and incidentally was the cause of the writing of the famous 'Apologia' of Newman. Consult 'Letters and Memories of Charles Kingsley' by his wife (1877). See 'Hypatia'; 'The Water Babies'; 'Westward Ho.'

KINGSMILL GROUP. See Gilbert Islands.

KINGSTON, Charles Cameron, Australian statesman; b. Adelaide, 1850; d. 1908. Graduated in law at his native city, he at once became interested and active in politics, and was, in 1881, elected to the assembly of Adelaide, a seat he held for years. After holding the office of Attorney-General, he became Premier in 1893 and held the chief executive office for eight years, when he entered the Federal Cabinet of the Australian Commonwealth, with the Cabinet office of Minister of Trade and Commerce (1901–03) from which date until his death he was a member of the Commonwealth. He was very advanced in his politics and favored most of the measures put forward by the Labor and Socialist parties. Among the measures which he strongly advocated were a very radical adjustment of the franchise and fundamental changes in the laws relating to tenure of land and the position of labor. He was instrumental in the passage of laws of a very radical character for the regulation of factories and the employment of labor, for the extension of the franchise to women, and the regulation of many other social questions, among them inheritance and income taxes and progressive regulations for the protection of workmen.

KINGSTON, Duchess of (Elizabeth Chudleigh), English adventurer; b. 1720; d. Paris, 1788. She was the daughter of Thomas Chudleigh, a man of no particular social standing, who died when his daughter was only six years old, leaving the family in poverty.
Elizabeth Chudleigh grew up to be a young woman of remarkable beauty, wit and intelligence. Through these gifts and some distant family connections she succeeded in being appointed maid of honor to the Princess of Wales. Of this advantage she made the best possible use for her own advancement. This was not a particularly difficult task since the Princess was the mother of Prince George who was destined to become king as George III in 1760. At the age of 24 she was privately married to Captain Hervey, a man of high social standing, but his and her own irregular conduct made their separation in a short time. She then became openly, in succession, the mistress of several prominent men until finally she succeeded in becoming the wife of the second Duke of Kingston with whom she had been living in irregular union for some years. Her life was spent in Spain and Italy, and to this period is due the introduction of the concept of a “private court” which is still associated with her. After Hervey’s death in 1793, she returned to England where, notwithstanding her advanced age, she continued to lead the life of a gentlewoman. Elizabeth Chudleigh has another interest apart from the romance of her life, in the fact that she is stated, on very good authority, to have been the original from which was descended the Chudleigh family. She was the beloved wife of Beatrix, in Thackeray’s ‘Esmond’ and Baroness Berustine in his ‘Virginians.’

Kingston was for many years the most important commercial and shipping centre in Upper Canada. The first mill was built in 1784, the first regular newspaper established in 1810; in the neighborhood the first steamboat was built in 1816, and others soon followed. The city has large grain elevators and is an important port for the transshipment of grain coming down from the western lakes. Some of the chief manufactures of the city are locomotives, cotton, hosiery, leather, flour and cereals, boats and shipbuilding.

The leading educational institutions are Queen’s University (q.v.), with which is incorporated the Kingston School of Mines; the Royal Military College, the Dairy School, Regiopolis College, the Kingston Business College and the Collegiate Institute. The city has a General Hospital, the Hotel Dieu Hospital, an Orphans’ Home and House of Providence, while just outside the city limits are the Provincial Penitentiary and Rockwood Hospital for the Insane. The Anglican and Roman Catholic cathedral and the Catholic Seminary are among the numerous university buildings are handsome stone edifices, adding to the attractions of the city, which has electric and gas lighting, waterworks and street railways. A bronze statue of Sir John A. Macdonald stands at the main entrance to the city park, while the Sir George A. Kirkpatrick memorial fountain faces the park in front of the county buildings.

In July 1673, the site of Kingston was first visited by Frontenac, the French governor of Canada, accompanied by La Salle. There the Indians were assembled for a conference, and during his stay the governor erected a fort built of wood and surrounded by palisades. Thus originated Fort Frontenac at Cataracaui, the first fort on the lower lakes west of Montreal. In 1673, La Salle obtained from Louis XIV a grant of Fort Frontenac and the seigniory of Cataracaui, with the adjoining islands, and two years later he partially completed a new stone fort replacing the wooden one. The fort and the mainland subsequently belonged to the French Crown, but a large part of Wolfe Island is still held by titles originally derived from La Salle. Owing to Indian incursions Fort Frontenac was abandoned and partly destroyed in 1689. In 1695, however, during Frontenac’s second term as governor, the fort was rebuilt, and, until the time of the English conquest, was maintained as one of the chief French centres of authority, communication and trade for the West. From there, in 1756, Montcalm launched his successful attack upon the British post of Oswego. But in 1758 Bradstreet captured and partly destroyed Fort Frontenac.

After the British conquest of Canada, Cataracaui was practically deserted until the arrival of the Loyalist refugees during the Revolutionary War. When Carleton Island was ceded to the United States by the treaty of 1783, Cataracaui was again occupied by the British government as a military and naval station; and in 1784 it was reorganized as the Loyalist settlements in the West, the place being renamed Kingston in honor of George III. Kingston was the chief naval and military post in Upper Canada during the War of 1812-15. A new fort was constructed on Point
Henry, in 1815–16, which was rebuilt in its present form in 1832–36, the advance battery being added in 1842. The four martello towers which, with the fort on Point Frederic, completed the fortifications of the city, were built between 1846 and 1848. After the convention of 1818, by which the United States and Great Britain agreed not to maintain naval establishments upon the Great Lakes, the naval depot at Kingston was given up.

In 1838 Kingston received the charter of a city, though still called a town. In 1841, on the reunion of the provinces of Upper and Lower Canada, it was selected by Lord Sydenham as the capital of the new province of Canada. In 1844 the capital was transferred to Montreal. From Kingston have come many of the leading statesmen of the Canadian Dominion, such as Sir John Macdonald, Sir Oliver Mowat, Sir Richard Cartwright, Sir Archibald Campbell and Sir George Kirkpatrick. Pop. 19,000.

ADAM SHORTT.

KINGSTON, Jamaica, the capital of the island. See JAMAICA.

KINGSTON, N. Y., city, county-seat of Ulster County, on the Hudson River and on the West Shore, the Walkill Valley, the Ontario and Western and the Ulster and Delaware railroads; and is connected by ferry with main line of the New York Central and Hudson River Railroad, also Central New England, on the east side of the Hudson; 88 miles north of New York city, and 55 miles south of Albany. The Walkill River and Rondout Creek enter the Hudson here; at Kingston and the Esopus Creek passes through the upper section of the city. The first settlement was made here in 1652 by the Dutch who named the place "Esopus." On 16 May 1661, Governor Stuyvesant granted a charter to the village which he called "Wildwyck" (Wildwyck). By the Treaty of Breda 21 July 1667, the settlement passed with the rest of the Dutch provinces along the Hudson River into the possession of the English, the first governor, Francis Lovelace, changing the name to "Kingston." in honor of his father, Sir Kingston, L'Isle, near Wantage, Berkshire, England. On 19 Feb. 1777 the first State Convention of the State of New York adjourned from Fishkill to Kingston, and the first State constitution was proclaimed in front of the courthouse on 22 April 1777. On 9 September of the same year, Chief Justice Jay opened in Kingston the first State court. The first State legislature met here in September of the same year, but was dispersed by the approach of the British who, under General Vaughan, entered the place on 16 October and destroyed nearly the whole town by fire, in revenge for the part taken in the War for Independence by Kingstonians. It was rebuilt and on 6 April 1805 incorporated as "Kingston Village," and charted as "City of Kingston." 29 March 1872, comprising the former villages of Kingston, Rondout (incorporated 4 April 1849), Willet which connected the two, and the hamlet of Willow.

KINGSTON-ON-THAMES, England, a town near Richmond, on the Thames and in Surrey. The derivation of the name is uncertain, but it is said to have had its origin in an ancient stone in the market place of the city upon which were engraved the names of several early kings of England of Saxon line. This stone, tradition says, was, like the famous stone of the Scottish kings, a sacred object upon which the kings were crowned; and it was intimately connected with the traditional life of the Saxon sovereigns and people and with their mythology and religio-traditional ceremonies, according to certain archaeologists who have given it close attention and study. This stone was in the church of Saint Mary until 1779. The town itself is of itself of considerable commercial and industrial importance, and has grown outside its original boundaries.
since 1880. It possesses an extensive market and mills and factories of several kinds; and it has long been a place of summer residence for the nobility of London. As will be gathered from the fact that there were crowned there several of the Saxon sovereigns, it was a place of importance at an early date in the history of England, and it never altogether lost its air of prosperity. On account of its social relations it figures frequently in English literature. Pop. 40,000.

KINGSVILLE, Tex., town, county-seat of Kleberg County, on the Saint Louis, Brownsville and Mexico Railway, 118 miles north of Brownsville and 235 miles southwest of Houston, Tex. Its chief manufacturing industries are cotton-oil mill, creamery with annual output of 200,000 pounds, broom factory, railroad shops, electric-power plant and ice factory. A considerable domestic and export trade is carried on in the agricultural products of the county, comprising cotton, cane, non-saccharine sorghums, broom corn, melons, potatoes and winter vegetables, and the Hereford, Shorthorn and Jersey cattle of the famous ranges and dairy farms of the neighborhood. In addition to substantial business buildings, the town has costly and handsome brick or concrete structures, including courthouse, county hospital, general railroad offices, hotel, Masonic Temple, two brick ward public schoolhouses and a high school. It is the seat of the Texas-Mexican Industrial Institute and of the projected South Texas State Normal College. Formed out of the 10,000,000-acre King Ranch owned by Mrs. Henrietta M. King and managed by her son-in-law, Mr. Robert J. Kleberg, after whom the county is named. Kleberg County borders on the Gulf of Mexico and has a semi-arid and semi-tropical climate. The summers are pleasant and the winters are so mild that palms and citrus fruits are grown. The topography of the country is slightly rolling and has an average elevation of 60 feet above sea-level. It is free from malaria and otherwise healthful. The King Ranch home is one of the most magnificent residences in the South. Paved highways, one of which leads to the celebrated Rio Grande Valley, extend throughout county and State. Pop. 5,500.

MARCUS PHILLIPS, Secretary, Kleberg County Commercial Club.

KINGTECHIN, king-tēch'ên, or CHINTECHEN, China, province of Kiangsi, one of the great porcelain manufacturing and market centres of the nation, a city of great antiquity. Pop. over 500,000.

KINGWOOD, a very handsome Brazilian hardwood believed by many to be a derived species by crossing, while others claim that it belongs to the Dalbergia, which has numerous representatives in India and the southern countries of Asia generally. It has been claimed for it that it is a species of Tripolomea while others have maintained that it belongs to the brya ehenus. Kingwood, which is generally very handsomely streaked with violet of different shades and densities of color, is used in the making of fancy cabinets, and cabinet ornaments of smaller dimensions.

KINDEL, kin'kēl, Gottfried, German poet and critic: b. Oberkassel, 12 Aug. 1815; d. Zürich, 13 Nov. 1882. Graduated in theology he entered the Protestant ministry where he distinguished himself as a lecturer and public speaker. Among his other duties he was lecturer in the University of Bonn from 1836 to 1848, from time to time, though not regularly, his special subjects being poetry, the history of art and ecclesiastical history. His usefulness was cut short in his own country through his getting mixed up in the revolution of 1848. His arrest followed; but he managed to escape and made his way to the United States, where he made his living for some time as a teacher of languages. Later on he was in London and Zürich in the same capacity. But he was never able to return to Germany. It was probably his love of his native country that brought him to Zürich. He was a poet of some power and originality. Among his published works are 'Gedichte' (2 vols., 1843); 'Otto der Schütz,' a narrative poem of which nearly 100 editions were published (1845); 'Die altechristliche Kunst' (1845); 'Die Ahr, Landschaft; Geschichte und Volksleben' (1845); 'Nimrod' (a tragedy, 1857); 'Mosaik zur Kunstgeschichte' (1858); 'Die Griechen' aus Griechenland' (1883); and 'Erzählungen' (with his wife, Johanna Kinkel, 1849).

KINNICUTT, Leonard Parker, American chemist and sanitary expert: b. Worcester, Mass., 1854; d. 1911. Educated at the Massachusetts Institute of Technology, Johns Hopkins, Harvard, Heidelberg and Bonn, he became instructor of chemistry at Harvard (1880-83) and full professor of chemistry (1885-90), being appointed, on the latter date, head of the chemistry department of Worcester Polytechnic Institute. He carried on extensive chemical investigations, extending them to the effects of chemical action on sewage. This and other more practical work made him one of the greatest sewage experts in the United States. He also gave a great deal of attention to the supply of water, its purification and preservation from impurities. His connection with the Connecticut Sewage Commission in the capacity of consulting chemist gave a very practical turn to his laboratory experiments of which he made full use. In his capacity of associate editor of 'Journal of Industrial and Engineering Chemistry' he wrote a great deal on industrial chemistry in all its many phases; but all this material, with the exception of some recent and incorporated in 'Sewage Disposal' (1910), has remained unpublished in separate book form.

KINO, kē'nō, an American gambling game evolved out of the juvenile game of lotto (q.v.). See Keno.

KINO, kē'nō, a kind of gum which exudes from certain trees when an incision is made, and is dried without artificial heat. The East Indian or Malabar kino comes from a leguminous tree (Pterocarpus marsupium); Bengal or Palas kino from Butea frondosa, and Australian or Botany Bay kino from Eucalyptus rotunda. The West Indian from a species of Combretum (coloba uninera). It consists of dark red angular fragments, rarely larger than a pea, and easily splitting into still smaller pieces. It is very soluble in spirits of wine, and in general behavior closely resembles catechu, and yields
by similar treatment the same products. In medicine it is an astringent and tonic.

KINSOLVING, George Herbert, American Protestant Episcopal bishop: b. Bedford County, Va., 28 April 1849. He was graduated from the Theological Seminary at Alexandria, Va., and was ordained to the priesthood in 1875. He was successively rector of churches in Baltimore, Cincinnati and Philadelphia, and in 1892 was consecrated assistant bishop of Texas. He succeeded his father, Bishop Gregory, bishop of Texas 11 July 1893. He was a delegate to the General Convention of his church in 1892 and has published "The Church's Burden."

KINSTON, N.C., town, county-seat of Lenoir County; on the Neuse River, and on the Atlantic and North Carolina, the Atlantic Coast Line, Kinston-Snow Hill and Carolina railroads, and the Southern National Highway from Pamlico Sound, the Atlantic Ocean and the Harbor of Refuge at Cape Lookout, about 78 miles southeast of Raleigh and about 60 miles from Pamlico Sound. It is situated in a hilly agricultural, stock raising and trucking region, in which tobacco and cotton are the chief productive crops. Kinston is an important trade centre and contains a number of large warehouses. Its chief industrial establishments are steameries, packing houses, ice plants, machine-shops, foundry, wagon works, turpentine distillery, box and barrel factories, shingle mills, knitting mills, silk mills, lumber mills, cotton and cotton-seed oil mills, gunnery mills, carriage factories, wholesale groceries, ice cream factory. It is the seat of the Rhodes Military Institute, of the Hermitage mansion, formerly the State Capitol, and has a handsome post office, high schools and public library. The city owns all its public utilities, has a modern sewerage system, asphalt paved streets and new light plant. While on the Neuse River and near Southwest Creek, Trent River, Stonington and other creeks, it secures a pure water supply from 10-inch overflowing artesian wells, over 400 feet deep. Pop. 10,000.

KINSTON, Battle of: On 1 March 1865 General A. P. Hill, with his division, pushed forward from Newbern, N.C. toward Goldsboro to open communication with General Sherman, who was marching northward from Savannah, and on the 7th of his two divisions were at Wise's Forks, near Southwest Creek, a tributary of the Neuse River, with one division three miles in rear. A brigade was advanced to a cross-road about midway between the main line and the creek. General Hoke, with his Confederate division, crossed the creek on the night and early morning of the 7th and 8th, flanked, surprised, and routed the advance brigade, taking over 900 prisoners and, pressing on, fell upon the left of Cox's line, but was repulsed. He renewed the attack and was again repulsed, and at there was sharp skirmishing and the Confederates made repeated efforts to turn Cox's right, which were foiled. On the morning of the 10th Hoke and D. H. Hill made vigorous and successive attacks first upon the left and then on the right of Cox's line, but were repulsed. Again at General Bragg, who was in supreme command, made a further effort, retreated across Neuse River during the night, burning all bridges behind him, left a small guard at Kinston and, with the rest of his command, hastened through Goldsboro to join J. E. Johnston, who was concentrating everything available to oppose Sherman. General Schofield joined Cox with troops from Wilmington, and reached Goldsboro on the 12th, Sherman joining him two days later. The Union loss at Kinston was 65 killed, 319 wounded and 930 missing; the Confederate loss is not known. D. H. Hill reports a loss in five brigades of 118 killed and wounded and 16 missing. Schofield estimated the entire Confederate loss at 1,500, which is probably excessive. Consult "Official Records" (Vol. XLVII); Cox, J. D., "The March to the Sea" (New York 1882), and "Military Reminiscences of the Civil War" (Vol. II, New York 1900).

KINTYRE, kint-tir, a peninsula of Scotland, between the Firth of Clyde and the Atlantic, forming the division of Argyllshire. It is 40 miles long from the Isthmus of Tarbet to the Mull of Cantyre, and has an average breadth of about 7 miles.

KINYOU, kin-yun, Joseph James, American educator and pathologist: b. East Bend, N.C., 1860. Educated at New York University, he soon afterward entered the United States Marine Hospital service (1886-1900). He became professor of hygiene and bacteriology at Georgetown College, 1900, and was connected with that institution until 1907 when he became professor of Pathology at George Washington University (1907-09) and later pathologist to the Washington Tuberculosis Hospital. He was decorated with the Order of Bolivar of Venezuela in 1895.

KINZIE, kinz-i, John, American pioneer: b. Quebec, Canada, 3 Dec. 1763; d. Chicago, Ill., 6 Jan. 1828. His name was originally McKenzie. His father, a British army surgeon, dying soon after the boy's birth, his mother married again and removed to New York. John Kinzie was educated there, but, at the age of 10, ran away from home and made his way to Quebec where he was a jeweler's assistant for some years. He then returned home and a few years later went with his step-father's family to Detroit. In 1820 he went to the western United States, and in 1803 established a post outside of Fort Dearborn on the site of the present Chicago, of which he was the earliest white settler. He also set up stations on the Illinois, Kankakee and Rock rivers. He was very successful as a trader and, as a result of his honesty and generosity, made many friends amongst the Indians. It was due to this fact that his life and the lives of his family were saved during the massacre in 1812. After the end of our second war with England, John Kinzie and his family returned to Chicago from Detroit where they had sought safety, though he himself had finally been taken prisoner by the British and sent to Quebec. He early recognized the possibilities of Chicago and acquired extensive real estate holdings. Consult Gordon, E. L. K., "John Kinzie, the Father of Chicago" (Savannah 1910); Kinzie, Mrs. J. H., "Wau-bun, the Early Day in the Northwest" (New York 1856); Laut, A. C., "First Families of Chicago," in "Owing," Vol. LIII, p. 591, New York 1909.

KIOSK, kî-ôsk, a Turkish word meaning pavilion. It has a tent-shaped roof, open on all sides and is supported by pillars, round the
foot of which is a balustrade. It is built of wood, roofed with straw or similar materials, and is a place where a free prospect of the sky and the sun, and of the green grass and flowers in the shade, but it also serves to embellish a rural or garden view. This kind of pavilion has been introduced from the Turk and Persian into the English, French and German gardens. The word has, however, gradually accepted and is now applied to temporary or permanent structures of the type described above, irrespective of the purpose for which they are used or of the material from which they have been built. Thus pavilions for musicians in public parks, booths for the sale of newspapers and similar articles, are now called Kiosks. The most famous Turkish kiosks are Bagdad Kiosk (Constanti-
nople), dating from the early 16th century; Chiril Kiosk (Constantinople), dating probably from the 15th century and now housing part of the collection of the Imperial Museum of Antiquities; Yildiz Kiosk (near Constanti-
nople), summer palace of the Turkish Sultan and frequently used to designate the Turkish court and government.

KIOTO, ke-ōtō, or KYOTO, Japan, a city in the province of Yamashiro, and for over 1,000 years the capital; situated on a flat plain about 26 miles inland from Osaka. A high range of hills to the east separates this plain from Lake Biwa, and on these some of the finest temples connected with the city are built. The city is rectangular in form, the longer streets running north and south parallel to the Kamo River, which flows along the base of the ridge. At the north end are situated in an enclosure the plain wooden buildings where the emperors of Japan dwelt so long in seclusion. The Honangan temples of the Monto sect of Buddhists, fine structures of their kind and the centre of the Buddhist faith in Japan, rise at the south end of the city. The university has six colleges, a staff of 350 professors and lecturers, and over 5,000 students, and possesses a library with over 225,000 volumes. The Doshisha, or Christian college, is a well-equipped institution, under American control. The streets, though narrow, are clean and attrac-
tive, there is a street railway, and the whole city is in an excellent state of repair. The singing girls of Kioto are noted for their graceful dances. The pottery, porcelain, crates, velvets and brocades of Kioto are highly esteemed; its embroideries, enamels and inlaid bronze-works are marvels of skillful handicraft. The capital was not removed from Kioto until 1868, when the Mikado and his court took up residence at Tokio (Yeddo). Pop. 509,380.

KIOWA, kiwō-wa (properly kāi-gwū meaning "Principal People"), a considerable Indian tribe now in Oklahoma, whose language forms a distinct stock, who have resisted with unusual virility the physical decay so common among the tribes, and whose pictograph calendar from about 1830 is of scientific interest. They were first noticed in 1732. In dress and dwellings they are civilized, but otherwise tenacious of their old customs; of which the most notable is their veneration for a stone image called the Taimé, a sort of guardian deity. They had a military order of six degrees, and were organized in six bands; one of which, inaccurately called the Kiowa Apache (by themselves "Nādishān-
dina"), is an Athapascan tribe immemorially confederate with them. First living (accord-
ing to their and other tribes' traditions) in the Montana Rockies along the head waters of the Missouri and Columbia, they followed the retreating buffalo herds southward along the plains, allying themselves with the Crow and Shoshoni, and in 1814 massacred and dispersed the Black Hills and along the Platte and Arkansas. At first warr-
ing with the Comanches, but since 1790 in confederacy with them they finally made peace with the Cheyennes and Arapahoes. They became one of the most formidable scourges of the plains, harrying the frontiers of the United States and Mexico. The treaty of Medicine Lodge, Kan., in 1867, enforced (after their dis-
obedience) by Custer's troops during the next winter, placed them with the Comanches, Cheyennes and Arapahoes, upon reservations in Oklahoma. They broke loose in 1874 and Mackenzie was obliged to kill their horses and deport their leaders and chief men to Florida. In 1892 measures and typhoid fever destroyed over 300 Kiowas. Thenceforth they remained on the reservation. This was thrown open to settlement in 1901, and they accepted American citizenship. Their number, about 1,300, is not very much less than at any time for a century. Mooney, "Calendar History of the Kiowa Indians" (17th Report, Bureau of American Ethnology, 1898); "Ghost Dance Religion" (14th Report, Bureau of American Ethnology).}

KIP, William Ingraham, American clergy-
man: b. New York, 3 Oct. 1811; d. San Fran-
cisco, 7 April 1893. He was educated at Rutgers College and at Yale, where he was graduated in 1831. His theological training was acquired at the Protestant Episcopal Theological Seminary of New York City from which he graduated in 1835. The same year he was ordained deacon and priest. He was rector of Saint Peter's, Morrisstown, N. J., 1835-36; Curate of Grace Church, New York, 1836-37; rector of Saint Paul's, Albany, N. Y., 1837-33; first missionary bishop of California, 1833-37; first bishop of California, 1833-37; first bishop of California, 1837-37; first missionary bishop of California, 1837-37; first bishop of California, 1837 until his death. He was the author of "The History, Object and Proper Observance of the Holy Season of Lent" (1843; 4th ed., 1853); "The Double Witness of the Church" (1844, other ed.); "The Christmas Holidays in Rome" (1845); "Early Jesuit Missions in North America" (1846); "Early Conflicts of Christianity" (1850); "The Catacombs of Rome" (1854, 3 eds. in New York and 2 in London); "Recantation," a tale of domestic life in Italy (1855); "The Unnoticed things of Scripture" (1858); "The Olden Time in New York," 1664-1775" (Anon. 1872); "Historical Scenes from the Old Jesuit Mis-
sions" (1875); "The Church of the Apos-
tles" (1877).

KIPLING, John Lockwood, British Indian civil servant: b. Pickering, Eng., 1837; d. 26 Jan. 1911. He entered the Indian Educational Service; wi dance, and devoted his life to the Indian School of Art, 1865-75; and principal in the Mayo School of Art and curator of the Central Museum, Lahore, 1875-93. He is the author of "Beast and Man in India" (1891).
Mr. Rudyard Kipling (q.v.), the distinguished novelist, is his only son.

**KIPLING, Rudyard**, English novelist and poet, b. Bombay, India, Dec. 30, 1865. His father, John Lockwood Kipling, known as the author of 'Beast and Man in India,' was at that time a professor of sculpture in the school of art at Bombay. The novelist's mother, Alice Macdonald, a woman of beauty and talent, was a daughter of a Methodist preacher at Endon, in Staffordshire. The boy was named, it is said, from Rudyard Lake in Staffordshire, where his parents first met. Taught to read by his mother, he was taken to England, at the age of five, and placed, with a younger sister, in the care of a relative at Southsea, a suburb of Portsmouth, where he remained for seven years, subject, it has been inferred from the opening chapter of 'The Light That Failed,' to narrow and irksome discipline. In 1878, he was sent to the United Service College at Westward Ho, near Bideford, in Devonshire. It was a school managed by civil and military officers for young men who intended to enter the Indian service. The rough life passed there was described in 'Stalky and Co.' (1899), wherein Kipling, who edited for two years the *College Chronicle*, figures as Beetle, the clever versemaker. In 1882 Kipling went out to India and obtained, by the aid of his father, a position on the editorial staff of the *Lahore Civil and Military Gazette*. After five years of this, he became assistant editor of the *Pioneer* at Allahabad, a position which he held until 1889. While on these papers he gained his wide and intimate knowledge of Indian life and affairs at first hand. The newspaper office of his time, he has said, attracted "every conceivable sort of person" from respectable army-officers and missionaries down to inventors of "unbreakable swords" and "every obsolete ruffian that ever tramped the Grand Trunk Road." Out of these motley people, what they told him, and what he saw and divined of them, he built up his tales. By 1886, when he appeared in 'Departmental Ditties and Other Verses,' in a buff paper wrapper, he was known to the literary world as the author of short-stories, local verse-satires and parodies, which he was contributing to his own and other newspapers. Then came 1888, the *annus mirabilis*. In that year Kipling published seven volumes of stories: 'Plain Tales from the Hills'; 'Soldiers Three'; 'The Stolen Gadsby'; 'In Black and White'; 'Under the Deodars'; 'The Phantom Rickshaw and Other Tales'; and 'Wee Willie Winkie and Other Child Stories.' In 1889, he made a tour of the world, with his stories and manuscripts, hoping especially to find a publisher in the United States. In this aim he was immediately disappointed. His severe strictures on America, contributed to the *Pioneer*, were afterward published in New York, and are now included in his works as a part of 'From Sea to Sea.' After a hard struggle, recognition in the western world came to him in 1890, while he was staying in London. To this and the next year belong 'The Courting of Dish Shudd and the Lady City'; 'The City of Dreadful Night and Other Sketches'; 'Life's Handicap'; and 'The Light that Failed.' While in London, Kipling met Mr. Wolcott Balestier, an American author, with whom he collaborated on 'The Naulahka.' In 1892, he married his friend's sister, Caroline Siarr Balestier, and settled near the Balestier Plantation, near Ashboro, Va., eventually building on the hillsise a long, low bungalow, called the Naulahka. There he wrote many of his best poems and stories. For verse may be cited some of the 'Barrack-Room Ballads' (1892) and 'The Seven Seas' (1896); and for fiction, 'Many Inventions' (1893); 'The Jungle Books' (1894–95), and 'Captains Courageous' (1897). Leaving Vermont in 1896, Kipling went out to South Africa in 1898, and paid a brief visit to New York in 1899, where he barely escaped death from pneumonia. He had already made his home in a little English village near Bighton, in Sussex. To this later period belong 'The Day's Work' (1898); 'From Sea to Sea' (1899); 'Kim' (1901); 'The Five Nations' (1902); 'From Sea to Sea' (1903), a volume of verse; 'Traffics and Discoveries' (1904); and 'Puck of Pook's Hill' (1906); 'Actions and Reactions' (1909); 'Rewards and Fairies' (1910); 'A History of England,' with R. C. L. Fletcher (1911); 'Songs of the English' (1913); 'The Harbour Watch' (1913).

Kipling has been one of the most striking figures in English literature since he first came to his own in 1890. It is now a commonplace to say that he revealed India to the western world, not after the romantic manner of Scott's dealing with Scotland, but in a wonderfully direct and realistic way. Of rare perceptive powers, he sees the import of things and is able to convey it to his reader exactly. Perhaps there was no set plan about it, but his early tales comprehended nearly every phase of the English government in India so far as it came under his eyes. In them he jostle the English soldier, the English civiliam, and the native man and woman. He kept most closely to the Punjab, which he best knew; to its sweltering heat under which the mercury climbs slowly to the top of the glass and the printing-presses grow red hot; to its drenching rains, fever and cholera, in other seasons; its blinding sandstorms, and the picnics and intrigues they interfere with; the immense mystery of their life and heaven; the filthy superstition of the natives; the haphazard process of law-making; villages invaded and blotted out by the jungle; and barrack-room yarns in which Tommy Atkins tells of his practical jokes, adventures and death grapples on the battle-field with giant Afghans.

The conditions under which he first worked demanded great concentration of incident and style. Engaged to sort telegrams and clippings or to write editorials for his newspaper, he had little time for developing his stories at length. They were dashed off rapidly from first impressions and made to fit into the scant space that was left for them. Merely the sketch or the outline was given in short jerky sentences, and the more important points were suggested by the epithet that comes only under the intense pressure of the moment. No other story-teller was ever able to put so much as Kipling into so little space. When more at his ease, he developed a type of his own running from 25 to 50 pages. Though, all in all, considering matter and treatment, the best story Kipling ever wrote is 'The Man Who Would Be King.' What happens to one or
the other when the Englishman involves himself with the affairs of the Hindoo woman in 482 'The Days of Clergy' and 483 'Beyond the Pale.' For the uncanny and ghastly may stand 484 'At the Pit's Mouth' and 485 'The Gates of a Hundred Sorrows,' and for ludicrous extravaganza 486 'My Lord the Elephant' and 487 'The Incarnation of Krishna Mulvany.' Among superb battle pieces are 488 'The Taking of Luntungpen,' 489 'The Lost Legion,' 490 'With the Main Guard,' and 491 'Drums of the Fore and Aft.' In the 492 'Jungle Books' Kipling gave fresh life and meaning to the ancient beast-fables of India.

Trained from the beginning in the short story, Kipling seems unable to break from its limitations. 'The Light that Failed,' and 'Captains Courageous' are most readable, but in neither case was the theme thoroughly grappled or the treatment adequate. 'Kim' is not so much a novel as a short story long drawn out. But within the province of the short story Kipling may be classed with Stevenson. A tendency to obscure symbolism, apparent now and then in his early work, has grown upon him, to the harm, it would seem, of his art. 'They,' for example, beautiful as it is, was difficult to understand, and some of the other stories in 'Fictions and Discoveries' were clearly an attempt to transfer to prose the dramatic monologue of Browning. Combined with this endeavor is also a fondness for coincidences, which, though cleverly managed, are unnecessary and unconvincing. The romancing of machinery in '0.07,' and 'The Ship that Found Herself,' so striking and novel at the time of their appearance, have since ceased to interest. Much of Kipling's later work has, however, its own grace and beauty. 'An Habitation Enforced' is certainly a fine story, and 'Puck of Pook's Hill' is a notable experiment in English folk-lore and legend. The later work of Kipling includes three volumes dealing with phases of the Great European War. 'France at War' (1915) is a tribute no less to the nerve and valor of the soldiers of that country than it is to the quiet, patient, day-by-day heroism and self-sacrifice of the women. 'Fringes of the Fleet' (1915) visualizes the work of the submarines, destroyers, and smaller craft of the British navy. 'Tales of the Trade' (1916) tells of the remarkably daring and successful work of the British submarines, especially at the Dardanelles, while 'The Eyes of Asia' (1918) gives the Asiatic view of the war and Europeans. In these, his latest works, Kipling shows all the astounding mastery in phrase-making, the same sure instinct for the inevitable word, that first brought him into fame.

It should be remembered that Kipling was a verse-maker before he wrote tales. As early as 1881 appeared for private circulation his 'School Boy Lyrics.' 'The Departmental Duties' were humorous and satirical jingles, which were originally thrown off without effort to fill in the blank spaces of his newspaper when other copy was wanting. His first great success was with 'Barrack-Room Ballads,' noticeable for the introduction of the British 'Tommy' dialect. They are not narrative ballads of the traditional type; they are rather songs with choruses and refrains, easily lending themselves to memory. In their kind there is nothing better than 'Tommy,' 'Danny Deever,' 'Fuzzy-Wuzzy,' 'Soldier, Soldiery, and Mandelay,' wherein 'the very refusal of language' is made poetical. Kipling's theme has 'broadened with time. No poems of the present generation are better known than 'The Recessional' (1897), composed on witnessing the naval review at Spithead on the occasion of Queen Victoria's diamond jubilee, and 'The White Man's Burden' (1899), an appeal to the spirit of imperialism in the United States. Something of the same exalted strain characterizes his short poem written on the outbreak of the Great European War, "For All We Here And Are." He was awarded the Nobel prize in literature in 1907. See BARRACK-ROOM BALLADS; JUNGLE BOOKS; THE; SOLDIERS THREE; KIM.

Bibliography.—Among the collected editions of Kipling's works in verse and prose are the "Outward Bound" and the "Swastika." "A Kipling Primer," by F. L. Knowles (Boston 1899) contains a brief biography, and a bibliography to date. Richard Le Gallienne's "Rudyard Kipling" (London and New York 1900) is the most complete estimate. Consult also "Rudyard Kipling, the Man and His Work" (London 1899) by G. F. Monkshood (the pen-name of W. J. Clarke); Young, "Dictionary of Characters and Scenes in the Stories and Poetry of Rudyard Kipling" (1911); Durand, "Handbook to the Poetry of Rudyard Kipling" (1914).

WILBUR L. CROSS,
Professor of English, Yale University.

KIPPER, a kipped herring, that is one preserved by smoking or pickling. Anciently in Scotland the word signified a salmon taken after the spawning season, and split, salted and dried, because of its inutility when fresh.

KIPPS BAY, Battle of, in the American Revolution. When Washington retreated from Brooklyn after the battle of Long Island, (Aug. 27) he took position on Harlem Heights, New York, leaving troops lower on the island to oppose Howe's advance. On 15 Sept. 1776 Howe began to land his troops at Kip's Bay where the Americans had thrown up defensive works. When the British and Americans became panic-stricken and, despite the efforts of Washington and Putnam, fled in disorder, whereupon all the troops were withdrawn to the position at Harlem Heights (q.v.). Consult Johnston, H. P., 'The Campaign of 1776'; id., 'Battle of Harlem Heights'; Lossing, 'Field-Book of the Revolution,' (Vol. II, p. 610 et seq.); Lowell, E. J., 'Hessians in the Revolution' (p. 72); Jones, 'New York in the Revolution' (Vol. I, p. 604); Livingston, William E., 'Life of Putnam' (pp. 306-309).

KIPCHAT, kip-chak', or KAPTCHAK, the 'Kingdom of the Golden Horde,' the successor to the kingdom of the famous Mongol conqueror, Genghis Khan, by whose descendants it has been ruled since his day. It was very much mixed up with the affairs of Russia for many years, and the last head of the royal Russian family, had in their veins the blood of the rulers of the Golden Horde, which at one time included much of modern Russia, reaching as it did westward to the Dnieper.
and extending far into central Asia. Its capital, Sarai, which was founded on the Volga in 1242, became, in the course of time, noted for its prosperous trade and market, where the Russians taken in the almost ceaseless contests between Mongol and Slav, were sold. Timur the Terrible plundered Sarai and the surrounding country in 1395, and it suffered several times and later years at the hands of the Russians. The formidable Golden Horde before whose magnificent barbaric court many a powerful Russian prince was forced to bow for centuries finally fell because of dissensions within itself which divided the kingdom into two independent governments. These fell, one by one, before the growing power of the grand princes of Russia, but not without many a bloody struggle which the Slavs long remembered. (See Genghis Khan.) Consult any good history of Russia; also Curtin, 'The Mongols' (Boston 1908); Douglas, 'Life of Genghis Khan' (London 1877); Erdmann, 'Temudschin der Uerschichtliche' (Leipzig 1862); Holworth, 'History of the Mongols' (London 1867-88); Hotke, 'History of the Mongols' (London 1890); Johnston, 'Famous Cavalry Leaders' (Boston 1908).

KIRBY, kër'bi, William, Canadian author; b. Kingston-upon-Hull, England, 13 Oct. 1817; d. 1906. He removed to Canada in 1832. In 1839 he went to Niagara, Ontario, where he edited the first newspaper, the Maid of the Mist, for 23 years, and from 1871 to 1895 was collector of customs. He published 'U. E., a Tale of Upper Canada,' a poem (1859); 'Le Chien d'or,' a novel (1867); 'Pontiac' (1867); 'Canadian Idylls' (1888); 'Annals of Niagara' (1896). His title to fame rests on his great historical romance, 'The Golden Dog,' a work that depicts with remarkable power the historical personages associated with the last years of the French regime in Canada, and has been instrumental in securing the establishment of Queen's Park, in which the scene of the romance is laid.

KIRCHBACH, kir'bär, Wolfgang, German critic and poet; b. London, England, 18 Sept. 1857; d. 1906. He was the son of a German artist and studied in Dresden and Leipzig. Settling in the former city in 1888 he was editor of the Magazin für Litteratur der In- und Auslande; but from 1896 lived in Berlin. Among his works may be cited 'Märchen' (1879); 'Salvator Rosa,' a romance (1880); 'Gedichte' (1883); 'Das Leben auf der Walze' (1892); 'Die letzten Menschen,' a drama (1892); 'Miniaturen' (Stuttgart 1892); 'Des Sonnenreichs Untergang' (Dresden 1895); 'Gordon Pascha' (ib. 1895); 'Eginhardt und Emma' (ib. 1896); 'Der Lieder vom Zweiarc' (1900).

KIRCHHOFF, kir'khôf, Charles William Henry, American editor and steel expert; b. San Francisco, Cal., 28 March 1853; d. Ashbury Park, N. J., 22 July 1916. He attended school in the United States and Germany and was graduated from the Royal School of Mines at Clausthal, Germany, in 1874, taking the degree of doctor of philosophy and engineering. During the next three years he was chemist, assayer and assistant superintendent of the Delaware Lead Mills at Philadelphia. Beginning his career in technical journalism in 1876, when he was correspondent of English, German and Capetown, Africa, papers, he became connected with the Metallurgical Review in 1877, and a little later joined the editorial staff of the New Age, leaving it for a time to be managing editor of the Engineering and Mining Journal, but returning in 1884. Four years later he became its editor-in-chief and vice-president of the David Williams Company, the publishers. Mr. Kirchoff kept the editorial work in which he won distinction, until his resignation in 1909, although he had been asked by Mr. Andrew Carnegie to quit New York for Pittsburgh and the Carnegie Steel Company. From 1896-99 and 1911-12 he was president of the American Institute of Mining Engineers. He was at one time a special agent of the United States Geological Survey for the collection of statistics of the production of copper, lead and zinc. He was a member of the Iron and Steel Institute, was once president of the Germania Club and was a member of the American Society of Mechanical Engineers.

KIRCHHOFF, Gustav Robert, German physicist; b. Königsberg, 1824; d. 1887. Graduated from the university of his native city, he was elected professor of physics at Breslau (1850), and four years later he went in the same capacity to Heidelberg, and then to Berlin (1875-87). He made many original investigations in the realm of physics and was joint discoverer with Bunsen of the spectroscope. His collected works, consisting principally of essays on his special subject of teaching, physics, were published in 1882, and a second edition was issued four years after his death.

KIRCHHOFF, kir'khôf, Johann Wilhelm Adolf, German writer and classical scholar; b. Berlin, 1820; d. 1908. Educated in his native city he was a teacher in various colleges, finally becoming professor in Berlin University (1865-1908). He was an indefatigable worker in the field of classical philology, linguistics, mythology and antiquities. A great deal of his investigations saw the light in print, hence his publications are many, and all of them are distinguished by depth of thought, neatness and careful and minute investigation. Among the most noteworthy of his published works are 'Umbrische Sprachdelemäler' (1849-51); 'Die Stadtrecht von Bantia' (1853); 'Euripides' (1855); 'Die homerische Odyssee und ihre Entstehung' (1859); 'Uber die Entstehungskrise des herodotischen Geschichtswerkes' (1870); 'Studien zur Geschichte des griechischen Alphabets' (1874); 'Thucydides und sein Umrudendmaterial' (1895); and edited editions of 'Plotinus' (1856); 'Erschein' (1880); 'Respublica Atheniensium' (1881); 'Christian Inscriptions.'

KIRCHMANN, kir'kman, Julius von, German writer and philosopher; b. near Merseburg, 1802; d. 1884. Educated in law at Leipzig and Halle, he became, some time afterward, state attorney in the Berlin Criminal Court (1846). He was successively a member of the National Assembly of Prussia (1848) and of the German Reichstag (1871-76). He studied and wrote much upon philosophy of
which he was recognized as one of the leading writers of his day. Among his published works are 'Die Wertlosigkeit der Jurisprudenzen als Wissenschaft' (1848); 'Ueber Unsterblichkeit' (1865); 'Aesthetik auf realistischer Grundlage' (1888), and many translations from the great philosophers, including Aristotle, Grotius, Hume, Kant, and Leibnitz. Consult Lasson and Meinecke, 'Julius von Kirchmann als Philosopher' (Halle 1885).

KIRCHWEY, George Washington, American writer on legal subjects: b. Detroit, Mich., 3 July 1855. Graduated in law from Yale University, he practised his profession in Albany, N. Y., for 31 years (1882-91), where he was dean of the Albany Law School and professor of law in Union University (1889-91). On leaving Albany he became professor of law in Columbia University (1891-1901), dean of the law school there (1901-10), and Kent professor of law Columbia University (1902-16), warden of Sing Sing Prison (1916). Professor Kirchwey has been president of numerous societies of note, legal and otherwise, among them the American Peace Society, American Society of International Law, and the American Institute of Criminal Law and Criminology, and he has contributed extensively to legal, technical and other magazines. At the close of 1918 he was appointed director of the United States Employment Service for New York State. Among his published works are 'Historical Manuscripts of the State of New York' (which he edited, 1887-89); 'Readings in the Law of Real Property' (1900); 'Select Cases and Other Authorities on the Law of Mortgage' (1901).

KIRGHIZ, kir-giz', KIRGHIS, or KIRGHIZ, a widespread nomadic people of Asia, of Turkish-Tartar race, who inhabit the steppes that extend from the lower Volga and the Caspian Sea in the west to the Altai and Thian-Shan Mountains in the east, and from the Sea of Aral in the south to the Turan on the north. They are divided into hordes, the Great Horde inhabiting both Russian and Chinese territory; the Middle Horde, Siberia, and the Little Horde the Volga-Ural steppes in European Russia. The term Kirghiz, though applied by Europeans to the whole of the people, properly belongs only to the Kara-Kirghiz (Black Kirghiz, called also Buruts or Fruts). Those to whom Europeans give the name Kirghiz are called by the Asiatics Kazaks. The Kirghiz-Kazaks speak the Turkish dialect of the Uzbeks. In their physical type they belong to the Mongolian race. They profess the Mohammedan faith, though they do not practise polygamy. They are below the general average of Europeans but are markedly healthy and vigorous. Their food is chiefly mutton and horse-flesh, with koumiss or fermented mare's milk, from which they extract an intoxicating spirit. Their dwellings consist of a hemispherical tent, the frame of which is of boughs, the covering felt; they are exclusively domestic, and consist of woolen cloths, felts, carpets, hair-ropes, leather, metal ornaments for horses-trappings, knives, etc. They carry on a trade by barter with the Chinese and Russians, exchanging sheep, horses, camels, cattle, wool, silk, etc. for tea, cutlery, silks and other manufactured goods. A considerable portion of the Kirghiz dwell in Chinese territory, for the most part in Turkestan, but the greater number of them are under Russian domination. Of these European Russia contains some 150,000. Consult Levshin, Alexis, 'Description des hordes et des stepes des Kirghiz-Kazaks' (trans. from the Russian by Ferry and Lejeune, 1844); 'Die primitive Kultur des turok-tartarischen Volkers' (Leipzig 1879); Karutz, R., 'Unten Kirgisen und Turkmenen aus dem Leben der Steppe' (Leipzig 1911); Parker, E. H., 'A Thousand Years of the Tartars' (1895).

KIRIN, ké-řen', the central province of Manchuria and its capital of the same name. The name, which means 'Loo, forest,' is in Chinese Ki-lin. Kirin province lies between the Sungari River on the north, the Usuri River and Russia on the east, Korea and Shengking province on the south, and the Sungari River on the west. A part of the country is very mountainous, the elevation of places, to the regions of perpetual snow, but that section of the province which lies within the bend of the river Sungari is level and inclined to be low in places. The highest range of mountains in Kirin is the Shan-a-lin, the upper ranges of which are known as Chang-Peh-Shan, or Ever-white Mountains. These rise, in places, to an elevation of over 10,000 feet, are covered, in their highest peaks, throughout the year with snow, hence their name. In addition to the two important rivers already mentioned Kirin has a third great river, the Hurka, which is inferior only to the Sungar, which, after a long and tortuous course, ultimately reaches the Amur. The Usuri, which is over 500 miles in length, is also a tributary of the Amur. A large part of the province is level and well adapted to agriculture and cattle-raising, but it is not so largely cultivated as the provinces of China. The mountainous regions are still in a state of sylvan wilderness and there tigers, mountain cats and various species of wild animals and birds abound, and the rivers and streams in the upland course are abundantly filled with fish. Among the products of the agricultural section of the country are barley; cotton, millet, pulse and other grains, potatoes and other root crops, and in the low sections rice, while poppies are grown everywhere. Among the important cities of the province are Kirin, 100,000; Ashiho, 60,000; Petuna, 40,000; San Sing, 30,000; Lalin, 26,000, and Ninguta, 23,000. The capital, Kirin, which lies along the foothills on the shore of the Sungari River, is the most handsome and favorably situated town of the province. It is surrounded by tobacco plantations and upland forests, which furnish it with a very considerable portion of its export trade. The tobacco goes to China, the timber to the regions farther down in the flat country where timber is not so plentiful. Owing to the abundance and excellent quality of the wood in the market the city does an extensive business in the building of boats for river trade; for this reason the Chinese call the city the 'Navy Yard' ('Chuen Chang'). The neighboring mountains are rich in ore, some of which has been exploited, especially silver, but most of them are unproduct. Kirin is well paved and is one of the cleanest cities in the province. Its many well-
attended squares and small parks give it a decided home-like appearance. Pop. of province, 1982, 26,000.

KIRK, kirk, Edward Norris, American Congregational clergyman: b. New York, 14 Aug. 1802; d. Boston, 27 March 1874. He was graduated at Princeton (then the College of New Jersey), in 1820, studied law in New York, was graduated from the Princeton Theological Seminary in 1825 and licensed to preach in 1826, was agent for the Board of Foreign Missions in the Middle States, and South Carolina, Georgia and Virginia, in 1829-37 was pastor of the Fourth Presbyterian Church of Alhambra, N. Y., and was the principal in establishing with N. S. Beman and others the Troy Theological Seminary, the forerunner of the Union Theological Seminary of New York City (q.v.). From 1837-39 he traveled extensively in Europe, becoming upon his return secretary of the Foreign Mission Society. From 1842 until his resignation in 1871 he was pastor of the Mount Vernon Congregational Church of Boston. In 1856 at the request of the American and Foreign Christian Union he inaugurated regular lecture series in Pennsylvania, previous to and during the Civil War he was one of the most outspoken and strongest supporters of anti-slavery. He was president of the American Missionary Association, and published 'Sermons in England and America' (New York, 1840); 'Lectures on the Parables of Our Saviour' (New York, 1856); 'Discourses, Doctrinal and Practical' (Boston, 1860), and many other single sermons and addresses. He also translated and edited with introductions S. R. L. Gouven's 'Theopneustia,' or the Divine Inspiration of the Holy Scripture (New York, 1842); the same writer's 'Canon of the Holy Scriptures' (Boston, 1866), and J. F. Astie's 'Louis XIV and the Writers of His Age.' His 'Lectures on Revivals' were collected and edited by D. J. Watts (Boston, 1874). Mears, D. O., 'Life of E. N. Kirk' (Boston, 1877), and other writings.

KIRKBRIDE, Thomas Story, American physician: b. near Morrisville, Bucks County, Pa., 31 July 1809; d. Philadelphia, 16 Dec. 1853. His ancestors, who had been colonists with William Penn, were, like himself, members of the Society of Friends. He received the degree of M.D. from the University of Pennsylvania in 1832, and was appointed resident physician of the Friends' insane asylum at Frankfort, Pa. A year later he was elected resident physician of the Pennsylvania hospital, in which he continued two years, when he began general practice in Philadelphia. In January 1841 he became superintendent and physician-in-chief of the Pennsylvania Hospital for the Insane, which had then opened, and continued in that office till his death. He was one of the most active members, and successively secretary, vice-president and president of the Association of Medical Superintendents of American Institutions for the Insane. He published 'Rules and Regulations of the Pennsylvania Hospital for the Insane' (1830), which has been a textbook and guide in the regulations of new hospitals, and a work 'On the Construction, Organization and General Arrangements of Hospitals for the Insane' (Philadelphia, 1854, enlarged 1880). In 1853, he proposed the erection of a new hospital, and the separation of the sexes in the different buildings, and was the first superintendent in the United States to carry such an arrangement into effect. In many other respects he was in the forefront of American alienists, holding advanced views in regard to the medical and hygienic treatment of insane persons. He was one of the most ardent and successful fighters for more humane and rational treatment of such sufferers and much of the admirable conditions now existing in public institutions for the insane is due to his efforts and initiative. Consult Anon. 'A Memorial of T. S. Kirkbride, M. D.' (in Pennsylvania Hospital of the Insane, Report for the Year 1883, p. 26, Philadelphia 1884); Curwen, J., 'Thomas S. Kirkbride' (in Proceedings, American Philosophical Society, Vol. XXII, p. 217, Philadelphia 1885).

KIRKCALDY, Sir William, Scottish leader, politician and adventurer: b. 1520; d. 1573. He had a very checkered and unsavory career. Faithlessness to party and principles, treachery, intrigue and murder formed a distinctive feature of his life; and he is notable for the things that stood in the way of his ambition seem to have been sacred. He took part in the murder of Cardinal Beaton at Saint Andrews (1546). He served as secret agent for Edward VI of England in France and elsewhere for several years, but later on he took up the cause of the king of France. On his return to Scotland he became prominent as an ultra-Protestant leader, and as such took part in the murder of Rizzio, the favorite of Mary Queen of Scots. Then turning his arms and his influence against the latter queen he contributed powerfully to her defeat at Langside. But finding Protestantism not altogether conducive to his ambitious schemes, he deserted the Protestant party and took up the cause of Mary Queen of Scots. The latter step led to his own downfall. The English government sent a powerful force against him, and the Regent Morton, seconding the efforts of the latter, defeated Kirkcaldy and forced him to retreat to his strongly fortified castle. There, after standing a siege for some time, he was captured and later on he was hanged. Having failed in all his plans and enemies alike, he finally found himself without friends. John Knox, with whom he had been hand in glove in the days of his ultra-Protestant attitude, later denounced him as a traitor, murderer and cut-throat. Consult any good history of Scotland or Life of Mary Queen of Scots.

KIRKCALDY, ker-kal'di, a seaport town in Fifeshire, Scotland. It is situated on the Firth of Forth, north of Edinburgh. It has excellent and extensive harbor and wet dock facilities and a large maritime trade, both coast and overseas. Its vessels do a direct trade with New York, Canada and parts of Central America. So important is this foreign trade of Kirkcaldy that the United States is represented there by a consul agent who has been instrumental in increasing the trade between American ports and Kirkcaldy. It is an old town, having been in existence in the 12th century, and a place of some considerable importance by the middle of the 15th c. It is a long, straggling town, which has been built up...
considerably of late, but it is still known as the long town on account of its covering close upon a mile in length, largely and other water-front. It has numerous fine buildings, and is supplied with libraries, schools and all other facilities for education. Its imports are large and varied, while its exports include coal, coke and patent fuel. Its local industries consist in the making of linen, and other kinds of yarns, linenoleum, carpets and machinery. Pop. 43,000.

KIRKDALE CAVE, in Yorkshire, England, 28 miles west of Scarborough, is famous for the numerous remains of Tertiary mammals. It was discovered in 1821, in the cutting back of an oolitic limestone rock in which it is situated. Its greatest length is 245 feet. The fossil bones are contained in a deposit of mud that lies on the floor of the cave. The remains of the following animals have been discovered: Hyena, tiger, bear, wolf, weasel, elephant, rhinoceros, hippopotamus, horse, ox, deer, hare, rabbit, water-rat, raven, pigeon, lark and duck.

KIRKE, Sir David, English adventurer: b. Dieppe, France, 1597; d. Ferryland, Newfoundland, 1656. The "merchant adventurers" of London were at the beginning of his life a powerful body of associated privateers, and his father, George Kirke, a dealer in French wines, who left France to escape from the perils of the religious wars, joined the adventurers and projected with Sir William Alexander a plan for capturing New France and colonizing Nova Scotia. They obtained letters of marque and a monopoly of the fur trade, and David Kirke sailed in 1627 as commodore of three privateers, his brothers, Lewis and Thomas, being each in command of one. Off Quebec they captured 20 French ships with cargoes and passengers. In 1629 he captured another vessel and compelled Champlain to surrender Quebec. In the meantime peace had been made with France, the captured territory was restored, but Kirke was knighted for his services. He seemed doomed to disappointed ambition to the end, for Cromwell's council revoked, after the execution of Charles I, the grant of all Newfoundland made to Kirke in 1637 by the king, although the adventurer eventually recovered most of the lands thus confiscated. Consult Kirke, H., 'The First English Conquest of Canada' (London 1871).

KIRKLAND, Caroline Matilda Stansbury, American author: b. New York, 12 Jan. 1801; d. there, 6 April 1864. In 1827 she married William Kirkland, a professor in Hamilton College, Clinton, N. Y., removing with him to Michigan in 1839. She lived for a few years a pioneer life and her experiences furnished the basis of her earlier books published under the pseudonym, "Mary Clavers." These include: 'A New Home; Who'll Follow?' her best work (1839); 'Forest Life' (1844), and 'Western Clearings' (1846). In 1842 she made her home in New York, where she established a school for girls and contributed frequently to periodicals. Among her later works are 'The Helping Hand' (1853); 'Memoirs of Washington' (1857); 'The Destiny of Our Country' (1864).

KIRKLAND, James Hampton, American educator: b. Spartanburg, S. C., 9 Sept. 1859. He was graduated from Wofford College (Spartanburg, S. C.) in 1877, was assistant professor of Latin, 1880-82, and professor of Latin and German in 1882-83. After European study (1883-86), he was professor of Latin in Vanderbilt University (Nashville, Tenn.) in 1886-93, and in 1893 became chancellor and professor of Latin language and literature. He is the author of several biographies, and published a 'Study of the Anglo-Saxon Poem called by Grein 'Die Höllenfahrt Christi'' (1885), and an edition of the 'Satires and Epistles of Horace' (1893). Since 1893 he has made many contributions to educational journals, and has filled positions in numerous educational societies. For 14 years he was secretary of the Southern Association of Colleges and High Schools; in 1911 president of the Religious Education Association; in 1914 president of the Classical Association of the Middle West and South. He was a member of the Southern Education Board and is at present connected with many educational movements and organizations. He has received the degree of D.C.L. from the University of the South, and L.L.D. from the Universities of North Carolina, Pittsburgh, Missouri and from Wesleyan University.

KIRKLAND, John Thornton, American Unitarian clergyman and college president: b. Little Falls, N. Y., 1770; d. Boston, 26 April 1840. He was the son of Samuel Kirkland (q.v.), was graduated at Harvard College in 1789, and ordained pastor of the Congregational (Unitarian) Church in Summer Street, Boston, in 1794, where he remained till elected president of Harvard College in 1810. He held this office until 1828. His 'Life of Fisher Ames' (1809) is perhaps the most valuable of the several biographies of which he was the author, and his 'Eulogy of General Washington' was much admired. He exerted a very great influence during his life, by the force of his intellect and character, and during his presidency the college flourished, both in its internal condition and in its external relations.

KIRKLAND, Joseph, American novelist: b. Geneva, N. Y., 7 Jan. 1830; d. Chicago, 1894. He was the son of Caroline Kirkland (q.v.), was educated in the schools of Michigan, resided with his parents in New York, making his home in Illinois after 1856. During the Civil War he served in the Federal army, attaining the rank of major, and after engaging in coal mining in Illinois and Indiana for a time, practised law in Chicago. He published 'Zury, the Meanest Man in Spring County' (1887), a faithful story of the beginning of pioneer life in Illinois; 'The McVey's' (1888); 'The Captain of Company K' (1889); 'The Chicago Massacre of 1812' (1893); 'The Story of Chicago' (1892-94; rev. ed. 1904).

KIRKLAND, Samuel, American missionary to the Indians: b. Norwich, Conn., 1741; d. 1808. He was graduated at Princeton 1765. He had previously visited the Senecas for the purpose of studying their language. In 1766 he was ordained, and sent by the Congregational Church to preach to the Indians. After living among the Senecas for a year and a half he went to the Oneidas, whom he considered to be the highest type of the Iroquois. During
the Revolution he persuaded the Oneidas and Tuscaroras, who were bent on taking one side or other, to join the Americans, instead of the British. He saw considerable success as a military chaplain, especially with General Sullivan on the Susquehanna, in 1779. In 1793 he founded the Hamilton Oneida Academy for the education of Indian boys. This is now known as Hamilton College. In 1794, the Indians made complaints concerning his administration, and he published a vindication, which with his letters and journals, furnishes a unique picture of life among the Iroquois. Consult Lothrop, 'Life of Samuel Kirkland.' (1848).

KIRKMAN, Marshall Monroe, American railway official; b. Illinois, 10 July 1842. He entered the railway service of the Chicago and Northwestern Line in 1856, held various posts in different departments, was comptroller in 1881-89, and in 1889 became second vice-president. He has been a constant writer on railway subjects since 1877. His chief works are: 'The Science of Railways' (1894; revised and republished in 17 volumes 1909); 'The Classical Portfolio of Primitive Carriers' (1896); 'The Air Brake' (1901); 'Building and Rebuilding Railways' (1st ed. 1899; 2nd ed. 1903); 'G. E. Gilbert Holmes' (1900); 'Iskander' (1903); 'The Alexandrian Novels' (3 vols., 1909); 'History of Alexander the Great' (1913).

KIRKPATRICK, Alexander Francis, English clergyman and educator; b. Lewes, Sussex, 30 Jan. 1849. He was educated at Trinity College, Cambridge, and elected one of its Fellows in 1871. He was ordained deacon in 1874 and priest in 1875. He was assistant tutor in Trinity College, 1871-82; also junior dean, 1876-82; regius professor of Hebrew and the same time canon of Ely 1882-1903; honorary canon of Ely and Lady Margaret Professor of Divinity, 1903-06; master of Selwyn College, Cambridge University, 1898-1907; dean of Ely since 1907. He is the editor of the Oxford University press. Among the volumes of his 'Cambridge Bible for Schools and Colleges.' To this series he contributed 'The First Book of Samuel' (1880); 'The Second Book of Samuel' (1881); 'The Book of the Psalms' (3 vols., 1890-1901). He is also the author of 'Divine Liturgy of the Old Testament' (1891; new ed. 1914); 'The Doctrine of the Prophets,' the Warburtonian Lectures for 1886-1890 (1892); 3d ed., 1912).

KIRKSVILLE, kérk's vil, Mo., city and county-seat of Adair County, on the Omaha and Kansas City and the Wahash railroads, 204 miles northwest of St. Louis. It was first settled in 1840, and adopted the commission form of government in 1914. There is a normal school here, court-house, public library and numerous churches. It is the seat of the original school of osteopathy. It lies in the centre of an extensive agricultural district and has coal mines and manufactures of iron, wagons, carriages, shoes, etc. The waterworks are the property of the municipality. Pop. 6,347.

KIRKUP, kérk'up, Thomas, English writer on economical and social questions; b. 1834; d. 1912. Educated at the universities of Edinburgh, Berlin, Paris, Göttingen, Tübingen and Geneva, he entered literature, and gave much attention to the study of socialism and to other subjects and social movements of the latter half of the 19th century and the first decade of the present. History and economics, especially their modern phases, occupied much of his attention. On all of these subjects he contributed extensively to various works of reference, especially to 'Chambers' Encyclopedia' and the 'Encyclopædia Britannica.' Among his published works are: 'An Inquiry into Socialism' (1867); 'History of Socialism' (1882); 'South Africa, Old and New' (1903); 'Progress and the Fiscal Problem' (1905); ' Primer of Socialism' (1908).

KIRKWALL, kêrk'wäl, capital of the Orkney Islands. It is a seaport and has an extensive import and export trade and regular steamship communication with all the important ports of Scotland and England and with Leith, Aberdeen and Berwick, ports of the Shetland Islands. It imports timber, flour and other articles of food and exports principally herrings, the fishing of which forms the occupation of most of the coast people. Kirkwall is quite an old city and has numerous ruins of ancient places that played a part in its past history. It is first mentioned in the 10th century and it was made a royal burg in 1480. Its fine old Norman-Gothic cathedral dates back to the first half of the 12th century. Pop. about 4,000.

KIRKWOOD, kêrk'wod, Samuel Jordan, American political leader; b. Hartford County, Md., 20 Dec. 1813; d. Iowa City, Iowa, 1 Sept. 1894. Having removed to Richland County, Ohio, in 1835, he studied law, was admitted to the bar in 1843, in 1845-49 was prosecuting attorney of the county, and in 1850-51 a member of the State Constitutional Convention. In 1855 he established himself in milling and farming in Iowa, the next year was a member of the State Senate and in 1860-64 Republican governor of Iowa. During the Civil War he levied 48 regiments of volunteers and equipped them at $50,000 less than the usual cost. He was United States Senator in 1865-67 (completing the unexpired term of James Harlan, resigned), was again elected governor of Iowa in 1875, in 1877-81 was a member of the Senate, and from 5 March 1881 to 6 March 1885 was Secretary of the Interior in Garfield's Cabinet. He then withdrew from political life.

KIRMESS. See KERMESS.

KIRSCH, Johann Peter, German ecclesiastic and author; b. Dippach, Luxembourg, 3 Nov. 1861. He received his education at the Luxemburg Seminary, the Campo Santo Telesculo and the Vatican Archives Paleographic School, Rome. In 1884 he was ordained priest of the Roman Catholic Church and in 1888-90 was director of the Historical Institute of the Görres Society. Since 1890 he has been professor of pathology and Christian archaeology at the University of Fribourg, Switzerland. He has published 'Die christlichen Culturgebäude im Alterthum' (1893); 'Die päpstlichen Kolledorien in Deutschland während des 14. Jahrhunderts' (1894); 'Die Finanzverwaltung des Kardinalkollegiums im 13. und 14. Jahrhundert' (1895); 'Die Abbekationen und Gebete der altchristlichen Grabschriften' (1897); 'Die christliche Epigraphik und deren Bedeutung für die kirchengeschichtliche Forschung.' (1899); 'Lehre von der Gemeinschaft
KIRSCH, KIRSCHWASSER, kirsch-väsär, a liquor in general use in Germany. It is made from cherries, hence its name which signifies literally "cherry water." It is a distilled liquor and is made chiefly in the Black Forest and in Switzerland. In English-speaking countries kirschwasser is frequently called cherry-brandy. This is really what it is; but it must be distinguished from cherry brandy which is made from a mixture of the juice of cherries and ordinary brandy.

KIRSCHNER, kirsch'när, Lola (Aloysia), Austrian novelist: b. Prague, 1854. She wrote very much under the pseudonym of Ossip Schubin, a name by which she is still generally better known to the reading public of Austria than by her own. Her novel "The Plume" she took from 'Helena,' a novel by Turgenev. She came of good family and was privately educated by excellent tutors at home, at Loclov. She traveled extensively and frequented the capitals of Europe where the fashions of the various nations were and still are accustomed to meet. This society in Berlin, Brussels, Paris and Rome attracted her irresistibly and she set herself to study it. She soon began to reproduce it in works of vivid presentation and truth of characterization. She is especially severe on the military and ruling classes of Austria which she depicts with great detail intermingled with biting sarcasm. All her works show great talent; but they are too often marred by haste and want of care in details. Her published works are: 'Echo' (1882); 'Die Geschichte eines Genies' (1884); 'Unter Uns' (1884); 'Gloria Victis' (1885); 'Erlachoff' (1887); 'Es fieh ein Reif in der Frühlingsschaft' (1888); 'Ausbein aus dem Leben eines Virtuosen' (1888); 'Boris Len-skj' (1889); 'Dieheimischle, Geschichten' (1889); 'O du mein Oesterreich' (1900); 'Finis Poloniae' (1893); 'Toter Frühling' (1893); 'Gebrochene Flügel' (1894); 'Die Heimkehr' (1897); 'Slavische Liebe' (1900); 'Marska' (1902); 'Refugium - Pecatorum' (1903); 'Der kunstdeameren' (1903); 'Der arme Nick' (1906); 'Primávera' (1908); 'Miserere nobis' (1910).

KIRLYU, k'ir'yoo', a Japanese city in the prefecture of Gunma. It lies north by north-west of Tokio, by which it is connected by rail over a distance of some 80 miles. It has a very considerable local trade, has been growing steadily of late and produces extensive quantities of excellent silk, for the manufacture of which and of satin it has large mills fitted with the latest modern machinery. Kiryu is one of the most progressive of the smaller cities of Japan. Pop. about 40,000.

KISER, ki'zér, Samuel Ellsworth, American journalist and author: b. Shippensville, Pa., 2 Feb. 1862. During the Civil War was taken by his mother to Washington, D. C., where his father, a soldier, was stationed for brief period. He entered journalism in Cleveland, later engaged in editorial work in Chicago and has been a regular contributor since 1900 to magazines and newspapers. He is also a lecturer and advertising specialist. He published: 'Budd Wilkins' (1888); 'Georgie' (1900); 'Love Sonnets of an Office Boy' (1902); 'Ballads of the Busy Days' (1905); 'Charles the Chauffeur' (1905); 'The Whole Glad Year' (1911); 'The Land of Little Care' (1912).

KISPALUDY, kiś'po-lú-dí, Alexander (Sandler), Hungarian poet and dramatist: b.
KISFALUDY — KISH.

KISFALUDY, Charles (Karoly), Hungarian poet and dramatist: b. Tet, 5 Feb. 1788; d. Pest, 21 Nov. 1830. A brother of Sandor Kisfaludy (q.v.), he early showed the family bent for literature and its talent for imaginative thinking and description. After some time spent in literary preparation he went to Pest in 1817 and there began turning out with wonderful rapidity, work covering almost every field of literary endeavor, until he soon placed himself in the fore rank of poets and dramatists in his own country. He became by far the most popular of the Hungarian dramatists of his day and he made of comedy a feature of the Hungarian stage to such an extent that he is to-day looked upon as the founder of the Hungarian drama. Many of his comedies have been translated into German, French and other European languages. Though they are only slightly inferior to his comedies, but superior to the work of his contemporaries, the best of his tragedies is *Irene*; and of his comedies are *The Murderer* and *The Suiters.* He also wrote good poems and excellent short stories and longer tales and talented humorous pictures of Hungarian life. His efforts in this direction created a school of younger writers who, in the work of their master, at least helped to make the literature of the country imaginative and truthful to life. But his services in the development of the Hungarian theatre surpass all his other efforts and have justly made him one of the foremost figures in Hungarian life. The Kisfaludy Society, founded in honor of him and his brother, to promote the interests of Hungarian literature, has recognized, to the full, his literary services and has made his work well known, not only at home but in foreign countries. Consult Bánóczi, for his life and works (Budapest 1882); Gaal, *Theater der Magyaren* (a translation of the best of his dramatic works, Bonn 1820); Hornianszky, J., *Irene* (translated into German, 1861). One of the best collections of his works is that published by Bánóczi at Budapest in 1893. Previous to this six other editions had already been published, and several complete or partial editions have been issued since then.

KISH, Dynasty of (4401 to 3815 B.C.), the second of the Babylonian dynasties of the Sumerian rulers. It followed the Opis dynasty which appeared in the north of Arabia, and east of the Tigris, and counted six known rulers. The Kish dynasty arose in the east of Babylonia superseding the Opis rulers; and the sovereigns appear to have been both temporal and spiritual rulers, that is, they were both high priests and kings; and it seems probable that, at this time in the history of Babylonia, belief was held that the sovereigns were of divine origin and hence the representatives of the gods, or at least the chief of the deity upon earth. That the Kish sovereigns played an important rôle in Babylonia in their day is evident from their written records which have survived the ravages of time. These are comparatively plentiful. They show that the dynasty consisted of at least eight rulers designated as follows: Azag Bau, who is said to have been a woman and to have reigned 100 years; Basha Eznum, 25 years; Ur Zamama, 6 years; Zimudar, 30 years; Uuzwidad, 6 years; Eimmu, 11 years; Igu Babbar, 11 years; Nanyacht, 3 years; a total of only 192 years, or just half of which time is occupied by the reign of one sovereign out of the eight. Yet the total length of the duration of the dynasty is given as 586 years. Undoubtedly the first sovereign, Azag Bau, is either altogether traditional, or is the family or tribal name of a number of sovereigns. Even at this early period in their history the Sumerian people gave every evidence of having been highly advanced in civilization. They had their own peculiar system of writing which was different from that of the Semitic races, by whom they were surrounded then or at a later date. From the nature of the existing records of the Kish dynasty, it seems probable that they recount the deeds of the medes and the kings of the rulers of the Sumerians at this comparatively early period in their national existence. The records give lists of other rulers who flourished or about the same time as the kings.
of the Kish dynasty; but, so far, there seems to be no reason for supposing that they belonged to the dynasty itself; but rather that they were rulers of adjacent territory over which they held independent sovereignty. Probably further discoveries of records and the decipherment thereof may bring to light more definite and detailed information relative to the Kish rulers, those ancient Asiatic sovereigns who appear upon the sun-line of the horizon of semi-mythical history, behind which even the brightest tradition grows cloudy. See Egypt, History.

KISHINEFF, késh-néff', Russia, the capital of the government of Bessarabia, 86 miles northwest of Odessa, on the Blyk, an affluent of the Dniester. It is a bishop's see, is well laid out on a picturesque site, and among its educational institutions are a seminary for priests, two gymnasia, a public library and botanical garden. The grapevine, plums and tobacco are cultivated in the vicinity; it has manufactures of flour and woolens, candle and soap works, and a considerable commerce with the East. Kishineff arose around the monastery of Kishnosaref in the 15th century. During 1812 it was subjected to attacks from the Turks and in 1812 was annexed by Russia. It came into world-wide prominence in 1903 owing to a shocking massacre of Jews on the Russian Easter and succeeding days. Pop. 128,290, consisting of Russians, Moldavians, Jews, Bulgarians, Wallachians and Tartars.

KISHON, kish'áh-nóhn, the biblical name of a river in Palestine. It is called El-Mukatta by the modern Arabs. It rises on Mount Gilboa, and pursues a northwesterly course through the plains of Edom and Judah, and empties into the Bay of Acre. Here Elijah slaughtered the priests of Baal, and Deborah and Barak defeated Sisera. The French and Turks fought a battle on its banks in 1799.

KISS, kis, August, German sculptor: b. near Ples, 11 Oct. 1802; d. Berlin, 24 March 1868. Educated in Berlin, he soon showed, after graduation, considerable originality which one of his teachers, Rauch, had early discovered in him. His first notable work, 'A Mounted Amazon attacked by a Tiger,' was produced for Louis I of Bavaria (1842), in marble and afterward cast in bronze by the noted founder, Fischer, for the portico of the Berlin Museum, where it still forms one of the notable and attractive features of the art treasure of the German capital. Kiss made a very careful study of animals at rest and in action and was able to seize, in a notable manner, the striking features of animal life and to couple them with infinite and carefully wrought-out details. These and other qualities, especially dramatic action and clever grouping, which distinguish all his work, are specially present in this, his first great effort, which is, by the general consensus of opinion, looked upon as the best expression of his ideals, his planning and his execution. Kiss made numerous copies, all executed on a high plane, some of them of notable persons and others of them developing some incident or scene. Among the most notable of his works are 'Equestrian Statue of Frederick the Great' (1847, at Breslau); one statue of Frederick William II at Potsdam, and another at Königsberg; 'Saint Michael Fighting the Dragon' (Babelsberg Castle); 'Saint George Slaying the Dragon' (in the courtyard of the Schlosshof, Berlin); 'Faith, Hope and Charity' (marble group, National Gallery, Berlin); six fine bronze statues of Prussian generals (Wilhelms Platz, Berlin).

KISS, kish, Josef, Hungarian Jewish poet: b. Temesvar, 1843. His name was originally Klein. His poems which deal principally with Jewish life, legend and history are often mingled with Magyar life, customs and traditions. His work is of two distinct kinds, religious and non-religious. His general popularity, which grew from year to year, was acquired, for the most part, from his non-religious writings, while he gained an added hold on the deeply-religious Jews of Hungary through his religious poems. He wrote lyrical, narrative and descriptive poems and excellent ballads and hymns. His first volume of lyrics, though displaying considerable power, attracted little attention because the author had not as yet acquired the individuality of style and subject matter which afterward was to distinguish him from the rest. He owes his popularity more to his ballads than to any other of his literary efforts, because of their life and his individualistic manner of treatment of his subjects. He has published a volume of 'Poems' (1869); 'Lyrics' (1870). and 'Religious Poems' (1888). But between times he contributed to the local press especially to the Jewish organs poems covering a wide range of subjects and a notable variety of treatment. Later on many of his literary efforts were published in The Week (A. Ke.), of which he became editor in 1890. In 1913, this date being the 70th anniversary of his birth, he was made honorary member of the Hungarian Society of Science and special festivities were held in his honor throughout the cities of Hungary.

KISS. See Salutation.

KISSIMMEE, Fla., city and county-seat of Osceola County, on Tohopkgaliga Lake, on the Atlantic Coast Line, 18 miles south of Orlando. It has extensive fruit and vegetable interests and is well known as a hunting and fishing resort. The headquarters of the cattle raising industry of the State are here. The worst storms attractively by the baths, great quantities are bottled for export. Pop. about 5,000.

KISSING-BUG. See Cone-nose.

KISSINGEN, kis'ing-én, Bavaria, a celebrated watering-place on the Saale, 43 miles north of Würzburg by rail. It is surrounded by walls flanked with towers, and has a magnificent bathing establishment. It was celebrated from the 9th century, are five in number, and all saline, contain a large quantity of carbonic acid gas, are used both internally and as baths, and are considered efficacious in gout and affections of the stomach and chest. Besides 30,000 visitors annually attracted by the baths, great quantities are bottled for export. Pop. about 5,000.

KISTNA, India, a river which separates the Deccan from southern India. It rises among the Western Ghâts, 4,500 feet above sea-level, in the province of Bijapur, 42 miles
from the Malabar coast, passes through Haldarabad, where it receives the Bhema on its left, and the Tungabhadra on its right bank, both flowing, like it, from the Western Ghats. The stream itself, which the ancients called the Krishna, a name which is frequently given to the whole river. The united river falls into the Bay of Bengal. Its course is estimated at 700 miles. A canal 90 miles long connects it with the Godavarty and numerous channels make its waters available for irrigation purposes. The Kistna is, perhaps, richer in gems than any other river of India. In the dry season, diamonds, cat's eyes, onyxes and chalcedonies are found along its course as well as minute portions of gold.

**KIT**, originally that which contained tools or necessaries; hence the tools or necessaries themselves. The term, which was probably derived from the Dutch, "kit" or Middle Dutch "kittie," a large bottle, beaker or decanter, has to-day various significations, among them a large bottle with a spout. It is derived from the Latin. The and other household articles, a soldier's kit, a sailor's chest and contents and a shoemaker's kit; and is also used in the sense of the whole outfit, the whole amount, the whole company, as in the expression "the whole kit of them." Used in this way it is often employed in a deprecatory sense. As a military term kit generally signifies the more intimately related articles of a soldier such as shoes, boots, socks, shirts, undershirts, brushes, combs. The soldier's kit weighs from 50 pounds upward, the weight depending upon whether the soldier is under ordinary or heavy marching orders. The heavy marching outfit of the British infantry soldier is a knapsack containing shirts, expecially uniform, boots, socks, brushes and a few other personal articles, mess tin, bread, rations for a certain time, generally of short duration, coat, cap, rifle, bayonet, ammunition and cartridge belt. This outfit, however, varies, according to the work for which a detachment of troops is destined for the moment. The German, Austrian and Italian soldiers are often more heavily laden than the British, they being frequently required to carry a part of a tent, and a great coat. The German, too, carried, before the outbreak of the European War, a ground sheet. But the latter war has tended to considerably change the kit of the infantry soldier under heavy marching orders and to make it somewhat more variable than it was formerly.

**KIT-CAT CLUB,** a club formed in London about 1688, originally for convivial purposes, but which soon assumed a political character, having in the reign of Queen Anne become the resort of Marlborough, Walpole, Addison, Steele and other leading Whigs. Its founder was Jacob Touson, the eminent publisher, and its name was derived from that of Christopher Cat, who supplied the club with mutton-pies. It was originally composed of 39 members, later enlarged to 48. The portraits (about three-quarters length) of the members were painted by Sir Godfrey Kneller, and hence a portrait of this length is called a "kit-cat." The club was dissolved about 1720.

**KIT-FOX,** or SWIFT-FOX, a small fox (*Pulex velox*) found in the central and northwestern parts of the United States, and especially common in the upper Columbia River region. It is about 20 inches long, with a broad, short face, and has the soles of the feet densely hairy. In summer its fur is of a brownish gray color, and dull with the inner flanks and white below; in winter it becomes much paler. It is especially noted for its activity, and for the deep burrows which it digs, and in which its young are born and nurtured. It feeds mainly on ground squirrels and small birds.

**KITCHENER CABINET,** a popular name applied to certain intimate political friends of President Andrew Jackson, who were supposed to have more influence over his actions than his official advisers. They were Gen. Duff Green, editor of the *United States Telegraph* at Washington, the confidential organ of the administration; Maj. William B. Lewis, of Nashville, Tenn., second auditor of the Treasury; Isaac Hill, editor of the *New Hampshire Patriot*, and Amos Kendall (q.v.) of Kentucky. He was leader of the Whigs who worked for the Jackson second choice movement in Kentucky; and received the office of fourth auditor of the Treasury. He was a man of exceeding ability, but of low moral perceptions, and, as a politician, was the incarnation of the worst evils of the American system. Harriet Martineau wrote of him, "I was fortunate enough once to catch a glimpse of the invisible Amos Kendall, one of the most remarkable men in America. He is supposed to be the moving spirit of the whole administration." Consult Parton, James, "The Life of Andrew Jackson" (Vol. III, New York 1860).

**KITCHEN-MIDDENS, or KJÖKENMÖDDINGS,** mounds of shells, bones, charcoal and refuse, remaining upon the site of prehistoric settlements along the coasts of seas, lakes and rivers in many parts of the world. The exploration of them has brought to light many relics of the Palæolithic and Neolithic men who formed them, and contributed greatly to the knowledge of prehistoric archaeology. Extensive deposits of this kind are found in parts of the United States, where they are known as shell-heaps (q.v.); and their formation is going on wherever savage conditions still exist.

**KITCHENER, kich′e-nər, Horatio Herbert, 1st Earl.** Kitchener of Khartoum and of Boomery. British soldier; b. Croter House, Ballylongford, County Kerry, Ireland, 24 June, 1850; drowned west of the Orkney Islands, Scotland, 5 June 1916. Though of Irish birth, he was of English descent, his father being Lieut.-Col. H. H. Kitchener, of the 13thDragoons. He was educated at the Royal Military Academy, Woolwich, and received his commission in the Royal Engineers on 4 Jan. 1871. Between the time of his entering the military academy and receiving his commission he had seen service in the Franco-German War. He was at Dinan when war broke out, offered his services to the French authorities and served as a private in the Second Army of the Loire under the command of General Chanzy. As a subaltern Kitchener was mainly employed on survey work in Palestine, but as Chief of the whole of the survey of Galilee for the Palestine Exploration Fund's map was executed by him. He was employed from 1882-92 in assisting in
the reorganization of the Egyptian army, and in 1892 became sirdar or commander-in-chief. The next four years were spent in preparations for the Dervish War, and in 1896 he began operations against the Khalifa, whose forces he defeated at Firket. The result of this engagement was the recovery of the province of Dongola. In 1898 he again defeated the Khalifa's forces at Athbara. Kitchener had learned well the lessons of warfare in Egypt and behind each advance constructed a railroad. On 2 September of that year the Khalifa's forces were utterly defeated at Omdurman and two days after the battle Kitchener entered Khartoum. For these services Kitchener was raised to the peerage as Baron Kitchener of Khartoum. A remarkable feature in the conquests was the economy with which the three campaigns from 1896-98 were conducted, the total cost exceeding little more than $12,000,000.

Then occurred an episode that might have led to war between England and France, when a French officer, Colonel Marchand, with a small force of Senegalese soldiers, established themselves at Fashoda, on the White Nile, 600 miles above Khartoum on territory claimed for Egypt. Kitchener met the situation very tactfully; he visited Fashoda, permitted the tri-color to remain hoisted and arranged with Marchand that the disputed occupancy should be referred to the diplomatists of the two countries.

In 1899 Kitchener was summoned from Egypt to join Lord Roberts as chief of the staff when the latter took over the supreme command of the British forces during the Great Boer War. Here his untiring energy was devoted first to the work of organization. He was responsible for the decision to attack the Boers at Paardeberg and his tactical dispositions on that occasion were subjected at the time to severe criticism. In November 1900, after both of the Boer capitals had been occupied, and it appeared as if the object of the war had been attained, Lord Roberts handed over the command to Lord Kitchener and to him fell the difficult and arduous task of coping with the guerrilla methods thereafter adopted by the Boers, and to which the country was well adapted. He first made his railway communications safe and secured the important centres; then he brought the non-combatant population into concentration camps; and finally he established a vast system of protective blockhouses hugging the railway lines, which were finally used as armed bases against which long lines of mounted men swept parties of the Boers. In the negotiations preceding the Treaty of Vereeniging in 1902, which ended the war, Kitchener took an active part, and he favored the granting of generous conditions of peace. As a mark of appreciation for his services he was raised a step in the peerage by being created a viscount, promoted to the rank of general and was awarded the Order of Merit.

Shortly after the conclusion of the Boer War he was appointed commander-in-chief in India, and this post he held till 1907, carrying through a number of important reforms in the organization of the Indian army. At the end of his term he was appointed commander-in-chief in the Mediterranean, but this appointment he subsequently declined. In leaving India he paid a visit to Japan and then proceeded to Australia and New Zealand, where he drew up schemes for the defense of these dominions which were subsequently put in operation. In April 1909 he returned to England, when an enforced respite from military duties and a relapse into civil life.

In 1911 Kitchener succeeded Sir Eldon Gorst as British Resident in Cairo. In this position he devoted himself to the suppression of the disloyal and anarchic agitation which had been gathering head during Sir Eldon Gorst's régime, and to the initiation and furtherance of measures for the economic development of the country. Largely owing to his exertions the value of the Egyptian cotton fields has largely increased, roads were constructed and improved, public health safeguarded by adequate sanitary measures and the fellaheen protected by legislation against the exactings of usurers.

The summer of 1914 found Kitchener in England in consultation with the imperial authorities. On 2 August he was boarding a steamship at Dover on his return to Egypt, when, owing to the threatening situation in Europe, he was summoned back to London. On the 4th war was declared and on the following day he was appointed Secretary of State for War—an announcement that was hailed with enthusiastic approval in Great Britain. The task that fell to him then was one of unexampled difficulty. The British army for effective purposes was composed of a striking force of 160,000 men; he expanded it into an army of 5,000,000, in a country traditionally devoted to voluntary enlistment, and his prestige and personality were main factors in the striking results achieved under the voluntary system and the acceptance by the nation with so little friction of the final resort to conscription. Certain it is, however, that he took on himself a burden that was too heavy for one man to bear. Following on a campaign of criticism in a section of the press the Ministry of Munitions was created and the powers of chief of the staff enlarged with a view to keeping the War Secretary to matters strictly within his own department. On 2 June 1916 he invited the members of the House of Commons, some of whom had attacked his conduct as War Minister, to a secret conference at the House, and there he is said to have emerged triumphantly from what must have been for him a trying and somewhat distasteful experience.

The termination of his career followed a few days thereafter with tragic and appalling suddenness. Accompanied by the members of his staff, he embarked on 5 June on the cruiser Hampshire at an unknown port in the north of Scotland, with the intention of proceeding to Archangel, and thence to Petrograd to confer with the Russian government. The cruiser was accompanied by two destroyers, but owing to the heavy seas that were running these had to be detached. At eight o'clock in the evening an explosion occurred on board, which was observed from the shore; four boats were seen to leave the vessel, but these were apparently swamped and the sole survivors of the commanders and officers managed to reach shore on a raft. It was afterward officially stated that the Hampshire had struck a mine. The news of the disaster was
KITES

1 Black-winged Kite
2 Egyptian Kite
3 Black Kite and Common Kite
4 Mississippi Kite
received with consternation and grief in all parts of the British Empire. Kitchener was followed as Minister of War by Mr. Lloyd George, and his elder brother, Lieut.-Col. Henry Elliott Chevalier Kitchener, succeeded to the title.

Kitchener in popular tradition was regarded as a stern, austere and somewhat unapproachable man; but his aloofness was due in the main to shyness, the conditions of his early service in Palestine, Cyprus and Egypt fostering a love of solitude that became a second nature with him. From the time of his Sudan campaigns he was regarded by the British public as an organizer of victory, one who never struck without making full and adequate preparation for the blow. This characteristic was fully revealed in his final task. When, at the outset of the great European conflict, a short war was generally anticipated, he had the courage and foresight to state the disagreeable truth and to make adequate preparations for a long war. No hope of temporary successes at the early stages of the conflict could divert him from his purpose, to ensure that, in what he conceived would be a war of exhaustion, the superiority in man power, munitions and equipment should in its later stages rest incontestably with the allied powers. Consult Begbie, H., 'Lord Kitchener' (London 1915); Burleigh, B., 'Twixt Sirdar and Khalifa' (London 1898); Doyle, Sir A. Conan, 'The Great Boer War' (London 1903); Groser, H. G., 'Lord Kitchener' (London 1915); Haig, F. W., 'Life of Lord Kitchener' (London 1913); Steevens, G. W., 'With Kitchener to Khartum' (1899-1914); Wheeler, H. F., 'Life of Lord Kitchener' (London 1914); 'The Boys' Life of Lord Kitchener' (New York 1917).

KITCHEN, George William, English historian and clergyman; b. Hadleigh, Suffolk, 7 Dec., 1827; d. 14 Oct., 1912. He was educated at Oxford, took orders in the English Church, and was prominent as tutor and lecturer at the university for many years. He became dean of Winchester in 1883 and in 1894 was translated to the deanery of Durham. He is widely known by his 'History of France', a standard work (1873-77); and has also published 'Winchester' in the 'Historic Towns' series (1890); 'Life of Harold Browne, Bishop of Winchester' (1895); 'Life of Pope Pius II' (1881). He also translated Brachet's 'Historical French Grammar and Lexicon' and did much to popularize the history of the French language in England.

KITE, a bird of prey associated with the buzzards in the sub-family Buteoninae of the family Falconidae, characterized by weak grasping-power in the feet, slender form, usually a forked tail, and long wings suited to the swift and graceful flight of the bird. The kites, a genus distinct from the hawks, are "These buoyant birds," says Evans, "are fond of perching but soar with ease, quartering the plains like harriers, or hovering with uplifted wings to dart down on their prey of insects, snakes, small mammals, and more rarely birds. The tail is forked or in some cases on bushes and reeds in marshes; and their eggs are whitish, marked in various degrees of spotting. The coves of most kites are loud and mournful, but some utter sharp, whistling notes. The Brahminy kite is exceedingly numerous in India and eastward, and is valued for its vermin-killing; and an Australian species, the whistling kite, is a powerful aid in suppressing insect-plagues. The red kite or "gleed," of Europe eats almost every sort of small creature, and like some of the others does not disdain carrion. In the 16th century large flocks of gleeds dwelt in and about London, and were welcome as scavengers, as they are to-day in Cairo and other Oriental capitals. They have suffered almost total extermination in Britain, mainly because of their depredations on poultry, pheasants, etc. The gavina, or Pariah kite, is the scavenger of Hindustan. Several species of these handsome hawks inhabit tropical America, one of which, the Everglade kite, comes to southern Florida, where it subsists exclusively on the snails (Ampullaria, etc.) that throng on the bushes in the mangrove swamps; hence it is locally known as snail-hawk. The swallow-tailed kite, black with purple and blue reflections, is commonly seen in the southern United States, and is pre-eminently a bird of the air. It carries its prey, devours it, and drinks while under way. Its flight possesses all the beauty and grace of a swallow's. The white-tailed is a species of Texas and southward, haunting marshes rather than uplands. The Mississippi kite, however, wanders in summer all over the southerly interior, where it is generally known as the blue kite. All these are migratory. Consult Newton, 'Dictionary of Birds' (London 1896); Evans, 'Birds' (New York 1900); and American ornithologies, especially Bendire, 'Life Histories of North American Birds' (Vol. I, Washington 1892).

KITE, a common aerial toy in the form of two crossed sticks covered with paper and balanced with a tail or string, on which are tied bits of cloth or paper. Kites were first employed in aid of science in 1749 by Dr. Alexander Wilson and Thomas Mellville of Scotland, who by means of a thermometer attached to a kite were able to take meteorological observations from the earth's surface. Franklin's experiments with electricity by means of a kite and key are familiar to everyone. Among the men who have given much thought and labor to improve kite making are W. A. Eddy, S. P. Langley, Octave Chanute, Lawrence Hargrave, J. B. Millet, J. W. Davis, C. F. Lamson, H. D. Wise, Captain Baden-Powell, Professor Marvin, C. F. Moore and others. The first improvement was to make a tailless kite, and this was perfected by Mr. Eddy.

In 1895 Captain Baden-Powell of England, weighing 150 pounds, was enabled to hoist himself 100 feet in the air by a tandem of five kites. Mr. Hargrave, with three kites, raised a total weight of 208 pounds to the height of 16 feet, as far as he goes, as Eddy, who, in 1897, with four kites, rose to 42 feet, the entire weight raised being 229 pounds. Mr. Eddy has done much to develop tandem kite flying. In 1897 he made a tandem of nine Eddy-Malay kites on a cord two miles long, with an elevation of 3,985 feet. Eddy kept up for 15 hours. At Blue Hill Observatory, near Boston, this height was exceeded, by the tandem of seven Malay and two Hargrave
kites, with an area of 170 feet, rising 8,740 feet above Blue Hill, or 9,375 feet above sea-level. It took three miles of pull and the work of three men for 12 hours to accomplish this feat. Piano wire has been found preferable to cord, having greater tensile strength and presenting less surface to the wind.

In the United States Weather Bureau parachute is used for the purpose of recording the velocity of the wind and the humidity and temperature at high altitudes, by the meteorograph. These can be obtained at a single observation and several hours before the effects are known in the lower atmosphere. Photographs have been taken by means of a camera fixed on the frame of a kite and operated by a cord, and Mr. Eddy had an arrangement of eight cameras strapped together in which all the shutters can be opened at once, and by which means a complete view of the horizon can be taken. Inventories of flying and soaring machines have made extensive use of kites in planning the construction of their various contrivances. Since 1905 meteorological observations by kites have been carried on continuously by the Weather Bureau at Mount Weather, Va. The instruments were raised to 23,835 feet on 5 May 1910 when 10 kites and 8½ miles of wire were used.

The first permanent station for kite flying in Europe, and the first in the world established by any government, auspices, is that at Viborg, in the extreme northern part of Denmark, the governments of Denmark, Sweden and France co-operating in the scheme. The most important building at the station is a tower 33 feet high, mounted on circular rails, so that it can be rotated easily and left open on one side. No matter from which direction the winds blow the tower is turned with this gap to leeward. Thus the operator can sit within, where the windlasses are, and watch his kites.

The latter, of course, naturally take their lines down to the ground. There are two windlasses, controlled by electric motors, one being held in reserve for immediate use in case the wire on the other breaks while in service. Kites have also been used to throw lines across streets or canals as a means of bringing life-lines to stranded ships. Consult 'Proceedings of the International Conference on Aerial Navigation' (Chicago 1893); Marvin, C. F., 'Mechanics of the Kite'; 'Instructions for Aerial Observations'; 'Investigation of the Sluggishness of the Meteorograph'; and other bulletins of the Weather Bureau (Washington 1898 et seq.); L. Teisserenc de Bort, 'Etudes sur la température et ses variations'; in the 'Annals of the Central Meteorological Bureau' (Paris 1897); 'Sur l'ointment des sondages aériennes' in the 'Memoirs of the International Congress for Meteorology' (ib. 1900); Rotch, A. L., 'Use of Kites to Obtain Meteorological Observations' (Boston 1900); Assmann and Berson, 'Ergebnisse der Arbeiten am aeronautischen Observatorium in den Jahren 1900 und 1901' (Berlin 1902); 'Arbeiten des Königliche preussischen aeronautischen Observatoriums' (Lindenberg 1904-13); and paper by Millet, J. B., in the 'Aéronautique Annual' for 1896.

KITSON, Henry Hudson, American sculptor: b. Huddersfield, England, 7 April 1855. At Paris he studied at the Ecole des Beaux Arts under Bonnaisieux. He was awarded three gold medals by the Massachusetts Charitable Mechanics' Association, a gold medal of honor by the American Art Association of New York. He received a medal at the Universal Exposition, Paris, 1889, as well as that in 1900. He also received the order of Bene Merenti from the king of Rumania. His most important works are 'Music of the Sea,' in the Boston Museum; the Major Doyle monument, Providence, R. I.; the statue of General Lee at Vicksburg, Miss.; 'The Minute Man,' at Lexington, Mass.; the Hayes Memorial Fountain at Providence; the W. H. Hunt Memorial, Boston, and the statue of Roger Conant, Salem, Mass.

KITSON, Theo Alice Ruggles, American sculptor: b. Brookline, Mass., 1871. Her maiden name was Ruggles. Educated in art in Boston and Paris, she married her most distinguished teacher in the former city, Henry Hudson Kitson (q.v.). From her earliest student days she showed peculiar talent for her work as a sculptor; and in Paris, under the instruction of Dagnan-Bouvet, she especially distinguished herself, and was the first American woman to receive honors in sculpture at the Paris Salon. In Paris her work is held to-day in high regard for its simplicity, force and directness coupled with its strength of vision and beauty and precision of execution. Her sculptures have been on exhibition at almost every great exhibition in the United States and in numerous art clubs. Among her notable works are 'Woods of Michigan' (two bronze figures at the Chicago Exposition); 'Statue of Eldy Ved' (Newburyport, Mass.); 'Soldiers' Monument' (Ashburnham, Mass.); 'Massachusetts State Monument' (National Military Park, Vicksburg); 'Portrait Medallions of Dodge, Blair, Howard, Logan, Ransom, Grierson and other generals for the Sherman Monument' (Washington); 'Statue of Minute Man' (Farmington, Mass.); 'Soldiers' Monument' (Walden, N. Y.); 'Mother' (Blickerdyke group); 'Students' Monument' (Spanish-American War University of Michigan); 'Monument' (Pasadena, Cal.). Her work also includes a long list of similar monuments, a list which is growing in length and importance from year to year.

KITTANNING, Pa., borough and county-seat, on Allegheny River, 45 miles north of Pittsburgh, on Pennsylvania Railroad, Buffalo and Allegheny Division. Bituminous coal, oil and gas are the chief products in minerals, also limestone and fire-clays in vast quantities, with some iron ore in places. The manufacture of plate-glass, basic iron, manganese, building brick, chinaware and flour milling are the chief industries. Connected with the town of Ford City by trolley. Ford City has a population of about 8,000 and is the location of the largest plate-glass manufactory in the world, works 4 and 5 of the Pittsburgh Plate Glass Company. The Allegheny River Mining Company with over 3,000 miners and laborers are operating in the immediate vicinity of Kittanning and Ford City, increasing the suburban population greatly in recent years. Pop. 8,000, excluding suburbs.
KITTATINNY (kit′a-tin′-t) MOUNTAINS, a range which extends from Ulster County, N. Y., south and southwest, through the northern part of Pennsylvania, and is a continuation of the Blue Mountains. The range varies in height from 500 to 1,500 feet. The mountains belong to the Appalachians, and form the eastern ridge of the main part of the system.

KITTATINNY PENNEPLAIN. See PENNEPLAIN.

KITTERY, kī′tē-rē, Me., town in York County, on the Piscataqua River and the Boston and Maine Railroad, four miles from the Atlantic Ocean, opposite Portsmouth, N. H. The United States Naval Station and Shipbuilding Yards are located here on Concordia Island, but are known as the Portsmouth Navy Yard. The town is one of the oldest in New England. It was settled in 1624 and incorporated in 1647. It is the birthplace and former home of Sir William Pepperell. There are numerous hotels and churches here, public schools and the Rice Public Library containing 5,000 volumes and the Traipe Academy. Pop. 3,533.

KITTIM, or CHITTIM, a term of Biblical origin for the inhabitants of the island of Cyprus, derived from the important town of Kition or Cition, the modern Lanarca. The isles of Kittim are mentioned in Jeremiah ii, 10, and Ezekiel xxvii, 6. It is also the name of the third son of Javan and the brother of Elisha, Tarshishard Dodanim (Gen. x, 4).

KITTWAKE. See GULLS.

KITTO, John, English Bible student: b. Plymouth, England, 4 Dec. 1804; d. Cannstadt, near Stuttgart, Germany, 25 Nov. 1854. He was the son of a mason at Plymouth, and after obtaining a very scanty education began to assist his father, but met with a fate which deprived him of the sense of hearing. Sent to the workhouse he was presently apprenticed to a shoemaker, who used him so cruelly that the magistrates canceled his indentures. He therefore returned to the workhouse, where some philanthropic gentlemen became interested in him, made provision for his support and procured for him permission to read in the public library. In 1824 he became the pupil of Mr. Groves, a dentist of Exeter, who supported him and gave him a small salary for his services. In 1825 he was sent to the Missionary College at Islington for the purpose of receiving training as printer for the foreign press of the Church Missionary Society. Shortly afterward he was sent abroad by the society, but returned two years later. In 1829 Mr. Groves organized a private missionary party which set sail for the Persian court, where from 1829-33 Kitto acquired that familiar acquaintance with the East which he afterward employed in his writing. He had opened a school for Armenians at Bagdad, which he was forced to abandon because of the ravages of disease and floods in the neighborhood. He founded and edited the Journal of Sacred Literature (1848-53), and although a layman of the English Church received in 1844 the degree of D.D. from Giessen. He published 'The Pictorial Bible' (1835-38); 'Pictorial History of Palestine' (1841); 'Gallery of Scripture Engravings' (1841-43); 'Handbook and Biblical Literature' (edited 1843-45); 'The Lost Senses: Deafness and Blindness' (1845); 'Physical Geography of the Holy Land' (1848); 'Daily Bible Illustrations: Morning Readings' (1849-51); 'Evening Readings and many other similar works. In his latter years he enjoyed a pension of £100 a year from the Crown.

KITTON, Frederic George, English author and artist: b. Norwich, 5 May 1856; d. 10 Sept. 1904. After receiving his education at a private school in Norwich, he was put under the training of W. L. Thomas, managing director of the London Graphic, and became an expert draftsman and wood engraver. In 1882 he added literature to his profession of book illustration. Among his delightful appreciations of artists, illustrators and authors of his time may be mentioned 'Phiz' (Hablot Knight Browne), a memoir (1882); 'John Leech, Artist and Humorist' (1883); 'Charles Dickens by Pen and Pencil' (1890); 'Dickens and his Illustrators' (1898); 'Charles Dickens, his Life, Writings and Personality' (1902).

KITTREDGE, George Lyman, American educator and author: b. 1858. Graduated from Harvard University (1882) he became instructor in English in that university, being raised to the rank of full professor 12 years later. He has given much attention to English philology and the study of English literature. Among his published works are 'The Mother Tongue' (with Sarah Louise Arnold, 1900); 'Words and their Ways in English Speech' (with James B. Greenough 1901); 'Old Farmer and his Almanac' (1903); 'Essays on Chaucer' (1914); 'Chaucer and his Poetry' (Johns Hopkins lectures, 1915).

KITTUL'S, Saint. See CHRISTOPHER, SAINT.

KIITUL, ki-tf-ool, or KITTOOL. See FIBRE.

KIU-KIANG, kēoō′kē-ăng′, a city in the province of Kiang-si, China. The name means, in Chinese, "Nine Rivers," and the city, which is the official head of the province, is situated on Yang-tse-kiang, a short distance above the entrance to Lake Poyang. The city which, like most Chinese cities, is walled, is, within this rampart, about five miles in circumference; but the modern town has outgrown the wall and a considerable important suburb exists without it. The city is well drained and lighted and possesses a better police force than is usually to be met with in a Chinese city of its size. This may be due to the fact that it has a large foreign population both within the city limits and in the suburban residence portion. Within the city are Roman Catholic churches, some of them fine buildings; and the British government maintains a consulate there. The greater number of the foreign residents occupy a stretch to the west of the city along the river, between the Chinese suburban quarters and the streets of hovels and tenements which lie some distance to the west of the city. The town exports considerable of the products gathered in from the surrounding neighborhood, but the range of its industrial and com-
mercial activities does not extend far inland. The exports consist, for the most part, of rice, tea, paper, tobacco, chinaware, hemp and other articles of coarse manufacture, and grass-cloth; while the greater percentage of the imports consists of cotton and woolen goods, metals, provisions and leather articles. In the past a great deal of opium was sold in the city and shipped to interior points in China. Pop. about 50,000.

KIUSHU. kyooˊshoo', or KYUSHU, Japan, one of five large islands of the empire; area, 16,840 square miles. It contains nine provinces but for administrative purposes is divided into seven Ken or prefectures. The island is mountainous and volcanic. The principal harbor is the treaty port, Nagasaki, but in 1869 five special ports of export were opened. Pop. 7,727,000.

KIVA, the sacred ceremonial chamber of the Pueblo Indians. The name is Hopi and the institution is to be found in every Hopi and other village throughout the Pueblo country. The kiva, which was generally known to the first Spanish visitors and explorers in the Pueblo territory, as estufa (stove or furnace) is older than the mines and its origin is lost in tradition. At one time its use was much more extensive than at present, or even within historical times, as is evidenced by the remains of kivas in the ruins of prehistoric villages in Arizona, Colorado, Utah and New Mexico. It was in use at one time in parts of Mexico. Some kivas were quite large; and some of those inuse in prehistoric times seem to have been larger than those existing at the present time, if we are to judge from existing remains. Castañeda, writing in 1540, tells of one which had twelve pillars, four of which, in the centre, were each as large as two men could reach around. He is also the authority for the statement that some of the kivas that he had seen were large enough for a game of ball. The early Spanish missionaries and other visitors to the land of the Puebloos gave the name estufa to the kiva because they mistook it for a sweat house, losing complete sight of its sacred character and the part it had long played in the past (and still plays) in the religious life of the Puebloos. Four hundred years ago the kivas of the Rio Grande country were much the same as they are now. They were large underground, or semi-underground, square or round structures, the roofs of which were supported by handsome pillars. About the time of the discovery of America, and for some time afterward, the young unmarried men of marriageable age lived in the kiva and with them also lived widowers or men who had repudiated their wives. Women were forbidden, under dire penalties, to sleep in the kivas, which they could visit only to bring to their relatives food and other prime necessities. This restriction upon the visit of women is still in force in all the Pueblo villages. Women, however, are permitted to visit the kivas on the occasion of certain public festivals or other ceremonial occasions. There are also, in the Pueblo villages, though much more rarely, kivas for women. These latter may not be visited by men except under certain prescribed conditions similar to those already indicated. These kivas of the women are also the club houses of secret religious ceremonies of a peculiarly sacred nature. The entrance to the kivas were at a lesser degree, and the village and never belonged to one individual or set of individuals notwithstanding the fact that they are the home of secret societies. In some villages the kivas are rectangular, in others square, and in still others circular. They were originally built in the rear of the houses of the village; but they are to-day usually hidden among the houses; and they are still partially or altogether underground. One Pueblo may have from one to a dozen kivas, according to its population, wealth and interests. Even those kivas that have the walls partly above the ground have few or no openings at all in the walls, and where the openings exist, they are invariably very small, the entrance to the buildings themselves being invariably from the flat roof, which is reached by means of a ladder that can be drawn up. A second ladder connects the inside of the kiva with the roof, through a trap-door. The roof, which is very strong and thick, is generally made of well tramped earth or adobe bricks overlying beams or rushes, which are supported by the pillars already mentioned. The trap-door which is placed in the centre of the roof, also serves as a hole to permit the escape of the smoke from the fireplace of the kiva which almost invariably occupies the centre of the edifice, and consists of a shallow fire pit. The kiva floor is usually covered with smooth sandstone slabs; and around three sides of the walls run stone benches supported by adobe brick-work. Against the fourth wall is a low ceremonial platform and a ceremonial altar. Many of the kivas have the walls, or part of them, covered with hieroglyphic paintings, symbolic in nature, and serving to remind the master of ceremonies of the main incidents in the ceremonies to be performed on certain stated occasions.

KIVINJE, kë–vë’n’yë, the modern name of the town of Kilwa, in German East Africa, which is so called to distinguish it from the ancient Arabian town of the same name on an island some 17 miles farther down the coast. See Kilwa, Kivinje.

KIWI-KIWI, kë’wi-kë’wi. See Apëryx.

KIZIL-IRMAK, kiz’il-i’rmak (the Turkish for Red or tribal nature) is one of the principal rivers of Asia Minor. Rising in the east of the peninsula, it flows in a circuitous route for about 500 miles and enters the Black Sea near Sinope.
KJERULF, Kyå’rulf. Halfdan, Norwegian musical composer: b. 1815; d. Christiania, 1868. He began the study of theology; but his musical inclination was too strong and he finally gave up his theological studies to pursue his love of music. He displayed a strong lyrical talent and a facility for the writing of popular songs much above the average of compositions of this class. He was undeniably encouraged to do his best in this field from the fact that his songs were sung in public by some of the greatest stage favorites of his day, among them Jenny Lind, Nilsson and Sontag, all singers of world-wide reputation, who made the compositions of Kjerulf almost as popular and well known as themselves. He also composed much excellent piano music. All his work shows melodic gifts and power of thought presentation equalled by few of his fellow-countrymen. His great popularity and his real musical gifts enabled him to exercise a noteworthy influence upon the national music of his native land and to create a school of his own, of which the most brilliant pupil was Grieg, who, in some respects, surpassed his master.

KLagenfurt, kla’gén’foor, capital of Carinthia, Austria. It practically forms a suburb of Wörther, though it is not within the city corporation of the latter place. The city has the usual educational and other buildings to be found in a German city of its size, and this may be accounted for from the fact that most of its inhabitants are German. In the cathedral built in the 16th century is the stone on which the dukes of Carinthia sat to receive the homage of their vassals. This stone has many legends attached to it; and it seems to have been originally connected with the ancient pre-Christian religious beliefs of the people of the country. The stone appears to have a history similar to that of stones in the history of England and Scotland. Among the principal industries of the city are the manufacture of leather, tobacco, cloth, machinery, white lead and shoes. Agriculture and mining occupy considerable of the attention of the people of the city and the surrounding country; and the place possesses an excellent school of agriculture and mining. Pop. 35,000, principally Germans.

KLAMATH, kla’må’t, a name applied to several tribes of American Indians formerly living along the Klamath River in Oregon and California, but now settled on a reservation at Klamath Lake. Their present lands were given them by treaty in 1864, the reservation containing 1,360 square miles. The Klamaths who now number about 700 are fairly civilized and are expert stock-raisers.

KLAMATH LAKE, Ore., a small lake in Klamath County, at the base of the Cascade Range. It is 44 miles long by 6 to 14 miles wide. It consists of two considerable bodies of water connected by a narrow strait less than two miles wide. Klamath River is the outlet, and issues from the south end, or Lower Klamath Lake, and flows thence into California.

KLAMATH FALLS, Ore., county, city and county-seat, situated on Lake Ewanna and is on the line of the Southern Pacific Rail-

road. The precipitous river sink, which passes through it, furnishes a vast amount of natural motive power, the fall of the river for the mile and a half before entering the town being on an average of 82 feet. The natural facilities have been made use of by the United States government which has established, in the immediate vicinity of Klamath Falls, a vast irrigation project for the reclamation of a considerable extent of territory. These and other conditions have made the town the centre of very active agricultural interests and of extensive cattle raising. The industrial activities of Klamath Falls are very largely centred in lumbering, milling, the bottling of mineral waters and the manufacture of cereal foods. Not far from Klamath Falls is the Klamath Indian Reservation with a population of some 1,200 Indians; and near to it are also the extensive lava beds which were the scene of the Modoc Indian War (1873). Pop. about 3,500.

KLAPKA, klå’pka, Gyorgy (George), Hungarian general: b. Temesvar, 7 April 1820; d. Budapest, 17 May 1892. He entered the Austrian army in 1838 and rose to high rank. In 1848, at the beginning of the revolution he joined the Hungarians and distinguished himself in nearly all the battles with the Austrians; in more than one the fortune of the day was decided by the troops under his command. His most noted exploit was his defense of Komorn, which he continued to hold for some weeks after all the rest of Hungary had submitted. He lived in exile in England, France and Italy, and remained at Geneva many years, occupied with plans for the liberation of his country. He assisted in the plans of Sardinia to form a Hungarian legion. He took an active part in the War of 1866, and after the amnesty of 1867 he returned home, and then became a member of the Hungarian Diet. He published 'The National War in Hungary and Transylvania' (1851), one of the best works on the subject; 'The War in the East' (1855); 'Memoirs' (1869); 'Recollections' (1887).

Klaproth, kla’pröth, Martin Heinrich, German chemist: b. Wernigerode, 1743; d. 1817. His position as professor at the University of Berlin permitted him to follow up his studies on the analyses of minerals which he carried to a perfection and exactness never before attempted or obtained. He was very liberal minded and quite willing to accept at their full value the work of any of his contemporaries and to encourage the young aspirants to honor and place. Thus he was one of the first to recognize and publicly point out the great value of the work performed for science by Lavoisier in his remarkable discoveries. His chief work 'Beitrag zur chemischen Kenntniss der Mineralkörper' appeared in six volumes between 1793 and 1815.

KLATTAU, kla’tau, or KlatoVY, a city in Bohemia, Austria, about 30 miles south of Pilsen, with which it is connected by rail. Its chief industries are the manufacture of woolen and cotton cloth, matches, machinery and chincloth. It has the usual buildings of an Austrian city of its size and, in addition, a fine old church dating back to the 13th century. Pop. 17,000.
KLAUSENBURG, kloʊˈʃenˌbʊrɡ, or KOLOZSVÁR, a county and capital town of the same name in Hungary. The town was at one time the capital of Transylvania. It consists of the old town and several growing suburbs, and possesses a historical cathedral, dating back to the 15th century, a reformed church of the same century and a citadel erected by General Steinville in 1715, as a protecting fortress for the town. The city is well provided with educational institutions, the most worthy of which is the Francis Joseph University founded in 1872. The attendance has increased from year to year; and the facilities of the institution have improved with the increase in attendance. It now has complete courses and offers over 3,000 students in normal times; and a library of over 100,000 books. The city also possesses machine shops, distilleries, paper, cloth and sugar mills, cigar factories, railway shops and a very extensive farm implements factory. Klaunburg has had, like most of the older Hungarian towns, an eventful career. Founded by German colonists, probably on the site of an older town, in 1178, it became a free royal town in 1405; and it was more or less mixed up with other events and other disturbances of the centuries. Finally in 1848 the revolutionists under Bem captured it; and it was the scene of revolutionary demonstrations in 1918, following the surrender of Austria to the French, English, American and Italian allies. Klaunburg has grown from 34,800 in 1890 to almost double that population in 1918. Notwithstanding this rapid growth of population the people are notably homogeneous, most of them being Magyars, and of the Protestant faith.

KLEBER, klébɛr, Jean Baptiste, French general: b. Strassburg, 9 March 1753; d. Cairo, Egypt, 14 June 1800. He first studied architecture in Paris, then entered the military school at Munich; and having joined the Revolutionary army was appointed brigadier-general and sent to La Vendée. He afterward commanded the left wing of the army of Jourdan, directed both the passage of the Rhine at Düsseldorf and the subsequent retreat; defeated the Prince of Würtemberg, took Maestricht and Frankfort, and subsequently Prince Charles. Under the Directory he had command of the French armies. Bonaparte entrusted the command of the army in Egypt to Kléber, who, deeming resistance useless, concluded the convention of El Arish with the British, by which the French were to be conveyed home with arms and baggage. This bargain was repudiated by the British government, and Kléber determined upon the resubjugation of the country, in which he was successfully engaged when he was assassinated. A monument has been erected to him at Strassburg. Consult Ernouf, ‘Le général Kléber’ (Paris 1867).

KLEIN, Charles, Anglo-American dramatist: b. London, England, 1867; d. 1915. Educated at Northwood College, 1881, he migrated to New York City shortly after graduation and there he became play censor for the Charles Frohn Company, a position that gave him immediate and helpful contact with the theatre. His constant exercise of judgment on plays presented to Frohn gave Klein a deep sense of the prime requisites of a good play. He frequently helped to fix up and recast the plays presented; and from this it was only a step to the production of plays on his own account. His dramatic works show considerable power and no lack of original situations and some of them have been notable successes, among the latter being ‘The Auctioneer’; ‘The Music Master,’ and ‘The Lion and the Mouse.’ Among his other dramas are ‘A Mile a Minute’; ‘Biff’; ‘Joy’; ‘District Attorney’; ‘Two Little Vagrants’; ‘HeartsEase’; ‘The Hon. John Grigsby’; ‘Mr. Pickwick’; ‘The Daughters of Men’; ‘The Step Sisters’; ‘The Third Degree’; ‘The Next of Kin’; ‘The Gamblers’; ‘Maggie Pepperc’; ‘The Outsiders’; ‘The Neer Do Well’; ‘The Money-makers.’

KLEIN, klin, Felix, German mathematician: b. Düsseldorf, 25 April 1849. He was educated at Bonn, became Plücker's assistant in the physical institute in 1866, was appointed lecturer at Göttingen in 1872, professor at Erlangen in 1872, and held chairs from 1875 in the Technical High School of Munich, from 1880 at Leipzig, and from 1886 at Göttingen. In 1892 he represented Göttingen at the World’s Columbian Exposition at Chicago. He exercised large influence on American mathematics, having taught many instructors in institutions in this country. In 1875 he became one of the editors of the Mathematischen Annalen, and in 1898 of the Encyclopädie der mathematischen Wissenschaften. In 1892 he collaborated with Fricke in the publication of Vorlesungen über die Theorie der automorph en Funktionen. He was chosen president of the International Commission on the Teaching of Mathematics in 1908. Among his more important works are ‘Über Riemann’s Theorie der algebraischen Funktionen’ (1882); ‘Vorlesungen über das Ilosäder und die Auflösung der Gleichungen vom fünften Grade’ (1884); ‘Einleitung in die höhere Geometrie’ (1895); ‘Evansston Colloquium’ (1898); ‘Über die hypergeometrische Funktion’ (1894); ‘Über lineare Differentialgleichungen der 2. Ordnung’ (1894); ‘Theorie des Kreisels’ (2 vols., 1897–98); ‘Vorlesungen über die Theorie der elliptischen Modulfunktionen’ (1900–1912); ‘Mathematical Theory of the Top’ (New York 1897); ‘Vorträge über ausgewählte Fragen der Elementargeometrie’ (1895; Eng. trans. by Beman and Smith, ‘Famous Problems of Elementary Geometry,’ Boston 1897). He also edited the works of Möbius.

KLEIN, Félix, French clergyman and writer: b. Château-Chinon, department of Nièvre, 12 July 1862. Educated at the seminaries of Meaux and Saint Sulpice, the Institut Cathol-
ique de Paris and the Sorbonne, he became professor of philosophy at the École Saint Etienne at Meaux in 1890, and in 1893 was appointed professor of French literature at the Institut Catholique. A tolerant, broad-minded ecclesiastic of the French Army, his preference for a French translation of a life of Father Hecker (q.v.) in 1897 laid him open to the charge of "Americanism." The papal interdiction of that heresy in 1899 led the abbé to retract and withdraw the book. In 1904 he visited the United States and Canada, an experience that still further strengthened his keen interest in, and admiration for, American institutions and ideals. He was received by President Roosevelt in Washington, and on his return published a record of his travels entitled 'Au pays de la vie intense' ('In the Land of the Strenuous Life,' Chicago 1905) and dedicated it to Mr. Roosevelt. In 1907 he made a lecturing tour in America, which furnished materials for his book, 'America of To-morrow' (1910). During the war the Abbé Klein was attached as chaplain to the American War Hospital in Paris. In this capacity he kept a record of events in a careful diary, published in 1915 as 'La guerre vue d'une ambulance,' of which an English translation appeared in the same year, 'The Discovery of the Old World by a Student from Chicago,' drawing comparisons between the two countries; biographies of Bishop Dupont of Metz, and Cardinal Lavigerie; 'New Tendences in Literature'; 'Higher Education of Women'; an edition of Montaigne and of Corneille; 'Autour du dillestantisme'; 'Le fait religieux,' and translations from Archbishops Ireland and Spalding.

KLEINITE, a mineral consisting of mercury ammonium chloride, of uncertain formula. A source of mercury in the Terlingua district, Brewster County, Tex., with other rare mercury minerals, monroydhite, eglestonite and terlingu site.

KLEIST, klist, Ewald Christian von, German lyric poet: b. at Zeblin, an estate near Köslin, 7 March 1715; d. Frankfort on the Oder, 24 Aug. 1759. He studied law, philosophy and mathematics at the University of Könsberg (1731), and entered the military service of Denmark in 1736, of Prussia in 1740. Being assigned to the garrison at Potsdam, he had occasion to meet Gleim, Ramler and Nicolai, literary lights, and to conceive an unreserved admiration for Wilhelm von der Goltz. He was an active military campaigner, and his death was due to wounds received at the battle of Kœnigsberg. His early lyrics were of anachronistic type, but he gradually developed them to a higher level for Wilhelm von der Goltz. He later, however, developing those original lyric qualities that are his principal charm. His most famous work is the fragment 'Der Frühling' (Berlin 1749); his 'Gedichte' appeared 1756; 'Neue Gedichte' (1758). A critical edition of his works, edited by August Sauer, appeared at Berlin in three volumes (1822-83).

KLEIST, Heinrich Bernt Wilhelm von, hin'rüt bernt vil'helm fôn klist, German dramatist: b. Frankfort-on-the-Oder, 18 Oct. 1777; d. Wannsee, near Potsdam, 21 Nov. 1811. He entered the army in 1795, but left it in 1799 to study at Frankfort and Berlin, and later engaged in journalism in Dresden and Berlin. His first drama, 'Die Familie Schroffenstein,' was published in 1803, and was followed by 'Amphitryon' (1807); 'Penhilsleia,' a tragedy (1808); 'Das Kätchen von Heilbronn' (q.v.) (1810), a popular poetic drama; 'Der zerbrochene Krug' (The Broken Jug) (1811). A volume of 'Tales' appeared (1810-11), and posthumously, 'The Battle of Hermann,' and 'Der Prinz Von Homburg.' He exhibits some of the worst faults of the Romantic school, to which he belonged; nevertheless his best plays, such as 'The Prince of Homburg' and 'The Broken Pitcher' possess sufficient vigor and fidelity to life to make them popular even at the present day. The best of his tales is 'Michael Kohlhaas,' a story of Brandenburg in the Middle Ages. He failed to gain recognition and shot himself, after first shooting a woman whom he loved, and who like him was weary of life. His works did not receive notice till after his death, when they were made known by Tischendorf. An incomplete edition of his works appeared at Berlin (3 vols., 1826). The best modern edition is that by Schmidt, Minde-Pouet and Steig (5 vols., 1904). His letters were edited by Bölow (Berlin 1848), Koberstein (ib. 1860) and Biedermann (Breslau 1888).

KLENNCK (klènck) -CHEZY, Wilhelmine Christine von, German poet and novelist: b. Berlin, 26 Jan. 1783; d. Geneva, Switzerland, 28 Feb. 1856. She was married to Antoine Léonard de Chézy (q.v.) in 1801. She acquired considerable celebrity by her 'Poems' (1812); 'Heart Notes During a Pilgrimage' (1833) and 'Emma's Ordeal' and other novels, but is perhaps best known as the writer of the libretto of Weber's opera of 'Euryanthe.'

KLENGEL, kļëng'ēl, August Alexander, German composer: b. Dresden, 1784; d. 1852. After studying art in his native city under several notable teachers, he went with Clementi, one of his teachers, to Saint Petersburg and other parts of Russia after having first traveled with him in Europe. He liked Russia so well that he remained in Saint Petersburg six years (1805-11). He acquired quite a reputation in Russia as a musician; but a desire to further his musical studies led him to leave Russia and he spent two years; after which he visited England and Italy, improving his execution and his knowl-
edge of his art. On his return to his native city in 1816 he became organist in the chief Roman Catholic church there. His music in the church soon became a feature of the musical life of the city; and many people not of the Catholic faith went to listen to his playing. He was as accomplished a pianist as organist; but his ability as a composer to-day outshines his work as a performer on these instruments. He wrote good salon music and numerous notable fugues and canons, among a multiplicity of other work, all of which is well done.

**KLEPHTS**, klefis (Greek, "thieves"). Greek bandits who, after the conquest of Greece by the Turks in the 15th century, kept themselves free in the mountains of northern Greece and Macedonia, and carried on a perpetual war against Turkish rule, considering everything belonging to a Turk a lawful prize. During the war of independence these Klephs furnished the Greek army with some of their best soldiers and leaders. Whole tribes, as the Suliotes and Chimiariots in Epirus, and the Sphakiots in Crete, are to be numbered among them. They developed a considerable literature of their own, especially in the form of ballads usually composed in the vernacular. The gradual development of the country after its independence had been established resulted in the disappearance of this picturesque class. See GREECE.

**KLEPTOMANIA** (from Greek akîstresse, steal, and μανία, madness), a mania for stealing, a propensity often regarded as being irresistible and involving a kind of moral insanity. It is frequently pleaded in law courts as an excuse for theft, although the act constitutes a legal offense. See INSANITY.

**KLESEL, Melchior.** See KIHISEL.

**KLIKATAT**, a shapathian tribe of North American Indians who once made their homes in Klikitat and Kamania Counties, in the State of Washington. They are closely related linguistically to the Yakima who were their neighbors on the east. The Klikitat seem to have never, since they have come within the knowledge of the white man, been very numerous. Lewis and Clark, who visited them in 1805, placed their number at 700. This may not, however, have included all those speaking the same tongue. Between 1820 and 1830 they crossed the Columbia river and dispossessed the confederate tribes occupying the Willamette Valley; but they were driven back over the river to their former habitat. The Klikitat were among the greatest traders of the western United States and Canada. They carried on an extensive exchange of commodities between the coast tribes and those living to the east, north and south of them. They were among the first of the western Indian tribes to cede their lands to the United States, which they did by the Yakima treaty (9 June 1855). In more than 60 years which have passed since then, they have become so mixed with other Indian stocks and tribes that they are now indistinguishable as a separate race, though their descendants are still, for the most part, on the old Yakima reservation, Washington. It is, therefore, impossible to estimate their present numerical strength. The word Klikitat means, in Chirman, "beyond or on the other side of" and was used with reference to the Cascade mountains, which lay between the Kikitat and the coast tribes.

**KLINGER,** kling'ær, Friedrich Maximilian von, German dramatist, novelist and essayist; b. Frankfurt-on-the-Main, 1752; d. 1801. By profession he was a soldier, though he early showed his literary tendencies when, as a student at Giessen, he was awarded a special prize for his tragedy 'Die Zwillinge' which was published in 1775. He was a man of considerable force of character, and made rapid advancement in his military life just as he made a strong impression on the literature of his day. In 1776, the year following his literary debut, he published a drama entitled 'Sturm und Drang' which was destined not only to profoundly influence the German literary tendencies of his day but to give its name to one of the most intensive literary movements in German literature. Klinger, after several years' military service in Germany, went to Saint Petersburg and there entered the Russian army where he remained most of his life, though in more or less close contact with the leaders of the literary movement in Germany. He rose, through gradual and successive promotions, to the rank of lieutenant-general, and he was held in high esteem by the Russian military authorities. In the army, too, he found some congenial literary spirits over whom he exercised considerable influence. Klinger was one of the first novelists in Germany who worked toward a certain definite purpose in its literature; and this in itself attracted many literary men to his standard and gained many readers and critics for his works. Unfortunately his literary taste falls generally below his inventiveness; and so his works are constantly offending through the crudeness of their presentations and their lack of literary discrimination and good form. But the vehemence with which he presented his opinions, more or less novel, and therefore attractive in his day, outbalanced all the shortcomings of their author; gained for him a very extensive following and an influence over literary thought and form of expression of his day out of all proportion to the real value and importance of his literary work. Yet, in the midst of much that offends good taste and of presentations and characterizations that are untrue to life, there is also much in Klinger's work that gave inspiration to the writers of his age and that left their impression indelibly imprinted upon the literary movement not only in Germany but upon that of most of Europe; for he was, in some senses, the most aggressive of the leaders of the "Storm and Stress" period in German literature. His work was very considerable and most of his writings have appeared in various editions. Among his works most worthy of attention for its own intrinsic merits and for the influence they have had on German literary thought are, in addition to those already mentioned, 'Faustus Leben, Thaten und Hollenfahrt'; 'Der Weltmann und der Dichter'; 'Betrachtungen und Gedanken über verschiedenste Dinge'; 'Yakima reservatin, Washington'; and his dramas, all of which are interesting as reflecting the thought and the literary influences of the age in which he was actively at work. A complete edition of his works was
published at Stuttgart in 1841, and a second edition, more or less selected in character, appeared in the same city in 1878-80 (8 vols.). Christian Erdmann, 'Klinger's dramatische Dichtungen' (1877); Kürschner, 'Deutsche Nationalliteratur' (Vol. I, which contains 'Stüttmer und Dränger,' Stuttgart 1883); Prosch, 'Klinger's philosophische Romane' (Vienna 1883); Schmich, 'Lenz und Klinger' (Berlin 1878). To these might be added a study of his life and work by Rieger (2 vols., Darmstadt 1880-96). This is very exhaustive, though not always reliable. It has been translated into French.

Klinger, kliinger, Max, German painter, etcher and sculptor: b. Leipzig, 18 Feb. 1857. He was a pupil of Gussow at Karlsruhe and later at Berlin; studied also at the Berlin Academy; was active at Rome in 1888-92; and from 1893 in Leipzig. Of unusual versatility he was at first chiefly an etcher (1879-86), perhaps the best of his work in this line being the 'Brahmas-Phantasien' (1894), deriving their subjects from various works of that composer. Then he directed his attention to painting in oils, and executed heroic canvases of 'The Crucifixion,' now in the Hanover Museum, and 'Christ on Olympus' (1897) at Vienna. In 1894 he began to devote himself to polychromatic sculpture and one of the best of his plastic works is his statue of Beethoven (1902, Leipzig Museum), in which onyx, bronze, and differently colored marbles are combined. Later works include 'The Drama' (1904), a colossal marble group in the Albertinum, Dresden; 'The Athlete,' a colossal bronze at Leipzig, and the striking bust of Nietzsche at Weimar. Klinger was the recipient of numerous awards, academic and knightly honors in recognition of his art. He published 'Malerei und Zeichnung' (3d ed., 1899).

Klipspringer, a small, robust antelope ('Oreotragus saltator'), about equal in size to the Thompson, and resembling it in habits, found in the mountainous districts of South Africa. It is yellowish-gray, and the hair is long and makes a rough fur. The flesh of the klipspringer is particularly esteemed; the hair is also valued for stuffing saddles; and it has therefore become rare in localities where it was once common. The pinacodes and precipices in which it delights make hunting it with dogs impossible, but to get within rifle shot of it is not difficult. Many interesting habits are given by writers on South African zoology and natural history.

Klöden, klö' den, Karl Friedrich von, German educator and geographer: b. Berlin, 1786; d. 1856. He received his education while apprenticed to a goldsmith; became Potsdam normal school director in 1817, and director, seven years later, in a Berlin commercial school. His chief geographical works are 'Landeskunde von Pálastina' (1816); 'Grundlinien zu einer neuen Theorie der Erdgestaltung' (1824). Prominent among his historical works are 'Ueber die Erstehung, das Alter und die frißende Kultur der Berter und Kölner' (1839); 'Lebens und Regierungs geschichte Friedrich Wilhelms III' (1840); 'Die Quitzows und ihre Zeit' (3d ed., 1889).

Consul 'Jugend Errin-nerungen Karl Fried-
in some mines pulsorteometers are used to thaw the pay-dirt in the drifts; the mechanical movement of pay-dirt is accomplished by a self-dumping cable tram called the "Dawson carrie," which is a beam 20 feet long, from 9 to 11 cubic feet; and gold-washing and separating plant has been installed. Many rich claims have been worked; one, the Eldorado paystreak, four miles in length, yielded gold of the value of $25,000,000, or $1,200 a running foot for the bottom of the valley. The total value of production in 1887 was $70,000, the highest yield (1900) being valued at $22,000,000. There has since been a decline in value, that for 1915 showing $4,758,098. From 1855 to 1915 (inclusive) the total production was valued at $162,233,984. See ALASKA.

KŁONOWICZ, klóno'witch, Sebastiań-
Fabian, Polish satirical poet: b. Sulmierzyce, 1551; d. Lublin, 1608. Studied at Cracow University, acquired the Latin name Accernus and established himself at Lublin, where he became burgomaster and president of the civil tribunal of the Jewish community. Of modest and virtuous character, his wife was a dissipated, vicious woman who brought him to poverty, obliging him in age to take refuge in the city retreat as an object of Catholic charity. He wrote 'Victoriae Judaeos et Christianos' (1637); 'De abrogatione rerum' (1639); 'Worek Judaeorum' (1647), an attack on the Jews through the maiming of their property, a poem concerning the ill of the poor at the hands of the rich; 'Roxolania' (1584), poem descriptive of Red Russia (Galicia); 'Flis, or the boatman navigating on the Vistula from Cracow to Danzig' (1654); 'Becoming Roman Catholic' (1873) his assertion to the Prussians increased and is distinctly marked in his writings. Later he went to Austria. He wrote 'Die Geschichte Öst-
friedlandes' (1854-81), 'König Friedrich II von Preussen und die deutsche Nation' (1860; 2d ed., 1867); 'Der König Friedrich II von Preussen und seine Politik' (1861); 'Tilly im Dreissigjährigen Kriege' (1861); 'Der Fall des Hauses Stuart' (14 vols., 1873-81); 'Das Jahr 1683' (1872); 'König Georg V' (1878) 'Der Dreissigjährige Krieg bis zum Tode Gustav Adolfs, 1632' (1891-96). He also edited the correspondence of Leopold I with Father Marco d'Aviano (1888).

KŁÓPSTOCK, klóp'stôck, Friedrich Gott-
lieb, German poet: b. Quedlinburg, Prussia, 2 July 1724; d. Hamburg, 14 March 1803. He studied at the school in his native town and at Schulpforta, and later pursued the course in theology at Jena and Leipzig. He is widely famous as the author of the sacred epic, 'Der Messias,' the first three cantos of which were published in 1748. They are in the Miltonic style, and excited general attention. In consequence, Klópstock was invited to Copenhagen by the minister Bernstoff, and offered a small pension. In 1764 he wrote his drama 'Herrnmanns Schlacht' (Battle of Arminius), and in 1771 left Copenhagen for Hamburg, under the character of a respected citizen and counselor of the margraviate of Baden. In Hamburg he finished his 'Messias' (1773). He also wrote 'Die Gelehrtenspruch' (The Scholar's Republic) (1749), his chief work in prose; 'Geistliche Wieder' (1775); 'Geistliche Lieder' (1771); and several dramas, an addition to the one already named. His reputation did not survive, but he is still known for his great service to German literature in assisting to free it from foreign, especially French, influence. His collected works were published in 12 vol-
umes at Leipzig 1798-1817. A fine edition by Muncker appeared in 4 volumes, 1807. (See MESSIAH, THE.)

KLOSS, klōs, Georg Franz Burkhard, German physician and bibliophile: b. Frankfort, 31 July 1787; d. there, 10 Feb. 1854. He was the son of a doctor and studied medicine in Heidelberg and Göttingen, but soon turned to book collecting, and gathered a fine collection of old manuscripts, purchasing entire libraries of monasteries. Obtaining Masonic degrees, he started collecting books referring to Free-
masonry. In 1844 appeared, at Frankfort, a bibliography of the Masonic works in his collec-
tion, another in 1846. His work 'Die Frei-
maurerei in ihrer wahren Bedeutung aus den alten und ächten Urkunden' reached its second edition in 1854; he published (1848) 'Ge-
schichte der Freimaurer in England, Ireland und Schottland,' then 'Geschichte der Frei-
maurer in Frankreich' (1852-53). His magnific-
ent library of Masonic works is now at The Hague.

KLOSTERMANN, klōs'tehr-man, August
Heinrich, German Lutheran theologian: b. Steinhude, Schaumburg-Lippe, 16 May 1837. He studied at Erlangen University, and Berlin (1855-58), was assistant pastor in Buckeburg (1859-64), and was rector and private teacher (docent) at Göttingen (1864-68) and has since been professor of Old Testament exegesis at Kiel. He wrote 'Vindiciæ Lucæ' (Göttingen 1866); 'Das Markus evangélium nach seinem Quellenwert für die evangelische geschichte' (1867); 'Untersuchungen zur alttestamentli-
chen Theologie' (Gotha 1868); 'Über deutsche Art bei Martin Luther' (1884); 'Die Bücher Samuels und der Könige ausgelegt' (Nörd-
ingen 1899); 'Zur Theorie der biblischen Weissagung und zur Charakteristik des He-
bräherbriefes' (1889); 'Deuterojesaja, he-
bräisch und deutsch' (Münich 1893); 'Schul-
westen sin alten Israel' (Leipzig 1906).

KLOTZ, klōts, Christian Adolf, German critic and Latin scholar: b. Bischopswera, 13 Nov. 1738; d. Halle, 31 Dec. 1771. He studied at Leipzig and Jena; became professor of philosophy at Göttingen 1763; and professor of oratory at Halle 1763. He proved himself ex-
pert in philology through his Latin poems (col-
clected in 'Opuscula poetica,' 1766); 'Der Aus-
gabe des Vorta,' and several numbers of essays such as 'Opuscula varii argumenti' (1766); 'Opuscula philologica et oratoria' (1772). He
got into controversy with the *Algemeinen Bibelthek,* to which he had contributed, and by his *'Uber den Nützen und Gebrauch der alten geschriebenen Steine'* (1768), criticizing Lessing's *Laokoon,* he brought forth that point's reply in *'Briefe an quánischten Inhalts'* (1768-69). His disputes were carried on in *Acta Literaria und Deutschen Bibliothek der schönen Wissenschaften* (1767-72); *'Genius Sacelli,* (1760) had a satirical purpose, as also had his *Mones Eruditorum* and *Der lachende Latin.* (1760). Consult Hausen, *'Leben und Charakter Herrn Klotz'* (Halle 1772); Hagen, *Briefe deutschen gelehrten an Klotz* (1773); Sands, *A History of Classical Scholarship* (Cambridge 1903-08).

**KLOTZ, Louis Lucien,** French statesman: b. Paris, 11 Jan. 1808, of Alsatian descent. Educated as advocate, he founded in 1888 the *Vie Franco-Russe,* in 1892 edited the *Voltaire,* and in 1895 established the *Francais Quotiden.* After two unsuccessful attempts, he was elected in 1896 as radical socialist to the French legislature, and prominent since that date in French politics, and many terms Minister of Finance, which position he now holds. In 1914 on the outbreak of the Great War Klotz was made head of the Press Department of the Ministry of War. In 1919 he was appointed one of the French delegates to the Peace Conference.

**KLOTZ, kōlt, or KLOTZ, Matthias,** Tyrolese violin-maker: b. about 1640; d. about 1696. He was a pupil of Jakob Stainer at Abenson near Innsbruck, there established himself, and made violins much in Stainer's manner, so that only the less metallic tone of Klotz's instruments offers a distinguishing feature. His violins range in date from 1675 to 1696.

**KLOTZ, Reinhold,** German philologist: b. Stollberg, 13 March 1807; d. Kleinschacher, near Leipzig, 10 Aug. 1870. He studied at Leipzig and became assistant professor there (1832), and, in 1849, full professor. He was one of the editors (1831-55) of *'Neuen Jahrbucher für Philologie,* and produced editions of the Greek *'Gallus* and *'Clement of Alexandria,* *'Euripides* (1836-60), and of the *'Chares* of Herart; *'Liber de Graecia Lingua particulis'* (1835-42). In the Latin he made complete editions of Cicero (1851-56); Terence (1838-40); Andria, *Nepos,* etc. He worked with Lübker and Hudemann on a Latin dictionary (1847-57). Consult Jahn, *'Jahrbuch'* (1871).

**KLÜBER, kluber,** Johann Ludwig, German law professor, author and state official: b. Tann, near Fulda, 10 Nov. 1762; d. Frankfort, 16 Feb. 1837. He became professor of law at the University of Erlangen (1786), privat-referendier, state and cabinet counsel, in Karlsruhe (1804), and professor of law at Heidelberg (1807). During the congress at Vienna (1814-15), by government permission, he resided there and published *'Akten des Wiener Kongresses in den Jahren 1814 und 1815'* (8 vols., 1825-28). He was elected president of the Wiener Gesellschaft, under the title of *'Quellensammlung zu dem öffentlichen Rechte des Deutschen Bundes.* Under von Hardenberg, chancellor of state, he became privy councillor in the Ministry of Foreign Affairs (1817) and, under its auspices he assisted in the congress at Aix-la-Chapelle (1818), and in political negotiations in Frankfort and Saint Petersburg. In 1822 he published the second edition of his *'Öffentlichen Rechte des Deutschen Bundes,* which brought on political persecution, his resignation and retirement to Frankfort, where he died. Other prominent works are *'Staatsrecht des Rheinbundes'* (1828); *'Die Selbständigkeit des Richteramtes und die Unabhängigkeit seiner Urteile in Rechtsprechren,* (1832); *'Fragmatische Geschichte der nationalen und politischen Wiedergeburt Griechenlandes* (1835).

**KLUCK, klūk, Alexander H. R. von,** German general: b. Münster, Westphalia, 20 May 1846. He entered the army in 1865 and served in the Austrian campaign of 1866 and the Franco-German War, 1870-71. In the latter he was twice wounded at Metz and awarded the Iron Cross (second class) for bravery. At the opening of the European War he commanded the First German Army (the right wing) in the invasion of Belgium and the subsequent drive on Paris. Von Kluck had long been regarded as one of the best infantry leaders in the German army. Starting from his Chapelle, he marched through Vise, took Brussels and Louvain, fought the battles of Mons and le Cateau, and finally came almost into touch with the outer defenses of Paris. Instead, however, of moving straight on to the French capital from Senlis, he turned in a southeasterly direction, leaving Paris and the British forces on his right. This unexpected move led to what has been called the turning-point of the war. Unknown to von Kluck, General Joffre had placed a new French army under Maunoury at the left of the British, and another army under Foch at the right, adjoining the command of Franchet d'Esperey, which stood immediately on the British right. Maunoury attacked von Kluck on his exposed flank and caused that gap in the German line into which General Foch threw all his strength, thereby deciding the battle of the Marne and forcing the Germans to retreat beyond the Aisne. Most military writers maintain that the strategy of von Kluck was responsible for the breakdown of the original German plan of campaign. Toward the end of March 1915, while inspecting an advanced position, he was struck by shrapnel, which caused seven wounds. Shortly afterward he received the Order Pour le Mérite. In October 1916 the * Militär Wochenblatt* announced that Field-Marshal von Kluck had been placed on half-pay, in accordance with his request to be allowed to retire. His son, Lieutenant Egon von Kluck, was killed early in 1915. See Foch, General; War, European; Battle of the Marne.

**KLUCHHOHN, klوكهُون, August,** German educator and historian: b. Bavenhausen, 6 July 1832; d. Munich, 19 May 1893. He studied at Heidelberg and Göttingen; and in 1850 became editor at Munich of a critical division of von Sybel's *'Historisches Zeitschrift.* After acting as teacher (docent) in Munich University from 1860, in 1870 he lectured on history and was professor in the technical high school in 1869. He was appointed professor of history in Göttingen University in 1883. He wrote *'Die Geschichte des Gottesfriedens* (1857); *'Wütem III, Herzog von Beyern-München* (1881); *'Ludwig der Reihe,
Herzog von Bayern-Landshut' (1865); ‘Friedrich der Fromme, Kurfürst von der Pfalz’ (1872); ‘Deutsche Vergangenheit von Preussen’ (1874); ‘Blücher’ (1879). He published ‘Ueber den von Westenrieder Leben und Schriften’ (1890). His ‘Vorträge und Aufsätze’ (1894) was issued as a posthumous work by Heigel and Wrede, Munich.

**KLUGE, kloog’g, Friedrich, German philologist and educator:** b. Cologne, 22 June 1856. He studied philosophy and Germanic in Leipzig, Strassburg and Freiburg; became teacher of English and German philology at Strassburg (1880), assistant professor at Jena in 1884, full professor in 1886, and in 1893 was appointed professor of German language and literature at Freiburg. He wrote ‘Etymologisches Wörterbuch der deutschen Sprache’ (1881, 7th ed., 1910); ‘Stammbildungenlehre der algermanischen Dialekte’ (2d ed., 1899); ‘Von Luther bis Lessing, sprachgeschichtliche Aufsätze’ (4th ed., 1904); ‘Angelsächsisches Lesebuch’ (3rd ed., 1912); ‘Dialekten der Teutschen Sprache’ (1895); ‘English Etymology’ (in collaboration with F. Lutz, 1898); ‘Rothwelsch, Quellen und Wortschatz der Gaunersprache’ (1901); ‘Mittelenglisches Lesebuch’ (glossary by Köbing, 1904; 2d ed., 1912). For Paul’s ‘Grundriss der algermanischen Philologie’ he wrote ‘Vorgeschichte der algermanischen Dialekte’ (1887) and ‘Geschichte der Englischen Sprache’ (1889). In 1900 he founded the Zeitschrift für deutsche Wortforschung.

**KNABL, kna’bəl, Joseph, Austrian sculptor:** b. Fries, Tyrol, 17 July 1819; d. Munich, 3 Nov. 1881. As son of a peasant he learned carving with F. Renn in Innsbruck. He went to Munich in 1836 and studied wood-carvings of the Middle Ages under J. Otto Entreles and, later, Sickinger, when he worked on images of saints. Working independently from 1842, he created the heroic size group ‘Baptism of Christ’ for the Mergenheim Church, Wurttemberg (1842); several statues for the cathedral altar at Augsburg (1854); ‘Christ and the Apostles,’ a life-sized group for the high altar at Velden, Lower Bavaria (1855). His group of Saints Ann and Mary for the Eichstätt Cathedral was awarded a prize at the Munich Exhibition in 1858. His chief-deuvre is considered to be a ‘Coronation of Mary’ for the Munich Frauenkirche high altar. He was appointed professor of sculpture (1862) in the Munich Academy.

**KNACKFUSS, knob’kfoos, Hermann, German artist and writer on art:** b. Wissen, Khen- sam, Prussia, 11 Aug. 1848. He studied in the Düsseldorf Academy (1865–69); went through the Franco-Prussian War (1870–71); then continued art study under E. Bendemann, later under E. von Gebhardt. He won the state prize (1872) which paid for his studies at Rome (1875–78). He taught anatomy in the Cassel Academy (1880) and history of art (1890). His noted works are ‘Battle of Muhl- dorf’ (belonging to the Kaiser); ‘Battle of Turin,’ in Berlin Zeughnus; mural decorations in the Potsdam Treppenhaus of the officers’ casino; ‘Entry of the Kaiser and Kaiserin into Jerusalem’ (1897); altarpiece in the picture in the Fulda Cathedral (1893); mural decorations in the Wohltau (Silesia) Gymnasiu. He is author of the following works, among others: ‘Deutsche Kunstgeschichte’ (1888); ‘Das Leben von Rembrandt’ (1890); he has contributed articles on Raphael, Rembrandt, Rubens, Michelangelo, Durér, Murillo, Holbein, Titian, Velázquez, Frans Hals, van Dyck, Menzel, etc.

**KNAPP, knäp, Albert, German clergyman and poet:** b. Alpirsbach, 25 July 1798; d. Stuttgart, 18 June 1864. He studied theology at Tübingen, Freiburg in Brabant (1815–18) and filled other positions till he made a reputation in the Hospitalskirche at Stuttgart (1836). Was archdeacon in the Stiftskirche (1839), later to become Stadtpräfett. His poetry was of a religious character chiefly; among his works are ‘Christliche Gedichte’ (1839); ‘Neuern gedichte’ (1834); the cycles, ‘Hohenstaufen’ (1839); ‘Bilder der Vorwelt’ (1862); and in hymnology, ‘Evangelische Liederschatz für Kirche und Haus’ (1837). He wrote ‘Das Leben von Ludwig Hofacker’ (1873), ‘Gesamtheit von Preussischen Schriften’ (1876–78). Published posthumously. Consult Gerok, K., ‘Albert Knapp’ (Stuttgart 1881); Knapp, A., ‘Knapp als Dichter und Schriftsteller’ (Tübingen 1913).

**KNAPP, nap, Charles, American philologist:** b. New York, 22 June 1868. He graduated at Columbia University (1887), took the degree Ph.D. (1890) and was prize fellow in classics (1887–90). He became tutor fellow in Latin (1890–91) and was appointed instructor in Latin and Greek (1891–1902), adjunct-professor of classical philology (1902–06), and was made professor in 1906. He became editor of the Columbia University Classical Weekly in 1907. He wrote ‘Stories from Aulus Gallius’ (1895); ‘Selections from Vini Romae’ (1896), in collaboration with R. Arrowsmith; ‘The Enneid of Virgil’ (1901, books I–VI, selections VII–XII). He has contributed many articles on classical subjects to periodicals and encyclopedic works.

**KNAPP, George Friedrich, German economist and educator:** b. Giessen, 7 March 1842. He studied in Munich, Berlin and Göttingen, and in 1867 became director of the Statistical Bureau of Leipzig. Two years later he was appointed assistant professor of economics and statistics in the University of Leipzig and in 1874 professor of political economy in Strassburg University. His writings dealing chiefly with population and agricultural topics include ‘Über die Ermittelung der Sterblichkeit’ (1888); ‘Die Sterblichkeit der Sachsen’ (1869); ‘Theorie des Bewässerungswechsels’ (1874); ‘Die Bauernbefreiung und der Ursprung der Landarbeiter in den alten Teilen Preussens’ (1887); ‘Die Landarbeiter in Knechtschaft und Freiheit’ (1891); ‘Grundwirtschaft und Ritter-Geschichte’ (1895); ‘Die Wirtschaftsverhältnisse der Gegenwart’ (1905). In 1891 he founded the periodical Abhandlungen aus dem staatswissenschaftlichen Seminar zu Strassburg.

**KNAPP, Hermann, German-American physician:** b. Dauborn, 17 March 1832; d. 1911. He studied in Munich: Würzburg, Berlin, Leipzig, Zürich, Vienna, Paris, London and Utrecht, and was appointed assistant teacher (1860) at Heidelberg (1860), becoming professor of ophthalmology at the university (1865). Com-
ing to America he founded (1869) the New York Ophthalmic and Aural Institute, and was made professor (1862) of the New York University. Medical School. He was appointed to the professor of ophthalmology (1888) at the College of Physicians and Surgeons, Columbia University, and (1902) emeritus professor. He did valuable service in optical surgery and wrote many valuable treatises on his special subjects, the eye and ear. Among his works are: 'Die Krümmung der Hornhaut des menschlichen Auges' (Heidelberg 1860); 'Die intraokularen geschwüle' (Carlruhe 1868); 'Cocaine and its Use' (New York 1885); 'Investigations on Fermentation, Putrefaction and Suppuration' (ib. 1886); 'Cataract Extraction without Iridectomy' (ib. 1887). In collaboration with Moos, he published Archives of Ophthalmology and Otology, from 1869, in English and German.

KNAPP, Martin Augustine, American judge and lawyer: b. Spafford, N. Y., 6 Nov. 1843. He was graduated at Wesleyan University, Connecticut (1868), received the degree of LL.D., and was admitted to the bar (1869), being appointed corporation counsel (1877-83) in Syracuse. In 1891 he was appointed interstate commerce commissioner by President Harrison, reappointed (1897) by President Cleveland, and again reappointed (1902) by President Roosevelt, becoming chairman of the commission from 1898. Under the Erdman Act as ex officio mediator, he assisted in the work of settling numerous labor disputes. He was appointed by President Taft additional circuit judge and assigned for five years to the United States Commercial Court as presiding judge, entering office 31 Dec. 1910, but immediately resigning. He was appointed a mediator for two years from 4 March 1911, becoming member of the Board of Mediation and Conciliation under the Newlands Act (1913), by appointment of President Wilson. On the dissolution of the Commerce Court (13 Dec. 1915) he was assigned to the District of New York Circuit Court of Appeals, 4th Judicial Circuit. He is member of the American Academy of Political and Social Science, the American Economic Association, American Political Science Association, American Society of Newspaper Editors, among other professional and scientific bodies.

KNAPP, Samuel Lorenzo, American lawyer and author: b. Newburyport, Mass. 19 June 1774; d. Hopkinton, Mass., 8 July 1838. He was educated at Phillips Academy and graduated at Dartmouth College (1804). He studied law under Chief Justice Theophilus Parsons, at Newburyport and quickly achieved a reputation as an eminent counsellor and as active member in the State legislature. In the War of 1812 he commanded a regiment of State militia on the coast; became editor of the Boston Monthly Magazine and established (1826) the National Republican, but went to New York after two years to practise his profession. He was given the degree of LL.D. from the Paris College. He wrote 'The Bachelor and other Tales' (1836); 'American Biographies of Travels in North America, by Ali Bey' (1818); 'Life of Aaron Burr' (1835); 'Life of Andrew Jackson' (1835); 'Memoirs of General Lafayette' (1824).

KNAPSACK, a bag or case of leather or strong cloth, used by soldiers, tourists and other travelers for carrying light personal baggage. Knapsacks are made in various styles, and are usually strapped to the back.

KNAUS, knous, Ludwig, German painter: b. Westfalen, 5 Oct. 1829. From 1849 to 1852 he studied art at Dusseldorf under Seohn and Schadow, but soon shook himself free from their influence and started on a path of his own. He chose scenes from country life and in 1850 painted 'The Country Dance'; 'The Players,' now in the gallery of Dusseldorf, a replica being in the gallery of Leipzic. His early pictures in this style were received with favor, although characterized by the dark, dull coloring of the Dusseldorf school. In 1852 he went to Paris, and resided there for eight years, which were fruitful in many well-known pictures of his early style, 'The Golden Wedding' (1858); 'The Baptism' (1859); and 'Starting for the Dance.' Returning to Dusseldorf in 1866, he remained there for eight years, during which period he produced the pictures on his subject as a genre painter is chiefly founded. Among these are 'The Child's Party' (1809), in the Berlin National Gallery; 'Funeral in a Hessian Village' (1871); 'The Goose-Girl' (1872). These works are distinguished by naturalism and naïveté, by delicate humor, mastery of detail, lifelike coloring and vivid expression. After his appointment to the direction of a studio in the Art Academy at Berlin he reached his latest manner, which was formed largely by his study of the Dutch school, from which he acquired his final skill as a colorist. His pictures, however, no longer showed the naïveté, the directness of his earlier productions; which were replaced by thoughtfulness and a striving after the didactic or admonitory. The most remarkable paintings of this period are 'The Holy Family' (1876); 'Tavern Scene—Bad Ways' (1876); 'The Refractory Model' (1877), etc. He has also painted many portraits combining the picturesqueness of genre with lifelike expression. Among his miscellaneous works are his designs in Watteau style for room decorations, his lead pencil sketches and aquarelles. Very many of his works have been reproduced by photography or engraving. Consult Pirsch in Kunstlexikon (Bielefeld 1896), and, id., an album of Knaus' work, published by the Berlin Photographic Society.

KNEBEL, knëbël, Karl Ludwig, German translator and poet: b. Wallerstein Castle, Franken, 30 Nov. 1744; d. Jena, 23 Feb. 1834. He studied law in Halle, was officer in a Potsdam regiment (1765-73), tutor to Prince Constantine at Weimar from 1774. During a trip to Paris with his princely pupil and the Crown-Prince Karl August, he visited the poet Goethe at Frankfort and introduced his royal companions. He retired in 1791 on a pension with the rank of major and lived in intimate and close fellowship with the gifted Weimar group of contemporaries: Goethe, Schiller, Herder, Wieland, Duke Karl August, etc., in Weimar, Ilmenau and Jena. As poet his best-known works are 'Sammlung von Gedichten' (1815); 'Distychs' (1827); but better known are his translations, such as 'Elegien des Propert' (1798); 'Lucretius' (1821); Alferi's 'Saul' (1829). His 'Correspondence with
Goethe (Leipzig 1851, 5 vols.); 'Letters from Duke Karl August of Saxe-Weimar-Eisenach' (ib. 1883); and a collection 'From Knebel's Correspondence with his Sister Henrietta' (Jena 1858), all afford very interesting light on the social culture of the noted period at the court of Weimar.

KNEE JERK, or PATELLAR REFLEX, a useful reflex test in diagnosis. When the leg is resting in an easy position, crossed over the other leg, for instance, a sharp blow given to the patella (knee-cap) tendon causes a sudden jerking forward of the leg. This action is brought about by a contraction of part of the quadriceps of the femur bone. This sudden extension of the leg is known as 'knee-jerk' and it is generally considered as a reflex action and is often tested for the symptoms of disease, the action being restricted in cases of locomotor ataxia, lead poisoning, chronic alcoholism, and even absent in other diseases as neurasthenia, hemiplegia, spasitic paraplegia, etc., the kick becomes abnormally extended.

KNEEJAND, něländ, Abner, American theologian and deist: b. Gardner, Mass., 6 April 1774; d. Farmington, Iowa, 27 Aug. 1894. He was at first Baptist, then entered the Universalist ministry, but later became deist. He edited Universalist literature at Philadelphia and New York, then went to Boston where he founded (1831) the Investigator. His expressed tenets brought him into the Boston Supreme Court (1836) where he was given a short sentence of imprisonment as guilty of blasphemy. He wrote 'The New Testament in Greek and English' (Philadelphia 1822); 'Lectures on the Doctrine of Universal Salvation' (1824); 'A Review of the Evidences of Christianity' (New York 1829). Consult Kneeland, A., 'Review of the Trial, Conviction and Final Imprisonment of A. Kneeland' (Boston 1838); Parker, S. D., 'Report of the Arguments at the Trial of A. Kneeland' (ib. 1834); 'Review of the Prosecution against A. Kneeland' (in Cosmopolite, ib. 1853).

KNEEJAND, Samuel, American naturalist: b. Boston, Mass., 1 Aug. 1821; d. Hamburg, Germany, 27 Sept. 1888. He was graduated from Harvard in 1840, practiced medicine in Boston 1845-50, and was an army surgeon during the Civil War. In 1866 he became professor of zoology and physiology in the Massachusetts Institute of Technology. He was a member of numerous scientific societies, and in addition to editing 'The Annual of Scientific Discovery' (1886-89), a translation of 'Andry's Diseases of the Heart' (1847), and Smith's 'History of the Human Species,' he wrote 'Science and Mechanism' (1854); 'The Wonders of the Yosemite Valley and of California' (1871); 'An American in Iceland' (1876); 'Volcanoes and Earthquakes' (1888).

KNEIPP, kuip, Sebastian, German clergyman: b. Stefanari, Bavaria, 17 May 1821; d. Worishofen, Swabia, 17 June 1897. He studied theology at Dillingen and Munich, became a Roman Catholic priest in 1852 and pastor at Worishofen in 1881. He became known for the "Kneipp cure," which he advocated for years. This method was based on water, fresh air, sunshine and a scheme of regular activity, and included walking barefoot in dew-moistened grass and on snow. Kneipp wrote 'Meine Wasserkur' (1887; Eng. trans. 1891); 'Mein Testament' (1894); 'Vorträge in Wörishofen' (1894-98); and other works. His collected works were published at Kempten (1890-99). Consult Verus, Vater Kneipp, sein Leben und Wirken' (Kempten 1897).

KNEISEL, nězěl or knězěl, Franz, German-American musician: b. Rumania, 26 Jan. 1865. He was a pupil in violin-method of Grün and Hellmesberger, became concert-master of the orchestra at Hofburg Theatre of Vienna, of Bilse's orchestra at Berlin, and later (1885) of the Boston Symphony Orchestra. He appeared prominently with the Symphony as solo violinist and in 1886 organized under his leadership the Kneisel quartet for chamber-music, in which he played the first violin part. This quartet, all of whom were members of the Symphony, withdrew from the latter in 1903 to undertake an extensive tour. Several European tours were undertaken with success. He removed to New York where since 1905 he is chief of the violin department of the Institute of Musical Art. He was member of the jury of the violin competition at the Paris Conservatory. He received the degree of Mus.D. from Yale in 1911 and from Princeton in 1913. He has compiled 'The Kneisel Collection for Violin and Piano' (3 vols., 1900) and composed 'Advanced Studies for the Violin' (1910) and a concert etude.

KNEELLER, něler, Sir Godfrey, originally GOTTFRIED KNILLER, Anglo-German portrait painter: b. Lübeck, 8 Aug. 1646; d. Twickenham, England, 7 Nov. 1723. He studied under Bol and Rembrandt at Amsterdam. He visited Italy in 1672, where he studied under Maratti and Bernin and painted several historical pieces and portraits, both at Rome and Venice. On his return he visited England, in 1674, and was introduced to Queen Mary, by whom he was much patronized and thereby enabled to quickly outstrip Lely (q.v.) in popularity. He was equally favored by James II, William III and Queen Mary, for the latter of whom he painted the "beauties" at Hampton Court, and several of the portraits in the Galleria. He also painted the portraits of the Tsar Peter the Great, Louis XIV and Charles VI of Spain for the same sovereign, who in 1692 knighted him and made him gentleman of the privy chamber. Queen Anne continued him in the same office, and George I, in 1715, made him a baronet. There was hardly a person of note, at least resident in or visiting England, of whom he did not paint a portrait. Among his works should be mentioned also a series of 43 portraits of his co-members in the famous Academy; and he continued to practise his art to an advanced age. Naturally his earnings were very large. Although he lost a good deal of money in the South Sea Bubble and lived in great style, both in London and on his estate, Kneiller Hall near Twickenham—where an art college for military musicians—he left a large fortune. He left money and instructions for a splendid monument to himself in Westminster Abbey, erected by Rysbrack in 1729, which bears an epitaph by Pope. His coloring is true and harmonious and his drawing correct, but he dis-
KNESSEBECK, knit-zee-bæk, Karl Friedrich von, Russian field marshal, b. Karwe near Neuruppin, 5 May 1768; d. 12 Jan. 1848. He entered the army (1782) and gained distinction in the campaigns of 1792-94 and was made captain (1799), major (1802), being on the general staff at Auerstadt (1806), where he saved the king from being taken prisoner. He drew up the plans of battle at Paltusk (1806) in the Russian campaign but retired, at the Treaty of Peace of Tilsit, to his estate. He was sent (1809) on a diplomatic mission to Austria during the Franco-Austrian War and went on a mission to Russia in the winter of 1811-12, advising peace. He was created general-adjudant to the king in 1813 and carried on the negotiations with Austria for a coalition, failing which he took a prominent part in the campaign, hindering the bold schemes of Blücher and Gneisenau. He was a prominent figure in the continuation of the campaign (1813-14) and in the plan of action. In 1847 he was appointed commander-general of the army of observation against Poland, and on his retirement, was created field-marshall. His memoirs are said to be unreliable. He wrote also, 'Lob des Kriegs' (1805), a poem which had great popularity. Consult Dunker, 'Die Mission des Obersten von dem Knessebeck' (in Abhandlungen zur preussischen Geschichte, Leipzig 1876); Lehmann, M., 'Knesbeck und Schon' (ib. 1875).

KNIAZHNIN, knyázh-nèn, Jakov Borisovich, Russian littérature and dramatic author: b. Pskov, 3 Oct. 1743; d. 14 Jan. 1791. He was educated in the University of Saint Petersburg, entered the army, where, however, he stayed only a short time, and for a number of years was connected with the civil service. In 1783 he became a member of the Russian Academy at Saint Petersburg. Of his tragedies the majority are but imitations of French plays, containing with the exception of two or three, nothing original. His comedies are replete with brilliant passages and full of spirit. The tragedies which were mostly written are 'Didon' (1769); 'Vladimir i Jaropol' (1779); 'Vladislan' (1786); 'Roslav' (1784); 'Vadim' (1789). The two last were patriotic plays, some of the passages of the 'Vadim' being of such a character as to cause the work to be suppressed, but it was published in 1793, two years after the death of the author. Of his comedies the most noteworthy are 'Khvastum'; 'Chudakh'; and the light opera 'Neschastie ot Karet'. A complete edition of his works, in four volumes, was published in 1787, several subsequent editions being published in two volumes in 1847-48.

KNICKERBOCKER, nik'er-bök-èr, the cognomen of an old Dutch burgher family of colonists in New York. The word has been used colloquially for many years as expressive genrically of the old elite resident families of New York City, but more properly restricted to the persons descended from the old Dutch settlers of Manhattan Island. Washington Irving, in his 'History of New York' (1809) names the author as 'Diedrich Knickerbocker.'

KNICKERBOCKER, Herman, American lawyer and legislator: b. Albany, N. Y., 27 July 1782; d. Williamsburg, N. Y., 30 Jan. 1855. He studied law at Albany, N. Y., was admitted to the bar in 1803 and entered practice in Albany. In 1809-11 he was a Federalist representative from New York in the 11th Congress, was re-elected to the New York State Assembly from Rensselaer County, and for some time also held the office of county judge. He became a Democrat during Jackson's administration. Through his hospitality he was known as "Prince Knickerbocker."
where in English. Illustrations for the 'History' have been made by Allston, Leslie, Jarvis and Darley.

**CARL VAN DOREN.**

**KNIFE.** A cutting tool of steel, german-silver, silver, gold, bone, horn, wood or other material. According to the purposes for which it is constructed it is called bread-knife, pen-knife, table-knife, erasing-knife, paper-knife, butchers-knife, etc. Knives can be divided into two broad classifications as having blades that fold into or onto the handle and those that have fixed blades. The essential parts of a knife are its blades and its handle (known as a *haft*); exceptions to the rule are those consisting solely of a blade, as those used by furriers, cigarmakers, etc. The knife haft generally consists of wood, bone, ivory, horn, metal, mother-of-pearl, etc. For the technical make-up of knives see under article CULTERY.

**History.** In its most primitive form the knife was formed from a piece of flint or other stone. The chipped and polished flint knives of the Stone Age (many are extant) are frequently wonderfully formed and show consummate skill in construction. They have keen, practical cutting edges, the ends usually pointed. They were found in nearly all parts of the globe. With the discovery of bronze (Bronze Age), knife blades were among the earliest utensils to be made from this metal. These are found in numbers in the ancient prehistoric *lacustrian* villages of Switzerland, some being fastened to handles of the same metal. In the ancient classical period knife blades were made of bronze, iron and copper; the copper being hardened, probably by hammering. In ancient Rome bronze knives were reserved for religious rites. The hafts (haulers) of this period are found in ivory, bone or bronze and of varying forms, sometimes the blades of these early knives folded into a groove in the handle. Some were carried in a sheath hung from the belt; the Gallo-Romanesque tombs furnish such, the extender being of wood and the inside of iron. The ancient sacrificial knife often figures on carved monuments. While a few of the early Greeks used knives at meals, it was usual to serve the meat and other foods cut up, the guests picking up the viands with their fingers and tearing it up with their teeth. For cutting up fruit they used bone knives; they also knew the use of hunting knives. In the 1st century B.C. the Chinese used copper knives as coins, known as *Dau tsien*.

The Franks (Germanic tribes, about 240 A.D.) carried an iron knife suspended from the belt, often enclosed within the same sheath as the dagger. In the Middle Ages steel-bladed knives appear, toward the 14th century. Sheffield, England, was the centre of a steel industry and Langres, France, was renowned, as well as Moulins, already for their steel knives in 1427. By the 17th century the blades were often decorated with chased and gold inlaid designs. Knife handles of that period are found in ivory, bone, mother-of-pearl, silver, copper, steel, and wood. By the 18th century knife handles often assume the form of figures or cariatids. During the Middle Ages one of the luxuries of the *seigneurs* consisted of having a table service of knives of which the handles varied according to the period of the liturgical year; the ebony handles were reserved for the period of Lent, those of ivory for Easter. Knives were employed in battle; the French termed them, in the 15th century, *couteaus de brêche*. Knives figuring among the knights were often highly decorated; that of Louis le Bon (extant) has its handle of hard-wood ornamented with bands of silver-gilt and enamels. On the handles were engraved, by the owners' coats-of-arms; enamel work, inlaid precious stones vie with arabesques and engravings in the decoration. The knight's knife was generally in a sheath or scabbard. The knife sheath in Bamberg Castle dates back, probably, to the 10th century and is extant; it is of ivory with metal ornamentation. The hunting knife of the Middle Ages (the *couteau de chasse* of the French) was a most elaborate equipment and consisted of a highly decorated sheath containing, besides the heavy-bladed huntsman's knife for killing the game and cutting it up, a set of smaller utensils arranged around it in the sheath. These latter were three small knives, a fork and a *bodkin*. In the sheath or case for use at table there were three knives; one large one, the *couteau à tranche* for cutting into slices or pieces (tranche) of which the very large blade terminated in a crescent-shaped point with which to pick up the pieces and serve on the guests' plates; another large knife with two cutting edges; a smaller knife that was placed in front of the host. A favorite method of decorating leather sheaths in the 14th and 15th centuries was to burn or brand designs on the outside. In the refectories of the convents they used knives whose blades had engraved on one side the Benedictine and on the other side "Dei Gratias" (*grace* after meals), the musical notes of the chant being cut into the metal. The oyster knife appeared as early as the 16th century. As to folding knives, after being already known to the Romans they probably never went out of use entirely; we read in an inventory of 1380 of "a little knife, of silver handle shaped like a lily, of which the blade folds back into the handle." Clasp or spring knives came into common use in middle of the 17th century. The large hunting knife is frequently termed a *Jack* knife; this kind of knife is said to have been introduced into England during the reign of James I (early 17th century) and to have received its name from this fact; it had no spring but the blade closed into the haft. See also CULTERY.

**CLEMENT W. COUMBE.**

**KNIFE MONEY,** a bronze currency in the form of knives long in use in China. These money knives were often highly ornamented and each bore on the blade hieroglyphical markings which indicated its value in the money market. The handle of the knife money was usually in the form of a disk in the centre of which there was a circular hole by means of which it was strung on a string with other similar money. See NUMISMATICS.

**KNIGGE,** Adolphus Francis Friedrich Louis, Baron von Gerstung, b. Bremenbeck, near Hanover, 16 Oct. 1752; d. Bremen, 6 May 1796. In 1769 he went to the University of Göttingen, where he studied law, later became assessor at Cassel, in 1777 was made a chamberlain at Weimar, and finally in 1791,
after leading a very unsettled life, became a resident of Bremen. Here he joined the Illuminati and later became implicated in the disputes relating to that secret order. Of his writings by far the most important is his 'Ueber den Umgang mit Menschen' ('On Intercourse with Men'), which contains much good humor and criticism. Of his life of living so as to get the greatest joy and happiness at the same time being useful. Of his other works those most read were 'Der Roman meines Lebens' (1781-87); and 'Die Reise des Siegverwundschen' (1782), a humorous romance; and 'Des seligen Eratstatze von Schaafskoff hinefterlassene Papiere' (1792). Consult Goedeke, 'Adolf Freiherr Knigge' (1844).

KNIGHT, Austin Melvin, American rear-admiral: b. Ware, Mass., 16 Dec. 1854. He was graduated at the United States Naval Academy (1873) and commissioned ensign (1874), promoted to master (1879), lieutenant, junior grade (1883), and made lieutenant in 1885, becoming lieutenant-commander in 1889 and commander in 1907. He became captain in 1907 and rear-admiral in 1911. He served on the Tuscarora on the Pacific station (1873-74); on the Kearsarge on the Asiatic station (1874-75). In 1876 he was appointed to the Naval Academy, later serving on thequinne-bay on the European station (1878-79); on the Galena on the European and Atlantic stations (1880-83). He was stationed at the Minneapolis ordnance proving ground (1883-85) and had charge of same from 1885-89. He served on the flagship Chicago on the North Atlantic, European and South Atlantic stations (1889-92), and was at the Naval Academy from 1892-95. From 1895-97 he served on the Lancaster and Cassine on the South Atlantic station, and on the Puritan on the North Atlantic station from 1897-98. In the Spanish-American War he assisted in the blockade of the north coast of Cuba, and in the Porto Rican expedition. He was stationed (1898-1901) at the Naval Academy and at the War College (1901). He commanded the Yankeetown on the survey of Cuba's south coast (1901-03), and on the Cassine on the North Atlantic squadron (1903-04), and presided over a special board on naval ordnance and on a smokeless powder board (1904-07). He commanded on the Washington from 1907 to 1909; later was commander at Narragansett Bay, R. I., station, and commandant of same and president of Naval War College from 1913-17; and in 1917 he was appointed commander-in-chief of the Asiatic fleet with rank of admiral.

KNIGHT, Charles, English editor and publisher: b. Windsor, 15 March 1791; d. Addlestone, Surrey, May 1873. He succeeded his father as a bookseller in Windsor, and for several years edited a Windsor newspaper. Having removed to London in 1823, he established Knight's Quarterly Magazine, in 1827 undertook the superintendence of the publication of the Society for Promoting Useful Knowledge, for which he superintended and published the 'Library of Entertaining Knowledge'; the Penny Magazine and the 'Penny Cyclopaedia,' afterward remodeled as the 'English Cyclopaedia,' etc. Other publications of his were the Pictorial Edinburgh Review, the Pictorial Shakespeare and many others. The Shakespeare (3 vols., London 1839-43) was edited by Knight himself, and has, both for its text and notes, taken a high place among editions of the great dramatist. It went through many editions, and was published in the United States as 'The Stratford Shakespeare' (5 vols., New York 1881). The most important of his works is his 'Popular History of England,' appeared 1854-61 (1st American edition, 4 vols., New York 1881). His autobiography, 'Passages of a Working Life During Half a Century' (3 vols.), was issue in 1864-65. It would be very difficult to give a complete list of all books in the publication of which he had a part, either as author or editor, because it is frequently impossible to determine just how large his share was in either of these capacities, instead of only in that of publisher. However, the following books, to which must be added a number of articles and pamphlets, are, beyond all doubt, results of either his authorship or editorial care: 'The Menageries' (1826); 'The Elephant' (1830); 'The Red Man' (1831); 'Capital and Labour' (1831); 'Trades Unions and Strikes' (1834); 'William Shakespeare' (1843); 'William Caxton' (1844); 'Old England, etc.' (2 vols., 1845); 'Studies of Shakespeare' (1849); 'The Struggles of a Book against Excessive Taxation' (1850); 'The Old Printer and the Modern Press' (1854); 'Once Upon a Time' (1854); 'Knowledge is Power' (1855); 'Beggad at Court' (1866); 'Shadows of the Old Booksellers' (1867). Consult Clowes, A. A., 'Knight, a Sketch' (London 1892).

KNIGHT, Daniel Ridgeway, American painter: b. Philadelphia, Pa., 1850. He has been a pupil of Gleyre and a student at the Ecole des Beaux Arts at Paris (1872), and four years later was in the studio of Meissonier, from whom he learned many of the secrets of the brilliant technique. He has received honors from Paris, Munich and Antwerp for his exhibited works, and has also been awarded medals at Chicago 1893 and at Philadelphia Academy of Fine Arts 1893. He is a painter, rather French than American, and he has idealized the French peasantry in more than one of his refined and delicately designed pictures, among which we may mention as especially characteristic of his charming qualities 'The Veteran' (1870); 'The Old Beau' (1873); 'Washerwoman' (1875); 'Harvest Scene' (1877); 'Sans Dot' (1883); 'Chatterboxes'; 'L'Appel au passeur'; 'Hailing the Ferry' (Pennsylvania Academy); 'The Shepherdess' (Brooklyn Institute Museum). Knight was made an officer of the Legion of Honors in 1909 and has received also the Cross of St. Michael of Bavaria.

KNIGHT, Edward Frederick, English journalist and author: b. 23 April 1852. He was graduated at Cambridge and in 1891 became a member of the staff of the London Times as a correspondent, and with the armies in the Sudan campaign of 1896, and in Greece in 1897, and in the Cuban and South African wars. He is an expert yachtsman, and has made voyages on small sailing yachts to South America, the West Indies and the Baltic. He has written 'Albania and the Byzantine Empire,' 'The Cruise of the Falcon'; 'The Threatening Eye';
KNIGHT, Edward Henry, American mechanical expert: b. London, England, 1 June 1824; d. Bellefontaine, Ohio, 22 Jan. 1883. After studying both surgery and steel engraving he came to this country in 1845 and settling in Cincinnati was a patent attorney for several years. In 1863 he entered the civil service in Washington, D. C., where he prepared the annual reports of the Patent Office and established and edited the Official Gazette of the United States Patent Office in 1871. He served on the international juries of world's fairs at Philadelphia (1876), Paris (1878), Atlanta (1881), and was made a chevalier of the Legion of Honor in 1878. He published 'The American Mechanical Dictionary' (1872-76); 'The New Mechanical Dictionary' (1876-80); 'A Study of the Savage Weapons at the Centennial Exhibition of 1876' (Phillipsonian Institution, Annual Reports, 1879, p. 213, Washington 1880).

KNIGHT, Ellis Cornelia, English author: b. 1757; d. Paris, 17 Dec. 1837. She went to Italy with her mother on the death of her father, Rear-Admiral Sir Joseph Knight (1775). She lived under the protection of Lady Hamilton and Admiral Nelson after her mother's death (1799) and returned with them to England. She was appointed companion to Queen Charlotte (1805) and to a similar position, later, in the household of Charlotte Augusta, Princess of Wales (1813). Her autobiography is a most valuable source of information for the court history of those days. The most important statements in the work were edited and published (1861) after her death. She wrote also 'Dinarbas' (1790); 'Flamininus', a romance of old Roman life (1792); 'Sir Guy de Lusignan' (1833), another romance. Her principal work was 'A Description of Latium, or La Campagna di Roma' (1805), with engravings by the author. She translated a number of German hymns and prayers which were printed privately (1822) and published in 1832.

KNIGHT, John James, Australian journalist and historian: b. Hanley, England, 7 June 1863. He has worked as a journalist in Australia and England. He arrived in Australia at the age of 11, and in 1884 he joined the staff of the Brisbane Courier. Five years later he went over to the Observer as sub-editor and was made editor the following year. In 1906 he became editor-in-chief of the Courier. Knight is one of the best writers on Australian history, and especially on that of Queensland. Among his published works are 'Brisbane, Past and Present'; 'Australian Pioneers'; and 'The Story of South Africa' (collaboration).

KNIGHT, Richard Payne, English numismatist and archaeologist: b. Wormsley Grange, near Ludlow, Herefordshire, 1750; d. London, 23 April 1824. Having been bequeathed a fortune, he traveled extensively, and wherever he went in Italy he took with him a large number of medals. In 1777 and 1785, he made a specialty of collecting ancient coins, bronzes, gems, drawings and other antiques. From 1780 to 1806 he was a member of Parliament, and for 10 years, 1814-24, served as one of the trustees of the British Museum, to which, upon his death, he left his magnificent archaeological collection, especially rich in bronzes and Greek coins. The trustees in 1830 published his catalogue of his coin collection. His works, which were numerous, included 'An Account of the Remains of the Worship of Priapus lately existing at Isernia in the Kingdom of Naples' (1778); 'Analytical Essay on the Greek Alphabet' (1791); 'An Inquiry into the Symbolic Language of Ancient Art and Mythology' (London 1818); 'Analytical Inquiry into the Principles of Taste' (1806), etc. He also published several volumes of poems and an edition of Homer (1808). Consult Edwards, E., 'Lives of the Founders of the British Museum, etc.' (Vol. I, London 1870).

KNIGHT, Sarah Kemble, American author: b. Boston, 19 April 1666; d. near New London, Conn., 25 Sept. 1727. In 1706-13 she conducted at Boston a school in which Samuel Mather and Benjamin Franklin were at one time pupils. By New England customs she was styled 'Madam,' Knight as a token of respect. Her 'Journal Kept on a Journey from Boston to New York in the Year 1704' (New York 1825) is a diary record evidently compiled from daily notes made on the way. It is valuable for its account of customs and manners and its descriptions of the settlements, being at the same time interesting for its original orthography and interspersed rhymes. A reprint with additional notes was published by F. H. Little (Albany 1865). Consult Caulkins, F. M., 'History of New London, 1612-1860' (New London 1895); id., 'History of Norwich, Conn.' (Hartford 1886); Deane, W. R., 'Journal of Madam Knight' (in Living Age, Vol. LVII, Boston 1858); Tyler, M. C., 'History of American Literature' (Vol. II, New York 1879).

KNIGHT, Thomas Andrew, English horticulturist: b. Wormsley Grange, near Ludlow, Herefordshire, 10 Oct. 1738; d. May 1838. He was a younger brother of Richard Payne Knight (q.v.). After graduating from Bala College, Oxford, he took up the study of horticulture. He first brought himself before the public in 1795 by the publication of the results of his researches into the present condition of fruit-trees and the diseases prevalent among them. He raised new varieties of many fruits and vegetables, many of which bear his name. He was one of the original members of the Horticultural Society, founded in 1804, and from 1811 until his death its president. He was also a fellow of the Royal Society (1805), recipient of his Copley medal (1806), and a fellow of the Linnean Society (1807). Beside the papers, 46 in number, which he contributed to the 'Transactions' of the Royal Society, and the papers, more than 100 in number, which he contributed to the 'Transactions' of the Horticultural Society, he wrote 'A treatise on the Culture of the Apple and Pear, and on the Manufacture of Cider and Perry' (1797); 'Pomona Herefordiensis, or Natural History of the Apple to which it is given (in 1770); the County of Hereford' (1811). 'A Selection from the Physiological and Horticultural

**KNIGHT, William Angus**, Scottish philosopher and author: b. Mordinton, Scotland, 22 Feb. 1836; d. 4 March 1916. He was educated at the University of Edinburgh, and from 1856–1902 was professor of moral philosophy at the University of Aberdeen. He was widely known as a student of Wordsworth, whose works he edited in 12 volumes (1896–97). Among his own writings may be cited *Studies in Philosophy and Literature* (1879); *Essays in Philosophy, Old and New* (1890); *The English Lake District as Interpreted in the Poems of Wordsworth* (1876–91); *Through the Wordsworth Country* (1892); *Memorials of Thomas Davidson* (1907); *The Glour of Oxford* (1911); *Pro Patria et Rege* (war poems, 1915).

**KNIGHT**. The word is said to be derived from the Anglo-Saxon Cuiht, a servant, one who serves. Hence in feudal times it was used for certain persons doing service to a superior lord or the king, the same as *duke* expressed leadership. As to our knowledge of the origin of the knightly status we must go back as far as the foundation of Rome. Among the early Romans the mounted warriors (*equites*) held a certain special position socially. Its origin has been traced by Romulus who said (about 750 B.C.) he had made of the three priestly tribes—Rutenses (Las), Tusses (Sabines) and Luceres (Etruscans)—three centurion (300) of riders in war service. Under the kings this number was raised to six, later, by additions of plebeians raising the rank to 18 and forming the basis of a special order (*ordo equester*) adapted for cavalry. As the service entailed no extra expense the standing of this body of armed riders was raised above that of citizenship. By law of Roscius (267 B.C.) the condition was imposed of owning a fortune of 4000 sesterces. The external badge on the campaign uniform of this body of cavalry was a narrow stripe on the tunic, also the distinction of wearing a gold ring and having special seats in the theatre and circus, besides other political and social features. Under the Caesars this order of riders (*equester*) was drawn on for imperial officials, to carry on the financial rule of the provinces, etc.

During the Saxon heptarchy, in England, the order of knighthood was conferred by a priest at the altar, Athelstan (900 A.D.) being the first king to create a knight. The receiving of arms at the arrival of the age of manhood was from the days of the Germanic hordes accompanied by a solemn ceremonial, and the candidate to wear arms had to prove fitness in capstone. The investiture of the investiture of arms had become general. Under the feudal laws some tenants and the owners of lands free from rent or service (*allodiat*) had to be ready on call to serve their lord as a squire. To ensure the security to the work and property of the manor, the receipt of mail. (See *Chain Armor*). They were called Caballarii, from whence the French term *chevalier* is derived. And we now read of a *knight's fee* in England, or the *feudum loricace*, *fief de hambert* (coat of mail) being *a certain value of land*; these vassals, we are told, were *serving as knights, mounted and equipped.*

The origin of the knight of chivalry is one involved in the history of morals of the European nations—the institution of chivalry. The knighthood of chivalry is an independent and voluntary service. The obligation of the vassal to service of knight in arms did not extend to the rest of the family except the heir. The younger son was not allowed to have glory and dignity as knights had to submit their military service to some wealthy lord in the hope of gaining an income by their prowess as well as that social distinction which was theirs by birth, and from this field of achieved personal ambition arose a social advance in which the voluntary seeker of fame in arms raised himself a step higher in the social scale than the knight by legal right regardless of merit or valor in the field. These were the first knights of chivalry. The Crusades increased the number and ranks of these hired knights and at the same time altered and advanced the status of chivalry itself. While the ritual of investing the hired officer with knighthood included such mandates as oaths of fidelity and honor, as well as gallantry and protection to women over and beyond the former claim to discipline demanded of the common soldier (*milités*), this act of crusading for the capture of Jerusalem and the Holy Land introduced a religious feature that did not before enter into the realm of knighthood's service. And we read of the applicant for knighthood first confessing his sins before the priest, spending nights in prayer and passing through pious rites before receiving his titular rank. And the order was conferred on him by a grand instead of being *dubbed* by a knight. Chivalry had become a religious institution and the crusading knight of the 12th century was the militant bearer of the Cross and protector of his Church. Gallantry and protection of the fair sex became a living force among the knights, and at tournaments the ladies took a prominent and distinguished part. And we now arrive at the time when the following were the qualifications of a deserving knight: Great respect for the female and three other virtues were enjoined on knighthood, namely, loyalty, courtesy and munificence.

The first of these three virtues included, as paramount, fidelity to engagements, and these engagements were the feudal obligation to superiors and keeping of every promise, besides fidelity to one's lady love. Any breach of engagement was looked upon and condemned with such epithets as: *False, perjured, disloyal, recreant.* It forbade the savage instinct to treachery. The knight who perpetrated an offense against this virtue was considered unfit to bear the title of knight. The virtue of courtesy was the display of *modesty, self-denial and respect for others,* and included chivalric treatment of prisoners. Under the term munificence was intended the behoof of liberality and hospitality to the visitor, freedom in the use of coin to recompense the traveling minstrel, *largeesse* to the poor, and financial aid to relatives in need. Besides the qualification of valor in the knight a fixed purpose of enforcing justice and redress of wrongs was
strongly inculcated. In return for his vows of renunciation of vices the knight received numerous privileges. These were the right to wear distinctive and resplendent armor-crested helm, heavy armor displaying his heraldic bearings, spurs of gold, etc. His horse was gav in its bards (see Barons) and gaudy "housmgs." In his castle or palace he was permitted the digress of wearing the certain to offices were filled by members of the order. He had the power (to be used not lightly) of conferring knighthood on others (if gentlemens). There were class distinctions of knighthood such as knights bannerets and bachelors. The former belonged to those having large estates and able to summon a certain number of lances for battle. A squire carried his master's sign of distinction in the form of a banner on the end of a lance. The knight bachelor was permitted only a pointed pennant.

But the above high moral plane of action in the knight's life code, though acting as an incentive to good work and restraint from evil, did not prevent abuse of power from entering the valorous rank. The very elevation of rank entailed a sense of ascendency and pride that made it hard to have the Orders in good standing and disfavor. The capacity of the Knights Templars impaired the fair name of chivalry and brought with it retribution. But the cause of the decline and fall of the institution of chivalry's knighthood is placed by some authorities as brought about by the French kings Charles VI and Charles VII bestowing the order of knighthood profusely, and the act of Francis I conferring knighthood on lawyers and other classes of civilians. The efficiency of gunpowder in rendering armor useless, however, is generally accepted as the chief cause of the extinction of the order of knighthood. (See CHIVALRY.) And the 16th and 17th centuries saw the displacement of knights by gentlemen and cavaliers. By the 18th century the institution of knighthood conferred by the sovereign as a civil more than military honor, as reward for services to state or ruler. And with more peaceful times have arisen numerous orders or fraternities in the social and commercial world utilizing the title, such as the Knights of Columbus, Knights of Labor, etc.

The term knight is applied to a certain piece in the game of chess which is identified by a horse's head; the term has been vulgarly applied in commerce to the traveling salesman as "knight of the grip."

KNIGHTS OF COLUMBUS. The Knights of Columbus is a fraternal beneficial society organized under a special charter granted by the State of Connecticut, 29 March 1882. It is open only to male Catholics, whose pastors testify that they practice their religion, and reside or have resided members from age 18 to 50; associate or non-insured members received from age 21 and upward. Its system of insurance is based upon the Fraternal-American Table of Mortality and was prepared by David Parks Fackler, ex-president and one of the founders of the Fraternal Order of the Knights of Pythias.

The insurance is based on a combination step rate—level rate plan, with very moderate advances every five years from entry to age 55, thereafter on a 15-year level rate with fully paid-up at age 70, with additional selection from age 55 of either Level Whole Life Plan with full insurance in force, or Economic Plan with reducing insurance after age 60; with paid-up and extended insurance and credits allowable toward payment of assessments after payment for specified time on level rates, all based on competent actuarial computation of the highest order. The Order has in force 1 April 1918 insurance certificates of $1,234,151.33. Its reserve fund amount to $8,532,967.89. Ratio of assets to liabilities (calculation made as of 31 December 1917) at 1917 29 per cent. The rate for the year 1917, 7.7 members per thousand. Insurance certificates issued for one, two and three thousand dollars. The order has now been established in every State and territory of the Continental United States, every province of the Dominion of Canada, in New Zealand, Alaska, the Philippines, Cuba, Porto Rico, Mexico, the Canal Zone and Panama.

In addition to the insurance features it is devoted to the promotion and protection of Catholic interests and the interest of Catholic men and women. Has the commendation of the entire Catholic Hierarchy, and special commendation from several popes. Endowed at $50,000 a chair of American History at the Catholic University of America. Later endowed at $50,000 fifty perpetual free scholarships at same institution. Aims to propagate Catholic doctrine from platform and by literature; publishes monthly a 24-page magazine known as The Columbus; has issued special EDITION OF "The Catholic Encyclopedia"; took large part in relief work in San Francisco earthquake, Kansas flood, Chelsea fire, Ohio flood and Halifax disaster, and also rendered large and efficient service in the Great World War both in America and abroad.

Has no oath, only obligation of secrecy. Four degrees of ceremonial teaching charity, unity, fraternity and patriotism. Has conducted propaganda by lecturers throughout the United States and Canada against Socialism for three years. Organized a Commission on Religious Prejudices to combat the spirit of bigotry through platform and publications, by setting forth, in an unfavorable light, and endeavoring to promote a spirit of fraternity among citizens of all races and creeds. Subordinate body known as council; governing body, supreme council. Chief officers known as supreme. Representative form of government. Laws forbid activity in politics and excludes from membership those in liquor business. No affiliation with any other society.
KNIGHTS OF THE CROSS.—KNIGHTS OF LABOR 485

KNIGHTS OF THE CROSS, The. The title of one of the novels of Henryk Sienkiewicz. It covers the period of the struggle of Poland with the German military Order of the Teutonic Knights, culminating in the great victory over the Knights at Tannenberg. Some of the atmosphere described are re-echoed in like cruelties of the Great European War. The hero of the story is a young giant Polish country lad, who became a great soldier. The story of his father-in-law Yurand is pathetic and stirring, and touches the emotions. The battle of Tannenberg is wonderfully depicted. The novel was translated by the late Jeremiah Curtin (2 vols., 1900).

KNIGHTS OF THE GOLDEN CIRCLE, a secret organization in the United States, established a few years before the Civil War, and formed with the object of destroying the republic and setting up a great Southern empire with negro slavery as its cornerstone, and also with the purpose of controlling the great commercial interests of cotton, sugar, and tobacco. With its centre at Harpers Ferry, it was intended to embrace in the territory of the new government a radius of 1,200 miles, and to include parts of Central America. The organization was never fully consummated, although thousands of persons joined in the movement in many lodges or councils were instituted. The society was strongest in Ohio, Indiana and Illinois. In 1863 the order was disbanded and was succeeded by the order of American Knights, which in turn was replaced by the Sons of Liberty. Its most ambitious project was one for an uprising in Ohio, Indiana, Illinois and Missouri, which should free all Confederate prisoners in those States and set up a Northwestern Confederacy. Three of the leaders were condemned to death by a military commission but were released after 18 months' imprisonment, the Supreme Court holding that the commission had no jurisdiction. Consult 'An Authentic Exposition of the Knights of the Golden Circle' (Indianapolis 1861); Holt, 'The Knights of the Golden Circle' (New York 1862); and Foulke, 'Life of Oliver P. Morton' (2 vols., 1893).

KNIGHTS OF THE GOLDEN EAGLE. Founded in the city of Baltimore, Md., 6 Feb. 1873, is now located in 22 States. Has a supreme or governing body, 14 Grand or State bodies and more than one thousand subordinate bodies, called castles, with a membership of more than 60,000. A female branch, composed of ladies, relatives of members, with six grand temples and several hundred subordinate bodies with more than 20,000 members. Its motto is *Fidelity, Valor and Honor for Males, and Faith, Hope and Charity for Females.* It has paid sick benefits amounting to more than $7,000,000. It is one of the most active and influential of American benevolent societies by associating its members in different locations for purposes of mutual relief against the trials and vicissitudes attending sickness, distress and death, by sympathy and pecuniary assistance. To assist in business, and to elevate its members, is the purpose of the order. The advancement to a higher life. A person qualified to be a beneficial member must be white, of the age of 18 years, of sound body and good moral character, a believer in the Supreme Being and of the Christian Faith, and competent to pursue some useful and lawful occupation, and not engaged directly or indirectly in the manufacture or sale of spirituous or malt liquors. It has a feature paying $250 to the widow of a member; pays weekly sick benefits and a benefit for a deceased wife. Has a military branch composed of members formed into commanderies, with neat and attractive uniform. Is semi-military in its ritualistic work. Its teachings are founded upon the history of the Crusades. Members are known as Sir Knights. Ladies are called Companions. It has a Home and Orphanage, where aged couples are not separated. It maintains a periodical published monthly and seeks to ennoble and refine the American flag is used in its meetings.

KNIGHTS OF HONOR.—A fraternal benevolent society founded in the United States in 1873. The social, moral and intellectual advancement of its members is among the society's principal objects, as also the payment of death benefits to the widows and orphans of deceased members. The head quarters of the society are at Saint Louis, Mo. Its membership is estimated at about 20,000; benefits disbursed since organization, $100,000,000. It has a supreme dictator, over 30 grand lodges and about 1,500 subordinate lodges.

KNIGHTS HOSPITALLERS. See Orders, Religious.

KNIGHTS OF LABOR, an American labor organization which originated among the garment-cutters of Philadelphia in 1869. It was founded by 10 members of the trade under the leadership of Uriah Stevens, as a secret society, with a rather elaborate ritual. It grew slowly at first; though workingmen of all trades were admitted, it was not until 1872 that the second local assembly was formed, but in that year 27 locals were organized, all in Philadelphia; the first local organized outside of city was that of the gold-beaters of New York. In its first organization politicians, physicians, lawyers and liquor-dealers were excluded from membership; the two latter classes are still excluded. The first general assembly was held at Reading, Pa., 1878, where seven States were represented. At this meeting a declaration of principles was adopted which remains substantially the same; the purpose was declared to be the *organizing, educating, and directing of the power of the industrial masses,* in order to *make industrial and moral worth, and not wealth, the true standard of national and individual greatness,* and to *secure to the workers the full enjoyment of the wealth they create.* To secure these aims, the organization demanded certain legislative remedies, including the referendum, the establishment of a bureau of labor statistics, abrogation of class laws, prohibition of tenements, abolition of the contract system under the age of 15, abolition of the convict-labor system, and reforms in the financial and land laws; and in the industrial field it proposed to *establish co-operative institutions which will tend to supply the wants of the people, to secure both sexes equal rights, and gradually to reduce the hours of labor to eight per day.*
In 1881 all secrecy was abolished, and in 1882 a revised constitution adopted, in accordance with which the organization consists of local associations of not less than 10 members, of whom three-fourths must be wage-earners or farmers; district assemblies, formed by not less than five locals, and the general assembly, which meets annually for the election of officers and the transaction of business. The executive officers are: general master workman, general worthy foreman, general secretary-treasurer, and general executive board. The constitution provides also for the support of strikes approved by the executive board after all attempts at conciliation have failed. The organization grew rapidly after this time, till in 1886 delegates at the general assembly represented over 300,000; at that time, however, dissensions began which resulted in a split and the formation of the American Federation of Labor (q.v.). Though the organization continued in existence for several years, its numbers began to decrease, and at present it has less than 100,000 members, and its influence has gradually declined. In 1890 The Journal of United Labor was established; later the name was changed to The Knights of Labor, and it is the official journal of the organization.

The Knights differ radically from the trades unions in the basis of their organization; their ideal is to organize labor without distinction of trade, and to harmonize individual and trade interests with the interest of the whole; though locals may be organized on trade lines, no autonomy of trades is allowed. This and the fact that the general executive board tried to exercise a too centralized authority were among the chief causes of dissatisfaction. Strikes were at one time condemned by the general assembly (1880), but later the organization took part in a number of strikes and also made use of the boycott; violence has been at all times condemned. (See AMERICAN FEDERATION OF LABOR: LOCAL ORGANIZATION.) Consult McNeile, 'The Labor Movement; the Problem of Today'; Powderly, 'Thirty Years of Labor'; Wright, 'Historical Sketch of the Knights of Labor' (in Quarterly Journal of Economics, Vol. I, p. 137, Boston 1887); Ely, R. T., 'Labor Movement in America' (New York 1886); Kirk, William, 'Knights of Labor and the American Federation of Labor' (ib. 1906).

KNIGHTS AND LADIES OF HONOR, a fraternal beneficiary society founded in the United States in 1877. It was merged and consolidated with the North American Union of Chicago 24 Aug. 1910. Men and women were admitted on equal terms. The central authority was the supreme lodge, and the chief officer was styled the supreme protector. It reported a membership of about 70,000; benefits disbursed since organization, $34,470,000.

KNIGHTS OF MALTA, Ancient and Illustrious Order of. See JOHN, SAINT, ORDER OF.

KNIGHTS OF THE MODERN MACCABEES. See Maccabees, THE.

KNIGHTS OF PYTHIAS, a brotherhood organized to disseminate the principles of friendship, charity and benevolence. The order was founded at Washington, D.C., 19 Feb. 1864, by Justus Henry Rathbone and four associates. An official declaration affirms that "toleration in religion, accommodation to the low, and respect to the government" are its three cardinal tenets. The theme upon which the entire fabric of the society rests is the story of Damon and Pythias, —friendship even unto death being a paramount doctrine. The order at present is confined, in its juris- 505d to New York, and counts, North America; efforts earlier in its history to include the world as its field of action having proved futile. The name chosen, Knights of Pythias, rather than the more historically accurate designation of "Knights of Damon," was probably due to dramatic license, the reasons for which, like that of poetry, are obscure.

On 15 Feb. 1864, in Washington, D.C., five clerks of the government met to organize the new order. Washington Lodge, No. 1, was organized at the North Temple, on 8 Apr. 1864, so run the minutes. The number of members is not stated; but, at the close of the year, these had increased to 52. The "founder" was elected worthy chancellor, with associate officers: Vice chancellor, a manly publicist, worthy scribe, assistant scribe, banker, assistant banker, worthy guide, inside steward, and four choral knights. Evidently the resolution, adopted on the 15th, had not yet gone into effect. The grand lodge of the District of Columbia was formed 8 April 1864, with J. T. F. Plant as grand chancellor. The other grand officers followed the titles adopted by the subordinate lodge. Franklin Lodge No. 2 was organized at Washington Navy Yard 12 April 1864, and others followed in rapid succession. Then the order waned, until, 1 Aug. 1865, Franklin No. 2 was the only lodge in existence; and it was an acting grand, as well as a subordinate lodge. When the year 1865 closed, the membership in No. 2 was nearly 60, there was a treasury of $200, and the "sole survivor" was in a prosperous condition, notwithstanding a loss of $255.55 through its "banker." On 1 May 1866 the grand lodge was reorganized, and the order spread to other jurisdictions. When the supreme lodge was constituted 15 Aug. 1868, the grand lodges of the District of Columbia, Pennsylvania, New Jersey, Maryland and Delaware were represented. Through many trials, beset at times with disloyalty within and litigation without, from this beginning sprang the great order of the Knights of Pythias.

Government—This is representative, and threefold, like the society's tenets. It is divided into three departments, namely: Legislative, executive and judicial. These are regulated by statutes based upon constitutions in three revisions. In these particulars, and in its methods of administration, the order has differentiated itself from others of its class. The government is vested in a supreme lodge, the source of all authority in the order; in State and provincial grand lodges possessing subordinate authority over 10 or more lodges; in subordinate lodges, which create the membership by the acceptance of petitioners, and conferring upon them the ranks of "page," "esquire," and "knight." The supreme lodge was incorporated 5 Aug. 1870, under an Act of Congress approved the previous 5th of May, and many of the grand and subordinate lodges are, also, corporations. The order has, in ad-
KNIGHTS OF THE ROUND TABLE — KNIT GOODS

dition to its three ranks, or degrees, an "endowment" rank, the insurance feature; and a "uniform" rank, the military division,—affiliation with which is voluntary, and predicated on regularity and good standing in the lodge. The titles borne by officers naturally follow the ritual of the Masonic Fraternity.

Uniform Rank.—The organization of the display branch dates from 1878. The "rank" sprang at once into popularity, and the notable parade at Cincinnati in 1888 served to induce the supreme body to perfect its rules and regulations. Before that year creditable appearances had been made, but then trained soldiers, properly officered, were in line. Since that time the Pythian army has been a regular feature of all assemblages. The ritual is emphatically patriotic; and the offer made to the United States government, by this army of disciplined troops, for service in the Spanish-American War, is worthy of note. The powers of this branch are delegated to a supreme assemblage,—with a representation in the aforesaid governing bodies,—and the organization follows the lines of the United States army, the "uniformed knights" using the government tactics.

Documents are dated by the Pythian era, beginning with 1864. To find it, subtract 1863 from the common era. For example: 1917 — 1863 = 54.

Statistics.—The reports for 1917 show 772,075 members, gathered in over 5,000 subordinate lodges, governed by nine grand lodges, and a supreme lodge. The records, entered since organization are about $50,000,000, and more than 40 periodicals are published in the interest of the order.

Bibliography.—Carnahan, "Pythian Knighthood, its History and Literature"; Van Valkenburg, "Jewels of Pythian Knighthood"; "Constitutions of the Supreme Lodge Knights of Pythias."

KNIGHTS OF THE ROUND TABLE, the knights of King Arthur, according to some accounts 12 in number, famed for their valor, wielded the round table and achieved virtually perfect equality. Other versions of the legend give their number as 50 or more. The most famous of them are Lancelot, Tristradam, Galahad and Gawayne. See ARTHUR; ARTHURIAN LEGENDS; GRAIL, THE HOLY.

KNIGHTS OF THE ROYAL ARCH, an organization which confines its membership to white, male persons engaged in the retail liquor business. It was founded in California in the year 1901, the first lodge being instituted in the city of Los Angeles. At one period of its existence it had branches in Oregon, Washington, California Arizona and Utah, but owing to the fact that Oregon, Washington and Arizona have gone "dry" and that Utah has become a separate State organization, membership is now confined to California exclusively. The organization consists of a grand lodge, associate membership and 40 subordinate lodges, the latter being located in the larger cities and towns of the State. The grand lodge consists of delegates from each subordinate lodge in proportion to its membership and holds a convention annually. The associate membership consists of wholesale liquor dealers, brewers and all classes of business which sell goods to the retail liquor dealer. Provision is also made for retail liquor dealers, in localities where there are not a sufficient number to form a lodge, to become certificate members upon payment of annual dues. The Knights of the Royal Arch is organized for the purpose of maintaining the reputation of its members and elevation of their business and to combat adverse legislation instituted by those opposed to the liquor industry. It also has a fraternal feature and has expended in that direction since its organization, approximately $300,000. Its annual disbursements in sick and death benefits and charitable work exceed $30,000. It has a membership of 4,900 and is supported by monthly dues.

KNIGHTS OF SAINT JOHN AND MALTA, a secret society founded 1883. It has a grand encampment, 52 subordinate encampments and 3,147 members. Since organization the society has disbursed $906,275 in benefits; and during 1910, the amount was $31,188.

KNIGHTS TEMPLARS. See MASONIC FRATERNITY, THE.

KNIGHTSTOWN, Ind., town in Henry County, on the Blue River, and on the Cleveland, Cincinnati, Chicago and Saint Louis railroads, 34 miles east of Indianapolis. Near the town are the State Soldiers and Sailors' Orphans' Home. The town has excellent water power, natural gas, flour-mills, torpedo works, saw and planing mills, poultry-packing establishments, cigar factories, automobile works, machine shops, wire-fence factory, ice plant, cement blocks and other industries, and owns the electric light and waterworks plants. There are two national banks, with combined resources totaling $221,092. The value of taxable property is placed at $1,217,470. There are a public school and a high school, and a Carnegie library. The government is vested in a town council. The receipts in 1915 were $51,908 and the expenditures $47,263. Pop., 2,908.

KNILLE, knil'e, Otto, German historical painter; b. Osnabruck, 10 Sept. 1832; d. Meran, 7 April 1898. He studied at the Dusseldorf Academy till 1856 under Karl Sohn, Th. Hildebrandt and W. von Schadow, then under Couture at Paris. He next spent three years in Munich and another three years in Italy. In 1865 he was commissioned to decorate the Castle of Marienberg with frescoes. At this time he did the oil painting "Fra Angelico painting in S. Marco Monastery, Florence." Other noted works were "Tannhauser und Venus," in the Berlin National Gallery (1873); he finished his four "Culture Epochs" in 1884, in the Berlin Treppenhaus of the University Library, which contain in their groups portraits of the famous men of these periods. He was elected (1880) member of the Academy of Art, and was leader of a "masters studio" in the academy (1885). Since then he painted little except small genre pictures, landscapes, studies from the Tyrol and Italy. He did considerable illustrating, and wrote "Grübeleien eines Mâlers über seine Kunst" (Berlin, 1887), and "Wollen und Hömmen in der Malerei" (ib. 1897).

KNIT GOODS. See HOSIERY AND KNIT GOODS.
KNITTING — KNOCHE

KNITTING, an industrial and ornamental art akin to weaving, but of much later origin. It does not appear to be more than three or four centuries old, and seems to have been first used in the manufacture of stockings. It consists in forming a series of loops with a single thread, through which another row of loops is passed, and so on consecutively in spiraled circles, the garment being shaped by variations in the number of loops in a row. In hand-knitting, steel-wires or bone or composition needles are used, termed knitting needles, and on these the loops are formed. For manufacturing purposes hand-knitting has been entirely superseded by machinery (see KNITTING-MACHINE), which is constantly receiving new improvements. Hand-knitting, however, still forms an agreeable domestic occupation and also furnishes many women in some parts of the world with means of subsistence. Promptly upon America’s entrance into the World War, many patriotic societies, and women of the Red Cross in particular, started a work of knitting sweaters for soldiers and sailors. The movement was taken up by thousands of women, who devoted their otherwise idle time to knitting, and it became common to see women everywhere with knitting bags on their arms, that they might work wherever they had spare moments. On the street cars, at social gatherings, in intervals of business, there was industrious knitting, resulting in a great volume of very serviceable sweaters and some other knitted garments being provided for the “boys at the front.”

KNITTING-MACHINE. Of the many kinds of knitting-machines in use, one of the best known has a bed-plate with a vertically projecting and grooved needle-guiding cylinder or bed, secured to a table or support. On the bed-plate is a loose ring with a thread-guide for the thread to the needles, and about the needle-cylinder is a revolving cylinder with an annular groove interrupted by a compartment and provided with adjustable cams, which govern the downward motion of the needle. And once the length of the loops, and raise the needles; two of these latter cams being needed for reversing the machine for knitting a heel or a flat web. The cylinder is moved by a bevel-gear connected to a driving-crank, and when moved continuously in one direction knits a circular web; and this web may be narrowed as desired, to fashion the leg of a stocking, by removing needles, and placing their loops on adjacent needles. One needle receives the thread within its hook, and is subsequently moved by the cam-cylinder so as to form the thread so taken into a loop. When the heel is to be formed some of the needles are drawn up, their loops thus being retained and the number of needles left in action corresponds with the width of the heel to be formed. The reverse order is now to be reciprocated in opposite directions, and in order to keep the thread-guide in advance of the descending needles sufficiently far, so that the thread will be caught, pins are inserted in the thread, and to engage the heel of the thread-carrier and stop it just before the cam-cylinder is stopped. See TEXTILE INDUSTRY.

KNOBEL, knô'blêl, Karl August, German Protestant theologian: b. Taschechlin, near Sorau, Silesia, 7 Aug. 1807; d. Giessen, 25 May 1863. He became private teacher (docent) at Breslau (1831), assistant professor of theology (1835) and professor at Giessen (1838). He wrote *Der Prophetismus der Hebräer* (Breslau 1837); *Die Völkertafel der Genesis* (Giessen 1850); *Kommentare über Koheleth* (Leipzig 1856); *Jesaias* (ib. 1843); *Die Genesis* (ib. 1860); *Exodus und Leviticus* (ib. 1857); *Numere, Deuteronomium und Josua* (ib. 1861). These were written for Hirzel’s *Kurzgefasstes exegetisches Handbuch zum Alten Testament*.

KNOBELSDORFF - BRENKENHOF, knô'belz-dôrf-brênkên-hôf, Nataly von, German novelist; b. Hofgeismar, 17 May 1860. She wrote under her maiden name, Nataly von Eschstruth. She was daughter of a Hessian officer and was educated in Berlin; married Capt. Franz Knobelsdorff-Brekenhof (1880), and after her travels lived at Schwerin. She started early, writing short stories and plays; of the latter *Karl Augusts Brautfahrt*, *Die Sturmnicke*, were placed on the stage. Her rapidly sketched novels and stories soon gained popularity and reached several editions. She wrote *Wolfsburg* (Jena 1884); *Gänsebiesel* (Berlin 1886); *Katz und Maus* (ib. 1886); *Zwanzig* (ib. 1886); *Hundesucht* (ib. 1889); *9th ed.* (1889); *Sternschuppen* (1890); *Im Schellenhemb* (ib. 1894, 2 vols.). Other two-volume works were *Von Gottes Gnaden* (1894); *Der Stern des Glucks* (1897); *Der Majoratskerr* (1898); *Der verlorene Sohn* (1902); *Die Bären von Hohen-Exp* (1902; 8th ed., 1904). She brought out a volume of her poems under the title *Wegekrat* (Dresden 1887), and a collection of her works has been published serially since 1899 in Leip.

KNOBBERIE, nôb’bêrî. A South African weapon used, either as a missile or as a club at close quarters, by the natives. The word is derived from the local Dutch term knop-birie, composed of the words knop, a knob, and birie, the Hottentot word for stick. It consists of a knob long and slender, which serves as a walking stick, but is thrown, as a weapon, with unerring accuracy, for quite a distance. Similar native weapons are found in Australasia.

KNOBLauch, knôp’louk, Hermann, German physicist; b. Berlin, 11 April 1830; d. Baden-Baden, 1 July 1895. He became private teacher (docent) in Berlin (1848) and Bonn (1849). In the latter year he was appointed assistant professor at Berlin and professor of physics at Halle (1854). From 1878 he was president of the Imperial Leopoldinisch-Karolinischen Academy of German Natural-History Research. His work consisted largely of examining the phenomenon of heat rays, and, through his and Melloni’s researches it was proved that light rays and heat rays do not differ.

Knoch, knôk, Walter Alfred, German meteorologist; b. Berlin, 7 March 1881. He studied at the Berlin Oberrealschule and the universities of Geneva and Berlin. He was appointed assistant professor at the Royal
Prussian Meteorological Institute (1906) and to the Public Weather Bureau (1907). In 1908 he accompanied the scientific expedition to the Bolivian plateaus, and entered (1910) the service of the Chilean government's meteorological department. He wrote three publications of the Central Meteorological Institute of Chile, also ‘Observaciones en la mina Agua, 5,200’; ‘Observaciones de provincias’ (1911) of the periodical Anuario Meteorológico de Chile (1911), and contributed many important essays to the contemporary journals on meteorology, ethnology and ethnography.

KNOCKE, knôk’ë, or KNOKKE, Belgium, a seaside resort on the North Sea coast near Bruges, destroyed by bombardment of the British fleet when used by the Central Powers, in the World War, as an offensive base.

KONLLES, nóż, or KNOWLLES, Rich-

ard, English historian: b. probably Cold Ashby, Northamptonshire, about 1550; d. Sandwich, Kent, 1608. He was graduated at the College, Oxford, in 1565, and became first a Fellow of his college and about 1571 master of the grammar school of Sandwich. He wrote a ‘Generall Historie of the Turkes’ (London 1603), the style of which is highly commended by Johnson, Hallin and other critics. A number of later editions were brought out, most of which had been brought up to the date of publication; the last of these with continuations, by Sir Paul Rycaut, was published (London 1700). A French edition was published by John Savage (2 vols., London 1701). Knolles also published a translation from the French and Latin of J. Bodin’s ‘The Six Books of a Common Weale’ (London 1606). A Grammatica Latina, Graecae et Hebreae, frequently attributed to him, was the work of the Rev. Hanserd Knollys.

KNOLLYS, SIR Francis, English states-

man: b. about 1514; d. 1596. He was favored by Henry VIII who secured to him the estate of Rotherfield Greys (1538) and made him a pensioner at court. He was graduated at Oxford (1542) as member for Horsham. As a staunch Protestant he threw in his allegiance with Edward VI and accompanied his army to Scotland. He was knighted (1547) and received the grant of the manor of Caversham (about 1551). With Mary’s accession his religious opinions necessitated his exile to Germany but he returned before the queen’s death. He was appointed a member of Elizabeth’s privy council (1558) and was made vice-chamberlain of the household and captain of the halberdiers. He was elected (1559) member of Parliament for Arundel and (1562) for Oxford. He was made governor of Portsmouth (1563), went to Ireland (1566) on a diplomatic mission and was appointed treasurer of Queen’s College, Oxford, the same year. When Mary, Queen of Scots fled (1568) to England he and Baron Henry Scrope were jointly entrusted with taking charge of the fugitive, first at Carlisle Castle, then at Bolton Castle. He proved unable to convert his housekeeper, the Protestant faith. He plainly told Elizabeth to bring charges against the prisoner or acquit her, but in 1587 urged her execution. He headed the land forces (1588-89) of Hertfordshire and Cambridg-

shire led to resist the Spanish Armada. He was created K. G. (1593). Many of his letters are printed in Wright’s ‘Queen Elizabeth’ in the Calendars of the Hatfield MSS., and in Haynes’ ‘State Papers’.

KNOLLYS, Hanserd, English Baptist clergyman: b. Cawckwell, Lincolnshire, about 1599; d. London, 1691. He was graduated at Cambridge and ordained there. He became Separatist (1636), denounced his orders and removed to London, then fled to New England to escape imprisonment for his heretical and heterodox opinions concerning ritual and admission to the communion. The English High Commission court warrant reached him at Boston and he suffered a short imprisonment but was soon preaching at Dover, N. H., when Cotton Mather enumerated him among ‘godly Anabaptists.’ He returned (1641) to England, taught in London, then became army chaplain. By 1644 he was preaching his own peculiar doctrines; his popularity leading to riots and outrages, he was brought twice before a committee of Parliament. From 1645 to the Restoration he was not interfered with, but escaped (1661) prosecution by exile to Holland and Germany for several years. Returning to London he continued his pastorate, was arrested (1670) and imprisoned, but soon freed. He wrote several grammars on Hebrew, Latin, Greek, etc. The Hanserd Knollys Society published a number of his works Consult also Crosby’s ‘History of English Baptists’ (1738); ‘Confession of Faith’ (1854), and ‘Records of the Churches at Fenstanton, etc.’ (1854), both the latter by Hanserd Knollys Society.

KNOLLYS, or KNOLLES, SIR Robert, English military commander; a native of Cheshire, birth-date unknown; d. 1407. His first military service was in Brittany under Sir Thomas Dagworth (1346) at the siege of La Roche d’Orient. He was a knight when he took part in the “Combat of the Thirty” and was one of the survivors made prisoner (1351). On his release he remained in Brittany and acquired renown on the field. He aided Henry of Lancaster on his raid into Normandy in support of Philip of Navarre and Godfrey de Harcourt (1356), and was head of the plunderers known as the “Great Company” (1358), his share in the loot being 100,000 crowns. In the Loire Valley he captured 40 castles and ravaged the country from Tonnerre to Vezelay and Nevers to Orleans, sacking and burning the suburbs of the latter city. He declared this warfare was neither for the English king nor for Charles of Navarre, but for himself alone. He sacked Auxerre and enforced a great ransom, captured Châtillon-sur-Loing (1359), then raided through Berri into Auvergne. He aided Simon de Montfort against Charles de Blois, aided the siege of Aix-la-Chapelle, defeated de Blois, then joined the Black Prince (1367) in his Spanish expedition. He aided in the capture of Navarrete, and was present at the battle of Najara. Soon he returned to Brittany, but was given command of an expedition in Aquitaine (1369). France having prepared a military expedition against Wales (1370), he was given command of a force to land at Calais. Thence he continued and sacked the suburbs of Arras and went
through Artois into Picardy and Varmandois, plundering till he reached Rheims, and thence to Villedufir, near Paris. This raiding counter attacked the mutineer, the Count, and French onslaught on Wales which did not take place. He was residing in London in 1381 when the Wat Tyler rebellion broke out, and the city gave him the leadership. He quickly suppressed the rising. Having acquired immense wealth in his campaign, he used some of the money to build the king and much was spent in building English churches, a hospital at Rome, the house of the Carmelites in London; at Pontefract he founded a college and hospital and endowed them. His 'Chroniques' (Vols. IV-VIII); Fuller's 'Worthies' (1811); Lobineau's 'Histoire de Bretagne', etc.

KNOOP, knöp, Gerhard Julius Ouckama, German novelist; b. Bremen, 9 June 1861; d. Innsbruck, 6 Sept. 1913. His health in early youth was poor, with the result that in his enforced summer vacations in the country, as well as in his winter quarters in the city, he was cut off from association with boys of his own age, and thus became somewhat singular and exclusive in manner. In 1878, a year before his father's death, he was graduated from the Bremen Realschule, and an uncle, Baron L. Knoop, undertook to pay for his further education, sending him to the Polytechnic Institute at Hanover, to qualify as an industrial chemist. In 1881 he changed his name to the corresponding institution at Münchén, and in 1883 he went to Mulhausen in Alsace, first attending the school of chemistry, and then entering a factory for further study. In 1885 he took an important position in the calico-printing firm at Moscov, which he retained until 1911, when he settled in Münchén. His literary work, which he regarded almost entirely as a pastime, was chiefly in the field of narrative satire. Particularly interesting for Americans are the two novels of which Sebald Soeker is the hero; they describe the adventures in Germany of a young German-American who for many years regarded Germany as the land of his ideal, but who finds, on acquaintance with actual conditions there, that the Fatherland contains much that is vulgar, meretricious, and base. His novels are 'Das Element' (1901); 'Hermann Olesb' (Berlin 1901); 'Sebald Soekers Pilgerfahrt' (1903); 'Sebald Soekers Vollendung' (1905); 'Nadesha Bachini' (Berlin 1906); 'Aus den Papieren des Freiherrn von Skarpö' (1906); 'Der Verfalltag' (1911); 'Die Hochmögenden' (1912); 'Unter König Max' (1913).

JACOB WITTMER HARTMANN.

KNOOP, nöp, Siegmund Adolphus, German-American physician; b. Hallé, 27 Nov. 1857. He gained his early education at the Higher Municipal School, Hallé, was graduated at the Sorbonne (Paris 1890). He gained his medical diplomas at Bellevue Hospital Medical College, New York (1888) and the Faculty of Medicine, Paris University (1895). He was made professor of medicine, department of phthisiotherapy, at the New York Medical School (1908), and was appointed visiting physician, Health Department's Riverside Sanatorium for Consumptives. He became honorary director, Gaylord Farm Sanatorium, Wallingford, Conn., honorary president, medical board

Bruches Tuberculosis Institute, Montreal, Canada, etc. He was consulting physician at Saint Gabriel's, N. Y., Sanatorium for Consumptives, West Hartford, United States, Scranton, Pa., etc., and is fellow of the American Academy of Medicine, American Public Health Association, New York Academy of Medicine, Society of American Jurisprudence, American Medico-Psychological Association. Among his numerous and frequent loans to the medical profession were the honorary vice-president, British Congress on Tuberculosis; government delegate International Prison Congress, Paris; vice-president Section V Tuberculosis Congress, Washington (1908). He took a leading part in subsequent tuberculosis propaganda and was first lieutenant Medical Reserve Corps, United States America. He wrote 'Les Sanatoriez Traitement et Prophylaxie de la Phthise pulmonaire' (thesis of 1895); 'Pulmonary Tuberculosis—Its Modern Prophylaxis, etc.' (1899); 'Die Tuberkulose als Volks-Krankheit und deren Bekämpfung' (1900); the latter work was translated into English and 27 other languages. He also wrote 'Tuberculosis a Preventable and Curable Disease' (1913) and other works, besides numerous articles and reviews of periodical journals on tuberculosis and kindred subjects.

KNORR, knör, Iwan Otto Armand, German composer; b. Meew, West Prussia, 3 Jan. 1853. He was educated at the Leipzig Nikolai Gymnasium, Riga Realgymnasium and the Leipzig Conservatory. He was appointed musical teacher at the Royal Ladies' Institute and Conservatory, Charkow (1874-83), and on the recommendation of Brahms was made (1883) theory and composition teacher at Dr. Hoch's conservatory at Frankfort, becoming director in 1908. Of his compositions should be cited the operas, 'Dunja' and 'Durch’s Fenster'. His other compositions consist of piano-quartets, orchestral pieces, solos, etc. His 'Ukrainische Liebesbilde' are popular. He wrote a biography of Peter Tchaikowsky and several works on music such as 'Aufgabe für die Harmonielehre'; 'Lehrbuch der Fugenkomposition'; etc.

KNORR, Ludwig, German chemist; b. Munich, 2 Dec. 1859. He studied in his home town and at Heidelberg and Erlangen, becoming (1885) private teacher at the latter university, but, in the same year, went to Wurzburg, where he was raised to assistant professor (1888), becoming professor at Jenae (1889) and Breslau. His experimental research brought to light synthetics of chinolino and pyrol derivatives, also discovering (1884) the pyrazole compounds to which antipyrin belongs.

KNORTZ, nörts, Karl, American author; b. Garbenheim, near Wetzlar, 28 Aug. 1841. He was educated at Heidelberg University and came to the United States in 1866. He has devoted himself to lecturing in Detroit, Oshkosh and Cincinnati, 1864-74, edited a German daily in Indianapolis for some years, and from 1892 to 1905 was superintendent of German schools in Evansville, Ind. In the latter year he removed to North Tarrytown, N. Y., and has devoted himself to lecturing. Among his numerous works are 'Tales and Legends of the North-American Indians' (1871); 'American Sketches' (1876); 'Longfellow' (1879); 'From the wigwam' (1880); 'Capital and Labor in America' (1881); 'In-
KNOT—KNOTTING AND SPICING

KNOT, a snipe (Tringa canuta) known in its native waters as the 'Reed Snipe,' is probably not the bird known in Europe as the 'Snipe,' a bird resembling it in habits and appearance but of smaller size. The 'Snipe' is not found in America. The bird of the wildfowl family, or snipe family, is a migratory bird, breeding in the northern parts of Europe and Asia, wintering in the southern parts of these continents. The snipe is known for its distinctive call, described in various works as resembling a flute or whistle when the bird is disturbed. It is a bird of the grassy fields and marshes, feeding on insects and small animals. The snipe is not a common bird in North America, but it is found in some areas, particularly in the Great Plains and the coastal regions. The snipe's markings include a green back and tail, and a white or pale green belly. The bird's legs are pink, and it has a short, pointed beak. The snipe's call is a sharp, sharp, 'pee-pee-pee,' and it is a bird that is often heard in the early morning hours. It is a bird that is sought after by hunters, but it is also protected by law in many areas. The snipe is a bird that is known for its adaptability, living in a variety of environments, from the marshes to the grasslands. It is a bird that is loved by many, and it is a bird that is often missed when it is not heard or seen. The snipe is a bird that is a symbol of the season and a symbol of the beauty of nature. It is a bird that is a reminder of the importance of protecting the natural world and the importance of preserving the beauty of the earth.
cord to prevent it slipping. By passing a loop instead of the end of the cord the common slip-knot is formed; and a useful fixed loop is got by tying a simple knot, or the "figure of 8 knot" on the loop of a cord. One of the simplest and most useful running knots for a small cord is made by means of two simple knots. The most secure method of fastening a line to a hook is the blackwall hitch, where the strain on the main rope jams the end so tightly against the hook that it cannot slip. There are many methods for shortening a rope temporarily, one of them being the sheeps Shank.

Of the methods for uniting the ends of two ropes, one of the most secure is the common reef knot, which must be carefully distinguished from the "granny," which will jam if it does not slip; the reef knot will do neither. For very small cords or thread the best knot is the weaver's. The fisherman's knot is a very useful one for anglers, and is formed by a simple knot in each cord being slipped over the other; when drawn taut it is very secure, and it is easily separated by pulling the short ends. A useful method of uniting large ropes is to tie a simple knot on the ends, overlap one rope and interlace the end of the other, and draw taut. This tie may also be made with the figure of 8 knot. For very large ropes the carrick bend is the simplest and most secure. The bowline bend is formed by looping two bowline knots into each other. For attaching a small line to a thick rope the becket hitch is very useful.

"Splicing" is the process employed to join two ropes when it is not advisable to use a knot. The three chief varieties of the splice are the short splice, the long splice and the open splice. The short splice is made by unlaying the ends of two ropes for a short distance and fitting them closely together; then, by the help of a marlinspike, the ends are laced over and under the strands of the opposite rope. When each strand has been passed through once, half of its thickness is cut away and the remainder passed through again; half of the remainder being also cut away, it is passed a third time, and, when all the strands are so treated, they are hauled taut and cut close. This reducing the thickness of the strands tapers off the splice. The long splice employed when the rope is used to run through a block, as it does not thicken it. The ends of the two ropes are un laid for a much longer distance than for the short splice, and are similarly placed together. Then one strand is taken and further unwound for a considerable distance, and its vacant place filled up with the corresponding strand of the other rope, and the ends fastened as in the short splice. Either two of the strands are spliced together in the opposite direction, or the "figure of 8 knot" on the remaining two fastened at the original joining place. The eye splice is, as the term implies, used to form an eye, or round a dead eye.

To prevent a rope fraying at the ends a variety of methods are employed, the simplest being to serve or whip the end with small cord.

KNOUT, now, or noot, the official instrument of punishment formerly used in Russia, dating from about 1450, made in various forms, but usually being a heavy whip of leather thongs artificially hardened, twisted with wire and sometimes hooked at the ends, etc. One hundred strokes were considered equivalent to a sentence of death, as the victim seldom survived. On account of the severity of the punishment Nicholas I issued an order substituting punishment with a lighter whip of three thongs, known as the pleti.

KNOWER, Henry McElderry, American anatomist: b. Baltimore, 5 Aug. 1868. He was graduated (1890) at Johns Hopkins, was appointed assistant in biology (1891–93), and became Adam T. Bruce Fellow (1895–96) and Ph.D. (1896). He became instructor of biology at Williams College (1897–99) and instructor of anatomy (1899–1908) and associate at Johns Hopkins (1908–9). In 1909–10 he lectured on anatomy at the University of Toronto, becoming in the latter year professor of anatomy of the University of Cincinnati. He was appointed (1897) assistant in zoology at the Marine Biological Laboratory, Woods Hole, Mass., (1897) and librarian (1900). He was co-editor and secretary of the American Journal of Anatomy. He specialized chiefly in embryology and anatomy of termites, research, and in lymphatic and vascular systems of frog embryos experimentally and by injection; muscles of the human heart, etc.

KNOWLEDGE, Theory of. See Epistemology.

KNOWLES, nôz, Frederic Lawrence, American poet: b. Lawrence, Mass., 8 Sept. 1869; d. Boston, Mass., 20 Sept. 1905. He was educated at the New Hampshire Conference Seminary of which his father, Daniel C. Knowles, was president for many years. After graduation he taught for some time in his father's seminary and at Wesleyan University and Harvard. His verse was published even in college days. His poems appeared in the best magazines and received wide quotation. The week before he died he wrote:

"This body is my house—it is not I.
Triumphant in this faith I live and die."

He was the author of "Love Triumphant" (1904, also 2d ed.); "On Life's Stairway" (1900; 3d ed., 1905). He compiled and edited several collections of poetry, the most important of which are "Poetry of American Wit and Humor" (1899); "Cap and Gown"; "College Verse—Second Series" (1900); "Golden Treasury of American Songs and Lyrics" (1900); "Yearbook of Famous Lyrics" (1901); "Treasury of Humorous Poetry" (1902); "Value of Friendship" (1904); "Value of Courage" (1905); "Value of Love" (1906).

KNOWLES, James Sheridan, Irish dramatist and actor: b. Cork, Ireland, 21 May 1784; d. Torquay, Devonshire, 3 Nov. 1866. He served as an ensign in the militia, became a M.D. of Aberdeen University, and then went upon the stage, but meeting with small success,
taught school in Belfast and Glasgow. His tragedy, "Caius Gracchus" was performed at Belfast in 1815 with success, and from this time he had a prosperous career. He visited the United States in 1834. In 1844 he underwent conversion and became a Baptist; he then took a prominent part in the work of religious revival, became known as a Roman Catholic. He was an opponent of Newman and a Catholic controversialist, but never preached against the stage. In 1848 he received a pension of £200 a year from government. Among his principal works were the dramas "Caius Gracchus" (1815); "William Tell" (1825); "Virginissima" (1820); "The Hunchback" (1832); "The Wife: a Tale of Mantua" (1833); "The Love-chase" (1837); "Love" (1839). He published besides various poetical pieces, tales and novels, and in his later years works denunciatory of Roman Catholicism.

KNOWLES, Lucius James, American inventor: b. Hardwick, Mass., 2 July 1819; d. West Concord, Mass., 25 Feb. 1884. He became a clerk in a shop at Shrewsbury, Mass., the first photographer using the system of Daguerre in Worcester, Mass., turned his attention to inventing, devised the Knowles safety steam-boiler feed-regulator, and constructed and operated several models of a steam-engine. In 1843 he invented a machine for the spooling of thread, and this machine he manufactured at New Worcester in 1843-45. He then built spinning-machines for the manufacture of four- and six-cord thread, and manufactured cotton thread and weaves at Spencer and Warren, Mass. (1847-53), and woven goods at Warren (1853-59). Subsequently he manufactured a safety boiler-feeder, a steam pump and a tape loom, under his own patents. He took out over 100 patents, mostly for loom improvements. His plant for the manufacture of looms and their accessories was located at Worcester, Mass., where it was later combined with an English concern and now, under the name Crompton and Knowles Loom Works, has branched operations of the world. The Knowles Pump Works, too, have grown to be one of the largest in the world. He was elected to the lower house of the Massachusetts legislature in 1862 and 1865, and in 1869 became State Senator. Williams College in 1868 gave him the degree of A.M. Consult Roe, A. S., Lucius J. and Francis B. Knowles (in New England Magazine, N. S. Vol. XXXI, p. 483, Boston 1904).

KNOWLES, Robert Edward, Canadian novelist: b. Maxville, Ontario, 30 March 1868; d. at Queen's College, Kingston, was appointed minister of Stewart on Church, Ottawa, 1891, and from 1898 has been pastor of Knox Church, Galt, Ontario. He is the author of 'St. Cuthbert's' (1905); "The Undertown" (1906); "Dawn at Shanty Bay" (1907); "The Attic Guest" (1909); "The Singer of the Kootenay" (1911).

KNOWLING, nöting, Richard John, English clergyman and educator: b. Devonport, Devonshire, 16 Sept. 1851. He was educated at Balliol College, Oxford, and was ordained deacon in 1875 and priest in 1876 in the Church of England. He was classical master in the Abingdon Grammar School, 1874-76; curate of Wellington, Somerset, 1876-78 and of Saint Martin-in-the-Fields, London, 1878-84; censor and lecturer in King's College, London, 1884-90; vice-principal of King's College, 1890-97; professor of New Testament exegesis 1894-1905; professor of divinity in Durham University and canon of Durham since 1905. He was a prelect-preacher at Cambridge University, and became Fellow of King's College, London 1899. He was examined at Oxford University 1897, 1905, and at the University of London 1905-06; examining chaplain to the archbishop of Canterbury and the bishop of Exeter, 1903-05, and Boyle lecturer for the same period. His writings include 'The Witness of the Epistles' (1892); 'Acts of the Apostles,' in the 'Expositors Greek Testament' (1901); 'Our Lord's Virgin Birth and the Criticism of Today' (1903); 'The Epistle of James' (1904); 'The Testimony of Saint Paul to Christ' (1905; new ed., 1911); 'Literary Criticism and the New Testament' (1907); 'Messianic Interpretations and Other Studies' (1911).

KNOWLTON, nöltôn, Frank Hall, American botanist and paleontologist: b. Brandon, Vt., 2 Sept. 1860. He was graduated from Middlebury College, Vt., in 1883. In 1890 he took the degree of Ph.D., George Washington University; was assistant paleontologist on the United States Geological Survey, 1889-1900, and paleontologist from 1900 to 1907, and geologist from the latter year. Among his scientific monographs are "Fossil Wood and Lignite of the Potomac Formation" (1889); "Fossil Flora of Alaska" (1894); "Catalogue of the Cretaceous and Tertiary Plants of North America" (1896); "Fossil Flora of the Yellowstone National Park" (1898); "Flora of the Montana Formation" (1900); "Birds of the World" (1909); "Flora of the Raton Mesa Region of Colorado and New Mexico" (1915); "Flora of the Laramie of the Denver Basin of Colorado" (1916). The Plant World, which he had founded in 1897, he united with "The World" in 1904. He was a contributor to the Century, Standard and Webster's dictionaries and to the Jewish "Encyclopedia."

KNOWLTON, Thomas, American soldier: b. West Boxford, Mass., 30 Nov. 1740; d. battle of Harlem Plains, N. Y., 16 Sept. 1776. He enlisted in the last French and Indian War, took part in the capture of Ticonderoga (1759), and in 1762 went with General Lyman's forces to Cuba as second lieutenant. After the siege of Havana he took up farming. Living at Ashford, Conn., at the beginning of the Revolution, he was elected captain of a militia company organized afterward by Lexington, and when other Connecticut troops was sent to Charlestown. His detachment, ununiformed farmers with shot-guns, fought at Bunker Hill. On 8 Jan. 1776 he made a successful invasion of Charlestown, and subsequently became lieutenant-colonel of the 20th regiment of the line, a regiment of Connecticut rangers, usually known as "Knowlton's Rangers." He was killed while leading his command at the battle of Harlem Heights, and was highly praised by Washington in general orders. A statue was erected to his memory for his state in 1865 on the capital grounds at Hartford. Consult
KNOW-NOTHING PARTY

Coffin, C. ed. 'The Lives and Services of Major-General J. Thomas, Colonel Thomas Knowlton, etc.' (New York 1845); Woodward, A., 'Memoir of Col. T. Knowlton' (Boston 1861); Woodward, P. H., and others, 'Statue of Col. Thomas Knowlton' (Hartford 1895).

KNOW-NOTHING PARTY. The, resulted from nativism in American politics and from the organization of secret political associations such as the United American Mechanics and the Order of the Sons of America in Pennsylvania; the Order of United Americans and the Order of the Star Spangled Banner in New York, founded for the purpose of obtaining the repeal of the Naturalization Law and of the law which permitted others than native Americans to hold office. As a definite political party it may be said to have started in 1852 and existed two or three years. The principles of the Know-nothing party were embodied in the following propositions (at New York, 1855): (1) The Americans shall rule America. (2) The perpetuation of the union of these States. (3) No North, no South, no East, no West. (4) The United States of America— as they are— one and inseparable. (5) No sectarian interferences in our legislation or in the administration of American law. (6) Hostility to the assumption of the Pope, through the bishops, etc., in a republic sanctified by Protestant blood. (7) Through reform in the naturalization laws. (8) Free and liberal educational institutions for all sects and classes, with the Bible, God's holy word, as a universal textbook. A society was formed in 1855 in opposition to the above, called Know-somethings. Both bodies were absorbed into the two parties, Democrats and Republicans, at the Presidential election in 1856.

The Know-nothing organization was primarily the result of foreign emigration. In 20 years from 1825 to 1845 the immigration amounted to 1,028,225. The consequence was a sharp awakening of native American prejudice and alarm. The sentiment first showed itself in New York, where the alien population had reached portentous proportions, in the estimation of citizens of the old stock. A native organization for political purposes was effected, and in 1844 it succeeded in electing James Harper mayor on a native American ticket. About this time began the great immigration due to the Irish famine, and in the five years from 1846 to 1850 there came in about as many aliens as had been received during the whole 20 years before. Native Americanism flamed up hotter than ever, and its political configuration extended to other cities and States. The great volume of the Irish immigration was Roman Catholic, and political feeling of slaveholders to the Territories, was disturbing party allegiance, and special efforts were made to kindle the native American spirit into a hot flame, with an anterior motive, it was believed, of turning the current of public sentiment into other channels. In 1852 the Know-nothing organization, distinctively, made its appearance. It was so-called because it was a secret oath-bound fraternity, regarding whose objects and whose real name its members always answered. "I don't know." "Americans must rule America!" was its rally cry, and relentless hostility to the increasing power of the Roman Catholic Church and a demand for the extension of the qualification for naturalization to a residence of 21 years were its main points. Know-nothings started off brilliantly. In 1854 they carried the State elections in Massachusetts and Delaware, and polled a great number of votes in New York. In 1855 they elected governors and legislatures in New York and four New England States, and in the South and West they were successful or nearly approached success in nine States. In 1856 eight of the 32 States had native American governors, but in the Presidential election of that year the party cast only about one-fifth of its national vote and obtained only eight electoral votes, the votes of the single State of Maryland. In the 34th Congress, 1855, it had 5 senators, 43 out-and-out Know-nothings as Congressmen and 70, nominally Republicans, but members of Know-nothing councils. In the 35th Congress, 1857, it had 5 senators and 14 representatives. In the next Congress it had 2 senators and 23 representatives, all of them from Southern States. Soon thereafter Know-nothingism went to pieces rapidly and no more of it was heard in politics with its mark as a party in Congress after the 36th. Amongst its most determined opponents were Henry Ward Beecher and Horace Greeley. (See also American Party.) Consult Carroll, A. E., 'The Great American Battle' (New York 1856); Cluskey, M. W., 'Constitution and Encyclopedia' (Philadelphia 1860); Cross, I., 'The Origin, Principles and History of the American Party' (in Iowa Journal of History and Politics, Vol. IV, p. 526, Iowa City 1906); Davis, H. W., 'Speeches and Addresses' (New York 1862); Dill, H. J., 'The Know-nothing Party' (Washington 1904); Gay, C. M., 'The Campaign of 1855 in Virginia and the Fall of the Know-nothing Party' (in Richmond College Historical Papers, Vol. I, p. 309, Richmond 1906); Hayes, G. H., 'Causes of Know-nothing Success in Massachusetts' (in American Historical Review, Vol. III, p. 67, New York 1897); id., 'A Know-nothing Legislature; Mass., 1855' (in American Historical Association, Annual Report for 1896, Vol. I, p. 175, Washington 1897); Hutchinson, E., 'Young Sam'; or Native Americans' Own Book (New York 1855); McMasters, J. B., 'Riotous Career of Know-nothingism' (in Forum, Vol. XVII, p. 524, New York 1894); Rhodes, J. E., 'The United States, 1850-1877' (Vol. II, New York 1893); Schneckebier, L. F., 'History of the Know-nothing Party in Maryland' (in Johns Hopkins University Studies in Historical and Political Science, Series XVIII, Nos. 4-5, Baltimore 1899); Seino, I. KNOX, George William, American Presbyterian clergyman: b. Rome, N. Y., 11 Aug. 1853; d. 1912. He was graduated from Hamilton College, Clinton, N. Y., in 1874, and from Auburn Theological Seminary in 1877. He subsequently was employed in missionary labors in Japan and was professor of philosophy and ethics in the Imperial University of Japan in 1880. He made profound researches in Japanese philosophy and had no equal among American scholars in his knowledge of Confucianism in its Japanese form. On returning to the United States he became pastor of a Presbyterian church in Rye, N. Y., and was a professor at Union Seminary, New York, 1890-94, and was honored with the title of professor of philosophy and the history of religion. He published (in English) 'A Japanese Philosopher' (1893); 'The Christian Point of View' (1902); 'The Direct and Fundamental Proofs of the Christian Religion' (1903; 1904), regarded as one of the great books of the century; 'Japanese Life in Town and Country' (1904); 'Imperial Japan' (1905); 'Spirit of the Orient' (1906); 'The Development of Religion in Japan' (1907); 'The Gospel of Jesus' (1909); (in Japanese) 'A Brief System of Theology'; 'Outlines of Homiletics'; 'Christ, the Son of God'; 'The Basis of Ethics'; 'The Mystery of Life.'

KNOX, nöks, Henry, American general and statesman: b. Boston, Mass., 25 July 1750; d. Thomaston, Me., 25 Oct. 1806. He was the seventh son of William Knox, Scotch extraction, who settled in Boston and became a shipmaster. After the father's death in 1762, the son was employed by a Boston bookseller, and in 1771 he opened a bookstore of his own. When a young man he threw in his lot with the patriots and devoted his leisure to reading books on the military art, supplementing his reading by observing and questioning the British officers stationed in Boston. He also joined a military company and, upon its organization, became second in command of the Boston grenadier corps. He was interested in athletics and sports and, in 1773, while hunting lost two fingers of his left hand. His marriage (16 June 1774) to Lucy Plucker, the daughter of an aristocratic Loyalist of Boston, did not prevent him from joining the Colonial army at the outbreak of hostilities in the spring of 1775. He fought in the battle of Bunker Hill, acting as aide of General Ward, and then aided in constructing the defenses of the camps around Boston. The army being in pressing need of artillery, Knox organized the plan of bringing heavy cannon and stores from Fort Ticonderoga near the Canadian frontier. He set out (15 Nov. 1775) on this perilous enterprise with a squad of mounted men. In the face of great difficulties he succeeded in getting 55 (by some accounts 59) guns, loaded them on sleds, with 23 boxes of lead and a barrel of flints, and reached Cambridge in safety (24 Jan. 1776). For this brilliant exploit he was warmly complimented by Washington. After his return he received his commission as colonel of the one artillery regiment, the appointment having been made by the Continental Congress (17 Nov. 1775). The cannonade of Knox's batteries (on the nights of 1-4 March 1776) enabled General Thomas to take possession of Dorchester Heights, which resulted in the evacuation of Boston by the British forces. In the autumn of 1776 he was stationed at New York City with Washington, who found him a true friend and an able officer. In December he was promoted to brigadier-general of the artillery. He distinguished himself in the battles of Trenton and Princeton and took part in the engagements at Brandywine, Germantown and Monmouth. He helped (May 1777) General Greene in planning the defenses of the Hudson River. In the trying winter of 1777-78 he was in camp at Valley Forge, with his young wife. Many of Washington's letters are written in terms of high appreciation. He rendered valuable service in the operations against Cornwallis in October 1781, his skill as an artillerist being praised by the Frenchman, De Chastellux. He was made major-general (22 March 1784) and appointed to the command at West Point (29 Aug. 1782). Upon him devolved the delicate task of disbanded the army late in 1783. He had already formed the Society of the Cincinnati (q.v.) to keep alive the friendships of officers formed during the war.

Congress appointed Knox Secretary of War (8 March 1785), a position he gladly filled for 10 years. In 1794 he was also at the head of the Navy Department, just organized. Owing to insufficient salary, he resigned from Washington's Cabinet (2 Jan. 1795). His remaining years were passed on his estate, Montpelier, near Thomaston, Me. Consult Brooks, N., 'Henry Knox, a Soldier of the Revolution' (New York 1900); Drake, F. S., 'Life and Correspondence of Henry Knox' (Boston 1873); Lindley, E. M., 'Montpelier, Home of Major-General Henry Knox' (in Magazine of American History, Vol. XVI, p. 121, New York 1886); Stimpson, M. S., 'Thomaston—The Home of Knox' (in New England Magazine, N. S. Vol. XXXIX, p. 730, Boston 1904).

KNOX, John, Scottish Protestant reformer: b. Giffordgate, Haddington, Scotland, 1505; d. Edinburgh, 24 Nov. 1572. (The Society of Antiquaries of Scotland discussed the subject of his birthplace in 1858, when Mr. John Richardson of Haddington brought forward evidence that he was born in Giffordgate, a suburb of Haddington, and not in Gifford, a village near that town. He was supported in this view by Mr. Laing, the editor of the reformer's works). After receiving his preliminary education at the grammar school of Haddington, he went in 1521 to the University of Glasgow, where for several years he studied scholastic philosophy and theology. Noted as a master of dialectic subtleties, he was ordained prior to 1530 and became a teacher of philosophy at Saint Andrew's. The study of the fathers, especially of Jerome and Augustine, had shaken his religious opinions as
early as 1535, but it was not till 1542 that he became an avowed and marked reformer. The long period of silence, before in mature age he explained his views with completeness, has been regarded as proof that he was naturally of a prudent and peaceful disposition and not a partisan, as his writings would indicate. His reprehension of certain practices of the Church caused him to retire from Saint Andrews to the south of Scotland, where he was declared a heretic. After the death of his friend, George Wishart, he remained in retirement till he took refuge with many other Protestants (1547) in the castle of Saint Andrews, which the regent was vainly attempting to reduce. There for the first time he became known as a powerful preacher against the papacy. The regent, re-enforced by a French squadron, obliged the garrison to surrender. The terms of the capitulation were violated and Knox with his comrades was transported to France, where he was imprisoned on the gallies for 19 months. He experienced extreme hardships and on his release (1549) directed his course to England, where he was appointed to preach at Berwick and at Newcastle and became one of the chaplains of Edward VI. For the boldness of his discourses he was several times called to account, but was able to vindicate himself. A bishopric was offered to him, but he declined it from scruples as to the divine authority of the episcopal order. On the accession of Queen Mary he fled from England to Dieppe and passed thence to Geneva, where, after taking part in the memorable troubles at Fettercairn and on his return to Scotland, he became pastor (1556) of a small English congregation. The two years of his residence in Geneva, in the society of Calvin, Beza and other learned men, were among the happiest of his life. While in Scotland he had been cited to appear before an assembly of the clergy to be held at Edinburgh, and after his return to Geneva the citation was renewed and he was condemned to be burned as a heretic and the sentence was executed on his effigy. Against this condemnation he published the 'Appellation of John Knox.' He then wrote a Hymn entitled the 'First Blast of the Trumpet against the Monstrous Regiment of Women' (1558), a vehement attack on the political government of women, at a time when Mary of Guise was regent of Scotland and Mary Tudor queen of England, and the nearest in succession to both thrones were females. Invited by the Scottish Protestants to resume his labors in his native country, he landed at Leith in 1559. The queen regent had laid her plans for the forcible overthrow of the reformation. At a convention of the nobility and clergy in Edinburgh all the demands of the Protestants were refused. Several of the reforming preachers were summoned to appear at Stirling for trial, but by the dissimulation of the regent were prevented from attending and then outlawed for their failure. Knox hastened to meet them at Perth, where he preached against the idolatry of the mass and the veneration of images. At the conclusion of the service there was a violent outbreak. The images in the churches were demolished, the pictures torn from the walls and trampled under foot, the presbyters invaded and the "rascal multitude," as Knox calls them, did not stop till they had sacked and laid in ruins the houses of the Dominican and Franciscan friars and the Carthusian monastery. The queen regent advanced upon Perth with an army, but, finding the Protestants well prepared for resistance, proposed terms of accommodation after waver, would indicate. The Protestants, in order to consolidate their strength, formed a religious bond or covenant and began to be distinguished as the congregation and their leaders as the lords of the congregation. Iconoclasts was a present feature of the Scottish reformation. Events similar to those at Perth followed at Stirling, Linlithgow, Cupar, Saint Andrews and other places. Knox had preached in the cathedral of Saint Andrews with such success that the magistrates united with the inhabitants in desolating the churches and monasteries and in establishing the reformed worship. Meantime civil war raged throughout the kingdom between the regent, assisted by French troops, and the lords of the congregation. In political as well as ecclesiastical affairs Knox took a foremost part, and took up his residence in Edinburgh after an extensive circuit through the southern and eastern counties. After a contest of 12 months, the vigorous assistance rendered by Elizabeth and the death of the queen regent while the English troops were investing Edinburgh led to a truce and to the summons of the Parliament to settle differences. Parliament assembled in August 1560, the reformed religion was established and Roman Catholicism interdicted by law in Scotland. Soon after the arrival of the young Queen Mary (21 Aug. 1561) she summoned the influential and noted reformer to her presence. Six interviews are recorded between him and the queen, and the questions which she raised were discussed by him with a rude vehemence and rigor, which once drove her to tears. She caused his arrest on a charge of treason in 1563, but all the councillors except the immediate dependents of the court voted for his acquittal. The vehemence of his public discourses led him into frequent difficulties. In 1562 he disputed publicly for three days with a woman at Haddington, entitled to the 'First Blast of the Trumpet against the Monstrous Regiment of Women' (1558), a vehement attack on the political government of women, at a time when Mary of Guise was regent of Scotland and Mary Tudor queen of England, and the nearest in succession to both thrones were females. Invited by the Scottish Protestants to resume his labors in his native country, he landed at Leith in 1559. The queen regent had laid her plans for the forcible overthrow of the reformation. At a convention of the nobility and clergy in Edinburgh all the demands of the Protestants were refused. Several of the reforming preachers were summoned to appear at Stirling for trial, but by the dissimulation of the regent were prevented from attending and then outlawed for their failure. Knox hastened to meet them at Perth, where he preached against the idolatry of the mass and the veneration of images. At the conclusion of the service there was a violent outbreak. The images in the churches were demolished, the pictures torn from the walls and trampled under foot, the presbyters invaded and the "rascal multitude," as Knox calls them,
Protestant churches in 1565. His character was marked by a stern realism, which could be reconciled with great devotion to his Reformed faith, to national dignities, no pompous traditions. From this sprang his scornful bitterness and his insensitivity to the social graces and refinements which Mary exhibited. He was not a thinker except on political topics. His "History of the Reformation of Religion in the Realms of Scotland" is the best known of his writings. The liturgy prepared by him has been edited by Sprot under the title "The Book of Common Prayer of the Church of Scotland." (London, 1911). "Constitutional History" by McCrie (1813); Taylor (1885); Brown, P. H. (1895); Lomier, "John Knox and the Church of England" (1875); Carrick, "John Knox and His Land" (1902); Hart, A. B., "John Knox as a Man of the World" (in American Historical Review, Vol. XIII, Lancaster, Pa., 1908).

KNOX, John, English military chronicler: d. Berwick, England, 1778. He became an ensign in the 43rd Foot, rose to be captain, was present at the sieges of Louisbourg in 1757 and 1758, served in Wolfe's forces before Quebec, and remained in Canada until after the capitulation of Montreal. His "Historical Journal of the Campaigns in North America, 1757-60," is the most valuable first-hand record of the events described that has ever been published. Consult: Dr. A. G. Dougherty's edition published by the Champlain Society (3 vols., 1914, 1916).

KNOX, John Barnett, American lawyer: b. Talladega, Ala., 16 Feb., 1857. His education was received at private schools, and after studying law, he was admitted to practise in 1878. Ten years later he removed to Anniston, Ala., where he has since resided, and soon became one of the most prominent lawyers in the State. He has taken an important part in State politics, was delegate to Democratic National conventions of 1892, 1896 and 1912 and was twice chairman of the Democratic State Executive Committee. In the State Constitutional Convention of 1901 he was the president. Of the debates of this convention and in the framing of the constitution he took an active part. His arguments on the legal problems presented showed that he was a master of constitutional law.

KNOX, John Jay, American financier: b. Knoxboro, N. Y., 19 March, 1828; d. New York, 9 Feb., 1892. He was graduated at Hamilton College in 1849, and was a banker till 1862. In that year he received an appointment from Secretary Chase, and subsequently had charge of the mint coinage correspondence of the Treasury Department, becoming in 1867 comptroller of the currency. A bill which he proposed was passed with a few modifications and is known as the Coinage Act of 1873. In 1872 he was appointed comptroller of the currency, resigning in 1884, to become president of the National Bank of the Republic, New York. In addition to various reports and addresses on financial subjects, he published "United States Notes, a History of the Various Issues of Paper Money by the Government of the United States" (New York, 1884, revised 1887). Some years after his death there was brought out by B. Rhodes and E. H. Youngman, his "A History of Banking in the United States" (New York 1900). Consult "Chamber of Commerce of the State of New York; 'Tribute to the Memory of John Jay Knox"' (New York 1892).

KNOX, Philander Chase, American lawyer and statesman: b. Brownsville, Pa., 6 May 1833. He was graduated from Mount Union College, Ohio, in 1872; studied law and was admitted to the bar in 1875. He was assistant United States district attorney for the western district of Pennsylvania in 1876-77; resigning this position he took up the practice of law in Pittsburgh in partnership with J. H. Reed. The firm's practice grew rapidly and Knox became known as one of the most successful corporation lawyers in the United States; in 1892 he was counsel for Carnegie during the Homestead strike. April 1901 he was appointed Attorney-General of the United States and held this office till June 1904 when he became senator from Pennsylvania for the unexpired term of Senator Quay, and in 1905 was elected for a full term. He served on the Judiciary Committee and took a prominent part in the debate relating to the Panama Canal. As Attorney-General he was involved in the "carnival agitation," and in 1902 brought a suit against the Northern Securities Company and the so-called "Beef Trust" on the ground that they were violating Federal statutes. In 1909 he became Secretary of State in President Taft's Cabinet. He was not considered to have been as successful in this office as in that of Attorney-General. In 1912 he made a tour of the Latin-American countries for the purpose of cementing closer relations between them and the United States. He was re-elected to the United States Senate in 1916 for the term 1917-23. He has published "The Future of Commerce" (1908); "International Unity" (1910); "Speeches" (1912), made during his tour of South America.

KNOX, Robert, writer on Ceylon: b. about 1640; d. 1720. He, together with his father—a commander of the East India Company's service—and 14 others were taken into captivity by the Ceylon natives when forced by storms to put into Cottiar Bay in 1657. His father died in captivity but the son escaped, after several months, after 19½ years, to Aripo, a Dutch settlement. The East India Company, in 1680, took him into their service and he made a number of other voyages through the Indian seas, becoming a commander. He wrote a number of letters to his cousin, John Stryke, now preserved in the University Library, Cambridge, but most interesting reading is furnished by his account of Ceylon, the first ever written. It is entitled "An Historical Relation of the Island of Ceylon in the West Indies; together with an Account of the Detaining in Captivity the Author and divers other Englishmen now living there, and of the Author's Miraculous Escape" (London 1681); it has been translated into Dutch, French, German, etc.

KNOX, Thomas Wallace, American journalist and traveler: b. Pembroke, N. H., 26 June 1835; d. New York, 6 Jan., 1890. He lost his parents while still a small child and was brought up on a farm, but managed to get enough schooling to become head of an academy at Kingston, N. H., in 1858. He went to
Colorado in 1860 and there engaged in journalism and during the Civil War served as volunteer aide, rising to the rank of lieutenant-colonel and war correspondent for the New York Herald. Some of his war letters were published as ‘Campfire and Cotton Field’ (New York 1865). With T. M. Coole he wrote ‘Horatio Seymour’ (New York 1868). He made a journey around the world as a newspaper correspondent in 1866 and again in 1877, and wrote many popular books for young people. From 1865 on he resided, when not traveling, in New York in the literary and artistic life of which he took an active part. He was one of the founder and early officers of the Lotos Club. Among his other very numerous published works are ‘Overland through Asia’ (New York 1870); ‘Underground World’ (1873); ‘How to Travel’ (1880); ‘Boy Travellers Series’ (15 vols. 1884-94); ‘Lives of Blaine and Logan’ (1884); ‘Decisive Battles since Waterloo’ (1887); ‘Life and Work of Henry Ward Beecher’ (Hartford 1887); ‘The Life of Robert Fulton; and a History of Steam Navigation’ (New York 1887); ‘The Republican Party and its Leaders’ (New York 1892); ‘The Lost Army’ (1894); ‘Hunters Three’ (1895); ‘In Wild Africa’ (1895), etc.

KNOX, William, British official and pamphleteer: b. in Ireland, 1737; d. Ealing, near London, 25 Aug. 1810. He was appointed by Lord Halifax, as His Majesty’s Council and Provost Marshal of Georgia, and sailed with Henry Ellis, who was appointed governor of the colony. They arrived in Savannah in 1757, but, returning in four years, he became agent in Great Britain for Georgia and East Florida. He suggested a colonized aristocracy and representatives in Parliament, then (1765) wrote two pamphlets defending the Stamp Act, and his services were dispensed with. He was Under Secretary of State for America from 1770-82. Lord North (1776) based conciliatory propositions on Knox’s views. In 1772 the reversion of the place of secretary of New York was granted to him without pay. The province of New Brunswick, Canada, was created in 1784 at his suggestion, lands there being granted to the expelled Loyalists. He wrote numerous pamphlets, most important of which were ‘A Letter to a Member of Parliament, wherein the Power of the British Legislature and the case of the Colonists are briefly and impartially considered’ (1764); ‘The Claim of the Colonies to an Exemption from Internal Taxes imposed by authority of Parliament examined’ (1765); these two pamphlets lost him his post. ‘A Defense of the Quebec Act’ passed through two editions in 1774, its year of issue; ‘Considerations on the State of Ireland’ was written in 1778; a number of pamphlets were written by him on controversies in the Church.

KNOX COLLEGE, a coeducational institution, founded in 1837 at Galesburg, Ill., as Knox Manual Labor College. The school was opened in 1841 and in 1857 the name was changed to Knox College. The original plan was for founding and maintaining the school was to secure subscriptions to the amount of $40,000 and to purchase lands in the Mississippi Valley, at government price, the lands to be resold at a profit. Every subscriber who purchased 80 acres of land was given free tuition for one student for 25 years. In 1917 the productive fund amounted about $400,000. There are in the library about 13,700 volumes; there were connected with the school 34 instructors and professors and about 600 students. A music department was established in 1893. The fair of the Ind. Th. School, held in 1858, was held on the grounds of this college. The 40th anniversary of this event was celebrated on 7 Oct. 1898, President McKinley and his Cabinet taking part.

KNOX-LITTLE, William John, Eng. Anglican clergyman and author; b. Stuartstown, County Tyrone, Ireland, 1839. He was educated at Cambridge University, took orders in the Church of England; and after holding several curacies was rector of Saint Alban’s, Cheetwood, Manchester, 1875-85. Since 1885 he has been canon residuary of Worcester Cathedral and vicar of Hoar Cross. He is an advanced churchman and has several times visited the United States, where he has preached in many Episcopal churches associated with High Church teaching. He is a popular religious writer and among his many books are ‘Meditations on the Three Hours’ Agony of Our Blessed Redeemer’ (1877); ‘The Broken Vow: a Story’ (1887); ‘The Child of Stafferton’ (1888); ‘The Perfect Life’ (1889); ‘Studies in South Africa’ (1889); ‘Holy Matrimony’ (1900); ‘Confirmation and Holy Communion’ (1901); ‘The Conflict of Ideals in the Church of England’ (1905).

KNOXVILLE, noks’vil, Iowa, city and county-seat of Marion County, on the Chicago, Burlington and Quincy and on the Chicago, Rock Island and Pacific railroads, 36 miles southeast of Des Moines. Here is the State Industrial Home for the Blind, courthouse, high school and public library. It is the centre of an extensive coal-mining, stock-raising and agricultural district and has flour-mills, canneries and machine shops. Pop. 3,190.

KNOXVILLE, Tenn., city, county-seat of Knox County, 110 miles northeast of Chattanooga and 160 miles east of Nashville, is located on the main lines of the Southern and the Louisville and Nashville railroads and on the Tennessee River, at the head of steam navigation. It is connected with South Knoxville, on the south side of the river, by an imposing steel bridge. Eleven railway lines radiate in all directions from the two railway systems; and 72 passenger trains go in and out of Knoxville daily. East Tennessee scenery is noted for its variety and beauty, and Knoxville is its central point. The variety of scenery around Knoxville embraces river, valley, mountain, forest—all within easy reach. Lake Townsend, the end of a 20-mile road ride, are the foothills of the Great Smoky Mountains. In the Appalachian Mountains splendidly equipped hotels and cottages are open to guests. The air, rarefied and made pure by the forests of the mountains and hills of the colony, is beneficial and invigorating. Numerous watering places, boasting mineral and fresh waters, are within easy reach of Knoxville. In point of climate and scenery, Knoxville is unsurpassed. The
KNOXVILLE

489

city is laid out with an idea to beauty and the architecture of residences corresponds to the general street plan.

Natural and Economic Resources.—This part of Tennessee has almost inexhaustible quantities of resources of coal, zinc, copper, iron, timber and marble. Knoxville is in the heart of the hardwood section, large quantities of which are shipped throughout the country. The lumber dealers of Knoxville say do an annual business of approximately $2,500,000. Practically all Tennessee marble is quarried in the Knoxville district. Annual shipments of marble approximate $5,000,000 in value, and even then the ground is scarcely scratched, for the hills surrounding Knoxville are literally filled with marble. It is the leading industry in Knoxville. Tennessee marble is noted for its variety, beauty, strength and durability, and therefore has all of the requisites for satisfactory building material, both exterior and interior. It is pronounced by Dr. Albert Colby, School of Mines, New York, as the purest marble he ever examined. It will stand 20,000 pounds per cubic inch crushing strain. Its absorption is only 0.01 per cent, lower than that of the great Tennessee-Kentucky coal area. Some 18,000,000 to 20,000,000 tons of coal are handled through Knoxville jobbers annually, a large proportion of which passes through Knoxville. A zinc producing plant now ships some 1,200 tons of ore per day and additional capacity is in contemplation. Nearly 400 men are now employed at the two shafts now being operated. The copper industry in the Knoxville district ships annually copper to the value of many millions of dollars. There is more undeveloped hydro-electric power within 50 miles of Knoxville than within any other equal area of the United States. It is estimated that the amount of power thus available is upwards of 1,000,000 horse power. The topography of the country in the Knoxville district is particularly adapted to the harnessing of the water in basins formed by the mountains and, as there are many mountain streams well located for the establishment of power plants, the prospective enormous development represents a natural one. The Ocoee River Power Company supplies Knoxville with its power. The Aluminum Company of America has one of their branch plants within a few miles of Knoxville. The use of electric current as heat gives them the best results in the process of making aluminum pig. The present site of the Aluminum Company's plant in the Knoxville district covers some 600 acres of ground. The plant as it is now constructed is only a nucleus for the larger operations which it is intended to increase in the future. The plants at Niagara Falls, Pittsburgh and Massena. The company now ships from its plant in Knoxville aluminum pig to the value of several millions of dollars annually.

Business Conditions.—The three railroads in Knoxville haul over 1,524,000 tons of freight (in and out) annually. Knoxville has 50 jobbing houses doing a business of $50,000,000 annually, while its manufacturing approximates $30,000,000 annually. The coal handled by Knoxville is put up in 125,000 tons annually, and the annual output of zinc is approximately $20,000,000 annually. Knoxville's marble brings in $3,000,000 to $4,000,000 annually, while the zinc, aluminum and copper industries in the Knoxville district do a volume of business running well up into the millions. Money for all legitimate business purposes is available at all times in Knoxville.

Financial Strength.—Owing to the geographic location of Knoxville in relation to inexhaustible quantities of economic and natural resources, and of the diversification of interests in the Knoxville district, this city is always the last to feel any sort of business depressions. At the beginning of the World War in 1914, Knoxville was the only city in the entire South to show an increase in bank clearings, and one of the five cities in the United States to show an increase in clearings during that period. During the first six months of the war—a period of lowered financial vitality—Knoxville showed decreased bank clearings of less than 5 per cent, as compared with decreases at other important points reaching as high as 35 and 40 per cent. The figures given below show that as a financial centre Knoxville is stronger than ever before in the history of the city. Its rating in bank circles throughout the country is high. There are now 12 financial institutions in a few miles of Knoxville's business district. The capital and surplus of these institutions is approximately $10,000,000. Knoxville's banking institutions are approximately $24,000,000. Bank clearings in 1901 were $24,000,000, while in 1917 they were $125,097,419.84.

Government.—Knoxville has a commission form of government, consisting of a mayor and four commissioners, elected by the people for a term of four years. The assessed value of property for taxation is $45,000,000 and the bonded debt of the city is $3,942,283, most of which was created for constructing sewers, building bridges and other public improvements. The city is supplied with pure wholesome water from the Tennessee River, by a municipality owned plant. The lighting plants, gas and electric, are owned by private corporations. Practically all telephone wires are underground. Everything is sightly. The main business thoroughfare has all the wires—electric light, telegraph and telephone—in the ground. The sidewalks are wide and the streets are wide and clean. The city fire department is a striking example of efficiency, it being partially motorized. The street cleaning department and police department are motor-equipped. The traction line runs past the edge of the city to the west. The city has over 53 miles of track in operation and 136 cars in service. Cheap electric current and gas are available. The city operates a splendidly equipped free public library. A marble post office, with seven sub-stations throughout the city and suburbs, ensures prompt delivery. The military authorities have found the police force so efficient that they are kept in a juvenile court. While awaiting trial they are kept in a
detention-house instead of being sent to jail. Charities are looked after by a central organization known as The Associated Charities, which is conducted under the auspices of the city and other dispensers of charities.

Knoxville is headquarters for the Third Regiment of the National Guard of the State of Tennessee. Knoxville's chief benevolent institutions are the Industrial School for Juveniles, sustained at the expense of Knox County, capable of housing and giving instruction to 200 girls and boys; the Home for Aged Women and an orphanage. The Knoxville General Hospital was erected at a cost of more than $30,000, and is one of the leading institutions of its kind in the South.

The City Market.—The city market is unqualifiedly the best in the South, where the housewife can find, at reasonable prices, a wide variety of foodstuffs. A rich agricultural country surrounds Knoxville. Truck farming is practised on a large scale. Supplementing the market, farmers' wagons each morning bring their produce to town. The wagons flank both sides of the market streets and sell directly to the consumer. This makes for cheap living conditions, and, being under the supervision of the city, is excellently managed.

Social Life.—The people of Knoxville are hospitable. Stranger and traveler are made to feel at home in short order. Knoxville is truly a "home city." Knoxville has an efficient Y. M. C. A. and Y. W. C. A. There are several men's clubs of different kinds, including the Cherokee Country Club, University Club, Cumberland Club, Irving Club, Elks' Home, Eagle's Home and a number of others. Among the women's clubs and societies are included the Lyceum and Art Museum, Nicholson Art League, Newman Circle, Ossofi Circle, United Daughters of the Confederacy, and Daughters of the American Revolution. There are 35 secret orders in Knoxville and suburbs. There are five posts of the G. A. R. and U. C. V. Camps, one Sons of Veterans and one Society of the Sons of the Revolution. Knoxville has eight hospitals and sanitariums; also two training schools for nurses. There are 106 white and 29 colored churches, with 15 different denominations, in the city and suburbs.

Home and Amusements.—Knoxville has well-constructed and well-kept apartment houses. Many new dwellings, quite a few being of the bungalow type, are constantly being erected. Rents are reasonable in Knoxville. Convenient car service to all of the outlying suburbs makes living within 15 to 20 minutes ride from the city both a convenience and a pleasure. All suburbs are growing rapidly. There are several parks in and around the city. The most prominent of these is beautiful Chilhowee Park, the site of the National Conservation Exposition. Two artificial lakes only serve to increase the attractiveness of this popular park. What nature has failed to supply in beauty, Knoxville's enterprise has abundantly supplied. The city government has well in hand plans for additional parks and playgrounds. Eight theaters furnish varied entertainments both afternoon and evening. Knoxville has two bands and orchestras.

School System.—There are splendidly equipped city schools, county schools, private schools, parochial schools, the State Deaf and Dumb School and the State University. There are two Catholic and one German-Lutheran parochial schools, three private schools and five high schools. Manual training and domestic science are taught in the several high schools. A part-time school curriculum obtains in the Knoxville High School. Graduates of Knoxville High School are admitted to West Point without test, upon recommendation of the principal or superintendent of the high school. The public school student enrollment is 13,000. The State enforces a compulsory school law. Approximately 80 per cent of the scholastic population can read and write. The Summer School of the South for teachers is also held in Knoxville, under the auspices of the State University. The Summer School has an annual attendance of more than 2,000 teachers from all over the country, and is the oldest Summer School in the South. The University of Tennessee is a coeducational institution. The location of the State Experiment Station here makes it possible to conduct agricultural extension course enrolled 2,400. It is one of the 10 Southern colleges whose bachelor degrees are accepted by the University of Berlin.

History.—Named in honor of General Knox of Revolutionary fame, the first Secretary of War, Knoxville was founded in 1792 by Gen. James White, who had been an officer in the American army in the War for Independence. In the valley of East Tennessee, where Knoxville is located, civilization was first planted west of the Alleghany Mountains. The pioneers faced the red men and an unbroken forest as they pushed forward with axe and rifle to plant the church and the schoolhouse and law and order. The city, therefore, has been for long years the centre of a region of country embracing eastern Kentucky, southwest Virginia, western North Carolina and North Georgia, and the commercial metropolis of this section. Some of its wholesale houses go back to the days when transportation was by wagon and goods delivered over almost impassable roads.

During the Civil War of 1861 to 1865 the city was alternately taken and retaken by the respective armies and suffered greatly. It began to grow actively in 1880, and since that time it has taken its place abreast of other Southern cities that date their growth from about that period. Being an old city it has a population which is essentially conservative, many of whom date their ancestry back to the original founders of more than a century ago. It has always been a university town, the University of Tennessee, located here, having been founded in the year 1807.

Climate and Population.—Knoxville is one of the healthiest cities in the United States. It is 1,000 feet above sea-level. An equable climate and moving picture houses furnish varied entertainments both afternoon and evening. Knoxville has two bands and orchestras.

Climate.—The average mean temperature for a period of 33 years is 57 degrees. The average temperature for the three hottest months of the year, June, July and August, is less than 75 degrees, while for the three coldest months, December,
January and February, it is 31.4 degrees. Sudden changes in temperature are comparatively rare. The growth of population is shown in the following census statistics: (1880) 9,693; (1889) 22,359; (1890) 32,120; (1910) 46,346. The city directory (1918) gives Knoxvill's population of 96,000, 20 per cent of which is colored.

O. J. STEPHENS,
General Secretary, Knoxville Board of Commerce.

KNOXVILLE, Siege of. On 3 Nov. 1863, before the battle of Chattanooga (q.v.), General Bragg sent General Longstreet to capture or destroy the Union army under General Burnside at Knoxville. The next day Longstreet moved from Tynner's Station with the divisions of McLaw and Hood, two artillery battalions and Wheeler's cavalry, and on 14 November crossed the Tennessee near Loudon. After the engagement at Campbell's Station (q.v.), Burnside resumed his march, reaching Knoxville on the morning of 17 November, Longstreet closely followed. The siege of the town had been thoroughly fortified, the line of defense extending from the Holston River on the left, a double line of works fronting west, a strong work called Fort Sanders on the northwest salient and a line from that point across the railroad and again to the right as far as the river. On the south side of the river were some detached works connected with the town by a pontoon bridge. On the night of 16 November communication with Cumberland Gap was cut off by the night of the 18th the siege was well established. Longstreet believed he could starve out Burnside and compel his surrender but Grant's success at Chattanooga rendered Longstreet's position critical, wherefore he resolved to carry the works by assault. On the night of 28 November he advanced his sharpshooters to within rifle range of the Union defenses and prepared a column to attack Fort Sanders. Early the next morning the assaulting party of three brigades approached unharmed to within 100 yards of the fort. At dawn Longstreet opened a heavy artillery fire and a half hour later his columns charged the fort. The Union troops had placed in front of the fort an abatis and entanglements of wire, on reaching which the forward Confederates became confused, but the heavy mass behind them pushed resolutely onward and some gained the ditch and the parapet. The Union guns then opened up with triple charges of canister and the infantry charged the Defenseless Confederates in the ditch, which soon was piled high with dead and wounded. After a long fight Longstreet withdrew with a loss of 1,000 killed, wounded and prisoners, while Burnside lost only 13 killed and wounded. Meanwhile Sherman had been sent from Chattanooga with reinforcements for Burnside and as Sherman's advance prevented his junction with Bragg, Longstreet on the night of 4 December passed around the north side of Knoxville and took up his line of march to Holston. Sherman reaching Knoxville the same day left there after Longstreet but it proved inadequate to cope with him and accordingly moved without hindrance to the south side of the Holston where during the winter he continued to harass the Union troops in Tennessee, in the spring joining Lee for the campaign of 1864. Meanwhile at his own request Burnside was relieved from duty and on 11 December the command was formally transferred to Gen. J. G. Foster. Sherman left a part of his troops at Knoxville and returned with the rest to Chattanooga. Consult 'Battles and Leaders of the Civil War' (Vol. III, pp. 731-752, New York 1888); 'Gist, H. M. The Army of the Cumberland' (pp. 258-259, New York 1882); Cox, Jacob D., 'Atlanta' (pp. 9-16, New York 1882); Evans, C. A. (ed.), 'Confederate Military History' (Vol. VI, pp. 264-267; Vol. VII, pp. 174-176; Vol. VIII, pp. 123-124, Atlanta 1899); Nicolas, J. C. and Hay, John, 'Life of Lincoln' (Vol. VIII, pp. 155-188, New York 1886-96); Woodbury, A., 'Burnside and the Ninth Army Corps' (pp. 327-351, Providence 1867).

KNUSDON, noot'soan, Albert Cornelius, American theologian: b. Grandmeadow, Minn., 23 Jan. 1873. He was graduated at the University of Minnesota (1898) and received the degree S.T.B. at Boston University (1896), studied at the School of All Sciences, Boston (1896-97), and the universities of Jena and Berlin (1897-98). In 1900 he received the degree of Ph.D., Boston University. He was appointed professor of church history at the Denver University (1898-1900), professor of philosophy and the English Bible at Baker University (1900-02), and professor of the English Bible and philosophy at Allegheny College (1902-06), professor of Hebrew and the Old Testament exegesis at Boston School of Theology from 1906. He wrote 'The Old Testament Problem' (1908) and 'The Beacon Lights of Prophecy' (1914).

KNUTZON, knu'tzon, Jørn Alexander, Norwegian Semitic scholar and philologist: b. Trondhjem, 9 Sept. 1854. He studied at the Trondhjem Cathedral School, Christiania University, Berlin and Leipzig. He became doctor of philosophy at Christiania (1889) and gave Semitic lectures on the Old Testament (1890-91) at the university. Renouncing theology, he devoted himself to Assyriology. He wrote many articles on philological, especially Semitic and Assyrian, subjects. Among such are 'Zur assyrischen und allgemeinen semitischen Grammatik' (1891-92); 'Assyrische Gebiete an den Sonnengött' (1893); 'Die El-Armarna Tafeln' (1899-1901); 'Die Arzawa — Briefe dig ältesten Urukden in indo-germanischen Sprache' (1902).

KNURR-AND-SPELL. See NUR-AND-SPELL.

KNYPHAUSEN, knip'how-zsn, Baron Wilhelm von, German soldier: b. Lützberg, 4 Nov. 1716; d. Cassel, 7 Dec. 1800. Educated at Berlin, he entered the Prussian army in 1734, in which he became in 1775 a general officer under Frederick II (the Great). He came to the United States in that year as second in command of the Hessians in the English service, and superseded General von Heister as commander-in-chief in 1777. He fought at Long Island, White Plains, Brandywine and Monmouth; and during the temporary absence of Clinton in 1780, commanded New York. In 1782 he returned to Germany, where he later
became military governor of Cassel. He was a capable soldier, and had no high opinion of his unreliable mercenaries.

KOALA, a remarkable marsupial (Phalangeridae) of the family Phalangeridae, found chiefly in the interior of New South Wales, and known to the colonists as "native bear." It is about two feet long, and has a heavy, depressed, somewhat bear-like form, no tail, strong limbs with five digits armed with long, sharp claws on each, the inner digit on the hind feet and two inner on the fore feet opposable to the others, the ears large and like the rest of the body covered with a dense gray woolly fur. These characteristics fit it for an arboreal existence, and it lives altogether in trees, descending only occasionally to dig for roots. It is especially active at night and feeds on leaves and buds of eucalyptus trees. It is timid and defenseless, and is killed with clubs by the Australian blackfellows, who eat its Best. (See WOMBAT.) Consult authorities cited under MARSUPIALIA.

KOBÉ, kōbē, Japan, a treaty port and former municipality of the main island Honshu, on the west shore of the Gulf of Osaka, adjoining on the northeast the prefectural city of Hiroo, with which it was united in 1892. It is the most important of the treaty ports with the largest trade and shipping, a fine harbor, docks, wharves for ocean steamers, ship-building yards, railway shops and other important industrial establishments. Kobé is well laid out with wide streets, electrically lighted. Pop. 442,167.

KOBELL, kōbēl, German family of artists, descendants of Johann Heinrich Kobell, who came to Mannheim from Frankfort in 1720. The most noted are Ferdinand, Franz, Hendrik and Wilhelm (q.v.).

KOBELL, Ferdinand, German painter and engraver: b. Mannheim, 7 June 1740; d. Munich, 1 Feb. 1799. He studied first at Heidelberg when the Elector of Bavaria, admiring a landscape, aided him to devote his entire time to painting. He next studied art in Paris and of M.A. from this institution in 1800; was on the staff of the New York Sun in 1881, and correspondent of the New York World at the first performance of Parsifal at Bayreuth in 1882. As a journalist he has always specialized in music, drama and art, and since 1916 has been art critic of the New York Herald. His Wagner (1889-90), after going through many editions, were combined in Wagner's Music-Dramas Analyzed (1904). Besides these and music-magazine articles in the Century, the North American Review, the Forum, the Ladies' Home Journal, the Delineator, etc., he has published 'My Rosary and Other Poems' (1896); 'Plays for Amateurs' (1892); 'Mimriam, a story' (1898); 'The Opera Singers' (1901); 'Signora, a Child of the Opera House,' a novel (1902); 'Famous Actors and Actresses and Their Homes' (1903); 'Loves of the Great Composers' (1905); 'Wagner and His Isohle' (1905); 'Famous American Songs' (1906); 'Himalaya Music' (1906); 'The Pianist' (1907); 'A Tribute to the Dog' (1911); 'Portrait Gallery of Great Composers' (1911); 'Modern Women' (1916). He was editor of the Lotus Magazine from 1909 to 1918.

KOBBÉ, William August, American army officer: b. New York, 10 May 1840. He was educated there and in Germany where he studied mining engineering until 1862, when he enlisted in the volunteer service and served until the end of the Civil War, rising to rank of captain, brevet-major and lieutenant-colonel. He was appointed lieutenant in the regular army (infantry) in 1866, serving on frontier in New Mexico and Kansas during Indian hostilities until 1872 when he was transferred to the artillery arm. He was graduated at the artillery school in 1873; was in the Philippine service 1899-1901, as major of the 3d United States Artillery, colonel of the 35th United States Volunteers, brigadier-general of the United States volunteers and brigadier-general of the United States army. He was in command of joint army and naval expedition to open the

Hemp Ports to commerce and was made military governor of Mindanao and Jolo; and commanded the Department of Dakota at Saint Paul from 1902 until retired as major-general in 1904.

KOBE, ko bē, Japan, a treaty port and former municipality of the main island Honshu, on the west shore of the Gulf of Osaka, adjoining on the northeast the prefectural city of Hiroo, with which it was united in 1892. It is the most important of the treaty ports with the largest trade and shipping, a fine harbor, docks, wharves for ocean steamers, ship-building yards, railway shops and other important industrial establishments. Kobe is well laid out with wide streets, electrically lighted. Pop. 442,167.

KÖBERLE — KOBOLO

Munich, 15 July 1855. He worked under his father, Ferdinand (q.v.), then studied the works in the galleries of Mannheim and Düsseldorf, especially those of Wouvermann, which he collected. After his death, in a fifth edition by Bartisch (Leipzig 1872-75). His other works include 'Vermischte Aufsätze zur Literaturgeschichte und Ästhetik' (ib. 1858); 'Heinrich von Kleists Briele an seine Schwester Ulrike' (Berlin 1860). He contributed to Löffel's 'Entwicklung der deutschen Poesie,' the volume on 'Lessing' (1865).

KOBO, kō-bō, the Cadmus, Philo and Euhemerus of Japan, all in one. The posthumous title of the Buddhist priest Kukai (koo-kigh), to whom is attributed the invention of the Japanese syllabary i ro ha, of 47 letters. He proposed and carried out the scheme, by which Shintōism was followed up in Buddhism. In 804 he went to China to study under the most renowned masters. On his return in 806 he excelled all by his erudition and eloquence, and founded the Shingon, or Sect of the True Word, which makes use of verbal formulas to a considerable extent. According to its tenets, a believer can attain to the state of the Enlightened, or Buddhahood, while in the body of flesh and blood. After a revelation from the gods at Isé, the most sacred of the Shinto shrines, he came forth to baptize all the native gods as avatars, or manifestations of Buddha, giving them new Buddhistic names, while for every Shinto festival he arranged a corresponding Buddhist saint's or gala day. He thus provided both for the scholars and the common people. He sent forth his pupils to preach the new theology, which soon captured the whole nation, thus establishing for a thousand years Ryobu, or mixed Shinto. In 816 he built on Mount Koya one of the most splendid temples in the whole empire. In 922 Kukai was canonized by the emperor, under the name of Kobo Dalshi (the Great Teacher, who promulgates the law). The popular legends concerning Kobo's amazing powers of learning, writing, literary accomplishments and painting from the favorite subjects of the art of Hokusai, etc., have given rise to many artists. Consult Reischauer, 'Studies in Japanese Buddhism' (1918), and Griggs, 'The Religions of Japan' (1895).

KOBOLO, kō-bō-lō', Hermann Albert, German astronomer: b. Hanover, 5 Oct. 1858. He studied at a private school and the Royal Gymnasium, Hanover, and at Göttingen University. He was attached to the Erd- und Observatory in Hungary (1880-83), was astronomer on the German Venus Expedition to Aiken, S. C., and was appointed (1883-86) to the commission of observation of the transit of Venus. He was attached to the Strassburg Observatory (1886-1902) and at Kiel Observatory (1902). In 1908 he became editor of the 'Astronomische Nachrichten.' He wrote 'Bau des Fixsternsystems, mit besondere Rücksicht der photometrische Resultate' in 'Die Wissenschaft' (1906).

KOBOLO, a species of elf in the popular superition of Germany, corresponding to the English goblin. The kobol is connected with a house or a family, and appears in bodily shape.
KOCH, kók, Christian Friedrich, German jurist: b. Mohrin, 9 Feb. 1798; d. Neisse, Silesia, 21 Jan. 1872. He studied under Savigny until 1825 and wrote "Versuch einer systematischen Darstellung der Lehre von Besitz und Verwaltung des Rechts" (Berlin 1826). This brought him immediate recognition and led to his numerous appointments. He studied French law in Cologne and Aix-la-Chapelle and was appointed justice of the Court of the diet of the province of Westphalia (1834). He was appointed director of the law courts, successively, at Kulm (1832); Grosslogau (1834); Halle (1840). He received the appointment of director of the Court of Justice of the principality at Neisse, where he worked zealously till his death. He reconstructed the entire Prussian jurisprudence. He wrote "Das Recht der Forderungen nach gemeinem und priva-
tischen Recht" (Breslau 1836–43; Berlin 1858–59); "Lehrbuch des privatrechtlichen Privatrechts" (Berlin 1845; 2d ed., 1857–58); "Das preussische Erbrecht im gemeinen deutschen Recht entwickelt" (Berlin 1866); "Das preussische Zivilprozessrecht" (ib. 1847); 6th ed., 1871). Another important work of his was "Kommentar zum Allgemeinen Landrecht" (Berlin 1855; 8th ed., 1883–87). He was founder of the Schlesisches Archiv für die praktische Rechtswissenschaft (Berlin 1813–46). Consult Behrend, J. F., "Christian Fried-
rich Koch" (Berlin 1872).

KOCH, Joseph Anton, Austrian landscape painter and etcher: b. Obergeibeln, Tyrol, 2 July 1768; d. Rome, 12 Jan. 1839. He started life tending cattle; was given instruction at the Stuttgart Karlschule through the recommendation of Bishop Umgedler (1785). He ran away from the strict discipline (1791) and reached Strassburg and, later, Rome (1795), where he became acquainted with and a follower of the classic tendency of Carstens. He adopted the style of Pusin and Claude Lorraine in land-
scape work. In his early days at Rome he etched the pages of Carstens 'Les Argonautes, selon Pindar, Orphée et Apollonius de Rhodé' (Rome 1790). He also etched 20 Italian land-
sapes and a large sheet representing "the Oath of the French at Millesimo"; 14 pages after Dante, adding later another 30 (published Vicenza 1904), and 36 after Ossian. He con-
tributed American landscape scenes to the works of von Humboldt (1805). At the Pinakothek, Munich, are his 'Sacrifice of Noah' and landscapes. He was forced, through inade-
quate income from his work, to go to Vienna, where he worked prolifically (1812–15). He returned to Rome, where he painted, among other works, the four frescoes in the Dante Room of the Villa Massimi (1824–29). His presence and personality had considerable influence among the younger generation in the art life of Rome. His work, directed humor-
ously against the unchangeable criticism and false conceptionship, was entitled "Moderne Kunst-
chronik oder die Rumfordische Suppe koeh und geschrieben von J. A. K." (Stuttgart 1834). His last years were spent in great poverty.

Consult Frimmel, "Joseph Anton Koch" (in Der neue Kunst und Kunstler des 19ten Jahr-

KOCH, Karl, German botanist: b. Ettersberg, near Weimar, 6 June 1809; d. Berlin, 25 May 1879. He studied in Jena and Wurzburg and taught, as privatdocent, in Jena (1834). He undertook a journey of research into Russia (1836–38) and a second (1843–44), then settled in Berlin (1847), being later appointed assistant professor and general secretary of the Verein zur Beförderung des Gartenbau of the state of Prussia, in which position he published "Wachsmischung für Gärtnerei und Pfan-
zentrume" (1858–72). He was appointed pro-
fessor of the Agrikola school in Berlin (1859). He wrote "Reise durch Russland nach dem kaukasischen Isthmus" (Stuttgart 1842–43); "Wanderungen im Orient" (Weimar 1846–47); "Hartus dendrologiscus" (Berlin 1853–54); "Dendrologie" (Erlangen 1869–72), etc.

KOCH, Max, German historian and critic:
b. Munich, 22 Dec. 1855. He studied in Munich and Berlin, and taught (as docent) at Mar-
burg (1880). He was appointed assistant pro-
fessor and later professor at Breslau. He wrote "Helferich Peter Sturz und die Schriften der Kgl. Literaturbrieft" (Munich 1879); "Über die Beziehungen der englischen Litera-
tur zur deutschen im 18. Jahrhundert" (Leip-
zig 1883); "Shakespeare" (Stuttgart 1885); "Geschichte der deutschen Literatur von den ältesten Zeiten bis zur Gegenwart" (Leipzig; 2 vol., 1904). He compiled for Goedcke's "Grundriss" der Goethe and Schiller literature, later to be followed by his compilations on "Shakespeare" and "Chamisso" for the Cotta's "Bibliothek der Weltliteratur," and on: Von Arnim, Brentano, Eichendorff, Fouqué, Hoff-
mann, Schulze, Immernann and Lenau for Kürcher's "Deutsche National Literatur," etc. He founded "Zeitschrift für vergleichende Literaturgeschichte" (Berlin 1886, later Weimar).

KOCH, Robert, German bacteriologist: b. Klausthal, Hannover, 11 Dec. 1843; d. 28 May 1910. He received a medical education at Göttingen (1862–66), was assistant surgeon in the Hamburg general hospital, was in private practice at Langenhagen, Rakowitz and Woll-
stein, and in 1872 was appointed to the Imperial board of health. In 1882 he succeeded in isolating the tubercle bacillus in 1882 and became its privy councillor and became director of the cholera commission to India and Egypt. He discovered in 1884 the cholera spirillum, or comma bacillus, regarded as a positive test of the presence of Asiatic cholera. For this serv-
vice he received by legislative act a gift of 100,000 marks ($25,000). In 1885 he was ap-
pointed professor in the University of Berlin, director of the newly established Hygienic In-
stitute of Berlin, and also director of the Prus-
sonian board of health. One of his pupils pre-
maturely announced in 1890 the discovery of a substance called tuberculin, which, he asserted, would cause to cease the growth of the tubercle bacillus. Subsequent experiment failed in the judgment of scientists to confirm this claim. In 1905 he was awarded the Nobel prize in medicine. In 1906 the German government sent Koch to investigate the "sleeping sickness" in West Africa. He had previously studied blood infections in East Africa in 1903, had found the spirochete of African relapsing fever in the ticks through whose bite it is transmitted. In the tick he found also the piroplasma which causes "Texas fever," and proved that the tsetse
fly transmits the trypanosomatidae at the moment of biting. Among his writings are 'Ent- 
zungskrankheiten' (1878; Eng. trans., 1880); 'Über die Milzbrandimpfung: Eine Entge- 
gnung auf den von Pasteur in Genf gehaltenen Vortrag' (1882); 'Beitrag zur Aetologie der 
Tuberculose' (1882; 1886); 'Über die Cholera-
krankheit und medizinische Kunst' (1885); 'On Dis- 
section' (1886); 'Über bakteriologische Forschung' (1890); 'Ergebnisse der von 
deutschen Reich ausgesandten Malaria-Expedi- 
tionen' (1900); 'Aerzliche Beobachtungen in 
der Tropen' (1892); 'Diagnose, Treatment 
and Prophylaxis of Tropical Malaria' (1896). 
Consult Biggs, H. M., 'Robert Koch and his 
XXIV, New York 1901); Fischer, Bernhard 
'Robert Koch' (in Deutsche Rundschau, Vol. 
XXXVII, Berlin, 1910); Wyeth, A., 'Memo- 
rial Address' (New York 1911).

KoChanowski, kò'ka-nôf'skë, Jan, 
1584. He was educated at the High School 
Cracow; studied at Padua (1552), and traveled 
for some time in France. He was inspired by Ronsard to write poetry. 
Returning to his native country he was appointed 
secretary to King Sigismund Augustus. He was 
granted two benefices (1560 and 1566), but 
returned to live on his family estate, CZarnylas 
(1570), where he devoted his time to the 
Muses. In 1575 he resigned from the duties of 
his religious offices and was invited to reside 
at the court by the newly-crowned king, 
Stephan Bathyö, but refused the honor, as also 
that of the court of Kastoria, offered by Chan- 
celloz Zamojski. Next to Mickiewicz, he was 
the most important poet of Poland. His 'Treny' 
(Cracow 1580), elegies on the death of his 
dughter Ursula, are considered masterpieces 
as to poetic light and mastery of language. 
His drama 'Odprawa posłowy' ('The Despatching 
of the Greek Ambassadors') was written (1578) 
in honor of the marriage of 
Zamojski to Princess Bathory. Other well- 
known poems of his are 'Proporzecz aoło bo 
przuski' ('The Banner or Homage to Prus- 
zie'); his first study appeared in 1554; 'Fraski' 
('Fragmens') was published in 1584 and is in 
the gayest strain, re- 
minding of the 'Decameron.' His translations 
of the Psalms is considered to be the 
best in existence. He wrote also, in Latin, such 
works as 'Lycoricum libellus' (1580); 'Ele- 
giarum libri quatuor' (1584), and numerous 
poems composed for special occasions. The 
perfection of the Polish language is due to him; 
he greatly enriched Polish poetry by naturalizing 
foreign poetic forms which he understood 
how to imbue with national spirit. Collections of 
his works appeared from 1584 to 1641, but 
the last and best (Warsaw 1884) is in four 
volumes. Consult Przyborowski, 'Biography of 
KoChanowski' (Posen 1857), also Löwen- 
felt, 'Jan KoChanowski and seine lateinischen 
Dichtungen' (Posen 1878).

KoCher, kò'ger, Emil Theodor, Swiss 
surgeon: b. Berne, 1841; d. there, 1 Aug. 1917. 
He studied medicine in his native city and sur-
gery in Berlin, London and Paris. He re-

Kock, kòk, Charles Paul de, French 
novelist: b. Passy, France, 21 May 1794; d. 
Paris, 29 Aug. 1871. He was the son of a 
Dutch banker who was guillotined in 1794. At 
15 he was placed in a banking-house, but pres- 
ently took to writing, and his reputation was 
made by 'Les Vauriens' (1820); 'Gustave, 
or le mauvais Sujet' (1821); 'Mon Voisin Raymond' (1822). The last is re-
garded as the typical romance of its kind. 
His scenes are cast in the lower ranks of mid-
dle-class life. His narrative is a constant su-
cession of stirring incidents without a cata-
strophe. The incidents are always gay and 
lively, frequently somewhat gross, but scarcely 
to the extent of indecency. The worst feature 
of Paul de Kock's works is his style, which is 
barely presentable, and is doubtless due to 
deficiency of education. This accounts for his 
popularity being greater abroad than at home, 
as the defects of style disappear in translation. 
Besides his novels, which are very numerous, he 
Wrote several dramas, chiefly taken from them. 
Two complete English translations of his works 
have appeared in 1902 and 1903-04, respectively. 
Consult Trimm, 'La Vie de Charles Paul de 
Kock' (1873).

Kockly, kòk'li, Hermann, German 
philologist: b. Leipzig, 5 Aug. 1815; d. Trieste, 
13 Dec. 1870. He studied at the Saalfeld Progymnasium (1837) and at the 
Dresden Kreuzschule (1840). He fled to Brus-

Koch, kòk, Robert, Russian physi-
ologist: b. St. Petersburg, 18 Feb. 1828; d. 
St. Petersburg, 27 Feb. 1897. He was the 
son of a Russian general. He studied medicine 
and natural sciences at the University of St.
Petersburg and the University of Berlin. He 
worked under the famous Russian physiologist 
Tchaikovsky and the Swiss physiologist 
Heidenreich. His researches in physiology and 
physiology of the nervous system were highly 
esteemed, and he became a member of the 
Russian Academy of Sciences in 1875. His 
work on the physiology of the nervous system 
and the development of the human brain 
was highly regarded, and he made important 
contributions to the understanding of the 
functioning of the nervous system.

Koch, kòk, Robert von, German

KODAK—KOHLER

'Griechische Kriegsgeschichtsstell' (Leipzig 1853-55); 'Einleitung in Cäsars Kommentarien über den gallischen Krieg, mit folgobrat' (nur undatiert) (Leipzig 1856). Others of his works are editions of Arrian's 'Anabasis' (1861); 'Euripides' and 'Iphigenia in Taurien' (1863); 'Medea' (1867), and capital translations, especially of Caesar, Aeschylus, etc. He is found in his 'Opuscula academica' (Leipzig 1853-56); 'Akademische Vorträge und Reden' (Zürich 1856); 'Opuscula philologica' (Leipzig 1881-82). Consult Hug, 'Hermann Köckly' (Basle 1878); Böckel, 'Hermann Köckly, ein Bild seines Lebens und der seiner Persönlichkeit' (Heidelberg 1904).

KODAK. The Kodak camera is the invention of George Eastman, and the first model appeared in the year 1888. It is now manufactured in a number of sizes and styles, some making use of both cartridge roll film and dry plates. The original Kodak camera took round pictures 2½ inches in diameter, was of the fixed focus type and carried a roll of film sufficient for 100 exposures. Its invention practically marked the advent of amateur photography. At that time both apparatus and processes were too burdensome to permit of classification in the field of recreation. The roll film used in the first model of the Kodak camera had a paper base but was soon superseded by a film with a cellulose base, a practical, transparent, flexible film. The first films had to be loaded into the camera and unloaded in the dark room, but the film cartridge system with its protecting strip of non-acidic paper made it possible to load and unload the camera in ordinary light. The Kodak Developing Machine and it simplified successor, the Kodak Film Tank, provided the means for daylight development of film, so that now the dark room is not necessary for any of the operations of amateur photography. The earlier types of the Kodak cameras were of the box form and of fixed focus, and as various sizes were added, devices for focusing the lenses were incorporated. The first folding Kodak cameras were introduced early in the nineties; these were sold with Kodak brand of paper which permitted much greater compactness. The first pocket Kodak camera was introduced in 1895. It was of the box form type, slipping easily into an ordinary coat pocket, and producing negatives 1½ x 2 inches. The first folding pocket Kodak camera was introduced in 1897, and at the present time all the Kodak cameras are of the folding type, except one specially designed for taking panoramic pictures, which is of the box type. A recent invention, the Autororphic Feature, provides a means for recording data on the margin of the negative itself at the time of exposure. This feature is now supplied on all Kodak cameras with the exception of the one for making panoramic pictures. The Kodak system of photography for the amateur has been so perfected that to-day the amateur has a wide range in optical equipment and every essential for the producing of a finished photograph may readily be carried in any ordinary Gladstone bag with room to spare.

KODAMA, kō'da-ma, Gentaro, Viscount, Japanese general: b. Tokuyama, 5 Feb. 1852; d. Tokyo, 23 July 1906. He was early drawn into the conspiracy that destroyed the shogunate. He fought to restore the power of the Mikado in the north island of Shikoku, and took part in the suppression of the insurrection in Saga (1874), also in an expedition to the Ryukyu Islands (1876). In 1891 he undertook a journey to study European conditions and was appointed, on his return, Assistant Minister of War (1892). He is found in his his 'Opuscula academica' (Leipzig 1853-56); 'Akademische Vorträge und Reden' (Zürich 1856); 'Opuscula philologica' (Leipzig 1881-82). Consult Hug, 'Hermann Köckly' (Basle 1878); Böckel, 'Hermann Köckly, ein Bild seines Lebens und der seiner Persönlichkeit' (Heidelberg 1904).

KOHLER, kōl-ler, Robert, American artist: b. Hamburg, Germany, 28 Nov. 1850. He came with his parents to the United States in 1854; was educated at Milwaukee, Wis., and learned lithography which he practised in Pittsburgh, Pa., and New York. After studying drawing and engraving and designing dress and millinery, he went to Munich where he learned painting under Lieffitz and Defregger and chose genre and portraiture as his special field of activity. In 1893 he was appointed director of the Minneapolis School of Art, and director emeritus since 1914; president of the Minnesota State Art Commission from 1903 to 1910; member of the Artists' League of Minneapolis; honorary member of the Minnesota State Art Society; honorary member of the Alumni Association of the Minneapolis School of Art; member of the Society of Western Artists; member of Institute des Beaux Arts of the University of Paris, France. Author and lecturer on art subjects. Organized the American Department at the International Art Exhibitions at Munich in 1883 and 1888. Received bronze and silver medals at the Munich Academy, honorable mention at the Paris World's Fair, 1889, bronze medal at the International Art Exhibition at Buenos Aires in 1910, across of the Order of Saint Michael of Bavaria in 1888. Represented by paintings in the Pennsylvania Academy of the Fine Arts.
KOEL, one of a group of East Indian and Australian fruit-eating cucuous, of the genus *Eudymanis*, which are popularly known as "rain-birds." They are parasitic, but have many peculiarities, among which are the glossy black plumage of the males, and the fact that, contrary to the rule, the immature young resemble the males instead of the females, which have a reddish dress. A Philippine species (*E. mindanaensis*) is locally called "pbow." They utter loud whistling cries.

KORNISBERGER, Ks. Régis, Leo, German mathematician: b. Posen, 15 October 1837. He was educated at Posen and Berlin, and taught mathematics and physics at Berlin (1860–64). He was appointed assistant professor at Greifswald (1864–66) and professor (1866–69) and successively at Heidelberg (1869–75), Dresden (1875–77) and Vienna (1877–84), after which he was active at Heidelberg. He wrote the biographies of Hermann von Helmholz and C. G. J. Jacobi, besides many articles contributed to mathematical periodicals.

KOESTER, Ks. Régis, Frank, German-American engineer and author: b. Stermkraade, Germany, 28 August 1876. After 10 years of theoretical training and practical engineering and municipal experience in Germany, including four years of shop and field practice, he came to the United States in 1902. He was connected with the construction of the New York subway system and other large engineering undertakings in the United States, South America, Alaska and the Philippines. A considerable part of his practice has been devoted to the design and operation of electric generating stations. Recognizing the great field in modern city planning he made a special study of modern methods in this field, taking up the city planning courses at Charlestown College, Germany. He was a delegate to the City Planning Congress at Dusseldorf, Germany, in 1912, and to the International Congress of City Planning and City Maintenance held at Ghent, Belgium, in 1913, in both of which he made addresses. He has published "Steam Electric Power Plants" (New York and London 1908); "Hydro-electric Developments and Engineering" (ib. 1909); "The Price of Inefficiency" (New York 1913); "Electricity for the Farm and Home" (ib. 1913); "Modern City Planning and Municipal Hygiene" (ib. 1911); and "Secrets of German Progress" (New York 1915).

KORTEVELD, Ks. Régis, Cornelia Eliza van, Dutch theologian and novelist: b. Rotterdam, 24 May 1807; d. The Hague, 4 November 1893. He studied at Leyden, and was pastor at Westmaas. He was a member of the "Hollandse Gereformeerde Synod" (Hague, 1849) and was appointed preacher to the court (1878). He wrote numerous religious works, but is better known through his "Scherzen uit de Pastorie te Mastield," (Schoonhoven 1843; 13th ed. 1902), which is humorous, true to nature and has been translated into English and German. His novels, sketches, etc., have been collected and published in 10 volumes (Arnhem 1897–98). Consults Brink, Jan Ten (in "Geschiedenis der noord Nederlandse Leteren in de 19e Eeuw," Rotterdam 1904), and in "Levensberichten van de Maatschappij der Nederlandse Letteren" (1893–94).

KOFORD, Ks. Hoi, Charles Atwood, American zoologist: b. Granville, Ill., 11 October 1865. He was graduated at Oberlin College (1890), took the A.M. degree at Harvard University (1892) and Ph.D. (1894). He was appointed teacher at the Oberlin Academy (1888–90), teaching Fellow (1890–91) and instructor of vertebrate morphology at the University of Michigan (1894–95). From 1895–1900 he was superintendent at the biological station of the University of Illinois at Havana, Ill., and assistant professor of zoology at the Illinois University (1897–1900). He was appointed to various positions at the University of California, being acting head of the department of zoology 1905–06, and professor and head of the department from 1910. In 1905–06 he was acting director of the San Diego Biological Station. He was associate naturalist of the Agassiz expedition to the eastern tropical Pacific on the United States steamer "Albatross" (1904–05), and assistant director at Scripps Institute of Biological Research from 1912. He invented several plankton nets, a deep-sea water sampler, etc., and received the Saint Louis Exposition gold medal (1904). Many valuable contributions from his pen have been published in the numerous scientific periodicals of both America and Europe. He was associate editor of the *American Naturalist* from 1897–1908; zoological editor of the *Journal of Applied Microscopy* from 1900–04, etc.

KOFU, Ks. Hoi, Japan, the capital city of Kai province, on the island Nippon, north of Fujiyama. It has an old castle, teachers' seminary and large silk mills, and does considerable trade in silk, rock-crystal, fruit, wine and resin. The district is very fertile and produces a grade of grapes which make a fine wine. The population has grown very rapidly, being 37,561 in 1896 and over 50,000 in 1918.

KÖGEL, Ks. Hoi, Rolf, German theologian and court preacher: b. Birnbaum, province of Posen, 18 February 1829; d. Berlin, 2 July 1896. He studied theology and philosophy at Halle and Berlin (1847–52); was appointed teacher of religion at the Gymnasium of Gummersbach, Berlin, 1852–54; then pastor in Nakel (1854–57), and was preacher of the German-Evangelical community at The Hague (1857–63). He was appointed simultaneously to the positions of court preacher and member of the Consistory of the Margrave Brandenburg and counsellor to the Minister of Public Worship. In 1880 he was appointed chief preacher of the court and was chosen member of the Privy Council (1884). He used his influence at court against the free-thought church policy of Prince and Heilbronn. His sickness (1892–94) enforced retirement from his official functions. A collection
of his sermons was published under the title 'Wach auf, du Stadt Jerusalem' (Bremen 1890) and 'Die Segrepeugungen der Bergepredigt' (4th ed. 1895). Other prominent works are 'Der erste Brief Petri' (ib. 3d ed., 1890); 'Der Brief Pauli an die Römer' (ib. 4th ed., 1904); 'Vaterländische und kirchliche Gedenkteage' (ib. 1897). He published, in collaboration with his brother, the yearbook 'Neue Christoterpe' from the year 1880. Consult his son's biography, 'Rudolf Kögel, sein Werden und Wirken' (Berlin 1899–1903).

KOGIA, ko'ji-ä, the generic and ordinary name of the 4-pigmented sperm whales of the Pacific, which differ from the true sperm whales (q.v.) in anatomical particulars, and conspicuously in size, not exceeding about 15 feet in length. There are several species of these cetaceans which belong mainly to the New Zealand region, although one species visits the coast of California, but they are little known.

KOI-L-NUR, ko'i-oor', or KOHL-NOOR. See DIAMOND.

KOHL, köl, Johann Georg, German traveler and historian: b. Bremen, 28 April 1808; d. there, 28 Oct. 1878. Nearly his entire life was devoted to travel and historical investigation in Europe and in North America, where he spent four years and published as the fruits of his researches 'Travels in Canada' (1855); 'Travels in the Northwestern Parts of the United States' (1857); 'History of the Discovery of America' (1861); and several essays on American cartography. Other works are 'Travels in the Interior of Russia and Bolland' (1841); 'The British Isles and Their Inhabitants' (1844); 'The Rhine' (1851); 'The Danube' (1853).

KOHL-RABI, köl-rā'bi, a botanical variety of the same species as cabbage (q.v.), from which it differs in the swelled, turnip-like stem with a tuft of loose leaves on the top. This bulbous stem, which may be six inches in diameter, is used for human and stock feed, less in America than in Europe. Its quality and texture are less agreeable, except in very young plants, than are those of turnips and cabbage.

KOHLER, köl'ær, Josef, German jurist, author and poet: b. Öffenburg, 9 March 1849. He studied at Offenbourg and Rastatt gymnasiums and Freiburg and Heidelberg universities. He became doctor of laws (1873) and was appointed judge at Mannheim (1874). He obtained the degree of professor at Würzburg (1878) and Berlin (1888). Through his many connections to the 'Zeitschrift für vergleichende Rechtswissenschaft' and other law journals he aided much in advancing the comparative history of law. He wrote on this subject such important works as 'Moderne Rechtsfragen bei islamithischen Juristen' (Würzburg 1885); 'Das chinesische Strafrecht' (ib. 1886); 'Rechtsvergleichende Studien über islamithisches Recht, das Recht der Berber, das chinesische Recht und das Recht auf Ceylon' (Berlin 1889); 'Altdteutsches Prozessrecht' (Stuttgart 1891). On civil law he wrote 'Gesamtbuch der Völkerrecht' in Leipzig 1902; 'Beiträge zur germanischen Privatrechtsgeschichte' (Würzburg 1883–88); 'Deutsches Patentrecht' (Mannheim 1878); 'Handbuch des deutschen Patentrechts' (ib. 1900–01); 'Fortsetzung aus dem Patentrecht' (ib. 1888); 'Das Autorechte' (ib. 1890); 'Aus dem Patent- und Industrierecht' (Mannheim 1888); 'Das literarische und artistische Kunstwerk und sein Autorschutz' (Mannheim 1892); 'Das Recht des Markenschutzes' (Würzburg and Chicago 1885). Kummerrecht' (1898). He treated the philosophical side of law in such works as 'Shakespeare vor dem Forum der Jurisprudenz' (Würzburg 1883); 'Das Recht als Kulturwer sich' (ib. 1885); 'Das Wesen der Strafe' (ib. 1886). On the subject of the history of art he wrote 'Aus dem Lande der Kunst' (Würzburg 1882); 'Aesthetische Streifereien' (Mannheim 1889); 'Zur Charakteristik Richard Wagners' (ib. 1893). As poet he wrote 'Lyrische Gedichte und Balladen' (Berlin 1892); 'Feuermynoth und Apotheose des Menschengistes; nach Motiven der polynesischen Sage' (ib. 1893); 'Der Liebestod: nach motiven der mexikanischen Uberlieferung' (ib. 1893); 'Neue Dichtungen' (ib. 1895); 'Dantes Heilige Reise' (Cologne 1901–03); 'Ausz Petrarcas uemischgeschichten' (Berlin 1902–03). He, together with Viktor Ring, founded and published Archiv für bürgerliches Recht und Berliner juristischen Beiträge.

KOHLER, Kaufmann, American rabbi: b. Fürth, Bavaria, 10 May 1843. After completing studies at the University of Munich, Berlin and Leipzig, he was chosen as rabbi in Detroit in 1869, and two years later elected rabbi of Temple Sinai, Chicago, where he introduced Sunday lectures, a novelty in those days. In 1879 he was called to Temple Beth El, New York. At his initiative in 1883 a rabbinical conference was held at Pittsburgh, Pa., which formulated a platform for Reformed Judaism. In later years he frankly receded from the radical standpoint and assumed a more conservative position. In 1903 he was elected president of the Hebrew Union College. He has been a frequent contributor to the Jewish press, edited the Sabbath Visitor (1881–82), the Jewish Reformer (1886), was one of the editors of the Jewish Encyclopedia, and in addition to various volumes and critical papers has written 'Der Segen Jakobs' (1868); 'Guide to Instructions in Judaism' (1900); 'On Capital Punishment' (1869); 'On Song of Songs' (1877); 'Ethical Basis of Judaism' (1877); 'Backwards or Forwards—lectures on Reform Judaism' (1885); 'Church and Synagogue in their Mutual Relations' (1889); 'Systematische Theologie des Judenthums auf geschihtlicher Grundlage' (1909); 'Well of Living Waters' (1916).

KOHLER, Ulrich, German archaeologist: b. Klein-Neuhausen, grand duchy of Weimar, 6 Nov. 1838; d. Berlin, 24 Oct. 1903. He studied at Jena and was appointed secretary of the Prussian embassy at Athens (1865) and later was made professor of archaeology at Strassburg. He was governor of the newly-founded Archaeological Institute at Athens (1875) and was appointed professor of ancient history at Berlin (1886). His principal work is the second volume of 'Corpus inscriptionum atticarum' (Berlin 1877–95), which contains the inscriptions from the time of the Archon.
Euclides to Augustus. Important also is his: 'Urkunden und Untersuchungen zur GeschICHte des deutschn-attischen Bundes' (Berlin 1872).

KÖHLER, Walther Erich, German church historian: b. Elberfeld, 27 Dec. 1870. He studied at Halle, Heidelberg, Strassburg, Bonn and Tübingen. He became private teacher (dozent) of church history at Giessen (1900), and associate professor (1904) and was appointed professor of church history at Zürich (1909). He belongs to the critical school of theology. Among his works are: 'Die katholischen Kirchen des Morgenlandes' (Darmstadt 1896); 'Luther und die Kirchengeschichte' (Erlangen 1903); 'Reformation und Ketzerprozess' (Tübingen 1901); 'Dokumente zum Ablabstreit von 1537' (1902); 'Die Entstehung des Problems Staat und Kirche' (1903); 'Ein Wort zu Derflles Luther' (1904); 'Die Anfänge des Pietismus in Giessen 1859-75' (Giessen 1907); 'Kritische Ausgabe von Luthers fünfjahrzehnteniun Thesen mit Gegenthesisen' (Leipzig 1903); 'Der Gnos- tizismus' (1911); 'Ausgewählte Schriften des Erasmus von Rotterdam' (1914).

KOHLRAUSCH, kō-froush, Friedrich, German physicist: b. Künstel, 14 Oct. 1840; d. Marburg, 1910. He studied at Erlangen and Göttingen, and was teacher (docent) at the Frankfort Physikalischer Verein (1864). He became assistant professor (1870) and was appointed professor, successively, of the Polytechnikum, Zürich (1870); Darmstadt Polytechnikum, 1871; and at Wurzburg (1875) and Strassburg (1888). He was appointed president of the Physikalisch-technischen Aus- takt (Imperial Physical-technical Institute) of Berlin (1885), and honorary professor of the Berlin University (1889). In 1903 he retired to reside at Marburg. His work was chiefly in the realm of electrical currents, resistance, the constitution of galvanic currents, the definition of the Ohm and electro-chemical equivalents, thermo-electricity and conductivity of heat, total resistance of matter, and especially reaction of elasticity. He constructed numerous magnetic and electric measuring instruments, a bifilar-magnetometer, an intensity-variation meter, a voltmeter, a switch- rheostat, etc. His exposition of the most important methods of measurements in physics is ex- pounded in his 'Leitfaden der praktischen Physik' (Leipzig 1870; 10th ed., 1905), and 'Lehrbuch der praktischen Physik' (1910) which latter was a 10th revised edition. His work in the field of electrolysis has been termed 'schock-making.' He wrote also 'Über die Leitungswiderstand des Quecksilbers' (Munich 1888); 'Das Leitvermögen der Elektrolyte, bis besondere der Lösungen' (Leipzig 1890); 'Kleine Leitfaden der praktischen Physik.' His later elementary work based on his 'Leitfadens.'

KOHLRAUSCH, Rudolf Hermann Arndt, German physicist: b. Göttingen, 6 Nov. 1809; d. Erlangen, 9 March 1858. He was successively teacher of mathematics and physics at Lüneberg, Rinteln, Cassel, Marburg. He was appointed professor of physics of the University of Erlangen (1857). In collaboration with W. Weber, he carried out the first mechanical measurements of electrical currents, laying the ground for the absolute system of electrical measurement. Consult Weber, W., and Kohlrausch, R., 'Fünf Abhandlungen über absolute elektrische Stromung, Widerstand, Wärmegang' (in Paper No. 142 of Ostwald's 'Klassiker der exakten Wissenschaften,' Leipzig 1904).

KOHLSAAT, kol'sat, Herman Henry, American publisher: b. Albion, Ill., 22 March 1853. He was educated in the public schools of Galena and Chicago, Ill., and after acting as traveling salesman for several years for Chicago firms became in 1880 a junior partner in a wholesale bakery. He became the owner of the 'bakery lunch,' subsequently acquired a fortune in the bakery business and other enterprises. From 1891-93 he was part owner of the 'Inter-Ocean' of Chicago. From 1894-1901 he was editor and publisher of the Chicago Evening Post and the Times-Herald. The latter, in 1901, was amalgamated with the Chicago Record into the Record-Herald of which paper he was editor, 1910-12. In 1912 he bought the Inter-Ocean, then bankrupt, succeeded in seeing it through another publication in 1914 in which year he combined it with the Record-Herald, the new paper being known as the Chicago Herald. At the same time he retired from the publishing field. Consult Flower, E., 'H. H. Kohlsaats' (in Cosmopolitan Magazine, Vol. XXXV, p. 338, New York 1903); Wellman, W., 'Mr. Kohlsaat of Chicago and His Part in the Political History Making of 1896' (in Review of Reviews, Vol. XV, p. 41, New York 1897).

KOHN, kön, Salomon, German novelist: b. Prague, 8 March 1825; d. there, 6 Nov. 1904. He was the son of a Jewish merchant; studied at the local university (1844-46), then became partner in his father's business and was sole proprietor from 1863. But (since 1873) he devoted his entire time to literary work. His novel 'Gabriel' was first published anonymously in a collection of works entitled 'Spur im Purim' (Prague 1852), and had various translations, but, strangely, only obtained circulation in Germany in the English, the author's name being unknown and his right to the authorship not being proven till 20 years later. Of his other works, should be cited 'Spiegel der Gegenwart' (Jena 1875); 'Die silberne Hochzeit' (Leipzig 1882); 'Prager Ghettobilder' (ib. 1884); 'Neue Ghettobilder' (ib. 1886); 'Der Lebensretter und andere Erzählungen' (Berlin 1883); 'Beresengut' (ib. 1894); 'Ein deutscher Handelsmann' (Zürich 1896); 'Judith Lörich' (Strassburg 1897).

KOKO-NOR, kō-kō-nor', or KUKU- NOR, a lake in Tibet, not far from the Chinese province of Kan-su, 100° E. and 37° N. It lies 9,975 feet above the level of the sea. Its very salt waters, excessively hard, and covering 66 miles by 40. It is very rich in fish, in spite of the fact that its surface is frequently frozen for two to three months. It contains five islands, one with a Buddhist monastery. To the west it receives the waters of the Burang. In the south it is bordered by the southern part of the Kokonor Mountains (10,000 feet).

KOKOMO, Ind., city, county-seat of Howard County, on the Wildcat River, and on the
Toledo, Saint Louis and Western, the Pittsburgh, Cincinnati, Chicago and St. Louis, and the Lake Erie and Western railroads, about 55 miles south of Toledo. In 1844 by Daniel Foster, incorporated as a town in 1845 and chartered as a city in 1855. Koko- mo is located in a region of good farms, but it is a manufacturing and commercial city. The chief manufacturing establishments are plate, opalescent and table glass works, potteries, steel-mills, a fibre-bond mill, stone works, rubber works, automobile factories, bit works, pulp and paper-mills, bins, nails, tools, rods, electrical goods, trunks and mitten works. There are seven churches, a classical school, a high school, public and parochial schools, a hospital and a public library. The three banks have a combined capital of over $300,000. The government is vested in a mayor and 10 councilmen, elected for four years. Pop. 20,930.

KOLA, kō′lā, Russia, a county town in government of Archangel, on the Kola Peninsula, southernmost portion of the river Tuloma and Kola. It is near the district Alexandrovsk with its harbor and naval station, and its sparse inhabitants live mostly by fishing and hunting. As early as 1264 mention is made of this place, and it was fortified in the 16th century. In 1862 it was for the Kopchensee, which, in spite of its extreme northerly Arctic position, is an open harbor the year round, frequently.

KOLA-NUT. See COLA-NUT.

KOLA PENINSULA, Russia, situated between the White Sea and the Arctic Ocean, and consisting largely of mountain ranges with pine forests covering their bases interspersed with large lakes. The Arctic coast here, some 260 miles long, is known as the Murman Coast, and it has been known as being prominent before the eyes of the world by the landing of the Allied troops, including an American contingent. Its rocky coast has numerous sheltering bays, one of which, Kola Bay, forms the government naval harbor and station Alexandrovsk. The peninsula has an area of about 50,000 square miles.

KOLAR, kō′lár, Josef Jiri, Bohemian actor, dramatist and novelist: b. Prague, 2 Feb. 1812; d. 1890. He studied philosophy at Prague University, but soon devoted himself to the theatre and became (1839) a member of the Prague State Theatre, gaining fame in Shakespearean roles. He was appointed director of the Czech Theatre at Prague (1869), becoming later a novelist. Among his numerous plays are: 'Monika' (1847); 'Děkova smrti' (1852); 'Magelona' (1851); 'Pražský žid' (1872); 'Smrtičti' (1881); 'Primator' (1883), etc. He made excellent translations of the plays of Shakespeare, Goethe and Schiller.

KOLB, kölp, Georg Friedrich, German politician, statistician and publicist: b. Speyer, 14 Sept. 1808; d. Munich, 16 May 1884. He was elected member of the Bavarian Landtag (1849) and published the Neue Speyerer Zeitung, which was suppressed in 1853. He escaped persecution by living in Zürich, but again became member of the Bavarian Landtag (1862). It was settled by the union of Bavaria in the German Bund. His principal works are 'Handbuch der vergleichenden Statistik' (Zürich 1857; 6th ed., Leipzig 1879); 'Statistisches Handbuchlein der Völkerstands- und Staatenkunde' (Leipzig, 5th ed., 1873); 'Kulturgeschichte der Menschheit' (ib. 1869-70). Under the pseudonym 'Broch' he wrote 'Italien und jüdische politische Luge des übrigen Europas' (Zürich 1859), and 'Kaspar Hauser' (ib. 1859).

KOLBE, kōlb, Adolph Wilhelm Hermann, German chemist: b. Ellehausen, near Göttingen, 27 Sept. 1818; d. Leipzig, 27 Nov. 1884. He studied at Göttingen and became assistant to Bunsen (1842) in Marburg. He was assistant to Playfair at London (1845), but returned to Marburg (1847) in order to continue, with Frankland, work on the nitrates of organic acids by electric currents; on the production of acids with higher carbonic-acid from cyanogen combinations with the alcoholradicles, on the synthesis of cacodyl, etc. Based on the doctrine of the para radicals he attempted to advance chemistry on the radicle theory and remained antagonistic to the type and structural theory. He discovered the synthesis of corinn from phenol (1861) and invented a simple process of salicylic acid production from phenol and carbonic acid, learning the next year the antisepsic properties of this composition. He wrote 'Ausführliches Lehrbuch der organischen Chemie' (Brunswick 1855-64), which has had many revised editions; 'Kurzes Lehrbuch der inorganischen Chemie' (ib. 1883); 'Zur Entstehungsgeschichte der theoretischen Chemie' (Leipzig 1881). He edited the Journal für praktische Chemie from 1870. Consult Hofmann, 'Nekrolog auf H. Kolbe' in Berichte der deutschen chemischen gesellschaft (Berlin 1888).

KOLBERG. See COLBERG.
KOLN’S FARM—KOLIN

(1877) the periodical *Englishe Studien*. Consult his biography in *Englishe Studien* (Leipzig 1900).

**KOLN’S FARM, Engagement at.** After the action at Pine Mountain (q.v.), 15 June 1864, General Sherman closed in on the Confederate army defending Marietta and the railroad south to the Chattahoochee, and began the extension of his lines to the right. The Confederates made a corresponding move to the left, and occupied the left of the 21st Hood’s corps of two divisions, Hindman’s and Stevenson’s, moved from the right, near the railroad north of Marietta, to the Marietta and Powder Springs road, near Zion Church, about four miles southwest of Marietta and a mile east of Koln’s farm. Hood now occupied the extreme left of the Confederate line, and has been instructed by Gen. J. E. Johnston to endeavor to prevent any progress of Sherman’s right toward the railroad, the course of which was nearly parallel to the Confederate line and was strongly and effectively guarded by Hooker’s and Schofield’s corps. On the morning of the 22d Schofield had advanced one division, Hascall’s, on the road from Powder Springs Church to Marietta, with orders to take possession of Hooker’s right, near Koln’s house, Hooker, in going to the right and forward, reached to the Marietta road at Koln’s, and made connection with Hascall’s division. Williams’ division, massed by brigades, held Hooker’s right, Gentry’s division was on the left of Butterfield’s division was further to the left on the line of Howard’s Fourth corps. Williams and Hascall had very sharp skirmishing in getting into position, and from prisoners taken of Hood’s corps it was learned that Hood, supported by Hardee, was about to attack, upon which both Williams and Hascall were ordered to deploy their divisions, and they threw up breastworks, Hascall in heavy woods and Williams, for the greater part, on open, commanding ground, giving good positions for artillery. The engagement had not been completed and but few breastworks had been thrown up when, about 5 P.M., Hood made his attack. As he advanced from the woods which had sheltered him and concealed his line, his right was met by a terrific fire of shell, case-shot and canister that tore great gaps in the line and partially broke up his formation; but he pressed on and, coming under still closer canister fire and deadly volleys of musketry, was repulsed after a most desperate struggle of less than an hour. The attack fell upon the divisions of Williams and Hascall, Williams losing only 130 killed and wounded and Hascall a less number. Hood’s loss was 1,012 killed and wounded and about 100 missing. Consult ‘Official Records’ (Vol. XXXVIII); Cox, J. D., *Italians* (New York 1892); Johnson, E., *Narrative of Military Operations* (New York 1874).

**KOLCSEY, Kőfié, Ferencz, Hungarian poet and critic: b. Sződemeber, Transylvania, 8 Aug. 1790; d. Szathmár, 24 Aug. 1838. He studied at Debreczin and went to Pest as a royal officer of the law (1809), where he gave out, in 1821, the periodical *Elet és irodalom (Life and Literature)*, for which he contributed a large number of articles on philosophy, art, history and criticism. He was a member of the Hungarian Diet (1832-36) and the chief orator of the Liberal party. The Hungarian Academy elected him a member. His poem of the *Landtag, 1832-36* (Pest 1848) is interesting. He was the author of the Hungarian national hymn. His complete works were published by P. Szemes (2d ed., Pest 1863).**

**KOLDING, Kolding, Denmark, a town on the east coast of Jutland, situated on Kolding Fiord, a small bay of the Little Belt, and the junction of several railways. The town does a good shipping business as well as considerable trade in lumber, grain and other products. On the northwest side is the picturesque ruin of the burned (1808) royal castle Koldinghus, built in the 13th century for the residence of the Danish kings. In 1849 the Schleswig-Holstein army under Bonin defeated the Danes here, causing much damage to the town. An antiquarian and historical museum is here. The population, about 14,219. Consult Fühn, ‘Efterretnings om Kjöbstaden Kolding’ (Kolding 1848-60).**

**KOLHAPUR, Kshala-poor’, or KOLAPUR, India, capital of the state of the same name, is terminus of one of the Southern Mahatta Railway’s branches. It is 144 miles south by east of Poona and 188 miles south-southeast of Bombay, situated on the Panchganga River, which is crossed here by a bridge. Numerous fine modern buildings include the palace of the Rajah, government offices, city hall, treasury, etc. From its interesting Buddhist remains this must have been once a religious centre of importance, evidenced in temples, shrines, caves cut into the rock and decorated, etc. Pop. 48,122.**

**KOLHAPUR, or KOLAPUR, India, the principal state under the Bombay government, covering an area of 3,165 square miles. In the western division it is covered with its mountainous Ghats, but the eastern section has the fertile Deccan plain. The western Ghats furnish little else than lumber and are the strongholds of the feudatory Mahattas. The vegetable produce of the valleys and plains are rice, millet, cotton, tobacco, sugar-cane, etc. The overlords, or rajahs, claim descent from Sivaji the Great, the Mahatta Empire’s founder. Pop. 883,441.**

**KOLIN, Kőlén, Austria, this Bohemian city is in part termed Neukolin and is built on two islands produced by the river Elbe at this point and crossed by two iron bridges. It is reached by two railways, the Austro-Hungarian State Railroad and the Northwestern Railroad, and is the seat of government offices. It contains the 14th century Gothic Bartholomew church, an Evangelical church and a synagogue, an ancient palace and townhall, gymnasium, commercial and trade schools, two sugar and two machine factories, several chemical works, petroleum refinery, two breweries, etc. It does a large trade in vegetables and fruit grown in the vicinity. A noted battle was fought here 18 June 1757 between the Austrians under Daun and the Prussians under Frederick the Great, and the subsequent raising of the siege of Prague as well as the evacuation of Bohemia, together with a battle loss of 14,000 cases**
alties, 29 standards and 43 cannon, while the Austrians lost about 8,000. Pop. 17,900, mostly Czechs.

KOLLÁR, kol-Lahr, Jan, Czech poet and archeologist: b. Móssóczi, Hungary, 29 July 1793; d. Vienna, 21 Jan. 1852. He studied at the Pressburg Lyceum (1812–15) and then at Jena, becoming Slovak preacher (1819) to the newly-founded Evangelical Community in Pest. His first work was a collection of short poems, 'Basné' (Prague 1821), followed by 'Slavy Dcera,' the Daughter of Slava, (Pest 1832). The work was added to in further editions (Pest 1845; Vienna 1852; Prague 1862). In these celebrated poems he gives expression to his pain over the suppression of his race under German kultur. He next brought out a praiseworthy collection of Slovak folk-songs, 'Narodne zpivanky' (Pest 1834–35). Of his other works should be mentioned 'Rozpravy o jmenach, etc.' (ib. 1830) concerning the names and ancient monuments of the Slovak peoples. With the fight for the freedom of his language in Hungary the entire Slovak youth congregated around the noted poet, although he tried to repress the tendency to Panslavism. He was appointed professor of archaeology at the University of Vienna (1849). After his death appeared the archaological work 'Staroitalia slavjanska' (Vienna 1853; Prague 1863) concerning Slavonic Italy. A collection of his works, containing the poet's autobiography, was published (Prague 1862–63) and a second edition (1866), both are incomparable.

KÖLKER, köl-kher, Rudolph Albert von, Swiss anatomist and physiologist: b. Zürich, 6 July 1817; d. Würzburg, Bavaria, 13 Nov. 1905. He studied at Zürich, Bonn and Berlin and became an assistant of Henle (1842), and was admitted to the faculty of the university at Zürich (1843) as docent. He received the degree of professor of physiology and comparative anatomy (1845) but moved to Würzburg (1847) where he was appointed professor of physiology and comparative anatomy. He taught anatomy, microscopics and comparative anatomy (1866–1902) and was acknowledged the highest authority in microscopical anatomy from the time of the publication of his 'Handbuch der Gewebelehre' (1852; 6th ed., Leipzig 1889–96). Much honor is due him for his epoch-making researches in evolution and zoology, more especially respecting the molluscs and worms in which he was a pioneer. He wrote voluminously; his principal works include 'Über die Pacinischen Körperchen' (Zürich 1843), written in collaboration with Henle; 'Mikroskopische Anatomie oder Gewebelehre des Menschen' (Leipzig 1854); 'Entwicklungsgeschichte der Menschen und der höheren Tiere' (ib. 1861); 'Icones histologicae' (ib. 1863–65); 'Entwicklungsgeschichte der Cephalopoden' (Zürich 1844); 'Die Schwimmpolyphen von Messina' (Leipzig 1853); 'Die normale Resorption des Knochengewebes' (Leipzig 1873); 'Grundriiss der Entwicklungsgeschichte des Menschen und der höheren Tiere' (ib. 1880). He edited Zeitschrift für wissenschaftliche Zoologie from 1849 in collaboration with Siebold, and with Ernest Ehlers, later. An accomplished linguist, he was also a great traveler, well known in all leading European educational centres. Conquered 1867 'Erinnerungen aus meinem Leben' (Leipzig 1899).

KOLMAR, kohl-mar, Germany, city and capital of the district of Kolmar in the German Reichsland of Alsace-Lorraine, Upper Alsace, formerly in the French department of Haut Rhin, 40 miles south-southwest of Strasbourg. Its situation of 1673 and it is now surrounded by boulevards and entered by three gates. Here is the public library with 80,000 volumes and some pictures by Schön, Albert Dürer, etc.; and the museum, where, among other curiosities, a remarkable aerolite is preserved, which fell near Ensisheim in 1492 and originally weighed about 284 pounds. The portion here weighs about 142 pounds. Kolmar has manufactures of printed goods, calicoes, silks, etc., besides cotton-spinning mills, tanneries and chamois-leather works. It has a considerable trade in the manufactured goods of Alsace, and in iron, grain, wine, madder, etc.; and in colonial produce, with which it supplies Switzerland. It became one of the free imperial cities in 1226, and as such became a place of considerable importance; it was taken by the Swedes, who maintained possession for two years. It was united to France in 1697 by the Peace of Ryswick, and surrendered to Germany by the Treaty of Versailles, 26 Feb. 1871. In the French invasion of Alsace, which followed the Great European War in 1914, Kolmar was captured; but the city was soon reoccupied as a result of a German counterstroke. Pop. 43,808.

KOLO, koh-luh, Russia, a town in the Russian Polish government of Kalisz, situated on an island in the river Warthe. It has a Benedictine church, several factories and a population of 11,655 in 1910. In the World War this town was one of the bases of the Germans in their first drive at Warsaw and it was a passing point for troops in the following expeditions against Warsaw. The neighborhood contains a number of important brick kilns.

KOLKOTRONIS, kol-koh-trohn-iss, Theodoros, Greek general: b. Karytena, Arcadia, 15 April 1777; d. Athens, 15 May 1825. He took part in the siege of Triopolita, Nauplia and Corinth and invaded Iviadia (1821) as a leader of the Klephts against the Turks. In the next campaign he beat the Turks at Kleonnes and Phlius. He seized Nauplia and made himself governor (1823) and, by force of threats, was appointed commander-in-chief and, later, vice-president of executive council. Frighteningly against the government troops under Gura, he withdrew to Karytena and made himself state's prisoner (1825). The campaign losses of the Greeks caused him to entrust himself to an army-corps and he fought successfully against Ibrahim Pasha. Under Count d'Istria he acted as general in the Peloponnesus and was chosen a member of the provisional government commission on the death of the president, but sided with the Russians against the government. He turned against the regency, but was arrested (1834) and condemned to death for high treason, but the sentence was changed by King Otto to 10 years' imprisonment. On the king coming of age and ascending the throne

519
(1835), he was released and his rank of general restored, besides honors being bestowed on him. He lived thenceforth at Athens. Consult Edmond’s translation of "Kolokotronis the Klepht and the warrior, an autobiography" (London 1891); Bikelas, ‘Un héros de la Guerre de l’Indépendance’ (in ‘La Grèce byzantine et moderne,’ Paris 1893).

KOMORN, kômörn, Magyar KOMA-ROM, Hungary, a royal free town with municipal powers and a fortification on the left bank of the Donau River, capital of the county of the same name. It is 65 miles west-northwest of Budapest by rail, and has seven churches, three monasteries, an important grain a lumber industry, besides fisheries. Its institutions include also a Benedictine gymnasiun and officers’ pavilion, and a monument to the Hungarian general Klajka, who held the old fortress (built originally by Matthiaus Corvinus, in the 15th century) long after the suppression of the Hungarian revolution elsewhere, but capitulating to the Austrian army 27 Sept. 1849. This is the seat of a Reformed bishop, and it was here that the noted novelist Maurice Leclai was born. Its population in 1900 was 22,337. Consult Szilámy, ‘Komorn in Jahr 1849’ (Leipzig 1851); Szirnnei, ‘Komorn in the Year 1848-1849’ (Budapest 1887, in Hungarian).

KOMPET, kômpèrt, Leopold, Austrian novelist: b. Münchengrätz, Bohemia, 15 May 1822; d. Vienna, 23 Nov. 1886. He studied at the Prague University and was appointed tutor of the children of Count Andrassy at Pressburg. He continued his studies (1847) at Vienna University. The revolution of the year 1848 drew him into politico-journalistic activity and he became editor of Oestreichischen Lloyd. In 1857 he was expelled from Pest, but returned to Vienna (1857) where he devoted himself to literature. Of Jewish descent his stories treat of Jewish life and conditions; in them he combined a large measure of truthful poetic action and description with great originality. His principal works are ‘Geschichte aus dem Ghetto’ (Leipzig 1848; 3d ed., 1886); ‘Böhmische Juden’ (Vienna 1851); ‘Am Pflog’ (Berlin 1855); ‘Neue Geschichten aus dem Ghetto’ (Prague 1860); ‘Novellen’ (ib. 1860); ‘Geschichte einer Gasse’ (Berlin 1866). Of novels he wrote, among others, ‘Zwischen Ruhm’ (Berlin 1875); ‘Franzi und Hein’ (ib. 1880); ‘Verstreute Geschichten’ (ib. 1883). His collective works were published in eight volumes as ‘Gesammelte Schriften’ (Berlin 1882, and Leipzig 1887). Consult Allgemeine deutsche Biographie (Leipzig).

KOMURA, kōmō’ro, Jutaro, Marquis, Japanese statesman and diplomat: b. 1855; d. Hayama, 24 Nov. 1911. In 1875 he was one of the first group of students sent by the Japanese
government to the United States. He was graduated at Harvard in 1877 and returned home, where he served some years in the Department of Justice and that of Foreign Affairs. Appointed secretary of legation in Peking, he acted as chargé d'affaires during the negotiations that culminated in the Chino-Japanese War of 1894-95. He next served as civil administrator at Antung, then on a special mission to Korea, and subsequently as Vice-Minister of Foreign Affairs in Tokio. From this post he was launched on his ambassadorial career, being successively Minister to Washington, Saint Petersburg (Petrograd) and Peking, while he remained during the troubled period of the Boxer Rebellion. In 1901 he became Foreign Minister in the Katsura Cabinet; he conducted the negotiations preceding the Russo-Japanese War and also the peace negotiations at Portsmouth. While the results of that were disheartening to the Japanese people, it is generally regarded that Komura really achieved a diplomatic victory by the Treaty of Portsmouth, which brought Japan the peace she sorely needed as well as the prime objects of the war. As Foreign Minister Komura had formed the Anglo-Japanese Alliance in 1902; three years later he was sent to England—the first Japanese Ambassador to that country. He returned in 1908 to take again the Foreign Office in the second Katsura Cabinet. He remained at work until a few weeks before his death—of tuberculosis—and left a profound impression on Japan's foreign relations. The late King Edward bestowed two decorations upon him in 1905 and 1907. On the renewal of the Anglo-Japanese Alliance in July 1911, modifications were introduced into the treaty to permit its obligations from clashing with the provisions of the arbitration treaty then signed, but not ratified, between Great Britain and the United States, the two countries for which Komura entertained sincere admiration and personal regards.

KONDRATOWICZ, kónd'rá-tô'vich, Ludwik Vladislav, Polish poet: b. Jaskowice, Lithuania, 17 Sept. 1823; d. Vilna, 15 Sept. 1862. He is better known under his heraldic nom-de-plume, Vladislav Syrokomla. He lived and died in Zaluczyn, near Vilna, but always in the greatest poverty. His poetry was not given over to high flights, but was fired with enthusiasm and deep, honest feeling, expressed with unusual simplicity. Among his folk stories are 'Urodzony Jan Deborze' (1854); 'Janko Cmentarnik' (1856); 'Noceleg hetmański' (1857); 'Zgon Acerna' (1856); the latter dedicated to the poet Klownicz (q.v.), whose said life story mirrored his own. His dramatic attempts, such as 'Kasper Karlinski,' were not so successful. He wrote a history of Polish literature—'Dzieje literatury w Polsce' (2d ed., Warsaw 1875), and his metrical translations of the Polish-Latin poets are excellent. A collective edition of his poems was published (10 vols., Warsaw 1872). His biography was written by J. J. Kraszewski (ib. 1863).

Kongo, West Africa, an inland city of importance in the district of the same name belonging to the French Ivory Coast colony. Prosperous cotton goods factories exist here, but its native commerce is chiefly in gold, coco-nuts and salt. Its population is about 15,000, consisting chiefly of Mohammedans. One of the first Europeans to visit this section was the French consul, L. G. Binger, who in 1888 did much toward bringing the natives under French protection.

KONGO, kóng'gô, or CONGO, The, once an independent state in central Africa (1882); a Belgian colony, 1907. It is bounded northwest and north by French Kongo and Ubangi, east by the Basutoland states, south by the plate, partly the Kongo itself and its tributary, the Ubangi, on the east it is bounded by British East Africa, German East Africa, Lake Tanganyika and British Central Africa; on the south by the Portuguese and British territories. It reaches the Atlantic at the mouth of the Kongo by a narrow neck of land. The territory has an area of 913,127 square miles, and is divided into 22 administrative districts, each of the districts being under a commissioner. In 1913 there were 350 ports and stations. The estimated revenue for 1914 was £1,218,050 and the expenditures £2,077,440. The public debt in 1912 stood at £1,149,888. The northeastern portion of the state, forming fully one-third of the whole, is mostly under dense and almost impenetrable forest, but the rest of the country consists of arable land of considerable fertility. Among the cultivated plants are maize, millet, manioc, tobacco, coffee, sugar-cane, hemp, bananas, etc., and most of the fruits and vegetables of Europe have been found to thrive excellently. The wild animals include the elephant, hippopotamus, crocodile, buffalo, antelopes of various kinds, the chimpanzee, soko, etc. The imports consist mostly of woven goods, spirits, tobacco and firearms, and the exports comprise ivory, rubber, ground-nuts, palm-oil, gum-copal, wax, etc. The climate is very unhealthful to white men owing to the combination of great heat with a very moist atmosphere, but in a few of the more elevated spots it is much better. There are two rainy seasons, namely, October-December and February-May; the latter being much the wetter, and between these intervene the two dry seasons. There are not as yet many good roads in the state, but there are thousands of miles of navigable rivers. The Kongo is navigable from the sea up to Matadi, and again for 1,200 miles between Stanley Pool and Stanley Falls, but the portion between Matadi and the Pool is obstructed by cataracts. In 1913 there were 1,039 miles of railway. The Great Lakes Railway, completed in 1915, links up the Upper Kongo with the German railway from Dar-es-Salaam to Ujiji. The colony is also linked up, via Elisabethville, with the Cape-to-Cairo Railway. In 1912 the tonnage entered at the ports was 1,044,864 tons. The bulk of the inhabitants are of Bantu stock, but in the extreme north the proper negro type is found, and in some of the eastern parts of the state Arabs and other ethnic groups occur. Large numbers of the inhabitants are cannibals of the most pronounced type, and the vast majority are heathens.

After Stanley had proved the identity of the Lualaba with the Kongo, a Comité d'Études du Haut Kongo was formed under the auspices of Leopold II, king of the Belgians, and in 1879 this body commissioned Stanley to return to
the Kongo region with a view to preparing for the development of its resources. He established his first station at Vivi, and afterward founded others at Isangula, Manyanga, Leopoldville, Equatorville, Stanley Falls, and elsewhere, several of these being connected by good roads. In 1884 the African International Association replaced the committee, and in the following year it secured the foundation of the Kongo Free State and the recognition of its independence by the Congolese Ex- trade and navigation on the Kongo and all the rivers, lakes and canals connected with it were declared absolutely free, and the suppression of the slave-trade was provided for. Leopold II was made sovereign, and Brussels was named as the seat of the government. In 1889 Leopold bequeathed his sovereign rights to Belgium. In 1890 the territories of the state were declared inalienable, and in that year also the right was reserved to Belgium of annexing it after ten years. This convention expired on 3 June 1900, when Belgium, having declared her intention to abandon the project of annexation, allowing the option to expire, the reasons given being popular opposition and the attitude of Great Britain. Scandals connected with the administration, especially in regard to the treatment of the natives, aroused in 1904 and 1905 world-wide interest, commissions of inquiry were appointed and remedies introduced. Under treaty of 28 Nov. 1907 cession of the territories was made to Belgium. The central government, located at Brussels, comprises the king of the Belgians as sovereign, and a secretary of state, etc. At Boma there is a governor-general, under whom of course there are numerous officials. There is an army of native Africans, having an effective strength of about 13,000, commanded by European officers. Besides Boma, the capital, the chief stations are Banana, Matadi, Vivi, Isangula, Manyanga, Leopoldville, Msawata, Kwamouth, Bolobo, Lebolela, Equatorville, Bolombo, Stanley Falls, Nyangwe, Yambaya, Basiko, Benabendi, etc. Pop. estimated at 15,000,000; in 1912 there were 5,465 Europeans, including 3,307 Belgians.

**Kongo, or Congo River**, Africa, a large river in southwest Africa, flowing into the Atlantic Ocean in lat. 6° S.; long. 12° 40' E. Its estuary was discovered by the Portuguese, Diego Cam, in 1482; and the lower part of its course was first explored by Captain Tuckey in 1816. The upper part of the river remained unknown until Stanley, by descending from Nyangwe on the Luabalba to the mouth of the Kongo (1876-77), proved the two rivers to be identical. The Kongo is formed by the junction of the Luabalba and the Luapula in about the same latitude as the mouth. Of these the former issues from the south end of Lake Bangweolo, bends northward and flows into Lake Moero, on leaving which it pursues a northwesterly course. The chief inflowing river of Bangweolo is the Chambeshi, which enters the lake on the east after flowing southwest from the mountains of northeastern Rhodesia. The Luabalba rises by several headstreams in the south of Kongo Free State and flows southward through a series of lakes to its junction with the Luapula. The river thence flows north and slightly west to Nyangwe, receiving the Lukuga on the right from Lake Tanganyika, thus being connected immediately with the great lake system of central Africa. It then follows a northerly course for about four degrees, near the equator turns west to the northwest and home, to the northwest and home, several of these being connected by good roads. In 1884 the African International Association replaced the committee, and in the following year it secured the foundation of the Kongo Free State and the recognition of its independence by the Congolese Ex- trade and navigation on the Kongo and all the rivers, lakes and canals connected with it were declared absolutely free, and the suppression of the slave-trade was provided for. posed at the end of the summer in a damp place, as under a rotting log, which, provided with a capitellum, a gelatinous covering, and are protected by the female who coils her body about them and afterward takes care of the young. The embryos have well-developed external gills, but these disappear with growth, and even gill-crefts are greatly reduced in adults. This characteristic may explain the name, 'Batrachia of North America' (1889); Gadow, 'Amphibia and Reptiles' (New York 1901).

KÖNSBERG, köns-bärk, Norway, a mountain town in the county of Buskerud, on the river Laagen and the Hougansen-Kongsberg Railroad. It is the seat of the royal mint and has a silver mine, an arms factory and a monument of Christian IV, its founder. The silver mine was discovered in 1623 and its output averages about 180,000 ounces pure silver annually. Pop. 6,260.

KONIA, köni, or KONIEH, Turkey, the capital city of the Asia Minor vilayet of this name. It stands at an elevation of 3,300 feet and contains beautiful but ruined medieval palaces, mosques, madrassas (Moslem seminaries), etc. As the crossing point of important roads, it has remained the chief staple market for produce, has rug, glove and hosier factories, and from 44,000 to 52,000 population, mostly Mohammedan. It has numerous Mohammedan schools and two directed by French Catholics as well as one Greek school. Besides its tombs of saints, it possesses the first monument in the Middle East of a Karahane dervish. This is the starting point of the railroad extension toward Bagdad and is connected with Constantinople. Russian and French consular agents are stationed here. It is the ancient Ikonion (Iconium) of the Phrygian origin, and under the Diadochi (Parians) and Romans it was the capital of Lycaonia, and from 1073 became the splendid residential city of the Seljuk sultans of Rum, but fell under the Osmanli rule. The Persian poet Jelal ud Din Rumi (1207-73) lived at the Seljuk court here. The battle of Ikonion, 18 May 1190, was Frederick Barbarossa's last great fight. This city was captured later by Bajisde I (1392), by Mohammed II (1460), and by Ahmed, son of Bajisde II (1511). It was occupied by Ibrahim Pasha when he captured Reshid Pasha (1822) near here. Consult Huart, 'Konia, la Ville des Dervishes tourneurs' (Paris 1897).

KÖNIG, ké:nik, Friedrich, German printer and inventor: b. Eisleben, 17 April 1774; d. Oberzell, 17 Jan. 1833. He learned the art of printing at Leipzig (1790-94), and was active (1803-05) in improving the printing press at Meiningen and Suhl. Lacking the means to carry out his experiments, he appealed, unsuccessfully, to the Saxon and Austrian governments, then traveled to Saint Petersburg (1806) to be received and disappointed. He then went to London and made an agreement with the printer Bensley (1809) to carry out his plans for a book-printing machine. They obtained a patent for a flat-press (1810), but the flat-plate principle was soon discarded for the cylinder principle, and the patents allowed (1811, 1813, 1814). He returned to Germany (1817) and formed a company (König and Bauer) at Oberzell and established a steam-press factory. In partnership with Cotta, of Stuttgart, they built a factory for machine-made paper at Schwarzhach, near Würzburg (1828). In combination with the inventor's sons they established a paper and color-printing factory, greatly extending its work with color-printing machinery, etc. (1886). Consult Goebel, 'Friedrich König und die Erfindung der Schnellpresse' (Stuttgart 1883).

KÖNIG, Friedrich Eduard, Semitic scholar: b. Reichenbach, Saxony, 15 Nov. 1846. He studied theology and Arabic at the faculty of Leipzig University (1879), became professor of theology at Rostock (1888) and Bonn (1900). He wrote 'Historisch-Kritisches Lehrgebäude der hebräischen Sprache' (Leipzig 1881-97); 'Der Offenbarungsgriff des Alten Testaments' (ib. 1882); 'Die Hauptsprüche der altisraelitischen Religionsgeschichte gegenüber den Entwicklungsstheoretikern beleuchtet' (ib. 1884); 'Die glaubensakt des Christen nach Begriff und Fundament untersucht' (ib. 1891); 'Einleitung in das Alte Testament' (Bonn 1893); 'The Exiles' Book of Consolation' (Edinburgh 1899); 'Neueste Prinzipien der alttestamentlichen Kritik' (Berlin 1902); 'Bibel und Babel' (ib. 1903); 'Die Babel, Bibelfrage und die wissenschaftliche Methode' (ib. 1904); 'Im Kampf um das Alte Testament' (ib. 1903); 'Geschichte der alttestamentlichen Religion' (1912).

KÖNIG, Heinrich Joseph, German author and politician: b. Fulda, 19 March 1790; d. Wiesbaden, 23 Sept. 1869. He studied in the Fulda Gymnasium and Lyceum, and was given an official position in the city government at Frankfort. He was appointed secretary of finance at Fulda (1817), and was sent officially to Hanau (1819) and sent back to Fulda (1840). His treatises 'Rosenkranz eines Katholiken' (Frankfort 1829) brought him into conflict with the clergy which caused him to more clearly express his religious views in 'Der Christbaum des Lebens' (ib. 1831). He was, in consequence, excommunicated by the bishop and joined the reform community. He wrote 'Liebvacht und Verfassungswacht, oder die Bedeutung der Bürgergarde' (Hanau 1831) in his fight for political freedom. As member of the Landtag (1832-33) he was in direct opposition to the Ministry of Hassenpflug and was forbidden to act as representative in the next Landtag. He retired to Hanau (1847) and then Wiesbaden (1860). His tragedy 'Die Bussfahrt' (Leipzig 1836) stands prominent as a dramatic work, but he wrote, for the most part, historical romances and short, sketchy stories. Of such works we might mention 'Die heile Braut' (Leipzig 1833); 'Die Waldenser' (ib. 1836); 'Williams Dichten und Trachten' (ib. 1839); 'William Shakespeare' (ib. 1850); 'Veronika' (ib. 1854); 'Täuschungen' (Wiesbaden 1858); 'Die Klubisten in Mainz' (Leipzig 1859); 'König Jérômes Karneval' (ib. 1855); 'Deutsche Familien' (Wiesbaden 1862). Autobiographical works are 'Auch eine Jugend' (Leipzig 1852); 'Ein Still-leben' (ib. 1861) and several descriptions of his travels. His chief romances have been published collectively in 20 volumes (Leipzig 1854-69).

KÖNIG, Otto, German sculptor: b. Meissen, 28 Jan. 1838. He studied art at the Dresden Academy and under Hähnel, and later resided at Vienna, where he was appointed (1868)
professor of the Arts and Crafts School of the Austrian Museum. His small groups are inspirations of graceful form and finish. Among his large works are the sepulchral monument of his wife and three children (1874), a "Mourning Sculpture," a "Moorsman," the Emperor Maximilian of Mexico erected by the marine officers at Pola; a life-size marble group in the Imperial Museum of Art, Vienna; a marble crucifix in the mausoleum of Archduke Sigmund, in the Imperial Hofburg, and a bronze executed for Queen Olga in Stuttgart, and a bronze statue of Emperor Franz Joseph in Waidhofen.

KÖNIG-GRATZ, kön·ig-grätz, Austria, city in Bohemia, situated in a great fertile region at the confluence of the river Adler and the Elbe and connected with the surrounding country by three lines of railroads. It is theiscopal see of Bohemia and among its institutions are an oberrgymnasium, oberrrealschule, teachers' college, trade academy, industrial school, theological-dioecesan teachers' institute, boy's seminary, museum and deaf-mute institute. It has manufactures of musical instruments, pianos and organs, roofing-paper, soap, a brewery, a branch of the Austro-Hungarian Bank and a savings bank. Its Gothic cathedral dates from the 14th century. The town was fortified till 1884. King Przemysł Ottokar I raised the status of the location to a town and it became the residence (1363) and a dower town of Queen Elizabeth with its name changed from Harde (Grätz) to the present one. The city suffered during the Hassite War and the Thirty Year War. The name of this city is especially noted for the bloody battle, fought in its proximity (1866), which decided the Prusso-Austrian War, and which is more generally known to the French and English as the battle of Sadowa. In this engagement the losses of the victorious Prussian army amounted to 360 officers and 8,812 men, dead and wounded, while the Austrian casualties were 373 officers and 12,695 men dead, with 738 officers and 16,127 men wounded, not mentioning the Saxon casualties. Pop. 11,000.

KÖNIGIN LUISE, a small Hamburg-American converted liner, was the first vessel lost in the European War. She was laying mines off the estuary of the Thames on 5 Aug. 1914, and was sunk by a British destroyer. Of 130 in the crew about 50 were saved.

KÖNIGSBERG, kön·igs-bérg, Prussia, a seaport town, capital of the province of East Prussia and of the government of the same name, on the Pregel, about 4½ miles above where it enters the northeast extremity of the Frische Haff. It was once the Prussian capital, and the residence of the electors of Brandenburg, and still is a residence of the sovereigns and the place of coronation. It is surrounded by ramparts and detached forts. The larger part of the town is on the north bank of the Pregel, on hilly ground, a feature being an ornamental sheet of water with richly wooded banks, called the Schloss-Teich (Castle Pond). The old part is divided into three parts — Altstadt, or Old Town, on the west, Löbenicht on the east, and Kneiphof, on an island of the Pregel. The town, provided with electric street railroads, has on the whole a modern appearance. The principal public buildings are the cathedral, begun in 1333, an interesting Gothic structure, situated in the Altstadt; the Haberberg Kirche, a conspicuous church in the southern portion of the city; the Schloss, or palace, a large building, containing apartments for the royal family, once the residence of the grandmasters of the Teutonic Order; the Schlosskirche, occupying a wing of the palace, in which Frederick I in 1701 and William I in 1861 placed the crown on their own heads as kings of Prussia; the old citadel of Fredericksburg; the handsome exchange, of recent erection; the university, founded in 1554 by the Margrave Albert, and hence called the Albertine, attended (1914) by 1,700 students, accommodated in handsome new buildings in the Renaissance style, and having connected with it a library of 320,000 volumes, a zoological museum, etc.; an observatory which the labors of Bessel have rendered famous, a botanical garden, a conservatory of music, museums and an ecclesiastical seminary. The town contains other valuable libraries in addition to that of the university. The manufactures include locomotives, machinery and iron castings, woollen cloth, yarn and thread, leather, sail-cloth, copper, steel and ironware, chemicals, tobacco and cigars, flour, cement, articles made of amber, earthen and stone ware, liqueurs and wines, and German and Russian wines. There are also breweries and distilleries, and some ship-building. The Königsberg Ship Canal, 29 miles in length, and terminating on the Bay of Danzig, was opened in 1901. The principal exports are grain, flax, hemp, oil-cake, bones, timber, etc. Königsberg is the seat of important provincial courts and public offices. Waterworks, gas and electricity are municipally owned. It was founded in 1255. In 1565 it became a member of the Hanseatic League; was the residence of the grandmaster of Teutonic Knights from 1457-1528; in 1620 was surrounded with walls; in 1657 it received a strong additional defense in the citadel of Fredericksburg, though the object of the margrave who built it is said not to have been so much to defend the town as to overawe its citizens. It suffered much during the Seven Years' War and from the French in 1807. The town suffered invasion and bombardment at the hands of the Russians in 1914, but speedy relief was given by the German counter-offensive. Pop. is predominantly Protestant, 245,994. See WAR, EUROPEAN.
KÖNIGSHOF, kén'igz-hôn, Bohemia, city on the Elbe. Its Czech name is Dvůr Králové. It has a department staff, Circuit Court, dispensary, hospice of the Holy Cross. It also has a gymnasium, textile school, manufactories of cotton goods, bleach, printing-presses, besides flax and jute mills, tanneries, four breweries, etc. It was here that Wenceslas Hanka hoaxed (1817) so many antiquarians with his alleged discovery of the oldest Czech manuscript in the ancient church tower. Pop. 11,065, mostly Czechs.

KÖNIGSCHUTTE, kén'igz-hût'-e, Prussia, a town in the province of Silesia, central point of the coal and iron district and junction of several railways and electric car lines running to the nearby towns of Gleiwitz, Beuthen, Kattowitz, Bismarckhütte, etc. It has two Evangelical and three Roman Catholic churches, a synagogue, gymnasium, seminary for women trade-school teachers, theatre, offices of mine officials, etc. Its chief industry is its great smelting works with allied ammonia, tar and benzine factories, with iron and steel foundries, puddling and rolling mills. It has a considerable manufacturing industry in bricks, glass, bridge metal and wheels. Pop. 72,640. Consult Mohr, ‘Geschichte der Stadt Königshütte’ (Königshütte 1890).

KÖNIGSKINDER, kén'igz-kîn'der (Ger., "Children of the King," or, more correctly, "Kings' Children"), a fairy opera in three acts by Engelbert Humperdinck, story by Mrs. Elsa Bernstein, first produced in New York, Metropolitan Opera House, 28 Dec. 1910. An old witch dwelling in the hills above the town of Hellabrunn had thrown a spell over a king's daughter and held her to watch a flock of geese. A ragged youth, the son of another king, encounters the goose girl in the wilds and falls in love with her, but the spell does not permit her to leave the forest. Three ambassadors from Hellabrunn, respectively disguised as a woodcutter, a broommaker and a fiddler, arrive to seek the missing prince, who had meanwhile gone to the city and accepted employment as a swineherd. The witch tells the ambassadors that the first person to enter the city gates shall be their future king. The multitude are gathered to receive their king when the ragged youth enters, accompanied by the goose girl, who had been delivered from the witch's power. The mob drive the two arrivals away with scorn. The outcasts return to the hut and are poisoned with some pastry left by the witch. A band of children sent out to find the couple discover their dead bodies lying side by side in the snow.

KÖNIGSMARK, kén'igz-mârk, Hans Christopher, Count von, Swedish nobleman: b. Stade, 14 March 1665; d. 1694 (?). He started his travels early in life and became acquainted with the Crown-Prince August of Saxony and lived as a Saxon colonel, for a time in Dresden. He fought under BIELKE in Hungary against the Turks (1685-86) and then went into the service of the Elector of Hanover. On the discovery that he was a secret lover of the Princess Sophia Dorothea, wife of the Crown-Prince (later George of England) he fled, 1 July 1694, and was probably assassinated by HANOVER. The 'Briefwechsel des Grafen Königsmark und der Prinzessin Sophia Dorothea von Celle,' published by Palmbald (Leipzig 1847) is said to have been forged by the Hanoverian court. Consult Havemann, 'Geschichte der Lande Braunschweig und Lüneburg' (Göttingen 1857); Wielken, W. H., 'The Love of an uncrowned Queen' (London 1900; Stockholm 1903); Bühlau, F., 'Geheime Geschichten und räthselhafte Menschen,' in special edition Reclain's Universal-Bibliothek, 1901, Vol. XII.

KÖNIGSTIN, kén'igz-stîn, Germany, a town in Saxony, 25 miles from Dresden by rail, situated at the confluence of the Biela and Elbe rivers. It has an Evangelical and a Catholic church, a monument to the composer Jolus Otto, saw mills, iron foundry, manufactures of cellulose, machinery, metal buttons, etc. A very noteworthy feature of the town is its great fortress lying to the northwest and serving chiefly for the storage of the archives, treasury-gold and other valuables, as well as for a prison for the military. Pop. about 5,000.

KONINCK, kó'nînk, David de, Dutch painter of still life: b. Antwerp, 1630; d. Antwerp, 1699. He was a pupil of Peter Boel at Antwerp and was made master in the Saint Luke's Guild. He painted animals, alive and dead, fruits, flowers and other still life after the style of Jan Fyt. Having traveled through Germany and France he went to Rome (1670), returning to Antwerp, 1675, to Antwerp. He took up his residence at Brussels in 1699. His pictures are rare; the Royal Museum, Vienna, has one of his still life (dead ducks) work.

KONINCK, or CONINGH, Philips, Dutch landscape painter: b. Amsterdam, 5 Nov. 1619; d. there, October 1668. He studied and perfected himself in landscape painting under Rembrandt, and favored the depiction of flat lands which distinguish themselves by the vastness of the view. His pictures are rare, a few being in the Royal Museum, Amsterdam, the Boyins Museum, Rotterdam, the Berlin Museum and in Frankfurt. The New York Metropolitan Museum of Art owns several.

KONING, or CONINGH, Salomon, Dutch painter: b. Amsterdam, 1609; d. there,
KONOTOP — KONTI

August 1656. He was a pupil of David Colyns, François Venant and Nicolaus Moeljaert, and became (1630) member of the guild of master painters. He kept in close touch with Rembrandt; in whose style he painted portraits, historical paintings and genre pictures. His work is to be seen in the galleries of Berlin ('Call of Matthew as an Apostle'); Dresden ('Hermit' and 'Astronomer'); Schwerin ('Joseph as Interpreter of Dreams'); also in Brunswick, etc.

KONOTOP, kɔnɔˈtɔp, Russia, a district town in the government of Tcherkisno, situated on the left bank of the Jesutich River and the junction of two railways. It has five churches and a technical school. The district is especially fertile and produces grain far beyond its own needs, and does profitable bee-keeping. Pop. 28,100.

KONRAD VON HOCHESTADEN, kɔnˈrɔd fon hɔkɛʃtɛn, German prelate and statesman; d. 28 Sept. 1261. He became archbishop of Cologne (1238) and was in constant feud with his neighbors, especially with the Duke of Brabant and Counts of Limburg and von Jülich. He joined the archbishop of Mainz against the Emperor Frederick II and was defeated, badly wounded and made prisoner (1242) by Count von Jülich near Lechenich. Obtaining his freedom he renewed the conflict and crowned William of Holland at Aix-la-Chapelle as Emperor (1248), upon whose death he crowned Richard of Cornwall as successor (1257). The erection of Cologne Cathedral was commenced (1248) by him. Consult Cardauns, 'Konrad von Hochstaden, Erzbischof von Köln' (Cologne 1880).

KONRAD VON MARBURG, mɔrˈbʊrk, German Roman Catholic inquisitor; d. near Marburg, 30 July 1233. He belonged to the Dominican Order, and was appointed by Pope Gregory IX inquisitor of the monasteries of Germany. His fanatical and limitless persecution of heretics carried out indiscriminately along the Rhine, Thuringen and Hesse (1232) brought him into contests with the nobility and he was besieged before an Imperial Convention at Mainz and was released with censure. On his return journey he was assassinated near Marburg (1233). He was canonized as martyr by the Pope. Consult Henke, 'Konrad von Marburg' (Marburg 1861); Beck, 'Konrad von Marburg' (Breslau 1871); Hausrath, 'Konrad von Marburg' (in Kleinen Schriften, Leipzig 1883); Kaltner, 'Konrad von Marburg in die Inquisition in Deutschland' (Prague 1882).

KONRAD VON MEGENBERG, mʌˈdʒenˌbɜrk, German author and naturalist; b. Bavaria; d. Regensburg, 1744. He translated among other numerous Latin works the book of John Holywood into German under the title of 'Sphaira, the first handbook on physics in Germany; it was printed in several editions by 1539. His 'Buch der Natur' was begun in 1530 and completed in 1540. Thomas of Cantimpère, and a general and fairly systematic natural history; it is interesting as evidence of the knowledge of that day. The work was written between the years 1349-51 and was completed by Thomas of Cantimpère, and a general and fairly systematic natural history; it is interesting as evidence of the knowledge of that day. The work was written between the years 1349-51 and was published in Augsburg (1475). It has been published by Pfeiffer (Stuttgart 1861) and translated into modern High German by H. Schulz (Greifswald 1897).

KONRAD DER PFÄFFE (the priest), German medieval poet. He lived in the first half of the 12th century, belonged to the priesthood and was in the service of Heinrich the Proud. He composed the 'Call of Apostles' (about 1135), a version of the French 'Chanson de Roland.' It was published by W. Grimm (Göttingen 1838) with preface on the history of the legend; also by Bartsch (Leipzig 1874). The 'Kaiserchronik' (1150) is said also to have been emanated from his pen. Consult Walz, W. 'Ueber Konrad der Pfeiff, dem Dichter des deutschen Rolandliedes' (Halle 1879); Goltner, 'Das Rolandlied des Pfeffen Konrad' (Munich 1897).

KONRAD VON WÜRZBURG, vʊrˈʦɪrˌbʊrk, Middle High German epic and lyric poet; b. possibly at Würzburg about 1220; d. Basle, 31 Aug. 1287. For his time he had developed, through the study of the poems of Hartmann von Aue (q.v.) and Gottfried of Strassburg (q.v.), an extreme perfection of verse and style, and delighted in the use of rhyme, which contribute much to the beauty of his short poems, narratives and legends. His longer romances seem never to achieve the same degree of artistic unity as his shorter works. His earliest poems were the 'Nantes Tournament' and the 'Legend of Saint Nicholas' (which Bartsch published together with Konrad's later and longest work, 'Partenopier and Melior,' Vienna 1870). After settling at Strassburg, where most of his literary life was spent, he wrote both at the Bishop's stories 'Otto mit dem Bart,' 'Der Schwanntetter,' 'Das Herzmarie,' the allegorical scene, 'Der Welt Lohn' (reprinted in Müller's 'German Classics,' New York 1900), and his best tale, 'Engelbert und Engelmart' (published by Haupt, 1844, by Joseph, 1885). His huge epic 'Partenopier and Melior' was written in 1277, after the French poem of Denis Piramus, of which Konrad had a translation made for his own use, and was followed by the incomplete 'Trojan War,' for which Konrad used as sources not only B vaping de Saint, but also Statius and Ovid. Consult translations into Modern German in Reckem's 'Universal-bibliothek'; Janson, 'Studien über Konrad von Würzburg' (Marburg 1902); Rösler, Marg, 'Die Passungen der Alexiuslegenden' (Wien 1905).

JACOB WITTMER HARTMANN.

KONTI, kɔnti, Isidore, American sculptor; b. Vienna, Austria, 9 July 1862. He studied at the Imperial Academy, winning later a scholarship at the Meisterschule of Professor Kundmann (1880) affording him two years' study at Rome. In 1890 he came to America, worked on the Chicago Exposition buildings and has since created in New York numerous monumental works, such as 'West Indies' and 'East and North River' for the Dewey Arch; groups decorating the Temple of Music and 'The Despot's Age' for the American Exposition esplanade (1901) and numerous other decorative groups for expositions; a group 'Progress' for the Manufacturers' building and two grand cascade fountains, 'Atlantic and Pacific' for the Saint Louis Exposition (1904) caused much favorable comment. Among his other numer-
ous creations are the McKinley Memorial, Philadelphia; a monument to Kit Carson and Lieutenant Beal at the National Museum, Washington; statues of Justinian and Alfred the Great at the Cleveland, Ohio, courthouse. He is a member of the council of the National Sculpture Society, of the Architectural League, New York Municipal Art Society, etc. His work is considered by contemporary experts as full of charm and refinement.

KOODOO, one of the largest species of antelope (Sirepsisceros kudu), originally found throughout the entire southern and eastern parts of Africa but now nearly extinct in Cape Colony. The males bear great, rough, twisted horns nearly four feet long, and wound in a wide, open spiral of about two turns; the females are hornless. Both sexes have short hoofs, a fringe of rough hair along the middle of the back and a similar one on the throat; and are marked with narrow vertical stripes on the flanks, a spinal band and a chevron on the face all of white. The koodoo lives in pairs or small parties in thick forests, especially on the rough hilly districts of Nyasaland. In many districts it has been decimated by the hide-hunters. A smaller species (S. imberbis) inhabits the low bushy countries of Somaliland and the Kilima Njaro region.

KOOKAS, koo'kaz, or KUKAS, a sect of fanatical Hindus in the Punjab, which originated after the annexation of that territory to British India (1849), in consequence of jealousy of the equal political rights granted to the Mohammedans of that region under British rule. They are a body of reformers of extreme views, and are hence regarded with as much hostility by the Sikhs as they are by the Mohammedans, whose rights they are anxious to invade. The chief right conceded to the Mohammedans by the British government of India, and objected to by the Kookas, is that of killing cows, which are regarded as sacred animals in the Sikh religion; and it was mainly this practice that led to the consolidation of the most violent and fanatical adherents of the Sikh religion into a distinct sect. Their number has been variously estimated at from 50,000 to 800,000. In 1871 they were incited to attack and massacre the Mohammedan butchers who killed cows in different parts of the Punjab, but they were quickly suppressed by the British government.

KOOSOO, or KOSIN, a bitter drug prepared from the dried flowers of an Abyssinian plant (Brayera anhelminica), which contains muscarine, and is used as a vermifuge.

KOOTENAY (koo'te-nä) RIVER, a tributary of the Columbia, rising in British Columbia. It is 400 miles long. After flowing south into Montana and Idaho it again enters British Columbium. It was discovered by David Thompson in 1808.

KOPISCH, kōpǐsh, August, German poet and painter: b. Breslau, 26 May 1799; d. Berlin, 3 Feb. 1853. He studied art in the Prague Academy (1815) and in Vienna. From 1850 to 1822 he continued painting, when an injury to his hand disabled him, and he started on travels through Italy, and in Rome and Naples applied himself to the study of local poetry and archaology. It was he who discovered the famous "Blue Grotto" or "Grotta delle Nymphae" on the island of Capri. He returned to Germany in 1828 and received the title of professor in Berlin. He removed to Potsdam in 1847 and occupied himself in writing an account of the royal castles there and in the neighborhood. Most of his pictures are mere sketches. His witty poems, clever stories and translations, including one of Dante, are all included in his "Gesammelte Werke" (1856).

KOPITAR, kōpǐ-tär, Bartholomaeus or Jernej, Austrian philologist: b. Carniola, Austrian Hungary, 1780; d. 1844. He was educated at the German gymnasia of Laibach, and immediately after his graduation became curator of the imperial library. In 1814 he set out on his travels through Europe, his tour embracing Germany, England, Italy and France, to which last country he went with the special mission of recovering the Slavic manuscripts carried off by the French in 1813. His contribution to philological science consists in pioneer work in Slavic grammar. His principal works are "Grammatik der slawischen Sprache in Krain, Kärnten, und Steiermark" (1806); "Giagolita Glazianus" (1836), and "Hesychii Glossographi Discipulus Russus" (1839).

KOPP, kōp, Georg, German cardinal and statesman: b. Duderstadt, 27 July 1837; d. 1914. He was the son of a poor weaver and attended the gymnasia at Hildesheim. In 1850 he became a telegraph operator in the employ of the Hanoverian government. From 1858 to 1861 he studied theology and in 1862 entered the priesthood. He rose rapidly in his profession and in 1872 was made vicar-general at Hildesheim and three years later bishop of Fulda. His reasonable ultramontanism was exercised in bringing about a better understanding between the German government and the papal curia. After his election to the House of Lords he obtained a mitigation of the harsh anti-Catholic provisions which characterized the May laws. In 1887, with the approval of the Prussian government, the Pope appointed him prince-bishop of Breslau, and in 1893 he was made cardinal.

KOPP, Joseph Eutychius, Swiss antiquarian: b. Beromünster, canton of Lucerne, 25 April 1793; d. Lucerne, 25 Oct. 1866. He studied theology and philology in Lucerne and Freiburg, and in 1819 was appointed professor of Greek in the lyceum of the former town. While serving in the legislative body of the republic, he was led as a conservative Catholic into such bitter controversy with the Jesuits, that in 1845 he was compelled to retire into private life, and undertook a tour of travel to Rome, for the purpose of examining such archives as might throw light upon the history
KÖPPEN — KORAN

of his native country. He was elected cor-
responding member of the academies of Berlin
and Vienna. Self-taught as he was, he became
the acknowledged leader of Swiss historiog-
raphy, and proved how
her true annals had been obscured by such
legends as those of William Tell, etc. Among
his chief publications are ‘Geschichte der Eid-
genössischen Bünde’ (1802); ‘Geschichtsblät-
ter aus der Schweiz’ (1836); ‘Dramatische
Gedichte’ (1860).

KÖPPEN, kép'pén, Peter Ivanovitch, Russ-
ian archaeologist; b. Kharkov, Russia, 19 Feb.
1793; d. Karabagh, Crimea, 4 June 1864. He
was educated at the University of Kharkov
and subsequently traveled widely in order to
procure historical and archaeological material
for his work. The outcome of this investi-
gations, written in German, is comprised in the
reports of the Academy of Saint Petersburg,
but among other works of his are ‘Kultur-
geschichte Russlands’ (1825) and his famous
‘Ethnographisches Kartei der Ungarischen
(Russland)’ (1851).

KORAN, kō'ran or kō-rān’ (Ar. qur'an, qoran, reading, from qara, read; with
the Arabic article, Alkoran; also called Furkan,
salvation, Al-Mushaf, the volume, Al-Kitāb,
the book, Al-Dhkir, the reminder or the
admonition), the sacred scripture of the
Mohammedans, written in Arabic and pre-
fessing to be the revelation of Allah (God)
to Mohammed. It contains a code for the gov-
ernment of all Moslem transactions, and is ac-
cepted by true Mussulmans as uncreated and
eternal. According to orthodox Mohammedan
belief it was written from the beginning in
golden rays on a magnificent tablet in heaven,
and was communicated to Mohammed on the
night of Al-Kadr, in the sacred month of Ram-
adan, by the angel Gabriel, chapter and verse
as they stand, on parchment made of the skin
of the ram which Abraham sacrificed instead of
his son Isaac, in a volume ornamented with
precious stones, gold and silver from paradise.
Other traditions are different, one being that
Mohammed was assisted in composing it by a
Persian Jew and a Nestorian monk. Its reve-
lations cover Mohammed’s entire prophetic
career, 610–32 A.D. It is the first work known
in Arabian prose, its scattered discourses being
preserved on stones, palm leaf ribs, leather, etc.
Except in a few instances, Allah is the speaker.
Mohammed named the book at the time of im-
porting the first revelations, and the name was
retained for the collection when this was made
in 633 by Zaid, son of Thabit, under direction of
Abu-Bakr, father-in-law of the prophet. The
authorized text, ever since accepted, was pro-
duced under the Caliph Othman, 650 A.D., from
the fragments, originally thrown together with-
out order, and afterward gathered in a volume
with no attempt at arrangement, not long after
Mohammed’s death. It is subjected to concor-
dence from various readings, Othman commanded
the destruction of all other copies, and in purity
of text the Koran stands alone among religious
scritptures. The chronological order has never
been clearly determined, and many conjectural
readings and divisions have been made by Mohammedan and other scholars.

In size the Koran is nearly the same as the
New Testament; it is divided into 114 suras or
chapters, each beginning: ‘In the name of God’;
the suras have various subdivisions. The
Koran is dogmatic throughout; from beginning
to end it is dominated by its author’s dictum
“There is no doubt in this book.” Its author
was indebted to many other writers. Of the
sacred writings of the Jews he directly cites
only the Pentateuch and the Psalms; of the
New Testament, with which internal evidence
shows him to have been acquainted, he quotes
nothing; but besides the religious writings of the
Jews and Christians he knew the systems of
the Magians, the Sabians and other sects,
from whom he derived many materials to be
incorporated in a new religion for his own coun-
try, where numerous and diverse faiths already
existed.

Mohammed lived much in solitude, medi-
tating on his mission and his doctrine; he did
not reject the teaching of any sect; asserted
his desire to restore the purity of the true
faith; announced as his fundamental doctrine
the unity of God. This idea, together with
conceptions of divine might, sovereignty, com-
passion and other attributes of Godhead, is all-
pervading in the pages of the Koran. When it
is God,” it declares, “and Mohammed is his prophet.” He felt that the unity of God had
been the essential doctrine of all true religion,
in which custom and ceremony were but acci-
dents. “We make no difference,” he says, “be-
tween that which God has taught us and that
which Abraham, Isaac, Ishmael, the twelve
tribes, Moses and Jesus have learned from the
Lord.” “God commands thee to receive the
religion which he prescribed to Noah, which he
has revealed unto thee, and which he imparted
to Abraham, Moses, and Jesus.” To Jesus Mo-
hammed assigns a place in the seventh or high-
est heaven, in the immediate presence of God.
The Koran dwells much on the resurrection
and the last judgment, setting forth some-
what after the manner of the Apostle Paul:
“When the trumpet sounds the second time,
they shall rise quickly from the graves to ap-
pear before God.” “A sound of the trumpet of
judgment will assemble all men before my
throne, and every one shall there receive the re-
ward of his deeds.” In its presentation of
the last judgment the Koran resembles the teach-
ings of the Jews and the Magians; in the pas-
sage of the narrow bridge to paradise—Al-
Sirat, over the abyss of hell, finer than a hair,
sharper than a razor; in the book wherein
all the actions of men are set down, and the
scale in which they are weighed. Quite Jewish
and Magian also are the Mohammedan views
of paradise. The doctrine of predestination as
contained in the Koran was successfully em-
ployed by Mohammed to encourage his follow-
ers in the face of every trial and danger.
Herein he probably availed himself of beliefs
already widely held, especially among the Sa-
bians, with their worship of intelligences sup-
posed to reside in the heavenly bodies, consider-
ing the lives of men and the course of events,
and by the Magians, who held a system of dual-
ism, the influence of these beliefs having ex-
ted itself upon the Arabs.

In the matter of religious exercises Moham-
med largely adopted such as he found, to those
which were narrow or vague giving more of
universality and precision. The Koran pre-
scribes prayer, fasting, alms and the pilgrimage
to Mecca; prayer embraces ablutions, purifica-
tions and all other exercises needful to preparation for it; to those who sought to be relieved from those obstructions the Koran replied, "Religion without prayer is nothing"; prayer he calls "the key to paradise." Surpassing the severity of the rabbis, he prescribed prayer five times a day, with the face of the suppliant turned toward Mecca. To give alms was always an Arabian practice, but the Koran makes it obligatory. Concerning polygamy, divorce, inheritance, etc., it follows the law of Moses and the decisions of the rabbis, adapting them to the prejudices and customs of the prophet’s people; it forbids few of the old practices save idolatry; “God,” it says, "intended that his religion should be easy, else, as he well knew, you would only become hypocrites.”

Although the Koran is written in prose, the different parts of a sentence end in rhymes, and there is marked diversity of style, yet withal an impressive unity, characterized by a free and forcible eloquence unequalled in any other Arabic writings. The earlier utterances of the prophet seem often to be outbursts of unbridled inspiration, though still the solemn words of the prophetic earnestness proclaiming God with power to reach and sway the hearts of men. In later portions of the book the tone takes more of calmness; imagination is subdued; the author discards extended passages to be taken down by his hearers. The highest elevations are where he speaks of the greatness of God and describes the last judgment, the pleasures of paradise and the pains of hell.

The moral precepts of the Koran exhibit a lofty feeling of humanity and a profound sense of ethical law reduced to most practical forms. They inculcate all the noblest virtues and pieties — obedience to divine commandments, charity, humility, mildness, temperance, toleration, and the strong virtues of courage, faith and justice. To death in the cause of religion it ascribes a peculiar merit. The influence of this book through many centuries and among many peoples has been vast, and it still controls the lives of a great portion of the human race.

"From the Atlantic to the Ganges," says Gibbon, "the Koran is acknowledged as the fundamental code, not only of theology, but of civil and criminal jurisprudence; and the laws which regulate the actions and the property of mankind are governed by the infallible and immutable sanction of the will of God." The divinity and authority of the Koran have at times been assailed among Mohammedans themselves. The first serious heresy, about 740, was suppressed by the execution of its chief author, but appeared again in the next century, and was not finally crushed out until 842, when Harun II prohibited all discussion regarding the character of the Koran, which has since been everywhere held by Mohammedans in admiration as the great Arabic classic, and in reverence as the book of religious authority. Once each day it is read through in the mosques of the Sultan and in the adjoining chapels. By the faithful it is never carried below the girdle; not without their own purification may they even touch it; and on all processions, banners, etc., its texts are frequently written.

Commentaries on the Koran are almost innumerable. The library of Tripoli, in Syria, is said to have contained no less than 20,000 of them. Many editions have been published in different countries. For English readers that of Sale (1734), with its comprehensive introduction, is still of prime value. The translation of E. H. Palmer (1880) is authoritative, as is also that of Rodwell (2d ed., 1876). Several versions in German have appeared in which it was attempted to reproduce the rhyming style of the original: among these, that of Fehling (1811), A. Sprenger’s (1861-65), Fr. Rückert’s (1888), and M. Klaproth’s (1890). Other editions which have their special values are Hinkelmann’s (1694), Maracci’s (1698), and Fligel’s (1883). Consult Sprenger, ‘Leben und Lehre des Mohammed’ (1865); Deutsch, ‘Islam’; Dozy, ‘L’Histoire d’Islamisme’; Muir, ‘Life of Mahomet and History of Islam’; Lane, ‘Selections from the Koran’; Johnson, ‘Oriental Religions: Persia,’ see ‘Islam’; Conway, ‘The Sacred Anthology’ (for many good extracts from the Koran); Hirschfeld, ‘Beiträge zur Erklärung der Korans’ (Leipzig 1886); id., ‘New Researches into the Composition and Elegies of the Koran’ (Eng. trans., London 1902); Murdock, ‘Selections from the Quran with Introductions and Explanatory Notes’ (London 1902); Nöldeke, ‘Geschichte des Korans’ (Göttingen 1860; 2d ed., by F. Schwall, Vol. I, ‘Über den Ursprung des Qorans’, Leipzig 1909); Grimm, ‘Mohammed’; ‘Einleitung in den Koran’; ‘System der koranischen Theologie’ (1895); Tisdale, ‘Sources of the Quran’ (London 1905). See also ‘Mohammedanism’, and consult the lives of Mohammed and other works referred to under these articles.

**KORAS.** See HOTTENTOTS.

**KORCE,** or KORITSA, also KORTCHA, GORITZA, a new and probably temporary republic situated in southeastern Albania. This state was created in the late autumn of 1916 by a French cavalry colonel. The bulk of Albania was at that time held by the Austrians. In the south the Italians held Avlona, on the Adriatic, but between them and the Allied Salonica forces was a solid wedge of Austrians and King Constantine’s unfriendly Greeks. In the autumn General Sarrail pushed forward in a northwesterly direction, and occupied Koritsa and the region near Lake Malik. This was the first time that French troops from Salonica had found themselves in Albanian territory and the colonel in command was faced with the problem of setting up a civil administration. Northeast lay Serbia and southeast lay Greece, but Koritsa was neither. According to the Treaty of Bucharest, the only legal instrument recognized by the Allies, it was part of Albania. The colonel solved the difficulty by proclaiming Koritsa, and the case, or administrative district of which it is the capital, to be an autonomous Albanian republic under the protection of the Allies. General Sarrail accepted the situation, and the republic remained. A council of 12 elders, mixed Christian and Mohammedan, was set up as the governing body; Essad Pasha uttered a blessing in Albanian, a flag was devised, a postal system instituted and stamps issued. Meantime, up to the summer of 1918, owing to various advances of the Allies, the republic had gained several extensions of territory.
KORDOFAN—KOREA

KORDOFAN, kör-dô-fân', Africa, a province of Egyptian Sudan, between the White Nile and Darfur; area, about 130,000 square miles. The principal article of export is gum, hides and skins, and copal, and the government by the imam is most absolute; ivory, cattle, tamarinds, ostrich eggs and feathers, gold, salt, slaves, etc.; the imports are spiccs, sugar, coffee, sulphur, rice, soap, cotton and linen cloth, etc. From 1822 onward Kordofan was attacked by the government of the Sudan and made a province by the government of the empire of Egypt, the country having been subdued by Mehemet Ali. In 1883 it took part in the successful Mahdist revolt, but was regained for Great Britain and Egypt in 1898. Pop. about 300,000.

KORDYAN. The revolution of 1830-31 was a prolific source for Polish literary works. Juliusz Słowacki seized upon the historic incident of the attempted assassination of Tsar Nicholas, who came to Warsaw to be crowned king of Poland, to create a Polish hero for the troubled times. Imitating Byron's ironical attitude, Stowawski, in the introduction to his poem treats the contemporary actors in the revolution rather flippantly. Then, representing his own early excesses and lack of faith and the change of mind which he experienced in Switzerland, he makes the hero, Kordyuan, look with contempt upon his aristocratic habits and abandon his life of a lovesick, and lets him return to the sands of Mazovia, there by an inner transformation to do good to his native country. Kordyuan attends a meeting of revolutionists in St. John's Church in Warsaw, where he makes an impassioned appeal, one that has become a classic passage in Polish literature, that Nicholas be killed. But the only scene which by modern Polish critics is considered as devoid of romantic exaggeration is where Kordyuan, under the influence of the mood induced by the tragic situation, is trying to combat his own hallucination and terror. This, no doubt, is a correct representation of the poet's own struggle with his feverish imagination, caused by his abhorrence of war, just as he became conscious of the moral necessity of joining the ranks of the revolutionists. A good discussion of the poem may be found in G. Sarrazin, 'Les grands poètes romantiques de la Pologne' (Paris 1896, pp. 221-225).

LEO WIENER.

KOREA, kô-ré'a, COREA, or CHOSEN, since 29 Aug. 1910, an integral part of the empire of Japan. The name means Morning Splendor. By the census of 1910 it contains 2,274,263 native dwellings and a population of 13,115,449, the females numbering 6,169,610 and the males 6,945,839, the discrepancy in sex number arising from the neglect of female infants, 146,147 Japanese, 1,818 Chinese and 889 other foreigners. It comprises a strip of coast and a peninsula projecting southward from Manchuria, divided from it by the great valleys of Yalu or Amnok northwest and the Tuman northeast, both rising in the colossal peak of Paik-tu (White Head), 8,300 feet high. The Japan Sea divides it from Japan, whose southernmost island (Kiusu) approaches its southern tip within 100 miles, separated by Korea Strait which is the straits of the same name, the Tuman Bay and the Yellow Sea, marked off by Shan-tung Peninsula, divide it from China. A dense archipelago fringes it south and west. Its parallels are from 33° 12' to 43° 2' N., or about the same as from Concord, N. H., to Wilmington, N. C., and average much south of Italy; its meridians, 124° 13' to 130° 54' E. It is about 600 miles long by 135 broad; area, 84,738 square miles.

Korea is traversed north to south by a mountain backbone of striking individuality: a perennial zigzag, skirted by the eastern shore with slender coast-lands, and a steep solid wall unbroken for hundreds of miles save the Car Yung-hung or Broughton's Bay at the northern neck. In the north it has summits 4,000 to 8,000 feet high, and at Cape Pelissier, about lat. 37°, culminates in Mount Popoff (4,800 feet); thence the main chain turns southwest and ends in the extinct volcano of Mount Auckland (6,700 feet), on Queelpaert Island, while to the east it throws out low hills and plateaus. The islands of the southern archipelago, verdant rocks worn into the semblance of fantastic castellated ruins, are the ends of its spurs. On the eastern side the ridge is timbered to the summit; on the west almost treeless, and fringed with deep ravines shallowing out into broad fertile plains, occupying most of Korea. On the east below the boundary there is but one river of any size, the Tuman, but on the southeastern uplands, and almost no islands; the west has 10 considerable streams, and the coast is thickly notched with harbors and fringed with fertile islets.

The chief rivers are, from the north: The great Yalu or Amnok, a mile wide and rising 40 feet in flood, navigable 30 miles for sea-going junks, and 175 for boats, to Wi-won, and now crossed by a superb steel highway bridge uniting Korea with the trunk lines through Russia to Europe. Opposite to Tuman is the Taedong or Ta-taeng, navigable for boats 75 miles to Ping-yang. The Han ("the river"), rises on the western slopes of the eastern ridge but 30 miles from the Japan Sea, draining nearly the whole breadth of the peninsula with two main arms, and emptying into a bay of the Yellow Sea among islands. About 30 miles up lies Keijo, or Seoul, the capital, and a line of small steamers runs between it and Chemulpo, on Imperatrice Gulf as much farther south; boats ascend nearly 100 miles more. The Nak-tong (above) empties into Korea Strait near Fusan, and is navigable 140 miles for vessels drawing four and one-half feet. The best harbors are Gen-san and Port Lazareff, on Broughton's Bay; the best on the coast is Fusan on Korea Strait, now finely equipped with docks for large steamers. The tides on the west and south are very high and rapid, often leaving vessels stranded on mud banks.

The climate is much like that of the eastern coast of America in the same latitudes; the north and centre have very hot summers and severe winters; the south is like the Carolinas, and tempered by the ocean breezes. The Han is frozen in winter so that at Seoul, where it is 400 yards wide, it is available for cart traffic three months of the year, from December to February. The rainfall averages 36 inches, 22 in the crop season. As a fall of only 4.1 inches in 1901 created a famine.

Flora and Fauna.—There is a great variety of excellent hardwood timber on the east slopes
and the northern mountains; in the west it is scarce and sparingly used; lack of coal has caused Korea to be wasteful in the production of electric light in other parts. The one surpassing animal of the native fauna is the man-eating tiger, who fills the native proverbs and literature, populates whole villages and even besieges houses for days, sometimes leaping on the thatched roof and dragging his way down through. Besides him there are leopards, tiger-cats and foxes; deer, beaver, badgers, otters, martens, etc., and a great variety of birds.

Products.—The great native crop is ginseng, which grows wild in the distant mountains, and is extensively cultivated about Sunzo; it is a government monopoly, and despite much smuggling yields a large part of the state revenue. Among other products are rice, wheat, millet, sesame, Indian corn, beans, cotton, hemp and perilla (for oil and pigment). The domestic animals are few. The cattle are excellent, the bull being the usual beast of burden; the ponies very small but hardy, fowls good, pigs inferior. Iron ores of excellent quality are mined, and there are copper mines in the middle and upper regions. In 1910 the value of the goods exported was $3,053,038; the silver output is very small. Three-fourths of the trade is with Japan, and over four-fifths of the remainder with China.

Government.—Formerly a hereditary absolute monarchy; till 1895 tributary to and receiving investiture from China, and like it in administrative forms, with officials appointed by examination in the classics. On the declaration of independence (see History), the entire system was abolished, as well as the privileges of the aristocracy, and a cabinet of 10 ministers in charge of different departments formed, who with five councillors formed a grand council of state to lay measures before the emperor. Till 1896 the country was divided into eight do or provinces; it was then reformed into 13, including a metropolitan province around the capital. There are now 12 urban prefectures, 317 local districts, 4,351 villages and 12 treaty ports.

Social Conditions and Education.—The usual dwellings are one-storied. Fire is built at one end for the cooking and the heat is utilized by being carried along through the house by means of a system of flues, the chimney being low down at the other end. Smoke is seen hanging at most Korean towns in the morning and evening, and the conditions of life for the masses, as in China, are hard and equated; but actual distress is rare and beggars are few. Caste till recently was iron-bound, and no offices of even local importance could be held by other than nobles, who are distinguished by colored clothing and horsehair hats. Women are secluded; concubinage is allowed, but only one legal wife at a time. The imperial system of education was almost wholly in Chinese, which contained the only written memorials needing it, and was of Chinese classics. The general course of culture and education in Korea was directed by the educated gentleman was nearly the same in Korea as in China. In the reconstruction of the national education by the Japanese there were, in 1914, 366 public or government schools attended by 50,000 children, and 814 private (mostly missionary) schools for Koreans, attended by 22,273 pupils, taught by 311 Japanese and 695 Korean teachers. Female schools numbering one-fifteenth of the whole. Under government auspices are 60 industrial, 14 agricultural and 2 commercial schools. There are also 149 schools with 17,264 pupils, with teachers for Japanese way down.

Religion.—See History. There are now, by the Japanese official report of 1911, over 370,000 native Christians. The popular religion is the degraded Shamanism (q.v.); the higher classes are Confucians; the anciently all-powerful Buddhism, crushed by the revolution of 1392, is slight and unimportant, with a few ignorant monks.

Population.—The people are a mixed race of disputed elements, apparently Mongoloid and Ain with Manchu and Malayan infusions.

The chief cities are Seoul (Han-yang), the capital, estimated at over 200,000; Pingyang, perhaps 40,000, and Kai-seng. A trolley line nine miles long, built 1899, is operated in Seoul by Americans, and a trunk-line of railways with branches traversing the peninsula from Wuju to Chirchon; the total mileage of railroads open in 1914 was 934.7, and of light railways and trams, 109.8 miles.

History.—The traditional founder of Korean nationality is the Chinese noble Ki-ja, who left China with 5,000 followers 1122 B.C., and established a kingdom with capital at Pjéng-yang. The first authentic history is the annexation to China 108 B.C. A century or so later it split into three princesoms, of which, about 960, Korai (Kao-ll) came to the front, probably from borrowing the higher Chinese civilization. It recast the administration upon the Chinese model, introduced Chinese methods and arts, and initiated several centuries of brilliant progress and prosperity, enriched by art and literature. Buddhism was the paramount religion, and developed a powerful and rigid ecclesiastical hierarchy. As a result, a protestant movement took place, and in 1392 a revolution resulted in the fall of Buddhism and the expulsion of Confucianism. The capital (Seoul) was fixed at Han-yang. When the Manchu power began to rise in the 15th century, China, to protect her territory, desolated a strip of fertile territory many thousand square miles in extent, then or early in the 17th century destroying four cities and many villages and removing 300,000 inhabitants; and down to 1875 this zone of 60 miles wide by 300 long was kept as a permanent buffer between China and Korea. During the rise of the Japanese shogunate out of the 16th century anarchy, Hideyoshi, as a preliminary to invading China, sent an army into Korea, rapidly overrunning it. But Korea is like Spain, easy to conquer and impossible to hold; and the solid resistance of the natives, with the Chinese armies, gradually forced the Japanese out of the peninsula six years later, retaining Fusán on the southeast coast as a trading station. Thirty years later the Manchus, whose disastrous defeat of China invaded it and exacted a tribute, which was continued to the Manchu dynasty in China; in 1653 it was reduced to a third, and for generations down to 1894, when it was finally abolished, had been only nominal, as an acknowledgments...

edgment of Chinese supremacy and a trading license. But the Chinese wisely attempted no permanent occupation.

Korea as a result determined to seclude herself from foreign influences as ancient Egypt, and practically the first knowledge obtained of it by modern Europe was through the shipwreck of some Dutch on the coast in 1653, though the Jesuit missionary Ciespedes had the year before opened the peninsula to the baptism, over which he was buried after the missionaries came and planted Christianity in the peninsula, despite steady persecution; in 1835 the French missionaries reinforced them. But in 1864 came a fiercer blast. The then king died childless, and his oldest widow set aside the natural successor, her nephew, and nominated Yi Hevi, the present king—the 12-year-old son of a royal prince, whom she made regent. The latter was a savage reactionist, and let loose fire and blood to extirpate the foreigners, rigidly excluding all new ones. A futile French expedition was sent against Korea in 1866; the same year a stranded American schooner, the General Sherman, was burned and her crew murdered in sight of Pinyang. An American expedition sent in 1871 had slight success. Korea in the next years a number of foreigners attempted to force Korea into treaties of commerce and gain trading privileges, but Japan was the first, in 1876, to succeed, having the ports of Gensan and Fusan opened in 1876 and Chemulpo in 1880. Meantime the "neutral" chief of the many years a number of bands and pirates, was abolished by Li Hung Chang in 1875. In 1882 Commodore Shufeldt negotiated a treaty of friendship between the United States and Korea, and thence on, other nations were rapidly admitted—Great Britain and Germany in 1884, Italy and Russia, in 1889, France in 1886, Austria in 1892 and China in 1897.

The flood of new ideas and habits agitated the conflict between the progressives and the reactionaries, in which the former won, and Korean embassies began to visit other countries—Japan in 1880, the United States in 1883. The nativists raised an insurrection in 1882. The greatest breach with the past, however, was the result of the Chino-Japanese War of 1894—95, one of the pretexts of which was the action of China in reasserting her ancient suzerainty over Korea. It was at Pinyang that the first heavy defeat was inflicted on the Chinese, and off the Yalu River that the Chinese fleet was destroyed. On 8 Jan. 1895 the king of Korea proclaimed its independence, and the Chinese gate near Seoul was publicly destroyed with impressive ceremonies. In 1897 the king proclaimed the country an empire, named it Dai Han and took the title of emperor. Under the Treaty of Shimonsok, Korea became a "sphere of influence" for the Japanese, whose struggle against Russian encroachments culminated in the war of 1904—05. (See MANCHUKIA). By the Treaty of Portsmouth (q.v.) Japan's preponderating interests in Korea were acknowledged, and a Japanese protectorate was established in November 1905. On 18 July 1907 the protectorate was succeeded in favor of the crown prince, but Japanese protectorate continued until, by virtue of a treaty made with the Korean emperor, the sovereignty and territory of Korea passed to Japan. Following this act, the royal family of Korea received "such titles, dignities and honors as are appropriate to their respective ranks and sufficient grants to be made for the observance of such titles, dignities and honors." Relatives, meritorious Koreans and men of rank, old persons, virtuous widows, etc., to the number of 87,643, also received monetary rewards. Since the Japanese occupation, new public buildings, roads, a national coinage, survey, systems of banking, postal communication, taxation, education, encouragement of agriculture, commerce, fisheries, etc., have given Korea most of the features of a modern state. Consult Annual Report of Reforms and Progress in Chosen, for 1913—14.

As Korea passes out of existence as an independent state, and her people increasingly conform, both in outward circumstances and inward characteristics, to modern conditions and requirements, it may well to inquirre as to Korea's place in history; to note her contributions to civilization and to survey the progress made in the 20th century. The Koreans rebuilt Kiya's (Kisse's) tomb at Pinyang, which was injured during the Chino-Japanese War of 1894, because they consider this historical character as their national hero, while popular and especially local tradition, in the north especially, concerning him is abundant and vivid. To him is credited the name of the country, Chosen, or Morante Splendor, which is now the modern, as it was the ancient, name. Critical scholars, however, incline rather to the belief that it was from some centuries later reading, in Chinese annals of the story of Kiya, that the Koreans became acquainted with the name and work of this ancient patriarch. In any event, only a small part of modern Korea lay within the area of the Kiya domain, which came to an end in 203 B.C. In 108 B.C. Korea formed a part of the Chinese Empire under the Han dynasty. Later the people revolted in 30 B.C. paying tribute to China, however, until 9 A.D. The early history of Korea resembles that of Britain, in which, after the Romans, men of three ethnic stocks contended for centuries together, Welsh, Scottish, English. Three states arose (Chinfeel, Kaokuli, Sinlo and Petti; Japanese Koral, Shinra and Pechi) and for 10 centuries border wars, with alternate invasions and succor from China and Japan are noted in the annals of the three countries and by comparison many of the events and dates, asserted to be historical, may be verified. In the modern reconstruction of the state under Japanese auspices, very interesting antiquities, in the form of mortuary art and literary relics, have been recovered and scrupulously cared for. Although Korea's ancient history is interesting, yet the story of progress and civilization is best expressed in that of Buddhism which, introduced into the peninsula in the 4th century, was destined to enjoy a thousand years of successful propaganda. Its career of material and spiritual splendor
KOREA

lends strong color to the idea held by scholars that the story of Korea and its civilization during the first thousand years of its existence is a chapter of decay rather than of progress. The Koreans from about 1500 A.D. having steadily degenerated. However this may be, it is certain that in the train of the faith, imported from India and China and Tibet, came elements that fertilized the Korean civilization and supplied the spiritual forces in which early Confucianism was lacking. Art, literature, folklore, noble monuments in sculpture and architecture, splendid temples and monasteries followed with the coming or as the result of this vast synthesis of Asiatic beliefs, forces, intellectual achievements, science and craftsmanship, called Buddhism. Not content with the spiritual conquest, of the peninsula, the Buddhist missionary activities overflowed into the islands of the Rising Sun. Japan received at the hands of Buddhist teachers of their monastic order the civilization which link her history with the great world of the West, besides thousands of Korean colonists, many of them skilled artists and craftsmen. This explains why, until lately, the Koreans were apt to look on themselfs as a vastly superior race of semi-savages. The political outcome of the factors of evolution in these early centuries was the strong state of Silla (Shinra), whose people, beside having the richest soil, were nearest to China, had first received Buddhism, traded with the Arabs and sent their students to Nanking in China for study. One of their literary statesmen invented what (except the Sanskrit letters imported from India) was a new thing in Chinese Asia—a true alphabet, of 14 consonants and 11 vowels (the en-mun), classified according to the organs of speech. This system, however, was not perfect and put into general practice until the 15th century, nor ever made nation-wide until the Christian missionaries made reading democratic and popular. With Confucianism the system was never given opportunity to develop. In the 10th century Shinra’s rule extended over the entire peninsula, but in the north the hardy men of Korai were uniting under Wang-gon (Chinese, Wu Wang) who made himself master of the rival states and unified the peninsula, making his capital at Song-do (Sunto). All historians agree that luxury was the chief cause of the downfall of Silla. Buddhism was now endowed as the state religion and the country was divided for administrative purposes into eight districts based on the river basins, provinces and capitals having the first syllable in common. The evolution of government was away from feudal forms to centralized monarchy, after the Chinese model. The mariner’s compass is recorded as used on Chinese ships voyaging to Korea, 1122 A.D. The Mongol invasions of the 13th and 13th centuries made apparently little impression on the country. In 1392, a new dynasty coming into power banned Buddhism. The first half of the 15th century was a period of inventions, the improvement of the alphabet (chakja), the creation of movable iron and copper “living” metal types, notable literary productions, the casting of great bells and improvements on agriculture being among these. In politics, political parties arose. Yet while both China and Japan felt, for evil and good, the contact of Europe, Korea became, in spirit and fact, more and more a protectorate of Japan, foreign trade being tabooed and the educated classes shrivelling into self-conceit and the pride of ignorance. The invasions of the Japanese, 1592–97, called forth the inventive powers of the Koreans. Admiral Yang invented an ironclad and iron-smitten ship, which disarrayed the enemy’s fleets. The use of bomb shells ("heaven shaking thunder") by the Koreans hampered the enemy’s siege operations. The Manchus in 1627, the entrance of Roman Christianity in 1777, through books, and by French priests (in 1830), and of Reformed Christianity in 1884, with the treaties made since 1876 and the presence of large armies on her soil during the Chino-Japanese War of 1894, form the nuclei around which recent events may be grouped. Repeated endeavors, made by Japan during 30 years, to have the Korean dynasty and nobility reform their corrupt administration and create a modern state were made, during which the Japanese legislation was twice attacked and burned and the Japanese driven from Seoul. Ploy, counterplot, insurrection and division of the Japanese followed in monotonous repetition. Japan, to maintain the independence of Korea as necessary to her own existence, was compelled to engage in two foreign wars—with China and with Russia. Finding Korea never free from anarchy and incapable of governing herself, Japan felt compelled to assume that responsibility of a protectorate. It had been made evident by the logic of events, that the interests of Japan and Korea were identical—a view that was recognized almost immediately and unanimously in the West, all governments promptly withdrawing their legations from Seoul, Japan, sending her ablest statesman, Prince Ito, as president-general, assumed the control of Korea’s foreign affairs and during three years attempted internal reforms according to an agreement signed 24 July 1907. The Korean soldiers resisted the attempts to disarm them and in the two years of intermittent fighting 21,000 natives and 1,300 Japanese lost their lives. At Harbin, 26 Oct. 1909, Prince Ito, and shortly afterward, in California, Mr. D. W. Stevens, an American adviser, were shot to death by Korean assassins. To this date, 1910, Japan’s outlay of money for railways, military and reforms in Korea had amounted to $720,000,000. Driven by necessity to the final step of annexation, which was taken 22 Aug. 1910, the Mikado declared that "all Koreans under his sway shall enjoy growing prosperity and welfare and be assured of repose and security," while he called upon "all his officials and authorities to fulfil their duties in appreciation of his will." How thoroughly Japan has carried out her purpose of reconstruction in every department of human activity and the opening to the Koreans of all avenues to prosperity—the purpose being to give, in time, to Koreans the same privileges as Japanese subjects enjoy—may be seen in the annual reports, issued by the Japanese colonial government, and copiously illustrated. In Count S. Terauchi, born in Choshi in 1852, the year of Commodore Perry’s arrival, a worthy successor of versatile ability and indomitable energy was
found to Prince Ito. The first work was in sanitation and cleanliness. Smallpox, always epidemic (exactly as in old Japan), and formerly a laudable andan at times nearly a thousand deaths in a day in Seoul alone, is now only sporadic. In one year 5,400,000 Koreans were compelled to receive vaccination. Cholera, typhoid fever, dysentery, diphtheria were also chronic visitors — often brought from China — and have almost ceased to be epidemics. Housecleaning twice a year is now compulsory. In 1913, with cholera almost unknown, the cases and deaths from all epidemic diseases were 4,068 and 805, respectively. In 1913, 384,000 patients were treated in the government charity hospitals and 2,408,126 visits made to patients. Silk raising is now a native industry, over 13,000,000 mulberry seedlings furnished the food material for the worms. The annual rice, wheat and barley crops have been doubled. In 1915, a great national exhibition was held in Seoul which showed that in every one of the 13 divisions of Korea modern methods in sanitation, agriculture, culture and education were in operation. The total trade of Korea in 1914-15 was 59,412,966 yen. The total trade for 1914 was 97,620,248 yen. In March 1913, 49,328 native pupils attended the government schools and 2,190 the private schools, besides 28,173 Japanese were under instruction; the official expenditures being 1,141,952 yen. The work of railways, road-making, harbor improvements and survey, sanitation, silk culture, agricultural development, banking (one family in 100 having a savings account) and finance, and the general prosperity and uplift of the people, as shown in annual publications both official and private, are remarkable. Japan, as a devotee of science and a pastmaster in the art of rejuvenating nations, profits by her own experience in renewing her own body politic, after the long miasma and anemia of centuries brought on in all three countries under Chinese culture by heritmage and bad government. Hence the vigor and thoroughness with Korea — apart from any question of political moralities — is even greater than she is in Korea than she has been with herself. Great as is the work done for the Koreans, their contact with the world, by changing the status from one of heritmage and degeneration to one of brotherhood and progress, bids fair to produce even greater ultimate results for the good of themselves and the race.

Language.—Korea since early times has employed two languages: Chinese for writings and native Korean for speech. Chinese if spoken being an acquirement like French in America. The literature in Chinese is sometimes translated into Korean, however; and the work of the missionaries in making general use of the en-mun or native script has reacted to the great appreciation by the Koreans of their own language. The reforms are proclaimed in the vernacular.

Korean is of a not extreme agglutinative type, belonging to the polysyllabic branch of the Mongol-Tartar languages like Japanese, and unlike the more syllabic Chinese; it is structurally unrelated to the latter, though it has very many Chinese loan-words, pronounced after its own phonology. Its resemblances to Japanese are far closer: mutual translations word for word, and even particle for particle, are quite feasible. The particles and grammatical terminations in both represent punctuation, emphasis and inflection of nouns and verbs. The honorific vocabulary — almost a complete ceremonial language even in construction, to express relations between superiors and inferiors and equals — is common to both. The differences are mainly euphonic: Korean vowels are heavily assimilated to those which follow, the syllables need not end with a vowel, and the spelling is as irregular as English, none of which is true of Japanese.

The grammar of Korean is extremely flexible and pregnant; like Chinese, the roots are invariable. There are no inflectional forms for number, person or case, or conjunction of verbs, and no form for gender; all are indicated by particles without meaning, or whose meaning has been lost, affixed to the subject varying with its terminal letter, as consonant, vowel or liquid. There are no pronouns of the first and second person; the third, with relational particles, serving for both. Development has expended itself on the verbs, which are marvels of varied, flexible and ingeneous expressiveness. Many words not primarily verbs can be turned into them (as in English), and these with the true verbs constitute 20 per cent of the entire vocabulary. The grammatical forms of the verb are said to average 300. Adjectives and adverbs are not distinguished from the verbs, and the prepositions are verb forms. All conditions expressed by inflections in Western languages — present, continuing, past, unfinished or completed, optative, subjunctive, potential, interrogative, participial, etc. — exist in Korean, and a vast number of others expressed by us in long sentences. Some verbs have no passive, but all have a negative voice. There is no number; the three persons in every variant are expressed by courtesy forms — one to or of superiors, one for equals, one for inferiors or of things. The syntax is positional, as with Chinese. The object precedes the verb or other governing word, the prepositions are postpositions, the adjective precedes the noun it qualifies and the adjective, (as in English). A dependent clause precedes its principal.

Korean has an alphabet of 25 letters, 14 consonants and 11 vowels, a very simple and scientific one, analyzed by organs of speech. The vowels are a, ya, ü, yô, o, yo, u, yu, i, eu, ä; with the diphthongs ê, é, ê. The consonants are — labial, p, ph, m; dental, t, th, n, j; palatal, ch, chh, s; gutturals, k, kh; laryngeals, (?) h, ng final. There are no letters f, v, w, h, d, g, j or z, though (except the first, which is replaced by p) they exist in speech. There is but one character for i and r, and neither of them can begin a word, their place being taken by n. The characters — women and children's only, the true learned characters being Chinese — are of an extreme simplicity, contrasting strongly with the complex Chinese; and there is a cursive form. This alphabet is called en-mun, *the vulgar*; and there is a system called nido, in which the letters are grouped in the 192 possible combinations and learned by rote. The writing is in syllables, in columns from right to left, as with Chinese. There is already a very respectable volume of Christian literature expressed in en-mun and the news-
papers of the capital and large cities are printed in this character.

WILLIAM ELLIOT GRIFFIS,
Author of 'Corea, the Hermi Nation,' etc.

KORN, körn, Arthur, German physicist: b. Breslau, 20 May 1870. He studied at the Breslau and Berlin gymnasiaums and, consecutively, at the universities of Leipzig, Heidelberg, Lipsia (1886), Paris (1889) and Berlin (1891). He was given degrees and (1890) became private teacher (docent) of physics in Munich (1895), then assistant professor (1903) and professor, and has resided, since 1908, at Charlottenburg. His work consisting of a long-distance photography, the phototelautograph, physical phenomena, mechanics; but he has devoted his best labors to the potential theory and the mathematics of physics. Among his numerous published works are 'Eine Theorie der Gravitation und der elektrischen Erscheinungen auf Grundlage der Hydrodynami' (2d ed., 1896); 'Ueber Molekular-Funktion' (1897); 'Lehrbuch der Potential-theorie' (Berlin 1899-1901); 'Reform und erzwungenen Schwiegungen' (1910); 'Eine Lehre der Phototelegraphie und Teleautographie' (1911). He has also contributed numerous articles to such journals as Berichte der Bayrischen Akademie der Wissenschaft; Comptes rendus de l'Académie des Sciences de la Naturwissenschaftlichen Wochenschrift, etc.

KORNEMANN, körn-né-mán, Ernst W. G., German historian: b. Rosenthal, 11 Oct. 1868. He studied at Giessen (1878-89) and Berlin (1889-92), and took the degree of doctor of philosophy (1891); he was appointed assistant professor (1892) at the faculty of science (1892). He became private teacher (docent) of ancient history at Giessen (1892) and took the degree of professor at Tübingen (1902). With Dr. Lehmann-Haupt, of Liverpool, he established the periodical Klio, dedicated to ancient history, and later took up his residence in Tübingen. He wrote 'De civibus Romanis in provinciis imperii consistentibus' (1891); 'Die historische Schriftstellerle des Consuls Asinius Pollio' (1896); 'Zur Geschichte der Gracchenzeit' (1903); 'Die neue Liturgie' (1910); 'Die Gynnæarchus' (1904); 'Kaiser Hadrian und der letzte grosse Historiker von Rom' (1905); 'Priesterkodex der Regeia und die Entstehung der altrömische Pseudogeschichte' (1912). Besides numerous articles written for Klio he contributed on classical subjects to the Realencyclopaedia of Pauly-Wissowa-Kroll.

KÖRNER, kör-nor, Christian Gottfried, German jurist and intimate of Schiller: b. Leipzig, 2 July 1756; d. Berlin, 13 May 1831. He studied law at Göttingen and Leipzig and took his degrees in the latter, where he traveled abroad (1779), was appointed councillor of the Consistorial Court at Leipzig (1781), chief judge of the Court of Appeals (1790), privy referendarius in the Privy Council (1798), and was then returned to the Court of Appeals (1811). His shining tenure toward science and art made his home the rendezvous of prominent men in this sphere. He was one of the most trusted and influential friends of Schiller, who resided (1785-87) on his Loschwitz vineyard or his home at Dresden. While Leipzig was under the occupation of the Russian army
he was created government councillor, and was appointed (1815) Privy Councillor of the Prussian Ministry of the Interior, becoming Privy Councillor in Chief. He instigated the first edition of Schiller’s works with a biographical sketch (Stuttgart 1812-15). Among his well-known works are: ‘Katholische Ansichten’ (Leipzig 1808); ‘Versuche über Gegenstände der innern Staatsverwaltung’ (Dresden 1812); ‘Deutschlands Hoffnungen’ (Leipzig 1813). Of much importance are his ‘Schiller’s Briefe,’ 3 vols. (Leipzig 1842). He entered into negotiations with the provisional government concerning the necessary steps to be taken in order to re-establish the fighting strength of the army. The greater part of the measures proposed by Korniloff were accepted by the government, which took a final decision on the questions involved on 26 August. The decision, however, was not carried out owing to the unexpected demand of Korniloff that the powers of dictatorship should be conferred upon him. On 9 Sept. 1917 he led a counter-revolution against Kerensky and marched on Petrograd with his troops. Kerensky, in compliance with a letter from his command, and Korniloff issued a bold proclamation to the people and the government pleading for a vigorous prosecution of the war. However, he surrendered on 13 September and was arrested with 23 generals and other officers. The affair was smoothed over eventually as a “misunderstanding” between the Premier and the general. See Russian Revolution; War, European.

KOROLENKO, kor’o-len’ko, Vladimir Galaktionovitch, Russian novelist: b. Zhitomir in Volhynia, 27 July 1853. His father, a member of an old Cossack family, was a judge, of stern and honorable character, who believed in a Spartan education for his children. His mother was of aristocratic Polish origin, and when she was left a widow in straitened circumstances, she opened a boys’ boarding-school. Korolenko, a boy of 15, assisted her and also gave lessons outside. In 1870 he entered the Technical School at Saint Petersburg, earning his way by teaching and doing copying. His mother was unable to aid him and he often suffered from hunger. He entered the Agricultural Institute at Moscow, but having become affected with revolutionary opinions he was expelled and sent to Kronstadt. He managed to return to Saint Petersburg where he finally secured a position as reader in a publishing house. He embodied his experience in a small volume entitled ‘Episodes in the Life of a Seeker’ or ‘Prokhan and the Students.’ This was begun in Russian Thought (Russkaya Mysl) but was stopped by the censor. He was already a marked man and was arrested in 1879 and sent to Viatka, Kama and Tomsk. He wrote a letter protesting against such persecution and as a reward was transferred to Yakutsk in eastern Siberia, where, amid the immense forests known as ‘taiga,’ in a filthy, smoky village, he spent three years. “My tiny hut,” he says, “was like an island lost in a boundless ocean.” He experienced the terrible sadness of exile and absolute loneliness, amid a degraded and hopeless people. He wrote his first notable story, ‘Makar’s Dream’ (‘Son Makara’), which was published several years later, as well as a number of tales, giving remarkably realistic pictures of life in that
desolate region and of suffering humanity, and introducing various types of revolutionists, exiles and vagabonds as he saw them in the frozen Siberian forests and in far-distant Sagh- balien. His 'Sketches of a Siberian Traveler' was published in 1896. In these stories and in 'The Murmuring Forest,' he gives many reminiscences of his own experiences, as a boy and as a young man. 'The Murmuring Forest,' published in the same year as 'Brodýag,' considerably added to his reputation, which was wholly due to his two previous works, 'The Blind Musician' ('Slepé Musíkánt'), which is an idyllic tale of that Ukraine where his childhood was spent. (Translated by Aline Delano, with introduction by George Kennan, Boston 1890). In 1888 he began the publication of a long novel in Russian Thought ('Russkaya Myśl'), but as soon as its plot began to develop, the censor interposed a veto and the publishers were compelled to announce that 'on account of circumstances beyond their control' the rest of the work could not be printed. In supposed answer to Tolstoy's doctrine of non-resistance, he wrote 'The Legend of Florus,' which is regarded as one of his most beautiful tales. The subject was taken from Josephus. Other stories and articles were elicited by famine conditions in Russia and by the evil customs of duelling. In the 90's he was permitted to return from Siberia and engaged in journalism and other literary activities. In 1903 the 50th anniversary of his birth was celebrated all over Russia and in 1908 the occasion of the 30th anniversary of his commencement as an author was made a jubilee. He is one of the freshest and most vivid of Russian writers and, as shown in his 'Yom Kippur' has a sense of humor unusual in Russian novelists.

NATHAN HASKELL DOLE

KÖRTE, Christoph E. Gustav, German archaeologist: b. Berlin, 8 Feb. 1852. He studied in the universities of Göttingen, Munich and Berlin (1870-75), then traveled in Italy and Greece. He was private teacher (docent) at Göttingen (1880) and received the degree of assistant professor at Rostock (1881) and professor (1883). He was appointed secretary of the Imperial German Archeological Institute at Rome (1905), and succeeded Dilthey at Göttingen University (1907). He has written 'Die antique Skulptur aus Beotien' (1876); 'Etruskische Spiegel' (1884-97), in collaboration with the late R. Klugmann; 'Die rilievi delle Urne etrusche' (1890-96), a continuation of the work of H. Brunn. He compiled a report of the results of excavations he and his brother made at Gordium in 1900 (Berlin 1904).

KÖRTING, kör'ting, Gustav, German philosopher: b. Dresden, 25 June 1845; d. 1913. He studied in Leipzig (1863-67), was appointed head teacher at Dresden (1868) and became professor of Romance and English philology at Münster (1876) and at Kiel (1892). He wrote 'Über die Quellen des Roman de Rou' (1867); 'Grundriss der Geschichte der englischen Literatur' (Münster 1887; 5th ed. 1910); 'Enzyklopädie der klassischen Philologie' (Leipzig 1894); 'Geschichte des griechischen und römischen Theaters' (Paderborn 1897); 'Lateinisch-deutsches Wörterbuch' (Paderborn 1890-91; 3d ed., 1907).

KÖRTING ENGINE. See INTERNAL COMBUSTION ENGINE.

KÖRTUM, kör'tüm, Karl Arnold, German physician and author: b. Mülheim, 5 July 1745; d. Bochum, 15 Aug. 1824. He practiced as physician at Duisberg, and moved to Bochum (1771). He wrote 'Verteidigung der Alchemie' (Duisburg 1789), but is better known through his comical epic poem in doggerel rhyme, 'Leben, Meinungen und Taten Hieronymus Jobs dem Kandidaten' (Münster 1784), published anonymously, but later appearing under the title, 'Die Jobsäide' (Dortmund 1799) and going through many editions. Besides a number of medical works, he wrote on subjects of general utility such as书籍, culture and antiquarian matters. Consult Deicke's two works, 'Der Jobsäidendichter Karl Arnold Körtum' (Mülheim 1893), and 'Des Jobsäidendichters Karl Arnold Körtum: Lebensgeschichte von ihm selbst erzählt' (Dortmund 1910).

KOSCHAT, kös'chät, Thomas, Austrian composer and singer: b. Viktring, near Klagenfurt, 8 Aug. 1845. He studied philosophy at the Vienna University, but took part as bass singer in small entertainments joining the chorus of the Vienna Court Opera (1867). He became a member of the cathedral choir (1874) and rose to the position of court bandmaster (1878). He is known through his many choruses, quartets and songs and the waltz-dyds, 'Ein Sonntag auf der Alm,' 'Bauernhochzeit in Kärnten,' etc. The success of them led him to write 'Hadrich,' poems in the Carinthian dialect (1877). He wrote also 'Errinnerungsbilder' (Klagenfurt 1889); 'Dorfbilder aus Kärnten' (Leipzig 1876); 'Consult Schmidt, O., 'Thomas Koschat,' (Leipzig 1878); Marold, 'Das Kärntner Volkslied und Thomas Koschat' (Leipzig 1895); Krobath, 'Thomas Koschat, der Sänger Kärntens' (Leipzig 1912).

KOSCIUSKO, kos'kůskó, Mo., capital town of Attala County, on the Yazoo, 13 miles from Jackson. It has a Baptist college, negro school, seven churches, two banks and two newspaper offices. Its industrial resources are derived from cotton and oil mills and wood-working factories, etc. Pop. 2,385.

KOSCIUSKO, Mount, in Australia, the highest mountain peak in the continent, in the Munroin Alps, in New South Wales, near the frontier of Victoria. It is 7,308 feet high.

KOSCIUSZKO, kos'kůskó (Polish kóso-skó), Thaddeus (Polish Thaddeusz), Polish patriot: b. Mereczowszczyzna, Lithuania, 12 Feb. 1745; d. Warsaw, 15 Oct. 1817. He was educated in the military school at Warsaw, and completed his studies in France. On his return to Poland he became suitor to the daughter of Sosnowsky, marshal of Lithuania, but his love meeting no return he betook himself to America (1777). Having attracted the notice of Washington, he was appointed
engineer, with the rank of colonel, and afterward general of brigade. He performed excellent service and at the end of the war received the thanks of Congress, with the brevet of major-general. He returned to Poland in 1786, and on the occasion of the reorganization of the Polish army in 1789 was appointed major-general, ranking, having declared for the Constitution of 3 May 1791, he fought in the war which soon after broke out, with the rank of lieutenant-general. When Stanislas Augustus in 1793 agreed to the second partition of Poland, Kosciuszko withdrew from the army and retired to Leipzig. At this time the Legislative Assembly in France conferred upon him the title of French citizen. When a new insurrection broke out in Poland in 1794 for the purpose of delivering the country from the Russians, Kosciuszko was recalled and made commander-in-chief of the insurgent army. He defeated the Russians at Racławice, but at the battle of Maciejowice his army was defeated and he himself wounded and taken prisoner. He remained in captivity for two years, and then proceeded to England, and thence to America. In 1798 he returned to Europe on a mission from Congress to France, and contributed to bring about an understanding between the latter country and the United States. In April 1814, he addressed a petition to Alexander I, emperor of Russia, requesting him to grant an amnesty to all expatriated Poles, to accept the title of king of Poland and to give that country a free constitution similar to that of England; but the petition remained without effect. In April 1815 he issued a letter of instruction to the serfs on his estate in Poland. His death was occasioned by a fall from his horse. In 1818 his body was removed at the expense of the Emperor Alexander of Russia to Cracow, where it was buried in the cathedral, and a monument erected to him. Consult 'Lives' by Falkenstein (1834), German; Chodzko (1837), French; Paszkowski (1837), Komon (1911), Polish; Evans (1883), English.

KOSEGARTEN, kô'že-gär'tên, Johann Gottfried Ludwig, German Orientalist and historian; b. Altenkirchen, island of Rügen, 10 Sept., 1727; d. Berlin, 10 July, 1805. He studied theology and philosophy at Greifswald and Oriental languages at Paris (1812-14), becoming adjunct professor of the faculty at Greifswald (1815). He was appointed professor of Oriental languages at Jena (1817), but returned to Greifswald (1824) where he died leaving many valuable works uncompleted, such as 'Taberistanias annales' (Vols. I-III, Greifswald 1831-53); 'Kitâb al-aghâni' (ib. 1840); 'Pantschatantra' (Bonn 1848 and Greifswald 1859). Among his earlier works are 'Carminum orientalium Trig.' (Stralsund 1815); 'Tûti nâmâ' (Stuttgart 1822), a collection of Persian stories translated into German; the 'Moallaka' of the Arabian poet Amr ibn Kulthum, with Latin translation (Jena 1819); 'Chrestomathia arabica' (Leipzig 1828). Of his later works might be cited 'Pommersche und rügische Geschichten den müller' (Greifswald 1834); 'Codic Pomeranian diplomaticus' (ib. 1843-62) in collaboration with Hasselbach; 'The Haudsalian poems' (Greifswald and London 1848). His Arabic Grammar and Dictionary of the Low German Language were unfinished. He also wrote 'Geschichte der Universitäts Greifswald' (Greifswald 1856-57).

KOSEZ, kô'zê, Reinhold, German historian; b. Schmarsow, Prussia, 19 Feb., 1852. He studied history and philology in Berlin, Vienna and Halfe and was appointed to work in the Berlin Academy on the correspondence of Frederick the Great. He was appointed keeper of the state archives at Berlin (1882) and was given the degree of assistant professor at Berlin (1884), professor at Bonn (1891) and succeeded Sybel as general director of the Prussian state archives (1896). At the same time he was made a member of the Akademie der Wissenschaften and Prussian state historian (1898). He wrote 'Friedrich der Grosse als Kronprinz' (Stuttgart 1886); 'König Friedrich der Grosse' (ib. 1890-1904); 'Preussische Staats geschichten aus der Regierungszeit Friedrichs II.' (Berlin 1877-85); 'Politischen Korrespondenzen König Friedrichs der Grosse' (ib. 1892-93); 'Unterhaltungen Friedrich der Grosse mit H. de Catt' (Leipzig 1885); 'Briefwechsel Friedrichs der Grossen mit Grumbkow und Maupertius' (ib. 1898); 'Mitteilungen der königlichpreussischen Archivverwaltung' (ib. 1900-04).

KOSEZHER, kô'sher, KASHER, or CO-SHER, in Hebrew 'טָבָה meaning lawful, pure, clean, in conformity with the laws of the Talmud. It is the antithesis of terefo or tref, the unclean. Food, utensils, etc., which have undergone the operations and rituals laid down for the orthodox Jews, such as meats slaughtered under the ritual of the Mosaic law. The slaughterer (schachet) acts under the license of a chief rabbi. As the far-reaching rules of the Jewish authorities render it impossible for a Jew to obtain sustenance among communities of other religions without breach of some or other of these Mosaic laws or their renderings, there are ever-increasing numbers of Jews who give the matter secondary consideration according to their surroundings and who are known as Liberal Jews.

KOSLIN, kês-în, or ČOSLIN, Prussia, town in Pomerania at the foot of Gollenberg Mountain, junction of two railroads, five miles from the Baltic. It has two Evangelical, a Catholic and an Apostolic church, and a synagogue; a statue of Frederick William I on the market place; a war monument, a monument of Government-president Fritsche, cadet school, gymnasmum, seminary, deaf and dumb institute, agricultural school, iron foundries and manufactures of machinery, paper, soap, railroad signals; a brewery, three steam sawmills, etc. It is a garrison town. The foundation dates back to about 1168, being incorporated as a town 1266. Pop. 23,200, chiefly Protestants.

KOSLOV, kôz-lôf', Russia, county-town of the government of Tambo, junction of two railroads. It has nine Greek Catholic churches, several banks, more than 50 factories, large grain and cattle trade, etc. Its origin is said to date back to 1627. In the neighborhood is the monastery Troitaki, where a great market is held yearly. Pop. 50,300.

KOSMOS. See Cosmos.

KOssel, Albrecht, German physiologist; b. Rostock, 16 Sept. 1853. He studied medicine
KOSSINNA — KOST

at Strassburg and Rostock and became assistant to Hoppe-Seyler (1877–81) in Strassburg and private teacher (docent). He studied physiological chemistry (1881) and became assistant professor and principal of the chemical division of the Physiological Institute, Berlin (1883). He was appointed professor of physiology at Marburg (1895) and at Heidelberg (1901). In 1910 he took the Nobel prize. His chief work was the study of the cell and its nucleus elements; the decomposition of albumen, its conversion into sugar; the synthesis of adenosin, thymin; action of the nucleic acids on bacteria. He also made researches in trypsin digestion. He wrote ‘Untersuchungen über die Nukleine und ihre Spaltungsprodukte’ (Strassburg 1881); ‘Die Gewebe des menschlichen Körpers und ihre mikroskopische Untersuchung’ (Brunswick 1889–91) in collaboration with Behrens and Schiefferdecker; ‘Leitfaden für medizinisch-chemische Kurse’ (5th ed., Berlin 1904). Numerous valuable contributions to the journals on physiological chemistry are from his pen.

KOSSINNA, kösˈtʃna, H. Gustaf, German archaeologist: b. Tilsi, 28 Sept. 1858. He studied at Göttingen, Leipzig, Berlin and Strasbourg and was promoted to doctor of philosophy at Strassburg University (1881). He was appointed to a position in the University Library at Halle (1886) and in the Berlin Library the same year; and became curator of the Bonn Library (1887), and of the Royal Berlin Library (1892) and librarian (1894). He was given the degree of professor (1900) and undertook a prolonged trip to study the German museums of archaeology. In 1902 he was made professor of German archaeology of the Berlin University and founded the Deutsche Gesellschaft für Vorgeschichte (1909). He was a prolific contributor to the archaeological journals. On ethnology he wrote ‘Die ethnologische Stellung der Ostgermanen’ (1894); ‘Die indogermanen Frage archäologisch beantwortet’ (1902); ‘Die Herkunft der Germanen’ (1911). Among his works on archaeological subjects should be cited ‘Die vorgeschichtliche Anerkennung der Germanen in Deutschland’ (1896); ‘Ursprun des Germanen-namens’ (1897); ‘Zur Geschichte des Volksnamens Griechen’ (1896). He also edited Mannus, Zeitschrift für Vorgeschichte.

KOSSOVO, koʊsˈo-və, Turkey, a vilayet bordering on Bulgaria, Serbia, Bosnia and Montenegro, having within its confines the sandjaks Uskub, Prizen, Prishtina, Ipek and Plevlje. Its capital is Uskub. Its population consists of Turks, Christians and Mohammedans to the number of 1,100,000 in 1905. On the plain of Kosovo west of Prishtina is said to have occurred the historic battle (1389) between the Serbians and Turks, after which defeat Serbia lost her power.

KOSSUTH, köʃˈoth, Francis, Hungarian statesman: b. Budapest, 1841; d. there, 25 May 1914. The son of the famous Hungarian revolutionist, he was educated in London and Paris and became an engineer. He took part in the construction of the Mont Cenis Tunnel and acted as managing engineer of a British coal-mining undertaking in the Romagna. He began to take an active part in Hungarian politics after the restoration of the constitution, and in 1849 became titular head of the ‘Party of 1848.’ He took the oath of allegiance and was elected a deputy, leading the ultra-Nationalist opposition against five consecutive ministries. His party gained a decisive victory in the election of 1905 and it was expected that Kossuth would be appointed Premier. Baron Fejervary, however, stepped into the post, but a Nationalist ministry came into power in 1906 and Kossuth became Minister of Commerce. The cabinet fell in 1909. Though a man of accomplishments, he was not a striking politician; the inheritance of his name was alone responsible for his entry into public life.

KOSSUTH, kösˈsooth’ (Hung. köšˈuːt’), Lajos (Louis), Hungarian patriot: b. Monó, Hungary, 19 Sept. 1802; d. Turin, Italy, 20 March 1894. He came of a family of noble rank and of the Protestant religion, studied and practised law, and in 1832 entered the Parliament of Pesth as the deputy of absent magistrates, becoming also editor of a newspaper which, owing to the stringent press laws, had to be circulated in manuscript. Writing in publishing the Parliamentary debates he was condemned to four years’ imprisonment, but was released in 1840 before the end of this period. In 1841 he became editor of the Pesth Journal, a paper that advocated very advanced views and in 1844 founded the national league in opposition to the Viennese government. In 1847 he was elected to the Hungarian Diet by the National party and in 1848 became Minister of Finance in the Hungarian government. His influence had much to do in bringing about the revolution which followed and in which he played the most prominent part, being appointed governor or dictator by his fellow-countrymen; but the intervention of Russia rendered all the efforts of the Magyars unavailing. He resigned his position in favor of Görgei (whom he accused of treachery), and in 1849 he found it necessary to take refuge in Turkey, where he was kept as a prisoner. Being released in 1851 through the influence of Great Britain and the United States, he soon after visited both these countries and was received in the most enthusiastic manner. He endeavored subsequently to induce Napoleon III as well as Victor Emmanuel to act against Austria in favor of Hungarian independence, but without success. Though by the amnesty of 1867 he might have returned to his native land he did not do so, but lived chiefly in Italy and was never fully reconciled to the union that had taken place between Austria and Hungary. His ‘Memories of My Exile’ appeared in English in 1880.

KOST, Frederick W., American painter: b. New York, 1861. He studied at the National Academy of Design under William S. Macy and later at Munich and Paris. He specializes on landscapes. In 1900 he received honorable mention from the Paris Exposition; a bronze medal, in 1901, from the Buffalo Exposition; silver medal, in 1904, from the Saint Louis Exposition. In the New York Metropolitan Museum of Art is his ‘Frosty Morning’; his ‘Smithfield Marshes, Staten Island’ hangs in the Brooklyn Institute; ‘On the Saint John River, N. B.’ is in the Philadelphia, Pa., Academy,
KÖSTER — KOSTOMAROV

etc. He is a member of the Society of Landscape Painters, of the Brooklyn Society of Arts and Crafts, the Artists' Fund Society, the Society of American Artists, etc.

KÖSTER, Rüdiger, Hans, German dramatist; b. Kritzow, 16 Aug. 1818; d. Ludwigsburg, 6 Sept. 1900. He studied philosophy, traveled in Italy and France and then took up residence in Berlin. He moved later to Weimar and then to Villa Priory, near Neuzelle, Brandenburg, for agricultural work. His dramatic works, mostly of historical events and show lively action and frequently capital characters; the earlier ones obtained the approval of the critics but did not reach the stage. Later dramas of his, often performed, are: 'Ulrich von Hutten' (Breslau 1846); 'Herrmann der Cheruskier' (Berlin 1861); 'Der Grosse Kurfürst' (ib. 1851), etc. He also wrote the tales 'Liebe und Leiden' (Breslau 1862) and 'Erlebnisse und Gestattungen' (Berlin 1872). The publications entitled 'König Wilhelm der Grosse und das Reich' (ib. 1872) are collections of his patriotic poems. He also wrote biblical poetry such as 'Hiob' and 'Die Bergpredigt' (Bielefeld 1885). His Prussia-German sentiments, so forcibly expressed in a number of political pamphlets, were also made manifest in his speeches as member of the North German and later of the first German Reichstag.

KÖSTER, Hans Ludwig Raimund von, German admiral; b. Schwerin, 29 April 1844. He studied at the Werder Gymnasium, Berlin, and was candidate for cadet in the navy (1859), being appointed to active service on the coast. He was promoted to lieutenant before reaching his 20th birthday and made a cruise around the world (1878–80). He was chief of staff in the Admiralty (1884–87) and rear-admiral in 1889. Till the end of 1893 he was director of the Department of Marine, and, until 1896, was in command of the first squadron, then chief of the Baltic marine station. In 1899 he was inspector-general of marine, in which capacity he commanded the squadrons of manoeuvre. In 1900 he was given the rank of rear-admiral and appointed to the command of the active battle fleet (1903). He was raised to the rank of great admiral in 1905, retiring from active service (1906) to devote his time to the advance of the "greater navy" proposition. In 1908 he was elected president of the German Navy League. His title of nobility made him a member of the Prussian House of Lords.

KOSTER, or CÖSTER, Samuel, Dutch dramatist; b. Amsterdam, 16 Sept. 1579; d. some time after 1662. He obtained his medical diploma (1610) and practised as a physician at Amsterdam where he was director of the infirmary till 1662. He founded, after Italian style (1617), the Dutchsche Academie. He is especially noted for his delightful comedies 'Tijssen van der Schilden' (1613) and 'Teeuwis dae van der Schilden' (1618) in which he shows up his talents in drawing up a plot and giving color to the characters. He wrote tragedies, such as 'Ivthv' (1615) 'Iphigenia' (1617), a political satire, and 'Isabella,' after Ariosto, in conjunction with Hooff; also 'Polyvexa' (1619). His works are printed in Amsterdam, 1633, with a preface by John Rolfe Collewyn (Haarlem 1683). Consult Rossing, who wrote his biography (Leidyen 1875).

KÖSSLIN, kést-lin, Christian Reinhold, German poet and criminologist; b. Tübingen, 29 Jan. 1813; d. there, 14 Sept. 1856. He practised law in Stuttgart (1836) but settled in Tübingen as private teacher (docent). He was writing, in the meanwhile, poems, also stories, for the Novellensammlun, all under the name of C. Reinhold, which were published collectively later (Bremen 1847–48). The success in his career as a jurist was established by his 'Die Lehre vom Mord und Totschlag' (Stuttgart 1838) and 'Wilhelm I, König von Württemberg, und die Entwickelung der württembergischen Verfassung' (ib. 1839). He was given the degree of professor (1851). His most important works on criminal law in his latter life are 'Der Wiederspiegel eines deutschen Strafverfahrens am 19 Jahrhundert' (Tübingen 1849); 'Die geschmacklich und literarisch gestaltete' (Leipzig 1851); 'Die Geschichte der deutschen Strafrechts' (Tübingen 1859).

KÖSSLIN, Julius, German Protestant theologian; b. Stuttgart, 17 May 1826; d. 12 May 1902. He traveled in England and Scotland (1849) and was appointed vicar at Stuttgart (1850), soon to become private instructor (Repetent) at the theological seminary at Tübingen. He was given the appointment of professor of Theology at Göttingen (1855), Breslau (1860) and Halle (1870), and retired in 1890. He wrote, among other numerous works, 'Luthers Lehre von der Kirche' (Stuttgart 1854); 'Das Wesen der Kirche, beleuchtet nach Lehre und Geschichte des Neuen Testaments' (ib. 1854); 'Luthers Theologie' (ib. 1860); 'Martin Luther, sein Leben und seine Schriften' (Elberfeld 1875; 5th ed., Berlin 1903); 'Luthers Leben,' a very popular work (Leipzig 1882; 9th ed., 1891); 'Der Glaube und seine Bedeutung für Erkenntnis, Leben und Kirche' (Berlin 1895); 'Christliche Ethik' (Berlin 1898). He was editor of Theologischen Studien und Kritiken from 1873. Consult 'J. Kößlin, Autobiographie' (Danzig 1891).

KÖSSLIN, Karl Reinhold, German theologian and aesthetic; b. Urach, 28 Sept. 1819; d. Tübingen, 12 April 1894. He studied philosophy and theology at Tübingen. He was soon devoted himself solely to philosophy. He was given the degree of assistant professor (1857) and made professor of aesthetics and art history (1863). He wrote 'Der Lehrbegriff des Evangeliums und der Briefe Johannes' (Berlin 1843); 'Ästhetik' (Tübingen, 1862–93), his chief work; 'Richard Wagner's Tondramen: Der Ring des Nibelungen' (Tübingen 1877); 'Ueber die Schönheitsbegriff' (Tübingen 1879); 'Geschichte der Ethik' (Tübingen 1887); 'Prolomogema zur Ästhetik' (Tübingen 1889).

KOSTOMAROV, kosto-maróf, Nikolai Ivanovitch, Russian historian; b. Ostrogosz, Government Veronezh, 1817; d. Saint Petersburg, 19 April 1885. He studied in the Kharlov and Moscow universities and entered a dragoon regiment (1836) but obtained his release and was appointed teacher (docent) at the Kiev University (1846). He was dismissed the following year for his activities in Little
Russian literature, and joined his friends Szewczenko, Kulisz and Bitzerzki in a secret literary society to resuscitate the Slavophile propaganda. He also took an active part in the movement for the restoration of the empire. After the death of Tsar Nicholas I he obtained permission to travel abroad, and was appointed (1859) professor of history at Saint Petersburg. On the closing of the university in consequence of a students' riot (1861) he retired to take up literary work alone, assuming the nom-de-plume of Jeremija Halka. His poetic works were written in Little Russia vernacular and were published in Odessa (1875) in a collective issue, the dramas, “Sawa Czalii” (1838) and “Ukrainskii balad” (1839), among them. In 1847 he was forbidden further publication of his works in Little Russian version and he then devoted himself to historical research. Among his principal works are: “Historical Monographs,” (Saint Petersburg, 1853-70, 12 vol.); “History of the old Slavic republics, Novgorod and Ikskov” (1863); “Russian history in Biographies of her most important Personages” (Saint Petersburg 1873; translation by Henckel, Leipzig 1886-98). Consult Pupin, “Nikolai Kostomarov” (in “History of Russian Ethnography,” Saint Petersburg 1893).}

KOSTROMA, Russia, a government bounded on the north, east and south by the governments Vologda, Viatka, Nizhni Novgorod and Vladimir, respectively, and on the west by Jaroslav. Its area is 12,432 square miles and its population, 1,745,800 in 1912, consists chiefly of orthodox Russians with a sprinkling of Tartars and Cheremisses. From an agricultural standpoint this government belongs to the so-called central-Russian industrial territory; its chief commerce is in lumber, but it has a considerable agricultural production of oats, rye, wheat and barley, and its flax industry is valuable, grown chiefly in the Nerechta district. Its bee industry and fisheries, formerly important, have fallen off. Of its incomparable manufactures might be cited cotton goods and linen ware, leather products and brandy distilling.

KOSTROMA, kōs’tro-mä’, Russia, capital of the government of the same name, situated at the confluence of the rivers Kostroma and Volga on and the Jaroslav-Kostroma Railway. It has a monument erected to Ivan Sussanin with a bronze bust of Tsar Michael Feodorovitch, whom he saved (1613) from the Poles. Here are no less than 38 churches, the 14th century, richly adorned cathedral of the Assumption and the beautiful Bogojavlensky Church (18th century) among them; also two monasteries, a gymnasium, a gymnasium for girls, a high school, priests’ seminary, lady-teachers’ seminary and a theatre figure among the prominent public buildings. Among the commercial features are two banks, numerous manufactures, of linen especially, besides a considerable trade in salt and other products and its shipping. It is said to have been founded in 1152 by Juri Dolgorouky. Pop. 07274.

KOSZTA (ko’sta) AFFAIR, a diplomatic incident. A Hungarian refugee to the United States, named Martin Koszta, obtained his declaration of intentions or first citizenship papers in 1850. He visited Smyrna in 1853 and was seized by members of the crew of the Austrian brig “Husor” on 21 June. Captain Ingraham, of the American war sloop “Saint Louis,” under instructions from the American Minister at Constantinople, demanded his release. Hearing that the prisoner was to be transported secretly to Trieste, Captain Ingraham set a time limit to the surrender and made preparations to attack the “Husor” on 2 July. The prisoner was surrendered. The Austrian government issued to the European courts a note of protest against the American procedure. Baron Hülsemann, Austrian Chargé d’Affaires at Washington, asked Secretary of State Marcy to disavow the conduct of its agents... hasten to call them to a severe account and tender to Austria a satisfaction proportionate to the magnitude of the outrage, claiming the arrested man to be an Austrian citizen and the action of Ingraham violative of international law. Marcy’s reply, within a month, declared Koszta was not a citizen of Austria but “that Koszta, when seized and imprisoned, was involved in the nationality of the United States, and they therefore had the right, if they chose to exercise it, to extend to him that from international law—the only law which can rightfully be appealed to for rules in this case—Austria could receive no authority to obstruct or interfere with the United States in the exercise of this right, in effecting the liberation of Koszta; and that Captain Ingraham’s interposition for his release was, under the extraordinary circumstances of the case, right and proper.” The Congress passed a joint resolution of thanks to Captain Ingraham and invested him with a medal in commendation of his services. Consult “Correspondence between the Secretary of State and the Chargé d’Affaires of Austria relative to the Case of Martin Koszta” (Washington 1853); Rhodees, J. F., “History of the United States from the Compromise of 1850” (New York 1910), this contains a bibliography of the controversy. See INGRAHAM, DUNCAN NATHANIEL.

KOTLIAREVSKI, kot’l-yār-f’skī, Ivan Petrovitch, Russian poet: b. Poltava, 9 Sept. 1769; d. there, 10 Nov. 1838. He first entered state service but in 1796 joined the army and was advanced, in the Turkish War, to captain of the staff. He undertook (1808) the management of an educational establishment for the children of poor nobility at Poltava, and superintended (1827) the local poorhouse until 1835. He raised the Little Russia idiom to a literary language and thereby became the founder of Little Russia national literature. His most important work is the travesty on Virgil’s “Æneid” (Saint Petersburg 1798; last ed., 1890), which overflows with transgressive, sparkling humor and was intended to shock off the apathy that had lost the Cossacks their freedom and which chastised without mercy the crimes of the lower classes. On the other hand his dramatic pictures of customs display the moral capacity of the people in his plays, “Natalia Poltawska” (Natalie Pol’ta-va) and “Moskal ćarimyn” (“The Soldier as Conjuror”). His entire works were published in Kiev (last ed., 1890).

KOTO, a Japanese musical instrument, having a long box, larger at one end than the other, and with a convex top over which 13 silk
strings are strung and fastened tightly at each end, each string having a bridge. To tune the instrument it is necessary to move the bridges. The instrument is played with both hands like a harp.

KOTOTSHIKIN, kö'tō-shē'kin, Gregory, Russian writer: b. 1630; d. 1667. He was an official in the Ministry of Foreign Affairs under Tsar Alexis and was suddenly deposed on account of a conflict with his superiors. He went to Polack (1664), then Russia, then Stockholm, where he wrote a book concerning the internal condition of Muscovy (1666-67) for the Swedish Imperial Chancellor de la Gardie. He was tried and executed for murder soon after this, and his name forgotten. His memory was re-visited by the discovery (1838) of his interesting work, in the original manuscript, in the Upsala University Library. Under the title 'About Russia under the Rule of Alexis Michaelovitch' it was published by the Imperial Russian Archaeographical Commission (last ed., 1884).

KOTOW, kö tow' or-ō-tō, a Chinese form of obeisance; a ceremony in which an inferior, kneeling, touches his forehead to the ground.

KOTZEBUE, köt'sh-bøo, Alexander von, German painter: b. Kötingsberg, 9 June 1815; d. Munich, 24 Feb. 1889. He studied art at the Saint Petersburg Academy under Sauerweide and after six years went (1846) to Paris to continue his art cultivation. In 1848 he started on a tour of Belgium, Holland, Italy and Germany, settling at last in Munich. He painted numerous battle scenes of the Russians in the Seven Years' War and of the campaigns of Suvorov for the tsar. The most important are 'Storming of Schlüsselburg'; 'Battle of Poltava'; 'Storming of Narva'; 'Passage over the Devil's Bridge.' His pictures are noteworthy for distinctness of composition, care in details and exquisite color work.

KOTZEBUE, August Friedrich Ferdin- and von, German dramatist and Russian official: b. Weimar, 3 May 1761; d. Mannheim, 23 March 1819. In 1781 he went to Saint Petersburg, where, obtaining the patronage of the empress, he was made governor of Esthonia and soldiery. About 1805 he returned to Germany and attacked Goethe and other great German authors who had refused to associate with him. In 1806 he went again to Russia, and lived from 1807 on his estate, Schwartzt, in Esthonia. In 1813, as counsellor of state, he followed the Russian headquarters, constantly writing to excite the nations against Napoleon. In 1817 he received a salary of 15,000 roubles, with directions to reside in Germany and to report upon literature and public opinion. Kotzebue, who, during the whole campaign had written in favor of the Russians, even at the expense of his native country, and had expressed the utmost contempt for liberal principles and institutions, was now odious in the eyes of most of his countrymen and regarded as a spy. This feeling was so strong in the case of a young enthusiast named Sand that he assassinated him as a traitor to liberty. Kotzebue wrote more than 200 plays, a history of Germany and other works, most of which are now forgotten.

KOTZEBUE, Otto von, Russian navigator; second son of A. F. F. Kotzebue: b. Reval, 30 Dec. 1787; d. there, 15 Feb. 1846. In his 17th year he accompanied Krusenstern in his voyage round the world. In 1815 he was appointed to the command of a ship destined 'to ascertain the practicability of a northeast passage in the direction of Bering Strait. He discovered several groups of islands in the Pacific, and a large sound on the southeast of Bering Strait, which now bears his name; and returned after a three years' absence. The results of the voyage were published in a work called 'A Voyage of Discovery in the South Sea and to Bering's Strait in Search of a Northeast Passage' (1821-23). In 1823 he was commissioned by the Emperor Alexander to make a third voyage round the world. He returned in 1826, publishing the results of the voyage in a work which has been of great importance to hydrography, particularly that of the Pacific, 'A New Voyage Round the World' (1830).

KOUMISS, See KIMISS.

KOUPATSKIN, koor'pə-tär'kin, Alexei Nikolayevitch, Russian soldier: b. 17/29 March 1848. He was trained for the army in the Imperial Military College and the Academy of the General Staff; was sent abroad to study military conditions in various European countries; in 1874 became a member of the general staff of the army; in 1876-77 assisted Skobelev in the conquest of Khokand, Turkestan, and its reorganization as the territory of Ferghana, and in 1877-78 won high distinction in the Russo-Turkish War by his services at Plevna and the Chipka Pass. In 1878 he was made colonel and in 1878-79 was chief of the Asiatic bureau of the general staff. In 1880-81 he was in Middle Asia, where he commanded the main detachment against the Tekke-Turkomenians, and, after a forced march of 600 miles across the desert, stormed Geok-Tepa, by which victory he won his greatest reputation. He was made major-general in 1882, lieutenant-general in 1890, governor of the Trans-Kaspi district and commander of the troops in that district in 1890, and Minister of War in 1898. In 1901 he became general of infantry. At the outbreak of the hostilities with Japan he was sent to command the Russian forces in the Far East. After the battle of Liaoyang he was superseded by General Liniwевич, under whom he continued in service as commander of the First Manchurian army. His failure in the Far East was attributable, in part at least, to his position of subordination to the viceroy, and to dissensions among his generals. In October 1915 he was appointed chief of the Russian Grenadier Guards, and acted in an advisory capacity to the tsar when the latter took up the chief command of the army during the Great European War in succession to the Grand Duke Nicholas. He was later command-in-chief on the northern front, including the Riga-Dvinsk line, and in August 1916 was transferred to the governor-generalship of Turkestan. As a military writer he is favorably known by several volumes including 'Kashgarie' (1879), for which he received the gold medal of the Imperial Russian Geographical Society; 'The Operations of the Troops of General Skobelev during the War of Russia with the Turks' (1883); 'The Conquest of Turkomania' (1889); 'Russia for Russians;
the Past and Future Problems of the Russian Army' (1910).

KOVALEVSKY, kó-vá-lyet'skii, Alexander, Russian embryologist: b. Dünnburg, 7 Nov. 1840; d. there, 22 Nov. 1901. He studied in Heidelberg and Tübingen, and, after traveling, became professor at the Saint Petersburg University and member of the Academy of Science. He rendered useful service by his researches into the formation of the ascidians (1866-71) and the Amphioxus (1867) and evolved the first acceptable hypothesis of the relationship between vertebrates and invertebrates. He did similar research work effectively on nearly all branches of the animal kingdom; among them was his useful work on the anatomy of the Balanoglossus (1866), on the formation of the Ctenophora ctenolateres (1865), the embryology of worms and arthropods (1871). Other work concerned the organs of secretion and lymphocytes of the vertebrates; brachiopods and foraminifers (1874). He wrote 'Entwicklungsgeschichte des Amphioxus lanceolatus' (1877); 'Celoplana metschnikovi' (1882); 'Entwicklung der Musciden' (1887); 'Anatomie de l'Archeobella esmontii' (1896); 'Anatomie de l'Acanthobella peledina' (1896).

KOVALEVSKY, Sophie, Russian mathematician and writer: b. Moscow, 15 Jan. 1850; d. Stockholm, 10 Feb. 1891. She wrote much under the name "Sonia." She received her early education through her father, a general of artillery, then studied mathematics at Heidelberg (1869) after a sham wedding ceremony to legitimize her as a college student. She next studied in Berlin (1871-74) under the private tuition of Weierstrass, her sex not being admitted to the university. Her thesis 'Zur Theorie der partiellen Differentialgleichungen' gained her a degree at Göttingen. Beside her thesis she wrote two no less important pamphlets 'Über die Reduktion einer Klasse Abelscher Integrale dritten Grades in elliptische Integrale' and 'Zusätze und Bemerkungen zu Laplaces Untersuchungen über die Gestalt des Saturnringes' (both published in Acta Mathematica, 1884). She returned to Russia, thence to Paris (1879), and, becoming widowed through her husband's suicide, she went to Berlin (1883). In 1884 she was appointed professor of the higher analysis at Stockholm. Other works of hers are 'Über die Brechung des Lichtes in kristallinem Mittel' (in Acta Mathematica, 1885); 'Über den besonders Fall des Problems der Rotation eines schweren Körpers um einen festen Punkt' (ib. 1889), for which she received the Bordin prize of the Paris Academy, raised from 3,000 to 5,000 francs for the extraordinary production. In the realm of light literature she wrote such works as 'Der Privatdozent,' a description of German university life; 'Die Schwestern Rajewski,' an account of her own childhood; 'Die Nihtili' (At Vilna 1898), etc. Her sketches from Russian life appear collectively in Literaturyja sochinenja (Saint Petersburg 1893). Consult 'Jugendarinnerungen' (Berlin 1896); Leffler, Anna, 'Sonja Kovalevsky' (Stockholm 1892), and the necrology of Mittag-Leffler in Acta Mathematica (Vol. XVI).

KOVNO, Russia, the government of this name is bounded on the north by Courland, on the east and south by Vilna and Swalvy and on the west by Prussia. It has an area of 15,518 square miles, mostly flat lands and small lakes and watered by the rivers Niemen, Vilja and Sventa, Nevjasha, Dubessa, etc., of which all but the last are navigable. The climate is relatively mild. Its inhabitants, 1,819,340 in 1912, are about three-quarters Lithuanians, the Jews 14 per cent, Slavs over 9 per cent and Germans nearly 3 per cent. The chief branch of industry but there is an improving cattle breeding industry and its growth of wheat, rye and other grains, as well as potatoes, is sufficient to permit a considerable export.

KOWLOON, or KAUJUN, a district in China, forming a peninsula at the mouth of the Canton River. A concession four miles square was granted to the British in 1860, and augmented by 376 square miles in 1898. The town is a free port, and the European section is fast growing. Pop. 85,000.

KOVUN, koo-yoon-jik', or KUJUN, see Nineveh.

KRAAL, kral, a South African word used to designate a native village whose huts are surrounded and protected by a circular hedge or stockade. The word may be derived from an African source, but is probably taken from the Spanish corral or the Portuguese curral, a cattle pen or fold. Hence the term is used to define the folds or enclosures built for the protection of cattle.

KRAFFT-EBIN, kraft'-ab'ing, Richard, BARON von, German neurologist: b. Mannheim, 14 Aug. 1840; d. Mariengrün, near Graz, 22 Dec. 1902. He studied at Heidelberg, Zurich, Vienna and Prague and was appointed (1864) assistant physician in the lunatic asylum at Illenau. He went to Heidelberg to study psychology (1868) and then settled at Baden-Baden as nerve specialist. After the Franco-Prussian War, in which he was army physican, he directed an electro-therapeutical establishment at Baden-Baden. In 1872 he went to Strassburg as assistant professor of psychiatry and director of the Clinic of Psychiatry, but, in the following year became professor of psychiatry, director of the national insane asylum at Feldhott, and practised at Graz. In 1886 he was appointed professor of psychiatry and neurology at the enlarged Graz clinic. He founded a private sanatorium at Mariengrün, but went to Vienna (1889) as professor of psychiatry and nervous diseases. In 1902 he returned to Graz. His 'Lehrbuch der Psychiatrie auf klinische Grundlage' (Stuttgart 1879-80; 7th ed., 1903) and his 'Lehrbuch der gerichtlichen Psychopathologie' (ib. 1875; 3d ed., 1900) determined the place of psychiatry in clinical science. In neuralgia great service by his work on epilepsy, hemi-crani, paralysis agitans, etc. He also wrote 'Grundzüge der Kriminalpsychiatrie' (Stuttgart, 1872) 'Über gesunde und kranke Nerven' (5th ed., Tübingen 1890), 'Psychopathia sexualis' (Stuttgart 1896; 12th ed., 1903) was translated into seven languages; 'Hypnotische Experimenta' (ib. 2d ed., 1892); 'Die progressiv allgemeine Paralyse,' in Nothnagel's Pathologie und Therapie (Vienna 1894, Vol. IX), etc.
KRAFT, kräft, Adam, German sculptor; b. Nuremberg, 1440; d. Schwabach, Bavaria, 1507. Nothing is known of his teachers, his student travels or his fortunes. His known productions begin with the seven reliefs (Stations of the Cross) set up in Nuremberg (1490) near the entrance to St. John Cathedral. Five of them now form the German Museum, their original place being taken by sandstone copies. He executed many sepulchral monuments; in the church of Saint Sebaldus is the statue he made for Sebald Schreyer (1492). In the choir of the same church are his relief of the scenes from the Passion, the figures being life-size. He also carved the monument for the Pergerstorf family in the Frauenkirche (church of Saint Mary the Virgin); that for the Landauer family in a chapel of the church of Saint Egidius. His last work was the "Entombment," a group of 15 life-size figures in the mortuary chapel of the Holzschuherschen family, a part of the church of Saint John (1507). He also executed several works of minor importance, as decorations of private and public buildings. His masterpiece is the tabernacle in the church of Saint Lawrence, which he took seven years (1493–1500) in completing. It is more than 50 feet high, and is an example of gorgeous Gothic carving enriched with numerous figures. At the foot he placed his own portrait, life-size. His style is bold and vigorous, his conceptions are profoundly religious, and his power of lifelike characterization is wonderful. He is the finest exponent of the Nuremberg school of Gothic sculpture.

KRAGYÜEVATS, kră-gy'yă-vät's, Serbia, a district town on the river Lepenita and the Lapovo-Kragyuevats State Railway. It is in the fertile Smedira plain and has a gymnasmum, cannon foundry, munitions and small-arm factory as well as an arsenal. It was built in 1431 and restored in 1890 by Miloš Obrenović, when it was the seat of government, and had a population of 18,452 in 1910.

KRAIT, krait, one of the most dreaded of Oriental poisonous snakes (Bungarus caeruleus), nearly related to the cobras. It inhabits nearly all India and Ceylon, is very common in the Peninsula and South China; more deadly than any other snake, since in its pursuit of rats, lizards and snakes, it frequently enters camps and village houses; furthermore, its venom is astonishingly rapid in its effects. It reaches a length of four feet, has smooth scales, a ridge along the spine, no hood, and is bluish or brownish black with highly variable bars and markings of yellow and white. Other deadly species of the same genus of bungars or rock-snakes are the larger raj-camp or "king-snake" (B. fasciatus), noted for its active killing of cobras and other snakes; and other species in Ceylon and the Indo-Chinese region. Consult Ewart, "Poisonous Snakes of India" (London 1878); Payrer, "Thanatophida of India" (ib. 1874); Wall, "The Poisonous Snakes of India" (in Journal of the Bombay Natural History Society, Vol. XVI, Bombay 1906); the "Proceedings" of the Zoological Society of London for 1899.

KRAKATOA, kră-kă-tō'a, a volcanic island in Sunda Strait, between Sumatra and Java; area, six square miles, formerly about 12 square miles. The island, now uninhabited, is known as having been the scene of a terrific volcanic eruption on the night of 26–27 Aug. 1883. The volcano had been practically inactive for over 200 years until May of 1883, when there were indications of an eruption, which culminated at the date mentioned. A number of explosions occurred, the noise of which was heard for many miles. A mass of rock, in the form of dust, ashes and small stones, and of the volume of about a cubic mile, was thrown up for a considerable distance. The dust was projected, vertically, nearly 20 miles, and distributed to all parts of the globe by the upper air currents. The effect, especially as shown in brilliant sunrises and sunsets, was visible for many months. The disturbance created a series of extensive sea-waves which swept over the shores of Java and Sumatra, destroying many villages and causing the loss of more than 30,000 people. The wave-motion was observed in South America. About one-half of the island was destroyed, including the highest mountain. One immediate effect was the darkness which alarmed many people, which continued 27 Aug. 1883 known as one of the dark days.

KRAKEN, krä'- or krâ'-Che, the term, of Norwegian origin, applied to a fabulous sea-monster, generally assumed to be a gigantic squid (q.v.). It was first described by Pontoppidan, bishop of Bergen in Norway, but other old writers have accounts of substantially the same kind of monster. It is described as of enormous size; rising from the sea like an island about 1½ miles in circumference, with enormous mast-like arms with which it wrecked ships, created whirlpools, and realized all that was prodigious and strange in size, habits and appearance. The kraken stories led to a similar creation by Victor Hugo in his "Toilers of the Sea," which, considered zoologically, is almost as far from possible truth as was that of old Pontoppidan.

KRAMBAMBULLI, kräm-bäm'boÖ-lo, a Slavic term referring originally to Danzig cherry brandy, concerning which Wittekind (1745) wrote a students' drinking song of lasting and widespread popularity in the colleges. The term has come to define any spirituous drinks at this day.

KRANACH, Lucas. See CRANACH.

KRASICKI, krä-shik-skë, Ignacy, Count, Polish poet and writer; b. Dubiecko, 3 Feb. 1735; d. Berlin, 14 March 1801. He was educated at Lemberg and studied at Rome (1760–61). He was appointed Fürstbischof of Ermland and lived, alternately, at Wolfsberg and Warsaw. Becoming a favorite of Frederick the Great at Sansouci, he was appointed archbishop of Gnesen (1795). His "Fabeln" and "Saitiren" (Warsaw 1779) display irrepressible humor and finished form. The mock heroic poem "Myszein" (Warsaw 1778) was translated into the German and French as "Die Mäusekade" (ib. 1790), and "La Souriaude" (Vilna 1817), respectively, and concerns the legend of King Popiel who was eaten up by mice, and contains allusions to the contemporary political conditions under his "Monachomachia" (Monks' War), published in 1778, chastises the idleness, lack of learning and drunkenness of certain monastic orders; while his "Anti-monachomachia" (1780), under the appearance of attempting to soften the rage
brought about by his first work, simply flays in stronger measure. Among his numerous prose works were ‘Mikol Doświadczyskis’ (1775), and ‘Pan Podstoli’ (1778). His collective works were edited by Dmochowski (Warsaw 1833-34); later extended editions were published in Berlin (1845) and Warsaw (1878). His biography, written by Ignacy Krasiński, was published under the title ‘Życie i dziela’ (Warsaw 1879).

KRASIŃSKI, krasňśki'n-ski', Zygmunt, Count, Polish poet: b. Paris, 19 Feb. 1812; d. there, 23 Feb. 1859. Son of a general, he was educated at the paternal home, which was a rendezvous for Polish authors and poets, under the tutelage of Konzenyiovski, an author. In his 14th year he wrote several historical romances in Sir Walter Scott's style. He entered the Warsaw Lyceum (1826), then studied law at the university (1828) but left Poland (1829) on account of the animosities against his father and which he inherited. He traveled through Italy and Switzerland and became acquainted (1830) with Mickiewicz (q.v.) who led him into writing poetry. Along with Mickiewicz and Slowacki he was one of the most notable poets of recent Polish literature. His poems were published under the noms-de-plume Konst, Gaszyński, Spiridion Prawdzicki, Liguzma and Mickiewski. First appeared the poetic stories ‘Agay Han’ (Breslau 1833); then came dramatic poems ‘Nieboska Komeda’ (Paris 1834); the ‘Undivine Comedy,’ in which the writer attempts to solve the greatest problems in the political and social sphere. His chief work, ‘Dawn’ (Paris 1836), is an epic, semi-dramatic poem showing the contrast between the spoiled Rome of the Caesars and the vengeance planned by enslaved Hellas, described in most glowing colors, allegorical of the suffering Poland. In his ‘Przedwiat, ’ ‘Dawn’ (1843), he praises the moral elements entering into the history of Poland and makes the renaissance of his fatherland depend on morality. His ‘Psalmy przysięczni,’ the ‘Psalms of the Future’ (1845-48), glorifies the heroism of martyrdom and brought forth hot opposition, some terming the work ‘lyric cowardice,’ and by it he lost the friendship of Slowacki. His works have all been translated into the German and a selection, in three volumes, appeared (Leipzig 1863), the most comprehensive, in four volumes (Lemberg 1880-88). Consult Tarnowski, ‘Zygmunt Krasiński’ (Cracow 1892); Endler, Anna, ‘Sigismondo Krasiński’ (in Nuova Antologia, 5th series, Rome 1913). His letters were published (Lemberg 1882-90) in four volumes. See Istvan. 

KRASNÍK, kras'ni-k, Russian, Poland, a town in the government of Lublin and containing an ancient castle. It had a population in 1910 of 9,178. In the World War this was the scene of a prolonged battle in which the Austrians attempted to force their way to Lublin were at first successful but the Russians, reinforced, drove them back in Galicia.

KRASNOYARSK, kras'no-yar'sk', capital city of the circuit of same name in the Russo-Siberian government Yeniseisk, located on the Yenisei and on the Trans-Siberian Railway. The name means red-cliff, derived from the quality of the marly soil of the river's banks. It is the seat of the governor and its manufactures consist of brick kilns, tannery, soapworks, iron foundry, etc., while its trade is in grain and supplies for the gold washers of the neighborhood. Pop. 80,102.

KRASNOYE SELO, krás'nö-yë sâ-lo', Russia, a summer resort in the government of Saint Petersburg, at the foot of the Duderhof Mountain and situated on the Lischenka River and the Saint Petersburg-Riga Railway. It contains the Imperial palace and park, a church erected by Catherine II and 3,741 inhabitants in 1912. The yearly manoeuvres of the Imperial Guard were held here and it was their summer camp.

KRASEWSKI, kru-shë-shki', Josef Ignacy, Polish novelist, dramatist and historian: b. Warsaw, 28 July 1812; d. Geneva, 19 March 1887. He was educated in Biala, Lublin and Swisloch and studied history, literature and languages at Vilna University. He was imprisoned (1831-33) for political views, and in the Polish insurrection, after which he returned to his family estate Dolhe, government Grodno, and rented (1837) the Omelno estate in Volhynia. He went to Schitomir (1853) where he filled several honorary positions, then went to Warsaw (1859) as editor of the Gazeta codzienna. Being exiled, for participating in the rebellion, he went to Dresden (1863), becoming a naturalized citizen (1876). In 1884 he was sentenced, at Leipzig, to three and a half years imprisonment for high treason, but was permitted six months' absence (1885) to recover his health. He traveled to Switzerland and Italy but never returned. At Cracow he was banished and died at Geneva. He was the most prolific of Polish writers, entering every branch of literature in prose and poetry, but his most substantial success lay in his romances. His stories, that have made up a total of 400 volumes, may be divided into two categories: up to 1863 dealing with social matters, then entering the realm of politics. Of his first works ‘Pan Walery’ (Vilna 1833) and later following the world took little notice, but his novel ‘Poeta i świat’—the Poet and the World (Poscn 1839) made him the pet of the Polish nobility. To the novels of the first period belong ‘Ulana’ (Vilna 1843) ‘Cordecki’ (ib. 1852) ‘Chata za wsia’ (Saint Petersburg 1854-55). His political novels, written under the pseudonym Boleslavia, include ‘Dziec, starego miasta,’ attractively relates the preparations that were made for the 1863 insurrection; ‘The Spy’ was translated into German as ‘Der Spion’ (Dresden 1864) as were also ‘The Pair’ ‘The Moscovite’ ‘The Jew’ ‘In the East,’ etc. Among his historical novels we find ‘Count Brühl’ (1865) ‘Countess Cosel’ (1874), etc. Of his cultural novels of the second period should be mentioned ‘Mori- turi’ (1874-75), and ‘Resurrecti’ (1876), both translated into German in Reclam’s Universal-Bibliothek. Of his poetic works should be mentioned ‘Anafielas’ (Vilna 1843-45), concerning the ancient history of Lithuania, and ‘Hymny boles’ (Paris 1857). Most important of his dramatical works are the comedy ‘Miód Kaszternski’ (Kief 1860) and the historical drama ‘Trzeci maja’ (Cracow 1876). His literary-historical dissertations were issued collectively, in part, as ‘Studia literackie'
(Vilna 1842) and 'Nowe studia literacki' (Warsaw 1843). Of his histories must be cited his 'History of Vilna' (1750); 'Litva' (Warsaw 1847-50), concerning ancient monuments of Lithuania. Besides which he wrote many philosophical, aesthetic art and archaeological treatises. Consult Boldanowicz, J. 'Ivan Krason und sein Wirken' (Leipzig 1879).

KRAUSE, krouz', Ernst Ludwig, German writer: b. Zielenzigg, 22 Nov. 1839; d. 1903. He studied pharmacy, but after passing the state examinations he turned to the study of natural history and the history of civilization. He settled in Berlin (1866) and advanced the Krassian theory of life, especially through his connection with Darwin and Haeckel in the publication of the monthly journal Kosmos (Leipzig 1877-82). He wrote numerous articles to the newspapers and periodicals that raised deep interest and caused deeper research, as did that concerning the color sense of primitive peoples. Historical studies led him to the recognition that Charles Darwin's grandfather, Erasmus Darwin, the English physician and poet, originated the theory of the descent of man. He wrote under the pseudonym Carl Schiller. Among his more important works are 'Werden und Vergehen: Eine Entwickelungsgeschichte des Nationalgunzen' (Berlin 1876; 6th ed., 1905); 'Sommerblumen' (Leipzig 1884); 'Herbst und Winterblumen' (ib. 1885); 'Die Krone der Schöpfung' (Teschens 1884); 'Ch. Darwin und sein Verhältnis zu Deutschland' (Leipzig 1885); 'Die allgemeine Weltanschauung in ihrer historischen Entwicklung' (Stuttgart 1889); 'Natur und Kunst' (Berlin 1891); 'Die Trojaner und die Nordeuropäer' (Glogau 1893); 'Die Entstehung der Herkunft der Trojasage' (ib. 1893); 'Geschichte der biologischen Wissenschaft in 19ten Jahrhundert' (Berlin 1901).

KRAUSE, Karl Christian Friedrich, German philosopher and writer: b. Eisenberg, 6 May 1811; d. Munich, 27 Sept. 1832. He studied philosophy at Jena under Fichte and Schelling and took as private teacher (docenti), becoming instructor at the Dresden Academy of Engineering (1805). He returned to Berlin (1814) after Fichte's death, but settled in Göttingen (1824), as private teacher without gaining the professorial degree. In 1831 he removed to Munich but without accomplishing his desire of a professorship. He was a prolific writer as he had to care for a large family. He was the originator of a philosophical system of his own, which he differentiated from that of the Schelling-Hegel Pantheismus (all-God doctrine) and as the name Pantheism (all-in-God doctrine) and defined as the union of Absolutism, Schelling-Hegel, and the Subjectivism of Kant-Fichte. He contended that the duty of man was to come in one single union (Bund) composed of an organism of branch unions, each member and branch belonging, fully and harmoniously, a part of the living whole. He hoped to gain advance in his propaganda by joining the Freemasons (1805), in which organization he thought he saw certain fundamental social features coinciding with his theories, and he wrote a number of articles on Freemasonry, but his expressed theories brought him into contest with the fraternity and he was expelled (1810). Among his followers were, Ahrens, Leonhardi, Lindemann, Roeder, etc., who spread the philosophical tenets through Belgium, Spain and South America. Foremost of his published works are 'Abriss des Systems der Logik als philosophischer Wissenschaft' (Göttingen 1828); 'Vorlesungen über das System der Philosophie' (ib. 1828); 'Abriss des Systems der Philosophie des Rechts' (ib. 1828); 'Vorlesungen über die Grundwahrheiten der Wissenschaft' (ib. 1829). Since his death a large mass of his unpublished manuscripts have been issued in numerous volumes by Leonhardi, Leutbecher and others (Göttingen 1834-48), by Röder ('System der Rechtspolitik', Leipzig 1874) and more recently by Hohlfeist. Consult Hoffeld, 'Die Krausesche Philosophie' (Jena 1879); Procksch, 'Karl Christian Friedrich Krause, ein Lebensbild nach seinen Briefen' (Leipzig 1880); Eucken, 'Zur Ermüderung an Krause' (ib. 1881); Martin, ' Chr. F. Krauses Leben, Lehre und Bedeutung' (ib. 1881); Leonhardi, K. Chr. Friedr. Krauses Leben und Lehre' (ib. 1902), and 'K. Chr. F. Krause als Philosophischer Denker gewürdigt' (ib. 1905); Kohler, 'Der Philosoph Krause als Geograph' (ib. 1904).

KRAUTH, krouth, Charles Porterfield, American Lutheran theologian: b. Martinsburg, Va., 17 March 1823; d. Philadelphia, 2 Jan. 1883. He was graduated (1839) at Pennsylvania College and was given charge (1841) of a Baltimore mission. He served congregations (1842-55) at Baltimore, Martinsburg and Winchester, Va. He was appointed minister (1855) of the Pittsburgh First Lutheran Church and (1859) at the Philadelphia Saint Mark's Church. He became editor of The Lutheran. He composed the "Fundamental Articles of Faith and Church Polity" (1866) which was adopted at the Reading Convention, as basis of the General Council of the Evangelical Lutheran Church in North America, also the "Constitution and By-Laws" (1880) adopted by the General Council. He was for 10 years president of the council. He was elected a trustee of the University of Pennsylvania and (1868) professor there of mental and moral philosophy, and undertook the department of history there in 1881. He was a member of the American Committee for the revision of the English version of the Bible. He wrote 'The Conservative Reformation and its Theology' (1872); translations of Tholuck's commentary on the gospel of Saint John (Philadelphia 1859) of the Augsburg Confession, with introduction and annotations (1868). He edited a new edition of Berkeley's Principles of Human Knowledge" (1874). Consult Spaeht, A., 'Charles Porterfield Krauth' (New York 1868); Schmucker, B. M., in Lutheran Church Review, July 1883.

KREATINE, or CREATINE, methylglycocyamin methylguanidinaceetric acid, CH$_2$N$_2$O$_3$ or NH$_2$C(NH$_2$)$_2$. COOH

An organic substance found in the muscular fibre of all vertebrates, it is present also in the
brain, urine, blood and in meat-extract. It occurs synthetically in combining sarcosine with cyanamide, and forms colorless and odorless crystals with one molecule water of crystallization, tastes slightly bitter and is water soluble barely in alcohol: Its reaction is neutral, producing acetic acid and water salts and creates: with the action of baryta water on bones, uric acid and sarcosine; with oxide of quicksilver methylguaridine and oxalic acid, with weak acid solutions kreatine (q.v.).

**KREATININ** or **CREATININE**, methyglycocoyaminid, C₅H₇N₂O₇ or NH—CO

N(CH₄). CH₄

This organic substance is found in urine. It forms colorless and odorless crystals, is slightly soluble in water and alcohol, tastes ammoniacal, has strong alkaline reaction. It forms crystallizable salts and is transformed by basic action easily back to kreatine (q.v.). It was formerly held as possessing valuable chemical and nourishing qualities on account of its nitrogenous composition, but it is known now it belongs to the waste of the organs and, with slight changes, passes into the excreta.

**KREFELD**, kref'feld, or **CREFELD**, Prussia, a town in the government of Düsseldorf, 12 miles northwest of the town of Düsseldorf, about 4 miles west of the Rhine and 35 miles northwest of Cologne. It consists of straight, spacious streets and well-built houses; it is the seat of several courts and public offices; contains archives for Roman Catholics, Old Catholics, Protestants, Mennonites and Jews; a royal textile college, gymnasium, a monument of Moltke erected in 1897, hospitals, etc.; and is the principal locality in Prussia for the manufacture of silk and mixed silk goods, which was introduced by refugees from Juliers and Berg in the 17th and 18th centuries. The number of factories producing silk goods is about 120, exclusive of nearly 50 silk-dyeing works. The town also contains railroad shops, boiler-works, machine-shops, saw-mills, distilleries, sugar-refineries, soap-works, tanneries, paper-mills, etc. Krefeld dates from 1166: it came into the possession of Prussia in 1702; it was occupied by the French during the Napoleonic ascendency. During the Great European War 1914–18, in common with other Rhenish towns its war industrial works were frequently bombarded by Allied aviators. Pop. 129,400.

**KREHBIEL**, kräbel, Henry Edward, American musical critic: b. Ann Arbor, Mich., 10 March 1854. He was musical critic on the Cincinnati Gazette (1874–80) and the New York Tribune since 1880. His published works include 'The Technics of Violin Playing' (1880); 'How to listen to Music' (1896); 'Studies in the Wagnerian Drama' (1891); 'The Philharmonic Society of New York: Memorial' (1892); 'Music and Manners in the Classical Period' (1898); 'Music of the Modern World' (1897); 'How to Listen to Music' (1896); 'Chapters of Opera' (1908); 'The Pianoforte and its Music' (1910); 'American Folk-Songs' and 'A Book of Operas' (1909). He also edited an 'Annotated Bibliography of Fine Art' (1897). He was American editor of the new edition of Groves' 'Dictionary of Music and Musicians' (1904–10).

**KREIL**, kril, Karl, Austrian meteorologist and astronomer: b. Ried, 4 Nov. 1798; d. Vienna, 21 Dec. 1862. He studied law and medicine at Vienna (1827). He became director of the Vienna Observatory, then acted successively at the Milan (1831) and the Prague observatories (1845). He became (1851) director of the Central Institute of Meteorology and the Earth's Magnetism, Vienna. Numerous magnetic and geographical observations were made by him, and he improved the magnetic instruments as well as constructing a series of automatic registering instruments. He wrote 'Cenni storici e teoretici sulle comete' (Milan 1832); 'Versuch, den Einfluss des Mondes auf den atmosphärischen Zustand unserer Erde zu erkennen' (Prague 1841), establishing by his researches that the moon had little, if any, influence on the earth's magnetism; 'Über die Natur und Bewegung der Kometen' (ib. 1843). Among his meteorological Jahrbuch für Prag (Prague 1842–45) and the Jahrbücher der Zentralanstalt für Meteorologie und Erdmagnetismus (from 1849 on).

**KREITTMAYR**, kril'mir, Wigulâaus Xavier Aloys, Baron von, Bavarian jurist and statesman: b. Munich, 14 Dec. 1706; d. 27 Oct. 1790. He practised law in Wetzlar in the Supreme Court and was made Aulic councillor (1725) at Munich. He was appointed judge-later of the Court of Justice, Bavarian Palatinate, of the Imperial Army (1741) and was created (1745) a baron of the empire. He became chancellor of the Aulic Council and privy councillor, to be promoted (1749) vice-councilor of the Privy Council and a Minister of the Cabinet, in which position he died. The most important post of Bavarian law was codified by him in such works as 'Codex juris bavarici criminalis' (Munich 1751); 'Codex juris bavarici judiciarii' (ib. 1753); 'Codex Maximilianus bavaricus civilis' (ib. 1756). These edicts, chemical and legal, distilleries, sugar-refineries, soap-works, tanneries, paper-mills, etc. Krefeld dates from 1166: it came into the possession of Prussia in 1702; it was occupied by the French during the Napoleonic ascendency. During the Great European War 1914–18, in common with other Rhenish towns its war industrial works were frequently bombarded by Allied aviators. Pop. 129,400.

**KRELING**, krâling, August von, German sculptor and painter: b. Osnaabrück, 23 May 1819; d. Nuremberg, 23 April 1876. He studied at the Hanover Polytechnic, and, at the age of 17, was a pupil of Schwanthaler at Munich, but soon devoted himself to painting. His first important work was the ceiling decoration at the Hanover Court Theatre. In 1853 he was appointed to reorganize the Nuremberg school of art, during which years he painted the Coronation of Ludwig of Bavaria in the Maximilianeum at Munich, and drew the cartoons for the pictures of German emperors, as well as a cycle of pictures from the traditions of Karl der Grosse. For his great service in advancing the arts and crafts, he was created by the Order of Merit. He modeled the colossal bronze statues of Prince Heinrich of Reuss, at Gera,
and of Kepler, at Weil, and a great fountain which was presented to Cincinnati by Mr. Probasco.

**KRELL**, or CRELL, Nikolaus, Saxon chancellor and anti-Lutheran reformer; b. Leipzig, about 1551; d. 9 Oct. 1601. He studied law and was appointed Aulic councillor at Dresden and secretary to the Elector Christian, who, on his accession to the throne (1586), made him privy councillor and (1589) chancellor. His opposition to the orthodox Lutheran Church and leaning toward Calvinism brought the hatred of the citizens and members of the court. By his introduction of a new catechism and edition of the Bible with his Calvinistic glossary he brought about his downfall when Friedrich Wilhelm von Weimar succeeded the deceased Christian. Involved in the meshes of law he was imprisoned and after much litigation between the higher powers of the different states he was finally condemned to death and was beheaded at Dresden. Consult Richard, 'Kurfürstliche sächsische Kanzler Nikolaus Krell' (Dresden 1859); Brandes, 'Der Kanzler Krell, ein Opfer des Orthodoxismus' (Leipzig 1873).

**KREMENETZ, kremë'y-nyëts, Russia, a district town in the government of Volynia, situated on the Ikva River and a branch of the South-West Railway. It has six churches, is the seat of the chief magistracy of the Radzivilov customs division. Above the town on a sandstone cliff are the ruins of an ancient castle. The town dates back to the 8th century, belonging formerly to the principality Vladimyr but was included in Poland; it was fortified by Sigismund I but was captured (1648) by a small body of Cossacks in revenge for persecution on account of their fidelity to Poland. It is a very fertile district. Its population is about 18,752 with about one-third Jews.

**KREMENTCHUG, kremënt'-choog', Russia, a district town in the government of Poltava, situated on the Dnieper River and junction of two railways. It has an iron railway bridge, nine Greek-Catholic churches, three churches of the Lutheran prayer house, three synagogues, a high school, girls' gymnasium, several banks; also numerous manufactures as sawmills, tobacco factories, etc. It does considerable trade in grain and wood and holds frequent annual markets. The town was founded 1571 and was, from 1765-89, the capital of New Russia. It has a suburb across the river called Krukow. Together they had about 98,652 inhabitants, of whom nearly half were Jews.

**KREMERS, kre'me-rz, Edward, American pharmacist; b. Milwaukee, Wis., 23 Feb. 1865. He studied at the University of Wisconsin, receiving the degree Ph.G. (1886) and B.S. (1888), and Ph.D. at the Göttingen University (1890). He was appointed instructor of pharmacy at the University of Wisconsin (1890-92), professor of pharmaceutical chemistry and director of a course in pharmacy from 1892, and director of the Pharmaceutical Experiment Station from 1913. He was editor of the Pharmacutical Review (1896-1900), scientific editor of the Midland Drugist and Pharmaceutical Review (1909-10), coeditor Standard National Dispensary, etc. In collaboration with Gillemeister and Hoffmann he compiled 'The Volatile Oils' (1900; 2d ed., 1913).**

**KREMLIN, a Russian citadel, especially the citadel of Moscow (q.v.). It lies in the centre of the city, and contains the royal edifices and churches, particularly the residence of the emperor.

**KREMNIITZ, Marie (Mite), German author; b. Greifsward, 4 Jan. 1852. She married and moved to Bucharest (1875), where she became acquainted with the Rumanian queen (Carmen Sylva). She removed to Berlin (1897), and settled there. In collaboration with Carmen Sylva she published the 'Rumänischen Dichtungen' (3d ed., translation Bonn 1889), and under the pseudonym Dito und Idem the following novels: 'Auszwei Welten' (Leipzig 1884; 7th ed., Bonn 1901); 'Astra' (Bonn 1886; 6th ed. 1903); 'Feldpost' (ib. 1887); and the tragedy 'Anna Boleyn' (ib. 1886); also 'In der Irre' (ib. 1888), and 'Rache, und andre Novellen' (ib. 1889). One of her later novels was 'Rumänische Skizzen' (Bucharest 1877); 'Rumänische Märchen' (Leipzig 1882); 'Carmen Sylva ein Lebensbild' (Breslau 1882); an extensive biography, 'Carmen Sylva' (Leipzig 1903). She also wrote the novel 'Ausgewanderte' (Bonn 1890), and the stories 'Elina: Zwischen Kirche und Pastorat' (Breslau 1895); 'Sein Brief' (ib. 1900); 'Herr Baby' (ib. 1901); 'Mann und Weib' (ib. 1902); 'Fatum' (ib. 1903). Under the pseudonym George Allan she wrote 'Plucht der Liebe' (Leipzig 1888), and other stories as well as the novels, 'Aus der Rumänischen Geschichte' (ib. 1881), and 'Ein Fürstenkind' (ib. 1883).**

**KREMNIITZ, kre'mni'ts, or CREMNITZ, Hungary, a royal free town (called in Hungarian Kőrömcszánya), in the county of Bars, in a deep valley surrounded by lofty hills, 15 miles northeast of Schemnitz. It consists of the town proper, surrounded by walls, and containing two ancient churches and a castle; and of several large suburbs, in which are almost all the public buildings. There are some old churches, a Franciscan monastery of the 17th century, a mint, hospitals, etc. The manufactures consist of paper, meal, wine, and cinnamon; but the prosperity of the town depends chiefly on the gold and silver mines in the vicinity. Pop. 4,515.

**KREMS, krems, Austria, a town on the confluence of the rivers Krem and Danube and on two branches of the State Railway, one of which crosses the Danube here on a great bridge. It is the official seat of the district and has four churches, a town-hall with archives, monuments to Joseph II and General Schmidt, an obergymnasium, upper high school, trade school, teachers' institute, wine and fruit industrial schools, Piarist College, lady-teachers' institute, city museum, theatre, savings bank, etc. Among its various manufactures are breweries and mustard, cognac, preserves, chocolate, coffee-substitute, machine, mill, garden tool and other factories. Pop. 14,384.**

**KREMSIERT, Austria, a town in Moravia, 37 miles from Brünn by rail, situated in the fertile Hanna region, on the March and on two railways. It is the official seat of the district, has a Collegiate church, archbishop's palace, finished 1711, library, grammar school, a German and a Czech oborygymnasium, German and Czech national upper high school, archie-
piscopal boys' seminary, teachers' institute, agricultural school, etc. Its manufactures consist of machinery, iron foundries, two malt factories and breweries, sugar factory, electric works, and it does considerable trade in barley, fruit, cattle, etc. In 1110 it was one of the estates of the 1,063 newly formed bishoprics of Olmütz by the purchase of the Olmütz Coun Otto, and obtained town rights through Bishop Bernard (1207) and Bishop Theodoric (1290), becoming the episcopal residence. It was besieged and stormed by the Swedes, in 1643, and burned. During the 1848 insurrection the Reichstag was held here. Pop. 16,528, chiefly Czechs.

KRENERITE—KREUTZNACH

A rare mineral consisting of telluride of gold and silver in orthorhombic form. Composition variable (AuAg) Te. Carries 43.86 per cent of gold and a very small amount of silver. Occurs in mines of Cripple Creek, Colo.

KRESTOVSKI, krés-tófskî, V., the pseudonym of Nadezhda Dmitrievna Khvostchinskaya, one of the most noted of Russian women novelists; b. Ryazan, 1825; d. 1889. See KHVOSTCHINSKAYA, NADEZHDA DMITRIEVA.

KRETSCHMAR, krésh-már, August Ferdinand Hermann, German musician: b. Olbernhau, 19 Jan. 1848. He graduated at the Leipzig Conservatory, was appointed (1876) bandmaster at the opera house at Metz, became (1887) music director at the Leipzig University, and was called to Berlin (1904) where he became professor of the history of music for the state. He wrote numerous choral and organ pieces and many monographs, essays on the lives of noted musicians, etc. His 'Führer durch den Konzerthaual' (3 vols., Leipzig 1887-90) is highly praised.

KRETSCHMAR, krésh-mér, Edmund, German musician and composer: b. Ostritz, 31 Aug. 1830; d. 1908. He was a pupil of Julius Otto and Johann Schneider at Dresden and was appointed court organist there (1844). He became (1872) instructor of the royal Kapellknabeninstituts and was leader of a number of choral unions. In 1892 he was given the degree of professor. He first became favorably known as a composer by his opera 'Die Kolonnensänger' (1874) that was followed by 'Heinrich der Löwe' (1877); 'Der Flüchtling' (1881); and 'Schön Rothraut' (1887). He also wrote several Masses and other church compositions, also profane choir pieces, such as 'Flügelfahrt', 'Festgesang', 'Sieg im Gesang'. His 'Geisterschlacht', written for a man's choir with orchestra, won a first prize. Consult Schmid, O., 'Edmund Kretschmar' (Dresden 1890).

KRETSCHMER, Paul W., German philosopher: b. Berlin, 2 June 1866. He studied at the Luienseidt gymnasium and the Berlin University, becoming private teacher (docent) there (1891). He became assistant professor (1897) at Marburg University, and professor (1899) at the Vienna University. He traveled in Greece (1896-1901) and wrote 'Griechischen Vaseninschriften' (1894); 'Einleitung in der Geschichte der griechischen Sprache' (1896); 'Entstehung der Koiné' (1900); 'Die heutige Lesische Dialekt' (1905). He was editor of Glotta, a periodical in the Greek and Latin languages, from 1907 and is member of the Imperial Academy of Science of Vienna.

KRETZER, kréz-ér, Max, German novelist: b. Posen, 7 June 1854. He went to Berlin at an early age and worked in various capacities, as a factory laborer, a house painter, etc. He met with an accident, and during the period of convalescence began to write, becoming one of the most popular German novelists for a time. His naturalistic novels dealing with the common people of Berlin are interesting pictures of contemporary life. The best examples are 'Gutten Genossen' (1880); 'Die Betrogenen' (1882); 'Im Sturmwind des Sozialismus' (1883); 'Meister Timpe' (1888).

KREUTZER, kroll-ter, Konradin, German composer: b. Messikirch, Baden, 22 Nov. 1780; d. Riga, 14 Dec. 1849. He studied law at first but produced an opera (1800) that was played while he was a student at Freiburg, and he then undertook the study of counterpoint (1804) under Albrechtsberger at Vienna. He was appointed bandmaster (1812) at Stuttgart and (1817) flutist in the Court of Count von Fürstenberg in Donaueschingen. In 1822 he returned to Vienna where he became bandmaster of the Kärntenhor Theatre, after the successful production of his opera 'Libussa'. He filled the same post successively at the Josephstädter Theatre (till 1840), then at the Cologne Stadtheater (till 1846), when he returned to Vienna. He wrote 30 operas of which only 'Nachtlager zu Granada' (1834) and Raimund's 'Verschwender', for which he wrote the score, have remained popular. On the other hand his male choruses are still pet pieces with the Vereine. A monument to his memory has been erected in his birthplace.

KREUTZER, Rodolphe, French violinist and composer: b. Versailles, 16 Nov. 1766; d. Geneva, 6 Jan. 1831. He studied the violin under Anton Stamitz, under whom he was perfected and was able to appear in public in his 13th year. He became solo-violinist in the Italian theatre orchestra (1790) where he produced his first opera, 'Jeanne d'Arc' in the same year, to be followed by 39 other dramatic works such as 'Paul and Virginia', 'Lodoiska' (1791); 'Werther' (1797); while accompanying a tour through Italy and Germany (1796) he was appointed teacher of the violin at the Paris Conservatoire. In 1801 he took Rode's place as solo-violinist at the Grand Opera, and (1817) became its bandmaster till his retirement in great honor (1826). Of his many compositions only those for the violin have survived to this day in popularity, among which his '40 Etudes ou Caprices' is a necessity in training a violinist. Beethoven dedicated his 'Kreutzer Sonata' to him.

KREUTZER SONATA, the popular title of Beethoven's Sonata for piano and violin in A, op. 47, dedicated to his friend R. Kreutzer, and played first in 1803. Leo Tolstoi, the Russian reformer and author, used the title for one of his novels, published in 1880, in which he placed the modern conventional marriage in a hideous light. It caused bitter debate for a rather prolonged period.

KREUTZNACH, kroll-ter-nagh, Prussia, district town and popular bathing resort in the jurisdiction of Coblenz, situated on the Nahe
and junction of several railways. It was formerly capital of the County Sponheim and consists of a new and old city; it has a Kursaal, or bathing establishment on an island, also the medicinal salt springs, Elizabeth-Quelle and others. The mineral waters of this location have been known since 1478 as having curative qualifications in skin diseases. In the near neighborhood is the ruin of an ancient Roman castrum, the so-called "heather wall." It has two Evangelical and three Catholic churches, synagogues, a marble statue to the sanitary professor Prieger, considered founder of the baths, a war memorial, Bismarck fountain and other monuments. Among the leading manufactories are tanneries, tobacco, leather, comb and glass factories, marble works and vineyards and considerable grain trade. It has among its public buildings a gymnasium, high school, provincial wine and fruit, industrial schools, a collection of antiquities, etc. Pop. 23,167.

KRIEGRSPIEL, krēgs'piel, (*war-game*), a game of German origin, played with maps on a large scale, and colored metal blocks, on the same scale as the map, representing bodies of troops of various strength (brigades of infantry, battalions of rifles, regiments of cavalry, besides artillery, engineers, etc.). The players are usually two, but on each side, and the game forms an exact miniature of tactical operations. It is played by alternate moves; each move represents the lapse of two minutes, and rules are given to determine the distance that each branch of the service may move in that time. When two bodies of men on opposite sides come into contact, the weaker in numbers and position is held to be defeated; but when they are equal in these respects victory is determined to one side or the other by the use of a die. A game of the same name has been introduced in chess clubs, the contestants playing on different boards screened from view of their opponents, and being obliged to guess from certain arbitrary conditions what moves are made on the other board.

KRIEHN, krēn, George, American professor; lecturer; b. Lexington, Mo., 1808. He received his education at the Wentworth Military Academy, Lexington, the William Jewell College, Liberty, Mo., and at the Universities of Berlin, Freiburg, Zürich and Strassburg. From 1822 to 1895 he was instructor in history at the University of Johns Hopkins, and from 1895 to 1898 was assistant professor at Stanford University, California. Since 1898 he has become widely known as a writer and lecturer on art subjects, and since 1908 he has been instructor in the history of art at the Woman's Art School of Cooper Union, New York. Since 1910 he has been lecturer in the Department of Extension Teaching of Columbia University. In 1911-12 he was preceptor at the University of Princeton and in the same years lectured at the Catholic Summer School of America, Pittsburgh, N. Y. He is a member of the American Historical Association and of the Metropolitan Museum of Art and secretary of the department of fine arts of the Brooklyn Institute of Arts and Sciences. He has published "English Rising in 1450" (1892); 'Studies in the Social Revolt of 1381' (1902); a translation of Muther, 'History of Painting' (2 vols., 1909), and numerous articles in encyclopedias, periodicals, etc.

KRIEKER, krē'ker, a gunner's name for jacksnipe (q.v.).

KRIS. See CREESE.

KRISHNA, krish'na, in Hindu mythology, the eighth avatar of Vishnu and the most popular deity in the Hindu pantheon. Krishna is regarded as an incarnation of Vishnu (q.v.). In the Bhagavad Gita he stands as revealing the doctrine of "bhakti" (religious devotion). At the close of the 15th century two East Indian teachers—Chaitanya and Vallabha—established sects in worship of Krishna. A modern teacher who has advocated Krishna doctrines is Swami Harayan of Gujurat. See AVATAR; HINDUISM.

KRIS KRINGLE, a sort of Saint Nicholas. On Christmas eve, Kris Kringle, arrayed in a fur cap and strange apparel, goes to the bedroom of all good children, where he finds a stocking or sock hung up in expectation of his visit, in which depository he leaves a present for the young wearer. The word means Christ-child, and the eve is called Kriss-Kringle eve. See SAINT NICHOLAS.

KROEBER, krō'ber, Alfred L., American anthropologist; b. Holoben, N. J., 11 June 1870. He was graduated (1890) at Columbia University, receiving the Ph.D. diploma (1901) and was appointed instructor (1901-06) at the University of California, became assistant professor of anthropology (1906-11), associate professor in 1911. He was curator of anthropology at the California Academy of Sciences in 1906-11 and curator of the Museum of Anthropology from 1908. He was founder of the American Anthropological Association, becoming its president in 1917. In 1906 he was president of the California branch of the American Folklore Society and is corresponding member of the Anthropological Society, Washington, member of the American Ethnological Society of Japan, Fellow of the American Academy of Arts and Sciences. He has been a frequent contributor to the periodicals on the subjects anthropology, folklore, etc.

KROL, ĉrūl, Sebastian Jansen (Bastaïn Jansz Krol), church officer, commissary and vice-director in New Netherland; b. Harlingen 1595; d. after 1645. Appointed in Holland by the Classis of Amsterdam, 12 Oct. 1623, he sailed 28 Jan. 1624. In November of same year he was in Holland again pleading for ministers to serve in the new colony. In 1625 he was again in New Netherland, as "Krakenbeozer" or comforter of the sick, whose office in the Reformed Church was to minister to the poor, to those in sickness or trouble, or in absence of the "voorsanger" (precentor) to read from the desk under the pulpit the commandments and the creed, and to marry the living or bury the dead. In many cases these officers read sermons and conducted divine service when there was no minister. For over two centuries this functionary was regularly supplied by the Classis of Amsterdam for the Dutch churches in the West and East Indies. Krol, with great efficiency, labored at Fort Orange (Albany), inspected all the New Netherland Company, to make the settlement of the Wallons and Dutch successful. In 1628, under Domine Michaelius, he was made an elder and member of the Consistory of the Reformed Dutch (now the Collegiate on Fifth avenue)
Church inside the fort, on Manhattan. He crossed the ocean four or five times and acted as m. Rensselaer in his manner. According to local tradition, during one winter, when provisions were scarce, he made a nourishing and palatable fried cake of flour and honey, which took its name from his, the cruller. The word is unknown in Holland and the pronunciation, very similar in the personal name and the actual thing, points to the probable origin of this American delicacy. On Van Twiller's arrival, in 1633, he was succeeded in the command of Fort Orange by Hans Jorissen Houten. On 28 Sept. 1645 he was at holy communion in the church in Amsterdam, Hol-

land. A handsome memorial of this zealous and efficient pioneer has been erected in the Reformed Church edifice on Second avenue in New York. Consult Van Laer, the 'Vansselaer-Bower Manuscripts,' published by the State (1906) and Ectote 'Bastiaen Janse Krol' (1910); Hofstede, 'Oost Indien Kerk-

Zaken,' Rotterdam (1779), and 'Ecclesiastical Records of the State of New York' (1901).

KROLL, kröl, Wilhelm, German classical scholar; b. Frankenstein, Silesia, 7 Oct. 1869. He studied at Breslau, Berlin and Bonn, and, after a journey through Italy and Sicily, he entered the faculty at Breslau University, for classical philology. He was made professor at Greifswald (1899), Münster (1906) and Bres-

lau (1913). He contributed numerous essays to the 'Rheinisches Museum, Jahrbereiche über die Fortschritte der Altertumswi-senschaft, Glotta, and the Realencyklopädie of Pauly-Wissowa. He edited the 6th edition of Teuffel's 'Geschichte der Römischen Literatur' (1910–13). Among his other works are 'Antike Alterthümer' (1897); 'Die Altertumswis-

schaft im letzten Vierteljahrhundert' (1905); 'Geschichte der klassischen Philologie' (1908).

KROMAYER, kröm'ter, Johannes, Ger-

man historian of ancient battles: b. Stralsund, 31 July 1859. He studied at Stralsund, Metz, Weissenberg and at the universities of Jena and Strassburg. He was appointed as teacher at the gymnasiums of Strassburg, Thann and Metz and then traveled through Italy and Greece (1887–88). In 1898 he became teacher at the Kaiser-Wilhelm University, Strassburg, but headed the scientific expedition in Greece and Turkey making research of the ancient battle-

fields (1900), and a similar expedition to Italy and North Africa (1907). He was appointed professor of ancient history at the Czernowitz University (1901) and filled the same post at Leipzig (1907). He was 'Antike Alterthümer' (1902–11); 'Roms Kampf um die Welt-
herrschaft?' (1912).

KRONBERG, krön'ba-g'-z-, Julius, Swedish painter: b. Karlskrona, 11 Dec. 1850. He studied at the Stockholm Academy of Art and gained a scholarship which permitted him to visit Düsseldorf, Paris, Munich and Rome. Upon his return he made his reputation with his biblical pictures of the Holy Land and Biblical pictures and became the leading colorist. His principal works are 'Death of Cleopatra'; 'David and Saul' (1885), in the Stockholm National Gallery; 'Romeo and Juliet'; 'Queen of Sheba'; 'Hyppatia'; and the ceiling decora-

tion of the Treppenhaus of the Royal Palace, Stockholm (1890–92). He was elected member of the Stockholm Academy of Art (1881) and was made professor in 1885.

KRONBERG, Louis, American painter: b. Boston, 20 Dec. 1872. He studied at art at the Boston Museum of Fine Arts, the Art Students' League, New York, and the Académie Julien. Paris. He is instructor of the portrait class of the Copley Society, Boston, received the silver medal of the Massachusetts Charitable Asso-

ciation and the Longfellow Traveling scholarship. His works have been shown at the Paris Exposition (1900) and are represented in the permanent collections of the Pennsylvania Academy of Fine Arts, Philadelphia ('Behind the Footlights'); New York Metropolitan Mu-

seum of Art ('The Pink Sash'); Boston Mu-

seum of Fine Arts, etc. Other works of his are in the private collections of Mrs. J. L. Gardner and F. Gair Macomber.

KRONECKER, krǫn'k-er, Leopold, Ger-

man mathematician: b. Liegnitz, 7 Dec. 1823; d. Berlin, 29 Dec. 1891. He studied at Berlin, Bonn, Breslau and took his degree (1845) in Berlin, when he returned to Liegnitz. He was made a member of the Berlin Academy of Science (1860) and held lectures at the university (1861). In 1883 he was made professor of mathematics of the university. He did exceptional service in the advancement and systematizing of algebra, and his graduates' feast essay, 'Grundzüge einer reinen arithmetischen Theorie der algebraischen Grössen' (Berlin 1882), is of lasting value. He edited, at first with Weberstrass, later alone, Crelle's 'Journal für Mathematik,' and commenced publishing the works of Lejeune Dirichlet at the request of the Academy. His 'Vorlesungen über Mathematik' were collected and published by Hensel and Netto in parts. The attempt he made to abolish irrational numbers and fractions reducing the science to whole numbers altogether is quite interesting. His biography by H. Weber is in 'Jahresbericht der deutschen Mathematiker vereinigung' (Berlin 1893).

KRONES, krön'nes, Therese, Austrian actress: b. Freudenthal, 7 Oct. 1801; d. Vienna, 28 Dec. 1830. She became a member of the Leopoldstädter Theatre, Vienna (1821), after numerous engagements at provincial theatres. She learned greatly to improve her technique here through playing with Raimund, and, being of a lively and cheerful temperament, besides possessing graceful form, she became a great favorite in comedies and national plays. Several plays were written by her, such as 'Spindelh' (1827); 'Nebelgeist,' etc. Her life figures in a novel by Bäuerle and in a play by Haffner.

KRONSTADT, kron'stät, or CRON-

STADT, Hungary, called by Hungarians Brassó, a town in the county of the same name in Transylvania, junction of four railways and most picturesquely situated. It is wedged in by a valley gorge of the Schöller Mountains, open only on the northwest. In front of the ancient town of the Schlössberg, an old fortification or citadel dating back to 1554. The suburbs lie in small neighboring ravines, some built on terraces. In the middle of the old former fortified central city is the cathedral erected under King Sigismund (1385–1435) in imposing Gothic style, but serving now as an
Evangelical parish church and termed locally the "black church," on account of its charred walls; its gigantic organ contains 4,060 pipes. The town, situated on the ancient town-hall with its archives, erected 1420 and renovated (1770) in Baroque style; also the great Kaufhaus, built 1545. There is also a Catholic parsonage in Italian style, a Rumanian church in Byzantine style, besides several other Catholic, Evangelical, and Greek churches and a Reformed Church. Other prominent public edifices are the Franciscan monastery, the Treasury building, etc. There are monuments erected in memory of Hunterus, one to Bishop Trent and the Millennium monument. Its population was about 41,056, of whom most are Magyars, the remainder Walachians, Saxons, Greeks and other Orientals. Considerable commerce is carried on, the metal and wood industries being important. There are manufactures of earthenware, bed-coverings, cement, leather goods, paper, as well as sugar and petroleum refineries. Among its institutions are three gymnasiums, a state upper high school, trade academy, theatre, etc. This city suffered many times by war ravages; it was destroyed by the Tartars (13th century), several times, was conquered by the Turks (1421), becoming a frontier town of Protestantism in the days of Hunterus the Reformer (16th century), it was plundered by Gabriel Băthori (1610), besieged in 1611 and 1612. General Carașești executed (1688) many of its citizens and plundered the city; it was burned down the next year by the soldier. In 1718 and 1755 the pest decimated its inhabitants; in 1849 it was besieged twice and the Russians took possession. Consult Hermann-Metzl, "Das alte und neue Kronstadt" (Hermannstadt 1885-88); Făltăș, "Die Stadt Kronstadt und deren Umgebung" (Vienna 1886).

KRONSTADT, kron'stät, or CRONSTADT, Russia, a maritime fortress in the government of Saint Petersburg, and about 25 miles west of that city. It stands in the narrow part of the Gulf of Finland, opposite to the mouth of the Neva, on a height of the long, narrow, rocky island of Kotlin, forming, both by its position and the strength of its fortifications, the bulwark of the capital, and the most important naval station of the empire. It was founded by Peter the Great in 1710, and has spacious, regular streets, with many handsome houses; Greek, Lutheran, English and Roman Catholic churches; very large marine establishments, a navigation school, a naval arsenal, a cannon-founding, a barracks, building-yards, docks, etc. The harbor consists of three separate basins—a merchant haven, capable of containing 1,000 ships; a central haven for the repair of ships of war, and the war haven, which, in addition to the other works of the place, is defended by the strong fort of Kronlot, built on two small adjoining islands. The chief disadvantage of Kronstadt as a port is the long period during which the harbor is blocked up by ice. The construction of a canal affording better access by sea to the capital has diminished the trade of Kronstadt, which in consequence show little increase to be a commercial port. A revolt of the fleet personnel took place in May 1917. The local administration passed to the hands of the Committee of Workmen's and Soldiers' Delegates on 2 June 1917. The provisional government at Petrograd was deposed by the president of the local committee. Drastic measures were decided upon by the former, but the fall of the Kerensky government gave the rebels an opportunity and others an excuse of escaping from the consequences of their acts. See Ship Canals; War, European.

KROPOTKIN, kró-pót'kín, Peter Alexievitch, Russian geographer and revolutionist: b. Moscow, 9 Dec. 1842. He was educated in the Corps of Pages at Saint Petersburg, and joining a regiment of Cossacks of the Amur went to eastern Siberia as aide-de-camp to the military governor of Transbaikalia, becoming later attaché for Cossacks' affairs to the governor-general of eastern Siberia. He was connected with a prison commission, and strove to get some reforms introduced into Siberian convict prisons, but his efforts proved of no avail. From 1863 he devoted his energies to a scientific investigation of Manchuria and the neighboring parts of Siberia, and his work in this department gained him, in 1870, election to the council of the Russian Geographical Society. In 1871 he was sent by the Geographical Society to Finland to study glacial phenomena. Arrested in 1874 for promoting radical ideas of social reform, he was confined in the prison of the military hospital, from which he contrived to escape to England in 1876. In the following year he went to Switzerland, where he founded at Geneva an anarchist journal called Le Révolût, but in 1881 was expelled by the Swiss authorities on the demand of Russia. Returning to England in 1882, he wrote and lectured against the government of Alexander III. Having gone to France, he was arrested by the authorities and condemned (January 1883) to five years' imprisonment for participation in the International, but he was released in January 1886, in consequence of a strong appeal made by leading French and English savants. Since then he has lived in England, and engaged in literary work. He has written much on scientific subjects and has contributed to various encyclopedias. His separate publications include "Paroles d'un Révolté" (1885); "In Russian and French Prisons" (1887); "La Conquete du Pain" (1888); "L'Anarchie, sa Philosophie, son Ideal" (1890), Moscow. "The State: Its Part in History" (1898); "Fields, Factories and Workshops" (1899); "Memoirs of a Revolutionist," first issued serially in The Atlantic Monthly (1899); "The O’reography of Asia" (1904) and "Ideals and Realities in Russian Literature" (1905); "The Great Revolution, 1789–93" (1908); "Terror in Russia" (1909). Prince Kropotkin is one of the ablest representatives and most eloquent exponents of that theory of society known as anarchist-communism. He is opposed to all societies based on force or privilege, and looks forward to the advent of a purely voluntary society on a communistic basis. He desires to see the division of labor, which is the dominant factor in modern industry, replaced by what he calls the "integration of labor," a scheme of labor that is a true believer in the immense possibilities of intensive agriculture. In 1901 he delivered a course of lectures at the Lowell Institute in Boston.

KROUT, Mary Hannah, American journalist and author: b. Crawfordsville, Ind., 3 Nov. 1857. She was educated at home, became asso-
ciate editor of the Crawfordsville Journal in 1881, and editor on the Terre Haute Express in 1882. She was for 10 years on the staff of the Chicago Inter-Ocean, was its staff correspondent in Hawaii during the revolution in 1898, furnishing special reports for the State Department. She was also staff correspondent in London from 1895 to 1898, then went to China for a syndicate of representative newspapers specially to investigate the commercial relations of China and the United States. In 1907 she visited Australia for the second time, lecturing on American political and economic conditions and writing a series of articles for the Sydney and Auckland press on American topics. In recent years she has engaged in miscellaneous literary work, and lecturing on literary and general topics. She has published 'Hawaiia and a Revolution' (1888); 'Alice in the Hawaiian Islands' (1899); 'A Looker-on in London' (1899); 'Two Girls in China' (1900); completed the 'Memoirs' of Gen. Lew Wallace (1907); 'Memoirs of Bernice Pauahi Bishop' (1909); 'Reminiscences of Mary S. Rice' (1908); 'Platters and Pipkins' (1908); 'The Coign of Vantage' (1909).

KRU, kroo, or KRUMEN, a negro tribe of Cape Palmas, West Africa, of exceptional stature and very dark skinned. They hire themselves as able sailors and boat crews along the entire northwest African coast and work also in the factories, being efficient workers and fairly reliable, which good characteristics have aided them to the principal trade of their section of country. They were found useful factors in the building of the Panama Canal. Consult Böttikofer, 'Reisebilder aus Liberia' (Vol. II, Leyden 1890).

KRÜDENER, krud néer, Barbara Juliane, BARONESS von, Russian novelist and poetist; b. Riga, 11 Nov. 1764; d. Karazu-Bazar, 26 Dec. 1824. She received through her father, Privy Councillor von Vetinghoff, in Russia and later at Paris, a very liberal education. In 1782 she married Baron Burchard von Krüden, an able diplomat attached to the Russian embassy at Paris, but who was already divorced from two wives. She accompanied him to Venice where he was appointed Russian Ambassador, and later (1786) to Copenhagen, where he filled the same position. Being of a coquettish disposition, she appears to have led an extravagant life, and, after bearing two children, her nervous condition caused her to leave her husband (1789) and live in Paris, where she became involved in a love affair with a young officer, Count Frêgeville, and, dropping her family name but not divorced, she spent the next few years in travel, returning to her husband in 1800, but leaving him again in 1801. She next became intimate with Coppet while living with Madame de Staël and in Paris. In Paris she became companion of Chateaubriand and Bernardin de Saint-Pierre, author of 'Paul and Virginia,' when she was informed of the death of her husband (1802). Her novel 'Valérie' (Paris 1803) was now published, in which she built up a romantic story in a style firmly in the eighteenth-century love episode of her at Venice. In 1804, at the age of 40, she came under the religious influence of the Moravian sect, then that of the South German cult 'Chiliasm,' and she now ardently devoted herself to a fanatical religion, her whole being becoming at last absorbed in mysticism and superstition. In 1806 she went to North Germany and, in the following year, did great good subsequently for the battle of Eylau (1807); in 1808 she fell under the influence of the teaching of Jung-Stilling in Carlsruhe, who acquainted her with the Swedenborgian cult, and a month later she was in Alhusen, now a great admirer of the hymns of Pastor Fontaine and the seeress Marie Gottliebin Kummer. She next held great religious meetings in Württemberg, Switzerland, Alsace, etc., to which the newly converted and the pious flocked. Turning her eyes toward political events, she placed Napoleon as the Apollyon of the Apocalypse and Alexander of Russia as the deliverer. She obtained audience with the Tsar Alexander (1815) and gained temporary influence over him. It was partly, some claim, through her influence that the 'Holy Alliance' was born, but she had not part in its drawing up. With the arrival of peace she traveled to Switzerland where she renewed her pietistic conventicles and preached repentance, spending prodigally of her wealth on the poor and suffering; but her immense popularity created alarm with the authorities and they expelled her from Switzerland in 1817. A similar fate met her in several German states, till she was taken (1818), under police escort, to the Russian border. Placed within bounds by her former convert, Alexander I, she now lived on her estate at Kosse, but in 1824, with her daughter and son-in-law, she went to the Crimea, where she died in the pietist colony of Princess Golovyn at Karasu-Bazar. Consult Eynard, 'Vie de Madame Krüdener' (Paris 1849); Capefigue, 'La Baronne de Krüdener et l'Enyéreuse Alexandre I' (ib. 1866); 'Frau von Krüdener,' in Zeitgemäße (Berne 1868); Lacroix, 'Madame de Krüdener ses Lettres et ses Ouvrages inédits' (Paris 1880); Ford, Clarence, 'Life and Letters of Madame de Krüdener' (London 1893); Turguan, 'La Baronne de Krüdener' (Paris 1900); Mühleneck, 'Etude sur les Origines de la Sainte-Alinance' (ib. 1888).

KRUG, kroog, Wilhelm Traugott, German philosopher; b. Radis, Prussia, 22 June 1770; d. Leipzig, 13 Jan. 1842. He studied at Wittenberg under Reinhard and Jelmichm, then at Jena and Göttingen, and was appointed (1801) assistant professor of philosophy at Frankfort-on-the-Oder. After Kant's death he was appointed his successor (1804) at Königsberg, and in 1809, was called to Leipzig, where he became riding master of the Saxon MountedJaeger and went through the War of Liberation (1813-14), returning to resume his chair at Leipzig, from which he retired, voluntarily (1834). He then devoted his time to writing on philosophical and rationalistic-theological subjects till his death. Of his numerous works should be cited 'System der theoretischen Philosophie' (Königsberg 1806; 3d ed., 1830); 'System der praktischen Philosophie' (ib.; 2d ed., 1829-38); 'Handbuch der Philosophie und philosophischen Literatur' (Leipzig; 3d ed., 1828); 'Handbuch der Philosophischen Wissenschaften' (ib. 1827-34). The basic idea of his philosophical system which he explains in his 'Fundamental philoso-
phie) (Zülichau 1803; 3d ed. Leipzig 1827), as a transcendental synthesis of being and knowledge, is that we have in our consciousness an original connection with the being and knowledge of the subject and the external world, which is not further explainable. Consult his autobiography, Meine Lebensreise in sechs Schritten (Leipzig 1826), with its sequel, 'Leipziger Freuden und Leiden in Jahr 1830, oder das merkwürdigste Jahr meines Lebens' (ib. 1831).

KRÜGER, krugér, Gustav, German Protestant theological historian: b. Bremen, 29 June 1862. He studied church history and was graduated at Heidelberg, Jena and the Giessen University (1886), where he became assistant professor (1889) and (1891) regular professor. He wrote 'Ludger von Calaris und das Schisma der Luciferianer' (Leipzig 1886); 'Die Apologie Justin's' (Freiburg 1881); 'Geschichte der altchristlichen Literatur' (ib. 1888); 'Das Testament des Neuen Testaments' (ib. 1896); 'Kritik und Übereinanderung auf dem gebiete der Erforschung des Urchristenthums' (Giessen 1903); 'Das Gnomon der Dreieinigkeit und der geschichtlichen Entwicklung' (Tübingen 1905); 'Handbuch der Kirchen geschichte' (1909-13).

KRÜGER, kroogér, Stephanus Johannes Paulus, Boer statesman: b. Colesberg, Cape Colony, 10 Oct. 1825; d. Clarens, Switzerland, 14 July 1904. At 11 he accompanied his parents in the 'great trek' or migration of Boers, whom the British administrators had antagonized, from the Cape Colony,—a movement which resulted in the colonization by Boers of Natal, the Orange Free State and the Transvaal. He and his parents resided for a time in the Orange Free State, but they ultimately made their home north of the river Vaal. At 16 he was assistant to a field cornet, and not long afterward became a field cornet himself. From that time he was constantly connected with either the military or the civil government of the Transvaal for a period of character gradually brought him to the front. In 1863 he became commandant-general, and in that capacity put down civil feuds and defeated the Basutos. At the time of the annexation of the Transvaal to the British territories in 1877 he was Vice-President under President Burgers. Upon the reorganization of the Boer government, by the national committee in 1880, he again assumed the office of Vice-President, and in the war of 1880-81 with Great Britain he took a leading part. He was elected President in 1883, and re-elected in 1888, 1893 and 1898. He visited England in 1883 in order to obtain a revision of the Pretoria Convention of 1881, and before his return in the following year he secured its replacement by a new convention practically granting independence—even in so far as relations with foreign countries were concerned—and authorizing the renaming of the state as the South African Republic. Kruger's position in the republic was now one of almost unlimited influence and authority. The enormous influx of foreigners after the discovery of the rich gold deposits of the Witwatersrand created problems of the utmost gravity. The greed of the British South Africa Company was extreme, the Uitlanders complained of injustice in being debarred from the franchise, and the Boers on their part were determined to resist foreign aggression. A crisis presented itself in the so-called 'Jameson Raid' of December 1895, which was easily crushed by the Boers, and at the same time led them to look forward to another and greater struggle with the English and to accumulate Leopoldscape (1826), with its sequel, 'Leipziger Freuden und Leiden in Jahr 1830, oder das merkwürdigste Jahr meines Lebens' (ib. 1831).

KRÜGER, krugér, Karl, German Byzantine scholar: b. Kürnach, Bavaria, 23 Sept. 1856; d. 1909. He studied classical philology at Munich and Leipzig and was appointed (1879) teacher of the Gymnasium at Munich, becoming assistant professor (1891) and professor of middle and modern Greek philology (1897) till his death. He is best known through his 'Geschichte der byzantinischen Literatur' (München 1891; 2d ed. 1897), covering from Justinian to the fall of the Eastern Empire, 1453. He founded the Byzantinische Zeitschrift (Leipzig from 1892), and Byzantinische Archiv (ib. from 1896). He wrote 'Griechische Reise' (Berlin 1886), a consequence of his residence in the Orient in 1884 and 1885. Numerous works of his on middle and modern Greek philology are in Reports of Proceedings of the Bavarian Academy. He wrote 'Codex der Grammatik des Dostiheus' (1884); 'Beiträge zu einer Geschichte der griechischen Sprache' (1885-89); 'Mittelgriechische Sprichwörter' (1893); 'Das Problem der neugriechischen Schriftsprache' (1902); 'Populaire Aufsätze' (1909).

KRÜMMACHER, krom'mah-er, Friedrich Adolf, German theologian: b. Tecklenburg, 13 July 1767; d. Bremen, 4 April 1845. A minister in the German Reformed Church and a professor of theology, he became widely known by his 'Parables' (1803), which ran through many editions and are familiar in an English translation. They were as a rule short, written in simple prose, on such subjects as 'The Blind Man,' 'Life and Death,' 'The Hero,' etc. None of his other writings won popularity.

KRUPP, kroop, Alfred, German inventor and metallurgist: b. Essen, Prussia, 26 April 1812; d. there, 14 July 1887. He was a son
of Friedrich Krupp (q.v.). In 1848 he assumed charge of the Krupp Steel Works at Essen and presently discovered the method of casting steel in very large masses. In 1851 he sent to the London Exhibition a block of steel weighing 4,300 cwt., and was able to cast steel in one mass weighing more than 100,000 pounds. Although he manufactured a great variety of articles for use in various peaceful industries, his world-wide fame arose from his production of the enormous siege guns used by the Germans when they invested Paris. Several of Krupp's processes in the manufacture of steel and in the making of cannon were very carefully kept from the knowledge of the outside world and only employees were admitted to his foundries.

KRUPP, Friedrich, German manufacturer: b. 1787; d. 1826. He established a small forge at Essen, Rheinish Prussia, in 1810, experimented in the making of cast-steel, the secret of which was then carefully kept in Great Britain, and was enable in 1812 to manufacture steel from the material. In 1818, on the site of the present large Krupp establishment, he built a small plant of eight smelting furnaces, each with one crucible. He turned out a steel of excellent quality, though not perfectly successful; but demand for the product was then slight, despite its use for mint-dies and some other purposes, and the activity of the manufactory was correspondingly small.

KRUPP, Friedrich Alfred, German gunmaker: b. Essen, Germany, 17 Feb. 1854; d. there, 22 Nov. 1902. He was known as the 'Cannon King' in Germany, and was the son of Alfred Krupp, who invented a new Bessemer steel, out of which he made rifles and cannons; a seamless tire for car-wheels and discovered a new method of hardening armor plate. His grandfather, Friedrich Krupp (q.v.), founded the steel industry of Essen, beginning in 1817 with two laborers. The Krupp's have been head of the iron and steel industry of Prussia for many years; their establishment is one of the greatest in the world. Friedrich Alfred Krupp was the richest man in the empire, was generous to his operatives, built for them 5,469 dwellings, each with its garden, besides providing convalescent hospitals and orphanages. He also maintained a pension fund of $4,125,000 for their benefit. He vastly improved the capacity of the business by taking in other steel works at Rheinhausen and in the neighborhood of Magdeburg; acquiring coal and iron mines in Germany, and iron mines in Spain. The shipyards and engine shops of Kiel and Berlin, which he amalgamated with mining and founding business were sources of great wealth, and he owned a fleet of steamers for the exportation of his goods. Although he took no active part in his business on its technical side (in which he differed from his father and grandfather) his skill in finance was so great that in 15 years he almost doubled his inherited fortune.

KRUPP FOUNDRIES, Social Work at, one of the early difficulties encountered by the great Essen works was that by 1861 the employees had outgrown the living accommodations, such as to create disturbances to the growth of the industry. Two rows of houses were constructed (1861-62) for the foremen and the workmen's dwellings were started in 1863, and became the colony known as Alt-Westend. The buildings were of simple construction, but sanitary, and rents were low. By the beginning of 1872 the second colony, called Neu-Westend—was completed. There were 3,659 dwellings built by 1891, besides 43 for widows free of rent. The capital expended had a net income of 2.5 per cent, which was invested in other improvements. The small Essen Co-operative Society had its management undertaken by the firm in 1868 and its title was changed to Consul-Aanstalt, and all varieties of goods were supplied at lowest possible prices to the workmen. This work was done at the responsibility and risk of the firm for numerous years at cost, but the work was later turned over to the employees for free co-operation. All sales are done for cash, and the balance of profit is returned yearly to the purchasers prorata of value of purchases.

A boarding establishment, known as the 'Menage,' was started in 1856 with 200 unmarried men. By 1873 the number had grown to 1,775, falling off to less than 500 in 1875, then growing to about 800. The lack of freedom caused its falling off. The health of the employees is looked after by a board of physicians, and a large bathing establishment is assisting the hygienic work. Three insurance associations have been formed, against accident, for life insurance and against sickness, to which the firm contributes $60,000 per year, $2,500 of which is paid under the Imperial Insurance Law. A trust fund of $250,000 produces from its interest pension funds for the use of those whose needs are not covered by other sources. Under the employees' widows pension plan payments are made annually amounting to nearly $952,000. The city of Essen also has a gift of $500,000 provided for building material and moral improvement from the interest. There are also numerous scientific and manual training schools. The rapid growth of socialist propaganda centre is remarkable, however, and of recent years has kept pace with the advance in the social and economical program.

In the last few years the colonies of Scheiderhof, Nordhof and Cronenberg were added to the two Westends, and a colony was built a short distance from the city in 1890 on cheaper land, affording detached buildings of two stories to accommodate three or four families and permitting larger gardens to surround the dwellings, at a rental of 85 cents per week for five rooms and garden. Following these came Alfeldshof (erected 1894) a model village, and Altenhof, started a little later, built on still more attractive lines. The latter accommodates aged employees and widows free of rent. Friedrichshof was the next colony erected, on advanced lines. Each of the numerous colonies has its market place, beer-hall, co-operative store, park and music pavilion. The dwellings, some few years ago, figured 4,300 about Essen and 700 in the colonies of Bredeney, Am, Gaarden and Boksum—consult Blencke, 'Alfred Krupp,' (1898); Klein and Hehmann, 'Friedrich Alfred Krupp' (1903).

KRUPP PROCESS OF ARMOR PLATE. See Armor Plate.

KRUSE, krooz'it, Heinrich, German dramatic poet: b. Stralsund, 15 Dec. 1815; d.
Bückeburg, 13 Jan. 1902. He studied philology at Bonn and Berlin after which he dwelt abroad several years, chiefly in England. He was appointed (1844) teacher at the gymnasium, Minden, then (1847) at the extraordinary staff of the "Kölnische Zeitung." As successor to Gervinus he managed (1848–49) the "Deutsche Zeitung" at Frankfurt, but returned to the "Kölnische Zeitung" and became chief editor in 1855, remaining in that post till he took up residence (1872) in Berlin. He lived at Bückeburg from 1884. Among his dramatic works are 'Die Gräfin' (Leipzig 1868; 4th ed., 1873), a tragedy which won the Schiller prize; 'Wullenwever' (1870; 4th ed., 1894); 'König Erich' (1871); 'Moritz von Sachsen' (1872); 'Brutto' (1874); 'Marino Faliero' (1876); 'Das Mädchen von Byzanz' (1877); 'Der Verbannte' (1879), etc., all tragedies. Of his short plays and poems might be mentioned 'Festnachtspiele' (Leipzig 1887); and his clever 'Seegeschichten' (Stuttgart 1880). Consult Bulwer, W., 'Deutsche Drame und Dramatiker' (Hanover 1898); Lange, E., 'Heinrich Kruses pommersche Dramen' (Greifswald 1902).

KRUUSENSTERN, krooz'-en-stern, Adam Johann von, Russian navigator: b. Haggun, Estonia, 19 Nov. 1770; d. there, 24 Aug. 1846. He entered the cader corps and took part in the war (1788) with Sweden, and served in the English fleet (1793–99). He was given (1803) command of an expedition to the northwest coast of America and Asia, with the object of opening up the fur trade of the Pacific coast and renewing the Japanese commercial relations. He failed in the latter object but the scientific outcome of the world's circumnavigation was important. From 1827 to 1842 he was director of the naval school and, in 1841, was made general-admiral. His bronze statue was erected (1876) at the naval school, Saint Petersburg. He wrote 'Voyage round the World in 1803–06' (Saint Petersburg 1810–12), translated into several languages and containing an atlas and 104 plates; 'Atlas de l'Ocean Pacifique' (Saint Petersburg 1809), with supplements.

KRYLOV, kró'-lôf, Ivan Andreievitch, Russian fable writer: b. Moscow, 13 Feb. 1768; d. Saint Petersburg, 21 Nov. 1844. He was the son of a poor subaltern officer, yet in his 15th year he wrote the successful opera 'Kofejnica' ('The Coffee Fortune-teller') and was appointed Unterkanzist in a circuit town (1781) and Kanzlist at Tyer end of the same year. He received a position in the Chamber of Finance at Saint Petersburg (1782) and in the cabinet of the empress (1788) but retired in 1790. He then published several periodicals unsuccessfully though they established his reputation as journalist, the fine satiric talent displayed in his contributions, and by gift of observation and masterly language. Meanwhile he was writing odes, tragedies, a comic opera 'The Crazy Family' (1793) and comedies, all in but not important. From 1797–1801 he lived on the estate of Prince Golitzy in the Ukraine, becoming his secretary (1803). In 1806 he went to Moscow, then Saint Petersburg, where he wrote (1807) his most popular comedy 'The Fashion Magazine,' and in 1809 his Drame 'Machiavell Opera,' 'Iliqua l'Hero,' etc. He next turned to poetry, his true field soon appearing to be fables. The first issue of his fables (23) appeared in 1809, the second (21 new) in 1811, in which year he was elected member of the Saint Petersburg Academy. The last collection under his supervision (1843) contained 197 fables and reached its 26th edition in Saint Petersburg in 1891. He was appointed assistant at the Imperial Library in 1812. A memorial in his honor was erected (1885) in the Saint Petersburg Summer Garden. The sentiment, humor and naturalness, wit and good nature, his fables have become the favorite book of the people and new editions continue to appear rapidly. Translations in the French (Paris 1825) and the Italian languages have been published, and German versions by Torney (Mitau 1842), Lüwe (Leipzig 1874) and Frau von Gernet (ib. 1881) find wide circulation. A comprehensive collection of his works was published (1847 and 1859) in Saint Petersburg with a biography by Pletnev, and another by Kalska (Saint Petersburg 1914). W. Kennedy's 'Bibliographical and Historical Notes on the Fables of Krylov' (Saint Petersburg, 2d ed., 1878) contains perhaps, the best commentaries.

KRYPTON, a gaseous element discovered in the atmosphere by Ramsay and Travers, in 1896. (The history of this member of the argon group is so bound up with that of argon itself that reference should be made to the article ARGON, and to the references there given). Krypton was discovered in the last fraction remaining after the evaporation of a quantity of liquid air. The residue consisted chiefly of argon, oxygen and nitrogen; but when the oxygen and nitrogen had been removed, a spectroscopic examination of what remained showed lines that indicated the existence of at least one new element, in addition to argon and helium. To this new element the name "krypton" was assigned, from a Greek word signifying "hidden," in allusion to the circumstances under which the discovery was made. (See also Xenon and XENON, Little is known yet concerning the properties of krypton. When it was isolated by means of a tedious diffusion process, it was found by Ramsay and Travers to have a density about 40.75 times as great as that of hydrogen and an atomic weight of about 81.5. The ratio of its specific heat at constant pressure to its specific heat at constant volume was found to be 1.66, as in the cases of argon and helium. Subsequent experiments by Ladenburg and Krügel have indicated a density of about 29.3, and therefore an atomic weight of about 59. Travers, in his book issued subsequently to these later experiments, makes no reference to them. Considerations based upon the periodic law (q.v.) appear to indicate that the results of Ramsay and Travers are the more probable; but this point is undecided. Krypton exists in the air in the proportion of about one part in a million. It has the chemical symbol Kr and appears to be as inert, chemically, as argon.

KTISTOLATRE. See Monophysites.

KU-KLUX (ku-kly'kls) KLAN, a secret society which existed in the Southern States of the United States during the period immediately following the Civil War (1865–76). It was originally established at Pulaski, Tenn., about
tive and emphatic declaration of the principles of the order. It was in the following terms:

"We the South being the Southern States of the United States of America; the supremacy of the Constitution; the constitutional laws thereof; and the union of the States thereunder."

This Nashville convention also defined and set forth the peculiar objects of the order as follows:

1. To protect the weak, the innocent and the defenseless from the indignities, wrongs and outrages of the lawless, the violent and the brutal; to relieve the injured and the oppressed; to succor the suffering and especially the widows and orphans of Confederate soldiers.

2. To protect and defend the Constitution of the United States and all laws passed in conformity thereto, and to protect the States and people from all invasion from any source whatever.

3. To aid and assist in the execution of all constitutional laws, and to protect the people from unlawful seizure, and from trial except by their peers in conformity to the laws of the land.

The Klan had a very large membership; it exerted a vast, terrifying and wholesome power, but its influence was never at any time dependent on or proportioned to its membership. A careful estimate placed the number of Kudlux in Tennessee at 40,000, and in the entire South at 550,000. In 1871, a special message was sent to Congress by President Grant, pointing out the fact that the constitutional rights of some of the citizens and officials of the United States were being rendered insecure by the lawless members of the country and urging a Congressional enactment to put a stop to this condition of affairs. An investigation followed, and Congress passed the 'Force Bill' for the purpose of enforcing the 14th Amendment and dealing with all offenders against that amendment. In October of the same year, the President issued a proclamation calling on the members of all illegal associations in nine counties in South Carolina to disperse and surrender their arms and disguises. Five days later a proclamation was issued suspending the privileges of the writ of habeas corpus in the counties named. Several hundred persons were arrested, and this demonstration caused the gradual dissolution of the organization. Its purpose—to check the threatening political supremacy of the blacks in the South—had been accomplished. Consult Fleming, 'Documentary History of Reconstruction' (Cleveland 1907); Lester, Wilson and Fleming, 'The Ku Klux Klan' (New York 1905).
The Kuban River and the lakes afford profitable fisheries, and salt is produced in the lagoons. Trade consists chiefly of grain, wool, wood, fish, etc. The Rostov-Vladikavkaz Railway runs through the province. Ekatorinodar is the capital. Pop. 2,830,200, consisting of 40 per cent Cossack. In 1901 there were but 467 schools and 41,086 pupils.

KUBAN RIVER, Russia, a river traversing the government of the same name; it is the Russian Hypanis or Varvamis and is known to the Tchergerese as the Pschtitchie. It is fed by the glaciers of the Caucasus Mountains and extends over 525 miles, running through the northern slopes of the range in a northerly direction, bends west and, forming immense swamps, discharges into a gulf of the Black Sea. Several arms fall into the Sea of Azof and are navigable to the mouth of the Laba, a tributary.

KUBANGO RIVER, or OKAVANGO, southwest Africa, a river flowing from the highlands of Biah, Portuguese Angola, between Keanza and Kunene, first southward then southeastward. It reaches and crosses the border of German Southwest Africa after making a sharp bend and creates, in British Zambesia, the Nona Falls; continuing in devious directions it reaches the plains and marshes of western Rhodesia north of Lake Ngami. In the rainy season especially, an arm of the river above the falls forms a tributary of the Zambezi.

KUBEK, Jan, yán koo'bê-lék, Bohemian violinist: b. Michle, near Prague, 1880. Born of humble parentage, he studied at the Prague Conservatory and subsequently performed at semi-private musicales. In 1896 he appeared at a public orchestral concert, and in 1900 with the Berlin Philharmonic Society, and made his début in London in June of that year. Subsequently he made a brief but successful tour on the Continent and in England, and in December 1901 came to the United States, where he was most enthusiastically received. He has since made tours in Europe, the Americas and Australia, and has been the recipient of many honors.

KUBLA KHAN. Coleridge's 'Kubla Khan' is a poetic fragment of 54 lines describing in highly imaginative language the stately pleasure palace built by an Eastern prince amid strange and visionary surroundings. According to Coleridge's own account the poem came to him as an opium dream, after he had been reading an account of Kubla Khan in Purchas' 'Pilgrimages.' On sitting down to write he remembered the entire vision perfectly, but an interruption prevented his completing the poem at the time, and on returning to the work he found that he could not recall the rest. 'Kubla Khan' was published at the request of Byron in 1816. It belongs to the brief period of Coleridge's creative activity and is akin in imaginative and poetic qualities to the two other masterpieces of Coleridge's muse, 'The Ancient Mariner,' though less coherent than either of these longer works. The vision has no meaning and needs none. It is simply a succession of images, dreamlike and unreal but vivid and colorful. Coleridge is a master of the magic suggestiveness of words, and he has a unique faculty of finding visionary music for his visionary speech. The rhythms of his verse are delicate and rich and the varied, but not discordant tones of a great organ. Consult 'Poetical Works' (edited by J. D. Campbell, p. 94 and notes); also the essays by Dowden, 'New Studies'; Pater, 'Appreciations'; and Stephen, 'Hours in a Library' (Vol. III).

JAMES H. HANFORD.

KUBLAI KHAN, koo'blî khâh (more properly KHUBILAI KHAN), called by the Chinese Chi-Tson, Mongol emperor: b. 1216; d. 1294. He was the founder of the twentieth Chinese dynasty, that of the Mongols or Yuen. He was a grandson of Genghis Khan, and in 1229 succeeded his brother as Great Khan of the Mongols, and in 1260 he conquered the whole of northern China, driving out the Tartar or Kin dynasty. He then ruled over the conquered territory himself, and 19 years later added to it southern China, the dominion of the Song dynasty, while he originally summoned his assistance in driving out the Tartars from the north. Kublai thus became sole ruler of an empire extending over a large part of Asia, as well as over those parts of Europe that had belonged to the dominion of Genghis Khan. He repaired the evils of so many wars by a wise administration, and by the encouragement which he gave to letters, commerce, industry and agriculture brought them all to a very flourishing condition. Marco Polo, the celebrated Venetian traveler, who lived 17 years at the court of this prince, gives some interesting information regarding him. He invited European Christian missionaries to take up work in his dominions; but the opportunity was lost, and Buddhism was the gainer thereby. Kublai Khan is the subject of a poetical fragment by Coleridge. Consult Yale, 'Marco Polo' (1875); and Howorth, 'History of the Mongols' (1876-88).

KUCH BEHAR. See COOC BEHAR.

KÜCHENMEISTER, ku'kên-mî'stîr, Gottlieb Friedrich Heinrich, German physician: b. Buchheim, 22 Jan. 1821; d. Dresden, 13 April 1890. He studied at Leipzig and Prague and started practice as physician (1846), but removed (1859) to Dresden. His most useful work was in the research into intestinal parasites. He differentiated the human tapeworms, described (1853) the mate of the itchworm and interested himself deeply in the trichinae infection problem. He pinned the value of vermiculuses, and recognized (1850) the toxic action of balsam of Peru on the itchworm, etc. He was an advocate of cremation and was chief founder of the Gotha Crematorium. He wrote 'Versuche zur Kenntniss der Parasiten der Men'schen' (1852); 'Die Parasiten der Menschen' (Leipzig 1855; 2d ed., 1878-81). Consult 'Die Tatenbestattungen der Bibel und die Feuerbestattung' (Stuttgart 1893), which has a biography.

KUEHL, ku'l, Gotthardt J., German painter: b. Lubeck, 28 Nov. 1818. He studied at Paris, Munich and in Holland. His range of subjects runs from peasantry interiors, ancient city views, churches, etc. Among his works are 'The Netmaker,' in the Lubeck Museum; 'The Tete-a-tete,' in the Luxembourg, Paris; 'The Elbe Bridge,' in the Dresden Gallery; 'Sad
News in the Danzig Orphan Asylum, in the Leipzig Museum; The Old Slaughterhouse, in Magdeburg Museum; Sunday Morn, in New Pinkothen, Munich; The Visit of the Composer, the Court and the Court in Danzig, in Vienna Museum; View of the Frauenkirche, etc. He has been created privy councillor and professor of the Dresden Academy, and is honorary member of the Imperial Academy of the Plastic Arts, Munich, etc.

KUEN-LUN, kwén-loon, a great mountain system of central Asia, a branch of the Himalayas, on the northern fringe of the Tibetan Plateau. It varies in breadth, both extremities being compressed, its middle portion consisting of numerous more or less parallel chains. Nearly the whole group is between lat. 30° and 40° N. The most northern part on the west is a continuous mountain-wall having several names and being farther continued by the Nan-shan and other chains well into China. Toward the south are three roughly parallel mountain ranges, the last of which, with its eastern continuations, forms the southern boundary of a mountainous region in which are the Tsa-dam salt waste and the Koko-Nor lakes. Between the last-named group and one farther south the Hoang-ho rises. The most southerly chain of the central Kuen-lun is that of the Yang-la Mountains. The greatest elevation of the Kuen-lun is in the western ranges, and reaches over 22,500 feet, while the chief western ranges average about 20,000 feet. Most of the peaks of the eastern chains, in China proper, are under 17,000 feet.

KUENEN, kù'nèn, Abraham, Dutch theologian: b. Haarlem, 16 Sept. 1828; d. Leyden, 9 Dec. 1891. He studied at Leyden, becoming (1853) assistant professor and (1855) professor of theology. His chief works are: Historic—Critical Research into the Origin and Collection of Books in the Old Testament (Leyden 1861–65, 3 vols.; 2d ed. 1885–93); De Godsdienst van Israel tot den Ondergang van den Joodschen Staat (Haarlem 1869–70); De Protestant en de Protestant onder Israel (Leyden 1875); National Religions and Universal Religion (5 Hubbert Lectures 1882). He published the Theologisch Tijdschrift from 1867. Karl Budde has issued translations into the German since his death, in Gesammelte Abhandlungen zur biblischen Wissenschaft (Freiburg 1894).

KUGLER, koog'ler, Franz Theodor, German writer on art: b. Stettin, 19 Jan. 1808; d. Berlin, 18 March 1858. He was appointed a professor of fine arts in the University of Berlin in 1833, and subsequently became a member of the Academy of Berlin. His works have undoubtedly exercised great influence on German art and culture; notably a History of Painting from Constantine the Great to the Present Times (1837); Handbook of the History of Art (1841–42); History of Architecture (1856). He also wrote a History of Frederick the Great (1840), which is popular in Germany. His History of Art was continued by W. Lübbe.

KUHLAU, koo'lou, Friedrich, German composer: b. Ulzien, Hanover, 11 Sept. 1790; d. Lynghyde near Copenhagen, 12 March 1832. He was trained by Schwenke at Hamburg but fled (1810) to Copenhagen to escape conscription. There he became violinist in an orchestra without salary, but became, in consequence of his compositions, the Kapellmeister of the Royal Court and the Court in Danzig. He wrote several operas using Danish folklore as subjects besides a number of voice, instrumental and piano pieces, but his sonatas alone are heard at this day and these because they afford useful instruction material for beginners. Consult Turane, Friedrich Kuhlau (Leipzig 1886).

KUHN, koon, Franz Felix Adalbert, German philologist and mythologist: b. Königsberg-in-der-Neumark, 19 Nov. 1812; d. Berlin, 5 May 1881. He studied in Berlin, becoming instructor (1841), then professor and (1870) director of the Kölnerisches Gymnasium at Berlin. He did great research work in comparative philology and, especially, in comparative mythology of the Indo-Germanic peoples. He was editor of the Zeitschrift für vergleichende Sprachforschung (from 1851, which combined (1862) with Beiträge zur vergleichenden Sprachforschung, their combined title becoming (1875) Zeitschrift für vergleichende Sprachforschung auf dem Gebiete der indo-germanischen Sprachen. His most important works in his sphere of thought are: Zur ältesten Geschichte der indogermanischen Völker (1845); Die Herabkunft des Feuers und des Götertranks (ib. 1859); Ueber Entwickelungstiden der Mythenbildung (Berlin 1874). Other works are: Markische Sagen und Märchen (Berlin 1842); Norddeutsche Sagen, Märchen und Gebärde (with Schwart, Leipzig 1848) and Sagen, Gebärde und Märchen aus Westfalen (ib. 1859).

KUHNBAU, koo'nou, Johann, German composer: b. Neugeising, Saxony, 6 April 1600; d. Leipzig, 5 June 1722. He was educated at the Kreuzschule, Dresden, and later under the bandmaster Albrici, then entering (1682) the Leipzig University to study law. Continuing, his musical activities as well he was appointed (1684) organist at the Thomaskirche, practising law at the same time but resigning from legal activity in favor of the position of director of the university in 1700. In 1701 he became cantor at the Thomaskirche, J. Sebastian Bach succeeding him. Of historical interest is his being the creator of compositions for the piano. Among his chief compositions are his piano sonatas, his works for this instrument being second only to Bach. Consult Wagner, Johann Kuhnau (Frauenstein 1912).

KÜHNE, kù'nè, Ferdinand Gustav, German novelist and critic: b. Magdeburg, 27 Dec. 1806; d. Dresden, 22 April 1888. He studied philosophy in Berlin under Hegel, became editor (1835–42) of the Zeitung für die elegante Welt and, from 1846, was editor of the periodical Europa but removed (1856) to Dresden. He published Mein Tagebuch in bewegter Zeit (Leipzig 1863); Christus auf der Wanderschaft (ib. 1870), a poetical satire on the papacy; also the popularly received Römisches Sonette (ib. 1869); Romanzen, Legenden und Fabeln (Dresden 1880). During his journalistic days he followed the Young Germany movement, keeping free from its extremes. Other works of his are Gedichten (Leipzig 1831); Die
beiden Magdalenen (ib. 1833); ‘Eine Quarantäne im Irrenhaus’ (ib. 1835); ‘Klosterneubel’ (ib. 1838); ‘Die Rebellen von Irland’ (ib. 1840); ‘Die Freimaurer’ (Frankfort 1854), his most entertaining novel. His critical articles stand in high repute, such as ‘Weibliche und männliche Charaktere’ (Leipzig 1838); ‘Sposi, Blind aus Venedig’ (ib. 1843); ‘Mein Karnival in Berlin’ (ib. 1843); ‘Porträts und Silhouetten’ (Hanover 1843). He wrote the dramas ‘Isaura von Kasilién’; ‘Kaiser Friedrich III.,’ and ‘Die Verschönung von Dublin,’ but they were not favorably received. ‘Empfinden und Gedächtnis, Lise Blätter aus Gustav Kühnes Schriften’ is a posthumous work edited by Edgar Pierson (Dresden 1890). Consult Pierson, ‘Gustav Kühne, sein Lebensbild und Briefwechsel’ (Dresden 1890).

**KUKA, koo’ka,** or **KUKAU, Afrika,** the half-ruined town in the negro kingdom Bornu in the Soudan and formerly one of the largest towns of central Africa. It is situated a few miles west of Lake Chad, which often inundates it. Its former prosperity was caused by being a thriving market for slaves, horses, hoes, kerosene and cotton goods, and then boasted a population of about 60,000 in the city proper and 100,000 in its suburbs. In 1898 Raben conquered all Bornu and leveled the city to the ground. In 1902 the British took possession, making it a government residence and garrison town.

**KUKIS,** a tribe living in the mountain regions between Lower Bengal and Upper Burma. See Chins.

**KUKU NOR,** koo’koo nor’, Tibet, the large salt lake in northeast Tibet near the boundary of Kansu on an altitude of 10,000 feet above the sea. It is richly stocked with fish, and has a Buddhist monastery on one of its five islands. The lake is 40 miles wide and 60 miles in length. From its southern shore rises the South Kuku Nor range of mountains with an altitude of about 15,000 feet. Its name is derived from Mongol “Kokonor,” “blue sea”; it is the Chinese Tsing hai.

**KUKUL, koo’koo-e’,** CANDLENUT, TUNG, or CHINESE WOOD OIL, the oil obtained from the different Aleurites. The three chief sources are as follows: (1) That obtained from the Aleurites trikoba (candlenut tree) of the tropics and subtropics of the Old World, the Antilles and Brazil whose seeds are similar to small walnuts and are used by the Polynesians as a lighting fuel. They contain 62 per cent of fatty oil known as banku, kukul or kukum. When dried in the air these are edible and serviceable for painting, and pressed into cakes are used as cattle food and manure. (2) Aleurites cordata, or tung-tree of China, Japan and tropical South Asia, at Bourbon, Zanzibar, West Indies and the United States, yields the oil; tung-oil, the Japanese abwagiri, Yani-giri, much used for furniture lac, waterproofing of woods, as well as burning for light and medicinal purposes. Cold pressed it is light-yellow. (3) Aleurites fordii, a species which is being successfully cultivated in the (Florida, States (Florida, California, etc.).

**KUKULJEVIC-SAKINSKI, koo’kool-yevich-sak-chin’ski,** Ivan, Croatian historian and jurist; b. Warasdin, 29 May 1816; d. Zagorien, 1 Aug. 1889. He served in the army (1833–42), then devoted himself to poetry but taking up actively the political movement of 1848. He was appointed a keeper of the archives, becoming (1875) president of the district schools commission. He did much useful research into ancient Croatian history and energetic activity on behalf of the Croatian nationality and endeavors to reform the laws. He wrote ‘Jura regni Croatiae, Dalmatiae et Slavoniae’ (Agram 1861–62); ‘Monumenta historica Slavorum meridionalium’ (ib. 1868–75). He assisted greatly to publishing Slavic works, a Croatian bibliography (1860–63), dictionary of southern Slav artists (1869), historical dissertations in Arkio, a publication brought out by him (1850–75) for the Historical Society of Southern Slavs. Of his poems, dramatical works and stories a collection was published under the title of ‘Razlicita djela,’ Mixed Writings (Agram 1842–47).

**KULJA, koo’jja,** or **KULDJA,** Turkestam, principal city of a district of the same name and situated on the Jil River. It has a 30-foot high clay wall forming a city almost entirely by Manchus, and outer gardens and plantations making a wide-spreading suburb. It is the seat of a Russian consul, has several mosques, two Buddhist temples, one Roman Catholic and a Greek church. Its chief industrial importance is created by its bazaars, caravans coming here from Bokbara, Khokand, etc., and the outlying lands are productive of wheat, barley, poppies, etc. The population of about 10,000 is mostly Mohammedan. This city is easily to be distinguished from New Kull, situated further down the valley and which lies in ruins, having been destroyed by the insurgent Dengans, in 1869, its inhabitants all being massacred.

**KULILAK, ku’lak,** Theodor, German pianoforte musician; b. Krotoschin, Posen, 12 Sept. 1818; d. Berlin, 1 March 1882. He was a pupil of Albrecht AGhie at Posen, of Greulich at Berlin, Czerny and Sechter at Vienna and was popularly acknowledged in 1842 as a piano virtuoso. In the following years he lived at Berlin as piano instructor of the Grand Duke of Prussia and was appointed (1846) court pianist. With Julius Stern and A. B. Marx he founded (1850) the Conservatory of Music and (1855) the “Neue Akademie der Tonkunst.” He is not claimed to have been great as a composer but his instruction works are highly valued, especially his Schule des Oktavenspiels and his Kinderleben.

**KULM, kulum,** Bohemia, a town in the district Aussig, at the foot of the Erzgebirge. It has a brewery, iron-foundry, brown-coal mine, etc., and has a population of about 1,000. It is chiefly noted as being the scene of a battle 29 and 30 Aug. 1813, between the French, under Vandamme, and the allied Prussian, Russian and Austrian armies. It ended in the surrender of Vandamme and 10,000 men, 5,000 French being killed and many cannon and equipments captured.

**KULPE, ku’lpé,** Oswald, German philosopher and psychologist; b. Candau, in Courland, 3 Aug. 1862. He was educated at Liban, becoming private teacher, then studying at the universities of Leipzig, Berlin, Göttingen and
KULTURKAMPF — KÜMMEI

Dorpat. He received the degree of doctor of philosophy in Leipzig (1887) and was made adjunct professor of philosophy and aesthetics (1894) at Würzburg where he, as director of the Psychological Institute, has done very effective service. Aside from many contributions to scientific periodicals he wrote 'Grundriss der Psychologie, auf experimenteller Grundlage dargestellt' (Leipzig 1893); 'Einleitung in die Philosophie' (ib.; 6th ed. 1913); 'Die Philosophie der Gegenwart in Deutschland' (ib.; 2d ed. 1904; 5th ed. 1911); 'Immanuel Kant' (3d ed. 1912); 'Psychologie und Medizin' (1912); 'Die Realisierung' (1912).

KULTURKAMPF, kool'toor-kämpf, a German term denoting the contest for political and legal rights waged between the authorities of Germany on the one hand and the authorities of the Catholic Church on the other. The conflict began by Bismarck in 1872 and had for its main point of dispute the control by the state of educational and ecclesiastical appointments. He urged that the declaration of Papal infallibility by the Vatican council in 1870 was an arrogation of rights dangerous to the state and that the Catholic Church had assumed an attitude of aggression dangerous to the laws of the state. The ill feeling arising from the questions at issue led the Reichstag to pass a law in 1872 expelling the Jesuits from the German Empire. The outbreak of the Kulturkampf, however, dated from the enactment of the May Laws (1873) aiming at state control of the clergy. The Catholic bishops, clergy and people refused to recognize the validity of the new laws. This opposition was met by still more drastic government measures and in 1875 all recusant priests were deprived of their salaries and all religious orders were abolished. The accession of Pope Leo XIII prepared the way, however, for a resumption of friendly relations between the Imperial government and the Catholic Church, and negotiations began in 1878 resulting in a nullification of the laws of 1873. The only remnants of the repressive legislation that are left are the prohibition of the Jesuits and compulsory civil marriage.

KUM, koom, Persia, capital of the former province Irak Adjemi, southwest of Teheran. It is in an arid section on the trade route from Shiraz, via Isphahan, to Teheran, and is noted for the number of graves of Mohammedan saints, many thousands of pilgrims visiting yearly the supposed grave of Fatima, sister of Iman Riza. The town was destroyed by the Afghans early in the 18th century. Pop. about 28,000.

KUMAMOTO, koo'ma-mō'tō, Japan, city, capital of the province of Hiogo, on the island Kiusiu in the river Shirakawa. It has a formidable 16th century castle famous in connection with Kiомas, invader of Korea, and with the Satsuma rebellion in 1877, and now the headquarters of one of the 10 military districts of the kingdom. It is noted as an educational centre where American teachers have been taught such as Acadia Hearn and Capt. L. L. Japes; and its silk industries are important. Its harbor is passable only for flat-bottomed junks. It had 61,233 inhabitants in 1908.

KUMASSI. See COOMASSIE.

KUMAUN, ku-mā'ũn, India, a division of the British-Indian northwest province, situated entirely in the Himalaya Mountains, bordered on the north by Tibet, on the east by Nepal, and having an area of 13,725 square miles. Part of the division consists of high mountains, the main section consisting of wooded highlands which, by artificial irrigation, afford good crops, the remainder being the swampy, unhealthy Terai. While possessing iron, copper, lead, asbestos, etc., they are but little exploited. The valuable forests are under the protection of the government as also are the numerous elephant herds. Barely one-fifth of the area is capable of agriculture and but little is tilled, but tea plantations have been cultivated recently. The division is made of three districts: Kumaun, Garwhal and Terai. The only true industry is the weaving of coarse cloths, but there is considerable trading done, chiefly in Almora. The health station, Naini Tal, is the summer residence of the lieutenant-governor of the Northwest Provinces and has its garrison. Consult Oakley, 'Holy Himalaya' (London 1905).

KUMBHAKONAM, kōm'ba-kō'num, or CUMBACONUM, India, a town in the district of Tanjore of the presidency of Madras, in the Caunya delta. There is a college established by the British, but the inhabitants, about 65,000, are mostly Mohammedans and Hindus. The town was once the capital of an ancient kingdom and is one of the oldest and holiest of India. It contains many ancient temples and palaces and is visited by large numbers of pilgrims.

KUMISS, koo'miss, a preparation of milk, whether cow's, mare's, ass's or goat's, which is said to possess wonderful nutritive and assimilable properties, so that it is very valuable in the treatment of consumption, scrofula, chronic diarrhoea and debility and emaciation in general. It consists essentially of milk in process of fermentation, and cow's milk is what is used for making it in Great Britain. On the Asiatic steppes, where it has been long used as a beverage, it is made of mare's milk, but kumiss of mare's milk or goat's milk has a more pleasant smell. The manufacture of kumiss is carried on in Switzerland, Russia and elsewhere. An analysis of a Swiss variety showed that it was composed of fully 90 per cent of water, nearly 34 per cent of alcohol, instead of 2 of sugar, about 1 1/4 each of butter and albuminates, besides lactic acid, free carbonic acid and inorganic salts.

KÜMMEL, küm'el, Henry Barnard, American geologist: b. Milwaukee, 25 May 1867. He was graduated at Beloit College (1889) and took A.M. degree (1892) at Harvard, Ph.D. (1895) at Chicago University. He was appointed instructor (1889-91) at Beloit College Academy, assistant in geology (1891-92) at Harvard. He was made Fellow in geology (1892-95) at Chicago University and became assistant geologist to the New Jersey State Geological Survey (1892-98); he was assistant professor of physiography (1896-99) at Lewis Institute, Chicago, and assistant State geologist (1899-1902) for New Jersey, and executive officer to the Forest Commission of New Jersey (1905-15). From 1892-1901 he was associate editor of the Journal of Geography, and was
KÜMMEL — KUNDT

president of the Association of American State Geologists from 1908–13. He has contributed numerous useful articles to the periodicals, especially on the stratification of the New Jersey soils and similar subjects.

KÜMMEL, or DOPPELKÜMMEL, döpf elküm‘el, a liqueur produced by the distillation of alcohol with caraway seed or by mixing oil of caraway with alcohol, and adding sugar and water. The best-known kinds are Gilka "Getreidekümme1, from the Gilka factory at Berlin; Ekaure, a very strong and fine liqueur having much oil of caraway; and Allasch, the Russian kümme1 made at Allasch, near Riga, and containing aniseed, fennel and coriander as well as caraway.

KUMMER, küm‘er, Ernst Eduard, German mathematician: b. Sorau, Silesia, 29 Jan. 1810; d. Berlin, 14 May 1893. He studied (1828–31) theology at Halle, then mathematics under Scherk, becoming a gymnasium teacher at Sorau. From 1832–42 he taught mathematics at Liegnitz, where Krones was among his pupils. During this period he worked on the appendix to Gauss, especially on the hypergeometric (Gauß’s) series (Crelle’s Journal, Vol. XVII). In 1842 he became assistant professor at Breslau, then professor of mathematics, and was called to Berlin (1855) to succeed Dirichlet, teaching there in the Military Academy till 1874. He was permanent secretary of the Academy of Sciences from 1863, retiring from active work in 1884. In his second period he worked on the theory of numbers, led up to by his work on cubic remainder (Crelle’s Journal, Vol. XXIII and XXXII). He created the system of ideal prime numbers in order to overcome difficulties encountered in his work on complex numbers. In 1857 he was awarded the Grand Prize by the Paris Academy. He also devoted later to advance the science of geometry. His "Allgemeine Theorie der Schwellenpreise" (Crelle’s Journal, Vol. LVII) led him to the "Kummer surfaces," named after him. Other works by him are "Über die Wirkung des Luftwiderstandes auf Körper von verschieden Gestalt insbesondere auf die Geschosse" (1875). "Consul Jahresbericht der deutschen Mathematiker-Verein" (Berlin 1894), Vol. III.

KUMMER, Friedrich, German literary historian and dramatist: b. Dresden, 30 March 1865. His family was cultivated and artistic, particularly in the field of music. He was educated at the gymnasium of his native city, and at the universities of Leipzig, Tübingen and Berlin, where his studies were chiefly in philosophy, aesthetics and modern languages. His doctoral dissertation was on Schiller's "Demetrius" (1889). His literary activity began at Berlin (1890–94), but since 1894 he has lived at Dresden, becoming a member of the staff of the journal Dresdenez Anzeiger, in 1897. His principal work is in the field of 19th century Ger man literature, "Deutsche Literaturgeschichte des 19 Jahrhunderts" (1st ed. 1901, numerous since), in which Kummer for the first time introduces into the study of literature the conception of the writer’s generation as the dominant factor in his work. He divides the history of German literature in the 19th century into five generations, culminating, respectively, about 1850, 1835, 1850, 1871 and 1889 (the latter date indicating the rise of the naturalistic movement and outlines the predominating causes of the attitude of each generation, together with a spirited and interesting elaboration of the contribution of each writer to the work of his specific generation. The book immediately produced a profound effect on students of literary history, as it led them to see the value of a social rather than a merely individual treatment of literary merit, and earned for Kummer the title of "Professor," conferred upon him the same year (1908). Kummer underestimates the material factors in literary history and exaggerates the factors of race (thus he attempts an explanation of the various groups of German writers on the basis of their origin from different German tribes, and their birth in different parts of the country), but the book has a permanent value as well as a sensational appeal. His dramas are "Tarquin" (tragedy, 1889); "Michael Weitmoser" (historical, 1892); "El frie" (modern, 1892).

JACOB WITTNER HARTMANN.

KUMQUAT, küm‘kwot, a genus of shrubs, Fortunella, of the family Rutaceae, related to the orange. Several species are known native of China and Japan. The plants are 10 to 15 feet high, with small fragrant white flowers, and oblong or globose fruits 1 to 1 1/4 inches in diameter. Kumquats were introduced into the United States about 1850 and are now extensively grown along the Gulf Coast and in California. They are the hardiest of the citrus fruits, being able to withstand temperatures as low as 15° F. without injury. The fruits are eaten raw but are more generally used for making marmalade, jelly and candied fruit.

KUMENDOROS, koo-moon‘du-ras, Alexandros, Greek statesman: b. Messenia, 1814; d. Athens, 27 Feb. 1883. He studied law at Athens. On his return to Crete he became one of the supporters of the revolution of 1841, and in 1843 was also an active revolutionist in the capacity of secretary to General Mavrocordatos. In 1851 he entered the Chamber of Deputies, becoming its president in 1855. He was subsequently appointed Minister of State with charge of the Department of Finance. After the fall of King Otto (1852), he was rewarded for his efforts by the appointment of the first Greek government of Prince I to the chair of Minister of Justice. In 1864 and 1865 he was Minister of the Interior, and in the latter year became president of the Ministry, an office to which he was repeatedly re-elected until 1880. His home policy was to develop parliamentary power. He worked also for the extension of Greek power and the exclusion of Turkey, but this foreign policy was annulled by the Congress of Constantinople and he was compelled to withdraw (1862). Consult Bikélas, "Aoumoundousos" (Montpellier 1884).

KUNCHINJINGA, koon-chin‘jing-a, or KINCHINJUNGA, India, one of the highest peaks of the Himalaya Mountains. It has been computed at 28,146 feet, whereas Mount Everest is said to be 29,002 feet. Its location is in the northeast corner of Nepal.

KUNDT, koont, August Adolf, German physicist: b. Schwerm, 18 Nov. 1839; d. Israelsdor, near Lübeck, 21 May 1894. He gradu-
KUNENE — KUNZ

ated at the Berlin University (1867), becoming teacher (privatdocent), going to the Zürich Polytechnikum (1868) as professor of physics, then (1870) to Würzburg, next (1872) to Strassburg and being called (1888) to Berlin. He investigated first the acoustic vibratory motion of solids and gaseous bodies and discovered the dust figures in closed sounding tubes, which offer a medium for calculating the velocity of sound in gases and to compare these with those in solid bodies. He investigated the phenomena of the anomalous dispersion of light of substances which show strong absorption of certain colors. His researches in heat conductivity and friction in gases were very fruitful, also those into the rotation of the plane of polarization in gases and the optical characteristics of metals. His 'Vorlesungen über Experimentalphysik' was published by Scheel (Brunswick 1903). Consult von Siemens memorial in Königliche preussische Akademie der Wissenschaften, Abhandlungen (Vol. II, Berlin 1893).

KUNENE, koo-nâ'ne, or CUNENE, Africa, a river having its source in the Portuguese province of Angola on the plateau of Bihe, receiving a number of lateral streams and flowing southward finally forms an immense swamp near Kiteve, to turn next in southeasterly direction where it receives the Kakulovar flowing from the Sierra da Chella. Thence it flows to the boundary of German Southwest Africa in an easterly direction and enters the Atlantic Ocean. It covers a course of 700 miles and at the outlet forms a sandbar hindering navigation besides having cataracts. Consult Baum, 'Kunene-Sambesi Expedition' (Berlin 1903).

KUNERSDORF, koo'ners-dorf, a village in the province of Brandenburg, Prussia, 10 miles north-northeast of Frankfurt-on-the-Oder, the scene of an important battle in the Seven Years' War, fought 12 Aug. 1759. A Prussian army of between 40,000 and 50,000 men under Frederick the Great attacked nearly twice that number of Austrians and Russians under Generals Landon and Soltykoff. In his initial attack on the left flank, Frederick gained considerable advantages, capturing 180 guns. Disregarding the advice of General Seidlitz, he next proceeded against the Austrians, who, however, held their ground and brought all their artillery to bear on the Prussian quarters, with the result that the Prussians were totally routed with a loss of 20,000. The other side lost even more, about 25,000.

KUNG TS'IN WANG, koong ts'ên wâng, or KONG CH'IN WANG, Chinese prince and statesman: b. 11 Jan. 1833; d. 2 May 1898. He was brother of the Emperor Hienlung and first (1860) became noted in the conflict with England and France as diplomatic mediator, when he made concessions to the Europeans, and was elected (1861) Minister of Foreign Affairs. On the death of the emperor, in the same year, he was appointed regent for his five-year-old nephew, Tungchi, after beheading the chiefs of the Old China party who tried to get the young emperor under their power. He rewarded the English and French for their assistance in suppressing the Taiping insurrection by carrying out reforms and affording religious tolerance. Several times, last of all in 1884, during the war with France he was in disgrace on account of his reforms and was robbed of his titles. From 1887 he was again regent, and, in 1894, was made president of the Tsung-il-Yamen. He was exceptionally progressive for a Chinese statesman.

KUNGUR, koon-goör', Russia, a circuit town in the government of Perm, situated at the junction of the rivers Iren and Sylva. It has 11 churches, a city bank, numerous tanneries and shoe factories, iron foundries, machine shops, etc. Its industrial resources include trade in grain, leather goods, hardware, etc. In 1910 it had a population of 19,638. In the vicinity are great caves on the banks of the Iren.

KUNIGUNDE, koo'nâ'-gûn'de, Saint: d. Kaufungen, near Cassel, 3 March 1039. She was a daughter of Count Siegfried of Luxembourg and wife of Emperor Heinrich II. Legend says both vowed to live in celibacy. She was active during the foundation of the bishopric of Bamberg in 1007. The legend that she passed unscathed through the fire test in order to prove her innocence when accused of infidelity has been proven false. After Henry's death (1024) she became a nun in the convent at Kaufungen, which she had founded, and died there. She was buried in Bamberg Cathedral. In 1200 she was canonized by Pope Innocence III. Her saint's day is 3 March. Consult Looshorn, 'Gründung und erstes Jahrhundert des Bistums Bamberg' (Munich 1886); Toussaint, 'Geschichte der kirchlichen Kunigunde von Luxemburg' (Paderborn 1901); Kaiser, 'Kaiser Heinrich II, der Heilige' (Kempten 1904).

KUNTH, koonth, Karl Sigismund, German botanist: b. Leipzig, 18 June 1788; d. Berlin, 22 March 1850. He went to Berlin in a commercial capacity but was influenced by Alexander von Humboldt to take up the study of botany and classified and described the collection of plant life collected in America by Humboldt and Bonpland, settling in Paris (1813) for this purpose. It was here that his 'Synopsis' (Paris 1822-23) was published concerning the Flora of the Americas and also his 'Mimoses et autres plantes légumineuses du Nouveau Continent recueillies par Humboldt et Bonpland' (ib. 1819-24, with 60 colored plates); 'Distribution méthodique de la famille des graminees' (ib. 1835, 2 vols., with 220 plates); also 'Nova genera et species plantarum' (ib. 1815-28, 7 vols., with 700 copper-plate engravings) issued in conjunction with Humboldt. At the same time he planned a herbarium containing 30,000 kinds. After traveling in England and Switzerland he was appointed (1819) professor of the Berlin University and made vice-director of the Botanical Gardens. He wrote also 'Enumeratio plantarum omnium hucusque cognitarum secundum famlias naturae disposita' (Stuttgart 1833-50, 5 vols.), which work treats of the greater part of the monocotyledons.

KUNZ, koonts', George Frederick, American gem expert: b. New York city, 29 Sept. 1856. He was educated in the public schools and Cooper Union, and has received the degrees of A.M. from Columbia University in 1892, Ph.D. from the University of Harvard (1903); D.Sc. from Knox College, 1907. He is president of the American Scenic and His-
KUNZE — KUOPIO

KUNZE, koon'tsē, John Christopher, American Lutheran theologian; b. Artern, Saxony, 4 Aug. 1744; d. New York, 24 July 1807. He studied theology in the gymnasiums of Breslau and Mersburg, and at the Leipzig University. After several years teaching as docent, he came to Philadelphia (1770), appointed associate pastor of the Lutheran church, keeping a theological seminary at the same time as editor as professor of Oriental languages at the Pennsylvania University (1780-84). He became pastor of the Lutheran church at New York in 1784, serving as professor of Oriental languages and literature at Columbia (1787-89) and again (1792-96). He was one of the early advocates of the need of teaching English to German youth, and he aided in introducing the English language in German churches in the United States. He wrote 'A Hymn and Prayer Book for the Lutheran Church' (New York, 1795), the first American-published Lutheran hymnbook. Consult Norton, C. E., 'Four American Universities' (New York 1895); Appleton's 'Cyclopedia of American Biography' (Vol. III, lb. 1898).

KUNZITE, koonzit, the name of a precious stone found in southern California; so called in honor of Dr. George F. Kunz, the special agent in charge of precious stones, United States Geological Survey, since 1882. It is a brilliant gem and is between the topaz and pink sapphire in color. A rose-like is the tint which marks this stone, a color new among gems; and its radiance is peculiar and beautiful. Kunzite was brought to light in 1902 near Pala, in San Diego County, Cal., and was sent for classification to Dr. Kunz, the eminent mineralogist of New York. Much attention was attracted by the beautiful lilac-colored crystals, for nowhere in the country, not even in the American Museum of Natural History at New York, which has the finest collection of spodumene, under which the new gem was classified, had there been seen such remarkable and perfect specimens as these. Dr. Kunz identified the gem and described it; but Dr. Charles Baskerville, professor of chemistry in the University of North Carolina, finally subjected it to ultraviolet light, then to the radiative power, and lastly to the bombardment of the corpuscles shooting out from radium, which resulted in some wonderful effects new to the scientific world. Of these effects Dr. Charles Baskerville, who took the liberty of naming the gem "Kunzite," for his friend, gives the following account:

On examining this gem we directed our attention to discovering the effect of radium on precious stones. It was shown early in the experiments of the French mineralogist, Curie, that many diamonds phosphoresce, that is, glow in the dark, after being exposed to the emanations of radium. All diamonds phosphoresce with radium, as we learned by applying the test to about two thousand gems collected from some fifteen thousand. The gem in which we were particularly interested belongs to the class of spodumene. Mineral spodumene is usually obtained in large opaque whitish crystals, but from time to time small specimens, often richly colored and transparent, are found. Characteristic varieties of the latter are a clear yellow gem spodumene of Brazil, the green bidentine, or lithia emerald of North Carolina, and the lilac sometimes found in Connecticut. These are without doubt remnants of large specimens, which must have been elegant. Spodumene is very subject to alteration and has usually lost all its transparency and beauty of tint.

The California spodumene crystals are of a rose-lilac tint, varying with the spodumene dichroism, from a very pale tinge and are transversely to the prism, to a rich amethystine hue longitudinally. No such crystals of spodumene have ever been seen before, and the discovery is of great mineralogical interest. The crystals have been either weathering and have a twinning like the bidentine variety. When cut and mounted parallel to the base, they yield gems of great beauty. Baskerville, Kunz and Crocke's have found this almost as luminously responsive to the action of radium as the diamonds.

KUOPIO, Russia, a government in the eastern part of the grand duchy of Finland, surrounded by the governments of Uleåborg, Vasa,
KÜPIO—KURDS

Saint Michel and Viborg and in the east by the Russian government Olones. It has an area of about 16,498 square miles, of which over 10,491 consist of lakes. The chief industries are the fisheries, forestry, agriculture and cattle breeding, also butter production. A considerable amount of iron ore is produced. Pop. 327,573, mostly Finns.

**KÜPIO,** vuelí-to, Russia, capital of the government of the same name, situated on Lake Ilmavirri. It is the bishop's seat and has Kallio-pyyni, and on the Kuivola, shops and a modern cathedral, fine park, two lyricums and several trade schools and has considerable commerce. Pop. 15,845.

**KUR,** koor, or **KURA,** koor, Russia, largest river in Transcaucasia, known in ancient days as Kyros. Its source is in the province of Kar, whence it runs, edged in by mountains, flowing in a southeasterly direction through the governments of Tiflis, Jelissavetpol and Baku; it enters an arid steppe and, branching out into several arms, tails into the Caspian Sea. Its course runs for 829 miles and is navigable for steamers for 130 miles up to the junction of the Ara branch. The leasing of the fisheries near Saljany and Boshij Promysl afford the state 1,000,000 rubles yearly. The most important places along its shores are Ardagani, Gori, Mzchet, Tiflis and Dzvart.

**KURANDA,** koo-rán'da, Ignaz, Austrian publicist and statesman: b. Prague, 1 May 1812; d. 4 April 1884. He was the son of a Jewish bookseller, studied in Vienna and did journalistic work on the leading papers at Leipzig, Stuttgart and Brussels. He founded (1841) in Brussels a weekly, Die Grenzboten, the editorial offices of which were transferred to Leipzig, where he issued the work, 'Belgien in seiner Revolution' (Leipzig 1846). In the same year his drama, 'Die letzte weisse Rose,' was performed for the first time at the Hofburg Theatre, Vienna. In 1848 he was elected member of the Frankfort Parliament. He went to Vienna and founded the Ostdeutsche Post, a political paper conducted with dignity, which lasted till 1866. He was a common councillor and elected member of the Reichsrat 1862, where he became one of its most noteworthy political orators.

**KURDISTAN,** koor-dé-stan' (Persian, 'land of the Kurds'), an extensive territory of western Asia, comprehending the greater part of the mountainous region which borders on the western side of the great plateau of Iran or Persia, and stretches westward till it overhangs the low plains of Mesopotamia on the southwest, and reaches the borders of the Turkish provinces of Diarbekir and Erzerum on the northwest. The surface is very mountainous, and is traversed by lofty ranges with summits reaching above 10,000 feet in height, stretching northwest to southeast. The whole surface on the west of the Persian frontier is drained by the Tigris and the Euphrates and their tributaries. Unless Lake Van is considered, the territory, there are no lakes of any consequence. The mountains are covered with forests of oak and other hard timber. Many of the valleys are under regular culture, with corn-fields, orchards and vineyards. One of the most remarkable vegetables is manna, expressively called in Turkish Kuyrek-hal-vassis, or the Divine sweet-meat, which is used as food. Fine horses and oxen are bred, and sheep and goats are kept in large numbers.

The Kurds are a stout, dark race, well formed, with dark hair, small eyes, wide mouth and a fierce look; the men are armed, using lances, sabres, daggers, muskets and pistols. Many of the tribes are still nomadic. The language is of the same stock as the modern Persian. The great body of the Kurds are Mohammedans. They care little for trade, although they send to Kirkuk, Hamadan, etc., gail-nuts, tobacco, honey and castor oil; obtaining in return coffee, rice, and leather and clothing (chiefly cotton goods). Their allegiance to the Turkish sultan is but slight. The famous Sultan Saladin was a Kurd. In the terrible massacres of Armenian Christians instigated and carried through by the Turkish government in 1914 and 1915, during the progress of the Great European War, the Kurds took an active and sinister part. It is very difficult to form even an approximate estimate of the whole Kurdish population; the Turkish portion is supposed to contain about 2,800,000 and the Persian portion 400,000; but another estimate would give for these numbers 1,300,000 and 500,000, respectively.

**KURDS,** koordz, or **KOORDS,** an Asiatic people of Iranian descent dwelling in a section named after them Kurdistan, 'the land of the Kurds' (q.v.), located in Persia and Turkey in Asia. They number about 2,300,000 and are nearly all Islamites. They are of mixed character, brave, freedom loving, hospitable, rather shy, and, to some extent, true to their word; on the other hand they have no liking for orderly work, are firmly devoted to bloody revenge and consider a robbery equally honorable as heroic acts. They have great family love, the nomads wandering with their tents of black skins or the settlers living in low houses with flat wooden roofs, that serve in summer time as sleeping quarters. Their women have more freedom than is usual among Orientals, going outdoors unveiled, dealing with men without timidity. The girls, as a rule, are given in marriage at from 10 to 12 years of age without payment. Only the rich and noble have a plurality of wives. For head covering they use the Turkish turban or a globular yellow fur cap; they shave the head generally, wearing only a mustache, the aged alone wearing a full beard. Their weapons are long riders' lances, sabres and pistols; the fighters on foot carry guns, and a daggier in the belt. Their history dates back to the Guti of ancient Assyria in which empire they appear to have had an independent political position; they were merged with the Medes after the fall of Nineveh. Cyrus subjugated them, since which they have been under the domination of the Macedonians, Parthians and Sassanians, successively. After numerous revolutions their chief fortress, Sermaj, was captured, in the 9th century, and reduced by the caliphate of Bagdad, but they appear to have been in the zenith of their 12th century and held sway over the Kurdist Mountain, and included Khorasan, Egypt and Yemen. The invading Mongolians and Tatars appear to have held them later in subjection. For further facts consult Lerch, 'Forschung über die Kurden' (Saint Petersburg 1837-38);
Roediger and Pott, 'Kurdische Studien' (in Zeitschrift für Kunde des Morgenlandes, Vols. III–VII); Schläfi, Beiträge zur Ethnographie Kurdisch. (in Petermann's Mitteilungen, 1863); Milligen, 'Wild Life among the Koords' (London 1870); Creagh, 'Armeniens, Koords and Turks' (ib. 1880); Chantre, 'Les Kurdes,' in Bulletins de la Société d'Anthropologie de Lyon (Lyons 1889).

KÜRENBERG, kü'rên-bêrk, Der von, or der Kurenberger, a German minstrel of the 12th century. His short love songs belong to the ancient folklore as to their subjects and are composed in Nibelungen stanza. He came of knightly family of Austrian origin located either at Linz, Burghausen or Schala, each of which places had branches of this family. He is called the oldest Minnesinger, and his songs are collected by Haupt 'Des Minnesangs Frühlings,' (4th ed., Leipzig 1888), and in Bartsch's 'Deutsche Liederdichtern' (4th ed., Stuttgart 1901); Bühring, 'Das Kurenberg Licht,' in der gegenwärtigen Zeit der Forschung' (Arnstadt 1901–02). Pfeiffer and Bartsch considered he was the originator of the Nibelungenlied. Consult Vollmüller, 'Kürenberg und die Nibelungen' (Stuttgart 1874); Eugen, Joseph, 'Die Frühzeit des deutschen Minnesangs, Quellen und Forschungen' (Strassburg 1886).

KURIA MURIA (koo're-ä moo're-a) ISLANDS, a group of five islands situated off the southern coast of Arabia at distances varying from 10 to about 30 miles, with a total area of over 25 square miles. Guano deposits are found in these islands, but they are considered too barren and have very few inhabitants. In 1854 they were ceded to Great Britain.

KURIHAMA, koo're-ha'ma, Japan, a mile west of the village of Uraga, where, on 14 July 1853, Commodore M. C. Perry anchored his four vessels. On 14 July 1901, the monument, a monolith of Sendai granite, inscribed in letters of gold (now in black), penned by the Marquis Ito and reared by the America's Friends Association, and to which the Mikado subscribed a thousand yen, was unveiled in the presence of Perry's grandson, Commodore Rogers, with three American men-of-war, part of the impressive fleet of a great company of distinguished Japanese. The military and naval display included the various types in the development of the Japanese fleet, showing progress from the war junk to the battleship. A dozen or so of natives, who remembered the scene of 1853, were present. The Perry monument stands enclosed by 36 granite posts, linked by ship's anchor chains, in the centre of a broad square enclosed by banks faced with stone. In 1917, Capt. Thomas Hardy of Seattle, Wash., aged 84, one of the oarsmen who rowed Perry ashore, visited Japan at the invitation and expense of the school children of the empire and received honors from the emperor, officials and people and children everywhere. Ten miles down the bay is the Marine Biological Laboratory, from which many Japanese students in the American institution of similar purpose at Wood's Hole, Mass., have studied.

KURILES, koo'rîliz, a chain of 31 islands in the north Pacific Ocean, belonging to Japan (q.v.). Area, 6,068 square miles. The highest elevation is 7,382 feet. The chain extends southwest to northeast from Yezo to Kamchatka. They are divided into the Great and the Little Kuriles. Pop. 4,400. Consult Snow, 'Notes on the Kurile Islands' (1896).

KURISCHES HAFF, koo'rîsh-ës hâf, Prussia, the largest of Prussia's lagoons, reaching from Labiau to Memel, 60 miles long and separated from the sea by a sand-bar called the Kurisch Nehrung. A number of rivers are discharged into this lagoon, such as the Dange, Minge, Russ and Gilge, etc. While navigation is carried on in the Memel Deeps, a channel connecting with the North Sea and 12 feet deep and about 1,000 feet wide, this lagoon has little shipping value. The water is fresh, being fed by the above-mentioned rivers and the much larger Memel or Niemen.

KÜRBNERGER, kü'rînbèrg-ër, Ferdinand, German novelist and critic: b. Vienna, 3 July 1823; d. Munich, 14 Oct. 1879. He studied philosophy at Vienna, but turned to journalism (1846), fled from his native town (1848) as a revolutionist, but returned (1859) and settled in Graz (1863), then Vienna. His first work was 'Der Amerikamüde' (Frankfort 1856) made his reputation. Other works of his are 'Das Goldmärchen' (Vienna 1857); 'Novellen' (Munich 1861–62), a collection of feuilletons on Austrian history from 1859–73, generally in satirical strain; 'Siegelringe' (Hamburg 1874); 'Der Haustyrann' (Vienna 1876), a novel. His chief attempt at dramatic composition was 'Catalina' (Hamburg 1855). He was a pessimist but made a good critic with his frankness and deep poetical understanding. W. Lauther brought out a volume of posthumous works entitled 'Novellen' (Stuttgart 1893), and Karl Rosner published his 'Schloss der Frevel' (Leipzig 1904), a novel. Consult Mulhinger, 'Kürbinger's Roman der Amerikamüde' (Philadelphia 1903).

KURO SHIWO, koo-roo she'wo (literally, 'dark blue salt'), or, in common parlance, the black current or stream. It is a mass of dirt brought from the water on either side of it and named by the Japanese ages ago. An old Japanese map shows the general features of the northern Pacific, Bering's Strait and islands and its shores quite accurately delineated. Yet this river of warm water in the Pacific Ocean was first scientifically studied and described by Lieut. Silas Bent, U.S.N., in Perry's expedition 1852–54, who made a report, the statements and suggestions in which have been in the main confirmed by later investigators. In history, this stream of black brave contributed notably to the peopling of both Japan and America and to its flora and fauna. The first host of invaders from the Asian continent through Korea were aided by it to reach Iozumo and Hiuga, and the second set, or the great drift of humanity, from the Malay world, made good use of the current and landed at many points on the coasts of Japan. The Kuro Shiwö is bent southward, not by impinging on the land, but is prevented from entering the Arctic Ocean by the Bering Strait, which at its deepest is only 30 fathoms, or 180 feet deep, and much less than 50 miles wide, and in it are three islands. Through this opening the
cold water rushes from the icy seas, drawing or pushing the Kuro Shiwō eastward. Though fog abounds, dense, the posidonia dammus through, with no icebergs, as in the Atlantic Gulf Stream. One curious effect was to supply the Hawaiian Islands with the splendid timber of "Oregōn"—a word which ultimately came to mean anything unusually fine and is so used as an adjective in the Hawaiian version of the Bible. Consult Perry's 'Narrative of the Japanese Expedition' (1857); Reim's 'Japan' (1884); 'Transactions of the Asiatic Society of Japan.

KUROPATKIN. See Kuropatkin.

KÜRSCHNER, kürʃ'nɛr, Joseph, German author and editor: b. Gotha, 20 Sept. 1853; d. on a journey to Huben, 29 July 1902. His first employment was in mechanical engineering, then he studied at the Leipzig University, thereupon (1875) living several years in Berlin. He managed the Stuttgart periodical Vom Fels zum Meer (1881-89) and founded Deutsche Nation (1896). He was appointed literary director of the Deutsche Verlagsanstalt and removed (1893) to Eisenach. He devoted some time to compiling theatrical history, then became editor (1880-82) of Neues Zeit, official organ of German dramatical authors and composers (1885-86) he edited Deutsche Schriftstellerzeitung, etc. After editing several encyclopedias he compiled Allegemeiner deutscher Literaturkalender from the fifth to 24th yearly issue. He wrote also 'Konrad Ehrenfels' (1872); 'Heil Kaiser, dir!' (1897); 'Frau Musik' (1898); 'Kaiser Wilhelm II als Soldat und Seemann' (1902).

KURSK, Russia, a government bounded by the governments Tschernigov on the northwest, Orel on the north, Voronesch on the east and Charkov and Poltava on the south and southwest. It covers an area of about 17,937 square miles. It consists of a wide plain framed in by heights which discharge their water by over 400 rivers of which the Sein is chief. It has a population of about 3,133,500, mostly Great Russians, who have, however, adopted many of the habits of the Little Russians, all belonging to the orthodox Greek Church. It is one of Russia's most fertile governments. The chief industry is agriculture with a large output of wheat, rye, oats, barley, buckwheat, sugar-beets, hemp, etc. It has a great growth of fruit such as apples, cherries and plums; the bee-culture, has, however, declined greatly and its cattle trade is small. Manufactures are inconsiderable, sugar being the most prominent along with oil-pressing.

KURSK, kürsk, Russia, capital of the government of the same name situated on the mouth of the Kur River and a junction of several railways. It has 16 orthodox Greek churches, a Lutheran church, priests' and teachers' seminaries, two gymnasium, a high school and a school of geoteics, besides banks, theatre, commercial exchange, etc. Considerable industry is carried on in leather work, steam grinding mills, oil-pressing, pottery, tobacco manufacturing, as well as commerce in grain, tallow, hemp and hemp-oil, and bristles. Pop. 83,330.

KURT, kérθ, Godofroid, Belgian historian: b. Arlon, 11 May 1847; d. Assche, Brabant, 4 Jan. 1910. From 1872 to 1900 he was professor at the University of Liége, and from the latter year until his death was director of the Belgian Historical Institute, Rome. He was a member of the Academy of the Catholic Religion of Rome, of the Royal Society of Literature of London, of the Dutch Literary Society of Leyden, of the Royal Academy of Belgian and of other societies Belgian and foreign. He was in charge of the board of administration of the Royal Library, Commander of the Order of Leopold and Knight of the Order of Pius IX. He wrote 'Caton l'ancien'; 'Étude critique sur Saint-Lambert et son premier biographe'; 'La loi de Beaumont en Belgique'; 'Les origines de l'organisation moderne'; 'Les origines de la ville de Liége'; 'Histoire poétique des Merovinigens'; 'La frontière linguistique en Belgique et dans le nord de la France' (2 vols.); 'Les études franques'; 'L'église aux courants de l'histoire'; 'Clovis' (2 vols.); 'Chartes de l'Abbaye de Saint-Hubert en Ardenne'; 'Notger de Liége et la civilisation au xe siècle' (2 vols.); 'La cité de Liége au moyen âge' (3 vols.); 'Manuel de l'histoire de Belgique'; 'Abrégé de l'Histoire de Belgique' (2 vols.); 'Histoire universelle' (2 vols.); 'Notre nom national'; 'Mizraim, souvenirs d'Egypte'; 'La nationalité Belge.' He founded and became first director of Archives Belges, revue critique d'histoiregraphie nationale.

KURZ, kurts, Heinrich, German historian of literature: b. Paris, 28 April 1805; d. Aarau, 24 Feb. 1873. Of German parents, he studied at Leipzig and Paris, and lived in Munich and Augsburg from 1830, in the latter city publishing a constitutional opposition paper, Die Zeit, which caused his incarceration for a few weeks. He next removed to Switzerland teaching German and literature in Saint Gall and was promoted to professor (1839) at Aarau and made librarian also (1846). The rich treasures of the Aarau Library furnished him material for the study and research in German literature. He wrote 'Handbuch der poetischen Nationalliteratur der Deutschen Zeit (Zurich 1890; 3d ed., 1869); 'Handbuch der deutschen Prosa von Gottsched bis auf die neueste Zeit' (ib. 1845-53); 'Schichte der deutschen Literatur' (Vols. I-III, Leipzig 1851; Vol. IV, 1866-72), his greatest work, which reached its seventh edition in 1876. He also edited 'Esopus von Burkard Waldis'; 'Simplizianische Schriften' of Christoff von Grimmelshausen; 'Fischart's 'Dichtungen'; Wickram's 'Rollwagenbüchlein.' He edited collective works of Goethe (1867-68) and of Schiller (1867-68) in 12 and 9 volumes, respectively, also of selected works of Lessing, Herder, Wieland, Chamisso, von Kleist and E. T. A. Hoffmann, and compiled 'Die deutsche Literatur im Elsaß' (Berlin 1874).

KUS, a semi-wild tribe of Dravidians inhabiting parts of Bengal and Orissa. They are also generally known as Khonds and number over half a million. See Khonds.

KUSI, koo sē. See Coosy.

KUSKOQUIM, kūsko-kw'im, Alaska, the second river in size in the Territory, rising on the northern slopes of Mount McKinley, and after a southwesterly course of over 650 miles, flowing through the wide estuary of Kuako-
KUSSMAUL, kúsˈmou̯l, Adolf, German physician; b. Graben, near Carlsruhe, 22 Feb. 1822; d. Heidelberg, 28 May 1902. He studied at Heidelberg, became assistant of Nägele and Pfeuffer, and removed (1847) to Vienna, then Prague and became (1848) military surgeon for Baden. He became instructor (1855) at Heidelberg University, and was appointed adjunct professor (1857) and professor (1859) and director of the medical clinic and polyclinic at Erlangen. In 1863 he practised in Freiburg in Breisgau and (1876) at Strassburg. He retired (1889) and lived at Heidelberg. He made useful researches in epilepsy, advanced the treatment of the stomach by usage of the stomach-pump. He wrote 'Die Farbenerscheinungen im Grunde des menschlichen Auges' (Heidelberg 1845), an invaluable work; 'Untersuchungen über das Seelenleben des neugeboren Menschen' (Leipzig 1859; 3d ed., Tübingen 1890); 'Untersuchungen über den constitutionellen Merkurlismus und seine Verhältnis zur constitutionellen Syphilis' (Würzburg 1851); 'Über die Behandlung der Magenerweiterung durch eine neue Methode' (Freiburg 1869); 'Zwanzig Briefe der Museen, scheinbeck und Kulpeckencimt' (Freiburg 1870); 'Die Störungen der Sprache' (Leipzig 1885); in Ziemssen's 'Handbuch der Pathologie'; 'jugenderrinnerungen eines alten Arztes' (Stuttgart 1889; 8th ed. 1909).

KUSSNACHT, kusˈnakt, recently called KUSSNACHT, Switzerland, capital of a district in Canton Schwyz, located at the foot of the Rigi Mountain on the shore of the Kusnach Lake, an arm of Lake Lucerne. It is the landing station for the lake steamers. The town was a station of the Rigi Railway, and the Gessler was shot, is Tell's Chapel, and the ruins of the castle supposed to have been the Gessler abode. Pop. 3,981.

KUSTENDJE, kúˈstendje, or CON-
STANTZA, Rumania, capital city of the Dobrudja, located on the Black Sea and on the Constantza-Tchernavoda Railway, which here bridges the Danube. The ancient remains of the end of the so-called Trajan's Wall is located here. Among its public and prominent buildings are a cathedral, Greek, Protestant, Catholic, Armenian and Bulgarian churches, eight state subsidized mosques, a gymnasion, four public schools, etc. The modern constructed harbor, finished 1902, has a breakwater and docking basins, freight elevators, etc. A large export trade is done in grain, hemp, petroleum and considerable merchandise is imported here, chiefly textiles, cast-iron goods and colo-
nial wares. It stands in direct communication by steamer with Constantimople, and its im-
portance led to its early seizure by the Central Powers, who occupied it (see World War, European). This city is the site of the old Roman town Constantiana and was the place of exile of Ovid. The Russians and Turks met here in the War of 1854. Pop. 26,628.

KÜSTENLAND, kúˈsten-land, Austria, the coastal lands or littoral comprising the three Crown lands: Görz, Gradiska, Istria and the city of Triest with its district. In the admin-
istration of these Crown lands Trieste is the focal point; Görz, Gradiska and Istria have independent representatives, Görz and Gradiska having 22 delegates and Istria 33, the conventions meeting at Görz and Parenzo. The political administration is at Trieste, vested in the gover-
nor, judiciary and finance branches. The area of the littoral lands is 3,077 square miles, with about 894,457 inhabitants. Consult Coenig, von, 'Die ethnologischen Verhältnisse des Oesterreichischen Küstenlandes' (Trieste 1885); id., 'Spezialortsverzeichniss des äus-
terreichisch-illyrischen Küstenlandes' (Vienna 1894), published by the Central Commission on Statistics.

KUSTRIN, kúˈstrin, or CUSTRIN, Prus-
sia, a town and fortress of the first rank in the government district Frankfurt, located at the confluence of the Warthe and Oder rivers and the junction of several railways. Its chief prominent buildings are three Evangelical churches, one being the Saint Mary Church containing the graves of the Margrave Johann and his wife, Katharina; a Catholic church, a synagogue, handsome town-hall and newly-
erection bridges spanning the Oder and Warthe. There is a noteworthy monument to the Mar-
grave Johann von Kustrin in the palace grounds, and a statue of the Grosser Kurfürst. Its in-
dustries consist of a potato meal factory and manufactures of fire-extinguishing apparatus, pianos, varnishes, roofing paper, hot-bed frames, wagons, furniture, cigars, ovens, etc., besides flour mills, saw mills, machine works, wood-
creseating works, pottery, etc. The crown prince, later Frederick the Great, was born there by his father from 1730-32. The town was bombarded by the Russians in 1758, and the fortification was surrendered, 1 Nov. 1806, to the French upon the arrival of a small party of cavalry and was held till 1814. Pop. 17,600.

KUTAIA, kooˈtjɑ́, or KUTAHIA, Turkey, the capital of a sandjak in the vilayet Brusa, Asia Minor. It is located in a fertile district, has an ancient Byzantine fortification, numerous mosques and baths, and a number of churches. The agricultural products are grain, tobacco, poppy, vegetables and fruit. Very pretty scenery is made here, but the former thriving potteries are mostly extinct. It has considerable commerce in wool, goats' hair, hare-pelts, opium and meerschaum. The Mehemed Ali peace with the Porte was made here 14 May 1833, and it was here that Kossuth was interned from 1850-51. Pop. 27,000, mostly Mohammedans.

KUTAIS, Russia, a government in Trans-
caucasia, bordered on the west by the Black Sea, on the north by the provinces, Kuhanian and Terek, on the east, southeast and southwest by the governments Tiflis, Kars and the vilayets Erzeroum and Trebizond, respectively. It has an area of 8,145 square miles, consisting largely of mountains, the Rion River and its tributaries,
flowing through the only level lands. The southwesterly part is the most fertile in the Caucasus. The agricultural products raised are corn, wine, tea, rame, wheat, nuts, figs, pomegranates, cherries, rye and barley, and the cattle, horses, and sheep of this country are of excellent quality. The mineral wealth of the region is mostly copper, lead, silver, and iron. The oil found in the area is of high quality. The weather is mild, and the climate is comparatively healthy.

KUTAIS — KUYPER

KUTAIS, koo-ts, Russia, capital of the government of the same name, in Transcaucasia, located on the Kion River and the Rion-Kutais-Tkibuli Railway. It is the seat of government and has two gymnasiums, a high school, and district school. Its magnificent cathedral of Georgian architecture dating from the 11th century was laid in ruins by the Turks in 1692, and has not been restored. The chief industries are hats and silks. (Pop. 57,361, including partly Armenians and Jews.)

KUTCHIN, koo-chin, a name given to the tribes of the Athabaskan Indians who live near the Yukon River in Alaska, and in British North America down to the lower Mackenzie Valley. They are also called Loucheux and Quarreleres. They number less than 2,000. They are very fond of games and athletic contests, and are of a hardy, manly and warlike disposition. They are among the most hospitable of the Indian tribes of the American continents. Guests are entertained for weeks and even months at a time. Property is carefully recognized by the Kutchin and the chiefs, medicine men and those in general, who possess wealth or rank or both, have several wives. They have somewhat complicated religious ceremonies and myths, and the medicine men possess very great authority, exceeding that of the chiefs. (Consult Petitot, 'Autour du lac des Esclaves' (1891); 'Géographie de l'athabasca-kaw Mackenzie et des grands lacs du bassin artique' (Paris 1875); Schoolcraft, 'Indian Tribes.')

KUTTENBERG, koo-tuhn-burg, Bohemia, known to the Czechs as Hora Kutná, a town on the Vienna-Budapest branch of the Austrian North-West Railway. It has nine churches, among them the beautiful unfinished Saint Barbara Church of the 14th and 15th centuries, in Gothic style, and the Saint Jacob's with its high tower. It has the old royal Wälsche Hof castle of the 13th century and its beautiful chapel as well as the Mint are notable structures, also the town-hall. It has several industrial schools, the old Headeck castle converted into a Czech teachers' seminary, the Ursuline convent, etc. Its industries consist of fruit and vegetable raising, sugar, alcohol factories, a brewery, machine works, iron foundry, organ factory, etc. The foundation of the town originated from the discovery of silver ore and mining flourished in the 13th century. (Pop. 15,542.)

KUTUSOV, Michail Ilarionovitch Golenischev, Prince of Smolensk, Russia, he was born at Varvary 16 Sept. 1745; d. Bunzlau, 29 April 1813. Entering the army in 1765 he fought against the Poles from 1769, against the Turks 1770; he lost an eye (1774) in the Crimean campaign, and then dwelt abroad for some years. He was made major-general (1784), and, at the siege of Odessa (1790), Bender and battle of Rymnik, and of Ismail and Matchin (1791) under Suvorov, he gained fame. In 1793 he was appointed Ambassador to Constantinople and later Ambassador at Berlin. After the tsar's assassination (1801) he was appointed governor-general of Saint Petersburg, for a while going thence to his estates in Volyn. In 1805 he was wounded on the First Army Corp. He gained a signal victory, on 18 and 19 November over Marshal Mortier at Dürrenstein, and commanded, under Tsar Alexander I, on 2 Dec. 1805, the allied armies in the battle of Austerlitz, where he was wounded for the third time. From 1806-11 he was governor-general at Kiev, then at Vilna, to become (1811) commander-in-chief in the Russo-Turkish War, for which he was created a prince. After the Peace of Bucharest (May 1812) he succeeded Barclay de Tolly as commander-in-chief in the army against Napoleon I. He fought the bloody battle of Borodino (7 Sept. 1812) and became field-marshall. He was awarded the title Smolensky for his victory over Davoust and Ney at Smolensk, and on all Europe by proclamation he carried on the campaign but died early at Bunzlau, where a monument was erected in his memory, as also at Saint Petersburg. Consult Buchholz, Friedrich von, 'Der Feldmarschall, Fürst Kutusow Smolenskoj' in Geschichte der europäischen Staaten (Berlin 1814); Schnitzler, J. H. 'La Russie 1812: Rostutochne et Kutousof' (Paris 1863).

KUTZING, kut'sing, Friedrich Traugott, German botanist: b. Rittingen, near Artern, 8 Dec. 1807; d. Nordhausen, 9 Sept. 1893. He studied natural science at Halle, was appointed (1838) teacher of natural science at the high school at Nordhausen, retiring in 1883. He wrote and studied on the algae species specially, establishing a new epoch in the knowledge of the subject. Among his most important works are 'Species Algarum' (Leipzig 1849); 'Algæ aque dulcis' (Halle 1833-36), containing dried specimens; 'Grundzüge der philosophischen Botanik' (Leipzig 1851-52), in which he fought against the theory of stability of the species and advocated spontaneous generation.

KUTZTOWN, kootz'town, Pa., borough in Berks County, on the Philadelphia and Reading Railroad, 18 miles northeast of Reading. There is a normal school here and manufactures of flour, leather, shoes, hosiery, shirts, silk goods and iron foundries and marble and granite works. The electric-lighting plant is the property of the borough. (Pop. 2,360.)

KUYP, Albert. See CUYP, ALBERT.

KUYPER, koip'per, Abraham, ex-Premier of the Netherlands, exponent of Calvinism, especially in its relation to art, literature and democracy: b. 29 Oct. 1837, at Maasluis. He was educated in Leyden, where he received the degree of doctor of theology. He held pastorate at Beed, Utrecht and Amsterdam (1867-74). He was the one of the founders of the Free University of Amsterdam (1880), now aided by the state, and has been for over 30 years leader of the Anti-Revolutionary party.
and editor-in-chief of *De Standaard* (the Standard). Among Dutch folks all over the world, especially in the Western States, he is regarded as a theologian, philosopher, and statesman of great ability, but standing in the front rank of writers of pure and forcible Dutch. He has tens of thousands of admirers in America, who read his writings, which include incisive editorials, an *Encyclopedia of Theology*, and various essays of general literary and historical interest, such as *Calvinism and Art* (1893); *Pantheism* (1893), and *Calvinism: The Origin and Safeguard of our Constitutional Liberties* (1895). He was Premier of the kingdom during the Boer War. In 1891 he visited the United States and delivered the Stone lectures at Princeton. Rev. J. Hendrick de Vries has translated into English some of Dr. Kuypers's best books and essays. His daughter Henriette, noted as an authoress, wrote (in Dutch), *Six Months in the Homes of Eastern America*; *Vacations in England*; *A Visit to Russia*, and *Henry Hudson, in Dutch Service* (1909) and has written her experiences as a nurse during the World War of 1914–18.

KVICAĻA, kvēčaļa, Jan, Bohemian classical scholar and politician: b. Münchengrait, 6 May 1834; d. 1908. He studied in Prague and Bonn and became (1867) adjunct-professor of classical philology at the Prague University. He wrote *Beiträge zur Kritik und Erklärung des Sophokles* (Vienna 1864–69); *Untersuchungen über die Schule zu Éuripides* (Vienna 1879); *Neue Beiträge der Æneis* (Prague 1881), etc. As a politician of the Old-Czech party he was elected (1880–83) to the Reichsrat and from 1881 he was a member of the Bohemian Chamber of Deputies in which capacity he put through a bill compelling the erection in Bohemia of special schools for Czech children (the lex Kvicala). In the Reichsrat he took a leading part in creating the law for the separation of the Prague University into Czech and German divisions, taking an instructor's position in the former.

KWALHIOKWA, kwäl-hé'kwa, a tribe of Athabaskan Indians, formerly living on Willopa River, Washington, near the Lower Chinook Indians. They are frequently confounded with the Owlipah or Whilpah.

KWANGSI, kwäng'se, China, a province in the southern kingdom, bordered by Kwangtung on the east and southeast, by Yungking on the southwest, Yunnan on the west and by Kweichou and Hunan on the north. It has an area of 77,200 square miles. The greater part of the section is composed of Mesozoic red sandstone forming a basin; the easterly and southern parts of the province are mountainous. The almost inavable Si-kiang River and its tributaries water the province, whose chief products are rice, maize, aniseed, cinna-

KYD, Thomas, English dramatist: b. London, about 5 Nov. 1558; d. December 1594. While one of the most important of the precursors of Shakespeare, Kyd's very name was scarcely known until the closing years of the 19th century. In 1773 Thomas Hawkins discovered his name in connection with The Spanish Tragedy in Heywood's *Apologie for Actors,* much concerning his troubled career has been unearthed by scholars within the last quarter-century. Kyd was entered at the Merchant Taylors' School late in 1565, where Edmund Spenser was his school-fellow. Kyd received no university training but after leaving the school above mentioned he entered his
father's profession of scrivener. He was greatly influenced by Seneca and Lylly. As far as known at present Kyd brought out his 'The Spanish Tragedie containing the Lamentable End of Don Horatio and Bel-imperia; with the Pitiful Death of Old Hieronimo' in the period between 1584 and 1589. For over 60 years 'The Spanish Tragedy' was the most successful play on the English stage and long retained its great popularity. A prologue was added in 1592 entitled 'The First Part of Jeronimo, or The Warres of Portugal' (first printed in 1605). It is now believed on good ground that Kyd was the author of the original draft of the tragedy of Hamlet, Prince of Denmark, which was drawn upon extensively by Shakespeare. Another work of Kyd, 'Soliman and Perseda,' appears to have been written about 1588. In 1590 or thereabouts Kyd abandoned his career of playwright and entered the service of a lord who kept a troop of players. Bos points this lord as Robert Radcliffe, 5th earl of Sussex. Kyd dedicated his translation of Garnier's 'Cornelia' to the Countess in 1594. Other works of Kyd are 'The Householder's Philosophy' a translation from Tasso, and 'The Most Wicked and Secret Murdering of John Brewer, Goldsmith' (1592). Other works are lost with the exception of fragments. When Marlowe was arrested in 1593 for his 'lewd libels,' some of Kyd's papers were found among his effects and the latter was also arrested. When papers at his house were examined there was discovered one of 'vile heretical conceits denying the deity of Jesus Christ.' Kyd was tortured at Bridewell, but maintained his innocence and blamed Marlowe for his predicament. Released after a time, he was abandoned by his patron and died in destitute circumstances. Kyd's importance in the literature of his period lies not in any inherent excellencies of his verse but rather in the fact that he was a pioneer who exerted a marked influence on Ben Jonson, Fletcher and Shakespeare. Consult the collected edition of Kyd's works with biographie edited by F. S. Boas (Oxford 1901); Manly, J. M., 'Specimens of Pre-Shakespearean Drama' (Vol. II, Boston 1897); edition of 'The Spanish Tragedy' by Schick (in 'Temple Dramatists,' 1898); Sarrozin, 'Thomas Kyd und sein Kreis' (Berlin 1882); Ward, 'History of English Dramatic Literature' (Vol. II, London 1881).

KYMRY. See CYMRY.

KYNNETT, kī'nět, Alpha Jefferson, American clergyman: b. on the site of the battle of Gettysburg, Pa., 12 Aug. 1829; d. Harrisburg, Pa., 23 Feb. 1899. His people moved to Iowa in 1842. He was a self-educated man and taught for sometime in the public schools. In 1852 he entered the ministry of the Methodist Episcopal Church, uniting with the Iowa Conference, becoming a charter member of the Upper Iowa Conference in 1856. After 12 years in the pastorate he became secretary of the Church Extension Society of the Methodist Episcopal Church in Philadelphia in 1866 and served until his death. It was through his influence that the society was organized in 1864. Its headquarters were located in Philadelphia. He was a member of eight General Conferences, beginning with 1864. During the Civil War he was on the staff of Governor Kirkwood and was active in recruiting several regiments as well as in the Sanitary and Christian commissions. Under his management the Church Extension Society aided over 11,000 churches to erect edifices to the extent of nearly $6,500,000, which was mostly raised by church collections.

KYRIE ELEISON, kī'rē ē-lē'i-sōn (from the Greek Kyrie eleison, 'Lord, have mercy'), an invocation following the Introtto of the Mass. It is almost the only part of the liturgy in which the Roman Catholic Church has retained the use of Greek words. Just after the Introtto the priest celebrating the Mass and the servers repeat alternately three times 'Kyrie eleison,' and then as many times in the same manner 'Christe eleison,' and so on alternately. When it is sung the leading singer takes the part of the priest, and the choir that of the servers. The introduction of the Kyrie into the Mass is attributed to Pope Sylvester I, in the beginning of the 4th century.
The twelfth letter of the English and most of the other modern European languages. Its definitive form in the Greek alphabet is Λ, but in very early Grecian, Hebrew and Phenician monuments it has the form ℋ or 𐤉. Its name in Hebrew and Phenician is lamed and in Greek lambda, in Arabic lam.

The sound of l is produced when the tip of the tongue is brought into contact with the palate behind the upper front teeth, and, with the jaws apart, the breath is emitted. The sound of r is produced in nearly the same way, but in sounding the r the tongue is not in contact with the palate and may vibrate. Thus these two letters represent sounds that are much alike. But there are nations that cannot sound the r, as the Chinese and sundry other races; these substitute l for r: the technical name for this vice of utterance is lamuncia; the opposite vice is an inability to pronounce l, for which r is substituted, as by the Japanese. In languages whose syllabaries admit both these sounds the two letters are freely interchanged or confounded. In languages belonging to one common family, the Aryan, for example, a word which in one language has r, in another has l, and vice-versa; examples: Lat. prunus, Eng. plum; Lat. silvis (elm), Fr. orme. The like is seen in the formation of derivatives within one language. Thus in Latin the adjective termination alis (Eng. al, as in liberal) is changed to anis when the word has already an l; for example: from peculum comes peculiaris, from auleium, auxiliaris, and vice-versa, r for a like reason is changed to l: thus from nervarum and lucidum comes pellucidus, from inter and lectus, intellectus. L is also substituted in one language for n in another; for example: Gr. pneunon (lung), Lat. pulmo. Or d and l are interchanged; Gr. Odyssea, Lat. Ulysses; the like is seen in the two Latin words odor and oler; and the Latin lingua was once written dingua, allied to Eng. tongue and Ger. zunge.

In Italian the l of Latin words is often changed to i: Lat. planus, plumbum (lead), It. piano, piombo.

In English l is often silent: palm, calm. In French al becomes au; à le becomes au, cheval (horse) plu, chevaux; and the English auburn is from Latin alburnus. In English and most of the other languages l, whether single or double, has one sound-value only, the same which it has in pale, pallid; but in French sometimes ll has a sound resembling that of li in million, and like y in meilleur; in Spanish ll may commence a word, for example: lana (wool), and is classed as a distinct alphabetic character; its sound-value is the same as that of ll in French. In Welsh, on the other hand, ll has a most peculiar, indescribable sound, partly l and partly a sibilant sh.

L. E. L., the nom-de-plume initials of an English novelist, Letitia Elizabeth Landon (q.v.), later Mrs. Maclean.

L'ABBÉ CONSTANTIN, lá-bá kón'staw-tán, the best of Hâlévy's works of fiction, has enjoyed an immense popularity in France and abroad. Published as a serial in the Revue des Deux Mondes in 1827, it did much to bring about the author's election to the French Academy two years later. The number of editions has run into the hundreds and the book is widely used as a text in the classroom. This unusual success is due largely to its sound moral tone and the worthy attitude toward the problems of life on the part of the principal characters. From the old country priest whose life has been one of self-sacrifice and charitable deeds, to the young American heiress who finally offers to marry the priest's godson, a modest artillery officer, all the characters show the same sense of honor combined with unaffected virtue and sincerity of purpose. A touch of exoticism due to the introduction of American characters and a lesson in patriotism drawn from events of the Franco-Prussian War, contributed in no small way to the great favor with which the book was received by the French public. Besides, it is written in a charmingly simple almost conversational style, admirably suited to the characters. The book contains a number of dramatic situations, and a play based upon it has been almost as popular as the novel itself. Many editions in the original French and in translations have been published.

LOUIS A. LOISEAUX.

'L'AIGLON,' lá'glohn. Edmond Rostand, having gained world-wide fame in 1897 by his romantic fantasy, 'Cyrano de Bergerac,' endeavored to confirm that success in 'L'Aiglon,' or 'The Eaglet,' produced three years later by Sarah Bernhardt in France and by Maude Adams in America. The play is less charming and spontaneous than its predecessor, but more fully grounded on history, more ambitious as a study of character, and more elaborate as a spectacle. Napoleon's son, the Duke of Reichstadt, known as "The Eaglet," is kept under the watchful eye of Metternich at the Austrian court. But he is the hope of a Bonapartist plot, and though physically unfit to rule, encompassed by enemies who will prevent his return to France, he yearns to emulate his great father. His inheritance descends from the decadent Austrian house, however, rather than from the all-conquering Corsican. His environment, too, determines his fate; and after fortifying his one opportunity to evade the relentless Metternich,
he recognizes his weakness. In his vision before dawn upon the battlefield of Wagram, he perceives that, in a sense, he must atone by his sufferings for all the blood that has been spilt to him; for his father's gold and silver, and a tiny, a passive hero to the last, and dies a theatrical death, lying beside his cradle, in the presence of the weeping Austrian court.

The six acts of the play present a few major characters, a host of those that merely come and go, and several striking scenes. Flambeau, the old grenadier of Napoleon, is the most alluring figure. Surprises and coincidences abound, and the atmosphere of the piece is distinctly romantic, although its careful detail and its central conception are almost naturalistic. Rostand's poetic imagination is sufficient to the task of making real here much that might otherwise seem mechanical melodrama. 'L'Aiglon' has been translated into English by Louis N. Parker (1900).

FRANK W. CHANDLER.

L'ALLEGRO, lā-lē'grō. 'L'Allegro' and 'Il Penseroso' (q.v.) are companion poems by Milton. They are assigned to the period (1632-38) after his life at Cambridge, in which he retired to his father's house at Horton, Buckinghamshire. They derive from his thoughts and reflections. That is, they were written about the same time as 'Comus' and 'Lycidas,' just before Milton's travels and some time before his prose writings and most of his sonnets and his greater poems. They are really poetic exercises; the young poet puts his thoughts on life in the forms common in the literary poetry of the day. The two poems are companion pieces; 'L'Allegro' gives the gay or cheerful mood or humor, while 'Il Penseroso' gives the contemplative mood. They give their ideas in much the same way: each begins by driving away the mood opposed to the subject of the poem; in 'L'Allegro' it is 'loathed Melancholy.' Each goes on with an invocation, as one may say, to the goddess of the mood; 'Thou Goddess fair and free, in Heaven yeclent Euphrosyne, and by men heart-easing Mirth.' The main part of each poem, however, presents the mood of the poet by describing a characteristic day; in 'L'Allegro' the poet is waked by the lark, hears the huntsman on the hill and the plowman nearer by, takes a country walk and joins the youths and maidens of the upland hamlets in their merry-making, he goes home and spends the evening in reading and music, or, according to another interpretation, he goes to town and enjoys the gay life of society. The poem is to the average mind old-fashioned and formal; it is classic in form and allusion and has little in it that seems inspired by deep poetic feeling. But on the other hand each word and phrase is so full of meaning and so characteristic of the poetic mood that it makes a definite place in the mind of every lover of poetry. Some other general considerations are noted under 'Il Penseroso.' There are a good many editions of Milton's Minor Poems, mostly made for school purposes. The first volume of Masson's edition of Milton or Verity's edition of the Minor Poems may be especially noted.

EDWARD E. HALE.

L'AMI FRITZ, lā-mē frits ('Friend Fritz'), published in 1864, formed for Erckmann-Chatrian a restful interlude between two stirring patriotic novels, 'Le Conscrit de 1813' (1864) and 'Waterloo' (1865). Indirectly it is like the plea for quiet living, toleration, peace and concord between religious confessions as well. The scene, significantly for one writing in the year of the Austro-Prussian attack on Denmark for Schleswig-Holstein, is laid in an idealized Bavarian Highland. The time is about 1830. The theme is an epicurean idyl, the untroubled moral that the shortest road to a middle-aged bachelor's heart is by way of his stomach. Seldom have the joys of eating and drinking been so affectationally dwelt upon in fiction. As the story opens, Fritz Koubus, a well-to-do bachelor of 36, rejoicing in his freedom, jests at the matrimonial counsels of his father's friend, the genial old Rabbi Sichel, a matchmaker by instinct and predilection. How in the next two years Fritz comes, step by step, unconsciously almost to the last, under the spell of Susel, the ingenious, charming and housewifely young daughter of his anabaptist tenant farmer Christel, is told with rare quiet humor and genial irony. With modifications, natural after the Franco-Prussian war, 'L'ami Fritz' was dramatized by its authors in 1876. The play was very popular and has been translated as 'Friend Fritz.'

BENJAMIN W. WELLS.

L'ASSOMPTION, lā-sōm'shōn', Canada, village and capital of L'Assomption County, Quebec, 23 miles northeast of Montreal, on the Canadian Northern Railroad. L'Assomption College is located there and the village is also the site of a Roman Catholic convent and hospital. It has several manufacturing industries. Pop. 1,747.

LA BALLERINA, lā bāl'är-na (The Ballet Dancer). This short realistic novel, by Matilde Serao, which first appeared in the Nuova Antologia (No. 165, 1889), and then in the form of a novel (Catania, 2 vols., 1889) portrays the trials of a poor young Neapolitan girl, Carmela Menino, in her efforts to earn a livelihood in the rank and file of the ballet dancers employed at the San Carlo Theatre in Naples and at other resorts in the vicinity. The interest of the romance centres in the description of the sinister conditions that prevail rather than in the characters themselves, which are of secondary importance and whose sensuality and material needs furnish the dominating motive of their every action. In the case of the heroine of the novel, Carmela Menino, however, it is not sensuality, but a kind of religious sentimentality and a sympathy with her poverty, which is the mainspring of her conduct in life. This sentimentality is the cause of her fetch worship for her godmother, the ballet artist, Amina Boschetti, and of her loyalty to the memory of the latter years after her death. It also figures prominently at the end of the novel in the night watch of Carmela Menino at the bedside of the prodigal suicide, Count Ferdinando Terzi di Torregrande. The entire descriptive material is characterized by that vividness and sentiment which is displayed in the best of the author's earlier books: 'Il paese di Cuccagna,' 1891 ('The Land of Cockaigne'), showing those keen powers of observation which have placed Matilde Serao
EXTINCT GIANTS PRESERVED IN THE ASPHALT LAKE, LA BREA RANCHO, LOS ANGELES, CAL.

1 Mastodon   2 Imperial Elephant   3 Sabre-tooth Tiger   4 Camel
in the front rank of the contemporary writers of fiction in Italy. Among the salient features clearly drawn in 'La Ballerina,' three stand out conspicuously: (1) The rottenness of the entire ballet system as carried on in Naples. So vivid and effective is the description of the ballet conditions, analogous to that of the lottery system (Il paese di Cucagna), as to create a strong impulse on the part of the reader never to lose an opportunity, if ever one be presented, of doing his best to purge the entire system. (2) The very important rôle these sentimentalities play in the life of the Neapolitan youth of both sexes, nullifying the possible advantages which the use of ordinary common sense would, in all likelihood, provide. The well-nigh uncontrollable desire of the youth of Naples to pose continually as millionaires is exposed so forcefully as to bring out strikingly the absurdity of creating so false a situation. (3) The distinction between the feeling of reverence, akin to love, as seen in Carmela Menino's life, and the varied and muttering songsters of love as seen in the lives of the sensual ballet personnel of which Carmela Menino is one of the links. The innate relations between the ballet dancers and their sentimental lovers contrast rudely with the sincere sentimental loyalty and worship, not, however, very well accounted for by the author, shown by Carmela Menino toward the victim of the suicide with which the romance ends, thus producing a strong revulsion from the false pleasures of life. Together with 'After the Pardon' ('Dopo il perdono') and 'Dopo il perdono' ('After the Pardon'), 'La ballerina' is among the best of the author's later novels. A translation of it was published in England without the translator's name, and issued in London 1901. JAMES GEDDES, JR. LA BARCA, là bär'kå, Mexico, town in the state of Jalisco, east of Lake Chapala, and 60 miles southeast of Guadalajara, on the International Railroad between that city and Mexico. The town was founded in 1529 by Nuño de Guzman, and during the Mexican war for independence the town was the scene of two serious battles. Pop. 7,437. LA BARRACA, là bär-rål'kål ('The Farmhouse') a novel by Vincente Blasco Ibáñez (q.v.). In 'La Barraca,' the agrarian problem as existing in the territory about Valencia engages the attention. First published in 1898, this work soon made its way into French and, appearing as 'Terres maudites' in the 'Revue de Paris' in 1901, it established the author's fame abroad and brought him more note at home. With a sure eye and a firm hand, Blasco Ibáñez has outlined for us, on the background of the huerta or suburban district of Valencia, types of character such as Pimentó, the local bully, and Batiste, the industrious small farmer. Batiste has the misfortune to take up a farm from which the avaricious landlord had evicted the previous tenant and upon the occupancy of which the people of the huerta had formed a cooperative, the result being the boy-cotting and ruthless persecution of Batiste by the huerta under the leadership of the worthless bravo, Pimentó, the killing of Pimentó by Batiste in defense of his own life, and the burning of Batiste's farmhouse by his neighbors. In the face of a systematic boycott the honest, home-providing Batiste has no redress, and he must depart sadly to try his fortunes elsewhere. JEREMIAH D. M. FORD. LA BARRE, là bår', Antoine Joseph Le- faire de, French sailor; b. about the beginning of the 17th century; d. 4 May 1688. He rose to early prominence as an officer of the French navy, and was appointed governor of Guiana in 1663. He was successful in recapturing Cayenne (1667), which had been occupied by the Dutch. On being commissioned lieutenant-general he sailed for the West Indies, and, in a fight with the English in the Antilles, compelled them to raise the blockade of Saint Christopher. Succeeding Frontenac as governor of Canada in 1682, his irresolution in his negotiations with the Indians was so disastrous that he was recalled in 1685. He obstructed La Salle in his western explorations. LA BREA, Los Angeles, Cal., a park, west of and within the city limits, on an almost level area bordered by the Santa Monica Range to the north. It is famous as the site of the "La Brea Tar Swamp," a prehistoric petroleum "trap" which has contributed to paleo-zoology the most extraordinary remains of extinct animals ever discovered. Major Hancock, the owner of the ranch on which the pool was located, as early as 1875, was presumably the first person to take particular notice of the bones in the asphalt, William Denton in that year mentioning a canine of the large sabre-tooth tiger received from him. After the definite discovery of the historical value of the deposits in 1906, excavation work was carried on by the University of California, and within a space of about 1,400 feet long, north-west by southeast, and 150 feet wide, 220,000 of skeletons were discovered, many hitherto unknown to science. Pools of water and tar still are characteristic features of this section of California, and in the Pleistocene period were natural drinking places for many kinds of herbivorous animals and for the carnivores which preyed upon them. Both in their struggles became trapped in the treacherous tar seep or pool, which has been an excellent preservative of their skeletons. The remains of mammals and birds of extinct species are thus far in the university collection include 630 sabre-tooth tigers; over 700 "big wolves"; 7 mastodons; 39 giant ground sloths; 39 bison; 39 horses; 39 camels; 17 elephants (including the skeleton of the first "Imperial" elephant found), besides skeletons of the great American lion; the gigantic tarantora, with a 14 foot wing spread; California peacock and a vast number of minor specimens. In 1914 a human skull, possibly several thousand years old, was recovered from the pit. For mounted examples of the most important of these remarkable prehistoric animals and a great quantity of un-mounted specimens are exhibited in the Museum of History, Science and Art in Los Angeles. Mrs. Ida Hancock, the owner of the property, donated 32 acres of the land to Los Angeles County, which now maintains a park and subsidiary museum around this interesting "death-trap." Consult Merriam, J. C., 'A Death-trap which antedates Adam and Eve' (in Harper's Weekly, 18 Dec. 1909). LA BRUYÈRE, là bru-yär', Jean de, French moralist; b. Paris, 17 Aug. 1645; d.
LA CALPRENÈDE — LA CITTÀ MORTA

Versailles, 10 May 1696. He was educated for the law, became treasurer at Caen, and through the influence of Bossuet was employed in the education of the Duke of Bourbon, grandson of the great Condé, with a pension of 3,000 livres, and was attached to his person during the remainder of his life. In 1688 he published the "Characters of Theophrastus," translated into French, to which he added others of his own, in which he represented the manners of his time with great accuracy, and in a style epigrammatical, ingenious and witty. The work contained 386 "characters" in the 4th edition (1689), 340 additional ones, while the 9th, in press at the time of the author's death, included over 1,100 "characters." Consult Rahstedt, "La Bruyère und seine Charaktere" (1886); Allaire, "La Bruyère dans la maison de Condé" (1886); Pelisson, "La Bruyère" (1893). See CHARACTERS OF THEOPHRASTUS.

LA CALPRENÈDE, là kä̃ pʁɛnɛ뒤, Gau-tier de Costes de, French novelist: b. Sarlat, Dordogne, 1610; d. 1663. He went (1632) to Paris and entered the guards' regiment as officer, becoming royal chamberlain. His chivalry novels, copying the style of "Amadis," brought him his "Cléopâtre," especially his "Cléopâtre" extending into 12 volumes (1647-58). He selected names from the period of Augustus as a framework in which to describe persons of his own day, the sublety and state sentimentalism of the work finding favor. The characters, however, are for the most part, well drawn and some scenes are excellent. Notable among the novels are "Cassandre" and other works in 10 volumes (1642-50); "Faramond" and others in seven volumes (1661-70); "Les nouvelles, ou les divertissements de la princesse Alcide" (1661). He also wrote a number of plays, most notable being "La Mort de Mithridate" (1637); "Le Comte d'Essex" (1639); "Edouard, roi d'Angleterre" (1640). Consult Körtig: "Geschichte des französischen Romans im XVII ten Jahrhundert" (Vol. I, Oppeln 1891).

LA CHAMPS DE LA CÀTARA, la shã t'r uz de par'm. "La Chaureuse de Parme," esteemed the best of the novels of Stendhal (Henri Beyle), was written in 1830, though not published till 1839. In time it belongs to the first flush of the Romantic movement, and it has happy, roseate passages, but there are others which seem clearly to foreshadow the naturalistic and the psychological schools of fiction. Some descriptive passages are of rare brilliancy. The story, opening in 1796, passes rapidly to the decade following Waterloo. The scene is chiefly in Milan or Parma; the plot, ingenious but over-long, deals with the intrigues of a petty Italian court; the interest, whether for author or reader, is almost wholly in character. Though crude in coloring and melodramatic in treatment the novel seems the first serious attempt in French fiction to exhibit not merely foreign scenes but foreign ideals and psychic life. Fabrice, the hero, his military career closed by the fall of Napoleon, turns his ambition, though not his heart, to the Church, and after adventures in Italy stays on in Sainte-Beuve's phrase, "like an animal given over to his appetites or like a wanton child who follows his caprices," not, indeed, without shrewdness, dies an archbishop in a Carthusian monastery, whence the story's title. The heroine, Duchess Sanscerverina, best beloved and loving Fabrice, her nephew, with the desperation of a lost passion, murders, marries and forgets her marriage vows in his behalf, reincarnating the intense passions of some familiar female figures of the Italian renaissance. Count Mosca, to Balzac a glorified Metternich, is for us a diplomatic courtier, ingeniously unscrupulous in reconciling the duties of his station with the demands of his lusts. Palla, a political outlaw and highwayman, the philandering agent of the duchess' criminal designs, is an interesting age-fellow of Hugo's Hernani. All four illustrate as many phases of Stendhal's conception of the unreasoning fatality of love. BENJAMIN W. WELLS.

LA CHAUSSÉE, la shø̃-sã, Pierre Claude Nivale de, French dramatist, founder of the so-called "pathetic comedy," b. Paris, 1692; d. there, 14 March 1754. "Le Prêjugé à la Mode" (1735) by him was the first French pathetic comedy. Of 18 dramas by him, among the best are "School of Friendship" (1737); "Melanie" (1741); "Love for Love" (1742); "Pamela" (1743); "School of Mothers" (1745); "The Governess" (1747). His plays were all written in verse and followed strictly the rules of the classic drama.

LA CITTÀ MORTA ("The City of the Dead"), a modern tragedy in five acts and in prose, by Gabriele d'Annunzio, performed for the first time in Paris at the Renaissance Theatre, 21 Jan. 1898. Although every effort was made to expose to the best advantage the artistic possibilities of the tragedy, Sara Bernhardt playing the part of the blind Anna with all her heart and soul, and with the play itself not a success. It has been played in England and in America, but received rather coldly, and for several reasons, one of which may be said to be its lack of dramatic action; for it is more a lyric poem in dialogue, or a succession of descriptive passages, artistically composed, than a drama as ordinarily understood.
LA CONDAMINE—LA CROIX

The scene is laid in Argolis, near the ruins of Mycenae. The *dramatis personæ* consist of five characters: an archaeologist of a most fervent type, Leonardo; his sister, Bianca, Maria, a young woman, endowed with exuberant health and beauty and possessing rare personal charm, who accompanies the archaeologist and shares his keen interest in his excavations and discoveries; Alessandro, a poet and scholar, ever inspiring and helping Leonardo in all he undertakes; Anna, the wife of Alessandro, who is blind although not from her birth. This misfortune gives Anna's mental vision a sensitiveness and acuteness which makes up in no small degree for her loss of sight; lastly, a nurse, an attendant of Anna, whose informing rôle suggests somewhat the part filled in a certain measure by the old Greek chorus. As in the plays of Sophocles and Euripides and of Racine's *Phèdre*, it is fate or destiny that controls the incidents of the tragedy and hangs heavily over the participants. In the air itself, breathed by the archaeologist and the poet in their passionate search for the tomb of the house of Atreus, is rank poison emanating from the crimes committed by the Atreids. So atrocious is the curse over this ill-starred house that, as Alessandro tells his wife (I-4) some direful traces must still remain in the dust trampled by the sons of Atreus. This gives the key to the trend of events.

That a tragedy having the three mainsprings of its action in incest, adultery and fratricide, even with a Greek setting, should be received coolly by Anglo-Saxon audiences is readily understood. That it received such acceptance as it secured is due in a measure to the remarkable acting of Eleonora Duse, who impersonated Anna. The tragedy has been the subject of much-diverse criticism. It is better adapted for reading than for representation. However repellent the subject may appear, enwrapped as it is in a sullen and depressing atmosphere, the tragedy itself is unquestionably a highly artistic production. The author not only possesses the inherent qualities ascribed to the Latin and Italian temperament, but the old pagan strain reveals itself in utterly ignoring the conventionalties usually adhered to more or less by writers. Moreover, his accurate knowledge, gained on the spot, of ancient history and literature, together with unusual poetical gifts make up a combination producing a result that has rightly attracted the attention of the literary world. Revealing as may be his remorseless brutality, especially to the non-Latin temperament, it is impossible not to recognize an artist exceptionally gifted and a literary production quite out of the ordinary. A translation of *La città morta*, by G. A. Symons, was published in 1900; another by G. Mantellini (New York 1902). Consult also Muret, Maurice, *La Littérature italienne d'aujourd'hui* (pp. 90-105, Paris 1906); Huneker, J., *Duse and d'Annunzio* (in *Iconoclasts* (pp. 338-344, New York 1907).

JAMES GEORGE, Jr.

LA CONDAMINE, la-kɔn dys-mɛ̃. Charles Marie de, French scientist: b. Paris, 28 Jan. 1722; d. 1773. He was invited to England, he was also a military professor, but soon renounced this career, and devoted himself to the sciences. He wrote on the subject of the law of nature, and in 1736 he was elected, with Godin and Bouguer, to determine the figure of the earth by measurements to be made in the equatorial regions of South America, and remained abroad for eight years. In 1748 he was elected a Fellow of the Royal Society of London, and in 1754 a member of the Academy of Sciences of Paris. His principal works are his account of his travels (1745), his work on the figures of the earth (1749), and that on the measurement of three degrees of the meridian in the equatorial regions.

LA CONFESSION D'UN ENFANT DU SIÈCLE, la kɔn syon d'ɔng' õ̃' fon də syə sl. ("Confession of a child of the century") is one of the most characteristic works of Alfred de Musset. It owed not a little of its immediate great success to the fact that, while ostensibly a novel, it was a thinly veiled history of the poet's love affair with George Sand, which she had already begun to use as literary material in her *Lettres d'un voyageur.* Written (1835) shortly after that ultra-romantic adventure in sensuality and torture, it is very generous to the heroine of that experiment and without the bitterness that later marked the references of each of the principals to the other. For the frankness and sincerity of its self-revelation it is a personal document of great interest. But it is more. It is a wonderful picture of that peculiar state of mind, often called "Byronic" in English, so common among the youth of the generation coming after the French Revolution and the Napoleonic wars, and known in France as the *la fin du siècle.* Its opening pages contain a famous description of that malady and an analysis of the conditions out of which it grew. So it is a document even more precious for what it tells us of the century than for what it reveals of the child. An English translation by Kendall Warren appeared in a privately printed edition of Alfred de Musset's works (New York 1908).

ARTHUR G. CANFIELD.

LA COSA, la kɔsa, Juan de, Spanish navigator: b. about 1460; d. November 1509. He was the companion of Columbus in his first voyage to the Pacific in 1493 and settling at Santaño, in Aranham, made his living and reputation as a draughtsman of charts (1496). He accompanied Ojeda in an expedition to the Pearl coast in 1499; and in 1501 explored the northern coast of South America from Venezuela to Panama. In the course of an expedition on which he accompanied Ojeda, the party on landing in the bay of Cartagena was attacked by Indians, and he perished with his companions, of whom Ojeda alone escaped. His map of the World, beautifully illustrated on vellum, is in possession of the Spanish government, and is the earliest known to include the New World, having been made in 1500.

LA CROIX, la krwâ, Alfred, French geologist: b. Mâcon (Saône-et-Loire), 4 Feb. 1863. He is director of the mineralogy of the School of Higher Studies, Paris. He was head of the expedition sent to Martinique (1902-03) and of numerous other scientific parties, to United States, Canada, Asia Minor, Greece, Italy, Germany and Switzerland. He was awarded the Gold Medal of the Historical and Scientific Work in 1895, and that charged with the geological map of France in the following year. His published
works include ‘Minéralogie et de ses colonies’ (1893–1902); ‘Les Enclaves des roches volcaniques’; ‘La Montagne Pelée et ses éruptions’ (1904). He has also contributed very extensively to scientific journals and magazines, especially on the metamorphism of eruptive rocks, volcanic action and causes and mineralogy.

LA CROSSE, la krós', Wis., city and county-seat of La Crosse County, on the Mississippi River and the Chicago, Milwaukee and Saint Paul, the Chicago, Burlington and Quincy, the Chicago and Northwestern and several other railroads, 200 miles northwest of Milwaukee, and 130 miles south of Saint Paul. La Crosse is the centre of the farming, manufacturing and dairying trade of western Wisconsin, southern Minnesota and northern Iowa. There are manufactory of boots and shoes, sashes, doors, blinds, automobile parts, gasoline engines, tents and awnings, plows, agricultural implements, boilers and heavy machinery, extensive carriage works, rubber mills, cracker and baking factories, etc., large flour mills, pearl button factories, steel and corrugated roofing works, woolen mills, a large tannery, mammoth cooperages, five large breweries, affording a market for 150,000 bushels of barley and 100,000 pounds of hops per annum; extensive cigar manufactories and various other industries. Sand, gravel and limestone are found in the neighborhood. The manufactures are valued at $20,000,000 annually. The city has five banks. La Crosse has a public library, the Washburn, containing 25,000 volumes, two business colleges, a high school, public school buildings and several Catholic and Lutheran parish schools. The city has a fine city hall, a Federal building, a convent, asylum for chronic insane, Saint Francis, the Lutheran, and La Crosse hospitals, opera houses, weather bureau station, four parks, a wagon bridge over the Mississippi, etc. There are numerous church edifices.

La Crosse was first permanently settled in 1848 by Nathan Myrick, John M. Levy and others. It became a village in 1851 and was incorporated as a city in 1856. Under a revised charter of 1891 the government is administered by a mayor, elected every two years, and a council of 10 members, one-half elected annually. The council appoints the minor officials. The city owns and operates the waterworks, and has electric light and street railroad plants. Pop. 31,367.

LA CROSSE, a Canadian outdoor game played with a ball and a stick of light hickory, bent at the top like a bishop's crozier, from which the game derives its name. It was very popular among the Indians of North America, being sometimes taken part in, according to Catlin, by 800 to 1,000 players, in which tribe was set against tribe, the game lasting for days, broken arms and legs being common among the players, and some even killed. The games were preceded by rigorous training on the part of the contestants. A game of ball, played at Michilimackinac on the king's birthday, 4 June 1763, was by Pontiac made the occasion of a great slaughter and the horrors of the French the garrison was surprised and massacred.

The stick employed in the game is 5 or 6 feet in length. Strings of deerskin are stretched diagonally across the hooked portion of the crosse, forming a network. Only one ball is employed, made of india-rubber, and eight or nine inches in circumference. Posts or poles about six feet high, with a small flat at the top of each, comprise the outline. The players are usually 12 on each side, but their number, as well as the distance of the goals apart, is nearly optional. The object of the game is for one side to drive the ball through their opponents' goal. The ball must not be touched with the hand or foot, but is scooped up from the ground with the bent end of the crosse, on which it is carried horizontally, while the player runs toward one of the goals, dodging his antagonists. The game is played in two halves, of a half-hour's duration. A club was formed at Montreal in 1846; in 1860 it began to attain popularity in Canada, and it was introduced into the United States in the early 70's. The National La Crosse Association of Canada was organized in 1867. Consult Beers, 'La Crosse: the National Game of Canada' (Montreal 1869); Schweiss, 'La Crosse: an Expert's Instruction' (New York 1904).

LA DAME AUX CAMELIAS, la dam o ka-mǎlˈja, ('the Lady of the Camellias'). This play by Alexandre Dumas, the Younger, first appeared (1848) as a novel written under stress of debts gathered in accumulating experiences that it in part reflects. The novel was dramatized in 1849, but, owing to the failure of a theatre and curious complications with the censorship, of which a preface gives vivid expression, it was first acted 2 Feb. 1852. Success was immediate and lasting. In manifold adaptations it has been played in many lands and has engaged the talent of many noted actresses. In America it is known in eight editions as 'Camille', in two as 'The Lady of the Camellias.' It had immediate origin in the life and death at 23 of an acquaintance of the dramatist, Alphonse Plessis, a Parisian courtesan, once maid on a farm, who died of consumption in 1847. Her unsellish charm was celebrated in a brief by Théophile Gautier and is commemorated in a much visited monument at the cemetery of Père La Chaise. Dumas 'Lady of the Camellias,' Marguerite Gautier, is so drawn by a requited love to Armand Duval that she makes all material sacrifices to live wholly with and for him. His father shows her what this will involve for Armand's career. Then, rising to the height of immolation, she deliberately estranges her lover, sacrificing his esteem and her life to Armand, who learns too late the price of her devotion. The theme of the courtesan redeemed by love is at least as old as Prévois's 'Manon Lescaut' (1731). It had been dramatized by Palissot (1782) and again by Hugo in 'Marion de Lorme.' But 'La Dame aux camélias' marks for France the beginnings of the realistic study of social problems which has since so largely engaged its attention.

Benjamin W. Wells.

LA DEBÂCLE, la dəˈbɑkl, ('La Debacle',) (1881), a realistic novel by Émile Zola, tells of the horrors of the Franco-Prussian War of 1870. Nothing more powerful of its kind has been written in France, or perhaps in any other country. Here Zola applies to war that natural-
istic method which he had used with remarkable, if displeasing, effect in his studies of domestic and social life and which has become celebrated as "Zolaism." In "La Debauche" the reader is carried from the disaster, from the home, from the horror of France in the grasp of uncontrollable events, which move and crush as surely and inexorably as a glacier. Of what importance, in the play of these giant social forces, are the lives of great artists?... Zola's pictures of the defense of the plateau of Illy, culminating in the magnificent but hopeless cavalry charge, and of the horrors of Sedan, are among the most powerful in literature. The effect is heightened by the author's objective treatment, his apparent indifference to the ruin of his country. Here the patriot, as Zola certainly was, is subordinate to the artist, as he shows himself to be in this his masterpiece. Whatever the reader's attitude toward "naturalism," it is doubtful if the naturalistic method could be carried farther than in "La Debauche" or applied with more telling effect. And whatever the future fate of "Zolaism," it is probable that this arch example of the method, presenting so graphic a picture of a fateful epoch, is secure of a permanent place in literature.

LA FAMILIA DE ALVAREDA of Fernán Caballero, pseudonym of Cecilia Bohl de Faber, is one of the best-known works of that author. The outline of the first sketched in German in 1822 but the book in its present form was not published until 1856. It is one of the first novels of manners in modern Spanish literature and bears the sub-title, "Novel of popular customs." The author states in the preface that the story was taken in its essential details from events narrated to her. The plot centres about the murder of Ventura by his jealous friend, Perico de Alvareda, and the degradation of the latter into banditry. The story culminates in the execution of Perico and the death of his integration of his own family and that of his victim. The tale merely serves as a vehicle for a vivid and picturesque description of Andalusian village life in the early part of the 19th century. Popular legends, traditions, and folksongs are generously interspersed. The author constantly obtrudes her moral both in the narrative itself and in footnotes, and insists that the Spanish peasant can be happy only by clinging to the religious faith and the simple customs of his forefathers. The book is liked by Spaniards because of its didactic and moral note, and is valued by foreigners because it is one of the many human documents of Spanish literature. There is a German translation of this tale, "Castellanos," much to her annoyance, was called "a German because of her father's German origin. There is a good annotated American edition by P. B. Burnet. An account of the author's life and work may be found in the complete edition of her works, Vol. 4, in the "Colección de Escritores Castelanos."

SAMUEL M. WAXMAN.

LA FARE-ALAIS, 1st fär-äl', Christophe-Valentin, Marquis of, a provençal poet and one of the forerunners of the Félibrige movement: b. Laciote (Gard), 1791; d. 1846. He came of a family celebrated in statesmanship, literature and military life, among his ancestors being the famous poet, La Fare, and the less notable French marshal of the same name. After having studied law at Toulouse he entered the army in 1814, but left it five years later and returned to his native place where he continued to reside and to devote himself to literature. In 1829 he began publishing in 'L'Echo d'Alais' his southern dialect poems, which became very popular in the langue d'oc country. These poems were published in book form in 1844 under the title, 'Las Castognados,' at Alais. In these poems the music-loving south felt an echo of their own life. Their harmony, their gentle sweetness and their brilliancy at once made La Fare a literary leader among the Provençal people, until then without one in later years. His poems, therefore, did much to further the elevation once more of the langue d'oc into a literary tongue.

LA FARGE, 1st fárj, Christopher, American architect: b. Newport, R. I., 5 Jan. 1862. He studied at the Massachusetts Institute of Technology (1880-81), and in the office of H. H. Richardson (q.v.), and in 1884, with G. L. Heins, took charge of the architectural works of his father, John La Farge (q.v.). Since 1886 he has been a member of the firm of Heins & La Farge, whose principal work is the cathedral of Saint John the Divine, New York. Other works that may be named are the Houghton Chapel at Welles College; the Roman Catholic chapel at West Point; and Saint Matthew's Church, Washington, D. C., church of the Blessed Sacrament, Providence, R. I.; Saint Paul's Rochester, N. Y.; Roman Catholic cathedral, Seattle, Wash.; all stations of the New York subway. From 1910 to 1915 he was a member of the firm of La Farge and Morris. He is Fellow and director of the American Institute of Architects and an associate of the National Academy since 1910 and past president of the Architectural League of New York.

LA FARGE, John, American artist: b. New York, 31 March 1835; d. 14 Nov. 1910. He was the son of Jean Frédéric de la Farge, French midshipman, who escaped imprisonment at San Domingo, 1806, and eventually settled at Philadelphia. He studied drawing with his grandfather Binse and went abroad in 1856. He studied for some time in Paris and later settled down in a lawyer's office in New York. He became much attracted by the Arundel prints of Giotto and formed a deep appreciation of Japanese art. He found a friend and master in William Hunt. He married Margaret Perry, great-granddaughter of Benjamin Franklin, in 1860. He originally developed a taste founded on Japanese liberalism, pre-Raphaelite conventionality and imaginative conventionality. In 1876-77 he was engaged on the mural decoration of First Church, Boston. He began glass painting and window designing in 1878 and was successful in the manufacture and designing of stained glasses. He was connected with Saint-Gaudens in the erection of the King memorial, Newport, R. I. He visited Japan and the islands of the Pacific in 1886. Many water-color
sketches of native life resulted from this trip. One of his greatest works is the large altarpiece in the church of the Ascension, New York (1888). Other noteworthy works are 'Christ and Nicodemus,' Trinity Church, Boston; 'The Meeting of Painting and Sculpture,' Metropolitan Museum, New York; 'Coming of the Magi,' church of the Incarnation, New York; among his mural decorations are those in the Brick Church, New York; Paulist's Church, New York; Congregations' Hall, New York; and the Museum of Minnesota State Capitol, Saint Paul; his glass designs include 'Samuel' in Judson Memorial Church, New York; 'The Philosopher,' Crane Memorial Library, Quincy, Mass.; window in Second Presbyterian Church, Chicago; 'Battle Window,' Memorial Hall, Harvard; 'Paul at Athens,' Columbia University Chapel. In 1869 he became a member of the National Academy; in 1891 was made officer of the Legion of Honor, and was one of the seven original members; and in 1894 became a member of the Academy of Arts and Letters. La Farge was skillful as a colorist, however much we may criticise his inadequate conception and weakness in drawing. He is an important figure in the history of American painting and was a real pioneer in mural painting. He also painted portraits, flowers and landscapes. He contributed frequently to the magazines and published 'Consideration on Painting' (1895); 'Great Masters' (1903); 'Higher Life in Art' (1910); 'Reminiscences of the South Seas' (1912). Consult Coffin, C. H., 'American Masters of Painting' (New York, 1892); Cary, E. L., 'International Studio' (Vol. XXXVIII, ib. 1909); Cortissoz, Royal, 'John La Farge: A Memoir and a Study' (ib. 1911); Isham, Samuel, 'History of American Painting' (ib. 1905); Waern, 'John La Farge: Artist and Writer' (London 1896).

LA FARINA, la fâr-nâ, Giuseppe, Italian statesman and historian: b. Messina, Sicily, 20 July 1815; d. Turin, 5 Sept. 1863. He studied at the University of Catania; entered the law; implicated in a revolutionary conspiracy, was compelled to flee to Sicily (1837); and finally settled in Florence (1841), where he devoted himself to historical composition. Having returned to Sicily in 1848, he was there successively member of Parliament, and Minister of Education, Public Works and the Interior. After the suppression of the revolution in Sicily (1849), he resided in France and Italy, was secretary of the National Italian Society, and strongly advocated Italian unity. Following the war of 1859, he reorganized the National Italian Society, of which he became president; in 1860 was sent to Sicily to represent Victor Emmanuel, and in 1861 became president of Messina in the Italian Parliament. His chief work is 'Storia di Italia dal 1815 al 1850' (2d ed., 1860). He wrote other historical studies, such as 'Storia della rivoluzione siciliana nel 1848 e 49' (1851), dramas, and works of fiction.

LA FAYETTE, la fâ-yâ, Marie Madeleine de la Rochejaquelein, Comtesse de, French novelist: b. Paris, 16 March 1634; d. there, 25 May 1693. All her life she was in the foremost literary circles, after marriage her house was a noted rendezvous of wits and scholars, including Mme. de Sévigné, La Fontaine and La Rochefoucauld. Her first novel was 'The Princess de Montpensier' (1660); followed by 'Zaide' (1670), which among her works ranks next after 'The Prince of Cleves' (1678), her most celebrated work, revealing the conflict between love and duty in a woman's heart, and one of the classics of French literature. She wrote also 'The History of Henrietta of England' (1720), and 'Memoirs of the Court of France for the Years 1688 and 1689' (1731). Consult 'Lives,' Haussonville and Rea (1909). See PRINCESS OF CLEVES, P.T.

LA FÈRE, la fâr', France, city in the department of the Aisne and the arrondissement Laon, on the river Oise which is joined here by the Serre. It is a fortification of second class with several outer forts and has a church of the 15th century, an artillery school, arsenal, college, theatre, museum, machine works, oil factory, etc. When the World War broke out (1914) it had about 5,000 inhabitants. It was captured by the Prussians under Bülow on 27 Feb. 1814, but held out in 1815 against bombardment and investment. In 1870 it surrendered to the Germans after two days' bombardment and an ineffectual sortie.

LA FLÈCHE, la flêsh', France, town and capital of an arrondissement in the department of Sarthe, on the Loire, 30 miles southwest of Le Mans. It is the seat of the famous Prytanee, a school for the sons of officers, originally a college founded for the Jesuits in 1607 by Henry IV. It is a preparatory school for Saint-Cyr. The town carries on tanning, flour milling, paper making and also has establishments for the manufacture of bicycles, gloves, wooden shoes, etc. Pop. (town) 7,800; (commune) 10,800.

LA FLESCH, Susette. See 'Bright Eyes.'

LA FOLLETTE, la falêt', Robert Marion, American statesman: b. Pribram, Wis., 14 June 1855. He was graduated from the University of Wisconsin in 1879, and the next year was admitted to the bar. He became district attorney of Dane County in 1880, retaining that position till 1884, when he took up the regular practice of his profession and has been elected to Congress, serving till 1891; he won reputation as an orator, and as a member of the Committee of Ways and Means took a prominent part in the framing of the McKinley Tariff Bill. At the close of his service in Congress he resumed his practice, and remained active in politics, becoming one of the leaders of the younger men in the Republican party. He took part in a campaign against the exclusion privileges of corporations and against the boss system. His two pamphlets, 'Menace of the Machine' and 'The Nomination of Candidates by Australian Ballot' (1897), attracted wide attention. In them he outlined his program for electoral reform in Wisconsin. He was elected governor of his State three times, 1900, 1902 and 1904. As governor he led the movement for a direct primary law, for the equalization of taxation and the regulation of railroad rates. He resigned the governorship in 1905 to become United States senator and was re-elected in 1911. In the Senate he has demanded progressive legislation and has become well known for his advocacy of the physical valuation of railroads, his speeches on
railroad subjects showing him to be a profound student of these questions. He was prominently mentioned for the Presidential nomination in 1908, receiving 25 votes, and again in 1912. During the Taft administration he voted with the Democrats on some of the tariff schedules which were vetoed by the President. He remained in the Republican ranks in 1912, being strongly opposed to Roosevelt, the Progressive leader of that year. In the first Wilson administration his opinion was often consulted. He was the chief of a small filibustering pacifist group in the Senate which opposed the arming of American merchant vessels in the European War zone. His action was severely criticised by the people and press of the country.

LA FONTAINE, la fön-tèn, Jean de, French poet: b. Chateau-Thierry, Champagne, 8 July 1621; d. Paris, 13 April 1695. He was the son of Charles de la Fontaine, a forest ranger of the highest middle class. Jean was the eldest child and was sent to school at Rheims. After finishing at the grammar school he studied for a time without much seriousness for the priesthood, but abandoned it because of lack of interest. At the age of 20 his father resigned his position in Jean's favor, and married him to Marie Héricart, a girl of 16, with considerable fortune. The marriage was not altogether satisfactory, for La Fontaine was absent most of the time, squandering his wife's fortune, in 1658 consented to a separation des biens. For the greater part of his life he lived at Paris, while his wife remained at Chateau-Thierry.

It was not until he was 30 that La Fontaine began to devote himself to literature. Content at first with the lighter forms of poetical composition, he wrote his first serious work, L'Enuque, an adaptation of the 'Enunciatus' of Terence in 1654. This was addressed to Fouquet, and won for the author his first patron. A number of minor poems and ballads were also written for the superintendent. When the displeasure of the sovereign was incurred by Fouquet, La Fontaine found new patrons in the Duke and Duchess of Bouillon, who settled what some of his legal difficulties and made him welcome at their home. In 1664 his first book of the Contes appeared. They are stories with old themes based on Boccaccio, the Cent Nouvelles Nouvelles, and other collections of legends, reanimated by his swift and easy power of narration and his keen analysis of the characters. Among his best friends of this period were Racine, Boileau and Molière, with whom he formed the famous quartet of the Rue du Vieux Colombier, which made the literary history of the time. The Duchesse d'Olonne was his next powerful friend. He lived for a few years under her protection, and at her death was invited to the home of Madame de la Sablière, where he remained for the next 20 years.

His Fables and Adonis, romantic novels, were printed in 1669. His second volume of Contes had appeared in 1666, and two years later six books of the Fables were published. Contemporary critics gave high estimates of his works, and public recognition came in 1682, when the considerable opposition he was elected to the Academy. His health began to fail, and it was during a severe illness (about 1692) that he was converted and repented of the improveries of many of his stories. The death of Madame de Sablière in 1693 affected him profoundly, and, broken in health and old, he accepted the patronage of Monsieur and Madame Herviat who cared for him in his last days.

The curious personality of La Fontaine has given rise to many stories concerning his life and habits. The candor and simplicity of his character acquired for him the title of le bon homme. He was proverbially absent-minded, awkward and rude in society. The best of his works are the Contes and the Fables, which mark him as the master of narrators of short stories and tales. The latter have received more favorable comment, since their tone has pleased more exacting critics; while the improveries of the former have blinded some to the high artistic value of the composition itself. The Fables abound in keen analysis, cleverly hidden political teaching, natural and homely morals and delightful descriptive passages. His rhymes are of artful irregularity and are in the main metric for his deft and skilful power of narration. Of his plays, which are considerably weaker than his other works, the most noteworthy are 'Le Floreintin', 'Ragotin' and 'La Coupe enchantée'. His separate poetical works are represented by 'La captivité de Saint Malo' (1673) and the 'Poème du Quinquina' (1682). A volume of mystically religious verse was published by him in 1671, and several important comedies (collected in 1702). His letters, scattered poems, etc., were edited as 'Œuvres diverses' in 1729. Both the Contes and the Fables have been superbly printed. The latter were illustrated by Oudry (1755-59), and the former by Eisen 1762. Gustave Doré also did illustrations for the Fables. The best scholarly edition is that by Walckenaer (1826-27), who has also written an excellent biography and critical estimate of La Fontaine. Most well known is the edition by Regnier in the Grand Ecrivains I series (9 vols., 1888-92). Other good editions are by L. Monin (2 vols., 1872-76) and Marty-Laveaux (5 vols., 1857-77). Consult Lafenestre, G., 'Jean de la Fontaine' (1885); Faget, E., 'Jean de la Fontaine' (1900); Taine, 'La Fontaine et ses fables' (15th ed., 1901); Hooker, P., 'The Masterpieces of La Fontaine' (New York 1916). See LA FONTAINE FABLES.

LA FONTAINE, Sir Louis Hippolyte, Canadian statesman and judge: b. Boucherville, Lower Canada, October 1807; d. Montreal, 26 Feb. 1864. He early achieved prominence at the bar, and after the rebellion of 1837, in which he was accused of complicity, he went to England and afterward to France, and on returning to Canada in 1838 was imprisoned but released without being brought to trial. He became prominent in the Assembly of United Canadians, was joint first minister in the La Fontaine-Baldwin administrations (1842-43, 1846-51). In the second of these important measures were passed and reforms effected — University and Rebellion Losses bills, the introduction of the decimal currency, reorganization of the postal system and the reduction of rates. La Fontaine worked successfully to improve feeling between the French and British elements in the two provinces. His was the first cabinet
in which the principle of colonial government was recognized. In 1833 he became chief justice of the Court of Queen's Bench of Quebec, and as such presided over the special Seigneurial Court which met in 1855 to adjudicate on claims under the act of the previous year abolishing feudal rights and duties in Lower Canada. He was| Consult 'Baldwin, Lafontaine, Hincks,' by S. Leacock, in the 'Makers of Canada' series (Toronto 1907).

LA FONTAINE FABLES. The Fables of La Fontaine are part and parcel of French literary consciousness to a greater degree than any other classic of its literature. For generations many of these little apologues have been read, committed to memory, recited, paraphrased, by every French school boy and school girl. Countless phrases from them are current coin of conversation; familiarity with them is assumed among all who have more than the rudiments of education.

The first collection of these Fables appeared in 1668 when La Fontaine was already 47 and known to readers chiefly as the author of 'Conte de la Grenouille' and some stories in verse, gracing at times sometimes transgressing the bounds of license. The 'Fables' had no such over-spreading. Additional groups of them appeared in 1678–79 and in 1694. After 1683 La Fontaine's mellowed genius expressed itself in this form alone. In all there are 239 of the 'Fables,' varying in length from a few lines to some hundred, those written later being as a rule longer than the earlier. They are divided into 12 books. The first six books, collected in 1668, were in the main adapted from the classical fabulists Aesop, Babrins and Phaedrus. In the later books there is a wider range. The Indian Bidpai is drawn upon, as those Eastern fables had come to the French through the Persian. Avenus and Horace are laid under contribution and the earlier French writers, Rabelais, Marot, Ma
turin Regnier and Des Periers. Contemporary happenings, too, were occasionally turned to account, as for instance an accident at the funeral of M. de Boufflers (vii, 11). No fable, save one or two of La Fontaine's inversions, is new. The subject is often common property of many ages and races. What gives La Fontaine's 'Fables' their rare distinction is the freshness in narration, the deftness of touch, the unconstrained suppleness of metrical structure, the unfailing humor of the pointed moral, the consummate art of their apparent artlessness.

The personages of the 'Fables' are usually animals, each, as Taine has observed, standing as a rule, of course with frequent exceptions, for a distinct class in French society in the 17th and 18th centuries. The fox, the king, the bear and the snail, the fox and the wolf represent different types of courtiers, as they might be observed at Versailles, shallow ingenuity of fables such as the sophist in 'Le Flambeau,' the hypocrite in 'La Fausse Truffe.' The dog is the gentleman in waiting, obsequious and supercilious by turns; the cat the hypocrite, watching his chance of advantage; the ass the eternal dupe. But, though these animals stand for men, La Fontaine never forgets that they are animals, and shows himself always a keen, if desultory, observer of nature. Where men are introduced, these too are social types, the king, the lord, the priest, the monk, the recluse, the burglar, the pedant, the doctor, the coward, the vain man, the arrogant man, the hypocrite, the self-seeker, and, most sympathetically treated of all, the peasant laborer. It has been well said of La Fontaine that he knew men like Molére and society like Saint-Simon. Keen insight into the foibles of human nature is found throughout the 'Fables,' but in the later books admirable ingenuity is employed to make the fable cover, yet convey, social doctrines and sympathies more democratic than the age would have tolerated in unmasked expression. So these 'Fables,' first delighting the child for their own sake, delight the man as social parables, full of ageless teachings of worldly wisdom, of ironic observation, of broad humanity, for all their seeming child-like simplicity.

Lamartine could find in La Fontaine's 'Fables' only "limping, disjointed, unequal verses, without symmetry either to the ear or on the page." But the poets of the Grand Style, Hugo, Musset, Gautier and their followers, found in the popular favor these verses had attained and held an incentive to undertake an emancipation of French prosody which they in large measure achieved. Yet it may be doubted if any lines they wrote would ever unfold an echo wherever French is spoken as the little apologies of the Grasshopper and the Ant, the Crow and the Fox, Death and the Wood-cutter, the Animals in the Pestilence, the Two Pigeons and many more that crowd to memory. "La Fontaine's Fables," wrote Madame de Sévigné, "are like a basket of strawberries. You begin by selecting the largest and best, but, little by little, you eat first one, then another, till at last the basket is empty."* There are translations into English verse by E. Wright and Rev. W. L. Collins. An attractive edition of the original text with a preface by Jules Chéretie was published in two volumes (New York 1910).

LA FOURCHE, la, a spoor, a bayou in southeast Louisiana, and an outlet of the Mississippi River, which begins at Donaldsonville, on the right bank, and flows southeast to the Gulf of Mexico, through Fourchon and Timbalier passes, about 50 miles west of the Delta of the Mississippi. It has a total navigable length of 150 miles and is navigable by steamboats 100 miles from its mouth.

LA GIOCONDA, la (/.k3n'da), a tragedy in four acts, in prose by Gabriele d'Annunzio and dedicated to "Eleonora Duse delle belle mani." It was first played 15 April 1899, at the theatre Bellini, Palermo, and was not very warmly received. Although the prose form and modern language of the play, the time and the place of the events differentiate it from the old Greek drama, nevertheless, the inexorable fatality which dominates the course of events and against which human desire is impotent renders the play tragic as in the case of the fateful tragedies of antiquity. And yet this fatality is not the predestination of the Greek drama, but a conception of Beauty, whether created by and for man and man's power of the world, to which must necessarily be sacrificed goodness, morality, and even life.
itself. The three principal characters are Lucio Setzia, a sculptor, his wife, Silvia, and his model and the inspirer of his works of art, Gioconda Diante, a woman of marvelous beauty, with whom he is infatuated. Silvia represents virtue, and Gioconda the supremely beautiful in art. The battle between these two for the soul of the sculptor forms the dramatic struggle of the tragedy. Finally Art triumphs over Virtue, just as a man triumphed over destiny in 'La Città Morta'; or, rather, in both cases, the triumph is with Eros, the instigator and director of the masses in d'Annunzio's production. In 'La Gioconda' aesthetic fatality has its fulfilment amid the tears of the good and innocent, upon the ruin of whom the work of immortal art rises, Beauty reigns supreme over the moral virtues trampled in the dust. Despite the lack of action throughout the play, its non-conformity by reason of very long passages to what is supposed to be the conventional dramatic procedure; despite its reversal of generally accepted standards of the conduct of life and the distribution of wealth which the tragedy ends; despite the supposed influence of German and French writers, the play remains, none the less, as in the case of 'La Città Morta,' a thoroughly original production such as only d'Annunzio is capable of producing. 'La Gioconda' has been translated by Arthur Symons (Chicago 1913) Consult Dorris, Jean, 'Le theatre de Gabriel d'An
nunzio,' in Revue des deux mondes (pp. 655-681, February 1904); Mantovani, D., Lettera
ture contemporanea' (Turin-Rome 1913); Maz

JAMES GREDDIS, JR.

LA GRANDE, lā-grānd', Ore., city and county seat of Union County, on the Grande Ronde River, and on the Oregon Railroad, branch of the Union Pacific, 300 miles east of Portland. It is the commercial and trading centre of an extensive live-stock, grain and fruit growing region, and has flour mills, brick works, railroad shops, cigar factories, sash, door and box factory, creameries, foundry, soda-water works, lumber mills, bee sugar and other factories. There are two national banks, and the value of the city's taxable property is $3,700,000. It contains a high school, three grade schools, courthouse, city hall, Federal building, and Elks', Masonic and Odd Fellows' buildings. The city is governed under a com
mission-manager charter. Pop. 7,000.

LA GRANDE, lā-grānd', Ga., city and county-seat of Troup County, on the Macon and Birmingham and on the Atlanta and West Point railroads, 70 miles southwest of Atlanta. A Baptist female college and a Methodist female college are located here. The town was settled in 1826 and was incorporated two years later. Under a charter of 1891 the city is gov
erned by a mayor, elected annually, and a coun
cil elected every two years. It has numerous industries, including cotton and cottonseed
mills, a creamery, and is of importance as a tra
ding centre. The waterworks, electric-light and sewage systems are municipally owned. Pop. 5,587.

LA GRANGE, Ill., town in Cook County, on the Chicago, Burlington and Quincy Railroad, 15 miles west from Chicago. It is a sub-
urban and residential town largely populated by Chicago business men, and has numerous churches, public and private schools and two weekly newspapers. It contains Broadway Seminary, Saint Joseph's Institute, Nazareth Academy and a State Masonic Orphans' Home. Pop. 5,282.

LA GRANGE, Ind., town and county-seat of La Grange County, on the Grand Rapids and Indiana Railroad, 45 miles northwest of Fort Wayne. It is the centre of a considerable agriculture section and has numerous manufacturing interests, including flour and lumber mills, chair factories, agricultural implement works, pickles, ice, ice cream, cement-brick works, etc. The waterworks are municipally owned. Pop. 1,772.

LA GRANGE, Tex., city and county-seat of Fayette County, on the Colorado River and on the Southern Pacific and the Missouri, Kansas and Texas railroads, 80 miles southeast of Austin. It has a cotton trade of 15,000 bales annually, and is important as a sugar and cottonseed-oil, grain and live-stock. There are cotton gins, compresses and cottonseed-oil mills and other industries here. The waterworks are owned by the city. Pop. 1,850.

LA GRANGE COLLEGE, an educational institution in La Grange, Mo., founded in 1858 under the auspices of the Baptist Church. It has 13 professors and instructors, 175 students, 8,000 volumes in library and productive endowment of $50,000. Its grounds and buildings are valued at $65,000; its income is $7,000.

LA GRITA, la grē'tā, town in Venezuela, in the state of Táchira, located in a beautiful mountain region 5,000 feet above the sea, and surrounded by coffee, sugar, wheat, cacao, rice and tobacco plantations. It lies 75 miles south of Lake Maracaibo and 60 miles southwest of Mérida. The town, which has a most delightful climate, was founded in 1576 by Francisco de Cáceres. It has suffered from several destructive earthquakes. Pop. (commune) 26,000.

LA GUAYRA, la gwā'rā, or LA GUAYRA, city and seaport in Venezuela, about five miles from Caracas, on the Caribbean Sea. It was founded in 1588 and is the most important commercial city in the republic. The harbor which was formerly an open seacoast has been improved by a breakwater, and is well protected by a fort. It has a floating dry dock and shipbuilding plant. La Guayra exports coffee, cocoa and skins, and imports chiefly manufactured goods. Its annual trade amounts to about $12,000,000. It contains cigar, cigaret
ettes, shoes and hat factories, the products of which go entirely into the home market. It has steamship communication with Europe and North America. It is connected with the car
tificate by a railway 29 miles long, winding around the bases of the mountains. The port was blockaded in 1903 by the British and German fleets, pending the settlement of claims against the government. The climate is very hot and its unhealthfulness has been lessened by modern sanitary improvements. Pop. 12,000.

LA HABANA, Cuba. See HAVANA, PROVINCE.

LA HIRE, la hir', Étienne de Vignolles,
French general: b. about 1390; d. 11 Jan. 1443.
On the fall of the town of Coucy (1418), besieged by the Duke of Burgundy, he bravely fought his way through the enemy at the head of the garrison. He hurried (1429) with Jeanne d'Arc to the aid of Orleans and showed his bravery at Jarjayes and Patay. In 1431 he set forth to Rouen to release the Maid of Orleans and was captured by the English, but was ransomed and devastated the provinces occupied by the English and Burgundians. His romantic bravery and his faithful adherence to the flag of Orleans made him a favorite among the citizens of La Hire, meaning, in Burgundian dialect, the snarling of a dog, his rough style also making him a favorite French cavalier and furnishing the reason for using his name in court-cards for the knave of hearts.

LA HONTAN, la ãn’tän, Armand Louis, Baron ne, French soldier and traveler: b. Mont-de-Marsan, about 1666; d. Hanover, 1715. He went to Canada (1683) and served as a common soldier till he was advanced in the ranks, and as commander of several inland forts explored the great lakes. In 1691 he returned to the court and was made king's lieutenant in Newfoundland and promptly picked a quarrel with the governor, fleeing on a merchant vessel to escape arrest and landed (1694) in Portugal to serve in Paris in time to receive his dismissal from office. Leaving Paris he went to his native province in Gascony, but hearing he was about to be arrested, he fled to Spain, then retired to Hanover and died there. He published an account of his adventures in America, together with his description of "the different inhabitants, the nature of their government, their commerce, costumes and religion" under the title 'Nouveaux voyages dans l'Amérique septentrionale' (The Hague 1703, 1709; Amsterdam 1705, 1742) with maps and drawings. A third volume appeared (Amsterdam 1704) under title of 'Suite du voyage de l'Amérique,' both the works being published together later (Amsterdam 1728). He relates the points in his narrative at Michilimakinac, which he left to reach the Mississippi via Wisconsin, using Carver's route. He describes a trip along a river which he names the Rivière Long and gives considerable details, but some writers declare this part to be fiction.

LA JONQUIÈRE, la zhɔ̃k′jɛr, Jacques Pierre Taffanel, Marquis de, French naval officer: b. Lagrassais, near Alby, 1680; d. Quebec, Canada, 1753. He accompanied Duguay-Prouin at the taking of Rio Janeiro (1711), was captain under Admiral de Court (1744) at the battle of Toulon and commanded the French fleet at the battle of Finisterre (1747), with his six vessels fighting against 17 British men of the line. Taken prisoner, he gained his liberty on the Treaty of Aix-la-Chapelle when (1749), he went to Quebec as governor of Canada to which he had been appointed in 1746, but his two former attempts to cross the ocean had been frustrated. He proved an able governor.

LA LANDELLE, la lẫndel, Guillaume Joseph Gabriel de, French author: b. Montpellier, 5 May 1812; d. 19 Jan. 1886. After finishing his studies at Strasbourg he entered (1828) the navy, becoming lieutenant after 11 years' service. He wrote quite copiously novels depicting maritime warfare, the manners and customs of seafaring men, and other phases of life he had experienced. His voyages and activities in South America afford the basis of some of his plots, and 11 novels are 'La Grogone' (1844); 'Frise-Poulet ou les epaulettes d'aspiral' (1847); 'La couronne navale' (1848); 'Une haine à bord' (1851). 'Les princes d'étoffe' (1852); 'Le dernier des Flibustiers' (1858); 'Sans-Feur le corso' (1859). He showed his sympathy for the markets, the language of the marins, researches historiques et critiques sur le vocabulaire maritime' (1859); 'Le tableau de la mer' (1862-69, 4 vols.).

LA LINEA, la lê-nâ-a, Spain, town in the province Cadiz, on the border or line (from whence its name) bounding on Gibraltar. Some consider it a suburb of San Roque. It is of recent growth and its chief buildings are the theatre and bull-ring, the casinos and the barracks; this being a frontier-post it has its garrison. The British razed the old fortifications in 1910. Gibraltar gets much of its fruit and vegetables from the market-gardens and the laborers of Gibraltar make this their dwelling place.

LA MARE AU DIABLE, la mär dâ-yäbl, ('The Devil's Pool'). The most perfect of the works of George Sand was undoubtedly 'La Mare au Diable' (1846). Its perfection is due to the fact that it escapes most of her characteristic defects and possesses her finest qualities in their full maturity. This resulted quite naturally from the choice of a simple plot — the love a lonely ploughman feels for a poor shepherdess just emerging into womanhood, and a setting laid in the heart of Berri, the country where the author had lived as a child, and to which she had now returned. The characters, simple Berriichon peasants, as well as the country, were known to her, therefore, not through an imagination only too easily fired, but through observation and long years of sympathetic interest. There is consequently a refreshing absence of that impassioned pleading which frequently threw her early works out of artistic focus and gave us threats and tears for facts and blood. Intense individualist that she was, her distrust of the social society had been re-enforced by her own unhappy marriage, and from the first she had, with Rousseau and Wordsworth, favored the primitive, the simple soul, close to nature. Here she found warrant for her faith that both man and nature are good. This had been indicated in many earlier incidental characters, the flower girls in 'André' (1833), the country philosopher, Patience, in 'Mauprat' (1837), and the story of the poacher, Mouny-Robin (1841). But throughout that earlier period her mind had been tense with the social problem. This nervous tension had disappeared with the years, and now among the scenes of her childhood her native genius had its way. There is here a sureness of touch and the sense of being on firmer ground. It is not impossible that in the peasants she also saw the salvation and future of France. Their way of life, their homes, the country roads, the night in the woods about the Devil's Pool are truly and beautifully described, and the idealized peasants themselves are likewise true, at least in the sense that they
are psychologically consistent and conform to a healthy ideal. The style is simple, limpid and musical, like a woodland brook. In spite of the severely unpremeditated character of the narration, the author keeps steadily to her story and in construction it is superior to ‘François le Champi’ or ‘La Petite Fadette’ which followed it. The student of George Sand feels that she had turned with a sense of relief to ‘these Georges of France’ and Saint-Siméon aptly called them, and there was something undoubtedly fresh and reassuring to readers stirred by the revolutionary spirit of ’48 in this new and hopeful portrayal of a realm that promised humanity health, stability and strength.” Consult Krenine, ‘George Sand.’ (Vol. III.)

CHRISTIAN GAUTS.

LA MARMORA, la már’mó-ra, Alfonso Ferrero, MARQUISS OF, Italian general and statesman: b. Turin, 18 Nov. 1804; d. Florence, 5 Jan. 1878. He was educated at the Sardinian Military Academy, was advanced (1823) to the rank of captain, and on March 31, 1831, was distinguished himself in the war (1848) against Austria at the siege of Peschiera and was advanced to the rank of brigadier-general. In 1849 he suppressed the rebellion in Genoa and took the portfolio of Minister of War to thoroughly reorganize a demoralized army. In 1855 he commanded the Sardinian expeditionary forces to the Crimea. From 1856 to 1859 he was Minister of War and Marine and became chief of the general staff on the outbreak of war with Austria. After the treaty of peace of Villafranca he again became Minister of War and Marine (1860). Late in 1861 he became first prefect at Naples and showed energetic action against the movements of Garibaldi and of the Camorra. He headed (1864) the cabinet, after the Turin troubles, as Minister of Foreign Affairs and carried out the September convention with France. In 1866 he concluded a trade treaty with Germany and an alliance with Prussia, and when the war broke out he joined the king and army as chief of general staff and was unsuccessful. The only campaign was his and he fell into great disfavor after the unfortunate battle of Custozza, resigning his portfolio. He wrote much in defense of his military plans and after the death of his former adjutant and friend, Govone, he published the dispatches of the Berlin (1856) mission in ‘Un pò-più di luce’ (Florence 1873) to prove faithlessness and traitorous intent of the Bismarck policy. The denunciations of Bismarck and Prussia stopped him from issuing the second volume of the work, but he issued ‘I segreti di stato nel governo costituzionale’ (ib. 1877) in self-defense. In 1891 a statue on horseback was erected in his memory at Turin. Consult Massari, ‘II generale Alfonso di La Marmora’ (Milan 1880) and a similar work by Chiala, ‘Le général La Marmora et l’Alliance prussienne’ (Paris 1878).

LA MESA, la mě’sá. Colombia, a picturesque city located about 25 miles from Bogotá. Owing to its elevated above sea-level (4,225 feet), its climate is genial. The surrounding country is a fertile agricultural region. Trade is carried on in cocoa, salt, grain and hats. Pop. about 5,250.

LA METTRIE, la mě-tré, Julien Offray de, French physician and atheist: b. Saint Male, 25 Dec. 1709; d. Berlin, 11 Nov. 1751. He studied theology in his youth, then decided upon the pursuit of medicine and in 1733 went to Leyden to study under Boerhaave. In 1742 he was appointed surgeon to the guards in Paris. His medical observations led him to believe that physical phenomena were purely physical in his opinion. His ‘Histoire naturelle de l’âme’ (1745) voiced this conviction and raised so strong a feeling against him that he fled to Leyden. There he elaborated his theories, presenting them forcibly in ‘L’Homme Machine’ (1748). He further expressed his beliefs in ‘Discours sur le bonheur’ and ‘L’Art de jouer.’ He maintained that happiness for the world could be found only in atheism, thereby ending theological strife and the ban on pleasures of the senses. He was forced to leave Leyden in 1748 and found a refuge at the court of Frederick the Great, who appointed him court reader. Among other writings are ‘Observations de Médecine pratique’ (1743); ‘Réflexions sur l’origine des amiaux’ (1750), etc.

LA MORRA, la mór’ra, an ancient Roman game still played in Italy; the Romans designated the game miraculi digitis, “to flash with the fingers.” The game requires two players and consists of the simultaneous throwing out of the right hands of the players and the calling of a number which, in order to score, must equal the number of fingers extended upon the right hands of both players. A tie means no score, a correct guess one point; and the game is played for 5 or 10 points. It is commonly used as a gambling game. Consult Story, W. W., ‘Rota al Roma’ (8th ed. Boston 1887).

LA MOTTE FOQUÉ, la mó’t fóok’éd, Friedrich Heinrich Karl, Baron von. See FOQUÉ, FRIEDRICH HEINRICH KARL.

LA NAVIDAD, la ná’vdá’d. See NAVIADO, LA.

LA NOUE, la noo’, François de (BRAS DE FER), Huguenot captain: b. near Nantes, 1531; d. Moncontour, 4 Aug. 1591. He came of an ancient Breton family and saw his first military service in Italy. He was in the first Huguenot War and in the second one distinguished himself by capturing Orleans in 1557 with only 15 followers. He commanded the rear guard at the battle of Jarnac in March 1569 and was taken prisoner at Moncontour in October of that year. However, he was soon exchanged, resumed the governorship of Poitou and defeated the royalist army at Rochefort. He lost his left arm at the battle of Fontenay in 1570, but an iron one was made for him, thus giving him the name ‘Bras de fer.’ With the dawn of peace in France he joined the Dutch Protestants in 1571, but was captured and sent as a prisoner to France. He was requested by Charles IX, after the massacre of Saint Bartholomew, to attempt the reconciliation of the Huguenots with the king, but finding the task impossible and war inevitable he gave up his royal commission and served as general of the army from 1574-78. With the conclusion of peace, a None served the Huguenot cause in Holland, but in 1580 he was taken prisoner by the Spaniards; they, holding him dangerous through the
splendid character he bore, confined him for five years in prison. While in prison he wrote "Discours politiques et militaires," a work of great value, which has been translated into English and German. He was exchanged in 1855 and bound not to take arms against his captors. In 1859 he joined Henry of Navarre, saw service through the siege of Paris, at Moreuil and other battles, and was fatally wounded at the siege of Lamballe in Brittany. He wrote "Déclaration pour prise d'armes et la défense de Sedan et Jamet" (1588); "Observations sur l'Histoire de Guicciardini" (2 vols., 1592), etc. His "Correspondence" was published in 1854.

LA NOUVELLE HELOISE, la nööv'l ə-lōˈzə ("The New Heloise") In "Julie" or "The New Heloise" (1761) Rousseau gave play to his temperament and talent. Here his genius abounded, for it was not a work based on erudition or on the bitter facts of life against which his ardent disposition so frequently rebelled. It was a creation of pure fiction, of unhampered imagination, touching life only on the sides to which he was most attracted, and it left him the largest possible freedom of procedure. Writing, furthermore, in the epistolary style, so common in 18th century French and English novels, he took full advantage of the discursive manner of his time. No little of the interest of the novel, therefore, lies outside of the plot proper, in eloquent passages on the right to love, the morality of duelling and suicide, the superiority of men, the advantages of country as against city life, and above all on the beauties of lake and mountain scenery in Switzerland. Some 30 years before, Thomson had published his "Seasons," and more than 20 had passed since Haller had written his stilled but historically important descriptive poem "The Alps," Switzerland, however, had not yet become a place of pilgrimage for tourists. The success of the "New Heloise" was to bring them to the shores of Lake Geneva in increasing numbers, and now as a goal to visit the scenes described in the famous novel and to wander about in them book in hand.

It would, however, be a serious mistake to overlook the extraordinary interest which the passionate love story itself aroused in Rousseau's contemporaries. The editions could not be printed rapidly enough, and persons of quality stood in line before circulating libraries for an opportunity to rent it at 10 sous an hour.

Rousseau's heroine was to him the model and type of the virtuous woman of sentiment. She had to be sure, yielded to her plebeian lover and tutor, Saint Preux. Her later marriage she explains as due to motives of duty, devotion and friendship. That after Saint Preux's long absence she should have been invited to live in the house of his former mistress and her husband, and should have accepted, may well appear to have produced an unnecessarily strained situation, fraught with dangers for the virtuous but once passionate lovers. The tension is therefore relieved when Julie loses her life in attempting to save her maid from drowning.

To attribute the genesis of Rousseau's famous story to his own attachment for Mme. d'Houdetot is no longer possible; for it seems well established that the novel had been planned before that episode. That he was indebted to Richardson and England is beyond question. For all this, however, most of his novel received its character and quality from the fact that it was prompted and colored by his own eager and vivid hopes, desires and aspirations. It is the expression of Rousseau's ideal of social and domestic life.

CHRISTIAN GAUSS.

LA PAZ, la päs (Sp. là päth), department in the northwest of Bolivia, bounded on the north by Brazil, on the east and south by the departments of Beni, Cochabamba and Oruro, and on the west by Peru. Its area has never been accurately determined; according to a recent conservative estimate it is 75,742 square miles. Extensive tracts in the northern portion are still unexplored, and the boundary disputes with Brazil and Peru add a large element of uncertainty. Calculations based upon the extreme Bolivian claims give the fabulous area of 275,413 square miles. The department is divided into nine provinces and these are subdivided into cantons. The entire department is subject to a prefect representing the national government. Some of the highest peaks of the Bolivian Andes rise above the great Titicaca Basin (itself 13,000 feet above sea-level) in the southern half of this department, which portion has a temperate and moderately salubrious climate (see LA PAZ, the capital, etc.). Chief products are copper, silver, tin, gold, coca, wheat, maize, barley, potatoes; in the torrid lowlands of the north, sugar-cane, rice, tobacco and coffee; and from the forests along the tributaries to the Amazon are obtained rubber and cinchona. Cattle and sheep are bred in large numbers on the upland pastures. The population, according to an official estimate, is 726,357.

LA PAZ, Bolivia, capital of the department of the same name, and, temporarily, of the republic (see STICKS). It is the metropolitan and commercial centre of Bolivia, situated in the Quebrada del Choqueyapu, 650 feet lower than Lake Titicaca (from which the distance by road is about 45 miles) and yet quite 12,120 feet above the level of the sea. The mean annual temperature is about 54° F., and the range of temperature 19° F. to 75° F. The clearness of the sky occasions rapid loss of heat by radiation; the nights are therefore much colder than the days. Though the thermometer often falls below freezing-point, plans are rarely frozen, for the reason that the air at this great height is very dry. It is substantially built on 40 hills, bridged by 20 bridges, with clean, well-paved streets. The Plaza Murillo, a fashionable promenade bordered with beautiful flowers, and the fine tree-bordered Alameda, are the best of its thoroughfares. The cathedral is distinguished by the fine carved stone work of its façades. There are some noteworthy public institutions—a museum, library, university with four faculties, professional schools of various kinds and courts. Railways connect with Antofagasta and the port of Arica. The city was founded in 1549 by Alonso de Mendoza. Pop. 78,856.

LA PAZ, Mexico, port on the east shore and capital of the southern district of Baja California. It is pleasantly situated between
LA PELTRIE, la pél'tre, Marie Madeline de, née CHAUVIGNY, French-Catholic educator: b. Alençon, 1603; d. Quebec, 1671. She was a religious turn of mind, but was refused permission to enter a convent, was married at 17 and widowed at 22. She answered Father La Jeunes' appeal for help in the education of Indian girls in the Jesuit religion in Canada, and decided to employ her fortune in founding an institution for the work. In 1639 she went to Canada, accompanied by three nuns and several hospital sisters, and founded the Ursuline Convent at Quebec, the first school in Canada for the instruction of girls, teaching both whites and Indians. She was with the Montreal colony in 1642-46, when she returned to Quebec and became a nun, devoting her entire means to the convent.

LA PÉROUSE, la pá'rooz', Jean François de Galaup de, French navigator: b. near Albi, Languedoc, France, 22 Aug. 1741; d. after 1788. He served in the French navy against England (1778-83), and was in command of the frigate Attila in the attack on a British convoy off the coast of Nova Scotia in July 1781. He sailed in August 1785 with two ships on an exploring expedition to the Pacific, one of the objects of which was to discover the northwest passage from the Pacific side. By sailing through the Perouse Strait, between Saghalien and Yezo, he discovered that each of these was a separate island. He touched at points in China and Japan and visited the Solomon Islands and Australia. In February 1788 he sailed from Botany Bay, and after this no more was heard of him. In 1820 it was fully ascertained by the English Captain Dillon that both of the French ships had been wrecked in a storm on a coral reef off Vanikoro, an island lying north of the New Hebrides, and in 1898 a few relics of his party were found there. An account of the early portions of La Perouse's voyage, prepared from journals sent home by him, was published under the title of 'Journey Round the World.'

LA PEYROUSE, Philippe Picot de, French naturalist: b. near Toulouse, 1744; d. 1818. He was advocate-general in the parliament of his native town in 1768-71; thereafter until 1789, engaged in natural history researches. He was then named president of the administration of Toulouse, became inspector of mines and professor of natural science at Toulouse, and in 1800 he was mayor. He became perpetual secretary of the Toulouse Académie des Sciences in 1783 and, in 1816, president of the Academy. He was president of the electoral college of Haute-Garonne. He wrote 'Description de plusieurs espèces nouvelles d’orthocéphales et d’ostracthes' (1781); 'Traité des mines et forges à fer du comté de Picardie' (1780); 'Flora de la province de Toulouse' (1795-1801); 'De quelques espèces d’orobres des Pyrénées' (1818), etc. Consult Decamp, 'Blogo de M. Le Baron de La Peyrouse' (1819).

LA PIEDAD, la pé'dád' , Mexico, city in the state of Michoacan, near the northern boundary, on the Lerma River, 62 miles southwest of Guanajuato. It is the centre of a large agricultural district. A fine bridge crosses the Lerma at this point. Pop., 10,604.

LA PLACE, la plás', or PLACEUS, Jo-sué de, French Protestant clergyman: b. Brittany about 1606; d. 17 Aug. 1665. He was educated at Saumur, became pastor of the Reformed church at Nantes in 1625 and professor of theology at Saumur in 1632. He wrote 'Theses theologice de statu hominis lapsi ante gratiam' (1640), in which he set forth liberal views on the subject of original sin. His views were rejected at the Formula concorsus of 1675. He also wrote 'Disputations académie' (3 vols., 1649-51), and 'De imputatione primi peccati Adami' (1655). His collected works were published (1699, 1702).

LA PLACE’S HYPOTHESIS. See LA PLACE, PIERRE SIMON, MARQUIS DE; NEBULAR HYPOTHESIS, THE.

LA PLATA, la pla’tá, Argentine Republic, capital of the province of Buenos Aires. After the Congress of the republic declared Buenos Aires to be the capital, the legislature of the province of Buenos Aires decided to build a new city, which should be the provincial capital. The cornerstone of La Plata was laid on 19 Nov. 1882, in a barren waste a few miles from the village of Ensenada and about 24 miles below Buenos Aires, on the southern shore of the Rio de la Plata. The port of La Plata, built in Ensenada, five miles distant, is in communication with the city by means of a railroad and a canal, which is navigable by seagoing vessels. The city is laid out on the same plan as Washington, D. C., with diagonal avenues 97½ feet wide, streets 58½ feet wide, and 23 public squares. The principal buildings are the government house, the capitol, and the various public departments, have been erected on a magnificent scale. To the National University there is attached an astronomical observatory, and it possesses one of the finest museums in South America, especially rich in the departments of paleontology and anthropology. There is an excellent water supply. There are several handsome churches, three race-courses, a splendid park planted with eucalyptus trees and street railway service. Railways connect this port with nearly every province of the republic, and there is steamer connection with Liverpool. Pop. 106,382.

LA PLATA, Rio de, río dá, an estuary on the southeastern coast of South America, between Uruguay and Argentina; an outlet for the united waters of the Paraná and Uruguay rivers. The enormous outflow, estimated at 2,000,000 cubic feet per second, which in volume is exceeded only by that of the Amazon, creates powerful currents; treacherous shallows are formed over the washings brought down from the interior of the continent; and the low-lying southern shores afford no shelter from storm winds. Therefore navigation in this estuary, which is 143 miles wide at its mouth, and about 100 miles long, narrow, and steep, between Montevideo and Buenos Aires, combines the perils of river and open sea. On the north shore there is one good natural harbor—that of Montevideo; on the Argentine side well-
directed efforts are being made to supply natural deficiencies by building massive docks, dredging deep-water channels and completing other extensive harbor improvements (see Argentina; Buenos Aires; and La Plata). The region to the north of La Plata, with the Uruguay, Paraná and Paraguay rivers, gives access, of vast extent. The estuary was discovered in 1509 by Díaz de Solís, received its name (silver-river) from Sebastian Cabot, and was explored by Day in 1853 and by Page from 1853 to 1856. In the latter part of Spanish dominion it was comprised in the vice-royalty of La Plata, from which the states of Argentina, Uruguay, Paraguay and Bolivia have been carved; and to-day the southern portions of that region sustain some of the most progressive of all LatinAmerican communities. Early in the last century Great Britain attempted to secure control of this continental gateway, a position which, as it now appears, would have enabled her to win in the south a colony possessing very great ressources to her Canada, at least. In 1806, when England and Spain were at war, Spain being the ally of Napoleon, Maj.-Gen. William Carr Beresford, with about 1,600 men, arrived off Buenos Aires, and captured the city quite easily. But a few weeks later the invaders were driven out. A much larger army, commanded by General Whitelocke, was sent in 1808 to recapture Buenos Aires, and a separate force succeeded in taking possession of Montevideo. But the British were defeated on the south shore; General Whitelocke capitulated on the day of the attack, withdrew to his ships and surrendered Montevideo.

La PORTE DU THIEL, la pôrt dû tã'y, François Jean Gabriel, French Hellenist: b. Paris, 13 July 1742; d. 28 May 1815. He served in the army, but after 1763 he engaged wholly in the study of Greek language and literature. In 1779 he gained the privilege of studying the archives of the Vatican, and his discoveries and collections of material there form an important addition to mediaeval history. He returned to France with more than 17,000 documents, which formed a basis for much of his later work, and many of which were published at the expense of the French government. He published 'Oreste, ou les choephores, tragédie d'Eschyle,' with notes (1770); 'Hymnes de Callimache, nouvelle édition avec une version française et des notes' (1778); 'Théâtre d'Eschyle, traduit du grec en français' (2 vols., 1794); 'Géographe de Straton' (3 vols., 1805-15), etc.

La RÁBIDA, la ra'bê-da, Spanish Franciscan convent of Santa Maria de Rábida on a hill near Ferro. The convent had fallen into ruins but was restored in 1853. Its historical interest identifies it with Christopher Columbus, who stopped there on the occasion of his projected visit to France to arouse interest in his theories. He succeeded in gaining the attention of the prior, who besought and gained for him the hand of the queen, Isabella. A monument to Columbus, consisting of a column 225 feet in height, surmounted by a globe, was erected here in 1892.

La RIVIERE, la ré'veyã', Alphonse Alfred Clément, Canadian statesman: b. Montreal, 24 July 1842. He was educated at the Jacques Cartier Normal School and at Saint Mary's College, Montreal. He entered government service in 1871, going to Manitoba as secretary of the board of education and serving as superintendent of Catholic schools. He also edited Le Manitoba. He served in the Manitoba legislative assembly in 1876-89, and in the Canadian House of Commons in 1898-1904. He was Provincial Secretary, Minister of Agriculture and Provincial Treasurer in the government of Manitoba in 1878-89, and since 1905 has been immigration commissioner for Manitoba with headquarters in Montreal. He was appointed a senator by the Duke of Connaught in 1911.

La ROCHE, la rôsh, Sophie, German novelist: b. Kaufbeuren, 6 Dec. 1731; d. Offenbach, 18 Feb. 1807. She was married to Georg Michael Frank von La Roche (or Lichtenfels) in 1754 and her home became a literary centre. The poets Goethe and Christoph Martin Wieland were both warm friends and admirers. Her earlier work shows the influence of Richardson's 'Carissa Marlowe.' Author of 'Geschiehte des Fräulein von Sternheim' (1771); 'Moralische Erzählungen' (1780); 'Geheimniss von Miss Long' (1789); 'Schöne Bild der Resignation' (1795), and 'Melusinens Sommerabende' (1806).

La ROCHEFOUCAULD, la rôsh-foo-kô, François, Duc de, Prince de Marillac, French courtier and moralist: b. Paris, 1613; d. there, 17 March 1690. He entered on a military career and was engaged as an officer at the age of 16 at the siege of Casale. In the wars and intrigues of the Fronde he served the party of the Parliament, took part in the defense of Bordeaux (1650), less from conviction than to please the Duc de Longueville, and he was wounded at the battle of Faubourg, Saint Antoine (1652). At the end of the civil war he abandoned the pursuits of ambition for a life of repose and reflection. He frequented the salon of Madame de Sablé, and his house became a resort of the most distinguished wits and people of culture of the time, Boileau, Racine, Mollière, Madame de Sévigné and Madame de La Fayette. The first fruits of his literary activity were his 'Mémoires sur la Régence d'Anne d'Autriche,' a spirited representation of that time, published surreptitiously in 1662 without the author's knowledge, and by him repudiated; but his denial of the authorship was not generally credited. It is now believed that only about a third of this work is his. In 1665 appeared anonymously the work that has made his name immortal, 'Réflexions, ou Sentences et Maximes Nordies,' which passed through five editions in the course of the author's life, was subjected to careful revision by him and have frequently been republished. There are about 700 maxims, varying from two or three lines to half a page in length. No one prior to his day or since has given so much point, brevity replete with fullness, and cutting edge to his thoughts. The prevailing thought in the book is that self-love is the dominating spring of human action; virtue but its recompense, but in being virtuous it is only our desire to gain the recompense. This view is presented with so much piquancy and variety of aspect that the reader is much enamored of the author's skill in presenting his point of view that he forgets to condemn this libeller of the
human race. An English version by G. H. Powell appeared in 1903. Consult 'Lettres,' his correspondence published 1818; Bourgeois, 'La Rochefoucauld' (1895); Hemon, 'La Rochefoucauld' (1896); Rahalsted, 'Studien zu La Rochefoucauld' (1888). See MAXIMS.

LA ROCHEFOUCAULD-LIANCOURT, lyân'koo', François Alexandre Frédéric, French philanthropist and social reformer: b. La Rochefoucauld, 1 Jan. 1747; d. Paris, 27 Aug. 1824. He early entered the carthierniers as an officer, and after a visit to England he established a model farm and a school for the children of soldiers. The school from 1788 received royal support as the École des Enfants de la Patrie. He was elected to the States-General in 1789 and there carried forward his measures for social reform. While devoted to the person of Louis XVI he was by principle opposed to the government and endeavored to warn the king of the dangerous trend of public affairs. On 18 July, four days after the fall of the Bastile, he became president of the National Assembly, and afterward he was appointed to the command of a military division in Normandy. He hoped to secure the personal safety of the king and sought to have him take refuge in Rouen. Failing in this he aided the king with a large sum of money. During the Terror he found safety in England, and in 1795-97 he visited America. He returned to Paris in 1799 but took no part in politics, devoting himself to his projects of social betterment and especially to the furtherance of vaccination. After the Restoration he entered the House of Peers. His school, the École des Enfants de la Patrie, received the favor and support of the successive governments and for 23 years he was government inspector of it. He founded the first savings bank in France and served as a member of boards of administration for hospitals, prisons and agriculture. He refused to support the government in 1823, which led to the loss of his positions and the abolition of his vaccination committee, the welfare of which he had greatly at heart. In protest the academies of science and medicine elected him to their membership. He never regained official favor. Author of 'Voyage dans l'Empire d'Angleterre' (8 vols., 1798); 'Les Prisons de Philadelphie' (1796).

LA ROCHEJACQUELINE, la rô什-zhakl'kli, Henri Du Verger, COMTE de, French Vene- dean royalist: b. Chatillon, 20 Aug. 1772; d. Nouaille, 4 March 1794. On the outbreak of the Revolution he retired to La Vendée, and the peasants of La Vendée having taken up arms in the royal cause, he placed himself at their head and addressed them in the short and pithy harangue: 'Let us go to meet the enemy; if I draw back, shoot me; if I advance, follow me. After gaining ten victories in 10 months he fell at Nouaille, shot by a Republican soldier whom he was offering quarter.'

LA ROCHELLE. See ROCHELLE, LA.

LA ROCORNIÈRE LE NOURY, la rô'kô-nér' lô noör', Camille Adalbert Marie Clé- ment, BAKOWE, French vice-admiral: b. Turin, 1813; d. Paris, 1887. He entered as an under officer to the École Navale in 1829, received rank as ensign in 1834, captain in 1855, rear-admiral in 1861, and vice-admiral in 1868. He was in charge of the evacuation of Mexico in 1867; and at the outbreak of the Franco-Prussian War he was placed in command of the marines in the forts of Paris. He was made admiral-in-chief and participated in the battles before Paris, receiving the Grand Cross of the Legion of Honor in acknowledgment of his services. He was elected to the National Assembly in 1871 and to the Senate in 1876. He was an ardent supporter of the Bonapartists. Author of 'Considérations sur les marines à violes et à vapeur de France et d'Angleterre' (1844); 'La marine au siège de Paris' (1872).

LA ROTHIERE, lô ro'trä', France, village in the department of Aube, seven miles southwest of Brienne and 23 miles east of Troyes. It has historical prominence as the scene of a battle between the Allies under Blücher with 100,000 men and the French under Napoleon with 45,000 men, 1 Feb. 1814. Napoleon was defeated. The combined losses of the armies was 8,000 men, about evenly divided.

LA SALE, la sal', Antoine de, French writer: b. in Provence, probably at Arles, about 1388; d. 1462. He entered the court of Anjou in 1402, doubtless as a page, and spent his life in the employment of various kings and princes. He is counted the most important satirist of his day but there is considerable doubt as to his authorship of several works ascribed to him, as he never acknowledged them. There is no doubt that 'Le petit Jehan de Saintre' (1459) is from his pen, and it is the work upon which his fame rests. It is dedicated to Jean d'Anjou, Duke de Calabre, one of the several princes he tutored; and 'La Salade' (1438-47), a textbook of studies suited to a prince, was likewise dedicated to his pupil. He is credited with the authorship of 'Les Quinze Joyes de Mariage,' one of the most celebrated of French satires and his claim is fairly well substantiated. The 'Cent nouvelles nouvelles' were long ascribed to Louis XI, but critics in general now credit the work to La Sale. The stories are modeled on the style of the Italian novelle. They are licentious in a licentious character. There are numerous other works credited to him by various critics. 'La Salade' was printed several times in the 16th century, while the 19th century saw editions of his other works. The best editions are Guichard, J. M., 'Petit Jehan de Saintre' (1843); Wright, T., 'Les Cent Nouvelles Nouvelles' (1858); and Jannet, P., 'Les Quinze Joyes de Mariage' (1857).

LA SALETTE, la sal'ês, France, place of pilgrimage in the parish of La Salette-Falla- yaux, department of Isère, 23 miles southeast of Grenoble. On 19 Sept. 1846 a full moon, the Virgin Mary is said to have appeared before two peasant children, Mélanie Calvat, called Mathieu, aged 15, and Maximin Giraud, aged 11. While the story was openly discredited outside the Church it was disputed within it; a great church was built there, the foundation for which was laid 25 May 1852. Miraculous cures are said to be wrought there and the church as a place of pilgrimage is second in fame only to the Lourdes. Consult Verdunoy, 'La Salette, étude critique' (Paris 1906).

LA SALLE, la sal', Jean Baptiste de, French priest and educator, called the father of modern pedagogy: b. Rheims, 30 April 1651;
d. Saint-Yon, 7 April 1719. After completing the preparatory course of humanities, he entered the university of his native city where, at the age of 19, he took his master's degree. Shortly afterward he went to the Seminary of Saint Sulpice at Paris; and, while living there, followed the theological courses of the Sorbonne. On Easter eve 1688, he was ordained priest, being already a titular canon at the Cathedral Church of Rheims; two years later, in 1681, after defending a thesis before the faculty of the University of Rheims he obtained the degree of doctor in sacred theology.

A man of means and academic culture, he was also a friend of the people, a true philanthropist, giving away all his patrimony in alms to help the deserving poor. He interested himself at an early period in education, especially the education of children belonging to the humbler classes. He noticed that nowhere there was a clear distinction drawn between primary and secondary education and that nowhere there was any provision made for instructing school-children in subjects of acknowledged utility to them. To correct this state of affairs he founded in 1681 a society of teachers under the name of Brothers of the Christian Schools (q.v.), enjoining them by rule to take the vows of religion but not to enter holy orders. By this latter regulation, he sought to free them from ecclesiastical duties so that they might be able to devote themselves unrestrainedly to the work of education. The rules and constitutions of the society were approved in 1724 by Pope Benedict XIII.

The first great change introduced by De la Salle and successfully carried out by his followers was the substitution of French for Latin as the language of the classroom. As in the case of antecedent reforms, this roused a storm of wrathful critics; but it soon met with the approval of the universities and highest authorities in church and state.

The individual system of teaching was then in vogue, and as it seemed to him to involve loss of time and to favor idleness, he replaced it by his famous method in which the teacher addresses himself to a numerous division and frequently to a whole class at a time. He insisted on the Socratic method of teaching for all subjects, rejecting the lecturing style as unsuited to elementary instruction. He also recommended the frequent use of object-lessons. Such thorough-going changes gave a great impetus to education inasmuch as it increased the efficiency of the teacher while diminishing his drudgery, and ensuring substantial results. In due time, these bold innovations in educational method brought about a general system of popular education in France as well as in other European countries, and merited for their author the title of Father of Modern Pedagogy.

In 1684 he opened a Séminaire de Maitres d'Ecole for the formation of competent masters for the rural districts, which seminary was the first normal school or training college founded in Europe. Admission was by examination; and during the course, opportunities were afforded for practice-work. In 1694, it was attached to the institution. In his endeavors to instruct the masses and educate the people, De la Salle established in Paris in 1699 regular public courses in science and art in which instruction was given to all comers on Sunday from 12 to 3, the session being always concluded by a short religious exercise. These schools were called Ecoles Domenicales and were, in some respects, the prototype of our Sunday schools. At Saint-Yon, near Rouen, he also founded a school of higher studies in which the students were allowed to select the courses best adapted to their tastes. De la Salle firmly established his society firmly established in France and his educational work appreciated at home and abroad. Among his published writings are 'Le Devoir du Chrétien' and 'La Conduite des Ecoles'; others are of an ascetical character and refer to the religious life.

This great educator and benefactor of the people was of a gentle yet firm disposition; severe to himself but kind and encouraging to others. The holiness of his life was proclaimed to the world by Pope Leo XIII, who on 24 May 1900 conferred on him the honors of canonization and enrolled him among the saints of the Catholic Church.

LA SALLE, René Robert Cavalier, Sieur de, French explorer: b. Rouen, France, 21 Nov. 1643; d. Texas, 19 March 1687. Born of a wealthy family, he became a novice of the Jesuit order. 5 Oct. 1658, and on the 29th of the same month he took the vows and was known as Brother Robert Ignace. In October 1667 he left the order. He sailed for Canada in 1668 with the hope of making his fortune there; became owner of a seigniory and a fur trader at La Chine (so named for its supposed position on the route to China), explored Lake Ontario, established forts on the Saint Lawrence, was made by Frontenac commander of a fort which stood where Kingston, Ontario, now stands, and was the discoverer of the Niagara and Ohio rivers. Returning to France he received large grants of land in Canada, and was ennobled, but on the discovery by Marquette of the Mississippi, he left his new estate to seek the mouth of the great stream. His designs were favored by the French Minister of Marine, who supplied him with men and ships. In 1679 he had built and launched on the Niagara River a bark of 45 tons, the Griffon, crossed Lake Erie and Lake Saint Clair, and reached Green Bay. Here he loaded the Griffon with rich furs and sent it to meet the claims of his creditors at Montreal. He then proceeded in bark canoes and reached the banks of Lake Peoria, Illinois, where he built Fort Crèvecoeur, and from thence he made a memorable journey, mostly on foot, back to Fort Frontenac, where he learned of the wreck of the Griffon, and another ship sent with supplies for him from France. In the meantime his little band of explorers had been scattered through dissensions, but he succeeded in gathering them and, late in 1681 he set out with an expedition and descended to the mouth of the Mississippi, of which he took formal possession in name of the French king (9 April 1682), and named the adjacent lands Louisiana, and built a fort. This was the great achievement of his life. In 1683 he constructed Fort Saint Louis, on "Starved Rock," near Utica, Ill. The return of Frontenac was disastrous to the explorer's interest; his successor, La Barre, was hostile to western expansion. After a visit to France he failed on his return (1684) with 4 vessels and 280 men, to locate the mouth of the Missis-
sippi. He had a difference on this point with Beaujeu, the naval commander, who persisted in sailing on to Matagorda Bay in Texas. Here La Salle, to avoid further quarrels and recriminations, abandoned his companions; the colonists who followed him lost most of their supplies in a gale of wind, but managed to fortify the port of Saint Louis; they failed in their agricultural attempts, and sought in vain for gold. Their numbers were reduced to 35, and in 1687 he set out for a return to Canada. Two men, Dubant and L'Archevêque, who had embarked capital in the enterprise, were incensed at its failure, and in a quarrel murdered the nephew of La Salle, who, when he enquired into the matter, was shot dead from ambush. Consult for memoir in French, 'Historical Collections of Louisiana' (2d series, Vol. II); for letters and other documents, Pierre Margry's 'Découvertes'; Abbott, 'Adventures of Chevalier de la Salle and his Companions' (New York 1903); Parkman, 'La Salle and the Discovery of the Great West' (in French and English in North America, Boston 1907); Shea, 'Early Voyage up and down the Mississippi' (Albany 1801); Justin Winson, 'Cartier to Frontenac' (Boston 1894).

LA SALLE, la-sâl', Ill., city in La Salle County, on the Illinois River, the Illinois and Michigan Canal, and on the Illinois Central and the Chicago, Rock Island and Pacific and other railroads, 99 miles southwest of Chicago. It is the centre of a large trade by river, canal and rail; is in a rich bituminous coal region; and is engaged in coal mining, zinc smelting and the manufacture of sulphuric acid, hydraulic cement, sewer pipe, bottles, clocks and ornamental pressed brick, common brick, glazed, nickelled, tools, machinery. Besides coal, cement rock, silica sand and fire clay are found in the neighborhood. It is the seat of Saint Bede College and Saint Mary's Hospital; has a public library; and the mine-rescue station, a bridge of the Illinois Central Railroad; good sewerage system, waterworks, hospitals, a national bank, electric light and street railroad plants, and daily and weekly newspapers. The city was incorporated in 1839, and named in honor of La Salle, the explorer who made a settlement at Starved Rock, near here. It was chartered in 1852. The government is vested in a mayor and council. The city owns and controls the electric-light plant and waterworks. Pop. 12,221.

'History of La Salle County, Ill.' (2 vols., Chicago 1896).

LA SALLE COLLEGE, an educational institution in Philadelphia, Pa., founded in 1883 under the auspices of the Roman Catholic Church. It is under the management of the Brothers of the Christian Schools. In 1916 there were 26 instructors, 310 students, 11,700 volumes in the library, 300 acres of land, and buildings and buildings were valued at $250,000.

LA SAUSSAYE, la só-sâ, Pierre Daniel Chantepr de, Dutch theological scholar: born Leeuwarden, 1848. He was professor at the University of Amsterdam in 1878-1900, and in 1900 was appointed professor of theological history and related branches at Leyden. Author of 'Lehrbuch der Religionsgeschichte' (2 vols., 1887-89; 2d ed., 1897), translated into English under the title 'Manual of the Science of Religion' (1891), and 'The Religion of the Teutons' (1902).

LA SERENA, la sér-ê-na, Chile, city, and capital of the department of Coquimbo (q.v.), on the Pacific Coast, 215 miles north of Valparaiso. A railroad connects it with Coquimbo, eight miles distant. Other railroads connect it with Vicuña and Rivadavia in the interior, and with Valparaíso and Santiago to the south. It is the seat of a bishopric and a Court of Appeals is located here. The city has a delightful climate, is surrounded by gardens and has fine straight streets bordered by well-built residences. It contains several plazas and promenades.

Pop. 15,996.

LA SERNAY DE HINOJOSA, la sér-ê-na jé'nô-hô'-sâ, José de, Spanish general and viceroy: b. Jérez de la Frontera, 1770; d. Cadiz, 1832. He served in the Peninsular War and was with Wellington in 1813 and in 1815 received rank as field-marshal. In 1816 he commanded the Royalist army in Upper Peru. Acting against his own judgment, but in accordance with that of the viceroy, Puebla, he was defeated by the patriots at Salta and Jujuy and resigned in 1819. The threatened invasion of San Martin induced him to accept the post of commander-in-chief of the forces against the patriot chief, and on 29 Jan. 1821, he succeeded his old antagonist, Puebla, as viceroy. He was compelled to evacuate Lima, 6 July 1821, but set up his capital at Curuco, and although cut off from Spain for three and a half years defended the interior successfully until the battle of Suacacho, 9 Dec. 1824, when he was defeated and with his army captured by Sucre. He returned to Spain in 1826, was created Count of the Sudes, and otherwise honored.

LA SIZERANNE, la só-zèr-ân', Maurice de, French philanthropist: b. Tain, in the department of Drôme, 1857. He was blind from the age of nine years, was educated at the Jeunes Aveugles in Paris and later was appointed professor there. He was particularly occupied in connection with literature for the blind, perfecting an abbreviated orthography for the blind widely adopted in France. He was the founder of 'La Revue Braille', and is a chevalier of the Legion of Honour. He was the author of 'Les aveugles utiles' (1881); 'Les Aveugles par un aveugle' (1888; 5th ed., 1912); 'Les Sœurs aveugles' (1901); 'La question des aveugles' (1911), etc.

LA SIZERANNE, Robert de, French writer and art critic, brother of Maurice de La Sizeranne (q.v.): b. Tain, in the department of Drôme, 1866. He was educated at the College de Vaugirard, Paris, was admitted to the bar in 1895, but turned to the study of art for a career. He received the Yset prize from the French Academy in 1909. He was a contributor to the 'Revue des Deux Mondes' and the 'Revue Encyclopédique', author of 'La Réfréndurne communal' (1893); 'La peinture anglaise contemporaine' (1895); 'Ruskin et la religion de la beauté' (1897); 'Le miroir de la vie' (1902; 2d series, 1909); 'Pages choisies de Ruskin' (1908), etc.

LA TÈNE (la tê'; PERIOD, name given an European period of culture known as the second early Iron Age, extending about
LA TOUCHE-TREVILLE, la toosh-trév’vəl, Louis René Vassor, Viscount de, French naval officer: b. Rochefort, 3 June 1745; d. Toulon, 20 Aug. 1804. He became a midshipman at the age of 12 and remained in the navy all his life. He served in the American Revolution, and for the capture of an English frigate off Newport, R. I., in 1780 he was promoted frigate-captain. He served under De Grasse and De Quinten, subsequently in the war, and was wounded at Yorktown in 1781. He was one of the framers of the Maritime Code in 1786, and in 1789 he was elected to the States-General. He attained rank as rear-admiral in 1792, served in the Mediterranean and off South America, and in 1795 was given command of the fleet at Aix, which, in conjunction with that of Admiral Joyeuse, was to operate against Santo Domingo. A misunderstanding concerning the supreme command caused the fleets to separate, La Touche-Treville proceeding to Port-au-Prince, where he landed in time to save the island from being burned by the negroes. He fortified the city and remained in command of the French navy in those waters until 1803, making many attacks on British shipping and succeeding in forcing the strong fleet sent against him to retire in October 1803. Returning to Rochefort in December 1803 he received his commission as vice-admiral and was given command of the French fleet in the Mediterranean. However, a lingering fever contracted while in the West Indies ended his career a few months later.

LA TOUR, la toor, Maurice Quentin de, French artist: b. Saint Quentin, 5 Sept. 1704; d. there, 18 Feb. 1788. His art was practically self-developed although his early teacher, Spéder, influenced him in taking up pastel work, which was not at the time in favor, although it became fashionable later and was the medium through which La Tour won his fame as a portraitist. He was at Cambrai when the congress was in session in 1724 and later visited England, supposedly upon the invitation of the English ambassador. In 1737 La Tour first exhibited in the Salon, and in the succeeding 37 years exhibited there some 150 portraits of exceptional beauty and excellence. He was elected to the Academy in 1751 and became councillor in the following year upon his appointment as painter to the king. His art was twofold in that he possessed the faculty of painting his sitters at their best, often with surroundings of exceptional beauty, and at the same time produced an indisputable likeness so that he both pleased his patrons and disarmed the criticism of his fellow artists. His sitters included the officers of the court, pastorals of the followers of the court, and as he painted until the age of 80 he amassed a large fortune with which he was very liberal. He founded three perpetual prizes for the Ecole des Beaux-Arts in Paris, and endowed a school of design and other useful institutions at Saint Quentin. Probably the finest specimen of his art is the Portrait of Madame de Maintenon in life-size and exhibited in the Salon in 1755, and now the most highly prized of the Louvre’s collection of pastels. His portraits of Louis XV, his queen, the Dauphin and Dauphiness, Voltaire and Rousseau are regarded as being almost as valuable for their historical exactitude as for their high art value. The splendid collection of his work owned by the museum at Saint Quentin consists of works which were in his own possession at the time of his death and were bequeathed to the museum by La Tour’s brother. Many of these are sketches for his finished portraits and afford a rich field for study. Consult Desmez, C., ‘M. Q. de La Tour, peintres du roi’ (1854); Goncourt, E. and J. de, ‘La Tour’ (1867); Tourneux, ‘La Tour, biographie critique’ (1903).

LA TRAPPE, la tràp’, the name of a Cistercian abbey founded by Count Rotrou of Perche in 1140. It was known as Notre Dame de la Maison Dieu and from its situation in a damp, unhealthy glen, accessible only by a narrow stony passage was called La Trappe (‘the trap’). The monks were as distinguished for austerity during the 14th and the 15th century as they subsequently became for licentiousness and violence when they were known as the ‘Bandits of La Trappe.’ The monastery, however, passed into the hands of the family of Bouthiller de Rancé in the middle of the 17th century. This brilliant abbey had early abandoned himself to worldliness, but became converted, introduced Benedictine monks into La Trappe and enforced severe discipline. The brethren rose at 2 a.m., retired at 7, slept on straw, were forbidden wine and flesh, spent each evening some time in digging their own graves, and never spoke excepting to say to each other, ‘Memento mori.’ Rancé discouraged literary pursuits but enforced constant manual labor; he died in 1700, and the Trappists were driven out of France by the Revolution. They founded a house at Valsainte, Switzerland, which was destroyed by the French in 1798, but they were again put in possession of La Trappe on the restoration of the Bourbons. In 1829 the Trappist houses were closed by a royal decree, and all but nine monasteries were suppressed; these were compelled to seek refuge in Algiers 1844, and the United States in 1848, where they established houses in Kentucky, Iowa and Rhode Island. Consult Gaillard, ‘Les Trappistes ou l’Ordre de Citeaux au XIXe Siècle, Histoire de la Trappe depuis sa Fondation’ (1844).

LA TRÉMOUILLE, la tràrmue’l, or TREMOUILLE, Louis II de, Viscount de Thouars, Prince de Talmont (‘chevalier sans approche’), French soldier: b. 20 Sept. 1460; d. Pavia, 24 Feb. 1525. He came of a distinguished family, commanded the army of Charles VIII in 1488, and at the battle of Saint-Aubin du Cormier defeated and captured the Duke of Orleans. He was appointed to the commander-in-chief and the fashionability of his followers captured Milan in 1500, but was defeated in the Neapolitan territories in 1503, and by the
Swiss at Novara in 1513. He fought at Marignano in 1515 and in 1522-23 he held Picardy against the English and Imperialists. He was killed in battle at Pavia. Consult Sandret, L., ‘Louis II de la Trémoïlle, le chevalier sans reproche’ (Paris 1881).

**LA TUQUE, la túk**. Canada, village in the province of Quebec, 87 miles northwest of Quebec, on the Rameau and the Saint Maurice rivers, and on the Quebec and Lake Saint John Railroad. The Saint Maurice River furnishes a water route to Grandes Piles. The town is chiefly interested in pulp manufacture. It has a Roman Catholic college, convenant and hospital. Pop. about 4,000.

**LA VALETTE, la valêt', Antoine Marie Chamans, COUNT DE, French statesman**: b. Paris, 1769; d. 15 Feb. 1830. He was in sympathy with the Revolution, but advocated leniency for Louis XVI and particularly for Marie Antoinette, whom he admired. He served under Napoleon in the Italian and Egyptian campaigns; was appointed Ambassador to Saxony by Napoleon, and was post director and Councillor of State during the First Empire and the Hundred Days. After the Restoration he was exiled to royalist exile but was smuggled out of prison by his wife, who paid with her own life for the exploit. He wrote a series of memoirs which were published after his death and which constitute an important source of information concerning the First Empire. ‘Mémoires et Souvenirs du Comte de La Valette’ (2 vols., 1831; new ed., 1905).

**LA VALLIÈRE, Louise Françoise de la Baume le Blanc de, lo-o-z frán-swâz dê lâ bôm le blân dê la va-lee-år, French mistress of Louis XIV**: b. Tours, 7 Aug. 1644; d. Paris, 6 June 1710. She was descended from an ancient and noble family, and in 1661 was brought to court by her mother, where Louis presently noticed her. Her manners were amiable and winning, and her sweet and tender disposition rendered her grace. What was still more extraordinary, notwithstanding her equivocal position, she possessed extreme, indeed morbid, delicacy and modesty. She bore Louis four children, but was always painfully sensible of the disgrace of their birth. Two of them died in infancy. Wounded by Madame de Montespia, she retired into the Carmelite convent in the suburb of Saint Jacques, where she took the veil in 1675. She is considered the author of ‘Récit de la Miséricorde de Dieu’ (1690), a copy of which dated 1688, with corrections by Bossuet, was discovered in the Louvre in 1852. A collection of her letters was published in 1767. Madame de Genlis wrote a historical romance founded on the events of her life, and Lebrun executed a penitent Magdalene, of which the face is from her portrait.

**LA VAULX, la vô, Henry, COUNT DE, French aeronaut and author**: b. Bierville, 2 April 1870. He served on scientific missions to Africa and Patagonia under the auspices of the French government. He delivered a series of lectures on aeronautics in the United States in 1901, and is interested in the establishment of a number of aero clubs. He held several long distance records for aerial flights, one of which was from Paris to Kiev. He was a member of the Academy of Sciences and of the Geographical Society of Paris, and an officer in various French and international aero clubs. As an owner as well as an aviator he did much to further the development of aeronautics. Author of ‘Sieze mille kilomètres en ballon’ (1901); ‘Voyage en Patagonie’ (1901); ‘Le triomphe de navigation aviaire’ (1912), and collaborated with A. Galoupin in writing ‘Cent mille lieues dans les airs’ (7 vols., 1904-05); ‘Le tour du monde de deux gosses’ (1909); ‘Le tour du monde en aéroplane’ (1910).

**LA VICTORIA DE JUNIN, la vik-tòr-yà, dà boo’ nín by Joaquín Olmedo. During the Peninsular War in Spain the patriotic poet, Quintana, cried out in his heroic odes against the conquest attempted by the tyrant, Napoleon. In similar fashion the Spanish-American poet, Joaquín Olmedo (1820-1847), voiced the spirit of revolt in the Spanish colonies which rose against the tyrannous exactions of the mother-land and combated the Spaniard as a tyrannous dominator. On 6 Aug. 1824, the forces of the Liberator, Bolivar, won a signal victory over the Spaniards at Junin in the vicinity of Lima. This triumph was followed on 9 December of the same year by the decisive battle of Ayacucho, in which Sucre, a lieutenant of Bolivar, vanquished a Spanish army with his smaller body of American patriots. As a result of the two victories, the independence of Peru, and ultimately of all Spanish America, was achieved. The Liberator requested Olmedo to celebrate the two battles and he responded with the long ode entitled ‘La Victoria de Junin, Canto a Bolivar,’ which was published at London in 1826, while Olmedo was there as the diplomatic representative of Peru. With Quintana’s odes as his model—and he doubtless had Gallege’s heroic verse in mind also—Olmedo has written a noble poem to Bolivar, which bears witness to the magnitude of that warrior’s whole military career and not merely to the significance of the two military exploits which the poet was asked to commemorate. The magnificent scenery of the South American forests provides a background; the poet’s reminiscences of Horace, Virgil and other classic writers supply no small part of the imagery abounding throughout the 800 verses of the Canto. Unfortunately, the supernatural is introduced without the support of a vision or dream and there is all too much hyperbole in the terms of praise lavished upon Bolivar and his generals. This latter fact was stressed by Bolivar himself in a letter to the poet, which shows that the Liberator was a man of surpassing modesty in his conception of himself and of wonderful good taste in matters of literary criticism. The ode opens with an account of the thunderous effect of the victory of Junin and of the revelry in which the Spanish-American camp is engaged on the night following it. Suddenly there appears in the clouds the shade of the Inca, Husyyna-Capac, who apostrophizes and vilifies the Spaniards and, by prophesying the approaching victory of Ayacucho, gives good counsel to Bolivar. When the Inca has ended his long address the Vir-
ode a work of freshness and vigor, containing brilliant passages of an epic and a lyric nature. The poet was a contemporary of Chateaubriand.

LA VILLEMARQUE, Théodore Claude Henri Hersart, Vicomte de, French antiquary and Celtic scholar: b. Quimperlé, Brittany, 7 July 1815; d. there, 8 Dec. 1895. His first notable literary achievement was the collection and translation into French of the full songs of Brittany, accompanied by their melodies. These were followed by the prose legends of the same district, and he next made an important contribution to the knowledge of Celtic verse of the 6th century, also translated into French, thereby establishing his reputation as an authority in that field. His further labors included the collection and translating of the prose legends of Ireland, Cambria and Brittany. He wrote a number of textbooks on the subject, and edited after the death of De Lébard, his 'Dictionnaire français-breton.' (1847-50). Author of 'Barzas-Breiz' (2 vols., 1839; 6th ed., 1867); 'Contes populaires des anciens Bretons' (2 vols., 1842); 'Nouvelle grammaire bretonne' (1849); 'Dictionnaire des harses des vie siècle' (1850); 'Notes des principaux manuscrits des anciens Bretons' (1856); 'Légende celtique en Iriand, en Cambri et en Bretagne' (1859); 'Myrdhinn ou l'Enchanteur Merlin' (1861); a Breton drama of the Middle Ages, 'La Grande Bretêche de Jésus' (1863); 'Poèmes bretons du moyen âge' (1879); 'La légende de Saint Gurnhiern' (1880).

LA VITA NUOVA, la vêta noo-ôva, ('The New Life'). 'La Vita Nuova' is the proper introduction of the reading and understanding of Dante's 'Divina Commedia' (q.v.). It is autobiographical, in that it purports to tell of his first meeting with Beatrice, when he was nine years of age, and how from that time "Love lorded it over his soul," how he saw her from time to time and with constantly increasing devotion attempted to keep secret his passion for her. He predicts her early death, and when his prediction is verified he portrays his intense suffering. Then in an interlude he tells of the change that has taken place in his life, and in the last part he enlarges on his renewed love for the glorified Beatrice and his resolve to study so as to compose a suitable memorial for her. The first 17 chapters embody nine sonnets and a ballade, describing his youthful love and the physical charms of his bellissima donna. Then follow 11 chapters which glorify her spiritual beauties, with seven sonnets and three canzoni, which he calls "new rimes," wherein the tongue spoke of its own accord. Here he relates his deeds and thoughts. The poems in these chapters were composed between the age of 22 and 25. The next seven chapters tell of Beatrice's early death, and contain two canzoni and two sonnets expressing his grief. The last makes a false start and begins anew. Four chapters treat of his love for another lady, who had shown him compassion. Each of them leads up to a sonnet. Then Beatrice reawakens, and in three chapters, each ending with a sonnet, he relates his acts and thoughts till he is 35, when, according to his chronology, he had the experiences described in the comedy. In the last chapter he has a wonderful vision and promises to say of Beatrice "what was never said of any woman." It will be seen that the prose narration of 'La Vita Nuova' is a setting for Dante's love-poems. It explains how each sonnet, ballade and canzone came to be written. Moreover, he appends to almost every one an elaborate and very artificial analysis of it. Dante, when he was writing this work was studying the Commentaries of Saint Thomas Aquinas, and as that learned man often treated Aristotle's statements with a formal analysis, the poet followed his example. Boccaccio tells us that the poet regarded these as blot and wished that he had omitted them. They have annoyed many students of the Vita Nuova. Dante Gabriel Rossetti left them out of his translation.

Students of Dante have differed widely in their interpretation of the meaning of the title of the work, as well as the work itself. Some have regarded it as wholly symbolic and have understood Beatrice to be not a woman of flesh and blood but a type of mystical love. The same differences are found in the various commentaries of the Comedy. The question is whether Dante incorporated in the 'Vita Nuova' and in the 'Convivio' ('The Banquet or Love-Feast') the minor poems which he wrote at various periods of his life. His earliest sonnet, written in 1263 when he was 18, is found in the third chapter, where he tells of having had a marvelous vision, and writes the sonnet, saluting all the "faithful of Love" and requesting that they expound it for him; he adds that many made answer, in many diverse ways. The sonnets and other lyrics in the first part of the 'Vita Nuova' are imitations of the Provençal troubadours; in the latter part, where Dante is supposed to have freed himself from this influence, the poems show more maturity, as of course they were written later. Dante in this brief composition, especially in the prose framework, betrays his recent study of Aristotle's 'Physics,' 'Metaphysics' and 'Ethics.' This is particularly evident in the pedantry of the style, which is artificial; and yet it breathes of that gay and beautiful Florence which was then coming to be one of the most prosperous cities of Italy. Dante's delineation of Beatrice has been the admiration of poets and artists for centuries. Charles Eliot Norton calls her "the most delightful personage in the daily picturesque life of Florence...the loveliest and most womanly woman of the Middle Ages."

"La Vita Nuova" was first printed in Florence in 1576, with reprints in 1723, 1877, and was copied in Pesaro 1529, in Venice 1840 and in Livorno 1843. It was published with English and Italian text by Luigi Ricci (London 1903). It was translated into English by Dante Gabriel Rossetti (London 1861); by Theodore Merin (London 1862); by Charles Eliot Norton (Boston 1867; revised ed., 1892, with essays and notes); by Charles Stuart Boswell, with notes and introduction (London 1905). It was published with illustrations and with music by Alfred Mercer (New York 1914).

NATHAN HASKELL DOLE.

LA VOISIN, la vwa-zâni' (real name CATHERINE MONVOISIN), French sorceress: d. Paris, 20 Feb. 1680. She was a fortune-teller, practising the most obnoxious arts of the pro-
fession, and was a midwife and medical practitioner of evil repute, but enjoyed a wide patronage among the grande dames of the court of Louis XIV. She also belonged to the coterie of professional poisoners whose activities at length became so notorious that in 1679 a royal commission was appointed to investigate and bring the offenders to justice and La Voisine was accused in particular of an attempt to poison Louise de La Vallière, mistress of Louis XIV, supposedly at the instigation of the Comtesse de Soissons. The sessions of the commission were for a time interrupted owing to the fear that theings established in such high quarters that exposure would have brought intolerable scandal upon the court, but while several of the chief offenders were shielded the commission resumed its work and many of the poisoners were convicted and executed. La Voisine was the first to be executed, first having been tortured. Consult Funck-Brentano, F., "Le drame des poisons" (1900); Masson, A., "La sorcellerie et la science des poisons au XVIIe siècle" (1901).

LAGER, läger (Dutch, "a camp"), in South Africa, an encampment more or less fortified. The original Boer laager was an enclosure formed by the wagons of a traveling party for defense against enemies.

LAALAND, lâland, or LOLLAND, an island of Denmark, in the Baltic Sea, between the islands of Falster and Langeland. Its greatest length, southeast to northwest, is 36 miles; breadth, varying from 9 miles to 17 miles; area, 447 square miles. It forms with Falster the district of Naribo. The surface, as implied by its name, meaning "low land," is so very little raised above the sea, the highest part being only 95 feet above sea-level, that parts of it along the coast are subject to frequent inundations, and for a considerable distance around it the water is so shallow that there are few places in which vessels drawing eight feet can approach it without danger. The soil, consisting generally of a heavy loam, is very fertile, and yields excellent crops of corn. Beans, hops and hemp are extensively grown. Varieties of hardwood timber are abundant.

LAAR, lær, or LAER, Peter van, Dutch painter: b. Haarlem, Netherlands, 1590; d. sometime after 1658. Early in life he went to France, and subsequently visited Italy (1623). Here he mainly resided at Rome, where he became associated with Claude Lorraine, Poussin and Sandrart. He was small and crooked in stature and was thus called by the Italians "Bamboccio," and the comic scenes of rustic life painted in his style became known as "Bambocciads." He returned to Haarlem in 1639. He painted Biblical, Oriental and banditti scenes, fancy landscapes and such like rural incidents, with spirited and vigorous brush, although his coloring is somewhat hard. A masterpiece of his, "The Market Crier," is in the gallery at Cassel. Other pictures, he found at London, Paris, Dresden, Vienna and Munich. About 20 etchings from his hand are also extant, chiefly animals and landscape, which are spirited and finely executed.

LAAS, lás, Ernst, German philosopher and pedagogue: b. Fürstenwalde, 16 June 1837; d. Strassburg, 16 June 1885. He studied at the Berlin University, at first theology then philosophy, under Trendelenburg. He became teacher (1860) at the Friedrich Gymnasium, then (1868) at the Wilhelms Gymnasium, and was given (1872) the degree of adjunct-professor of philosophy at the newly founded Strasburg University. He leaned toward empiricism which induced him to write "Idealismus und Positivismus" (Berlin 1879-84), differing from Plato and Kant and more nearly following the English theories of Hume and Mill. He became a leading representative of positivism in Germany. An eminent making work of his was "Der deutsche Aufsatz in den obern gymnasialklassen" (Berlin 1868; 3d ed, by Imelmann, 1898). He wrote also "Der deutsche Unterricht auf höheren Lehranstalten" (ib. 1872); "Gymnasium und Realschule" (ib. 1875); "Kants Analogien der Erfahrung" (ib. 1876). His "Literarischer Nacklass" was edited by Kerry (Vienna 1887) and contains a short dissertation on pedagogy. Consult Hanisch, "Der Positivismus von Ernst Laas" (Halle 1902); Giunta, "Das Theorie des Ernst Laas" (Leipzig 1903); Kohn, P. "Der Positivismus von Ernst Laas" (Bern 1907).

LABADIE, Jean de, French mystic and separarist: b. Bourg en Guienne, 13 Feb. 1610; d. Altona, Prussia, 13 Feb. 1674. He was educated at Bordeaux by the Jesuits and belonged to their order till 1639. He then quitted it, both because irregularities were detected in his conduct and he was found to have adopted many very peculiar and extravagant views. For these he was cited before the Parliament, but fled to Geneva. At a later period he returned to France and took up his residence in Amiens, whose bishop entrusted him with the visitation of the monasteries in his diocese. He also found a patron in the archbishop of Toulouse. His zealous opposition to some of the clergy subjected him again to persecution, and to escape from it he, in 1650, went over to the Reformed Church, but not finding himself so comfortable as he expected, he thought he had received a call to found an apostolic church for himself. He now became a preacher in Montauban, and afterward, on being obliged to leave it, in the town of Orange, from which he proceeded successively to Geneva, Middleburg and Amsterdam. In the last city he collected his followers into a distinct church or society under the name of Labadists. They were anabaptists, believed in the community of goods, held that marriage with the unregenerate was not binding, and that the children of the regenerate were born without original sin. Toleration being now denied him, he in 1670 proceeded to Hertford, where the Palsgrave and Elizabeth gave him protection. Driven thence by an imperial edict in 1672, he went first to Bremen and finally to Altona, where he held private meetings. See LABADISTS.

LABADISTS, followers of Jean de Labadie (q.v.), whose doctrines were a compound of mysticism and Calvinism. The sect was formed at Amsterdam in 1669. Important prominent defenders were Anna van Schurmann and Antoinette Bourignon. The Labadists, proposing to form a colony in America after failure in Surinam, S. A., sent over (1678-79) two of their number, Dankers
and Sluyter, to spy out the land and report. To these men, in their journal, translated into English and published by the Long Island Historical Society, we owe the existence of a most lively, not to say rather tart descriptions and criticisms of the Dutch and other folk in the middle colonies. The Labadists made a settlement, first in New York, which mismanaged, impoverished the home congregations and failed. Another was made later in Maryland which continued during a generation or two, but after the death in 1722 of Dankers, the leading spirit, was abandoned and the name and faith were lost among the dispersed. Consult the (Journal of Our Voyage to Neuw Nederlandt, begun in the Name of the Lord and for His Glory.)

LABAND, Is' bant, Paul, German jurist: b. Breslau, 24 May 1838. He studied law at Breslau, then Heidelberg and Berlin and was appointed private teacher (1861) of German law at Heidelberg. He was made adjunct-professor (1866) at Königsberg, and went (1872) in the same capacity to Strassburg. He devoted his work mainly to the history and commercial law, on which subjects he wrote 'Das Budgetrecht nach den Bestimmungen der preussischen Verfassungsurkunde' (Berlin 1871); 'Das Finanzrecht des Deutschen Reichs' in (Hirth's Annalen 1873); 'Das Staatsrecht des Deutschen Reichs' (Tübingen 1876-82; 5th ed., 1901), his greatest work, of which he issued an abridged edition in Marquardt's 'Handbuch des allerkünftlichen Rechts der Gegenwart' (Freiburg 1883; 6th ed., 1912). He was coeditor of Zeit- schrift für Handelsrecht from 1864, and founded (1886), with F. Stoerk, the Archiv für öffentliches Recht, and was long editor of Deutsche Juristenzeitung. Direkte Reichssteuern was published 1908.

LABARUM, the name given from the time of Constantine to the imperial banner and intended to commemorate the vision of the cross in the sky which was the cause of the emperor's conversion. Eusebius has described it with much particularity. It was in the form of a long pike, crossed at a certain height by a beam, from which depended a banner richly embroidered with gold and precious stones. The pike was surmounted by a crown of gold, enclosing within it a monogram of the two initial letters of the name of Christ.

LABAT, Jean Baptiste, zhoń báp'tést lä-bä, French Dominican missionary and traveler: b. Paris, 1604; d. there, 6 Jan. 1738. In 1693 he went as a missionary to the French Antilles, landed at Martinique and undertook the care of the parish of Macouba, which he superintended for two years, after which he was sent to Guadaloupe. His mathematical knowledge recommended him to the governor there, whom he accompanied during a tour through the island to assist him in selecting the points best adapted for works of defense. On his return to Martinique Labat received the office of procurer général of the mission, in which an opportunity was afforded him of displaying the whole extent of his useful activity at the same time that he served the government by his mathematical knowledge. In 1705 he was sent to Europe on business of the order, and, landing at Cadiz, surveyed geometrically and scientifically the environs and the whole coast of Andalusia as far as Gibraltar. He returned to Paris in 1716. His 'Neuoev voyage aux îles de l'Amérique,' which has been translated into several languages, contains an account of the natural history, particularly of some of the smaller and less frequented islands; of their customs, the origin, customs, religion and governments of the inhabitants. He also published a 'Nouvelle relation de l'Afrique occidentale'; 'Voyage en Espagne et Italie'; 'Relation historique de l'Ethiopie occidentale'; 'Mémoires du chevalier d'Abarieux.'

LABBE, lâb, Philippe, French Jesuit: b. Bourges, 10 July 1607; d. Paris, 25 March 1667. He taught philosophy and theology for a time at Bourges, but was soon called to Paris where he spent his life in writing and research. He was quite a prolific writer, but his most prominent works are 'Sacro sancta concilia ad regiam editionem exacta' (Paris 1662-72, 18 vols., reprinted by Coletus, Venice 1728-32, 23 vols.), Gabriel Cossart edited the last 10 volumes after the author's death; 'Gallie synodalium et conciliorum ab iis editorum editiones' (Paris 1646); 'Historia synopsis conciliorum nationalium, provincialium,' etc. (1661). Chronological works of his are 'Concordia chronologica' (Paris 1656); 'Abrégé chronologique de l'histoire sacrée et profane' (1663-69). On martyrology he wrote 'Hagiologium Franco-Galliae excerptum ex antiquo martyrologio sanctae obligations Sancti Laurentii Bituricensis' (1643). On history he wrote 'Michelis Gyscan annales' (1660); 'Mangel curriculae de plusieurs auteur' (Paris, 1650); 'Bibliotheque bibliothecarum' (1664). Consult Michaud, 'Biographie universelle' (Paris 1843-65, Vol. XXII); Backer, 'Bibliotheque des ecrivains de la Societe de Jésus' (Liège 1869-76, Vol. 11).

LABE, lâb, Louise, French poet: b. Parcieux, Ain, about 1526; d. Lyons, March 1566. Her true name was Charly and her father was a ropemaker, hence, on account of her beauty, she was called 'la belle cordière.' Her talent in acquiring foreign languages and her bold and dauntless disposition in her early years created her companions. While scarcely 16 years of age she took part, dressed as a cavalier, and in the name of Captain Loy, in the siege of Perpignan (1542). She married and devoted herself to poetry and music and her home became the rendezvous of poets, sages and artists; the street on which she lived was called, in 1607, rue de la Belle Cordière. Her poems, sonnets and elegies show Petrarch influence, but have lyric flights and a purity of expression of great rarity. We have of hers also an allegory in prose, De Débat de Pâle et d'Amour. The earliest editions of her works (1555 and later) are very rare; the latest appeared in Paris (1887). Consult Gonon, 'Documents historiques sur la vie et les mœurs de Louise Labé' (Lyons 1844); Laur, 'Louise Labé' (Strassburg 1873).

LABEDOYERE, Charles Angélique Huchet, shärl a-njä lihsh shâ-lâ-bä-dé-yär, COMTE DE, French general: b. Paris, 17 April 1786; d. there, 19 Aug. 1815. He entered the army in his 20th year and served with much distinction in Spain, Germany and elsewhere. Napoleon raised him to the rank of general of
division in 1815 and he fought with great courage at Waterloo. After the battle he hurried to Paris and there distinguished himself by his hostility to the Bourbons. On the capitulation of Paris he followed the army behind the Loire, but returning to Paris was taken, tried by court-martial and shot.

LABEL, Union. See Union LABEL.

LABEO, la'bā'o, Marcus Antistius, Roman jurist. He was a man of unbinding firmness of character, of strong republican sentiment, which turned him against Augustus, and of all-round training. His juridical works compose 400 volumes. Notable among them are found in the pandects of the Justinian 'Corpus Juris.'
Seeking to extend the law he became the founder of a special juridical school, which was called the Proculeian, after his pupil Proculeius. Consult his publications, 'Marcus Antistius Labeo' (Halle 1873–92; Sohm–Ledit, 'Institutes of Roman Law' (2d ed., Oxford 1901); Teuffel, 'Geschichte der romanischen Literatur' (Vol. II, 6th ed., Leipzig 1910).

LABERIUS, la'bē-rē'us, Decimus, Roman knight and writer of mimes: b. 106 B.C.; d. 43 B.C. At the age of 60 he was commanded by Cesar to appear on the stage in one of his own mimes, a disgrace for nobility which forfeited all titles, actors being of the lower and slave class. His prologue was filled with touching complaint of the insult and its wording has come down to us. The knightly honors lost by the act were not regained. Obeche has collected the existing fragments of some 40 mimes of his in 'Comicorum romanorum fragmenta' (3d ed., Leipzig 1898); they show original wit and keen expression.

LABEZARES, Guido de, gwé-dó dá là-bá-thá'res, Spanish adventurer: b. Bilbao, Spain, 1510; d. Manila, 1580. He began his career in South America, from which he made a voyage to Java and Sumatra, 1542. In 1550 he discovered the Bay Filipina, in Florida, and in the following year with Luna de Arellano visited and renamed the place Bay Santa Maria. He entered with Legaspi upon the project of converting the Philippines and the Gilbert Islands. His success was complete in the matter of conquest, and in 1574 he was appointed governor-general of Manila. By means of new fortifications he so strengthened the place against the Chinese corsairs and the Dutch pirates that these were driven from the adjacent islands. In 1575 he took the position of lieutenant-governor, under a new governor-general from Spain and kept his position until his death.

LABIATAE. See MENTHACE.

LABICHE, Eugène Marin, è-zhén mā-rā lá-bāsh, French dramatist: b. Paris, 5 May 1815; d. there, 23 Jan. 1888. He wrote, chiefly in collaboration with other authors, upward of 100 popularity to the Bourbons. It was in the dramatist's duties that he sought to preserve the qualities that he brought to the collaboration that made them a success. His long series included a few real comedies of character and manners, his farces and vaudevilles are distinguished by extravagant plots, crisp and swift action, and a certain broadness, by the absence of the love element and admirable stage technique, and they form capital characterizations of the bourgeoisie of his time. In 1880 he was elected to the Academy and after that date ceased to write for the stage. His dramatic works collect 17 volumes (1878–79) and met with a notable and, for the author, an unexpected success. Among the best of them may be mentioned 'Friisette' (1846), the original of the famous farce, 'Box and Cox'; 'The Italian Straw Hat' (1857); 'Le Voyage de M. Perrichon' (1860); the delightful picture of middle-class vanity; 'Moi' (1864). Consult Matthews, 'French Dramatists' (1901).

LABLACHE, Luigi, loo-'ē-jē là-blahsh, operatic singer: b. Naples, Italy, 6 Dec. 1794; d. there, 23 Jan. 1858. He studied at the local Conservatorio della Pietà della Turchini under the guidance of Valesi and made his début as a bass singer, buffo Napoletano, in Fioravanti's 'Molinara.' Later he enlarged his repertoire by singing in grand opera, to which his voice, which was one of wonderful range and volume, was admirably adapted and appeared as Mercadante in 'Elisa and Claudio.' His reputation soon extended over Italy. In his 20th year, when the triumph of Rossini was at its height, he stood forth as the greatest interpreter of that master, and reached the summit of his fame. A medal was struck off in his honor at Vienna in 1825. For the next 17 years he annually appeared in Italian opera in London, Paris and Saint Petersburg. He was the singing-master of Queen Victoria. He was equally admirable in comic and serious opera and the school of music which lie opened in Paris had considerable success in handing on the traditions of his style. Don Giovanni and Leporello were his greatest parts.

LABOR. Definition.—Labor may be defined as the physical or mental effort of human beings for the attainment of some object other than the pleasure of the effort itself. Simple as this definition is there is scarcely a word in it but what has been the subject of discussion. The popular use of the word labor restricts it to those who engage in manual toil, but this is of course too narrow. The most modern definition must include mental effort. In modern industry brains are needed as well as muscle. Men must organize the productive forces and direct their employment along chosen lines. Upon their ability quite as much as upon the skill and strength of the manual workers, and indeed to an even greater degree, depends the success of modern enterprise. To-day this concept is fully recognized and not even the most extreme socialists would deny the productive character of mental effort.

Labor is generally limited in popular usage to that of human beings but not all economists have so defined it. Adam Smith spoke of "labouring cattle," and said more than once that "nature labours along with man." J. R. McCulloch, who always exaggerated or distorted any half-truth of his intellectual father, Adam Smith, went so far as to say that no distinction should be made between the operations of domestic animals, of machinery, of nature and of man. Labor, he said, is "any sort of action or co-operation, whether performed by man, the lower animals, machinery, or the elements; that tends to bring about any desirable result." Such a definition is, however, confusing rather
than helpful. To-day practically all economists restrict the term labor to that of human beings. Labor means human labor.

More difficult of restriction within the ring-fence of a definition is the next concept. Some writers have denied the term labor to any exertions which yield pleasure or are undertaken for the sake of the pleasure accompanying them. Painful effort on labor and labor thus defined is, in the words of St. Jevoux, “Labor, I should say, is any painful exertion of mind or body undergone partly or wholly with a view to future good.” And yet even Jevoux pointed out that most forms of labor, after the initial irksomeness had been overcome, yielded distinct pleasure to the worker, a principle which the French socialist Fournier had earlier made the basis of his scheme for the organization of labor. It is impossible thus to limit the term, for it would exclude some of the highest forms of creative or literature or even handicraft and confine it only to distasteful or painful occupations. Indeed the same kind of exertion might at one time be called labor and at another time be denied that name. The whole psychology of labor, in fact, involves the very idea of the concept labor is regarded as a curse. But the purpose of economic progress and of human invention is, or should be, to lighten the burden upon labor, to associate with the performance of necessary tasks a pleasure and pride in workmanship. In its highest aspect labor should be regarded as a privilege rather than a curse.

The final notion involved in this definition is that the labor is performed for the sake of some ulterior object or some useful purpose. Quite aside from the question of whether pleasureful effort is entitled to the name of labor, it is contended that it must be productive. The distinction was early made between productive and unproductive labor. The Physiocrats, for instance, insisted that over the work of agriculture was productive, the labors of manufacturers, merchants and others being sterile. Even Adam Smith thought that the work of servants was unproductive. The modern conception is that any effort which satisfies a want or creates a utility is productive—that of the actor, the fireman or the judge, as well as that of the farmer, the miner, the cotton-spinner or the locomotive engineer. Effort directed toward the rendering of some intangible or transient pleasure is held to be productive as well as that engaged in extractive industry or in fashioning some durable object. In no case does man create anything; he can never do more than change the form or the place of material things. It is, therefore, as impossible to draw a line of distinction between the labor of those engaged in raising grain and those employed in serving bread at the table as it is to make a distinction between manual and mental effort.

Free and Slave Labor.—Thus far only free labor has been considered, but historically probably more of the work of the world has been performed by unfree labor than by free. Slavery has existed as far back as historical records go into the dim past. Indeed it has been as serenely or as paradoxically, that the institution of human slavery marked the greatest step forward that had yet been made in human progress. From an ethical standpoint slavery was certainly an improvement over cannibalism, and from an economic standpoint it marked a great advance because now for the first time there was provided a fund of labor that could be directed to steady and arduous toil. Until this time man had lived by hunting and fishing primarily; but now settled agriculture became possible, permanent homes were established, cattle domesticated, and the right to property began. Primitive man did not work willingly and the compulsion of slavery furnished the training school in which the human race painfully and slowly learned the lessons of labor.

The question has been raised and much debated as to whether the course of human progress has been from a state of original freedom and equality to one of inequality and bondage, or the reverse. The view was formerly widely held that the original tribal organization early gave place to a closer union in the village community or mark. Freedom, equality of rank and possessions, and in the case of the mark communal ownership and cultivation of the land characterized these early communities. As the result of this limitation of the idea. Labor is regarded as a curse. But the purpose of economic progress and of human invention is, or should be, to lighten the burden upon labor, to associate with the performance of necessary tasks a pleasure and pride in workmanship. In its highest aspect labor should be regarded as a privilege rather than a curse.

The final notion involved in this definition is that the labor is performed for the sake of some ulterior object or some useful purpose. Quite aside from the question of whether pleasureful effort is entitled to the name of labor, it is contended that it must be productive. The distinction was early made between productive and unproductive labor. The Physiocrats, for instance, insisted that over the work of agriculture was productive, the labors of manufacturers, merchants and others being sterile. Even Adam Smith thought that the work of servants was unproductive. The modern conception is that any effort which satisfies a want or creates a utility is productive—that of the actor, the fireman or the judge, as well as that of the farmer, the miner, the cotton-spinner or the locomotive engineer. Effort directed toward the rendering of some intangible or transient pleasure is held to be productive as well as that engaged in extractive industry or in fashioning some durable object. In no case does man create anything; he can never do more than change the form or the place of material things. It is, therefore, as impossible to draw a line of distinction between the labor of those engaged in raising grain and those employed in serving bread at the table as it is to make a distinction between manual and mental effort.

Free and Slave Labor.—Thus far only free labor has been considered, but historically probably more of the work of the world has been performed by unfree labor than by free. Slavery has existed as far back as historical records go into the dim past. Indeed it has been as serenely or as paradoxically, that the institution of human slavery marked the greatest step forward that had yet been made in human progress. From an ethical standpoint slavery was certainly an improvement over cannibalism, and from an economic standpoint it marked a great advance because now for the first time there was provided a fund of labor that could be directed to steady and arduous toil. Until this time man had lived by hunting and fishing primarily; but now settled agriculture became possible, permanent homes were established, cattle domesticated, and the right to property began. Primitive man did not work willingly and the compulsion of slavery furnished the training school in which the human race painfully and slowly learned the lessons of labor.
property prevented the working classes from making any economic advance.

Economic Views.—The Renaissance and the discovery of the New World made far-reaching changes in economic institutions and thought which were reflected in the conceptions of labor. By the Mercantilists labor was assigned a position of considerable importance; according to Locke (1690) labor is the almost exclusive source of value, for, he wrote, "it is labour indeed that puts the difference of value on everything." But the Mercantilists after all emphasized trade and money rather than labor. The Physiocrats insisted that the distinction between productive and unproductive labor; according to them the only productive labor was that which added something material to the world's stock of goods. They therefore confined the term to agricultural laborers and the extractive industrial merchants and manufacturers were unproductive or sterile. Emphasis was laid by them therefore more upon the direction of labor than upon its well-being. Land and the bounty of nature was the real centre of the Physiocratic system.

Adam Smith placed labor in the very arch of his economic philosophy; his book on 'The Wealth of Nations' begins with a discussion of labor as the source of the annual wealth of a nation, and the first chapter describes the division of labor as a means of increasing production. The opening sentence of this book is, "The annual labour of every nation is the fund which originally supplies it with all the necessaries and conveniences of life." Labor is both a value and its measure. In spite of the high position thus assigned labor in Smith's economic system, the practical results in the hands of his followers were bad. He had insisted upon the need of greater freedom of enterprise and of contract and this doctrine was erected into the principle of laissez-faire by the classical school. Competition was given full sway and all restrictive barriers were swept away. This meant the exploitation and degradation of labor. Ricardo and Mill, in their writing in the hopelessly态度 of economists as to the impossibility of improving the condition of labor, a view which persists even in John Stuart Mill.

A reaction against this position soon set in. The Socialists insisted upon the rights of labor and the injustice of existing methods of distribution. The changes wrought by the Industrial Revolution brought many industrial readjustments and serious economic ills such as poverty, unemployment and crises. Increasing attention began to be given to the subject of distribution instead of production or exchange. Social reformers interested themselves in the practical work of abolishing specific abuses. The labor movement became too important to ignore, and not only has it secured an increasing amount of space in recent economic literature, but it has been treated with greater sympathy and understanding. In many of our colleges and universities courses in labor problems are given, and an increasing amount of study is being devoted to the subject.

ERNEST L. BOGART, Professor of Economics, University of Illinois.

LABOR, American Federation of. See AMERICAN FEDERATION OF LABOR.

LABOR, Department of. A government department of the United States established by Act of Congress, approved 4 March 1913, to foster, promote, and develop the welfare of the wage earners of the United States, to improve their working conditions, and to advance their opportunities for profitable employment. Before the passage of this act the affairs of this department were administered by the Bureau of Labor, a subdepartment of the Department of Commerce and Labor. Originally the Bureau of Labor was a part of the Department of the Interior, but at the creation of the new department by the Congress, 11 Feb. 1903, the bureau was transferred. It was transferred to the Department of Labor in 1885, and Carroll D. Wright, who had been very successful as chief of the Bureau of Statistics in Massachusetts, was appointed Commissioner of Labor. At the end of three years Commissioner Wright had made such signal success in the new department that the bureau was changed to the Department of Labor, with independent functions. Under the Act of 1913 the bureau of labor, immigration and naturalization and the children's bureau were included in the new department. The Bureau of Labor is now the Bureau of Labor Statistics, and the heads of the divisions are known as commissioners, with the exception of the heads of the children's bureau and the bureau of information, who are entitled chiefs. The head of the department is a secretary, with last rank among the members of the Cabinet. There is also an assistant secretary of the department. The Bureau of Labor Statistics conducts investigations in all disputes between capital and labor and issues a bimonthly bulletin reviewing the condition of labor in the United States and abroad. The Bureau of Immigration maintains local offices at the several ports of entry, and through these it administers the immigration laws and kindred statutes. The Bureau of Naturalization has charge of the returns from the clerks of the United States courts throughout the land who issue declarations of intention certificates and final naturalization certificates to applicants for naturalization. The Children's Bureau deals with all matters affecting child-life, infant mortality, birth rate, orphanage, juvenile delinquents, dangerous occupations for children, children's diseases and child labor, especially the State laws in regard to the latter evil. Consult 'Annual Reports' of the Secretary of Labor. See Commerce, Department of.

LABOR BUREAU. See L A B O R, DEPARTMENT OF.

LABOR BUREAUS. Nearly every State in the Union has a labor bureau, or department of labor, the oldest being that of Massachusetts, organized in 1869. Several of the State bureaus, particularly those of New York and Connecticut, maintain free employment agencies. These State bureaus have been kept remarkably
free from partisan politics, and they have been decidedly successful in the settling of labor disputes and in preventing strikes and lockouts. The chief functions delegated to be performed by the State bureaus are assistance in bettering the condition of toilers, investigating complaints of ill-treatment, grievances, etc., to furnish information as a basis for enlightened legislation to keep a record of labor supply and labor condition in the State and to inform the general public of the results of its work. In some States the administration of the labor laws was committed to the bureaus, as also administering employment offices, compensation laws, etc. These organizations proved so successful that European nations soon followed the American example. In 1891 France organized a bureau of labor and in 1892 Germany followed with a labor commission. In 1893 a labor department under the direction of a commission for labor was instituted in England. Austria, Italy, Sweden, New Zealand, New South Wales, and Canada have since established similar bureaus. Consult Wright, "The Workingmen's Department of Labor," and "The Value and Influence of Labor Statistics," in Monographs on Social Economics (Washington 1901); "American Year Book." Labor Legislation Review (1911, I, No. 2, 123-134; No. 3, 59-68; No. 4, 61-104).

LABOR CHURCH, a movement started in England to bring religious work into the labor movement. John Trevor was the founder (1881), the first Labor Church service opening in Charlton Town Hall, Manchester. The growth of the movement was such that, at a conference held in 1893, the Labor Church Union was organized with 10 churches represented, and by 1894 there were 24 labor churches in England and Scotland. Five principles were adopted at the inauguration declaring religion part of the labor movement, that it is no class movement or class religion, but non-sectarian, etc. In 1903 a restatement of principles was drawn up embodying the conditions of the former one and declaring the labor movement, besides its religious activity, includes improvement of social conditions, development of good character, both essential to emancipation from moral and social bondage, and therefore insists on the study of the economic and moral forces of society. Over 30 labor churches were eventually established, but since 1907 the movement apparently has lost vitality.

LABOR COLONIES, or agricultural communities, are common in Europe but almost unknown in the United States. They are maintained for the purpose of giving employment and training to individuals who, on account of misfortune or inexperience, find it difficult to earn a living. In Holland there are four of these labor colonies, at Wilhelmsoord, Frederiksoord, Wilhelminasoord, which have been established for three-quarters of a century. They occupy 5,000 acres of land and have a membership of over 2,000. At La Chalmelle, France, is a colony established in 1880. It occupies 370 acres of land and has 500 colonists. In Germany there are nearly 40 colonies all established since 1882. New Zealand has a government farm of 1,000 acres. In Belgium are three colonies which are practically penal institutions for vagrants and beggars. There are several colonies in England and Scotland, and in the United States three small colonies have been established by the Salvationists, one each in Colorado, California and Ohio. The most successful is the Colorado colony which has 150 members. The colony system in all the European countries is practically communism under government control, all the colonies being in a central plan. Consult Encyclopaedia of Social Reform, edited by Bliss (1908).

LABOR AND COMMERCE, Department of. See COMMERCE, DEPARTMENT OF; LABOR, DEPARTMENT OF; LABOR DEPARTMENTS, FOREIGN.

LABOR CONGRESS, an assemblage, either national or international, of representatives of organized labor. The first attempt to form an international organization of workers was made by a group of continental exiles at a conference held in London in 1847, in which Karl Marx took part. The Communist League was that formed, which issued Marx' and Engel's famous manifesto just before the revolution of 1848, but the organization disappeared in the succeeding reaction. In 1866 the first International Labor Congress was held at Geneva, Switzerland, about 80 delegates being present from England, France, Germany, Holland and Switzerland. The results of this meeting were the condemnation of the industrial employment of women, the advocating of technical education and the organization of mutual credit associations. At the congress of 1869, held at Basel, Switzerland, labor representatives were in attendance from Russia, Austria, Germany, France, England, Spain, Italy and Switzerland. This assembly by a vote of 54 to 4 declared that landed property should be abolished. Other similar congresses were held at Dresden, 1871; The Hague, 1872; Paris, 1886; Berlin, 1891, and Zürich, 1897.

Two International Socialist-Labor Congresses were held in Paris in 1889; one, the Marxists, by 400 delegates, and the other, the Possibilists, by 600 delegates. In 1891 a Socialist-Labor Congress was held at Brussels, at which 400 delegates were present from nearly every country in the world, including Canada and the United States. Among the topics discussed were the eight-hour day, militarism, universal suffrage and legislative protection of labor. At the Congress of 1893 at Zürich, Switzerland, 385 delegates were present, and admission was denied to all avowed anarchists. The congress, now assuming definite organization, met in London in 1896 and arranged to meet every four years thereafter. The anarchists were again denied admission, and resolutions were adopted opposing standing armies, advocating the nationalization of land and the socialization of industry.

The next meeting of the International Socialist-Labor Congress was held in Paris in 1900, when the assembly discussed the laws regulating strikes and boycotts and favored the abolition of the capitalistic class. Resolutions were passed favoring a fixed minimum wage and the nationalization of mines. Subsequent meetings have been held at Amsterdam (1904), Stuttgart (1907), Copenhagen (1910) and Stockholm (1917). Of this organization which meets every four years there is a standing com-
mittee known as the International Socialist Bureau, which meets annually.

Various national labor congresses are held in several countries, particularly in England, where an annual convention has been held since 1868. Congresses of anarchists convening under the guise of labor have been held at intervals in Lyons, Havre, Brussels, Barcelona and other cities. See also UNIONISM; SOCIALISM.

LABOR DAY, in the United States, the first Monday in September, a legal holiday in all the States and District of Columbia, Porto Rico, Hawaii and Alaska. The celebration of this day was inaugurated by the Knights of Labor, who in 1882 held a parade in New York, and again in 1884, when a resolution by George R. Lloyd, one of the Knights of Labor, was passed to hold all parades on that day. Workmen of all organizations then began agitation to have the day made a legal holiday, and on 15 March 1887 the first law to that effect was passed in Colorado. New York, New Jersey and Massachusetts soon followed this example. The day is celebrated by parades and by meetings addressed by prominent labor leaders.

In Europe the celebration of the first of May as Labor Day was begun in 1890 with a demonstration in favor of the eight-hour day; it was at that time and for a few years later much feared and violently opposed by the various governments, and there were many clashes between the police and soldiers and the workmen. It is now usually celebrated without trouble. In the United States May Day is celebrated by the Socialist-Labor party, but there is no attempt to cease work on that day.

LABOR DEPARTMENTS, FOREIGN. The development of early labor legislation in all countries soon pointed out the fact that labor laws are useless unless properly enforced by special authorities. Accordingly most countries sooner or later created one or more departments to deal with the ever-increasing number of labor questions. The development of these departments is first of all to administer all existing labor laws and then to conduct investigations that will lay foundations for future legislation. Under their administrative functions labor departments appoint inspectors to enforce workshop regulations, regulate social insurance laws, conduct labor exchanges to help unemployed and serve as or create boards to settle industrial disputes or fix wages and hours of labor. Under their functions as investigators labor departments conduct research, gather statistical data, issue reports and often draft laws. In the larger European countries the departments are under the guidance of ministers of labor, while in smaller countries they are attached to other ministries.

In England factory inspectors to enforce workshop regulations were for the first time provided for under the Factory Act of 1833. They were placed under the supervision of the Secretary of State for Home Affairs. At present the Factory Office is a legal holiday, and the department is first of all to administer all existing labor laws and then to conduct investigations that will lay foundations for future legislation. Under their administrative functions labor departments appoint inspectors to enforce workshop regulations, regulate social insurance laws, conduct labor exchanges to help unemployed and serve as or create boards to settle industrial disputes or fix wages and hours of labor. Under their functions as investigators labor departments conduct research, gather statistical data, issue reports and often draft laws. In the larger European countries the departments are under the guidance of ministers of labor, while in smaller countries they are attached to other ministries.

LABOR EXCHANGES, a name erroneously applied to employment bureaus. It was also a term given to a class of institutions founded by the followers of Robert Owen (q.v.) in 1832-35. These were designed to bring about an exchange of products of labor without the intervention of money. Many stores were founded for the purchase and sale of commodities for labor notes, the amount of time spent in producing a commodity being the basis of its value. Different classes of labor were all valued alike. The plan was soon found impracticable.

LABOR LEGISLATION. The term "Labor Legislation" is now used to cover a broad field of lawmaking for the benefit of wage earners in particular and of society in general. It includes the factory inspection of earlier days, but is much broader in its scope.

History.—In the United States labor legislation has passed through several stages of transformation. In the early period of our nation the propertyless man was viewed with
LABOR LEGISLATION

Suspicion and contempt, and coercive laws were passed for the capture and virtual enslavement of the "shiftless." Men who worked for wages received scant consideration in law. In the 20's and 30's of the 19th century propertyless men were clothed with full rights of citizenship. Legislation for their benefit soon began, taking the form of abolition of imprisonment for debt, of indenture and finally of slavery, and providing wage and homestead exemptions, and free schools. Following the Civil War labor and capital entered the stage of direct competition, and the contest between them became sharp and bitter. From the legislatures labor secured favorable laws; from the courts capital secured favorable decisions which declared such laws unconstitutional because taking property without due process of law and violating freedom of contract.

The limit in this stage was reached in 1885 when the court (In re Jacobs) voided a law of New York designed to end sweating, because the act would force the laborer "from his home and other associations and beneficent influences, to ply his trade elsewhere." The next stage, that of the public welfare, received definite recognition in 1888 when the Supreme Court held (Holden v. Hardy) that a law which deprived property without due process of law was yet a valid exercise of the police power because it was for the good of society at large that the freedom of both employer and employee be restricted.

The last stage is still in the process of developing out of the preceding. It avoids "class legislation" by making a "reasonable classification" of persons and industries. Equality before the law is maintained by treating alike all within any given class. If an employer thinks that his bargaining power has been unduly curtailed and that of the employee unduly enlarged, it is his privilege to change classes and secure the larger privileges. For the employee to do the same is not yet equally easy. Neither is he quite as sure of his property as his employer is his. When a man engages to sell a farm and delivers titles to the same he may be held to strict accountability for the performance of the contract and required to pay damages if he fails to do so. But here every item of property is transferable from himself. When a man engages to sell his labor he is selling something now recognized as property, but it is not a commodity; it cannot be separated from himself and is closely identified with his liberty. To compel the performance of a labor contract would mean slavery. On the other hand, the propertyless man is at a decided disadvantage in bargaining for the delivery of his labor. He is free to engage for 12 hours a day or refuse the job. The employer is free to take him for 10 hours a day or wait for another man. But the employer can much better afford to wait for another man than the employee can afford to go without his dinner. Their equality in bargaining for his "right to work" is a matter of fact. Society now says that the nominal freedom of both should be restricted to the end that the laborer may be more secure in the possession of his property right to work and the social welfare be enlarged. This is the basic principle of present day labor legislation under the police power.

State and Federal Laws.—Labor legislation in the United States is covered largely by the States though there is a considerable body of national laws affecting labor. The right of Congress in such matters is based on its power of control over interstate commerce.

Among the early laws were those affecting wages. The first mechanic's lien law was passed by New York in 1830 and similar laws have been passed by all the States. Such laws aim to protect the laborer by making the goods, structure or land on which he works security for his wages. Laborers and mechanics are now covered by these laws. State and Federal laws also make wages a preferred claim in receiverships and in administrations due to bankruptcy or death. Following close upon the abolition of imprisonment for debt (beginning with Kentucky in 1821) came the exemption of wages from attachment for debt. This is now the law in every State. The amount of protection varies, some States exempting by days (30 to 60), others by amounts ($20 to $100). The lack of uniformity is due to the lack of uniformity in the persons protected. Some exempt "all laborers, mechanics and day laborers," others all "householders," or "respective debtors," or "all who support themselves and their families by their labor," or "their household." There are also exemptions of homesteads and tools in all the States, the amounts varying from $500 to $5,000. Some States forbid the assignment of future wages, while others put very strict limitations on such assignments.

A good many laws govern indirectly the amount of wages. Except as affecting women there is no general law providing a minimum wage. The National and State governments regulate employment on their public works, generally prescribing that the customary wages shall be paid, in some cases fixing a minimum. In recent years several States have forbidden payment in store checks or truck; a few require cash payments. Two-thirds of the States regulate the time of payment, a great many requiring an equality in daily and weekly payment. Some States require payment on the premises, a few during working hours, a few a few days after work and payment in saloons. Several States have the "mine run" law, forbidding the screening of coal before it is weighed. A dozen States regulate "dockage" or deductions in the way of fines.

A great many laborers receive a part of their pay in houses or "furnishings." Legislation aimed to regulate houses furnished by employers is only in the formative stage. There are three types of legislation on truck stores: (1) Laws that seek to eliminate such payments in certain industries; (2) permitting the system, but regulating the prices; and (3) eliminating the coercion of employees to patronize company stores.

Laws regulating hours of labor have a direct bearing on wages. The first law of this kind was passed in New York in 1842 and made 10 hours a working day in factories for children under 12. In 1847 the law was extended to women. Several States followed this example, but no enforceable law was passed before 1879. In 1895 the Illinois Supreme Court declared void an 8-hour law for women.
Labor Legislation

on the ground that it unduly limited the freedom of contract. In 1908 the Oregon 10-hour law for women was upheld by the United States Supreme Court. By 1915 the 8-hour law. By 1915 there were only seven States with no restrictions on hours of labor for women, and these States have few women workers. The laws vary considerably, but most of them fix daily and weekly maximum hours in the principal industrial occupations, agriculture and domestic service being excepted. They are based on the health of the worker and the public welfare, but have an important effect on wages. A few States recognize that the determination of what is necessary for the health of the worker and for the public welfare is not a legislative question and leave it to their commissions. Laws regulating the hours for men are fragmentary. Most of them relate to public or semi-public works. In 1840 President Van Buren, by executive order, fixed the 10-hour day in the navy yards. A Congressional law of 1886 (amended 1992 and 1912) fixes the 8-hour day for laborers on public works. Of the States and municipalities now have similar laws. The first law of the kind applying to private industry was that of Illinois in 1867. It applied only in the absence of a contract and was not really enforceable. Over half the States and the United States now have laws shortening the hours for employees on steam and electric railways and a dozen or more protect miners with 8-hour laws. Mississippi (1912) and Oregon (1913) have 10-hour laws for factories. The hours in transportation are arranged by "runs"—a maximum of 16 hours, with 8 hours of rest before starting again. This applies particularly to engineers and conductors. Many States have similar laws applying to operators of street cars, telegraphers, train dispatchers and signalmen in continuous employment are commonly limited to eight hours. Under the extreme pressure of a strike called by the trainmen for 4 Sept. 1916, Congress passed a law (signed 3 September) fixing eight hours as a day's work after 1 June 1917, for men engaged in interstate transportation and allowing extra pay for overtime. The same act provided for a commission to observe the effects of the law and report to Congress. The constitutionality of such laws has been contested many times, but they have generally been upheld as a valid exercise of the police power for the public welfare. The traveling public has a vital interest in having trains handled by men not so worn out by long hours of toil that they cannot assure them of a reasonable degree of safety. However, this particular law unquestionably was a wage law. The most notable decision sustaining such laws was that of Holden v. Hardy upholding the 8-hour day law of Utah for miners. Agricultural laborers are still practically untouched by such legislation.

Partial protection against cheap labor is furnished in the Chinese Exclusion Act (1882) and the act of 1885 (amended 1907) forbidding the importation of laborers under contract. The act of 1884 (amended 1898) requiring 20 or more workers to see that at least 80 per cent were citizens was declared unconstitutional on the basis of unjust discrimination, but the New York law limiting employment on public works to citizens was upheld.

Competition of convict labor has been regarded as a serious menace by free labor. Four States now forbid the employment of convicts where there would be such competition. Five prohibit the employment of convicts in certain industries, several provide for the employment of their convicts in certain industries, and five seek to distribute them among the various industries. Several seek to regulate the sale of convict-made goods. The agitation for a Federal law on the subject has not yet met with success.

Recognition of the Union.—There is virtually no law forbidding the organization of public employees, but executive orders discourage it. In private industry unions could secure legal recognition by incorporating, but they have little to gain and much to lose by this form of recognition, hence they have sought it in other ways. At least one-third of the States have passed laws forbidding employers to discriminate against members of unions. A similar law of the United States (Ermdan Act) and several of the State laws have been declared void because unduly limiting the freedom of contract. (Case of Coppage v. Kansas). Texas and some other States have exempted labor unions from the operation of their anti-trust laws, and Congress made a slight modification of the Sherman Law in favor of the unions after the adverse decision in the case of the Danbury Hatters. Over 40 States provide for the registration of union labels and protect them against counterfeiting. A few States have legalized the peaceful boycott, whether declared by unions or collections of individuals.

Special Legislation.—The so-called "factory acts" of the United States vary greatly in scope and effectiveness. Some date as far back as the seventies, but most of them are much more recent.

The first law requiring the reporting of industrial accidents was passed by Massachusetts in 1883, the first covering occupational disease by California in 1911. The reporting of accidents has gradually spread to other States, but the laws vary greatly and are not altogether satisfactory. Sixteen States now require the reporting of occupational diseases and some of the laws are very comprehensive.

Laws excluding certain persons from particular industries are becoming common. The age limit, educational and physical qualifications for children in many occupations are gradually being raised. Women are excluded from a few industries in some States, in four States from all industries for some weeks before and after maternity confinement. There are many laws requiring certain physical and technical qualifications of men for particular industries. In general the physical qualifications cover a reasonable immunity from diseases common in the vocation, freedom from diseases easily communicated to others, and strength sufficient for the performance of one's duty. Ohio and Pennsylvania require monthly examinations of workers exposed to poisonous lead salts. The technical qualifications cover all the way from such as may be required of aeronauts and electricians in one State to those expected of plumbers and chauffeurs in 22 States. These requirements are made primarily
for the public safety, secondarily for the good of the worker.

A few substances have been outlawed. A national law (1912) virtually prohibits the manufacture of matches containing white phosphorus. Several States forbid the manufacture and sale of alcoholic drinks. This was made national by constitutional amendment in 1919. Massachusetts forbids the use of a shuttle touched by the lips of the operator, but no State forbids the use of the same blowpipe in glass industries by more than one person.

The States, in many States, have laws requiring the fencing of dangerous machinery and provision for stopping of machinery at once, forbidding the running of such machines without guards or cleaning or repairing while in motion. Laws designed for safety also require certain amounts of space; they call for the screening of stairways and elevator shafts, and require inspection of steam boilers. Laws for protection against fire are found in all the States. Some of them comprise a code in themselves, giving preference to draftsman's precautions. The things ranging from the material used in constructing a building to how often the floors shall be swept and how the gas shall be turned off.

The health of a factory worker is fairly well guarded in some cases, very poorly in others. Few States have any legislation on lighting, heat and humidity. Half the States require ventilation though most of the laws are too vague to be of much value. The Illinois law of 1909 sets a good standard. Some States forbid sleeping in workrooms and make certain regulations for cleanliness. It was difficult to regulate "sweating" after the decision of the Jacobs case, but attempts are made through licenses and inspection. All the mining States have more or less comprehensive laws for safety in underground works, but the provisions for health are less adequate.

Employment in transportation is regulated by both national and State laws. Navigation is controlled mainly by national laws. The act of 1915 sought to abolish virtual slavery among seamen by taking away the right to enforce contracts by imprisonment and provided for health and safety under regulations comparable to the factory acts. All the States seek to regulate employment in railroads, but Federal laws supersede in cases involving interstate commerce. Both seek to make full provision for the protection of employees and the safety of the public. There has been a sharp contest over the "full crew" law which fixes the number of employees in proportion to the kind and size of the train. Twenty States have enacted such laws over the protests of the railway managers on the ground of useless expense, but the laws have been sustained by the courts as police regulations. In Missouri this law was defeated by popular vote.

Many of the earlier laws were incomplete in definition or inclusion. Lack of responsibility for enforcement, lack of responsibility for violations, the delay in developing standards and lack of responsiveness to changing conditions were common defects of most of the legislations of most of the States. Of late the tendency has been to remedy these defects by defining in the law the end aimed at and leaving to commissions large discretion.

ary powers in defining the means necessary and the methods to be followed.

In recent years a great deal of legislation has centered around the question of liability for accidents. The old common-law rule was that responsibility for an accident must be fixed on some individual. If the employer could show that he had exercised ordinary care, he was exempt. Even when he had violated a law in failing to provide safe machinery, if it could be shown that the laborer knew of the danger, the courts held that he had assumed the risk. Or if the accident was due to the negligence of another employee (fellow-servant), this released the employer of all responsibility. In recent years a hard fight has been waged to change this law and make the industry bear the cost of accidents to its workers, just as it bears the accidents to its machinery. Georgia led the way as far back as 1856 in abolishing the fellow-servant rule on railways, but so far has been followed by only half the States. In 1910 New York shifted the burden of proof on the employer. The Federal corollary of such legislation is some provision for compensation without lawsuit. By the opening of this century some of the European governments had enacted laws requiring definite compensations to workers in cases of accident. Some countries put the whole burden on the employers, who take out insurance in regular companies or in government bonds and pass the cost on to the consumers. The first law looking to this end in the United States was passed by Maryland in 1902 as a sort of cooperative insurance law. This and several more advanced laws by other States were declared unconstitutional. In 1908 Congress made a beginning for public employees and since 1911 no less than 32 States have legislated on the subject. In order to avoid the rock of unconstitutionality, most of the statutes have been made elective, but coupled with the abolition of the employers' old points of refuge, such as fellow-servant rule, contributory negligence and assumption of risk. New York amended her constitution and made the law compulsory. Five States provide State insurance funds, but employers may elect to carry their insurance in stock or mutual companies.

Health insurance is being agitated and the American Association for Labor Legislation has drafted a model (1915) for introduction in State legislatures, but so far no State has passed this or any bill like it.

Except for some kinds of public service liability and a few pensions are practically unknown in the United States. National, State and municipal governments provide pensions for several classes of employees, especially soldiers, sailors, policemen, firemen and teachers. Massachusetts and Wisconsin offer State assistance for voluntary old age pensions and Alaska and Arizona have recently legislated on the subject. For pensions for women see Mothers' Pensions.

Unemployment.—The problem of unemployment is so acute that the matter cannot be left to the decisions of No State requires or even offers any insurance against it. Twenty-three States and a dozen or more municipalities maintain employment exchanges, some of which have placed a great many applicants. At least seven States require licenses of private employment agencies, and
Labor legislation. 597

Idaho forbids the running of such agencies for profit. Emergency work is provided by several municipalities and by Idaho. The latter offers work on the public roads to citizens who have resided in the State six months. In theory at least, the national government greatly enlarged its activity in bringing workers and jobs together.

Administrative Agencies.—Massachusetts created the first bureau of labor in 1869. Congress followed with the National Bureau of Labor in 1884, the Department of Commerce and Labor in 1903, and the Department of Labor in 1913. Nearly every State now has such a bureau. The chief duty of such bureaus is to collect and distribute statistical information relating to the various fields of labor and to the development of productive industries. In some States they are expected to enforce the important labor laws. In recent years there has been a decided movement for the creation of industrial commissions, uniting in one authority that which has been divided among various boards and those dealing with workmen’s compensation, factory inspection, etc. Five States—Colorado, Indiana, Montana, Nevada and New York—went over to this system in 1915. The entrusting of discretionary power to these commissions has gone a long way in remedying early laws, especially where they were defective in definition and inclusion or not responsive to changing conditions. For example, Congress now merely demands safety of the railroads and leaves it to the Interstate Commerce Commission to determine what devices are necessary to meet this requirement. See Child Labor; Labor Movement; Labor Unions.

David Y. Thomas, Professor of History and Political Science, University of Arkansas.

Labor Legislation, Foreign. Labor legislation is an attempt to lessen or abolish the evils resulting from the factory system in industry. The rapid advent of modern capitalism and the broadening of markets enormously increased the keenness of competition among employers, compelling the latter to exploit labor to the fullest possible extent in order to lessen the cost of production. As a result the state was called upon to step in and protect the worker from the consequences of his unequal bargaining power with the employer, especially the women and child workers. At present each of the more important countries in Europe and elsewhere possesses some sort of system of labor laws, the scope and extent of which varies with the development of the factory system in each country.

Great Britain.—Great Britain, which is the country of origin of modern capitalism, is also the country most highly industrialized and the most advanced in labor legislation. The first important factory law here was passed in 1802 and is known as the Health and Morals Act. This act forbids the employment of children under nine years of age, restricts the working hours of children to 12 a day and provides for sanitary conditions and education for the latter. It was nearly enforced, and like so many similar acts of 1819, remained a dead letter. It was not until 1833 that an extensive and strict factory law passed through Parliament. The Factory Act of 1833 applied to all textile establishments and provided for a system of inspection by a specially trained group of men. It again forbade the work of children under nine years of age, and limited the number of hours for children under 13 to nine a day or 48 a week, and for persons under 18 to 12 a day and 69 a week. Night work was entirely prohibited and schooling was provided for. This notable law was followed by a series of other laws, wider in scope and stricter in enforcement, the most important of which are the Laws of 1844 and 1847, the first extending the protection to women and the second a 10-hour day for children and women. In 1878 the Factory Consolidation Act was passed, which systematized and strengthened all previous labor laws. Since then many labor laws were passed extending protection to workingmen. In 1901 work was prohibited for children under 11 years of age. There is also a vast body of regulation in regard to sanitation and safety in the factories. Night work and Sunday labor for women and children under 18 is entirely prohibited.

No less remarkable is the development of the labor laws in England dealing with the legalization of labor unions and with industrial arbitration. Up to 1824 English labor unions were illegal under the common law and statutes of Parliament. In 1824–25 all Combination Laws previously passed against unions were repealed and freedom of association was granted to a limited extent. In 1871 the Trade Union Act was passed, which declared unions not to be illegal combinations in restraint of trade. This act was followed in 1875 by the Conspiracy and Protection of Property Act, which protected labor from the conspiracy laws in their criminal aspects and gave some protection to union funds. In 1906 the Trade Disputes Act freed unions from civil conspiracy laws and gave them complete exemption from responsibility for damages as a result of acts committed by laborers. Peaceful picketing, strikes, boycotts and blacklists were made legal. The first important Conciliation Act was passed in 1896. According to this act the Board of Trade was given certain powers to help bring about conciliation between employers and employees. In 1911 an industrial national council of conciliation was organized. A notable step toward arbitration was taken by the Trade Boards Act of 1909. The latter provides for the establishment of wage boards by the order of the Board of Trade to make minimum wage laws for employees working in industries where wages are very low. This law was especially directed against sweating industries. In 1909 also was passed the Labor Exchanges Act, according to which labor exchanges were organized all over the country with information in regard to employment and help to distribute them all over the country.
The development of social insurance in England is quite recent. Various laws recognizing employers' liability were passed beginning with 1880. These laws, however, were narrow in scope and voluntaristic in character. The first extensive piece of social legislation was only accomplished with the passage in 1906 of a Workmen's Compensation Act. This act did away with all previous legislation and reorganized accident insurance on a new basis, extending it to workmen in almost every kind of employment. According to the act employees in event of disability exceeding seven days are entitled to one-half the average weekly wage. In case of permanent disability the compensation continues until the death of the employee. The law also provides for funeral and medical expenses and for dependents in case of death. The Act of 1906 was followed by the Old-Age Pensions Act of 1908, which provides that all persons over 70, having an annual income less than $153, are entitled to a pension varying with the yearly income of the recipient and not exceeding $3.12 a week. Money for this purpose is raised by general taxation. In 1911 the system of social insurance was made complete by the passing of the National Insurance Act, which provides for sickness and unemployment insurance for some trades. Sickness and invalidity insurance was made compulsory for all workmen doing manual labor and for other persons whose income do not exceed $600 a year. The law is administered by local benefit societies and contributions come from the employer, employee and the state. It provides for medical aid and for sickness, invalidity, and maternity benefits, the amount varying with sex or age. As far as unemployment is concerned the government instituted an experimental scheme of insurance against unemployment in the building and engineering trades. According to the law all laborers above 16 in these trades are required to be insured against unemployment. The system is supported by joint contributions from employees and employers and a government subsidy.

Germany.—Labor legislation in Germany came later than in England, owing to the backward state of the factory system. The first important German labor law was passed by Prussia in 1839 and dealt mainly with the restriction of hours of labor of children. The employment of children under nine years of age was entirely prohibited and the working day of children under 16 was limited to 10 hours. The law was a complete failure, as it was not enforced. In 1853 another child labor law was passed, raising the minimum working age of children to 12 years and restricting the working day of children under 14 to six hours. The law also provides for the education of the children and for factory inspectors, but like similar laws in other German states and the law of 1839 it remained a dead letter. In 1869 an Industrial Code was adopted by the North German Federation, putting on the statute books Prussian regulations of earlier laws.

The rapid development of German industry after the Franco-Prussian War of 1870 greatly increased the factory evils. As a result great demands began to be made for uniform labor laws and strict factory inspection. In 1878 the inspection of factories were made compulsory throughout the empire. In 1891 a uniform industrial code was passed for the entire German Empire. Children under 13 years of age were prohibited to work in factories and children above 13 could work only if they had received a factory education. The law also regulates the employment of women, limiting their working day to 10 hours, as well as that of children under 16, and prohibiting night work. The law also provides for Sunday rest and sanitation in the factories. Since 1878 the Industrial Court has been in existence in many ways. The Industrial Code expressly legalizes strikes and lockouts and allows the organization of labor unions for the improvement of economic conditions. In 1890 Germany passed a general law establishing industrial courts throughout the empire to settle industrial disputes. The courts have an equal number of representatives from labor and capital and are presided over by a chairman who represents neither.

By far the greatest progress in labor legislation was made by Germany in the field of social insurance. The latter is used by the Imperial German government as a check on the ever-growing influence of Social-Democracy among the people. The most important insurance act was the Sickness Insurance Law, passed in 1883. It provides for sickness benefits, free medical aid and maternity and funeral benefits. The funds are sustained by the employers and employees, the former contributing one-third and the latter two-thirds of the fund, and are administered by boards representing both sides. According to provisions of the law sickness benefits begin on the third day and amount usually to one-half of the wage. The Accident Insurance Law was passed in 1884. It provides that accident funds are to be contributed entirely by employers and to be administered by associations of employers engaged in the same general trade or industries. The latter fix rates, classify trades and pass on safety requirements. Compensation for the first 13 weeks comes from the sick fund. After that compensation comes from the accident fund. In case of total disability a workman gets 50 per cent of his wages and for partial disability 25 per cent. In case of partial disability, he receives a pension in proportion to the degree of disablement. In case of death, funeral benefits are paid and dependents are given a liberal pension. The Compulsory Old-Age and Invalidity Insurance Law was passed in 1889. According to it all wage earners above 16 must insure against old age and invalidity. Liberal contributions are also made by capital and the state. Pensions usually amount to two-thirds of the average wage of the class to which the worker belongs. As far as unemployment insurance is concerned, some beginnings have been made by a few municipalities, but a national system against unemployment is still under consideration. All the original insurance laws have been extensively modified and now include practically all workers. In 1911 all insurance laws were revised and combined into one law.

France.—The first half of the 19th century brought the industrial revolution to France and together with it all the evils of the factory system. Very little protective legislation, however, was enacted before 1841, but in that
year, owing to strong public pressure, a child labor law was passed declaring that the minimum age of children working in factories, mills and workshops should be eight and limiting the working day of children between eight and 12 years of age to eight hours and between 12 and 16 to 12 hours. The law was hardly enforced, as factory inspection was inadequate. The Revolution of 1848 brought more labor legislation to France. Under the influence of Louis Blanc, national workshops providing everybody with work were established, but failed. In 1848 a law was also passed establishing a 12-hour labor day all over France. The law was not enforced. In 1874 a law was enacted reorganizing factory legislation. It limited the age of child workers to 12 years, restricted the working day of children from 12 to 16 years of age to 12 hours, and prohibited night work for children under 16 and for women under 21. It also established sanitary requirements and instituted an inspection service. In 1892 the law was replaced by another law, the age insurance law of 1893, which dealt with the protection of health and safety of employees and requires that all accidents be reported and investigated. In 1900 the Act of 1848 for a 12-hour day was amended and factories where women and children work the working day is limited to 10 hours. In 1915 a minimum wage law was enacted, according to which wages for women are to be fixed by wage boards.

In the field of legislation in regard to legislation of unions France took a favorable step forward. In 1791 a law was passed allowing labor organizations to organize. This law remained in power until 1884, when the Syndicate Law, making labor organizations and strikes lawful, was passed. Yet by 1909 an order was issued prohibiting strikes and closed unions. In 1887 the government took a favorable step toward unionism by establishing labor exchanges, which serve as employment bureaus and are regulated for unions. In 1890 the Code of arbitration France has progressed considerably through the help of industrial courts or conseil de prud'hommes, originated at Lyons and since then spread over France and Europe. This system has spread rapidly over Belgium and other important countries of Europe. Holland's system of protective legislation dates since 1874 and provides for mediation and arbitration, regulation of work of women and children and super- vision of sanitation. In 1901 compulsory accident insurance was established by law in almost all branches of industry. Holland has also taken important steps toward sickness and old age insurance and has introduced the Dutch system of unemployment insurance.

Scandinavia.—Sweden introduced a comprehensive scheme of labor laws in 1901 and additional laws have been passed since then. They provide for mediation and arbitration, protection of women and children, placing of workmen on land, etc. Social insurance was started in 1891, and in 1916 an entirely new compensation law was passed. It embraces all wage earners in all industries and provides
for medical aid, cash benefits in case of temporary disability and pension payments in case of permanent disability. Denmark passed its basic labor law in 1901. A permanent arbitration court representing both labor and capital was established in 1910. In 1913 a law was passed establishing a central labor exchange in Copenhagen with many branch exchanges all over the country. An old-age pension system was passed in 1891, sickness insurance was established in 1898, and accident insurance in 1899. In 1916 all compensation laws were revised and combined into one. Norway's important labor legislation dates since 1872. Accident insurance began in 1895 and sickness insurance in 1899.

**Australia and New Zealand**—Australia is highly advanced in the field of labor legislation owing to the fact that the governments of the commonwealth and of all the states except Victoria are in control of labor ministries. The labor laws for which Australia is most famous are the compulsory arbitration laws. Compulsory arbitration was first adopted by New South Wales in 1901 and is now present in all the states. The Commonwealth Compulsory Arbitration Act was passed in 1904. It provides for a court with a president at its sole member whose decisions are final. Strikes and lockouts are strictly forbidden. Australia also has an eight-hour law and most of the states have passed minimum wage laws and compensation insurance. In New Zealand a Compulsory Arbitration Act was passed in 1894 as a result of the great strikes of 1890-93. In 1908 the law was changed and now provides for the appointment of commissioners of conciliation who in turn appoint advisors nominated by both parties. Registered unions are prohibited from striking under penalty. Either side may demand arbitration and the decisions are binding. Like Australia, New Zealand has an eight-hour day and laws protecting women and children in the factories. It also has a broad system of social insurance, including old-age and mothers' pensions.

**Other Countries**—Most of the European countries possess some system of labor regulation and inspection. Since 1880 many laws protecting children and women have been passed in Russia. Before the Revolution Russia also possessed a fairly advanced system of factory inspection. In Italy many important labor laws have been passed since 1886, in Spain since 1900. The most important labor law of Canada is the Industrial Disputes Investigation Act, passed in 1907 after the great Alberta mining strike of 1906. The object of the act is to prevent strikes and lockouts in mines and industries connected with public utilities. When a strike is threatened, the government appoints a board of conciliation and investigation, having one capitalist, one labor representative and a chairman appointed by the latter or by the government. Before the report of the board is published strikes are forbidden under penalty, but after publication each side is free to act. The idea is to arouse public opinion against the side which refuses arbitration. Practically all of the countries possess more or less of a system of workmen's compensation. In Italy a law of 1898 makes insurance against accidents compulsory at the expense of employers. At the same time an old-age invalidity insurance law was enacted.

**International Association for Legislation.**—Considerable impetus to labor legislation in Europe and America was given by the International Association for Labor Legislation. The association was organized at the Paris Exposition in 1900 and has branches in most of the industrial countries of the United States. Biennial conventions are held in Switzerland, where uniform laws are drafted and recommended to the different countries. After such laws are adopted by a country, they become equivalent to a treaty.

The World War greatly added to the importance of labor legislation and administration. For instance, the work performed by labor exchanges had formerly interested mainly social reformers and wage earners; the war made it a cornerstone of the nation's industrial efficiency. For industrial labor suddenly became a rare and precious commodity. In the first rush of necessity governments and employers permitted a lowering of the existing standards of labor protection. Soon, however, investigations proved that enforcement of the existing labor laws was not so much a matter of social justice as one of a continuous industrial efficiency. The inflow of millions of women into the munitions industries greatly broadened the scope of factory inspection. Thus it led to the creation of posts of special welfare supervisors. Another side of labor legislation which the war strongly developed was that which deals with the prevention and settlement of industrial disputes. Special tribunals as well as special administrative organs were created with this in view.

**LABOR MOVEMENT IN AMERICA**

The *Labor Movement* is a term applied to the conscious, united and persistent efforts of the laboring people to improve their economic and social conditions. *Laboring people* has come to mean employed workers for wages. Organizations of laborers have existed from time immemorial. The guilds of the Middle Ages were exclusive and monopolistic, caring nothing for other workers. This form appeared among the shoemakers in Massachusetts in 1648, organized mainly for the purpose of controlling inferior workers. Like organizations appeared in other industries from time to time, always local in character and more or less temporary. Several strikes for higher wages occurred before the close of the 18th century.
History.—The birth of modern trade unionism may be assigned to the closing years of the 18th century, though it never attained the dignity of a movement until the 19th was well under way. The manner and motives of it were those of the factory movement, and so caused a wider separation between master and journeyman. The change is well illustrated in the shoe industry. At first the master made only a "bespoke" product and employed journeymen to meet this demand. Then came the capitalists, "cunning men from the East," who stocked up and held shoes for chance purchasers. Changes of this character, which brought about the factory system, were especially noteworthy 1830-40, but were noticeable before this. Stocking up and the competition between the capitalists for sales necessitated a reduction of wages. The labor movement came as a protest against such conditions.

While the aims of the labor organizations were industrial in its earlier stages the movement assumed a political character and a workingmen's party appeared in various places in the later twenties and early thirties. No doubt this was largely due to the fact that the suffrage was a new instrument in the hands of the propertyless laboring man. As a separate body the labor party accomplished little that was good while doing some harm to the cause. It was impossible to make a complete divorce between labor and politics, for many of its demands could be realized only through legislation. But to insist upon the passage of certain laws was one thing, to enter politics as a party was another. The experiment in politics brought out this truth, though its significance has been lost a few times since, in labor organizations and in recent years. Through them and by proper action the labor party accomplished little that was good while doing some harm to the cause. It is always been a decided disadvantage. A dozen men may combine as a corporation for the purpose of doing business and employing others. It then becomes in law a person. It may employ only a dozen men. No act of the corporation (composed of a dozen men) to reduce wages is illegal. Each of the 12 employees may work or refuse to work, but if they combine in such action then legal difficulties may arise. Such difficulties were swept away in England in a series of acts beginning in 1824 and ending in 1906. In America strikes ("turnouts") occurred every few years throughout the first quarter of the 19th century. Sometimes the shorter hours, generally for higher pay. In 1803 the striking sailors at New York used intimidation against strikebreakers. "Scab" and "rat" came into use, and occasionally lists of "rat" were published. The elementary form of picketing and boycott also appeared. The answer of the employers was appeal to the courts and organization. In 1806 eight strikers were fined at Philadelphia, and three years later DeWitt Clinton, mayor of New York, fined 24. The charge was conspiracy to raise wages and the court held that this was illegal even when there was no intimidation or violence. Several other like prosecutions followed. In 1834 the carpet manufacturers of Thompsonville, Conn., even secured judgment for $15,000 damages. But the doctrine of the public lands, local settlers and the taxation of unearned increments in town property.

Specific demands have varied from time to time, but the essential principles have remained the same, though stated at times in more specific terms. But the whole movement most emphasis has been laid upon a shorter working day and better pay. The working day of the farm, "from sun to sun," had been carried over into the industries and extended there, for in some industries men worked longer in winter than did the farmer. The weapons used to remedy the situation were organization and the strike, backed up by appeal to public sentiment.

Trade unionism reached the "coming out" stage with the organization of the Mechanic's Union of Trade Associations at Philadelphia in 1827. Others soon followed. After a brief flirtation with politics they settled down to industrial and social questions. The rising tide of prosperity and the mounting cost of living in the first half of the fourth decade stimulated them to feverish activity. The conditions which are most apparent in factories that caused unrest, it was not the factory workers, but skilled artisans who took the lead. By 1836 the Trades' Union at Philadelphia consisted of 48 societies, two of which had over 500 members and four others over 700 each. The journeymen tailors, cordwainers, printers and hatters represented the skilled workers, the cotton spinners and "female operatives," the factory workers. The printers included at least 24 cities in their organization. The pioneer national union was the National Trades' Union, which met at New York in 1834. This may be taken as the progenitor of the American Federation of to-day. The Right to Organize.—The right of laborers to organize has never been questioned. What they may do after organization has always been a disputed question, for our courts have generally held that a good many things which may be legally done by individuals may not be done by combinations of individuals. The first thing for the laborers to do was to establish the right to strike and make collective bargains. In this they have always been at a decided disadvantage. A dozen men may combine as a corporation for the purpose of doing business and employing others. It then becomes in law a person. It may employ only a dozen men. No act of the corporation (composed of a dozen men) to reduce wages is illegal. Each of the 12 employees may work or refuse to work, but if they combine in such action then legal difficulties may arise. Such difficulties were swept away in England in a series of acts beginning in 1824 and ending in 1906. In America strikes ("turnouts") occurred every few years throughout the first quarter of the 19th century. Sometimes the shorter hours, generally for higher pay. In 1803 the striking sailors at New York used intimidation against strikebreakers. "Scab" and "rat" came into use, and occasionally lists of "rat" were published. The elementary form of picketing and the boycott also appeared. The answer of the employers was appeal to the courts and organization. In 1806 eight strikers were fined at Philadelphia, and three years later DeWitt Clinton, mayor of New York, fined 24. The charge was conspiracy to raise wages and the court held that this was illegal even when there was no intimidation or violence. Several other like prosecutions followed. In 1834 the carpet manufacturers of Thompsonville, Conn., even secured judgment for $15,000 damages. But the doctrine of the public lands, local settlers and the taxation of unearned increments in town property.
fused to indict these employers for conspiracy, but the striking tailors were fined $90 to $150 each.

These prosecutions were one of the factors which were not the only one and probably not the most important, which led to the decline of the labor movement. Organization had been overdone and the unions were quarreling with each other. There had already been a tendency toward politics. After the conviction of the tailors a mass meeting was held in the park to protest against it, and a State convention was called. The tide of discontent and the spirit of reform were rising throughout the nation and every kind of "ism" was going into politics. One labor candidate was elected to Congress, but the laboring men ruined their cause by admitting outsiders and championing various issues which had no direct bearing upon their objective. The various parties now played for the labor vote, the Whigs supporting the tariff as a protection to labor instead of capital and Tammany Hall turning to the working men instead of the wealthy class. *Thus* says Professor Commons, "did the labor movement of the thirties furnish to the 19th century both its philosophy of labor's priority over property and its secret of maneuvering labor to the advantage of capital."

Some results worth while had been accomplished: (1) A mechanic's lien law; (2) the abolition of imprisonment for debt, and (3) improvement of the public schools, had all come by legislative enactment, mainly because of the pressure of the laboring class. The appeal to public sentiment was strong, both through the platform and the press. Between 1820 and 1837 no less than 68 papers were projected. The best known of these were the Mechanic's Free Press (Philadelphia 1828), the New Kingman's Advocate (New York 1829) and The Man (New York 1835), the last two under the editorship of George H. Evans. The denunciation of employers in the papers was direct, often bitter. But no legislative enactment was secured for the shorter day and very little was accomplished by agreement, but an executive order was secured for the 10-hour day from President Van Buren. More important perhaps was the cessation of fines for mere strikes. The same year that the tailors were fined the cordwainers were acquitted and in 1842 the Massachusetts Supreme Court established the right of men to quit work for the improvement of their condition. However, this did not establish any general right to quit work. Men might quit work to benefit themselves but not to injure others, and prosecutions for conspiracy continued in the fifties, especially where acts of violence were committed.

The lean years following the panic of 1837 saw little activity in the labor world. The rising prices following the partial business revival of 1843 witnessed some sporadic union activity. Factory operatives now began to take part in the movement, but their real significance belongs to a later period.

The period of the forties is one of the most loquacious in all our history. It was a hot and the heat of discussion generated a great many issues, some of which have taken root. The old democracy had stood for a negative, laissez-faire policy. The call now was for a constructive democracy, one that would take best and guide and help. There were two avenues of approach, that of higher idealism along which the humanitarians and transcendentalists; the lower, on which the workers traveled. The former called for justice; the latter demanded rights. Gradually, especially after the panic of 1837, the transcendentalists got down to earth and sought to apply the principle of labor. It assumed concrete form in the experiment at Brook Farm (q.v.) and the various efforts to establish Fourierism (q.v.) and Owenism. The transcendentalists soon vanished into thin air, but not before they had served a useful purpose. They opened the eyes of society as they had not been opened before to the grievances of labor, and touched a chord of sympathy; in the laboring class they at least touched the chord of aspiration and caused them to think a little more of duties if no less of rights. One of the most powerful agents in bringing about these results and a partial fusion of the two ideals was Horace Greeley.

The Homestead Act.—The most significant concrete thing in the labor movement of this period was the agitation which led to the passage of the Homestead Act. Among the natural rights ascribed to man in the Declaration of Independence was the right to "life, liberty, and the pursuit of happiness." In the thirties men had begun to look upon the right to pursue happiness as illusory, unless they had the right to own land. Men had as much right to land as to air. George Henry Evans now gathered up these ideas and evolved out of them a constructive policy. Wages, he said, were low and strikes were futile because the Western lands were bottled up and the best lands of the East were in the hands of speculators. If these lands were opened up, enough settlers would be drawn off to cause a rise in wages. In 1844, mainly through his activity, the National Reformers' Association was organized for the purpose of restoring to the "natural right to land," and proceeded to demand of candidates a pledge to vote for a homestead law. At first Greeley opposed, holding that the hills of labor were social, not political, and that they were to be remedied by mutual agreement. In a congress made up of representatives of employers and employees. The first "Industrial Congress" met in New York in October 1845. It stood for land reform and a 10-hour law. It continued to meet at intervals until 1856, but Greeley soon saw the futility of its efforts and came out for legislative action (1845), endorsing in particular the homestead idea. In 1848 he introduced such a bill in Congress. In 1852 Andrew Johnson introduced another. Ten years later it became a law.

Along with this went the movement to exempt homesteads from execution for debt, the first response to which came from Wisconsin in 1847, though similar laws had been enacted in several Southern States prior to this. Entailment or absolute inalienability was demanded by some, but voluntary alienation under mortgage was allowed everywhere.

Weary of waiting on philosophy and legislation the workers again resorted to strikes fol-
lowing the period of 1843, generally with success. However, the Phalans denounced the "degrading bitterness and insufficiency of this attempt at a compromise" of the rights of labor from men, holding that it did not change the terms of dependence on masters and only converted them from 12 and 14 hours to 10 hour slaves. The only remedy was "to associate and combine" and secure ownership of "the tools of life and the tools and machinery with which they work."

The influence of the Fourierists appears in the action of a convention representing several unions. It endorsed the homestead proposition, the 10-hour movement and the Workingmen's Protection Union which was working out distributive co-operation and rejected a proposal looking to political action. All efforts to secure a 10-hour law failed in Massachusetts, but they were successful in New Hampshire (1847), Pennsylvania (1848), New Jersey (1850), Ohio (1852) and Rhode Island (1853). However, the laws were not enforced. The movement for co-operation (q.v.) had some tangible results and by 1838, 769 co-operative stores had been started. About this time, the war to stop by the opening of the Civil War the stores had all disappeared or passed into private ownership. The failure was due to two things, bad management and greed for gain. The Boston Tailors' Association Union (1849) was organized for productive co-operation, but lasted only a few years.

Nationalization of the unions was hardly possible until industries were enlarged and distribution more rapid and general. This transformation was under way in the fifties. Railroads were being built and disconnected lines were being consolidated into greater systems. Epoch-making inventions, such as the sewing-machine, the reaper and mower and shoe machinery had already been registered in the Patent Office. Expansion and consolidation were going on. In 1840 there were 1,240 cotton factories with 51,000,000 capital, employing 72,000 workers. In 1850 the number had been reduced to 1,074, the capital increased to $76,000,000 and the workers to 95,000. The woolen and cotton industries were undergoing a rapid change. Many local unions were formed, several of larger scope. At least two national organizations still in existence date from this period, the International Typographical Union (1850) and the Iron Moulders (1839). The revolution in industry, instead of being checked, was rather stimulated by the Civil War the next decade. Associations of manufacturers were common and business was assuming the monopolistic type. The absence of so many workers on the firing line weakened the laboring classes and their organization was strengthened but little while the war lasted, though one union, that of the cigar-makers, dates from 1864. The increased use of woman, child and convict labor, the influx of immigrants, especially men from southern Europe, and the freeing of the negroes, whose low standards were said by the workers to misfit him for "a fair competition of the white worker," and multiplicity of machinery, all added to the perplexities of the laboring men and made organization inevitable.

The most significant demand of this period was the 8-hour day. The basic philosophy of this demand was somewhat different from that for the 10-hour day. As formulated by Ora Stewart, a Boston mechanic, this philosophy held that this increase of the worker's leisure would raise the standard of living. This would cause a rise in wages and an increased use of machinery. The carrying out of the program would, he said, eliminate the capitalistic for the rise in wages and resultant cap- italist and laborer one. The specific program naturally arising from such a philosophy called for the establishment of co-operative production and distribution and of emigration to the Western lands as a remedy for unemployment; it demanded the abolition of monopoly, of the contract system of convict labor, educational advantages suitable for laboring people and better housing. Gresham's law, said Stewart, operated in the labor world as surely as in money and these measures should be taken to guard against it.

A natural corollary of this last was opposition to convict labor, Chinese immigration and the coming of Europeans under contract. Even the recently freed negro was an object of fear, and demands were made by some labor organizations for more effective regulations. With the help of the humanitarians the convict lease system has been practically abolished and the working of convicts under contract considerably modified. The agitation for Chinese exclusion was finally successful in 1882 and other additions except Japanese were included in 1916. A law against the importation of laborers under contract was passed in 1885, amended in 1907.

Coincident with some of the significant changes in production was the development of the middleman who pushed in as a connecting link between producer of raw materials and the manufacturer and the manufacturer and the consumer. This was particularly noticeable 1860-80. The same period also saw the capitalization of intangible wealth, good will, trade marks, franchises, etc., interference with which was a violation of property rights. Intangible capital became an effective security for banking and credit business through which the merchant could control the products of laborer and employer. Such a system contributed largely to the first greenback movement, which aimed to take this control out of the hands of the middleman. The proposition for legal tender currency convertible into bonds and bonds convertible into legal tender, as backed by several labor unions, was stoutly resisted then, even when limited in quantity and based on 3 per cent bonds, and has since been condemned by historians and economists.

Consolidation and concentration moved on. Between 1870 and 1905 the factory, mechanical and neighborhood industries a little more than doubled in number, but the number of workmen trebled, the value of the products quadrupled and the capital was multiplied by six. The number of establishments making agricultural implements declined (1870-1900) 66 per cent, but the capital per establishment rose from $16,780 to $220,571 and the products from $25,080 to $141,349. The close of the 19th century and the opening of the 20th witnessed the appearance of the giant corporations. This in itself destroyed the personal nexus be-
tween the employer and employee. More than that, there was a union of industries through interlocking stockholders and directors. The result was that capital, instead of passing into the hands of laborers and farmers, itself became the master or the ally of big business. A very small part of the demand of labor in the sixties was granted at the request of business in 1913 in the Federal reserve banks; of the farmers to the farmers in the rural credit bill of 1916.

The answer of labor to concentration and to the rising prices of the war period was organization. By September 1864 the local unions had over 200,000 members, and then nationalization began with the organization of the International Industrial Assembly of North America. The preamble to the constitution of this union gives causes of unions and expresses the feelings of that age. It may also be said to give the basic motives of unionism from that day to this, though their expression has been modified. Capital is denounced as "aggressive" and seeking to "enslave the working masses." It has assumed to itself the right to own and control labor for the accomplishment of its own greed and selfish ends, regardless of the laws of nature, and of nature's God. Experience has demonstrated that if the dignity of labor is to be preserved, it must be done by our united action. Therefore, believing the truth of the following maxims, that they who would be free must strike the first blow, that in union there is strength and that self-preservation is the first law of nature, and calling upon God to witness the rectitude of our intentions, we do ordain and establish the following constitution.

The objects of the order were the social and moral elevation of the workers, the correction of abuses so as to secure to them their rights and privileges. This was to be secured through promoting organization and the adjustment of difficulties between employers and employees. Other orders soon grew more specific in their demands and brought into the foreground such questions as the recognition of the union, the closed shop, immigration and the importation of labor under contract, prison labor, hours, wages, the boycott, the blacklist, picketing, sanitation and safety. All of these questions have been prominent since the Civil War, some of them all the time, others at particular periods.

Organizations now multiplied and grew rapidly. The National Labor Union was formed in 1866 and by 1868 had 640,000 members. It now boldly entered politics, largely to support Greenbackism. The result was decline and dissolution, though the American Labor party arose out of its ruins and put forth a candidate for President in 1872. The Knights of Saint Crispin was organized among the shoemakers in 1867 as a secret society and became an influential order, but it played with politics and died soon after 1873. For 10 years national organizations floundered in the mire of secrecy and politics.

But national unions of particular workers were now found to be insufficient. Unions of skilled workers, based on the wage-fund theory, gradually gave place to industrial unions, which arose from a class consciousness and included all skilled and unskilled workers in a particular industry, though the process has never been completed. It was found that strikes conducted by such unions were more effective. The next extension was the sympathetic strike, a good example of which is found in the trouble of 1894. The most radical extension of this movement appears in the Industrial Workers of the World (q.v.).

The Knights of Labor (q.v.), which was organized at Philadelphia in 1869 as a secret order of garment workers, was gradually transformed into an order for all workers. Its program of reform was extensive, demanding the referendum, bureaus of labor, the reservation of land for actual contractors, prohibition of child labor, income and inheritance taxes, postal savings banks, government ownership of railways, the 8-hour day and arbitration of labor difficulties. The membership grew somewhat slowly until it reached 100,000 in 1885. This was a period of prosperity and the membership suddenly leaped to 600,000. It relied more upon co-operation than upon strikes to realize its industrial aims. But these men had come in, not to discuss patiently, adopt calmly and execute bravely the command of its own general will, and selfish ends, regardless of the laws of nature, and of nature's God. Experience has demonstrated that if the dignity of labor is to be preserved, it must be done by our united action. Therefore, believing the truth of the following maxims, that they who would be free must strike the first blow, that in union there is strength and that self-preservation is the first law of nature, and calling upon God to witness the rectitude of our intentions, we do ordain and establish the following constitution.

The objects of the order were the social and moral elevation of the workers, the correction of abuses so as to secure to them their rights and privileges. This was to be secured through promoting organization and the adjustment of difficulties between employers and employees. Other orders soon grew more specific in their demands and brought into the foreground such questions as the recognition of the union, the closed shop, immigration and the importation of labor under contract, prison labor, hours, wages, the boycott, the blacklist, picketing, sanitation and safety. All of these questions have been prominent since the Civil War, some of them all the time, others at particular periods.

Organizations now multiplied and grew rapidly. The National Labor Union was formed in 1866 and by 1868 had 640,000 members. It now boldly entered politics, largely to support Greenbackism. The result was decline and dissolution, though the American Labor party arose out of its ruins and put forth a candidate for President in 1872. The Knights of Saint Crispin was organized among the shoemakers in 1867 as a secret society and became an influential order, but it played with politics and died soon after 1873. For 10 years national organizations floundered in the mire of secrecy and politics.

But national unions of particular workers were now found to be insufficient. Unions of skilled workers, based on the wage-fund theory, gradually gave place to industrial unions, which arose from a class consciousness and included all skilled and unskilled workers in a particular industry, though the process has never been completed. It was found that strikes conducted by such unions were more effective. The next extension was the sympathetic strike, a good example of which is found in the trouble of 1894. The most radical extension of this movement appears in the Industrial Workers of the World (q.v.).

The Knights of Labor (q.v.), which was organized at Philadelphia in 1869 as a secret order of garment workers, was gradually transformed into an order for all workers. Its program of reform was extensive, demanding the referendum, bureaus of labor, the reservation of land for actual contractors, prohibition of child labor, income and inheritance taxes, postal savings banks, government ownership of railways, the 8-hour day and arbitration of labor difficulties. The membership grew somewhat slowly until it reached 100,000 in 1885. This was a period of prosperity and the membership suddenly leaped to 600,000. It relied more upon co-operation than upon strikes to realize its industrial aims. But these men had come in, not to discuss patiently, adopt calmly and execute bravely the command of its own general will, and the membership suddenly leaped to 600,000. It relied more upon co-operation than upon strikes to realize its industrial aims. But these men had come in, not to discuss patiently, adopt calmly and execute bravely the command of its own general will, and the order continued to grow. The increasing number of Socialists sought to control it, but failed, and many withdrew (since 1900) to join more socialist orders, such as the Trade and Labor Alliance and The American Labor Union, in forming the Industrial Workers of the World. In spite of this the strength of the Federation has hardly been impaired. Its largest affiliated order, the Mine Workers' Union, is of the industrial type. The most important entering industry since the Civil War has led to the formation of many unions of women workers. The National Women's Trade Union League was organized in 1903. Its platform is: Organization of all workers into trade unions, equal pay for equal work, an 8-hour day, a minimum wage scale and full citizenship for women. This order and its local units are really auxiliaries of the Federation. In recent years the school teachers have been entering the Federation, and in 1916 the teachers came over. The membership is now over 2,000,000.

The pen has developed into a powerful adjunct of the union. There are many papers devoted entirely to the cause of labor, the most influential of which is the American Federationist. In addition, many newspapers have columns or pages devoted to labor news.

The fundamental aims of the unions have already been stated in giving their platforms. Better wages and a shorter working day have been in the foreground. As already indicated, several unions favored co-operation and opposed strikes. A good many experiments were made in co-operation and a few of the later ones have succeeded. But neither co-operation
nor profit-sharing, which was introduced by the operators, has displaced the wage system, and for the improvement of wages the strike or threat to strike is still common. From 1881 to 1905 there were 36,757 strikes involving 8,703,824 workers. Fully 35 per cent of these strikes called directly for an increase of wages and 10 per cent were to oppose a reduction, while nearly 5 per cent called for a reduction in hours.

The question of hours has been a vital one. The 12-hour day was still common in some of the large wool industries until 1886. The 7-day week was added the 7-day week, especially in those industries such as steel which depended upon the continuous process. The humanitarians again entered the field and, basing their demand upon social welfare rather than upon simply the welfare of the workers directly affected, they and the workers together succeeded in getting the 8-hour day enacted into law in certain industries. This marks the beginning of the industrial hygiene period. On the same basis considerable limitations have been put upon woman and child labor (q.v.).

Since the Civil War strikes have been marked by increasing violence. The great railroad strikes of 1877 and 1894, the strike in the steel mills at Homestead in 1892, in the textile mills at Lawrence in 1912 and in various coal mines culminating in the troubles in Colorado and Arkansas in 1914 are good examples of this. The legal position of the strikers has experienced little change. The New York law of 1820 legalizing the strike added little to the rights already held, that of merely striking. In 1894 Eugene V. Debs was acquitted of a charge of conspiracy, but convicted and sent to prison for violating an injunction forbidding the American Railway Union and "all other persons whatsoever" to interfere with certain trains carrying United States mail and interstate commerce. The use of the injunction since the Civil War has been of far greater consequence than the fines for conspiracy before the war, even with the slight limitations imposed upon its use in recent years. Such prosecutions as that of Mr. Debs and of the Federation officers (Messrs. Gompers, Mitchell and Morrison) for violating an injunction against the publication of unfair lists and the awarding of damages against the Danbury hatters for boycotting under the Sherman Anti-Trust Act have virtually nullified picketing and the boycott (q.v.), two of labor's effective weapons, though three States nominally legalizing the boycott and a recent decision has upheld picketing.

Under the circumstances it is no wonder that the unions have expended considerable energy in fighting for recognition. In the period 1881-1905, 18 per cent of the strikes, or nearly one-third of those ordered by unions, were for recognition of the union and another 7 per cent really involved this question. Many employers have agreed to recognize and deal with unions; a few have agreed to the closed shop; some, on the other hand, keep their shops open to non-union labor and closed to union labor. In large scale production unionism is weak, practically non-existent in some cases. In 1908 the Federation began active participation in politics in furtherance of its aims. It does not have official candidates, but works for those in sympathy with the cause and against those known to be hostile. Among the demands presented to the national conventions of the political parties in 1916 was one for the legalization of unions.

A general recognition of labor unions would make employers' unions almost necessary. Such unions exist and they seek to ward off the labor unions. There is also another employers' union which is bitterly hostile to labor unions and uses every means to break them up. Unions of this type began in the sixties. Refusal to employ union men, blacklists and lockouts are the weapons used.

One of the most significant things in all the history of the labor movement is the comparatively recent entrance of a third party to the trouble, the public. Quarrels and disputes are vexatious to the disinterested, where they have to listen to them. They disturb repose. But with the modern social organization such as it is, disputes long protracted may cause inconvenience, even when they do not terminate in violence and war. The movement for conciliation and arbitration to end such disputes has gained considerable headway in the last quarter century. The United States and most of the several States have provided official machinery for this work. A few notable cases of successful operation could be cited, but the general attitude of both labor and capital toward this movement is hostile. Compulsory arbitration would have to be adopted to cover anything like all the cases. This, says capital, is taking property without due process of law. This, says labor, with the enforcement of the award would mean compulsory labor or slavery. But the public is beginning to ask whether the right of operators and miners to keep a mine closed while they dispute over the terms of operating it, as in 1902, or to close a city by tying up the railways, as in 1894, is any more sacred than the right of the public to keep from freezing and starving. A negative answer may mean taking property without due process of law, but it does not mean slavery. It simply means that it is to the welfare of the entire community that mines be kept open and the railroads in operation. It may mean that the present capitalization of industry will be displaced, not by industrial democracy, but by the democratization of industry. See Labor Legislation; Profit-Sharing; Labor Unions; Wages.

DAVID Y. THOMAS,
Professor of History and Political Science, University of Arkansas.

LABOR ORGANIZATIONS, Foreign. Modern trade unionism in Europe has its origin in the industrial revolution, which began in England during the latter part of the 18th century and spread during the next century over
the greater part of the Continent. The development of the factory system, the extension of markets and the increase in competition between employers led to the breakdown of the mediaeval guild system and resulted in an open breach between employers and employees. The latter soon began to organize for protection and improvement of conditions. As a result we have the modern trade union, which after many difficulties, partly with the aid of strikes and partly through politics, has been able to assert itself, and now plays an important part in all of the principal manufacturing countries of Europe.

Great Britain.—In Great Britain modern trade unions began to appear during the 18th century, earlier than in any other country in the world. Such unions had to disguise themselves as friendly societies, since combinations in restraint of trade were contrary to the common law and thus illegal. The persecution of trade unions increased during the Napoleonic Wars, but in 1824 all Combination Laws previously passed were repealed and freedom of association granted. In 1825, however, part of the laws against combinations were re-enacted and persecutions of unions renewed.

From 1825 to 1850 English trade unionism was revolutionary and political in character. The falling of prices and the lack of prosperity gave rise in 1832 to the Grand National Consolidated Trade Union, established by Robert Owen. This union included many workmen, skilled as well as unskilled, and was co-operative and revolutionary. This movement was followed by the labour movement, which aimed at the attainment of economic equality through political equality or universal suffrage. It went to pieces in the latter forties with the return of prosperity and its place was taken by the modern trade union of England.

The English trade unions established after 1850 differed from their predecessors in that they took in only skilled labor and placed little confidence in political action. They believed in and tried to establish collective bargaining, limitation of apprenticeship and big reserve funds for strikes. In 1867 laborers, given the right of suffrage and in 1875 the Conspiracy Laws were greatly limited. Between 1858 and 1867 many federations of branches in all principal towns formed under the name of trade councils. The trades councils united into a trade union council in 1868.

Beginning with 1880 English unionism again turned its eyes toward politics. Radical leaders like Mamb and Burns became dissatisfied with the conservatism of the unions and turned to organize the unskilled workmen, a move which culminated in the famous dockers' strike of 1889. In 1883 they launched the Independent Labor party upon a socialist platform, with James Keir Hardie as the most prominent leader. For a time the trade unions continued aloof until they were forced into the new movement by the Taff Vale decision in 1901, which threatened their very existence. Already in 1899 the Trades Union Congress, which since the sixties had kept watch over the parliamentary interests of the trade union, endorsed independent political action and in 1900 the "Labour Representation Committee" was organized, containing representatives from the trade unions and the several Socialist organizations, including the Independent Labor party. The name was later changed to "Labor Party."

In 1906 the new party scored its first great success, electing 29 members of Parliament and 11 others unaffiliated with the party but representing the trade union point of view. The movement passed the Trade Union and Trade Dispute Act, which did away with the effects of the Taff Vale decision. The Labor party continued to influence British legislation throughout the succeeding years, aligning itself on the side of the Liberal government. The Great War caused British labor to give up many of its cherished privileges in order to hasten war production. In 1917 the Labor party modified its constitution to take in individuals, brain workers and unorganized individuals, and worked out a comprehensive reconstruction program. Since 1915 the Labor party was represented in the Cabinet.

In 1915 the trade unions affiliated with the Trades Union Congress numbered 190 with a membership of 2,697,357. The General Federation of Trade Unions, founded in 1899, is not a legislative but an economic organization, akin to the American Federation of Labor. It has a membership of about 800,000. The total number of trade unions, including those unaffiliated with any general organization at the end of 1915, was 1,123 with a total membership of 3,960,000.

Germany.—In Germany the medieval guild system came to an end about 1880 and its place was taken by modern guilds, made up mainly of the municipalities, and encouraged by the government. Modern trade unions were started in 1865 and at present are of three kinds, each being in opposition to the others: the "free" or Social Democratic unions, the Hirsch-Duncker or Liberal unions, and the Christian unions. Each of these groups has its separate federal organization.

The Social Democratic unions started in 1865 and grew very rapidly in membership till now they make up the largest and most powerful organization in the German labor movement. Their rapid growth started in 1888, when the workingmen succeeded in getting freedom of association. From 1878 to 1890 the unions were persecuted together with the Socialists and many unions were dissolved. The majority of them, however, were able to survive and prosper. All the Socialist unions are closely united in the General Commission, which is allied with the Social Democratic party. The Socialist unions are characterized by a centralized and efficient organization. In 1914 they numbered 2,548,763 members, including 223,676 women, and divided into 47 districts. They are very strong among the metal and mineral workers, in the building trades, and among the transport and factory workers. During the war the Socialist unions have lost more than 60 per cent of their membership. The Hirsch-Duncker or Liberal unions were started in 1868 in order to unite the workmen who supported the Radical Parliamentary party. They have since lost their political interests and are now mainly economic in character. They recognize the equal rights and duties of capital and labor and are non-socialistic. Their membership is mostly skilled workmen, and in 1912 they numbered 109,225.
LABOR ORGANIZATIONS

Socialists being barred from membership. The Christian or Catholic unions were started in 1894 as a result of the anti-religious bias of the Socialist unions. They are most numerous in the Catholic industrial and mining districts of Westphalia and the Rhine Valley. They repudiate Socialism and class conflict and support only the Center, or Catholic Party. They are less aggressive than the other unions. In 1912 they had a membership of 34,687, which is gradually decreasing.

Besides these three principal classes of unions there are several minor groups. There are some independent unions, yellow unions promoted and subsidized by employers, and some Polish unions.

France.—Modern trade unionism in France was greatly retarded by the Law of 1791, which prohibited labor combinations. The old guild system was thereby overthrown and no organizations were allowed to take its place. Napoleon I tried to form compulsory organizations of employers and employees, but failed. Before 1894, however, many unions sprang up secretly formed. In 1892 the latter united with friendly societies or under such a disguise. The revolutionary activities during the middle part of the century gave great momentum to the labor movement and workmen began to demand strongly the right of combination. In 1899 trade unionism began to be tolerated, though they were still illegal. During the seventies numerous unions were formed and several labor congresses held in Paris. All during this time unionism was closely connected with the various factions of the Socialist party.

In 1884 the Syndicat law was passed, legalizing trade unions and strikes. Since then French trade unionism developed rapidly. In 1886 a National Federation of Syndicates or Unions was formed. In 1887 the first bourse du travail, or labor exchange, formed by workers opposed to the Federation, was opened in Paris. The latter takes in workers of all trades. It spread all over France and in 1892 a National Association of Labor Exchanges was formed. In 1902 the latter united with the General Confederation of Labor, which in 1895 took the place of the National Federation. The General Confederation is revolutionary in spirit and believes in direct action, such as general strikes, boycotts and sabotage rather than in political action. It consists of national federations of trades and industries, national unions, single local unions and labor exchanges. It is characterized by a lack of centralized authority, discipline and stability. Owing to its revolutionary spirit France has had many strikes. In 1912 the Confederation had a membership of 600,000 workmen.

Italy.—In Italy trade unionism is closely connected with Socialism and its growth is very recent. The first important Italian labor organization was the Unione del Lavoro, founded in 1864 at Rome, under the influence of Mazzini, and were mostly co-operative. At present the Italian labor unions are of several kinds. The General Italian Federation of Labor is made up of Socialist unions and was formed in 1906. It is the most important organization and in 1912 had a membership of 400,000. The Unione Sindacale is syndicalist and believes in direct action. It has a membership of 100,000. The Catholic unions include mostly women and are as yet not united. They also have a membership of about 100,000. The agricultural laborers form a National Federation of Rural Workers and have more than 150,000 members.

Austro-Hungary.—In 1859 Austria tried to compel by law employers and employees to unite into trade guilds, but failed. In 1869 the workmen of Vienna won through demonstrations the right of combination. Since then trade unions came into existence, but owing to racial differentiation and antagonism their growth was rather slow. Most of the trade unions are found in Vienna and the industrial districts of Bohemia, and Lower Austria. The General Commission of Austrian Trade Unions had in 1912 a membership of 423,000, 50,000 of whom were women. To this organization also belonged 70,000 Bohemians, some Poles, Italians and Slavs. In addition there are two independent movements, one among Bohemians and one among Germans, each having a membership of 85,000. The Catholic unions had 82,000 members, 45,000 belonging to the General Commission. During the war Austrian unions have lost more than 60 per cent of their membership.

Hungary has a separate trade union movement, whose centre is Budapest. The National Centre had in 1912 a membership of 112,000. Besides that we have the Christian unions and separate movements in Bosnia, Herzegovina and Croatia-Slavonia. At the beginning of the war Hungarian trade unions lost 50 per cent of their membership, but since 1916 thousands of miners, iron and metal workers and government employees have joined the trade union movement.

Russia.—Under the old régime the development of Russian trade unions was greatly hampered by the autocratic government. Labor began to organize in the latter seventies under the leadership of the intellectuals and the Social Democrats. The unions were suppressed and continued to revive under different names only to be suppressed again. With the middle of the nineties taught labor how to organize secretly under the banners of the Social Democratic party. Many strikes followed and several general strikes took place during the Revolution of 1905-06. The Constitution granted at the end of the Revolution gave labor the right of association and of striking. The latter was a dead letter and unions continued to be persecuted up till the Revolution of 1917. While the larger part of the labor movement was absorbed in the Socialist movement, there were numerous non-Socialist labor organizations, which were benefit or friendly societies. Some of the latter kind were supported by the government. After the Revolution of 1917 unionism spread like wildfire. The Bolshevik Revolution in November 1917 resulted in the government passing over into the hands of the workmen.

Belgium and Holland.—The abolition of guilds in Belgium occurred in 1795 and since then trade unionism gradually developed out of trade benefit societies. In 1879 Belgian workmen started co-operation and, in 1885, a Socialist workmen's party was launched. The
latter conducted general strikes in 1893, 1902 and 1913. The unions affiliated with the Labor party have a membership of 116,000. The Catholic unions have 82,761 members. In Holland the trade union movement has been weakened by religious differences and legal repression. The Federation of Trade Unions of the Netherlands in 1912 had 61,535 members, the Catholic unions 25,000 and the Protestant unions some 7,000. There were 50,000 more union men belonging to other organizations.

Candinavia.—The trade union movements in Sweden, Denmark and Norway are closely allied. In Sweden trade unions began to form in 1880 and in 1890 a national organization was formed, which in 1912 had a membership of 85,000. The latter was greatly weakened by strikes and lockout during 1909, when it lost more than half of its membership. The syndicalist unions have some 35,000 workmen. In Denmark trade unions came to an end in 1857 and trade unions began to appear in the early seventies, uniting into a General Federation of Labour in 1902 a membership of more than 100,000 and was allied with the Socialists. There are also some Christian and some Syndicate unions. The General Federation of Norway has a membership of 64,000. In Sweden and Denmark trade unions greatly increased their membership during the war.

Switzerland.—Swiss unions resemble closely the German trade unions. The National Federation in 1912 had 80,000 members, the Syndicalists 7,000 and the Catholics 4,000. Besides these there were 45,000 organized engineers and railwaymen. Since 1886 all the unions are united into a Worker's League, which meets every three years in a congress and elects a labor sectorat to represent the unions in the government. The Swiss unions are very conservative.

Australia and New Zealand.—Trade unionism in Australia and New Zealand is very common and extends in almost every industry. In 1916 Australia had 705 unions with 465,536 members. Extensive strikes took place in Victoria in 1890 in which the unions lost the latter organized a labor party and entered politics. By 1915 the Labor party was in control of the government of Australia and of the governments of all the states of the commonwealth except Victoria. New Zealand in 1912 had 322 unions with 60,000 members. The strike of 1917, in which the unions were beaten, weakened the unions considerably.

Other Countries.—The National Federation of Trade Unions of Spain has a membership of 100,000 and is growing rapidly. Legal repression hampers its growth and railway strikes are still prohibited. South Africa has 100,000 union men, mostly miners, engineers, railwaymen and building workers. Canadian trade unions are closely allied with the American labor: a convention held at Rochester and Labor. There are also some independent unions. The former has 86,542 members and the latter 13,717. There are also trade union movements in Finland and the Balkans.

Selig Perlman,
Department of Political Economy, University of Wisconsin.

LABOR PARTY. The British political party made up of trade unions, trades councils, Socialist societies and labor associations. The name was adopted by the Labor Representation Committee in 1906 and its purpose was declared to be the maintaining of a parliamentary Labor party acting independently as to policy and working. In order to secure the election of truly representative candidates, these candidates must accept their constitution and follow the decisions of the groups. An affiliated society has to become financially responsible for its candidate's expenses and his constancy. The Labor party business is carried on by an executive committee of 13 members, nine representing trades unions, one trade councils and three Socialist societies. Funds are raised by assessing affiliated societies at two pence per member per annum. The candidates must appear before their constituents under the title of Labor candidates only. While, in 1910, the Labor party had but 42 representatives in the House of Commons with its 657,000 members, they have proved itself a powerful factor in legislation. In 1916 the voting power of the Labor party was approximately 1,500,000 and became, politically, the central Socialist body for Great Britain, with 37 members in Parliament and its ex-chairman, J. Ramsay MacDonald, M.P. The Independent Labor party is an off-shoot of the Labor party and was established in 1893 but actively supports members of the parent concern at times. Dissenting from the majority on a vote at the beginning of the war the members continued during the war, Chairman MacDonald resigned and Arthur Henderson succeeded and entered the Coalition Cabinet (1915) the chairmanship devoted on John Hodge, W. brace, M.P. and G. H. Roberts, M.P., former officials of the Labor party were also taken into the ministry.

LABOR TURNOVER. Definition.—The first definition of the term 'labor turnover' that has been presented with any considerable degree of authority was offered by the Bureau of Labor Statistics of the United States Department of Labor, in 1918. Prior to this time there had been so great a diversity of opinion upon this subject that it was difficult to find two authorities who agreed in every particular. At the National Employment Managers' Conference, held at Federation and Labor, there was appointed to define the term and fix a method of computing the percentages of turnover, but the original report of the committee was not favorably received, its rejection being due to the fact that it was based on net hirings instead of separations.

Adopting the conclusions that were reached by a majority of the delegates to the Rochester conference, the Bureau of Labor Statistics
preparing a report which has since been very generally accepted as the standard definition and method of computation in the matter of labor turnover. This report defines labor turnover as follows:

Labor turnover for any period consists of the number of separations from service during that period. Separations include all quits, discharges and lay-offs for any reason whatsoever.พรรนาการการการ

Computing Turnover.—The bureau's report was also the first official attempt to establish a standard method by which the percentages of labor turnover might be computed. This follows:

1. The percentage of labor turnover for any period considered is the ratio of the total number of separations during the period to the average number of employees on the force report during that period. The force report gives the number of men actually working each day as shown by the attendance records.

2. It is recommended that the percentage of turnover be computed for each week. All turnover percentages for a week or for any other period should always be reduced to a yearly basis.

3. To compute the percentage of labor turnover for any period find the total separations for the period considered and divide by the average of the number actually working each day throughout that period. Then multiply by the proper factor to reduce to a yearly basis.

4. Example: Method of computing percentage of labor turnover for one week:

Total number of separations during week, 300.

4. Daily force report (workers actually on the job): Monday, 1,020; Tuesday, 1,065; Wednesday, 1,070; Thursday, 1,035; Friday, 1,040; Saturday, 900. Average for week, 1,037.

5. Percentage of labor turnover:

\[
\frac{300}{1,037} \times 52 = 1,505 \text{ per cent.}
\]

6. Percentage of labor turnover for one year (assuming that records of daily attendance are averaged for each month):

Total number of separations during the year, 5,020.

Average number working each month as determined from the force reports or daily attendance records: May, 2,040; June, 2,100; July, 2,000; August, 1,980; September, 2,200; October, 2,220; November, 2,280; December, 2,240; January, 2,250; February, 2,170; March, 2,230; April, 2,400. Average for year, 2,176.

7. Percentage of labor turnover:

\[
\frac{5,020}{2,176} = 231 \text{ per cent.}
\]

8. In case the number employed by a plant or a department of a plant decreases because it is the deliberate policy of the plant management to reduce permanently its working force, this fact should be explicitly stated.

Cost of Labor Turnover.—The significance of employment matters in their relation to the cost of production is clearly demonstrated by the fact that the best authorities in industrial efficiency, both in the government service and in private industry, are devoting so much time to the study of these problems. They have long since reached the conclusion that the shifting working force represents one of the most enormous sources of wastage with which the manufacturer has to contend, as well as one of the greatest avenues of personal loss for the individual worker, and they assert that time and money are not wasted when these expenditures result in a reduction of the labor turnover.

There are, of course, no methods sufficiently comprehensive to apply in computing the cost of the labor turnover in all plants, because, of necessity, this expense, depending upon the cost of employing and training skilled workers, must differ, not only in each industry, but to some degree in each factory as well. Magnus W. Alexander, who has made a most thorough study of this question, estimated that the 12 metal working factories of which he made a survey lost $331,000 in a single year in the effort to maintain a normal force of workers. During this period 42,571 persons had been employed and 37,274 employees had quit the organizations for one reason or another, making a net increase in the working force of only 6,697.

While few reliable investigations have been made regarding the actual cost of changing help in industrial plants, it is generally agreed that the estimate of $40 per operative is extremely conservative. As Mr. Alexander says ("Hiring and Firing"): "While one manager estimated the cost of hiring and breaking in an employee at $30, the estimates of all others ranged from $50 to $200 per employee. The great difference in these estimates is no doubt due to the diversity of the industries represented by these managers. Most estimates ranged between $50 and $100."

In view of Mr. Alexander's estimate that it costs $73.50 to engage and break in a new semi-skilled operative and $8.50 to make an unskilled laborer fit into this part of the organization, it would seem that the lower estimate of $40 might safely be adopted as a minimum cost of a new worker, yet, even at this figure, the labor turnover becomes an item of expense that is worthy of the most serious consideration, the loss from this source undoubtedly being greater than that due to strikes.

For example, it is generally admitted that a labor turnover of 100 per cent should provide for every contingency, including all weaknesses in the labor situation and the inefficiency of the employment force. This estimate is based upon the assumption that about 1 per cent of the employees will be annually; that from 4 to 5 per cent will have to be replaced because of prolonged absence due to illness or other unavoidable causes; that about 5 per cent will be discharged for justifiable reasons; that about 8 per cent will leave with legitimate excuses, and that another 8 per cent will be released on account of natural fluctuation of production. It is also admitted, of course, that no employment department can be operated on a 100 per cent efficiency basis, but, assuming these estimates of the percentage of labor turnover to be reasonably correct, the difference between them and the 100 per cent turnover should make ample provisions for all conditions that might arise, including human frailties and all normal changes in the labor situation.
LABOR TURNOVER

As a matter of fact, however, a 100 per cent turnover is the exception and not the rule, for in plants where special efforts have been made to stabilize the working force it is not uncommon to find the turnover ranging from 200 to even 700 per cent, and this under conditions that are not regarded as abnormal. For example, the United States Bureau of Labor Statistics, in a study of the turnover of 12 companies in the San Francisco Bay region, for year ending 1 June 1918, found it had been necessary to hire 32,489 persons to keep 14,083 jobs filled. This means an annual turnover percentage of 224 for the aggregate labor forces of these concerns. To compute the cost of this changing force, estimating the expense at the conservative figure of $40 per man, indicates how stupendous must be the economic waste that is traceable directly to this source, an amount running into the tens of thousands—if not hundreds of thousands—for the average employer every year.

Computing Turnover Cost.—The difficulties of computing the cost of labor turnover are many, as the item of expense is one that depends largely upon the character of the industry and individual plant conditions. Thus, in plants where highly skilled workers are required an operative is not easily replaced and the cost of finding a successor for such a workman is much greater than that of employing an unskilled or even a semi-skilled laborer. Other factors besides those of skill and experience also have a bearing upon this question, for the cost of breakage in new operatives must necessarily depend upon such considerations as the value of the tools or machinery with which they work, or the value of the materials which they must handle.

In spite of all these difficulties, however, there are certain basic principles that may be followed in making an analysis of the cost of employing workers. These include (1) the cost of hiring; (2) the cost of instruction; (3) the loss through wear and tear on tools and machinery used by unskilled hands; (4) the loss through excessive waste made by inexperienced hands; (5) the loss through reduced production, including the excess plant equipment required to offset the smaller production made by inexperienced operatives.

This cost of turnover may be summarized as follows:

(1) In figuring the cost of hiring include (a) the salaries of employment department officials and clerical help; (b) the cost of advertising and printing; (c) the cost of physical examinations; (d) all such miscellaneous expenses as fees to labor bureaus, cost of badges, etc. In regard to the item of employment department salaries, Boyd Fisher (in 'Determining Cost of Labor Turnover') calls attention to the fact that while other costs of hiring may be spread over the total number hired, the same rule does not apply in the case of employment department expense. Figure total number of men on 'live' record during the year, whether employed or not, he writes, 'substitute the total for average standing payroll. The ratio of remainder of names to the total on 'live' record is proportion of cost of salaries which should be spread over the number of men hired.'

(2) A computation of the cost of instruction should include: (a) the time of foremen spent in the instruction of new employees; (b) the time of workmen devoted to breaking in new help; (c) the time of inspectors or investigators required in handling work of new employees; or, if segregated schools are in operation in the plant: (a) the salary of the director of the department schools; (b) the wages of the instructors; (c) the cost of the equipment devoted to school purposes, including all such items as interest on capital invested, depreciation, power, repairs, etc.

(3) In figuring the cost of wear and tear include (a) the excess time spent by maintenance department on machines used by learners and new operatives; (b) cost of excess materials used for repairing these machines; (c) excess breakage and wear on tools, etc., and, when possible, (d) the cost for premature depreciation of machinery.

(4) The loss through spoiled work and other waste may be found by comparing the total scrap and waste made by new men with that made by old men. By dividing the difference by the number of men in the shop, the total per new employee will be obtained.

(5) The loss due to reduced production depends, of course, upon the value of the article produced and the skill and experience necessary for its production, but there are various ways in which the cost can be estimated with approximate correctness. One of these is presented by Mr. Fisher in his study of turnover costs. He says: "(a) Select a number of machines worked by new men and an equal number of like machines worked by men over a year in service; (b) record the production of each group until the total of new men reaches the total of old men; (c) time required to reach this may be taken as average learning time; (d) total difference of production during this time may be spread over the number observed and the average taken as the loss for the average man hired; (e) for men dropping out of the group while under consideration substitute one with approximately equal production and equal length of service." The excess plant cost and the loss due to reduced production should be figured separately and then added together, because, as Mr. Fisher points out, the burden is not the same for man and department for department. For example, in departments where wages are in proportion to efficiency, 'excess plant' costs plus excessive supervision constitute the sum lost by slow production. In estimating the excess plant cost he suggests that we "assume that the plant investment required under present conditions will bear the same ratio to total investment in plant which would be needed if there were no turnover, as the production which would be possible with the present equipment operated by all experienced men would bear to the present actual output. In other words, if the reduced production is 20 per cent the excess plant required is 20 per cent."
clearly that the desired results may be attained by these means. Of course, this does not mean that the inauguration of the various "welfare" schemes in lieu of a fair wage and otherwise decent working conditions will be permanent, any more than a remedy for industrial unrest, for nothing could be further from the truth. The first step in stabilizing employment is to make certain that the wages paid will compare favorably with the wage prevailing in competitive plants and that the hours of labor are fixed; conditions are the best that can be offered. Once these foundation principles have been firmly established, however, the work of creating a loyal, efficient and stable force of workers can be undertaken with confidence.

In accomplishing these results it is not necessary that all, or even a greater part, of the suggestions embodied in this article should be adopted. The ideas suggested represent many of the plans that have been put into practice by a large number of different employers in various sections of the country and all tend toward the same end by giving assurance to the worker that it is the purpose of the employer to see that he receives a square deal.

In other words, so-called "welfare work" is successful only when it assumes a logical place in the program of a "square deal shop."

The first step in the reduction of the labor turnover is the establishment of a properly-equipped employment department under the direction of a high grade man who must be given all necessary authority and one of his first duties will be to ascertain, by the study of carefully compiled statistics, the sources of the excessive turnover and, as far as possible, its causes.

These facts ascertained, as they will be by an efficient employment manager, ways will be found to remedy existing defects in the organization. By hiring men in accordance with properly prepared "job specifications" he will greatly reduce the danger of assigning new employees to jobs that they are not fitted to perform; by seeing that they are given adequate instructions he paves the way for more speedy efficiency in service, which means a higher earning capacity for the worker as well as greater and better production for the firm, while in the majority of establishments the employees and the employer he is in a position to receive the grievances of the workers, to see that any injustices are made right, errors are adjusted or misunderstandings explained to the satisfaction of the parties so as to prevent friction.

The supplementary remedies that have been adopted by those who have interested themselves in the effort to make employment congenial for the employed include a wide variety of activities. In many plants a number of these activities have been found helpful, so far as the writer's knowledge extends, in no case where a well-defined program of such activities has been adopted has the plan ever been dropped. Undoubtedly, as Boyd Fisher says, "it is hard to make an intelligent guess as to what is owing to the difficulty that a plant has in establishing its character with its workmen."

Workmen have been disappointed too often to be anything but skeptical. They have tested too many mere paper plans for their welfare to place any easy reliance upon new ones. But when a management, by showing by the ability, determination and good spirit, carries through during a term of years a program of employees' betterment, it cannot fail to win their confidence and friendship—two factors which, he might have added, constitute one of the strongest incentives to loyal and efficient service.

These plans include:

Health, Sanitation and Safety.—The provision of standardized sanitary working conditions, with sufficient light, proper temperature and adequate ventilation, properly maintained toilets and well-equipped washing and dressing-rooms. While many plants now provide for a physical examination of applicants for employment, others who do not make this requirement have established an emergency, or first-aid, hospital where quick and efficient treatment can be given to those who meet with accidents or who are taken ill. In some instances regular physicians are kept in attendance, in others graduate nurses are in charge of the emergency work, and the nurses frequently perform equally important functions as home visitors or by acting as friends and advisers to the female workers.

There are plants in this country where a dentist and an optician are regular members of the physical staff and in a few cases the medical supervision includes attendance upon the workers even when they are confined to their homes. Where there is a physician on the staff he is almost invariably a member of the safety organization and is intrusted with the duty of seeing that the plans of the management regarding the enforcement of all safety regulations and the adoption of standardized equipment for the protection of the operatives are effectively carried out.

Lunchroom.—The maintenance of lunchrooms where properly selected and carefully prepared foods are served, practically at cost price, is common. In some plants three regular meals are served daily that workers who do not live at home may have an opportunity to secure the right kinds of food at reasonable prices; in the majority of plants lunch service is confined to one meal—luncheon or dinner—for each shift of operatives.

Co-operative Stores.—For the advantage of those who are housekeepers many plants maintain co-operative stores, thus using the purchasing power of the company to buy commodities cheaply and dispose of them to the workers with little or no profit. Some concerns have developed this plan to so high a degree that they supply their employees with bakery products baked in their own ovens, and vegetables and dairy products from their own farms, as well as the commodities which are ordinarily found in such stores.

Promotion of Thrift.—Many of the activities that have been adopted along betterment lines are designed to bring a proper use of the income on the part of the employees. To accomplish this result, different avenues of approach are required. These include (a) the promotion of a mutual aid association, providing something beyond the benefits for the employees; (b) the establishment of a home building association; (c) the
Labor Union, American—Labor Unions

Maintenance of banking facilities (either in connection with or independent of a local bank), through which employees may deposit and withdraw their savings and transact other banking business without loss of time or danger of loss through fraud or error; (d) payment at discount of the debts of overburdened employees, the money to be repaid in small weekly installments; (e) furnishing free legal aid in safeguarding real estate transactions of the workers, in preventing their exploitation by unprincipled professional men and tradesmen and in affording them advice and assistance in case of other legal troubles; (f) discourage the use of alcoholic drinks and other habits that lead to extravagance; (g) encourage the employees to purchase stock in the company as an avenue for the investment of their savings, thus giving them a personal interest in the prosperity of the plant.

Educational.—The establishment of classes in foreign-born workers, supplemented by instructions in citizenship. In some plants the work of instruction is carried still further, classes being formed for those who desire to pursue the studies that will fit them for higher positions in the employ of the company. Others enable the employees to improve their education by reimbursing them for the money they may spend in courses of study when completed.

Housing.—In many cases companies have found it advantageous to inaugurate housing developments, thus enabling the workers to live under decent conditions in a proper environment, either by the payment of rent or on an installment-purchase basis. In several instances thriving communities have been established, with all the attractions of small city life, and under conditions that are conducive to health, contentment and efficiency.

Developing a Plant Spirit.—Many of the activities adopted by different plants are particularly designed to develop a spirit of friendship and loyalty on the part of the employee. Among these are (a) the plant paper, a periodical which details the gossip and news happenings in the plant and which has almost invariably proved a source of great mutual enjoyment and profit; (b) the promotion of social functions, such as picnics during the summer months and entertainments, amateur theatricals, minstrel shows, amateur circuses, lectures and dances in the winter; in some plants foremen's meetings or dinners are held; in others, departmental gatherings for various social purposes; (c) the encouragement of any form of self-directed organization on the part of the employees as long as they are not contrary to the interests of the plant; such organizations including singing societies, bands, drum corps and all kinds of athletic activities. In many plants such facilities as athletic fields, hand-ball courts, tennis courts, indoor gymnasiums, bowling alleys, billiard tables and even playgrounds for the children or the employees are provided.

Day Nurseries.—In several instances day nurseries have been established in manufacturing plants for the care of the small children of women who are compelled to support their families or who are unable to work and properly care for their little ones.

Suggestion Box.—Many employers have reported the success of plans for considering written suggestions submitted by employees, the reward being such commendation, promotion or prizes as the employee may deposit and withdraw.

Protection for Workers.—During the past few years many plans have been adopted for the better remuneration and fuller protection of employees. These include (a) the payment of bonuses for efficient and faithful service; (b) the purchase of group insurance providing for payments in case of sickness or death; (c) the pensioning of aged or disabled employees, and (d) various plans for profit-sharing that have been adopted as a substitute for the pension. In addition, there are the several systems of co-operative management that have been adopted as a means of reducing the labor turnover through the promotion of industrial peace and contentment and which range from a slight variation from the ordinary shop committee to the more radical industrial democracy. Consult Slichter, S. H., 'The Turnover of Factory Labor' (1919).

John R. Meader,
Labor and Service Department, Brighton Mills, Passaic, N. J.

Labor Union, the American, a Socialist-Labor organization founded in May, 1886, as the Western Labor Union. At a convention held in Denver, Colo., in 1902, the scope of the organization was widened and the name changed. It favors international socialism, and the government of the body is more centralized than ordinary federations of trade unions. The Union is composed largely of trade unions in the States of Colorado, Idaho, Montana, Washington and Wyoming. The organization is governed by an executive board of nine, and the usual president, vice-president and secretary-treasurer of such unions. The term of the officers is two years and they are voted for by the entire body of members. It has about 173 local unions, 5 district unions and a membership of 150,000. The most important affiliated organization is the Western Federation of Miners. The official organ is the Voice of Labor, published at Butte, Mont.

Labor Unions. The government of labor unions has developed somewhat like our political institutions. First there was the local union, which confined its activities to one place and was very democratic. The members all came together in primary assembly where they decided all questions and elected a few officers for short terms. In time several unions in the same industry came together and formed a State or interstate union. These soon evolved into national organizations, such as the United Mine Workers or the Brotherhood of Locomotive Engineers. Then there seems to have been a conscious effort to model after our political institutions. The local unions still exist. Some such organizations in a particular State have a State union though there is little State organization except in federations. City and State federations exist largely for political purposes, to influence elections and secure favorable legislation. At the top of the unions in any particular industry stands the national union. This is governed by a convention of delegates from the local unions and a set of executive officers. However, direct legislation by the initiative and referendum has gone a long way toward displacing convention legislation. It
also solves the vexatious problem of proportional representation.

Centralization.—The extent of centralization has greatly increased in the different unions. The Cigar Makers' International Union has taken over a great many matters formerly left to the local unions and still left to them in some organizations. Extensive supervisory powers are vested in the hands of the president and the financial officer. Sick, disabled and unemployment benefit funds are left with the locals, but the administration of these funds is rigidly inspected by the financial officer. The use of the union label is another matter of national control and fines may be imposed for violation of the rules governing it. The United Mine Workers is a very democratic organization. Since 1911 the constitution has provided that no strike shall be ordered or called off by district or national officers without a referendum. The centralization of industry has done much to centralize the unions, though it is still possible for local strikes to be called in some industries. At the top of the orders stands the American Federation of Labor (q.v.), though several of the larger unions never have affiliated with it. It is more nearly a confederation. It is a federation of federations. Local unions, with few exceptions, are known to it only through city, district, State or national federations. Exceptions are made in favor of unions which have no national federation exists. The executive council may levy a tax of one cent a week per member on the affiliated unions for not more than 10 weeks, the proceeds to be used to support an affiliated union on strike.

Membership.—Previous to 1880 membership in the unions was controlled mainly by the locals, but since that time this has passed more and more into the hands of the national authorities. Especially have they been active in forming new local unions. The race question is a vexatious problem. Two or three unions, mostly in the railway service, absolutely exclude the negro. The Knights and the American Federation are favorable to him, but he has a hard row in many unions from which the negro is excluded. The fee for the right to be exacted of new members is generally left to the locals, but this is some times abused to exclude persons not desired by the particular local. To correct this some national unions prescribe maximum and minimum fees. Some require actual instruction and work in the trade amounting virtually to an apprenticeship and this must be in a "fair" shop. Kinship often plays a part. For example, in 1905 a local of the Plumbers' United Association accepted none but sons of journeymen or boss plumbers as apprentices. Limitations upon the number of apprentices are common. Competency for membership is tested in most unions by wage-earning capacity. The applicant must be competent to command the minimum wages established by the local union. A few apply the time test, that he shall have worked three years at the trade. A few combine the tests of wages and time. Some unions will not admit foreigners unless naturalized, or exact high fees of them. In some the presentation of the national union, or the presentation of a foreign card. Under certain conditions members may be required to withdraw or they are automatically dropped, for example, when a member advances to the position of foreman or employer.

The control exercised by unions over their members is considerable. The only penalties they can impose are fine and suspension or expulsion, but the force of these is very great. The courts have held that such fines are not unlawful and a few decisions intimate that that they may be collected by law. At least they may expel from membership for failure to pay the fine and this renders it very difficult for the one thus expelled to secure employment. The legality of such expulsion will be looked into by the courts and in one case a New York court has ordered restoration to membership. In some unions these penalties may be imposed by the locals. The Carpenters and Joiners Union requires trial by the district council, where one exists.

Benefits.—American unions were much later than the English in developing benefits, although until recent times there was no system of State insurance against accidents, sickness and unemployment, and no old age pensions. The leaders in this work have been the International Typographical Union, the American Federation of Labor, the Cigar Makers' International Union, The United Brotherhood of Carpenters and Joiners and the Street Railway Employees. The Typographical Union began paying burial benefits in 1892 and the same year it opened a home for disabled printers at Colorado Springs. In 1916 it paid $274,822 in death benefits, $352,920 in old age pensions and $109,431 for the maintenance of the home. The death benefits paid by the Carpenters in 1916 amounted to $314,977, by the Street Railway Employees, $283,287. The total of such benefits paid by over 70 unions in the American Federation amounted to $2,264,610, the sick benefits, $1,068,609, death benefits to members' wives, $63,662, for unemployment, $120,770, traveling benefits (in search of employment), $26,283. In 1916 the Carpenters voted almost unanimously for an assessment of 20 cents a month for an old age donation fund. A man 60 years old and for 25 years a member of the union is entitled to $10 a month. Some unions of the Cigar Makers' Federation have similar arrangements, especially the railroad brotherhoods.

The accumulation of strike benefit funds is a common practice. The funds paid out by the members of the Federation in 1916 amounted to $2,798,789 to which should be added $154,009 paid by unions to aid other unions. For the relief of the Danbury Hatters, who were heavily fined for boycotting, the Federation collected $138,636.

By far the larger part of organized laborers belong to crafts unions. The industrial revolution and its continued evolution has brought about a disintegrating tendency in unions, crafts becoming subdivided into many new crafts. The result has been many and bitter jurisdictional disputes. For example, in the building trade steam fitters and plumbers have often disputed over the handling of certain pipes. Some now show a tendency toward more comprehensive organization along industrial lines, such as the United Mine Workers, which includes all workers about mines. Another still broader organization is the Independent Workers of the World (q.v.).
Women's Organizations.—Previous to the Civil War most of the organizations of women were local and more or less temporary. The first organized factory workers were organized for a strike in 1828 and those at Lowell in 1838. In the fifties there was a renewal of activity and there were many strikes for fewer hours and better pay, but practically all failed. Attempts at peaceful trade agreements also failed, but the public was sufficiently aroused to secure a few laws limiting the hours.

The Civil War had been particularly hard on the working women and brought many into the labor market who had never been there before. Organization now began anew, though conditions were so hard in the sewing trade that organization from within was almost impossible. Two States-wide organizations for women were soon formed, one in Massachusetts and one in New York. Only two national unions of men at this time admitted women. In the Typographical Union there was great opposition to the admission of women, mainly because of the low wages for which women worked. In 1868 the Woman's Typographical Union was formed, secured recognition of the national convention and was led by Lissa Augusta Lang, corresponding secretary of the national union, but no woman has ever since held a national office. In 1881 women were admitted to the Knights of Labor. At the Richmond convention in 1886 the women delegates (76) formed a permanent organization to investigate the condition of women workers and to demand equal pay for equal work and the abolition of child labor. The organization of locals was now taken up by Mrs. Leonora Barry and carried on for four years with energy. The American Federation admitted women from the beginning (1881). In 1891 the office of national organizer to be filled by a woman was created, but little was done for several years, partly due to the panic of 1893. More male unions now began to admit women. In the later nineties there was a renewal of activity in the organization of women and many locals were formed, notably in the laundries and packing industries.

Real national organization began in 1904 with the Women's Trade Union League, the main object of which was to secure the organization of women, a work in which Mrs. Raymond Robins (elected president in 1907) became very active. This organization aided the strikers in the sewing trades in 1909-11. To-day is largely due to the present unions of the cloak makers, waist makers and other white goods workers. It established with Hart, Schaffner and Marx the "Preferential Shop," on which was based the "Peace Protocol" in the New York cloak and suit industry, affecting 300,000 workers.

The great strike of 1909 gave a great impetus to the organization of women. The Ladies' Garment Worker's Union soon rose to third place in the American Federation, though it holds fourth, having been passed by the Machinists. Yet this organization is officered by men.

The attitude of the unions of men toward admitting women is determined partly by geography—more favorable in the West than in the East—mainly by the character of the trade. Those trades in which men supply the greater part of the labor have tended to be hostile though most have ultimately realized that it was better to have the women with them than against them.

It is the duty of the unions to promote the interests of the members first of all. They seek to do this in many ways, among them by securing the following: (1) Shorter day, now generally eight hours. This is done partly out of consideration for personal welfare, partly to make work more for more people. (2) Higher pay, through the closed shop, limiting apprentices, restricting immigration, and sometimes the tariff. (3) The closed shop, through the union label, the boycott, extending the boycott even to the use of machinery made by non-union labor, and using it to control commerce and even the retail business. Dealers sometimes have to get the consent of unions to move perishable goods, simply because they were handled by non-union men in a distant State. Even the United States government has been forced to secure permits. In 1916 a non-union competitor sought an injunction against the cigarmakers' boycott, the object of which was to stop the sale of his cigars at retail. (4) Employment for men—through giving employment more times, such devices as "full crew" laws, opposition to "scientific management," but opposition to new machinery has about ceased. (5) Limitation of production. Probably this is one reason for opposition to convict labor, though the unions have voted for Compensation for accidents. All are agreed on the employers' liability, but not on a fixed scale of compensation fixed by law. (7) The safety of workers. (8) The extension of mutual aid, through strike benefits, insurance, etc. (9) The molding of public opinion—through publicity.

The demands of the political parties as formulated in 1916 were: (1) Adequate compensation for employees of the government, including a minimum wage; (2) a compensation law; (3) a retiring allowance; (4) a tribunal of appeal and (5) the right to organize; (6) government ownership and operation of the telephone, telegraph lines; (7) equal suffrage and (8) restriction of immigration. The unions do not enter politics as a party, but they work for the election of those who will be sympathetic to them in the fight for the defeat of men known to be hostile.

The unions composed of women or in which the women predominate seek primarily the betterment of women. The specific things they call for vary according to geography and industry, but all are pretty well agreed on the need for greater safety and they have been influential in securing better protection against fire in factories. Some are strong for educational industrial training, industrial history, the teaching of the philosophy of collective bargaining, and of the relation of government to labor. They demand equal suffrage and protest against the anti-woman's suffrage activity of the leisure class.

Legal Status.—The legal status of the unions will vary as to what they may do and what they may not do, is well established in some particulars, in others it is not. Collective agreements are legal and an employee who has contracted for a certain sum may recover more, if it afterward transpires that the employer is not able to pay it for more for its members. Whether the employer could recover from an employee after having made a lower contract with the union
does not seem to have been decided. The closed shop by agreement has been held legal, but the State may not require private business to be run on this principle, as Arizona sought to do. It may require only the allowance on public works, as in the New York case, though the Nebraska Supreme Court has rendered a decision to the contrary, and quotes cases in six States to sustain it. Neither can the State favor unions by forbidding employers to exact as a condition of employment, from the employee not to affiliate with any union (Coppage v. Kans.). Several States had followed the lead of Kansas in attempting to give such protection only to have their acts declared null and void.

Picketing is a common practice, but is stubbornly resisted by employers. In 1913 Judge Sayer (Ohio) declared that picketing was lawful when done "in a peaceful manner and by such limited numbers as not to awaken the fear and lead to the intimidation of workmen," but the following year the majority of the Supreme Court of Michigan held that there could be no such thing as peaceable picketing (In re Langwell) and quoted several cases to sustain the opinion.

The boycott has been declared legal by the courts of California and Montana. Elsewhere it is illegal, unless made legal by legislation. California, Maryland and Montana have legalized the peaceful boycott. Alabama, Colorado and Illinois have outlawed it by name. The publication of "unfair" lists has been held illegal several times (Buck Stove case, and Loewe v. Lawler), but the union papers continue to print them. Suits for damages have been instituted, the most noted of which was the Danbury Hat case (Loewe v. Lawler), in which the court awarded damages against the members of the union. Several decisions have held that the unions, not being incorporated, are not liable. For that reason suits are brought against the members as individuals. However, in a few recent cases (1917) suits have been brought against both the individuals and the unions, and the courts have declared the unions liable.

Several acts have been passed to exempt unions from the operation of anti-trust laws (restraint of trade) and they have been held not to violate that clause of the Constitution which guarantees to all the equal protection of the laws. The Clayton Act (1914) gives a very limited legality to the peaceful boycott and the peaceful picket so far as the Sherman Act is concerned.

On the other hand, the very existence of certain unions has been declared illegal. Unions may exercise considerable control over their members, even to the collection of fines, but there are limits of control over members and of interference with outsiders to which they may not go. The Amalgamated Window Glass Workers had rules forbidding any except members and apprentices to work at certain trades and fixing the number who should be allowed to work in certain departments. Every member of such a union, declared Judge Phillips (Ohio), had surrendered his industrial freedom, making a contract he had no right to make. For this reason he ordered by dissolution of the company and the appointment of a receiver. For similar reasons Judge Dayton declared the United Mine Workers an illegal combination, though he did not order a dissolution and some points of his decision were overruled. So far full legal responsibility has been avoided by refusing to incorporate labor organizations, but the status is yet to be determined. See Arbitration, Industrial; Eight-Hour Law; Labor Legislation; Labor Movement in America.

Labor Vote. See Vote, Voters, Voting.

Laboratory (from the medieval Latin laboratorium, a workshop). The word is used to denote any room or building devoted to experimental investigations in technics and the sciences for the purpose of acquiring knowledge of special applications of natural law or of human physiology and mentality. Laboratories have been introduced into educational institutions to teach scientific and technical knowledge by means of experiment. The term is used to denote the workroom of a manufacturing chemist, or to the testing-rooms of an industry. In early times the nature of the chemical work of making drugs and potions was more or less disguised by the priesthood who called the place where they were made simply a workshop. Out of these early laboratories grew those of the Middle Ages. In this later period they were devoted to astrology, the making of drugs, potions and charms and to the search for the philosopher's stone by means of which it might be possible to change the baser metals into gold. Some of these laboratories were very important in that day, being patronized by the nobility or maintained at the public expense.

Among the first laboratories open to students were those of Parquin, who established a physiological laboratory at Breslaw in 1825, and the chemical laboratory of Baron von Liebig at the University of Giessen in the same year. The first physical laboratories for students were founded about 1840; one at Heidelberg, by Philipp Gustav Jolly, and one at the University of Glasgow by William Thomson—Lord Kelvin.

Among the great laboratories of the world may be noted that of the Royal Institution, established in 1800 by Count Rumford, which was to be devoted to the applied sciences, but which soon became the seat of great activity in researches in pure science, conducted by such men as Davy, Faraday and Tyndall. The Physikalische Reichsanstalt, in Charlottenburg, near Berlin, was a very famous laboratory where there were departments devoted to research in pure science, and other departments for the study of the application of science to industrial pursuits. In 1875 a committee of weights and measures, made up of representatives of 18 nations, was organized for the purpose of reproducing and furnishing inter-
national metric standards to the members. A laboratory for their manufacture and for research was established near Paris. Great Britain has placed with the Royal Society the control of its National Physical Laboratory, where standards of weights and measures are to be kept, duplicates made, instruments tested and research is to be carried on. In the United States the Smithsonian Institution (q.v.) was established in 1846. Many important lines of research have been developed there, out of some of which have grown up some governmental departments, as the United States Weather Bureau and the United States Fish Commission. The United States government has established, by act of Congress, approved 3 March 1901, a National Bureau of Standards, a suitable building and equipment also being provided. The buildings and equipment have been added to until there are over half a dozen well-appointed buildings in use. The bureau has the custody of the standards of weights and measures, and has power to manufacture duplicates, multiples and submultiples. It also has the power officially to test and calibrate physical and chemical apparatus and issue certificates for them. A great deal of work is done in standardizing and calibrating physical, chemical and technical apparatus and machines for educational institutions, manufacturing plants and various governmental departments. Tests of commercial products are carried out and standard specifications adopted, unifying and in many cases simplifying them. Researches in pure and applied sciences carried on have been of the greatest importance in technical and commercial work. Especially have important results been attained during the World War, in solving such problems as the production of optical glass, increasing the production of fuel for internal combustion engines and aid in the further development of wireless telegraphy and wireless telephony.

All American institutions of learning laboratories for studying science by means of experiment and for research have been established. In many preparatory schools, and in an ever-increasing number of high schools, elementary laboratories are included for the study of physics and chemistry. Chemical laboratories for educational purposes were introduced by the Rensselaer Polytechnic Institute and by the Massachusetts Institute of Technology.

Laboratories.—Laboratories for research and testing form an ever-increasing part of many industrial enterprises. Materials are treated either chemically or physically or both at various stages of the processes of manufacture, these tests often indicating the subsequent course that the material will take. Another function of the laboratory is the laboratory maintained by a large firm making paper from wood pulp. As an illustration of the gains made by such laboratories it may be remarked that much of what was formerly cast aside in the making of pulp paper is now manufactured into products which increase the profits of the business. In the paper manufacturer's laboratory there are not only machines for testing every possible quality of the paper, such as its ability to resist folding and creasing, but also a complete chemical laboratory, whose chemist, after years of experimentation, has found a means of making from a by-product of the paper a variety of charcoal much needed in clarifying certain drugs for pharmaceutical and other purposes.

Many industries of to-day are based on processes devised and worked out in laboratories for research. Some examples are the great plants at Niagara Falls, where metallic aluminum, calcium carbide, sodium carbonate and many other compounds are made. The basis of the progress in applied electricity is research in physics and chemistry. In many lines of industry scientific research in public and private laboratories has made possible new and better processes.

Notable examples of such progress are the recent developments in X-ray theory and apparatus, both wireless telegraphy and telephony, new alloy steels, chemical processes and products. The laboratory work done in the educational and technical chemical laboratories during the World War aside from purely war work have been of inestimable value in making the United States independent of foreign countries for certain products in which this country was previously almost entirely dependent. In those cases where government activity in research in sciences and its applications there is also the greatest industrial activity. And it may be expected with confidence that in view of recent developments that many more commercial laboratories will be established and a greater degree of co-operation will be developed between the industrial and great educational laboratories.

Biological Laboratory.—Research in the biological sciences has helped to a better understanding of life and to its prolongation. The causes of many infections and contagious diseases have been discovered and effective methods of prevention and of combating them have been found. The Pasteur institutes in many large cities all over the world are witnesses to these facts.

In psychology research and laboratory tests have lead to a better understanding of the limitations and adaptability of the individual for various lines of work. This matter has been brought to the attention of the world very forcibly in the chemistry and biology. Chemical laboratories for educational purposes were introduced by the Rensselaer Polytechnic Institute and by the Massachusetts Institute of Technology.

Louis Agassiz led the movement in the United States in the establishment of biological laboratories, by establishing a zoological laboratory at Harvard.

Agassiz also developed the modern marine laboratory which has led to the establishment of many such laboratories in all parts of the world. The researches in these laboratories have been of greatest value in the biological
bacteria have led to the establishment of important bacteriological laboratories throughout the world. The universities and colleges in the United States have set up many laboratories devoted to teaching and investigation along the different groups of the biological sciences.

The botanical laboratory is devoted to the study of the life of plants and their classification according to their distinguishing characteristics and structure.

The laboratories for the whole group of biological sciences have much equipment in common. The laboratory rooms should be well lighted, preferably with north light and with window bars done away with as far as possible; the building should be situated so as to have a low horizon. This is important in microscopic and microphotographic work, in order to get a uniform lighting of the slide on the microscope stage. The rooms should be provided with tables, on which is placed a full equipment of reagents, staining and preserving solutions. Dissecting instruments are among the individual needs of the students. Microscopes are needed for cutting sections, to be mounted on slides for examination under the microscope. The photomicrographic camera aids very materially in the careful, systematic study of specimens. The negatives thus obtained are available for making lantern slides for projection purposes and for making enlarged photographs. In some lines of research work, as in bacteriology, culture media, in which the particular form of life may grow and multiply, may be used. Often the cultures must be kept for hours at a certain temperature, thus necessitating incubators, of which the temperature is regulated by thermostats. Frequently rooms are set apart for cultures. Dark rooms are essential for the development of negatives resulting from the photographic work.

Chemical Laboratory.—The chemical laboratory is one of the most important factors in the educational and industrial systems of our civilization. The rooms of the chemical laboratory should be well lighted and ventilated. Special lines of work should be isolated. The lecture-room for demonstration purposes should be much the same in its general arrangement as the physical lecture-room (q.v.). The lecture-room should be supplied with different gases, including common illuminating gas, oxygen and hydrogen. The oxygen and hydrogen are generally supplied in heavy steel tanks under high pressure. A demonstration lantern should be conveniently placed. The table top should have one or two holes in it connected to the suction fan for carrying off fumes and gases, thus keeping them from being disseminated through the room.

The inorganic laboratories, for elementary purposes, may be divided into three principal divisions: first, that devoted to the study of the simple reactions by the beginner, who there learns experimentally what takes place in the simple reactions, as the combustion of hydrogen gas by pouring sulphuric acid on zinc, forming zinc sulphate and liberating the gas. The second division is that part devoted to qualitative analysis, where more complex reactions are studied and where the student learns to recognize and to test for the presence of the different elements. Under the third division is found quantitative analysis, which, as the name
implies, is devoted to the study of the quantitative relations of compounds.

The work in these three divisions leads up to the more complex work of organic chemistry and research work. The equipment of these laboratories will give a general outline of the whole. Wide top tables should be provided. The tops should be impervious to water and as little acted on by acids as possible. Albereine stone is excellent material for such purposes. A good construction is to have the tops slope a little from both sides to the centre line, where a trough is placed to carry off the wastes to the sewer. Racks for the storing of bottles containing reagents should be placed so as to be easily reached by the students from both sides of the table. Beneath the top should be drawers and shelving so subdivided that each student may keep his apparatus separate. The tables should be provided with gas and water, with plenty of taps and with electrical connections. Means should also be furnished for boiling under reduced pressure. For the experiments where noxious gases are given off, hoods should be provided, the bases being of the same material as the table tops, the sides and top of fixed glass with a glass window that may be opened in front. For ventilation within the hood there should be openings to a flue connected with a blower which produces a suction of the gases from the hood. One of the openings should be well toward the top and the other at the bottom of the hood. If artificial lighting is required it should be from above the glass top. Plenty of stop-cocks for gas, water and suction should be provided for each student.

Among the independent rooms needed are those for the following purposes: A hydrogen sulphide plant is an absolute necessity, and it should be isolated to the extent of having a well-ventilated room of its own. It should, however, be situated as conveniently as possible to the main divisions of the laboratory. Sometimes it may be advantageous to pipe the gas to different rooms. Near the quantitative laboratory should be a balance-room well supplied with subject balances and solid tables or wall brackets. A combustion-room and a furnace-room are often required. The furnace-room should be so located as to get a good draft or so as to be connected to a suction fan system.

The study of the spectrum of gases makes it necessary to have a good induction coil to produce a spark spectrum, which may be viewed by the eye, or which may be photographed. The range of temperatures at which chemical phenomena are now studied calls for very high and very low temperatures, which means that the electric furnace and a liquid air plant are often desirable. Apparatus for distillation under different pressures and for obtaining constant temperatures are very necessary in some phases of the work. The rooms for gas analysis will be so situated as to make it possible to have but small temperature fluctuations. A north exposure, thus getting rid of direct sunlight and yet getting good illumination, is preferable. The principal part of the equipment needed for gas analysis by the Hempel method includes gas burettes, to measure volumes, absorption pipettes for the different reagents used to absorb different gases, combustion pipettes and oxygen generators.

The physical chemistry laboratory requires much apparatus and equipment needed in physics and in the other divisions of chemical work, including analytical balances, thermometers, barometers, manometers, calorimeters, thermostat, motors, stirring gear, refractometers, spectrometers, apparatus for studying polarized light, ammeters, voltmeters, resistances and many other pieces. Among the subjects studied in the student laboratory are density, viscosity, vapor pressure, boiling and freezing points, heats of fusion and vaporization, critical temperatures, pressures and volumes, heats of combustion, solubility and the various divisions of electrolysis and electrochemistry.

**Electrical Laboratory.**—The student and investigator in the field of electricity should have a thorough grounding in general physics and physical laboratory methods. The student in the electrical laboratory becomes acquainted with the relations of electric currents, electromagnetic forces and resistances; and the production and transmission of electrical energy, electrical quantity, capacity, magnetism and the relations of the same material. The laboratory should be of strong construction on account of the lines of shafting and the heavy machines used. In the general laboratory will be found for purposes of investigation dynamos of the various direct and alternating current types; direct and alternating current motors, the latter covering synchronous, two-phase and three-phase motors, induction motors and rotary converters. Portable and variable inductive and non-inductive resistances; portable and fixed instruments for measuring current, electrical pressure or potential and power should be plentifully supplied. The fixed machines, instruments, the private rooms and tables should have lines of wire connecting them with a central switchboard through which any desired grouping of stations may be made. Among the separate departments may be one for testing and studying transformers; one for investigating the magnetic properties of iron, steel and other metals; a potentiometer-room in which supported is an instrument used in the measurements. Some interesting and important parts of the work are the investigation of the resistance and strength of insulators and conductors; the study of condensers and their effects in circuits; the study of self and mutual induction and the measurements of them. Separate rooms which can be made dark, the walls of which absorb as much light as possible, or which can be made any color desired by a proper arrangement of coverings, where work in lighting and photometry may be performed, are also important parts of the equipment of an electrical laboratory.

The electrical engineering student should find it possible to make tests in all lines of his profession, approximating as nearly as possible, actual working conditions in the commercial world. In order to give the greatest usefulness to the laboratory, the equipment should be kept abreast with the advances in the best engineering practice.

**Engineering Laboratory.**—Engineering laboratories have been developed within the past 40 years along all lines of engineering and technical education. The divisions are many, but only a few of them will be considered here.
The electrical engineering laboratory has been discussed above under the head of Electrical Laboratory. Under the division of Mechanical Engineering may be mentioned marine engineering and the like. Among the subdivisions under Civil Engineering are mining engineering, hydraulic engineering, sanitary engineering and bridge engineering, for all of which laboratories have been developed.

The laboratory should be a solid structure with massive foundations for the heavy machines used. Boiler-rooms, engine-rooms, material testing-rooms and general experimental rooms on mechanical devices, are the requisites. The boilers tested comprise fire-tube, water-tube and shell boilers. Tests are made of fuels, as to their steaming qualities, the ash and flue gases, by means of calorimeters, gas meters, thermometers, thermo-elements and balances. Engine tests may be made on many steam motors comprising steam turbines, simple slide valve, Corliss and compound engines of high and low pressure types. For these tests are needed steam gauges, thermometers, indicators communicating directly with the inside of the cylinders and "reducing motions" for obtaining automatic records of the steam pressure within the cylinders during a complete stroke, from which data may be obtained by means of which to compute the energy put into the engine; and dynamometers to measure the output in useful work.

Another department is devoted to internal combustion motors. Under this class are included hot air engines, oil and gas engines, which require dynamometers, gas meters and other measurers of the fuel supplied, and means for testing the products of combustion. In the mechanical laboratory, water motors, fans, blowers, air compressors, compressed air machines and tools, different methods of power transmission, as by shafting, gearing, belts, ropes and chains and the like, are studied. Measurements of the coefficients of friction of different substances are found, and the effects of lubrication by different substances are investigated. Lubricants are tested under various conditions, together with the effects of fatigue, pressures and in the presence of different vapors or gases. The testing of materials is common to mechanical and civil engineering laboratories. It will be outlined under the latter head.

In the civil engineering laboratories, calculating and measuring instruments are tested and calibrated. Among these instruments are transit instrument, and all instruments having graduated circles, cross-hairs and spirit levels; steel tapes; chains and bars for measuring lengths; chronometers for measuring time; barometers and thermometers. Here also is studied the magnetometer; and by means of it the strength of the horizontal component of the earth's magnetic field. The variation and dip of the field are noted, and its measurement. The acceleration of gravity is determined.

In the hydraulic division of these laboratories are studied the flow of water in pipes, *skin friction,* the flow of water through different nozzles under different conditions, the flow of water through weirs and its measurement. This is very important in irrigation.

The laboratory devoted to the testing of materials is very important one in all engineering work. All kinds of materials used in engineering work are tested. The apparatus required comprises machines to test resistance to compression, of tensile strength, of torsion and flexure of materials. Cements are tested for their resistance to tension and compression and for the length of time required for them to set. For the last test named, automatic apparatus has been devised which registers time and amount of "set." Forms in which to mold the briquettes, and water tanks in which to immerse them for setting, are among the required equipment. Tests on concretes are made in a similar manner. Abrasion machines are used to test material and other material subject to wear.

Physical Laboratory. The housing and equipment of a physical laboratory is of very great importance. The building in which the laboratory is to be located should be so situated as to reduce to a minimum all jar and tremor, and to do away with all outside magnetic disturbances, such as those due to electric car lines.

Many rooms are needed for special divisions of the work; such as constant temperature rooms, which require special precautions in design and construction and which are best situated below ground. Special rooms are demanded for radiometers, spectrometers, potentiometers and such other instruments as require constant conditions to ensure good results. Dark rooms are necessary for work in light, which includes experiments requiring diffraction gratings, photometers and the phenomena of light in general. Since photography has become of very great practical importance, fully equipped dark rooms are desired; also a sky-light room where enlargements and reductions of negatives may be made, and lantern slides prepared. It should be possible to introduce sunlight into some of the rooms.

A lecture-room in which experimental demonstrations may be given is a necessity, and much attention should be given to its arrangement. The lecture-room should be well lighted but should be provided with arrangements for readily darkening it. The experimental table should be placed so as to be easily seen from all parts of the room. This table should have water, gas, air blast, suction, water motors and other motors, sink and terminals for obtaining direct and alternating currents. A solid masonry pier upon which to set up delicate apparatus and that requiring no vibration should be provided. The table tops should be impervious to water and so far as possible acid-resisting.

An apparatus-room in which is kept demonstration apparatus should be situated conveniently to the lecture-room; general apparatus may also be kept there. The opening between the apparatus-room and the lecture-room should be large enough to admit the passage of large pieces of apparatus, and may not allow experiments to be set up on wheeled tables in the apparatus-room, then wheeled directly into the lecture room.

Separate rooms should be provided for research work. It is desirable that it be possible to connect some of the rooms by igloos, and to provide dark rooms for some of the suits.

Research-rooms should contain water and gas, both ordinary illuminating and acetylene.
gas. They should have electrical connections to a central switchboard sufficient to obtain various types of current at one time. The floors of the building should be solid. Stone tables built in the walls form good supports for instruments, but there should be provided in some cases stone piers with independent foundations.

The physical laboratory should have plenty of light and should be provided with separate rooms for some classes of work, as in light and sound, where it is often necessary to have darkened rooms. A heat bench or table should be provided; it should have an impervious top with enough pitch to drain into a central trough or hole to conduct away the waste. A rack with hooks above the bench, from which to suspend thermometers, is convenient. The rooms should be well supplied with tables, and along the walls some shelving built in the walls will be found useful. The dirt incident to priming batteries may be concentrated if all the cells be kept together, their terminals leading to a switchboard to which are connected the terminals of lines leading to the various stations in the laboratory.

The laboratory should also have storage batteries, and, if necessary, have its own dynamo in order to procure direct and alternating currents. An acetylene gas plant, and a compressor and liquefier for obtaining liquid air and other gases, are becoming necessary parts of the general equipment of a physical laboratory. A plant for the production of oxygen and hydrogen is also often desirable. A workshop in which to repair and build apparatus is a great convenience. The wiring and plumbing should be open and accessible as possible. All dark rooms as well as other rooms should be well ventilated, as it is often imperative for an observer to be confined in a room for hours at a time. Further reference to physical laboratory equipment will be found under the head of Electrical Laboratory.

Psychological Laboratory.—Since the establishment of the first psychological laboratory in Leipzig in 1875, by Wilhelm Wundt, where one room was devoted to apparatus and research, the development of the psychological laboratory has been rapid. One of Wundt's first students, G. Stanley Hall, established the first psychological laboratory in America at Johns Hopkins University in 1881, since which time many others have been started in the United States and foreign countries, including Japan.

The requirements of the psychological laboratory have increased very rapidly with the development of the subject, until its housing and equipment has become a problem of great importance and interest. Many rooms and much equipment are now required for a detailed study of the various expressions of conscious mentality. Beside the rooms necessary in teaching and conducting psychological experiments, other rooms for research are needed. Quiet and relaxation being often necessary, it is important so to arrange the rooms that the work of one student will in no way interfere with that of another. The stair cases should be provided with gas, electric lights and water. Where absolute quiet is required, piping of all kinds should be excluded, the heating being done by indirect radiation if necessary, and only incandescent electric lighting being used. The rooms should be wired for electrical intercommunication between those which may likely be desired for use in studies where, as is frequently the case, the experimenter must be in one room and the "subject" in the other. They should also have wires leading to the rooms where chronometers and electrical recording devices are located.

For the study of the sensations of light and the eye, its capacity and limitations, suites of rooms are desirable in many instances. These rooms should be capable of being either, well lighted or darkened at any desired degree. The equipment of this part of the laboratory includes models of the eye and the muscles governing its movements, sectional models; apparatus for studying color sensations, color mixing, color blindness, contrast, brightness independent of the color sensation; apparatus for studying optical illusions, the sensitiveness of the retina at different points, the sensitiveness of the eye to changes in position, the sense of location and the imperfections of the eye; and apparatus for studying reactions and reaction times.

The sensation of sound takes place in isolated rooms where the noises produced may not reach other parts of the laboratory, and for certain parts of the work rooms that are sound and light proof. In this part of the laboratory the sensitiveness, range and analyzing power of the ear are studied. The equipment for the work in sound comprises models of the ear; instruments for producing sound, such as tuning-forks, sirens, organ pipes and other sources of vibrations; and resonators for analyzing complex sounds.

Other rooms are needed for studying the sense of heat and cold, pressure, pain and the locations of the various end organs. The apparatus necessary is that required to produce the corresponding sensations. The effects of different sensations on the respiratory organs and heart action is another subject for investigation. Other parts of the laboratory are devoted to the senses of taste and smell. The equipment comprises the substances with which to test the various parts of the tongue and also substances to produce different odors.

An essential feature of the psychological laboratory is a workshop where the many special forms of apparatus may be made, which are necessary to be used in the ever-changing problems which the scientific study of the conscious mind presents. Such a workshop contains a fairly complete equipment for both wood and metal working with a plentiful supply of power for running the machines.

Among the special pieces of apparatus necessary may be mentioned the chronometer, the chronograph, electrically driven tuning-forks, sources of mechanical and electrical energy and induction coils.

Aeronautical Laboratories.—The Central Establishment for Military Aeronautics at Chalais-Meudon near Paris led the way for aeronautical laboratories in 1884. A second was that of G. Eiffel, and a third that of de la Meurthe at Saint Cyr—the Aerotechnical Institute of the University of Paris. The Langley Aerodynamical Laboratory was opened in 1913. Other aeronautical laboratories which have been very productive are those at Gottingen, the English National Physical Laboratory, and the Bureau of Standards at Washington.
In these laboratories there are wind-tunnels specially constructed to give uniform wind streams at various velocities. In connection with these tunnels there are specially constructed balances to measure the left and drag on wing surfaces, the resistances of parts and the forces on various shapes, and the retarding forces on airplanes as a whole. One very important laboratory established at the Bureau of Standards in 1917 is that for testing engines at reduced atmospheric pressures and the corresponding reduced temperatures simulating conditions for varying altitudes.

Municipal laboratories for the standardization of supplies bought by cities, such as asphalt, fire hose, food for various municipal institutions and many other commodities are maintained by several cities. These laboratories not only test what is supplied for the city's use, acquired through the purchasing departments, but also enable their agents to form more accurate specifications for further supplies. Water, coal, gas and other things for public use are submitted to regular examinations in such laboratories.

ERNEST BLAKE,
Assistant Professor of Physics, Cornell University.

LABORDE, lā'bor'd, Léon Emmanuel Simon Joseph, COUNT DE, French archeologist and author: b. Paris, 12 June 1807; d. there, 25 March 1884. He accompanied his father, Alexander Louis Joseph on a journey to the Orient concerning which he wrote 'Voyage dans l'Arabie Pétrée' (Paris 1830-33), and was appointed secretary of legation at Constantinople. In 1834 he was appointed Leyland's secretary at London, to fill later the same position at The Hague and Cassel. He was elected a member of the Academy in 1842. He became later curator of modern sculpture at the Louvre and (1856) director of the Imperial archives and was made a senator. Notable among his works are 'Histoire de la Gravure en matière noire' (1839); 'Voyage en Orient: Asie-Mineure et Syrie' (1837-62), with 180 plates; 'Le Parthénon' (1854), with 30 plates, but unfinished; 'De l'Union des Arts et de l'Industrie' (1856). He also wrote a number of works on the Paris libraries and monuments, etc.

LABORI, Fernand Gustave Gaston, fér'nān gūs-tāv gästōn lā-bo-rē, French lawyer and editor: b. Rheims, 18 April 1860; d. 14 March 1917. He studied at the Rheims Lycée and for two years in the German of Strasbourg. He took his degrees in the law faculty of Paris in 1881 and 1883, and was enrolled at the bar of the Court of Appeals in 1884; was secretary of the conference of advocates in 1887-88; took a high professional rank; and was especially prominent as counsel for the defense in notable cases, as the libel action by Comparay against Numia Gillly, and the trial of Le Faure and Duval and Vaillant. In 1898 he was chosen deputy for Fontainebleu. In the same year he defended Emile Zola (q.v.), accused of libeling the army and the President of the republic in the letter concerning the Dreyfus affair. In 1902 he was junior counsel to Demange in the defense of Dreyfus at the trial at Rennes in 1899, and thoroughly confuted his opponents by his logic and his brilliant cross-questioning. He did not make the final plea, but his 'Notes de Plaidoyer' were published in the 'Compte-rendu Sténographique In-extenso du Procès Dreyfus a Rennes.' On 14 August, while on his way to the court, he was dangerously wounded by a revolver bullet fired by a fanatic or mercenary. He was shortly enabled, however, to continue the case. In 1903 he defended the Humbert windloppers (see HUMBERT SWINDLE) and in 1914 defended Madame Caillaux (see CAILLAUX; CALMETTE) and secured her acquittal. He was editor-in-chief of the judicial daily 'La Gazette du Palais in 1888-94; established 'Le Palais and Grande Revue' in 1897; and is joint author of 'Repertoire Encyclopédique de Droit Français,' in 12 volumes (1898). See DREYFUS, ALFRED.

LABOUCHÈRE, lā-boosh-kār, Henry Du Pré, English politician and editor: b. London, 9 Nov. 1831; d. Florence, Italy, 15 Jan. 1912. He was of Huguenot origin, was educated at Eton and Trinity College, Cambridge; was in the British diplomatic service in 1854-64, being at one time a member of the British legation at Washington; in 1865-66 sat in Parliament for Windsor; was then unseated on petition; but represented Middlesex in 1867-68 and Northampton in 1880-1906. During his parliamentary career he strongly advocated Home Rule. He was at one time part proprietor of the London Daily News, to which he contributed letters from Paris during the siege (1870-71). In 1876 he established and became editor of Truth, a weekly journal, in which he expressed his opinions with great vigor. The denunciations of all manner of public frauds in the columns of Truth brought him into frequent trouble with the law courts for libel, and though he almost invariably won his cases, he frequently lost heavily on them through being unable to recover costs from the unsuccessful litigants. He was an extreme Radical in politics, was a strong opponent of the South African War of 1899-1902, a man of cosmopolitan sympathies, and on account of his wit and incisiveness popular with all parties in the House of Commons.

LABOULAYE, Edouard René Lefebvre de, dé-doo-ār ré-nā le-fāv lā-boō-rē, French publicist and jurist: b. Paris, 18 Jan. 1811; d. there, 23 May 1883. He studied law and in 1842 joined the Paris bar. He was a close student of the great German writers on jurisprudence, whose works and researches he introduced to his countrymen in a series of able essays, written in an admirable style. The Academy of Inscriptions and Letters conferred on him his 'Histoire du Droit de Propriété Foncière' (1839), and elected him to its membership in 1845. An 'Essai sur la Vie et les Ouvrages de Savigny' (1840), was followed by 'Recherches
sur la Condition civile et politique des Femmes' (1843), and an 'Essai sur les Lois criminelles des Romains' (1845), both crowned by the Académie des Sciences and a Moral Science in 1849 he was appointed professor of comparative legislation in the Collège de France. After the foundation of the Second Empire he constantly strove to rouse opposition to it, and in several published works as well as in his lectures held up the American Constitution to the admiration of his countrymen. In his 'Paris en Amérique' (1863), an ingenious and delightful satirical romance, which passed rapidly through 30 editions, he held up to a ridicule that was but thinly disguised the Napoleonic régime. 'Prince Caniche' was another extremely popular novel on the same lines, and had the effect of disintegrating in the minds of the French people attachment to the empire. The popularity of the first, however, declined somewhat through his support of the plebiscite in 1870, and soon afterward he resigned his chair at the Collège de France. After the fall of the empire he was elected for Paris in 1871. In 1875 he was elected a life senator. Besides the works above mentioned he wrote 'Histoire des États-Unis d'Amérique' (1854); 'Etudes Contemporaines sur l'Allemagne et les Pays Slaves' (1854); 'Souvenirs d'un Voyageur' (1857); 'Liberté Religieuse' (1858); 'Etudes sur la Propriété Littéraire en France et en Angleterre' (1858); 'Abdallah' (1859), an Arab romance; 'L'État et Ses Limites' (1863); 'Paris en Amérique' (1863), an ingenious and extremely popular satirical romance; 'Contes Bleus' (1864), a series of admirably told tales; 'Bleuets' (1865); 'Contes et Nouvelles' (1868); 'Discours Populaires' (1869), etc. He translated into French several of Channing's works and the 'Memoirs and Correspondence of Franklin' with an introduction. Consult Bigelow, J., 'Some Recollections of the Early Ed. of Labrador' (New York 1889). See Contes Bleus.

LABRADOR. History.—The peninsula of Labrador is doubtfully distinguished as the first part of North America to be discovered by Europeans, and by being the last portion of the continent in which large areas remain unexplored by white men. In 1497, the Norseman, voyaging westward from Greenland in the year 1000 reached its northeastern part and sailed south along its Atlantic coast to more temperate regions. Cortereal rediscovered this coast and traced it northward from the Strait of Belle Isle to the entrance to Hudson Strait, in 1500. A cargo of Eskimo slaves carried by him to Portugal accounts for the name Labrador given to the country. Jacques Cartier, on his voyage up the Gulf of Saint Lawrence, in 1535, outlined the northern coast of the peninsula, while the northern and western coasts were discovered by Henry Hudson in 1610. The valuable fisheries of the western early attracted the fishermen of Europe and the town of Brest was founded, near the Strait of Belle Isle, in 1504. At the height of its prosperity about the year 1600 it contained upwards of 200 houses and was visited by fishing vessels from France, England, Spain and Portugal.

Exploration.—Although the coasts of the peninsula were early known, their barren character and the mountainous-looking interior, which could only be penetrated by the ascent of difficult and dangerous rivers, long delayed the exploration of the interior. In 1849 a commission was appointed to investigate the possibility of mining the interior of Labrador, and to examine the possibility of opening railroads into the interior. The report of the commission was favorable, and the province of Labrador was created in 1869. In 1870 the government of Canada took possession of the territory, and the province was organized in 1871. The government of Canada has since taken steps to develop the natural resources of the province, and to encourage immigration and settlement.

Geology.—The crystalline rocks which form the peninsula belong to the earliest crust of the earth, the oldest dating back to Hauronian time. Since then the plateau has been continuously raised and the sea has been subjected to the degrading action of atmosphere and stream. Great thicknesses of rock became rotten and the landscape was gradually altered.
LABRADOR. DUCK.—LABRADOR TEA.

rivers cut deep valleys into the granites and other hard rocks. In recent geological times a thick cap of ice covered the peninsula moving slowly out and east from the interior. The melting of the ice removed the rotted rock from the hills and deposited it in the valleys, thus blocking many of the deep river valleys and reducing the surface of the interior to a general level with a gentle slope toward the coasts. No physical changes have occurred since the melting of the ice-cap and the interior country is still slightly undulating with low ridges of rock, or of glacial drift separated by wide, shallow valleys.

Lakes.—Myriads of lakes, great and small, occupy the lower parts of the valleys and are connected by networks of streams so that canoe travel is possible in any direction. Mistassini and Michigamau having areas exceeding 500 square miles are the largest, while dozens of others range in surface-area from 50 to 250 square miles.

Rivers.—The rivers in the central portion flow in the depressions without distinct valleys and in fact are chains of lake-expansions connected by short stretches of rapids. As they approach the coast they fall into the ancient valleys cut deep below the surface of the plateau. The descent is usually abrupt and is often accompanied by a great development of power and beauty. The Hamilton River, one of the largest streams of Labrador, falls from the surface of the plateau into its ancient valley about 200 miles above its mouth. The descent of 900 feet is accomplished in a distance of less than 10 miles and includes one direct fall of 315 feet where the river shoots from a gigantic trough into a circular basin at the head of a narrow canyon in which the last part of the descent is made. A rough estimate of the energy developed by the water in this descent gives the enormous sum of 9,000,000 horse power. This wonderful display of energy and the grand beauty of the fall and canyon place the Grand Falls of the Hamilton among the marvels of the world. With light rock-cuttings the river might be diverted into a side channel, where, passing through small lakes, it would fall sheer 700 feet into the ancient valley; this actually happens on a smaller scale when the river is in flood.

Climate.—The climate of Labrador varies from cold temperate in the south to Arctic on the northern highlands and about the shores of Hudson Strait; it is generally so rigorous that it is doubtful if the country will ever be fit for agriculture except in the southern valleys and on the low lands fronting the southern part of Hudson Bay. In the interior the mercury often drops to —50°F. during the winter.

Forests.—The southern half of the peninsula is included in the sub-Arctic forest belt, which contains the following trees: White birch, aspen, balsam, poplar, cedar, balskian pine, white and black spruce, balsam fir and larch. The forest is continuous over the southern interior; to the northward of latitude 54° N. the higher hills are treeless, open glades appear and the trees branch from the ground. Proceeding north the size and number of the treeless areas increase rapidly until trees totally disappear on the northern third. At least one-half of the forests has been destroyed by frequent fires.

Resources.—Among the resources of the peninsula are the fur-bearing animals, all prized for their dark glossy pelts and all fairly numerous throughout the region. Of these the most valuable are the silver fox, marten, otter, mink, beaver, cross, red and white foxes and white and black bears. The barren-ground caribou of the interior and seals along the coasts are the chief source of animal food for the natives.

Fisheries.—The cod and salmon fisheries of the Atlantic coast have long been sources of wealth to Newfoundland. The fisheries of Hudson Strait and Hudson Bay are still undeveloped, but enough fish from Blanc Sablon to predict their future great value. All the lakes and streams of the interior swarm with superior food fishes, including land-locked salmon, lake and brook trout, whitefish, pike and pickerel.

Minerals.—The mineral wealth of the peninsula is totally undeveloped. Immense deposits of valuable iron ore have been found in the interior and along the northern and western coasts. Over great areas are found rocks similar to those from which the most beautiful ornaments—gold, silver, copper, and nickel—are taken in southern parts of Canada and they only await discovery by the prospector.

Population.—The total population is about 14,000, of which 8,000 are whites, living along the southern and eastern shores. The remaining 6,000 are Indians and Eskimos, the former being confined to the wooded country, while the Eskimos live mainly along the northern coasts and on the northern barrens of the interior.

Government.—A strip of land along the Atlantic coast, extending from Blanc Sablon on the Strait of Belle Isle to Cape Chidley, is under the jurisdiction of the government of Newfoundland. The province of Quebec has jurisdiction over the remainder of the peninsula.

A. P. LOW.

Of the Geological Survey of Canada.

LABRADOR DUCK, a rather small, handsome sea duck (Camptolemus labradoriis), allied to the eiders, of the northeastern American coast; it bred in Labrador, and migrated in winter as far south as Chesapeake Bay, but was never very numerous. The last pair was taken about 1875, leaving only about 35 specimen-skins in the museums of the world. No very satisfactory theory exists to account for the closure of the species, since the fault does not seem chargeable to excessive shooting or disturbance of breeding-places. The race seemed to be waning, and an epidemic of disease or some weather-disaster destroying many eggs and young may have been a final blow. The last one seems to have been killed in 1875. Consult Stejneger, 'Birds' (Vol. IV, of 'Standard Natural History', 1883); Lucas, 'Annual Report Smithsonian Institution, 1888; Dutcher, article in The Auk (January 1894).

LABRADOR TEA, or MARSH TEA, either of two species of heath of the genus Ledum (L. latifolium and L. palustre). They grow in the northern parts of Europe and America, and are low shrubs with alternate entire leaves clothed underneath with rusty wool. The fragrant crushed leaves are used by the natives of Labrador as a substitute for tea, and were used by Franklin in his expedi-
LABRADORITE.—LABYRINTH.

tion of 1819-22. They possess narcotic properties, render beer heady and are used in Russia in the manufacture of leather, yielding an oil known to druggists as ledum oil, rich in tannin and resinous properties. The plant finds a place in medicine as an astringent and tonic.

LABRADORITE, a plagioclase feldspar of the albite-anorthite series, corresponding chief constituent in the feldspars. It is therefore, a silicate of aluminum, calcium and sodium. It has a hardness of 5 to 6 and a specific gravity of 2.73. It ordinarily occurs in cleavable or granular masses, or as an essential constituent of certain basic eruptive rocks, such as trap, diabase, basalt, dolerite or andesite. In these it is associated with some member of the pyroxene or amphibole groups. Labradorite abounds in the Adirondacks, but its type locality is along the coast of Labrador, where it occurs in the massive rocks of enormous size which exhibit a wonderful change of colors, from dull gray to a gorgeous blue, or more rarely green, copper-red, purple or yellow. It has been used as an ornamental stone, especially in inlaid work.

LABRIDE, a family of marine fishes, the wrasses, representing the highly specialized sub-order Pharyngognathi by a large number of beautiful and useful species inhabiting all the warmer seas, and traceable as far back as the Eocene period. These are brilliantly colored fishes, usually elongate in form and of large size, with cycloid scales and thick fleshy lips. There are powerful teeth on the margins of the jaws, but none on the palate; while the united lower pharyngeals are much thickened and form a plate beset with rounded, rarely acuminate gill-teeth. The upper pharyngeals are usually separate, bearing similar teeth. Jordan enumerates 60 genera and 450 species, chiefly of the tropical seas, living among rocks or kelp. The typical genus Labrus is almost wholly European. The principal genera represented in American waters are: Junco (sculpins), Tautoga (tautogs), Harpe (lady-fishes), Pimelometopon (fatheads), and Iridus (donccells); and by some authors the parrot-fishes (Scardidae) are included.

LABUAN, la-boo-in, an island of the Malayan group, in the administration of the Straits Settlement, belonging to Great Britain, situated 6 miles off the northwest coast of Borneo; about 12 miles in greatest length by 7 miles in greatest breadth; area, 28.5 square miles. It is mostly low and marshy, and not very fertile; the climate is hot and humid, but the island is well supplied with water, with an annual rainfall of 166 inches, and has a good harbor at the settlement of Victoria (the capital; pop. 1,500) on its southeast side. Coal of excellent quality is plentiful, and has been mined for many years. Pop. estimated, 6,746, mostly Malays.

LABURNUM, GOLDEN-CHAIN, or BEAN-TREE, a genus of trees and shrubs of the order Leguminose. The few species, which are natives of southern Europe and western Asia, are deciduous, with trifoliate leaves and brilliant yellow blossoms in pendulous many-flowered racemes produced during late spring and early summer. The larger species yield a very hard, heavy, tough, fine-grained, dark green or brown wood, which can be highly polished and is valued for inlaying, cabinet work, turning, etc. The species are also prized for ornamental planting in shrubberies, not only for their flowers, but also for their glossy foliage, which remains green until late in the autumn. No part of the plant is relished by insects, and all parts, but particularly the seeds, are reputed poisonous, containing cytisine, a purgative and narcotic. Nevertheless the young stems are greedily eaten by rabbits and hares, and may thus be made to serve as a sacrificial protection to other shrubbery. The best-known species, probably, is the English laburnum (L. vulgar), which sometimes attains a height of 40 feet but usually not more than 20 feet. It is hardy nearly as far north as Massachusetts. The Scotch laburnum (L. alpinum) is harder, more erect and rigid, bears broader leaves and much longer and slenderer racemes of dark yellow flowers, and continues in blossom about two weeks later than the preceding. In America they are known as golden-chain or bean-tree. By some botanists it is considered only a variety of L. vulgar. Laburnums thrive in any well-drained soil in either partial shade or full sun. They are readily propagated by seeds generally spring-sown, and also by layers. Choice varieties, of which there are many, are grafted upon seedlings.

LABYRINTH, a structure having many intricate, winding passages; specifically, the legendary labyrinth of Crete, out of which no one could find his way, but became the prey of the Minotaur. This Greek legend has been interpreted as a sun-myth, and in various other ways, but excavations in Crete since 1900 have shown its foundation in fact, and have localized the labyrinth beyond reasonable doubt in the ruined "palace" of the Minoan kingdom at Knossas, near Candia. Minos may probably be regarded as a title, like Pharaoh or Caesar, for a line of kings; but the legend of the Minotaur seems to refer to an individual, one of the sea-kings of Crete whose period was about 2000 B.C. This king's son, according to the legend, went to Athens to play the games, and becoming victor was murdered by direction of the Athenian king, Theseus. Thereupon Minos sent a fleet which subdued Athens. One condition of the peace was that thereafter, in every ninth year, seven youths and seven maidens should be sent to Crete by Athens, to become the prey of the Minotaur—a monster half human, half bull. When the second time for this ghastly tribute arrived a hero of great prowess, Theseus, volunteered to go. Arrived in Crete he and his companions were immersed in a great prison—the Labyrinth; but Ariadne, the daughter of Minos, enamored of Theseus, gave him a sword with which to kill the Minotaur, and a thread to unwind as he was led into the prison-maze, by means of which he could find his way out. The plan succeeded. Theseus and his fellow captives escaped, and the tribute ceased.

When the royal house at Knossas came to be excavated, first by Dr. A. J. Evans in 1900, it was trifoliate leaves and brilliant yellow blossoms in pendulous many-flowered racemes produced during late spring and early summer. The larger species yield a very hard, heavy, tough, fine-grained, dark green or brown wood, which can be highly
this and all other Minoan buildings, the design
called the "double ax" is very prominent in
decoration; and it is known that the symbol of
minotaur was named "labyrinth." The
coincidence of this term with "labyrinth,"
together with other evidences of the connection
of ideas, makes indubitable in the minds of
antiquaries that the labyrinth of the legend
was but another name for the central
Minoan cult was represented as a bull. Once
every nine years the reigning king was obliged
to go into the Dictaean Cave (near the present
town Lyttos) and renew communication with
heaven. It is thought probable that human
sacrifices may have been offered to the divinity
in the cave on these occasions; that probably
captives would be slain rather than citizens;
and that the Athenian youths were destined to
this sacrifice. Another theory is that vigorous
war-captives were reserved for the national
sport of the bull-ring, in which an athlete
seized by the horns a charging bull, then skil-
fully vaulted to safety over the animal's back.
Both men and women acted in this dangerous
bull-fighting; and captives were probably kept and trained as toreros for the amusement
of the populace.
A vast and wonderful temple in Egypt, con-
built by Amenemhat III at Hawara, about
the time when the Minoan kingdom was in the
height of its power, came to be called Labyrinth
by the time Herodotus visited it, evidently in
allusion to the similarly vast and complicated
difice at Knossos. More recent labyrinths are
small, and often merely ornamental in their
purpose. That at Clusium, in Italy, was erected
by the Etruscans, according to Varro, for the
sepulchre of King Porsenna. Imitations of
labyrinths, called mazes, were once fashionable
in gardening. They were made of hedges; the
best known is that at Hampton Court, near
London. Consult for the Cretan labyrinth, be-
sides the reports of exploration, Mossa, 'Nu
Palaces of Crete'; Baikie, 'Nu Sea-Kings of
Crete' (London 1913)

'Labyrinth, The.' In 'The Labyrinth' ('Le Dédale'), played in 1903, Paul Hervieu,
the most logical and abstract of contemporary
French dramatists, has developed a theme
suggested earlier by Yeux in 'The
Cradle' ('Le Bercceau'). What, both writers
ask, will be the results of divorce and remarriage
when a wife meets again her first husband at
the sick bed of their child? Will she revert
to the first husband or remain true to the
second? Will the husbands contend to the
death or be reconciled? According to both
playwrights, the wife's reversion to the father
of her child is inevitable, but Hervieu has
sharpened the conflict and given it a tragic
conclusion. Marianne, having divorced her
temperamental Max, has married the brisk
but correct Guillaume. Max resents the rigor-
ous education proposed for his son by Guillaume,
and Marianne, to avoid legal complications,
agrees to the arrangement. During the course of
this visit, little Louis falls ill, and Marianne,
suppressed to attend him, is thrown daily into
the closest companionship with her former
husband. In their mutual relief after an agony
of anxiety, they forgot everything except their
original love. Guillaume confesses his error
to her, parents and to Guillaume, the
latter is enraged, but her mother excuses her
deed as only natural: Since divorce is reli-
giously unlawful, Marianne of necessity was
erased to her second husband. Guillaume is
now ready to renounce her, upon condition that
Max will do as much. But Max, refusing,
taunts his rival; and, as the two men clinch,
they fall from a cliff into the Rhone. Although
the play is strongly emotional, the theme is
little more than the illustration of an idea, every
word and scene being nicely adapted to that
end. Its characters live only to confirm the
playwright's thesis. The piece was played in
English in 1905; it may be read in the trans-
lation of B. H. Clark and L. MacClintock,
published in 1913.

Frank W. Chandler.

'Labyrinthodon, or Stego-
cephali, a group of primitive four-footed
animals, forerunners of modern amphibians and
reptiles, whose remains are found fossil in
Peruvian, Carboniferous and Triassic strata,
and which are the oldest known lung-breathing
terrestrial quadrupeds. They were first discov-
ered through finding their footprints imprinted
in the Triassic rocks (Keuper beds) of Ger-
many, long before the actual fossil remains
were brought to light. The footprints were
described at first as those of a hypothetical
form to which the name Cheirotherium ('Hand
beast') was given. As geological science and
research progressed, the remains of the laby-
rinthodonts were discovered, when a compar-
ison of their structure with the footprints
showed that some of the latter were made by
these creatures; many of the tracks, however,
are unidentified. Later, when a great variety
of related remains had been discovered, the
term Labyrinthodon, which relates to the curi-
ous *labyrinthine* infoldings of the enamel-wall
of the teeth, was restricted to a single group
or suborder (also called Stereospodyll) within
the general amphibian order Stegocephalia.
This suborder contains highly developed and
mostly large forms, characterized by the com-
plication in tooth structure above mentioned,
and by co-ordinate anatomical distinctions. The
principal genera are Laxomeryx, Metopias, Capi-
tosaurus, Mastodonsaurus and
Labyrinthodon, the last including the most re-
cent forms of the Upper Trias, at the close of
which period the group appears to have be-
come extinct. See Stegocephalia.

'LAC is the product of one of the scale-
insects (Coccids, or Tachardia, lacco) of the
family Coccidae, which is the source of an im-
portant Oriental industry. This species, like
other scale-insects, multiples with amazing
rapidity, and feeds in compact colonies of tens
of thousands, carrying the twigs of certain
trees, especially the banyan or "religious" fig
and related species of Fious, the dhak (Butea
frondosa) and some other trees in India and
Assam, and on privet trees in Yunnan and
Schuen provinces in southwestern China. In-
sect is always present on the leaves and thorns
for these insects suck the sap, a large part of
which passes out as excrement, transformed into a
sort of resin that accumulates over the insect's
back and forms the "scale." The scales of the
crowded insects coalesce at their edges into a
continuous layer over the slender branch on
which they are feeding, and such a branch, cut
off, is known as "stick lac." By tying a few of these sticks on fresh parts of trees the natives induce the insects to spread to and over fresh branches, and thus obtain two crops a year. The industry is a very ancient one and is carried on by a large number of people; and the value of lac products exported from India alone approaches 35,000,000 rupees (about £500,000) annually. The best lac comes from Bengal and the central provinces.

The original method of preparing the lac for use and market was by pulverizing the insect-covered twigs, at the proper time, and placing them in hot water. The separated the scales from the wood, softened the resin, and dissolved the coloring-matter of their interior tissues, especially strong in the egg-sacks. The remains of the insects are then taken out and dried; and this operation of washing and drying is repeated until the resin from the melted scales is (or ought to be) entirely colorless. The mass is then put into a bag of coarse cotton cloth which is held near enough a fire to melt the lac, and is spread by waving. The melted resin drips on small sticks arranged to receive it, and congeals in thin, light-colored, transparent flakes called shell-lac, the shelllac of commerce. Large and small drops falling on the ground form button-lac, lump-lac, and so forth. Latterly this work has been done by machines made to grind the sticks, and melt and wash the material in steam-heated apparatus, which quickens the process and improves the product.

The water in which the first washings are made is deeply reddened by the dissolved coloring matter of the insects. This water is saved, strained and evaporated, or cleared by the aid of alum, and the residue is deposited. This, when dried, is molded into cakes that furnish a rich dye. Previous to the invention of aniline colors this was very valuable, but now, like cochineal, it has nearly disappeared from trade. It furnishes, however, the basis of many "laze" tints among artist's colors, particularly the exquisite carmine-lake. "Lake" is a modified form of the Sanskrit (and modern Indian) word lak, meaning a hundred thousand, and here refers to the multitude of insects in a colony; it is also familiar to us in the financial term lakh, meaning 100,000 rupees.

Lac is of great value for making varnish, because easily dissolved, furnishing a hard coating susceptible of fine polish, and easy to take a dye. The Indian, Burmese and Chinese use it for making and coating ornaments, and various artistic objects, usually rich in color. It also enters into the composition of the fancy sealing wax sold by stationers, and serves for other useful purposes; but it must not be confused with lacquer (q.v.), an Oriental vegetable product that resembles lac, when applied as a coating of boxes, bowls, etc.

LAC, or LAK, from the Sanskrit lakṣa, or laksha, that is, 100,000. In the East Indies it is applied to the computation of money. The value of lac is 100,000 rupees. A lac is equal to about $46,350. A lac of Siaca rupees was equal to about $50,000; 100 lacs, or 10,000,000 rupees, make a crore. In 1835 the British government remodeled the currency of India, establishing a more uniform system, and the value of the rupee is now fixed at 32 cents (15 to the sterling £), divided into 16 annas of 12 pies.

LACAILLE, Nicolas Louis de, né-kō-lā loo-ē de lá-kā-ē, French mathematician and astronomer: b. Rumigny, France, 15 March 1713; d. Paris, 21 March 1762. He was educated for the Church, but soon renounced theology for astronomy. He took an important part in the work of measuring an arc of the meridian, and in 1746 was appointed professor of mathematics in the Collège Mazarin. In 1751 he went to the Cape of Good Hope at the expense of the government, where he determined the position of some 10,000 stars with wonderful accuracy. As his departure from the Cape was delayed, he employed the interval in measuring a degree of the southern hemisphere. His works on geometry, mechanics, astronomy and optics were numerous. Among them are "Leçons d'astronomie" and "Astronomie Fundamenta"; "Colom Australe Stellatum"; "Journal du voyage fait au Cap de Bonne Espérance."

LACANDONES, lá-kān-dō-nēs, an Indian tribe living in Guatemala and Mexico. At one time numerous and powerful, they waged war against the whites. They are now about 300 left, of whom a part are friendly to the white people, though retaining their native customs.

LACAZE - DUTHIERS, lá-kāz-dō-tē-yē, Henri de, French comparative zoologist: b. Montpazat, 15 May 1821; d. Las Fous, 21 July 1901. He studied medicine at Paris and received (1854) the degree of professor of zoology at Lille, and was appointed to the chair (1865) of zoology at the Paris Museum of Natural History and (1868) at the university there. He edited, from 1872, "Archives de zoologie générale et experimentale," and directed the Zoological Station at Roscoff, which he founded (1873) on the Brittany coast. In 1881 he started the "Laboratoire Arago" at Banyuls on the Mediterranean. For a number of years he devoted his researches to the study of the comparative anatomy of aquatic life, especially molluscs, and wrote, among other works, "Histoire naturelle du Corail" (1884) and "Récits des labouros" (1889). His letters to Alexander Dedekind appeared in 1902 (Paris).

LACADDIVE (lā-kā-div) ISLES, a group of small coral islands in the Indian Ocean, about 200 miles off the west coast of Malabar and politically part of the Madras Presidency. They form 17 separate reefs, containing, however, but 14 islands, only 9 of which are inhabited. The surface soil is naturally so barren that there is little or no spontaneous vegetation on the majority of the islands, and their prosperity must ever depend on the cultivation of the coconut. The natives of these islands, a race of Mohammedans called Moplas (of mixed Hindu and Arab descent), are mild and inoffensive and dwell in low, thatched, stone-built houses, and live poorly. Vasco de Gama discovered these islands in 1498. They were ceded to the British in 1792. Pop. 10,600.

LACCOLITH, lá-kō-lith, or LACCOLITE (Greek, *stone-plat*), a mushroom-shaped mass of molten rock which has been forced along bedding planes, between layers of sedimentary rock, and which has arched up the sedimentary beds into a dome. It differs from a sill in that a sill does not produce doming of the over-

LACE, a cimbor background of threads with delicate patterns of flowers, figures and ornaments, also of threads, and used for ruffs, cuffs, collars, caps, scarves, handkerchiefs, cravats and aprons, and to trim articles of clothing, was first made in the 16th century. It reached perfection in the 17th and 18th centuries and deteriorated after the introduction of machinery. The word comes from laco, meaning braid. The translators of the Bible used the word lace to denote braid. This definition survives in the gold and silver lace on uniforms and liveries. What is now called lace wasanciently called cut-work, *purlas* and *points*. It was also known as *passement* or *passement*; and *passement dentelé* (from the French dent, tooth) occurs in the inventory of Henri II of France (1547–1559). *Dentelle de Florence*, occurring in an inventory of 1545, introduces the term *dentelle* for lace—*dentelé*.

The word guipure, applied to all large patterned and coarse laces which have no threads joining pattern to pattern and no delicate net background, was also anciently used for braid. The tape guipures of Italy and France were famous. Before the days of cut-work and laces, people wore *cut-work* and *drawn-thread work*, also known as reticella, *point gotico* and needle-point *gotico*. Its effect is much the same as that of diaphanous lace.

Reticella, or cut-work, originated in the long, pointed needles. They went from Italy and thence to Italy and throughout Europe. Reticella was made from about 1480 to 1620. The patterns, hand-drawn for generations, are stiff and geometrical and consist of circles, triangles and wheels, often decorated with tiny, spiky knots. Reticella was largely used for collars and cuffs and to edge ruffs and handkerchiefs. It appears in portraits of the 15th and 16th centuries and in old pattern-books. Laces, which also adorned flimsy lace, was the darned netting, or *spider-work*. *Point de Venise* was popular in Italy. One of its names is *Siena Point*. The pattern was darned with the needle upon a plain ground of coarse net. *Lasis* was made in squares and stripes and then joined. It was much used for household decoration. Catherine de' Medici had a bed draped with such square. *Lasis* was sometimes combined with reticella, as the pattern book of Isabella Catanea Parasole (1616) shows.

Filmy lace appeared in the 16th century and in Italy. Antiquaries have sought in vain for its origin. It was probably an effort to imitate by woven threads the exquisite cut-linen that had reached perfection in Italy. There are but two classes of this diaphanous fabric: one, made with the needle; the other, with bobbins. The first variety is called *point-lace*, or *needle-point*, and the second, *pillow-lace*. *Point* takes its name from the French *point* (stitch). The French call it *point d'aiguille* (point of the needle). By extension, *point* has been given to a few laces of high quality to denote their excellence, such as *punto d'Angletet*, *point de Valenciennes*, *punto de Valenciennes*, and *punto di Milano*, which are not made with the needle, but are bobbins (or pillow) laces. This produces more confusion regarding the classification of lace, already made difficult by the term pillow-lace instead of bobbin lace. As the pillow is also used for making *point-lace*, the name pillow-lace is misleading; but the classification of *point* and *pillow* is, however, established to admit of any change. The technical words used to describe lace are French. In both *point* and *pillow* the groundwork consists of a net of fine threads called réseau; or, instead of this réseau, slender threads called bides connect the patterns with each other. These bides are sometimes tipped here and there with little spiky knots, called pickots. The edge, or border, is often decorated also with these pickots. In some laces the background consists of both réseau and bides. The solid part of the design is called toile. In *point* there is but one kind of stitch,—the old familiar button-hole, or looped; and no matter from what country the lace comes, or how intricate, or how solid its pattern, or how fine its réseau, every stitch is the button-hole. If *bides* occur, they are also button-hole d over, and if *pickots* or ornamentation is used, too, it is button-hole over.

Pillow-laces are divided into two classes: (1) the pattern is first made on the pillow and the réseau filled in afterward; (2) pattern and réseau made in one continuous piece. Charles Blanc shows the difference as follows: *The dominant character of pillow-lace is the soft blending of its forms. The needle is to the bobbin what the pencil point is to the stump. The pattern softened when wrought in pillow-lace is depicted with crispness by the needle. Pillow-lace is produced by the intercrossing and plaiting of the threads which are rolled at one end around bobbins and fastened at the other upon a cushion by means of pins. Bobbins are elongated spindles, tapering and swelling into little handles. They are made of wood, bone, or lead. They vary in size according to the thickness of the threads; and the more delicate the lace the greater the number of bobbins. A pattern is pricked out by pins on the pillow to guide the worker. The pillow varies in size and shape.*

**Italian Point.**—Italian Point lace, poetically called *Punta in Aria* (stitches in the air), was developed in Venice. The graceful scrolls and lovely flowers of the earliest lace resemble the arabesques of Persian ornament. Venetian Point is the richest and most beautiful of all laces. There are three classes: (1) Venetian Raised Point and Venetian Rose Point; (2) Venetian Flat Point (including the famous Coralline), and (3) Venetian Grounded Point (including *Punta di Burano*). Venetian Raised Point has large fantastic flowers issuing from rich scrolls and foliage in the Renaissance style. These designs are outlined with a heavy, padded thread, called cordonnet, button-holed over. The designs are connected by bides and often decorated with pickots. Rose Point has smaller patterns and more bides and more pickots. It has a whirling, snowy effect and is also called *Point de Neige* in consequence. (2) Venetian Flat Point has no cordonnet; but bides and pickots are plentiful. Coralline Point represents a tangle of seaweed; and, though lacking in clear outlines, is extremely beautiful. Venetian Grounded Point has a net background. It was inspired by the new *Point d'Alençon*, which the
French had created in imitation of Venetian Raised Point. The pattern of Venetian Grounded Point is usually the lily and the edge is a shallow scallop. It has a cordonnet, stitched down around the outline of the pattern. Burano was the chief place where this Grounded Point was made, and it was manufactured there until the beginning of the 19th century. The 1872 Burano lace was revived under the patronage of the king and queen of Italy. The Burano makers copied the Point d'Alençon designs and also the square mesh of the réseau. The unevenness of the thread gives Burano ground a somewhat cloudy appearance, which aids in identifying it.

Italian Pillow Lace.—Milan and Genoa were also famous maris for lace. The most beautiful of all Italian pillow-laces is punta di Milano, or Milan point (the name describing the quality). The lace pattern was made first and the ground net-work filled in afterward. The meshes of this net are diamond shaped with a palt of four threads. The Genoese lace was of two kinds: (1) a *tape guipure,* the two threads being interlaced with *brides,* and decorated with *pistils,* and (2) pointed scallops decorated with little ornaments called *wheat-ears.* Genoese lace was much used for collars and cuffs and appears in portraits by Rubens, Van Dyck, Rembrandt and Frans Hals, as well as in portraits by Italian masters.

French Pillow Lace.—French Pillow lace was made by the wealthy and fastidious of high degree throughout Europe. To encourage home industry, Colbert, Prime Minister of Louis XIV, established a school at Alençon in 1672 for lace-makers from Venice. *Point d'Alençon* was at first an exact imitation of Venetian Raised Point; but after a time the French invented a beautiful *réseau* in imitation of the bobbin net-work ground of Flemish lace. This was an entirely new idea, for point lace had never before been ground on net; and, as noted above, the Venetians, hoping to win back their trade, imitated the *Point d'Alençon* in their Venetian Grounded Point, or *Point de Venice à réseau.* Point d'Alençon is called *true pillow lace.* It was made in 1672. By royal decree it was called *Point de France.* The effect of this lace is delicacy; but the wonder of it can only be appreciated by applying a magnifying-glass. How human fingers can execute such delicate and minute stitches is beyond understanding. The average size of a diagonal taken from angle to angle in an Alençon hexagon is about one-sixth of an inch and each side of the hexagon is about one-tenth of an inch. An idea of the minuteness of the work can be gathered from the fact that a side of the hexagon is overcast with 9 or 10 button-hole stitches. One characteristic of *Point d'Alençon* is a heavy outline (cordonnet) button-holed over horsehair, which makes it firmer and heavier than any other fine lace. The design is flowers, foliage, scrolls and arabesques, in the style of the decoration of the period. Spots, tears, sprigs and insects were used for designs in the days of Louis XVI. The factory became extinct during the Revolution. It was revived by Napoleon, when Bonaparte brought lace workers from Milan, and was used for motives in combination with flowers. This superb lace has always commanded fabulous prices. The Empress Eugénie had a dress of *Point d'Alençon,* for which Napoleon III paid 200,000 francs ($40,000) in 1859. In later years she gave it to Pope Leo XIII, who wore it as a rochet.

Argentan was established at the same time as Alençon and also produced lace in imitation of Venetian Point. It can only be distinguished from Alençon after Alençon adopted the *réseau.* Argentan Point is a more open work and the mesh worked over with button-hole stitches. The large *bride* ground could support bolder and larger flowers and in heavier and higher relief than the *réseau* ground. The *bride picotée* is also a characteristic of the Argentan Point. Checked by the Revolution, it was revived in 1810; but in 1830 cotton, instead of linen thread, was used and debased the quality. Argentan Point became rare about 1858 and the secret of making it was lost in 1869. Although France borrowed the technique of lace-making from Italy, she put her own stamp upon it, and gradually brought it to such perfection that both *Point d'Alençon* and *Point d'Argentan* enjoyed enormous vogue. Other workshops were founded at Le Quesnoy, Arras, Rheims, Paris and Soissons.

French Pillow Lace.—Ten years before Colbert made French lace such an item of trade Le Puy had become a centre for lace-making, and the Duchesse de Longueville, Bonde’s sister, had established lace-makers at Chantilly. Le Puy was the oldest lace-centre in France. It was noted for its thread laces and silk guipures. These guipures were made in bands, for which designs of geometric character, squares, stars and formal blossoms were used. Some of the Le Puy lace were known as “guipures de Cluny,” from the Cluny Abbey in Paris. Flax, silk, worsted, goat’s hair and Angora rabbits’ hair were used with equal facility at Le Puy.

Valenciennes is the most beautiful of all French pillow laces. Bobbin lace was made in Valenciennes in the 15th century, when the town belonged to Flemish Hainault. After Colbert founded Le Quesnoy the lace industry at Valenciennes revived and supplanted that in the neighboring town. Owing to the number of bobbins as was first made in 1665. By royal decree it was called *true pillow lace.* It was made in 1665. By royal decree it was called *Point de France.* The effect of this lace is delicacy; but the wonder of it can only be appreciated by applying a magnifying-glass. How human fingers can execute such delicate and minute stitches is beyond understanding. The average size of a diagonal taken from angle to angle in an Alençon hexagon is about one-sixth of an inch and each side of the hexagon is about one-tenth of an inch. An idea of the minuteness of the work can be gathered from the fact that a side of the hexagon is overcast with 9 or 10 button-hole stitches. One characteristic of *Point d'Alençon* is a heavy outline (cordonnet) button-holed over horsehair, which makes it firmer and heavier than any other fine lace. The design is flowers, foliage, scrolls and arabesques, in the style of the decoration of the period. Spots, tears, sprigs and insects were used for designs in the days of Louis XVI. Valenciennes is the most beautiful of all French pillow laces, for Bobbin lace was made in Valenciennes in the 15th century, when the town belonged to Flemish Hainault. After Colbert founded Le Quesnoy the lace industry at Valenciennes revived and supplanted that in the neighboring town. Owing to the number of bobbins as was first made in 1665. By royal decree it was called *true Valenciennes* and in the suburbs *false Valenciennes* was produced. At the Revolution many workers fled to Belgium and settled in Alost, Ypres, Ghent, Menin, Courtrai and Bruges. Every town made a characteristic *réseau.* Valenciennes was revived, but the modern productions are not so fine as old Valenciennes. In the 18th century Valenciennes was much used for ruffles, cravats and trimmings. It was not regarded as a lace for full dress, nor was it a Church lace. Valenciennes is all made in one piece, the threads forming a continuous *réseau* and *toile.* There is no *cordonnet.* The *réseau* consists of circles in the widest examples, but of squares in later examples. The flowers in early examples are tulips, anemones, iris, or carnations and have almost the appearance of cambric. Later specimens usually have

a scalloped border containing a leaf, petal or feather, and the réseau is sprinkled with dots. Machinery has imitated this lace very successfully and a vast amount of it is sold. It is commonly called \textit{Venetian lace}.

\textbf{Chantilly.}—Chantilly was also famous for its lace. After having produced lace of second-rate value of the Valenciennes and Mechlin type, Chantilly suddenly achieved reputation by making silk lace, experience of which was later used as \textit{grèisade d'Alaiss}. The peculiar twist in spinning these threads so diminished the lustre that people frequently imagine Chantilly is made of flax, dyed black. The réseau is a six-pointed star known as \textit{Fond Chantil}, an abbreviation of Chantilly, often used by other workshops. Chantilly also used the Alençon ground and sometimes used the Alençon and the \textit{Fond Chantil} in the same piece. The patterns of old Chantilly (whether in white or black) were often of vases of flowers and other decorative patterns. It is ornamented on Chantilly pottery. Chantilly lace ceased to be made during the Revolution, but was popular again under the Empire, when \textit{blonde} lace became the rage in Paris. Chantilly was first made in France by needle-motlic and other artisans. After 1840 (in the reign of Louis Philippe) it enjoyed great favor and large pieces were made, such as shawls, fichus and bridal-veils, and smaller articles such as \textit{barbes}, parasol-covers, handkerchiefs, fan-mounts, etc. In the days of Napoleon III fancies and dresses and all other articles of Chantilly were made even more popular by the Empress Eugénie and they found a large market among wealthy Americans. In 1870 the workshops became bankrupt. Modern Chantilly is made at Calvados, Caen and Bayeux.

\textbf{Bayeux.—} Bayeux made exquisite black lace in which the elaborate patterns of flowers and other ornaments are rendered with the utmost delicacy of shading. At first Bayeux made lace in the Venetian style, then it followed the styles of Chantilly, and so beautifully that experts are puzzled to tell the difference. Many so-called \textit{Chantilly shawls} were made in Bayeux, but are none the less valuable for that. \textit{Blonde Bayeux lace} came into fashion about 1745. It was made of unbleached silk imported from Nankin, whence the name \textit{nankins}, as well as \textit{blondes}. Soon the French made it of white and black silk. Marie Antoinette gave it special vogue. Blonde lace was made at Chantilly, Le Puy, Bayeux and Caen. Spain almost made it her own lace; old Spanish blondes do not equal those of Chantilly and Bayeux. Of blonde are made the Spanish mantillas that so gracefully drape the heads of Spanish women. Those of white are worn on full dress occasions only; black blonde is used for \textit{second-best}. During the Second Empire, owing to the taste of the Empress Eugénie, the big Spanish floral designs were made in the French workshops. These patterns have never gone out of fashion.

\textbf{Spanish Lace.}—Spanish blonde is the typical lace of Spain. Barcelona early attained a reputation for it and is still the centre for its manufacture. Comparatively little is known regarding Spanish lace, for it has not been studied so thoroughly as the lace of other countries. We know, however, that cut-work (\textit{reticella}) and \textit{lacies} were made in Spain in the 15th and 16th centuries and that \textit{Spanish Point} was as celebrated in its day as the \textit{Points} of Italy or France. Regarding it Mrs. Palliser says: \textquote{The sumptuous Spanish Point, the white thread \textit{point de Venise} lace, was an Italian production originally. It was imported for the Spanish churches and then imitated in the convents by the nuns, but was little known to the commercial world of Europe until the dissolution of the Spanish monasteries in 1830, when the splendid specimens of nuns' work came suddenly into the market, not only the heavy lace generally designated as \textit{Spanish Point}, but pieces of the very finest description (like \textit{Point de Venise}), so exquisite as to have been the work only of those whose time was not money and whose devotion to the Church and to their favorite saints rendered this work a labor of love.\textquote{ A great deal of fine lace went to Spain from Flanders; for in the 16th century Flanders was a part of the Spanish domain and the Emperor Charles V, therefore, ruled both countries. He, a native of Ghent, preferred the Netherlands to Spain and brought here as much of his native atmosphere as possible. Tapestry-weavers, lace-makers, embriderers, furniture-makers and other artisans were sent. After 1840, when the most large numbers and Spanish workers were also sent to the Netherlands. Consequently, there was an interchange of styles between the two countries.

\textbf{Flemish Lace.}—Flanders was superior to all other countries in its flax and the fineness of the linen thread the people were able to produce. An immense quantity of bobbin (or pillow) lace had been made in this country from an early period, and also \textit{tape guiipure} (the tape following the lines of the pattern and connected by \textit{brides}), lightened by holes called \textit{bird's eye} (single, or arranged in groups). As soon as Alençon began to succeed, Flanders began to make artistic needle-point, too.

\textbf{Brussels Point and Pillow.}—The Needle-point made in Brussels from about 1720 closely resembled Alençon in pattern and in general effect; but it was not so firm, and the \textit{toilé} was looser than Alençon and the button-hole stitched \textit{cordonnet} (so distinctive of Alençon) was absent in Brussels. The fineness of the thread was almost fabulous. It had to be spun in dark, cold, underground rooms, for light and heat were said to hurt it. The earliest patterns of Brussels Point resemble the Venetian and the Alençon designs; and as Brussels lace enjoyed such patronage at the French court it followed the ornamentation in fashion. Brussels lace of the days of Louis XIV shows the designs of Marot, Berain and Lepautre; in the days of Louis XV zig-zags, pagodas and Chinese figures appear; then come leaves and flowers (pastoral scenes of tulip and rose), insects, birds, trophies, feathers and striped ribbons of the Louis XVI period; and then the pseudo-classic motives of the Napoleonic period, as well as flowers, sprigs, wreaths, columns, stars, crosses and spots. The palm and pyramid were also frequent during the empire. Brussels Needle-point was and is still known as \textit{point gaze}. It is famous for the variety of its patterns, the great diversity of the \textit{fillings} between them and its marvelous firmness. There were two kinds of grounds: the \textit{réseau} (or net) and the \textit{bride}. Sometimes, too, \textit{réseau} and \textit{bride} grounds are mixed in the
same piece. The réseau was made in two ways — by needle and with bobbins. Hence Brus-
sew a pillow-net and a pillow-lace. There are two ways of producing the flowers and other ornamental — with the needle and with bobbins. When the ornaments are made with bobbins on the pillow, the lace is called point plat. In old lace the plat flowers were set in a flat design, the ground, for the "Sappi-
plied" method was unknown. In the modern point gage, according to Mrs. Palliser, "the flowers are made with the same thread as the ground (as in old Brussels). It is made in small pieces, the joining concealed by small sprigs, or leaves. Brussels point de gace is the most filmy and delicate of all point-lace. Its forms are not accentuated by a raised outline of button-hole stitching as in point d’Alençon; but are simply outlined by a thread. The execu-
tion is open more than in the early lace and part of the toilé (heavy part of the design) is made in close and part in open stitch to give an appearance of shading. The style of the designs is naturalistic. The introduction of ma-
chine-made net (tulle), the famous "Brussels net," has a new impetus to Brussels point-gage for the substitution of a machine-made for a hand-worked ground diminished the costliness, and such large articles as shawls and bridal veils were multiplied. The flowers and other ornaments, after being made by hand, were applied on the net (sewn on delicately). Sometimes these were needle-point and sometimes bobbin-made (pillow). Great ingenuity, variety and skill were displayed in the fillings be-
tween these ornaments. Ghent and Alost, as well as Brussels, derived great profit from this kind of lace.

Point-plat appliqué is the name given to bobbin-made sprigs applied to machine-made net. Point Duchesse is also a Brussels lace. It is a bobbin (or pillow) lace of fine quality in which the sprigs (resembling Honiton) are connected by brides. Duchesse is a modern name. The lace resembles the old tape-gui-
pure of Flanders, made at Bruges in the 17th and 18th centuries and much used for cravats. Mechlin lace — Mechlin lace is now ranked very high by connoisseurs. It is also called Point de Malines. Mechlin is made in one piece on a pillow with bobbins, the ground and the pattern being worked together with various fancy stitches. Its distinguishing feature is the cordon-
net, here a flat, silky thread which outlines the pattern and gives this lace almost the character of embroidery. The hexagonal mesh of the ré-
seau is made of two threads twisted twice on four sides and four threads plaited three times on the other two sides. Sometimes the pat-
tern is "fond de neige," sometimes "œil de per-
drix" and sometimes Fond Chant. Very early Mechlin has points d’Esprit (little square dots); but this is rare. The characteristic pattern is a sort of sunflower, rose, or pink, in full blos-
som and also with flowering petals. The border is a shallow scallop, or it is slightly waved. The flower appears on the edge and the rest of the ground is sprinkled with square spots, quatrefoils, or leaflets. The flower is Flemish in character and the powderings (armés) are French in style. One style of pillow-lace with brides, that make a kind of lattice-work, are characteristic and give Mechlin a charming delicacy. A four-petaled flower often fills in the spaces in the scrolls. Mechlin was always a costly lace. It is without question, writes Lefebure and Le Lude, a pillow-lace. Mechlin was in great request during the reign of Louis XV and the rococo style of ornament prevailed in its designs. To some extent, in their lighthearted and delicate, they may be com-
pared with similar patterns upon contemporary engraving done from Saxony and Bohemia. Under Louis XVI, floral sprays and delicate interlayings were used in the patterns. No better lace can be found to assimilate with and adorn light textures, such as gauze and muslin. Our great-grandmothers showed appreciation of its appropriateness in using it to adorn their mountains of powdered hair. Mechlin was also made in Lierre, Turnhout and Antwerp.

Antwerp—Antwerp was a great mart. Its distinctive lace had a vase, or pot of flowers, when its name "Potten Kant." The blossoms are pinks, roses and sunflowers, and sometimes straggling branches are thrown from the flowers. The ground varies: sometimes it is the six-pointed star; sometimes the partridge eye, etc.

Lille, the old capital of Flanders, was not a French town until after the Treaty of Aix-la-
Chapelle. Its lace resembles Mechlin. The chief difference is in the réseau, which is even lighter than that of Mechlin. It uses the Fond Chant (six-pointed star) and the "fond sim-
ple." Square dots, known as "points d'esprit," are also characteristic of Lille. The laces of Mons are also Flemish. Ypres, Alost, Courtrai and Bruges made lace of the Valenciennes type. Ghent, Binche, Liège and Saint Trond were also centres. In fact, for three centuries lace-making has been the chief industry of Flanders and of Belgium.

German Lace.—Germany claims the inven-
tion of lace. A tombstone in Annaberg reads: "Here lies Barbara Uttmann, died, 14 Jan. 1775, whose invention of lace it is." The benefactress of the Harz Mountains. Barbara Uttmann, wife of a rich mining overseer, how-
ever, learned to make pillow-lace from a Brea-
bant exile. She set up a workshop in Annaberg. The lace is ranked very high by connoisseurs in northern Germany (most of them from Alençon) improved lace-making there and Italians influenced work in Bavaria and Saxony; but German lace never acquired artistic reputa-
tion outside of Germany.

English Lace.—England was never a great lace-making country; but the wealthy lords and ladies purchased lavishly of the fine laces of other countries. English flax was poor in com-
parison with that of the Continent, which may have been the reason that Point lace was little made. Tudor inventories mention the fine cutworks and "points" of Italy, and no one had more of them than Queen Elizabeth. She also patronized fine Flemish lace. In her reign Flemish refugees, fleeing from the persecu-
tions of the Spanish Inquisition, carried the lace-making industry to Devonshire. Honiton was their chief settlement, and from this time onward we read of "bone-lace" in old Eliza-
bethan literature, a name, of course, for bob-
bins (sometimes made of bone). In the se-
cond half of the seventeenth century, Pillow sup-
planted Venetian and French lace in the estimation of the English. When Cromwell’s body lay in state it was draped with superb Flemish Point.
1 Austrian 19th century pillow and bobbins

2 French 19th century bobbin, Chantilly black
1 Brussels 19th century needlepoint  
2 French early 18th century needlepoint. Flounce-Point de France
The enormous demand for Flemish Point oc-
casioned smuggling on such a vast scale that Par-
liament prohibited all importations of it. Then,
to supply their customers, merchants bought lace
made in England, and smuggled it out of the
country where they sold it under the name of Point
d'Angleterre, or English Point; and under this
name it often was taken to France and sold.
This lace was Brussels Point, Flemish lace
continued popular for a long time in England.
Lace makes Roland and Clairette it is very
popular in Lisbon "some Flanders lace of good value as a
present to the wife and daughter of his partner
in the Brazils."

Hontton Pillow.—The most famous English
lace is Hontton. It resembles the old tape
guipure of Flanders with open bides. The pat-
terns are large and made first and then
joined. The Hontton Sprigs were (and still
are) famous, although the poppy, butterfly,
acorn, etc., have not always been of fine
design. Hontton resembles in some degree the
"Purtissand" lace of Portugal, which keeps
the Flemish type. Its value was determined by
covering a piece of lace with shillings. Queen
Victoria's wedding-dress was of Hontton and
cost £1,000 ($5,000). Hontton lace-veils, worth
hundreds of guineas, are treasured heirlooms
in America and in England. England has had
two centres of lace-making: Devonshire; and
the South Midlands (Nottingham, Bedford and
Buckingham). In the latter town lace was
made after the style of Mechlin, Antwerp and
Lille, always grounded and never guipure (as in
Flanders). Much lace for making dresses was
made in Nottingham. In 1768 a workman,
Hammond, conceived the idea of making a net
tissue on a stocking-knitting machine. This
was improved by Heathcote's bobbin net loom
in 1809. The French then established manufact-
uries. This lace was called "cut-work."

Irish Lace.—Lace began to be an industry
in Ireland in 1829–30 in Limerick and Carrick-
macross. Limerick is a tambour, i.e., threads
embroidered on net, and Carrickmacross is
distinguished by patterns cut in cambic and ap-
plied on a net ground. Beautiful, ornate
stitches like lattework are also characteristic
of Carrickmacross. The style came from Italy.
Vasari says it was invented by the painter Bot-
ticelli. Point lace, in the style of the 17th cen-
tury, is now made at Youghal (County Cork),
the chief centre, and also in Kemmare, Killar-
ney, Waterford, Kinsale and New Ross. Linen
thread of the finest kind is used and the meshes
are so small that the stitches are almost invis-
able. Irish Point owes its existence to the
failure of the potato crop in 1847. The Irish
then tried to gain money by the Point Lace
industry. It is a beautiful production and is
worn entirely for the purpose of ornament.
Peasants make pillow lace in every country,
 differing in style and pattern in every place. In
many countries Torchon is made. This is also
called "beggars" lace. It has been imitated suc-
cessfully by machinery. The knotted lace
known as Macromé, made in convents in the
Riviera, is taught by the nuns to the peasants.
It is a survival of the old knotted lace made in
Spain and Italy in the 15th and 16th centuries.
It is tied with the fingers. Macromé is much
used in Genoa. The name is Arabic in origin.

Of late years beautiful handmade lace has been
produced in the English factories in the newly
established "lace-schools" particularly after
Italian methods. Some of these schools are un-
der wealthy patronage; others are connected
with settlement work.

Lace is made in the Latin-American coun-
tries after the Spanish styles. In Fuyal lace is
fashioned out of the fibre of the aloes. In the
Philippines lace is made from the fibre of the
pineapple.

The machine-lace industry of Europe is cen-
tred in Paris, Lyons, Calais, Saint Gall,
Nottingham and Plauen. The importations of
laces and embroideries (including nets, veilings
and curtains) at the port of New York during
the years 1914 to 1917 were: March 1914,
$3,164,594; March 1915, $1,810,376; March 1916,
$2,306,618; March 1917, $1,388,262.

LACE BARK, is derived from the inner
bark of several species of trees and is readily
detached in sheets or layers like birch bark,
each layer being a delicate network of fibre,
which when gently stretched a pentagonal or
hexagonal mesh is formed which resembles
lace. The most commonly known species is the
lace bark tree of Jamaica, Lagetta lintearia.
It is said that Charles II was presented by the
governor of Jamaica with a cravat, frill and
pair of ruffles made from this substance. The
fibre can also be twisted into strong ropes and
in past time thongs and whips were made from it,
with which the negroes were beaten. The
lace bark tree of New Zealand is an Australian
species, Plagianthus betulina, more commonly
known as the ribbon tree; its layers of bark
showing the same beautiful lace-like texture
as the Jamaica form. Another species producing
a delicate, white lace-like tissue is the Birabara
of South America, Daphnopsis tenuifolia.

LACE BUG, vulgar name for some of the
Tingidae, given on account of the gauze-like
or lace-like meshes of the wing covers, lacking
membrane and almost transparent, widely ex-
ploded beyond the body. This hood-like process,
also filled with meshes, sometimes projects for-
ward. The Corythoca arcuata is an example
of the group and is found in vast numbers on the under-sides of leaves of oak trees. It lays its eggs next the mid-rib and veins and stays there during the heat from midsummer till frost. It measures about a sixth of an inch. The *Corytheca ciliata* abounds on the sycamore. They are both white.

**Lacedemon**, lás-ě-démôn. See SPARTA.

**Lacépède, Bernard Germain Etienne de la Ville, bár-nár zhâr-mâⁿ ă-té-ên de là vîl bâr-nár zhâr-mâⁿ, French naturalist:** Agen, France, 26 Dec. 1756; d. Epinay, France, 6 Oct. 1825. He abandoned the military profession, for which he was destined, and devoted himself to the study of natural history. His teachers and friends, Buffon and Daubenton, procured him the important situation of keeper of the collections belonging to the department of natural history in the Jardin des Plantes. In 1791 he was elected member of the Legislative Assembly and belonged to the Moderate party. Napoleon made Lacépède a member of the Conservative Senate and conferred on him the dignity of grand-chancellor of the Legion of Honor. After the restoration he was made peer of France. He continued Buffon’s ‘Histoire naturelle’ with the titles ‘Histoire des quadrupédés ovipare et des serpents’ (1788-89) and ‘Histoire naturelle des reptiles’ (1789) and published also ‘Histoire naturelle des poissons’ (1798-1803); ‘Histoire des cétacés’ (1804), etc.

**Lacertilia**, lás-ěr-ill’è, or Auto-SAURI, the order of saurian reptiles which contains the lizards. These are distinguished from the serpents (*Ophidia*), to which they are most nearly allied by the fact that the right and left halves of the mandibles (lower jaws) are connected by a sutural symphysis, whereas those of serpents are connected by a more or less distensible cartilage. The great majority possess well-developed limbs, movable eyelids and cutaneous scales, covered by a horned epidermis, usually thin, but sometimes thick and rising into pointed projections. In a few degraded and burrowing forms the limbs have become lost or almost entirely lost, while the eyes may have become buried beneath the skin and the scales nearly or wholly obsolete. The vertebræ are prococelous, except in some of the geckos, where they are amphiocelous; the ribs of the trunk articulate by their capitular heads only, the reduced tubercula being attached to the vertebræ by ligaments. The limbs are typically formed after the pentadactyl pattern; and the shoulder girdle and sternum are complete. The hoid apparatus resembles that of birds. In the skull the quadrate bone is movable except in a few degraded forms. The skin is covered with scales formed within it, and the epidermis is horny and is periodically shed in flakes; but in many cases these scales do not overlap and leave well-marked limits. They are represented by bone granules, giving a "pebbly" aspect to the surface; or these osteoderms (which never occur in snakes) may form in the ordinary scales. The skin contains no glands; but in many lizards, tubercles in chromatophores (q.v.) controlled by muscles whose action causes the variations in surface color of which many lizards are capable and of which they avail themselves as an aid in hiding from their enemies. In their reproduction lizards never undergo any metamorphosis and are generally oviparous, but in some cases eggs are retained until they hatch within the abdomen of the mother. Salivary glands are found which in *Heloderma* act as poison glands. The lungs are thin-walled sacs, from which terminal pouches may arise. The movement of the ribs assists in respiration. The lizards are most abundant in tropical regions, but are absent only from the cooler temperature and the frigid regions of the globe. The group possesses strong power of regenerating lost parts and especially of renewing the tail, which in many families breaks off under a very slight strain.

**Fossil History.**—The Lacertilia are a comparatively recent development of the reptilian race, not traceable beyond the beginning of the Tertiary. Fragmentary remains of several existing families occur in the Eocene and Miocene rocks; and the Pleistocene river-deposits of Queensland, among which was a monitor-lizard 30 feet long. The line probably originated in the *Prosauroia* (q.v.), represented by a single living form—the tuatara (q.v.). Lizards are now so well adapted for the warmer parts of the world and seem to be increasing and developing. They are said by Hoffman to include 434 genera and 1,925 species.

**Classification.**—The Lacertilia are divided into three sub-orders, of which the following is an outline:

**Sub-order 1. Geckones.**—Lacertilia with four legs, amphiocelous vertebrae and clavicles dilated ventrally. The chorda persists and grows throughout life, in the centre of and between the vertebrae; the ribs are bifurcated, and dentition is pleurodont. Some species have mechanically adhesive discs. The one family (*Geckonidae*) is coextensive with the sub-order. This is a very old group, modern species existing in tropical and southern European countries. See GECKO.

**Sub-order 2. Lacertae.**—Lacertilia with prococelous vertebrae and the ventral part of clavicles not dilated. Eighteen families, as follows:

1. *Agamidae.*—A family of exclusively Old World lizards, containing some 200 species, among which the Malayan dragon (q.v.), and the frill-lizard (q.v.) are remarkable species. Many have a very chameleon-like appearance.

2. *Iguanidae.*—A large and chiefly American family with pleurodont dentition, and a short, thick, non-protractile tongue. The genus *Anolis* contains the common "chameleon" of the southeastern United States. (See ANOLIS; CHAMELEON). *Basiliscus* of Central America has a great, erectile vestigial crest on the back and tail. (See BASILISK). *Iguana* (q.v.) includes large edible lizards of Central and South America. *Phrynosoma* is the genus of the "horned toad" (q.v.).

3. *Xenosauridae.*—A Mexican family intermediate between the *Iguanidae* and the *Angiidae*; represented in Africa by (4) the *Zonuridae*.

4. *Aniidae.*—Terrestrial pleurodont lizards, with bony plates in the skin and the tail long and brittle, dwelling in Central America, Europe and India. *Opheleia*, the genus of the glass snakes (q.v.) of the Central States,
has the limbs reduced to mere spikes. Anguis, the "slow-worm" (q.v.), has no limbs at all, and the eyes are well developed.

6. Holodermatidae.—Plereudont, poisonous lizards of New Mexico and Arizona. See Gila Monster. The (7) Lanthanotidae are Asiatic representatives of the foregoing.

8. Varanidae.—Plereudont aquatic lizards of the Old World, with bifid, protractile tongue. See Monitor Lizards.

9. Xantusia.—Three Central American genera.

Tejida.—A large tropical-American family of large forest-dwelling, carnivorous lizards of great strength and swiftness. See Teju.

11. Lacertidae.—Typical small lizards of the Old World, with pleuropedent dentition, and bony dermal plates over the temporals. About 100 species. All live on animal food, chiefly insects, worms and snails.

13. Scincidae.—Plereudont, viviparous lizards, with feebly nicked, scaled tongue. They burrow in sandy ground. The family contains about 400 species distributed all over the world. See Skin.

The following five families have become degraded on account of their burrowing instincts: (14) Anotyphidae, worm-like, legless lizards of the tropics; (15) Dibamidae, of Malay Archipelago; (16) Anguilidae, worm-like lizards of California, limbs entirely absent; (17) Amphisbaenidae, worm-like blind lizards which burrow like earthworms, especially in ants' nests and manure heaps. Chorotes of Mexico and California has the fore-limbs remaining. See Amphisbena.

18. Pygopodidae.—Snake-like lizards; forelegs absent; hind-legs a pair of scaly flaps; Australasia.

Sub-order 3. Chameleonotes.—Old-World slowworms, with compressed body and prehensile tail; tongue club-shaped and capable of being protruded to a distance equal to the length of the body; two digits of the feet are permanently opposed to three; head crested; eye-balls very large and movable on the two sides independently of each other; capacity for changing color conspicuous. (See Chameleon). Consult Boulenger, "Catalogue of Lizards in the British Museum" (London 1887); Cope, "Crocodilians, Lizards and Snakes of the United States" (Washington, U. S. Nat. Museum, 1900); Gadow, "Amphibia and Reptiles" (in "Cambridge Natural History," Vol. VIII, London 1902).

LACEWING, a neopterous insect of the families Hemerobiidae and Chrysopidae. About 40 species are found in the United States; the most common perhaps being the golden-eyed flies of the genus Chrysopa. These are greenish, ill-smelling, gauzy-winged creatures usually less than two inches long and feeding little or not at all in the adult state. The females lay their eggs upon the summits of silky threads, by which means they are protected from predacious enemies. The larvae, as soon as hatched, crawl down the threads and feed upon the first soft-bodied insect they reach—perhaps a brother. They are considered useful in destroying plantlife, hence the name "aphis-ions" (q.v.), but in California they attack the larvae of the useful ladybirds.

LACHAISE, François d'Air de, frânswâ da de lá-sházh, French Jesuit confessor of Louis XIV; b. Château d'Arques, near Lille, 10 June 1628, d. Paris, 20 Jan. 1709. He was the provincial of his order when Louis, on the death of his former confessor, appointed Lachaise to that office. The new confessor with admirable tact kept himself clear of the innumerable meshes of court intrigue. Jansenism was at the time a powerful factor in ecclesiastical and political circles, and the Jesuits were its most formidable adversaries, but Lachaise knew how to conduct himself under all circumstances with address, coolness and sagacity; and never allowed himself to be drawn into violent measures against his opponents. That Louis XIV married Mme. de Maintenon was owing principally to the counsels of his Jesuit confessor. Lachaise retained the favor of his monarch till his death, and Louis had a country just excited to send him to the west of Paris, on an eminence which had received the name of Mount-Louis. Its extensive garden now forms the cemetery of Père Lachaise, the largest in Paris.

LACHAMBEAUDP, la zhan bo de, Pierre, French fable writer: b. Sarlâs, Dordogne, 15 Dec. 1807; d. Brunny, 6 July 1872. He was son of a poor peasant and became bookkeeper for a Lyons commercial house, then obtaining a position on the railway while editing Echos de la Loire until, after much poverty and misfortune, his Fables populaires were published (1839; 7th ed., 1840) with such brilliant success that his future was well assured and his name honored. During his period of exile at Brussels for activity in the 1848 revolution he published Fleurs d'exilé (1851); Fleurs de Villemombœuf (1861) and Hors d'œuvre (1867).

LACHES, làsh'ës, a legal term derived from the Old French lachesse, remissness, which in turn was derived from the Latin laxus, slack. Unreasonable delay; neglect to do a thing or to seek to enforce a right at a proper time. Courts of equity witheld relief from those who have delayed the assertion of their claims for an unreasonable time. The question of laches depends not upon the fact that a certain definite time has elapsed since the cause of action has accrued, but upon whether, under all the circumstances, the plaintiff is chargeable with want of due diligence in not instituting the proceeding sooner. To constitute laches to bar a suit there must be knowledge, actual or imputable, of the facts which should have prompted action or, if there were ignorance, it must be without just excuse. Laches may be excused from the obscurity of the transaction; by the pendency of a suit; and where the party labors under a legal disability, as insanity, but poverty is no excuse for laches, nor ignorance and absence from country. Laches on the part of its officers cannot be imputed to the government and no period of delay on the part of the sovereign power will serve to bar its right either in a court of law or equity when it sees fit to enforce it for the public benefit.

LACHESIS, lák'sës, in classical mythology, one of the three Fates (q.v.).
LACHEM, lā-shēm, Canada, town in Jacques Cartier County, Quebec, on the Grand Trunk Railway, eight miles southwest of Montreal, on Montreal Island, which is here connected with Caughnawaga, on the south bank of the Saint Lawrence, by a bridge. It is a popular resort for pleasure parties in the winter and in summer it is largely a residential place for Montreal business men. It is best known as the terminus of the Lachine Canal, nine miles long, connecting it with Montreal and built to carry steamers around the Lachine Rapids. All the commerce of Montreal by the Great Lakes passes through this canal. Lachine is the starting point of steamers for Kingston, Toronto and Hamilton. Lachine has some manufactories, and here are the electric works of the Lachine Power Company, furnishing power and light for the city of Montreal. It was first named Saint Sulpice, but was changed in derision to Lachine after the return of La Salle’s expedition of 1669, which it was mockingly said, set out to find China by ascending the Saint Lawrence. In 1689 the Indians burned the town and massacred all the inhabitants. Pop. 10,699.

LACHINE CANAL. See CANADIAN CANALS.

LACHISH, lā-kīsh, Palestine, a city of Judah. It was destroyed by Joshua and given to the tribe of Judah, and was fortified by Rehoboam. King Amaziah sought refuge there but was slain. Sennacherib, in his campaign against Judah, captured this town and King Hezekiah sent a deputation there with presents to placate Sennacherib. Micah denounced the place as "the beginning of sin to the daughter of Zion," the intent of which is not clear. Its site is identified with Tell-el-Hesi, the hillock excavated by Flanders-Petrie and Bliss (1890-93) for the Palestine Exploration Fund, some 15 miles west of Gaza. Cousens, Flanders-Petrie, ‘Tell-el-Hesi’ and Bliss, ‘A Mound of many Cities,’ both published by the Palestine Exploration Fund in 1891 and 1894, respectively; Rogers, ‘Cuneiform Parallels to the Old Testament’ (New York 1913) ; Schrader, ‘Cuneiform Inscriptions and the Old Testament’ (Vol. II, London 1885-88).

LACHLAN, lāk’lăn, a river of New South Wales, having its source in the Cullarin-range, 175 miles southwest of Sydney. The river makes a semi-circular sweep north of about 240 miles, when, pursuing a generally southwest course, it joins the Murrumbidgee, the united stream afterward falling into the Murray. The total course is about 700 miles.

LACHMANN, lāch’man, Karl Konrad Friedrich Wilhelm, Teutonic and classical philologist: b. Brunswick, 4 March 1793; d. 1851. As a student at Leipzig and Göttingen his work lay in Italian, English and Old German poetry, as well as in Greek and Latin. As a teacher he passed from various gymnasiaus positions to professorships in the universities of Königsberg and Berlin. His work in textual criticism, both in Judeo-German and in this language, is of no small importance. Editions of Walther von der Vogelweide, Wolfram von Eschenbach, Lucretius (his greatest achievement as an epoch-making work), Catullus, Tibullus, Propertius, the New Testament and Shakespeare’s sonnets and Macbeth deserve mention among his numerous publications. Consult his "Life" by Hertz (Berlin 1851).

LACHNER, lāch’ner, Franz, German orchestral composer: b. Rain, Bavaria, 2 April 1804; d. Munich, 1890. He studied music at Vienna under Stdaller and Sechter (1822) and became familiar with Schubert. He was appointed (1826) vice-bandmaster of the Kärnthnerthor Theatre and bandmaster in the following year. In 1834 he went to Mannheim to conduct the opera and became court-bandmaster (1836), general music director at Munich (1852), retiring (1865) on a pension. His works are prodigious in number, consisting of an oratorio, a sacred cantata, four operas, requiems, three grand masses, besides other cantatas, entr’actes, etc. Also eight symphonies, one winning the prize offered by the Gesellschaft der Musikfreunde, overtures, serenades for orchestra. His suites for orchestra are considered his best work. Critics declare he lacked fire but was a prodigy of conscientious industry.

LACHRYMAL (lāk’rimal) ORGANS. See EYE.

LACHUTE, lā-shoot’, Canada, town in Ar- genteau County, province of Quebec, on the North River, and Canadian-Pacific and Canadian Northern railroads, 44 miles from Montreal. It is an important shipping centre for farm and dairy products and has large paper mills, pulp mills and wood-working industries. Pop. 2,400.

LACINARIA, lā-sin’ar-ē-a, a genus of plants of the thistle family containing about 30 species of tall perennial herbs growing in dry soil throughout the eastern and central United States and known as blazing-stars and button snakeroots. They bear late in the season dense spikes of purplish flowers, often in the south a foot in length and of a delicate lavender tint very effective when seen in a mass of goldenrod or autumnal grasses. L. squarrosa is known as colic-root, and all the species are in repute among the southern country folk, not only as good family medicine in the form of a decoction made from the root, but as a specific against rattlesnake venom.

LACKAWANNA, lāk’a-wōn’na, N. Y., town of Erie County, on the Lackawanna River and on the Lake Shore and Michigan, the Pennsylvania, the Lehigh Valley and other railroads, and six miles from Buffalo. Coal is mined here and there are blast furnaces and coking plants, and a number of coal-breaks. It has six churches and a hospital. Among its manufactures figure chiefly the large steel plant and the bridge works. Pop. 15,737.

LACKAWANNA RIVER, a considerable stream which flows through the northeastern part of Pennsylvania and flows through the valley formed by the Shawnee and Moose mountains, discharging into the Susquehanna at Pittston; length about 50 miles. Great quantities of the best anthracite coal are mined in the valley and many towns grow up to this river, the entire district being given over to collieries, rolling mills, blast furnaces and factories, Scranton being the principal town. The greatest thickness of strata belonging to the coal measures amounts in the central portion of the basin to nearly 1,800 feet. On each side they dip toward the
LACONIA, a territory in ancient Greece. See SPARTA.

LACONIA, N. H., city and county seat of Belknap County, on the Winnipesaukee River, and on two divisions of the Boston and Maine Railroad, about 28 miles north of Concord, the capital of the State, and 100 miles north of Boston. It was settled in 1780-82 by English people from the southern part of New Hampshire. It was incorporated as a town in 1822 and chartered as a city in 1893. It is in an agricultural and manufacturing section, in a beautiful lake region. Its charming scenery, cool climate and opportunities for fishing make it a favorite summer resort. Its principal manufactures are hosiery and knit goods, railroad cars, machinery, lumber, clutches, needles and paper boxes. The State Home for Feeble-Minded Children is located here, also the State Fish Hatchery. The educational institutions of the city are the public and parish schools and the Gale Memorial Library. The prominent buildings are 12 churches, an opera house, cottage hospital, three national banks, public library and the courthouse. The government is vested in a mayor and six councilmen. Pop. 11,094.

LACONIA GRANT. See BOUNDARIES OF THE UNITED STATES.

LACORDAIRE, la-kor'dar, Jean Baptiste Henri Dominique, French preacher: b. Recy-sur-Ource, 12 March 1802; d. Sorèze, 22 Nov. 1861. After studying law in Paris he began practice in that city. He was in religion a deist of the Voltairean school, and it was only after reading the Essai sur l'Esprit des lois (q.v.) that he came to the conclusion that Roman Catholicism was a primal factor in the development of political life. It was with this view that he determined to become a priest. Entering the Seminary of Saint Sulpice in 1824 he was ordained priest in 1827. In 1835 he was appointed preacher at Notre Dame, where his sermons attracted crowded congregations. He was, however, bent on a wider project, the revival of the Dominican order, the great order of preachers in France. With this view he revisited Rome in 1838, and after the usual novitiate became a Dominican. The Dominican is originally a Spanish order, and was never popular in France, and Lacordaire, who was appointed provincial of the order in 1850, had little success in establishing it there. He was in 1848 elected a member of the National Assembly. He was, however, rebuked by his bishop for calling himself a Republican and retired from politics in 1852. His honest indignation against the coup d'État expressed in a sermon roused the animosity of Napoleon III, and he was driven from the pulpit and became director of the Lycée at Sorèze. He was elected to the Academy in 1850. A collected edition of his works appeared at Paris in 11 volumes in 1872. Consult 'Lives' of Montalembert (1862); Foisset (2d ed., 1874); Chocarne (8th ed., 1894); Greenwell (1877); Lear (1882); D'Haussonville (1895); Nicolas, 'Le Père Lacordaire et le Libéralisme' (1880); Fesch, 'Lacordaire, Journaliste' (1897).

LACOSTE, la-kôst, Sir, Alexander, Canadian jurist; b. Boucherville, Quebec, 12 Jan. 1842. He was educated at the College Saint Hyacinthe and at Laval University and was called to the bar in 1863. He sat in the Legis-
LACQUERING — LACQUERS AND LACQUERWORK

IATIVE Council of Quebec 1882–84, became a Dominon senator in 1884 and chief justice of the Queen's Bench of Quebec 1891–1907. He was knighted in 1902.

LACQUERING. læk'ë-rë-ing, the art of giving a smooth and brilliant surface with various preparations of shellac (see JAPANING). In Chinese lacquering they first stop up the holes and crevices, covering all the imperfections with a coating of diluted lac by means of a soft brush. Then they cover the whole with a thick coating of lac and white clay. This clay, oily to the touch, is found at the bottom of certain lakes in Tonking; it is dried, pulverized and sifted with a piece of fine silk before being embossed with the lac. This operation is designed to conceal the inequalities of the wood and produce a uniform surface which, when completely dry, is rendered smooth with pumice stone. If the object has portions cut or sunk the clazy mixture is not applied, for it would make the details clumsy, but in its place a single, uniform layer of pure lac. In any case, after the pumicing, a third coating, now pure lac, is passed over the piece which at this time has a mouse-gray color. This layer, known under the name of som lot, colors the piece a brilliant black. As the lac possesses the remarkable property of not drying in dry air, the object is left in a damp place. When perfectly dried the piece is varnished and the desired color imparted by a single operation. If the metallic applications are excepted, the lac is colored only black, brown or red.

The operation of lacquering is then ended, but there are parts to be gilded. These are again covered with a mixture of lac and of oil of trau. When this layer is dry the metallic leaves are applied, which are themselves protected by a coating composed also of lac and oil of trau. These lac and oil of trau mixtures are carefully filtered, which the natives effect by pressing the liquid on a double filtering surface formed of wadding and of a tissue on which it rests. It can only be applied after several months when the metallic leaf is of gold. In the case of silver or tin the protecting coat can be laid on in a few days.

The wood to be lacquered should be absolutely dry. In Japan when wood is well prepared and the faults have been corrected with pure lac it is dried, pumiced and covered with a coat composed of crushed flax mixed with glue. Then a layer of lac is applied and covered with a fine linen fabric which should perfectly adhere in all its parts. This first preparation, suitably dried, serves as a foundation for the successive applications of lac. Each coating is rubbed with a fine-grained stone before drying in the moist chamber. This is done with the greatest precaution, so as to avoid impurities and dust. The last polish is obtained by rubbing with the powder of calcined deer horn. The decorative applications of gold or of silver, which is effected as follows: The design to be reproduced is drawn on very fine paper prepared with a mixture of glue and alum, and on the back of the paper the outlines are traced with a brush of fine hair, dipped in lac previously boiled over a brisk charcoall fire. This paper is then applied to the object to be decorated, and it is made to adhere by rubbing with a spatula, either of minoki wood or of whalebone. When the paper is removed the design is found transferred on the object, with the application of a white powder by means of a piece of wadding. With one of these transfer papers 20 reproductions can be secured, and the lines can be retracted with the boiled lac, it is said, so as to procure copies almost indefinitely. The outlines remain and the consequence of the use of the boiled lac, and imperfections can be corrected. In this case the outlines are retracted with a pencil of hare's hair lightly charged with a preparation of lac not boiled. This operation is delicate and requires great care not to displace the original outlines. When ended the whole is covered with fine gold, silver or tin powder, as desired; the powder is applied by means of a piece of wadding. If the object to be decorated is of large dimensions the process is conducted on separate parts, and each step is placed in a dam closely closed, so as to exclude the dust. When the metallic coating has hardened sufficiently the piece is taken out, and the design is covered with a fine transparent lac laid on with a brush of hare's hair. The gilding of the succeeding part is never attempted until the preceding has been completed dried in the dam chamber. All the parts of the object are finally rubbed with a piece of camelia wood charcoal in order to equalize the thickness, and then polished with the fingers moistened with a mixture of calcined deer horn powder and oil.

Indian lacquer is a natural black varnish obtained from the inquisitive juice of the unripe fruit of the Semecarpus anacardium or some related tree. Burmese lacquer is obtained from the black varnish tree (Melanorrhoea usitata). European and American imitations of Oriental lacquering may be regarded as identical with japanning. Late in the 18th century lacquering was regarded as a polite art or fad of the well-to-do, and a variety of ornamental varnishing was performed under this name. The art possessed quite a literature. Consult Audsley, 'Ornamental Arts of Japan' (1882); McQuoid, 'History of English Furniture' (1908); Schrader, 'Handbuch der Lach- und Firnis-Industrie' (1910).

LACQUERS AND LACQUERWORK. Japanese.—While the art of lacquerwork was first known to the Chinese and taught by them to the Japanese, this latter nation has so far excelled all others as to make its lacquer product stand out as a class by itself. Louis Gonse says "Japanese lacquer objects are the most perfect works of art that have issued from the hand of man." W. T. Walters says: "Lacquer is the vehicle exclusively identified with Japanese art and art industries. The Chinese have attempted its use, and in Europe the connoisseurs are familiar with the term 'Japan,' the product of the Martins. But lacquer in all its beautiful uses and decorations is a truly Japanese belonging." In this context it must be said that, while Nippon's natives far outrank all others in this work, there is a very great and distinct difference in the workmanship produced by the connoisseur, and the commercial wares made for export by the Dutch during the 18th century and since. This difference was forcibly
displayed when a steamer laden with both kinds was returning the fine exhibits from a world’s fair and sale. The poor quality of the lacquers used to cover the base of the body. Then commences the first polishing and the object is left to dry slowly; then the second coat is applied and allowed a long period to dry, when the polishing is renewed. This process is continued till, sometimes, as many as 20 applications have been superimposed, dried and rubbed down with clay. The painting or other decoration follows next.

When the great European demand started, about 1700, inferior goods were rushed to market and decadence in the industry soon followed. The Japanese government, middle of last century, tried to raise the artistic level of the art, and met with considerable success, so that Tokio, Kioto and Osaka produced really meritable pieces. Cheap, inferior ware is made in the provinces of Aizau and Yechizen. The hardness of fine lacquer pieces is such that lacquer bowls are used to serve hot wines, liquors, soups, etc.

Japanese lacquer periods are Kamakura, 1100 to 1336; Ashikaga, 1336 to 1573; Momoyama, 1573 to 1603; Tokugawa, 1603 to 1808. Noted lacquer artists are Kano, 15th century; Sumio, 16th century; Shunsho, 18th century; Yosai (imported from China and produced the first carved red lacquer), about 1600; Koma, 17th century; Titsu, early 18th century; Hanzan (Ritsu's pupil); Kanie, 18th century; Kiyokawa, Shioi, Toyko, Kwansho, Toshida, Yousai, Zeishin.

A fairly exhaustive list of Japanese lacquer articles is medicine boxes (inro); paint-boxes (sudzuri-bako); clothes-presses, chests; small tables for incense burners (tesan); large tables (sen); sake tables; traveling trunks (hosa-mibako); tobacco boxes (tobacobon); palanquins, or Sedan chairs (nornmonos); clothes-horses (iko); writing and toilet sets; book coffers (oi); dinner sets; sake sets; smoking sets; dinner and sake dishes; sake bottles; sake dish stands; water pots; incense boxes; picture easels; hair combs and pins; neck rests; boxes to hold tea services (chadansu); tea trays; urns; fans; foot baths; hats; braziers; (bitchi); letter boxes; bowls and covers (kira); little boxes for perfumes (ko-bako); rouge boxes; kaké boxes; mirror stands; sword racks (katamake); horse saddles; stirrups; brush jars; incense burners (koro); tea caddies (cha-ire); tea bowls (sen); dinner caddies (miseru); dinner chests (benitobako); sweet meat boxes (washi-bachi); book chests (bunko); fruit dishes (takahushi); screens, sliding doors, etc. Besides their furniture and utensils, the Japanese, as protection against atmospheric action, coat their light wooden houses (pillars, pilasters, verandas, movable wall frames) with lacquer.

Chinese Lacquerwork.—The Chinese term for their lacquer is tsi. They were the predecessors in this as in many other arts and taught the Japanese, but the date is not known. In the esteem of the Chinese their coral-red Soo-chow carved lacquer stands foremost. Dr. Bushell says Pekin and Soo-chou have done no highly artistic work since Chien Lung (1736-95). There are, however, in the National Museum of fine specimens extant of coral-red. The term "Coromandel" lacquer has been for two centuries used for some very fine incised and decorated old Chinese work; the reason for the term is conjectural. The Celestials produced a
style of lacquer done by placing a very thin layer of iridescent shell in black lacquer, before the black may harden. The peculiarly pretty effect was very much admired by the French who termed it "laque burguaite" and the production thrived greatly late in the 17th century (Kang-he). The Chinese also excelled in coating porcelain with black lacquer decorations. As in other lines of decorative art of the Chinese the crafts are very much "specialized." Thus the different operations of cabinetworkers, lacquers, decorators, metal-workers, etc., often necessitate each piece passing under the hands of many workmen. Like the Japanese the Chinese extend the use of lacquer in many directions; as Semper says: "The Chinese lacquer everything, even their tree trunks." The body of Japanese and Chinese lacquer pieces consists of thin wood, fine bamboo wickerwork, feather, skins, etc.

**Indian and Persian Lacquerwork.**—The method of production of these natives is quite different from that of China or Japan, inasmuch as the lacquer is utilized only as a covering or decoration. In India and Persia the lacquer is applied to wooden surfaces. The best work emanates from the northwest provinces of East India. They show a close relationship in style to the Persian painting. Indian pieces have been divided into two categories: "Masnadi" or royal—large panels and decoration pieces; and "Parast" or Persian—portable articles. Unlike the Japanese and Chinese decoration, that of India and Persia is extraordinarily rich and complex. Gold, green, yellow, blue are the favored colors; deep black is a frequent background. In contrast with the Chinese and Japanese the Indian and Persian method of decorative treatment covers the entire surface; borders, sides, covers of the object show harmonious repeats of the same motifs. Another difference lies in the fact that Indian and Persian decoration is confined almost exclusively to plant life motifs. The Persians, however, intersperse medallions and human figures, though of distorted or unnatural form. A common method of the Indian decoration is stippling on a white, yellow or light scarlet ground. Several coats of transparent lacquer are laid over the painting. The Indians also do a relief decoration under lacquer, the embossed parts being made up of a lead and glue substance placed on the surface of the object, coated with white, then allowed to dry thoroughly, after which it is carefully carved. The surface then receives a coat of lacquer of the desired color and, lastly, several more layers of transparent lacquer. Indian lacquer pieces range from bowls, boxes, fan-holders and plates to book-covers. And in Cashmere, where the best lacquer ware is made, the product extends to chairs, tables, even bedsteads. The body of Indian and Persian pieces is paper, papier-mâché or very light wood.

**French Lacquerwork.**—The beautiful pieces of old Japanese and Chinese lacquerwork that were being imported to France created a great vogue for making up French modern furniture to include Oriental lacquer panels. This vogue lasted from 1890 to say 1793; that is to say, under Louis XIV, during the Regency, and under Louis XV and the Pompadour and still under Louis XVI and Marie Antoinette. Thus for a hundred years French "Béristes" were breaking up the finest old Oriental étagères, boxes, folding screens, etc., to produce their armories and cabinets; and the lovely effects produced when bronze and gilt carved mounts were added to these artistic hands of the Caffiers and other clever metal carvers are shown in the costly extant pieces. Marie Antoinette had a fine collection of Oriental pieces, now to be seen in the Louvre. Even under Napoleon lacquers were much favored. It is not to be wondered at, considering the great demand and remunerative prices paid for lacquerwork, that French artisans should attempt creations in imitation. They were not without success, though the product is one created from varnish gums combined with shells, not lacquer. Most successful in this field of endeavor was Robert Martin (1706-65), a decorator of furniture, Sedan-chairs etc. By 1733 he received the title of "varnisher to the King." His panels with Chinese landscapes, figures, etc. (chinoiseries) and other French decoration were of a high quality, as were those of his descendants, equalled by the excellent workmanship of the cabinet work. Good pieces of Martin's fetch high prices to this day, and the product includes small ware such as snuffboxes, etc.

**English Lacquerwork.**—From the last quarter of the 17th century and during first half of the 18th century England was passing through a veritable rage for lacquered furniture. Oriental imports on a large scale gave impulse to the fad. This style of decoration was termed "Indian." It became so popular that the art was taught to young ladies in the schools. Again in contrast with the Chinese and Japanese the Indian and Persian method of decorative treatment covers the entire surface; borders, sides, covers of the object show harmonious repeats of the same motifs. Another difference lies in the fact that Indian and Persian decoration is confined almost exclusively to plant life motifs. The Persians, however, intersperse medallions and human figures, though of distorted or unnatural form. A common method of the Indian decoration is stippling on a white, yellow or light scarlet ground. Several coats of transparent lacquer are laid over the painting. The Indians also do a relief decoration under lacquer, the embossed parts being made up of a lead and glue substance placed on the surface of the object, coated with white, then allowed to dry thoroughly, after which it is carefully carved. The surface then receives a coat of lacquer of the desired color and, lastly, several more layers of transparent lacquer. Indian lacquer pieces range from bowls, boxes, fan-holders and plates to book-covers. And in Cashmere, where the best lacquer ware is made, the product extends to chairs, tables, even bedsteads. The body of Indian and Persian pieces is paper, papier-mâché or very light wood.

LACROIX, lak'roks Paul, French historian and novelist: b. Paris, 27 Feb. 1806; d. there, 16 Oct. 1884. He wrote under the nom-de-plume P. L. Jacob, Bibliophile, and is best known under that name. He was a prolific writer. Among his early works are *Disserta-
tions sur quelques points curieux de l'histoire de France et de l'histoire litteraire* (Paris 1831-47); *Histoire du XVle siecle en France* (1834); *Histoire de la vie et du regne de Nico-
las ler* (1864), in eight volumes. His novels are on romantic history subjects. He edited (from 1829) in collaboration with Pichot, *Mercure du XIXe siecle and founded* (1830) *Gastronome* and *Garde national.* In cultural art he pub-
lished, notably illustrated works, among them *Costumes historiques de la France* (1852, 10 vols.); *Le Moyen-Age et la Rena-
sissance* (1847-52, 5 vols.); *Mecurs, usages et costumes au moyen-age et a l'epoque de la re-
naissance* (1870; 2d ed. 1872); *Vie militaire et religieuse* (1872).

LACROIX, Sylvestre Francois, French mathematician: b. Paris, 1765; d. there, 25 May 1843. He was (1787) instructor at the Paris Military School, became (1789) professor at the artillery school at Besancon and examiner (1791) of artillery officers. In 1794 he was appointed chief of the Bureau of Committee for the Restoration of Public Instruction, and professor of mathematics at the Ecole Normale. He was appointed (1799) professor of the Poly-
technic School and then professor of mathematics at the Lycée (1814), and in the same capac-
ity (1815) at the Collège de France. He re-
signed from most vocations in 1821. He wrote excellent books of instruction still in use; also *Traité du calcul differentiel et du calcul inté-
gral* (Paris 1797; 7th ed., 1807); *Traité des différences et des series* (1800); *Traité ele-
mentaire du calcul des probabilites* (1816; 4th ed., 1833); *Cours des mathematiques* (1797-1816). These have found German ver-
sions on account of their high value.

LACRUMES CHRISTI, lak'riims krish'ti, an Italian red wine produced from grapes so named grown on the slopes of Vesuvius near the Lacrume Christi monastery. Its delicate, spicy flavor, fire and aromatic bouquet give it a popularity higher than other Italian wines. On which account vintages from elsewhere in Italy are often labeled with this name when the wine has a more or less similar character, especially as the true vintage is a small one. It is numbered among the liqueur wines. The dark, amber-yellow Lacrume Christi of Mount Somma is the closest in quality to the true vintage.

LACTANTIUS, Firmianus, often called the Christian Cicer, on account of his pure Latin style, lived in the last half of the 3d cen-
tury and at the beginning of the 4th. Con-
stantine the Great made him tutor of his son Crispus. His most important work is the *Institutiones Divinae,* a manual of Christian doctrine written to defend the religion to which he had been converted. His works appear in Migne's *Patrologia,* and have also been edited by G. Laubmann and S. Brandt (Vienna 1891).

LACTARENE, lak'tar-e-nen, the casein of milk as commercially prepared by being freed from fat, precipitated by an acid, thoroughly purified, dried and powdered. It is insoluble in water, but is soluble in an alkali, such as ammonia, and in this form is used, like albumen, for fixing pigment colors in calico-printing. The cloth, after it has been printed, is steamed, the ammonia is driven off and the pigment is thereafter able to resist the action of water.

LACTATION. See Milk, Human.

LACTEALS, lak'te-als, vessels which, together with the lymphatics, constitute one system for conveying a fluid or fluids from various organs of the body to the veins near their terminations in the heart. The fluid which the lacteals convey is milky at first, and is called chyle, though during its fasting it is a yellowish lymph, as in the lymphatics. The lacteal vessels commence on the intestinal villi, unite with one another in the mesentery and, after leaving the mesenteric glands, dis-
charge their contents for the nourishment of the body into the receptaculum chyli, in front of the second lumbar vertebra. See also Lymp:
Lymphatic Glands.

LACTIC ACID (CH₃COOH). Scheele, in 1780, was the first to describe the acid present in sour milk. In 1832 Liebig and Mitscherlich showed it to be a distinct acid. Lactic acid is widely distributed in nature, occurring in the sap of several plant families, in sour milk, in the saliva, blood and urine, and the brain and gastric juice of animals. Lactic acid is a result of the fermentation of the various sugars, and of dextrin and mannitol. There are many modes of preparing it artificially; and its iso-
eric varieties, of which four have been de-
scribed, have excited much attention. Its two principal kinds are fermentation and paralactic or sarcolic acid. The former is got from concentrated sour whey by remov-
ing the curd, adding lime, filtering, diluting with water, removing the lime with oxalic acid, evaporating and extracting the lactic acid with alcohol. It is more usual, however, to get it by what is called the lactic fermentation, from sugar or saccharine substances. The sugar is dissolved in water; to the solution is added sour milk or decaying cheese and a quantity of fine, well-washed prepared chalk, and the mix-
ture is kept for about four weeks at between 85° and 95° F. Fermentation ensues and much lactic acid is formed, which combines with the chalk and forms lactate of calcium. This salt is then decomposed by sulphuric acid, filtered, and the fluid is boiled with carbonates of zinc. Lactate of zinc is formed, which is collected and decomposed by sulphurated hydrogen. The fluid filtered from the sulphide of zinc is evaporated, and the syrupy fluid which remains contains the lactic acid. Lactic acid of commerce is a syrup (specific gravity 1421) which contains a small percentage of water. It re-
 mains liquid even at very low temperatures. It
LACTIC FERMENT — LADAKH

deliquesces in moist air, dissolves in all proportions in alcohol and water, has no odor and has a purely sour taste. It cannot be distilled, or even heated, without undergoing decomposition, lactic anhydride or lactolactic acid being formed; at a higher temperature carbonic oxide is evolved, and a variety of products distill with sourness i.e. is left in the retort. By oxidizing agents, such as bleaching-powder and nitric acid, it is converted into oxalic acid; by oxide of manganese into aldehyde.

The paralactic or sarcolactic acid was observed in flesh by Berzelius in 1806, and he considered it the same as that derived from milk. Liebig showed that they were not absolutely identical, but the nature of their differences is at present unknown. This acid is readily got from the cold aqueous extract of meat by adding a solution of baryta, coagulating and remodelling albumen, concentrating the solution, precipitating the baryta, filtering and evaporating. The syrupy residue contains the acid. Paralactic acid can be distinguished from lactic acid by its property of rotating the plane of polarization to the right, lactic acid being inactive. The calcium salt of the fermentation acid contains more water of crystallization; when heated it retains it for a shorter time; and it is more soluble than the sarcolactate. Again, the zymolactate of zinc contains more water in water, and is less corrosive, and imparts a finer feel and lustre. With an equal part of potassium dichromate it forms lactol, regarded as superior to the plain acid. Lactic acid is a solvent for several dyestuffs which are insoluble in water, and is of special use in the dyeing and printing of cotton textiles. It is also used in the tanning industry, in coloring, bating and plumping the skins, to which it imparts a fine grain. In the distilling industry it is used to check the development of deleterious bacteria.

In medicine, lactic acid is used in laryngeal tuberculosis, and diluted with six parts of water, it is applied locally in diphtheria and croup to dissolve the false membrane. It is also used as a local application in tuberculous ulcers, lupus and epithelioma.

LACTIC FERMENT, a minute organism which, under the microscope, is seen to consist of small elliptical cells, generally detached, but sometimes occurring in chains of two or three. It is developed in milk when it is allowed to stand for some time, and is the cause of the milk coagulating on souring, the sugar of the milk changing into lactic acid. It is also developed when cheese is added to a solution of sugar, and kept at a temperature of 35° to 40°. See also FERMENTATION; LACTIC ACID.

LACTOMETER, or GALACTOMETER, an instrument for ascertaining the different qualities of milk. Several instruments of this sort have been invented. One consists of a glass tube one foot long, graduated into 100 parts. New milk is filled into it and allowed to stand until the cream has fully separated when its relative quantity is shown by the number of parts in the 100 which it occupies. Another is a specially constructed hydrometer used to determine the specific gravity of milk for the purpose of detecting adulteration with water. It has been learned by experience that the specific gravity of the milk of healthy cows does not fall below 1.029. See MILK ADULTERATION.

LACTOSE, sugar of milk (C₁₂H₂₂O₁₁), a substance obtained by evaporating whey, filtering through animal charcoal and crystallizing. It forms hard, white, semi-transparent trimetric crystals, which have a slightly sweet taste, and grate between the teeth. It is convertible like starch into glucose by boiling with very dilute sulphuric acid.

LACTUCARIUM, the brown viscid juice of the common garden lettuce, obtained by incision from the leaves and flowering stems, and dried in the air. It is a mixture of various substances, including lactucone, lactucin, lactric acid, mannite, albumin, etc. Lactucarium is hypnotic, anti-spasmodic and has been recommended in cases in which opium is inadmissible, particularly for children. It has been administered with advantage in chronic rheumatism, diarrhoea and asthma, in doses of two to five grains.

LACUNAR, lāk’na-r, the Latin word defines a wainscoted and gilded ceiling, a panel ceiling, and obtains its intent from the sunken spaces (coffers) of the paneling. It applies in architecture also to the under surface of an member of an order, the under side of the larnier of corona of a cornice, etc.

LACUSTRINE DEPOSITS, sediments laid down in lakes. They are generally consolidated into conglomerates, sands into sandstones, clays into shales, or marls into limestones. See LAKES, section on Lakes in article on GEOLOGY, and section on Sedimentary Rocks in article on ROCKS.

LADAKH, lā’dāk, India, a province of Kashmir including the valley of the upper Indus and its tributaries. It is located between the Himalayas and Karakorum and has a climate ranging from fierce heat in the day time to icy nights. Vegetation is hindered by the dryness of the atmosphere, grain and fruit growing being restricted to the sheltered valleys and then only in stunted growths; and forests are few. The area is about 8,000 square miles, all at a great elevation, from 9,000 to 14,000 feet. A number of salt lakes furnish an endless supply of borax. Its game consists of wild horses, ibex, wild sheep, hares, etc. Goats supply a short wool which is used in the production of shawls. The inhabitants, 186,650, approximately, are small, unclean Turanians, strong of body and for the most part agriculturalists. They are Buddhists and each village has its monastery. Except for the healthy, polyandry is the rule. Commerce consists chiefly of the passage through from China of wool, tea, gold dust, silver, Indian cotton, skins, leather, grain, fire-arms, etc.; but native wool,
borax, sulphur and dried fruit are exported. Consult Cunningham, 'Ladakh, physical, statis-
tical, and commercial', The Commercial Dispatch, New York, 1881; and also the compila-
tion, 'Routes in Jammu et Kashmir' (Calcutta 1897); Adair, 'Sport and Travel in Baltistan
and Ladakh' (London 1899); Younghusband, 'Kashmir' (London 1911); Neve, 'Thirty
Years in Kashmir' (New York 1913).

LADARIO, Lis fabry, an arsenal and small
town in the State of Mato Grosso, Brazil, about five miles east-south-east of Cruzeiro on the Paraguay
River; one of the three arsenals of the Brazilian navy. See Brazil — NAVY.

LADD, George Trumbull, American educa-
tor: b. Painesville, Lake County, Ohio, 19 Jan.
1842. The Laddys, originally of Norman
French extraction, intermarried with the Welsh
family of Williams and the name appears in
English history as early as the 13th century.
Dr. Ladd is a lineal descendant, through the
paternal line, of Elder William Brewster and Gov.
William Bradford. He was graduated at Wester
Barnard College, A.B., in 1860; A.M., in 1867;
and his honorary degrees are D.D. (1879),
L.L.D. (1895), Andover Theological
Seminary; A.M., Yale (1881); L.L.D.,
Princeton (1896). After graduation at
Western Reserve University he spent two years in
business, and then entered Andover Theological
Seminary, whence he graduated in
1869. In 1869-71 he preached in Edinburg,
Ohio, and in 1871-79 he was pastor of Spring
Street Congregational Church, Milwaukee,
Wis. In 1879 he was called to the chair of
philosophy at Bowdoin College, and held that
position until he became professor of philosophy
at Yale College in 1881. After the death of
President Porter (1892) he was made Clarke
professor of metaphysics and moral philosophy,
which position he held until 1906, when he
resigned. His services to the cause of educa-
tion have carried him, at various times, be-
yond Yale. During the academic year 1895-96
he was chosen a member of the faculty of
Harvard University and conducted the graduate
seminary in ethics, and in 1906-07 he was sub-
stitute professor in Western Reserve Univer-
sity; since then, much of his time has been
spent in lecturing and travel upon important
educational missions in foreign lands. Twice
he was asked by the Imperial Educational So-
ciety of Japan to deliver courses of lectures,
and in the summer of 1892 and again in 1899
he visited and lectured at Osaka, Kioto, Tokio,
Hakone and Kobe. In this period Professor
Ladd for 16 months delivered courses in
Imperial Universities of Tokio and Kioto, and
in Count Okuma's and other private univer-
sities, and in the government business colleges
where he spoke on "Commercial Ethics," and
made many other public addresses. His lectures
on "Commercial Ethics" were later adopted as
a textbook, and his other writings have been
adopted as textbooks in Russia and other coun-
tries, as well as in Japan and India. In the
spring of 1907 he went to Korea as guest and
"unofficial adviser" of Marquis Ito, returning to
the University of Chicago, where he stayed a
month was spent in lecturing to teachers. For
his services to the cause of education in Japan
he was thrice admitted into audience with the
emperor, the last in private when he was in-
vested with the third degree of the order of
the Rising Sun. He was elected Gold Medalist
of the Imperial Educational Society, and on
the occasion of his third and last visit received
the second degree of the order of the Rising
Sun at the hands of the emperor.
In 1899-1900 he lectured on philosophy be-
fore the University of Bombay, India, and on
the philosophy of religion at Calcutta, Madras,
Benares and elsewhere. The Conven-
tation Hall, Bombay University, were unique,
inasmuch as no one 'before that time had
learned under its auspices, which honor was,
in part, an official justification of the substitu-
tion of Professor Ladd's books for those of
Herbert Spencer as required reading for the
M.A. degree. His visits to Japan, and espe-
cially to Korea in the critical time of the
readjustment of the political and social relations
of the two countries, constitute an important
factor in their history.

His contributions to the science of psy-
chology and philosophy are widely known. He
was one of the founders of the American
Psychological Association, was its second presi-
dent and its delegate to the International Con-
grass at Paris in 1910. Among the most
permanent of his achievements is the founding
of the psychological laboratory at Yale, which,
under his guidance, became one of the best
equipped in the world. Up to the time of his
resignation in 1906 there proceeded from Yale
a continuous stream of teachers of philosophy,
whose success has been largely due to the
lecturing and influence of Professor Ladd.

His position in American philosophy is
sufficiently indicated by the appended list of
his works. By some critics he has been
erroneously called a disciple of Lotze and
Porter, a theological apologist and defender
of the traditional views, none of which appraise-
ments is supported by the facts of his mental
development. The fact is Ladd never studied
with either Lotze or Porter, or became ac-
quainted with their works until he had been a
student of philosophy for 20 years. For many
years he devoted himself to his great work,
The Doctrine of Sacred Scripture, from which,
when completed, he turned exclusively to
the problems of philosophy; but at no time
has he been anybody's disciple, or adopted any
system, still less has he founded any "school."
His freedom from schools and parties was
accompanied by a sagacity of judgment and catholicity of
taste, accompanied by great patience and
capacity for hard work, which are the strongest
marked elements of his personality and tem-
perament, scarcely warrant his being called a
dogmatist, but rather a "critical realist," or
"radical rationalist."

Professor Ladd's published works include
volumes on technical theology, psychology, phi-
losophy and education. Besides these works
he has written extensively on his travels in
Japan, Korea and India, and on questions con-
Nected with politics and the great war, upon
social criticism and practical ethics. He has
also been a frequent contributor to the technical
journals, whose indices will serve as
guides. His more important works are:
Principles of Church Polity" (1882); Doctrine
of Sacred Scripture" (1884); "Outlines of
Philosophy" (trans. of Lotze, 5 vols., 1887);
Elements of Physiological Psychology" (1887, revised with R. S. Woodworth 1914).
LADD — LADIES OF THE MACCABEES OF THE WORLD

What is the Bible? (1888); 'Introduction to Philosophy' (1889); 'Outlines of Physiological Psychology' (1890); 'Philosophy of Mind' (1891); 'Primer of Psychology' (1894); 'Psychology Descriptive and Explanatory' (1896); 'Philosophy of Knowledge' (1897); 'Outlines of Descriptive Psychology' (1897); 'Essays of the Higher Education' (1899); 'A Theory of Reality' (1899); 'Lectures to Teachers on Educational Psychology' (in Japanese); 'Philosophy of Conduct' (1902); 'What Can I Know?' 'What ought I to Do? (1914-15).

LADD, Herbert Warren, American journalist and politician: b. New Bedford Mass., 15 Oct. 1843. After a high school education he secured a position on the staff of the New Bedford Mercury, and during the Civil War went to the field with the 43d and 44th Massachusetts regiments. In 1864, his novel was published in the Boston Journal before the New York papers heard of it. He issued a Sunday edition of the Mercury to announce the battle of Fredericksburg. The first Sunday paper ever published in New England outside of Boston. In 1864 he entered the dry goods business and in 1871 served the firm of Ladd and Davis in Providence, which in 1857 was incorporated as the H. W. Ladd Company, of which he was president. He founded the Commercial Club in Providence, was vice-president of the Board of Trade for two years, was a generous patron of Brown University, and in 1891 presented to the university a fully equipped astronomical observatory. In 1890 he was elected governor of Rhode Island, was a candidate for that office in 1890 and was defeated, but was re-elected in 1891.

LADD, William, American philanthropist: b. Exeter, N. H., 1778; d. Portsmouth, N. H., 9 April 1841. He was graduated at Harvard College in 1797, became a sea captain, but retired at the outbreak of the War of 1812, and subsequently took an active part in organizing the American Peace Society, of which he was for many years president, and in behalf of which he labored efficiently until the close of his life. In the interests of this society he edited the Friend of Peace, commenced by Dr. Noah Worcester, and the Harbinger of Peace, and published a number of essays and occasional addresses on the subject of peace. He carried his views to the extent of denying the right to maintain defensive war, and caused this principle to be incorporated into the constitution of the American Peace Society.

LADEGAST, Friedrich, German organ builder: b. Hermendorf, 30 Aug. 1818; d. 1905. He learned organ construction at Rochlitz, Saxony, through his brother Christlieb, then worked in several localities and established himself (1846) at Weissenfels. Most notable of his works were the reconstruction of the organ in Mereburg Cathedral (1855) and the construction of the organ (1859-62) with four manuals and 85 stops. He trained his son Oskar, who was born 26 Sept. 1856, in the profession and they have built many large as well as ordinary organs.

LADENBURG, Albert, German chemist: b. Mannheim, 2 July 1842; d. 1911. He studied at Heidelberg, Berlin, Ghent and Paris and became instructor (1868) at Heidelberg, adjunct professor (1872) and professor at Kiel (1873) and then (1889) at Breslau. He did useful work on the synthesis of alkaloids and the constitution of benzol. He wrote 'Vortrage über die Entwickelungsgeschichte der Chemie in den letzten 100 Jahren' (1888); 'Vorlesungen über die Theorie der aromatischen Verbindungen' (ib. 1876); 'Handwörterbuch der Chemie' (13 vols., Breslau 1883-93); 'Naturwissenschaftliche Vorträge in gemeinverständlicher Darstellung' (1908).

LADIES' HOLIC BENEVOLENT ASSOCIATION, The. This association was instituted 9 April 1890, and chartered under the laws of Pennsylvania in June of the same year. The association proposes as its objects, as set forth in its incorporation articles, to write into a fraternal sisterhood all the Catholic women; to elevate them morally, mentally and socially; to educate them in integrity and frugality, and to mutually aid and assist each other by providing relief and death benefits to its members. On 1 Jan. 1916 it had a membership of 157,521 in 12,253 subordinate branches, located in 29 States. Its disbursements in death benefit to that date was $13,640,077, with relief benefits of $23,560. Its disbursements in 1915 were $1,369,920.46 — death benefits, $1,327,980.51; $41,930.95. Its recording and financial office is located at 443 West 11th street, Erie, Pa.

LADIES' LOYAL ORANGE ASSOCIATION. See ORANGEMEN.

LADIES OF THE Maccabees. A woman's benevolent society, organized 24 March 1866. This was the first society in North America composed exclusively of women, to give fraternal life insurance to women. The society has a beautiful ritual used by its lodges, and inculcates the principles of sisterly love and fraternal assistance. In its inception, the society was an auxiliary socially of the Knights of the Maccabees, but always an entirely independent body. Several years ago the benefit protection was changed from the current cost plan to a flat rate plan and the extension extended from the State of Michigan only to any of the States of the Union in which it was considered advisable to organize. The order now has 51,000 members and is doing business in 21 States. It has beds in several hospitals, endowed in perpetuity, where the members may receive free treatment, and a bed for the little orphans in the Children's Free Home, Detroit. It has a reserve fund for the benefit of its members in financial distress. The society pays for claims under $100,000 and has a reserve fund of one million and a quarter dollars. The finances are managed entirely by women. Mrs. Frances E. Burns, has filled this office since 1898, and the secretary, Dr. Emma E. Bower, has held her office since 1893. The headquarters are at Port Huron, Mich.

LADY'S OF THE MODERN MACCAEBEE—ADMIRALUT

LADY'S OF THE MODERN MACCAEBEE—ADMIRALUT

LADINO, lə-dë'ño, (1) a hybrid language of the Jews of Hamburg, London, Amsterdam, southern France, North Africa and Constanti-

nope. (2) The old Castilian language. (3) In Central America and Mexico the word is used to designate the descendants of whites from Indian mothers. (4) The Romanesch dialect used in the Engadin, etc.

LADISLAS, lă'dîs-las, or LADISLAUS I, the Saint, king of Hungary: b. Poland, 1040; d. 29 July, 1095. He was son of Bélas, fought and conquered the Cumans (1074) and was made king of Hungary (1077) after the death of his brother Geza. In 1091 he overthrew the Croatians and placed his nephew Almos as ruler over them. He organized the con-
ditions of the Christian Church in Hungary, killed out the remnants of heathendom, converted the colonized Cumans and issued strict laws. On account of his services to Christiani-
ty he was canonized in 1192.

LADISLAS IV, the Cuman, king of Hung-

gary: b. about 1262; d. Körösszeg, 1290. He was son of King Stephan V and reigned from 1272 to 1290, when he was assassinated by three Cumans for attempting to get rid of his wife so as to marry another. With the Magyars and Cumanians he fought with Rudolph of Habsburg at Dunahurta (26 Aug., 1278), over-
throwing Ottokar of Bohemia. Later in life he threw in his destiny with the Cumanians he had favored, and of whose blood he was on his mother's side. The country, however, fell into dire anarchy and he died fighting his enemies and the Pope.

LADISLAS V, called the PROSTRUMOUS, 

king of Hungary and Bohemia: b. Komárom, 27 Feb., 1440; d. Prague, 23 Nov., 1457. He was son of Emperor and King Albrecht II and Elizabeth, daughter of Emperor Sigismund, and born four months after his father's death. The estates of Hungary had elected Wladislas III of Poland as king, but Elizabeth forced the infant's coronation. He was placed in the care of Frederick III, his uncle, as guardian, and he was acknowledged king of Hungary on the death (1444) of Wladislas and was crowned in 1453. Under the evil trelage of his uncle Ulrich Cilei he cared little for his duties as ruler and took no part in the glorious raising of the siege of Belgrade (1456) by Janos Hunyadi, the great general who ad-

ministered the government during his minority. On the assassination of the traitorous Ulrich he had young Hunyadi beheaded, but was forced to flee from Hungary to Prague, where he died suddenly, presumably of poison, as he was preparing to marry a French princess.

LADISLAS, king of Naples: b. 1375; d. Castelnuovo, 6 Aug., 1414. He was the son of Charles of Durazzo, and on his father's assas-

sination, the regency was conducted by his mother, Margaret, who won the support of the Pope when the nobility set up Louis II of Anhemburg to stand in for his son. In 1390 Pope Boniface IX had him crowned, and after eight years' warfare he drove the invaders out. He attempted (1403) to gain the Hungarian throne, utilizing the great schism and the con-

sequent political confusion to gain power over the Church and Rome. Failing in his schemes he was forced to sign the peace (25 June 1412) after his defeat at Rocca Secca by Pope John Xvii.; but he took Rome the following year. Consult Creighton, 'History of the Papacy' (Vol. I, London 1882).

LADISLAS II, Jagello, king of Poland: b. 1348; d. Grodek, 31 May 1434. He was the son of Grand Duke Olgerd of Lithuania and succeeded his father (1377) and was baptized as a Christian (1386), receiving the name Vladislas. He married, in the same year, Hedwig, daughter and heiress of Louis the Great, and was crowned king of Poland under the title Ladislas II. Under his rule Poland progressed greatly, and, in the battle of Tannen-

berg (1410), he defeated the Teutonic Order of Knights. He granted the nobility great rights and freedom; in 1400 he founded the Cracow University.

LADISLAS III, king of Poland: b. 1424; d. Varna, 10 Nov., 1444. He was son of Ladislas II, was crowned in 1437 and took the government in 1439, becoming elected in 1440 king of Hungary. But his coronation, at Stuhlweissenburg, did not take place till he had successfully fought against the widow of Albrecht II, who upheld the rights of her infant son Ladislas Posthumous; he, in 1442, married the widow, Elizabeth, who died three days later leaving him an undivided throne. With an army of 20,000 Hungarian and Wallachs under the great general Hunyadi he entered Bulgaria against the Turks and, after some successes, was defeated and killed at the battle of Varna (1444).

LADISLAS IV, king of Poland: b. Cracow, 1595; d. Merecz, 20 March, 1648. He was son of Sigismund III, and was elected tsar of Russia (1610), making Moscow his residence. But the Russians (1612) rose in rebellion and elected another tsar (Michael Romanov) and he was ejected. In 1632, on Sigismund's death, he was called to the throne of Poland, when he started a successful campaign against Russia, defeating the tsar's force and compelling surrender (1633), and meeting with equal success against the Turks. The nobility gained gre-: supremacy over the monarch's powers, taking over the army and leaving him 1,200 guards, and great disturbances occurred among the Cossacks in his last years.

LADISLAV I, lă-dîs'lav, or VLADISLAV I, king of Poland: b. 1220; d. 1333. He was called "Lokietek," the Yard-long, and was son of Duke Casimir of Cuiavia and was acknowledged king (1288) by a part of the nobility. It was not, however, till after the death of the Bohemian King Venceslas and after fighting unsuccessfully against the former and Duke Heinrich of Breslau and being exiled, that he (1305) conquered Cracow to rule there. In 1312 he crushed his enemies, becoming crowned, finally, at Cracow as king of Poland in 1320. Through the marriage of his daughter Anna with Prince Gedimin Lithuania became united with Poland.

ADMIRALUT, lăd'mêrô, Louis René Paul de, French general: b. Montmorillon, 17 Feb., 1808; d. Paris, 3 Feb., 1898. He went to Algiers (1831) as lieutenant, serving 22 years there and becoming general of a division. He
commanded a division (1859) in the war with Italy and was wounded at the battle of Solférino. In 1860 he was commander of the 4th corps with which he took part in the battles before Metz. On 18 August he defended Amanvillers with great bravery and success against the Prussian 9th corps. He was taken prisoner in Metz, but on his release took part in the fight against the Commune, becoming governor of Paris till 1878. He was member of the Senate 1876-91. He wrote 'Bases d'un projet pour le recrutement de l'armée de terre' (Paris 1871).

LADOGA, lă-do-gă, the largest lake of Europe, situated in the northwest of Russia, 40 miles east of Saint Petersburg; Greatest length, 200 miles; greatest breadth, about 75 miles; area, 7,156 square miles or 31 times as large as the Lake of Geneva. It receives no fewer than 70 streams, the principal of which are the Volkho and Sias, which enters it on the south, and the Svir, which enters on the west, bearing the surplus waters of Lake Onega and has the Neva for its outlet. It is ice-free from May to October; its fauna, Arctic in character, is exceptionally rich and varied. It contains numerous islands, and its shores are generally low. Peter the Great Canal (1718-31) and the Alexander II Canal (1861-66) connect the Neva and the Volkho; Sias Canal (1764-1802) and the Empress Maria Feodorovna Canal (1883) connect the Volkho and the Sias; the Svir Canal and the Alexander III Canal connect the Sias and the Svir. These canals form a navigable chain around the south of the lake. On two of the islands in the north of the lake there are ancient monasteries, founded, respectively, in 960 and 1393, which are regarded with great veneration, and to which thousands of pilgrims annually repair.

LADRONES, la-dró-nés, or MARIANNE (mä-rä-nē') ISLANDS, a group of 16 islands in the north Pacific Ocean, north of the Caroline Islands and 1,500 miles east of the Philippines. The northern group is volcanic and uninhabited. Guahan is the southernmost and largest of these islands; and next in importance is Satao, southeast of Sisqon. The group as a whole have a total area of 250 square miles. The inhabitants, who are mainly indigenous, are tall, robust and active, and naturally acute, lively and ingenious. Their huts are constructed of palm trees, and divided by mats into different apartments. Rice, sugar, maize, indigo, coffee and tobacco are the main products, with the breadfruit tree, first discovered here. The islands were discovered by Magellan in 1521, and were settled by the Spaniards. Magellan called them Islas de Ladrones (Thieves' Islands), because the Pacific pirates had a rendezvous here. Toward the end of the 17th century they received the name of Mariana or Marianne Islands, from the queen of Spain, Marianne of Austria, the mother of Charles II, at whose expense the Jesuit missionaries were sent over who settled here in 1602. The chief inhabitants are settlers from Mexico and the Philippines. Guahan (Guam) was ceded to the United States in 1898, and the rest sold to Spain by Germany in 1899, becoming part of the German New Guinea Protectorate. In the early days of the Great European War they were captured by the Japanese as one of the allied nations, and are now (1917) in their possession. Pop. estimated at over 15,000.

LADY OF THE AROOSTOOK, a'roos-tu-kă, title of a novel by William Dean Howells appearing first in the Atlantic (1878-79), then in book form (Boston 1879).

LADY-BIRDS, beetles of the family Coc-cinellida. This is a very large family of small beetles of rounded, convex form, usually shining and hairless. The head is prolonged beneath the pronotum, the legs are short and hidden and the elytra are usually brightly colored and marked with dark spots. These colors vary much in the same species, especially in the English Coc-cinella septem-punctata,- the pet of children. The most widely known American species is the black one with two red spots (C. bifurcata), common all over the United States. These beetles live upon plants, shrubs and trees, depositing their eggs in little bunches on the lower sides of the leaves. The worm-like maggots are active, searching the leaves for plant-lice, which are eagerly devoured, each kind of beetle choosing a special kind of aphid for its food. In this habit the lady-birds, which are sometimes extremely numerous, perform a valuable service, since their minute prey is highly injurious to the plants. See SCALE-INSECT.

LADY BOUNTIFUL, a character in Farquhar's 'The Beaux Strategem' (1705). Widow and benefactor of Sir Charles Bountiful and his will, she dispenses her wealth curing the Lichfield inhabitants of their maladies.

LADY CHAPEL, a chapel dedicated to the Virgin Mary, and when attached to cathedrals, generally placed eastward from the altar. The lady chapel of Westminster Cathedral is that usually known as Henry VII's. Saint Patrick's Cathedral in New York possesses a most ornate lady chapel.

LADY CRAB, a common name for the Platyneichus ocellatus, an American species of edible crabs beautifully covered with rings of red and purple. It is one of the group Cal-inecetes hastata. There are, however, other crabs which are so termed because they all bear what is described as the outline of the head and shoulders of a woman.

LADY-DAY, one of the quarter-days in England and Ireland, on which rent is made payable. It falls on 25 March in each year. In the Roman Catholic Church it is held as a great festival under the title of the Feast of the Annunciation. In the English Church it is observed as a feast. In France the day is termed Notre Dame de Mars.

LADY FERN, vulgar name for Asplenium fíx-fárna. It has ovate-oblong or broadly lanceolate, two-pinnate fronds, and is found in moist woods of Europe and North America. It is claimed by some to have the properties of a vermifuge. The British place this fern in the genus Athyrium. Scott refers to it in the words:

"Where the cope-wood is the greenest,
Where the fountain glitters shiniest,
Where the mountain dew lies longest,
Where the lady fern is strongest."

Edwin Lees calls it "the sweet lady fern" and Howitt says: "Do not pluck the strawberry flower nor break the lady fern."

şi-pænits as one of the allied nations, and are now (1917) in their possession. Pop. estimated at over 15,000.
LADY OF THE LAKE, The. Scott's 'Lady of the Lake,' published 1810, was the third of his metrical romances. Its apparent simplicity and the reverence of the charactor of the scenery and its apperance of a poetic treatment of historic associations. "This poem," he said, "the action of which lay among scenes so beautiful and so deeply imprinted on my recollections, was a labor of love, and it was no less so to recall the manners and incidents introduced. The frequent custom of James IV, and particularly of James V, to walk through their kingdom in disguise, afforded me the hint of an incident which never fails to be interesting"—that is, the participation, on the part of royalty in disguise, in a romance among humbler folk. The poem may be said to reach the high-water mark of Scott's success in blending the interest of scenery, action and simple human feeling, so far as his metrical works are concerned, though it is rather the evidence of its author's participation in the battle of Flodden in 'Marmion.' The characters of the king and of Roderick Dhu are brilliantly sketched; that of the young lover, Scott, as usual, found difficult in handling. "You must know," he wrote to a friend, "this Malcolm Graham was a great plague to me from the beginning. . . . I gave him that dip in the lake by way of making him do something; but wet or dry I could make nothing of him." He also related, to illustrate his care for accuracy of detail, that he himself rode into Perthshire "to see whether King James could actually have ridden from the banks of Loch Vennachar to Stirling Castle within the time supposed in the poem." 'The Lady of the Lake,' like the earlier romances, met with instant success, and has proved lasting popularity. Incidentally, its epilogue is one of Scott's few distinguished achievements in purely lyric poetry. In the Edinburgh Review the work was discussed by Jeffrey. Scott's good friend and critic, and his summing up of its qualities remains one of the best accounts of Scott's poetic style: "A medley of bright images and flowing words, set carelessly and loosely together,—a diction tinged successively with brilliancy and sarcasm, with harshness and antique simplicity of the old romances, the homeliness of vulgar ballads and anecdotes, and the sentimental glitter of the most modern poetry; passing from the borders of the ludicrous to those of the sublime, alternately minute and energetic, sometimes artificial, and frequently negligent, but always full of spirit and vivacity, abounding in images that are striking, at first sight, to minds of every complexion, and never expressing a sentiment which it can cost the most ordinary reader any exertion to comprehend." —RAYMOND M. ALLEN.

LADY OF LYONS, The, a play, by Bulwer-Lytton, originally called 'The Adventurer.' It was first produced in 1838.

LADY OF MERCY, Order of Our, a Spanish order dating from 1218. It was founded by James I of Aragon, in compliance with a vow made during his captivity in France. Pope Gregory IX approved the order in 1230.

It was instituted to redeem Christian captives from the Moors. The order was extended to women in 1261. A woman of the Order of Our Lady of Mercy in France was suppressed at the time of the Revolution. It is now a missionary order, mainly in South America and South Africa.

LADY OF SHALOTT, The, a mediaeval poem by Tennyson. It is the title of one of Tennyson's poems (1832).

LADY OR THE TIGER, The, a title of a play by Francis Richarson (written about 1884). It received exceptional popularity heightened by the fact that the sequel or decision is left to the reader, thereby creating a considerable fund of conjecture and discussion. The title has become a pet phrase to express a dilemma.

LADY WINDERMERE'S FAN. Oscar Wilde had made himself notorious in affecting to write only to the few. In 'Lady Windermere's Fan' he throws his dart directly at popularity with the many. Nothing in Wilde's career is more perversely more characteristic than the extraordinary success of his series of comedies beginning in 1892 with 'Lady Windermere's Fan.' This success is secured by a impudent practice of all the codes he had preached in his early career. And now his affronts to the public bring him fortune as well as fame. In the '80s Wilde had been the enfant terrible of the British Isles; he had shocked the prudes; he had pained the apostles of beauty for man's sake with his impious contempt for the British middle-class manners. In 'Lady Windermere's Fan' Wilde had got himself lampooned and made the central figure of a Gilbert and Sullivan opera, but still he was poor. Now at the age of 38 he turns respectable as to morals and conventional as to artistic manners. Nothing could be more lofty, more smug, more British middle-class than the morals of 'Lady Windermere's Fan'; nothing could be more au fait according to the current English imitations of French serious drama than the innocent-guilty intrigue that it propounds. The men are long-winded praters, wise and witty and sophisticated in words, impeccable as to their private lives. The women are dowagers and faithful wives. If any has sinned it was very long ago. The young girls are silent. In all these respects Wilde was giving the respectable English audience exactly what it wanted. He knew that the audience would accept any amount of banality in the theatre if only it were given a dash of piquant French sauce. Above all it must not be called upon to think; it must not be brought up short with an arresting observation of real life. It would enjoy risque allusions but only as verbal badinage. It resented bitterly any attempt on the part of the dramatist to be honest. Wilde was never more witty and ingenious than when he was in 'Lady Windermere's Fan' and the succeeding plays. Never, save in 'The Importance of Being Earnest,' which is a true farce, was he less honest. In his earlier work, with all his absurdities, he had been a corrective for characteristic British faults. In his society plays he pampers and кодifies the faults and prospers upon them. Wilde's wit and paradox and epigram have become famous. The verbal brilliancy of his plays is what gives them continuing life. The stories are secondary; the characters are not differentiated. All
are artificial creations in a fictitious code. But the author's own quips of observation, his turn of phrase and observation, the heartless polish of his contemptuous comedy, make the play memorable among the few examples of English comedy of manners. 'Lady Windermere's Fan' was produced by George Alexander at the Saint James Theatre, 22 Feb. 1892; it was revived at the same theatre 19 Nov. 1904 and 14 Oct. 1911. Its first production in America was at the Columbia Theatre, Boston, 1893. It has been one of the most popular stock plays for revivals in this country, in England and on the Continent. Consult Ransome, A., 'The Life of Oscar Wilde, a Critical Study' (1912); Sherard, R. H., 'Oscar Wilde' (1906); 'The Real Oscar Wilde' (1915); Wilde, O., 'The Truth of Masks, in Intentions' (1891).

THOMAS H. DICKINSON

LADYFISH, BANANA-FISH, or BONEFISH, the name of several different marine fishes conspicuous for elegance of outline and handsome coloring. They are found mainly in the tropical regions.

LADY'S FAN. See GIANTS CAUSEWAY.

LADY'S or FAIRY'S, FINGERS, GLOVE, THIMBLE, etc., are some among many commoner's names for the purple foxglove (Digitalis purpurea), in regard to which much provincial folklore might be cited. See DIGITALIS; FOX-GLOVE.

LADY'S MANTLE, popular name for the Alchemilla pratensis (Schmidt) of the Rosacea family. The Alchemilla vulgaris L. is also called. This term is derived from the fact that there is supposed to be a similarity to a mantle in the shape of its leaf. It is a perennial with orbicular-remiflare leaves, 5-9 lobed, more or less pubescent, serrate. Flowers are two inches broad. It grows in grassy places near the Nova Scotia, Cape Breton and eastern Massachusetts coast, but was naturalized from Europe. The Alchemilla alpina L. is found on Montebello Island and on the White and Green mountains and is distinguished by its being along silky entire leaves. The Aphanes arvensis L., or parsley-piert, is also called field lady's mantle. This is found in dry fields of Nova Scotia, Georgia, Tennessee, etc., and has claims to astrigent and diuretic properties.

LADY'S SLIPPER, or MOCCASIN FLOWER, an orchid of the genus Cypripedium, several species of which grow both wild and cultivated in the United States. See ORCHIDS.

LADY'S SMOCK. See CUCKOO-FLOWER.

LADYSMITH, British 'Columbia, city situated on Oyster Harbor, Vancouver Island, in the Nanaimo district, 17 miles southeast of Nanaimo, on the Esquimalt and Nanaimo Railway. It is a shipping port for the collieries which are located about 12 miles inland. The Canadian Pacific Railroad Company operates a train ferry from Vancouver to this point and the railroad is transferred here. The city was founded during the Boer War and the streets are named after the generals who took part in that conflict. It was incorporated in 1904 and owns its own electric light and sewerage systems. The Canadian Bank of Commerce and the Royal Bank of Canada have branches here. There are four churches, two public schools and a high school. There are smelters and stove works, shingle mills, aerated waterworks, boat-building yards, etc. Oyster cultivation is carried on in the harbor and there is a large farming district tributary to it. Pop. 3,229.

LADYSMITH, South Africa, town of northern Natal, near the Klip River, 119 miles by rail north by west of Pietermaritzburg, and 322 southeast of Pretoria. It is situated in a hilly region about 30 miles east of the Drakensberg Mountains. During the South African War of 1899-1901 Ladysmith was besieged by a strong force of Boers. The complete investiture began on 2 Nov. 1899 and the relief was not effected till 28 February of the following year, or 118 days after the Boers succeeded in isolating the town. The town was held by a garrison of 1,000 men under Sir George White, and during the siege much damage was done by the shells of the Boer artillery. Disease also carried off many of the garrison and the inhabitants. The relief was effected by General Buller after a hot battle by way of Pieters and Nelthorpe, to the east of the railway. Three previous attempts by the same general to relieve the town had to be abandoned owing to the strength of the Boer positions and to their superiority in long-range guns. The population numbers about 4,000.

LAeken, ləˈkɛn, Belgium, a suburb of Brussels on the Brussels-Ostende and the Brussel-Hambeek railways. It has a royal palace, built 1782 but restored 1890 after the fire; with handsome park. On a neighboring hill is the colossal monument of Leopold I with its statue by W. Geefs. Pop. 35,024.

LAELIUS, ləˈliːəs, (1) Gaius, Roman general and statesman: d. after 170 B.C. He was a friend of Scipio Africanus the elder, and fought under the latter in most of his campaigns. In 190 B.C. he was made consul in consequence of his successes in the Spanish campaign (210-206 B.C.) and in Sicily and Africa. He defeated Syphax in 203. In 170 he was ambassador to Transalpine Gaul. (2) Gaius, surnamed Sapiens (the Wise), son of the preceding Roman statesman and student: b. about 186 B.C.; d. 115 B.C. He was an intimate friend of Scipio Africanus the Younger which comes out clearly in Cicero's treatise 'Laelius sive de Amicitia.' In 151 he was tribune of the plebs, in 145 praetor, and in 140 was consul. His love of literature and philosophy is noted as well as his friendship and social intercourse with talented contemporaries as the philosopher Panaceius, the historian Polybius, the poets Terence and Lucilius. His early life was devoted to the study of politics and philosophy. Besides figuring in 'De Amicitia,' as interlocutor, he is a speaker in 'De Senectute' and in 'De Republica.' He had some talent for military work as proved by his campaign against the Lusitanian Viriathus. He inhabited the district of the Stoics Island it is sometimes supposed here. Early in his political successes he attempted to procure a division of the public land among the people but wisdom caused him to drop the measure as inopportune; later he became an adherent of the aristocratic party.
How highly his course of life was honored is clearly shown in one of Seneca’s injunctions to his friend Lucilius *to live like Lucilius.*

LAEMMER, lem’mær, Hugo, German theologian: b. Allenstein, East Prussia, 25 Jan. 1835. He studied at Königsberg, Leipzig and Berlin, obtained the degree of D.Ph. (1854) at Leipzig, became (1857) private teacher at Berlin, then made a visit to Italy. He entered the Catholic Church (1858) and was ordained a priest (1868) and made doctor of theology at Breslau. He was made prelate-protonotary in 1882. He wrote *Misericordias Domini* (1861) in justification of his entering the Catholic Church; *Clementis Alexandrini de logico Doctrina* (1855); *Enseilii pamphili historiae eclesiasticui libri decem* (1859-62); *Zur Kirchengeschichte des 16ten und 17ten Jahrhunderts* (1863; 2d ed., 1892); *De Caesaris Baronii literarum commercio Diatriba* (1903).

LAENNEC, René Théophile Hyacinthe, rê-nä tø-o-fël é-à-saⁿt lë-nëk, French physician: b. Quimper, France, 17 Feb. 1819; d. near Dieppe, France, 13 Aug. 1862. He took his degree of doctor of medicine in 1814 and his professional reputation was already so high that in the same year he was appointed principal editor of the *Journal de Médecine.* In 1816 he was appointed chief physician to the Hôpital Necker, and soon after made the notable discovery of mediate auscultation, that is, of the use of the stethoscope. The original discovery, however, is claimed for Anenbrugger (q.v.). In 1819 he published his *Traité de l’auscultation médiate,* having read a memoir on the subject to the Academy of Sciences in the previous year. The remainder of his life was devoted to the perfecting of this new system of diagnosis, and so far as diagnosis is concerned his treatise has produced an effect not attained by any other work. The special study of Laennec was diseases of the chest, and by means of auscultation, either by the direct application of the ear, or of the stethoscope as an auxiliary, he elucidated the pathology of these diseases, which were previously involved in the greater part of his *Life* by Saint-ignon was published in 1904.

LAERTES, king of Ithaca and father of Ulysses. He had been one of the heroes engaged in the chase of the Calydonian boar, and in the expedition of the Argonauts. The absence of his son in the Trojan War plunged him into melancholy; but the return of Ulysses restored his energies, and he took part in the fight with the suitors of Penelope.

LESA MAJESTAS, Latin term meaning injured majesty. It is a phrase taken from the Roman law and entering modern civil law to designate an offense against the person or dignity of the king; therefore high treason. Consult Glanvil, lib. 8, c. 2; Blackstone’s *Commentaries,* 75.

LETARE (lë-tär’) SUNDAY, called also Mid-LENT, the fourth Sunday in Lent. The introit for the day in the Roman Catholic Church begins with the words, *Letare, Jerusalem,* from Ps. 101, 9; hence the name.

LAFARGE, Marie Cappelle, French victim of circumstantial evidence: b. Villers-Helon, 1816; d. Ussat, 7 Nov. 1852. Of distinguished family and highly educated, she married (1839) an iron-master of Corrèze and was accused of poisoning him when he died (1840) from eating poisoned sweetmeats. She had purchased arsenic from a pharmacist, which did not clearly account for its use; her neighbors testified against her, and she had been accused of the theft of diamonds from a lady friend (1839) which were then, in part, discovered in her residence and was sentenced to two years’ imprisonment for the theft. The evidence of witnesses as to the poison was contradictory and her lawyer, the celebrated Paillet of Paris, made a good defense. But the animosity of the judge prevailed and she was adjudged guilty and sentenced to hard labor for life, and later evidence in her favor did not stay the punishment. Friends gained her release after 12 years in prison, but she soon died from the experience she had gone through. While in prison she wrote *Mémoires* (Paris 1841), which have been read with interest by the public. She also wrote *Heures de Prison* (1853) and *Une femme perdue,* a drama.

LAFAYETTE, la-fä’-t, or LA FAYETTE, Marie Jean Paul Roch Yves Gilbert Motier, Marquis de, French soldier and statesman: b. Chavagnac, near Brioude, Auvergne (in the present department of Loire), 6 Sept. 1757; d. Paris, 20 May 1834. He was an eminent family of France. He was educated in the College of Louis le Grand in Paris, in 1774 entered the army as an officer of the Guards, and on hearing of the Declaration of Independence by the American colonists determined to lend them his assistance. In 1777 he left France for America with 11 companions, among whom was Baron De Kalb, set sail from Pasages, Spain, in a yacht equipped by himself, and arrived at Georgetown, S. C., 14 April. He proceeded to Philadelphia, and to the Congress there in session volunteered his services without pay. On 31 July he was commissioned major-general, and not long after became a member of Washington’s staff. He was severely wounded at Brandywine (11 September), while rallying the American forces from a retreat; was appointed to the command of an expedition for the proposed invasion of Canada, never executed owing to lack of means, and in April 1778 was ordered to join Washington at Valley Forge. On 19 May he was surprised by General Grant with 5,000 troops at Barren Hill (12 miles from Valley Forge), where he had taken post with 2,100 troops and five cannon. Though nearly surrounded by a superior force, he succeeded in extricating himself, recrossing the Schuylkill and reaching Valley Forge in safety. He received the thanks of Congress for his conduct at Monmouth (28 June), where he fought brilliantly under Lee. War between France and England having broken out, Lafayette returned (January 1779) to place himself at the disposal of the French government; obtained for the American Cause the loan of 50,000 livres, and the reinforcement of a fleet and 6,000 troops under Rochambeau; and 11 May 1780 rejoined the American army. He was shortly afterward stationed at Tappan with a light infantry corps of observation, and was a member of the court of inquiry by which Major André was tried and condemned to death (29 September). On 20 Feb. 1781 he was sent by Washington with 1,200 New Eng-
land and New Jersey troops to aid in the defense of Virginia. Reinforced, he pursued Custis to the battle of Brandywine and defeated him at Germantown, thus contributing to the decisive operations by which the war was virtually concluded. He sailed from the United States in December 1781, but revisited America in 1784, when he was enthusiastically received. Lafayette was called to the Assembly of the Notables in 1787, and was elected a member of the States-General, which took the name of National Assembly (1789). Two days after the attack on the Bastille he was appointed (15 July) commander-in-chief of the National Guard of Paris, and gave them the tricolor cockade. It was through his means that the lives of the king and queen were saved from the mob that had taken possession of the palace at Versailles (5-6 October). After the adoption of the Constitution of 1790 he resigned all command and retired to his estate of La Grange. He had previously resigned his title, the abolition of titles having been decreed by the National Assembly. The first coalition against France (1792) soon called him to arms from retirement. Being appointed one of the three major-generals in the command of the French armies, he established discipline and defeated the Austrians and Prussians at Philippeville, Maubeuge and Florennes, when his career of success was interrupted by the factions of his country.

During the Reign of Terror commissioners were sent to arrest him, but he escaped to Flanders. Having been captured by an Austrian patrol (19 August), he was delivered to the Prussians, by whose order he was again transferred to Austria. He was carried with great secrecy to Olmutz, where he was subjected to much privation and suffering, and whence he was not released until 25 Aug. 1797. He returned to his estate at La Grange, and taking no further part in public affairs devoted himself to agricultural pursuits. He sat in the French Second Chamber from 1818-24 and from 1825-30 was leader of the opposition. In August 1824 he landed at New York on a visit to the United States, upon the invitation of the President at the request of Congress, and was received in every part of the country with the warmest expression of delight and enthusiasm. Congress voted him $200,000 and a township of land, his own fortune having been mostly lost by confiscation during the Terror. During the Revolution of July 1830 he was appointed general-in-chief of the National Guard of Paris, and though not personally engaged in the event, was, through his activity and name, of the greatest service. When the National Guard was established throughout France, after the termination of the struggle, he was appointed their commander-in-chief. Of Lafayette, Edward Everett said: "Who, I would ask, of all the prominent names in history, has run through such a career, with so little reproach justly or unjustly bestowed." At the celebration of the centenary of the surrender at Yorktown a representative of his family was present as the guest of the nation. Early in 1817 the historic chateau in which Lafayette was born was purchased by the French Heroes Fund, an American organization, to be restored and perpetuated as a memorial and museum of American and French patriotic emblems. Consult 'Memoires et Manuscrits de La Fayette' (8 vols., Paris 1837-40); Sarras, 'General Lafayette and the French Revolution of 1830' (2 vols., London 1869); Tower, 'The Marquis de Lafayette in the American Revolution' (2 vols., Philadelphia 1895); Tuckerman, 'Life of Lafayette' (New York 1889); Whitman, 'Lafayette in Brooklyn' (New York 1905).

LAFAYETTE, Ala., town and county-seat of Chambers County, on the Central Railroad of Georgia, 85 miles southwest of Montgomery. Here is the seat of Lafayette College (q.v.), founded in 1885. There is a large trade in cotton and other products, the town being a distributing point for a large section of country. Pop. 1,632.

LAFAYETTE, Ind., city and county-seat of Tippecanoe County, on the Wabash River, and the Cleveland, Cincinnati, Chicago and Saint Louis, Indianapolis and Louisville (Monon), the Lake Erie and Western and the Wabash railroads, 64 miles northwest of Indianapolis and 130 miles southeast of Chicago. The Terre Haute, Indianapolis and Northwestern, the Fort Wayne Northern Indiana and the Battle Ground traction lines also connect the city with outside points. Lafayette derives its chief business from agriculture, being the farming and manufacturing centre for the surrounding country. Other industries are carpet mills, soap factories, flour mills, wire and iron works, foundries and machine shops, electric accessories, automobile factories, agricultural implements, lumber and carriage works. There are five national, two State banks and one savings bank and two loan and trust companies having a combined capitalization of $965,000 and deposits of about $13,000,000. There are also two building and loan associations. There are 31 church edifices. Lafayette is the seat of Purdue University, embracing the State Agricultural College, contains a high school, supplemented by an excellent public school system, a public library containing over 20,000 volumes and the Indiana State Soldiers' Home. Here also is the Wabash Valley Sanitarium. The city stands six miles above the site of the old French fort, built in 1720, and called Post Ominatoan. In 1760 the fort was surrendered to the British, but later in the same year was captured by the Americans. Lafayette was first chartered as a city in 1853. It is governed under the General Indiana Charter which went into effect in April 1905, by a board of public works composed of three members and a city council composed of 10 members elected for four years. The city owns and operates the waterworks, has electric lights, electric street railway and a well-equipped fire department. The foreign element in the population is small. Pop. 20,061; including West Lafayette about 30,000.

LAFAYETTE, La., parish-seat of Lafayette Parish, on the division terminal Southern Pacific Railroad, with shops and roundhouse, 144 miles west of New Orleans. Elevation, 41 feet. Forty miles from Gulf, in the heart of a fertile, undulating prairie. Is the commercial centre of a region noted for its cane, cotton, corn and rice, and is the centre of the Marquis de Lafayette oil fields. Here is located the Southwestern Louisiana Institute, established in 1900, a State coeducational institution of academic and technical learning, with agriculture, domestic
LAFAYETTE—LAFFITTE

science and commerce, and teacher-training for each, the Mount Carmel Academy established in 1835. Has two large brick public schools, six church buildings, three banks, flour hotels, $30,000 theatre, two wholesale houses, cotton oil mill, two ice plants, two cotton gins and one of the largest sugar refineries in the State; three newspapers and modern post-office building; commission form of government and municipal light and water plant. Many miles of paved sidewalks and graveled streets and 22 passenger trains daily. Lafayette lies in the region of the two bayous, the Vermilion and the Teche, which is called the Attakapas country, after the Indian tribe that once inhabited it. The region was settled in 1755 by the descendants of the French colonists who were expelled from Nova Scotia by the English. A large element, other than French, has come within the last 30 years through the development of the railroads. Pop. 6,392.

LAFAYETTE, a fish. See Goody.

LAFAYETTE AT BARREN HILL. The first independent command of the Continentals entrusted by Washington to Lafayette as a major-general was with 2,100 of his best troops (out of 11,800 effectives trained by Steuben), with five pieces of artillery, to take a position on Barren Hill, 10 miles from Philadelphia. The object was to cut off British foraging parties and make reconnaissance to see if Howe was about to evacuate the city. The British got wind of the projected movement and a ship was kept waiting in the Delaware River for 10 days, the commander hoping to take Lafayette as a prisoner to England. On 8 May, a day of joy, news of the French Alliance was read in camp. On the 18th Lafayette sallied out and secured a strong position on Barren Hill. On the 19th, 5,000 British and Hessians marched by three roads to envelop the young Frenchman and his force, one detachment west of the Schuylkill expecting to cut off his retreat at Matson's Ford. The plan, skilfully conceived, seemed one of success, when Lafayette, detecting the red uniforms, quickly occupied the strongest positions and sent out false heads of columns, which delayed the British advance until reinforced and able to deploy. The race was now for Matson's Ford. The enemy rallied but, retreating roads to cut off the Americans, but the retreat was so skillfully conducted, Lafayette bringing up the rear, that, despite the heavy cannonade from the British batteries of field artillery and the swift charges of the Hessians, the young Frenchman, by his wisdom, coolness and promptness, saved the day. One incident illustrates this. A British round shot, hitting the axle, disabled one of the five cannon of the Continentals. To abandon a gun would mean a breach between Lafayette and Washington. Ordering the artilllers to leap from their caissons and horses into the farm yard of John Harby, a farmer, Lafayette commandeered his wagon and had the gun quickly lashed by the breech to the hind axle. Then, whipping up the horses, he charged across the fields and miles over the rough road to Matson's Ford. In the skirmish at the river side the American rear guard lost nine men. That of the British was reported as three, but the retreat was perfected and all the guns saved, together with the troops, to the joy of Washington and the confirming of his trust. A few days later the army started in pursuit of Howe. Consult Carrington, ' Battles of the American Revolution' (1888).

WILLIAM ELLIOT GRIFFIS.

LAFFITTE COLLEGE, a Presbyterian college at Easton, Pa., founded in 1832. In 1916 it had 58 professors and instructors, 612 students, 41,922 volumes in the library, $643,000 in productive funds, ground valued at over $1,500,000, income $126,000, number of graduates 3,078. It was originally chartered in 1826, but owing to the failure of the legislature to make any appropriation, the college was not opened until 1832. Since the Civil War the college has had a location change. The college curricula offers courses leading to the degree of bachelor of arts, bachelor of philosophy, bachelor of science, bachelor of science in chemistry, bachelor of science in civil engineering, chemical engineering, electrical engineering, mechanical engineering, mining engineering, mechanical engineering and civil engineering. There are now 42 buildings, including Pardee Hall, a memorial library, a memorial chapel, the Gayley Laboratory of Chemistry and Metallurgy and the Mechanical Engineering building.

LAFFITTE, Jacques, zhäk là-fét, French banker; b. Bayonne, 24 Oct. 1767; d. Paris, 26 May 1844. He entered the banking house of the senhor Perregaux, and in 1809 became head of the firm, which he made one of the first houses in France. In the same year he was appointed director of the Bank of France, and in 1814 governor of the same establishment. When the credit of France, in 1815, was in a very dangerous crisis, Laffitte advanced 2,000,000 francs in ready money, by which means a necessary article in the capitulation of Paris was settled. He was elected to the Chamber of Deputies in 1816. In 1819 he was deprived of the presidency of the bank, which was bestowed on the Duke of Gaeta, yet he was in 1822 unanimously re-elected to the office of regent de la banque (director). Laffitte was again elected to the Chamber of Deputies in 1827, and took an active part in the Revolution of July 1830, being one of the deputies who signed
the protest, and declared themselves deputies of France, in spite of Polignac's order to annul the election. He founded a new credit bank in 1837, and was president of the Chamber of Deputies in 1843. He became bankrupt in his latter days, and was obliged to sell all his property to pay his debts, but his Paris hôtel was preserved to him by a national subscription.

LAFFITAU, Joseph François, zhô-zë-gfôûwr-re, French missionary and writer; b. Bordeaux, 1 Jan. 1661; d. there, 3 July 1746. He belonged to the Society of Jesus, and was for some years (1711–17) attached to their missions in Canada, and was afterward procurator of the Canadian missions. On his return to France he published 'Mémorie concernant la précieuse plante ging-sang de Tartarie' (1718), the plant here noticed, which was highly valued by the Chinese, having been found by Laaffitau in the Canadian forests. 'Mœurs des sauvages Américains comparées aux mœurs des premiers temps' (1723); 'Histoire des Découvertes et des conquêtes des Portugais dans le nouveau monde' (1733).

LAFFITTE, lä-fê'të', Jean, American pirate and smuggler; b. France, 1780; d. Silan, Yucatan, 1826 (according to some authorities, at sea 1817). He was at one time a privateer in the employ of Cartagena for the destruction of British and Spanish commerce. Soon he turned to piracy, and by 1812 was leader of a band of desperadoes, which maintained headquarters on the island of Grande Terre in Barataria Bay, and thence plundered traders in the Gulf. During the War of 1812, Commodore Percy, commanding the British naval force in the Gulf waters, unsuccessfully endeavored to obtain Lafitte's co-operation in the expedition against New Orleans. Lafitte later offered his services to the governor of Louisiana and General Jackson, on condition of full pardon for himself and followers. He assisted in the construction of the fortresses of Barataria Bay, and in command of a detachment of his band participated most creditably in the battle of New Orleans (8 Jan. 1815). President Madison by proclamation confirmed the amnesty granted to the outlaws. Lafitte was a bold smuggler, and brought cargoes of negro slaves. He was associated with a brother, Pierre, with whom he is often confounded. He is the hero of J. H. Ingraham's story, 'Lafitte.'

LAFFLAMME, lä-flam', Toussaint Antoine Rodolphe, Canadian jurist; b. Montreal, 15 May 1827; d. 1893. He was educated at Saint Sulpice College, in 1849 was admitted to the bar, became an editor of L'Avenir, and was a member of the "Rouge" or liberal reform element in Quebec province. At the same time he continued his legal practice, and was appointed professor of the law of real property in McGill University. In 1872–78 he sat in Parliament for Jacques Cartier County, in 1876 was Minister of Inland Revenue in the Mackenzie administration, and in 1877–78 Minister of Justice.

LAFONTAINE, la-fô-ntä', Paul Anton, German Orientalist; b. Berlin, 2 Nov. 1827; d. Göttingen, 22 Dec. 1891. He studied theology and Oriental languages at Berlin, and was appointed assistant instructor of the Halle University, but continued (1852–53) his studies at London and Paris, returning to Halle to lecture. He taught at several schools of science, from 1866, at Berlin and Schlesingen, and was appointed (1889) professor of Oriental languages at Göttingen University. The most important of his astonishingly numerous and many-sided philological works are 'Gesammelte Abhandlungen' (Leipzig 1866); 'Mitteilungen' (Göttingen 1884–91); 'Über Lehre über die iranischen und abbasidenischen und bhāratischen übliche Bildung der Nomina' (ib. 1889); 'Semitica' (Göttingen 1878–79); 'Orientalia' (ib. 1879–80); 'Symmicta' (ib. 1877–80); 'Petri Hispani de lingua
Arabica libri' (Göttingen 1883); 'Egyptiaca' (ib. 1875); 'Bibliothecae Syriacae' (ib. 1892); 'Armenische Studien' (ib. 1877); 'Persische Studien' (ib. 1890). He also wrote several poems which were published by Anna de Lagarde (Göttingen 1897). His great learning and gifts were curiously mixed with dogmatism and distrust in the activities of others. His 'Deutsche Schriften' (4th ed., Göttingen 1903) and his 'German State to Theology, the Church and Religion. His library now belongs to the New York University. Consult Lagarde, Anna de, 'Paul de Lagarde, Erinnerungen aus seinem Leben' (Göttingen 1894).

LAGARTE. The Spanish word for 'lizard.' It was applied by the early Spanish explorers of Central America to the alligator, and their use of the word clung to the literature of the natural history of the New World for many years.

LAGERLOF, la'ger-lief, Ottilda Lovisa Selma, Swedish author: b. Mårbacka, Värmland, 20 Nov. 1858. Her father was a Swedish army officer, and one member of a famous family of artists and clergymen. She was educated at the Royal Women's Superior Training College, Stockholm. She became a teacher at the Girls' High School at Landskrona (1885-95), and during this time prepared her first book, 'Gösta Berling's Saga' (2 vols., 1891; Eng. trans., Boston 1898). Its refreshing breath of romance was a pleasant change from the pessimistic realism which had been the vogue and brought the author prompt and large success. A year's travel in Egypt, Palestine and Greece provided her with material for the second volume of her 'Jerusalem' (2 vols., 1901-02; Eng. trans., New York 1903), and also for portions of 'Christ Legends' (1904; Eng. trans., New York 1908). Out of travel and a study of conditions in Italy and especially in Sicily came the 'Miracles of Anti-Christ' (1897; Eng. trans., Boston 1899). Commissioned in 1902 by the National Teachers' Association of Sweden to write a school textbook which should present in story form the national history, she prepared a history of her country, and also a book on health and hygiene for the various of the provinces of the country, Miss Lagerlöf accomplished her task with a success that added a children's classic to Swedish literature—'Nils Holgerson's Wonderful Journey through Sweden' (2 vols., 1906-07). The English translation of which is entitled 'The Wonderful Adventures of Nils' (New York 1907). Honors followed Miss Lagerlöf's successes; in 1904 the Swedish Academy awarded her its great gold medal; in 1907 she received the degree of doctor of letters from Upsala University; in 1909 she was awarded the Nobel prize for literature, the only woman to have received this honor; and in 1914 the Swedish Academy elected her to membership. The first woman so honored. Her novel of life in America is in part due to Mrs. Velma Swanton Howard, who early believed in her appeal to Americans and carefully translated many of her books. Her work includes also 'Invisible Life,' 'Girl From a Swedish Homestead' (1899; Eng. trans., New York 1901); 'The Girl from the Marsh' (1908; Eng. trans., Boston 1910); 'Further Adventures of Nils' (1911); 'Liljecrona's Home' (1911); 'The Legend of the Sacred Image' (1913; Eng. trans., New York 1914); 'Matilda Wrede' (1913; Eng. trans., New York 1914); 'Dunungen,' a comedy based on her 'Gösta Berlings Saga' (1914); 'The Emperor of Portugal' (1916; Eng. trans., New York 1916). See STORY OF GÖSTA BERLING, THE.

LAGO MAGGIORE, lâ-gô mâd-jô-rô, or LAKE OF LOCARNO (anciently Verbanus), a large lake in northern Italy and Switzerland, extending from Sesto to Locarno, about 37 miles long and from 1½ to 3 miles broad. It is 635 feet above the level of the sea, and at the northern end in some places as deep as 1,220 feet. On the upper end it is enclosed by lofty and finely wooded mountains, and the east bank slopes gradually to the Lombard plain. There are several islands, two of which, Isola Bella and Isola Madre, called Borromean Islands, are laid out in gardens and pleasure grounds.

LAGONEGRO, lâ-gô nâ'grô, a small town 38 miles south of Potenza, Italy, noted as having been the scene of a great French victory in 1806.

LAGOON (from the Latin lacus, a gap or hollow), shallow lakes or creeks connected with the sea, which are found along low-lying coasts. It is also applied to the expanse of water in the interior of those coral reefs which present to view above the surface of the water nothing but an external fringe. See CORAL.

LAGOS, lâ-gôs, town, at present the temporary capital of the British colony and protectorate of Nigeria. It is the most important seaport in upper Guinea, situated on an island of the same name. A bridge, 2,500 feet long, connects with Iddo Island. There is also direct rail connection with Kano, 717 miles distant. Its exports are rubber, cocoa, ground nuts, hides and skins, kerosene oil and mahogany. Pop. 60,000, of which about 500 are Europeans. Lagos, with its hinterland, were acquired from the native king in 1861, and have been successfully administered as an independent protectorate, part of the Gold Coast Colony, part of southern Nigeria, and are now incorporated in the colony and protectorate of Nigeria. See NIGERIA.

LAGOS, lâ-gôs, Mexico, city in the northeast of the state of Jalisco, on the Mexican Central Railroad. It lies 6,000 feet above the sea; was founded in 1563 by Francisco Martel; and after the war of independence was named Lagos de Moreno after its defender, Pedro Moreno, who died here in battle against the Spaniards in 1817. Pop. 12,243.

LAGOS, la'gush, Portugal, a fortified city in the district Faro, province Algarve, beautifully located on the western shore of a bay on the Atlantic Ocean. It has several handsome aqueducts, a great stone bridge spanning an arm of the sea. The harbor is sandy. Its industries consist of wine-growing, southern fruit culture, fisheries of tuna fish and sardines. This is the old Roman site of Lagoa. Pop. 8,268.

LAGRANGE, Joseph Louis, zhô-zôf loo-e lâ-grânzh, Comte, French mathematician: b. Turin, 25 Jan. 1736; d. Paris, 10 April 1813. His great-grandfather was a cavalry officer in the French army, who afterward passed into the service of Sardinia. When scarcely 19 La-
Laguerra—Laun

Laun, Philipines, a province of the island of Luzon, situated in the southern part of the island, on the south and east shores of the Bay Lagoon (q.v.); area, including dependent islands, 752 square miles. The province is mountainous in the centre and north, and in the southwest is Mount Maquiling, 3,666 feet high; there are extensive forests of valuable timber, very fertile; the climate moist and variable. All varieties of tropical plants and trees found in the Philippines grow here; the staple products are sugar, rice, corn, cotton, tobacco, indigo, cocoanut, betel nut and fruit and vegetables. There is a number of industries, including coconut-mills for the extraction of cocoanut oil, furniture manufacture, the manufacture of cheese and stock raising; there is considerable export trade, products being sent to all parts of the archipelago. Civil government was established in the province in July 1902. The inhabitants are mostly Tagalogs. A railway runs along the south shore of the bay from Santa Cruz (the capital, q.v.) to Manila. Pop. 148,000.

Laharpe, la ärp', Jean Francois de, French author and producer of b. b. 1749; d. there, 11 Feb. 1803. He first brought out several volumes of 'Héroïdes' but first gained note by his tragedy 'Warwick' (1763), though his other tragedies met with no success. But his 'Loges' on Henry IV, Fénélon, Racine, etc., show refinement and added to his fame, but his conceit and harsh criticisms made numerous bitter enemies, nearly losing him the election (20 June 1776) to the Academy. He gave lectures, as professor of literature at the newly founded Lycée (1786-88) with great success. His articles as critic of France brought applause, also those under the title 'Lycée ou Cours de littérature' (Paris 1799-1805). His participation in the Revolution brought him five months in jail in 1794, but he became an enemy of revolution later and an earnest worker for religion and monarchy. He supervised a selection of his works in six volumes (Paris 1778), and his 'Œuvres choisies et posthumes' appeared in four volumes. Con- sul Sainte-Beuve, 'Causeries du lundi' (5 vols., Paris 1856), 3rd Edition. He was also Kritiker der französischen Literatur im Zeitalter Ludwigs XVIII (Leipzig 1910); Teign, 'Recherches sur La Harpe' (Dijon 1820).

Lahee, Henry Charles, American writer on musical topics: b. London, England, 2 July 1856. He was educated at Saint Michael's Col- lege, Tenbury, Worcestershire, where he was chorister (1865-69), and was in the English mercan- tile marine (1871-79). Coming to the United States he was secretary of the New England Conservatory of Music at Boston (1891-99), and since the last-named date has conducted a musical agency in Boston. He has published 'Fa- mous Singers of Yesterday and To-Day' (1881); 'Famous Violinists of Yesterday and To-Day' (1889); 'Famous Pianists' (1900); 'Grand Opera in America' (1901); 'The Organ and its Masters' (1902); 'Grand Opera of To-Day' (1912), and contributions to musical and other magazines.

Lahe, län, Germany, a tributary of the Rhine having its source in the Rothaargebirge, Westphalia. Its length is 135 miles and is navigable from the mouth up to Giessen by the aid of locks. The valley, sometimes quite nar-
row, is rich in natural beauties and much visited by sight-seers. It has the principal town on the Ravi.

LAHORE, lā-hōr', India, second city and capital of the Punjab, on the left bank of the Ravi, 298 miles northwest of Delhi by rail. The native city covers an area of 640 acres, surrounded by a brick wall 30 feet high, flanked by bastions, and approached by 13 gates. The streets are extremely narrow, and the houses have in general a mean and gloomy appearance; but these only appear by contrast with the magnificent structures by which they are dominated. On the northeast side especially the mosque of Aurangzeb, with its plain white marble domes and simple minarets, the mausoleum of Ranjit Singh, with its rounded roof and projecting balconies, and the desecrated façade of the Mogul palace, stand side by side in front of an open grassy plain, exhibiting a grand coup d'œil. The citadel or fort stands on a slight hill commanding eminence. The European quarter and the Mean Meer cantonment (three miles distant) lie to the south and east. Among modern buildings are the College of Arts and Science, the Oriental College, Aitchison Chief's College, Mayo Hospital, Victoria Jubilee Hall, school of art, Anglican cathedral, etc. It was at one time a great centre of the decorative arts — gold and silverware, glass and enamel work — but most of the workshops have gradually declined or vanished, and was famous for its superb cloths made of Bokhara thread. The North-West Railway workshops employ 5,000 men; the other industries include soap, acids, printing, leather, cotton and woolens, furniture, bricks and tiles; and the city is the centre of a rich agricultural district. A municipality was organized in 1867, a water supply was introduced in 1881 and a drainage system in 1883.

In 1524 Lahore became the seat of the Mogul Empire, under which it reached its greatest splendor. Before passing into the hands of the British it was the capital of the Sikhs. Pop. about 228,887 (60 per cent Mohammedan). Lahore division (commissionership, 177, 000 sq. m., a population of 4,656,629. The Lahore district has an area of 3,704 square miles; pop. about 1,250,000.

LAHR, lār, Germany, town in the district of Offenburg, Baden, on the Schutter River, junction of the Dinglingen-Lahr State Railway and street railways. It has three Evangelical and one Catholic church, a monument to Bismarck and another to the poet Eichrodt. Among its other public buildings are a gymnasm high school, trade school, Imperial orphan asylum and several government edifices. Among its manufactures are ovens, pottery, snuff and cigars, roof-paper, toys, frames, chintz, leather, artificial flowers, also book-binding and lithographic work and wine culture are done on a large scale. The town has been in existence since 1278 and was the principal town under the Geroldseck government, later belonging to Nassau, and (1497) coming under the rule of Baden. Pop. 15,191.

LAIBACH, lēb'hàch, Slovenian Ljubljana, capital of the Austrian Grand-duchy Carniola, located on the Ljubljan River, which is spanned here by seven bridges, and on the southern branch of the Vienna-Trieste and the Laibach-Oberlaibach, and other railways. It is embellished with large squares, and the monument to Radetzki von Fernkorn, and beautiful promenades. Among its more important edifices are the Saint Nicholas Cathedral (18th century) with its high cupola and frescoes; the Church of Saint Jacob's, the Ursuline and other churches, the latter in Byzantine style; the government building, palace of justice, agricultural building, town-hall, bishop's palace, casino, etc. A monument was erected (1886) to Anastasius Grün. The industrial establishments include a cotton-goods factory, bell foundry, iron foundry, machine works, candy and chocolate factories and manufactures of wire, paper, twine, stone and earthenware, leather, beer-brewery, electrical works, etc. Among her educational institutions are two Obergymnasium, a high school, teachers' institutes, a theological institute, trade school, commercial institute, students' library, museum and theatre. The museum contains interesting relics of a lacustrine village discovered in the Laibach fens. The Schlossberg towers high above the town and has a castle dating 1416-1520, partially destroyed (1813) by the French. The town is generally acknowledged to be the seat of the ancient Emona. In 1270 Ottokar of Bohemia captured the place, and it received municipal rights in 1416. After capitulation (1809) to the French it was occupied till 1813 as seat of the governor-general of the Illyrian provinces. The Congress of Monarchs met here to debate the situation of Italy which later brought about the overthrow of the liberal constitution of Naples, England being dissident. Consult Müllner, A., 'Emona' (Laibach 1879); Richter, 'Geschichte der Stadt Laibach bis 1461' (in Klun's 'Archiv für Geschichte Karins,' parts 2 and 3).

LAIDLDER, HARRY WELLINGTON, American socialist author: b. Brooklyn, N. Y., 18 Feb. 1884. He was educated at Wesleyan University A.B. (1907) and received the degree of LL.B. at Brooklyn Law School (1910), and of Ph.D., Columbia (1914). He was member of the reportorial staff, and(late 1907-10), a founder of the Intercollegiate Socialist Society (1905) and its secretary from 1910, an association on similar lines as the English Fabian Society. He was editor of the Intercollegiate Socialist from 1913. He studied the labor question and social movements in Europe and here and has delivered numerous lectures on these subjects. He wrote 'Boycotts and the Labor Struggle' (1914), and a pamphlet entitled 'The British Cooperative Movement' (1917).

LAING, làing, Alexander Gordon, British African explorer: b. Edinburgh, Scotland, 27 Dec. 1793; d. near Timbuctoo, Africa, 26 Sept. 1826. After serving for several years in the English army, he entered on his career as an African traveler in 1822. In that year he visited Falaba, the capital of the Sulima country, got to within three days' journey with the supposed source of the Niger, but had perforce to return. An opportunity having presented itself of proceeding on the discovery of the course of the Niger, it was arranged that he should accompany the caravan from Tripoli to Timbuctoo. He left Tripoli in July 1825 in com-
pany with the Sheik Babani, and after a tedious journey of nearly 1,000 miles arrived at Ghadamis; and on 3 December reached Ensala. He quit Ensala on 10 Jan. 1820 and on the 26th entered on the sandy desert of Tennisoff. After some fighting with the Taweregs he arrived at Timbuctoo on 18 August, the first European who had ever reached that city. After a short stay he set out on his return, but was assassinated on 26 Sept. 1826. The murder was committed by the order of the son of the Prime Minister of Tripoli, whose agent, Babani was Laing's journal, which he had prepared for the press, were published in 1825 under the title, 'Travels in the Timmanne, Koorkanka and Soolima, Countries of Western Africa.'

LAING, Gordon Jennings, American classical scholar: b. London, Ontario, 16 Oct. 1869. He was graduated (1891) at the University of Toronto, took the degree Ph.D. at Johns Hopkins (1896), then studied for a year at the American School of Classical Studies, at Rome. He was instructor of classics at Whetham College, Vancouver, British Columbia (1892-93); lecturer on Greek and Latin (1893) at Toronto University, and on Latin literature (1897-99) at Bryn Mawr College. He was made professor at the University of Chicago (1913) and was appointed managing editor of the Classical Journal (1905-08), associate editor Classical Philology, from 1905; general editor of the University of Chicago Press since 1908. He was vice-president of the Archeological Institute of America from 1913. He edited 'Masterpieces of Latin Literature' (1903); 'Selections from Ovid' (1905); 'Phormio of Terence' (1908).

LAING, Malcolm, Scottish historian: b. near Kirkwall, Orkney, 1762; d. there, 6 Nov. 1818. He was a lawyer by profession and later a member of Parliament, but devoted himself principally to historical investigation. He completed the last volume of Henry's 'History of Great Britain' (1785) and was the author of a 'History of Scotland' (1800), which may be regarded as supplementary to Robertson's history and is a monument of painstaking research. In the preliminary dissertation he presents an elaborate argument to prove Queen Mary's participation in the murder of Darnley. He published in 1805 an edition of Ossian.

LAING, Samuel, Scottish author: b. Kirkwall, Orkney, 4 Oct. 1780; d. Edinburgh, 23 April 1868. Entering the army in 1805 he served in the Peninsula War and in 1834 traveled in the Scandinavian countries. He published 'Journal of a Residence in Norway' (1834-36) (1836); and 'A Tour in Sweden' (1839); 'Notes of a Traveller' (1842); but is best known by his important translation of the 'Helmskringla' or Icelandic Chronicle of the Kings of Norway, with a Preliminary Dissertation' (1844).

LAING, Samuel, English railway administrator, politician and author: b. Edinburgh, 12 Dec. 1812; d. Sydenham Hills, Kent, 6 Aug. 1897. He is the son of Samuel Laing (1780-1868). He was prominently identified with railway legislation in England, the inception of "parliamentary" passenger trains with a fare of one penny a mile being due to his suggestion, and he was chairman of the Brighton and South Coast Railway. He was for many years prominent in Parliament and from 1860 to 1863 held the office of Finance Minister in India. In his old age he took to writing books, mainly philosophical. Of his works, 'Modern Science and Modern Thought' (1885), and 'A Modern Zoroastrian' (1887), have occasioned some discussion. His other publications of a miscellaneous character include 'India and China' (1863); 'A Sporting Quixote; or the Life and Adventures of the Hon. Augustus Fitzmuddle' (1886); 'The Antiquity of Man' (1890); 'Human Origins' (1892).

LAIRD, lārd, David, Canadian politician: b. New Glasgow, Prince Edward's Island, 1833; d. Ottawa, 12 Jan. 1914. He was educated at Truro, Nova Scotia, and subsequently established and edited the Patriot in Charlottetown. In 1871 he became a member of the assembly of Prince Edward Island and after the admission of the province to the Dominion was a member of the House of Commons and Minister of the Interior, 1873-76. He was lieutenant-governor of the Northwest Territory, 1876-81. In 1877 and 1889 he was a commissioner in the arranging of treaties which extinguished by purchase the Indian title to great tracts in the Qu'Appelle and Peace River districts.

LAIRD, John, English shipbuilder: b. Greenock, Scotland, 14 June 1805; d. Birkenhead, Cheshire, England, 29 Oct. 1874. His shipyards were at Birkenhead, on the other side of the Mersey from Liverpool, and he was for a long time the head of the firm of John Laird and Sons. He was the first builder of iron steamships and built the John Randolph, the Nemiess and the Alabama. The first was the earliest iron vessel that was ever seen in America and was sent out to Savannah in pieces; the second, the first armed vessel of iron. The history of the Alabama is well known. He entered Parliament for Birkenhead in 1861 when he retired from active business.

LAIRESSE, lär'əs, Gerard de, Dutch painter and etcher: b. Liége, Belgium, 1640; d. Amsterdam, 11 June 1711. He engraved the engravings of his father, Regnier Laireesse, and of Fiamelis, and left them for Utrecht, and afterward Amsterdam, where he labored hard for perfection in his art. He first of all confined himself to models of the antique and classical ideals of Poussin. His work was thus distinguished by somewhat wearisome mannerism and his pictures very frequently seem painted in an unnatural silvery, metallic tone. His masterpieces are to be seen in Amsterdam, Schlesheim, Cassel and in the Louvre, Paris. His ideas on art, as dictated to his pupils and associates, together with his etchings, were published after his death in two volumes, under the title 'Het Groot Schilderboek' (1712). The work has been translated into German, French and English and has had a great influence in the art education of the 18th century.

LAIS, lá'z, the name of two Greek hetairae, celebrated for their remarkable beauty. The first lived at Corinth at the time of the Peloponnesian War; the most eminent and wealthy men of the time,карт, the Cynic philosopher, and Diogenes, the cyiic, fell under her spell. The younger Lais was the daughter of Timandra and was born
at Hycera, Sicily, 422 B.C. She came to Corin- th in her eighteenth year, and was educated in her profession by the painter Apelles. Later in life she followed a certain Hippostratus to Thessaly, where she was stoned to death by women in the temple of Aphrodite. But it is impossible to sift the really historic from mere anecdotal tradition: the accounts of these women which have come down to us. Consult Jacobs, 'Lais, die ältere und die jüngere' (1830); Wieland, 'Aristipp.'

Laissez-faire, lā′sā fark′. A slogan of great potency in the political and economic discussions of the 18th century, particularly in France. It made a strong appeal to the jurists and to the philosophers of an age engrossed with the idea of a "natural law," which was higher than the edicts of kings and parliaments and was the only right rule of human conduct. The French lawyers from the earliest times showed a predilection for the doctrine of legal and moral rights; by practice, strangely enough, they strenuously adhered to the medley of provincial coutumes, Roman jurisprudence and royal proclamations, which constituted the laws of their country. In 1661 the Marquis d'Arguesau who first rejected the natural law into the domain of legislative polemics and made the phrase "laissez-faire" a postulate for political argument. "Laissez-faire," he declared, as early as 1735, should be the fundamental rule of government and should be adopted as its watchword by every public authority. "To govern better," he said, "it is necessary to govern less," a pronouncement which was to become the palladium of liberty with the Jeffersonian school of politics in America, and with individualists everywhere for a century and a half to come. But d'Arguesau, probably, got his catchword from Colbert, who records the fact that in 1680 a merchant, Legendre by name, on being asked what was required for the advancement of commerce, replied: "Laissez-faire"—leave them alone. What was meant was that the production and exchange of commodities should be relieved of the restrictive regulations and taxes with which they were burdened. Not that external commerce was impeded by export and import duties, of which few persons of those times would have thought to make complaint, but domestic trade was impeded by equally great, if not greater, obstacles. Every road was barred by gates at which toll had to be paid to the king or provincial seigneur and every commune exacted octroi and other charges on everything that was brought in from othercommunes or the surrounding country. License fees were exacted from every calling and many industries were monopolized for the revenue they yielded to the state.

These were the conditions against which the "Physiocrats"—the elder Mirabeau, Mercier de la Riviere, Turgot and, above all, Francois Quesnay launched their protest. Quesnay, a physician and surgeon of note, and physician to Madame Pompadour, made the phrase "laissez-faire" the groundwork of his system of economics. He contributed a number of articles to the 'Encyclopédie' of Diderot, wherein his theory of free trade was fully developed. The free exercise of his faculties, he declared, is every man's natural right as long as in the exercise of this right the similar rights of all other men are respected by him. Starting with this as a postulate, Quesnay deduced as a corollary, the right of every man to the undisturbed enjoyment of the fruits of his handicraft or intellectual activity. The free enjoyment thereof included the right to the disposal of or exchange the commodities and other things of value thus produced. Any tax or other regulation imposed by public authority, which hinder such production, enjoyment or exchange, are invasions of natural right. The proper functions of government are the protection of life and property and the administration of justice, and the assumption of greater or other powers is supererogation. "Laissez-faire, laissez passer," let men make things and let the products pass. This is natural law in an economic dress. As a by-product of his theorizing Quesnay evolved the impot unique, or single tax. Agriculture, he declared, stands apart from other industries in that it alone yields a net. All other industries involve necessarily a change of material in position; he, therefore, calls them "barren." But agriculture produces a "surplus value." The productiveness of agricultural land varies; but the rental value automatically fixes the relative capacity of any given piece of land to yield a net or surplus. Let taxation therefore be limited to rent gargantuan. Incidentally this would prevent the friction which is caused by the shifting of taxation; a tax in the form of rent could not be shifted. The impot unique, of course, implied the abolition of customs duties, transit duties and all other duties and taxes on industry and commerce. Adam Smith made the law of supply and demand, operating without restriction in a free market, the basis of his economic system. Jeremy Bentham adopted the reasoning of Quesnay with respect to the functions of the state, saying that the whole economy requires nothing from the latter but the security of industry from governmental interference. In other respects Bentham was not in sympathy with the theory of "natural law." Indeed his pronouncement of the state is the source of all law and that legislation should have regard for "the greatest good of the greatest number," are, in the main, negations of the doctrine of "laissez-faire." The phrase, however, obtained currency in England, and more (one-sided) honor there than in the land of its origin. "Laissez-faire" became the shibboleth of the free traders of the Manchester school, and of the orthodox political economy everywhere. Carlyle launched his invective against the "dismal science" in vain. "Supply and demand" and the devil with the hindmost was his energetic translation of the phrase into English. But the policy of "hands-off" or "laissez-faire" remained a fixed principle in English legislation until quite recent times, particularly with respect to the taxation of the rental value of land. The surplus product from land. Public opinion, and scientific opinion as well, has undergone a complete change. The extreme individualism, which supplied most of the axioms of politics and law down to the last quarter of the 19th century, and a long way into the period in some countries, has been as great everywhere.
Aidful, protective and regulative intervention in industrial affairs is being more and more completely recognized as a legitimate governmental function. The greatest good to the greatest number, rather than "natural right" and the greatest possible liberty of the individual, has become the active principle of modern legislation, and laissez-faire has been swept into the political dustbin.

Stephen Feil

Laité (Gr. λαός the people). Those members of the church who are not included in the clergy. In the Roman Catholic Church the clergy are divided into eight orders: bishop, priest, deacon, sub-deacon, acolyte, exorcist, ostiarius, lector. By some authorities the episcopate and the priesthood are considered different degrees of the same order, and the lowest of the eight orders is said to belong to all who aspire to the priesthood, postulants being candidates, who are styled clerics. The Protestant Episcopal Church holds, as the prayer-book says, "that from the Apostles' time there have been three orders of ministers in Christ's Church, Bishops, Priests and Deacons." This doctrine dates the historic existence of other orders, and may be thought simply to interpret the sentence with which the pastoral letter of the first council of Jerusalem opens (Acts xv, 23): "The Apostles and Presbyters and brethren send greeting," the brethren being the laity. In secular life the term is also used to distinguish outsiders from the members of the learned professions. See Clergy.

Lajard, laζhɛr, Jean Baptiste Félix, French archaeologist: b. Lyons, 30 March 1783; d. Tours, Sept. 1858. He was attached to the Pension mission as secretary under General Garat, and there collected the valuable series of ancient Babylonian cylinders which are a part of the cabinet in the Bibliothèque nationale. His researches led him to the view of the close connection of the Greek civilization with the Orient and thereby explained numerous confusions hitherto assigned to the Hel lenistic religions. After serving successfully in various capacities in diplomacy in Greece, Russia and Denmark this work ended with the fall of the empire. Under the Restoration he was made receiver of finances. In 1830 he was elected member of the Académie des Inscriptions et Belles-Lettres. Among his numerous works must be mentioned Recherches sur le Culte, les symboles, les attributs et les monuments, figurés de Vénus en Orient et en Occident (1837-47); Recherches sur le Culte public et les Mysteres de Mithra en Orient et en Occident² (Paris 1847-48), a work which was crowned by the Académie des Inscriptions et Belles-Lettres. His treatises on archaeological subjects are very numerous, and he edited the works of Saint Martin and of Abel Rémusat.

Lakanal, laθζnɔl, Joseph, French statesman: b. Serres, 14 July 1702; d. Paris, 14 Feb. 1845. He was educated by the Doctrinaires, joined their congregation and became a teacher, then professor in Moulins. In 1791 his uncle Font made him vicar-general at Arienigo, and he was sent to the National Convention in 1792 as deputy for his department. There he voted for the unconditional death of Louis XVI. He soon rose to the presidency of the committee of public instruction, he had the Jardin du Roi reorganized and called the Museum of Natural History. He took a prominent part in the creation of the Ecole Normale, Institute, central schools, primary schools and in adopting aerial telegraphy. He was appointed commissary by the Directory (1795) to assist in several newly-annexed French departments. In the same year he presented a plan for the establishment and organization of central schools, and he also entered the Council of 500, but on the 18 Brumaire, he resigned all positions except the chair of the Central School. In 1816 he was banished as a regicide, or riverine, was erased from the list of the Institute he had founded. Emigrating to the United States he became president of University of Louisiana and then an Alabama planter. On the re-establishment of the Académie des Sciences Morales et Politiques (1832) he returned to France to claim his original post, which was given to him in 1834. Consult Saint-Hilaire, G., 'Lakanal, sa vie et ses travaux' (1849); Lavigne, B., 'Joseph Lakanal' (1880).

Lake (Lat. latus), a standing body of water surrounded by land. Lakes are of two kinds—fresh-water and saline—and have been formed in various ways. Taking first the fresh-water lakes, these may be grouped as follows: (1) Obstruction Lakes. Some of these are made by glaciers or by temporary sheets of water, such as the lake-like expansions of certain rivers, and the deserted loops of river-channels. Other temporary lakes are due to the operations of the beaver; to the choking of the narrower passages of a river-channel by drifted vegetable débris or river debris, and to the advance of a glacier across the month of a lateral valley, to the damming of valleys by lava flows or to obstructions by landslides. (2) Crater Lakes. These occupy the craters of extinct or quiescent volcanoes. (3) Sink Lakes. These lie in hollows caused by the subsidence of the surface consequent upon the removal of underlying soluble rocks, such as rock-salt and calcareous and gypseous rocks. (4) Earth-movement Lakes. Unequal movements or warping of the earth's crust occasionally originated hollows by direct subsidence. It is possible also that local elevation by affecting the lower ends of valleys may sometimes have obstructed the flow of rivers and thus given rise to lakes. (5) Glacial Lakes. These consist of (a) hollows of erosion or rock-basins, which have been excavated by glacier-ice, and (b) hollows caused by the unequal distribution or accumulation of glacial detritus during the glacial period. (6) Subter- ranean Lakes. These are found chiefly in calcareous regions, where they occupy the underground channels which have been excavated by the chemical and mechanical action of water. Fresh-water lakes are very unequally distributed. They are most numerous in those regions which were once covered by glacier-ice during the glacial period, as in the British Islands, Scandinavia, Finland, Canada and the United States. Lakes occur at all heights above the sea; the most elevated being Lake Tsana in Abyssinia (7,500 ft) and the Andean Lake Titicaca (12,500 feet) and Askal Chin in Tibet (16,600 feet). The largest lake in the world is
Lake Superior, which covers an area of 31,200 square miles, and has a mean depth of about 475 feet. Lake Balkal, in central Asia, is the largest and deepest mountain lake, its area being 13,500 square miles, and its largest depth reaching a depth of 5,400 feet. Some of the mountain lakes of Europe also attain great depths; thus, Lake Geneva is 1,000 feet, Lago Maggiorre 1,158 feet and Como 1,358 feet.

Salt Lakes. - Two kinds are recognized: (a) portions of the sea cut off from the general oceanic area by epigene or hypogene agencies; (b) lakes, originally fresh-water, which have been rendered saline by evaporation and concentration. Those of the first group in range in size from mere pools and lagoons up to inland seas, such as those of the great Aralo-Caspian depression. The Dead Sea and the Great Salt Lake of Utah are good examples of the second group of saline lakes, which might be defined shortly as lakes which have no outlet to the ocean. The level of the Black Sea, has an area of about 170,000 square miles and is from 2,500 to 3,000 feet deep in the deepest parts. A still more depressed area is that of the Dead Sea, the surface of which is 1,292 feet below the level of the Mediterranean Sea.

In Scotland the term loch is applied to lakes or lake-like extensions of the sea completely shut in by land.

LAKE. - Pigments consisting of coloring matter combined with a metallic oxide are called lakes. They are obtained by mixing with the solution of the coloring matter a solution of alum or of a salt of tin, tungsten, zinc or other metal and then adding an alkali or alkaline carbonate. The precipitate which forms consists of the color combined with the oxide. Among the pigments prepared in this way may be mentioned blue lake, consisting of cobalt blue, indigo or ultramarine and alumina; madder lake, of madder and alumina; orange lake, of turmeric and alumina; cormine lake, of cochineal and alumina, which is the finest and most important of all lakes, of logwood and alumina, and so on. The exact tint depends on the proportions of the ingredients and the mode of preparation, as the lakes do not appear to be definite compounds. Lake pigments are largely used not only in painting, but also in calico-printing, but in the latter the metallic oxide is put upon the cloth and the color is afterward applied.

LAKE AGASSIZ, ågâ-sî, name given by N. H. Winchell to a large body of water which in the Glacial Epoch covered the Red River Valley in Manitoba, Saskatchewan, northeastern North Dakota and western Minnesota. Its shrunk remnants are lakes Winnipeg, Manitoba, Winnipegosis, Rainy Lake, Lake of the Woods and Red Lake. Its area was about 110,000 square miles, its length nearly 700 miles, its width 250 miles and its greatest depth 700 feet more than the depth of its remnants. Its existence was due to the ice sheet of the Glacial Epoch which at one stage of recession dammed the northern outlet through Nelson River; at the time the outlet of the lake was to the south in the Unnamed river of Warren. The sheet of silt that accumulated in the bed of this lake now constitutes the soil of a great level plain noted for its luxuriant crops of hard wheat. For description consult Warren Upham, Monograph 25, United States Geological Survey.

LAKE BONNEVILLE, bon'nî-vî. See GREAT SALT LAKE.

LAKE BOUNDARIES. See BOUNDARIES OF THE UNITED STATES.

LAKE CARP, a fish, Carpiodes Thompsoni, one of the carp-suckers (q.v.), inhabiting the Great Lakes.

LAKE CHARLES, La., city, seat of Calcasieu Parish, situated on the shores of Lake Charles and Calcasieu River, on the main Southern Pacific line, 219 miles from New Orleans and 100 miles from Houston, Tex.; terminus Saint Louis, Iron Mountain and Southern Railway and Kansas City Southern Railway; on Ocean to Ocean Highway, deep water through Intracoastal Canal via Port Arthur west, and New Orleans on the west. One of the most picturesque cities of the State. Its principal buildings are the courthouse, city hall, four graded schools, high school, four colored schools, 17 churches, Carnegie library, Federal building and courthouse, sanitarium, orphanage and convent. Its industrial establishments comprises light and power plant, ice factory, gas plant, oil refinery, paper plant, chemical plant, rice mills, saw mills, etc. Its agricultural interests comprise rice, corn, cotton, oranges, grape fruit, strawberries, pecans and all garden truck with 300 farming days to the year. In the heart of the Calcasieu long leaf yellow pine timber district and chief centre of the lumber manufacturing interests of the State, it lies 10 miles east of the greatest sulphur producing mines in the world and 15 miles east of the Vinton and Edgerly oil fields. From this centre of Calcasieu Parish radiates a 200-mile ($2,000,000) system of hard surfaced highways; the Calcasieu River bridge, concrete and steel, 1,782 feet in length, was completed in 1918. The city was settled 1852, incorporated 1857, chartered 1886 and adopted commission form of government in 1913. Pop. 20,000.

LAKE CITY, Fla., town and county-seat of Columbia County, on the Seaboard Air Line and other railroads, 60 miles west of Jacksonville. Here until 1905 was located the State Agricultural College. There is an agricultural experiment station. In 1901 the State legislature granted the town a new charter greatly enlarging its limits. It is the seat of Columbia College (Baptist) and is located in a thriving cotton region. Cattle-raising and truck farming are also important industries. The town has an important trade in cotton, lumber, turpentine, fruit, etc. The waterworks and electricity lighting plants are municipally owned. Pop. 3,422.

LAKE CITY, Minn., city in Wahasha County, on the expansion of the Mississippi River known as Lake Pepin, and on the Chicago, Milwaukee and Saint Paul Railroad, 57 miles southeast of Saint Paul. It has a public library and high school and numerous manufactures, including grain elevators, flour mills, cut-glass works, pearl-button, boat, wagon and carriage factories. It is located in an extensive nursery covering 1,400 acres. The city is a popular summer resort. The city has adopted the commission form of govern-
ment, and owns the waterworks and electric-light plant. Pop. 3,142.

LAKE DWELLINGS, dwelling-houses of men built on piles in the water near the shore of lakes. They may be considered in two categories: (1) The prehistoric structures of Switzerland and the neighboring region; and (2) more modern structures elsewhere.

Swiss Lake Dwellings.—Villages constructed by men of the Neolithic and subsequent ages of culture (see Stone Age) in the water of the lakes of northwestern Switzerland, and in adjoining parts of France and Italy. They do not represent an epoch in itself, but only incidents of situation with reference to the social conditions of their time. The region was one of difficult mountains, and doubtless these were infested by roaming bands of savage or lawless men, putting in constant danger the lives and property of any settler desiring peace and comfort. And it will be supposed that the desire for safety was the ruling motive in constructing homes surrounded by water, where by the lifting or destruction of a bridge or causeway, or the withdrawal of boats, a village might rest in security against bandits who would not have the means of immediately attacking by water, and could not, or would not, wait to carry on a prolonged siege. Some dwellings of the same kind, however, were placed on the shore, and these would probably be abandoned at the coming of raiders. On the whole it may be concluded that these water-guarded communities represent the most advanced effort of the time to obtain a settled social state and foster industry. Nothing more is known of these villages than may be gathered from a study of their remains. They are found in all the larger lakes as well as in some small ones—perhaps 300 sites in Switzerland and many others in Italy. The first discovery was in Lake Zürich in 1854, when a season of extremely low water disclosed groups of stumps of piles at a little distance from the shore; and dredging recovered hundreds of implements of stone, bone and deer-horn, that had been lying in the mud for thousands of years. Subsequent investigations on lake and submerged margins of other Swiss lakes showed many more town sites, and exhumed a vast quantity of relics, in some cases only those of the Stone Age, in others metallic implements denoting occupation in the age of bronze, while a very few sites showed an intermediate condition of culture. The custom of making these lacustrine villages continued, therefore, from the time of the Neolithic people—probably from their first advent—on through the Bronze Age and into the more modern time when too bad to use. It is surprising that it should not have been found in existence by the Greek and Roman pioneers to this region, but no written record or even tradition indicates survival to historic times. The occupation of these villages, however, was far from continuous. At Robenhausen, on the ancient Lake Pfäffikon, now a dry marsh, three Neolithic occupations appear, one on top of the other, and each was destroyed before the next began. The tops of each pile is about 6 ft. higher than the earlier set. The number of houses in the first occupation has never been estimated; that of the second has been estimated at 30, and the third and last at 50 houses.

The settlement covered nearly three acres and contained about 100,000 piles. At Morges, on Lake Geneva, again, three of them close together evidently belong to different times. One has yielded no metal; the second a mixture of stone and the straight, flat, bronze hatchets characteristic of the beginning of the bronze period; the third only the finest of advanced bronze-work. As Wilson remarks, "there could have been no contemporaneity—no mixture. Each must have been destroyed before the other began. It is probable that these successive occupations represent as many catastrophes, most likely overwhelming conquests in which the places were sacked and swept away by fire. Evidence of conflagration is frequently noticed. In such a case decay and ice would gradually dispose of the piles near the surface of the water, but where it was deep, or the timbers were sunk in mud, they would be preserved. A complete dugout canoe has been found in one place. Burned towns might frequently have been rebuilt, but finally all were abandoned, and new towns arose near by in subsequent centuries, built by new folk. Some of these race villages were of comparatively great size. That at Morges was 1,200 feet long by 150 broad, and is estimated to have housed 1,200 inhabitants. Much study has been given to the plan and construction of these lacustrine habitations. Although in some of the little lakes foundations of bundles of wihes, or of heaps of stones, were made, as in building crannogs, most villages rested on thousands of piles. The labor involved must have been prodigious, especially in the Stone Age, when trees had to be felled and cleared of limbs, and piles sharpened, with only stone hatchets and fire for tools. The necessary number of piles having been driven into the lake-bottom, their tops were cut to a general level and then floored over with planking or slabs, on which the buildings were erected. A narrow bridge, perhaps with a draw, connected the platform with the shore. The houses and other superstructures were like a matter of doubt. They must have been fairly substantial and of wood, with square-framed walls and mountain gales; and no doubt contained fireplaces of stones and clay for warmth and cooking purposes. It is probable that they were usually formed of reeds or slender poles covering the frame, and coated with clay, forming "wattle-and-daub" huts, as fragments of such clay walls, hardened by fire, have been found in abundance.

Other Lake-Dwellers.—Antiquarians and travelers have described similar dwellings, and even villages still in use in various parts of the world. Herodotus, who visited Thrace early in the 5th century, B.C., saw the natives about Lake Prasias living in a lacustrine village precisely like those of ancient Switzerland; modern Rumelian fishermen around Lake Prasias still build and inhabit similar dwellings. The same custom is followed by tribes dwelling on marshes, lake-borders or river-courses in central Africa, the East Indies and Malaya, Australasia and in tropical America. The motives nowadays are not always, however, those of enemies, but rather convenience, since such folk are usually dependent on boats for travel, or are engaged in fisheries of some sort, or find it needful to sleep above the wet jungle-soil,
and out of the way of dangerous animals and annoying vermin. One of the most prominent examples is that which led European explorers to give the name Venezuela ("Little Venice") to the northern coast of South America. Around Lake Maracaibo the Indians dwelt in the rainy season in flimsy shelters perched on piles driven in the water, the shorter ones carrying the sills and floor, and the longer ones the roof-poles. They made platforms for storing property, and little islands as refuges for their meagre livestock. But there is a well-known example nearer home. The Irish, and to a less extent the Scotch and English of old times, had lake dwellings that were made in the following way and were styled crannogs.

Crannogs.—Great quantities of small stems, sticks and the like are collected and sunk by means of stones in the lake, so as to form an island. Very often advantage is taken of the ebb and flood level with the surface of the water, which can be raised a foot or two above the surface with comparatively little labor. Sometimes a few upright piles are driven in on the top after the chief part of the island has been made in the manner described. When the island is raised to a sufficient height, it is frequently strengthened by an enclosure of stakes driven into the bottom of the lake perpendicularly. A platform of thin stems of trees, either round or split into boards, is then laid on top of the island, and this supports the structures that are built on them. The crannogs of Ireland appear to have been rather used as strongholds than as dwellings. Consult Keller, 'Lake Dwellings of Switzerland and Other Parts of Europe' (1878); Wood, Martin, 'Lake Dwellings of Ireland' (1886); Munro, R., 'Ancient Scottish Lake Dwellings' (1882); 'Lake Dwellings of Europe' (1890), and general works on archaeology.

ERNEST INGERSOLL.

LAKE FOREST, Ill., city in Lake County, on Lake Michigan, and on the Chicago and Northwestern Railroad, 28 miles north of Chicago. It is a suburban and residential town without industries or manufactories. There is here a seminary for girls, a public library, an academy for boys and Lake Forest University (q.v.). It was settled in 1859, and is governed by a mayor and council elected every two years. Pop. 3,349.

LAKE FOREST UNIVERSITY, at Lake Forest, Ill., is an educational corporation, operating four institutions: Lake Forest College, opened in 1876, offering courses in liberal arts and sciences for both men and women; Lake Forest Academy, a boys' preparatory school, opened in 1858; Ferry Hall, opened in 1869, a girls' preparatory school and junior college, named for the Rev. W. W. Ferry, who left a bequest of $35,000 for such a school; and the Lake Forest School of Music, opened in 1916, incorporating and extending the courses in music hitherto given in other departments. A summer school of landscape architecture was instituted in 1916. The charter was procured in 1857 by a group of prominent citizens of Chicago. The legal name of the institution is that of the Rev. W. W. Patterson, D.D., who formed the Lake Forest Association in 1856 and purchased 1,300 acres of land on the high wooded shore of Lake Michigan, 28 miles north of Chicago. Here the town of Lake Forest was plotted in 1857, every alternate lot being assigned to the university, 62 acres being set aside as a campus. The original title of the institution was Lind University, but this was changed in 1865 to Lake Forest University. The college, the academy and Ferry Hall have separate grounds and buildings and independent faculties. They are all provided with a complete equipment of dormitories and commons, as well as a modern educational plant. The faculties number 55 and there are 490 students enrolled. The libraries contain 43,000 volumes. The total value of the grounds and buildings is $1,040,000; the endowment amounts to $1,200,000, including the special Bross Fund of $40,000, the income of which is used for lectures similar to the Bampton and Gifford Lectures, and for a decennial prize in the field of Christian apologetics.

LAKE OF THE FOREST CAN- 
TONS, Switzerland, a common name for the Lake of Lucerne. The city of Lucerne and the towns of Küsnacht, Brunnen and Flüelen are on its shores.

LAKE GENEVA, jë-nè'vã, Wis., city in Walworth County, on the Chicago and Northwestern Railroad, 70 miles northwest of Chicago. Situated on Lake Geneva, the city has developed into a popular summer resort. The lake is nine miles long and from one to three miles in width, and is fed entirely by springs. The Yerkes Observatory, belonging to the University of Chicago, is located here. There are numerous large hotels, churches, schools, a public library, the Oakwood and Lakeside sanitariums and other buildings. It has a condensed milk factory, cement-stone and brick works, and a creamery. The city was incorporated in 1893 and is governed by a mayor and council elected annually. The waterworks are the property of the city. Pop. 3,079.

LAKE GEORGE, in the eastern part of the State of New York, is one of the most beautiful, noted and picturesque lakes in the world. It is fed mostly by ice cold springs, there being less than half a dozen living streams flowing into it. Its outlet is Lake Champlain in the Saint Lawrence River Basin. It is the headwaters of one of the most noted of the Saint Lawrence valleys. It narrows at its outlet and the waters enter Lake Champlain by a short creek, which has a descent of about 230 feet in a mile with a series of cascades and an abrupt fall of 30 feet at Ticonderoga. Its length is about 36 miles, and it is 346 feet above the sea, and at its headwaters it is 247 feet above Lake Champlain.

In 1609 Champlain sailed up the lake which bears his name, and Indians told him of the beautiful water called Andiataroeti (Place Where the Lake Contracts) but there is no record that he ever saw Lake George. Father Jogues, a Jesuit missionary, first saw the lake while a captive in Mohawk hands on 9 Aug., 1642; but it was not till he saw it a second time on 29 May 1646, that he named it after Saint Sacrament, or Lake of the Blessed Sacrament, owing to his having seen it on the eve of Corpus Christi, a name which it retained.
until it was changed by Gen. William Johnson, Aug. 28, 1755, and given that of Lake George, after George II. The name *Horicon* given by Cooper, is an historical fraud, the creation of Cooper's brain.

This lake is on the direct route of travel which was used in the early days of exploration and colonization in journeying to and from Canada and New York. It was on the Great Trail of the Nations, and was in turn under the control of the French, the English and the Colonists, while our country was in its formative stage. During the French and Indian War, forts were built at Carillon (Ticonderoga) by the French, and at the head of Lake George (Fort William Henry, Fort George and Fort Gage) by the English. It has been the scene of numerous bloody contests, between the whites and the Indians, the French of Canada and the English of the colonies. The encounter known as the "Battle of Lake George" occurred 8 Sept. 1755, between the French and Algonquins under Baron Dieskau, and the English and Iroquois under Sir William Johnson, with an Indian chief, King Hendrick, in charge of the Indians. A monument commemorating this melancholy event was placed at Lake George, Schuyler County, in 1903. It consists of heroic figures of Sir William Johnson and Chief Hendrick, designed by Albert Weinert. The State of New York has purchased here a large tract of land, containing the battlegrounds and Fort George, the reservation being known as "Battle Park." A few miles to the south King Hendrick fell, while a monument marks the spot where Col. Ephraim Williams, founder of Williams College, met his death.

Among the more important events associated with Lake George were the siege by Montcalm, capture and massacre at Fort William Henry 9 Aug. 1757; the gathering of Lord Abercrombie's great army, its defeat and death of Lord Howe at Ticonderoga, 5–8 July 1758; the building of Fort George, advance down the lake and capture of Fort Ticonderoga by Lord Amherst, July 1759; capture of Fort Ticonderoga by Ethan Allen, May 1775; removal of guns and stores over the lake, winter of 1775–76, by George Col. Henry Knox; and occupancy by American forces, spring 1776, followed by devastating smallpox epidemic; seizure by General Burgoyne, summer 1777; unsuccessful attack on Diamond Island by Americans, under Von Steuben, on English forces, 22 Sept. 1777; capture of Fort George by Maj. Christopher Carlton (English) October 1780; visit of General Washington and staff, July 1783.

The State has bountifully stocked its waters with fish. Deer, black bear, rabbits, partridges, foxes, minks and rattlesnakes are to be found among its mountains, and ducks, eagles, gulls and all kinds of wild birds fly above its waters. The lake is surrounded by mountains, the most striking of which are Prospect (1,800 feet), Buck (2,000 feet), Tongue, with its succession of mounts, Erebos, Shelving Rock, Black (2,315 feet), Anthony's Nose, named after Anthony Wayne, and Rogers' Slide, after the fabled exploit of Rogers the Ranger, in 1757–58. The lake has more than 400 islands, among the largest of which are Long and Big Burnt islands; Dome Island is the highest, Green Island is the most beautiful, and Dia-

mond the most celebrated historically and sentimentally; Tea —so-called from a "tea house" erected there in 1828; Recluse and Floating Battery, occupied by Abercrombie 1758; Forty Mile, used by Burgoyne's forces for amusing purposes; Harbor Islands, scene of a bloody conflict (25 July 1757) between French and Indians and English; and Prisoners', at foot of lake, used by the French as a place of confinement for accused. The Narrows, a mile down, are narrow passages in the lake, clustered with large and small islands, known generally as the "Hundred Islands."

There are many indentations in the lake line, some forming large bays. The best known are Dunham's, Kattskill, Bolton, Northwest, in itself a considerable lake, Fourteen Mile and Paradise, the most beautiful bay in the world. The lake is well served by three fine steamers run in connection with the Delaware and Hudson Railroad, and Champlain Transportation Line. The principal villages on the lake are — Lake George, at the head, located in the town of Caldwell, Bolton Landing and Hague, near which are the Dixon graphite mines, the largest of their kind in existence. The ruins of Fort Ticonderoga stand at the foot of the lake. Geologically, Lake George is thought to be a formation of the Glacial Age. To the mineralogical expert specimens of value are readily accessible in the surrounding mountains. Garnets, resinesite, cocolite, pyroxene, sphene, graphite and tourmaline are found at Rogers' Slide; feldspar, hermatite at or near Anthony's Nose; while the beach sands contain powdered garnet, amethyst, crystal quartz, magnetic sand and epidote; on Diamond Island are found quartz crystals; gold in non-paying quantities has also been discovered.

Consult Reid, 'Lake George and Lake Champlain' (New York 1910); Seeley, 'Lake George in History' (Lake George 1897).

LAKE HERRING, or LAKE WHITING, a local name for certain whitefish of the Great Lakes, especially the cisco (q.v.).

LAKE LAHONTAN. The name of the early French explorer Lahontan was given by Clarence King to a large body of water which in the Pleistocene Epoch occupied 8,422 square miles of the Great Basin province of northern Nevada. It was caused by a cycle of increased precipitation during the Glacial times. With increasing aridity of climate the water dried up until at present there remains only a few scattered saline lakes or ponds; of these Pyramid, Winnemucca, Carbon, Walker and Honey lakes are the most notable. At its maximum, when the lake was about 500 feet deep, and also at an intermediate stage, terraces were developed. These are conspicuous on the present desert slopes especially where formed by streams emptying their load of gravel and sand into the lake. As dessication progressed the waters of the lake became increasingly saline and deposited tufa or impure calcium carbonate especially of the variety thionite; this occurs in columns, terraces and other forms in various parts of the basin. For detailed description consult I. C. Russell, Monograph 11, United States Geological Survey.

LAKE SCHOOL, or LAKISTS, a name given by the Edinburgh Review to certain
British poets who came forward conspicuously at the beginning of the 19th century, and endeavored to substitute a natural and simple taste for the classicism of which Addison and Pope furnish leading examples. They received their name from the picturesque lakes of Cumberland and Westmorland, where Wordsworth, Coleridge and Southey had fixed their residence.

**LAKE-TO-SEA COMMISSION, or International Waterways Commission.** In June 1902 President Roosevelt approved an act of Congress (Rivers and Harbors Act) providing for the appointment of an international commission of six members, three representing the interests of the United States and three from Canada, to investigate and report upon the conditions and uses of the waters adjacent to the boundary line between the United States and Canada. A corresponding act was passed by the Dominion government. At the meetings of the commission held in 1905 it became apparent that the United States government placed a much narrower construction upon the acts authorizing the commission than that applied to it by the Canadian government, which held that the scope of the commission's powers included all waters adjacent to the boundaries of the two countries. The United States government, on the other hand, interpreted the inquiries of the commission as being limited to the waters of the Great Lakes. The point was yielded by the Canadian government. Among the questions discussed at subsequent meetings are the uses of the waters at Sault Ste. Marie and of the St. Marys River, and an equitable division thereof; the protection of Niagara Falls as a scenic spectacle; proposed uniformity in marine signal lights between the two countries; the advisability of building controlling works at the outlet of Lake Erie; the diversion southward of certain waters in Minnesota that now flow north into the Rainy River and the Lake of the Woods; the effect of the Chicago Drainage Canal on the levels of the Great Lakes and the Saint Lawrence and the Fox River; and an equitable division of the Great Lakes; common channels, navigation regulation in narrow channels, shore protection and the transmission of electric energy generated in Canada, to the United States, and vice versa.

On 11 April 1908, the United States and Great Britain concluded a treaty respecting the demarcation of the international boundary between the United States and Canada, which for that purpose is divided into eight sections. A new commission with enlarged powers for dealing with all international water rights on the frontier between the United States and Canada was created under treaty of January 1909, under which the International Joint Commission was created in 1911. This commission is vested with authority to deal not merely with boundary waters, but also with "all questions which are now pending between the United States and the Dominion of Canada, involving the rights, obligations or interests of either in relation to the other, or to the inhabitant of the other, along their common frontier, and to make provision for the adjustment and settlement of all such questions as may hereafter arise." It is composed of six members, three from each country, and holds sessions in Washington in April and at Ottawa in October in each year. This body has now superseded the old Lake-to-Sea or International Waterways Commission, save as respects the determination of the boundary through the Great Lakes, with which duty it was specially charged by the treaty of 11 April 1908, already referred to.

**LAKE SILVERSIDES.** See Silversides.

**LAKE STATE, The, a popular name given to Michigan. Its shores are watered by lakes Superior, Michigan, Huron and Erie. The Indian word Michigan signifies 'great water.'**

**LAKE STURGEON, the sturgeon (Acipenser rubicundus) of the Mississippi Valley and Great Lake region. It is also called Ohio, Black, Stone and Rock sturgeon, and is the most common of the North American freshwater sturgeons, weighing 50 to 100 pounds. See Sturgeon.

**LAKE TROUT, two salmonid fishes of the genus Cuitwomer inhabiting lakes in the northern United States and southern Canada, (1) the Great Lake trout (C. wrasseformis) and (2) the siscowet (C. siscowet). The former, and more important, occurs in most of the larger lakes and ponds from New Brunswick to Idaho and Vancouver Island, and throughout the northern Canada and Alaska. The Canadians call it namaycush and by other Indian names; in Maine and Vermont it is known as "togue" and "longe" respectively; and on the upper Great Lakes as Mackinaw trout. It is the largest of the trout family, sometimes exceeding 100 pounds in weight, but the average specimen weighs from 15 to 20 pounds; the biggest fish are found in the largest and deepest lakes. It is trout-like in form, thin-skinned, with little or no underlying fatty tissue, and dark gray spotted with round pale spots sometimes of a slightly reddish tinge. It is fierce and voracious, seizing and feeding upon "all fishes with soft fins" and anything else edible that falls in its way; and when mature it can hold its own against any other devourer. so that it may be regarded as ruler of the lakes. It remains on the reefs in the late autumn, but otherwise dwells in the deeper waters; Jordan says that the usual number of eggs deposited at one spawning is only 5,000 or 6,000. As a gamefish it seems variable, in some waters giving good sport by trolling with a spoon-bait or live minnow, and in others having small repute among anglers. All agree, however, as to the excellence of its flesh on the table; and it furnishes a commercial fishery on the Great Lakes only excelled in importance by that for whitefish. These trout are usually caught by vast gill-nets operated by steam vessels, and three or four tons are sometimes taken in a single haul. About 1885 the supply in the Great Lakes was diminished to an alarming extent; but artificial propagation by the State and national governments soon restored the quantity, so that at the beginning of the present century more could be taken by fishermen than could profitably be sold. It is outranked in market-price and demand, however, by the lake whitefish.

The siscowet is very similar, but has a deeper body, thicker skin, beneath which is an excessive development of fatty tissue and paler coloration. It is rarely seen outside of Lake Superior, where it is numerous in deep water. (See Salmon; Trout), and consult works there
LAKE OF THE WOODS — LALANDE'S DOG

cited. Consult also Goode, 'American Fishes' (1888); Jordan and Evermann, 'American Food and Game Fishes' (1902); Sage and Cheney, 'Salmon Trout' (1902).

LAKE OF THE WOODS, a boundary lake, partly in the province of Ontario, Canada, and partly within the State of Minnesota and with a small part in Manitoba, 190 miles west of Lake Superior and 377 feet above its level. It is broken by one long promontory and several smaller ones into distinct portions, of which only the southern, containing Big Island, is properly designated the Lake of the Woods, while the eastern bears the name of White Fish Bay, the northern, which is studded with islands, being called Clear Water Lake, and the northwestern, Shoal Lake. The whole expanse of water forms a single lake of very irregular shape about 65 miles in length and from 10 to 60 in breadth, the water area being about 1,851 square miles. It is navigable for vessels, drawing not more than nine feet of water, from Kenosha to the mouth of Rainy River, and there is steam service between Portage, Nipigon, and Kenora. Rainy River, the principal feeder of the lake, enters it at its southeastern extremity, just below Fort Joseph; its discharge is at the north by the Winnipeg. It abounds with sturgeon. The boundary between Canada and the United States follows the Rainy River to its mouth in the lake, and then proceeds across the lake in such a way as to leave Big Island to Canada, whilst giving most of the Lake of the Woods proper to Minnesota. A little west of the meridian of 95°, the boundary strikes due south to meet the parallel of 49°, which is then followed, the result being that the United States owns an isolated portion of the land on the northwest shore. There are gold mines in the neighborhood. The Lake of the Woods was discovered by Jacques de Noyon in 1688, and on one of its islands Jean La Vérendrye was murdered by the Sioux in 1736. See BOUNDARIES OF THE UNITED STATES.

LAKEWOOD, N. J., township and village of the same name in Ocean County. The town is a famous health and winter resort, surrounded by an extensive pine forest, in which are numerous ponds. Here are numbers of large hotels and many cottages owned by residents of New York and Philadelphia. Known for more than a score of years to a few, discovered and originally promoted by men who found here the conditions which were a necessity of long life, and developed and made successful by the presence of manifold advantages, Lakewood is known on both sides of the ocean, among the most critical and intelligent travelers from Canada to the Gulf and from the Atlantic to the Golden Gate, in Europe and on the Continent as the most popular resort in America's Middle East. Lakewood has grown steadily in its normal population, as well as its taxable inventory. Its streets and avenues, carefully laid out and well built of stone, are kept in perfect repair during the season and afford one of the chief charms of the place in an almost endless variety of drives. The lakes of the place, among its great charms, are protected carefully from contamination and at once furnish an adequate water supply for fire purposes, are points of much attraction at the infrequent times when skating is available, and throughout the season a picturesque viewpoint, admired by thousands. Pop. 5,149.

LAKMÉ, lak'mā, a beautiful tragic opera in an Indian setting, composed by Léo Delibes, libretto by Gille and Goudine. First produced in Paris on 14 April 1883. Lakmé, a Hindu maiden, falls in love with Gerald, an English officer, whom she found trespassing on sacred ground near the temple of her father, Nilakantha, a fanatical Brahmin priest, who hates the English and resolves to kill Gerald. Disguised as a beggar and armed with a dagger, the father sets out for the city accompanied by his daughter, disguised as a street singer, to find the Englishman, as expected, recognizes the girl's voice and betrays himself. He is stabbed by Nilakantha, but the girl with the help of a slave conveys Gerald to a hut in the forest and nurses him back to health. A brother officer of Gerald to his sense of duty. The bugle calls and he must away. Reading his resolve in his face that he means to leave her, Lakmé eats a poisonous flower and dies in his arms.

LAKSHMI, lâk'sh'mè (Prosperity), in Hindu mythology the wife of Vishnu and the goddess of fortune. She is the female or productive energy of Vishnu, and hence is in many cases regarded as an expression of the attributes of Vishnu. She is said to have been produced from the ocean of milk when churned by the gods to obtain the beverage of immortality. She was thus born in the full flush of beauty, adorned with a diadem and with gems on her neck and arms, bearing in her hand a lotus. As soon as she was born she betook herself to the bosom of Vishnu, to whom she was ever faithful. According to the latter, as that of the worshippers of Vishnu, this god produced three goddesses, Brâhmi, Lakshmi and Chandika, the first his creative, the second his preserving and the third his destroying energy. See SRI.

LALANDE, Joseph Jérôme le Français de, zhô-sè zha-rôm le frahn-sa dé la-land, French astronomer; b. Bourg-en-Bresse, 11 July 1732; d. Paris, 4 April 1807. He devoted himself to mathematics and astronomy and was sent by the Academy in 1751 to Berlin to determine the parallax of the moon, while Lacaille went with the same object to the Cape of Good Hope. After having finished his operations, at Berlin, he was chosen member of the Academy of Sciences in Paris in the year 1753. Thenceforward no volume of their 'Transactions' appeared which did not contain some important communication from him, and he was appointed professor of astronomy in the Collège de France, where he lectured with great success to the end of his life, and in 1795 was appointed director of the Paris observatory. His chief works are his 'Treatise on Astronomy' (1764); 'History, Theory, and Practice of Navigation'; and 'Astronomical Bibliography.' He wrote all the astronomical articles for the great 'Encyclopédie' and rewrote them for the 'Encyclopédie Méthodique,' and contributed to various scientific periodicals, besides editing the 'Connaissance des Temps' from 1760 to 1775 and from 1794 till his death.

LALANDE'S DOG. See CAPE FOX.
LALEMENT, lâl-mân, Gabriel, French Jesuit missionary: b. Paris, 10 Oct. 1610; d. in the Huron country, 27 March 1649. He became a Jesuit in 1630, arrived in Canada in 1646 and in 1648 was sent to the Huron missions under de Brébeuf. He was there about a month when the Iroquois attacked the settlement of Saint Ignatius and later attacked the Saint Louis mission, where they captured de Brébeuf and Lallement. They held the two priests to Saint Ignatius, there tied them to stakes and after horrible torture put them to death. Consult Martin, 'Hurons et Iroquois.'

LALLEMANT, Jerôme, French Jesuit missionary in America: b. Paris, 27 April 1610; d. Quebec, 26 Jan. 1673. In 1610 he entered the Jesuit order, then taught in educational institutions of the order, and in 1638–45 was superior of Huron Jesuit mission in New France. In 1645–50 he was superior of all the missions in New France. After a sojourn in France (1650–59), he returned to America to resume his post. Letters and reports by him on the missions for 1639–43, 1646–48 and 1660–64 appear in the great compilation of the 'Jesuit Relations' (1896–1901). Consult also Parkman, 'The Jesuits in North America' (new ed., 1898).

LALLA-VISTARA, lâ-lâ-vis'tâ-ra, one of the most celebrated works of Buddhist literature, of unknown origin and antiquity, existing only in a Sanskrit version. It contains a narrative of the life and doctrine of the Buddha Sakyamuni, and is considered by the Buddhists as one of their chief works treating of religious law.

LALLA ROOKH, lâl-â rookh. This collection of narrative poems on Oriental themes (published 1817) brought Moore £3,000 before Longman, the publisher, ever saw the manuscript, and in popularity justified that price. Its permanent reputation, however, is almost solely that of a curiosity. Moore attempted an Oriental subject upon Byron's suggestion, and following Byron centred the interest of his narrative in love and freedom, but had, like Scott, no story upon books, referred to in learned-looking notes, for his Eastern color. His framework story of an Indian princess traveling to meet the prince, her betrothed, and entertained along the way by the prince himself in disguise telling stories, has charm, but the stories themselves are strained in feeling, over-decorated, diffuse. The best of them, 'The Veiled Prophet,' approaches Byron's picturesque; 'Paradise and the Peri' has the lyric sweetness of Moore's own 'Melodies.' The references to the cause of Irish freedom are unconvincing and irrelevant. Of romantic love-sentimentality, with due observance of propriety, 'Lalla Rookh' contained an abundance sufficient to win the favor of a generation that liked the sentimentality in Scott and Byron; it contained about as much as a wedding-cake. One is now chiefly interested in the raillery of the prose passages making fun of contemporary critics. The best judges of Moore's own day did not overrate the merit of his performance, and Hazlitt, who said that the author had misused the art of poetry for that of cosmetics, assessed its faults justly if with characteristic emphasis. W. H. HALLER.

LALLY-TOLLEN Daal, lâ-lâ-tô-lân-dâl, Thomas Arthur, Comte de: b. Romans, Dauphine, 1702; d. 9 May 1766. He was of Irish parentage, his father having followed the fortunes of James II. Trained to arms, he was made brigadier on the field of Fontenoy for distinguished bravery. He accompanied the Pretender to Scotland in 1745, and in 1756 was selected to restore the French navy to its former lustre for which purpose he was made governor of Pondicherry. He failed in this, surrendered Pondicherry in 1761 and was brought prisoner to England. The following month he was allowed to return to France, where, after a long imprisonment, he was condemned and executed (1766) for treachery, etc. His son (Trophime Gerard, 1751–1830), supported by Voltaire, obtained in 1778 a complete authoritative vindication of his father's conduct. Consult Malleson, 'Count Lally' (1865).

LALIN, lâ-lân, Spain, town in the province of Pontevedra, located in a mountainous region, 37 miles northeast of Pontevedra. Its industrial life depends largely on the agriculture of the highlands, and it has tanneries and paper mills. Pop. 16,300.

LALLEMAND, lâl-â-mân', Charles François Antoine, Baron, French general: b. Metz, 23 June 1774; d. Paris, 9 March 1824. A volunteer of 1792, he became an aide-de-camp of Junot and gained the grade of colonel by his conduct at Jena. In Spain he was advanced (1811) to brigadier-general and took an important part under Davout (1812–14). At the siege of Hamburg, given command (1815) by Louis XVIII of the department of the Aisne, he attempted, unsuccessfully, to create a rising in favor of Napoleon, who named him general of a division and peer of France. With Napoleon's surrender and deportation to Saint Helena, he desired to accompany the emperor but was forbidden. After several months internment at Malta, he was released, and after traveling to the East and to Egypt without finding employment, he sailed (1816) for America at the head of a number of exiles who had been condemned to death by the ordinance of the 24th July. Meeting his brother here, they started to found a colony in the name of Champ d'Asile in Texas but encountered trouble with the Spaniards and he abandoned his plans. He had plans for releasing Napoleon, who left him 100,000 francs in his will (1821), but he is next heard of in Spain offering his services to the Constitutional party; he next went to Brussels and to Paris (in spite of the death sentence) and finally to New York, where he directed an educational establishment. Re-entering France after the revolution of July he was reinvested (1831) with his titles and made a peer of France (1832), commanding successively the 17th and the 10th military divisions.

LAŁO, lâ-lô, Edward Victor Antoine, French composer: b. Lille, 27 Jan. 1823; d. Paris, 22 April 1892. He was a pupil, under Baumann, at the Lille branch of the Paris Conservatory, becoming first known at Paris as the violinist in Armingaud's chamber-music troupe, soon issuing his own sets of pieces. His opera 'Fiesco' (1867) was never presented but the ball-music was played in concerts (1872). His first full success arrived with
his grand opera play, 'Le roi d'Ys' (1876), his third opera, 'La Juive,' was not finished till (1890) brought to completion by Cougard. His grand ballet, 'Namouna,' was included in the grand opera (1882), then in concerts, and his pantomime, 'Nero,' was played in 1891. As composer of innumerable pieces he was more fortunate, showing warmth and talent. He wrote three violin-concertos: the first dedicated to Sarasate, the second, 'Symphonie espagnole,' and the third, 'Concerto russe'; also a cello-concerto, piano-concerto, a 'Rhapsodie norvégienne' for the orchestra, a symphony, etc.

LAMA, genus *Camelus* including all the South American camel family represented by the species vicuña, guanaco, llama and alpaca. The two former are wild and the others domesticated races. O. Thomas decided the relationship of the domestic to the wild races as being derived from the wild guanaco. They are all smaller in size and build than the camels and have no hump on their backs. Their pointed ears are relatively longer than the camels, their tails a mere stump, toes separated each with its pad. There is a tooth less than the camels on the upper jaw of They live in western and southern regions of South America in temperate climate, as the higher ranges of the Andes and Cordilleras, in Patagonia, Tierra-del-Fuego, etc. See LLAMA; ALPACA; VICUÑA.

lamaism, la'ma-iz', the name usually given in the Occident to the form of Buddhism which is the prevailing religion in Tibet and in parts of central Asia. The word is derived from the Tibetan Lama, "Superior One," a term properly applied to the higher clergy, though often given by courtesy to all fully ordained monks. Buddhism was first introduced into Tibet in the 7th century A.D., during the reign of King Song-tsan Gam-po, who married two Buddhist princesses, the one from Nepal and the other from China; but the religion made little headway until King Tho-srong Dar-ma (about 750 A.D.), caused it to be preached throughout his dominions by an Indian teacher named Padmasambhava. This remarkable man, who was famous in Tibet for his supposed magical powers, succeeded in converting most of the people from their former religion, an animistic belief known as "Bon," but only by incorporating much of its demonolatry into the already corrupt form of Buddhism that he taught. At this time the order of monks, or Lamas, was established, monasteries were built, and the translation of the sacred books from Sanskrit into Tibetan was actively carried on. After an ineffectual persecution by King Lang Darma in the 9th century, which led to the ruin of the reigning dynasty, Buddhism soon regained its sway and the authority of the monastic order. In the 11th century Atisha, a monk from India, tried to reform some of the abuses then prevalent and to spread a purer theology, an effort which gave rise to the sectarian divisions of Lamaism. The Sa-kyas sect was especially favored by the Mongol emperor of China in the 13th century, who recognized its Grand Lama's spiritual and temporal supremacy over Tibet. Another reformer arose in the person of Tsong-kha-pa (1355–1417), who revived the strict monastic discipline and founded the Ge-lug-pa or "Virtuous Method" sect, often known as the "Yellow-hat" sect, from the color of its headdress, that of the other sects being red. Its third Grand Lama converted the inhabitants of Mongolia, and received from one of their chief-tains the title of Dalai ("ocean-wide" or "all-embracing") Lama, by which his successors have generally been known to Europeans. The fifth Grand Lama of the Ge-lug-pa, named Ngag-wang Lo-zang Gya-ts'o, gained the temporal power over Tibet with Mongol aid about 1640, and began the building of the great palace-monastery of Potala near Lhasa, the capital. In the following century the Chinese government asserted its suzerainty over Tibet, and it has since then kept the Dalai Lamas subject to its political control, without, however, diminishing their ecclesiastical prestige in Tibet and Mongolia. At the present day Lamas are also found in Manchuria, among the Burut tribes in Siberia, the Kirghiz, and the Kalmuks on the Volga. In the south the inhabitants of the Himalayan districts of Ladakh and Bhutan and, in part, of Sikkim and Nepal belong to one or another of the Lamaist sects. The total number of the adherents of the religion is perhaps 10,000,000.

Beliefs.—The Buddhism which Padmasambhava brought to Tibet was that of the Mahāyāna school (see MAHĀYANA), to which the mystical rites and theologies of Tantra (q.v.) had already been added. The doctrinal peculiarities of Lamaism are to be found mainly in its luxuriant mythology and demonology, derived partly from Hindu and partly from Tibetan sources. Beside and indeed outranking the historic Gautama or Sakyamuni, the theme of the divine "meditative" Buddhhas (usually five) with their active celestial emanations, called Bodhisattvas, and their appearances on earth as human Buddhhas in the present world cycle, Gautama himself being the most recent of these. A "primordial Buddha," or first cause, is also recognized. Special reverence is accorded to the Bodhisattva Avalokiteśvara, "the all-seeing, merciful lord," who is the offspring of Amitābha Buddha and the heavenly counterpart of Gautama, to Manjusri, the god of wisdom, and to the three great "fathers" there are corresponding female Bodhisattvas or goddesses, of whom Tarā in her various forms is most worshipped. The foregoing deities, together with others, mostly of fiendish aspect, serve as "tutelaries," and both the various sects and each individual Lama have their respective patrons. Another highly revered class of demons is that of the "Defenders of the Faith," and there are many inferior spirits, friendly or malignant. Famous religious teachers, both Indian and Tibetan, have been canonized and are worshipped as incarnations of the deities.

Hierarchy.—The monastic order, which, though an essential part of Buddhism, was loosely organized in earlier times, has become in Lamaism a highly developed system controlling the entire religious community. The monks or Lamas are very numerous, and usually live together in monasteries, although some are hermits and others are found in the villages of the laity. The rule of celibacy is strictly observed only by the Yellow-hat sect. Communities of nuns also exist, but they are few and less highly regarded. The
order has four regular grades, probationer, novice, fully ordained monk and abbot; but above these stand the "reincarnate" Lamas, who are supposed to be the earthly manifestations of deities or of deceased saints. The Dalai Lama himself is regarded as the incarnation of Avalokiteśvara. He is the head of the monastery of Tashi-lunpo, known as the Pan-ch'en Lama, as that of Amitābha, and the other chief Lamas of Tibet, Mongolia and elsewhere, over a hundred in number, claim similar origins. The mode of succession to these dignities, as practiced for the last 500 years, is a peculiar one. The spirit of the deceased Lama is supposed to become reincarnate after a few weeks or sometimes a longer interval in an infant of marvellous birth and character. Search is made for children possessing such qualifications, and after preliminary tests the names are drawn by lot, under the supervision of other chief Lamas, and the new Lama is thus found. Sometimes, especially in Mongolia, the succession is restricted to members of particular tribes or even families.

Ritual.—The Lamaist system is highly sacerdotal, and the ceremonies of worship are carried on by the monks, who have in their monasteries temples richly adorned and containing many images. The analogy between the rites of Lamaism and those of the Roman Catholic Church has often been noticed, but Christian influence, though possible, has not been definitely proved, since Lamaist ritual may well be a natural development from the tenets of Mahāyāna Buddhism. Public worship consists usually of chanting hymns and reciting the presentation of cakes, rice, water and other offerings to the Buddhhas and the other gods. Sacred sentences, the best known of which is the om mani padme hum, or "Jewel-lotus" formula, are repeated in private devotion with the aid of a rosary or, when printed on paper together with mystic diagrams, are inserted in the well-known praying wheels or used as flags. Sorcery and magic are in high repute, even among the members of the reformed Yellow-hat sect, who possess an official oracle, and astrologers are often consulted. There are many religious festivals, the greatest being the feast of the conception of Gautama Buddha in the first month (February), the commemoration of his death in the fourth month, the water festival in the autumn and the festival of Saint Tson-kha-pa in the 10th month. A great mystery-play is enacted toward the close of the year.

General Influence.—While Lamaism in its distinctive features and as it is found in ordinary practice presents itself to the Occidental mind as a form of polytheistic superstition in which the propitiation of fiendish powers is a chief element, the ethical side of early Buddhism and its teachings have an ameliorating influence upon the more enlightened among the people, especially the clergy.

Literature.—The sacred books of Lamaism are the Canon proper, called the "Kah-kyur" or "Kanjur," which is divided into 100 or sometimes 108 bulky volumes, and the Commentaries, the "Tan-kyur" or "Tanjur," containing 225 volumes. The former consists mainly of translations from the Sanskrit of the scriptures of the Mahāyāna school, and of works on the Tantra system, together with a few translations from the Pāli and the Chinese; the latter form a huge collection of theological, exegetical and scientific works partly of Indian and partly of Tibetan origin. Consult analysis of the "Kanjur" made by Csoma Körösi, as translated and augmented by L. Feer in Annales du Musée Guimet (Vol. II, pp. 131-573, 1881). For modern accounts of Lamaism, consult Grünwedel, A., "Mythologie des Buddhismus in Tibet und der Mongolei" (1900); Köppen, C. F., "Die lamaische Hierarchie und Kirche" (1859); Schlagerwielt, E., "Buddhismus in Tibet" (1863); Schulemann, G., "Die Geschichte der Dalailamas" (1911); Waddell, L. A., "The Buddhism of Tibet" (1895).

Charles J. Ogden

LAMAMIAO—LAMAR

LAMAMIAO, China, a town in southeast Mongolia known to natives as Dolonor. It is in the jurisdiction of the province Techilli and is located on the western slopes of the Chingan Range at an altitude of about 4,000 feet. It has an earthen wall, narrow, unclean streets and two large monasteries. Its inhabitants number about 30,000 and it is a large commercial emporium trading with eastern Mongolia, Chinese bartering tobacco, jewelry and arms against cattle, horses and sheep. It is noted for its skilled workers in clocks, bronze and cast iron idols, bells and vases, known all over China.

LAMANSKY, Vladimir Ivanovitch, Russian philologist and historian: b. Saint Petersburg, 1833. He was professor of Slavic languages at the Saint Petersburg University from 1865 to 1890, and belongs to the most enthusiastic and, at the same time, most learned representatives of the Slavophile movement in Russia. He wrote "The Slavs in Asia Minor, Africa and Spain" (1859); "Serbia and the Southern Slav Provinces of Austria" (1864); "Historical Study of the Greco-Slavic World" (Saint Petersburg 1871), in which he advances his theory of the contrast between the Greco-Slavic and the Romano-Germanic World. He works also on the language and literature of the Bulgarians (1869); the literary monuments of the ancient Czechs (1879). In 1884 and later he issued "Secrets d'Etat de Venice," concerning 15th and 16th century documents in the archives of Venice, and (1893) "Three Worlds of the Asiatic-European Continent." He has been, since 1890, editor of the ethnographic periodical Zitra Starina.

LAMAR, la-mär', or LAMAR Y CORTEZAR, la-mär 'e kor-tä-thär', José, Spanish-American general: b. Cuenca, Ecuador, 1778; d. San José, Costa Rica, 11 Oct. 1830. He went to Spain in his youth, and entering the army there fought against the French at Saragossa. He was ordered to Peru in 1815, and was governor of Callao Castle at the time of its surrender, 21 Sept. 1821. He then joined the political lists, and in 1824 became marshal. He was elected President of Peru in 1827; caused the deposition of Sucre, President of Bolivia; provoked a war with Colombia, in which he was defeated, and on 29 June 1829 was deposed by his own officers and exiled.

LAMAR, la-mär, Lucius Quintus Cincinnatus, American jurist: b. Eatonton, Putnam County, Ga., 1 Sept. 1825; d. Macon, Ga., 23 Jan. 1893. He was graduated from Emory Col
LAMAR — LAMARCK

le (Oxford, Ga.), studied law at Macon, was admitted to the bar in 1847, removed in 1849 to Oxford, Miss., was there professor of mathematics in the University of Mississippi (1850-52), in 1852-55 practised at Covington, Ga., was elected to the Georgia legislature in 1853, and having returned in 1855 to Mississippi, was therein re-elected in Congress in 1857 and 1859. In 1860 he resigned his seat in Congress; drafted Mississippi's ordinance of secession; and was a member of the State convention that passed it (9 Jan. 1861). Chosen lieutenant-colonel of the first Confederate regiment organized in Mississippi, serving with his regiment at Yorktown and Williamsburg, he resigned from military service in October 1862, and in 1863-64 was in Europe, whither he had gone as commissioner to Russia, though he did not proceed to his post. From December 1864, until the close of the war, he was judge-advocate of the military court of the 3d Army Corps with the rank of colonel. After the war he held the chairs of ethics and metaphysics (1865-70) and of law (1867-70) in the University of Mississippi, and resigned when the Republicans secured control of the university upon the readmission of the State into the Union. He was a representative in Congress (1873-77) and a United States senator (1877-85); and Secretary of the Interior in President Cleveland's Cabinet (1885-88). From 1888 he was an associate justice of the United States Supreme Court. He bent his efforts to bring about a reconciliation and a better understanding between the South and the North. On 27 April 1874 he introduced before the House a resolution deploring the conduct of Charles Sumner, highly praised for its eloquence and generally for its liberal tone, but so displeasing in that respect to many of his constituents that they endeavored to defeat his re-election. His strong opposition to the debasement or inflation of the national currency caused the Mississippi legislature formally to direct him to renounce either his views or his seat in the Senate, both of which he declined to do. He was re-elected to the Senate by an increased majority. His oration at the dedication of the monument to John C. Calhoun at Charleston, S. C. (1887), was one of the best of his public addresses. Consult the study by Mayes, including Lamar's speeches (Nashville, Tenn., 1896).

LAMAR, Mirabeau Buonaparte, American politician, second President of the republic of Texas: b. Louisville, Ga., 16 Aug. 1798; d. Richmond, Tex., 19 Dec. 1859. After being employed a number of years in mercantile business and farming, he established in 1828 the Columbus Inquirer, a journal devoted to the defense of State rights, and was actively engaged in politics until his removal in 1835 to Texas. Arriving there at the outbreak of the revolution, he at once sided with the party in favor of independence, and participated in the battle of San Jacinto to the success of which the charge of the cavalry under his command greatly contributed. He was soon after called into the Cabinet as Attorney-General, a position which he subsequently exchanged for that of Secretary of War. In 1836 he was elected the first President of the young republic, and the months previous held the rank of major-general in the army. In 1838 he was elected President, in which office he remained until 1841. During his term of office Texas was formally recognized as an independent republic by the principal powers of Europe. He founded the educational system, advocating the grant of three leagues of land to each county for the maintenance of an academy, and 50 leagues for two universities. Upon the breaking out of the war between Mexico and the United States in 1846, he joined General Taylor at Matamoros, and fought at the battle of Monterrey. He subsequently stationed himself with an armed force at Laredo, where for two years he was engaged in constant conflicts with the Comanches, whose depredations on the frontier he greatly curtailed. He was appointed United States Minister to Argentina in 1857, but did not go to his post. The last public position which he held was that of United States Minister to Nicaragua and Costa Rica, from which he had but lately returned when he died. He published "Verse Memorials" (1857).

LAMAR, Mo., city and county-seat of Bar- ton County, on the Spring River and the Missouri Pacific railroad, 39 miles north of Joplin. Lamar College is located here. There is a public-school library and courthouse. The city has extensive coal mining and lumbering interests and is the centre of a large agricultural district. It has a large flour trade. The city owns a waterworks and electric-lighting plants. The population is about 2,316.

LAMARCK, łaˈmærk/, Jean Baptiste Pierre Antoine de Monet, Chevalier de, French scientist, a pre-Darwinian evolutionist: b. Bazentin, Picardy, 1 Aug. 1744; d. Paris, 18 Dec. 1829. He was of noble family, entered the army in 1760, but was compelled on account of an accident to abandon active military service, after which he devoted his attention to study, first to medicine; afterward, after hearing Jussieu's illustrations of botany, he turned to the study of that science. Jussieu had intimated that the old method of classification in botany was defective and Lamarck determined to remedy the deficiency. He labored with great diligence on a treatise in which he corrected the defects of the old classification, and proposed a new one which met with general approval. He then applied his new system to the plants of France, and delivered to the Academy his 'Flore Francaise,' which brought him celebrity and secured his admission to the Academy of Sciences. This work was printed on the recommendation of the Academy, at the expense of the government, for the benefit of the author (1780).

Lamarck now turned his whole attention to botanical research, and made several excursions to Auvergne, and into Germany, in the last of which he was accompanied by the son of Buffon. On his return to Paris he undertook the botanical department of the encyclopedia which Panckouyst undertook and failed in this task with such assiduity that, in 1783, he produced the first half of the first volume, with an introduction containing a sketch of the history of the science. He published the second volume in 1788. But a dispute between him and the publisher brought the unfortunate to a stand, and ended Lamarck's botanical career. At the breaking out of the Revolution
L. Q. C. LAMAR

Late Justice of the United States Supreme Court
he was the second professor of the royal Jardin des Plantes, but in consequence of new arrangements he received a chair in the department of zoology, in which he was soon as much distinguished as he had been in botany. In his writings he shows himself a real forerunner of Darwin. Lamarck's comprehensive mind was also directed toward physics, on which he published several works. He published also a report annually on meteorology and weather predictions. His 'Hydrogéologie' was published in 1805.

Lamarck is the founder of invertebrate paleontology. The most permanently important work of his is 'Philosophie Zoologique' (1809), although at the time it was published it excited little attention. He was doubtless familiar with Erasmus Darwin's 'Loves of the Plants,' which in spite of its many absurdities contained some premonitions of the great discoveries to be made by the author's greater grandson, Charles Darwin. The essence of Lamarck's views was contained in the following propositions: (1) Every considerable and sustained change in the conditions of life produces a real change in the needs of the animals involved; (2) change of needs involves new habits; (3) altered function evokes change of structure, for parts formerly less used become with increased exercise more highly developed, other organs in default of use deteriorate and finally disappear, while new parts gradually arise in the organism by its own efforts from within (efforts de son sentiment intérieur); (4) gains or losses due to use or disuse are transmitted from parents to offspring. The main point is of course contained in the last proposition, which is controverted by Darwin and Weismann and their adherents in England and Germany. There is, however, a Lamarckian school of considerable influence in Paris, and the Neo-Lamarckians of the United States, including Cope, Hyatt and Packard, have much to support their 'laws of growth' as involving the inherited effects of use and disuse of environments. See Darwin: Evolution; Heredity.

Lamarckism, lə-mɑrkˈkizm. The theory of organic evolution which, in brief, accounts for the origin of life-forms by change of environment, the exercise or use, and the disuse of organs, and the transmission of characteristics acquired during the lifetime of the individual. It differs from Darwinism in lacking the principle of natural selection.

History of the Rise of the Theory.—Lamarck in 1801, after 25 years' experience as a botanist, and when as a systematic zoologist he had devoted 10 years of labor in classifying the invertebrate animals of the Paris Museum, then the most extensive zoological collection in the world, published a lecture delivered in 1800, in which he claimed that time without limit and favorable conditions of life are the two principal means or factors in the production of plants and animals. Under the head of favorable conditions he enumerates variations in climate, temperature, change of habits, variation in means of living, of preservation of life, of means of defense, and varying modes of reproduction. As the result of the action of these different agencies or factors, the faculties of animals, developed and strengthened by use, become diversified by the formation of new habits, and by slow degrees the new structures and organs thus arising become preserved and transmitted by heredity. Although Lamarck did not discover the principle of natural selection, he recognized the fact of competition, of a struggle for existence, but did not dwell on the extent that Darwin and later observers did. In 1802, 1803 and 1806 he reiterated and somewhat extended these views, which were published in final form in 1809, in his 'Philosophie Zoologique,' and again, in 1815, in the introduction to his 'Animaux sans Vertébres.' By this time Lamarck had become the greatest zoologist of the period between Linné and Cuvier. He was expert in detecting the limits between species, and has given us the best definition extant of a species.

Lamarck's Factors of Organic Evolution.—These in their essential form are contained in his famous two laws:

First Law.—In every animal which has not exceeded the term of its development, the more frequent and sustained use of any organ gradually strengthens this organ, develops and enlarges it, and gives it a strength proportioned to the length of time of such use; while the constant lack of use of such an organ imperceptibly weakens it, causes it to become reduced, progressively diminishes its faculties and ends in its disappearance.

Second Law.—Everything which nature has caused individuals to acquire or lose by the influence of the circumstances to which their race may be for a long time exposed, and consequently by the influence of the predominant use of such an organ, or by that of the constant lack of use of such part, it preserves by heredity (génération) and passes on to the new individuals which descend from it, so that the changes thus acquired are common to both sexes, or to those which have given origin to these new individuals.

Lamarck also insisted that animals are modified in accordance with the diversity of their surroundings; that local causes, such as differences in soil, climate, etc., give rise to variations and that the whole surface of the earth affords a diversity in localities and habits, one region differing from another, that though the environment remains the same for a long time and species remain constant for that period, yet there is a slow gradual change, and species are modified in adaptation to such changes. More over such changes induce alterations in the wants or needs of animals: this necessitates other movements or actions to satisfy the new needs, and hence they give origin to new habits, and this leads to the use or exercise of some organ or organs in a new direction, with the result that different parts or organs are modified in adaptation to the new surroundings and the necessities of existence are thus fulfilled. We now know that by geographical changes or from lack of food animals are compelled to migrate into new regions, and are there obliged to adopt new habits and become transformed into new species or types. Thus
whales have descended from terrestrial forms; the baleen whale has in its embryo stage rudimentary teeth showing that it is a descendant of toothed whales. Lamarré refers to Geoffreys discovery in embryo birds of the groove with which the teeth develop, and subsequently fossil birds with teeth were unearthed. The mole with its functionless eyes, due to underground life, the blind Proteus of Austrian caves, the headless and eyeless bivalve mollusks, these parts lost by disuse; the evolution by atrophy of the limbs of the snakes due to their lack of use in passing through narrow places; wingless insects whose wings have been lost by disuse; the webs between the toes of ducks, geese, as well as those in the feet of the frogs, sea turtles, otter and beaver, are mentioned by Lamarré as examples of the effect of use and exercise. Other examples of use results are the origin of horns in ruminants; the long neck of the giraffe, which by the absence of herbage was obliged to browse on the foliage of trees *and to make continual efforts to reach it*; the carnivores, of the kangaroo and of the sloth which are accounted for by the necessity of their adopting new habits, and, by exercise in new directions, becoming adapted to the new conditions of life. Although Lamarré gave few illustrations, it may be doubted whether any one has since his day more satisfactorily explained the origin of such forms or modifications. Lamarré also accounts for the origin of man, suggesting in a tentative way his rise from an arboreal or ape-like creature, with a detailed hypothesis of the gradual process of his transformation, into a being with an upright posture, an enlarged brain, powers of reason and other human qualities. But besides these special cases Lamarré was broad and comprehensive in his views of nature and creation. He was the first to show that the animal series was not a continuous chain of being, but rather should be compared to a tree, with its branches. In fact he was the first to construct a genealogical tree, the first attempt at a phylogeny of the animal world. He demanded unlimited time for the process of evolution. He anticipated the uniformitarian views of Lyell. He pointed out that where, as in Egypt, the climatic conditions have remained the same for many centuries, species have remained constant, but that under a varying environment they become modified. He writes of the struggle for existence; shows that the stronger devour the weaker; he refers to the principle of competition in the case of the sloth. He repeatedly insists on the fact that vestigial structures are the remains of organs which were actively used by the ancestors of existing forms. He shows, what is much insisted on at the present day, that change of functions in organs leads to their transformation or recreation, and that the assumption of new habits precede the origin of new, or the modification of organs already formed. A great deal is now said of the effects of migration and consequent geographical isolation in the origination of new species; Lamarré invoked this factor in the case of man, and he also pointed out the swamping effects of intercrossing. Lamarré's theory of use-inheritance is denied by some, but by others is regarded as an important factor in evolution. He does not, however, refer to the inheritance of mutilations, etc.

All these views lie at the foundation of the theory of organic evolution; yet Lamarré's opinions were set aside, misunderstood and ridiculed; unscientific hypotheses were mingled with them. In his time the sciences of palaeontology, embryology and bionomics were undeveloped. Lamarré collected but few facts, and he lacked the experimental skill of Darwin; so that it was reserved till the last half of the century later, to convert the world to a belief in evolution. At present, however, it is acknowledged that Lamarckism affords the fundamental principles on which rests the theory of organic evolution, and many of the most eminent naturalists have worked and are working along Lamarckian lines.

Elliot's translation of the 17th and 18th volumes of the Zoologique' (New York 1914); Spencer, H., 'Factors of Organic Evolution' (New York 1885); Cope, 'The Primary Factors of Organic Evolution' (Chicago 1886); Hutton, 'Darwinism and Lamarckism: Old and New' (London 1909).

Alpheus S. Packard, Late Professor of Zoology, Brown University.

LAMARTINE, lá-mär-tén, Alphonse Marie Louis de Prat de, French poet and statesman; b. Mâcon, Burgundy, 21 Oct. 1790; d. 22 Feb. 1869. He came of well-to-do parents of royalist sympathies. His father was imprisoned during the Terror. He was educated first by his mother, then, after a brief period at Lyons, by the Fères de la Foi at Berry (1805-09). He then passed two years at home, reading poetry and romance, and was in Italy from 1811 to 1813. At the Restoration he entered the Gardes du Corps. The Hundred Days of Napoleon's return he passed in Switzerland and Aix-en-Savoie. Here a love affair with a girl who died soon after opened a copious and touchingly poetical vein. At Waterloo he returned to France, revisited Switzerland, Savoy and Italy in 1818-19, and in 1820 published his first book, the much admired Méditations. Soon after he left the army for the diplomatic service, was made secretary of the embassy at Naples and married a congenial, wealthy and beautiful English lady, Marianne Birch. Nouvelles Méditations followed in 1824, with a transfer to Florence and the Cross of the Legion of Honor from Charles X in return for a laudatory poem. In 1829 came Les Harmonies, with a mission to Saxe-Coburg and election to the Academy. The Revolution of 1830 terminated his diplomatic career. He entered politics, was defeated in the elections of 1832, made a journey to Palestine, of which he told in Voyage en Orient (1835), was chosen deputy in his absence, and soon gained repute as a steady speaker and effective orator, becoming steadily more democratic in his political sympathies. Jocelyn (1836), La Chute d'un Ange (1838), two fragments of a would-be epic of the human soul, and Recueilllements (1839) contain his last significant poetry. The Histoire des Girondins (1847) was less a history than a vaguely
declaratory invitation to the revolution of February 1848, in which Lamartine had a prominent part, being Minister of Foreign Affairs in the provisional government, a member of the Constituent Assembly by concurrent election in 10 departments, and one of its executive committee. His own strong repudiation of routine, joined to the futility of his colleagues' and the unreason of the mob, led to the conspicuous failure of his efforts to govern by speeches and reconcile the middle class to democracy. In June he yielded to Cavaignac and got a brief but not a nominated term of office. He edited his own complete works in 41 volumes, 1858-63. A pension, tardy recognition of his sacrifices and his deeds was accorded him in 1867. Amiable, vain, fond of pose, pictureously sentimental, fatally fluent alike with tongue and pen, with a habit of inaccuracy and rhetorical embellishment, without well-grounded political convictions, Lamartine's best titles to remembrance are the poems of his early years. (See MONTAIGNE.) Consult Brunerie, 'Evolution de la Poésie lyrique' (Vol. I, 107 ff.); Sainte-Beuve, 'Portraits contemporains' (Vol. I, 190 ff.); Deschanel, 'Lamartine' (Paris 1893); Doumic, R., 'Lettres d'Elvire à Lamartine' (ib. 1895); Séché, L., 'Études d'histoire romantique: Lamartine de 1816 à 1830' (ib. 1911); Delamare, 'Les amitiés de Lamartine' (ib. 1911); Lacretelle, P. de, 'Les origines et la jeunesse de Lamartine' (ib. 1911); Clouzet, G., 'Lamartine' (ib. 1912); Sachs, E., 'Les idées sociales de Lamartine' (ib. 1915). There are translations of the 'Girondists,' 'The French Revolution' and 'La Restauration,' of 'Graziella' and the 'Stone Mason of Saint Point,' and of 'Reaper.' There are school editions of 'Columbus,' 'Jeanne d'Arc' and 'Cromwell' and of excerpts from the 'French Revolution.'

Benjamin W. Wells,
Author of 'Modern French Literature.'

LAMB, Charles, English poet, critic and essayist, b. The Temple, London, 10 Feb. 1775; d. Edmonton, England, 27 Dec. 1834. Lamb was the youngest of three surviving children, among seven, of John Lamb, a clerk in the Inner Temple, and Elizabeth [Field] Lamb. Both parents were of humble and rural origin. Charles passed the first seven years of his life in the Temple, where he received some instruction, and in 1782 went to Christ's Hospital, where he remained the next seven years. Here he met his life-long friend and counsellor, S. T. Coleridge (q.v.). Lamb was known as a gentle and sensitive boy, whom brusqueness and sensitiveness were increased by a trick of stammering, of which he never succeeded in completely ridding himself. Aside from these traits, there is to be noted the strain of mania in Lamb's family which in the boy expresses itself as excitability and nervousness. Other important determinants in Lamb's career were the influence of Coleridge, which tended to develop thoughtfulness and a love of poetry, his own liking for early English authors, particularly the Elizabethans, and his genuine and un- failing delight in the life of the city. Though a fair scholar at school, Lamb was really more of a reader, and his reading had a great effect on his literary career and the quality of his work.

Shortly after leaving Christ's Hospital, Lamb entered the South Sea House. In 1791 he got a clerkship in the East India Company at £70 and there remained, with gradual increase in salary, until he was retired in 1825, on a pension of £441. From the time he entered business to his death, his life was singularly uneventful. The critical year, 1795-96, was marked by his father's falling into imbecility, his own solitary attack of mania, and (September 1796) his sister's stabbing of their mother in a fit of insanity. The nature of the hereditary complaint and his sister's need of a guardian determined his mode of life. He turned his back on an inchoate love affair, put aside all thought of marriage and devoted himself to his sister, as she to him in her sane moments. In 1797, on the death of their father, the two began their long life in London, unbroken except for one short trip to Paris. In the period their local home was changed but six times.

Lamb began his literary career in 1797 by the addition of three sonnets to a volume of Coleridge's. His poetical production was small; altogether during the course of his life his known poems number about 110, of which the best known are 'The Old Familiar Faces,' 'Hester' and 'On an Infant Dying as Soon as Born.' In 1798 he wrote 'Rosamond Gray and Old Blind Margaret,' a prose tale of sentiment. Though praised by Shelley and others for a charm that it undoubtedly possesses, the story, as a composition, is very incoherent and shows the writer's lack of technical skill. Structural defects equally great, because of lack of adequate motive in characterization, abound in Lamb's next attempt, 'A Wood in the Vil,' a very undramatic ditty which was refused by Kemble in 1799 and published by Lamb in 1802. Nor was Lamb's third attempt at imaginative literature more successful: the farce, 'Mr. H.,' ran one night in 1806 and is probably one of the least dramatic pieces ever put on any stage. The truth of the matter is that Lamb had very little constructive ability in narrative and dramatic forms, that his attempts in them were due to the influence of the early dramatists, of whose work he was very fond and whose vogue he did much, later, to restore. His liking for them rested on their poetry rather than their dramatic ability.

In the next kind of work that he took up, Lamb had much better success. These were stories retold and they stand in three chief volumes, 'Mrs. Leicester's School,' 'Tales from Shakspeare' (1807), and 'Adventures of Ulysses' (1808), in many of which his sister was his coworker. Lamb had here his material made for him and, therefore, his own quality was less trammeled. The 'Tales from Shakspeare,' of which Charles wrote the tragedies and 'Mary the comedies,
quickly went into a second edition and has since become an English classic of a minor order. The stories are retold with much simplicity and with a very happy emphasis on the characters and the comic incidents. Besides the Tales of Criticism, but proportionately given to the under-plots. Next to the ‘Essays of Elia’ the ‘Tales’ are Lamb’s best-known work.

In 1808 Lamb entered the field of criticism, and for the next decade his published writings indicate that his thoughts were, broadly, of a critical nature. His chief motive for this change seems to have been his desire to express in the form of commentary the admiration for the early writers which he had expressed, by imitation, in his own dramas, and, by transcript, in such works as the ‘Tales.’ In 1808 appeared his ‘Specimens of English Dramatic Poets Contemporary with Shakspeare,’ with his valuable notes thereon. Other important essays are ‘On the Tragedies of Shakspere’ and ‘On the Genius and Character of Hogarth,’ both of which appeared in Leigh Hunt’s ‘Reflector’ in 1811, an essay on Wordsworth’s ‘Excursion’ in the Quarterly in 1814, and ‘On the Poetical Works of George Wither’ published in the collected works of Lamb, issued in 1818. There are also a few minor pieces of criticism, but the amount of Lamb’s critical work is exceedingly small in view of his high reputation, and its form is fragmentary. Its place is probably due to the fact that Lamb did very much to restore to their rightful heritage those old writers from whom he drew much of his own inspiration and to the fact that, in an age of critical dogmatism, Lamb insists constantly, though not always with an eye to logic or historical fact, on broad appreciation.

Lamb’s fame rests chiefly on the next important work, or rather kind of work, which he attempted. Having practically failed in creative narrative and drama and having achieved only a moderate contemporaneous success in fields of retold stories and criticism and poetry, he turned his attention to the literary essay and found it a proper vehicle for his peculiar genius. Lamb had from time to time during his earlier life as well as his later written miscellaneous essays of a quaintly humorous quality, like the ‘Imaginary Conveniences of Being Hanged’ (1811) and ‘The melancholy of Tailors’ (1814), but the idea of regularly using the essay form did not occur to him until the famous ‘Essays of Elia.’ These were published as books in two series, in 1823 and in 1833, but they originally appeared in the London Magazine. For the first two or three years, from August 1820 to December 1822, they were published almost every month; after that they came out at irregular intervals until 1833. Of the 71 essays and 16 ‘Popular Fallacies’ in the two series only about 14 are really well known; of these ‘Imperfect Sympathies’ and ‘A Dissertation on Roast Pig’ are probably the most famous, though such essays as ‘The South Sea House,’ ‘Mr. Babb’s Opinions on Whist,’ ‘Dissertation on Tobacco’ and ‘My Relations’ are scarcely less well known and in no wise inferior. The essays have, in the main, come to be regarded as the best examples of the personal essay that English literature possesses. Certainly no English essays more completely reveal the personality of the author or reveal it in more winning terms. They are renowned for their quaintness, their wit, their sympathy, their humor, their serenity and their reverence.

Between Lamb’s retirement in 1825 and his death, his work in literature was of a miscellaneous character. A few essays of the Elia type and some miscellaneous pieces of criticism, and a wholly undramatic and unsuccessful drama, ‘The Wife’s Trial, or, The Intruding Widow,’ are about all that he produced after he ‘came home forever.’ See Essays of Elia.

Bibliography.—The best edition of Lamb’s works is that by Canon Alfred Ainger, in six volumes. This does not include the ‘Specimens,’ which are most conveniently to be had in the Bohn Library. A full bibliography of Lamb’s writing is to be found in B. E. Martin’s ‘In the Footprints of Charles Lamb’ (New York 1890). Canon Ainger’s ‘Life,’ in the English Men of Letters, is the most convenient biography of Lamb; it contains a short but excellent bibliography of the contemporary writers from whom we gain our knowledge of the author. To his list of titles may be added De Quincey’s ‘Recollections of Charles Lamb.’ Of the many essays on the subject, that of Pater, in ‘Appreciations,’ is probably the nearest to finality.

WILLIAM T. BREWSTER,
Professor of English, Columbia University.

LAMB, Charles Rollinson, American architect and artist: b. New York. He established a high reputation for talented ecclesiastical architecture and decoration in his partnership with his brother Frederick as proprietors of the J. & R. Lamb Corporation. He designed the Dewey Arch erected at Madison Square (1889) for the triumphal procession after the Spanish War, and the Court of Honor erected for the Hudson–Fulton Celebration (1909) was from his designs. He was president of the Art Students' League and of the Municipal Art Society and is trustee for numerous art associations.

LAMB, Daniel Smith, American physician: b. Philadelphia, 29 May 1843. He took his M.D. at Georgetown University in 1867. He volunteered in the United States army in 1861 and was on duty in military hospitals throughout the war. He was acting assistant surgeon at the Army Medical Museum in 1868–92 and since 1892 has been pathologist there. He has been professor of materia medica and then anatomy at Howard University since 1873; and was professor of general pathology at the United States College of Veterinary Surgeons in 1894–1909. He conducted the autopsy on President Garfield. He edited the Medical Annals, has written numerous monographs on medical, sanitary and anthropological subjects and is author of ‘History of the Medical Department, Howard University, Washington’ (1900).

LAMB, Horace, English mathematician and physicist: b. Stockport, England, 27 Nov. 1494. He was educated at Owens College, Manchester, and at Trinity College, Cambridge, where he was Fellow and assistant tutor in 1872–75. He was professor of mathematics at the University of Adelaide, Australia, in 1875–85; and since 1885 has been professor of mathematics at Owens College and the University of Man-
HAM — LAMBALLE

671

chester. He was elected a Fellow of the Royal Society in 1854, was royal medalist in 1902 and in 1909-10 he served as vice-president of the society. As an exponent of mathematical physics he is the author of 'Motion of Fluids' (1878); 'Hydrodynamics' (1895; 2d ed., 1906); 'Infinitesimal Calculus' (1897; 3d ed., 1907); 'Dynamic Theory of Sound' (1910); 'Statics' (1912); 'Dynamics' (1914).

LAMB, John, American soldier: b. New York City, Jan. 1, 1737; d. May 31, 1800. He at first worked in New York with the elder Lamb in the trade of optician and mathematical instrument maker, but in 1760 entered the liquor trade. He was one of the "Sons of Liberty" (q.v.) and active in all the early Revolutionary scenes in New York. He supported the resistance of the colonies to the "Stamp Act" and subsequently went to Philadelphia to urge a firm stand against any further oppression. Commissioned captain of artillery in 1775, he was authorized by Congress to remove the cannon from the Battery in New York on 23 August of that year; he subsequently took part in Montgomery's expedition against Quebec, where he was wounded and made prisoner. Later he rose to be colonel and at the time of Benedict Arnold's treason commanded at West Point. After the Revolution he was elected to the State legislature of New York, and for some years previous to his death held the post of customs collector of New York port. Consult the biography by Leake (Albany 1857).

LAMB, Martha Joan Reade Nash, American historian: b. Plainfield, Mass., 13 Aug. 1820; d. New York, 2 Jan. 1893. She was married to Charles A. Lamb in 1852 and removed with him to Chicago, III., where in 1863 she was secretary to the United States Sanitary Commission Fair. She made her home in New York from 1866 and was editor of the Magazine of American History from 1883 till her death. Her publications include a scholarly 'History of the City of New York' (1877-81); 'The Homes of America' (1879); 'Wall Street in History' (1883); 'The Christmas Owl' (1881); 'Snow and Sunshine' (1882).

LAMB, Mary Ann, a sister of Charles Lamb (q.v.).

LAMB in ART. In the ancient Christian art of the Catacombs we find the lamb figuring as emblem of the Redeemer as early as the 3d century, though rarely, later to become quite commonly used to represent Christ, and referring to the mention by Saint John the Evangelist and the Jewish Paschal lamb. Some early depictions have an accompanying shepherd's staff, later the Good Shepherd appears. Early in the 4th century we find the symbols of the cross and nimbus, to be followed later by the cross and banner of the Agnus Dei that has continued to this day. And easily representation met with is that of Christ, in the form of a lamb, standing on a mount, from which four streams flow, typifying the four Evangelists. Other pictures give the Savior in human form with a lamb by His side and surrounded by 12 other lambs, symbols of the 12 Apostles. But the primitive Christians used the lamb or sheep as symbol of other Old and New Testament personages; as instances are those where it represents Moses, Saint John the Baptist, the Apostles. In fact the Apostles are found represented by a lamb constantly in the Catacomb frescoes, ancient sarcophagi and ancient mosaic. The lamb has been used as symbolic of the 12 tribes of Israel. It is generally conceded in ecclesiastical art that when more than 12 lambs are presented they refer to the faithful. Entire Biblical scenes have been depicted in which the sacred personages perform the miracles of Agnus Dei, the form of lambs. Illustrations which depict the lamb of the Apocalypse represent the symbol, with seven horns and seven eyes, breaking the seven seals of the mysterious book. It is often seen surrounded by wings with the four Evangelists depicted at the extremities; several sepulchral brasses display this composition. Ancient pictures portray the lamb performing numerous acts, such as raising Lazarus from the dead, multiplying the loaves in the wilderness, crossing the Red Sea. It is also found being baptized in the Jordan, standing at the foot of the cross, lying slain upon an altar, shedding blood from its breast into a chalice, blood pouring in four streams from its feet. In such cases the lamb is depicted also carrying a cross. Early mosaics and frescoes show the lamb lying on a throne surmounted by a cross. The lamb pictured on chasubles and altar frontals is often lying, as if dead, upon the Book with the seven seals, also as holding, while standing, the banner of the Resurrection with the foot sole or the rear foot. In this action it has been accepted as the heraldic insignia of several towns, noble families and societies. Artists in depicting the Agnus Dei have generally accepted the following rules: The lamb's body is white. The head is surrounded with a nimbus of gold containing a red cross; the banner, depending from the traverse of a reclining cross, has a white field, red at the base point and a red cross in centre. The whole is usually enclosed either in a circle or quatrefoil with field of gold. In the Christi gules (red). As an attribute in ecclesiastical art the lamb is found accompanying Saint Agnes, Saint Genevieve, Saint Catherine and Saint Regina. Saint John is frequently depicted carrying a lamb or accompanied by the Paschal lamb, and buildings dedicated to this purpose show the lamb as decorative motif. In some pictures and statuary the lamb appears as symbol of the virtues the person represented was noted for, such as Innocence, Meekness, Patience, Purity.

CLEMENT W. COTUMBE.

LAMBALLE, lâm'bäl', Marie Thérèse Louise de Savoie-Carignano, PRINCESSE DE, French-Italian princess, friend of Marie Antoinette: b. Turin, 8 Sept. 1749; d. Paris, 3 Sept. 1792. She was the fourth daughter of Prince Louis Victor of Carignano and in 1767 was married to Prince de Lamballe who died in the following year. Upon the marriage of Marie Antoinette the princess returned to court and was accorded the favor of the royal lady, to whom her gentleness, and submissiveness greatly appealed. They became close friends and upon Louis XVI's accession to the throne the queen made her superintendent of the royal household. The Comtesse de Polignac superseded her in 1776-83, when the queen sought a rec-
LAMBAYEQUE—LAMBERT

Oscillation and resumed their former intimacy. The salon of the princess was used by the queen as a sort of headquarters for her various intrigues, and as this became known the populace believed her to be the responsible party and hated her accordingly. When, after the Revolution, the royal family, in 1791, attempted to escape the princess made her way to England to appeal for aid for her royal friends. She returned to the Tuileries in November of that year and was permitted to share the queen's imprisonment in the Temple from 10 August until 19 August, when she was removed to La Force. On 3 September she was brought before the tribunal and commanded to take an oath against the king. Upon her refusal she was turned over to the mob, which tore her in pieces and bore her head on a pike before the windows of the queen in the Temple. Selections from her letters were published in Volume XXXIX, 'La Revolution Francaise', Consult Berin, Sir George, 'Madame de Lamballe' (Paris 1888); Lescure, Comte de, 'La Princesse de Lamballe' (1864); Hardy, B. C., 'The Princesse de Lamballe' (1908).

LAMBAYEQUE, lámbá-yá'ká, Peru, capital of the maritime department of the same name, which was created in 1874. It is situated on the Lambayeque River, about six miles from the Pacific Ocean, the outlet for its trade being the ports of Eten and Pimentel, with which it has railway connection. Cotton and woolen fabrics are manufactured on a small scale. Its inhabitants, mainly of mixed blood, are estimated at 8,000. The department of Lambayeque, lying between the Pacific and the department of Piura, Cajamarca and Liberdad, has an area of only 4,614 square miles, is, set along the river valleys where irrigation is possible, but contains some fertile lands which produce good crops of cotton, rice, tobacco and sugar-cane, and there is good pastureage in the uplands. The total population of the department is estimated to be 127,000. Capital, Chiclayo.

LAMBEAUX, lá'bo, Jef (Joseph Marie Thomas), Belgian sculptor: b. Anwerp, 1852; d. 6 June 1908. He studied at the Antwerp Academy of Fine Arts and under Jean Geefs. His first production, 'War', was exhibited in 1871, but owing to financial diffculties his work for some years was confined to profitable humorous subjects. He then went to Paris to study, and in 1881 executed his masterpiece, 'The Kiss', which is in the Antwerp Museum. He later studied in Italy where the work of Jean Boulogne greatly impressed him, although his style undoubtedly formed by the Flemish masters. His fountain at Antwerp (1886) is a fine example of his work, and among other famous pieces are 'Robbing the Eagle's Eyrie' (1890); 'The Bitten Faun' (1905), and a colossal marble bas-relief, 'The Human Passions'.

LAMBECHA, lám'běk, or LAMBECCIUSS, Peter, German scholar: b. Hamburg, 13 April 1628; d. Vienna, 7 April 1680. He studied at Hamburg, Amsterdam, Paris and Rome, was teacher of history in the gymnasium at Hamburg from about 1650 to 1662 when he became rector. In 1662 he was converted to the Roman Catholic faith and went to Vienna, where in 1665 he was installed as librarian of the Imperial Library. His most valuable works are 'Commentarii de Bibliotheca Caesarina Vindobonensi' (8 vols., Vienna 1665—67), and the 'Prodromus omnium of the unfinished 'Historia Literaria' (1710).

LAMBERT, Alexander, American pianist: b. Warsaw, Poland, 1 Nov. 1862. He studied in early life with his father, and on the advice of Rubinstein was sent to the conservatory at Vienna, where he graduated in 1880. In 1881 he gave a series of concerts in New York, which he repeated the next season through Germany and Russia. After studying for a while under Liszt he returned (1884) to the United States, and from 1888 to 1906 was director of the New York College of Music when he resigned in order to devote his entire time to private teaching. He is author of many compositions, but is best known as a successful teacher. He has written 'Systematic Course of Studies' (6 vols., 1892), and 'Piano Method for Beginners' (1907), which is in use in every part of the United States.

LAMBERT, Daniel, English citizen famed for his unusual corpulence: b. London, 3 March 1770; d. 21 July 1800. Up to his 19th year he gave no indications of the remarkable stoutness which he afterward attained, being an enthusiastic lover of field sports and athletic exercises. He succeeded his father as keeper of the Leicester prison, exchanged an active for a sedentary life, and from this time rapidly increased in size till he became an object of public curiosity and attracted visitors from all parts of the country. He now resolved to turn his obesity to account, and in 1800 commenced an exhibition of himself in Piccadilly, London. He afterward exhibited himself in the principal towns of England. At the period of his death he was 5 feet 11 inches in height, weighed 739 pounds and measured 9 feet 4 inches round the body and 3 feet 1 inch round the leg. In diet he was remarkably abstemious, drank water only and never slept more than eight hours.

LAMBERT, Eugène Louis, French painter: b. Paris, 24 Sept. 1825; d. 1900. He studied under Delacroix and Delaroche and made his début at the Salon in 1847. He is famous chiefly as a painter of cats, the remarkable success of his 'Chat et Femelle' (1857) largely influencing his choice of subjects in later years. He became a member of the Legion of Honour in 1874 and was awarded third medal at the Exposition Universelle in 1878. His work is familiar throughout the United States, and his 'Cat and Kittens' (1870) hangs in the Metropolitan Museum, New York. His 'Family of Cats' (1887) is in the Luxembourg. The charming illustrations for Cherville's 'Chiens et chats' (Paris 1889) are his work.

LAMBERT, Johann Heinrich, yó-tan hin'r lámbert, German mathematician and philosopher: b. Mühlhausen, in Alsace, 26 Aug. 1728; d. Berlin, 25 Sept. 1777. His father was a tailor in humble circumstances, and he was obliged to follow his father's employment. In this situation he spent the greatest part of the night in study and soon acquired a knowledge of mathematics, philosophy and the Oriental languages. At the early age of 19 he discovered
the so-called "Lambert's theorem." He became tutor to the sons of Salis, President of the Swiss Confederation, accompanying his pupils (1756–59) on a continental tour. In 1759 he was released from his duties, and in 1764 Frederick the Great ordered him to Germany to form a committee. He was a member of the Architectural Council and made him a member of the Academy of Sciences. He enriched the transactions of various societies with his papers and treatises, all of which bear the stamp of eminent and original genius. Most of his mathematical papers were collected in three volumes by himself. Philosophy, and especially analytic logic, are greatly indebted to him for his "Neues Organon, or Thoughts on the Examination and Relations of Truth" (1764), and his "Architektonik, or Theory of the First Simple Principles in Philosophical and Mathematical Knowledge" (1771).

LAMBERT, John, English soldier: b. Kirkby Malhamdale, Yorkshire, 7 Nov. 1619; d. 1683. He entered the army and had attained the rank of colonel in 1644, when he fought for the king at the battle of Marston Moor. He assisted Ireton in drawing up the "Heads of the Proposals," in 1647, as a brave, chivalrous and able soldier and the idol of the army, holding a place second only to Cromwell, was generous in his treatment of Royalist prisoners and took no part in the measures leading up to the execution of the king. He accompanied Cromwell into Scotland in 1650, specially distinguished himself at Dunbar and Worcester, and took the lead in the council of officers who gave the Protectorate to Cromwell. He subsequently opposed the Protector and was deprived by Cromwell of all his commissions, though a pension of £2,000 was allowed him for past services. When Richard attempted to assume the Protectorate, Lambert came forward and became the head of the Fifth Monarchy Men, or extreme Republicans. In August 1659 he suppressed a dangerous Royalist rising at Chester, in the same year was member of Parliament for Pontefract, dismissed the "Rump" Parliament, governing with the aid of the Council of Public Safety. In order to detach him from the Commonwealth suggestions were made by Royalists for a marriage between Prince Charles or his brother the Duke of York and his daughter. In 1662 he set out for the north to encounter Monk, but was deserted by his troops, seized and committed to the Tower, whence he soon escaped, again attempted to gather troops and was again arrested. At the Restoration he was excepted from the act of indemnity, brought to trial and condemned in 1662, but his sentence was commuted to banishment to Guernsey, from whence he was removed to Drake's Island, Plymouth Sound.

LAMBERT, John, English traveler: b. about 1775; d. unknown. He visited North America in 1806–09 under the auspices of the Board of Trade, with the object of introducing hemp-raising in Canada in order to render England independent of the hemp of northern Europe, with which supply Napoleon was interfering. This project was unsuccessful, but Lambert remained in America exploring "those parts made glorious by Wolfe and Washington" and studying "the effect of the new government." He published the results of his investigations a year after his return to England. "Travels through Lower Canada and the United States of North America, 1806–08" (3 vols., London 1810). The work is written from a liberal standpoint and ran through three editions. He also edited for the Architectural Council and made him a member of the Academy of Sciences. He enriched the transactions of various societies with his papers and treatises, all of which bear the stamp of eminent and original genius. Most of his mathematical papers were collected in three volumes by himself. Philosophy, and especially analytic logic, are greatly indebted to him for his "Neues Organon, or Thoughts on the Examination and Relations of Truth" (1764), and his "Architektonik, or Theory of the First Simple Principles in Philosophical and Mathematical Knowledge" (1771).

LAMBERT, Louis A., American Roman Catholic clergyman: b. Charleroi, Pa., 13 April 1835; d. 1910. He was educated at Saint Vincent's College, and the archdiocesan seminary, Saint Louis, and was ordained to the priesthood in 1859. He was chaplain in an Illinois regiment during the Civil War, was pastor at Cairo, Ill., 1863–69, and subsequently at Seneca Falls and Waterloo, N. Y.; was professor of modern theology and philosophy at the Paulist Novitiate. He founded the "Catholic Times" in 1874, and was its editor till 1880, and after 1894 was editor-in-chief of the New York "Freeman's Journal." He was involved in a controversy with Robert G. Ingersoll, and his side of the controversy was published in a volume. The bishop of Rochester, Dr. McGuinness, refused to assign Dr. Lambert to a parish in his diocese, but was overruled by the Pope. Thereupon Dr. Lambert was made rector at Scottsville, N. Y., where he remained until his death. He published "Thesaurus Biblius"; "Notes on Ingersoll"; "The Christian Father"; "Tactics of Infidels," etc.

LAMBERT VON HERSFELD, German historian: b. probably Thurinia; d. Benedictine monastery at Hersfeld, 1088. He was finely educated, ordained a priest at Aschaffenburg, and is sometimes spoken of as Lambert of Aschaffenburg or Shafnaburg. He entered the Benedictine monastery at Hersfeld in 1058, and made a pilgrimage to the Holy Land, visiting many monasteries of his order. His fame rests upon his "Annals," a history of the world from its beginning until 1077. Lambert followed the work of other historians until 1046, when he emerged as an independent historian treating familiar contemporaneous history. The work is written in a beautiful Latin and the style is excellent. The writer is definitely antagonistic to Henry IV, whose visit to Canossa is brilliantly described, as is the battle of Hohenburg; and the work, naturally, is strongly in favor of the papacy. Until recently the fairness and accuracy of the "Annals" have been unquestioned. The "Annals" were first published in 1525 in the "Monumenta Germaniae historica." (Band III and V Hanover and Berlin 1826 fol.), and translated into German by Hesse (Leipzig; 2d ed., 1893). He is credited with the authorship of some of the monastery records, and with "Carmen de Bello Saxonicum," edited by Pannenborg (Göttingen 1892), and by Holdegger (Hanover 1894). Conrad Delbruck, H., "Über die Glaubwürdigkeit Lambert von Hersfelds" ("Bonn 1873"), and Potthast, A., in "Bibliotheca Historica" (Berlin 1896).

LAMBERTON, Benjamin Pfefer, American rear-admiral: b. Cumberland County, Pa., 25 Feb. 1844; d. 9 June 1912. He was graduated at the United States Naval Academy in 1864 and was assigned to the United States steamer "America" for service during the remainder of
the Civil War. He was regularly promoted and at the outbreak of the Spanish-American War was chief of staff for Admiral Dewey. After the battle of Manila Bay he was advanced in rank seven numbers for "eminence and conspicuous conduct." He commanded Admiral Dewey's flagship, United States steamer Olympia, in 1898-99, served on the naval retiring board in 1900, and on the lighthouse board in 1900-03. He was in command of the South Atlantic squadron in 1903-04 and served at the Naval War College in 1904. He was chairman of the lighthouse board in 1905-06 and was retired 25 Feb. 1906.

LAMBERTON, John Porter, American editor and author: b. Philadelphia, 22 Oct. 1839; d. 26 July 1917. He was graduated from the University of Pennsylvania in 1858 and received degree of A.M. in 1861. He was teacher of classics in several academies (1859-68), but was obliged to retire from this field on account of the impairment of his hearing. Entering upon literary work he was associate editor of the American Supplement to the Encyclopædia Britannica (9th ed.), and assisted in preparing the index to that edition of the Britannica. He was for five years (1891-96) in the editorial department of the J. B. Lippincott Company and revised Worcester's Dictionary and other works of reference published by it. He was managing editor and chief writer of Historic Characters and Famous Events (12 vols., 1896-98) and Literature of All Ages (10 vols., 1898-99). To the series Six Thousand Years of the World's History he contributed Literature of the 19th Century (1900). He prepared an educational work on English Literature (1903); revised and enlarged The Drama of Alfred Bates (1905-07). In 1902 he became an assistant in the library of the University of Pennsylvania.

LAMBERTVILLE, N. J., city in Hunterdon County, on the Delaware River, the Delaware and Raritan Canal and the Pennsylvania Railroad, 16 miles northwest of Trenton. Water power is here furnished for extensive paper mills, rubber works, smoke factories, stone-quarries, flour mills, manufactories of pottery, hairpins, wire novelties and foundry and machine shops. The city was first incorporated in 1849, and a charter of 1864 is governed by a mayor and council elected every two years. The city is located on the site of a ferry on the old route from New York to Philadelphia and was long known as Coryell's Ferry and later as Georgetown. The population is about 4,657.

LAMBERTVILLE, Jean de, chanoine de l'Ien-bœuf, French missionary: b. Paris, 6 Feb. 1714. In 1671, as a member of the Jesuit order and under their direction, he settled in the Iroquois village of Onondaga. He had previously spent three years in Canada, and he now became active in cementing the alliance between the Indians and the French. Meanwhile Governor Dongan of New York was striving every nerve to win over the Iroquois League to the English, but without success. Lamberville, who was chaplain of the French garrison at Forts Frontenac (Kingston) and Niagara, was obliged to abandon his post by the risk he ran when the Iroquois delegates were treacherously seized at Fort Frontenac to which they had repaired on receiving pledges of a peaceful conference (1687). In 1691 he was at Sault Saint Louis. He returned to France in 1692 and for the next 20 years was procuror for the Canadian mission.

LAMBESSA (anc. LAMBESA), Algeria, a village in the department of Constantine, seven miles southeast of Blida and 17 miles west of Timгад. The town owed its ancient importance to a Roman military camp founded there under Hadrian 123-129 A.D. The modern village has an agricultural colony founded in 1848 and a large convict establishment built about 1850. The village is interesting chiefly because of its historical remains. While vandalism has destroyed many of these, those still existing are cared for by the Service des Monuments Historiques. There are triumphal arches erected to Septianus Severus and Commodus; the capitol or temple dedicated to Jupiter, Juno and Minerva, which has a portico of eight columns; a splendid building in the old Roman camp dating from 268 A.D.; cemeteries to the north and east with the stones still standing, although the houses of the town have had their stones removed for building purposes. There are, besides, remains of an amphitheatre, arsenal, baths, residences, an aqueduct, a single standing column of the temple to Asclepius and some fine statues and mosaics. The ruins of the town have yielded many inscriptions, of which Renier edited 1,500 and 4,185 are in the Corpus Inscriptionum Latinae. More than 2,500 of the inscriptions relate to the Roman camp. Consult Renier, D.'Inscriptions romaines de l'Algérie' (Paris 1855); Graham, A., 'Roman Africa' (London 1902); Boissier, 'Roman Africa' (New York 1899); Gsell, S., 'Les Monuments antiques de l'Algérie' (Paris 1901).

LAMBETH, a municipal and parliamentary borough of London, on the right bank of the Thames, in the county of Westminster. Area, 4,480 acres. Lambeth has been famous for its potteries for over 200 years; soap and chemicals are the other chief manufactures. Lambeth Palace has been the official residence of the archbishops of Canterbury since the end of the 12th century, a charter of 1644 was confirmed by the King of England, the so-called Lollard's Tower dates from 1440. The palace contains a fine series of portraits of the archbishops and possesses a magnificent library containing a valuable manuscript collection. Lambeth suspension bridge crosses the river below the palace. Astley's Circus and Vauxhall Gardens, at one time famous resorts, were located here. The borough for parliamentary purposes is divided into four constituencies, each returning one member. Pop. 298,058. Consult Allen, 'History of Lambeth' (1826); Hill, 'Electoral History of the Borough of Lambeth' (1879); Honey, 'Origin and Duties of Overseers of Lambeth for 300 Years' (1900); Tanswell, 'History of Lambeth' (1858).

LAMBETH ARTICLES, in English ecclesiastics, a name given to a statement of certain doctrines of predestination, justification and free-will, drawn up at Lambeth Palace in 1595 by William Whitaker, master of Saint
LAMBETH CONFERENCE — LAMENNAIS

John's College, Cambridge, and other Calvinists. They were approved by Archbishop Whitgift, but disapproved by Queen Elizabeth. Considered, "Calvinist and polemic" (Edinburgh 1911).

LAMBETH CONFERENCE, the name given to periodical assemblages of Anglican bishops at Lambeth Palace, near London, England. The idea of a pan-Anglican conference was first mooted by Bishop Hopkins of Vermont in 1866. It was revived by Bishop Lewis of Ontario during what was called the Colenso schism in 1866. The first conference was summoned by Archbishop Longley in 1867, at which 76 bishops were present. The second conference held in 1878 was attended by 100 bishops. In 1888 there were 145 present, in 1897 194, and 241 in 1908. The conference does not legislate or formulate Church doctrines, but finds profit in discussing serious ecclesiastical problems. The most important practical outcome of the conference has been the publication of what is called the "Lambeth Quadrilateral" as a basis for Christian unity, embracing the scriptures, the Nicene and Apostles' Creed, the two sacraments and the historic episcopate. The conference will continue every 10 years. Consult Davidson, "The Lambeth Conferences of 1867, 1878, and 1888" (London 1899); "Conference of the Bishops of the Anglican Communion" (London 1897, 1908).

LAMBINUS, Dionysius (DENYS LAMBIN), French scholar; b. Montreuil-sur-Mer, Picardy, 1516; d. Paris, September 1572. He was educated at Amiens and in Italy, and from 1561 was professor of Latin and Greek at the College Royal, Paris. His lectures were often interfered with by illness but his fame was secured through his editing of classical authors. His work was characterized by conservatism and profound scholarship and is still in use. His principal editions are "Horace" (1561); "Lucretius" (1564); "Cicero" (1566); "Cornelius Nepos" (1569); "Demosthenes" (1570); "Plautus" (1576). Consult Sandys, "History of Classical Scholarship" (Vol. III, Cambridge 1908).

LAMBBILL, or CALF-KILL. See MOUNTAIN LAUREL.

LAMBROS, lam-brōs, Spyridian, Greek historian; b. Corfu, 21 April 1851. He studied at Athens, Berlin and Leipzig, and in 1882-85 he was inspector of public schools under the Hellenic Ministry of Education. He was appointed professor of ancient history in the University of Athens in 1887 and was rector there in 1903-04. He has made numerous translations of English and German works into Greek; became general secretary of the Committee on Olympic Games in 1903; and edited a Greek periodical, Σφημογραφιώς, dealing with Greek literature in the 19th cent. His publications include "Collection de romans grecs en langue vulgaire et en vers" (1880); "History of Greece" (6 vols., 1868-1908); "Catalogue of the Greek Manuscripts on Mount Athos" (1895-1901); "Aργυροπόλεις" (1909).

LAMBRUSCHINI, lam-brū-skē-nē, Luigi, Italian cardinal; b. Genoa, 16 May 1776; d. Rome, 12 May 1854. At an early age he entered the order of Barnabites; became archbishop of Genoa in 1819; and from 1827 until the revolution in 1830 he was nuncio at Paris. He was created a cardinal 30 Sept. 1831, and in 1836 succeeded Bernetti as Secretary of State under Pius IX. It was a trying period and Lambruschini, although an able man, did little to improve matters. He bitterly opposed modern changes, even to railways and illuminating gas, and was credited with a too liberal use of spies and prisons. He fought valiantly for temporal control; and in the quarrel between the bishop of Cologne and Prussia he wrote the famous allocutions. He was made bishop of Sabina in 1842 and of Porto in 1847. The Roman Revolution of 1848 forced him to flee and eventually he joined Pius IX at Gaeta, returning to Rome with him in 1850. He wrote "OpereSpirituale" (1838); "Sull'immacolato concezione" (1843), etc.

LAMPS' CLUB, The, a club founded in New York, Christmas, 1875, "for the purpose of social recreation and the cultivation of musical, literary and artistic tastes." The club was incorporated 10 May 1877 and is classed on the order of the Lamb's Club of London. It strictly limits its non-professional membership, and while its professional members include musicians, artists and authors it succeeds in maintaining its theatrical traditions. The Lamb's Gambol, an entertainment comprising the notable features of the season's plays presented by the principals, tours the larger cities each spring and is an event of prime importance in the theatrical world. The Gambol's financial receipts paid for the comfortable building which houses the club at 128 West 44th street, New York.

LAMB'S LETTUCE. See CORN-SALAD.

LAMBS' QUARTERS, a roadside 'pigweed' (Chenopodium album). See GOOSEFOOT.

LAMECH, name of two scriptural personages mentioned in the book of Genesis. (1) Descendant of Cain. (2) Son of Methusaleh, and father of Noah, lived 777, and died five years before the Flood.

LAMENNAIS, lām-nē', Hugues Felicite Robert de, French religious and political author; b. Saint Malo, 19 June 1789; d. Paris, 17 Feb. 1854. His father was ennobled in 1788 for public services. His mother died when the boy was five years old, and he was sent to live with his uncle at Dinan. There he found ample opportunity for study in the splendid library of his uncle, where he became steeped in the philosophy of the century. With his elder brother Jean-Marie, he published in 1808 'Reflexions sur l'état de l'Eglise en France pendant le XVIIIème siècle et sur sa situation actuelle,' which caused widespread discussion and was suppressed by the police. In 1809 he entered the priesthood, but it was not until 1816 that he finally accepted ordination at Vannes. In the intervening years, he had written an effective treatise on 'La tradition de l'Institution des évanges en France' in which he advocated the creation of bishops without papal sanction. During the Hundred Days he escaped to England, fearing the Imperial police, and there became familiar with the policies and thought of that country. After his ordination, Lamennais devoted himself with great energy and zeal to the service of the Catholic Church. In 1817 he began the pub-
lication of his monumental work 'Essai sur l'indifférence en matière de religion' (4 vols. 1790; English tr., by Stanley, London 1898). With the fervor of intellectual conviction he advocated a strict restoration of the original Catholic doctrine. He denounced the spirit of individual inquiry which Descartes, Rousseau and Luther had stimulated to the detriment of the church and the state. Politically he favored the submission of temporal to spiritual authority and advocated a form of democracy deriving its power from a theocracy. Pope Leo XII at first approved of his religious philosophy, and invited Lamennais to visit Rome where he was graciously received and offered a place in the Sacred College. He preferred, however, to return to France, where he already had a large following, especially among the younger clergy, and with Chateaubriand he soon became known as a political power. His essays appeared in the Conservateur for a time, but the monarchial tendencies of de Villèle, one of the chief owners of the paper, soon alienated his sympathies, and he began an independent journal, La Drapeau blanc and La Memora Catholique. From 1825-26 he was also occupied with the publication of 'De la religion considérée dans ses rapports avec l'ordre civil et politique.' La Chenaie, Lamennais with a brilliant following, including among its ranks Lacordaire, Gerbet, Rohrbacker, Salmis, de Carné, and later de Guérin, worked enthusiastically for his great reforms. The organ of this group was the journal L'Avenir, which took as its motto, 'Dieu et Liberté,' and the body of active sympathizers and workers for the cause of theocratic democracy was known as the 'Agence générale pour la défense des intérêts catholiques.' The liberal tone of the paper offended a great number of the conservative clergy, and Lamennais resolved to go to Rome to take the matter up with the Pope. Accordingly, he suspended publication, and with Lacordaire set out for the Holy City in 1831 to meet Gregory XVI. They were, to their surprise, personally received by the Pope, who asked them to drop the matter. All obeyed promptly except Lamennais who still hoped for a favorable reception; but when further letters of the Pope indicated clearly his concessions to temporal authority, Lamennais abandoned hope. Shortly after his departure, the encyclical 'Mirari vos' was sent out by Rome in which Gregory formally denounced the theories set forth in L'Avenir and propagated by the 'Agence.' Broken-spirited, the party returned to La Chenaie where, in 1834, Lamennais wrote his stirring answer, 'Les Paroles d'un croyant,' which he sent to Sainte-Beuve for publication. Gregory made reply in the encyclical 'Singulari nos' (1834).

It was not long before Lamennais rallied his followers and began to direct his energy toward the championship of the rights of the people alone. In support of 'la liberté et la humanité' he wrote 'Les Affaires de Rome' (1836); 'Le Livre du peuple' (1837); and 'Le Pays et le gouvernement' (1837), the latter of which he published for a year at Sainte-Pelagie, where he wrote 'Une Voix de prison.' This was followed in 1843 by 'Amschaspands et Darvands,' 'Le Deuil de la Pologne' (1846), and numerous other pamphlets and treatises. In 1844 he collected the articles which had appeared in L'Avenir and published also a remarkable work in three volumes, 'Esquisse de philosophie.' The third volume entitled 'De l'Art et du beau' still remains one of the finest of discussions on aesthetics. He was recognized as one of the leaders of the Liberal Democratic party, and in defense and support of the Revolution of 1848 published Le peuple constituant, which, like a later publication, La Revolution democratique et sociale, was forced to an early death through lack of financial means. He was chosen a member of the Constituent Assembly where he sat with the Extreme Left. His last years were occupied with the translation of Dante's 'Divina Commedia.' He refused to accept a church burial, and was interred without any religious ceremony.

Several volumes of posthumous works and letters have been published by Forgues (1858); H. de Courcy (1862); A. Blaise (1866); by A. du Bois de la Villarabé (1866); and M. A. Roussel (1892). Incomplete collections of his works have been made, one in 10 volumes (Paris 1836-37); and another in 10 volumes (Paris 1844). Consult also Blaise, A., 'Essai biographique sur M. de Lamennais' (1858); Brunetière, F., 'Nouveaux essais sur la litterature contemporaine' (1862); Cabanas, Paul, 'La philosophie de Lamennais' (1890); Renan, E., 'Essais de morale et de critique' (1857); and Sainte-Beuve, 'Portraits Contemporains' (1832) and 'Nouveaux Lunds.'

LAMENTATION FOR THE DEAD.

See FUNERAL RITES.

LAMENTATIONS, Book of. See JEREMIAH, LAMENTATIONS OF.

LAMETH, Ignier, Charles Malo Francois, Count de, French general and politician: b. Paris, 5 Oct. 1757; d. Poutoise, 28 Dec. 1832. He served in the French expeditionary force which aided the American Revolutionists, was aide to Rochambeau and at the battle of Yorktown received serious wounds. He was deputy to the Pope, who asked him to drop the matter. In 1791 he was elected to the National Assembly by the nobility. His opposition to Mirabeau resulted in his arrest and he fled to Hamburg where he remained until 1800. He returned to France under the consulate, fought under Napoleon and was made governor of Würzburg. In 1814 he joined the Bourbons, and in 1829 succeeded his brother, Alexandre, as deputy.

LAMIA, a mythical queen of Libya, who, on being robbed of her own children by Hera, devoted her life to strangling and eating children. In later story Lamia was a vampire who seduced and then sucked the life-blood of young men. As a vampire she appears in Goethe's 'Die Braut von Korinth' and Keats' 'Lamia.'

LAMIA, (Turkish Zeytuni or Zituni), city of Greece, capital of the provinces Phthiotis and Phosis, near the head of the Gulf of Lamia, 28 miles southeast of Pharsalos. It is situated upon the site of a hill cut out by a medieval fortress and built from the remains of the ancient city from which the Lamian War (323 B.C.) takes its name. On the south of the gulf is the Pass of Thermopylae. The modern city has a
bazaar, gardens and a mosque. Its principal industry is the raising of camels. The city resumed its ancient name after Turkish rule was thrown off. In its more recent history is famous the nearby bridge of Alamanna, where, in 1921, General Cressy commanded by Diakos and the bishop of Salona withstood the progress of a Turkish army. Pop. estimated 8,000.

**LAMIA.** This narrative poem in couplets was written by Keats in 1819 and published, together with 'Isabella' and 'The Eve of Saint Agnes' in 1820. Keats founded his poem on an incident given by Burton in the 'Anatomy of Melancholy' from Philistatus, concerning the marriage of a Corinthian youth to a serpent woman or Lamia. At their wedding her real nature is detected by the philosopher Apollonius, and on being denounced she vanished. The story belongs to a familiar type of folklore incident, commonly known as the 'swan-maiden motive,' of which Coleridge’s 'Christabel' is another example in literature. Keats does not, like Coleridge, emphasize the supernatural suggestiveness of his material, but is interested rather in the human interest involved. He prefaches the meeting of Lamia and Lycus by a brilliant description of the serpent and an account of her transformation by Hermes into a woman. Lycus is enthralled by Love and the enchantment endures until the fatal desire comes upon him to marry the maiden in the presence of his friends. The close of the poem is made to illustrate Keats' favorite idea of the antagonism between the life of feeling and abstract reflection. Apollonius, who comes uninvited to the feast, represents the chilling philosophy which destroys the illusions of poetry and romance. The poet's sympathies are all with the enamored lovers. In style and versification 'Lamia' shows traces of the influence of Dryden. The rich sensuousness of 'The Eve of Saint Agnes' here takes on an almost metallic brilliancy, but the poem is little inferior as a work of art. For references see article One on a Grecian Urn. JAMES H. HANFORD.

**LAMINARIA.** An important genus of brown seaweed of the family Laminariaceae, prolific in the colder coast waters of the temperate zones. The species has no definite leaves, the thallus forming a ribless, expansion, flat and ribbon-like, either simple or cleft. A few species are edible, while others are employed as fertilizers and in making kelp. Among them L. bulbosa and L. dioica, which attain immense length, were formerly important in the production of carbonate of soda, but the discovery of common salt as a more accessible and prolific source of supply has largely superseded their use. L. potatorum is a native of the Australian coast and furnishes the natives with food and material for domestic utensils and implements. L. buncinale, a native of Cape of Good Hope, yields iodine, while several Japanese varieties are edible.

**LAMINATION** (from Lat. lamination, thin plate), the division or divisibility of rock into thin layers or sheets. Lamination occurs in the usual course of many geologic processes. The materials and evidently is produced by deposition in water and variation in the nature of material deposited. The term usually is limited to stratified rock, although some geologists apply it to the tabular structure of igneous crystalline rocks.

**LAMMAS DAY.** (M.E. lammasse, 'loaf-mass') in the calendar, the 1st day of August, so called perhaps from the custom which formerly prevailed among the tenants who held lands of the cathedral church in York, England, of bringing offerings of the first fruits of the harvest in the form of wheat loaves on that day.

**LAMMASCH, lam'asch, Heinrich, Austrian jurist:** b. Saisensieten, 1853. He studied at the University of Vienna and was appointed law lecturer there in 1878. In 1883-89 he was professor at the University of Jena, and in 1889 he became professor of law at Vienna. He entered the Austrian Upper House in 1899 and became leader of the Conservatives. He represented Austria at the first Hague Peace Conference and in 1911 was president of the Hague Tribunal. He was an arbitrator on the Venezuela case, 1903-04; and presided over the boards deciding the Mackenzie Island and the Newfoundland fisheries controversy in 1910. He has published 'Moment objektiver Gefahrlichkeit im Begriffe des Verbrechensversuchs' (1879); 'Diesstahl und Beleidigung' (1893); 'Rechtskraft internationaler Schiedssprüche' (published by the Nobel Institute, 1913); 'Schiedsgerichtsbarkeit' (1914), etc.

**LAMMENS, la'mans, Henri, Belgian Orientalist:** b. Ghent, 1862. He entered the Society of Jesus, was later appointed professor of Arabic literature in the Institute Biblico, Rome, and has specialized in the study of Oriental history, Syrian geography and Mohammedanism. His works include 'Fatima et les filles de Mahomed' (Rome 1912); and 'Le becque d'Islam; l'Arabic occidentale a la veille de l’hijri' (Vol. I, Rome 1914).

**LAMMERGIEIER, lam-mer-gi-er, the largest of European eagles (Gypaetus barbatus), often called griffon-vulture because it frequently feeds on carrion, especially bones abandoned by other animals, which it has power to break, or carries to a great height in the air and then lets fall; it does the same with tortoises, which form an important part of its fare in some countries. The lammergier is a bird of the mountains and deserts of southern Europe (where it has now been nearly exterminated), northern Africa and southern Asia; it builds a great rude nest on some mountain ledge and lays a single brownish-olive egg.

**LAMON, la-món, Ward Hill, American biographer:** b. 1828; d. Martinsburg, W. Va., 7 May 1893. He was the law partner of Abraham Lincoln at Springfield, Ill., and after the latter's election as President became his private secretary and was appointed by him marshal of the District of Columbia. He published 'Life of Abraham Lincoln, from His Birth to His Inauguration as President' (Boston 1872); 'Recollections of Abraham Lincoln.'

**LAMON, la-món', Bay of, a landlocked bay on the eastern (Pacific) coast of Luzon, Philippines, dividing the southeastern peninsula from the main part of the island. The island of Alabat and smaller islands make an inner bay on the south. The bay is bounded by the prov-
LAMONT, Daniel Scott, American politician; b. Cortlandville, N. Y., 9 Feb. 1851; d. Millbrook, N. Y., 23 July 1905. He was educated at Union College, Schenectady, entered journalism at Albany, became a political correspondent, in 1883-89 was private secretary to Grover Cleveland, was later in business, and in 1892-96 was Secretary of War in Cleveland's second administration. In 1897 he was elected vice-president of the Northern Pacific Railway Company.

LAMONT, Johann von, Scottish-German astronomer and mathematician; b. Braemar, Aberdeenshire, 13 Dec. 1805; d. Munich, 6 Aug. 1879. At an early age he was sent to the Scottish monastery in Regensburg to be educated and so far as is known he never returned to his native country. He became assistant at the observatory of Bogenhausen near Munich in 1828 and was its director from 1835 until his death. From 1852 he was also professor of astronomy at the University of Munich. His most notable contributions to astronomy consist of 11 zone catalogues and 34,674 stars; his measurements of nebulae and clusters; and his observations of the satellites of Uranus resulting in the determination of its mass. He was instrumental in the establishment of a magnetic observatory at Bogenhausen in 1840; made extensive magnetic surveys of Germany, France, Spain and Denmark; announced in 1850 the magnetic decennial period, and in 1862 made his discovery of earth currents. Most important among his writings is the standard work, 'Handbuch des Ermagnetismus' (Berlin 1849).

LAMORCIÈRE, Christophe Léon Louis Juchault de, French general; b. Nantes, 5 Feb. 1806; d. Prouzel, 11 Sept. 1865. He entered the engineers in 1828, served in the Algerian campaigns from 1830, and in 1843 became a general of division. He rendered important service at the battle of Isly, 14 Aug. 1844; acted temporarily as governor-general of Algeria, and in 1847 secured the surrender of Abd-el-Kader, thereby terminating the war. Upon his return to France he was elected to the Chamber of Deputies and served as Minister of War under General Cavaignac. A bitter opponent of Louis Napoleon, he refused to give allegiance after the coup d'état of 2 Dec. 1851 and was exiled from the country at the Stelidard, 18 Sept. 1860. The remaining years of his life were spent in retirement in France.

LAMOUREUX, Charles, French violinist and orchestra leader; b. Bordeaux, 20 Sept. 1834; d. Paris, 21 Dec. 1899. He entered the conservatory at Paris in 1850 and in 1853 became first violin at the opera. He founded the Société de l'Harmonie Sacrée, and gave the first performance in Paris of Handel's 'Messiah' in 1873. In 1876 he became leader of the orchestra at the Opera Comique and in 1881 he inaugurated a series of Wagnerian concerts. He was twice leader of the orchestra at the Paris Opera and his visits to London were the occasion of many successful concerts at Queen's Hall. He was one of the first in his efforts to popularize the music of Wagner. The Concerts Lamoureux were continued in Paris after his death by his son-in-law, Chevillard.

LAMP, any contrivance which through the formation of its parts affords a means of producing light, and sometimes heat, by the combustion of oils, fats or inflammable fluids, with the aid of a wick, which, by capillary attraction, conveys the substance burned to the flame point. By modern adaptation of the word many appliances for producing light and for the concentration of light are designated as lamps, and the illustrations of lamp standards that accompany this article show the high pitch of artistic excellence to which they have been brought. The history of the lamp, however, is interesting, especially as the development of the modern electric and general illumination can be said to date only from about 1840. Man ignorant of fire is unknown; therefore, the use of the burning brand as a torch may be regarded as coeval with the race, and the torch as the progenitor of the succeeding lamp. Considered archaically the primitive lamp was a very simple device. An unworked stone, having a natural concavity, a sea shell, or the skull of an animal, constituted the earliest forms. A bit of moss or a twist of vegetable fibre served as a wick. Fat, grease or fish oil furnished the illuminant. The introduction of the lamp marked the first stage of man's advancement toward civilization, and may, therefore, be appropriately considered as a figure or symbol on the dial of time pointing to the dawn of his intellectual awakening. When, or where, or by what people the first lamps were made cannot now be determined. Recent archaological discoveries in the ruins of the long-buried cities of the Mesopotamian plain, Assyria, have revealed many lamps of a variety of forms, and of good workmanship, that were in common use 7,000 or 8,000 years a.c. It would be an unwarranted assumption to assert that these well-developed creations denote the beginning of the lamp. Stone Age determins so little that is of real chronological value that classifications in archaeology cannot always be wisely made upon data thus furnished. French archaeologists have within a few years recovered from the lakes of Switzerland bronze lamps that were in use by the lake-dwellers at a period late in the Laestrian Age. These are without doubt the first ancient metal lamps yet discovered.

Early Examples.—Whether the first emigrants from Asia into ancient Greece found the Pelasgic races using lamps or whether the invaders brought the art of lamp making with them, neither legend nor tradition has left even a mythical answer. In our researches in lamp

archaeology we can at the best but work our way backward, from the known to the unknown, from the ascertained facts to that dim, mysterious darkness of remote antiquity where all traces of chronology are lost, and where our conclusions must be drawn by deductions drawn from analogical reasoning. The poems ascribed to Homer, 950 B.C., contain all that we know of the manners and customs of early Greek society. He speaks of the “Festival of Lamps,” and makes frequent mention of the torches of the more ancient and Roman lutanis. We have simply a terracotta, or bronze, lamp-shaped device secured to a staff. The so-called “grease-pot-lamp” of Egypt is without doubt more ancient than the oldest lamp of Greece, and the terracotta lamps of Babylonia are also thousands of years older. Egypt as a nation was on the decline when the history of Greece began. Assyrian records founded on clay tablets proclaim a nation with a remoteness of antiquity as yet undetermined. Among the many ancient relics discovered in the Nineveh and Babylonian cities there have been terra-cotta lamps that closely resembled those of early Greece. This similarity of configuration between the earliest examples discovered and those of Greek make of a period that was perhaps midway between the first Olympiad, 776 B.C., and the beginning of the Christian era is remarkable. Only the simplest essentials are represented. A shallow, saucer-shaped oil or fat reservoir being the most primitive of terra-cotta lamps. Then comes the oval in shape, with a slight projection of the rim into a short, narrow rostrum, or wick support, and the formation of a rudimentary handle. Then the oval-shape with the reservoir enclosed, and one or two wick supports. These constitute the types that were essentially common to all Eastern lands. The later Greek and Roman lamps, both terra-cotta and bronze, are remarkable in ornamentation, and artistically graceful in form. These constitute a division that separates the crude primitive from the finished product. The earliest terra-cotta lamps were made in one piece, and baked without glazing. Later Greek and Roman terra-cotta lamps were made in two principal parts, the “crater,” or oil reservoir, and the “discus,” or covering for the reservoir. Each of these parts were joined together by means of a neck and baked without glazing. The ornamentations were generally confined to the “discus,” and were called the “limbus.” The “nasi,” or wick support, as well as the “ansa,” or handle, were most frequently made separately and carefully attached to the body of the lamp before baking. The “discus” had a small circular opening near the centre through which the lamp could be filled. Many of the better lamps had the maker’s name, and often his private mark, stamped on the bottom. Large terra-cotta lamps were frequently made with two, three and sometimes six or even 12 “nasi.” The lamp with “nasi” for one wick was called a “monomysos,” and that for two wicks a “dimysos,” and so on. The Greek and Roman bronze lamps were made in an almost equal manner as terra-cotta lamps, but more artistic and artistic to a marked degree. Plain iron lamps were used by the common people at a later period. They were either cast or forged in a single piece, and were mostly eucalyptus of the more artistic and costly terra-cotta and bronze lamps, but were without decorations.

The study of the ancient lamp maker was devoted alone to the external form of his wares. Grace, beauty and elegance, as expressed in outlines and decorations, were his chief concern. No attempt was made to improve the light. The pale, smoky, flickering, uncertain light from the massive and costly silver candelabrum of the wealthy just as it had, for untold ages from the simple stone and terracotta lamps of their ancestors. Etruscan terracotta and bronze lamps so closely resembled those of early Greek make that a separate description is not required in this article. The chief characteristic, however, that distinguished the true Etruscan pottery from that of Greece is the strong coloring that was applied to the former. What was true of the art of lamp making in Greece was also true of the rest of the civilized world, for it was more than 17 centuries after the Christian era before any real improvement was introduced in lamp construction.

The Inventive Age.—Prior to 1783 many lamps and illuminating appliances had been introduced, but there was little if any improvement in the light afforded, or marked advance in the construction or mechanical arrangement of the parts designed to increase the brilliancy of the flame. The first real improvement was the introduction of the flat, woven, ribbon-like wick, and the securing the wick in a close-fitting support. This arrangement permitted only a small surface of the wick to be exposed to the flame, and the width of the flame was narrowed the flame came in contact with the centre as readily as the outward parts and thus most of the free carbon was consumed, consequently there was less smoke than in the old style of loose wick. M. Legers of Paris introduced this improvement in 1783. To this was attached for the first time a spur-wheel, which by rotating adjusted the wick, thus regulating the flame. The same year M. Argand, the Swiss chemist, introduced his improvement in burners, which consisted of a tubular wick attached to a tube which extended through the oil reservoir and opened into the base of the lamp, thus affording a means of centre draught, which supplied an abundance of oxygen to the flame and created sufficient heat to consume all of the carbon and make the fire white of smoke. This was truly the beginning of a new era in lamp making, for the art now entered upon what may be designated as “the inventive age of the lamp.” Science and invention now came to the aid of the artisan. Principles involving an understanding of the laws of combustion and the science of light were applied to the construction of illuminating devices. The result was more light and better light. Argand’s epoch-making invention related wholly to his improved burner. His first lamps were simply huge oil reservoirs with his lamp attached to the top. He used sheet iron chimneys formed with a hood opening over the flame. The use of glass chimneys with the Argand burner came about purely by accident. A workman in an attempt to get a better heat over the flame cracked off the bottom, and because the glass had become too hot for him to hold he momentarily placed it over the burner. The result was surprising; the brilliancy of the flame was not only increased but the light became steady and in every way
superior to that produced with a sheet iron chimney. The brilliancy of the light on the top of the huge reservoir made a wide shadow. To overcome this was a problem that was finally solved by a German lamp-maker, who produced a model in which the burner was set at the end of a long neck or rostrum, very much like the present so-called German student lamp. The removing of the light away from the great reservoir not only reduced the shadow but afforded a more ready means of supplying the oil to the wick uniformly. In 1880, the Pilgrims brought with them one lamp which was provided with a clock-work device, which operated a small pump, raising the oil from the base of the lamp to the wick-holder, thus keeping the wick uniformly submerged in the oil. This contrivance was too costly to come into general use, and was confined mostly to lamps used in halls and large rooms. Many lamps were offered by makers that were designed to burn crude, heavy whale oil, and others in which lard oil was consumed. Lard oil lamps were the cheapest and cheapest for the oil would become solid. To overcome this several devices were invented. Perhaps the most successful was the lamp with a copper tube, the upper end of which was between two wick tubes, while the other end was turned through the oil to the bottom of the lamp. Copper being a good conductor of heat, the oil was thus kept in a liquid state while the lamp was burning. For many years lard oil was the only illuminant used in the great lamps of the lighthouses of the world. It was not until after 1880 that burners for lighthouse lamps had been constructed that would satisfactorily consume kerosene oil. Up to about 1800 but few small, portable lamps had been manufactured. Nearly all the appliances so far introduced for domestic illumination were large, so-called, table lamps, and mural lamps. English manufacturers first made small hand lamps of tin, brass and pewter. These were mostly lard or whale oil burners, with a single wick tube. In the whale oil lamps the wick tube was to be seen in the lard oil lamps the flat, woven ribbon-wick was used, the wick being moved up and down in the lard oil lamps by a spur-wheel. In the whale oil lamps a small aperture in the upper part of the wick tube was provided, through which a pricker could be inserted by which the wick was pricked up or down. In the large and important field of research and experiment in domestic illumination, American genius and skill very early took a prominent part.

Lamps in America.—Before proceeding to the introduction of a description of early American inventions relating to lamps and lighting appliances, it will be interesting to briefly notice what may be truly designated as the original American lamp. There has never been found among the remains of the mysterious mound-builders of the Western Continent any utensil that could be rightly regarded as a lamp. The North American Indians, who were found inhabiting the country on the arrival of the first Europeans, did not possess a lamp. The pine torch was their only means of artificial illuminating. The one lamp that can claim the distinction of being really American is the stone lamp of the Eskimo. This is usually a shallow vessel of stone, most frequently of soap-stone, sometimes bone, clay, wood and the skull of an animal is used. The oil of the seal, walrus and whale is burned in these rude lamps, dry moss serving as a wick. These lamps also serve as stoves, for they are used for cooking and warming. Without these simple lamps human life could not be maintained in the inhospitable regions where these strange people inhabit.

The first lamps used in the Plymouth Colony were of Dutch make, and were called by the English emigrants Betty lamps (German, Beser-better). The few lamps that the Pilgrim fathers brought with them on their memorable voyage were of this class. They are of iron, either forged from a single piece or were cast of gray, coarse iron. The earliest, of these were known as the open Betty, or "slot lamp." Then followed the Betty with a top, one part of which was formed as a hinged lid. The wick support was an angular, half round iron secured to the inside bottom of the lamp. There was an upright handle at the back, to which was attached, by a link, a pointed hook. The point could be pushed beyond the crook. This was used to suspend the lamp from the high back of the rush-bottom chair, or the point was thrust into the crevice between the great stones of the end post placed through the top of the Betty was pear-shaped, flat on the top and bottom. This form was sometimes made in brass, but rarely was any attempt made at ornamentation. These lamps were in use in some parts of the New England colonies as late as 1790. Prior to 1680 all lamps used in the American colonies were imported, mostly from England. In 1680 a tinsmith of Newbury, Mass., began the manufacture of tin Betty lamps. These, after Newburyport was separated from Newbury, became known as Newburyport Betteys. Later these lamps were made in New Bedford (Portsmouth, N. H.) and were called Portsmouth Betteys. In 1720 a few pewter and brass lamps had been made by small manufacturers at Salem, Mass., and Providence, R. I. These were pewter and extremely inconvenient to be carried about. Among the earliest makers of pewter lamps and candesssticks in the New England colonies was Richard Graves, a pewterer who came from England, where he had learned the trade, or, as it was then called, the art. He came first to Boston, but moved to Salem, Mass., where he long worked at his business, and brought out many fine goods in his line. Henry Shrimpton of Boston was also a maker of fine pewter lamps, and his beautiful lamps and candesssticks graced many of the grand old colonial homes. Among the earliest American experimenters in lamp construction and inventors of improved burners was that marvelous investigator, philosopher, statesman and inventor, Benjamin Franklin (q.v.). Not content with perfecting an improved stowe, known as the Franklin heater, he very early turned his attention to the improvement of domestic lamps. When we recall the fact that Franklin's first manual labor was cutting wicks in his father's chandler shop, it is not surprising that and his versatile mind turning to the subject of improved illuminating appliances. Prior to 1742 candles were in general use in American colonies. The iron Betty lamps were used in a comparatively few families. The shallow, saucer-shaped clay crust introduced from Scot-

land was still used for lighting among the poorer classes, but candles were the chief illuminators. Franklin's first invention consisted in devising two round wick tubes so arranged that a corresponding portion of the circumference was cut away behind the workmen who constructed the burner, the distance between the tubes should equal the diameter of one of them. His theory was that the proximity of the two flames created an updraft that sucked the smoke away, and the liberated carbon was consumed, thus adding to the light and preventing smoke. He observed that the introduction of the third burner, while it consumed a third more oil, and added a third more flame, did not give a corresponding increase in light. Franklin also suggested the improved cotton wick, loosely braided, which afforded a better medium for supplying oil to the flame by capillary attraction. Franklin did not secure patents on his inventions, but allowed manufacturers to freely introduce them, which they did on quite an extensive scale, and small portable lamps of tin and brass with Franklin burners soon became very common.

Another American of note, Benjamin Thompson, better known as Count Rumford (1753-1814), in 1792 wrote an exhaustive essay on "The Management of Heat," in which he constructed a broad and progressive theory of the nature of heat, the properties of heat, and the various applications of heat. He constructed over 100 different lamps in his extended experiments. He invented the photometer to measure the relative intensity of light emitted by different illuminants. He found that the purest white light could be obtained by means of lamps properly directed, using clarified vegetable or animal oil, at less than one-eighth of the cost for the same degree of light produced by wax candles, and for about half the cost of tallow candles. He invented but one burner. In this he constructed a central, flat wick tube, with two similarly shaped tubes placed at acute angles on either side of the wick tube, his design being to supply oxygen through the angular tubes impinging on the wick tube. This burner did not satisfy him, and he invented what was known as the "Astral lamp," which consisted of constructing the oil reservoir in the form of a flat, circular tube with radiating arms attached to the pedestal of the lamp, and securing the burner within the circle. He also introduced what he called the "Balloon illuminator." This was for use in halls, ballrooms and salons. He also made what he called a "Dining-room Illuminator," and also a table or reading illuminator. All of Count Rumford's investigations and his extended experiments relating to lights and lamps, were carried on while he was in the public service of the Elector of Bavaria, who created him a count as a reward for his valuable services and as a recognition of his great learning and the importance of his researches and inventions.

Hundreds of patents have been granted to American inventors for lamps and lamp burners. One of the earliest patents on record in the United States Patent Office was for a device in which an adaptation was made of Franklin's two-wick tubes by securing them to a perforated disc through which the tubes passed. Beneath the disc was a cork through which the tubes also passed, the cork being cemented to the under side of the disc. This could then be fitted into the top of the lamp. The cork that fit the cork fits the neck of a bottle. This was mostly applied to glass lamps, which were first introduced in America in 1810. In 1812 one J. Neal secured a patent for a lamp provided with a telescopic sliding yoke. A small neck tube was secured to the top of the cylinder, being screwed into a collar which formed the upper part of the tube. When the lamp was filled with oil, a float on the bottom of the tube extended the cylinder to its full length. The wicks were long, reaching to the bottom of the cylinder. As the oil was consumed the cylinder was correspondingly lowered, thus keeping the wicks uniformly submerged in the oil as long as any remained in the lamp. These lamps were made in tin, brass and pewter and became quite popular. In 1839 one J. Price of Nashville, Tenn. obtained a patent on an arrangement for burning pine knots. According to the directions the knots were to be cut up into small pieces and inserted into a tube, which had a diameter of about an inch and a half and a base not unlike an ordinary brass candlestick. A sheet iron chimney with the upright tube was compressed as the pieces of pine knots were forced in. When the tube had been filled an oval cap or cover with a large opening was placed over the top and secured by a bayonet cloutch. The spring forced up the wood to be burned through the space in the cap; as it was burned away the ash fell into a circular receptacle secured on the upright pedestal. A sheet iron chimney with a broad hood partly surrounding the flame was provided as the specification says to convey the ascending smoke away from the face of the person using the lamp. S. P. Moorehouse obtained a patent in 1830 for a lighting device in which halls of cotton or tow saturated with grease or fat were burned while held by an upright supporting cloutch. The smoke was conveyed through the chimney. The ash was collected. Between 1843 and 1845 S. Rust secured eight patents on lamps and five on burners. These patents did not introduce any new features, and consisted mostly of the introduction of novelties relating to forms and supposed ornamentation. His innovations in the line of burners did not involve any new features and possessed but little real utility.

The so-called "Solar" Lamps, patented in 1843 by the Philadelphia firm of Cornelius & Company, were a great improvement over any table lamp so far introduced. They were constructed to burn lard oil. The burner proper was a modification of Argand's. The wick tube, over which the circular wick closely fitted, extended through the bottom of the oil reservoir, where it was provided with openings for the admission of air. The heat conveyed through the lard oil by the wick tube served to keep the oil in a liquid state in cold weather. The burner was so constructed that the flame was diffused more generally than in other lamps, while the bulb-shaped glass chimney created a hot-air chamber in which all free carbons were burned. The light was profuse, white and clear. This firm manufactured a large variety of elegant lamps, which were used extensively in the homes of the wealthy. Benkler's lamp, introduced in 1840, had a tube through which air
LAMP

was admitted to the flame, the angle of the tube being such that an upward movement of air was produced when the oxygen came in contact with the hot tube, and this forced downward, and was secured which made the light constant and aided greatly in the consumption of smoke. Through the means thus adopted cheap heavy oils could be burned without the offensive smell and excessive smoke produced by cheaper lamps when these low-grade oils were consumed.

Coal Oil and Kerosene Lamps.—About 1845 was introduced in the United States a compound that was known as burning fluid, or, from its inventor’s name, Potter’s fluid. This was a highly inflammable illuminating fluid, composed of a mixture of about three parts of wood alcohol to one of purified oil of turpentine. This, was burned in lamps provided with long, slender, tapering brass tubes, secured to a disc that screwed into a collar fitted to the upper part of the lamp. The wick was round, firmly woven cotton, which closely fitted the wick tube. This was to prevent the escape of the vapor from the fluid. Little thimble-shaped caps, secured by small chains, were provided to cover the end of the wick tubes when the lamp was not in use. This was to prevent the evaporation of the highly volatile burning fluid. Camphene was the trade name of a burning fluid composed of oil of turpentine, purified by being distilled over quick-lime. This fluid was burned in lamps provided with the same class of wick, wick tubes, and tube for burning fluid. The highly explosive nature of these dangerous compounds rendered them unpopular for domestic use, and they were soon displaced by the safer and cheaper kerosene oil, which came into general use about 1850. This was just called coal-oil, and in some localities mineral oil, while in others it was known as petroleum oil. Many hundreds of lamps and burners have been invented to use this cheap illuminant. In all successful kerosene burners a glass chimney is necessary. Many attempts have been made to produce a kerosene burner that would afford a clear, brilliant, steady, smokeless flame, without a chimney, but so far no good, practical lamp has been put on the market that successfully accomplishes this much-desired result. A lamp was made and introduced in the United States a vapor of naphtha without a chimney. While the flame from this device was white and brilliant, the light was flickering, and when moved about emitted annoying smoke. The highly explosive nature of the fluid burned made its common use unsafe, so that the vapor lamp never became popular. What is known as the German student lamp, supplied with an improved Argand burner, and the so-called Rochester lamp, employing another modification of the Argand burner, are the best and most successful kerosene lamps so far introduced. There are hundreds, if not thousands, of different kerosene oil burners attached to an almost endless variety of lamps now on the market. These embrace hand lamps, table lamps, piano lamps and a variety of lamp cases made in a manner rich in ornamentation and graceful in form and shape, but in the construction designed to assist the combustion of the oil in producing the illumination the same general principles are involved, and with the exception of the smaller hand lamps the original Argand burner principle is adhered to, with slight modifications and improvements. In the small hand lamps a perforated hood-shaped cap surrounds the wick making a dome-like chamber forced downward and the outside is deflected into the flame, thus supplying the needed oxygen. The flat ribbon wick is used in most of the smaller lamps, the wick being moved up and down by a spurt-wheel as before described in the lamps produced by cheaper lamps when these low-grade oils were consumed.

Safety Lamps are lamps so constructed that the danger from the foul explosive air of mines, especially deep coal mines, may be lessened or prevented, by so protecting the flame of the miner’s lamp that it will not come in contact with explosive gases in the mine. Such lamps were used in the English copper mines as early as 1820. By 1838 the flat ribbon wick was generally used, and lamps were placed around the wick in such a manner that the gas or atmospheric air was admitted only from the sides and top, cutting off the flame. Other types of lamps were also in use, which were either arranged to protect the flame from the sides, or from the top only. Argand lamps with flat ribbon wicks were also introduced in the English copper mines, and lamps of this kind also were in use about that time. The first safety lamp was described in 1813 by Dr. Canny in England. In his invention he produced a lamp in which the external air was admitted to the burner through a chamber containing water, while the air used in the flame was protected by a glass bulb, the product of combustion escaped through perforations in a flat support on which the glass bulb rested. This contrivance was so cumbersome, and so liable to breakage that it never came into general use. In 1815 George Stephenson and Sir Humphry Davy contrived a safety lamp that, with slight modifications, has continued in use up to the present time. The air to support combustion was admitted to the flame through small openings in the bottom of the lamp, while the flame was protected by a glass upright cylinder, the top of which was covered with a wire gauze cap. Several forms introducing slight changes from the original Davy lamp have been made. The lamp in which the flame is protected by a wire gauze cylinder placed in the side of the lamp was a later invention of Sir Humphry Davy. Mackworth’s safety lamp was an improvement over the Canny lamp, and introduced features common to that and the Davy lamp. A water chamber was provided through which the external air passed before reaching the flame. Immediately surrounding the flame was a thick, glass cylinder and above that a fine wire gauze cylinder, making a continuous protection against the flame. Outside of this was an additional wire gauze cylinder added as a means of protection against breakage. Lamps for jewelers, chemists and laboratory use are in reality miniature furnaces, and are generally provided with wide wick supports in which are large cotton wicks. Alcohol is the most common fluid used for generating heat that in these lamps is contrivances in which naphtha is burned under pressure, the resulting heat being employed in the removing of old paint from surfaces which it is desired to repaint. Hand lanterns are simply lamps of various forms, surrounded by glass globes or cylinders to protect the flame from the wind. Ancient lan-
terns were provided with transparent protectors made of horn scraped thin to permit the light to be reflected through. The word lantern is a combination of lant-horn, and was employed to express a light which was protected with a transparent horn. Another form of early lantern, now designated by collectors as the "Guy Fawkes lantern," was of tin, perforated with small punctures through which the light shone. Early hall, or as they were called entry, lanterns were often massive and elegant ground glass globes, ornate and beautiful to a marked degree. Either candles or oil were used as illuminant. They were suspended by chains from the ceiling and a glass smoke protector was provided in those of more elaborate make. (See Electric Lighting; Gas Illumination.) Consult Bolton, H. C., 'Legends of Sepulchral and Perpetual Lamps' (London 1879); Hough, W., 'Lamps of the Esquimo' (Washington 1896); Norton, C. A. Q., 'Light and Lamps of Early New England,' in Connecticut Magazine Harvard 1903-04; Walters, H. B., 'Greek and Roman Lamps in the British Museum' (London 1914). C. A. Quincy Norton, M.D.

LAMP, Electric. See Electric Lighting.

LAMPADEDROMY, or LAMPADEPHORIA, an ancient Greek torch race on foot or horseback, held in honor of Prometheus, Athena, Hephaestus, Demeter, Pan, Artemis and other divinities. The races undoubtedly originated in honor of Prometheus. The aim of the competition is to be the first to reach the goal with the torch still burning. The races were held at night, and in some of them the contestants were mounted. The foot races were run either singly, each contestant running the entire course, or in relays, in which case the torch was passed from one runner to another and the winner was the team whose torch first arrived. Extinguishment of the torch prohibited a bearer from continuing in the race. The races were regarded as very important, requiring rigorous physical tests and long training.

LAMPASAS, lám-pás'sás, Tex., town and county-seat of Lampasas County, on a branch of the Lampasas River, and the Gulf, Colorado and Santa Fe and the Houston and Texas Central railroads, 80 miles northwest of Austin. There is a large trade here in agricultural produce, live stock, cotton, grain, wool, and the town has cotton gins, wagon and carriage factories, flour-mills and other industries. Sulphur springs in the locality have attracted many invalids here. The town owns the water supply system and has a public library and two public parks. Pop. 2,119.

LAMPBBLACK, finely divided carbon or soot, produced on a commercial scale by the imperfect combustion of organic materials that are rich in carbon, such as tar, resins, pitch and petroleum. The combustion is usually carried out in brick furnaces, or in cast-iron vessels, to which a smaller supply of air is admitted than would be required for complete oxidation. The dense smoke that results is led through a current of air, which, when the lampblack is deposited, the finest grade being precipitated in the last chamber. Lampblack so prepared contains about 80 per cent of carbon, the remaining portion consisting of oily and resinous matters, together with moisture and certain inorganic substances, such as ammonium sulphate. The inorganic and other organic constituents can be removed by heating to redness in a closed crucible, after which the soot is digested with hydrochloric or sulphuric acid, and finally washed to remove the inorganic constituents. Lamplack is used chiefly in the manufacture of paints and printers ink, and for these purposes the crude product is sufficiently pure. For the manufacture of Chinese ink ("India ink") the purified soot is preferable. In the German method the soot is deposited on woolen cloths hung in the chambers, from which the pigment is detached by beating. See also Blacks; Carbon.

LAMPER-EEL, or LAMPERN, a lamprey (q.v.).

LAMPERS, or LAMPAS, an inflammation and swelling of the mucous membrane of the hard palate in the roof of a horse's mouth. The swelling is back of the incisor teeth and is due to physiological causes; it usually occurs in young horses and at the time of shedding the teeth. No treatment is necessary although an astringent wash may be used.

LAMPERTI, lám-pérté, Francesco, Italian teacher of vocal music: b. Savona, 11 March 1813; d. Como, 1 May, 1892. He studied at the conservatory at Milan and for many years was director of the theatre at Lodri, where he also engaged in vocal training. From 1850-75 he was professor of vocal music at the Milan Conservatory, after which time he engaged in private instruction. His reputation was world-wide and he numbered among his pupils Sembach, Campanini, Galli, Abmani and many other famous singers. He published several treatises on the training of the voice, an English translation by J.C. Griffith, 'A Treatise on the Art of Singing' (1876), covering the essentials of his methods.

LAMPMAN, Archibald, Canadian poet: b. Morpeth, Kent County, Ontario, 17 Nov. 1861; d. Ottawa, Ontario, 10 Feb. 1899. Of United Empire Loyalist descent, he was graduated from Trinity College, Ontario (1882), and after 1883 held an appointment in the Post Office Department at Ottawa. He published two collections of poems, 'Among the Mists' (1888), and 'Lyrics of Earth' (1895). His 'Complete Poems' with 'Memoir' by D.C. Scott appeared in 1900.

LAMPRECHT, lám-prékt, Karl, German historian: b. Jessen, near Wittenberg, 25 Feb. 1856; d. 11 May 1915. He was educated at Göttingen, Leipzig and Munich and in 1885 became professor of history at Bonn, in 1890 at Marburg and in 1891 was appointed to a similar office at Leipzig, which was admirably equipped for his work. As a teacher he was original in his methods, and to him history meant as much the revelation of sociology as of political events. In 1905 he represented Germany at the Congress of Science held at Saint Louis. He founded in 1882 the 'Westdeutsche Zeitschrift für Geschichte und Kunst. He was the chief exponent of the Kulturgeschichte and believed intensely in the superiority of German kultur. Shortly before his death he repudiated, with some indignation, the conception of Germany's part in the Great War as having been dictated
by the "War Lords," and avowed that in regard to it that Germany was a unit. His writings include ‘Beitrage zur Geschichte des französischen Wirtschaftslebens im ersten Jahrhundert’ (1878); ‘Die römische Frage von König Pippin bis auf Kaiser Ludwig den Frommen’ (1889); ‘Deutsche Geschichte’ (13 vols., 1891-1908); ‘Zur jüngsten deutschen Vergangenheit’ (1901); ‘What is History’ (1905); ‘Franzosen’ (1906).

LAMPREY, an eel-like creature of the group Cyclostomi and family Petromyzontidae. The anatomical characters are described under Cyclostomata. The lampreys feed principally on fishes, to which they attach themselves by their succorial mouths, and then scrape away the flesh with their rasplike teeth. There are about 7 genera and 15 species, living mostly in the north temperate zone. Lampreys inhabit both salt and fresh waters, but those of the sea ascend rivers and brooks to deposit their spawn on pebbly shallows, and great numbers die there. Most of them are plainly dark colored, but some of the fluvial species are bluish or silvery, as the common one (Ichthyomyzonculus), in the Upper Mississippi Valley and Great Lakes, which is about a foot long.

LAMPSACUS, ancient Greek city of Asia Minor, on the Hellespont and opposite Gallipoli. The modern village of Lapsaki is built on its site. The city was colonized by Ionian Greeks, possessed a fine harbor and was celebrated for its wine. It came under Persian rule during the Ionian revolt, but after the battle of Mycale, in 479 B.C., it joined the Athenians. After its defense against Antiochus the Great of Syria in 196 B.C. it became an ally of Rome. Lamprocas was the seat of worship of the nature-god Priapus.

LAMPTON, William James, American journalist; b. Lawrence County, Ohio; d. May 1917. He was educated in public and private schools and at the Ohio Wesleyan University and Marietta College; edited a newspaper at Ashland, Ky. (1887-88); was reporter for the Cincinnati Times, writer for the Stenhouseville Herald and the Louisville Courier-Journal, editor of the Merchant Traveler, Cincinnati, and was on the staff of the Cricic and the Evening Star, Washington, and of the Detroit Free Press. He was also, after 1896, a special writer for the New York Sun and the New York Herald. In March 1910 he was appointed colonel on the staff of Governor Willson of Kentucky. He published 'Yawps and Other Things'; 'Mrs. Brown's Opinions' (1886); 'Confessions of a Marshall Man and Tame Animals' (1910), and 'The Trolley and the Lady' (1908). He was a member of the Poetry Society of America and the Author's League of America.

LAMSDORFF, läms'dôrf, or LAMBSDORF, Vladimir Nikolaevitch, Count, Russian statesman; b. Petrograd, 25 Dec. 1844 (old style); d. 20 March 1907. He entered the Foreign Office in 1866 and was continuously in service until his resignation in 1906. He became Assistant Foreign Minister in 1897 and Foreign Minister in 1900. He was likewise Privy Councillor from 1901; and in 1902 he was Secretary of State to the Emperor. He was one of the framers of the Pekin Treaty of 1900 which determined the future commercial relations of the two countries and stipulated that China should defray the costs involved in the suppression of the Boxer; and in his official capacity worked earnestly in 1903 to avert the Russo-Japanese War. He was successful in securing an amicable settlement with Great Britain when the Russian fleet by mistake fired on a British fishing fleet off Dogger Bank 25 Oct. 1904. He possessed all the Orders of Russia from 1898.

LAMSON-SCRIBNER, Frank, American botanist; b. Cambridgeport, Mass., 19 April 1831. He was graduated at the Maine State College of Agriculture in 1873; served two years as clerk to the secretary of the Maine State Board of Agriculture; and was an agent of the U.S. Department of Agriculture (1876-84). In 1887 he was made chief of the section of vegetable pathology in the United States Department of Agriculture, and from 1888 to 1894 was professor of botany in the University of Tennessee, and director of the agricultural experiment station there 1880-94; chief of Division of Agrostology, United States Department of Agriculture, 1894-1901, and chief of the Insular Bureau of Agriculture, Philippine Islands, 1901-04. In 1889 he received from the French Minister of Agriculture the cross of the Chevalier du Mérite Agricole. He was in charge of exhibits of the United States Department of Agriculture at various exhibitions since 1904, including those at Saint Louis (1904), Portland, Ore. (1905), Jamestown (1907), Seattle (1909), Buenos Aires (1910), Turin, Italy (1911), the Dry Farming expositions at Lethbridge, Can. (1912), Tulsa, Okla. (1913), Wichita, Kan. (1914), Denver, Colo. (1915); appointed expert on exhibits by the Secretary of Agriculture (1913); and member of the Government Exhibit Board by the President for the Panama-Pacific International Exposition. Among his writings published in the proceedings of various bodies, encyclopedias and in government reports, are 'Weeds of Maine' (1869); 'Ornamental and Useful Plants of Maine' (1874); 'Agricultural Grasses of Central Montana' (1883); 'Revision of the North American Melica' (1885); 'Grasses of Mountain Meadows and Deer Parks' (1889); 'Philippine Agriculture'; 'Diseases of Plants' (1885-87); and papers on 'Grasses and Soil Binders' and on 'Grasses and Foliage Plants,' including descriptions of many new species (1894-1900). He has also published 'The True Grasses,' translated from 'Die natürlichen Pflanzenfamilien' (1890).

LAMY, la'mé, Bernard, French philosopher and author; b. l. Mâurs, d. Paris, 29 Jan. 1715. He studied at the oratory at Le Mans and in 1658 entered that at Paris. From 1671-75 he was professor of philosophy at Saumur, and later taught at Grenoble and at Paris.
He was removed from Saumur because of his advocacy of the Cartesian philosophy; and he later had trouble over the publication of one of his books without requisite permission. He thereupon, in 1690, retired to Rouen, where he pursued his literary labors. His works include 'Nouvelles Réflexions sur l'art poétique' (Paris 1668; 2d ed. 1679); 'L'art de parler' (Paris 1670; 8th ed., 1757); 'Entretiens sur les sciences' (Grenoble 1683); 'De Tabernaculo fœderis, de sancta civitate Jerusalem et de Templo ejus,' a work of 30 years (Paris 1720), etc.

LAMY, Etienne Marie Victor, French author; b. C. F. J. C. 2. June 1843. He took his degree in law at the University of Stanislas in 1869, and from 1871-81 he served in the House of Deputies. He was elected to the Academy in 1895 and in 1913 became its perpetual secretary. His works include 'Le Tiers Parti, l'Assemblée nationale et la Dissolution' (1872); 'Témoins de jours passés' (1909, 1913); 'Au service des idées et des lettres' (1909); 'Quelques œuvres et quelques ouvriers' (1910, 1913), etc.

LANARK, Scotland, a parliamentary, royal and municipal burgh and the county town of Lanarkshire, 32 miles southeast of Glasgow. It is finely situated in romantic scenery; the Falls of Clyde are near by. The principal industries are weaving and shoemaking. Lanark was the scene of some of Wallace's exploits, and it has interesting Roman and feudal remains. The race course is the scene of a famous Scottish meeting. New Lanark, about a mile off, was for 28 years (1800-28) the scene of the noteworthy social experiments of Robert Owen. Pop. 12,764, or 5,000.

LANARKSHIRE, an inland county in the southwest of Scotland, bounded on the north by Dumfriesshire and Stirling shires, on the west by Lanarkshire, Midlothian and Peeblesshire, south by Dumfriesshire and west by Ayrshire and Renfrewshire. Area, 897 square miles. Holding tenth place in area of the Scottish counties, it contains one-fourth of the population of the country. It is almost entirely drained by the Clyde and its affluents, and shows a remarkable diversity of aspect, bleak uplands, smiling orchards, busy coal fields and magnificent loch and seafaring districts. The surface rises toward the south, where the Leadhills reach an altitude of 2,403 feet. The Upper (or southern) Ward is chiefly composed of hill or moorland; the Middle Ward is famous for its orchards and the Lower Ward has rich alluvial lands. Dairy farming is one of the principal agricultural industries. Lead-mining is carried on. It is the principal seat of the iron and coal trade of Scotland, with its numerous dependent industries. A large part of the coal needed in Scotland is raised in Lanarkshire. For Parliamentary purposes the county contains six divisions. The county town is Lanark (q.v.). Pop., including Glasgow, 1,486,081; exclusive of Glasgow, 652,575.

Lancashire, which has many interesting Celtic and Roman remains, was in ancient times inhabited by the Damnonii, a Celtic tribe. It formed part of the Saxon kingdom of Strathclyde, which in the 7th century was subdued by the Northumbrian Saxons, who brought great numbers of the Celts migrated to Wales. The county has stirring associations with the struggle for Scottish independence; at Langside the fate of Mary, Queen of Scots, was settled by the defeat of her forces by the Regent Moray (1568); the Covenanters defeated Claverhouse at Dun-clog in 1679, and were in turn defeated by the Duke of Monmouth at Bothwell Brig in the same year.

Lancashire, län'ka-shér, county palatine in England, bounded on the north by Cumberland and Westmoreland, on the east by Yorkshire, on the south by Derbyshire and Cheshire and on the west by the Irish Sea. Area, 1,880 square miles. It is somewhat flat toward the shoreline, but elevated in the north and east. Geologically, carboniferous limestone prevails in the north, old red sandstone on the coast. Wheat, oats and potatoes form the principal crops; and among its minerals the principal are coal, slate, paving stone, stoneware and fireclay. The great coal field extends in square miles between the chief rivers, the Ribble—the dividing line between the northern and southern parts of the county—and the Mersey. Iron is abundant in the Furness district, also famed for its copper and lead. Its minerals, and especially its great cotton industry, have given it world-wide fame; and its other manufactures include worsted, wool, silk, machinery, glass and soap. Liverpool and Manchester are the principal cities. The capital is Lancaster. For Parliamentary purposes the county has 23 divisions. After the Norman Conquest, Lancaster became first an earldom and then a duchy, and since the reign of Edward IV it has been a Crown duchy and palatinate. Pop. 1,477,532, of which 4,000,000 are in South Lancashire.

Lancaster, län'kə-stər, Sir James, English navigator: b. about 1550; d. London, May 1618. He served under Drake against the Armada in the Edward Bonaventure. He commanded the same ship in the first English expedition to the East Indies (1591-94). The record of this voyage is one of perilous adventure, in which some Portuguese ships were captured, and a mutiny broke out in his own crew. Of the 200 who had doubted the Cape with him, but 25 returned to England. This voyage led to the founding of the East India Company, of which he was an original director. He captured Pernambuco in Brazil in 1594, and commanded the first fleet of the East India Company (1600-03). On his return home he was knighted. He did much to promote the voyages of Weymouth, Hudson and Baffin, in search of the Northwest Passage to India. The strait leading west from the north of Baffin Bay was in 1616 named Lancaster Sound by Baffin. He was the first of the navigators to use lemon juice as a remedy for scurvy, the virtue of which was afterward entirely forgotten for nearly 200 years. Consult his 'Voyages,' edited by Markham for the Hakluyt Society (London 1877).

Lancaster, Joseph, English educator, the founder of the educational system bearing his name: b. London, 25 Nov. 1778; d. New York, 24 Oct. 1838. Early awakened to religious impressions, he served as a naval volunteer and afterward joined the Society of Friends, and became deeply imbued with the educational needs of the poorer classes. In 1796 he opened a school for children in Southwark,
which he conducted on the Madras system, previously made by him (see Bell, Anna. The principal features of the system were the teaching of the younger pupils by the more advanced students, called monitors, and an elaborate system of mechanical drill. By means of which these young teachers taught large numbers at the same time. Although his schools were opposed by the Established Church as subservient of its monopoly, he soon found powerful support, and in 1805 was teaching 1,000 children. The number of his patrons and the amount of subscriptions continuing to increase, he founded a normal school for training teachers in his system. He made extensive tours through Great Britain and Ireland, and in 1811 had founded 95 schools, attended by 30,000 children. He was somewhat unbusiness-like and imprudent in his habits; became bankrupt, and emigrated to America in 1818, where schools were founded on his model at New York, Philadelphia, Boston and Baltimore, and afterward attempted to set up one in Montreal. He ultimately fell into poverty. He finally subsequently removed to Mexico, where his system was very popular, and where his grandchildren, bearing the name Lancaster-Jones, became prominent politically.

**LANCASTER, William Joseph Cosens**, English civil engineer and author: b. Weymouth, 23 May 1851. He entered the Indian army as a midshipman, but on account of defective eyesight resigned, and became a civil engineer, in that capacity visiting different parts of the world. Under the pseudonym "Harry Collingwood," he is known to have visited England and America as the author of the popular nautical romances, 'The Secret of the Sands' (1878); 'The Under the Meteor Flag' (1884); 'The Pirate Island' (1884); 'The Congo Rovers' (1885); 'The Missing Merchant' (1888); 'The Cruise of the Esmeralda' (1894); 'An Ocean Chase' (1898); 'The Castaways' (1899); 'A Pirate of the Caribbees' (1900); 'Across the Spanish Main' (1900); 'Under the Chilean Flag' (1908); 'Overdue' (1910).

**LANCASTER, England,** municipal borough and county town of Lancashire, on the south bank of the Lune where it becomes tidal 12 miles from the sea, and 21 miles north of Preston. The silting up of the estuary with sand has made the port inaccessible for large vessels, but a dock has been built at Glasson, five miles distant, where ships transfer their cargoes to lighters. The principal manufactures are cabinetmaking, oilcloth and linoleum, cotton and silk goods, and machinery. Lancaster was a Roman station; its earliest charter is dated 1193; but except for the castle keep, built by the Normans, and Saint Mary's Church, no building antedates the 17th century. The town owns the gas, water and electric undertakings, as well as slaughterhouses, baths, markets and cemeteries. A magnificent town hall, built in the classic style and the gift of Lord Ashton, was opened in 1909. There are technical and art schools, a fine aqueduct and a fine public park, the Williamson Park. Pop. 41,410.

**LANCASTER, Mass.,** town, and several villages combined, in Worcester County, on the Nashua River, and the Boston and Maine Railway, 18 miles north of Worcester. Here is the State Industrial School for Girls, a public library, four churches, the Thayer Museum of North American Birds, high school, and manufactories of brick, cotton yarn, brushes, etc.; printing office and bookbindery; also large poultry and other farming interests. The Seventeenth Day Society is one of the largest academies at South Lancaster. The town was first settled in 1651 by John Prescott. In 1676 the Indians laid the place in ruins and killed 40 of the inhabitants. It is the birthplace of Mrs. Caroline Lee (Whiting) Hentz, author of "The Planter's Northern Bride" and other once popular novels; James C. Carter, the noted lawyer, and Luther Burbank. The town owns the waterworks. Pop. 2,585.

**LANCASTER, N. H.,** town and county seat of Coos County, on the Salmon River, 126 miles north of Concord, on Western Boulevard route of the State system, with direct roads and good roads to all mountain resorts. There are excellent schools. The town is on the Boston and Maine and the Maine Central railroads and is a popular summer resort and residential section for New York and Boston people, being situated in an attractive part of the White Mountain region. It has manufactories of drugs, chemicals, lumber, wood-work and machinery. The town was settled in 1764. The town owns and controls the waterworks. Pop. 3,054.

**LANCASTER, N. Y.,** village in Erie County, on the New York Central and Hudson River, the Lehigh Valley, the Delaware and Lackawanna and Erie railroads, 10 miles east of Buffalo. An important manufacturing centre containing iron-works, brass foundries, machine shops, glass-works, flouring-mills, brick-yards, knife-works and other industries. The waterworks plant is owned by the village. Pop. 4,364.

**LANCASTER, Ohio,** city and county seat of Fairfield County, on the Hocking River and Canal, and the Pennsylvania and other railroads, 32 miles south of Cincinnati, the farming centre for the county; is in the natural-gas belt and is engaged in the manufacture of agricultural implements, stoves, paper, automobile tires, wood-pulp machines, lenses, carbon pyrometers, foundry products, flour, glass, shoes, and has railroad shops and carbon works. It is the seat of the State Industrial School for Boys, Crawfis Institute and the Columbia Commercial School; contains a fine courthouse, high school, four banks and many churches; and has electric light and street railroad plants; a good water supply; daily, weekly and monthly periodicals; and an assessed property valuation of over $2,000,000. The city does an annual business amounting to $750,000. It was first settled in 1800 by Ebenezer Zane and is governed by a mayor and a city council of seven members elected every two years. The city owns the waterworks and gas plants. Senator John Sherman and Gen. W. T. Sherman were born here. Pop. 14,840.

**LANCASTER, Pa.,** city and county seat of Lancaster County, the richest agricultural county in the United States (census 1910), on the main line of the Pennsylvania and the Philadelphia and Reading railroads, 68 miles west
of Philadelphia and 37 miles east of Harrisburg. It is the manufacturing trade centre for the county; it is an important tobacco market and is engaged in tobacco growing, cigar-making, cattle raising and the manufacture of cotton goods, locks, watches, umbrellas, silk, linen, cork, iron and steel goods. It is the seat of Marshall College and the Thaddeus Stevens Industrial School of Pennsylvania; contains the General, Saint Joseph’s and the County hospitals, Children’s Home, a public library, a Y. M. C. A. and Y. W. C. A.; has gas and electric light plants, 162 miles of electric railroad in the city and county, 13 national and State banks having a combined capital of $2,904,000, about 50 churches and an assessed property valuation of over $25,000,000. The city was founded in 1718 by Memontes (q.v.) and was called Hickory Town until 1730. In 1777 Congress sat here for a few days and from 1799 to 1812 it was the capital of the State. It became a borough in 1742 and a city in March 1818. It is governed by a mayor, elected every two years, and by a select council of nine members and a common council of 27 members elected annually. Here is the birthplace of Gen. John Fulton Reynolds, home of President James Buchanan, 15th President of United States, and the tomb of Thaddeus Stevens, the great statesman. The municipality spends upward of $250,000 yearly in maintaining the public service. Pop. 55,000.

LANCASTER, S. C., town and county-seat of Lancaster County, located on the Southern and Lancaster and Chester railroads, 72 miles north of Columbia and 40 miles south of Charlotte. This is the shipping and trade centre of a large and fertile district devoted to the growing of cotton, tobacco, alfalfa and grain, and to the live-stock industry. The largest cotton-mill under one roof in the South, 137,778 spindles and 3,006 looms, is located here; machine shops, cotton-oil mill and other industries; the second largest department store in the State; splendid graded schools; paved streets and all modern city conveniences; 100 business houses; three strong banks; one semi-weekly newspaper; magnificent churches; a salubrious climate and a most hospitable citizenship. Pop., city, 3,500; city and mill district, 7,000.

LANCASTER, House of, a name given in English history to designate the line of kings — Henry IV, V and VI, immediately descended from John of Gaunt, fourth son of Edward III. Edmund, second son of Henry III, was created Earl of Lancaster and four of his descendants added Derby and Lincoln to his titles, became leader of the baronial opposition to Edward II and was beheaded for treason. His grandson was advanced to the dignity of a duke and, dying without male issue, the inheritance fell to his daughter Blanche, heiress of Lancaster, who became the wife of John of Gaunt, who in 1362 was created Duke of Lancaster. His elder brother Lionel was created Duke of Clarence, and thus originated the rival houses of Lancaster and York. Henry IV, son of Edmund, second son of Edward III and son of Lionel, and usurped the crown, being succeeded by his son Henry V, and both sovereigns obtained Parliamentary and Church sanction for their rule. The long minority of Henry VI and his feeble rule ended in the Wars of the Roses (q.v.), the contest being concluded by the union of the two houses in the marriage of Henry VII, the Lancastrian heir, with Elizabeth, eldest daughter and heiress of Edward IV, of the House of York. See also England.

LANCASTER SOUND, an outlet of Baffin Bay, in lat. 74° 20’ N., connecting it with Barrow Strait. This opening into the Arctic Ocean was discovered by Baffin in 1616 and was named in honor of Sir James Lancaster (q.v.), but it was first navigated by Parry in 1819. Only part of it is navigable each season.

LANCASTERIAN SCHOOLS. Democracy had not yet obtained such a strong hold upon the people of America at the beginning of the 19th century as to lead them to provide free public schools for all the children. Then, too, the financial conditions of the country were such that the people were unable to meet the expense which would be incurred in the maintenance of such schools. Private schools which received pay pupils, church and charity schools and home instruction were the educational facilities afforded in these early times. Probably not more than 25 to 30 percent of the children of the country were afforded the opportunity of attending a school. Men of vision recognized the menace to a republican form of government in a large body of illiterate citizens and the need, therefore, of remediating the situation which existed. It was known that in London a type of schools had been established which afforded instruction for a large number of pupils at very small cost. These schools were known as Lancasterian schools.

The founder of these schools was Joseph Lancaster, a native of London. His parents were very poor and he received only the rudiments of an education. He possessed a philanthropic, benevolent spirit and showed marked interest and sympathy in the poor. At the age of 20 he opened in Southwark, London, in 1798, a school for the poor. His personality, his genius for organization and the great necessity for a school of this type made the enterprise a success and he soon enrolled 1,000 pupils in the school. A small tuition was charged those who could pay it but no pupil was refused admission who was unable to pay tuition. The receipts from tuition did not permit the employment of sufficient teachers to give instruction. Lancaster was familiar with the type of school maintained by Dr. Andrew Bell under a monitorial system. He modified and improved the Bell system and adapted it to meet the needs of his school.

In 1805, the legislature of New York incorporated an organization known as a "Society for establishing a free school in the city of New York for the education of such poor children as do not belong to or are not provided for by any religious society." One of the prime movers in the organization of this school was DeWitt Clinton. The first school opened by this society was in 1806 and the complete system was put in operation in that school. The dominant influence in this society was that of the Friends and as Lancaster’s school in London was non-sectarian and had been sup-
LANCASTERIAN SCHOOLS

ported by the Friends it was natural that this society should adopt the Lancasterian type of school. The name of the society was later changed to Public School Society and continued its operations for nearly 50 years or until 1852 when it was merged into the public school system of the city under the control of the board of education. More than 60 schools had been established and in each of these during their entire history the Lancasterian system was in operation. While the Lancasterian system will always be associated with the Public School Society of New York City, such schools were very generally organized in the northern and eastern parts of the United States. He attempted the organization of an institution in Baltimore under his own direction known as Lancasterian Institute. Little is known of this institution except that it was a failure. He also organized a model Lancasterian school in Philadelphia. Outside of New York city these schools were not a factor in public education for a longer period than 20 years and gradually disappeared after 1830. A fine school building administered under the Lancasterian plan was erected at Albany in 1812 and still stands on Eagle street one block south of State street and is owned and occupied by the Albany Medical College.

The most distinguishing feature of the Lancasterian schools was the employment of monitors. One teacher with the assistance of monitors would give instruction to 500 and often to 1000 pupils. The monitors were chosen from the pupils in the school. The pupils who were regarded by the master as the best students in the advanced classes were selected. They were generally allowed their tuition for the services rendered and sometimes were paid a shilling or two per week. A monitor was charged usually with the instruction of 10 younger pupils. He sat on a high stool or raised seat at the end of a bench on which his pupils were seated. These monitors were very often divided into two classes: general monitors and subordinate monitors. The general monitors were the superior monitors; they were divided into: general of reading, monitor-general of writing, monitor-general of arithmetic. The subordinate monitors were called assistant monitors or simply monitors of reading, monitors of arithmetic, monitors of writing, etc. Each monitor wore a badge or ticket usually made of leather and on this was printed the title of the monitor and his rank.

The curriculum in these schools consisted almost wholly of instruction in reading, writing, arithmetic and morals or religion. Instruction in science and in English grammar was added to the course of study in the schools of New York City during the later years of their existence. The teaching was wholly mechanical. The sole effort of instruction was that of imparting information by the use of the memory. There was an absolute lack of effort to arouse the child's powers of observation, to stimulate the exercise of his own mental attainments and to develop him into a reasoning, thinking being. Much of the instruction was given by dictation and by the use of formal questions. This was necessary under the monitory system because the monitors did not possess sufficient education to give independent instruction. Sand tables were used for the children in the younger classes. Boards containing the letters of the alphabet — small and large — were posted in the schoolroom. The alphabet wheel was also largely used. This was arranged so that a wheel adjusted to a standard might be turned in such a way as to show consecutively letters of the alphabet. When a letter was exhibited the child from dictation traced the letter in the sand or on a slate.

Children who had not received instruction were placed beside those who had received instruction, so that the latter might aid the former. This process was called the "teaching the alphabet" tedious and required from one to two years to enable the child to "learn his letters." This process was termed a "very intellectual method of teaching the alphabet." Writing was of course taught in conjunction with the reading. When a pupil had learned his alphabet he was promoted to the class in monosyllables and was taught b - a spells ba. Arithmetic was taught under the same general plan. The subject included the four fundamental processes. The monitors would give the pupils a figure from the blackboard. The monitor would write a column of figures on the blackboard and the first pupil would read aloud as, "3 and 4 are seven and 5 are twelve and 6 are twenty-five, put down 5 and carry 2 to the next." If the first pupil made an error, in addition the pupil who discovered it took rank over the one who made the error. As pupils became proficient in arithmetic they were promoted in that subject independently of their proficiency in other subjects. They were promoted in each subject on the same basis. Here was the idea of the modern departmental system of school organization. Teachers of today and even the layman in education will understand the general defects of the Lancasterian system of instruction.

The principles upon which Lancaster founded his schools were sounder than his plan of organization or his systems of instruction. He declared that all children were entitled to an education and that the good of society required that they should be taught to copy figures from the blackboard. If the first pupil made an error, in addition the pupil who discovered it took rank over the one who made the error. As pupils became proficient in arithmetic they were promoted in that subject independently of their proficiency in other subjects. They were promoted in each subject on the same basis. Here was the idea of the modern departmental system of school organization. Teachers of today and even the layman in education will understand the general defects of the Lancasterian system of instruction.

Lancaster made extended use of mottoes which were posted conspicuously in the schoolroom, on cards or boards, and which were also made the subject of classroom instruction. Some of these were as follows: "A place for everything and everything in its place." "Let every child at every moment have something to do and a motive for doing it."
brought from London to take charge of a public school in New York City. The training of teachers which had already received attention was given prominence and the trustees announced that they would gratuitously train teachers for this system in six or eight weeks. Lancaster did not approve this limited training and referred to it as preparing "mush-room teachers." The plan of training teachers in New York City was later improved and the course extended to include more advanced instruction. The work of these schools in training teachers was no more effective than the instruction which the schools provided for the children.

Lancaster was opposed to the rod as a disciplinary agency. His ideas on this subject are represented in the following statement: "The guillotine in France, during the Reign of Terror, and the rod in the hands of the advocates of ignorance, are alike. DeWitt Clinton stated in relation to the discipline of these schools, "The punishments are varied with circumstances, and a judicious system of rewards, calculated to engage the infant mind in the discharge of its duty, forms the keystone which binds the whole edifice." Rewards were offered for meritorious conduct and fines were imposed for breaches of discipline. These were arranged on an elaborate scale through the issuance of tickets; some of the common modes of punishment were as follows: placing a wooden log weighing from three to eight pounds around the pupil's neck; putting wooden shackles on the legs of a pupil and compelling him to walk around the room, putting the hands behind the back and tying them with wooden shackles; tying the legs together, detention after school hours, placing a label on the pupil which specified his offense, compelling a pupil to wear a tin or paper cap or a fool's coat, giving an indolent boy a cart or a pillow. It is suggested in the manual that boys should be rocked in a cradle.

In the year 1818, Lancaster came to the city of New York. He was received as a distinguished guest of honor. He was welcomed on behalf of the city by the recorder and the mayor and on behalf of the State by Governor Clinton. The governor invited him to Albany and there introduced him to the leading men of the State. He then visited the city of Philadelphia and was there received with unusual honor and distinction. From Philadelphia he went to Washington where the House of Representatives passed the following resolution: "That Joseph Lancaster, the friend of learning and of man, be admitted to a seat within the hall." Clinton gave the Lancasterian system his unqualified approval and through his great influence the system was readily adopted in every city in the State of New York. Clinton said of him, "I recognize in Lancaster the benefactor of the human race. I consider his system as creating a new era in education, as a blessing sent down from heaven to redeem the poor and distressed of this world from the power and dominion of ignorance." One of the governor's last official acts was to recommend the enactment of law authorizing the supervisors of each county to raise $2,000 for the establishment of a monitorial high school in each county of the State.

This system did not provide a sound system of public education. It became established in certain parts of the country, notably in New York City, and delayed the establishment of a sound, practicable, efficient system of education in such places for several years. Its adoption not only throughout the United States but in England, Holland and Germany was due largely to the claim of its friends, who said the teacher could instruct one thousand pupils. The fact that throughout the world for a period of 25 to 50 years shows the lack of appreciation of a sound, scientific system of education which existed not only in America but abroad in the formative period of our national government.

THOMAS E. FINNEGAN,
Deputy Commissioner of Education and Assistant Commissioner in charge of Elementary Education, State of New York.

LANCE, George, English painter: b. Dunmow, Essex, 24 March 1802; d. Birkenhead, 18 June 1864. When less than 14 years old he entered the studio of Haydon in London and remained a pupil there for seven years, also studying at the Royal Academy. He began to exhibit in 1824 and is best known as a painter of flowers, fruits and garden subjects. He produced historical and genre work. He exhibited 135 pictures at the British Institution, 48 at the Society of British Artists and 38 at the Royal Academy. His work may be seen in the National Gallery, the South Kensington Museum and the Tate Gallery. Among his pupils were Sir John Gilbert and William Duffield.

LANCE, a weapon consisting of a long shaft, with a sharp point, much used before the invention of firearms and still in use. It was common among the Greeks and Romans. Frederick the Great formed an entire regiment of lancers. The Austrians followed and soon established three regiments. After the partition of Poland, many Poles entered the French service and a body of Polish lancers was established. The war with Russia, in which efficiency of the lance in the hands of the Cossacks, particularly in 1812, was strikingly manifested, brought this weapon into still more repute, and the Prussians formed three regiments. The French lancers were brought in 1813 to cope with the Cossacks. Almost all the armies of Europe have regiments of lancers: the Cossacks of the Ural, the German Uhlangs, the independent cavalry of the French dragonos, the first regiment of each division of Turkish cavalry and the Bengal native cavalry are armed with the lance, as are four Belgian and six British cavalry regiments. This arm is not in use in the United States cavalry. The weapon is from 8 to 11 feet long and is made of oak, bamboo or (in the case of the Uhlangs) of tubular steel. It has long been a subject of debate whether the lance or sword is the more effective cavalry weapon; its execution is most deadly in the pursuit of a fleeing enemy.

LANCELET. See AMPHIOXUS.

LANCELOT OF THE LAKE, a name celebrated in the traditions relating to King Arthur or the Round Table. Lancelot was the son of Ban, king of Brucic, and after his father's death was educated by Viviana (the Lady of the Lake). She took him to the court
of King Arthur, to make him one of his knights, and to admit him to the Round Table. Arthur, with his sword (Escalibor) dubbed him knight, and Lancelot subsequently distinguished himself by his great heroism. His love for Guinevere, the wife of Arthur, and his disregard of Morgana, a fairy, and the sister of Arthur, plighted the knight in the most dangerous situations, from which, however, he always extricated himself. He finally succumbed to the throne, after having defeated King Claudas, the murderer of his father, but was slain by Mordred, the murderer of Arthur, whom Lancelot wished to punish. In his last moments Viviana appeared and kissed the last breath from the lips of the dying hero, the sole survivor of the Round Table. His remains were deposited near those of Guinevere.

Lancer, a soldier of the European light cavalry, carrying the lance as a weapon. The use of the lance is of mediaeval origin although in later European warfare the Cossacks originally used the lance; it was not introduced into regular army regiments until Napoleon made use of it. Lancer regiments have since been in existence in most European armies. The Prussian regiments so armed are designated Uhlan, while the Cossacks retain their original name with the weapon. There are no lancer regiments in the United States army. The lance regiments were used effectively in the early stages of the European War, but trench warfare interrupted their usefulness, together with that of other cavalry divisions. The lancer regiments are most useful when the enemy infantry is in retreat, the effect usually being demoralizing.

Lancet-Fish. See Surgeon-Fish.

Lancet Window, a high and narrow window with an arch acutely pointed, resembling a lancet in form. This form of window structure was characteristic of the first half of the 13th century and remained in use in England and Scotland long after the French had perfected the more ornate forms. They were often built double or triple and in some instances more than three windows are used together, as in the case of the Five Sisters at York Minster. The groups at Ely and Salisbury provide excellent examples of the double and triple types. In the lancet groups the central arch may be higher although this is not invariably.

Lancewood, the wood of a West Indian tree (Bocaego virgata), of small or moderate size, but of great usefulness and value, possessing in a high degree the qualities of toughness and durability. It is well adapted for the shafts and poles of light carriages, and for all uses where light, strong, elastic timber is required. Both in strength and elasticity it is considered superior to the best ash. The name is also applied to the trees themselves, as well as to several other trees and their wood.

Lanchow, lân’chôw, Chinese capital of the province Kansu, on the right bank of the Hoang-ho and near the Great Wall of China. It is one of the most important cities of interior China, due in part to its situation at the junction of the trade routes to Turkestan, Tibet and Afghanistan. The streets are paved with stone, although the buildings are chiefly of wood. The important manufactories are those of woolen and camels’ hair goods and ammunition, while a large trade is carried on in silks, silver and jade ornaments, fur, wood-carvings, tin and copper wares, grain, vegetables, fruit and tea. The population is variously estimated at from 100,000 to 500,000.

Lanciani, lân-châ’né, Rodolfo Amedeo, Italian archeologist: b. Rome, 1 Jan. 1847. He received his education at the Collegio Romano and the University of Rome, and in 1878 was made professor of archeology and history in the latter. He attained celebrity by his investigations among the ruins of Rome, is the author of upward of 400 archeological or historical publications, and is a member of many learned societies and a senator of the kingdom of Italy. In 1887 he gave a course of lectures at Harvard University, published with the title ‘Ancient Rome in the Light of Recent Discoveries’ (1888). Other works of his are ‘L’Itinerario del conte Federico l’Ordine di Benevento Canonic’ (1891), ‘Il Parnas e Christiana’ (1893), ‘The Ruins and Excavations of Ancient Rome’ (1897); ‘Forma Urbis Rome’ (1893-1901), a map of Ancient Rome in 46 sheets on a scale of 1:1000, showing all the excavations; ‘The Tombs of Old Rome’ (1901); ‘Golden Days of the Renaissance in Rome’ (1906); and ‘Wanderings in the Roman Campagna’ (1909).

Lanciano, lân-châ’no (ancient Aux-Annium), Italy, city and episcopal see in the province Chieti, eight miles from the Adriatic and 12 miles southeast of Chieti. The city is built upon three hills, two of which are connected by a Roman bridge, and is 984 feet above sea level. It has an imposing cathedral, with a clock-tower built in 1619. There is a Gothic church erected 1227, and there is a fine rose window, 1302, in the church of the Annunziata. It is the seat of an archbishop, whose palace is built upon the remains of an old Roman theatre. The ancient city was a judicial and civic headquarters under Roman occupation. The modern city, which has a hospital, gymnasium, library and other progressive institutions, the trade of the city is concerned largely with the products of the surrounding country, silk, wine, oil, fruits and grain, and there are linen and hemp factories. Pop. (commune) 19,917.

Lancrat, lân’kra, Nicolaus, French painter: b. Paris, 22 Jan. 1663; d. there, 14 Sept. 1743. He studied under Ulm and later under Gillot who had taught Watteau. Lancrat’s style was largely influenced by Watteau, for whom he had a great admiration, and while his productions never equalled those of his model, he did excellent work in the portrayal of the gay scenes of the court under the Regency. More than 80 of his paintings have been engraved and the total of his work is immense. He was admitted to the Academy in 1719 and in 1735 he became a councilor. The National Gallery, London, has four of his paintings, ‘The Four Ages of Man’; the British Museum has an excellent series of drawings done in red chalk; there are 28 of his paintings in the royal palaces at Berlin and Potsdam, these being purchased by Frederick the Great of the cite are paved with stone, although the buildings are chiefly of wood. The important manufactories are those of woolen and camels’ hair goods and ammunition, while a large trade is carried on in silks, silver and jade ornaments, fur, wood-carvings, tin and copper wares, grain, vegetables, fruit and tea. The population is variously estimated at from 100,000 to 500,000.

Consul d’Argenville, ‘Vies des peintres,’

LAND, in Political Economy. In economic theory as in social fact, land holds a peculiar position, which the laws normal to other industrial objects are deflected. Foremost is the fact that it being an indispensable locus for all industry or even social existence, its price or rental in a community where all the land is taken up is non-competitive, a monopoly which it is also a using and non, as would be that of air or water, and consequently is always higher than its productive value justifies, or what is the same thing, men are content to receive a less return on their capital invested in it than in any other object. This is of course aggravated in countries where, as in England before 1832, all political privileges are annexed to it, the richest manufacturer having no vote unless he bought land and became a freeholder; less so, but still heavily, in England at present, where an undisturbed majority confer great social and political prestige, but not of in societies like the south of Ireland where there is practically no industry but agriculture, and a footing on the soil at some terms is the one refuge from starvation. Farms there in former days were bid for on which one could obtain a dozen times the gross annual produce, because there are no degrees in impossibility, and they could not in any event be deprived of a bare coarse subsistence. But the only countries in which it is of any economic value with other objects are those like America, where there has been an inexhaustible abundance of land to be had at about the cost of surveying and registering title; and here it has been the economic regulator of other prices and wages, which cannot fall below the profit of free agriculture.

The economic discussion over land in England, where freeholds are very difficult to acquire, naturally took the form of an investigation of the phenomena of Rent (q.v.); and an important part of the first economic philosophy was used, a theory of the origin and mutations of the rent charge. According to them it could only exist where there were different grades of soils, and represented the difference in profit of farming better ones over than the worst. The labor invested in their utilization worth while. In fact, however, even if all soils were alike, rent would still be paid for their hire if the labor and capital could produce more than the rent. Another principle early formulated, differentiating the working of land from other industries, was that of diminishing returns: it was said that labor and capital in any other field produce in exact proportion to their volume, whatever that be,—10 times the investment producing 10 times the return,—whereas upon the land it is manifestly not so. A laborer produces but a small and rapidly dwindling accretion to the product, till it soon ceases to produce any. Here again there was imperfect observation: two plowings or hoeings would not produce double the crop of one, but a laboriously invested in manures or other fertilizers, loads of loam, etc., often produce very much more than a proportionate extra return. The real difference is, that in other industries the extra outlay can be applied in exactly the same channels, in land it must see different ones.

Land in this sense refers purely to land used for raising food; where it has other uses, it is subject to the general laws of industry. Land, for instance, on which is located a water-power for manufacturing, or minerals to be sold, if for sale, follows the usual mercantile conditions.

The subject of land belongs under Land Laws; of the single tax, under Taxation; of land nationalization, under Socialism, it being a branch of the question how far it would profit the country to place the entire social property under elected instead of self-determined managers; of agrarian difficulties, under the special branches of history concerned,—the Roman agrarian contests, for example, shed little light on and are little illumined by the system of peasant distribution in France or the Irish land laws, with its changes from feudal to dual and finally to occupying ownership. For the methods followed in the United States, see Public Lands.

LAND BANKS, Massachusetts. Early in the 18th century Massachusetts paper currency had driven abroad nearly all her coin, broken her credit and demoralized her business, and the failure of the Quebec expedition in 1711 carried the embarrassment to a climax. Encouraged by the success of the South Sea scheme in England, some Boston merchants induced the General Court to make the bills of credit of the province legal tender for debts of seven years previous and three years subsequent. Besides this, a number of notable men, including Peter Faneuil, devised the scheme of a bank whose resources should rest on real estate mortgages, to make loans of its own notes; to encourage subscriptions it was proposed that Harvard College should have $1,000 a year out of the proceeds. Governor Dudley, Attorney General, memorialized the General Court against it, and the latter forbade them even to print their scheme till they had laid it before the court, which then refused to incorporate it. To ward it off and produce the same result, at Dudley's suggestion a public bank was founded, with a capital of $250,000 provided by the General Court, to lend bills of credit for five years at 5 per cent, one-fifth to be repaid each year, the whole secured on real estate mortgages. In 1729, with the bad market, the bank was increased by the still worse state created by the paper money of Rhode Island, and silver rated at 27 to 1, the project of a land bank was again brought forward. Several hundred persons were to form it; notes were to be issued up to $250,000, the security being a mortgage on each partner's real estate in proportion to his holding, or sureties also possessed of sufficient estate, and each partner paying 3 per cent on the loans made him, in bills or in kind, at a rate fixed by the directors. The House of Representatives was largely favorable, but Governor Belcher denounced it as tending to fraud, disturbance of order and confusion of business, and he set aside the election of the speaker and nearly half the council for connection with the bank, besides displaced many of his party. Despite this, the company began operations, expecting that the notes would circulate readily. They were mistaken: not over $300,000 were issued. But in 1741 Parliament not only extended to the colonies an act forbidding the issue of bills not payable in coin at the end of the term, but made the directors liable to the
LAND OF BEULAH.—LAND-BRIDGES ACROSS THE OCEANS

holders of the bills for their face with interest. As a large part of them had been issued at a discount, the partners (though many had little to lose) were threatened with ruin; and Parliament had to permit relief measures. One of these partners, who lost all his property, was the father of Samuel Adams.

LAND OF BEULAH (Isaiah lxii, 4), the name of Israel when it shall be married. In Pilgrim's Progress Bunyan uses the term to designate a resting place "where the sun shineth night and day" and where the Pilgrims remain until they cross the river Death to the Celestial City.

LAND BOUNTY. See BOUNTIES.

LAND-BRIDGES ACROSS THE OCEANS. One of the most attractive studies in geology is that of the change in form of the continents, and in the relative spaces of ocean, especially since the continents assumed their present general shape, and especially since the beginning of the Age of Mammals, or Tertiary Period,—that geological period which closed with the Glacial Epoch. By this time that during this period millions of years long, many changes occurred in the level of the lands of the globe. Sometimes one or the other of the great masses was lifted, until a much larger expanse of land was out of water than before; then again it would sink until the sea overran broad areas. Geologists know this from the fact that they find rocks which were evidently formed under salt water. By their characteristic fossils, and by other marks, they know where these rocks belong in the scale of geological succession, or time; and by plotting them on a map they can show approximately the shape any continent had at some long-past time. Of course this may not be done for any stage you may ask for, but it can for some of them. Thus in the early part of the 'tories,' both America were in much their present condition, only broader in Canada, Europe was an archipelago of large islands, separated from Asia by a broad sea, and the Mediterranean extended over the Sahara deserts, leaving central and southern Africa as an island. All Persia, Syria and Arabia were then under water, so that the cold Arctic Sea flowed through into the Indian Ocean, which must have made the climate of India and East Africa very much cooler than now.

The most interesting feature of these changes, however, is that by which, now and again, the Old World was connected with the New by necks or spaces of land, known as land-bridges; especially as these permitted an interchange of plants and animals, giving to us many new ones from the other side of the ocean, including finally, man himself.

No more fascinating department of natural history exists than the study of the distribution of the earth's living beings, past and present. A striking result of this study is the knowledge that the world, its great and small islands, and the southern hemisphere, in their plants and animals, the several parts of the northern hemisphere are closely similar in this respect. The same families of trees—pines, cypresses, cedars, are present in both, and so goes it with flowers, grasses, ferns, leeks, and so on; and the same sorts of animals—quadrupeds, birds, fishes and insects—are found in Europe and northern Asia as in North America. In fact, many of the living species are virtually identical in all three regions. It is hard to separate the Indian and the New World, the Russian argali, our musk ox and caribou from the elk and reindeer of Norway; and some, like the polar bear, fox and wolf, the raven, golden plover, crossbill, bank-swallower and others, are quite alike in both the Old and the New Worlds. This has been so, judging by the fossils in the various Tertiary strata, ever since the Age of Reptiles.

What is the explanation? None of these animals, save possibly certain birds or fishes, could get across an ocean. They must have been able to travel upon land, and it is from their presence that it seems certain that land-bridges have existed, at various times in the past, between the northern parts of America, and Europe and Asia.

Let us pause here a moment to note what North and South America have to show on this point. South America possesses a fauna which is peculiar to itself. Several large groups there are not represented in any other part of the world, and nearly all its animals in every class, are different from those elsewhere. The fossils show that the same was true in the far past; so that it looks as if that continent has been isolated ever since its life began: only Australia is more self-supplied.

But if South America has always been cut off from the rest of the world (except from North America, at times), where did it get its marsupials? These were numerous there in Tertiary times, and big and little opossums still remain. The only answer is a supposition that at a period when mammals and birds were just beginning to take distinctive form in a world mainly reptilian, both the Australasian islands and South America were attached to an Antarctic continent then far broader than now. An elevation of 10,000 feet above the present level would expose dry land far beyond the Antarctic Circle and include Australia, New Zealand and Patagonia in a South-polar continent; and there is other evidence that such an "Antarctica" existed in Cretaceous and Paleocene times, and that its borders, at least, had a temperate climate.

It is supposed, also, that at the same time, and somewhat later, Brazil and Africa were connected by a ridge, or a chain of islands, since it is hard to account otherwise for the presence of monkeys in South America, which first appeared there in Miocene time, or for certain rodents like those of South Africa. Furthermore, the Atlantic is comparatively shallow and island-studded even now in that narrow part.

Let us return now to North America and its oceanic bridges. These appear, from the data given in the works of Professors Osborn and Scott, to have been repeatedly established and destroyed by alternating elevations and depressions of the land and the sea-bottom, both before and during the Age of Mammals.

At the beginning of the Tertiary Period, continuous land encircled the North Pole. That this was the case is shown by the startling change from the present level may be seen by looking at a chart of the northern oceans. This shows
that a broad space extends from Scotland, to Greenland, where the water is nowhere more than 1,000 fathoms deep, and that the central part of this is a wide, winding plateau, named Wyville Thomson Ridge, which at the present time comes within 300 or 400 fathoms of the surface. Therefore an uplift of the bottom of the north Atlantic of less than 2,000 feet would have drowned the Banks of Newfoundland, include the British Isles within Europe, drain the Baltic and North Sea and connect the two continents by a neck of dry land about 300 miles wide in its narrowest part. There also would appear, probably, a second line of dry land about on the 80th parallel. Both of these, in the warm climate of the early Tertiary Period, would speedily have become covered with vegetation and attract and sustain wandering animals.

On the Pacific side, such a rise would drain nearly the whole of Bering Strait, and join Alaska to Siberia by a stretch of mountainous land a thousand miles in breadth. Even 500 feet of uplift would now close Bering Strait.

A moment's thought will show one that a definite and characteristic fauna of our countrymate of all northern lands must have followed the elevation of these "bridges." The Arctic Sea would then be confined to its own basin, and unable to pour its icy currents into either the Atlantic or the Pacific Ocean. Hence the warm Gulf Stream and its Oriental counterpart, the Japan Current, would, and must, follow a solid coast right around to Europe and western America, respectively, without interference by any cold currents from the north, as at present; and so the whole ocean must have been warmer than now. Hence, we find in the northern coast-rocks of that period remains of tropical sea-animals which could not exist in waters as cold as those of the present day. At the same time solid land extended much farther toward the North Pole than at present; warding off Arctic influences to some extent.

All these circumstances, with others, produced a warm climate in the earlier half of the Tertiary, so that, as the fossil plants of that time show, tropical conditions in the United States and even southern Greenland must have had weather in summer like that of Maryland, for it was clothed with similar plants and hardwood trees.

One may ask: What is the evidence that enables geologists to speak so confidently of the existence of these "land-bridges," since nothing is left of them? It is this: In the older layers of North American Eocene rocks, all the fossils are of animals peculiar to this continent—families and species which had developed here alone. In the next later layers, however, races of animals suddenly appear, for which no American ancestors can be found, but which are identical with those of the Old World of that time. None of these is much like any present creatures, of course, but the similarity of fossils on both sides of the ocean is so great that it is evident that these animals must then have been able to pass from one continent and colonize the other. The road lay far to the north, but the genial climate kept it open to all migration by migratory creatures.

There was at this period, also, a broad isthmus between the two Americas, permitting migration north and south as well as east and west, and it is from that time that we date the arrival of many ancient South American animals, one of which still remains—the opossum. Such a condition for world-wide distribution of plants and animals seems never to have arisen again, although lesser migrations have occurred, for "bridges" were submerged and re-established more than once in the subsequent periods.

Finally the advancing world arrived at that comparatively recent stage, just preceding the Glacial Epoch, which is known as the Pleistocene. All land-connections between Europe and Greenland had then sunk under the waves, leaving only Iceland, the Faroes and the Sketlands as monuments to its former situation; but now the basin of Bering Sea was once more drained and an isthmus of dry land, a thousand miles wide, united Siberia with Alaska, and this remained until the disappearance of the continental ice-cap.

It was by this broad path that America became peopled by a large number of the many kinds of animals which formed the truly grand faun of the American continent. Only those who have studied the matter realize how rich and varied this fauna was (as compared with the present paucity) in the genial time just preceding the general glaciation. A large proportion of the animals were immigrants; and, as no bridge had existed across the Atlantic for a long time previous, they must have come over from Asia by way of Alaska.

In this way we obtained most of our northem animals—the bighorn and the mountain goat, the bison, such deer as the moose, caribou and wapiti, the bears, the badgers, otters and other fur-bearers, foxes, wolves and a long list of lesser mammals, birds, etc. None of these have American ancestors. In return, America gave to the Old World the horses and camels, which, originating here, passed over into Asia and on beyond, where they survived, in more favorable circumstances, the extinction that overtook their races here. These two also passed into South America, where the horses died out, but representatives of the camel family remain in the guanacos, vicuñas and their domesticated races; and there came north the cumbersome ground-sloths and other strange early beasts, and, later, such modern ones as the puma, the porcupine and a few others.

But the strangest incident of this nature is that of the elephants which, from the Miocene onward, wandered over North America and finally penetrated to Patagonia. They developed as species and grew in size until at last they resulted in the huge imperial elephant, the mastodon and the mammoth, the last two of which were killed off here, as in Europe, by primitive men. All of these were, as races, immigrants; but from others? It is only within half a dozen years that this question could be answered. "Appearing," says Dr. Scott, "suddenly in the Miocene of Europe and North America; in which regions nothing was known that could, with any plausibility, be regarded as ancestral to them, they might have dropped from the moon for all that could be told concerning their history. The exploration of the Eocene and Oligocene beds of Egypt
has dispelled the mystery, and has shown that Africa was the original home of the group, whence they gradually spread to every continent except Australia. See ELEPHANT. See enormous numbers. See the world-wide evidence of the existence of "land-bridges" and their lasting effects upon the plant and animal history of the earth.

ERNST INGERSOLL.

LAND CRABS. Almost all shore-crabs will withstand exposure to the air for some hours without suffering injury, and many of them are regularly so exposed at ebh tide. It is not surprising, then, that some of them have wandered far from the seashore into the fresh-water streams and the moist woods and mountain forests, or even largely forsaken the vicinity of water and established themselves on dry hillsides. The land crabs, par excellence, belong to the family Geocarcinidae, in which the carapace is thick and hard, strongly arched above, rounded, bent downward and truncate in front, and vaulted in the branchial region. The branchial chamber is spacious and lined by a spongy membrane which retains moisture for a long time and thus keeps the gills damp. Six or seven genera and several species inhabit the warmer regions of both hemispheres. One species (Geocarcinum ruricola) is common on many of the West Indian islands, is excessively abundant on some of the Bahamas and occurs in southern Florida. They abound at the eastern end of Cuba, and were a source of immense annoyance to the inexperienced soldiers of the United States army in the campaign of 1898 against Santiago de Cuba. On Jamaica and the other larger islands they inhabit a zone in the hills from one to three or four miles from the shore, where they live in burrows beneath stones or under the roots of trees, from which they emerge at night to seek their chiefly vegetable food. They are large, robust creatures with extremely powerful claws, which a pugnacious disposition leads them to use freely. Mating takes place in the spring, and during the rainy season in May a common impulse causes them to migrate in vast armies into the sea, where they bathe and deposit their eggs, which are washed up and buried in the sand by the waves. By resident naturalists and travelers who have observed it, this animal's march to the sea is described as a most impressive sight. Most of the males form an advance guard which is followed in two or three days by the females and remaining males. They are said to proceed in a direct line and to climb over, instead of passing around, every obstacle, even houses and trees. After a bath, resting and resting, the crabs return to the hills and in midsummer close their burrows with leaves, grass, etc., and retire to their inmost recesses to moult. At this time, while in the soft-shelled state, they are in high favor for the table, and are dug out with great numbers for market. The crabs of this family possess well-developed gills, but in addition the gill-chambers are modified for air-breathing, the lining being thick and well supplied with blood-vessels, and divided by a fold of membrane so as to leave a sort of pocket in the upper part. The Brazilian mangrove-crab shows this especially well.

On Christmas Island, in the Indian Ocean, the soil of the high lands is in some places honeycombed with the burrows of a land-crab (Geocarcinoides calandi) that feeds on leaves which are dragged into the burrows. From their enormous numbers of them, "they must play a great part in the destruction of decaying vegetable matter, and its incorporation into the soil." Once a year, in the rainy season, they migrate to the sea for breeding purposes.

Another family of crabs, the land-hermit crabs (Camnobidae), are found on all tropical coasts, and spend most of their lives inland, often climbing bushes and trees. To this family belong the large coconut, or robber, crabs of tropical islands.

Even more perfectly adapted to terrestrial life are the many species of land isopods called wood-lice (q.v.); and many of the river-crabs (Thelphusidae), and of the crayfish, are more terrestrial than aquatic in habit. A well-known species of Thelphusa in Japan is sometimes met with on mountains at an elevation of 2,000 feet or more above the sea-shore. Consult Kingsley, 'Standard Natural History' (Vol. II); Proceedings of the United States National Museum (1899); Catman, 'Life of Crustacea' (New York, 1911).

LAND CREDIT AND LAND CREDIT INSTITUTIONS. Credit accorded on real estate security is short term if the period is nine years or under, and long term if it is 10 years or over. In the United States, however, long term is understood to begin after five years. Usually the principle of short-term loans is payable in lump at the end of the period, but the principal of long-term loans is reducible to final extinction by partial payments at stated intervals during the period. There are two methods for determining the amount of each of such payments, and also two ways of using them for the reduction and extinction of the debt. The amount may be determined by dividing the principal into equal parts by the number of years, or by splitting it into unequal parts and leaving the larger ones to the latter years so that the partial payments, with interest included, may be as nearly even as possible. Each payment is represented by a promissory note drawing interest from date of the loan. This is not an infrequent practice for 10-year loans, and is known as payment by installments.

But the common method of computation is to divide the principal by the present value, at interest compounded at the given rate, of a payment of one dollar at the end of each year for the period of the loan. To illustrate, the present value of a 20-year series of such one-dollar payments at 5 per cent compound interest is $12,46221 — a figure that divides 1,000, for instance, into 80.24 equal parts. Hence, this would be about the annual sum that a borrower would have to pay at the end of each year, in his burrows in large numbers for market. The crabs of this family possess well-developed gills, but in addition the gill-chambers are modified for air-breathing, the lining being thick and well supplied with blood-vessels, and divided by a fold of membrane so as to leave a sort of pocket in the upper part. The Brazilian mangrove-crab shows this especially well.

On Christmas Island, in the Indian Ocean,
method are called **annuities**, and the process of paying off a loan by such annuities is called **amortization**.

A variation of this method and process is to require the annuities to be paid at the beginning instead of at the end of each year, and to calculate them accordingly. On a 20-year $1,000 loan at 5 per cent interest the annuity would then be $77.94. But inasmuch as the first annuity is deducted from the face of the loan, the borrower would have to pay only $922.06. So if he wished the full $1,000 he would have to borrow $1,084.53 and pay correspondingly larger annuities. When payments are semi-annual, the interest dates are counted instead of the full years, and only one-half of the annual rate is taken; and so also with quarterly payments. Tables published in various languages give the rates by which the annuity can be computed for amortizing a loan of any amount, interest or period up to 30 years, embodying figures in integral figures, as $25, $50 or $75, but inasmuch as they let the period take care of itself, they are objectionable because of the odd number of years and the fractional payments at the end.

The amortization of loans by annuities supposes that out of each annuity there is taken the necessary part to cover interest on the loan and that the remainder is immediately applied to the reduction of the unpaid principal. The effect is the same as that of the installment plan; and this is one way to use the borrower's payments for the gradual extinction of his debt. The other way is to reckon the principal as remaining at its original amount throughout the period and to place the payments, less interest, into a sinking fund to be credited with interest at a given rate. If this rate is the same in every particular as that of the loan, there will of course be no difference between these two ways in actual results. But the borrower would be at a disadvantage if the sinking fund's yield were lower than that of the loan; and such is often the case in Austrian savings banks, where this sinking-fund plan is much used and the borrower's payments are kept in a deposit account. Loans, whatever be the manner of payment, attain their land-credit character by the mortgage given by the borrower to secure the performance of his contract. The value of the mortgaged property must at least equal the amount of the loan, and the borrower's title to it should preferably be free and unencumbered. The value and title are determined to the lender's satisfaction. Titles may be guaranteed by companies formed for such purpose. In the United States 19 States have enacted laws, embodying features of the Torrens system, for determining the title expeditiously; but in a number of the Western States the foreclosure laws, by reason of the borrower's homestead and other exemptions and redemption rights, do not permit a speedy collection of the debt in the event of default.

Long-term reducible loans are manifestly not suitable for the individual investor. They are practicable only for institutional investors that can hold a large number of them and thereby effect the immediate recovery of their funds, despite the length of the loan period. These instruments may be either bonds, like a promissory note, or debentures in the nature of a certificate of indebtedness with or without a date set for payment. Both may be subject to recall at the maker's will and be secured by mortgages held in trust. Debentures, however, usually have no fixed maturity or specific security, but are retired periodically by lot, while the holder's protection is the prior lien of the debentures on all the institution's assets. The length of a loan depends, from the borrower's standpoint on the size of the annuity he wishes to pay; from the lender's standpoint, it depends upon the terms and conditions upon which money may be obtained. The institutions for according land credit are either public, semi-public or private. Pure public institutions are those in which government supplies the working funds or the permanent fund, if any, and appoints the executive officers. In form public institutions are bureaus, commissions or departments of government, or supported by regular state appropriations, or incorporated bodies with capital or a foundation supplied by government, and with its guaranty, expressed or implied, or any credit instrument they may issue. They are not intended for the average landowner, any more than they ever extend credit without imposing conditions in regard to the person, the rule being that wherever the cash or credit of government is used, the borrower must be in actual need of such help and must swear to apply the loan to the specified object for which it was granted. They were established for breaking up the feudal system, for dividing and allotting large estates, for enabling peasants or workmen to acquire small farms or homes, for promoting interior colonization or settling the public domain, for financing land reclamation, for relieving distress due to war or natural causes, or for meeting problems arising from compulsory military service, absenteeism of landlords, congested population or political emergencies. Government has sometimes subsidized private institutions having such objects. Institutions in which private individuals may hold stock, or participating in profit and loss, and join government in electing the directors and officers are semi-public. Like pure public their instruments have various forms, and the older ones were authorized by special laws.

The German **landschaften** are a notable type of semi-public institution. There are 25 of them in Germany, and some very loose adaptations of them in Sweden, Denmark, Austria, Hungary and Russia. Formed under special laws enacted at widely different times, they vary greatly in organization and operation. But an outline of the Silesian landschaft (created in 1769 and so the oldest of all land-credit institutions) will give a fair idea of the others. A landschaft is a district managed by an administration whose chief officers are appointed by government upon nomination of resident landowners enrolled as members. The district includes only lands lying outside the towns and cities and is divided into lesser areas, each with a local administration subordinated to the one just above it. The central organization consists of a president, two vice-presidents, a secretary and a treasurer. The local associations have a similar organization, except the lowest subdivisions where the sole executive officer is a superintendent.
The organization is associational without capital stock or shares. The voting strength of each member is determined by the number and size of his proportion of the loans. The voting is done in circles, as the lowest subdivisions are called. Members elect the superintendents and also delegates to sit in convention for selecting the nominees for the other offices. Beyond this members have no voice in the management. They cannot dissolve the landschaft nor alter its structure or purpose since it is not formed under articles of agreement, but was established by legislative act. Acceptance of office is obligatory upon election. Members are bound when duly called upon to perform such duties as caretakers, cultivators or receivers of mortgaged farms taken over upon default of loans. Compensation may or may not be allowed them. All members are borrowers, since nobody joins except applicants for loans, and membership ceases with repayment of the loan. Any qualified landowner is entitled to admission. If his application be refused by the local officers, he may appeal to the central administration, which in all cases must make the final determination.

The loans of the landschaft must be secured by first mortgage on land worth 50 or 40 per cent more than the loan and stocked with enough equipment and domestic animals to assure a production at least equal to annual dues and taxes. The loans are without any other restriction as to amount, use or purpose. They are always long term and repayable by amortization on the sinking-fund plan. A feature, however, that distinguishes the landschaft from other land-credit institutions is that the loans are made, not in cash, but by an exchange of the borrower’s note and mortgage for the landschaft’s own debentures. The law prescribes $1,000 to $20 as the denominations, and 5 to 3 per cent per annum as the interest rate of these debentures, and gives the borrower the right to select the kind he wants. The annuity consists of the interest on the debentures he selects, plus one-half of 1 per cent of their face; and so the loan and the debentures become inextricably connected in amount and interest rate. The borrower undertakes to pay the annuity until his debt is completely extinguished. To this may be added a small charge for expenses during the first 10 or 15 years. Besides the obligatory annuities, the borrower may make voluntary payments as often as he pleases, and tender debentures at par in lieu of cash for all his dues. Defaults are never allowed for longer than six months, since the only money the landschaft has for meeting its obligations on the debentures comes from the loan they represent.

The annuities and other payments by borrowers are placed in the sinking fund as soon as they are received. When the borrower’s account therein, after entries of his proportional share of any profit or loss have been made, equals the original amount of his loan, his mortgage is canceled and his membership ceases. This may happen sooner or later than expected. So the period of the loan is somewhat variable. No debenture is, except upon the making of a loan. But the landschaft maintains a bureau for selling them for the borrowers. The sale may be below or above par, and so the interest the borrower actually pays depends upon the market quotation. With the view of protecting investors, the interest date of the loan is set a few months ahead of its maturity. The voting rules are such that while the membership agreement gives the landschaft a right to instant possession of the mortgaged property in the event of default, or even if it deems its claims in jeopardy. Every six months the landschaft must by lot retire debentures up to the amount of cash on hand in the sinking fund, so as to preserve an exact balance between the outstanding amounts of the loans and debentures. For this reason the debentures are made without any fixed maturity, but are recallable at par at the landschaft’s will.

This semi-annual retirement and payment of its own debentures and interest coupons, or the acquisition of the same by purchase in open market or through borrowers tendering them for their debts, is the only lawful use that a landschaft may make of its sinking fund. This fund cannot be reinvested in mortgages. If it should become impaired, the landschaft may levy assessments on all borrowers in proportion to the amount of their loans, in order to make good the deficiency. Hence, since the borrowers are thus collectively liable on the debentures, they are mutually responsible by one another’s defaults; and this continues for two years after membership ceases. In most of the landschafts the liability is unlimited, but in a few others it is limited to some percentage or multiple of the mortgage. The landschafts are not profit-making. Their sole object is to exchange their debentures for the less salable note of the borrower, and so enable him to obtain a loan at a lower rate and on easier terms than he could get through his own unaided credit. Operating in this way, the landschafts have need of no other money than what they receive from the borrowers for paying running expenses and interest and for redeeming the debentures. Consequently their only funds are the sinking fund and perhaps a small reserve to guard against contingencies.

Privately owned and managed those that are owned, financed and managed entirely by individuals without any assistance or intervention of government, except official supervision. With a few exceptions, they are authorized under general laws and not by special acts. There are three kinds: Companies for insuring or guaranteeing titles or mortgages, bond and mortgage companies, and building and loan associations. The first kind, when they confine their business to their distinctive object, serve rather than to extend credit. When they extend credit, they follow the methods of other private institutions, and so will not be treated separately. Bond and mortgage companies have fixed capital stocks divided into shares, usually paid in.

The various laws of bond and mortgage companies differ widely in detail and at important points, but their first model was the French legislation of 1852, which contains two master clauses. These are capital stock and surplus must be maintained at a stated ratio to bonds or debentures; and bonds or debentures in circulation must represent first liens on real estate of adequate value and never exceed outstanding loans in either
amount or interest rate. The ratio is never more than $1 to $20. A part of the capital stock or all of an obligatory reserve is set aside from annual earnings. This reserve is created out of a portion of the annual earnings. With this exception, a company may invest all its assets, regardless of source, in mortgages and distribute all its profits among shareholders. There is no limit to the amount of the fund unless it is made permanent. A maximum is sometimes prescribed for capital stock, so as to prevent monopoly, but inasmuch as the capital stock serves not only as a working-fund, but also as a guaranty-fund and must be maintained at the statutory ratio to bonds or debentures, its amount may be increased upon approval or order of the supervising authority.

Generally the companies may extend credit to any class of landowners or on any kind of land or property, or on any kind of loan; there is no limit to the amount of the loan. The loans may be made for long-term payable by annuities, or for short term payable by instalments or in lump, but rarely on the sinking-fund plan. The longest term in France is 75 years. But it is a rule that the security must have a value 40 or 50 per cent greater than the sum lent upon it and be capable of yielding a durable and certain revenue, which, in the case of long-term loans, must at least equal the borrower's annual dues. If there be a maximum for amount of the loan, it is usually one-tenth of the capital stock. The interest rate must not exceed that borne by the latest issue of bonds or debentures, plus an addition usually limited to one per cent more for costs and profits. Payments on loans are made annually or semi-annually. Pervishable parts of the mortgaged property must be insured. The bonds or debentures are issued in series, with dates fixed for payment of principal and interest, but with a provision under which they may be recalled before maturity at a premium; in France prizes are lawful at their redemption. That country also has provided for licensed land-credit companies a special procedure for examining titles, and has enacted that an association is an incorporated body with a variable capital; that is to say, a capital which may be increased or decreased by the issuing or canceling of shares, or by payments or withdrawal of payments on such shares. There may be any number of members above the minimum fixed for incorporation. According to the original design, the area of an association was delimited by a radius of a few miles from headquarters, so as to make all operations local. Its powers are to receive members' savings to lend to members for building or acquiring homes. These features stimulate thrift, and for this reason tax exemptions are accorded. The administration consists entirely of members elected by members, the funds all coming from members and the facilities are available for members only. The association is, therefore, co-operative.

Shares may be held only by duly admitted members, and each member has one vote. These are of various kinds. The most common are instalment shares, on which the subscriber makes payments at stated intervals, and investment shares, for which payment may be made in whole or in part at subscription. A permanent association may issue shares at any time. A serial one may issue shares only in series, and no new shares may be issued in a series after a definite liquidation of investments. The reserve is created out of a portion of the annual earnings. With this exception, a company may invest all its assets, regardless of source, in mortgages and distribute all its profits among shareholders. There is no limit to the amount of the fund unless it is made permanent. A maximum is sometimes prescribed for capital stock, so as to prevent monopoly, but inasmuch as the capital stock serves not only as a working-fund, but also as a guaranty-fund and must be maintained at the statutory ratio to bonds or debentures, its amount may be increased upon approval or order of the supervising authority.

By reason of this method the loans of a building and loan association are repayable in instalments on the sinking-fund plan, and may run for 10 or even 18 years. The funds that an association may have for investment are auctioned off to the highest bidder at a regular meeting or at some meeting specially called for the purpose. The sum which the successful bidder pays in addition to the interest rate is called the premium. The law prescribes no limit for this, while entrance fees and fines for withdrawals or defaults may be charged. Hence, the borrower may be required to pay what would be usury in the case of any other institution or lender. In the United States, there are at least 68 premium plans, 25 plans for distributing profits, 12 withdrawal plans and 7 kinds of shares. So many changes have been made in their original scope that the building and loan associations under the laws in a number of the States, are no longer true to type. This has been brought about by removing restrictions as to area, making shareholding a mere nominal requirement for borrowers and depositors, and permitting the associations to borrow money, issue bonds, incur liabilities with persons not members, and to finance themselves with funds coming from outside sources.

LAND LEAGUE, an Irish organization founded under the presidency of Charles S. Parnell, but of which the inspirational force was Michael Davitt, which came into being at a meeting held in Dublin, 21 Oct. 1879. The failure of the Irish crops in 1878-79 was followed by distress among the Irish tenant-farmers and peasantry; they were unable to meet their obligations, and the numerous evictions which took place were accompanied by outrages. The principal tenets of the association formed to meet this situation were the right of the tenant to the hereditary right of tenure, fair rent, and free sale (of the tenant's interest); but many speakers at Land League meetings, held in different parts of the country, went so far as to demand that the soil should belong to the cultivator. Opposition by direct violence was deprecated, and recourse was had to boycotting. (See BOYCOTT). This state of things continued till the end of 1880, and was greatly aggravated by the rejection by the House of Lords of the Compensation for Disturbance Bill of that year, when 14 members of the Land League, of whom the most important were Parnell, Dillon, Biggar, T. D. Sullivan and T. Sexton, were indicted. The chief counts were 'conspiring to prevent payment of rents, to defeat the legal process for the enforcement of payment of rents, and to prevent the letting of evicted farms.' The trial, which took place early in 1881, was a farce, but it drew from Justice Fitzgerald the declaration that the Land League was an illegal body. The agitation increased, a coercion act was passed and a habeas corpus suspended, and the 'No Rent' cry became more frequent. Gladstone denounced Parnell, and soon afterward Parnell, Dillon, Sexton, O'Kelly and the chief officials of the League were arrested and imprisoned in Kilmainham. They issued a manifesto calling on the Irish tenants to pay no rent during their imprisonment. The government replied by declaring the Land League an illegal body, and suppressed its branches throughout the country. All that the Land League had contended for was finally conceded when Wyndham's great land purchase scheme of 1903 was passed into law, and the dual ownership which has subsisted from 1870 was changed into an occupying ownership. Consult Parnell, Charles Stewart; Ireland and the Land League (Boston 1881); Davitt, 'The Fall of Feudalism in Ireland; or the Story of the Land League Revolution' (London 1904). See IRELAND.

LAND-LOCKED SALMON, a salmon which inhabits an inland body of water and can never go and come to the sea. The term applies in America only to salmon inhabiting certain lakes in the eastern provinces of New England; and whether these salmon should be regarded as distinct species or merely as representatives of the Atlantic salmon modified to suit their local conditions is a question upon which ichthyologists do not now agree. It is most convenient to follow the distinctions made by sportsmen and regard the land-locked salmon as two species, the Sebago salmon and the ouananiche.

LAND OF NOD (Gen. iv), an unknown land on the east of Eden wherein Cain took refuge. In colloquial and nursery allusion the state of sleep, a land of drowsiness or nodding.

LAND OFFICE OF THE UNITED STATES, a government department charged with the management and disposal of the public lands. On 25 April 1812 it was organized as a bureau of the Treasury Department, but on the creation of the Department of the Interior, it was transferred to the latter on 3 March 1849. Under the law, the Commissioner of the General Land Office shall perform, under the direction of the Secretary of the Interior, all executive duties appertaining to the surveying and sale of the public lands of the United States, or in any wise respecting such public lands, and, also, such as relate to private claims of land, and the issuing of patents for all grants of land under the authority of the Government.

The bureau is at present organized in 15 divisions and employs about 1,500 officials. The purchase, location and entry of land is made through local offices, of which there are 100 in continental United States and three in Alaska. As the lands in a district are sold, the local office for that district is closed. The office employs a field force for the protection of public lands, to investigate timber trespass, unlawful enclosure, fraudulent entry, etc., or, in general, any infringement of the land laws. The cash receipts of the Land Office for the fiscal year ending 30 June 1917 amounted to $6,149,630.54, consisting of $3,632,021 from disposal of public lands, $2,445,429 from sales of Indian lands, $4,996 from leases of power permits, etc., $38,639 from fines for depredations on the public lands, $25,395 for copies of records and plots, and $3,147 from sales of government property. The area of public and Indian lands originally entered during the year amounted to 16,201,794 acres and lands patented to 11,313,862 acres. See PUBLIC LANDS, and consult Donaldson, Thomas, 'Public Domain' (1884).

LAND REGISTRATION. See REGISTRATION OF PROPERTY TITLES; TORRENS LAND SYSTEM.

LAND-SNAIL, an air-breathing terrestrial gastropod mollusk, or snail of the family Helicida or some nearly related pulmonate. These mollusks possess well-developed, usually globose and more or less spiral, horny and brightly colored shell (except in slugs, q.v.), into which the whole animal may be withdrawn, and which has, usually, a lunate aperture, not
closed by an operculum. Four retractile tentacles exist, the upper pair being the larger and possessing eyes at their tips. A distinctly developed so-called ‘foot’ is present. The aperture by means of which air is admitted to the lung-chamber for the purpose of breathing exists on the right side, under the edge of the shell. The mouth possesses an upper mandible of horny consistence and toothed structure, and, as in other gastropods, there is a tongue or lingual plate very delicate which feeds generally of a vegetable nature, and snails are capable of doing great mischief in gardens, but none in the United States is noticeably harmful. The sexes are united in the same individual; but the copulation of two such hermaphroditic individuals is necessary for impregnation, which becomes mutual. The eggs are globular or oval, have coriaceous shells, and are laid singly in damp places, as under leaves, stones, etc.; Bulimus (q.v.) is noted for the comparatively large size of its eggs. These eggs and the snails themselves are eaten by birds, turtles and other enemies, especially in the tropics, where land-snails are more varied, numerous and conspicuous than in temperate regions. Some species, however, live in very cold climates or high on mountains or ranges. Those of cold climates hibernate in winter, creeping into sheltered places, and closing the aperture with one or more air-tight drum-head-like curtains of hardened mucus. In hot and dry places they protect themselves in midsummer against undue loss of moisture in the same manner.

The land-mollusks offer very interesting problems in geographical distribution, as they are easily disseminated and hence widely scattered; and are easily affected by the environment, so that species have developed in very limited areas, as on certain islands and in valleys close to one another yet very distinct in their molluscan faunas.

The family Helidae, which embraces not only the terrestrial snail, Helix, but the bush-climbing, long-spired Bulimus (q.v.), and several smaller genera, includes thousands of species. Specimens are almost always numerous in moist woods and in a limestone region than elsewhere. In addition to the number of species, properly called land-snails, belong to families other than Helidae, as the Orthalicidae, Bulimulidae and Pupidae, the last containing many minute American species, not larger than a pin-head, shaped like a grain of rice, and beautifully chiseled; Stenogryidae, in which are found the great agate-shells (Achatina) and sundry others of the tropics; Succineidae, represented by many small, glossy expanded forms of great beauty; and others, some of which contain shell-less and slug-like forms.

The French physiocrats and the American single-taxers maintain that the entire source of revenue for government uses should be vested in the taxation of land. While these theories have many adherents the present consensus of opinion among economists is that their application would involve many serious injustices. More recently special taxation of land for the purpose of preventing large tracts being held in idleness for speculative purposes, and large estates held in unproductiveness, have held the attention of legislators.

In New Zealand, Australia and western Canada taxation of land for the purpose of regulating its use is prevalent.

In the United States the laws of the individual States vary, but the general procedure is the assessment at a uniform rate of all property, including land. There is no Federal
taxation of land, direct taxation being left in the hands of the States. As a rule changes in land taxation in the States are at present employed in converting the land from being held in idleness, thereby retarding the development of the community as a whole.

**LAND TORTOISE**, a terrestrial turtle of the family Testudinidae, order Cryptodira (see CHELONIA), a family characterized primarily by the possession of a strong box-like shell, completely ossified when young and covered with horny shield, into which the whole body may be withdrawn and in some forms wholly enclosed. The family also contains aquatic and amphibious forms (see MUD-TURTLES; TREE TURTLE), but these need not now be considered. American representatives are found in the box-turtles (properly so-called) of the genus Cistudo, in which the plastron is connected with the carapace by ligaments and is divided into two movable lobes, the transverse hinge being so perfect that the box can be completely closed after the legs and tail have been withdrawn. The carapace is high and arched. The common box-tortoise of the United States (C. carolina) has become completely terrestrial, and has undergone some interesting structural modifications, especially in the leathery carapace, among others a loss of webbing between the toes. It reaches about six inches in length, is highly variable in the arrangement of the blackish and reddish tints of its coloration, and each dorsal shield is nicely sculptured in concentric rings, but these become worn nearly smooth in old age. They wander about the woods, walking with the shell well lifted from the ground, and searching for food most diligently in the evening and early morning and in moderate and moist weather. Their food consists chiefly of snails, slugs, earthworms, crayfish, grubs and the like, together with fungi and a little green stuff. In winter they hibernate, buried in soil or garden rubbish. They are fond of staying in one limited district, are easily tamed and exhibit some intelligence, but they differ much in these respects.

The typical land-tortoises, however, are those of the genus Testudo, in which the plastron has no hinged, folding part, and the feet are short and webless. The 40 or more species are scattered through the warmer parts of the world, excepting in Australasia. The small, convex, highly sculptured Greek tortoises of Europe and North Africa, so often kept as garden pets, are familiar representatives. They feed almost wholly upon green grass, leaves and vegetables. The captive made famous in Gilbert White's 'Natural History of Selborne' was one of these (T. hera), and its shell is now preserved in the British National Museum. The gopher tortoise (q.v.) of Florida is a North American species; and a similar widely spread South American species (T. labulata), which lives mainly on forest fruits, is often two feet long.

**Gigantic Land Tortoises.**—Certain terrestrial tortoises of very large size survived until the Historic Age, and in some cases still exist, on islands in the interior of the continents. They are relics of a bygone period, when even larger ones prevailed. Fossil bones in Miocene and Pliocene strata of India, western North America and other parts of the world indicate tortoises of that period whose heads alone must in life have been nearly a foot in length, and beside those giants even the largest of the modern species so-called would look small. The presence of such tortoises gave to the Galapagos (q.v.) group of islands off the coast of Ecuador, where each of the large islands of the archipelago supported a separate species, but all resembled one another in the relative small size of the head and great length of the neck. The most peculiar looking were or were T. ephippium and T. abingdonii, the shell of which is extremely thin, with large lacunae in the osseous plates. The profile of the shell is saddle-shaped, with the horny shields partly concave and turned upward at the sides. The general color of these and other Galapagos tortoises is black. Toward the close of the 19th century all that remained of these tortoises were caught and distributed alive to various parks and zoological collections in North America and Europe, where they will be cared for and will probably continue their race. They eat grass and leaves of succulent plants, as lettuce; their food in the Galapagos having been mainly cactus and a lichen (Usnea).

Other giant tortoises inhabited the islands of the Indian Ocean until within the historic period, and a few remain in captivity. In 1898 there was still living in England a specimen of T. sumeiri, once existing in thousands on the Seychelles, whose history was known since 1766, when it was already of large size. Other species inhabited Madagascar, where they became extinct, prehistorically, Bourbon, Mauritius and Rodrigues. They were utilized as food by the voyagers of the 17th and 18th centuries; were wastefully slaughtered by the European colonists, and carried in shiploads from island to island, until at last none remain but a few captive specimens. Consult Günther, 'Gigantic Land Tortoises' (1877); Gadow, 'Amphibia and Reptiles' (1901); Baur, 'American Naturalist' (Vol. XXXIII, December 1899).

**LAND TRANSFER, Reform in,** modern methods of land registration which have replaced the old-time conveyancing by feoffment, livery of seisin and other primitive methods which were effective in early times. The modern deed gives an accurate description by actual survey of the land, and is legal evidence and recorded; the records being open to the public in the United States. If there are encumbrances or burdens of any sort against the land, these also are recorded. The Torrens system of land registration is in effect in Australia and adaptations of it have come into use in England, the Philippines, Hawaii, California, Colorado, Illinois, Massachusetts, Minnesota and Oregon. Insurance of title is largely used in the United States, this taking the form of the payment of a premium for a private investigation and guarantee of title.

**LANDER, Richard Lemon, English Afri- can explorer:** b. Truro, 8 Feb. 1804; d. Fernando Po, 6 Feb. 1834. He became a domestic servant; in that capacity accompanied Capt. Hugh Clapperton as his servant on his second expedition to the interior of Africa (1825).

After Clapperton's death in 1827 he returned to the coast and in 1830 published 'Records of Captain Clapperton's Last Expedition to Africa.' In the spring of 1830 he set out with his brother John to explore the course and termination of the Niger, under the auspices of
LANDER FEMALE COLLEGE—LANDIS

the English government, and from Badagry, near Cape Coast Castle, they proceeded to Banam on the Niger, and thence down the river for about 100 miles tace its course down ward to the sea and proved that it entered the Bight of Benin by several mouths. They were the first also to discover that it was fed by the Benue. Their journal was published in 1832, entitled 'Journal of an Expedition to Explore the Course and Termination of the Niger,' and was translated into several languages. While on a trading expedition in the delta of the Niger, he was wounded by the natives and died soon after. The story of his last journey is told in 'Narrative of an Expedition into the Interior of Africa' (London 1835).

LANDER FEMALE COLLEGE, a Methodist institution of higher education at Greenwood, S. C., founded in 1872. Its faculty numbers 25; the average annual attendance of students is 277. The tuition fees are $30 to $80, living expenses, $140 to $150; the productive funds amount to $10,500; the income, including tuition and incidental charges, is $38,550. The library contains over 3,100 volumes. The number of graduates since organization is 388.

LANDES, land (Landes de Gasconne), a tract of sandy marshland in southern France, on the Bay of Biscay, and covering some 5,400 square miles in the provinces of Landes, Gironde and Lot-et-Garonne. The land is a plateau with sterile soil composed of fine sand on a subsoil impermeable by water. Parallel with the coast are numerous dunes, from 100 to 300 feet high, which, however, have been kept from extending by building a palisade which the sand cannot cross. The land was formerly inundated three-fourths of the year, forming an unhealthy swamp, but in the 18th century the engineer François Chambrelent succeeding in perfecting a system of draining and planting to remedy this condition. One thousand six hundred miles of ditches were dug and 1,600,000 acres were planted with pine and oak. The dunes also have been planted with Maritime pines and cork trees, a scheme devised by Nicolas Thomas Brémontier toward the end of the 18th century, which, together with the protecting palisade, prevents the advance of the sand toward the east, and thereby obviates the formerly steady encroachment upon tillable fields.

LANDES, maritime department of southern France, bounded on the west by the Bay of Biscay. Its area, 3,615 square miles, makes it the second largest department in France, but owing to the fact that three-fourths of its territory is occupied by the Landes (q.v.) marsh and pine lands, it is one of the most sparsely-settled districts in the country. The remaining land is highly fertile, however, and the population draws a considerable part of its income from the cork, wind pine trees of the marsh lands, which yield tumber, resinous products, charcoal and cork. There are also saw-mills, salt works, iron works, stone quarries, brick and tile works and potteries. Mont de Marsas is the capital of the department. Pop. 288,902.

cacy he was privately educated. He became deaf and partially blind in his fifteenth year, and afterward wholly blind. He nevertheless pursued a literary career with marked success. His lyrics are considered the most important of his works, but they are marked by a gloomy spirit. He went to Berlin in his early twenties and there is said to have gained the enmity of Metternich through some political criticism. He was later critic for Kühne's periodical, Europa. His writings include 'Abdul' (1843); 'Ein Zögling des Jahres 1848' (1855; later published as 'Gabriel Solmar'); 'Der ehrliche Name' (1880); 'Das Leben kein Traum' (1888); 'Geheimrätin' (1891); 'Nachsommer, neue Gedichte' (last ed., 1901), etc.

LANDGRAVE (German Landgraf), a title assumed by certain territorial counts of the German empire to distinguish them from the inferior counts. There were originally three landgraves, those of Thuringia and of Upper and Lower Alsace, who were princes of the empire. The title was assumed by Louis III of Thuringia about 1190.

LANDING FORCE, or LANDING PARTY, a permanently organized force composed of infantry and artillery, attached to each ship of a squadron. The organization of a landing force varies from that of police duty in cases where anarchy or revolution may exist, and where there are no other forces at hand, to the hardest kind of offensive warfare on shore. The force is usually comprised of marines, although they may be supported by blue jackets; the landing of marines is a recognized procedure in the way of maintaining order where necessary without bringing up a question of war or invasion such as would arise from sending an army force into a country.

The men are landed in ship's boats and the flotilla is commanded by an officer acting as beach master, who has a sufficient number of armed men to protect the boats. The organization of the landing party, although the boats may return to the ships if they are near at hand. The warships furnish a base of supplies and communication for the landing force and the warships must always be kept open and ready.

A section of a landing force is a unit consisting of one officer, three petty officers and 24 men. Two such sections form a company and two or more companies (not exceeding six) form a battalion. Two or more battalions form a regiment, and two or more regiments form a brigade. In the boats the men are seated in squads, ready to deploy the instant the beach is reached. There are six special details of a landing force, consisting of pioneers, signalmen, messmen, ammunition and ordnance party, garrison party and ambulance party. The officers are armed with pistols, the men with rifles, and each battalion has two machine guns and one three-inch field piece. Each battalion carries a guard of marines consisting of two officers and about 70 men. In case a larger landing force is required a body of 5,000 marines can be started at 24 hours' notice. They would be carried on their own transports or upon warships.

LANDIS, Kenesaw Mountain, American justice. b. Millville, Ohio, 20 Nov. 1866. He
was graduated at the Union College of Law, Chicago, in 1891, admitted to the bar in that year and engaged in the practice of law in Chicago. He served as private secretary to United States Secretary of State Gresham, and since 28 March 1905 has been United States district justice of the northern district of Illinois. He came into national prominence when presiding at the trial of the Standard Oil Rebate cases in 1907, imposing a fine of $29,240,000. While the decision was set aside by the higher courts it did much to establish a reputation for Justice Landis.

LANDIT, or LENDIT, lãn'dët, (The Fair or), a famous fair held in France in mediæval times. The fair found its origin in the desire of the bishop of Paris to arrange a public display of a reputed fragment of the true cross received by the cathedral of Paris in 1109. The second Wednesday in June was designated as the time when the fragment might be viewed by the people in the open space between Saint Ouen, Saint Denis and Paris. Owing to the gathering of great crowds of people the Bishop's fair was held under the direction of the monks of Saint Denis, and for many years was largely attended. In 1556 the fair was removed to Saint Denis, after which time its importance steadily diminished, and in the 18th century the fair was abandoned. A sheep market was afterward established in its place.

LANDLORD AND TENANT, the relation of renter to rentee; not necessarily of land, except as all dwellings or industries must have land for a locus, but of any of its material encumbrances. The landlord need not be the owner; he may himself be a lessee or tenant granting occupancy or use to a sub-tenant. It is sufficient that his title is superior to that of the one who holds through him. The difference between the latter's interest and that of the landlord is known as the reversion of the latter; but there is obviously no reversionary interest unless the grant is specifically limited to a less volume than the grantor's, and none unless it is inferior in kind. Historically, the relation originated in the practice of infuedation in the Middle Ages, where the fee simple vested in a chain of vassalships, when even kings did homage for portions of their possessions, and no property was held by any but kings, except as vassal to some overlord. The feudal incidents were abolished by the English statute of Quia Emptores in 1290. The modern mercantile relation of lessors and lessees is the creation of statute, judicial decisions and the specific agreements of written contracts.

The mutual obligations of the contracting parties in law are natural consequences of the relation. The landlord on his part must protect the tenant from any other claim of occupancy; must not evict him or suffer him to be evicted and if he does either is liable in damages. He is, however, under any obligation to protect him against violence, trespass, nuisances or other unlawful acts of outsiders; nor to furnish habitable buildings, usable implements or anything whatever of specific quality unless specially agreed on. The doctrine of caveat emptor is also extended to caveat lessor; he must form his own conclusions and run his own risks. The tenant cannot question or interfere with the landlord's title, even if the latter be worthless: his own is derived from it, and must stand or fall with it. Nor does any length of occupancy enable him to plead the latter in bar of the latter's title in fee simple.

LANDOIS, lãn'dwa, Hermann, German zoologist; b. Münster, Germany, 19 April 1835; d. 1905. He entered the priesthood, but in 1859 turned his attention to science, and in 1873 was
appointed professor of zoology at the Academy of Münster and head of the zoological museum. He is the author of 'Sound and Voice Apparatus of Insects' (1867); 'Text-Book of Zoology' (1870); 'Text-Book of Botany' (1872); 'Voices of Animals' (1875); 'Textbook of Instruction, the Description of Nature,' and other popular works of a like character.

LANDOIS, Leonard Christian Clemens, German physiologist: b. Münster, Germany, 1 Dec. 1837; d. 1902. He is a brother of H. Landois (q.v.), and was educated at the University of Griesfeld and had been professor of physiology of the poem 1872. He was widely known as an original investigator and the discoverer of blood pulse transfusion, and has published 'Le Diagnostic des Maladies des Yeux' (1867); 'Manuel d'Ophthalmologie' (1878); 'Traité complet d'Ophthalmologie' (1886); 'Lehrbuch der Physiologie' (12th ed., 1909), etc.

LANDON, Letitia Elizabeth, English poet, better known by her initial signature 'L. E. L.': b. Chelsea, England, 14 Aug. 1802; d. Cape Coast Castle, Africa, 15 Oct. 1838. She wrote much for the then popular annuals, and was long popular both as poet and prose writer. In June 1838 she was married to a Mr. George MacLean, and sailed with him to Cape Coast Castle in western Africa, where he was governor. She died there mysteriously soon after her arrival from poison, and was buried in a grave with the following inscription: 'Here Chief works are 'The Improvisatrice and Other Poems' (1824); 'The Golden Violet' (1827); 'The Venetian Bracelet' (1829); 'Ethel Churchill,' a novel (1837), and 'Traits and Travels in Africa' (1836), supposed to be autobiographical. Consult her 'Life and Remains,' edited by Blanchard (London 1841).

LANDON, Melville de Lancey ('Elip Perkins'), American author: b. Eaton, N. Y., 7 Sept. 1839; d. 1888. He was graduated at Union College in 1861, and soon after joined the Union army, from which he retired in 1864, having reached the rank of major. He became a cotton-planter in Arkansas and Louisiana, traveled in Europe, and was for a time secretary of the State of Louisiana. He was born at Petersburg. His writings have made him known chiefly as a humorist, but have dealt with serious as well as lighter subjects. He has published 'Saratoga in 1901' (1870); 'History of the Franco-Prussian War' (1871); 'Wit, Humor and Pathos' (1875); 'Wit and Humor of the Age' (1880); 'Kings of Platform and Pulpit' (1887); 'Thirty Years of Wit' (1890); 'Elip Perkins on Money — Gold, Silver or Bimetallism' (1895), and other works.

LANDOR, A. Henry Savage, English traveler and painter: b. Florence, 1865. He is a grandson of Walter Savage Landor (q.v.). He was educated at Florence and in Paris. He has spent many years in travel, visiting in Korea, China, Japan, India, Nepal, Tibet, South Mongolia, Persia, Beluchistan, the Philippine, Azores, and Sulu islands, and in Australia, America and northern Africa. He was the first white man to reach the sources of the Brahmaputra River and established their exact position ('Tibet 1897); and was also the first

white man to explore Central Mindanao Island, there discovering the Mansakas ('white tribe'). He was with the allied troops on their march to Peking in 1900, and was the first Anglo-Saxon to enter Lissa, the Forbidden City. He holds the world's record in mountaineering. Mr. Landor declared the River Doubt, which Theodore Roosevelt claimed to have discovered in South America, to have no existence. He served as a dispatch rider during the European War. Among his writings are 'Alone with the Hairy Ainu'; 'Corea, or the Land of the Morning Calm'; 'A Journey to the Sacred Mountains of Siao-on-tai-shan'; 'China and the Allies' (1901); 'In the Forbidden Land' (1898); 'Across Coveted Lands' (1902); 'The Gems of the East' (1904); 'Tibet and Nepal' (1905); 'Across Widest Africa' (1908); 'The Americans in Panama' (1910); 'An Explorer's Adventures in Tibet' (1910); 'Mysterious South America' (1914).

LANDOR, Walter Savage, English poet and author of prose dialogues: b. Warwick, England, 30 Jan. 1775; d. Florence, Italy, 17 Sept. 1864. The literary life of Landor is among the longest in the history of letters; his first book, 'The Poems of the Island,' appeared in 1795; his last work, 'Heroic Idyls,' came out in 1863. He was the eldest son of Dr. Landor and his second wife, Elizabeth Savage, both of ancient families. As a boy Landor showed great love of reading, was fond of trees and flowers, and was known for his physical strength and fiery temper. At school near home and at Rugby, which he entered at 10, he was an excellent Latin scholar, and his rebellion against the somewhat arbitrary dictum of his tutor regarding a Latin quantity was the cause of his rustication in his sixteenth year. Two years later he entered Trinity College, Oxford, where he was known for his sympathies with republican government and whence he was expelled the following year for a boyish prank. This led to a quarrel with his father, and in 1794 he left home. For the next 10 years he lived a somewhat nomadic life, fluctuating between London and Tenby, Wales, with short periods of residence in Bath and other intervening cities, and trying his hand at journalism and poetry. In the latter he did write rather temperate articles for the 'Courier' against the Tory government then in power; in the latter he did some of his best work. Besides 'The Poems of Walter Savage Landor' already mentioned, there appeared in 1798 his long and vogue, but often musical, poem, 'Cebir,' and four years later 'Poetry by the Author of Cebir.' The literary influence to which he was at this time most subject was Milton.

On the death of his father in 1805, Landor succeeded to a goodly property, and began to look about for a country place. Finally in 1809 he bought a large estate at Llanthony in Wales, which he conducted in so high-spirited and impractical a way that in five years he sunk £70,000 in it and was obliged to give it over to trustees, who made it yield a sufficient income to support him elsewhere. Mr. Landor had with characteristic enthusiasm enlisted with a company of volunteers in the war for Spanish liberty, but after a few months in Spain returned disgusted with the pusillan-
Landouzy — Landreth

mouseness of the leaders. With equal impetu-
sity he had, in 1809, married Miss Julia
Thullier, a young girl 18 years his junior, whom
he met at a dance in Bath. Owing to his un-
evenness of temper and to the commonplace
ness of her mind, the marriage proved, in many
ways, to be an unhappy one. In a fit of anger,
he went to France without her, in 1814, though
they had planned the journey together. During
this period he published several books, of which
the most important is ‘Simonide, 6 a volume of
elegiac verses (1806), some of his Latin poems,
‘Idylia Heroica’ (1810), and the tragedy
‘Cimba’ (1815).

Settling first in Tours, Landor was there
joined the following year by his wife, and the
two then went to Italy. For three years they
lived at Como and later in various Italian cities,
until, in 1821, the Landors made Florence their
home. Here they were for eight years, and
here Landor, who had done comparatively little
literary work except for the finishing of ‘Idylia
Heroica’ (1820), wrote the books most inti-
mately associated with his name, the ‘Imaginary
Conversations’. The first of these appeared in
two volumes in 1824; this was followed by a
third in 1828 and by the fourth and fifth in
1829. Altogether the number of conversations
was about 80, which was about doubled during
the rest of Landor’s life. Though not in any
sense popular, they were welcomed by the men
of letters of the time. In general they express
Landor’s reflections and feelings on subjects
of high importance. Colvin, in his life of
Landor, divides them into two classes, the
dramatic, represented by the excellent ‘Leofric
and Godiva’; and the reflective, to which type
the majority conform, but in a strict sense none
are dramatic, for the reason that Landor rarely
expresses more than his own emotion, and though
this feeling is often high and noble, it is not to
any notable degree historically accurate. The
reflective dialogues express Landor’s ideas and
thoughts on a great variety of subjects, the char
acter of which is represented by the gal-
axy of famous men who serve as his mouth-
piece. All in all, the ‘Conversations’ are among
the best examples of restrained, polished,
classic style that we possess.

In 1829, Landor removed to Fiesole and
here, among other works, he wrote ‘The Cita
tion and Examination of William Shakespeare,’
published in 1834. The book is one of his
longer pieces but is not so successful as the
‘Conversations’ because of its rather labored
humor. Nor is it so good as the two succeeding
pieces, which Landor planned or wrote in Italy
and published after his return to England in
1835. ‘Pericles and Aspasia’ (1836), his
longest single work, is commonly regarded as
his most finished production, in regard to beauty
of thought and finish of expression. Scarcely,
if at all, inferior, however, is the ‘Pentameron,’
the record of a five-days’ visit of Petrarch with
Boccaccio, a book which contains some of
Landor’s most amusing criticism, as well as the
most charming of his descriptive passages, the
narrative of Ser Francesco’s visit to church.
It is on these perhaps as much as on the more
miscellaneous ‘Conversations’ that Landor’s
name chiefly rests, though the latter by reason
of their earlier appearance and the novelty of
their form are more commonly coupled with
Landor’s name.

Landor’s work after 1837 is comparatively
unimportant, and except for some articles to
Leigh Hunt’s ‘Monthly Repository,’ a satire, and
some ‘Hellenic,’ supplies little new in type.
The most conspicuous volumes were ‘Last
Fruit of an Old Tree’ (1853), containing con-
versations and miscellaneous work; ‘Dry Sticks,
Fagots and Fire,’ about S. Landor (1858), and
‘Heroic Idylls’ (1863).

Criticism is in substantial agreement that
Landor occupies a high but not a pre-eminent
place in 19th century letters. The excessively
cultivated nature of his subjects, the com-
parative scantiness and restraint of his pro-
duction, and the fact that his style is conspic-
ous for rhetorical graces rather than for nat-
ural warmth or broad sympathy, keep him from
attaining the highest position either as a poet
or as a prose writer, but as the master of pol-
ished prose and the writer of isolated passages
he has few superiors. See IMAGINARY CONVER-
SATIONS; PERICLES AND ASPASIA.

Bibliography.—The standard life is that by
John Forster (2 vols., 1869), now forming the
first volume of the third edition. Appeared in
two volumes in 1876. Colvin’s life in the
‘English Men of Letters’ is good; it supplies a
good list of authorities on Landor. Leslie
Stephan’s essay (‘Six Hours in a Library,’ Vol.11),
and Vernon Lee’s ‘The Rhetoric of Landor’
(Contemporary Review, Vol. LXXIV, p. 856,
1903), should be consulted.

LANDRAIL. See Concrake.

LANDRETH, Burnet, American agricultur-
ist: b. Philadelphia, 30 Dec. 1842. He was
educated at the Polytechnic College, Philadel-
phia, was captain of infantry during the Civil
War, serenely regarded as his most finished produc-
ion, in regard to beauty of thought and finish of expression. Scarcely,
if at all, inferior, however, is the ‘Pentameron,’
the record of a five-days’ visit of Petrarch with
Boccaccio, a book which contains some of
Landor’s most amusing criticism, as well as the
most charming of his descriptive passages, the
narrative of Ser Francesco’s visit to church.
It is on these perhaps as much as on the more
miscellaneous ‘Conversations’ that Landor’s
name chiefly rests, though the latter by reason
of their earlier appearance and the novelty of
their form are more commonly coupled with
Landor’s name.
Landreth. He has published several works on agricultural subjects.

Landreth, David, American agriculturist, b. Philadelphia, 1802; d. Bristol, Pa., 22 Feb. 1880. He was privately educated and joined his father in the seed and nursery business, devoting himself to matters of public interest in agricultural and horticultural lines after the death of his father. He was one of the founders of the Pennsylvania Horticultural Society in 1827 and acted as its corresponding secretary in 1828-36. He was president of the Pennsylvania Society for the Promotion of Agriculture and established the Illustrated Floral Magazine in 1832. He wrote numerous articles on agricultural and horticultural subjects and edited with additions Johnson’s ‘Dictionary of Modern Gardening’ (Philadelphia 1847).

Landry, Auguste Charles Philippe Robert, Canadian author and statesman: b. Unionville, Ont., 13 July 1804; d. Laval University in 1866; then took a course in agricultural science at the College of Sainte Anne and devoted himself to farming. He served for several years in the militia, rising to the rank of lieutenant-colonel. In politics he is a member of the Conservatives; he was a member of the Quebec assembly (1875-76); was elected to the Canadian House of Commons in 1878, where he served till 1887, when he was defeated at the general election; in 1892 he was called to the Senate. He became president of the Quebec Exhibition Company in 1894, is a member of several agricultural societies and was elected president of the Council of Agriculture in 1896. He has written 'Traité populaire d’Agriculture théorique et pratique' (1878); 'L’Église et l’État' (1883); and numerous papers on political and scientific subjects.

Lands, Public. See Public Lands.

Land’s End, England, a headland in Cornwall, about 60 feet in height, consisting of granite cliffs bristling with sharp fangs of rocks somewhat resembling the back of an alligator, which forms the southwestern extremity of England. There is a lighthouse on the rocks, called Longships, about a mile to the west. Here is the entrance to the English Channel from the Atlantic Ocean.

Landsberg, Max, American rabbi: b. Berlin, 26 Feb. 1845. He was educated at the universities of Göttingen, Breslau and Halle and at the Jewish Theological Seminary at Breslau, becoming a rabbi in 1870. From 1871-1914, when he retired, he was in charge of the Berith Kodesh congregation at Rochester, N. Y. He was governor of the Hebrew Union College at Cincinnati, Ohio, and in 1911 he was president of the 12th New York State Conference of Charities and Correction. He published ‘A Ritual for Jewish Worship’ (1884; 3d ed., 1910).

Landsberg - An - Der - Warthe, länts'-bērk-ań-der-vār'tē, Germany, city in the province of Byelorussia, 139 miles northeast of Berlin. The town obtained civic privileges in 1257: Pop. 39,539.

Landscape, in painting: a picture presenting a view of natural scenery as it appears within the range of vision from a single point of observation, with or without figures of men or animals. The landscape is essentially modern in its evolution, the Greeks ignoring it in their absorption with the human figure; the Roman and Pompeian wall-painters developed an approach to landscape painting afforded by classic art. The Odyssey landscapes, now in the Vatican Library, and the pictures of a garden painted upon the walls of an apartment in the villa of Livia at Prima Porta near Rome, are the best of the remaining examples of the art as practised by the Romans.

In Christian art the landscape makes a late appearance, but Giotto (1267-1337) under the influence of Saint Francis of Assisi makes use of natural scenic effects as backgrounds. It was not until the beginning of the 16th century, however, that the modern landscape made its appearance in the Flemish and Italian schools of art, and even then the landscape was subordinate to the figure interest. Fra Angelico makes use of actual copying from nature, preceding efforts having only comprised in certain typical objects such as rocks, clouds, trees or buildings. Leonardo makes use of landscape backgrounds and Raphael is amazing in the diversities and harmony of his adaptations of natural scenery in his backgrounds. Michelangelo, on the other hand, ignored the landscape in art and held it and its admirers in contempt. Andrea Mantegna follows Raphael but his work is far from possessing the grace which characterizes that of his successor, Correggio. In the Venetian school the beauties of nature received more enthusiastic representation, and the Bellini, Giorgione and Titian, particularly the latter, are considered the founders of the modern landscape. The pupils and followers of Titian accorded the landscape ample consideration in their compositions, among them being Tintoretto and Veronese. Canal and Guardi follow and are considered the last of the Venetian schools. In the southern Alps, Salvador Rosa showed considerable power in reproducing the wilder aspects of nature and had a considerable influence in the development of the art.

In the northern countries of Europe, as in Italy, painting was a later development of art, following sculpture and architecture. The miniatures were the precursors of landscape in Flemish art and the first great impulse to the use of nature in painting was given by the van Eycks (1380-1440). Roger van der Weyden, H. Memling and Gheeraert David complete this period of Flemish art, reaching perhaps the greatest attainments in landscape painting in the 15th century. Later Flemish painters were attracted by the glamour of the Italian Renaissance and the distinctiveness of the old Flemish school was temporarily submerged. The work of Bernard van Orley however, showed originality and genius; and the influence of the true Flemish art was apparent, likewise, in the productions of Herri de Bles and Patenier. Brueghel follows with excellent work and one of his sons was notable, as were Paul and Mathew Brill. Rubens did,
not paint landscapes until late in life and then was largely influenced by Titian; but in Rubens, one of the most notable innovators in portraying the changes in the sky. Later in the development of Flemish art were Brouwer, a pupil of Frans Hals, Jacques d’Arthois, Cornelis Huysmans and Jan Siberechts.

The landscape in German art originated at Cologne in the work of Stephen Lochner and reached its greatest heights in the productions of Albert Dürer of Nuremberg. Dürer showed originality and power as an interpreter of nature and stands alone in German art. It is nearly a century later that Adam Elsheimer comes into prominence, after which interval, strife appears to have suppressed art for a considerable period.

In the early days of French landscape painting it is difficult to distinguish between the miniaturists and the painters. Jean Pouquet of Touraine practised both arts. The work of French artists was also considerably influenced by the presence of France of both Flemish and Italian art colonies, and the attraction Italy held for French painters had a powerful influence on the development of the early French painters. Among the greatest of the early painters was Poussin, although his success came in Italy, and after him came Claude Lorrain whose work presents much of the grander aspects in nature with wonderful effects of space and atmosphere.

The earliest of the Dutch landscape painters were Mabuse and his pupil Jan van Schoreel through whom Utrecht became a centre of art. They were followed by Abraham Bloemaert and Cornelis van Poelenburgh, the latter of whom founded the style known as the Arcadian landscapes. Like that of other countries the Dutch school was largely influenced by Italy where numerous Dutch painters studied and often remained. Among these returning artists were Andries and Jan Both. Jan Asselyn and Nicolas Berchem also lived and worked in Italy although of Dutch origin. Karel du Jardin, Vermeer, Pieter de Hooch and Jan van der Croos were among the pupils of Berchem. Pieter Molijn, Esaias van de Velde and Jan van Goyen also became great names in the Dutch school where political changes and a Protestant religion were largely instrumental in forcing the painters into the field of landscape painting as affording a patronage lacking in other lines. Salomon Ruysdael and Allart van Everdingen were really the originators of the Dutch school of art which chose its own peculiar but very adaptable country for portrayal with lasting effects in the world of landscape painting. Hobbema follows with the Cuypers, Paul Potter, Adrian van de Velde, Phillips Wouwerman, Emanuel de Witte and Jacob Ruysdael, the latter of whom in some of his landscape compositions rivals and even surpasses Rembrandt. The Dutch school found its culmination in Rembrandt who raised to its highest art the presentation of a simple stretch of landscape, though Rembrandt showed his originality in landscape painting later than in other work. The Dutch school was decadent after Rembrandt.

The Spanish school of art rose with the decline of Spain’s greatness among the nations. Zurburan is the first among Spain’s landscape painters, followed by Velasquez and his contemporary, Francisco Collantes, and then Murillo.

The 18th century saw the development of landscape painting in England with Richard Wilson, a Welshman, as its first great exponent. Gainsborough’s work foreshadowed greater developments although with him the landscape is subsidiary to the portrait. Thomas Barker, known as Barker of Bath, was among the early landscape painters of England, and John Crome, “Old Crome,” was one of the founders of the Natal School of Art. Constable, while influenced by the Dutch, was sound in principle and was the originator of innovations in light effects, furnishing inspiration later to the Barbizon school and so influencing much of the later art of Scotland and Holland. J. M. W. Turner possessed a range in the field of nature perhaps wider than any of the landscape artists, and while perhaps some of his work may be criticized for effects which were the outcome of a peculiar temperament he left a mass of exceptional creations on the subject of landscape subjects, many of them among the finest extant.

In the more modern French school, Watteau, Odry, Boucher, the three generations of the Vernet family, Hubert, Robert and Honore Fragonard, produced a type of decorative landscapes not hitherto attempted, and this romantic group was succeeded by the Barbizon school upon which the sound principles of Constable had so material an influence. In this later group the effects of nature were combined with a pictorial ideal of English landscapes. The work of French painters is lengthy and distinguished, including Georges Michel, Louis David, D. Ingres, Delacroix, Richard Parkes Bonington, Paul Huet, Alexandre Decamps, Camille Flers and Corot; as well as Eugene Isabey, Rousseau, Charles Jacque, Millet, Diaz, Jules Dupre, Louis Cabat, Prosper Marilhat and Francois Couchet.

French influence has been of powerful effect in recent landscape painting, originating the Barbizon school, the Glasgow school and the Cornish school of Newlyn, in Great Britain, have also exercised wide influence.

In America landscape painting has come under a considerable amount of criticism as being of European origin and coming under European influence. Considering, however, the European origin of American civilization, and the interchange of ideas and influences to be traced among the exponents of the art of landscape painting in Europe the criticism becomes capricious rather than otherwise. It was not until the 19th century that landscape painting gained any real foothold in America although the landscape background for portraits was occasionally employed. The Hudson River school of landscape painting and its remnants brought much criticism through their too great attention to detail and the panoramic character of their canvases. Of a later group F. E. Church...
painted subjects ranging from Labrador to South America, and Thomas Moran and Albert Bierstadt felt the lure of the Rockies. Succeeding this earlier group came George Inness, Alexander H. Wyant, Homer Martin and Henry W. Ranger whose art is of unexceptional quality even though admittedly somewhat under the influence of the French school. Later are Ralph S. Blakelock, Albert P. Ryder, Eakins (1844-1916), Winslow Homer, Paul Dougherty, Allan B. Talcott, Alexander Harrison, F. W. Benson, J. Alden Wier, W. L. Lathrop, Colin Campbell Cooper, Willard L. Metcalf, Albert L. Groll, Leonard Ochtman, Dwight W. Tryon, Frederick Ballard Williams and others who are doing earnest work. Of those influenced by the Impressionist school, Childe Hassam and John W. Twachtman are notable as producing work of strength and originality. Winslow Homer, while a marine rather than strictly a landscape painter, is considered typically original in his work; and while Whistler, Sargent and Alexander use landscape effects only in subordination to their portraits the character and distinctiveness of their work is unquestioned.

**LANDSCAPE ARCHITECTURE.** Landscape architecture is primarily a fine art, and as such must be properly created and preserved. It is to create and preserve beauty in the surroundings of human habitations and in the broader natural scenery of the country; but it is also concerned with promoting the comfort, convenience and health of urban populations, which have scanty access to nature and urgently need to have their hurrying, workaday lives refreshed and calmed by the beautiful and reposeful sights and sounds which nature, aided by the landscape art, can abundantly provide. (C. W. Eliot.)

Very early in his historical past man shaped the economic changes which he made in the earth's surface so that they gave him also an aesthetic satisfaction. This satisfaction was due in great measure to the fact that the changes were obviously man-made; they bore witness that he had impressed his ideas on the stubborn natural material. Much later in his development—almost, it might be said, in modern times—came the period when man, instead of being isolated and overpowered in the midst of wild nature, found himself cramped and oppressed by the works of his own hands, and sought relief in the aesthetic pleasure to be derived from landscape which expresses not man's will but the operation of natural forces. The province of landscape architecture is so to guide man's modification of the landscape that he may get the greatest possible aesthetic satisfaction of one or both of these two quite different kinds. The resulting beauty might be, at one end of the scale, that of the formal surroundings of a palace—architecture in natural materials to show man's magnificence—or, at the other extreme, that of a woodland solitude—apparently an age-long natural growth—a place of rest from all the works of man. Within comparatively recent years, there has come a general recognition of the value to the public of designed and organized cities, and of parks, reservations and other out-of-door spaces, and a greatly increased interest in private pleasure grounds of various kinds. There is now an effective demand for designing skill using as materials ground forms and vegetation, and for designing skill in the landscape and architectural forms—streets, parks, buildings—in larger units, for public use. This demand has been met by the rise of a separate profession, because the materials and technique of this new field are not those of the older allied professions of architecture and engineering, and are quite as difficult to master within an ordinary lifetime.

Like architecture, its sister profession in the fine arts, landscape architecture requires of its practitioner diverse abilities not often found in the same person: the aesthetic appreciation and creative power of the artist, together with the executive skill of the business man. The landscape architect should know the materials of his art; ground forms, vegetation and structures in their relation to landscape. He should know on the one hand what results are physically possible of accomplishment with these materials, and on the other hand what kinds of beauty were better attained in the materials of some other art. Since, for the most part, the landscape architect cannot produce at will in his design all the forms which he might desire, but is limited to the forms offered by nature those which will suit his purpose, he cannot be confident that
his design is possible of execution unless he possesses an accurate first-hand knowledge of the local materials and conditions from which he must choose the elements of his composition. Since the beauty of vegetation is that of intricacy, of multiplicity, of growth and change, the landscape architect's experience and power in design will come to be quite different from that of the architect, who deals with definite, rigid forms and balanced masses. In his formal designs in close conjunction with buildings the type of beauty which he seeks will not be widely different from that sought by the architect. But since the fundamental organization of his naturalistic designs, of his preservation and enhancement of natural scenery, will be the real or apparent manifestation of the unrammed forces of nature, the landscape architect who would attempt such design must have humbly studied the forces which carve the valleys, and which direct the flow of the streams, and he must be keenly sensitive to the aesthetic unity of a mountain or the perfect growth of a garden. Scurrying forces may four and dominate or decorate his nature-inspired work.

Historic Styles of Landscape Design.—In studying existing works of landscape architecture we find that we may consider in groups works which produce a similar effect on the beholder on account of a fundamental similarity in their organization; and this similarity of organization comes in the case of each group from a similarity of conditions under which the examples in the group were brought forth—conditions, namely, physical environment and material, of the people who made them, and of the purposes for which they were produced. We find that the various historic styles of landscape design which have been differentiated have taken their names usually from the peoples which originated them and the countries in which they arose, occasionally from an individual whose name was associated with certain definite pieces of work which were the first examples of the art, and rarely from the total aesthetic effect produced by the style; for instance, Italian style, style of Le Nôtre, Romantic style. From the point of view of the fundamental ideal expressed by the designer, styles of landscape design are distinct from those which express the dominance and the will of man and those which express the designer's appreciation of the power and beauty of nature. We may call the styles in the first of these categories humanized and those in the second, naturalistic. Since giving an object geometrical form is a common and obvious way of making it express man's will, the term formal has often been used in the sense of man-made or man-dominated, but the two terms are not synonymous, for there are many informal designs which nevertheless are definitely and obviously humanized. The hand of the designer and his artistic achievement may be recognized as fully in this design as in man's formally-arranged compositions. The following are some of the clearly characterized historic styles which have taken form, each under its own circumstances.

The Egyptians have left us records of their gardens, which in their early form were inner courts with fruit and ornamental plants, but later were extended outside to larger rectangular areas, formally planted. The Babylonian gardens on the ground forms commanding extensive views, as in the case of the famous "hanging gardens" of Babylon, and cooled and decorated by water features. In ancient Persia, again, water was a leading element in the enclosed gardens, which were made pleasant and grateful to the dwellers in the hot and dry climate by shade and fruit, and were usually adjacent to an extensive thickly-planted wilderness or park. The "groves" and orchards of the Greeks reflect the immediate influence of Persia on the treatment of outdoor areas after the Persian wars. Classic pleasure-grounds, however, find their highest development in the Roman villas, for instance, Pliny's Laurentine and Tuscanian villas, and Hadrian's at Tivoli,—carried out as splendid architectural schemes, and with regard to the advantages of cool breezes, view, shade and the decorative beauty of water and statuary. In the Middle Ages we find in the monasteries gardens primarily utilitarian, of which Saint Cateo in Chartres may four and dominate or decorate his nature-inspired work. In the Far East garden design had been developing to a high degree of definiteness and finish. Chinese gardens, said to date from earlier than 2000 B.C., took the form of miniature landscapes, carefully designed and enclosed; and with the spread of Chinese culture the Japanese took suggestion from these landscape gardens of China and ultimately produced styles of garden design which expressed their reverence for nature, wrought out, conventionalized and symbolized by successive generations of artists, in forms of great intrinsic beauty. The Moorish gardens in Spain had for their direct prototype the gardens of Persia and Syria. They were patios surrounded by buildings, shady cool, full of the scent of flowers, and the splash and sparkle of running water. The gardens were necessarily a part of the architectural scheme, both being in a clearly marked style which may, those which express the dominance and the will of man and those which express the designer's appreciation of the power and beauty of nature. We may call the styles in the first of these categories humanized and those in the second, naturalistic. Since giving an object geometrical form is a common and obvious way of making it express man's will, the term formal has often been used in the sense of man-made or man-dominated, but the two terms are not synonymous, for there are many informal designs which nevertheless are definitely and obviously humanized. The hand of the designer and his artistic achievement may be recognized as fully in this design as in man's formally-arranged compositions. The following are some of the clearly characterized historic styles which have taken form, each under its own circumstances.

The Egyptians have left us records of their gardens, which in their early form were inner courts with fruit and ornamental plants, but
development there was shown in the villas a feeling for the beauty of water, displayed in increasingly ingenious ways, for the relief of shade and its contrast in design with open spaces, for the spirit of repose associated with the distant view, and a feeling, never as yet elsewhere equalled, for effective formal design in materials of architecture and vegetation. In France, England and Holland the Renaissance called forth an expression of architectural design in the work of the spirit promising the greatest influence, which flowered in different periods. The Dutch had their small, trim, topiary gardens; the English their Tudor and Elizabethan country estates with pleasant flower gardens, stretches of turf, and sumptuous kitchen gardens; enclosed one next to the other; and the French had their great open parterres and large gardens, consisting of different treatments of rectangular units more or less intervisible, -- precursors of the work of Le Nôtre. Coincident with the later Renaissance, but springing from Persian influence through the Mogul dynasty, a style of garden design was produced in India, which, as in other hot climates, utilizing shade and flowers and fruit, and water in long pools and splashing fountains, as well as terraces, covered the country, giving rise to the influence that the designs rival in magnificence those of the Grand Style in France. Le Nôtre's work at Versailles expressed the power of France and the magnificence of Louis XIV. Built on flat ground, the gardens produced the effect of great extent with recognizable unity and variety of open and wooded areas by the use of allees, here for the first time employed at so great a scale, separating one bosquet from another, connecting various points of interest, forming vistas large and small centered upon the architectural and sculptural decoration of the scheme. Next the garden façade of the main buildings, a great terrace decorated with water basins or carpet-bedding, served as a foreground to the open design. This formal design in the "grand manner" extending its influence all over Europe, even into Russia, and often carried to extremes by incompetent designers, invited a reaction toward the inspiration of Nature. The principles of landscape design, where it was expressed in the work of Kent and Brown, was influenced deeply by the work of such landscape painters as Claude Lorrain and also somewhat by ideas introduced from China. It spread to France and to other parts of the Continent with the Romantic movement and fell later into extremes as unfortunate as any of those of formal design. It substituted the formless for the formal, and the Romantic symbol for aesthetic unity, before it settled to the more rational landscape style of Repton in England and of Pückler-Muskau in Germany. The work of Repton and his followers inspired the park-like estates in America with which Downing was familiar and the tradition of which he followed in his designs for the removal of the use of native vegetation. At the time of his death in 1852, the industrial growth of the United States had begun to cause congestion in towns, and Downing was a leader in the movement to ameliorate the life of town-dwellers by the provision of public parks. It was reserved for Calvert Vaux and Frederic Law Olmsted to develop to meet this need a style of naturalistic landscape design which has had the most profound influence on the work of the last 50 years, -- compositions of open meadows enclosed are diversified by water in which the public may find a sense of seclusion and of relief from the insistence of urban surroundings. In Central and Prospect parks in New York and Franklin Park in Boston we have this style at its best. The work of H. W. S. Cleveland extended the park movement in the West, and at the same time through his writings he pointed out the necessity for the application of the principles of landscape architecture to the planning of new towns. Charles Eliot, a disciple of Olmsted and last his partner, continued the naturalistic tradition, and is especially known for his activities culminating in the park system of Boston, which has influenced extensively the park development of America. The private place design of the United States in the last half century has also deeply felt this same influence. Large estates have been treated like parks; very small estates have in some of the best examples approached a style not unlike the Japanese, though less small in scale. Simple informal plantings have been the accepted type in mixed use of settings, and have naturally enough often degenerated in unskilful hands into meaningless curvilinear beds and needlessly indirect paths. In America there has also been a tradition of garden design dating from the colonial period, -- gardens of trim hedges and fragrant flower borders, often overhung by fruit trees, usually near the houses and closely adapted to the uses of their owners, and often pleasantly naive in expression. With our present increasing appreciation of colonial art there has been a revival of outdoor design inspired by this period. As the number of country estates of wealthy owners has increased in America, we have followed also the examples of English gardens, and Italian gardens, originally designed for pure requirements somewhat similar in spirit. And also, both in America and in England, has arisen a comparatively new style, -- the wild garden, the rock garden, the pond garden and so on, -- an attempt to produce at small scale, and usually with a certain attempt at the attainment of almost Japanese, some striking type of wild nature. Quite different in spirit is the work of the last 25 years in Germany, which, expressing in formal terms the needs of the German family for outdoor living, is consciously differentiated from all previous styles of landscape design. When handled by a designer with some inborn sensitiveness to beauty of form, this modern German work has great interest, but in many cases even some of the Germans themselves would admit that unhappy aesthetic results have arisen from their conscious seeking for an independent style peculiar to German "kultur." The modern landscape architect has in the examples of the styles of the past a treasury of inspiration and information to aid him in his present task, and diversified by their study these styles not as an archaeologist, not as a copyist, but as a workman providing himself with tools for future original use. He should endeavor to see how in each case the designer met a particular and individual problem; he should feel a brotherly and human interest in the way his predecessor has adapted
means to ends, and he should thus get from an example in any style some inspiration for his own work however different its circumstances might be.

The Professional Practice of Landscape Architecture in America.—Not until recently has there been in this country sufficient demand for the services of the trained landscape architect to make it possible for any considerable body of men to engage in the profession. The American Society of Landscape Architects was founded in 1899, the first degree for the accomplishment of a designated collegiate course in landscape architecture was granted in 1901. But now (1918) professional degrees are offered by at least six institutions in the United States, and the field and scope of the profession and the technical knowledge which its practitioners should possess are being differentiated with considerable clearness from the culture field of other professions like architecture and engineering. The general principles of the proper professional conduct of a landscape architect are in effect the same as those governing the action of the architect, and are not essentially different from those relating to the work of the client, nor are they fundamentally the principles of common honesty applied to the relations of a man who sells skilled advice to a client, who directs for the client the carrying out of this advice, and who serves as arbiter as to the meaning of these directions between the client and the person who does the construction. According to the constitution of the American Society of Landscape Architects, a landscape architect, a landscape gardener, or a landscape designer, in good standing is one who practises the art of arranging land and landscape for use and enjoyment, whose compensation is received directly from his client and not directly or indirectly from labor, plants or other material used in fitting land for use, or from persons supplying the same. The most direct professional activity in which the landscape architect finds himself most frequently in co-operation with practitioners from other professions is the field of city planning, where the landscape architect works in collaboration with engineer, economist, sociologist, and lawyer. Unlike the case of co-operation of architect and landscape architect in the design of a building and its grounds, the delimitation of field in city planning cannot be territorial, but must be according to the subjects in which the various collaborators are severally skilled. It is, therefore, doubly important that each collaborator should appreciate the point of view of the others, and that all should have at least a sound fundamental conception of the subject of city planning. This is necessary for collaboration and mutual comprehension and the fundamental value of the contribution of the landscape architect in such a collaboration have been made especially plain in the case of government industrial housing projects and war workers during the European War, where the determination of the physical arrangements of the communities was arrived at usually by such a co-operation of professional skill.

Typical Problems of the Landscape Architect.—The landscape architect to whom the demands of each problem with a design which, though almost necessarily sacrificing some factors which are theoretically desirable, combines on the whole the maximum of aesthetic and economic excellence possible for him to create under the particular circumstances. These circumstances are the local conditions of topography, soil, climate and so on, the financial means available, the preferences of those whom the landscape architect serves as to the appearance and expression of the design and the economic practice of the client, the extent to which he can put, with their resultant fixing of the sizes and shapes of many parts of the composition. Beauty of appearance may be sought in many different ways, and where one kind of beauty proves to be impossible with the sizes and shapes necessary to be used in the design, another kind may be attained, perhaps at a different scale and with a different aesthetic expression. No two problems are ever exactly alike, but each typical well-defined use of the land has returns or less characteristic effect on the composition, no matter what the other circumstances may be. The ordinary work of the landscape architect falls, therefore, into classes most readily according to use. Some of the types of landscape designs which naturally cover the work of the architect in our time and in our condition of society are the garden, the private estate, the "land subdivision" or development of land for residential use, the country club and country hotel grounds, the grounds of colleges and institutions, hospitals and other public or semi-public building groups, the grounds of public buildings, exposition grounds, amusement parks, zoological parks and botanical gardens, cemeteries, playgrounds, the smaller intown parks, the larger country parks on the outskirts of our cities and the great landscape reservations, State and national, scattered throughout the country which are now being recognized as having a peculiar worth.

As man has more and more greatly utilized natural resources the amount of actually wild landscape has decreased, and in our time it is decreasing at an enormously accelerated rate, so that the unhampered expressions of nature's forces remain only in inaccessible and inhospitable places, and the pleasant, rapidly passing away before the blind destructive force of man's enterprise. A possession of inestimable value to mankind is thus becoming in our country so rare that we are beginning to appreciate its preciousness, and the responsibility rests largely upon the landscape architects of this generation to see to it that the best of the scattered remnants of natural character and natural beauty, which we still have left to us, are preserved for the recreation and inspiration of the future generations. Almost within the memory of living men has come the effective conception of the city as a complete organism which must provide for its inhabitants such things as they cannot provide for themselves for complete and efficient living; and with this conception has come the realization of the importance to the individual, and so to the community, of beauty, and especially of outdoor beauty, and the duty which the community has to provide it. This duty has been put before the community very definitely in these times, not only in the designing of a city or a country, but especially in the reconstruction of cities and country sides destroyed in the war.
We are now coming to see that this same conception of a complete functional organism applies as well to the State and to the nation; that the lands of the nation should be studied as to their various fitness to all the purposes which land may serve, and that each may best serve that purpose, economic or aesthetic, to which in the general nation-wide scheme it is best fitted.

Bibliography.—Some of the most important general books on landscape architecture which have appeared in recent years are Whately, T., 'Observations on Modern Gardening' (1770); Hirschfeld, C. C. L., 'Theorie der Gartenkunst' (1775–80); Repton, H., 'Sketches and Hints on Landscape Gardening and Observations on the Theory and Practice of Landscape Gardening' (1794 and 1803); Loudon, J. C., 'An Encyclopaedia of Gardening' (1822); Prince von Pückler-Muskaus 'Andeutungen über Landschaftsgarten' (1834; now available in an English translation); Downing, A. J., 'Treatise on the Theory and Practice of Landscape Gardening' (1841); André, E., 'L'Art des Jardins' (1879); Van Rensselaer, Mrs. Schuyler, 'Art out-of-doors' (1898); and the photographs by his father 'Charles Eliot, Landscape Architect' (1902). Of recent general works should be mentioned Meyer and Ries, 'Die Gartenkunst in Wort und Bild' (enlarged 1914); Parsons, S., 'Art of Landscape Architecture' (1915), and Hubbard, H. V., and Kimball, T., 'An Introduction to the Study of Landscape Design' (1917). In this last book will be found a selected list of references on landscape architecture, which gives fuller bibliographical information for all the titles here mentioned and many others, arranged by subject for professional use. The Boston Public Library Catalogue of the Codman Collection of Books on Landscape Gardening (1899) contains a large number of titles of the older works.

Among the books treating the history of landscape architecture Goethe, M. L., 'Geschichte der Gartenkunst' (1914) stands out most consistently both in comprehensiveness of scope and wealth of source-material consulted. In English, Triggs, H. E., 'Garden Cities in the Making' (1915) is still the best work on the subject; 'Gardens Ancient and Modern' (1885), also published as 'The Praise of Gardens,' ed. by A. F. Sieveking (1899), together with Miss Rose Nichols' 'English Pleasure Gardens' (1902), include an historical survey of European gardens to show their influence in England, and Mrs. Van Rensselaer's series of historical articles in 'Garden and Forest' (1889–90), will be found useful. Noteworthy treatises on historic styles of landscape design in special countries are for England, the garden histories by the Hon. Alicia Amherst and George W. Johnson, for France, the works of M. Fouquier and Stein; for the Netherlands, Van Sypesteyn, 'Oud-Nederlandsche Tuinkunst'; for Japan, Josiah Conder's work; for India, Mrs. Villiers Stuart's 'The Hinterland'; for China, Mughals; and for the American colonial gardens, Grace Tabor, 'Old-Fashioned Gardening.'

The books on the design of estates and gardens are legion, and similarly abundant are descriptions of famous parks and gardens in various parts of the world. Some of these works by such writers as Alphand, Blomfield, Jekyll, Kemp, Mawson, Muthesius, Robinson, Schultz- Naumburg, Sedding, Triggs and others are to be found in the bibliographies already mentioned. Current professional literature is noted in the quarterly Landscape Architecture (official organ of the American Society of Landscape Architects), which contains articles by eminent practitioners, as did the earlier periodical Garden and Forest (1888–97).

Henry V. Hubbard, Assistant Professor of Landscape Architecture, Harvard University.

LANDSCAPE GARDENING. See LANDSCAPE ARCHITECTURE; HORTICULTURE.

LANDSEER. Sir Edwin Henry, English animal painter; b. London, 7 March 1802; d. 1 Oct. 1873. Hampstead Heath was the scene of some of his early studies, and on one of his early productions now at Kensington his father has written 'at the age of five.' Following the advice of Haydon he studied the Elgin Marbles and the wild beasts at Exeter Change and dissected every animal whose carcass was obtainable. His life is the record of his works and successes. In the Academy's exhibition for 1815 he exhibited the 'Portrait of a Mule' and the 'Heads of a Pointer-Bitch and Puppy.' In 1818 he contributed several studies of animals to the Academy and the British Institution. In that year a picture exhibited at the Academy was that of the Ox and Water Color Society in Spring Gardens, 'Fighting Dogs Getting Wind,' attracted great attention and set a seal upon his work. In 1820 he painted his 'Dogs of St. Gothard.' In 1821 he exhibited 'Ratcatchers,' a 'Prowling Lion' and other works of great spirit. In 1822 he received a prize of £150 from the British Institution for the 'Larder Invaded.' The 'Cat's Paw' appeared at the Academy in 1824 and was sold for £100. In 1826 he was elected A.R.A., and in 1831 became R.A. In 1827 he exhibited 'The Return from Deer- Stalking'; a 'Fire-Side Party,' 1829; 'High Life' and 'Low Life,' 1831; 'Spaniels of King Charles' Breed,' 'A Jack in Office,' 1833; 'Bolton Abbey in the Olden Time,' 1834; 'The Drover's Departure,' 1837; 'The Return from Hawking' and the 'Shepherd's Chief Mourner,' 1837; a 'Distinguished Member of the Humane Society' and 'There's Life in the Old Dog Yet,' 1838; in 1840, 'Laying Down the Law'; in 1844, 'Coming Events Cast Their Shadows Before;' and in 1846, 'The Stag at Bay'; in 1849, 'The Forester's Family'; in 1850, 'A Dialogue at Waterloo'; in 1851, 'A Scene from the Midsummer Night's Dream'; in 1853, 'Night and Morning' and 'The Children of the Mist.' His later works include 'Saved,' 'Deer-Stalking,' 'A Flood in the Highlands,' 'A Random Shot,' (the most
pathetic of all his works), 'Wild Cattle at Chillingham,' and his celebrated work of sculpture, the Lions in Trafalga Square. Landseer's pencil was productive, and besides many works not here named he produced portraits of celebrities of the time, that of Sir Walter Scott being in the National Gallery. In 1850 he was knighted; in 1855 he received the gold medal of the Paris exhibition. He declined the president-ship of the Royal Academy offered him on the death of Sir Charles Eastlake (1865).

Landseer, notwithstanding his noble work in portraiture, was essentially an animal painter, his success being in fur rather than in flesh. Down to about 1823 he was content to reproduce the natural expression and characteristics of animals, but after that date, at the sacrifice of genuine artistic qualities, his animal pieces are treated with more or less pictorial effects, with the idea of enforcing the analogy between the character of men and dogs. Dogs and deer are his favorite subjects. His draughtsmanship is facile and elegant, and he was exceedingly rapid in execution. He held a distinguished place in the society of his time, but his abnormal sensibility made him in his later years subject to fits of mental depression due to imagined slights by social superiors. Consult Graves, A., 'Catalogue of the Works of Sir Edwin Landseer' (London); Mawson, J. A., 'Landseer' in 'Makers of British Art' (London 1902); Monmouth, Cosmo, 'Studies of Sir Edwin Landseer' (London); Stephens, F. G., 'Sir Edwin Landseer' (ib. 1880); Sweetser, M. F., 'Landseer,' in 'Artist Biographies' (Vol. 11, Boston 1878).

LANDSHUT, lants'hoot, Germany, capital city of lower Bavaria, on the right bank of the river Isar, and 40 miles by rail northeast of Munich. From 1253-1503 the town was capital of the duchy Bayern-Landschut, and in 1800-26 it was the seat of a university. There is a fine Italian Renaissance palace built in the 16th century, and near the town is the ancient castle of Trausnitz, once a seat of the dukes of lower Bavaria. There are 11 churches, one of which, a Gothic brick edifice, dates from 1392 and has a tower 43 feet high. The Cistercian monastery of Seligenthal, founded in 1232, is near the city, and has a church built in 1729-38. The city is important for its manufactures and markets. Pop. 25,157.

LANDSKRONA, lans'kroo'na, Sweden, a fortified seaport town on the east side of the Sound, 15 miles northeast of Copenhagen. It has a castle which was completed in 1543 and is now used as a prison, and opposite the town on the island of Hven is the famous subterranean observatory of Uraniborg, built by Tycho Brahe in the 16th century. The modern town ranks 12th in the manufacturing industry of Sweden, leather and sugar products being of chief importance. There are coal mines in the neighborhood and the town possesses an excellent harbor 35 feet in depth. The harbor was the scene 24 July 1677 of a great naval battle in which the Swedes were victorious over the Danes. Pop. 16,130.

LANDSLIDE, or LANDSLIP, the slipping or sliding of land, through the failure of supporting strata, from its original position. They are due to a variety of causes. Water, particularly in its changing forms through frost and thaw, is the chief agent in their production. The wearing away of supports by water, the cracking of underlying materials by summer droughts and the rending of existing crevices by the thawing of water frozen in them are some of the commonest modes by which they are brought about. Sometimes a mass of land resting on an inclined bed slides for a considerable distance before it is arrested by a level surface. The landslip of 1772, near Shaftesbury, loosened by excessive rains, rolled over 400 acres of cultivated land, reaching in some parts to the roofs of the houses. The fall of the Rossberg in Switzerland and the slip at Charnbury, near Lyme Regis, are other familiar instances. In 1902 in British Columbia a remarkable landslide occurred destroying an entire mountain village and causing the death of nearly 100 persons.

LANDSLIDE is a term employed in United States political philosophy to denote the crushing defeat of a political party in an election, and especially of the overwhelming defeat of the party in power, as for example, the Democratic landslide of 1890 and the Republican landslide of 1896.

LANDSMAN, in the United States navy an enlisted man who is not in the seaman branch of the service, but takes the rating of third class seaman. Persons possessing a mechanical trade may be enlisted up to the age of 30 years instead of 25 years as in other branches of the service, and a landsman enlisted for a special position must have the qualification recorded on his service card. Originally the term embraced the lowest rating in all branches of the enlisted force of the naval service, but latterly the term has been confined to men enlisted in the artificer or special branches, while in the seaman branch the lowest rating is that of apprentice seaman. The pay in peace times is $17.50 a month; in wartime and for six months thereafter, $32.50 a month.

LANDSTAD, land'stad, Magnus Brostrup, Norwegian bishop, folklorist and poet: b. near North Cape on the island of Andoya, 1802; d. Christiania, 8 Oct. 1880. He was educated for the ministry and became minister at Seljord, where he lived until his retirement in 1876, after which time he resided in Christiania. His literary activities were confined chiefly to versification of folklore and to the composition of hymns. His 'Norske folkeviser' (1851-53) comprised about 130 poetic versions of folklore, set to music by Lindeman. He, together with Andreas Faye, was a pioneer in the classification of Norse folklore. Landstad made a translation of the hymns of Luther (1855) and he also compiled a book of hymns, 'Kirkesalmebog,' which in 1869 was adopted for use in the Norwegian churches and which contained some 60 hymns of his own composition. He also published 'Digte og sange' (1878), and 'Gamlle sagn om Hjartdølæne' (1880).

LANDSTURM, lants'toom (land storm, land uprising), in Germany, a local militia, consisting of two levies or bands, the first embracing all males liable to service but as yet untrained of age from 17 to 39, and the second all men, trained or untrained, from 39 to 45. See LANDWEHR.

LANDWEHR, lants'ver ('national defense'), in the German Empire, a term applied
to that part of the military force of the state which is not kept constantly under arms, but during peace follows ordinary trades, and is only summoned into active service on the breaking out of war or some internal emergency. It was first organized by Prussia in 1813, and was extended to all states of the German Empire in 1871. On leaving the reserve of the regular army the soldier spends 12 years in the Landwehr, after which he is transferred to the Landsturm (q.v.). In Austria and Hungary the Landwehr, which form cadres alongside the regular army, was reorganized in 1889. In Switzerland the years from 32 to 40 are spent in this force, after which discharged men are drafted to the Landsturm, in which they remain for eight years, thus terminating their military service.

LANE, Alfred Church, American geologist: b. Boston, 29 Jan. 1863. He was graduated at Harvard in 1883 and studied at the University of Heidelberg in 1885–87. He was instructor in mathematics at Harvard in 1883–85; petrographer of the Michigan Geological Survey and instructor in the Michigan College of Mines in 1889–92; and assistant, then State, geologist of Michigan in 1892–1909. Since 1909 he has been Pearson professor of geology and mineralogy at Tufts College. He was a delegate to the International Geologic Congress in 1913. Besides numerous articles he is editor and part author of various reports on geologic surveys in Michigan and Canada, as well as those of the United States Geological Survey.

LANE, Edward William, English Orientalist: b. Hereford, 17 Sept. 1801; d. Worthing, Sussex, 10 Aug. 1876. Owing to a breakdown in health he went to Egypt in 1825, lived the life of its people and adopted the dress of the country. In 1836 he published 'Manners and Customs of the Modern Egyptians,' a book which bears on every page the stamp of authenticity. His next work was the first accurate version and one of the most famous translations of the 'Arabian Nights' (1838–40), from which the first translations into English, which was made directly from the Arabic, all previous translations having been made through the French. It contained valuable illustrations and numerous scholarly and indispensable notes. The translations of Burton and Payne were subsequent to it. The world is indebted to him for many valuable works on Egypt and especially for his 'Arabic-English Lexicon' (1863–74), which cost him 30 years of unremitting labor, the expense of production being generously undertaken by his friend, the 4th Duke of Northumberland. The succeeding parts came out from 1877 to 1892 under the editorship of S. Lane-Poole, the whole forming a dictionary indispensable to the students of Arabic. (See Arabian Nights). Consult his 'Life' by S. Lane-Poole ('London 1877').

LANE, Franklin Knight, American Cabinet officer: b. Prince Edward Island, Canada, 15 July 1864. He removed to California in early childhood and was graduated at the University of California in 1886. He was engaged for a time in newspaper work, and in 1889 was admitted to the bar of California. He practised law in San Francisco, where in 1897–1902 he was city counsel. He was active politically and in 1905–13 served on the Interstate Commerce Commission, receiving his appointment from President Roosevelt. In 1913 he was appointed Secretary of the Interior in the Cabinet of President Wilson.

LANE, George Martin, American educator: b. Charlestown, Mass., 24 Dec. 1823; d. Cambridge, Mass., 30 June 1897. He was graduated from Harvard in 1846 and after four years at the universities of Berlin and Göttingen returned to America and became professor of Latin at Harvard in 1851. He held this chair until 1894 when he became professor emeritus. He published 'Latin Pronunciation' (1871) in which he contended for the continental pronunciation of the language as against the English method. He left unfinished a Latin grammar, completed by Morgan (1898). The famous ballad of 'The Lone Fishball' was written by Professor Lane.

LANE, Harry, American legislator: b. Corvallis, Ore., 1835. He was graduated at the Willamette University in 1856, and engaged in the practice of medicine at Portland, Ore. He was superintendent of the Oregon State Insane Asylum in 1887–91, and was mayor of Portland in 1905–09. He was elected to the full term in the Senate in 1913. He is an advocate of government ownership of telegraphs and telephones. In the debates on the Armed Neutrality Bill, Senator Lane greatly incensed his constituents by taking part in the filibuster of 5 March 1917 against the bill.

LANE, Henry Smith, American politician: b. in Montgomery County, Ky., 24 Feb. 1811; d. 1881. He studied law, and was admitted to the bar; removed to Indiana in 1832, and while engaged in his profession became prominent in Whig politics. After serving as State senator (1837), he was twice elected to Congress (1838 and 1840), and in the Mexican War lieutenant-colonel of an Indiana regiment. The dissolution of the Whig party was followed by a preliminary organization which led to the formation of the Republican party, and in this movement Lane was conspicuous, acting with other leaders who planned the first Republican national convention, held in Philadelphia in 1856, and of which he was permanent chairman. A coalition of Republicans with members of the disappearing American party in 1859 elected him to the United States Senate, but after a contest he was unseated in favor of his Democratic competitor. He was elected governor of Indiana in 1860, and in the same year became United States senator, serving one term.

LANE, James Henry, American politician and soldier: b. Lawrenceburg, Ind., 22 Feb. 1814; d. Leavenworth, Kan., 11 July 1863. He was admitted to the bar in 1840, enlisted as private in an Indiana regiment in 1846, served in the Mexican War, became colonel and at Buena Vista commanded a brigade. Returning from the war, he was elected lieutenant-governor of Indiana; from 1853 to 1855 was a Democratic representative in Congress; in the latter year removed to Kansas, joined the Free-State party, acted as president of the Topeka and Leavenworth constitutional conventions and became major-general of the Free-State forces. In 1856 the Free-State legislature
elected him to the United States Senate, but he was not allowed to sit. He was a prominent actor in turbulent scenes, and was twice indicted once for treason and again for murder; on the second charge he was tried and acquitted. In 1861 Kansas was admitted to the Union and Lane was elected United States senator, but entered the Federal army and in the same year was appointed brigadier-general of troops, serving with ability until March 1862, when his commission was canceled. The "Great Southern Expedition" from Kansas (1861-62) and other military schemes of the period were conceived by Lane, but came to nothing. As commander for recruiting in the Department of Kansas (1862) he came into collision with the State authorities and was charged with attempted usurpation. In 1865 he was again elected to the United States Senate, suffered from paralysis in the following year, and died by his own hand.

**LANE, Jonathan Horace, American mathematician:** b. Genesee, N. Y., 9 Aug. 1819; d. Washington, D. C., 3 May 1880. He was graduated at Yale in 1846 and entered the United States Coast Survey in 1847. He was appointed assistant examiner of the United States Patent Office in 1848 and was principal examiner in 1851-57. In 1869-80 he was connected with the Bureau of Weights and Measures in Washington. He was a member of the Coast Survey's expedition to Des Moines, Iowa, to observe the total solar eclipse in 1869, and to Catania, Spain, in 1870. He invented a machine for finding the real roots of higher equations; a visual telegraph; an improved basin for mercurial horizon; a mechanism for holding the Drummond light and reflector on shipboard, etc. He published "On the Law of Electric Induction in Metals" (1846); "Report of the Solar Eclipse of 7 Aug. 1869" (1869); "Theoretical Temperature of the Sun" (1870); "Coefficients of Expansion of the British Standard Yard Bar" (1877), etc.

**LANE, Joseph, American soldier and politician:** b. Buncombe County, N. C., 14 Dec. 1801; d. Oregon, 19 April 1881. In 1816 he removed to Henderson County, Ky., to Warwick County, Ind., where he was for some time clerk in a mercantile establishment, and in 1822-46 served in both houses of the State legislature. He resigned from the senate in 1846 to enlist as a private in the 2d Indiana Volunteers, was soon commissioned colonel of the regiment, and in the same year was promoted brigadier-general. He was wounded at Buena Vista, defeated Santa Anna at Huamantla and was brevetted major-general, U. S. A., for this service. After the Mexican War he was appointed governor of Oregon Territory, was Democratic delegate from Oregon to Congress in 1851-57, defeated the Rogue Indians at Table Rock in 1853 and in 1859-61 was a United States senator. He was nominated for the Vice-Presidency in 1860 on the unsuccessful Breckenridge ticket. He then returned to his humble life and lived at his ranch in Oregon for the rest of his life.

**LANE, Sir Ralph, English administrator in America:** b. Northamptonshire, England, about 1530; d. in Ireland, 1603. His early life was spent in maritime adventure; in 1583-84 he held a command in Ireland, in 1585 took the direction of the colony that Raleigh was establishing in Virginia, sailed in that year in the fleet commanded again for Sir Francis Drake, and was left with 107 colonists at Roanoke Island, while the fleet returned to England (25 August). He was thus the first governor of Virginia. The location proved unsuitable, provisions ran low and the colonists quarrelled and dispersed. On 19 June 1586 Sir Walter Raleigh discharged two vessels, the Golden Hind and the Golden Alpine in the fleet of Sir Francis Drake. In 1589 Lane was a colonel in Drake's expedition against Portugal, and in 1591 helped to quell a rebellion in Ireland. It is regarded as not unlikely that he and his companions first brought tobacco and potatoes to England. Letters by him may be read in Hawks' "History of North Carolina" (1857); and in Hale (editor), "Archeologia Americana" (Vol. IV 1861). Consult also his "Account of the Particularities of the Impositions of the Englishmen left in Virginia," printed by H. S. Burrough in "Early English and French Voyages" (New York 1906).

**LANE, Ralph Norman Angell (Norman Angell), Anglo-American author:** b. England, 26 Dec. 1874. He was educated at the Lycée de Saint Omer, France, and at Geneva, Switzerland. He came to the United States in 1890 and engaged in ranching, prospecting and newspaper work. In 1898 he returned to Europe as Paris correspondent of several American newspapers, serving in this capacity until 1900, when he became editor of the Daily Messenger in Paris. In 1905-15 he was general manager of the Paris Daily Mail. He is famous as the author of "The Great Illusion" (1910) which has appeared in England, America, France, Germany, Holland, Denmark, Sweden, Spain, Italy, Russia, Japan and China, and in Hindu, Bengali, Urdu, Marathi and Tamil. The Garton Foundation was established in London in 1912 for the dissemination of Angell's ideas of a modern world state. Among his other writings are "Patriotism Under Three Flags" (1903); "Europe's Optical Illusion" (1909); "War and the Essential Realities" (1913); "The World's Highway" (1915); "The Dangers of Half-Preparedness" (1916), etc.

**LANE, William Coolidge, American librarian:** b. Newton, Mass., 29 July 1859. He was graduated at Harvard in 1881 and was assistant librarian there from 1887 to 1893, when he became librarian of the Boston Athenæum, continuing in that position until 1906, at which time he has been the librarian of Harvard University. From 1886 to 1900 he served as secretary and treasurer of the publishing board of the American Library Association, in 1898-99 was president of the association and since 1899 chairman of the publishing board. From 1904 to 1909 he was president of the Bibliographical Society of America.

**LANE-POOLE, Stanley, English archeologist and historian:** b. London, 18 Dec. 1854. He is a nephew of E. W. Lane, the Orientalist (q.v.). He was educated at Corpus Christi, Oxford, in 1874-92 was employed in the coin department of the British Museum; was sent by the British government on archaeological missions to Egypt (1883) and Russia (1886); was employed by the Egyptian government in archeological research at Cairo (1895-97); and
LANE THEOLOGICAL SEMINARY—LANG

from 1898-1904 was professor of Arabic in Trinity College, Dublin. He has published in all over 70 volumes, among them being 'Social Life in Egypt' (1887); 'The Moors in Spain' (1887); 'Saracenic Egypt' (1900); 'Medieval India' (1902); and 'The Story of Cairo' (1902). He also edited many volumes and prepared the extensive catalogue of the Oriental and Indian coins in the British Museum (1875-92); 'North' (1883); 'North' (1905); 'The Thousand and One Nights' (3 vols., 1906).

LANE THEOLOGICAL SEMINARY, a divinity school founded at Cincinnati, Ohio, 1829. It was opened for students three years after its foundation and its endowment amounts to about $300,000; its income $20,000; it has 8 instructors and 57 students. Although it is under the control of the Presbyterian Church it receives students from other reformed bodies. No tuition fees are charged, board is low and there are 40 scholarships, each of the value of $2,000. The college stands on a lot of 60 acres donated by Nathan Kemper in 1829; there are five professors' houses and a library containing over 23,000 volumes. Two clubs are maintained, the General Society of Alumni and the Lane Club.

LANESSAN, Jean Antoine de, zhôhân-tē Nacional historiador, b. Parmá, 1580 or 1581; d. Rome, 1647. He was a page in the service of the Marquis of Montalto, who placed him in the studio of Agostino Carracci at Parmá. Later he studied in Rome under Annibale Carracci, assisting him in painting the frescoes in the Farnese Palace. His most notable work was done in fresco painting, although there is a considerable number of his oil paintings in the various Italian collections. He was also an engraver, his most famous work in that line being the plate for Raphael's biblical subjects in the Vatican. Among the most famous of his frescoes are his 'Angels in Glory,' painted for his old patron, the Marquis of Montalto, in the cupola of Maria in Piazzo at Piacenza; the completion of the cupola frescoes of San Andrea della Valle; the cupola of the church of Gesù Nuovo at Naples; and he painted other frescoes in various northern Italian cities. He painted 'Saint Peter walking upon the Sea' for Saint Peter's Church in Rome and likewise executed a Passion series for the chapel of the Crucifix there. His services to ecclesiastical art were recognized by Pope Urban VIII who knighted him.

LANFRANCO, lan-frânkô, Giovanni, Italian historical painter; b. Parma, 1580 or 1581; d. Rome, 1647. He was a page in the service of the Marquis of Montalto, who placed him in the studio of Agostino Carracci at Parma. Later he studied in Rome under Annibale Carracci, assisting him in painting the frescoes in the Farnese Palace. His most notable work was done in fresco painting, although there is a considerable number of his oil paintings in the various Italian collections. He was also an engraver, his most famous work in that line being the plate for Raphael's biblical subjects in the Vatican. Among the most famous of his frescoes are his 'Angels in Glory,' painted for his old patron, the Marquis of Montalto, in the cupola of Maria in Piazzo at Piacenza; the completion of the cupola frescoes of San Andrea della Valle; the cupola of the church of Gesù Nuovo at Naples; and he painted other frescoes in various northern Italian cities. He painted 'Saint Peter walking upon the Sea' for Saint Peter's Church in Rome and likewise executed a Passion series for the chapel of the Crucifix there. His services to ecclesiastical art were recognized by Pope Urban VIII who knighted him.

LANFRED, Pierre, pê-âr lan-frânf, French historian and publicist; b. Chambéry, 26 Oct. 1828; d. Pau, France, 15 Nov. 1877. He was educated in the Jesuit college of his native town and in Paris and became well known by the publication of works in support of political and religious liberalism. These include 'L'Eglise et les philosophes au XVIII siècle' (1853); 'Essai sur la révolution française' (1858); 'Histoire politique des papes' (1860); 'Lettres d'Everard' (1860), a social novel in epistolary form; 'Le rétablissement de la Pologne'; and 'Études et portraits politiques' (1863). His most important work is a 'Histoire de Napoleon P' (1867-75), which is strongly hostile to Napoleon. It was incomplete at his death. In 1871 he was elected to the National Assembly by the department of Bouches-du-Rhône, and took his seat with the Republican Left. He was Ambassador at Berne (1871-73), and in 1875 he was elected a life senator.

LANG, Andrew, English author; b. Selkirk, 31 March 1844; d. 20 July 1913. He was educated at Saint Andrews and at Balliol Col-
lege, Oxford; was elected Fellow of Merton, Oxford, in 1868. He was probably the most versatile writer of his time, and was recognized as an authority on many subjects, including Greek, French, and English literature, anthropology and folklore, Scottish history (especially the Jacobite period), telepathy and physical research. His wide learning appears in his prose rendering of the 'Odyssey' (1879; with Reformation, 1882; with Myers and Leaf), and 'Homer and the Epic' (1893), a defense of the unity of the poems; in his works on comparative mythology and religion, 'Custom and Myth' (1884), 'Myth, Ritual, and Religion' (1887; new ed., 1899); 'The Making of Religion' (1898), and 'Magic and Religion' (1901); and in his studies of Scottish history, such as 'A History of Scotland from the Roman Occupation'; 'The Mystery of Mary Stuart'; and 'Prince Charles Edward.' Some of the most interesting of his work is to be found in 'Letters to Dead Authors' (1886); 'Letters on Literature' (1889); 'Angling Sketches' (1891); 'Essays in Little' (1891); 'Adventures Among Books' (1904). He published also volumes of verse, 'Ballades in Blue' (1880); 'Poèmes à la Mort' (1884); 'Grass of Parnassus' (1888); 'Ballads of Books' (1888); 'Ban et Arrière Ban' (1894). Mention should also be made of 'Cock-Lane and Common Sense' (1894), a discussion of the spiritualistic question; 'John Knox and Reformation' (1905), 'A Defence of Sir Walter Scott and the Border Minstrelsy' (1910); and the biographies of Lockhart (1896) and Tennison (1901). See LETTERS TO DEAD AUTHORS.

LANG, Arnold, Swiss zoologist and anatomist; b. Öffingen, 1855. He was educated at the universities of Geneva and Jena, and in 1876 became privatdocent in zoology at Bern. He was assistant at the zoological station at Naples in 1878-85, and was Ritter professor of phylogeny at Jena in 1886-89. In 1889 he became professor of zoology and comparative anatomy at the University of Zürich, where in 1898-99 he was rector. He wrote 'Die Polycladen (Seeplankien) des Golfes von Neapel' (1884); 'Über den Einfluss der feststehenden Lebensweise auf die Thiere' (1888); and his 'Lehrbuch der vergleichenden Anatomie' was translated into the English 'Text-book of Comparative Anatomy' (Part I, 1891; part II, 1896).

LANG, Benjamin Johnson, American musician; b. Salem, Mass., 28 Dec. 1837; d. 1909. He studied music under his father, an organist and pianoforte teacher, and at 15 began work as teacher and organist. In 1855 he went to Germany for further study, which for three years he pursued under the instruction of Liszt, Albert Jaell and others. Returning to Boston he at once attained prominence as organist, pianist, teacher and conductor; became organist of the Handel and Haydn Society in 1859 and conductor of the same in 1895; conductor of the Apollo Club in 1868, and of the Cecilia Society in 1874. In 1869 he made a second visit to Europe, and gave concerts in Berlin and other cities. As a member of the concert committee of the Harvard Musical Association he did much for the interests of musical culture, and through this and other organizations secured the production of many new works. The introduction of Wagner to the American public was in no small part due to his presentation of that master. He also introduced in America Mendelssohn's 'Midsummer Night' and Berlioz's 'Damnation of Faust.' While he accomplished much work as a composer, few of his compositions have been published.

LANG, Cosmo Gordon, English archbishop; b. 31 Oct. 1864; the son of the Rev. John Marshall Lang D.D., C.V.O. As an undergraduate he had a brilliant career at Balliol College, Oxford, and was a student of the Inner Temple, London, 1883-89. He became a Fellow of All Souls' College, Oxford, in 1888, and attained the degrees of D.D., D.C.L., L.L.D., and D.Litt. He was curate at Leeds 1890-93; Fellow and Dean of Divinity, Magdalen College, Oxford, 1893-96; vicar of Saint Mary's,—the university church,—Oxford, 1894-96; vicar of Portsia, 1896-1901; bishop of Stepney, 1901-08; Canon of Saint Paul's, 1901-08; and honorary chaplain to the late Queen Victoria. He was created archbishop of York in 1908 and at the confirmation held in the Church House 20 Jan. 1909 objections were raised on behalf of the Protestant Churches of Germany and Switzerland, while bishop of Stepney he had allowed infractions of the law as to church ritual. The objections were dismissed by the commissioners in chambers presided over by the archbishop of Canterbury, on the technical grounds 'that they could not be lawfully received.' He visited the United States in 1918.

LANG, Heinrich, German-Swiss theologian and reform leader: b. Frommern, Wurtemburg, 14 Nov. 1826; d. Zürich, 13 Jan. 1876. He was educated in theology at the University of Tübingen and took part in the uprising of 1848, for which he was banished. He became pastor of Wartau, Switzerland, and won wide recognition for his advocacy of the Reformed Church. He later became pastor of the church at Melten. He established a paper called Die Zeitstimmen aus der reformirten Kirche der Schweiz which he later combined with Bitzius' Berner Wochenblätter under the new name Reform. He opposed the old doctrines of the orthodox church, and was uniriting in his efforts to promote broader views. He wrote Versuch einer christlichen Dogmatik' (1838; 2d ed., 1868); 'Ein gang durch die christliche Welt' (1859; 2d ed., 1870), and 'Religiöse Reden' (2 vols., 1873-74; 2d ed., 1896).

LANG, John Marshall, Scottish Presbyterian clergyman and educationist: b. Glasfowl, Lanarkshire, 14 May 1834; d. Aberdeen, 2 May 1909. After completing his education at Glasgow University he filled successively several important charges, and was minister of the Barony parish in Glasgow from 1873-1900. He was moderator of the Church of Scotland in 1893. He was the author of several social and other religious works. His third son, Cosmo Gordon Lang (q.v.), was appointed archbishop of York (1909). In 1900 he was appointed vice-chancellor and principal of Aberdeen University.

LANG, Karl Heinrich Ritter von, German historian; b. Balgheim, near Nördlingen, 7 July 1764; d. Ausbach, 26 March 1835. He was educated at the universities of Altdorf and Göttingen, specializing in history and jurispru-
dence. In 1789 he was private secretary to Baron von Bühler, Wurtseburg’s envoy at Vienna; but he traveled extensively, and from 1793-1801 he was private secretary and archivist to the Prussian leader Hardenberg. In 1797 he was secretary of the legation at the Congress of Rastadt. He was ennobled in 1807, and became archivist and Privy Councillor, retiring in 1817. His dependability is lessened by his tendency to satire and his giving rein to personal prejudices. Among his many works are ‘Memorien’ (Brunswick 1842; 2d ed., 1881); ‘Beiträge zur Kenntnis der naturlichen und politischen Derangements der oettingischen Vaterlandes’ (1786); ‘Neuere Geschichte des Fürstentums Bayreuth’ (1798-1811); ‘Bayerns Gauen’ (1830).

LANGBAINE, lang’ba:n, Gerard (LANGBAINE THE YOUNGER), English dramatic biographer and critic: b. Oxford, 15 July 1659; d. there, 23 June 1692. He was the son of Gerard Langbane, provost of Queen’s College, Oxford, and was educated at University College, Oxford. For years he trifled with literary pursuits and in November 1687 a work appeared under the name of ‘Thomas Triumphus, or the Plagiaries of the English Stage Expoused in a Catalogue of Comedies, Tragedies, etc.’ A month later the work reappeared as ‘A New Catalogue of English Plays,’ the advertisement claiming responsibility for the title of the first edition and for an uncorrected preface. Langbane attributed the unauthorized edition with its derivative title to the mafice of Dryden. At this time Langbane had collected 900 English dramatic works. He later wrote ‘A Review of English Dramatic Poets’ (Oxford 1691), which is his best-known and most valuable compilation. He was elected yeoman bedel of arts at Oxford in 1690 and esquire bedel of law and architgographus in 1691.

LANGBEIN, lang’bin, August Friedrich Ernst, German humorist: b. Radeburg near Dresden, 6 Sept. 1757; d. Berlin, 2 Jan., 1835. He was educated for the law at Leipzig and engaged in practice in Dresden until 1800 when he went to Berlin to enter upon a literary career. His verse and prose are of a rollicking humorous cast and were widely popular. He wrote ‘Schwänze’ (1792; 2d ed., 1888); ‘Thomas Kellermann’ (1806); ‘Sämmtliche Schriften’ (1835-37); ‘Humoristische Gedichte’ (edited by Tittmann, 1872); ‘Humoristische Erzählungen’ (1891). Many of his poems enjoyed a lasting popularity as songs.

LANGDALE, Marmaduke, BARON, English soldier: b. near Beverley, about 1598; d. Holme, 5 Aug. 1661. He came into public notice in 1659 when he opposed the ship-money levy on Yorkshire, but when the Civil War began he espoused the cause of King Charles I, and in 1643 he raised a regiment to fight for him. He afterward became a commander of cavalry, defeated the invading Scottish army at Corbridge, Northumberland, 19 Feb. 1644, and later fought at Marston Moor. He was victorious at Marston Mowbray 25 Feb. 1645; and succeeded in raising the siege of Pontefract on 1 March 1645, a piece of work regarded as perhaps the most brilliant of his career. He was defeated at Naseby, at Rowton Heath and at Sherburn; and the battle of Otterley completely shattered the remnant of his 1,500 horsemen so that he was compelled to flee to the Isle of Man, whence he escaped to France in May 1648. In the second Civil War he returned to Scotland with a commission from Charles II, and on 28 April 1648 he surprised Berwick and quickly raised a body of Royalists. He was defeated by Cromwell’s army at Preston, 17 Aug. 1648, and was taken prisoner 25 August. He was one of seven persons debarred from pardon by Parliament, but he succeeded in escaping from prison. He entered the Venetian service and was prominent in the defense of Candia against the Turks in 1652. After the Restoration Charles II created him a peer. His estates had been confiscated by Parliament, his losses in the service of the king amounting to £100,000, and he excused himself from the coronation ceremonies in 1661 on the ground of poverty.

LANGDELL, Christopher Columbus, American lawyer; b. New Boston Hillsborough County, N. H., 22 May 1826; d. Cambridge, Mass., 6 July 1906. He studied at Harvard, was graduated from its law school in 1853, in 1853-70 practised in New York, in 1870 became professor of jurisprudence in the Harvard Law School, and in 1871 dean of the faculty. In 1895 he retired. He was an originator of the so-called ‘case’ system of legal study, and was otherwise prominently identified with the progress of professional education in this country. His publications include ‘Selection of Cases on the Law of Contracts’ (1870; enlarged ed., 1877); ‘Cases on Sales’ (1872); ‘Summary of Equity Pleading’ (1877; 2d ed., 1883), and ‘Cases in Equity Pleading’ (1878); Brief Survey of Equity Jurisprudence’ (1904).

LANGDON, John, American statesman; b. Portsmouth, N. H., 25 June 1739; d. there, 18 Sept. 1819. At the outbreak of the Revolutionary War he embarked in the patriotic cause, and in 1775 he was a delegate to the Continental Congress, but resigned office in June 1776, on becoming navy agent. In 1777, while speaker of the New Hampshire assembly, he pledged a large portion of his property for the purpose of equipping the brigade with which Stark defeated the Hessians at Bennington. He took part in the battle of Stillwater and commanded a company at Saratoga and in Rhode Island. Subsequently he was a member and speaker of the State legislature, a member of the Continental Congress, a delegate to the convention which framed the Constitution of the United States, and president of New Hampshire. He was one of the first United States senators from New Hampshire, which office he held until 1801, serving for a time as president of the Senate. In politics he acted with Jefferson, who upon assuming office in 1801 offered him the post of Secretary of the Navy, which he declined. He died on 17 Nov., 1812, with the exception of about two years, he was governor of New Hampshire; and in 1812 he was offered by the Republican congressional caucus the nomination for the office of Vice-President of the United States, which, on the score of age and infirmities, he declined. The remainder of his life was passed in retirement.

LANGDON, Samuel, Congregational clergyman and educator: b. Boston, Mass., 1723;
d. Hampton Falls, N. H., 1797. He was gradu-
ated from Harvard in 1740 and was pastor at
Portsmouth, N. H. 1747-74. In 1774 he became
president of Harvard, resigning in 1780. In the
New Hampshire Convention he ardently advok-
ted the ratification of the Federal Constitu-
tion. He received the degree of D.D. from
Aberdeen in 1762. Langdon was the author of sev-
eral works on religion and philosophy.

LANGE, læng'ē. Ernān, Géllé Karl (PHILIPP GALEN, German novelist; b. Potsdam,
21 Dec. 1813; d. there, 20 Feb. 1899). He took
his degree in medicine at Berlin, became a
surgeon in the Prussian army in 1840, saw service
in the Schleswig-Holstein campaign of 1849 and
afterward settled at Bielefeld, where he practised
medicine and began his literary career. He retired
with the rank of surgeon-
general in 1878. He wrote 'Der Inselkönig'
(1852; 3d ed., 1858); 'Der Irre von Saint
James' (1854; 9th ed., 1891); 'Walter Lund'
(1870); 'Die Tochter des Diplomaten' (1865);
'Die Moselnixe' (1877); 'Der Meier von
Monjardin' (1891), etc. His 'Gesammelte
Schriften' was published in 36 volumes
(1857-66).

LANGE, Friedrich Albert, German soci-
ologist and economist; b. Wald near Solingen,
28 Sept. 1828; d. Marburg, 23 Nov. 1875. He
was educated at Dinsberg, Zürich and Bonn,
and became privatdocent in philosophy at Bonn
in 1855. In 1858 he became schoolmaster at
Duisberg, but resigned upon the government
forbidding schoolmasters to partake in political
activities and subscribed to liberalism in the cause
of political and social reform. He was a bitter
opponent of Bismarck's ministry. In 1866 he
remained at Winterthur near Zürich, where he
was connected with the Winterhurer Land-
bote. He became privatdocent at Zürich in
1869 and professor of inductive philosophy in
1870. His strong sympathy with the French in
the Franco-Prussian War influenced his resigna-
tion from Zürich but he afterward abandoned
politics. In 1872 he became professor at Mar-
burg. He wrote 'Unter der Stuart-Mills Aussicht
über die sociale Frage?' (1865); 'Geschichte des
Materialismus' (1867; 6th ed., 1908); 'Logische
Studien' (1877; 2d ed., 1894), etc.

LANGE, Henry, German cartographer; b.
Stettin, 13 April 1821; d. Berlin, 20 Aug. 1893.
He was for three years engaged upon John-
son's Physical Atlas in Edinburgh and in 1855-
60 he was head of the geographical depart-
ment of Brockhaus in Leipzig. He was appointed
inspector in the Berlin Statistical Bureau in
1868. Among his publications are 'Atlas vom
Nordamerika' (1854); 'Brockhaus Reise-atlas'
(1858-73); 'Südbrasilian, mit Rücksicht auf
die deutsche Kolonization' (1885), etc.

LANGE, Johann Peter, German theolo-
gian; b. Sonneform near Elberfeld, 10 April
1802; d. Bonn, 9 July 1884. He studied at
Bonn, held several pastures and in 1854 be-
came professor of theology at Bonn. He was
one of the editors of the 'Theologische
homiletisches Bibelwerk,' which was trans-
lated, edited and enlarged under the direction of
Dr. Philip Schaff as 'A Commentary on the
Holy Scriptures, Critical, Doctrinal and Homi-
etical' (25 vols., New York 1858-80). He
wrote 'Christliche Dogmatik' (3 vols., 1849-52;
new ed., 1870); 'Grundriss der theologischen
Encyclopädie' (1887); 'Grundriss der christ-
lichen Lehre' (1893); 'Grundriss der Bibel-
kunde' (1881), etc.

LANGE, læng'ē. Julius Henrik, Danish
art critic; b. Vordingborg, 19 June 1838; d.
Copenhagen, 20 Aug. 1896. After leaving the
University of Copenhagen he traveled in Italy,
and thereafter devoted himself to study of the
history of art, becoming in 1888 professor in
that subject at Copenhagen University.
Among his works are 'On Art Values' (1876);
'Danish and Foreign Art' (1879); 'Gods and
Men in Homer' (1881); 'Art and Politics'
(1885); 'Bastien Lepage and Other Painters'
(1889); 'Thorwaldsen's Representation of the
Human Figure' (1893). In his 'Billed-
kunstens Fremstilling på Menneskeskikk
sen' (3 vols., 1892-99) he elaborates his dis-
coveries of the "Law of Frontality." Consult
Brandes, C., "Julius H. Lange" (Copenhagen
1898).

LANGE, Thomas, Danish novelist; b. Co-
benhavn, 1829; d. Lyngby, 1887. He studied
theology but abandoned it for a literary career.
His work ranks nearly equal to that of his
contemporary countryman, Goldschmidt. His
first successful novel was 'Eventyrerets Land'
(1865). Later writings include 'Aaen og
havet' (1870); 'Romantiske skildringer'
(1872); 'De lyse Notter' (1875); 'Nyt Liv'
(1879), etc.

LANGE, Thor Næve, Danish author and
translator; b. Copenhagen, 1851; d. 1915. He
studied at the Technical University and took his
Ph.D. there in 1894. He became a professor at
Moscow in 1877 and in 1887 he was Danish consul there. His work includes some excelle
poetry and prose work besides translations of verse from the French, Italian, Greek, Russian and English. His 'Skildringer fra den russiske Literatur' (1886) ranks as a notable work. He wrote 'En Maaned i
Orienter' (1887); 'Skisser og Phantasier'
(1890); 'Genem fanget' (1894); 'I
Danske Farver' (1907), etc.

LANGELIER, län'shy'ē, Sir François
Charles Stanislas, Canadian jurist and states-
man; b. Saint Rosalie, Quebec, 24 Dec. 1838;
d. 8 Feb. 1915. He was educated at Saint
Hyacinthe College, Laval University and the
Law Faculty of Paris, and was professor of
Roman law and afterward of civil law and
Economics at Laval University. He served in the
Canadian House of Commons in 1884-98; was
Minister of Crown Lands, Quebec, 1878-79;
mayor of Quebec in 1882-90; and puisne
justice of the Superior Court in 1898-1907.
He was acting chief justice of the Superior
Court of the province of Quebec division in
1906-11; and from 1911 he was lieutenant-
governor of the province of Quebec. He was
knighted in 1907. He published 'De la
Preuve en Matière Civile et Commerciale';
'Commentaire du Code Civil de la Province
Québec.'

LANGEN, Joseph, German theologian; b.
Cologne, 3 June 1857; d. Bonn, 13 July 1901.
He studied at the University of Bonn and
was ordained a priest in 1859. He became assistant professor in 1864 and in 1867 professor of
the exegesis of the New Testament at Bonn, a
LANGENBECK — LANGENIN

position he held for the remainder of his life. In 1873 he supported Döllinger in his controversy with the Vatican and was excommunicated. He left the Old Catholic Church in 1878 because of the permission to marry which was given priests, but he was never reunited with the Roman Catholic Church. His writings, which made him well known, include "Introduction to the New Testament" (1868; 2d ed., 1873); "An Examination of the Vatican Dogma in the Light of Patristic Exegesis of the New Testament"; "History of the Church of Rome to the Pontificate of Innocent III" (4 vols., 1883-93), etc. He also contributed to the "International theologische Zeitschrift".

LANGENBECK, längén-bëk, Bernhard Rudolph Konrad von, German surgeon: b. Pardingsbüttel, 8 Nov. 1810; d. Wiesbaden, 29 Sept. 1887. He took his degree at Göttingen in 1835. He traveled in France and England, returned to Göttingen as privatdocent and in 1842 became professor of surgery at Kiel. He succeeded Dieffenbach as director of the Clinical Institute for Surgery and Ophthalmology at Kiel in 1848, and was still there in 1848-92, when he retired. He was a daring and skillful surgeon and made a reputation in facial surgery, as well as in resection, an operation on the bone which frequently obliterates amputation of a limb; and in the treatment of gunshot wounds he was an authority. He was general field surgeon of the army in the war with Denmark in 1848, served in 1864-1866 and in the Franco-Prussian War of 1870-71. He was emblazoned for his services in the Danish War. He published "Chirurgische Beobachtungen aus dem Kriege" (1874).

LANGENBECK, Karl, American ceramic chemist: b. Cincinnati, Ohio, 7 Oct. 1861. He studied under Victor Meyer in Zürich and under Carl Liebemann in Berlin. He was superintendent of the Rockwood Pottery in Cincinnati in 1889-90, and is the originator of the Rockwood faience and adventurous pottery glazes. In 1888-90 he was professor of chemistry at Miami Medical College. He is well known as a consulting chemist and since 1908 has been associate editor of the "Journal of Industrial and Engineering Chemistry". He wrote "Chemistry of Pottery" (1895).

LANGENBECK, Konrad Johann Martin, German surgeon: b. Horneburg, 5 Dec. 1776; d. 24 Jan. 1851. He studied at Jena, Vienna and Würzburg and took his degree at Göttingen in 1802. He was appointed professor at Göttingen in 1804. He was eminently successful both as a surgeon and as a teacher. He founded and edited the "Bibliothek für Chirurgie und Ophthalmologie" (1806-28). He was the father of Maximilian Adolph Langenbeck (1818-77), also famous as a surgeon and uncle of Bernhard Rudolph Konrad von Langenbeck (q.v.).

LANGENDJIK, længén-dik, Pieter, Dutch poet and dramatist: b. Haarlem, 1683; d. 1756. He was by trade a designer of textile patterns, but in literature, in which he achieved considerable success. His work includes a number of dramas, chiefly comedies, some of which are still produced, and he was the author of numerous poems. His works include "Don Quijote" (1696); "De Zwetser" (1712); "Het wederzys huwelyksbedrog" (1714); "Kreis Louwen" (1715); "Quincapox de de wind-baudefairs" (1721); and "Het wyt des filosoof Socrates betengeld" (1756), etc. His poems were published in his collected works, "Gedichten" (1760). Consult Van Hampen, "Histoire des lettres Neerlandaises" (1821-26); Meijer, "Pieter Langendijk" (1891).

LANGENSAHLZ, längén-sälts, Prussia, city in the province of Saxony, on the Salza, 19 miles northwest of Erfurt. It became a town in 1211, was subsequently part of the electorate of Saxony, and in 1815 came into Prussian possession. Near it are the remains of the Benedictine monastery of Hohenburg, where Henry IV was victorious over the Saxons in 1075. It was the field of three other famous battles; the defeat of the imperial army by the Prussians and English, 15 Feb. 1761; the victory of the Prussians over the Bavarians 17 April 1813, and the defeat of the Prussians by the Hanoverians 27 June 1866, the results of this battle being reversed by the arrival of Prussian reinforcements 29 June. The modern town is chiefly engaged in the textile industries. There are sulphur springs in the vicinity. Pop. 12,800.

LANGENScheidt, længén-schit, Gustav, German philologist and publisher: b. Berlin, 21 Oct. 1832; d. there, 11 Nov. 1895. He was an extensive traveler and the originator with Charles Toussaint of the Toussaint-Langenscheidt method of self-instruction in languages. The first textbook of the series, "Französischer Unterrichtsbriefe zum Selbststudium" (1856) reached its 62d edition in 1902. He was assisted by Karl von Dalen and Henry Lloyd in the preparation of "Englisch Unterrichtsbriefe." He published also the Sachs-Villatte Französischdeutsches Wörterbuch" (1868-94); the Muret-Sanders "Encyclopädie Wörterbuch der Englisch und deutsche Sprache" (1891-1901), etc. The system was founded on the Hamilton-Jacotot method and has been widely adopted for use in different languages.

LANGEnVIN, länzh-ven, Sir Hector Louis, Canadian statesman: b. Quebec, 26 Aug. 1826; d. 1906. He was called to the bar in 1850. He entered Parliament during the Union period, and on Confederation was appointed Secretary of State; was subsequently Minister of Public Works (1869-73); Postmaster-General (1878); and again Minister of Public Works (1879-91). He retired from public life in 1891.

LANGEnVIN, Jean Francois Pierre La Force, zhon frazn-swa pe-ar la fors, French-Canadian Roman Catholic bishop: b. Quebec, 22 Sept. 1821; d. 26 Jan. 1892. He was educated at the Quebec Seminary. He was ordained priest in 1844 and consecrated bishop of Rimouski in 1847. In 1870 he founded the College of Rimouski. Among his publications were "Histoire du Canada en Tableaux" (1860); "Cours de Pédagogie" (1865).

LANGEnVIN, Louis Philip Adelard, Canadian Roman Catholic priest: b. Montreal, 20 Oct. 1854; d. Montreal, 15 June 1915. He was educated in theology at the Sulpician College, Grand Seminary, and St. Mary's College,
Montreal; was ordained in 1882; was appointed professor of theology in the University of Ottawa 1885; and in 1893 became rector of Saint Mary's Church, Winnipeg. He was consecrated archbishop of Saint Boniface, 19 March 1895. He played a conspicuous part in the separate schools controversy in Manitoba.

LANGHAM, Simon de, English archbishop and cardinal; b. Larchmont, about 1310; d. Avignon, 22 July 1376. He became a monk, then prior and later abbot in the abbey of Saint Peter at Westminster. He was appointed treasurer of England in 1360 and in 1361 became bishop of Ely. He was chancellor of England in 1363, and in 1366 was elected archbishop of Canterbury. He expelled the secular clergy, headed by John de Wyclif, from their college at Canterbury Hall, Oxford, and as chancellor of England took part in the anti-papal measures of 1365–6. He was nevertheless made a cardinal by Urban V in 1368, but his acceptance cost him the favor of Edward III and he was compelled to resign his archbishopric. He retired to Avignon, soon held only as a place of residence. In 1374, when he again offered the archbishopric of Canterbury, but declined it. He left his estate to Westminster Abbey, where his tomb is the oldest monument to an ecclesiastical personage.

LANGE, John, English poet and translator of Plutarch; b. Kirkby Stephen, Westmoreland, March 1735; d. Blagdon, 1 April 1779. He entered Clare Hall, Cambridge, in 1760, and having taken orders became a curate at Dagenham in Essex in 1761, and rector of Blagdon, Somerset, in 1766. In 1777 he was invested a prebendary of Wells Cathedral. He wrote verses and stories once popular, but he is remembered now only by the translation of Plutarch's Lives which he made with his brother William (1721–72). This work, originally published in six volumes in 1770, has passed through many editions.

LANGLOIS, Charles Michel de, French-Canadian soldier and pioneer, known as the founder of Wisconsin. b. Mackinaw, Mich., May 1729; d. Green Bay, Wis., January 1800. His mother was the daughter of an Ottawa chief, and as head of the Ottawas he carried out the ambuscade which resulted in the defeat of General Bradock in 1755. He was in the service of the French at Fort Duquesne; and in 1757 he joined Moncàalm with a band of Ottawas, rendering services at Fort George for which he was made second in command at the military post at Moncàalm. He was with Moncàalm at the siege of Quebec, was in the battle of the Plains of Abraham, and in 1760 fought under Chevalier de Levis. At the outbreak of the American Revolution he joined the British at the head of a large body of Indians. When the Indians deserted General Burgoyne after the severe reprimand which followed the murder of Jane McCrea, Langlois was forced to accompany them; but while Burgoyne bitterly blamed him the British government did not. Langlois became Indian agent in 1780 and later became Indian superintendent and commander-in-chief of the Canadian militia. He held these offices until his death, and received a life annuity of $800 from the British government. He was a man of unquestioned integrity, and inspired sentiments of warm regard of which traditions still linger in Wisconsin.

LANGLANDE, lord of Longland, William, English poet; b. Cleobury Mortimer, about 1332; d. about 1400. Little is known of him except from tradition, according to which he was educated at Oxford, and became a monk of Malvern. The familiarity of the author with the Scriptures and the Church fathers indicates that he was an ecclesiastic; several local allusions in the poem, and the fact that its scene is the "Malvern Hills," prove that it was composed on the borders of Wales; and internal evidence fixes its date at about 1362. It narrates the dreams of Piers Ploughman, who, weary of the world, falls asleep beside a stream in a vale among the Malvern hills; and while satirizing in vigorous allegorical description the corruptions in church and state, and the vices incident to the various professions of life, and painting the obstacles which resist the amelioration of mankind, presents the simple plowman and in 1374 was again offered the archbishopric of Canterbury, but declined it. He left his estate to Westminster Abbey, where his tomb is the oldest monument to an ecclesiastical personage.

LANGHORNE, John, English poet and translator of Plutarch; b. Kirkby Stephen, Westmoreland, March 1735; d. Blagdon, 1 April 1779. He entered Clare Hall, Cambridge, in 1760, and having taken orders became a curate at Dagenham in Essex in 1761, and rector of Blagdon, Somerset, in 1766. In 1777 he was invested a prebendary of Wells Cathedral. He wrote verses and stories once popular, but he is remembered now only by the translation of Plutarch's Lives which he made with his brother William (1721–72). This work, originally published in six volumes in 1770, has passed through many editions.

LANGLOIS, Charles Michel de, French-Canadian soldier and pioneer, known as the founder of Wisconsin. b. Mackinaw, Mich., May 1729; d. Green Bay, Wis., January 1800. His mother was the daughter of an Ottawa chief, and as head of the Ottawas he carried out the ambuscade which resulted in the defeat of General Bradock in 1755. He was in the service of the French at Fort Duquesne; and in 1757 he joined Moncàalm with a band of Ottawas, rendering services at Fort George for which he was made second in command at the military post at Moncàalm. He was with Moncàalm at the siege of Quebec, was in the battle of the Plains of Abraham, and in 1760 fought under Chevalier de Levis. At the outbreak of the American Revolution he joined the British at the head of a large body of Indians. When the Indians deserted General Burgoyne after the severe reprimand which followed the murder of Jane McCrea, Langlois was forced to accompany them; but while Burgoyne bitterly blamed him the British government did not. Langlois became Indian agent in 1780 and later became Indian superintendent and commander-in-chief of the Canadian militia. He held these offices until his death, and received a life annuity of $800 from the British government. He was a man of unquestioned integrity, and inspired sentiments of warm regard of which traditions still linger in Wisconsin.

It narrates the dreams of Piers Ploughman, who, weary of the world, falls asleep beside a stream in a vale among the Malvern hills; and while satirizing in vigorous allegorical description the corruptions in church and state, and the vices incident to the various professions of life, and painting the obstacles which resist the amelioration of mankind, presents the simple plowman and in 1374 was again offered the archbishopric of Canterbury, but declined it. He left his estate to Westminster Abbey, where his tomb is the oldest monument to an ecclesiastical personage.
was Royal Medalist of the Royal Society in
1892, and was awarded the Baly medal of the
Royal Astronomical Society in 1895. He has
contributed extensively to scientific journals,
and is the editor of the Journal of Physiology.

LANGLEY, Samuel Pierpont, American
astronomer, physicist and pioneer designer of
airplanes: b. Roxbury, Boston, 22 Aug. 1834;
d. Aiken, S. C., 27 Feb. 1906. He was gradu-
ated from a high school, studied architecture
and civil engineering and after a two years' trip
abroad became an assistant in the Harvard
Observatory in 1865, and later assistant pro-
fessor of mathematics in the United States
Naval Academy; and in 1867 was appointed
director of Allegheny Observatory. In 1877
he became secretary of the Smithsonian Insti-
tution. He organized in 1881 an expedition to
Mount Whitney, Cal., where he was successful
in re-establishing the color constant and in
extending the invisible solar spectrum, also
devised the bolometer, or thermic balance,
a contrivance for detecting minute differences
of radiant heat and measuring accurately to
less than one ten thousandth of a degree
Kolrether. He established the Astrophysical
Observatory and the National Zoological Park
at Washington and in 1887 was president of the
American Association for the Advancement of
Science. His name became generally known
through his experiments in connection with the
problems of aerial navigation. In 1903 he
achieved a powered, motor-driven airplane de-
designed and built by him accomplished the
first sustained flight. Further experiments
were not so successful, but his design of appar-
atus has been shown to be correct; in fact, in
1914, Glenn Curtiss installed a more power-
ful engine in Langley's machine of 1903 and
made a successful flight with it at Hammond-
sport, N. Y. Congress voted Langley $5,000 to
carry out his ideas. Criticism and lack of
support, led him to abandon his experiments,
which, if persevered in, would have been suc-
cessful eventually, as aeronautical engineers
now recognize the correctness of Langley's
reasoning and the value of his contributions in
this field of science. Among his writings are
"The Theory of Aerial Navigation"; "Scientifi-
cal Work of the Air"; "Air and Aeronautics"; and
"Internal Work of the Wind."

LANGLEY, Walter, English painter: b.
Birmingham, 1852. After attending the
National School, Birmingham, he qualified as
a lithographer, meanwhile studying in the local
school of art. He there gained the National
scholarship and studied at South Kensington
two years; settled in Newlyn, Cornwall, 1882.
Among his watercolor paintings are "Among
the Missing"; "Departure of the Fleet";
"Disaster"; "After the Storm. His oil paint-
ings include "Never Morn Wore to Even-
ing but Some Heart Did Break"; "Mother-
less"; "Bread-winners," etc.

LANGLOIS, lã̃gwa, Hippolyte, French
soldier and military writer: b. Besaçon, 1839;
d. 12 Feb. 1912. He was educated at the Ecole
Polytechnique at Paris and entered the artillery
as sub-lieutenant in 1859. He became captain
in 1866. He was with the army of Metz in the
Franco-Prussian War. He be-
came professor of artillery at the Ecole de
Guerre in 1887 and in 1898-1900 he was com-
manded of that institution. He received rank
as general of division in 1898 and in 1901 was
designated commander of the 20th Army
corps at Nancy. In 1902 he was a member of
the superior council of war, and upon reach-
ing the age limit in 1904 he was retired. He
served in the French Senate in 1906, was
elected to the French Academy in 1907, and
was a grand officer of the Legion of Honor.
He was deeply interested in the improvement
of the artillery and was influential in the pro-
duction of the famous 75 mm. quick-firing gun.
He founded in 1907 the Revue Militaire Gen-
erale, a publication dealing with military art
and history. He wrote "L'Artillerie de cam-
pagne en liaison avec les autres armes" (1891-
92); "Manoeuvre d'un detachement de toutes
armes avec fusé réels" (1887); "Guerre turco-
russe et anglo-boer" (1903), etc. His military
writings gained worldwide recognition.

LANGOBARDI, lã̃g-o-bârdì. See Lom-
barbs.

LANGREO, lã̃g̃ro, Spain, city, in the
province of Oviedo on the river Nalón, 18
miles from the coast and 10 miles southeast of
Oviedo on a branch railway from Oviedo to
Labiana. Its chief industries are the mining of
coal and iron ore and the manufacture of
iron products. The surrounding country pro-
duces fruit, wheat and hemp.

LANGRES, France, capital of an arrondis-
sement in the department of Haute-Marne,
21 miles southeast of Chaumont on the eastern
railway to Belfort. It is situated on the "Plateau of Langres" which is famous in mili-
tary history as a commanding strategic point.
The town in ancient times was known as
Andematum, capital of ancient Lingones;
under Roman rule it was practically autonom-
ous until the revolt of Sabinus reduced it to
rank to a colony in 71 A.D. The cathedral of
Saint Mammes was built in the 12th century,
and the church of Saint Martin in the 13th,
15th and 18th centuries. There is a Gallo-
Roman gate, a museum of Gallo-Roman an-
quities, a picture gallery and library. The
town is the seat of a bishop, has a higher
eclesiastical seminary and a printing house
for both sexes. The industries of the town include a famous line of cutlery and textile
manufactures, together with a trade in grain
and oil. Pop. 6,335.

LANGSHAN, a breed of small, active
"Asiatie" fowls, long held in esteem by
poultry-raisers; cock weigh 10 pounds. Two
varieties are approved—the pure white and
the glossy black. See POULTRY.

LANGSIDE, Scotland, a village forming
a suburb two miles south of Glasgow. It is
famous as the scene of the battle in which the
Regent Murray on 13 May 1568 defeated the
forces of Mary, Queen of Scots and forced
her flight to England where she was made
prisoner and held until her execution. The
battle lasted only three-quarters of an hour.

LANGSON, French Indo-China, capital
of the province of Langson in Tongking, 82
miles northeast of Hanoi, on the railway be-
tween there and Lungchow in the Chinese
province Kwangtung. The town has a citadel
and was the scene of two battles in which the
French were first defeated by and in turn de-
feated the Chinese in 1885, since when it has
belonged to the French.
LANGSTON, John Mercer, American educator: b. in Louisa County, Va., 14 Dec. 1829; d. Washington, D. C., 15 Nov. 1897. He was born a slave, but when six years old was emancipated, and in 1849 was graduated at Oberlin College, where he was also (1855) a graduate in theology. Admitted to the bar in Ohio (1854), he practised law in that State for 13 years, and in 1869 was appointed professor of law at Howard University, Washington, D. C., became dean of the law department, and in 1873 vice-president of the university. In 1871 he was appointed a member of the board of health of the District of Columbia, and was afterward elected secretary of the District. From 1877 to 1885 he was United States Minister and consular general in Haiti, and when he returned to this country he was made president of the Virginia Normal and Collegiate Institute at Petersburg. He was elected to Congress in 1888. He published 'Freedom and Citizenship,' a collection of addresses (1883).

LANGSTON, Stephen, English cardinal: b. about 1150; d. Slindon, Sussex, 9 July 1228. He was educated at Paris, and while on a visit to Rome in 1206 Innocent III created him a cardinal and nominated him to the see of Canterbury, consecrating him archbishop the next year. King John refused to allow Langton to take possession of his see, and it was not till England had been placed under an interdict, John excommunicated and threatened with deposition, that the king yielded. Langton was acknowledged in 1213, and in August joined the insurgent barons, and acted with them in compelling John to sign Magna Charta. He crowned Henry III, and in 1223 demanded of him the full execution of the charter. He was the author of some theological treatises, and the division of the Bible into chapters has usually been attributed to him. Consult Hook, 'Archbishops of Canterbury' (1862).

LANGTRY, Lily, English actress: b. island of Jersey, 1852. She was the daughter of the Rev. W. C. Le Breton, dean of Jersey, and as the 'Jersey Lily' (a name given by her father to the portrait of her which he had painted) was famous for her singular beauty and social graces. She was married to Edward Langtry in 1874. In 1881 she made her first appearance on the stage at the Haymarket Theatre in 'She Stoops to Conquer.' She has paid several professional visits to the United States, and in 1903 she starred in 'The Crossways,' a play written by herself in collaboration with J. Hartley Manners. In 1899 she was married to Sir Hugo de Bathe, Bar.

LANGUAGE. See ETYMOLOGY; LANGUAGE, SCIENCE OF; SPEECH; WRITING.

LANGUAGE, Science of. Language in its broadest sense is any means of expressing thought. The cries of the lower animals are language in so far as they give expression to their state of mind, there is a language of flowers and so on. The present article deals with only one form of language, i.e., human speech. The Science of Language in this narrower sense of the word is called Linguistics (q.v.), comprising three branches: (1) General Linguistics; (2) Comparative Philology; (3) Special Grammar. The object of the General Linguistic is to ascer-
tain the fundamental laws and characteristics of the language processes by the examination and comparison of all the languages available for this purpose. This branch interprets the phenomena observed in the light of the known laws of psychological processes, and by these means lays the foundations for all the branches of language study. Comparative Philology has a narrower field, being limited to the comparison of languages of kindred origin. Its purpose is to determine the general characteristics of the whole family of such languages. Examples are Indo-European Comparative Philology, Comparative Philology of the Bantu languages, of the Semitic languages, etc. Special Grammar is of two types, historical and systematic. The latter offers a systematic classification and description of the forms and usages of any given language or dialect at some definite period of its life, e.g., the grammar of Modern English, of Chaucer's English, of Hellenistic Greek. Historical grammar aims to explain the development of a given language from generation to generation.

A. GENERAL LINGUISTICS.

Description of the Language Processes.—It is customary to define language as articulate sounds expressive of ideas. While such a definition may satisfy the popular notion of it, it is extremely inadequate. As a matter of fact, language is a complex series or group of nervous, muscular and physical processes. It is a well-known fact that the nervous system is made up of a great many groups of nerve cells. Each group performs some special function. For example, one part of the brain receives the impressions from the eye, another from the ear and so on. In particular from one area on each side of the brain run fibres which reach either directly or indirectly (by relays) all the muscles of the body. When we wish to give utterance to an idea, we set up (in some way not fully understood) a nervous activity in that portion of this "motor area" which controls the muscles that must be moved in order to produce the required sounds. Physiologists assume that this activity consists of chemical activity in the nerve cells. Reaching the muscle this nervous activity sets up what we will designate as (1) the first stage of the speech process, i.e., a chemical activity in the muscle cells and the consequent movement (shortening and toning) of the muscle. The moving muscle drags with it the bones and other tissues attached to it. Practically all the muscles of the body from the hips upward to the level of the ears are employed in speech. Those of the abdomen and chest control the stream of breath; those of the larynx control the production of musical tones; those of the head and neck control the movements of the jaws, tongue, lips, etc., necessary to the modification of musical tones and the production of consonantal noises.

These movements initiate (2) the second stage, i.e., they set the air particles of the breath into rapid oscillation. These air vibrations, the physical stage of the speech process, are propagated in accordance with the laws of physics in all directions and this image upon the ear drums of the listener. Propagated thence to the inner ear they there act upon appropriate sense organs and through them stimulate the tips of the auditory nerves. The nervous process thus
set up is propagated along the nerve, like fire along a fuse, till it reaches the brain, where it initiates (3) the third stage, i.e., sensations of sound, which awaken in the mind of the listener ideas and emotions similar to, but not identical with the ideas and emotions which started this train of processes in the mind of the speaker.

This series of psycho-physical processes may be figuratively called the main trunk line of speech, but the following accessory processes are also essential. Not only do the muscular and melodic ideas and emotions which started the process leading to sound (1), develop into ideas of form and motion (2), but these ideas are reflected in ideas of sensation (3). These latter ideas of sensation may be either (a) kinesthetic sensations (of strain, deep pressure and touch) which report to us the location, nature and extent of the movements executed. Aided by the auditory sensations they provide a means by which we control our movements; through them we learned to repeat desired movements in infancy; through them we become aware of errors of movement (mispronunciations) in later years; without them tradition in language would be impossible, or, less vital are (5) the many associational processes. The parts of the brain active during thinking are connected (directly or through sub-centres) with the motor areas, and it is a law of mental life that all thought tends to pass over at once into action. There is likewise association between the sounds of the words and their meaning, between the sounds and the kinesthetic sensations, between the kinesthetic sensations and the ideas, between the visual sensations (that is, the appearance of the written or printed words) and the meaning, etc. The effect of these associations is to bind the whole into a co-ordinated and harmonious system, in which each process takes place with a degree of accuracy and order of sequence adequate to the accomplishment of the purposes for which speech is used.

All the above processes both in man and animals have been developing since primaeval times by a natural process of evolution in accordance with the laws of physical and mental growth. On the other hand alphabetic signs or letters are arbitrarily designed or selected by individuals to represent certain sounds. They yield (6) visual sensations. Although originating as symbols of sounds, the letters when grouped into words quickly become associated with the meanings and are primarily symbolic of them.

Thus we see that speech is a combination of three different kinds of symbols: (a) the primary symbols, muscular movements, (b) the secondary symbols, speech sounds, and (c) the tertiary symbols, written or printed words. The average man thinks usually of the last two forms, but he who would understand the nature of language and fathom the laws of its development should rather direct his attention chiefly to the real primitive symbol, the ideographic study as applied Psychology of Movement.

The above described processes beginning with thought in the mind of the speaker and ending with the awakening of thought in the mind of the listener do not, however, complete the cycle of speech. It must not be forgotten that speech is a social activity. Man cannot live without the co-operation of his fellow-men. The chief purpose of speech is to secure this co-operation and thus achieve some form of self-realization, of accomplishing our desires. The communicative function is completed only when the speaker gets a response by word, look, gesture or even silence (for silence is sometimes eloquent), which will enable him to judge the attitude of the listener and hence the degree of his own success or failure.

The problems of General Linguistics fall into two classes: first, those which have to do with the processes of expression and, second, the problems of understanding. Under the first fall the following: the relation of thought to language, the relation of physical to spiritual matter, the origin of language, the degree of accurancy and completeness with which language expresses thought, the extent to which the forms of thought are controlled by language and vice-versa, the effect of environment on speech, the problems of analogy, and the physiology of nerve and muscle and of the localization of brain functions, the problems of muscular control. The problems of interpretation include those of understanding and those of sensation. Here fall the questions as to the degree of accuracy with which sensations correspond to words, or, conversely put, how far the state of mind determines the character of the sensation (mishearings, misreadings and misunderstandings), how sensations awaken thought. All these problems may be grouped under two heads: Phonetics and Semantics.

Phonetics.—Phonetics is the general science of speech sounds; phonology is the study of the system of sounds of any given language, e.g., English phonology. The organs of speech in the narrower sense are the mouth and nose cavities and especially the tongue and larynx, also the trachea and lungs with their controlling muscles. In a broader sense they include those muscles of the abdomen which aid in the control of breathing. The lungs force the air through the trachea a stream of air, the rate of compression of which are varied from moment to moment to meet the needs of speech. The larynx, which rests on the top ring of the wind pipe, is a small box having a cartilaginous framework overlaid with muscles, connective tissue and mucous membrane. Its top parts are the so-called "vocal cords." These are not, strictly speaking, cords at all, but are overhanging, ledge-like projections, one arising from each side of the inner wall of the larynx. The core of each is formed by a small muscle, the front ends are immovably attached to the inner front angle of the thyroid cartilage (Adam's apple) in contact with each other. Each muscle is attached at its posterior end to one of the arytenoid cartilages, which can be moved by means of the larynx muscles inward, downward, forward or sidewise. Thus by the approximation of the arytenoid cartilages the "cords" can be brought into contact along their entire length, completely closing the glottis as the opening between the two parts of the cords may be separated, yielding a V-shaped glottis. When brought into contact, or nearly so, and sustained by proper muscular action, they are made to vibrate by the current of air forced through the trachea. The vibrations can be heard as felt if a proper place is felt if a finger is placed upon the Adam's apple during speech.
The sound produced is musical tone, consisting physically of a series of like vibrations, and technically known as the rate per second of the vibration determines the key or musical note on which a sound is pronounced or sung. The shorter the cords and the higher the tension the higher the rate and the higher the note. The loudness is determined also by the amplitude of the vibrations of the cords. The air waves produced by the cords are very feeble; but they are reinforced by the resonating effect of the mouth and nose cavity. It is estimated that the voice as heard is some 3000 times as loud as it would be if not thus reinforced. The cords, like a violin string, vibrate not only as a whole but also in segments, the segmental vibrations yielding overtones. For example, if the cord as a whole vibrates 100 times per second, the half cord will vibrate 200 times, the third 300 times, the fourth 400 times, the eighth 800 times, the twelfth 1200 times and so on. The commingling of these overtones of varying loudness is what gives the main characteristic distinction to the voices of different persons.

The vowels are "voice" with little or no audible commingling of other sounds. After much study it has been established that the difference between the various vowels is caused by the presence of certain characteristic tones. Some of these have been recently calculated as follows:

<table>
<thead>
<tr>
<th>Sound</th>
<th>250 vibrations per second</th>
</tr>
</thead>
<tbody>
<tr>
<td>oo as in moon</td>
<td>460</td>
</tr>
<tr>
<td>ee in meet</td>
<td>500</td>
</tr>
<tr>
<td>a in moon, room</td>
<td>372</td>
</tr>
<tr>
<td>a in me</td>
<td>1050</td>
</tr>
</tbody>
</table>

The following vowels have two characteristics:

- ee in meet ca. 310 and ca. 3100
- a in meet ca. 490 and ca. 2400
- e in meet ca. 690 and 1950
- a in meet ca. 800 and 1840

A in ma has also been found with two characteristics, 950 and 1240. According to the above definition we must regard the liquids and nasals I, m, n, and r as vowels (even though they lack the clear, open quality of a, e, i, o, u), particularly in such words as apple, serum, over (often pronounced ov'm) and over, in which the e and u are usually silent, the l, m, n and r being the loudest sounds in their syllables.

In addition to musical tones the speech organs produce sounds which consist either of irregular vibrations or of regular vibrations, that do not produce on the ear the effect of musical tones. Such sounds are called noises. There are two classes of these noises: (1) Explosive noises, (2) fricative noises.

The former are made by the complete stoppage of the air (affected by a closure at some point in the throat, mouth or larynx), and the subsequent compression of the air behind the closure, followed by the sudden opening of the closure by muscular action and the air pressure. The resulting consonantal sound is called a "stop" or "explosive." The closure yielding p is made by bringing the lips into contact, t by pressing the tongue against the teeth (French and German dental t) or the gums (alveolar t, as commonly made in England and American), and against the back part of the tongue (cerebral or pre-palatal t, as found in Sanscrit), k by pressing the rear part of the tongue against the back part of the hard palate (palatal k, as in kick) or against the velum (velar k, as in cool or coal) or against the back part of the throat below the velum (guttural k, as in Arabic). In all of these sounds except Arabic k and the two now to be mentioned, the velum is also drawn upward, closing the nose passage. A k may also be produced by the epiglottis against the back of the throat and a glottal stop is produced by an explosion at the vocal cords (Greek rough breathing). A velar-nasal stop is made by closing the lips and velum and snapping open the latter. b, d, g are the same explosive noises accompanied by voice.

Trilled r is produced by a succession of such stops made by the rapid vibration of the tongue or the uvula against the adjacent parts of the mouth. Frictional noises (spirant consonants or fricatives) are produced when the air passage is reduced by near closure to a very small channel and the air forced swiftly through it. Thus are produced voiceless s in see, sh in shall and th in think. To these correspond voiced s in sept, s as unsure and th in these. All these are hisses. If the channel is larger and the breath driven more gently, the noise is a much gentler one, the voiceless or (vocal or voiceless). Glottal spirants are English h (sometimes voiced) and the "whisper." If immediately following an explosion the passage remains narrow for an instant the explosion is followed by a hiss. These sounds are called affricates: ch in change, j in jump. Y as in yet is a swiftly pronounced "long" e; w in we is an evanescent oo as in boot.

In the production of most of the above sounds the uvula may remain open, i.e., drawn forward and downward, adding the resonance cavity of the nose to that of the mouth. This greatly increases the quality (by reinforcing the higher overtones) and volume of the sound. Hence singers are especially trained to use nose resonance to the greatest possible extent. If the uvula is closed, fully half the resonance effect is lost. By using more breath and over-straining the muscles of the larynx one can partly make up the loudness, but the quality is irretrievably lost. A full, clear resonance can be secured only when the mouth opening is fairly wide. If it is completely closed (pronouncing n), or made very small, we get a muffled nasal twang characteristic of certain French vowels and of Yankee pronunciation.

The lips may be more or less puckered or rounded in the pronunciation of all the vowels and most of the consonants. This gives a peculiar resonant effect. English o in note and u in tune are rounded. German ü and French u are rounded long e (as in meet or mere).

Accent is of two kinds. Stress accent is a variation in the energy of utterance (amplitude of vibration) of successive (a) words, (b) syllables, (c) sounds or (d) parts of the same sound; (a) constitutes sentence accent, (b) is word accent, (c) is syllable accent. Attraction accent is a variation of musical tone (rate of vibration) similarly affecting sounds, syllables and words. In most, if not all, languages both types occur. In English stress predominates.
Comparatively few speech movements and sounds are here described. Those actually produced are innumerable; they run into the millions or even billions. Each nation has a group of sounds more or less "main," sounds and countless minor variations. Each individual has his own way of speaking; we easily recognize his voice; but even he varies his pronunciation from day to day, nay, even from minute to minute. Here, as everywhere else in animal and even vegetable life, nothing is fixed. As the old Greek philosopher said, \textit{panta rhei}, "everything is in a flux." Movement and change are life; rigidity is death.

\textbf{Sound Changes.--} As already stated, Phonetics is applied psychology of movement. The muscles used in speech, though highly trained, act as other muscles act. You cannot close the eyes and draw with a sharp pointed pencil 10 lines exactly one inch long. A ball player cannot throw the ball twice through exactly the same point over the plate. If he does it is an accident. The best marksman rarely hits the exact center of the bull's eye. So in speech no one can repeat at will exactly the same movement, much less a group of movements necessary for any word. The movements will always be variations in range, direction, duration and co-ordination. The variations are slight, as are those of an expert marksman; and the consequent variations in sound are either noticed or unnoticeable, according to the user. We feel or, if unnoticed, since our attention is wholly absorbed in what a person is saying and we give only the slightest heed to the details of sound. It is only occasionally that variations occur large enough to thrust themselves on our attention. Then we call them mispronunciations.

But the variations, though small and unnoticeable, will in a given community: under favorable conditions accumulate in a given direction. Thus there will be a slow but steady shift in a single sound, which in time will result in entirely different movements, that is, in entirely different sounds. For example, the word stone in Early English was written \textit{stane} and pronounced with the sound of a as in father. From the time of the Great Vowel Shift the sound of \textit{aw} in \textit{bought} and the spelling was reformed to \textit{stone}. Since then it has shifted to the present pronunciation. The following types of changes occur: (1) \textit{Cessation of movement}. Sounds become silent, as most e's, at the end of English words, gh in \textit{high}, b in \textit{lamb}, etc. This change may be facilitated by a stress accent on the preceding syllable. (2) \textit{Increase} or \textit{decrease} in the duration of the movement. Example: The Indo-European extra long diphthongs \textit{ai}, \textit{ei}, \textit{ei}, etc., became the ordinary length diphthongs \textit{ai}, \textit{ei}, \textit{ei}, etc., in Latin. (3) \textit{Variation in extent of movement}. This variation affects, for example, the shape of the mouth cavity and the tension of the vocal cords, giving rise to variations in the quality of the sound and characterizing such shifts as that of Indo-European palatal \textit{k} to fricatives in Sanskrit and Slavic. (4) \textit{Anticipation} or delay of individual movements composing a group. Such changes are possible in the pronunciation of both consonants and vowels. \textit{Assimilation} both progressive and regressive; and \textit{Umlaut}. (5) \textit{Change in the order of movements}. This is a fertile source of mispronunciation, but appears to have caused few historical changes.

The causes of these changes are partly physiological and partly psychological, being due to changing chemical conditions of the muscle or to changes in state of mind. Widespread regularity observed in these changes has given rise to the belief that, like other natural phenomena, they follow regular laws; but the conditions determining the changes are extremely complex and difficult to control. Such laws are Grimm's law of consonant change, with its modifications by Verner and Burgmann.

\textbf{Semantics, or Semasiology; the Science of Meaning.--} The simplest word has six "personalities," so to speak; it is an intricate Dr. Jekyll and Mr. Hyde. It has three material forms: the moving muscle, the vibrating air and the written or printed signs. To each of these corresponds a purely mental side or word picture, as seen \textit{in the mind's eye}; the memory image of the sound and the kinesthetic or "motor" image; that is, the feeling of touch, strain, etc., in the muscles. These are mental states, mental "contents." The picture of a word is the picture of a house. Both are made up of ideas of color, shape and direction. We saw above that these are linked to one another by associations, that they are also linked up with the gross motor areas. We now add that they are linked up with all other mental contents that constitute thought, so that when these last are in consciousness the word images also appear. It is a law of psychology that any mental content may thus be linked up with, that is, suggest, recall or \textit{represent} any other mental content. But all ideas are mental contents and all word images are ideas or mental contents. Meaning is simply one mental content; which some other mental content by association calls up, that is, represents. When we hear or see words, their mental images simply through association call into consciousness other mental contents, which are their meaning. Meaning is representation.

Two kinds of mental contents enter into all thought: sensation and feeling. The first is the mental state resulting immediately from the stimulus of one of the sense organs. Examples are: red, bitterness, cold, hardness, fragrance, pain, etc. We locate them (except headache) outside of the brain. Combinations of these sensations constitute ideas. No idea ever enters consciousness without awakening a personal response, such as that of pleasure, displeasure, relaxation, strain (as in anxiety), stimulation or inhibition. This reaction is called feeling. Combinations of these feelings constitute emotions and passions. The will is one form of them. On the basis of ideas and feelings abstract ideas develop.

In ideas, as in muscular movement, there is continual variation. The details of form, direction, color, intensity, feeling, are all changing. We never obtain a wholly new idea; it is always a variation or modification of the old. The variations are greatest in childhood; in manhood the ideas become more stable; in old age they approach conditions of rigidity as we draw near to death. Changes in ideas consist in the loss of former elements from them and the addition of new ones.

\textbf{LANGUAGE}
Of the elements of an idea some are relatively permanent, recurring time after time with the recurring idea, as, for example, the general shape of a horse. Others a temporary, as the color, actions or temper of the horse. A detail may be present once and then disappear forever. Permanency is often, as in the case just mentioned, based on qualities of objects in nature, but often it is not. Again, not all the elements are equally prominent in our consciousness. Some come out clearly, others fade into the background. Now it is the color of the bird on which we fix attention, now his song, now he is for us merely a symbol of the coming of spring.

In the meanings of words, as in muscular movement, the small variations accumulate with time so that a word may eventually have totally changed its meaning. We are not usually aware of these changes any more than we are aware of the sound changes, because our attention is wholly occupied with the present idea and we seldom recall its older form for comparison. But when we read old books, these changes force upon the attention. Comparing old and new meanings, we find that concrete words have become abstract and vice-versa, comprehend meant at once time "seize," and we now use catch, take, get,umble in the meaning of "understanding," that words have often expanded or expansion of meaning (a minister was originally any servant, now it is a servant of God, or of the state; gain originally had the narrower meaning "harvest," that they have shifted to a higher or to a lower moral value (German selig "blessed," this English silly. Latin mens means "mind," but mentiri means "to lie," i.e., falsify). There have also been distinguished (a) changes of non-dominating elements, (b) of dominating elements, (c) of permanent elements, (d) of transitory elements, (e) from ideational content to emotional content and the reverse, (f) in degree of emotional value, (g) ideas corresponding to one sense organ to those corresponding to another, as when we say "a sharp knife, a sharp pain," the idea of "sharp" (the last usage being abstract).

Grammatical Categories.—An especially important branch of semantics is that dealing with the parts of speech and other grammatical categories, the case relationships, mood, tense, voice, number, degree, etc., all of which are the product of the analyzing and classifying processes of the mind. The normal mind quickly develops the power of distinguishing various qualities, such as sex, and their degrees, and of observing relationships of time (present, past, future, before, after, simultaneous), place (in, on, about), cause, effect and so on. Other categories reflect the attitude of mind: purpose, will, desire, probability, doubt, necessity. They run into the thousands. Finnish has 18 cases. On one language has over 60. Some of these occur very frequently and are very important dominating elements of thought. Their frequent occurrence, importance and the degree of readiness and closeness with which they fuse with other concepts, are such that the sounds or words representing them act both phonetically and semasiologically in peculiar ways. They find expression in the following forms: (1) Juxtaposition, e.g., apple tree, tree load. Juxtaposition is but the first stage of composition, as seen in therefore, Johnson; (2) Relative rapidity of utterance of different sounds or groups of sounds, including pauses. (3) Stress of voice, signifying, for example, relative importance; (4) Pitch of voice, indicating interrogative, irony, etc.; (5) order, e.g., apple pie, pie apple; (6) adverbs; (7) prepositions; (8) conjunctions (including 9) pronouns); (10) auxiliary verbs; (11) inflectional forms: suffixes, prefixes, infixes and various modifications of sound, such as umlaut (mutation) and vowel gradation; (12) often no special formal sign is needed, as when the relationship in which objects stand to each other in nature is so impressed upon us that the mere mention of the objects suggests it. Dickens' character Jingle depended much upon this fact. (13) Lastly, the general circumstances and conditions of a conversation and the knowledge of the speaker are valuable keys to the meaning.

The associative processes and sound changes combine to give origin to inflectional endings. Some are known to have originated in composition, others have been forced upon the attention. Comparing old and new meanings, we find that concrete words have become abstract and vice-versa, comprehend meant at once time "seize," and we now use catch, take, get,umble in the meaning of "understanding," that words have often suffered restriction or expansion of meaning (a minister was originally any servant, now it is a servant of God, or of the state; gain originally had the narrower meaning "harvest," that they have shifted to a higher or to a lower moral value (German selig "blessed," this English silly. Latin mens means "mind," but mentiri means "to lie," i.e., falsify). There have also been distinguished (a) changes of non-dominating elements, (b) of dominating elements, (c) of permanent elements, (d) of transitory elements, (e) from ideational content to emotional content and the reverse, (f) in degree of emotional value, (g) ideas corresponding to one sense organ to those corresponding to another, as when we say "a sharp knife, a sharp pain," the idea of "sharp" (the last usage being abstract).
is Magyar; Chinese, an isolating language, as are also the related Amharic, Siamese, Burmese and Tibetan; Turk-Tataric.

There are about 30 groups of languages recognized on the American continent but their relationships are not all perfectly understood. The Semitic branch includes, among others, the Assyrian (with Babylonian), Hebrew, the language of the Old Testament, Phoenician and Arabic (classical and modern). To the Hamitic branch belong Ancient Egyptian, Coptic, Berber and several languages in Abyssinia and adjacent territory. The Indo-European family will be discussed in detail in the next section of this article.

B. COMPARATIVE PHILOLOGY.

In this article only Indo-European Comparative Philology is treated. The Indo-European family of languages contains the following branches:

1. Aryan or Indo-Iranian group. This comprises (a) the Indian languages, that is, literary Sanscrit (both Vedic and Classical) with a very complicated mythology; Pracrit, the ancient vernaculars, from which many of the spoken languages of modern India are descended; Pali, the language in which the Buddhist writings are largely preserved. Modern Gipsy also belongs here; (b) The Persian group, that is, Avestan (the language of the Zend Avesta); Old Persian (the language of the cuneiform inscriptions); Middle Persian or Pehlevi (till about 700 A.D.); Modern Persian, Kurdish, Ossetian and Baluchi; Parsi, the language of the Fire Worshippers.

2. Armenian, old and modern.

3. Greek, with its many dialects and marvelous literature. The chief ancient dialects were Attic-Ionic, Doric and Æolic; the main historical periods are Homeric, Classical Attic, Hellenistic, Byzantine, Modern.

4. The Illyrian group, represented by the Albanian.

5.Italic group, comprising Latin and the Osca-Umbrian dialects. From spoken Latin derivative, the Romance languages have developed.

6. Celtic, including the language of the ancient Gauls, and modern Welsh, Cornish, Scotch and Irish, the last with an important literature.

7. Germanic or Teutonic, represented by (a) Old Gothic; (b) Scandinavian (Danish, Swedish, Norwegian and Icelandic); (c) West Germanic with its various older dialects from which modern German, Dutch, Flemish and English are sprung.

8. Balto-Slavic includes (a) Lithuanian, Lettish and Old Prussian (now extinct); (b) East-Southern Slavic (Russian, Bulgarian, Serbian, Croatian, Slovenian); Western Slavic (Czech Bohemian, Wendish, Polish and Lithuanian).

It is known that all of these had their origin in dialects of one common language, the home of which on linguistic and archaeological evidence is generally conjectured to have been between Italy and the Caspian sea. Then they spread by migrations to their later habitats. By the separation thus brought about and in some cases at least by race mixture the differences between the dialects increased until they became distinct languages, which in their turn spread over larger areas, and broke up again into dialects. These later dialects developed into still other languages, and so on indefinitely. This process is still going on, though more slowly, because of the closer communications existing between nations. It is possible, perhaps even likely, that the Celtic and Italic groups arose from one common dialect, just as did Baltic and Slavic or Indian and Iranian; in which case we should have to speak of an Italo-Celtic group instead of two separate groups. Each of these Indo-European groups developed separately, no one of them springing from another. Thus English is just as closely related by origin to Hindi or Bengali or Russian or Czechish as it is to Irish or French, although the extensive borrowing of French words in modern times gives the English vocabulary a closer resemblance to the French.

The reconstruction of the primitive dialects is accomplished (only, of course, to a very slight degree) by discovering through comparison of the related languages what were the original sounds, words, together with the rules by which they must be understood, however, that it is impossible to reconstruct combinations of words. For, while we may reconstruct two different words, we cannot be certain that both were used in the given form in a given dialect at the same time. Furthermore all reconstructions are only approximate. But philologists are not distressed on this account, since they are interested not in discovering the starting points of modern forms (which, after all, were only end points as compared with the innumerable forms that for ages preceded them), but in discovering the nature of the changes that took place and the laws by which they were governed.

We know that the early dialects possessed roughly the same group of sounds as is described in the earlier part of this article. It doubtless possessed at one time a strong stress accent which appears to have brought about such variations in vowel sound as are seen in Greek thithem, thitos, in which the vowel ε as long, short and vanished. It also seems that at least in the eastern area this accent was combined with a marked musical or pitch accent. Compound words were freely formed. There was extensive use of suffixes in derivations. There was very elaborate inflection; three genders (not referring, however, mainly to sex); three numbers (singular, plural and dual); eight case forms were differentiated in the singular, six in the plural and four in the dual; the verb had forms distinguishing actions as beginning, ending, progressing, completed or momentary, but gave less accurate expression to the time; it had also desideratives, intensives, causatives and iteratives; the verb had also three persons, three numbers, five moods, two voices, active and middle, but apparently no special passive form; there were also various verbal nouns and verbal adjectives. The noun and verb show some striking resemblances in form, which suggest that at a much earlier period they, like the English noun and verb (cf. the word stone used both as a noun and a verb), were only slightly differentiated or not at all.

For the Origin of Language, see Speech.

GENESIS OF.
C. History of Language Study in Europe.

The scientific study of language in Europe began with the Greeks, who, however, were not interested in language for its own sake so much as for the light it threw on other fields of knowledge. Plato investigated etymology because he hoped thereby to learn something of the nature of material things. Aristotle, who studied language as an accessory of logic, investigated especially the relations between thought and the forms of words. His main contribution was the definition of some of the parts of speech and some of the categories of the noun and the verb. He is justly regarded as the founder of systematic grammar. The Stoic philosophers extended and supplemented his definitions till they covered practically the whole field of grammar. Unfortunately the domination of their thought by logical theory led them into some errors. The work of the Greeks was summed up in two grammars (that of Dionysius Thrax in the 1st century B.C. dealing with sounds and inflections, and that of Apollonius Dyscolus in the 2d century A.D. dealing with syntax), which have served as models for the thousands of systematic grammars later composed in Europe. The Roman grammarians added practically nothing to the achievements of the Greeks, contenting themselves with translating their words into Latin and adapting them to the Latin language. (See DONATUS; PRAXINIAN.) The Scholastic philosophers from the 12th century on did positive harm by completely subjecting grammar to logical theory. Grammar became practically applied logic (see NONIUS). The last representative of this school was the German Gottfried Hermann (1772-1848), who, however, endeavored to combine the older ideas with the Kantian categories. Some slight influence was exerted in Europe by Arabic grammarians by way of Spain. In addition the Hebraist Reuchlin (1453-1522) introduced the idea of ^a^§ that has played so important a part during the last 150 years.

A new era in language study begins with the development of the ^historical-philosophi- cal^ school in the earlier part of the last century. The change was determined chiefly by the growth of Romanticism and the^ discovery^ of Sanscrit. Language study was more completely liberated from the domination of logic and speech came to be thought of rather as an historical development than as a static structure. The wonderful enthusiasm for language study then prevalent was stimulated by such works as Schlegel^s^ "Sprache und Weisheit der Inder" and von Humboldt^s^ "Kawi Sprache." Franz Bopp (1791-1867), starting out to investigate the nature of verbal endings, published a series of works which laid the foundations of Comparative Philology. Sir Wm. Jones had recognized Greek, Latin, Sanscrit and possibly Gothic and Celtic as related languages. Bopp added Zend (in 1816), Lithuanian and Old Bulgarian (1833-35) and Albanian (1855). He laid the foundations for the study of root (in etymology), Fick (lexicography), Schleicher (critical phonology) and Schrader (prehistoric antiques of the Aryan people). The books of Max Müller, professor in England, and William D. Whitney, American, have popularized the whole subject, which is summarized in Brugmann and Delbrück^s^ "Principles of Comparative Philology of the Indo-European Languages" (7 vols., in German). Grimm^s^ "German Grammar" (Vol. I, 1819) is the first great embodiment of the historical point of view. He directed his attention mainly to the changes continually occurring in the living spoken dialects of Germany (instead of studying remanents) and on the basis of a previously unparalleled collection of data, he deduced the famous statement of Indo-European consonant changes known as Grimm^s^ law. This and the similar work of other later scholars combined with the invention of instruments for the exact measurement of muscular movements and air waves has led to the development of the important field of Experimental Phonetics. Most important of all, however, is the fact that in language study the laws of psychology have replaced the laws of logic as the basis of the methods employed in all investigations. As a result of this, language study has taken its place beside jurisprudence, history, economics, etc., as one of the Humanistic or Psychological Sciences.

CLARENCE L. MEADER,
Professor of Latin, Sanscri and General Linguistics, University of Michigan.
LANGUAGE MAP OF EUROPE.

(a) The Romance Languages.—Portugal is about the only country in Europe that has no languages other than the national language of the Portuguese, is spoken in it. In the 12th century the Galician (Gallego) dialect of Spanish, to which it is closely related, and which is still spoken in the northwest of Spain, was used by Spanish and Portuguese poets in the 13th century. Portuguese is spoken in the Azores, the islands of Madeira and Santa Thomas, in the Portuguese colonies of India and Africa, and is the official language of Brazil. Spain is less fortunate. Although the greater part of the people speak dialects more or less closely related to the Castilian of the centre, which is the official language, namely Aragonese in the northeast, Asturian in the north, Leonese and Andalusian in the south, yet the Galician is more nearly Portuguese, and the Catalanian of Catalonia and the Balearic Islands must be considered, and is so claimed by the natives, a distinct language, which is more closely related to the Provençal of the south of France. Besides, the Basque of the Basques, unlike the other languages of the Pyrenees, is not even an Indo-European language, but a remainder of the ancient Iberian tongue of the peninsula. Outside of Spain, Spanish is spoken in South and Central America, in Mexico and some Southern States of the United States, in the Philippines, the Canaries, the Carolines, while Catalan is spoken in the southwest of France, to the east of Perpignan, in Cuba and in the Argentine Republic.

Except for a spur of the Basque in the Basses Pyrénées, the Catalan at Perpignan, the Celtic Breton sporadically still spoken at Finsisterre, Côtes-du-Nord, and the Morbihan, and a Flemish border in the northeast, the rest of France is divided up between the French and the Provençal dialects of the Romance family. The Romance line in the north runs from Graulines through Merville, Steenwerck and Nieppe, then follows the Lys and passes into Belgium. The linguistic line in the northwest is approximately along the West Flanders and Hainaut borders, enters Brabant and runs to Longue, where the line turns to the east and follows the Luxemburg frontier. It takes in Metz, Sarrebourg in Lorraine and a part of Alsace, and from Munster follows the border up to Switzerland, where it cuts the cantons of Soleure and Berne, goes to Lake Brienne, follows Lake Morat, goes through canton Freiburg and over Mount la Berta, then runs through the southern part of Berne and the Col du Valais, follows the Italian frontier up to Savoy, runs along the Piedmont, and goes as far as Menton.

In the departments of Haute-Garonne, Ariège, Girond, the Gascon is spoken, which is now generally considered to be a separate language, rather than a dialect, that stands in the same relation to the Provençal that Portuguese occupies in regard to Spanish. The rest of the French territory consists of the Langue d'oil, which contains the north French and the Langue d'oïl, to which the Provençal dialects belong. It is not possible to run a well-defined line between the two, but approximately an irregular line, which runs east of Angoulême, south of Montluçon and Lyons, and north of Geneva, almost to Bern, is the southern limit of the French dialects. Besides, the southeastern dialects, which include those spoken in Switzerland, and part of the Franche-Comté, are mixed, and generally go under the name of Gallo-Roman. The official language of France is the one which evolved out of the dialect of the Ile-de-France. With the growth of the French colonies it also spread in America to Canada, where some 3,000,000 speak a peculiar patois, in Louisiana, in the western part of San Domingo, at Dominique, in some of the Antilles and in French Guinea. In Africa it is spoken in Algiers, Madagascar and, besides, in the smaller French colonies, both in Africa and in Asia.

Although the official language of Italy is the one which evolved out of the Tuscan dialect, the country represents even more variety of Romance than does France. The Gallo-Roman dialects are found in Liguria, Piedmont, Lombardy and in Sardinia. Then there are the distinct Venetian, Corsican, Neapolitan, Umbrian, Abruzzan and Sicilian, which differ widely from the standard language. North of northeast a line running west of Triest and east of Udine is the eastern border of the Friulan, which is sometimes considered to be a separate language, closely related to the Ladin of the Alps. This Ladin is in the west found in the Grison region of Switzerland, in the centre in the western Tridentino, also in Switzerland, and in the eastern Tridentino and the Alto Beluno, where it also enters Italian territory. In addition to this we have the Provençal spurs in the northwest, the German Tredici and Sette Comuni in the north, and a few Greek spots south of Brindisi, while about Brindisi and in a long strip to the north of it, as well as sporadically in Calabria and in Sicily, there are Albanian settlements. Outside of Italy, Italian is spoken extensively in the Argentine Republic and in the United States. We still have a Romance group in the East, whither it was transplanted during the Roman domination. As Daco-Romanian it is spoken in Rumania proper, and the linguistic line runs far into Hungarian and Austrian territory, along an irregular line, east of Weiskirchen near the Danube, Temesvar, Gross-Wardein, to the Theiss River. Here it turns due east, past Seiget and south of Cernowitz, after which the line runs very irregularly to the Dniestra in Russia, and down the Dniestra to the Black Sea. To the east of the Dniestra there are a large number of Rumanian settlements, of considerable size, almost up to the Dnieper. To the west of the Dniestra there are considerable Russian bases to the north of Kishinev, and the whole Black Sea littoral up to the mouth of the Danube is settled by Bulgarians. In the Dobrudja the Rumanians are almost cut off from the sea by a large Tatar region, but the whole of the Danube in the Dobrudja is Rumanian. From there to the west there are but few Rumanian settlements to the south of the Danube, except for a large chain from Vidin to Bracis, in Serbian territory. Within the compact Rumanian region there is a solid Hungarian block from Marom Vasarhelyi in the west to beyond Berets in the east, and from near Brasov in the south to the river Maros.
in the north, and a large number of minor Hungarian settlements throughout the region north of Rumania proper. There are also very many German colonies throughout that region and solid German blocks around Brasso, south of Naszód, and in the Banat, which has central territory to the south and west. Hungarian territory to the north and Rumanian territory in the north and east.

The Macedo-Rumanians are found in a long oasis running north and south about Samaris, Aveda, Perivolos, Syrako, Kraina, in Macedonia and in scattered settlements in Albania, almost as far as Bitola. Of the Istro-Rumanians there are but a few isolated settlements south of Monte Maggiore, but they are rapidly adopting the Slavic language of their surroundings.

(b) The Germanic Languages.—We have already discussed the western limit of the Germanic languages on the Continent. In the south the line runs from Monte Rosa over the heights of the Savoy. But Alps are numerous and so is Gotthard, to the south of Samnaun, over Laurein, Salurn Altrei, south of Brixen, Innichen, Pontafel, Villach, Klagenfurt, Mahrenberg, Mureck, Radkersberg, but from Pontafel to Radkersburg there are numerous German colonies to the south, in Slovenian territory, the largest being the one around Gottschee, while a large Slovenian settlement is found in Austrian territory. At Radkersburg the German linguistic line runs north inside Hungarian territory (through Eberau, Rechnitz, Ödenberg, around Wieselberg and Pressburg, from where it runs along the Hungarian border as far as Hohenau. Here it gradually turns in a westerly direction through Moravian and Bohemian territory, leaving Znaim, Riegerschlag, Krumau, Neumark on the Germanic side. Here it turns to the northeast, just grazing past Pilsen, Leitmeritz and Reichenberg. Then it turns southeastward in a very irregular line as far as Olmutz and reaches Troppau. There are numerous German colonies in Hungary on both sides of the Danube, from Neustadt to Neusatz, and large settlements in Bohemia and Moravia about Budweis, Iglaau, Landskron, Brunn, and in the Slovak country, about Kremsitz, Kasmak.

From Troppau, northward to the sea, the linguistic line is very broken, there being hundreds and thousands of German colonies through Galicia, Poland and Russia, as far as the Volga. But running a straight line northward through Oppeln to Kempen, thence to the northwest through Lissa, to Bentschen and Schwerin, thence to the northeast through Bromberg, Allenstein, Goldapp, thence in a semi-circle through Eydtkuhnen to Polanzen on the sea, most of the territory to the left is German. But there is a very mixed Polish strip from Bromberg to Danzig, and for a distance of some 40 miles to the west of the Vistula. Besides, to the northwest of Danzig there is a solid settlement of Kashubs, speaking a language closely related to Polish, and around Kottbus and Bauen there are two large oases of people speaking a language intermediate between Polish and Bohemian, known as Wendish or Serbo-Lusatian. If a line is drawn from Karlsbad in the east to Cologne and Aix-la-Chapelle in the west, the territory to the south represents the High German, from which the official language is derived, while the northern part represents the Low German dialects. According to the Pan-German atlas of 1900 the whole world is more or less German. Thus the United States are 46 per cent German, forming 39 per cent of the foreign-born population. Milwaukee is given there as 66 per cent German, Hoboken as 57 per cent, etc. Rio Grande do Sul in Brazil is 28 per cent German. Canada is 7 per cent. South Africa is 6 per cent German, and so forth. This map explains much of the World War.

A line running from Eupen, to the southwest of Aix-la-Chapelle, past Cleve, Emmerich, Benthem, Neuhau to Emden, separates the low German group in the east from the Dutch in the west and Frisian in the north. But a strip of territory along the western part of Jutland, as far as Tondern, including the Syt and other islands, is also Frisian. A line running west, over the French, to above Flensburg, separates German from Danish, so that a considerable part of German Schleswig is linguistically Danish.

Denmark and Norway are linguistically almost identical, and Sweden differs from them only by a different official language. Norway and Sweden have Lap inlets, and Swedish is spoken outside of Sweden in the provinces of Estercboithia and Nyland in Finland, and in the Aaland Islands. In addition, we have the related Icelandic in Iceland.

The remaining Germanic language, English, is spoken in Great Britain, but in the northwestern, western and southern counties of Ireland Gaelic is spoken to some extent, even as Scottish Gaelic is preserved in the extreme northwest of Scotland, and Welsh through a considerable part of Wales. The Pan-German map mentioned above accredits 25.8 per cent of the population of the earth as speaking English.

(c) The Slavic Languages.—The western boundary of the Slavic nations was determined as the southern and eastern boundary of Austria and Germany. We can now establish the various subdivisions within this group. The Slovenian language is spoken in southern Carinthia and Styria, in Croatia, in Istria, and in part of Istria. The western line runs from Neuenmark, to the west of Triest, to Görz, passes through Italian territory and follows the political borderline as far as Pontafel. From here it turns due east to Villards having German settlements within the line, however, and runs somewhat north of the Drau and strikes the Mur at Mureck. From here it runs into Hungarian territory as far as S. Gotthard, to the north, abruptly turns south to Warasdin on the Drau, then to the south, taken in Agram and Nesselthal, and not quite reaching Fiume, through northern Istria, to a point south of Triest, leaving the littoral chiefly to an Italian populace. The Serbo-Croatian language is spoken to the southeast of it. The line runs from Mureck along the Mur until its union with the Drau, thence along the Drau up to its union with the Danube, then down the Danube to Weisskirchen, where Rumanian territory is reached; but from Esseg on there are numerous Serbian settlements to the north of the river, as far north as Segedin. Going
up the Morava to Leskovac all the territory to the west is Turkish, except the triangle between the Morava, Danube and a line running from Leskovac past Nish to Negotin, is chiefly Serbian at the periphery, but Rumanian at the core. From Leskovac the line runs to Vranja, from there westward to Skopje, thence in a semi-circle to Scutari. But there are numerous Serbian colonies in northern Albania. Thus all of Dalmatia, Slavonia, Sirmia, Bosnia, Herzegovina, Montenegro and the greater part of Serbia are Serbo-Croatian, while a spur from Nish to Pirot in Serbia is Bulgarian. The Serbo-Croatians and Slovenians form together the Yugo-Slav division of the Slavs.

All the territory south of the Danube, from Vidin to Kustendji, and to the east of the Serbian line, which, however, has to be extended from Skopje to Kostur, thence to Saloniki, then straight to Seres and all along the littoral almost up to Constantinople, is chiefly Bulgarian. But there are within this territory innumerable Albanian settlements in the west, Greek colonies along the Aegean, the Sea of Marmora and the Black Sea, and Turkish colonies in the interior. Besides, there are several Bulgarian spurs into Albania and a considerable number of colonies in southern Albania and in northern Greece. On the other hand, much of the Bulgarian territory in Macedonia is claimed by the Serbians to be Serbian, because in reality the Bulgarian and Serbian dialects pass here into each other.

If a line be drawn from Kostur to the Adriatic opposite the island of Corfu, all the territory to the north not yet occupied for is held by a non-Slavic race, the Albanians, who have also many colonies in Greece, especially in Attica. If a line is continued from Kostur to Saloniki, most of the territory to the south, including the islands in the Ionian and Aegean seas, is Greek.

The Czech and Slovak linguistic line was defined by the German circular line from Pressburg, around Pilsen, to Tropau. A line running from the Adriatic almost to Skalica, thence along the Carpathians up to Babia Gora, forms the southern border of Czech. Continuing the line in a semi-circle to Neumarkt, thence in a very irregular line to Kaschau, and from there almost in a straight line to Kazan this includes the Slovak subdivision of the Czecho-Slovak territory. There are, however, numerous Slovak colonies as far down as south of Budapest. If a line be drawn from Kaschau to Sing, thence to Czernowitz, and from Kaschau a semi-circle be drawn to the west, as far as some distance south of Przemysl, then past Varoslav to Lezaisk, we get the western limit of Ruthenian, which belongs to the same group as Little Russian or Ukrainian. The rest of Galicia, north of the Slovak territory, is Polish. If a straight line be drawn north from Lezaisk to Suvalki, all the territory to the west, up to the German border, is Polish, except for Ruthenian indentations, as far as the river Niemen, south of Suvalki, and indentations to the north. A semi-circle from Suvalki to Vilna, thence an irregular line to Dvinsk, and from there a fairly straight line past Busk to the sea north of Memel, up to the German border in the west and with deep spurs into German territory, include the non-Slavic Lithuanians.

Proceeding from Dvinsk up to the Dvina as far as Druya, then drawing a line northward to near Izborsk, thence northward to the sea, we get the Letts to the north of the Lithuanians. But the Lithuanian territory is dotted with Polish and Russian settlements, while the Lettish territory is similarly filled with German colonies, and, in the east, with Great Russian oases.

To the north of the Letts live the Estonians, who almost reach to lakes Pskov and Peipus, then down the Narova to the sea. The islands of Dago and Onega are also Estonian. The Estonians are not Indo-European, but belong to the same group as the Finns. Various Finnish races, in small groups, occupy the littoral from the Narova almost to Petrograd. North of Petrograd, between the Bay of Finland and Lake Ladoga, as far up as Rantas, the population is mixed Russian and Finnish. The southern littoral of Lake Ladoga, up to the mouth of the Swir River, is Russian. If a straight line be drawn from here to Perm and the Urals, most of this territory to the south would be chiefly Russian. To the north of this line they live only along the rivers, the largest block being on the Kama, north of Perm, as far as Cherdy. The southern line of the Russians runs along the Black Sea to Gagri in the Caucasus. Thence a line to Aleksandrislya on the Caspian Sea forms the southernmost border of the Russians. Within this region, we distinguish between the Little Russians or Ukrainians, related to the Ruthenians of Galicia, in the governments of Chernigov, Poltava, Kharkov, Voronezh, Podol and parts of Kherson, Ekerinoslav and the Crimea. Eastward they have been settling in the government of Stavropol and as far as the Volga. The White Russians occupy the greater part of the governments of Grodno, Vilno, Vitebsk and Smolensk, and all of Mogilev and a small part of Chernigov. The rest of the Russian territory belongs to the Great Russian dialects. But it must be borne in mind that there is no strict division of the groups, as dialects pass into each other at the points of meeting. The vast territory of Russia has, besides, a large number of other than Indo-European linguistic blocks.

Finland, except for the littoral in the bays of Bothnia and Fina, which is Swedish, and the extreme north Uleaborp, which is inhabited by the Lapps, is Finnish. Related tribes are Carelians, between lakes Ladoga and Onega, and as far north as Lake Pavozero, and also in many settlements in the government of Tver; the Estonians, already mentioned; the Mordovians, in many settlements in the governments of Nizhegorod, Penza, Simbirsk, Saratov, Samara; Cheremisses to the north of the Volga and to the west of Kazan; Votyaks between the rivers Vyatka and Kama; Syryans along the rivers Vychedga, Mezen and Pechora. Of Turkish people the most numerous are the Bashkirs between the rivers Urail and Kama; the Tatars in the government of Kazan and along the Kama, also in the Crimea; the Chuvashes on the Volga, near the Kama, the Tatars and Nogays south of the Volga, along the Caspian Sea; the Kirgizes to the north of the Caspian Sea, east of the Volga. Of Mongols we have the Calkmucks, on the upper Urals, between the Kirgizes and the Bashkirs.
The races of the Caucasus battle any brief description and must be treated separately. The Poles, for example, who belong the Magyars or Hungarians, who occupy all the territory of Hungary not otherwise described as occupied by Slavic people. In addition to the Tata settlements of the Dobrudja there are the related Turks in the westernmost of the Egean and in small scattered colonies in Macedonia. In about the same regions are also found scattered colonies of Armenians who belong to the Indo-European group. There are also Armenian colonies in Galicia, which, however, are rapidly becoming Polonized. We have also one Semitic language in Europe, namely, Maltese, a curious mixture of Arabic and Romance, which is spoken at Malta and Pitayusa, islands of the Mediterranean.

LEO WINTER.

LANGUE D'OC, lâng-dôk', the Provençal tongue of the south of France. See PROVENÇAL LANGUAGE; PROVENÇAL LITERATURE; FÉLÉBRIGE.

LANGUEDOC, lâng-gê-dôk (Fr. lân-gé-dôk), France, a former province, varying very considerably in extent, its unity being entirely a political creation, but including the present departments of Aude, Tarn, Hérault, Lozère, Ardèche and Gard, as well as the arrondissements of Toulouse and Villefranche, in the department of Haute-Garonne; and the arrondissements of Puy and Yssingeaux, in the department of Haute-Loire. Toulouse was its capital.

LANGUR, lân-goør', a monkey of the genus Semnopithecus, containing large leaf-eating species of the Himalaya Mountains, India, southward into Ceylon, southwestern China and the Malayan region eastward as far as Java. The genus represents an interesting transition-group between the gibbons and the catarhine monkeys, and includes a large assemblage of species with a long, thin body, tall hind-legs, long, slender tail and no cheek-pouches, such as the entellus, or sacred monkey of the Hindu, the wanderers of Ceylon and several other kinds. These monkeys dwell chiefly in forests and go in troops of considerable size. They feed on leaves and fruit, often doing much damage in native plantations. They rarely descend to the ground, and when disturbed there seek to escape by prodigious bounds; but ordinarily they remain in the tree-tops, and progress by swinging from branch to branch, one arm after the other, often at surprising speed. Twenty-nine species are described by H. O. Forbes in his monograph in Allen's 'Naturalists' Library' (London 1894).

LANIARD, or LANYARD, a small rope, usually a four-stranded hemp rope, used on a ship. It is employed in setting up rigging, being rove through dead eyes, and in making fast heavier ropes or other objects. The article to which the rope is attached gives it the names bucket-laniard, lock-laniard (for firing the percussion hook of a cannon), etc. A knife-laniard is the long whipcord hanging from a knife around a sailor's neck and is a part of the regulation uniform in the United States navy.

LANIER, lâ'nyôr, or LANIERE, Nicholas, English musician: b. London, 1588; d. there, Feb. 26, 1655. He followed the royal family into exile and after the Restoration resumed his former post of master of music. He composed the music for Ben Jonson's masques 'Lovers Made Men' and 'The Vision of Delight,' introducing the Italian 'stiloy recitativo' into England. He was also a painter and a connoisseur of art, and was in Italy in 1625-28 buying pictures and statues for the collection of Charles I. Portraits of Lanier painted by Van Dyck, Jan Livens, Isaac Oliver and Lanier himself are in existence. Of his music much remains in manuscript, but a large portion is published in 'Select Musicall Ayres and Dialogues' (1653, 1659); 'The Musical Companion' (1667); 'The Treasury of Music' (1669), and 'Choice Ayres and Songs' (1685). The Lanier family continued to exhibit its talent for music, the American branch being represented by Sidney Lanier (q.v.).

LANIER, Sidney, American poet: b. Macon, Ga., 3 Feb. 1842; d. Lyny, N. C., 7 Sept. 1881. His father, Robert Lanier, a lawyer of Macon, came from a family noted for a love of music and art. An ancestor, Jerome Lanier, a Huguenot refugee, was well known at the court of Queen Elizabeth as a musical composer; another forebear, Nicholas Lanier, was director of music at the court of James I and Charles I, and first marshal of the Society of Musicians incorporated at the Restoration. Sidney Lanier's mother, Mary Anderson, belonged to a prominent Virginia family also noted for decided talent for music and poetry. The poet's artistic temperament was therefore a direct inheritance. As a child Lanier was passionately fond of music and without any instruction learned to play on the guitar, piano, flute and violin. A critic said of him in his earlier years: "In his hands the flute was transformed into a voice that set heaven and harmonies into vibration." This passion for music also showed itself in his keen sensitivity to rhythmic effect. At 14 he entered the sophomore class at Oglethorpe College, Georgia, and after three years graduated with distinction. He was tutor in the college until the outbreak of the Civil War, when he joined the Confederate army as a private soldier. He fought in several important battles, was transferred to the signal service and finally became signal officer of a blockade runner. In the autumn of 1864 he was captured and confined in Point Lookout Prison. He had taken advantage of every leisure moment to pursue his studies in literature, modern languages and music, and during his long idle hours in prison he gained a complete mastery of the technique of the flute. He was released in February 1865 and made his way on foot to Macon, but the fatigue of the journey added to the previous hardships of camp and battle had weakened his constitution and did irreparable damage to his lungs. The years that followed were years of hand-to-hand fight for a subsistence. For two years he was
clerk in a hotel in Montgomery, and there wrote his novel 'Tiger Lilies,' a book of promise, but not of much enduring power. He was then made possible the valiant struggle and the achievement of the next 14 years. In the autumn of 1873, after an unsuccessful attempt to re-establish his health by a winter in Texas, he determined to move to Baltimore, where he could find greater opportunities for culture. He played the flute in the Peabody orchestra; in the intervals of hemorrhage he wrote articles for magazines; he gave lectures on literature in private schools; and thus, with the generous aid of his father, he supplied the necessities of his family. His study of languages, of Anglo-Saxon and early English texts, of English and of foreign literature, was incessant and systematic. In February 1879 he was appointed lecturer on English literature at Johns Hopkins University, and this position he held until his death. His two principal courses of lectures at the university are embodied in his 'Science of English Verse' (1879), a thorough and suggestive treatise on English metre, (showing that English verse depends on stress, not accent, and that it is based on certain easily recognized musical rhythms, and 'The English Novel,' a masterly treatment of the development of the idea of personality and its place in the modern novel. Again and again Lanier was driven by illness to Texas, to Florida, to North Carolina, but he was never idle; he studied much, he thought largely on all vital subjects, on love, life, art, economics, religion, and now and then he gave to the world poems of exquisite truth and beauty. In the spring of 1881 it became evident that the unequal fight was nearing its end, and as a last resort he tried tent life in the mountains of North Carolina. The last illness came at Lynn, in Polk County, and on a morning of early September he passed away.

Lanier's most important prose works besides those already mentioned are 'The Boy's Froissart' (1878); 'The Boy's King Arthur' (1880); 'The Boy's Mabinogion' (1881); 'The Boy's Paradise' (1882); Shakespeare and his Forerunners (1902). His best-known poems are 'Hymn of the Marshes'; 'Clever'; 'The Song of the Chattahoochee'; 'The Crystal'; 'Corn'; 'The Symphony' and 'The Centennial Meditation.' The distinctive characteristics of his poetry are a wholesome outlook upon life, a constant recognition of the highest in character and in thought and a varied fresh and melodious rhythm. His passion for good and love, his robustness, his high conception of the meaning and power of the love of man and woman, proclaim his close kinship to Browning. In questions of social economics Lanier was abreast of his time; he believed in the rights of the individual, he hated the iron hand of unjust trade, but he realized that these problems must be solved in the ways of business.

He knew that the great poet must be an artist in sound and color, as well as a thinker, and that no labor was too arduous for perfecting verse forms; to attain perfection in his art the poet must make the mechanical verse fulfil its vast possibilities, he must gain the mastery over imagination, so that imagination may become his servant. But for Lanier, there was no art for art's sake; art was consecrated to man and to God. Like all true poets he lived near to nature, and he has described our Southern scenery with loving faithfulness warmed by vivid imagination. He has given a new meaning to our florilegium, he has fully braided and woven with intricate shades of the vine; to our broad fronded fern and keen-leaved canes. The luxuriance of the Southern forests, the wealth of undergrowth, the warmth, the color, the singing birds live in his poetry, but there is no undue heat, no tropical languor. Whittier has not been more faithful to the rocky coasts, to the snowstorms of New England, than has Lanier to the South.

His letters and complete poems were edited by his widow with a memoir by William Hayes Ward (New York 1881, 1884, 1906), with bibliography. Consult also 'The Lanier Book' (New York 1904), and Nims, 'Sidney Lanier' (Boston 1905). See 'SONG OF THE MARSHES.'

President of Sweet Briar College, Sweet Briar, Va.

LANJUNAIS, lan'zhwé-ná', Jean Denis, COUNT DE, French statesman: b. Rennes, 12 March 1753; d. Paris, 13 Jan. 1827. He took his degree as doctor of laws at 19 years of age and was qualified for the bar at 20. In 1779 he was appointed counsel for the Breton estates and was a successful legal practitioner when he became professor of ecclesiastical law at the University of Rennes in 1775. He was a deputy in the States-General in 1789 and demanded the abolition of titles of nobility, working valiantly for a constitutional monarchy meanwhile. At the Convention of September 1792 he was charged with reactionary views; but while opposing the extremes of the Mountain and its following, Lanjunaïs remained faithful to Republican principles. He denied the right of the Convention to condemn to death Louis XVI, but voted for banishment in the hope of saving the monarch's life. He came under arrest with the Girondists but escaped to Rennes and concealed himself until after the downfall of Robespierre. He returned to the Convention on 8 March 1795 and was president of the Upper House during the Hundred Days. He opposed Napoleon and upon the restoration of the Bourbons he was created a peer. As a member of the tribunal which tried Marshal Ney he voted for exile. He wrote 'Constitutions de la nation française' (1819); 'Appréciation du projet de loi relatif aux trois cordonnants' (1806; 6th ed., 1827); 'Études biographiques et littéraires sur Antoine Arnaud, P. Nicole et Jacques Necker' (1823), etc. His collected works were published in four volumes in Paris (1832).

LANKESTER, Edwin, English scientist: b. Melton, 23 April 1814; d. 30 Oct. 1874. His early medical studies were attended with difficulty; he had a short course at the University of London, and took his M.D. degree at Leipzig in 1839. In 1840 he settled in London as a lecturer and writer, and in 1850 he became professor of natural history at New College, London. He was appointed lecturer on anatomy and physiology at the Grosvenor Place School
in 1853, and in 1853–71 was joint editor of the Quarterly Journal of Microscopical Science. His microscopic examination of the water from the "Broad Street Pump," undertaken with Dr. Snow, identified the outbreak of the cholera epidemic of 1854 with the famous pump. He was an indefatigable and popular worker on matters concerning sanitation and public health, many of his articles and lectures being prepared for the layman. His work was taken up by the National Health Society. In 1853 he edited for the prince consort William Macgillivray's 'Natural History of the Dee Side and Braemer' (privately printed). He contributed the article 'Rotifera' to the Cyclopedia of Anatomy and Physiology; and wrote a school manual, 'Health, or Practical Physiology' (1866); 'Lives of Naturalists' (1842); 'An Account of Asken and its Mineral Springs' (1842); 'Half-hours with the Microscope' (1859), etc.

LANKESTER, Sir Edwin Ray, English zoologist: b. London, 15 May 1847. Educated at Downing College, Cambridge, and Christ Church, Oxford, he was elected a Fellow and lecturer of Exeter College, Oxford, in 1872; 1874–90 he was professor of zoology and comparative anatomy in University College, London, and from 1891 till 1896 Linacre professor of comparative anatomy at Oxford. From 1898–1907 he was director of the natural history department of the British Museum. In 1884 was prominent in founding the Marine Biological Association, now located at Plymouth, and in 1889 became chief editor of the Quarterly Journal of Microscopical Science. Lankester's works include the following: 'A Monograph of the Fossil Fishes of the Old Red Sandstone' (Part I, 1870); 'Comparative Longevity in Man and the Lower Animals' (1870); 'Developmental History of the Mollusca' (1875); 'Studies in Apus, Limulus, and Scapaio' (1881); 'On Food' (1882); 'The Advancement of Science' (1890); 'Extinct Animals' (1905); 'The Kingdom of Man' (1907); 'From an Easy Chair' (1908); 'Science from an Easy Chair' (1910–12); 'Diversions of a Naturalist' (1915).

LANMAN, Charles, American author: b. Monroe, Mich., 14 June 1819; d. Washington, D. C., 4 March 1895. He was educated at the Academy of Norwich, Conn., and went to New York, where he was in business from 1835 to 1845. He then returned to Monroe as editor of the Gazette. He afterward joined the staff of the National Intelligencer at Washington, D. C. He was private secretary of Daniel Webster in 1850 and secretary to the Japanese legation in Washington in 1871–82. He was at various times librarian of the War Department, librarian of copyrights, of the Interior Department and of the House of Representatives. He prepared the first Congressional biographical directory. He was among the first to explore the mountains in North Carolina. He painted many landscapes and made many sketching trips. He published in all about 52 volumes, including, besides the River Saguenay' (1848); 'Private Life of Daniel Webster' (1852); 'Dictionary of Congress' (1858); 'The Japanese in America' (1872); 'Leading Men of Japan' (1883); 'Biographical Annals of the Civil Government of the United States' (1876); 'Haphazard Personalities' (1886), etc.

LANMAN, Charles Rockwell, American Orientalist: b. Norwich, Conn., 8 July 1850. He was graduated at Yale in 1871; studied Greek and Sanskrit there and from 1871 to 1874 pursued studies in Orientalism at Berlin, Tübingen and Leipzig, returning in the latter year to accept a fellowship at Johns Hopkins University. Since 1890 he has been professor of Sanskrit at Harvard. He has lectured at many institutions on Oriental subjects; has traveled in India, and from 1879 to 1884 was secretary of the American Philological Association, edited its 'Transactions' (Vols. X–XIV), and in 1890 became its president. He was corresponding secretary of the American Oriental Society from 1884 to 1894 and in 1896, and served it as vice-president from 1897 to 1907, when he became its president. His published works include 'Nom-Inflection in the Veda' (1880); a 'Sanskrit Reader, with Vocabulary and Notes' (1884–88); 'The Beginnings of Hindu Philology' (1890); Raja-Cekharaj, Karpura-madijar, a translation of a Hindu drama of 900 A.D. (1900); and numerous contributions to Oriental and other journals. He projected the Harvard Oriental Series (1891), to which he has made several contributions. He received the degree of LL.D. from Yale in 1902, and from Aberdeen University in 1905. In 1909 appeared his Pali Book-Titles and their Brief Designations, in 'Proceedings' of the American Academy of Arts and Sciences (Vol. XLIV, pp. 601–707, Boston).

LANNER, Joseph Franz Karl, Austrian musical composer: b. Vienna, 12 April 1801; d. there, 14 April 1843. He early showed an aptitude for music, playing the violin and composing music before he had any instruction. He established a quartet with the elder Strauss as viola, which proved the nucleus of a great orchestra. Lanner's genius ran to dance music and he developed the modern waltz from the old Viennese national dance ländler. He composed 208 marches and dances, and is generally acknowledged the father of modern dance music.

LANNER, the name of a small *noble* falcon formerly in high repute among European falconers of mediæval times, the identity of which, however, is not quite clear. It was probably the handsome reddish-gray Falco feldspi, of the Mediterranean region, still highly valued among Bedouin falconers for its docility and graces. The name is extended to other African and Asiatic hawks of similar appearance and qualities.

LANNES, lăn', Jean, Duke of Montebello, marshal of France: b. Lectoure, 11 April 1749; d. Vienna, 31 May 1809. He had a scanty education but his physical prowess caused him to be made sergeant in the battalion of volunteers which he joined in 1792 for service in the war with Spain. He had attained rank as colonel when in 1795 army reforms caused his loss of rank. He re-entered the volunteer and went with Napoleon to Italy, and in 1797 rose to the rank of brigadier-general. He had by this time demonstrated to Napoleon his extraordinary ability for hard advanced guard fighting against any odds and
the great Corsican thereafter used him repeatedly to prepare the way for his own crushing attacks. He commanded a brigade in the Egyptian campaign; he accompanied Napoleon to France and distinguished himself at the 18th Brumaire. He was again a member of the advance guard in crossing the Alps in 1800, and at the battle of Montebello so aided Napoleon that he was created a duke, taking his title from the name of the battle. At Marengo he nobly contested the harder fighting. He was ambassador in Portugal in 1801 and in 1804 he became a marshal of France. At Austerlitz he commanded the advanced guard, and in the campaigns of 1805-07 he rendered signal services. His method at Saeftingh is still studied as a model in the French Staff College. He won further laurels at Jena and at Friedland, then went with Napoleon to Spain as commander-in-chief of a separate army with which he won the battle of Tudela, 22 Nov. 1808. He then engaged in the sieges of Montevideo and Cadiz, and took possession 21 Feb. 1809. Later in 1809 he was again engaged in an Austrian campaign, leading the army across the Danube. Forced to retreat in the battle of Aspern-Essling, 22 May 1809, he exposed himself recklessly, was twice wounded, and was wounded, dying at Vienna, 31 May, 1809. Napoleon entertained for him a deep affection and was bitterly grieved at his loss. He was one of the ablest of the marshals of France, possessing signal ability for high command, and remarkable daring and strength as a leader.

Consult Perin, R., 'Vie Militaire de Jean Lannes' (Paris 1809); Thoumas, 'Le Marechal Lannes' (1891).

LANOE, Falconer. See HAWKER, MARY ELIZABETH.

LANOLIN, a fatty substance obtained from the grease of sheep's wool, and consisting chiefly of cholesterol. The wool-grease is saponified by means of caustic soda, and the resulting emulsion is diluted with water. The lanolin then separates in fine particles, which, by the aid of a centrifugal separator, may be obtained in a creamy mass. The lanolin of commerce contains about 30 per cent of water. Lanolin is very generally used as a basis in the preparation of salves and ointments, since it does not grow rancid, and is itself antiseptic to a certain extent. It absorbs water and penetrates the tissues of the body much more freely than lard or vaseline.

LANSDALE, lan'sdal, Pa., borough of Montgomery County, 22 miles north of Philadelphia, on the Philadelphia, Reading and the Stony Creek railroads. The principal industries include the manufacturing of agricultural machines, silks, shirts, heating apparatus and iron and brass products. Pop. 3,551.

LANSDOWNE, George Granville (or GRENVILLE), Lord, English poet and dramatist: b. 1667; d. London, 30 Jan. 1735. He was educated in France and at Trinity College, Cambridge. He came of a family devoted to the cultivation of literature and at the age of 12 recited to the Duchess of York some verses he had written in honor of her visit to Cambridge. During the reign of William III he lived quietly, devoting himself to dramatic writing and the society of the great poets of his day: Pope, Dryden, Allison and Wycherley. He entered public life upon the accession of Queen Anne in 1702, being elected to Parliament, and in 1710 he became Secretary of War. In 1711 he was created a peer and in 1712 he was appointed Comptroller of the Household and a privy councillor. In 1715 he was Lord George I he lost the favor of the court and was removed from office in 1714. He was later suspected of complicity in a plot to aid the Pretender and was confined in the Tower from 26 Sept. 1715 until 8 Feb. 1717. Upon his release from prison he went to Paris and lived for 10 years, later returning to England but refraining from further participation in public affairs. His poetry was of less value than his dramas, but he was a distinguished patron of the poets of his day. His dramatic works include 'The British Enchanters' (1706); 'Heroick Love' (1698); 'Once a Lover and Always a Lover' (1696). His collected works were published 'The Genuine Works in Prose and Verse of G. G. Lord Lansdowne' (2 vols., London 1752; another ed., 3 vols. 1736).

LANSDOWNE, Henry Charles Keith Fitzmaurice, 5th Marquis of, British statesman: b. 14 Jan. 1845. He was educated at Eton and Oxford, and entered politics as a member of the Liberal party. He was one of the leaders of the Treasury (1869-72); under-secretary for War (1872-74); under-secretary for India, 1880; and from 1883-88 governor-general of Canada. From 1888-93 he was viceroy of India; in 1895 joined Lord Salisbury's cabinet as Secretary for War; and from 1900-05 as Secretary of State for Foreign Affairs. His tenure of office in the last-named post was marked by the further cementing of the alliance with Japan and the growth of the entente with France. The rejection by the House of Lords under his leadership of Mr. Lloyd-George's budget of 1909 was followed by the defeat of the Unionist party at a general election in the early part of 1910 and by the passing of the Parliament Act, which curtails the powers of rejection formerly possessed by the House. In 1915 Lord Lansdowne joined the Asquith coalition government as a minister without portfolio.

LANSDOWNE, Pa., borough in Delaware county, five miles southwest of Philadelphia, on the Philadelphia, Baltimore and Washington Railway. It is chiefly important as a growing suburb of Philadelphia with the public improvements following a residential development. It has steel manufactures. Pop. 4,066.

LANSFORD, Pa., borough in Carbon County, on the Lehigh and New England Railway, 40 miles north of Reading. It is the centre of the anthracite coal fields, has extensive coal mining interests and manufactories of shirts, knit goods and garage supplies. In the neighborhood is situated an immense electric-power plant. It was settled in 1845 and was incorporated in 1876. The government is administered by a burgess elected every four years and a borough council which controls the local administrative offices. Pop. about 10,000.

LANSING, John, American jurist: b. Albany, N. Y., 30 Jan. 1754; d. 12 Dec. 1829. He studied law in Albany and New York; was engaged in practice at the beginning of the Revolution, during a period of which he served as
military secretary to General Schuyler. In 1784 he was elected to Congress, and while a member of that body was elected to the lower house of the New York legislature, where he was chosen speaker in 1786, in which year he also became mayor of Albany. For a short time he represented New York in the Constitutional Convention (1787), which he left because he held that he had been sent to participate in an amendment of the Articles of Confederation and not in the forming of a new constitution. In 1788, at the New York convention, his opposition to the new Constitution was stoutly maintained. He served on the New York-Vermont boundary commission; in 1790 was appointed a judge of the New York Supreme Court and became chief justice in 1798. From 1801 to 1814 he was chancellor of the State. He declined the Anti-Federalist nomination for governor of New York in 1804. He disappeared mysteriously in New York City on 12 Dec. 1829, after having quit his hotel to post a letter on a wharf nearby.

LANSING, Robert, American statesman: b. Watertown, N. Y., 1854. After graduating from Amherst College he was admitted to the New York bar and began to practise law in his native town. On various important occasions he was engaged by the United States government on international questions, among them the Bering Sea Fur- Seal Arbitration (1896-97), in which he served as counsel and technical delegate; the Bering Sea Claims Commission (1896-97), Alaskan Boundary Tribunal (1903), North Atlantic Coast Fisheries Arbitration (1909-10) and the American and British Claims Arbitration (1912-14). Mr. Lansing was appointed counsellor for the Department of State in March 1914. On the unexpected resignation of Mr. William Jennings Bryan (q.v.) from the office of Secretary of State on 8 June 1915, President Wilson on the following day authorized Mr. Lansing to perform the duties of that office 'for a period not to exceed thirty days, until a Secretary shall have been appointed and have qualified.' The subsequent definite appointment of Mr. Lansing as Secretary of State proved a fortunate chance. In the delicate negotiations with foreign powers which Mr. Lansing conducted during 1915, 1916 and 1917, he displayed a statesmanlike breadth of view and a judicial grasp of essential points. The unrestricted submarine policy of the German government, involving diplomatic duels with ambassadors and Foreign Offices, and the intricate problems arising under international law from the British and French attitude with regard to the rights of search and blockade, in addition to many other thorny questions concerning the difficulties of neutrality, were alike handled by Mr. Lansing with diplomatic skill and tact. Among his other interests Mr. Lansing is associate editor of The American Journal of International Law and part author of 'The Government, Origin, Growth and Form in the United States.' (New York 1902.)

LANSING, Mich., city, capital of the State and county-seat of Ingham County, at the junction of the Grand and Cedar rivers, and on the Chicago and Grand Trunk, the Lake Shore and Michigan Southern and several other railroads, 85 miles northwest of Detroit. It occupies an elevated site on a plateau rising from the water level and is well laid out. Its streets are well shaded. There is an abundance of water power derived from both rivers, the Grand River having here a fall of 18 feet. It is a trade centre and is engaged in the manufacture of agricultural implements and electrical machinery, beet sugar, canned goods, automobiles, gasoline engines, carriages, wagons, trunks, wheelbarrows, building materials, malleable castings, furniture, fixtures, electric supplies, cut glass, candy, ice cream, cigars, automobile accessories, artificial stone and knick-knacks. There are over 200 manufacturing concerns, employing about 11,000 persons, and an annual product valued at about $30,000,000. It contains the State Capitol, built at a cost of $1,500,000; State Hospital; State Library, containing 105,000 volumes; United States government buildings; State School for the Blind; and the State Industrial School; State Agricultural College, with a farm of 675 acres; and has electric-light and street-railroad plants; water power from the river, which is spanned by several bridges; national and State banks; about 20 churches; daily, weekly and monthly periodicals; and an assessed property valuation of over $6,000,000. Under a charter of 1897 the city is governed by a mayor and council elected every two years. The waterworks and electric-light plant are owned and operated by the municipality. The city was settled in 1837, laid out for the State capital in 1847, when a single family occupied the site, and incorporated in 1869. Pop. 37,512.

LANSING MAN, a term applied to a collection of human bones, found near Lansing, Kan., 20 feet below the surface of the earth, under a stratum of carboniferous limestone. The skull which was well preserved measured: Maximum length, 188 mm.; breadth, 138 mm.; cranial index, 73.4. From the date of this discovery in 1902, men of science have been divided in their opinion as to the antiquity of the remains. It is now generally agreed that the skull does not represent an ancient type of man. The skull is preserved in the United States National Museum. Consult Alžs Hrdlička, 'Skeleton Remains Suggesting or Attributed to Early Man in North America,' in Bulletin No. 33, Bureau of American Ethnology (Washington 1907).

LANSINGBURG, N. Y., village in Rensselaer County, north of the city of Troy, of which it became a part, 1 Jan. 1901. It was a manufacturing town with a population of 12,595 when absorbed.

LANSON, Gustav, French literary critic: b. Orleans, 5 Aug. 1857. He was educated at the Lycée d'Orléans, the Lycée Charlemagne and the École Normal Supérieure, receiving the degree of doctor of letters. He engaged in the teaching of rhetoric and later became professor of French literature at the University of Paris, and at one time he was engaged in teaching in the United States where his methods have been adopted by several universities. He is a member of several French literary societies and an officer of the Grand Legion of Honor. His works include 'Nivelle de la chausée et la comédie larmoyante' (1867); 'Histoire nationale de la littérature française' (1894; 11th ed., 1909);
LANTERN—LANTHANUM

‘Manuel bibliographique de la littérature française, 1500-1900’ (4 vols., 1910-12), etc. He edited ‘Les lettres philosophiques de Voltaire’ (1908).

LANTERN, formerly LANTHORN (1) an open-work carrier or structure with transparent sides, used for carrying a lamp or candle, as a portable light, or for protecting it from the wind. Lanterns were used by the ancients in augury. They were also carried before troops on the march by night, being then borne on the top of pikes, and so constructed as to throw the light backward. Dark lanterns are provided with only a single opening, which can be closed up when the light is required to be hidden, or opened when there is occasion for its assistance to discover some object. See LAMP.

(2) In architecture, a small structure on the top of a dome, or in other similar situations, for the purpose of admitting light, promoting ventilation, or for ornament, of which that on the top of the capitol at Washington may be referred to as an example. In Gothic architecture the term is sometimes applied to louvres on the roofs of halls, etc., but it usually signifies a tower which has the whole height, or a considerable portion of the interior, open to view from the ground, and is lighted by an upper tier of windows. Notable examples are the Cambroi of Burgos Cathedral, the celebrated example of Coutances Cathedral, Normandy, and the equally famous octagon of Ely Cathedral.

(3) The elaborate lighting fixture, with its prisms, in a lighthouse (q.v.).

LANTERN OF DEMOSTHENES. See LYSICRATES, MONUMENT OF.

LANTERN-FISH, a general term for the luminous fishes of the depths of the sea, most of which belong to a single group (Inimomi). See DEEP SEA EXPLORATION; DEEP SEA LIFE; FISH; Ichthyology.

LANTERN-FLIES, homopterous bugs with membranous forewings concealing the folded hind-wings when the insects are at rest, and the head greatly prolonged and said to be light-giving in some tropical species. They feed upon plants and deposit their eggs in slits cut in the bark. The best-known species is the candle-fly (Fulgora laterna) of tropical America, but the luminosity alleged of it is an old story not recently verified. Many other popular beliefs are attached to the insect. It is said in Brazil, for instance, to be so poisonous that anything against which it strikes its long beak will fall dead. Several small and non-luminous species of this family occur in the United States. Consult Brunner, ‘Am. Naturalist,’ (Vol. XXXIII, p. 833, 1885).

LANTERN SLIDES, Method of Making. Lantern slides are so universally used in educational work and are so easily made that teachers should know the process. Besides lanterns, which can be attached to any electric light socket, have been become so cheap and so efficient that illustrated descriptions of travels and outings may be enjoyed in the home. As far as the method of making them is concerned, there are three classes of lantern slides: (1) lantern slides by contact, (2) by reducing or enlarging, and (3) by copying illustrations or photographs.

1. Lantern Slides by Contact.—Put the lantern slide plate on the negative in a printing frame and print just as if the plate were a piece of printing-out paper. The time of exposure will be rather short. With a gas mantle lamp or an ordinary electric light, allow two seconds at a distance of three feet. If the negative is weak, increase the distance, underexpose and develop thoroughly; if the negative is dense, lengthen the exposure. If the negative is uneven, increase the distance so that 8 or 10 seconds, or even longer will be required for the exposure. This will give an opportunity for shading the weaker parts, just as in printing on paper. With most kodak films and with other negatives up to 3×4×4½ inches, this is the best method. Even with larger negatives, a desirable portion may be covered by the plate and a print made of that particular feature.

2. Reducing and Enlarging,—If a lantern slide is to be made from a negative either smaller or larger than the lantern slide, a camera is necessary. Place the negative in a perfectly vertical position so that a good light, but not direct sunlight, may shine through it, as in making an ordinary picture. Remember that the lantern slide plate is very slow, so that the exposure times that required for instantaneous plates or for kodak films. Lantern slides made by reduction from larger negatives are likely to be the best; enlargements from negatives smaller than the lantern slide are not so satisfactory.

3. Copying Illustrations or Photographs. In making lantern slides from photographs, maps or pictures in books, it is necessary to make a negative and then make a lantern slide from the negative. Preferably, this negative should be of the same size as the lantern slide plate. The lantern slide may then be printed by contact. Lantern slide plates may be used in making such negatives. If an average 5×7 photograph is to be copied in good diffuse daylight, with an F 16 stop, and a lantern slide plate, try an exposure of 1 minute. In copying maps and line drawings, where dead blacks and pure whites are desired, expose fully and overdevelop. Formulae for developers are furnished with every box of plates. Consult Chamberlain, Charles J., ‘Methods in Plant Histology’, (1901): ‘The Photographic miniature,’ ‘Lantern Slides, Vol. I, No. 9, 1899.’

CHARLES J. CHAMBERLAIN.

LANTHERNS, Feast of, a religious ceremony held in China on the 15th day of the first month of the year. It derives its name from the vast number of lanterns which are hung out of the houses and in the streets. The lanterns used are often of great value, being richly ornamented with gilding, painting, japanning and sculpture, and some of them are of great size, reaching nearly 30 feet in diameter, and are so constructed as to resemble halls or chambers.

LANTHANUM, a rare metallic element resembling cerium in its general properties, discovered by Mosander, in 1839, in the Swedish mineral cerite. It has the symbol La, and an atomic weight (for O = 16) of 138. Its melting point is between that of antimony (840° F.) and silver (1740° F.). It has
a specific gravity of 0.16, and a specific heat of 0.0448. It is a white metal, moderately ductile and malleable. It oxidizes rapidly upon exposure to the air, and decomposes water slowly when cold, and rapidly when hot. It dissolves readily in acids, with the formation of corresponding salts, which are mostly colorless, with an astringent taste. The metal is prepared by the reduction of its chloride by metallic potassium, which forms potassium chloride that is formed, by washing with alcohol. Neither lanthanum nor its salts are of any industrial importance. The name is from a Greek word meaning "concealed," in allusion to the rare and lanthanum element. Lanthanum occurs, as a silicate, in the minerals cerite, gadolinite, orthite and allanite; as a carbonate in lanthanite occurring in Lehigh County, Pa., and Essex County, N. Y.

LANZA, lán'tsä, Gaetano, American mathematician and engineer: b. Boston, 26 Sept. 1848. He was educated at the University of Virginia, and for two years was an instructor there; was an instructor and assistant professor at the Massachusetts Institute of Technology (1872-75); professor of theoretical and applied mechanics (1875-1911), in charge of the department of mechanical engineering (1883-1911), and since 1911 professor emeritus. He has served at various times as consulting engineer and in 1906-11 was president of the Mathematical and Physical Club. He is a Fellow of the American Academy of Arts and Sciences, a member of the British Association for the Advancement of Science, and of other scientific bodies at home and abroad. He has published "Applied Mechanics" (1885; 9th ed., 1905), and "Dynamics of Machinery" (1911), and his writings include many papers presented to scientific societies.

LANZAROTE, lán-thär-ō'té, one of the Canary Isles, the most easterly of the group, about 90 miles from the African coast; area, 235 square miles; greatest length, 31 miles; breadth, 5 to 10 miles. Its coast is in general very bold, and presents ranges of basaltic cliffs rising in some parts to 1,500 feet; its interior is deeply indented, and contains several mountains, the loftiest of which has a height of 2,000 feet. The only port of any consequence is Arrecife. Pop. 19,261.

LANZI, làn'tsi, Luigi, Italian antiquary and art critic: b. Monte dell' Olmo, near Macerata, 1732; d. Florence, 30 March 1810. He was educated for the priesthood, entering the order of the Jesuits. He became keeper of the galleries of Florence in 1773 and through study and research became an authority on Italian painting and Etruscan language and antiquities. He was buried beside Michelangelo in the church of Santa Croce at Florence. His writings include "Storia Pitorica della Italia" (1792, 1796); "Saggio de lingua Etrusca" (1789); "Saggio delle lingua Italia antiche" (1806); "Dei vasi antichi dipinti volgentemente chiamati Etruschi" (1806), etc. He also wrote verse, edited and annotated Hesiod, "Works and Days," and he wrote a number of treatises on spiritual subjects.

LAO-TSE, là'o-tsé, or LAO-TSEU, Chinese philosopher: b. Ku-hi-jin about 604 B.C. The date of his death is unknown, but some early writers think he attained the age of 160. His principal name was Li Uhr, but as he became distinguished he was called Li, a venerable philosopher. He was the founder or reformer of one of the most ancient and important religious sects of China, known as the Tao or sect of reason. He was a historiographer and librarian to a king of the Chow dynasty; traveled to the borders of India, where he may have become acquainted with Buddhism; met Confucius and reproached him for his pride, vanity and ostentation; was persuaded to record his doctrines in a book, which he did in the "Tao-ti-king" or "The Path to Virtue," and on completing this task is reputed to have disappeared into the wilderness, and there ascended to heaven. According to him silence and the void produced the Tao, the source of all action and being. Man is composed of two principles, the one spiritual and impenetrable, the other material and perishable, from which he emanated, and to which he will return on the subjugation of all the material passions and the pleasures of the senses. Lao-tse's moral code is pure, inculcating charity, benevolence, justice, obedience, truth, honesty, and the love of justice. Peace and concord, respect for the will, moral agency and responsibility of man. Since the 2d century of our era the sect has continued to extend over China, Japan, Cochin-China, Tonquin and the Indo-Chinese nations. See Taoism.

LAOAG, là-o'-gō, Philippines, capital of the province of Ilocos Norte, Luzon, on the Grand de Laog River, four miles from its mouth. It is picturesquely situated in a fertile plain and is well built; it is open to the coastwise trade and is the centre of shipment for the agricultural products of the region. Rice, indigo, tobacco and sugar are the principal products. The name signifies "clearness" from the fact that the sky and atmosphere are almost continuously clear. Pop. about 43,000.

LAOCOÖN, là-o-kót'ō-n, a priest of Apollo at Troy. As he was sacrificing a bull to Poseidon on the shore, two serpents swimming from the island of Tenedos advanced to the altar. The people fled, but some men, among them his sons fell victims to the monsters. The sons were first attacked, and then the father. Winding themselves round him, the serpents raised their heads high above him, while in his agony he vainly endeavored to extricate himself from their folds. They then retired to the temple of Pallas Athene, where they took shelter under her shield. The people saw in this omen Laocoön's punishment for his impiety in piercing with his spear the wooden horse consecrated to Athene. The story has frequently been subject to the poets, but it is chiefly interesting to us as having given occasion to a fine work of sculpture—the Laocoön group, now in the Vatican. It was discovered in 1506 on the site of the baths of Titus. Pope Julius II bought it and placed it in the Vatican. Its preservation was perfect, except that the right arm of Laocoön was wanting: this was restored by a pupil of Michelangelo. This group is of the dramatic Rhodian school, and by no means belongs to the best style of Greek sculpture. Yet it has been much treated of in literature, especially by Goethe, Heine, Lessing, Winckelmann and Herder. It represents three persons in agony, but in different attitudes of struggle.
or fear, according to their ages. Pliny declares it was made of one stone by the sculptors Age-sander, Polydorus and Athenodorus, all natives of Rhodes, and the two latter probably sons of the former.

Lessing makes it probable that those three artists were considered by different authors. It may be fairly doubted whether the statue mentioned by Pliny is the same as that we now have; acute observers have found that the group does not consist of one block, though the junctions are carefully concealed. To this it may be answered that the main and a privileged class of the clergy, but regulate strictly ritual, precedents, heresy, baptism, fasts, angel-worship and other matters of form and faith. From the list of canonical books notable omissions are those of the Apocrypha and the Revelation. The canons are published in Hardouin, 'Conciliorum Collectivum' (Vol. I, 1875).

LAODAMIA. Wordsworth's 'Laodamia,' published in 1815, is a narrative poem in stanzas dealing with the classical story of Protessilas, a Greek hero who sacrificed himself in fulfilment of the oracle which declared that victory should be the lot of that party from which would fall the first victim in the Trojan War. According to the legend, as narrated by Wordsworth, Laodamia, the wife of Protessilas, prays to the gods that her husband may return to her from Hades. He does so and relates the story of his death at the hands of Hector, rebuking the excessive passion of his wife, who cannot bring herself to consent to his return to the shades of death. Summoned by Hermes the spectator departs, leaving Laodamia a lifeless corpse upon the palace floor. The poem closes with a description of the trees which grew from the tomb of each and withered at the top when they had attained such a height that they commanded a view of the walls of Troy. The underlying idea of the poem is the weakness of the soul exemplified in Laodamia, whose uncontrolled love makes her incapable of lifting her heart to a "higher object" and accepting her husband's sacrifice and fate. Both the motive of the piece and its classical atmosphere reflect the change in point of view which Wordsworth experienced in his later years. (See ODE TO DUTY.) Its beauty of style and calm nobility of tone make it one of Wordsworth's unquestionable masterpieces. The poem bears traces of the influence of Virgil, whom the poet was rereading at the time. In an earlier version Laodamia is more pitied than condemned. Later the ethics of the poem seemed to require her punishment. The present ending, adopted in 1845, is a kind of compromise. Consult notes in Dowden's 'Poems by Wordsworth' (Atheneum Press Series).

JAMES H. HANFORD.

LAODICEA, lá·ö-dē·i·kə, the ancient name of eight places in Asia Minor including (1) Laodicea, now called the Turks Eski Hisar (Old Castle), an ancient and ruined city, once the capital of Greater Phrygia, 120 miles east of Smyrna, the site of one of the seven primitive Christian churches of Asia. Nothing but very extensive ruins of inferior architectural merit remain to show the locality of this interesting city. (2) Now Nicaea, a city in Lydia, north of Iconium. (3) An ancient city of Syria, founded by Seleucus Nicator, which stood to the northeast of Balbec, in a plain watered by the Marsyas.
of the effective handling of such a scene in the poetry of Virgil.

This hint, and a similar one from Winckelmann and Moses Mendelssohn with reference to the statue of Laocoon, and Virgil’s narrative of the ‘Aeneid’ gave the ‘Omnia’ good point for his discussion; —for his discussion, not for the development of his ideas; these he had derived from consideration of the practice of Homer, a practice vividly brought to his attention by a parallel case. But the question, ‘What is the True and Beautiful?’ Upon the basis of first principles discovered in Homer, Lessing built up his theory of the fundamental difference between poetry and painting. But the first 15 chapters of ‘Laocoön’ pursue an inductive method to which he gave a casual air by taking up the views of three of his most distinguished predecessors: Winckelmann, Joseph Spence and Count Caylus. Then, in chapter 16, he formulated his results in dogmatic, deductive fashion, essentially as follows: The symbols, or means of expression, in painting are lines and colors; the symbols, or means of expression, in poetry are articulate words. Lines and colors are properties of bodies, the parts of which coexist in space; articulate words have no existence in space, but succeed one another in time. If, therefore, as is evident, there should be a suitable relation between the subject of artistic treatment and the means employed, the proper subject for painting is something, the constituent parts of which coexist in space, i.e., bodies; and the proper subject for poetry is something, the constituent parts of which succeed one another in time, i.e., movements or, in general, actions. Painting can represent action only suggestively, by means of bodies; poetry can represent bodies only suggestively, by means of action. Painting can represent only a single moment, but suggest other moments; poetry can present a body to view, but will give it the aspect which it bears at a definite moment, the moment of mention. The painter will choose a moment, i.e., one which gives the imagination free play with cause and effect; and the poet will choose a significant aspect, i.e., one which gives the imagination a vivid picture of present reality. But the painter will suggest, he cannot tell, a story, and the poet will present, he cannot exhaustively describe, a body —instead, he will translate a work into the terms of an operation, and will transform beauty into grace. Grace is beauty in motion. Space is the realm of the painter; the realm of the poet is time.

Lessing’s treatise was a protest against two abuses that ran riot in his day: excessive allegorizing in painting, excessive detailed description in poetry. Painting subordinated beauty to subject substance and ran the risk of unintelligibility; pictorial poetry dissipated its energy in the vain endeavor to assemble the parts of extensive objects which defined imaginative unification. Lessing was more concerned with poetry than with painting; he was a poor visualizer, but quick to respond to sensory motor appeal. Further, he cared more for ideas than for things, more for action than for being. His rationalistic mind dealt chiefly with the objective aspect of arts which must, in the last analysis, justify their methods by their subjective effect upon the whole man, the sensuous even before the rational. But he made a theoretical distinction which is unsalvageable, however much it may be subject to modification when applied to special cases. Lessing himself was ready and willing to relax the rigidity of his demarcations. The ‘Laocoön’ as we have it is but the first part of a treatise planned to comprehend music and dancing as well as painting and poetry. We need not regret that it remained a fragment. ‘On the True and Beautiful’ might, as the title suggests, have continued in incisiveness. The first part, that we have, is a masterpiece of composition, a work of art, in which discussion of abstract principles is made marvelously concrete and stimulating. Translated by Elen Frothingham (Boston 1874), and by Sir Robert Phillimore (London 1874). Edited by W. G. Howard (New York 1910). Cf. Irving Babbitt, ‘The New Laocoön’ (Boston 1910).

WILLIAM G. HOWARD.
Assistant Professor of German, Harvard University.

LAOMEDON, Greek mythological character, son of Ilus, king of Troy and father of Priam (Podarcas). By command of Zeus Laomedon was served by Apollo and Poseidon. Apollo tending his flocks and Poseidon building the walls of Troy which Laomedon refused. Laomedon refusing the homage agreed upon the country was visited by a pestilence sent by Apollo and a sea monster sent by Poseidon. The oracle declared that relief could be obtained only by the sacrifice to the sea monster of one of Laomedon’s daughters. Lots were cast and Hesione was chosen and chained to a rock to await the sea monster’s coming. Here Hercules found her and promised to free her in exchange for the magic horses given to Tros, the father of Gannymede, to comfort him after the loss of his son. Laomedon again broke his word and Hercules returned, destroyed Troy, killed Laomedon and all his sons except Priam who had opposed his father’s methods. Hercules carried away Hesione and placed Priam upon the throne. It was said that the grave of Laomedon remained inviolate by the Ocean gate the walls of Troy would remain impregnable.

LAON, 1st., France, capital city of the department of Aisne, 87 miles northeast of Paris. It has been from earliest times a fortified city, owing to its situation upon commanding ground. It was the ancient Laudunum and was fortified by the Romans in the 5th century. The invasions of the Franks, Vandals, Huns and others were checked here in early times: in the Hundred Years War Laon changed hands several times, being held successively by the Burgundians and English. Napoleon here was defeated by Blücher in 1814, and in the Franco-Prussian War Laon fell into the hands of the Germans. In the European War Laon again fell before the Germans in the autumn of 1914 and remained within the famous German v. Hindenburg line as it stood in the summer of 1918. The cathedral of Laon was built in the 12th and 13th centuries and is considered one of the most important Gothic structures in France. There is an old episcopal palace, now in use as a courthouse; the 13th century
LAOS — LAPHAM

LAOS, a territory in the French Indo-China Peninsula, surrounded by the British Shan states, Anam, Tongking and the Chinese province of Yuan-nan. Its boundaries and political status have been the subject of four international agreements, the last concluded in 1907, when the Luang-Prabang territory on the west side of the Mekong was partially restored to Siam. Its extent and the number of its inhabitants are unknown, but they have been estimated at one and a half million. The country is intersected by mountain ranges and traversed by the Mekong or Cambodia River, the alluvial valley of which produces abundant sugar, rice, tobacco, etc. Laos exports to the neighboring states a considerable quantity of ivory, gold, silver, precious stones, silk, etc. The inhabitants are reported to be connected with the Burmese in their racial, social and religious peculiarities. The capital is Chiang-Mai.

LAOSIAURUS, læ-ô-sâ-rú-s, a genus of unarmored, herbivorous dinosaurs (q.v.) of the suborder Ornithopoda, whose remains are found fossil in the Jurassic rocks of western North America.

LAPAROTOMY, surgical operation consisting of the opening of the abdomen by making an incision in the loin in order to reach the abdominal cavity or pelvic viscer.a

LAPEER, la-pér', Mich., city and county-seat of Lapeer County, on the Michigan Central and the Grand Trunk railroads, 60 miles north of Detroit, 45 miles west of Port Huron and 41 miles south of Bay City. It was first settled in 1836 by A. N. Hart and was incorporated as a city in 1868. The municipal government is administered by a mayor and city council of eight members, elected every two years. It is located in a fertile agricultural region and is an important trading centre for poultry and farm produce. The waterworks are the property of and are operated by the municipality. The city has factories engaged in the production of numerous large factories, stone works, planing mills, flouring mills, stove works, a tannery, machine works and iron foundries. The Michigan Home for the Feeble-Minded is located here; also the Lapeer Business College, High School and various church buildings. Pop. 3,946.

LAPHAM, lâp³m, Increase Allen, American naturalist: b. Palmyra, Wayne County, N. Y., 7 March 1811; d. Economowoc, Wis., 14 Sept. 1875. From 1825 to 1832 he assisted in the survey of the Erie Canal, the Ohio Canal and the Welland and Miami canals. In 1833 he removed to Columbus, Ohio, as secretary of the State Board of Canal Commissioners, and also turned his attention to botany, meteorology and geology. He removed to Milwaukee in 1836 where he dealt in real estate and also made a thorough study of the Wisconsin climate, topography, geology, fauna and flora, its resources and its commerce. He was chief geologist of Wisconsin in 1873-75. He was a member of most of the scientific and historical associations of the United States. His publications, including "Travels in the Central Parts of Indo-China, Cambodia and Laos" (1864); Hallett, H. S., "A Thousand Miles on the Elephant in the Shan States" (1899), are all small enough to be carried in the pocket. They are printed in French, English and German, and represent an immense amount of research; the best known are 'Geographical and Topographical Description of Wisconsin'.
LAPIDARY WORK—LAPITHAE

(1844); ‘Antiquities of Wisconsin?’ (1855); ‘Geological Map of Wisconsin’ (1855). The first-named work was the chief authority on the subject for many years and had much influence in directing emigration toward Wisconsin.

LAPIDARY WORK. The lapidary is the skilled cutter, polisher and engraver of precious and semi-precious stones. This work was known to the ancient Greeks and Romans, who excelled in it, as the “glyptic” art, which term is used to this day to express the work done on stone. In the case of precious stones intended for jewelry or adornment the ancients at first had to satisfy themselves with rounding off the edges and irregularities of the crude stone and then polishing their surface. These rounded or pebble forms are known as “en cabochon” and are still usual in our curiosities. The method of faceting to bring about a greater brilliance from light reflections on the many-faced surface required too great an amount of grinding until better methods were discovered. The harder gemstones, as the ruby and diamond, had to wait until the great cutting power of diamond dust was learned. See GEMS.

The invention of lapidary work dates back far behind the days of civilization, in fact to the time when the mind of the savage found that hard stones would cut softer ones. And hence we have our earliest extant engraved stone work on steatite, serpentine, limestone, lapis, etc., all of which are easily cut with splinters of flint or other hard stone available to the savage. Many specimens of real art engraving on stone are extant from such early states of civilization, as those of Babylonia, Egypt, the Ægean Islands, etc., these early engravings were done in the production of seals; those of the Babylonians, early Egyptians and Assyrians assumed the form of a stone cylinder, the incised characters on which were impressed on soft clay by the simple process of rolling, the engraved devices appearing in relief on the clay. Later we find the Egyptians reduced the proportions of their stone seals to what we would now call signet size, soon to receive a bored hole threaded with leather, wire or other material so as to be hung portably on the person. Later again the religiously venerated scarab beetle was carved on the obverse side of the signet by the lapidary. Soon the loop was reduced and used for the circlet of a finger—-the embryo of the finger ring was therefore a signet.

As to the lapidary’s technique in early days we know a little but not much, though the amount of deductive conjecture written by experts would cover many pages. The close examination of the surfaces of extant ancient examples affords fair evidence that sharp splinters of stone or chips of metal were the tools used. The point rendered by a splinter of corundum set in some kind of handle could furnish the work we find done on the earliest pieces; in fact there are proofs that just before this tool was in use. Besides ineing, however, we come across work impossible by such method. Here the drill was used to obtain the depth of cutting, the frequent use of holes is evidenced under a magnifying glass, the lines showing the drill perforation deeper than the chipped-out depths done between to bring the connected holes into a line. This work was, no doubt, done with the very ancient bow-drill, the bit or drilling piece being pointed with a quartz or corundum end moistened with corundum powder and oil to create a cutting edge. Ancient specimens found on the island of Crete show us they used tubular drills, thus permitting, at a single process, the cutting of a ring or circle. It may be here stated that the Chinese, even the Maoris of New Zealand, still use the tube drill; the ancient Aztecs also used it. A great advance in lapidary work was brought about by the lapidary’s discovery of the disc tool. By the 5th century B.C. the Greeks created magnificent stone engraving through the use of the revolving disc as an adjunct with the drill. The cutting power of a rapidly revolving disc edge is comparatively speedy and produces lines of mathematical accuracy and cleanliness of incision. The potter’s lathe dates back to very early civilization, with its motion produced by foot power on a large wheel or disk near the latter end of a machine; the hard stone was not used by the Greeks.

So far we have discussed only the production of incising devices in negative below the surface, the design being brought about in relief by impressing on soft surfaces (seals); such work is termed intaglio cutting; and, properly about the 5th century B.C. when the creation of positive engraving on stone, known as “cameo” (see CAMES), was started. By this method a design in relief is brought about directly by cutting away the background and carving the subject in different depths as is done by the sculptor. The lapidaries producing intaglio work were known as cavatores or sculpatores by the Latins, and the workers in cameo were termed calcatores or sculpatores. Recent discoveries in the production of metals for cutting tools and inventions in lathes and other machines for lapidary work have aided our artisans to quicker production, but their output will not compare in quality and perfection of art with the marvelous intaglios and cameos of the ancients. Such patience and art is the result of the paucity of tools. Consult Paquier, L., ‘Les Lapidaires français du Moyen Age’ (Paris 1882); Claremont, L., ‘The Gem Cutters’ Craft’ (London 1906); Natter, L., ‘Traité de la Méthode antique de graver en Pierres fines, comparé avec la Méthode moderne’ (London 1754).

CLEMENT W. COUMBE.

LAPILLI. See PYROCLASTIC.

LAPIS-LAZULLI, the sapphire of the ancients, is a highly-prized ornamental stone. It was long supposed to be a simple mineral, but now has been shown to be a variable mixture of lazurite, haüynite, diopside, &c., and porphyroclastic lapilli, calcite, pyrite, and other minerals. The most important mineral in the stone is lazurite, which is itself a highly complex compound, essentially Na₂(Al₂Si₃O₁₀)₄, but containing also in molecular combination varying amounts of haüynite and sodalite. Lazurite is usually massive, has a hardness of 5 to 5.5, a specific gravity of 2.45, and rich azure-blue color. Its most important localities are in Siberia, Persia, China and Chili.

LAPITHAE, a mythical race of the Thessalians, whose struggles under the leadership of their king, Pirithoëus, against the Centaurs are a fre-
quent subject in art and literature. The final
century was due to the unsuccessful attempt of
the Cenomani and the Aedui, the bride of Prithivis, at their marriage-feast.

LAPLACE, Pierre Simon, père se-môn-
la-plas, Mangeus de, French mathematician and
served the higher mathematics at the academy of
Beaumont; in 1767 went to Paris and there
by the influence of D'Alambert became pro-

fessor of mathematics in the École Militaire.
By his brilliant memoirs on the theory of
probability he attracted wide notice and in
recognition was elected membre-adjoint (1773)
and titular member (1785) of the Academy of
Sciences. He was appointed examiner in the
royal artillery corps (1784) and professor of
analysis at the Normal College (1794); and in
1816, for the elegance of his style in the 'Ex-
pulsion du Systeme du Monde' (1796), was ad-
imitted to the Académie Française, of which in
1817 he became president. Appointed by
Napoleon Minister of the Interior (1799), he was
shortly dismissed, being, according to the em-
pire's constitution, not minister of his own
choice, though having been appointed by him.
Aiming to "conduit the government on the
principles of the infinitesimal calculus," he was,
however, given a seat in the Senate, became its vice-president and in 1803 chancellor.
He also held the post of president of the Bureau
of Longitudes and was a member of the com-
mission for the establishment of the metric
system. On the creation of the empire he was
made a count; but he acquitted in the down-
fall of Napoleon, and was the recipient of a
marquisate at the hands of the monarch in
1817.

Nichol called him the "titanic geometer," and
he has been styled also "the Newton of
France." Among the more important of his
remarkable investigations are the discovery of
the inequality in the movements of Jupiter and Saturn; his researches in probabilities (con-
tained in the 'Théorie analytique des proba-
bilités,' 1812, and the 'Essai philosophique sur
les probabilités, 1814'); his improvements in the
theories of the tides. His chief work is the 'Mécanique céleste' (1799-1825), a compendious solution of
the problems of physical astronomy, and one of the
greatest contributions ever made to science. It
was translated into English by Nathaniel
Bowditch (q.v.) (1829-39). A collection of
Laplace's works in 13 volumes was made by the
French government (1878 et seq.). Consult the
life by Kaufman (Paris 1841), and Arago,
"Biographies of Scientific Men" (in Eng. trans.,
Boston 1859).

LAPLACIAN HYPOTHESIS. See Cos-
mogony, Geology and Laplace.

LAPLAND, an extensive territory in the
north of Europe, between lat. 64° and 66° N.,
and from the shores of Norway east to those
of the White Sea; area, about 150,000 square
miles, of which more than a half belongs to
Russia; and the remainder is shared in nearly
equal proportions between Sweden and Nor-
way. The boy from the hydrographica position
and its physical conformation Lapland, or the
country of the Lapps, is one of the most
bending regions of the globe, consisting either of
rugged mountains, some of them covered
with perpetual snow, and many of them only
for a short period free from it, or of vast
monotonous tracts of moraines and moors. The
extensive territory appears to have been at
one time wholly occupied by the people to
whom it owes its name; but its southern and
better portions have been gradually encroached
upon by Norwegians, Swedes and Finlanders.
The Lapps call themselves Sami, or in
meladsjak (the Norwegians call them Finns),
belong to the Ural-Altaic stock, and are con-
sequently closely related to the Finns (Suomi).
As a race they are the shortest people in
Europe (four or five feet in height). They
are spare of body, with dark, bristly hair and
scanty beard, and short, often bandy legs.
Though not very muscular, they are capable
of great exertion and fatigue, and frequently
live to a great age. The mouth is large, the
lips thick and the eyes small and piercing.

The Lapps are usually distinguished as
Mountain, Sea, Forest and River Lapps. The
Mountain Lapps, the backbone of the race,
are nomads; they move constantly from place
to place in order to find sustenance for their
reindeer herds, their flocks, and their families.
In summer they go down to the fords and
coasts, but spend the rest of the year in the
mountains and on the plains of the interior.
The Sea Lapps, mostly impoverished Mountain
Lapps, or their descendants, dwell in scattered
hamlets along the coast, and live by fishing.
The Forest and River Lapps are nomads who
take to a settled mode of life; they not
only keep domesticated reindeer, but hunt and
fish. The nomad Lapps live all the year round
in tents. The reindeer supplies nearly all their
wants, except coffee, tobacco and sugar. They
live on its flesh and milk; they clothe them-
selves in its skin, and use it as a beast of
burden. It is computed that there are 400,000
reindeer in Lapland, for the most part semi-
wild. In his personal habits and in his clothing
the Lapp is the reverse of cleanly; he gets his
last bath when two years old. He is rather
prone to self-indulgence, is good natured, but
sad, melancholy, misanthropic and selfish; he is past caring for the country.
He is opposed to everything that
has an appearance of frivolity or pleasure,
especially dancing; although the nation is rich
in folklore, hymns are preferred to the weird
old national songs. The Lapps all pro-
\[\text{DMS: The rest of the text contains more information about Laplace and Lapland.} \]

Valuable beds of iron ore have been found
within recent years in the southern part of
Swedish Lapland, at Gifjovari and Kiruna,
respectively 44 and 100 miles north of the Arctic
circle, and these are being developed by the
Swedes with rapidity and thoroughness. At
Kiruna in 1886 there was not a single house;
and in 1914 there was a population of 10,000, with
movie shows, a Salvation Army band and a trolley car system (the most northerly in the world) and other marks of an advanced civilization. On the opposite side of Luossajaryri there is a great mountain of iron ore (7 per cent pure metal), the largest deposit in the world, yielding over 3,000,000 tons a year. The Lapps themselves will not work in mines, regarding it as devil's work, and in consequence the mines are operated by a motley crowd of cosmopolitans.

The Lapps of Norway and Sweden belong to the Lutheran Church, those of Russia to the Greek Church. The Norsemen treated the Lapps as a subject race as early as the 9th century, but had to reconquer them in the 14th; the Russians followed in the 11th, and the Swedes in the 16th. From the 13th to the 17th century the Lapps were kept in a state little better than slavery by Swedish adventurers known as Birkarlans. But at the present day both the Scandinavian governments bestow on them every consideration; they pay no taxes of any kind; they have an organized system of local government; stationary and ambulatory schools are maintained for the benefit of their children; and they are exempt from military service. The number of Laplanders is not supposed to exceed 30,000 of all description, of whom Norway has nearly 15,000, Sweden about 7,000, the rest belonging to Russia. Probably one-third of them are nomadic. Consult Acerbi, G. 'Travels through Sweden, Finland, and Lapland,' in 1796 and 1797; (2 vols., 1828); Du Chaillu, P. B., 'Land of the Midnight Sun' (New York 1882); and 'Land of the Long Night' (ib. 1889); Fulton, J. W. H., 'With Ski in Norway and Lapland' (ib. 1912); Rae, Ed., 'The Land of the North Wind' (London 1875); and 'The White Sea Peninsula' (ib. 1882); Tromholt, S., 'Under the Rays of the Aurora Borealis' (2 vols., London 1883); Walter, L. E., 'Norse and Lapp' (New York 1913); and 'Lapland, Sweden's America,' in The American-Scandinavian Review' (Vol. II, 1914).

LAPLAND LONGSPUR. See Longspur.

LAPORTE, la-pör't, Ind., city and county seat of Laporte County, on the Lake Shore and Michigan Southern, the Père Marquette, Lake Erie and Western and several other railroads, 59 miles east of Chicago. It is the farming trade centre for the county; and is also engaged in the manufacture of woolen goods, agricultural implements, saw mills, cooperages, braiding mills, foundry and machine shops, sash and door factories, a brewery, manufactories of furniture, carriage wheels, goods, radiators, pianos, blankets, bicycles, flour, wheels, hubs, etc. It is an attractive summer resort, having several beautiful lakes in its vicinity; contains a handsome courthouse, city hall, Saint Rose's Academy, the Ruth C. Sabin Home, the Association House for women and girls, a hospital, Fox Memorial Park and public library; and has an electric light which has a power plant supplied from one of the lakes; several churches, national and State banks, daily, weekly and monthly periodicals, and an assessed property valuation of about $4,000,000. In the winter large quantities of ice are cut at the lakes here and shipped to Chicago. The city is governed by a mayor and council, elected for a term of four years. The waterworks are the property of the city. Laporte was incorporated in 1832 and received its charter as a city in 1852. Pop. 12,533. Consult Packard and Daniel, 'History of Laporti County' (Laporte 1876).

LAPPARENT, lê-pà-rà̄n', Albert-Auguste Cachon, du, French engineer and geologist; b. Bourges, 30 Dec. 1839; d. Paris, 5 May 1908. He was educated at the Ecole Polytechnique and at the Ecole des mines. In 1858-60 he was an engineer in the mining corps engaged in making a geological map of France; and in 1874 he became secretary of the Comité du Submarine Tunnel Committee, and with A. Poitier made the geologic surveys in connection with the Channel Tunnel project. He received the appointment of professor of geology and mineralogy at the Catholic Institute, Paris, in 1875; and was also professor of mineralogy, geology and physical geography of the Ecole Libre des Hautes Etudes. He was president of the French Geological Society in 1880, and was elected to the Académie des Sciences in 1897. He published: 'La Géologie' (1 vol., 1881; 5th ed., 3 vols., 1905); 'Cours de mineralogie' (1884; 3d ed., 1899); 'Les Tremblements de terre' (1897); 'La Philosophie minerale' (5th ed., 1910), etc.

LAPPENBERG, Johann Martin, German historian; b. Hamburg, 30 July 1794; d. there, 28 Nov. 1865. He was educated at the University of Edinburgh, later studying in London, Berlin and Göttingen. In 1820 he was elected by the Hamburg Senate as Resident Minister at the Prussian court. In 1823 he became keeper of the Hamburg archives, and he there laid the foundations of his fame as a historian through his exhaustive researches, continuing in the office until 1863. He served as Hamburg's representative in the German Parliament at Frankfort in 1850. His publications include 'Geschichte von England' (2 vols., 1834-37); 'Über den ehemaligen Umfang und die Geschichte Helgolands' (1831); 'Hamburgisches Urkundenbuch' (1842); 'Urkundliche Geschichte des Hansischen Stahlhofs zu London' (1851), etc. He was also editor of the 'Monumenta Germaniae historica.'

LAPRADE, la-prad', Pierre Martin Victor Richard de (Victor de Laprade), French poet and critic; b. Monthbrison, 13 Jan. 1812; d. Lyons, 13 Dec. 1883. He was educated for the law at Lyons but turned to literature for a career. He produced four volumes of verse in the years 1839-44, and in 1845 traveled in Italy engaged in literary research. He received the professorship of literature at Lyons in 1847 and in 1858 he was elected to the French Academy. His publications include his political satire 'Les Muses d'Etat' (1861) caused his removal from his professorship at Lyons. He was elected to the National Assembly in 1871. His patriotic poetry ranks highest among his work. His verse includes 'Les Parfums de Madeleine' (1837); 'Le mystère du cœur de Jésus' (1840); 'Psyc'he' (1841); 'Odes et noëmes' (1844); 'Idylls Héroïques' (1858); 'Poèmes civiles' (1873); 'Le livre des adieux' (1878), etc. In prose he was author of 'Des habitudes intellectuelles de l'avocat' (1840); 'Questions d'art et de morale' (1861); 'Edu-
LAPRADELLE, la-pra-dee', Geouffre de, French international lawyer; b. Paris, 1871. He was professor of international law at the universities of Paris and Grenoble, and in 1914 was exchange professor at Columbia University, where he received an honorary LL.D.; with Professor Politi he established in 1908 the Recueil des arbitrajes internationaux. His writings cover discussions of international rights over territorial waters, disarmament and similar matters. Author of ‘Imperialism and Monroeism’; ‘Théories et pratiques des fondations’ (1894); ‘La question du Maroc’ (1904); ‘La Guerre et le droit des gens’ (1908).

LAPRAIRIE, la-pra-ree, Canada, capital, village of Laprairie County, Quebec province, on the south shore of the Saint Lawrence River and eight miles southwest of Montreal on the Grand Trunk Railway. It is a summer resort and is growing in industrial importance. It was the starting point of the first railway built in British North America, in 1832. It possesses an old fort which in June 1700 was attacked by Col. Peter Schuyler and his New England troops in the ‘Battle of Laprairie.’ Pop. 2,388. Laprairie, also a district of 319 square miles in Quebec province.

LAPSE, legal term with several definitions. In the law of wills lapse is where a beneficiary under the will dies before the testator and the legacy is lost, or fallen and automatically becomes a part of the residuum of the testator’s estate, unless provision is made in the will to prevent such lapse. In several States the law provides against total lapses in certain cases, as in the instance of children or grandchildren surviving the legatee, in which case the bequest would go to the heirs by direct descent. There is a distinction between ‘void’ and ‘lapse,’ a bequest becoming void when the legatee is dead at the time of the making of the will.

In ecclesiastical law a benefice is adjudged to have lapsed when the patron fails within six months after the death of the incumbent to exercise his right of presentation. In such case the rights of patronage devolve upon the bishop as ordinary patron, the metropolitan as superior patron, and the sovereign as patron, pari passu, amount of all the benefices in the realm.

In English criminal procedure ‘lapse’ is used in the sense of ‘abate,’ to indicate that the death of one of the parties involved brought the proceedings to a conclusion.

LAPSED, term applied in the early days of Christianity to those converts who fell away from faith in times of persecution, returning to their heathen practices such as idol worship, burning incense or sacrificing to the heathen gods. Excommunication was the punishment accorded such as denied the faith or reverted to heathen practices, and there was vigorous opposition to their being restored to the Church. However, on profession of penitence they were permitted to hope for reinstatement in the Church, but were compelled to pass a long probation and perform special penances, and most often were admitted to communion only at the time of death.

LAPUTA, island described in Swift’s ‘Gulliver’s Travels’ as floating in the air guided by a loadstone under the control of the inhabitants. It was peopled by a race of philosophers devoted to mathematics and music, and who let their land run to waste and their people live in penury, Smithies devoted themselves to visionary schemes such as softening marble “for pillows and pin-cushions,” extracting “sunbeams from cucumbers” for use in raw weather, and similar absurdities, directed as satire against Sir Isaac Newton and the Royal Society. The philosophers were attended by “rapers” whose duty it was to awaken them from their deep introspection when addressed. Laputa in many respects resembles the “lantren-land” in Rabelais’ “Pantagruel.” Swift being generally believed to have imitated that work.

LAPWING, a plover (Vanellus vanellus or cristatus); found throughout temperate Europe and Asia, across the whole breadth of which it breeds. It has a hind toe and in this respect departs from the true plovers. In the summer a few are found as far north as Norway, Iceland and Greenland, and in winter they migrate for the most part to Africa and India. In its habits the lapwing much resembles the American killdeer; and, like that bird, it is hated by gunners on account of its alarm-cries. This pursuit and the market demand for its flesh, and more especially for its eggs greatly reduced its numbers, especially in Great Britain, where it is again on the increase due to its recent protection by law. The lapwing is noteworthy for the long flowing crest on the head, the contrasting white and deep iridescent green of its plumage, and for its peculiar jerking, yet rapid flight. In the breeding season it is always seen in pairs, but in the winter months great flocks are visible on the seashore and on the borders of marshes. Consult Newton, ‘Dictionary of Birds’ (London 1896), and ‘The Lapwing, Green Plover or Temminck’s Lapwing’ in ‘Agriculture and Fisheries Board of Great Britain, Leaflet No. 44’ 9th ed., ib. 1905.

LAPWORTH, Charles, English scientist: b. Farrington, Berkshire, 1842. He was trained as a schoolmaster at Culham College, ham University, holding the chair until 1913. 81. The whole of his leisure was devoted to geology, and in 1881 he was appointed professor of geology and physiography at Birmingham University, holding the chair until 1913. He has done notable work in his geological investigations, especially in the Durness-Eriboll district of Scotland, which he began in 1882, and during the course of which he established his theory of “rock-fold” and interpreted the complicated strata which had baffled previous observers. Among his works are ‘The Geological Distribution of the Rhabdophora’ (1880); ‘Intermediate Text-Book of Geology’ (1899); ‘British Graptolites’ (1900-08), etc.

LARAMIE, la-rum-ee, Wyo., city and county-seat of Albany County, on the Laramie River and the Union Pacific Railroad, 10 miles west of Cheyenne, the State capital. It is a popular summer resort, being situated on the plains in close proximity to the mountains. It is the shipping and trade centre for a large stock-raising and mining section; and is also
engaged in manufacturing; has large deposits of gold, silver, lead, graphite, antimony, cinnabar and other minerals; and rolling mills, plaster mills, planing mills, a tannery, a packing plant, limestone quarries, plaster mills and railroad and machine shops. It is the seat of the University of Wyoming, the State fish hatchery, Agricultural Experiment Station, and the State penitentiary; contains public and college libraries, Elks Home, State Museum and Saint Joseph's Hospital; and has electric-light plants, newspapers, daily and weekly newspapers, and an assessed property valuation of over $1,500,000. Laramie was first settled in 1867 by employees of the Union Pacific Railroad, incorporated in 1869 and chartered as a city in 1884. The municipal government is vested in a mayor and a council of six members elected biennially. The waterworks are owned by the municipality. Fifty per cent of the population are American born, 20 per cent Scandinavian and 10 per cent German. Pop. 8,250.

**LARAMIE MOUNTAINS**, a Rocky Mountain range which extends through Wyoming and Colorado, and bounds the Laramie Plains on the east. The highest point is Laramie Peak, 10,000 feet high. Coal is the principal mineral, and is found in the foothills of the range.

**LARAMIE PLAINS**, a plateau in southeastern Wyoming, about 7,500 feet above sea level. It is situated between the Laramie and Medicine Bow Mountains, in the counties of Albany and Carbon. In spite of its high altitude the region has become a highly developed and very prosperous agricultural centre.

**LARAMIE RIVER**, an important stream rising in northern Colorado and flowing into the North Platte at Fort Laramie in Wyoming. Its length is about 200 miles.

**LARAMIE STAGE**, geological formation of western North America from about the 26th to the 50th parallel and, in certain districts, from the 103d to the 115th meridian. There has been considerable controversy as to the true geological age of the strata, and it is now assumed that it represents the time-interval between the Cretaceous and Tertiary series. It varies from a depth of about 4,000 feet in Colorado to much greater depth in Montana and Canada and to only a few hundred feet in other regions. The formation is remarkably uniform and appears everywhere to have been the result of continuous sedimentation from base to top. Its strata is composed mostly of sandy material; shaly strata also occur, and the formation is coal-bearing in its entire extent. Molluscan fauna of both fresh and brackish waters, many species of reptiles and land plants characterize the fossils of the entire formation. Consult *United States Geological Survey Bulletin No. 82* (Washington 1911).

**LARASH, la-rash, or EL-ARAISH**, Spanish Morocco, seaport and capital city of Azgar province on the Atlantic Coast, 43 miles by sea southwest of Tangier. It was originally a suburb, but for 1,400 years being fairly deep inside the bar, but the alluvial soil brought down by the Wad Lekkous now prohibits its admitting any but small vessels. It has an ancient wall in fair condition and 10 antiquated forts. The Spanish occupation of 1610-89 is evidenced by towers of Saint Stephen, Saint James and the castle of Our Lady in Europe, the latter now the kasbah or citadel. The town has a fine market place and its streets are generally paved. It exports wool, sheep skins, goat hair and dates, Aptines, fullers' earth, grains and fruits. The trade of the town is about $2,500,000 annually. There is a tradition which connects Larash with the Garden of the Hesperides. Pop. about 6,000.

**LARBOARD**, left side of a ship looking toward the bow, a term probably derived from its usually being the lading-side. The word is now obsolete, its similarity to its opposite *starboard* having caused it to be superseded by the word *port*. In the United States navy since 1913 steering orders have been changed to *right rudder* and *left rudder*.

**LARCENY**, the fraudulent appropriation of the personal property of another person without that person's consent. To commit this crime the removal of the goods to any distance is not necessary, but it requires to be shown that the article has completely passed, or however short a time, into possession of the criminal. Concerning the language of things the appropriation of which is larceny, the common law restricted them to personal property as distinguished from real estate, but this distinction has been largely abolished by recent statutes. At one time in Great Britain the punishment for grand larceny was death; later it was restricted to transportation; now the punishment for larceny is imprisonment, the same as in the United States, and depends on the previous character of the prisoner. The common-law rules on larceny have been greatly modified by statute and the conversion of goods to one's own use with felonious intent, as in the embezzlement of funds which has been confined to one, is now defined and punished as larceny. It is necessary to consult the legislation in each State jurisdiction. Consult Bishop's *Commentaries on the Law of Statutory Crimes* (Chicago 1901), and Clark and Marshall's *The Law of Crimes* (2d ed., Saint Paul 1905). See also *Theft*.

**LARCH**, a genus (Larix) of coniferous trees characterized by a partial clumping habit of growth; small linear leaves arranged in clusters upon the older branches, singly and spirally upon the young twigs, often conspicuous pistillate flowers which develop small, erect, globose or oblong cones, the attenuate scales of which are not decussate at maturity. The species, of which there are about a dozen, are natives of the colder parts of the northern hemisphere. The best-known one in the United States is the American larch, hackmatack or tamarack (L. laricina), which grows generally in wet, peaty soils and shallow swamps, or occasionally upon drier upland soils, from Hudson Bay to Pennsylvania, and westward to Manitoba and Illinois. It attains a height of 60 or more feet, and has nearly horizontal branches. Its wood is hard and very durable, but light in proportion to its size. Being very straight and slowly tapering, the trunks are much used for telegraph poles, scaffold-supports, fence-posts, railway-ties and in ship-building. It is less planted for ornamental
purposes than the following species because its branches are less pendulous and less leafy.

The European larch (L. decidua) grows usually upon dry uplands and a wide range of soils, but rarely in moist ground. Its range is from the mountains of southern Europe to the far north of Europe. It is adding the few hardy trees; in Asia it has a similar distribution. In height it exceeds the tamarack, often reaching 100 feet, and since it is of rapid growth, and is used for an even larger number of purposes than the preceding, it is often planted for commercial purposes, windbreaks and for ornament. The timber which is rich in resin and is practically exempt from insect attacks is valuable for wet situations. It is little used for planks because it warps badly. Since it does not ignite readily and does not splinter it was largely used in wooden battle-ships. Its bark, which contains tannin, is somewhat used in preparing leather; its stem yields Orenburgh gum resembling gum arabic; and its leaves in warm climates exclude Branson mann,m a sweetish, turpentine-flavored manna (q.v.).

The other species more or less resemble the foregoing in habit and uses. The most beautiful and ornamental is probably L. leptolepis, a native of Japan. It attains height of 70 and 80 feet and is remarkable for the brilliant autumn colors of its foliage. All the species except the Himalayan larch (L. griffithii), which seldom exceeds 40 feet in height, are hardy throughout the United States. The timber and ornamental is probably L. leptolepis, a native of the Pacific Coast region from Oregon northward, is considered the best yielded by coniferous trees. The tree is the largest of the genus, often reaching a height of 150 feet.

The only insect seriously harmful to the larch is a sawfly (Neumatus erichsonii), whose young hatch in early summer from eggs previously inserted into the young shoots, and immediately begin feeding upon the leaves. This pest is occasionally sufficiently numerous to defoliate large tracts of forest.

LARCH SAWFLY, insect pest (neu- matus erichsonii hartigii), whose larvae feed upon the foliage of larch trees. The pest exists in Canada, United States and England and is very destructive, entire forests being defoliated. The eggs, which are laid in the new growth of wood, hatch in June or July and the larvae usually feed until August.

LARCHEY, Etienne Lorédan, French author and antiquarian: b. Metz, 1831; d. Paris, 1902. He was educated at the Collège Saint Louis and the École des Chartes. He received an appointment at the Marais Library in 1852 and later became its librarian, leaving there in 1873 to become adjunct curator at the library of the arsenal where he was curator from 1880. He was noted for historical and linguistic research, and did much editing and miscellaneous writing. Author of "Un Mois à Constantinople" (1855); "Éccentricités du langage" (1860); "Origines de l'artillerie française" (1862); "Maitres bombardiers de Metz" (1860); "Petits documents pour servir à l'histoire de nos auteurs" (1860); "Mémorial illustré des deux sièges" (1871), etc.

LARCHMONT, or LARCHMONT MANOR, N. Y., village in Westchester County, on Long Island Sound, and 21 miles northeast of Grand Central Station on the New York, New Haven and Hartford Railroad. It is a growing suburb of New York; and is also a summer resort, with advantages in bathing and fishing. It was at one time the home of J. Fenimore Cooper, F.R.S. 2,000.

LARCOM, Lucy, American poet: b. Beverly, Mass., 1826; d. Boston, 17 April 1893. In her youth she was a factory girl in Lowell, Mass., and to the Lowell Offering, a magazine conducted by the operatives in the cotton-mills, made contributions which attracted the favorable notice of Whittier. She afterward compiled "Child-Life" and "Songs of Three Centuries." For three years she studied at Monticello Seminary (Godfrey, Ill.), for six years taught in Wheaton Seminary (Norton, Mass.). She was editor-in-chief of "Our Young Folks," a Boston magazine, later merged with Saint Nicholas, in 1865-74. She passed her later years at Beverly Farms, Mass. She edited several collections of verse, and published "Sheep in the Mist, and Other Stories" (1859); "Poems" (1868); "A Idol of April, a Story in Verse" (1875); "Childhood Songs" (1877); and "Wild Roses of Cape Ann, and Other Poems" (1880); "A New England Girlhood Outlined from Memory," an autobiograph (1889). Her collected critical works appeared in 1884. Her poems of New England life were especially effective, perhaps the best known being "Hannah, Binding Shoes." Consult Addison, "Life, Letters and Diary of Lucy Larcom." (Boston 1894).

LARD, the melted and strained fat of swine, which differs in its situation from that of almost every other quadruped, as it forms a thick, distinct and continuous layer between the flesh and the skin, somewhat like the blubber in whales. The greater part of the finer sorts of the lard of commerce is procured from the abdominal part of the animal. Lard is rather soft, white and readily fusible at 100° F. It consists of stearin, which is a solid, and olein, which is a liquid fat; but it usually contains small quantities of impurities, and it is to them probably that it owes its becoming occasionally rancid. Lard is much used for culinary purposes such as pastry making, for shortening and for frying, and as a base for various ointments. Stearin is used for candle-making, and olein is much used as a lubricant for machinery. Leaf lard is taken only from the fat surrounding the kidneys. Formerly lard was much adulterated but recent legislation has stopped this almost completely. Great quantities are exported annually from the United States. There are now in the market several substitutes for commercial lard.

LARDNER, Dionysius, Irish physicist: b. Dublin, 3 April 1793; d. Naples, 29 April 1859. He was graduated from Dublin University in 1817 and was made professor of astronomy and physics in the University of London in 1828. From 1840 to 1845 he lived in the United States, where he gave popular scientific lectures in many towns. He wrote several notable mathematical treatises; and edited, himself becoming one of the chief contributors, a "Cabinet Cyclopædia" (13 vols, 1829-49). Among his other writings are "Manual of Electricity," etc. (1841); "Treatise on Heat" (1844); "The
Steam Engine' (1852); 'Natural Philosophy and Astronomy' (1851–52).

LARDY, Charles (ÉDOUARD), Swiss lawyer and diplomat; b. Neuchâtel, 1847. He took his LL.D. at Heidelberg in 1867. He was appointed first secretary of the Swiss legation at Paris in 1869 and in 1883 he became Minister Plenipotentiary at the first Swiss member of the Permanent Arbitration Court at The Hague; was president of the Institut de Droit International in 1902; and has served as a delegate to various international conferences. He has written many legal articles and reports on trials of congresses, and translated into French Bluntschi's 'Codified International Law' (1870; 4th ed., 1886).

LAREDO, lär'dó, Tex., city, port of entry and county-seat of Webb County, on the Rio Grande opposite Nuevo Laredo, and on the Mexican National, the International and Great Northern, and the Rio Grande and Eagle Pass railroads, about 150 miles west of San Antonio. It is situated in an agricultural and stock-raising region and in the Rio Grande coal belt, with valuable iron ore deposits in the vicinity. Nuevo Laredo was settled by the Spaniards in 1767 and was incorporated in 1848. The Spaniards found here Indians who tilled the soil and built houses. The early missionaries established here a mission some years before a permanent settlement was made. The chief manufacturing establishments are extensive concentrating and sampling works, brick-yards, furniture factories, foundry and machine-shop products, sheet-metal works, broom and mattress factories, car and machine shops, brickworks, warehouse, pickle and cracker factories, a hide establishment, stock-yards, grain elevators and large coal yards. It is the trade centre for a large section of the southwestern part of Texas and has a large international trade. Its imports amount to over $2,500,000 annually and its exports to $14,000,000. It is connected with Nuevo Laredo, on the Mexican side of the Rio Grande, by bridges. Some of the prominent buildings are the courthouse, the jail, the Mexican National Hospital, the Mercy Hospital and the Catholic Convent. It is the seat of the Laredo Seminary, established in 1882, under the auspices of the Methodist Episcopal South Church, and the Ursuline Academy. The park of 65 acres is an attractive feature of the city.

Pop. 15,401.

LARES, Amador de, the contador or royal treasurer of the island of Cuba at the time when Velázquez was governor, that is, in the first quarter of the 16th century. He had, as he proudly boasts, previously spent 22 years in the wars of Italy. He is remembered for the aid he gave Hernán Cortés in securing and retaining the command of the expedition fitted out for the conquest of Mexico in 1518–19. He exerted his strong influence with the governor to secure the appointment of captain-general of the armada for Cortés. In this favor to Cortés, Lares was seconded by his own private secretary, Andrés de Urrutia, and it was the latter who warned Cortés, when Velázquez, suddenly changing his mind, was about to deprive the latter of the command of the expedition even before he had his vessels completely fitted out or had sailed from the island of Cuba. This warning permitted Cortés to sail suddenly before the notice of demotion from Velázquez could reach him. After the future conqueror had sailed away on his brilliant venture Lares remained his friend and helped to furnish him information that was invaluable to him. His name is, therefore, inseparably connected with that of Cortés and the conquest of the domains of the Aztecs.

LARES, plural of the Latin word lār, tutelary divinities of the Romans, originally either the spirits of ancestors who watched over the family of a descendant or, according to a perhaps more probable view, gods of the lands on which the man's house stood, and only later household gods. See LARIS.

LARGESS, or LARGESSE, term used in mediæval times by the minstrels, who as a reward for their services at the feasts of their lords used to cry "Largess!". The term was also used to designate fees paid to heralds for services on high occasions. While more or less archaic the word has still some place in the sense of a large gift, bounty, donation or present.

LARGILLIERE, lär' Jill-yār', Nicolas, French portrait painter: b. Paris, 20 Oct. 1656; d. there, 20 March 1746. He studied at Antwerp under Goubeau and at 18 went to England where for four years he worked under Lely. His work attracted the favor of Charles II, but the hatred engendered against Roman Catholics by the Rye House Plot and culminating in ordinances for their expulsion caused him to withdraw to Paris in 1678. There he made the acquaintance of Mme. Le Brun and of Van der Neulen, and he speedily gained recognition as a portrait painter. There remains some doubt as to the place where Largillière's portraits of James II, the queen and the Prince of Wales were painted, for while the painter was recalled to London after the accession of James II, his stay was brief and the birth of the prince was a later event, so that the portraits were probably painted in Paris. He became a member of the Academy in 1685; his diploma picture was the portrait of Le Brun now in the Louvre. He was made chancellor of the Academy in 1743. Among his sitters were the greatest celebrities of his day, Huet, bishop of Avranches, Cardinal de Noailles, President Lambert and his wife and daughter being among them. While he occasionally treated other subjects his fame rests upon his portraits of which he is said to have produced about 1,500, including those of both single sitters and large portrait groups. His work is well represented in the leading European portrait galleries and was widely circulated through engravings executed by Van Schuppen, Desplaces, Pitou and others.

LARGO, lär'gō, musical term from the Italian designating a slow tempō, largely used to indicate a slow, broad, solemn style. Handel often employs it, as in the 'Messiah' and 'Behold the Lamb of God.' Haydn used it in the introduction, the first chorus and in the introduction to the third part of the 'Creation.' Beethoven used it to convey only grandeur and deepest feeling. Style, not pace, is its dominating characteristic. The term 'largemente' indicates breadth of style without change of tempo.
LARKS

1 Wood-lark, Sky-lark and Crested Lark
2 Alanda callandra
3 Alanda yeltoniensis; A. sibirica; A. brachydactyla

4 Desert Larks
5 Horned Lark
LARGS, läręs', Scotland, seaside resort in Ayreshire County, on the Firth of Clyde, 43 miles southwest of Glasgow on the Glasgow and Southwestern Railroad. It has a superior beach, dry climate and excellent yachting facilities. Its historical remains include the Church of St. Michael, the gothic Church of St. Ninian, and the Church of St. Carll, a relic of the old parish church of Saint Columba, converted into a mausoleum in 1636 and a mound supposed to cover the remains of the Norwegians killed in the battle fought at Offa's Bridge between Norway and Alexander III in 1263. Pop. 3,724.

LARI, lä-rë, Italy, market town in the province of Pisa, 14 miles by rail southeast of Pisa and 14 miles northeast of Leghorn. It has hot springs and is situated in an agricultural district producing fruit, grain, wine and oil. Pop. about 2,000. Pop. of commune 12,268.

LARI, suborder of birds including the gulls and their allies. They are of large or medium size, with aquatic habits, and possess long, and, as a general thing, pointed wings in which there are 11 primaries, the last of which is extremely short. The three front toes are webbed, and the hind toe, not always present, is very short. The nostrils are slit-like and the birds have a split palate. Of the suborder the gulls, terns and skimmers have bills without a cere and the claws only slightly curved. The skua or jaegers have a bill with a cere almost half its length, and strong, curved, sharp claws. As a rule they make no nest or but a suggestion of one, and lay from one to four eggs. The young are covered with down when hatched, and while of somewhat independent habit are kept near the nest and fed by the parents. The plumage of the fully developed birds is thick and soft and of neutral tints. They are scattered over the world and include some 125 varieties.

LARIAT. See LASSO.

LARIIDÆ, the family of sea-going birds which includes the skuas (Stercorarina), gulls (Larinae), skimmers (Rynchopina) and terns (Stermita), but some naturalists regard the skuas and skimmers as of family rank. They are practically cosmopolitan, although the great majority is distributed in the temperate zones.

LARIOSAURUS, lär-ë-sär-ë-sör-üs, a genus of fossil reptiles, of the family Notosauroidea, allied to the pleosaurias, which were lizard-like in shape, rarely a yard long and had heads of moderate size with numerous prehensile teeth. Nearly complete skeletons of L. baltsami are obtained from the black Triassic shales near Lake Como and from the German Muschelkalk.

LARISSA, lär-ë-sä, Greece, city and capital of a nomarchy or province in Thessaly, on the Salamvria River, 35 miles northwest of the port of Volo, with which it is connected by railway. Situated in a rich agricultural district, it is now the largest, richest and most populous city in Thessaly, is the seat of a Greek archbishopric, and has tobacco, cotton, leather and silk industries. For centuries under the rule of the Turk, it was ceded to Greece in 1881, since which time the large Mohammedan population then residing there has greatly decreased. It was the headquarters of the Greek army mobilization in the Balkan War of 1913. Pop. about 18,000.

LARIVEY, lär-vë, Pierre de, French dramatist: b. Troyes about 1550; d. 1612. He came from a famous Italian family of printers, and is said to have cast horoscopes and been clerk at the church of Saint Biienne where he afterward became a canon. While not the pioneer of French comedy he was the first to make use of ordinary natural dialogue on the stage. His dramas were chiefly adaptations from the Italian, and of the 12 he wrote nine were printed as 'Comédié facétieuses' (Vol. I, 1579; Vol. II, 1711). Vaut de gents properly was never popular until Molière's time it is generally admitted that both Molière and Regnard were signally influenced by the work of Larivey. He was also a translator of catholic taste, his subjects ranging from Straparola's 'Facetieuses nuits' (1572) to Ariosto's 'Humainité de Jésus-Christ' (1604). His plays were reprinted in Jannet's 'L'Ancien Théâtre français' (Vols. V-VII, 1879).

LARK, a bird of the family Alaudidae. Larks are small, ground-keeping birds, with smallawl-like beaks, the long tarsi scutellated posteriorly, and the claw of the hind toe usually greatly lengthened; the wings are in length, but are usually short, as also is the tail. The normal coloration is light brown with darker longitudinal streaks, the under parts being whitish and the breast usually spotted. There is frequently a crest or decided blackish marks about the head, while the desert forms are, as usual, pale and ornamented. Larks dwell in open grassy places, making their nests on the ground or among rocks, sometimes elaborately, and laying spotted eggs; they are sociable, but hardly gregarious. Some frequently perch on trees, and most of them soar while singing, as is well known of the sky-lark (q.v.), and the song of many resembles that of this renowned musician. It is a physiological peculiarity of the family that larks molt only once a year. The food consists of insects and their larvae, worms, small seeds, buds, berries, etc. The flesh of all is considered a dainty, and great numbers are caught annually on both sides of the Mediterranean to be sold in the markets. The family includes about 100 species, divided among about 50 genera of which only one, Otocorys, with probably but a single species (the horned lark, q.v.) is found in America, and only a single species occurs in Australia. The remainder of the family belongs to Europe, Asia and Africa, where familiar types are the sky-lark and wood-lark (q.v.).

The name is also given to many more or less similar birds of other families, as to several of the pipits and Old World warblers, while the meadow-lark (q.v.) of the United States is a starling.

LARK-BUNTING, a fringilline bird of the western plains of the United States, the male of which is in summer a glossy black, except a conspicuous white patch on the wings and the female brown-streaked. The habits of the pair are terrestrial, and the male soars in singing after the manner of the sky-lark and with some similarity in notes. A very different bird, one of the smaller plains sparrows (Chondestes grammacus), is known as the lark-finch.

LARK FINCH, or LARK SPARROW (Chondestes grammacus), small grayish-brown
sparrow of the Mississippi Valley region, called
lark finch because of its thick, finch-like bill.
Its head is marked with black and white streaks
and a chestnut patch. It nests in bushes or trees and feeds on grasshoppers, locusts and
weevils and the seeds of weeds and grass.
The song is long and varied, with a purring
phrase and is very pleasant.

Larkin, James, Irish labor leader. He
organized the Irish Transport and General
Workers Union, under central leadership all Irish labor. He
was prominent in several strikes, most notably in
that of the Irish Transport Workers' Union
beginning 26 Aug. 1913. The strike was
attacked by sabotage and violence and engendered severe suffering among the strikers be-
cause of inadequate funds and its continuation
into the winter. Larkin was tried and sen-
tenced to seven months' imprisonment for
sedition, but was released on bail and found
his popularity increased by the experience.
He edited the Irish Worker, and in 1912 was
elected to the Dublin corporation. He possesses
a large following, 'Larkinism' in Ireland being
similar to the I. W. W. in America.

Larksprurs, a genus (Delphinium) of annual
and perennial herbs of the family Ranunculaceae, characterized by palmately lobed
or divided leaves and showy racemes or panicles
of large irregular flowers. Many of the species,
of which there are about 60 in the north tem-
perate zone, are cultivated for ornament, and
have developed numerous improved varieties,
some of which are double-flowered. The most
popular annual species is D. ajicis, which attains
a height of about 18 inches and bears
showy blue, pink or violet, sometimes white,
flowers throughout the summer. Of the per-
ennial species, D. barbeyanum, D. grandiflorum
and D. hybriatum are most popular in America,
and have yielded the largest number of horti-
cultural varieties. They are all natives of Asia,
become two to four feet tall, blossom dur-
ing most of the summer and are noted for their beautiful
tints of blue, their hardness and ease of cul-
tivation. If cut down immediately after flower-
ing they often blossom a second time before
frost. Among the best-known American species are
D. simpleum, D. scopolorum and D. nudicaule,
which range from the Pacific coast to the plains region; and D. exaltatum, D. tri-
corne and D. carolinianum, found most com-
monly east of the Mississippi. The larksprurs
thrive best in rich, deep, sandy loam well
exposed to the sun. The annuals are propagated
from seed, as are many of the perennials, which
are also increased by cuttings taken in early
spring or from second growth in summer.
Established clumps may be divided in fall or
spring. Since the seeds are very slow in germinating they are usually sown in autumn
out of doors or in early winter in a green-
house.

Larksville, Pa., borough in Luzerne
County, three miles northwest of Wilkesbarre,
on the Susquehanna River. It has a growing
population and its chief industry is coal mining.
Pop. 9,289.

Larmie, William, Irish poet: b. Wex-
ford, 1849; d. Bray, 19 Jan. 1900. He
spent most of his life in the civil service, ill-
health compelling his retirement a few years
before his death. He was identified with the
Irish Literary Revival and was strongly in-
fluenced by the Gaelic legends. His dramatic
poem 'Moynuad' ranks among his best work.
He published several books of 'Irish Folk
Tales' (1893) and was author of 'Glaubria
and Other Poems' (1889); 'Fand and Other
Poems' (1892). A selection of his verse is
given in Brooke and Rolleston's 'Treasury of
Irish Verse,' accompanied by an appreciation
by George Moore of 'A Nation under central
control.'

Larmor, Sir Joseph, British physicist:
b. Magherall, County Antrim, Ireland, 11 July
1857. He was educated at Queen's College,
Belfast, and Saint John's College, Cambridge.
He was professor of natural philosophy at
Queen's College, Galway, and at the Queen's
University in Ireland in 1890-85; examiner in
mathematics and natural philosophy in the Uni-
versity of London, and lecturer in mathematics
at Cambridge University in 1885-1903. He was
Knighted in 1909 and since 1911 has served as
member of Parliament from Cambridge Univer-
sity. He is a member and officer of many
scientific societies, and in 1915 received the
Royal Society's Royal Medal. He has pub-
lished numerous articles on mathematics and
physics, and is author of 'Ether and Matter'
(1900).

Larnaca, or Larnaka, or Lar-
inca, Cyprus, city at the head of a bay on
the south coast, 23 miles southeast from Nico-
sia. It is the chief seaport of the island and
is built on the site of the ancient Citium. It
has Phoenician inscriptions, Mycenaean tombs
and other antiquities, but the ancient citadel
was leveled in 1879. It has an iron pier 450
feet long and the harbor affords anchorage
waters from 16 to 70 feet deep. Exports, grain,
fruit, raisins and gypsum. Pop. 8,681.

Larnaudiean Epoch, period at the
close of the Bronze Age in European prehis-
toric archeology. It was named from the
Larnaud station situated in the Jur Mountains.

Larne, Ireland, seaport city of County
Antrim, on Lough Lorne, an inlet of the North
Channel, 18 miles north of Belfast, on the Bel-
fast and Northern Counties Railway. Larne's
situation, 39 miles from the Scottish coast,
makes it a base of the shortest passage from
Ireland to Great Britain, and there is a daily
mail service. It is a market town and seaside
resort, ships iron ore and there are a bleach-
ing establishment, flour mills and a weaving
factory. Pop. 8,036.

Larned, JosNu Els, American
author and librarian: b. Chatham, Ontario,
Canada, 11 May 1836; d. 1913. He was a member
of the editorial staff of the Buffalo Express
1859-69, and editor, 1869-72; he was then super-
intendent of public education in Buffalo for
a year, and in 1877 became librarian of the Buf-
falo Library, a position which he held for 20
years. He was president of the American Li-
brary Association in 1893-94. He edited and
published (1902) 'The Literature of American
History,' a bibliography, in which the 'scope
and comparative worth' of each book is indi-
cated in short annotations by historical students.
His other works include 'Talks about Labor'
(1877); 'History for Ready Reference' (7
vols., 1895-1910; rev. ed., 1913); ‘Talk about Books’ (1897); ‘History of England for Schools’ (1900); ‘A Multitude of Counselors’ (1901), and ‘Primer of Right and Wrong’ (1902). He was ‘Director of the United States for Secondary Schools’ (1903); ‘Seventy Centuries: A Survey’ (1905); ‘Books, Culture and Character’ (1906); ‘A Study of Greatness in Men’ (1911); ‘A History of Buffalo’ (1911).

LARNED, Kan., city and county-seat of Pawnee County, at the junction of the Arkansas and the Kansas, in Kansas, U.S.A., in 240 miles from Topeka. It is on the Missouri Pacific and the Atchison, Topeka and Santa Fe railroads, and is the shipping centre of a large farming and stock-raising country. It has flour mills, foundries, an ice factory, grain elevators, machine shops and other industries and has electric light and waterworks. The State hospital for the insane is located here. It contains also the Larned Sanitarium, a hospital, city library and old Fort Larned Military Reservation and fort. The city is governed by a mayor and council elected every two years. Pop. 2,511.

LAROMIGUIERÉ, lárö-më-gyär’, Pierre, French philosopher: b. Livignac, 3 Nov. 1756; d. Paris, 12 Aug. 1837. He studied under Condillac, and became professor of philosophy at Toulouse, but being censured by Parliament, for his publication of a treatise on taxation he went to Paris, where he was favorably received. He was appointed professor of logic in the École Normale and lecturer at the Prynée, and in 1811 professor of the faculty of letters in the University of Paris. He was a member of the Tribunate in 1799. In 1833 he was elected a member of the Academy of Moral and Political Sciences. His theories as a philosopher led him to distinguish clearly between the psychologic phenomena which may be traced to physical causes and the action of the soul itself, and he developed the theory of attention beyond even his master, Condillac, and other who influenced his views, Destutt de Tracy and Cabanis among them. He maintained that the soul is independent of the body and therefore immortal. While not distinctively an originator, but rather a developer of philosophic theory, he possessed a faculty for clear and accurate statement so that his work crystallizes not only the results of his own observations but those of others who influenced his thought. Author of ‘Projet d’éléments de metaphysique’ (1793); ‘Les Paradoxes de Condillac’ (1805); ‘Leçons de philosophie’ (1815-18).

LAROUSSE, Pierre, pé-rå lär-oo, French lexicographer and encyclopaedist: b. Toucy, Yonne, 23 Oct. 1817; d. Paris, 3 Jan. 1875. He was the son of village blacksmith. For several years he compiled educational textbooks. In 1865 appeared the first volume of his great ‘Lexique de l’information, anti-clerical et satirique, Grande Dictionnaire Universel du XIX Siècle.’ It was in 15 volumes, and 1875; and was followed by an ‘Encyclopédie du XVIII Siècle.’ He published also small condensed editions of the large works and admirable supplementary publications are regularly issued. Larousse’s aim was to be entertaining and bright in his articles rather than scholarly, critical and exact, and the fruits of his enormous labors have been a very present help in time of need to successive generations of journalists. His native town raised a statue to him in 1894.

LARRA, Luis Mariano de, Spanish writer, son of Mariano José de Larra (q.v.): b. Madrid, 17 Dec. 1830. On graduation in arts he entered journalism and became editor, finally, of the Gaceta de Madrid (1856-66). He filled many public offices and was decorated by several of the governments of Europe for brilliant literary work and advocacy of governmental and other reforms. He was for a number of years director of the Boletín Oficial of the Department of Formento. He was the author of a vast quantity of poetry, short stories and critical articles which appeared in almost every newspaper of note in Spain. Among his formal published works are ‘Tres Noches de amor y celos,’ ‘La gota de tinta,’ ‘La última sorrisa’ (novels); ‘El Amor de la moda,’ ‘Juicios de Dios,’ ‘La flor del valle,’ ‘Batalla de reinas,’ ‘El amor y le interés,’ ‘El rey del mundo,’ ‘La oración de la tarde,’ ‘Flores y perlas,’ ‘Oros, copas, espadas y hastos,’ ‘Las corazonas de oro,’ ‘Un buen hombre,’ ‘La viuda de Lopez,’ and ‘Julia’ (dramas); ‘Las hijas de Eva,’ ‘La conquista de Madrid,’ ‘Cadenas de oro,’ ‘La insula Barataria,’ ‘Los infernos de Madrid,’ ‘Los hijos de la costa,’ ‘El atrevido en la Corte,’ ‘Sueños de oro,’ ‘Lan vuelta al mundo,’ ‘Chorizos y polacos,’ ‘Las campanas de Carion,’ ‘La guerra santa,’ ‘Los hijos de Madrid,’ ‘Bocaccio,’ ‘El Guerrilero,’ ‘El Estudiante’ (Zarzuelas). The work of Larra is generally interesting, and brilliant in spots; but he wrote too rapidly to produce much of the highest order. His dramas and zarzuelas have been long very popular in Spain and in the Latin-American countries where they have been presented by the best companies. Among the noted musicians who have furnished the music for his zarzuelas are Gazambide, Arrieta, Rogel, Marqués, Caballero and Barbieri.

LARRA, Mariano José de, Spanish author: b. Madrid, 24 March 1809; d. 13 Feb. 1837. Educated partially in Paris, he early displayed a tendency to compose in both languages and an inordinate love of study. At the age of 13 he had translated from French into Spanish the whole of Homer’s ‘Iliad’ and had written a grammar of the Spanish language. After this he continued his education in Madrid where he studied literature, mathematics, ancient and modern languages and medicine. Dropping the latter in his third year, he began the study of law at the University of Valladolid which he soon abandoned. He finally drifted into journalism and literature and became very active in politics. He wrote under a number of noms de plume, one of which, ‘Figaro,’ he soon made famous. His first popular literary production was a weekly publication entitled ‘Pobrecito Hablador,’ in which he burlesqued very cleverly the so-called bad habits and customs of the Madrid of his day. On the arrival of a more liberal policy toward the press on the death of Ferdinand VII (20 Sept. 1833), he took a very active part in politics in which he soon became a noted journalistic contender, satirizing with great cleverness the follies and absurdities of his time. Witty in the extreme, he
never descended to the bitterness of the political, party and personal vituperation of the writers of his day. All the world laughed with him and appreciated the truth of the pictures he painted and the humor of the situations, characters and incidents he depicted, in the best, most fluent and most happy of language which was in general devoid of partisanship and inspired with a spirit of fairness. This fairness of mind and breadth of view increased his popularity and extended the field of his readers. He also acquired a reputation as literary and dramatic critic inferior to that of no other contemporary writer in Spain. At the height of his fame he visited England, France and Portugal and everywhere he was received as a personage of the highest distinction (1835). The following year he visited Belgium and Germany, during which he was elected, in his absence, diputado to the Cortes.

Larra’s family relations were unhappy, probably on account of his own lack of domestic qualities; and these were intensified by his relations for several years with a married woman with whom he appears to have been infatuated. Jealousy made his life miserable both at home and in his irregular marital relations, the latter of which becoming unbearable to the woman in the case, she turned her back on the poet; and Larra, in desperation, took his own life. So great was his popularity that all Madrid turned out to his funeral. Among Larra’s published works are ‘El dogma de los hombres libres’ (translation); the following dramas, translated or adapted, ‘Julia’; ‘Una imprudencia’; ‘Don Juan de Austria’; ‘Felipe’; ‘Roberto Dillon’; ‘Siempre’; ‘Tu amor o la muerte’; ‘Partirá tiempo’; ‘Un desafío’; ‘Un rapto’ (operetta); ‘El retrato de Shakespeare,’ his original drama, ‘El conde de Fernan González,’ met with some success. A complete edition of Larra’s works was published by Montaner and Simon, Barcelona.

**LARRABEE, lär’r-a-bē, William Clark,** American Methodist Episcopal clergyman and educator: b. Cape Elizabeth, Me., 1802; d. 1859. He was principal of Methodist academies at Cazenovia, N.Y. (1831–35), and Kent’s Hill, Me. (1835–37); was a member of the Maine Geological Survey. In 1840 he was appointed professor of mathematics and natural science in Indiana Asbury (now De Pauw) University, and in 1852–54 and 1856 was superintendent of public instruction in Indiana. He worked efficiently toward the improvement of educational methods in his denomination. Among the works published by him are ‘Scientific Evidences of Natural and Revealed Religion’ (1850); ‘Wesley and his Co-laborers’ (1851); ‘Asbury and his Co-laborers’ (1853); and ‘Rosabower’ (1854), a collection of articles written for the Ladies’ Repository.

**LARRAMENDI, lär’rá-mén’dē, Manuel de,** Spanish Jesuit scholar: b. Audoain, about 1690; d. Loyola, about 1750. He was educated at Bilbao and was professor of theology at Valencia, Valladolid and Salamanca. After serving for some time as minister in the household of the queen dowager, Maria Anna, he, in 1733, retired and devoted himself to study and writing. Author of ‘De la antigüedad y universalidad del vascuence en España’ (1728); ‘El impossible vencido; arte de la lengua vascongada’ (1729); ‘Discurso histórico sobre la antigua y hervosa cantabria’ (1736); ‘Diccionario trilingüe, castellano, vascuso y latino’ (1745).

**LARREY, lär’r-e, Dominique Jean, Baron,** French military surgeon: b. Baudéan, near Bagneres-de-Bigorre, July 1770; d. Lyons, 1842. He studied medicine at the hospitals Hôtel Dieu and Hôtel des Invalides, and visited America before entering the French army in 1793 as surgeon in the German and Spanish campaigns. He was with Napoleon in Italy and again in Egypt, was created a baron and pensioned in 1810. He continued in service and in 1842 was inspector of military hospitals in Algeria. Larrey originated the *ambulance volante* and was noted for his humanity as well as possessing a high scientific reputation. He became known as ‘la Providence du Soldat.’ Author of ‘Mémoires chirurgicale militaire et campagnes’ (4 vols., 1812–17); ‘Relation des voyages et des campagnes de 1815 à 1840’ (1840); ‘Clinique chirurgicale’ (5 vols., 1830–36); ‘Recueil de mémoires de chirurgie’ (1821), etc. He was also author of many important scientific papers.

**LARS, lärz,** Roman tutelary deities. Lars is an Anglicized plural, derived from the Latin Lar, singular of *Lares* (pron. la-rāz). Lares occurs on old Italian monuments beside Lares, an older form of the same word. Attempts have been made to identify Lares or its singular Lar with an Etruscan word, Lar, Earth, Larthi or Larthi, common on sepulchral inscriptions, equivalent to the English lord or lady, king or hero; and possibly akin to another Tyrrhenian word Laran, name of the Etruscan god of war. But this attempt has not met with general favor. In Döllinger’s opinion the Lars were deified ancestors, or souls of men, personifying the vital powers, and so assure the duration of a family, over whom their protection was supposed to extend. Wissowa, on the contrary, holds the Lars to have been originally the gods of lots of arable land, above which rose shrines at those spots (comitia) where the paths bounding such lands met those of another’s holding. Wissowa rejects therefore the older idea of deified progenitors. Holding, as he does, that the Lars were originally gods of the cultivated fields, thence he derived them, granting that from such agrarian status they later appeared within the Roman home.

Some, looking upon the Lars as earthy beings, discern a distinction thus between them and the Manes on one hand, and between them and the Penates on another. Such as perceive this distinction regard the Manes as infernal spirits; and say the Romans regarded the Penates as heavenly. Yet all authorities agree that Manes, Penates and Lars were regarded as guardian spirits by those who worshipped them.

From very early times a distinction existed between private and public Lars. The Lars domestici (private Lares of the home) were worshipped by the Roman household, and by the family alone. One of those household gods, the Lars familiares, who accompanied the family whenever the residence was changed, was conceived of as the very centre of the household cultus. One view regards the Lars do-
mestic as souls of virtuous ancestors, who (according to the Roman idea) were set free from the realm of shadows by Acheronic rites; exalted into deities; which thereupon became protectors over their progeny, as household gods.

The Lars publici (public lars), enjoyed a wider sphere worship, and received particular names from the place over which their influence was supposed by the Romans to extend. Among these may be mentioned (1) Lars compitales, originally two in number, the mythic sons of the street roads and the guardian spirits of the cross-roads, where their shrines were erected, and in whose honor an annual festival, the Compitalia or the Laralia was held, the celebration itself falling in the month of December, a short time after the observance of the Saturnalia. It was not alone the cross-roads, but also the whole neighboring district, town and country, which felt and acknowledged the divinity and the power of the Lars compitales of their respective localities. (2) Lars rustici or rural; (3) Lars praestites originally tutelaries of the public common; finally guardians of the state. On the Via Sacra near the Palatine Hill, they had a temple and an altar. On coins they appear as the figure of a young man, wearing a chlamys, holding a spear, seated with a dog, symbol of vigilance. (4) Lars viales, of the roads, protecting genii of travelers. (5) Lars permarini, of the sea. (6) Lars rustici, of the country. (7) Lars hostilii, who guarded the state from enemies. The Lars grundleus, too, should not be omitted. Their worship was connected with that of the white Sow of Alba Longa and its 30 young. Opposed to the Lars, who were peaceful, happy spirits of the dead, were the Larvae, bearing a name whichin its connection with the Latin word Lar just as the parallel word form arvum or arvini, or arma, betrays its affinity with the Latin word arare. These Larvae, unlike the Lars, were uncanny and disquieting apparitions, as were likewise those ghost-like spectres, which the Roman knew as Lemures.

The Lars were worshipped daily in the Roman home, particular honors being paid them on the Kalends, the Nones and the Ides, of the Roman month. Originally each household had only a single Lar; and the shrines, a small domestic chapel, sheltering an image of the good spirit, was kept in each home. The Roman gave this shrine the name of Ædicula or Lararium. The image of the god was sometimes of stone, wood, of metal, in the last case, sometimes even of silver.

In early times the Lar stood in the Atrium; but later, when the family hearth was removed, it was placed elsewhere in the Roman home. At home a Roman felt himself surrounded by invisible friends and guardians, and these sentiments found expression in festive gatherings, at which the Lararium was thrown wide open, and the exposed Lar garlanded about with flowers. Every morning a prayer was made to the Lar, and his image washed with water, and of drink were set before him. Then a part of the offering was placed on the hearth and finally taken up and shaken into the flames. Whenever a son of the family assumed the toga virilis; whenever the birthday of the head of the family recurred; whenever a new bride entered into the family circle; or whenever the festival of the Caristia in memory of the deceased was celebrated, on these and on the occasion of every other event of importance to a Roman family, special offering and sacrifice were made to the Lar. He (for, as the Romans conceived this ideal domestic god, personified and its hold upon the Roman soul appears to have been such, that long after the invention of Christianity we hear of a Roman emperor, Alexander Severus, who numbered among his household gods, besides images of Alexander of Macedon, and Abraham, a figure, even the Lar of Jesus Christ. The Lar was represented variously. Sometimes as a youth, his head covered by a hat, with a traveler’s staff in one hand, and accompanied by a dog. Again, we find the Lar figured as a young man, with a girt tunic (symbolic of readiness to serve); he holds a rhyton (drinking horn) in one hand and carries a patena (cupid) in the other. Witness to domestic happiness or misfortune, the Lar hallowed every domestic occurrence; his presence rendering every Roman home, as it were, a sacred temple. “No other nation,” remarks one student of comparative religion, “except the Chinese, have carried the religion of the home so far as have the Romans in their worship of the Lar.”

LARSSON, lär'sən, Carl Olaf, Swedish painter: b. Stockholm, 28 May 1853. He studied in Stockholm and in Paris. After some ambitious early attempts he engaged in illustrating, gaining for himself the title of “Swedish Dore.” He then took up water-color painting and in the spring of 1883 he exhibited at the Paris Salon two water-colors which won a medal. He was from the first especially happy in his handling of colors, his work being spirited and vigorous and full of gaiety and charm. While he is credited with a French vivacity, the Scandinavian point of view is clearly expressed. He excels in outdoor subjects and in pictures of home life. He has also distinguished himself as a mural painter as well as in the field of water-color and oil painting. He is an earnest advocate of maintaining the national type of dress and coloring, pleading for the so-called “gaudy peasant colors that are needed contrasts to the ice and snow” of his native land. He executed the illustrations for Rydberg’s “Singoala” and the mural paintings in the Füstenberg Gallery and the National Museum, Stockholm.

LARVA, the young of an animal, when it differs from its parents in form and manner of life. In most invertebrates and in some of the lower vertebrates, the animal hatched from the egg is so different from the adult that in many cases the relationship was long unsuspected by naturalists, and the old fossil names were given as separate beings,—zota, nauplius, etc., now applied to the forms of larva they represent. These larvæ may grow by imperceptible degrees into the stature and likeness of the adult; or they may pass by comparatively sudden changes through a series of more or less
different forms, until finally the adult form is reached and retained. In the latter case the development is said to be by metamorphosis (q.v.), most completely and familiarly manifested by insects. Whatever the method, the course of larval growth in its successive stages recalls the phylogeny of its race—that is, the course of its evolution in history. Thus each of the various phases of the larval life of any of the lower animals, like the fetal life of embryos of the higher ranks, indicates probable ancestral forms. Some of the most remarkable larvae may be mentioned. Among the marine annelids a larva known as the trochophere or trochosphere (Fig. 1) is common. It has a short compact body, traversed by the alimentary canal, and has one or more bands of cilia around the body and a sensory patch at the top of the head. By feeding, this larva grows, the increase being chiefly in length, and with this increase, the joining or metamorphosis of the body, so noticeable in the adult, appears. Other worms have different types of larvae, among them the plidium of the nemertines (Fig. 2), shaped somewhat like a chapeau with enormous ear lappets. Between these is the mouth which leads to a large blind sac, the stomach of the worm. The worm itself develops inside the plidium and later escapes from it to continue its existence, leaving the rest to die.

Among the mollusks larvae like the trochophere occur, and it is the existence of these larvae which leads naturalists to think that annelids and mollusks, so different in the adult, had a common ancestry. Later, with the appearance of molluscan characters, a larva known as the veliger may appear. This is characterized by a large disk on the top of the head, which serves for a time as a swimming organ and is later lost.

All of the lower and some of the higher crustacea pass through a so-called nauplius stage (Fig. 3). The adult crustacean consists of several segments, but the nauplius is without joints, has a single eye, a straight alimentary canal, the mouth being overhung by an enormous upper lip, and three pairs of appendages, which later became changed into the two pairs of antennae and the mandibles of the adult. The first pair of the nauplius appendages are simple and apparently are only sensory, while the two remaining pairs are two-branched, and serve as swimming organs, the basal portions being also used as jaws to force food into the mouth which lies between them. In the higher crustacea two other and better developed larvae known as the zoea and megalops may appear.

Possibly the most remarkable larvae occur among the echinoderms. These forms, exemplified by the starfish and sea-urchin, are noticeable for their radial symmetry, but in the larva, of which there are several distinct types, not a trace of a radial arrangement of parts can be found. They are rather markedly bilaterally symmetrical, with well-marked dorsal and ventral surfaces, which, however, do not correspond with the upper and lower surfaces of the adult. Some of these larvae are more or less barrel-shaped, but in others, as in the pluteus (Fig. 4) and bipinnaria (Fig. 5), the body is drawn out into a number of processes, soft and flexible in the latter, but stiffened in the pluteus by internal calcareous rods. The starfish or sea-urchin later arises on one
Certain larvae enter extensively into the food-supply of many mammals, and are even eaten, or become otherwise useful to man. Some are artificially cultivated for his service, the silk-worms, for an example.

Among vertebrates larvae are rare, and appear only in the lower forms, those of the lamprey (Amphioxus), of eels (Leptorhina), of certain salamanders (axolotl), and of frogs (tadpoles), being the most noticeable.

LARVAE, also LEMURE, in Roman mythology ghosts conceived as the souls of the dead revisiting earth at night with harmful intent. They were exorcised by the head of the household in a ceremonial ritual held at midnight 9, 11 and 13 May, which comprised a festival called *lemuralia* or *lemuria,* and at which games were played with other suitable observations. Later the term came to mean supernatural monsters or goblins and sometimes the souls of criminals.

LARYNGISMUS (lär-in-jis-mus) STRIDULUS. Laryngismus is spasm of the glottis, causing contraction or closure of the opening; laryngismus stridulus (also called Kopp's asthma, Miller's asthma, etc.), is spasm of the glottis usually associated with some disease, especially with the common ailment of children known as rickets.

LARYNGITIS, lär-in-jî’tis. See Nose and Throat, Diseases of.

LARYNGOSCOPE, lär-ing’go-skóp, an instrument used for examining the larynx. It consists of a little plane mirror attached to a stem, about four inches long, at an angle of 120 degrees or more. This mirror is introduced into the mouth of the person to be examined, and held near the back of the throat, while a strong light is thrown upon it from a reflector worn upon the forehead, or held between the teeth of the examiner. In the strong light of the sun, or of an arcane burner, the light thrown from the reflector is concentrated upon the laryngeal mirror, which lights up the parts to be examined, while it at the same time reflects the images of these parts into the eye of the examiner. In this way the mechanism of the human voice may be studied, and what is of considerable importance, disease if present can be readily detected, and the fitting remedy applied. The chief merit of introducing this instrument in a very complete form into medical practice must be assigned to Drs. Turck of Vienna and Czernak of Prague, although Garcia, Liston, Babington, Avery and others used a reflecting mirror to explore the recesses of the throat. It was not until the two German physiologists took up the subject in 1857 that the benefits arising from its use were fully recognized. A somewhat similar arrangement is used in examining the posterior nasal cavities, a smaller mirror is used with its face turned upward.

LARYNGOTOMY, lär-ing-göt’o-mî. See Bronchotomy.

LARYNX, the collection of structures by which the voice is partially produced, situated at the upper part of the trachea. It is formed mainly by two pieces of cartilage, the thyroid above and the cricoid, which is situated below. The thyroid is formed of two extended wings like plates meeting at the
middle line in front and making a prominence known as Adam’s apple; above and from the sides two horns project upward, and are connected by bands to the hyoid bone, from which the larynx is suspended. The thyroid cartilage rests and is movable upon the cricoid, moving backward or forward, but not from side to side. The cricoid cartilage is shaped like a signet-ring (Greek kríkos, a ring), the narrow part of the ring being in front. The cricoid carries, perched on its upper edge behind, the arytenoid cartilages, which are of great importance in the production of the voice. These various cartilages form a framework upon which muscles and mucous membranes are disposed. The mucous membrane which lines the larynx is thrown into various folds. These folds about 15 mm. long in man and 11 mm. in woman are called the true vocal cords, and by their movements the voice is produced. Projecting toward the middle they form a chink, which is called the glottis. By the contraction of various muscles this chink can be so brought together that the air forced through it throw the edges of the membrane into vibration and so produce sounds. Variations in the form of the chink will effect changes in the sound. Thus the production of voice is the same as in musical instruments, the arrangement of the many complicated muscles in the larynx being such as to produce (1) the vibratory sounds, (2) to regulate the sound, (3) to vary the pitch, and (4) to determine the quality of the sound. While the voice is produced in the larynx, it is modified by the rest of the respiratory passages. (See Voice). In the act of swallowing, the glottis is covered by a cartilaginous plate called the epiglottis. In the accompanying cut, Fig. 1, shows c, the larynx internally, a being the epiglottis situated above the glottis or entrance to the larynx, a a the trachea, and v the osophagus or gullet. In Fig. 2, t is the trachea, b the hyoid bone, v w the thyro-hyoid membrane, o the thryco-hyoid ligament, c the thyroid cartilage, b the cricoid cartilage, p the cricothyroid ligament. See Nose and Throat.

LAS CASAS. See CASAS, BARTOLOMÉ DE LAS.

LAS CASES, Emmanuel Augustin Dieudonné Marin Joseph, MARQUIS, em-mán-o-él dé-o-dón-né ma-rén-de-doon-mós, French historian, one of the companions of Napoleon at Saint Helena: b. Chateau Las Cases, near Revel, 1766; d. Passy-sur-Seine, 15 May 1842. He was educated at the school of the Oratorians in Vendôme, and at the military and naval schools of Paris, and when the Revolution broke out took part with the Royalists. After the defeat of the Prussians in Champagne he fled to London, where he lived as a teacher. While here he executed his ‘Atlas historique et géographique’ (1802), which he published under the name of Le Sage. When the émigrés were recalled by Napoleon, Las Cases returned to Paris. Having entered the army of Bernadotte (1807) he gained the favor of Napoleon, who in 1810 made him chamberlain and count of the empire. After the disasters of Leipzig and Moscow, Las Cases commanded the 10th legion of the National Guard. In 1814 he refused to assent to the request for Napoleon’s abdication, and went to England, whence he subsequently sent in his adhesion to the Bourbons. After the return from Elba he went back to France, and after the final defeat of the emperor at Waterloo followed him to Saint Helena. Here with his brother he devoted himself to the care of Napoleon, and passed his evenings in recording the emperor’s remarks, which were subsequently published in his ‘Mémorial de Sainte Hélène’ (1822–23). Having written a letter to Lucien Bonaparte commenting freely on the treatment which Napoleon was subjected, he was arrested, 25 Nov. 1816, sent to the Cape of Good Hope, presently taken to England, thence conveyed to the Continent and to Frankfort-on-the-Main, where he at last received his liberty after 13 months’ captivity. He was not allowed to return to France until the death of Napoleon. In the reign of Louis Philippe he was elected in 1831 and 1839 to the Chamber of Deputies, taking his seat at the extreme left, or, with the ultra-opposition. He wrote, in addition to the works above mentioned, his own life, ‘Mémoires d’E. A. D., Comte de Las Cases’ (1818).

LAS CRUCES, lās kroo’sēs, N. Mex., village and county-seat of Dona Ana County, near El Paso, Tex., on the Atchison, Topeka and Santa Fe Railroad. It is situated in a fruit-growing and agricultural region and has important mining industries in silver, copper, lead and zinc. The State College of Agriculture and Mechanic’s Art is located here and the town owns its waterworks. Pop. 3,386.

LAS PALMAS, lās pāl’mas, Canarias, the chief town of Grand Canary Island and capital of the archipelago, the third port of Spain and first in point of tonnage, is situated in the northeast of the island, 52 miles from Tenerife and 228 from Madeira. It is an attractive place, beautifully situated in a fertile valley and contains a fine town-hall and a museum richer in aboriginal remains than any other in the world. Besides the cathedral of Saint Cristóbal it has a number of quaint churches; in the church of San Antonio Abad, but in an earlier building, Columbus attended Mass before setting out for the discovery of America in 1492. The city has been the seat of a bishopric since 1435. The principal industries are fishing, shi and sugar are among the exports. Steamer services are maintained with the principal European ports, and with the West Coast of Africa, the Cape, Australia, and New Zealand and America. Pop. 62,886.
LAS VEGAS, lās vä'gəs, N. Mex., city and county-seat of San Miguel County, on the Gallinas River, a branch of the Pecos, and on the Atchison, Topeka and Santa Fe Railroad, 83 miles east of Santa Fe. There are here practically two towns, the old Mexican settlement, which is the county-seat, and the modern city lying to the east, first known as East Las Vegas, but incorporated in 1888 and chartered in 1893 as the city of Las Vegas. The New Mexico Normal University and the New Mexico Insane Asylum are located here, and there is a public library, sanitarium, flour-mills, carriage and wagon shops, railroad machine shops, planing-mills, foundries and machine shop, tie-preserving work, lumber and brick yards, candy and cigar factories, a brewery, etc. The surrounding country is devoted to agriculture and stock raising and Las Vegas is an important wool market. The health resort known as Las Vegas Hot Springs is located six miles distant, at an elevation of 6,767 feet above the sea. It is noted for its fine scenery and equable climate and for its numerous medicinal springs, with temperatures ranging from 75° to 160° F. Pop. about 8,000.

LASAULX, läz'oöl, Ernst von, German archeologist: b. Coblenz, 16 March 1805; d. Munich, 9 May 1861. He studied at Bonn and Munich, traveled through Austria, Italy, Greece and Palestine, and took his degree at Kiel in 1835. He was appointed professor of philology and aesthetics at Munich in 1844, but his influence having caused the downfall of the Minister Abel, he was dismissed from the university by King Louis 28 Feb. 1847. He was elected to the National Assembly at Frankfort in 1848, and on 15 March 1849 he was reinstated at Munich by King Maximilian II. He served in the Bavarian House of Deputies from 1849 until his death. He was magnetic as a teacher and of a mystical temperament. His writings deal largely with parallels between the Christian religion and the Hellenic philosophy. He wrote 'Geschichte und Philosophie der ab in Griechen' (1852); 'Der Untergang des Hellenismus' (1854); 'Des Sokrates Leben' (1857), etc.

LASCARIS, lask'æris, Constantine, Greek scholar and grammarian: b. Constantinople, about 1434; d. Messina, about 1500. He came of a Byzantine noble family, which had among its members three emperors of Nicea in the 13th century. The fall of Constantinople in 1453 forced him to flee to Corfu. He later went to Italy where he was appointed Greek tutor to Hippolita, daughter of the Duke of Milan. He taught in Rome where he gained the friendship of Cardinal Bessarion; went to Naples at the request of Ferdinand II and there dealt with lectures on Greek; but also taught in Spain, and for the last 35 years of his life he taught Greek at Messina. Among his pupils there was the future Cardinal Bembo. He collected and copied many manuscripts, which he willed to the Senate of Messina, and which were taken to Spain in 1712 and placed in the National Library in Madrid. His 'Grammatica Graec, sive Compendium octo Orationes Partium' (1476) was the first work printed in the Greek language. Consult Villemain, A., 'Lascaris on les Grecs en XVe Siecle' (1825).

LASCARIS, Theodore I, emperor of Nicea; d. 1222. He came of a noble Byzantine family, was son-in-law of Alexander III and was distinguished by his exploits in defeating the Latin invasion of Constantinople in 1203-04. After the fall of the city he went to Nicea and there founded a new Byzantine state which became a rallying point for his countrymen and of which he became emperor in 1206. He maintained his empire against the aggressions of the Latin Emperor Henry and Alexius Comnenus of Trebizond, carried successful war into the enemy's territory and in 1210 he captured Alexius and wrested considerable territory from the Turks. His daughter, Irene Lascaris, married his successor, John aptatzes, and became the mother of Theodore II, who reigned from 1254-58, and recovered Thrace from the Bulgarians in 1255-56.

LASK, Russian Poland, city in the government of Piotrkow, 82 miles southwest of Warsaw and 12 miles southwest of Lodza on the Newolka River and on the Warsaw-Katowic Railroad. It has important textile manufactories. It lay within the district over run by the Central Empires in the European War and was the scene of much sanguinary fighting. Pop. over 4,000.

LASKER, lask'ær, Eduard, German politician: b. Jarotschin, Posen, 14 Oct. 1855; d. New York, 5 Jan. 1884. He was of Jewish descent, and after being educated at the universities of Breslau and Berlin obtained a post in the Municipal Court (1851). He spent three years in England in the study of political conditions there. On his return he entered the government service and was elected in 1865 to the Lower House. He sat subsequently in the Constituent North German Diet, and up to the time of his death in the North German and German Diet for the district of Saxe-Meiningen. He was associated with the "Portschrittspartei" or Progressives, and in 1866 assisted in forming the National Liberal party, from which he later withdrew in opposition to Bismarck's economic policy. He took an active part in the civil consolidation of the German Empire in 1871 and on his death in New York the House of Representatives passed a vote of condolence and transmitted it for presentation through the authorized channels to the German Reichstag, but the message was peremptorily returned by Bismarck through the German Embassy at Washington. Among his writings is "Zur Verfassungsgeschichte Preussens" (1874). Consult Bamberger, 'Eduard Lasker' (Leipzig 1884).

LASKER, Emmanuel, German chess champion: b. Berlinchen, 24 Dec. 1868. He chose mathematics as a profession, but eventually turned his attention to chess, playing with such success that since 1892 he has been the recognized champion over all competitors both in tournaments and duel matches. He has outplayed, without losing a single game, Blackburn, Bird and F. Mieses of Leipzig. In 1892 he won the first prize in the London tournament; and in the International tournament at New York in 1894 beat all the best players, including Steinitz, champion of the world. A decisive match was arranged between him and Steinitz at Moscow and came
LASO DE LA VEGA - LASSEN

off December 1896 and January 1897. Lasker won ten games to 2, 5 being drawn. In 1902 he was appointed assistant lecturer on mathematics at Victoria University, Manchester. He had arranged a match with the celebrated Russian player, Rubenstein, for August 1914, which was canceled on the outbreak of war. He founded "Quarterly Chess Magazine" in 1904, and is the author of 'Common Sense in Chess.'

LASO DE LA VEGA, lá'só dá la vá'ga, Garcia, or GARCILASO DE LA VEGA, Spanish poet and soldier: b. Toledo, 6 Feb. 1504; d. Nice, 14 Oct. 1536. He entered the army, served under Emperor Charles V against the French and the Turks and received his death wound at the assault upon a castle near Fréjus when but 32 years of age. His reputation as a poet, however, was already established. He was an intimate friend of the poet Boscan, with whom he adapted the Italian verse forms to Spanish. Comparatively little of his poetry remains. There are a few early villancicos in the native Spanish manner; three eglogas, two elegies, five canzonets, and epistle in blank verse and 37 or 38 sonnets. His work bears no trace of the cut-and-thrust of the cantuy scenes among which his life was passed, but is marked by a tender melancholy. There are traces of the influence of the Italian poets in his manner and some of his grace is doubtless due to Horace. His poetry was printed in 'Works' (1544) with Boscan's poetry: reprinted (New York 1903). Consult Fitzmaurice-Kelly, J., 'Bibliographie de l'Histoire de la Littérature Espagnole' (Paris 1913).

LASSA, lá'sá. See LHASA.

LASSALLE, lá-sél', Ferdinand, German Socialist: b. Breslau, 11 April 1825; d. Geneva, 22 Aug. 1864. He studied at the universities of Breslau and Berlin, and while there gained the friendship of such men as Becker and Humboldt. Toward the end of 1844 he met at Berlin the Countess Hatzfeld, who had contracted an unfortunate marriage, conducted her suit for separation and brought it to a successful issue. He first made himself known as a leader during the democratic troubles of 1848, and was imprisoned for a year for alleged inciting to revolt. In 1858 he produced a work on the philosophy of Heracles and in 1861 published his 'System of Acquired Rights.' Thereafter he proceeded to organize the working classes, which caused the government to accuse him of sedition, and he was imprisoned for four months. He was at first allied with the party of the Progressists, but in 1862 he broke with them; in 1863 he issued his famous 'Offenes Antwortschreiben,' a brochure in which he sets forth his working-class program, and later in the same year founded a Labor Union (Allgemeiner deutscher Arbeiterverein), an Edinburgh branch of the International in Germany. In 1864 he published an attack on the Manchester school of economists under the title 'Herr Bastiat-Schulze von Delitzsch der ökonomische Jügan, oder Kapital und Arbeit.' In the summer of 1864 he was killed by a duel occasioned by a love affair. One of the chief points in his economic theory was that the iron law of wages* tended always to reduce wages to the mere cost of living; to remedy this he proposed associations of the working classes in productive enterprises with capital furnished by the state. He left no such elaborate statement of his views of the nature of capital and capitalist society as did Marx; nor did he influence the labor movement so much through his theoretical teachings as through his power and success as an organizer. Consult Bernstein, 'Lassalle as a SocialReformer, ' and Dawson, 'Germans and Socialism.'

LASSBERG, láz'brk, Joseph Maria Christoph von, Baron (Meister Sepp von Ephfusen), German antiquary: b. Donauwiesingen, 10 April 1770; d. 15 March 1855. He studied at Strassburg and at Freiberg, specializing in law, economics and forestry. He cultivated a love of literature and traveled extensively. His library was bequeathed to the town of Donauwiesingen. He was known under his pseudonym many medieval German poems. Among them are 'Eisen schöns und anmutig Gedicht, der Littower' (1825); 'Egenelied' (1832); 'Liedersaal' (4 vols., 1820-25), etc. Consult Peters, E., 'Briefwechsel zwischen Lassberg und Uhland' (Vienna 1870).

LASELL, lá'sél, William, English astronomer: b. Lancashire, 18 June 1799; d. 5 Oct. 1880. His early education was scanty, and while serving a mercantile apprenticeship at Liverpool he made telescopes for his pupil, and in a private observatory which he built near that city he began his astronomical work, about 1820, and continued it until 1861. There he built and mounted reflecting telescopes equatorially, the first of the kind in use, and also invented a method of polishing the specula. With his own telescope he discovered the satellite of Neptune in 1847, observed the eighth satellite of Saturn in 1848, and in 1851 discovered two new satellites of Uranus. In 1861, at Cape Cape, on the island of Malta, he mounted another reflecting telescope, and at that place until 1865 he made observations, also describing new nebulae and correcting many of his former results. In 1865 he returned to England, built an observatory near Maidanhead and there spent the remainder of his life.

LASSEN, lá'sén, Christian, Norwegian philologist and linguist: b. Bergen, Norway, 22 Oct. 1800; d. Bonn, Prussia, 8 May 1876. He studied at Christiania, Heidelberg and Bonn, at which latter university he became in 1839 extraordinary professor and in 1849 full professor. With Eugene Burnouf he deciphered many Pali MSS., and the result of their labors was published by the Asiatic Society in an 'Essay on the Pali or Sacred Language from the Peninsula beyond the Ganges.' He also published this book with Schlegel, the 'Krefeld,' and the 'Hitopadesa,' and was for many years editor of the Zeit- schrift für die Kunde des Morgenlandes. His works, which are numerous and valuable, relate to a variety of Oriental languages and ancient history, embracing, among other subjects, translations from the Hindu philosophy, the history
of Bactriana, Cabool and India, and cuneiform inscriptions.

LASSEN, Eduard, Danish composer: b. Copenhagen, 13 April 1830; d. Weimar, 15 Jan. 1904. He began his education at Brussels and in 1851 won the "Prix de Rome. Through Liszt he opera "Landgraf Ludwigs Brautfahrt" was produced in Weimar (1875), where he was made the following year "Kapellmeister" to the court. He retired in 1895. Of his compositions those which are most remarkable for talent and artistry are his oratorios "Frauenlob" (1890); "Le Capitif" (1868). He wrote two symphonies and the music for Sophocles' "Edipus" and Goethe's "Faust," as well as numerous songs, etc.

LASSEN PEAK, Cal., volcanic peak of the Sierra Nevada, on the boundaries between Plumas, Shasta, Lassen and Tehama counties, about 135 miles north of Sacramento, in latitude 40° 28' north. It was supposed to be extinct, but on 30 May 1914 clouds of steam and ash issued from the summit, and on 8 June and 18 July 1914 a column of steam rose to a height of 10,000 feet above the crest. The activity was credited to the great earthquake preceding it in Alaska and California. Its ancient lava beds are of vast extent and there are boiling springs and hot mud lakes at the base of the mountain. Altitude, 10,577 feet.

LASERRE, Isâr, Paul Joseph Henri de la Croix, French religious writer: b. Carthage, 25 Feb. 1828; d. 1900. He studied law at Paris and in 1851 created a sensation by the publication on 2 December of L'Opinion et le coup d'état, written in favor of the coup d'état. He was active in behalf of Poland, gaining the Pope's condemnation of the massacres of Warsaw; gained wide attention by his strictness on Renan's "Vie de Jésus"; and was later noted for his writings on the Lourdes pilgrimage, where he stated that he had received beliefs by word of mouth in which he had a bitter controversy with Zola. Author of L'Esprit et la Chair (1859); La Pologne et la Catholique (1861); L'Evangile selon Renan (1862); Notre-Dame de Lourdes (1869); Épisodes Miraculeux de Lourdes (1883), etc.

LASSO, a long strong string of buffalohide, rope or leather, with a running noose at one end, used by ranchmen and hunters. It is thrown in such a way as to fall over the horns or head of the animal, the hunter coiling one end round a high pommel on his saddle. When he makes a successful cast the hunter spurs his horse to its fullest speed, and the horse or other animal is almost strangled or borne to the ground and becomes an easy prey. Instead of a noose a leaden ball may be attached to the end of the thong, which is thrown so as to entangle the legs, neck or horns of an animal to be captured. The lasso has been used in the South American wars: it was employed against the French sentinels by some of the semi-barbarous tribes whom Russia had pressed into her armies during the Crimean War.

LASCO-CELLS, or STINGING CELLS, names applied to the cnidocytes of coelenterates. See NEMATOCYST.

LASSON, Iâsón, Adolf, German scholar: b. Strelitz, Mecklenburg-Strelitz, 12 March 1832. He was educated at the University of Berlin, where he became privat-docent of philosophy in 1877 and honorary professor in 1897. He was greatly influenced by the philosophy of Hegel. Author of "Baco von Verulams wissenschaftliche Principien" (1860); "Das Kulturideal und der Krieg" (1881); "Meister Eckhart der Mystiker" (1868); "Giordano Bruno" (1872); "Das Gedächtnis" (1894); "Der Leib" (1896); "Aristotelische nikomaische Ethik" (1899), etc.

LASSUS, Is'sus, Jean Baptiste Antoine, French architect: b. Paris, 13 March 1703; d. Vichy, 15 July 1857. He studied at the École des Beaux-Arts and under Lesbas and Labrouste. From Labrouste he imbibed the influences which started him toward the pre-eminence he attained in the 19th century Gothic revival in France. He was engaged with Duban and Viollet-le-Duc in the restoration of Saint Chapelle in 1840-56, and in 1842 he began with Viollet-le-Duc the restoration of Notre-Dame. He was also engaged in the restoration of Saint-Germain-l'Auxerrois, the cathedral of Moulins and built the churches of Dijon and de Nantes as well as other churches and convents throughout the provinces of France. He was a contributor to Annales archéologiques and author of "Monographie de la cathédrale de Chartres" in collaboration with Didron and Amaury Duval (1843); "Réaction de l'Académie des beaux-arts contre l'art gothique" (1846); annotated "Album de Villard de Honencourt" (1858).

LASSUS, Orlandus, or LASSO, lâs'so, Orlando (originally ROLAND DELATTRE), German composer: b. Muns, in Franconia, 1520 or 1530; d. Munich, June 1594. As a composer he was excelled only by Palestrina among musicians of the 16th century. About 1556 he went to Munich as chapel-master to Albert, Duke of Bavaria, and in 1558 became chaplain, an office which he held till his death. Among his more than 2,000 works are some 60 masses, many madrigals and songs, and the celebrated music for the Seven Penitential Psalms. In the royal library at Munich is the richest collection of his works. He landscaped a museum in Munich with his motets entitled "Magnus Opus Musice" (1604, 17 vols., folio). An edition of his collected works appeared at Leipzig 1893, et seq.

LAST DAYS OF POMPEII, The. Bulwer-Lytton's "The Last Days of Pompeii," published in 1834, has as its subject the destruction of Pompeii by fire, water, ashes and lava in the terrible eruption of Mount Vesuvius in the year 79 of the Christian era. The novel was mainly written at Naples near the scene of the ancient calamity in order that all incidents pertaining to it might be completely visualized. Bulwer climbed Mount Vesuvius, studied the excavations of the ruined city and was generally well prepared for the task by his knowledge of the classical literatures. It was his aim to restore the decayed life of Pompeii just before the destruction of the city. He reanimated, as it were, the skeletons found in houses, baths, temples and forum, all of which places he minutely described. These old skeletons, clothed in flesh and blood, became the dramatis personae of his plot. Many of them were buried in the ruins; but the hero and heroine, Glaucus and Ione, escape by the aid of
LAST JUDGMENT — LAST OF THE MOHICANS

Nydia, the Thessalian blind girl, and, being Greeks, retire to Athens. Nydia, hopelessly in love with Glauceus, drowns herself in the sea. Another heartbreak is Glauceus and Ophelia, a Christian, who converts Glauceus and loses to the new religion in which they are supremely happy.

Bulwer's novel annoys the reader of the present day by its stifled style, its melodrama and its sentimental trim; but the story and other grave faults cannot blind the critic to the fact that 'The Last Days of Pompeii' is the most successful novel we have dealing with ancient life and manners, so difficult to restore at all. The catastrophe which Bulwer chose for his theme at once interests and appalls; and the last chapters, descriptive of the awful fate that overcame the inhabitants of Pompeii, reach a high level of vivid narration, quite sufficient to keep the novel alive.

WILBUR L. CROSS.

LAST JUDGMENT, The, subject of religious paintings based upon Matt. xxv. 31, et seq., when Christ shall return to judge the world. It was a subject much favored by medieval artists, some of the greatest religious paintings and frescoes being founded upon the idea. Among them are that by Fra Angelico at the Florence Academy; one by Fra Bartolommeo painted in 1498-99 on the wall of the cloister of Santa Maria Nuova at Florence; Jean Coussin at the Louvre; a fresco by Giotto at Santa Maria dell' Arena, Padua; the fresco by Michelangelo in the Sistine Chapel at the Vatican; by Rubens in the Munich Gallery; by Tintoretto at Santa Maria dell' Orto, Venice; the fresco by Peter von Cornelius at Ludwigskirche, Munich.

LAST LETTERS OF JACOB ORTIS, (Ultima lettere di Jacopo Ortis) (1802), the most significant prose work of the Italian poet, Ugo Foscolo, is an autobiographical novel in epistolary form. Begun in 1798 when the author was a mere boy of 20 the history of this book is a romance in itself. Published in unfinished form in 1799, continued for an impaired ten years by the unscrupulous Angelo Sassi whose unauthorized edition was repudiated by Foscolo when he brought out his true text in 1802. The 'Ultime lettere' shows the influence of Rousseau's 'Nouveaux Héros' and still more of Goethe's 'Werther'. Like its German predecessor it was imitated by a quarter of a century. Foscolo's narrative reflects the pessimism, the unhealthy sentimentalism and the excessive morbidity of that period of social and political upheaval. The suicide in 1796 of Girolamo Ortis, a fellow student at the University of Pavia, Foscolo's unhappy love affairs, the Treaty of Campo Formio (17 Oct. 1797) by which Austria acquired Venice and which caused the poet's departure from his adopted state, became the genesis of these letters written for the eyes of the patriotic ardor of the Italian youth of the succeeding generation. An exile from Venice, Ortis (Foscolo), in a series of letters to his friend Lorenzo (G. B. Niccolini), laments his country's servitude and gradually lays bare his hapless passion for the lovely Teresa, the affairs and later the bride of another. This correspondence runs from October 1797 until March 1799, when the wretched youth stabs himself to death after writing an affecting farewell to Teresa. Such scenes as the meeting between Ortis and the aged poet Parini, the incident of the kiss, the final parted embrace of Ortis and the other descriptions of nature, are full of feeling. The language, while not exempt from affectations, is a robust, eloquent and animated poetic prose. Although the intermingling of the patriotic motive with the love idyll weakens the unity of the work, its effectiveness is compensated by the intense passion for liberty that animates Ortis. It is the first modern Italian novel of incontestable merit and the harbinger of the romantic movement in Italy. Consult Martineti and Antona-Traversi for a critical edition of the text (Saluzzo 1887); Albertazzi, A., 'Il Romanzo' (Milan 1902); Mazzoni, G., 'L'Ottocento' (Milan 1913); Marmoni, E., 'Prose' . . . di Ugo Foscolo' (Milan 1913).

ALFRED G. PANARONI.

LAST OF THE MOHICANS, The. The 'Last of the Mohicans' was the second of the Leather-Stocking series which Fenimore Cooper wrote, and it stands second in the order in which these novels present the deeds and emotions of the greatest character American fiction has furnished to the world of the imagination. Perhaps less realistic than 'The Pioneers,' and less poetical than 'The Prairie,' 'The Last of the Mohicans' is still the most representative not only of the series, but of Cooper's romances in general. In this tale Leather-Stocking first reaches his true proportions. 'The Pioneers,' in which he had first appeared, had shown him somewhat hardened by age; only at the end of that book, when Natty, in search of simplicity and perfect freedom, withdraws from the settlements and plunges into the deeper woods, does he make his full appeal. In 'The Last of the Mohicans,' which presents Hawkeye, as he is now called, in the prime of his strength and valor, he has grown nobler as he has grown more remote, more the poet and hero as the world in which he moves has become more wholly his own. Chingachgook has undergone an even greater change. He had been known in 'The Pioneers' as Indian John, a drunken old vagabond who was dignified only by his death. 'The Last of the Mohicans' restores to him his cunning and pride. The appearance of the story lies in Uncas, the son of Chingachgook, gallant, swift, courteous, a lover for whom there is no hope, the last of his mighty line. Cooper was perfectly willing to admit that Uncas was idealized, like other epic and romantic heroes. It is clear also that Uncas possesses many of the virtues which Rousseau had said are to be found in the state of nature. Romantic idealization, however, and romantic sentiment cannot deprive Uncas of the perennial appeal which youth makes when cut off in the flower. Nor is a book which has added three such personages to fiction to be too lightly dismissed as without power of characterization.

The action and setting of 'The Last of the Mohicans' are by the same high plane as the characters. The forest, with all the events take place, surrounds them with a changeless majesty which deepens, by contrast, the restlessness sense of danger. Flight and pursuit,
Cooper’s favorite plot-device, fill almost the entire book; two white girls, being escorted from Fort Edward in the Hudson to the Hudson on Lake George, are pursued by the hostile savages who infested that region during the French and Indian War; they are captured and, after another desperate pursuit, rescued. The thrilling contest is carried on with every subtle trick known to the Hurons; it is told to Hawkeye and the Mohicans, who are the real heroes of the piece, though there is a conventional lover for one of the conventional girls. Among the most moving moments in fiction is that in which Uncas reveals himself to the Delawares; of all Cooper’s climaxes it is the one built up with the greatest skill. The coincidences are occasionally strained and the style is careless, but the narrative force of the book, no matter what its defects, is too compelling for it to be called less than a masterpiece.

CARL VAN DOREN.

LAST ROSE OF SUMMER. The, a famous song by Thomas Moore, published in his ‘Irish Melodies.’ The air was derived from an old melody, ‘The Groves of Blarney.’

LASTMAN, last’mán, Pieter, Dutch painter and engraver: b. Amsterdam, 1580; d. Haarlem, about 1649. He was a pupil of Goyaert Pieters, and later studied in Rome under Ellemeier. Returning to Amsterdam he established a studio and in 1622 Rembrandt became one of his pupils. He made his reputation as a historical painter. His work is well represented in European galleries. Among them are ‘Repose in Egypt’ (1608), Rotterdam Museum; ‘Ulysses and Nausicaa’ (1609), Brunswick Museum; ‘Apollo and the Muses’ (1625), Cas sel Gallery; ‘Tobias’ (1618), Moltke Collection, Copenhagen; ‘Adoration of the Shepherds’ (1629), Haarlem Museum; ‘Raising of Lazarus’ (1632), Hague Museum, etc.

LASUS, Greek poet: b. Hermione, Argolis. He flourished in the early part of the 6th century and lived in Athens in the reign of Hipparchus. He was of the literary and artistic circle Feissistratidæ, a rival of Simonides, and teacher of Philemon. He was held in high repute, was considered the inventor of the dithyrambus and did much to perfect it and increase its popularity. He was the author of the first treatise on the theory of music.

LASZLÓ DE LOMBOS, lás’ló dé lom’bôz, or VON LANLOS, Philip Alexius, Hungarian painter: b. Budapest, 1809. He studied at the Industrial Art School and National Drawing School at Budapest, under Liezenmayei at Munich and under Lefebre and Benjamin Constant at Paris. He received gold medals from the Paris Salon in 1899, 1900; and also from Munich, Düsseldorf, St. Louis and Venice; and the golden plaque from the National Salon of Art in Budapest in 1912. He was ennobled by the emperor of Austria in 1912. In 1907 he took up his residence in England. His reputation rests upon his portraits. Among his sitters are Prince Leo XIII, King Edward VII, Queen Alexandra, Kaiser Wilhelm II, Theodore Roosevelt, King Alfonso XIII, Queen Victoria of Spain, Lord Roberts and other notables. He has done excellent work in portraying children and his portrait of himself is in the Uffizi, Florence.

LATACUNGA, lá-tá’koon’ga, Ecuador, capital of the province of Leon, 36 miles south of Quito, and one of the oldest towns in the republic and on the railway from Guayaquil and Quito. Owing to its situation on a plain more than 9,120 feet above sea-level, it has an even and temperate climate, and the surrounding country is well adapted to agriculture and cattle-raising; but it is only 25 miles distant from the great volcano, Cotopaxi, and has repeatedly been destroyed by earthquakes. There are manufactures of woolens and cottons, potteries, etc., and pumice stone and saltpetre are worked. A palace of the Incas is still in existence in the vicinity. Lataguncia was discovered by the Spaniards in 1534. Pop. estimated at 12,000.

LATAKIA, lá’tá-ké’a, Syria, seaport town in the vilayet of Beirut, opposite the island of Cyprus and 75 miles north of the town of Tripoli. It was the ancient Laodicea ad Mare, named by Seleucus Nicator in honor of his mother; and in the Roman period it was known as Julia. It was the seat of an ancient bishopric, and at the time of the Crusades was a wealthy city. It came under the rule of Tamar in 1102, but was recaptured by Saladin in 1118. It had a Christian colony, in order to build fortifications for its protection but the Christians were banished and their defenses leveled by Sultan Kala‘ün. In the 16th century Laodicea was almost non-existent but the establishment of the tobacco trade in the 17th century gave new life to the town, and tobacco raising is still its chief industry, although it also exports silk, oil, sponges and eggs. Pop. (estimated) 25,000.

LATEAU, lá’tô, Louise, Belgian visionary: b. Bois d’Haine, 30 Jan. 1850; d. 25 Aug. 1883. She entered the Third Order of Saint Francis of Assisi and after a vision of Christ which appeared to her in 1868 she was said to be stigmatized with wounds which bled on Fridays, although Belgian medical authorities pronounced the case stigmatic neuropathy. Bishop Dumont of Tournay believed the young woman’s case a miracle, but others denied it. Deposed Lateau left the Roman Catholic communion. Consult Rohling, A., ‘Louise Lateau, die Stigmatifirte von Bois d’Haine’ (1874).

LATENT FAULT or DEFECT, legal term used in the law of sales and in personal injury law. In the law of sales a purchaser is guarded against a blemish or defect not apparent or fraudulently concealed at the time of purchase. The seller does not impliedly warrant against latent defects in goods not of his own manufacture, but is bound to disclose latent defects known to him. In the law of injury a lender must have permitted damages for an injury incurred by the borrower in the use of a borrowed article whose defects were not made known. However, an employee or third party is not bound to take notice of defects in the article or appliance loaned. If an article is rented by Leo XIII, King Edward VII, Queen Alexandra, Kaiser Wilhelm II, Theodore Roosevelt, King Alfonso XIII, Queen Victoria of Spain, Lord Roberts and other notables. He has done excellent work in portraying children and his portrait of himself is in the Uffizi, Florence.
or undiscovered defects, such as leakage through a defective rivet in a water-tank, or a defective rivet in the hull, unknown to the owner at time of sailing.

**LATERAL MORAINE.** See Moraine.

**LATERAN,** palace and church at Rome. The name is derived from Plautius Lateranus, head of a rich patrician family whose estates were confiscated by Nero, while he himself was put to death for complicity in the conspiracy of Piso. The palace afterward became an imperial residence, but was given to Pope Melchizedek in 312 by the Constantine the Great, and thereafter was the residence of the popes for a thousand years. Only fragments of the palace of Constantine remain. Above is a chapel so sacred that none but a pope may officiate at its altar, and none but priests worship within its walls, and containing a portrait of our Lord known as the 'Acheiropoieton' or portrait not made with hands, traditionally begun by Saint Luke and finished by an angel. At one end of the dining hall called the Triclinium, in a building attached to the convent of the Passionist fathers, is the Scala Santa, or Holy Stair, reported to be that of Pilate's house, made holy by feet of our Lord as he passed to judgment. The rest is more recent, the hall having been rebuilt from designs of Fontana by Sixtus V. The palace also contains notable museums of Christian and pagan antiquities.

**LATERAN COUNCILS,** five ecumenical councils of the Roman Catholic Church, held in the church of Saint John Lateran, Rome, under the presidency of the Pope. The first Lateran Council, attended by 300 bishops, took place in 1123, under Calixtus II. The Concordat of Worms (the agreement between the emperor and the Pope) was confirmed; the indulgences granted to the Crusaders by Urban II were renewed; the consecrations performed by Burdin, the anti-pope, were annulled; the decrees against simony, marriage of the clergy, etc., were repeated. The second (1139), under Innocent II, attended by 1,000 bishops, laid the interdict upon King Roger of Sicily, excommunicated the Petrobrusians, and ordered Arnold of Brescia to keep silent. The third (1179), under Alexander III, decreed that a vote of two-thirds of the total concane should be required legitimately to elect a pope. The fourth, convened by Innocent III in 1215, is the most important of all the Lateran Councils. Besides representatives of many princes, two Oriental patriarchs were present, 412 bishops and 800 abbots and priors. Seventy decrees were issued. The first, directed against the Cathari and Waldensians, contains a confession of faith, in which the term *transubstantiation* occurs for the first time. The second decides the Trinitarian controversy between Petrus Lombardus and Joachim of Floris (in favor of the former). The 13th forbids the foundation of new monastical orders. The 21st decrees that all the faithful shall confess at least once a year to his sacerdos proprius (Mansi xxii 953-955, Pagi 1512-17), which was convened by Julius II and continued in 1517 under Leo X, and was not recognized by the Gallican Church, abrogated, on the command of Julius II, the Pragmatic Sanction issued by the Council of Pisa, and approved the concordat between Francis I of France and the Pope by which the *liberties* of the Gallican Church were abrogated. Consult Valentini, 'Basilia Lateranensis descrita ed illustrata' (1839); Buddeus, 'De Concilis Lateranensibus,' Jena (1725); von Kefele, 'Conciliengeschichte' (9 vols., Freiburg 1855-90).

**LATERITE,** a highly ferruginous, argillaceous rock or soil, found in India. The laterite of the highlands results from the weathering of the underlying volcanic rocks in situ. A low-level laterite is the surface-rock of the extensive low lands near the western coast; is formed from the débris of volcanic rocks of the region and of highland rocks. True laterite is a mixture of ferric hydroxide and aluminum hydroxide, with a small amount of free silica. It differs from true clay, in that the aluminum is present as a hydroxide, instead of as the silicate, kaolinite. Laterite is sometimes rich enough in iron to constitute an ore of that metal.

**LATEX.** The name, Latex, was first applied to certain plant juices which have a white, milky appearance. The white juice of the common milkweeds (*Asclepias*) is a familiar and typical example. The application of the name was then extended to cover similar juices which lack the whitish appearance, like the colorless, slimy juice of the Spider Lily (*Tradesacanica*).

The latex is contained in cells which are often remarkable for their length and complexity. In many families of plants, like the *Asclepiadaceae* (Milkweeds) and *Euphorbiaceae* (Spurges), the latex cells are differentiated early in the development of the embryo and continue to grow as the embryo develops into the seedling and into the mature plant, and may finally reach a length of many yards. Consequently, they are the longest cells in the plant kingdom. They may branch profusely, but no transverse partitions are formed and, therefore,

---

**FIG. 1.** They are regarded as unicellular vessels. A portion of a single latex cell is shown in Fig. 1.

The walls of latex cells are generally smooth and thin and more or less elastic. During growth, they weave in and out among
the other cells but do not penetrate them. A small portion of a latex cell surrounded by other cells is shown in Fig. 2.

Not all of the latex carrying structures are formed in the way just described, for the partitions in rows of cells may become dissolved, so that long vessels are formed, the process being like that involved in the formation of the woody vessels which carry ordinary sap. Whether formed from a single cell or from rows of cells by the breaking down of partitions, long continuous tubes are developed. If there were any transverse partitions, they would interfere with the free flowing of the latex.

The contents of the latex tube or vessels are as varied as the plants which contain them. There is a rather thin layer of protoplasm lining the wall and containing many nuclei and various inclusions, while the hollow part of the vessel contains most of the latex. The consistency of the latex varies, but it is usually a milky sap which flows easily. It contains mixtures of gums and resins, rubber, fat and wax in emulsion. Sometimes there are tannins, salts, ferments and poisonous alkaloids. In the Euphorbiaceae there are also starch grains. Rubber is such an important form of latex that it is treated under its own heading.

The great Euphorbia trees of South Africa, when cut into with an ax, exude great quantities of a sticky, milky latex which might be of commercial importance.

When a plant containing latex is injured, the latex flows out and quickly coagulates as it is exposed to the air. The latex of Euphorbia splendens, a plant very common in the cactus rooms of greenhouses, will pull out into threads as fine as cobwebs, within a minute from the time the cut is made; but in such a small plant the elastic material is not in sufficient quantity to be of any commercial value. In some plants, especially in the flower clusters, the latex tubes are very close to the surface and the tissue covering them is very thin and delicate, so that creeping insects break through and are held by the rapidly coagulating latex and thus prevented from reaching the nectar, which is reserved for flying insects which have an effect cross-pollination. Consult Molisch, H., 'Studien über den Milchaft und Schleimsaft der Pflanzen' (1901). Various textbooks on botany have paragraphs on latex.

CHARLES J. CHAMBERLAIN.

LATHAM, lath'am, John, English ornithologist: b. Eltham, 27 June 1740; d. Winchelsea, 23 Aug. 1837. He studied anatomy under Hunter, engaged in the practice of medicine at Dartford, and in 1796, upon inheriting a fortune, retired in order to devote his time to nature study. He was elected to the Royal Society in 1775, and was active in the establishment of Linnean Society in 1788. He was closely associated with the leading scientific men of his day, and made a notable collection of birds. His last work, the 'General History of Birds,' was written in his ninth decade, and the illustrations were designed, etched and colored by the author. It is his most important work and is referred to by ornithologists as an authority for the assigned names of species. Although Latham has acknowledged faults as a compiler the work is a remarkable achievement. Author of 'A General Synopsis of Birds' (3 vols., 1781-85); 'Index Ornithologicus sive Systema Ornithologicum' (2 vols., 1790; ed. Johanneau, Paris, 1809); 'General History of Birds' (11 vols., 1821-28), etc.

LATHAM, Robert Gordon, English ethnologist and philologist: b. Billingborough, Lincolnshire, 24 March 1812; d. Putney, Surrey, 9 March 1888. He was educated at Eton and Cambridge and became professor of English literature in University College, London. He published numerous works on the English tongue, among them 'The English Language' (1841; frequently republished); 'History and Etymology of the English Language' (1849); 'Handbook of the English Language' (1851); 'Elements of Comparative Philology' (1862), and a revised edition of Johnson's Dictionary (1870). His principal works on ethnology are 'Natural History of the Varieties of Man' (1850); 'Man and his Migrations' (1851); 'Ethnology of the British Islands' (1852); 'Ethnology of Europe' (1852); 'Descriptive Ethnology' (1859); 'Russian and Turk' (1878).

LATHROP, lathrop, Francis, American decorative artist and portrait painter: b. at sea near the Hawaiian Islands, 22 June 1849; d. Woodcliff, N. J., 18 Oct. 1909. He studied under T. C. Farrar in New York, at the Royal Academy, Dresden, in 1868, and in 1870-73 under Madox Brown in London, and assisted William Morris, Spencer Stanhope and Edward Burne-Jones in the execution of various works. He returned to New York in 1873 and engaged in decorative design with stained glass work. His chief decorative works are in the Metropolitan Opera House, New York; Trinity church and the Bijou Theatre, Boston; and in the chapel at Bowdoin College, Brunswick, Me. His work also appears in many private residences in New York, Albany and Baltimore. Of his stained glasses notable examples are those of the Marquand Memorial in Princeton College chapel, and in Bethesda church, Saratoga.
LATHROP—LATHYRUS

He was one of the founders of the Society of American Artists, and an associate of the National Academy of Design.

LATHROP, George Parsons, American author: b. Oahu, Sandwich Islands, 25 Aug. 1851; d. New York, 19 April 1898. He was educated in New York and in Dresden, studying in the latter city from 1867 to 1870, when he returned to New York and for a short time studied law. He went to England and there, in 1871, married Rose, second daughter of Nathaniel Hawthorne. (See LATHROP, ROSE HAWTHORNE.) From 1875 to 1877 he was assistant editor of the Atlantic Monthly; editor of London Courier till 1879; resided afterward at Concord, Mass., and in New York. Among his writings in prose and verse the following are best known: 'Rose and Roof-Tree,' poems (1875); 'Study of Hawthorne' (1876); 'A Fingal' (1876); 'Masque of Poets' (1877); 'An Echo of Passion' (1882); 'In the Distance' (1882); 'Spanish Vistas' (1883); 'History of the Union League in Philadelphia' (1883); 'Newport' (1884); 'Gettysburg, a Battle of 1863' (1888); 'Dreams and Days' (1892); 'God of Power' (1892). With his wife he published 'Annals of Georgetown Convent' and 'A Story of Courage' (1894), and he brought out an edition of Hawthorne's works, with a biography (1893). The American Copyright League was founded (1883) by Lathrop.

LATHROP, John (also LATHROP, LATHROPS), American clergyman: b. Yorkshire, England; d. 1653. He was educated at Oxford; took holy orders; was rector at Egerton in Kent; and about the year 1624, in Leinster, Ireland, minister (succeeding Henry Jacob) of the first Independent and Congregational church organized in England. He and his congregation underwent annoyance and persecution at the hands of churchmen, and for some time (1632–34) Lathrop was imprisoned. During his confinement he was bereft by the death of his wife and by a division in his flock over a question of baptism, and in 1634 sailed to Massachusetts, where he settled as minister at Scituate, removing in 1639 to Boston. The record of his ministry is kept in "an original register" written by him are referred to as authority by Prince in his 'Annals of New England.'

LATHROP, John Hiram, American educator: b. Sherburne, N. Y., 22 Jan. 1799; d. Columbia, Mo., 2 Aug. 1866. He was graduated at Yale in 1819; from 1822 to 1826 was tutor there; adopted the profession of law, which he followed for six years, then abandoned it for that of teaching. He taught at Norwich, Vt., and at Gardiner, Me. Between 1829 and 1840 held professorships of mathematics, natural philosophy, law, history, and economics at Hamilton College; was president of the University of Missouri 1840–49; afterward became chancellor of the University of Wisconsin (1849–59); president of Indiana University (1859–60); professor of English literature at the University of Missouri (1860–62). He was again president of the University of Missouri in 1865, and until the time of his death.

LATHROP, Julia Clifford, American social worker: b. Rockford, Ill., 1838. She was graduated from Vassar College in 1889 and since 1889 has spent much of her time as a voluntary resident at Hull House, Chicago. She has specialized in the study of the care of the insane, the education of children and in the development of juvenile courts, and has made several tours abroad for the study of methods of obtaining in other cities. She served on the Illinois State Board of Charities, was president of the Illinois Society for Mental Hygiene, vice-president of the Chicago School of Civics and Philanthropy, and was appointed the first chief of the new Children's Bureau in the Department of Labor at Washington. She is author of reports and articles on care of the insane, civil service, and of "The Children's Bureau" (1912).

LATHROP, Rose Hawthorne, American author: b. Lenox, Mass., 20 May 1851. She was educated in the public schools, having lived during the years 1853–60 in England, where her father, Nathaniel Hawthorne (q.v.), was United States consul at Liverpool (1853–57), and in Portugal; studied art in Dresden and London; and in 1871 married George Parsons Lathrop, with whom, until his death, she was associated in literary labors. She has been especially interested in the improvement of conditions for suffering and needy people, and in 1891 established Saint Rose's Free Home for Cancer, and Rosary Hill Home, in New York, where she afterward became head of a Dominican community of the Third Order and directress of a charitable home, her title being Mother Mary Alphonsa. Besides many sketches and stories, her writings include "Along the Shore," poems (1888), and "Memories of Hawthorne," with her husband (1897), with whom she also collaborated in other works.

LATHROP, William Langson, American painter: b. Warren, Ill., 29 March 1859. He was self-taught in art and has devoted himself to landscape painting. He was awarded the gold medal of the Philadelphia Art Club, won the Webb and W. T. Evans prizes, and was also awarded prizes from the Carnegie Institute and Worcester, Mass. His work is represented in the permanent collections of the National Museum of Art, New York; the Carnegie Institute, Pittsburgh; the Albright Gallery, Buffalo; the National Museum of Art, Washington; and the Minneapolis Art Museum. He was elected to the National Academy in 1907.

LATHYRUS, lat’he-rús, a genus of plants of the family Leguminosae, the vetchlings or everlasting peas, which resemble Vicia but have usually fewer leaflets (often two), broader petals, an obliquely truncate staminal tube, and a style longitudinally flattened and bearded on the inner face. The species are numerous and grow in sandy and waste places, or in meadows. L. pratensis, the meadow vetchling, a climbing plant, two or three feet long, with yellow flowers, is a familiar example in many parts of the northern hemisphere. Another species (L. maritimus) of the beach-pea, is equally common and widespread. The roots of L. tuberosus are edible. L. sativus and other species are used as green fodder for cattle in India, but are harmful to pigs; and several species contain a poisonous principal injurious to the human system. L. latifolius and L. sylvestris, of southern Europe
LATIMER — LATIN

and England, respectively, are both perennials and known as the everlasting pea. L. odoratus, a native of the East, is a common garden plant, with fragrant flowers. L. sylvestris wagneri is grown as a fodder plant in Germany, France and the United States. It yields abundant green forage and when well started is very resistant to drought. Nearly 200 species of the genus are cultivated for their handsome flowers — yellow, red, scarlet, purple and blue. The larger kinds are well adapted for arbors and shrubberies, where they may climb upon some support.

LATIMER, Hugh, English prelate, reformer and martyr; b. Thurcaston, Leicestershire, about 1490; d. Oxford, 16 Oct. 1555. He was educated at Cambridge, took holy orders, and by and by began to preach Protestant doctrine, which led to vigorous opposition. As one of the representatives of the University of Cambridge, he supported Henry VIII's claim to the validity of his marriage with Catharine of Aragon; was made chaplain to the king in 1530, and bishop of Worcester in 1535. In 1539 he resigned his bishopric, not being able to accept the Six Articles, and was put in prison, but on the accession of Edward VI he was released and became highly popular at court. This continued until Mary ascended the throne, when Latimer was cited to appear, with Cranmer and Ridley, before a council at Oxford, and condemned. After much delay and a second trial Latimer and Ridley were burned at the stake. His dying words are famous: "Be of good cheer, Master Ridley, and play the man; we shall this day light such a candle by God's grace in England as (I trust) shall never be put out." His preaching was popular in his own time for its pith, simplicity and quaintness, and his 'Sermons' are still read. Consult Lives by DEMAUS (1869); R. M. Carlyle (1899).

LATIMER, James Elijah, American clergyman and educator; b. Hartford, Conn., 7 Oct. 1825; d. Auburndale, Mass., 26 Nov. 1884. He was graduated at Wesleyan University in 1846 and in teaching until 1851 when he became pastor of the Methodist Episcopal church at Elmira, having entered the ministry in 1858. He traveled in Europe in 1868 and in 1870 he was selected as professor of historic theology in the Boston University School of Theology. In 1874 he was appointed dean and professor of systematic theology there, which positions he retained the remainder of his life. He was a contributor to magazines and religious periodicals.

LATIN, The Mechanism of. Under this heading it is proposed to give a brief description of the morphology of Latin with a few preliminary remarks on the Latin alphabet.

1. The Alphabet.—Originally and even up until Cicero's time, the Latin language had only 21 characters to represent its sounds. Toward the end of the republic or the beginning of the empire the letters Y and Z were introduced from the Greek alphabet in Greek loanwords, so that at this time there were 23 characters in Latin (6 vowels and 17 consonants), as follows: ABCDEFGHILMNOPQRSTUVWXYZ. The 9th and 20th characters, however, had consonantal as well as vocalic values. Unlike the Greek, the Latin alphabet was not borrowed directly from the Phoenician, but through the medium of the Greek alphabet of the Doric-Chalcidian colony of lower Italy.

2. The Parts of Speech.—In Latin there are the following parts of speech: noun (which includes substantives and adjectives), pronoun, verb, adverb, preposition, interjection and conjunction. Numerals are considered as adjectives or adverbs accordingly as they are cardinals or ordinals. Particles partake of the nature and functions of both the adjective and the verb. Words which undergo change in form to indicate a change in meaning are said to be inflected. The last four parts of speech mentioned above are uninflected. The inflection of nouns and pronouns is called declension; that of verbs, conjugation.

3. Gender, Number and Case.—In Latin one and the same nominal form indicates simultaneously gender, number and case without any of these categories having a distinctive mark.

A. Gender.—There are three genders in Latin: masculine, feminine and neuter. It is difficult, however, to foretell a priori what would be the gender of a given word. In general, masculine and feminine mark a difference of sex, and neuter denotes inanimate objects, but there is also a grammatical gender which must not be confused with the natural gender.

B. Number.—Latin distinguishes two numbers: singular and plural. The dual, which in Indo-European served to designate two objects, has completely disappeared, although there are traces of some dual forms such as ambi and amboo, which however are treated as plurals.

C. Case.—Latin possesses six cases: nominative, genitive, dative, accusative, vocative and ablative. The ablative was formerly a local case and with it is confused a case primarily distinct, the instrumental or case of accompaniment and of means. There are also some traces of a locative case, now lost. The use of prepositions with some of the cases supplies some deficiencies of the mere cases in expressing word relationship. The functions of the cases are as follows: nominative — case of subject or of predicate attribute genitive — case of complement of noun, whether subjective or objective dative — case of person or thing interested accusative — case of direct complement of verb; of extent of space and duration of time; of limit of motion vocative — case of direct address ablative: real ablative — case of point of departure or origin instrumental ablative — case of means, instrument, manner and accompaniment locative ablative (in part) — case of place in which locative — case of time at which or in which
It is characteristic of Latin that from the very beginning there is a tendency to reduce the number of cases. In the singular the instrumental has disappeared, the locative has only a precarious existence and the vocative and nominative tend to be confused. In the plural Latin never had but one form for the dative, ablative, instrumental and locative, not to mention the single form for the nominative and vocative, whose identity goes back to the Indo-European.

4. The Noun.—Variation of accent plays no part in the declension of Latin nouns, for since prehistoric times Latin had an accent at a fixed place, and the displacements of the Indo-European movable accent, of which some traces are found in Greek, have entirely disappeared in Latin. Moreover, the Indo-European variation of the quality or quantity of stem-vowels, a phenomenon called ablaut or vowel gradation, which is not preserved intact in any one language, leaves but few traces in Latin. The Indo-European noun was composed of a stem, to which was added an ending which, concurrently with the vocative variations of the stem, marked at once the number, gender and case. Since the vocalic variation of stem was almost entirely eliminated in Latin, Latin declension is to be recognized by the endings. The Latin grammarians laid down five types of declension according to the relation between the nominative and genitive:

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>nom. rosa</td>
<td>dominus</td>
<td>dux</td>
<td>mensa</td>
<td>classis</td>
</tr>
<tr>
<td>gen. rose</td>
<td>domin</td>
<td>duct</td>
<td>mentis</td>
<td>classis</td>
</tr>
</tbody>
</table>

This distinction is very artificial, although it is always taught. The following paradigm shows the case-endings of the five declensions:

5. Pronouns.—Pronouns in Latin fall into five chief classes: personal (including possessives), demonstrative, relative, interrogative and indefinite. Although in many respects pronouns do not differ to a great extent from nouns in declension, they have essential characteristics which show clearly that they have their own declension. This is particularly true of personal pronouns whose declension is therefore given here:

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>(demonstrative)</th>
</tr>
</thead>
<tbody>
<tr>
<td>nominative</td>
<td>ego</td>
<td>tu</td>
<td>noster, nostri</td>
</tr>
<tr>
<td>genitive</td>
<td>mi</td>
<td>tu</td>
<td>nostrum, nostri</td>
</tr>
<tr>
<td>dative</td>
<td>mid</td>
<td>tu</td>
<td>nobile, nobilis</td>
</tr>
<tr>
<td>accusative</td>
<td>mi</td>
<td>tu</td>
<td>nobis</td>
</tr>
<tr>
<td>ablative</td>
<td>mi</td>
<td>tu</td>
<td>nobis</td>
</tr>
</tbody>
</table>

6. The Verb.—The conjugation of the Latin verb depends entirely upon the contradistinction of two stems, that of the present and that of the perfect. Related to the latter is the stem of the verbal adjective in -to, which serves not only to form the perfect of the passive and of deponents. The contransdistinction did not, at least originally, imply an entirely temporal idea, but merely an action viewed as uncompleted or completed respectively. Moreover, the two stems were at first independent of one another, but, as the language developed, they were gradually linked together (conjugare) as parts of the same system and parallel temporal forms based upon each of the two stems appeared.

In the conjugation of the verb there are two voices: active and passive. The active indicates a fact, an action, a state pure and simple. The passive has a double meaning: 1, impersonal, with the meaning of the indefinite second or third person; and 2, a middle-passive, expressing, as in Greek, that the subject is interested in the action expressed by the verb, often with a reflexive sense. A certain number of verbs of middle or active meaning have only passive endings; these are called deponents.

As regard forms, the conjugation of the verb
distinguishes personal and non-personal forms. The former, which are the more important, comprise the tenses and moods provided with personal endings; the latter, declinable or indeclinable forms which by their origin and their morphology are attached to the substantive.

Personal forms comprise three moods: indicative, or mood of reality or affirmation; imperative, which serves to give orders; and subjunctive, or mood of subordination, which marks will and anticipation and in Latin also wish, possibility and condition. Each of the stems has three tenses in the indicative: present, imperfect or past, and future; the imperative has no past; and the subjunctive no future or future perfect. Each of these tenses has two numbers: singular and plural; there is no dual. Each of these numbers has three persons: first, second and third (except the imperative which has not the first).

Non-personal forms comprise: a, verbal substantives: infinitive (present and perfect in the two voices), gerund and supine, which form a sort of declension of the active infinitive; and b, verbal adjectives: participles (present and future active, perfect and future passive).

Latin has not merely one conjugation, but it is difficult to find a satisfying classification. The distinction into four conjugations, imagined by the Latin grammarians and still in use in the teaching of Latin, takes into account only the present and even here unites two different formations. In the perfect it is even altogether improper. But the division into thematic and non-thematic or athematic verbs is equally unsatisfactory. The four conjugations now generally adopted in teaching are those whose stem ends in -a (first conjugation), -e (second conjugation) and -i (fourth conjugation), together with the third conjugation which includes, among others, all those verbs whose stem ends in a consonant and requires a thematic vowel to join it to the personal or tense endings. There are quite a few verbs which do not fit into these artificial categories, such as sum ("I am"), volo ("I wish"), fero ("I bear"), etc.

The personal endings of all the tenses (indicative and subjunctive) in the active voice except the perfect indicative are:

<table>
<thead>
<tr>
<th>Person</th>
<th>Singular</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-s or -m</td>
<td>-mus</td>
</tr>
<tr>
<td>2</td>
<td>-s</td>
<td>-tis</td>
</tr>
<tr>
<td>3</td>
<td>-t</td>
<td>-nt</td>
</tr>
</tbody>
</table>

The personal endings of all the tenses (indicative and subjunctive) of the present stem in the passive and in deponents are:

<table>
<thead>
<tr>
<th>Person</th>
<th>Singular</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-r</td>
<td>-mur</td>
</tr>
<tr>
<td>2</td>
<td>-ris or -re</td>
<td>-mini</td>
</tr>
<tr>
<td>3</td>
<td>-tur</td>
<td>-ntur</td>
</tr>
</tbody>
</table>

The personal endings of the perfect indicative tense in the active are:

<table>
<thead>
<tr>
<th>Person</th>
<th>Singular</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-i</td>
<td>-imus</td>
</tr>
<tr>
<td>2</td>
<td>-ist</td>
<td>-istis</td>
</tr>
<tr>
<td>3</td>
<td>-i</td>
<td>-iunt, -ere</td>
</tr>
</tbody>
</table>

The personal endings of the tenses (indicative and subjunctive) of the perfect stem in the passive and in deponents are formed by the participle and the auxiliary verb.

HERBERT F. WRIGHT,

Sometime of the Department of Latin, The Catholic University of America.
